LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RODD ISLAND.

(CORRESPONDENCE RESPECTING)

Ordered by the Legislative Assembly to be printed, 11 January, 1893.

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 26th October, 1892, That there be laid upon the Table of this House,—

“All correspondence, dating from the year, 1859, between any and all Ministers of the Crown and Mr. B. C. Rodd, of Five Dock, and any other persons, in connection with the sale or alienation, or reservation of an island in Long Cove, Parramatta River, now called Rodd Island, and all reports, minutes, notations, and all other papers or matters concerning or relating to such correspondence, &c., and concerning the alienation, reservation, uses, or proposed uses of such island.” ;

(*Mr. Darnley.*)

SCHEDULE.

No. 1.

B. C. Rodd, Esq., to the Colonial Secretary.

Sir,

Sydney, 1 January, 1842.

I request permission to purchase a small island in Iron Cove Bay, nearly opposite Iron Cove Bay Point, containing about 1 acre.

The land is of little value, and my principal object in purchasing it would be to prevent squatters, or rather shell-gatherers, from taking up their abode there occasionally, and thereby becoming a great nuisance to me.

If His Excellency will not permit me to purchase, perhaps he will suffer me to occupy at a nominal rent, as even then my object would in some degree be gained, and the whole neighbourhood benefited.

I have, &c.,

B. C. RODD.

The Surveyor-General is requested to report.—E.D.T., B.C., 7/1/42. Apprised.

The island is situated in the navigable waters of Port Jackson, with 2½ to 3 fathoms of water round it, and would serve very well for a police station in connection with Cockatoo Island. I do not think it should be either sold or let.—T.L.M., 14/1/42.

Inform Mr. Rodd that I do not consider it would be proper either to sell or let this island.—G.G., 19/1/42. Mr. Rodd and Surveyor-General, 21/1/42.

No. 2.

The Colonial Secretary to The Surveyor-General.

Sir,

Colonial Secretary's Office, Sydney, 21 January, 1842.

In reference to your report on the application of Mr. B. C. Rodd to be allowed to purchase or rent a small island in Iron Cove Bay, I do myself the honor to inform you that His Excellency the Governor does not consider it proper either to sell or to let this island, of which Mr. Rodd has been apprised.

I have, &c.,

W. ELYARD, JUNR.

(For the Colonial Secretary).

B.C. 42-280 received by Surveyor-General, 13/1/42. To report on Mr. Rodd's inquiry whether shell-gatherers have any right on his portion of his Five Dock farm. Replied to 19/1/42.

No. 3.

No. 3.

B. C. Rodd, Esq., to The Secretary for Lands.

Sir, Barnstaple Manor, Long Cove Bay, Five Dock, 22 March, 1858.

There is a small island in Long Cove Bay, containing about 1 acre of Crown land, unoccupied. It is now being destroyed by goats and ballast men. From the spot where I live it has a picturesque effect. The real value is *nil*. My object now is to preserve it, having no anxious desire to possess it.

1. I have therefore to request it may be put up for sale.
2. That I have a lease of it with a nominal rent, or be authorised to hold it for the Government.
3. Or that some person be put in charge of it.

I have, &c.,
B. C. RODD.

The Surveyor-General is requested to report.—M.F., B.C., 24th June.

Sir George Gipps in the year 1842 refused to sanction the sale of the island referred to, on a report from Sir Thomas Mitchell that it was surrounded by water $2\frac{1}{2}$ to 3 fathoms deep, and would serve very well for a police station in connection with Cockatoo Island, and that he did not think it should either be sold or let. It seems probable that the late Surveyor-General was mistaken in the identity of the island applied for by Mr. Rodd, which is not surrounded by deep water, and is at least a mile and a half from Cockatoo Island, and that Sir Thomas Mitchell's report refers to one of the small islands, known as Spectacle and Snake Islands, which lie within a few hundred yards of Cockatoo, and between it and the Five Dock estate. The island referred to by Mr. Rodd contains, so far as the plans show, rather less than 1 acre. I see no probability of its ever being required for any public purpose, and I therefore think that it might be brought to sale in compliance with Mr. Rodd's renewed application.—GEO. BARNEY, Surveyor-General, Surveyor-General's Office, 4/10/58; 58-499, folio 398.

May be submitted for sale.—JOHN R., 6/10/58. The Surveyor-General,—To be acted on accordingly.—M.F. B.C., 6/10/58. Inform B. C. Rodd, Esq.—6/10/58. Licensed-Surveyor Neild, 23rd October. B.C., 25th. 23rd October, 1,064. Sydney schedule (2nd day, dated 12/2/59).

No. 4.

The Surveyor-General to The Under Secretary for Public Works.

B.C. immediate.

24 September, 1858.

The refusal to sell the island referred to was by Sir George Gipps, in 1842, on a report by Sir Thomas Mitchell that it was surrounded by water $2\frac{1}{2}$ to 3 fathoms deep, and would serve very well for a police station in connection with Cockatoo Island, and that he did not think it should either be sold or let.

It seems probable that the late Surveyor-General was mistaken in the identity of the island applied for by Mr. Rodd, which is not surrounded by deep water, and is at least a mile and a half from Cockatoo Island, and that Sir Thomas Mitchell's report refers to one of the small islands known as Spectacle and Snake Islands, which lie within a few hundred yards of Cockatoo, and between it and the Five Dock Estate.

The island referred to by Mr. Rodd contains, so far as the plans show, rather less than 1 acre. I see no probability of its ever being required for any public purpose, and I therefore think that it might be brought to sale, in compliance with Mr. Rodd's renewed application.

A.G.M., G.B.

B.C.—1/10/58-499.

No. 5.

The Under Secretary for Lands to B. C. Rodd, Esq.

Sir, Department of Lands and Public Works, Sydney, 6 October, 1858.

Adverting to my letter of the 24th June last, respecting your application to purchase a small island, situated in Long Cove Bay, Parramatta River, I am now directed to inform you that under a report received from the Surveyor-General, the Secretary for Lands and Public Works has, in compliance with your request, issued instructions for the sale of the island in question.

I have, &c.,
MICHL. FITZPATRICK.

No. 6.

Mr. Licensed-Surveyor Neild to The Surveyor-General.

Sir, 98, Palmer-street, 18 November, 1858.

Herewith I have the honor to transmit a plan and description of an island in the Parramatta River, near Long Cove and Iron Cove Bays.

Measured in accordance with your letter of instructions, No. 58-542, dated 23rd October, 1858, and have the honor to be,

Yours, &c.,
JOHN NEILD,
Licensed Surveyor.

Cat. C 727-690.

No. 7.

B. C. Rodd, Esq., to The Minister for Lands and Works.

Sir,

Sydney, 21 April, 1859.

On the 31st ultimo, I purchased from the Government, at a land sale, a small island in Long Cove Bay, containing about 3 acres.

2. I am informed that the grant, when issued, will be in the usual form, unless ordered to the contrary.

3. I consider that in purchasing the whole island I have a right to its appurtenances and privileges—such as the land betwixt high and low water mark, oysters, seaweed, &c.—in short, to make it clear that no person could land upon the island without my permission.

4. The island is all but a barren rock—a second Pinchgut—valueless to any person, and regarded by me as a picturesque object, and for picnicing; therefore, unless I could obtain a grant of these privileges, I should have no inducement to complete my contract. On the place where I live, instead of water frontage being a benefit, it is a nuisance, the public claiming a right to traffic betwixt high and low water mark.

5. As I have to pay the balance of purchase money on the 30th instant, I shall esteem it a favour to have a reply before then, or if there is not time to consider the matter in taking the opinion of the Law Officers of the Crown, I would pay the balance of purchase money forthwith, subject to its being returned to me should my present request be refused.

I have, &c.,

B. C. RODD.

The Surveyor-General is requested to report.—M.F., B.C., 3 May. Informed.

The clause reserving 100 feet above high-water mark is now omitted in all deeds of grant by purchase, nor am I aware of any reason why, in the alienation of the small island purchased by Mr. Rodd, the reservation should be specially introduced.—G. BARNES, Surveyor-General's Office, 11/5/59., B.C., 59-335, fol. 131, vol. vii.

Inform Mr Rodd.—13.

No. 8.

B. C. Rodd, Esq., to The Under Secretary for Lands.

My dear Sir,

2 May, 1859.

This is all but a copy of the letter I sent you on the 21st ultimo. I fear now it is too late, and the deposit must be forfeited.

Yours, &c.,

B. C. RODD.

I find, on personal inquiry, that Mr. Rodd has failed to complete the purchase of the island herein alluded to, and that the deposit has been forfeited. The matter might therefore be allowed to drop, as the statement made in the Surveyor-General's report is no answer to Mr. Rodd's application, which was for the reservation, in his favour, of the land between high and low water-mark, and not above high water-mark.—G.W.W., 20/5/59.

[Enclosure.]

Sir,

Sydney, 21 April, 1859.

1. On the 31st of last month I purchased at a Government land sale a small island in Long Cove Bay, containing about 3 acres.

2. I am informed that the grant, when issued, will be in the usual form, unless specially ordered to the contrary.

3. I consider that in purchasing the whole island I have a right to its appurtenances and privileges, such as the land betwixt high and low water mark, oysters, seaweed, &c.—in short, to make it clear that no person could even land on the place without my permission.

4. The island is all but a barren rock—in fact, a second Pinchgut—quite valueless to any person, and regarded by me as a picturesque object only; therefore, unless I could obtain a grant of these privileges, I should not complete my contract.

5. As I have to pay the balance of purchase on the 30th, I should esteem it a favour to have a reply before that, or if there is not time to consider the matter or test the opinion of the Law Officers of the Crown, I would pay the amount in full, subject to its being returned to me in case my request is not granted.

I have, &c.,

B. C. RODD.

The Hon. John Robertson.

No. 9.

D. Ramsay, Esq., to The Surveyor-General.

Sir,

Petersham Post Office, 1 December, 1865.

I request you will be good enough to bring to auction sale Jack's Island, in the Long Cove, Parramatta River, opposite Austenham, my residence, formerly belonging to Captain Perry.

I am under the impression that it was once bought, and that the purchaser forfeited the deposit.

I have, &c.,

DAVID RAMSAY]

No. 10.

Office Memorandum.

Recommending revocation of reserve, island at entrance of Long and Iron Cove Bays.

21 July, 1866.

RECOMMENDED to the Honorable the Secretary for Lands that the island, containing 3 roods and 20 perches, situated near the entrance to Long Cove and Iron Cove Bays, Port Jackson, county of Cumberland, reserved from sale until surveyed by notice, 17th April, 1862, not being required for public purposes, the reservation be revoked and the island brought forward for auction sale.

W.E.D.

The Under Secretary for Lands,—Very urgent. Submitted, 31.

No. 71.

No. 11.

Minute Paper for The Executive Council.

Department of Lands, Sydney, 2 August, 1866.

It is recommended to His Excellency the Governor and the Executive Council, that authority be given for the revocation of the temporary reservation from sale of the within described island, near the entrance to Long and Iron Cove Bays, under the 6th section of the Crown Lands Alienation Act of 1861.

J. BOWIE WILSON.

The Clerk of the Council.—M.F., B.C., 3/8/66. Urgent. Withdrawn for the consideration of the Executive Council, at the request of the Honorable the Secretary for Lands.—ALEX. C. BUDGE, Clerk of the Council, 6/8/66. A notice withdrawing the land from sale will appear in to-morrow's *Gazette*. Papers now returned to Surveyor-General in order that the auctioneer may be so informed.—M.F., B.C., 6/8/66. Urgent. Messrs. Richardson and Wrench, 6/8/66.

No. 11½.

Gazette Notice.

WITHDRAWAL OF LAND FROM SALE.

Department of Lands, Sydney, 7 August, 1866.

NOTICE is hereby given that the portion of land, hereunder described, advertised in the *Government Gazette* of the 6th ultimo (No. 133) for sale at the office of Messrs. Richardson and Wrench, Pitt-street, Sydney, on the 9th instant, has been withdrawn from sale, viz.:—Lot A, 3 acres 20 perches, county of Cumberland, parish of Concord, being an island near the entrance to Iron Cove and Long Cove, Port Jackson, about a quarter of a mile north-easterly from Iron Cove Point.

J. BOWIE WILSON.

No. 12.

B. C. Rodd, Esq., to The Colonial Treasurer.

Sir,

Sydney, 11 February, 1869.

About eight years since, I bought the island in Iron Cove Bay, and paid to your office deposit of £17, or thereabouts.

I am trying to get this returned, as it was no fault of mine that I did not complete the purchase.

I have now to beg the favour of your informing me the exact amount I paid, and when.

I have, &c.,

B. C. RODD.

Will the Under Secretary for Lands be good enough to favour me with the date of the sale of the island in question.—J.T. (for the Under Secretary), B.C., 15/2/69. Sale at Sydney, 31st March, 1859. Special country lot No. 1.—G.J.A. (for the Under Secretary), Department of Lands, B.C., 18/2/69.

Mr. B. C. Rodd became the purchaser of lot 1, containing 3 roods 20 perches, at £170. A deposit of £17 was paid. Mr. Rodd failed to complete the purchase, and thus forfeited the deposit. It is believed that Mr. Rodd, some time after the sale, had a correspondence with the Lands Department. This application is now referred to that Department. The Under Secretary for Lands, B.C., 19/2/69.—J.T. (for Under Secretary, Lands), 20/2/69. Inform Mr. Rodd.—W.F., 26/2/69.

No. 13.

B. C. Rodd, Esq., to The Secretary for Lands.

Sir,

Barnstaple Manor, Five Dock, 11 February, 1869.

Some time in the year 1860, or thereabouts, I purchased at a Government sale the island in Iron Cove Bay, Five Dock, opposite my residence, and paid the deposit of £17.

2. Before the time of completion, one month from sale, I wrote to your office to know if the above island would be granted to me, and not on the old grant terms, viz., reservation of water frontage.

3. Awaiting the reply the time expired for completion, and I was told at the Treasury that my purchase was forfeited.

4. Since then the Government advertised the island for sale which was withdrawn, and I wrote to Mr. Wilson, the late Secretary, on the subject.

5. My only object in purchasing was to preserve a picturesque island in the bay. I saved it wholly from destruction by ballast men. It is otherwise valueless. There is not 20 rods of earth upon it, and no water.

6. I have, therefore, to request the Minister's consideration either to let me take the island by appraisal, or return me my deposit as it was no fault of mine that I did not complete at the time, as I then had plenty of money to fritter away, and now the sum of £17 odd would be useful.

I have, &c.,

B. C. RODD.

Letters and correspondence.—Fitzpatrick, Esq. Papers relating to purchase of island in Farm Cove Bay by Mr. B. C. Rodd in 1859.—W.F., February, 1869. Forfeiture may be cancelled, and deposit taken as part payment being held in suspense in the meantime.—W.F., 27/2/69.

[Enclosure.]

THESE papers relate to an island at Long Cove, which was offered for sale at Sydney on the 31st March, 1859, as a special country lot, No. 1, and purchased by Mr. Rodd, but he failing to complete the purchase, the deposit of £17 paid by him was forfeited. It

It appears, by letter of Mr. Rodd, dated 21st April, 1859 (*vide* 59-3,971 herewith), that he wrote to the Minister for Lands requesting to know if the land would be granted to him between high and low water mark, instead of the usual reservation of 100 feet of high-water mark, but no answer appears to have been sent to Mr. Rodd, and after waiting some time, as he alleges, he tendered the balance of the purchase money at the Treasury, but it was refused, as the time for payment had lapsed.

Since forfeiture the island was reserved from sale.

On 1st December, 1865, Mr. David Ramsay applied to have the land re-offered at auction, and the Surveyor-General recommended (*vide* 65-21,200 herewith) that the reservation from sale be revoked, which was approved by the Executive Council, and the land was advertised for sale on the 9th August, 1866, but withdrawn because the revocation of reservation from sale had not been advertised in *Gazette*.

The land having been withdrawn for the above reason, it should have gone on for sale at some subsequent period, but it appears that such action was never taken.

Mr. Rodd now wishes to have his deposit refunded or allowed to purchase the land. As it is against the law to refund forfeited deposits on auction sales, the island may perhaps be re-offered at auction, when Mr. Rodd can purchase it if he wishes to do so.

This matter having been submitted to the Cabinet, they are of opinion that the remission asked for by Mr. Rodd ought not to be recommended. Inform.—W.F., 16/3/69. Is the land to be advertised for sale, as requested by Mr. Rodd, in the event of the deposit not being refunded?—W.W.S., 17/3/69. At present answer his first inquiry. B. C. Rodd, 23/3/69.

No. 14.

The Under Secretary for Lands to B. C. Rodd, Esq.

Sir,

Department of Lands, Sydney, 23 March, 1869.

With reference to your letter of the 5th ultimo respecting the refund of a forfeited deposit of £17 paid by you at a land sale held at Sydney on the 31st March, 1859, I am directed to inform you that the matter having been under the consideration of the Government, it has been decided that your application cannot be complied with.

I have, &c.,

M. FITZPATRICK.

No. 15.

B. C. Rodd, Esq., to The Secretary for Lands.

Sir,

132, Pitt-street, Sydney, 8 May, 1869.

I do myself the honor to acknowledge the receipt of your letter of 23rd March last, No. 69-1,452 (alienation), refusing to accede to my request to refund the £17 paid for deposit on island in Iron Cove Bay.

1. No reason having been given for refusal, I am at a loss to understand upon what grounds you have acted.

2. Venturing to suppose my case has been misunderstood, I solicit your reconsideration.

3. I will try to be explicit. The point I take in law, equity, and practice of the profession is this: In all conditions of sale by auction of land in Sydney there is always a clause that the contract shall be completed usually in fourteen days, and upon demand of abstract, or making inquiries as to measurements or locality, or any other inquiry, the time is in abeyance and does not again commence until all inquiries answered.

4. Now, by the conditions under which I purchased the island, was that I had to pay the deposit down and complete in thirty days.

5. About this time the question of measurements and reservations on grants was talked of. About twenty days after the purchase (I can account for the delay), I applied by letter to know in what form the grant would be issued to me, and to that letter I have not had any reply to this day. I believe it was intended that that letter should be answered, but through some mistake or oversight it was omitted.

6. Should you decline to reconsider the matter, may I beg you to refer it to the Attorney-General for his opinion, or allow me to sue the Government in the District Court, not pleading the statute of limitation, or allow me the deposit if the island is sold again, or allow me to complete the purchase.

I have, &c.,

B. C. RODD.

Cabinet to sue. I recommend Mr. Rodd be allowed to sue the Government as he requests in this letter; but the question of what line of defence would be adopted on behalf of the Crown in such case is a matter for the Crown Law Officers.—W.F., 17/6/69.

B. C. Rodd.—7/69. For Crown Solicitor, B.C., 9-10/7/69.

No. 16.

The Crown Solicitor to The Under Secretary for Lands.

(No. 69-664A.)

Sir,

Crown Solicitor's Office, Sydney, 12 July, 1869.

I have the honor to inform you that I have laid before Mr. Solicitor-General Josephson the accompanying papers, received by me from your Department, relative to an application of Mr. Rodd for a refund of a deposit paid by him on the purchase of an island in Iron Cove Bay, and that Mr. Solicitor-General wishes to see the conditions under which the island was sold to Mr. Rodd. If you will return the papers, accompanied by the conditions, I will lay them before Mr. Solicitor-General.

I have, &c.,

JOHN WILLIAMS.

Copy of articles and conditions of sale are enclosed herewith.—M.F., B.C., 4-5/8/69. Crown Solicitor. To be returned.

[Enclosure.]

[Enclosure.]

No. 2, 1869.

LAND SALE LIST.

ARTICLES and conditions of sale held by public auction, at Sydney, on the 31st day of March, 1859, commencing at 11 o'clock, under the direction of the Treasurer, at that place (acting for and on behalf of Her Majesty the Queen) of the following portions of land advertised by His Excellency the Governor-General's proclamation dated the 21st day of February, 1859, in conformity with existing regulations, of which those more particularly necessary to be noticed are as follows, viz. :—

- 1st. Each lot will be put up for sale at the price stated in the proclamation, and the bidder of that sum, or the highest bidder above it, will be declared the purchaser, provided he shall immediately pay down a deposit of 10 per cent. on the amount of the purchase money, and sign the Sale List, thereby binding himself to the observance of all the conditions of sale.
- 2nd. The balance of the purchase money is to be paid at the Treasury within one calendar month from this date, or the deposit will be forfeited, and the land again open for sale.
- 3rd. Immediately after the biddings on each lot are concluded, and before another lot is put up, the name of the purchaser will be entered by the auctioneer in the Sale List. If previous to such entry any question or dispute arise between the seller and bidders, or amongst the bidders themselves, the lot in question shall be put up again. Subsequently to such entry no dispute whatever can be admitted.
- 4th. Deeds of grant will be completed and issued in each case as soon as practicable after payment in full of the purchase money; and will be delivered to the grantees by the Surveyor-General on payment of the regulated fee named in the proclamation, which will be required to be paid on completion of the purchase. Each lot will be granted to the purchaser by deed poll, under the hand of His Excellency the Governor-General and the great seal of the Colony, to be held in free and common soccage, subject to the payment of a quit rent of one pepper-corn yearly, if demanded, and subject to such other reservations as may be deemed expedient for the public benefit.
- 5th. If the officer holding the sale, or other person acting on behalf of the Government, shall have reason to believe that any lot will not obtain its fair value, or shall otherwise have just cause to withdraw the same from the sale, he shall have full power to do so at any time previously to its being actually sold.
- 6th. Persons having affixed their signatures to the Sale List, in token of their having become purchasers (or agents for purchasers) of the lots to which their signatures are respectively so affixed will be held to have previously obtained all necessary information, and not to be entitled to allege ignorance or any other cause for their not fulfilling all and every obligation incumbent upon them by these articles and conditions.

Declaration.

We, whose signatures are attached to the lots respectively purchased by us, do hereby acknowledge that we are the purchasers (or agents for purchasers) of the same; and we do each of us severally for ourselves (or on behalf our constituents) undertake to make payment to the officer appointed to receive the same, of the remainder of the purchase money of the said lots respectively, within one calendar month from the date of these presents, and to fulfil all and each of the foregoing articles and conditions; and failing our doing so we do further acknowledge that we thereby forfeit all and every claim to the said lot or lots, and to the deposit of 10 per cent. of the price thereof which we have paid. In witness whereof we have, on the day and year above written, severally signed our names against the descriptions of each lot respectively purchased by us.

No. 17.

The Under Secretary for Lands to B. C. Rodd, Esq.

Sir,

Department of Lands, Sydney, 13 July, 1869.

Referring to your letter of the 8th May last, respecting the deposit paid on your purchase of an island at Long Cove, which was forfeited in consequence of your failing to complete the purchase, I am directed to inform you that your request therein made, to be allowed to sue the Government in the District Court in connection with this matter, has been granted.

I have, &c.,

M. FITZPATRICK.

No. 18.

The Crown Solicitor to The Under Secretary for Lands.

Sir,

Crown Solicitor's Office, Sydney, 16 August, 1869.

I have the honor to return to you herewith the papers received by me from your Department relative to Mr. Rodd's application for the refund of a deposit paid by him on the purchase of an island in Iron Cove Bay, and to state that I have laid them before Mr. Solicitor-General Josephson, who has been pleased to write an opinion on the matter, a copy of which I send you on the annexed half sheet.

I have, &c.,

JOHN WILLIAMS,

Crown Solicitor.

Inform accordingly.—W.F., 20/8/69.

B.C. Rodd, 4/9/69.

[Enclosure.]

HAVING perused the papers submitted to me and read the conditions of sale, I cannot see that Mr. Rodd has made out any case whereby the Government can be justified in repaying to him the deposit money paid on the island being knocked down to him.

Mr. Rodd, after the sale, made some inquiries from the Minister for Lands as to whether the land between high and low water mark would be granted to him, and failing to get a speedy reply, he did not pay the balance of purchase money, according to the conditions of sale, and thereby he forfeited his deposit money paid at the time of sale, one of such conditions being that the balance of purchase money should be paid at the Treasury within one month from the day of sale.

J. F. JOSEPHSON,

Solicitor-General.

16th August, 1869.

No. 19.

The Under Secretary for Lands to B. C. Rodd, Esq.

Sir,

Department of Lands, Sydney, 4 September, 1869.

With reference to your letter of the 8th May last, applying for leave to sue the Government for the refund of the deposit paid by you for the purchase of a small island, situated in Iron Cove Bay, I am directed to inform you that, for the reasons stated in the enclosed copy of an opinion given by the Honorable the Solicitor-General, the Secretary for Lands cannot recommend compliance with your request.

I have, &c.,

M. FITZPATRICK.

[Enclosure.]

[Enclosure.]

Attorney-General's Opinion *re* Return of Deposit to E. C. Rodd.

HAVING perused the papers submitted to me and read the conditions of sale, I cannot see that Mr. Rodd has made out any case whereby the Government can be justified in repaying to him the deposit money paid on the island being knocked down to him.

Mr. Rodd, after the sale, made some inquiries from the Minister for Lands as to whether land between high and low water mark would be granted to him, and, failing to get a speedy reply, he did not pay the balance of purchase money according to the conditions of sale, and thereby he forfeited his deposit money paid at the time of the sale, one of such conditions being that the balance of purchase money should be paid at the Treasury within one month from the day of sale.

16th August, 1869.

J. F. JOSEPHSON,
Solicitor-General.

No. 20.

B. C. Rodd, Esq., to The Secretary for Lands.

Sir,

Barnstaple Manor, Five Dock, 15 May, 1878.

I have been informed by a person, whom I am disposed to credit, that the island in Iron Cove Bay, Five Dock, known as Rodd's Island (no name heretofore), and situated between my house and Callan Park, Balmain, has been applied for to rent, for the purpose of taking ballast. Should this report be true, I respectfully enter my protest against the same, because I consider the island mine.

2. The island is a picturesque object from my residence, and I have at all times tried to preserve the same. It has no other value in my eyes.

3. A few years since some men took possession and commenced blowing up the rocks for ballast. I represented the trespass to Captain Perry, who was then Deputy Surveyor-General, and he at once had them removed. After this, my neighbours put on some goats, and they all but consumed every vestige of a shrub. This I represented to the Government, and they were removed.

4. About the beginning of the year 1859 or 1860 the island was put up for sale by the Government, and I attended and became the purchaser for £170, and paid the deposit of £17. The conditions, I presume, were that the balance should be paid in a month.

5. A report got about at this time that the Government were looking up and selling the reserve mentioned in grants bounded by the water. Now, as the island only contained about three quarter's of an acre, I wrote to the Minister for Lands at the time to know if any reserve would be made of the water frontage, also the form and conditions of grant. This I sent directly after the sale, and I know for certain the Minister received it. From that day to this I never received any answer, and I happen to know there was not any sent.

6. When the day came for the balance to be paid I attended at the Treasury, and tendered the balance (this is admitted), and asked for my grant, and was told it was not ready. I asked if it would be of a special or usual form, and could get no answer for certain, but was told it would be in the usual form.

7. I repeatedly applied for the grant, and was told that as I had not complied with the conditions of sale in paying the balance within the time, the sale was cancelled, and the deposit forfeited.

8. Thinking there was not a possibility of obtaining the grant without an equity suit, I applied for a return of my deposit. This was refused, but I was informed at the same time that if I made another purchase of land the deposit should go in part payment.

9. I then applied for leave to sue the Government (Mr. Foster being then Minister for Lands), or to take the Attorney-General's opinion as to the forfeiture. Permission was granted, and just after I had placed the matter in the Court, I received a notification that the consent had been withdrawn. The Solicitor-General, upon an *ex parte* case, had given an opinion against me. For special reasons of my own, I would not then refer the question to the Solicitor-General.

10. Some time, just before or after this, the island was again put up for sale, as I believe at the instance of Mr. David Ramsay. My attention being called to the same I at once wrote to the Minister for Lands, Dr. Wilson, claiming the island, and stating my reason for doing so, when he caused it to be withdrawn from sale.

11. The ground I take is that according to law, when the conditions of sale state that a certain thing is to be done within a certain time, that time does not begin to run until the requisitions are answered, as in this case. Now, had I received an answer to my letter or requisition that the whole island would be granted, I should have paid the balance, and then there would not have been any trouble about it.

12. It may be asked why I have allowed the question to remain over so long. To give all my reasons would occupy too much space. Suffice at present to say that I had appointments with Mr. Parkes and Mr. Sutherland, and tried several times to see yourself on the subject of taking charge of a petition to the Legislative Assembly, just after your first election at North Shore.

13. I have lost or mislaid my original documents, except the receipt for the deposit of £17, dated 31st March, 1859 (*copy herewith*). I write from memory, but am certain that I am substantially correct.

I have, &c.,

B. C. RODD.

Chief Officer of the Occupation Branch.—CHAS. A. BROWN (for the Under Secretary), B.C.,
28/5/78.

I have visited the island in question, but found no person on it. The soil has been removed apparently for the purpose of measuring the stone, but none has been taken away. The island is small and ornamental. It would not, I think, be advisable to allow stone to be quarried on it.—W. F. PIPEB,
Land Bailiff, 30/5/78.

No. 21.

No. 21.

B. C. Rodd, Esq., to The Secretary for Lands.

Dear Sir,

Barnstaple Manor, 17 May, 1878.

Since writing the accompanying letter I have been informed by Mr. West, road contractor, and a neighbour of mine, that the men are now actually on the island quarrying, blasting, and removing the stone. I cannot bring myself to believe this.

If the Government are taking the stone they might take thousands of tons from my ground free of all charge sooner than see the island demolished—there is only three-quarters of an acre of it.

Yours, &c.,

B. C. RODD.

This complaint is probably in reference to employees or contractors under the Leichhardt Municipal Council, from which an application to lease the island. The application is under reference to the Surveyor-General (78-1,693, 16 April).—E. O'D., 29/5/78. Mr. Piper had better visit the island and take steps to prevent any trespass, if committed, being continued.—T.W.H., 29/5/78. See memo.—W.L.P., 30/5/78. To Surveyor-General for his information.—T.W.H., B.C., 29/5/78.

Police District of Sydney, 31 March, 1859.

RECEIVED from B. C. Rodd, of Five Dock, the sum of seventeen pounds, being the amount of the deposit on the sale of lot 1 of this day's sale. The purchase money of the above land amounts to £170, on which a deposit of 10 per cent. is now paid (£17), leaving a balance payable on 30th of April, 1859, £153. The deed fees amount to £1. This is sent in place of the original.—L. S. BRENNAN, Agent.

No. 22.

B. C. Rodd, Esq., to The Secretary for Lands.

Sir,

Barnstaple Manor, Five Dock, 22 January, 1879.

About nine months since I addressed a letter to the Minister for Lands (Mr. Farnell) in reference to an island in Long Cove Bay (Five Dock) known as Rodd's Island.

This island I claim by purchase from the Government, and the full particulars are set out in the letter above alluded to, with the receipt for the deposit annexed.

I called and saw Mr. Farnell on the subject, but for some reason my letter had not been brought under his notice.

In the *Echo* of this day I observe that Sir George Innes is to move that this island (amongst others) may be dedicated to the public.

My object now is to beg you to look into the question and do what is just.

The letter above alluded to I last saw with a gentleman in one of the Branch Land Offices, a large corner house in Macquarie-place.

Sooner than have any trouble in the matter, I would waive my claim upon being paid back my deposit with interest, the island called Rodd's Island, and be perpetually dedicated to the use of the public, and remain,

Yours, &c.,

B. C. RODD.

Under Secretary.—Urgent. Let me have the papers in this case.—J.H., 23/1/79. Papers herewith obtained from Occupation Branch, Department of Mines.—W.W.S., 25/1/79. Surveyor-General. Has Mr. Rodd been hitherto recognised as the owner of this island; if not, what is intended to be done with it?—J.H., 3/2/79. Mr. Freeman.—P.F.A., 7/2/79.

The island in question was offered for sale at auction on 31st March, 1859, as "special country lot 1." Mr. Rodd was the highest bidder, and paid deposit, £17 (10 per cent.), and as the balance was not paid within the specified time the deposit was forfeited. The land was again offered for sale on 9th August, 1866, but withdrawn from sale and selection in view of protest from Mr. Rodd, who subsequently, in 1869, applied for a refund of deposit, and the Crown Solicitor (Papers, 69-9,693 Alienation) gave it as his opinion that "Mr. Rodd's" application cannot be complied with; therefore, hitherto Mr. Rodd has not been recognised as the owner of the island, which has recently been dedicated as a place of public recreation, to be called Rodd Island—W.F., 10/2/79. ROBT. D. FITZGERALD (for the Surveyor-General).

Under Secretary for Lands, B.C. For information.—W.W.C., 21/2/79. Especially Crown Solicitor's opinion. Approved.—J.H., 22/2/79. Mr. Freeman, 4/3/79. The Crown Solicitor's opinion is enclosed (*see* Papers, 69-9,693, Alienation).—W.F., 5/3/79. Auction Branch, Lands, B.C. Inform that in accordance with the Crown Solicitor's opinion his request cannot be complied with.—R.H.D., 14/3/79. B. C. Rodd informed accordingly, 20/3/79.

No. 23.

B. C. Rodd, Esq., to The Secretary for Lands.

Sir,

Barnstaple Manor, Five Dock, 7 February, 1879.

On the 31st March, 1859, I attended a Government land sale and became the purchaser of the island in Long Cove Bay, known now as Rodd's Island, and paid the deposit, viz., £17; a copy of receipt enclosed.

About the time of the sale a rumour was rife that reserves of 1 chain wide to water frontages would be made.

I wrote directly to the then Minister for Lands, to know on what terms or form the grant would be issued. From that day to this I have never received any reply or answer; and as the island only contains three-quarters of an acre, if such a reserve had been made there would have been little or no land left in the centre.

582—B

On

On the 30th April, 1859, I attended at the Treasury and tendered the balance due—£153; but as I could not get the grant (although £1 was demanded for it) or any information about the terms and conditions, I came away.

About twelve months since came or went on to the island—nearly all rock—to get ballast. I immediately represented same to your office (see my application, a letter), and an officer was sent out and made them discontinue.

Now, as the Assembly has virtually deprived me of my claim to the island, by asking to have it dedicated to the public, to which I make no objection, I have now to ask for a return of my deposit, viz., £17, and interest on same at 5 per cent., amounting to £ , which I only think fair and reasonable.

I have, &c.

B. C. RODD.

P.S.—I may add that when there was a question about forfeiture of the deposit, Mr. Fitzpatrick, who was then Under Secretary, offered to give me credit for the deposit against any future land I might purchase; but I refused to give up my claim to the island.

No. 24.

B. C. Rodd, Esq., to The Secretary for Lands.

Sir,

Barnstaple Manor, Five Dock, 21 February, 1879

Referring to the conversation I had with you this day, I now apply to have the deposit I paid of £17 returned, the Government having resumed the island as a perpetual Government reserve.

I may be permitted to observe that there would never have been any difficulty in this matter had I received any answer to my letter as to reserves in grant, and that opinion given by one of the Law Officers was not in accordance with the facts, he having assumed that a reply was given to that letter.

I never had any desire to possess the island; my wish was to preserve it.

Possibly in strict law I may have forfeited the deposit; but, as a matter of fairness and equity, I am entitled to a return of the deposit under the circumstances, and I venture to say, after forty-five years' practice, that if it were worth while a Court of Equity would decree me relief.

With this I send the receipt for deposit, also a letter from Mr. Perry, and also from Sir John Robertson. I blame him for all the bother and trouble there has been about this business.

I have, &c.,

B. C. RODD.

[Enclosures.]

Police District of Sydney, 31 March, 1859.

RECEIVED from B. C. Rodd, of Five Dock, the sum of £17, being the amount of deposit on the sale of lot 1 of this day's sale.

Note.—To be filled up by the Agent.

The purchase money of the above land amounts to	£170 0 0
On which a deposit of 10 per cent. is now paid	17 0 0
Leaving a balance payable on or before the 30th of April, 1859	£153 0 0
The deed fees amount to	£1 0 0

L. J. BRENNAND,
Agent.

Dear Rodd,

Reform Club, 5 February, 1859.

I duly received your letter on the subject of Rodd Island, and you rightly judge when you suggest that I did not know (or remember) anything about your interest in it.

I do not even now see how I can have been in the way of your purchasing it, unless the general land regulations framed by me, and prohibiting the sale of islands, was the cause.

You speak of a balance of money—or, at any rate, of money owing to you by the Government in connection with the island.

I presume that, if that be so, there will be no difficulty in getting it on application to the Lands Minister—
Mr. Hoskins.

Yours, &c.,

JOHN ROBERTSON.

P.S.—If the money paid was a "deposit," there will be no necessity to apply to Parliament.
B. C. Rodd, Esq.

My dear Sir,

Surveyor-General's Office, 6 March, 1847.

I am much obliged to you for having mentioned the trespass on that valuable portion of Crown property, the island in Iron Cove, as it will oblige me to bring under the notice of the Government these trespasses generally; and I am glad, also, to find that there is one individual who can appreciate the beauty of the Cove so little known to the Sydney people. With respect to the proposal to purchase, I apprehend there may be a difficulty, as the upset price must necessarily be high to warrant the expense of survey, and you are aware that, except for pictorial or picnic purposes, the rock is of no value whatever, unless, as you observed, to carry away as ballast, and I believe it is a principle in political economy, that the worst land ought to be retained in the hands of Government—at least, so opines Adam Smith.

I have, &c.,

S. A. PERRY.

No. 25.

B. C. Rodd, Esq., to The Secretary for Lands.

Sir,

Barnstaple Manor, Five Dock, 22 March, 1879.

I do myself the honor of acknowledging the receipt of your letter of the 30th (evidently intended for the 20th) instant, referring to my claim for return of deposit of £17 paid on account of island.

I make no complaint at the decision you have arrived at, assuming it to be based upon the opinion given by Mr. Josephson, Solicitor-General, because I shall be able to show that that opinion is not correct upon the face of it, and I am confident a true and full state of the question was not submitted to him.

With this belief, I trust you will do me the justice to let me have a copy of the case, or sight thereof of the case, submitted to him for his opinion, also copy of that opinion, and also copy of letter I sent, asking for conditions upon which a grant would issue.

Assuming

Assuming the law to be against me, surely Government can deal out equities the same as other people. My case is not like one who has abandoned his purchase, or had not the means of completion.

The money question is, with me, a matter of perfect indifference, and as I feel that justice has not been done to me under all the circumstances, I trust I shall be able to induce you to alter your mind.

I felt all along that you would have decided in my favour, that* . . . abstained from intruding upon you again, which I had a desire to do, to point out a defect in the opinion, and also to impress upon you that Mr. Fitzpatrick offered me the deposit back. I have, &c.,

B. C. RODD.

It would appear that Mr. Rodd desires either to see or have copies of the papers. I presume there is no objection to his inspecting them or taking copies. We cannot, however, supply the latter.—C.O., 26/8/79.

Mr. Rodd can see the papers, or employ one of the clerks to copy them for him on usual conditions—W.W.S., 29/3/79. Inform, 31/3/79. B. C. Rodd informed, 17/4/79.

No. 26.

Mr. Surveyor Deering to The Surveyor-General.

General Survey.

Sir,

Sydney, 8th July, 1881.

In compliance with your general memorandum of instructions to me (Trigonometrical Branch) of 25th June, 1881, I have the honor to transmit herewith the above-mentioned traverse table.

There is but one trigonometrical station upon the island, and the survey is therefore dependent upon itself.

It will be observed, however, that the survey closes to 10 links of latitude and 49 links of departure, Boileau's Tables.

I have, &c.,

JOHN W. DEERING.

No. 27.

Mr. Surveyor Deering to The Surveyor-General.

General Survey.

Sir,

Sydney, 14 July, 1881.

In compliance with your memorandum of instructions to me of the 25th June, 1881 (unnumbered), I have the honor to transmit herewith the plan and field-book of Rodd Island, Long Cove.

2. The island being small, and the details numerous, I have plotted the work to a scale of 50 links to 1 inch.

I have, &c.,

JOHN W. DEERING.

Memo., Trigonometrical Branch,—Field-book herewith. Received, without memo. of instructions, field-book in Trigonometrical Branch.—T.F.F., 29/7/81. Plan in Trigonometrical Branch.—J.M.S., 29/7/81. Plan P. 116-574.

No. 28.

The Under Secretary for Lands to B. C. Rodd, Esq.

Sir,

Department of Lands, 13 July, 1885.

In compliance with the request contained in your letter of the 22nd ultimo, I have the honor to inform you that application must be made on the prescribed form (enclosed) for the area you wish to reclaim and purchase fronting Iron Cove Bay.

I have, &c.,

F. H. WILSON

(For the Under Secretary).

No. 29.

B. C. Rodd, Esq., to The Secretary for Lands.

Sir,

Barnstaple Manor, Five Dock, 8 May, 1888.

The island in Long Cove Bay, Five Dock, known as Rodd's Island, I consider belongs to me legally and equitably. About thirty years since I bought the same at auction from the Government, and paid the deposit (£16 odd), for which I have receipt.

Within three months, according to conditions of sale, I called at the Treasury and tendered the balance of the purchase money and demanded the grant, which was refused.

Before the expiration of the three months, and just after the sale, I wrote to the Minister for Lands (then the present Sir John Robertson), to know if there would be a reservation of 66 feet all round the island; and, if so, it would take in all the island, to which letter I never had any reply. It was found ten months afterwards in one of Sir John's old hats at Clovelly—so Mr. Fitzpatrick told me; and so, from changes of Ministry, the question remained dormant. In meantime I took possession, and put rabbits and goats on same. The goats I removed, as they destroyed the shrubs, and also kept off ballast men from year 1842.

Some time afterwards Mr. David Ramsay applied to buy the island, when I entered a protest, and wrote and called upon Dr. Wilson, then Minister for Lands, and upon my representation the sale was withdrawn. After this a long correspondence ensued, when finally I attended on Mr. Hoskins, then Minister for Lands, and after a long conversation with him, and upon his recommendation, it was finally agreed that I should, in writing, absolutely renounce all claim to the island, and he, on his part, verbally agreed that the island hereafter was to be called Rodd's Island, and I should be paid or refunded the deposit with interest, and that the island should not be sold to any one. All this was done at the earnest request of Mr. Hoskins, and the place has ever since been known and called Rodd's Island.

I never had any desire to possess the freehold; all I wanted was to preserve the island as a picturesque object from my house.

I hope and trust, sir, you will personally look into the question, and do me justice.

Mr. Hoskins told me there would be no occasion to go to the Assembly for the refund. He could do it out of the Lands grant.

I have, &c.,

B. C. RODD.

What is the position of this matter now?—T.G., 12/5/88.

Mr. Rodd became the purchaser of this island at a sale by auction held in Sydney on the 31st March, 1859, paying a deposit of £17. He failed to pay the balance of purchase money within one month, as prescribed in the conditions of sale, consequently the deposit money became forfeited (see opinion of the Crown Solicitor on Alienation 69-9,693).—R.L., 9/6/88.

Mr. De Low,—Please see Minister's inquiry of the 12th. The case has long since been settled. It has been several times under review, but with the result that the Government, from time to time refused to recognise the claim set up. May be informed the case cannot be reopened.—R.H.D., 19/6/88.

Submitted.—F.H.W., S.F., C.O. Inform—T.G., 21/6/88. B. C. Rodd informed.—H.L.T., 27/6/88.

No. 30.

The Under Secretary for Lands to B. C. Rodd, Esq.

Sir,

Department of Lands, Sydney, 27 June, 1888.

I am directed by the Secretary for Lands to acknowledge receipt of your letter of the 8th ultimo, respecting your alleged claim to Rodd Island, Long Cove, and to inform you that Mr. Garrett declines to re-open the case. The previous decisions that your claim cannot be recognised must, therefore, be adhered to.

I have, &c.,

F. H. WILSON

(For the Under Secretary).

No. 31.

Mr. J. de V. Lamb to The Under Secretary for Mines.

Sir,

Sydney, 18 April, 1890.

Herewith I have the honor to hand you copy* of minutes on meeting of the Board appointed to inquire into the best cure and drenches for worms in sheep, which was held yesterday, and have to request that Rodd Island, with all appliances and caretaker, may be placed at the disposal of the Board for carrying on these experiments in place of the Randwick Sheep Quarantine, for (say) fourteen days.

I have, &c.,

J. DE V. LAMB,

Chairman.

Submitted.—A.B., 18/4/90. The Under Secretary for Mines.

Submitted.—H.W., 21/4/90.

I shall be glad if my honorable colleague, the Minister for Lands, will grant this request.—S. SMITH, 21/4/90. The Under Secretary for Lands—A.B. (for the Under Secretary), B.C., 21/4/90.

At the present time but little use is being made of the establishment at Rodd Island, and assuming it to be suitable for the purpose, I see no objection to the island, together with the services of the caretaker, being placed at the disposal of the Department of Mines for the period named. Some restriction must, however, be placed on the use of the appliances, as many of the articles are of a costly nature, and were procured for a special purpose. Such of the appliances as are actually necessary might be made use of, and it should also be made conditional that no fires are to be lighted except in the places constructed for the purpose, and that the whole of the operations are conducted under the supervision of an officer, who should be responsible to the Minister for the exercise of proper precautions for the safety of the establishment.—H.C.T., 23/4/90. F.H.W.

May perhaps be approved under the conditions above mentioned, and for terms specified in Mr. Lamb's letter.—W.H., 23/4/90. Approved.—J.N.B., 23/4/90. Inform the Under Secretary for Mines and the caretaker.—H.C.T., 24/4/90. Under Secretary for Mines and caretaker, Rodd Island, informed, 23/4/90.

The period for which the use of the island was granted having expired, the Under Secretary for Mines may, perhaps, be asked whether the experiments have been brought to a conclusion.—H.C.T., 10/5/90. F.H.W., 12/5/90. Yes.—W.H., 12/5/90. The Under Secretary for Mines asked.—W.R.S., 14/5/90. No reply has been vouchsafed to the letter of 14th ultimo, but I notice by this day's *Sydney Morning Herald* that the experiments are still being continued.—H.C.T., 2/6/90. Reply now to hand (*vide* 90-736).—H.P.T., 3/6/90.

No. 32.

The Under Secretary for Lands to The Under Secretary for Mines.

Sir,

Department of Lands, Sydney, 24 April, 1890.

In acknowledging the receipt of your blank cover communication of the 21st instant, forwarding a letter from the Chairman of the Board appointed to inquire into the best cure and drenches for worms in sheep, applying for the use of Rodd Island, with all the appliances thereon, for a period of fourteen days, I am directed by the Secretary for Lands to inform you that he approves of the island, together with the services of the caretaker, being placed at the disposal of your Department for the period named.

In addition, such of the appliances on the island as are actually necessary for the purposes of these experiments may be made use of, but it must be distinctly understood that no fires are to be lighted except in the places constructed for the purpose, and that the whole of the operations are to be conducted under the supervision of some officer responsible to the Minister for the exercise of proper precautions for the safety of the establishment.

I have, &c.,

WM. HOUSTON,

Under Secretary

(*Per* W. H. CAPPER).

13

No. 33.

The Under Secretary for Lands to The Under Secretary for Mines.

Sir, Department of Lands, Sydney, 14 May, 1890.
 With reference to my letter of the 24th ultimo, I have now the honor to request that you will be good enough to inform me whether the experiments at Rodd Island have been brought to a conclusion, the period for which the island was placed at the disposal of your Department having expired.

I have, &c.,

WM. HOUSTON,
 Under Secretary
 (Per F. H. WILSON).

No. 34.

The Under Secretary for Mines to The Under Secretary for Lands.

Sir, Department of Mines, Stock Branch, Sydney, 30 May, 1890.
 I have the honor to inform you, in reply to your letter of the 14th instant, that the experiments at Rodd Island have not yet terminated, and to request permission to use the island until they are brought to a conclusion.

I have, &c.,

HARRIE WOOD,
 Under Secretary.

I think it would be as well to place some limit upon the time during which the island is to be used for this purpose, and would suggest that the request be granted upon the understanding that a further application shall be made in the event of the experiments not being brought to a conclusion by the end of the present month.—H.C.T., 3/6/90.

T.H.W. (for the Under Secretary), 3/6/90. Approved.—J.N.B., 6/6/90. Under Secretary for Mines informed.—W.R.C., 11/6/90.

No. 35.

The Under Secretary for Lands to The Under Secretary for Mines.

Sir, Department of Lands, 11 June, 1890.
 In reply to your letter of the 31st ultimo, requesting permission to use Rodd Island until the experiments are brought to a conclusion, I have the honor, by direction of the Secretary for Lands, to inform you that the request is granted, upon the understanding that a further application shall be made in the event of the experiments not being concluded by the end of the present month.

I have, &c.,

WILLIAM HOUSTON,
 Under Secretary
 (Per F. H. WILSON).

No. 36.

The Under Secretary for Mines to The Under Secretary for Lands.

Sir, Department of Mines, Stock Branch, Sydney, 27 June, 1890.
 With reference to your letter of the 11th instant, I have the honor to inform you that the experiments at Rodd Island are for the present at an end, but should they be again renewed, fresh application will be made for the accommodation which has been kindly given.

I have, &c.,

HARRIE WOOD,
 Under Secretary.

Submitted.—H.C.T., 3/7/90. F.H.W. (for the Under Secretary), 4/7/90. Seen.—J.N.B. 7/7/90.

No. 37.

The Assistant Under Secretary for Mines to The Under Secretary for Lands.

Sir, Department of Mines, Stock Branch, Sydney, 4 November, 1890.
 In order that this Department may be in a position to properly carry out the experiments to be made from time to time in regard to diseases in stock, it is necessary that a laboratory should be provided, and as Rodd Island is not likely to be required again in connection with experiments for the destruction of rabbits, I am directed by the Secretary for Mines and Agriculture to request that you will be good enough to ask the Secretary for Lands to cause it to be handed over to this Department as it now stands, with buildings and other appointments.

I have, &c.,

GERARD E. HERRING,
 Assistant Under Secretary.

Mr. Taylor.—W.H., 5/11/90.

This letter has been written without a proper knowledge of the circumstances existing, as it is not at all unlikely that Rodd Island may at any moment be required, in order that experiments may be carried out, having for their object the extermination of the rabbit pest by the means of disease, and while such continues to be the case, I do not think it would be wise for this Department to part with the control of the island. At the present time there is before the Department an application which may result in the island being put to the use stated, and only this morning an analytical chemist called upon me making inquiries with a similar object, whilst almost every foreign mail brings letters from correspondents who

hope

hope to bring about the desired result in the manner stated, and until such time as the rabbit question has been settled in some satisfactory manner this Department should, in my opinion, retain possession of the establishment upon which it has spent so much money, as should the necessity arise some difficulty will be experienced in securing the use of a suitable place upon which to conduct operations. However, there can be no objection to the Department of Mines being permitted (as was previously done), upon application to make use of the establishment, to carry out the experiments to be made from time to time, and it may not be out of place to point out here that even now the island is being used in the interests of stock-owners without inconvenience, arising from the circumstance that the property is not vested in the Department before-mentioned.—H.C.T., 5/11/90. F.H.W., 6/11/90.

The suggestion contained in the latter part of Mr. Taylor's memo. is submitted for approval; the question of transferring the Rodd Island Laboratory might, however, perhaps stand over for the present.—W.H., 6/11/90. Submitted.

Approved.—J.N.B., 7/11/90. Informed.—W.R.S., 13/11/90.

No. 38.

The Under Secretary for Lands to The Under Secretary for Mines.

Sir,

Department of Lands, Sydney, 13 November, 1890.

With reference to your letter of the 4th instant, requesting that Rodd Island, as it now stands, with buildings and other appointments, may be handed over to the Department of Mines, in order that it may be in a position to properly carry out the experiments to be made from time to time in regard to diseases in stock, I am directed by the Secretary for Lands to inform you that, while the rabbit question continues in its present unsettled state, this Department is not prepared to relinquish its control of the island, but the temporary use of the establishment for the purpose of carrying out necessary experiments, will from time to time be granted upon application, provided that the granting of such permission would not interfere with any operations conducted in the interests of this Department, and that the provisions of the Animals Infectious Diseases Act are fully complied with.

I have, &c.,

WM. HOUSTON,
Under Secretary
(Per F. H. WILSON).

No. 39.

The Under Secretary for Mines to The Under Secretary for Lands.

Sir,

Department of Mines, Stock Branch, Sydney, 14 November, 1890.

I am directed by the Under Secretary for Mines and Agriculture to acknowledge the receipt of your letter of the 13th instant respecting the use of Rodd Island, and to request that you will be good enough to ask the Secretary for Lands to allow this Department the use of Rodd Island for a period of six months, so that M. Loir may be able to conduct his experiments in regard to diseases in stock without interference.

I have, &c.,

HARRIE WOOD,
Under Secretary.

The request herein made is not in accordance with the intimation contained in the Under Secretary's letter of the 13th instant, and the necessity for complying with it is not apparent, seeing that Mons. Loir is at present in occupation of the island, and has been so for upwards of four months without interference, carrying on operations in connection with diseases in stock, and no inconvenience has arisen, from the fact that the authority for him to do so emanated from this Department and not from the Department of Mines. Considering the conveniences which exist at the island, the exclusive use of it should not, it is thought, be granted to any private individual for such a lengthy period, especially as similar applications are likely to be made shortly by gentlemen who are entitled to the same amount of consideration as has been shown to Mons. Loir. In addition, past experience has shown that this Department should be acquainted with the nature of all experiments to be carried out on the island, in order that it may be seen that the provisions of the Animals Infectious Diseases Act are complied with, a course which will not be attended with so much difficulty whilst this Department retains control of the establishment.—H.C.T., 17/11/90.

The letter of the 13th instant (copy enclosed) appears sufficiently explicit, and while this Department retains possession of the island, laboratory, &c., some definite information should be afforded as to the nature of the experiments to be carried on and their bearing on the public interest. There is no objection to granting permission to use the island, buildings, &c., to Mons. Loir, assuming that the experiments contemplated are for the benefit of the public. If, in the nature of a private or partially private venture, it might be necessary to make some special arrangements. This letter, however, apparently conveys that the Department of Mines wishes Mons. Loir to conduct some experiments with regard to diseases in the stock of the Colony. That being so, there would not be any objection to granting the permission, but the purpose should be definitely stated, and it should further be explained what is meant by the concluding words of the letter, as Mons. Loir is already in occupation of the island, and has been so for some time.—W.H., 17/11/90.

It is not within the knowledge of this Department that Mons. Loir has met with any obstruction or interference in the conduct of his experiments during the past few months. The improvements and laboratory at Rodd Island have been provided at great cost, and, whilst it is desirable that the island with the appliances provided should be profitably utilised in the interests of the Colony, I cannot consent to a complete transfer to Mons. Loir without further information. If the Minister for Mines will fully explain the purposes for which the island and laboratory are required, and will indemnify this Department, and such explanation is satisfactory, I can see no objection to granting the Mines Department the use of the island for a specified period to assist in conducting experiments in connection with the Stock Branch of the Department.—J.N.B., 20/11/90.

The Under Secretary for Mines.—W.R.S., 20/11/90.

[Enclosure.]

[Enclosure.]

Sir, Department of Lands, Sydney, 13 November, 1890.
 With reference to your letter of the 4th instant, requesting that Rodd Island as it now stands, with buildings and other appointments, may be handed over to the Department of Mines, in order that it may be in a position to properly carry out the experiments to be made from time to time in regard to diseases in stock, I am directed by the Secretary for Lands to inform you that while the rabbit question continues in its present unsettled state this Department is not prepared to relinquish its control of the island, but the temporary use of the establishment for the purpose of carrying out necessary experiments will from time to time be granted upon application, provided that the granting of such permission would not interfere with any operations conducted in the interests of this Department and that the provisions of the Animals Infectious Diseases Act are fully complied with.

I have, &c.,
 WM. HOUSTON,
 Under Secretary
 (per F. H. WILSON).

The Under Secretary for Mines, Sydney.

No. 40.

The Under Secretary for Mines to The Under Secretary for Lands.

Sir, Department of Mines, Stock Branch, Sydney, 24 November, 1890.
 I have the honor to acknowledge the receipt of your letter of the 20th instant, and in reply beg to refer you to my communication of the 5th instant, from which it will be seen that the work proposed to be done by Mons. Loir—the identification of the microbe of pleuro-pneumonia—is only a portion of that contemplated in asking for the transference of Rodd Island to this Department, and as Mr. Secretary Smith is satisfied that this work will not only be for the interest of the stock-owners in this Colony but throughout Australia, he is prepared, if the island is handed over for six months, to indemnify your Department for any loss which may arise through its occupancy by this Department.

I may add that Dr. Manning, the health officer, has asked Mons. Loir to make investigations in regard to tuberculosis, in which he will be assisted by Mr. Government Veterinarian Stanley, and that Mons. Loir is willing to undertake this work also if the use of the laboratory on Rodd Island can be obtained.

I have, &c.,
 HARRIE WOOD,
 Under Secretary.

No. 41.

The Under Secretary for Lands to The Under Secretary for Mines.

Sir, Department of Lands, Sydney, 27 November, 1890.
 I have the honor to acknowledge the receipt of your letter of the 24th instant, on the subject of your request to be allowed to use the establishment of Rodd Island for a period of six months, and in view of the explanation furnished in respect of the purposes for which it is required, and of the undertaking to indemnify this Department for any loss that may arise through its occupation, I am directed to inform you that the Secretary for Lands has approved of the use of the establishment being granted to the Department of Mines for the period above-mentioned, in order that certain experiments may be carried out in the interest of the Stock Branch of that Department. At the same time it must be distinctly understood that the provisions of the Animals Infectious Diseases Act must be duly observed, and that the establishment shall be available to this Department if it should at any time be required in connection with the suppression of the rabbit pest.

I have further to point out that the expense of maintaining the island during the period specified must be borne by the Mines Department.

I have, &c.,
 WM. HOUSTON,
 Under Secretary.

No. 42.

Office Memorandum.

Respecting the use of the experimental station at Rodd Island by the Department of Mines or Mons. Loir. IRRESPECTIVE of the statement herein contained, I am given to understand by Mons. Loir that the island is principally required in order that he may be able to carry out experiments, in the interest of the Queensland Government, without being compelled to visit Brisbane to enter upon his duties; and if Mons. Loir's convenience in this respect is to be studied, I see no reason why he should not be required to pay this Department the amount of the caretaker's wages during the period he may be in occupation. It is also pointed out that the work he is to be engaged upon is of such a character as can only be performed under the conditions contained in the Animals Infectious Diseases Act, the administration of which is vested in the Minister for Lands, and so far as Mons. Loir is concerned, the whole matter could be more readily dealt with providing he consults with this Department direct instead of through the Department of Mines.

In the event of the explanation supplied being considered satisfactory, and it is decided to grant the use of the island to either the Department of Mines or Mons. Loir, which will practically be the same thing, it should, in my opinion, be upon the distinct understanding that every care is taken to comply with the requirements of the Act before quoted, and that the occupancy must terminate in the event of the establishment being required at any time in the interests of the owners of rabbit-infested country, who are being debited with the cost of it, and in this particular it may be mentioned that a suggestion by Dr. Belgrave, that trials be made on Rodd Island with a view of ascertaining whether the destruction of rabbits cannot be brought about by the use of the "Bacillus Pyocareus," yet remain to be considered.

The letter of the 5th instant referred to has not yet reached this Department.

H.C.T., 25/11/90.
 F.H.W., 26/11/90.
 Urgent.

Urgent. Submitted in view of previous decision on 90-1,165 herewith.—W.H., 26/11/90.
 The Department of Mines may be permitted to use Rodd Island for six months, subject to the conditions specified in my minute 20/11/90, and with a due regard to a compliance with the provisions of the Animals Infectious Diseases Act. It is of course understood that the island and laboratory shall be available to this Department at any time it may be required for experimental purposes in connection with the suppression of the rabbit pest. The expense of maintaining the island during the time specified to be borne by the Mines Department.—J.N.B., 27/11/90. Informed.—W.R.S., 27/11/90.

No. 43.

The Under Secretary for Mines to The Under Secretary for Lands.

Sir, Department of Mines, Stock Branch, Sydney, 1 December, 1890.
 I have the honor to acknowledge receipt of your letter of the 27th ultimo, stating the terms upon which you are prepared to allow the use of Rodd Island for six months, in order that experiments in the interest of the Stock Branch in diseases in stock may be carried out, and to state that this Department is prepared to accept the use of the island for the period and on the terms stated by you, and would feel obliged by you naming an early day for handing over the premises, plant, and other articles to Mr. Government Veterinarian Stanley, in whose charge the island will be placed, on behalf of this Department.

I have, &c.,

HARRIE WOOD,

Under Secretary.

With the approval of the Under Secretary, I propose visiting the island on Monday next, in company with the Government Veterinarian, in order that the plant, &c., may be handed over as desired.—H.C.T., 5/12/90.

F.H.W., 6/12/90. Approved.—W.H., 8/12/90.

On the 8th December Mr. Stanley visited the island, in company with the Government Veterinarian, and the establishment, together with the articles mentioned in the inventory with papers 90-938 were duly handed over to him as the officer representing the Under Secretary for Mines.—H.P.F., 9/12/90.

No. 44.

Office Memorandum.

I AM informed that the Colonial Secretary has approved of Rodd Island being dedicated as a reserve for recreation, and that the Department of Mines has received instructions to vacate the place forthwith, in order that steps may be taken to beautify it.

Submitted as to whether any action should be taken by this Department to obtain possession of the household furniture and other effects now on the island, the use of which was temporarily granted to the Department of Mines.

H.C.T., 18/4/91.

F.H.W., 20/4/91. Is there any official communication on this subject?—W.H., 21/4/91. Cannot trace.—J.F.W., 21/4/91.

Rodd Island is already a dedicated recreation reserve, and has been so for the past twelve years, having been dedicated 16th April, 1879, under section 5 of the Crown Lands Alienation Act of 1861. No trustees have been appointed.—J.O'D., 21/4/91.

The Under Secretary.—R.H.D., 22/4/91. The Colonial Secretary's office should probably be communicated with in reference to this matter. Submitted.—W.H., 24/4/91. Submission approved.—J.N.B., 24/4/91. The Principal Under Secretary, with reference to proposed dedication.—W.R.S., 28/4/91.

No. 45.

The Under Secretary for Lands to The Principal Under Secretary.

Sir, Department of Lands, Sydney, 28 April, 1891.
 It having been brought under the notice of this Department that the Stock Branch of the Department of Mines will be required to vacate the experimental establishment at Rodd Island at an early date, in order that the island may be resumed for the purposes of a recreation reserve, I have the honor, by direction of the Secretary for Lands, to request that you will be so good as to ask his honorable colleague, the Colonial Secretary, whether it is in contemplation to give effect to the instrument of dedication, dated the 16th April, 1879, and to resume the island, with a view to its improvement and conversion into a place of resort for the public.

In this connection I desire to point out that a substantial building, provided with a well equipped laboratory, and all necessary apparatus and appliances for the conduct of experiments and investigations, requiring an isolated position for their prosecution, has been erected upon the island at a cost of some thousands of pounds to the Government; and as the establishment has been almost continuously availed of up to the present time, first in connection with the labours of the Royal Commission of inquiry into schemes for the extermination of rabbits in Australasia, and subsequently by the Stock Branch of the Department of Mines for the purposes of carrying out certain researches relating to the cure and prevention of diseases among stock, it might perhaps be a matter for future consideration whether, in view of the great difficulty which in the first instance was experienced in obtaining so suitable a site, of the expense and loss which the removal of the institution to another locality would entail, and of the facilities which it at present offers as a bacteriological station for the study of the communicable diseases of animals, some steps should not be taken to temporarily postpone, if not to relinquish entirely, the project to resume the island for the purposes of a recreation reserve.

I have, &c.,

WM. HOUSTON,

Under Secretary.

No. 46.

No. 46.

The Assistant Under Secretary for Mines to The Under Secretary for Lands.

Sir,

Department of Mines, Stock Branch, Sydney, 20 May, 1891.

Referring to your letter of the 27th November last, granting the use of the establishment at Rodd Island for a period of six months, I am now directed by the Secretary for Mines and Agriculture to inform you that the experiments being carried out are not yet complete, and to request that you will be good enough to ask the Secretary for Lands to grant the use of the island for a further period of six months from the 8th proximo.

I have, &c.,

GERARD E. HERRING,

Assistant Under Secretary.

The use of the establishment is not at present required by this Department, and providing it will not interfere with any arrangements being made by the Colonial Secretary to beautify the island and make it available as a place of resort for the people, there does not appear to be any objection to the Department of Mines continuing in occupation for a further period of six months, subject to the conditions previously decided upon.—H.C.T., 26/5/91. F.H.W., 27/5/91. Submitted for approval.—H.C., 27/5/91. Approved.—J.N.B., 28/5/91. Under Secretary for Mines informed.—W.R.S., 1/6/91.

No. 47.

The Under Secretary for Lands to The Under Secretary for Mines.

Sir,

Department of Lands, Sydney, 1 June, 1891.

I have the honor to acknowledge the receipt of your letter of the 20th ultimo, requesting that the use of the establishment at Rodd Island may be granted to your Department for a further period of six months from the 8th instant; and with reference thereto, I am directed by the Secretary for Lands to request that you will be so good as to inform the Secretary for Mines and Agriculture that no objection exists to the term of the occupation of the island being extended to the 8th December next, subject to the conditions specified in my letter of the 27th of November last, and provided that such occupation does not interfere with any arrangements that are being made by the Colonial Secretary to beautify the island, and make it available as a resort for the public.

I have, &c.,

WM. HOUSTON,

Under Secretary

(Per F. H. WILSON).

No. 48.

The Under Secretary for Lands to The Under Secretary for Mines and Agriculture.

Sir,

Department of Lands, Sydney, 19 July, 1891.

With reference to your letters of the 3rd ultimo and 4th instant, stating that it is contemplated to renew experiments on Rodd Island, I have the honor, by direction of the Secretary for Lands, to inform you that if the experiments have ceased the island should be handed back to this Department; but whether such is the case or not, and before the use of it can be granted for a further term, it will be necessary for you to state definitely what experiments are to be renewed, and when they are to be commenced.

In addition, it will also be necessary for this Department to be informed for what further period the occupancy of the island may be required.

I have, &c.,

WM. HOUSTON,

Under Secretary

(Per F. H. WILSON).

No. 49.

E. Darnley, Esq., M.P., to The Secretary for Lands.

Dear Sir,

Parliament House, Sydney, 10 September, 1891.

I shall deem it a favour if you will kindly furnish me with the information asked for in the following questions:—

1. Is it not a fact that horse-racing, cricket, football, rifle shooting, &c., and other land sports have been encouraged by the Government by means of the appointment of reserves for such sports?
2. What similar encouragement has been given to the aquatic sports of rowing and sailing?
3. Have there been any applications (if so, by whom and when), for the use of Rodd Island, Long Cove, in the interests of aquatics?
4. Is there any reason against the granting of Rodd Island, Long Cove, as an aquatic reserve under the control of proper trustees?
5. Is there any reason against the granting of Clark Island as a like reserve under similar control?

I have, &c.,

E. DARNLEY.

No application can be traced for the use of Rodd Island in the interests of aquatics. The island is at present used for experiments in the cures of stock diseases. An application has been made for Clark Island which is being dealt with on other papers.—J.O'D., 24/9/91.

Submitted. As to answering these questions.—R.H.D., 25/9/91. F.H.W., 25/9/91.

Mr. Darnley, M.P., may be informed that limited areas of vacant and unused Crown land have been set apart from time to time for various purposes of public recreation, subject to the provisions of the Crown Lands Acts in force for the time being. No application has been received for the use of Rodd Island in the interests of aquatics, and there are reasons why this island and Clark Island should not be appropriated for such purposes.—W.H., 25/9/91.

Approved.—J.N.B., 29/9/91. Mr. Darnley, M.P., informed.—2/10/91.

No. 50.

The Under Secretary for Lands to E. Darnley, Esq., M.P.

Sir,

Department of Lands, Sydney, 2 October, 1891.

With further reference to your letter of the 10th ultimo, making certain inquiries as to the setting apart of reserves for recreation purposes, I am directed by the Secretary for Lands to inform you that limited areas of vacant and unused Crown land have been set apart from time to time for various purposes of public recreation, subject to the provisions of the Crown Lands Acts in force for the time being.

I have to add that no application has been received for the use of Rodd Island in the interests of aquatics, and there are reasons why this island and Clark Island should not be appropriated for such purposes.

I have, &c.,

WM. HOUSTON,
Under Secretary.

No. 51.

The Under Secretary for Lands to The Under Secretary for Mines.

Sir,

Department of Lands, Sydney, 20 November, 1891.

With reference to your letter of the 14th instant, requesting that the Department of Mines may be allowed the use of Rodd Island for a period of six months, so that Mons. Loir may be able to conduct his experiments in regard to diseases in stock without interference, I have the honor, by direction of the Secretary for Lands, to inform you that it is not within the knowledge of this Department that Mons. Loir has met with any obstruction or interference in the conduct of his experiments during the past few months he has been in occupation of the island, and while recognising the desirability of the laboratory and its appliances, which have been provided at great cost, being profitably utilised in the interests of the Colony, he cannot consent to what is practically a complete transfer of the island to Mons. Loir for such a lengthened period without further information as to the nature of the experiments to be carried on and their being in the public interest.

If the Minister for Mines will fully explain the purpose for which the island and laboratory are required, and will indemnify this Department, the Secretary for Lands will, in the event of such explanation proving satisfactory, have no objection to granting the Department of Mines the use of the establishment for a specified time, to assist in experiments carried out in the interest of the Stock Branch of that Department.

I have, &c.,

WM. HOUSTON,
Under Secretary.

No. 52.

The Assistant Under Secretary for Mines to The Under Secretary for Lands.

Sir,

Department of Mines and Agriculture, Stock Branch,
Sydney, 11 December, 1891.

As the experiments being carried out at Rodd Island are not yet concluded, I am directed by the Minister for Mines and Agriculture to request that the use of the establishment at the island may be granted to this Department for a further period of six months from the 8th instant.

I have, &c.,

GERARD E. HERRING,
Assistant Under Secretary.

It is recommended that the request be granted subject to the conditions previously decided upon. As the nature of the experiments being carried out may have changed since the use of the island was first granted, it would, I think, be well to call particular attention to the fact that it is, of course, understood that in the conduct of all such experiments every care is taken to comply with the requirements of the "Animals Infectious Diseases Act."—H.C.T., 17/12/91. F.H.W., 18/12/91.

Submitted for approval.—W.H., 18/12/91. Approved.—H.C., 21/12/91. Under Secretary for Mines informed.—W.R.S., 23/12/91. The period for which the use of the island was granted to the Department of Mines has now expired.—H.C.T., 8/6/92. Submitted.—T.H.W., 9/6/92. The Mines Department should, perhaps, be asked whether the experiments for which the use of the island was obtained have ceased, and if so, that steps should be taken to hand it back to this Department.—W.H., 9/6/92. Approved.—H.C., 22/6/92. Asked.—W.R.S., 24/6/92.

No. 53.

The Under Secretary for Lands to The Under Secretary for Mines and Agriculture.

Sir,

Department of Lands, Sydney, 23 December, 1891.

I have the honor, by direction of the Secretary for Lands, to acknowledge the receipt of your communication of the 11th instant, requesting that the use of the establishment at Rodd Island may be granted to your Department for a further period of six months from the 8th idem, and to inform you that he approves of the extension of the period of your occupation of the island upon the same conditions as those named in my letter of the 27th of November, 1890.

In connection with this matter, I am directed to invite your special attention to the fact that it is of course understood that in the conduct of experiments every care is taken to comply with the requirements of the "Animals Infectious Diseases Act."

I have, &c.,

WM. HOUSTON,
Under Secretary.

No. 54.

E. Darnley, Esq., M.P., to The Secretary for Lands.

Sir,

Parliament House, Sydney, 22 February, 1892.

Some time ago I had some correspondence with your Department in regard to the question of dedicating Rodd Island, Leichhardt Bay, as an aquatic reserve. Mr. Brunker replied that there were reasons why the island in question should not be so dedicated, at the same time did not state what those reasons were. Knowing your determination to give back to the people the various islands in Port Jackson, I take the opportunity of placing the matter before you for your consideration.

I may here state that a great interest is taken in aquatics in the district, an annual regatta being held, which is largely patronised, not only by people living in the immediate vicinity, but by people from Sydney and elsewhere, and to whom the use of the island would be a great advantage, and the use to which it is put to at the present time is considered by many a menace to the district.

Hoping that you will give this matter your careful consideration, and if possible accede to my proposal, which is made at the instance of a considerable number of my constituents,

I have, &c.,

E. DARNLEY.

No. 55.

E. Darnley, Esq., M.P., to The Secretary for Lands.

Dear Sir

Parliament House, Sydney, 28 March, 1892.

I should like a reply to my letter in reference to the "dedication of Rodd Island, Long Cove, as an aquatic reserve," at as early a date as possible.

Yours, &c.,

E. DARNLEY.

Submitted as to whether any action in the direction desired is to be taken. The land is dedicated for public recreation, but has not been vested in trustees, and has been principally used for experimental purposes in connection with the rabbit plague and diseases of stock. The question of the harbour islands generally is being dealt with on papers 92-266, Individuals, now under submission.—J.O'D., 13/4/92.

R.H.D., 22/4/92. F.H.W., 23/4/92. W.H., 18/5/92.

Mr. Darnley, M.P., may be informed that his letter of 22nd February has only now come under my notice, and that I will take an early opportunity of visiting Rodd Island, and make inquiries of Mines Department whether the island can be spared, or whether it is required for experimental purposes.—H.C., 18/5/92.

Mr. Darnley, M.P., informed, 19/5/92. Under Secretary for Mines, 21/5/92.

No. 56.

The Under Secretary for Lands to E. Darnley, Esq., M.P.

Sir,

Department of Lands, Sydney, 19 May, 1892.

Referring to your letter of the 22nd March last, respecting the dedication of Rodd Island, Long Cove, as an aquatic reserve, I am directed by the Secretary for Lands to inform you that your letter of the 22nd February last, on the same subject, has only now come under his notice, and that he will take an early opportunity of visiting Rodd Island, and make inquiries of the Mines Department whether the island can be spared, or whether it is still required for experimental purposes.

I have, &c.,

WM. HOUSTON,

Under Secretary.

No. 57.

The Under Secretary for Lands to The Under Secretary for Mines.

Sir,

Department of Lands, Sydney, 21 May, 1892.

Application having been made by Mr. E. Darnley, M.P., for the dedication of Rodd Island, Long Cove, as an aquatic reserve, I am directed by the Secretary for Lands to inquire whether the island referred to is required for experimental purposes in connection with the rabbit pest, diseases of stock, &c., or otherwise.

I have, &c.,

WM. HOUSTON,

Under Secretary.

No. 58.

The Under Secretary for Mines and Agriculture to The Under Secretary for Lands.

Sir,

Department of Mines, Stock, and Agriculture, Sydney, 3 June, 1892.

I have the honor, by direction of the Minister for Mines and Agriculture, to inform you, in reply to your letter of the 21st ultimo, that it is contemplated to renew experiments on Rodd Island, and to therefore request that you will be good enough to retain the island for that purpose. I may state that it is especially desirable that this should be done in view of the possible establishment of an Intercolonial Stock Institute in Sydney.

I have, &c.,

HARRIE WOOD,

Under Secretary.

Submitted in connection with the action taken on 92-1,303. Mr. Darnley, M.P., may, perhaps, be informed in terms of this letter.—J.O'D., 30/6/92. Please see the Minister's promise to visit the island.—R.H.D., 30/6/92. F.H.W., 1/7/92. Mr. Taylor (Rabbit Branch) in first instance.—W.H., 1/7/92.

Mr. Darnley may, perhaps, be informed that inquiries are being made, with a view to ascertaining whether the island is likely to be any longer required for the purpose for which it has latterly been used.—H.C.T., 19/7/92.

Yes.—F.H.W. (for the Under Secretary), 20/7/92.

No. 59.

The Under Secretary for Lands to The Under Secretary for Mines and Agriculture.

Sir,

Department of Lands, Sydney, 24 June, 1892.

Referring to your letter of the 11th December last, requesting that the use of the establishment at Rodd Island may be granted to your Department for a further period of six months from the 8th idem, as the experiments then being carried out were not concluded, I have the honor, by direction of the Secretary for Lands, to ask that steps may be taken to hand the island back to this Department if the experiments for which the use of it was obtained have ceased.

I have, &c.,

WM. HOUSTON,

Under Secretary,

(Per F. H. WILSON).

No. 60.

The Under Secretary for Mines and Agriculture to The Under Secretary for Lands.

Sir,

Department of Mines, Stock, and Agriculture, Sydney, 4 July, 1892.

With reference to your communication of the 24th ultimo, asking that steps may be taken to hand Rodd Island back to your Department if no longer required for experimental purposes, I am directed to invite your attention to my letter of the 3rd ultimo on this subject.

I have, &c.,

HARRIE WOOD,

Under Secretary.

The letter referred to is herewith, 92-3,935 Miscellaneous. The use of Rodd Island was granted to the Stock Branch of the Mines Department on certain conditions, and for a period the term of which has now expired. If the occupancy is to be renewed it should be for some more definite purpose than the contemplated renewal of experiments. Moreover, from the concluding portion of the letter, it is inferred that in the event of the establishment of an Intercolonial Stock Institute in Sydney, this island is to be the site, and it is pointed out that the adoption of such a course would amount to a permanent occupation, and would be at variance with the expressed desire of the Government to do all things possible to hand over the harbour islands to the people as places for resort and recreation.—H.C.T., 8/7/92.

F.H.W., 8/7/92.

If the experiments have ceased the island should be handed back to this Department. Whether or not, the Mines Department should state definitely what experiments are to be renewed, when, and for what further period occupancy of the island is desired for the purpose.—W.H., 8/7/92.

Approved.—H.C., 15/7/92. Under Secretary for Mines informed and asked.—W.R.S., 19/7/92.

No. 61.

The President, Board of Health, to The Under Secretary for Lands.

Sir,

Board of Health Offices, 127, Macquarie-street, Sydney, 19 July, 1892.

Understanding that the Lands Department has now no further use for the laboratory situated at Rodd Island, I have the honor to recommend for the consideration of the Minister for Lands that the control of the island and the buildings thereon should be handed over to the Health Department, which, by reason of having a scientific and professional staff, comprising medical men, analytical chemists, and veterinary surgeons, is in a position to make, without extra expense, research into the diseases of man and animals, besides such investigations as may be necessary in connection with the administration of the Diseased Animals and Meat, and the Animals Infectious Diseases Acts.

The laboratory, situated in Macquarie-street, which is in the charge of the Government Analyst (an officer of this Department), has frequently been found to be placed in too confined an area to admit of certain experiments being carried out, and as the buildings on Rodd Island are extremely suitable, I am of the opinion that the possession of the island would greatly facilitate the working of the Health Department.

I have, &c.,

F. NORTON MANNING,

President, Board of Health, and Medical Adviser to the Government.

Mr. Taylor, Rabbit Branch.—So far as I am aware, Rodd Island is not likely to be required any longer for the purposes of research in connection with this branch of the Department, and if the Department of Mines, as would appear to be the case, has completed the operations recently carried out there, the question of the future control of the island is one requiring careful consideration. The buildings on Rodd Island are no doubt extremely suitable for the purpose described by Dr. Manning, but the setting apart of the island for such a purpose would no doubt raise a storm amongst the residents of what is fast becoming a crowded suburb, and in considering the matter, the representations made by Mr. E. Daruley, M.P., must not be overlooked.—H.C.T., 10/8/92. F.H.W., 10/8/92.

The only possible use to which this Department might apply the island and laboratory would be bacteriological investigations, the diseases of rabbits, and it is a question whether such investigations could not be as well conducted under the supervision of Dr. Manning as under any other person that might be appointed by the Department. If the transfer is authorised, it should, perhaps, be on the condition that any such investigations required by this Department will be conducted by Dr. Manning and his staff. At present, however, the island is in the occupation of the Mines Department.—W.H., 10/8/92.

May be referred to Mines for their opinion.—H.C., 10/8/92.

In view of the remarks made by the Minister in reply to the deputation that waited upon him on Friday last, it is submitted whether the reference to the Department of Mines will now be necessary.—H.C.T., 23/8/92. See slip herewith.—F.H.W., 23/8/92. W.H., 23/8/92.

The

The use of Rodd Island.—A deputation, including the Members for Canterbury and Balmain, together with Alderman Walsh, waited upon the Minister for Lands yesterday, and represented that they had heard that the Board of Health had applied to have Rodd Island handed over for the purposes of an experimental station in connection with microbes, &c. They protested against the island being used in this manner, as it might affect the health of the people in the neighbouring localities. The island should be set apart as a recreation reserve. Mr. Copeland said the application had been made somewhat late, as there were now £4,000 worth of buildings on the island. The place had been lent to the Mines Department, who had asked for the further use of it, and the Board of Health also wanted it for an experimental station. Personally he did not think that much danger was to be apprehended from having experiments carried on at the island. He would, however, before dealing with the matter in any way, see if some other site could be found for an experimental station for the Board of Health.

No. 62.

The Under Secretary for Mines and Agriculture to The Under Secretary for Lands.

Sir, Department of Mines, Stock, and Agriculture, Sydney, 8 August, 1892.
In reply to your letter of the 19th ultimo, asking what experiments are to be renewed at Rodd Island, and when they are to be commenced, I am directed by the Secretary for Mines and Agriculture to state that Dr. Loir arrived by the steamship "Australien" on Saturday, and he is to resume work immediately at Rodd Island in the preparation of Pasteur's vaccine of anthrax.

It is also proposed to use the island in connection with the establishment of an Intercolonial Stock Institute, but for how long cannot at present be determined.

I have, &c.,
HARRIE WOOD,
Under Secretary.

Before referring the case to the Mines Department, in accordance with the decision on 92-5,202 (next paper), this letter is submitted.—J.O'D., 11/8/92. R.H.D., 11/8/92. F.H.W., 12/8/92.

No. 63.

E. Darnley, Esq., M.P., to The Secretary for Lands.

Dear Sir, Parliament House, Sydney, 16 August, 1892.
The Members for Canterbury and Balmain desire an interview with you on Thursday next about 11 o'clock, if you could make it convenient to see them, in reference to the question of the dedication of Rodd Island for the use of the people.

If you can receive us, you will greatly oblige.

Yours truly,
E. DARNLEY.

Send letter to the Assembly by a messenger this morning and inform will see them to-morrow at 11.15.—H.C., 17/8/92. Informed.—W.R.S., 17/8/92. Submitted for consideration in connection with 92-991 herewith.—H.P.T., 23/8/92. F.H.W., 23/8/92. Shorthand notes of interview herewith. Mr. Inspector Bruce would like to be informed when the Minister intends to visit the island.—W.H., 23/8/92. This matter must stand over for the present. I will arrange a visit with the Minister for Mines.—H.C., 16/9/92.

[Enclosure.]

Shorthand Notes.

Deputation consisting of Messrs. Darnley, Carruthers, Danahy, Bavister, and G. D. Clark, M's.P., and Alderman Walsh, re Rodd Island.

19 August, 1892.

The Deputation represented that it had come to their knowledge that the Board of Health had applied for Rodd Island as an experimental station, and they deemed it their duty to protest against any such application being granted, as they thought the establishment of a station for experiments in microbes and other diseases on the island would be detrimental to the health of the large population in the neighbourhood. The wind blew over the island on every side towards populous centres, and they thought might carry the germs of disease with it. There were not many recreation reserves in the locality, and they would suggest that the island be granted for an aquatic reserve. Regattas were held there every year; vessels could not be got up there for flagships. Anyway, if the Minister was not in favour of this, they hoped the Board of Health would fix upon a less populous locality to carry out their experiments in, and must enter their protest against the island being granted for the purpose.

The Minister (Mr. Copeland) said he was somewhat in sympathy with the object of the deputation, but unfortunately they had taken action rather late. Already there were on the island about £4,000 of buildings. The island was originally dedicated as a recreation reserve, but subsequently made a quarantine reserve, the use of the island was sought by two departments, the Board of Health and the Mines Departments. The Mines Department had the loan of it at present for experiments, and as a quarantine ground, and asked for the still further use of it.

He had a letter there from Dr. Manning, on behalf of the Board of Health, applying for the island (read letter as under).—

"Understanding that the Lands Department has now no further use for the laboratory situated at Rodd Island, I have the honor to recommend for the consideration of the Minister for Lands that the control of the island, and the buildings thereon should be handed over to the Health Department, which, by reason of having a scientific and professional staff, comprising medical men, analytical chemists, and veterinary surgeons, is in a position to make, without extra expense, research into the diseases of men and animals, besides such investigations as may be necessary in connection with the administration of the Diseased Animals and Meat, and the Animals Infectious Diseases Acts.

"The laboratory, situated in Macquarie-street, which is in the charge of the Government Analyst, an officer of this Department, has frequently been found to be placed in too confined an area to admit of certain experiments being carried out, and, as the buildings on Rodd Island are extremely suitable, I am of the opinion that the possession of the island would greatly facilitate the working of the Health Department."

So they would see, so far as the microbes were concerned, that the Board of Health were experimenting in the present offices in Macquarie-street. It would, he thought, be better that those experiments should be conducted on an isolated island than in the centre of the city. Personally he did not think there was anything to be feared from the experiments being carried out on the island.

He would be perfectly willing to hand over the island for recreation purposes, but for the buildings upon it; he could not ignore £4,000 worth of buildings. He was quite with them in their desire to beautify the island. Perhaps there was some other island which would suit them. Had Schnapper Island anything on it? The

The deputation thought not. As to the buildings on Rodd Island they were of galvanized iron, and could, they thought, be removed elsewhere; in fact, they understood they had been built with that view, Alderman Walsh stating that when it was first proposed to make Rodd Island an experimental station an agitation against the proposal was got up in Leichhardt, but was dropped, as they were promised that the station would be removed when the experiments were finished. They would urge the Minister to defer his decision until he had an opportunity of inspecting the buildings himself. Some other site could be found for the Board of Health experimental station, the Five Islands, Wollongong, being suggested. There was room enough on any one of those for all the Board of Health would want.

The Minister pointed out that the station must be somewhere not too far away, as the medical men could not spare the time to travel a long way away. If it were not for the buildings on the island he should have no hesitation in handing over the island for recreation purposes. He would promise them this much,—that he would not create any fresh difficulty by handing over the island to any other branch of the Service, and would take an opportunity of inspecting the building himself. In the meantime he would keep a look out for another suitable place for the Board of Health's experiments. It did not appear to him absolutely necessary that they should be conducted on an island—somewhere inland, away from settlement, would, he thought, do as well.

WALTER D. BINGLE.

No. 64.

The Under Secretary for Lands to E. Darnley, Esq., M.P.

Sir,

Department of Lands, Sydney, 17 August, 1892.

In reply to your communication of the 16th instant, stating that the Members for Canterbury and Balmain desire an interview with reference to the question of the dedication of Rodd Island for the use of the people, I have the honor, by direction of the Secretary for Lands, to inform you that he will be prepared to receive those gentlemen at 11:15 a.m. on Thursday next, the 18th instant.

I have, &c.,

WM. HOUSTON,

Under Secretary.

(Per F.H.W.)

No. 65.

Extract from The *Sydney Morning Herald* of 20th August, 1892.

Rodd Island and the application of the Board of Health.

Messrs. Darnley, Carruthers, Danahey, G. D. Clark, and Bavister, M's.L.A., together with some other gentlemen, waited upon the Minister for Lands yesterday to urge that, instead of Rodd Island being handed over to the Board of Health, so that it might conduct certain experiments thereon in regard to microbes, &c., it should be set apart as an aquatic or public recreation reserve. Members of the deputation expressed it as their belief, that if Rodd Island were used by the Board of Health in connection with experiments relating to disease, it would prove a menace to the health of the neighbouring population.

Mr. Copeland said he sympathised with the object the deputation had in view, and would have given proof of his sympathy if he could have seen his way to do so, but, unfortunately, the deputation had taken action too late. Already there were on the island buildings which were worth about £4,000. The island was dedicated as a recreation reserve as far back as 1879, but in 1891 it was proclaimed a quarantine reserve for imported stock. At present the use of the island was sought by the Mines Department and the Board of Health. The Mines Department had the loan of it at the present time for their experiments and as a quarantine, and they asked for the further use of the island. In addition to that, Dr. Manning had applied, on behalf of the Board of Health, for the island. Dr. Manning's letter was in these terms: "Understanding that the Lands Department has now no further use for the laboratory situated at Rodd Island, I have the honor to recommend, for the consideration of the Minister of Lands, that the control of the island and the buildings thereon should be handed over to the Health Department, which, by reason of having a scientific and professional staff, comprising medical men, analytical chemists, and veterinary surgeons, is in a position to make, without extra expense, research into the diseases of men and animals, besides such investigations as may be necessary in connection with the administration of the Diseased Animals and Meat and the Animals Infectious Diseases Acts. The laboratory, situated in Macquarie-street, which is in the charge of the Government Analyst (an officer of this Department), has frequently been found to be placed in too confined an area to admit of certain experiments being carried out. As the buildings on Rodd Island are extremely suitable, I am of opinion that the possession of the island would greatly facilitate the working of the Health Department." At present, the Board of Health conducted their experiments in a building in Macquarie-street, near Parliament House. Undoubtedly it would be better that those experiments should be conducted on Rodd Island which was isolated, rather than that they should be continued in the present laboratory. He did not think that any danger need be apprehended from those experiments being conducted at Rodd Island, which was not in immediate contact with the people.

The deputation pointed out that as the buildings were of iron they could easily be removed without their value being greatly diminished.

Mr. Copeland then promised to take the first opportunity of personally inspecting the buildings before deciding finally what should be done. It appeared to him, he said, that it was not absolutely essential that Rodd Island should be used for the purpose contemplated by the Board of Health.

Possibly some site in the country, which was far removed from population and isolated, would be suitable for carrying on the experiments.

No. 66.

The President, Board of Health, to The Under Secretary for Lands.

Sir,

Board of Health Offices, 127, Macquarie-street, Sydney, 22 August, 1892.

With reference to my letter of the 19th ultimo and the views of the deputation which waited upon the Minister for Lands on the 19th instant with regard to the disposal of Rodd Island, I think it advisable to point out for the information of the Minister when considering this question:—

First. That there is already a fine public park at Leichhardt, purchased by the Government some eight or ten years ago, and shown coloured green on the enclosed plan.

Second.

Second. That, owing to the very isolated position of Rodd Island, it is a specially suitable place for dealing with investigations into infectious diseases in man and animals, and that no danger need be apprehended from the spread of these from such a locality; and

Third. That any laboratory for the study of infectious diseases should not be too far from the central offices of the Government, as otherwise the time of scientific officers would be too much taken up in journeys to and from their work, and they would be less at the service of the head of the Department for ordinary duties.

I have, &c.,
F. NORTON MANNING,
 President, Board of Health, and Medical Adviser to the Government.

No. 67.

The Under Secretary for Mines and Agriculture to The Under Secretary for Lands.

Sir, Sydney, 26 August, 1892.

Referring to previous correspondence in regard to the use of Rodd Island, and more particularly to my letter of the 8th instant and the subject therein referred to, in regard to the use of the island for the establishment of an Australasian Stock Institute, I am now directed by the Secretary for Mines and Agriculture to request that you will be good enough to ask the Secretary for Lands to place Rodd Island under the control of this Department, so that Dr. Loir may have the use of it for conducting his important investigations, and the preparation of Pasteur's vaccine of anthrax, and other work.

I have, &c.,
HARRIE WOOD.

No. 68.

F. Walsh, Esq., to The Secretary for Lands.

Sir, Glen View, Leichhardt, 26 August, 1892.

I have the honor to protest against the dedication of Rodd Island, Port Jackson, for any purpose other than public recreation, and in so doing beg to forward herewith extract from to-day's issue of *Sydney Morning Herald*, in which my reasons are set out at length. I trust your consideration of same will result in a decision welcome to the residents of Leichhardt and to the aquatic community.

I have, &c.,
FRED. WALSH.

Rodd Island, Port Jackson. Submitted in connection with action on 92-5,202 Departmental. This is a dedicated recreation ground of 1 acre 23 perches. The Board of Health have applied for it for an experimental station, &c. Miscellaneous 92-5,202 Departmental, and 92-6,279 Departmental. The Mines Department also seek to have it granted for the establishment of a Stock Institute, for carrying out investigations respecting stock diseases (92-6,416 Departmental), and this letter is a protest against giving the island for any other purpose than public recreation—J.O'D., 15/9/92.

R.H.D., 16/9/92. F.H.W., 17/9/92. Let me know what was the cost of the buildings erected on the island, including wharfage accommodation, if any.—W.H., 19/9/92. Mr. Miller.—Please ascertain the cost of erection of buildings. The furnishing was, I think, paid for by this Department and the erection by Colonial Architect.—V.C., 19/9/92. [Enclosures.]

[Extract from *Sydney Morning Herald* of 25th August, 1892.]

RODD ISLAND—THE BOARD OF HEALTH AND AN AQUATIC RESERVE.

To the Editor of the Herald

Sir,—On Friday last a deputation waited upon the Minister for Works in order to protest against the granting of Rodd Island to the Board of Health for use as an experimental or propagating nursery for diseases of man and animals, and to ask that such island be dedicated to the uses of the aquatic community.

As one who has taken a continuous and strong interest in this matter, and carefully watched all the actions concerning this beautiful little island, will you allow me to give particulars of the public's right to the same, and to protest against the attempted institution of such an alarming and most likely highly dangerous disease factory as the Board of Health wish to have.

In the first place, it might be as well to point out that Rodd Island is a beautiful little islet in the midst of Leichhardt Bay (late Long and Iron Coves), fairly between the shores of Leichhardt and those of Drummoyne. Its picturesque rocks and native shrubs and grasses have always been an attraction for picnic parties, and have secured for the islet a patronage and fame which are not to be despised. It lays abreast of the Leichhardt Public Park, and forms a pleasing eye rest in the magnificent landscape views which are obtained from the high ground of that park, where, on holidays, thousands of people congregate to view the fleets of sailing boats visiting such a charming spot, and sent forth with cheerful parties on board from the sheds all round the inlet, and to become spectators of the feats of the local oarsmen, who have an extensive and ornamental shed, yecept the Leichhardt Rowing Club shed, on the shores of the park, where, gradually lowering to the water's edge, the originally rocky, but now ornamentally laid out ridge of the cape which forms the park, shelters the sportsman from the sharp north-easters.

This rocky and romantic islet was claimed for a good many years by the father of the legal profession, Mr. B. C. Rodd, whose interesting residence faces and overlooks it, and I understand that he released all right, title, and interest in it to the Government on condition that it should be dedicated as a reserve to the people for ever, and should be left in its natural state. Mr. Rodd evidently thought that, with the varieties of taste in beautifying, the green, grey, and brown gem of the inlet would stand a chance of losing for ever its interest as a sight. Well, Rodd Island, or "Jack's" Island, was dedicated as a reserve in 1871, though to no particular purpose that I am aware of; but to all intents and purposes from that date until recently it has been a recreation reserve of great resort. Now, about five years ago, the residents of Leichhardt, Drummoyne, Five Dock, and Ashfield, were alarmed to hear that Pasteur's method for the destruction of rabbits was to be experimented upon on Rodd Island. The indignation was very keen.

The island was taken possession of, and buildings commenced before we had any idea of the purpose; but as soon as ever it was known, as by magic, a numerously signed requisition was prepared and handed to the Mayor of Leichhardt asking him to convene a public indignation meeting. The Mayor and the Members for the district were at that time supporting the Government of the day, and instead of a public meeting being called a special meeting of the local Council was convened, at which an assurance was given on behalf of the Members for the district and the Government of the day—on condition of the withdrawal of opposition to the use of Rodd Island for the Pasteur experiments—that the occupancy of the island would only be for about nine months—at any rate, for not more than twelve.

Building

Building after building has been added to the original one, but although it is said they are now worth £4,000, an experienced builder tells me he would like half that sum for the job of putting them all up, and would even make a penny or two at a quarter of the price. The island has never reverted back to the people for recreation purposes, and I do think it now should do so.

From the expressions which fell from the Minister for Lands last week it will do so, if he is convinced the buildings are not of such permanent character that great loss will be entailed in disregarding their existence. This loss, I conceive, will be but very small; but even if it were great, I apprehend that it should not weigh with those in charge when it becomes a question of conserving the health of the people.

The present and proposed use of the island is one calculated to injure the rights and properties of owners and residents in Balmain, Leichhardt, Ashfield, Drummoyne, and Five Dock, even if it only leads to the belief that the propagation of diseases and experimenting in the same of both animals and man so close to thickly-populated places, if they are not really so, are a menace to the health and well being of the people. I say if even it is only believed so; but we find strong arguments, though opposed by others, that this is a dangerous proceeding. No risk at all should be incurred. Microbes and all their concomitants are as a breath of air, and may be wafted hither and thither by the slightest breeze; and how nice for the pleasure-seekers upon the water and upon the park to have this fear in mind.

There were, by your own report, some 5,000 people on Leichhardt park on the 30th ultimo, on the occasion of the carnival for the distressed, while other estimates made it twice that number. On New Year's Day, when the annual regatta is held, a similar number of people always congregate there in most enjoyable sport, while on Saturdays and holidays very great crowds gather to view cricket or football matches, and to hold private picnics.

Surely this menace, if it only be a very insignificant one, is not going to be held up to this large section of the community. Now, as to an aquatic reserve, I do think that the sport which has opportunity second to none in the world in the placid waters of our harbour should be fostered equally with the others. I would refer to the encouragement afforded to land sports and pastimes, as to cricket, football, bowling (as instanced by the occupancy of the Victoria Park), horse-racing, and others, and to other pleasures and callings, such as horticulture, agriculture, and such like, by the appointment of reserves for cricket grounds, sports reserves, show grounds, &c., and suggest that aquatics, both as a sport and as a calling, merits like treatment, while, so far as we are aware, no reserves beyond "camping" reserves have been set apart for such purpose.

The Leichhardt residents have in the past successfully carried out a yearly aquatic festival in the form of a comprehensive regatta, and it is now established as the "New Year's Day Regatta" of the metropolis. This has been done under considerable difficulty, owing to the Iron Cove bridge preventing the entrance to the noble waters of Leichhardt Bay (late Long Cove) of a vessel of suitable size for a flagship.

Had the Committee the right to use Rodd Island as the flag station, better enjoyment and more satisfaction to the public and the workers would be afforded.

It would, I conceive, be only right and proper that the public should have the use of Rodd Island, and it would be a boon to aquatic men, and only fair as between them and other sportsmen.

I therefore put this suggestion forward for consideration, and trust that our Members will work with the object suggested, and that we shall see soon gazetted an admirable flag station for the Leichhardt regattas.

In effecting such dedication we apprehend it would be wise to appoint trustees of the Rodd Island aquatic reserve having the confidence of the public, and would suggest that they should have power to erect grandstands and other buildings for the comfort of sight-seers, and to charge for admission to the same, and that upon public holidays and on other days, of which seven days notice in one Sydney newspaper and the local papers might be given, the trustees should be allowed to charge a landing fee. Under this reservation, the trustees might be the Minister for Lands or one of his officers, the president of the Rowing Association, the mayors of the surrounding districts, with the presidents of rowing clubs *ex officio*.

Very soon, I think, we should have a club-house and surroundings equal to those of the Association Cricket Ground, and of equal service to the votaries of aquatic sport as the former is to those of athletic taste.

I do not think it out of the way to ask for this recognition of aquatics, seeing the other sports and callings are so well endowed by the Government assistance in finding them a habitation and a home. I do trust that the Minister for Lands, with that acumen which so well characterises him, will consider all sides of the matter, and come to a decision in accordance with the above views, which are not only held by me, but by most persons of my acquaintance.

Do not have a microbe factory close to densely-populated places, make the islands of the harbour recreation grounds, and give the aquatic men some encouragement.

I am, &c.,
FRED. WALSH.

Re Rodd Island.

Account Branch, 21 September, 1892.

With regard to the Under Secretary's question as to cost of buildings, wharfage accommodation, &c., at Rodd Island, inquiries made at the Government Architect's office have elicited the information that the following expenditure is recorded there, viz.:—Year 1888, erection of buildings, furniture, &c., £3,078 5s. 3d.; year 1889, additions to buildings, furniture, &c., £243 12s.; total, £3,321 17s. 3d.

Respecting the wharf, the only expenditure recorded in the Harbours and Rivers Branch, Works Department, is for alterations to wharf, 1891, £75.

The records there have been searched as far back as 1887, but nothing can be found as to any contract being let for the original wharf. Mr. Quodling saw the Under Secretary for Works on the subject, and the Under Secretary has no recollection of any other expenditure than that above quoted for wharfage accommodation at the island since 1887.

The Accountant. Submitted. Herewith I append the report of the Royal Commission, in which is contained a description of the buildings, &c.—V.C., 27/9/92. W.H., 10/10/92.

Pending the voting by Parliament of a sum of money for the establishment of an Intercolonial Stock Institute, and of the appropriation of a site for the use of the Board of Health to make researches into diseases of men and animals, Rodd Island may be used for scientific purposes for the present. I, however, anticipate that there will be only a temporary delay in applying it to public recreation, as dedicated.—H.C., 12/10/92.

Papers, Mines 92-10,509, returned, and the Under Secretary informed as above, 17/10/92. Council Clerk, E. Darnley, M.P., F. Walsh, and President, Board of Health informed.—(M), 20/10/92. Mr. Taylor, Rabbit Branch, 26/10/92. Seen.—H.C.T., 28/10/92.

No. 69.

The Council Clerk, Leichhardt, to The Secretary for Lands.

Sir, Municipal District of Leichhardt, Town Hall, Norton-street, 13 September, 1892.

By a resolution of this Council adopted at their last meeting, I am directed to prefer a request that you will be pleased to take into your favourable consideration the advisability of dedicating Rodd Island as a public reserve to the people.

It is understood that a deputation has already approached you on this subject, and it is hoped that, in view of the fact that the island is no longer required for experiments in connection with the destruction of rabbits, and the inestimable boon it would be to the public as a place of recreation and a health-giving resort, you may find it in your power to accede to this request.

I am, &c.,
T. D. MEARES,

Council Clerk.

This matter is now under consideration. Acknowledge and inform, please.—W.H.S., 24/9/92. Council Clerk, Leichhardt, accordingly, 26/9/92.

No. 70.

No. 70.

The Chief Inspector of Stock to The Under Secretary for Mines and Agriculture.

Department of Mines, Stock Branch, Sydney, 26 September, 1892.

Minute Paper—Australasian Stock Institute.

THE Prime Minister of Queensland telegraphs to know the present position of matters in regard to the proposed Australasian Stock Institute, and points out the desirability of making definite arrangements while Dr. Loir is in Australia. He also states that his Government agree to the location on Rodd Island.

This refers to a resolution passed unanimously at the Intercolonial Stock Conference, held in Melbourne in 1889, "That there should be an Australasian Stock Institute, and that it should be established at Sydney.

With a view to giving Sir S. W. Griffith a reply, I have the honor to suggest that the Lands Department, in terms of our letter, 3rd June last, be required to hand over Rodd Island to this Department, with the view to the establishment of the Temporary Intercolonial Stock Institute on Rodd Island, and the appointment of Dr. Loir as director, as recommended at a meeting of the Chief Inspectors of Stock for the Colonies, held during June, 1891.

The reason for selecting Rodd Island as the seat of operations is that Dr. Loir is at work there where there is a well-appointed laboratory and everything in readiness; and I think it is very improbable that the island will be required again by the Lands Department in connection with rabbit experiments. If it is every assistance would, of course, be given for carrying them on there.

The only objection, as I understand, that can be urged against Rodd Island being taken for this purpose is on the score of danger to the public health; but I would point out that this is more imaginary than otherwise, for there is no risk to human subjects in the experiments to be carried out, as similar experiments are so at the Pasteur Institute, in the centre of Paris. The only risk is contact with animals, which cannot take place, the institute being on an island, which is the chief recommendation of the place as a site.

It is unnecessary to enumerate the advantages of having the institute in Sydney; and as the colonies interested are agreeable to Rodd Island as the site of the temporary institute, I would strongly recommend the transference of the control of the island, with all appointments, to this Department.

It will be seen that the question is very urgent.

ALEX. BRUCE,
Chief Inspector of Stock.

Submitted.—H.W., 26/9/92. Approved.—T.M.S., 27/9/92. The Under Secretary for Lands.—
A.B. (for the Under Secretary), B.C., 27/9/92.

No. 71.

The Council Clerk, Leichhardt, to The Secretary for Lands.

Sir, Municipal District of Leichhardt, Town Hall, Norton-street, 1 October, 1892.

As this Council has passed resolutions and public meetings been held, protesting against the use of Rodd Island for any other than recreation purposes, and as a deputation from this Council and numerous other Councils interested is shortly to wait upon you, I am requested to ask that you will not enter into any definite arrangements *re* the same until such deputation has been received.

I have, &c.,
T. D. MEARES,
Council Clerk
(Per O.E.M.)

Submitted.—H.C.T., 4/10/92. F.H.W., 4/10/92. W.H., 5/10/92. No deputation is
necessary; the paper may be put away.—H.C., 12/10/92

No. 72.

The Under Secretary for Mines and Agriculture to The Under Secretary for Lands.

Sir, Department of Mines, Stock, and Agriculture, Sydney, 7 October, 1892.

Referring to previous correspondence upon the subject of the transfer to this Department of the laboratory on Rodd Island for the purpose of carrying on experiments for prevention of diseases in stock, I have the honor to request that I may be favoured with a reply to my communication of the 27th August last on that subject, in order that a reply may be given to the letter from Sir Samuel Griffith, the Premier of Queensland, to Sir George R. Dibbs, of the 24th ultimo, copy of which I append hereto.

I have, &c.,
HARRIE WOOD,
Under Secretary for Mines and Agriculture.

[Enclosure.]

Sir, Queensland, Chief Secretary's Office, Brisbane, 24 September, 1892.
Referring to previous correspondence on the subject of the permission granted by the New South Wales Government to Dr. Loir to make use of the laboratory and appliances at Rodd Island for the purpose of carrying out on behalf of this Government a course of experimental investigations into the mode of preserving the virus of pleuro-pneumonia, I have the honor to inquire whether the Government of New South Wales will renew their permission to carry on the experiments at the expense of this Colony at Rodd Island.

I have, &c.,
S. W. GRIFFITH.

The Honorable Sir George R. Dibbs, K.C.M.G., Sydney.

Question and Answer.

LEGISLATIVE ASSEMBLY, WEDNESDAY, 12 OCTOBER, 1892.

Question.

6. EXPERIMENTS ON RODD ISLAND, LONG COVE:—MR. DARNLEY asked THE SECRETARY FOR LANDS,—
- (1.) What requests have been made, and by whom, for the use of Rodd Island, Long Cove, for the purpose of carrying out experiments in and propagation of disease of man and animals?
 - (2.) Is it a fact that the said island is in close proximity to the populous districts of Balmain, Leichhardt, Ashfield, Five Dock, and Drummoyne?
 - (3.) Have any protests been made against the use of such island for such dangerous purposes; and, if so, by whom?
 - (4.) What requests have been made for the dedication of such island for recreation purposes; and by whom?
 - (5.) What is his intention with respect to the future use of Rodd Island?

Answer.

Mr. Copeland answered,—

(1.) (a) By the Department of Mines, that Dr. Loir may have the use of it for conducting his important investigations, and the preparation of Pasteur's vaccine of anthrax, and other work. (b) By the Department of Mines, with the view to the establishment of a temporary Intercolonial Stock Institute thereon, with Dr. Loir as Director. (c) By the Board of Health, to enable that body to make researches into the diseases of men and animals, besides such investigations as may be necessary in connection with the Diseased Animals and Meat, and the Animal's Infectious Diseases Acts.

(2.) Yes.

(3.) By the Honorable Member and Mr. Walsh, of Leichhardt.

(4.) By the Municipal Council of Leichhardt, and by the Honorable Member on behalf of a considerable number of his constituents.

(5.) This island, although dedicated for public recreation in 1879, has recently been loaned to the Mines Department for experimental purposes in connection with diseases of stock. Pending the voting by Parliament of a sum of money for the establishment of an Intercolonial Stock Institute, and of the appropriation of a site for the use of the Board of Health to make researches into diseases of men and animals, it has been decided to allow the island to be used for scientific purposes for the present; but it is anticipated that there will be only a temporary delay in applying it to public recreation as dedicated.

Question and Answer.

LEGISLATIVE ASSEMBLY, THURSDAY, 20 OCTOBER, 1892.

Question.

(3.) RODD ISLAND:—MR. CARRUTHERS *asked* THE SECRETARY FOR LANDS,—

- (1.) To what purposes is Rodd Island now devoted?
- (2.) Is it intended to permit the island to be used as a station for the cultivation of the microbes of certain diseases; and, if so, of what diseases?
- (3.) Are any animals to be inoculated with the virus of any disease on the island?
- (4.) What safeguards will be provided against infection and contagion to the general community?
- (5.) Have any objections been made to the establishment of the bacteriological station at Rodd Island?
- (6.) Are there no places in New South Wales, save an island in the centre of a thickly populated locality, suitable for the purposes of a bacteriological station?

Answer.

Mr. Slattery answered,—

(1.) It is being used by M. Pasteur's representatives (Drs. Loir and Momont) for the cultivation of vaccine of anthrax and black-leg. Those gentlemen are also carrying on a series of experiments in regard to pleuro-pneumonia on behalf of the Government of Queensland.

(2.) Yes; at present anthrax and black-leg.

(3.) Yes.

(4.) The same safeguards as are adopted in other countries under similar circumstances, *i.e.*, all infected animals being destroyed, and material being sterilised by heat.

(5.) Yes; objections have been received, but not in the main directed against the particular use to which it is put.

(6.) No doubt there are; but at Rodd Island there is a properly appointed laboratory available, easily accessible from all parts of the Colony, and it is so situated that no risk is incurred in using it for the purpose.

CALAGHAN'S CONDITIONAL PURCHASES, BRAIDWOOD AND QUEANBEYAN.

REPORT.

THE SELECT COMMITTEE of the Legislative Assembly, appointed on 1st March, 1893,—“with power to send for persons and papers, to inquire into and report upon all the circumstances connected with Calaghan's conditional purchase 81-51, Braidwood, and 83-246 and 84-30, Queanbeyan, recommended for forfeiture,”—and to whom was referred, on the same date, “the Report from the Select Committee on the same subject, during the Session of 1890,”—have agreed to the following Report:—

Your Committee, having carefully considered the Report referred to them, find,—

That it is satisfactorily proved that Calaghan was a *boná fide* resident upon his conditional purchase, and is entitled to get the land in question, and that he had justifiable reasons for leaving his wife and children to reside elsewhere.

Your Committee recommend Calaghan's case to the favorable consideration of your Honorable House.

WM. H. HOLBOROW,
Chairman.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

**LAND OWNED BY MR. J. P. GARVAN IN VICINITY OF
 THE TWEED AND LISMORE RAILWAY.**

(RETURN RESPECTING.)

—
Ordered by the Legislative Assembly to be printed, 2 February, 1893.

[Laid upon the Table of the House in answer to Question No. 3, of 8 December, 1892.]

—
Question.

3. LAND OWNED BY MR. J. P. GARVAN IN THE VICINITY OF THE TWEED AND LISMORE RAILWAY:—
 MR. KELLY (for MR. BLACK) asked THE SECRETARY FOR PUBLIC WORKS,—
- (1.) What was the value per acre of the land owned by Mr. J. P. Garvan in the vicinity of the Tweed and Lismore railway before the railway was carried through?
 - (2.) Who were the valutors in connection with the assessment of the portion resumed by the Government?
 - (3.) What was the valutors' award per acre?
 - (4.) What, approximately, will be the total amount paid to Mr. Garvan?

Answer.

- (1.) Cleared land (say), £10; scrub land (say), £4; average value of Mr. Garvan's land (say), £6
 - (2.) T. F. Waller.
 - (3.) Partially cleared land, £15; bush land, £4.
 - (4.) Awarded by Arbitration Court, £1,050.
-

1892-3.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

LAND RESUMED AT MICHELAGO.

(RETURN RESPECTING.)

Ordered by the Legislative Assembly to be printed, 12 May, 1893.

[Laid upon the Table of the House in answer to Question No. 8 of 26 April, 1893.]

Question.

8. LAND RESUMED AT MICHELAGO, IN THE QUEANBEYAN ELECTORATE:—MR. JONES (for MR. HAYNES) asked THE SECRETARY FOR PUBLIC WORKS,—
- (1.) What is the amount of money paid to the Honorable Alexander Ryrie, Member of the Legislative Council, for land resumed at Michelago, in the Queanbeyan electorate, and the number of acres resumed?
 - (2.) The amount of money spent on such land during the last six years in the erection of public buildings?
 - (3.) The number of tenanted houses at the present time in the township of Michelago?

Answer.

- (1.) 53a. 2r. 31p. were resumed for railway purposes, and 2a. 3r. 34p. were acquired for police purposes, the total cost being £851 1s.
- (2.) Irrespective of railway works, the sum of £1,865 13s. was spent by this Department in the erection of buildings.
- (3.) I am informed by the Government Statistician that, according to the Census of 1891, the number of tenanted houses was as follows:—Michelago, 28; Tindry Vale, near Michelago, 7; Waterholes, near Michelago, 8.

1892.

NEW SOUTH WALES.

CROWN LANDS.

(DEDICATION OF CERTAIN LANDS UNDER ACT 48 VIC. No. 18, SEC. 105, AND ACT 53 VIC. No. 21, SEC. 41.)

Presented to Parliament, under Acts 48 Vic. No. 18 sec. 105, and 53 Vic. No. 21 sec. 41.

Department of Lands,
Sydney, 25th August, 1892.PROPOSED RESUMPTION OF PUBLIC SCHOOL SITE
AT TRANGIE, AND DEDICATION FOR THE
SAME PURPOSE IN LIEU.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the Public School site at Trangie, area 2 acres, viz., portion 2, in the parish of Trangie, county of Narromine, dedicated 16th January, 1886, and hereunder described, with a view to the inclusion of that area in the temporary common, and to the dedication of allotment 1 of section 7, village of Trangie, as a site for Public School, in lieu.

[Ms. 92-1,241 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Area proposed to be resumed.

2 acres. County of Narromine, parish of Trangie, at Trangie, portion 2: Commencing at the eastern corner of portion 1 of 160 acres; and bounded thence on the north-west by part of the south-eastern boundary of that portion bearing south 32 degrees 30 minutes west 6 chains 7 links; on the south-west by a north-eastern boundary of portion 3 of 10 acres bearing south 57 degrees 30 minutes east 3 chains 29½ links; on the south-east by a north-western boundary of that portion bearing north 32 degrees 30 minutes east 6 chains 7 links; and on the north-east by a line bearing north 57 degrees 30 minutes west 3 chains 29½ links to the point of commencement,—as shown on plan P 1,368-1,978.

Area proposed to be dedicated.

County of Narromine, parish of Trangie, village of Trangie, being allotment 1 of section 7, village of Trangie, area 2 acres: Commencing at the intersection of the north-western side of Temoin-street with the south-western side of Derridong-street; bounded thence by the south-western side of the latter street being a line bearing north 46 degrees 18 minutes west 5 chains 30½ links; thence by the south-eastern side of Goan-street bearing south 43 degrees 42 minutes west 3 chains 77.1 links; thence by a line bearing south 46 degrees 18 minutes east 5 chains 30½ links to the north-western side of Temoin-street aforesaid; and thence by that side of that street bearing north 43 degrees 42 minutes east 3 chains 77.1 links, to the point of commencement,—as shown on plan T. 4-2,418.

Department of Lands,
Sydney, 25th August, 1892.PROPOSED RESUMPTION OF GENERAL CEMETERY
AT HELENSBURGH, AND DEDICATION FOR
THE SAME PURPOSE IN LIEU.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the General Cemetery at Helensburgh, area 11 acres 3 roods, dedicated 24th June, 1890, and hereunder described, with a view to sale by auction or other appropriation under the Crown Lands Acts, and to the dedication of 12 acres 3 roods at Helensburgh West, also hereunder described, for General Cemetery in lieu.

[Ms. 92-2,899 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

General Cemetery proposed to be resumed.

All that piece or parcel of land situate at Helensburgh, in the parish of Heathcote, county of Cumberland, containing by admeasurement 11 acres 3 roods: Commencing on the south-western side of the Main Illawarra Road, at a point bearing north 7 degrees 20 minutes west 22 chains 27½ links from the most easterly corner of George Davison's 50 acres, portion 43, parish of Heathcote; and bounded thence by a line bearing west 11 chains 86½ links; thence by a line north 13 chains 63 links; thence by a line east 2 chains 92 links to the south-western side of the Main Illawarra Road before mentioned; and thence by lines forming that side of that road bearing south 51 degrees 48 minutes east 5 chains 27½ links, south 33 degrees 1 minute east 4 chains 66½ links, south 19 degrees 10 minutes east 6 chains 83½ links, to the point of commencement,—as shown on plan catalogued Ms. 254 Sy.

General Cemetery proposed to be dedicated.

County of Cumberland, parish of Heathcote, at Helensburgh West, area 12 acres 3 roods: Commencing on the south-western side of a road 1 chain wide, at a point bearing south 32 degrees 30 minutes east 10 chains 43 links from the south-western corner of measured portion 168 of 1 acre 2 roods 38½ perches; and bounded thence by a line south 14 chains 45 links; thence by a line east 9 chains 50 links; thence by a line north 12 chains 44 links to the road before mentioned; and thence by the said road bearing north 78 degrees west 9 chains 71 links, to the point of commencement,—as shown on plan catalogued Ms. 525 Sy.

Department of Lands,
Sydney, 25th August, 1892.

PROPOSED RESUMPTION OF SHOW GROUND AT FORBES, AND DEDICATION FOR THE SAME PURPOSE IN LIEU.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884 and the 41st section of the Crown Lands Act of 1889, it is proposed to revoke the dedication of the Show Ground at Forbes, area 56 acres 3 roods 39 perches, viz., portions 362 to 366 in the parish of Forbes, county of Ashburnham, dedicated 20th July, 1877, and hereunder described, with a view to its being made available for suburban settlement, and to the dedication of portion 827 of 20 acres 2 roods 14 perches, in the same locality, for Show Ground in lieu.

[Ms. 92-1,345 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Show Ground proposed to be resumed.

56 acres 3 roods 39 perches. County of Ashburnham, parish of Forbes, portions 362, 363, 364, 365, and 366: Commencing on the southern side of a road 1 chain wide at a point distant 1 chain south from the south-eastern corner of portion 363 of 23 acres; and bounded thence on the north by that road dividing it from that portion and from portions 370 and 371 of 23 acres each bearing west 30 chains; on the west by a road 1 chain wide dividing it from part of portion 378 of 27 acres 2 roods 20 perches bearing south 10 chains; on the south-west by a road 3 chains wide bearing south 59 degrees 2 minutes east 35 chains $\frac{1}{2}$ a link; and on the east by a road 1 chain wide bearing north 28 chains and 30 links, to the point of commencement,—as shown on plan A. 868-1,770 Roll.

Show Ground proposed to be dedicated.

20 acres 2 roods 14 perches. County of Ashburnham, parish of Forbes, portion 827: Commencing at the north-east corner of portion 824 of 2 acres 3 roods and 38 perches; and bounded thence on the north by part of the south side of a road 1 chain and 50 links wide bearing east 16 chains 22 $\frac{1}{2}$ links to the west side of a road 1 chain and 50 links wide; on the east by part of the west side of that road bearing south 12 chains 69 links to the north side of a road 1 chain and 50 links wide; on the south by part of the north side of that road bearing west 16 chains 22 $\frac{1}{2}$ links to the south-east corner of portion 826 of 3 acres; and on the west by the east boundaries of portions 826 and 824 aforesaid bearing north 12 chains 69 links, to the point of commencement,—as shown on plan A. 4,773-1,770 Roll.

Department of Lands,
Sydney, 25th August, 1892.

PROPOSED RESUMPTION OF RECREATION RESERVE AT SHELLHARBOR.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the land at Shellharbor, dedicated 24th September, 1889, for public recreation, and hereunder described, with a view to its rededication for the same purpose in two areas of 15 acres and 1 acre 2 roods respectively.

[Ms. 92-2,446 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Area proposed to be resumed.

All that piece or parcel of land situate in the county of Camden, parish of Terragong, town of Shellharbor: Commencing on the left bank of a creek, which forms the south-eastern boundary of section 1, at its intersection of the south-easterly prolongation of the north-eastern side of John-street; and bounded thence on the south-west by a line partly forming that side of that street north-westerly to the easternmost corner of allotment 4 of section 2, by the north-eastern boundaries of allotments 4, 5, 8, 9, 12, and 13 in the same section north-westerly to the northernmost corner of the last-named allotment, by a line north-westerly to the easternmost corner of allotment 2 of section 3, and by the north-eastern boundary of that allotment north-westerly to its northernmost corner; thence on the west by a line northerly to the southernmost corner of allotment 1 of section 4; thence on the north-west and west by the south-eastern and eastern boundaries of allotments 1 and 2 of that section north-easterly to the north-eastern extremity of the south-eastern side of Town-street; thence again on the west by a line northerly to the easternmost corner of allotment 7 of section 5; thence on the south-west by part of the north-eastern boundary of that allotment north-westerly to high-water mark on the shore of the Pacific Ocean; and thence by that shore generally southerly to the left bank of the creek aforesaid; and by that bank upwards, to the point of commencement, containing about 30 acres.

Areas proposed to be dedicated.

All that piece or parcel of land containing by admeasurement 15 acres, more or less, situated in the town of Shellharbor, parish of Terragong, county of Camden: Commencing on the left bank of a creek, which forms the south-eastern boundary of section 1, at its intersection with the south-easterly prolongation of the north-eastern side of John-street; and bounded thence on the south-west by lines bearing north 32 degrees 30 minutes west 13 chains 60 links, north 36 degrees 40 minutes west 2 chains 75 $\frac{1}{10}$ links, north 39 degrees 1 minute west 1 chain 76 $\frac{2}{10}$ links, north 48 degrees 27 minutes west 1 chain 82 links, north 46 degrees 55 minutes west 1 chain 80 $\frac{1}{10}$ links, north 54 degrees 33 minutes west 2 chains 15 $\frac{2}{10}$ links, north 47 degrees 53 minutes west 2 chains 7 $\frac{3}{10}$ links, north 70 degrees 49 minutes west 1 chain 27 $\frac{1}{2}$ links, north 54 degrees 23 minutes west 3 chains 23 $\frac{1}{2}$ links; thence by a line, being the south-easterly prolongation of the south-western side of Wollongong-street, bearing north 32 degrees 30 minutes west to its intersection with the south-westerly prolongation of the south-eastern boundary of section 4; thence on the north-west by a line partly forming the south-eastern boundary of section 4 bearing north 57 degrees 30 minutes east to the high-water mark of the Pacific Ocean; thence on the north-east, east, and south-east by that high-water mark south-easterly and south-westerly to the left bank of the creek before mentioned; thence by that creek upwards to the point of commencement,—as shown on plan catalogued Ms. 408 Sy.

Also, all that piece or parcel of land containing by admeasurement 1 $\frac{1}{2}$ acres, more or less, situated in the town of Shellharbor, parish of Terragong, county of Camden: Commencing at a point on the high-water mark of the Pacific Ocean bearing south 32 degrees 30 minutes east, and distant about 45 links from the most northerly corner of section 4; and bounded thence on part of the south-west by a line bearing south 32 degrees 30 minutes east about 65 links until it again meets the high-water mark; thence on the remainder of the south-west, the south-east, east, and north by that high-water mark to the point of commencement,—as shown on plan catalogued Ms. 408 Sy.

Department of Lands,
Sydney, 25th August, 1892.

PROPOSED RESUMPTION OF GAOL SITE AT WILLYAMA AND REDEDICATION OF PART THEREOF FOR THE SAME PURPOSE.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Acts of 1884, it is proposed to revoke the dedication of the Gaol site at Willyama, area 18 acres 2 roods 17 perches, dedicated 7th August, 1889, and hereunder described with a view to the rededication of 16 acres 2 roods 22 perches thereof for the same purpose, and to the setting apart of the remainder as a part of Galena-street.

[Ms. 92-2,901 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Area proposed to be resumed.

County of Yancowinna, parish of Picton, town of Willyama, area 18 acres 2 roods 17 perches: Commencing at the intersection of the south-eastern side of Mica-street with the south-western side of Gosan-street; thence bounded by that side of Gosan-street bearing south 41 degrees 39 minutes east 12 chains 12 links to the north-western side of Cobalt-street; thence by that side of that street bearing south 49 degrees 21 minutes west 12 chains 83 $\frac{1}{10}$ links to the original north-east side of Galena-street; thence by that side of that street bearing north 64 degrees 15 minutes west 13 chains 12 $\frac{1}{2}$ links to the aforementioned south-east side of Mica-street; and thence by that side of that street bearing north 48 degrees 21 minutes east 17 chains 57 $\frac{1}{10}$ links, to the point of commencement,—being section 4, town of Willyama, as shown on plan catalogued W. 1-2,492.

Area proposed to be dedicated.

County of Yancowinna, parish of Picton, town of Willyama, area 16 acres 2 roods 22 perches: Commencing at the intersection of the south-eastern side of Mica-street with the south-western side of Gosan-street; and bounded thence by that side of Gosan-street bearing south 41 degrees 39 minutes east 12 chains 12 links to the north-western side of Cobalt-street; thence by that side of that street bearing south 48 degrees 21 minutes west 11 chains 20 $\frac{2}{10}$ links to a north-eastern side of Galena-street, as altered by Gazette notice of 8th August, 1891; thence by that side of that street bearing north 64 degrees 16 $\frac{1}{2}$ minutes west 13 chains 13 links to the south-eastern side of Mica-street aforesaid; and thence by that side of that street bearing north 48 degrees 21 minutes east 16 chains 25 $\frac{1}{2}$ links, to the point of commencement,—being section 4 town of Willyama, shown on plans catalogued W. 1-2,492 and Ms. 235 Be.

Department of Lands,
Sydney, 25th August, 1892.

PROPOSED RESUMPTION OF PUBLIC SCHOOL SITE AT GALATHERA ROAD, AND DEDICATION FOR THE SAME PURPOSE IN LIEU.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the Public School site at Galathera Road, area 2 acres, viz., portion 104, in the parish of Galathera, county of Jamison, dedicated 13th April, 1888, and hereunder described, with a view to the reservation of that area for travelling stock, and to the dedication of portion 438 of 2 acres, in parish of Narrabri, county of Nandewar, for Public School site in lieu.

[Ms. 92-1,240 Ind.] HENRY COPELAND.

DESCRIPTIONS.

Public School site proposed to be resumed.

2 acres. County of Jamison, parish of Galathera, portion 104: Commencing at a point bearing north 88 degrees 50 minutes east and distant 14 chains 91 links from the north-east corner of portion 101; and bounded thence on the north by a line bearing east 4 chains; on the east by a line bearing south 5 chains; on the south by a line bearing west 4 chains; and on the west by a line bearing north 5 chains, to the point of commencement,—as shown on plan J. 975-1,968.

Public School site proposed to be dedicated.

County of Nandewar, parish of Narrabri, containing an area of 2 acres. The Crown Lands within the boundaries of measured portion 438 of 2 acres,—as shown on plan catalogued N. 1,099-1,774.

Department of Lands,
Sydney, 25th August, 1892.

PROPOSED RESUMPTION OF TOWN HALL SITE AT KIAMA.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884 and the 41st section of the Crown Lands Act of 1889, it is proposed to revoke the dedication of the land at Kiama, area 24 perches, viz., allotment 18 of section 5, dedicated 25th July, 1884, for Town Hall site, and hereunder described, with a view to reservation of that area for public buildings, and to the dedication of a site for Council Chambers in lieu.

[Ms. 92-2,447 Ind.] HENRY COPELAND.

DESCRIPTION.

All that piece or parcel of land situate in the county of Camden, parish of Kiama, town of Kiama, containing by admeasurement 24 perches: Commencing on the north-western side of Manning-street, at a point bearing south 27 degrees west and distant 4 chains 15 links from the intersection of the north-western side of that street with the south-western side of Terralong-street; and bounded thence on the south-east by Manning-street bearing south 27 degrees west 1 chain; on the south-west by a line bearing north 63 degrees west 1 chain 50 links; on the north-west by a line bearing north 27 degrees east 1 chain; and on the north-east by a line bearing south 63 degrees east 1 chain 50 links, to the point of commencement,—shown on plan catalogued K. 40-1,091.

Department of Lands,
Sydney, 25th August, 1892.

PROPOSED RESUMPTION OF PUBLIC SCHOOL SITE AT TURI.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884 and the 41st section of the Crown Lands Act of 1889, it is proposed to revoke the dedication of the Public School site at Turi, area 2 acres, viz., portion 173, in the parish of Turi, county of Parry, dedicated 28th June, 1878, and hereunder described, with a view to its being set apart as a special area in conjunction with portion 102 adjoining.

[Ms. 92-2,900 Ind.] HENRY COPELAND.

DESCRIPTION.

County of Parry, parish of Turi containing 2 acres: Commencing on the west boundary of portion 102 of 68 acres 3 rods, at a point on the east side of a road one chain wide, distant 6 chains north from the south-west corner (portion 102 aforesaid); and bounded thence by a line bearing east 4 chains; thence by a line north 5 chains; thence by a line west 4 chains to the one-chain road aforesaid; and thence by part of the side of that road being a line bearing south 5 chains to the point of commencement,—to include measure portion 173 of 2 acres, as shown on plan catalogued P. 346-1,978.

Department of Lands,
Sydney, 25th August, 1892.

PROPOSED RESUMPTION OF RECREATION RESERVE AT KIAMA, AND REDEDICATION OF PART THEREOF FOR SITE FOR COUNCIL CHAMBERS.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the land at Kiama, known as Boat Harbor Reserve, dedicated 6th December, 1867, for public recreation, and hereunder described, with a view to the rededication of 25½ perches thereof for site for Council Chambers, and to the reservation of the remainder for public recreation.

[Ms. 92-2,448 Ind.] HENRY COPELAND.

DESCRIPTIONS.

Recreation Reserve proposed to be resumed.

All that piece or parcel of land situate in the county of Camden, parish of Kiama, town of Kiama, containing by dedication list No. 2 of 6th December, 1867, an area of 1 acre 2 rods; bounded by Minumurra, Shoalhaven, and Terralong Streets, the Presbyterian Church site, and Kiama Harbor.

Site for Council Chambers proposed to be dedicated.

County of Camden, parish of Kiama, town of Kiama, area 25½ perches: Commencing at the intersection of a fenced line with the north-eastern side of Terralong-street, being a point bearing about north 44 degrees 28 minutes west 4 chains 70 links from the most eastern corner of town, section 5; and bounded thence by Terralong-street bearing north 63 degrees 4 minutes west 1 chain 55 links; thence by a line bearing north 26 degrees 56 minutes east 1 chain 25 links; thence by a line bearing south 47 degrees 17 minutes east 1 chain 62 links; and thence by that line bearing south 27 degrees 59 minutes west 82 links, to the point of commencement,—as surveyed and shown on plan catalogued Ms. 552 Sy.

Department of Lands,
Sydney, 25th August, 1892.

PROPOSED RESUMPTION OF SHOW GROUND AT HAY, AND DEDICATION FOR THE SAME PURPOSE IN LIEU.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884 and the 41st section of the Crown Lands Act of 1889, it is proposed to revoke the dedication of the land at Hay, areas 5 acres 1 rood 12 perches and 4 acres, dedicated 18th November, 1881, and 15th January, 1886, respectively, for show-ground and addition thereto, with a view to portions thereof being set apart for roadway and for access to water and to the sale by auction of the remainder, and to the dedication of portion 16 of 15 acres, parish of Hay, county of Waradgery, for show ground in lieu.

[Ms. 92-2,903 Ind.] HENRY COPELAND.

DESCRIPTIONS.

Areas proposed to be resumed.

5 acres 1 rood 12 perches. County of Waradgery, parish of Hay, town of Hay, section 20: Commencing on the northern side of Cadell-street, at its intersection with the eastern side of Coke-street; and bounded thence on the south by Cadell-street bearing east 10 chains to Stephen-street; on the east by Stephen-street bearing north 5 chains and 33 links to Church-street; on the north by Church-street bearing west 10 chains to Coke-street aforesaid; and on the west by that street bearing south 5 chains and 33 links to the point of commencement,—as shown on plan H. 25-1,694.

4 acres. County of Waradgery, parish of Hay, town of Hay: Commencing at the intersection of the southern side of Cadell-street with the eastern side of Coke-street; and bounded thence on the north by Cadell-street bearing south 89 degrees 40 minutes east 10 chains 6 links to Stephen-street; on the east by that street bearing south 20 minutes west 4 chains 2 links; on the south by a line bearing north 89 degrees 40 minutes west 10 chains 6 links to Coke-street aforesaid; and on the west by that street bearing north 20 minutes east 4 chains 2 links, to the point of commencement,—as shown on plan H. 17-1,694.

Area proposed to be dedicated.

County of Waradgery, parish of Hay, area 15 acres; suburbs of Hay, being portion 16. The Crown Lands within the following boundaries: Commencing at a point bearing north 1 minute west 32 chains 89 links from the north-west corner of section 31, town of Hay; bounded thence on the west by part of the east side of a road 3 chains wide bearing north 1 minute west 15 chains ½ link; thence on the north by a line bearing north 89 degrees 59 minutes east 10 chains; thence on the east by a line bearing south 1 minute east 14 chains 99½ links; thence on the south by part of the north side of a road 3 chains wide bearing south 89 degrees 55 minutes west 10 chains, to the point of commencement,—as shown on plan catalogued W. 1,301-1,839.

Department of Lands,
Sydney, 25th August, 1892.

PROPOSED RESUMPTION OF MOAMA RECREATION RESERVE, AND REDEDICATED FOR SHOW GROUND AND PUBLIC RECREATION.

It is hereby notified that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the land at Moama, area 108 acres, dedicated 20th July, 1889, for public recreation, and hereunder described, with a view to dedication of 10 acres thereof for Show Ground, and to the rededication of the remainder for public recreation.

[Ms. 92-3,159 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Recreation Reserve proposed to be resumed.

County of Cadell, parishes Moama and Tataila, containing an area of 108 acres. The Crown Lands within the following boundaries: Commencing on the south side of a road 1 chain wide, at a fence-post distant 1 chain from the south-west corner of portion 74 of 20 acres, parish of Tataila; and bounded thence by lines bearing east 36 chains 49 links, south 33 chains 98 links, west 25 chains 31 links, north 52 degrees 54 minutes west 8 chains 43 links, north 17 degrees 27 minutes 20 second-east 13 chains 70 links, north 13 degrees 11 minutes east 4 chains 42 links, north 2 chains 13 links west 8 chains 54 links, and north 9 chains 32 links, to the point of commencement,—shown on plan catalogued C. 72-1,817.

Show Ground proposed to be dedicated.

County of Cadell, parish of Moama, suburban lands at Moama, area 10 acres: Commencing at a point on the north side of a road 1 chain 50 links wide, distant 1 chain west from the south-west corner of portion 139 of 10 acres 1 rood 1 perch; and bounded thence by part of the north side of the road aforesaid being a line bearing west 10 chains 18 links; thence by a line bearing north 26 minutes east 7 chains and 46 links; thence by a line bearing north 45 degrees 25 minutes east 4 chains 11 links; thence by a line bearing south 89 degrees 34 minutes east 7 chains 19½ links; and thence by the west side of a 1-chain road being a line bearing south 10 chains 29 links, to the point of commencement,—as shown on plan catalogued C. 955-1,817.

Recreation Reserve proposed to be dedicated.

County of Cadell, parishes of Moama and Tataila, containing an area of 98 acres: Commencing on the south side of a road 1 chain wide, at a fence-post distant 1 chain south from the south-west corner of portion 74 of 20 acres, parish of Tataila; and bounded thence by lines bearing east 36 chains 49 links, south 23 chains 69 links to the north-east corner of portion 219 of 10 acres; thence by a line bearing north 89 degrees 34 minutes west 7 chains 19½ links; thence by a line bearing south 45 degrees 26 minutes west 4 chains 11 links; thence by a line bearing south 26 minutes west 7 chains 46 links to the north side of the 1 chain 50 links road from Moulamein; thence by part of that side of that road being a line bearing west 16 chains 13 links; thence by a line bearing north 52 degrees 54 minutes west 8 chains 48 links to the southernmost corner of the area of 12 acres, dedicated for purpose of racecourse; thence by the eastern and northern boundaries of that land being lines bearing respectively north 17 degrees 27 minutes 20 seconds east 13 chains 70 links, north 13 degrees 11 minutes east 4 chains 42 links, north 2 chains 13 links, west 8 chains 54 links; and thence north 9 chains 32 links, to the point of commencement,—as shown on plan catalogued C. 72-1,817.

Department of Lands,
Sydney, 25th August, 1892.

PROPOSED RESUMPTION OF RECREATION RESERVE AT WARIALDA.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the land at Warialda, area 134 acres 3 roods 39 perches, dedicated 22nd October, 1889, for public recreation, and hereunder described, with a view to the reservation of the area in question for racecourse and show ground.

[Ms. 92-3,293 Ind.]

HENRY COPELAND.

DESCRIPTION.

County of Burnett, parish of Warialda, containing an area of 134 acres 3 roods 39 perches: Commencing at a point bearing north 73 degrees 2 minutes west 72 chains 50 links from the north-west corner of section 8, village of Warialda; and bounded thence by lines bearing north 35 chains, west 33 chains 57 links, south 35 chains, and east 33 chains 57 links, to the point of commencement,—as shown on plan catalogued B. 1-2,334.

Department of Lands,
Sydney, 25th August, 1892.

PROPOSED RESUMPTION AND REDEDICATION OF DUNGOWAN RECREATION RESERVE.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884 and the 41st section of the Crown Lands Act of 1889, it is proposed to resume and rededicate the recreation reserve at Dungowan, viz., portion 65, parish of Piallmore, county of Parry, dedicated 18th January, 1884, and hereunder described,—an amended plan of the land in question having been furnished.

[Ms. 92-2,902 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Area proposed to be resumed.

10 acres. County of Parry, parish of Piallmore, portion 65: Commencing on the right bank of Dungowan Creek, at a point bearing about north 59 degrees 22 minutes east and distant 7 chains 97 links from the south-eastern corner of portion 8 of 60 acres; and bounded thence on the west by a line bearing north 10 chains 50 links; on the north by a line bearing east 8 chains 61 links; on the north-east by a line bearing south 56 degrees east 60 links; on the east by a line bearing south 13 chains 18 link to Dungowan Creek; and on the south-west and south by that creek downwards, to the point of commencement,—as shown on plan L. 172-1,834A.

Area proposed to be dedicated.

9 acres. County of Parry, parish of Piallmore, portion 65. Commencing on the right bank of Dungowan Creek, at a south-east corner of portion 103 of 133 acres 1 rood; and bounded thence on the west by an eastern boundary of that portion bearing north 10 chains 87 links; on the north by part of a south boundary of that portion bearing east 4 chains; on the north-east by the south-western side of a road 1 chain wide, being lines bearing south 55 degrees 13 minutes east 60 links and south 23 degrees 30 minutes east 14 chains 85½ links; and on the south by a line bearing west 49½ links to the right bank of Dungowan Creek aforesaid; and by that creek downwards, to the point of commencement,—as shown on plan P. 1,331-1,764.

Department of Lands,
Sydney, 25th August, 1892.

PROPOSED RESUMPTION OF PUBLIC SCHOOL SITE AT CUNNINGAR, AND REDEDICATION OF PART THEREOF FOR THE SAME PURPOSE.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884 and the 41st section of the Crown Lands Act of 1889, it is proposed to revoke the dedication of the land at Cunningar, area 21 acres 2 roods, dedicated 18th February, 1870, for Public School site, and hereunder described with a view to the reservation of 8 acres 3 roods 39 perches thereof for camping, and to the rededication of the remainder (exclusive of the part taken for railway purposes) for Public School site.

[Ms. 92-3,455 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Area proposed to be resumed.

County of Harden, parish of Cunningar, containing an area of 21 acres 2 roods, village of Cunningar, allotment 5 of section 22: Commencing on the western side of Grant-street, at the eastern corner of allotment 4 of section 22; and bounded thence on the south-east by that street north easterly 10 chains 75 links to Chalmers-street; on the north-east by that street north-westerly 20 chains to Allen-street; on the north-west by that street south-westerly 10 chains and 75 links; and on the south-west by the north-eastern boundaries of allotments 1, 2, 3, and aforesaid 4 being in all a line south-easterly parallel with Chalmers-street 20 chains, to the point of commencement,—plan catalogued P. 58-1,978.

Area proposed to be dedicated.

County of Harden, parish of Cunningar, village of Cunningar, area 10 acres 2 roods 26 perches: Commencing on the north-western side of Grant-street, at the southernmost corner of portion 167 of 6 acres; and bounded thence by part of that side of Grant-street aforesaid, being a line bearing south 56 degrees 54 minutes west 10 chains 75 links; thence by the north-eastern side of a road 1 chain wide, being a line bearing north 33 degrees 6 minutes west 12 chains 40 links to the fence forming the boundary of the Great Southern Railway; thence by that fence bearing north 81 degrees 43 minutes east 11 chains 84½ links to the westernmost corner of portion 167 aforesaid; and thence by the south-western boundary of that portion, being a line bearing south 33 degrees 6 minutes east 7 chains 43 links to the point of commencement,—shown on plan catalogued P. 58-1,978.

NOTE.—The above is in lieu of the notices in the Government Gazette of 15th May, 1891, and 31st July, 1891.

Department of Lands,
Sydney, 25th August, 1892.

**PROPOSED RESUMPTION AND REDEDICATION OF
GENERAL CEMETERY AT TELEGRAPH POINT.**

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884 and the 41st section of the Crown Lands Act of 1889, it is proposed to resume and rededicate the General Cemetery at Telegraph Point, dedicated 16th January, 1886, and hereunder described, an amended plan of the land in question having been furnished.

[Ms. 92-3,292 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Area proposed to be resumed.

County of Macquarie, parish of Cairncross, containing an area of 7 acres 3 roods 33 perches. Commencing on the western side of a road 1 chain wide forming part of the western boundary of portion 16, at a point bearing south 45 degrees west 1 chain 41 links, from the south-east corner of portion 75, Public School site of 2 acres; thence by that road south 8 chains; thence west 9 chains 96 links; thence north 8 chains; thence east 9 chains 96 links, to the point of commencement,—including roadway 1 chain wide, as shown of plan catalogued C. 1,033-1,984.

Area proposed to be dedicated.

County of Macquarie, parish of Cairncross, at Telegraph Point, containing an area of 9 acres 1 rood 10 perches. The Crown Lands within the following boundaries: Commencing on the western side of a road 1 chain wide forming part of the western boundary of portion 16, at a point bearing south 52 degrees 28 minutes west, and distant 1 chain 26 links from the south-east corner of portion 75, Public School site of 2 acres; thence by that road south 10 chains 31 links to a road 1 chain wide from Rolland's Plains to Port Macquarie; thence by that road by lines north 40 degrees west 2 chains 94 links north 66 degrees 67 minutes west 5 chains 26 links, and north 80 degrees 30 minutes west 3 chains 29 links; thence north 8 chains 37 links to another road 1 chain wide from Rolland's Plains to Port Macquarie, forming part of the southern boundaries of portions 81 and 75; thence by that road south 71 degrees 33 minutes east 5 chains 93 links; thence south 75 degrees 04 minutes east 4 chains 43 links, to the point of commencement,—as shown on plan catalogued Ms. 278 Gfn.

Department of Lands,
Sydney, 25th August, 1892.

**PROPOSED RESUMPTION OF RECREATION RESERVE
AT EAST MAITLAND, AND REDEDICATION FOR

Sydney, 25th August, 1892.

**PROPOSED RESUMPTION OF RACECOURSE AT
TENTERFIELD, AND REDEDICATION OF PART
THEREOF FOR THE SAME PURPOSE.**

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884 and the 41st section of the Crown Lands Act of 1889, it is proposed to revoke the dedication of the land at Tenterfield, area 116 acres, dedicated 27th July, 1863, for racecourse, and hereunder described, with a view to the re-dedication of 78½ acres thereof for the same purpose, and to the sale or other appropriation under the Crown Lands Acts of the remainder.

[Ms. 92-3,457 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Area proposed to be resumed.

County of Clive, parish of Tenterfield, within the population area of Tenterfield, area 116 acres: Commencing at the north-eastern corner of portion 33 of 71 acres 2 roods; and bounded thence on the west by the eastern boundary of that portion, a line crossing a road 1 chain wide from Tenterfield to Grafton and the eastern boundary of portion 32 of 54 acres 1 rood, in all bearing south 45 chains; on the south by a line bearing east 25 chains and 40 links; on the east by a line, the western boundary of portion 107 of 50 acres, the end of a road 1 chain wide, and part of the western boundary of portion 106 of 42 acres, in all bearing north 45 chains; and on the north by the southern side of a reserved road bearing west 26 chains and 40 links, to the point of commencement, exclusively of a road 1 chain wide from Tenterfield to Grafton passing through this land in an easterly direction, the area of which has been deducted from the total area,—plan catalogued C. 2-1,809.

Area proposed to be dedicated.

County of Clive, parish of Tenterfield, within the population area of Tenterfield, proclaimed 29th August, 1885, area 78½ acres: Commencing on the northern side of the road from Tenterfield to Grafton, at the south-east corner of portion 33 of 71½ acres; and bounded thence by the eastern boundary of that portion, being a line bearing north 12 minutes west 29 chains; thence by a line bearing east 26 chains 73 links and forming the southern side of a road 1 chain wide; thence by a line, part of which forms part of the western boundaries of portions 106 and 107 bearing south 26 minutes west 30 chains 20 links to the northern side of the Tenterfield to Grafton Road aforesaid; and thence by part of that side of that road, being a line bearing north 87 degrees 23 minutes west 26 chains 43 links, to the point of commencement,—as shown on plan catalogued C. 1,532-1,809.

Being the land comprised within measured portion 435.

Department of Lands,
Sydney, 25th August, 1892.

**PROPOSED RESUMPTION OF PUBLIC SCHOOL SITE
AT GRONG GRONG.**

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the Public School site at Grong Grong, area 2 acres, being part of section 52, dedicated 15th January, 1886, and hereunder described, with a view to sale by auction of part thereof, and to the inclusion of the remainder in a proposed extension of Balara-street.

[Ms. 92-3,458 Ind.]

HENRY COPELAND.

DESCRIPTION.

2 acres. County of Bourke, parish of Lupton, village of Grong Grong, portion 40, being part of section 52: Commencing on the northern side of Junee-street, at the south-western corner of allotment 5; and bounded thence on the south by that street bearing north 84 degrees 37 minutes west 4 chains 1½ links; on the west by the eastern boundary lines of allotments 3 and 1, in all bearing north 4 chains 81 links to Binya-street; on the north by that street bearing east 4 chains; and on the east by the western boundary line of allotment 4 and the western boundary line of allotment 5 aforesaid, in all bearing south 5 chains 10 links, to the point of commencement,—shown on plans catalogued G. 1-2,309 Roll, and P. 1,104-1,978.

Department of Lands,
Sydney, 25th August, 1892.

**PROPOSED RESUMPTION OF WHARF SITE AT
COORUMBUNG (DORA CREEK).**

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the land at Coorumbung, area 6 acres 2 roods 17 perches, dedicated 20th July, 1877, for wharf site, and hereunder described, with a view to its being reserved for the same purpose, exclusive of an area of 1 rood 22 perches included in portion 30, as amended by recent survey.

[Ms. 92-3,844 Ind.]

HENRY COPELAND.

DESCRIPTION.

County of Northumberland, parish of Coorumbung, containing an area of about 6 acres 2 roods 17 perches. The lands within the following boundaries: Commencing on the left bank of Dora Creek, at the south-western corner of G. K. Holden's 25 acres; and bounded thence on the east by part of the western boundary of that land bearing north about 1 chain and 50 links; on the north by the end of a road and the southern boundary of portions 30 and 31 of 40 acres each, in all bearing westerly to the south-western corner of the latter portion; on the west by a line bearing south about 1 chain; and on the south by a line bearing east about 3 chains 80 links to the aforesaid creek; and thence by the bank of that creek downwards, to the point of commencement,—as shown on plan catalogued N. 640 and 641-1501.

Department of Lands,
Sydney, 25th August, 1892.

**PROPOSED RESUMPTION OF SHOW GROUND
AT YASS.**

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884 and the 41st section of the Crown Lands Act of 1889, it is proposed to revoke the dedication of the land at Yass, area 37½ acres, viz., portion 149, in the parish of Yass, county of King, dedicated 24th August, 1877, for the use of the Yass Pastoral and Agricultural Association, and hereunder described, with a view to sale thereof by auction or other appropriation under the Crown Lands Acts.

[Ms. 92-3,964 Ind.]

HENRY COPELAND.

DESCRIPTION.

County of King, parish of Yass, at Yass, portion 149, 37 acres 2 roods: Commencing on the eastern side of Hovel-street, at a point distant about 1 chain 50 links east from the north-eastern corner of allotment 9, section 31, town of Yass; and bounded thence on the west by that street bearing south 50 minutes west 22 chains and 28 links; on the south by lines bearing east 12 minutes south 4 chains 31 links, and thence north 85 degrees 54 minutes east 2 chains 55 links to the Yass River; on the south-east by that river upwards in a direct line about 21 chains and 16 links; on the east by a line bearing north 50 minutes east 6 chains 93 links; and on the north by a line bearing westerly 21 chains and 41 links, to the point of commencement. Plan catalogued X. 34-965.

Department of Lands,
Sydney, 25th August, 1892.

PROPOSED RESUMPTION OF PRESBYTERIAN CHURCH AND MANSE SITES AT QUIRINDI.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the Presbyterian Church and Manse sites at Quirindi, area 1 acre 1 rood 30 perches, viz., allotments 1, 19, and 20 of section 18, dedicated 20th April, 1875, and hereunder described, with a view to sale thereof by auction.

[Ms. 92-3,459 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Church site.

County of Buckland, parish of Quirindi, town of Quirindi, allotments 1 and 20 of section 18, 1 acre: Commencing at the south-eastern corner of the section; and bounded thence on the east by George-street northerly 2 chains; on the north by the southern boundary line of allotment 2, westerly at right angles to George-street 5 chains to a lane; on the west by that lane southerly, parallel with George-street 2 chains to William-street; and on the south by that street easterly 5 chains, to the point of commencement,—shown on plan Q. 8-1,613.

Manse site.

County of Buckland, parish of Quirindi, town of Quirindi, allotment 19 of section 18, 1 rood 30 perches: Commencing on the northern side of William-street, at the south-eastern corner of allotment 18; and bounded thence on the south by that street easterly 2 chains and 20 links; on the east by a lane northerly at right angles to William-street 2 chains; on the north by the southern boundary line of allotment 17 westerly, parallel with William-street 2 chains and 20 links; and on the west by the eastern boundary line of allotment 18 aforesaid southerly at right angles to William-street 2 chains, to the point of commencement,—shown on plan Q. 8-1,613.

NOTE.—The above is in lieu of the notice in the Government Gazette of 3rd December, 1889.

Department of Lands,
Sydney, 25th August, 1892.

PROPOSED RESUMPTION OF RECREATION RESERVE AT MOREE, AND REDEDICATION FOR CRICKET GROUND AND PUBLIC RECREATION.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the land at Moree, area 19 acres and 5 perches, dedicated 23rd November, 1886, for public recreation, and hereunder described, with a view to dedication of 9 acres 2 roods 5 perches thereof for cricket ground, and to the rededication of the remainder, in conjunction with part of reserve 11,239, in all 24 acres 2 roods 28 perches, for public recreation.

[Ms. 92-3,717 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Recreation Reserve proposed to be resumed.

County of Courallie, parish of Moree, town of Moree, containing an area of 19 acres 0 roods 5 perches: Commencing on the southern side of Albert-street, at the point of intersection of the south prolongation of the west side of Balo-street; and bounded thence on the north-west by part of the southern side of Albert-street bearing south 81 degrees 30 minutes west 18 chains 96 links; on the south-west by the south prolongation of the east side of Chester-street, being a line bearing south 8 degrees 30 minutes east 10 chains 4 links; on the south-east by a line bearing north 81 degrees 30 minutes east 18 chains 98 links; and thence on the north-east by a line bearing north 81 degrees 30 minutes west 10 chains 4 links, to the point of commencement,—shown on plan catalogued M. 18-1,769.

Cricket Ground proposed to be dedicated.

County of Courallie, parish of Moree, town of Moree, containing an area of 9 acres 2 roods 5 perches: Commencing at the point of intersection of the southern side of Albert-street with the western side of Balo-street; and bounded thence by part of the southern side of Albert-street aforesaid south 81 degrees 31½ minutes west 9 chains 48 links to the north-east corner of public recreation, ground proposed to be dedicated this day; thence by part of the north-eastern side of park aforesaid south 8 degrees 28½ minutes east 10 chains 5 links; thence by a line north 81 degrees 31½ minutes east 9 chains 48 links to the western side of Balo-street aforesaid; and thence by part of the western side of that street north 8 degrees 30 minutes west 10 chains 5 links, to the point of commencement,—as shown on plan catalogued M. 25-1,769.

Recreation Reserve proposed to be dedicated.

County of Courallie, parish of Moree, town of Moree, containing an area of 24 acres 2 roods 38 perches: Commencing at the north-west corner of a measured block of 9 acres 2 roods 5 perches, proposed to be dedicated for cricket ground this day; and bounded thence by the south-west boundary of the aforesaid cricket ground and a line, in all south 8 degrees 28½ minutes east 18 chains 64 links to the Gwydir River; thence by the right bank of that river downwards to the eastern side of Edward-street; thence by part of the eastern side of Edward-street aforesaid north 8 degrees 25 minutes west 10 chains 65 links to the southern side of Albert-street; and thence by the southern side of Albert-street aforesaid north 81 degrees 31½ minutes east 16 chains 29 links, to the point of commencement,—as shown on plan catalogued M. 26-1,769.

Sydney, 25th October, 1892.PROPOSED RESUMPTION OF RECREATION RESERVE
AT COONABARRABRAN.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, and the 41st section of the Crown Lands Act of 1889, it is proposed to revoke the dedication of the land at Coonabarrabran, area 10 acres, viz., portion 142, in the parish of Coonabarrabran, county of Gowen, dedicated 24th October, 1882, for public recreation, and hereunder described, with a view to the area in question being restored to the temporary common.

[Ms. 92-4,580 Ind.]

HENRY COPELAND.

DESCRIPTION.

County of Gowen, parish of Coonabarrabran, village of Coonabarrabran, area 10 acres, portion 142: Commencing on the western side of a road 1 chain wide, at a point distant 1 chain west from the south-western corner of portion 211 of 10 acres, appropriated for a show ground; and bounded thence on the east by that road dividing it from that portion bearing north 10 chains; on the north by a line bearing west 10 chains; on the west by a line bearing south 10 chains; and on the south by a road 1 chain wide, dividing it from part of portion 125 of 160 acres, appropriated for public recreation bearing east 10 chains, to the point of commencement,—plan catalogued C. 13-1,704.

Department of Lands,
Sydney, 25th October, 1892.

PROPOSED RESUMPTION OF RECREATION RESERVE AT MACLEAN, AND DEDICATION FOR RACECOURSE IN LIEU.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the land at Maclean, area 159½ acres, viz., portion 234, in the parish of Taloumbi, county of Clarence, dedicated 14th March, 1881, for public recreation, and hereunder described, with a view to that area being set apart as an extension to the temporary common, and to the dedication in lieu of portion 199 of 100 acres for racecourse.

[Ms. 92-4,791 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Recreation reserve proposed to be resumed.

County of Clarence, parish of Taloumbi, containing an area of 159 acres 3 roods: Commencing on the southern side of a road 2 chains wide at a point distant 2 chains south

from the south-western corner of portion 192 of 80 acres; thence on the north by that road bearing east 40 chains 74 links; on the east by a line bearing south 40 chains; on the south by a line bearing west 40 chains 74 links; on the west by a line bearing north 40 chains, to the point of commencement,—as shown on plan catalogued C. 868-1,577.

Racecourse proposed to be dedicated.

County of Clarence, parish of Taloumbi. All that piece or parcel of land containing an area of 100 acres, and measured as portion 199, within the following boundaries: Commencing at a point on the south boundary of portion 234 of 159½ acres, bearing west and distant 12 chains 64 links from its south-east corner; thence by part of that boundary and part of the south boundary of portion 236 bearing east 32 chains 55 links; thence by a line bearing south 31 chains 32 links; thence by a line bearing west 26 chains 96 links; thence by a line bearing north 30 degrees 24 minutes west 8 chains 83 links; thence by a line bearing north 24 chains 48 links, to the point of commencement,—as shown on plan catalogued C. 1732-1,577.

Department of Lands,
Sydney, 25th October, 1892.

PROPOSED RESUMPTION OF CHURCH OF ENGLAND CHURCH, SCHOOL, AND PARSONAGE SITES AT JUGIONG.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the Church of England Church, School, and Parsonage sites at Jugiong, area 2 acres, viz., allotments 1, 2, 3, and 20 of section 7, dedicated 16th July, 1863, and hereunder described, with a view to the reservation of allotment 20 of 2 roods, for the Preservation of Graves, and to the sale by auction of the remainder.

[Ms. 92-4,792 Ind.]

HENRY COPELAND.

DESCRIPTION.

County of Harden, parish of Jugiong, town of Jugiong, area 2 acres: Commencing on the north-western side of Stapylton-street at the intersection with the north-eastern side of Larmer-street; and bounded thence by part of that side of Larmer-street bearing north 12 degrees west 5 chains to the south-eastern side of Renwick-street; thence by part of that side of that street bearing north 78 degrees east 4 chains to the north-western corner of allotment 4 of section 7; thence by the south-western boundary of that allotment bearing south 12 degrees east 5 chains to the north-western side of Stapylton-street aforesaid; and thence by part of that side of that street bearing south 78 degrees west, to the point of commencement,—plan catalogued C. 728-730.

1892.

NEW SOUTH WALES.

CROWN LANDS.

(DEDICATION OF CERTAIN LANDS, IN ACCORDANCE WITH THE PROVISIONS OF THE 105TH SECTION OF THE ACT 48 VIC. No. 18.

Presented to Parliament, under Acts 48 Vic. No. 18, sec. 105.

Department of Lands,
Sydney, 22nd November, 1892.PROPOSED RESUMPTION OF PERMANENT COMMON
AT CONDOUBLIN.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the permanent common at Condoublin, area 640 acres, dedicated 6th December, 1867, and 15th August, 1871, hereunder described, with a view to the reservation of 20 acres thereof for public recreation, 10 acres for cricket ground, and 610 acres (the remainder) for temporary common.

[Ms. 92-5,028 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Area dedicated 6th December, 1867.

County of Gipps, parish of South Condoublin, area 640 acres: Commencing on the left bank of the Lachlan River at the north-east corner of George Lee's portion No. 1 of 320 acres, exclusive of road; and bounded thence by part of the east boundary of that portion bearing south 29 chains 15 links; thence by a line bearing east 82 chains 33 links; thence by a line bearing north 92 chains 15 links to the Lachlan River; and thence by that river downwards, to the point of commencement,—but exclusive of portion $\frac{2}{3}$ of W. Lee's 24 acres.

Area dedicated 15th August, 1871.

County of Gipps, parish of South Condoublin, on the Lachlan River. 640 acres: Portion $\frac{1}{3}$, commencing on the left bank of the Lachlan River at a point bearing about north 15 degrees east and distant 19 chains from the north-east corner of portion 1 of 320 acres at Condoublin Head Station; and bounded thence on the south by the northern boundary line of portion $\frac{2}{3}$ of 24 acres bearing east 12 chains 65 links; on the west by the eastern boundary line of that portion bearing south 20 chains and 20 links; again on the north by the southern boundary line of that portion bearing south 87 degrees west 12 chains 65 links; again on the west by a line bearing south 30 chains and 91 links; again on the south by a line bearing east 77 chains 33 links; on the east by a line bearing north 96 chains 41 links to the Lachlan River; again on the north and again on the west by that river downwards, to the point of commencement,—exclusively of the existing road 1 chain wide from the Lower Lachlan to Condoublin passing through this land in a northerly direction, and of the road 1 chain wide to Forbes in an easterly direction; also of a road 1 chain wide from the last-mentioned road to a lagoon; and also of the existing lagoons, the areas of which have been deducted from the total area,—shown on plan catalogued G. 47-1,871.

Department of Lands,
Sydney, 22nd November, 1892.PROPOSED RESUMPTION OF RESERVE FOR
RECREATION AND TOWN PASTURAGE AT
DUBBO.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to resume the land at Dubbo, area 640 acres, appropriated 6th January, 1859, for Public Recreation and Town Pasturage, and dedicated 25th August, 1865, for town common, hereunder described, with a view to the reservation of 10 acres thereof for rifle range, the dedication of 23 acres and 10 perches for show ground, and to the reservation of the remainder for temporary common.

[Ms. 92-5,349 Ind.]

HENRY COPELAND.

DESCRIPTION.

County of Lincoln, parish of Dubbo, at Dubbo, containing 640 acres: Commencing at a point distant 1 chain east from the south-eastern corner of portion 40 of 7 acres 3 roods and 36 perches; and bounded thence on the north by a line bearing east 80 chains to the eastern boundary of the extended Dubbo Reserve, as proclaimed on the 12th March, 1859; on the east by part of that boundary line bearing south 80 chains; on the south by a southern boundary of that reserve bearing west 80 chains; and on the west by a line bearing north 80 chains, to the point of commencement.

Department of Lands,
Sydney, 22nd November, 1892.PROPOSED RESUMPTION OF SHOW GROUND AT
DUBBO AND DEDICATION FOR THE SAME
PURPOSE IN LIEU.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the land at Dubbo, area 15 acres, viz, portion 310, in the parish of Dubbo, county of Lincoln, dedicated 22nd April, 1886, for site for Show Ground for the use of the North-western Pastoral and Agricultural Society, and hereunder described, with a view to the re-dedication of the area in question, in conjunction with portion 206 adjoining, in all 23 acres and 10 perches, for Show Ground.

[Ms. 92-5,348 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Area proposed to be resumed.

County of Lincoln, parish of Dubbo, at Dubbo, portion 310: Commencing on the eastern side of Fitzroy-street, at its

intersection with the easterly continuation of the northern side of Church-street, being a point distant 1 chain 50 links easterly from the south-eastern corner of allotment 4 of section 26; and bounded thence on the west by Fitzroy-street bearing north 12 chains and 21 links; on the north by a street 1 chain 50 links wide along the Great Western Railway bearing easterly 12 chains and 31 links; on the east by a line bearing south 12 chains and 19 links; and on the south by a line bearing westerly 12 chains and 31 links, to the point of commencement,—Plan cat. L. 1,219-1,566.

Area proposed to be dedicated.

County of Lincoln, parish of Dubbo, at Dubbo, containing an area of 23 acres 10 perches: Commencing on the eastern side of Fitzroy-street at its intersection with the easterly continuation of the northern side of Church-street, being a point bearing north 89 degrees 59 minutes east and distant 1 chain 50 links from the south-eastern corner of allotment 4 of section 26; and bounded thence on part of the west by part of Fitzroy-street bearing north 12 chains 21 links; thence by a line bearing south 89 degrees 56 minutes east 12 chains 31 links; thence by a line bearing south and forming the east boundaries of portions 310 and 206, 18 chains 74 links to the northern side of a road 1 chain 50 links wide; thence by part of that side of that road bearing north 89 degrees 57 minutes west 12 chains 30½ links to the eastern side of Fitzroy-street aforesaid; and thence by part of that side of that street, being a line bearing north 6 chains 53½ links, to the point of commencement.

Includes measured portions 310 and 206,—as shown on plans catalogued L. 1,219-1,566 and L. 1,736-1,566.

Department of Lands,
Sydney, 22nd November, 1892.

PROPOSED RESUMPTION OF PERMANENT COMMON AT WOLLOMBI, AND RE-DEDICATION FOR PUBLIC RECREATION AND PERMANENT COMMON.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the permanent common at Wollombi, area 127 acres, dedicated 5th January, 1872, and hereunder described, with a view to about 10½ acres thereof being included in an area of 13 acres, proposed to be dedicated for public recreation, also hereunder described, and to the re-dedication of the remainder, about 116½ acres, for permanent common.

[Ms. 92-5,027 Ind.] HENRY COPELAND.

DESCRIPTIONS.

Permanent Common proposed to be resumed.

County of Northumberland, parish of Corrabare, within the suburban boundaries of the town of Wollombi, containing an area of about 127 acres: Commencing on the right bank of Sugar Loaf Creek, at a point where the south-eastern side of Yewe-street meets it; and bounded thence on part of the north-

west by that side of that street bearing north-easterly to its intersection with the north-eastern side of Butcher-street; thence on the south-west by that side of that street bearing north-westerly to the south corner of allotment 1, section 25; thence on the remainder of the north-west by the south-east side of that section and its prolongation bearing in all north-easterly 12 chains 50 links; thence on the north by a line bearing east 44 chains; thence on the east by a line bearing south 23 chains 75 links; thence on part of the south by a line bearing west 19 chains; thence on the south-east by a line bearing south 49 degrees west 3 chains 75 links; thence again on the south by a line bearing south 82 degrees west 17 chains 40 links to the right bank of Sugar Loaf Creek aforesaid; and thence on the west and the remainder of the south by that bank of that creek downwards, to the point of commencement.

Recreation Reserve proposed to be dedicated.

County of Northumberland, parish of Corrabare, within the suburban boundaries of the town of Wollombi, containing an area of 13 acres. The Crown Lands within the following boundaries: Commencing on the right bank of Sugar Loaf Creek, at a point bearing south 80 degrees 12 minutes east from the south corner of allotment 12 of section 28, town of Wollombi; and bounded thence on the north-west by a line bearing north 74 degrees 41 minutes east 7 chains 98 links; thence on the north by a line bearing east 8 chains; thence on the east by a line bearing south 10 chains; thence on the south by a line bearing west 11 chains to the right bank of Sugar Loaf Creek aforesaid; and thence on the south-west by that bank of that creek downwards, to the point of commencement,—as shown on plan catalogued N. 3,209-2,111.

Permanent Common proposed to be dedicated.

County of Northumberland, parish of Corrabare, within the suburban lands of the town of Wollombi, containing an area of about 116½ acres. The Crown Lands within the following boundaries: Commencing on the right bank of Sugar Loaf Creek, at a point where the south-eastern side of Yewe-street meets it; and bounded thence on part of the north-west by that side of that street bearing north-easterly to its intersection with the north-eastern side of Butcher-street; thence on the south-west by that side of that street bearing north-westerly to the south corner of allotment 1 of section 25; thence on the remainder of the north-west by the south-east side of that section and its prolongation bearing in all north-easterly 12 chains 50 links; thence on the north by a line bearing east 44 chains; thence on the east by a line bearing south 23 chains 75 links; thence on part of the south by a line bearing west 19 chains; thence on the south-east by a line bearing south 49 degrees west 3 chains 75 links; thence again on the south by a line bearing south 82 degrees west to the east boundary of portion 102 of 13 acres; thence on the west by part of that boundary of that portion bearing north to its north-east corner; thence again on the south by the northern and north-western boundaries of that portion bearing westerly to the right bank of Sugar Loaf Creek aforesaid; and thence on the remainder of the south by that bank of that creek downwards, to the point of commencement.

NEW SOUTH WALES.

CROWN LANDS.

(DEDICATION OF CERTAIN LANDS, IN ACCORDANCE WITH THE PROVISIONS OF THE 105TH SECTION OF THE ACT 48 VIC. No. 18.)

Presented to Parliament, under Act 48 Vic. No. 18, sec. 105.

Department of Lands,
Sydney, 29th November, 1892.PROPOSED RESUMPTION OF RECREATION
RESERVE AT QUEANBEYAN AND DEDICA-
TIONS FOR SHOW GROUND AND PUBLIC
RECREATION IN LIEU.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Acts of 1884, it is proposed to revoke the dedication of the land at Queanbeyan, area 35 acres 3 roods 36 perches, dedicated 10th January, 1865, for Public Recreation, and hereunder described, with a view to the dedication in lieu of the areas of 9 acres 2 roods 35 perches and 27 acres 1 rood 15 perches, also hereunder described, for Show Ground and Public Recreation respectively.

[Ms. 92-5,496 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Recreation Ground proposed to be resumed.

County of Murray, parish of Queanbeyan, town of Queanbeyan, area 35 acres 3 roods 36 perches: Commencing on the northern boundary of C. Campbell's 1,057 acres, at the intersection with the south-western side of Lowe-street; and bounded thence by part of that northern boundary aforesaid bearing westerly 28 chains 4 links to the south-east corner of R. Campbell's 1,040 acres (Garryowen); thence by part of the east boundary of that portion northerly 87 links; thence by a line bearing north 50 degrees east 20 chains 90 links to the south-western side of Lowe-street aforesaid; and thence by part of that side of that street bearing south 40 degrees east 18 chains 44 links, to the point of commencement. Again commencing on the east boundary of R. Campbell's 1,040 acres (Garryowen) aforesaid, at the intersection with the south-western side of Lowe-street; and bounded thence by part of that side of that street bearing south 40 degrees east 19 chains 34 links; thence by a line bearing south 50 degrees west 16 chains 24 links to the east boundary of R. Campbell's 1,040 acres aforesaid; and thence by part of that boundary bearing northerly, to the point of commencement,—plan catalogued Q. 35-1,057.

Show Ground proposed to be dedicated.

County of Murray, parish of Queanbeyan, town of Queanbeyan, area 9 acres 2 roods 35 perches: Commencing on the south-eastern side of Moneroo-street at the most western corner of allotment 3 of section 56; and bounded thence by a line part of which forms the south-western boundary of that allotment bearing south 40 degrees 30 minutes east 13 chains 18.1 links to the southern boundary of the town lands, being also the northern boundary of Charles Campbell's 1,057 acres; thence by that boundary bearing south 89 degrees 10 minutes west 16 chains 37.3 links to the western boundary of the town lands aforesaid; thence by part of that boundary bearing north 50 minutes west 3 chains 55.4 links to the intersection with the south-eastern side of Moneroo-street aforesaid; and thence by part of that side of that street bearing north 40 degrees 32 minutes east 10 chains 33.5 links, to the point of commencement,—plan catalogued Q. 47-1,057.

Recreation Ground proposed to be dedicated.

County of Murray, parish of Queanbeyan, town of Queanbeyan, area 27 acres 1 rood 15 perches: Commencing on the northern boundary of Charles Campbell's 1,057 acres at the easternmost corner of allotment 4 of section 56, town of Queanbeyan; and bounded thence by the north-eastern boundary of that allotment bearing north 40 degrees 30 minutes west 11 chains 18.1 links to the southernmost corner of allotment 3, same section; thence by the south-eastern boundaries of allotments 3, 2, and 1 bearing north 49 degrees 32 minutes east 8 chains 75 links to the south-western side of Lowe-street; thence by part of that side of that street bearing south 40 degrees 24 minutes east 16 chains 52 links to the north-western side of Isabella-street; thence by part of that side of that street bearing south 49 degrees 39 minutes west 2 chains 30.4 links to the northern boundary of Campbell's 1,057 acres aforesaid; and thence by part of that boundary bearing south 89 degrees 10 minutes west, to the point of commencement, exclusive of Cooma-street. Again commencing on the eastern boundary of R. Campbell's 1,040 acres (Garryowen) at the intersection with the south-western side of Lowe-street; and bounded thence by part of that side of that street bearing south 40 degrees 25 minutes east 19 chains 34 links; thence by a line bearing south 49 degrees 32 minutes west 16 chains 24 links to the eastern boundary of R. Campbell's 1,040 acres aforesaid; and thence by part of that boundary bearing northerly, to the point of commencement,—plan catalogued Q. 35-1,057.

Sydney, 14th February, 1893.**PROPOSED RESUMPTION OF RECREATION GROUND
AT RYLSTONE AND REDEDICATION FOR RACE-
COURSE AND PUBLIC RECREATION.**

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884 and the 41st section of the Crown Lands Act of 1889, it is proposed to revoke the dedication of the land at Rylstone, area 186 acres, viz., portion 67, parish of Dabee, county of Phillip, dedicated 22nd March, 1883, for Public Recreation, and hereunder described, with a view to the dedication of 100 acres thereof for Racecourse, and to the rededication of remainder, 86 acres, for Public Recreation.

[Ms. 93-199 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Recreation Ground proposed to be resumed.

County of Phillip, parish of Dabee, area 186 acres, portion 67: Commencing on the southern side of a road 1 chain wide, at a point distant about 1 chain southerly from the south-eastern corner of portion 54 of 208 acres; and bounded thence on part of the north by that road dividing it from part of that portion bearing south 87 degrees 56 minutes west 30 chains 5 links; on the west by a line bearing south 35 chains and 5 links; or the south-west by a line bearing south 51 degrees 30 minutes east 6 chains 21 links; on the south by a line bearing east 30 chains; on the south-east by a line bearing north 45 degrees 16 minutes east 21 chains and 32 links; on the east by a line bearing north 25 chains; and on the remainder of the north by a line bearing west 19 chains and 97 links, to the point of commencement,—plan catalogued P. 12-2,072

Racecourse proposed to be dedicated.

County of Phillip, parish of Dabee, containing an area of 100 acres: Commencing on the south side of a road 1 chain wide, at the north-east corner of portion 67 of 86 acres; and bounded thence on the west by the east boundary of that portion bearing south 39 chains 72 links; thence on the south by a line bearing east 12 chains 72.5 links; thence on the south-east by a line bearing north 45 degrees 16 minutes east 21 chains 32 links; thence on the east by a line bearing north 25 chains to the south side of the aforesaid road; thence on the north by parts of that side of that road bearing west 19 chains 97 links and south 2 degrees 4 minutes west 7 chains 90.5 links, to the point of commencement,—to include portion 32, as shown on plan catalogued P. 1,930-2,125.

GSR—

Recreation Ground proposed to be dedicated.

County of Phillip, parish of Dabee, containing an area of 86 acres: Commencing on the south side of a road 1 chain wide, at the north-west corner of portion 32 of 100 acres; and bounded thence on the east by the west boundary of that portion bearing south 39 chains 72 links; thence on the south by a line bearing west 17 chains 28 links; thence on the south-west by a line bearing north 51 degrees 30 minutes west 6 chains 21 links; thence on the west by a line bearing north 35 chains 5 links to the south side of the aforesaid road; thence on the north by part of that side of that road bearing north 87 degrees 56 minutes east 22 chains 15 links, to the point of commencement,—to include portion 67, as shown on plan catalogued P. 12-2,072.

Department of Lands,
Sydney, 14th February, 1893.**PROPOSED RESUMPTION OF RECREATION
GROUND AT ULMARRA.**

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884 and the 41st section of the Crown Lands Act of 1889, it is proposed to revoke the dedication of the land at Ulmarra, area 68 acres 3 roods 36 perches, dedicated 22nd March, 1883, for Public Recreation, and hereunder described, with a view to sale thereof by auction.

[Ms. 93-198 Ind.]

HENRY COPELAND.

DESCRIPTION.

County of Clarence, parish of Ulmarra, containing an area of 68 acres 3 roods 36 perches. All that piece or parcel of land within the following boundaries: Commencing at the north-east corner of portion 426; and bounded thence on the west by the east boundary of that portion bearing south 26 chains 10 links; thence by a line bearing east 4 chains 96 links; thence again on the west by a line and the east boundary of portion 428 bearing south 34 chains 17 links; thence on the south by a line bearing east 9 chains 40 links; thence on the east by lines bearing north 08 minutes east 34 chains 99 links and north 25 chains 28 links; thence on the north by a line bearing west 14 chains 44 links, to the point of commencement,—being measured portion 431, as shown on plan catalogued C. 97-1,834.

Department of Lands,
Sydney, 14th February, 1893.

PROPOSED RESUMPTION OF NATIONAL SCHOOL SITE AT ADAMINABY.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884 and the 41st section of the Crown Lands Act of 1889, it is proposed to revoke the dedication of the National School site at Adaminaby, area 2 acres, viz., allotments 1, 2, 3, and 10 of section 18, dedicated 3rd May, 1865, and hereunder described, with a view to amendment of town design.

[Ms. 93-201 Ind.]

HENRY COPELAND.

DESCRIPTION.

County of Wallace, parish of Seymour, town of Seymour (now Adaminaby), area 2 acres, being allotments 1, 2, 3, and 10 of section 18: Commencing at the northern corner of the section; and bounded thence on the north-east by Cosgrove-street south-easterly 2 chains; on the south-east by the north-western boundary of allotment 9 and its south-westerly prolongation, being in all a line south-westerly at right angles to Cosgrove-street 2 chains and 80 links; again on the north-east by the south-western side of a lane south-easterly parallel with Cosgrove-street 4 chains; again on the south-east by the north-western boundary line of allotment 4 south-westerly at right angles to Denison-street 2 chains and 50 links to Denison-street; on the south-west by that street north-westerly 6 chains to Lucas-street; and on the north-west by that street north-easterly 5 chains and 30 links,—to the point of commencement, exclusively of the lane 30 links wide dividing allotment 1 from allotment 10, passing through this land in a north-westerly direction, the area of which has been deducted from the total area.—Plan A1-1,747 Roll.

Department of Lands,
Sydney, 14th February, 1893.

PROPOSED REVOCATION OF FLOOD REFUGE RESERVE AT ULMARRA, AND DEDICATION FOR PUBLIC SCHOOL SITE AND REFUGE IN TIME OF FLOOD.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884 and the 41st section of the Crown Lands Act of 1889, it is proposed to revoke reserve 160, at Ulmarra, area 100 acres, notified 31st July, 1871, for Refuge in Time of Flood, and hereunder described, with a view to the dedication of 4 acres thereof for Public School site, and to the dedication of the remainder, 96 acres, for Refuge in Time of Flood.

[Ms. 93-200 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Flood refuge reserve proposed to be revoked.

County of Clarence, parish of Ulmarra, area 100 acres: Commencing at the north-west corner of portion 365; and bounded thence on the east by the west boundaries of portions 361 and 360, crossing a road 1 chain wide bearing north in all 33 chains and 34 links; thence on the north by the south boundaries of portions 350 and 347, crossing Callighan's Creek bearing west in all 29 chains; and thence by a line west 1 chain to the east boundary of H. Paterson's portion 68; on the west by part of the east boundary of that portion and part of the east boundary of Z. Angelo and R. Callahan's portion 49 bearing south in all 33 chains and 34 links; on the south by a line bearing east 1 chain to the north-west corner of portion 368; thence by the north boundary of that portion and portion 367 and its easterly prolongation bearing east in all 33 chains, to the point of commencement,—shown on plan C. 10-1,834.

Public School site proposed to be dedicated.

County of Clarence, parish of Ulmarra, at Calliope, area 4 acres: Commencing at a peg on the eastern side of a road 1 chain wide bearing north 62 degrees 26 minutes east and distant 1 chain 11'8 links from the marked south-west corner of reserve 160, notified 31st July, 1871; and bounded thence by a line bearing north 89 degrees east 14 chains; thence by a line bearing north 1 degree west 2 chains and 7 links; thence by a line bearing south 89 degrees west 8 chains 39 links; thence by a line bearing north 56 degrees west 6 chains 85 links to the eastern side of the 1 chain road aforesaid; and thence by part of that side of that road being a line bearing south 1 degree east 6 chains, to the point of commencement,—to include measured portion 92, as shown on plan catalogued C. 1,708-1,577.

Area proposed to be dedicated for refuge in time of flood.

County of Clarence, parish of Ulmarra, containing an area of 96 acres. The Crown Lands within the following boundaries: Commencing at the north-west corner of portion 366; and bounded thence on the east by the west boundaries of portions 361 and 360, crossing a road 1 chain wide, bearing north in all 33 chains and 34 links; thence on the north by the south boundaries of portions 350 and 347 crossing Callighan's Creek, bearing west in all 29 chains; and thence by

a line west 1 chain to the east boundary of H. Paterson's portion 68; on the west by part of the east boundary of that portion and part of the east boundary of Z. Angelo and R. Callahan's portion 49 bearing south in all 33 chains and 34 links; on the south by a line bearing east 1 chain to the north-west corner of portion 368; thence by the north boundaries of that portion and portion 367 and its easterly prolongation bearing east in all 30 chains, to the point of commencement,—as shown on plan catalogued C. 10-1,834, but exclusive of portion 92 of 4 acres, as shown on plan catalogued C. 1708-1,577.

Department of Lands,
Sydney, 14th February, 1893.

PROPOSED RESUMPTION OF DANGAR PARK NARRABRI WEST, AND DEDICATION FOR PUBLIC RECREATION IN LIEU.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the land at Narrabri West, area 153 acres 2 roods 3 perches, dedicated 13th May, 1887, for Public Recreation, and hereunder described, with a view to sale by auction of that part within section 30, and to the rededication for Public Recreation of the remainder, in conjunction with sections 26 and 27 and intervening lanes, Wollah-street, and parts of Bohcena and Narrim-streets,—in all 157 acres 2 roods.

[Ms. 93-480 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Area proposed to be resumed.

County of White, parish of Cooma, town of Narrabri West, area 153 acres 2 roods 3 perches: Commencing at the intersection of the west side of Cooma-street with north side of Mooloolbar-street; and bounded thence on part of the south by that side of the latter street bearing 290 degrees 59 minutes 3,120 links to the east side of Walowa-street; thence generally on the west by that side of that street bearing 20 degrees 59 minutes 241 links, 315 degrees 57 minutes 406 links, 322 degrees 59 minutes 217 links, 330 degrees 47 minutes 174.5 links, 338 degrees 26 minutes 438.5 links, 347 degrees 34 minutes 60 links, 348 degrees 30 minutes 175 links, 355 degrees 21 minutes 127 links, 357 degrees 40 minutes 154 links, 3 degrees 2 minutes 121 links, 5 degrees 1 minute 120.5 links, 10 degrees 33 minutes 149.5 links, 11 degrees 53 minutes 113 links, 20 degrees 59 minutes 2,422 links, to the south side of Ugoa-street; thence on the north by that side of that street bearing 89 degrees 57 minutes 3,424 links to the north-west corner of temporary reserve 1,931, of about 41 acres, for camping and access to water, notified 18th February, 1884, No. 78, page 1229; thence generally on part of the east by the western boundary of that reserve and by the west side of Wukawa-street, being lines bearing 189 degrees 49 minutes 300 links, 162 degrees 50 minutes 649 links, and 207 degrees 46 minutes 2,625 links, to the north side of Bohcena-street; thence on the remainder of the south by that side of that street bearing 277 degrees 55 minutes 1,825 links to the south-west side of Narrim-street; thence on the north-east by that side of that street bearing 170 degrees 25 minutes 561 links, 142 degrees 15 minutes 329 links, 130 degrees 30 minutes 439 links, 117 degrees 45 minutes 2,010.5 links to the east side of Cooma-street aforesaid; and thence on the remainder of the east by that side of that street bearing 207 degrees 46 minutes 699 links, to the point of commencement,—as shown on plan catalogued W. 2-2,450 Roll.

NOTE.—All bearings are taken from magnetic north.

Area proposed to be dedicated.

County of White, parish of Cooma, town of Narrabri West, containing an area of 157 acres 2 roods: Commencing at the intersection of the north-eastern side of Mooloolbar-street with south-westerly prolongation of the north-western side of Wukawa-street; and bounded thence on part of the south by that side of Mooloolbar-street bearing 290 degrees 59 minutes 1,750.7 links to the east side of Walowa-street; thence generally on the west by that side of that street bearing 20 degrees 59 minutes 241 links, 315 degrees 57 minutes 406 links, 322 degrees 59 minutes 217 links, 330 degrees 47 minutes 174.5 links, 338 degrees 26 minutes 438.5 links, 347 degrees 34 minutes 60 links, 348 degrees 30 minutes 175 links, 355 degrees 21 minutes 127 links, 357 degrees 40 minutes 154 links, 3 degrees 2 minutes 121 links, 5 degrees 1 minute 120 links, 10 degrees 33 minutes 149.5 links, 11 degrees 53 minutes 113 links, 20 degrees 59 minutes 2,422 links, to the south side of Ugoa-street; thence on the north by that side of that street bearing 89 degrees 57 minutes 3,424 links to the north-west corner of temporary reserve 1,931, of about 41 acres, for camping and access to water, notified 18th February, 1884, No. 78, page 1229; thence generally on part of the east by the western boundary of that reserve and by the north-western side of Wukawa-street, being lines bearing 189 degrees 49 minutes 300 links, 162 degrees 50 minutes 649 links, and 207 degrees 46 minutes 4,785 links, to the point of commencement,—as shown on plan W. 2-2,450 R.

Department of Lands,
Sydney, 14th February, 1893.

**PROPOSED EXCHANGE OF PART OF BREWARRINA
RECREATION GROUND FOR PART OF TEM-
PORARY COMMON.**

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of that part of the extension to the Brewarrina Recreation Ground, dedicated 23rd September, 1881, area 31 acres, hereunder described, with a view to the dedication in lieu for Public Recreation, by way of exchange, of that part of Brewarrina Temporary Common within measured portion 37 of 30 acres 3 roods.

[Ms. 93-304 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Area proposed to be resumed.

County of Clyde, parish of Brewarrina, area 31 acres: Commencing at the north-west corner of portion 35 of 14 acres; and bounded thence by a line bearing west 10 chains and 17 links; thence by a line south 30 chains; thence by a line east 10 chains 37.7 links to the south-west corner of portion 35 aforesaid; and thence by the western boundary of that portion bearing north 23 minutes 30 seconds west 29 chains 97 links, to the point of commencement.

Area proposed to be dedicated.

County of Clyde, parish of Brewarrina, area 30 acres 3 roods: Commencing at the south-east corner of portion 34 of 75 acres, dedicated as a site for racecourse; and bounded thence by a line bearing south 10 chains 41 links; thence by a line bearing west 29 chains 68 links; thence by a line bearing north 10 chains 41 links to the south-west corner of portion 35 of 14 acres; and thence by the south boundaries of portions 35 and 34 bearing east 29 chains 68 links, to the point of commencement,—includes measured portion 37, as shown on plan catalogued C. 543-1,828.

Department of Lands,
Sydney, 14th February, 1893.

**PROPOSED RESUMPTION OF SHOW GROUND AT
FORBES, AND DEDICATION FOR THE SAME
PURPOSE IN LIEU.**

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884 and the 41st section of the Crown Lands Act of 1889, it is proposed to revoke the dedication of the Show Ground at Forbes, area 56 acres 3 roods 39 perches, viz., portions 362 to 366, in the parish of Forbes, county of Ashburnham, dedicated 20th July, 1877, and hereunder described, with a view to its being made available for suburban settlement, and to the dedication of portion 827 of 23 acres 3 roods 13 perches, in the same locality, for Show Ground in lieu.

[Ms. 93-394 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Show Ground proposed to be resumed.

56 acres 3 roods 39 perches. County of Ashburnham, parish of Forbes, portions 362, 363, 364, 365, and 366: Commencing on the southern side of a road 1 chain wide at a point distant 1 chain south from the south-eastern corner of portion 369 of

23 acres; and bounded thence on the north by that road dividing it from that portion and from portions 370 and 371 of 23 acres each bearing west 30 chains; on the west by a road 1 chain wide dividing it from part of portion 378 of 27 acres 2 roods 20 perches bearing south 10 chains; on the south-west by a road 3 chains wide bearing south 59 degrees 2 minutes east 35 chains $\frac{1}{2}$ a link; and on the east by a road 1 chain wide bearing north 28 chains and 30 links to the point of commencement,—as shown on plan A. 868-1,770 Roll.

Show Ground proposed to be dedicated.

23 acres 3 roods 13 perches. County of Ashburnham, parish of Forbes, portion 827: Commencing at the south-east corner of portion 826 of 3 acres; and bounded thence on the west by the east boundaries of portions 826 and 824 bearing north 14 chains 69 links; on the north by the southern side of a road 1 chain wide bearing east 16 chains 22 $\frac{1}{2}$ links; on the east by the western side of a road 1 chain 50 links wide bearing south 14 chains 60 links; and on the south by the northern side of a road 1 chain 50 links wide bearing west 16 chains 22 $\frac{1}{2}$ links, to the point of commencement,—as shown on plan A. 5,392-1,770.

NOTE.—The above is in lieu of a notice in the Government Gazette of 25th August, 1892.

Department of Lands,
Sydney, 14th February, 1893.

**PROPOSED RESUMPTION OF GENERAL CEMETERY
AT ULLADULLA, AND DEDICATION FOR THE
SAME PURPOSE IN LIEU.**

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884 and the 41st section of the Crown Lands Act of 1889, it is proposed to revoke the dedication of the General Cemetery at Ulladulla, area 7 acres 2 roods, dedicated 12th March, 1869, and hereunder described, with a view to the dedication in lieu of 10 acres 1 rood 20 perches, to include the above, for General Cemetery.

[Ms. 93-479 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Area proposed to be resumed.

County of St. Vincent, parish of Ulladulla, area 7 acres 2 roods: Commencing at a point bearing north 45 degrees east and distant 1 chain 41 links from the south-eastern corner of D. Warden's 26 acres; and bounded thence by a line bearing east 10 chains 38 links; thence by a line bearing north 8 chains; thence by a line bearing west 10 chains 38 links; and thence by a line bearing south 8 chains, to the point of commencement,—but exclusive of a road 1 chain wide intersecting this land.

Plan catalogued C. 53-1,984.

Area proposed to be dedicated.

County of St. Vincent, parish of Ulladulla, within the Ulladulla population area, proclaimed 26th February, 1887, area 10 acres 1 rood 20 perches: Commencing at a point bearing east and distant 1 chain from a peg on the east boundary of David Warden's portion 63 of 26 acres, which peg bears north 70 degrees 25 minutes east and is distant 61 links from a moss-mate tree marked *xy*, shown on plan catalogued R. 4,234-1,603; and bounded thence by a line bearing east 10 chains 38 links; thence by a line bearing north 10 chains; thence by a line bearing west 10 chains 38 links to the east side of a 1-chain road; and thence by that side of the road bearing south 10 chains, to the point of commencement,—shown on plan catalogued Ms. 233 Ca.

1892-3.

NEW SOUTH WALES.

CROWN LANDS.

(DEDICATION OF CERTAIN LANDS UNDER THE ACT 48 VIC. No. 18, SEC. 105.)

Presented to Parliament, pursuant to Act 48 Vic. No. 18, sec. 105.

Department of Lands,
Sydney, 14th March, 1893.**PROPOSED RESUMPTION OF PERMANENT COMMON
AT BOOROWA AND RE-DEDICATION OF PART
THEREOF FOR THE SAME PURPOSE.**

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the Permanent Common at Boorowa, area 1,552 acres, dedicated 2nd October, 1866, and hereunder described, with a view to 558 acres thereof being set apart as a special area, and to the re-dedication of the remainder for permanent common.

[Ms. 93-860 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Area proposed to be resumed.

County of Monteagle, parish of Murrungal, area 1,552 acres: Commencing on the left bank of the Boorowa River, at the south-east corner of portion 18; and bounded thence by an east boundary of that portion bearing north to the eastern side of the road from Boorowa to Binda; thence by that side of that road, the western side of which forms the eastern boundaries of portion 16, bearing northerly to the south boundary of portion 58; thence by part of that boundary, a line, the south boundary of portion 62, a line, and the south boundary of portion 66, in all bearing east to the Boorowa River aforesaid; thence by that river upwards to the south-east corner of portion 20; thence by the east boundary of that portion, by its north and west boundaries being lines bearing respectively north, west, and south to the Boorowa River; and thence by that river upwards, to the point of commencement,—as shown on plan catalogued M. 15-1,780.

Area proposed to be dedicated.

County of Monteagle, parish of Murrungal, area 980 acres: Commencing on the left bank of the Boorowa River, at the south extremity of the easternmost boundary of portion 18; and bounded thence by that boundary bearing north to the north-eastern side of the road from Boorowa to Binda; thence by that side of that road, the opposite side of which forms north-eastern, eastern, and south-eastern boundaries of portion 18 aforesaid, bearing respectively north-westerly, northerly, and north-easterly to the south boundary of portion 58; thence by

a line bearing east, part of which forms part of that south boundary and the south boundaries of portions 62 and 66, to the left bank of the Boorowa River aforesaid; thence by that river upwards to the most northern north-western corner of portion 67; thence by north-western boundaries of that portion bearing respectively south 27 degrees 20 minutes west 15 chains 28 links, south 14 degrees 39 minutes west 22 chains 9 links, and south 47 degrees 30 minutes west 6 chains 73 links to the north extremity of the west boundary of the portion; thence by a line south, part of which forms that west boundary and the west boundary of portion 70, to the Boorowa River; thence by that river upwards to the south-east corner of portion 20; thence by the east, north, and west boundaries of that portion bearing respectively north, west, and south to the Boorowa River; and thence by that river upwards to the point of commencement.

Plans catalogued M. 15-1,780; M. 25-1,780; M. 4,768-1,780 Roll.

Department of Lands,
Sydney, 14th March, 1893.**PROPOSED RESUMPTION OF RECREATION
GROUND AT GLEN INNES.**

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the land at Glen Innes, area 14 acres, viz., section No. 47, dedicated 29th June, 1880, for Public Recreation, and hereunder described, with a view to the reservation of 7 acres 1 rood 27 perches thereof for Railway purposes, and to the sale or other appropriation under the Crown Lands Acts of the remainder.

[Ms. 93-859 Ind.]

HENRY COPELAND.

DESCRIPTION.

County of Gough, parish of Glen Innes, town of Glen Innes, area 14 acres: Commencing at the intersection of the south side of Wullamulla-street, with the east side of Mossman-street; and bounded thence by the south side of Wullamulla-street east to the west side of Lambeth-street; thence by the west side of Lambeth-street south to the north side of Herbert-street; thence by the north side of Herbert-street west to the east side of Moesman-street; and thence by the east side of Moesman-street north, to the point of commencement,—but exclusive of the area already taken for railway purposes.

Sydney, 14th March, 1893.

**PROPOSED RESUMPTION AND RE-DEDICATION OF
TOWN HALL SITE AT CONDOUBLIN.**

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to resume and re-dedicate the Town Hall site at Condoublin, viz., allotment 4 of section 20, dedicated 6th January, 1891, as 2 roods, and now found to contain 1 rood 37½ perches.

[Ms. 93-577 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Area proposed to be resumed.

County of Cunningham, parish and town of Condoublin, area 2 roods: Commencing on the north side of Bathurst-street, at the south-east corner of allotment 3 of section 20; and bounded thence by the eastern boundary of that allotment bearing northerly to its extremity; thence by the south side of a lane bearing easterly to the north-western corner of allotment 5,

same section; thence by the western boundary of that allotment bearing southerly to the north side of Bathurst-street, aforesaid; and thence by part of that side of that street bearing westerly, to the point of commencement.

Area proposed to be dedicated.

County of Cunningham, parish of Condoublin, town of Condoublin, area 1 rood 37½ perches: Commencing on the north side of Bathurst-street, at the south-west corner of allotment 3 of section 20, town of Condoublin; and bounded thence by the eastern boundary of that allotment bearing north 5 minutes 30 seconds west 4 chains 85 links to the south side of a lane 20 feet wide intersecting the section; thence by that side of that lane bearing north 89 degrees 54 minutes 30 seconds east 1 chain to the north-western corner of allotment 5, same section; thence by the western boundary of that allotment bearing south 5 minutes 30 seconds east 4 chains 85 links to the north side of Bathurst-street aforesaid; and thence by part of that side of that street bearing south 89 degrees 54 minutes 30 seconds west 1 chain, to the point of commencement,—to include allotment 4 of section 20, town of Condoublin, as shown on plan catalogued C. 13-1,705.

1892-3.

NEW SOUTH WALES.

CROWN LANDS.

(DEDICATION OF CERTAIN LANDS UNDER THE ACT 48 VIC. No. 18.)

Presented to Parliament, pursuant to Act 48 Vic. No. 18, sec. 105.

Department of Lands,
Sydney, 11th April, 1893.PROPOSED RESUMPTION AND REDEDICATION OF
PADDINGTON RECREATION GROUND.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the land at Paddington, area 9 acres 3 roods, dedicated 22nd November, 1870, for Public Recreation, and hereunder described, with a view to the dedication in lieu for Public Recreation of an area of 14 acres and 22 perches, to include the above.

[Ms. 93-1,155 Ind.]

HENRY COPELAND.

DESCRIPTIONS.

Area proposed to be resumed.

All that piece or parcel of land situate at Paddington, parish of Alexandria, county of Cumberland, area 9 acres 3 roods, more or less: Commencing at the intersection of the south-eastern side of Glenmore Road with the north-eastern side of Tannery Road; and bounded thence by the latter road south-easterly to its intersection with the northern boundary of Messrs. Cooper, Underwood, and Forbes' grant of 100 acres; thence by that boundary bearing east about 5 chains 45 links; thence by part of the north-eastern boundary of the said grant bearing south 45 degrees east about 8 chains 40 links; thence by a line bearing north 45 degrees east about 6 chains 60 links to its intersection with a south-western boundary of St. James' Glebe; thence by that boundary, the south-eastern and another south-western boundary of the said glebe, north-westerly, south-westerly, and again north-westerly to the south-eastern corner of W. Thomas' grant of 40 acres; thence by part of the southern boundary of that grant westerly about 3 chains 70 links to the south-eastern side of Glenmore Road aforesaid; and thence by the said road south-westerly, to the point of commencement,—as shown on plan catalogued O. 916-690.

Area proposed to be dedicated.

County of Cumberland, parish of Alexandria, at Paddington, area 14 acres 0 roods 22 perches: Commencing at the intersection of the north-eastern side of Tannery Road with south-eastern side of Glenmore Road; and bounded thence by the latter road bearing north 19 degrees 25 minutes east 4 chains 23 links and north 16 degrees 52 minutes east 39 links; thence by a line bearing south 89 degrees 53 minutes east 3 chains 97 links to the north-eastern boundary of W. Thomas' grant of 40 acres; thence by that boundary bearing south 22 degrees 59 minutes east 51 links; thence by a line forming the south-eastern boundary of St. James' Glebe, bearing north 68 degrees 10 minutes east 1 chain 81 links; thence by lines forming part of the south-western boundary of that land bearing south 50 degrees 34 minutes east 1 chain 99 links, south 49 degrees 46 minutes east 1 chain 63 links, south 51 degrees 41 minutes east 1 chain 29 links, south 48 degrees 46 minutes east 2 chains 60 links, south 47 degrees 10 minutes east 42 links, south 62 degrees 17 minutes east 2 chains 10 links, south 57 degrees 22 minutes east 2 chains 6 links, south 58 degrees 36 minutes east

2 chains 1 link, south 60 degrees east 73 links, south 62 degrees 45 minutes east 1 chain 2 links, south 73 degrees 19 minutes east 40 links, south 87 degrees 4 minutes east 66 links, north 87 degrees 26 minutes east 24 links, south 39 degrees 20 minutes, east 2 chains 30 links, south 34 degrees 50 minutes east 55 links, to the most northerly corner of the Woollabra Quarry Reserve, containing 4 acres 2 roods 11 perches; thence by the north-western boundary of that reserve bearing south 52 degrees west 7 chains 61 links to a north-eastern boundary of Cooper, Underwood, and Forbes' grant of 100 acres; thence by that boundary bearing north 44 degrees 53 minutes west 13 chains 28 links; thence by a northern boundary of the same grant bearing south 89 degrees 23 minutes west 5 chains 23 links to the north-eastern side of Tannery Road before mentioned; and thence by that road bearing north 36 degrees 13 minutes west 94 links, and north 55 degrees 45 minutes west 2 chains 62 links, to the point of commencement,—as surveyed and shown on plan catalogued Ms. 289 Sy.

Department of Lands,
Sydney, 11th April, 1893.PROPOSED RESUMPTION OF WALLABADAH
COMMON.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the land at Wallabadah, area 1,149 acres, dedicated 15th August, 1876, for temporary common as 1,180 acres, and hereunder described, with a view to the proclamation thereof as a special area.

[Ms. 93-1,252 Ind.]

HENRY COPELAND.

DESCRIPTION.

EASTERN DIVISION.

LAND DISTRICT OF MURBURUNDI.

County of Buckland, parish of Wallabadah, area 1,149 acres: Commencing at the north-east corner of portion 218 of 50 acres being a point on the left bank of the Quirindi Creek; and bounded thence on the west by a line formed partly by the east boundary of that portion and the east boundary of portion 214 bearing south 20 minutes east in all 95 chains 18 links to the right bank of Kangaroo Flat Creek; thence by that creek upwards to the north-west corner of portion 160; thence on the south by the north boundary of that portion bearing east 64 chains 18 links to the west boundary of portion 158; on part of the east by part of the west boundary of that portion bearing north 40 chains to its north-west corner; on part of the north by a line bearing west 40 chains; thence again on the east by a line bearing north 21 minutes east 47 chains 41 links; thence on the remainder of the north by a line formed partly by the south boundaries of portions 8, 9, and 10 bearing south 89 degrees 57 minutes west 40 chains 15 links to the south-west corner of the latter portion; thence on the remainder of the east by the west boundary of that portion bearing north 22 chains 68 links to the aforesaid left bank of Quirindi Creek; and thence by that creek downwards, to the point of commencement.

Department of Lands,
Sydney, 11th April, 1893.

PROPOSED RESUMPTION OF SITE FOR QUARANTINE STATION AT NEWCASTLE.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to resume the land at Nobby's Head, Newcastle, appropriated in 1851 for site for Quarantine Station, and hereunder described, with a view to reservation thereof for Pilot Station and Harbour Improvements.

[Ms. 93-393 Ind.] HENRY COPELAND.

DESCRIPTION.

EASTERN DIVISION.

LAND DISTRICT OF NEWCASTLE.

County of Northumberland, parish of Newcastle, City of Newcastle. The lands within the following boundaries: Bounded on the south-east, east, and north by the South Pacific Ocean; on the west by Port Hunter; on the south-west by the northern termination of Newcastle Breakwater,—vide plan catalogued N. 1,316 Roll.

Department of Lands,
Sydney, 11th April, 1893.

PROPOSED RESUMPTION OF PUBLIC SCHOOL SITE AT CADDIGAT.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the Public School site at Caddigat, area 2 acres, viz., portion 161, parish of Caddigat, county of Wallace, dedicated 18th January, 1884, and hereunder described, with a view to its being included in a proposed special area.

[Ms. 93-1,048 Ind.] HENRY COPELAND.

DESCRIPTION.

County of Wallace, parish of Caddigat, area 2 acres, portion 161: Commencing on the left bank of the Caddigat Creek, at the north-eastern corner of portion 84 of 100 acres; and bounded thence on the south by part of the northern boundary of that portion bearing west 4 chains and 64½ links; on the west by an eastern boundary of portion 162 of 10 acres bearing north 4 chains; on the north by a southern boundary of that portion bearing east 5 chains and 35 links to Caddigat Creek; and on the east by that creek upwards, to the point of commencement,—plan P. 943-1,978.

Department of Lands,
Sydney, 11th April, 1893.

PROPOSED RESUMPTION OF RECREATION GROUND AT COONAMBLE AND DEDICATION FOR THE SAME PURPOSE IN LIEU.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the land at Coonamble area 56 acres, dedicated 24th June, 1890, for Public Recreation, and hereunder described, with a view to the dedication in lieu for Public Recreation of an area of 58½ acres, also hereunder described.

[Ms. 93-1,251 Ind.] HENRY COPELAND.

DESCRIPTIONS.

Area proposed to be resumed.

County of Leichhardt, parish of Moorsambilla, area 56 acres: Commencing on the right bank of the Castlereagh River, at a point bearing south 1 chain 50 links, and west 14 chains 5½ links from the south-east corner of reserve 6,778 for cricket ground; and bounded thence by lines bearing east 14 chains 5½ links, south 37 chains, west 14 chains, north 2 chains 15½ links, north 24 degrees west 2 chains 65 links, north 36 degrees 59 minutes west 2 chains 2 links, north 24 degrees 58 minutes west 1 chain 52½ links, north 2 minutes east 3 chains 68 links, north 25 degrees 12 minutes east 2 chains 39 links, north 33 degrees 38 minutes east 5 chains 4½ links, north 8 degrees 31 minutes east 74 links, and west 9 chains 32½ links, to the Castlereagh River aforesaid; and thence by that river downwards, to the point of commencement,—plan catalogued Ms. 151 Do.

Area proposed to be dedicated.

County of Leichhardt, parish of Moorsambilla, area 58 acres 1 rood: Commencing on the right bank of the Castlereagh River, at its intersection with the south side of M'Cullough-street; and bounded thence by that side of that street bearing east 2 chains 52 links; thence by lines bearing south 28 degrees 40 minutes east 3 chains 29½ links, south 10 chains 71½ links, east 11 chains 50 links, south 37 chains, west 14 chains 50 links, north 10 chains, north 24 degrees 14½ minutes east 4 chains 32 links, and north 64 degrees 48 minutes west 10 chains 41 links to the Castlereagh River aforesaid; and thence by that river downwards, to the point of commencement,—plan catalogued Ms. 264 Do.

1892-3.

NEW SOUTH WALES.

CROWN LANDS.

(DEDICATION OF CERTAIN LANDS UNDER THE ACT 48 VIC. No. 18, SEC. 105, AND 53 VIC. No. 21, SEC. 41.)

Presented to Parliament, pursuant to Act 48 Vic. No. 18, and 53 Vic. No. 21, sec. 41.

Department of Lands,
Sydney, 9th May, 1893.PROPOSED RESUMPTION OF GENERAL CEMETERY
AT GILGANDRA.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884 and the 41st section of the Crown Lands Act of 1889, it is proposed to revoke the dedication of the General Cemetery at Gilgandra, area 7 acres 1 rood 22 perches, dedicated 18th January, 1884, and hereunder described, with a view to reservation of that area for village purposes.

[Ms. 93-1,568 Ind.] HENRY COPELAND.

DESCRIPTION.

CENTRAL DIVISION.

LAND DISTRICT OF COOSAMBLE.

7 acres 1 rood 22 perches. County of Gowen, parish of Eringinerin, at Gilgandra: Commencing at the south-east corner of portion 15 of 50 acres; and bounded thence by the east boundary of that portion bearing north to its north-east corner; thence by a line bearing east 5 chains 64 links to the south-western side of the road from Coosamble to Mendooran; thence by that side of that road bearing south 57 degrees 30 minutes east 4 chains 48 links; thence by a line bearing south 5 chains 93 links; and thence by a line bearing west 8 chains 42 links, to the point of commencement,—shown on plan catalogued C. 992-1,384.

Department of Lands,
Sydney, 9th May, 1893.PROPOSED RESUMPTION OF PUBLIC SCHOOL SITE
AT MENINDEE AND DEDICATION FOR THE
SAME PURPOSE IN LIEU.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884 and the 41st section of the Crown Lands Act of 1889, it is proposed to revoke the dedication of the public school site at Menindee, area 1 acre 3 roods 17 perches, dedicated 18th February, 1870, and hereunder described, with a view to the dedication for public school site in lieu of an area of 2 acres 3 roods 12 perches, including the above.

[Ms. 93-1,676 Ind.] HENRY COPELAND.

DESCRIPTIONS.

Area proposed to be resumed.

County of Menindee, parish of Perry, town of Menindee, area 1 acre 3 roods 17 perches: Commencing at the intersection of the east side of Cadell-street with the north side of Menindee-street (now Bear-street); and bounded thence on the south by the north side of the latter street bearing east 8 chains

21 links to the south-west side of Cole-street; thence by part of that side of that street bearing north 50 degrees 1 minute west 4 chains 45 links to the south side of the part of Candilla-street now closed; thence by that side of that street bearing west 4 chains 80 links to the east side of Cadell-street aforesaid; thence by part of that side of that street bearing south 2 chains 86 links, to the point of commencement,—being section 13, town of Menindee, as shown on plan catalogued P. 62-1,978.

Area proposed to be dedicated.

County of Menindee, parish of Perry, town of Menindee, section 13, area 2 acres 3 roods 12 perches: Commencing at the intersection of the south-western side of Cole-street with the eastern side of Cadell-street; and bounded thence by part of the eastern side of the latter street bearing south 6 chains 38.5 links to the north side of Bear-street; thence by that side of that street bearing east 8 chains 21 links to the south-western side of Cole-street aforesaid; thence by part of that side of that street bearing north 50 degrees 1 minute west 10 chains 71.5 links, to the point of commencement,—shown on plan catalogued M. 8-1,863.

Department of Lands,
Sydney, 9th April, 1893.PROPOSED RESUMPTION OF INVERELL NATIONAL
SCHOOL SITE AND EXTENSION.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884 and the 41st section of the Crown Lands Act of 1889, it is proposed to revoke the dedication of the lands at Inverell, hereunder described, areas 2 acres and 19 perches respectively, dedicated 16th July, 1868, for national school site and 28th September, 1886, for addition to public school site with a view to sale thereof by auction.

[Ms. 93-1,677 Ind.] HENRY COPELAND.

DESCRIPTION.

County of Gough, parish of Inverell, town of Inverell, area 2 acres 19 perches: Commencing at the intersection of the south-western side of Otho-street with the south-eastern side of Rivers-street, being the northern corner of section 22; and bounded thence by part of the south-western side of Otho-street south-easterly 4 chains to the northern corner of allotment 8 of section 22; thence by the north-western boundary of that allotment, a line, and the north-western boundary of allotment 3 south-westerly in all 5 chains 30 links to the north-eastern side of Campbell-street; thence by part of that side of that street north-westerly 4 chains to the south-eastern side of Rivers-street aforesaid; and by part of that side of Rivers-street north-easterly 5 chains 30 links, to the point of commencement,—shown on plan catalogued I. 11-1,651 (Inverell). Includes allotments 1, 2, 3, and 10 of section 22.

Department of Lands,
Sydney, 9th May, 1893.

**PROPOSED RESUMPTION AND REDEDICATION OF
PERMANENT COMMON AT ARTHUR.**

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the permanent common at Arthur, (area 613 acres 3 roods, dedicated 23rd September, 1881, and hereunder described, with a view to sale by auction of 2 acres thereof, and to the rededication for permanent common of the remainder.

[Ain. 93-5,916]

HENRY COPELAND.

DESCRIPTIONS.

EASTERN DIVISION.

LAND DISTRICT OF CARCOAR.

Area proposed to be resumed.

County of Georgiana, parish of Mulgunnia, area 613 acres 3 roods: Commencing at the north-east corner of portion 18, parish of Mulgunnia; bounded thence on the west by part of the east boundary of that portion bearing south 79 chains; thence on the south by a line bearing east 96 chains 30 links to the south-west side of Forbes-street, village of Arthur; thence by the south-western side of that street bearing north-westerly to its intersection with the north-western side of Raleigh-street; thence by the north-western side of that street north-easterly to the right bank of the Crooked Tree Creek; thence by the right bank of that creek upwards to a point due east from the point of commencement; thence on the north by a line bearing west 77 chains 55 links, to that point.

The above area is exclusive of the general cemetery, the public school site, and the roads,—shown upon plan catalogued G. 8a-2,065.

Area proposed to be dedicated.

County of Georgiana, parish of Mulgunnia, area 611 acres 3 roods: Commencing at the north-east corner of portion 18, parish of Mulgunnia; and bounded thence on the west by part of the east boundary of that portion bearing south 79 chains; thence on the south by a line bearing east 96 chains 30 links to the south-west side of Forbes-street, village of Arthur; thence by the south-western side of that street bearing north-westerly to its intersection with the north-western side of Raleigh-street; thence by the north-western side of that street north-easterly to the right bank of Crooked Tree

Creek; thence by that bank of that creek upwards to a point due east from the point of commencement; and thence on the north by a line bearing west 77 chains 55 links to that point.

The above area is exclusive of the general cemetery, the public school site, and the roads,—as shown on plan catalogued G. 8a-2,065; also of measured portion 61 of 2 acres, as shown on plan catalogued G. 4,374-1,506.

Department of Lands,
Sydney, 9th May, 1893.

**PROPOSED RESUMPTION OF RICHMOND HILL
COMMON.**

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884 and the 41st section of the Crown Lands Act of 1889, it is proposed to resume Richmond Hill Common, area 608 acres 3 roods, hereunder described, with a view to sale or other appropriations under the Crown Lands Acts.

[Ms. 93-1,539 Ind.]

HENRY COPELAND.

DESCRIPTION.

County of Cumberland, parishes of St. Matthew and Pitt Town, 608 acres 3 roods: Commencing at the north-west corner of the Common; and bounded on the west by portions of land granted to Carroll, Curry and Payne, Bates and Aspinall, being a line bearing south 46 chains to a reserved road 1 chain wide separating W. Aspinall's 30 acres from Joseph Jenkinson's 30 acres; thence on the west by the reserved road, being a line bearing south 1 chain to J. Jenkinson's north-east corner; thence on the west by J. Jenkinson's and Joseph Dullage's grants of 30 acres each, being a line bearing south 6 degrees east 20 chains 60 links; thence on the west by 30-acre portions of land granted to Jacob Russell, Richard Burman, and James Baker, being a line bearing south 31 degrees 30 minutes east 35 chains 20 links to the north-east corner of F. Fowkes' 30 acres grant, being a line bearing south 4 degrees east 10 chains 40 links to a mark on the present fence, being the southern boundary point of the Common; thence on the south-east by C. Marsden's 900 acres, being a line bearing east 40 degrees north 84 chains; thence on the north-east by the old Hawkesbury Road separating it from Andrew Thompson's grant of 260 acres, being a line bearing north 30 degrees west 60 chains 70 links; thence on the north by William Balmain's 270 acres, being a line bearing west 57 chains 50 links to the north-west corner of the Common aforesaid.

[3d.]

Sydney: Charles Potter, Government Printer.—1893.

1892-3.

NEW SOUTH WALES.

CROWN LANDS.

(DEDICATION OF CERTAIN LANDS UNDER THE ACT 48 VIC. No. 18, SEC. 105, AND 53 VIC. No. 21, SEC. 41.)

Presented to Parliament, pursuant to Act 48 Vic. No. 18, sec. 105, and 53 Vic. No. 21, sec. 41.

Department of Lands,
Sydney, 6th June, 1893.PROPOSED RESUMPTION OF GENERAL CEMETERY
AT COROWA.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884 and the 41st section of the Crown Lands Act of 1889, it is proposed to revoke the dedication of the General Cemetery at Corowa, area 7 acres 2 roods, dedicated 22nd November, 1870, and hereunder described, with a view to reservation thereof for preservation of graves.

[Ms. 93-1,990 Ind.] HENRY COPELAND.

DESCRIPTION.

CENTRAL DIVISION.

LAND DISTRICT OF COROWA.

Within the population area of Corowa.

County of Hume, parish of Corowa, area 7 acres 2 roods: Commencing at a point 1 chain due south of the south extremity of the most eastern boundary of portion 293 of 40 acres; and bounded thence on the north by a line bearing west 8 chains and forming the north boundaries of the areas set apart for General and Presbyterian Burial Grounds; thence on the west by the west boundaries of the Presbyterian and Wesleyan Burial Grounds, a line crossing a road 1 chain wide, and the west boundary of the Church of England Burial Ground south in all 10 chains 38 links; thence on the south by the south boundaries of the Church of England and Roman Catholic Burial Grounds east 8 chains; thence on the east by the east boundary of the Roman Catholic Burial Ground, a line crossing a road 1 chain wide, and the east boundary of the General Burial Ground north in all 10 chains 38 links, to the point of commencement, but exclusive of the road 1 chain wide aforesaid,—shown on plan catalogued C. 137-1,984.

Department of Lands,
Sydney, 6th June, 1893.PROPOSED RESUMPTION OF PERMANENT
COMMON AT BALLINA.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, it is proposed to revoke the dedication of the Permanent Common at Ballina, area 540 acres, dedicated 19th May, 1868, and hereunder described, with a view

to the proclamation of 160½ acres thereof as a special area, the reservation of 200 acres for Public Recreation, and the sale or other appropriation under the Crown Lands Acts of the remainder.

[Ms. 93-1,892 Ind.] HENRY COPELAND.

DESCRIPTION.

EASTERN DIVISION.

LAND DISTRICT OF LISMORE.

County of Ross, parish of Ballina, containing an area of 540 acres: Commencing on the north boundary of portion 99 at a south-east corner of portion 103; and bounded thence on the west by a line bearing north 100 chains; thence on the north by a line bearing east to the Pacific Ocean; thence on the east by the ocean bearing southerly to a point due east of the starting point; thence on the south by a line partly forming the north boundaries of portions 195 and 99 bearing west to that point,—shown on plan catalogued R. 345-1,759.

Department of Lands,
Sydney, 6th June, 1893.PROPOSED RESUMPTION OF RECREATION GROUND
AT CUDAL AND RE-DEDICATION THEREOF FOR
SHOW GROUND.

It is hereby notified, for public information, that in accordance with the provisions of the 105th section of the Crown Lands Act of 1884, and the 41st section of the Crown Lands Act of 1889, it is proposed to revoke the dedication of the land at Cudal, area 8 acres, dedicated 15th August, 1879, for Public Recreation, and hereunder described, with a view to re-dedication thereof for Show Ground.

[Ms. 93-1,991 Ind.] HENRY COPELAND.

DESCRIPTION.

EASTERN DIVISION.

LAND DISTRICT OF MOLONG.

County of Ashburnham, parish of Boree-Cahonne, area 8 acres: Commencing at a point bearing south 58 minutes west 9 chains 22 links from the south-west corner of portion 22 (5 over VII), W. Starr's 100 acres; and bounded thence on the north by a line bearing east 8 chains 94 links; thence on the east by a line south 8 chains 95 links; thence on the south by a line bearing west 8 chains 94 links; and thence on the west by a line bearing north 8 chains 95 links, to the point of commencement,—as shown on plan catalogued A. 1,921-1,770.

ANNUAL REPORT.

TO THE HONORABLE THOMAS M. SLATTERY, ESQ., M.P., MINISTER FOR MINES AND AGRICULTURE, &c.

Sir,

I have the honor to submit to you the following report upon the working of the Department under your control during the year 1892, having regard, however, chiefly to the progress of mining and the results obtained during the year.

STATEMENT of the Number of Papers registered and Letters despatched by the several Branches of the Department of Mines and Agriculture.

	Papers Registered.		Letters Written.	
	1891.	1892.	1891.	1892.
Mines proper.....	*25,727	21,282	19,392	16,004
Lease Branch, applications and plans registered.....	3,009	1,591
Account Branch	13,843	15,245
Agriculture	8,171	§12,724	9,754	15,981
Stock Branch	†12,914	15,050	5,192	5,034
Public Watering Places	‡13,432	10,955	‡12,193	3,165
Prospecting Votes and Chief Inspector of Mines.....	{ 4,542 1,045	8,108 1,140	2,618 257	3,906 315
Diamond Drills	3,427	2,268	1,175	984
Geological Branch.....	2,642	2,013	3,616	3,243
	88,912	90,466	¶54,202	48,722

* Exclusive of applications to lease. † Returns and circulars not registered this year ‡ Exclusive of caretaker's reports. § This number is exclusive of *Gazette* and seed applications. ¶ This number includes partly printed advices and particulars of seeds and publications despatched. ¶ Exclusive of printed forms, circulars, and telegrams.

It will be noticed that there has been a falling off in the work of some of the Branches, notably in the Lease Branch, due no doubt to the depression which prevailed in mining ventures during the year. The opportunity thus afforded has been availed of to clear off arrears of work, especially in the Lease and Charting Branches, consequent upon the rush which prevailed for some years, and during which all but the most pressing cases were necessarily pushed aside in order to keep pace with the demand for leases.

The officers as a whole have performed their duties with commendable zeal and ability, and I gladly acknowledge, with thanks, the readiness with which they have assisted me in the work of the Department. To the Assistant Under Secretary, and the heads of branches generally, I am especially indebted for the valuable help they have given me in the performance of my duties.

With regard to the acquisition of lands for mining purposes :—

The number of applications to lease Crown lands for mining purposes during 1892, including applications for special gold leases, was 1,068, being 1,142 less than the number in 1891.

Of the 1,068 applications to lease, so made in 1892, 602 were for auriferous land, comprising an area of 3,986 acres 2 roods 37 perches, and 466 were for mineral land, comprising an area of 23,875 acres 1 rood 28 perches.

The number of applications dealt with in 1892 was 1,412, which, compared with the number dealt with in 1891, shows a decrease of 1,617. With the exception of cases in which conflicts of title occurred, applications were dealt with as speedily as possible consistent with safety.

Of the 1,412 applications dealt with 725 were for gold-mining leases, comprising an area of 5,437 acres 3 roods 8 perches, and 687 were for mineral leases, comprising 19,976 acres 5 perches.

The area of auriferous land applied for in 1892 was less by 3,484 acres 2 roods 34 perches than in 1891. The area of mineral lands applied for in 1892 was less by 27,351 acres 2 roods 17 perches than in 1891.

LAND applied for to Lease during the year 1892, and the Minerals to be mined.

	a.	r.	p.		a.	r.	p.
Gold.....	3,986	2	37	Silver	2,243	1	0
Alum	84	0	0	Silver and copper	40	0	0
Antimony	474	0	0	Silver, lead, and copper	820	0	0
Coal and shale	8,386	0	25	Silver and mineral pigments	40	0	0
Copper.....	100	0	0	Shale	100	0	0
Diamonds	378	0	0	Silver, lead, copper, and nickel.....	40	0	0
Gems	20	0	0	Silver, lead, and limestone	352	0	0
Graphite.....	40	0	0	Silver, lead, and platinum	113	2	0
Iron.....	35	0	0	Silver, lead, copper, and platinum	80	0	0
Ironstone	40	0	0	Silver, lead, and ironstone	2,519	2	16
Infusorial earth.....	20	0	0	Silver, lead, copper, and ironstone	380	0	0
Limestone	137	0	0	Silver, lead, limestone, and ironstone	180	0	0
Limestone and ironstone.....	120	0	0	Silver, lead, and tin.....	504	3	4
Ochre and bismuth	40	0	0	Silver, lead, wolfram, copper, ironstone, and tin.....	137	2	23
Opal.....	480	0	0	Tin	2,740	0	0
Ochre (paint pigments)	280	0	0	Tin and diamonds.....	190	0	0
Platinum.....	480	0	0	Tin, silver, and diamonds	20	0	0
Silver, lead, and wolfram	25	0	0	Tin, silver, and copper	40	0	0
Silver, lead, limestone, ironstone, and calcite	20	0	0	Wolfram and scheelite.....	20	0	0
Silver, lead, platinum, and ironstone	40	0	0	Wolfram	80	0	0
Silver and ironstone.....	60	0	0				
Silver and lead	1,975	2	0				
					27,862	0	25

The above table shows a considerable decrease in gold and all other minerals, coal and shale, limestone, ochre, platinum, diamonds, and opal.

AREA held under application to Lease on 31st December, 1892.

	a.	r.	p.		a.	r.	p.
Gold.....	2,089	2	37	Silver	300	0	0
Antimony	120	0	0	Shale	100	0	0
Coal.....	15	0	0	Silver, lead, and copper	260	0	0
Coal and shale	6,581	0	0	Silver, lead, copper, and nickel.....	40	0	0
Copper.....	40	0	0	Silver, lead, and ironstone	260	0	0
Diamonds	38	0	0	Silver, lead, ironstone, and limestone	160	0	0
Gems	20	0	0	Silver, lead, copper, and ironstone	40	0	0
Iron.....	35	0	0	Tin	992	0	0
Infusorial earth.....	20	0	0	Tin, silver, and copper	40	0	0
Manganese.....	80	0	0	Wolfram	20	0	0
Platinum.....	480	0	0				
Pigments.....	200	0	0				
Silver and lead	230	0	0		12,160	2	37

The area held under application to lease, on the 31st December, 1892, shows a considerable decrease as compared with the area so held at the end of 1891. This is mainly due to the decrease in the number of applications to lease made during the past year.

The following table shows the area of Crown lands held under Lease, and the Minerals to be mined:—

Minerals.	Mining Act, 1874.			Mining Act Further Amendment Act, 1884.			Crown Lands Occupation Act, 1891.			Total.

The decrease in the above table is due to the number of leases cancelled during the past year, either for non-observance of the conditions of the leases in regard to the employment of labour or for non-payment of the rents reserved. The number so cancelled is 1,690, comprising an area of 92,156 acres 3 roods 2½ perches; of these 632 were gold leases, covering an area of 4,502 acres 1 rood 85½ perches, and 1,058 were mineral leases, embracing an area of 87,654 acres 1 rood 7 perches.

The number of applications for permits or authorities under Sections 27 and 28 of the Mining Act to mine on or under reserves received during 1892 was 181, being a decrease of 72 compared with the number in 1891. The number dealt with in 1892 was 224, being a decrease of 219 compared with the number dealt with in 1891. The area of land comprised in the permits and authorities granted in 1892 is less by 19,676 acres 3 roods 10 perches than the area so granted in 1891.

Table showing area of reserved lands comprised in permits and authorities granted during 1892, and minerals to be mined thereunder:—

Coal	a.	r.	p.
Coal and shale	10,004	2	39
Shale	41,946	0	38
Silver and lead	1,280	0	0
Copper.....	11	1	31
Tin.....	105	1	32
Copper and cobalt.....	4	0	0
Ironstone.....	4	0	24
Gold and silver	4	0	10½
Gold.....	20	0	0
	190	2	26
	53,570	3	0½

Table showing area of reserved lands comprised in authorities (secs. 27 and 28) issued prior to 1892, and minerals to be mined:—

Coal	a.	r.	p.
Coal and shale	25,524	3	34½
Coal, iron, and shale.....	8,435	0	6
Shale	18	2	16

Gold.....	7	1	15
	87	3	2
	34,375	0	6½

Table

Table showing areas comprised in authorities (sec. 27 and 28) issued which were in force on 31st December, 1892 :—

	a.	r.	p.
Coal	26,003	1	37
Coal and shale	9,141	0	26
Coal, iron, and shale	18	2	16
Shale	8	2	32
Limestone	10	0	0
Tin	156	1	10
Copper	205	3	22
Bismuth	4	1	7
Copper and cobalt	4	0	28
Antimony	7	1	15
Gold	95	2	25
	<u>35,655</u>	<u>2</u>	<u>18</u>

The foregoing tables comprise all lands occupied for mining purposes other than Crown lands held in virtue of miners' rights and mineral licenses, and alienated lands. These exceptions comprise a considerable area, but the exact extent is not known.

The following information has reference to the search for minerals in alienated lands, and the removal of minerals from such lands :—

The number of permits to dig and search for gold in terms of the Crown Lands Act, 1884, applied for during 1892 was 194, being a decrease, as compared with such applications in 1891, of 70. The number dealt with in 1892 was 148, being a decrease, as compared with 1891, of 93. The number of such permits in force on 31st December, 1892, was 139. The number in force at the end of 1891 was 310.

The number of applications for permits, under the Mining Act, 1889, to dig and search for gold and other minerals in 1892, was 209, being less by 263 than in 1891. The number dealt with in 1892 was 206, being less by 263 than in 1891. The number of such permits in force on the 31st December last, 96. The number in force at the end of 1891 was 99.

The number of applications for permits, under Section 7 of the Land Act of 1884, to win and remove gold and minerals reserved in the Crown grants of freehold lands received during 1892 was 94, being less by 22 than in 1891. The number of such applications dealt with in 1892 was 56, being 31 less than in 1891. The number of such permits in force on the 31st December last was 185. The number in force at the end of 1891 was 182.

The royalty received during 1892 was, from alienated land, £2,340 10s. 2d., and from Crown lands £7,703 7s.

During the past year the returns of gold and mineral leases and permits, under sections 27 and 28, have been punctually published, so that the public may know what lands are not being worked.

PROSPECTING BOARD.

During the year 1892 the Prospecting Board visited, amongst others, the following places, viz. :—

Adelong	Condobolin	Hill End	Peel
Alectown	Coolac	Hillgrove	Rockley
Araluen	Cooma	Home Rule	Rylstone
Armidale	Cowra	Inverell	Sally's Flat
Ashford	Cudal	Kempsey	Sofala
Ballina	Dalmorton	Kerr's Creek	Stuart Town
Barmedman	Deep Creek	Kookabookra	Sunny Corner
Barraba	Deepwater	Lewis Ponds	Taralga
Bateman's Bay	Denison Town	Leadville	Temora
Bathurst	Drake	Limekilns	Tilba-Tilba
Batlow	Dungog	Lionsville	Tingha
Bega	Euabalong	Lucknow	Trunkay Creek
Bendomeer	Eden	Mandurama	Tuena
Bermagui	Emmaville	Marulan	Tumbarnmba
Bingara	Engowra	Mogo	Tumut
Blayney	Fernmount	Moonan Brook	Two-mile Flat
Bombala	Forbes	Moruya	Umaralla
Bowraville	Forest Reefs	Mount M'Donald	Upper Pyramul
Braidwood	Galley Swamp	Mullion Creek	Uralla
Bredbo	Girilambone	Nelligen	Walcha
Brimbramallia	Glanmire	Nerriga	Wattle Flat
Bundarra	Glen Elgin	Nimitybelle	Wellington
Byrock	Glen Innes	Nine Mile	Windellama
Canadian Lead	Gloucester	Nymagee	Windeyer
Canowindra	Grafton	Nyngan	Wiseman's Creek
Captain's Flat	Grenfell	Oberon	Woodstock
Cargo	Gulgong	Orange	Woolgoolga
Cassilis	Gundagai	Pambula	Young
Clear Creek	Guyra	Peak Hill	

During the year 1,370 applications for aid were received, which were disposed of as under :—

Aid granted in	653 cases, as against 312 cases in 1891.
Aid refused in	432 cases, as against 206 cases in 1891.
Applications abandoned	63 cases.
Applications not yet dealt with...	222 cases, as against 296 cases in 1891.

1,370

814

The results of the operations under this Vote were, on the whole, fairly satisfactory so far as regards work done on selected sites, but unfortunately in many cases the full benefit of the discovery has not been secured, owing to the prospectors and the holders of surrounding claims lacking the means or the enterprise to develop the deposits. No doubt the financial depression which prevailed during the greater part of the year rendered it very difficult to secure the requisite capital. As regards the parties who were aided to search for new fields, I regret to say their efforts were absolutely without success. The districts in which these parties searched were Braidwood, Nymagee, Nundle, Stewart's Brook, Bingera, Niangala, Carcoar, and Hillgrove.

It affords me much pleasure to recognise the zeal with which Mr. David M'Culloch has performed the duties of Secretary to the Board.

The following extracts are taken from reports on the work of parties aided from the Prospecting Vote for 1892:—

1. Walker and Middleton.—The Warden's clerk, Dalmorton, reports that no gold is visible, but some of the quartz will yield about 30 per cent. of mineral, which Mr. Walker states is very rich in gold. This reef is situate at Cherry Tree Creek, Dalmorton.
2. P. Fitzgibbon, Mount M'Donald.—The Warden's clerk at Mount M'Donald states that this prospector has struck a reef, which is about 10 inches wide, and is estimated to yield about 12 dwts. per ton.
3. James Headrick, Kangaroo Flat.—The Warden's clerk at Drake reports that the prospects of this and the adjacent claims are very encouraging, gold being visible to the naked eye in almost every piece of stone broken from the reef.
4. John Ellis, junr., Tucker's Gully, Drake.—The Warden's clerk, Drake, reports that this mine is being worked for silver, and assays made give a return of 40 oz. of silver and $\frac{1}{2}$ oz. of gold per ton.
5. C. H. Vickery, Roper's Gully, Drake.—The Warden's clerk, Drake, reports that this reef is about 19 inches wide, and gold can be seen in almost every piece of stone broken down.
6. Henry Bowers, Stoney Creek, Tingha.—The Warden's bailiff at Tingha reports that this shaft was bottomed at 128 feet, and 10 inches of wash obtained containing about 1 lb. tin to the dish, and considers that payable wash will soon be struck through driving.
7. G. G. Talbot, Buckley's Reef, Tallewang.—The Chief Inspector of Mines reports that the last crushing from this reef yielded 15 dwt. per ton, the average thickness of the vein being 9 inches.
8. Thomas Cotterill has struck a reef at Back Creek, Rockley, and assays made yielded 64 oz. 7 dwt. silver and 19 dwt. 11 gr. gold per ton.
9. Sowden and Hardwick, Gally Swamp, Carcoar, have struck a gold-bearing reef, showing very favourable indications. A subsequent report states that this reef has been proved payable.
10. Jacob Nail and party, Valentine Hill, Tambaroora, have cut a new reef 10 inches thick showing gold freely, and also two small veins carrying gold.
11. William Rowe and party, Forest Recfs, have been successful in striking gold, yielding at the rate of 2 oz. to the ton.
12. John Clymo and party, Laucashire Reef, near Hill End, at a depth of 60 feet, have struck a vein 2 feet 6 inches wide, estimated to yield 15 dwt. per ton, which is considered payable.
13. Oliver and party, aided to sink a shaft at the lower end of Adams' Lead, Gulgong, report having bottomed at 150 feet. The wash is about $3\frac{1}{2}$ feet thick, without water, and yields 2 to 3 grains to the dish.
14. Charles Beagley, Mount Carrington, Drake.—A parcel of 8 tons, taken from this shaft, yielded 25 oz. 12 dwt. retorted gold. A second crushing of 2 tons yielded 145 oz. 9 dwt. gold.
15. New Hargraves Gold-mining Co., Hargraves, have struck gold in their straight shaft at 114 feet. The average thickness of vein is about 9 inches, and gold is regular throughout the stone. This reef is one of a series known to exist in the auriferous belt which can now be easily worked owing to the ground, through the powerful machinery used, being free from water. Splendid results are anticipated when the ground is properly opened, and taking the whole body of the stone now raised, it should yield (say) 30 to 50 oz. to the ton. Samples of pyrites from this find assayed 179 oz. to the ton. **NOTE.**—Further developments proved this to be a patch only, but prospecting is being vigorously proceeded with.
16. Mason and party, Snowball, Braidwood, were aided to open out a paddock, and, at a depth of 11 feet, obtained from two loads 6 oz. 11 dwt. gold. One nugget weights 1 oz. This find has caused some excitement in the district.
17. John Slattery, junior, and party, Sally's Flat, Hill End, have, at a depth of 50 feet, struck a reef about 7 inches wide, and likely to improve with depth, which yields 7 dwt. per ton, and is considered payable, the ground being easily worked.
18. Farthing and Oliver, Adams' Lead, Gulgong, have struck payable gold at a depth of 150 feet. This party received aid to continue their 110-foot shaft another 40 feet.
19. C. Staples and party were aided to sink on M'Guigan's Lead, Parkes, and are now raising payable stone, yielding about 1 oz. of gold per ton.
20. Coomber and Williams, Alectown.—A report from the Warden's clerk there states that the leader met with in their shaft is now about 9 inches wide, well defined, and gold can be seen in the stone with the naked eye. The party have every hope that this will prove a payable vein.
21. Cook and Barnett, Lady Jersey Reef, Tichborne, have struck a rich patch of gold at the 35 feet level, from which 92 oz. of gold were obtained from 25 lb. weight of specimens.
22. J. Unsworth and party, East of Star Lead, Gulgong, report that payable gold has been obtained in their claim. Operations have resulted in 2 grains to the dish, with a face of 2 feet of heavy quartz wash.
23. Charles Curnow, Chump Reef, Ironbarks.—A drive has been put in 32 feet south from shaft on a well-defined reef of over 2 feet of average thickness, and 8 feet at north of shaft, where the reef is 4 feet wide, and, as far as can be judged without a crushing, is believed to carry payable gold. This reef, from present appearances, should be permanent.
24. John Sweeney and party, Calula, report that a parcel of 2 tons, treated at Clyde Works, yielded 4 oz. 8 dwt. gold. This party are proceeding with the erection of extensive machinery.
25. M'Namara and Slattery, Alectown, discovered a reef which is from 18 inches to 2 feet wide, and appears payable. A crushing is now being got out.
26. Charles Walker, Florida Reef, Dalmorton.—The Warden's clerk reports that this reef is about 5 inches wide, and highly mineralised; carries very fair gold, and appears to improve as it gets deeper.
27. Jacob Scott and party, Valentine's Hill, Tambaroora.—This reef is about 6 inches thick, and, it is considered, will yield 1 oz. per ton.

28. P. Keane and party, Allectown.—The Warden's clerk reports that the reef, struck by this party, is over 11 feet wide, and is estimated to yield 1 oz. per ton.
29. William Lonorgan, Hargraves, reports that 5 tons quartz crushed from the reef he was aided to prospect, yielded 21 oz. 18 dwt. gold.
30. Watt Hetherington and party, while prospecting on wages at Hillgrove, struck a good-looking reef, which is likely to prove payable. A bulk test is to be made of the stone.
31. Homeward Bound Gold-mining Co., Gally Swamp, have struck two rich shoots of gold, which will give a great impetus to mining in that locality.
32. Thos. Lee and party, near London Lead, Parkes, struck wash-dirt 6 feet thick, six loads of which yielded 2 oz. 6 dwt. gold.
33. Fred. Copper, 2-mile Flat, Gulgong.—A sample of stone from this shaft yielded, on assay, at the rate of 20 oz. 17 dwt. 23 gr. gold and 3 oz. 11 dwt. 19 gr. of silver per ton, and a second sample yielded 19 dwt. 11 gr. of gold and 5 dwt. 10 gr. silver per ton.
34. Henry Butcher, Allectown.—This reef is 16 inches wide and contains visible gold, estimated to yield 15 dwt. to the ton. This stone is, however, highly mineralised.
35. Archie Richard, Bathurst.—The stone taken out from this reef is estimated to go about 8 dwt. per ton, and is improving.

During the year seven parcels of ore have been treated in Sydney under the supervision of the officers of the Geological Branch. In some cases the Board considered it advisable to test the true value of a reef or deposit before recommending that aid be granted to open it out. It is the practice, therefore, to defray the cost of railway carriage and treatment from the vote when the returns from the treatment would not cover such cost. The ore came from Borah Creek, Inverell, Newbridge, near Oberon, Condobolin, Gundagai, Kempsey, and Scrubby Rush.

GEOLOGICAL SURVEY.

On the 22nd February the Government Geologist proceeded to Broken Hill with the object of inspecting the work being performed there by Mr. Geological Surveyor Jaquet, and instructing him as to the area to be examined, &c. While in Broken Hill he inspected and reported upon several mines for which aid had been applied for under the Prospecting Vote. He also inspected the underground workings of the principal mines at Broken Hill, and the information gained there led him to the conclusion that the Broken Hill lode, in its mode of occurrence, is analogous to the peculiar saddle reefs of the Bendigo district of Victoria. On his return to Sydney he made a special report (which is appended) on this subject.

During parts of the months of April and May he inspected and reported upon a number of applications for aid from the Prospecting Vote for mines in the neighbourhood of Woodstock, Murrumburrah, Junee, and Grong Grong.

From the 26th May to the 1st June he was engaged (in conjunction with Mr. Boulbee) in choosing a site for a bore in the neighbourhood of Nyngan, for the purpose of obtaining a water supply for stock.

During the months of May and June he traced the course of several dolerite dykes in the hills surrounding Sydney harbour, and made a careful geological examination of Cremorne Point with the object of choosing a site for a second diamond-drill bore to test for coal there. On the 26th June he furnished a report (a copy of which is appended) and indicated a site which has since been adopted.

On the 27th June he proceeded to Newbridge and investigated a number of applications there and at King's Plains for aid from the Prospecting Vote. On his return to Sydney he furnished a report on the recently discovered reefs at Sugar-loaf, near Newbridge.

On the 21st July he proceeded to Springwood and examined a supposed gold reef near the banks of the Nepean River. It proved to be merely a bed of ferruginous grit in the Hawkesbury sandstones, and contained neither gold nor silver.

In September he visited Hillgrove and made a geological examination of an area of ground which had been resumed by the Government, from Mr. R. Hargrave, for a reservoir for supplying the town of Hillgrove with water. He also investigated a number of applications for aid from the Prospecting Vote for mines in the neighbourhood of Hillgrove.

On the 11th October he again proceeded to Armidale and gave evidence before the Court as to the mineral value of Mr. Hargraves' land. He also inspected some alluvial workings in the neighbourhood of Uralla, and reported as to the inadvisability of resuming the conditional purchase on which the lead is situated.

During the month of November he inspected the various coke ovens at Wallsend, Rix's Creek, Lithgow, and Bulli, and furnished a report (which is appended) on the relative composition and crushing strength of the cokes manufactured in the Colony, and those imported from Germany and Great Britain for use at Broken Hill.

During the year a large number of papers have been reported upon in reference to proposed alienations of land within gold-fields.

During

During the first two or three months of the year the Senior Geological Surveyor, Mr. Wm. Anderson, was engaged chiefly in investigating applications for aid from the Prospecting Vote. On the 21st March he left Sydney for Braidwood, and commenced a geological survey of the valley of the Shoalhaven River. It is hoped that this survey will be of practical use in view of the amount of attention which is being devoted to the auriferous drifts of the Shoalhaven valley.

Mr. Anderson has already finished a map of a small area in the vicinity of Major's Creek, and it is hoped that the map, which is now in the Government Printer's hands, will be issued with this year's report.

Mr. Geological Surveyor G. A. Stonier, F.G.S., has during the year travelled over a considerable portion of the Colony, a great part of his time having been taken up in reporting upon proposed revocations of reserves, alienation of portions of land within gold-fields, and in investigating and reporting upon applications for aid from the Prospecting Vote. He also furnished a long report upon the geology of the Swamp Oak and Niangala gold-field.

Mr. Geological Surveyor J. B. Jaquet, A.R.S.M., F.G.S., has during the past year, completed his geological survey of Broken Hill, and is now engaged upon the map and report, which it is believed will be of general interest. He has also investigated several applications for aid from the Prospecting Vote, and has examined the country in the Purnamoota, Thackeringa, Pinnacles, Appolyon Valley, Umberumberka, Euriowie, Tarrawingee, Nuntherungie, Wankeroo, and White Cliffs districts, and has furnished reports upon the Nuntherungie silver-field, the platinum deposits near Broken Hill, and the opal fields at White Cliffs, near Wilcannia.

Parliament having provided on the estimates for 1892 a salary for an extra Geological Surveyor, Mr. J. E. Carne, F.G.S. (who has for many years filled the office of Curator of the Geological Museum) was, on the 1st September, promoted to the new position. Mr. Carne's time since his promotion has been mainly taken up by work in connection with the Chicago Exhibition whither he proceeded in charge of the exhibits of this Department.

The position of Curator of the Museum and Mineralogist, vacated by Mr. Carne, has been filled by the appointment of Mr. G. W. Card, A.R.S.M., F.G.S., who had previously occupied the position of Assistant Demonstrator in Geology at the Royal College of Science, London. Mr. Card was highly recommended by Professor Judd, and has special qualifications as a mineralogist and petrologist. It is believed that he will afford valuable assistance in the study and classification of the igneous rocks of New South Wales.

The laboratory attached to the Department continues to be largely used by the public. During the past year 3,570 numbered samples were dealt with by the Analyst and Assayer, Mr. J. C. H. Mingaye, F.I.C., F.C.S., and his assistants, and of these 207 samples were analysed and the remainder assayed. There were in addition to these 330 check assays made.

Professor David, B.A., F.G.S., has been good enough to furnish a report on the kerosene shale or torbanite at Doughboy Hollow, near Murrurundi. The report was written from data collected by Professor David when he occupied the position of Senior Geological Surveyor in this Department. A copy of the report is appended.

The Palæontologist, Mr. Robt. Etheridge, jun., F.G.S., has done a large amount of useful work in determinative and descriptive Palæontology during the year, and another valuable memoir from his pen has been published, the subject of it being the Carboniferous and Permo-Carboniferous Invertebrata of N.S.W., part 2. Mr. Etheridge has also contributed largely to the subject matter of the three numbers of the "Records of the Geological Survey," which have been published during the year. He has also continued to perform very creditably the duties of librarian, and in addition to his ordinary duties, made, in conjunction with Mr. John Mitchell, an examination of the Goodravale Caves.

Mr. W. S. Leigh, Superintendent of Caves, has done good work in improving and supervising the caves under his charge at Jenolan, Wombeyan, Yarrangobilly, Wellington, Abercrombie, and Rosebrook, and has made several reports (which are appended) upon newly-discovered caverns.

It affords me great pleasure to state that all the officers of this branch, including the juniors, have displayed great interest in their work, which has been performed carefully and well.

It is interesting to note that a new mineral, having a definite crystalline form, and consisting of iodide of copper, has been discovered by Mr. C. W. Marsh at Broken Hill. Mr. Marsh discovered the mineral in the Alldridge collection, and it is supposed to have come from one of the upper levels of the Broken Hill Proprietary Silver Mine. The mineral has recently been described in a paper, by Mr. C. W. Marsh, read before the Royal Society by Professor Liversidge, who has given it the name "Marshite," in honor of the discoverer. I understand that several specimens of the mineral have since been found in the Proprietary Mine, and Mr. Marsh has been good enough to send one for the Geological Museum.

MINING SURVEYS, &c.

The number of mining surveys made during last year was 671: of these 376 were for gold leases, 147 for mineral leases, 118 for mining tenements, and 30 for mining permits. Seventeen surveyors were employed, of whom 9 were salaried, and 8 non-salaried, but 4 of the former were employed only during the early part of the year, and another was engaged from April to the end of the year on important colliery surveys in the Newcastle district, and has made very careful and elaborate surveys of the Hetton, the Stockton, and the Wickham and Bullock Island Collieries. Of the above mentioned surveys, 631 were made by the salaried surveyors. The number of lease applications awaiting survey on the 31st December was 85, of which 58 were for gold and 27 for other minerals. These applications are scattered over a very large area, and being in most cases for isolated portions, very far apart, a large amount of travelling will necessarily be involved in dealing with them, especially as the staff of salaried surveyors is now reduced to five.

Charting Branch.

As an improved system of keeping the entry-books has been in force during the year, and as new forms of draftsmen's monthly returns were adopted, it is now possible for me to submit returns that will balance exactly.

The average number of lease cases dealt with by each charting draftsman, per month, was 25½. This I consider to be a very fair average indeed, as the charting work was intermittent, and the draftsmen had, consequently, to take up other kinds of work. I have no doubt that during a busy time the above average will be greatly exceeded.

In addition to the charting of lease work, mining tenement surveys to the number of 1,633 were examined and charted, but they were not included in the above average. This work had never been dealt with before, but it has now been thoroughly completed, and will prove to be of great benefit.

The Examiner of Charting reports that the charting work has been performed in a most satisfactory manner, and that the draftsmen engaged on that work have reached a state of great efficiency.

In the compiling section of the Charting Branch, 29 compilations were put into office use during the year, and they embraced 47 parishes or parts of parishes. Thirty-three compilations were examined, 27 published, and 11 were in hand at the close of the year, in various stages of progress. The work has been well performed indeed, with the exception of some done by contract draftsman March, who has left the Department.

The work of charting up mining maps for wardens, mining surveyors, and others, was heavy; as many as 543 maps were completed and issued.

The 28-clause work is now in a most satisfactory state, and there will be no difficulty, in future, owing to the present system of dealing with it, in keeping up to current work.

The applications to dig, and search, and remove minerals and gold from alienated lands, dealt with, numbered 422. The work of dealing with these necessitated a great deal of inquiry and reference to the Lands, Registrar-General's, and other Departments, and this has been performed in a most satisfactory manner by Mr. E. P. Mayes, who is singularly well qualified for this duty. Mr. Mayes also dealt with a great deal of miscellaneous work, and assisted with various matters which required reference to other Departments.

The work of properly noting plans with cancellations, refusals, &c., is found to be of great convenience, not only to the Charting but to the Clerical Branch as well. The back noting necessitated a great deal of labor, for upwards of 5,000 plans were noted during the past year.

The notifications and cancellations of reserves, gold-fields, &c., and alterations in, and preparations of descriptions of mining divisions, wardens' courts, and miscellaneous work of this nature, has been well and carefully performed by Mr. Lee, sometimes assisted by probationer Landers. Four hundred and sixty-three papers in connection with the above work were disposed of last year, and this necessitated a great deal of work.

The re-arranging of the catalogue books was taken in hand by Mr. Jaques. This was greatly needed, and I am glad to say it has been completed most satisfactorily.

A considerable amount of plan-mounting and other allied work was done by the plan-mounter, Mr. Bowles. Three thousand one hundred and forty-nine plans, maps, &c., and 170 sheets of drawing-paper were mounted, and 1,994 parcels of maps and plans were put up for post, as well as various packages, &c., for different Branches of the Department.

In March the contract draftsman took over the work of plan-drawing for the surveyors, and the work has been satisfactorily performed and speedily.

I may add that the Branch is now in a most efficient state and quite prepared to meet any rush or great influx of work.

COMPILATION OF MINING MAPS.—Report for the year 1892.

The year's work has resulted in a considerable addition to the number of mining maps—a total of twenty-nine (29) compilations, embracing forty-seven (47) parishes or parts of parishes, having been put into office use as against sixteen (16) compilations, embracing twenty-five parishes or parts of parishes, for the previous year. Thirty-three compilations were examined and completed, twenty-seven published, and eleven remained on hand in various stages of progress.

Seventy-six proofs of parish and town maps were received from the Lands Department, seventy-seven were revised for mining work and returned, and copies of thirty-seven of these maps (as against twenty-six for the previous year) were adopted as mining maps and put into office use, making a total of sixty-six new maps for the year, as against forty-two for the previous year. As the past year was the first during which a complete record of the different stages of the work was kept, a comparison with previous years, on other items than those given, cannot be made.

In the latter end of 1891 instructions were issued to all mining surveyors in reference to the numbering of mining surveys, with the object of reducing the size of the cumbersome references hitherto necessary. This action has already resulted in a considerable reduction of size, and consequently cost, in preparing the same. Surveyors are now instructed as to what numbers are available in any parish in which surveys have to be made, the lowest available numbers being given. In localities not yet embraced in mining maps, considerable trouble is experienced in ascertaining what these numbers are, owing to the want of gold and mineral references on some of the maps in the Lands Department; but this trouble will gradually decrease, as proofs for new editions of all maps showing mining measurements are now forwarded to this Department for revision before being published.

A uniform system of lettering is now adopted for all maps prepared in the Charting Branch, and a considerable advance has been made in their legible reproduction at the Government Printing Office, but there is still room for improvement in the matter of obtaining a reduced map accurate to scale.

During the year copies of mining maps, periodically charted up to date, have been supplied as under:—To wardens, 379; to district surveyors, 70; to mining surveyors, 43; to others, 51; total, 543.

LIST of new Maps published during 1892.

Parish, or part of.	County.	Parish, or part of.	County.

INSPECTION OF MINES OTHER THAN COAL AND SHALE MINES.

The report of the Chief Inspector of Mines (Mr. Slec, F.G.S.), states that 18 fatal and 28 non-fatal accidents occurred in connection with metallic mining during 1892, being a decrease of two fatal accidents and 4 non-fatal accidents as compared with 1891. Unfortunately, the percentage of fatal accidents is slightly higher this year than during 1891, being 1·04, as compared with ·93, and the non-fatal accidents 1·62, as against 1·49 during the same period. During the year there was 1 fatal accident for every 963 miners employed, as against 1 in every 1,071 miners employed during 1891. Of the 18 fatal accidents during the year, 2 were from falling down shafts, 2 from fall of timber, 7 from fall of earth, 5 from explosion of shots, 1 from flooding of mine, and 1 due to an accident to the boiler. Of the non-fatal accidents, 2 were from falling down shaft, 1 from bucket falling down shaft, 5 from fall of earth, 13 from explosion of shot, 2 from injury by railway trucks, and 5 miscellaneous.

The following localities were inspected during the year :—

By the Chief Inspector.

Orange, Blayney, Carcoar, Cowra, Bathurst, Wattle Flat, Sofala, Hill End, Hargraves, Windeyer, Mudgee, Gulgong, Denison Town, Leadville, Rylstone, Cudgegong, Woodstock, Canowindra, Cargo, Alicktown, Peak Hill, Tomingley, Cobar, Billygoe, Nymagee, Parkes, Forbes, Grenfell, Gundagai, Adelong, Tarcutta, Tumberumba, Snowy River, Coolac, and Muttama Districts.

By Inspector Milne.

North—Armidale, Hillgrove, Rockvale, Uralla, Glen Innes, Glen Elgin, Inverell, Stewart's Brook, Moonan Brook, and Copeland. South—Marulan, Towrang, Taralga, Mount Werong, Goulburn, Bungonia, Windellama, Curragh Creek, Boro, Braidwood, Nelligen, Brimbramalla, Yalwal, Mogo, Moruya, Nerigundah, Wagonga, Mount Dromedary, Bega, Bermagui, Coolagalite, Pambula, Wyndham, Cooma, Queanbeyan, Captain's Flat, and Bungendore. West—Rylstone, Ilford, Mudgee, Gulgong, Denison Town, Windeyer, Hargraves, Hill End, Sofala, Quartz Ridge, Wattle Flat, Sunny Corner, Bathurst, Newbridge, Caloola, Cowra, Cargo, Canowindra, Orange, Ophir, Stuart Town, Peak Hill, Myall, Parkes, and Molong.

By Inspector Hebbard.

Mr. Hebbard is stationed at Broken Hill, and, in addition to making frequent inspection of the mines in the Broken Hill District, has also visited the localities of Purnamoota, Apollyon Valley, Thackaringa, Umberumberka, Nuntheringie, Numba, Mount Browne, and Tibooburra.

DIAMOND DRILLS.

Though the demand for diamond drills was not nearly so great in 1892 as in previous years, the work was, as usual, successfully conducted under the supervision of Mr. W. H. J. Slec, F.G.S.

The aggregate depth bored in 1892 was 4,139 ft. 1 in., being 3,658 ft. 8 in. less than in 1891. Average cost per foot in 1892 was 16s. 0½d, as compared with 14s. 11¼d. per foot in 1891. Cost of diamonds used in 1892 was 2s. 2d. per foot bored, as compared with 1s. 9¾d. in 1891. But for the increase in the cost of diamonds, and the large diameter (5½ inches) of the Cremorne Bore, the cost would have been less than in 1891. The earnings of the diamond drills during the year amounted to £3,486 7s. 11d. The amount paid into the Treasury during the year was £4,359 12s. 5d., the surplus over the earnings being part of the earnings of 1891, which was received too late to include in the Report for 1891. The result of the year is a debit balance of £26 6s. 4d. This has been caused by having to purchase during the year a new stock of diamonds and boring rods. The aim being to work these drills in such a manner that the persons who employ them shall have their work done at cost price, it is the duty of the Superintendent to estimate the cost of each bore at such a rate as will just cover the cost. In this he is invariably successful; but usually there is a slight balance in favour of the Department.

METALLURGIST.

In June, 1886, it was decided that efforts be made to secure the services of a thoroughly competent metallurgist to take charge of metallurgical works to be established in or near Sydney on a site as convenient as possible for the carriage of ores by rail or water. It was also decided that the selection of the site be left to the metallurgist, who should advise upon the necessary building and appliances. Advertisements were published, and inquiries instituted in Europe and America, the result being a
number

number of applications, and eventually it became necessary to make a selection. With this object, a Board was appointed, consisting of Mr. Cosmo Newbery, C.M.G., of Melbourne; Professors Liversidge and David, of the Sydney University; Dr. Liebius, of the Sydney Branch of the Royal Mint; Mr. Pittman, the Government Geologist; and myself. The Board advised the appointment of Mr. James Taylor as the most suitable of the applicants. The Board also advised that on account of the costliness of erecting smelting works and carrying on smelting operations for the purpose of satisfactorily testing bulk samples of ores, the Government should not in the first instance erect such works, but should erect suitable crushing and concentrating apparatus, sampling-floors, and appliances for the extraction of gold, silver, and other metals by processes other than smelting, and that persons duly authorised be allowed to see the working of any process he may use in the extraction of metals from ores and the separation of metals so extracted.

SCHOOL OF MINES.

In dealing with this important question it was requisite, in order to avoid unnecessary expenditure of public money, to take into consideration the provision made outside this Department for imparting instruction in mining subjects. To have started a separate school of mines without regard to what had already been done, would have involved the expenditure of a very large sum of money in the erection and fitting up of suitable buildings, and a large annual expenditure in maintaining the same and providing the necessary teaching staff, and then such a school would have been duplicating much of the work undertaken at great expense by the Sydney University and the Technical Branch of the Department of Public Instruction. Under these circumstances, it was deemed expedient to appoint a Board, consisting of gentlemen representing the University, the Department of Public Instruction, and this Department, and possessing some knowledge of the subject referred to them.

The Board at once recognised the importance in the public interest of utilising to the fullest extent the expenditure already incurred, and the provision made for giving instruction in subjects included in the curriculum of a mining school, and addressed themselves to the consideration of the best means of providing as complete a course as possible for the training of mining engineers and mine managers respectively, while guarding against unnecessary duplication.

It appeared to the Board that the Technical Branch of the Department of Public Instruction possesses facilities for imparting instruction in mining centres which might prove of the greatest advantage to persons engaged in mining pursuits who cannot afford to devote the time in Sydney necessary to qualify for a certificate, and that such persons might thus, while following their avocations in the mine, acquire as much theoretical instruction as would enable them to pass the requisite examination in some of the subjects, if not in the whole course. In order that all candidates for the certificate of competency as mining manager shall possess practical as well as theoretical knowledge, the Board stipulate that in addition to passing the prescribed examination in the several subjects of the course, they shall produce proof of having for a period of at least two years been employed in a mine. Consequently, a student at the Technical College in Sydney will be required, either before entering upon his course of instruction, or at any rate before presenting himself for examination, to have served at least two years in a mine.

The course at the University provides for the higher training necessary to qualify for the degree of Bachelor of Engineering in mining and metallurgy. This course includes a large amount of practical work in the laboratories, but no practical training in a mine is requisite for this degree, but before proceeding to the degree of Master the graduate must produce proof of practical training in a mine or metallurgical works. This course should provide a class of Managers that should be of the greatest value in our larger mines, and the difficulty of treating the refractory ores in so many of our mines will afford ample scope for their employment, and they should be able to render valuable service to the Colony.

In order that students who enter for the Mining Manager's Certificate may proceed to the higher course at the University with the smallest sacrifice of money and time, the Board recommends that any student who produces a certificate from the Technical Branch of having passed the examination for the first or second year's course, or for any subject comprised in such course, be exempted from attending lectures or passing the prescribed examination at the University for such first or second year's course or for such subject. The Board also suggests that facilities be afforded for entering upon the course of the Mining School at the University, and approve of the proposal to provide bursaries to enable students to complete their course at the University. The Board also recommends that facilities be afforded to Mining Students at the University and at the Technical College to acquire practical instruction under the Government Metallurgist in metallurgical processes and in the manipulation of metallurgical appliances.

MINERAL PRODUCTS.

When writing my report for 1891, I fondly hoped I should have had the pleasure of reporting that at the end of 1892 the value of our mineral products had exceeded one hundred millions sterling. Had the value of our output in 1892 equalled that of 1891 my expectation would have been realized, but, unfortunately, owing to the strike at Broken Hill, and the financial depression as affecting mining ventures, the value of our output in 1892 fell short of that of 1891 by £1,349,194 9s. 4d. Consequently, the value of the minerals produced up to the end of 1892 amounted to only £98,812,779 1s. 5d. Notwithstanding the decrease, as compared with 1891, the value of the output in 1892, £5,305,815, is greater than that of any year prior to 1891, and exceeds the decennial average by £1,207,456. With an increase in knowledge regarding the treatment of ores it is more than probable that many of our mines now idle or struggling to exist may become prosperous ventures and afford increased employment to a number of miners and others. The decreases in the value of the output of minerals other than silver ores is more than counterbalanced by the increases in the output of other minerals.

The following table shows the aggregate value of minerals, the produce of New South Wales for the years 1891 and 1892 respectively compared:—

Minerals.	Quantity.	Value.		Quantity.	Value.		Increase in Value.		Decrease in Value.	
		£	s. d.		£	s. d.	£	s. d.	£	s. d.

GOLD.

The value of gold won in the Colony from the opening of our gold-fields to the end of 1892 amounts to £39,202,655 15s. 2d. The output in 1892 was 156,870 oz. valued at £569,177 17s. 4d. being £10,872 5s. 1d. in excess of the value of gold won in 1891, and being the largest of any year since 1876. From 1888 when the output was the smallest of any year since the discovery of gold in this Colony the quantity of gold has increased each year, whether this increase is due to the aid granted out of the vote for prospecting, and if so, to what extent, it is not possible to determine with any accuracy, but it may, I think, be fairly assumed that it has contributed in some degree, and had the prospectors, who, with the aid afforded them, have made discoveries, possessed in all cases the requisite enterprise, and been able to secure the necessary capital to develop the deposits, the results would have been much more definite and more satisfactory. There can, I think, be little doubt that we are not realising the full benefit of our gold-mines, and shall not, until we are able to extract and save all the gold contained in the ores we are treating, and that contained in ores we are not yet able to treat satisfactorily. Without desiring to appear too sanguine I cannot help thinking that with the requisite knowledge and appliances we might increase our output of gold to such an extent that our gold-fields would become attractive to both capital and labour.

1872 ...	425,129	1,643,681 16 11		10,530,322	39,202,655 15 2

The following extracts taken from the reports, furnished by the Wardens and Mining Registrars, indicate the condition of mining in the several Mining Districts and Divisions:—

BATHURST DISTRICT.

The value of gold won in this district is given as £37,132 10s., as compared with £34,194 16s. 5d. during 1891. One thousand two hundred and forty tons of stone from the Paddy Lackey Claim, at Dark Corner, yielded gold to the value of £3,800 14s. 2d. The last crushing of 485 tons, taken from the 350 feet level, gave 475 oz. of retorted gold—the result of fifteen weeks work. The proprietors of the Big Hill Mine, also situated in the Mitchell Division, crushed 1,700 tons of stone for 296 oz. of retorted gold. It is stated that a number of men fossicking in the same Division obtained 735 oz. of gold.

At Oberon, in consequence of a rush, Stevenson Brothers, after obtaining the necessary authority from this Department, threw open their Essington Estate to the miners. The rush, however, proved a failure, and the ground is now all but abandoned.

From the localities of Glanmire and Clear Creek 338 oz. were obtained, valued at £1,267 10s.

Rockley contributed 313 oz. of gold, valued at £1,173 15s., 80 oz. of which were obtained by Cotterill and Party by means of sluicing.

Lambert and Party, prospecting on the Sugar Loaf Hill, near Newbridge, reported payable gold. This caused a rush, and a number of leases were taken up, on which some real good surface shows have been obtained. Some trial crushings have been made, giving returns from 8 dwt. to 2 oz. to the ton. The nearest battery being 7 miles away, the reefs have not been proved to any great depth.

On the Isabella River, in the Burruga Division, Reid and Party are driving a tunnel into the mountain in search of a gold-bearing lode, which they expect to strike at about 250 feet. They are now in 110 feet.

Heylin and Party are still proceeding vigorously with their prospecting operations in a range above the Burruga township.

Tuena has not yielded so well during last year, the total being about 700 oz., valued at £2,625. Prospecting is still being carried on at Junction Point, Victoria Flat, and Markdale.

At Trunkey 530 oz. of alluvial gold were won, valued at £2,062 10s. The old reefs known locally in Cronin's line of reefs are again being opened up by Mr. Vivian, who is now erecting pumping and winding machinery on the main shaft, which is to be sunk to a depth of 300 feet.

Blayne yielded 456 oz., principally from the Last Chance Mine at King's Plains.

From Galley Swamp 676 oz. were received, 227 oz. of which were won from the Nil Desperandum Mine at Mullally's paddock.

During

During the winter a rush took place to some alluvial ground near Neville. Three nuggets were found, weighing 8, 18, and 23 dwts. respectively, but the rush has collapsed for the present. An impression, however, prevails that the true wash-dirt has not yet been found, and I have hopes that the ground will yet have a further trial when the busy season is over.

At Tenandra Mines and Party washed 70 loads for 51½ oz. of gold.

At Lewis Ponds the Spicer's Syndicate Gold and Silver Mining Company won, in connection with their silver mining operations, 557 oz. of gold, valued at £2,230 13s. 7d.

Prospecting operations are still being carried on at Forest Reefs.

The mines at Lucknow are turning out well, having yielded during the year 16,745 oz. of gold, valued at £57,913 19s. 5d.

MUDGEE DISTRICT.

Mining in the immediate vicinity of Mudgee and at Apple Tree Flat, Pipeclay, Limestone, Eurenecree, and Log Paddock is somewhat dull. During the latter part of the year a rush took place to Goree, situated about 11 miles from Mudgee, and near to an old alluvial working. Two men, at a depth of 8 feet, struck 9 inches of wash, yielding ½ oz. to the load. Subsequent washings yielded from 6 to 14 dwts. and as high as 1 oz. to the load. At one time 150 men were on the ground, but the rush was short-lived, lasting only a month or two. About 25 men are now on the ground earning a bare living.

At Gulgong, the English syndicate has bottomed a shaft in the Lagoon Paddock at a depth of 146½ feet, on 8 feet of wash, interspersed with bands of cement, varying in thickness from 2 to 10 inches. Fair prospects can be obtained, but owing to the heavy influx of water a satisfactory test could not be made. Operations are now suspended awaiting the arrival of more powerful pumping machinery.

Heavy water has also delayed the operations of the Junction Leads syndicate. A number of smaller claim holders are still at work with varied success in the neighbourhood of Two-mile Flat, Canadian, and Home Rule, and on the eastern fall of the Talbragar. As near as can be ascertained the yield of gold for the year was 1,430 oz., valued at £5,387.

At Hargraves the principal prospecting operations are being carried on by the New Hargraves Gold-mining Company, who met with a rich vein which yielded £1,200 worth of gold. The company are receiving aid from the Prospecting Vote; but work is very much retarded owing to the heavy influx of water.

Melbourne and party, working the Jubilee Lease, near Windeyer, crushed during the year 1,200 tons of quartz for 650 oz. of gold. A few Europeans and Chinese are still fossicking about the main creeks, bringing the total yield for the Division up to about 1,200 oz., valued at £4,380.

At Peak Hill steady progress is being made in developing the various lodes. The Proprietary Company have erected a 20-head battery and winding machinery. The shaft is now down about 450 feet, and a considerable quantity of ore is available for treatment. A very important discovery has been made during the year in this mine. A prospecting tunnel being put into the hill passed through a hard ironstone bar into soft lodestuff, a crushing of 40 tons from which yielded 14 dwts. per ton. The tunnel is now 80 feet into the lode without having crossed it. From present indications it runs into the adjoining properties, and should it prove as good as in the Proprietary, it will be a good thing for the district.

The Great Eastern and Great Western Mines are now paying dividends. Renkes and party discovered a vein on the eastern slope of the hill which assayed as high as 10 oz. of gold, and from 83 to 1,141 oz. of silver per ton. The vein is small, but is increasing with depth, and at the 45-foot level has widened out to 15 inches. Steps are being taken to have a ton of the stone treated in Sydney.

At the Myall, 9 miles north of Peak Hill, two claims are working both on payable gold. No. 1 Myall crushed 1,400 tons from a reef at the 170-foot level, which yielded 1 oz. per ton. The total yield from the Peak Hill Division may be put down as 10,070 oz.

Crowhurst and party, at Tomingly, are still carrying on prospecting operations with fair hopes of ultimate success.

The Mitchell's Creek Freehold Gold-mining Company, near Wellington, are still hard at work, and during the year raised 4,002 tons of stone, yielding 4,047 oz. of gold, valued at £14,960 12s. 3d. During the year a small rush took place to some alluvial ground near Jawbone, but nothing has so far been obtained to warrant it. The prospector, John Norman, was in receipt of aid from the Prospecting Vote. The total value of gold won in this division during the year was 7,410 oz., valued at £23,303, being an increase of £5,188 as compared with 1891. 833 oz. of the gold obtained in 1892 were from alluvial, the balance, 6,577 oz., being from quartz.

TAMBAROORA AND TURON DISTRICT.

The Hill End Division has yielded £3,677 15s. worth of alluvial, and £7,877 14s. worth of quartz gold during the year. The heavy water met with in some of the mines has compelled the owners to apply for suspension until heavier pumping plants can be erected. The Lancashire Lass mine, on the eastern side of the Macquarie River, is being vigorously prospected by Mr. Alex. Downe, who was successful in striking a vein 9 inches thick, yielding 1 oz. to the ton. Aid has been granted from the Prospecting Vote for this mine. The last crushing by Lonsdale and party, at the head of Golden Gully, yielded 70 oz. of gold. On the Root Hog Reef Clyms Brothers are erecting a powerful pumping plant, to cope with the heavy water in their mine. This party have a very fair show, the reef being 30 inches thick, and averaging about 15 dwts. to the ton. This party were aided from the Vote to test this reef. The Consolidated Company are putting in an adit from Oakey Creek, and hope to strike the main belt of veins shortly. The New Paxton Company's last crushing yielded 3 oz. per ton. The last crushing by Lord and party, in Specimen Gully, was the best for years; and Carver and party have resumed sinking on the old Monk Reef, which proved so rich some years back. At Sofala considerable activity was displayed during the year in connection with mining operations. The continuous wet weather has allowed a lot of the old ground to be sluiced, which has been rigorously carried on, the most successful parties being Herriott and McLean, at Maitland Point, who obtained 70 oz.; Bennett Brothers, 50 oz., at Wallaby Point; and John Roach, 20 oz., at Golden Point.

Mini and party obtained from their quartz claim at Oakey Creek 1,385 oz. of gold from 725 tons of stone. The best crushing from this claim yielded 292 oz. from 47 tons. This reef was originally opened up through aid from the Prospecting Vote granted to Ellis and party. Martin Bros., working on Mount Rosette, had several fair crushings from their 3-foot reef, and Moyle and party, at Middle Creek, are raising payable stone. The Queenslander Company, at Spring Creek, crushed 875 tons for 147 oz. The total yield from the Division was 4,680 oz., valued at £17,550. At Ironbarks the Golden Gully Company crushed 3,272 tons for 2,441 oz., the total yield for the Division being 2,930 oz., valued at £11,700.

THE LACHLAN DISTRICT.

At Forbes the owners of the Old Britannia Lease discovered a new vein, from which some good specimens were got. At Parkes some valuable discoveries have been made during the year in reefing. A party of tributors took up the Old Bushman's Reef, and during six months crushed 378 tons of stone for 774 oz. of gold. The Quayles Proprietary Company are now on payable stone at the 395-foot level, and so is the Robinson Gold-mining Company at the 275-foot level. The Deep Sinking Gold-mining Company have struck payable stone in the west cross-cut at the 170-foot level. The Pinnacles Reef Quartz Gold-mining Company crushed 686 tons for 172 oz. A start has been made to extract the gold from the tailings at the Old Dayspring Mine, which is hoped will prove successful. A small rush took place to some alluvial ground near the London Lead, situated about 3 miles west of Parkes, owing to Lee and party reporting payable gold. The sinking is 112 feet and the wash 6 feet thick, yielding about 7 dwts. per load. The width of the lead, so far as proved, is only 14 feet. This party were in receipt of aid from the Prospecting Vote. The value of the gold won in this Division during the year was £23,235.

At Alecstown 3,915 loads of wash-dirt passed through the puddling machines for an average yield of 4 dwt. per load. The prospector's claim is still proving payable, as it has been since the rush in 1889. The reefs are still being worked with varied success. Payne and Bartlett crushed 56 tons for 4 dwt. per ton. Breathour and party, working the Pride of Alecstown, crushed 58 tons for 3½ dwt. per ton. 110 tons were crushed from the Stockman's Reef, yielding 4 dwt. per ton. 23 tons by Coomber and Williams, from the Bird's Nest reef, for 8 dwt. per ton, and from Lowry Reef 30 tons were crushed which yielded 7½ dwt. per ton.

The reefs are now being sunk on to a greater depth, in hopes that the returns will improve. At Canowindra the Blue Jacket mine yielded 900 oz., valued at £3,831 2s. 2d. At Roney's Rocks prospecting is being carried on with fair prospects of success. At Grenfell a local company has been formed to work the Homeward Bound Reef to a greater depth. Pettet and Company, working the Enterprise Reef, crushed 430 tons for 235 oz., Hinchcliffe and Party, on the Lawson Reef, 46 tons for 19 oz. 12 dwt., and Fitch and party, on the Young O'Brien Reef, had one crushing of 57 tons for 62 oz. Alluvial mining has been principally confined to Quondong and the vicinity of Two-mile. The total amount of gold produced in this division during the year was 781 oz. from quartz, and 132 oz. from alluvial, being a total of 913 oz., valued at £3,493.

At Temora the various puddlers put through 1,089 loads for 2½ dwt. per load. Mr. Haensler, Gundibindyal, crushed 34 tons for 40 oz. of gold. At Barmelma a Melbourne company has purchased the old Jackson Reef, from which the late owners were swamped out. Powerful pumping machinery is in course of erection, and it is proposed to take out a crushing from the 160 feet level. Steffani and party, prospecting west of the Fiery Cross, have struck an 8-in. vein, which yields about 2 oz. to the ton. A rush took place to Mr. R. Payne's selection, where some new reefs had been discovered giving fair prospects. As the discovery is on private lands, its value will not be thoroughly tested until the necessary permit has been obtained.

At Woodstown, Andrews and party are still working on the Little Wonder Reef, with varied success, and on John Chamber's selection a rush took place to some alluvial ground, where fair prospects had been obtained, but the ground was proved patchy.

In the vicinity of Young much activity has been displayed in prospecting operations during the year. Tilden and party made an important find on the property of Mr. Boxsell, which will ensure the ground being thoroughly worked at once.

The much-fancied locality of Sherlock Creek is at last being thoroughly prospected, and at Wombat good returns are being got.

The South Burrangong Mine yielded during the year, £12,810 worth of gold.

TUMUT AND ADELONG DISTRICT.

At Stoncy Park, Jindera, near Albury, several reefs of a fairly paying nature are being worked, and better returns are expected when a lower level is reached.

At Germanton a lot of prospecting work is being carried on with fair hope of success.

At Corowa a deal of attention has been drawn to the probability of the great deep lead worked on the Victorian side of the Murray being traced on the Corowa side of the river. A local syndicate have sunk several shafts and obtained very fair prospects, with the result that a considerable area was occupied and applied for on lease.

In the Junee Division mining has been fairly brisk. Lynch and Brown working the Pioneer claim, Eurongilly, crushed 35 tons for 59 oz. Brown and Smith on the New Reef on Pioneer Hill are raising good-looking stone, estimated to go 2 or 3 oz. per ton. Hutton and Dalton, Victoria Hill, expect the stone they are now raising to go 2 oz. per ton.

At Adelong the Gibraltar Co. crushed 182 tons for 805 oz. and expect to get other 90 oz. from 9 tons of pyrites.

The Adelong Prospecting Co. crushed 1,245½ tons for 1,570 oz.

The Currajong Co., 33 tons for 92 oz., and The Lady Mary Co., 122 tons for 68 oz. The total yield for this division was 2,065 oz. Ryan and party have put down over 20 bores on the flats near the town, in search of payable gold. In view of the prospects obtained there is every probability of extensive works being initiated.

At Cootamundra the Excelsior Reefing Co. crushed 160 tons for 86 oz. Johnson and party, on Mr. Bragg's private property, 11 miles east of Cootamundra, have struck what promises to be a highly payable lode. No. 1 shaft is down 40 ft., and cross-cutting has proved the lode to be gold bearing for a width of 30 ft.; about 20 chains north of this shaft, Walsh and party have found rich specimens; Curran and party adjoining, have struck stone near the surface which assayed 30 oz. per ton.

At Tarcutta, Kelly and party have struck a reef 10 in. wide, estimated to go 2 oz. per ton.

At Kiandra, A. Luttrell, on the New Chum Hill, won 14 oz. of gold by sluicing during fourteen weeks' work.

At Cooma, the gold won is given as 652 oz., i.e., 584 oz. from quartz and 68 oz. from alluvium.

Solomon and party are still prospecting at Fiery Creek, with good prospects; and Freebody and party crushed 232 tons for 222 oz., value £857.

At Captain's Flat, the New Kohinoor Company, in connection with their silver and copper-mining operations, saved 842 oz. of gold.

SOUTHERN DISTRICT.

At Nelborthery, about 16 miles from Bombala, the Delegate River Hydraulic Sluicing Company have erected machinery capable of lifting 4,500,000 gallons of water to a height of 330 ft. in twenty-four hours. The result of their operations will be watched with great interest, and if successful a great impetus will be given to hydraulic sluicing in the Colony.

At Bimbimbi, Keating and party, the prospectors, crushed 75 tons for 50 oz.; and on the same line of reef Barling and party raised 19 tons, yielding 11 oz.; 170 tons raised from Keating and party (10-acre lease) gave a return of 172 oz. Messrs. N. Leoni, J. Bartlett, and Mison and party are doing good prospecting work on the adjoining properties.

At Mogo, Annetts and party have struck a large reef in their tunnel, from which a 20-ton crushing yielded 1½ oz. per ton; and in the same locality Casey and party have found a very promising looking reef which crushes 1 oz. of gold to the ton.

The Italia Mine, near Moruya, is now working, and 500 tons at grass is expected to go 1 oz. per ton.

At Bateinan's Bay, Fitzgerald and party are working a reef 2 ft. wide, and a ton taken from the 60-ft. level, and treated in Sydney, went 17 dwt.

At Brimbermalla, Thorburn and Robinson crushed 183 tons for 329 oz.

At Nerrigundah, the Gulph Proprietary Mining Company, Ocean View, crushed 100 tons for 120 oz.; and the Wandella Proprietary Company got 46 oz. from 179 tons of stone.

A rush took place to some alluvial ground at Bob's Creek, near Little River, during the year, but subsequent operations did not confirm the sensational reports circulated at the time.

Meredith and Party from a small leader on the Dog's Head Reef obtained 20 oz. gold, and the same party took 10 tons of stone from the Scotch Lassie Reef which yielded 20 oz.

Voss and Party from a new reef on Cardy's Hill obtained 30 oz. from 30 tons of stone.

The Araluen Division yielded during the year 3,200 oz., or 1,000 oz. in excess of 1891. A party at Bell's Creek crushed 299 tons for 193 oz. of gold. The returns from Major's Creek give 1,065 oz., valued at £3,952 11s. 6d., as the yield for the year, being a slight increase over 1891.

Mining operations at Pambula are very active, the yield being 4,863 oz., valued at £19,912. The Mount Gahan Company raised 2,187 tons, which yielded 3,446 oz. The Pambula Gold-mining Company 600 tons for 1,200 oz. The Golden Diorite Company 220 tons for 76 oz. The Morning Star Company 150 tons for 65 oz. The Great Victory Company 85 tons for 36 oz. The Falkner Company sent during the year 262 tons of ore to Germany for treatment, which yielded 2,100 oz. of gold and 440 oz. of silver. The Hidden Treasure Company sent 14½ tons to Sydney for treatment, which yielded 3 oz. per ton.

At Wagonga the Mount Dromedary Proprietary Company crushed 153 tons for 179 oz. A good deal of genuine prospecting is being carried on in this locality.

THE HUNTER AND MACLEAY DISTRICT.

At Copeland the principal mine at work is the Lady Belmore, from which was crushed during this year 12½ tons for a yield of 75 oz. of gold. The No. 1 South Centennial has been taken up and is being worked. The syndicate working the Old Mountain Maid put through 50 tons of stone and 50 loads of mullock both of which gave payable returns. The total amount of gold won in the division during the year was 303 oz. from quartz and 50 oz. from alluvium.

At Wangat, on the Little River, near Duugog, a party crushed 48 tons for £253 3s. 6d. worth of gold.

At Kempsey, the Nambuca Heads Gold and Silver Mining Company put through their chlorination plant, from June until Christmas, 1,235 tons, yielding 1,235 oz., valued at £4,936. The company propose proving the lode they are working to a greater depth.

THE PEEL AND URALLA DISTRICT.

At Stewart's Brook the United Bluey Company raised 1,900 tons of stone, which yielded 800 oz. of gold, valued at £2,700. The Royal Standard Company 330 tons for 558 oz., and Adams & Towns on their new reef, in Mr. R. H. Carter's paddock, raised 132 tons, which yielded 284 oz. of gold. C. Davis and party, working the Pride of the Brook Reef, raised 50 tons of stone, which gave a result of 104 oz. of gold, and Bartlett and Jeffries on the same line raised 48 tons, 23 of which yielded 31½ oz. In all, 2,846 tons of stone have been crushed during the year in this division, which yielded 2,184 oz. of gold, valued at £7,435 12s.

In the Denison District the Newcastle Gold Mining Company at Moonan Brook raised from Fuller's Reef 400 tons of stone, which yielded 456 oz., valued at £1,527. John M. Harle got 35 oz. of gold from 60 tons of stone raised from his prospecting area, and E. Williams crushed 133 tons for 133 oz.

At Nundle the Mount Sheba Hydraulic Sluicing Company were fortunate in having a good supply of water during the year, and washed the large quantity of 126,000 cubic yards of ground for 466 oz. Thompson and Isaacson obtained some very rich specimens during the year, and about 120 oz. were got from the Black Snake Reef. At Bowling Alley Point the Peel River Company raised 226 tons for 144 oz. At Swamp Oak a small parcel of stone, weighing 16 cwt. taken from the Surprise Reef, yielded 11 oz. of retorted gold. The Little Tichborne Company on the same line crushed 2 tons 16 cwt. for 18 oz. From the Highland Mary claim, owned by John M'Donald and party, 200 tons of stone were raised, which gave the handsome return of 3½ oz. of gold per ton. Another gold crushing was taken from the Great Britain mine of 57 tons which returned 168 oz. of gold, or nearly 3 oz. per ton. The Storm King is being worked on tribute and in five weeks the tributors raised 49 tons of stone which returned 109½ oz. of gold. Some very good stone is now being taken from the mine which is believed will eclipse anything yet raised on the field. Wallworth and party are working on the Rainbow Reef which is 11 feet wide, and from 400 tons of stone got 206 oz. of gold, which is considered satisfactory. The total yield from this field is given as 2,583 oz. valued at £9,040 10s. taken from 2,064 tons of stone. A slight increase has taken place in the value of the gold won during the year at Niangala, the figures being 861 oz. valued at £3,229. The stone taken from the Starlight mine crushes 2½ oz. per ton. Small crushings were taken from the Jersey mine, which went as high as 6 oz. per ton. The owners of the Bungendore mine put through a crushing of 200 tons for 190 oz. Some good reefs are being opened up at Paradise about 7 miles from Niangala, from which great things are expected. The output of gold from the Armidale Division during the year was 36,093 oz. 3 dwt. 22 gr., showing an increase of 5,726 oz. 4 dwt. 13 gr. as compared with 1891. Of that amount 18,923 oz. were won by the Baker Creek Gold-mining Company which was crushed from 8,847 tons of stone, 3,000 oz. by the Eleanor Company. The New Baker Creek North, 329 oz. from 360 tons of stone; the West Sunlight Company, 306 oz. from 418 tons. The Sunlight Company, 4,261 oz. from 7,226 tons; and the Earl of Hopetoun, 2,686 oz. from 4,832 tons. From the Glen Innes District 2,105 oz. of gold were obtained valued at £8,209 10s., 1,789 oz. being from quartz, and 316 oz. from alluvium, chiefly from Glen Elgin, Bear Hill, and Kookabookra. The English syndicate at Glen Elgin is pushing on prospecting work with vigour, and also the erection of extensive machinery. Mr. Bertram, working at the same place, had a crushing of 190 tons for 170 oz., valued at £595. The Nolan's Creek Gold Mining Company, about 2 miles from Bear Hill, and formerly known as the Bear Hill Proprietary, crushed 1,750 tons during the year for 1,250 oz. The Welcome Stranger mine, which is being worked on tribute, crushed 15 tons for 12 oz. A few men are still making a living on the old Oban diggings, and obtained about 100 oz. of alluvial gold. From the vicinity of Barraba 245 oz. of gold were obtained, valued at £875. Very little is now doing in connection with gold mining in the neighbourhood of Bingera, most of the old mines being now abandoned.

THE NEW ENGLAND DISTRICT.

In the Fairfield division the total amount of gold won during the year was 3,299 oz., valued at £10,545 15s. 6d., 460 oz. being obtained from alluvium, and the balance 2,839 oz. from quartz. The principal mine in the district is the "Lady Jersey" at Long Gully, from which 903 tons were crushed yielding 1,881 oz., valued at £5,793. Barkers' mine, at Mount Carrington, crushed 110 tons for 163 oz., and 925 tons from the Mount Carrington mine, owned by Mr. Robert Ross, yielded 265½ oz. of gold. From Beagley's mine the most recent development on the field, and situated on the eastern boundary of the Mount Carrington mine, there was obtained 167 oz. of gold from 30 tons of stone. The owners of the "Rise and Shine," on a quartz reef near Tooloom, raised during the year 200 tons of stone, from which a few cwts. were picked and crushed for a return of 209 oz. At Pretty Gully a party took a crushing from the outcrop of a reef known as the "Poor Man's Friend" which yielded 1½ oz. per ton. The principal part of the alluvial gold won in this division came from this locality, and at Frazer's Gully on the north side of the Clarence River a good number of men make fair wages. Kelly Bros. have made an important discovery of auriferous quartz during the year at a place known as Gough's Gully, about 6 miles south of Drake. A number of blocks have been taken up on each side of the prospectors, and as developments proceed, probably a large number of men will find employment. Stevenson and party are still at work on the Buck reef, near Boonoo-Boonoo, and have obtained some fair returns from crushing at various times. Broughton and party are at work at Basket Creek on a claim of 40 acres, and have sent away 40 tons for treatment, but the result is not yet known. Funnell and party have erected a small stamper battery, which will be a convenience to the public. Very little work has been done on the Boonoo-Boonoo field during the year, in consequence of the heavy rainfall, and the lack of pumping machinery; the total output of gold being 533 oz., valued at £1,332 10s.

THE CLARENCE AND RICHMOND DISTRICT.

The value of gold won in the Dalmorton Division of this District during the year was 2,024 oz. from quartz, and 342 oz. from alluvium, or a total value of £8,764. The Mount Poole Marvel Co. crushed 165 tons for 162 oz., and have a 300-ton crushing ready to start. The Mount Poole Co. have done a lot of prospecting during the year, and intend to push on with the tunnel when the ventilation has been improved. The Chandler's Creek Amalgamated Co., on Garden Hill, crushed 361 tons for 523 oz. Hexham and Mulligan, the owners of the Golden Hill, crushed 55 tons for 106 oz. of gold, and Comerford and party, on the "Working Miners," crushed 15 tons for 24 oz. H. H. Ashworth, on the Pioneer Reef, struck a shoot of gold, which yielded 21 oz. from 10 tons of stone. Aid was granted from the Prospecting Vote in this case. A 9-ton crushing, taken from the Golden Hope Mine, gave a return of 17 oz. Mr. A. Cadell, on the Black Slate Reef, on Mount Swain, crushed 86½ tons for 247 oz. or equal to about 2 oz. 17 dwt. per ton. A 10-head stamper battery is being erected on this property. A new find, of some importance, was made in this Division during the year at Mount Remarkable, 1½ miles N.E. from Mount Poole, by Kemp and party. There are several reefs, one of which is 1 foot wide, showing coarse gold freely. A tunnel has been driven along it for a distance of 275 feet, and a crushing of 18½ tons taken therefrom yielded 78 oz. of gold. Another crushing of 100 tons is now going through.

The Nana Creek Division yielded 215 oz. of gold during the year from quartz-mining. The principal crushings were by Nicholson and party, Speculation Claim, who put through 16 tons for 11 oz.; Alexr. Nicholson, the Pioneer Claim, 30 tons for 28 oz.; O'Grady and party, on the Nana's Daughter Reef, 76 tons for 69 oz.; and another by Forbes and party, on the Surprise Reef, 62 tons for 76½ oz. A good deal of prospecting work is being carried on in the vicinity of Nana Creek with good prospects of success.

The miners working the beach sand at Ballina have won during the year 682 oz. of gold, as compared with 274 oz. in 1891. The return, from the few men employed, shows the richness of the sand, when the primitive appliances used in the work are considered.

At Cangai the Sir Walter Scott Gold-mining Company have erected a plant for the treatment of their refractory ore, which was ready to start work about the end of the year.

THE COBAR DISTRICT.

The Occidental Gold-mining Company, on the United Hill, Cobar, raised 2,800 tons of stone, which gave a return of 841 oz., valued at £3,448. This mine has been closed during a great part of the year while extensive alterations were being made in the machinery.

Towards the middle of the year alluvial gold was discovered at the north-west end of Mount Billagoe and about 1½ miles north of the old claim. The three principal claims have yielded 165 oz. of coarse gold, but the payable area was found to be small, and is now nearly worked out. Prospecting is, however, still being proceeded with, and the miners are confident that something more permanent will be struck.

At Hillston the Mount Allen Gold-mining Company, on Ironstone Hill, Coan Downs Station, put through 719 tons for 838 oz. of gold, valued at £3,521.

At Mount Hope Messrs. Harvey and Fullerton raised 50 tons of fair looking quartz, but have not yet crushed.

At Errebundery, near Euabalong, a discovery was made by D. Edgar and party. They raised 70 tons from a 4 feet reef, and from 4 cwt. of stone treated got 9 oz. of gold. The rising of the Lachlan River has prevented the discovery being thoroughly tested, but it is predicted that it will prove a valuable one. At Bourke, Nolan and party reported the discovery of payable gold on the banks of the River Darling just outside the town boundary, and within a camping reserve. Before the discovery could be tested the flood waters rose and covered a shaft said to be down 83 feet. A few parties are engaged prospecting the north-west of Condobolin; one crushing of 8 tons taken from the Surprise Reef yielded 8 dwt. per ton.

THE ALBERT DISTRICT.

At Milparinka the continued drought has completely paralyzed the mining industry, the output of gold being only 276 oz. A few parties are still at work, the best results being 6 or 7 dwt. to the load. About 2 miles south-west of Mount Browne a few diggers are obtaining fair prospects, but the ground is of limited extent. A 3 oz. nugget was found at Little Bendigo, and in the neighbourhood of Evans Gully payable gold was found after the late rain, but operations had shortly afterwards to be abandoned owing to the scarcity of water. When water is available the puddlers around Tiboolburra can earn good wages, and during about six months of the year obtained 500 oz. of gold of the approximate value of £2,000. The Broken Hill Proprietary Co., at Broken Hill, obtained 5,018 oz. of gold from silver lead bullion.

The geological survey of the country along the Shoalhaven River is progressing satisfactorily, and when complete it is hoped the information available concerning the alluvial deposits along the banks of the river, coupled with the data which Mr. H. G. McKinney, the Chief Engineer of Water Conservation, will be able to supply respecting the facilities for securing a water supply capable of operating upon such deposits, that portion of the Colony will be very attractive to both capitalists and miners.

I am indebted to E. O. Haywood, Esq., the Acting Deputy Master of the Royal Mint, for the following information:—

QUANTITIES of Gold, the produce of New South Wales, received into the Royal Mint, Sydney, during 1891 and 1892 compared.

SUMMARY.

District.	1891.	1892.
	oz.	oz.
Bathurst	8,233·00	10,289·59
Tambaroora and Turon	1,669·30	2,514·61
Mudgee	3,961·08	3,871·04
Lachlan	11,116·39	8,502·56
Albert	1,513·79	775·35
Southern	6,682·63	5,859·63
Tumut and Adelong	7,073·65	5,666·67
Peel and Uralla	30,940·99	32,032·63
Hunter and Macleay	39·57	204·95
Clarence and Richmond	691·01	918·48
New England	1,326·87	575·75
Mixed—Western, Northern, and Southern	27,468·87	31,513·88
Localities unknown	41,753·08	35,534·34
	142,470·23	144,259·48

From the above table it will be seen that the quantity of gold sent to the Mint during 1892 exceeds the quantity so sent in 1891 by only 1789·25 oz. The greatest increase in 1892 was from the Orange district due no doubt to the operations of the companies on the Wentworth Estate at Lucknow, the next largest is from Armidale due probably to the mines at Baker's Creek, the largest decreases are in the returns from Bathurst and Parkes.

The following table is compiled from information kindly furnished by the Collector of Customs:—

EXPORT OF GOLD, 1892.

Gold.		Quartz Tailings and Pyrites.		Total.	
Quantity.	Value.	Quantity.	Value.	Quantity.	Value.
oz.	£		£	oz.	£
3,003	11,436	5,451 packages	31,825	12,610	46,312

The quantity of gold sent to the Mint, plus the quantity exported, represents, for the year 1892, the quantity of gold won, as none of the gold that passed into the Mint during that year was exported. Thus the gold sent to the Mint, 144,259·48 oz., plus the quantity exported, 12,610 oz., equals 156,869·48 oz. It is worthy of remark, that while in 1891 the Proprietary Company, at Broken Hill, extracted 5,277 oz. of gold from their silver mine, they return no gold for 1892.

The returns furnished by the Mining Registrars of the gold won in their respective districts, show 7,852 oz. in excess of the quantity sent to the Mint, but 4,758 oz. less than the total output.

RETURNS of Gold for 1892 from Mint and Mining Registrars compared.

Less Decrease	20,612
Increase in yield for 1892	2,066

The following statement of yields from alluvial mines is far from satisfactory, but the Registrars say it is most difficult to obtain any information concerning the yields from these mines, as the owners rarely keep any account of the quantity of earth treated. The parcels included in the statement, with the exception of those from the Lachlan and the Hunter and Macleay districts, are the result of sluicing operations.

COMPARATIVE Statement of Average Yields from Alluvial Mines for 1891-92.

					Peel and Uralla	126,517	0	0	2
						197,112	0	0	4
									1,807 14 33

The following statement gives the results of parcels of stone from certain quartz mines in the several districts. The returns from these mines are more complete than usual, and I trust this may be taken as an indication that the mine owners are giving more attention to keeping proper records of the stone treated. The average yield is not only very satisfactory, but it is an improvement upon previous years.

COMPARATIVE Statement of Average Yields from Quartz-mines for 1891-92.

									98,399 12 20

Dividing the quantity of gold won by the number of gold miners gives the result 17.33 oz. per man, and dividing the value of the gold won by the number of miners gives nearly £62 18s., as the earnings for the year of each miner, being £11 8s. 3d. in excess of the earnings per man in 1891.

During

During the year 3,147 samples were assayed for gold in the Laboratory of this Department.

1,706 yielded Nil.

1,048 yielded under 10 dwt. per ton.

393 yielded as follows:—

Locality.	Description.	Per ton.

COAL.

I regret to say our output of coal for 1892 compared with 1891 shows a considerable decrease both in quantity and value. The decrease appears to be mainly due to the reduction in the consumption of coal within this Colony. The export of coal, as a whole, shows comparatively small diminution, indeed, the quantity sent to foreign ports shows an increase in quantity, the decrease being to intercolonial ports, but there was a reduction all round in the price of coal, which has not been so low since 1881. I presume the decrease in our home consumption of coal must be due to the financial depression which has prevailed of late.

QUANTITY

QUANTITY and Value of Coal raised from the opening of the Coal-seams to 1857, inclusive :-

Year.	Quantity.	Average per ton.	Value.	Year.	Quantity.	Average per ton.	Value.
Prior to		£ s. d.	£			£ s. d.	£

The aggregate thickness of coal bored through by the Government diamond drills during 1892, was 42 feet 7 inches, of which 12 feet 4 inches was coal and bands. The details are as follow:—Greta, 6 feet; Cremorne, 3 inches; Bulli, 36 feet 4 inches.

The number of collieries under inspection was 101 coal and 5 shale.

The following statement shows that the output of coal in the Northern collieries in 1892 was less by 241,520 tons than in 1891, and less in value by £251,333 18s. 3d. The output of the Western collieries in 1892 was 110,441 tons 12 cwt. less than in 1891, and the value was less by £16,689 4s. 2d. The output of the Southern collieries in 1892 exceeded that of 1891 by 95,000 tons, but the value was less by £12,383 0s. 9d.

The number of men employed in and about the coal and shale mines in 1892 was 10,910. The total number of fatal accidents was 8; non-fatal, 77; compared with 21 fatal and 54 non-fatal accidents in 1891. In the Northern district there were 6 fatal and 59 non-fatal accidents. In the South and South-western districts no fatal and 16 non-fatal accidents occurred. In the Western district there were 2 fatal and 2 non-fatal accidents.

SUMMARY of persons employed, number of fatal accidents (deaths), and ratios of the number of persons employed, and the number of fatal accidents in and about the "United Kingdom" and "New South Wales" Coal Mines, since 1874:—

Year.	United Kingdom.				New South Wales.

"	Coal	0·70	19·70	66·60	13·00	·658	1·442	Coke, 79·60 per cent. 1 lb. of this coal will convert 13·8 lb. of water into steam.	
Bundanoon Coal Mine.....	Splint coal	1·75	22·10	50·25	25·90	Ash, grey. Coke—This coal formed a coke on heating, firm and dense.	
" (upper seam).....	Bituminous coal	1·95	30·05	56·15	11·85	·603	1·402	Coke, 68 per cent., not much swollen, fairly bright and firm. Ash, light, grey. 1 lb. of this coal will convert 14·2 lb. of water into steam. A good steaming coal.	
Bourke (Corella bore; depth, 400 feet).	Lignite	13·83	40·02	39·65	6·50	No coke formed, only a loose black powder left after ignition in a covered crucible. Ash, reddish tinge, with white spots.	
" (800 feet)	"	14·45	32·45	44·85	8·25	Coke; no true coke formed. Ash, reddish tinge, with white spots.	
Curlewis Coal Company ...	Samples of splint, with layers of bituminous coal, from top, middle, and bottom of seam.	3·60	31·32	57·31	7·68	·52	1·337	Coke, 64·99 per cent., well swollen, firm, and lustrous. Ash, grey, flocculent. 1 lb. of this coal will convert 12·4 lb. of water into steam.	
Clifton (near)	Semi-bituminous coal ..	·85	17·80	68·30	13·05	·343	1·409	Coke, 81·35 per cent., dull and firm. Ash, white and flocculent. 1 lb. of this coal will convert 12·1 lb. of water into steam. An excellent coal for steaming purposes.	
Helensburgh (Metropolitan Coal Mine).	Bituminous coal	·90	18·50	71·10	9·50	·466	1·369	Coke, 80·60 per cent., well swollen up, bright, and firm. Ash, white, flocculent. 1 lb. of this coal will convert 14·05 lb. of water into steam. An excellent quality of steaming coal.	
Illawarra District.....	"	1·25	20·05	65·35	12·45	·562	1·384	Coke, 77·80 per cent., well swollen, firm, and lustrous. 1 lb. of this coal will convert 13·8 lb. of water into steam. Ash, reddish tinge, dense.	
"	"	1·05	23·15	66·65	9·15	·754	1·390	Coke, 75·80 per cent., well swollen, firm, and fairly lustrous. 1 lb. of this coal will convert 13 lb. of water into steam. Ash, reddish tinge, dense.	
"	"	1·10	22·80	65·70	10·40	·549	1·396	Coke, 76·10 per cent., well swollen, firm, and lustrous. 1 lb. of this coal will convert 13·5 lb. of water into steam. Ash, grey in colour, dense.	
"	" .. (dirty)...	1·40	19·05	66·45	13·10	·349	1·438	Coke, 79·55 per cent., well swollen, firm, and lustrous. 1 lb. of this coal will convert 12 lb. of water into steam. Ash, reddish tinge, dense.	
Killarney	Splint coal	4·00	35·75	32·90	27·35	No true coke formed; only a loose coherent mass left after ignition. Ash, reddish tinge, and slightly granular.	
"	" with iron oxide	3·95	28·15	16·45	51·45	No coke formed. Ash, reddish tinge, granular.	
"	"	2·90	41·45	34·90	20·75	·892	1·388	Coke, 55·65 per cent.; firm, cracked, and lustrous. Ash, reddish tinge, granular.	
Leconfield Bore (No. 1 Seam.)	Coal	·94	59·32	51·31	7·87	·56	...	Coke, 59·18 per cent., well swollen, firm, and fairly lustrous. Ash, grey, dense. Sulphur, ·65 per cent. Fixed sulphur, ·09 per cent. (in ash). 1 lb. of this coal will convert 13 lb. of water into steam.	
Seani. (No. 2 Seam.)	"	·83	37·77	52·14	8·00	1·26	...	Coke, 60·14 per cent., well swollen, with cauliflower-like excrescences, firm, and lustrous. Ash, reddish tinge, dense. Sulphur in coal, 1·332 per cent. Fixed sulphur (in ash), ·070 per cent. 1 lb. of this coal will convert 12·9 lb. of water into steam.	

Locality.	Description of Mineral.	Analysis in 100.00 parts.				Sulphur.	Specific Gravity.	Remarks.
		Hygroscopic Moisture.	Volatiles (fixed carbons).	Fixed Carbon.	Ash.			
Lithgow	Bituminous coal, with earthy band.	2.34	32.39	54.45	10.82	.617	1.369	Coke, 65.27 per cent., well swollen, with cauliflower-like excrescences, firm, dull in lustre. Ash, grey, flocculent. 1 lb. of this coal will convert 12.5 lb. of water into steam.
Mittagong (Bullock Head)	Dirty bituminous coal .	10.85	25.75	52.65	10.75	0.933	1.445	Coke, no coke formed. Ash, grey flocculent. 1 lb. of this coal will convert 9.7 lb. of water into steam.
Maclcan	Bright bituminous coal, with thin shale bands.	1.10	10.45	61.35	27.10	Coke, 88.45 per cent.; very dull. Ash, grey, dense.
Murrurundi	Cannel coal	2.25	35.20	49.95	12.60	.865	1.371	Coke, 62.55 per cent., well swollen, firm, and lustrous. Ash, reddish tinge, slightly granular.
Morcee District ..	Shaly coal, with bituminous layers.	10.25	32.30	36.55	20.90	No coke formed. Ash, grey, granular.
Mount Pleasant Coal Mine	Semi-bituminous coal (dirty).	1.45	13.80	61.10	23.65	Coke, 84.75 per cent., dull and firm. Ash, grey, slightly granular.
Mount Victoria.....	Semi-bituminous coal	1.70	27.40	59.95	10.95	.494	1.385	Coke, 70.9 per cent., well swollen, firm, and fairly lustrous. Ash, white, flocculent. 1 lb. of this coal will convert 12.5 lb. of water into steam.
Muswellbrook	Bright bituminous coal...	7.70	32.80	54.45	5.05	.658	1.312	Coke, 59.50 per cent., 1 lb. of this coal will convert 14.4 lb. of water into steam. An excellent description of coal, the percentage of ash being low, and the calorimetric estimation proving it to be an excellent coal for steaming purposes.
Nattai River, Mittagong District.	Dirty bituminous coal ...	12.34	30.74	47.97	8.95	0.521	1.463	Coke—no coke formed. Ash, grey in colour, dense. 1 lb. of this coal will convert 8.5 lb. of water into steam.
„ „	Bituminous coal	2.04	25.81	58.35	13.80	1.466	1.416	Coke, formed a cake on heating, dull in lustre, fairly firm, does not form a true coke. 1 lb. of this coal will convert 11.6 lb. of water into steam. Ash, grey, granular.
Rocky Mouth	Bituminous coal, average sample of 5½ inches.	5.67	13.47	55.61	25.25	No coke formed. Ash, grey.
„	Bituminous coal with ¼ inch shale band.	3.90	34.65	36.80	24.65	Coke, 61.45 per cent., fairly swollen, firm, cracked, and lustrous. Ash, grey, granular.
Richmond River (Aberdare Coal Mine.	Bright bituminous coal...	0.85	15.95	65.40	17.80	Coke, 83.20 per cent. Ash, white flocculent. Coke, well swollen, firm and lustrous.
Stroud (near)	Dirty bituminous coal ...	1.75	13.55	71.15	13.55	Ash, reddish tinge, flocculent. No coke formed, a loose coherent mass left after ignition.
Tenterfield and Lismore (between).	Laminated inferior coal	1.90	22.20	20.75	55.15	No coke formed. Ash, grey flocculent.
Talbragar River, near Mudgee.	Coaly shale	4.70	43.35	35.20	16.75	1.043	1.326	Coke, 51.95 per cent., cracked, firm, and fairly lustrous. Ash, red and granular. One pound of this coal will convert 13.1 lb. of water into steam.
Louth, Waanaring Road, Bourke District (46 mile bore, depth 1,010 feet)..	Lignite	12.78	34.17	46.49	6.56	Coke, no coke formed. Ash, reddish tinge, granular.
Yarrunga, near Moss Vale	Splint coal	1.34	16.91	52.75	29.00	Only a loose powder left after ignition of this coal. Ash, light grey colour, granular.

COKE.

TABLE showing the quantity and value of Coke made in the Colony of New South Wales.

Year	Quantity		Total Value.
	Northern District.	Southern and Western Districts	
	tons cwt.	tons cwt.	£ s. d.
1890	15,886 2	15,211 0	41,147 3 7
1891	9,474 2	20,836 5	34,473 5 10
1892	5,245 0	2,654 0	8,852 8 6
Totals.....	30,605 4	38,701 5	84,472 17 11

There is a considerable falling off in the make of coke, especially in the Southern and Western districts, but there is reason to hope that the makers will adopt such appliances and methods as will raise the quality of the coke to the highest standard possible, and then it will probably compare so favourably with

with foreign coke that it will be exclusively used at all our smelting works, and thus an extensive trade will be established. The report furnished by the Government Geologist upon the Colonial cokes, as compared with those imported, should tend to bring about such improvement:—

Geological Survey, N.S. Wales, Department of Mines,
Sydney, 22nd December, 1892.

Sir,

With the object of obtaining as much information as possible in reference to the coke at present being made in the Colony, I have inspected the following Coke works, viz., (1) the Purified Coal and Coke Company's Coke Ovens at Wallsend, (2) the Singleton Colliery Coke Ovens at Rix's Creek, (3) the Vale Colliery Coke Ovens near Lithgow, and (4) the Bulli Colliery Coke Ovens at Bulli; I have also obtained samples of the washed and unwashed coal from which coke is at present being prepared, and also representative samples of the coke made at the above-mentioned coke ovens. These samples were collected by the Inspectors of Collieries and myself, and were analysed by Mr. Mingaye, F.C.S., Analyst to this Department. At my request Mr. Mingaye also subjected each sample of coal to a careful washing in the laboratory, and it may, I think, be assumed that the results obtained by this washing are about equal to the results obtainable by the best washing appliances used on the large scale at the present day in Europe. The accompanying table (A) of coal analyses shows the constituents of such coals before and after being subjected to the process of washing by hand in the laboratory, and it will be observed that in the two instances where the coal had been previously washed by machinery at the works (viz., the Purified Coal and Coke Company, Wallsend and the Singleton Colliery) a still further reduction of the percentage of ash, amounting to .55 in the one case and 2.75 in the other was effected by the Laboratory treatment. In a sample from the Co-operative Colliery, the coal which had not been previously washed by machinery was treated in the Laboratory, with the result that the percentage of ash was reduced from 6.85 to 3.85 and a firm coke obtained, containing 6.30 per cent. of ash. In another sample from the Mount Pleasant Colliery the percentage of ash in the coal was reduced (by washing in the Laboratory) from 10.65 to 4.70, and a firm and lustrous coke was obtained which contained 6.42 per cent. of ash.

The system of washing the coal before introducing it into the coke ovens is only adopted at four collieries, viz., (1) the Singleton Colliery, (2) the Purified Coal and Coke Company, Wallsend, (3) the Vale Colliery, and (4) the Bulli Colliery. At the Singleton Colliery the washing process is of the simplest kind: the coal after coming from the tunnel is thrown upon screens of $\frac{3}{4}$ -inch mesh, and the smalls thus separated are carried in trucks to a hopper, whence they are fed into wooden sluice boxes having a maximum fall of about 1 in 36, and the coal is separated from the shale and brass by running water. The cleaned coal is then further separated by screens into blacksmiths' nuts, and fine coal, which is converted into coke in ordinary Beehive Ovens. The method of washing here adopted is crude, and as already stated, it was found by experiment in the Laboratory that the percentage of ash in the coal after washing at the works could be further reduced by about 2.75 per cent.

The Purified Coal and Coke Company, Wallsend, have a much more extensive coal-washing plant, which I understand was designed by Mr. Taylor, the Manager. The coal is delivered into a hopper whence it is carried by an elevator to a pair of rolls. After being crushed it is carried by another elevator to distributing troughs which divide it amongst three pulsating washing machines. The shale and brass fall through a grating and are carried away by a sluice, while the cleaned coal is carried forward by the water on to screens of $\frac{3}{4}$ -inch mesh, which separate it into blacksmiths' nuts and fine coal; the latter is carried downwards in a sluice with a perforated bottom, and thus reaches the next pair of rolls in a sufficiently dry condition. After being crushed fine between these rolls it is elevated to trucks, whence it is charged into Beehive Ovens. The method of washing as practised at these works is quite automatic, and is perfect as far as it goes; but there is I think, little doubt that it could be improved by the addition of another pulsating washer provided with a layer of felspar above the sieve. After the second crushing, the small particles of shale or dirt which it liberates from the coal, could be separated therefrom by a second washing in a machine such as I have referred to. As before stated, the percentage of ash in the coal which had passed through this washing plant was reduced by hand-washing in the laboratory from 5.20 to 4.65.

At the Vale Colliery, near Lithgow, a small coal-washing machine of American manufacture, and known as Diescher's Coal and Ore Washing Plant, is employed. The coal is first thrown on screens of about 1-inch mesh, and the smalls from these screens are then crushed between rolls with spiral corrugations. The crushed coal passes thence into a pulsating washing machine; the small dirt passes through a fine wire sieve with apertures of $\frac{1}{8}$ to $\frac{1}{4}$ inch, the sieve having a slight inclination from back to front; the clean coal is washed over a lip in the front, and the pieces of shale or dirt which are too large to fall through the sieve escape by a $\frac{3}{4}$ -inch aperture under the lip. As at present worked the process is far from perfect. The washed coal contains a good deal of dirt, and a considerable amount of coal is necessarily lost with the larger pieces of shale which escape through the $\frac{3}{4}$ -inch aperture. The Western coal contains a large amount of dirt intimately mixed with it, and it is questionable whether it is of sufficiently good quality to warrant the expenditure of such a sum as would be required for the erection of a washing plant capable of thoroughly cleaning it.

At the Bulli Mine a Sheppard coal-washing plant has been erected. The small coal is raised by an elevator, and is then fed into a large pulsating washing machine; the clean coal is carried forward by the water, and is washed over a lip, while the dirt and brass escape by an aperture which can be regulated by a valve. The cleaned coal is carried by a screw to an elevator furnished with a perforated bottom and is delivered in a sufficiently dry condition to the rolls, where it is crushed, and again elevated to trucks which convey it to the Coke Ovens. In this plant as in that of the Purified Coal and Coke Co. there is no provision for a second washing after the coal has passed through the rolls, and consequently none of the dirt, which may be liberated by the fine crushing, is separated from the coal before charging into the ovens. It is in this respect, I am of opinion, that the principal improvement can be made in the coal-washing plants of the Colony.

The New South Wales coals are inferior to the British only by reason of the fact that they contain a larger percentage of dirt intermixed with the coal. There is no doubt that the most perfect washing appliance in the world will not reduce the percentage of ash in coal below a certain limit, so thoroughly is a part of it incorporated with the fuel, at the same time much of the dirt besides that occurring in bands can be removed by alternate crushing sizing and washing, and the superiority of the modern coal-washing plants, such as the Lüthrig, consists in this, and in the final treatment of the finely-powdered coal, which is washed in pulsating machines provided with a layer of felspar—a mineral intermediate in specific gravity between the coal and the dirt. With such improved coal-washing plants there appears to be no reason why Colonial Coke should not be made of a quality (so far as the percentage of ash is concerned) suitable for any smelting operations it may be required for, and if the more modern ovens of a rectangular form were adopted, a great saving of time and a corresponding reduction in the cost of manufacture would probably result.

The Bulli Company use a rectangular oven which is a modification of the Coppée Coke Oven, and produces a dense coke capable of bearing a heavy furnace burden, but unfortunately the coal is very dirty, and the coke is consequently high in percentage of ash. The period required for making coke in these furnaces is considerably shorter than with the Beehive Ovens, which are used at all the other works visited by me. The charge of coke is removed by a hydraulic ram, and is quenched in the open air by spraying water over it. The gases of combustion are caused to traverse flues built in the sides and floor of the oven, so that a minimum amount of the heat is lost, and altogether there is no doubt that these ovens are more economical than the Beehives.

With the object of comparing the imported Cokes in actual use at Broken Hill with those now manufactured in the Colony, samples were at my request taken from the coke stacks at the Broken Hill Smelting Works by Mr. Geological Surveyor Jaquet, and were analysed by Mr. Mingaye.* The three samples taken were (1) Hood's (Welsh) Coke taken from the Broken Hill Proprietary Company's smelting works; (2) Brancepeth (Welsh) Coke from the Proprietary Company's works; and (3) Hood's (Welsh) Coke from the Central Broken Hill Company's works. The first of these contained only 4.75 per cent. of ash, but the second and third contained 7.80 and 9.70 per cent. respectively. These percentages appeared to be so high compared with the composition claimed for the imported coke, that I determined to check the results by an examination of the foreign cokes as they arrive at Port Pirie. With this object in view six samples were taken for me at Port Pirie by Mr. Hebbard, Inspector of Mines. The samples were analysed by Mr. Mingaye, and the results were as follow:—(1) Westport (New Zealand) Coke containing 7.15 per cent. of ash; (2) Hamburg (German) Coke containing 9.20 per cent. of ash; (3) Shamrock (German) Coke containing 7.30 per cent. of ash; (4) Brancepeth (Welsh) Coke containing 5.50 per cent. of ash; (5) Hood's (Welsh) Coke containing 8.20 per cent. of ash; and (6) Hood's No. 2 (Welsh)

* A former Report on the Manufacture of Coke in New South Wales by Mr. J. C. H. Mingaye, F.C.S., Analyst to this Department, together with supplementary remarks by Mr. Geological Surveyor David, B.A., F.G.S., was printed and laid before Parliament in October, 1890.

(Welsh) Coke containing 5.85 per cent. of ash. The annexed table (B) shows the proximate analyses of the nine samples of foreign coke taken at Broken Hill and Port Pirie, together with that of fourteen samples of coke made in different parts of New South Wales. It will be observed that some of the Welsh Coke used at Broken Hill contains a higher percentage of ash than the Colonial Coke made by either the Purified Coal and Coke Company, Wallsend, or the Singleton Colliery Companies; also, that the *average percentage* of ash, calculated from the nine samples of foreign cokes in use at, or in transport to Broken Hill, amounts to 7.26 which is only 0.6 per cent. lower than is contained by the coke made at the Purified Coal and Coke Company's ovens Wallsend. Also, having in view the improvements that are possible in the manufacture of Colonial Coke by the adoption of more complete washing plants, it will be seen by reference to table A that two samples of coke, containing less than 6½ per cent. of ash, were made in the Laboratory from hand-washed coal, from the Co-operative (Newcastle) and Mount Pleasant (Southern) Collieries, while a coke has been made from the Newcastle-Wallsend coal, closely approximating, in the percentage of ash it contains (7.51) to the average of the Coke used at Broken Hill.

With regard to the strength of Coke, or its capacity for resisting the crushing weight of the ore burden in the furnace, it has been asserted that the colonial-made article is much inferior to the imported. It was proposed that a practical test of the relative merits in this respect of the colonial and foreign cokes should be made in the furnaces at the Clyde Smelting Works. It appeared to me however that to make such a test satisfactorily would be both difficult and expensive. The furnace would have to be run for several weeks with the same ore in order to ascertain the strength of each sample of coke to be tested, and I therefore decided to adopt a simpler method of testing, which though not absolutely free from objections, may I think, be taken as fairly conclusive in regard to the relative strength of the different cokes tested.

I had cubes of some sixteen varieties of foreign and colonial cokes carefully cut on an emery wheel, and these were then forwarded to the University, where their crushing strength was ascertained in the testing machine. Professor Warren was good enough to devote a great amount of care to these tests, and the results, which are appended in Table C, are somewhat surprising. Four of the samples tried were foreign cokes, and twelve were of New South Wales manufacture, and the latter, with one exception, exhibited better pressure-resisting qualities than any of the foreign samples. The reason why only four of the foreign cokes were tried was that the balance of the other samples collected for me at Port Pirie were too small to allow of cubes being cut from them.

Without placing too much importance upon the results of these tests, I think they demonstrate beyond doubt that the average strength of the cokes made in this Colony is much superior to some at any rate of the imported cokes used in the smelting works of Broken Hill.

It will also be noticed that the Bulli Coke, which is the only one made in rectangular ovens, is superior in strength to all the other cokes, which are manufactured in Beehive Ovens.

In regard to freight rates there appears to be no doubt that the coke manufacturers of New South Wales labour under a disadvantage, so far as the Broken Hill trade is concerned, compared with the manufacturers of British and German Coke. I have made inquiries from several shipping firms, and am informed that while the freight from British and German ports to Port Pirie is now about 16s. per ton it has been as low as 9s. On the other hand the cost of freight on coke from Newcastle to Port Pirie varies from 15s. to 18s. per ton.

The conclusions which I have arrived at may be summarised as follows:—

- (1.) That there is room for material improvement in the manufacture of Colonial Coke, both in the direction of reducing the ash, and increasing the density or capacity for resisting pressure, and these improvements can best be achieved by a more perfect system of coal-washing, and by the use of a more modern type of Coke Oven.
- (2.) That some of the cokes at present manufactured in New South Wales are nearly equal as regards ash to the *average* of the imported Cokes in use at the Broken Hill smelting works.
- (3.) That several of the cokes at present manufactured in New South Wales are superior (as regards percentage of ash), to some of the imported Cokes in use at Broken Hill.
- (4.) That in regard to strength, or capacity for resisting pressure, the Cokes manufactured in New South Wales are superior to some of the imported Cokes at present in use at Broken Hill.

I have, &c,

EDWARD F. PITTMAN, A.R.S.M.,
Government Geologist.

The Under Secretary for Mines.

TABLE A.

TABLE showing Analyses of Washed and Unwashed Samples of New South Wales Coals.

Description of Coal.	Analysis of Coal as received.						Analysis of Coal after being washed in the Laboratory.					
	Moisture at 100° C.	Volatile Hydro-carbons.	Fixed Carbon.	Ash in Coal.	Percentage of Coke.	Ash in Coke.	Moisture at 100° C.	Volatile Hydro-carbons.	Fixed Carbon.	Ash in Coal.	Percentage of Coke.	*Ash in Coke.
Unwashed coal, from the Co-operative Colliery's Coke Ovens	2.85	34.70	55.60	6.85	62.45	10.96	1.60	37.35	57.20	3.85	61.05	6.30
Unwashed screened coal, from Mount Pleasant Colliery	0.95	24.90	63.50	10.65	74.15	14.36	0.65	26.20	68.45	4.70	73.15	6.42
Washed coal, from Purified Coal and Coke Company's Coke Ovens, Wallsend	2.50	35.90	56.40	5.20	61.60	8.44	1.35	36.80	57.20	4.65	61.85	7.51
Washed coal, from Singleton Colliery Coke Ovens	3.05	35.85	53.35	7.75	61.10	12.68	1.65	36.70	56.50	5.05	61.65	8.19
Unwashed, unscreened coal, from Mount Pleasant Colliery	0.85	23.85	64.85	10.45	75.30	13.87	0.75	26.10	67.15	6.00	73.15	8.20
Unwashed crushed slack, from Unanderra Coke Works, Wollongong ...	1.15	24.40	64.40	10.05	74.45	13.49	0.55	25.90	67.25	6.30	73.55	8.56
Unwashed coal, from Brown's Minmi Colliery	2.55	34.15	53.35	9.95	63.30	15.71	2.10	37.80	54.95	5.15	60.10	8.56
Unwashed small coal, from Singleton Colliery Coke Ovens	3.40	32.60	48.60	15.40	64.00	24.06	2.20	36.80	55.45	5.55	61.00	9.09

* This represents the percentage of Ash in the Coke made by hand in the Laboratory from the hand-washed Coal. It is probable that better results could be obtained if the Coke were made on the large scale in rectangular Coke Ovens.

SHALE.

The output of boghead mineral or petroleum oil cannel coal, commonly called shale, in 1892 is the largest we have yet had, exceeding that of 1891 by 33,818 tons, and exceeding the largest previous output by 18,187 tons. The price in 1892 was some 2s. per ton lower than in 1891, and the lowest since 1882.

The

The following table shows the quantity and value of Kerosene Shale produced during the years 1865 to 1892:—

Year.	Quantity.	Average price per ton.	Total value.	Year.	Quantity.	Average price per ton.	Total value.
	Tons.	£ s. d.	£ s. d.		Tons.	£ s. d.	£ s. d.

SILVER AND LEAD.

The strike at Broken Hill has caused a serious decrease in our output of silver and lead, and the fall in the price of silver has greatly reduced the value of the products of our silver mines, the value in 1892 being less by £1,141,753 than in 1891. Considering the length of time the principal mines were idle it is highly satisfactory that the value of the output reached nearly two and a half millions sterling. I am happy to say there are indications of revival in some of the mines in other parts of the Colony, where for some time past silver-mining has been practically abandoned.

No effort is being spared to solve the problem how to treat profitably our sulphide ores, and upon the solution of that problem to a great extent depends the future of silver-mining in this Colony.

* NOTE.—In the Annual Report for 1888, 11,730 tons 7 cwt. of silver ore valued at £164,020 was omitted from the table.

The bulk of the silver is exported as silver-lead or in the ore.

The following information in connection with the silver-mining industry is taken from reports furnished by the Wardens and Mining Registrars:—

At Broken Hill, the principal seat of silver-mining in this Colony, the unfortunate strike, which lasted about four months during the year, was the means of seriously interfering with this most important industry. This, coupled with the gradual decrease in the market value of silver, has resulted in an almost total cessation of prospecting operations. The quantity of ore raised in the district during the year was 403,132 tons, valued at £2,479,692, as compared with 471,101 tons, valued at £3,960,676, in 1891. This shows a decrease in value of £1,480,984, which is directly traceable to the disastrous and unforeseen events before mentioned. A difficulty is experienced in giving the exact quantity in ounces of the silver won from this field, it being chiefly exported in the form of silver-lead bullion, but as near as can be ascertained the output for the year was 12,969,195 oz. as compared with 17,243,807 oz. in 1891. In connection with the silver-mining operations, 223 tons of copper were also obtained, valued at £0,240. It is satisfactory to learn that a good water supply for the town and mines is assured for the next eighteen months, which will allow of work proceeding without stoppage.

At Nuntherungie mining operations are in a languishing state, and the field has not shown that development expected, consequently the proposed smelting works have not been proceeded with.

At Mitchell, the Sunny Corner Silver-mining Company only worked a few months during the year, the output being 108,462 oz. of silver valued at £17,654 6s. 6d., 21 tons of lead valued at £189, and 77 tons of copper valued at £3,388. The total output from the mine amounted to £26,740, which includes gold to the value of £5,508. The Phoenix Mine at Daylight Creek, worked by Mr. Lewis Lloyd, put out 58 tons of ore.

At Rockley, Baker Bros., from their silver leases at Back Creek, having erected a small plant, turned out 175 tons of matte valued at £2,630. The Mount Costigan Mine, near Tuena, has again resumed operations, after being closed for about two years.

At Lewis Ponds, the Spicer's Syndicate Gold and Silver Mining Company raised 1,739 tons of ore, which yielded 35,767 oz. of silver valued at £5,363 11s., 48 tons of silver-lead valued at £384, copper to the value of £165 8s., and £2,230 worth of gold.

At Donison Town, or Leadville, as it is now known, the Mount Stewart Silver-mining Company have completed the erection of their smelting plant, and produced 145,389 oz. of silver from 943 tons of ore. To the efforts of this company is due the permanent establishment of the silver-mining industry in this district, and under the able management of Captain Scobie further development may be looked forward to. On the same line, and about 1½ miles to the south-west, the Mount Scott Mine is being opened up with rigour, which is expected to prove a valuable addition to the field. Several other mines in the locality are in course of being opened up. At Captain's Flat, the Lake George Silver and Copper Mining Company, lately known as the Commodore Vanderbilt, treated during the year 7,322 tons of ore, which yielded 8,824 oz. of silver, 156 oz. of gold, and 671 tons of copper, valued at £29,827. The new Kohinoor Company raised during the year 11,900 tons of ore, which yielded 83,050 oz. of silver, 785 oz. of gold, and 556 tons of copper, of the total value of £32,750.

At Pambula the Great Jingera Silver-mining Company raised 31 tons of ore, which gave a return of 6,107 oz. of silver, 3½ tons of bismuth, and 12 oz. of gold, of a total value of £2,343.

The Moruya Silver-mining Company, at Moruya, is still carrying on prospecting operations, and have 600 tons of ore at grass. Work is, however, suspended, awaiting the erection of pumping machinery.

At Deepwater the Castlerag Syndicate despatched 12 tons of silver ore, but the returns are not yet to hand. The Webb's Consols Silver-mining Company, near Emmaville, raised during five months of the year ore to the value of £1,100. The Mascotte Gold and Silver Mining Company, near Drake, have 1,000 tons of ore at grass, which is estimated to yield 31 oz. of silver and 16 dwt. of gold per ton. At Rivertree a leaching plant has been erected at great expense. The Rivertree Proprietary Company have a lot of ore in sight, and ready to begin stoping. The Rivertree No. 1 Company is doing a lot of prospecting work. The Rivertree Central sent 40 tons to Queensland for treatment, which gave a return of 170 oz. of silver per ton. The Rivertree South had 8½ tons treated at the same place, which returned 200 oz. per ton. The results from the new leaching works will have a great bearing on the future of this field, and better returns may be expected when it gets into full work.

TIN.

The tin-mining industry, which has been declining since 1882, when it had reached its highest point, showed some slight revival in 1892.

As will be seen from the following table, the value of the tin exported during last year exceeded that of 1891 by £12,702. The Vegetable Tin-field near Emmaville, the principal seat of tin-mining in the Colony, produced 863 tons of stream and 200 tons of lode tin, valued at £56,339. From sluicing old ground on Vegetable Creek Moore & Co. got 43 tons of stream tin during the year, and 25½ tons from their claim at the Water Holes in the same locality. Mr. Bensusan, the Butters Tin Mine, crushed 400 tons of ore from 15 tons of tin; the Vegetable Creek Tin-mining Co. (Limited) are still at full work in the same locality. The prospects for this Division for 1893 are certainly brighter, a much larger share of attention being paid to lode tin-mining, which has, with one or two exceptions, up to the present been worked, and the ore treated, in a very primitive and laborious manner. The stream tin is chiefly won from shallow ground, but at Rose Valley and Kangaroo Valley the sinking is deep. At both these places prospecting operations were vigorously carried on during the year. At Wilson's Downfall the output was 227 tons of stream tin, valued at £12,258. In this Division work is only carried on at intervals, when water is plentiful. The rainfall was heavy during the year, and if steps were taken to conserve the water, so that work might be carried on without stoppage, the returns would be largely increased. From the Tingha Division 300 tons of tin were produced, giving an aggregate value of £27,000. There are numerous reefs in this Division well worth testing, which are now attracting the attention of our practical miners. The Deepwater Division gave a return of 420 tons of tin, valued at £22,200, 360 tons of this being stream tin. Promise is given that the output from this Division for 1893 will be much increased. From Glen Innes the product was 67½ tons of tin, the value given being £4,254 10s. Attention is being directed to the probability of finding rich deposits of tin ore underlying the long stretch of basaltic table-land dividing the valleys of the Beardy and the Mann, lying in the Division of Glen Innes. At one point on the eastern flank of the range one party obtained from surfacing, tin to the value of £795 10s. Gardner and party, north-west from Bendemeer, obtained tin to the value of £406. In the Kempsey District the Gundle Tin-field has not progressed to any great extent during the year, the principal part of the work carried on being more of a prospecting nature. The total output from the field being 14½ tons of tin, valued at £390 12s. At Euriowie, in the Broken Hill District, the Wheal Byjerkerno Tin-mining Company won 6½ tons of tin, valued at £311 13s. The Mount Euriowie Tin Company, on the same field, are still carrying on prospecting operations, and have fair indications. At Burra, near Tumberumba, the gold miners, in conjunction with their operations, saved half a ton of tin, valued at £56 per ton. In the Albury District, at Dora Dora, an important find of lode tin has been made. A large area of land has been applied for, and a syndicate has been formed with capital sufficient to thoroughly test the deposits.

TABLE

TABLE showing the quantity and value of Tin exported from, and the product of, the Colony of New South Wales, since the opening of the Tin-fields in 1872.

Year.	Ingots.				Ore.				Total.

Glen Innes District	Tin-bearing granite	18.1
" " nr. (Glen Elgin)	Concentrated stream tin ore, with free gold, some of the gold coated with mercury	73.34
Galley Swamp (Bald Hills)	Stream tin, with quartz sand	46.84
Gundle Tin-mine (nr. Kempsey)	Felspar, with tin oxide, and one piece of quartz with ditto	20.0
" "	Concentrated tin oxide	65.5
Mann River (near Glen Innes)	" stream tin ore	71.85
" "	" tin oxide	71.14
Mount Violet (Cooma District)	Ferruginous quartz, with tin oxide	19.40
Mo'ony (14 miles west of)	Blue and green carbonates of copper and cassiterite in felspathic material	15.23
Richmond River	Beach sand, concentrated from 100 lb. to 2½ lb. (platinum, 21 oz. 17 dwt. 16 gr. per ton; gold, 13 oz. 7 dwt. 20 gr.).	19.28
" "	Beach sand (platinum, 2 oz. 8 dwt. 6 gr.)	20.02
" "	" (platinum, few grains)	2.5
" "	Concentrated platinum-bearing sand (platinum, 501 oz. 2 dwt. per ton)	51.03
" " Heads (north of)	Tin-bearing beach sand (platinum, 4 oz. 7 dwt. 4 gr.; gold, 4 oz. 12 dwt. 10 gr.; iridium, 17 dwt. 9 gr.; osmiridium, 1 oz. 9 dwt. 6 gr.).	30.3

COPPER.

The value of the copper produced during the year was £187,706, or £17,387 less than in 1891. At Nymagee the Nymagee Copper-mining Company raised 6,238 tons, which yielded 697 tons of copper, valued at £31,360. The Great Cobar Company's Mine is still shut down. The New Mount Hope Copper Company, near Hillston, raised and sold as ore during the year 1,159 tons, valued at £2,805, and smelted 190 tons, valued at £6,283. The Burruga Copper-mine raised 800 tons of ore during the year, but it was not all smelted; but from the ore put through 80 tons of smelted copper were obtained, valued at £3,600. At Blayney the Annandale Copper Company's output was 10 tons of smelted copper, valued at £435 12s. At Woodstock the Nobby's Copper-mining Company sold 150 tons of ore for £620. The output from the Burley Jacky Mine, near Cowra, was about 120 tons of copper. At Mitchell the Sunny Corner Silver-mining Company obtained 77 tons of smelted copper, valued at £3,338; and at Lewis' Ponds the Spicer Syndicate obtained copper to the value of £165. At Captain's Flat the Lake George Copper-mining Company obtained 671 tons of smelted copper, valued at £40 per ton. In connection with the silver-mining operations at Broken Hill 223 tons of copper were obtained, valued at £9,240.

TABLE

TABLE showing the quantity and value of Copper, the produce of the Colony, exported from the Colony of New South Wales, from 1858 to 1892.

Year.	Ingots.		Ore and Regulus.		Total.	
	Quantity.	Value.	Quantity.	Value.	Quantity.	Value.
	Tons cwt.	£	Tons cwt.	£	Tons cwt.	£

The export of copper ore and regulus in 1892 is the largest yet, being nearly twice as large as in 1891.

During the year seventy-four assays were made for Copper in the Laboratory of this Department, the following yielding over 10 per cent. :—

Locality.	Description of Ore.	Per cent. Metallic Copper.	Per ton.

IRON.

Notwithstanding the natural advantages which, according to some experts, this Colony possesses, iron-making has not yet been established in this Colony. At the Eskbank Ironworks 2,782 tons 3 qr. 1 cwt 15 lb. of iron, valued at £22,605 2s. 6d., was manufactured from scrap.

During the year the following assays and analyses were made for iron in the Laboratory of this Department:—

Locality.	Description of Ore.	Assay or Analysis.	Iron %.
Appin	Ferruginous sandstone	Ferric oxide	19.08 %
"	"	"	21.04 "

ANTIMONY.

During the past year 1,600 tons of antimony were produced in the Armidale District, being a slight increase over the yield of the previous year. At Hillgrove the output was 1,135 tons, valued at £25,658. From the antimony field at Taylor's Arm, on the Nambucca River, Kempsey District, 280 tons of crude ore were produced, valued at £3,920, giving an average of about £14 per ton. There is a probability that the Corangula Antimony Mines will be re-opened at an early date. Near Grafton Mr. T. H. Smith is still working his antimony mine, and, during the year, raised 24 tons of ore, valued at £288.

During the year twenty assays were made for antimony in the Laboratory of this Department, the following giving the best results:—

Locality.	Description of Ore.	Per cent. Metallic Antimony.	Per ton.	
			Gold.	Silver.

BISMUTH.

The Great Jingera Silver-mining Company, near Pambula, sent away to Europe 40 tons of argenti-ferous bismuth ore for treatment, but complete returns are not yet to hand. The 40 tons were sent away in four consignments, and if the value of the 40 tons were based on the return from the first shipment, it would amount to £2,343. However, the market for bismuth is so erratic that it is difficult to give anything but an approximate value.

During the year twenty-five assays were made for bismuth in the Laboratory of the Department, the following giving the best results:—

Locality.	Description of Ore.	Per cent. Metallic Bismuth.	Per ton.	
			Gold.	Silver.
Glen Innes District	Granitic gravel, with molybdenite, and sulphide and oxide of bismuth.	3.03	oz. dwt. gr.	oz. dwt. gr.

PLATINUM.

On the beach, to the north of Evans Head, in the Clarence and Richmond Mining District, several leases have been applied for during the year to mine for this metal. Very little labour has yet been expended upon them, with one exception, when some of the sand was concentrated and forwarded to England and Germany for further treatment. The platinum found in this deposit is extremely fine, and it is questionable if, with the present appliances, it can be worked to a profit. Traces of the metal are found in the sand by the gold-miners all along the coast at Ballina, small quantities of which they contrive to save. About 10 or 12 miles from Broken Hill a discovery of platinum was made during the year, from which good results were expected. The tests so far made, however, prove that the small percentage of metal present, and the cost of extraction, would barely leave a margin of profit. This metal has also been found in the Murrumbidgee District, in the valley on the Lachlan Falls, about 60 miles west from Parkes, but not yet in payable quantities. Two samples from this locality were found to consist of sand containing quartz, black titanite, and magnetic iron, angular particles of shotty gold, rounded grains of platinum, with a few little red and white zircons.

During the year sixty-four assays were made for platinum, the following giving the most favourable results:—

Locality.	Description of Ore.	Per ton Platinum.			Per ton Gold,			Per cent. Tin.
		oz.	dwt.	gr.	oz.	dwt.	gr.

PIGMENT.

A deposit of this mineral is to be found near Kerr's Creek, situated in the Orange Division of the Bathurst Mining District. The Gordon Emery and Colour Company (Limited) have taken up a lease of 80 acres, and are now carrying on operations. A fair quantity of the raw material, consisting of purple oxide and yellow ochre, has been produced, which will be forwarded to the Company's works at Forest Lodge, near Sydney, now in course of completion. A trial shipment of about 100 tons of the pigment has been sent to England, but the value of the raw material in that market is not yet known. About 4 miles to the east of Dubbo, and also 17 miles in the same direction, several 40-acre blocks have been taken up to search for paints and pigments, and machinery is expected to be placed on the ground at an early date. A large deposit of this mineral also exists near Mudgee, which was worked for some time more or less successfully.

WOLFRAM.

At Berridale, Margoehis and party are receiving aid from the Prospecting Vote to test a wolfram lode, which they expect to cut at a depth of 100 feet.

TUNGSTEN.

During the year twenty-two assays were made in the Laboratory of this Department, the following giving the best results:—

Locality.	Description of Ore.	Tungstic Acid, per cent (w.o.n)
Clive (county of, parish of Beugha)	Wolfram in siliceous gangue, stained green by iron arseniate.....	42.55
Deepwater (near)	„ in quartz	47.02
„ (Nine-mile)	„ „	51.23
Emmaville	„ rubble, with quartz and mispickel	64.06
„	„	68.03
Frogmore (2 miles from).....	„	51.67
„	„ with quartz	62.67
Gundagai	„ in granite	61.44
Hillgrove	Scheelite	71.80
„	„	50.74
„	Quartz, with scheelite	38.25
Mount Soltan (New England)	Wolfram, a little quartz present	71.22
Mount Hope (30 miles from).....	„	72.2
„ „	„	68.8

ALUM.

During the year 1892, the Australian Alum Company, Bulladelah, have raised 1,600 tons of alumite, valued at £3,200.

DIAMONDS.

In the Bingera District the yield of diamonds is on the increase. From the Monte Christo Mine, twenty loads of wash-dirt yielded 2,250 diamonds, and from a test of 40 lb. of wash-dirt thirty-five stones were obtained, weighing 7½ carats. The largest stones obtained in this district range from two to three carats, but the majority run five or six to a carat. Prospecting operations for diamondiferous wash is still being prosecuted with vigour in the Inverell and Berrima Districts.

EMERALDS.

About 25,000 carats, value unknown, were obtained from the Emerald Proprietary Company's Mine, situated at the Glen, near Emmaville. The hardness of the matrix in which the emeralds are found is still a source of difficulty, as it is almost impossible to break down the rock without injuring and frequently destroying the emeralds.

OPAL.

Work at the White Cliff Opal Mines, in the Wilcannia District, is still being carried on. One leaseholder raised during 1892 about 500 oz. of noble opal, valued at over £2,000. Some of the opal from this field has realised as much as £18 per oz.

LIMESTONE.

In the Hunter and Macleay Mining District, the Patent Asphaltum Company have forwarded from their quarries, on the Myall Lake, near Bungwall, in the Bulladelah Division, 1,270 tons of limestone to their works in Sydney. This Company have started the manufacture of hydraulic lime.

Limestone Flux.

Large quantities of limestone flux are still being supplied to the silver mines at Broken Hill from the Tarrawingee flux quarries. The quantity supplied last year was 103,368 tons, valued at £93,031, as compared with 74,057 tons, valued at £65,357, during 1891. This is now a very important industry in the Barrier District.

During

During the year the following analyses were made of limestone in the Laboratory of this Department:—

Locality.	Description of Ore.	Analysis.	Iron %
Mount Pleasant Colliery	Limestone	Moisture85 % Lime (Ca O) 34.61 " Magnesia (Mg O) 1.01 " Ferrous oxide (Fe O) 1.36 " Alumina (Al ₂ O ₃) 13.29 " Silica (Si O ₂) 15.74 " Potash (K ₂ O) 2.29 " Soda (Na ₂ O)19 " Phosphoric acid (P ₂ O ₅)... .15 " Sulphuric Acid (S O ₃) ... trace. WATER ANALYSIS.

During the year twenty-three analyses of water were made, 18 of which are given.

LOCALITY—BARRAGAN, NEAR MUDGEK.

Total solid residue dried at 220° F. equals 47.260 grains per gallon.

Free ammonia010 parts per 100,000.
Albuminoid ammonia024 " "
Nitrogen as nitrates	strong reaction "
" as nitrites	trace parts per "
Oxygen absorbed in 15 minutes..030 " "
" " 4 hours.....	.207 " "

Colour in 2-foot tube, pale green; odour, nil; taste, nil; reaction to litmus paper, slightly alkaline; poisonous metals, none detected; chlorine as chlorides, 8.900 grains per gallon.

A qualitative analysis of the total solid residue proved it to consist mainly of soda, potash, and lime, with lesser quantities of silica, alumina, and magnesia, combined with carbonic acid, chlorine, sulphuric and nitric acids. On comparing this analysis with the one previously furnished of the water on the 26th August, 1891, it will be observed as regards impurities, the water has not improved in quality. It is still thought that it is not a suitable water in its present state for human consumption.

LOCALITY—BOURKE, BARRINGUN BORE.

Total solid matter dried at 220° F., 37.688 grains per gallon.

Analysis of solid matter—

	Grains per gallon.	In 1,000 parts.
Silica	1.736	0.0243
Alumina and trace (minute) of iron oxide.....	.252	.0036
Carbonate of lime350	.0050
" magnesia		
" potash	6.104	.0872
Chloride of sodium	6.739	.0962
Carbonate of soda	23.932	.3418
Organic matter	trace.	trace.
Nitrates	"	"
Phosphates	"	"
Total solids.....	39.113	.5586

Remarks:—No poisonous metals detected. The water gave a slight acid reaction, due to carbonic acid, and on warming for a short time, a strong alkaline reaction, due to the alkaline carbonates present. The composition of this water is very similar to several samples received from Bourke, Youngarrina, and Native Dog Bores, analyses of which were furnished during last year. It is thought that this water, if used with care, is a suitable one for irrigation, and a good description of water for all domestic uses.

LOCALITY—BOURKE, FORT BOURKE STATION, BOURKE.

Total solids, 72.80 grains per gallon.

A qualitative analysis showed that the total solids consist of sodium chloride, with traces of a potassium salt. A very small quantity of the sodium or potassium is present as a carbonate.

LOCALITY—

LOCALITY—BOURKE, No. 1 BORE, CORRELLA.

Analysis of total solids :—

	Grains per gallon.	Per 1,000 parts.
Silica and silicates.....	1.288	.0184
Carbonate of lime (Ca C O ₃)	1.000	.0142
" magnesia (Mg C O ₃).....	.336	.0017
Alumina (Al ₂ O ₃)	trace.	trace.
Carbonate of soda (Na ₂ C O ₃)	27.813	.3973
" potash (K ₂ C O ₃)	7.170	.1024
Chloride of sodium (Na Cl).....	8.733	.1146
Organic matter	trace.	trace.
	<hr/>	<hr/>
	46.340	.6516

Free ammonia, nil per 100,000 parts. Albuminoid ammonia, nil per 100,000 parts.

This water is similar in composition to two other samples taken from near Bourke.

The total solids are mainly carbonates of sodium and potassium, these salts being known when present in quantity to exert a corrosive action on the roots of plants. The amount present however is small, and it is thought that the water is suitable for irrigation purposes. An excellent water for domestic use.

LOCALITY—BOURKE, CORRELLA STATION.

Total solid matter (dried at 220° F., 49.154 grains per gallon) :—

Chlorine, 5.6 grains per gallon; sulphuric acid (S O₃), nil per gallon.

The total solid matter consists mainly of carbonates of soda and potash, and chloride of sodium, with lesser quantities of carbonates of lime and magnesia, silica, &c.

The water on evaporation gave a strong alkaline reaction, the residue strongly effervescing with acid, due to the alkaline carbonates present.

The composition of this water is almost identical with the analysis made of the water taken from the No. 1 Bore, Corrella, also two other samples from the Bourke district.

It is thought that the water is a suitable one for irrigation, stock, and an excellent one for domestic uses.

LOCALITY—BOURKE, WARRAWEENA STATION.

Depth, 1,175 ft.; temperature, 102° F.

Analysis of total solids :—

	Grains per gallon.	In 1,000 parts.
Silica and silicates.....	4.088	.0584
Carbonate of lime	4.750	.0678
" magnesia037	.0006
" alumina	trace.	trace.
Sulphate of potash	1.250	.0178
Chloride of sodium	9.720	.1388
Carbonate of potash	12.260	.1751
" soda	21.663	.3094
Organic matter	trace.	trace.
	<hr/>	<hr/>
	53.768	.7697

Remarks :—Water slightly acid, due to carbonic acid gas. As the water was contained in a stoneware jar, corked with a cork which had been previously used, no attempt was made to perform a sanitary analysis of the water.

LOCALITY—BOURKE, WARRAWEENA STATION.

Depth, 450 ft.; temperature, 102° F.

Analysis of total solid matter :—

	Grains per gallon.	In 1,000 parts.
Silica and silicates	1.960	.0280
Carbonate of lime
" magnesia	trace.	trace.
" potash	2.952	.0421
" soda	20.941	.2991
Chloride of sodium	8.445	.1203
Organic matter	trace.	trace.
	<hr/>	<hr/>
	34.298	.4808

The water gave a slight acid reaction—due to carbonic acid. The sample was contained in a jar, corked with a cork which had been previously used, the jar also having a peculiar odour, due no doubt to the liquid it previously contained, hence no attempt was made to perform a sanitary analysis of the water.

Remarks :—The suitability or unsuitability of water for irrigation purposes depends on various circumstances—the kind of crop or trees it is proposed to grow, also the drainage whereby the salts accumulated in the soil may be got rid of. On comparing the analysis it will be observed that the total solid residues consist largely of alkaline carbonates, which are known to exert a corrosive action on the young roots of plants. This action can to a certain extent be remedied by the addition of small quantities of gypsum to the soil it is proposed to irrigate. The amount of alkalis present, however, in these waters is not very large, and it is thought that if they are carefully used they are suitable waters for irrigation purposes.

LOCALITY—COONABARABRAN.

Total solid matter dried at 220° F. = 41.076 grains per gallon.

Free ammonia0023 parts per 100,000
Albuminoid ammonia	Nil.
Nitrogen as nitrates	Minute trace.
" nitrites	Nil.
Oxygen absorbed in 15 minutes0015 parts per 100,000.
" " 4 hours0021 " "

Colour in 2-ft. tube, colourless, no suspended matter present; odour when heated to 100° F., nil; reaction to litmus paper, slightly acid, due to carbonic acid; poisonous metals, nil.

Analysis

Analysis of total solids:—

	Grains per imperial gallon.
Silica as silicates.....	2.352
Lime (Ca O)	5.124
Magnesia (Mg O)	4.348
Potash (K ₂ O)	3.130
Soda (Na ₂ O)	5.538
Phosphoric acid (P ₂ O ₅)	minute trace.
Sulphuric acid (SO ₃)153
Carbonic " (CO ₂)	1.540
Chlorine (Cl)	16.700
Organic matter and moisture	2.188
	<hr/>
	41.073

LOCALITY—LOUTH, WANABING ROAD, 25-MILE BORE.

	Grains per gallon.	Per 1,000 parts.
Chloride of sodium	278.382	3.9769
" potassium	12.274	.1953
" calcium	5.838	.0834
" magnesium.....	6.580	.1169
Carbonate of lime	8.190	.0940
Silica and silicates996	.0142
Sulphuric acid (SO ₃)	trace.	trace.
Organic matter	"	"
	<hr/>	<hr/>
Total solid residue	312.200	4.4507

Remarks:—The sample contained a sediment at the bottom of the bottles, which consisted largely of sand, showing that they were not carefully taken. The analysis was conducted on the filtered water.

The amount of saline matter present in this water, consisting mainly of sodium chloride (common salt), renders it not a desirable one for irrigation purposes. For a time, plants and vegetation would no doubt thrive, but the water, if continually used, would be injurious to plant life, owing to the accumulation of salt, which would collect near the surface.

The water is unsuitable for continued domestic use, and is not a good water for stock.

Taking the total solid residue at 312 grains per gallon, the amount of salts formed as a white deposit near the surface, on the evaporation of the water, would be about 4½ ounces per square foot irrigated.

Note.—Ten inches of water is usually estimated in the course of the year to perfect a crop. One gallon covers about ½ a square foot 1 inch deep. Six gallons per square foot is equal to 10 inches depth of water. (Professor E. W. Hilgard, College of Agr. culture, California.)

LOCALITY—LOUTH, WANABING ROAD, 46-MILE BORE.

	Grains per gall.	In 1,000 parts.
Chloride of sodium	78.173	1.1167
" potassium	52.508	.7501
Carbonate of soda	7.952	.1136
" magnesia.....	.987	.1078
" lime	7.550	.0141
Silica and silicates.....	1.204	.0172
Sulphuric acid (SO ₃)	trace.	trace.
Organic matter	"	"
	<hr/>	<hr/>
Total solid residue.....	148.374	2.1195

Remarks:—This water is too saline for continued domestic use, but may be used for stock purposes. The amount of common salt present is rather high, it being over the quantity allowable in an irrigation water, but the large proportion of chloride of potassium renders the water valuable, especially for the irrigation of growing crops. The water should be carefully used, and it is possible that by deep drainage, and occasional floodings, that a water of this class could be used. * The amount of saline matter deposited on evaporation of the water would be about 2 ounces per square foot irrigated.

* Note as per foregoing

LOCALITY—MARY VALE, NEAR WELLINGTON.

The water yielded on evaporation at 220° F. 1305.248 grains of total fixed matter per gallon

Chlorine in combination, 613.816 grains per gallon; sulphuric acid in combination, 133.952 grains per gallon; free ammonia, .012 parts per 100,000; albuminoid ammonia, .008 parts per 100,000.

Taste, very saline; reaction, alkaline; odour, earthy; colour in 2-ft. tube, light pale green.

The total solids consist largely of sodium, potassium, lime, magnesia, with lesser quantities of silica and alumina, combined with chlorine, sulphuric acid, carbonic acid, &c.

Remarks:—The water is strongly impregnated with mineral matter, a large proportion of the total solids consisting of chloride of sodium (common salt). May be classed as a brackish water, possessing no medicinal qualities, and unsuitable for human consumption, irrigation purposes, and is not a desirable one for watering stock with.

LOCALITY—MENA, MUDGER.

Well 30 feet deep, in drift, half a mile from Cudgegong River.

The water on evaporation yielded a total fixed residue at the rate of 54.264 grains per gallon (dried at 220° F.)

	Grains per gall.	In 1,000 parts.
Silica and silicates	2.260	.09228
Alumina and oxide of iron	trace.	trace.
Lime (Ca O)	7.700	.11000
Magnesia (Mg O)	7.570	.10814
Soda (Na ₂ O)	11.089	.15841
Potash (K ₂ O)	trace.	trace.
Carbonic acid (CO ₂)	3.400	.04857
Sulphuric acid (SO ₃)	2.278	.03254
Phosphoric acid (P ₂ O ₅)	trace.	trace.
Chlorine (Cl)	20.800	.29714
	<hr/>	<hr/>
	55.097	.78708

Free ammonia, nil per 100,000 parts; albuminoid ammonia, nil per 100,000 parts; nitrogen as nitrates, nil per 100,000 parts; nitrogen as nitrites, nil per 100,000 parts. Colour in 2-foot tube, pale green; odour when heated to 100° C., organic; taste, nil; reaction to litmus, slightly acid, due to carbonic acid; poisonous metals, nil.

The analysis made proves the water to be exceptionally free from organic impurities, and it may be classed as a good sample of potable water, suitable for all domestic uses, stock, and irrigation purposes.

LOCALITY—

LOCALITY—MITTAGONG.

	Grains per gall.
Magnesium chloride	1·206
Potassium chloride	2·012
Sodium chloride.....	2·158
Calcium bicarbonate	2·041
Magnesium bicarbonate	2·243
Iron bicarbonate	5·985
	15·765

Free ammonia, nil per 100,000 parts; organic or albuminoid ammonia, nil per 100,000 parts; nitrogen as nitrates, nil per 100,000 parts; nitrogen as nitrites, nil per 100,000 parts. Colour in 2-foot standard tube, light brown; reaction to litmus, acid, due to carbonic acid; taste, inky; odour, earthy.

Remarks:—This water may be classed as a chalybeate water, and possesses medicinal qualities; should be useful as a general stimulant and tonic.

LOCALITY—PARRAMATTA WATER SUPPLY.

	Grains per gall.	Parts per 100,000.
Free ammonia	nil.	nil.
Albuminoid ammonia	·011	·016

" " 4 hrs.....	·217	·310
	9·338	13·340
Phosphoric acid as phosphates	minute trace.	minute trace.
Chlorine as chlorides	2·200	3·140

Appearance in 2-foot tube, reddish brown colour; odour when heated to 100° F., organic.

Remarks:—Water turbid, due to fine clay held in suspension. The residue strongly darkened on ignition, emitting a foul odour, thus showing the presence of organic matter.

Water as delivered to the town of Parramatta, after passing through the filter beds:—

	Grains per gall.	Parts per 100,000.
Free ammonia	nil.	nil.
Albuminoid ammonia	·010	·015
Nitrogen as nitrates	present.	present.
" nitrites	"	"
Oxygen absorbed in 15 min.	·122	·175
" " 4 hrs.....	·205	·293
	10·05	15·00
Phosphoric acids as phosphates	minute trace.	minute trace.
Chlorine as chlorides	2·20	3·14

Remarks:—The residue strongly darkened on ignition, emitting a foul odour. The water was turbid, and extremely difficult to filter, due to fine clay held in suspension.

Appearance in 2-foot tube, reddish brown colour; odour when heated to 100° F., organic.

LOCALITY—PEAK HILL, 30 MILES FROM PARKES.

The water yielded on evaporation a total solid residue equal to 942·004 grains per gallon (dried at 220° F.)

	Grains per gallon.
Chlorine in combination	329·63
Sulphuric acid in combination	183·92

The major portion of the total solid residue consists of saline matter, chiefly of chloride of sodium (common salt), sulphate of soda (Glauber's salt), with lesser quantities of sulphate of magnesia (Epsom's salts), alkaline carbonates, traces of nitrates, iodine, &c.

The "insoluble" of silica, carbonates of lime and magnesia, trace of alumina, &c.

Remarks:—The water was strongly saline to the taste, and gave a slight alkaline reaction. The action of this water should prove a strongly purgative one from the large amount of sulphate of soda (Glauber's salt) present, but the presence of such a large quantity of chloride of sodium (common salt) renders it of little value as a medicinal water having any commercial value. The sample may be classed as unfit for man or beast.

LOCALITY—TIROOBURRA, OLIVE DOWNS.

Water from Station well.

On opening the bottle containing the water a strong smell of sulphuretted hydrogen was noticed, and the water was found to contain a quantity of that gas in solution.

	Grains per gallons.
Total solids	109·20
Chlorine	58·31
Sulphuric acid (SO ₃)	8·17

A qualitative analysis showed that the water contained chiefly chloride of sodium, with small quantities of silica, lime, magnesia, and organic matter. No nitrates, nitrites, poisonous metals, or phosphoric acid present.

LOCALITY—No. 2 WELL, OLIVE DOWNS, TIROOBURRA.

This water was colourless and odourless, it tasted strongly of common salt. As the sample was rather small, only a partial analysis was made. Total solids equal—1292·90 grains per gallon. Partial analysis of total solids.

	Grains per gallon.
Lime (CaO)	67·012
Magnesia (MgO)	114·276
Sulphuric acid (SO ₃)	171·220
Chlorine.....	578·200
Potash and soda (approximate only).....	362·192

1292·900

No nitrates, nitrites, or organic matter, carbonates, phosphates, or poisonous metals present.

	100.23

Remarks.—The amount of potash present in this clay is high. A brick made of the clay, in drying and burning, split to pieces.

LOCALITY—BROKEN HILL.

Garnet bearing kaolin, with yellow, brown, and red stains. From 235 feet deep, Block 11, Broken Hill.

It is stated that the mineral on exposure to the light darkens. The dark portions of the mineral consist of iodide of silver, with a trace of chloride of silver. Streaks of cinnabar occur through the mineral. The darkening on exposure to the air is due to the chloride of silver present, light having little action on iodide of silver, excepting in the presence of nitrate of silver, or metallic silver.

LOCALITY—BLOCK 10 MINE, BROKEN HILL.

I have perused the letter sent with the samples re new process for the treatment of the sulphide ores at Broken Hill, and failed to see what reaction could take place by this treatment. The zinc is not removed, this metal being the whole trouble in connection with the treatment of this class of ore. The "treated sample" is certainly not suitable for smelting in an ordinary blast furnace, without previous treatment, in order to eliminate the bulk of the zinc.

A trace only of fluorine was detected in the "treated sample," the balance of the quantity stated to have been used as fluorspar, no doubt being eliminated through some cause in the treatment.

J. C. H. MINGAYE, F.C.S., &c.,
Analyst and Assayer.

Micaceous shaley sandstone, yielding:—

	Per cent.
Moisture at 100° C.22
Combined water	1.04
Silica	89.64
Alumina	6.53
Ferric oxide	1.94
Manganous oxide	trace.
Lime	"
Magnesia.....	.03
Potash.....	.83
Soda07
Phosphoric acid.....	trace.
Sulphuric acid	nil.
Carbon dioxide	"
	100.30

Two small bricks were made of this material, and submitted to the highest heat obtainable in the coke assay furnace, with the result that no fusion had taken place, the sharp edges being retained.

LOCALITY—2 MILES FROM CAPREITEE.

Argillaceous sandstone.

A small brick was made up of this material, and submitted to nearly a white heat in the coke assay furnace, with the result that no fusion had taken place, the sharp edges of the brick being retained. Should prove useful for the manufacture of a good description of fire-brick.

LOCALITY—CALOOLA CREEK, NEAR ORANGE.

Pipeclay, yielding:—

	Per cent.
Moisture at 100° C.35
Combined water	3.13
Silica	79.28
Alumina	14.80
Oxide of iron54
Lime28
Magnesia25
Alkalies	1.37
	100.00

LOCALITY—CORAKI COAL-MINE.

Clay, yielding :—	Per cent.
Moisture at 100° C.	2.45
Combined water.....	4.86
Silica.....	67.64
Alumina.....	19.18
Oxide of iron (Fe ₂ O ₃).....	1.11
(FeO).....	.23
Lime (CaO).....	.52
Magnesia (MgO).....	.79
Potash (K ₂ O).....	2.98
Soda (Na ₂ O).....	.57
Titanic acid (TiO ₂).....	nil.
Sulphuric acid (SO ₃).....	tracc.
Phosphoric acid (P ₂ O ₅).....	tracc.
	<hr/>
	100.38

LOCALITY—DOUGHBOY HOLLOW.

Volcanic mud, yielding :—	Per cent.
Hygroscopic moisture.....	6.20
Volatile hydrocarbons.....	18.71
Fixed carbons.....	6.42
Ash.....	69.67
	<hr/>
	100.00

LOCALITY—FORSTER (?).

Clay, yielding :—	Per cent.
Moisture at 100° C.	2.88
Combined water.....	5.95
Silica (SiO ₂).....	70.57
Alumina (Al ₂ O ₃).....	16.27
Ferric oxide (Fe ₂ O ₃).....	1.07
Ferrous oxide (FeO).....
Manganous oxide (MnO).....	nil.
Lime (CaO).....	.13
Magnesia (MgO).....	.38
Potash (K ₂ O).....	2.20
Soda (Na ₂ O).....	.27
Phosphoric anhydride (P ₂ O ₅).....	nil.
Sulphuric anhydride (SO ₃).....	.41
Titanic acid (TiO ₂).....	nil.
Organic matter.....	"
	<hr/>
	100.13

Remarks.—Bricks made from this clay, and submitted to a high heat in the coke assay furnace, showed no fusion, the sharp edges being retained. The bricks appeared to be of excellent quality.

LOCALITY—FORSTER, CAPE HAWKE.

Decomposed intrusive rock, probably a felsite. Two models were made of this material, and subjected to nearly white heat in coke assay furnace, with the result that no fusion had taken place, the sharp edges being retained.

LOCALITY—GOULBURN DISTRICT.

Amorphous carbonate of lead, yielding :—	Per cent.
Moisture at 100° C.16
Carbonate of lead.....	85.63
Carbonate of magnesia.....	.66
Alumina and trace of oxide of iron.....	.74
Insoluble in acids (clay).....	11.88
Undetermined.....	.93
	<hr/>
	100.00

Silver, a trace.
Gold, nil.

LOCALITY—42 MILES FROM GLEN INNES.

Tripolite, yielding :—	Per cent.
Moisture at 100° C.	6.50
Combined water.....	6.14
Silica.....	71.53
Alumina.....	14.36
Oxide of iron.....	tracc.
Oxide of manganese.....
Carbonate of lime.....	.82
Carbonate of magnesia.....	.68
	<hr/>
	100.03

LOCALITY—NEAR GREENFELL.

Black substance, probably derived from the decomposition of animal excrement in caves, yielding :—

	Per cent.
Total nitrogen.....	2.24
Equal to potassic nitrate.....	16.15
Phosphoric acid.....	.377
Insoluble matter (sand and clay).....	30.570

The whole of the nitrogen present is combined with potash, the major portion of the phosphoric acid is in the soluble state. This substance, if found in any quantity, should be valuable as a manure.

LOCALITY—GREAT JINGERA SILVER-MINE, WHIPSTICK, WYNDHAM.

Roughly concentrated ore, rich in silver, yielding :—

	Per cent.
Moisture at 100° C.	1.44
Combined water.....	3.24
Chloride of silver (AgCl).....	47.70
Sulphide of silver (Ag ₂ S).....	5.03
Oxide of bismuth (Bi ₂ O ₃).....	12.73
Ferric oxide (Fe ₂ O ₃).....	1.24
Ferrous oxide (FeO).....	7.72
Alumina (Al ₂ O ₃).....	1.16
Magnesia (MgO).....	.10
Insoluble siliceous matter.....	20.30
Carbonic acid (CO ₂).....	tracc.
	<hr/>
	100.66

Gold, a trace.
No bromine or iodine detected.

LOCALITY—LECONFIELD, BRANXTON.

Clay, yielding :—

	Per cent.
Moisture at 100° C.	6.43
Combined water.....	5.33
Silica.....	59.15
Alumina.....	22.68
Ferric oxide.....	1.74
Lime.....	.76
Magnesia.....	1.08
Potash (K ₂ O).....	3.09
Soda (Na ₂ O).....	.05
Sulphuric acid (SO ₃).....	nil.
Phosphoric acid (P ₂ O ₅).....	tracc.
	<hr/>
	100.31

A brick made of this clay, when carefully dried and burnt, split to pieces. A second was made with the addition of half its weight of sand. No fusion had taken place, the sharp edges being retained.

LOCALITY—LECONFIELD, BRANXTON.

Clay, yielding :—

	Per cent.
Moisture at 100° C.	3.15
Combined water.....	6.98
Silica (SiO ₂).....	60.10
Alumina (Al ₂ O ₃).....	24.88
Ferric oxide (Fe ₂ O ₃).....	1.27
Ferrous oxide (FeO).....
Manganous oxide (MnO).....	nil.
Lime (CaO).....	.36
Magnesia (MgO).....	1.18
Potash (K ₂ O).....	2.49
Soda (Na ₂ O).....	.08
Phosphoric anhydride (P ₂ O ₅).....	tracc.
Sulphuric anhydride (SO ₃).....	tracc.
Titanic acid (TiO ₂).....	tracc.
Organic matter.....	nil.
	<hr/>
	100.49

Remarks.—Bricks made from this clay, and submitted to a high heat in the coke-assay furnace, showed no fusion, the sharp edges being retained. The bricks appeared to be of excellent quality.

LOCALITY—MOUNT PLEASANT COAL-MINE.

Micaeous shale with plant impressions, yielding :—

	Per cent.
Moisture at 100° C.	1.48
Combined water.....	4.61
Silica.....	68.28
Alumina.....	21.29
Ferric oxide.....	.87
Manganese oxide.....	nil.
Lime.....	.30
Magnesia.....	.70
Potash (K ₂ O).....	1.86
Soda (Na ₂ O).....	.31
Sulphuric acid.....	nil.
Phosphoric acid.....	nil.
Titanic acid.....	tracc.
Organic matter.....	tracc.
	<hr/>
	99.70

LOCALITY—MOONBI.

Portion of meteorite,* yielding:—

	Specific gravity of borings at 60° F....	7.833	Per cent
Metallic iron			91.350
„ nickel			7.886
„ cobalt			.564
„ copper		A minute trace.	
„ tin			.003
„ manganese		absent.	
„ chromium		trace.	
„ calcium		trace.	
Silica			.039
Graphite			.068
Combined carbon		trace.	
Sulphur		absent.	
Phosphorous			.217
Oxygen		trace.	
			100.127

* This meteorite had been subjected to the heat of a blacksmith's forge before it had been received at this office.

LOCALITY—MACLEAY DISTRICT.

Light grey-coloured clay, yielding —	Per cent.
Moisture at 100° C.	2.37
Combined water	6.07
Silica	65.17
Alumina	21.89
Ferric oxide	.19
Manganous oxide	nil.
Lime	.50
Magnesia	1.03
Phosphoric acid	trace.
Sulphuric acid	nil.
Potash (K ₂ O)	2.02
Soda (Na ₂ O)	1.16
Titanic acid	nil.
Organic matter	nil.
	100.40

LOCALITY—MERIMBULA.

Clay, yielding —	Per cent.
Moisture at 100° C.	2.04
Combined water and organic matter	7.17
Silica	68.73
Alumina	19.00
Oxide of iron (Fe ₂ O ₃)	1.85
Lime	.20
Magnesia	.27
Titanic acid	trace.
Alkalies	.74
	100.00

LOCALITY—MOUNT COSTIGAN.

Crushed sample, yielding:—	
Gold	2 dwt. 10 gr. per ton.
Silver	15 oz. 16 dwt. 1 gr. „
Silica	2.50 per cent.
Iron	23.78 „
Arsenic	nil „
Lead	9.70 „
Copper	6.72 „
Zinc	12.66 „
Sulphur	38.42 „

LOCALITY—MOUNT COSTIGAN.

Crushed sample, yielding:—	
Gold	1 dwt. 15 gr. per ton.
Silver	36 oz. 10 dwt. 2 gr. „
Silica	17.49 per cent.
Iron	5.73 „
Arsenic	nil „
Lead	25.07 „
Copper	17.14 „
Zinc	7.90 „
Sulphur	10.61 „

LOCALITY—MOUNT COSTIGAN.

Crushed sample, yielding:—	
Gold	2 dwt. 10 gr. per ton.
Silver	10 oz. 11 dwt. 12 gr. „
Silica	16.06 per cent.
Iron	14.24 „
Arsenic	trace „
Copper	1.35 „
Lead	4.98 „
Zinc	31.06 „
Sulphur	27.67 „

LOCALITY—MOUNT COSTIGAN.

Crushed sample, yielding:—

Gold	2 dwt. 10 gr. per ton.
Silver	14 oz. 8 dwt. 7 gr. „
Silica	14.36 per cent.
Iron	13.57 „
Arsenic	a trace „
Lead	9.13 „
Copper	9.86 „
Zinc	19.32 „
Sulphur	26.47 „

LOCALITY—MOUNT COSTIGAN.

Crushed sample, yielding:—

Gold	5 dwt. 10 gr. per ton.
Silver	29 oz. 2 dwt. 13 gr. „
Silica	28.74 per cent.
Iron	23.58 „
Lead	7.03 „
Copper	2.96 „
Sulphur	4.68 „

LOCALITY—MOUNT COSTIGAN.

Crushed sample, yielding:—

Gold	2 dwt. 4 gr. per ton.
Silver	2 oz. 18 dwt. 8 gr. „
Silica	38.09 per cent.
Iron	18.36 „
Lead	6.01 „
Copper	1.07 „
Sulphur	.56 „

LOCALITY—MOUNT COSTIGAN.

Crushed slag, yielding:—

Lead	2.39 per cent.
Ferrous oxide, 32.32 = Metallic iron	25.14 „
Lime	18.43 „
Silica	33.60 „
Silver	2 oz. 1 dwt. 9 gr. per ton.
Gold	a trace.

This sample nearly all decomposed in hot acids.

LOCALITY—MOUNT COSTIGAN.

Crushed slag, yielding:—

Lead	4.09 per cent.
Ferrous oxide (FeO) 36.17 per cent. = Metallic iron	28.15 „
Lime (CaO)	13.85 „
Silica (SiO ₂)	33.02 „
Silver	2 oz. 3 dwt. 13 gr. per ton.
Gold	nil.

This sample only partially decomposed in hot acids.

LOCALITY—2 MILES WEST OF MOLONG.

Clay, yielding:—	Per cent.
Moisture at 100° C.	4.06
Combined water	9.33
Organic matter	.83
Silica (SiO ₂)	58.84
Alumina (Al ₂ O ₃)	22.86
Ferric oxide (Fe ₂ O ₃)	1.66
Ferrous oxide (FeO)	nil.
Lime (CaO)	trace.
Magnesia (MgO)	.61
Alkalies	1.81
Phosphoric acid (P ₂ O ₅)	nil.
Sulphuric acid (SO ₃)	nil.
	100.00

Some of the clay was moulded into a small brick with sharp edges, and submitted to nearly a white heat in the coke assay furnace, with the result that no fusion had taken place.

LOCALITY—NEWCASTLE.

Carbonaceous clay, yielding:—

Moisture	9.76
Carbon	19.53
Gangue	70.71
	<hr/>
	100.00

LOCALITY—RICHMOND RIVER (ABERDARE COAL-MINE, SWAN BAY).

Light grey coloured clay (6 feet thick); yielding:—

Moisture at 100° C	2.37
Combined water	6.07
Silica	65.17
Alumina	21.89
Ferric oxide	0.19
Manganous oxide	nil.
Lime50
Magnesia	1.03
Phosphoric acid	trace.
Sulphuric acid	nil.
Potash (K ₂ O)	2.02
Soda (Na ₂ O)	1.16
Titanic acid	nil.
Organic matter	nil.
	<hr/>
	100.40

Remarks—Several small bricks with and without the addition of silica, were made of this clay and carefully dried, they being submitted to a high heat in the assay coke furnace with the result that no fusion had taken place, the sharp edges being retained. The bricks had the appearance of being excellent fire bricks.

LOCALITY—RICHMOND RIVER (ABERDARE COAL-MINE, SWAN BAY).

Dark grey clay with plant impressions (7 feet thick), yielding:—

Moisture at 100° C	1.72
Combined water	5.66
Silica (SiO ₂)	65.11
Alumina (Al ₂ O ₃)	21.55
Ferric oxide (Fe ₂ O ₃)71
Ferrous oxide (FeO)	trace.
Manganous oxide (MnO)	trace.
Lime (CaO)	1.15
Magnesia (MgO)	0.90
Potash (K ₂ O)	3.09
Soda (Na ₂ O)	0.25
Phosphoric anhydride (P ₂ O ₅)	trace.
Sulphuric anhydride (SO ₃)	nil.
Titanic acid (TiO ₂)	trace.
Organic matter	trace.
	<hr/>
	100.14

Remarks.—The above remarks may refer also to this sample.

LOCALITY—RICHMOND RIVER (ABERDARE COAL-MINE, SWAN BAY).

Dark grey clay with plant impressions (7 feet thick), yielding:—

Moisture at 100° C	3.05
Combined water	4.63
Silica (SiO ₂)	63.02
Alumina (Al ₂ O ₃)	20.96
Ferric oxide (Fe ₂ O ₃)	2.91
Ferrous oxide (FeO)	nil.
Manganous oxide (MnO)	nil.
Lime (CaO)	1.32
Magnesia (MgO)	1.06
Potash (K ₂ O)	2.90
Soda (Na ₂ O)44
Phosphoric anhydride (P ₂ O ₅)04
Sulphuric anhydride (SO ₃)	nil.
Organic matter	trace.
	<hr/>
	100.36

Remarks:—Bricks made from this clay burnt to a reddish colour, no fusion was observed, the sharp edges being retained. Not equal to the foregoing.

LOCALITY—RICHMOND RIVER (ABERDARE COAL-MINE, SWAN RIVER).

Very dark brown clay with plant impressions, yielding:—

Moisture at 100° C	3.76
Combined water	7.12
Silica (SiO ₂)	56.50
Alumina (Al ₂ O ₃)	25.39
Ferric oxide (Fe ₂ O ₃)	1.11
Ferrous oxide (FeO)	trace.
Manganous oxide (MnO)	nil.
Lime (CaO)	1.45
Magnesia (MgO)	2.08
Potash (K ₂ O)	2.71
Soda (Na ₂ O)29
Phosphoric anhydride (P ₂ O ₅)	trace.
Sulphuric anhydride (SO ₃)	nil.
Titanic acid (TiO ₂)	trace.
Organic matter	trace.
	<hr/>
	100.41

Remarks:—Bricks made from this clay with and without the addition of silica were of excellent quality, no fusion had taken place, the sharp edges being retained.

LOCALITY—RICHMOND RIVER (ABERDARE COAL-MINE, SWAN BAY).

Clay, yielding:—

Moisture at 100° C	2.33
Combined water	2.13
Silica (SiO ₂)	67.03
Ferric oxide (Fe ₂ O ₃)	0.91
Ferrous oxide (FeO)	nil.
Alumina (Al ₂ O ₃)	20.75
Manganous oxide (MnO)	nil.
Lime (CaO)	trace.
Magnesia (MgO)	0.54
Potash (K ₂ O)	2.89
Soda (Na ₂ O)	0.31
Phosphoric anhydride (P ₂ O ₅)	trace.
Sulphuric anhydride (SO ₃)	"
Titanic acid (TiO ₂)	trace.
Organic matter	3.04
	<hr/>
	99.93

Remarks.—Bricks made from this clay with and without the addition of silica, were of excellent quality, no fusion had taken place, the sharp edges being retained.

LOCALITY—RICHMOND RIVER (ABERDARE COAL-MINE, SWAN BAY).

Clay, yielding:—

Moisture at 100° C	2.60
Combined water	2.38
Silica (SiO ₂)	65.95
Alumina (Al ₂ O ₃)	18.85
Ferric oxide (Fe ₂ O ₃)	3.33
Ferrous oxide (FeO)	trace.
Manganous oxide (MnO)	nil.
Lime (CaO)	trace.
Magnesia (MgO)97
Potash (K ₂ O)	2.02
Soda (Na ₂ O)83
Phosphoric anhydride (P ₂ O ₅)09
Sulphuric anhydride (SO ₃)	trace.
Titanic acid (TiO ₂)	trace.
Organic matter	2.96
	<hr/>
	99.98

Remarks.—Bricks made of this clay were of reddish colour—due to the iron oxide present—on burning the sharp edges were retained, but in one or two places fusion had slightly taken place.

LOCALITY—RICHMOND RIVER (ABERDARE COAL-MINE, SWAN BAY).

Clay, yielding :—	
Moisture at 100°C.....	1.56
Combined water.....	4.38
Silica (SiO ₂).....	67.23
Alumina (Al ₂ O ₃).....	20.07
Ferric oxide (Fe ₂ O ₃).....	1.03
Ferrous oxide (FeO).....
Manganous oxide (MnO).....	nil.
Lime (CaO).....	.60
Magnesia (MgO).....	1.19
Potash (K ₂ O).....	3.08
Soda (Na ₂ O).....	.62
Phosphoric anhydride (P ₂ O ₅).....	nil.
Sulphuric anhydride (SO ₂).....
Titanic acid (TiO ₂).....	trace.
Organic matter.....
	99.81

Remarks.—Yielded excellent bricks, the sharp edges being retained, and no fusion had taken place.

LOCALITY—SHOALHAVEN DISTRICT.

Quartzite boulder, yielding :—		per cent.
Silica.....	89.32	
Alumina.....	5.15	
Potash.....	.91	
Sulphuric acid.....	.99	

LOCALITY—SHOALHAVEN DISTRICT.

Fine grained quartzite, yielding :—		per cent.
Silica.....	95.30	
Alumina and iron oxide.....	4.37	
Potash.....	.84	
Sulphuric acid.....	.16	

LOCALITY—SHOALHAVEN DISTRICT.

Conglomerate, yielding :—		per cent.
Silica.....	84.78	
Alumina and traces of oxide of iron.....	10.62	
Potash (K ₂ O).....	.31	
Sulphuric anhydride.....	.94	

LOCALITY—WHITE CLIFFS, NEAR WILCANNIA.

Flint, yielding :—	
Moisture at 100° C.	2.66
Combined water.....	5.70
Silica.....	82.70
Ferric oxide.....	.72
Manganous oxide.....	trace.
Alumina.....	1.48
Lime.....	1.40
Magnesia.....	2.97
Potash.....	.26
Soda.....	.11
Carbonic acid.....	1.58
Sulphuric acid.....	trace.
Phosphoric acid.....
Titanic acid.....
	99.56

LOCALITY—NEAR WILCANNIA.

Sand cemented by carbonate of lime, yielding :—	
Water at 100° C.90
Combined water.....	.98
Silica.....	38.75
Alumina.....	7.42
Ferric oxide (Fe ₂ O ₃).....	.63
Ferrous oxide (FeO).....	.12
Manganous oxide.....	nil.
Calcium carbonate.....	45.30
Magnesium carbonate.....	5.06
Magnesia (MgO).....	.56
Phosphoric anhydride.....	nil.
Sulphuric.....	.14
	99.86

LOCALITY—WYRALLAH.

Tripolite, yielding :—	
Moisture at 100° C.	5.36
Combined water.....	5.96
Silica.....	86.01
Alumina and oxide of iron.....	2.83
Lime.....	trace.
Magnesia.....
Organic matter.....
	100.16

LOCALITY—YULGILBAR, NEAR KEMPSEY.

Magnesite, yielding :—		per cent.
Magnesium carbonate.....	96.72	
Impurities.....	1.64	

Silica, alumina, moisture and trace of iron oxide.

SUMMARY.

The total value of the mineral products of this Colony to the end of 1892 is £98,812,779 1s. 5d., details of which are given in the following table :—

	Quantity.	Value.	Total Values.
Quantity and value of coal raised prior to 1st January, 1892.....	53,850,743.88 tons	£ 25,809,040 10 11	£ s. d.
Quantity and value of coal raised in 1892.....	3,780,967.71 „	1,462,388 9 4	
Totals.....	57,631,711.59 tons	27,271,429 0 3	27,271,429 0 3
Quantity and value of shale raised prior to 1st January, 1892.....	653,041.00 tons	1,416,716 7 6	
Quantity and value of shale raised in 1892.....	74,197.15 „	136,079 6 0	
Totals.....	727,238.15 tons	1,552,795 13 6	1,552,795 13 6
Quantity and value of coke made prior to 1st January, 1892.....	61,407.35 tons	75,620 9 5	
Quantity and value of coke made in 1892.....	7,899.00 „	8,852 8 6	
Totals.....	69,306.35 tons	84,472 17 11	84,472 17 11
Quantity and value of gold won prior to 1st January, 1892.....	10,373,452.10 oz.	38,633,477 17 10	
Quantity and value of gold won in 1892.....	156,870.00 „	569,177 17 4	
Totals.....	10,530,322.10 oz.	39,202,655 15 2	39,202,655 15 2

	Quantity.	Value.	Total Values.
Quantity and value of silver, silver lead, and ore raised prior to 1st January, 1892	Ingots..... 4,941,138.52 oz. Silver lead..... 199,616.32 tons Ore..... 219,715.90 „	£ s. d. 11,802,005 0 0	£ s. d.
Quantity and value of silver, silver lead, and ore exported in 1892	*Ingots..... 350,661.50 oz. Silver lead... .. 45,850.20 tons Ore..... 87,504.75 „	2,477,836 0 0	
Totals	13,779,931 0 0	13,779,931 0 0
Quantity and value of copper exported prior to 1st January, 1892	Ingots..... .. 93,925.95 tons Ore and regulus 5,317.35 „	6,023,431 0 0	
Quantity and value of copper exported in 1892	Ingots..... .. 3,535.00 „ Ore and regulus 1,299.20 „	187,706 0 0	
Totals	6,211,137 0 0	6,211,137 0 0

Department of Mines and Agriculture,
Sydney, February 27th, 1893.

HARRIE WOOD,
Under Secretary for Mines and Agriculture.

CHIEF INSPECTOR OF MINES' REPORT.

In submitting my Annual Report for the year 1892, I have the honor to inform you that the following is a list of the accidents reported on by the Wardens, Coroners, Inspectors of Mines, and Mining Registrars, as having occurred during the year 1892 in the Metalliferous Mines of New South Wales.

TABLE A.

No. of Accidents.	Date.	Name of Mine or Company.	Locality.	Persons killed.	Persons seriously injured.	Occupation.	Cause of death or injury.	Fatal.		Non-fatal.									
								Fall down shaft.	Fall of timber.	Fall of earth.	Explosion of shot.	Flooding of mine.	Miscellaneous.	Fall down shaft.	Fall of bucket.	Explosion of shot.	Injury by railway truck.	Miscellaneous.

TABLE C.

ACCIDENTS of a minor nature which occurred during the year 1892.

Date.	Name of Company.	Name of Injured Person.	Nature of Injury.
1892.			
4 Jan	Junction, South, Broken Hill	Robert Johnson	Slight injuries to head and ankle from fall down shaft and explosion.
11 "	Proprietary Company, Broken Hill ...	R. Chimnick	Hand bruised by crushing in pump.
11 "	Crown of Peak Mine, Peak Hill	A. Williamson
16 "	Eleanora Mine, Hillgrove	— Johns	Injury to shoulder from collapse of stago in stope.
18 "	Junction Mine, Broken Hill	James Miners	Slight bruises from fall of earth.
5 Feb	Wyambene Mine, Krawarree	David N. Heazlett	Thigh cut by explosion of shot.
6 "	South Extended, Broken Hill	James Teanlough	Back injured by explosion of shot.
9 "	Globe Mine, Broken Hill	— Vellansy	Explosion of shot—slight wounds.
8 April ...	Balaclava Iron Quarries	James Hoare	Fall of ground.
8 "	"	Thomas Hoare	"
4 May ...	Pinnacles Mine, Broken Hill	W. J. Tremayne	"
15 June ...	Junction North, Broken Hill	George Tholander	Fall of cage—slight injury to foot.
27 Aug. ...	Timothy Lewis and Party, Forbes ...	Timothy Lewis	Crushed hand.
29 "	Cobalt Mine, Carcoar	" Sharkey "	Fell off ladder—scalp wound.
30 "	Lady Jersey, Long Gully	John Hoult	Cut head due to explosion of shot.
9 Oct.	Proprietary Mine, Broken Hill	Richard Jones	Wrists sprained—fall down pass.
27 "	"	James Bryant	Toe crushed by truck.
28 "	"	Jacob Bower	Bruised by fall of ground.
29 "	"	W. Stock	Arm cut by piece of steel flying off drill.
1 Dec	" Block 11, Broken Hill ...	William Hocking	Slight wounds caused by explosion of shot.
17 "	Drew's Shaft, Broken Hill	G. H. Simpson	Struck by cage.
17 "	Block 11, Broken Hill	H. G. Vine	Fall of stone from waggon.
17 "	Broken Hill South Mine	John Schlomaker	Explosion of shot.
24 "	Paterson's Shaft, Broken Hill	J. Stirling	Fingers crushed by trucks.
29 "	Rose's Claim, Stewart's Brook	Frederick Faulkner	Struck by windlass handle.

Table B gives, in addition to the percentage of persons killed or injured, the number of persons employed, and the value of machinery in, on, or in connection with, the metalliferous mines of New South Wales.

Out of the total of the eighteen persons killed during the year, six lost their lives in auriferous quartz-mining, four in alluvial gold-mining, six in silver-mining, one in tin-mining and one in cobalt-mining, being a decrease in the number of accidents during the year, as compared with 1891, of seven in silver-mining, but an increase of three in gold quartz-mining, one in tin-mining, and one in cobalt-mining, leaving a total decrease of fatal accidents of two during the year.

There were, in addition of the above, twenty-four minor accidents reported on, but some of which were so slight that the persons were able to keep to their work. Nevertheless, as they were reported on, it seems but right that they should be noted in this report.

The total number of persons employed on the metalliferous mines, or on the machinery in connection with said mines, during the year 1892, were 17,332, or 4,096 persons less than were employed on said mines in 1891. The value of machinery in connection with metalliferous mining has (with the one exception—that of the Broken Hill district) also considerably decreased. During the month of November a competitive examination was held at the Department of Mines, Sydney, for the position of two temporary Inspectors of Mines. No less than forty-seven applications were received, but only thirty-three of

of the forty-seven applicants presented themselves, of which Messrs. J. R. Godfrey, B.A. (Cambridge), and T. W. T. Atherton, A.I.M.E., obtained the highest number of marks, and were recommended by the examiners (consisting of the Under Secretary for Mines, the Government Geologist, and the Chief Inspector of Mines) for appointment. So far, these two new officers have given general satisfaction.

Both Mr. David Milne and Mr. James Hebbard (Inspectors of Mines) have, during the year, performed their duties faithfully and well. They have at all times been willing and ready to assist me in forwarding the interest of the Department, and through it that of the mining community, both in the inspection of mines and in connection with the Prospecting Vote. The following districts were visited by me during the year in connection with the inspection of mines and the Prospecting Vote:—Orange, Blayney, Carcoar, Cowra, Bathurst, Wattle Flat, Sofala, Hill End, Hargraves, Windeyer, Mudgee, Gulgong, Denison town, Leadville, Rylstone, Cudgegong, Woodstock, Canowindra, Cargo, Alectown, Peak Hill, Tomingley, Cobar, Billygoe, Nymagee, Parkes, Forbes, Grenfell, Gundagai, Adelong, Tarcutta, Tumbarumba, Snowy River, Coolac, and Muttama districts.

I herewith furnish four progress reports of the Billygoe, Cobar, Nymagee, Gundagai, and Peak Hill.

The reports of Messrs. David Milne and James Hebbard are also furnished herewith.

While the clerical work in connection with the diamond drills has somewhat decreased during the year, that in connection with the Prospecting Vote and inspection of mines has considerably increased, as will be seen by the following number of letters written and papers registered in my branch:—

Letters written in 1892.					Papers registered in 1892.	
Prospecting Vote	3,996	8,198	
Chief Inspector	315	1,040	
				4,311	9,238	
Total	4,311	9,238	
Drills	984	2,268	

Total letters written in the branch are 5,295, and papers registered 11,506. The whole of this work has so far been performed with four clerks. Mr. D. McCulloch, with his usual energy and ability, assisted by Mr. Stone, has successfully performed the clerical duties in connection with the inspection of mines and Prospecting Vote; whereas Mr. McNeil, in his usual painstaking manner, assisted by Mr. J. S. Leigh, has successfully performed the clerical duties in connection with the drill work. But as Mr. Leigh has to perform both the duties of storeman and clerk, he is frequently absent, and the clerical work principally falls on Mr. McNeil.

I have, &c.,

W. H. J. SLEE,

Chief Inspector of Mines.

REPORT on the Billygoe Rush, by W. H. J. Slee, F.G.S., Chief Inspector of Mines.

Sir,

Cobar, 17 August, 1892.

Having inspected the Billygoe District, I do myself the honor to inform you that owing to the great scarcity of water, both for domestic and mining purposes, the population, which a short time ago reached about 200, has now dwindled down to twenty-four men, one woman, and two children. The present discovery is in a small, shallow gully, on the foot of one of the hills forming the Billygoe mountain ranges. There are only three claims on gold—two paying fair wages and the third can hardly be considered payable. A large number of shafts have been sunk in a southern direction, where the gully opens out into a large plain, draining into the Yanko Creek. In this flat only a very few colours of gold, of a very fine nature, were obtained. There is no such deposit as is known to the gold-miner as wash-dirt or gravel; but what gold has been discovered is simply in the crevices of the bed rock, of a fairly coarse nature. The largest piece so far obtained weighed 18 dwts. The gold is not of a high quality, but contains a large percentage of silver. Although I think it would be useless to search for deep auriferous alluvial leads in the neighbourhood of the Billygoe mountains, as the geological formation and other indications are unfavourable, I nevertheless believe that other small alluvial patches will be discovered in the small ravines and gullies throughout the Billygoe Ranges when water for prospecting purposes is obtainable. Billygoe is not likely to become famous as an auriferous quartz-mining district, as the auriferous quartz veins likely to be found will be small, of a fragmentary character, and very patchy. The latter is one of the characteristics of the conglomerate (probably the paleozoic formation), which forms the principal formation of the Billygoe mountains.

I have, &c.,

W. H. J. SLEE, F.G.S.,

Chief Inspector of Mines.

The Under Secretary for Mines and Agriculture.

REPORT on the Gundagai Gold Field, by Mr. W. H. J. Slee, F.G.S., Chief Inspector of Mines.

Sir,

Gundagai, 6 October, 1892.

I do myself the honor to inform you that I have completed my inspection of the Gundagai district. Although the mining industry is at a low ebb for the present, indications are not wanting which point to the belief that in the near future Gundagai will have settled in its midst an industrious mining population. Independent of the numerous quartz reefs in the district, there are very extensive auriferous alluvial deposits which only require capital and systematic, economical working to become some of the best payable mines in this Colony. Good progress is now being made at Mr. Enery's mine—Big Ben, at Stony Creek, and Lindlay's, on the bank of the Murrumbidgee, which has been idle for a time awaiting machinery, and will be started under an improved system of working under the able management of Mr. T. Cotter Hill. That these river flats contain extensive payable auriferous deposits is beyond doubt and it only requires two or three mines besides that of Lindley's to start on a systematic and

and economical footing, and hundreds of persons would find profitable employment, and an industry would be opened proving beneficial to all concerned. So far, however, want of practical knowledge and capital combined have retarded the development of these undoubtedly rich alluvial deposits. I leave for Coolac and Muttama to-morrow.

I have, &c.,

W. H. J. SLEE,
Chief Inspector of Mines.

The Under Secretary for Mines.

REPORT by Mr. W. H. J. Sleo, F.G.S., Chief Inspector of Mines, on the Mines at Cobar and Nymagee.

Sir, Department of Mines, Sydney, 29 August, 1892.

I do myself the honor to inform you that I have completed the inspection of the Cobar and Nymagee mines.

Mining at Cobar is very dull, owing principally to the low price of copper and the consequent stoppage of work at the Great Cobar Copper-mine. Several parties are, however, at work on the gold-bearing line of lode, such as the Fort Bourke Tunnel Company, North Chesney, the Chesney, and the Occidental Mines. The latter company had just completed a crushing of 140 tons, yielding 55 oz. 5 dwt. of gold. There is a large body of ore near the surface, which, with increased battery power and a good supply of water, should give payable returns. Indications on the surface, and as far as these deposits have been worked, point to the great probability that at a greater depth the whole of these mines will turn into gossan, copper pyrites, or copper lodes.

NYMAGEE.

Like Cobar, Nymagee is also suffering not only from the severe drought which has overtaken these parts, but from the low price of copper, which has fallen below the price at which copper can be produced without loss to the company.

There are still large bodies of sulphide, but cannot be operated upon until the price of copper has risen considerably. A new find has been made in that part of the mine known as No. 8 section. It consists of an apparently wide but dreggy lode, with strings or branches of rich red oxide and grey ores, which deserve to be followed down to ascertain if they improve at a greater depth, more especially so as this part of the mine has been very little prospected.

There are several parts of country between Cobar and Nymagee which have a decided auriferous appearance, and which in favourable wet seasons deserve a thorough prospecting. I have no doubt that gold will be discovered, but if it exists in payable quantities can only be proven by practical results. The localities noted by me are near the Rest Down Station; the old sawmill, about seventeen miles from Nymagee, a tract of country about four miles on the Nymagee side of the lime kiln (Morris's Hotel), and between the limekilns and Cobar.

It would be of very little use for parties to start out prospecting in those localities until heavy rains have fallen, as they would be able to do very little good without horses to carry their tools and provisions, and at present there is no grass or water.

I have, &c.,

W. H. J. SLEE,
Chief Inspector of Mines.

The Under Secretary for Mines.

REPORT by W. H. J. Sleo, F.G.S., Chief Inspector of Mines, on Peak Hill Gold-field.

Sir, Peak Hill, 20 June, 1892.

I do myself the honor to inform you that, owing to the fact that no fresh alluvial discoveries have been made, the population of Peak Hill has somewhat decreased. I still hold the opinion as expressed in my former reports that payable alluvial leads will sooner or later be discovered westerly or south-westerly of Peak Hill. A few shafts, about six or seven, have been sunk, varying from 100 to 320 feet in depth, and in every instance gold has been obtained, but not in payable quantities. This fact ought to have encouraged prospectors to keep on, as no person with the slightest knowledge of the characteristics of our auriferous alluvial deposits will for a moment consider that one or even a dozen shafts sunk in an alluvial valley several miles in length and perhaps a mile in width can be considered as thoroughly prospected.

At Gow's Tank, about 3 miles south-westerly of Peak Hill, the prospectors sunk two (2) shafts, one 68 feet in depth and the other—only 80 feet to the east—320 feet in depth. At the 268-foot level they passed through a quartz wash about 12 inches in thickness containing a little gold not payable. This wash dipped sharply to the east and rested on a clay bottom. The shaft was then continued to the depth of 318 feet, when another layer was met with resting on a talcose slate bottom; the wash contained a little gold, and not dipping on the same angle as the top wash, but also containing a little gold, one piece weighing 8 grains. But owing to the flow of water near the bottom and the primitive appliances in use for such a depth, the party of six men discontinued work, and the land is now again available. Here is a very good opportunity for nine to twelve good miners to sink another shaft about 150 feet easterly of the 318-foot shaft, to ascertain whether or not the two layers of auriferous wash will junction to the east and perhaps form into a payable yield of gold. The shaft would have to be at least 6 feet long, and 3 feet wide, and would require slabbing from surface to bottom, the sinking being easy and fairly good standing ground, there being no heavy drifts to contend against; the hauling would have to be done either by a small engine or horse whim. The valley is very extensive, being several miles in length by a $\frac{1}{4}$ to 1 mile in width, and is probably the bed of an old river, which emptied itself into the sea, which at one time existed towards Nevertire and Nyngan during the cretaceous period. The Hon. the Minister for Mines and Agriculture has already granted a very large subsidy for the sinking of another shaft, and should payable gold be once obtained in these deep valleys west of Peak Hill the benefit to New South Wales in the present depression would be incalculable.

Although the population of Peak Hill has fallen off in numbers, business and mining are now placed on a more substantial and permanent footing, owing to the fact that several of the mines at the Peak are giving excellent returns in the lode formation. The Proprietary Mine, which was inspected by me, is the deepest on the field, and has far better prospects of payable results at the 255-foot level than there appeared on the higher levels. At this level the lode has now been opened for 80 feet in length, averaging

averaging from 4 feet 6 inches to 6 feet in thickness, with well-defined walls, having the appearance of permanency. Gold could be seen in the crushing stuff, and which by appearances should give a better yield than on the higher level. A good quantity of water is making as deeper sinking proceeds, which will greatly assist the Company in their crushing operations, as the crushing plant is now in course of erection on the mine. The mine has wonderfully improved under the management of Mr. Veitch.

The Crown of the Peak has certainly as good prospects as the Proprietary Mine, and may look forward to further improvements as greater depth is reached. The Great Eastern, Great Western, and other mines on the Peak, are all showing signs of improvement, and taking all circumstances into consideration, Peak Hill is now permanently established as an important mining centre of New South Wales.

I have, &c.,

W. H. J. SLEE,

Chief Inspector of Mines.

The Under Secretary for Mines and Agriculture.

Sir,

Sydney, 3 January, 1893.

I have the honor to submit this my annual report of the Mining Districts inspected by me for the year 1892.

Armidale, Hillgrove, Rockvale, Uralla, Glen Innes, Glen Elgin, Inverell, Stewarts Brook, Moonan Brook, and Copeland in the north.

Marulan, Towrang, Taralga, Mount Werong, Goulburn, Bungonia, Windellana, Curragh Creek, Boro, Braidwood, Nelligan, Brimbermall, Yalwal, Mogo, Moruya, Nerrigundah, Wagonga, Mount Dromedary, Bega, Bermagui, Coolagalite, Pambula, Wyndham, Cooma, Queanbeyan, Captain's Flat, and Bungendore, in the south.

Rylstone, Ilford, Mudgee, Gulgong, Denison town, Windeyer, Hargraves, Hill End, Sofala, Quartz Ridge, Wattle Flat, Sunny Corner, Bathurst, Newbridge, Caloola, Cowra, Cargo, Canowindra, Orange, Ophir, Stuart Town, Peak Hill, Myall, Parkes, and Molong in the west.

The total number of mines inspected in the different localities is 205.

In some of the districts I found the mines were worked with no regard whatever for the safety of persons employed therein.

With those managers who value their reputation and study the benefits of their employers and men under their charge, less occasion may occur for future complaints.

Besides the above mines a number of applications for aid from the Prospecting Vote have been inspected and reported on by me.

I have, &c.,

DAVID MILNE,

Inspector of Mines.

Chief Inspector of Mines,

Department of Mines, Sydney.

Sir,

Broken Hill, 1 January, 1893.

I have the honor to present my report for the year 1892 as follows:—

At the beginning of the year many of the outside small mines had been closed, owing to scarcity of water, and a variety of causes since has prevented the resumption of work, the low price of silver, the staple product of the district, being the principal cause.

The mines actually in work at this date, exclusive of the gold-fields of Mount Browne and Tibbooburra, number 37, employing in the mining and subsequent reduction of the ore about 4,850 hands. Of these about 2,600 are directly employed in mining and raising ore.

A strike of the workmen, commencing in the early part of July, kept the mines entirely idle until the latter part of September, and since then most of the mines have gradually got into full work. Some have, however, not resumed work at all.

The number of accidents that have occurred in the mines during the year is 36, made up of 6 fatal, 10 serious, and 20 slight accidents. Of the fatal accidents 4 were the result of explosion, 1 from falling down a shaft, and only 1 the result of a fall of ground. Two of the fatal accidents occurred by premature explosion, and 2 by misunderstanding the direction or position of the blast to be fired. The serious accidents are all from other causes than falls of ground, and this speaks well for the care taken throughout the district in securing the ground.

The accompanying sketch shows the means adopted in the principal mines to secure the heavy ore-bodies, in addition to the ordinary sets and angles. By this method the ore-body is worked as nearly as possible in square or oblong sections; the gangways are left clear the whole height of the stope around the section, and the section surrounded with bulkheads, which, together with the intervening spaces, are filled with mullock and strongly wedged against the standing ore or rock as the stope is opened in the different directions. The bulkheaded section is carried from level to level or to the hanging wall.

I find that the regulations are obeyed in every particular, and every precaution taken that is possible for the safety of the workmen.

I have visited every mine in the Broken Hill district frequently during the year, and have also inspected the mines in the outlying places, such as Purnamoota, Apollyon Valley, Thackaringa, and Umerumberka. I have also visited Nuntherungie, Mumba, Mount Browne, and Tibbooburra; but at the time of my visit these places were almost idle owing to scarcity of water,

I have, &c.,

JAMES HEBBARD,

Inspector of Mines.

The Chief Inspector of Mines,

Department of Mines, Sydney.

SUPERINTENDENT OF DRILLS' REPORT.

The Superintendent of Drills to The Under Secretary for Mines and Agriculture.

Sir,

Department of Mines, Diamond-drill Branch, Sydney.

In submitting my Annual Report on the working of the Diamond-drills and Water-augers for the year 1892, I do myself the honor to attach to said Report the following Appendices:—

Diamond-drills.

Appendix A.—Return showing the locality, strata, depth bored, percentage of core extracted, and rate per foot, exclusive of office salaries, store wages, and rent; also Superintendent of Drills' travelling expenses.

Appendix B.—Summary of diamond-drills showing the number of feet bored, working cost to the Department, average cost at per foot, and amount receivable for the year 1892.

Appendix C.—Balance-sheet of diamond-drills.

Appendix D.—Diagrams No. 1 to No. 5 sections of borings during the year 1892.

Appendix E.—Summary showing total cost to the Department for reaming, clearing, and repairing in connection with No. 3 Bore at Anna Bay, Port Stephens district.

Appendix F.—Cost exclusive of office salaries, store wages, rent, and Superintendent of Drills' travelling expenses in connection with No. 2 Bore, Cremorne; previous to commencement, waiting decision of Company.

Water-augers.

Appendix G.—Summary of water-augers expenditure showing total cost to the Department in connection with winding up of water-auger work, waiting for teams, packing up, and forwarding the plant from Milparinka, Wanaaring Road, to Sydney.

Appendix H.—Balance-sheet, water-augers.

The total depth bored with the diamond-drills during the year 1892 was 4,139 ft. 1in., or 3,658 ft. 8in. less than during the year 1891. The average cost per foot for boring, exclusive of office salaries, store wages, and rent, also the Superintendent of Drills' travelling expenses was 12s. 10½d. per foot, or 3½d. more than during the year 1891.

The total working and field cost, exclusive of office salaries, store wages, and rent; also the Superintendents travelling expenses amounts to £2,668 17s. 3d. But the total cost, inclusive of office salaries, and all expenditure in connection with the Diamond-drill Branch amounts to £3,318 18s. 5d., or at the rate of 16s. 0½d. per foot, or 1s. 1½d. per foot more than in 1891, whereas the total earnings during the year amounts to £3,486 7s. 11d. or 1s. 9½d. per foot less than in 1891.

Taking the expenditure in connection with the Drill Branch, without the new stock bought during the year, there remains the surplus of £167 9s. 6d.; but with the new stock the expenditure has exceeded the revenue by £1,278 14s. 4d. This is due to the arrival near the end of the year of a consignment of £690 worth of diamonds; also new stock such as boring-rods, &c., to the amount of £562 8s., making a total of £1,252 8s. which have not been used as yet, and therefore represents cash. The item of £1,258 8s. should, therefore, be deducted from £1,278 14s. 4d., which leaves £26 6s. 4d. expenditure in excess of amount receivable. The sum of £346 3s. 10d. was also expended for material, of which fully 50 per cent. is still in stock, hence the amount receivable has exceeded the actual expenditure.

Two items appear on the expenditure account which require some explanation, namely, £73 5s. 7d. for Cremorne and £566 9s. 2d. Anna Bay. The £73 5s. 7d. was charged and paid for caretaking of the diamond-drill plant pending the decision of the Company as to their intention to proceed with No. 2 Bore conditionally that the Company paid the cost incurred while waiting for their decision which has been done by them.

The £566 9s. 2d. was expenditure caused through the bore-hole at Anna Bay falling in, owing to a very fine serpentine rock having been met with, which, while boring, ground into a fine powder in which the core-barrel stuck fast. Several weeks were occupied with little or no favourable results, and as by a geological report it was considered useless to bore deeper in such strata for the search of coal, the dismantling of drill and removal to Sydney was approved of. The item, therefore, appears for clearing the bore for dismantling the drill, and removing the whole of the drill plant to the diamond-drill store, Sydney.

Percentage of core saved during the year is 89·71, or 1·13 less than during the year 1891. This percentage would have been higher had it not been for the fact that at the Port Stephens Bore, owing to the sand-drift and clay through which tubing had to be forced to the full depth reached at the end of the year, namely, 87 feet, no core could be obtained.

The cost of wear and tear of diamonds during the year is 2s. 2d. per foot, or 4½d. per foot more than during the year 1891. [*See comparative statement of diamonds used per foot in Appendix B.*]

The principal cause of the extra cost per foot for wear and tear of diamonds is the great increase in the price of diamonds in the London market suitable for diamond-drill boring purposes, and to the large diameter (5½ inches) of the bore at Cremorne Point.

The

The decrease in the number of feet bored during the year is due to uncontrollable causes, such as the wave of financial depression, which is passing over this Colony, and the fact that the Government diamond-drills are not worked free of cost to the applicants, but are so controlled, that, although every possible encouragement is given to mining enterprise by the use of diamond-drills, and no conditions are exacted oppressive to those who make use of them, the drills are no actual loss to the State.

No. 7 drill completed a bore at Greta 1,207 ft. 7 in. in depth, of which 99 ft. 7 in. were bored during the year. No. 8 completed a bore 1,213 ft. 1 in. at Anna Bay, of which 14 ft. 9 in. were bored during the year. No. 11 drill completed No. 1 Bore at Cremorne, near Sydney, to the depth of 3,095 feet, of which 152 ft. 10 in. were bored during the year with the same drill, about $\frac{1}{4}$ of a mile from No. 1 Bore. A second bore is now in progress, and at the end of the year the depth had reached 1,875 feet. No. 13 drill completed a bore at Bulli 805 ft. 3 in., of which only 12 ft. 2 in. were bored during the year, and the full section published in last year's report. No. 7 drill completed No. 2 Bore at Bulli, 865 ft. 4 in. in depth, and No. 3 Bore, 749 feet to the end of year; No. 13 drill is employed at Yarraba, Port Stephens, and had reached at the end of the year 87 feet through sand-drift. At Doughboy Hollow a bore was put down by a Wright and Edwards machine and diamond-drill combined for kerosene shale, and completed at the depth of 283 ft. 5 in.

The most important bore during the year is that at Cremorne, which was started with the largest diameter (5 $\frac{1}{2}$ inches), so far attempted with diamond-drill boring in New South Wales. Many difficulties had to be contended with, owing to the large diamond bit (Crown head) required, and the comparative small diameter of the boring rods (3 in.), which caused a great vibration, and in consequence, the bit (Crown head) commenced to wobble, causing a great loss and friction on the wear and tear of diamonds. To prevent this as much as possible three steel core-barrels, in the aggregate 30 feet in length, were screwed together, which had the effect of making the drill work more satisfactorily; nevertheless, the work is carried on with difficulty; and as the bore is of very great importance to the Colony at large, I feel reluctant to reduce the diameter of the bore, and, if possible, will carry it down to the required depth. A core 29 feet in length and 4 $\frac{1}{2}$ inches in diameter was brought to the surface, but unfortunately broke in two pieces; however, solid pieces of core, 14 to 15 feet in length and 4 $\frac{1}{2}$ inches diameter, can now be seen in the Museum of the Department of Mines from No. 2 Cremorne Bore.

The section of the core has been carefully taken by Mr. Pittman, A.R.S.M., Government Geologist, who intends furnishing a report to the Under Secretary for Mines on the whole of the strata passed through on the completion of the bore.

An alteration was made in the clerical staff of the Diamond-drill Branch on the retirement of Mr. Dalrymple, in whose stead Mr. J. S. Leigh, formerly storeman, was placed—the latter holding the dual position of storeman and clerk, by which arrangement a saving of £182 per annum was effected. New arrangements were also come to with the lessees of the diamond-drill store by which a saving of £58 per annum was effected, but as the latter arrangements only commenced in the latter part of the year, the total expenditure for the year has not been much affected thereby. The clerks in the Drill Branch, Messrs. McNeil and Leigh, have given me all the assistance possible to bring the diamond-drill work for the year to a successful issue.

Water-augers.

Nothing further to report than that the whole of the water-augers have been withdrawn from the field and placed in the diamond-drill store.

I have, &c.,

W. H. J. SLEE, F.G.S.,
Superintendent of Drills.

EXAMINER OF COAL FIELDS REPORT.

Report of the Examiner of Coal-fields for the Colony of New South Wales
for the year 1892.

In accordance with the provisions contained in the 26th section of the Coal Mines Regulation Act, 39 Vic. No. 31, I have the honor to submit reports from Messrs. Dixon, Bates, and Humble, Inspectors of Collieries, for coal mines at work and opening out in the counties of Northumberland, Durham, Gloucester, Buckland, Pottinger, and Richmond, called the Northern District; and Mr. Rowan, Inspector of Collieries, for coal and shale mines at work and opening out in the counties of Cumberland, Camden, Cook, and Roxburgh, called the Southern and Western Districts, with this my general report for the year ending 31st December, 1892.

The information I have the honor to submit with respect to the condition and progress, &c., of the coal and boghead mineral (yielding large quantities of gas and oil per ton) mines during the year 1892 is as follows:—

In 1892, the year under notice, there have been 8 fatal and 77 non-fatal accidents. Four of the fatal accidents happened from falls of coal, 3 from falls of stone roof, and 1 from skips in motion.

Thirty-eight of the non-fatal accidents occurred from falls of coal, 10 from falls of stone roof, 12 from skips, 5 from explosion of blasting powder, 1 kick from a horse, 5 from ignition of fire-damp, 1 bursting of a steam pipe, 1 from pit-cage in shaft, 1 from explosion of a shot, 1 from haulage rope, and 1 from a block on jetty.

In 1891 the fatal accidents were 212 and the non-fatal accidents 51. Seven of the fatal ones happened from falls of coal, 1 by fall of roof stone, 4 from falls of stone in sinking shafts, 2 by skips, 1 by a pit inundation, 1 by being suffocated in a coal-hopper, 1 by being injured at screens, 1 by fire-damp, and 3 by waggons.

Twenty-six of the non-fatal accidents occurred from falls of coal, 8 from falls of stone roof, 8 injuries from skips, 1 by a descending cage, 4 by blasting powder, 1 by a horse-whim, 1 blow from a sprag, 1 by winch handle, 1 by a horse, 1 by a prop, 1 by a wagon, and 1 by a trolley.

In 1890 the fatal accidents were 13, and the non-fatal accidents 36. Four of the fatal ones happened from falls of coal, 2 by trains of skips, 1 by a bucket falling down a sinking shaft, 1 by an explosion of powder, 1 by a fall of stone, 1 by a boiler explosion, and 1 by a pit cage.

Seventeen of the 36 non-fatal accidents occurred from falls of coal, 2 falls of stone roof, 2 by skips, 1 blow from a prop, 1 ignition of fire-damp, 1 an explosion of powder, 1 foot crushed by ventilating fan, 2 by surface waggons, and 1 through being scalded by steam.

SUMMARY

1892...	8	4 by falls of coal, 3 by fall of roof	77	38 by falls of coal, 10 by stone roof	10,514	3,730,967	472,620

From the above Return we find that the fatal accidents (eight) in the year under notice (1892) are considerably less than they have been since 1882, and that seven-eighths of the fatal accidents have happened from "falls of coal" and "roof," and three-fourths of the non-fatal accidents have also happened from the same cause.

The returns of the collieries raising coal and shale (boghead mineral) which have been collected, and forwarded to me by the Mining Department show the following figures for the year 1892:—

Increase „	64	

From these returns we find that in the Northern District in the year under notice there has been a decrease of 241,520 tons in the quantity of coal raised, and £251,333 in the value. Last year (1891) there was an increase of 783,205 tons in the quantity and £358,079 in the value.

In the South and South-western Districts there has been an increase of 95,000 tons and a decrease in value of £12,383. Last year (1891) there was an increase of 240,275 tons, and in the value of £97,499.

In the Western District there has been a decrease of 104,441 tons and £16,690 in the value of the coal raised, whilst in the previous year (1891) there was an increase of 3,572 tons in the quantity of coal raised and £3,109 in the value.

THE LARGE CARGO STEAMERS AND THE NEWCASTLE COAL TRADE.

(From the *Newcastle Herald and Advocate*, 10 February, 1893.)

The enormous cargo steamers at present tramping the ocean in any direction that a freight is to be obtained, are playing up with the sailing fleet of merchantmen to an extent that surprises all persons connected with maritime and commercial affairs. How far this class of vessels is likely to affect the trade of Newcastle is a matter that ere long promises to demand the most serious consideration of commercial men. For many years past very few vessels have arrived at this port from intercolonial ports when compared with the fleet that till recently came round to Newcastle for coal from the neighbouring colonies. This to a large extent is attributable to the introduction into the Australian trade of such huge carriers as the vessels of the Port, Lund's, White Star, P. and O, Orient, and other lines of steamers. The new steamer Southern Cross, which recently visited Newcastle, brought out from England a cargo of 7,300 tons of merchandise, equal to the cargoes of three or four ordinary-sized sailing vessels. Other steamers of her class are now making frequent voyages to the colonies. As a natural consequence the wind has been taken out of the sails of many of the sailing fleet heretofore solely engaged in this trade. A glance at the vessels listed to arrive in the various colonial ports from places beyond the colonies, will at once reveal a lamentable falling off in the number of sailing vessels, while that of steamers is on the increase. The enormous cargo carriers so far, with a few exceptions, have not sought coal cargoes at this port, and, therefore, Newcastle has been the sufferer by their introduction into the Australian trade up to the present time. For some months past we have had to rely upon the arrival of tonnage from foreign ports to supply our foreign markets with coal. The bulk of the shipping in port now is comprised of vessels that have arrived from Brazilian ports, with a few from South Africa, and one each from Mauritius and Java. The cause of most of these vessels coming in this direction is due to the low rates of freight offering from these places, as proved by the fact that many come seeking employment and not under charter. Had it not been for the arrival of tonnage from foreign ports our coal industry and export to foreign markets must have suffered very considerably, seeing what little support was received or could be expected in the way of arrival of sailing vessels from colonial ports to supply our foreign coal trade. With anything like a fair rate of freight offering from the West Coast of South America to Europe the vessels that have recently arrived would certainly not have come so many thousands of miles to Newcastle in ballast on the chance of picking up a charter. With a possible advance in freights, and a determined attempt on the part of steamship owners to monopolise the Australian trade out and homewards, those interested in the welfare of Newcastle will have to consider the best means of competing with the times in order to hold and if possible increase her position in the foreign coal trade.

COMPLAINTS MADE OF DEFICIENT VENTILATION, &c.

Sundry complaints of deficient ventilation and non-compliance with the requirements of the provisions of the "Coal Mines Regulation Act, 1876," have been inquired into, and proceedings, where necessary, have been taken to enforce the provisions of the Act, and reports furnished thereon.

The following notices were received during the year, of new mines opening out, or in course of development, mines re-opened, sinking of shafts, driving tunnels, changing name of company and colliery and colliery managers:—

Fern Valley Colliery.

On 28th January, Messrs. Burge and Rooke gave notice that, under the management of Mr. W. D. Bedlington, the Fern Valley Colliery was being re-worked.

Changing Name of Colliery.—Abram in lieu of Homeville Greta.

On 23rd February, Mr. Richard Baxter notified, on behalf of the proprietors, that they had decided to change the name of their Company (Homeville Greta) to that of the Abram Coal and Cannel Company, and the Colliery that of the Abram Colliery, West Maitland.

Sinking for Coal, Stockade Hill.

On 21st March, Mr. Henry Bailey notified having commenced to sink for coal in the Stockade Hill, East Maitland.

Kayuga Colliery.

On 22nd March, Mr. W. Weiss notified having started a coal-mine at Kayuga, on the late Mr. E. Cox's property, about 3 miles from Muswellbrook.

Co-operative Old Tunnel.

On 27th April, Mr. Andrew Sneddon notified having commenced to open a new tunnel at Plattsburgh, in close proximity to Co-operative Old Tunnel, for the purpose of mining for coal.

Sinking for Coal, Morpeth Road.

On 18th May, Mr. Matthew Tulip notified his intention of sinking a trial shaft on private property, behind the residence of Mr. Alexander Brown, on the Morpeth Road.

Homeville Tunnel.

On 19th of May, Mr. Jonathan Dixon notified that, in partnership with Mr. James H. Paul and William Randall, he had commenced to mine for coal, adjoining the leasehold of Abram Colliery, West Maitland.

Denton Park Colliery.

On 6th June, Mr. C. Horsfield notified that he had started to work Denton Park Colliery, West Maitland.

Changing Name of Colliery.—Seaham, in lieu of Monkwearmouth.

On 17th June, Mr. J. B. Turnbull notified, on behalf of his Company, that it had been decided to have the name of the colliery altered from the Monkwearmouth Colliery to Seaham Colliery.

Brown's and Duckensfield Collieries, Minni.

On 25th June, Mr. Richard Thomas notified, on behalf of Messrs. J. and A. Brown, having commenced to sink a shaft in connection with the dip workings of No. 4 Tunnel, Brown's Colliery.

Seaham Colliery.

On 10th August, Mr. J. B. Turnbull notified having commenced operations at the Seaham Colliery (late Monkwearmouth), West Wallsend.

West Burwood Tunnel Colliery.

On 22nd August, Mr. William Humphry having leased the West Burwood Colliery, notified his intention to start operations in a few days.

The Carlo's Gap Coal and Iron Company, Capertee.

Mr. Thomas Foster gave notice that it was the intention of the Company to re-open the Carlo's Gap Colliery on the 22nd of August.

Coal Cliff Colliery.

On 9th September, Mr. D. McGeachie, colliery manager, notified that it was the intention to start mining operations on the 12th.

The Mittagong Land and Coal Company (Limited).

On the 14th September, the Company notified, in terms of clause 7 of the Coal Mines Regulation Act, 1876, that they had accepted a contract to sink for coal on their property, at an old shaft at Mittagong, and that machinery, &c., is being erected, and the sinking will begin at the present depth of shaft (about 220 feet from surface) forthwith.

Toronto Coal Company, Lake Macquarie.

On 19th September, Mr. E. Matthew notified that the Toronto Coal Company would make a fresh start that day.

East Lambton Colliery.

On 24th September, Mr. L. Hodson notified that the above colliery had resumed work.

Harper's Mine, near Doughboy Hollow.

On the 11th October, A. M. Fell & Son notified their purpose of mining about 25 tons shale from Harper's Mine, situate near Doughboy Hollow.

Richmond Vale Shaft.

On 15th October, Mr. A. Thomas, of West Maitland, notified that work was recommenced at Richmond Vale Shaft on 20th September.

New South Wales Coal Company (Limited), Prospecting Tunnel.

On 18th October, Mr. W. D. Bedlington notified that the above company were prospecting by tunnel on their mineral lease near Awaba, and have proved what he considers to be the seam of coal immediately under the northern seam.

Irondale, Piper's Flat.

On 14th October, Mr. T. Gleeson notified that he was about to start the coal-mine at Irondale, on the Mudgee Line.

Sinking Shaft for Coal, Inganee Property.

On 9th November, Mr. Matthew Tulip notified having commenced to sink a shaft for coal on the Inganee property, Four-mile Creek, having abandoned the one he was sinking on Mr. Dixon's property.

Change of Colliery Manager.

On 14th November, Mr. James Heron Paul notified having taken control and management of the Pioneer Colliery, Homeville, West Maitland, from the 10th.

Thornton Colliery, Woodford.

On 22nd November, Mr. Henry Evans notified having commenced operations to open up the old Woodford Colliery, and that it will go by the name of Thornton Colliery.

Anvil Creek Colliery.

On 17th December, Mr. A. Thomas, Mining Engineer, West Maitland, notified, on behalf of himself and others, having leased and entered into possession on 1st day of December, and immediately commenced to work the mine.

Change of Colliery Manager.

Mr. Wm. Sanford, owner of the Eskbank Iron and Steel Works, Lithgow, notified on the 31st December that Mr. Thomas Bertram had been engaged as colliery manager for the Eskbank Colliery and Adit.

COAL-MINES ABANDONED OR WORK SUSPENDED DURING THE YEAR 1892.

Richmond Vale Sinking-pit.

Mr. John R. Rigg, on 25th January, gave notice that work was temporarily stopped at their pit, and would notify when work would again be resumed.

The

The Maitland Colliery.

On 9th February, Mr. Jonathan Dixon gave notice that mining operations were temporarily suspended at the abovenamed colliery.

West Burwood Colliery.

On 16th March, Mr. W. H. Morgan notified that mining operations had been suspended at the West Burwood Colliery.

East Lambton Colliery.

On 29th July, Mr. T. G. Griffiths notified that he had abandoned the abovenamed colliery as manager.

Swansea Mine, Lake Macquarie.

On 11th August, Mr. Thomas Parton notified having for a time suspended all mining operations at the Swansea Mine.

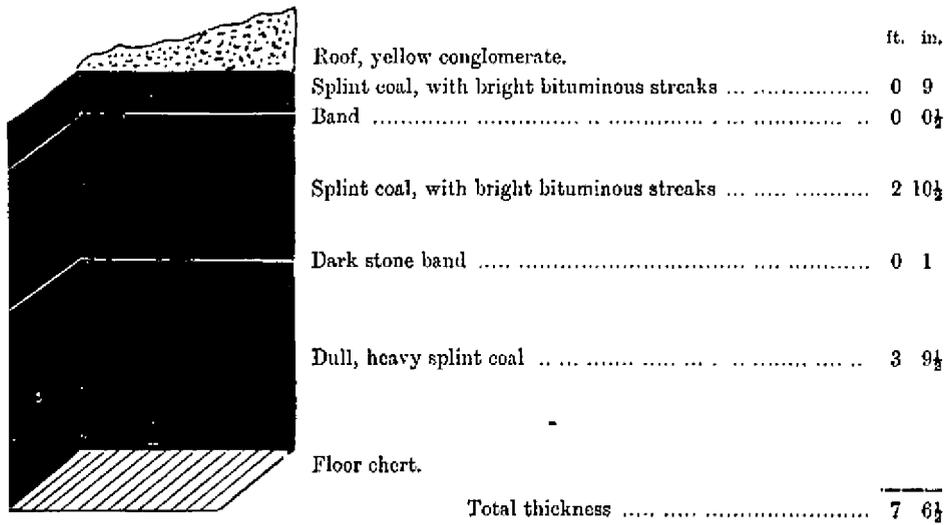

Pioneer Colliery.

On 10th November, Mr. Jonathan Dixon gave notice that he had from the above date ceased to hold authority or responsibility in any way connected with the Pioneer Colliery.

Morley Colliery.

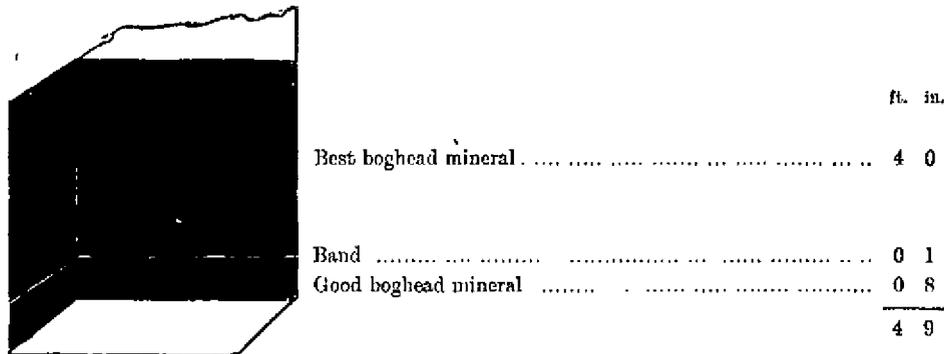

On 3rd January, Mr. Watkin W. Lord gave notice that no work had been done at Morley Colliery since August (of the year under notice), and has decided to abandon the mine for the present.

SECTION showing the thickness and character of a coal-seam opened out by an adit by the New South Wales Syndicate Coal Company, at the Broken Back Ridges, in parish of Awaba, county of Northumberland, taken 29 December, 1889, by Mr. Dixon, F.G.S., Inspector of Collieries.

Mr. Dixon is of opinion that the general appearance of the seam indicates it to be identical with that wrought at the Northern and Gartlee Collieries, in Black's Adit, Teralba, and Holmes' Adit, at the Sugarloaf Mountain, near West Wallsend Colliery, which there is no doubt is correct. The height of it above sea-level is about 130 feet. Mr. W. D. Bedlington is the manager. There are only 4 men employed in the adit, in two shifts, prospecting it.

NEW SOUTH WALES SHALE AND OIL COMPANY.

The above section represents the boghead mineral seam (petroleum oil cannell coal), which is now being opened out where it was previously thought not to exist, adjacent to the main road from Hartley Vale to the Great Western Hartley Vale Railway Station, which road the company are about to drive headings under for the purpose of getting the mineral on the north-west and west side of the road. The above section was taken by myself, Mr. Hall, the Company's General Manager, and Mr. Russell, the Company's Mining Manager. Since Mr. Russell became mining manager, in 1891, the company have, through him, succeeded in finding the boghead mineral, equal to any previously gotten as far as quality is concerned, in the creek and flat, where it varies from 2 ft. 6 in. to 4 ft. 9 in. of best quality.

Mr.

Mr. Russell was four years at the Joadja Company's Boghead Mineral Mine, and afterwards at Katoomba. He informs me that how he came to find that the seam existed in places in the flat, &c., where it was before supposed to be denuded (washed away), was: After taking over the management of the mine from Mr. Barr, the previous mining manager, he sank a shaft 71 feet deep, to the dip of the old brickyard workings, and when driving in a westerly direction he came across a jump-down fault of 11 feet, and on continuing the drive he struck a patch of splendid boghead mineral, under the flat where it was supposed to have been proved—by borings, &c., made by the company—not to exist; that he then sank several trial shafts on the flat at various places, where he found the seam as above stated.

In conclusion, I have only to add that there were 101 coal and 5 boghead mineral (petroleum oil cannell coal) mines under inspection, and that notices have been received of 21 new mines opening out, or in course of development, re-opening, sinking, &c.; and of 5 having suspended operations. Also, that the year's return show a decrease in the northern district of 241,520 tons of round and small coal raised, and £251,333 in value; in the south and south-western, an increase of 95,000 tons, and a decrease in value of £12,383; and in the western, a decrease of 104,441 tons, and £16,690 in its value.

I have, &c.,

JOHN MACKENZIE, F.G.S.,
Examiner of Coal-fields.

The Half-yearly Report on the Collieries in the Northern District of New South Wales, and accidents investigated by the Inspectors of Collieries during the six months ending 30th June, 1892.

The Examiner of Coal-fields, Sydney,—

Newcastle, 23 July, 1892.

Sir,

Pursuant to the provisions of section 26 in the Coal-mines Regulation Act, 1876, we have the honor to transmit to you this our six-monthly report on the state of the various collieries in the Northern District for the half-year ending 30th June, 1892.

The total number of collieries under inspection in the Northern District during the time embraced in this report is sixty-eight.

Eight collieries, viz., Hill End, Rosehill, Seven-mile Creek, Sunderland, Buttai, Dunmore, Tick Hole, and Coal Point, have been abandoned, and are not included in this report.

The following collieries have been added, viz.:—Pioneer, Sneddon's tunnel, Tulip's sinking shaft, and Kayuga.

PRESENT STATE OF MINES.

A. A. Co.'s No. 2 Colliery.—There are about 220 men, &c., employed in this mine during the day, and the total quantity of air circulating in the mine is about 70,000 cubic feet per minute. The face workings are divided into separate and distinct districts, none of which are overcrowded. The Act in other respects also is complied with.

A. A. Co.'s New Winning.—About 240 men, &c., are employed in this mine during the day, and are supplied with about 80,000 cubic feet of air per minute. The face workings are divided into separate and distinct districts. The Act is complied with in other respects also.

Newcastle-Wallsend Colliery.—There are about 700 men, &c., employed in this mine during the day, and the total quantity of air circulating in the mine is about 170,000 cubic feet per minute. The face workings are divided into separate and distinct districts, none of which are overcrowded. The Act in other respects also is complied with.

Newcastle Co.'s Colliery.—About 400 men, &c., are employed in this mine during the day. The total quantity of air circulating in the mine is about 90,000 cubic feet per minute. The districts and number of men in each district are in accordance with the provisions of the Act. The furnace at the bottom of the new air-shaft in connection with the B pit workings is now in use, and the ventilation of this colliery largely increased. The provisions of the Act in other respects also is complied with.

Co-operative Colliery.—There are about 260 men, &c., employed in this mine during the day, and the total quantity of air circulating in the mine is about 60,000 cubic feet per minute. The face workings are divided into separate and distinct districts, none of which are overcrowded. The Act in other respects also is complied with.

Lambton Colliery.—There are about 360 men, &c., employed in this mine during the day, and are supplied with about 90,000 cubic feet of air per minute. The face workings are divided into separate and distinct districts, and the number of men in each district is in accordance with the provisions of the Act. The Act is complied with in other respects also.

Burwood Colliery.—About 120 men, &c., are employed in this mine during the daytime, and are supplied with about 50,000 cubic feet of air per minute. The districts and number of men in each district are in accordance with the provisions of the Act. The Act in other respects also is complied with.

Stockton Colliery.—There are about 200 men, &c., employed in this mine. The total quantity of air circulating in the mine is about 60,000 cubic feet per minute. The face workings are divided into separate and distinct districts, none of which are overcrowded. A third shaft in connection with this colliery is in process of sinking. The Act is complied with in other respects also.

Wickham and Bullock Island Colliery.—There are about 340 men, &c., employed in this mine during the day, and are supplied with about 50,000 cubic feet of air per minute. The face workings are divided into separate and distinct districts, none of which are overcrowded. The Act in other respects also is complied with.

Helton

Hotton Colliery.—About 230 men, &c., are employed in this mine during the day. The total quantity of air circulating in the mine is about 70,000 cubic feet per minute. The districts and number of men in each district are in accordance with the provisions of the Act. The Act is also complied with in other respects.

Ferndale Colliery.—There are about 50 men, &c., employed in this mine during the day, and are supplied with about 10,000 cubic feet of air per minute. The provisions of the Act are complied with.

Brown's Colliery.—About 300 men, &c., are employed in this mine during the day, and the quantity of air circulating in the mine is about 40,000 cubic feet per minute. The districts are in accordance with the provisions of the Act. The Act in other respects also is complied with.

Duckenfield Colliery.—There are about 260 men, &c., employed in this mine during the day, and are supplied with about 40,000 cubic feet of air per minute. The face workings are divided into separate and distinct districts, none of which are overcrowded. The provisions of the Act are complied with.

South Waratah Colliery.—There are about 220 men, &c., employed in this mine during the day, and the quantity of air circulating in the mine is about 40,000 cubic feet per minute. The districts and number of men in each district are in accordance with the provisions of the Act. The Act in other respects also is complied with.

New Lambton C Pit.—There are about 120 men, &c., employed in this mine during the day, and are supplied with about 25,000 cubic feet of air per minute. The provisions of the Act are complied with.

Ebbw Vale Colliery.—About 30 men, &c., are employed in this mine during the day, and are supplied with about 12,000 cubic feet of air per minute. The Act is complied with.

West Burwood Colliery.—All work at this mine is for the present temporarily suspended.

Hillside Colliery (Merewether).—There are 6 men, &c., employed in this mine. The ventilation is satisfactory, and the provisions of the Act complied with.

Fern Valley Colliery (Adamstown).—Five men are employed in this mine. The ventilation is satisfactory, and the provisions of the Act complied with.

East Lambton Colliery (Adamstown).—All work at this mine is temporarily suspended.

Rotunda Colliery (North Lambton).—Two men are employed in this mine. The ventilation is satisfactory, and the provisions of the Act complied with.

Enterprise Colliery (North Lambton).—All work at this mine is temporarily suspended.

Elemore Vale Colliery (Wallsend).—There are about 10 men, &c., employed in this mine, and are supplied with about 6,000 cubic feet of air per minute in one current. The provisions of the Act are complied with.

Summerhill Colliery (Plattsburgh).—About 16 men, &c., are employed in this mine. The ventilation is satisfactory, and the provisions of the Act are complied with.

Sneddon's Tunnel (Plattsburgh).—Two men are employed in this mine. The ventilation is satisfactory, and the Act complied with.

Dudley Colliery.—There are about 160 men, &c., employed in this mine. The quantity of air circulating in the mine is about 35,000 cubic feet per minute. The provisions of the Act are complied with.

Durham Colliery.—There are 30 men employed in connection with this colliery. The quantity of air circulating in the mine is about 10,000 cubic feet per minute. The provisions of the Act are complied with.

Burwood Extended Colliery.—About 60 men, &c., are employed in this mine, and are supplied with about 20,000 cubic feet of air per minute. The provisions of the Act are complied with.

Morriset Colliery (Lake Macquarie).—There are 2 men at work in this mine. The ventilation is satisfactory, and the Act complied with.

Swansea Colliery (Lake Macquarie).—Only 1 man is employed. The ventilation is satisfactory, and the Act complied with.

Wallarah Colliery (Catherine Hill Bay).—There are about 90 men, &c., employed in this mine, and are supplied with about 18,000 cubic feet of air per minute. The provisions of the Act are complied with.

Northumberland Colliery (Fassifern).—All work at this mine is temporarily suspended.

Northern Colliery (Teralba).—There are now about 140 men, &c., employed in this mine. The quantity of air circulating in the mine is about 30,000 cubic feet per minute. The provisions of the Act are complied with.

South Stockton Colliery (Teralba).—All work at this mine is temporarily suspended.

Gartlee Colliery (Teralba).—About 18 men, &c., are employed in this mine, and are supplied with about 9,000 cubic feet of air per minute. The provisions of the Act are complied with.

Teralba Colliery.—All work at this mine is temporarily suspended.

South Wallsend Colliery (Cardiff).—There are about 55 men, &c., employed in this mine, and are supplied with about 12,000 cubic feet of air per minute. The provisions of the Act are complied with.

West Wallsend Colliery.—About 240 men, &c., are employed in this mine. The quantity of air circulating in the mine is about 60,000 cubic feet per minute. The districts, and number of men in each district, are in accordance with the provisions of the Act. The Act in other respects also is complied with.

Seaham Colliery (formerly Monkwearmouth Colliery).—This mine has been idle for a considerable time, but arrangements are now in progress for resuming work.

Killingworth Colliery.—All work in this mine is temporarily suspended.

Young Wallsend Colliery.—About 25 men, &c., are employed in this mine, and are supplied with about 30,000 cubic feet of air per minute. The provisions of the Act are complied with.

North Stockton Colliery (Hexham).—All work in this mine is temporarily suspended.

Thornley Colliery (Four-mile Creek).—About 26 men, &c., are employed in this mine. The ventilation is satisfactory and the provisions of the Act complied with.

Bloomfield Colliery (Four-mile Creek).—Seven men are employed in this mine. The ventilation is satisfactory and the Act complied with.

Tulip's Sinking Shaft (East Maitland).—Only one man is at work under ground. The Act is complied with.

Marshall's Colliery (Four-mile Creek).—Two men are employed in this mine. The ventilation is satisfactory and the Act complied with.

- Shamrock Hill Colliery (Four-mile Creek).*—All work at this mine is temporarily suspended.
- North Borehole Colliery (Four-mile Creek).*—All work at this mine is temporarily suspended.
- Richmond Vale Colliery (East Maitland).*—All work at this colliery is temporarily suspended.
- Stanford Greta Colliery (West Maitland).*—All work is temporarily suspended.
- Maitland Colliery (West Maitland).*—All work at this mine is temporarily suspended.
- Abram Colliery (formerly Homeville Greta Colliery).*—Ten men are employed in this mine, and are supplied with about 8,000 cubic feet of air per minute. The provisions of the Act are complied with.
- Pioneer Colliery (West Maitland).*—Three men are employed in connection with this mine. The ventilation is satisfactory, and the Act complied with.
- Denton Park Colliery (West Maitland).*—Four men are employed in this mine. The ventilation is satisfactory, and the provisions of the Act complied with.
- East Greta Colliery (West Maitland).*—Five men are employed in this mine. The ventilation is satisfactory, and the provisions of the Act complied with.
- Greta Colliery.*—There are about 300 men, &c., employed in this mine during the day. The quantity of air circulating in this mine is about 9,000 cubic feet per minute. The face workings are divided into separate and distinct districts, none of which are overcrowded. The provisions of the Act in other respects are also complied with.
- Leconfield Colliery (Greta).*—All work at this mine is temporarily suspended.
- New Anvil Creek Colliery (Greta).*—All work at this mine is temporarily suspended.
- Ellesmere Colliery (Singleton).*—About 25 men, &c., are employed in this mine. The quantity of air circulating in the mine is about 8,000 cubic feet per minute. The provisions of the Act are complied with.
- New Park Colliery (Singleton).*—There are about 27 men, &c., employed in this mine, and are supplied with about 4,000 cubic feet of air per minute. The Act is complied with.
- Elliott's Colliery (Singleton).*—Seven men are employed in this mine. The ventilation is satisfactory, and the Act complied with.
- Rosedale Colliery (Singleton).*—About 15 men are employed in this mine, and supplied with about 2,400 cubic feet of air per minute. The provisions of the Act are complied with.
- Dulwich Colliery (Singleton).*—Six men are employed in this mine. The ventilation is satisfactory, and the Act complied with.
- Oakvale Colliery (Singleton).*—All work at this mine is temporarily suspended.
- Kayuga Colliery (Muswellbrook).*—Three men are employed, and everything in good condition.
- Morley Colliery (Gunnedah).*—Only the proprietor employed getting a little coal for household purposes. Everything in good working order.
- Gladstone Colliery (Gunnedah).*—All work at this mine is temporarily suspended.
- Centenary Colliery (Curlewis).*—Eight men employed and supplied with about 5,000 cubic feet of air per minute in one current. The provisions of the Act fully complied with.

ACCIDENTS IN MINES.

The accidents investigated by us in the Northern District during the six months ending June 30, 1892, are 39 in number. Of this number, 30 were fully reported on at the time, and 9 were found to be of a minor character, and full reports were not written thereon. Of the 30 accidents in the annexed tabulated list, only 1 proved fatal, from fall of coal. Of the non-fatal accidents, 14 were caused by fall of coal, 5 from injury by skips, 4 from explosion of powder, 3 from ignition of fire-damp, 1 from injury by horse, and 1 by fall of roof (shale).

The fatal accident occurred to a miner named Thomas Cammick, by a fall of coal in Brown's Colliery, Minmi. The accident occurred on March 23, and Cammick died on March 25. The District Coroner, G. C. Martin, Esq., held an inquest on the body of deceased at Minmi, on March 26. The inquest was attended by Inspector Humble, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The first of the non-fatal accidents occurred to a wheeler named James Dunlop, at the Co-operative Colliery, on January 14th, and resulted in fracture of arm by skips.

The second occurred to a miner named John Parkinson, at Stockton Colliery, on January 15th, by a fall of coal, resulting in injury to leg and hip.

The third occurred to a miner named Thomas Hall, at Stockton Colliery, on January 16th, by a fall of coal, and resulted in fracture of collar bone.

The fourth occurred to a miner named John Davis, at the Co-operative Colliery, on January 18th, resulting in fracture of leg by fall of coal.

The fifth occurred to a miner named William Hildred, at New Lambton Colliery, on January 19th, by a fall of coal, resulting in fracture of leg.

The sixth occurred to a miner named John Crook, at New Lambton Colliery, on January 20th, resulting in injury to foot by fall of coal.

The seventh occurred to a miner named Robert Hunter, at West Wallsend Colliery, on February 1st, by an explosion of powder, resulting in burns on face and neck.

The eighth occurred to a flatter named Robert Walker, at Newcastle Wallsend Colliery, on February 1st, resulting in fracture of arm by full skips.

The ninth occurred to a miner named Joseph Ritchie, at A. A. Co.'s No. 2 Pit, on February 12th, by an explosion of powder, resulting in burns on chest, neck, and face.

The tenth occurred to a miner named Anty. Ba'ey, at Hetton Colliery, on February 24th, resulting in injury to head and hips by fall of coal.

The eleventh occurred to a miner named James Cook, at Dudley Colliery, on March 2nd, by fall of coal, resulting in injury to legs and back.

The twelfth occurred to a miner named George James, at Newcastle Wallsend Colliery, on March 15th, resulting in injury to face, arms, and chest, by being knocked down by a horse.

The thirteenth occurred to a miner named Ralph Taylor, at Wickham and Bullock Island Colliery, on March 23rd, by an explosion of powder, resulting in burns on arms, back, and chest.

The fourteenth occurred to a miner named Solomon Heslop, at Stockton Colliery, on March 28th, resulting in fracture of thighs by fall of coal.

The

The fifteenth occurred to a miner named John Andrews, at New Lambton Colliery, on April 7th, by a fall of coal, resulting in fracture of thigh.

The sixteenth occurred to a miner named George Palmer, at Dudley Colliery, on April 20th, resulting in fracture of leg by fall of coal.

The seventeenth occurred to a miner named John Sykes, at Dudley Colliery, on April 20th, by a fall of coal, resulting in injury to foot.

The eighteenth occurred to a miner named William Robson, at Wallarah Colliery, on April 21st, resulting in fracture of thigh by fall of coal.

The nineteenth occurred to a miner named Thomas Timmons, at Newcastle Wallsend Colliery, on April 25th, by a fall of coal, resulting in fracture of thigh.

The twentieth occurred to a wheeler named William Brimsmead, at South Wallsend Colliery, on April 29th, resulting in injury to foot by full skips.

The twenty-first occurred to a miner named Thomas Finlay, at Newcastle Wallsend Colliery, on May 4th, by ignition of fire-damp, resulting in burns on the back, shoulders, and arms.

The twenty-second occurred to a miner named William Thompson, at Durham Colliery, on May 18th, by ignition of fire-damp, resulting in burns on the body, above the waist.

The twenty-third occurred to a miner named George Virgo, at Durham Colliery, on May 18th, by ignition of fire-damp, resulting in burns on the back.

The twenty-fourth occurred to a miner named Richard Williams, at Brown's Colliery, on May 23rd, resulting in fracture of leg by fall of coal.

The twenty-fifth occurred to a miner named James Hamilton, at Brown's Colliery, on June 16th, by a fall of roof (shale), resulting in fracture of collar-bone and ribs.

The twenty-sixth occurred to a miner named James Pettigrew, at the Co-operative Colliery, on June 23rd, by an explosion of powder, resulting in burns on face.

The twenty-seventh occurred to a horse-driver named Robert Cassels, at Duckenfield Colliery, on June 27th, resulting in fracture of leg by loaded skip.

The twenty-eighth occurred to a trapper named Edward Knight, at South Waratah Colliery, on June 28th, resulting in fracture of arm by loaded skip.

ACCIDENT ON SURFACE.

An accident occurred on the surface to an engineman named James McDowell, at Young Wallsend Colliery, on May 28th, resulting in burns on face and arms by the bursting of a steam pipe.

The tabulated list of accidents is hereto appended.

We have, &c.,
JOHN DIXON,
THOS. L. BATES,
WILLIAM HUMBLE,
 Inspectors of Collieries.

The Half-yearly Report on the Collieries in the Northern District of New South Wales and Accidents investigated by the Inspector of Collieries during the six months ending December 31st, 1892.

The Examiner of Coal-fields,—
Sir,

Newcastle, 24 January, 1893.

Pursuant to the provisions of section 26 in the Coal-mines Regulation Act, 1876, we have the honor to transmit this our six-monthly report on the state of the various collieries in the Northern District for the half-year ending December 31st, 1892.

The total number of collieries under inspection in the Northern District during the time embraced in this report is 73.

The following collieries have been added, viz., Toronto, Awaba, Thornton, Richmond Hill, and Nicholai's Tunnel.

PRESENT STATE OF MINES.

A. A. Co.'s No. 2 Colliery.—There are about 250 men, &c., employed in this mine during the day, and the total quantity of air circulating in the mine is about 100,000 cubic feet per minute. The face workings are divided into seven separate and distinct districts, none of which are overcrowded. The Act in other respects also is complied with.

A. A. Co.'s New Winning.—There are about 280 men, &c., employed in this mine during the day, and the total quantity of air circulating in the mine is about 80,000 cubic feet per minute. The face workings are divided into seven separate and distinct districts. The Act is complied with in other respects also.

Newcastle Wallsend Colliery.—About 700 men, &c., are employed in this mine during the day, and are supplied with about 170,000 cubic feet of air per minute. The face workings are divided into separate and distinct districts, none of which are overcrowded. The Act in other respects also is complied with.

Newcastle Co.'s Colliery.—There are about 370 men, &c., employed in this mine during the day, and the total quantity of air circulating in the mine is about 140,000 cubic feet per minute. The face workings are divided into eight separate and distinct districts, none of which are overcrowded. The provisions of the Act are complied with.

Co-operative Colliery.—There are about 250 men, &c., employed in this mine, and are supplied with about 35,000 cubic feet of air per minute. The face workings are divided into separate and distinct districts. The provisions of the Act in other respects also are complied with.

Lambton Colliery.—There are about 350 men, &c., employed in this mine during the day. The total quantity of air circulating in the mine is about 90,000 cubic feet per minute. The face workings are divided into ten separate and distinct districts, none of which are overcrowded. The Act in other respects also is complied with.

Burwood Colliery.—About 190 men, &c., are employed in this mine, and are supplied with about 40,000 cubic feet of air per minute. The districts and number of men in each district are in accordance with the provisions of the Act. The Act in other respects also is complied with.

Stockton Colliery.—There are about 250 men, &c., employed at this mine. The total quantity of air circulating in the mine is about 30,000 cubic feet per minute. The face workings are divided into separate and distinct districts, none of which are overcrowded. The Act is also complied with in other respects.

Wickham and Bullock Island Colliery.—About 350 men, &c., are employed in this mine, and are supplied with about 40,000 cubic feet of air per minute. The face workings are divided into separate and distinct districts, and the Act in other respects also complied with.

Hetton Colliery.—There are about 350 men, &c., employed in this mine. The total quantity of air circulating in the mine is about 53,000 cubic feet per minute. The districts and number of men in each district are in accordance with the provisions of the Act. The Act is also complied with in other respects.

Ferndale Colliery.—About 50 men, &c., are employed in this mine, and are supplied with about 12,000 cubic feet of air per minute. The provisions of the Act are complied with.

Brown's Colliery.—There are about 260 men, &c., employed in this mine during the day. The total quantity of air circulating in the mine is about 55,000 cubic feet per minute. The districts and number of men in each district are in accordance with the provisions of the Act. The Act in other respects also is complied with.

Duckenfield Colliery.—About 260 men, &c., are employed in this mine, and are supplied with about 32,000 cubic feet of air per minute. The face workings are divided into separate and distinct districts, none of which are overcrowded. The Act is complied with in other respects also.

South Waratah Colliery.—There are about 239 men, &c., employed in this mine during the day. The total quantity of air circulating in the mine is about 40,000 cubic feet per minute. The face workings are divided into separate and distinct districts, none of which are overcrowded, and the Act is in other respects complied with.

New Lambton C Pit.—There are about 180 men, &c., employed in this mine during the day, and are supplied with about 17,000 cubic feet of air per minute. The provisions of the Act are complied with.

Ebbw Vale Colliery.—About 35 men, &c., are employed in this mine during the day. The total quantity of air circulating in the mine is about 14,000 cubic feet per minute. The Act is complied with.

West Burwood Colliery.—About 20 men, &c., are employed in this mine, and supplied with about 3,000 cubic feet of air per minute. The Act is complied with.

Hillside Colliery.—There are 6 men, &c., employed in this mine, and supplied with 4,000 cubic feet of air per minute. The Act is complied with.

Fern Valley Colliery (Adamstown).—This mine has been under inspection during the six months, but work is now suspended.

East Lambton Colliery (Adamstown).—About 26 men, &c., are employed in this mine, and supplied with about 8,000 cubic feet of air per minute. The provisions of the Act are fully complied with.

Rotunda

Rotunda Colliery (North Lambton).—Only 1 man is employed in this mine. The ventilation is satisfactory, and the Act complied with.

Enterprise Colliery (North Lambton).—All work at this mine is temporarily suspended.

Elemore Vale Colliery (Wallsend).—There are about 12 men, &c., employed in this mine, and supplied with 4,000 cubic feet of air per minute. The provisions of the Act are complied with.

Summerhill Colliery.—About 18 men, &c., are employed in this mine. The ventilation is satisfactory, and the Act complied with.

Maryland Colliery, Plattsburgh (formerly Sneddon's Tunnel).—There are about 5 men, &c., employed in this mine. The ventilation is satisfactory, and the Act complied with.

Dudley Colliery.—There are about 180 men, &c., employed in this mine. The total quantity of air circulating in the mine is about 50,000 cubic feet per minute. The provisions of the Act are complied with.

Durham Colliery.—There are about 12 men, &c., employed underground at this colliery, and supplied with about 13,000 cubic feet of air per minute. The Act is complied with.

Burwood Extended Colliery.—There are about 52 men, &c., employed in this mine. The total quantity of air circulating in the mine is about 31,000 cubic feet per minute. The provisions of the Act are fully complied with.

Toronto Colliery (Lake Macquarie).—There are 3 men, &c., employed in this mine. The ventilation is satisfactory and the Act complied with.

Morrissett Colliery (Lake Macquarie).—There are 2 men employed in this mine. The ventilation is satisfactory, and the provisions of the Act complied with.

Swansea Colliery (Lake Macquarie).—Work at this mine is at present temporarily suspended.

Wallarah Colliery (Catherine Hill Bay).—There are about 100 men, &c., employed in this mine, and are supplied with about 13,000 cubic feet of air per minute. The provisions of the Act are complied with.

Awaba Colliery.—Four men employed in prospecting adit. Ventilation good and no cause of complaint.

Northumberland Colliery (Fassifern).—All work at this mine is temporarily suspended.

South Stockton Colliery.—All work at this mine is temporarily suspended.

Northern Colliery (Teralba).—There are about 120 men, &c., employed in this mine, and are supplied with about 30,000 cubic feet of air per minute. The provisions of the Act are fully complied with.

Gartlee Colliery (Teralba).—There are about 30 men, &c., employed in this mine, and are supplied with about 9,000 cubic feet of air per minute. The Act is complied with.

Teralba Colliery.—All work at this mine is temporarily suspended.

South Wallsend Colliery (Cardiff).—There are about 50 men, &c., employed in this mine, and are supplied with about 12,000 cubic feet of air per minute. The provisions of the Act are complied with.

Young Wallsend Colliery.—Work at this mine is at present temporarily suspended.

West Wallsend Colliery.—There are about 200 men, &c., employed in this mine. The total quantity of air circulating in the mine is about 56,000 cubic feet per minute. The provisions of the Act are complied with.

Seaham Colliery.—About 80 men, &c., are employed in this mine, and are supplied with about 13,000 cubic feet of air per minute. The provisions of the Act are complied with.

Killingworth Colliery.—All work at this mine is temporarily suspended.

North Stockton Colliery.—All work at this mine is temporarily suspended.

Thornton Colliery (Thornton).—Three men are employed clearing out old adit. Ventilation good. No cause for complaint.

Thornley Colliery (East Maitland).—About 12 men, &c., employed in this mine. The ventilation is satisfactory, and the Act complied with.

North Borehole Colliery.—This colliery has been under inspection during the six months, but work is now suspended.

Bloomfield Colliery.—About 8 men, &c., are employed in this mine. The ventilation is satisfactory, and the Act complied with.

Tulip's Sinking Shaft.—Only 1 man employed underground. The Act is complied with.

Marshall's Colliery (East Maitland).—Two men employed underground. Ventilation satisfactory, and the Act complied with.

Shamrock Hill Colliery (East Maitland).—All work at this mine is temporarily suspended.

Richmond Vale Colliery (East Maitland).—Three men are employed in this mine. The ventilation is satisfactory, and the Act complied with.

Stanford Greta Colliery (West Maitland).—All work at this mine is temporarily suspended.

East Greta Colliery (West Maitland).—About 10 men, &c., are employed in this mine. The ventilation is satisfactory, and the provisions of the Act complied with.

Maitland Colliery (West Maitland).—All work at this mine is temporarily suspended.

Abram Colliery.—Only 2 men are at present employed in this mine. The ventilation is satisfactory, and the Act complied with.

Pioneer Colliery (West Maitland).—Two men are at present employed in this mine. The ventilation is satisfactory, and the Act complied with.

Denton Park Colliery (West Maitland).—All work at this colliery is at present suspended.

Greta Colliery.—There are about 260 men, &c., employed in this mine during the day. The quantity of air circulating in the mine is about 60,000 cubic feet per minute. The face workings are divided into separate and distinct districts, none of which are overcrowded. The provisions of the Act are complied with.

Leconfield Colliery (Greta).—All work at this mine is suspended.

New Anvil Creek Colliery (Greta).—About 20 men, &c., are employed in this mine, and supplied with about 9,000 cubic feet of air per minute. The provisions of the Act are complied with.

Ellesmere Colliery (Singleton).—About 24 men, &c., are employed in this mine. The quantity of air circulating in the mine is about 8,000 cubic feet per minute. The provisions of the Act are complied with.

New Park Colliery.—There are about 20 men, &c., employed in this mine, and are supplied with about 4,000 cubic feet of air per minute. The Act is complied with. *Elliott's.*

Elliott's Colliery (Singleton).—Seven men are employed in this mine. The ventilation is satisfactory. No cause of complaint.

Rosedale Colliery (Singleton).—About 15 men, &c., are employed in this mine, and supplied with about 3,000 cubic feet of air per minute. The provisions of the Act are complied with.

Dulwich Colliery (Singleton).—About 12 men, &c., are employed in this mine. The ventilation is satisfactory, and the act complied with.

Oakvale Colliery (Singleton).—All work at this mine is temporarily suspended.

Kayuga Colliery (Muswellbrook).—Two men are employed. The ventilation is satisfactory, and the Act complied with.

Morley Colliery (Gunnedah).—This mine has been under inspection during the half-year, but work is now temporarily suspended.

Gladstone Colliery (Gunnedah).—All work at this mine is temporarily suspended.

Centenary Colliery (Curlewis).—About 15 men, &c., are employed in this mine. The ventilation is good, and the Act complied with.

Richmond Hill Colliery (Coraki).—About 3 men, &c., are employed in this mine. Ventilation is satisfactory. No cause of complaint.

Nicholai's Tunnel (Coraki).—Four men are employed underground. The ventilation is satisfactory. No cause of complaint.

ACCIDENTS IN MINES.

The accidents investigated by us in the Northern District during the six months ending 31st December, 1892, are 42 in number. Of this number 35 were fully reported on at the time, and 7 were found to be of a minor character and full reports were not written thereon, and they are not included in the tabulated list. Of the 35 accidents in the annexed tabulated list, 5 proved fatal, 3 from falls of coal, 1 from fall of stone, and 1 from loaded skips. Of the non-fatal accidents 14 were caused by fall of coal, 6 by fall of stone, 5 from injury by skips, 3 from explosion of powder, 1 from ignition of fire-damp, and 1 from injury by hauling rope.

The first fatal accident occurred to a miner named Thomas McDonald, by a fall of coal, in the Wickham and Bullock Island Colliery on July 18th. The District Coroner, G. C. Martin, Esq., held an inquest on the body of deceased at Hamilton, on July 19th. The inquest was attended by Inspector Humble, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The second occurred to a miner named John Brown, by a fall of coal in the Newcastle Co.'s A pit, on August 29th, terminating fatally on September 2nd. The District Coroner, G. C. Martin, Esq., held an inquest on the body of deceased at Morewether, on September 3rd. The inquest was attended by Inspector Bates, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The third occurred to a miner named Patrick Cronin, by a fall of coal, at Thornley Colliery, East Maitland, on September 9th. The District Coroner, J. N. Brooks, Esq., held an inquest on the body of deceased at East Maitland, on September 12th. The inquest was attended by Inspector Humble, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The fourth occurred to a miner named James Russell, by a fall of stone (roof), at Burwood Colliery, on September 16th. The District Coroner, G. C. Martin, Esq., held an inquest on the body of deceased at Adamstown, on September 16th. The inquest was attended by Inspector Humble, who heard all the evidence and fully agrees with the verdict of "accidental death," as returned by the jury.

The fifth occurred to a miner named Stewart McGregor, by a train of full skips at Lambton Colliery, on September 21st. The District Coroner, G. C. Martin, Esq., held an inquest on the body of deceased at Lambton, on September 22nd. The inquest was attended by Inspector Bates, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The first of the non-fatal accidents occurred to a miner named Enoch Davis, at the Newcastle Co.'s A pit, on July 6th, by a fall of coal, resulting in fracture of right leg.

The second occurred to a miner named George Larmouth, at South Waratah Colliery, on July 8th, resulting in dislocation of left ankle and injuries to spine by empty skip.

The third occurred to a miner named James Bone, at Stockton Colliery, on July 13th, by a fall of coal, resulting in injury to spine.

The fourth occurred to a miner named David Price, at Newcastle Wallsend Colliery, on July 14th, resulting in fracture of leg by fall of coal.

The fifth occurred to a water bailer named Wm. Tames, at Denton Park Colliery, on August 16th, by a fall of stone, resulting in fracture of arm.

The sixth occurred to a miner named James Collins, at Co-operative Colliery, on August 17th, by a fall of coal, resulting in fracture of arm.

The seventh occurred to a miner named William Jones, at New Lambton C pit, on August 17th, resulting in injury to back by fall of coal.

The eighth occurred to a miner named Robert Hunter, at A. A. Co.'s No. 2 pit, on August 19th, resulting in severe injury to pelvis by fall of coal and stone.

The ninth occurred to a miner named Edward Mordue, at Rotunda Colliery, on August 24th, by a fall of coal, resulting in fracture of left leg.

The tenth occurred to a miner named John Bart, at Newcastle Wallsend Colliery, on September 12th, resulting in injury to face by fall of stone.

The eleventh occurred to a miner named George M'Quillan, at Wickham and Bullock Island Colliery, on September 29th, by explosion of shot, resulting in injury to body.

The twelfth occurred to a shiftman named Patrick Commerford, at Wickham and Bullock Island Colliery, on October 6th, by a fall of stone, resulting in injury to head and foot.

The thirteenth occurred to a miner named William Phillips, at West Wallsend Colliery, on October 10th, by explosion of loose powder, resulting in burns on chest and arms.

The fourteenth occurred to a miner named John Lovett, jun., at Newcastle Wallsend Colliery, on October 18th, by a fall of coal, resulting in fracture of leg.

The fifteenth occurred to a miner named John Whyte, at Newcastle Wallsend Colliery, on October 18th, resulting in fracture of leg by fall of coal.

The sixteenth occurred to a shiftman named Thomas Charlton, at Newcastle Wallsend Colliery, on October 26th, by a fall of stone, resulting in injury to arm and chest.

The seventeenth occurred to a miner named Wm. Cobley, at Stockton Colliery, on October 31st, resulting in fracture of leg by haulage rope.

The eighteenth occurred to a miner named Edward Hartshorn, at West Wallsend Colliery, on November 2nd, by a fall of coal, resulting in fracture of thigh.

The nineteenth occurred to a miner named William Bellamy, at A. A. Co.'s No. 2 pit, on November 7th, resulting in fracture of leg by fall of coal.

The twentieth occurred to a water-bailer named William Watson, at Newcastle Wallsend Colliery, on November 12th, resulting in injury to back by skip.

The twenty-first occurred to a fireman named Joseph Trotter, at Newcastle Wallsend Colliery, on November 15th, by ignition of fire-damp, resulting in burns on the face and hands.

The twenty-second occurred to a wheeler named Sydney Conder, at South Wallsend Colliery, on November 16th, resulting in fracture of leg by skip.

The twenty-third occurred to a miner named Guy Stevenson, at Brown's Colliery, Minmi, on November 16th, by a fall of coal, resulting in fracture of ribs.

The twenty-fourth occurred to a main-road driver named Fred. Carter, at Newcastle Wallsend Colliery, on November 22nd, by full skips, resulting in loss of left arm.

The twenty-fifth occurred to a miner named James Jackson, at South Wallsend Colliery, on November 22nd, by fall of coal, resulting in fracture of leg.

The twenty-sixth occurred to a miner named Andrew Rennie, at A. A. Co.'s No. 2 pit, on November 22nd, by a fall of coal and stone, resulting in severe internal injuries.

The twenty-seventh occurred to a miner named John Mason, at Newcastle Wallsend Colliery, on November 23rd, resulting in severe injury to body by fall of coal.

The twenty-eighth occurred to a miner named John Anderson, at Lambton Colliery, on November 28th, by a fall of coal, resulting in injury to foot.

The twenty-ninth occurred to a wheeler named John Parker, at Dudley Colliery, on November 28th, resulting in fracture of leg by loaded skips.

The thirtieth occurred to a miner named Charles Ogilvie, at Gartlee Colliery, on December 2nd, resulting in burns on breast and arm by explosion of loose powder.

There were no accidents on the surface.

The tabulated list of accidents is hereto appended.

We have, &c.,
 JOHN DIXON,
 THOS. L. BATES,
 WILLIAM HUMBLE,
 Inspectors of Collieries.

The Half-yearly Report of the Inspector of Collieries in the Southern and Western Districts of the Colony of New South Wales, and Accidents for the Half-year ending 30th June, 1892.

The Examiner of Coalfields,—

Sir,

Wollongong, 26th July, 1892.

In compliance with the requirements of clause 26 in the Coal Mines Regulation Act, 1876, I have the honor to transmit to you this my six-monthly report on the state of the various collieries for the half-year ending 30th June, 1892.

The total number of collieries under inspection in the Southern and Western Districts during the last six months is 32: Western District, 13 coal-mines and 4 shale-mines; Southern District, 12 coal-mines; Berrima District, 2 coal-mines and 1 shale-mine; making in all 32 collieries.

PRESENT STATE OF MINES.

WESTERN DISTRICT.

The Australian Kerosene Oil and Mineral Company (Katoomba), Mort's Nos. 1 and 2 Tunnels.—About 45 men are employed underground, and served with 8,500 cubic feet of air per minute in two separate currents.

Ruined Castle—Shale Mine.—Sixteen men employed, and served with 3,000 cubic feet of air per minute. *Coal Mine.*—Twenty-five men employed underground, and served with 7,000 cubic feet of air per minute. The Act, in all respects, complied with.

New South Wales Shale Mines (Hartley Vale)—No. 1 Tunnel.—Forty-five men, &c., employed underground, and served with 12,000 cubic feet of air per minute in one current. *No. 1 Shaft.*—An average of 15 men have been employed during the last six months, and served with about 4,000 cubic feet of air per minute. *Coal Mine.*—Five men employed, and served with 3,000 cubic feet of air per minute. The Act, in all respects, complied with.

Oakey Park Colliery.—About 5½ men employed underground, and served with 16,000 cubic feet of air per minute in one current. The Act, in all matters, complied with.

The Vale Colliery.—About 50 men, &c., employed underground, and served with 15,000 cubic feet of air per minute. The Act, in all respects, complied with.

Zig-zag Colliery.—About 36 men employed underground, and served with 9,000 cubic feet of air per minute in one current. The ventilation and all other matters in connection with the Act complied with.

The Vale of Clwydd Colliery.—About 38 men employed underground, and served with 5,000 cubic feet of air per minute. A new return airway has been made, 25 chains in length, through a large portion of the waste workings, which will greatly improve the ventilation. The Act, in other respects, complied with.

Eskbank Pit.—About 44 miners, 10 wheelers, and 10 horses employed underground, and served with 18,000 cubic feet of air per minute. *Old Tunnel.*—8 men employed underground, and served with 6,000 cubic feet of air per minute. The Act complied with.

Lithgow Valley Colliery.—62 men, 5 wheelers, and 5 horses employed underground, and served with about 23,000 cubic feet of air per minute in three separate splits; and the ventilating currents are well conducted round the colliery. The intake, returns, and second way to the day in good order. The Act, in all matters, complied with.

Hermitage Colliery.—Forty men, &c., employed underground, and served with 18,000 cubic feet of air per minute. The Act, in all matters, complied with.

Coerucull Coal Mine.—One man employed getting a few tons of coal weekly for Bowenfels tweed factory.

Cullen Bullen Colliery.—About 20 employed underground, and served with 14,000 cubic feet of air per minute. During the last six months several tests have been made in the upper seam, proving the quality of coal for the purpose of making coke. The Act, in all matters, complied with.

During the last six months work at the undermentioned collieries has been temporarily suspended, viz., Rawdon Colliery (Mudgee line), Genowlan Shale Mine (*Capertee*), Mary Vale Colliery (near Wellington).

SOUTHERN DISTRICT.

Mount Kembla Colliery.—About 200 men, &c., employed underground, and served with about 40,000 cubic feet of air per minute. The colliery workings are divided into four separate splits, none of which are overcrowded, and the Act, in all matters, complied with.

Osborne Wallsend Colliery.—About 140 men, &c., employed underground, and served with 30,000 cubic feet of air per minute in three distinct and separate splits. The ventilating currents are well-directed round the workings. The Act, in all respects, complied with.

Mount Pleasant Colliery.—About 120 men are employed underground, and served with 25,000 cubic feet of air per minute in two separate splits. The Act, in all matters, complied with.

Corrimal Colliery.—During the first four months of the half-year about 80 men, &c., were employed underground, and served with 17,000 cubic feet of air per minute in two separate splits. For the last two months all work has been suspended, with the exception of a few surface men filling slack from the mine. The Act complied with.

South Bulli Colliery.—One hundred and fifty-four men, &c., employed underground, and served with about 50,000 cubic feet of air per minute in five distinct separate splits. Each split and number of men are in accordance with the Act. During the last six months the endless wire-rope system has been adopted for the underground haulage. The Act in all respects complied with.

Bellambi Colliery.—About 80 men, &c., employed underground during the day-shift, and served with about 16,250 cubic feet of air per minute; during the night-shift, about 60 men, &c., employed.

employed. During the last six months a large staff of men have been working on the return air-ways and repairing air-stoppings. When these new returns are finished the ventilation will be increased throughout the colliery. The Act complied with.

Bulli Colliery.—About 170 men, &c., employed underground, and served with about 55,000 cubic feet of air per minute in four distinct and separate splits, each district is well ventilated, and the narrow headings bratticed up to within a few feet of the face. The Act in all respects complied with.

Bulli Pass Colliery.—About 30 men employed underground, and served with 15,000 cubic feet of air per minute in one current. During the last six months a new furnace has been built, and a new travelling road has been made from the main heading to the back heading which leads out to the day.

North Illawarra and Coal Cliff Collieries.—During the last six months very little work has been done, only a few men in each colliery keeping the roads and air-ways in repair.

Metropolitan Colliery.—About 190 men employed underground, and served with 250,000 cubic feet of air per minute in four distinct and separate splits, each district is well ventilated, and the narrow headings bratticed up to within a few feet of the face. The miners and wheelers are all working with locked safety lamps, and the mine examined every morning before the miners commence work. The Act in all matters complied with.

ACCIDENTS IN MINES.

During the last six months I have investigated eight accidents which have been fully reported upon, one of which was fatal.

The first non-fatal occurred to a miner named Richard Oughton, by a fall of coal in the Bulli Colliery, on 5th January, resulting in a fracture of leg.

The second occurred to a miner named William Whittaker, by a fall of coal in Bellambi Colliery, on January 7th, resulting in fracture of leg.

The third occurred to a miner named R. Artley, by a fall of stone in South Clifton Colliery, resulting in fracture of shoulder-blade, on January 14th.

The fourth occurred to a miner named William Weeks, by a fall of coal in South Bulli Colliery, on April 16th, resulting in injury to the head and fracture of leg.

The fifth was a fatal accident to a miner named John Wilson, in the New South Wales Shale Mines (Hartley), on April 26th, by a fall of roof while taking out a pillar. The District Coroner held an inquest on the body of deceased, at Hartley Vale, on April 28th. I attended the inquest and heard all the evidence, and fully agree with the verdict of "accidental death" as returned by the jury.

The sixth was a non-fatal accident to a miner named H. Scarlett, by a fall of stone at Mount Kembla Colliery, on May 11th, resulting in fracture of leg.

The seventh occurred to a miner named Michael Gallagher, on May 31st, who was burnt about the face and back by an explosion of fire-damp.

The eighth occurred to a miner named James Wood, by a fall of coal in the Metropolitan Colliery, on June 7th, resulting in fracture of hip bone.

I have also investigated other accidents which were not of a serious nature, and are not included in this report.

The tabulated list of accidents is hereto appended.

I have, &c.,
JAMES ROWAN,
Inspector of Collieries.

TABULATED LIST of fatal and non-fatal accidents in the Southern and Western Districts of New South Wales Collieries investigated by the Inspector of Collieries during the half-year ending 30th June, 1892:—

No.	Date.	Colliery.	Persons killed or injured.	Occupation.	Remarks, &c., on the nature and extent of injuries.	Explosion of fire-damp.	Fall of Stone.	Fall of Coal.	Non-fatal.	Fatal.
1	Jan. 5	Bulli	Richard Oughton	Miner	Leg fractured by a fall of coal.	1
2	Jan. 7	Bellambi	Wm. Whittaker	Miner	Leg broken by a fall of coal.	1
3	Jan. 14	South Clifton	R. Artley	Miner	Shoulder broken by a fall of stone.	..	1
4	April 16	South Bulli	Wm. Weeks	Miner	Head cut and leg broken by a fall of coal.	1
5	April 26	N.S.W. Shale Mines	John Wilson	Miner	Killed by a fall of roof.	..	1
6	May 11	Mount Kembla	H. Scarlett	Miner	Leg broken by a fall of stone.	..	1
7	May 31	Mount Kembla	M. Gallagher	Miner	Burnt by an explosion of fire-damp.	1
8	June 7	Metropolitan	James Wood	Miner	Hip-bone fractured by a fall of coal.	1

The Half-yearly Report of the Inspector of Collieries in the Southern and Western Districts of the Colony of New South Wales, and Accidents therein, for the Half-year ending 31st December, 1892.

Sir,

Wollongong, 17 January, 1893.

In compliance with the requirements of clause 26 in the Coal Mines Regulation Act, 1876, I have the honor to transmit to you this my six-monthly report on the state of the various collieries for the half-year ending 31st December, 1892.

The total number of collieries under inspection in the Southern and Western Districts during the last six months is 33: Western District, 14 coal-mines and 4 shale-mines; Southern District, 12 coal-mines; Berrima District, 2 coal-mines and 1 sha'e-mine; making in all, 33 mines.

PRESENT

PRESENT STATE OF MINES.

WESTERN DISTRICT.

The Australian Kerosene Oil Company (Katoomba), Mort's Shale Mines.—About 90 men, &c., are employed underground, and served with 12,000 cubic feet of air per minute in three separate splits.

Ruined Castle Shale Mines.—25 men are employed underground, and served with 4,000 cubic feet of air per minute. The colliery is worked on the long-wall system; the packwalls and propping are well carried out in every bord. *Coal-mine.*—About 10 men are employed underground, and served with 10,000 cubic feet of air per minute. The Act in all respects complied with.

New South Wales Shale Mines (Hartley).—About 80 men are employed underground, and served with 6,000 cubic feet of air per minute.

Brickfield Tunnel.—40 men employed underground, and served with 5,000 cubic feet of air per minute. The shaft and tunnel are being worked on the Long-wall system, and every care is taken by the manager and men to ensure safety. The Act in all respects complied with.

The Vale Colliery.—About 40 men, &c., are employed underground, and served with 18,000 cubic feet of air per minute in two separate splits. The return air-ways and second way to the day in good order, and the Act in other matters complied with.

Oakey Park Colliery.—About 35 miners, 5 wheelers, and 3 horses are employed underground, and served with 15,000 cubic feet of air per minute. The Act complied with.

Lithgow Valley Colliery.—45 men, &c., employed underground, and served with 22,000 cubic feet of air per minute in two separate currents. The travelling road and second way to the day, intake, and return air-ways in good order.

Hermitage Colliery.—45 men, &c., are employed, and served with 18,000 cubic feet of air per minute. The Act in every respect complied with.

Eskbank Pit.—About 40 men, &c., employed underground, and served with 18,000 cubic feet of air per minute, and the Act in all respects complied with.

Eskbank Old Tunnel.—8 men employed and served with 6,000 cubic feet of air per minute. The return air-ways and second way to the day in good order, and the Act in other matters complied with.

The Vale of Olwydd Colliery.—34 men, &c., employed and served with 13,000 cubic feet of air per minute. During the last six months a new return air-way has been made about 80 chains through the waste workings which has greatly improved the ventilation throughout the colliery. The Act in other matters complied with.

Zig Zag Colliery.—About 44 men, &c., are employed underground, and served with 15,000 cubic feet of air per minute. The Act in all respects complied with.

Cullen Bullen Colliery.—About 35 men are employed underground, and served with about 15,000 cubic feet of air per minute. The Act in every respect complied with.

Genoulan Shale Mine (near Capertee).—About 12 men are employed underground, and served with 4,000 cubic feet of air per minute. The colliery is being opened out on the Long-wall system, and every care is taken by the manager and men to ensure safety. The Act in all matters complied with.

Carlo's Gap.—Work at this colliery has been suspended for about two years. During the latter part of the six months ending 31st December the colliery has been reopened, but very little work has been done.

Rawdon Colliery.—During the last six months only 1 man at work getting a few tons of coal occasionally for local purposes.

Cooerwull Mine.—Only 1 man at work getting a few tons of coal weekly for the Tweed factory. The Act complied with.

SOUTHERN DISTRICT.

Metropolitan Colliery.—About 260 men, &c., are employed underground, and served with 310,000 cubic feet of air per minute, in five separate splits. Each district is well ventilated, and the narrow headings bratticed up to within a few feet of the face. The miners and wheelers are all working with locked safety lamps. During the last six months proceedings have been taken against five of the miners for a breach of the colliery's special rules, viz., two of them damaged the brattice cloth while working, and other two saw the damage, neither of the parties having reported the matter to a "responsible official of the mine." The other case was a miner fined for having matches and a key in his possession while at work. Great care is exercised by the management, and strict discipline enforced in order to ensure safety.

Coal Cliff Colliery.—This colliery has almost been suspended for the last twelve months, but is now commenced to work with about 15 men. The Act complied with.

South Clifton Colliery.—About 125 men, &c., are employed underground, and served with 46,500 cubic feet of air per minute in two separate splits. During the last six months a large ventilating fan has been erected, which has greatly improved the ventilation in the colliery. The Act in all respects complied with.

North Illawarra Colliery.—No miners have been getting coal during the last six months. Only a few day-men at work keeping the air-ways in order. The Act in all respects complied with.

Bulli Pass Colliery.—About 26 men, &c., are employed underground and served with 15,000 cubic feet of air per minute. Travelling road, in-take, and return air-ways, and second way to the day in good order. The Act in all other respects complied with.

Bulli Colliery.—During the last two months of the half-year ending 31st December, 1892, no miners have been employed, only a few day-men keeping the roads and air-ways in repair. The Act complied with.

Bellambi Colliery.—About 88 men, &c., are employed underground, and served with 17,000 cubic feet of air per minute in two separate splits. During the last six months several return air-ways have been made, which have greatly improved the ventilation throughout the colliery. The Act in other matters complied with.

Corrimal Colliery.—About 87 men, &c., are employed underground, and served with 18,000 cubic feet of air per minute in two separate splits. The Act in all respects complied with.

Mount Pleasant Colliery.—120 men and horses are employed, and served with 28,000 cubic feet of air per minute in two separate currents. The return air-ways, travelling road, and second way to the day in good order, and the Act in all matters complied with.

Osborne-Wallsend Colliery.—About 150 men, &c., are employed underground, and served with 35,000 cubic feet of air per minute in three separate currents. The ventilating currents are well directed round the workings, and the Act in all other matters complied with.

Mount Kembla Colliery.—About 260 men, &c., are employed underground, and served with 80,000 cubic feet of air per minute in four separate splits. During the last six months two new return air-ways have been made, which have improved the ventilation in all parts of the colliery. The Act in every other respect complied with.

South Bulli Colliery.—About 200 men, &c., are employed, and served with 49,000 cubic feet of air per minute, in four separate splits. The return air-ways, travelling road, and second way to the day in good order.

BERRIMA.

The Australian Kerosene Oil Company (Joadja).—About 90 men are employed underground, and served with 12,000 cubic feet of air per minute. Incline tunnel, 50 men, and supplied with 7,000 cubic feet of air per minute. Nos. 1 and 2 tunnels, 40 men, and served with 5,000 cubic feet of air per minute. This colliery is worked on the Long-wall system, and the air currents are brought in straight line along the working faces. The Act in all respects complied with.

Box Vale (Mittagong).—Only 2 men employed, getting a few tons of coal weekly. The ventilation and all other matters in connection with the Act complied with.

Great Southern Colliery (Berrima).—Five men are employed underground, and served with 10,000 cubic feet of air per minute. The Act in other matters complied with.

ACCIDENTS IN MINES.

During the last six months, ending 31st December, I have investigated 12 accidents, which have been fully reported upon, 1 of which was fatal.

The first non-fatal accident happened to a miner named Charles Laws, at the Metropolitan Colliery, on 1st July, resulting in a severe cut on the head by a fall of coal.

The second non-fatal accident happened to a miner named E. Ellis, at the Zig Zag Colliery, on 11th July, who had his arm broken by the cage coming in contact with loose bolt in one of the shaft guides, and jammed his arm against one of the buntens.

The third non-fatal accident happened to a wheeler named John Wollett, at Bulli Pass Colliery, on 19th July, who had his arm broken by a full skip at the entrance of the tunnel.

The fourth non-fatal accident to a miner named Thomas Dennehy, at Osbourne Wallsend Colliery, on 4th August, resulting in a broken leg by a fall of coal.

The fifth non-fatal accident happened to a miner named William Glesby, at the Metropolitan Colliery, on 16th August, who had his arm broken by a fall of coal.

The sixth non-fatal accident happened to a miner named Joseph Buckley, at South Bulli Colliery on 17th September, resulting in a fracture of the skull, by a fall of top coal.

The seventh non-fatal accident occurred to a miner named A. Chesson, at Mount Kembla Colliery, on 11th October; who had his head and back bruised, being jammed by a full set of skips on the main incline.

The eighth was a fatal accident which happened to a miner named Archibald Arbuckle, at New South Wales Shale Mines, Hartley, who was killed by a fall of roof on 27th October. The District Coroner held an inquest at Hartley Vale on the 28th, which inquest I attended and heard all the evidence, and fully agree with the verdict of the jury, viz.:—"No blame is attached to any person."

The ninth was non-fatal, which happened to a miner named S. Sheppard, on 24th November, at the Australian Kerosene Oil Company's shale-mines, Katoomba, who had his leg broken by a fall of stone from the roof.

The tenth accident occurred to a miner named Hugh M'Lennan, at Bellambi Colliery, who had his leg broken by a fall of coal on 29th November.

The eleventh accident happened to a surface labourer named James Tobin, who had his leg broken while shifting waggons into a side road on the jetty on 19th December.

The twelfth accident occurred to a miner named George Gunn, at the Metropolitan Colliery, on 23rd December, who had his leg broken by a fall of coal.

I have also investigated other accidents which were not of a serious nature, and are not included in this report. The tabulated list of accidents is hereto appended.

I have, &c.,

The Examiner of Coal Fields, Mines Department, Sydney.

JAMES ROWAN,
Inspector of Collieries.

TABULATED LIST of Fatal and Non-fatal Accidents in the Southern and Western Districts of New South Wales, investigated by the Inspector of Collieries during the half-year ending 31 December, 1892.

GEOLOGICAL SURVEY OF NEW SOUTH WALES.

Progress Report for 1892 by the Government Geologist.

APPENDIX 1.

Sir, Geological Survey Branch, Department of Mines, 12 April, 1892.

During my recent visit to Broken Hill, where my colleague, Mr. J. B. Jaquet, F.G.S., is engaged upon a geological survey of the mines and their surroundings, I had an opportunity of inspecting the underground workings of several of the principal mines, and I was impressed by some facts in connection with the geological occurrence of the lode which appear to me to be of general interest.

The principal impression conveyed to my mind is that the Broken Hill ore deposits do not occur in what is known as an ordinary true fissure lode, but should be referred to what are called "segregated lodes" of the type known in the Bendigo district (Victoria) as "saddles."

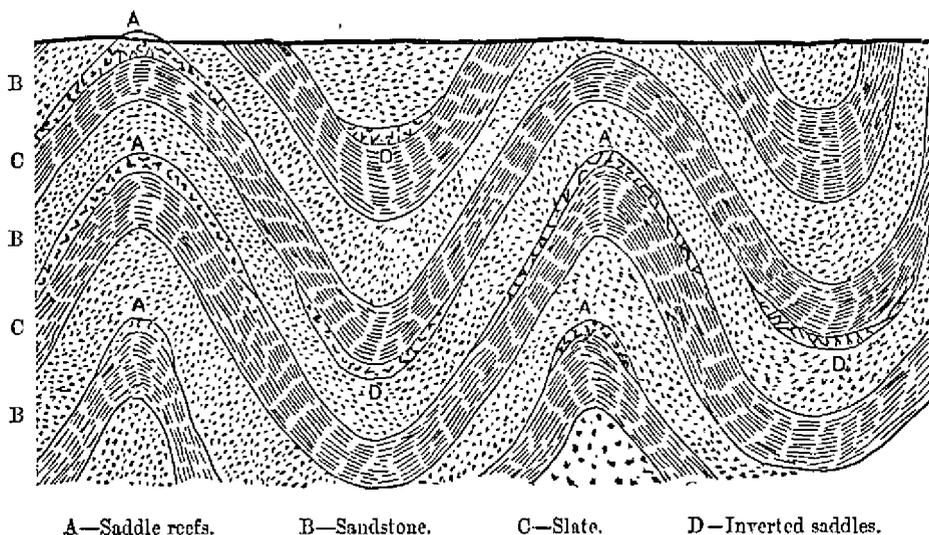

It is true that the "saddle reefs" of Bendigo differ materially from the Broken Hill lode in dimensions, in metalliferous contents, and in the character of the gangue or veinstuff, the first-named consisting of auriferous quartz with a small percentage of iron pyrites, while the Broken Hill lode is argentiferous (though containing some gold), and consists, at and near the surface, of manganiferous ironstone, which below is replaced by kaolin and oxidized ores (carbonates) of lead, and these are again at greater depths succeeded by sulphides of lead and zinc.

Nevertheless, there are points of similarity between the two which are worthy of note, and which may have some bearing upon the probable persistence in depth of the Broken Hill ore deposits.

The difference (according to J. A. Phillips) between a true fissure vein and a segregated vein consists in the fact that the former occupies a fissure cutting (in a direction which may be more or less oblique) across the bedding planes of the country rock, while the latter is deposited in a fissure formed between and parallel with the stratified beds—the ore, in fact, having filled the space caused by the forcing apart of two contiguous beds. The variety of segregated veins so well known in Bendigo as "saddle reefs," and which, so far as I know, have not been hitherto recorded as occurring in any mining country except Victoria, differs from ordinary segregated lodes merely in the fact that instead of lying in one plane they occupy spaces or fissures which, owing to the bending or contortions of the country rocks, have assumed somewhat the shape of an inverted trough, and in cross section have the appearance of a saddle—hence the name.

The country rock at Bendigo consists of highly contorted slates and sandstones, which are of lower Silurian age.

The contortions of these slates and sandstones have assumed the forms of anticlines and synclines. If a quire of paper be placed flat upon the table and lateral pressure be exerted against the sides, it will be found to form saddles and troughs, or anticlines and synclines, corresponding with the contortions of the Bendigo rocks, which have, in fact, been produced in an analogous manner, and it will be noticed that spaces will be formed between the sheets of paper, more particularly at the upper parts of the anticlines and at the lower parts of the synclines, corresponding exactly with the fissures in which the saddle reefs of Bendigo were deposited.

The reefs at Bendigo are associated with narrow intrusive dykes of dark grey dolerite, which probably have had some influence upon their auriferous contents.

One of the chief points of interest about these saddle reefs of Bendigo is that while the "legs" of the saddles are invariably found to thin out and disappear in depth, the permanence of the mines is assured by the certainty of other saddles being discovered almost perpendicularly under the first, and at greater or less intervals of depth.

Now the Broken Hill district is composed of similarly contorted rocks, consisting principally of crystalline gneisses passing into banded quartzites, micaceous and hornblende schists, and garnetiferous sandstones. Owing to the highly altered character of these rocks, and the consequent absence of organic remains, it is difficult to determine their exact age, but they were considered by the late Mr. C. S. Wilkinson, F.G.S., to be at least as old as lower Silurian and probably older.

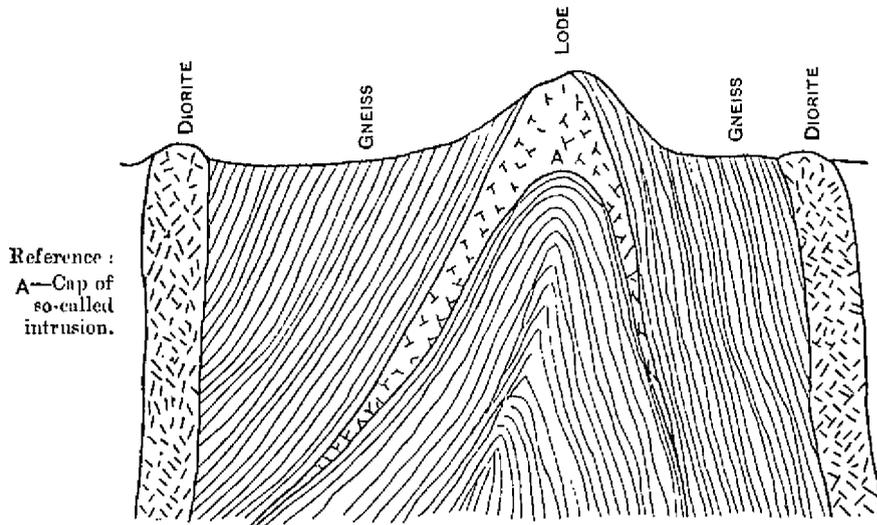

There are no dolerites in the neighbourhood of the mines, but intrusive dykes of highly basic diorite are seen extending along both sides of the hill and more or less parallel to it. Broken Hill itself

is

NOTE.—For Progress Report of the Government
Geologist, *see* pages 6 and 7.

is composed of an anticline, the highest part of the ridge being occupied by the outcrop of the lode—a mass of manganiferous iron ore which has withstood denudation by reason of its hardness and compactness—while on the eastern and western slopes of the hill the gneissic rocks are found to be dipping east and west respectively.

Below in the mines the lode is found to divide into two portions, one following the eastern dip while the other and larger portion dips to the west. The depth at which the lode divides differs in the different mines along the hill. The rock which separates or divides the lode into the eastern and western portions is locally referred to by some as the "horse," and by others as the "intrusion," but it appears to me that both terms are incorrect and misleading. It is not an intrusion because it has not the character of a volcanic or intrusive rock, but consists in some places of gneiss, and in others of banded quartzite, both similar in character to the rocks to be seen at the surface. A "horse" consists of a mass (of greater or less extent) of country rock which has fallen from the hanging wall into the vein fissure before the latter has filled with mineral. But in my opinion the character of the rock forming the so-called "horse" at Broken Hill shows that it has not fallen into the fissure and been subsequently surrounded by lode-stuff, but that it is the country rock or footwall of the lode *in situ*. In short, the foliations of this rock, which appear to coincide with its bedding planes, are clearly defined, and appear to indicate that it is the cap of an anticline, forming the lower wall of a saddle-shaped fissure which the lode has filled, and similar in formation to the curved beds of slate and sandstone which separate the legs of the saddle reefs at Bendigo.

Ideal Section of Broken Hill.

It has already been stated that this so-called "intrusion" is found at materially different depths in the principal mines along Broken Hill, and herein is another point of similarity to the Bendigo saddle reefs, which rise near to the surface in some mines, and descend to greater depths in others, owing to the fact that the country rocks in which the reefs occur are contorted into curves along their line of strike, as well as in the transverse direction.

The Broken Hill lode, in short, appears to me to be a huge saddle lode, formed in a fissure which owed its shape to the contortions which the gneissic rocks have undergone. If this opinion be correct, the probability is that the eastern and western legs will be found to thin out gradually as they descend, and in that case the depth at which they would disappear would depend to a great extent upon the width of the synclinal basins on either side of the Hill. The underground workings in Block 10 show that at a depth of over 600 feet the western leg is still represented by a huge width of sulphide ores, so that the possibility of the lode thinning out is evidently not a matter for immediate alarm. What appears to me, however, as the most interesting question, is the possibility of similarly-shaped lodes being found more or less vertically under the present one, as they are found to occur in Bendigo, and undoubtedly the best means of ascertaining this would be to put down diamond drill bores through the cap of the so-called intrusion.

The conclusions which I have endeavoured to convey, and in forming which I was assisted by the work already performed by Mr. Geological Surveyor Jaquet, may be summarised as follows:—

1. In several important respects the geological formation and origin of the Broken Hill lode, and the saddle reefs of Bendigo, appear to be analogous.
2. If this analogy hold, the eastern and western legs of the Broken Hill lode may be expected to thin out in depth, and
3. There is a possibility of other similarly-shaped lodes being found more or less vertically underneath the Broken Hill lode, and this could best be tested by putting down diamond drill bores through the cap of what is locally known as the "intrusion."

The Under Secretary for Mines.

I have, &c.,

Government Geologist.

APPENDIX 1A.

Report on Site for new Bore at Cremorne.

Geological Survey Branch, Department of Mines, Sydney, 24 June, 1892.

I HAVE made a careful examination of Robertson's Point (Cremorne), and find that it is intersected by two volcanic dykes, one trending N. 20° W.,* and the other N. 60° W., as shown on the accompanying lithograph. [Appendix 1A 1.] These dykes, where their outcrops can be observed, are nearly vertical.

The

* The first trace of this dyke was originally discovered by Professor David.

The one marked AB has a dip towards Mossman's Bay of $85^{\circ} 51'$, as ascertained for a vertical height of 54 feet, viz., between the top of the spur and high-water mark. The old bore (shown by double circle on plan) was put down about 1 chain from this dyke, and about 7 chains from the nearest point of the other dyke, CD, and I am of opinion that both dykes were pierced by the bore, as two masses of dolerite were intersected, the first at a depth of 2,767 and the second at a depth of 2,840 feet. If the dyke AB preserves a uniform dip of $85^{\circ} 51'$ in its downward course, the old bore should have pierced it at a depth of 955 feet, and as the core was not examined by a geologist until a depth of over 2,700 feet had been attained, it is impossible to say now, for certain, whether it did or not. It is very unlikely, however, that the dip is absolutely uniform to great depths. It is quite probable that the course followed by the dyke may have been more nearly vertical, and I am inclined to think that the dolerites noted in the core at the depths of 2,767 and 2,840 feet represent the intersections of the bore with the two dykes shown on the plan.

As the whole of the metropolitan area is intersected by these dolerite dykes at greater or less intervals, it is difficult to point to any part of the harbour in regard to which it could be said that a bore could be put down with the certainty of escaping their influence, although it is not considered likely that such influence will extend for more than a short distance on either side of the plane of intersection in each case.

I have selected the site (shown by a thick circle on the plan) as being, in my opinion, a suitable one for the new bore, because, while situated midway between the two dykes, it is about 18 chains distant from the nearest point of the one and 23 chains from the other, and it is reasonable to expect that the influence of the dolerite upon the coal will not extend to that distance. The site chosen is within portion 35, section B, of Mills, Pile, and Wilson's subdivision.

EDWARD F. PITTMAN, A.R.S.M.,
Government Geologist.

APPENDIX IB.

Geological Survey, New South Wales, Department of Mines, Sydney, 6 July, 1892.

I HAVE inspected the gold-field known as the Sugarloaf, in the parishes of Galbraith and Cole, county of Bathurst, and have the honor to report as follows:—The field is situated about $3\frac{1}{2}$ miles north of New-bridge, and about half a mile in a north-westerly direction from the old "Dry Diggings." The formation consists of fissile slates and hard blue schists (of Upper Silurian age), which strike nearly north and south, and are nearly vertical, the dip being to the east, at an angle varying from 70° upwards. About a mile south of the Sugarloaf these slates exhibit a well defined cleavage, and have been worked in a quarry where slate-cutting machinery has been erected by a company. The industry has, however, been abandoned, and the greater part of the machinery removed. The slates appear to be well adapted for flagging and door-steps, though the cleavage is hardly perfect enough to ensure their use for roofing purposes.

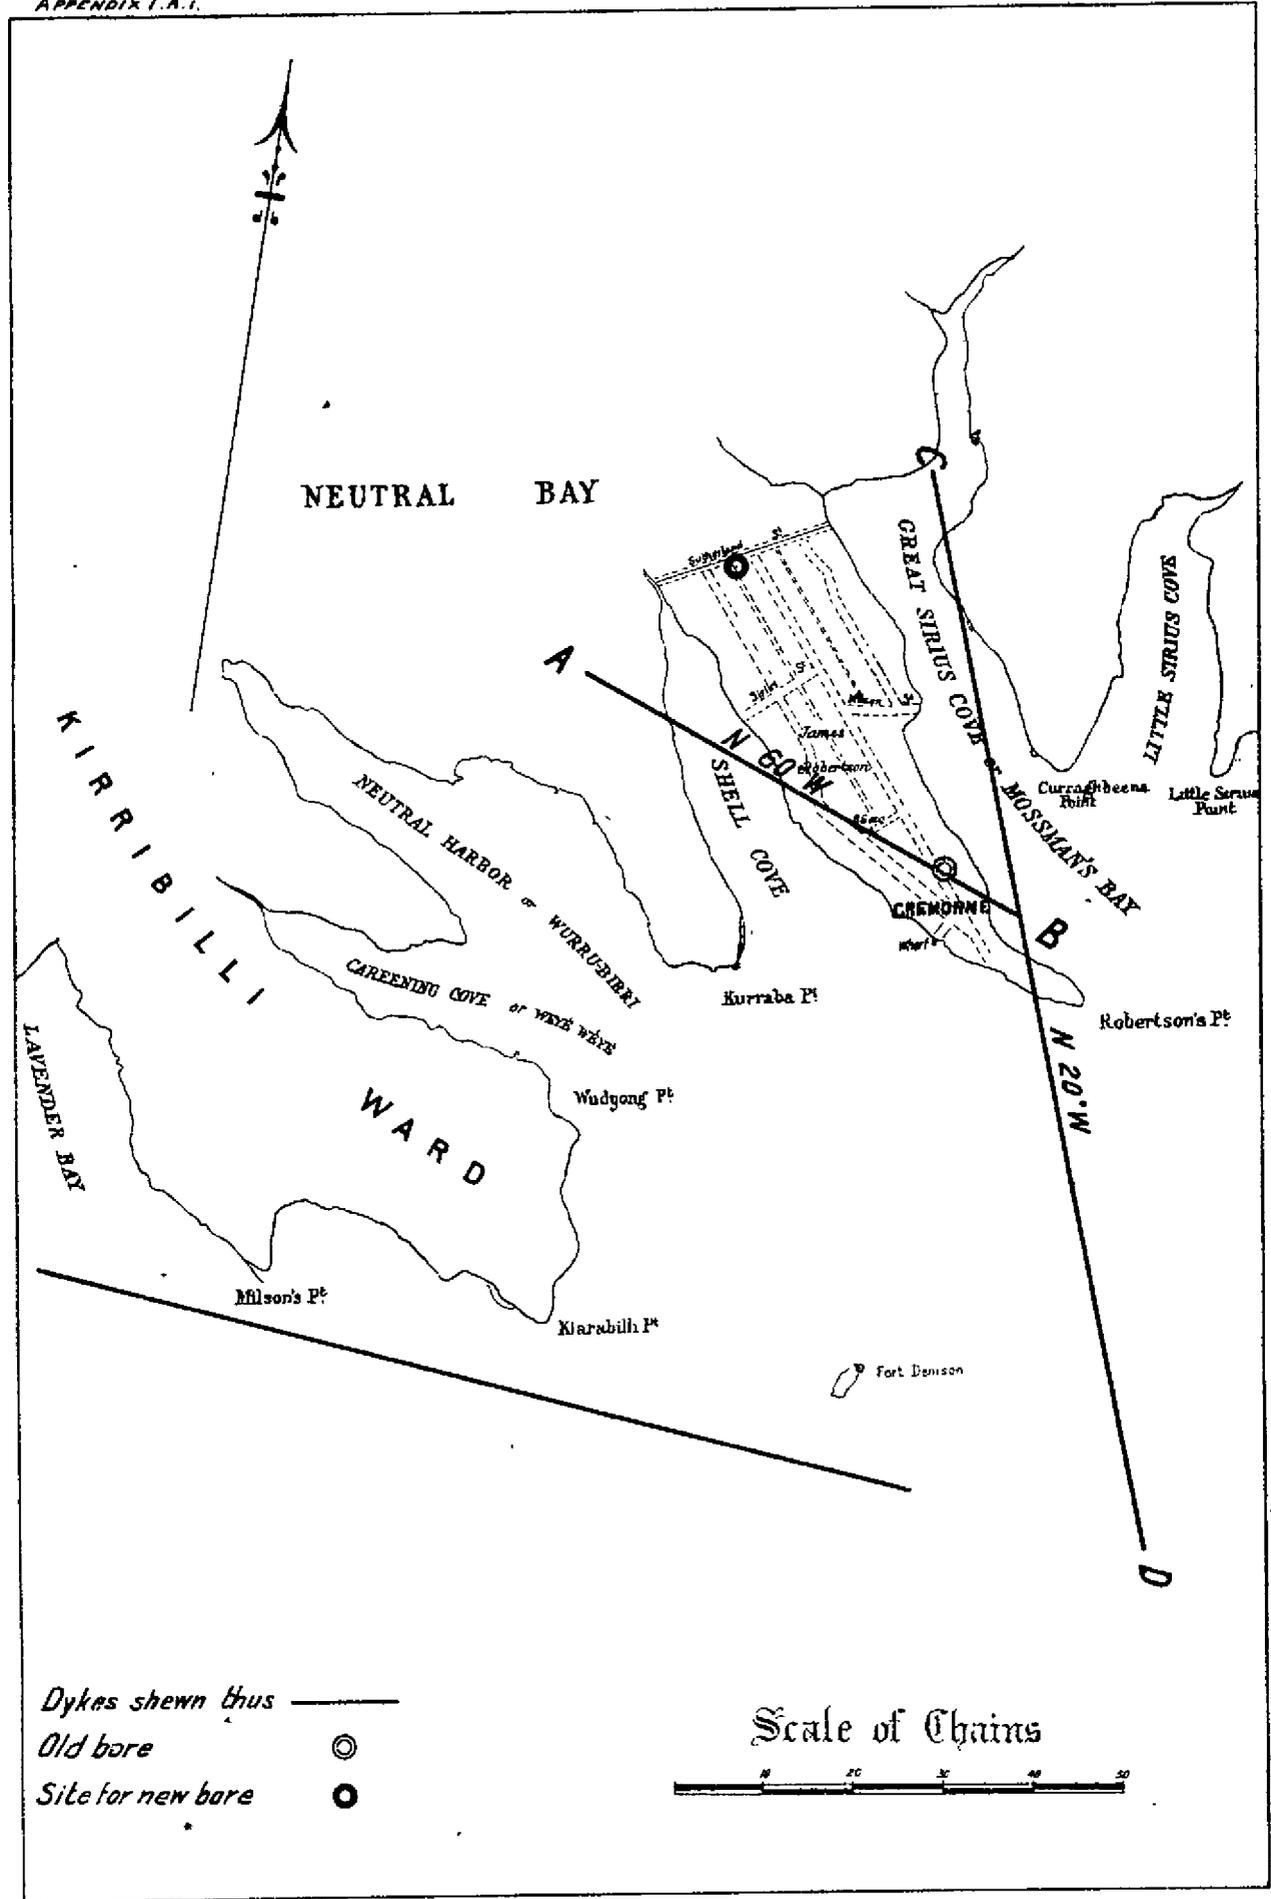

The name "Sugarloaf" has been given to the place on account of a conical capping of basalt which occurs on the highest part of the range through which the auriferous reefs run in a direction $\approx 20^{\circ}$ w. Old alluvial workings (which I am informed yielded a large amount of gold between twenty and thirty years ago) trend in several directions from the ranges, and it is probable that their auriferous contents were derived partly from the reefs which intersect the hill, and partly from a pliocene drift underneath the basalt. The capping of basalt now forming the summit of the Sugarloaf evidently once formed part of a continuous flow which filled up the old pliocene valley, and which has since been partly removed by denudation, leaving isolated patches such as the Sugarloaf, and the red hill which is situated about a mile and a half to the north. The denudation of the intermediate portions of the lava flow has resulted in the redistribution of the underlying auriferous drift, which has since been concentrated in the pleistocene and recent drainage valleys trending from the range.

Well defined parallel quartz reefs, with a strike of $\approx 20^{\circ}$ w are found all through this belt of country, and at least five of them, varying in thickness from 10 inches to 6 feet, intersect the Sugarloaf Range from north to south. The reefs were, I am informed, first tested about three years ago, but very little work has been done upon them up to the present time. The deepest shaft is only 65 feet, and was sunk by Lambert and party, the prospectors. At a depth of 35 feet the reef crossed the shaft (having an easterly dip), and was found to be 6 feet wide. A trial crushing of this stone was made at the Clyde Works, and yielded only 2 dwts. of gold per ton. A new shaft was then started by Lambert and party, about fifty yards lower down the hill, and $2\frac{1}{2}$ tons of the surface-stone were recently crushed at Locksley for a yield of 5 ozs., or at the rate of 2 ozs. per ton. Attention was thus attracted to the field, and a number of leases have been applied for. In Cunningham and party's lease (GL 46), which is No. 2 north of the prospectors, a shaft 17 feet deep has been sunk, apparently on the same line of reef, which is, however, only 2 feet wide at this point. I was informed that 2 tons taken from this shaft yielded at the rate of 2 ozs. per ton, while the balance gave 11 dwts. per ton. Scarcely any other work worthy of mention, with the exception of trenching, has been performed on the field, and it is consequently a difficult matter to estimate the value of these reefs; for although there is undoubted evidence of the auriferous nature of at least some of them, the gold will in all probably be found to occur in shoots, and a considerable amount of prospecting will be necessary to determine the position and trend of these. The field at present labours under the disadvantage of not having a battery within a convenient distance, but I was informed that steps were being taken which will probably result in the erection of one at an early date in one of the adjoining gullies, where a machinery site has already been secured for the purpose.

In conclusion, I am of opinion that the reefs are sufficiently promising to warrant thorough prospecting, and it is probable that a tunnel under the Sugarloaf, if driven in an easterly or westerly direction, would not only intersect five or six reefs, but would at the same time enable the drift under the basalt to be tested.

APPENDIX 1C.

Geological Survey Branch, Department of Mines, Sydney, 28 August, 1892.

[Minute Paper.]

Subject:—Supposed auriferous deposit at Springwood.

IN consequence of reports which lately appeared in the press to the effect that an auriferous reef had been discovered near Springwood, I have visited the locality, which is in the parish of Nepean, county of Cook. The supposed reef consists of a stratified deposit, about 9 inches thick, of very siliceous ironstone or ferruginous grit, interbedded with the Hawkesbury sandstones, and dipping east at an angle of 25 degrees, which is about equal to that of the slope of the Hillside; two open cuttings have been made, and an inclined shaft about 50 feet deep has been sunk with the object of striking the deposit at a depth. The ironstone bed is exposed on the eastern slope of the Blue Mountains (facing the Nepean River about 8 miles from Penrith) and almost immediately on the line of fault which caused the country now forming the Emu Plains to sink from its former height (on a level with the top of the Blue Mountains) to its present position. The ironstone bed would therefore probably be found to extend horizontally under the upper beds of Hawkesbury sandstone forming the escarpment of the Mountains; and as a matter of fact similar beds of ironstone are of common occurrence in the higher portions of the ranges, a noticeable instance occurring in the neighbourhood of Mount Victoria, where one of these beds can be traced for miles. So far however these deposits have not been found to contain more than bare traces of gold, and the probabilities appear to be against the occurrence of payable quantities of the precious metal in them. Three samples of the ironstone from Springwood were taken by me, and were assayed by Mr. J. C. Mingaye, F.C.S., in the laboratory attached to this Department with the result that neither of them was found to contain gold or silver.

APPENDIX 1E.

Site for Artesian Bore at Nyngan.

Geological Survey Branch, Department of Mines, Sydney.

ON the 26th May I proceeded to Nyngan (in company with Mr. Boulton) for the purpose of choosing a site for a second diamond drill bore there, the first bore having bottomed in diorite at a depth of 710 feet, after striking a supply of about 10,000 gallons per day of slightly brackish water. After a careful examination of the country to the west and east of Nyngan, I chose the site, marked on the accompanying lithograph, and situated in travelling Stock Reserve 8,049, Parish of Boonum, County of Gregory, about 8 miles east of Nyngan, on the Warren Road.

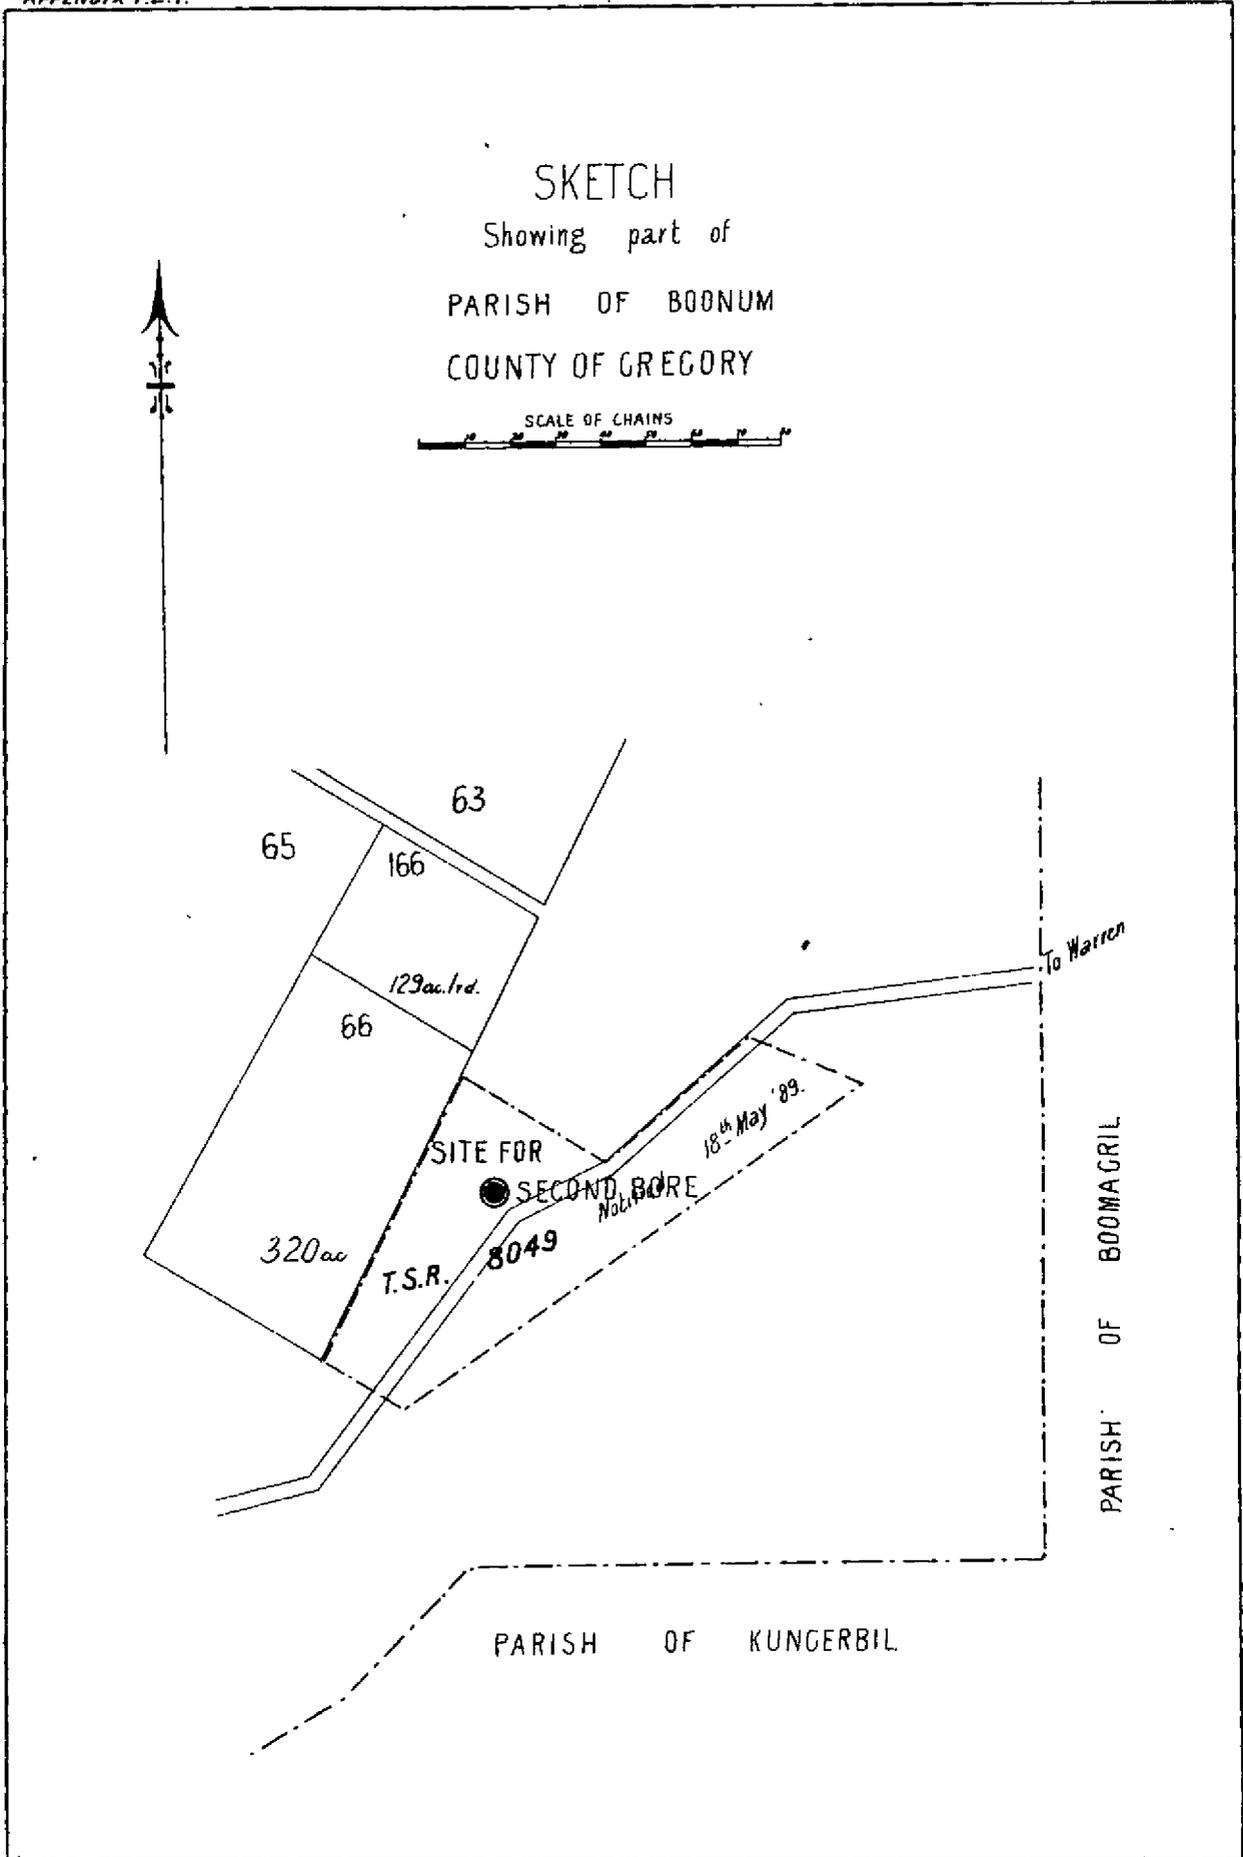

The subjoined sketch shows a geological section of the country between Narramine and Nyngan, and which is supposed to contain a southerly extension of the cretaceous basin, within which artesian water is likely to occur.

EDWARD F. PITTMAN,
Government Geologist:

The Under Secretary for Mines and Agriculture.

APPENDIX 2.

Progress Report by Mr. William Anderson, Geological Surveyor.

Sir,

Geological Survey Camp, Reidsdale, Braidwood, 16 February, 1893.

I have the honor to furnish you with a Progress Report of the work upon which I have been engaged during the year 1892.

From 3rd January till 24th January I was on annual leave of absence.

On 1st February I left town for the Monara, where I was engaged as a member of the Prospecting Board until 27th February. During that trip I dealt with cases at Fiery Creek, Cowra Creek, Mount Pilot, Matong, Paupong, Kiandra, Lobb's Hole, Coolaman, Bombala, and Tantawanglo Mountain.

From 28th February till 20th March I was engaged in the office writing up reports on the above Prospecting Vote cases, making preparations for a geological survey of the Shoalhaven Valley, and other office work.

On 20th March, accompanied by Mr. P. T. Hammond, field assistant, I proceeded to Braidwood, and commenced the survey of the Shoalhaven Valley, starting at Major's Creek, about 12 miles from Braidwood. Here I was engaged till 22nd June, mapping, geologically, an area of about 9 square miles, on a scale of 4 chains to the inch. This map has been published separately on a scale half that size—viz., 8 chains to the inch, and embraces the alluvial deposits in the immediate vicinity of the township of Major's Creek, or Elrington, from which large quantities of gold have been obtained.

From 22nd June till 12th July I was engaged in the office, preparing the above map of Major's Creek for publication.

On the 13th of July I returned to camp for the purpose of carrying out the general survey of the Shoalhaven River Valley. This work will be carried out on the scale of the Parish maps, which is 40 chains to the inch.

The area which I have already surveyed geologically embraces the parishes of Bendoura, Elrington, Seymour, and Coghill, with portions of Boyle, Monga, Jineró, and Jinglemony. I furnish you herewith a preliminary report on the country examined and mapped up to date.

The northern part of this area consists of what is known as the Braidwood and Major's Creek granite. To the westward of Major's Creek, extending from Jinglemony Parish, through the Parish of Elrington, into the Parish of Talaganda, occurs a quartz and felspar porphyry; while still further to the westward, in the Parish of Bendoura, are a series of sedimentary rocks, which rest immediately on the quartz porphyry. In the Parish of Monga sedimentary rocks also occur, forming the Monga and Reidsdale Ranges, and resting immediately on the granite. Locally, in the river and creek-valleys, we get alluvial deposits of Pleistocene and Recent age, some of which have yielded large quantities of gold.

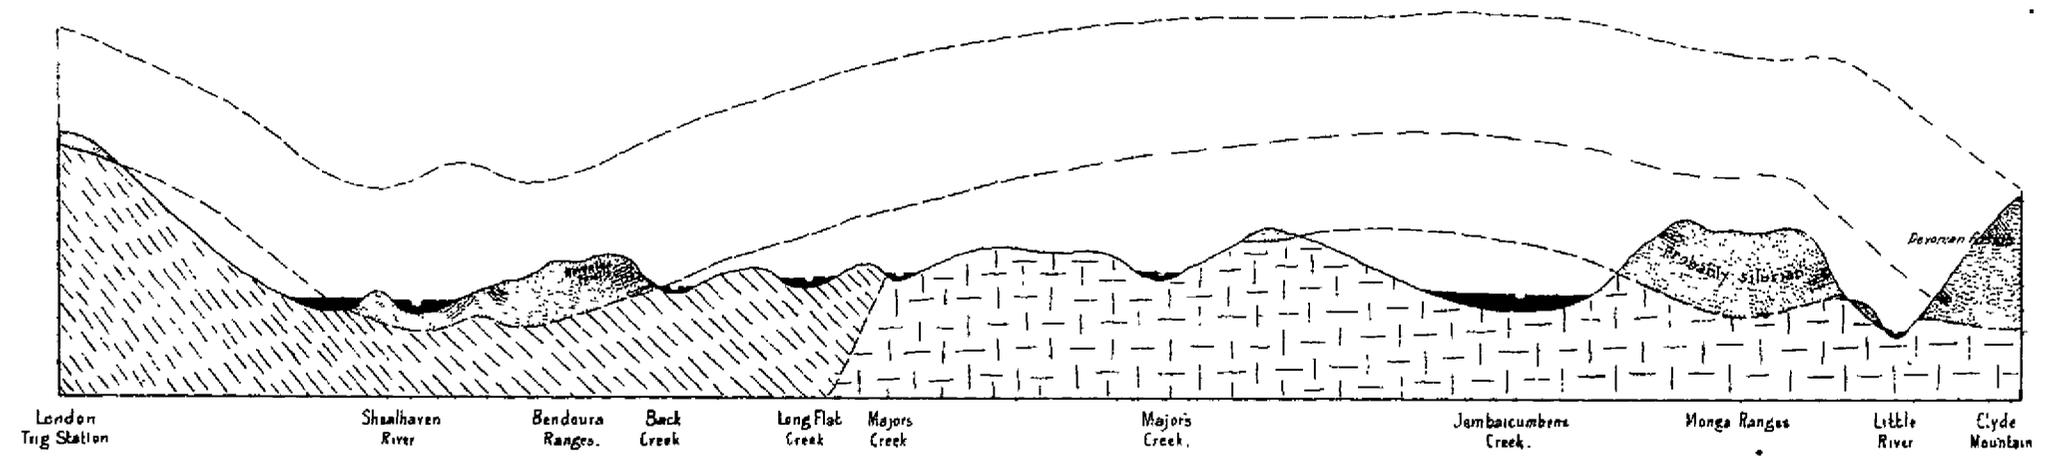

The Braidwood granite is chiefly hornblende, but locally it is micaceous, and in places heavily charged with pyrites. This granite has been cited by the Rev. W. B. Clarke as one in which free gold has been detected as one of the constituents of the rock, specimens having been obtained showing free gold visible to the naked eye. It is intruded by dykes of basalt, diorite, and porphyry, and contains many reefs of all sizes, which generally consist of quartz with or without pyrites. In some places, as at Bell's Creek, they are chiefly micaceous, and have proved fairly rich on the surface, but when sunk upon to any depth the yield of gold has been unpayable. The pyrites reefs have been, however, those which have been prospected to a depth, because, as a rule, they always show at least traces of gold near the surface. At Major's Creek pyrites reefs have been sunk upon to a considerable depth, and, so far as I can learn, with fairly good results. The richest and most extensive alluvial deposits in the area geologically examined have occurred resting on the granite, at Major's Creek, Long Flat, and in the Valley of the Jembaicumbene Creek.

The Long Flat porphyry occurs immediately to the west of the granite, and occupies the western half of the Parish of Elrington and the eastern part of Bendoura. The junctions between the granitic and porphyry, which is seldom exposed in the area examined, is an intrusive one, and so far as any present knowledge goes, I am inclined to think that the granite is the intruding rock, although the proofs are not yet altogether conclusive. Reefs occur in the porphyry, but few or none of them have been proved to be auriferous. At Long Flat the alluvial which has been deposited on the porphyry in the valley of the Long Flat Creek has yielded large quantities of gold, but little or no auriferous drift has been found in Back Creek, between its junction with Long Flat Creek and the Shoalhaven River. This may be accounted for by the fact that the fall on Back Creek between these points is considerable, and little alluvial has been left in that portion of the creek. Many miners and others supposed that the porphyry at Long Flat was a false bottom, and that underlying auriferous deposits would be found by sinking through it, as is the case with many Tertiary basaltic deep leads and felsitic lava sheets, such as occur near Vegetable Creek in New England. This, however, is not likely to be the case when it is remembered that there is conclusive evidence of the Devonian rocks in Bendoura having been deposited on top of this same porphyry, showing that the origin of the latter rock was anterior to the Devonian Period, and not a Tertiary lava sheet. In places, the porphyry is intruded by dykes, but, so far as our examination has proceeded, I have not yet met with an intruded granitic dyke passing into the porphyry.

The sedimentary rocks which are developed in the Parish of Bendoura rest immediately on the porphyry, and at Brick-kiln Creek there is undoubted evidence, in the presence of porphyry pebbles in the basement beds of the series, that the latter were deposited on the porphyry, which is therefore of older date than the sedimentary series. Fossils occur in these latter rocks at various places, and these have been identified by my colleague, Mr. R. Etheridge, Junr., as belonging to the Devonian Period. In the central portion of Bendoura the beds are approximately horizontal or only slightly inclined, but to the westward, near the Shoalhaven River, where they still rest on the porphyry, they are highly tilted, and form two small synclines which have possibly been produced by the crushing due to the intrusion of the granite which crops out on the range of mountains on the western side of the river, in the Parishes of Jineró and Jinglemony, and which is part of the same granitic mass that occurs around Braidwood. To the eastward of Major's Creek, outside the area occupied by the porphyry, a few outliers of sedimentary rocks of small extent occur resting immediately on the granite. These rocks are considerably altered and indurated, but still possess characters which will, I think, identify them either with the Devonian rocks of Bendoura or the sedimentary rocks of the Monga Ranges. The main mass of the Monga and Reidsdale Ranges consists of sedimentary rocks which rest upon the granite, and are highly altered

14.8

altered and tilted. On the western flank of the range the original dip of the beds has been almost entirely obliterated by the degree of alteration which has been produced by the intruding granite. On the summit of the Clyde Mountain, which forms the eastern watershed of the Little River, the beds have a decidedly westerly dip. These rocks contain fossiliferous remains, which Mr. Etheridge has been able to determine as of Devonian age. Lower down the mountain, on the eastern side of the Little River, the beds have an easterly dip.

The Major's Creek, Long Flat, and Jembaicumbene Creek, alluvial deposits have been worked for a number of years, and are practically worked out, at least so far as individual mining effort is concerned. There is no doubt that in these places there are still large areas which would pay if a sufficiently powerful head of water could be got to the fields to permit of sluicing. Even as it is numbers of Europeans and Chinamen knock out a precarious living by washing and rewashing the recent alluvial in the creek beds, and after a flood portions of the untouched Pleistocene deposits are sluiced with fairly good results, notwithstanding the primitive way in which the sluicing operations are carried on. There are undoubtedly on these creeks isolated areas of alluvial deposits, which there is every reason to believe may be auriferous, which have not yet been tried. At Major's Creek quite a number of reefs have been opened out and tested to a considerable depth. They chiefly consist of pyritous quartz, and although considerable quantities of free gold occur near the surface, at a depth the gold is entirely confined to the pyrites, so that this pyritous ore has to be chlorinated. A chlorination plant and a battery has been erected at great cost on the creek, but has not been in use for a considerable time. As none of the mines were in work during the time I was camped in the vicinity I had not an opportunity of making an underground examination, I can, therefore, form no opinion as to the auriferous-bearing capabilities or persistency of the reefs. I may state, however, that Dargue's Reef, which has been opened out to a considerable depth, occurs upon the junction line between a porphyry dyke and the granite, and, therefore, there is a likelihood that it will persist either continuously or in lenticular masses to a considerable depth.

It seems to me a very doubtful point that the enormous quantities of gold which have been obtained from the alluvial deposits in the courses of the Jembaicumbene, Major's, and Long Flat Creeks can be accounted for by the supposition that they were derived from the disintegration of the granite alone. There is little doubt that a certain portion of this gold has been accumulated from this source. But at Long Flat, to the west of Major's Creek, the alluvial deposits, which were very rich in gold, rest immediately on the quartz porphyry, and no part of the watershed of this creek is formed of granite. It is, therefore, clear that in this instance at least the alluvial gold could not have been derived from the granite. There is certainly evidence to show that the Devonian rocks of the Clyde Mountain and the sedimentary rocks of the Monga Ranges were at one time continuous with the Devonian rocks of Bendoura, for in many parts of the Jembaicumbene Creek we find, far from the present outcrops of these sedimentary rocks, Pleistocene areas, consisting almost entirely of waterworn fragments of these rocks, besides the presence of outliers between the points referred to, and therefore, the whole area occupied by the basins of these three creeks, from the Clyde Mountain to Mount Elrington, on the western side of the Shoalhaven River, was covered by these sedimentary rocks. It would therefore seem probable that the alluvial deposits now found in the creek-valleys which drain this area are the concentrated residue of the denudation of these overlying sedimentary rocks, as well as a considerable mass of the granite and porphyry. The relation between the sedimentary rocks above referred to and those which occur at Little River (Sergeant's Point), among which auriferous reefs have long been known to occur, has not yet been worked out. In the Monga Ranges, however, I have been told that auriferous-bearing quartz has been repeatedly met with, and I think that it is not at all improbable that these rocks will prove to belong to the same series as those of Sergeant's Point. If this be the case, it is quite evident that in these facts we have a reasonable and satisfactory origin for the large quantities of gold which has been found in these creeks.

In conclusion, I desire to draw your attention to the able way in which my assistant, Mr. P. T. Hammond, has performed his duties, and supported me in carrying out the work upon which I have been engaged in this district.

I have, &c.,

WILLIAM ANDERSON,
Geological Surveyor.

The Government Geologist.

APPENDIX 3.

Progress Report by Mr. Geological Surveyor Stonier, C.E., F.G.S.

Sir,

Bombala, 2 February, 1893.

I have the honor to furnish you with the following report of the work done by me during the year 1892:—

From the commencement of the year till the 17th January I was engaged in office work and in writing reports upon the claims inspected by me during December, 1891.

On 18th January I proceeded to Braidwood, and reported upon the various applications for Government aid in the districts of Nerriga, Nelligen, Braidwood, and Snowball, returning to Sydney on 30th January.

On 8th February I left Town for Dungog, and, as a Member of the Prospecting Board, visited Dungog, Copeland, Bulladelah, and Coolongook. I proceeded then to Walcha, and was engaged till 3rd March examining the gold-mines at Swamp Oak, Niangala, and Paradise (my report on the fields forms Appendix 3 A).

From Swamp Oak I travelled to Barraba, and dealt with several applications for aid. I then visited Coonabarabran, and examined the various sites which had been assisted from the Prospecting Vote. From a mining point of view, the Coonabarabran district has not hitherto been of importance. Colours of gold can be obtained in many of the gullies and watercourses, but the alluvial deposits, which are well developed, have not added to the gold production of the Colony. As well as the Recent and Pleistocene drifts which follow most streams, there are a series of high-level drifts, composed chiefly of well waterworn quartz pebbles, and apparently of a lacustrine rather than fluvial origin. Several shafts have been sunk with a view of testing the deposits, but the results have not been encouraging. One of the Tertiary (ancient river) channels has been discovered by Mr. Souden at Belah Creek, and a small quantity of gold was won, but the lead tailed out. Zircons, sapphires, topazes, &c., are associated with the gold. It is evident that

that the old river channels existed, and they are likely to carry payable gold in places, but as the overlying basalt has been but slightly denuded, there is difficulty in ascertaining the position of the channels. At Spring Creek a conglomerate, probably of Permo-Carboniferous age, and somewhat resembling the Cudgong conglomerate, carries gold, but not in sufficient quantity to pay the cost of extraction.

The formation which is generally reef-bearing in New South Wales, viz., slate of Silurian and other ages, does not come to the surface in large areas, as it is hidden by the overlying sandstones, basalt, &c., and there is, therefore, little chance of its treasures being unearthed. A small outcrop occurs at Scabby Rock, and several veins which were discovered have been partly tried, but without successful results. The various patches of slate are, however, worthy of a trial, particularly where they have been intruded by an eruptive rock, such as that which forms the bulk of Scabby and Timor Rocks. The rock in question is not a sandstone, as popularly supposed, but belongs to the granitic type of rocks.

A sample of stream tin, said to come from the Warrumbungle Mountains, was shown to me, but I was unable to find the mineral *in situ*—no attempt has been made to work the supposed deposit. Diatomaceous Earth is also reported from the same locality (Annual Report Dept. Mines, N.S. Wales, 1887, p. 165).

The geological features of the district are varied and interesting. To the north of the township of Coonabarabran there are several good sections of a sandstone bed, with a maximum thickness of about 50 ft., which resembles the Hawkesbury Sandstone in its lithological character. The sandstone in the immediate neighbourhood of Sydney was originally called Hawkesbury, and latterly the Dubbo, Talbragar (Annual Report Dept. Mines, 1888, p. 184), and Clarence River sandstones (Annual Report Dept. Mines, N.S. Wales, 1891, p. 221) have been correlated with the Sydney beds. Some idea can now be formed of the enormous size of the fresh water lake in which the sand, to form the sandstone, was deposited. Coal measures underlie the bed referred to, and outcrop close to Coonabarabran; they are probably an extension of the Dubbo and Gunnedah Measures. Natural sections do not show more than 50 ft. of the beds, so that it will be necessary to resort to boring in order to obtain a knowledge of the coal-bearing strata. Basalt occupies a considerable area, and about $1\frac{1}{2}$ mile west of the township a coarse volcanic breccia occurs, marking the position of a point of eruption. The breccia carries a fair quantity of titanite iron, &c., which has been mistaken for tin. The Warrumbungle Mountains have been the seat of repeated volcanic action, and will well repay geological research. I returned to Sydney on 25th March.

On the 24th April I started for the Kempsey District, and visited the Gundle tin-mines, Toranghi silver lodes, antimony deposits at Dungay Creek and Bowraville, and the gold-mines at Deep Creek, and dealt with a number of applications for aid from the Prospecting Vote. The tin occurs as rich bunches of cassiterite with quartz in a coarse granite, which decomposes readily, and, yielding a large amount of soil, renders prospecting work difficult. An interesting feature is the occurrence of tin in a felsite dyke, which yielded the mineral readily by dollying the outcrop, but when the rock became hard the claim was abandoned. The silver occurs in well-defined lodes, chiefly as argentiferous galena, and associated with mispickel. In places the lodes are several feet in width, consisting of solid mispickel, with bunches of galena. The Dungay Creek antimony deposits and Deep Creek Gold-mines have been described (*Vide* Annual Report Dept. Mines, N.S. Wales, 1889, pp. 204-205). Since the report was written, several important finds of antimony have been made, and at Taylor's Arm there is a fair tonnage of ore in sight. At Bowraville the bunches are of considerable size, having a maximum width of as much as 3 ft. of almost pure sulphide of antimony. There is no doubt that the district will be of importance in the future for the production of antimony, and it is desirable for the development of the industry that a smelting plant be erected in some convenient locality, so that the small percentage ores may be dealt with.

I returned on the 17th, and left Sydney again on the 25th May for the Southern District, visiting Temora, Barmedman, Sebastopol, Tulgogorin, Demondrille, Young, Grenfell, Warraderry, Forbes, Condobolin, Lake Cowal, Melrose, Burra, Euabalong, and Lake Cudgellico. I dealt with various applications for aid and Land Alienation papers, and inspected the new finds at Warraderry, Condobolin, and Erribenderry. The former is of interest because of the occurrence of the gold in small quartz veins in felsite. I have previously referred to the importance of felsite in the Northern District in association with silver, lead, and tin, and it is important to note its occurrence at Grenfell, Warraderry, and the Britannia reef at Forbes in association with gold. The discovery of a reef at Condobolin created local excitement, which considerably cooled down when the result of a crushing became known. The vein is not well defined, and the yield is disappointing, but it should not deter the proper testing of the vein. Mining at Condobolin has been badly supported, and credit is due to those who have continued prospecting in the face of disappointment. The gold-bearing reef at Erribenderry, near Lake Cudgellico, has been tested to the 30-ft. level. It is fairly well defined, and is well worth proving. It averages 3 ft. in width in the 20-ft. drive, and shows fine gold freely. The quartz is solid and somewhat vitreous, and at the bottom level strongly impregnated with pyrites. At the time of my visit there were 20 tons of quartz at grass, and it was intended to send several tons to Sydney for treatment. Claims have been taken up on either side of the prospectors, but have not yet struck the prospectors' vein. At Lake Cudgellico, and later in the year at Bygalore, I examined the basalt sheets and found them to contain leucite—a description of the occurrence will be published in the next number of the Records. On 27th July I returned to town, and from the 10th to 30th August was occupied at Lewis Ponds, Cowra, Canowindra, Mandurama, Trunkey, and Tuena, dealing with Prospecting Vote applications and Land Alienation papers.

From the latter date till the 10th September I was away on leave of absence, and spent the time with Professor T. W. E. David, who was geologically mapping the measures in the immediate vicinity of Kiama.

On the 20th September I examined a manganese deposit at Havilah, near Mudgee, and then proceeded to Gulgong to deal with the alienation of certain land.

From the 11th October until the end of the year I was engaged at Thirlmere, Dalton, Murrumburrah, Young, Wombat, Temora, Tumberumba, Copabella, Yerong Creek, Tarcutta, Muttama, Forbes, Parkes, Orange, Kerr's Creek, Cargo, Byng, and Yetholme, dealing with applications for aid from the Prospecting Vote and the alienation of certain portions of land.

The remainder of my time has been spent, with the exception of five days leave of absence, in writing various reports.

I have, &c.,
GEO. A. STONIER, F.G.S.,
Geological Surveyor.

APPENDIX 3A.

Sir, Geological Survey, N.S. Wales, Department of Mines, Sydney, 11 April, 1892.

In accordance with your instructions, I have the honor to furnish you with the following report upon the Swamp Oak and Niangala fields.

The two diggings have been proclaimed under one Gold-field, in order to meet the requirements of the Act, not that the one is dependent on the other, for they are 9 miles apart, and, although many important features are common to both, there are decided differences between them.

1. *General Physical Features.*

Swamp Oak is partly in the Parish of Loftus and partly in Ainsley, Co. Parry, and is distant from Tamworth 25 miles, in a direction a few degrees south of east, while Niangala is 9 miles further south-easterly, and in the Parish of Walcha. Both places are within the watershed of the Swamp Oak Creek, which rises in the Great Dividing Range, and, flowing in a north-westerly direction for 15 miles, turns to the west and joins the Mulla. It is then known as the Cockburn, runs into the Peel River a couple of miles to the east of Tamworth, and flows into the Darling through the Western Plains.

Swamp Oak Creek is intermittent, although water can always be obtained by sinking in the bed of the creek, but the Mulla is permanent, and when the former is dry, the latter is a strong-flowing stream.

The physical features present marked differences. Swamp Oak Township is 2,400 feet above sea-level, and is situated on a gentle, well-grassed slope, which was formerly used as a "top station" for the Swamp Oak Creek Station. The surrounding country is mountainous, and consists of well-timbered hills, rising fairly abruptly, with rocky, and in places almost precipitous, sides.

Niangala is on the table-land, and, by barometer levels, 3,500 feet above sea-level. The water-parting of the Great Dividing Range occurs a short distance easterly, and is sharply defined. The table-land continues easterly for some miles, but the western fall is soon broken, in places very abruptly. The table-land forms part of the New England Table-land, and presents only slight undulations as a result of erosion.

From Sydney it is usual to travel by train to Walcha Road, 320 miles, and then by coach to Walcha, 12 miles, and a further distance of 16 miles to M'Hatton's farm, which is 14 miles from either of the mining townships. The coach journey to Walcha can be avoided by driving direct from Walcha Road to M'Hatton's.

Communication has lately been established between Swamp Oak and Farquharson Siding, and, as this route saves twenty miles of railway travelling, as well as eighteen miles of coaching, it will doubtless take much of the traffic in the future.

2. *Geology.*

The formations developed may be classified as follows:—

- | | | |
|--|--------------------------|--------------|
| 1. Recent Alluvium. | Quaternary. | } Cainozoic. |
| 2. Basalt. | } Tertiary. | |
| 3. Tertiary Alluvium. | | |
| 4. Diorite. | | |
| 5. Granite. | | |
| 6. Serpentine. | | |
| 7. Mudstones, sandstones, &c., more or less altered. | Lower Carboniferous (?). | |

1. *Quaternary. Recent Alluvium.*—As the various watercourses are chiefly confined, and have precipitous sides, there has not been the opportunity for the accumulation of large areas of alluvium. The patches which have been formed are of small extent, and consist of quartz sand, and pebbles, more or less rounded, of the altered mudstones. Gold has been obtained since 1852 in Swamp Oak Creek; and at the present time in the Cockburn River, particularly after rain, pieces up to 5 dwt. can be obtained. In Swamp Oak Creek, from its junction with the Mulla almost to its source, grains up to half a penny-weight are found. As a rule the gold is shotty, and differs entirely from the fine gold that is obtained from the reefs, so that the older river courses may be found to contain coarse gold. Several of the alluvial patches are worth a trial, but as the water is strong the work will be attended with some difficulty.

2. *Basalt.*—This formation occurs in oval patches near Niangala, and towards Walcha has a large development, and furnishes the regularity of outline which is characteristic of portions of the New England Table-land. It consists of a coarse olivine-dolerite, well crystallised and rich in olivine. The older alluvials, to which reference will next be made, underlie the basalt.

3. *Tertiary Alluvium.*—About one and a half miles north-west from Niangala an outcrop of drift has been discovered, and a couple of shafts sunk, which show the wash to be several feet in thickness and of a bouldery nature. The pebbles consist chiefly of quartz and altered slate, with several quartz boulders up to 2 ft. in diameter. Colours of gold are said to have been obtained, but the work done has not been of a character to test the lead at any one spot. It is certainly worthy of further attention.

Between Niangala and Walcha there is a large area occupied by basalt, which overlies in places old watercourses. These leads may be hard to trace and in places wide, but they are likely to carry payable deposits of gold where they have traversed auriferous strata, and should repay the time devoted to prospecting them. It is difficult to fix the exact age of the lead discovered at Niangala, as palæontological evidence is not available, but it is probably contemporaneous with the wide-spread leads at Nundle. In the latter the width of the channel which contains the auriferous drift has not been proved. The superficial alluvium is 10 chains wide in places, so that it is not easy to locate the position of the deepest ground. An important point, too, is the occurrence of a bar which runs parallel to the course of the channel, and to the north of Nundle has increased the difficulty of determining the position of the washdirt. It is not to be inferred that the same width of alluvium will be found at Niangala, but the occurrence is mentioned to emphasize the necessity of the leads being properly tested before they are pronounced to be valueless. For information on the Nundle leads, *vide* report by the late C. S. Wilkinson, F.G.S., &c., Annual Report Dept. of Mines, N. S. Wales, 1885, page 132.

4. *Diorite.*—Diorite occurs on both fields in a well-marked axis of upheaval, and is of the utmost importance, as it has probably occasioned the veins, and furnished the precious metal.

At Swamp Oak the axis runs north-west, the dyke being well defined, and varying from 8 feet up to a chain in width. From the Cemetery, near the New Year Gift Mine, it can be traced in an almost unbroken

unbroken line northerly, until it crosses the Swamp Oak Creek, then turns slightly to the west, and after a short break opposite the Rising Moon battery, can readily be followed to the Mystery lease, when turning almost at right angles for a short distance, it is then lost. Overlapping this line, and a few chains westerly, another dyke starts at a gully to the south of the Victory tunnel, and goes northerly to the Mystery shaft where it turns to the west, and crossing the Highland Mary lease, passes to the west of the Nelson Blocks, and across the northern corner of the Recreation Reserve. I did not attempt to trace it further either north or south, but it doubtless continues in both directions, and in prospecting towards Nundle or Walcha Road, should be an invaluable guide. So far as my observations went, there are not any parallel or cross dykes. On the Carbine Block there is a patch, a chain and a half square, which is probably a boss, indicating the existence of a much larger mass underneath, of the same age as the dyke. Doubtless other dykes occur either outcropping or at some little depth below the present surface, and it must be remembered that, since the intrusion of the diorite, a considerable time has elapsed, and the country has been subjected to extensive denudation.

At Niangala, the dyke is not so wide as at Swamp Oak, nor does it make so bold an outcrop, but it can readily be traced from the Golden Spur property to the Jersey Lily. Its width is difficult to determine, but does not exceed 20 feet. Immediately to the south of the Golden Spur it does not appear to outcrop, nor has any vein been discovered along an extended line of the actual outcrop.

I have classified the dykes as later than the granite because the country between the two auriferous belts has been altered, and is traversed by quartz veins which are not auriferous, while at Swamp Oak there is evidence that a vein resembling those referred to has been reopened, and become gold-bearing. These facts appear to me to find their explanation in the influence of the diorite, and not of the granite, and to justify the proposed classification, although the evidence is not clear enough to establish the later age of the diorite.

The direction of the Swamp Oak dyke bears N. 20° W., and it will be observed that it is roughly parallel to the granite dyke shown on the accompanying plan.

The upheaval does not appear to have been violent, as reversals or even flexures of strata are not distinguishable, and only such fissures as were inevitable have been developed.

The rock is holocrystalline, but varies in degree of crystallization, and at Niangala appears, macroscopically, to be a felspar-porphry. However, under the microscope, it is seen that the only primary mineral present of importance, whereby to determine the rock species, is felspar. Both orthoclase and a triclinic felspar are developed; the latter predominates. It is clear, as pointed out by Professor T. W. E. David, B.A., F.G.S., to whom the slides have been submitted, from the fractured state of the crystals that the rock has been subjected to stress prior to its final consolidation. A ferro-magnesian mineral has been present, and is quite replaced by mica, with a little chloride, epidote, and actinolite (?). Probably it has been amphibole, and there seems to have been an interaction between it and the felspars. Some magnetite is also present, but there is neither olivine nor quartz. It is clear that the rock belongs to the intermediate type, and, as there are both monoclinic and triclinic felspars, it should perhaps be classed as a syenitic-diorite. The specific gravity of a specimen from Swamp Oak, kindly determined at the Sydney Mint, is 2.881, and of one from Niangala, 2.924.

5. *Granite*.—Granite occurs in the form of a dyke, averaging about 35 feet wide, of felspar-porphry, and is found on the eastern extremity of the auriferous belt at Swamp Oak. It is well defined, and can readily be traced. I started at G. L. 58, and found that it crosses the Commotion lease, runs to the east of the Carbine, and just within the western boundary of G. L. 67, continuing in a direction N. 30° W., about 10 chains to the east of the Rainbow north-eastern corner.

The rock is compact, with a slightly slaty-grey base, in which the felspar crystals are well defined, and of a yellowish-white tint. Some of these felspars weather a reddish-brown, and have much the appearance of orthoclase; but many are unaltered, and are probably oligoclase, as they show fine lineation. Hornblende and primary and secondary mica are also present.

To the east of Niangala is found the western limit of the New England table-land granite, which outcrops also near Paradise.

The intrusion of the granite has crumpled the beds on the western side for a width of 22 yards.

6. *Serpentine*.—A large mass is found to the west of the Mulla, in the Parish of Ogumbil, which shows the characteristic irregular and dirty-brown outcrop, bold in places, and forming prominent rocky faces, with scanty vegetation, and, at the flanks of the hills, yielding rich alluvial soil formed by denudation of the ultra-basic rocks. Its width is about a mile, and the eastern boundary bears north by west. The mass thins in a northerly direction, and it is doubtful if it can be correlated with either the Moonbi (Beedle's) or Black Jack outcrop. From Barraba the serpentine can readily be traced for a long distance in a southerly direction; but on approaching Tamworth it thins, so that the Mulla may be a distinct inlier.

At Barraba it would appear that the occurrence of gold is dependent upon the serpentine, which, so far as has been proved, has not had the same influence in the Nundle district. The question, however, cannot be looked upon as settled, and it is important that veins near the junction of the serpentine with the sediments should not be neglected.

That the serpentine at Barraba is an intrusive rock is evident, both from the junction-line seen in the large sections, as well as in a hand specimen, which was secured by Professor David during our trip through New England in March, 1891.

7. *Lower Carboniferous* (?).—Mudstones, &c, more or less altered. The sediments occupy a very large area in both fields, and consist of mudstones, sandstones, &c., more or less altered, occurring, in the unaltered state, in small patches only. It is, however, the occurrence of these patches, as well as the similarity of the beds generally to much of the sedimentary area in New England, which has induced the proposed classification. That it is open to question is freely admitted; but after repeated observations I have come to the conclusion that a large area in New England (*vide* Annual Report Dept. Mines, N. S. Wales, 1891, p. 261) may ultimately be referred to the Lepidodendron Series, which is now considered (*vide* R. Etheridge, Junr., Records Geol. Survey, N. S. Wales, vol. 11, Pt. III, p. 119) to be Lower Carboniferous. In going hurriedly over the section it is difficult to trace any break from the beds under consideration to those belonging, without doubt, to the Lepidodendron Series. At Barraba also the unaltered rocks can be followed into beds altered, as are some of the Niangala rocks, with independent cleavage, &c., there being no apparent break in the sequence.

The metamorphism to which the rocks have been subjected is selective. Prior to the formation of the reefs, some of the beds have been opened for a certain distance along their strike, and this has allowed the percolation of silicified waters. Thus the alteration has been patchy. In some cases it appears to have been more intense close to the western side of the reefs, and there the rock ranges in a short distance from a claystone up to a quartzite. Speaking generally, the amount of silicification to which the rocks have been subjected has been great, and quartz veins penetrate them in all directions, some following and others cutting across the bedding planes at various angles.

At the junction of both the diorite and the serpentine with the sediments, the immediate contact beds have been altered, but there appears to have been little opposition to the passage of these eruptive rocks. The granite, however, has caused not only silicification on a large scale, but for 20 yards on the western side of the granite dyke at Swamp Oak the rocks have been contorted, the plications varying in width from one-sixteenth inch upwards. The contortion has been accompanied by the infiltration of silicified water, which has passed into the opened bedding planes and deposited silica, which now appears as if interbedded. The contortion of slate in the district was noted by the late Rev. W. B. Clarke in 1852. The occurrence is by no means uncommon in the Northern District.

As a rule the dip is obscured by jointing and cleavage planes, and it is only in odd places that the lines of stratification can easily be distinguished. At Swamp Oak township the general strike is N. 15° W. with a dip to the west at 37°, increasing in a westerly direction. On the Storm King line of reef the rock is a greenish-grey argillite, in which the jointing is well marked, and might be mistaken for stratification planes, and is known to the miner as "greasy backs." In the same series, but nearer Tamworth, there are sections which show clearly the obliteration of bedding planes in favour of jointing. At the Mystery lease the sediments have been more shattered than at any other portion of the field, and trenches several feet in depth fail to touch the undecomposed and compact rock. Between Swamp Oak and Niangala the rocks are more argillaceous, and as cleavage is developed they approach the slates in structure, but of fissile slates I did not see any sign. At Niangala the thin-bedded character of the mudstones can be seen in the Golden Spur mine, but the section is not continuous over any large area, and cleavage again predominates.

The whole series is scamed with quartz, but it is only in the vicinity of the diorite dykes that the veins carry gold. At Swamp Oak the auriferous belt is 2½ miles long and 1½ mile wide. Immediately to the north and south of this area there have not been any auriferous veins found, but as the tract of country is more or less of the same geological formation, there is reason to believe that payable quartz reefs will be found; and it is a matter of importance that the country should be well prospected between Nundle and the Swamp Oak Creek, and also from Swamp Oak Creek in a northerly direction, until the granite is met. There is every likelihood that outcrops of diorite will be found, and the sediments in the immediate vicinity should be carefully examined for the veins.

3. Mining.

(a) *Swamp Oak.*—In the immediate vicinity of Swamp Oak various reefs have been discovered, and the lines of reef have been named from the claim where the find was originally made. In few cases, however, has a reef been found which, undoubtedly, extends into an adjoining claim. The reason for the difficulty in following the outcrop is at present doubtful, but the available evidence goes to show that the walls of the various fissures close, rather than that there is a complicated system of faulting. The Storm King is the only one which can claim to be a "line" of reef, and in this case it appears likely that the intrusion of the diorite has caused a series of fissures, extending in one general line, and not one main fissure. There is evidence, however, that some of the gold-bearing veins are of later formation than others, and it may even be possible, when the field is further developed, to reduce the veins, as has been done in Cornwall, to two distinct systems, but, as at present opened, many of the fractures bear a resemblance to the breaking of a cross-grained piece of wood.

Most of the veins which have been worked dip towards the dyke, *i.e.*, easterly, and later than these there have been formed a series of veins which, where opened, are almost vertical, and have faulted the flatter veins. The latter carry a fair body of quartz and payable gold, but where the former have been cut their walls are actually in contact. I cannot, however, but believe that in places these walls open and allow the formation of shoots of auriferous quartz, but it is impossible at present to estimate the depth at which the shoots may be expected to occur. The question is one which must ultimately be met, and the sooner a solution is arrived at the better it will be for the whole line of reef. In future prospecting, therefore, it is important that the vertical veins should be tested to ascertain (1) if they turn either to the east or west, in which case a body of stone will make; (2) the depth at which the faulted reef will again be met. The fault is a strike fault, and a body of stone will be found which does not make any surface outcrop.

The most southerly of the mines on the Storm King line is the New Year, which has a shaft 60 feet deep. The hanging-wall is well defined, and the foot-wall fairly so. The vein bears N. 12° E., and has an underlay to the east at 17°. At the bottom of the shaft the channel has an average thickness of a foot. A parcel of 3 tons sent to Sydney yielded 5 oz. to the ton; and 14 tons, treated locally, gave a return of 28 oz. 5 dwt.

Coming north, the Storm King mine is 125 feet deep, and at the 86-foot level there is a drive 70 feet to the north and 50 feet to the south; tributaries are now stoping from the bottom of the shaft to the 86-foot level. The shoot which carries the richest stone is 15 feet wide, and has an average thickness of about 15 inches, and a maximum of 3 to 4 feet. Other veins have been discovered, and one of them tested to a depth of 35 feet, but the richest specimens were obtained from a small leader which proved to be lenticular, but showed gold very freely. A crushing of 2 tons yielded 40 oz. of gold, 17½ cwt. gave 20 oz., and from the main vein 86 tons were treated at the Rising Moon battery for a return of 107 oz.

The Rising Moon adjoins the Storm King on the north. The underlay shaft now being worked is 90 feet deep, and from the bottom level a drive goes north for 125 feet and south for 120 feet. The vein bears N. 15° W., with an underlay to the east at 11°. A shoot of stone dipping to the north at about 18° is now being stoped from the bottom level upwards. It averages, *i.e.*, the richest portion, 8 inches in thickness, running up to 3 feet. I did not determine the length of the shoot, but, owing to the small angle of dip, it is not so long as would appear from the drive. To the south of the working shaft, two shafts, respectively 50 and 70 feet, and connected by a drive 40 feet in length, have been sunk on a
vein

vein supposed to be distinct from the vein now being worked. The quartz varies in thickness up to 3 feet, with an average of about 18 inches. There are other veins known to exist, but the company have wisely confined operations to the payable shoot of stone—it is a pity that other claims have not followed example. A 10-head battery, with 2 Wheeler and 1 Berdan pans, has been erected, and crushings are made for the public as well as for the special claim. From the lease there have been raised 463 tons, yielding 489 oz. of gold.

Adjoining the Rising Moon there is a narrow strip of ground known as the Surprise Claim, which has had a portion of the Little Tichbourne shoot, and has been worked to the 70-foot level. A crushing of 80 tons yielded 264 oz. and 45 tons gave 86 oz. of gold.

Within a chain of the shaft is the Little Tichbourne No. 4 shaft, which is 75 feet deep, on the underlay, and at the eastern boundary of the lease. At the surface two auriferous veins were discovered, and after being followed for 30 feet they were found to unite or, rather, overlap, and, as they both carried gold, it gave the two shoots the appearance of one long and continuous shoot. In places the quartz was 2 feet in thickness, but is said to have averaged 10 inches. The vein bears N. 12° W., with an underlay to the east of 45°. At the 30-foot level the quartz was taken out for a width of 35 feet, yielding 6 oz. to the ton, and could have been picked to return 30 oz. to the ton. The best specimens were obtained where the quartz was "bound" on to the footwall, and it is self-evident that even in the shoots the gold is unevenly distributed. To the north of No. 4 shaft a vein has been followed on the underlay for 108 feet, and meets a vertical shaft 40 feet deep, which is continued for a further 50 feet, but has not proved any important shoot of quartz.

The next claim is the Wandering Jew. A shaft has been sunk to a depth of 30 feet, disclosing a well-defined vein 2 ft. 4 in. in thickness. The shaft is situated close to the Swamp Oak Creek, and the difficulty of baling water in an underlay shaft seems to have been more than could be managed. There was no work going on at the time of my visit, but it is difficult to understand that the water difficulty will be easier in winter than in summer.

On the northern side of the Swamp Oak Creek is the "Highland Mary." Several veins have been discovered and four shafts sunk, but, as little or no driving has been attempted, it is impossible to say what the width of the shoots will be. The "Water" shaft is the most southerly, and is 55 feet deep, disclosing a formation 3 to 4 feet wide, consisting of quartz and capel. The quartz shows gold freely, and should crush well if kept free from the capel. To the north there is a shaft 25 feet deep on a vein which bears N. 10° W., and another 65 feet deep on a well-defined vein averaging 1 foot. A chain to the west a party of tributers are sinking a shaft which is now 40 feet deep on a vein averaging 9 inches, and with a maximum thickness of 2 feet. The country is a kindly slate which has been shattered and fractured by the change in direction of the diorite dyke. The following crushings have been made:—

	oz.	dwt.
24½ tons, yielding	86	12
39 " "	23	18
28 " "	56	1
19 " "	38	0

To the east of the Highland Mary is the Victory Claim, and credit is due to Messrs. McNeally and Party for the steady manner in which the mine has been worked. The vein bears N. 12° W., with an underlay to the east at 45°, and occurs at the junction of the diorite with the mudstones, the latter forming the footwall, and dipping to the east at a low angle. It is worked by a tunnel 80 feet in length, which gives 48 feet of "backs," and a level 15 feet lower, and 140 feet in length, from which the quartz is won by underhand stoping. The reef varies from 3 inches to 12 inches in thickness, carrying very little gold where it pinches. A crushing of 14 tons yielded 5½ oz. per ton, and another lot of 12 tons gave 3 oz. to the ton. There is at the present time at grass about 20 tons awaiting treatment.

To the north of the Victory is the Mystery. A shaft has been sunk 60 feet deep at the junction of the diorite with the sediments, and a tunnel driven northerly. Patches and leaders of quartz have been cut, but no defined shoot has yet been met.

The diorite dyke then turns north-west. No payable veins have been discovered further north.

On the eastern side of the dyke and on G.L. 36 there is the Great Britten Claim. Several shafts have been sunk to a depth of 50 feet, and a little work has been done on the outcrop of the vein, which bears W. 30° N., with an underlay to the north-west. The quartz varies in thickness from 4 inches to 8 inches, and a parcel of 6 tons is said to have been treated at Mort's Dock, and to have given 30 oz. of gold. Parcels of about 1 cwt. each, treated by Mr. Goddard, of Uralla, in his new pan, are said to have yielded even better results. To the east and on the same lease a formation, 4 feet in thickness, consisting of quartz and arsenical-pyritous, siliceous mudstone, has been opened to the 20-foot level. It bears N. 30° W. with an underlay to the north at 45°.

The Golden Belt is on G.L. 63. The southern shaft is 70 feet deep, and at the 30-foot level a drive to the north meets another shaft. The reef bears N. 28° W., and has an underlay to the east of 26°. The vein is not well defined, the walls having been thoroughly saturated with silica when the vein was in process of formation.

At King Bungaree a shaft has been sunk 40 feet on a vein somewhat similar to that just described. Very good specimens were obtained from the outcrop. On this lease a defined quartz vein, for an outcrop particularly well defined occurs, and has a channel 3 feet wide. It is worthy of a trial.

On G.L. 63 Mr. Bakewell is working a vein which is better defined than any other on the field, and shows not only every sign of permanency, but also the direction in which the movement of the hanging wall has taken place. It is evident that this direction has been to the north-west, and it would lead to the expectation that many of the shoots on the field will be found to have a northerly dip. The vein bears W. 43° N., with an underlay to the north at 4°, and averages about 10 inches. The quartz has a dull, bluish-black tint, and on the hanging wall there is an auriferous dig of white clay, with angular pieces of flinty quartz. It has been worked to the 40-foot level for a length of 60 feet. A crushing of 44 tons gave 79 oz., and 23½ tons 21½ oz. of gold.

The Alpine is situated on a mining tenement, and is of interest as being the first vein discovered on either field. The prospectors were, however, attracted to other and more promising finds, and the vein has not received as much attention as it warranted. It bears W. 35° N., with an underlay to the west of 9°, is fairly well defined, and has been tested to a depth of 40 feet. A crushing of 16 tons yielded 16 oz.

The

The Routine Flush is a claim which has been much talked about, and from which great things have been expected. One of the shafts is 100 feet deep, with a drive of 100 feet, but the richest veinstone has been won from a shaft now 45 feet deep. The shoot is 20 feet wide and averages about 10 inches in thickness, with a maximum of 2 feet. Two "clayey" floors have been met, and, owing possibly to a secondary precipitation of the gold, have marked the position of some of the best specimens. One ton of quartz was treated, and yielded 12 oz. of gold.

The Welcome Stranger and the Sunlight, two adjacent claims, have been abandoned. The latter has been tested to a depth of 50 feet.

The Rainbow has two shafts, one 60 feet and the other 20 feet, on veins supposed to be parallel. The former averages 3 feet of quartz and capel, and bears N. 15° W., with an underlay to the east at the bottom of the shaft at 15°. A crushing of 81 tons gave 72 oz. of gold. From the leader in the 20-foot shaft, a parcel yielded 7 oz. to the ton. Several other veins and leaders have been discovered, and a shaft 18 feet deep has been sunk on one, and a tunnel driven 40 feet on another vein. From various leaders good specimens have been obtained, but it is of importance to the property that the width of the shoots be determined, and as this can be ascertained only by sinking and driving, the more systematically the work is carried out the sooner will the lease return something for the money which has been outlaid.

At the Carbine a well-defined reef has been cut in a trench, although there has not been any attempt to test it in depth.

At the Commotion and Mount Sheba, veins have been discovered at the junction of the granite.

From a perusal of the preceding description of the various properties, it will be understood that the auriferous belt contains a number of veins, running chiefly north and south, and varying a few points to both the east and the west. The veins all carry mispickel, more or less, and if the stone be crushed, roasted, and panned off in the ordinary fashion, will be found to carry gold. The feature of the quartz is the presence of mispickel, giving near the surface the light yellow stains which accompany the best "shows" of gold, and at a depth the bluish tint, which is its characteristic. In almost any reef, where the quartz is blue, gold is present, and the reason why various reefs appear to lose the gold is because it is in combination with the mispickel, from which, however, it can be freed by roasting. In prospecting any reef, it is essential that the powdered stone should be thoroughly heated, until fumes cease, before an attempt is made to pan off the free and freed gold.

The mispickel occurs as small, isolated, and well-formed crystals scattered through the veinstone, even where there is no sign of a joint, so that it must have crystallised out before the solidification of the quartz. The percentage is generally about 1½.

The quartz is compact, vitreous, and of a dark and slightly bluish-grey tint, so that the free gold is readily distinguishable. The gold is fine, somewhat resembling the mispickel in its occurrence, and appears to be a primary mineral, not solely resulting from decomposition of the pyrites. Iron pyrites is exceptional, but galena is found crystallised in small cubes on the Alpine line, and associated with zinc-blende.

The Storm King amalgam retorts to two-fifths; the Highland Mary, three-sevenths; and the Rising Moon, one-third.

After deducting Mint and escort charges, the gold is worth £3 11s. 1d. per oz.

Notwithstanding the fact that the field was discovered more than eighteen months ago, the deepest shaft is only 125 feet, and it is a pity that a more decided attempt has not been made to prove the field in depth, for it cannot be urged, with the number of encouraging shows which have been unearthed, that there has not been sufficient inducement to properly test the veins. The work done proves that the gold will be found to run mostly in shoots, through which it is unevenly distributed. The rich shoots, so far discovered, have not exceeded 20 feet in width, although, in several cases, the stone on either side has been sufficiently rich to pay for stopping. The average thickness is from 9 inches to a foot, the veins themselves running up to 3 feet. Several of the claims have not attempted to prove the width of the shoots. Apparently the fact of gold being in the shaft is held to be the sole desideratum. The distance the shoots are apart, and the likelihood of longer shoots being discovered, will be referred to subsequently.

(B.) *Niangala*.—The reefs discovered at Niangala resemble in many respects those found on the sister field—Swamp Oak. The quartz carries mispickel in the same form, perhaps in rather greater abundance, and the reefs owe their origin to exactly the same forces, exerted, probably, at the same time; so that the one set of veins cannot be looked upon as younger than the other, for they traverse sediments which are of the same geological age. Microscope sections show that the diorite is of the same kind as the Swamp Oak rock, but the dyke itself is not so wide, nor can it be traced either with the same ease or for the same distance. Owing to this distinction, there is not a general line of reef similar to the Storm King, nor are there as many leaders running in various directions. The veins are, however, of a permanent character, and if the occurrence of the shoots be carefully studied, the erection of crushing machinery will be justified. At the time of my visit most of the principal claims were not working, for various reasons; and with the knowledge of the well-watered character of the New England Table-land, it is a mistake to allow the summer months to slip by, and the work of sinking, difficult enough under favourable conditions, left until the wet season has set in. Another point, which cannot be too carefully attended to, is that the paddocks be kept strictly for crushing stone only, and free from anything which does not carry gold, whether veinstone or country rock. There may be some advantage in having a big paddock of stone, but it does not give a mine a fair chance when so much absolutely useless material is allowed to mix with the auriferous veinstone.

The veins all run in a north-westerly direction, and the most easterly is the Morning Star, which has been tested to a depth of 9½ feet, where the vein is said to be 2 ft. 6 in. wide; the shaft was not open to inspection. That the quartz will vary in size, and may even pinch completely out is only to be expected, but provided the vein be of a true-fissure nature, there need be no fear that it will not make again at depth. The vein bears N. 20° W., with a slight underlay to the south-west, and occurs to the east of the diorite dyke, but has not been identified outside G.L. 10. A little work has been done on the outcrop, but the width of the shoot of gold has not been determined. A crushing of 6 tons yielded 1 oz. 9½ dwt. per ton, and another parcel of 6 tons returned 2 oz. 10½ dwt. per ton.

Close to the dyke, and still on its eastern side, are the Gem, Surprise, Jersey Lily, and Golden Spur. The two former are not at work, as the crushings did not go as high as was expected. Two shafts, each about 50 feet deep, were sunk, and crushings of 26 tons gave about 7 dwt. to the ton. The Gem is said

said to have had one crushing of 3 tons, which yielded 2 oz. 16 dwt. At the Jersey Lily, G.L. 34, a shaft is being sunk, and is now 97 feet deep on a vein bearing N. 12° W., having a variable underlay to the west. The thickness of the veinstone is said to average 8 inches. The Golden Spur, G.L. 13, is a well-defined vein traversing thin-bedded mudstones, which dip south. It bears N.W., with a slight underlay to the east. Four shafts have been sunk to the depths of 40, 45, 48, and 75 feet, and stopping done at various levels. The quartz varies from 3 inches to 8 inches, and the average yield has been about an ounce to the ton.

To the west of the diorite dyke are G.Ls. 19 and 21, known as the Twicer line; the vein bears N. 30° W., with an underlay to the east of 8°. At present there is no work being done on the leases, although the shaft is 50 feet deep on a reef which is 1 foot in thickness (at the outcrop), and has yielded 9 dwt. per ton.

To the north-west of the Twicer is the Australian Republic. A shaft has been sunk 42 feet, but has not proved a defined vein.

Continuing westerly, then comes the Starlight line. Four shafts have been sunk to 20, 26, 40, and 75 feet, with various drives, and quartz has been stoped from the surface to the water level for a certain distance along the outcrop. The vein bears S. 22° E., with a dip of 38° to the north-east, and averages about 4 inches (in places up to a foot) in thickness. Crushings of 70½ tons have yielded 140½ oz. of gold. The mine has paid expenses since its initiation, but obviously it will be necessary, now that the water level has been reached, to provide the necessary pumping gear in order to test the reef at the lower levels. Gold shows freely in the stone, with specks up to half a grain, and is the coarsest found on the field. The reef has not been traced north or south of G.L. 8, the attempts to find it in G.L. 24, South Starlight, having failed.

A few chains to the west are the veins known as the Jersey and Just-in-time, which are found on G.Ls. 3 and 1 respectively. At the former the shaft is 10½ feet deep, and at the 64-foot level there are drives 40 feet each way. The site is, unfortunately, close to a gully, which adds to the difficulty of overcoming the water, but it was considered inadvisable to leave the shoot of gold and sink a shaft further along the outcrop. A steam pump has been purchased, and, as soon as it has been placed in position, work will be resumed. The vein is said to average 6 inches, and a crushing of 40 tons to have yielded 150½ oz. The reef bears N. 5° W., with a slight underlay to the west.

At the adjoining claim, the Just-in-time, there are supposed to be two parallel veins, which bear N. 10° W., with an underlay to the west at 5°, and three shafts, respectively 45, 50, and 110 feet deep, have been sunk, and at the 40-foot level a tunnel driven for 176 feet, with a cross-cut to connect the two shallow shafts. The quartz varies very much in width, with a maximum of 3 feet, and an average of about 10 inches. The channel is well defined in places and wide, so that care will have to be exercised or a vein may be left in either hanging or foot-wall. A parcel of 60 tons was crushed at a local 5-head battery, and yielded 1 oz. per ton, but it is expected that better returns will be obtained when the battery, recently purchased from the Little Tichbourne Company and now being erected at Niangala, is in working order. It is clear in this mine that two of the shoots of stone dip to the north, and are about 15 feet wide and 30 feet apart.

To the south is a claim known as the Joker. Two shafts, 30 and 31 feet deep, have been sunk on a vein bearing N. 40° W., with an underlay to the east at 55°. The quartz varies up to 12 inches in thickness. No crushings have yet been made.

At Paradise, 8 miles to the south of Niangala, and in the parish of Scott, several veins have been discovered. Messrs. Hoppeworth and Howlett have one shaft 60 feet, and another 40 feet, connected by a drive 83 feet in length, which is continued 25 feet north and 10 feet south. The quartz averages 6 inches, and varies up to 1 foot in thickness. Kynhardt and party have sunk two shafts about 20 feet deep, and stoped a few tons of quartz from a vein which varies in thickness from 8 inches to 2 feet. Nine tons were crushed for a yield of 1½ oz. per ton. Several other claims have been taken up and shallow shafts sunk. Very little work has yet been done, although the veins are worth prospecting. A discovery of sulphide of antimony has recently been reported.

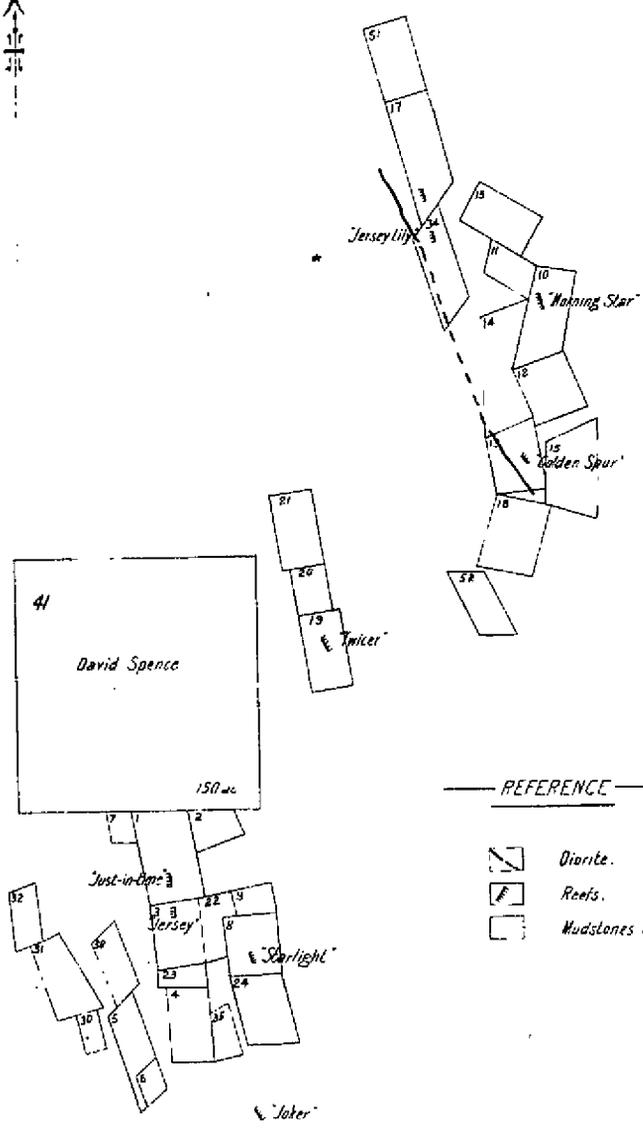

Niangala, like Swamp Oak, has suffered from a want of prospecting energy, for, when once the reefs were discovered, the owners have allowed the development, in many cases, to practically look after itself. It is now eighteen months since the first finds were made, and there has been ample time, notwithstanding the difficulty which there is with water in most of the claims, to prove whether the mines are likely to become a permanent industry. That there is payable gold is attested by the fact that one claim has paid its way since the commencement of operations. Objection may perhaps be taken to the manner in which the stone has been raised, but if all the mines had been continuously worked, there would be a different tale to be told to-day. The veins are all well defined, and do not appear to have been subjected to any complicated system of faulting; there is evidence of one fault with a throw of about 40 feet, but it should not give much trouble. The deepest shaft is 110 feet, and the work done proves that the rich parts will be found to run chiefly in shoots as at Swamp Oak.

4. *Prospects of the Fields.*

The deepest shafts on either field is only 125 feet, not a very grand record for 20 months work, but there has been sufficient exploitation done to enable the general characteristics of the veins to be studied. Attention is constantly being directed to the manner of veins which have been discovered on a lease, while inquiry elicits the fact that there has been no attempt to demonstrate the existence of a single payable shoot of stone. This surface style of mining has been disastrous to the progress of the district, and in a great measure is responsible for the present state of things. Speaking generally too of the character of the work done, it is evident that there has been a scarcity of experienced miners. In testing the veins there have been the usual mistakes made, and it cannot be too strongly insisted upon that, when gold is discovered, the shaft should follow not only the underlay of the vein, but also the run of gold. The evidence for the true-fissure nature of the veins is, I think, conclusive, and in one claim, viz., G.L. 3, Swamp Oak, the direction of the movement of the hanging-wall has been clearly to the north-west at about 45°. The latter feature is one of importance, and, taken in conjunction with the variable dip of the shoots already opened, warrants the expectation that the width will be variable, and wider shoots may subsequently be discovered. The richer gold-bearing quartz runs chiefly in shoots, which do not exceed 20 feet in width, and have a thickness averaging about 8 inches to

a foot, and running up to 3 feet. The distance the shoots are apart is very variable; in one case they overlap, and within half a mile a drive has been extended for 50 feet, without touching the next shoot. The shoots will run to a certain depth, and may then pinch; but, if the walls be followed, another shoot will be found to "make," and it is only by prospecting that the exact position of these lozenge-shaped deposits can be ascertained. The gold occurs in patches, and is not evenly distributed throughout the veinstone, so that it will be difficult for the crushings to be kept regular; in fact, much harm has resulted from several sensational crushings, for, immediately the average yield per ton has become known, there has been the inevitable reaction. The gold is present both free and in combination with arsenical pyrites (mispickel), and the percentage of the latter is likely to increase as the veins are followed down. At the present time, at Swamp Oak, there is about $1\frac{1}{2}$ per cent., and at Niangala up to 5 per cent. The free gold is fine, and coarse specks are the exception, but I think it could be readily saved by amalgamation, were it not for the mispickel which flours the mercury and entails a certain loss. The loss may be minimised by the adoption of short copper plates with drops, in place of the long plates generally in use, and by constant attention, so that the surfaces may be bright and free from film; but there is still the auriferous mispickel to be saved. Even under the most favourable conditions blankets cannot do what is required, and it becomes necessary to adopt some kind of concentrator. At Swamp Oak the Rising Moon battery consists of 10 stamps, 2 Wheeler and 1 Berdan pan, tables, and blankets. The Little Tichborne has 5 stamps, &c., and a shaking table; and Carter's has 5 stamps, tables, and blankets. At the present time, at Niangala, there is a 5-head stamp battery with tables and blankets; and the Tichborne battery has been sold to the Just-in-time Company, and is now being erected on the Company's property. I was unable to see the shaking table at work, but it is said to have given good results, the Wheeler's pans appeared to me to be run at too high a speed for the best returns. To save all the gold, doubtless chlorination after dry crushing must be resorted to, but in my opinion a Huntingdon mill, followed by short copper plates, and the concentrates saved on Frue Vanners will be found to meet present requirements; the concentrates might be bagged and sent to Sydney for treatment.

It has been demonstrated that payable gold exists, and the nature of the veins warrants, I think, the expenditure of capital to prove them at a depth, but it will only be by systematic prospecting that the establishment of a settled mining district will be accomplished. At present it cannot be looked upon in that light, and it remains for the miner to show that the erection of complete plants for saving all the gold is warranted. Unfortunately, it is not sufficient now-a-days for the quartz to contain payable gold to ensure that a mine will pay, and it cannot be gainsaid that it is an immense advantage for the management to be under local and interested directors, who are *bona fide* and experienced mining men.

In conclusion, I desire to express my thanks to the managers and owners of the various mines for the facilities afforded during my inspection, and in particular, to Messrs. Buckland and Delahunty for assistance kindly rendered.

I have, &c.,

GEO. A. STONJER,
Geological Surveyor.

The Government Geologist.

APPENDIX 4.

Progress Report by Mr. J. B. Jaquet, F.G.S., A.R.S.M., Geological Surveyor.

Geological Survey, New South Wales, Department of Mines,
Sydney, 5 February, 1893.

Sir,

I have the honor to hand you the following report of the work done by me during the year

1892:—

The commencement of the year found me still at Broken Hill, engaged in my geological survey of the district.

During the months of January, February, March, April, and the greater portion of May, I was chiefly occupied in making a careful examination of the Broken Hill lode as far as it has been exposed in the numerous workings carried out for its exploration and exploitation. I also was engaged upon my detailed geological map of the country in the immediate neighbourhood of Broken Hill.

From the 25th February until the 2nd March, I was engaged with yourself, chiefly in visiting the various Broken Hill Mines.

On the 28th March I made an examination of the Day Dream Silver-mine, in the Appolyon Valley, and reported on the application for aid from the prospecting vote to continue prospecting this mine.

During the period I was stationed at Broken Hill, in accordance with your instructions, I inspected the various deposits of platinum ore which have been discovered in this neighbourhood, and my report upon these deposits forms Appendix 4 C.

I left Broken Hill on the 24th May, and from that date until the 18th June was engaged examining the various mines and making a geological survey of the Euriovie and Tarrawingee districts.

On the 14th June, I left Broken Hill for the recently-discovered silver-field at Nuntherungie, distant from Broken Hill about 160 miles. During my visit to this silver-field, I made an examination of the Nil Desperandum Mine, and reported on an application for aid from the prospecting vote, made by the company working this mine. I also made a general examination of the whole silver-field, and the country lying between Nuntherungie and Kooningberry. My report on the Nuntherungie silver-field forms Appendix 4 A.

Arriving back in Broken Hill on the 4th July, I left again on the 6th July for Rockwell. From Rockwell I went on to Pinacles, and from Pinacles to Umberumberka, Thackaringa, Purnamoota, and Appolyon. In each of these districts I was occupied a few days inspecting the various mines and making a geological examination of the country around them.

On the 23rd August, I left Broken Hill for the White Cliffs opal-field, and was engaged in work on this field until the 3rd September, when I returned to Broken Hill. My report on the White Cliffs opal-field forms appendix.

During the remainder of September I was engaged in making a geological examination of the Waukeroo tin-field, and in completing my general geological survey.

Arriving back in Sydney on the 6th October, I was occupied during the remainder of this month in preparing geological maps of Broken Hill and the district.

During the months of November and December I was engaged in writing my reports on the Nuntherungie Silver-field, White Cliffs opal-field, and the Broken Hill platinum deposits. I also commenced writing my report on the geology of the Broken Hill lode and the surrounding country, and prepared various plans and sections illustrating this report.

I may mention that the geological map of Broken Hill is now ready for the printer, but some time must yet elapse before my report, which will be a very lengthy one, approaches completion.

I have, &c.,

JOHN B. JAQUET,

Geological Surveyor.

The Government Geologist.

APPENDIX 4A.

Minute.

It appears, from Mr. Geological Surveyor Jaquet's report, that important argentiferous lodes occur in palæozoic slates in the Nuntherungie field, but that prospecting for them is tedious on account of the overlying Post-Tertiary deposits which cover most of the western plains, and which prevent the lodes from being seen at the surface. The silver-bearing lodes contain chloride of silver in their upper portions and argentiferous galena at greater depths, and they appear to be free from zinc-blende or other substances likely to complicate smelting operations.

Mr. Jaquet is of opinion that these lodes will be found to occur over a large extent of country.

Notwithstanding that good returns have been obtained from the ore sent to Adelaide (*via* Wilcannia), very little work has been done even on the most promising lodes.

Copper lodes, which were prospected twenty years ago, also occur on the Nuntherungie field in beds of sandstone and quartzite interbedded with slates, but it is not likely that these could be profitably worked at present, in view of the low price of copper and the isolated position of the field.—E.F.P., 4/11/92. The Under Secretary for Mines and Agriculture.

Sir, Geological Survey Branch, Department of Mines, Sydney, 3 November, 1892.

In accordance with your instructions I have made an examination of the Nuntherungie Silver-field.

Nuntherungie Silver-field is situated on Nuntherungie Pastoral Holding, about 60 miles in a north-westerly direction from Wilcannia.

The occurrence of lodes containing copper in this neighbourhood has long been known, and more than twenty years ago several tons of copper ore, raised from shafts sunk near the western base of the Cootawundy Range, were sent down *via* Wilcannia to South Australia for treatment. Notwithstanding the high price of copper which was then prevailing, it was found that copper could not be raised at a profit—probably on account of the isolated position of the mines and the great expense of transporting the ore to the smelting works.

About three years ago, Mr. Lownes, residing at Nuntherungie Station, picked off the surface of the ground a small boulder of ironstone, which, on assay, yielded a considerable quantity of silver. This discovery gave impetus to a search for silver, and many prospectors from Broken Hill took up their residence upon the new field. In 1890 a great number of mineral leases were applied for, and in 1891 Nuntherungie was proclaimed a township.

The silver bearing country consists of indurated slates of Palæozoic age, striking north-west and south-east, and having an almost vertical dip. On the eastern boundary of the silver-field is the Cootawundy Range, made up of sandstones and quartzites apparently interbedded with the silver-bearing slates. The western and southern boundaries of the silver-field are formed by conglomerates, of Devonian age, which, lying almost horizontally on the edges of the slates, prevent any further exploration of these rocks for mineral deposits. To the northward the slates can be seen cropping up in places as far as Koningberry, distant 30 miles from the silver-field.

The slates found at Nuntherungie are without doubt a direct continuation of the more or less altered rocks occurring at Broken Hill. Like the Broken Hill rocks, they are intruded by two varieties of dyke, the one having an acidic and the other a basic composition. At Broken Hill the intrusive dykes consist of hornblende rock which passes in places into diorite, and coarsely crystalline granite. On the Nuntherungie silver-field dykes of hornblende rock and quartz felsite are met with, and in addition dykes of altered amygdaloidal basalt are found, which have no homologue among the intrusive rocks of Broken Hill. I shall describe more fully the Nuntherungie intrusive rocks, and the relations existing between them and those found at Broken Hill in my report on the geology of Broken Hill and the Barrier District.

The slates are greatly faulted and contorted, and I think it is to the movements which produced these contortions that the fissures, which probably preceded the metalliferous lodes, owe their origin.

A post-tertiary deposit, varying in thickness from a few inches to 15 feet, hides the slates from view, and it is only in a few places that they are to be seen cropping up at the surface. The presence of this recent deposit, hiding the silver-bearing rocks and the outcrops of lodes which are contained in them, makes prospecting much more difficult. It is only by a careful search on the surface for stones of silver ore, followed by deep trenching in the neighbourhood where such stones are found, that the field can be prospected. A great number of the prospectors who first arrived on the field, coming from the neighbourhood of Broken Hill, and having been previously accustomed to prospect the bare hillsides of that district, were soon discouraged by the more tedious operations necessary for success at Nuntherungie. There is a very large area of country in the north-west district of New South Wales, where the geological features are identical with those at Nuntherungie, and it is reasonable to suppose that metalliferous lodes exist in portions of this district. Now, if fresh mining fields are to be opened up in this area, it will only be by careful prospecting, carried out in the manner indicated above.

The silver-bearing lodes, which have at present been discovered at Nuntherungie, vary in thickness from 2 to 6 feet, and appear to run sometimes in a north-westerly direction with the country rock, and at other times almost at right angles to it; but owing to the contortions into which the slates have been thrown, and the little work at present carried out on the lodes, it is impossible to give precise information on this point. In all cases the lodes have an almost vertical underlay.

In the upper portions of the lodes the silver occurs as chloride (kerargyrite) and chlorobromide (emboelite), finally disseminated through a gangue of decomposing carbonate of iron (chalybite), and the lead as carbonate of lead (cerussite). This ore gives place below to argentiferous galena, associated with copper pyrites, chalybite, and calcite.

On

On Mineral Lease No. 77, worked by the "Nil Desperandum Silver-mining Company," five distinct lodes have been found. One of these lodes has been proved to a depth of 104 feet. At this depth the lode is 6 feet wide, its contents are very little oxidised, and a few pieces of ore which I took at random from the face were found on assay by Mr. Mingaye, F.C.S., to contain 46 oz. 1 dwt. of silver, and 7.37 per cent. of lead. Another lode has been proved to a depth of 50 feet, and some ore carrying a considerable quantity of silver chloride obtained from it. Two other lodes have been proved to a depth of 30 feet, and in one of them a small shoot of galena is to be seen, which I was told by the mine manager was very rich in silver. A mass of decomposing chalybite, about 6 feet wide, can be seen cropping out in places across this mineral lease, and evidently represents the outcrop of another lode. On the Mineral Leases numbered 76 and 104, also held by this company, the outcrops of two other lodes have been discovered in costeaning trenches. A parcel of ore which was raised from the shafts sunk on Mineral Lease 77, and weighed 4 tons 6 cwt., yielded on being smelted in South Australia 70 oz. of silver per ton, and 30 per cent. of lead. An assay of a small parcel of this ore, weighing 1 cwt. 6 qrs., which was sent down to the Department for exhibition at Chicago, yielded 62 oz. 14 dwt. of silver, and 8.6 per cent. of lead.

On mineral lease numbered 68, worked by the "Central Nuntherungie Silver-mining Company," a shaft has been sunk 30 feet on a lode 3 feet wide. From this shaft two drives, one of 23 feet in a westerly direction, and the other in an easterly direction of 16 feet, have been driven on the lode. Thirty-seven tons of ore have been stoped out of "the backs" of these levels, and sent down to Adelaide, where it was smelted. I am informed by the secretary of this company that this ore yielded on an average 87 oz. of silver and 47 per cent. of lead.

The lode at the end of each of these drives has split up into a number of thin veins, and at the time of my visit all available ore seemed to have been extracted. Another shaft about 30 feet deep has been sunk on this company's property on a lode having an average width of 18 inches.

The Great Nuntherungie Proprietary Silver-mining Company have sunk a shaft to a depth of 50 feet, on their property, but, at the time of my visit, no defined lode had been met with; some small but very rich isolated patches of ore had, however, been obtained. A sample, taken from a small parcel of ore weighing 2 qrs. 8 lb. sent down for exhibition at Chicago, was found by Mr. Mingaye to contain 204 oz. of silver per ton, and 38.6 per cent. of lead.

Small silver-bearing veins, and also boulders of silver ore, have been met with in costeaning trenches and shallow shafts sunk on other parts of the field.

Several lodes composed of quartz with copper carbonates and decomposing copper pyrites occur in the sandstones on the eastern side of the field. In some places small veins of copper pyrites have decomposed, and the copper carbonates resulting from their decomposition have been deposited in the interstices of the sandstone containing them, and this mass of copper-stained sandstone has been mistaken for the outcrop of a very broad copper-bearing lode. I do not think the copper lodes at present discovered could be worked at a profit, while the present low price of copper prevails.

It will be seen from my description that very little work has at present been done to find out the true value and nature of the Nuntherungie silver deposits, but I think the results hitherto obtained are highly encouraging. The average ore met with has been of a fairly high grade, and, being entirely free from all refractory substances, the silver and lead could easily be extracted from it. The field labours under two disadvantages. In the first place, the cost of carting ore to the River Darling at Wilcannia is very great; and in the second place, the average rainfall of the district is very small (about 9 inches), and before a company could commence mining operations on a large scale, it would be necessary to expend some capital in conserving water.

I have appended to this report a geological sketch section running across the centre of the silver-field.

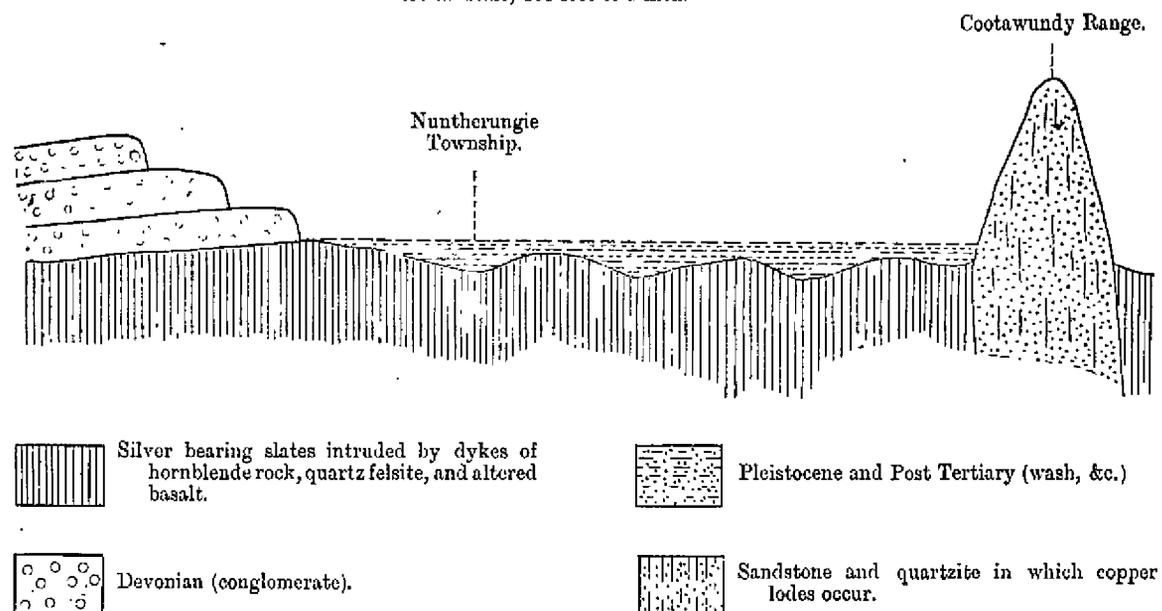

I have, &c.,

J. B. JAQUET,
Geological Surveyor.

The Government Geologist, Sydney.

Vertical scale, 100 feet to 1 inch.

APPENDIX 4B.

Minute.

MR. GEOLOGICAL SURVEYOR JAQUET'S report, which is now submitted, contains a considerable amount of interesting information in regard to the White Cliffs Opal Field, near Wilcannia, and is important as establishing the geological horizon of the rocks in which the opals occur. They appear to be of upper cretaceous age, and correspond to the well-known desert sandstone series of Queensland. The occurrence of water-worn boulders (full of typical Devonian fossils) in the kaolin beds, is of interest as showing whence these upper cretaceous beds were derived. I quite agree with Mr. Jaquet's opinion that similar deposits of opal are likely to be found over large areas of the north-western portion of New South Wales. I have lately had the opportunity of examining some rocks from Elsinora Station (beyond Wanaaring), 100 miles from White Cliffs, and these show a distinct tendency towards opalisation.

Moreover, it is probable that many deposits of opal are hidden from view by the superficial pleistocene and recent deposits.

There appears to be reason to hope that an extensive and profitable industry in opal-mining will be established in New South Wales.

The Under Secretary.

E.F.P., 30/12/92.

Sir,

Geological Branch, Department of Mines, Sydney, 18 November, 1892.

I have the honor to report that I have examined, according to your instructions, the "White Cliffs" opal field.

The "White Cliffs" Opal Field is situated in the county of Yungnulgra, on Momba Run, and near the boundary of Tarella and Momba Runs. It is distant about 65 miles in a north-north-westerly direction from Wilcannia.

In 1880 a kangaroo hunter, while tracking a wounded kangaroo, picked up a piece of precious opal, which displayed an unusual brilliancy of colour. This discovery on becoming known led to a more careful search being made on the surface, and several other pieces of opal were discovered. Trenching was next resorted to, and the discovery of opal *in situ* followed. In 1890 several mineral leases were applied for, and a steady output of opals has been kept up from this date until the present time.

The beds in which the opal is found are evidently identical with those occurring in Queensland, which were described by Mr. Daintree under the name of "Desert Sandstone." Mr. Daintree was of opinion that they were of tertiary age. He assigned this position to these rocks on account of their being stratigraphically conformable with beds of tertiary age, but unconformable with the cretaceous (Rolling Downs) formation. The subsequent discovery of fossils by Mr. Norman Taylor at Battle Camp, near Cooktown, Queensland, and by Mr. R. L. Jack, and others elsewhere, showed that they were closely allied to the cretaceous beds, and that the unconformity occurred during the cretaceous period dividing this formation into an upper and lower series.

Two wells on Tarella Station have penetrated the beds of clay, sandstone, &c., and entered the palaeozoic slate. I was enabled to examine the station records which had been kept during the sinking of these wells, and could get no information from them of any unconformity being met with between any strata. The slates were met with in these two wells mentioned at depths of 127 and 143 feet respectively. Having regard to these facts, and the character of the rock met with in the wells, I am led to think that the lower cretaceous (Rolling Downs) series has thinned out and not come so far south as "White Cliffs" in this longitude.

On the northern portion of Tarella Station, a well (Coondaroo) has been sunk to a depth of 383 feet without reaching the slates, and the last 100 feet was sunk through a very hard sandstone. It may be that the sandstones forming the lower portion of the upper cretaceous beds get thicker towards the north, or it is possible, in some places, these beds rest on the horizontal Devonian sandstones and conglomerates, and not on the older and upturned slates.

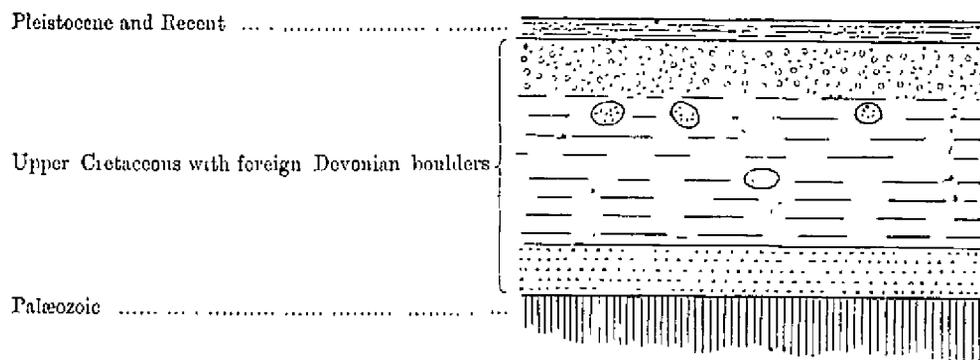

Mr. H. Y. L. Brown, now Government Geologist of South Australia, and formerly Geological Surveyor on the staff of the Mines Department of New South Wales, made an examination in 1881 of the upper cretaceous beds in the neighbourhood of Mount Poole, and reported as follows* :—"Resting on the soft cretaceous formation in outlying hills and tablelands, and in some cases covering it over large areas, is a series of kaolin, sandstone, grit and pebble conglomerate beds, capped by a layer of quartzite boulder conglomerate, having often a slight dip in various directions, but being generally horizontal. The pebble conglomerate is formed of large rounded boulders, and pebbles of a yellow or reddish colour, together with yellow flint, quartz, &c., porcelained in some way or other to an intense hardness, and bearing the appearance of having been fused. The total thickness, from the bottom of the kaolin and sandstone to the top of the quartzite, averages about 100 feet.

Opals have been obtained in many places from the upper cretaceous beds in Queensland. They occur here in the interior of siliceous ironstone nodules. The occurrence of nodules and veins of opal, the replacement of the remains of mollusca and other organisms by opal, and the deposition of opaline quartz in the interstices of the conglomerates belonging to this formation, and the foreign boulders of sandstone which are found in it, would seem to indicate that at some period the beds had siliceous waters passing through them. The presence of hydrous silica in various forms seems characteristic of these beds wherever they have been observed. I am of opinion, from a consideration of all these circumstances, that large deposits of precious opal exist in other portions of New South Wales where this same formation is present.

Ideal

*N.S.W. Par. pap. 1881, 427-A.

Ideal Geological Section at "White Cliffs."

The pleistocene and recent deposit overlying the cretaceous beds is absent in places, and very little prospecting for opals has been carried out where it occurs. This deposit has sometimes a thickness of 3 or 4 feet.

The beds of conglomerate, marked "B," consist of small pebbles, cemented together by a matrix of kaolin impregnated with opaline quartz. No hard and fast line can be drawn in many places between these conglomerate beds and the kaolin which is found below them. These beds are sometimes absent altogether, and in some places are seen in the walls of the tablelands to be 20 feet thick.

The beds marked "C" consist chiefly of kaolin, of various degrees of purity, and passing by insensible gradations into highly ferruginous clays. This kaolin is in some places quite loose, and can be easily removed by a pick and shovel, while in others its component particles seem densely packed or even cemented together, and blasting has to be resorted to in order to loosen it. The alternate soft and hard varieties of kaolin occur chiefly as bands parallel to the bedding planes, and the veins of opal, which I shall afterwards describe, frequently occur between bands of clay having different densities. Concretionary nodules, and more rarely, thin beds of gypsum are found in these kaolin beds. Beds of loose white and red sand are sometimes interstratified with the clays, and in some instances the particles of sand have become more or less consolidated, and a loose sandstone has been produced.

Peculiar nodules of a brown amorphous variety of silica occur in some places. They are in most cases found in definite bands extending over a very small area, but sometimes scattered through the kaolin in an erratic manner with no appearance of order. These nodules have some resemblance to the flints which are found in the cretaceous beds of Europe, and have been given this name by those who have previously observed them in other portions of the upper cretaceous beds of Australia. The fact of these flints being so characteristic of beds having the same chronological position both in Europe and Australia, gives them a special interest, and caused me to pay particular attention to them. I found they had approximately the same hardness and specific gravity as the opal, and on analysis by Mr. J. C. H. Mingay, F.C.S., Analyst, they yielded an even larger percentage of combined water than this latter mentioned mineral. When examined in thin sections under the microscope no traces of organic structure can be detected. I would suggest that these "flints" are simply common opal stained with oxide of iron.

Scattered in an erratic manner through the beds of clay and conglomerate, and lying on the surface of the ground, are enormous waterworn boulders of close-grained vitreous looking sandstone. Some of these boulders are impregnated with oxide of iron, and have in consequence a deep brown colour, while others are free from this substance. When broken in some cases thin veins of opal are seen ramifying through them, and their peculiar vitreous appearance is no doubt due to hydrous silica having been deposited in the interstices of the sandstone. I found in some of these boulders abundant impressions of characteristic Devonian mollusca and other invertebrates. These fossils have yet to be described in detail by Mr. R. Etheridge, jun., Palaeontologist to the Survey. The question will be asked, "Where did these boulders come from?" About 20 miles westward of the opal field there is a large elevated area of palaeozoic rocks. These rocks consist of two series, the one consisting of very old slates, having an almost vertical dip, and the other of conglomerates and sandstones, lying unconformably on the first series. I think the boulders have been derived from the conglomerates and sandstones.

These sandstones and conglomerates are found as outliers on the top of the older slates over a very large area of the north-western district of New South Wales. The late Government Geologist, Mr. C. S. Wilkinson, from observations of their stratigraphical position and lithological characters assumed them to be of Devonian age. The discovery of Devonian fossils at White Cliffs in boulders evidently derived from these sandstones and conglomerates proves the correctness of Mr. Wilkinson's assumption.

Mr. Charles Cullen, Fossil Collector, obtained at the time of my visit a few fossil mollusca and belemnites *in situ* in the kaolin beds.

The beds "D," which are situated immediately below the beds of kaolin, consist of grits and sandstones. One characteristic variety, which is quarried for building stone near Tarella Station where it outcrops at the surface, is highly ferruginous, of a loose texture, and has numerous angular fragments of quartz scattered through it.

The palaeozoic slates "E" are dark blue in colour, have been greatly contorted and faulted, and appeared similar in character to those which, as I have mentioned before, were to be seen outcropping about twenty miles westward of the opal field.

It is in the beds "B" and "C" of conglomerate and kaolin that the opal is found, and the chief workings are confined to places where the conglomerate beds are absent, and the kaolin is seen at the surface.

The opal occurs in the following forms:—

- (1.) In thin horizontal veins between the bedding planes of the kaolin.
- (2.) As irregular nodules scattered through the kaolin.
- (3.) As wood opal.
- (4.) As opaline shells and pseudomorphs, probably after gypsum.

1. The commercial variety is all obtained from these deposits.

The veins vary in thickness from $\frac{1}{4}$ inch to 3 inches, are never continuous over wide areas, and, as they invariably taper from their centre to their edges, they may be described as slightly lenticular in shape. When the miner has discovered one of these veins, by removing the rock which is above it, he follows it along and carefully examines all the opal he obtains from it. Sometimes a vein may consist entirely of opal displaying a brilliancy of colour, and otherwise suitable for commercial purposes, but more often it is composed of an inferior opal, only passing in places into the valuable variety. A shaft 50 feet deep has been sunk in the kaolin beds, and opal has been obtained from the bottom of this shaft. The opal can be more economically extracted from the veins near the surface, and, until the supply from these sources is exhausted, it is unlikely that the deeper deposits will be proved.

2. Most of the nodules consist of hyaline and other varieties of opal worthless as gems. A few nodules of precious opal are however obtained.

3. Opal wood, though of some interest scientifically, is of no commercial value. The substance of the wood has been entirely replaced by an opaque variety of opal, while in the cracks which probably existed before the opalization of the wood, a more brilliant variety has been deposited. In some cases the wood opal is found in the interior of sandstone boulders.

4. These are shells of mollusca, which have had their original substance replaced by opal. They are of rare occurrence, and possess some value as curios.

It is difficult to arrive at any exact method of determining the value of opal, especially before it is cut and polished.

The chief points which are taken into consideration are as follows:—

- (1.) Weight and form of the specimen.
- (2.) Relative freedom from flaws.
- (3.) Hardness.
- (4.) Display of colour which the specimen presents, when viewed by reflected light, falling on it at different angles.

1. The determination of weight is a simple matter and requires no comment.

2. This is an exceedingly difficult point to determine. In a large rough specimen, if it is full of flaws, it is only possible to obtain a number of small pieces of cut and polished opal from between these flaws. If the opal is cut before it is sold, to a great extent this difficulty is abolished.

3. On the hardness of the opal depends how long it will retain its fine surface after being cut and polished. Professor Dana* gives the hardness of opal as 5.5–6.5. The more "fiery" varieties are invariably softer than the common opal. The opal from White Cliffs has a hardness of 5.5–6.

4. Supposing all the other characters of opal were constant, this one would still make exact valuation of opal impossible. No two pieces of opal show the same play of colours, and the value to be assigned to any specimen entirely depends on the fancy of a particular individual.

Every description of opal can be obtained at White Cliffs, and a gradual passage can be observed from the most brilliant and valuable stones to those which are dull and opaque, and possess no intrinsic value. The opals from this field are particularly rich in the display of red fire, and selected specimens would probably compare favourably with any obtained from Hungary or Mexico.

The field at present supports a population of about twenty miners, who own and work the various claims. They sell the opals on the field to dealers who come from Sydney and Melbourne for the purpose of buying them and I understand considerable profits have been divided among the owners of the claims. There is probably an almost unlimited supply of opals in the kaolin beds, and the output could be largely increased if a good market were obtained for the gems. At present only small quantities are exported by the dealers to Europe, and no attempts have been made, so far as I am aware, to introduce these stones to the markets of America and other parts of the world.

An absurd superstition has overshadowed the opal in the past, and prevented this most beautiful gem from assuming its proper place in the public favour. This superstition is fast disappearing, and, with its disappearance, an increased demand for opals should be brought about.

I have to record my indebtedness to Mr. Edward Quinn, of Tarella Station, for the great assistance he gave me while carrying out my work.

I have, &c.

JOHN B. JAQUET,
Geological Surveyor.

The Government Geologist.

APPENDIX 4C.

Minute.

MR. JAQUET'S report is interesting from a scientific point of view, inasmuch as the platinum deposits which it describes differ in their mode of occurrence from any hitherto known.

He is of opinion that the masses of platiniferous ironstone (chiefly copper-stained) owe their origin to springs, which carried the iron, copper, and platinum in solution, and deposited them on the surface. These masses of ironstone appear to have no connection with lodes, but occur capping intrusive and sedimentary rocks alike. None of the deposits have been prospected to any great depth; and in none of the samples assayed was platinum found in sufficient quantity to pay for extraction. I observe that since the day of Mr. Jaquet's report the value of platinum has declined very considerably; so that unless very much richer ores than any of those hitherto met with be discovered, it is not likely that platinum mining will become one of the industries of the Barrier.

The Under-Secretary.

E.F.P., 30/12/92.

Sir,

Geological Survey, Department of Mines, Sydney, 5 December, 1892.

I have the honor to report that, in accordance with your instructions, I have visited the various deposits of platinum which occur in the neighbourhood of Broken Hill.

During the year 1889 Mr. T. B. Belgrave, M.D., of Broken Hill, sent some samples of ore obtained from the Parish of Tara to the Mines Department, in order that they might be assayed for silver and lead.

* "A System of Mineralogy," by J. D. Dana.

lead. These samples were assayed by Mr. J. C. H. Mingaye, F.C.S., &c., Analyst to the Mines Department. While engaged in assaying the ores, certain unusual reactions were observed, which caused Mr. Mingaye to suspect the presence of platinum, and he accordingly made a careful examination for this metal.

Mr. Mingaye, in his Progress Report for the Year 1889, says, in reference to these samples, as follows:—

*“Platinum was detected *in situ* in small quantities in three minerals obtained from the Broken Hill District. The samples yielded, on assay, as follows:—

No. 1911 (ochreous felspathic lodestuff)—Platinum, 1 oz. 9 dwt. 9 gr. per ton.

No. 1912 (compact ferruginous claystone)—Platinum, 6 dwt. 12 gr. per ton.

No. 1913 (ferruginous felspathic rock, with green carbonate of copper)—Platinum, a strong trace (under 5 dwt. per ton).

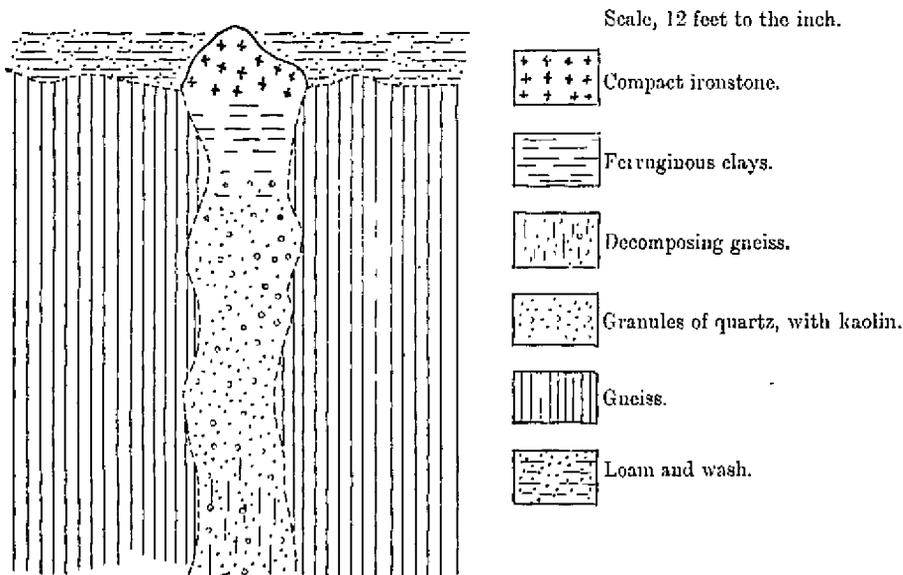

“The platinum occurs associated with the metals which usually accompany it in a very fine disseminated state through the lode-bearing material, so fine that I doubt if it could be extracted by concentration and after treatment. The quantity present in the samples is too small to pay to profitably extract.”

I have no doubt that ore carrying a small quantity of platinum could be obtained over a very wide area of the Barrier District; but hitherto prospecting for this metal has been confined to two localities. One is situated near Little Darling Creek, in the Parish of Tara, and the other at Mulga Springs, in the Parish of Moorkaic. Mulga Springs are distant 7 miles in a north-easterly direction from Little Darling Creek.

The country at both localities consists of schists, gneisses, quartzites, &c., representing highly altered sedimentary rocks, probably of Lower Silurian age. These rocks are intruded by dykes and small bosses of a very basic diorite and by granite, while 6 miles south of Little Darling Creek a boss of serpentine occurs. In order to discuss the exact nature of these rocks, and the relations which they bear to one another, reference would have to be made to their occurrence over the whole Barrier District and it is not necessary to do this to describe the platinum deposits under consideration.

Scattered over the country are superficial masses of ironstone, generally more or less impregnated with carbonate of copper, but sometimes free from this substance. Sometimes these masses have a regular trend for a short distance, and have been described as the gossanous outcrops of lodes, but more often they are quite irregular, and I have never seen any deposit that could be continuously traced over a wide area. They are found capping altered sedimentary and intrusive rocks alike, and no definite law seems to govern their distribution, but in a number of cases they occur at the junction of a compact rock with one of looser texture. It is in these deposits of ironstone, and the more or less decomposed rock underneath them, that the platinum occurs. All the superficial deposits of ironstone do not contain platinum, and no difference can be detected in the appearance of those ironstones in which this metal is present and those in which it is absent. Occasionally the ironstone is seen cropping up at the surface, but it is generally covered by shallow pleistocene and recent deposits, and trenching is necessary to discover it.

Ideal Section of Platinum Deposit.

The ironstone cap passes by insensible gradations into ferruginous clays below, and these clays into granules of silica, cemented together with kaolin, or into a compact kaolin. The siliceous kaolin passes into a decomposing felspathic rock, which may be either gneiss or a portion of granitic dyke. Defined walls never occur, the platinum-bearing ore gradually passing into the rocks containing it. It would appear from the assays that the clays and kaolin contain a larger amount of platinum than the ironstone.

At Little Darling Creek, on what is known as Dr. Belgrave's claims, a shaft has been sunk to a depth of 20 feet on a platiniferous deposit, which is about 7 feet thick, and dips slightly N.N.W. The ironstone clays, &c., appeared to pass below into a decomposing gneiss. It was from this shaft that the ore first analysed by Mr. Mingaye, and that subsequently concentrated under the direction of the Department,

Department, was obtained. Several other deposits, which occur approximately in an E.N.E. line with this one, have been assumed to be a continuation of the same lode; but I think this is not the case, and it is simply a coincidence that they occupy this position. In every direction small isolated patches of ore have been met with in small shafts and costeaning trenches in this neighbourhood.

On the Broken Hill Proprietary Platinum Co.'s property some very large masses of copper-stained ironstone, which carries platinum, are to be seen. Very little work has been done to prove these deposits, and hence I am unable to give an exact account of their dimensions, &c. A specimen of ironstone, which I selected at random, yielded on assay by Mr. Mingaye, platinum 5 dwt. and silver 1 oz. 16 dwt. per ton, and a trace of gold.

Platinum was first discovered at Mulga Springs in some cupriferous ironstone which was being worked for copper on Mineral Lease No. 74. Subsequent trenching has shown this mineral lease, and those which are situated around it, to have a large number of detached masses of ironstone upon them. A shaft, or, more strictly speaking, an inclined drive (for it is inclined at an angle of 28°, and bears with the deposit), has been put down at one place to a depth of 70 feet. The cupriferous ironstone cap here is about 3 feet thick, and the remainder of the drive is sunk through a rock consisting of fragments of quartz loosely cemented together with kaolin, and passing in places into masses of felspar only slightly kaolinised. A piece of decomposing felspathic rock, which I obtained from this drive at the time of my visit, yielded platinoid metals, 7 dwt.; gold, 4 dwt. per ton; and a trace of silver. Another shaft, 13 feet deep, has been sunk on a mass of ore occurring on the side of a dioritic dyke. A piece of ferruginous clay which I took from this shaft yielded platinum 5 dwt. per ton and traces of gold and silver.

On Warburton's claim a mass of decomposing gneiss, carrying a considerable quantity of copper carbonates, has been worked. No defined walls are to be seen, and the copper-bearing rock gradually passes into the ordinary country. Thin veins, and irregular patches of ironstone and quartz are met with in some places in the deposit, and I picked out some pieces of ore which had small fragments of gold attached to them. Some ore which I took from this claim yielded platinum, a trace (under 1 dwt. per ton); gold, a trace; silver, a trace; and copper, 15.75 per cent.

Hancey's claim is situated a little way off the track between Mulga Springs and "Mount Gipps Hotel." A mass of granite has in places been superficially replaced by ironstone, and this ironstone, and the slightly altered felspar in contact with it, contains a trace of platinum, gold, and silver.

Having noticed a similarity in the appearance of altered portions of a granitic dyke passing through Mineral Lease 5, Parish of Naradin, to the ore carrying platinum, I took two samples from it and had them assayed. One sample contained a trace of platinum, and silver at the rate of 6 dwt. 12 grs. per ton, and the other contained traces of gold and silver.

Some ironstone obtained from the Parish of Sebastopol, where it occurs as a contact deposit between serpentine and gneiss, I was told had been found to contain platinum; but the samples which I took from this deposit yielded no platinum when assayed by Mr. Mingaye.

I also took samples from other reported finds of platinum ore, but in no instance, other than those mentioned above, was this metal found to be present.

Two attempts at concentrating this ore were made under the direction of the Department at the Clyde Works, and the results obtained were very discouraging.

*A parcel of ore weighing 1 ton 1 cwt. was "dry crushed," and an average sample yielded—platinum, 1 dwt. 15 gr. per ton. The crushed ore was then concentrated by means of Frue vanners until its weight was reduced to 26 lb., and these concentrates only yielded at the rate of 9 dwt. 18 gr. of platinum per ton. Another parcel of ore weighing 17 cwt. 2 qr. was "wet crushed" in a Huntingdon mill, and concentrated until its weight was reduced to 66 lb. This 66 lb. of concentrates yielded on assay at the rate of—platinum, 16 dwt. 7 gr. per ton. Mr. Mingaye found by qualitative analysis the concentrates to contain, in addition to platinum, iridium and osmium, the elements lead, zinc, antimony, arsenic, gold, silver, bismuth (a trace), iron, lime, magnesia, and two acids—sulphuric and carbonic.

The platinum deposits in the Broken Hill District differ from any previously discovered. Owing to this circumstance, and certain general peculiarities in the mode of occurrence of platinum and its allied metals, they possess a considerable amount of scientific interest.

All the commercial platinum has hitherto been obtained from alluvial deposits where it is found in the form of small but well defined grains, scattered through gravels, &c., over wide areas. In no respects do the Broken Hill deposits resemble these alluvial ones.

Authentic instances of platinum occurring in lodes are rare. Mr. J. A. Phillips mentions—"That small grains of platinum are said to have been occasionally observed in the auriferous quartz of the Beresovsk mines." Messrs. F. W. Clarke and C. Catlett reported in 1889—"That they had found as much as 2.55 oz. of platinum per ton in some samples of nickel ore obtained from the Sudbury Mines in Ontario, Canada. In the case of the Broken Hill deposits, when the copper-stained ironstone cap and the clays immediately below it are penetrated, no traces of copper pyrites or other iron and copper ores are to be seen, and so the cap is not a gossan representing the oxidised portion of ore beneath. Again the platinum bearing rock has most irregular boundaries, and nothing like defined walls are ever present. These circumstances, I think, are sufficient to show there is no analogy between these deposits and metalliferous lodes.

After a consideration of all the circumstances connected with these platinum deposits, I am of opinion that they owe their origin to springs, which issued at some period from the earth in their neighbourhood. The iron, copper, platinum, and small quantities of other metals found in these deposits were probably originally carried by these springs in solution. The iron and copper were precipitated from these springs when they reached the surface, and were brought under the oxidising influence of the atmosphere, but the platinum seems to have been partially absorbed by the kaolin, and only a portion of it reached the surface.

In

* Annual Report Department of Mines New South Wales, 1891, p. 276. J. C. H. Mingaye, F.C.S., on Platinum-bearing Minerals at Broken Hill. † A treatise on Ore Deposits, by J. A. Phillips, F.R.S. ‡ American J. Sci., xxi. vii, 372-374.

In no instance have these deposits been proved more than a few feet from the surface, and so nothing is known as to whether the spring waters only parted with their platinum to kaolinised rocks comparatively near the surface, or whether rocks impregnated with platinum extend to great depths.

The spring waters may have derived their platinum during a long journey through the rocks containing the deposits, or they may have brought this metal from some deep-seated source. In speculating as to the probable origin of the platinum, it is interesting to note that the number of metals which I have previously mentioned Mr. Mingaye found in concentrates of this ore, are identical with those commonly occurring in the metalliferous lodes and other ore deposits in the neighbourhood. The gneisses, diorites, &c., have a considerable quantity of pyrites disseminated through them, and the iron and copper in the spring waters were probably derived from this source. The late Rev. W. B. Clarke has given it as his opinion that the deposits of iron found in this Colony at Mittagong have been deposited from springs which originally held this metal in solution.*

Notwithstanding the present high price of platinum, owing to the small amount of this metal in the ores, and the failure of attempts to concentrate it, I am of opinion that these deposits could not be worked at a profit. Spring waters generally pursue a most erratic path to the surface, and so even if the platinum bearing rock did extend to a great depth, a great expense would have to be incurred in order to follow it.

I have, &c.,
JOHN B. JAQUET,
Geological Surveyor.

The Government Geologist.

APPENDIX 5.

Progress Report by Mr. J. E. Carne, F.G.S., Geological Surveyor.

Geological Survey Branch,

Department of Mines and Agriculture, 16 January, 1893.

Sir,

I have the honor to make the following report upon the work performed by me and under my supervision during the year 1892; also to hand you herewith for incorporation in the Annual Report of the Under Secretary, an analytical statement of the results of treatment of samples in the laboratory during the same period. The total number of tests for each metal and mineral is stated, together with particulars of the nature, yields, and localities of the samples giving the best returns.

A falling off, as compared with the previous year, is noticeable in the total number of specimens submitted to the laboratory. The amount of analytical work, however, has increased. The following figures will show the number of separate tests and analyses made of the 3,570 samples treated under the supervision of Mr. J. C. H. Mingaye, F.I.C., F.C.S., Analyst and Assayer:—

Separate Tests.		Complete and partial Analyses.	
Gold	3,147	Coal	68
Silver	3,156	Shale	36
Lead	81	Coke	24
Copper	74	Iron	56
Tin	81	Limestone	2
Antimony	20	Water	23
Zinc	8	Miscellaneous	43
Manganese	23		
Cobalt and Nickel	19	Total	252
Tungsten	24		
Mercury	12		
Platinum	64		
Bismuth	25		
Chromium	36		
Total	6,770		

During the year considerable interest has been manifested in the platiniferous beach sands on the North Coast, between the Richmond and the Tweed. For a number of years beach-washing for gold has been carried on in this locality, especially after south-easterly gales. During operations—which have been conducted with very primitive appliances—a small quantity of platinum has been obtained from time to time on the blanketings. The beach-sand consists chiefly of coloured and colourless zircons, titanite iron, quartz, and tin oxide, with traces of gold and platinum. In its natural condition, save, perhaps, in small pockets concentrated by the waves, the proportions of the valuable metals is extremely small. Both the gold and platinum occur in very minute thin plates, capable of floating when presented with the flat, dry surface to the water.

It is to be regretted that misleading reports (which are so damaging to enterprise) as to the richness of the sand as it occurs on the beach have frequently been made, the results of assays of concentrated samples being quoted as representing the value of the unconcentrated material. Whilst it is highly probable that these sands may yet be profitably worked by means of efficient classifying and concentrating machinery, as indicated by the results obtained from hand-concentrated samples, it is but right to state that in no instance have any properly-selected samples of the sand in its natural condition yielded more than traces of the valuable metals.

Owing to the fineness of the platinum and gold particles, it is absolutely necessary that classification should precede any attempt at concentration, because of the equal weight of the larger particles of the titanite iron and zircon. An attempt to concentrate without classification by means of the Frue vanner was not successful. I quote here the specific gravities of the components of the sand, for the purpose of showing the possibilities of concentration:—

Quartz	2.6
Zircon	4. - 4.7
Titanite iron	4.5 - 5.
Tin oxide	6.4 - 7.
Platinum	16. - 19.
Gold	15. - 19.3

From

* Rec. Geol. Sur. N.S.W., Vol. 1, Pt. 2: The Mineral Resources of New South Wales; by J. E. Carne, F.G.S.

From these figures it will be seen that there is a clear difference of 2 between the gravity of the heaviest waste material and that of the lightest valuable metal present—viz., tin oxide. For the information of investigators, I would also state that the concentrated tin oxide presents a resinous, brownish-yellow colour, the black material being titanite iron, which is of no value.

Concentrating experiments are at the present time being carried on by different persons interested. Very good results, so far as concentration is concerned, have been obtained by Mr. Robert Young, of Old Parramatta Road, Sydney, with a model of a classifier and concentrator which he has invented and patented. I have not had an opportunity of inspecting this model, but if the capacity and economy of the machine is equal to the concentrating success of the model, more should be heard of it.

A sample concentrated by Mr. Young, but which, unfortunately, does not represent any definite weight of material operated upon, yielded, in the Department of Mines Laboratory, the following returns per ton of concentrates:—

Gold, 79 oz. 2 dwt. 1 gr. per ton.
Tin, 26.08 per cent.

Other samples submitted by different persons have yielded from a few dwt. to several hundred ounces of platinum, and up to 4 oz. of gold per ton of concentrates, and metallic tin up to 38 per cent.

Prospecting Board.

During the year I attended the meetings of the Prospecting Board at frequent intervals; and, in connection with the distribution of the prospecting vote, inspected sites, and reported upon applications for aid, in the following localities:—Tarana, Oberon, Rockley, Tuena, Trunkey, Newbridge, Blayney, Manduramah, Gally Swamp, Woodstock, Scrubby Rush, Mount McDonald, Cowra, Koorawatha, Uralla, Kookabookra, and Bear Hill.

Seven bulk tests were made at the Clyde Smelting and Chlorination Works by direction of the Prospecting Board, six of which were supervised by my assistant, Mr. Whittle, and one by Mr. Geological-Surveyor Stonier. Following are the names of the parties for whom the tests were made:—

	ton	cwt.	qr.	lb.
1. Bourke and Party, Scrubby Rush.....	1	19	2	20
2. J. Lambert, Sugarloaf, Newbridge	1	19	1	7
3. P. Foley, Campbell's River, near Oberon	1	17	2	0
4. Bouffler and Party, Condobolin	2	1	2	6
5. Timmins and Party, Gundagai	5	0	0	0
6. G. W. Thompson, Borah Creek	3	17	3	21
7. J. Weingarth, Kempsey	5	0	0	0

Geological Survey.

In September I was appointed to the position of Geological Surveyor, and shortly afterwards, in accordance with your instructions, proceeded to the Gundagai district and inspected and reported upon the occurrence of chromite in the neighbourhood of Coolac and Mount Lightning. Later on I visited the deposit of marble limestone at Cow Flat, in the Bathurst District, for the purpose of reporting as to the suitability of a portion of the outcrop on Mr. Barrett's property for marble cutting, in view of the proposal to establish this industry in connection with the Bathurst Gaol.

On Mr. Barrett's property lime-burning had been carried on for many years, but was abandoned about four years since. It is, however, still being carried on in the adjoining property, Mr. Bell's.

During the lime-burning operations first mentioned, the well known contractor, Mr. John Young, obtained from the excavations thus made the marble from which the white tiles used in the flooring of the Great Hall in the Sydney University were prepared. The marble is fairly white in colour, and of good quality for polishing purposes. Quarrying operations, however, have not progressed sufficiently far enough to allow of solid blocks being obtained free from surface cracks and weathering.

Whilst engaged on work connected with the Prospecting Board earlier in the year, I noted the occurrence of a handsome black and white oncrinital marble on the Briar Park Estate, near Rockley. With the exception of a few blocks procured for a monument in the Bathurst cemetery, erected to the memory of the late owner of the property, Mr. Brownlow, sen., this property has not been opened. In character and quality it very closely approaches the Moonbi marble, near Tamworth, but differs in colour, the latter being red and white.

In connection with alienation of land within gold-fields, I inspected certain portions in the New-bridge, Young, and Grenfell districts.

Exhibitions.

Early in the year the mineral exhibits displayed by the Department at the Launceston Exhibition, under the superintendence of Mr. T. Ford, were returned to Sydney.

In February I was selected by the Honorable the Minister for Mines and Agriculture to undertake, on behalf of the Department and the New South Wales Commission, the necessary work in connection with the collection and preparation of an adequate representation of the mineral resources of the Colony at the forthcoming World's Columbian Exhibition at Chicago; also to accompany the exhibits and arrange them in the mineral section, and to remain in responsible charge during the currency of the Exhibition.

In the furtherance of the first portion of this work the major portion of my time has been occupied. In the supervision of the packing and labelling of exhibits I have had the able assistance of Mr. Ford, the Commission having appointed him to act as my assistant both here and in America.

The exhibits returned from the late London Mining Exhibition formed an excellent nucleus to work upon, and notwithstanding the depression which has recently prevailed in mining matters, owing to the low price of silver and copper and the labour troubles at Broken Hill, a very fair addition has been made to the exhibits mentioned. The display of the mineral wealth of the Colony at Chicago will, I believe, eclipse any previous representation.

The number of packages for the mineral section which have been despatched to date amounts to 2,357, of an approximate weight of 286 tons.

From some of the principal mines yielding ores of a refractory character, which have hitherto baffled ordinary treatment, large bulk samples have been procured, the object being to have sufficient in hand to practically test any new processes or machinery which may be available in the machinery section of the Exhibition.

Mining

Mining and Geological Museum.

With regard to the Mining and Geological Museum, little of a satisfactory nature can be recorded, the temporary iron building in which the specimens are displayed is yearly becoming more unsuitable, and the risk of destruction of the contents correspondingly greater also. Neither rain nor dust can be excluded. I venture to hope that my successor's advent to office as Curator will be signalled by the erection of a more commodious and suitable building.

During the year small economic collections of minerals were shown at Pastoral and Agricultural Shows, under the care of the Assistant Collector, Mr. Allen, at Tamworth, Dungog, Muswellbrook, Bathurst, Junee, and Bowral. Collections were also prepared for the following institutions and individuals:—

School of Arts, Hillgrove.
 School of Arts, Molong.
 School of Arts, Wyndham.
 Public School, Marrickville.
 The School, Mount Victoria.
 St. Vincent's Girls' High School, Darlinghurst.
 Newington College, Staunmore.
 Mechanics' Institute, Deniliquin.
 Municipal Council Chambers, Hillgrove.
 Pastoral and Agricultural Association, Tamworth.
 Manager, Bulli Colliery (Exchange).
 Manager, Australian Broken Hill Consols (Exchange).
 J. Dall, New Zealand (Exchange).
 J. J. Peadow, for lecture purposes, United Kingdom.
 J. W. Shepherd, for lecture purposes, United Kingdom.
 J. F. Small, junr., Bowraville.
 H. Herrenschildt, Sydney.
 Lady's College, Mount Victoria.
 C. H. Pennypacker, West Chester, United States (Exchange).
 Mons. Piquié, Gouverneur par Interim, Noumea New Caledonia.

Attached is a list of the donations of minerals to the Museum: the donations of fossils will be noted by the Palæontologist.

In relinquishing the position of Curator I desire to express my sincere thanks to the officers who have worked under my supervision for the hearty co-operation and assistance at all times cheerfully rendered during my term of office, and to express a hope that the cordial relations which have existed between us, will continue between them and my successor Mr. G. W. Card, F.G.S., &c.

My special thanks are due to my Assistants Messrs. Whittell and Morrison, who have been most regular and exact in the performance of their duties, especially in connection with the important work relating to assays and correspondence.

I have, &c.,

JOSEPH E. CARNE, F.G.S.,
 Geological Surveyor.

DONATIONS to the Mining and Geological Museum.

Donor.	Description.	Locality.
Mr. J. B. Nicholson, M.P.	Ochre	Woonona.
Mr. C. Arbouine	Tin ore	Gundle.
Mr. L. W. Lee	Iron ore with chloride of silver and carbonate of lead	Nil Desperandum Nuntherungi.
Mr. J. Williams	Marble, limestone, serpentine, and quartz crystals with inclusions of chlorite.	Moonbi District.
Mr. T. Beedle	Marble and serpentine	Moonbi.
Mr. H. T. Gordon	Auriferous quartz	8 miles from Nerriga.
Mr. C. G. Freeman	Cinnabar	Nakety, New Caledonia.
Mr. G. I. Rivers	Sulphides of zinc and copper with gold	"The Lady Jersey Claim," Long Creek Gully.
"	Sulphides of zinc, copper, and iron, with gold in quartz.	" "
"	Sulphides of copper, and zinc in quartz	" "
"	Sulphides of zinc, copper, and iron, with gold in quartz	" "
Mr. C. H. Kerry	Specimens of crystallised zinc blende and galena	Spring Creek, Bungonia.
Mr. N. Leoni	Auriferous quartz	Victory Mine, Mogo.
"	"	" "
"	Gold-bearing quartz	Bimbimbi Creek, Mogo.
Mr. N. Borchardt	Cassiterite in steatite	New Emerald Proprietary Emerald Mine, Wellington Vale, 14 miles from Vegetable Creek.
Mr. C. H. F. Albert	Stibnite	Aurora Mine, Jumpup, New England.
Mr. J. E. Kelly	Auriferous quartz	Peak Hill.
Dr. Storer	Artificial sulphide of tin	Pymont Tin Smelting Works.
Mr. G. Smith	Fine woolly stibnite	Baker's Creek Gold and Antimony Mine.
Mr. E. Tindale	Pipeclay	Barragan, near Mudgee.
Mr. C. Haviland	Tinnfeldia	Mount Piddington, near Mount Victoria.
Mr. H. S. Molineaux	Auriferous quartz	Joker Reef, Niangala.

"	"	Morning Star, "
"	"	Bungador Gold Mine, Niangala.

APPENDIX 5A.

Geological Survey Branch, Department of Mines,

Sir,

Sydney, 18 February, 1890.

I have the honor to report, that in accordance with your instructions, I inspected the principal known iron deposits, adjacent to the railway lines, in the neighbourhood of Lithgow, Newbridge, Blayney, and Lyndhurst, for the purpose of collecting all available evidence on which to base an opinion as to their permanency as sources of supply for smelting operations.

In

In several instances I have given an approximate estimate of the quantities which would be available under certain conditions, but in the absence of any definite proof of the latter, which can only be obtained by prospecting, such estimates cannot be other than very approximate and arbitrary.

At Lithgow, which I visited first, I ascertained from the Manager of the Eskbank Iron Works, Mr. Sandford, particulars of the localities from which ores were obtained during the smelting operations at the above works some years since. Through his courtesy also, I was enabled to learn from some of his operatives, who took part in the production as well as the smelting of the ores at the time mentioned, that the supply obtained from the immediate neighbourhood was very limited, the deposits being patchy and of poor quality; my own observations, as far as I was enabled to extend them, confirmed this statement.

The so-called "clayband iron ore" of the vicinity occurs as thin bands in the coal-measures, and in one instance under my notice, in the shale in the Hawkesbury series.

On the Eskbank Iron Company's property a good deal of trenching was done on thin bands cropping out on the slopes of the range; the trenches have since fallen in, but judging from the ore left on the surface, it was of very poor quality.

During 1883, two new bands were reported as being discovered on this property, the Collector Mr. Cullen, was despatched to obtain samples for examination. One sample of a concretionary nature gave a return equal to 33.1 per cent. of metallic iron, but the other two which form the bulk of the bands, proved to be clay shales impregnated to a small extent with ferric oxide. The analyses were as follows:—

	(1.)	(2.)	(3.)
Loss on ignition	8.47	5.10	5.30
Silica	37.80	66.80	63.43
Alumina	5.89	19.84	24.55
Oxide of iron (Fe ₂ O ₃)	46.11	7.53	6.02
Traces of Magnesia, Phosphoric acid, Alkalies, &c.	1.73	0.73	0.70
	100.00	100.00	100.00

On the opposite side of the railway line, at the Lithgow Pottery Works, a band of the clayband ore is exposed in the excavations for pottery clay; it varies from 6 to 10 inches in thickness, with an overburden of from 10 feet to 30 feet, which will rapidly thicken as the hill is penetrated. The ore, if such it can be called, is of very low grade, and in the heaps rejected by the pottery works, it is rapidly crumbling to powder, just as the shale does, under atmospheric exposure.

The so-called "clayband iron ores" are simply shales with a varying percentage of ferric and ferrous oxides. In places where the shale has become thoroughly impregnated with the iron salts an economic iron ore is obtainable.

Where the bands are compact the precipitation of the iron may have been due to the organic matter of the plant remains, which are abundant in the shale. In other instances, from the pseudo-concretionary character assumed by the ore, it is evidently due to infiltration of the iron salts into joints and shrinkage cracks, resulting in a thin film of ferric oxide from $\frac{1}{4}$ to $\frac{1}{2}$ of an inch in thickness, with a kernel of ochreous or shaly material. In both instances the iron was, most probably, originally combined with carbonic acid, and afterwards reduced to ferric and ferrous oxides by exposure consequent upon denudation.

At about 1 mile from Bowenfels, at the back of Portion 46, a band of ironstone, about 1 foot in thickness, occurs in the shales just overlying a bold escarpment of Hawkesbury sandstone. It was driven upon by means of a small tunnel for about 25 feet, but thinned out. A good deal of trenching was also done at this spot. I was informed that about 600 tons of ore were obtained from here, which exhausted the supply.

As the ironstone bands described occur throughout the coal-measures in this and the neighbouring districts, it is quite possible that a considerable quantity could be raised by small parties by means of shallow pits and trenches at the base and on the slopes of the ranges, but it is very evident from the thinness and poor quality of the bands that it would not pay to open up extensive excavations on an outcrop, even if it were persistent over any considerable area, which is not generally the case.

In the event of the renewal of smelting operations in this locality, the clayband ores of the coal-measures may have a value for mixing with the richer magnetic and ferric oxides of the Blayney and other districts, which will probably require the admixture of argillaceous ores for fluxing purposes, but by themselves they are of little value as sources of metallic iron.

Having ascertained that the principal supplies of iron ores during the smelting operations at Lithgow were drawn from the Blayney district and from Newbridge, I proceeded to the former place as being most centrally situated for carrying on the work of examination.

A considerable quantity of brown iron ore was raised from the hills in the immediate neighbourhood of Blayney by means of small pits and trenches, which are now nearly filled with soil, but, from appearance and report, there is reason to believe that the deposits partook of a lumpy character, and were not extensive, being, in part, more or less, exhausted during operations. I was given to understand that a large quantity of ore was taken from the cap of what is now the Blayney or Annandale Coppermine, but that the presence of copper in the later supplies rendered the ore unworkable. It is probable that a limited supply could yet be obtained in small quantities by trenching across the hills in the vicinity.

It is, however, on Cowrigan or Brown's Creek, about $5\frac{1}{2}$ miles west of Blayney, that the most important deposits of iron ore exist. Close to the creek, and within a distance of about 2 miles, four deposits occur, amongst them being the magnetic oxide in Portion 7, Parish Errol, County Bathurst, the property of Mr. H. Glasson. Its character is denoted by the following analysis:—

Moisture, loss on ignition	0.13
Silica, &c. (insoluble in acids)	6.50
Alumina	14.22
Oxide of iron { Fe ₂ O ₃	60.48 } *
{ FeO	18.67 }
Trace of phosphoric acid

100.00

* Equal to 56.85 per cent. of metallic iron.

A quantity of this ore was despatched to Lithgow, the excavation made in winning exposes a solid face of about 20 feet by 25 feet, which, at the lowest level, is very compact. This opening was made on small outcrop on the brow of a hill falling into Sugarloaf Creek on the east, about 1 chain from the boundary of portion 7, at a point about $1\frac{1}{2}$ chains south of the south-west corner of portion 8. On the western slope of the hill falling into Brown's Creek at a distance of about 10 chains in a line bearing about west 20 degrees south, the ore again crops out under the soil with a width of about $1\frac{1}{2}$ chains of clean ore; small excavations reveal its presence for about $1\frac{1}{2}$ chains further to the westward. Between the excavations first mentioned, and the outcrop on the west, no trace of the ore is visible, but from the occurrence at the former spot in close proximity to the iron ore, of a chalcedonic quartz reef, which crops out alongside of it, also on the west, and from there strikes north 85 degrees west in the direction of the Brown's Creek Gold-mine, with a well-defined outcrop, it appears probable that the iron ore is associated with the fissure represented by the reef, in which case it may persist between the points of outcrop in more or less lenticular bunches; this however, and its vertical extent, can only be proved by prospecting, whether in the latter case it will descend to any considerable depth unaltered, or pass into pyrites, as to some extent indicated by the occurrence of pyrites in the quartz reef, which it appears to accompany.

The country rock is diorite and may possibly have been the source of the iron ore. If the ore can be taken as persistent between the points mentioned, with an average width of 1 chain, each foot in depth would yield about 6,047 tons of ore, at 40 feet which is a very reasonable estimate (at the excavation) the amount available would be 242,691 tons equal to 175,741 tons of metallic iron.

On Portions 3 and 4, Parish Errol, on the end of a low ridge falling into Brown's Creek, at a point directly opposite Brown's Creek Gold-mine, a quantity of ore was raised for the Lithgow smelter; but from the prospecting on this ridge for the continuation of the auriferous deposit in the above mine, it seems very evident that no extensive or regular deposit of iron ore exists, for amidst the small pits and cuttings made in obtaining the iron ore, are several shafts—one to a depth of 160 feet—without any appearance of ironstone. The ore evidently occurs in bunches in the diorite. Between the ridge mentioned and the north-west corner of Portion 7, a number of small excavations have been made for the ore. A considerable quantity may yet be obtainable in this locality in small patches, but as a source of regular supply it does not seem to be of much importance.

About $1\frac{1}{2}$ miles higher up the creek in Portions 28 and 29, Parish Calvert, the property of Mr. M. B. Gilkrest, occurs an outcrop of brown iron ore on a low rise near the creek. The ore has been exposed in small pits and cuttings—made in obtaining ore for Lithgow—over an area of about 4 or 5 acres, but from the shallowness of these openings it is practically untested.

Judging from the openings the ore appears to extend in an east and west direction for about 10 chains, and varying for about 6 chains of this distance from 2 to 3 chains in width; but being heavily soiled and grassed the exact area could not be ascertained. It is probable, however, that prospecting operations will prove this deposit to be more in the form of a lenticular bunch than a lode. The ore in places is very rich, a good average sample yielded the following results on analysis:—

Moisture at 100° C.	1.02	
Combined water	10.74	
Iron peroxide (Fe ₂ O ₃)	72.36	= 50.65 per cent.
„ protoxide (Fe O)	nil	of metallic
Manganese protoxide	trace	iron.
Silica	10.20	
Alumina	3.94	
Lime.....	1.35	
Magnesia.....	0.86	
Phosphoric anhydride ..	nil	
Sulphur trioxide	„	
Carbonic acid	„	
		100.47

Specific gravity, 3.602.

Close by on the north in portion 28 another small elevation occurs in an alluvial flat, on which boulders of ironstone can be seen; there is every probability of it representing the cap of another deposit.

On the south side of the main deposit the same character of chalcedonic quartz occurs as that connected with the magnetic iron and the auriferous lode lower down the creek, which, taken in conjunction with the iron ore, indicates thermal spring action.

In the bed of the creek, a few feet from the iron ore, limestone occurs, through which the waters of the creek evidently have a channel, for I was informed by Mr Gilkrest that the surface water sinks about half a mile higher up, and does not reappear for some distance below the spot referred to.

Taking the ore exposed by the pits and trenches as 10 chains in length, and an average width of 1 chain, with a depth of 50 feet, which is reasonable in view of the ore exposed near the creek level, a quantity of ore equal to about 218,772 tons would be available, but if the surmise as to the bunchy character of the deposit be proved correct by prospecting, this estimate would probably be considerably increased.

On the opposite side of the creek, and directly facing the northern boundary of Portion 28, on A. Clement's property, another deposit of brown iron ore occurs, very similar to that on Portions 28 and 29; from it a considerable quantity of ore was despatched to Lithgow. It was extracted by means of small pits and openings into the slope of the hill. A shaft was sunk near the iron ore to a depth of about 35 feet, which bottomed on limestone; it seems, probable, however, that the ore extends for some distance into the hill. The area over which iron ore has been exposed, including the excavations, is, roughly speaking, about 5 acres.

The occurrence of the iron ore, associated with the limestone in this and the above portions, renders it extremely probable that a good supply will be found available, occupying cavities in the latter.

In portion 13, parish of Walli, county of Bathurst, near the Cliefden Homestead on Limestone Creek, about 4 miles from the Myalla Siding, on the Blayney-Cowra Railway Line, a large lode of brown iron ore crops out in limestone for about 30 chains, with a width of from 1 to 3 chains. No openings whatever have been made on the outcrop. Its occurrence in limestone may be regarded as a favourable indication

indication of its permanency, providing that it does not prove to be the cap of a copper lode, as indicated by the occurrence of a strong trace of that metal in the average sample selected for analysis:—

Moisture at 100° C	43
Combined water.....	11.15
Iron peroxide.....	82.95*
Iron protoxide	trace
Manganese protoxide08
Copper.....	strong trace
Silica	2.45
Alumina	2.10
Lime.....	.34
Magnesia.....	nil
Phosphoric anhydride	"
Sulphur trioxide	"
Carbonic acid	"
	99.50
Specific gravity	3.993

* Equal to 53.06 per cent. of metallic iron.

If a depth of 30 feet can be assumed without the copper present in the ore increasing to such an extent as to cause cold-shortness in the iron produced from it, and taking the average width of the lode as 1 chain, which is considerably under the mark, the amount available to the above depth would be about 623,169 tons.

The deposit of iron ore at Newbridge is situated on reserve 15 for railway purposes, at about $\frac{1}{4}$ of a mile from the railway-station. It occurs on the northern end of a low ridge of micaceous schist, and consists of brown iron ore of good quality, as may be seen from the accompanying analysis of a fair sample:—

Moisture at 100° C.....	2.83
Combined water.....	10.10
Iron peroxide.....	79.76*
Iron protoxide	trace
Manganese protoxide	"
Silica	2.72
Alumina	3.62
Lime.....	nil
Magnesia.....	.54
Phosphoric anhydride	nil
Sulphur trioxide	"
Carbonic acid	"
	99.57
Specific gravity	3.625

* Equal to 55.34 per cent. of metallic iron.

A large quantity of this ore was sent to the Lithgow smelter, in the raising of which an excavation was made on the outcrop for about 1 chain, with a width of from 25 to 30 feet, and a depth of about 20 feet. The schist walls, which are well defined, dip slightly to the east. In the face of the cutting the ore exposed shows a thickness of about 10 feet near the surface by about 20 feet at the bottom. It has the appearance of pinching in the direction of the strike. At about $1\frac{1}{2}$ chains from the cutting on the line of strike a shallow trench has been cut without revealing the cap of the lode. About six chains further south a shaft is being sunk by G. Hayton in the schist; at a depth of 37 feet iron ore is making in the shaft, but in what quantity remains to be proved by the prospecting operations now being carried on. I understand it is the intention of the prospector to sink 100 feet, and then drive east and west; a good estimate of the extent of the deposit will thus be gained, whereas at present it is impossible to form even a reasonably approximate estimate. At $4\frac{1}{2}$ chains further south from the shaft, the Great Western Railway line crosses the ridge, but in the cutting, the bottom of which was on a lower level than the bottom of the shaft at the time of my visit, no sign of the lode was visible.

The lode can, however, be traced some distance to the north; first in the bed of the creek a few chains from the cutting, but here it is very narrow; again at about 20 and 22 chains small openings have been made revealing ore of rather ochreous character, the face being from 6 to 10 feet wide. I understand from the Chief Inspector of Mines, Mr. W. H. J. Slee, F.G.S., that the lode or fissure can be traced for about 3 or 4 miles towards the Dry Diggings, but that no important outcrops are visible. To the south, on Noble Wilson's property, about three-quarters of a mile from where the railway line crosses the ridge, I inspected a small opening from which ore had been taken, but here it was of a very siliceous character, being accompanied and closely associated with chalcidonic quartz. I was informed, however, by Mr. Wilson, whom I met just before leaving Newbridge, that a short distance further south another and larger excavation had been made on a good outcrop. Being unable to obtain a guide, I missed the latter.

The Newbridge deposit appears to be an abnormal thickening in a lode or fissure which strikes across the country for several miles. A further examination may possibly reveal the occurrence of other similar bunchy deposits. I was informed that the greatest depth attained in the cutting was between 30 and 35 feet, at which level the ore was very solid; but to what depth it will continue unaltered, or whether it will pass into pyrites at the water-level, can only be proved by sinking.

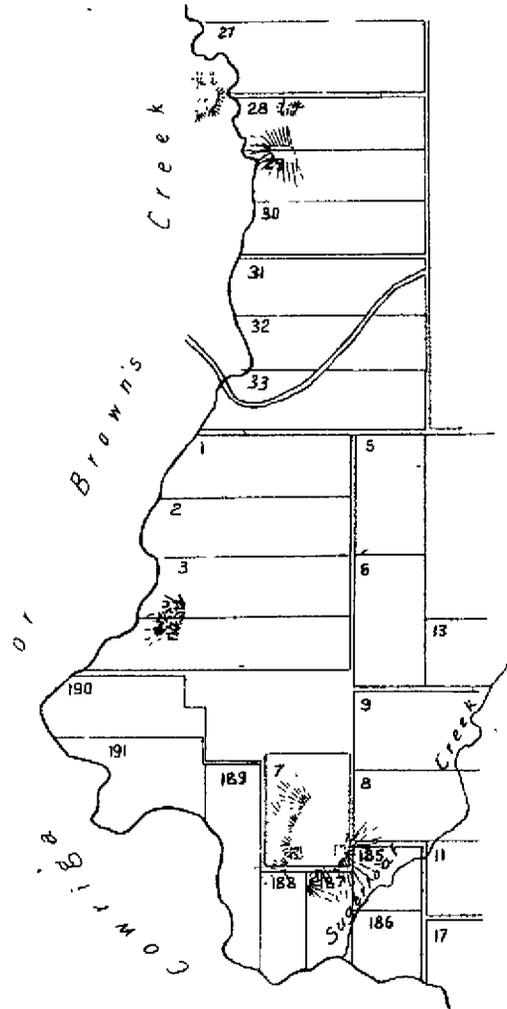

I have, &c.,

JOSEPH E. CARNE,
Curator.

The Geological Surveyor-in-Charge.

APPENDIX 5B.

REPORT on the Chrome Iron Ore deposits near Coolac, in the Parish of Gobarralong, County Harden and Darbalara, County Buccleugh.

Sir,

I have the honor to report that, in accordance with your instructions, I have inspected the chrome iron ore deposits near Coolac in the Gundagai district.

Coolac is situated on the Cootamundra to Gundagai branch railway line, about 12 miles from the latter town and 276 miles from Sydney.

The nearest chrome deposit lies about 4 miles north-easterly from Coolac, and is at present held as a mineral permit (M.L. 201) of 35 acres, on a conditional lease of 177½ acres, taken up by the executors of the late James Crowe.

M.L. 201 is situated on the Mooney Mooney Range which traverses the Parish of Gobarralong in a north-westerly and south-easterly direction. The range is formed of a belt of serpentine and peridotite, with occasional outcrops of an apparently felsitic rock not yet fully determined. Near Coolac a parallel ridge was crossed, formed of nearly vertical slate of probably Silurian age.

The second group of chrome deposits occurs about 5 miles south-easterly from the first-mentioned, and on the northern fall of Mount Lightning, in the Parish of Darbalara, County Buccleugh. The Mooney Mooney Range is cut through by the Murrumbidgee River about 18 miles above Gundagai; and Mount Lightning forms the commencement of the extension of the same range on the south side of the river.

On M.L. 201, locally known as Wright's Mine, which was the first examined, a little prospecting has been done, consisting of a cutting about 28 feet long and 10 feet deep (about 12 feet of the length being in ore), and the partial removal of the surface soil from the chrome bunches.

The main pocket or lenticular bunch of chrome occurs on the eastern slope of the range, at about 85 feet from its crest. Its greatest length is about 63 feet and the greatest breadth 12 feet. The longest axis of the bunch lies in a north and south direction. The surface soil has been removed from the southern portion of the deposit for a distance of about 23 feet, and a cutting at right angles to its length penetrates it at this point; the cutting is about 10 feet deep and 4 feet wide at the bottom. A small opening has been made at the northern end of the ore bunch, where it has a width of about 5 feet. Between the cutting and this opening, a distance of about 40 feet, the soil which covers the deposit has not been removed. At the bottom of the cutting the ore is as solid as at the surface.

From measurements taken in four places where the soil had been removed, the average width of the main bunch may be taken as about 7 feet and the length at 63 feet. Taking the specific gravity of the ore at 4.3, this deposit should yield about 52½ tons for every foot of sinking, or about 525 tons to the level of the bottom of the present cutting, viz., 10 feet. This depth could probably be doubled, thus showing an available supply equal to 1,050 tons.

As to the actual depth at which the ore in this deposit may exist, it would be very unwise, in the total absence of any vertical prospecting (other than the 10 feet cutting) or of natural sections, to hazard an opinion, especially in view of the proved irregular and bunched character of chrome deposits wherever they are worked. It is possible that the vertical extension may prove equal to half the exposed horizontal, in which case the supply would be equal to about 1,650 tons. This assumption is based on the supposition that the deposit was originally a lens-shaped bunch, from which the upper half had been removed by denudation and weathering.

Though experience has proved that chrome ore deposits are most likely to pinch out at comparatively shallow depths, yet the probability is that other bunches will make at lower levels. Hence it will be very necessary for prospecting operations to be carried on concurrently with the actual winning of the ore.

About 2 chains further down the eastern slope, and about 25 feet below the level of the main deposit A, bunches B and C occur. They lie about 22 feet apart, and very probably are connected below the intervening soil-covered surface. Fifteen feet south of C a small opening has been made, about 8 feet long and 2 feet deep, revealing about 3 feet of ore, which is probably also connected with the bunches B and C.

A few feet west of these outcrops three shallow shafts, from 4 to 6 feet deep, have been sunk without touching any extension of the ore body in that direction. Assuming that the ore is continuous between the three places mentioned—a distance of about 45 feet—and taking the average width as 5 feet, this deposit should yield about 26½ tons for every foot of sinking. Estimating, as before, a vertical extension of the deposit equal to half the horizontal, the available supply of ore in this bunch (if continuous between the points mentioned) would be about 600 tons. These estimates must perforce be on assumption.

For a distance of about 5 chains below the last-mentioned deposits loose blocks of ore have rolled down the gentle slope to the east. A road has been lately surveyed from the chrome deposits for a distance of 3 miles to the main Coolac to Jugiong Road, which it joins at a point about 2 miles from the former place. The distance of carriage by team would therefore be 5 miles, 2 of which being on a macadamised road and 3 over good travelling ground in fair weather. The ore deposits being situated on a gentle slope, teams can load direct at the workings.

The following analyses of average samples, selected by myself by carefully breaking portions from all over the exposed bunches, were made by Mr. J. C. H. Mingay, F.C.S., Analyst and Assayer to the Department of Mines:—

1. From Main Bunch A.—Chromite, yielding sesquioxide of chromium 47.68 per cent.
2. From Bunch (?) B and C.—Chromite, yielding sesquioxide of chromium 48.00 „

A selected sample, assayed in the departmental laboratory for Mr. Wright, yielded 52 per cent. of sesquioxide of chromium.

Though it is stated that the standard of marketable chrome has been lowered to 45 per cent. of sesquioxide of chromium, yet it is probable that ore yielding less than 47 per cent. is not in much request. The best quotations I have been able to ascertain for 50 per cent. ore is £3 12s. per ton in London, with an addition or reduction of 2s. 6d. per unit over or under that amount. The American quotation for a year's production equals £2 13s. 4d. per ton.

Taking the English price as a basis for calculation, and adopting 48 per cent. as the average yield of the ore, the chrome from the deposits would be worth £3 7s. per ton in London.

Against this amount must be placed the cost of mining and carriage to market. The local rates for carriage by team amount, so I am informed, to 1s. per ton per mile; the railway carriage rates for crude ores from Coolac to Sydney depend to a certain extent upon the amount of ore dispatched; but based upon an estimate of 20 truckloads of 6 tons each per week, the rate would be 12s. 6d. per ton.

From inquiries made of several of the leading shipping firms in Sydney, the freight of chrome during the wool season would range from 2s. 6d. to 5s. per ton to London by sailing ships; at other times it would rise to 10s. per ton. The wool season lasts about four months. If large quantities of ore came forward it is not unlikely that an all round freight of about 7s. per ton could be arranged.

The items to be debited against the value of the ore in London can therefore be summarized as follows:—

	£	s.	d.	
Mining and ore bags.....	0	7	6	per ton.
Carriage by team to Coolac.....	0	5	0	„
Carriage by rail to Sydney.....	0	12	6	„
Railway terminus to ship, &c.....	0	2	6	„
Freight to England.....	0	7	0	„
Total.....	£1	14	6	„
Value of ore in London.....	3	7	0	„
Balance.....	1	12	6	„

Though the known deposits of chrome ore in this property are confined to those mentioned, it is not improbable that a little trenching on the eastern slope, and at right angles to the trend of the range, may reveal other bunches which are at present covered with an overburden of surface soil.

The second group of chrome deposits examined occurs, as before stated, on the south side of the Murrumbidgee River, about 5 miles south-easterly from Wright's Mine, and 6 miles from Coolac.

With the exception of two small bunches (B and C), the chrome occurs in John Quilter's 320 acres of purchased land fronting the above river, in the Parish of Durbalara, County of Buccleugh. The two bunches above-mentioned occur just outside the eastern boundary of the 320 acres. Bunches A, B, C, and E crop out at a considerable elevation on the northern fall of Mount Lightning; D and F crop out on the undulating country lying between the mountain and the river.

The north-eastern spur of the mountain consists of peridotite, and the western of serpentine and serpentinous schist with a belt of the felsitic rock before-mentioned.

Ascending the mountain towards the south-east corner of the 320 acres, loose, slipped boulders of ore are seen on the surface at frequent intervals, until bunch A is reached at an elevation of about 500 ft. above the river. The chrome here crops out several feet above the ground on the fall side. The average superficial measurement equals about 26 ft. by 12 ft. As no prospecting has been done—the surface soil not even being removed—the exposed surface only can be taken into consideration.

Bunch B is situated a few chains about south 20° east from A. It consists of a small deposit just showing above the soil, and measuring about 13 ft. by 5 ft. The surface of the bunch is much broken, and it may be that it is not a solid mass.

About 2½ chains south 20° west from B is another small bunch C, measuring about 5 ft. by 4 ft., probably a loose boulder, though no ore could be seen above this on this spur of the mountain. These bunches of ore are all close to the eastern boundary of the 320 acres.

The remaining bunch on the mountain was discovered by Mr. Quilter and myself during my visit. Loose boulders of ore were traced up the side of the mountain at about midway between the eastern and western spurs. At about the same elevation as the deposit B, and near the top of the range, a large outcrop of ore was met with. Above this no sign of ore could be seen. This deposit (E) consists of a rugged outcrop measuring about 25 feet wide at the upper or south end, and extending down the range for about 80 feet, with an average width of about 25 feet. It is probable that at least half of the outcrop may be taken as solid ore, and the other as a talus of broken and slipped blocks. The solid portion has either a dip or a cant to the north-east at a high angle.

Bunches D and F occur as before stated in the gently-sloping ground between the base of the range and the river. D has a superficial measurement of about 36 ft. by 8 ft., and F about 25 ft. by 6 ft. A large number of loose blocks of ore are to be seen cropping out in the soil and amongst the boulders of serpentine for some distance below the ore bunches.

With the exception of two small openings about 2 feet deep made in the latter, there is a total absence of prospecting in connection with this group of chrome deposits. The surface soil and loose boulders of ore and country rock have not been removed. Estimating the true form or dimensions of the several deposits is therefore extremely difficult, if not impossible, as far as approximate accuracy is concerned. Before anything like just estimates can be formed the outcrops must be exposed, and a certain amount of vertical prospecting performed.

The following average measurements and estimates may serve as a guide, but being based upon inadequate data can only be regarded as very approximate:—

Bunch A.....	26 ft. x 12 ft. =	37 $\frac{1}{10}$	tons per foot of sinking.
„ B.....	13 ft. x 5 ft. =	7 $\frac{1}{10}$	„ „
„ C.....	5 ft. x 4 ft. =	1 $\frac{1}{5}$	„ „
„ D.....	36 ft. x 8 ft. =	34 $\frac{1}{5}$	„ „
„ E.....	40 ft. x 25 ft. =	119	„ „
„ F.....	25 ft. x 6 ft. =	22 $\frac{1}{10}$	„ „
Total.....		221	

Assuming

Assuming a vertical extension equal to half the greatest horizontal, the following figures will give some idea of the supply available:—

A	482 tons.
B	49 "
C	2 "
D	614 "
E	2,380 "
F	276 "
	<hr/>
	3,803 "
Ore on surface at E, averaging 2 ft. over 80 x 25	476 "
	100 loose boulders.
	<hr/>
Total	4,379 tons.

It is not improbable that deposit E will continue to a greater depth than that assumed, and also prove of greater superficial measurement, but until some prospecting has been done, no arbitrary level or measurement can be determined, especially as before-mentioned in the case of chrome iron ore, which is characterised by its irregular bunchy occurrence.

In connection with the cost of winning and the carriage of this ore to market, the estimates made in the former case (Wright's) stand good in this also, subject, however, to the additional charge of 1s. per ton for carriage to Coolac, and the extra cost of getting the ore down the range to the river (about $\frac{1}{4}$ mile), and of punting it across.

Probably these extra items of expense will raise the cost of conveying the ore to rail to 10s. per ton. The total cost therefore of placing it on the London market would not be less than about £2 per ton.

The quality of the chromite may be judged from the following assays made by Mr. Mingaye of samples selected from four of the deposits by breaking portions from all over the exposed surfaces of the bunches:—

Bunch A, sesquioxide of chromium	45.09 per cent.
„ B and C „ „	52.10 "
„ E „ „	47.46 "

Bunches D and F appear to be of lower grade owing to the admixture of serpentinous material, but there is no doubt that at least two-thirds of the ore in each could be rendered marketable by judicious sorting. Leaving B and C out of the question as being too small to be taken into consideration, the following estimates may be formed, based upon the quality of the ore in A and E. Taking into consideration the relative estimated amount of ore in each deposit, these should yield about 46.75 per cent. of sesquioxide of chromium, which, at the English price before quoted (£3 12s. per ton), would be worth about £3 3s. 10d. per ton on the London market. Deducting £2 per ton for cost of placing it in London, there would be an estimated balance of £1 3s. 10d. per ton.

As regards the yields and values of the ores in both groups of deposits, it must be borne in mind that they are based upon assays of samples selected from the outcrops; it would therefore be advisable for a trial shipment of one or two hundred tons to be made before any large outlay is incurred.

Presence of Chrome in New South Wales.

In addition to the deposits just described, chrome iron ore exists in quantity in the Clarence River District, on Gordon Brook and Yugalbah Runs. Those on Gordon Brook were reported upon by Mr. Geological-Surveyor David. (Annual Report Department of Mines N. S. Wales, 1890, p. 218.) It occurs also in quantity near Nundle, on the Peel River, mentioned by the late Government Geologist, Mr. C. S. Wilkinson (Annual Report Department of Mines N. S. Wales, 1885, p. 135), and also by Professor Liversidge in his "Minerals of New South Wales," p. 106. It is believed also to occur near Barraba and Bingera in the New England District. Samples have been submitted to the Department of Mines, for examination and assay, from other localities within the Colony, but no inspection has yet been made of the ore *in situ*.

In view of the fact that considerable uncertainty exists locally regarding chromite, I venture to add a brief description of this mineral, its character and composition, mode of occurrence, and uses.

Character and Composition.—Colour, between iron-black and brownish-black; lustre, submetallic; streak-brown; fracture, uneven; brittle; hardness, 5.5; specific gravity, 4.321 to 4.498; composition oxide of chromium, 68; oxide of iron, 32; = 100. (Dana's Mineralogy.)

Occurrence.—Chromite usually occurs in pockets or lenticular bunches in serpentine and ultrabasic rocks.

Uses.—Chromite yields compounds which are largely used in the arts as pigments. Perhaps the best known of these are the following:—

Chrome green—Used in porcelain painting, and as an ingredient in green glass and enamel.

Chrome red—Used in calico printing, and in the arts generally.

Chrome yellow—Used in the arts generally.

From the great infusibility of chromite it has been found suitable for lining the sides of open hearth furnaces. According to Stahl, furnace-lining of good quality has recently been made with chromite and thin layers of dolomite (magnesian limestone).

In the Journal of the Iron and Steel Institute 1890, No. 2, it is stated that at the Tamaris Works, Siemens-Martin Iron-furnaces are lined with blocks of chromite built in with a mortar formed of two parts of the ore with one part of pure lime. The molten metal in the furnace is stated not to remove chromium from the lining; neither has the silica in siliceous pig any action upon it.

The chief use of chromite, however, is probably for the production of chrome steel. Sir F. A. Abel, in his presidential address before the British Association for the Advancement of Science, Leeds, 1890, stated that "Chrome-steel has for some time been a formidable rival of the very highest qualities of carbon-steel produced for cutting tools, and of the valuable tungsten-steel. The great hardness, high tenacity, and exceeding closeness of structure possessed by suitably tempered steel containing not more than from 1 to 1.5 per cent. of chromium and from 0.8 to 1 per cent. of carbon, renders this material invaluable

---	---	---	---	---	---	---	---	---	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----

invaluable for war-purposes; cast projectiles, when suitably tempered, have penetrated compound steel and iron plates over 9 inches in thickness, such as are used upon armoured ships of war, without even sustaining an important change of form."

The presence of a small percentage of chromium in gun-metal is also likely to prove beneficial. Chromium is also used in the production of first quality steel rails for railway purposes.

Steel with 1 to 1.5 per cent. of carbon and from 2.5 to 4 per cent. of chromium is stated to be so hard that it cannot be worked with the ordinary hardened tools, and consequently has been called into requisition for the construction of burglar-proof safes; for this purpose it is welded and rolled with iron plates.

For some time the difficulty and cost of reducing chromium from chromite, owing to its extreme infusibility, greatly retarded its extended use; but this has been overcome through the discovery by a German Engineer—Mr. H. Eckhardt—that its fusibility was greatly increased by the presence of manganese; and for the purpose of reduction he used the acid manganese slag from the Bessemer Process, which acts as a solvent, and adding to it additional manganese if required.

I have, &c.,

JOSEPH E. CARNE, F.G.S.,
Geological Surveyor.

APPENDIX 6.

Report by Professor T. W. E. David, B.A., F.G.S., on Kerosene Shale Deposits, Doughboy Hollow, near Murrurundi.

Sir,

14 December, 1892.

Having inspected some of the principal deposits of kerosene shale in the neighbourhood of Doughboy Hollow, I have the honor to report as follows:—

The deposit of Kerosene Shale is distant three and a half miles north-easterly from the Doughboy Hollow Railway Station, and a trifle over three miles, measured in a straight line, from the railway at the nearest point. Doughboy Hollow is distant 224 miles northerly from Sydney and 122 miles northerly from the port of Newcastle.

The country between the Doughboy Hollow Railway Station and the principal outcrops of the Kerosene Shale is rocky and somewhat broken, being traversed by numerous small creeks separated from one another by steep narrow ridges.

From the railway station to near "Temi," the residence of Mr. R. Huddle, the rocks seen are chiefly basalts, porphyrites, and tuffs, the first being perhaps of tertiary age, and the two last probably belonging to the lower beds of the Permo-Carboniferous System, in the upper beds of which system the deposits of kerosene shale occur.

Near "Temi" the sedimentary rocks of the Permo-Carboniferous are represented by hard pobbly sandstones and grits, with much volcanic material intermixed, so as to render the rock tuffaceous; fine-grained marly claystones traversed by thin vertical veins of calcite half an inch in thickness, and some beautifully laminated very fine-grained felsitic beds, perhaps fine indurated tuffs.

These last have a persistent dip in a direction N. 35°, E. at 10° to 11°.

At one and a half miles north-easterly from "Temi" the principal patch of Kerosene Shale is met with, and at about half a mile south-east from the southern extremity of the main patch a very small outlier of Kerosene Shale has been discovered in the middle of portion 74, Parish of Temi, County of Buckland. A glance at the map shows that this small outlier was probably at one time united with the main patch, but has subsequently been isolated from it by denudation, for a prolongation of the longest axis of the main patch passes almost directly through this outlier.

The level at this outlier is about 2,550 feet above the sea, the railway at Doughboy Hollow being 2,070 feet above the sea.

The Kerosene Shale at this outlier has been so much denuded that it is questionable, in my opinion, whether any of the shale now observable there is actually *in situ*. If it be so, however, it cannot have an extent of more than a few square yards, so that the quantity of shale contained in it may be considered negligible.

The following is the result of an analysis made by Mr. J. C. H. Mingaye, F.C.S., Assayer and Analyst to the Department of Mines, from a piece of Kerosene Shale selected by me from this outlier in portion 74:—

Moisture	1.28
Volatile hydrocarbons	73.21
Fixed carbon	8.09
Ash	17.42
	100.00
Percentage of sulphur in shale	0.81
Specific gravity of shale	1.134
Shale caked slightly in heating in closed crucible.	
Ash—white, granular.	

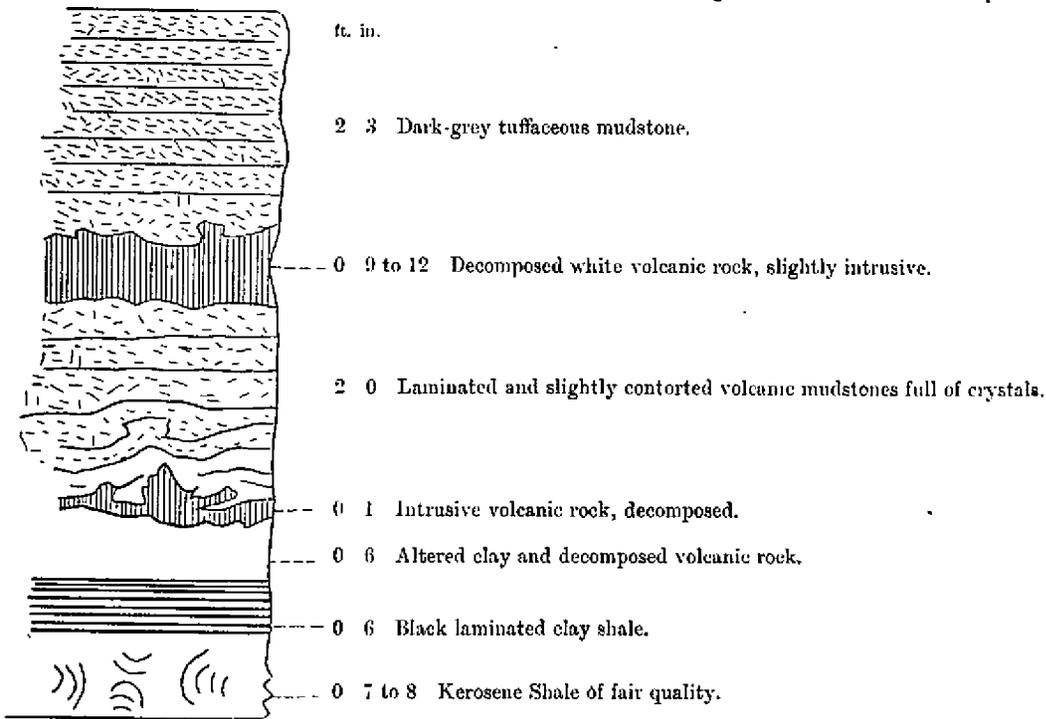

As far as can be judged from the loose outcrop specimens, the shale here is not more than about 3 or 4 inches in thickness. Some vesicular basalt outcrops close to the Kerosene Shale, but their mutual relation is not determinable.

The main patch of shale may be now described, together with the chief workings and exploratory shafts or tunnels, and the diamond-drill bore, the south-east extremity of the patch being taken first in order.

At the spot marked as Harper's Tunnel in portion 83, a tunnel has been driven in a direction about N. 3° E., for a distance of 128 yards, there being a dip, according to my aneroid levels, of about 25 feet from the outcrop of the kerosene shale at the mouth of the tunnel to the "face" of the same seam at the end of the tunnel.

At the mouth of the tunnel a thickness of several feet of dark-grey tuffaceous mudstone is observable forming the roof over the seam, and higher up the slope of the hill this is capped by basalt.

At 12 yards in from the mouth of the tunnel the following section was measured by me:—

At 58 yards from the mouth of the tunnel a drive extends west for a length of about 53 feet.

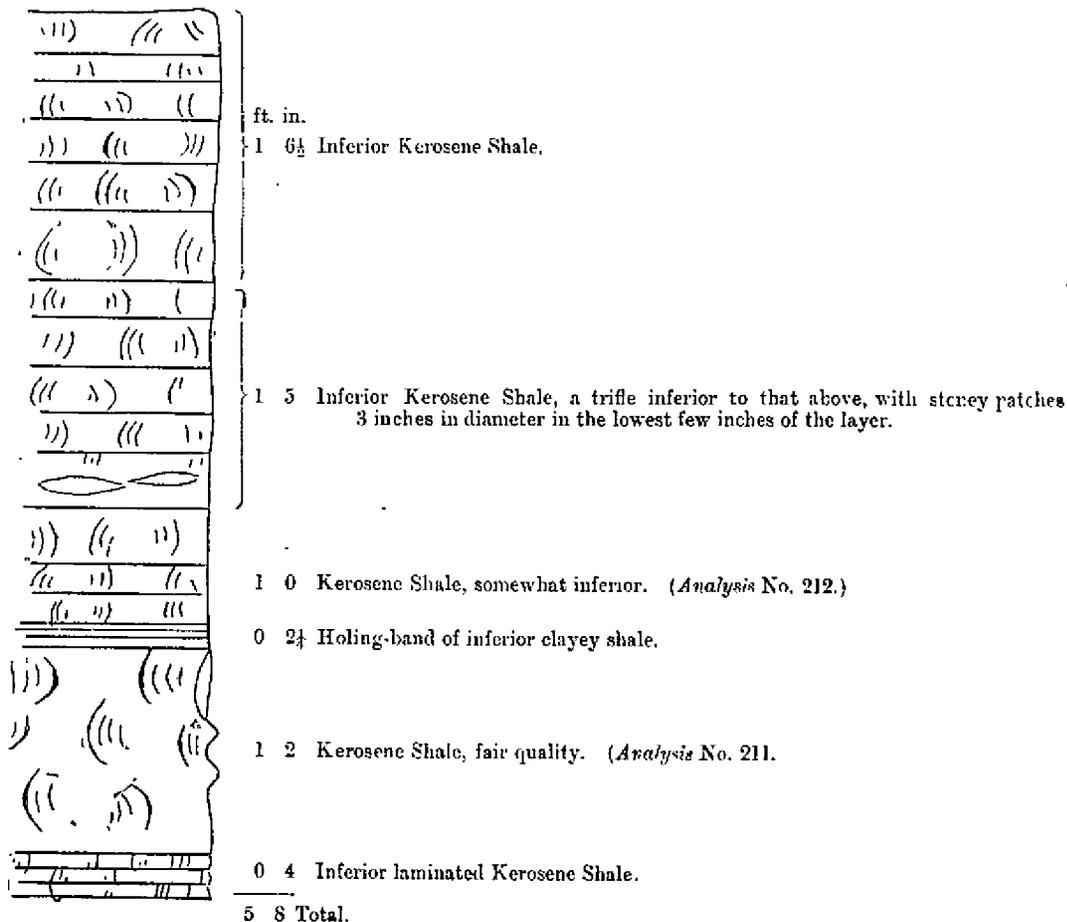

At the end of this drive the following section was measured by me:—

Inferior shale.....	Several feet.	Kerosene shale (of medium quality)...	6 in.
Holing-band	3 to 4 in.	Kerosene shale (of fair quality).....	1 ft. 0 in. (Analysis No. 213).

The following are the details of analysis No. 213, made by Mr. Mingaye, from a sample of this shale, selected by myself:—

Moisture	3.12
Volatila hydrocarbons	48.50
Fixed carbon	7.57
Ash	40.81
A loose black powder left on heating in closed crucible.	
Ash-white, granular.	100.60

At 106 yards from the mouth of the tunnel a drive extends W. 5° N. from the main tunnel for a length of 46 feet. This may be termed the inner west drive. At the end of this I measured the following section:—

The following are the details of the analyses of my samples by Mr. Mingaye:—

ANALYSIS No. 212.		
Moisture		Not determined.
Volatile hydrocarbons		36·28
Fixed carbon		9·48
Ash		54·24
A loose black powder left on heating in closed crucible.		
Ash—white, granular.		

ANALYSIS No. 211.		
Moisture		Not determined.
Volatile hydrocarbons		47·90
Fixed carbon		11·28
Ash		40·82
Ash and caking quality similar to those of preceding sample.		

From a portion of the main tunnel, not far from the point of intersection of this drive with it, I selected five samples of kerosene shale for analysis, each representing approximately 1 foot of the seam, and therefore representing a total thickness of about 5 feet.

The results of these analyses by Mr. Mingaye are quoted on the following page, the samples being arranged in descending order, just as they occurred in the seam:—

No.	Moisture.	Volatile Hydrocarbons.	Fixed Carbon.	Ash.	Per-centage of Sulphur.	Specific Gravity.	
203	Not determined.	34·30	5·66	60·04	A loose black powder left on ignition of shale in covered crucible—Ash, white in colour, flocculent.
204	„ „	32·00	5·40	62·60	
205	„ „	26·25	5·65	68·10	
206	„ „	26·35	5·80	67·85	
207	2·24	58·54	7·05	32·17	0·46	1·306	Slightly caked in heating in covered crucible. Ash, grey, granular.

Near the extreme end of the tunnel a drive has been extended for a short distance in an easterly direction. At the end of this drive I found that the best shale, which is about 14 inches thick in other parts of the mine, had thinned down to 3 inches. This, however, may have been due to a local roll, as would seem probable from the fact that the floor *rises* in this direction, that is, easterly, whereas the general *dip* is north-easterly.

At the face of the main tunnel I measured the following section, the distance being 128 yards from the mouth of the tunnel:—

Part of Roof ...	ft. in.	
	1 0	Hard black clay shale, containing a good deal of carbonaceous material.
	3 0	Kerosene Shale, inferior.
	0 8	Kerosene Shale, a trifle inferior.
	0 2	<i>Band</i> , black laminated inferior kerosene shale.
	1 0	Kerosene Shale of fairly good quality.
	0 5	Kerosene Shale, somewhat inferior and laminated; locally termed "Curly."
Total	5 3	

At Harper's Tunnel there has been proved to exist a seam of kerosene shale having a total thickness of from 5 to 6 feet, the bottom, 12 to 14 inches, being of fairly good quality, and the upper, 4 to 5 feet, being inferior. The seam has been proved for about 384 feet in a north-easterly direction, and for about 50 feet to the west, and an almost equal distance to the east.

If the hill in which Harper's Tunnel is situated be now traversed in a north-westerly direction, following the general trend of the outcrop of the shale, several old shafts and tunnels are observable, in most of which the existence of the kerosene shale has been proved, but I was unable to obtain any reliable information as to its exact thickness and quality at any of these workings, with the exception of Humphries' shaft, 52 feet deep, situated in portion 82.

At Afflick's New Tunnel, however, about 10 chains south-westerly from Humphries' shaft, there was clear evidence in the spoil bank that the tunnel, which was stated to be 100 feet long, had reached the kerosene shale, as fragments of shale of fair quality, and having a maximum thickness of about 6 inches, were observable in the spoil bank, associated with inferior shale. The latter contains numerous fragments of mineral charcoal (mother-of-coal) and small fragments of what appear to be portions of coniferous wood like *Araucaria*, together with coniferous fruit.

A short distance above Afflick's New Tunnel, the soft clay shales of the coal-measures are capped by a hard basalt, rendered slightly porphyritic by augite. It was near here that the diamond-drill bore was put down.

At Humphries' Shaft, the water having been baled out with some difficulty by means of windlass and bucket, I measured the following descending section:—

Roof	ft. in.	
	2 0	Fine dark grey carbonaceous clay shale.
	0 1	Inferior Kerosene Shale.
	1 5	Kerosene Shale, rather inferior.
	1 1	Kerosene Shale, a trifle more inferior than that above.
	0 1	<i>Band</i> , brown clay shale.
	0 5-7	Inferior Kerosene Shale, like the "curly" shale in Harper's Tunnel.
Total	3 2	

The floor here, as in Harper's Tunnel, was evidently of the nature of clay shale, as was proved by testing it with a pick, but as it was found impossible to bale the water down below the floor of the seam I was unable to ascertain its precise nature.

No analyses were made of the samples of shale taken by me from this shaft, but the analysis of shale from Afflick's New Tunnel, the sample being taken by myself, may be considered as probably equivalent to that of the best shale in Humphries' Shaft.

This analysis (No. 208), made by Mr. Mingaye, is as follows:—

ANALYSIS No. 208.	
Moisture	Not determined.
Volatile hydrocarbon	37.40
Fixed carbon	4.78
Ash	57.82
	100.00

A loose powder left on heating shale in covered crucible.
Ash—grey, granular.

As regards the diamond drill bore, which was completed near Afflick's New Tunnel this year, subsequent to the time of my inspection, the following is the section quoted from the Report of the Government Superintendent of Diamond Drills:—

Nature of Strata.	Thickness of Strata.	Depth from Surface.	Remarks.
	ft. in.	ft. in.	
Alluvial soil	3 0		
Hard basalt (broken and jointy)	37 9		
Soft red sandstone	5 0		
Grey shales	26 0		
Hard grey basalt with calcite veins.....	97 3		Bottom of basaltic rock.
Brown chert rock or fireclay.....	4 0		
Dark shales	1 9		
White or bluish chert.....	14 0		
Dark shales	3 10		
Dark grey sandstone and shale	8 10		Faulty felspar veins at 200 ft. to 204 ft.
White chert and sandstone	12 10		
Small band of dark shale	0 6		
Fine white sandstone and chert	13 6		Bottom of sandstone and chert rock.
Dark shales	40 6	268 9	Temporary stoppage of work.
Tuffaceous mud or indurated shale, lettered (A) on core.	0 4		
Inferior shale (B)	0 10½		
Oil shale (C)	1 0	4 7	Thickness of shale bed.
Dark shale with films of calcite (D).....	1 10		
Core lost in passing through bed	0 6½		
Indurated clay, grey sandstone, and chert...	1 8		Floor.

ANALYSIS A.—No. 1811.

Blue clay shale struck at 269 feet from surface, Doughboy Hollow:—	
Hygroscopic moisture	6.65
Volatile hydrocarbons	20.47
Fixed carbon	2.31
Ash	70.57
No coke formed.	
Ash—white and heavy.	100.00

ANALYSIS B.—No. 1812.

Inferior oil shale.	
Hygroscopic moisture	3.98
Volatile hydrocarbons.....	40.11
Fixed carbon	5.81
Ash	50.15
No coke.	
Ash—white, granular.	100.00

ANALYSIS C.—No. 1813.

Oil shale.	
Hygroscopic moisture	3.23
Volatile hydrocarbon	47.80
Fixed carbon	12.07
Ash	36.85
No coke formed.	
Ash—grey, granular.	100.00

ANALYSIS D.—No. 1814.

Volcanic mud.	
Hygroscopic moisture	6.20
Volatile hydrocarbons	18.71
Fixed carbon	5.42
Ash	69.67
No coke formed.	
Ash—grey, granular.	100.00

The above analyses were made by Mr. Mingaye from samples selected by Mr. E. F. Pittman, Assoc. R.S.M., the Government Geologist, from samples of the core forwarded by the Superintendent of Drills.

A report by A. Helms, Ph. D., may be of interest with reference to the ammonia contained in the shale.

The report is as follows:—

“A. W. Fell & Sons, Darling Harbour,
Gentlemen,

The liquor obtained by wet distillation of kerosene shale, received September 22, gave the following result:—
250 C.C. (cubic centimeters) redistilled gave 0.2091 ammonia, the 19 lb. 6 oz. kerosene shale yielding 9.625 litres ‘liquor’ gave then 8.0504 ammonia, or at the rate of 0.085 per cent. ammonia, equal to 0.0707 nitrogen, which is in all probability much below the amount of nitrogen originally contained in the shale.

Yours, faithfully,
A. HELMS.

“One ton of shale would accordingly give 19.04 p. (*pounds avoirdupois*) ammonia, equal to 69.8 lb. sulphate of ammonia.”

(The words in italics are my own).

As regards the dip of this deposit of kerosene shale, I might add that in a small creek a short distance above the mouth of Afflick's New Tunnel, at the spot shown on the map which accompanies this report, black and yellow clay shales, probably overlying the Kerosene Shale, dip N. 30° E. approximately at 10°. This dip, however, is a trifle in excess of that observed at Harper's Tunnel, but the dip at the latter locality is lessened probably by the roll already referred to as having been encountered in the east drive.

A dip of ten, equals a descent of 17.7 feet in a horizontal distance of 100 feet in the direction of the full dip, which in this case is about N. 30° E.

My

My aneroid measurements show that there is dip of at least 25 feet from the mouth of Harper's tunnel to the face, and I understood from Mr. Fell that there was a total fall of 38 feet in the tunnel from its mouth to within 10 yards of the face, the tunnel for the last 10 yards being level.

The total length of the tunnel being 384 feet, and its direction N. 3° E., instead of N. 30° E., the dip should theoretically amount to about 58 feet instead of 38 feet, which latter, according to Mr. Fell, is the actual amount.

Summary.—The small patch of shale in portion 74 being omitted from consideration, it may be stated that a single patch of Kerosene Shale has been proved at various spots near to or along its line of outcrop almost continuously for a distance of about 56 chains, from Harper's Tunnel on the south-east to Humphries' Shaft on the north-west. There can, I think, be no doubt that the seams of shale at Harper's tunnel, and at Humphries' Shaft respectively, belong to one and the same seam.

I imagine, therefore, that the patch of shale would probably be found to extend approximately as I have shown on the plan in portions 82 and 83, the area which will probably be found to be shale-bearing being tinted yellow. Possibly the area should be reduced as I have shown by the dotted line. If the average width of the patch be 5 chains, and the length 50 chains, the total area of unworked shale might be equal to about 25 acres, but this estimate is only very approximate, and might be two or three times below or above the true quantity, as it is well known, from actual experience at Joadja and Hartley Vale, that deposits of Kerosene Shale are very lenticular in character.

The total thickness of the seam varies from 3 feet 2 inches to about 5 feet 8 inches. A small portion of this thickness in the lower part of the seam, from 12 to 14 inches in thickness, is shale of fair marketable quality, yielding about 60 per cent. of volatile hydrocarbons. Shale, however, of this quality has not been proved as yet to exist at the north-west end of the patch, so that it would be impossible to calculate its quantity even approximately. As regards the inferior quality of shale, it may be assumed that an average thickness of about 4 feet of it extends over this assumed area of 25 acres. This would contain a gross quantity of about 158,000 tons—that is, about 6,320 tons per acre—the specific gravity of the inferior shale being taken as 1.3

The average composition of this inferior shale would probably be approximately as follows:—

Moisture	2.00
Volatile hydrocarbon	34.00
Fixed carbon.....	6.00
Ash.....	58.00
	100.00

As regards the cost of production of the shale I was supplied with the following information when inspecting the deposits:—

	Per ton.
	£ s. d.
Cost of mining shale, and carrying to mouth of tunnel, &c.....	0 15 0
Cartage from mine to Doughboy Hollow Railway Station.....	13s. 6d. to 0 15 0
Railway carriage, Doughboy Hollow to Newcastle	0 10 0
Royalty	0 2 0
Total.....	£2 1 0

The price realised for the best quality of shale from this mine—that is, the layer 12 to 14 inches thick near the bottom of the seam—was, as I was informed, £2 18s. per ton.

It is obvious from these figures that it would not pay to export the inferior shale. Apparently the only possible means of working the inferior shale to a profit, if this can be done at all, would be by erecting works for treating the inferior shale on the ground where it occurs.

There is a considerable thickness of this inferior shale, as already stated, and it appears to me that the future of this deposit will depend chiefly on the possibility of successfully treating this inferior shale for the extraction of its oils and other useful products.

As regards the eruptive rocks, the basalts penetrated into the diamond-drill bore are, I think, certainly of later date than the Kerosene Shale. The large quantity however of tuffaceous material present in the rocks above and below the shale, prove that volcanic activity prevailed contemporaneously with the formation of the Kerosene Shale. It is unlikely, in my opinion, that the kerosene shale deposits in this district will be found to have been interfered with at all seriously, by either the older volcanic rocks contemporaneous with the kerosene shale, or by the newer volcanic rocks, chiefly basalts, except in the cases of narrow dykes of basalt, which may have intersected the seam and spread for a short distance along it laterally, as shown in the diagram near the beginning of this report.

The case of the intrusive eruptive rock in the Kerosene Shale at Hartley Vale might be cited as a parallel instance.

It is unlikely however, I think, that considerable areas of shale will be found to be damaged by these basalt dykes at Doughboy Hollow.

Appended are a report by Mr. Mingaye on the Doughboy Hollow Kerosene Shales, some aneroid levels taken by myself, and a lithograph of the Parish of Temi, showing the position of the Kerosene Shale and the principal openings which have been made to prospect the deposit.

I have, &c.,

T. W. EDGEWORTH DAVID,

Professor of Geology, University of Sydney.

E. F. Pittman, Assoc. R.S.M., The Government Geologist.

Department of Mines, Geological Survey Branch,

Laboratory, Sydney, 17 February, 1891.

Sir,

On separate form I have the honor to furnish you with the analyses of twelve samples of so-called "Kerosene Shale," and also beg to offer a few remarks as to their quality:—

Samples Nos. 208, 209, 211, and 213 contained numerous rounded grains of sandstone dotted through the shale, and plainly visible to the naked eye. It was thought that perhaps by a system of washing that the bulk of the impurities existing otherwise than in the natural ash of the shale could be removed. Numerous experiments were made, and in the case of those containing sandstone it was found possible to remove the bulk of this impurity, but even then the washed mineral was so heavy in ash as to make it of little value as an article of commerce.

It

It was proved by experiments made that the bulk of the inorganic matter present in these shales has been derived from the vegetable matter from which the shales were formed. The analyses made, excepting in one case, show them to be of very inferior quality.

I have, &c.,
JOHN C. H. MINGAYE,
Analyst and Assayer.

ANEROID LEVELS.

Level above sea in feet--	
2,070.....	Doughboy Hollow Railway Station.
2,410.....	Outcrop of kerosene shale at Harper's Tunnel.
2,364.....	Humphrics' Shaft.
2,333.....	Afleck's Tunnel.
2,550.....	Outlier of kerosene shale in portion 74, parish of TeMi.

APPENDIX 7.

Report by Mr. P. T. Hammond, Field Assistant, on the Condobolin District.

Sir, Geological Society, N.S. Wales, Department of Mines, Sydney, 19 January, 1892.

In accordance with instructions received from you, I proceeded to Condobolin on Thursday, 8th October, in order to examine that district with a view to reporting its mineral prospects. I have now the honor to furnish you with my report.

The time proved to be a most unfortunate one for my purpose as throughout the district shearing was in active progress, and the squatters on whom I was dependent for the loan of horses, were too busy to be able to devote much of their time in showing me the country, although in all cases such assistance as could be given me was most willingly accorded.

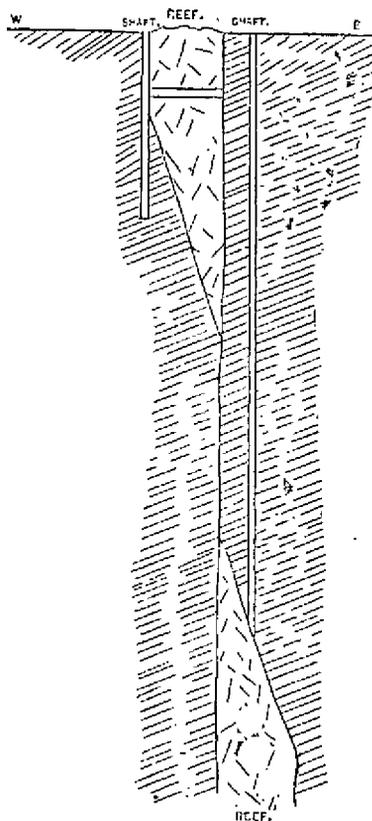

I was obliged therefore to confine my inspection to such localities as had already been to some extent prospected.

The first mine I inspected was the Eureka, which I visited in company with Mr. Bouffler, a member of the Condobolin Progress Committee. This mine is situated about 3 miles north east of the town on portion 113, parish of Condobolin.

The lodestuff consists of massive and crystallised quartz with stains of blue and green carbonates of copper and manganese oxide; there is also a little galena in places and some red and yellow oxides of iron.

Two shafts have been sunk on this lode, one to a depth of 32 feet on the footwall side of the lode, and the other on the hanging wall side to 100 feet.

I was unable to descend either shaft as the mine at the time of my visit was not working and the ladders had been removed; but from surface indications and from an examination of the material which had been brought up from the shafts, I have little hesitation in stating that this is a true fissure lode, the footwall being of partially decomposed talcose slates, and the hanging wall of a fairly hard white and purple sandstone, and the strike of the reef being about N. 14° W., and S. 14° E., whereas the slates strike about S. 78° E. The western (32 feet) shaft follows the footwall of the lode for about 16 feet, where the dip becomes much sharper and the eastern (100 feet) shaft was sunk to catch the reef again on the underlay, which it did, so that the reef probably occupies the position represented in the accompanying sketch.

The reef outcrops strongly on the surface, being in some places as much as 15 feet wide, and can be traced in length for about 280 yards.

I took two samples for assay from the stone from the shafts lying on the surface, averaging it as well as I could under the circumstances, but the returns were poor, the sample from the 32-foot shaft yielding only 2 oz. 12 dwt. of silver and a trace of gold per ton, and that from the 100-foot shaft only 4 dwt. 8 gr. of silver and 2 dwt. 4 gr. of gold per ton. These assays, however, owing to having been taken from the surface may not give quite a fair return of the reef.

I next visited the Condobolin Copper, Gold, and Silver Mining Company's shafts in company with Mr. R. Officer. These shafts are situated a little over 2 miles north-westerly from the town, and close to the road from Condobolin to Melrose Station. The first shaft I visited was sunk to a depth of 32 feet in slate on a small outcrop of quartz, in the hope that it would widen out at a depth, but at the time of my visit no defined reef had been found, and though I examined the shaft closely I could find no evidence of faulting of the strata. This shaft is on the western side of the road to Melrose.

I next examined a shaft on the eastern side of the road, which has been sunk to a depth of 47 feet on a lode known as the "Red Paint," from the prevailing red colour of the cap, which consists of a very ferruginous quartz showing cavities after the decomposition of pyrites. An average sample taken from here yielded 1 oz. 8 dwt. 6 gr. of silver per ton. The reef is 3 feet wide in the widest part, the average breadth being considerably less. A pinch occurs at 15 feet in depth, and the reef is only represented in the bottom of the shaft by a few small veins of quartz in the slate. Both walls consist of sandy slates, which are broken and disturbed near the surface. There are no indications of true fissure, and the dip of the reef agrees with that of the sedimentary beds, as does also the strikes. The outcrop cannot be traced far on the surface, but another outcrop occurs on the same strike about 7 chains further east, which is regarded as being the continuation of this lode.

This shaft has been sunk with private money by Messrs. Officer, Shepherd, and Co.

The second outcrop before mentioned consists of very vesicular quartz, enclosing some felspathic material, and a little hardened black slate, and a good deal of carbonate of lead.

I had two assays made from here, one being a sample of ferruginous quartz coated with manganese oxide, which yielded 5 dwt. 10 gr. of silver, and a trace of gold per ton. The other was a picked sample of carbonate of lead, and yielded 18 oz. 3 dwt. 16 gr. silver and a trace of gold per ton.

This outcrop has not been opened up to any great extent.

The next outcrop examined is known as the Piebald Reef, a little to the north-east of the last, and probably got its name from the mottled character of the stone, which is dark quartz, finely pyritous, with a network of white quartz veins throughout its mass. The outcrop is about 2 feet broad, but, like the last, cannot be traced far in the direction of its length.

The last shaft visited was the Company's 90 feet shaft. The lodestuff here consists of a ferruginous quartz, stained green in places with carbonate of copper, and showing a little free gold. I was unable to get down the shaft, as the ladders had been removed, but so far as I was able to judge from an examination of the surface the reef was not a well defined one. A good deal of trenching had been done about this ground, but the section exposed was in all cases slate with quartz veins in places.

The workings are all situated within $\frac{1}{4}$ mile of one another, on Mineral Leases 140 and 141, Parish Condobolin, and agree in having approximately the same strike. The fissures in which the reefs occur have probably had a common origin, which may have been the bulging of the slates along their planes of bedding, caused by pressure at right angles to the line of strike. The result of this would be a series of lenticular cavities, which might be subsequently filled in with lodestuff.

None of these lodes have been proved at a depth, the deepest shaft being the 90 ft.

I do not think that the reefs will be found to continue at a depth, but if it is proposed to prove any of them, the two known as the Red Paint and the Continuation of the Red Paint seem to me the most worthy of a further trial.

I was also shown a shaft which had been sunk for copper, close to the eastern boundary of the travelling stock reserve, and on Mining Tenement 120, which was sunk some time back by the Condobolin Copper Co., since defunct.

This shaft was sunk to a depth of 33 feet, the lodestuff being quartz stained with blue and green carbonates of copper, earthy green carbonate of copper of rather poor quality, and red oxide of iron; the lode so far as I could see from the surface was narrow, not exceeding 18 inches in the widest part, and had the same dip and strike as the sedimentary beds.

I next proceeded to Melrose, stopping on the way to examine an iron-stone lode to which my attention had been directed, but which proved to be a very ferruginous bed in the Silurian series, being in some parts a pure iron ore, but for the most part too siliceous to be workable for iron, the good ore being in comparatively small quantity.

Side by side with this bed, and above it in geological sequence, was another bed of very deceptive appearance, viz., a quartz conglomerate with the pebbles so closely cemented as to present the appearance of a quartz reef, both the pebbles and the matrix being of white quartz.

Whilst following the strike of the bed, which I traced in a direction N. 75 W. to the top of a hill on the east side of the road, I came across some interesting beds of sandstone and loose conglomerate containing obscure fossils, amongst which some enchrinite stems only were recognisable. These beds all dip at a much lower angle than those nearer Condobolin.

From this point on to Melrose there is little to be seen of interest, except at about $\frac{1}{2}$ mile south-east of Reserve 641, Parish of Taratta, where some large blocks of limestone at the side of the road indicate the presence of a bed of that rock somewhere in the vicinity, which, however, is not exposed on the road.

From this point the country consists almost entirely of alluvial flats and low slate ridges, broken only in places by gilghi holes, densely covered with scrub of all descriptions, mostly pine, yarran, and mallee, and teeming with rabbits. Now and then through a break in the brushwood might be seen mobs of kangaroos and emus.

On nearing Melrose the slate hills become somewhat higher, and are strewn with fragments of quartz; and these give place at Melrose homestead to highly-altered beds (a similar series to which in the New England district have been described by Professor David by the term porphyroids).

The morning after my arrival at Melrose I proceeded to Mount Tinda. A very interesting section of the porphyroid beds is to be seen at the 1-mile marked tree on this road, and from thence eastward to the top of a spur, where an eruptive porphyry occurs which has been intruded along the bedding-planes of the strata, and has apparently been the cause of their alteration.

The rest of the road lies over slaty ridges and pleistocene alluvial deposits, until within a $\frac{1}{4}$ of a mile of the 2-mile marked tree on the Cobar Road (7 miles from Melrose), the formation changes, being replaced by granite, which continues from here to the mountain, a very steep granite hill, rising with two or three similar hills abruptly out of a level scrubby plain.

Right on the top of this hill two prospecting shafts have been sunk but abandoned, and were full of water to within 20 feet of the surface at the time I saw them.

I descended one shaft to the level of the water, but could see no true lode, the shafts having apparently been sunk on a belt where the rock was of a more broken character than the surrounding mass, the interstices being filled in by decomposition products of the minerals in the granite, which was at this place very pyritous and contained a little fluorspar.

The principal workings are on a smaller ridge, on the south-eastern side of the mountain, where several shafts have been sunk in the hope of discovering silver lodes, the indications of the lodes being in nearly every case a cap of decomposed granite, sometimes much stained with iron oxide, striking in a general E. and W. direction, and varying between that and N. 45° E., S. 45° W.

The only shaft at present working is one for which assistance has been granted out of the Prospecting Vote, and is being worked by Messrs. Prendergast and Hurley. I descended this shaft, which was then 40 feet deep, and made a close examination of the walls; but owing to the formation being granite, I could not ascertain with certainty whether any faulting had occurred; but from the appearance of the lode I incline to the belief that the deposit has been filled in to one of a series of joint planes in the granite, and will not, probably, widen out at a depth.

Some good galena is now showing in this shaft in quartz and decomposed granite and a little chlorite, but was only $3\frac{1}{2}$ inches in width, and had been taken about 2 feet in depth to make to this width. A few smaller veins of galena also occur, varying in thickness from $\frac{1}{2}$ an inch downwards. An assay of the galena from the largest vein yielded 34 oz. 12 dwt. 12 gr. of silver per ton, which, together with the value of the lead, should pay well to work if any body of the ore could be struck.

The other shafts are known respectively as the Black Shaft, McAuliffe's shaft, and the Mundic shaft, and are in a series of parallel fissures; and it is worthy of note that an outcrop of basalt occurs approximately parallel to them, and a few chains higher up the hill.

The most remarkable of these shafts are McAuliffe's and the Mundic shafts, in which the lode consists principally of chlorite, which in the Mundic shaft, as the name implies, is very pyritous, and contains a few minute cubes of fluorspar. The lode, also, is broader in this shaft, being over a foot in breadth, pinching out a few feet below the surface; but an assay of the stone yielded only traces of gold and silver, and an assay from McAuliffe's shaft yielded only 4 dwt. 8 gr. silver, and no gold. These two shafts were half full of water, so that the assays were made from stone taken only a little below the surface, and, as galena frequently occurs in bunches, these assays (which showed no galena) cannot be regarded as a fair return.

It is not unlikely that bunches of galena may occur at a depth in either of these shafts.

I next returned to Condobolin, visiting on the way a mine situated on a hill between portions 1, 5, and 14, parish Melrose, and some shafts known as the "Boona West Mines," about 2 miles further south and $\frac{1}{2}$ mile west of the road.

The first-mentioned consisted of a tunnel driven into the hill for 30 or 40 feet, at about 25°. It is in slates, which are a good deal bent and broken, and cuts across the nearly vertical beds at an angle. The mine was not working, and appeared to be worked out. It had been worked for silver, and Mr. O'Donoghue, who kindly accompanied me to the mine, assured me that he had seen large blocks of galena taken from this tunnel. However, none of the ore was to be seen *in situ*, but after a close search at the mouth of the tunnel, I discovered some blocks of quartz stained with blue carbonate of copper, which, on breaking open, showed a few fairly large cubes of galena, and an assay of this stone yielded 29 oz. 2 dwt. 12 gr. per ton of silver and no gold. Some earthy limonite taken from the end of the fissure formerly occupied by the lode also yielded 3 dwt. 6 gr. of silver per ton.

Some working had also been done north of this tunnel, and on the same hill, where a shaft had been started, but abandoned at 8 feet, no ore showing. A little irregular trenching had also been done where some limonite stained green by carbonate of copper, and enclosing pieces of slate, had resisted the weathering which has denuded the slates, leaving it some inches above their level, but the section exposed shows that it is only an infiltration in the joint planes of the strata, and is not of any extent. The slates here show no sign of disturbance beyond their steep dip, which is easterly, at 57 $\frac{1}{2}$ degrees.

A very interesting bed of altered calcareous sandstone occurs here, having at first sight the appearance of a lava, with the surface full of steam holes, but, on closer examination, is seen to be a sedimentary rock containing fossils (principally encrinite stems), which, by their weathering out, have given the appearance referred to. In the interior of the rock these fossils are replaced by calcite, and give the appearance of porphyritic crystals.

The Boona West mines are similarly situated on the side of a hill, and consist of several shafts, some of which have been sunk on a bedded quartz conglomerate which outcrops N. 8° W. and S. 8° E., and only one of them showed any sign of a lode on the surface, which in this case consisted of a felspathic cap, stained blue and green, with carbonates of copper, and having dendritic manganese stains. An assay from this returned only traces of gold and silver, and 11.5 per cent. of copper, being a picked sample; lower down, the lode becomes more ferruginous. This shaft was the highest but one on the hill, and the cap of the lode contained waterworn pebbles derived from the conglomerate close to which it occurred.

One of the old ladders being left in this shaft I descended as far as I could (about 30 feet) but was unable to reach the bottom, where I could see that a drive had been made to the west. The lode exposed in the shaft is a ferruginous quartz, in breadth about 1 foot 3 inches, dying out in about 10 or 12 feet of depth. A shaft west of this had also brought up stone of a similar character, so that it probably makes again in depth but appears to be only in small lenticular deposits. The lodes are here dipping westerly. The highest shaft on the hill appears to have brought up only hardened slate with small quartz veins, which is the only stone in any way approaching a lode which is now to be seen at the surface.

None of these shafts were working at the time of my visit, and appeared to have been abandoned, there were no miners on the ground and I was unable to obtain any definite information as to what returns had been obtained from them.

After my return to Condobolin, I proceeded to Melrose Plains, and visited some workings in the vicinity, accompanied by Mr. W. Tout. I reached Melrose Plains by a bush track, which follows pretty closely,

closely, the general trend of Murda Creek, and passes over Silurian beds for the most part covered with deep alluvial, but within a few miles of the station the slates are capped with horizontally bedded Devonian sandstone and quartzites, &c. The home paddocks are for the most part on a rich chocolate coloured volcanic soil and in other places has apparently been derived from the disintegration of limestone.

The first workings we saw were two shafts which had been sunk on a quartz-vein in hornblende granite, situated on Gold Lease 2, parish of Burra Burra. One of these shafts, the one in which the vein had been worked, had only been sunk to a depth of about 20 or 30 feet, when the vein (which is said to have been nearly 2 feet wide in places, and which was represented by a vein of quartz showing about 1 foot wide in the roof of one of the tunnels) had been tunnelled on towards the north and south in the direction of the strike of the vein, but the northern tunnel had only been driven a distance of 27 feet when the vein had died out, and the southern one 18 feet, and here the vein had dwindled to 3 inches. The part of the vein left in the roof of which I took a sample for assay showed a speck of free gold and yielded 15 dwt. 2 gr. of gold per ton, and 4 dwt. 2 gr. of silver per ton, and I was informed that the average yield had been only about 7 dwt. of gold per ton, and that it had been opened up and floated into a company.

It appeared to be only a lenticular vein deposited in a contraction joint of the granite and not likely to be of any permanency; the vein was slightly inclined from the vertical having a dip of about 76 degrees westerly. Both walls were very much decomposed near the vein, and were exactly similar in composition and texture.

The other shaft was sunk to 40 feet, south of this one in the hope of the lode having made again in this direction, but only small leaders of quartz were struck and the shaft abandoned.

At about 100 yards due south of these workings six or seven more shafts or holes had been sunk to various depths. These were all in the same granite, and some had struck narrow quartz-veins with films of green carbonate of copper in their joints, and in one which reached a depth of 30 feet a quartz-vein was struck which showed free gold, but was not of sufficient size to pay for working.

The granite here was decomposed for some feet in depth and contained very little hornblende until the solid rock was reached, the hornblende being replaced by mica near the surface.

Another shaft had been sunk 146 yards north of the main shaft in order to strike the reef, but it had been sunk in alluvial with numerous loose blocks of sandstone through it. This was sunk to a depth of 18 or 20 feet, but was not bottomed.

From here we went to a place locally known as the "Bursted Boulder," situated on mineral lease 1, parish of Tout. This consists of a large deposit of brown iron oxide, which had been prospected for gold, but found to contain none, although one very favourable assay return had been obtained from it. I took two samples for assay and analysis from here, which yielded—the one a slightly magnetic sample,—gold, a trace; no silver; iron, 56.99 per cent.; oxide of silicon, 4.04 per cent.; and the other sample neither gold nor silver; iron, 56.54 per cent.; oxide of silicon, 3.44 per cent. These analyses show the iron to be of excellent quality.

The ironstone is evidently a stratified deposit, and appears to be of Devonian age or later, and, so far as I could see from a rather hurried examination, lies horizontally on the upturned edges of the Silurian beds, forming a capping to a range of hills which extends in an *N.E.* direction, and I was informed that the deposit can be traced in detached masses for a distance of about 4 miles.

This deposit should, I think, prove payably workable as soon as cheap carriage is available; and, being horizontally bedded, the method of working would be much simplified, as the ironstone could be quarried out in the same manner as road metal is quarried. This circumstance would also preclude the possibility of its extending to a great depth; but the deposit is of quite sufficient thickness to be worth attention, and extends in breadth in places for about 20 to 30 chains, and is of nearly equal quality throughout. The depth has not been proved by any of the shafts sunk on it, which are, for the most part, holes about 10 feet deep.

The nearest limestone to this deposit is 6 miles to the south-west, and the country is thickly timbered; but no coal is known nearer than Maryvale or Dubbo, on the Western Line, the former of which is distant about 80 miles from here in a direct line, and by road 130 miles, and the latter about 70 miles in a direct line, and 100 miles by road.

I traced this deposit in a north-easterly direction on the top of the next hill, and found that it was there lying unconformably upon the upturned edges of some very silicious and impure ironstone beds traversed by a network of chalcidonic quartz-veins which varied in thickness from 2 inches downwards, and as I was informed that a white metal had been obtained from this stone by crushing and washing, I took a sample for assay for platinum, but none of the metal was detected. I also had two samples of the iron ore from here tested for the same metal as I noticed the occurrence of platinum in the Burra Burra alluvial workings, and was informed that the gold there had occasionally been observed with pieces of ironstone attached, although some shafts had been sunk in the next alluvial flat southerly from here to depths of about 40 to 60 feet, and no gold obtained.

From this place we rode along the south-western boundary of Burra Burra and Melrose Plains as far as the corner of these two runs, and Murrumbogie and Carlisle, the track passing over nearly vertical slates and quartzites striking about *N. 10° E., S. 10° W.*, with a slight easterly dip; here sandstone beds occur and from here the track takes a more easterly direction following the northern boundary of Burra Burra and Murrumbogie for about a mile. Here we found three diggers at work on the alluvial which I was informed had been worked for four or five years. A good deal of work had been done here the holes being sunk to various depths, ranging from about 3 feet to 10 feet (generally about 8 feet), and was said to be very patchy and only to pay wages, and sometimes not even that; but I was shown some very fair prospects in the dish, and noted the occurrence of platinum in small grains with the gold. I was afterwards informed by Mr. Harwood, assayer and analyst at Parkes, that he had noticed the metal before in alluvial gold from this locality, and he kindly showed me some which he had been testing for that metal. I have also been informed that Mr. Connolly discovered platinum many years ago in this place, and have since had a conversation with him on the subject.

It is said that the ground here has not been proved at a depth (the gold lying on what is known to the miners as tissue bottoms), although some shafts had been sunk to a depth of 40 feet.

The gold was shotty and not very much waterworn, and some of it stained black, and accompanied by much black sand. The lead had been traced for about $\frac{1}{2}$ mile, the gully running *S. 30° W.* and *N. 30° E.*, the method of separating the gold being by cradling and panning off.

The

The miners informed me that the wash was about 6 inches to 2 feet in width, its thickness being in the best parts about 6 inches.

The wash-dirt contained many pebbles of diorite, limonite, and quartz, and in both the latter it is said free gold has been found. The pebbles were somewhat waterworn in all cases, but did not appear to have travelled very far. Large ironstone boulders were got in the 40-foot shafts, but were not found to contain gold.

The hill immediately south of these workings consists of diorite (which is probably the source of the diorite pebbles, and perhaps the quartz in the wash), covered deeply with pleistocene alluvium, and it is quite possible that quartz-reefs may be discovered in this, or at its junction with the sedimentary beds when the country is more thoroughly prospected, the chief drawback to search being the depth of alluvium under which it is buried, which renders the work uncertain.

On our return I observed a deposit of carbonate of magnesia, which appeared to be interbedded with the siliceous ironstone before mentioned, or in more or less lenticular patches in its bedding planes, and can be obtained here in masses from 18 inches to 2 feet through, and of very fair quality, an assay of it yielding carbonate of magnesia, 91.09 per cent.; magnesia oxide, 3.43 per cent., and lime, 1.10 per cent.

From Melrose Plains I proceeded to Burra Burra. The road between these two places passes over hardened slates with occasional flats of volcanic soil, and outcrops of diorite.

The morning after my arrival Mr. Gatenby drove me out along the Dandeloo Road to see some prospecting shafts which had been sunk to find a reef on the travelling stock reserve, about 10 chains north-east of the boundary fence of Burra Burra and Jumble Plains.

The country rock consists of hardened slates and soft talcose slates, and the shafts have been sunk on small quartz-veins running with their joint planes, viz., s. 60° E. and N. 60° W.

There is one main shaft, the others being only sunk a few feet. A good deal of trenching has also been done in an irregular manner. The main shaft was nearly full of water, and was a large square hole, which I was informed was not more than 12 feet deep, and showed only numerous small quartz-veins in the bedding of the slates. These veins were slightly ferruginous, and carried a little pyrites. No miners were on the ground, and the workings appeared to have been abandoned for some time.

On our return to Burra Burra we saw some alluvial workings where several shafts had been put down, but were all abandoned and full of water, many of them having been filled in by floods in the creek. None of the shafts were deep, the most recent looking one being about 8 feet 6 inches, and being probably partially filled in. Mr. Gatenby informed me that some of them were sunk to about 6 to 8 feet, but could not inform me as to what prospects had been obtained from them.

We also saw two quartz-reefs which had been partially opened up, and which cropped up out of the alluvial about $\frac{1}{2}$ mile from the main road in sandy slates. Gold is said to have been got here, but no shafts had been sunk on them, and they had been abandoned after a little irregular surface working. The reefs were of a barren-looking white quartz, and their strike was due north and south. One of them was about 3 feet broad, and its outcrop could be traced for 2 or 3 chains by detached blocks on the surface of the alluvial under which it is buried.

From Burra Burra I proceeded to Trundle, and thence to Sydney via Parkes.

SUMMARY.

From this review of the mining in the district of Condobolin it will be seen that comparatively little systematic prospecting has been done, and that in most cases the reefs sunk upon have been in openings along the bedding planes of the sedimentary strata, and not in true fissures. This class of lode has seldom any permanency, but cases are known where they continue to depth, as at the "Excelsior Mine," at Muttama, where a reef of this description has been proved to a depth of over 150 feet, keeping a uniform breadth of about 18 inches for the whole distance, and is said to yield payable returns.

There can be little doubt that true fissure lodes do occur in this district besides those already mentioned, especially in the northern part of the county of Cunningham, and the southern part of the county of Kennedy, where large areas of igneous rocks occur, and will no doubt be found to have caused faulting of the sedimentary rocks, especially where they have cut across the strike of the beds.

The difficulty which prospectors will experience in finding the reefs will be much increased by the depth of the alluvial deposit which covers a great portion of the country, and it is probable that reefs will not be discovered until these alluvials have been more thoroughly worked, as has been the case at Parkes and Forbes, and also at Ballarat in Victoria.

Payable alluvial leads will no doubt eventually be discovered, as many parts of the country yield gold in small quantities, and in the alluvial round these centres the gold will no doubt be found to be naturally concentrated; more especially where it has been deposited from the drainage flowing along the strike of the reefs, or that of the beds containing gold-bearing veins.

I have elsewhere drawn attention to the deposit of ironstone at Burra Burra, which may at some future time become of importance.

The silver only remains to be noticed. It will be seen by the assay returns furnished that rich silver ores occur in this district, and those at Mount Tinda, and between there and Boona West should prove very payable in the event of their being discovered in true fissure lodes.

In conclusion, I have to express my thanks to officers Tout, Gatenby, Ling, and others for assistance afforded me in my examination of the country.

I have, &c.,
P. T. HAMMOND,
Field Assistant.

APPENDIX S.

Annual Report of the Palæontologist for the Year 1892.

Geological Survey, N.S. Wales, Department of Mines, Sydney, 6 Jan., 1893.

Sir,

I have the honor to hand you herewith a Progress Report of the Palæontological work done during the past Year 1892.

Memoirs.—The following Memoir of the Palæontological Series, reported in last year's Progress Report, as "ready for printing," has been printed, published, and distributed:—

No. 5.—A Monograph of the Carboniferous and Permo-Carboniferous Invertebrata of New South Wales, Part 2. The Echinodermata, Annelida, and Crustacea, pp. 64, pls. 10 (4to, Sydney 1892.)
The

The third part of this Memoir, "The Polyzoa," is well advanced towards completion, and will, I hope, be ready for printing during the current year. In addition to this, Memoir, No. 11, "The Cretaceous Fauna of New South Wales," is well advanced towards completion, and the plates, with the exception of one, are drawn. This may possibly be ready for the printer during the current year.

Records.—Part 4 of Vol. II of the *Records of the Geological Survey of New South Wales*, Index to Vol. II, and Parts 1 and 2 of Vol. III, have been published. Part 3 of Vol. III. is practically ready for printing. These contain the following Official Papers by myself:—

- (a.) Descriptions of four Madreporaria Rugosa—Species of the Genera *Phillipsastraea*, *Heliophyllum*, and *Cyathophyllum*; Vol. II, Part 4, pp. 165–174, plates 11 and 12.
- (b.) Idiographic Rock-carvings of the Aborigines at Flat Rocks, near Manly; Vol. II, Part 4, pp. 177–180, plate 18.
- (c.) Index to Vol. II.
- (d.) *Hymenocaris Salleri*, McCoy, ms.; Vol. III, Part 1, pp. 5–8, plate 4.
- (e.) Notes made at the Kybean Caves, Parish of Throsby, County Beresford, in October, 1890, &c.; Vol. III, Part 1, pp. 21–24, plate 5.
- (f.) Idiographic Drawings by the Aborigines in a Cave-shelter at Weony Creek, Colo River, near Richmond; Vol. III., Part 1, pp. 33–37.
- (g.) The Caves at Goodravale, Goodradigbee River; Vol. III, Part 1, pp. 37–44, plates 7–9.
- (h.) The Pentameridæ of New South Wales; Vol. III., Part 2, pp. 49–60, plates 10 and 11.
- (i.) Report on a Visit to the Narrangullen, or Cavan Caves, Taomas, Murrumbidgee River; Vol. III, Part 2, pp. 68–70, plate 12.

Miscellaneous Determinations.

The following are the more important Miscellaneous Determinations made during 1891:—

1. Plant-remains and crushed Unios from the Tertiary (?) strata at Lake Speculation, near Menindie. The plants were too indefinite for determination, but were reed-like in appearance. The Unios were internal casts, at the same time one presents the exact outline of a living Australian species, *U. Stuarti*, Ad. and Angas, inhabiting Central Australia. Collected by Mr. Geological-Surveyor Jaquet.
2. Permo-Carboniferous Crinoid remains, from Jamberoo, forwarded by Mr. B. G. Engelhardt, Public School, Jamberoo. These consist of portions of the calices of *Tribrachyocrinus Clarkei*, *T. corrugatus*, and *T. granulatus*.
3. Diatomite (Infusorial Earth)—From Bello Mountain, Parish of Cobbadah, County Murchison, forwarded by Messrs. W. M. Cameron & Co. This earth contains 74.21 per cent. of silica, and is exceedingly rich in the frustules of *Melosira*, the usual form of Diatom in the New South Wales Infusorial Earths.
4. Diatomite (Infusorial Earth)—Five miles from Barraba, again very rich in *Melosira*. Contains 71.62 per cent. of silica. Forwarded by Hon. G. Day, M.L.C.
5. Diatomite (Infusorial Earth)—Forty-two miles from Glen Innes, forwarded by J. C. Gladow. The *Melosira* contained in this earth are unusually large.
6. Spicular Earth—A white earth resembling Diatomite, but having comminuted sponge spicules in place of the frustules. From Ballina, forwarded by A. J. Hodgkinson.
7. Plant remains from the Wianamatta Shales at Enfield, communicated by Mr. J. B. Henson.
8. A collection of Permo-Carboniferous fossils presented by Mr. J. Waterhouse, M.A., from Branxton, St. Clair, and Carrowbrook.
9. Sandy-shale from Hebden, Wandaring Station, containing plant remains, some portions of which are converted into semi-jet.
10. Mesozoic plant remains from Mitchell's Creek, Talbragar River, consisting of *Tæniopteris Daintreei*, and *Alethopteris australis*.
11. Upper Devonian fossils collected by Mr. Geological-Surveyor W. Anderson, near Major's Creek.
12. Mammalian remains from the Wellington Caves, collected by the Inspector of Caves, consisting of bones of *Macropus*, *Phascogale*, *Thylacinus*, *Sarcophilus*, *Perameles*, &c.
13. Fossil Fruits from the Plisocene Gold-drifts, determined for the Agricultural Branch, viz.:—
Penteune Clarkei, F.v.M.
Plesiocapparis leptocelyphis F.v.M.
Oethodocarpan Wilkinsoni, F.v.M.
Phymatocaryon Mackayi, F.v.M.
14. A Human Skull discovered in a small cave at Bungonia by Mr. L. Guymer, Keeper of the Bungonia Caves, covered with a net made of aboriginal twine, and reposing on a skin. The cephalic, narial, and orbital indices demonstrate this to be the skull of an Aborigine and the state of the teeth, &c., indicate it as that of a child of not more than eight years.
15. Plant remains from the Wianamatta Shales at Thirlmere, collected by Mr. W. A. Cuneo, and consisting of an undetermined fern.
16. Mammalian bones from the Rosebrook Caves, near Cooma, Parish of Wollumba, County Beresford, consisting of those of Dasyure, Wallaby, and Wombat, probably existing species. Also human bones, too much decayed for illustration, but clearly those of an Aborigine, found in black loam under a small rock-shelter. Collected by Mr. Elphick, Acting Keeper of Caves.
17. Plant remains and *Estheria*, from the Estheria and other shales, struck in the second Cremorne Bore, Mossman's Bay, consisting of fine examples of *Thinnfeldia odontopteroides*, Morris, *Odontopteris microphylla*, Ten. Woods, and an undescribed plant, allied to *Sagenopteris*; the two former from a depth of 1,274 feet, the latter 1,410–1,417 feet. The *Estheria* are from a depth of 1,658, feet accompanied with the remains of a conifer, allied to *Brachyphyllum*, collected by yourself and Mr. Geological-Surveyor Carne.

In addition to the above memoranda, small Collections were named as follows:—

- (a.) Plants from the Lepidodendron beds of Goonoo Gonoo, and Vegetable Creek, for Mr. D. A. Porter, Tamworth.
- (b.) Two small collections of Permo-Carboniferous, Silurian, and Miscellaneous fossils for the Curator, Technological Museum, Sydney.
- (c.)

- (c.) Silurian fossils from the Macdonnell Ranges, Central Australia, for Mr. H. Y. L. Brown, Government Geologist, South Australia.
 (d.) Two species of Permo-Carboniferous Mollusca, determined for Mr. C. W. de Vis, M.A., Curator, Queensland Museum, Brisbane.

Exchanges.—Small collections in exchange were prepared as follows:—

- (a.) Prof. R. Tate, Adelaide University—New South Wales Permo-Carboniferous fossils.
 (b.) Mr. A. Morton, Curator, Tasmanian Museum, Hobart—Mesozoic Fish, from Gosford and Talbragar.
 (c.) Mr. G. Smith, Broken Hill—Gosford Fish.

Chicago Exhibition.—The Collection exhibited at the Exhibition of Mining and Metallurgy, London, 1890, was revised and augmented for the Chicago Exhibition.

Stores.—The Palaeontological stores have been re-examined, mostly repacked, and the boxes catalogued.

Field-work.—During January last an examination was made of the Goodravale Caves, in company with Mr. John Mitchell, to whom I was indebted for very efficient assistance. I accompanied yourself on three occasions to the North Shore, on work in connection with the second Cremorne Bore; and two excursions have been made for the examination of Aboriginal Idiographic Carvings, viz., to the Hawkesbury and Cockle Creek, a branch of Cowan Creek.

In conclusion I have to express my cordial appreciation of the assistance rendered me by the Assistant, Mr. W. S. Dun, who has taken part in most of the investigations detailed above. Mr. Dun has published one paper in the Geological Records, viz.—

Notes on the Teeth known as *Sceparnodon Ramsayi*, Owen (*Phascolonus gigas*, Lydekker), Vol. iii, pt. 1, pp. 25–28, pl. 6.

I have, &c.

R. ETHERIDGE, JUN.

Fossils registered during 1892:—

Formation.	Locality.	Donor or Collector.
Palaeozoic	White Cliffs Opal Fields	C. Cullen.
Silurian <i>Linguloceras</i>	Sandhurst	W. W. Froggatt.
"	Wellington Caves	J. Sibbald.
Devonian, "Erratics"	Sloan's Paddock, Woodville	T. W. E. David.
Carboniferous	Parish of Babbingboon, County of Parry	G. A. Stonier.

Recent, Aboriginal remains	Rosebrook Caves, Cooma	S. Elphick.
"	Jerusalem Bay, Cowan	R. Etheridge.

APPENDIX 8 A.

Annual Report of the Librarian for the Year 1892.

Sir, Geological Survey, N.S. Wales, Department of Mines, Sydney, 5 Jan., 1893.

I have the honor to herewith report on the Work performed in the Departmental Library since January 1st, 1892.

During the year 102 volumes and pamphlets have been received, of which 35 were purchased, and the remainder, 67, presented. Of Societies' Proceedings, Reports, and Serial publications, 1,417 parts have been acquired, 323 by purchase and 1,094 as presentations, giving a total of 358 purchases and 1,161 presentations; or a grand total of 1,548 books throughout the year.

The Library is now in correspondence with 148 Institutions, from 129 of which exchanges have been received.

An exchange of duplicates was effected with Mr. J. Kinsey, of Christchurch, N.Z., by means of which several desirable works were acquired for the Library.

All presentations have been suitably acknowledged, immediately on receipt of the present.

The general register, register of periodical publications, letter book, and invoice ledger have been regularly kept up to date.

The general library catalogue has been completed in manuscript.

The rapid increase in the Library renders it difficult to accommodate the books, and the question of a separate room for their reception will soon have to be taken into consideration. In the meantime to gain space the Palaeontological books have been placed in the Palaeontological workroom, and shelves erected for their reception.

During

During the year the following Departmental publications were distributed through the medium of the Library :—

- (1.) Records of the Geological Survey of New South Wales, Vol. ii, part 4 ; Index to Vol. ii ; Vol. iii, pt. 1.
- (2.) Memoirs of ditto. Pal. Series. No. 5, part 2 (Permo-Carboniferous Echinodermata, &c.) ; No. viii, part 2. (Catalogue of Works relating to the Aborigines, &c.)
- (3.) Annual Report of the Department of Mines and Agriculture for 1891. (To Societies and Institutions.)

I have, in conclusion, to acknowledge the very cordial and efficient assistance rendered to me by Mr. W. S. Dun.

I have, &c.,
R. ETHERIDGE, JUN.,
Librarian.

APPENDIX 9.

Progress Report by Mr. J. C. H. Mingaye, F.C.S., M.A.I.M.E., Analyst and Assayer.

Department of Mines, Geological Survey Branch, Laboratory,

Sydney, 15 February, 1893.

Sir,

I have the honor to furnish you with the following general report, showing progress made, and the work performed in the laboratory during the year 1892.

Three thousand five hundred and seventy numbered samples were received for assay and analyses. 252 complete, qualitative, and partial analyses were furnished.

The total number of assays and tests performed, exclusive of those made for gold and silver, are 467.

From 1883 to 1892, the following figures show the number of samples received in the laboratory for assay and analyses :—

Year 1883	242 samples	Year 1888	*5,245 samples.
" 1884	661 "	" 1889	3,287 "
" 1885	1,428 "	" 1890	3,323 "
" 1886	1,807 "	" 1891	4,082 "
" 1887	2,222 "	" 1892	3,570 "

* The large increase this year due to the mining boom.

The number of samples received for the year are less by 512 than those sent for the previous one, but the check work has been exceptionally heavy, over 380 check assays having been performed for gold and silver only. These samples consisted largely of average samples—concentrates, tailings, and slimes.

The analyses have largely increased in number, 252 analyses being performed this year against 145 for the previous one. A large number of these samples have been very complicated, thus taking up a large amount of time and careful work. Although the number of samples received were less than the previous year, the large amount of check assays, assays other than gold, silver, analytical work, &c., will bring the total work performed in excess of last year's. A large number of samples of artesian waters have been received from the Conservation of Water Branch, analyses furnished, and reports given as to their value for irrigation and stock purposes. The necessity for a proper and systematic examination of our artesian and inland waters, and thus obtaining their value for irrigation and stock purposes, is one of the greatest importance to the Colony ; as if the waters are proved suitable it is the means of opening up a vast amount of country which otherwise would be locked up, and the saving in time of drought of thirsty and travelling stock. This matter has received a large amount of careful attention in America and Victoria, where systematic analyses are made, and their records tabulated for the information of the public. A large amount of useful work has been performed by the Department in this direction. As an instance of the value of an analysis, I may point out that two samples of water received (Nos. 2,176 and 283), stated to be poisonous to stock, and having been the cause of the death of a large number of animals, were examined. The analyses proved them to be of a highly objectionable character, their action on stock being a strong purgative one. They were reported as being unfit for man or beast. Eighteen samples of water were examined and reported on.

A large number of samples of coal were received during the year for analyses, some sixty-eight analyses being performed. Experiments were conducted on eight samples, with a view of ascertaining if by careful washing it were possible to lower the percentage of ash in the coal. The experiments conducted were, on the whole, of a very satisfactory nature. Twenty-four analyses were made of British, foreign, and New South Wales coals, these being required for a report furnished by the Government Geologist on the value of the New South Wales coals for metallurgical purposes. An analysis was made of a portion of a meteorite found at Moonbi, near Tamworth. A greenish-coloured mineral, somewhat resembling malachite in appearance but darker in colour, was qualitatively examined, and found to be a hydrated silicate of alumina and nickel. This mineral, as far as I am aware, has not previously been found in New South Wales.

Pieces of calculi, or intestinal concretions, taken from the stomach of a horse, were qualitatively examined and reported on.

A bituminous looking substance, which is probably marsupial excrement, was submitted to a qualitative analysis.

A large number of fire-clays and other substances were received, analyses being made, and reports furnished as to their value for the manufacture of fire-bricks, and samples of beach sand, concentrates, &c., from the Richmond, Manning, and Clarence Rivers, also the Broken Hill district, were assayed for gold, platinum, and tin, some 64 samples being treated during the year.

Every care has been exercised in reducing the expenditure in the laboratory, the strictest economy being observed.

In concluding my report, I desire to thank the assistants, Messrs. White and Neilson, for the manner in which they have carried out the work entrusted to them, it having been performed in a highly satisfactory manner. Messrs. C. Hildebrandt, H. Fletcher, Doolan, and Burns have also largely contributed to their share of the work.

I have, &c.,
JOHN C. H. MINGAYE, F.C.S., M.A.I.M.E.,

The Government Geologist.

Analyst and Assayer.

APPENDIX 10.

APPENDIX 10.

Progress Report by Mr. W. S. Leigh, Superintendent of Caves.

Sir, Department of Mines, Geological Survey Branch, 28 January, 1893.

I have the honor to submit the following progress report on the caves for the year 1892:—

During the year I have inspected the following caves in connection with their general supervision, improvement works, and new discoveries, &c., viz.:—Jenolan, Wombeyan, Yarrangobilly, Wellington, Bungonia, Abercrombie, and Rosebrook.

As regards new discoveries, the most important was made at Wombeyan, the new cave being conveniently situated near the accommodation house, and in close proximity to the Wollondilly and Kooringa Caves. (See Appendix 10 B.)

It was reported to the Department, in January last, that good caves had been discovered in a belt of limestone at Rosebrook Station, near Cooma, partly on reserve No. 1,034, and partly on Mr. Harnett's property. On inspection, it was found that the only cave of any importance was situated on portion No. 125, adjoining the reserve. (See Appendix 10 A.)

This cave, although comparatively small, is strikingly pretty and interesting, and its discovery led to the belief that some of the many similar crevices noticed in the vicinity would lead to cavities equally interesting and important. As the opening up of these would entail an amount of labour, it was decided to employ two men temporarily on the work, by which means about a dozen of the most likely looking crevices were explored. In almost every instance, however, after the openings had been enlarged just sufficient to allow of a descent being made, only vertical shafts or "pipes" were found, ranging from 12 feet to 115 feet deep, and of various widths. As a rule, the deeper the shaft the more spacious became the cavity, and a few specimens of stalactitic growth were met with. As the greater portion of the limestone is private property, it could only be partially explored; but if it can be arranged (say) by an exchange of land, to have the whole reserved, it might then be advisable to resume operations in this direction.

A few fossil bones were found here, viz., those of a wombat (*Phascolumys*), a wallaby, and a native cat (*Dasyurus*), the Palæontologist states, in all probability of existing species.

The total amount collected at the different caves for the use of the magnesium light was £180 9s., and the expenditure in connection therewith as follows:—Purchase of magnesium wire, £110; purchase of new lamps and repairs, £24 2s.; total, £134 2s., leaving a profit for the year of £46 7s.

The total number of visitors to the different caves was 4,203.

Following are particulars, showing number of visitors, improvements, &c., at each of the caves, for the year 1892.

Jenolan Caves.

Number of visitors, 1,540. Most necessary improvements have been carried out in the Imperial Cave, Right Branch, which include the cutting of a track 4 feet deep, through gravel drift and stalagmitic flooring, from the "Vestry" to the "Lily of the Valley," now accessible to visitors. The erection of new guard-rails and netting at the "Alabaster Column," and "Mysteries." The replacing of old and light standards and netting by stronger material where necessary, and the building of twenty-four concrete steps. The improvements in the Wilkinson Cave have been completed, which include forty-two concrete steps, and the erection of hand-rail and netting throughout.

The track to the Nettle and Arch Caves has been made good by building eighty-four concrete steps, and erecting an iron hand-rail alongside of same. A guard-rail has also been placed at the "Look-out" in the Nettle Cave. Twelve new steps have been built at the entrance to the Elder Cave, and the gate of same rebuilt in rubble masonry.

On the 6th of April, Mr. F. J. Wilson, Assistant Keeper, reported the discovery of a passage leading from the Grand Arch to the Lucas Cave, which was inspected and approval obtained for having same opened up as an additional entrance to the Lucas Cave. It is intended to proceed with this work when the more urgent works, now in course of progress in the Imperial Cave, are completed.

Wombeyan Caves.

Number of visitors, 265. The improvement of the new cave having been approved of, tenders will be invited for the supply of the necessary ironwork, &c., directly the plan and specification of same is prepared.

Work on the proposed extension from the Wollondilly River to the caves (distance 7 miles) of the Bowral-Caves Road, has not yet been commenced. The extension was surveyed in 1891; but the making of the road was postponed for the time being, owing to the residents of another part of the district proposing another route, which would tap the Southern Railway, near Marulan. It has also been proposed to connect the Jenolan and Wombeyan Caves by a road, the survey of which has just been completed and the route marked. Distance, 45 miles 55 chains.

Yarrangobilly Caves.

Number of visitors, 746, or more than double the number recorded during the year previous. This is no doubt due to the increased attractions offered to the public by the splendid discoveries of 1891, which include the "Jersey," the "Harrie Wood," and the "Castle" Caves. The first two have been opened up and protected, and improvement works are now being proceeded with in the Castle Cave.

Two new branch roads have recently been made to the caves—one to connect with the main Tumut-Kiandra road, on the Tumut side of caves; and the other to connect with the same road on the Kiandra side. It is needless to state that the new discoveries at Yarrangobilly, coupled with the increased facilities for travelling there, will be the means of bringing these caves into much greater prominence.

Wellington Caves.

Number of visitors, 1,007. Owing to the proximity of a travelling stock reserve it was found necessary to fence in a portion of the cave reserve. A permanent water supply has also been provided for the use of the keeper and visitors. This was accomplished by sinking a well on the alluvial flat, near the keeper's cottage, about 30 feet deep, and fixing a pump on same.

The Keeper has succeeded in recovering a good number of fossil bones from excavations made in the caves, which were forwarded to the Department.

Bungonia Caves.

Number of visitors, 85. Owing to the action of a selector, through whose land the caves road runs, in obstructing the road, a number of intending visitors were on different occasions prevented from visiting the caves. On the matter being referred to the Department of Lands the selector was warned that his actions were illegal, and if persisted in other steps could be taken.

Abercrombie Caves.

Number of visitors, 510, showing a large increase on the previous year. A number of iron staircases have been provided and guard-rails erected at some of the most dangerous places along the creek which flows through the main cave.

Bendithera Caves.

Number of visitors, 50. It is intended to carry out some necessary improvements at these caves when particulars of same are obtained.

The Government Geologist.

I have, &c.,

W. S. LEIGH,

Superintendent of Caves.

APPENDIX 10A.

Newly-discovered Caves at Rosebrook, near Cooma.

Sir,

Geological Survey, Department of Mines, Sydney, 12 April, 1892.

I have the honor to report having, as requested, inspected the caves recently discovered at Rosebrook, near Cooma.

I was accompanied by Messrs. E. H. Harnett and Haslingden, of Rosebrook Station, who kindly provided assistance, and the necessary material required for effecting a descent into the caves. They are situated in the Parish of Woolumla, County of Beresford, and within $2\frac{1}{2}$ miles of the Bunyan Railway Station, and 9 miles from Cooma, easily accessible by a first-class road. The limestone in the locality is 30 or 40 chains wide, and running south crops up at intervals for a distance of about 4 miles.

From the vicinity of the cave openings, which are on high ground about 100 feet above the railway, or 2,540 feet above sea level, an extensive and picturesque view is obtained of surrounding undulating plains, dotted here and there with homesteads, and backed in every direction by lofty mountain ranges.

Four openings in the limestone in close proximity to each other which may lead to caves are known, two of the principal being not more than 6 chains apart. The first is situated on the Limestone Reserve, No. 1,034, 30 chains north, 80° east of the south-west corner of that reserve. This cavity is about 10 feet in length by 2 feet in width, and is formed by a fracture in the limestone boulders, the lower parts of which meet and become wedged together at 5 feet below the surface, terminating in a hole less than 1 foot in diameter. A stone dropped into this opening can be heard falling for several seconds, and it is evident from the nature of the sounds produced that there are large cavities below. An entrance cannot be effected into this cave before the boulders which block up the mouth are removed, an undertaking comparatively easy of accomplishment in the hands of a practical miner.

The other opening is situated within the adjoining portion, No. 125, M. Harnett's Conditional Purchase, 81,594, 220 acres, and about 6 chains due south of the one just referred to. The top layer of rocks having been removed, the opening is now 6 feet square on the surface, and an almost vertical shaft, 80 feet deep, has to be negotiated with the aid of ropes before the main cave is reached. At 20 feet below the surface the shaft narrows considerably, the hole at this point becoming circular, and not more than 2 feet 6 inches in diameter. Descending 30 feet more through this natural funnel a landing is made on a narrow ledge of rock projecting over an immense cavity. After a further descent of 32 feet into space the floor of the main cave is reached. This, the largest chamber of the series, averages about 30 feet in length by 20 feet in width, and in places over 30 feet in height. The floor immediately below the entrance shaft is covered with limestone debris, its sombre appearance being in marked contrast to the other portion, which is thickly covered with some of the prettiest forms of stalagmitic growths.

An embankment at each end, the full width of the chamber, is coated with a pure white coral-like formation. From the roof and rugged projections of the walls depend long tapering stalactites and "shawls," here and there relieved by patches of crystallised and ripple-marked rock.

Leaving this chamber at the northern end, over a gently-sloping embankment, and following a generally north-westerly course, a series of narrow, circuitous passages are traversed for a distance of 50 feet. The whole surface of the passage—floor, roof, and sides—is one mass of white glistening calcareous growths. At present it is impossible to travel through this part of the cave without damaging, to some extent, the brittle ornamental excrescences projecting in all quarters. Emerging from the passage, a grotto about 20 feet in length by 8 feet wide is entered, which, so far as at present known, forms the terminal chamber and the prettiest part of the whole cave. It might well be termed the Coral Grotto, as about one-half the floor surface represents exactly a bed of pure white and very delicate coral. It also contains some fine specimens of "shawls" and other drapery-like hangings intermixed with other long and tapering stalagmitic growths. These being mostly pure white and sparkling, stand out in bold relief on one side of the chamber against a ripple-marked, chocolate-coloured wall, the contrast producing a pleasing effect.

The cave, on the whole, although not very spacious, is strikingly pretty and interesting, and can be traversed from the entrance a distance of about 130 feet. Small openings are met with at different points, which, if opened out, might lead to other branches.

A striking feature of the cave is the great amount of white coral-like growths met with all over the stalagmitic floors. As regards this class of formation, considering its size, it compares most favourably with any of the other known caves. This cave alone, if opened up, will be well worth a visit, and if the openings on the reserve be enlarged, other good caves, probably more extensive than the one explored, may be met with. In that case the Rosebrook Caves, on account of their proximity to a railway station and the town of Cooma, would certainly become a popular resort for sight-seers.

The limestone in the locality does not appear to be very fossiliferous, the specimens obtained being few and far between.

Elsewhere certain recommendations are submitted for carrying out exploration works on the reserve and other matters in connection therewith.

The Government Geologist.

I have, &c.,

W. S. LEIGH,

Superintendent of Caves.

APPENDIX

APPENDIX 10B.

Report on newly-discovered cave at the Wombeyan Caves.

Sir,

Geological Survey Branch, Department of Mines, 12 December, 1892.

I have the honor to report, as requested, on the newly-discovered cave at the Wombeyan Caves. The cave was discovered by Mr. P. Kelly, of Taralga, and further explored by Mr. M. Chalker, Keeper of the Caves. It is situated on the brow of the hill, near the Wollondilly and Kooringa Caves, being only 2 chains distant from the latter, the entrance of which is very conveniently situated about 20 chains south-west of the Accommodation House.

The passage from the surface to the main part of cave dips at an angle of about 60 degrees, the first 45 feet of which, running mostly through red earth, is very tortuous, and about as large as a good-sized wombat's hole, which it closely resembles. Beyond this, a large fissure in the limestone is traversed, in a stooping posture, a distance of 20 feet, when the main chamber is reached. This cavity is almost circular and dome-shaped, with an average diameter of 40 feet, and in height about 50 feet to top of dome. The floor is made up of a chaotic mass of immense boulders, which have become detached from the ceiling and walls of the cave, the most recently fallen being still coated with the red earth which fills the joints in the parent mass. The rest, having become cemented together by the lime-charged water, have a complete stalagmitic coating, which, unlike that in any of the other caves here, is glistening black in colour. This peculiarity forms one of the principal features of the Jersey Cave, Yarrangobilly, and was attributed, after analysis, to the exuvia of bats.

The walls of the "dome" are of a reddish tint, relieved at intervals with patches of pure white calcareous growths, producing a striking and pleasing contrast. On the north-eastern portion, from a fissure in the rock about 20 feet above the floor, depend a series of graceful circular canopies formed of large fluted stalactites, each successive deposit dipping and projecting beyond the former, the covering layer hanging in drapery-like folds, trailing on the floor of the cave. Immediately beneath the eastern end of canopies is an alabaster-like column, 2 ft. 6 in. in diameter, apparently supporting the stalactitic group overhead.

The western wall is partly covered with pretty shawl-like hangings, not more than $\frac{1}{4}$ inch in thickness, the intervening spaces being studded with long tapering stalactites.

On the south-western side of the "dome," at about 10 feet above the floor, is an immense horizontal fissure, running back about 20 feet, with an average width of 30 feet and 5 feet in depth, which forms a beautiful grotto. In addition to groups and rows of fine glistening stalactites, depending from the lines of fracture in the ceiling which intersect each other at various angles, this grotto contains specimens of dripstone growths which in their delicate construction could hardly be excelled. Stalactites not thicker than a straw reach to within a few inches of the floor, 4 and 5 feet in length; others have united with the floor, and form needle-like pillars. In the latter instances it would appear that the drip of water through the limestone roof has been so minute, and so highly charged with lime, that no part of it has left the stalactite; consequently the usual accompanying stalagmite, numerous specimens of which occur on the same bed, does not appear, and, as a result, these slender "pipes" are of a uniform thickness throughout.

Intermixed with these are numerous specimens of the "Mystery" type of formation, these lateral growths assuming spiral and various contorted forms.

A portion of the floor of the grotto is coated with glistening black matter of the same composition as that before referred to.

Running in a southerly direction, on a level with the floor of the "dome," is another winding passage, about 20 feet in length, by which a small but very pretty bell-shaped bower is reached. It is packed with stalactitic growths of various designs, and, as far as recent explorations have brought to light, forms the terminus of the new cave. Another passage was discovered and traversed for a considerable distance, when further progress was stopped by fallen debris, the removal of which would entail a large amount of labour.

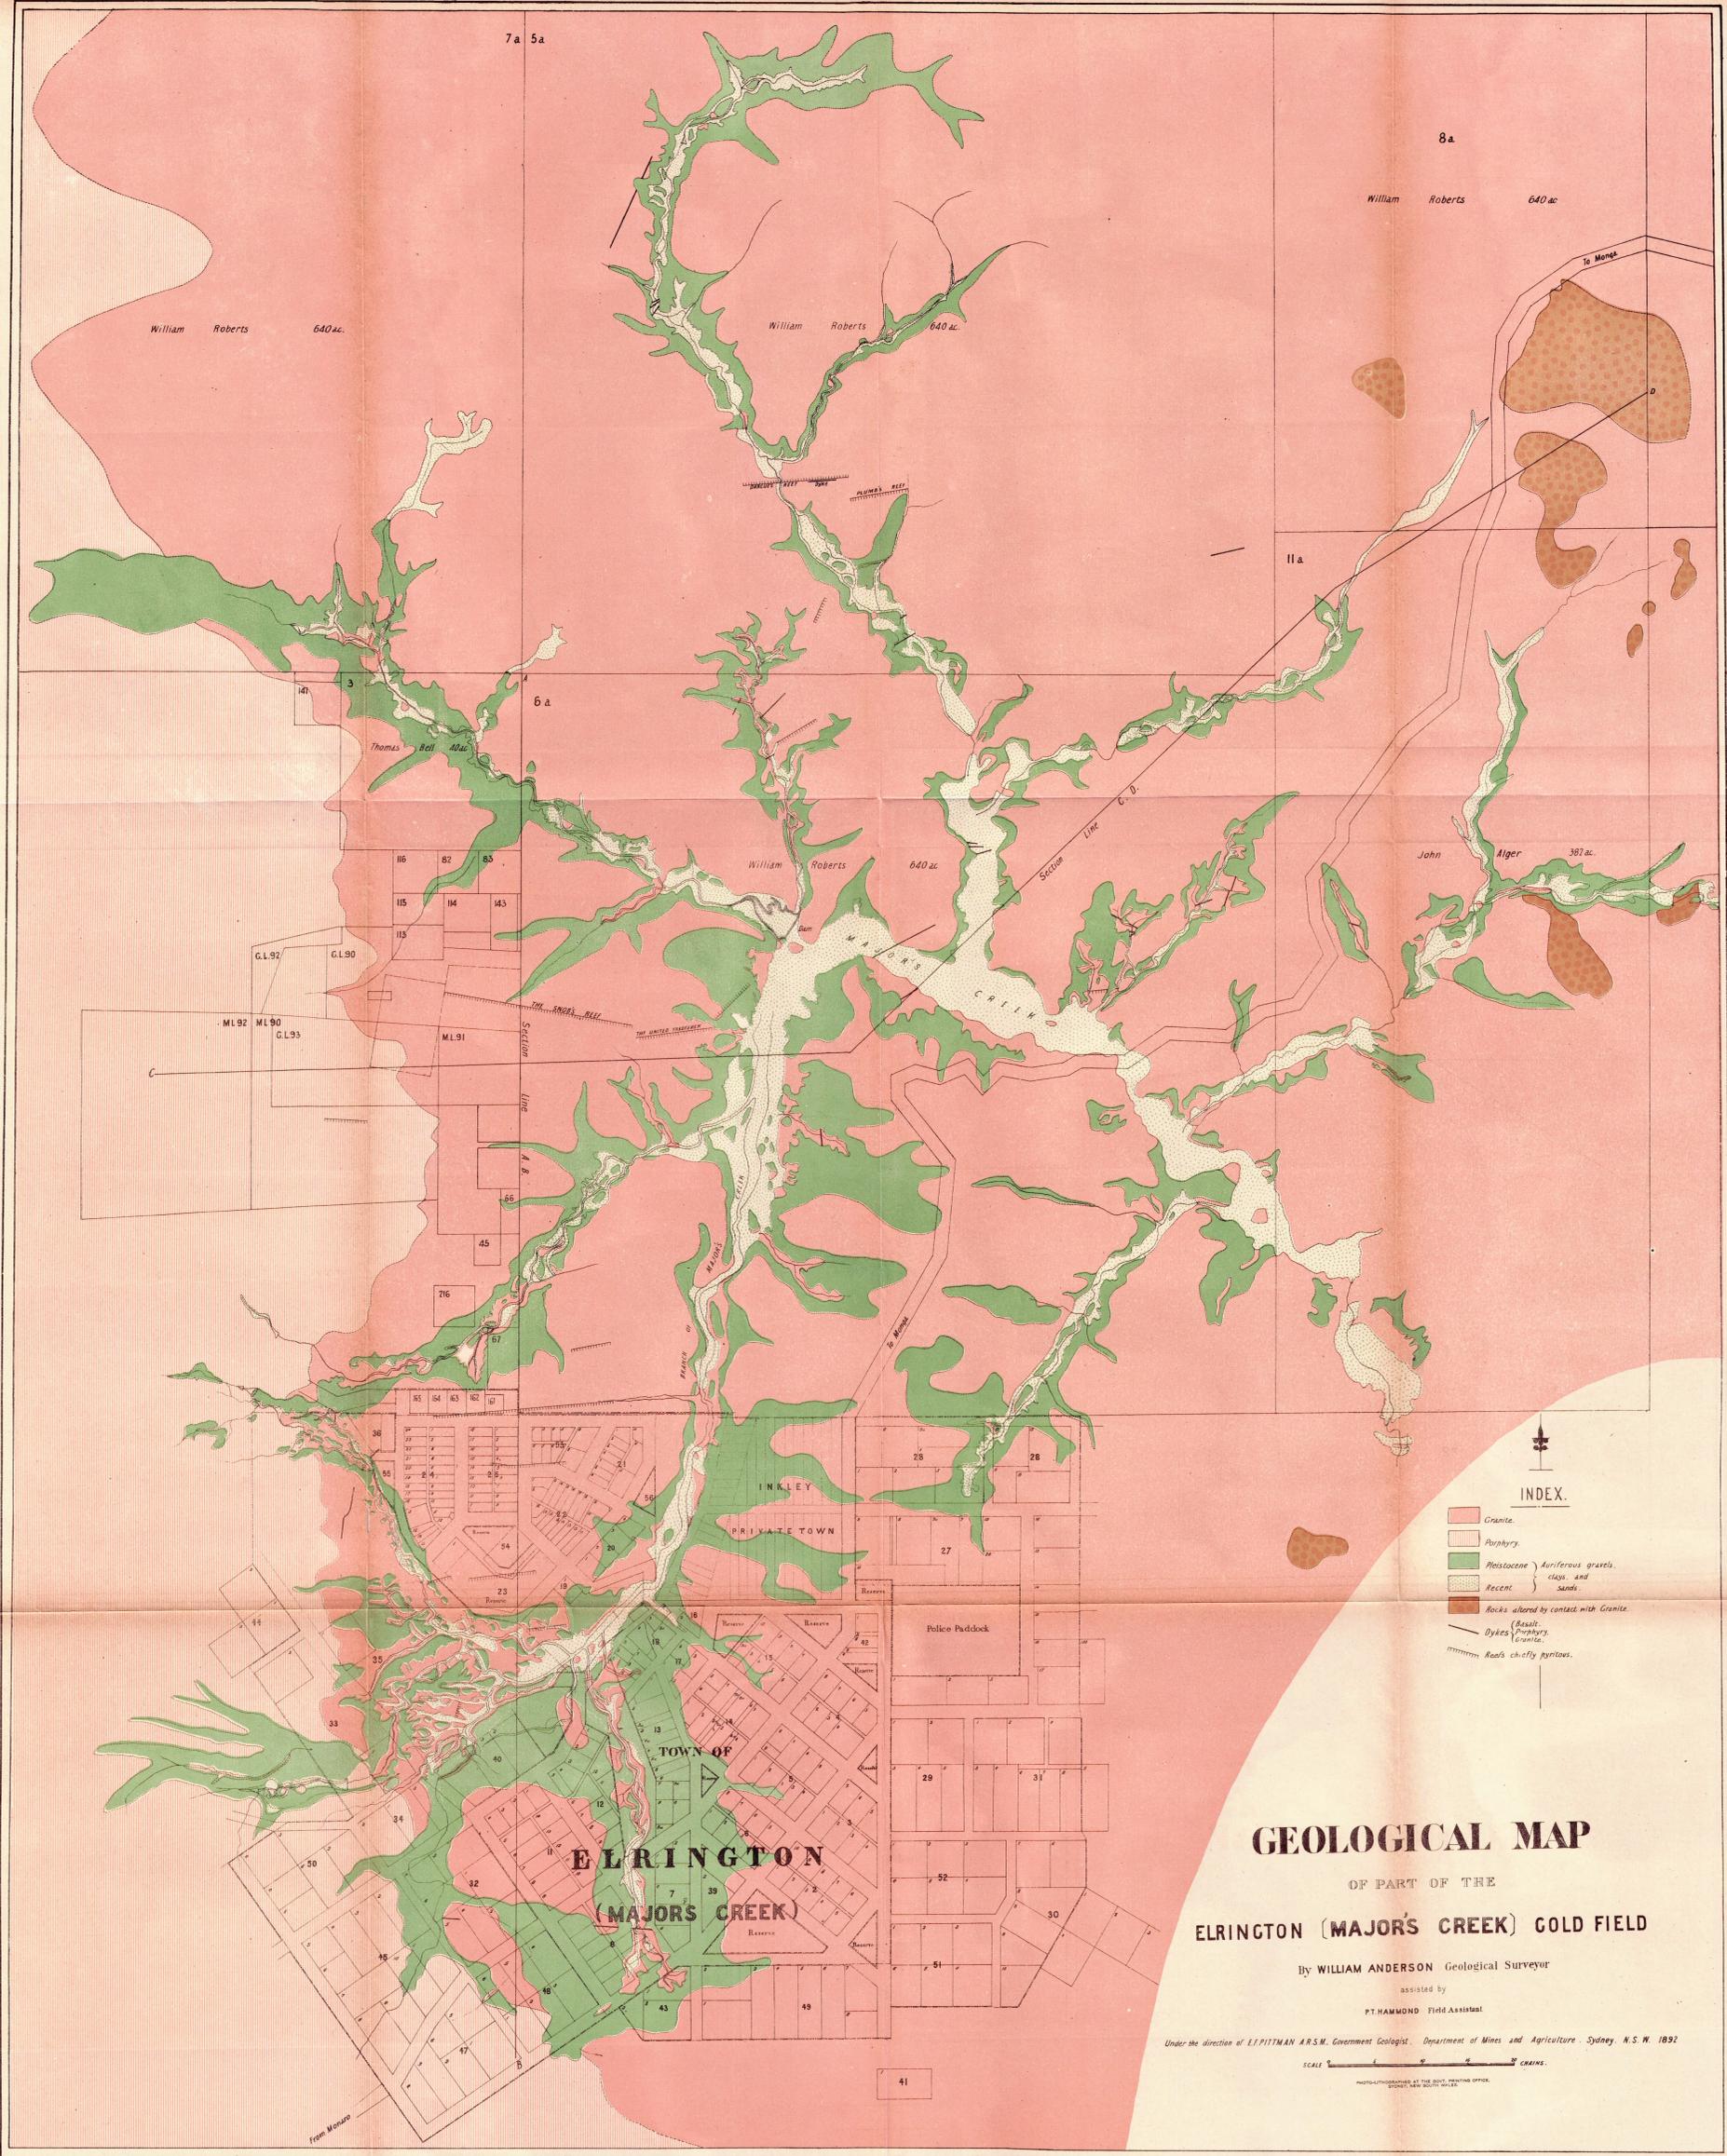

On the whole this cave will prove a good addition to the series of splendid caves now open to the public at Wombeyan; and I would recommend that it be opened up and the necessary improvements carried out at an early date, plan and specification of which will be submitted in due course.

I have, &c.,

W. S. LEIGH,

Superintendent of Caves.

REPORT

OF

BOARD APPOINTED TO INQUIRE INTO THE PREVALENCE
AND PREVENTION OF LEAD POISONING

AT THE

BROKEN HILL SILVER-LEAD MINES

TO THE

HONORABLE THE MINISTER FOR MINES AND AGRICULTURE.

ORDERED BY THE LEGISLATIVE ASSEMBLY TO BE PRINTED,
25 *May*, 1893.

SYDNEY : CHARLES POTTER, GOVERNMENT PRINTER.

1893.

LEAD POISONING INQUIRY BOARD.

MINUTES OF MEETINGS.

MONDAY, 20 JUNE, 1892.

The Board met in the Council Chamber, which was courteously granted by the Mayor and Aldermen of Broken Hill for the purposes of the inquiry.

PRESENT:—

J. Ashburton Thompson, Esq., M.D., D.P.H., Chairman,
W. M. Hamlet, Esq., F.I.C., F.C.S. | R. Sleath, Esq.,
J. Howell, Esq.

The Chairman opened the proceedings by describing the way in which the appointment of the Board had been made, and stating in general terms the nature of the inquiry with which it was charged. Attention was drawn to the subject of lead poisoning in the mines of the Albert Mining District through a question asked by Mr. Cann, M.L.A., on the 16th of August, 1891. The Chairman himself, in his capacity of Chief Medical Inspector of the Board of Health, made a sanitary inspection of Broken Hill during his return from Europe, beginning on the 3rd October, 1891, and pointed out that there had been four deaths from lead poisoning during the year 1890. He also drew attention to the importance of making inquiry into the matter. The then Minister for Mines (the Hon. Sydney Smith), made a Cabinet Minute on the 28th September, 1891 (*See Appendix A*), in which he proposed that a Board should be appointed consisting of a medical man, an analytical chemist, and a representative of the miners. Accordingly, the Minister for Mines (the Hon. T. M. Slattery), requested the Board of Health to nominate a medical man and an analytical chemist, and the Amalgamated Miners' Association to nominate a representative of the miners. The Miners' Association, through their President, Mr. M. Bourke, nominated Mr. R. Sleath, District Secretary of the Amalgamated Miners' Association; the Board of Health nominated Dr. Ashburton Thompson and Mr. W. M. Hamlet. Then, on the 3rd May, 1892, the Hon. Secretary of the Barrier Ranges Mining Companies' Association, Mr. W. Knox, addressed the Minister for Mines requesting that a representative of the Mining Companies' Association might be appointed to sit on the Board. The Association was requested by the Minister to nominate a representative from among the mine managers, and on the 23rd May the Mining Companies' Association nominated Mr. John Howell, general manager of the Broken Hill Proprietary Mine, to represent the proprietors. Accordingly, on the 23rd May, Mr. Howell was appointed by the Minister for Mines to represent that Association on the Board.

The Board then proceeded to consider the course of procedure to be followed in conducting the inquiry.

It was thought desirable to visit the leading mines of the District, in the first place, and the following were selected for inspection by the Board in the order named:—The British and Block 14 on Tuesday, Block 10 and the Central on Wednesday, the Proprietary Company on Thursday, and the South Broken Hill on Friday, the Secretary being instructed to write to the managers of the several companies requesting permission to visit their mines.

It was also decided to write to the managers of the different mining companies referred to, requesting them each to furnish a statement showing the number of hands employed in the various departments of each mine during the years 1890 and 1891, under classes such as miners, truckers, platmen, feeders, smelters, and others, including tradesmen; also a brief description of the general character and lead contents of the ore treated during the two years 1890 and 1891, together with the quantities of ore raised during that period; and the Secretary was instructed accordingly.

The next question dealt with was that of taking evidence; and it was resolved to begin taking evidence on Monday, 27th instant, the Secretary being instructed to call the following witnesses for that date:—Mr. P. O'Donnell, secretary of the Surface Branch of the Amalgamated Miners' Association; Mr. A. J. O'Connell, secretary of the Underground Branch of the Amalgamated Miners' Association; and Mr. J. Triplett, secretary of the S.C. and S.H. Union.

The question whether Press representatives should be admitted to the meetings during the examination of witnesses having been raised, the Board unanimously resolved that its duties would not be facilitated, and might be impeded, if its proceedings were reported piecemeal, and therefore that the Press should not be admitted.

The Board then adjourned.

TUESDAY, 21 JUNE, 1892.

The Board met by appointment at 10 o'clock, a.m.

PRESENT :—

J. Ashburton Thompson, Esq., M.D., D.P.H., Chairman.
W. M. Hamlet, Esq., F.I.C., F.C.S. | R. Sleath, Esq.,
J. Howell, Esq.

Proceeded to the office of the British Company, where they were courteously received by the manager, Mr. Cecil Morgan, and were by that gentleman escorted through the workings of the mine.

At 2 o'clock the Board paid a visit to Block 14 Silver-mining Company's Mine. The manager, Mr. Z. Lane, was not in his office, and the Chairman of the Board was informed by the officer in charge, Mr. Roddar, that Mr. Lane had gone rifle-shooting, and had left instructions that no one was to be allowed to go down the mine in his absence. The Board therefore returned to the office at the Town Hall, and made arrangements for the business of the following day.

The Secretary reported that in accordance with instructions he had written to the managers of Block 10 and the Central, asking permission for the Board to visit those mines, and had received favourable replies from them.

It was accordingly resolved to visit Block 10 Mine at 10 a.m. on the following day, and the Central in the afternoon at 2.30.

The Secretary was instructed to ascertain the names and addresses of the secretaries of the various local benefit societies with a view of calling them as witnesses.

The Board then adjourned.

WEDNESDAY, 22 JUNE, 1892.

The Board met by appointment at 9.45 o'clock, a.m.

PRESENT :—

J. Ashburton Thompson, Esq., M.D., D.P.H., Chairman,
W. M. Hamlet, Esq., F.I.C., F.C.S. | R. Sleath, Esq.

Mr. Howell was absent in consequence of his attendance being required at the Assessment Appeal Court.

The Board visited Block 10 Mine, and were escorted through the workings by the manager, Mr. John Warren.

It had been arranged to visit the Central Mine in the afternoon, but during the forenoon a letter was received from the manager, Mr. R. Adams, intimating that he would be engaged at the Assessment Court, and asking that the Board would appoint some other day.

The Secretary was instructed to write Mr. Adams asking if Saturday forenoon would be convenient.

The Board then adjourned.

THURSDAY, 23 JUNE, 1892.

The Board met by appointment at the Proprietary Company's office at 10 o'clock, a.m.

PRESENT :—

J. Ashburton Thompson, Esq., M.D. D.P.H., Chairman.
W. M. Hamlet, Esq., F.I.C., F.C.S. | R. Sleath, Esq.,
J. Howell, Esq.

The forenoon was occupied in travelling through the underground workings of the mine, more particularly the lead stopes.

In the afternoon the Board were shown over the extensive surface works, and inspected the smelting furnaces, the concentrating and leaching machinery, and the newly-erected amalgamating plant.

The Board then adjourned.

FRIDAY, 24 JUNE, 1892.

The Board met by appointment at 9.30, o'clock, a.m.

PRESENT :—

J. Ashburton Thompson, Esq., M.D., D.P.H., Chairman.
W. M. Hamlet, Esq., F.I.C., F.C.S. | R. Sleath, Esq.,
J. Howell, Esq.

Mr. Howell explained that he would be engaged during the day at the Assessment Court. The other members of the Board subsequently visited South Broken Hill Mine. They were met at the office by the manager, Mr. J. M'Kay, and were shown through the underground workings of the mine, and also the surface works.

The Secretary was instructed to call two additional witnesses for Monday, viz., Mr. B. Hoddinott, secretary of the Broken Hill Lodge, No. 65, I.O.O.F., and Mr. H. Inmann, Secretary, Bourke Lodge, I.O.O.F.; and for Tuesday to summons the following:—J. Pedler, secretary of the Picton Lodge, I.O.O.F.; D. Townsend, secretary of the Manchester Unity Lodge, I.O.O.F.; G. Howard, secretary of the Foresters' Society; B. Brittan, secretary of the Druids Society; Charles Wort, secretary, Imperial Lodge, I.O.O.F.; and E. Archibald, Grand United Lodge, I.O.O.F.

The Board then adjourned.

SATURDAY,

SATURDAY, 25 JUNE, 1892.

The Board met by appointment at 10 o'clock, a.m.

PRESENT :—

J. Ashburton Thompson, Esq., M.D., D.P.H., Chairman.

W. M. Hamlet, Esq., F.I.C., F.C.S. | R. Sleath, Esq.

Proceeded to the Central Company's Mine. Were met at the Company's office by Mr. Randolph Adams and escorted through the underground workings of the mine. The Board subsequently spent some time in examining the surface works and machinery.

The Board then adjourned.

MONDAY, 27 JUNE, 1892.

The Board met at 10.30. o'clock, a.m.

PRESENT :—

J. Ashburton Thompson, Esq., M.D., D.P.H., Chairman.

W. M. Hamlet, Esq., F.I.C., F.C.S. | F. Sleath, Esq.,

J. Howell, Esq.

The following witnesses were examined :—A. J. O'Connell, secretary, Underground Branch of the Miners' Amalgamated Association of Broken Hill; J. Thomas, president of the District Branch of the Amalgamated Miners' Association; J. Triplett, secretary of the S.C. and S. Union; P. O'Donnell, secretary of the Smelters' Branch of the A.M.A.; and S. H. Alker, Inspector of Nuisances.

It was arranged to call the managers of Block 14, Block 10, the Central and the South Mines, and the underground manager and metallurgist of the Proprietary Mine as witnesses for Wednesday, and the Board then adjourned until 11 o'clock, a.m., the following day.

TUESDAY, 28 JUNE, 1892.

The Board met at 11 o'clock, a.m.

PRESENT :—

J. Ashburton Thompson, Esq., M.D., D.P.H., Chairman.

W. M. Hamlet, Esq., F.I.C., F.C.S., | R. Sleath, Esq.,

J. Howell, Esq.

The following witnesses were examined :—G. Howard, secretary of Court Stuart, Ancient Order of Foresters; John Hines, secretary of the Broken Hill Branch of the H.A.C.B. Society; J. Pedler, secretary of the Picton Lodge, I.O.O.F.; R. B. Brittan, secretary of the Broken Hill Branch of the Ancient Order of Druids; W. R. Stewart, secretary of the Loyal Silver City Lodge, M.U., I.O.O.F.; E. A. Archibald, secretary of the Broken Hill Branch of the Grand United Order of Oddfellows.

Mr. B. Hoddinott, who had been asked to attend and give evidence, as the secretary of the Broken Hill Lodge, No. 65, I.O.O.F., sent, per favour of Mr. Pedler, an apology for his non-attendance, and a statement showing the number of members of his Society who had suffered from lead poisoning during the years 1890, 1891, and 1892.

The Secretary was instructed to write to the several secretaries of the benefit societies who had been examined asking them to furnish additional particulars on the subject of lead poisoning, showing the proportion of such cases to the number of members enrolled and working in the mines during the years 1890, 1891, and 1892, &c.

The Board then adjourned until 11 o'clock the following day.

WEDNESDAY, 29 JUNE, 1892.

The Board met at 11 o'clock, a.m.

PRESENT :—

J. Ashburton Thompson, Esq., M.D., D.P.H., Chairman.

W. M. Hamlet, Esq., F.I.C., F.C.S. | R. Sleath, Esq.

J. Howell, Esq.

The Secretary reported that a letter had been received from Mr. R. Adams, manager of the Central Mine, stating that he could not attend to give evidence on this date owing to his presence being required at the Assessment Court, and a similar communication was received through the telephone from Mr. Lane, manager of Block 14.

The following witnesses were examined :—Thomas P. Uren, underground manager of the Proprietary Company; J. Koehler, metallurgist of the Proprietary Company; Andrew Eddy, miner; John Warren, manager of Block 10 Mine; Wm. Strachan, miner.

The Board then adjourned until Friday, the 1st proximo, at 11 o'clock.

FRIDAY, 1 JULY, 1892.

The Board met at 11 o'clock, a.m.

PRESENT :—

J. Ashburton Thompson, Esq., M.D., D.P.H., Chairman.

W. M. Hamlet, Esq., F.I.C., F.C.S. | R. Sleath, Esq.

J. Howell, Esq.

The following witnesses were examined :—J. B. Doolotte, Assistant Town Clerk, Broken Hill; S. Brenton, miner; Cecil C. Morgau, manager of the British Mine; J. McKay, manager of the South Mine; B. B. Hoddinott, secretary of the Broken Hill Lodge No. 65, I.O.O.F.; Wm. Curganven, miner; M. Ormsby, miner.

The Board then adjourned.

MONDAY,

MONDAY, 4 JULY, 1892.

The Board met at 11 o'clock, a.m.

PRESENT:—

J. Ashburton Thompson, Esq., M.D., D.P.H., Chairman.

W. M. Hamlet, Esq., F.I.C., F.C.S.

The Chairman explained that the strike of miners and others engaged in the Barrier Mines would in all probability prevent Mr. J. Howell, as general manager of the Proprietary Company, and Mr. R. Sleath, as district secretary of the Amalgamated Miners' Association, taking part in the proceedings of the Board at this stage. Accordingly, he suggested that, as arrangements had been made for the examination of several medical men and certain Government officers, the evidence of these witnesses might be taken by the members of the Board now present, and that then the inquiry should be adjourned until a future day to be appointed; the evidence already taken to be in the meantime transcribed, printed, and proof copies forwarded to the witnesses, and the local members of the Board.

It was agreed to carry out the arrangement suggested by the Chairman, subject to the approval of the other members, but to call only such witnesses as could be depended upon to appear again before the Board some weeks later for cross-examination, if necessary, by the members now absent.

The Secretary communicated these messages to Messrs. Howell and Sleath. Mr. Sleath expressed himself well satisfied with the course proposed to be adopted, which suited his convenience under the circumstances. He proposed to call a number of witnesses who could speak from experience as to the effects of lead poisoning in the district. Subsequently, Mr. Sleath wrote to the Secretary to the same effect, and drew attention to the necessity of meeting again at some future date to take further evidence. A letter was received from Mr. Howell, also expressing concurrence in the course proposed, and his intention to call several witnesses.

The following witnesses were examined:—J. Hebbard, inspector of mines; F. Whysall, telegraph-master, Broken Hill.

The Board then adjourned.

TUESDAY, 5 JULY, 1892.

The Board met at 11 o'clock, a.m.

PRESENT:—

J. Ashburton Thompson, Esq., M.D., D.P.H., Chairman.

W. M. Hamlet, Esq., F.I.C., F.C.S.

The following witnesses were examined:—Dr. J. F. Bartley, Dr. Belgrave, Dr. Blaxland.

The Board then adjourned.

WEDNESDAY, 6 JULY, 1892.

The Board met at 11 o'clock, a.m.

PRESENT:—

J. Ashburton Thompson, Esq., M.D., D.P.H., Chairman.

W. M. Hamlet, Esq., F.I.C., F.C.S.

The following witnesses were examined:—Dr. H. J. F. Groves, Dr. E. Govett.

The Board then adjourned.

THURSDAY, 7 JULY, 1892.

The Board met at 11 o'clock, a.m.

PRESENT:—

J. Ashburton Thompson, Esq., M.D., D.P.H., Chairman.

W. M. Hamlet, Esq., F.I.C., F.C.S.

The following witnesses were examined:—Dr. J. T. Harvey, Mr. D. Parr, veterinary surgeon.

The Board then adjourned.

FRIDAY, 8 JULY, 1892.

The Board met at 11 o'clock, a.m.

PRESENT:—

J. Ashburton Thompson, Esq., M.D., D.P.H., Chairman.

W. M. Hamlet, Esq., F.I.C., F.C.S. | R. Sleath, Esq.

The following witnesses were examined:—Mr. A. N. Barnett, warden; Mr. J. Melville, veterinary surgeon; Dr. F. C. Evill; and Dr. C. E. Thompson.

The Board then adjourned *sine die*.

SATURDAY, 14 JANUARY, 1893.

The Board met by appointment at 11 o'clock, a.m.

PRESENT:—

J. Ashburton Thompson, Esq., M.D., D.P.H., Chairman.

W. M. Hamlet, Esq., F.I.C., F.C.S. | J. Howell, Esq.

J. Thomas, Esq.

The further proceedings of the Board were discussed at length.

The further evidence necessary to be called was settled.

The Board resolved to visit the British Blocks Silver Mine on Monday next, at 11 o'clock a.m.

The Secretary was instructed to inform the manager, Mr. Cecil Morgan, of the proposed visit.

The Board then adjourned.

TUESDAY,

TUESDAY, 17 JANUARY, 1893.

The Board met by appointment at 11 o'clock, a.m.

PRESENT :—

J. Ashburton Thompson, Esq., M.D. D.P.H., Chairman.
 W. M. Hamlet, Esq., F.I.C., F.C.S. | J. Howell, Esq.
 J. Thomas, Esq.

The following witnesses were examined :—C. Lawrey, tapper; J. Dimpsey, feeder; H. Barnet, tapper; J. Cogan, feeder; S. Seymore, feeder.
 The Board then adjourned.

WEDNESDAY, 18 JANUARY, 1893.

The Board met by appointment at 11 o'clock, a.m.

PRESENT :—

J. Ashburton Thompson, Esq., M.D., D.P.H., Chairman.
 W. M. Hamlet, Esq., F.I.C., F.C.S. | J. Howell, Esq.
 J. Thomas, Esq.

The witnesses through a misunderstanding failed to appear.
 The Board discussed the proposed recommendations for the prevention of lead poisoning, drawn up by the Chairman.
 The Board then adjourned.

THURSDAY, 19 JANUARY, 1893.

The Board met by appointment at 11 o'clock, a.m.

PRESENT :—

J. Ashburton Thompson, Esq., M.D., D.P.H., Chairman.
 W. M. Hamlet, Esq., F.I.C., F.C.S. | J. Howell, Esq.
 J. Thomas, Esq.

The following witnesses were examined :—Wm. Gilbert, Francis Daykin, James Henry Christopher T. Ellery, underground miners.
 The recommendations, as amended, were further discussed.
 The Board then adjourned.

FRIDAY, 20 JANUARY, 1893.

The Board met by appointment at 11 o'clock, a.m.

PRESENT :—

J. Ashburton Thompson, Esq., M.D., D.P.H., Chairman.
 W. M. Hamlet, Esq., F.I.C., F.C.S. | J. Howell, Esq.
 J. Thomas, Esq.

The proposed recommendations, for prevention of lead poisoning, drawn up by the Chairman, were further discussed.
 The Secretary was instructed to inform Messrs. Morgan and Lane that the Board would visit their mines on 23 January, at 11 a.m.
 The Board then adjourned.

SATURDAY, 21 JANUARY, 1893.

The Board met by appointment at 11 o'clock, a.m.

PRESENT :—

J. Ashburton Thompson, Esq., M.D., D.P.H., Chairman.
 W. M. Hamlet, Esq., F.I.C., F.C.S. | J. Howell, Esq.
 J. Thomas, Esq.

The Chairman resubmitted the proposed recommendations, with amendments, for further consideration, and they were considered.
 The Board then adjourned.

MONDAY, 23 JANUARY, 1893.

The Board met by appointment at 10:30 o'clock, a.m.

PRESENT :—

J. Ashburton Thompson, Esq., M.D., D.P.H., Chairman.
 W. M. Hamlet, Esq., F.I.C., F.C.S. | J. Thomas, Esq.

The Board proceeded to Block 14; but Mr. Z. Lane, the manager, refused to allow them to inspect the mine. The Board then retired and proceeded to the manager's office at the British Blocks. The manager was not there. The Board went on to the mine and inspected the surface workings, but upon requesting the braceman to send them down the mine he refused.

The Board then adjourned.

TUESDAY,

S,

TUESDAY, 31 JANUARY, 1893.

The Board met by appointment at 9:30 o'clock, a.m.

PRESENT:—

J. Ashburton Thompson, Esq., M.D., D.P.H., Chairman.
 W. M. Hamlet, Esq., F.I.C., F.C.S. | J. Thomas, Esq.

As Messrs. Lane and Morgan, managers of the Block 14 and British Blocks Silver-mine respectively, had written to the Chairman, intimating that they had withdrawn all opposition to the Board visiting their mines, it was resolved to proceed to the above mines. Mr. Hebbard, the Inspector of Mines, at the Chairman's request, accompanied the Board.

Block 14 was visited. The manager was not in his office and could not be found. The Board went on to the mine and made an inspection of the surface works, after which they requested the braceman to send them down the mine, but he refused.

After consultation, the Board decided that they had been again obstructed in their endeavour to act on the authority vested in them.

The Board then adjourned.

TUESDAY, 7 FEBRUARY, 1893.

The Board met by appointment at 9:40 o'clock, a.m.

PRESENT:—

J. Ashburton Thompson, Esq., M.D., D.P.H., Chairman.
 W. M. Hamlet, Esq., F.I.C., F.C.S. | J. Thomas, Esq.

The following witnesses were recalled, and examined:—Dr. T. R. Belgrave, Dr. C. E. Thompson, and Dr. W. Blaxland.

After lunch the Board, accompanied by the Mining Inspector, proceeded to Block 14 and the British Mine, and inspected the underground workings.

The Board then adjourned.

Report of a Board appointed to Inquire into the Prevalence and
Prevention of Lead Poisoning at the Broken Hill Silver-Lead
Mines.

Sir,

Sydney, April 17, 1893.

In presenting this Report I do myself the honor to make the following remarks :—

1. Unempowered as the Board were to examine witnesses on oath, it can scarcely be necessary to excuse manifest deficiencies in evidence which directly affected pecuniary interests of very unusual magnitude. Had the illness which was the subject of inquiry been either novel in kind or obscure in manifestation, it is possible that an investigation conducted under the conditions referred to might have failed altogether; it is fortunate, therefore, that lead-poisoning has been familiar from antiquity, and that its symptoms are a common-place of practical medicine.

2. The Report is not unanimously signed, and I venture to express the opinion that no other conclusion could be expected. The inquiry was really into the mode of conducting a trade-process which actually had proved harmful (it was well known) to many of the workmen engaged in it. It might have been found that every reasonable precaution to prevent injury to health had been taken already by the management on the one hand, and by the workmen themselves on the other; but whether it were so or not was the question to be judged. In consequence the representative of the Associated Mining Companies, and the representative of the Amalgamated Miners' Association, stood from the beginning in a false position; and as all who are acquainted with the history of sanitary effort against harmful trade-processes could foresee, it was probable that the latter would, and extremely likely that the former would not, feel able to accept conclusions arrived at by the disinterested and merely practical members of the Board. Thus, also, it has turned out.

I have, &c.,

J. ASHBURTON THOMPSON.

Harrie Wood, Esq.,

Under Secretary for Mines and Agriculture.

LEAD POISONING INQUIRY BOARD.

 REPORT.

To the Hon. the Minister for Mines and Agriculture,—

Sir,

March, 1893.

The constitution of this Board, appointed to gather the best information obtainable as to the amount of sickness and the percentage of deaths due to lead-poisoning under the present conditions of work at the Broken Hill silver-mines, and to recommend measures to remove the unsatisfactory state of things actually existing (*cf.* Appendix A), was completed on 28th May, 1892, by addition of Mr. John Howell, Manager of the Proprietary Mine, to represent the Associated Mining Companies. The first meeting was held at Broken Hill, on 20th June, and between that date and 1st July the full Board met nine times; the late strike was then declared, and further attendance of Mr. Richard Sleath, who represented the Amalgamated Miners' Association, and of Mr. Howell was thereby prevented. With consent of those members, however, the remainder of the Board continued to examine such witnesses as could probably be recalled when, at a future date, the full Board should meet again; but that class of evidence having become exhausted in the course of a week, farther proceedings were necessarily adjourned. On 1st December you appointed Mr. Josiah Thomas, President of the Amalgamated Miners' Association, to the seat formerly occupied by Mr. Richard Sleath, which had fallen vacant; and on 14th January the full Board reassembled. Between that date and 7th February nine meetings were held, and we now have the honour to present the following Report:—

2. The important lead-yielding properties are situated on Broken Hill itself, a low, long outcrop of manganiferous ironstone, which springs abruptly from a barren plain, and which runs north-east for a distance of about $1\frac{1}{2}$ mile. (*See map.*) This ridge is parcelled into 40-acre blocks, of which numbers 6, 7, and 8 form the South Mine; 9 the Central; 10 Block Ten; 11, 12, and 13 the Proprietary; 14 Block Fourteen; and 15 and 16 the British. The number of workmen employed on 19th December, 1892, [*See Appendix H*] was 4,445, namely, 2,345 on the surface, 1,926 underground, and 174 unclassified; and that is much below the number employed before the late strike. Smelting is carried on at all the mines except Block 10, whence ore is sent away for treatment; the total weekly output of silver-lead bullion is very great, that from the Proprietary alone (or Big Mine, as it is commonly called) being usually equivalent to more than 225,000 ounces of fine silver each week. A considerable town, officially known as Willyama, has gathered round the Hill, by which it is divided into two parts, called the north and south towns. Of these the former is the more important. The total estimated population within the municipal boundaries (12 square miles) was 22,500 at the end of 1891, the Census enumeration, taken at beginning of the second quarter of that year, having shown 19,789 persons. Only 5,000 of them live in the south town, and, as the prevailing winds are southerly, by far the greater number are thus exposed to the fumes which escape day and night without ceasing from the smelter stacks. This place is extremely remote; all supplies have to be brought by rail either from Adelaide, South Australia, or from Port Pirie in the same colony, over distances of 333 or 253 miles. Outside the town there is nothing but a waterless wilderness of salt-bush country, in which no industry can be conducted except a hazardous sheep-farming, and which in consequence is nearly uninhabited; however, there are in various directions from the Hill itself a few mines which for the present are of little significance. The climate,

climate, although extremely favourable to health from its dryness, is very hot in the summer months; and this circumstance, combined with want of wood and water, and with inefficient sanitary management has told unfavourably on the public health in past years, when the infantile mortality and the proportion of total deaths due to filth diseases were unusually high. Such information on these latter points as it has been possible to gather will be found tabulated in Appendix B.

3. The present inquiry concerns the extent to which lead poisoning occurs, not alone among the getters and smelters of silver-lead ores, but also among the townspeople who live in houses clustered round the mines and smelter-nests, who are not themselves engaged in mining. The kind of poisoning to be expected among both classes is almost exclusively of the chronic sort: this is not very often so immediately fatal that the cause of death is clearly seen to lie in it; and in fact only eleven deaths out of a total number of 2,132 have been due to it during the five years, 1888-92, in one of which no death, and in one other only a single death occurred. [*Appendix B, Table XII.*] Nevertheless lead poisoning has immediate economic and remoter social effects of serious importance. Its immediate economic importance lies in its reducing the power of effective work in persons who are still able to attend to their daily duty although suffering to some extent, and in causing repeated attacks of graver illness which incapacitate them entirely for more or fewer weeks at a time. Its remoter and less obvious social importance consists in its being attended, in persons at young ages or in the prime of life, who alone are here exposed to risk, by degenerative organic changes which are akin to those commonly observed at old ages. A branch of its social importance, equal to the former as far as it goes, but doubtless of less magnitude, is the special power possessed by lead to interfere with the procreative function; so that chronically lead-poisoned persons often produce no offspring at all, or one which dies soon after birth. All these effects are so well known and so much feared that several European Governments regard the production and use of lead with great jealousy, and have enacted searching laws to shield workmen and the public from risk of leading, in as far as they may be so protected. The qualities in virtue of which lead requires safe-guarding in its uses by man may be summarily described as follows:—

4. Lead is an irritant poison which can destroy life when it is taken in the form of a soluble salt (such as sugar of lead) and in large quantity; but even under those favourable conditions it is seldom immediately fatal. Farther, in nature this metal occurs in nearly insoluble forms, in which also it is used in various arts and manufactures; and it is absorbed by those who get lead-ore, or who produce lead, or who work with materials which contain lead, in very small and scarcely appreciable quantities. Nevertheless, bad effects of a serious character are produced upon those who habitually absorb minute portions of these insoluble forms. This result is due to a power possessed by the natural juices to transform the insoluble into soluble compounds, so that they can be taken up by the blood and carried to the farthest recesses of the body; to the property lead has of then accumulating in the tissues so that the inappreciable quantities absorbed day after day presently aggregate into large and easily discoverable amounts; to its power (probably exerted directly upon the elements) of impoverishing the blood; to the irritative action it has upon the nervous structures in which it is in part deposited, and in which it produces degenerative changes; to the same action exerted on the liver, through which both nutrition and the excretion of wastes is interfered with, and on the kidneys whereby the excretion of wastes is checked, so that effete matters are retained in a degenerated blood-stream, and in their turn act as deleterious poisons. Thus it appears that lead is a slow and insidious poison, generally obscure in its earlier effects; sometimes productive of permanently diminished efficiency of vital organs.

5. In consequence, the usual effects of lead poisoning are, briefly, as shown in the following description, which is compiled from the experience of medical practitioners at Broken Hill, and mainly from the evidence appended hereto; it does not differ in any important way from similar descriptions compiled from experience got in other parts of the world, although, for reasons to be given later, it is in some respects defective. The earliest symptoms are indefinite as a rule, and such as are comprised under the word indisposition; that is to say, the appetite becomes poor, the face pallid, the bowels constipated, and the day's work is
done

done with reluctance as well as with difficulty. After a longer or shorter time, during which indigestion, a sweetish taste in the mouth, a foul breath, slightly ulcerated gums, and rheumatic pains gradually show themselves, an acute attack of colic supervenes; very severe pain is suffered for a few days, and weakness remains after the pain has been relieved; but in two or three weeks the sufferer is again able to work. If he should then resume his occupation he will most likely experience the same train of symptoms over again, and repeated attacks of colic will ensue; his digestive powers will become weaker and weaker, his pallor greater and greater, until at last he finds himself compelled to relinquish his business and to resort to some other. But too often he carries to it a broken constitution. After a time of withdrawal from influence of lead he may recover his health to a considerable extent, but seldom perfectly; the subtle degenerations of structure which have already been spoken of persist and progress; and, from vital organs becoming inadequate fully to perform their functions, he becomes prematurely aged, and liable to be carried off by one of those affections which so often are the immediate cause of death in the old, but which are usually escaped or survived by the young and vigorous. Earlier or later in the course of illness many sufferers from chronic lead poisoning get muscular paralysis in addition, of which dropped wrist, familiar to plumbers and house-painters, is an example. This paralysis is often delayed, sometimes even until exposure to the source of poisoning has ceased; and when it does appear it is often permanent. In other cases, which occur in but small proportion, the brain seems to be especially attacked, and epilepsy is caused; in yet another form, which attacks but a still smaller proportionate number of leaded persons, the sufferer continues to work, unconscious of danger, until he is suddenly struck down by an apoplectic seizure, in the course of which death ensues after a day or two. In two or three instances a form of insanity has been seen to follow here. Rheumatic pains, felt principally about the knees and legs, commonly attend upon the symptoms already mentioned, but pronounced arthritis (or chronic joint inflammation and distortion) has very seldom been observed, probably from want of opportunity to watch the more serious cases sufficiently long. Affections of the eye, not infrequently traceable to leading, have not been noticed here; and especially no case of optic neuritis has been seen among mine hands. Gout is extremely uncommon, practitioners of long experience having seen but very few cases, and those not in lead-workers alone. (Q. 1986, 2154, 2208, 2756.)

6. Thus it appears that a description of chronic lead poisoning deduced exclusively from experience gained at Broken Hill would be wanting in some details usually witnessed elsewhere; whence it becomes necessary to say a word of conditions of labour there, to which the deficiency referred to is probably due. One of those conditions lies in the circumstance that silver-lead production is a branch of mining but recently undertaken in Australia, so that the workmen employed at it are largely miners of other metals, to getting which they can sometimes revert if they get leaded. Besides this, miners of all kinds often have a trade or some occupation altogether unconnected with mining, which last they have been accustomed to follow only at intervals; this, also, opens a way of escape from an occupation which many of them find hurtful. Another important condition is that among the several mines on the line not a few yield classes of ore in which either there is little lead, or which are found to be harmless in practice; and sometimes bodies of ore which are not dangerous are met with on the same blocks with and adjoining ore-bodies of the dangerous kind, so that men who have fallen ill while working at one mine can sometimes get employment at a harmless mine without leaving the locality. Sometimes, again, there is opportunity of exchanging from underground work to safe work at the surface; or employment may be found on some of the mines off the main line, which, as a rule, yield little or no lead, or at the flux and iron-stone quarries, whence large quantities of material are being daily gathered and sent in to the Hill. All these means of relief are open to and are used by a proportion of the miners, so that there is a pretty steady stream of workmen through the more dangerous mines. If, on the one hand, however, this may prevent any large proportion of miners from becoming constitutionally wrecked by enforced long adherence to their occupation, on the other hand it must expose a much larger number of persons in the course of several years to the slighter degrees of poisoning than might be supposed after averaging the number borne on the pay-sheets for the same period.

7. At Broken Hill the proportion borne by the lighter forms of lead poisoning (colic) to those which are more obviously persistent or more immediately dangerous to life is probably 85 or 90 per cent. ; the remaining 15 or 10 per cent. being pretty equally divided between those cases in which muscular paralysis and wasting are the prominent signs, and those in which the brain is the main seat of injury. Actual figures were furnished by Dr. Bartley [*Appendix E*], who classified 294 cases of leading which were admitted to the hospital between 1st January, 1890, and 30th June, 1892, while he was house-surgeon ; 85 per cent. of them were cases of colic, 13 per cent. were cases in which the brain was chiefly affected (epilepsy, dementia, and the apoplectic form called encephalopathy), while only 2 per cent. were attended by muscular paralysis. Dr. Harvey also furnished a statement (Q. 2391), drawn, however, from a brief experience of five months duration only ; he had met with twenty cases of leading during that period of practice, of which seventeen were examples of colic, two were brain cases, and one muscular paralysis. Dr. Blaxland, who has practised here several years, furnished an estimate (Q. 2194) ; he thought that in every 100 cases 90 would be examples of colic, five would be brain cases, and five would be paralytic. The discrepancy in the proportion of colic to brain attacks, and of the latter to paralytic, between this estimate and Dr. Bartley's record, is probably due to the tendency of hospitals to attract the more urgent cases, and to the paralytic forms being of no apparent danger and unattended by great pain. Other medical witnesses agreed in general terms that the proportions mentioned are most likely correct, colic being very greatly more common than all other forms taken together. It was not thought that repeated attacks of colic usually led up to one of the other and more serious forms, but that (as one medical witness put it) patients usually "stick to their type" of illness (Q. 2673) ; but perhaps this opinion would be modified if the general conditions either obliged workmen to steadily persist in returning to work after each attack of colic, or permitted such patients as retired after suffering two or three times to be subsequently watched. However, it is well known, and is observed here, that susceptibility to lead varies very widely in different persons. There are those who can work in lead almost with impunity for years without taking any special precautions (and even at that most dangerous industry, the making of white-lead), while there are others who begin to feel ill almost as soon as they are brought into contact with lead, and who are incapacitated, or even killed, after an exposure of a few weeks. This difference between people appears to depend on a constitutional peculiarity, which stands in no relation to general robustness or muscular strength ; the special susceptibility is inevitable when it exists, and therefore any person who finds that he possesses it should not try to overcome it, but should forthwith retire from an employment for which he is unfitted by nature. As, however, it is beyond possibility to make a majority of persons engaged in lead-manufactures understand this, or, at least, voluntarily act upon it ; and as there is no difference of opinion among the well-informed, who know that continuance at the work in spite of this natural unfitness can only end (and after no long time) in permanently incapacitating illness or death ; the case is one for interference of Governments. But it is much easier to point this out than to devise a way of prevention ; and after careful consideration it appears to us that no law or regulation which could be enforced can be based upon the knowledge just recapitulated. This natural incapacity to resist lead is matched by an incapacity which is acquired. It is equally well-known, and equally observed here, that drinkers are especially susceptible to this poison. Medical men and employers alike observe that lead picks out the drinker ; if others escape, he is sure to suffer.

8. Such are the effects of mining and smelting silver-lead ores at Broken Hill, as far as it has been possible to follow them. In different persons they differ in the speed with which they make their appearance, in severity, and (from parts being selected for attack in some people which in others seem to be passed over) in manifestation ; and it is likely that a large, although unascertainable, proportion of those who suffer in the slighter degrees do recover entirely if they withdraw from the danger in time and if their constitution happens not to be of the specially susceptible kind. The next question to be discussed is the extent to which lead-workers on this field actually do suffer—what the incidence of lead poisoning upon them is.

After

After much time had been spent in inquiring it turned out that no exact statement could be made; no records at all existed. The secretaries to the several labour unions which, at the date of earlier inquiry, June, 1892, represented about 4,500 men, could furnish nothing; the secretaries to the several Friendly Societies had nothing of value—they represented less than 1,000 men, admitted members of all sorts of occupations, and members entered on the books at joining as miners were in many instances found, after a time, to be following some other kind of employment (Q. 1620). Such officials at the various mines as could be examined had often no knowledge of lead poisoning among the workmen they controlled, or, at best, would admit knowledge of only rare or occasional cases (Q. 797, 957, 1435, 1544); an attitude of mind with reference to a circumstance perfectly well known to every other adult inhabitant of the town, to which it will be necessary to revert when certain recommendations and the manner in which they can best be enforced come under consideration. No figures were furnished by the medical witnesses, but several estimates were given of the number of leaded persons met with by them in the ordinary course of the year's practice. Thus, Dr. Belgrave thought he met with 300 cases during the year, and (Q. 2052) that it would be impossible to find more than 1 or 2 per cent. of all miners working in the British, Block 14, and the Proprietary mines who had escaped leading, and possibly not a single one; and he expressed the opinion that taking all hands together (surface and underground) probably three-fourths became leaded sooner or later. Dr. Blaxland thought he saw two or three cases every week (Q. 2164). Dr. Groves thought (Q. 2282) he saw about three a week, excluding "mild cases." Dr. Emilius Thompson met with about five cases a week (Q. 2646). All the foregoing have practised in Broken Hill four years or more. Then Dr. Evill, who has practised here about a year, had seen thirty-eight cases during the latter six months alone (Q. 2562); and Dr. Harvey had seen twenty cases during a short experience of five months (Q. 2388). Lastly, from Dr. Bartley's record already quoted, it appears that about 118 cases per annum (or more than two a week) are admitted to the hospital, where, for economical reasons, admissions are limited as far as possible to the more urgent forms of illness. Thus, although the above statements are for the most part merely estimates and not records, they amply serve to prove that leading is an extremely common cause of illness among workmen at the mines; but should doubt remain in any mind then reference may be made to the five witnesses brought forward by the managers to show that some workmen had followed their employment for years without suffering (Q. 2788-3227). It appeared from the evidence they gave that none of them had ever been laid off by leading; but on examination it also appeared that three out of the five showed a well-marked blue line. These three, then (but the medical testimony in general shows clearly that even in leaded persons the blue line is so often absent that it is its presence alone which is of value in judging the cause of an illness)—these three then, although not ill, afforded evidence that they had absorbed and were eliminating lead; so that, if they had so far escaped such illness as would incapacitate them for a time, that was due, not to any care taken by themselves or others, but to the personal insusceptibility, or (possibly) power of steadily eliminating the poison, which some people seem to possess. Such people, however, are in a minority, and lead-works must therefore be regulated in the interests of the majority, who are sure to suffer by them. The first step towards such regulation is to provide for ascertaining the extent of the evil to be abated, and for subsequently watching its fluctuations. This can very easily be done on this field since the mine-owners have lately undertaken the management of a sick-fund to which every workman is obliged to belong; every man laid off has, of course, to furnish a medical certificate of the cause of his absence from work.

9. But the lead-workers themselves are not the only persons who are here exposed to risk. Lead is volatile at high temperatures, and very large quantities are steadily poured forth from the smelter-stacks by day and night. The loss from the twenty-eight smelters, of which none are of less than eighty tons capacity, thus suffered in the form of "smoke" was calculated by Mr. W. M. Hamlet, F.C.S., to contain a quantity of metallic lead and silver in excess of fifteen tons weight of metal every twenty-four hours—a moderate estimate, probably well within the truth (for the data and calculation *see Appendix L*). This for the most part is in an exceedingly attenuated and light form, which floats away to great distances; but another part
consists

consists of sensible particles which are heavy, and which are deposited at a distance from the stack from which they have issued, which varies partly with their size and partly with the state of the atmosphere. These two constituents of the "smoke" are distinguished as fume and flue-dust, and their actual contents at Broken Hill were found to be as follows:—The fume consists of that metallic vapour which arises when the molten metal is brought into contact with atmospheric air which is forced into the furnaces in the form of a cold blast, at a pressure of about eight ounces; thus lead, silver, and copper oxides, chlorine, bromine, iodine, and sulphur compounds, traces of antimony and arsenic,* and (rarely) of selenium and mercury compounds, make up the fume. The heavier part or flue-dust consists, first, of particles of all that goes into the furnaces borne out upon the draught—of coke, quartz, limestone, and iron, lead, silver, and manganese ores; secondly, of minute globules of argentiferous lead as metal, together with lead oxides and sulphates, and traces of arsenic* compounds. The proportion of lead in flue-dust varies between 20 and 40 per cent., the quantity of silver from fifteen to thirty ounces fine per ton of dust; and the amount of dust deposited in the flues is about one-third of the total produced, two-thirds being discharged to the air. Although the stacks reach to heights of from 200 to 300 feet above the houses, yet the prevailing wind very frequently indeed directs the smoke towards the earth, and so that it strikes it at about the distance of the nearest street to the north. Hence the houses in the north town are very frequently, though not continuously, enveloped in the fume, and the various forms of lead and other mineral compounds are deposited on roofs and soil; a point on which the following observations were made [*Appendix L*]:—

Samples of the air were tested from a point distant twenty-two chains from Block 14, and somewhat more than one-twentieth of a grain of lead was obtained from one cubic foot, equivalent to fifty-two grains per 1,000 cubic feet of air. Glycerine-coated plates exposed on the verandah of the "Freemason's Hotel," in Argent-street, for eight hours were found to collect three and one-third grains of lead, and traces of arsenic per square foot of surface. On 31st January, the smoke from the British and Block 14 was blown downwards immediately over the town, and was found to pollute the atmosphere very considerably. As much as 165 grains of lead was estimated per 1,000 cubic feet.

Thus, those persons who live in or frequent those streets which are nearest to the Hill (of which Crystal-street runs parallel with it at a distance of about 400 yards, while Argent-street, the principal business thoroughfare, lies parallel with and next to Crystal-street) must have frequent opportunities of respiring these lead compounds with the air, both directly from the stacks and indirectly from the ground on which they have been deposited, and from which they are raised again on the winds which almost constantly blow there, and which keep the atmosphere more or less laden with dust. Nor would these lead-particles reach the inhabitants by the lungs alone. Until the end of 1892 the water supply was either from private overground or underground rain-water tanks, or from public open tanks, or from private ponds; and these reservoirs, in many cases still retained to catch rain-water, so as to economise the use of the town water which is sold by meter, do contain lead in solution. Thus, lead was found in the waters of eight sources of domestic supply out of thirty-one which were examined, and in quantities which varied from traces to one-fourth of a grain per gallon [*Appendix L*], the latter being a large quantity, and having been found in a water-tank attached to the Central Public School. [*See description and comment in Appendix C.*] In another case which was separately examined, and which will be referred to again below, no less than five and a half grains of lead per gallon were found in the iron water-tank from which the household was supplied; but the water had fallen low before the sample was taken, and had been purposely so stirred up that the deposit at the bottom of the tank should pass into suspension. Thus, many people living at Broken Hill within an unascertained limit of distance from the smelters are exposed to danger of respiring and of swallowing portions of lead-compounds; it is therefore necessary to inquire whether the public health (of the townspeople as distinguished from the lead-workers) suffers from the industry carried on in their midst.

10. When the subject of inquiry is some influence suspected of acting unfavourably upon the general body of the population, the registered causes of death usually afford the required evidence. But, as has been pointed out above, lead is not very often a direct or immediate cause of death, and therefore leading cannot be expected to appear frequently in the register; and, in fact, it does appear in the course of the five years,

* No evidence whatever was gathered of arsenical poisoning.

years, 1888-92 only eleven times. [*Appendix B, Table XII.*] For the same reason however, since cases of death from leading do appear year after year it is certain that there must be a large number of cases of non-fatal illness from which such deaths, even in small number, could alone be furnished. From the Table quoted it appears that all those who died were lead-workers, with a solitary exception; here, then, is farther evidence that lead-workers do suffer in numbers—which has already been ascertained in a more direct way. Only one death among the general population was registered during those five years as due to leading; and that was of a child belonging to the family of the manager of Block 14, who is believed to have been poisoned in consequence of a habit she had of picking flowers and putting them in her mouth, the flowers bearing visible particles of flue-dust which had fallen upon them from the smelter stack under the shadow of which she resided. Fatal cases among the general population could not but be rare at the worst; the latter number many more than the total workmen, but on the other hand the conditions of their exposure are entirely different—much less persistent and less close, and probably of rapidly decreasing importance as distance between their residences and the stacks increases. Failing deaths, as in the nature of the case they usually must fail, the general causes of death must be examined for a preponderance amongst them of those diseases to which chronic lead poisoning conduces. Those general causes will be found abstracted from the registers for the years 1888-91, tabulated, and as far as possible analysed, especially for the purposes of this inquiry (the births and deaths in no town or district outside Sydney being as yet returned in a form useful for purposes of practical sanitation). It will be noticed that the diseases referred to do occur; but they are more often due to what may for the present be called indifferent causes than to leading, and upon consideration it does not seem that they appear in these lists in proportions which would make it necessary to seek a special cause of them such as leading would be (as to infantile deaths *Cf.* medical evidence under Q. 2084, 2220, 2321, 2710.) Probably, then, the townspeople are not subject to leading in any such degree as would leave manifest traces on the death-roll; but that is far from being equivalent to a statement that they do not suffer to any appreciable extent. Farther and more direct inquiry was made with assistance of the medical witnesses. In part their evidence was clear, in other part it was little more than conjectural. Dr. Bartley said (Q. 1974-84) that many townspeople were admitted to the hospital, and among them he had seen four who were leaded; but in those instances he had traced the illness to the causes of leading which are met with in every large town, and therefore they stood in no relation at all to the works. But he had, in addition, seen cases of malaise, languor, and anæmia, which might probably have been due to leading (no other cause being assignable), and he had seen “a slight blue line in several cases in which no other symptom of lead poisoning was present” (Q. 1980). That he had never seen a leaded female (Q. 1949) seems to be an observation of some importance (but compare Dr. Belgrave’s evidence *infra*); but he pointed out that his hospital experience was limited in several directions, and that the doubtful or, rather, not certain cases he mentioned had come before him casually. Dr. Belgrave had met with two cases of leading which were not referable to the common risks of town life referred to above—one in an infant, the other in a woman, both of whom lived in the north town and about half-a-mile from the Hill. Dr. Groves had seen one case among the townspeople in a man who drank a great deal of water from roof-tanks attached to premises in Crystal-street (2312-20); if this patient got lead with his drinking water, he should expect that many other persons would get it by the same channel, and thought they probably had done so, although no other case of consequent illness had fallen under his notice; he met with no cases of indisposition among townspeople which he could not satisfactorily account for without reference to lead, and was not of opinion that the smoke had any appreciable effect; he thought that children who lived within 400 yards of the smelters did suffer, but not adults; and, finally, that the general population did not suffer from leading. Dr. Harvey, who had practised here but five months, had met with cases of ill-defined illness, in producing which he thought lead played a part (2414-9); he had never actually diagnosed lead poisoning among the townspeople, and, as far as that went, thought the fumes not harmful, but, on the other hand, he would not express an opinion that they were innocuous in view of the ill-defined cases he had mentioned. Dr. Evill’s opinion was (2555-640) that the fumes were deleterious to the townspeople, and that children suffered to about the
age

age of ten years; but the evidence on which he relied was not clearly given, and should be referred to. Dr. Blaxland thought that leading was practically confined to lead-workers; and Dr. Emilius Thompson (2702-9) considered that the fumes were practically innocuous, having very often heard them accused, but after long and careful watching having formed that general opinion nevertheless. The evidence of these two last witnesses was made weightier by the circumstance that both gentlemen met with their first cases among townspeople after they had given it, and they deposed to them on being recalled under Questions 3618 and 3620.

11. Connected with the foregoing inquiry was the fate of animals kept within moderate distances from the Hill. The evidence on this point was unanimous; it was wanting in detail, but certain facts appeared. There is no doubt that milch cows kept within a radius from the Hill of between 1 and 2 miles at farthest suffered from an illness which was new to persons acquainted with stock, and sometimes died of it; also that they recovered from it after being removed to more distant spots. It was also certain that there was mortality among cats, dogs, and fowls not met with in other localities, and which diminished as the distance from the Hill at which they were kept increased. There were no sparrows in the district, and other birds, although not entirely wanting, were rare; on the other hand, there was no difficulty in keeping many different sorts of cage-birds (even quite near the smelters) provided sand put in their cages was carefully gathered, and not scraped off the surface within something like the radius mentioned.* The evidence showed, then, that animals suffered from an illness which was connected with locality, and that the locality was included in a circle of from 2 to perhaps as much as 4 miles in diameter, to which the Hill was central; but attempts to more exactly define the area, and to ascertain whether its quality were equally fatal over the whole of it or stood in any definite relation to prevailing winds, failed. So, also, it has to be admitted that attempts made to ascertain the nature of the illness, or, rather, whether it were due to leading, also failed. Only three bodies of animals said to have died of it were procured—a horse, a fowl, and a dog, and in the latter alone was lead found. [Appendix L.] Several samples of soil, and the only sample of herbage that was gathered, taken within a fourth of a mile of several stacks and to the north of them, all contained more or less lead [Appendix L]; while similar samples gathered in the south town only yielded traces. It appeared, on the whole, that animals which ran about the surface and took their food therefrom were those chiefly exposed to danger, which the immunity of carefully-tended cage-birds supported to some extent; and the Inspector of Stock had observed that there was less illness of the kind now referred to in a bad season, when food and water had both to be supplied by hand, than in a good one, when the animals were allowed to wander and to pick up what they could for themselves. (Q. 2773.)

12. In attempting to answer this important question, whether the general public health was injuriously affected by the smelting operations or not, after carefully considering the circumstances we found the *data* were as follows:—Matters are emitted from the stacks in large quantities, which could, and, in one case at all events, probably did destroy human life. In the case of some persons who lived within 600 yards of the Hill, and to leeward of the smelters in relation to prevalent winds, it was shown by medical evidence that leading occurred, and was not traceable to any other cause than near neighbourhood of the smelters and consequent exposure to smoke. Other medical witnesses testified that they met with cases of illness among the townspeople which they suspected were due to leading, although they could never make certain of it; and evidence of similar kind, but of greater weight, was got from inspection of the scholars in the three public schools. [Appendix C.] These are distinguished as the North, Central, and South schools, and the average attendance is respectively about 500, 800, and 600. The children who attend the North school come from neighbourhoods east and northerly from Oxide-street; those who attend the Central from west of Oxide-street, and easterly thereof so as to include nearly all the length of Argent-street and the streets between it and the mines; those at the South school are residents of the south town exclusively. [See Map.] The result of inspection of the scholars in class was as follows:—At the South and North schools there were not more than half-a-dozen scholars altogether whose

* It may be here noted that persons of many different classes generally agreed that fleas and bugs were rarely met with, although not absent; but merely as an observation of fact, and without attempted explanation.

whose pallid appearance attracted attention, but at the Central pallor seemed to characterise them as a body, and in many individual cases was very marked. The markedly pale children being in some instances interrogated were often, but not always, found to live either in Crystal-street or in streets to the west of Argent-street, but close to it. The relation to the smoke of the three districts roughly indicated above will be understood at once if the usual prevalence of southerly winds and the line of smoke-stacks on the Hill be compared. The south town is almost free from it; it blows in that direction very seldom, and then for but a few hours at a time. The northerly district is, no doubt, on the line usually taken by the smoke, but (regarded as a source from which scholars come) it may probably be taken to begin at least half-a-mile distant from the nearest stack, and to stretch far away northerly. The Central school, however, draws its pupils in great numbers from just those streets which lie within three-quarters of a mile from the Hill, and are pretty constantly bathed in the smoke; they are the streets upon which the smoke was seen so often to beat down before it rose again and was carried farther afield; they are the streets immediately adjacent on one side or the other to those spots at which the air was found to be so heavily charged with flue-dust and lead-fume; they include the streets in which the indubitably leaded persons and the doubtful cases spoken of by certain of the medical witnesses lived. Then, it was proved that lead is borne upon the air, by examining the latter in suitable ways at points of the inhabited area near to the stacks and farther away; lead was found in drinking-waters and in soils: animals died of an illness connected with locality, and that locality lay within a short distance of the Hill—the exact radius could not be ascertained with reference to the properties on which their owners lived, and especially it could not be ascertained in particular cases whether the animals had wandered or had been confined to such properties. From these *data* we conclude that the fumes are injurious to the general population; and after considering all the circumstances, it seems probable that at this place the effectively poisonous part of the matters which issue from the stacks is the heavier part, or flue-dust—no direct evidence having appeared to show that the fume which travels to very great distances actually exerts poisonous influence; and that the flue-dust affects man, perhaps, mainly through drinking water. Hence, we are of opinion—not that lead-fume is innocuous, but that in the present case the task of preventing the escape of particles of flue-dust should be regarded as imperative and urgently needing to be undertaken. It may be pointed out that the expense incurred in any alterations necessary to prevent its escape would probably be balanced, or more than balanced, by the great weight of lead and silver which would be saved, but which at present is entirely lost by scattering over the country: and on the other hand it must be noticed that the smelter-nests have here been erected absolutely without reference to the effects likely to be produced on the health both of workmen and of neighbouring residents. The proof of this lies—first, in the convenient but remarkably reckless way in which the ports for removing flue-dust have universally been made to open into those populous and partly-enclosed spaces, the tapping-floors (but on this point see farther below); and, secondly, in the circumstance that the total length of flues, reckoned from the junction of the first furnace-flue with the champion flue to the top of the stack, varies at different mines between about 250 feet and 600 feet only, whereas at works where economy is an object, and where in consequence exit to the air of valuable material is as far as possible prevented, corresponding flues are usually built of lengths which vary between half a mile and several miles, even up to 8 miles.* No hesitation, therefore, need be felt in insisting upon the alterations referred to; and, in fact, Mr. Howell, who is General Manager of the Proprietary Mine has already caused experiments to be undertaken with an apparatus which, it is expected, will save much of the heavier dust. [See Appendix K.]

13. The general public health being thus appreciably injured by the flue-dust discharged at present from the smelter stacks and (apparently) not in any other way, and the remedy being a profitable process of catching and retaining the dust within the flues for re-smelting, this branch of the subject may be dismissed for the present, and

* The flue at Sunny Corner Silver-lead Mine, New South Wales, approaches a mile in length, and rises several hundred feet.

and the circumstances under which lead-workers become leaded in the large numbers already noticed may be inquired into. To lead-workers alone, then, the following remarks refer:—The channels by which lead enters the body are three—the stomach, the lungs, and the skin. Of these, the stomach is that which should be most carefully guarded, although the others have real and great importance; and the difficulty of guarding it is considerable, and arises in the many and hidden ways by which it can be reached. Thus it can be reached by a dusty atmosphere, particles of lead-dust being filtered out of respired air, caught against the back of the throat, and thence swallowed. Thus:—

Some of the dust obtained from one of the lead-stopes was analysed and found to contain 8 and 15 per cent. of lead respectively * * * Some of the air in the stopes was found to contain .58, .40, and .51 grains of lead per cubic foot in suspension as dust or solid particles * * * while some sputum obtained from miners contained 2, 1.6, and 1.8 grains of lead respectively. [*Appendix L.*]

Or, dust falls directly on the lips and is swallowed in moistening them; or dippers exposed in a dusty place communicate lead to the water subsequently drunk out of them; or food which, perhaps, may have been carefully wrapped in paper to protect it, becomes contaminated by being touched by dirty hands. By dusty air the lungs also are reached, to which the finest particles are drawn in and are there rendered soluble and capable of being absorbed into the blood; yet the lungs probably become most important as a channel of entry when the exposure is to strong fumes of molten lead, such as escape from the lead-well, from molten slag, and occasionally from imperfectly constructed furnace throats, or from well constructed furnaces under certain occasional conditions of the ore within them; or such, again, as obtain when water-jackets have to be replaced while furnaces are in blast. That the skin affords a sufficiently easy channel of access seems proved clearly enough, though it has been doubted, by the numberless cases of leading which have been traced to use of lead-containing hair-dyes. In every other instance the chance that lead has entered by the mouth as well is very great, but in that one not great; and thus although it is impossible to assign to the skin its exact degree of importance as a channel under the conditions of mining, which are such as to make sure that in every instance in which the skin is dirtied some of the lead-compound shall be swallowed as well, stress should be laid upon need for keeping the skin thoroughly clean and free from prolonged contact with lead-dust. Leadly clothes have an indirect importance likely to be overlooked; it is that the movements of the body must drive out the particles in small clouds, whence they may be inhaled with the air. The custom of cutting plug tobacco while at work, and of rubbing it small for the pipe with dirty hands, is also a means by which lead in the form of vapour reaches the lungs and the blood.

14. The workmen chiefly exposed to dust are underground hands in general, and these include carpenters sometimes employed underground; and among surface hands, those who feed concentrators, and all hands on smelter feed-floors, who are liable to have it blown upon them when trucks discharge ore into the bins, and when the ore is shovelled into barrows, weighed, and tipped at the furnace throat to be fed in by the feeder. Those who are exposed to that dangerous material, the flue-dust, are all those engaged at smelter-nests on both upper and lower floors, and, of course, those engaged to remove it from the flues. Those especially exposed to danger from fumes are tappers, bullion-skimmers, and slag-wheelers; workmen engaged on feed-floors to a small extent generally, but to a greater extent when (as at the Central Mine) the feed-floor is not doubled with close and broken joints, so that the fumes which ascend to the ceiling of the tapping-floor are able to pass through it without much hindrance; and, lastly, workmen who repair furnaces in blast.

15. The manner in which work is carried on below ground may be expressed (for the present purpose) as follows:—A perpendicular shaft having been sunk, a horizontal drive is run off it along the lode; this gallery is lined with squared timbers to carry the super-incumbent weight; passages at right angles to the main galleries are carried to suitable distances, and are opened out by removal of the ore; the cavity thus formed is called a stope; it is carried up in the ore and divided by timbers into floors, which are connected by foot-ways; shoots are also carried up by which the ore is passed down to the main level, delivered into trucks, and thence wheeled along a tramway to the plat in the shaft, whence it is lifted to the surface. The more shafts there are, and the more complete the connection of the various passages with them, and with channels called air-passes which are sometimes carried to the surface for purposes

purposes of ventilation only, the better is the ventilation of the main galleries; but in every mine any recess carried off a well-ventilated passage must of necessity become less and less well ventilated until it has been carried far enough to open into another well-ventilated passage, or in the case of stopes, until they have been raised high enough to open into a level above that from which they started. The ore is broken by blasting, or sometimes with the pick, according to its character, and thus great quantities of dust are raised which settle upon the timbers, and which are raised again and again by every fresh concussion. In addition to dust, the air becomes mixed with carbonic acid from the earth itself, from candles which are burnt for light, from human respiration, and from combustion of explosives; and the fumes of dynamite form a serious impurity of another kind. The character of the dust, the extent to which it is sometimes present in the air of the stopes, and an idea of one way by which it enters the stomach from this source, may be gathered from the quotation already made at page 18 from *Appendix L*; in which latter, also, a note is made of the warm and oppressive feeling of the air met with in some of the less well-ventilated stopes and passages. This matter of ventilation is one of great importance, both in general and as regards presence in confined air, not only of lead-dust, but also of dynamite fumes. Natural forces are relied upon to ventilate metalliferous mines, and as regards main galleries are here sufficient; however, they must be supplemented in the recesses just referred to, and generally by forced currents of air. Now, in the first place, it seems necessary to furnish the Mining Inspector with a criterion of good ventilation, and not leave it, as at present it is left, entirely to his judgment, which practically means to his personal sensations—in this matter misleading, and therefore worse than useless. We have concluded that in such mines as these, where the main galleries furnish a nearly normal atmosphere, and the earth but little carbon dioxide, a criterion may be found in the proportion of carbon dioxide present, and that where the proportion exceeds one part in 1,000 parts of air the Inspector should have power to order work to cease in that place until, either by putting in a blower or by some other means, the proportion shall have been reduced to less than one part per 1,000 parts of air. Then as regards the laying of dust and dispersion of dynamite fumes, we draw attention to the following matters:—Water is at present led (in carefully managed mines) so that it can be scattered over lead faces, and it is usually run from an ordinary rubber hose; secondly, the fans by which the forced ventilation just declared necessary is best effected are most conveniently and most economically worked by air compressed at the surface and conducted below in pipes. Then, what is wanted to lay dust is not the slop of water which issues from a hose, but a fine spray which shall damp without wetting; and such a spray if properly produced would have the farther effect of washing the air as it passed through it, and so of clearing it of suspended dust particles. To produce this spray why should the compressed air not be turned into the water-pipe? But it is especially desirable to kill the dynamite fumes, and for this purpose it would be easy to devise a spray-apparatus which should be worked from the compressed-air pipe, and which should be fed with a solution of proto-sulphate of iron. Thus the three main objects might be gained at one operation, and gained quickly; the dynamite fumes would be killed, the dust would be washed out of the air, the face and dislodged fragments would be damped, while no superfluous water would drip through the floors, &c., &c.; and there cannot be doubt that so far from its being costly to secure these advantages to the workmen it would prove profitable—by actual saving of time after shooting, and, less directly, by the improvement in working power and energy which attends upon a pure atmosphere when it is substituted for a foul one.

16. The dangers due to dust (aggravated in the stopes underground by the other causes of ill-health which attend on faulty ventilation), are continued at the surface, in as far as ore is there handled after being raised, although in a minor degree, no doubt. Other and fresh dangers are now added, however—they are those which attach to the operation of smelting. The way in which this part of the business is conducted is the following:—The smelting furnaces are structures which have an area of 47 square feet, and which are 14 feet high; they are fed at the top; a forced draught is supplied to them at a pressure of about 8 ounces; they stand in a row, and parallel with them runs the (champion) flue which leads

leads to the stack, and with which they are connected by short furnace-flues, which enter it at right angles; bullion and slag are drawn off at the bottom by apertures which are pierced at different levels, and which are stopped with wet clay; the bullion is run from the crucible into the lead-well, where it is skimmed, and then ladled into moulds; the slag runs into iron pots on wheels, from which it is discharged at the edge of the slag dump. The furnaces are placed in view of the needs thus indicated; they have to be fed at the top, and, therefore, when possible, a hill or bank is chosen, in the side of which, at a low level, a surface is cut on which the smelters can be built; this surface forms the tapping-floor, and the slag dump is continuous with it. Then the champion flue is built in the angle between the level surface and the cutting, and the tapping-floor is covered by a shed, which is closed on the side of the cutting, and sometimes at the two ends as well, but which is always left open on one longitudinal side—that, namely, parallel with and opposite to the champion flue. This shed has two stories—that is, the ground, or tapping-floor is ceiled; and the ceiling stands at the height of the smelters, so that on the first floor the oblong openings through which they are to be fed are seen like traps in it; and this part is called the charge- or feed-floor. The feed-floor is roofed, closed at the ends, and open on one longitudinal side—that, namely, opposite to the side on which the tapping-floor below is open; and as the structure ascends in height the bank falls farther and farther away from it, so that the feed-floor has to be run back to the bank to touch it, and thus a very large unroofed part of this floor is made. Upon this latter are several large open bins, and above the bins is a tramway; trucks which run on the tramway discharge ores of different grades, flux, and coke into the several bins, and opposite the latter stand weighing-machines. A hoist connects the tapping and the feed floors, and by this slag and flue-dust are raised for return to the smelters. The course of proceeding is briefly as follows: workmen, called charge-wheelers, take ore, coke, flux, &c., from the various bins in the required proportions, which are measured by weighing, and dump them at the furnace throat; thence the feeder gradually supplies them to the furnace; they are smelted in the blast, and tappers on the floor below draw off the bullion to the lead-well and slag to the slag-pots; the bullion is transferred to moulds by the bullion-skimmer, and the slag to the slag-dump by the slag-wheeler. The main or champion flue accumulates flue-dust, which is daily removed by special workmen; it accumulates between the first furnace-flue and the base of the stack, and is carefully hoed out, so as not to cause more of it to blow about than can be helped, at small ports in the main flue, to the tapping-floor at the base of the latter—for from the mode of arrangement which has just been described it will be seen that these ports can be placed only so as to open into the smelter shed on the tapping-floor; it is cautiously wetted, so as to convert it (or rather most of it) into a moderately wet mud; it is then shovelled into trucks, which are sent to the feed-floor by the hoist; the hoist rises high above the feed-floor, so that the partly wetted flue-dust falls to the latter through a height of about 12 feet; and it is taken thence in quantities of a shovel full and a half at a time by the charge-wheelers, and added to the charges they dump at the furnace-throat. Thence it is fed with a shovel again by the feeder.

17. Thus workmen on the feed-floor are exposed to the influence of ore-dust, of flue-dust, and of fumes; but the latter risk is there slight when furnace-throats are carefully constructed, when furnaces are running well, as they usually do, and when charge-floors are laid double and with broken joints. As for ore-dust, without for a moment suggesting that it is of no practical importance as met with on the feed-floor, it may yet be pronounced to be (*quâ* air-borne particles) in all probability of comparatively slight importance, and not to come in this respect of dangerousness into comparison with the same dust as it impregnates the confined and still air in the stopes underground; the danger of conveying it to the mouth from the hands remains, too, although doubtless in a lessened degree. The case with regard to flue-dust is different. This dangerous material, which, as already described, contains from 20 to 40 per cent. of lead, and chiefly in very pure metallic form brought to a state of extremely fine subdivision, is difficult to wet thoroughly; and consequently, when after wetting it is disturbed (as in discharging to a feed-floor from trucks) numbers of aggregations of still dry dust are disclosed, which until disturbance had lain hid in the centre of wet masses. Then, even if it were thoroughly wetted, yet outlying portions of the
larger

larger mass become dry and reconverted to dust; and since the place of hoeing it below and of tipping it above is not protected from being trodden upon, portions of the mud must be carried by feet to various parts of the floors, whence, after drying, they must become detached and borne on the air. As to danger from vapours of lead, that seems to be small on the feed-floors; but furnace-throats are not always carefully constructed or carefully kept in repair, and then fumes escape continuously by cracks, &c., and cannot fail to be harmful in the long run. [*See Appendix M*]. On the tapping-floor the workmen are exposed to vapours and to flue-dust much more fully than on the feed-floor above. Vapours rise from lead and slag in course of every operation as long as they are molten; they do not often appear in considerable quantity, but the time during which they continue to appear in the course of a shift is rather long, and they cannot escape from the tapping-floor as steadily and as easily as should be possible. And so on this floor with flue-dust, from which the danger is so great and so constant that it seems likely (though impossible to ascertain) that the total effects of vapours may sink into insignificance by the side of the total effects of flue-dust: it has already been pointed out that because advantage is generally taken of a hill, to build against it and thus save part of the expense of staging to carry tram-lines above, that side of the flue which is away from the furnaces is inaccessible, and therefore the ports have to be on the furnace-side of the flues—that is to say, have to open on the tapping-floor. Then, in the first place, the tapping-floor has many persons on it and within the shed constantly; and next, while some dust blows about in mere process of hoeing it out of the flues, however carefully this may be done, much more must of necessity cling to the natural earth to which it is hoed and must be carried about the shed as mud adhering to boots, and both thence and from the soil near the flue, must circulate in the air, after the moisture which holds it for a time has been removed by the drying to which the heat of the neighbouring flue conduces. The arrangement described seems calculated to bring this finely-divided, and in part impalpable dust in contact with as many workmen as possible; the way in which it came to be made has been described. It appears to be dangerous and wrong, and to require alteration.

18. Certain conditions of labour are the following: The day is divided into three shifts of eight hours each; no man works more than one shift a day; every man works on a certain shift for a week, and then changes to the next for the next week. Each man, except tappers and slag-wheelers, is entitled to twenty minutes out of his shift; this is called crib-time, and it gives him an opportunity to eat the food taken to work, which is called crib. It is customary to carry this food in paper, and to tear the paper down to eat it, so that it is held by the part still remaining wrapped up. When crib-time comes, underground hands retire to any neighbouring spot which is well-ventilated; surface hands sit down on barrows, &c., at their work; and those engaged at the smelters cannot be sure of having their crib-time uninterrupted—usually it is so, but sometimes the furnaces run so that they cannot be left for as long as twenty minutes. Underground hands carry their tea or water below with them in their own vessels, and in quantity sufficient to last them through their shift. If the work is very hot, they drink their water before they have finished; then they may take their billies or bags to the plats, whence they can be sent up, filled by the brace-man, and returned. On the surface drinking water is furnished from tanks in which it is condensed from the engines, to canvas-bags, and a dipper hangs upon them by a wire loop. The bags are of different patterns; thus, at the Proprietary smelter-sheds they are circular and deep, open at the top and without covers, and the water has to be baled out with the dipper which hangs as described, exposed to dust; at the Central the bags are of similar construction, but have a rude and inefficient canvas cover, and the water has to be baled out with the dipper; at the South the bags have a rough cover, and in addition a canvas pipe leading from the bottom, through which the water can be drawn by lowering its outlet end. The rule as to smoking, which is probably a matter of as much importance as any other, is that there shall be none underground; but this rule is neither observed nor enforced, and it appears that in practice it cannot be enforced. Above-ground there is no rule against smoking. Water is led below along main drives, &c., at some mines for the purpose of sprinkling the faces, to which it is conducted by hose. Above-ground changing-rooms are provided in accordance with the letter of mining regulations devised to meet the case of any but lead-mines; these rooms consist

consist of the barest provision that could be taken in satisfaction of the regulation referred to, and in nearly every instance had an appearance of never being used; in the one exceptional case the use was certainly very small, and probably exceptional. [*See Appendix M.*] Workmen appeared to us sufficiently aware of the desirability of washing hands before eating, of eating away from their place of immediate employment, of changing their home-clothes for working-clothes before going on duty, and of washing after shift; but the necessary opportunity or provision is not made by proprietors, nor probably will be generally made except under definite regulations very strictly enforced by an official responsible to the Minister; these should also provide for an entire reform of the manner in which drinking-water is at present furnished.

19. The danger of getting leaded is not the same to miners at different mines on the line, nor to those who are working in different parts of the same property; all silver-ores do not contain lead in important quantity, but, on the contrary, some are so dry (a term used with reference to absence of lead and to their consequent behaviour in the furnaces) that it is necessary to add lead-ore to them before they can be successfully smelted; some are damp, and afford much less dust than others which are free from moisture; some again are massive, and yield less dust in being blasted and broken down than do others which are not so compact and brittle, and which are more friable. These different kinds of ore are met with sometimes on the same mine; and when that is the case the proportion of dry ore (or ore containing little lead) being got is sometimes greater than that of dangerous lead-ore; it is then possible to so change the men from face to face that they shall work in lead faces and out of them alternately. At the Proprietary Mine this practice has been followed, and as far as could be learned with good results to the workmen, as it has been followed also at the South Mine, when changing character of ore-bodies rendered it possible. The kinds of ore met with at the more important mines are as follows:— Beginning at the north end, the British yields carbonates alone of grades which vary between 12 and 40 per cent. of lead; Block 14 yields carbonates which are of a less compact and much dustier character than those found in the British Mine, and a deposit of sulphides underlies them; the three blocks which constitute the Proprietary Mine carry ores as follows:— Block 13 is the principal lead-yielding block, and carries this metal in combination with iron, and in forms of which some are hard and some soft; Block 12 carries a silicious kaolin and ironstone ore with 7 to 8 per cent. lead, which is moist and putty-like; Block 11 formerly yielded carbonates, but that deposit has been worked out, and it now yields manganic iron-ore, garnet-sandstone, and kaolin, with a deposit of sulphides at bottom not yet touched. Block 10 has kaolin and sulphides, and but few spots in which some carbonates have been met with (and cases of poisoning are extremely rare or altogether wanting among the workmen at this mine); the Central Mine carries kaolin, carbonates, and sulphides, much mingled together; while the three blocks which constitute the South Mine carry carbonates of varying degrees of hardness, and, consequently, of danger. Thus, the lead-ores occur mainly in one of two forms, carbonates and sulphides, and of the two the sulphides are very massive and little dangerous. All carbonate ores do not occur in the same state, however; and there is some evidence that they are dangerous in proportion to their friability, or, in other words, to their dustiness. Thus, although exact figures are wanting as has been pointed out already, the South Mine, which carries hard or massive forms of carbonate ore, has not been so dangerous a mine as the British, which also carries carbonates but in a less compact form; and the British is beyond doubt less dangerous (dangerous as it is) than Block 14, which, again, carries carbonates, but largely in a pulverulent form, which sometimes is nothing more than a running sand or dust. So that the amount of poisoning met with at different mines will differ, first, according to the kind of ore met with, then partly according to the state in which dangerous ore-bodies occur, and, more indirectly, according as the mine affords opportunity for judiciously transferring the workmen from lead-faces to harmless kinds of work. Lastly, a mine at which no smelting is done will, of course, yield somewhat fewer cases than others. It is necessary to mention these circumstances, on which depend not only the amount of leading met with at particular mines, but also the closeness with which the management should be watched. But they vary too much, even at the same mine as work progresses, to influence regulations. These should be uniform, of general applicability, well known to all concerned (to men as well as masters), and easily enforced.

20. We believe that the recommendations with which this Report closes need no other explanation than may be drawn from the above descriptions and comments. Before proceeding to give them, however, it is necessary to point out the steps which have already been taken by some managers to abate the risk of leading in their mines. In mines which afford bodies of harmless ore as well as the dangerous kind, it appears that men have been so allowed to work at the latter and the former faces alternately, as to benefit them considerably. This is to be commended, but it cannot, of course, be made the subject of any formal recommendation. The Proprietary is the sole property where this course has always been open; it has occasionally been possible at the South Mine; but at the British and Block 14 but one class of ore is got, and it has never been possible there. Something has been done to lay the dust at some mines, by carrying water-pipes through the principal levels, to which hose are attached, so that it can be delivered in the stopes. The Proprietary Mine and the British are equipped in this respect; these mines also are kept free from accumulations of dust and rubbish as far as possible, and bear evidence of careful tendance. Then, in the matter of forced ventilation, very much has been done at the Proprietary Mine, where little engines, which are moved by compressed air to rotate fans of large size, are numerous; these are made to deliver air to close places through 10-inch pipes, commonly called blowers. At the South Mine there is at the surface one engine of a different pattern for the same purpose, which is said to be all that mine requires; and there may be some similar small provision at another mine, but the Proprietary is the only one which is equipped in this respect. Then at all the mines such changing-rooms are provided as will serve to fulfil the letter of existing mining regulations; they are bare sheds with a seat round, and a few nails in the walls. Only at the South was there any washing accommodation, and there it was trivial and apparently out of use. Lastly, during the strike, baths were erected at the Proprietary Mine, which are excellent, and which appear to be used by the men in reasonable numbers; they are farther referred to in the Recommendations, and might be taken as a pattern (but not necessarily) for similar baths to be erected on the other properties. We are strongly of opinion, however, that baths and changing-rooms should be close together and in communication, and that the use of both these accommodations would be seriously restricted were they separately provided.

21. Something, then, has been done to reduce leading; but neither uniformly at all mines, nor systematically, nor with sufficient thoroughness. It appears necessary, therefore, to frame regulations to apply to lead mines especially; and after this inquiry we think that such regulations should be made so that they can be easily enforced by penalty for neglect, and so that the Mining Inspector may easily see that they are observed; and that they should be so published that the men may learn to what they may thus be newly entitled. Perhaps it is unnecessary to support by reasons the expression of opinion that new rules should be compulsory under penalties, since, after all, this is a merely usual arrangement; but we feel obliged to point out that the evidence appended hereto shows that not all managers are likely voluntarily to recognise the obligations under which they fall as employers of labour at so dangerous an occupation as this is. Thus, for instance, to illustrate the point, it is enough to quote the following evidence:—

Colonel Cecil C. Morgan, manager of the British Blocks:—

1435. *Chairman.*] Do any of your men get leaded? I have never personally known of a case.

1436. If a man desires to leave his work, does he state the reason? Not to me. No one has done so yet.

1437. If a man became leaded, and was obliged to give up work, or fell ill of a fever, or any other disease, and was obliged to leave, you would only know that he had left his work? Of course he would have full right to let me know, but I have never had any case brought before me by any man personally.

1438. Do you wish us to understand that your personal knowledge does not enable you to say whether or not your miners do get leaded? Yes. I have never had a case of lead poisoning brought before me—that is, of one of our men—since I have been at the mine:—

it being notorious on this field that the British Mine is the most dangerous in point of lead poisoning next after Block 14. Or the thoughtful consideration apparent in the following answer to Question 1439:—

1439. *Chairman.*] Do you take any precautions against leading? Yes; we do take every possible precaution; for instance, we take very great care in regard to ventilation. We also take great care in regard to keeping our faces sprinkled, so that the dust shall not fly around. Of course, as you doubtless know, there is great trouble in getting men to be strict in the observance of cleanliness. We always impress upon our men the necessity of changing their things when they go home, and especially warn them against sleeping

in the garments they have worn all day; because, as they perspire freely, the dust will enter the system through the pores of the skin. I have had a great deal of experience in lead mines during the past twenty years; and have found the main thing, as well as the great difficulty, is to get the men to keep themselves clean, and change their clothes regularly. I may say, Mr. Chairman, that since I saw you at the mine, I have had a rather severe attack of rheumatism, and I was afraid that I would not be able to attend to give evidence personally, so I wrote out a statement of what I consider worthy of attention in regard to the conditions of work, &c., and with your permission I will make that statement here now:—

may be contrasted with the facts as elicited from Colonel Morgan at a later stage of his examination:

1446. *Chairman.*] You lay great stress upon the point of personal cleanliness of the men? Yes.

1447. But under the conditions of this town you know it is very often difficult for the men to get the conveniences for washing, or even the water itself for washing, in the ordinary way; probably they cannot afford to do it? I do not mean necessarily to take a bath frequently, but at least to sponge themselves down. What I consider the main danger is sleeping in the clothes they have been sweating in all day; a great many of them do that. I am speaking from hearsay, of course, but I have made enquiries, and I am positively assured they do.

1448. Do you provide a changing-house for the men on your mine? Yes.

1449. Do they use it? Well, they generally change underground. They take their upper garments off underground—they prefer it. They say they catch cold unless they have a jacket or something else on when going up.

1450. Can you describe your changing-house? It is a wood and iron building at the back of the shaft.

1451. It is quite true that the men who work underground do feel cold when they come to the surface, is it not? Yes; that is what they say. They would rather take their things down, and put them on when they are coming up.

1452. I suppose if they had a changing-room warmed by a waste steam-pipe running through it, they would be more likely to take advantage of it. You do not, I suppose, yourself recommend that their outer clothes should be hung up in the stopes, underground? Well, it certainly would be best if they kept their outer clothing away.

1453. What provision at the mine do you make for helping the men to carry out these rules of cleanliness which you think are of the first importance—what provision, for instance, have they for washing? We have no washing-place at the British. The fact of the matter is, directly the men reach the surface they rush away to their homes as fast as they can. I do not think they would use a convenience of that kind if they had it. Nor should I advise them to wash at the mine, because they ought not to put on their lead clothes again afterwards.

1454. That is what I have in mind. Of course, if every man could have a nice bath in his cottage, and have it suitably warmed in winter, I think I should recommend that he washed at home. But we know, as a matter of fact, that the majority of the men cannot make that provision for themselves; and therefore, it occurs to me, if cleanliness is of such importance, that the mine-owners might reasonably do something to provide for it. If, for instance, they provided warm baths—which might easily be done, with plenty of waste steam—perhaps there would be a considerable proportion who would not rush away from the mine as soon as they reached the surface; what do you think upon that? Well, I think we might try it; but I did not mean that it was necessary for the men to take hot baths regularly. I think if they sponged themselves down on leaving their work it would be all that would be required.

1455. But you know, perhaps, that in some lead works it is considered necessary, and the men not only take hot baths provided for them, but also medicated baths? I know it is frequently done in America; that is, that baths are provided for the men:—

from which it is reasonable to infer that rules having the force of law would probably be a judicious safeguard to provide. Or again, the attitude held by Mr. Lane, the manager of Block 14, towards the Board may be pointed out for consideration in this connection [*See the Correspondence printed in Appendix O.*] This mine is by common consent the most dangerous of all on the line [*see the evidence passim*], which is mainly due in all probability to the extremely friable and dusty character of the carbonate ore it yields: and yet it is the case that when at last the obstinate evasions of this manager were overcome, we were able to discover no provision of water-pipes for sprinkling and moistening the very dusty ore, and no arrangements for forced ventilation in places where it was much required; while for accumulations of rubbish, dust, and litter underground, these workings were conspicuous among those visited by us on this field. It is unnecessary, probably, to say more on these points, except that most managers were courteous and obliging; it is true that all alike were a little blind (as already pointed out) to the occurrence of lead poisoning, but that is a small matter on which it would be captious to lay stress. Regulations, however, have to be made so as to meet all possible cases, and they will not bear harder upon the humane and law-abiding for that they are strait enough to oblige the unruly.

RECOMMENDATIONS.

1. It should be illegal to employ females in any capacity at works where lead, lead-ores, or lead-compounds are mined, dressed, smelted, or manufactured.

2. It should be illegal to employ any boy below the age of 16 years underground at any mine where lead-containing minerals are got; to employ any such boy on the surface in any place where lead-ores, lead, or lead-compounds are handled; to employ any boy below the age of 14 years.

3. The manager of every mine should be required to record the name, age, branch of occupation, and length of time employed of every workman laid off by leading, and to transmit a copy every month to the Minister not later than the seventh day of the next following month.

4. *Drinking-water.*—An ample supply of sweet and wholesome drinking-water, freely and easily available to all hands at all times should be maintained; (*b*) it should be stored with special care to prevent contamination with dust; (*c*) whenever canvas bags are provided—as, for instance they now are generally provided at smelter-sheds—they should be so constructed as to be closed at the top by a solid (not a canvas cover), and the water should be drawn from them through a metal or wooden tap (not a canvas pipe) suitably fixed to the bottom; (*d*) the dipper for drinking out of should hang in an enclosed place so as to be thoroughly protected from dust; (*e*) a pattern water-bag, &c., should be submitted, and after approval by the Minister should alone be used; (*f*) as an alternative to the pattern water-bag either condensed water safely stored as mentioned above, or Stephen's Creek water, may be drawn from taps on pipes connected with the protected reservoir of condensed water or with the public mains, provided an enclosed space for the dipper be furnished as already mentioned; (*g*) drinking-water should be supplied by pipe to every plat in the following way, the source being either the public water-mains or well-protected reservoirs of condensed water at the surface; the supply pipe should descend to the lowest plat and should there enter a closed metal reservoir of about 100 gallons capacity or larger; a delivery-pipe should return from the reservoir to the surface, and should be fitted with a tap at every plat for supply of water thus cooled to underground workmen. When the shafts extend to much greater depths than at present a modification of this arrangement may be necessary.

5. *Sprinkling water.*—On feed-floors and tapping-floors, and at every other place where dust is raised, stand-pipes and hose should be so provided that dust may be conveniently laid by sprinkling the ore &c.; (*b*) as long as flue-dust is collected and removed as at present, and as long as may be necessary, water for wetting it should not be delivered except by hose; (*c*) sprinkling water should be furnished in the main drives on all the different levels so that it can be led to every working, and so that it may be easily distributed to allay dust; (*d*) it is very much to be desired that pipes carrying compressed air should accompany the water-pipes into the faces for uses mentioned in the text (*see* Sec. 15); (*e*) such taps should be fixed on these water-pipes in the levels as would enable men to wash their hands before crib with least possible difficulty.

6. *Bath-water, bathing, and changing.*—At every mine bath-houses and changing-rooms should be provided, in general as follows:—(*a*) the baths should include both showers and plunge-tanks; (*b*) the changing-rooms should be attached to and in communication with, although separate from, the bath-houses, and should have boarded floors; (*c*) both bath-houses and changing-rooms should be available to the workmen free of cost at all reasonable hours and so that they can be used by every shift; (*d*) both should be reasonably comfortable, sufficiently lighted after dark, and sufficiently warmed in cold weather; (*e*) both plunge and shower baths should be supplied with water warmed to such a degree as may be found desirable in cold weather—probably to 75° or 80° F.; (*f*) a caretaker should always be in charge of baths and changing-rooms, and it should be a part of his duty to keep a day-book and to record therein the names of all persons who use the baths*; (*g*) plans and specifications of any buildings proposed to be erected in accordance with these recommendations, and a block-plan showing the position in which it is proposed to erect them, should be submitted for approval before beginning the work, and power should be reserved to the Minister to direct such improvements, extensions, structural alterations, and alterations of position, as may from time to time seem necessary upon report made by his officers:

7. Every underground workman should be required to change his ordinary clothes for working-clothes, in the changing-rooms to be provided for this purpose, before descending to his work; and to change his working-clothes for his home-clothes again on finishing his work and before leaving the mine. Surface workmen should have liberty to make the same change and should be encouraged to do it, but for the present need not be obliged. 8.

* This has already been spontaneously ordered by Mr. John Howell, the General Manager of the Proprietary Mine.

8. Emission of flue-dust from smelter stacks should be as nearly prevented as possible, and should at all events be very greatly reduced below what is at present allowed; a time should be named within which the necessary alterations are to be made, and such time should not exceed twelve months.

9. The way in which flue-dust is at present handled urgently requires radical alteration on some systematic plan which shall as far as possible avoid the possibility of its being blown about on the air; in the meantime points which should be insisted upon are the following:—(a) the ports by which flue-dust is removed from champion flues must not open into tapping-floors, but on the other side of the flues and into a space otherwise unoccupied; (b) the floors to which the dust falls when first hoed out, when tipped on the feed-floor, &c., &c., must be smooth and impermeable, slightly raised above the surrounding surface so that the deposited dust or mud may not be stepped on and carried about, and must be perfectly clean except when in actual use; (c) workmen employed to cleanse flues and to gather and transport flue-dust should lie under the same obligation to change before going on shift as underground hands; (d) it should be illegal for any man thus employed to appear on the mine unless carrying a suitable respirator to cover nose and mouth; and to engage in his work, and to stand about where it is being carried on by others, except after having put his respirator on; (e) no accumulation of wet flue-dust should be permitted on any mine unless within a securely closed receptacle, nor any accumulation at all of dry flue-dust outside the flues; but this material should be charged back as regularly as possible.

NOTE.—No *a priori* difficulty appears to prevent the collection, transport to the feed-floor, wetting, and (perhaps) feeding of flue-dust entirely by mechanical means, and without scattering it in the least; but we are unaware of any machine devised to do this.

10. Tapping-floors should be ventilated at the angle between the top of the champion-flue and the feed-floor, to reduce draught on the tapping-floors, and to afford fumes a way of escape which at present they nowhere have; probably circular flues of large diameter might be carried up through the feed-floor without interfering with operations there, and they might expand below into oblong openings inches across and feet in length.

11. It should be illegal for any workman to engage in repairing a furnace in blast (as in replacing a faulty water-jacket panel) except he be wearing a respirator as mentioned above in connection with removal of flue dust.

12. It is very desirable that furnaces should be surrounded with a jacket which should expand below so as to catch fumes from molten metal and slag, and which should terminate on one side in a chimney leading to the air on the open side of the tapping-floor.

13. Inspectors of Mines should be required to show themselves proficient in some simple process of estimating the proportion of carbon dioxide present in atmospheric air; and the minimetric process devised by Dr. Angus Smith appears to us to be a suitably easy and rapid one.

14. It should be an instruction to inspectors of metalliferous mines to pay especial attention to the state of the air in the various workings; to see that sufficiently pure air circulates through the galleries; to see that the air in all workings off through-ventilated passages is sufficiently pure; and to stop work in any place until by appropriate means the air has been restored to sufficient purity.

15. The criterion of "sufficient purity" should be the presence in the air of less than one part of carbon dioxide in every one thousand parts of air, as ascertained by the method mentioned above.

16. Any regulations which may be made in accordance with these recommendations should be enforced by the Mining-Inspector; penalties recoverable before a court of summary jurisdiction should attach to neglect or infringement of them; and they should be continuing penalties in every suitable case, and in others progressively increasing for successive offences under the general body of regulations.

17. Such regulations should be framed definitely whenever possible, and should leave as little as may be to the discretion of the Inspector, or to be dealt with as a matter of opinion between managers and the Inspector.

18. Such regulations should be printed and presented by managers to each workman on engaging him under a penalty; and it should be an instruction to the Inspector to ascertain from time to time that this is duly done, a similar regulation at present in force being altogether neglected.

19. The following circular of advice to men engaged in lead-mining or smelting, &c., should be delivered to every hand on every occasion of engaging him or of letting a contract to him, and for this purpose every man employed by a contractor should be deemed to be a contractor; it should be affixed to and maintained on many parts of the surface workings—as poppet-legs, office-doors, bath-houses, changing-rooms (within and without), &c., &c. Any other circular containing information as to the provision and use of baths, and as to other matters, which it may seem desirable to issue, should be additionally distributed by Managers as the Minister may from time to time direct.

PREVENTION OF LEAD POISONING.

To all Underground and Surface Workmen.

Lead gets into the system in the shape of ore-dust, flue-dust, and smoke formed in the course of smelting, by way of the stomach, lungs, and skin.

The way to avoid leading is to guard the stomach, lungs, and skin as closely as possible; to follow such habits of life that any lead which does enter nevertheless shall be rendered comparatively harmless by nature acting within the body; and to take care that no accumulation of lead particles shall take place in the bowels.

Lead gets to the stomach with the food swallowed, and it gets to the food from dusty or dirty hands as well as from the air; it gets into drink either by dust falling into it or by the drinking-vessel being so carelessly kept that it becomes dusty; it can also reach the stomach from dusty air, which deposits it on the throat, &c., whence it is swallowed. So that

Food should be carefully protected from dust;

Water should be kept in securely covered vessels;

Pannikins, &c., should be so kept that they cannot get dusty, especially on the *outside*;

The mouth should be rinsed out before drinking or eating;

Hands should be washed before eating.

Lead gets to the lungs from dusty air breathed where ore or flue-dust is being handled, and from working clothes which have got full of dust, and from which it is shaken into the air by movements of the body; as vapour (or smoke) from the smelters, molten bullion, and slag, &c.; and as vapour with tobacco smoke, when tobacco is cut with dirty hands, so that portions of lead or of ore are put into the pipe, where they are turned to smoke by the heat and breathed in. So that

Dust should be prevented both underground and at the surface by regular sprinkling, &c., as much as possible;

Moustachios should be worn to protect the lips from falling dust;

The vapour and smoke from smelters should not be breathed for a moment when it can be avoided by moving to windward;

Tobacco should be cut with clean hands *before going to work*.

Lead gets to the skin as dust, and if allowed to remain upon it long works through it into the system. So that

Working clothes should be kept in the changing-rooms, and put on before beginning work;

A bath or shower to cleanse hair and skin should be taken after work and before putting on home-clothes again.

Milk is an excellent preventive, but it must be suitably taken. A pint every day is probably enough—more will do no harm. It should be taken at twice, and one time must be immediately or *very shortly before beginning work*, not in the course of work; the other time may be chosen—after getting home from work would do well.

Never begin work with an empty stomach, nor more than two hours after a meal.

Wash

Wash hands and rinse the mouth before eating; rinse the mouth before drinking; keep the teeth well brushed and clean.

Bathe every day if possible; do not bathe less than twice a week.

Regulate the bowels in the following way: Use Epsom salts for the purpose; take as much every day as will cause a single action of the bowels every day. That is a much more useful plan for the present purpose than the custom now generally followed of taking a large dose of salts once a week or once a fortnight. Each must find out for himself the proper quantity he requires to produce this regular and daily action; but the following is a good way to make the medicine, and more or less of it should be taken daily as may be found necessary.

Epsom salts	2 ounces.
Water	A wine-bottle full.
Red pepper	As much as is agreeable.

Take a wine-glass full (or more or less as may be necessary to cause a single action of the bowels) in a tumbler of water, on getting up after sleeping, once every day.

Notice.—There are a few people who throw the lead off and who are not seriously affected by it. There are other people who cannot throw it off at all, but feel ill, or actually fall ill, almost as soon as they begin to work in it. This difference has nothing to do with bodily strength, but is a personal peculiarity. *It is therefore of no use to persevere against leading.* Persons who suffer soon, however slightly, should leave their work in lead without delay, and seek some other kind of labour. For example: If a man get colic within a few weeks of taking up his employment, or if he get colic twice in the first six months, or three times in the first year, he should give up. His constitution will not stand it, and if he keep on he will probably suffer badly, and permanently, or even fatally.

Men who drink are in special danger of getting leaded, and are sure to suffer seriously.

We beg leave, in conclusion, to express the opinion that this matter of lead-poisoning is of far-reaching importance and urgently requires attention in the general public interest.

We have the honour to be,

Sir,

Your most obedient Servants,

J. ASHBURTON THOMPSON,
Chairman.
WILLIAM M. HAMLET.
JOSIAH THOMAS.

My reason for not signing the foregoing report in conjunction with my fellow members on the Board is that I dissent from some of the clauses and portions of clauses therein. It is not my intention to traverse the whole of the report here, as such would render this addendum too lengthy, but I beg to submit the following remarks having reference particularly to the recommendations forming the concluding portion of the statement.

Recommendation No. 3—Monthly returns of lead cases.—In my opinion it would be practically impossible for mine managers to comply with the terms of this recommendation if it should become law. In a mine, and reduction works, where nearly 3,000 men are employed, we know as a matter of fact that large numbers of workmen lay off for three or four days or a week from some trifling ailments and do not go near a doctor. If asked what is the trouble with them, many will say they are "leaded," but we have no proof whatever that they are, and I am satisfied that anything like reliable data could not, by the means suggested, be obtained of the number of men leaded or affected by lead.

Recommendation

Recommendation No. 4—Drinking-water.—Referring to that portion of this recommendation which relates to the manner of supplying the “underground” workmen with drinking-water, I am of opinion that the suggested means would not be as good as the method now followed. Many of the men now bring billy-cans of tea with them when they come to work which last them to the end of the shift; others, who prefer water, fill their cans at the mouths of the shafts with condensed or other pure water, which is provided for them before they go underground. These billy-cans have close fitting covers, and are always hung in a cool place some distance away from where the men are working. I know of no other way by which the underground hands could be supplied with cooler or better water, and I am satisfied that even if water-pipes were put all through the mines on each plat the men would still adhere to their present custom.

Recommendation No. 7—Changing.—We have the best of proof gained from long experience, that miners and men working on smelting furnaces will not, as a general thing, change their clothes in changing-rooms on the mines no matter how the accommodation is constructed, preferring to change underground or at their homes.

Recommendation No. 8—Emission of flue-dust.—It is certainly desirable to prevent the emission of flue-dust from the smelter stacks as much as possible, but, with the volume of atmospheric air necessarily forced into the furnaces, and the strong draught required to carry off the smoke and gases, a very considerable quantity of flue-dust must of necessity escape no matter how flues are constructed.

Recommendation No. 9—Handling the flue-dust.—From close and constant observation I am satisfied that flue-dust (and the method of handling and treating it) is charged, in the foregoing report, with more bad effects than it should be, for there is nothing of a dusty nature left in this material. The fact that the dust and fine particles of ore escaping from the furnaces having to pass through flues in which there is constantly a very strong draught renders it impossible for fine dusty particles to settle, and any ordinary wind would not disturb or blow it about after it had been drawn out of the flues.

Recommendation No. 12—Jackets to catch furnace fumes.—It would also in my opinion be impossible to surround the jacket portions of the furnaces with draught-pipes or other devices which would effectually carry off the fumes from the slag taps or lead wells. Experiments of this kind have been made, and, in practice, have been found to be ineffectual. The ingress end of a draught-pipe of any kind would have to be a considerable distance away from the tapping hole or lead well in order to give the men an opportunity to do the necessary work. This intervening space would permit the ordinary currents of air to drive the fumes away, and would prevent them from entering the pipes. There would be very little danger from these fumes did the workmen exercise more care in keeping out of them which they can do without interfering with their work.

Recommendation No. 13—Estimating carbon dioxide.—I do not think it would be possible for the Inspector of Mines to satisfactorily determine the quantity of carbon dioxide in stopes, drives, dead ends, winzes, or other openings in the Broken Hill mines. It is a well-known fact that carbon dioxide is found irregularly throughout the mines, impounded in small cavities in the ore, and is liberated only when these little cells are broken into; consequently, in any opening where the ventilation is fairly good and steady, the quantity of carbon dioxide would be continuously changing as the ore, containing more or less quantities of the gas, was broken into. Tests made as suggested would vary several times in an hour from pure atmosphere to over one part of carbon dioxide to one thousand parts of atmospheric air.

Respectfully submitted,
JOHN HOWELL.

LEAD-POISONING INQUIRY BOARD.

MINUTES OF EVIDENCE.

MONDAY, 27 JUNE, 1892.

Present:—

DR. ASHBURTON THOMPSON (CHAIRMAN).

W. M. HAMLET, Esq., F.I.C., F.C.S. |

J. HOWELL, Esq.

R. SLEATH, Esq.

Mr. A. J. O'Connell called and examined:—

1. *Chairman.*] What office do you hold, Mr. O'Connell? At present I am Secretary to the Underground Branch of the Miners' Association of Broken Hill.
2. And you keep all the books of your society, I suppose? Yes.
3. Have you referred to them at all in connection with the evidence you are asked to give here? Unfortunately, Mr. Chairman, I have not. That is, in the sense you would take it, because we have never compiled any statistics in reference to this question.
4. We shall come to that presently. Your society deals with men only, I believe—that is to say, your membership includes only men? Yes.
5. What limit of age is there—how young, and up to what age will you take them? We take them as members independent of age, so long as they are working in the mines.
6. Would you take a lad who was ore-picking, for instance? Yes.
7. You would take him if he offered himself? Provided he was doing that work underground, we would.
8. How long has your society existed—I mean your branch here on the Hill? As it is at present constituted, it had been in existence two years on the 22nd March last; but it was in existence before I came here, five years ago, I cannot exactly name the date.
9. That will take us over the time we want. The class of workers represented in your society, you say, are the underground workers? Yes.
10. What class of underground workers do you recognise? Miners, truckers, plattmen, bracedmen, and all such men as work underground.
11. How many members are there in your branch? Just a fraction over 3,000.
12. Has that been the average number during the two years last past? No; the average number has been about 2,700. That is a rough estimate. I may state that we started, when I took office, with 2,000 members, and at the present time there are over 3,000.
13. Do you refer to five years or two years ago? Two years ago.
14. Your society is not a sick fund in any sense, I understand? No; it is entirely an accident fund in regard to its business.
15. Have you any knowledge at all when a member falls sick? Oh, yes. We have a record; but in that case he is merely marked as being out of work, or sick. There is no record kept of the nature of his illness.
16. Then, can you give us any information at all as to the number of members who have been incapacitated by leading? I can do so in a general sense. I should think, so far as my opinion goes, that of the men who work in lead ore, the percentage affected would be about seven out of every ten, more or less; but I would wish to be understood that that applies only to certain mines and certain portions of those mines.
17. Very well. Then any information you may have to give us now will be simply the opinions you have formed from what you have heard on the subject, and so forth? Yes; chiefly so.
18. Have you, yourself, worked below? Yes; I worked two years underground in the British Mine.
19. What kind of work were you doing? I was mining at the time.
20. What class of ore were you getting? I was working fourteen months altogether in lead. For ten months I worked in wet ground in the shaft.
21. Were these fourteen months and the ten months continuous? The ten months was continuous away from the lead.
22. Were you working for the fourteen months continuously in the lead? There was a break between the fourteen months. After working in the lead, I was taken away from it and put to this other class of work, and when that was completed I began again on the lead.
23. How long did you stay at it? I suppose I was at it about eight months. Then I was taken away, and went to the other class of work.
24. And you remained at that ten months, and then went back to to the lead again? Yes.
25. Have you ever been leaded? I felt the effects of lead after I had worked there three months.
26. Were you laid off? Yes; I remained, I think it was, seven days off.
27. And did you resume your work again immediately after that? Yes.
28. Did you fall ill again? Not sufficiently so to prevent me working.
29. Then you finished your first spell in lead ore without any further illness? Yes.
30. Then you went away and came back to the lead; and did you suffer again? Yes.
31. After you had been working how long? Well, I had been working a good while before I felt it a second time. The mine was more opened up, and the ventilation was better when I returned the second time.

Mr. A. J.
O'Connell.

27 June, 1892.

- Mr. A. J. O'Connell.
27 June, 1892.
32. What form of illness did you have the first time—was it colic, or did you feel it in the head? It was colic, and weakness in the knees and the joints.
33. I suppose you had a doctor;—do you remember the doctor who attended you then? Yes; it was Dr. Drinkwater, who is since dead, I believe.
34. What kind of lead ore was it that you were working in? Carbonate of lead ore.
35. At that date, part of the mine in which you were working was being opened up, you say? Yes; it was being opened up at the time I started.
36. What measure of ventilation had you? At that time there was only the ventilation coming down the shaft. We were not connected with any other shaft. I was working in a drive at the first level.
37. Then there was no circulation of air? No; not at that time.
38. Was there any sprinkling of the ore done at that time? No; but there was subsequently, and before I left the mine.
39. Was your second attack of leading of the same character as the first attack? No; there was less pain, but more weakness.
40. There was no distinct paralysis? No.
41. What was your custom as to meals—did you take any food below with you? Yes.
42. Do you smoke? Yes.
43. And you smoke plug tobacco? Yes, as a rule.
44. Did you change your clothes when you went down the mine? Not at the mine, that is, when we were working in the lead. We used to change at the mine when we were working in the shaft, and it was wet; but that was different altogether.
45. In wet ground you changed at the mine? Yes.
46. The wet ground obliged you to do so; but you did not think there was any necessity to do so in the lead-dust? No. I may say I was living only about a quarter of a mile from the mine at the time.
47. Were you below eight hours at a time? Yes.
48. Where would you eat your meals? Usually, a very short distance from the face in the workings.
49. I suppose you have a smoke during that time—crib time, I think you call it? Yes.
50. But not at other times, while you were at work? Well, very rarely.
51. You think some men may, or rarely, do so? Yes.
52. When you went up from the mine, would you then go straight home? Yes, I went straight home.
53. Had you wished to wash your hands and mouth before beginning your lunch, had you the means, or opportunity of doing so? No; not very well.
54. Had you wished, before going down the mine to put on a working suit, had you the means of doing that—or was there a changing-room provided for the purpose? Well, there was a very small changing-room which was usually used by the shaft-men; but, so far as I can recollect, I never saw any of the men who were working in the stopes use the room. In fact, it was very small.
55. Was it the same room as is there now? I think not, because the one I alluded to was pulled down, when heavier machinery was put up. I have never been in the changing-room they have at the present time.
56. When you began this work, did you know that if you worked in lead you would be liable to suffer permanently? Yes; I was always led to understand that by the experience of other men.
57. Have you any idea of the way in which the lead gets into the system? I was always led to understand, that, it was by inhaling the fine dust that flies about.
58. Did it occur to you, or the other men with whom you worked, that you could do something yourselves to prevent the effects of lead? I can only give you the opinion of the medical man I quoted just now, who attended me. He told me that washing was the main thing, that is general cleanliness, and not to cut up tobacco, or rub it up fine with dirty hands. He led me to understand that lead was not so much absorbed through the pores of the skin as by respiration.
59. Still after being leaded, you went back to the mine and suffered a second time? I did.
60. Did you take any special precautions after that, against the effects of lead? None other than taking opening medicine, occasionally, to prevent constipation.
61. Have you any knowledge yourself—that is something more than hearsay, of any persons, say, among your friends, or acquaintances, not at all connected with the mines, who have been leaded? I have not of my own personal knowledge—I have as a member of the hospital committee. I gave a certificate the other day to a man whose case was represented by a medical man to be one of leading, and he had not been working in a mine.
62. *Mr. Hamlet.*] You say your first work in these mines here was in the early days, when the British first opened? Yes.
63. Was there only one shaft down about that time? It was what was known as No. 2, and we started to sink the main shaft.
64. *Mr. Howell.*] You were working in lead, and the ventilation was very poor—is that so? There was no connection between the shafts at the time I speak of.
65. The mine was very dry and dusty, was it not? Yes.
66. The conditions now, as you know presumably, are very different? Yes; no doubt they are. But I have not been underground for two and a half years.
67. At all events there are three shafts in that piece of ground now? Yes; there are three now, in that same extent of ground.
68. But it used to be considered a close mine in the early days? Yes.
69. *Mr. Hamlet.*] How did you usually carry the food that you took down with you—did you have it wrapped in a cloth or paper? It was usually wrapped up in paper.
70. And it was then put aside with your clothes, I suppose? Yes; it was left in the coat pocket and stowed away in as clear a place as we could find, so that it would be free from the dust, or the effects of any explosion that might take place.
71. And did you ever experience any metallic taste in eating your food? Yes.
72. And before eating it and after? Yes, always. In fact, there was always a peculiar taste in the mouth after a man had been working in the mine a little time—between a sweet and a bitter taste on the lips.
73. Did you try in any way to wash or clean your hands before eating your food? Well, as a rule there was no opportunity of so doing.

Mr. A. J.
O'Connell.

27 June, 1892.

74. But, I suppose, every man would have his own way of cleaning his hands, in some manner, before beginning to eat his food? The only way possible, in the stopes, would be if he had a handkerchief to brush the dust off. That is taking the general run of workers in the mine—particularly in the place where they were working, at the time I speak of.

75. But, that was at the very outset—in the early days? Yes, at the commencement. But I do not think it was a bit more dusty than it is now, when the quantity of work done and the number of men employed in a small space are taken into consideration. At the time I speak of, in the early days, there were perhaps only three or four men working altogether. There were two as a rule working in a drive, or cross-cut, and they had only their own smoke and dust to contend with.

76. Did you see on any occasion any persons visibly affected by lead down below? Yes; I have known several cases of men falling down in fits, and I have seen two cases, of men going to their work. In each case the man was walking in front of me, and fell down in a fit.

77. Did you ever hear a man working with you say, "I cannot stand this any longer," and then go up to the surface? Oh, yes. I have seen men have to lay up. One of my mates had to go home on one occasion, and was away from his work eleven weeks.

78. Had you pretty good health before you began silver-mining? Yes.

79. *Mr Sleath.*] You say you were working in lead, but you were principally engaged in driving? Yes; in the early days.

80. And you were not connected with the other shaft in any way—were there any artificial means of bringing the air into that part of the mine? No. We had no air but what came down the shaft.

81. There were no air-pipes? No.

82. Had there been such provided, do you think it would have been beneficial to the men working there? Yes; no doubt it would have been, to draw the smoke and dust out.

83. The changing-house you had at that time, was it connected with the engine or boiler house, or was it apart from those? At that time there was no changing-house at the British Mine.

84. No changing-house at all? At that time I was driving. When I was working in the shaft, a small house was built round the vertical boiler.

85. When you were working in the shaft, could those working in dry ground—the stopes and drives—have had an opportunity of changing, if they so chose? Not very well, because the changing-house was not sufficiently big for all of them, although it was very suitable for the shaft-men.

86. There was not room for all to change there? No.

87. Were they in the habit of sprinkling the drives or stopes with water during that time? When I worked in the British stopes last they were. That was just before I got into the position which I occupy now. At that time Mr. Howell was general manager, and they had air-pipes in and the water laid on, and the stopes used to be sprinkled with water. That, in my opinion, was a very good thing for the men, because it laid the dust, and kept the place pretty sweet.

88. From your personal knowledge, do you think less cases of lead-poisoning took place after that was done? I think so. Personally I know I felt the benefit of the sprinkling, and the air coming in.

89. You have not worked in any other mine than the British, have you? I worked for a very short time in Block 14 before the stopes were opened up.

90. Did they have air pipes and water pipes for sprinkling in Block 14? Not at that time, because there was no stopping done then.

91. Were the men in the habit of changing their clothes when they went to work in Block 14? Yes, at that time; but they were principally engaged in shafting.

92. In any case was there opportunity of getting water to wash your hands if you wanted to do so before eating your crib? Not as a rule. At the time I speak of, when the water was laid on to the British, possibly the men might be able to do so, but probably the water was cut off further back. There was one man told off to let this water on.

93. Then the conditions were changed between the time when you began to work and when you finished? Yes; a good deal changed.

94. As secretary of the underground branch of the Miners' Association you must come in contact with plenty of men working underground in the different mines? Yes.

95. Have you seen many men suffering from lead poisoning since you left off mining yourself? Yes; I have seen many cases.

96. I suppose in most cases the men come and report themselves to you when they are sick? Yes; as a rule they do. But some of them go straight away to their homes in South Australia, Victoria, or elsewhere.

97. *Chairman.*] During your second term of working in the lead did you take advantage of the improved conditions which you have spoken of? Yes; where they reached.

98. Did you wash your hands, and did you regularly wash out your mouth before eating? No; unless to take a drink of tea out of the can.

99. You said just now that as a rule the men reported themselves to you when they were sick. But you did not keep any record of the nature of their illness? No; not particularly. They might have been suffering from some internal complaint other than leading. We never made a distinction between the two, but just marked them down as being sick.

100. Then you would adhere to what you said first, that any evidence you have to offer as to the number of men leaded in your society during your term of office will be rather a matter of opinion than of fact? Yes, sir.

101. But for that opinion you have this ground—namely, that the men usually report themselves to you? Yes.

102. I did not ask your opinion as to the kind of occupation or place of occupation which seems to cause most leading—whether underground or surface work, and the kind of ore, for instance? Well, underground, I consider that the British, Block 14, and the northern part of the Proprietary Mine are the worst as regards the effect upon the miners. Of course there are other mines in which the men may suffer more or less, but these three I consider are the worst. As to the smelters, I could not reasonably say, as I have not worked on them.

103. Very well, we can get that from the other branch. And are Block 14 and the British still called dangerous mines in that respect? I think so, but from personal knowledge I cannot say. I have been very little on either of these mines, or any mine during the last two years.

- Mr. A. J. O'Connell.
27 June, 1892.
104. Still you do know where the men who are members of your society work, and they do report themselves to you when they are sick? Yes. I know of two cases where men fell down in fits last week—that was in Block 14. I can bring them before you.
105. *Mr. Sleath.*] What mine is considered by the miners on the Hill absolutely the worst as regards lead? Block 14 is, in my opinion, considered the worst by the miners.
106. It is considered the worst? Yes.
107. You do not know what provision is made there against the effects of leading? No; I cannot speak from practical knowledge.
108. *Mr. Howell.*] When you were sick, did you notice a peculiar feeling in your knees and joints? Yes. Sometimes more than others.
109. Was there any swelling? No swelling, but sometimes in walking down the hill I would suddenly lose control of my legs.
110. Have you noticed it among other miners? Yes, I have heard them complain to a great extent, more or less. Some complain of it in their arms, and others in their legs.
111. Had you any discolouration of the gums at the time? Yes.
112. What part of the system is generally affected? It affects you in the form of colic in the first instance.
113. Does the peculiar feeling in your knees and arms come on at the same time? No; it comes on subsequently.
114. *Mr. Hamlet.*] Do you suffer from loss of appetite, or is your digestion affected? Sometimes there is loss of appetite for two or three days, and then again there is a great craving for food, perhaps almost immediately afterwards.
115. *Chairman.*] Were you on day shift when you were working in the mine? I used to work three shifts round.
116. That is round and round? Yes.
117. Used you to make a point of having a meal before going down? When working on day shift I always had breakfast before going down. When working the afternoon shift I would have lunch between 12 and 1 o'clock and go to work at 4. On the night shift I would usually have something, perhaps about 11 o'clock, according to the distance we had to go to the mine.
118. Then the longest time between meals and work would be on the afternoon shift? Yes; that would be the longest time.

[The witness withdrew.]

Mr. Josiah Thomas called and examined:—

- Mr. J. Thomas.
27 June, 1892.
119. *Chairman.*] What office do you hold? I am President of the District Branch of the Amalgamated Miners' Association.
120. Can you give us any figures touching the prevalence of lead-poisoning among the miners, and so on? Do you mean the exact number that have been leaded?
121. Have you any official record from which a comparison might be made between the number of men enrolled on your books, and the number of men who have been leaded? No; we do not keep any.
122. *Mr. Sleath.*] Mr. Thomas, as President of the District Branch, holds simply an honorary position. He is employed on the mine, and can, therefore, speak only from his personal experience.
123. *Chairman.*] Very good. Which mine are you employed in, Mr. Thomas? I have been working in the Broken Hill South, but for the last two months I have not been working anywhere.
124. How long have you been working in the mines here? I have been a little over four years on the field. But I have been two years underground working as a miner on the Hill. I have had other positions in the mines. I was assaying at Umberumberka.
125. Have you yourself been leaded? Yes.
126. More than once? No, once only.
127. Under what circumstances were you attacked? It was at the South Mine, I was in the lead for about six weeks. I became leaded, and had to give up work. I left the place for a little while, and then I went back again, but I have not worked since, as I was unable to get work at the South when I returned.
128. Had you never before worked in lead ore? Not very much—I had a little.
129. And six weeks' continuous work in the lead-ore in the South Mine terminated in your getting leaded? Yes.
130. What form of illness did you have? Well, I vomited a good deal, and I was unable to take food, and felt very sick; I was very loose in the bowels.
131. That was rather unusual, was it not? I do not know. Mostly, I believe, they are constipated. It is more violent, I believe, in that form.
132. Did you suffer from paralysis? No.
133. Had you the blue line on your gums? Yes, a little.
134. And how long were you laid off with this illness? As soon as I found I was ill I gave up work; the doctor said it was necessary for me to go away for a little while, and I did so.
135. How long did you stay away? From the time I went away till the time I came back—it was about four or five weeks.
136. During the six weeks' work you have spoken of, did you work on all the shifts all the clock round? Yes.
137. When you were on the morning shift, what time did you get up, and what was your custom as to taking food? I used to get up a little before 7, and we began work at 8. I would have breakfast before I left home. At 12 o'clock we would have crib, or lunch—a piece of bread and cheese, or meat. Then I would go home about half-past 4.
138. Then, as to the next shift, at what time would you have to be at the mine for that? At 4 o'clock.
139. And you would have your lunch at what time? When I was on that shift I would have my breakfast at about 10 o'clock in the morning, and my dinner at about 2 o'clock, or half-past 2.
140. And at what time does the next shift begin? At midnight.
141. At what time would you get up to go on this shift? Oh, at all times—it would depend upon how I could get my sleep; whether the weather was hot or cold.

Mr.
J. Thomas.
27 June, 1892.

142. At what time did you have your meal before going to work at night? At about 11 o'clock.
143. Immediately before going on shift? Yes.
144. And I suppose you would take something below to keep you going? Yes.
145. Used you to smoke about that time? No, I do not smoke.
146. Where did you eat your crib? It would depend upon where we were working in the mine. We would generally leave the exact working-place, and go in, a level, or something like that. There is generally a place where the men go.
147. Used you to wash your hands or your mouth before eating? When working in lead, yes, generally. I would rinse out my mouth with water, and gargle my throat, and generally wash my hands.
148. Then the men had the means of washing their throats? We would do that with the water we fetched from home in our billy-cans.
149. Was sprinkling carried out in the mine at that time? No.
150. What was your custom as to changing your clothes before going on duty? Well, I did this. I generally brought two flannels with me, that is, I wore one, and the other, being the one I used to work in, I would put on when I got to the mine. When knocking off work I would change this flannel for the clean one, or put the clean flannel next my skin and the dirty one over it.
151. And when you got home, I suppose you would reject the outside one? Yes; I would take that off.
152. Was any changing-room provided at the mine? Not for the ordinary miners. They have a small room at the South, where the shiftmen change their clothes when they get wet.
153. Do you mean that the other men could not go to that room and use it? I cannot say that they would be objected to—I never knew anyone who went there and was refused. But it was not the custom. They might possibly use it, occasionally for all I know, but I do not know of anyone having done so, except the shiftmen.
154. And, therefore, it was not the general custom? No.
155. You have a good deal of general knowledge about the conditions of work in the mines, I suppose? Yes.
156. What kind of work do you consider the most likely to cause leading—mining or smelting? I should say mining.
157. Have you a strong opinion about it? Well, it seems natural, I should say. In the first place a large proportion of those working underground in the stopes get leaded, and, naturally, the men who work underground get considerably less ventilation than those working on the surface.
158. I mean are you speaking from observation and experience, or are you telling us now what you think would be probable? That is all.
159. That is what you think would be probable? Yes.
160. Do you regard one mine as being more dangerous than another, and if so, which? Do you mean as regards the leading?
161. Yes? There is certainly a good deal of difference in mines, because some of them have more lead ore than others.
162. Have you observed that men who go to work in certain mines are more likely to fall ill than they do in other mines? I do not know—I should think so.
163. But have you observed that they do, that is what I want you to tell me? I was about to explain why it necessarily must be so. For instance, in Block 14, and the British, the workings are nearly all lead stopes, and the men who work there—especially in Block 14—will have to practically work the whole of the time in lead. In the Proprietary there is a part of the mine—McCulloch's—where there would be a good deal of lead. But in another part of the same mine—Jamieson's—it is mostly kaolin. The men are shifted from McCulloch's to Jamieson's, and consequently each man works a fortnight out of the lead. If he works in Block 14, he will work in the lead right through while he remains there. Consequently he stands a greater chance of being leaded. In another part of the big mine (the Proprietary)—I refer now to Block 11—there are, I understand, certain portions of lead there. But it is mostly ironstone and kaolin, and consequently a man works there perhaps two weeks in the lead and may be six weeks out of it. Block 11, I should say, furnishes very few cases of leading, on account of their being able to change. At the South, where I was working recently, the cases have been few, as far as lead poisoning is concerned, on account of the men working in the stopes, where there was no lead, turn about, so that they were able to change the men continually. Now, however, at the South these stopes are filled in, and nearly all the mine is in carbonate ore, and the cases of leading are more than in the past, simply because the men have to work in the lead all the time.
164. That is a very reasonable argument, but what I ask you is, have you observed that it is so? Well, I will give you one instance. I am a member of the Hospital Committee, and I moved some time ago that the doctor should give us a return every month of the names of the patients, and also from what mines they came. In one month, from Block 14, it was over eleven or twelve, and from the Proprietary, in the same month, it was over thirty or forty. I cannot give the exact figures, but I should say there were three or four times as many from the big mine as from Block 14.
165. Can you make any practical suggestion as to the steps that should be taken to reduce the amount of leading among the miners? Of course that is difficult, but I have no doubt if the stopes were watered it would make a great difference. When the stopes are wet there is not that likelihood of leading that there is in the dry stopes.
166. What I mean by my question is this—you know that cleanliness on the part of the men is a great aid to preserving health;—in the mines you have had experience of, have there been the means of keeping yourself clean? Yes. Of course the mines I have been most accustomed to are the Cornish mines.
167. I am speaking about the Barrier mines? I do not know of any mines here where means are provided for washing. There is a place where the men could change, I think, at the big mine, but I do not know of any facilities for washing.
168. Do you know among your own acquaintances or friends any persons not at all connected with the mines who have become leaded;—I do not mean from hearsay, understand, but cases that you have a personal knowledge of? Would you include children?
169. Yes, any persons? Well, I have a child, and whether she was leaded or not I cannot say, but she was extremely healthy when we lived at Silverton, but when we came to live here, after about three months, she became very ill—so ill, that I thought she might die. I, therefore, sent the child with my wife to Adelaide, and she has recovered wonderfully since she has been there. I put the child's illness down to the lead, and that is the reason I do not bring them back.

- Mr. J. Thomas. 170. You consulted a doctor probably? No, I did not.
- 27 June, 1892. 171. *Mr. Howell.*] Do you not know, as a matter of fact, that there is a water-pipe running through the whole length of the Proprietary Mine? No, I do not.
172. I may say, for your information, that there is;—have you worked in the Proprietary Mine? Yes; I worked there for about a month.
173. When was that? About twelve months ago. I left Silvertown in May, and started in the South. I worked there from six to eight weeks at least, and then a certain number of men were put off on account of shutting down. I went among the number, and afterwards new men were put on. I went to the big mine then. I had a chance to go back to the shaft, which I did. I must have worked there part of July and part of August, if not more recently. I was in McCulloch's and Jamieson's two weeks each.
174. We began to put the pipe in in June, and it probably took six weeks to complete the work;—you say you worked in McCulloch's? Yes; in what we call the north end.
175. In what levels did you work? I think it must have been between the 300 and the 400.
176. What shaft did you go down? That near the Block 14 boundary.
177. Wilson's shaft? Yes.
178. I suppose you know there is a good changing-house at McCulloch's? I have seen one at Jamieson's.
179. Was the ore you worked in that portion of McCulloch's shaft a dusty ore—it was a lead-ore, of course? Yes. I may say I was there a fortnight. In the place where we were working there was a good deal of lead and dust. I think it is a little extra bad perhaps. They had a system there of changing the men into Jamieson's. I believe the understanding is that new hands coming to the mine generally work in McCulloch's a month. I was there only a fortnight, when I went back to Jamieson's.
180. Was it a fine grain of ore there, or a lumpy ore? It was very fine.
181. Did you ever work in the south end of the mine? No; not in Block 11.
182. I suppose you are aware that north of Block 11 it is dry kaolin and silicious iron ore? I understand that a large portion of it is. As I have already said, I understand that in Block 11 the men can stay out of the lead from six to eight weeks.
183. *Mr. Hamlet.*] You say you had the blue line on the gums—how long after you started to work was that? Well, I did not notice it a great deal, until I was too ill to go to work. You see, I had been working in the lead about six weeks; then I stayed at home. As a matter of fact, I worked there after I was leaded. I was feeling unwell a week before I gave up. I had never been leaded before.
184. What were the indications you experienced? I began to vomit, and I felt weak, and felt generally unable to go to work. I had no relish for my food, and was altogether out of sorts. When I was going home on the Monday I said to the shift boss, "If I am not well to-morrow I shall not come to work." I stayed away on the Tuesday, and sent for the doctor, who told me I was leaded, and that I had better go away for a change as soon as possible.
185. Did the doctor attend you for your illness? Yes.
186. After working at what mine was that? At the south.
187. And that was the mine you preferred to go back to? Yes. You see, at the South, at this time, I refer to, most of the work was being carried on at the north end, which was mostly dry kaolin ore. Since then they have discovered a body of ore away to the south, and that is mostly carbonate.
188. Then, with regard to your child, is that the only instance you know of a supposed case of lead poisoning in the town? Well, the people send away their children. The same day I was at the station, sending my wife and child off, I was speaking to a miner, who told me that Mr. Prior, the editor of *The Barrier Miner*, had sent his wife and child away also, for the same reason.
189. Then you do not speak from your own knowledge, and in the case of your wife and child you did not seek medical advice, but merely sent them away for a change? Well, the child was extremely unwell; so much so, indeed, that it was fully expected she would have died by the time she reached Adelaide. She was a very young baby.
190. What was the age of the child at the time of your sending her to Adelaide? About eighteen months.
191. How far did you live from the South Mine where you worked? I lived at the south township, about a half-mile from the South Mine.
192. *Mr. Sleath.*] What sort of changing-room have they at the South? I should say it is a place about half the size of this room here; say, about 20 feet square.
193. Was there any provision made for the men to wash if they wished? Well, there was water in the trough, and the men could get water there and bring it round in a kerosene tin, if they liked. But whether the men were allowed to go to the changing house to get a wash I could not say. I never heard of anyone being prevented, at the same time I never heard of anyone trying it except the shiftmen. It was not looked upon as a general changing-place for the miners.
194. It was generally looked upon as a changing-place for the shiftmen alone? Yes. But of course whether the men did right to look at it in that light I cannot say.
195. At all events, that was the general impression among the men? Yes.
196. Do you know whether the room was kept clean, and in a good condition generally? I was in it twice, I think. I believe it was when I went to see one of the shiftmen, or to see if he was there, but I could not say whether anyone was appointed to keep it clean.
197. I think you said, that in the South Mine, they have no water underground, nor any air-pipes to carry the ventilation into the places? When I referred to that I did not understand the Chairman to mean forced ventilation in the case of driving a level a long way from the winze for instance, that is carrying in the air to help the men. I have seen that done.
198. *Chairman.*] I meant ventilation effected by a machine to supply the place of the natural draught, that is, if you are in a long drive you must force your air in by some means or other? I thought you meant a forced ventilation throughout the mine. Oh, yes; I have seen that. When the men have been a long way from the shaft an air-pipe has been brought in to them.
199. That is what I mean? I misunderstood you, sir.
200. *Mr. Sleath.*] Did they have any water-pipes for sprinkling purposes? No.
201. As a practical miner, do you think any better means of ventilation for the men could be provided than they have at present? Well, I may say that the part in which I was working when I became leaded was well ventilated—splendidly ventilated in fact, as I was working very near to the winze.

202. What is your opinion of the general ventilation of the South Mine as a whole? I think it is fairly well ventilated. Of course some of the places are not. If you are driving a place a long way from the winze it naturally does get hot.

203. What do you think would be the best means of assisting the men to guard against becoming leaded, or do you think anything could be done to minimise the number of lead-poisoning cases that take place? I fancy the liberal use of water would be a measure of some benefit. It would also be a good thing if the men were careful to wash their mouths before eating. I noticed they did that when I was working at McCulloch's end in the big mine. I think it is a system adopted by the men generally when working in lead, to wash out their throats.

204. Is it a general custom amongst the management to make provisions against leading by changing the class of employment, and do they take you back again in case you have been laid off, when you are sufficiently recovered to resume? My opinion is, that it is practically understood in most of the mines that when a man is leaded underground, and has to go away, he notifies the fact to the shift boss or time-keeper, and when he returns as a rule I believe he is put back to work again if he is fit to go underground. That, I believe, is the general understanding.

205. Was that your experience? I did not find it so myself. But still I understand that it is the custom of the mines generally. As I have said, my experience was not so. At the same time I have known of a case where a man was taken back again after being laid off. The mate I had with me was leaded at the same time as I was. He remained at work two or three days longer, but eventually had to go off, and when he came back he was allowed to go on again.

206. *Chairman.*] Did that man return to the same class of work? To the same mine.

207. But did he return to the same place;—that is the same class of ore? No; he was put on in another part of the mine then, but I presume in his turn he would have to go back again to where he was working before.

208. Are you a temperate man? Yes; I have been a teetotaler for about sixteen years.

209. Is there any one mine that you know which gets the credit of being worse than others for leading the men, or are they all considered alike? Block 14 is considered to have the worst name, that is to say, there are supposed to be more cases from that mine in proportion to the number of men employed.

210. You have not had much experience outside of the South Mine, I understand? No.

[The witness withdrew.]

Mr. J. Triplett called and examined:—

211. *Chairman.*] What office do you hold, Mr. Triplett? I am secretary to the Barrier Ranges Smelters, Concentrators, and Surface-hands Union, affiliated with the Trades and Labor Council of Sydney.

212. Do you keep all the books? Yes.

213. Have you referred to your books in connection with this inquiry? With regard to one or two cases I have.

214. Do you admit only men as members of your association? No; we have some boys.

215. Men and boys. What are the limits of age—how young and how old will you take them? We have no limit. The condition is, that they must be employed at that branch of work.

216. How many members have you on your books? About 800.

217. And does that number include all the workers of the same class on this field? All work on the surface—yes.

218. It includes all the surface workers on this field? Yes.

219. How long have you been secretary to this branch of the association? A little over two years.

220. Your society is not a sick fund? No.

221. When any of the men fall sick are you made aware of it? Not in all cases.

222. Then you cannot give us any statement of the number of your members who have been laid off from leading? No.

223. Is it your opinion that a large proportion of those who are laid off are laid off from that cause? Well I would not like to venture to say that. Certainly a large proportion of them have been laid off, and a number of them do suffer from the effects of lead.

224. If the men did not work in lead is it your opinion that a considerably less number would be laid off in the course of the year? Yes.

225. Have you yourself worked in the mines? Yes.

226. Have you been leaded? No.

227. Will you tell us how long you continued to work in the mines from the time you first began that class of work, confining yourself to the Barrier? I cannot say to a month, but it is something like three and a half years since I started work on this field.

228. And you continued working until when? Until about two years and a month or two ago.

229. And did you work continuously all that time? Yes; with the exception of about a month.

230. What kind of work were you doing? Part of the time I was working at the Block 14 concentrating mill, and later I was on the bullion at the smelters of the Proprietary Company's mine, although I was not recognised as one of the smelter hands.

231. Then you have had opportunities of forming some opinion as to the relative dangers of this class of work. Are the men working at the concentrators liable to get leaded? Yes.

232. Are the smelters liable to get leaded? Yes.

233. Is there any difference in the liability, so far as you have observed, between these two kinds of work? I think the percentage would be greater in connection with the smelters.

234. You keep in mind, of course, that a different number of men might possibly be employed at one class of work as compared with the other, and you think the percentage of cases of leading would be greater at the smelters? Yes.

235. Are the smelters all equally exposed to the danger? Yes.

236. The removal of flue-dust is the work of another set of men, is it not? Yes; I may say I worked a little in the removal of flue-dust myself previous to going on the bullion at the Proprietary Mine. I forgot to mention that.

237. Do you think the removing of the flue-dust is a more dangerous occupation than attendance on the smelters or concentrators? It might perhaps be more dangerous to the men working there if they received no instructions when going on.

238.

Mr.
J. Thomas.
27 June, 1892.

Mr. J. Triplett.
27 June, 1892.

Mr.
J. Triplett.
27 June, 1892.

238. Then you are of opinion that a man can do something to protect himself at that work, at all events? Well, I am of opinion that he can last longer at it by taking precautions.
239. But you are of opinion, too, that he must eventually suffer from it? Oh, yes; he must eventually suffer from it.
240. On the concentrators, would you say that the men employed at the screens are in greater danger of leading than those employed at the tables? Yes; I should say they would be more liable to be laid off than the men at the tables.
241. Do you speak from personal observation—did you notice that? Yes; I noticed that when I was working there. I happened to be working on the top floor, at Block 14, driving the stamp engine, and I noticed that the feeders were more frequently laid off than any of the other men.
242. Does the stamp engine work dry? No; the water goes in, but it is fed dry.
243. Have you noticed that some people are more liable to fall ill than others, apart from their occupation? Yes; I have often thought some men were more liable to be laid off from the effects of lead than others—it is something in the constitution, I think.
244. Now, supposing a man had been laid off from the top floor of the concentrators on account of leading, would the management make any objection to the return of that man to the same kind of work, or would they make any suggestion as to his taking some other kind of work? In all cases, I believe, when a man is leaded and goes off, he has the privilege of returning to his work. He might, by asking, perhaps, be removed to some other kind of work, but that is granted as a privilege only.
245. He does not get that concession by a planned arrangement or as a right, but only if he asks? Yes.
246. In the work of removing the flue-dust, what do you think ought to be told to men who first go on to clean the flues? He should be told, in the first place, of the danger liable from it, and then that he should be careful in taking his shovel out from the flues when he is putting the dust in his barrow, because it is very light, and may be scattered by the draught coming through the smelters, and so affect his neighbour by carelessness.
247. No printed instructions to that effect are issued for that or other branches of work on the mine, I suppose? No.
248. To what do you ascribe your own escape from leading for over eighteen months? Well, I do not know; perhaps it is constitutional.
249. You do not, yourself, observe any particular rules of health? No; only general carefulness.
250. Do you think you were more careful in changing your clothing or washing your hands than other men? I do not know; but I was always careful to wash on the mine. You may notice the majority of the hands do that, especially on the smelters. There are some tubs of water there for dipping the iron into which they plug up the smelter taps with, and the majority of the men will wash in that. If there is any wound on the hands, and there is poison in the water, I suppose it would penetrate the skin that way. I myself have had the skin knocked off my hands when working in the bullion, and when I washed them in that water at the mine they did not heal at all, but I stopped washing my hands there and then it was not very long before they healed.
251. Used you to smoke at any time? Oh, yes.
252. But I suppose you did not smoke at your work? Oh, yes.
253. And you smoked plug tobacco, of course, and ground it up in your hands? Yes.
254. Have you ever heard of any other men who have worked as long, or longer than yourself without suffering from leading? Yes; I have heard of men working two years, and two years and three months without being leaded;—I should say, without being laid off, although they have suffered a little.
255. I think you have said that you never had any of the ordinary symptoms of lead poisoning such as colic, for instance; do you know whether you have had the blue line on the gums? I have not.
256. You never observed it, at all events? No.
257. I suppose you think it important, where men are working among lead fumes, that they should wash frequently, and so on? Certainly.
258. But of course, during the drought, and under the conditions of life here, there would be considerable difficulty in getting baths? Yes; great difficulty.
259. And, as a matter of fact, I suppose, there must be a considerable portion of the men who do not set much store by baths; do you think it a provision that would be taken advantage of by the men if the management, having water for the purpose, did establish baths, and warm them, as they very well might do, with the waste steam, that would be a useful provision? I think so, certainly.
260. And do you think the men would take advantage of such accommodation in appreciable proportion? Yes; I think the majority of the men would take advantage of it.
261. It would be a matter of comparatively small expense to the companies, I presume? Well, yes, without taking into consideration the water; but in the past the water has been a consideration. The cost of erecting the baths and keeping them clean would not be great.
262. The mineralised water is not fit for drinking purposes, of course, but the men have always had sufficient water for washing, I suppose? I think there has been sufficient, but, having heard so much about the shortness of water, I would not like to say they had too much at any rate.
263. I suppose that bathing is important to the health of the men, and one would be inclined to recommend that means should be provided specially, as the men cannot easily make provision of the kind for themselves at home? Yes; I think the mines should provide it, not only for the sake of the men, but for themselves, because they have men who get used to the work, and it would save a lot of sickness.
264. Quite so; would it be a small thing to the companies and a great thing for the men? Yes.
265. In regard to the removal of the flue-dust, I suppose it would be quite out of the question to wet it before removing it from the chamber at the back of the furnace? It could not be done.
266. Do men at that work fall ill more quickly than those engaged at other work, or would you have any choice between drawing off bullion and removing the flue dust? I think it would be a hard matter to tell whether the men fall ill from the effects of the flue-dust, although it is put down to that, because the same men do not always stay at that work.
267. They do not remain at flue-cleaning? No; not more than three days.
268. Is the ventilation at the Proprietary smelters what it should be; is the roof open at the top? No.
269. Then you think the ventilation is not good, except when the wind happens to be favourable? Then it is good.
270. At other times the fumes do not clear off as they should do? No.

271. Do you think the fumes penetrate to the feed floor? I think so; but they also have the bad fumes that rise from the feeders.

272. Do any fumes rise there when the furnaces are in full blast, and all is going well? No; not when it is going well.

273. How often do the fumes get a chance of rising from the feeders? Well, from one furnace or the other, every day, and sometimes every few hours.

274. Do you know of your own knowledge of any persons living in the town, and not connected with the mines, who have been leaded? No; not for a fact.

275. But you have heard of such cases? Yes.

276. Have you heard of many such? Yes; I have heard of several at different times.

277. Now, can you make any suggestion to the Board as to the measures which you think ought to be adopted outside of what you have already spoken of—that is, the provision of proper bathing and changing rooms? No; I think not.

278. In the course of your eighteen months' experience did you work all round the clock? No; only on day-shift.

279. At what time did you start? At 8 o'clock.

280. You had your breakfast before starting, and your dinner you would have at 12 o'clock, I suppose; would you take that on the mine? No; I invariably took my dinner off the mine, though not at my own home.

281. You went off the ground? Yes.

282. How long had you for lunch? One hour.

283. Is that a common practice for the men to go away? No.

284. I suppose they would sit about in the sheds and eat it? Yes.

285. You would then have another four hours' work? Yes; from 1 to 5.

286. And you then went home? Yes.

287. *Mr. Hamlet.*] I think you said you were at Block 14, Mr. Triplett? Yes; I worked there for a time.

288. And you used sometimes to be employed getting out the flue-dust at the Proprietary? Yes.

289. What quantity of flue-dust did you get out daily? About sixty barrow-loads.

290. You find that generally a dusty operation, I suppose? Yes; especially if there is any wind at all.

291. Did you ever experience any ill effects at the time of getting out the flue-dust? Well, yes; I have felt queer once or twice, but it has worked off in the course of an hour or so.

292. Which do you consider the most dangerous work, that on the charge floor or tapping the smelters? I should think the men on the bottom floors would be the most likely to suffer from the effects of lead.

293. I think you said you have not seen any fumes rising on the charge floor, except when the furnaces were not drawing, or if they were being shut down? Yes; or when they were just starting.

294. Do you remember whether there were any mining regulations posted upon the mine where you were working? Oh, yes; there are mining regulations posted, but no regulations as to how you should do certain work.

295. No precautions? No precautions.

296. *Chairman.*] As to the regulations, the witness might be asked whether a printed copy of the rules was ever delivered to him.

297. *Mr. Hamlet.*] Page 148 of the "Mining Acts and Regulations" says: "A printed copy of these rules shall be posted in the office and on a building or board in some conspicuous part of the mine, and a copy shall be supplied to each man in any mine to which they shall apply." Were you ever supplied with a free copy of the rules? No.

298. *Mr. Sleath.*] What sort of regulations did you see posted on the mine; were they Government regulations or those of the company? The only regulations I have any knowledge of were posted on the smelters, and also on the concentrators by Mr. Schlapp—the rules and regulations governing the work.

299. Were they issued by the company? I suppose so; but they were not regulations as to how you should do certain work, or what precautions should be taken to save yourself from the ill effects of the work, or anything of that kind.

300. Do you consider, upon the whole, that the work you were engaged in while you were working on the different mines was dangerous, so far as lead poisoning was concerned;—for instance, while you were working at the bullion? Certainly.

301. Do you know of any one apart from yourself who worked for twelve months continuously on the mine without suffering from lead poisoning? No. I never knew of any man that I came in contact with, but had suffered more or less from lead poisoning, or what was said to be such. I know the case of a man working on the smelters only four months who was leaded, and was in the local hospital for seven months. He had to be taken to Melbourne, and will never be able to do any work again, so the doctor was telling me. Maroney is the man's name—he was a strong able-bodied man when he came here.

302. If proper baths were provided for the men, the water could be used again for the concentrators, of course? Yes; or for the smelters to run through the jackets.

303. Then the water would not be any cost at all to the company? No; it could be used again.

304. When the jackets are leaking what do they generally use to stop the leak? They use bran, or they did when I was there.

305. Do they still use bran for that purpose? I do not know what they use now. It is two years since I was there. That was the general thing, however, and I believe it has been used since. That is, of course, when they can get it. It is the simplest way of filling the cracks.

306. Is it a customary thing for the men who are working on the smelters, either on the top floor or the bottom floor, to take their crib in their hands to eat while they are working? Well, I have seen it done but only in case the furnaces are going very quick. Sometimes one of the furnaces will run twenty or thirty times as quick as another, and if the slag is on hand it must be tapped.

307. Then, there is really no specified time allowed since the work has to be done in that way? They are supposed to have a stated time for their crib.

308. But there is no cessation of work to enable them to have their lunch—they have to do their work one way or the other? Yes; of course, if the furnaces are working fairly the men have time to take their crib by helping one another.

- Mr. J. Tripett.
27 June, 1892.
309. Have you ever noticed whether the men engaged in ladling out the bullion, or those wheeling slag, or men employed in other work were the most likely to suffer from lead poisoning the quickest? That would be a difficult matter to decide, because the men working on the lead to-day, say, would be off two days, and other two men would take their place. There are two slag wheelers, and two running off the lead. They change about.
310. *Chairman.*] What is the object of that change? To take them off the lead.
311. For that purpose only? Yes.
312. *Mr. Sleath.*] Ladling out the lead is considered the most dangerous? Yes.
313. *Chairman.*] By lead, I suppose you mean the bullion—that is the lead and silver which is run off into the moulds? Yes. It is the term freely used among the men.
314. You would want plenty of water to drink on work like that, is any provision made to supply you with water? Yes; there are water-bags, but it is often put in hot, and the men have to wait until it cools.
315. Does that arise from it being taken out of the rain-water tanks? No; it is condensed water.
316. Then you think there might be a better arrangement for supplying the condensed water cool? Yes.
317. Would it be an impracticable rule with regard to the men on the smelting floor that no one should eat his crib while at his work? I believe it would be better for the men working, but it would be a rather arbitrary proceeding to stop them from eating for eight hours.
318. We have already spoken of providing bath-rooms? Yes.
319. Suppose a bath-room and dining-room were provided together—they ought to have a place to wash their hands—would it be well to make a rule that the men should eat nowhere except in the attached dining-room? I am afraid it would not, especially with the smelters. You never know how they will run, and the feeder might have to start charging the furnace at any moment.
320. In fact, there are not a sufficient number of men on at that work to allow of the men having a quiet time for taking their crib? No.
321. Why should there not be? That is a question the directors might be able to answer a great deal better than I can.

[The witness withdrew.]

Mr. P. O'Donnell called and examined :—

- Mr. P. O'Donnell.
27 June, 1892.
322. *Chairman.*] What office do you hold, Mr. O'Donnell? I am secretary to the Smelters' Branch of the Amalgamated Miners' Association.
323. What class of work is represented by your branch? The general surface hands and smelters.
324. How many members have you? About 1,000.
325. And do they include all men engaged in the same class of work on the field? They include the unskilled labourers and smelting hands.
326. There are not many workers who are not members? They are all mining members that I have mentioned. There are about 250 who work at different kinds of employment outside the mines.
327. However, the men you are going to speak about number 1,000? Yes.
328. Are they all men in your society? There are a number of boys among them.
329. How many have you got, do you know? I should say about fifty boys.
330. Up to what age—what do you call a boy? So far as I am able to judge, I should say they would range from about 7 to 15 years of age.
331. And what are they employed at? On the mine principally, or sorting.
332. Have you really boys as young as 7 years on your books? Well, we do not take the age; but, in my opinion, the age of some of them would not be more than 7.
333. You judge by appearance, and some of them look quite young. What mines are these boys employed on principally? On the Proprietary Mine principally, and some of them are employed on the British Mine; but the British Mine has not got many boys.
334. Do you think at the British we should find some boys looking as young as 7 or 8 years? I cannot say. There are not more than three or four boys in the British.
335. Your knowledge of the boys is rather general. Have you seen them working there yourself? Yes; I have seen them.
336. Your society is not a sick fund, and therefore I want to ask you if you are informed when any member falls ill? Whenever a member falls ill it is reported to us. Some of his friends report the fact to the office; but we do not keep any record of those who are sick from natural causes. Statistics in that direction could be obtained from the Friendly Societies.
337. Exactly. We hope to get some particulars from them. In the meantime I will ask you this question—I do not wish you to answer it unless you have good reason for doing so one way or the other: Is a considerable number of your membership laid off on account of lead poisoning? Yes; a considerable number.
338. What proportion should you say? Well, I cannot speak from the records—I can only go by my daily intercourse with the men, and I find that a considerable number of them have had to knock off work from time to time in consequence of that, and they have often had to go away in order to get rid of the effects of lead.
339. Have you formed any opinion of the kind of surface work that is most dangerous, or which is most liable to result in leading the men engaged at it? I think the work in connection with the smelters is certainly the most dangerous.
340. That is certainly, in your opinion, more dangerous than any other kind of surface work? Yes. In connection with the smelters generally, I mean. The men employed about the flue-dust are liable to get leaded as well.
341. You include them in the class of workers who are engaged on the most dangerous kind of work? Yes.
342. Have you yourself been employed on the smelters? Yes; and have been leaded.
343. What mines have you worked on? I have worked on the Proprietary.
344. Only at the Proprietary? Yes; only there.
345. When did you first begin to work there? I began to work on the Proprietary Mine just six years this month.
346. And when did you leave off? About three years ago.
347. What work in particular were you doing—were you feeding the smelters, or drawing off the bullion? I was for a time feeding; but I was at all work round the smelters—feeding, wheeling, and on the surface for a time.

Mr.
P. O'Donnell.
27 June, 1892.

348. Did you remove flue-dust? No.
349. Then how long were you at work before you fell ill? About six months, I should think.
350. What was the nature of the illness—what kind of symptoms did you have? Well, there was a general loss of appetite, and a kind of "all gone" feeling.
351. Colic? Yes, sir.
352. Did you suffer from paralysis—dropped-wrist? No; I did not have that.
353. Did you consult a doctor? Yes.
354. Do you remember who? There were two doctors here then—I forget the name of the doctor now.
355. At all events, you did consult a doctor;—how long were you off? About a month.
356. Then did you return to work? Yes.
357. To the same kind of work? Yes.
358. And did you suffer again? Yes; I had to leave off then, and go to surface work, away from the smelters.
359. How long after you returned to work did you stay at the smelters? About a week.
360. And you found you were getting ill again? Yes.
361. What other kind of surface work did you go to? I worked in what they call the rigging gang—constructing the rigging.
362. How long did you continue in that work? I was in that gang about eighteen months.
363. Did you suffer any more from leading afterwards? No.
364. Can you tell me when a man has been employed at the smelters, and has become leaded, is he allowed to go back to the same kind of work, or is it suggested to him that he had better take up some other kind of work, to prevent him getting leaded again? It is generally understood when a man is laid off through leading, that when he recovers he will be allowed to take the same place as before.
365. That is, it they apply to be allowed? Yes.
366. Your work at the smelters is pretty hot and hard, is it not? Yes.
367. What provision is made for water for you to drink there? When I worked there it was condensed water put in bags and left to cool—open water-bags.
368. Was there a good supply? Yes; a fair supply.
369. Was the water always cool enough for you to drink? No; I remember when we have had to wait a long time for it to get cool enough to drink.
370. Were you on the day shift, or the night shift? When I was in the rigging gang, I was generally on day-work; on the smelters it was shift work, of course.
371. You kept going round on the three shifts? Yes.
372. Did you on every shift take food to the mine with you? Yes.
373. Where did you eat your crib? We just sat on the handle of the barrow at the work.
374. Used you to wash your hands before you took your crib? Yes; I always took that precaution.
375. Where did you get the water from? The water from the furnace, which was used to sprinkle the charges with.
376. What time did you have for eating your crib? The time supposed to be allowed is twenty minutes, but we had not always that. A man working at the furnaces has to take ten minutes whenever he can get it. It depends upon the way the furnaces are running. Sometimes he may be able to get the full twenty minutes on a stretch; but sometimes when they are working differently he has to take it as he can.
377. Is that a necessary arrangement? It is certainly necessary for the faithful carrying out of the work.
378. On the other hand, if there were more men engaged on that work, you could have the full twenty minutes? Oh, yes; we could do it then.
379. Were you engaged in removing flue-dust at all? No.
380. Do the men in general, who are engaged at the smelters, change their clothing when they go to work? They never do so, as far as I know.
381. Have you ever been told about the dangers of lead poisoning, and the little things you might do to save yourself from the effects of lead? No, sir.
382. However, you must have heard, and you know it is important to wash and keep yourself clean? I am sure it would be a great preventive.
383. The great proportion of the men have not the convenience for washing in their own homes? No; it is a luxury unknown to the working men here.
384. In your opinion, would it be an expensive matter for the mines to have bath-rooms and hot water laid on? I should not think it would be expensive.
385. Do you think it would be a reasonable provision—one, that is, which might be reasonably asked for? Well, about the reasonableness of such a request I am not prepared to express an opinion; but as to the necessity of such a provision being made, of course I would say that it is an absolute necessity.
386. Have the men ever asked for it, do you know? Not to my knowledge.
387. Why not, do you think;—the necessity seems clear, and yet you have never sought to get it? Well, I suppose we are supposed to act under instructions, and not to make requests of this kind to the employers.
388. From whom would you get your instructions? From meetings of the Miners' Association.
389. How would your instructions be conveyed to you? By resolution of the branch.
390. Then, no resolution has ever been proposed that such provision should be asked for? The matter has been discussed, but no resolution passed; and, as far as I can remember, the reason of it not being further dealt with was the feeling generally that it would be hardly any use making such a request.
391. You are clearly of opinion that the men should have a clear twenty minutes for their lunch? I think the time is little enough for them to eat their crib, yes.
392. And you think there should be provided a proper place for them to eat their crib, with provision for washing their hands, so that they might be able to take their food away from the smelters altogether? I should think so, certainly.
393. Have you any suggestion of your own to make on any point? No; I cannot think of anything further.
394. *Mr. Howell.*] At what time do you say you worked on the Proprietary Mine? I worked on the smelters first about six years ago this month.

- Mr. P. O'Donnell. 395. That was the time the old style of water-jackets were in use, was it not? Yes.
396. And the smoke-stacks were low then as compared to what they are now? Yes; the small stacks where I was working were lower, I think.
- 27 June, 1892. 397. The draught was not quite as good? I do not know about that. Of course, if it follows on account of the stacks being lower then, it was so.
398. Were they the old style of water-jacket furnaces, or had they open throats like they are now? On the feed-floor, they were the old-fashioned ones, going up to the roof.
399. And were fed through a door at the side? Yes.
400. Did not the fumes come out of those doors? Yes; the same as they do now from the present ones.
401. Did you ever see fumes come out of the present ones? Yes.
402. Did you notice any more fumes about the lower portion of the furnace than there is now? I cannot say if there was. There are always fumes even now, especially if the furnace is not going as it should.
403. If there is sufficient draught to carry the fumes off, there cannot be much coming on the feed-floor? No; there may be some dust, but not much fume.
404. And if the draught takes it all away, there cannot be any left? Of course not.
405. As a matter of fact, does not the draught take the fumes away from the present furnaces well? Since the higher stack has been built I have seen the fumes coming out on the feed-floor.
406. Would that be when the furnace is burning regularly? No; it would be when the furnace was not running as it should be.
407. But that does not often happen, I suppose? I am not often on the mine. I only go on the mine when I have business there, as secretary to my branch of the Association. I am not on the feed-floor now more than once in three weeks.
408. Are not the conditions much more favourable now than when you were working there? Yes; I must certainly say that.
409. That is, in every respect, so far as the chances of the men getting leaded round the smelters are concerned? The conditions are better now than they were in my time, no doubt.
410. Have you, of your knowledge, known of a considerable number of men, or any men, being leaded on the feed-floor of late? Yes.
411. At the Proprietary furnaces? Yes; I can name two.
412. What length of time elapsed between the first case and the second? There was a case about a month ago, and the man was off for some considerable time. It was through a friendly society that I found that out, because he happened to be a member of the same society as I am. It is very exceptional if a fortnightly branch meeting night passes without our having a certificate from the doctor describing some case of illness as plumbism.
413. You remarked, in answer to the Chairman, as to the suggested changes which might be made for the benefit of the men, that you did not think it would be much use to make any application for any change that might be required, such as providing bath-tubs, for instance;—have you any personal knowledge of any such application having been made to the management of the mines here, and of it being refused? No; I think I said that I understood such an application had not been made.
414. I thought you said that it would be of no use to make such an application? Well, the discussion that took place on the subject led to that conclusion.
415. That is what I understood;—then, I ask you the question; have you, as secretary of the association you belong to, made any application to the principal companies here for changes of that kind, and which application has been refused? I have not made any.
416. Mr. Hamlet.] I think you mentioned that colic was one of the symptoms you suffered from? Yes.
417. What would you generally call colic? Well, pains in the chest and stomach.
418. You have experienced it yourself, and have seen it in your mates? Yes.
419. You have spoken of cleanliness as being, in your opinion, a preventive;—do you know, as a fact, that some men get very little time or opportunity for washing? I can hardly say that.
420. It is no great disgrace, I think, under the circumstances? I should think it would be a disgrace for a man to go a long time without washing.
421. What I meant was, that a man, during the drought, would be forced to go a longer time without washing than he would under happier circumstances? Well, I think that some men go longer with dirty clothes than they ought to.
422. From what you have heard or seen of the men, how long should you think some of them would go without having a bath all over? I think I have said that a bath is a luxury unknown to the working men here.
423. So that they might go for a whole twelvemonth or more without one? Yes, or perhaps two years.
424. And work hard all the time? Yes, very hard.
425. You also mentioned, I think, that your association had discussed the question of adopting some measures to give the men opportunities for observing cleanliness? The matter was discussed, but they never came to any resolution.
426. Why was that? It was simply mentioned in the course of a general discussion.
427. Perhaps they thought it not important enough? Oh yes, they thought it important, but at the same time they thought it would be useless to make the request.
428. Chairman.] I think you might explain that; it seems curious: here are people who have power to give you what you need; you acknowledge you do want it, and at the same time you say you think it of no use to exert yourselves to obtain it? There are persons certainly that we have to depend upon for many little matters, and as we so frequently have requests to make and often meet with refusals it was thought to be useless to move in such a matter.
429. Mr. Sleath.] The water, you say, at the smelters, is kept in open water-bags? Yes.
430. Do you think that a proper thing, where there is so much dust flying about? No. I have often had to push the scum away with my pannikin before drinking the water.
431. Mr. Hamlet.] You dip in a pannikin to take the water out of the bag? Yes.
432. Mr. Sleath.] Outside of your own branch, do you know of any request having been made that bath-rooms should be erected? I think the underground men made a request at one time—I do not mean as to the matter I am speaking of now. I am speaking as the secretary of the smelters' branch.
433. That might be one reason that would influence your members in not making the request, if they knew

knew that others had made a request and it had not been complied with? I think it would be a very sound reason. Mr.
P. O'Donnell.

434. What work on the surface do you consider most dangerous, or most likely to cause lead poisoning? I have stated about the smelters, and about the flue dust, and there is another class of work, filling the trucks from the bins where the lead is—that always creates a great dust. 27 June, 1892.

435. For washing, what provision is made on the floor of the furnace down below, or say on the feed-floor; if you wanted to wash your hands, where would you go to find the water? I think the water comes from the jackets. There are taps running into a tub which is always full of dirty water.

436. It comes from the jackets? Yes, I think it comes from the jackets.

437. What do they put in the cracks of these jackets when they become a bit leaky? I have heard that they used to use horse manure.

438. Of course you come into contact with a great many men working in the mines. Do you know of the case of any man who has been working on any of these mines for a period say of twelve months who has not become leaded more or less during that time? Well; it is a very wide question. I may say that I have known such cases, but they are very few indeed.

439. You do not know many? No.

440. *Mr. Howell.*] How long have you known of a man to work at the furnaces without being affected by lead? Well, I can hardly say that. I think any man working on the furnaces for twelve months must be more or less affected. There are certainly some men who are all the time taking medicine, and they certainly get along for a good while—almost creeping along, so to say. But they certainly are leaded although they attend to their work.

441. We know that if a man begins to suffer from leading he will be laid off very soon. He would not be able to creep along very much—do you think he would? As I have said, they keep on taking medicine to stave it off.

442. Do you think it really does stave off lead poisoning? Well, it seems to me that it does—of course I am not a doctor.

443. Is it not a fact there are a number of those men who have been working on the furnaces say for twelve months, who will tell you they have not been affected by lead poisoning? If there were many who told me they were not affected by it I would not believe them, because their very appearance would belie them.

[The witness withdrew.]

Mr. S. Alker called and examined:—

444. *Chairman.*] You are Inspector of Nuisances for the municipality of Broken Hill? Yes.

445. How long have you held that post? For four years, or nearly so. Ever since the municipality was formed. Mr. S. Alker.
27 June, 1892.

446. You are well acquainted with every part of the town, and many of the inhabitants? Yes.

447. Are you Inspector under the Dairies Supervision Act? Yes.

448. How long have you held that office? Within six months of the Council being established—I should say about three years, or a little over.

449. Have you noticed any illness among the milch cows that you have attributed to lead? Oh, yes; I have seen several that have been leaded.

450. Would you describe the symptoms—what happens to them? My attention was first directed to some cows belonging to Mr. Lane, of Block 14. They seemed to lose condition, and their hair was all on end, while their mouths seemed to have a blue or purple tinge. They lost flesh rapidly, and did not eat. They had also a slight frothing at the mouth, and gradually sank. At that place they could not keep a cat or dog. My attention was then directed to the cows in the township. At Mr. Brenton's, in William-street, all his cows died exhibiting the same symptoms. Some of these cows in the township being taken out to the Race-course gradually recovered; but not completely for a long time afterwards.

451. Are those the only two persons whose cows were affected in that way? Oh, no. All the cows in the township were affected—Craig's, and also Schomburg's.

452. Do you say all the cows in the township were affected? Well, no; I cannot say that exactly, because some of them removed their cows. Those that I have spoken of were the cows that came particularly under my notice, and which I can speak of with some degree of certainty. The others I cannot, because the owners removed them shortly afterwards for fear of losing them.

453. Are you quite clear that those symptoms which you have described were not due to poor feeding? Quite clear. As an old farmer, I have had some experience of cattle, and I never saw any cattle attacked that way. Those that have died at Stevens' Creek have not shown the same symptoms—they were quite different altogether.

454. Has the number of cows in the town diminished lately? Yes.

455. What is the cause of that diminution? Probably death. There are very few cows in the town now.

456. You think the cause of death has been principally lead-poisoning? I hardly know how to reply to that question, because I have not seen them all. But it is from the disease peculiar to cows in the town that the people have got rid of their cows. They would not retain their health here.

457. Can you think of any other cause of unhealthiness to cows which are kept in the town? Well, there are one or two cases that I have not alluded to, notably Reddleford's, of Railway Town. They used to allow their cows to run about the town and eat and drink matter not fit for cattle to consume, and I attributed the falling off of her cows to that.

458. That was an exceptional case? I think so. The other people fed their cows properly, that is, on bran and chaff, and good water, and yet they have exhibited the symptoms I have mentioned.

459. Now, can you tell us anything as to the effect of position or situation in producing or avoiding the lead-poisoning of cattle. The people live at varying distances from the hill, and they also live at different points of the compass? Yes.

460. What is the farthest distance from the hill at which you have known cows to suffer as you say? The farthest dairy we have here is something like 7 miles from the town, and the next farthest from here is about 5½ miles, and then there is one about 4 miles. Those are all the dairies in that direction.

461. In which direction? The north-east. Due north there is one at Stevens' Creek. I saw the cattle there

Mr. S. Alker. there within the last fortnight, and they were looking in splendid health. The same with Craig's and Wilson's, and Renton's.

27 June, 1892.

462. Those are all south? Yes.
463. But what I want to know is what is the farthest distance from the hill at which you have seen cows suffering from this peculiar disease? I should say about 2 miles and a half.
464. In which direction? More particularly south-west and west.
465. And whose cows were those? Schomburg's, Craig's, Renton's, and Block 14.
466. The last was on the side of the hill? Yes.
467. What places are there close to the hill now? Craig's and Wilson's.
468. How far away are they? About a mile and a quarter—it depends upon which point you start from. Going westerly I should say between a mile and a quarter and 2 miles.
469. Do the horses suffer? We have had a tremendous number of dead horses removed. But I think they suffer more from starvation than lead-poisoning. They do not get a fair chance here. They do not seem to suffer so much as the cows.
- 470-473. You go about a great deal into people's houses, and so on. Do you ever hear of any persons not connected with the mines who have become leaded—something more than hearsay I mean? No. I have known of several cases of lead-poisoning; but none except persons working in the mines.
474. *Mr. Hamlet.*] What water do the cows get to drink here? At that time we got the water from Berg's well.
475. The cows about town, where did they get the water from? Those that were in the town got the water from Berg's well, and we got it from the Imperial dam while it lasted.
476. Is it not a fact that you got water out of the mines for the purpose of watering the cattle? Yes, certainly.
477. Was that water good? We used to drink it. There was no other water to use.*
478. Did you ever get water from Silverthorne's well? No; that was strictly prohibited.
479. What other wells were there from which the cattle were watered? At M'Laughlin's and at the Sportsman's Arms—they got water from there.
480. What was the quality of that water? It was fairly good stock water. A large number of horses and travelling bullocks were using that water.
481. It was mineralised water, was it not? I believe so.
482. Do you know what minerals it contained? No; we had no estimate of that.
483. Silverthorne's well is not used now? No.
484. Can you give me the names of any other wells that are being made use of? No, sir, I cannot. One or two were being sunk; but whether they have been finished or have come into use during the last week or two I cannot say.
485. At the Sportsman's Arms, are they using that well there? Yes; they use it for stock purposes.
486. Are there any other wells you know of in use? There are M'Laughlin's and Berg's.
487. Can you manage to get a pint bottle of each of these waters for me? Yes.
488. With regard to Mr. Lane's cows, they were at his stables, I suppose, that is within about two or three hundred yards of the mine? Yes, about that. His place is right under the stack.
489. What feed did the cows usually have? The same feed as the horses—bran and chaff—which came from South Australia.
490. Then if they got leaded it would be from something in the air or the water? Yes.
491. *Chairman.*] Unless their food happened to be exposed? Yes.
492. *Mr. Hamlet.*] Would you have any difficulty in finding me a dog or cat, or some other small animal which has died from lead poisoning here? In the summer time we should have no difficulty whatever, in the winter time they seem to recover their vitality.
493. *Chairman.*] Do you observe the same variation in the health of cows between summer and winter? Do you mean on the hill here?
494. Yes, within the sphere? I have observed that the cows are not affected alike, either in summer or winter. For instance, in a mob of cows perhaps two or three would take bad, and the others would show no sign of leading. Then when those cows were disposed of others would become ill. With regard to the seasons I cannot say, because on the hill during the dry seasons we have had them pretty much alike for heat. At the same time in the summer undoubtedly the mortality is greater among the animals generally.
495. Except as to the cows, you say you do not distinguish any difference in the effects upon them? Well, I have not followed it closely enough to say. Among the smaller animals I have noticed it.

[The witness withdrew.]

TUESDAY, 28 JUNE, 1892.

Present:—

DR. ASHBURTON THOMPSON (CHAIRMAN).

W. M. HAMLET, Esq.

J. HOWELL, Esq.

R. SLEATH, Esq.

Mr. George Howard called and examined:—

- Mr. G. Howard. 496. *Chairman.*] What office do you hold? I am Secretary of the Lodge Court Stuart, Ancient Order of Foresters.
- 28 June, 1892. 497. When was that lodge established? The 27th November, 1889.
498. What we hope to get from you is material for forming some idea of the prevalence of lead poisoning among the members of your society. I suppose you enroll men only? Yes. We do take their wives.
499. They pay extra for medical attendance only on their wives and children? Yes.
500. What is the limit of age for children—fourteen? Yes. 501.

* NOTE (on revision):—I did not wish it to be understood as here given. I never heard of mine-water being used for domestic purposes; but I and others used the water from M'Laughlin's well for drinking purposes.

Mr.
G. Howard.
28 June, 1892.

501. But the women and children are not noticed in any way in your books? No.
502. What is your limit of age for entrance as a member? Forty.
503. That is the downward limit—how young will you take them? They must be over seventeen.
504. Do you appoint a medical man? Yes; we have two doctors, they are Dr. Thompson and Dr. Korff.
505. When a member is laid off do you require from him a certificate of the kind of illness he is suffering from? Yes.
506. And I suppose you require that certificate to be signed by a doctor? Yes, he must be the surgeon of the Court.
507. In this certificate you require the nature of the illness to be stated? Yes.
508. What do you do with these certificates—do you record them? Yes.
509. And you record also the nature of the illness? Yes.
510. Also the number of days the sick man is away, I suppose? Yes.
511. Have you had charge of the books of your lodge since it was established? Not from its establishment originally; there were secretaries before me.
512. Have you access to them, at all events? Yes.
513. Have you referred to them at all in connection with this inquiry? Yes.
514. You will have among your members men of all classes of occupation? Yes.
515. Can you tell me what proportion of them are employed at the mines? There are not many of our members employed on the mines. We have a few engineers, and one or two miners.
516. One or two only? Yes, there are not many miners in our society.
517. Can you give the Board the actual number of your members who are employed about the mines? No, I cannot state positively. If I had known I could have looked it up.
518. You can give that information? Yes, I will do so.
519. What is your total number of members? Up to 1891 we had eighty-eight.
520. Do you know how many have been laid off by leading? We have had one case only.
521. Only one case—during what period was that? During 1891. That was the only case we had.
522. How long have you lived in Broken Hill yourself? Nearly five years.
523. Have you formed any opinion as to whether lead poisoning is a serious cause of illness here? No, I have not.
524. Is it within your own knowledge that any persons unconnected with the mines have been leaded? No; I have no knowledge of any cases personally.
525. Do you think you can make any suggestion that may be useful to the Board in pursuing this inquiry? I do not know that it is in my power.
526. Nothing especially occurs to you? No.
527. *Mr. Howell.*] Have you been in your present employment for the last five years? No; not until next November;—about four years and a half.
528. Your place of business is close to the Proprietary Company's mine? Yes; right in the middle of the mine I may say.
529. It is close to one of the principal lead ore bins, too? Yes.
530. How many men and boys have you in your employ? One man and one boy.
531. Have they been with you all the time you have been there? No;—that is, the man has; the boy we have had for eighteen months.
532. Have you had any complaint from them as to any ill effects of the lead? No.
533. Your work is in about as dusty and dirty a place as there is on the mine, is it not? It is.
534. *Chairman.*] What is your occupation then, Mr. Howard? I am storekeeper on the Proprietary Mine.
535. Whereabouts is your place of business? It is between the two smelters; on the line of the feed floor.
536. Between the south and north-west? Yes.
537. Is it a specially dusty place? Yes; it is one of the dustiest parts of the mine, being so close to the bins where the ore is tipped down.
538. And you have never suffered from the effects? No.
539. Nor the man who is assisting you? No; nor the boy.
540. How long has the boy been with you? Eighteen months.
541. Have you taken any particular precautions? No; I have never been ill myself, except it might be to have a cold.
542. Do you live on the premises at the mine? No; I used to.
543. Tell us how long you lived there? I lived on the mine about twelve months, I think.
544. How many hours a day are you employed in your store? Eight.
545. Always in the day time? Yes.
546. Where do you get your meals? I get them at my brother-in-law's.
547. That is away from the mine? Yes.
548. Will you have the goodness to look at your books, and tell us how many of your members were employed in the mines in any capacity during the years 1890 and 1891, and include with that the statement that you have only given sick-pay to one member of your society for lead poisoning during those years? Yes; I can furnish you with such a statement.

[The witness withdrew.]

Mr. J. Hynes called and examined:—

Mr.
J. Hynes.
28 June, 1892.

549. *Chairman.*] What office do you hold, Mr. Hynes? I am secretary to the Hibernian Australian Catholic Benefit Society of Broken Hill.
550. Do you enrol only men? Yes; only men; that is, in this branch. We have family branches.
551. In Broken Hill? No.
552. We have only to do with the Broken Hill Branch, and in that you enrol men only; do you limit the ages of those you admit to membership? Our scale of entrance fees runs from 16 years to 40.
553. But do you take them over 40 years of age? We have not done so as yet. Of course a man over 40 would have to pay more.

- Mr. J. Hynes.
28 June, 1892.
554. Then there is provision for taking members over that age? Yes; for 40 years the entrance fee is £4 10s., and over that a fraction in addition for every year over that age.
555. You load them for coming in after 40 years of age? Yes.
556. Are they allowed medical attendance for their wives and families by paying an additional fee? Yes.
557. And do you appoint the medical man? Yes.
558. When a member is laid off, do you require a certificate of illness? Yes.
559. Do you require that it should be written by the medical man whom you appoint? Yes; we provide our own forms, and the doctor signs them.
560. Do you accept certificates from other medical men than those you appoint? No.
561. Who are your medical men? Dr. Blaxland and Dr. Korff.
562. Do you require the nature of the illness to be stated in the certificate? Yes.
563. Do you record these certificates in any book? Yes; they are all kept in the books.
564. Do you preserve them? Yes.
565. And they are in your charge, I suppose? Yes.
566. Will you produce them? Certainly.
567. Have you referred to the books in your possession in connection with this inquiry? Yes.
568. When was your branch established? On the 4th October, 1888.
569. How long have you been in charge? Eighteen months.
570. Your members follow all kinds of occupations, I suppose? Yes.
571. Can you give us the number who are employed in the mines? Well, I daresay I could, but I have not gone into that.
572. What is your total enrolment? On the 1st January it was 205.
573. Has your membership greatly increased since the 1st January, 1891? Yes. In January, 1891, we had 151.
574. Do you know how many members you paid sick pay to for sickness induced by lead during 1890 and 1891? I have not the certificates to hand from 1890; I have them only from July, 1890, to July, 1892.
575. Will you be kind enough to draw up a statement showing the number of members of your society who were working on the mines during 1890 and 1891-2, and also a list of the members who were leaded during the same period? Does that mean a statement showing the number initiated during that period, or the total number of members in the branch employed in the mines?
576. The total number? Very well.
577. Do you know if any of your members not connected with the mines have become leaded? Not to my knowledge.
578. You have not given sick pay to any such? No; but all the men I have on that list as having received sick pay from my branch were on the mines.
579. The question is whether among the members recorded in your books as having received sick pay there are any tradesmen who are not employed about the mines, such as carpenters, bricklayers;—do you know of any cases of lead poisoning among that class of persons? No.
580. You know that persons who work in lead are likely to fall ill? Yes.
581. That is a matter of common knowledge? Yes.
582. Do you admit them to your society on the same terms as other members? Yes.
583. You know, also, that if a man has been once leaded he is very likely to be leaded again? Yes.
584. Still there is no rule of your society which regards such cases as special in any way. You do not load them—make them pay more on that account? No.
585. And have no special rule touching them? No.
586. You are a smelter hand yourself? Yes.
587. Have you been leaded? Yes.
588. What mine are you employed at? The Proprietary.
589. How long have you been employed there? About four years.
590. Have you worked on any other mine? On no other mine.
591. What is your particular branch of work at the smelters? Feeding the furnace.
592. How long had you worked before you fell ill? A little over four years.
593. You worked four years before you fell ill? Yes—that is, from leading.
594. How old are you? Thirty years of age.
595. Do you account for your illness in any way—that is, after working for four years without falling ill, and then becoming sick so suddenly? No; I cannot.
596. Were you very bad? Yes; I think so.
597. What were your symptoms? I had pains in the bowels.
598. Colic? Yes.
599. Had you any paralysis, weak legs, or dropped wrist? No.
600. How long were you laid by? I lost fifteen shifts.
601. And then you went back to your work, I suppose? Yes.
602. To the same work? Yes.
603. How long ago is it since you returned to work? At the latter end of March or some time in April.
604. You are not suffering now? No.
605. You have no sign of it? Well, I would not like to say that. I may have it on me for all I know.
606. At all events, it does not interfere with your work? No.
607. I suppose you have wondered why it was that you should fall ill after having escaped so long? I certainly did wonder a little.
608. And you could not think of anything? No.
609. No change in the conditions of your work, for instance? Well, there was a slight change, perhaps.
610. What was that? We had more fumes coming from the furnaces than what there had been previously.
611. What was the cause of that? I cannot say. The furnace used to blow up terribly on us, and cause the place to be full of smoke.
612. How many months before you became ill did that begin to be the case? Some four or five months.
613. And it continued until you actually did fall ill? Yes. We have had occasional bursts of it since, but not so bad.
614. Did anybody else on the same floor fall ill? Yes.

Mr.
J. Hynes.
28 June, 1892.

615. Were they men who had hitherto escaped? I would not be quite sure. I think they may have had an attack once before.
616. Do you often get much fume on the feed floor? Not a very great deal.
617. As a rule, there is a strong downward draught. When do they begin to rise? Well, at the present time the floor on the furnace where I am working is slightly open, and the fumes from the bottom floor come through the cracks rather more than was the case in the earlier days of the smelters.
618. What shifts do you work on? I work the three shifts.
619. That is, all round in turn? Yes.
620. And how long do you remain on one shift—a week? Yes. Seven shifts a week.
621. Do you always have a meal at home before you go to work? Not always.
622. Do you not have a meal before going on each shift? No. Sometimes I am on the afternoon shift, and then I do not, as a rule, have anything before going on.
623. What time do you go on, then? At 4 o'clock.
624. And you have your dinner about 1 o'clock, I suppose? Yes.
625. Do you take some food with you to the mine? Yes.
626. And how long are you allowed for your "crib"? Sometimes we have a reasonable time—twenty minutes.
627. But you are not sure of having twenty minutes clear? No; not at all times. It depends upon how the furnaces are working.
628. Do you take your own tea with you, or do you drink the water provided on the mine? We get the water from an iron tank.
629. Is it condensed water? Yes.
630. Is it always cool? No; sometimes it is quite warm.
631. When you are going to eat your "crib," do you wash your hands first? As a rule, I tear a piece of paper off, and eat it from this paper. I do not use the water there on account of it coming from the water-jackets.
632. Do you wash your mouth first? No.
633. Do you live far away from the mine? About twenty minutes' walk.
634. Is any precaution taken by the men in general against leading, or are there any rules which they observe themselves? I cannot say anything as to the other men. I can only speak for myself.
635. Very well, what do you do? I change my clothes immediately on going from work. I divest myself of shirt and flannel, and put on fresh ones. I also have a fair wash all over the body—that is, every time I come off shift—and two or three times a week, perhaps, I wash my legs. Of course, we cannot get a bath here.
636. I understand—you do what you can under the circumstances? Yes.
637. Do you take an aperient regularly? Yes.
638. What do you take? As a rule, salts and senna.
639. How often do you take a dose? I take a wineglassfull every morning.
640. You find it necessary to take it? Yes.
641. Could you not get on without it? I do not know that. I make it a rule to take it.
642. You take it purely as a matter of precaution? Yes.
643. Are there many other men who take as much care as yourself in that respect? Well, I believe the men in general who work the same shift as myself do. From conversing with them I should judge so.
644. Are there other men on the feed floor who have been continuously working there as long as you have—that is, three or four years? Yes.
645. Is there any one of them who has never suffered from leading? I do not think so.
646. Do you smoke? No.
647. The others do, probably? No; not all.
648. Do you think you ought to have your full twenty minutes for "crib" free? I do—certainly.
649. Do you think it would be an easy matter to establish warm baths at the mine? Yes. Considering that they have lots of machinery, I think they might be able to do that for us.
650. Do you think if they were provided that the men generally would take advantage of them? Yes.
- 651-3. The baths would require to be warm as much in the summer as in the winter months, if not more so, I suppose? That is more a question for a medical man to answer, I should think.
654. You never wash yourself in cold water when your object is to have a thorough clean up. I presume;—have you never had any printed instructions reminding you of the little things which might be done and precautions taken to avoid lead-poisoning? Yes; I have had them.
655. Where did you have them? On one occasion I saw them at the pay office of the Proprietary Mine.
656. You have lived at Broken Hill five years you say;—have you ever known yourself, as an acquaintance or friend, of any person not connected with the mines who has become leaded? No; I am not acquainted with any. I have heard of them, of course.
657. But you have not heard of a great many, have you? No.
658. Now, what is your opinion of leading;—is it a cause of a serious amount of illness here? Yes; I should say so.
659. I mean a serious amount in proportion to the number of persons employed? Yes.
660. *Mr. Howell.*] You say you have been working at the Proprietary Mine for four years? I said four years and a half, sir.
661. That takes you back to the early days, when the smelting arrangements were different from what they are at the present time? Yes. I was a short time on the old furnaces.
662. But the arrangement of the furnaces and the general conditions of working are very much better now than when they first started, are they not? Oh, yes.
663. Do you of your own knowledge know of any men who have worked on the smelters as long as you have without being laid up by what is termed lead poisoning? I have known of one man who worked as long without being leaded.
664. Only one? Yes; only one, to my knowledge.
665. But there might have been other cases, I suppose? Yes; there might have been.
666. Did you ever notice any fumes rising directly out of the feed-throats of the furnaces when they were running? Yes.

- Mr. J. Hynes.
28 June, 1892.
667. What was the cause of it, do you know? I cannot give you the cause of it. I think, from observations that I have heard, that it gave Mr. Schlapp a good deal of anxiety.
668. Have you ever seen smoke rising from the furnaces when they have been running regularly? Yes.
669. Is it not a fact that when smoke does rise from the throats of the furnaces it is caused by their being under repair? No; I do not think so.
670. But you say you worked for three years on the furnaces—part of the time when they were in a much worse condition than they are now, as regards the chances of lead poisoning, without feeling any bad effects from it? Yes.
671. *Mr. Hamlet.*] I think you said that you found it necessary to take medicine, and made a practice of it every day? Yes.
672. If ever you left would you continue that;—would you still take a wine-glass of salts and senna every day? Not every day; perhaps once or twice a week.
673. And did you find by this means you kept yourself all right? Yes.
674. You spoke of the difficulty of workmen obtaining warm baths;—are there warm baths to be had at Broken Hill at all—I mean by paying for them? Not to my knowledge; there may be, but I do not know of them.
675. You also said the fumes sometimes rise from the throat of the furnace when it is running regularly? Yes.
676. Do you mean by that from the furnace itself? Yes.
677. Not from down below? No.
678. Is it not a fact that when a furnace is running regularly there is such a powerful draught that it actually carries all the smoke and dust and fumes with it? Yes. When I say that smoke rises from the throats I do not mean to say that it is continually so; but I have seen the smoke rising from the throat of the furnace when it was running—that is, in occasional puffs.
679. Would that be if the blowing-engine suddenly stopped? No.
680. You have known it to occur when the blowing-engine was at work and the furnace was running regularly? Yes.
681. But I suppose the worst cases of smoke and fume rising were on occasions when they were repairing the furnaces? When the furnaces have been down for repairs I have seen very little fumes rising from them.
682. I do not mean when the furnace is actually shut down, but (say) when the jackets are under repair? Oh, of course there would be in that case.
683. What I particularly meant was, when anything in the shape of repairs is going on, such as Mr. Howell referred to, there would be more fumes then? Oh, yes.
684. Considerably more than if the furnace was running as it should be? Yes; of course. But the furnaces at the present time, on account of the material that is going through, get clogged round the corners, and the blast from underneath then makes its way through the easiest place, and occasionally comes on to the feed-floor. We have to use bars to clear it.
685. *Chairman.*] Can you give us the name of the man you referred to just now who has not suffered from leading at all? He is not working on my floor at the present time. He might have been leaded for all I know. I have known him to be off through sickness, but not from lead, so far as I know.
686. *Mr. Sleath.*] You have been asked about the time you spent on the new furnaces? Yes; what I meant was the 80-ton ones.
687. Were the conditions when you started to work on the new furnaces much worse than they are now? Yes; I was referring then to the 30-ton furnaces.
688. I am talking about the new furnaces? There was less trouble from the fumes than since the new furnaces started.
689. And the conditions were really better then than they are now? Yes.
690. You only worked a short time on the 30-tonners? Yes; only a few weeks.
691. And you worked on the new furnaces the balance of the time? Yes.
692. And the conditions were better then than they are now? Yes.
693. Are water-bags used at the smelters? Yes.
694. The ordinary open water-bags? Yes.
695. Does the dust get into the bags? Yes.
696. Do you think it would be better if some provision were made to keep the dust out of the water-bags? Yes; certainly.
697. *Chairman.*] The information the Board desires you to furnish is as to the total number of members in your society from the 1st August to the end of 1890, the number who were employed in the mines in any capacity, the total enrolment for 1891, and the number in that year who were employed in the mines in any capacity, and the same for the two quarters of 1892. [*Witness here produced certain medical certificates and handed them in.*]
698. These are the certificates referring to the members you have on your sick list? Yes.

[The witness withdrew.]

Mr. R. B. Brittan called and examined:—

- Mr. R. B. Brittan.
28 June, 1892.
699. *Chairman.*] What office do you hold? I am secretary of the Broken Hill Branch of the United Ancient Order of Druids.
700. On what date was your branch established? On the 3rd May, 1888.
- 701-3. How long have you been secretary? About three years.
704. You enrol men only, I suppose? Yes; men only.
705. But they can pay for medical attendance for their wives and families? Yes.
706. In your books you do not take any notice of the wives and families? No.
707. What are your limits of age for entrance? From 16 to 45.
708. Do you admit persons over 45 years of age except by transfer from some other branch? No.
709. Do you appoint a medical man? Yes; we have three doctors—Dr. Thomson, Dr. Blaxland, and Dr. Korff.
710. And when a member is laid off, do you require a certificate of illness? Yes.

711. Do you require that it should be written by one of your appointed doctors? Yes.
712. Will you accept a certificate from any other medical man? Provided a member is absent from home we do. Mr.
R. B. Brittan.
713. In that case, if he is taken ill he must supply a certificate from a duly qualified medical man? Yes. 28 June, 1892.
714. You require that he should be duly qualified? Yes.
715. Do you record the nature of the illness in any book? No.
716. Do you preserve the certificates? Sometimes, yes, and sometimes, no. It is referred to in the minute-book.
717. Is the nature of the illness mentioned in the minute-book? No.
718. Then you have no written record of the nature of the illness? No; only sometimes the doctors put it in the butt of the certificate. [*Certificate produced in illustration.*]
719. As a general rule you have no record of the kind of illness that the members suffer from? No.
720. Your members include persons following all kinds of occupations? Yes.
721. Can you fill up for us a short form, showing your total enrolment for the last two or three years, and the proportion of members during the same periods who have been laid off by lead poisoning? Yes; I dare say I can if I have a little time to do it. I shall have to look up all the certificates of declaration on the funds, and then compare them with the doctors' book.
722. You may not have the record complete? I may not be able to complete it thoroughly, but it would give a very good idea, I think.
723. Then can you say off-hand whether any of your members, not being mine workers, have suffered from lead poisoning? I do not think they have.
724. There is another question bearing on the same point;—you know that persons working in lead are very likely to fall ill? I believe such is the case.
725. But your society does not find it necessary to compel miners who do work among lead, and who are consequently more likely to fall ill than others, to pay an increased subscription? No.
726. Then the number of patients in your society who have suffered from lead poisoning has not been so great in proportion to the other members as to embarrass the funds? No.
727. What is your own occupation? I am a clerk in the employ of the Broken Hill Proprietary Company.
728. Are you in the office? I am in an office by myself in connection with the smelters.
729. Where is the office situated? On the south dump of the Proprietary Company.
730. Is that near the smelters? Oh, yes; close to them.
731. Do you walk about among the men, or do you stay in your office all the time? I have a sort of roving commission, as it were, from north to south.
732. And does that occupy you mainly at the smelters? Yes.
733. Would that be above or below? Level with the tapping floor.
734. How long have you been working in that way? A little over five years.
735. Have you ever been leaded? No.
736. Of course you do not handle any of the materials;—if you were exposed to any danger at all it would be from the fumes? Yes.
737. However, you walk to and fro, and are inside and outside, but you are not continually in the fumes? Exactly.
738. Do you know, among your friends and acquaintances, any persons not connected with the mines who have suffered from lead poisoning? None whatever.
739. Is lead poisoning in your opinion, as a resident, a cause of illness to any important extent among the population here? Well, I can hardly say that. I can only go by my books, that is, the proportion shown there.
740. Very well, that is the best answer;—have you any knowledge of the mines at which the men were working who were laid off from leading—that is, members of your society, of course? I think principally the Broken Hill Proprietary.
741. Then you would be able, of your own knowledge, to name some of the mines at which the men were working who were laid off by lead poisoning? Yes.
742. You have, I suppose, some members who work at Block 14? Yes; at all the mines.
743. Have you any reason to form the opinion that working at one mine is more dangerous than working at another? According to report—I can only speak from hearsay as to that; in fact, I am quite ignorant about the underground workings.

[The witness withdrew.]

Mr. W. R. Stewart called and examined:—

744. *Chairman.*] What office do you hold? I am Secretary to the Loyal Silver City Lodge, M.U., I.O.O.F.
745. When was the lodge established? On the 11th April, 1889.
746. How long have you been Secretary? Nine months.
747. Have you access to the books of the society previous to that period? Yes; but there were no books kept in which the cause of sickness was entered previous to that period.
748. Then will the information you have to give us be confined to the nine months during which you have held office? Not altogether. I can give you the number of members on the books, and several other items of information previous to that period. But the evidence I have to give on the subject will be from the time I took office.
749. You enrol men only? Yes.
750. But they are allowed medical attendance on their wives and families by paying something extra? Yes.
751. You do not notice the illness of the wives and families in your books at all? No; there is no entry made at all of the wives and families.
752. What is the limit of age for admission to your society? Well, thirty-seven is the limit under one rule, but they can join at any age provided they pay a yearly subscription beyond the age of thirty-seven. Suppose a man enters at forty, he has to pay for three years in addition to the initiation fee.
753. And how young do you take them? From sixteen years.

Mr. W. R.
Stewart.
28 June, 1892.

- Mr. W. R. Stewart.
28 June, 1892.
754. Do you appoint doctors? Yes.
755. Who are your doctors? Dr. C. E. Thompson and Dr. Blaxland.
756. When a member is laid off, do you require a certificate which mentions the kind of illness from which he is suffering? Yes.
757. Do you record the certificate in any book? Yes; I do. It had not been done previous to my taking office.
758. Do you keep a record of the kind of illness in your books? Yes.
759. Your members are of all kinds of occupations, of course? Yes.
760. If we furnish you with a few questions referring to your membership—as to your total enrolment, the number of members who are employed about the mines, and two or three other questions of that kind, can you fill it in for us? I think so.
761. Can you fill it in for a period before you became Secretary? I can give you some information I have no doubt; but some of the men have changed their occupations, and others have left the district.
762. From the other societies we are to get a statement of the kind for 1890-91, and part of 1892. If we send you such a table, will you be good enough to do your best to fill it in? Certainly.
763. What is your own occupation? I am an engine-driver at the Proprietary.
764. Have you ever been leaded? No.
765. You are not exposed to any risk in that direction, except from dust? No.
766. Do you know among your friends or acquaintance, of any person not connected with the mines in any way who has become leaded? Well, I have heard complaints of the townspeople feeling the effects of lead—that is, losing their appetite and colour, and showing signs of lead-poisoning generally. I suppose it would be from drinking the water from the roofs.
767. Have you heard of many such cases? No; I have not heard of many—perhaps four or five.
768. Of course, in going about the streets we keep our eyes open, and we do not see many people who look very pale? You do not see many as a rule, I admit.
769. Then, so far as you know from your experience as a resident, you would say that you believe if there have been cases of slight derangement from lead poisoning among the townspeople, such cases must be rare? Yes; they are not very common to my knowledge.

The witness withdrew.

Mr. E. A. Archibald called and examined:—

- Mr. E. A. Archibald.
28 June, 1892.
770. *Chairman.*] What office do you hold in connection with any of the Friendly Societies? I am Secretary of the Broken Hill Branch of the Grand United Order of Oddfellows.
771. When was your branch established? On the 17th November, 1886.
772. How long have you been secretary? I have been secretary nearly the whole of the time.
773. You appoint medical men, I suppose—who are your doctors? We have only one doctor. We had the late Dr. Schinzinger, and his place has been taken by Dr. Korff.
774. Do your certificates of illness state the cause of illness? Yes.
775. Do you make an abstract of them, and record them in any book? No; we simply get the certificates and pay the sick pay on those certificates.
776. You have not during the past years kept any record of the illness which was the ground of granting sick pay? Only by keeping the doctor's certificates.
777. The doctors have to fill in the butts of their certificate-books, I suppose; do you keep the certificates yourselves? Yes; they are regularly filed.
778. Well, we want you, if you will be kind enough, to give us certain figures showing the total membership of your branch, the percentage who work in the mines, and so forth? I can supply that.
779. But first, as to your occupation, what is that? I am Accountant to the Municipal Council of Broken Hill.
780. You have nothing to do with the mines? No.
781. Do you know, among your own friends and acquaintances, of any person not connected with the mines who has been leaded? No; not to my knowledge.
782. That is among your own circle? No.
783. But you have heard of such cases, I suppose? Yes; I have heard of them.
784. Is it your impression that such cases of lead poisoning are numerous? I do not think they are.
785. *Mr. Sleath.*] Will you be able to estimate the number of your members who are employed in the mines? Yes; I can almost tell you that from memory. More than three-quarters of our members are employed at the mines. I can say that for a certainty. They follow various occupations, such as smelting, and underground and surface works.
786. What would you estimate the average age of your members to be? I cannot tell you that with certainty just now. I have the papers at home. I keep a record of such particulars. So far as I can remember, the average age is about 32 years. We do not admit them over 40 years of age as full members.
787. Has every member on joining to go through the usual medical examination? Yes; and of that examination we get a certificate from each medical officer, filled in in the same way as this. (*Produced.*)
788. So that no one suffering from any complaint would be admitted? No.
789. *Chairman.*] I have omitted one question: People working in lead are very likely to fall ill, and have, according to common repute, a greater proportion of illness than people who work at other trades; but the result of your experience has not been to lead you to think it necessary to alter the usual terms of subscription to your society, in other words to make the lead-workers pay more? No. (*The witness produces certificates, and undertakes to supply a tabulated statement containing the information asked for by the Chairman.*)

[The witness withdrew.]

WEDNESDAY, 29 JUNE, 1892.

Present:

DR. ASHBURTON THOMPSON (CHAIRMAN).

W. M. HAMLET, Esq.

R. SLEATH, Esq.

J. HOWELL, Esq.

Mr. Thomas P. Uren called and examined:—

790. *Chairman.*] What office do you hold. Mr. Uren? I am underground manager at the Proprietary Mine.

Mr.
T. P. Uren.

791. How long have you held that office? I have held the office for nine months.

29 June, 1892.

792. Were you employed at the Proprietary Mine before that? Yes.

793. What were you doing prior to your filling the office of underground manager? I was foreman, or, rather, boss of the timber men.

794. Are you prepared to give some evidence with regard to the conditions of the underground work? I will give you whatever information I can.

795. A statement is produced which shows the number of men employed in the different branches of work;—do you say that in 1891 there were 984 miners employed underground, 76 brace and plattmen, and 318 truckers and labourers, making a total of 1,378 men employed underground during that year? I am willing to accept that statement as correct. [*Statement put in. See Appendix.*]

796. Is any record kept of the number of men who get leaded underground? No; not to my knowledge.

797. Have you yourself any knowledge as to whether men do become leaded more frequently at one kind of underground labour than another? No; I have not.

798. Do not men who work in the lead stopes suffer when men in the kaolin stopes do not suffer? During my time, of all the men I have noticed there have been just as many at the kaolin stopes as at any other part of the mine.

799. Is it your practice to shift the men backwards and forwards between the lead and kaolin stopes? They are changed every fortnight.

800. The rule is carefully adhered to? Yes.

801. What is the object of it? Well, the rule was made before I came here, and, as I understand, in the early days what are termed M'Culloch's stopes were mostly lead ore, and that was supposed to be the worst part of the mine; the men therefore wanted a change, and I believe the rule was made according to their wishes. That, I believe, is the foundation of the practice of changing the men from one part of the mine to the other.

802. You say you suppose the men wished it? No.

803. You know nothing about that? No; I do not.

804. Is it a mere matter of practice, followed in accordance with a verbal rule, or is it printed or written anywhere? Do you mean as to changing the working places?

805. Yes? I really do not know.

806. If a man has become leaded and is laid off, when he recovers is he allowed to return to the same class of work again? When they come to the mine again they can return to work again if they wish to do so.

807. Is it a recognised rule that if such a man, on returning, requests to be given some other kind of work that it will be found for him if possible? We have always done that if possible; but not in all cases, because perhaps two-thirds of the cases would be of men not working in the mine two days before they were sick. I cannot find a place for every one who comes back after being sick.

808. Can you give us any idea of the number of cases you meet with among the underground hands? No; I have not the least idea.

809. But you are clear, from your observation, that two-thirds of the cases occur when the men have not been working at the mine very long? Yes; I find that to be so in two-thirds of the cases.

810-1. After they have been working, say, for a fortnight? Yes.

812. Have you noticed that some persons are especially liable to suffer? No; not in particular.

813. Have any rules or instructions been drawn up to inform the hands in general of the little precautions they could take for themselves, and which no one else could take for them, against leading? I know the men have been advised, in many instances, how to take care of themselves against these dangers as much as possible.

814. In what form has such advice been given? Well, they have been instructed to observe cleanliness for one thing.

815. But how has it been given? Simply as a matter of advice, not as a rule of the mine.

816. You mean it has been given orally, and not in a printed form? No; there are no rules printed to that effect, as far as I know.

817. Do you think it would be a useful, or, at least, a reasonable and proper thing to do, to draw up and print and post, in some conspicuous place, or distribute among the men, a leaflet drawing attention to these little matters? Well, really, I do not think it would be of any use.

818. Why not? Simply because, as it is, they understand what should be done, and they have every opportunity of doing it; but they do not seem to take any notice.

819. What guarantee have you that they do thoroughly understand? Well, I can give you one instance to illustrate my meaning. Take the matter of wearing their ordinary clothes in the mine. We put up changing rooms, and had them there for about eighteen months, so that the men could go there and change their clothes, and not wear their working clothes to their homes; but they failed in almost every case to go into these rooms.

820. They did not use them? No.

821. How many of these rooms were there;—what were they built of, and what was the size? There were three. I cannot tell the exact size.

822. Say approximately? Well, about 60 ft. x 25. or 30 ft., I should say.

823. Each of them? Yes.

824. What do they contain? There are seats, and hooks to hang the clothes on. That is all, I think.

825. And where are they placed? There is one in each section of the mine, where the men get their candles to go below.

- Mr. T. P. Uren. 826. The blocks of the Proprietary Company are 40 acres, I believe? Yes.
- 29 June, 1892. 827. And they are square? Yes.
828. How many shafts are there in each block—shafts in use, I mean? There are three shafts in Block 13, three in Block 12, and, at the present time, there are two in Block 11.
829. How far away from the changing-room is the most distant shaft? About 30 feet to 35 feet, I think.
830. That is from where the men go down? Yes; they are all within about 50 feet, I think.
831. Are the three shafts you mention in Block 13 within a radius of 50 feet? Not each shaft. We do not change our men at every shaft.
832. Do you mean that they descend and ascend by one out of the three only? We have working shafts, but do not allow the men to ride through them.
833. How many are they allowed to ride through in Block 13? One in each block they ride through.
834. And you say there is a changing-room within a few yards of each of them? Yes.
835. What precautions against leading would you recommend to be taken by the miners? Well, I do not know that anything more can be done than to provide them with water to wash themselves when they come out of the mine. That is all I can think of, or really know.
836. And to change their clothes, of course? Yes, certainly; and keeping the mine as clean as possible.
837. What provision is there for washing in the changing-rooms or elsewhere? We have water carried through the mine in pipes, to keep the mine clean below by sprinkling the dust. At the present time this supply is not in working order, as certain repairs are in progress which made it necessary to take out some of the pipes.
838. That is not what I refer to. Your recommendation is that the men should wash after finishing their work, and that they should change their working clothes for others; and I want to know what provision there is for them to wash, as you recommend, either in the changing-room or elsewhere? Well; I just stated that as a recommendation. I did not mean to state that we had provided these things. I am giving you my ideas of what should be done.
839. Very good. I suppose a man who is beginning to become leaded, and really is leaded to some small extent, is not quite up to his work, before he becomes really ill? That is a question I cannot well answer. That is a matter which is left to the shift bosses. If a man cannot really do his work, they are the ones to find it out. But we have men who claim they have been leaded, and who are, nevertheless, very good men.
840. Do you know anything about lead poisoning—as to its effects? I do not.
841. Do you know that the early effects of it are to make men less energetic, and a little dullish, and then to produce muscular weakness, and so forth? I have never experienced it.
842. You do not know that? No.
843. Do you employ any boys in the mine below? No; none.
844. What do you suppose is the age of the youngest man you have below? Well; I really do not know their ages. But no one is employed unless he can do a man's work.
845. There is no fixed limit of age, at which you begin to call a boy a man? No; not that I know.
846. In that connection, would you make the same remark as you made just now—that is, if the shift boss found a young man not able to do a man's work, would he tell him to go? Most certainly. It lies entirely with the shift boss, whether he keeps a man or not.
847. Have you been engaged in lead-mines, or silver-lead mines, in any other part of the world? Yes.
848. Do you know anything of the use of milk as a preventive? I have heard that it is a good remedy—they use a good deal of it in the United States.
849. Have you been interested in it to the extent of observing whether it is an effectual remedy? No; I have not.
850. But you know it bears a good reputation among miners for the purpose? Yes; it is entirely a matter of hearsay with me.
851. In any of the mines you have been connected with, has it been customary to keep medicine on hand for the use of the men? No.
852. On the Proprietary Company's mine, do they keep iodide of potassium for the men to take in their drink, if they like? Not that I know of.
853. Are you responsible for the ventilation of the mine below? Well; in a certain sense I am—yes.
854. *Mr. Howell.*] Do you consider the mine at the present time in a better condition, so far as ventilation is concerned, than it was two or three years ago, Mr. Uren? Yes, I do; much better.
855. What number of shafts, and what are called air-passes, are there in the different blocks of the Proprietary Mine, in addition to the working shafts? I think there are about six in number, although they have not all been in use for some time.
856. But they were put down for the purposes of air shafts? Yes.
857. How many main shafts are there altogether—nine, do you say? There are eight in use, and one out of use. There are two new passes, and either four or six of the old ones. I am not positive about the number; but there are five shafts in Block 11.
858. That is, working shafts and air-passes? Yes.
859. They are described along the line of lode at pretty nearly uniform distances apart, for the purpose of ventilation? Yes.
860. Is there any part of the mine you know of where there is not good air? None at all. The mine is well ventilated throughout.
861. If the natural ventilation is not sufficiently good, what means do you take to supply or improve the ventilation? We use fans to force the air in by means of pipes.
862. Then they are put in when the ground is newly opened up? Yes, invariably. The air is carried into places where there is any immediate occasion for ventilation.
863. So that if you were running a drive from a cross-cut or rise, or sinking a winze in new ground, where the natural ventilation is not good, you would put up a little air-compressing engine, and fix a fan to it, and force the air into those different places? Yes.
864. Is it not a fact that when you were working the old carbonate ore above the line of the 200-foot level, the ore was very much higher in lead, and very much drier than the ores which have been found below the 200-foot level? Yes, very much so. It required more fracture and more breaking of the rocks, and it carried a much higher percentage of lead.
865. And the ore was more inclined to give off dust? Yes.

866. How does the breast of ore that the Board examined the other day compare in the matter of dryness and tendency to give off dust with the other lead ore stopes in the mine? I showed them the very driest carbonate ores we had.
867. Going through the mine, as you do every day, from one end of it to the other, and talking with the men, you sometimes, of course, meet with some men who say they feel badly, and wish to be let off, or something of that kind, do you not? Yes.
868. But such matters are principally brought before the shift bosses? Yes.
869. Speaking from your own knowledge, what do they complain of generally? Well, I really do not think they know themselves. Some will ask to be kept in the lead stopes, and others will ask to be kept in the kaolin stopes, but they do not give any reason, as to illness, or rather the nature of it, they simply say they do not feel well, and want to have a spell. That is the excuse I get.
870. Did you ever notice any dust in the kaolin stopes? No; very little.
871. The ore is damp? Yes.
872. In breaking into little cavities that are found frequently in mines, that are called "vughs," you meet with what appears to be foul air, do you not? Yes.
873. That is almost invariably the case, is it not? Yes; I have always found it in all kinds of lodes.
874. You do not know of any portion of the mine that could be improved by additional ventilation, do you? No; I do not.
875. Is it not a fact, that as a general thing, there is too much air in the mine? Sometimes I think it is too strong.
876. *Mr. Hamlet.*] You have had experience in America as well as on this field, have you not? Yes.
877. For how long back does your experience of underground mining extend? For twenty years.
878. Did you notice cases of men suffering from lead poisoning in America? I have known men to be suffering there from that cause.
879. And do you consider the cases of leading you saw in America worse than those you have seen here, or not so bad? I consider the cases I saw in America were worse than those here.
880. How much of your time is spent underground daily? From five to six hours—sometimes more, and part of the night.
881. You say you have been engaged for nine months on the Proprietary Mine? I have been altogether two years and nine months on the mine, in different capacities.
882. And you have worked all through the mine? Yes, in every part of it.
883. And do you say you have been leaded or not? I have not. For the first twelve months I worked in M'Culloch's stope, that is the north stope, but it is known by that name.
884. Do you think a man wearing a moustache would be better protected from lead than a man without a moustache? Well, that is a matter of opinion, I suppose. I do not really know, but I think a man with a moustache would be less liable to be affected by dust than a man without one.
885. Do any of your men shave the upper lip? I do not know.
886. I want to know whether the majority of the men wear moustaches or not? I should say the majority of them wear a beard of some kind. It is a matter I do not know anything about.
887. But you see the men every day of your life down in the mine? Yes.
888. Then can you say whether there is a considerable percentage of the men who do shave the upper lip? The majority of the men have hair on their faces no doubt. But I cannot give you any stated number, one way or the other. I know there are some men who have scrub beards, some have long beards; others wear only a moustache, and some none at all.
889. Have you always worn a moustache since you have been doing underground work in the mines? I have worn a moustache ever since I was able to grow one.
890. I think you said the cases of lead poisoning might be less if the men were habitually cleaner? Well, with regard to the cause of sickness, I am not prepared to express an opinion, but I think the cases of sickness might be less if the men were cleaner both in the mine and out of it.
891. *Mr. Sleath.*] I think you said just now, Mr. Uren, that there were as many cases of sickness in the kaolin stopes as in the lead stopes. Now I want to ask you if you do not think it is a fact that many a man may be leaded in reality, but that the effect does not become apparent—because the poison has not got thoroughly hold of his system—until he is removed from the lead into the kaolin stopes? I suppose it is possible; but I do not know. I find as many miners lay off sick from Jamieson's as from McCulloch's, and oftentimes more.
892. You change the men every fortnight from the lead stopes to the kaolin, and *vice-versa*? Yes.
893. Is it not reasonable to suppose that a man who has worked a fortnight in the lead might have the effects of it in his system, but not feel it until he is removed? It is quite possible.
894. Is it not reasonable to suppose that? —
895. *Chairman.*] That seems to me to be rather a question for the doctors.
896. *Mr. Sleath.*] Are there not a number of men who are not changed every fortnight? What we class as timber men are not changed.
897. But I mean are there not a number of face men who are not changed every fortnight? No; not a man to my knowledge. Every man that works in the face is changed every fortnight. That is the rule.
898. Is it not a fact that when the men become leaded and suffer from lead poisoning, and consequently are not able to continuously follow their work, the management give the preference to fresh men? No, sir; nothing of the kind.
899. During the last two months have there not been something like 400 new men put on the Proprietary Mine underground, while hundreds of the old hands who have been leaded are walking about the streets? (To the Chairman.) Has that question anything to do with this Board?
900. *Mr. Sleath.*] If you do not wish to answer the question I have no desire to press it. How long ago is it since the changing-rooms you speak of were erected? About eighteen months.
901. Before that there were no changing-rooms? No.
902. Do all your underground men go up and down one shaft on the block? They are supposed to. It is in the conditions.
903. Are there any regulations to that effect? There is a regulation to change at one shaft.
904. I am speaking of printed regulations? There is no printed regulation to that effect.
905. Is it just a general understanding? Yes.

Mr.
T. P. Uren.
29 June, 1892.

Mr.
T. P. Uren.
29 June, 1892.

906. So that a man may go up any one of two or three shafts that may be in working-order in the block, and not break any printed rule of the company? If they go up three shafts they are most certainly breaking a rule.

907. Is there any printed rule against doing it? No; not to my knowledge.

908. Would you explain in what way they would be breaking a rule if there are no printed rules or notices posted? They would break a rule because it is my order that they should not do so.

909. And are you satisfied that your order reaches the whole of the men? Yes; perfectly satisfied.

910. Have you given these orders direct to the men yourself, or through the shift boss? Are these questions necessary for me to answer, Mr. Chairman. *Chairman*: It appears to me that they have an important bearing in this way: you tell us that the men go up or are supposed to use one shaft out of the three, and that there is a changing-room within a few yards of that shaft; the usefulness of the changing-room depends upon its being easily accessible to the men.

911. *Witness*.] I am prepared to answer any question bearing on the inquiry.

912. *Mr. Sleath*.] What I want to get at is this; whether every man has got your orders as to which shaft he should go down and ascend by; otherwise a man might feel justified in using any shaft, and, therefore, he might be 100 yards from the changing-room instead of 50 yards? I give my instruction to the foreman, who conveys them to the shift bosses, and the shift bosses see that they are carried out. The plattmen and brace-men have strict orders not to allow a man to get on the cage of a shaft which is not to be used for the day.

913. So that according to you it is impossible for any man to enter or leave the mine except by the one shaft? Yes; unless they steal a ride, and we do not know it.

914. Have you ever used water in the underground workings of the Proprietary Mine for sprinkling purposes? Yes, I have.

915. How long ago is it since the water was laid on? Practically it is within the last twelve months.

916. You go through the mine every day? Yes.

917. How often have you seen the stopes sprinkled yourself? Every day when the water is on. There is a man in each block who is told off to sprinkle the dust, and do nothing else.

918. Every day when the water is on. But how often is the water off, and how often are the drives or stopes sprinkled altogether? It would be sprinkled every day; but a short time ago we had to do some repairs, and the pipes in McCulloch's shaft had to be disconnected.

919. Have the shift bosses or underground managers, any instructions to make allowance for men who may be suffering, or recovering from lead-poisoning? Those men are all referred to myself. If a man has worked any length of time in the mine he has a chance to work on the surface. Many a case of the kind has occurred. In other cases the men will refuse to go on the surface work, preferring to work underground.

920. But in the case of a man who may be weak from the effects of lead poisoning, and who could not do sufficient work—that is, perhaps, as much work as an ordinary healthy man would do—would a shift boss make any allowance for him; or would he be sent up? Do you mean discharged.

920½. Yes? No. I do not know of a case where a man has been discharged on that account.

921. I think you said a little while ago that you used to force air into the winzes. In how many cases have you carried forced air into the winzes, or is it a regular thing? It is a regular thing in drives or crosscuts, or anywhere where we may be running for connection with the natural ventilation. We put in the fans, place them in the purest air we can get, and force it into the working place.

921½. My question was, is it a common occurrence to carry air-pipes into the winzes? Well, we have not sunk a winze over 23 feet deep since I have been in the mine—we do all our work by rises.

922. Have you carried air-pipes into all the winzes you have worked? It is not necessary at all. There is as much air in the bottom of the winze as there is at the top.

923. You have never found it necessary to carry air-pipes into the winzes? I have had no winzes to carry them into. We run from one level to the other—rising up; and in every case we put a pipe up. There has not been a rise put up where that has not been done.

924. I was talking about the winzes, and you say you have not found it necessary to carry the air-pipes into them? Yes. But we have only sunk to a depth of about 20 feet, anyhow. In order to make that more plain, I will explain the exact process. For instance, in sinking a shaft, we sink a portion, and at the same time rise towards the middle, the rise having the pipes in; and if we sink about 20 feet whilst rising 50 feet we make the connection, and then get the natural ventilation.

925. My question will not affect your mine at all, if you have not sunk in winzes; so we need not trouble about that any further. You said in answer to Mr. Howell I think, that the lode in the north end of the mine some time ago was more hard and solid than it is at the present time? Yes, very much so.

926. Would the hard, solid material, or the fine, dusty stuff, give off most dust? Yes; you have to use more fracture in dealing with it.

927. The massive, hard, compact lode, in your opinion, gave off more dust than the finer stuff? Yes.

928. You have said that some of the men wished to be kept in the lead stopes—have you known of many such cases? Yes; I have had quite a number.

929. Then, again, I think you said in answer to Mr. Howell, that there was generally too much air in the mine. Will you explain how the air could be detrimental to the men? Certainly. If you throw too much air into a very dry stope, it stirs up the fine, pulverised dust; whereas, if the stope is nearly warm it becomes damp, and the fine dust does not rise with a current of air as it would if dry.

930. You say you keep your stopes thoroughly sprinkled with water—would not that have the same effect? I am speaking of dry, dusty stopes.

931. Where water is not used? Yes.

932. Well, if the stopes were thoroughly sprinkled with water, would it not have the same effect? The dust would not rise if thoroughly sprinkled with water, certainly.

933. The sprinkling would have a beneficial effect? Yes.

934. Have you got any stopes where there is not a sufficient quantity of fresh air? Not one.

935. I think you said you were working for the Proprietary Company close upon two years before you took charge of the underground workings, and that you never felt the effects of lead? Yes.

936. In what class of work were you employed? I was employed looking after the timbers in McCulloch's for the first twelve months.

937. You never were really working in the stopes—at the face, I mean? I was in the stopes eight hours every day.

938. That is, superintending the work? Yes.

939. I suppose you knew Mr. Harper, the late underground manager? Yes.

940. Did you hear what was the cause of his complaint after he left here. He was supposed to be sick—was he leaded, do you know? I do not think so.

941. What regulations have you as to sweeping the floors—do you make any effort to keep them free from broken stuff? We have men regularly employed in cleaning the floors, and doing nothing else, every day. That is their line of work. In some places we sprinkle all the drives, and scrape up all the waste material that may be thrown down, and have the place cleaned every day—thoroughly cleaned.

942. Would that be a useful measure—as against the chance of leading—to keep the floors sprinkled? I do not think so.

943. Why not, since it would tend to prevent the dust rising? I think by putting water on the floors it would wash too much of the dirt on to the men, and that would be worse than the dry dust.

944. I think I heard you say you had to disconnect the water-pipes in McCulloch's shaft, but you did not say for how long? It is only a temporary stoppage. The connections will be made again as soon as possible—that is, when the necessary repairs are completed.

945. How long has it been discontinued now? About three or four weeks.

946. Have you any idea when it will be renewed? I expect in about a couple of weeks; perhaps it may be longer; I cannot tell exactly.

[The witness withdrew.]

Mr. Walter J. Koehler called and examined:—

947. *Chairman.*] What office do you hold, Mr. Koehler? I am metallurgist at the Proprietary Mine.

948. How long have you held that office? I have been acting as metallurgist for the Proprietary Company for close on five years now. I was assistant under Mr. Schlapp.

949. Are you prepared to give the Board some evidence with regard to the surface hands employed at the Proprietary Company's mine? I do not know that I can give you any definite information without having the figures to guide me, but I will give you what evidence I can.

950. I have a statement here which has been furnished by the management of your company, as to the number of men employed and the quantity and character of the ore raised. Do you say that for the year ending 31st May, 1891, you had employed on the surface 14 firemen, 41 carpenters, 5 tinsmiths, 18 blacksmiths, 17 blacksmiths' strikers, 33 turners and fitters, 6 boiler-makers, 9 masons, 39 ore shunters and truckers, 16 horse drivers, and 250 labourers—making in all 448 men; and on the smelters, 39 tappers, 39 feeders, 132 slag-wheelers, 162 charge-wheelers, 57 labourers (on "dumps" and "bins"), and 45 labourers handling slag and bullion, &c.—making 474 men? Yes; that will be the approximate number. (For statement referred to *see Appendix*.)

951. Has the number of men employed on the surface increased to any extent from the last year? No; very little indeed.

952. Then we may take it that the figures here given for the year ending 31st May, 1892, practically represent the number of surface hands generally employed about the surface of your mine? Yes. There may have been a few more put on since, as two more furnaces have been started, but the number is about the same as shown there.

953. Then, during the same period ending 31st May, 1892, you smelted 219,145 tons ore, averaging 27 per cent. of lead and 37 ounces of silver, and you smelted that in quantities of about 50 per cent. lead, 36 per cent. kaolin and silicious, and 61 per cent. iron ore? Yes; I should say about that.

954. And the ores are generally described as oxidized and carbonate ores? Yes.

955. Do you keep any record of the number of men who get leaded? No; we do not.

956. Have you observed whether the men who get leaded have worked more frequently at one class of work than another? Do you mean on the surface?

957. I am speaking now of the surface workers only? Speaking generally, the cases of lead poisoning have been really very few; but undoubtedly there is more liability to leading in the work of tapping, and wheeling the slag on the lower floor than in other parts.

958. How is the removal of flue-dust arranged? The dust settles in large chambers behind the furnaces, and it is taken from there to the slag-dump, from which it is transferred by means of lifts to the feed-floors of the furnaces.

959. Do the men engaged in that work form a separate class by themselves? Undoubtedly. Formerly the men handling the slag and bullion attended to the flues, but for the last four or five months we have let the work out by contract, so that there are three or four men who do nothing but that; they attend to that especially.

960. During the last few months there have been three or four men who have been engaged removing the flue dust, and do nothing else? Yes.

960½. Since you say the men engaged in tapping and wheeling the slag, and so on, are liable to suffer rather more than the men otherwise engaged, have you any system of changing the men from that kind of work to the less risky kinds? If the men desire it they can have a change of employment. We change them on to the dump occasionally. But it rests with them. We try to accommodate them. We change some of the hands from time to time from the furnaces to the leaching works, and other departments like that.

961. And you consider the conditions of work at the smelters are such as to make a change in the work desirable and necessary? Yes; I should try to do everything I could to give them a change; more especially if they have been employed a long time on the works.

961½. Of course, that is a concession—it is not a formal rule? No.

962. However, if a man has got leaded, and comes back to work, you allow him to continue the same class of work as that in which he got leaded, if he chooses? Yes.

963. You make no objection? No.

964. Are you aware whether any rules have been drawn up and published for the benefit of the men in this connection, or hints or suggestions made to them in that way, as to the little precautions they could

Mr.
T. P. Uren.

29 June, 1892.

Mr.
W. J. Koehler.

29 June, 1892.

- Mr. W. J. Koehler
29 June, 1892.
- take themselves to avoid leading? No rules have been published, but the men have been very often cautioned about certain things. However, I am afraid the cautions given to them are not attended to as they ought to be.
965. You mean as to observing cleanliness, I suppose? Yes; and not to rub their tobacco in their hands whilst they are dirty from the work in which they have been engaged; also to wash themselves before eating their "tucker," and so forth.
966. They eat their "tucker" at their work, I suppose? Well, they have twenty minutes allowed them to eat their "tucker," and they can go away if they like.
967. Are they allowed a clear twenty minutes? Yes.
968. Are there no exceptional cases? Well, in cases of emergency they might not be able to get the full twenty minutes at one time: there might be something going wrong with the furnaces, for instance; which would require their attention at the time.
969. Then it would be only in cases of emergency when they would not be able to get their full twenty minutes for their meals? Yes. The custom is that during the twenty minutes one or two men are told off to do the work for the rest, while they are getting their "tucker."
- 970-1. You know that is the custom except in cases of emergency? Yes.
972. Do you think it would be a useful thing to publish a fly-sheet of the rules to be observed by the men? Well, I am afraid it would not have much effect. I may say that the men there have been spoken to very frequently about these things, but they pay no heed to them.
973. Still it would, I suppose, be a reasonable thing to do;—would it not be a relief to yourself, for instance, to feel that you had told them everything necessary to insure their safety? I have said that they have been spoken to over and over again.
974. You have told them everything about the precautions necessary to be taken to insure their safety? Well, yes, they have been told; but I may say that the precautions they should take are so self-evident that it should not be necessary to do even that. It is simply a matter of cleanliness, that's all.
975. Will you tell us in detail what you would recommend as preventive measures to be adopted by the men working in lead? Well, in the first place I recommend their washing their hands and faces before taking their meals; and then when they get home to have another wash all over. Very often men come on to work next day without the slightest signs of having washed. I do not mean to say that that is by any means the rule. But in circumstances of that kind the remedy is simply a matter of cleanliness, so far as I can see. The men cannot expect to keep in a sound state of health, in work of that kind, particularly, unless they observe ordinary rules of cleanliness.
976. You would not, in fact, make any other recommendation—is that what we are to understand, Mr. Koehler? That and keeping their bowels open, and regulations generally of that kind, I think, are the only suggestions I could make.
977. Are you aware that taking a purgative once in a fortnight or fifteen days has been recommended as a prophylactic? Yes.
978. As to the rules of cleanliness you very properly suggest, I suppose a great many of these men really have little or no opportunity of washing themselves, considering the cost of water and the conditions of life in general here? Well, I do not think water has ever been so scarce as that. We have always had plenty of water on the mines, anyhow.
979. You have always had plenty of water? Yes; we have always had plenty of water.
980. Has there been any special provision made for the men to wash themselves on the mine? I cannot say there has been any special provision made, but there have been plenty of buckets, and they could always get water.
981. Then as to the furnace-sheds, I suppose you would recommend that the men should always have nice clean water to drink? We take good care of that. There is always a good supply of condensed water to be obtained. They never run short of drinking water.
982. How is it supplied to them;—where do they draw it from? We have one boiler running off the condensed water. It runs into two large covered tanks, and from these it is drawn by carts and put into covered tanks on the different floors and different parts of the surface workings. The men can draw it from there. The shift bosses are supposed to look after the taps of these tanks, and whenever the men want water they can get the key from the shift boss.
983. Then you use no water-bags in your sheds? Oh, yes; we use water-bags.
984. What shape are they? They are just ordinary canvas water-bags; I should say about 20 inches deep and 10 inches diameter.
985. Circular-shaped? Yes.
986. Are they covered? Well, covers are provided for them, but they are very seldom on. I suppose they find it more convenient to get at the water without having to lift the cover.
987. But an arrangement of that kind, which depends upon the co-operation of the workmen, is a bad one, is it not;—in other words, would it not be better to have the covers made self-acting or permanent? I dare say that might be done very easily.
988. Are you responsible for the ventilation of the furnace-sheds? Yes. I may say our furnace-sheds are very well ventilated indeed. The arrangements in that direction are very complete indeed.
989. You would be able to explain that to the Board if they came to look at the arrangements? Yes.
990. Are you aware of any cases of metallic poisoning among the men engaged on the mines other than lead poisoning? No; I have heard of arsenical poisoning, but I do not believe in it. In fact, I have had too much experience of that myself to put any faith in the reports of its existence here.
991. But there is some arsenic found in the ore, I believe? Yes; there is some, but not enough to do any harm at all.
992. Are the effects of lead poisoning felt in the first instance on the general energies and muscular strength of a man before he is actually laid by? Well, I am hardly able to answer that question; I think it is more a question for a medical man.
993. How many boys are employed on the surface at your mine? There are no boys directly in my department. There are some on the surface, but I have nothing to do with them.
994. Can you say who would be the proper person from whom to ascertain the exact number? Mr. Hansen, one of the surface foremen, has them in his charge. I should say I have two boys employed at the furnaces sweeping floors and carrying messages

995. How long have you had the two boys you have got now? They have been on a couple of years now, I think. One of them has been on a couple of years, and the other I changed the other day, for a new boy. Mr.
W.J. Koehler.
996. And they have never been ill? Not that I am aware of; nothing serious, at all events.
997. How old are the boys who were engaged two years ago? I think they were about 14 or 15 years of age when they were put on; one of them was possibly 16 years old. 29 June, 1892.
998. Have you been engaged in silver or lead mines in other parts of the world? Yes.
1000. Do you know anything of the use of milk as a preventive of lead poisoning? Yes; I have heard it mentioned, and its use advised.
1001. Do you only know that as a matter of conversation, or have you, from personal knowledge, drawn a conclusion of your own about it? I have not had any experience personally.
1002. Is it anywhere customary to keep medicines upon the mines for the use of the men, iodide of potassium, or anything of that kind? Well, yes. There is one case I know where they keep medicines on hand, but for a rather different purpose, that is, the mine was away from any town where treatment could be obtained in the case of illness.
1003. In that case no specifics for lead poisoning were kept? No.
1004. *Mr. Howell.*] How long have you been working at furnaces in connection with smelting operations, Mr. Koehler? About eleven or twelve years.
1005. More particularly in America, I believe? Yes; principally in the United States and Mexico, and out here.
1006. Have you, in your experience in connection with smelting operations, been in any place where there is much more lead poisoning than there is here? No; I have never heard so much complaint about it as I have here.
1007. Were the furnaces you worked on in America the same as those we have here? Yes; they were the same style, but of different dimensions.
1008. Have you ever worked on smelters in connection with which there were better arrangements for conveying the dust or fumes than those provided here? Never.
- 1008½. Then, you do not think there could be any improvement made in that respect in the Proprietary Company's furnaces? Not for conveying the smoke away from the furnaces themselves.
1009. Have you noticed the smoke coming up from the throat of the furnaces on the feed floor? Very seldom indeed. Occasionally it may do so, but it happens very rarely.
1010. In such a case, the explanation would be that there was something wrong with the furnace? Yes; it might occur occasionally from the running down of the furnace.
1011. Do you know, of your own knowledge, of any considerable number of men, or any men that have worked on the furnaces continuously for two or three years, and have never been laid off on account of what is claimed to be lead poisoning? Yes. I have known a very large number, indeed, who have worked for two or three years without being laid off, and some have never been laid off.
1012. That you know for a certainty? Yes.
1013. Would that apply to all parts of the furnaces—above and below? Yes. I know of one shift where no man has been laid off from that cause for two or three years.
1014. And you have heard of no complaint? No.
1015. There is always plenty of water provided for the men, is there not? Oh, yes. Of course, there was a time when there was a restriction to some extent on account of the general scarcity.
1016. But you say that the men have always been supplied with plenty of water? Yes; they have always had plenty of water.
1017. Is the water kept in covered vessels until it is put into the water-bags for the use of the men? Yes; but sometimes when they want to take the water home, they will pull off the covers, and take the water out themselves.
1018. But the understanding is that the water should be kept in iron tanks, and covered over entirely until it is drawn off into the water-bags? Yes.
1019. And the water is quite good and pure? Yes; certainly.
1020. It is not contaminated with lead in any way? No.
1021. In fact, is it not the same water we use for domestic purposes in our private houses? Yes; exactly the same.
1022. It has been remarked here in evidence, which has been already given, Mr. Koehler, that the fumes from below—that is, from the lower portion of the furnaces—penetrate through the floor, and come on to the feed floor in considerable volume; does that statement coincide with your experience? No; I do not see how it could. At all events, it would be a very exceptional case.
1023. There is a ventilator, is there not, the whole length of the smelting building, for the purpose of drawing off the fumes from below, immediately under the floor? Yes.
1024. And there is always a strong draught going up along that floor? Yes; there is an opening above the flue, and the smoke goes out there. It does not come out on the floor at all, but is carried away direct.
1025. Any fumes from the slag-tap would naturally find their way into the flue? Yes.
1026. The draught through the flue would be greater than that of the cracks through the floor? Undoubtedly.
1027. And you think the general conditions in and about the furnaces, above and below, are as good for sanitary purposes as they possibly could be? Yes; I think so; certainly.
1028. *Mr. Hamlet.*] Have you had an extensive experience as a metallurgist, Mr. Koehler? Yes; I have had something like twelve years' experience.
1029. Can you give us a short description or list of the various ores that are used in connection with your smelting operations? Well, our ores are carbonate of lead ores, and kaolin ores, silicious iron ores, all carrying lead and silver in the shape of chlorides, bromides, iodides, and compounds of these different elements, with silver of course.
1030. It would, perhaps, be simpler if you named the various elements irrespective of their technical terms? Well, the ores we are seeking carry lead and silver—the constituents we seek—besides traces of copper, very little arsenic, very little antimony, and fine traces of the rarer elements.
1031. Do you find much arsenical ore? Very little, indeed. If there were any amount of arsenic in the ore it would show itself in the way of speiss. There is very little of that.
1032. Do you find any mercurial ores? The minutest trace possible. 1033.

- Mr. W. J. Koehler.
29 June, 1892.
1033. And, briefly stated, your process of smelting is just that of adding the flux to the ore—adding the fuel, and so much iron or ironstone to make it fuse;—that is the general process in as few words as possible? Yes.
1034. What kind of furnaces have you in use? They are called water-jacket furnaces. They have no specific designation.
1035. How many tons are smelted per day? We smelt 750 tons per day—that is the ore, exclusive of flux, of course.
1036. And what proportion of sulphides have you? Very little, indeed. We avoid dealing with the sulphides at present as much as possible. Occasionally we get a little, but it does not amount to more than a quarter of 1 per cent. of the ore put through.
1037. Have you any roasting operations? No, sir; none at all.
1038. Of course you are aware that very deleterious gases arise from roasting? Yes; but it depends upon the class of ores treated.
1039. Do you consider that more fumes arise from roasting than from the process you adopt? Yes; I should say a larger amount of fumes arise from roasting.
1040. Do you carry on any desulphurising operations? Not here—at Port Pirie.
1041. So that you never roast matte or speiss? No.
1042. Are you aware that lead fumes arise from the furnaces which you use? Yes.
1043. And what provision have you for removing the lead fumes? In the first place, we condense as much fume as we possibly can in the flue chambers at the rear of the furnaces, and the gases are carried into the air by means of high stacks.
1044. You really have in your lead fumes all the volatile elements that are in the ores, such as chlorine and iodine? Yes; except what collects in the chambers, such as sulphuric acid.
1045. Which, in addition to the lead fumes, are the products of combustion from the furnaces? Yes.
1046. And you say you have these flues to condense the fumes? Yes.
1047. Is that a well-known method of condensation? Yes; it is the only method practised on a large scale.
1048. Are you aware of the method of condensation in other parts of the world? Yes; I have a good general knowledge. Sometimes they build the flues longer, and with parallel iron sheets.
1049. What would be the total length of your condensing arrangements? I can hardly give you that off-hand. I should say between 350 and 375 feet of flue. There would be about 225 feet in the first nest, and 150 feet in the other. These, of course, are rough estimates, but I could tell you exactly by measuring.
1050. Are you aware that in some parts of the world condensing flues extend to miles in length? Yes, sir.
1051. And that to avoid the excessive length of flues different forms of condensers have been used from time to time? Yes; but the only condensers that are practically used are the long flues with wider chambers to check the velocity of the fumes.
1052. *Chairman.* Does the length you mention include the stack? No; not the height of the stack.
1053. *Mr. Hamlet.* There are two kinds of condensers in vogue, I think—the wet and dry condensers? Yes.
1054. Of which kind are yours? Ours are the simple dry condensers. I believe wet condensers have never proved a success in any part of the world. It has not been found a practical way of treating a large quantity of smoke to use these condensers. It has been found that the lead fume practically gets away—that is, it passes through in large bubbles, which only get wet on the outside.
1055. That is a matter of opinion? It is a matter of fact, sir, I think. It has been tried in large works in Germany and the United States of America, and has not proved a success at all. I can refer you to authorities on the subject.
1056. Would you approve of spray condensers? Not on lead fumes.
1057. You think the only practical way is to have long chambers, and to bring the smoke in contact with large surfaces—a cooling process, in fact? Yes.
1058. Is it a fact that the condensing of lead fumes would be a matter of monetary interest to the Company? That is a question which it would be hard for me to decide. We have not enough data to go upon yet—in fact, we are doing some work in that connection now, but I am not in a position to express an opinion. The question is whether it would cost more to save the lead and silver going up the stack than it is worth.
1059. But apart from the financial aspect of the question, is it not a sanitary problem of very great importance? I doubt it very much. I think the leading caused by the smoke coming out of the stacks is practically nil. All the leading that occurs as far as I know, is caused directly round the furnaces. Personally, I have never known of any case caused by the fumes. I have always lived round the stack, and have experienced nothing of it.
1060. You have resided there with your family? Yes; I have only one child, but we live in the lead smoke. I know of a whole family that live on the hill, and get the whole of the smoke from a stack a little lower down, and they are as healthy a family as you could find.
1061. Is a considerable quantity of the lead in the lead fumes condensed in your flues? Yes, by far the larger proportion.
1062. Can you tell us what proportion? I cannot give you the exact figures. I could, by referring to the books, tell you how much is collected each year.
1063. Would there be 25 per cent. of lead in the fumes? No, not nearly that. But I cannot give you an estimate without referring to the figures.
1064. You think your condensing plant, or your method of treatment is as perfect as could be under the circumstances? Well, I am not prepared to say our condensing plant here is as perfect as it could be.
1065. But you think it would be improved by using longer condensers? It might be by putting in larger chambers, or something of that kind. We are now experimenting on condensing the flue-dust by a new method, but I am not prepared to go into details. I can only say that it promises to be successful.
1066. I suppose it is a matter of fact with you that both lead and silver will be volatile at the highest heat of your furnace? At the highest heat, certainly—that is to say, the silver in conjunction with the lead, and other things that may be in the ore. The silver itself would not be.
1067. Have you ever obtained the temperature of, say, the hottest zone? No; I have not.
1068. Can you give any estimate? Not without working it up.

1069. Do you know for a fact that volatility of both lead and silver is increased by the altitude of the place? I do not know it as a fact, but judge so.

1070. Have you any knowledge of the mines of Leadville, Colorado? I know the place, but have no personal knowledge of the mines themselves.

1071. Do you know if the lead question is found to be more or less serious there than it is at Broken Hill? It would be hard to tell at present. In those days there was not much attention paid to these matters. Therefore, I cannot say.

1072. So your opinion is that the best method of condensing is the dry method? Yes. Passing the fumes through water would be useless, I know for a fact. The main factor is bringing the smoke in contact with a large surface.

1073. In the ordinary running of your furnaces, you say there are no fumes arising from the throat of the furnace? No.

1074. If any fumes did arise from the throat of the furnace, it would be caused by the furnace being under repair or something being the matter with it? It might occur through the furnace being out of order or something of that kind. It might arise from a choked flue, for instance, but that could soon be remedied.

1075. *Mr. Sleath.*] Do not the feed-floors become open through the influence of the heat, so that the fumes can pass through? No, the floor itself never gets so hot as that.

1076-8. Does not the timber contract in consequence of the heat in the course of twelve months or so? Yes; but the floor is kept in a state of repair.

1079. So that there is not much chance of the fumes coming through the floor? No.

1080. I think you have said there is plenty of water on the mine for washing purposes? I said generally. I did not specify for washing purposes.

1081. Is there any water provided for washing on the floors, or can anyone get water to wash? They can with the least trouble, certainly.

1082. Where does the water come from? It came from the Acacia Creek supply.

1083. Do the men ever use water from the furnace-jackets for washing purposes? They do occasionally, I suppose; but I think the bulk of them do not use any water at all round the furnaces.

1084. In the case of leaking jackets, what do you use to stop the leak? They use either manure or bran. There is certainly nothing unhealthy in that.

1085. Would it be a difficult or expensive thing to erect changing-rooms with hot water baths, for the employees at the different smelters? It would be quite an expense, decidedly so.

1086. I mean in comparison to the amount of work done, would it be considered very expensive? Well, under ordinary circumstances, where the water is plentiful for instance, I think it right that the men should have something of the kind. I should advocate it, that is, if you take the circumstances into consideration.

1087. I think you said there was one shift on which you did not think any of the men had been leaded? Yes; where the men had been working for a couple of years or so.

1088. Were the same men working on that shift all the time? Yes; many of them for three or four years.

1089. Do you employ the same number of men on the mine now as you did some years ago? I think the number has been lessened during the last few months. The reason for that was that the men did not have sufficient to do. I may mention that there is one other great cause of leading among the men employed in the mine. I have found men lying asleep on the flue-dust. They also go to sleep on the ore. I think a practice of that kind has a very great tendency to injure the system, especially lying down on the flue-dust.

1090. *Chairman.*] Is there any rule against that? The general rule is that if a man is found sleeping on shift he is discharged. The bosses are supposed to look after that.

1091. Would you cite that as an illustration of the general carelessness of some men? Yes. I do not mean to say it is the case with all men; but the other evening seven or eight men were found doing the same thing.

1092. *Mr. Hamlet.*] Can you supply us with an account of the quantity of flue-dust obtained from your smelters? Yes.

1093. And you will? Yes.

1094. Are you aware that Mr. Guyard, for the United States Government in America, has undertaken an investigation in regard to flue-dust? I have heard of it.

1095. And are you aware that one of his conclusions is that the quantity of lead completely lost in the atmosphere is sensibly twice as large as the quantity of lead got in the dust chambers generally recognised? I was not aware of that.

1096. *Mr. Howell.*] About what percentage of lead does this flue-dust carry? About 30 per cent.

1097. You have said there is now a contract let for the men to take out the flue-dust? Yes.

1098. How many men have you employed on the north nest of furnaces on the flue-dust? One man has taken the contract, and he has three or four men working under him.

1099. How long has that contract been let? I was away at the time. I think it was in March sometime.

1100. Those men work continuously in the flue-dust, do they not? Yes.

1101. It is quite dry and dusty when it comes out? Yes.

1102. Do you know of your own knowledge whether those men have been laid off on account of sickness? No.

1103. Would you consider that the most dangerous place on the whole of the works, so far as the liability to get leaded is concerned? I can hardly say that.

1104. There is a pretty large pile there? Yes; but it is wetted down as it is taken out.

1105. Does not the sprinkling of the dust, throwing water on it, send out a good deal of dust? Yes.

1106. And it goes round where the men are working? Yes.

1107. And yet you hear no complaints from the men working on the flue-dust about being sick or leaded? No.

1108. *Mr. Sleath.*] With regard to those men who were in the habit of sleeping on the ore—of course as you say they would be discharged, I suppose? They would be given a caution as a rule; but anyone who made a habit of it would not be employed about the furnaces.

[The witness withdrew.]

Mr.

Mr.
W. J. Koehler.
29 June, 1892.

Mr. Andrew Eddy called and examined:—

- Mr. A. Eddy. 1109. *Chairman.*] What is your business, or occupation, Mr. Eddy? I am a miner.
 1110. How many years have you been working on this field? One year and nine months.
 29 June, 1892. 1111. Which mines have you worked at? I have worked in Block 14.
 1112. For how long? For three months.
 1113. And then? I then worked in the South mine.
 1114. How long did you work there? I worked in the South two months.
 1115. And after that where were you employed? After that I worked in outside mines. When I first came to the field I worked in the South mine. I got leaded in Block 14.
 1116. Were you leaded at all while you were working in the South? No.
 1117. There is lead ore in that mine, is there not? Oh yes.
 1118. Were you working among it—that is in the lead slopes—while you were there? Yes.
 1119. How long did you work in Block 14? Three months.
 1120. Three months before you fell ill? No. I worked there three months and fell ill during that time. I may say I had six different mates in three months, and five of them got leaded. Two of them got leaded the first fortnight we worked the contract.
 1121. Was your reason for leaving the South mine that you took a contract on Block 14, or because you were ill? I thought I explained I was not ill before I went to Block 14, and the first place I went to work on the field was the South mine.
 1122. Block 14 is entirely silver-lead ore? Yes, it is principally lead.
 1123. How long were you ill? After I was laid off at Block 14, I was two months unable to do anything.
 1124. Who was your doctor? Dr. Thompson.
 1125. What were your symptoms? Terrible pains in the stomach, I was not bound up—I had dysentery all the time, and cramps in the stomach.
 1126. Did you have paralysis or drop-wrist? No.
 1127. Did you have the blue-line on the gums? Yes.
 1128. And Dr. Thompson said you were suffering from lead? Oh yes.
 1129. What was your contract for in Block 14? For driving the main drive.
 1130. What were the conditions of work in Block 14—the ventilation for instance? The ventilation was very bad when I was there, and I suppose that was the cause of so many men being knocked up. There was no ventilation until we broke through into the main drive.
 1131. Were there any air-pipes carried into the workings, in Block 14? No.
 1132. I do not mean in your drive alone, but anywhere? Well, I was not in the other levels, so could not say as to that.
 1133. *Mr. Hamlet.*] Did you find there was generally a sufficient amount of ventilation in Block 14? I could not say that, because I did not work all over the mine. I understood the Chairman to refer to that part where I was working. There was none there. Of course there was a little ventilation, or we could not have lived: but the ventilation was very bad until we got through to the other shaft.
 1134. Was it very dusty? Yes. There was lead all through where I was working.
 1135. Was any precaution taken to lay the dust by water sprinkling? No; not anything of that kind.
 1136. How did this dust seem to affect you? It used to affect me all the time.
 1137. Tell me the kind of feeling—the symptoms you experienced? I felt ill with dysentery all the time; and pains in the stomach. The other two men were bound up. It took them quite differently.
 1138. Did you take your crib with you into the drive? Yes.
 1139. And you used to eat it there? Yes. But it was very little crib I used to eat. Very often I did not take it at all.
 1140. Did you make a practice of washing your mouth out before eating your crib? Yes.
 1141. Did the others do the same? I have seen some of them do it; but I do not think they all did it.
 1141½. Was there, at Block 14, provision made for the men to change their clothes before going down the mine? I did not see any.
 1142. *Mr. Hamlet.*] Are you aware that there are Government mining regulations, and that those regulations are supposed to be posted at the mouth of the shaft? What regulations do you refer to?
 1143. Did you see any regulations at all—any printed instructions? The rules, do you mean?
 1144. Yes? Oh, certainly.
 1145. Printed rules posted up at the top of the shaft? Yes.
 1146. You did see them? Yes.
 1147. Were they rules like that (*pointing to printed copy of the Mining Regulations under the Act*)? Well, I think they were similar.
 1148. You think they were something to that effect? Well, you see, we miners do not take much notice of the rules in that way—that is, no particular notice, to study them.
 1149. *Chairman.*] The Act says, “A printed copy of these rules shall be posted in the office, and on a building or board in some conspicuous part of the mine, and a copy shall be supplied to each person in any mine to which they shall apply”? Then is each miner supposed to have one of these?
 1150. That is what the regulation says? That is not done.
 1151. *Mr. Hamlet.*] Were you ever presented with a copy? No.
 1152. Did you ever know a man to be presented with a copy? I cannot say. I have worked in five or six different mines, and I was never presented with a copy of the rules.
 1153. Did you ever receive any suggestion from the shift-boss, or the manager, or anyone on the mine, with regard to the possibilities of getting leaded at your work, and what steps you should take to save yourself? Yes; I have been told by the boss of the shift himself not to break up the ground too much, or shake it about too much, on account of the dust. In general, not to work too much with the pick.
 1154. What you understood by that was that the dust was injurious to you? Yes.
 1155. Was the mineral you were working in the mine hard or soft? It was not very hard. It was this lead ore.
 1156. But it made dust? Oh, yes, it made dust. You cannot do much in lead ore without making a dust, unless it is damp.
 1157. What time did you work at a stretch? Eight hours.
 1158. And after you knocked off work did you wash yourself? I did.

Mr. A. Eddy.

29 June, 1892.

1159. Did you wash yourself very carefully? Yes.
1160. That was at home, I suppose? Yes; and I changed my clothes every day.
1161. How often did you put on clean flannels? Every day. I used every precaution, and still I got leaded.
1162. *Mr. Sleath.*] Was there any provision made for washing on the surface of the mine? I was never informed of any, and I never saw any. There may have been, but I had no knowledge of it.
1163. I think you have said that you did not see any changing-house on the mine? Yes; I did not. I never knew anyone to change there. It is possible there may have been a changing-house on the mine, of course, but I never knew of it.
1164. During the time you have been on the field, have you found it a common occurrence for men when leaded to leave this place for other parts and other colonies? Yes.
1165. You think there have been a number of such cases? Oh, yes; and numbers try to get into the outside mines. That is where I have been since I left Block 14.
1166. Are you aware if any one mine bears a worse name than another, as regards lead poisoning? Yes; there is said to be more leading in Block 14 than in any other mine.
1167. While you were at work there, did you go much through the stopes? No; I only worked in one main drive. I worked there for three months.
1168. Do you think if the main drive had been sprinkled with water, and air-pipes had been carried in, that such measures would have tended to prevent the injurious effects you speak of? I am sure of it. We only worked two shifts there. We could not work three. We used to leave one shift out, so that the place could get cool.
1169. That was to allow the bad air to get out? Yes, and the smoke.
1170. Do you know of many men who have worked a period of twelve months in these lead mines, and have never felt the effects of lead? No; I do not know one. In my opinion he would be of a strange constitution, who could work for long in the lead without being affected.
1171. When you found the dry character of the work you had to do, did you make application to have the air forced in, or the water sprinkled? No: we only had a couple of hundred feet to drive, and I suppose they did not think it worth while to put air-pipes through, especially as there was another drive coming to meet us.
1172. You had five mates, you say? Yes, five mates in three months. We earned £5 a week at it; but still we had to go up.
1173. How many men formed your gang? We were working two shifts with four men.
1174. *Chairman.*] But you say you had five mates in three months; how many constituted your gang? We had four in the party at the beginning of the contract; but they fell ill sooner or later.
1175. All of them? Yes; the first fortnight two of them fell ill, and had to leave the field.
1176. Then you had to replace those two with other men? Yes.
1177. That is what I want to get at; how many men were employed with you during the three months? We started with four the first fortnight. Two of them got leaded and had to leave. They went to Victoria. We then got two other hands, and they remained three weeks, when they also got leaded and had to leave. Then we got two more men, and they held on through the contract.
1178. Are all of those men here on the Hill now? I have not seen them the last six months. The other two are in Victoria. As I have said, I was earning £5 a week on the contract, still I had to go up. I would not take another one of the kind, because taking the bad time with the good, it is of no advantage.

[The witness then withdrew.]

Mr. John Warren called and examined:—

1179. *Chairman.*] You are manager of Block 10 mine, Mr. Warren? Yes.
1180. How long have you held that position? About twenty-seven months.
1181. You hand in a statement concerning the operations of your company during the last two years, and you say the total number of men employed by you in 1890 was 311? That is what we make it, striking an average for the year.
1182. Their occupations being described as shown in the list you hand in? Yes. (*See Appendix.*)
1183. And in 1891 the number was 298? Yes.
1184. Their occupations being similarly described, as shown in the list? Yes.
1185. Then, in 1890, did you raise 23,333 tons, 13 cwt., 2 qrs. of ore? Yes; we have taken that from the 31st March, 1890, to 31st March, 1891, per this statement, and then from the same period from 1891 to 1892.
1186. Then, in the first term you raised 23,333 tons, averaging 16 per cent. of lead; and in the second term 50,000 tons, averaging 12 per cent. of lead? Yes; we had scarcely got into full work in 1890, and that accounts for the discrepancy shown between the two periods.
1187. Do any of your hands get leaded? I have never heard of any complaint, with one exception.
1188. Was there anything particular about that case? Yes; he was a surface-man—an engineer—and I cannot account for him getting leaded. It was reported that he was leaded, that is all I know about it. That was the only case of leading I had brought under my notice.
1189. And an engineer would be just about the last person you would expect to get leaded? I should think so. I do not know of anything injurious to health, in Block 10, from my own experience.
1190. You are aware that men do get leaded in other mines? Well, there is no doubt that men do suffer from lead, or something else. I have seen men come to the mine looking for work, that I would not care about employing.
1191. Is there not an illness—a prevalent illness, to which the men here are liable, which is called leading; are you not aware that men do suffer from that illness at other mines than yours? Yes; I believe they do.
1192. Can you explain why they do not suffer at your mine? I cannot.
1193. Have you been employed in managing mines in other parts of the world? Yes; from my youth upwards, in England and the Colonies, and in New Caledonia.
1194. Have you in those different places seen anything of the effects of lead-poisoning? Well, at home we do not attribute the illness the men suffer from to lead. They complain of the dust which arises from the stone. In the neighbourhood I came from there is more tin-mining than lead. 1195.

Mr.
J. Warren.

29 June, 1892.

- Mr. J. Warren,
29 June, 1892.
1195. Of course, miners are subject to various complaints; but what I ask is, if you have worked in lead-mines elsewhere, have you not seen the effect of lead poisoning among the miners? Yes, I have.
- 1196-7. Do you know anything of the use of milk as a prophylactic—as a preventive? No.
1198. Can you tell us of any particular steps that are taken by miners to protect themselves against the effects of lead? I cannot.
1199. I do not think I asked you at first whether you smelt any ore—do you do so? No.
1200. *Mr. Hamlet.*] Then, if you do not smelt the ore, it is chiefly sent away? It is all sent away, or sold to the other companies. There are two companies on the hill that are smelting ore.
1201. Have you received any formal complaint from any of your men? None whatever.
1202. Not as to lead poisoning, or the want of ventilation? No.
1203. Nothing to lead you to suppose that your mine is an unhealthy mine to work in? No.
1204. I should like you to tell us the kind of ore you find in your mine? The prevailing ore is kaolin.
1205. Is there lead in it? There is a little lead—it averages, perhaps, 8 per cent. of lead.
1206. And besides kaolin? There is a little carbonate; but not in any quantity.
1207. Any sulphide? Yes. That has developed with the depth.
1208. And do you work the sulphide? Vere little.
1209. Do you find any arsenical ores in your mine? I have seen two small specimens containing arsenical pyrites.
1210. You have not found them to any considerable extent? No. One of the specimens I have referred to was found in a cross-cut, a small vein in the country rock, and I have seen one small specimen from the sulphides.
1211. And all these ores are sent away from your mine? Yes. We sell about 100 tons a week to the the British, and 50 or 60 tons a week to Block 14. The balance goes to Port Pirie and Dry Creek. I would like to say with regard to lead poisoning, that I think a great deal of illness is attributed to lead poisoning that is nothing of the kind. It may surprise you to be told that before I came to Broken Hill I had occasion to consult a doctor, and he told me I was leaded.
1212. *Chairman.*] Before you came here? Yes; and I told him I could not account for it, as I had not been working in lead.
1213. You suggest, then, that the doctors do not always correctly diagnose the illness—that they may be sometimes mistaken? Yes; and it leads me to think that a great deal of the sickness which is attributed to lead is really something else.
1214. You know, however, that lead poisoning is not uncommon among the general population, from obscure causes? I know there is something of the kind here. I merely mentioned my own case as an instance or illustration that doctors are sometimes wrong in their diagnoses.
1215. What I ask you is whether you are aware that people who do not work among lead do sometimes get leaded nevertheless. Thus, they may get lead in their wine if they drink claret; they may get lead from sweatmeats, they may get it from paint, from hair-dyes—a common source—and from a dozen different sources not at all likely to be suspected by the individual until the doctor points out that it is lead he is suffering from. Now tell me what caused you to think the doctor was wrong in that case? I thought he was wrong because I did not see how I could have inhaled, or taken the lead into my system in any form.
1216. Did the doctor adhere to his opinion? I never troubled him about it afterwards.
1217. Well then, what other kinds of illness do you say the miners suffer from on this field which may, in your opinion, be mistaken for lead poisoning? I am not speaking of my practical experience. I merely mentioned that case by way of illustration.
1218. *Mr. Sleath.*] Is the percentage of lead in your ores less than in most of the mines on the field? Yes; I believe it is.
1219. In fact your mine contains about as little lead as any mine on the field? Yes; I think so.
1220. So far as you know do your ores contain more moisture? I think the kaolin ores do usually contain a large percentage of moisture.
- 1220½. More than carbonate of lead would, for instance? Yes; I should say so.
1221. Where dust exists to any extent, do you think it would be beneficial, as regards the health of the miners, to sprinkle it with water? It would lay the dust certainly; but whether it might not be the means of generating other gases I am not prepared to say.
1222. Do you think it would be beneficial, where lead poisoning exists, or where strong lead ore bodies are being worked, if hot-water baths were provided close to the shafts, so that the miners could use them previous to going off? It has been understood that such baths would be an advantage. But I understand that they have been supplied here, on the Proprietary Mine, and the men refused to use them.
1223. How did you arrive at that understanding? I have heard it spoken of.
1224. You are not speaking of your own knowledge? No.
1225. You never saw such baths? No.
1226. Neither did I, and I looked very carefully for them. Do you think the expense would be too great to ask the company to incur if it would benefit the men? No; I do not think it would be, provided the men would take advantage of such a provision.
- 1227-8. But you never saw anything of the sort yourself? No; I did not.

[The witness withdrew.]

Mr. Wm. Strachan called and examined:—

- Mr. W. Strachan,
29 June, 1892.
1229. *Chairman.*] What are you? I am a miner.
1230. How long have you followed that occupation? I have worked at mining all my life. I never worked in lead until I came to the Barrier.
1231. When did you come to the Barrier? About three years ago.
1232. Which mine were you first employed on? Well, I came here under engagement for sinking in the country, that is the main shaft of the Proprietary Mine. I was engaged in Victoria. There was no lead in the ground I was working in.
1233. Well, what did you do next? I was working in Block 14, sinking the shaft. I did not get into much lead there. It was all country.
- 1234.

Mr.
W. Strachan.
29 June, 1892.

1234. And after that? I worked in another shaft—all country—the Silver Ring. After that I worked in the British, and there I got leaded.
1235. What kind of ore were you working in? It was carbonate.
1236. At what date did you begin to work in the British Mine? About two years ago, or a little over perhaps.
1237. How long did you continue to work there before you fell ill? I worked there for about three months before I was really ill. Sometimes I felt indisposed before that, but I did not attribute that to the lead.
1238. But after three months of working there you fell really ill, and it was from the lead? Yes; it came upon me by degrees, with pain in the bowels, loss of appetite, spasms running through me, and stiffness in the limbs; in fact, I was affected altogether, and did not feel well at all.
1239. Did you suffer from constipation? Yes, and very badly too. After some weeks of it I was forced to cave in.
1240. At the end of three months you were obliged to lay off? Yes.
1241. How long did you lay off? I dare say I was six weeks laid off; but I was ill for four or five months altogether.
1242. Did you return to work at the end of the six weeks? Yes; I returned to work after about six weeks, but I was not well.
1243. Did you go back to the same work? Something similar.
1244. Did you go back to work the same class of ore again—lead ore? Yes.
1245. At the British Mine? Yes.
1246. And how long did you continue to work there? I only worked a few weeks, when I had to knock off again.
- 1247-8. Because the symptoms returned? Yes, as soon as ever I went near the lead.
1249. And have you ever worked in the lead since that time? Well, I had another try at the British. The mine is better ventilated now.
1250. How long did you remain out of the lead? I stayed out of the lead twelve months or so. I started to work in the country.
1251. And then you returned to the British because you thought the mine was in better order? Yes.
1252. About what time was that—long ago? No; only a few months ago.
1253. And did you fall ill again? No. I got hurt.
1254. When you returned, did you find the state of the mine better than when you first went to work there? Yes.
1255. Better in respect to ventilation? Yes, because we had the water-hose down there.
1256. How does the water help ventilation? Well, where water is there is ventilation generally. Water will make ventilation.
1257. And during the later time did you find sprinkling was systematically carried out? Yes; they have had sprinkling in the mines, but unfortunately in some places the pipes do not lead into the face where the men are at work, and then the sprinkling drives the fumes, or small particles that are flying about into that end, and the men get the disadvantage of that. If you only water a small portion of a level, what is in one place will be driven back to another, because there is no get-away; just in the same way that you will get the smoke from a charge of dynamite which has been fired in a place below you.
1258. During your last term in the British Mine, were there any changing-rooms provided for the men? I never saw any.
1259. You said a little while ago that you were hurt—when did that occur? About ten weeks ago.
1260. Do you smoke? Yes.
1261. Do you smoke when you are below? Yes.
1262. Do you eat your "crib" below? Yes; but oftentimes I could not eat when I was leaded.
1263. But you take it below to eat? Yes.
1264. And that is the general custom? Yes.
1265. Used you to wash your hands and mouth before eating? No; we had no time to do that.
1266. No time? No; we were only allowed twenty minutes, and it took me that time to eat my food.
1267. Is it not the general custom to wash before eating? Well, they could not wash there unless they washed in dirty water.
1268. The water is laid into or near to every drive or stope, is it not? Yes; but the water is only used for sprinkling at certain times, and one has to go down to turn the tap on while another uses the hose, and you would have to go to that trouble to get your hands washed if you wanted to do it.
1269. Do you cut up your tobacco in the mine? No, I never cut up my tobacco down below; I take it into the mine already cut up.
1270. Is that the common custom among the men in your experience? No; it is customary for the men to cut up their tobacco below, and that is one of the worst things there is.
1271. If some kind of facility for washing were provided, do you think it would be taken advantage of by the men? Oh, yes, it would be used, I am sure, and thankfully received too.
1272. In the mines? Yes.
1273. What rule did you observe as to changing your clothes? The only chance I had to change was when I got home, and then I would pull off everything.
1274. You made that a rule? Yes; and I never wore the same clothes. I would also wash my hands and face when we had water; but sometimes we had not water. Then I would dry sponge myself all over with a towel.
1275. You are a careful man in respect to what you could do to save yourself? Yes.
1276. Which of the mines has the worst reputation as regards men getting leaded? Block 14, I hear; we were working on the boundary of Block 14.
1277. Do you think you got leaded by the dust in the stopes? Yes; I think so.
1278. Was the dust generally very bad? In some places it would be worse than others, but there was dust more or less all over. It depends upon the surroundings. In loose ground where you have to get timber, and there is much dust flying about, that is where you get leaded. I have seen it so, when you could not see the candle for dust, and I have seen the dust burning in the candle.
1279. You approve of the plan of sprinkling? Yes; it lowers the dust. Unfortunately for us, when I was working there they did not do that in all the places, and it was worse for those who had not the benefit of it, because the water drives it down on to the bottom levels.

Mr.
W. Strachan.
29 June, 1892.

1280. Suppose the stopes were thoroughly ventilated, and water sprinkled over them, would you, as a miner, have any objection to go down and work there? Of course, if there was proper ventilation, and plenty of water I would not. But I would not work in lead for £1 a shift, because I would be only losing my life by it. I have seen hundreds of men here from Victoria and other places, strong, powerful men, who have had to leave again after twelve or eighteen months, actually ruined for life.
1281. Have you ever seen a man fall down from the effects of lead? I have seen a man take a fit supposed to be from the effects of lead.
1282. How long did the fit last? The man was taken away; I cannot say how long it lasted.
1283. Did you ever fall down when you were suffering from the effects of lead? Yes, through my legs being weak at the ankles. I was walking one day near the "Grand Hotel," when my right leg suddenly gave way and I went down—fell on my face.
1284. Is that a frequent occurrence? Oh, yes. It takes some men in the ankles and knees, and some suffer more in the bowels; others about the back of the neck and arms.
1285. You think that a sign of lead-poisoning? I should think so. At all events a man suddenly collapsing, and falling down in the street, would show there was something wrong.
1286. Do you think it would be a good thing to have baths on the mine for the use of the men? I do. It is a great mistake that they are not able to keep themselves clean. They should be able to wash all over, the same as coal miners. I may say I worked in the coal for years.
1287. Have you ever known of lead-mines where they have baths for the use of the men? I never worked in lead elsewhere.
1288. And you have never seen any on Broken Hill? No.
1289. Did you provide for yourself all the medicine you ever took while working at the mines? Yes; and it cost a good sum of money altogether, too.
1290. During the time of scarcity of water here, how much water would you have to wash yourself after you came from the mine? Do you mean where I was living?
1291. Yes; your home? Well, during the hard times, we might have, perhaps, a pint, or perhaps two pints of water.
1292. And you came home dirty from the mine? Yes.
1293. You could not wash all over then? No; we could not often wash clean our hands and neck, let alone all over.
1294. How often could you get a good wash all over? If I paid 1s. for a bath I could.
1295. Then you could get a bath? Yes; by paying 1s. or 1s. 3d. for it, but I would not say much for the water.
1296. Still, that was better than none? Oh, yes; but then we cannot afford to give 1s. 3d. a day for baths out of the money we get.
1297. Do you ever get a bath all over? Oh, yes.
1298. How often? I used to have a bath regularly every Sunday morning once.
1299. But not in the time of scarcity, of course? No; we could get little or no water at all then.
1300. So that you did not get a bath during that time? No.
1301. *Mr. Sleath.*] You are what is generally termed a shiftman, are you not? Yes.
1302. The first work you did in the stopes was in the British? Yes.
1303. So that you had no chance of getting leaded previous to that? No.
1304. Are you a temperate man? Yes. I am a teetotaller.
1305. Have you seen water laid on in any other mine than the British? No.
1306. You have worked in the Proprietary mine? I have worked in the shaft of the Proprietary, sinking.
1307. In what part, as a rule, did you first feel the effects of lead? In the stomach.
1308. During the scarcity of water here, could you get a bath for 1s. 3d.? I never tried myself. I do not think anyone could.
1309. Have you observed a copy of the Mining Regulations posted at the various shafts of the mines where you have been working? I have on some of them. I would not like to swear that I have on all of them.
1310. Did you ever see them at the British? I cannot say positively.
1311. Did you ever have a copy handed to you? No.
1312. I suppose you know a good number of the miners employed here? Yes.
1313. Do you know many who have worked a considerable time in lead, and who have not suffered from lead-poisoning? I have in my time met one or two who have not been affected, but in my experience mostly all of them have been affected more or less.
1314. Do you know any man who has worked here any length of time without being leaded? No; I cannot name one.
1315. *Chairman.*] How old are you, Mr. Strachan? Fifty-one.
1316. Is there anything that makes it a little easier to water the British Mine down below as compared with the other mines that do not water the stopes to the same extent apparently? Well, I think from appearances, and taking everything into consideration, that they all have the means, so far as carrying the water round. But I think the British is better in that respect than any place I have been in. There is a lot of lead there.
1317. What I asked you was this: has the British any advantage over other mines that would make it easier for them to lay on the water? I do not think so; that is, I think they have the same trouble that other places have.
1318. Have they the same expense—that is what I want to know? Yes; I think so, certainly.
1319. Do you know the cause of the death of the late manager of the British? I do.
1320. What was the cause of his death? Well, I went to see him off; I believe I was the last man that shook hands with him in the train. I knew him in the old country. I said to him, "I shall have the pleasure of seeing you at Christmas"; and he answered, "You will never see me again; I am going home to die."
1321. But did he tell you the cause of his illness? Yes; he said he was leaded; and the doctors told him he would have to clear out. You could see it in him. But I may say he was continually down below.

[The witness withdrew.]

FRIDAY,

FRIDAY, 1 JULY, 1892.

Present:—

DR. ASHBURTON THOMPSON (CHAIRMAN).

W. M. HAMLET, Esq.

J. HOWELL, Esq.

R. SLEATH, Esq.

Mr. J. B. Doolette, called and examined:—

Mr. J. B.
Doolette.

1 July, 1892.

1322. *Chairman.*] You hold office under the Municipal Council of Broken Hill, Mr. Doolette? I am Chief Rate Collector and Treasurer.
1323. You have lived at Broken Hill a long time, I believe? I have been five years a resident of Broken Hill altogether.
1324. Have you observed anything peculiar in the course of life among the animals in this district? Yes; I have made it a study as regards animals, particularly ever since I have been here.
1325. Then will you be good enough to give us the result of your experience? Well, I find, from my experience, that it is impossible to rear a dog here on the Barrier. I have had a great many dogs, and the only ones I have been able to keep are those I brought from South Australia, over twelve months old. Dogs that have reached that age seem to stand it better.
1326. They get hardy when they reach that age? Yes.
1327. You are speaking now of dogs you have kept yourself? Yes; and dogs that I have had pupped here.
1328. How far away from the hill and towards what point of the compass have you tried to keep dogs? Within a quarter of a mile of the hill, north-easterly.
1329. And does all you may say about dogs apply to the dogs kept there? Yes.
1330. Your own dogs only? Yes. In fact, I have a dog now that I brought up here when I came to the place five years ago. He was then four years old, so you know what his age is now, and that dog is quite well.
1331. He never suffered at all? No. I also had sent up to me, about four years ago, a couple of full-grown cats from South Australia. One of them I have alive now; the other met with an accident; a dog got at it in the street; but the kittens do not thrive. I have been able to keep them up to about three months old; in fact they seem to flourish up to that age, and then they take fits, and go off.
1332. Is that invariably the case with all the kittens you have tried to rear? Yes; and I may say dozens. We are fond of dumb animals. I may also remark that we have found it impossible to keep parrots.
1333. In cages? Yes. I have never been successful in keeping them in cages; that is, the Gallard parrot-cockatoo; they will not live on the Barrier. You will not find one of them in town to-day.
1334. What other kinds of birds have you tried to keep? I have had all the ring-necked parrots, and they take fits and go off. Only the white cockatoo seems to survive. As regards poultry, I have never been able to rear poultry there.
1335. At what age did you get those parrots that died, as a rule? About six months, I should say. I bought them outside, and brought them into the town.
1336. What do you mean by outside? Beyond Steven's Creek.
1337. And how long have you been able to keep them? Not more than three or four months.
1338. What happened to them; how did they die? Well, they take those fits, and go off, as I have said.
1339. Do they die after one of these fits? No; they may get over one of them, but they die eventually, and these are birds that are kept in cages, and fed out of a pan in the usual way.
1340. What kind of water do you give them? The same water that we drink ourselves.
1341. You get the water out of an iron tank as a rule, I suppose? Yes; and of course we have to give them the gravel which comes from the yard and gutters. It is necessary to give it to the parrots.
1342. Did it never occur to you that you were giving them material that disagreed with them? No; it did not.
1343. The poultry would run about the yard in the usual way, I suppose? Yes.
1344. And feed off the ground? Yes. I have a place for them as large as the Council Chamber, netted in 6 feet high. Just before last Christmas I bought three geese to fatten. But they began to pine away at once, and went off within three weeks.
1345. Have you noticed whether the laying of the fowls was interfered with? Yes; I have never been successful in getting them to lay. I have had a splendid lot of hens too; but have never been successful.
1346. Do you mean that, literally, you never had any eggs? I have had a few, but nothing to speak of. I went in for an expensive lot of Leghorn fowls, and had them for a couple of months, when they began to drop off one by one. They were quite healthy and well when I brought them here.
1347. And during those two months did they lay less eggs than they ought to have laid? Yes; they began laying, but soon pined away.
1348. Did the fowls get fits? No.
1349. Did they waste? Yes; they seemed to waste away, and mope about, getting into corners, and dropping off.
1350. Then as to horses, can you tell us anything about them? No; I cannot say much about the horses, but I have seen the effect of the place, apparently, in cattle.
1351. We have heard something about the cattle;—what do you think affects them? I put it down to a poisonous weed. I pointed out to a couple of persons who kept cows, that they had the weed in their place, and both of those cows died.
1352. Did you recognise a poisonous weed in the paddock? I did.
1353. What is it? It lies very close to the ground. In fact, I do not think a beast would pick it up unless the feed was very short.
1354. Can you get us any of it? It is not in season now; but I will endeavour to get you some.
1355. How were the cows affected that you saw? They began by running round the paddock. One of them had a bell on, and I was awakened one morning by the noise. I saw the cow racing round the whole section, and stood looking at it until it fell down and died.
1356. Have you seen cows affected in any other way? Yes. I saw a cow at one of the dairies out here one Sunday afternoon. I thought it was affected by pleuro, and I drew attention to it. I have seen that in South Australia.

1357.

- Mr. J. B. Doolette.
1 July, 1892.
1357. Have you seen cows kept within a mile of the Hill affected in any way? This cow I have spoken of was in Jodice-street; and there was another one not 100 yards off died in the same way.
1358. Have you seen cows suffer in any other way than the illnesses usual among cows? No; I cannot say that.
1359. Are you of opinion that the cows are not affected by the same cause as your birds, and dogs, and cats? Well, in the case of cattle, I have always been of opinion that their illness was caused by the poisonous weed I speak of. I do not think they get leaded.
1360. You do not think they suffer from the same disease as carries off the dogs and cats? No, I do not. I think they are affected by the weed. At the time I asked the papers to caution the public about it, and there was in one of them a long article on the subject.
1361. *Mr. Hamlet.*] With regard to these birds that died in their cages, you always had earth or gravel in their cages? Yes.
1362. And, of course, the geese you had were free to pick up anything they liked from the ground? Yes; they had a place as large as this chamber to run in.
1363. *Mr. Sleath.*] How did you find out that the weed you speak of is poisonous? I was told so; it is called the poisonous weed.
1364. You had heard so? Yes.
1365. *Chairman.*] Have you any special point to add to what you have already said, Mr. Doolette? I do not think so. I did promise to bring some cats which are peculiarly affected, by way of illustrating how the smaller kinds of animals suffer here. I was not able to get them to-day; they are not mine, but I can get them. They are deformed in every way.
1366. What age are they? They are about 4 or 5 months old. They keep having fits. I will bring them for you to look at.

[The witness withdrew.]

Mr. S. Brenton, called and examined:—

- Mr. S. Brenton.
1 July, 1892.
1367. *Chairman.*] What is your occupation? I am a miner.
1368. How long have you been so engaged; I mean on this field? About four and a half years.
1369. What mines have you been employed upon? The Proprietary, Block 11, Block 14, and the British.
1370. Have you been leaded? I have not been thoroughly leaded. I have taken care to avoid the lead as much as possible; but I have felt the effects of lead, and when I do feel the effects of it I take a spell at other work.
1371. Then tell me at which place were you first engaged in, and how long did you stay at that? I was at the Proprietary first.
1372. At which Block? I was at Block 12 and Block 13.
1373. And how long did you remain at that? I was there eighteen months, and I then left for about six months.
1374. Was that because you felt you were going to be leaded? I left for a spell because I felt the effects of the lead.
1375. Did you not work at any mine during that six months? No.
1376. Then, what did you do at the expiration of the six months? I went to the mine again—the same mine.
1377. How long did you stay there the second time? About ten months.
1378. Did you leave again, then? I asked for, and got, a shift on the surface.
1379. That was at the end of the ten months? Yes.
1380. How long did you stay on the surface? I stayed about six months on the surface.
1381. And why did you leave on that occasion, when you had surface work? Well, I went to work down in Block 11, as a matter of change.
1382. How long did you stay at underground work from that time? I have been at underground work ever since. I was only in Block 11 four months, I think; and then I was in Block 14 about ten weeks, or three months, and then I shifted to the British.
1383. You have told us that you felt the effects of lead in the first instance after your first term of work in the Proprietary, and that you took a spell in consequence;—when did you commence to feel it the second time? In the Proprietary.
1384. Then you took a spell on the surface? Yes.
1385. Well, when did you next feel it after that? In Block 14 I began to feel the effects, and I left about ten weeks or three months, I cannot say exactly how long to a week.
1386. You never suffered from a fully-developed attack of leading, you say? Well, it was evidently the effects of the lead, because I had all the symptoms—weakness in the legs, pains in the knees, and loss of appetite.
1387. Any other symptoms? No other symptoms. The only thing I noticed was that when I worked in lead it came on more often than when I worked in other places.
1388. It came on worse while you were at work? The more lead there was where I worked the worse it seemed to be.
1389. Which place do you consider the worst or most dangerous of those in which you have worked? Well, the north stope, at the time I worked there, in the Proprietary Mine, that was a very bad place; and Block 14 also was a very bad place. They are about the worst places still, I think.
1390. Do you belong to any friendly society? Yes.
1391. Which society do you belong to? I am a member of the "Silver Star" Branch of the Grand United Order of Oddfellows.
1392. Did you consult a doctor when you were affected in the way you have described? Yes; Dr. Schinzinger.
1393. *Mr. Howell.*] You say you worked in Block 11 about a year? About four months I say.
1394. It was in the northern stope you worked? Yes.
1395. At what depth, or about what level? I considered the worst part from about 150 feet up.
1396. That was in the old workings? Yes; of course there was a good deal of lead there from 216 feet up, but that was the dustiest part.
- 1397.

Mr.
S. Brenton.
1 July, 1892.

1397. The ore was dry carbonate of lead ore? Yes.
1398. Did you leave Block 11 to go to Block 14? No; I did not leave it for that purpose. I left Block 11 because I had the offer of a better situation.
1399. You left there of your own accord? Yes.
1400. You do not know anything about the workings of the 216 feet level in the Proprietary? No: I just know down about the intermediate. I do not know how many feet down it is. I cannot say positively.
1401. You say that the only bad effects you felt from what you considered to be lead-poisoning was weakness in the knees and pains in the legs a kind of lead rheumatism;—did you suffer from colic? I had colic at the same time. I had to be constantly taking opening medicine.
1402. *Mr. Sleath.*] Was provision made for keeping the dust down by sprinkling it with water in any of the mines you worked in? Only in the British. That was the only mine in which I have seen sprinkling.
1403. Do you think sprinkling is a measure of advantage to the men to prevent them getting leaded? I think it is a very good plan—superior, in fact, to anything I know of, with good ventilation.
1404. Have you seen changing-houses in all the mines you have been employed on? No; I have never been in the habit of changing. There used not to be any. I believe there is in Block 11 (McCulloch's) a changing-house at the present time. I do not think there is at the British. I have never had occasion to go in them; but I have never seen them there.
- 1405–6. Do you think if hot baths were provided for the men it would act as a preventive of leading? Well, it would go a considerable way towards it, I should think.
1407. Do you think the men would use such baths if they were provided? I think so, most of them would.
1408. In the different mines you have worked in have you been presented with a copy of the Mining Regulations by any of the mining authorities? No.
1409. Have you seen them posted up at the mines? In some places I have seen them.
1410. Do you drink? No.
1411. Have you taken great care of yourself as far as cleanliness is concerned? Yes; I have been very particular so far as that is concerned.
1412. *Chairman.*] What kind of precautions as to cleanliness did you take—used you to regularly change your clothes when you went to and left your work? Yes: I used to put on fresh clothes, and wash all over.
1413. You changed your clothes at home? Yes.
1414. And you washed all over? Yes; in most cases, very nearly every day.
1415. You took something to eat with you when you went to work, I suppose? Yes.
1416. And did you eat it down below? Yes.
1417. Did you wash your hands and mouth before eating? I used to wipe my hands as clean as possible, and wash my mouth out with tea before eating. I did not touch my tucker with my hands. I used to hold it with the paper.
1418. Used you to smoke? No; I never smoked.
1419. May the men smoke below during crib time? I do not think there is any rule to bar them from smoking during crib time.
1420. But they do not smoke while they are working, I suppose? I have seen them smoking while they are working.
1421. Do you think your precautions were effectual in preventing you getting leaded sooner than you otherwise would have been? Well, no doubt the precautions I took had a good deal to do with it; but I think I have a very good constitution.
1422. In your opinion, do a great many miners suffer from leading in comparison with the total number employed? Yes. I think it is very much a matter of constitution. I have not formed any decided opinion. One man is different from another, you understand.
- [The witness withdrew.]

Mr. Cecil C. Morgan called and examined:—

- 1423–4. *Chairman.*] What is your office, Mr. Morgan? General Manager of the British Broken Hill Proprietary Company.
1425. How long have you held that position? Since last February.
1426. Can you give us some evidence about the conditions of work both above ground and below at your mine? Yes.
1427. Do you bring with you the statement which we asked you to be good enough to prepare? I was not here during the two former years, so that I am personally unable to speak of that period. But I have made a note of the men who were working in the mine from the books. With regard to the nature of the ores and the class of work done during that time, of course I could only speak from hearsay.
1428. Was the average number of hands employed by you in 1890, 210? Yes.
1429. And their occupations are described as shown on the list produced? Yes; I got those particulars from the books.
1430. Similarly the average number employed during 1891 was 145? Yes.
1431. And then we asked you a question as to the amount of ore that was smelted, and you say you are unable to answer that? Of course I can only answer from hearsay as to the time prior to my taking charge.
1432. You can tell us how many smelters you have running? Two.
1433. And they have been running how long, as far as you know? Since I have been here.
1434. Were they running for some time before? Yes; some short time before.
1435. Do any of your men get leaded? I have never personally known of a case.
1436. If a man desires to leave his work, does he state the reason? Not to me. No one has done so yet.
1437. If a man became leaded, and was obliged to give up work, or fell ill of a fever, or any other disease, and was obliged to leave, you would only know that he had left his work? Of course he would have full right to let me know, but I have never had any case brought before me by any man personally.
1438. Do you wish us to understand that your personal knowledge does not enable you to say whether or not your miners do get leaded? Yes? I have never had a case of lead poisoning brought before me—that is, of one of our men—since I have been at the mine.
- 1439.

Mr.
C. C. Morgan.
1 July, 1892.

Mr.
C. C. Morgan.
1 July, 1892.

1439. Do you take any precautions against leading? Yes; we do take every possible precaution; for instance, we take very great care in regard to ventilation. We also take great care in regard to keeping our faces sprinkled, so that the dust shall not fly around. Of course, as you doubtless know, there is great trouble in getting men to be strict in the observance of cleanliness. We always impress upon our men the necessity of changing their things when they go home, and especially warn them against sleeping in the garments they have worn all day; because, as they perspire freely, the dust will enter the system through the pores of the skin. I have had a great deal of experience in lead mines during the past twenty years; and have found the main thing, as well as the great difficulty, is to get the men to keep themselves clean, and change their clothes regularly. I may say, Mr. Chairman, that since I saw you at the mine, I have had a rather severe attack of rheumatism, and I was afraid that I would not be able to attend to give evidence personally, so I wrote out a statement of what I consider worthy of attention in regard to the conditions of work, &c., and with your permission I will make that statement here now.

1440. If you please? In the first place, with regard to the lead fumes, the smoke from the smelting furnaces consists of the gaseous products derived from the combustion of the fuel, and the oxidation of the ore, the nitrogen of the atmospheric air which supports combustion with more or less of free oxygen or of lead, or certain compounds of lead partly sublimed, *i. e.* brought into a state of vapour by heat, and when cooled changed to a solid state, and partly carried off in mechanical suspension. The contact of these lead vapours with atmospheric action, causes immediate sublimation, and what is generally known here as flue-dust, is so formed. Now, this flue-dust, which is formed immediately the vapour leaves the furnace, contains, as you all know, a very high percentage of lead. The weight of lead is so well known, that it requires no scientific calculation to consider, even in the event of the highest wind, that the actual flue-dust must settle, owing to its well-known gravity, within a maximum distance of 500 yards from the stack it is emitted from. The so-called fumes or smoke that escapes, is therefore chiefly derived from the carbon consumed; the pungent smell is mainly due to sulphurous acid and gases, such as is caused by consumption of ordinary coal, or any other carbon, and unpleasant as the smell is, it is in no wise injurious to human beings, although it unquestionably affects vegetation. There is no manufacturing town in the world free from it, and people who choose to reside in manufacturing towns, know they will have its unpleasant odour to put up with. The long horizontal chimney or flue that this "fluedust" has to pass through, the length of same at the British being 135 feet, and the vertical stack 125 feet high, it has to ascend before it can escape into the open air; and, taking into consideration that sublimation commences immediately it enters the flue, has 200 feet to pass through; and also that it being a commercial product, as a matter of course every precaution is taken to save as much as possible of it, so that by having these long horizontal and vertical stacks, what escapes beyond this 500 yards radius is so finite that I can positively assert that in no smelting district of the world has anybody ever been injured by the smoke, living outside of the maximum circle. It is a well-known and acknowledged fact, that here at Broken Hill nearly every ailment is put down to "lead poisoning," and the argument—"well, it is either lead or arsenic"—is being constantly heard. To prove the absurdity of this, I will now give the result of the analysis made—1st, of the general average taken from our smelting floor for twelve days,—24th May to 11th June—of our "British" lead ore, produced from our daily sample, taken for assay and analysis of the ore we are smelting.

Daily assay result, and arsenic determination of our carbonate ore, taken from smelter floor.

May 24th, lead, 35 per cent.; arsenic, trace.	June 1st, lead, 32 per cent.; arsenic, trace.
,, 25th, lead, 34 per cent.; arsenic, minute trace.	,, 3rd, lead, 30 per cent.; arsenic, trace.
,, 26th, lead, 32 per cent.; arsenic, trace.	,, 4th, lead 35 per cent.; arsenic, 0.018 per cent.
,, 27th, lead, 33 per cent.; arsenic, trace.	,, 7th, lead, 35 per cent.; arsenic, 0.018 per cent.
,, 28th, lead, 33 per cent.; arsenic, 0.025 per cent.	,, 11th, lead 28 per cent.; arsenic, 0.015 per cent.
,, 30th, lead, 29 per cent.; arsenic, trace.	
,, 31st, lead 33 per cent.; arsenic, trace.	

Full analysis of the ore.

Lead, 36.2 per cent.	Lead oxide	39.18 per cent.
	Silica	41.70 "
	Iron oxide.....	7.25 "
	Manganese oxide	1.33 "
	Alumina	0.49 "
	Copper oxide	0.20 "
	Zinc oxide.....	1.40 "
	Magnesia	traces.
	Lime	trace.
	Arsenic	0.018 "
	Carbonic acid	7.74 "
	Silver	

99.308

Secondly—Of careful analyses made of the flue-dust taken from the flue, resulting as follows:—

- No. 1 sample—lead, 38.0 per cent.; arsenic, trace.
No. 2 sample—lead 38.0 per cent.; arsenic, 0.08 per cent.

By these analyses, the Commissioners will see how impossible it would be for this small amount of arsenic to have an injurious effect upon health. On the contrary, the medical experts, who I hear are to come before the Commissioners, will assure them that such a finite amount of arsenic could only act—if it could possibly act at all—as a light tonic, and could by no possible means be injurious to health.

Lead in the mine.—In the British Mine, every face in every floor is kept moist and sprinkled, and in my connection, so far with the mine, since the early part of the month of February, I have not yet heard of a man being injured by lead effects. It must be remembered that in consequence of the porous state of the carbonate ore, certain gases are confined naturally in it. Carbonic acid gas, for instance, in more or less volume. If an unusually large volume is freed, it sometimes acts as a narcotic, causing asphyxia and unconsciousness. I myself, in America, have more than once been rendered unconscious by inhaling irrespirable gases, and carbonic acid gas is so dense and heavy that it can be bottled, and not only bottled, but poured from one bottle to another. Then again, the nitric and other fumes and gases caused by the explosives used are more or less unhealthy, but the great cause of all illness is lack of cleanliness. I am sorry to say that in my experience of over twenty years, I have not found miners to use the precaution so needed, to keep their bodies clean. If the men would only give themselves a good washing, from top to

to toe, with soap and water, and get out of their mining togs as soon as they got home, there would rarely be a case of lead-poisoning known. Many of our men do this—you can almost pick them out by their healthy appearance; but many do not, they get the dirt off their hands and face and that is about all the washing they do from January to December; they keep their same clothes on, and some of them sleep in the same shirts they have used underground. Only recently my esteemed and honoured friend, the Catholic priest, of this district, has told me how often he had begged men working in the mines to pay more attention to cleanliness. It is a well known fact, that some men are far more susceptible to foul gases and fumes, than others. Many of our men in the British have worked in lead-faces since the mine started, now some four years ago, and I claim that, as a rule, a healthier lot of miners can rarely be seen anywhere in the world. Now, it must be remembered that working underground in more or less close atmosphere makes one perspire freely, and that all the pores of the skin are thus thrown wide open. These pores as a matter of fact absorb far more lead and take it directly into the system, than inhalation does; that which is inhaled passes into the stomach and is thrown off to a great extent by nature, whilst that which gets into the pores, if not carefully washed out, gradually works its way into the system. If miners would, therefore, take my advice and change their clothes as soon as they get off shift, especially their shirts, and under clothes, they would do far more towards abating lead poison, than this honorable Commission can ever dream of doing. By keeping as good ventilation as possible in the mines for gases to escape by, and by having a bountiful supply of water (which the British has always done, notwithstanding the cost) to sprinkle the faces and floors with; we are doing everything in our power for the comfort and safety of our men, and anything that I was convinced would add to their comfort and safety, and I should be recommended to adopt, the miners can rest assured that our Directors would not, for one moment, hesitate to provide as soon as possible.

Mr.
C. C. Morgan.
July, 1892.

1440½. We are obliged to you for your statement, Mr. Morgan. There is only one question I will ask you upon it, that is as to the statement that the flue-dust must settle within 500 yards from the stack it is emitted from, on account of its specific gravity. I should like to ask you whether you made that statement as the result of your observation and experience? Yes; that is the result of observation and experience at Leadville, Colorado. We were rather anxious in regard to the matter, and from the tests made at Leadville it was proved conclusively that the amount of flue-dust beyond that region was inconsiderable. My opinion is that the flue-dust beyond that region is so freely dispersed through the atmosphere that it could have very little effect upon the human system.

1441. I should like now to refer to the first part of the evidence you gave, which rather gave me the impression that you were not aware that any of your men at the British mine had suffered from lead poisoning. You then pointed out that you took a good many precautions against lead poisoning by ventilation and sprinkling, and urging cleanliness upon the men. Are we to understand from that evidence, that you think without those precautions there would be danger of the men getting leaded? I think there should be as much ventilation as possible for the escape of the gases that are given off in mines, and especially carbonic acid gas. I think good ventilation is most necessary in heavy lead-faces, especially in carbonate ore.

1442. A precaution as against carbonic acid? Yes: against that principally.

1443. Not against lead? Not so much against lead. If you keep the dust down by sprinkling you will get little lead, I think.

1444. Then I repeat the question, you think but for precautions of this kind your men would run the risk of getting leaded? Yes.

1445. But you do not mean to say that you think your mine is an especially leady mine? No. Those are the precautions taken in America; and I may say the manager of the British before my time thought such precautions necessary, and I quite agree with him.

1446. You lay great stress upon the point of personal cleanliness of the men? Yes.

1447. But under the conditions of this town you know it is very often difficult for the men to get the conveniences for washing, or even the water itself for washing in the ordinary way; probably they cannot afford to do it? I do not mean necessarily to take a bath frequently, but at least to sponge themselves down. What I consider the main danger is sleeping in the clothes they have been sweating in all day; a great many of them do that. I am speaking from hearsay, of course, but I have made enquiries, and I am positively assured they do.

1448. Do you provide a changing-house for the men on your mine? Yes.

1449. Do they use it? Well, they generally change underground. They take their upper garments off underground—they prefer it. They say they catch cold unless they have a jacket or something else on when going up.

1450. Can you describe your changing-house? It is a wood and iron building at the back of the shaft.

1451. It is quite true that the men who work underground do feel cold when they come to the surface, is it not? Yes; that is what they say. They would rather take their things down, and put them on when they are coming up.

1452. I suppose if they had a changing-room warmed by a waste steam-pipe running through it, they would be more likely to take advantage of it. You do not, I suppose, yourself recommend that their outer clothes should be hung up in the stopes, underground? Well, it certainly would be best if they kept their outer clothing away.

1453. What provision at the mine do you make for helping the men to carry out these rules of cleanliness which you think are of the first importance—what provision, for instance, have they for washing? We have no washing-place at the British. The fact of the matter is, directly the men reach the surface they rush away to their homes as fast as they can. I do not think they would use a convenience of that kind if they had it. Nor should I advise them to wash at the mine, because they ought not to put on their lead clothes again afterwards.

1454. That is what I have in mind. Of course, if every man could have a nice bath in his cottage, and have it suitably warmed in winter, I think I should recommend that he washed at home. But we know, as a matter of fact, that the majority of the men cannot make that provision for themselves; and therefore, it occurs to me, if cleanliness is of such importance, that the mine-owners might reasonably do something to provide for it. If, for instance, they provided warm baths—which might easily be done, with plenty of waste steam—perhaps there would be a considerable proportion who would not rush away from the mine as soon as they reached the surface; what do you think upon that? Well, I think we might

try

- Mr. C. C. Morgan.
1 July, 1892.
- try it; but I did not mean that it was necessary for the men to take hot baths regularly. I think if they sponged themselves down on leaving their work it would be all that would be required.
1455. But you know, perhaps, that in some lead works it is considered necessary, and the men not only take hot baths provided for them, but also medicated baths? I know it is frequently done in America; that is, that baths are provided for the men.
1456. Can you cause us to be furnished with the names of any men who have worked in the lead faces of your mine for long periods without having suffered? I will.
1457. You have had a great deal of experience in lead works;—can you tell us of any general precautions that you have noticed to be effectual against leading; do you know anything of the use of milk as a preventive, for instance? I do. I was in charge of a mine in Utah for some time, which contained a very poisonous kind of carbonate ore, and we found unquestionably that milk was a great benefit. But I must tell you there was a great deal more arsenic in that ore than in our ores here. We bought cows on the recommendation of a medical man for the purpose of supplying the milk; we found it a great benefit.
1458. I suppose you did not find it an absolute safeguard? All I can tell you is this: When first we got our cows there we experienced great difficulty in getting the men to take the milk, and we made it compulsory. We said to them, "If you do not drink the milk you cannot work here." They used to have two or three drinks a day. Formerly we sent a great many men to the hospital, suffering from lead and arsenic; but after that it was a rare thing to send one to the hospital.
1459. Did you cause any particular quantity of milk to be taken, and make a rule of it? No. Simply, a man would drink a glass at each meal, having three meals a day, and after that they got to like it. They would generally drink about a pint at a meal.
1460. Did you make it a point that they should have their milk before beginning the work of the day? They had milk at breakfast.
1461. And they did no work before breakfast? No.
1462. Was it all day work there? No; there were three shifts. The mine was some distance from the town, and we had our own boardinghouse there. So that at all their meals when they came off the night or afternoon shift they had their milk. Supper was provided at midnight.
1463. Then in cases where men are likely to get leaded it is to the interests of the proprietors to do what they can to prevent that? Yes. I am sure they would be only too glad to. I know our company would be.
1464. *Mr. Howell.*] You were employed in other lead mines in different portions of America before you came here? Yes; in Utah, Nevada, and Colorado.
1465. Generally, what was the character of the ores you were employed on? Principally carbonate ores.
1466. Was it a dry sandy carbonate? Yes, in Utah especially.
1467. A good deal of hard carbonate? In the Flagstaff mine in Utah it was a yellow ochre, a very soft carbonate.
1468. From what you know of the mines here on the Hill, do you think they are as well ventilated, and that as many precautions are taken to avoid the effects of lead, as in the mines in other parts of the world you are acquainted with? The mines here are the best ventilated I have seen in all my experience. Of course, in deep mines, where the shafts are long inclines, and drives off them, it is almost impossible to get proper ventilation. They have artificial ventilation, which is very different from what we have here, with our series of shafts and winzes.
1469. Artificial ventilation in any form is not as good as natural ventilation? No; because you have a current of air with a natural ventilation.
1470. It is now about six months since you took charge of the British;—have any of the men left your furnaces to your knowledge from the effects of lead, during that time? No, not to my knowledge. I think I should have heard of it if they had. The bosses would have told me.
1471. Have you ever, in your experience, seen furnaces better constructed, or freer from lead fumes than the furnaces on the Barrier? No. They are tremendously ventilated; in fact almost too much; the men complain of the draughts.
1472. Have you ever seen any smoke coming up through the feed-floors of your furnaces? No. We have been very successful in that way; we have had no leakage, I mean.
1473. Have you draught sufficient to carry off the fumes and prevent any from coming out of the throats of your furnaces? Oh, yes. I may say that in the British the average class of our ore being of a low grade, we are not so anxious to save a large percentage of lead. We lose a good deal of lead in the smelters, and find we get through a much larger amount of lead in that way; and, moreover, our blast is as heavy as we can possibly get it. We lose it in the slag. Our slag itself gives us the return of lead that we lose. It contains very often as much as 9 and 10 per cent. of lead.
1474. Then can you suggest anything that would improve the working of the furnaces, or prevent any more dust or fumes coming out? No. I may say we are very careful to keep the ore on the smelter-floor well damped.
1475. The British ores are dry, are they not? Yes; and for that reason we take particular care.
1476. You are working altogether past the 200-ft. level? Yes.
1477. *Mr. Hamlet.*] You have told us the different kind of ores you have to deal with;—do you find any arsenical ore—mimetite? No, very little. Strictly speaking, I have not seen any in the British.
1478. Do you find antimonial ores? No.
1479. The smelting process at your mine is the same as at the other mines here, I suppose? Well, I can hardly say that. The only difference, I think, perhaps, is that we smelt with a heavier blast. I think our slag contains more lead than most of the others.
1480. Have you any roasting process? No.
1481. What happens in the roasting process, with regard to noxious fumes? Of course we should have a good deal of sulphuric acid escape from the sulphur in our ore. You mean, I suppose, in roasting the sulphide ores?
1482. Yes? Of course we should free the sulphur to some extent, and get the sulphur fumes.
1483. Have you ascertained the velocity of the fumes in the flue chamber, and what is the diameter of your stack? I can get you that afterwards. I would rather give such information exactly.
- 1484-5. I should like you to get the diameter of the stack, at top and bottom, and the sectional area of the flues. What provision is made for condensing the fumes? Simply long flues, or stacks.

Mr.
C. C. Morgan.
1 July, 1892.

1486. The object of lengthy flues is to collect and put to use what would otherwise be a nuisance? Yes.
1487. And you save the flue-dust, so that it serves two objects? Yes.
1488. How are the fumes generally dealt with in lead works? Well, our stacks here are the highest I have ever worked with. I have never worked in lead works in England at all. There, I believe, they have simply lengthened flues.
1489. And in Germany they have flues miles in length—is that not so? Yes, I think so, but I have never seen them in Germany.
1490. I understand you have had considerable experience in Leadville, in America. What condensers have they there? Do you mean smoke condensers?
1491. Fume condensers? I do not think they go in for condensing there at all.
1492. Are you not aware that Mr. Guyard, for the United States Government, has been specially engaged examining the question of lead fumes, at Leadville? No. I have not been there for the last few years.
1493. Would you agree with Mr. Guyard's conclusion that the quantity of lead lost in the atmosphere is sensibly twice as large as the quantity of lead got in the dust chambers? Well, I do not think I would. It is very hard to calculate. I do not know what they are doing at Leadville to-day in that direction. But I know that things were done there in a very crude way at first for some time. Instead of flues the same as we have here, they have a straight stack going directly from the surface through the roof of the house about 25 feet high. Then there is usually what they call a downcast flue, conical shaped, and looking like a funnel, which is put into the stack above the roof of the building, and it is made in such a way that there is a back current of air passing through this funnel, the stack being wide at that particular part. The dust spreads when it comes out, and a portion of it falls to the bottom. The stack is only 25 feet high, and as a rule showers of dust go over the town close to it. There is only one case that I know in which the flue and stack are connected as we have here, and that is at Selby's works. That is the method followed in all the mining districts throughout the mining districts of Nevada, and Utah, and what I saw in Colorado.
1494. *Mr. Howell.*] Have they got condensers at the Richmond works, Eureka? No; nothing but what I have described. Their works are situated at the base of a high hill. They run an underground flue, about 6 feet by 8 feet, up to the top of the hill, an incline of about 70 degrees, and at the top of that is the stack. Their neighbors, the Eureka Consolidated, run four or five furnaces with only the stack, and as a result of this peculiar system of working, after they had run about five or six years, the lead had accumulated to such an extent on the ground that it became a commercial commodity. There were hundreds of thousands of tons, and it was sent to San Francisco for treatment. The works were right under the town.
1495. *Mr. Hamlet.*] Are you acquainted with the Bartlett smelter system? Yes. I know Mr. Bartlett personally.
1496. Is that an effective means of condensing fumes? That is a matter of opinion. I saw him about a year and a half ago, and at that time he did not consider his process was complete at all. He was making many changes. So I can hardly answer that.
- 1496½. Do you know of the existence of any water condensers? Yes; I have seen them in operation.
1497. Have you heard whether they are successful? It is claimed that they are. I should judge that they would be pretty fair settlers.
1498. Which in your opinion would be the most effective method of preventing the fumes? I rather like the wet process myself.
1499. Do you think it likely that a man would become leaded through raking out the flue-dust? Well, I do not know that the chance of leading at that work is especially great, because a man is employed to thoroughly saturate the dust with water from a hose, and it comes out as mud from our flues.
1500. Can you satisfactorily account for all the lead that passes into your furnaces? Yes; we do account for it all.
1501. To within what percentage, including the slag and the flue-dust? Well, if you want me to go into that I should prefer to make the calculation properly for you. It would be far more satisfactory to have it exact.
1502. Of course, it is a well-known fact that silver and lead are volatile at the high temperature of your furnaces? Yes.
1503. And you think the lead is condensed in your flue and stack? Yes, the main part of it.
1504. Do you also recognise that lead is more volatile at a higher altitude, than at a lower one? I do, most certainly.
1505. Do you agree with this as an authority on lead condensation: "In the flue-gases, lead and other metallic substances are suspended together with the products of combustion from the furnaces: this is termed the flue-dust. The longer the flue the more the dust is collected; if, however, the draught be too strong, then the dust becomes imperfectly deposited, and may be carried up through the stack into the atmosphere"? Well, I do not quite understand that. Of course, sublimation starts immediately the atmospheric connection is struck—immediately it enters the flue. I suppose you could get such a tremendous draught that you would blow the whole thing up. You have to regulate your draught to a certain extent.
1506. But the substance you speak of as being sublimated is the lead oxide? Yes.
1507. And that is exceedingly volatile? Yes; it is very volatile.
1508. So that with increased draught it would be possible for the lead oxide to escape? Yes.
1509. I think you have given the quantity of arsenic in the flue-dust? I have.
1510. And with regard to the gases relieved from nitro-glycerine and dynamite in the stopes, have you, in your experience met with men who have suffered from that? Yes, I have; but not here. It generally happens in long, tight drives, and long cross-cuts.
1511. *Mr. Sleath.*] In regard to gases, do you think cleanliness would prevent poisonous gases taking effect upon the men? No; I should say not. I was speaking more particularly of the lead getting into the system through the pores of the skin.
1512. On that account it is admitted that lead-poisoning does take place? I think there is no question that fine lead-dust is more or less injurious to one's health; but what I claim is that more are affected by the lead-dust through the pores of the skin than there are by inhalation through the stomach.
1513. Just so. And do you think the men, as a rule, are careless with regard to cleanliness? I think a

- Mr. C. C. Morgan.
1 July, 1892.
- great many of them are very careless. I do not say they all are. But I think the men who wash themselves thoroughly—that is, make a habit of it—are the healthiest men we have.
1514. Do you consider the cost of erecting baths on the mine would be excessive? No; I do not. I may say in Virginia City we had large swimming and plunge-baths for the men.
1515. In America is it customary to make any provision for baths on the mines? It is very often done in the large mines in America.
1516. You are of opinion that water-sprinkling underground is a beneficial measure? Yes; I think, as a means of keeping the dust down, it is of great benefit.
1517. In regard to sprinkling underground, what arrangements do you make in the British Mine? We carry a water-pipe to the top floor, and attach a hose to it.
1518. Let us understand, please; do you bring the water from the surface, carry the pipes along the different drives, and then again up to the different stopes? Yes.
1519. And at each floor you have connections with a hose? Yes; and the men have strict orders to keep the faces well sprinkled—in fact, if they do not, the bosses have orders to draw attention to it.
1520. In your opinion, does sprinkling improve the ventilation? Yes; to a great extent it would.
1521. The water would force the hot gas up? Yes.
1522. Do you use any air-fans in your mines? We do in places; but only very rarely. We try to get the natural air circulation to every place. We have air-pipes in all our workings; but it is mostly in cross-cuts, and when we are driving these we use means to force the air in. At the present time there is only one place where we are driving a cross-cut.
1523. But you have the air-pipes there in case they are required? Yes; in case of a stoppage, or anything of that kind.
1524. How many shafts have you got in the British altogether? There are nine air-shafts.
1525. And you are quite satisfied that the provisions made for ventilation in the British are quite complete? Yes; the mine is as well ventilated as it can possibly be.

[The witness withdrew.]

Mr. J. R. McKay called and examined:—

- Mr. J. R. McKay.
1 July, 1892.
1526. *Chairman.* What appointment do you hold, Mr. McKay? I am acting manager of the South Broken Hill Mining Company, Ltd.
1527. You are acquainted probably with the conditions of work both underground and on the surface? Yes.
1528. How long have you been at the mine? Three years.
1529. We asked you to be good enough to draw up a statement for the information of the Board;—have you done so? I have drawn up a statement. I did not exactly know in what form you wanted it.
1530. What we wanted was the average number of workers in each department, and the quantity of ore raised, &c.? Yes; I have it here. [*Statement handed in. See Appendix.*]
1531. There were only about fifty men employed at your mine during the early part of 1890? Yes.
1532. But by the end of the year the number increased until about 130 men were employed? Yes; for the year 1890 that was.
1533. And during the year 1891, did the number increase to 300? Yes.
1534. In August, 1891, the number had further increased to 400? Yes.
1535. And what are the approximate numbers employed in each department at the present time? Practically, the same as in the latter part of 1891. The figures are—miners, 205; truckers, 55; platmen, 12; smelters, 86; ordinary surface men, 42.
1536. What class of work do the surface hands represent? They include blacksmiths, surface labourers, and mechanics.
1537. The ores broken from various parts of the mine are of similar character to those of the other mines, consisting of carbonate, oxidised and sulphide ores? Yes.
1538. Is the carbonate generally of a massive nature, breaking freely in blasting, with comparatively little dust? Yes; the carbonate face is very solid.
1539. Do the average contents of silver and lead vary considerably, namely, from about 10 to 40 per cent. lead, and from 15 to 50 oz. silver? Yes.
1540. You do not include the sulphide average in that statement? No; not in that.
1541. Can we obtain the quantity of ore raised from the half-yearly report? Yes. At the end of that year. I may mention that the ores were sent to Dry Creek for treatment, and all the results were sent to Melbourne, they have the figures there now.
1542. How many smelters have you in work now? We have three on at the present time. The third was started last Saturday.
1543. Then until now have you had only two at work? Yes.
1544. Can you tell us whether your men do ever become leaded? From what we can learn our mine is very free from lead. The miners prefer the South to almost any other large mine on the field.
1545. Still, I suppose, you do not mean to say that your men do not suffer at all, since you say you have between 10 and 40 per cent. of lead in the ores you are working? Well, we never have these matters brought before us in the office; but from examining the books in the mine, we find very few men indeed lose any time.
1546. When a man is laid off from sickness, do you record the nature of the complaint? No.
1547. Do you make a note of the fact that a man is sick? Yes; that is noted in the books.
1548. How many young people do you employ, of, say, 14 years of age or under? On the whole of the mine, I think, we have about five boys, and they are all employed on the surface.
1549. What do they do? Run messages, and that kind of thing. They are not engaged in ordinary labour at all.
1550. Have you any boys employed in ore-picking? No.
1551. And you never did? No.
1552. Then, in point of fact, what you would wish us to understand, I suppose, is that you have never had any occasion to turn your attention to such measures as are usually taken against leading? No, we have not.

1553. May I ask if you have been employed on other lead or lead-silver mines? Not on silver-mines. I have been engaged in copper-mines. Mr.
J. E. M'Kay.
1554. So that you have no general information about leading? No. 1 July, 1892.
1555. Do you care to express a personal opinion, as to whether upon the whole, lead is a cause of much illness among the miners, as a body, on this field? I think that would be more a matter for a medical man to speak upon. We have not got the information to go upon. We know, of course, that cases of lead poisoning do occur.
1556. Do you say that work was never impeded from that cause? No; not with us. I cannot speak regarding any other mine whatever.
1557. Do you consider your mine well ventilated, Mr. M'Kay? I consider it very well ventilated on the whole.
1558. What means do you adopt for ventilation? Just the ordinary connections between the various levels by means of winzes and rises.
1559. And from the character of the ore, do you think that it is a good thing to have the face regularly sprinkled? That depends upon the character of the ore—speaking generally. The ore in the South Mine is dense and damp, and breaks with comparatively little dust, and there is not the necessity for it.
1560. And what measures do you take to abate, as far as possible, the fumes coming from the blast-furnaces? Well, we have never taken any measures at all, but just allow the fumes to pass off as they come from the flues. We have never had any complaints of the fumes from the furnaces.
1561. What is the total length of your flues from the blast-furnaces to the stack? No great length. The iron flue itself would be about 15 feet, or 16 feet long, and that leads directly into the stack-flue.
1562. Is the stack-flue of any length? It runs the whole length of the shed.
1563. Can you give us that length? I can furnish you with it later on.
1564. The total distance the fumes have to travel from the furnace to the base of the stack, and the height of the stack? The height of the stack is 130 feet.
1565. And do you consider these precautions are ample as regards the fumes? Of course a certain quantity of the fumes is bound to escape even after all that.
1566. *Mr. Hamlet.*] Do you know whether there are any ores in your mine which contain arsenic? There is a little arsenic in some of them.
1567. What would be the mineral chiefly? In our case it is in the sulphides.
1568. In the sulphide ores? Yes.
1569. What is the quantity of lead in the flue-dust from your furnaces? About 20 per cent.
1570. And it is to your interest to collect as much as possible of that? Yes. We do collect it. It is not allowed to accumulate in the flues at all.
1571. It would impede the draught? Yes; we have a man specially employed keeping the flues clear—he does nothing else.
1572. You keep a man constantly on that work? Yes.
1573. What precaution do you adopt to prevent him inhaling the flue-dust? He has the use of a water-hose there, and as the dust comes from the escape doors, the water is mixed with it till it becomes of the consistency of mud.
1574. Has this man ever complained of lead poisoning? No. He has not been away from his work since he has been on the job, and that is five or six months—not from that cause at least: he was away from other causes.
1575. In an ordinary blast-furnace, if the furnace is running properly, would there be any escape of fumes from the throat of the furnace? No; there should not be. You would get the fumes if the stack or flue was not drawing freely.
1576. Or if the furnace was under repair I suppose? Yes.
1577. And about what is the length of life of one of your furnaces? From eight to fifteen weeks.
1578. So that repairs would be necessary about every eight or fifteen weeks? Yes. To give them fair play at all they should be repaired every eight or nine weeks. It does not do them any good to run them longer.
1579. At the time of shutting down or making repairs to your blast-furnaces have you had any unusual complaints from the men? No; none whatever.
1580. And have you ever had complaints from the men on the charge-floor? No.
1581. Have you a knowledge of any method of condensing in any other parts of the world? Not personally. Before we had all reverberatory-furnace work.
1582. Do you consider if you had a greater draught than was necessary that it would be possible to convey the lead fumes outside the stack? With the blast-gauges, the man in charge is not allowed to run the engine above a certain speed. We have a gauge for each furnace, and one in the engine-room. The air-pipes are so arranged that the blast is equal all over the furnace, and they judge of the speed by the pressure displayed in the gauge. Eight ounces of the mercury is the general working pressure.
1583. Have you ever exceeded the 8 ounces? No; it does not pay.
1584. Because you would be blowing away silver and lead? Yes.
1585. Have you ever ascertained the velocity of the gases in the flues? No.
1586. You have not found it necessary? No.
1587. Will you give us the area of the flues when you give us particulars of the length—the sectional area I mean? Yes. I may say our main flue is much longer, considering the number of furnaces, than any of the others on the line. It was built for four furnaces, and until this last week there were only two running.
1588. Are there many sulphides used in your blast-furnaces? We use one-tenth in our charges.
1589. Have you any other than the ordinary blast-furnaces? No.
1590. Do you conduct any operations from which there would be much arsenical fume? No.
1591. You have no roasting? No; not any desulphurising operations.
1592. *Mr. Sleath.*] You said your lead ore is mostly massive in character? Yes.
1593. Do you consider massive lead ore would be more or less liable to raise dust, and thus cause lead poisoning than the soft, friable ore? The soft, friable ore would produce the most dust. If you put a shot into a solid face it would not cause half the dust.
1594. Do you think using the water for sprinkling in the stopes, not only lays the dust, but tends to improve the ventilation—makes the air purer? The very fact of reducing the dust would improve the ventilation. In the close places in the mine we can blow the smoke away with compressed air.

Mr.
J. R. McKay,
1 July, 1892.

1595. Have you any water-pipes underground? Not for the purpose of sprinkling.
1596. Have you got any air-pipes underground? We have air-pipes leading to the various faces in the mine, as they are required, to blow the dust and smoke away.
1597. But you have not got pipes for the express purpose of ventilation, have you? Well, we have had them in places where there was no chance of ventilation otherwise.
1598. I suppose a man might become leaded in your mine without you knowing anything about it? Well if a man were away for any length of time we would be apt to inquire; if he were away only for a couple of days we would make no inquiry at all.
1599. Is your ore body all of a similar character, or have you some which contain less lead than others? Our dry oxidised ore contains little or no lead.
1600. I suppose the men are not always kept at the lead faces—they are changed occasionally? Yes.
1601. *Chairman.*] Are they changed systematically? You cannot always regulate it; sometimes a man may be longer on the lead than at other times.
1602. *Mr. Sleath.*] Do you always make an effort to give them a change, as far as possible, to avoid all risk? Yes.
1603. In case a man is leaded do you give his case any particular consideration? In what way do you mean?
1604. Supposing any of your men left through the effects of lead-poisoning, would you give them an opportunity of resuming work when they came back to the mine? If such had been the case we would have done that, certainly. Whenever a man gets ill in the service of the company and has to go away for the benefit of his health we always make a point of taking him back if he is anxious to come.
1605. And if a man who had been working underground was laid off through lead-poisoning would you give him the opportunity of doing some other kind of work if you had it? Yes; we have done that before, even in cases where, perhaps, the man had not contracted the sickness with us. If he had been working with us when he laid off we would give him the chance of working at some other job when he came on again.
1606. What sort of a changing-house have you got? It is a stone building.
1607. Have you any idea of the dimensions? About 15 feet by 20 feet.
1608. Is there any accommodation for the men in the changing-house, such as seats, for instance? Yes, there are seats, and nails all round the walls for them to hang their clothes on. There is also a place for them to wash.
1609. You have accommodation for them to wash? Yes.
1610. In the shape of a water basin? Yes.
1611. Is the water laid on? No; but there is a tank close by. I would not say, however, that they always use it.
1612. I was about to ask you, is it taken advantage of—do many of the men use it do you think? Some of the men use it, but I should say that the majority of the miners do not use it.
1613. Are you sure that they all know of it being there? They ought to know it.
1614. You do not know that any of them think it is specially reserved for the shiftmen? They could not become imbued with that idea, because the place is always open for them to go into.
1615. Can you tell us as an actual fact that anyone outside the shiftmen ever make use of it? I cannot.
1616. Do you think it would prevent lead-poisoning to a great extent if, on all the mines, provision were made for the men to have a thorough wash on leaving their work? It would undoubtedly be better for their general health if such opportunities were provided; but as to whether it would prevent lead-poisoning is another matter.
1617. Would it involve much expense to the companies to provide such accommodation? I do not think the expense would be very great, provided they had the water; but the question is whether the employees would use it; they are generally in a great hurry to get home.

[The witness withdrew.]

Mr. B. B. Hoddinott called and examined:—

Mr. B. B.
Hoddinott,
1 July, 1892.

1618. Are you secretary to the Broken Hill Lodge No. 65, I.O.O.F.? Yes.
1619. When was the Lodge established? In October, 1888.
1620. You have been good enough to furnish the Board with a statement of the number of members you had in 1890, in 1891, and the present total enrolment; and you have also mentioned the number of members of your society who have received sick pay on account of leading in 1890, 1891, and 1892, and the number of days that each of those members was laid off from that cause. Can you tell us, in relation to that, how many of your members are engaged in or about the mines? I have no means of telling that, because a man may join the society and put his occupation down as a miner, and may not work in the mines after that another week.
1621. Some of the other secretaries have furnished us with a statement showing the number of their members who were miners. Does what you have said just now apply to all such records—that a man may enrol as a miner and may soon after cease to be a miner? I should take it to be so; and also those who register themselves as following other trades may possibly become miners afterwards.
1622. How long have you been a resident of Broken Hill? A little over four years.
1623. Is it your opinion that lead causes a serious amount of illness—that is, serious in point of the numbers attacked—among the persons engaged at the mines? I should judge that lead causes more sickness in the district than any other single disease.
1624. But whether it causes a larger proportion of miners to be ill than a corresponding number of the general population you have no means of judging? No; but there is just one thing I may say. Our report, which we send in from the books, does not necessarily show the full extent of lead-poisoning amongst our members, because there are so many members who get leaded and do not declare on the funds, and therefore we have no official information on that head.
1625. Still, we take it that a man who begins to suffer from lead-poisoning will not suffer very long without having to lay off—is that not so? Well, yes, I suppose that would be the case.

[The witness withdrew.]

Mr.

Mr. W. Curgenvén called and examined:—

Mr. W.
Curgenvén.
1 July, 1892.

1626. *Chairman.*] What is your occupation? I am a miner.
1627. Have you worked in mines containing lead anywhere else than on this field? No; I have only worked here.
1628. Where did you begin to work here? At the big mine—the Proprietary.
1629. When was that? At the first starting of the mine—about seven years ago. I was working in the shaft.
1630. How long have you lived in the neighbourhood? During the seven years. I only went down when I was laid up with my hand.
1631. How long did you continue to work in the big mine before your first spell? About two years.
1632. What class of ore were you getting? I was on the lead, working down to the 216 level, and from there upwards.
1633. In which shaft was that? McCulloch's, principally.
1634. Did you work there for two years without getting leaded? Well, I felt it coming on; but they shifted us from one place to another. At the end of the two years, Mr. Wilson came there, and he started contracts, and the men then had to stay in the lead face. There were six of us in the lead face, and only one escaped—in fact, I believe he was bad, although he said he was not.
1635. The six were on the same contract? Yes.
1636. Are you of opinion, if the original system of changing had been continued, that you would not then have suffered? Yes; at least I think if the system of changing had gone on, we should not have been so bad. But as I have said there was no changing on this contract work at the time.
1637. Up to the time you began to take contracts, was there not any changing to and from the lead stopes? No; there was no shifting.
1638. But you mentioned shifting just now? Well, I was in Jamieson's, and had a contract there; and I was in McCulloch's, and had a contract there. That is what I called shifting; but after I got leaded, we shifted about—a fortnight in the lead, and a fortnight in the ironstone.
1639. During that two years, was all the work done by contract? No.
1640. Were you doing the work by contract all the time? No; we were doing day work sometimes.
1641. We will pass over these two years. Tell me how long you stayed away, when you laid off from the effects of lead? The first time I was away four weeks.
1642. Then did you go back to work? Yes; I worked three or four shifts, and then had to go home again. I was home eight or ten weeks, and never did anything. I was very bad.
1643. What sort of attack had you—was it colic? I had pains across the chest, pains in the bowels, and weakness in the legs.
1644. Were your arms not affected at that time? No; not at that time.
1645. You had no fits? No.
1646. Well, after this last spell of a few weeks, did you go back to work again? No; I left then, and went to work at the outside mines. The doctor said it would not do to work at the lead again, that if I did, I should be as bad as ever in a few days.
1647. Is there no lead in the outside mines? No.
1648. Then did you come in again? Yes; and I worked in the British.
1649. In what year was that? A little over two years ago.
1650. That was in 1889 or 1890? Yes.
1651. And how long did you work there? About seven or eight, or nine months.
1652. Was there any system of shifting you from one working place to another in that mine? No; there was not much difference there.
1653. At the end of the nine months did you get leaded again? Yes; I had to go away from there again. In fact, I was leaded twice there.
1654. Did you experience the same symptoms on the second occasion? Yes; it used to take me in the chest, and the pains would go right through me. I was completely bound up for a fortnight.
1655. Well, did you go back again after that attack? Yes; I stopped a few weeks; then I found it was coming on me again, and went home. I remained home for some time; then I went to the Junction, and that is where I finished.
1656. Did you get more lead then? I do not think it was lead altogether. I think it was the gas there mostly. You can see by my hands what the lead has done for me. [*The witness showed that he was suffering from paralysis of the extensor muscles.*] It is about twelve months ago since I first began to feel it in my hands like this, and for the last nine months my hands were bent so that I could not get a cup of tea to my mouth.
1657. Your statement amounts to this: that you became leaded towards the end of the first two years you have spoken of? Yes. I may say that there was no air going through the mine when I first worked there.
1658. It was ill-ventilated at that time? Yes.
1659. Then you had three or four attacks subsequently to that each time on going back to work, but it was not until the last attack that you got wrist-drop? Yes.
1660. Is the condition of the mine now much better than when you first went to work there? Yes; there is very much more air there now.
1661. Do you know whether any one mine is considered more dangerous or better than others to work in? Of course; there is a great deal of difference between some of the mines. There is Block 14, for instance, though I never worked there, or Block 11.
1662. At present do you mean to say that Block 14 and Block 11 are better than the other mines? Well, I cannot really say anything about them personally. I know what Block 10 and the Junction are. The lead is very damp in those mines.
1663. *Mr. Hamlet.*] Did you experience any headaches when you were working at the mine underground? Yes; when we have been firing the lithofracteur.
1664. Did you suffer from thirst much? Yes; you require to drink a good deal of water or tea while at work there.
1665. About how much do you carry down with you? About a quart.
1666. Do you find that enough, as a rule? Sometimes it was, and sometimes not.

- Mr. W. Curgenven.
1 July, 1892.
1667. When you were at work on the lead had they any means of damping the stopes or sprinkling the face with water? No; they had nothing of the kind at all.
1668. And your opinion is, the air was very bad there? In places it was. Some places were worse than others; but, taking it altogether, the Junction is not very bad. Of course, when we fired a shot there would be a great smell arising from the gas, and the candle would die away for a time.
1669. In your experience as a miner have you ever found, on striking your pick into the face, any out-rush of foul gas? I have found a little of that in the Junction at places, and I have seen it in the Big mine near Block 10.
1670. Had it any effect on the candles? Just for a little while, especially if the candles were down low.
1671. You would notice your candle go dim if you held it (say) 8 inches from the floor? I have noticed it go dim many times, but have never noticed whether it was at the bottom or not.
1672. In consequence of your hands being in the state you have shown us, are you unable to work? I cannot do heavy work; I cannot lift my arm up high enough to do that class of work; I cannot get a good grip of anything, but I daresay I could do light jobs.
1673. Do you think you will ever be able to wield a pick again? I do not think I shall be able to work in the face again, because the strength has all gone out of my upper arm.
1674. *Mr. Steath.*] You say you were working contract when you got leaded first? Yes.
1675. Then do you think that by working contract men are more liable to get leaded than when they are working for a wage? Of course he is; because when a man is working on contract he is all the time pegging away at the face.
1676. Have you seen water-pipes carried through the Proprietary Mine? No.
1677. Did you ever see the stopes or any part of the mine sprinkled with water;—that is, in the Proprietary? Not in the Proprietary.
1678. Have you seen it done in any of the mines? Yes; I have seen it in the British.
1679. You have not seen it in any other? No; in the British they used to water it about once a week.
1680. Do you think, as a practical miner, that sprinkling the stopes and drives would tend to prevent lead-poisoning? It would keep the dust down, certainly; but I would not advise that it should be put near the timber.
1681. Why not? Because it causes a foul smell to come out from the timber.
1682. You think the water does that? Yes. I have noticed it myself, when I was working there, when the water was put on to it the effect was enough to knock you backwards.
1683. Did you ever see a changing-house in the Proprietary? No.
1684. At the British? None at all.
1685. Was there a changing-house at the Junction? No; if they changed at all it would be in a little bit of a shed round by the shaft.
1686. Did you ever see provision made for the men to wash on the surface of the mine? No.
1687. Do you think it would be beneficial if hot baths were provided, so that the men could have a wash on leaving their work? I should think so.
1688. Do you think the men would make use of it? Yes; I think they would if proper provision were made for them to change.
1689. Do you take precautions as to cleanliness;—are you careful to wash yourself, for instance? My word I am. My wife has washed my back many a time when I have gone home pretty well black.
1690. Have you ever known any one other than miners to suffer from what is called lead-poisoning? No; I never did.
1691. Have you ever applied for any lighter kind of work at the place where you had been engaged since you have been able to get about? Yes; I went up to Mr. Howell, and he told me that he had too many men suffering from the same complaint.
1692. Do you mean to state that he said he had too many men suffering from lead-poisoning? Yes; I do not mean to say that he referred to the condition of my hands altogether, but suffering in different ways from the lead.
1693. Anyhow, you did not get employment? No; not from him.
1694. How long have you been out of work now? I have worked only seven days during the last nine months.
1695. What doctor attended you? Dr. Groves.
1696. *Chairman.*] You said that you began work here about seven years ago, more or less? Yes.
1697. You worked in the Proprietary Mine first, and you worked there two years? Yes.
1698. Have you worked there since? I worked there once since then.
1699. In what year, do you think? I can hardly say; I know I was away, and after coming back worked two or three months when I felt the effects of lead return and went away again.
1700. Was it two or three years ago? About that, I should say.
1701. Was it before you went to the Junction? Oh, yes; a long time before I went to the Junction.
1702. When you said there was no sprinkling done at the Proprietary, you meant, I suppose, at the date you worked there? Yes.
1703. You do not say there is no sprinkling there now? Oh, no.
1704. And what is the latest date you speak of with regard to the changing-rooms;—you said there were no changing-rooms at any of the mines to your knowledge; to what date were you referring when you said that? From the time I went there up to the time I left. I cannot say whether there is any changing-room in the big mine now, but I know there is not in the Junction.

[The witness withdrew.]

Mr. Matthew Ormsley called and examined:—

- Mr. M. Ormsley.
1 July, 1892.
1705. *Chairman.*] What is your occupation? I am a miner.
1706. How long have you been working on this field? I have been working four and a-half years on the Proprietary.
1707. Were you working there all the time? Yes, all the time.
1708. In what parts of the mine have you been working in mostly? In the stopes.

1709.

1709. But in which part, particularly? Well, we have been used to change this last three years now, turn about each fortnight, between Jamieson's and McCulloch's—the lead end; only the second time we shifted we might be detained a month in the lead-end.

1710. Does that system of shifting hold good throughout the whole mine, or was it for the benefit of the men working in McCulloch's? I suppose it is for the benefit of the men working in the lead; but they never get more than a fortnight's work at Jamieson's end.

1711. That practice, you say, has lasted for three years? Yes.

1712. Have you ever been leaded? Yes, three or four different times.

1713. Tell us of the different times;—in the first place you went to work in the mine about four-and-a-half years ago—that would be in 1888? Yes.

1714. How long did you work before you were laid up the first time? The first time I felt the effects was after I had worked eighteen months at the mine.

1715. And during those eighteen months had you been working in the lead stopes all the time? No. I was working partly in Jamieson's, and partly in McCulloch's—that is, the lead end.

1716. But not always a fortnight in each place? No; we were more often six weeks in the lead end. But within the last three years this arrangement came to pass—to shift the men every fortnight or so.

1717. How long were you laid up the first time? About six weeks.

1718. Do you think the attack was long in coming on? Yes; I think I worked on after I got a touch of it, and never took any notice of it.

1719. What were your symptoms? The first time I got it right across the bowels, with great pain, and my loins were also affected. I had to undergo an operation to give me ease.

1720. You had colic and constipation? Yes.

1721. Did your legs give way? Yes; I had it in my feet very bad, and my legs are swollen now from the effects of it.

1722. Did you go back to work again? Yes.

1723. And in the lead-stopes? Yes, in the stopes.

1724. How long did you work then before you fell ill again? It might have been eight or nine months afterwards when I felt the effects a second time; but I generally took stuff to check it.

1725. What stuff? All kinds of stuff to check the pain, and also opening medicine. I was subject to giddiness.

1726. However, you got it a second time, and had to lay up, and then you went back again, I suppose? Yes.

1727. Still in the lead-stopes? Yes; there and in Jamieson's.

1728. How long did you stay at work before you became ill again? Well, I worked there for some time. But I am off now through the lead; I got affected again in the head.

1729. You kept on suffering and going to work again, and you are now off because you have become affected again? Yes.

1730. And does it chiefly attack you in the head, now? Yes, but I am getting better.

1731. What doctor has been attending you? I have been attending myself. If it had not been cold weather I should have blistered my temples, but I find I am getting better again. It is still in my system, I think, because my legs are all swollen. I may say that I had a fall from the cage, of about 15 feet, a few months ago, and that, perhaps, may have affected me.

1732. How old are you? I am fifty-five.

1733. Have you been attended by a doctor for lead-poisoning? Yes, I have been.

1734. Who generally attended you? Dr. Bartley for one, and I have also been attended in Adelaide.

1735. Is it, in your opinion, a very common thing for men who get leaded here to go to their homes at a distance to get well? Yes; a great many do go—for a change as well. I think some men are more liable to get leaded than others, having weaker constitutions.

1736. You know that yourself? Oh, yes.

1737. Do you think there are some people who, on account of constitutional weakness, ought never to work in lead? If they could get anything else to do it would be better, but I did not adopt that advice myself, being so used to one mine. I never worked in any others on the Barrier.

1738. Do they not take you on? No.

1739. Do they not give you any reason? No; they give me no reason. I got a chill when I was last taken ill, and started to vomit, and could not keep my head up.

1740. Have you seen many men affected by the lead in your mine? Yes; I have known men who have been carried away to their graves through it.

1741. Can you say if any class of men are more particularly subject to lead poisoning than others? I think the young men are more subject to it than elderly men.

1742. Are there many teetotallers in the mines? Yes.

1743. Do you think they get leaded as well as others? Yes.

1744. It makes no difference? No.

1745. Have you noticed any improvement in any of the mines of late—any particular precaution taken by the mine managers against leading? The only thing I know is that there is better air in the mines now than there used to be formerly. Although sometimes when the mine is given a spell, such as a shift off, you will find very faint smells coming from the ground.

1746. How is that? It comes from the ground, I fancy.

1747. *Mr. Hamlet.*] Can you tell us now what you and other men used to do to relieve yourselves when you wanted a motion of the bowels—how far did you go off from where you were working? There is a certain place left in the mine—left for the purpose.

1748. Do the men usually make use of it? Yes. Sometimes there is a slight smell there. I think they ought to have carbolic acid or lime to destroy it.

1749. There is a bad smell there sometimes from that cause apart from the lead? Yes.

1750. What do you do with regard to washing. I suppose you know that a man who washes carefully after he leaves the mine every day is not so likely to get leaded? I do not know. I generally wash myself all over when I come out of the mine—that is, my body and face and hands.

1751. When you were at work in the mine you got very hot, I suppose—sweated a good deal? Yes; and of course when you are breaking the lead ore it all comes down on your arms.

Mr. M. Ormsley.
1 July, 1892.
1752.

- Mr. M. Ormsley.
1 July, 1892.
1752. How were you dressed at your work—had you more than trousers and shirt on? Trousers and flannel.
1753. And another shirt beyond that? No.
- 1753½. Just the trousers and flannel? Yes.
1754. And you found it hot then? Yes; in places.
1755. And I suppose you sometimes wiped your face with your hands? Yes; and you naturally run out occasionally to get a little fresh air, and then it dries on you.
1756. Do you take your food down below with you? Yes.
1757. Where do you keep it? In the coat pocket.
1758. And then you hang up your coat in the mine? Yes.
1759. And then when crib-time arrives can you wash your hands? No; we cannot do that very well.
1760. What do you do? We wipe our hands as well as we can. We generally have a little place some distance back where we keep our crib.
1761. Did you ever suffer from headache when you were working in the stopes? Yes; very often.
1762. I suppose you always wore a beard and moustachè? Yes; I think it is best.
1763. Do you know any miners who shave at all? Yes.
1764. Shave the upper lip? Yes.
1765. And do you think men who shave are more likely to get leaded? I do not know; but I have heard a good many complain who had the moustache off. They used to get on to me about taking it off; but I thought it was a preventive, to some extent.
1766. *Mr. Sleath.*] You have been employed all the time at the Proprietary Mine? Yes.
1767. Was there much dust there? Oh, yes; very often a tremendous lot of dust. Sometimes you could not see your hand before you.
1768. Did they use any water? Not at that time.
1769. Did you ever see water used in the Proprietary for sprinkling? No.
1770. Never once? Not to my knowledge.
1771. How long is it since you worked there last? It is going on for six weeks now.
1772. Then, up to six weeks ago, you never saw any water used in the Proprietary? No.
1773. Do you think it would be beneficial to use water for sprinkling purposes? Certainly.
1774. Independent of laying the lead dust, would it make the ventilation better? Yes; I think it would.
1775. What sort of changing-house have they got on the Proprietary Mine? The changing-house is very good, I think; but it is only for the use of the shaft-men who work in wet places.
1776. You never used the changing-room? No.
1777. Did you ever know any man who worked in the stopes to use it? No.
1778. Is it generally understood that they can use it? I think it is understood they can.
1779. Did you ever have a copy of the mining regulations presented to you? No.
1780. Did you ever see them posted at the shafts, or anywhere about the mine? I did not take notice.
1781. But you are certain you never got a copy? I am certain I never got a copy.
1782. Have you seen any number of the men who have been working with you (your mates) suffering from the effects of lead poisoning? Yes; several.
1783. Do you know if any men who have been working in the lead stopes here for any considerable length of time without suffering from lead poisoning? I have heard from one or two, or perhaps three, that they have never had a touch of it; but where there is one like that there are fifty the other way.
1784. Speaking generally, which mine bears the worst reputation for lead poisoning, or is there one that bears a worse name than the others in that respect? I think the worst mines on the Hill are Block 14 and the Proprietary.
1785. So far as you know, those are the two worst mines for lead? Those are the only two that I know of. I have heard a little talk about the British.
1786. When a man is laid off from leading, is it a customary thing, in such cases, to allow him to return to his work again when he recovers? I believe it is customary.
1787. Is it customary to find lighter employment for them? I have known a few to get on the surface for a while.
1788. But they have refused to give you employment this time? Yes.
1789. On the previous occasion when you suffered from lead poisoning, did you get your place back again when you returned? Yes.
1790. Then, this was the first time they refused you? Yes.
1791. Did they tell you directly the reason? No.
1792. They simply refused you? Yes. I went to Mr. Uren, and he told me to appeal to the bosses I was working under, and, accordingly, I went to the head man at M'Culloch's, when I left off. I found I did not get any satisfaction, however, and I then went to Mr. Howell, the manager. He told me that he had nothing to do with the under-ground work whatever, and that I should apply to Mr. Uren; but I did not go to Mr. Uren again.
1793. Do you think if hot baths were provided on the surface alongside the changing-room that that would be a beneficial measure? Yes, it would be a great thing for the men.
1794. Do you think the men would take advantage of it? I do.
1795. Would you do it personally? I would do it for my own sake, certainly.
1796. *Chairman.*] It has been suggested to us that even if warm baths and a suitable room for changing were provided that the men, when they come up from below, are in such a hurry to get home that they probably would not care to stop an extra quarter of an hour to wash;—what do you think of that suggestion? Well, I do not know. Every one would not be of that opinion. I believe that any of the men who had some distance to go would be glad to make use of it. Those who lived handy to the mine might not think it worth while to wash until they got home. But I am sure a good hot bath would do them all a lot of good. I know I generally use it myself when I get home from the mine.
1797. But is it not the case that comparatively few men have the means of bathing themselves at home, or in the bad times hitherto, have had no water? Yes; very often in the way we were situated there would not be a great deal of water at home for washing purposes.

[The witness withdrew.]

MONDAY,

MONDAY, 4 JULY, 1892.

Present:—

DR. ASHBURTON THOMPSON (CHAIRMAN).

WM. M. HAMLET, Esq.

J. HOWELL, Esq.

R. SLEATH, Esq.

Mr. Jas. Hebbard called and examined:—

Mr.
J. Hebbard.
4 July, 1892.

1798. What office do you hold, Mr. Hebbard? I am the Government Inspector of Mines.
1799. Under what Act are you appointed? The Mining Act of 1874.
1800. Do the general rules, which form a schedule to the regulations for the regulation of mines, other than coal and shale mines, made under section 64 of the Mining Act of 1874, apply to these mines on the Barrier? Yes.
1801. Are your duties defined in the regulations just referred to. Yes. (*Copy of the Regulations handed in*).
1802. How often do you inspect the mines—do you go round regularly, or only when you are asked to do so? My duty is to occupy my time by inspecting the mines of this district.
1803. Is it a particular instruction to you under the general rules to see that there is adequate ventilation in the workings? Yes, as a general rule.
1804. Will you kindly tell us how you proceed to ascertain whether the ventilation is adequate or not? A certain test is the possibility of a candle burning in the place where the men are working, and the action of the atmosphere on the candle, as well as the feeling of coolness or otherwise, which may be in the mine.
1805. Under the fifteenth rule, is it ordered that there shall be accommodation near the principal entrance of the mine for enabling the employees to conveniently change and dry their clothes? Yes.
1806. Is such accommodation invariably provided on the mines? In several of the mines there is accommodation provided, but in no instance that I know of is there sufficient accommodation of the kind to allow of all the men employed at the mine changing and drying their dresses.
1807. The rule says "change and dry," is there any provision at any of the mines for drying the clothes? There is the top of the boilers.
1808. But this accommodation is ordered to be separate from the engine-room or boiler-house, is it not? Only for changing, I think—that is the way we generally read the rule, at any rate.
1809. But rule 15 says definitely that the changing and drying-room shall be near the principal entrance to the mine, and not the engine-house or boiler-house; so that the rule is plainly framed to prevent any boiler or engine-house being used for the purpose? Yes; the rule definitely states that; but I know in my experience as a mine manager, that the drying of dresses has always been allowed on the boiler top.
1810. You are now speaking as from your former experience as a manager? Yes.
1811. And you point out that the rule has usually been contravened; but as a mining inspector—? I wish to speak as a mining inspector, sir.
1812. I think you should do so—yes? I only want to make that part of it clear.
1813. You know that where men working in the mines get their clothes wet they ought to have a chance of drying them; why is it not provided, according to regulation. But I will ask you another question:—Men working in lead mines ought to have the amplest opportunity of washing, and of changing their clothes; but in winter, at all events, when they come from below into a cold atmosphere, I should say they would be very little likely to use an unwarmed changing room, and perhaps would be wise in not using it, but in going straight to their homes. Do you agree with that upon the whole? I do.
1814. In general, you agree that they should have every inducement and opportunity of changing? Yes.
1815. Then if rule 15 were observed, and they had a changing house and a place in which they could dry their clothes, as provided by that rule, it would be a warm room, and not a draughty place such as we see it to be, is not that so? That is so, certainly.
1816. Do you then think it would be desirable, in connection with the working of lead ores, that the changing rooms should be something more than the mere sheds that we see them to be? Yes.
1817. Do you know of any other reason why the men do not resort to these changing rooms than that they are devoid of necessary accommodation and warmth? No; I do not; unless it is—but perhaps I should not be right in saying anything in that regard. I would only remark that, as a miner, I always changed my clothes.
1818. I suppose you think there is a proportion of the miners who would not take the trouble to change their clothes, or wash themselves, whatever you might do for them? Yes; the great majority of them.
1819. Still, it is much more likely that they would wash and change if they had a suitable place to do it in—a warm place? Yes; and proper facilities.
1820. And in connection with the getting of lead ore you think it desirable that everything should be done to encourage habits of cleanliness? Undoubtedly.
1821. Personal cleanliness is regarded as one of the best means of preventing lead poisoning, is it not? Yes; I think so.
1822. Does not rule 22 of the Mining Regulations provide that a copy of the rules shall be posted in some conspicuous position on the mines, and also that a copy of the rules shall be supplied to each of the men employed on the mine? Yes.
1823. Do you think those rules are observed—that is, the last one? Well, that is not stated in my copy of the rules. This is supplied by the Department:—[*Copy of the Regulations issued from the Department of Mines, put in by the witness, from which, as he points out, the last sentence of Rule 22, is omitted.*] I certainly thought that was in it myself until I looked through this copy. Of course, it is in the original Regulations.
1824. *Chairman.*] Is that provision of any practical use, that a copy of the Rules shall be given to every person employed upon the mine? I cannot say. They have ample opportunities of seeing them on the mine. That part of the clause is carried out I know, because it is part of my duty to see that they are posted up on the mines.
1825. Whereabouts are they posted on the British, for instance? At the entrance to the main shaft.
1826. Are they posted at every mine? Yes.

- Mr. J. Hebbard.
4 July, 1892.
1827. At the same time, the intention of Rule 22, appears to be to make them well known to every individual; and, as in point of fact, no mine has yet provided proper facilities for changing clothes, perhaps if the men were made thoroughly aware of it, they might, by this time, have got that accommodation? Yes, that might be so.
1828. Have you managed any lead-yielding mines? Yes, I was managing the Junction Mine in this locality up to August, 1888.
1829. What kind of ore were you getting at that time? Principally carbonate of lead.
1830. Were there any cases of leading among the employees? Yes, there were cases.
1831. Can you give the Board any information as to the way in which leading comes about—anything connected with the arrangements of the mine, or the personal habits of the men; or things that induce leading? I cannot speak conclusively on that point; but I have a theory.
1832. You have thought about the matter, and formed a theory. We should like to hear it? I think one great cause of leading among the men is a want of personal cleanliness, and the neglect to change their clothes immediately after finishing their work.
1833. Anything else? Yes; there is the constant stirring of the dust in the mines, causing the men to breathe it in that way. There are also the gases arising from the ground itself, as the mine is opened up.
1834. Well, what do you think should be done by way of a remedy—suppose you take the dust and the gases first? The constant damping of the stopes would, in my opinion, be one great remedy.
1835. Is that done in all the mines? There are several mines in which it is pretty well carried out.
1836. Can you name them? Notably in the British, and the lead stopes of the Proprietary Mine. I cannot speak definitely to having noticed it in the other mines.
1837. Do the other mines make any provision at all for sprinkling? I cannot say. I have not noticed that.
1838. In the case of the British and the Proprietary Mines, are you of opinion that sprinkling is regularly carried out in the lead stopes? Yes.
1839. You know that it is so from your personal inspection of those mines? Yes; I have seen it. Perhaps I should qualify that a little, because I cannot actually say now from memory whether I have actually seen the water carried to the stopes or not. But I have seen it in the levels, and places of main traffic.
1840. That is, you have seen the pipes carried through to contain water? I have seen sprinkling actually going on as well.
1841. Do you mean that the main passages are sprinkled as well as the working places and floors? Yes.
1842. Do you mean that the main drive is sprinkled regularly? Yes, the main drive.
1843. You are speaking of the Proprietary? I am speaking of the British more particularly; but the Proprietary can be included.
1844. The main drive very often goes through country, does it not? No; as a rule the main drives are in the lead, and the dust is very likely to be beaten up and disturbed and carried through the air passages.
1845. Well, sprinkling is one thing;—I suppose the floors ought to be kept swept reasonably clean? No; I believe that is rather harmful than productive of good.
1846. Then, what would you do with the accumulations on the floors? I would let it lie undisturbed as much as possible, so as to avoid affecting the men in the working places.
1847. But does it not fall through the cracks from floor to floor, and does it not get shaken up every time a shot is fired, and so forth? Yes. But it is not possible to sweep the place so clean that there will be no dust there. In my opinion, you can sweep as often as you like, and there will still be dust. That is why, I think, it would not be productive of much good, especially as by disturbing the dust, you must cause a certain amount of it to circulate through the air-passages.
1848. Would sprinkling assist the ventilation? I think not.
1849. Not by cooling the air in hot places;—several witnesses have suggested that it would assist the ventilation? I think it would produce a dampness in the air, and that certainly would not be beneficial.
1850. Do you mean the evil produced by dampness would outweigh the good produced by laying the dust? No; I mean on the cooling of the atmosphere.
1851. Then, as to the ventilation of dead ends and tops, and the upper part of the stopes, and so forth? Connection is formed with the upper level by winzes, and so on to the surface; and in some cases the ventilation is carried by means of pipes through which the air is forced by fans.
1852. To which mine are you referring now? I was referring to the British and Proprietary. I do not know whether I can speak definitely as to the artificial ventilation in the other mines.
1853. What else can be done besides sprinkling, and the observance of cleanliness on the part of the men, by way of diminishing lead-poisoning? I am inclined to think that the practice of eating their food with dirty hands may be part of the evil. There is no provision for washing the hands, although they may wash their mouths out with the tea they carry with them. I think, also, that the use of the pipe may do something towards leading them, as they commonly rub their tobacco in their hands.
1854. Some of these are personal matters which the men must look after themselves; but there are several things which the proprietors can do to assist the men, as it appears to me, thus: the proprietors can at all events make such provisions nowhere—as we have seen down below—for the men to wash their hands underground before taking their food during crib-time;—do you agree with me so far? I think so.
1855. Such provision is not made anywhere now, is it? No.
1856. As to the use of tobacco, and eating with dirty hands, &c., these are personal matters which the men must undertake for themselves along with some others;—but would you express an opinion as to whether the men are generally aware that such precautions as you mention are necessary, that is, are they aware of what they may do for themselves? I do not know whether it is so at present, but at one time I know there were instructions issued by the company as to the measures to be adopted against lead poisoning. That was during my time as shift-foreman, under the Proprietary Company.
1857. How long ago was that? It would be over six years ago now.
1858. That was at the very beginning of the work, or very nearly the beginning? Yes. I was employed by the Proprietary Company between 1885 and 1886.
- 1859-60. Then what was your experience; did the men attend to these regulations in any degree? They did not. I may give you the chief points of these instructions, perhaps.
- 1861.

Mr.
J. Hebbard.
4 July, 1892.

1861. If you can remember them? Yes. The principal one was the observance of absolute personal cleanliness; the use of as great a quantity of fruity food as the stomach would take, and to use dilute sulphuric acid, which was provided for the men if they wished to use it. There were at the time these instructions were issued baths provided on the site now occupied by the north smelters, but which, so far as I can remember, nobody used. Those were about the chief instructions.

1862. Then from your account it would appear that at first considerably more was done for the men than is done now? In that respect, at any rate.

1863. How long have you held your present post? Since the 16th December of last year.

1864. Do you see much of the men? Yes; I mingle with them constantly.

1865. Do you think the amount of lead poisoning that actually occurs is important—in the course of a year, for instance, do you suppose that an appreciable proportion of labour is lost on that account? Yes.

1866. Which mine is the worst as regards leading, do you think? I do not think a comparison could be instituted between any of them as regards the lead stopes; because some places are entirely free from lead, such as in Block 10, for instance; in the Central also, it is a very small item; and the same may be said of portions of the Proprietary Mine.

1867. You have not noticed whether any one mine has furnished a larger number of cases of leading than other mines? No.

1868. You have not the means of noticing, in fact? No; and chiefly for this reason: Say I visited one particular mine once a fortnight, I would only see one set of men out of the three engaged there, and there are so many that I do not become personally acquainted with them.

1869. *Mr. Hamlet.*] Do you know, from your own experience, whether these regulations that you produce here to-day, are observed on the part of the mine proprietors? Yes; except in the one particular matter we have already referred to under clause 15.

1870. Is there a similar tendency among the men to observe these regulations? Yes; so far as I have seen.

1871. Have you observed whether they take much notice of the regulations? I never saw a man reading them; but from what I hear in my talks with the men, I find they know the regulations as well as I do. A great many of them do at any rate; they get to know them somehow.

1872. How often do you visit the mines? My duty is to employ my time constantly in visiting the mines. If you wish it, I will give an idea from my diary of how my visits do occur.

1873. If you please, just give us a month, by way of example? I will take the month of June. The first entry is *re* accidents, and so on. That is how I was employed on that date. Then 2nd June, Central mine; 3rd June, Jamieson's section; 4th June, boiler inspections; 7th June, Jamieson's portion of the Proprietary; 8th June, McCulloch's portion; 9th June, M'Gregor's; 10th June, Junction North and South, and North Broken Hill Mines; 11th June, the British; and so on throughout the month.

1874. I think that will do. Now, with regard to ventilation, what is the principle adopted in those mines? Just the natural draught.

1875. And that, I think you said, is sometimes assisted by artificial means? Yes.

1876. Have you any means of ascertaining how the ventilation is going—at what speed? No.

1877. You never use an air-meter? No.

1878. And what would be your method of finding out whether the air was very bad? My personal experience, and seeing its effect on the candle, I suppose. It would be an extra bad case, of course, if the candle were much affected. Roughly speaking, the rule is that where a candle will burn, a man can live, but I never allow it to go that far.

1879. Do you ever try to ascertain the temperature of the mines? No.

1880. Is there much difference, or variation, between summer and winter? Yes; the mines are cooler as a rule in the winter; and there is a good deal of heat in the summer. It is caused by the absorption of the heat by the timber.

1881. What is the size of the drives or main passages underground, as a rule? Generally 7 feet by 5 feet.

1882. That is 5 feet wide and 7 feet high? Yes; the main levels.

1883. What would be the size of what they call a set? An ordinary set is 6 feet by 5 feet.

1884. That is 6 feet high? Yes; that is a top set.

1885. Have you, in your experience as a mine inspector, ever heard of men going to sleep in the mines? No; not in my experience as a mine inspector. I can only say that I have heard it as a common remark.

1886. You have never, in your experience, found men asleep in the mine? No.

1887. If the remark that they do so is correct, where do you think they sleep in the mine? In the face, I should say.

1888. Or on the timber? Yes.

1889. From your experience of this class of mining, do you think that sleeping in a dusty atmosphere would tend to produce lead-poisoning? Yes; I think so.

1890. With regard to the instructions once issued to the miners and the provisions made for them against leading, you mentioned dilute sulphuric acid. Was that provided by the mine proprietors? Yes.

1891. And did the men use it? At first they did; but they afterwards left it off. There was not very much demand for it.

1892. Can you describe those baths which you say were provided; what were they like? Well, I have only a very rough recollection of what they were like. I know they were attached to the smelters somewhere, and were ranged in a shed.

1893. Were there arrangements for a man to take off his clothes decently and have a bath? Yes; so far as I recollect there were small compartments with a hip bath in each.

1894. How many compartments were there? Twenty or thirty, I should say. The mine was only in a small way of working then. There were only two 30-ton furnaces going at that time.

1895. Do you remember if the men made free use of the baths? I do not remember that they were made use of at all; I never made use of them myself.

1896. Was warm water provided? Yes; so far as I remember the water was laid on from the boilers. I am only speaking from memory, of course; it is a long while ago.

1897. *Chairman.*] Those instructions which were issued to the men, and which were not regarded by them at the time, were issued, perhaps, before the men had become alive to the danger they were running?

Oh,

- Mr. J. Hebbard. Oh, no; cases of lead poisoning had occurred; that, indeed, being the reason why the instructions were issued.
- 4 July, 1892. 1898. In what capacity were you employed by the Proprietary Company? As foreman.
1899. You say you never used those baths yourself; probably you had bathing accommodation at home? Yes; my practice was to strip off and have a sponge bath—water being scarce—and change my clothes entirely.
1900. Were you ever leaded? No; I was never leaded.
1901. How long have you worked continuously in a place where you had the opportunity of becoming leaded? I suppose I was in the Proprietary fifteen or sixteen months.
1902. But were you working in the lead? I was never actually working in the lead.
1903. What I was coming to was this: You happened to have the means of keeping yourself clean in your own house, which very many of the miners had not, and have not now; is that not so? Scarcely. I was living exactly the same as they were then—everybody lived in tents at that time.
1904. Well, will you express an opinion upon this point. Do you think that whether the employees take advantage of the means provided for them to preserve their health or not, that the proprietors would do well to furnish those means? Yes.
1905. Can you make any general suggestion to help the Board in conducting this inquiry? I do not know that I can add anything to what I have said. I think sufficient accommodation should be provided and that it should be made compulsory on the miners to change their dress.
1906. Do you think that is a rule you could enforce? I think so. It has almost become a law in Victoria. That is where I first learnt the habit of changing the clothes.
1907. Has it actually become the law in any part of Victoria? Yes; in Bendigo—at least almost the law—it is the law of the district, at any rate.
1908. Do you mean to say it is the custom? Well, it is slightly more than a mere custom in the general sense, because the companies will not allow any man to work in the mines who will not change his clothes.
1909. It is a rule made and enforced by the employers? Yes; by the whole of the employers in the district.
1910. That is the associated employers? Yes.
1911. What is the object of the regulation in relation to mines other than lead mines? Well, I believe the primary object of it was to prevent the men stealing gold. But it has had a good effect upon the men.
1912. Upon their general health, do you mean? Yes; it must do; because most of the miners get their clothes very damp.
1913. Is there any opposition to it on the part of the men, as a whole? No. It is regarded as a very good thing.
1914. Then you think a scheme might be devised by which every man going below in these mines on the Barrier should, first of all, change his clothes? Yes.
1915. Then, on coming up again, he would put off his working clothes, and resume his ordinary dress? Yes.
1916. And he should take a bath where such is provided? Yes.
1917. Is there anything else you think might be done, or anything you would like to suggest? The only thing I can say is that I believe a list of instructions, similar to those that were sent round here at one time, prepared by some medical authority, would be advisable.
1918. Yet, when such instructions were sent round, the men did not attend to them, as you say? Well, probably there are not many of the men here now who were working on the mines in those days, and, perhaps, they might take more notice of the rules now. I think changing of importance; but there are differences of opinion. For instance, I have two brothers in the mines here as miners. I was speaking to one of them the other day, and he said he preferred to go home, and change at home, and he had been brought up to change his clothes in the mine as well as I had; and he did not avail himself of the accommodation when it was offered.
1919. Notwithstanding what your brother said, you would still have it made compulsory to change? Yes. I am only giving you his opinion. It is my opinion that such a provision would be beneficial.

[The witness withdrew.]

Mr. Thomas Whysall, called, and examined:—

- Mr. T. Whysall. 1920. *Chairman.*] You hold the office of Telegraph Master at Broken Hill, Mr. Whysall? Yes.
- 4 July, 1892. 1921. You keep a record of the wind and weather? Yes.
1922. Do you hand in a statement which gives particulars as to the rainfall and prevailing winds for the two years from July, 1890, to 1892? Yes.
1923. And the only statement with regard to the winds is that southerly winds prevail? Yes; it is southerly nine months in the year. [*Record handed in. See Appendix.*]

[The witness withdrew.]

TUESDAY, 4 JULY, 1892.

Present:—

DR. ASHBURTON THOMPSON (CHAIRMAN).

WM. M. HAMLET, Esq. | R. SLEATH, Esq.
J. HOWELL, Esq.

Dr. J. F. Bartley, called and examined:—

- Dr. J. F. Bartley. 1924. *Chairman.*] What are your qualifications, Dr. Bartley?
- 4 July, 1892. 1925. Are you registered by the Medical Board of New South Wales? Yes.
1926. How long have you lived in Broken Hill? Two years and seven months.
1927. During that time have you been resident medical officer at the hospital? Yes; for all that time.
- 1928-9. Will you tell me your average daily number of in-patients at the hospital? For the last year it was forty-two; this year it has been fifty-five. 1930.

1930. Have you an out-patients' department? We have no organised out-patients' department. I have treated some cases occasionally, when they have come to the hospital and have not been able to obtain relief elsewhere; but we are not supposed to treat out-patients.

Dr.
J. F. Bartley.
4 July, 1892.

1931. You attend out-patients in cases of necessity if they present themselves? Yes.

1932. You have treated in the hospital a good many cases of lead-poisoning? Yes.

1933. Can you tell me the number of cases you have met with during each year of your residence at the hospital? During the year 1890 there were ninety-eight cases; during 1891 there were 123; and during the first six months of this year seventy-three cases. I may remark, with regard to these numbers, that not all the patients who presented themselves while I was connected with the institution could be taken in, as the hospital was greatly overcrowded, and provision could only be made for the more serious cases of illness; cases of the milder forms of lead poisoning had to be refused. And again, though we have no organised system of out-door relief, I treated a number of cases of lead-poisoning as out-door patients. Those are not included in the numbers I have given you. During the two and a half years I was connected with the institution the numbers so treated would be, say, about forty.

1934. Do you mean forty cases per annum? No; forty cases of lead poisoning altogether.

1935. In those forty cases were the patients sufficiently ill to be admitted if there had been room for them in the hospital? No; what I wish you to understand is, that I treated those cases because I thought they could be well enough treated outside, the institution being full, or fairly full; but a large number presented themselves when the place was overcrowded that I did not treat at all; and those I do not include in the forty I have spoken of as having been treated as out-patients.

1936. Have you formed any opinion as to whether many leaded persons go away from Broken Hill for treatment? Oh, yes; a number of them go away.

1937. Where do they go to? To Adelaide, or other parts of South Australia, I believe. I think the reason they go away is that they know they will have to stop work for a certain time, and many of them have homes or friends in South Australia, so they go for a change of air very likely.

1938. Have you observed whether some of the mines furnish more cases of lead poisoning than others? Yes. I have no figures to guide me, but I can speak definitely, I think, from memory.

1939. Can you mention them in their order, so far as you have formed an opinion? I should say they are Block 14, the British, and part of the Proprietary.

1940. And from the Central, Block 10, and the South, you did not get many cases? Not many.

1941. Have you observed that some kinds of work, either above or below ground, furnish more cases of leading than other branches? In the statistics I furnish I have divided the cases according to their occupations.

1942. From which we shall be able to draw our own conclusions? Yes.

1943. Have you noticed in the course of your practice that some people are more susceptible than others if exposed to lead: that they are more likely to get poisoned? Do you refer that question as to one attack predisposing to another, or that persons of a certain temperament are more likely to take it than others?

1944. The latter? I cannot say that I have noticed that.

1945. Very well, then we can go on with the cases. I understand that you distinguish three, or even four classes of symptoms caused by leading? I divide the cases treated into four classes, namely, lead colic, lead dementia, lead paralysis, encephalopathy.

1946. In encephalopathy, do you include epilepsy and coma together? Yes; that is, they very often occur together, or in the same patient, first coma, and then epilepsy. For the information of the non-professional members of the Board I have prepared a definition of the various classes. Colic being the most common form in which the poisonous action of lead exhibits itself amongst those working in lead, the attack entailing a good deal of suffering on the persons afflicted, and varying under treatment in duration from a few days to a fortnight, during which time work must be entirely stopped. But in some cases the miner loses more time even than a fortnight, as the attack leaves the patient so weak that it may be a month before work is resumed. Dementia, being the chronic form of brain disease, is slow in onset, and usually more permanent in its results, paralysis being loss of muscular power. Encephalopathy being a more acute form of brain disease, is sudden in onset, and more dangerous as to its immediate results, shorter in duration, and in it I have classed all cases of brain disturbance, acute in form. That includes coma and epilepsy.

1947. Do you regard plumbism as essentially affecting the nervous system? I can certainly say that I do.

1948. What is the relationship of these four classes to each other. Do repeated attacks of colic lead to paralysis, and then to epilepsy or coma, or are the four forms in your opinion merely indications of determination of the poison to different parts of the nervous system? Rather the latter, I should say. Certainly you do see cases of encephalopathy, or cases of paralysis, or dementia, occur after repeated attacks of colic; at the same time it does not necessarily follow that colic will precede any one of the three classes. And again, I have seen the worst cases of encephalopathy occur in persons who never had an attack of lead colic.

1949. I will ask you just there have you had any females among your lead patients? No.

1950. Then will you mention these different forms of the disease in the order of frequency with which you see them? They will be readily seen by my figures.

1951. Your experience being limited to your hospital practice? Yes.

1952. Then have you any reason to think that your hospital practice is generally representative of the practice of others, excepting, of course, that you get a larger number of serious cases? Yes; generally, I should think; colic, being as I have said, the more common form.

1953. All I ask you now is whether the outside general practitioner would, in your opinion, probably agree with your classification? Yes.

1954. Colic is the most common? Yes.

1955. And paralysis, perhaps, next? Encephalopathy I rank next. Perhaps you will allow me to explain here, as I make encephalopathy next in frequency and before paralysis, that all cases of encephalopathy are brought to the hospital because they exhibit such serious symptoms at the mine. All cases of paralysis do not come to the hospital. Possibly, only a small proportion of such cases reach the hospital. They may be first treated by a medical practitioner in town, and perhaps never require hospital treatment.

1956. Will you kindly describe a case of encephalopathy—the man is brought to the hospital in a state of coma? Yes. The history you usually get is that the man has been working in the mine, or has just come

- Dr. J. F. Bartley.
4 July, 1892.
- come up the shaft, when he has been stricken suddenly; has fallen down, in most cases without previous warning. He will remain in a state of coma for twenty-four hours, perhaps, more or less, and then take the epileptic form of convulsions, generally passing on to the maniacal condition, with delusions. Then, in most cases they recover. Out of thirty-five cases of encephalopathy I have seen in the hospital, there have been only two deaths, although most of the cases seemed to be exceedingly serious during their course.
1957. Do you mean to say a novice in that class of case would generally expect death? Yes, decidedly.
1958. Then as to the remainder of the course of those who do die, do they remain comatose all the time, or do they become delirious? They exhibit coma and epilepsy usually. Of course, I am speaking now from my observation of the two cases I have mentioned.
1959. They exhibit coma and then epilepsy? Yes, and the fits become frequent, and death supervenes.
1960. In those cases did you usually meet with the blue line? Do you mean in the cases of encephalopathy?
1961. Yes? Well, usually; but not necessarily so.
1962. Now, suppose you get a case which you describe as of encephalopathy, in which the patient does not exhibit any blue line on the gums, how do you recognise it as being due to lead and not to some other cause; in short, what do you especially rely upon in your diagnosis? In the first place there is no history of accident, and it occurs in persons not likely to be apoplectic, and excluding accident and apoplexy, the cases present symptoms not met with in any place where there is no lead-poisoning.
1963. That is, the symptoms are not met with in any other disease, or where there is no lead poisoning? Exactly.
1964. You have had opportunity of watching the ultimate effects of lead-poisoning, such as affections of the circulatory system of the kidneys? Yes.
1965. Have you observed retinitis among your patients? I have not examined for it.
1966. You do expect affections of the eye in your patients? No.
1967. Have any of the encephalopathic cases ended in insanity to your knowledge? Yes; they have recovered from the acute symptoms, and have remained demented.
1968. Shall we find those cases mentioned in your notes? No. The dementia cases you will find here have not been the result of encephalopathy; they have been rather a chronic form of brain disease.
1969. Not associated with lead work? Not associated with any acute attack during any period of their lives, but incidentally connected with the occupation of lead-mining.
1970. You think them due to chronic poisoning? Yes.
1971. Do you recognise any personal conditions as predisposing to lead-poisoning? No; I cannot say I do.
1972. Is anæmia a constant sign of lead? Yes; a fairly constant sign, or perhaps I should say a fairly constant accompaniment.
1973. You have not made any systematic examination of the blood to ascertain that? No.
1974. I suppose you admit to the hospital a great many residents who are not connected with lead-work in any way? Yes.
1975. Have you ever met with cases of leading among that class of patients? Yes; but of the cases of lead-poisoning seen by me, they were all of persons actually exposed to lead by working in or about the mines, except four, and the cause of lead-poisoning in those cases could be distinctly traced to circumstances independent of the presence of lead mines in the town, such circumstances being present in other cities, and recognised there as causing lead-poisoning.
1976. Can you name occupations followed by the persons you refer to? Yes; one was a painter, one a plumber, one a labourer, working at a beer factory with lead pipes, and one a cook, who was fond of an early glass of beer in the morning, which he drew from the lead pipes in the hotel where he was engaged.
1977. Among the general population, do you ever meet with cases of indisposition which you cannot satisfactorily account for, and which may possibly be due to a slight degree of leading? Yes.
1978. I presume they do not present any definite symptoms? Not of lead-poisoning; rather of *malaise* and languor.
1979. Are they anæmic? For the most part, yes.
1980. Do they show any blue-line? I have seen a slight blue-line in several cases, in which there was no other symptom of lead-poisoning present.
1981. But that, I understand, is common enough among miners and smelters;—you will find them very often have the blue-line and at the same time no symptoms of lead-poisoning? Yes.
1982. But what is the value of the blue-line as a diagnostic; if, for instance, you meet with an anæmic person showing the blue-line, is that sufficient to establish the diagnosis of leading or not? It would be sufficient to establish that lead has been imbibed into the system; but whether lead is the cause of illness at the time is another question. In such a case probably it would.
1983. These people you mentioned just now were members of the general population not known to be connected with the mines? Yes; but I take it that my evidence on that point would not be of much practical value, because that class of persons do not come before me professionally in the hospital, as they are not ill enough to be admitted. They are cases I see in a casual sort of way, and not in large numbers.
1984. Do you treat children to any extent? Not to any large extent.
1985. Can you speak of the ultimate effect of lead upon man from your own observation? Yes; the ultimate effect frequently is to make a man quite incapable of pursuing his occupation as a miner in lead mines, and perhaps to make him incapable of employment at all for a very long time. In such cases we generally advise them to leave Broken Hill; and, so far as I am personally concerned, I have not been able to find out how they have got on elsewhere.
1986. Have you met with gout among your lead patients? No; I have not among the lead patients. In fact, I may state that gout does not seem to be a common complaint in the town—so far as my experience goes, that is.
1987. Now, as to prophylaxes;—what do you think the workers can do for themselves to guard against the effects of leading? That opens up the question as to how the lead is received into the system. I may state my opinion upon that is, that carbonate of lead is the usual form of ore which causes lead poisoning. I think the carbonate ore taken into the lungs or into the stomach, will be absorbed, and cause lead-poisoning.
1988. And as to the skin? As to the skin, I cannot speak authoritatively, but I do not think it is usually taken into the system through the skin.
- 1989.

1989. However, where the skin and lungs and stomach are all exposed it is, of course, very difficult to say which is the chief channel? Yes; but seeing that the carbonate ore dust can get into the lungs very easily—for it is a dry ore, and makes a good deal of dust—we know that men working on a dry face must take in a great deal of it through the lungs. Regarding the matter from a prophylactic point of view, we should turn our attention, in the first place, to lessening the quantity—if it cannot be done away with altogether—of the lead ore taken in by the lungs, and the same holds good as to the stomach—we should do the utmost to stop the ingress of the ore into the stomach.

1990. Have you considered practically in what way these ends could be attained? No; I have not sufficient knowledge of the manner of working the mines.

1990½. Do you know anything of the use of a purge periodically—say, once in ten days or a fortnight—is that done, and is it, in your opinion, a useful practice? I do not know of it having been done.

1991. *Mr. Hamlet.*] I had intended to ask something regarding the prevalence of gout, but you say there is none, or very little. It has been stated that swelling of the calves of the legs and pains in the muscles were caused by carbonic acid gas—do you agree with that, or do you think it is more probably caused by lead? I think it is more probably caused by lead, the swelling of the legs, accompanied by anæmia.

1992. Have you ever heard of it as the result of carbonic acid? No.

1993. Has it come to your knowledge that lead-poisoning has caused loss of sexual appetite and impotence? No.

1994. And functional derangements of the kidneys—are they frequently met with? Yes; very frequently.

1995. With special reference to cases of lead-poisoning, I mean? I understood you to ask if derangement of the kidneys was frequently met with in Broken Hill.

1996. I am asking the question with special reference to those who are exposed to the effects of lead? Well, yes; I would still say it is met with very frequently.

1997. Then, with regard to the channel by which lead is introduced into the system, do you not think it possible for the lead to be absorbed through the pores of the skin? Well, I do not know that it is impossible, but I have not got sufficient knowledge of the subject to give a decided answer. It could easily be tested by making an ointment of carbonate of lead, and rubbing it into the skin, to see if the symptoms would be exhibited. In the case of a man perspiring freely it might be taken in through the pores. Drugs can be introduced through the skin, and therefore, I suppose, there is no reason why carbonate of lead could not be introduced into the system in that way also.

1998-9. Do you not also think the skin is affected, since authorities say that anæsthesia is sometimes observed in such cases? Well, I can hardly go by what other authorities say on the subject of lead-poisoning. I must rather be guided by such symptoms as I have seen myself, and I have not seen that in my experience.

2000. Has anything ever been done, after a *post mortem*, for instance, in a lead case, to ascertain the extent of the poison taken into the system, or what is a poisonous dose? No. I know nothing on the subject, except, I may remark, that some persons seem unusually susceptible to lead-poisoning, and others, again, appear to be better able to withstand it. I have known miners here to be working three and four years in the lead without exhibiting any form of lead-poisoning whatever; and, again, I have known lead-poisoning to occur in an individual who has worked no longer than a fortnight underground in the lead.

2001. The prevailing ore on the Barrier is carbonate of lead ore, which is almost identical with white lead, and cases of lead-poisoning are of frequent occurrence in white lead works? Yes.

2002. Then you would infer from that that the lead ore would be easily taken into the lungs and stomach, because carbonate of lead is so easily soluble—is that so? Yes.

2003. Do you think the precautionary measures to be taken against lead-poisoning are well known amongst the miners here? Well, as a rule, I do not think they take any precautionary measures at all.

2004. When they are told of the necessary precautionary measures, do you think there is any disposition to carry them out? Well, I am afraid they are not generally told. But then I do not know what precautions you could advise, against the entrance of the lead into the lungs, for instance, with any chance of them being carried out. You might tell them to wear a respirator for example, but a man would not work incommoded by a respirator. They might certainly carry out the rules of personal cleanliness, and washing their hands before eating.

2005. With regard to the use of a respirator, you think it would be impossible for a man to wear one while at work? No, I did not say that. It would be decidedly possible, I think. But as to whether a man would wear one is another question. I do not think it probable that miners, as a rule, would take kindly to wearing a respirator while at work.

2006. But you know, as a matter of fact, I suppose, that in some of the industries in England respirators are used? Yes; I know they are used by the operatives in certain factories; but the dangers of those occupations are much more universally acknowledged, and the evil consequences of not wearing respirators would more surely follow.

2007. *Chairman.*] Does your experience here vary from the accounts given in the various text-books and the like in any important respect? Yes; in a most important respect, it varies from one authority. Dr. Oliver last year lectured on this very subject; and he said that miners working underground never got leaded—that it was not the miners working in the raw material, but the workers amongst the manufactured material, or in the manufactories, that got lead-poisoned; that miners did not get leaded, although it had been found in the smelters. Well, I have seen cases of leading among the smelters here, but as the figures, which I will give you, will show, they do not suffer to anything like the extent that the miners underground suffer from lead-poisoning; that is, of course, within my experience.

2008. You are aware that Dr. Arlidge, another physician, who gave a course of lectures under similar circumstances, but who no doubt spoke from experience, gained in a different place, and a different country, from that which furnished Dr. Oliver's experience, recognised lead-poisoning less among smelters and others than among miners? I have not read the lectures you refer to.

2009. Would you be inclined to say, therefore, that that is a point which depends upon local conditions usually? It depends upon the class of ore in which they are working, I take it.

2010. Is there any other point on which your experience here varies from the teachings of authorities on the subject elsewhere? Yes; in the case of the ordinary lead-colic. Here we find very little; indeed an infinitesimal

Dr.
J. F. Bartley.
4 July, 1892.

Dr. J. F. Bartley. infinitesimal amount of wrist-drop amongst those cases, whereas in the ordinary lead-colic occurring in the plumber or the painter, or the white-lead manufacturer, we find that wrist-drop is a fairly constant symptom.

4 July, 1892.

2011. In fact, teachers almost always refer to wrist-drop as a leading symptom, and almost a diagnostic sign of lead-poisoning, do they not? Yes, very often.

2012. But wrist-drop here you say is of rare occurrence? Very rare indeed. Except in cases of general lead paralyses, when the wrist-drop seems to be the chief paralysis, or when the paralyses of the extensor muscles of the forearm seem to be more decided than others.

2013. Do you mean to say that when paralysis does occur it takes the form of wrist-drop, but that very often it does not occur at all? What I rather mean to say is this, that when you get paralysis from lead poisoning here a great number of muscles are affected; but especially the extensors of the forearm.

2014. But still you say muscular paralyses are uncommon? Yes; certainly uncommon.

2015. Can you express an opinion as to the importance of the fumes issuing from the stacks here, to the general inhabitants of the town? Not from the result of experience of cases seen. But it is a well-known fact in the district that dogs and cats, and cows and horses are affected when living within a radius of a mile from the mines; and I think it is granted that a large amount of lead escapes with the fumes from the smelters, and falls over the town, and on the roofs of the houses, so that the inhabitants run the risk of taking it into their system by drinking water, or of inhaling it while it is in suspension in the passage down. Nevertheless, as I have said, I have had no cases in my experience here that I could definitely state to be cases of lead poisoning, other than those of men working in or about the mines, and the four outside cases, which were also due to definite causes, as I have already explained.

2016. Then your statement amounts rather to this: that lead-poisoning from the fumes does occur among cattle and the smaller animals, and ought therefore to occur among the people of the town; but, as a matter of fact, you have had no evidence that it does occur among the people? Not lead poisoning. But I am of opinion that there is a certain amount of languor, or *malaise*, caused among the general population by it, without definitely assuming any of the forms of lead poisoning.

2017. Children are susceptible to lead poisoning, are they not? Yes, usually.

2018. Are the children of Broken Hill, as a rule, very rosy, and strong, and fat? As I have said already, my experience of the children is limited.

2019. I mean from general observation, such as I am able to make in going about the streets? Well, no; they do not present a robust appearance as a rule, I think.

2020. I have gone through the Death Register for 1889, 1890, and 1891, and I find in each of the three years certain cases of lead poisoning. I find also some cases in which the entry in the register is not quite clear. For instance in May of 1890, you certified that a man named Henry Lobb, a miner, died of epilepsy of eight weeks' duration—do you remember anything about that case? Yes; I remember the case very well: the man had a previous history of epilepsy. I do not know why I put down the "eight weeks' duration"; but he had a previous history of epilepsy I think.

2021. You remember that it was not a case of lead epilepsy? Yes. I remember the case distinctly.

2022. And lead had nothing to do with it? No.

2023. Then in July the record of your certificate in the case of Wm. Hunt, a carpenter, aged 40, as it appears in the register, is merely "death from poisoning." Can you explain that? I do not think that was given by me. There was a coroner's inquest on that case. That was strychnia poisoning, I think, and should have been a coroner's case.

2024. There is no record in the register of an inquest having been held. Then, in February, 1891, you certified the death of James Frederick Roberts, an ore-dresser, 17 years of age, as being due to "meningitis—duration, fifteen days"? I do not remember that case at all just now.

2025. Can you look it up? Yes.

2026. In May, 1891, you certified that James Major, a miner, aged 41, had died of meningitis after an illness of seventeen days; do you remember that case? Yes. So far as I remember now I had no reason to suspect that the cause of meningitis was lead poisoning; if I had I should have then put it down.

2027. Then, in September there was a third case entered thus:—"James B. Bruce, carpenter, age 39, died of meningitis, after twenty-one days' illness," do you recollect that? Yes; that was after influenza.

2028. Do you think that in your certificate you probably put down influenza as the first cause? I think so. The influenza I did not see. He went through his attack of influenza, and developed meningitis in the place where he was living. He came to me with meningitis. I do not know why I did not put influenza in the certificate. As you suggest, probably I did. But I remember the case distinctly. It was after influenza.

2029. As to Major's case, you have not as clear a recollection? No; I do not remember what was the cause of meningitis in that case, but I feel sure that if I had had reason to suspect that lead was the cause, or I was satisfied in my mind that lead was the cause, I would have put it down.

2030. Then, in October, you certified that Adam M'Arthur, age 43, died of anæmia; duration of illness three months; and influenza, duration five days. Do you remember whether the anæmia was lead anæmia or not? No. I remember the case now; it was malaria, as far as I can recollect.

2031. Was he a man who came down from the northern territory? Yes.

2032. Then, lastly, do you think, it would be a good thing, in view of what you said just now, if a short fly-leaf of instructions were published and disseminated among the miners, informing them what they could do to protect themselves against leading? Yes; if your Board will be able to suggest certain precautions which are at once easy of adoption, and are likely to be adopted by the men, it will be a very good thing, I think.

2033. Do you hand in a statement for the years 1890, 1891, and 1892, which shows the number of cases of lead poisoning treated in the Hospital, the distribution of those cases, according to class of cases, and mentioning the occupations of the patients? Yes.

[The witness withdrew.]

Dr. T. R. Belgrave called and examined:—

Dr. T. R.
Belgrave.

4 July, 1892.

2034. *Chairman.*] What are your qualifications, Dr. Belgrave? Doctor of medicine of the University of Edinburgh, member of the College of Surgeons, and Licentiate of the Apothecaries' Society.
2035. You are registered by the Medical Board of New South Wales? Yes.
2036. How long have you practised in Broken Hill? I am now in my fourth year of residence here, I think.
2037. Do you hold any special appointment? No; I cannot say I do. But there is a Medical Fund here, which is the chief medical institution. I founded it. But I am just a member co-ordinately with any other member of the profession who may come here, and likes to join it. It is a commercial undertaking on the part of the medical profession resident on the Barrier.
2038. You attend a proportion of the persons employed about the mines, I suppose? I do.
2039. And also a proportion of the townspeople who are not connected with the mines? Yes.
2040. Can you give us any idea as to how many of the people employed about the mines would apply to you if they were sick? About 400 I should say, at the present time.
2041. Is that an average number? Yes.
2042. Then can you tell us how many cases of lead poisoning you meet with in the course of the year? I cannot say the precise number. But they are very numerous, and the numbers vary; sometimes there is quite a rush of them, and it has appeared to me that this rush of cases has been traceable in some degree to states of the weather. When the weather has been as it is now, that is damp, there have not been many cases; when, on the contrary, it has been dry and dusty, there have been many.
2043. We have been told that animals suffer more in the hot weather—has temperature any influence in your opinion? Yes. I think so, too. I have seen more animals lying about dead, presumably from drinking water contaminated by lead, in the summer, than I have during the winter.
2044. Does that apply to men also? I think it does.
2045. Do you think the proportion of cases of leading to the number of workers on the field is decreasing or increasing? I cannot give an answer that would be satisfactory to my mind in that detail.
2046. You did not mention the number of cases which you estimate you treat in the course of a year? Several hundred, I am quite sure.
2047. Do you think you treat 300 cases? Oh, yes; I am quite sure of that number.
2048. Then will you extend that statement to this: that three-quarters of all the persons employed about the mines as miners or surface hands, become leaded? As to all the principal mines, such as the British, Block 14, and the Proprietary, I would say yes; but not as to the others.
2049. That, I suppose, is because they contain very little lead? Yes; the others contain little lead, comparatively.
2050. Is there anything to choose between the three mines you have mentioned, as regards danger to the men, in the direction of lead poisoning—are they all equally dangerous? Well, I think Block 14 is the worst, the British next, and the Proprietary next.
2051. Do you think the better reputation of the Proprietary is because the management make a practice of periodically shifting the men from the lead faces to other kinds of ore? Yes; I think that arrangement has worked very beneficially indeed.
2052. And it may be that the uniform character of the ore in Block 14, and the British, prevents them carrying out a similar arrangement? I do not know that; I think very likely they have more surface work in the Proprietary Mine. But I think it would be impossible to find more than 1 or 2 per cent. of all the persons working in the three mines I have mentioned who have escaped leading, and possibly, not a solitary one.
2053. Your view then, on that point is, that a man employed at any of these three mines in the lead faces, is sure to get leaded sooner or later? Yes. There may be an idiosyncrasy which prevents the ordinary manifestation at the junction of the gums and the teeth, but even then they will suffer from colic and paralyse, and from the other conditions.
2054. The blue line is not universally present, even when the teeth are there? No.
2055. Do the tradesmen about the mines furnish cases of leading? Yes; such as mechanics; and the rule as to the weather applies very much to this question, I think; thus, when it is very dusty the surface men suffer more than usual, and more than the underground men, I think.
2056. Only a small number of young people are now employed as ore-pickers, I understand? I believe so. Certainly, there are not nearly so many employed now as there were when I first came here, and very properly so too.
2057. I think you have already said that you have noticed some people are much more susceptible to lead than others? Yes, I have.
2058. Now, will you tell us something about the symptoms of lead poisoning—I understand that you distinguish three or four classes of symptoms caused by lead, namely, colic, motor paralysis, epilepsy, and coma; is that the proper classification, in your opinion? No. I think it is not sufficient. In addition to these there is a kind of paralysis of the sensory system. The sensory nervous system is affected.
2059. And that class of cases you think distinct from the others? Yes; and my conclusion is that the sensory nervous system is more frequently affected than the motor here.
2060. You find motor paralysis decidedly uncommon? Certainly. I have only met with one or two cases during the time I have been here.
2061. And sensory paralyse, are they common? I think it is nearly universal. It shows itself in this way: the subjects are exceedingly dull in the use of their fingers and hands, and the same observation would apply to their minds. They are dull of apprehension. If they go to work with their fingers, in sewing, or in tying a knot, for instance, you can see how awkward they are. And in addition to that they suffer from amaurosis, that is to say the retina is affected.
2062. By way of diminished perception? Yes.
2063. Do you think these sensory symptoms are liable to be overlooked except by careful observers? Yes, I do.
2064. Are you of opinion that lead poisoning is essentially a disease of the nervous system? Chiefly, I should think, that is the case; though it affects the muscles very much. I should say it is not from the local deposition of lead in the muscular structure, but in the nervous structure.
2065. Then what do you think is the relationship of these four or five classes to each other;—do repeated attacks

Dr. T. R.
Belgrave.
4 July, 1892.

attacks of colic lead to paralysis, and then to epilepsy or coma; or are they independent of each other? It is quite the contrary, I think. In proportion to the severity of the colic, the treatment becomes more effective. The patients suffer so much that they implore the medical man for assistance, and they have to clear out the *prima via*, and by that means remove the large quantity of lead that may have accumulated in the intestinal canal. But in those cases where the sensory system becomes affected, and where, too, the mind becomes dull, the accumulation appears to me to be much slower than in colic; and patients neglect treatment sometimes until complete recovery is scarcely to be expected.

2066. Then is it the case that the encephalopathic class of cases do occur quite suddenly, and without prodromal symptoms? Yes.

2067. Then how do you establish the diagnosis in those cases, without any forewarning, or any blue line, for instance? In the cases I have had the blue line has been present. Those were the cases of two children who had been ore-pickers, and whom I attended. In both cases they were comatose when I reached the house. One died within a few minutes after my arrival, and seeing that the patient was dead, and the parents went in to perform their last duties, I did not further disturb them, but left the house.

2068. Can you tell me the names of the patient you are now referring to? No; but it is procurable.

2069. Are you referring to the case of Joseph Bennetta, 1889? No; but he was my patient.

2070. Are you referring to Henry Christopher? Yes; I think that was the name. With regard to Bennetta, I may say that he was on the sick list one or two years before the fatal attack. They were living upon the mine, you may say, and were somewhat dirty people. They took none of the precautionary measures that had been suggested to them.

2071. Do you observe that drinking predisposes to leading? It does morally; not physically.

2072. How do you mean? I mean to say that they become so careless and uncleanly in consequence of their drinking habits, that they do little towards preventing the absorption of the poison into their systems. But I do not think that the drinking of any particular kind of liquor contributes by itself to lead poisoning.

2073. Have you had opportunities of watching the ultimate or later effects of lead poisoning, such as disease of the kidneys? No, I have not; I have wished to do so.

2074. Such effects you think must occur? Yes; they must occur in some portion of the renal structure.

2075. Is albuminuria common among the leaded people? No.

2076. Are they usually anæmic? Yes; worse than that; they are very sallow and unhealthy looking, and very dull in intellect; and so slow in their movements that it is quite surprising to me that some accidents, in the street for instance, have not occurred. Speaking of children, I have known babies affected in Argent-street—that is between Argent-street and Crystal-lane, but nearer Argent-street than the lane. A person named Ford, a water and wood carter, has a child about 2 years of age, which had a definite attack of lead poisoning; and the entire family while they resided there were exceedingly unwell; but since they removed to a distance of about 2 miles from here, they have recovered their health. The baby had convulsions.

2077. Did the baby recover? Yes.

2078. I was on the point of beginning to ask you about such cases. Can you tell us of any other case of lead poisoning among the general population? Yes; there was one woman in Crystal-street, whose name I forget, and whose husband is one of the shift bosses of Block 14, whom I attended several times for severe lead colic.

2079. At what distance from the middle of the ridge do you think she lives? About half a mile.

2080. Ford, I understand, had nothing at all to do with the mines? Nothing whatever.

2081. Well, are there any other cases? No. I have frequently been applied to by persons who thought they were leaded, but who were not.

2082. Do you find any cases of indisposition among persons not connected with the mines, but living rather near them, which you cannot account for? Oh, yes; that is a very common experience; indeed, I may say it is general. Those persons who are unable to take a change suffer very severely, and I think that is the cause of so many deaths during the summer. Those persons who can take a change for three or four weeks before the summer sets in pull through better.

2083. Have you found any particular line of treatment so usually beneficial to those persons who are suffering from indefinite symptoms that you can use the result of it as an aid to diagnosis? Yes.

2084. Now, as to the causes of death, I have consulted the records and I find, in 1891, there were ninety-two deaths of persons under 1 year of age ascribed to disorders of the digestive system, and thirty-three of those deaths were ascribed to wasting diseases; that is, to such causes as marasmus, consumption of the bowels, malnutrition, and indigestion. Are you of opinion that lead poisoning aids at all in bringing about these deaths from wasting diseases? I think not. I think they can be accounted for in other ways. I mean the disposition of the diseases and their developments, indeed.

2085. Do you refer to tuberculosis? Yes; and tabes—the gradual decay of young children.

2086. Then what happens—to what do you ascribe that gradual decay? I think such cases are not so prevalent now as they were. But, during the first year or two I was here I noticed that they occurred in the poorest families, of those least protected from the inclemency of the weather and having little food.

2087. You ascribed them to the general hardships of life on this field during the earlier period? Yes.

2088. I find also that there were fifty-nine deaths ascribed to such causes as diarrhoea, dysentery, gastritis, enteritis, intestinal catarrh, and the like—are you of opinion that improper feeding is the cause of that class of deaths? Yes; I am quite sure of it.

2089. Do you think general insanitary conditions have anything to do with them? Yes; I think so.

2090. But at all events lead has probably nothing at all to do with them? No.

2091. Then, in the same year, twenty-five deaths were ascribed to premature birth, defective development, and malformation; and, of course, in our system of registration, that applies solely to live-born children, do you consider that premature birth—whether live or still—is commoner among this population than among others of which you have had experience? I think it was greater at first—that is, during the earlier years of the field—and I do not think it was attributable to lead.

2092. Is abortion more common here than elsewhere? Not now, I think. It was, during the earlier years of the field. When it occurs now it is generally in the case of new-comers.

2093. Are derangement of the menstrual function more common? I think they are very much more common. The women sustain great trials on new mining-fields.

2094. Do you ascribe it to general hardship? Yes.

2095.

Dr. T. E.
Belgrave.

4 July, 1892.

2095. And among the males, is impotence at all common? I think so.
2096. Do you think that is a result of lead poisoning? I should say it is very probable.
2097. Can you say anything as to the absence of small birds here, and the leading of stall-fed animals? Yes; during the first year I was here, I found a very large number of dead cows, horses, cats, dogs, and rabbits, lying within a few miles of the town, and generally not far from water.
2098. Can birds be kept in cages here? There is some difficulty with them from what I hear. I have been unlucky with my own birds.
2099. You live about a mile from the centre of the ridge? Yes, about that distance.
2100. I have been informed by more than one apparently credible person, that you do not have fleas here—does that accord with your experience? That is very true, there are no fleas here.
2101. And bugs? I have never seen one.
2102. You corroborate what they have told me? Yes.
2103. Are you of opinion that the fumes from the smoke-stacks, which do pass over, and often beat down on the houses, are without recognisable or appreciable effect upon the inhabitants? I think between Blend-street and the mines they have an appreciable effect.
2104. And the deaths of animals you are inclined to ascribe rather to the drinking of mineralised water than to the licking up of oxide or sulphide of lead from the ground? Yes.
2105. You have mentioned one or two cases of lead poisoning among the inhabitants, one of them a woman. Do you think she may have been a susceptible person, and taken it from her husband's clothes? I think not, because he was a superior boss, and was cleanly about his person.
2106. But she would have to do the washing? Yes.
2107. Are you of opinion that lead poisoning here is practically confined to the workers in lead? Yes.
2108. That is, with the exception of cases due to causes which exist in every town, such as house-painting, and so forth? Yes; I believe we have had a few of such cases—I have not had one of them.
2109. Now, will you give us your opinion on the subject of prophylaxes; there are personal measures, of course; and measures that could only be taken by the proprietors? The personal measures are habits of cleanliness, and refraining from rubbing up their tobacco in their hands, while they are dirty from their work. The text-books tell us that 4 grains of lead are sufficient to produce autopsic symptoms, and 4 grains of lead might easily be removed from the hands by rubbing the tobacco in that way after leaving work. Then, again, I frequently meet with men returning from the mines in the same clothes that they have worked in, which, I think, should not be. They should have conveniences at the mines for changing their clothes, and also for washing before they leave the mines; at least they should be able to wash their hands.
2110. It is desirable, especially in a place like this, where water is scarce, that they should have the means of washing the whole body? Yes; they should have baths. In the medical treatment of such cases I have found great benefit from warm bathing.
2111. I presume you agree that the proprietors ought to make such provision, whether the men take advantage of it or not? Yes; certainly.
2112. We have been told that in all probability no important proportion of the men would use it? I think the probability is that every one of them would avail themselves of it, and would be only too thankful, because the conveniences for washing without being seen by other members of the household, or people outside, do not exist in one out of ten of the cottages on the field; the result is that you will find the men pretty clean down to their waist, while the rest of the body is covered with grime.
2113. You have noticed that? Yes. The majority of the yards are not enclosed, and there is no quiet corner where the men can wash unobserved. As a matter of fact, they rather like washing in the open, but there is no corner, as a rule, where they could do so unobserved.
2114. Then you think if a reasonably suitable bath-room were established on each mine, with hot water in the winter, with towels and soap, and the necessary appliances, that probably they would be used by the majority of the men? Yes.
2115. We have been told that at Bendigo, Victoria, it is customary to provide clothes for the men, and make the men change, the object there being to prevent the stealing of gold; but since it is practicable there, apparently, it might be made a matter of regulation, or even a matter of law here;—if that were enforced, would it be a useful measure in your opinion? Yes; very much so.
2116. Then your view of the seriousness of lead poisoning here is such that you think some such regulation might well be enforced by law? Certainly, I think so.
2117. Do you think so, in view of its immediate consequences, and the amount of labour which is lost through leading throughout the year? Yes.
2118. You also think it of importance, I suppose, in view of the ultimate constitutional effects upon the men? I do. There is another important thing, I think, which I mentioned to the late Minister for Mines, Mr. Sydney Smith, who agreed with me, and that is the way in which the town sections here are subdivided. Allotments of land in the centre of the town, being not more than the third or fourth of an acre, are permitted to be cut up indefinitely, so that we have houses with frontages of 10 feet or 12 feet; and I have noticed that severe lead poisoning cases occur in the worst and most confined dwellings, where there are the least conveniences for cleanliness, for breathing freely, and for living decently. I am of opinion that no allotment should be subdivided without the assent of the Minister, or the Department of Mines.
2119. I entirely agree with your views on that point, Dr. Belgrave, and in other places, for other reasons, attention has often been drawn to it; but as yet no regulating powers exist? No; but I believe if an effort were made that a measure of the kind would be carried. I have myself written about it, and spoken to many political gentlemen, and they all agree. Mr. Smith was very strong upon the point. I brought it before him and Sir Henry Parkes when they visited Broken Hill. The frequency of cases of disease in the places I have mentioned has been very marked indeed.
2120. In short, in attempting to prevent disease, one cannot isolate one cause of death from other concurrent causes? No.
2121. And as you point out, lead poisoning, as it is, is aggravated by general insanitary conditions of other kinds? It is.
2122. *Mr. Hamlet.*] What means actually exist, or if they do not exist, could be adopted in the mines to reduce the liability to lead poisoning? In the dusty mines it is necessary to keep down the dust as much

Dr. T. R.
Belgrave.
4 July, 1892.

much as possible, of course. There is an ore here called lead ore,—I think the experts call it “dry ore.” It is very dusty, and like quicksand, and is blown about by draughts, and so forth. I had under my care the underground manager of the British Mine once. He was exceedingly ill, and I thought he would die. His illness was due to lead. An accumulation had taken place in the liver. He had bleeding, and lost a bucketful of blood. I was astounded that he survived. He recovered, and in the course of a year or two afterwards he had another attack, and recovered from that. With the view of completely regaining his strength he went away to Victoria, but in about six months, though he had been away from the lead all the time, he had another attack, and died from it. After the first attack he adopted the system of sprinkling in that part of the mine where this ore is that I have spoken of. The result was that for some time I had very few cases from that mine, and at the time I speak of I had nearly all the cases that occurred. However, he became careless, like the rest of the men, and as I have told you, he was again attacked. He said he would resume the sprinkling, but I doubt if it was resumed.

2123-4. Is there a tendency in the miners to ignore these precautions? Yes. I think stringent regulations should be framed and enforced by fines.

2125. You have told us that you think the habits and conditions of the miners are favourable to lead-poisoning; and you think it desirable that precautionary measures should be adopted? I do, certainly.

2126. Do you think the country sustains any abiding loss through the permanent effects of lead-poisoning? I do, yes; in this way: I think the children of persons who have been frequently leaded are not so robust as those of persons who have not been leaded.

2127. Have you noticed any peculiar liability on the part of people of any particular nationality, race, or temperament, to leading? Yes; I have noticed that fair people are more liable to lead-poisoning than dark people. With regard to race, I think all are equally liable; that is to say, I have not been able to determine whether there is a greater or less tendency in the Germans, Italians, and Indians. If there is any difference I think the Germans suffer least. It may be owing to their superior cleanliness and orderly habits.

2128. Do you observe that they are cleaner than the others? Yes.

2129. What part of Germany do they come from? I have not ascertained; but I think from Westphalia. That is the dark men; and the fair men come from the north—from Pomerania and those parts. We do not get the best specimens of the nation here.

2130. My question referred simply to their personal habits, of cleanliness? Yes. I think they are cleaner—that is for the most part—than our people. They are so well trained too. Their wives are so well trained; they can sew, and do so many things that we cannot do.

2131. What ultimately becomes of the most severe cases of lead-poisoning? They leave the Hill.

2132. Do many persons go away for treatment? I think not. The majority receive their treatment here; but occasionally by the advice of their medical men they may go away for a change, as that is sometimes found to be the only way to bring about a permanent cure. And strange to say, the lead remains in their systems a year or two afterwards, even when they have left the Hill.

2133. In what part of the town particularly would you expect to find people suffering from lead poisoning? In Crystal-street chiefly.

2134. *Chairman.*] Why? Because it is a low street, and is nearest the mines, and it is not formed and clean. Curiously enough, the street belongs partly to the Government, and the Local Corporation have no control over it. It is a source of danger to the town.

2135. Do you mean us to infer, then, that general insanitary conditions stand in almost direct relation to susceptibility to lead? Yes.

2136. You do not mean to say that in Crystal-street there is any considerable accumulation of lead or flue-dust? Yes; I think so. The fumes from the smelters reach the people there pretty suddenly, because the wind blows mostly towards the west, and the people in Crystal-street catch it first.

2137. Notwithstanding that the top of the stacks is, perhaps, 250 feet high? Yes; notwithstanding that.

2138. And the distance between the stacks and the street about 500 yards? Yes. I have frequently noticed the smoke from the stacks fall down towards Crystal-street and Argent-street.

2139. *Mr. Hamlet.*] Do you think it possible for a man who has once recognised lead fumes, to be able to detect them by the smell after a lapse of years? Yes; I think so. For I have noticed a relationship between the density of the smoke and the smell of it myself. It is very pungent sometimes.

2140. Of the persons whom you have had under treatment for lead-poisoning, how many have died of the disease? Two children and one man, Mr. John Gregg, a miner, age 50, he died of extreme debility through chronic lead-poisoning.

2141. Did you ever meet with cases of lead-poisoning before you commenced practicing in Broken Hill? Yes, frequently; among plumbers and gasfitters.

2142. Do you consider the majority of the cases you meet with here are of a severe type? No; I think not—not nearly so severe as those I have met with elsewhere, among plumbers and gasfitters.

2143. In your opinion, does the temperate use of beer, wine, or spirits, conduce to lead poisoning? No; I think not. I do not think it exerts any influence one way or the other.

2144. Have you any suggestion to make to the Board which might tend to reduce these dangers to a minimum? Well, I think suitable dressing-rooms should be provided at every lead mine.

2145. Do you think special legislation is required to cope with the dangers of lead poisoning? Yes; I think special legislation is required; but inasmuch as the measures of prevention would necessarily change in the course of the development of scientific knowledge of the subject, I think there should not be any hard-and-fast rule, but that the Minister of the Department for the time being should have the power to fix the rules.

2146. If miners are not particular in their habits the risk of lead poisoning is necessarily increased? Yes. For instance, I think the habit of using uncut tobacco, and rubbing it in their hands after they have cut it, is a fruitful source of lead poisoning here, also there is the impossibility of the men being able to get a good wash all over, in a great many instances, without being seen by their mates, or even when at their own homes, by the people about the house.

2147. What, in your opinion, is the minimum age at which young people should be permitted to work about the mines? Eighteen years, I should say.

2148. Do you think the social arrangements, or the want of such in Broken Hill, in any degree contribute

contribute to the induction or persistence of the disease? Yes; particularly, I think, the habit of subdividing the land with the view to gain, and entirely irrespective of the sanitary interests of the people, conduces very largely to the absence of cleanliness here, as I have mentioned already.

2149. *Chairman.*] There is only one other question I should like to ask you, and it is whether your experience of lead poisoning here corroborates the statements usually met with in the text books on the subject; or rather, I should ask does it perhaps differ from those statements in any important respect? Well, I read, not very long ago, a paper which I think had been written in London by a gentleman who assumed authority from his connection with some lead works, and I remember that I disagreed with many points that he mentioned.

2150. You cannot mention any particular point? No; nor can I remember his name, but I know it occurred to me at the time that the medical men at Broken Hill could have given him some important information on the matter, and that he was radically wrong on one or two points.

2151. As to the children of Broken Hill, and speaking quite generally, would you say they are robust, and fat, and strong, as a rule, as children should be? Well, I think those that survive are particularly robust, but a large proportion succumb.

2152. You are aware that the infantile death rate is large? Yes.

2153. Do you attribute that to the lead? Well, I think the influence of the lead on the parents has conduced to the fewness of the children.

2154. Do you meet with gout up here? We do.

2155. But rarely? Yes.

2156. And it is not prevalent among the leaded men? I have not noticed that. It is not common. I have only met with one case of gout here, and he was a beer drinker.

[The witness withdrew.]

Dr. W. Blaxland called and examined:—

2157. *Chairman.*] What are your qualifications, Dr. Blaxland? Licentiate of the Royal College of Physicians, London; Fellow of the Royal College of Surgeons, England.

2158. Are you registered under the Medical Board of New South Wales? I am.

2159. How long have you been practising in this town? About three years.

2160. Do you hold any special appointment? Only as surgeon to several lodges.

2161. Do you attend a proportion of the persons engaged about the mines? Yes.

2162. And a proportion of the persons who are not in any way connected with the mines? Yes.

2163. Can you tell us how many miners and surface hands would apply to you, with a view to comparing with such number the number of cases of leading you meet with? I am afraid I cannot.

2164. Can you give us an idea of the number of cases of leading you do meet with in the course of the year? I should think an average of two or three a week.

2165. Does that apply to the three or four years you have been here? Yes.

2166. I suppose the yearly number increases with the number of hands employed—do you know anything on that point? No. But of course we may naturally conclude that it would be so.

2167. Can you form any opinion as to whether the proportionate number is increasing? So far as my experience goes, the cases are not as frequent as they used to be.

2168. Do you think many leaded men go away for treatment? I think they do.

2169. Do you think a considerable proportion go away for treatment? No: a small proportion I should say. Many of them, after recovering from an acute attack, go away for a change. That I do not consider going for treatment. Then some men have told me that they have been leaded, as they call it, and have gone away to Adelaide immediately.

2170. Do you think the seasons influence the prevalence of leading, and if so in which season do you think it is most prevalent? I think cases of leading are more frequent in the hot weather.

2171. Have you noticed whether some mines furnish more cases than others? Yes; because some mines have a greater proportion of lead than others. Such mines as Block 14 and the British, and Proprietary, for instance.

2172. You do get some from the Central and Block 10? Yes, occasionally.

2173. But much more rarely? Yes. I may remark that a number of cases have come under my observation, of men who had not for some time previously been working in lead, but I should think—if you will allow me to give my opinion—that the system had become impregnated with the poison, and, as in other diseases, when the system became lowered the poison made itself felt. One man I remember particularly. He assured me he had not been working in lead for six months, but he was apparently suffering from lead colic, and he got well very rapidly under proper treatment.

2174. Did you ascertain as far as you could that he was not suffering from any of the common causes of leading—which are common to every population I mean? No. As far as I could make out he had the poison in his system, and his system becoming lowered it made itself manifest.

2175. Are such cases common? No; but I have noticed several.

2176. Do the tradesmen employed about the mines furnish cases of leading? Yes.

2177. But less often than the miners or smelters, I suppose? Certainly. For instance, I have had cases of carpenters employed round the smelters.

2178. Then as to fitters, engine-drivers, and mechanics? No; I do not remember any cases among that class.

2179. In the case of the carpenters, you think it depended upon the place in which they worked? Yes. For instance, knocking down old timbers where the smoke would be playing on them, and that sort of thing.

2180. Are there many young children employed in ore-picking and similar occupations? Not many now, I think. We had cases of leading among ore-pickers some time ago.

2181. Are some people more susceptible to lead poison than others? Yes.

2182. And for them there is nothing for it but to stay away from their occupation, that is to say, in lead? Yes.

2183. Their disposition to become leaded is constitutional, and cannot be removed? No.

2184.

Dr. T. R.
Belgrave.
4 July, 1892.

Dr.
W. Blaxland.
4 July, 1892.

- Dr. W. Blaxland.
4 July, 1892.
2184. Do you know of any person who has been employed a long time in the mines and has escaped? I know such a case of escape from the acute symptoms; but, though he never had lead colic, the lead had got into his system, and he had the blue-line, and lost weight very much, and became very bad. I recommended him to leave for six months, at any rate, and I have not seen him for six months. I think he left the district.
2185. Is it your belief that every man who works in lead is sure to get leaded sooner or later if he stays at it long enough? That is my belief.
2186. He is certain to suffer? Yes, in time. Whether from the lead only, or whether from that combined with other poisons that are probably in the mine, I will not say; but they get into this state of ill-health, lose their appetite, become pale, and lose flesh.
2187. I should have asked you, if, in speaking of other causes of poisoning, you meant mineral poison—arsenic, for instance? There are some cases which rather puzzle one sometimes; but I have never had a case of acute arsenical poisoning.
2188. You do meet with anomalous cases? Yes; cases suggestive of metallic poison of some kind, exhibiting tremor and nervous debility.
2189. I believe three, or even four classes of symptoms caused by lead are distinguished, namely, colic, motor paralysis, epilepsy, and coma;—are you of opinion that cases of plumbism may be conveniently divided into these classes? Well, I should rather combine the epilepsy and coma. Very often the patient has a distinct fit of epileptic form, and then becomes comatose.
2190. Then we have been told that besides motor there is also sensory paralysis? Yes. I regard that as a preliminary to actual paralysis, and always advise those exhibiting the symptoms to go away from the place.
2191. What connection or relationship is there between the three classes you do admit. Do repeated attacks of colic lead to motor paralysis, and then after a time paralysis to epilepsy and coma; or are the different forms in your opinion merely indications of determination of the poison to different parts of the nervous system? I do not connect them. I have always had an idea that the lead attacks what is probably the weaker part of the system.
2192. And do you look upon lead poisoning as being essentially an affection of the nervous system? Yes.
2193. Can you tell which of the symptoms is the commonest? Colic is the commonest. Paralysis is comparatively rare, and so are fits of epileptic form.
2194. You say you meet with two or three cases of leading in the course of a week, probably—that would be, say 150 a year. Can you give an estimate of the way in which these cases would be distributed amongst the three classes. What proportion would be of colic for instance? They are nearly all of colic. I suppose 90 out of the 100 would be of colic, of various degrees of severity. Sometimes a man is writhing with pain on the floor; at other times there is merely loss of appetite, and a feeling of general indisposition, from which, of course, they rapidly recover. Some of them, of course, come for treatment at once; others, again, wait until they cannot do a hand's turn, and then they are really bad.
2195. Then, how would the remaining ten cases out of the 100 be divided between paralysis and encephalopathy? I should think they would be about equal.
2196. What do you look upon as the prodromal symptoms of lead poisoning? Loss of appetite, I should say, is one of the first symptoms. They complain that they have no appetite, but force themselves to eat, as they have work to do. That is what I hear in many cases. In such cases, if a man continues in that course he will be attacked with pain; and then he may take a dose of salts, perhaps, which will give temporary relief. But the constipation continues, and he is attacked with vomiting; and then he will come for treatment.
2197. Are you aware whether at any stage the evacuations are blackened? I cannot say from personal observation. But I often inquire, and they generally say it is very black, and think it is the lead-dust.
2198. Do you think it is? No.
2199. What do you think it is? Well, I have always had an idea of the sulphate of lead being formed in the bowels. Of course any faecal matter being contained any length of time in the bowels becomes more or less dark.
2200. Do you sometimes get cases of coma or epilepsy in which all prodromal symptoms are absent? Yes.
2201. Including the blue-line? Yes.
2202. What is the value of the blue-line as a diagnostic in the case of people who have their teeth? I do not consider it of great value.
2203. Has it not a positive value—if you found it in a patient, for instance, would you suspect lead to be the cause of his illness? If I found it in a man who came to me suffering from any complaint whatever, I should add something to his medicine to eliminate lead. But further than that I do not consider it of any practical value.
2204. Do you include anæmia in the prodromal symptoms we are talking about? I should say only so among the men working underground, and in many cases they are pale looking; but beyond that I do not think I should include it; that is, one hardly investigates for anæmia as a disease here.
2205. Now as to the later effects of lead poisoning, there is an important question, not merely as to how many persons are laid by, and how many days of labour are lost, but also as to the ultimate constitutional effects. Men come here and get leaded; you recommend them to go away, and they do so. Now, do they recover, do you think, or are their constitutions permanently damaged—that, perhaps, could scarcely be a matter of experience with you? Hardly as yet. Men go away, and perhaps, never come back; and if they do return I may not see them again.
2206. It is, however, a generally accepted opinion that lead poisoning does lead to permanent alterations? I think it is. I have always considered that it has a damaging effect upon the constitution.
2207. By way of predisposing the patient to diseases of the kidneys, or the circulatory of system? Yes. It has been noted before, I think, and I have noticed here, also, that there is a distinct connection between gout, rheumatism, and lead.
2208. Do you meet with gout here? Yes.
2209. Do you meet with it often? No.
2210. You meet with it especially among lead workers? I have only seen two or three cases of it here. In one of those cases the man was working in lead, and I told him he must keep away from it.
2211. That refers to gout, but do you say rheumatism too? Well, among other things, the way in which lead affects the system is, that they get pains in the joints of the knees, and weakness. Sometimes when

I have been a little doubtful in a case, I have asked the patient if he felt pains in the knees, and he has answered "Yes, and as I am going up to the mine sometimes my knees give way." I have always thought there was a connection between that and rheumatism.

Dr.
W. Blaxland.
4 July, 1892.

2212. It has been suggested to the Board that the symptoms you have described are in reality due, not to lead poisoning, but to carbonic acid poisoning. Do you know anything about that? No.

2213. Those persons who are leaded in a moderate degree, are they dull or slow in their manner at all? I have not noticed that particularly. When they get colic badly they take little or no food. Their stomach rejects it.

2214. You are sure there is no prevalent dullness of intellect among persons slightly affected by lead? I have never noticed it.

2215. As to the general population, have you met with any cases of plumbism among persons not in any way connected with mines? None that I have recognised as such.

2216. Do you meet with doubtful cases in which you may suspect lead to be a factor? I did meet with one case that I thought might possibly be due to that. But while I had been seeking for the cause of trouble, the patient had been seeking for other advice, and as soon as I came to that conclusion I lost sight of her.

2217. You have seen only one such case? Only one of the kind in which I thought lead might possibly be a factor.

2218. Do the people in general show signs of anæmia? No.

2219. Are the children here as a rule rosy and strong, active, and healthy? I think so.

2220. Then, touching the causes of death, in 1891 there were 188 deaths of children under one year of age; thirty-three of these were ascribed to wasting diseases, such as marasmus, tabes, mesenterica, or consumption of the bowels, malnutrition, and indigestion. Are you of opinion that lead has anything to do with that class of cases? No.

2221. Are you of opinion that tuberculosis is answerable for a considerable portion of them? No; not in my experience.

2222. Are you of opinion that improper food is a great cause of death among children of tender years? Yes; my experience leads me to that conclusion. As you know, some children appear to be born with just sufficient energy or vitality to last them till teething time; and beyond that they cannot stand anything. A number of deaths are due to teething and improper feeding.

2223. You are quite clear that lead has nothing to do with it? That is my opinion.

2224. Then fifty-nine deaths of persons under one year of age, were ascribed to such cases as diarrhœa, dysentery, gastritis, enteritis, intestinal catarrh, and the like. Are you of opinion that improper feeding is a cause of that class of deaths? Yes, a very important cause. Dysenteric diarrhœa naturally plays an important part in that class of deaths.

2225. Is dysentery frequently met with? It is rather common among children. Not true dysentery, but inflammatory diarrhœa.

2226. Partly contributed to by the necessarily hard conditions of life here, and partly due to improper feeding, but not contributed to by lead poisoning in any degree? Not that I know of. It has occurred to me occasionally that the systems of the parents, or that of the father at least, might have been debilitated from that cause.

2227. As to diarrhœa and dysentery, I presume you would recognise the general insanitary conditions of life as being contributory, or a concurrent cause of such diseases? To a certain extent I do. But I do not think the sanitary conditions here are so very bad. Sometimes the water we have to drink here is not very good.

2228. Then, in the same year twenty-five deaths were ascribed to premature birth, defective development, and malformation; and under our system of registration that number includes only such children as were born alive, and none of the still-born. Do you consider that the number of such cases, whether still-born or alive, is greater here than in other communities of which you have had experience? Well, this is the only population I have had experience of in private practice, therefore, I cannot say.

2229. Is abortion very common here? Yes.

2230. Are derangements of the menstrual function common among both the married and unmarried here? Yes.

2231. Do you hear impotency complained of amongst the males? No.

2232. Have you seen any reason to ascribe abortions, premature births, derangements of the menstrual function, and so forth, to minor degrees of leading? No; I have seen no reason to conclude that.

2233. Then, in short, are you of opinion that the fumes from the smoke-stacks which do pass over the town and often beat down on the houses, are practically without ill-effects upon the inhabitants? I think so far they have not shown any bad effects upon the systems of the inhabitants.

2234. You think that lead poisoning among the men is confined to persons who work amongst the lead practically? Yes.

2235. Now, as to animals, I believe they do die here. Can you tell us anything as to the cause of death among the animals here? One of the symptoms frequently exhibited in cats and dogs here is an epileptiform seizure in which many of them die.

2236. Cats and dogs are liable to fits are they not? Yes. But here they are remarkably liable to fits.

2237. Have you made any post-mortem examination in such cases? No.

2238. We have been told that fleas are absent here? There are remarkably few, certainly; but they are not absent altogether.

2239. They are unmistakably few? Yes.

2240. Have you seen bugs here? I have seen an occasional one; but they also are rare.

2241. Like other physicians, I suppose you have had opportunities of making acquaintance with the homes of the poor, in other parts of the world? Yes; in the east end of London for instance.

2242. Do the small birds die here? If not in captivity they do. If they are allowed to hop about on the ground they get ill and die. I do not remember any in cages.

2243. Do you keep fowls? Yes; and I have lost some of my fowls.

2244. They run about? Yes; about the yard.

2245. And your yard is not made up of refuse from the mines, as in the case of some people's premises? No.

2246. Do you think your fowls die on account of what they pick up from the ground? I really do not know. I have one now which has paralysis of the extensors of the legs.

2247.

Dr.
W. Blackland
4 July, 1892,

2247. Will you hand that hen over to Mr. Hamlet for analysis? Yes.
2248. As to prophylaxes, there are two kinds of precautions that may be observed—one that the workers can take for themselves, and the other that the proprietors alone could enable them to take;—have you anything to suggest in that connection? I have thought if the men could wear some form of respirator it would be a good thing; but I am informed that the men could not breathe through it satisfactorily.
2249. But supposing a miner did wear a respirator, do you think he would be entirely protected thereby? No; but he would be protected in a great measure. I may say, also, that the men would do well to wash their hands before eating, or cutting up their tobacco, which they rub fine in their hands before putting into the pipe.
2250. Have you considered at all what direction legislation might fairly take in regard to providing for increased protection for the men? No, I have not.
2251. Have you any knowledge of the use of milk as a prophylactic? I have no direct knowledge. I always recommend them to drink it.
2252. May I ask on what ground? Merely that I saw it stated sometime ago that in some place where the people were working in lead they drank enormous quantities of milk, and that cases of lead-poisoning there were very rare.
2253. Among the people whom you have recommended to take milk here, do you know of any who have taken it regularly? No. The fact is, that the milk is so scarce here very often that they tell me they cannot get enough to drink in the ordinary way.
2254. Are you of opinion that personal cleanliness—I do not mean merely washing the hands or mouth, but general cleanliness and attention to the skin—is of special importance in this class of work? I have no ground for believing that the lead is absorbed through the skin. I have always had the idea that it is taken in chiefly through the lungs; but I have no evidence to bring forward on the subject.
2255. At all events, I suppose you think that the workmen should have their time clear in which to eat their crib—that is, they should not be compelled to leave their food every now and then to take a hand at their work? No, certainly not.
2256. That arrangement being incompatible with clean hands during crib-time? Quite so.
2257. *Mr. Hamlet.*] With regard to the ingestion of lead into the stomach, we know, for a fact, that men are subject to that on being in the atmosphere of lead-dust. May it not also be taken in through the skin, do you think? That is what I do not know, as I have already said. I suppose it might be taken in by the skin in certain forms. For instance, finely-powdered carbonate of lead might be rubbed in through the skin.
2258. Especially when a man is perspiring, and the perspiration being of an acid character? Yes; but the current there is outward rather than inward. I have always thought that perspiration tended to clear the skin.
2259. At present we have no positive knowledge on that point? No; I have none.
2260. Lead is an accumulative poison, is it not? Yes.
2261. Consequently, it might be a very short time during which a poisonous dose of lead might be taken into the system? Yes.
2262. Especially seeing the poisonous dose is from 4 to 9 grains of compound of lead? Yes; that might be taken in very rapidly; but some systems might not suffer from the same dose as others.
2263. With regard to precautionary measures, do you consider that the compulsory changing of clothes would be an advantage? I should think it would. For instance, after a man has done his work, if he could throw off all his working-clothes, and put on others, especially after a good wash, he would be in a decidedly better position than the man who had not done so—that is, provided we are right in concluding that lead may be absorbed through the skin, which is possible.
2264. Do you think that the companies might be reasonably asked to provide baths for the use of their men? Yes.
2265. And you think that would be especially reasonable, seeing that the opportunities which the men have of getting a bath here are rare? Yes—that is, they used to be rare, but now I suppose we are going to have plenty of water.
2266. Speaking generally, what are the conditions of life in Broken Hill of the ordinary miner? Well, he gets plenty to eat and drink, but is rather short of water for domestic purposes, including washing and bathing, and his house in many cases is too little ventilated in the summer-time—too hot, and in nearly all cases too small for himself and his family.
2267. As a rule, when a miner goes home from his work, has he an opportunity of washing himself all over thoroughly—would he have a place, for instance, out of view of the rest of his family? No, not to strip. They strip to the waist, and wash at their back door, generally.
2268. Have you noticed, as a fact, whether they are clean from the waist upwards? Yes; fairly clean, so far as a casual glance goes. I have driven by and seen them performing their ablutions at the back door. I have seen men from the mine with their skin black and grimy from the dust.
2269. *Chairman.*] A statement has been made to the Board that owing to the want of decent accommodation for washing the men do wash from their waist upwards, but are found to be from the waist downwards dirty? I understand.
2270. *Mr. Hamlet.*] Is that your experience? No; but in any case I think you can hardly blame them altogether. For instance, a woman has come to me concerning something the matter with her foot or leg, perhaps, and appearing ashamed of the condition of her feet, has assured me that she washed them before starting, and got them dirty on the ground coming from her home. We have a great deal of dust here sometimes, and suddenly rising up under one's clothes will dirty the legs very much.
2271. So that, under all the circumstances, if baths were provided on the mines it would be a good thing, you think? Yes; I think it would be a very good thing, indeed.
2272. And a reasonable thing for the mining companies to provide? I think it would be a fair thing; but, of course, it is a large question.
2273. *Chairman.*] Have you certified any deaths as being directly due to lead-poisoning? Yes; one occurred recently which I believe was due to lead-poisoning, and I certified it as such.
2274. During the last three years have you given any other certificates to that effect? No.
2275. Has your practice here led you to differ from the statements regarding lead-poisoning usually met with in the text-books, and so forth? No; it agrees with them very fairly.
2276. Is there any other point that you can bring under the notice of the Board, or any suggestion you can make that might assist them in this inquiry? No, I think not.

[The witness withdrew.]

WEDNESDAY, 6 JULY, 1892.

Present:—

DR. ASHBURTON THOMPSON (CHAIRMAN).

W. M. HAMLET, Esq.

Dr. H. J. Groves called and examined:—

Dr.
H. J. Groves.
6 July, 1892.

2277. *Chairman.*] What are your qualifications, Dr. Groves? I am a Member of the Royal College of Surgeons, Licentiate of Royal College of Physicians, and Licentiate of the Apothecaries' Society.

2278. You are registered by the Medical Board of New South Wales? Yes.

2279. How long have you been practising here? Six years.

2280. You do attend a proportion of the persons engaged about the mines? Yes: I was the second doctor on this field.

2281. Have you any idea how many miners and surface hands would apply to you, if they were sick—that is, in view of making a comparison between that number and the number of cases you meet with during the course of the year? I can get you that information.

2282. Can you give me an idea of the number of cases you meet with in the course of the year? Well, you may put it down at 150, I think that would be a fair average; but there are a number of mild cases which would not be included in that average.

2283. Do you think that the proportion of cases of that kind, to the number of men employed, is increasing or decreasing? It is decreasing; that I am positive of.

2284. Why is it decreasing, can you tell us that? Well, it has decreased since the mines have been better ventilated.

2285. Do you think many persons go away for treatment? Yes; many of them, after the first effects of the lead, go away for a holiday, perhaps for months.

2286. Do you think the seasons have any influence—do you meet with more cases in the summer than you do in the winter? I do not think so. But I have heard patients say when they are getting better that if they go out in the cold the pains come back again.

2287. Do you notice that some people are more susceptible to leading than others? I have noticed it in one way—for instance, I believe the unmarried men who “batch” are liable to get leaded quicker than married men.

2288. To what do you trace that? It is, I think, largely a matter of cleanliness. Married men have their rooms and meals prepared for them; they have time to get a wash and change, and their circumstances are generally more favourable. The unmarried men are not usually so cleanly in their ways. They have to cook their own food as soon as they get home.

2289. Are the men who live in boarding-houses better off, do you think? Yes; better off than those that batch.

2290. Do you think every man who works among lead is sure to get leaded sooner or later—is it merely a matter of time? Yes; it practically comes to that, whatever care he may take. I have known a man to work five years without being leaded. The man I have in my mind now, when I saw him, had been working for five years in lead, and he was then complaining of the first symptoms, and I sent him out to the White Lead, where there is no lead. He was a married man, and his house was very cleanly kept.

2291. How many classes of cases do you recognise as being due to lead poisoning;—do you recognise one as being characterised by colic, for instance? Yes; acute cases are characterised by colic, and very rare cases of chronic poisoning are characterised by paralysis. Then there are other cases where the men will come for a dose of medicine, and after getting a good clearing out will go to work again.

2292. Then, is there not a class of epileptic patients? Yes; that comes rather under the class of chronic cases.

2293. How many deaths due to lead have you noticed in your own practice? Very few. I can only recollect two.

2294. You have had none during the last three years—that is, during 1889, 1890, 1891;—you have not recorded any? Well, I suppose I have not. I was just thinking of the cases of some children on the other side of the Hill some three years ago. The whole family were lead poisoned, I have no doubt. They were under the smelters of the Big mine.

2295. Was the father employed about the mine? Yes; he was an engine-driver. I should say he was not leaded. The majority of the family showed the blue line, but did not complain of lead poisoning. Two of the children died of convulsions.

2296. How do you suppose the lead reached them? I take it, directly from the smoke. Possibly it was from drinking water contaminated by the fumes.

2297. Are cases of colic the commonest cases? Yes.

2298. Are paralysees more or less common than epileptic and encephalopathic cases? I have seen very few cases of paralysees—only two or three; two of them in one family, by the way.

2299. Do you consider that the absence of the blue line weighs strongly against a diagnosis of lead poisoning? Yes.

2300. You are not of opinion that the blue line is often absent from persons who are suffering from lead poison, and who have their teeth? No; I have never seen a case in which I could say the person was leaded in which there was not the blue line. It might occur, perhaps, in the first place that no lead line would be apparent. I remember I had two cases when I first came here, and I was then new to lead poisoning. These men had been put to clean out the flue leading up to the stone stack at Block 14, which was since pulled down. They only worked there four hours, and both suffered severely from colic. I do not think in those cases I saw any lead-line, so far as my memory serves me.

2301. And they had not been exposed to lead except for the four hours you mention? No.

2302. Do you find people who are leaded dull in intellect or slow of movement? No; not in the early stages.

2303. I do not refer to those who are so affected as to be epileptic? So far as my observation has gone, I do not think it makes any difference in the mental condition.

2304. Have you noticed any effect upon the kidneys? Yes; I believe it is so in cases where they have been leaded several times. In one case I found albumina in the urine of a patient who died from what appeared to be lead anæmia.

- Dr.
H. J. Groves.
6 July, 1892.
2305. You do not commonly meet with albuminuria? Not commonly.
2306. Have you any reason to think that the kidneys are commonly affected in persons who have suffered from lead poisoning several times? Yes; I have reason to think so. I believe myself that such would be the effect from what I have seen. But it would require a longer experience than I have had here to speak with certainty.
2307. You are of opinion that people suffer constitutional damage of which the effects are not developed until after many more years than you have practised here? Yes.
2308. Do you meet with gout here? Very slightly. I have not seen enough gout here to associate it with lead in any way.
2309. Have you seen six cases altogether since you have been practising here? No; not true gout.
2310. With regard to rheumatism, do you think that is an accompaniment of lead poisoning? Yes.
2311. And anæmia? That is a constant sign.
2312. Have you met with cases of plumbism among the general population—that is, in persons not connected with the mines in any way? Yes; there was the case of an employee of the South Australian Brewery Company two summers ago. He drank a great deal of water from the roof, and got it in that way. The place is under the stack in Crystal-street.
2313. Was he the only man who suffered in that way? The only one I can call to mind at that time.
2314. If he suffered from drinking water contaminated by lead dust, would you not expect other persons in other parts of the town to suffer in the same way? Yes; and they probably have done, but they have not come under my observation.
2315. Do you meet with many cases of indisposition among the general population that you cannot satisfactorily account for? No.
2316. Are you of opinion that the fumes from the smoke-stacks, which pass over and often beat down upon the houses, have a recognizable effect upon the general population? No.
2317. The people in general do not show signs of anæmia;—are the children healthy, rosy, and strong-looking? The children living near the mines suffer, I believe, but not the adult population.
2318. Will you tell us what you call near the mine? I mean the houses right under the mine—on the side of the hill, and as far as Crystal-street, I should say. The cases of children I have seen were much nearer, right under the smelters, in fact.
2319. Speaking generally, you would say a distance of about 400 yards, I suppose? Yes; or closer, some of them. At that distance, notwithstanding the height of the stacks, you see the smoke beating down on the houses in some states of the weather, but I do not think the general population in other parts of the town suffer so much from lead poisoning.
2320. You say, "not so much"—do you think they suffer at all? No; I do not think they do suffer from lead poisoning.
2321. I find in the Register for 1891, a number of deaths of children ascribed to wasting diseases; do you think that lead has had anything to do with bringing about those deaths? From my experience, I should say that many of the cases were caused by improper feeding and gross ignorance.
2322. Do you think that tuberculosis is here a common cause of death by wasting diseases? Yes; but as I have said, the deaths are largely due to gross negligence and ignorance that seem almost incredible.
2323. Then there were fifty-nine deaths of children under one year, ascribed to intestinal diseases, such as diarrhœa, dysentery, gastritis, enteritis, and so on; and these you would probably ascribe to a similar cause? Yes; mostly, of course, in the summer months.
2324. Do you think that the same ignorance and neglect is a concurrent cause with general insanitary conditions? Yes.
2325. You do not expect to get specific diseases like summer diarrhœa and dysentery, merely from bad feeding. The records for 1891 show that ninety-two deaths of persons under one year of age were ascribed to distempers of the digestive system. Of these, thirty-three were ascribed to wasting diseases, that is, to such causes as marasmus, tabes, mesenterica, consumption of the bowels, malnutrition, and indigestion. Then besides these, in the same year, there were also fifty-nine deaths of children under one year, ascribed to diarrhœa, dysentery, gastritis, enteritis, and intestinal catarrh; and the question is whether you are of opinion that improper feeding is the chief cause of those classes of deaths? I do think so, coupled with insanitary conditions, and the intense heat of the small iron houses, and the bad water. Up to the present time, these people have been in the habit of drinking the surface water collected round the place.
2326. They have drunk the surface water of the area round about, which, in part, becomes putrid before they take it? Yes.
2327. Then, as regards these ninety-two deaths, you would say that lead has nothing to do with them practically? No; not with the great majority.
2328. None of the still-births are recorded at all? No.
2329. Do you think premature birth, whether live or still, is more common among this population than among others? Difficult labours are more common here.
2330. But premature birth, malformation, defective vitality, and that sort of thing? I would not give a definite opinion upon that question.
2331. Do you think the proportion of such cases is much greater in this population than in others? Not particularly, I should say.
2332. Are derangements of the menstrual function at all common here? Not more than in other parts of Australia, so far as I have seen.
2333. Among males, is impotence a common complaint? No; I have not heard of it.
2334. Now, as to animals, which are said to die here of lead poisoning;—do you know if the cause of death has actually been established? No; but everyone has a strong feeling that it is so. It occurs principally in young animals. I have lost pups. The bowels become paralysed.
2335. And birds in cages? No. I have birds now—English birds—which I have had since I came here, and I have only lost one, a thrush, which was killed. We lost one bird the other day, I should say; but that, I think, was from old age. They are healthy enough now.
2336. But animals and birds which take their food on the ground are in great danger? Yes.
2337. We have also been told that if you bring a dog here after it has reached the age of twelve months, it may survive, whilst the pups born here all die? Yes; very likely. I think it depends upon the distance they are from the mines.

2338. Can you give us an idea of the limit of distance in that connection? Well, I have lost pups at my house, as I have said, and it is between half a mile and three-quarters to the west. Dr.
H. J. Groves.
2339. Do you agree that there are scarcely any bugs or fleas here? There are not many bugs, I believe; but there are plenty of fleas. 6 July, 1892.
2340. I think four witnesses have stated that fleas are very scarce here? There are plenty of fleas.
2341. Do you have to use fleapowder to your dogs, for instance? No.
2342. Or you birds? No.
2343. Then, finally, you say the lead poisoning you meet with here, for all practical purposes, is confined to persons working in or about the mines? Yes; or those who live close by, as in the case of the children I have mentioned.
2344. You do not think it reaches persons not connected with the mines, but who live close to them? Yes; in the case of children, certainly.
2345. And by close you mean how far off? Close up, or near to them.
2346. Crystal-street, for instance? No; not Crystal-street. As I have said, I have only known one case there.
2347. Then, if people live 400 yards or 500 yards from any stack, they are safe, in your opinion? Yes; so far as my experience goes.
2348. Will you tell us what you consider the most important steps towards the prevention of lead poisoning? Personal cleanliness, I think, is the most important thing, and if the miners were provided with the means of changing their clothes on starting and leaving their work, and some provision were made to ensure their taking advantage of it; that, I think, would go a long way towards checking the evil.
2349. There are some things which the men can do for themselves, and others that the proprietors only could do for them? Yes.
2350. Then there is another thing; if a man has been leaded several times, and he is a good worker, should that be taken into consideration to the extent of giving him some other kind of work which would enable him to recover? Yes; but many men are unable to get work out of the lead, and go back again and again.
2351. But we have been told by more than one manager that they do systematically shift the men;—at all events, as far as they can? They shift the men from one end of the workings to the other; but there is such a thing as surface work, where the men are away from the lead altogether, and, on the production of a medical certificate by the men who are so suffering, they might be kept away from the lead altogether.
2352. You think the system of changing the men might be carried out more thoroughly? I think attention might be drawn to it.
2353. It has been suggested that if suitable changing-rooms were provided, few of the men would use them? It is quite likely.
2354. Nevertheless, you think they ought to be provided? Certainly; and I think the men should be compelled to change, by a rule making systematic neglect to do so a reason for discharging them. A man who is suffering from lead poisoning cannot do a fair amount of work.
2355. Your inference is that it would pay the companies, looking at it merely as a matter of money? Yes. I do not think they would lose by it. What they would lose in one way they would gain in another.
2356. *Mr. Hamlet.*] What, in your estimation, is the distance from the mines to Crystal-street—about a quarter of a mile? Yes.
2357. Have you, during your practice here, found many cases of lead poisoning in Crystal street? No; only one. In fact, almost all the cases I have seen have been those of men who have been leaded on the mines.
2358. From your knowledge, can you say whether the children here drink all kinds of water? They drink any water they can get. A great deal of illness among children, and a number of deaths, arise from carelessness in that respect.
2359. They drink any water they can get? Yes.
2360. Do you know, in your experience of the working people here, of any family who keep a filter? I cannot call one to mind. Some of them do, I believe.
2361. We may take it that some do? Yes.
2362. Have you had opportunities of knowing how long a man here will or may go without washing his body entirely? I cannot say that exactly. Of course, I know that some of them are not so careful as they should be about washing.
2363. You have sometimes had opportunities of seeing the bodies of these men from the loins upwards; do you find many dirty men among them? I should say about the same as you would find among the ordinary class of labouring men anywhere. Some are dirty, of course, but I think the greater number are fairly clean. The point I take is that they are not careful enough about washing when they come from the mine, especially, as I have said, in the case of the young men who "batch."
2364. Do you think there are instances of men who never completely wash their bodies? Well, I cannot say I have ever met with a case of that sort. I cannot recall one to my mind.
[The witness withdrew.]

Dr. C. Govett called and examined:—

2365. *Chairman.*] What are your qualifications? M.R.C.S., England.
2366. You are registered by the Medical Board of New South Wales? Yes.
2367. Do you hold any special appointment? I am the local medical referee for the A.M.P. Society.
2368. Have you any private practice? No; I am not practicing privately.
2369. Do you know anything in general about the subject of lead poisoning here? What I know is simply from those who have come before me for examination. I have had a few of such cases in that way.
2370. Do you load candidates for life assurance here? Yes, certainly, among the miners.
2371. How much do you load them? Five years.
2372. Is that loading imposed in every case in which a man says that he is a miner? Yes, when their occupation brings them in contact with lead ores. I am very particular to ascertain whether they are in actual contact with the ores. For instance, I had a man yesterday who told me he was what they call a timber

Dr.
C. Govett.
6 July, 1892.

Dr.
C. Govett.
6 July, 1892.

timber-man—a man employed in the mine putting up timbers; and I asked him: "Have you anything to do with the ores?" "No, sir," he said, "I have nothing to do with the ores; I simply put up the timbers." In such a case I make a note of the statement made to me, and perhaps make further inquiry. I

have had to reject one or two of them that have come before me in that way.
2373. Do you load smelters—the men on the tapping-floor—as distinguished from those who work on the feeding-floor? I am not prepared to say that—that is, whether they should be included in the category of miners, the men who handle the ores.

2374. My question is, whether you load smelters—the men who tap the furnace on the bottom floor? Yes, I think so. I would load anyone having to handle the ores in any way whatever.

2375. Of the proponents that come before you in the course of the year, what proportion do you find to be suffering from the effects of lead, at the time of examination? I have only seen two, and I have been here for eight months. I imagine they take care to be in good health, as a rule, before they present themselves.

2376. Does your experience enable you to mention any points that might be of service to the Board in this inquiry? I cannot speak from actual experience; as I have told you, I do not practise here. From what I have noticed of the people here, I should say that a great many of those I have met betray more or less signs of lead saturation.

2377. Do you distinguish in any way between the townspeople, in general, and those employed in or about the mines? Yes, I think so; I think the lead is more or less apparent among the latter class particularly.

2378. Do you think you observe the lead line among the townspeople—those not connected with the mines—to any extent? I should be disposed to think not.

2379. What is your opinion of the aspect of the children here? Generally, I think fairly healthy.

2380. People do not often die directly from lead poisoning? Not to my knowledge.

2381. On what principle does your Society load applicants for life insurance who are workers in lead—is it in view of damage to the constitution which may be caused through working in the lead? I think so.

2382. In view of the permanent damage which may have occurred, rather than in view of acute poisoning? Yes; although there have been very bad cases here, I am told.

[The witness withdrew.]

THURSDAY, 7 JULY, 1892.

Present:—

DR. ASHBURTON THOMPSON (CHAIRMAN).

W. M. HAMLET, Esq.

Dr. J. T. Harvey called and examined:—

Dr.
J. T. Harvey.
7 July, 1892.

2383. *Chairman.*] What are your qualifications? M.B., C.M., Edinburgh; M.R.C.S., England; and M.B., Melbourne.

2384. Are you registered by the Medical Board of New South Wales? Yes.

2385. Do you hold any special appointment here? No.

2386. How long have you lived here? Five months.

2387. You attend a proportion of the people engaged about the mines, as well as the general townspeople, of course? Yes.

2388. How many cases of lead-poisoning have you met with during the time you have been here? About twenty, I should say.

2389. Have you any idea of the proportion that number bears to the total number of persons engaged about the mines who would apply to you if they were sick;—by the way, are you a member of the Medical Fund? No.

2390. Then you have no notion of the number of persons who might apply to you if they were sick? No.

2391. You say you have met with twenty cases of leading during five months;—can you tell us how they fell under the different classes of lead-poisoning? There was one case of acute encephalopathy, one case of eclampsia, one of wrist-drop, and the remainder were chiefly lead colic—that is, there were a few cases in which digestive trouble formed the cause of complaint; but the bulk of them were colic. In fact, unless the men get a pain they will not send for a medical man. As a rule it is the colic that makes them call the doctor in.

2392. Then you do recognise a minor degree of lead-poisoning which is not betrayed by any definite symptoms? Yes—that is to say, cases indicated by disorders of the digestion, and constipation.

2393. Then are you of opinion that probably some of those cases of encephalopathy which appear to be sudden, and therefore apparently acute, are really cases of chronic lead-poisoning in which there have been no symptoms but indigestion and constipation? Yes. I should look upon that as being so. I look upon the conditions as not being understood by the men; they do not refer these effects, or brain affections to lead-poisoning at all, that is, unless they get symptoms they themselves understand, such as colic.

2394. Have you formed any opinion as to the value of the lead-line as a diagnostic? I look upon it as valueless by itself, because it may be seen on the gums of persons other than those who are suffering from lead-poisoning.

2395. But you find it very little among the townspeople, I suppose? I have seen it on the gums of the townspeople. I do not look upon it as necessarily an indication of the existence of lead in the system.

2396. You have reason to believe that it may be merely a local manifestation—a deposit of lead on the outside of the gums? It may be. I do not know why there should be a blue mark there because, as I have said, it is met with in persons who present none of the usual symptoms of lead-poisoning.

2397. And do you meet with it frequently among the townspeople? Yes. I make a point of examining the gums, and I find it fairly constant; but I cannot say the percentage.

2398. When you see a townsman with the blue line, do you prescribe the usual remedies for leading? Not necessarily; he might be suffering from a disease totally distinct from lead-poisoning.

2399.

2399. Would you disregard it? Yes; I would not base my estimate of the case on the existence of the blue line alone.

2400. Have you seen it in children? Yes.

2401. Suppose in the case of a sick miner the blue line were absent, should you consider that against a diagnosis of lead-poisoning? It is against a diagnosis of lead-poisoning to that extent; but when other symptoms are present you may accept the blue line as an indication.

2402. Then what you say is this: That the blue line confirms the diagnosis of lead-poisoning where other symptoms point to it; but if the blue line is absent you do not therefore disregard the diagnosis, which the other symptoms seem to warrant? Yes; that is precisely my view.

2403. Is anæmia common among the townspeople not connected with the mines? I do not think so—not especially common.

2404. What is your opinion of the children here—are they as sharp, quick, and healthy-looking as the children living in other places? I fancy there is a form of anæmia among them; but I believe they are as sharp and active as the children in other places. You do not meet with the rosy children here that you see in an agricultural population.

2405. Are the children, in your experience, liable to suffer minor degrees of indisposition which may be attributed to lead? No; I cannot reasonably say I have ever diagnosed a certain case of lead-poisoning in any of the children here.

2406. Then you do not mean us to infer that the anæmia you speak of as being among them is due to lead? No.

2407. Have you noticed whether the majority of your twenty leaded patients came from a particular mine or not? They mostly came from Block 14.

2408. Do you know how many? I should say the half of them came from Block 14. I have no particular statistics.

2409. And the other half were distributed? Yes.

2410. Have you noticed what particular place or occupation about the mines the twenty men followed? They were mostly smelters and underground men. The underground men, I think, suffer more than the smelters.

2411. What about the ore-wheelers? I have not met any of that class professionally.

2412. Do you find derangements of the menstrual function more common here than you have found them elsewhere in the course of your practice? No; I do not think so.

2413. Have you any reason to think that abortion is especially common? Not in my experience; but I should say that my experience of midwifery here has been rather limited. It is mostly done by the midwives, I think.

2414. Nearly all of the questions I have asked you have had reference to the importance of the fumes that issue from the smoke-stacks to the general population here, and in conclusion on that point I infer that you would say they are of no consequence to the general population? So far as the diagnosis of lead-poisoning goes, I should say not.

2415. Will you explain what you have in your mind besides that? Well, I have not successfully diagnosed a case of lead-poisoning among the general public; but I do not wish you to infer that I think the fumes are innocuous.

2416. What I want to know is whether you do meet with cases of illness among the townspeople in which, though you cannot diagnose lead poisoning, you suspect that lead poisoning plays a part? Yes; I believe it does play a part in certain indefinite forms of illness. But there is difficulty in establishing proof of it, of course.

2417. That is what I want to get at; and the point of what you say is, that you suspect it? Yes.

2418. Have you noticed whether that suspicion arises in the case of persons living in particular neighbourhoods within a certain distance of the mines? No. I do not think it is localised to any particular spot. It seems general.

2419. But I suppose you never had a case of that description come to you from Stephens' Creek, or even Round Hill, did you? No. Of course my remarks refer to the immediate neighbourhood of the town, within a radius of 2 or 3 miles.

2420. Have you turned your attention to the question of prophylaxes? Yes; I have thought about it. In the first place, as regards constipation that should be attended to. Any man suffering from constipation should be treated for it at once, and then he should be put to a class of work at which he would not be liable to absorb lead. Then the men might use respirators. Sprinklers have been used in the mines, I understand, but I think they should be more extensively used. The men should also bathe regularly, and change their clothes. That is a necessity, not only to keep the lead out of the system, but to keep the men clean. At the top of the furnace there should be trap-doors and shoots—long shoots for the charges, so that the men could then work at a distance from the fumes. I have heard that the ventilation of the shed over the feed-floor is not always what it should be. Of course there is always a certain amount of difficulty with the men themselves, as they do not usually realise the gravity of their complaint until they are obliged to call in somebody.

2421. Notwithstanding that they subscribe regularly to a sick-fund, and have to pay, whether they get attendance or not? Yes.

2422. Is that partially due to ignorance—do you think, that they do not know what is the matter with them? They try to put off calling in the doctor as long as possible, I fancy. It is a general prejudice, particularly marked among these men.

2423. Can you think of anything else;—do you think it would be useful to circulate among the men a fly-leaf of hints as to what they might do to protect themselves? Yes, probably it would.

2424. It would be a judicious thing, at all events? Yes.

2425. You think baths should be provided for the men by the mine-owners? Yes.

2426. And they should be capable of being warmed? In winter, yes.

2427. And you have told us, I think, that you approve of the periodical purge that has been recommended? Not necessarily a periodical purge, but the men who are becoming liable to constipation should be treated for it promptly, before it advances any further. There is another thing. The men who work in that dust get their clothes saturated with the dust, and then go into the town without changing; and a number of them, I am sure, do not change their shirts for a long period, and they are really undergoing a form of in-unction of lead all the time.

2428.

Dr.
J. T. Harvey.
7 July, 1892.

- Dr. 2428. You think, then, the absorption of lead may take place through the skin? Yes.
- J. T. Harvey. 2429. Do you know anything of the use of milk as a prophylactic? No.
- 7 July, 1892. 2430. *Mr. Hamlet.*] Have you ever been on the feed-floor of a furnace? Yes, I have been up there.
2431. Have you noticed cases of defective ventilation there? Yes. It is not so much defective ventilation of the building itself, as that there is no suction at the top of the furnace in order to draw off the fumes from the men before they come to the edge.
2432. Have you often observed that? Yes. As a rule, the man who is wheeling the charges gets the fumes all over his face and body the moment he comes up to the mouth of the furnace.
2433. But do you not know, as a matter of fact, that there is a powerful draught in the throat of the furnace—a draught downwards, to carry away the fumes? Yes. But any of these men who feed the furnaces will tell you that the fumes come up round them as they are tipping the charges down.
2434. *Chairman.*] Has that been represented to you as an habitual occurrence? Well, no. I have gathered the idea chiefly in conversation with the men. It is not an occurrence that I have actually seen frequently myself. It has been mentioned to me by the men.
2435. As an habitual occurrence, or as an exceptional thing? It has been mentioned to me as happening.
2436. *Mr. Hamlet.*] Do you think men on the floor of the furnace—that is, the tapping-floor, are more subject to fumes than those on the feed-floor? I do not know exactly. I am not sure; but as cases of leading occur there the presumption is that they are subject to them at all events.
2437. It has come out in evidence that the men are accustomed to eat their food in the mine, in the stopes? Yes; at crib time, as they call it.
2438. What do you think could be done to avoid their inhaling the dust and getting leaded through eating their crib in that way? They should wash their hands, in summer especially. In dry workings they should have the ore sprinkled with water, and of course the ventilation should be sustained. The habit of rubbing tobacco in the hands is also a very dangerous practice for men so engaged. They rub the tobacco, and then put it in their pipes, and I dare say the heat of the lighted tobacco causes the lead to vapourise and go down their throat. It might also be absorbed through the hands.
2439. With regard to the Public Schools, have you met with any cases among the pupils that you could attribute to lead poisoning, either directly or indirectly? No. I have not met with a case that I could ascribe to lead poisoning among any of the children.

[The witness withdrew.]

Mr. Daniel Parr called and examined:—

- Mr. D. Parr. 2440. You are a veterinary surgeon, Mr. Parr? Yes.
- 7 July, 1892. 2441. What are your qualifications? I am a registered veterinary surgeon of Victoria, and I am a member of the Veterinary Medical Association of Australasia.
2442. How long have you practised here? About two and a half years.
2443. Are you of opinion that animals of all kinds suffer from lead poisoning here? I am certain of it.
2444. How have you established the diagnosis in any case? Well, the cases that I see on the hill are different from any cases that I have seen in any other part of the Colony. They develop peculiar traces of disease.
2445. How long have you practised as a veterinary surgeon? Since 1879.
2446. And where have you been practising? In different parts of Victoria and New South Wales.
2447. Are you aware of any case in which a chemical analysis has resulted in the finding of lead in a dead animal? Yes.
2448. Will you tell us of such a case? Yes. I had the stomach of one of my own patients analysed, and it contained lead, arsenic, and copper.
2449. What animal was that? It was a pig.
2450. Who made the analysis? Mr. Arthur Smith, an analytical chemist, of Broken Hill.
2451. What is the distance from the hill up to which cases of poisoning are observed, taking the Proprietary Mine as the central point of the line? Most of the cases I have seen have been in the immediate vicinity of the mines.
2452. Do you mean between Crystal-street and the Hill? Yes. More horses die between Crystal-street and the Hill than anywhere. I have had more cases in cattle on the opposite side of the Hill, between that and Aldridge's farm, about due east from here.
2453. And on Mr. Aldridge's farm? No; between the two. Cases occur up to a distance of two miles away or more. I think the greatest distance at which I had a case was 3 miles away, or say between the dairy and the Hill $2\frac{1}{2}$ miles.
2454. That would be the farthest in that direction? Yes.
2455. And in other directions? I should say $2\frac{1}{2}$ miles all round.
2456. You do not think the points of the compass have much to do with it? I think not. I have had them all round, but more particularly in the rear of Block 14 Mine and the Junction—that would be about south-east.
2457. Who keeps animals there now? The horses are kept by the carters; the dairy cattle were originally close to the town.
2458. They are nearly all removed now? Yes.
2459. All moved outside in consequence of their suffering from illness? Yes. I advised the people to do so.
2460. Are the symptoms the same in horses and cows? No. I have made a few notes here which I will quote from, with your permission. I find the symptoms run through about three different stages.
2461. You are now speaking from your own observation? Yes. With regard to the symptoms in horses, I will describe the different stages, as follows—(1.) Loss of appetite, staring coat, cold legs and ears, tucked up appearance of barrel, pulse slightly above normal, about 46; temperature taken per rectum, about $101\frac{1}{2}$ or 102; head depressed. In no case have I noticed colic at this stage. In a few days large quantities of grey or crystal coloured matter discharges from the nostrils and saliva from the mouth, and they champ their jaws every few minutes. (2.) Coming to the second stage, the breathing now becomes very laboured, and so difficult that the animal appears in danger of suffocation. The stench from the breath

Mr. D. Parr.
7 July, 1892.

breath at this stage may be smelt at a distance of a few yards. The animal trembles violently and perspires freely; becomes very restless, and is constantly lying down and rising up again, as if suffering from inflammation of the bowels, suffering the most agonising pain; temperature, 103 or 104; pulse very small and quick. (3) In the third stage the breathing becomes more irregular, and is performed with greater difficulty. The urine is ejected in very small quantities every few minutes. The animal is constantly walking round and round, until it loses control over its movements, staggers, and dies convulsed. They are generally quite dead in three or four minutes after they stagger and fall. The temperature during this stage is from 104 to 106½; I have registered 107 in one instance with Arnold & Sons' clinical thermometer. The flanks have a peculiar lifting motion, characteristic of this disorder. I have a note here on this class of cases, as follows:—"Cannot reduce temperature; exhibits in many cases tuberculosis in kidneys and lungs; bladder highly inflamed; kidney pale, and spleen rather large; liver pale."

2462. The symptoms you have been describing occur in horses, is that so? Yes. I may say before starting to speak of the cattle, that the disease runs through them very quickly, or else they recover quickly; either it terminates with a fatal issue or the beast starts to mend. In the case of the horses the disease will lie dormant for a time, but I have never seen an instance of that in cattle. The symptoms in cattle may be described as follows:—First stage: a beast that has been well suddenly loses its appetite, ceases to chew its cud, and stands apart from the herd. It becomes very restless, has a very anxious expression, a staring eye, and a pupil dilated, and foams at the mouth, the pulse is slightly above normal—about 65; internal temperature, taken from rectum, about 102½ to 103; respirations, about 25 per minute, or about 10 above normal; the external temperature of body is variable; the legs are generally cold; ears and forehead temperature above normal. I have often observed the muscles of the body spasmodically contracting and twitching, especially those of the shoulders and face. The animal will also run round or forward, dashing its head right and left, as if labouring under an attack of inflammation of the brain. I may say I have never seen these symptoms in horses at all. If a person who had not been accustomed to observing these symptoms were to examine a horse under the circumstances he would be almost sure to conclude that the horse was suffering from typhoid fever.

2463. You think horses do suffer from typhoid? We know they do. I have treated horses successfully for typhoid. Professor Kendall, in Melbourne, has had a good many cases. In the second stage of the disease, as observed in cattle, in a few hours fever sets in, and the internal temperature rises to 104 or 105 Fahr.; pulse about 80. The heart beats are very distinct, and may be felt by placing the back of the hand slightly in rear of the animal's elbow on the near or off side; there is also grinding of the teeth, and champing of jaws, and generally at this stage there is a flow of saliva from the mouth. Colic is often present. In the third stage the eyes are motionless; convulsions occur, during which the animal utters low groans, and dies. In some instances the breathing becomes very laboured, and the animal dies gasping for breath: in others the animal lies down, closes its eyes, and dies in a state of coma. The temperature in these cases falls very fast, and the pulse becomes very small, until it is lost. In conclusion on this branch of the subject I have some notes here which may be of use to you. During the past two years I have seen a large number of these cases; about 25 per cent. of them die. I have had about twenty cows and bullocks die during that time. It is questionable whether the animals that live are worth the trouble, and expense of treatment. They are generally ill four or five weeks, and have to be well nursed—very often gruel-fed during that time. They invariably go dry, and are therefore useless as milkers for at least nine or twelve months after suffering from an attack. I have known cows worth £6 or £7 cost over that amount to cure. Having no green forage is a great drawback in treating these cases.

2464. Have you had reason to think that the milk, which does not cease to flow altogether, I believe, is altered dangerously? According to the best authorities milk taken from cows which are suffering from plumbism is highly injurious. Anything that diminishes the secretion of the milk is injurious, and makes it less wholesome.

2465. Can you furnish us also with some notes as to the post-mortem appearances? Yes, I have opened them for examination, and can get you some particulars.

2466. Perhaps you can give them now? The horses generally die of gangrene of the lungs. I may state that in the horses the stomach and alimentary canal are very seldom inflamed in the least—are generally very pale. In the cows I find it seems to cause paralysis or nerve depression, and it also seems to cause inflammation of the whole of the alimentary canal, and the stomach. I have seen congested spots from the size of a pin's head to the size of half a split pea.

2467. To what do you trace this lead poisoning, in the case of horses, for instance? I attribute a great deal of it to feeding the horses in the open air, where the lead-dust can fall into the animal's food.

2468. Do you refer to the fumes emitted by the smoke stacks? I am not in a position to express a decided opinion on that. Probably the smelters have a good deal to do with it; but I think, probably, there is more dust thrown into the food—that is, the dust that comes from the hill. The winds here are very strong sometimes, and a considerable amount of stuff containing poisonous matter is blown from the hill. Then again, I know two or three instances of horses dying through feeding in the immediate vicinity of the British Mine, that is before the smelters were erected, and drinking at the Junction dam. I cannot say whether they took in the poison in solution from the Junction dam, or from the herbage growing near the mine. But oxide of lead is but slightly soluble in water, and I am of opinion that the streams running from the mines carry a good deal of lead and other poisonous substances as a vehicle, that is, the water acts as a vehicle, and carries it down. With regard to the fumes, my opinion is that if the lead from the fumes which fall over the town is soluble in water, and the fumes contain the poisonous property attributed to them, very few people would be able to live here.

2469. As a matter of fact, have you ever known of a case of lead-poisoning in a man here unconnected with work among lead? No; I have not known of any.

2470. Do you think, so far as you have been able to observe, that the fumes which issue from the smoke stacks are not of consequence to the health of the animals here? I think they are; but that they are not soluble in water.

2471. You have said that you never heard of a case of lead-poisoning except in persons working in lead or lead ore? Yes.

2472. The fumes from the stacks do contain lead, and they do beat down upon the houses, and therefore if the townspeople are not poisoned the fumes do not do them any harm? I would not say that. What I wish you to understand is this: that I do not think the fumes falling into the water do the people any harm. I am not talking about inhaling the fumes.

2473.

- Mr. D. Parr. 2473. Very well; then I will ask you again. Do you think that the fumes interfere with the health of the people who are entirely unconnected with the mines? I am of opinion that they do.
- 7 July, 1892. 2474. On what sort of evidence—what leads you to think so? I understand from some of the chemists in town that there is arsenic in the fumes, and I think the inhaling of arsenic in any shape or form must be injurious.
2475. Still, you do not hear, in the case of any of your neighbours falling ill, that the doctors say they are ill of lead-poisoning? I do not place myself in a position to hear that.
2476. Do you mean that if the air were impregnated with oxide of lead and arsenious acid, it is most likely the people would suffer from it? Yes; certainly.
2477. Besides those you have mentioned, other animals die, do they not, from lead—dogs and cats? I have had two or three cases of dogs, but no cats at all.
2478. Still you know that cases do occur? I know that a lot of them die, and that the deaths are attributed to metallic poisoning. I may say that there are very few valuable dogs here worth treating.
2479. We have been told that it is of no use to try to rear pups on the Hill, but if they are brought here after they have reached the age of twelve months or thereabouts, there is a chance of rearing them—is that correct, in your opinion? It may be correct in some instances; but I have seen full-grown dogs brought here and die just as quickly as dogs that have been born in the district.
2480. I understood you to say that in several cases cows had been removed from the town on your advice. Are there any remaining within a distance which you consider dangerous? Yes; some of them are allowed to feed at the back of the hill here.
2481. Mr. Hamlet.] In the case of the *post mortem* examination of animals you have referred to, was the quantity of lead found in the stomach estimated? No.
2482. Would you get lead quicker in the urine than anywhere? Yes.
2483. Have you any cattle or horses under your care now suffering from leading? I have two horses.
2484. Are they going to die, do you think? I cannot say. I thought one was going to die the day before yesterday, but he seems to be getting better now.* The horse belongs to Mr. Lane, of Block 14.
2485. I think you said there were more deaths of animals from lead-poisoning in Crystal-street than any other street in the town? Yes.
2486. Is there any street corresponding in position to Crystal-street on the other side of the Hill? No.
2487. Are there any other streets on this side in which animals are kept, which do afford you an opportunity of comparing the effect of the lead upon animals? Yes; there are other streets where animals are kept.
2488. And in Crystal-street the proportion of deaths is much greater? Yes; much greater. My opinion is that the cows wander away and get poisoned on the rubbish heap.
2489. You refer to the Municipal garbage tip, which, I believe, is 4 or 5 miles from the Town hill? Yes; about 3 or 4 miles.
2490. Which is too far away for the fumes to poison the cattle? I would not say it is too far. But I have never had cases of lead poisoning that far out.
2491. No cases except near the tip? No.
2492. And you are of opinion that the milch cows ought to be kept away from garbage heaps? Yes; certainly.
2493. How is it they are not kept away from them here;—can no means be devised for keeping them off? Not without fencing the rubbish heaps in. The dairymen here save very little by allowing their cattle to roam at large; in fact they lose by it, because the cattle pick up all sorts of injurious things. I may say, when I first came up here, or about six months afterwards, I was not quite satisfied that these cattle were dying from lead poisoning; so I bought a horse—I gave £2 10 for it, and turned it out between the Junction Mine and the British, and allowed it to find its own food and water. It lived three weeks after that, and died of plumbism. It developed all the symptoms I had previously seen.
2494. Do you happen to know the distance between the Slag Dump and Crystal-street? I do not think it is more than 800 yards.

[The witness withdrew.]

FRIDAY, 8 JULY, 1892.

Present:—

DR. ASHBURTON THOMPSON (CHAIRMAN).

WM. M. HAMLET, Esq.

Mr. A. N. Barnett, called, and examined:—

- Mr. A. N. Barnett. 2495. Chairman.] What office do you hold, Mr Barnett? I am Warden of the Broken Hill and Silverton district, divisions of the Albert Mining District.
- 8 July, 1892. 2496. How long have you held that appointment? Since 1889.
2497. Briefly, what are your duties? They consist chiefly of hearing disputes in the Warden's Court at the different mining centres. Broken Hill, Silverton, and Purnamoota, visiting the various mines throughout the district, in regard to their compliance with the labour conditions, and dealing with the question of leases, &c.
2498. You are not officially brought in contact with the miners? Not generally with those in the large mines. I come in personal contact more with the prospecting class.
2499. Then, am I right in supposing that you know nothing of the subject of lead poisoning among the men? Yes. I have no personal knowledge of the matter whatever.
2500. And also with regard to those provisions which are necessary in the mine to preserve health in general, you have nothing whatever to do with that? Nothing whatever.
2501. I see that on the 30th September, 1890, you reported that you had made inquiry to discover instances in which children were being employed in ore-sorting on the Barrier? Yes.
2502. Did you report that it was possible in some cases, that youths of, or about 14 years of age were so employed, but that you were satisfied that the employment of younger children in that capacity was not a general practice, and that you were not aware of any such instances at that date? Yes; that must be the tenor of my report.

2503.

* Note (on revision):—This horse recovered.

2503. Have children under 14 years of age ever been employed in sorting, so far as you know? No; not to my knowledge.

2504. Then did you, at a later date—that is, towards the end of 1891—make some general inquiry into the prevalence of lead poisoning? Yes.

2505. And you concluded that during the last five years there had been considerably more than 1,000 cases of lead-poisoning in the Barrier District? Yes.

2506. May I ask how you arrived at that? The information I supplied in that report was obtained by conference with the mine managers, miners, and medical men. Of my own knowledge, I knew nothing; but from the information I was able to obtain, and more especially that derived from the medical men, I came to the conclusion that it would be quite impossible to give an exact estimate of the number of cases of lead poisoning that had occurred during five years, which I took then to be the life of this place. However, taking all the reports of the medical men together, I felt that I was quite safe in saying that there had been considerably more than a thousand cases known of during the preceding five years. I may state that the accounts of the medical men varied as to the numbers, and as to whether the evil was increasing or decreasing, but from a synopsis of the whole of the communications made to me, I thought I should be on the safe side in stating that number.

2507. You mentioned 1,000 as being a safe number, without wishing to imply that there might not have been more? Yes; I thought that sufficient to answer the question.

2508. Then you also concluded, I think, that the fatal cases where lead poisoning, perhaps, had been the cause of death had been extremely rare? Yes; I had no doubt of that.

2509. And, thirdly, you thought the evil was chiefly confined to the three principal mines here? Yes.

2510. You think that the contradictory evidence you have just referred to arose from a really different experience of the medical men? Yes. The discrepancy was confined to the number of cases, and as to whether they were on the increase or the decrease, but I found no difficulty in arriving at the conclusion that there were but three mines on the line where lead poisoning was considered as an evil. I refer more particularly to the Proprietary, Block 14, and the British.

2511. And then, lastly, you concluded that owing to the adoption of the most approved methods of ventilation, and also water-sprinkling, the evil was probably on the decrease—that was your opinion from what you had heard? Yes; from what I was informed.

2512. Can you furnish the Board with any information likely to be of service to them in this inquiry? No; I cannot say I can do that. I may state that, not being even a resident of the town, I am not able to speak of it from a resident's point of view. I live in Silverton.

2513. I think we have been told of one lead mine outside Broken Hill—I mean Umberumberka? Well, I made inquiries particularly of the manager there, and also of the men who had been working there, and they assured me that there were no cases of lead poisoning there.

2514. From what you learned on the occasion in question, do you think it would be necessary for the Board to concern itself with that mine? I think it would be quite unnecessary, not only because I think the evil does not exist there, but as a matter of fact the mine has ceased to work, and there is very little probability of its working again, except, perhaps, on tribute.

2515. Is there any other considerable lead-bearing mine outside Broken Hill? Not of any extent.

2516. In any case, such recommendations as the Board may find it expedient to make with regard to the Broken Hill mines will of course apply to any other mines of the same character that may now or subsequently be worked? Yes.

2517. *Mr. Hamlet.*] Have you ever heard of any case of lead poisoning at Silverton? No; I cannot say that I have heard of any actual case of lead poisoning. I have heard of men who have voluntarily left the Big mine here to work on smaller ones in Silverton, in order to get rid of lead poisoning; but I know of no instance in which the malady has been contracted in or near Silverton.

2518. Do you know if it has been the practice of some men to buy allotments of land in Broken Hill, and divide them up into smaller allotments of say only 10 feet frontage? No; I have known cases where the ordinary mining allotment of $\frac{1}{2}$ acre has been divided into three, but that would not be of such a small frontage as 10 feet.

2519. You have never heard of such a case? I cannot say I have. I would not speak specifically on the subject; so many cases come before me. But I do not know of any so small as that.

2520. Can you suggest anything under the existing law to prevent the cutting up of allotments into small areas? Do you mean under the Mining Act itself?

2521. Yes? No; I know of nothing to prevent a man doing that if he gets a title to his land; he can then do as he pleases with it. It is necessary that he should hold a business license, and reside upon it himself in order to keep alive his title under the Mining Act. But he might have half a dozen people living with him at the same time without vitiating his title in any way.

2522. Can you tell us anything with regard to the number of boarders taken in some of the common lodging-houses of Broken Hill? I am afraid I cannot give you any information on that point.

[The witness withdrew.]

Mr. J. Melville called and examined:—

2523. *Chairman.*] Are you a veterinary surgeon? I have not passed through any college, but I have been practising fourteen years, and have had three years' experience on the Barrier, during which I have devoted the greater portion of my time to lead poisoning cases; but, before I go any further, I would like to say that I am not in favour of giving evidence which would assist outsiders to give a diagnosis of the disease.

2524. What the Board wishes to hear from you, if you will be good enough to tell them, is whether animals of all sorts, or what sort, do die of lead poisoning here, and how far away from the Hill you have observed them dying from that cause? I can simply state that cows, horses, poultry, dogs, and cats all suffer from lead poisoning. It is common among poultry, cats, and dogs, and this I attribute to their drinking the water where the men wash after coming from the mines. I have been very successful in treatment of dogs and horses. In horses I have generally remarked inflammatory symptoms of the trachea and bronchi tubes, and inflammatory patches on the lungs, rather lighter in colour than ordinary inflammation, and I have also found traces of lead in the liver and the spleen.

2525. Have you found traces of lead anywhere else? I have not tried for it anywhere else. The intestines are generally inflamed.

Mr. A. N. Barnett.

8 July, 1892.

Mr. J. T. Melville.

8 July, 1892.

Mr. J. T.
Melville.

8 July, 1892.

2526. Taking the Proprietary Mine as the central point of the Hill, can you say at what distance animals appear to be safe from lead poisoning? From the cases I have had, I should say about 2 miles. I find none outside of that suffering from symptoms of lead poisoning, excepting in the case of horses engaged in carting water about the town. Poultry I have found suffering from lead-poisoning within 2 miles of the line, but not outside of that.
2527. Do you agree with what we have been told, that pups brought up here and kept within the dangerous limit are almost certain to die, but that if dogs are allowed to attain the age of twelve months before being brought here they may live within the dangerous limit without being affected? That is not correct. I have had old dogs brought to me that have been badly leaded, coming from within half-a-mile of the Hill.
2528. Cows suffer also, do they not? Yes; but I was about to say, further, of horses that plenty of them suffer from paralysis of the respiratory apparatus. This I attribute to the effect of salts of lead on the system, varied by cold changes. I have also seen many cases of paralysis of the optic nerve, but have never arrived at any conclusion as to whether that was the result of lead; but it is prevalent on the Barrier more than anywhere else, I fancy; and that alone, I think, is sufficient to prove that it is the effect of lead in the fumes from the smoke-stacks.
2529. *Mr. Hamlet.*] You have spoken of the spleen in horses; have you ever found traces of lead in it? Yes.
2530. Will you tell us how you found that? By means of the blow-pipe and the microscope.
2531. What quantity of the spleen did you take? Only a small piece—a chip.
2532. A chip of the spleen? Yes? The lead seems to be distributed; it does not collect together.
2533. And how did you ascertain the presence of lead in these chips? I subjected it to the blow-pipe on a piece of carbon, and used carbonate of soda as a flux; and what appeared under the microscope was a bright globule of lead.
2534. So that, according to your account, the spleen would contain a large quantity of lead? Yes. That is in the case where an animal dies of lead poisoning.
2535. Would you be surprised to learn that in the analysis of the spleen of human beings only very minute traces of lead are found, as a rule? What I saw was invisible to the naked eye.
2536. Well, the spleen must have contained an enormous quantity of lead to give you globules of lead under the blow-pipe? —
2537. *Chairman.*] Are you of opinion it does contain a large quantity of lead? I think the spleen has an affinity for lead; but a certain amount of the lead which is taken into the stomach becomes soluble, by the agency of acid secretion before it enters the system.
2538. *Mr. Hamlet.*] In the course of the next month or so, if you get such a spleen as you have described, will you be good enough to take the trouble to send a small portion to the Government Analyst in Sydney? Certainly.
2539. Have you ever examined the liver? Not under the blow-pipe, although I have seen a bluish colour in the liver.
2540. Do not you see that colour sometimes in ordinary *post-mortem* cases? Not the same. The horses show the same blue line that is present on the gums of a man who is leaded, and that is a sure guide to making a diagnosis of lead poisoning. I see, according to a Royal Commission appointed in England some time ago, that the blue line is caused by the salts of lead mixing with the tartar of the teeth.
2541. *Chairman.*] What is the title of the Royal Commission you refer to? It was a Commission appointed to inquire into the effects of lead poisoning somewhere in Wales. I can give you the title to-morrow.
2542. Have you got the report? Yes.
2543. *Mr. Hamlet.*] You have noticed cases of lead poisoning in animals within 2 miles of the town? Yes.
2544. Have you ever seen a case 6 miles from the mines? No.
2545. So you think a horse sent to grass in a paddock 6 miles distant would not be affected? I think not.
2546. It would be quite a safe limit, you think? Yes; I think if a horse were kept 2 miles away continually he might be safe. In the cases I mention, the horses got lead into their systems whilst working in the town.
2547. Did you ever see a horse die of lead poisoning? Yes. A horse dying from lead poisoning has a discharge from the nostrils of a grayish matter, and the membrane is very much inflamed.
2548. Does the horse fall down suddenly, or does he become paralysed in the legs? Very often the horse shows paralysis of the extremities, sometimes behind, and sometimes before. They seem to die in great pain.
2549. *Chairman.*] The cows suffer also, do they not? Yes; I have not had many cases of cows. I have had a few. Their great trouble is constipation, and they seem excited, like an animal intoxicated; probably caused by renal trouble, or something of that kind.
2550. Do you meet with pleuro among the cows here? I have heard of a few cases, and have seen one; but of course we have an Inspector of Stock here, and directly a case is known the cow is condemned.
2551. Which one do you refer to? About two years ago was the last case I saw.
2552. You have heard of none since then? Yes; I did hear of one case, about 4 miles on the other side of the White Lead, a few months ago. They told me they were going to shoot the animal that day.
2553. Was it a milch cow? No; it was a dry cow left by a travelling mob, I think. There was a report here some time ago about pleuro, but I contradicted it. Dr. Groves and myself made a post-mortem of the animal, two inspectors being present also at the time.
2554. At all events, there was no suspicion of lead poisoning there? No.

[The witness withdrew.]

Dr. F. C. Evill called and examined:—

Dr.
F. C. Evill.

8 July, 1892.

2555. *Chairman.*] What are your qualifications? Member of the Royal College of Surgeons, and Licentiate of the College of Physicians.
2556. You are registered by the Medical Board of New South Wales? Yes.
2557. Do you hold any special appointment here? I am one of the honorary physicians to the hospital. That is the only official position I hold.
2558. Do you attend a proportion of the persons engaged about the mines? Yes.
2559. And a proportion of the townspople as well, of course? Yes.
2560. You have no idea, probably, how many persons engaged about the mines would apply to you if they were ill;—do they belong to clubs? Yes; a great number of them; and they also belong to the Medical Fund, a great many of them. I am on the staff of that Fund, and a certain number on the list would apply to me.

2561.

Dr.
F. C. Evil
8 July, 1892.

2561. How many on your list are actually engaged about the mines? Those actually on my list I should say, number between 300 and 400 altogether, including the clubs, of those actually engaged in the mines.
2562. Can you tell us how many cases of lead poisoning you have met with in the course of a year? In my general practice, since January, I find by my books I have had thirty-eight cases of lead poisoning out of 900 cases altogether.
2563. What we wish to get at is, in the first place, the proportion of leading there is among the persons who are exposed to lead, such as miners, and so forth. You are not able, more than anyone else, to form an estimate, are you? I estimate that 4 per cent. of my general practice are lead cases, and of course there would be a much larger percentage of those actually engaged about the mines.
2564. How long have you practised here? Just one year.
2565. Do you think many of the miners go away for treatment when they get leaded? A small percentage, I should say. They first come under the observation of medical men in the town.
2566. Have the seasons any influence, in your opinion, on the prevalence of leading? I think it is very likely. The worst cases of lead poisoning that have come under my observation have been in the winter. The only fatal cases I have seen were in last winter.
2567. The proportion of fatal cases is very small, is it not? Yes; very small indeed.
2568. It has been said that leading both among men and among animals is more common in the hot weather;—have you seen anything to lead you to endorse that statement? Among the animals I should think it might be, on account of their drinking more in the hot weather. That is the cause of leading in animals. But it is not so among the men, I think.
2569. Do you observe that some mines furnish more cases of leading than others? The mines which furnish the greatest number of cases are those in which there is the largest proportion of carbonate ore.
2570. Which are the mines that furnish the larger number of cases, in your opinion? There is a great deal of leading in Block 14.
2571. Does that furnish most cases? Proportionately, more than any other block, I think. I have not actually gone into the statistics.
2572. Have you observed that some kinds of work, whether above or below ground, furnish more cases than other branches? Certainly; I think the underground work—stoping—is more dangerous. There is much more leading among that class than among the smelters.
2573. That is, having regard to the vastly larger number of men employed underground than at the smelters? Yes; even then, I think, it is more prevalent among the underground workers.
2574. More prevalent proportionately? Yes; the numbers coming for treatment for lead poisoning from the smelters are comparatively few.
2575. Do the tradesmen furnish cases—such as carpenters, engine-drivers, mechanics, and so forth? Yes, occasionally; but rarely. Of course, among the plumbers, it is commoner.
2576. Are you now speaking of the townsmen? No; I am speaking of the plumbers employed at the mines.
2577. Have you noticed whether some people are especially susceptible to lead poisoning? Yes; it depends a great deal upon their habits of life.
2578. You do not think it is a constitutional peculiarity so much as a matter of habit? No; I think it depends rather upon their habits to a great extent.
2579. Have you met with any cases at all in your general practice in persons not connected with the mines in any way? Yes.
2580. Can you tell us how many? Very few. I dare say not more than three or four altogether.
2581. Do you trace those cases to some of the causes which are common to every large town? No.
2582. To what cause do you attribute them? I attribute them to the fumes amongst those living or working close to the mines.
2583. But as to those not connected with or working in the mines? Those whom I have in mind now were not connected with the mines; they were tradesmen in Argent-street.
2584. Were they men, women, or children? Children are affected.
2585. You know that as a matter of practical experience? Yes. They may not be exactly leaded, but their health is certainly affected by the fumes.
2586. In what way is their health altered? In the direction of general debility. There may be no actual illness discovered, but all the functions of life appear to be a little below par.
2587. Do you now speak of children of all ages? Well, children up to 10 years of age, I should say.
2588. I think you did not tell us whether the cases of actual leading you referred to were in men, women, or children? In men.
2589. What business did these men follow? One, I remember, was a draper's assistant, and another was connected with an hotel as barman; but now I remember that I have seen one case which could be traced to the occupation directly. It was that of a man who had been connected with an aerated-water factory, where there would be a good deal of lead piping about. I think the leading in that case might have been directly connected with the man's work.
2590. You have now mentioned two;—were there any others? The first barman was another case.
2591. Were there two barmen? Yes; the man who had been working in the factory I have referred to was a barman.
2592. There were two barmen and one draper's assistant;—in the case of one barman you attributed the leading to the usual cause among barmen; in the other you could not trace it to the usual cause? No.
2593. And in the case of the draper there was no suspicion of any of the usual causes? No.
2594. Do the people here in general show signs of anæmia? Well, yes, they do, decidedly; especially those living down in the town, near the mines.
2595. You are quite clear about the distinction between the condition of the people who live in Argent and Crystal Streets and those who live at a greater distance? Yes; there is a decided difference between the people living out of the town and those living in the town. The further away from the fumes, the more healthy the climate is; there is no doubt about that.
2596. A good many deaths here of children under one year are ascribed to marasmus, consumption of the bowels, malnutrition, and indigestion—wasting diseases, in short;—do you think that lead has anything to do with them? I think a small proportion of them may be due to lead; but certainly the climate has a great deal to do with those cases in the summer. It is a very unhealthy place for children in the summer, owing to the want of water, and the smells, and generally insanitary conditions of the houses, which are much too small.
2597. Do you mean that it is a naturally unhealthy locality, or that it is an unhealthy town? Well, it is insanitary to a great extent, certainly. The locality I consider decidedly unhealthy.

- Dr.
F. C. Evill.
8 July, 1892.
2598. In 1891 there were fifty-nine deaths of persons under one year ascribed to diarrhoea, dysentery, gastritis, intestinal catarrh, and such causes;—would you ascribe any considerable proportion of them to lead, or would you trace them rather to the general insanitary conditions? I should attribute the majority of them to the general insanitary conditions and the intense heat in the summer.
2599. Upon the whole, speaking generally, would you say that lead had anything to do with them? No. It might have had something to do with a small proportion of them, but certainly not the majority.
2600. Then there seems to be a considerable number of cases of premature birth, malformation, and so on. Among persons under one year a good many deaths are ascribed to these cases. Do you think lead has anything to do with such cases? In this way, perhaps, that they were the children of unhealthy parents.
2601. That is the point of view I am asking you to take? Certainly from that point of view. Lead poisoning among the fathers would be a considerable factor.
2602. Is that your opinion merely, or do you make that statement as the result of observation? It is merely an expression of opinion.
2603. As a general rule, do you find menstrual irregularities more common here than elsewhere? I am hardly in a position to answer that.
2604. Or abortion? I hardly think so; but I have not had much experience in that direction elsewhere.
2605. They are not strikingly numerous, you think? No; I should say not.
2606. Have you had complaints of impotency from patients? Yes, but not particularly among the miners.
2607. Were they traceable to usual causes? Yes; the cases I had to do with.
2608. You do not think lead had anything to do with them? No; certainly not the majority.
2609. Speaking generally, are you of opinion that the fumes that issue from the smoke-stacks and beat down upon the houses, covering the roofs with lead-oxide which gets into the water-tanks, and so forth, are a matter of consequence to the general population? Oh, yes.
2610. You are quite clear about that? Yes. Of course there is not only the lead; there are other deposits, such as arsenic.
2611. Then I will ask you, have you met with any cases of arsenical poisoning? No; not pure arsenical poisoning. But it seems to me that the lead poisoning here is different from what we meet with in England. It is more acute, and it is a little masked—the ordinary symptoms indeed are very considerably masked by the effects of the dynamite fumes and other causes. It is not purely lead poisoning always. Of course in many cases it is. But there are many symptoms of lead poisoning which one does not get here, or very slightly.
2612. For instance? Well, I have only seen one case of optic neuritis here. That was in a man who had been a painter for fifteen years and had never had any symptoms of lead poisoning until he came to me with double optic neuritis, and a very marked blue-line; it was unquestionably lead neuritis; and that was the only case I have seen. I have looked out for that specially.
2613. You say it is a very common case in England? It is a great deal more common than here, where it is very rare indeed.
2614. Have you practised in England among a population engaged in lead-works? No, but I have done a good deal of work in the hospitals at home, and have seen a good many cases of the class I refer to.
2615. What other symptoms do you miss here? Wrist-drop is very rare here. I have only seen one case, and that case was not my own. Paralysis is very rare; that I put down to the poisoning here being more acute. If the lead poisoning were more chronic and more gradual, the other symptoms no doubt would supervene.
2616. Can you express any opinion as to the value of the blue-line as a diagnostic? I think it is a valuable sign, undoubtedly. But a great number of persons come under my observation, who are not suffering from any of the usual symptoms of lead poisoning; but who yet have the blue-line. Many persons, of course, do not wash their teeth.
2617. Then, you look upon the blue-line as being caused by a deposit on the gums from outside? Yes; in many cases.
2618. And do you think it arises from causes operating externally merely? Not always. Of course, the typical blue-line could not be removed by washing the teeth; but I see that many cases come to me with the blue-line, in which it could be removed by washing.
2619. Do your leaded patients have albuminuria as a rule? I cannot say I have examined all the cases for that.
2620. Have you found any of them suffering from albuminuria? Yes, certainly; some of them. I cannot say how many.
2621. Then, lastly, on this subject, you say that lead poisoning at Broken Hill is not confined to persons who work about the mines? Well, I can only speak as to one or two cases of persons outside the mines; so perhaps I could say it is almost entirely confined to them.
2622. And as to children? I certainly think that children are affected by the fumes; but they do not present any typical symptoms of lead poisoning. Their health is generally affected; the various functions of the body seem to be a little deranged, and that I put down to the effect of the fumes.
2623. Are you now speaking of children brought to you as being ill, or from your general observation of the children here? I am speaking rather of those brought to me.
2624. What do you think could be done by way of prophylaxis by the workers or their employers? One very simple thing, I think, should be done, namely, to provide sulphuric acid beverages for the mine. It is done at Home in the lead factories, and would, I think, certainly be a very useful measure here.
2625. You are probably not aware that that was done here four or five years ago, and it was found that the men would not take advantage of it? I did not know that it had been tried. It is certainly a good thing.
2626. Have you a personal knowledge of factories where it is kept? Not personally—I know from reading.
2627. Is there any other point of prophylaxis which has presented itself to you as being very important? Of course, ample washing is a necessity. The men should pay great attention to cleanliness; but want of water has been the difficulty in that respect. Then, it would be a good thing if the men could be persuaded to change their clothes on leaving their work, it would do a great deal to keep them from getting leaded. I understand there is on the Proprietary mine a changing-room which is not much used.
2628. Have you seen this changing-room? Yes.
2629. Do you think it is what it ought to be? It is merely a place set apart for the men to change and hang their clothes in. You could hardly call it a dressing-room, of course.
2630. Did you see any provision for washing there? No.

2631. Are you of opinion that it is just sufficient to comply with the Mining Regulations and nothing more? As far as I recollect it was, I think, supplied at the suggestion of some one; I do not know anything about the regulation.

2632. *Mr. Hamlet.*] Have you heard, or known, in your own experience, of a case of insanity arising from lead poisoning in Broken Hill? Well, I have a case under my care now, in which, however, I should say, the symptoms do not point to lead. But I have not seen any other cases, except of course of a temporary character.

2633. Have you any opinion to offer as to the effects of intemperance in accelerating the effect of lead poisoning? I can only say from my experience that the men who are the heaviest drinkers get leaded more quickly than others, and get poisoned more acutely.

2634. *Chairman.*] Do you think it has a physical as well as a moral effect? I do not call it a moral effect at all. It is purely physical.

2635. But you have told us that careless habits tend to induce lead poisoning, and careless habits may be said to be almost characteristic of drunkenness, are they not? Yes. Lead poisoning is more prevalent among people of careless habits, and I include intemperance with it. Also heavy smokers are more affected by lead. In that case it is probably due to their cutting up the tobacco and rubbing it in their hands.

2636. *Mr. Hamlet.*] Do you meet with obscure cases among the townspeople, of slight indisposition, or *malaise*, that might be attributed to the lead fumes that emanate from the stacks? I do not remember meeting with any case of the kind that could not be ascribed to simple causes that might occur anywhere.

2637. Do you meet with any cases of lead poisoning in say Crystal-street, that you might attribute to the lead smoke? I have not met with any in Crystal-street. I have mentioned three cases of persons unconnected with mines that I remember. Two were in Argent-street. I have seen no cases of women.

2638. Can you make any recommendations with regard to precautionary measures which might be taken by the mine-owners? I think they should change the men from one working place to another, so that they may not work too long in the lead, and the stopes should be sprinkled to lay the dust as far as possible. These are well-known precautions which should be taken, together with ample opportunities of washing.

2639. Do you say that warm baths might be provided? Yes, they might be certainly. Of course there is some difficulty with the scarcity of water here. But better opportunities for washing certainly ought to be provided in the mines.

2640. With regard to the provision of the sulphuric acid you spoke of just now, do you know the suitable strength to recommend? I should say about 10 minims of the dilute to the ounce. It makes a pleasant acidulated drink.

[The witness withdrew.]

Dr. C. E. Thompson, called and examined:—

2641-2. *Chairman.*] What are your qualifications? Member of the Royal College of Surgeons, F.S.A., London.

2643. Are you registered by the Medical Board of New South Wales? Yes.

2644. How long have you practised here? About four and a half years.

2645. You attend a proportion of the persons engaged in or about the mines, I suppose, and also a proportion of the general population? Yes.

2646. How many cases of leading do you think you have met with in the course of each year since you have been in practice on the Barrier? I should think an average of about 250 cases a year.

2647. I suppose the absolute number has increased since the first year? Yes; I think so.

2648. Have you any idea whether the proportionate number has increased? I think the proportionate number has decreased; but I have no notes to help me in forming an opinion.

2649. However, that is your opinion? That is my opinion.

2650. Do you think many people go away for treatment? Not a great number.

2651. Do you think the seasons have any influence on the prevalence of lead poisoning? I have no doubt of it at all. Lead poisoning occurs most frequently in summer.

2652. Can you account for it in any way? It may be that in summer the wet skin favours the absorption of lead through the skin.

2653. Wetted by perspiration? Yes.

2654. Do you observe that some of the mines furnish more cases than others? I do.

2655. Which are they? Block 14 and the British are those from which we seem to get the most cases.

2656. And do you get any cases from the other mines? Yes; we get a good many from the Proprietary, some from the Central, and some from the South.

2657. But from them you get many less than from the mines you first named? Oh, yes.

2658. Have you noticed whether any particular kinds of occupation about the mines are more likely to cause leading than others? Yes;—smelting, on the whole, yields more cases than mining here.

2659. And as smelting includes both charge-wheelers and tappers, do you distinguish between these two classes of smelting hands? Yes; and the tappers are those who suffer most, in my experience. The charge-wheelers do not suffer much. I have on my list a charge-wheeler—a shift boss—who has been on the charge floor a long time, I think nearly three years. He is now suffering from some indirect effects of lead poisoning; but he has never been leaded, that is, in the sense the men mean when they say "I am leaded"; he has never had colic, or symptoms of that kind. He is now suffering from nervous affection, neuralgia of the fifth nerve, and debility.

2660. Would you be inclined to look to lead anæmia as the cause of those symptoms? Yes; he had also the blue line and constipation, but no other symptoms of lead poisoning. As I have said, I think he was a long time engaged on the charge floor.

2661. Do you get any cases among the tradesmen engaged about the mine, such as mechanics, carpenters, engine-drivers, and the like? I have seen a case which is, I think, singular, in one of the fitting-shops on a mine where there is no lead at all and no smelting works.

2662. Which mine is that? Block 10. It was an aggravated case; the man became maniacal and epileptic. He said that when the wind was blowing in a certain direction the smoke from the Central stack blew right into the fitting shop of Block 10, where he was working. I am not aware whether any other cases occurred in the same fitting-shop; but they may have occurred without my knowing. Among other tradesmen, some of the men employed in timbering suffer, but the carpenters generally work on the surface.

Dr.
F. C. Evill.
8 July, 1892.

Dr. E. C.
Thompson.
8 July, 1892.

- Dr. E. C. Thompson.
8 July, 1892.
2663. The carpenters who go below to fix the timbers disturb a great deal of dust in hammering, and so forth? Yes; that is the way they get leaded.
2664. What is the longest time you have known a man to work about a mine without becoming leaded? I know a man, who, according to his own statement, worked for nearly five years on the tapping-floor of one of the smelters and escaped leading during that period; but he has since suffered from an acute attack. He has been ill for three months, and is still ill. Michael Toohy is his name. He will not be able to work in lead again, I think.
2665. Do you think he was entirely free from lead during those five years until he fell acutely ill? I do.
2666. Did you ascertain how it happened? Yes. He was exposed in some way to strong fumes. It was at the time we were very short of water, and the jacket got out of order, and in setting the matter right it appears he was exposed to the thick fumes from the furnace.
2667. Do you think every man engaged working in lead is sure to get leaded, sooner or later; or do you think that, by taking precautions, he can save himself? I am inclined to think it is largely a matter of predisposition. Some can work in lead, and, with precautionary measures, save themselves indefinitely, I believe; whilst others, I am convinced, cannot work in lead at all without suffering.
2668. You distinctly recognise a constitutional susceptibility not due to specially dangerous personal habits? Yes; that is what I mean.
2669. I believe lead poisoning causes different classes of symptoms in different patients? Yes.
2670. Will you mention the classes? The commonest class of cases are cases of colic, generally without other symptoms, except obstinate constipation. The next class are the epileptics—they are not very common.
2671. Very much less in number than the cases of colic? Very much less; but I think next in the order of frequency. Then there are cases of motor paralysis, sometimes taking the form of wrist-drop, and sometimes taking the form of general muscular atrophy.
2672. Are motor paralyses in general common? No. Then there are cases—principally allied to the epileptic form of cases—in which a man becomes comatose at once. Those cases are frequently fatal. I have seen one or two recover; but they are generally fatal. They are happily very uncommon.
2673. What do you consider is the relationship of those four classes to each other;—do repeated attacks of colic lead to paralysis, and then, after a time, does paralysis lead to epilepsy, or coma? I cannot say so. I think not. I do not think they lead from one to the other in that way. A man, whose poisoning assumes the colic form, sticks to his type, as far as I have seen; he may have it again and again, but will not get anything else.
2674. Roughly speaking, you take it that lead absorbed preferentially affects different parts of the nervous system in different people probably? I think so. It is a poison which appears to affect the nervous system chiefly.
2675. What do you mean by "chiefly"? I say "chiefly" because there may be indirect secondary results which affect the circulatory system. They are not primary.
2676. In those cases of sudden coma and encephalopathy, have you found sometimes that the attack has been in reality sudden—that there have literally been no prodromal symptoms at all? So far as I have been able to ascertain, yes. The patient has been perfectly well until he has fallen down in a fit. I believe that kind of illness sometimes occurs to miners who have been following the same class of work all the time.
2677. What is your opinion of the value of the blue line as a diagnostic? Well, it is extremely uncertain; I do not think it is of much value. I pay very little attention indeed to it. I am satisfied with other symptoms. Some present the blue line and some do not.
2678. Do you think it is produced by merely taking the lead into the mouth? No; I do not think it is ever produced by the deposition of lead in the mouth.
2679. Do you think it not a merely local condition? No; it is a constitutional manifestation.
2680. If in any suspicious case you find the blue line absent you would not think that against the diagnosis of lead poisoning? Not at all. I regard it as being of no essential value. Being present, it is a corroborative sign, but if it is absent we can do without it.
2681. What affections of the circulatory system have you had opportunities of observing as the result of lead poisoning? Beyond retardation of the heart's action I have observed no disturbance of the circulatory system at all.
2682. As to the kidneys, do you find albuminuria sometimes as a result of recent poisoning by lead? No; not to my knowledge.
2683. If albuminuria occurs as the result of lead poisoning, are you of opinion that it must be in chronic cases, and after a period of years—in such cases as there has not yet been opportunity of watching in this place? Yes.
2684. What about optic neuritis—have you had any experience of that here? No case of the kind has ever come under my notice as the result of such lead poisoning as we get, nor have I ever heard of a case up here, although I have inquired of several medical men.
2685. Has any encephalopathic case ended in insanity in your experience? No; I think not. I do not recollect any such case. The case of the man who worked in Block 10 was not such a case. He was a lead-epileptic, and that resulted in insanity.
2686. Have you known it to result from any case of coma? No; they have either died or got well. I only remember one case of a man who got well, and I have reason to believe that he died subsequently from a second attack.
2687. Do you observe among the persons who are poisoned by lead, any of the various lesser forms, any evidence of mental dulness and muscular slowness? I think in cases where the poison is slow in its action, and where it is slowly eliminated, you do get a certain amount of mental dulness; but most of the cases I have seen here are sub-acute in nature. They are ill, and then get well again, and then they are well in reality.
2688. You have said that some people are more susceptible of lead than others; have you been able to explain that to yourself satisfactorily? No; I was never able to trace any reason why it should be so, although I have more than once observed that it was so.
2689. Can you describe one case of coma? Yes; one case I remember tolerably well. A youth of about 21 fell down underground at his work, and was picked up unconscious, and remained so fully forty-eight hours. His respiration was quick, his pulse was accelerated, and his face was very much suffused. He was treated in the hospital. I was not able to observe him the whole time that he was ill; but that was his

Dr. E. C.
Thompson.

8 July, 1892.

his condition when I saw him. At length he became moribund. However, he did not die; he quite recovered. When I saw him, I did not think he would live more than an hour or so. But generally the cases I have seen—and I think I can recollect three other such cases—have ended fatally.

2690. But is that coma not followed by delirium or mania? I have not seen it; but such cases are uncommon. I think I can recollect only five cases in five years.

2691. You mean that you personally have never seen delirium or mania following? Certainly.

2692. But you know it has occurred here? Not as a sequel to a case of coma. I have known it as a sequel to epilepsy in more than one case.

2693. Do you regard epilepsy and coma as separate kinds of lead poisoning? Yes, I do.

2694. You do not think they constitute one class of illness? No; but we know from other experience that repeated epileptic convulsions will merge into coma, and the patient dies.

2695. Have you ever had any cases of lead poisoning among the general population? I have.

2696. You had the case of a barman, I believe? I did have one case. That was a case of lead poisoning through drinking beer out of a beer engine.

2697. It was due to one of the causes commonly met with in cities? Yes.

2698. Have you ever met with cases of indisposition among the general population not connected with the mines which might be attributed to the effects of lead? Never, except in one case, which was clearly one of lead poisoning, and that occurred to the child of a mine-manager, who lived just underneath the smelter stack.

2699. That child was 2 years and 8 months old, if I remember right? Somewhere thereabout.

2700. Did any other members of that family suffer then or at any other times? Not to my knowledge.

2701. How was it that that child alone suffered? She was permitted to run about in the garden, and it was her custom to pull the flowers and put them in her mouth, the flowers being covered with flue-dust. The case was fatal.

2702. Do the people show signs of anæmia? No; certainly not.

2703. What is your opinion of the children in general here—are they rosy and stout and active as children should be? Very much so. They are very healthy children indeed, even exceptionally so, I think.

2704. It has been given in evidence that the children here, that is, such children as were presented to the medical witness on account of some indisposition or another, exhibited anæmia with especial commonness? It has not come within my experience.

2705. Are you of opinion that the fumes which issue from the smoke-stacks, which beat down upon the houses and deposit lead dust upon the roofs, and therefore, ultimately in the iron-water tanks, are of no consequence to the inhabitants, speaking from your own direct observation? That has been my experience, that they are absolutely inert, so far as affecting the general health. The fumes do not practically affect the general health at all; that is, they have not so far.

2706. You have practised here five years? Yes.

2707. And you have always been alive to the possibility that harm might arise from the fumes? Certainly.

2708. And you probably hear it frequently alleged that they ought to be, or must be, dangerous? Frequently.

2709. So that it is not from overlooking results that you are of opinion that no results do ensue? No.

2710. There are among the deaths of persons under one year of age—I am now quoting from the Register for 1891—a certain number which are ascribed to wasting diseases; are you of opinion that lead at all events has nothing to do with such cases? I am.

2711. Do you think many of them were probably due to tuberculosis? A proportion, though not a larger proportion than elsewhere.

2712. Do you think that improper feeding is a main cause of such deaths? I am very strongly of that opinion.

2713. Are you of opinion that improper feeding conduces largely also to the class of deaths from intestinal diseases, such as diarrhœa, dysentery, gastritis, enteritis, and the like? I am.

2714. Then in the same year twenty-five deaths of persons under one year of age were ascribed to premature birth, defective development, and so forth; do you think lead contributes to these in any degree, not as directly affecting the children, but through their parents? I have never had reason to think so; but on the other hand I am not prepared to say that I have made any special investigation of the question.

2715. Do you think that premature birth and malformation are commoner among this population than among others? No; I do not think they are commoner here than elsewhere.

2716. They do not occur especially, perhaps you can say, in the families of persons employed about the mines? No; not with more commonness than among people otherwise employed, as far as I know.

2717. As to menstrual disorders and abortions, are they more common here? I think not.

2718. Is impotence a common complaint among men? Not at all.

2719. When you meet with it are you able to ascribe it to the ordinary causes of impotence? I think I have only seen three cases of impotence since I have been here.

2720. And were you able to exclude lead as the cause of it? Yes.

2721. Do you agree that animals die here of what is called lead poisoning, and which probably is lead poisoning? They die of something which is probably a local condition anyway.

2722. They die in a way you have never seen elsewhere? I cannot say that. Cats and dogs die in fits here; and cats and dogs are everywhere subject to fits. But I do know you cannot keep pets in the town—that is to say, cats and dogs.

2723. Do you mean by "in the town," near the Mill? Yes.

2724. Now, as to prophylaxes, do you agree that personal cleanliness ought to be carefully observed by persons who work in lead? I do.

2725. Will you tell us whether in your opinion, under the circumstances of this town, a majority of the miners have in their houses sufficient accommodation for bathing, and whether they can get sufficient water to bathe in? The accommodation does not exist. There is no accommodation for bathing either in the houses which the miners build for themselves, or in the boardinghouses. The general custom is for a man to wash himself down to the waist in a basin of water when he comes off the shift—that is to say, when he comes from his work in the afternoon, after 4 o'clock. Whether they do the same at night I cannot say.

2726.

- Dr. E. C. Thompson.
8 July, 1892.
2726. It has been given in evidence that the men do wash themselves down to the waist as you describe, but that they do not very often wash themselves below the waist, because there is no place to which they can retire out of view of the household? That is so; there is no sort of accommodation for it.
2727. Now, are you quite clear that personal cleanliness is an important part of the prophylaxes of lead poisoning? I am quite clear that it must be so. I cannot quote you any case or cases of dirty men being more subject to lead poisoning than clean men; but I am quite sure it must be so.
2728. In any case do you think the mines should provide baths for the men? Yes; I certainly think there should be some provision of that kind.
2729. Do you think that these baths should be provided with hot water? Quite so. In the winter it should be so, certainly, to induce the men to use them at all. If they were not supplied with hot water the men would not use them.
2730. And for a similar reason, I presume, you think a changing room should be something more than a shed merely sufficient to comply with the words of the Mining Regulations? A partitioned shed is all that is necessary—that is a series of partitions, forming little boxes.
2731. It has been given in evidence that at Bendigo the men are provided with suits in which they do their work, and are compelled, not by the law, but by the universal custom among the proprietors, to put on these suits when they go below, and take them off and put on their own clothes when they come up again. The rule was established in the first instance to prevent the stealing of gold; but it has been found a beneficial regulation as regards the health of the men, who there often work in wet ground;—do you think this rule might be enforced with advantage here? I do not think it is necessary. In fact, the men, as a rule, change directly they get home. They do not walk about the streets in the clothes in which they have worked. They go to and from their work in their working clothes; but they always change their outer garments.
2732. You cannot say whether they change everything? I cannot.
2733. Is it not a usual custom amongst all classes of working men to change their clothes when they are not at work. For instance, a blacksmith, I believe, does not loaf about the streets in his working clothes? No; I suppose it is the custom.
2734. Are you able to say whether the changing of clothes which is done here is done solely with the object of getting rid of the leaded garments? No; it is done because it is not considered dignified to walk about in working clothes.
2735. Are you of opinion that a miner should not walk about longer than necessary in leaded clothes? I am, certainly.
2736. It has been given in evidence, also, that the men employed about the smelters have twenty minutes crib time allowed them, but that they do not always have that twenty minutes clear. Do you think it desirable that the men employed about the smelters should have a clear time for their crib? I think it is on general principles, desirable that every man should eat his food leisurely—that he should have time in which to eat it.
2737. Do you think he should be able to wash his hands and mouth before taking his food, and that he should not be called upon to contaminate his hands and mouth again until he has finished eating? Certainly; I think that important.
2738. What other steps do you think might be employed besides general cleanliness, and attention to the way in which food is taken? Periodical purging I think.
2739. As to smoking for instance? I do not think smoking exerts any influence for or against, except in the matter of preparing their tobacco for the pipe, the men rub the tobacco in their hands, and I think it would be wise to forbid smoking at the works. A periodical purge is probably useful.
2740. Are you acquainted with any men who use it? Oh, yes; many men do, but get leaded all the same, however—some of them. But it is useful to a large number of people who never saw a lead-mine in their lives. I do not know that it is much good as a prophylactic measure. I think the employment of milk is an important measure, remedial or prophylactic, or both. I think, also, the free employment of water about the stopes is of importance to keep down the lead dust.
2741. Do you think it so important that it would be well to enforce it by law? I have not the experience of underground working to be able to say that, but any measure that would minimise the dust is very important.
2742. And the ventilation of the mine, I suppose ought to be especially good? Yes.
2743. *Mr. Hamlet.*] With regard to prophylactics, and specially of purges, do you find any special value in soluble sulphates? I always prescribe them as a prophylactic; they are in fact used by the majority of the men themselves in the form of sulphate of magnesia.
2744. Is that the usual form of purge they take? Yes.
2745. Does alcoholism seem to aggravate plumbism? Yes; very much. A man may drink, or work in a lead-mine, but he cannot do both with impunity.
2746. Would a man sleeping underground thus place himself in a favourable position for getting leaded? Certainly; if he slept where the work was going on.
2747. More so than if he were working himself? No; I do not think that.
2748. When the smelter-tappers describe their pains and symptoms, what do they say—that is, how does the lead usually affect them? It usually takes the form of colic. They begin with feeling "off colour"; they cannot eat, and have headache, and the bowels become constipated; then they suffer from obstinate constipation and colic.
2749. Generally you find no distinction between their complaints and those of the men who work underground? No; I think not.
2750. During your practice here, have you found general complaints made by the persons living in the town against the fumes that issue from the smoke stacks? No; I have not.
2751. They pass it by as a matter of every-day occurrence? Yes. Occasionally I have heard specific diseases, like pneumonia, for instance, attributed to the smelters; but I have not met with any disease that is really attributable to that cause.
2752. *Chairman.*] Fatal cases of lead poisoning are very rare, are they not? Very rare.
2753. Is it your opinion that lead poisoning eventually damages the constitution, and is an indirect cause of illness which may be fatal at a future date? I do not believe the lead poisoning that occurs here does damage the constitution permanently. However, it is a matter which could only be decided by many years of observation. I have never seen constitutional secondary effects such as chronic neuritis; and I do

- not think it does occur, in fact; because the men are not bound to stick to the work, and do not stick to it.
2754. Are you of opinion that in any mine which contains lead-bearing ore and other sorts of ores, there should be systematic shifting of the men periodically, from one part to the other? If possible, yes.
2755. And if a man gets leaded through working in the lead-ore, an effort should be made to find him work where he will not be exposed to lead? Yes.
2756. Is gout a common complaint here? No.
2757. How many cases have you met with during the five years you have been here? I think only two, and only one of them occurred in a lead subject—a man who was suffering at the time from lead poisoning.
2758. *Mr. Hamlet.*] It is sometimes alleged that lead is not the sole cause of supposed lead-ore poisoning, but that arsenic is frequently the cause? Yes.
2759. Do you find any symptoms to warrant that? I have never seen any symptoms that remotely suggested arsenical poisoning, to my mind.

Dr. E. C.
Thompson.
8 July, 1892.

[The witness withdrew.]

Mr. Joseph Wilks called and examined:—

2760. *Chairman.*] What office do you hold? I am Inspector of Stock.
2761. How long have you been here? I have been in the district about two and a half years.
2762. Generally speaking, what are your duties? The supervision of all stock in the district.
2763. You travel about a great deal? Yes.
2764. Have you ever performed the same duties in any other part of the country? Yes.
2765. Do you see cattle and horses and other animals in this district ill of diseases that you have not seen elsewhere? Yes.
2766. What do you attribute that illness to? To minerals. I see cattle affected immediately round Broken Hill that I do not see similarly affected elsewhere.
2767. How far from the Hill do you see cattle affected in that particular way? Not above 2 or 3 miles from the main line.
2768. And you think it is mineral poison that they suffer from? Yes; I have at various times reported cases to my chief, and through him to the Government Veterinary Surgeon. I remember when I first came here, more especially, I reported several cases, and I think my opinion was upheld by the Government Veterinary Surgeon. I have never had reason to believe otherwise.
2769. What I want to know from you is this: whether you are acquainted with any case of an animal dead of supposed mineral poisoning in which the viscera were sent anywhere for chemical analysis? No.
2770. You do not know of any case in which evidence of mineral poisoning has been established? I do not.
2771. Can you form any independent opinion of your own as to whether the mineral poisoning you found the cattle to suffer from was due to mineralised water or to deposits of the fumes from the smoke-stacks either in the water or on the soil? I think it was from drinking the water, on these grounds. When I first came here, about two years ago, many cases were reported to me, and I found, upon inquiry, that those cattle which were affected had been drinking the deposit water, on the catchment area, whereas those that drank the good water from the Imperial tank at that time were not suffering.
2772. The water you refer to was not distinctly mineralised water—pools on the surface, you mean? Yes; and I think they were also affected by the fodder they picked up—that is, the cattle which were turned out to pick up what they could find.
2773. There was a difference in the diseases of the two classes of cattle you refer to? Yes; that was during the summer when we had a fairly good season. During the season last past there has not been nearly the quantity of poisoning, and I attribute that to the circumstance that there was really nothing for the cattle to pick up at all, nor was there any water, except that which was brought here.
2774. Then, in this last very bad season, they were protected because they had nothing except good water and food, so far as it went? Yes; with the exception of some outside the boundary which drank from mineralised wells. They were affected.
2775. And if the cattle drank from these wells they would be affected all the year round? This special lot of cattle had only come out during the last season, to the place I refer to. But they were not affected in a similar way to the cattle I had seen previously. Dr. Groves and I made a *post mortem* on them, and we did not trace the death in those cases to lead poisoning, so much as to bad food and water—probably mineral water. If they had had good food and water they would not have died.
2776. You think death was practically caused by partial starvation? Yes.
2777. Whose cows were they? Rammart's.
- 2778-9. Who made the *post mortem*? Dr. Groves and myself, and a person named Melville, who opened the cow under my direction.
- 2780-1. Did you see the lungs? Yes.
2782. Were they free from disease? Yes; they were discoloured a little, but not actually diseased; at all events not suffering from pleuro-pneumonia.
2783. *Mr. Hamlet.*] Do you remember having seen the spleen of those animals? Yes.
2784. Did you observe anything that would lead you to suppose they died of lead poisoning? No; not in those animals.
2785. Did you see anything remarkable about the spleen of those animals? Not about the spleen. It was to all intents and purposes healthy; the colour and size proper.
2786. Is it not a fact, that after a *post mortem*, sometimes some of the organs appear bluish-black in colour? Yes.
2787. And such appearance is due to decomposition? Yes; in nearly all cases it is due to decomposition—that is where the organs are sound. I may say I looked especially at the spleen of these animals, and I saw nothing to lead me to think that there was in any way disease of the spleen. The symptoms seemed to me to indicate an impoverished state of the body. The whole of the tissues contained water instead of blood.

Mr.
J. Wilks.
8 July, 1892.

[The witness withdrew.]

TUESDAY, 17 JANUARY, 1893.

Present:—

DR. ASHBURTON THOMPSON (CHAIRMAN).

W. M. HAMLET, Esq., F.I.C., F.C.S. |

J. HOWELL, Esq.

J. THOMAS, Esq.

Mr. C. Lawrey called and examined:—

Mr.
C. Lawrey.
17 Jan., 1893.

2788. *Chairman.*] What is your name? C. Lawrey.
2789. What is your occupation? A tapper.
2790. *Mr. Howell.*] How long have you been in the employ of the Broken Hill Proprietary Company? About five and a half years.
2791. Working steadily all that time? Yes.
2792. What work were you doing when first employed? Slag wheeling.
2793. And then you went from slag wheeling to tapping? Yes.
2794. How long have you been tapping? About three and a half years.
2795. On the north or south smelters? I have been on the south, but I am on the north now.
2796. You have been at both? Yes.
2797. Are you a north smelter at present? Yes.
2798. Have you ever been laid off with sickness caused by lead poisoning? I have been laid up for over a week at a time, but I do not know whether it was lead poisoning or not. I have never been very seriously leaded.
2799. Do you think you positively have felt the effects of lead symptoms? Yes; I have felt the effects of fume.
2800. Did you apply to a physician for medicine or advice? No.
2801. How long was the longest time that you were laid off? Never above eight or nine days.
2802. You went back again? Yes.
2803. How many times do you think you have been laid off in the five years you have been employed? I could not say; a couple of times, I think. I have been laid off by an accident to my hand.
2804. Yes, but that is a different thing altogether. Are you aware, from your own knowledge, there are a great number of men disqualified from working by lead poisoning? I have known some cases where lead poisoning has laid the men off.
2805. The Chairman is very anxious to learn all particulars with regard to lead poisoning. I will be glad if you will give me all the evidence that you can, and I might say that you need not be in the least afraid of offending anyone by so doing, as we are all here with a desire to learn from the witnesses their feelings upon the matter; also any suggestions that they might make. You never fed? No.
2806. At what particular furnace do you think at which a man is most likely to become effected with lead fumes? I could not say anything about the upstairs. I only know of the lower portion.
2807. Do you think there is as much care exercised around the furnaces as there should be, in order to prevent men from getting lead poisoned. Could you suggest anything that you think would be an improvement? That is a question that I could not very well answer.
2808. You being there constantly, would as likely as anybody observe a thing of that sort? The only thing I know of is that if you could stop the wind from blowing, it would be far better.
2809. Well, you have plenty of air? Yes; rather too much.
2810. Do you think in the position you are in at your work, that you are as liable to become leaded as any other man? I think I am about as liable to become affected as any other man. I am as much in the fumes as anybody.
2811. *Mr. Hamlet.*] Have you ever noticed any difference on different days. Suppose you were at work on a very close muggy day, do you find any bad effects from the lead then? I do not know that the atmosphere has much to do with it. Certainly on a hot day, you see it laying about more than on a cool day.]
2812. Is your work connected with any particular smelting furnace? No; not particularly.
2813. In any of them? Yes.
2814. Who selects the furnace for you to work at—is it a matter of your own choice? No; it comes in our turn.
2815. There is one furnace worse than the rest, probably you will be sent there? Yes; there is a furnace a little worse than the rest.
2816. The one where matte is smelted? Yes.
2817. Every man will take that furnace in turn? I do not know that they do it on every shift, but they do it on our shift.
2818. In any of your cases of illness when you were laid up, was it through working on that particular furnace?
2819. *Mr. Howell.*] It was not in existence at the time; it is a recent construction.
2820. *Mr. Hamlet.*] So far as your experience goes, then, one furnace is just about as good or bad as another? Of course, the outside furnaces are always regarded as the best, as you get more air there.
2821. Have you worked at all different kinds of work on the smelting floor—have you worked at tapping and slag wheeling? Yes.
2822. And skimming the bullion? Yes.
2823. Which kind of work do you prefer as a matter of choice? The easiest.
2824. Which is the easiest? Well, I suppose that tapping is about the easiest.
2825. But then would you not be likely to get more fumes in tapping than slag wheeling? Yes.
2826. But you have never found the fumes to be so bad as to make you wish you were on some other job? No; I cannot say that I have.
- 2826½. I suppose if you complained of the fumes you could be put on to something different? I do not know now whether we could or not—one time we could.
2827. Supposing you found the fumes pressing you, and you would like to go slag wheeling—could you do that? Yes.
2828. Can you give us any ideas as to the kind of feeling you experience when laid up? A dull, heavy feeling mostly. Never had a severe attack.

2829.

Mr.
C. Lawrey.
17 Jan., 1893.

2829. *Mr. J. Thomas.*] You say you have not been leaded, not of any consequence yourself. Mr. Howell asked you if you had seen a doctor or physician when laid up, you said no. Did you ever go to a chemist's? No.
2830. You never took anything as a preventive? No.
2831. You have been here five years now, and I suppose you know a lot of men in Broken Hill? Yes.
2832. Have you heard of a large number of cases of lead poisoning? Yes; a good few.
2833. Amongst your friends, whom do you think are more likely to be leaded—underground men, or men around smelters? Underground men are.
2834. As far as the slag wheelers are concerned, I suppose they very rarely get leaded? I do not know. I am sure some of them get leaded.
2835. But there is less probability of a slag wheeler getting leaded than a tapper? Yes.
2836. A slag wheeler does not get the wages a tapper does? No; he gets a shilling a day less.
2837. The tapper is looked upon rather as in charge of a furnace; he is next to the foreman. Well, although the slag wheeler is the harder worked, do you believe, if the pay was exactly the same, that men would prefer slag wheeling because of less probability of getting leaded? I could not say. Some men like tapping, and some men like slag wheeling.
2838. Oh, there are some men who would prefer slag wheeling to tapping? No; I did not say that.
2839. You do not think it probable that if Mr. Howell was to tell a man he could go tapping instead of slag wheeling, that he would prefer to stay slag wheeling? No; I could not tell other men's thoughts.
2840. *Chairman.*] He has already said that it is much lighter work, and so it is;—but it may require a little more dexterity;—do you know of any friend of yours who has ever died from lead poisoning? No.
2841. *Mr. Howell.*] If you had your choice to-day to work on the surface on top of that hill in the sun in the open air for the same wages as you are getting now at tapping, which would you prefer to do? I think I would take the tapping.
2842. *Chairman.*] Are you a married man? No.
2843. How far from work do you live? About a quarter of an hour's walk.
2844. You work on one shift, I believe, one week, and the next week on another shift? Yes.
2845. Is it your custom to make a point of getting food before you go to work? Well, about an hour or an hour and a half, two hours sometimes, it depends upon the shift.
2846. You go on at 4 o'clock in the afternoon on one shift? Yes.
2847. Then you have had your dinner at 1 o'clock? About half past one.
2848. Then the next shift is 12 o'clock. Yes.
2849. Then you have your supper at 11 o'clock? Well, I mostly have my dinner at 6 o'clock, and have a little to eat about 11. Scarcely anything to eat at 11, just something light.
2850. Have you got your working coat on now? Yes.
2851. You have been at work to-day? Yes; working this morning.
2852. Then you change when you get home only? Yes; when I get home.
2853. Have you ever had anything to do with flue-dust? Well, I have never been connected directly with flue-dust, but I have been working with flue-dust near me.
2854. How old are you? Twenty-eight.
- [Chairman examined witnesses gums, and showed that they had the blue line. He noticed that the witness was not evidently anæmic.]
2855. *Chairman.*] You take some food to the mine with you? Yes.
2856. What do you generally take? Mostly sandwiches.
2857. How do you carry your crib? Mostly wrapped up in paper.
2858. When you get to your work what becomes of your coat, where do you put it? Hang it outside the shed on the post.
2859. Your crib being still in the pocket? Yes.
2860. Do you get always a clear twenty minutes in which to eat your crib? Well, we have no specified time for crib at the furnaces.
2861. In fact when you think the time has come round you just take it in your hand and eat some of it, and do a little more work and take another piece, and get through it that way? We sit down till we are finished.
2862. How do you mean that you have not a specified time;—you have a right to twenty minutes, have you not? I do not know that we have ever had any specified time at furnaces, sometimes we get twenty minutes, if anything was wrong we might not get that much.
2863. Do you mean you get a little time by arrangement with other men, by arrangement between yourselves?
2864. *Mr. Howell.*] There is no specified time;—they can eat their crib any time they wish.
2865. *Chairman.*] Are the men allowed to smoke at their work? Yes.
2866. And those who smoke do smoke, I suppose, pretty often during the course of eight hours? Yes; every time they feel inclined.
2867. There is always some flue-dust lying about the tapping-floor? Well, I cannot say always, every time the flues want cleaning it is there.
2868. It is nearly every day, is it not, that either one part of the shed or another has it? Yes.
2869. Is the dust wetted as soon as it is brought out of the flues? Yes; it is immediately damped down.
2870. And that is done regularly? Yes.
2871. How is it raked out? With long rakes.
2872. There is a good deal of dust when it falls down of course? Yes; there is bound to be some dust.
2873. And then you wet it to prevent it flying about? Yes.
2874. Does the process of wetting cause much dust? None. The water runs on a level with the dust, and does not drop upon it.

[The witness withdrew.]

Mr. John Dimpsey called and examined :—

- Mr. J. Dimpsey.
17 Jan., 1893.
2875. *Chairman.*] What is your name? John Dimpsey.
2876. What are you? I am a feeder of the smelters.
2877. You are on the upper floor? Yes.
2878. How old are you? Thirty-nine or forty.
2879. *Mr. Howell.*] You are in the employ of the Broken Hill Proprietary Company? Yes.
2880. How long have you been in their employ? Five years and five months.
2881. Engaged on the furnace all the time? Yes.
2882. In the capacity of feeder? Four years feeding.
2883. What first? Charge wheeling first; then feeding furnaces.
2884. On north or south smelters? I am on south now—have been on both.
2885. You fed on the old furnaces as well as the new ones? Yes.
2886. Did you find that there was much more fume coming out of the old than out of the new furnaces on the feed floor? There has not been so much fume since the new furnaces have been put up.
2887. Do you find any fumes on the feed floor now to amount to anything? No.
2888. Have you during your time been leaded at all? Never.
2889. Have you been laid off sick at any particular time? About twelve months last November for a fortnight, with influenza.
2890. You have not felt any serious effects from lead-poisoning at all? No; not in any way.
2891. *Chairman.*] You say you were laid off for a fortnight? Yes; with influenza, twelve months ago.
2892. You are one of the oldest hands on the furnace? Yes; only one or two are there now that were on when I came.
2893. You never worked below on the bottom floor? No.
2894. Do you think there could be any improvement made on the feed floor to prevent what is known as lead-poisoning, or do you know that there has been any lead-poisoning to any considerable extent? I never knew of any lead-poisoning. I hear some people talking of people being leaded, but I never heard of anyone being leaded on my floor.
2895. When the furnaces are all running regularly, do the fumes come up on the feed floor? No; it cannot come through to the feed floor.
2896. When a furnace is shut down for repairs occasionally a little fume will go up? Yes; a little.
2897. When the draft is off? Yes.
2898. *Mr. Hamlet.*] What time of the day do you have your crib? Twelve o'clock.
2899. That is once in a shift? Yes.
2900. The other meals you have at home? At 12 o'clock night-shift we have it. After 4 in the morning, and in the afternoon shift about 8.
2901. Where do you generally keep your food? In my pocket.
2902. Wrapped in paper? Yes.
2903. I suppose that is the custom of almost everybody? Yes.
2904. And what do you drink when you are thirsty on the mine? I drink tea or water.
2905. You bring tea with you? Sometimes I take it made at home, and other times I make it up at the mine. If I am not in a hurry in the morning I make it at home, but if in a hurry I make it at the smelters.
2906. Where do you get water to make tea at the smelters? Take it generally from the water-bags up stairs, and sometimes go down to the tank for it.
2907. Where is that water got from in the bags? From the condensing-plant.
2908. It is condensed water? Yes.
2909. Now, taking the hottest and stuffiest day that you can ever remember, do you think there is enough ventilation on feed floor? I think so. A hot day never troubled me any more than the ordinary days since the new floors were built. Of course the old floor was a bit warm in sultry, hot weather.
2910. I think your feed floor is quite open on one side to the sky? Yes. I think there is plenty of ventilation. Rather too much in winter time, when it is pretty cold.
2911. I suppose you know what is meant well enough by being leaded? I do not know. Of course, the person who was leaded would know better himself, but I do not know the result of it at all.
2912. But have you not seen any of it yourself? No; I have seen no man laid up with the lead. Only one, I think, who was treated for lead.
2913. *Chairman.*] Who was that? A man of the name of Toohey.
2914. So far as you yourself are concerned, you have never been leaded? No; never troubled with the lead in any way since I came to Broken Hill.
2915. *Mr. Thomas.*] You have been here six years? Five years and five months.
2916. And you have not been leaded yourself, and in that time you have only heard of one man who has been leaded? I said I heard of people being leaded, but I only knew the one man.
2917. You have only come across one man who has been leaded in that time? Yes; where I knew the case.
2918. There is very little sickness, then, amongst the smelters? Very little sickness on the top floor; I know nothing of the bottom floors.
2919. Do you think there is less sickness now than at the early time of the mine? I believe there is.
2920. They were worse off in the early days than they are now—I mean just as far as the smelters are concerned? As to the men working on the smelters, there are not as many here sick now as there was one time. I do not know of any one sick now. Some four or five years ago there were more sick.
2921. But now that rarely occurs? Very seldom.
2922. What would you put the increased health of the mine down to? That I could not tell you.
2923. You do not think it is through any improvements? Yes, that might be; there are improvements.
2924. You think the smelters that are there now are more conducive to the men's health than they were one time? Yes; there is less fume than there used to be in the old workings.
[Chairman here examined witness and showed that he had the blue line, but that it was less marked than in the former case.]
2925. *Chairman.*] Is it your opinion that men who work on the feed floor are free from danger of being leaded, speaking from your own knowledge and observation? Speaking from my own knowledge and observation, I do not think that there is anything on the top floors to hurt them.

2926. Which nest do you work in? In the south nest.
2927. How many men on an average are engaged on the top floor? There are four men on the top floor to each furnace.
2928. That is twenty-four altogether? Yes; besides the men in the bins. There are three in the bins, three charge wheelers, and one feeder—that is, thirteen and a half men on each furnace in twenty-four hours.
2929. Do the same men always change shifts together? Yes; the one man always relieves me, except once in three weeks, when he takes his long shift off.
2930. What shift are you working on this week? Day shift.
2931. At the end of the week you will change? Yes; it will be my long shift off at the end of the week.
2932. Next week, whatever shift you are working on, shall you be working with the same men? Yes; they all change together.
2933. Are you an old hand up on that floor compared with others? There are some old hands and some new.
2934. How many, then, have worked there as long as yourself in your shift? There is one that I know of who was there when I first started, a Mr. Witkin.
2935. Has he ever been leaded? Not to my knowledge.
2936. If he had been leaded you would know by his being away from work? Yes.
2937. Well, do you say he has not been leaded? I do not think he has been leaded.
2938. *Mr. Thomas.*] Where do you think a man is more likely to get leaded—underground or at the smelters? I know nothing at all about underground.

[The witness withdrew.]

Mr. Henry Barnett called and examined:—

2939. *Chairman.*] What is your name? Henry Barnett.
2940. What are you? A tapper.
2941. How old are you? Thirty-three.
2942. *Mr. Howell.*] How long have you been in the employ of the Broken Hill Proprietary Company? Six years.
2943. Always tapping? No; wheeling slag for three years, and from wheeling slag to tapping.
2944. How long have you been tapping? Three and a half years.
2945. Did you ever attend to the lead? I have been amongst lead now eight weeks.
2946. You are working on the matte furnace now? Yes.
2947. A matte furnace is the only one they consider that gives off the most fume? Yes.
2948. Have you ever been affected by lead? No; not to hurt me in any way.
2949. You have been laid off occasionally? Not by lead; I have had a spell now and then, and have gone to Adelaide.
2950. But not from any lead poisoning? No.
2951. During the time that you have been employed by the Broken Hill Proprietary Company, are you aware of any great number of men that have been seriously affected by lead poisoning? I have known a few that say they have been affected by lead.
2952. Do you of your own knowledge know of any men that have been laid off for any considerable length of time from what the physicians call lead poisoning? Yes; I do.
2953. Are they back working again—most of these men? Yes, some of them. Certainly a great many of them have left since I was first employed upon the mine.
2954. You do not think, then, that you have felt any serious effects from what you would call lead poisoning? No.
2955. These mates of yours that you are personally acquainted with, and have been laid off with lead poisoning, how long were they off? About eight or nine days.
2956. In talking with them, did you ever ask them how they felt? Yes; I asked them the symptoms of it. They said they had pains in the stomach. I could not speak for myself.
2957. You worked on the old furnace as well as the new? Yes.
2958. Do you think that the present furnace and the general system of the smelting there is better than it was on the old furnace? Yes.
2959. And the men are less liable to get poisoned? Yes.
2960. On what part of the furnace on the tapping floor do you consider a man would be most likely to get leaded? I could not say, as I know nothing about the top floor.
2961. But I mean on the bottom floor? I do not know that there is much difference that I am aware of, and I have been up and down all the furnaces.
2962. Do you think a man is more likely to become leaded if worked continuously on the lead well than if tapping or slag wheeling? No; I do not think so. Tap men are mostly inside, and the slag wheelers take their turn on the lead every third day.
2963. Is it not a fact that a man tapping is more likely to be among the lead fumes? Yes; he has to be there to watch his work.
2964. It is a pretty certain thing that a man tapping continuously would be far more likely to become lead poisoned? Yes; a wheeler has got the opportunity of going out into the open air. He is three-fifths of his time in the open air.
2965. How often do you draw off a charge of lead? It has to be considered what charges we are putting through.
2966. Say at the present time? At the present time we might get three, four, or five off on a shift. Sometimes we run more.
2967. How long does a man remain on the lead well;—how often does he change from the lead well to some other department? He changes every day. He only works one day in the one department. We have three wheelers, and they take a day on the lead. The tappers remain on the furnace.
2968. *Chairman.*] Why is the man on the lead well changed so often? It gives the men a spell at wheeling, as the wheeling is very hard work, and the lead well work is easier.
2969. *Mr. Howell.*] In taking out dust from flue chambers there, do you ever notice that dust flying around? Occasionally it does, until they put the water on. They put the water on almost instantly, then we do not notice the dust, if there is a very strong wind a very little of it might rise; it is damped down as soon as it is put out, and we find no more of it.

Mr.
J. Dimpsey.
17 Jan., 1893.

Mr.
H. Barnett.
17 Jan., 1893.

- Mr. H. Barnett.
17 Jan., 1893.
2970. You generally find that the fumes are carried away by the ventilation air? Yes.
2971. And I suppose with the exception of a very warm still day? Yes; that is when we find it most.
2972. Where do you keep the water that you use for drinking purposes? That is generally kept in a bag which we hang on a verandah post outside.
2973. Do you ever cover the bag up? Yes; I generally make it a practice to cover it up to keep the dust out of it.
2974. Is that generally observed? No; sometimes they do not take that much notice of it.
2975. It would be a very easy matter to put a tin plate over it so as to cover it in? Yes.
2976. That water is good? Yes.
2977. Condensed water? Yes.
2978. Plenty of it? Yes.
2979. *Chairman.*] Cool? Yes; that is if they fill the bags regularly.
2980. *Mr. Howell.*] But then that is their own fault as the tank is there? Yes.
2981. Have you ever made use of these baths since we put them up? Yes.
2982. Do you find that they are a benefit to the men? Yes.
2983. The men say they are a benefit? Yes.
2984. *Mr. Hamlet.*] Are you a married man? No.
2985. Where do you live? At South Broken Hill.
2986. Do you live in a boarding house? No; I have got my own place.
2987. What is about the size of your house? 12 feet x 14 feet.
2988. *Mr. Hamlet.*] One or two rooms? One room. I simply live in it, I board out; I simply live in it, I have my meals out.
2989. What is the house made of? It is wood and iron.
2990. I suppose you do not require water there? I catch enough water to supply my wants; if I want any I buy it.
2991. You get the water off the roof? Yes.
2992. What provision for bathing had you before these baths were put up? I have got a big tub of my own.
2993. You used to have it at home? Yes; occasionally I go down to the baths. If I do not go there I have a bath of my own. I generally wash every night and put clean clothes on.
2994. Can you give me the estimated cost of living for unmarried men in Broken Hill at the present time? It costs me 18s. a week for boarding out, independent of my own room.
2995. You have your own property, and you pay rates? Yes.
2996. Then you have to pay for your board in addition? Yes.
2997. Would that, do you think, amount to 25s. a week altogether? Close upon it.
2998. You would reckon 25s. a week as the cost of your living? 20s. to 24s. a week, taking water and everything that I used to buy.
2999. *Mr. Thomas.*] I suppose you have known a good many men here during the six years you have been a resident? Yes; a great many.
3000. And none of those have been leaded? Yes; they have complained of lead.
3001. A large number have complained of lead? Yes.
3002. I suppose most of your friends are smelters;—have many of them been leaded? A few of them occasionally have stayed off on account of lead.
3003. And you know some miners? I cannot say that I know many.
3004. There are some baths up on the mines now that you can wash in;—how long have they been there? To my knowledge, three months.
3005. You think that the health of men who use these baths is a great deal better? I should think so; there is plenty of water there.
3006. You only think so? Well, I have been in there myself.
3007. *Mr. Thomas.*] As far as you are concerned, by taking that hot bath you are a better man? I do not feel any the worse for it.
3008. You feel better? Yes, certainly; any man who is clean always feels better.
3009. Then you think, to the extent that men have been using these baths there is that amount of illness less than there was previously to their not using them? I could not express an opinion on that point. But you think it would be reasonable? Yes, I think so.
3010. Was there a time when you did not enjoy as good health as you do now? I do not know. I have never enjoyed bad health since I have been here. If I thought it would have injured me I would have left.
3011. You being a careful man, then, if you felt at all unwell, you would have the money to leave at once, say, to go to Adelaide? No; I have not got an extra lot of money.
3012. But I mean a young man would have that opportunity? If careful, he might go away.
3013. There is no difficulty at all if you go to the boss and say that you are unwell—that you are leaded—there is no difficulty in getting away? No; not if you give them some time.
3014. Then, if a man could not get away;—I presume it is general here if men feel the least ill they try and get away for a change, is it not? Yes.
3015. So that if a man could not possibly get away the lead would probably tell on him? Yes; he would have to lay up.
3016. Have you had any spells at all—that is, holiday spells—during the six years? Yes, two different spells.
3017. Three weeks each time? No; a fortnight once, and a three weeks at another time.
3018. These are the only two holidays spells that you have had? Yes.
3019. Do you smoke? Yes.
3020. Are you a teetotler? Yes, for the present—for the last six months.
3021. *Chairman.*] Some men working under the same conditions as yourself among your acquaintances have suffered from the lead, you have told us? Yes.
3022. Do you attribute your own escape to any particular thing that you have done—to any particular care of yourself that you have taken? No; I think it lies in every man's power to do the same as I have done. I have certainly looked upon it that prevention is better than cure any time.
3023. What about changing your clothes;—you put on your working clothes in your own place and walk up to the mine, and walk back in them? Yes.
- 3024.

3024. Do you make it a rule of changing them when you get back? Yes, as soon as I get home.
 3025. Is that a common rule? Well, it is common to me.
 3026. Do you know the custom among the men—do they generally change their clothes when they have finished their day's work? Those that live near me do the same.
 3027. Of course, there are some men who do not? Certainly, some are careless.
 3028. In a general way, can you give us an idea what is the average custom;—do you look upon a man who does not take the trouble to change his clothes as an exception, and a very careless man, or is there a large portion who do not take that trouble? Yes.
 3029. What do you think is the reason—is it pure carelessness? Well, certainly, it is people with different ways.
 3030. Now, as to yourself, do you do it as a matter of personal habit merely, or do you do it as a protection? I have always made it a habit to dress again after work. No matter what we are employed on I have always made it a practice to change myself after work.
 3031. You never had anything to do with fluo dust? No, only simply round the furnace, when taking it from the flues. I consider that I get as much as a good many of them.
 3032. You have no regular crib time? No; get it when we can.
 3033. But when you find an opportunity to take your crib, do you have sufficient time to take it in? Yes.
 3034. You do not have to take up your work again in the middle? No.
 3035. Where do you take it? Under the verandah occasionally.

[The Chairman examined the witness, and showed that he had a very marked blue line on his gums, but no anæmia; in other respects, he appeared to be perfectly well.]

[The witness withdrew.]

Mr. J. Cogan called and examined:—

3036. *Chairman.*] What is your name? J. Cogan.
 3037. What are you? A feeder.
 3038. How old are you? Thirty-five next birthday.
 3039. *Mr. Howell.*] You are working for the Broken Hill Proprietary Company? Yes.
 3040. On the feed floor? Yes.
 3041. North or south smelter? South smelter.
 3042. How long have you been in their employ? Five years.
 3043. You have worked on the old and on the new furnaces? Yes.
 3044. Have you worked continuously all that time? Very nearly, excepting holidays.
 3045. Have you been laid up from what is termed lead poisoning? I do not know. I was bad for a fortnight once during the five years.
 3046. Did you have any idea that you were lead poisoned;—you went to a chemist about it? Yes.
 3047. What did he say was the matter with you? He said I was a little feverish, and wanted tuning up.
 3048. He did not attribute it to lead poisoning? No.
 3049. You did not feel cramps in your stomach? No.
 3050. That was the only time you have been laid off with sickness? Yes.
 3051. Have you been feeding continuously? No; I was wheeling first. I was charge-wheeling at the old furnace.
 3052. You did work below, too? Yes, a little; not much.
 3053. And then you went on to the feed floor, and then to charge-wheeling, and from that to feeding? Yes.
 3054. How long have you been feeding? Since the new smelters started.
 3055. That is two years ago? Yes.
 3056. In bad windy weather do you notice any fumes coming out of the throat of the furnace? No.
 3057. Is there always sufficient draft to keep them down? Yes.
 3058. At times, when the furnace is out of repair, and they are fixing it down below, and the draft is pretty well off, do you ever see puffs of white smoke coming up through the floats? No.
 3059. Generally, that feed floor is very clean? Yes.
 3060. Do you notice, when charge-wheelers dump their charge of ore at the mouth of the furnace that any dust rises from it? No.
 3061. The ore at that time has become very dry; it has been lying out in the sun three or four days? No; not in all cases.
 3062. It is dry when it comes out of the mine? The draft of the furnace takes everything down in the way of dust.
 3063. Have you ever heard amongst your mates and the men on your shift much complaint about what is termed lead poisoning? No.
 3064. Do you, of your own knowledge, know of any of your associates who have been seriously affected by lead-poisoning? Yes; there are a few.
 3065. Can you name one or more? Yes; there is Hughes; he looks very badly affected with it.
 3066. How long was he laid off? I could not tell you.
 3067. Is he working again? I do not think he is.
 3068. As a general thing, you have not heard very much complaint in your department? No.
 3069. Of course, the men talk about these things;—do you hear the men talking amongst themselves as if they thought that there is more sickness caused by lead-fumes below than above on the feed floor? No; I have not heard that.
 3070. If you were at all afraid of being lead poisoned, and had your choice of working above or below, which place would you prefer? I have not had any knowledge of below, but I think I should prefer being on top.
 3071. Then you have been constantly employed, with the exception of that fortnight? Yes.
 3072. For about five years? Yes.
 3073. Feeding, slag-wheeling a little, and charge-wheeling? Yes.
 3074. You cannot say that you have suffered any inconvenience? No; no inconvenience.

3075.

Mr.
H. Barnett)
17 Jan., 1893

Mr. J. Cogan.
17 Jan., 1893.

- Mr. J. Cogan. 3075. You consider the ventilation of the feed-floor there about as good as it can be? Yes.
 17 Jan., 1893. 3076. You think the new furnaces are very much better protected in that way than the old ones? Yes.
 3077. Can you, of your own knowledge, state that there was any more sickness on the old furnaces than on the new? I believe there was more sickness on the old.
 3078. Are you acquainted with any of the underground men? No; not many.
 3079. *Mr. Hamlet.*] Are you a married man? No.
 3080. How do you live;—do you live at a boarding-house, or house of your own? I live in a house of my own, but board at a boarding-house.
 3081. How far is the boarding-house from your house? Only a few yards.
 3082. And then, starting off in the morning, you go off in your working clothes, do you not? Yes.
 3083. And when you come home again, do you change those clothes? Yes.
 3084. Before you have your meals? Yes.
 3085. That has been your habit always? Yes.
 3086. What is the size of your house? Ten feet by 12 feet.
 3087. Made of wood? Wood and canvas.
 3088. Have you any water supply of your own? No; I get it from the boarding-house.
 3089. What do you do for water? I get it from the boarding-house.
 3090. Carry it for yourself? Yes.
 3091. You carry the water, and wash yourself in your own house? Yes.
 3092. Do you know, for a fact, that there are certain regulations or instructions given to every man to regulate himself, so as to prevent sickness or prevent lead poisoning? I believe they were posted at the Proprietary office one time.
 3093. Do you know them yourself? No.
 3094. Suppose you were to go into another district, say to America, and you were going on to a very bad mine, would you know what to do to try and prevent leading? No; I might eat lemons and drink milk.
 3095. Have you ever heard that milk is a good thing? Yes.
 3096. Do you know, from your knowledge, that the men use milk? Yes. Some milk-men come on to the floor, and we have a pint of milk occasionally.
 3097. What do you drink? I drink milk.
 3098. And what is it;—where do you get it? The milk-man brings it round.
 3099. To your house, or to the boarding-house? To the floor.
 3100. The milk-man goes up to the mine? Yes.
 3101. And what do you pay for a pint? Threepence.
 3102. Do you know anything about concentrated milk? A little; I do not like it.
 3103. What is the milk you generally have? Cow's milk.
 3104. Good milk? Yes.
 3105. Do many men besides yourself use the milk? Yes.
 3106. And they all seem to know that it is a good thing? Yes.
 3107. Where do you keep your tucker when you go on duty? Generally, I have got a small box.
 3108. You try to keep it out of the dust? Yes.
 3109. Is there any rule against smoking on the premises? No.
 3110. Any man can smoke? Yes.
 3111. *Chairman.*] You think it better to keep your crib in a box than to follow the other plan of keeping it in paper in your pocket? I do not know whether it is better.
 3112. You do that in preference? Yes.
 3113. Does anybody else? Yes.
 3114. How many times a day do you drink milk? Once.
 3115. *Mr. Hamlet.*] Once during a shift? Yes.
 3116. *Chairman.*] You get milk on each shift? Not on the night shift, but in the day and afternoon shift.
 3117. Have you ever heard anybody say that it was desirable that milk taken for the purpose of preventing lead-poisoning, should be taken before you go to work—that is, before you begin your work? No.
 3118. Do you use the new baths at all? Yes.
 3119. Do many men use them? Yes; crowds of them use them.
 3120. Do they like them? Yes; they enjoy them.
 3121. They are very glad of them? Yes.
 3122. There is hot water, is there not? I have not seen it.
 3123. *Mr. Howell.*] There is no need for hot water at present, but the connections are all ready for it when it is wanted in the cold weather.

[The Chairman examined witness, who showed a good deal of redness of gums, and a slight black line on the front teeth, otherwise he appeared to be perfectly well.]

[The witness withdrew.]

Mr. J. Seymore called and examined:—

- Mr. J. Seymore. 3124. *Chairman.*] What is your name? J. Seymore.
 17 Jan., 1893. 3125. What is your occupation? I belong to the smelters.
 3126. *Mr. Howell.*] You are a feeder? Yes.
 3127. For the Broken Hill Proprietary Company? Yes.
 3128. How long have you been employed? Four years the 4th of this month.
 3129. Have you been a feeder all the time? No.
 3130. What did you start at first? Wheeling.
 3131. Charge wheeling? Yes.
 3132. You have been on the upper floor all the time? Yes.
 3133. You were never down below? No.
 3134. How long were you charge-wheeling? Three years.
 3135. And then promoted to feeder? Yes.

Mr.
J. Seymour.
17 Jan., 1893.

3136. Then you have been feeding about a year? Yes.
3137. On which furnace? I have been on every one of them, at one time I used to feed odd shifts.
3138. In the four years you have been employed there, have you been laid off on account of lead poisoning, or what you thought was lead poisoning? I have never been laid up at all.
3139. You have worked steadily all the time? I have only lost about five shifts, and then it was only for a spell.
3140. Do you know of any of your mates whom you are personally acquainted with, who have been laid off through lead poisoning, or have been sick through lead poisoning? I never knew but one, and what his complaint was I could not say.
3141. Did you hear him say that he thought it was lead poisoning? He did not know; the doctor told him that it was.
3142. How long was he off? He was often off odd shifts.
3143. Do you know if he was a temperate man? I do not know.
3144. Do you drink anything yourself? Yes; a pint of beer every day if I can get it.
3145. You do not drink very much? No; I cannot afford it.
3146. You have never noticed any considerable quantity of dust when feeding or when charge wheeling? Only when the wind comes round from the south-west; and then our shift boss orders the hose to be put on; he very often puts it on himself.
3147. When the wind is blowing in that direction, I suppose it is dusty everywhere? Yes.
3148. Of course, ore dropping down from trucks on to the floor would make a good deal of dust if the wind was blowing as you say? Yes; but the dust does not rise much, it does not come into the shed. Coke-dust is the worst, it makes us so dirty.
3149. Do you ever notice any fumes coming from the furnaces when they are running along regularly? Occasionally they will puff up.
3150. Little puffs? Yes.
3151. Not often? No.
3152. A furnace, I suppose, when shut down for repairs, and when being cleaned out—then there may be little puffs come up while they are working on them? I do not know; I have cleaned out a good many, and I have not seen much of that.
3153. You have worked frequently down in the furnaces when cleaning them out? Yes; as a rule, every man who is working on a furnace, that is his job to do.
3154. All have got to attend to their own furnace? Yes.
3155. After working in the furnace like that, did you feel any bad effects? Yes; once I did.
3156. Was the furnace hot at that time? Yes; I think it was warm.
3157. You do not hear many complaints about it? That is the only time. I have cleaned out every one in the north shed, and that was the only one I have felt bad from, but it passed away after I had a good vomit.
3158. Perhaps drinking water brought it on—you were very warm, and drank a good deal of water? Yes.
3159. Have you availed yourself of the new baths since put up? No.
3160. As a general thing, men do go there and bathe? Yes; some of the men who relieved us last week go there.
3161. *Mr. Hamlet.*] Did you not take the bath simply because you had your own bath? As a rule, when we get home we generally strip off and have a good wash.
3162. Was that your reason for not having baths on the mine? Well, it is time more than anything else, as I am glad to get home.
3163. Are you a married man? Yes.
3164. How many children have you? I have eleven alive.
3165. In Broken Hill? No. Two away from here, and the others are here.
3166. Have you nine in Broken Hill? Yes.
3167. And what are their ages? The eldest is in Broken Hill, she is 31; and the youngest is 11 years of age.
3168. I wanted to know how many children you had living at home in your dwelling? Two constantly.
3169. What size house have you got? A three-roomed house.
3170. Can you tell us the size of the rooms? Yes; each room is 11 ft. 6 in. square in the clear.
3171. What would be these rooms, would you call one the dining-room? Yes.
3172. And the other two are bedrooms? Yes.
3173. Have you got a kitchen besides? No; just a few stones I have put up outside, where the missis generally cooks.
3174. What is the house built of? Canvas and wood.
3175. When you come home from your work, do you change all your clothes? I do not change my flannels.
3176. But you change your outer clothes? Yes, as a rule.
3177. Do you have your wash? Yes.
3178. Where? Outside.
3179. You cannot wash outside all over can you? I just pull off my shirt.
3180. When do you wash all over? That is very rare for me to do, because when I change my flannel I often take cold.
3181. That is your reason for not washing all over? Yes. Of course, I wipe myself with a flannel.
3182. But you do not have a real good wash by getting in water? No.
3183. *Chairman.*] Are you an Englishman? I am a Cornishman.
3184. *Mr. Hamlet.*] You put off your outside working clothes on returning from work? Yes. When it is day or afternoon shift we go home and have a wash and go straight to bed. It is only one week out of three that we get a chance to change our clothes.
3185. You have two bedrooms;—how many beds are there in those rooms? One in each.
3186. Do you drink much milk? No; none, as I do not like it.
3187. Can your wife get plenty of milk? Yes.
3188. And what water supply have you at home? We have been favoured lately during the last six months; we have had it off our own roof.
3189. What is the roof? Galvanised iron.
3190. You collect the water yourself? Yes.

- Mr. J. Seymore.
17 Jan., 1893.
3191. Can you tell me the price of bread in Broken Hill? I think it is 4d. a loaf.
3192. But is it always about that price? We have had it for 3½d. a loaf; but, as a rule, I think it is 4d.
3193. Does your house belong to yourself? Yes.
3194. I suppose most of the small houses belong to the dweller—the one who lives in them? As a rule
3195. Do you ever make use of the changing-rooms on the mines? When I used to work underground I did; but I have not used them in Broken Hill, as I have never worked underground here.
3196. I suppose on the feed-floors you just hang up your clothes in the shed somewhere? Yes.
3197. *Mr. Thomas.*] How old are you? Fifty-six.
3198. I suppose you know a good many people in Broken Hill? Yes, a good many.
3199. Men that are working underground? No; I am not very much acquainted with many of them.
3200. Have you any sons working here? I have two.
3201. What do they do? One is feeding up at the Proprietary, and the other is feeding at the British.
3202. Have they ever been leaded? Not that I am aware of.
3203. Have you ever heard that if you drink milk you are not likely to get leaded? No.
3204. There is a good deal of milk drunk at the smelters, is there not? Yes; one or two men generally come around on our shift every day, when we are day or afternoon shifts.
3205. And the men do not drink the milk, then, to keep away lead poisoning, but simply because they are thirsty? I am sure I could not tell; I do not make use of it myself.
3206. If you had the chance of working at any smelter at any of the mines, which mine would you prefer to work at? I could not tell you, because I have not worked a day anywhere else only where I am now.
3207. You have not heard of any smelters in any of the mines that are likely to be worse for the men than the others? No.
3208. How long since have you been in the Colony? I came to Australia in 1849. I was then very small.
3209. Have you enjoyed as good health in Broken Hill as in any other place where you have been in the Colonies? Yes; I have enjoyed better health since I came to Broken Hill, and I have a family, and we have never had a doctor inside of our doors.
3210. Some little while ago for close on three months there were no fumes going over the town;—do you think it was at all healthier to live in town during that period than when the smelters were working? I am sure I could not tell you that. Of course, I did feel better, because I had a long spell; I felt fresh and nimble, but as for fumes I could not say anything about that.
3211. For some reason you felt better? Yes; of course, after having six months spell.
3212. Were your wife and family any better? No, I do not think they were. They have enjoyed good health since we have been here.
3213. *Chairman.*] Where did you work underground? At a mine in Cornwall and at the Burra.
3214. The Cornish mine was a wet one? Yes.
3215. Is the Burra? No; it is dry.
3216. You changed your clothing before going underground at the Burra mine? I did not, as a rule; although there was a place for us to do it.
3217. Some men did change? Yes; those who lived a long way from their work.
3218. Those who lived reasonably near preferred to change at home? Yes, as a rule.
3219. What is their reason;—when they have done their work, I suppose they want to get away? It differs according to the different places where they work. At some places in the bottom levels it is very wet; then, as a rule, all those working there change on the mine.
3220. In Cornwall, was there any rule about that, or could a man please himself there just as he could at the Burra? I was very small; I know we lived 3 miles from the mines, and we had to change.
3221. *Mr. Thomas.*] Did you work underground in Cornwall? Yes.
3222. How old were you when you left? I had just turned twelve.
3223. Did most of the men change at the mine you worked at? Yes.
3224. Nearly all? Yes.
3225. In connection with those changing-houses there would be any amount of water for the men to wash? I really could not say.
3226. Would there be a man in charge of that to look after the clothes of the men and dry them for the men? Yes.
3227. They could go there and take off their clothes as they came to and from work, and that man would have charge of them? I could not tell you that; but I know there was a man always there, and when a shift came back their clothes would be hung up to dry on their own pegs.

[Witness withdrew.]

THURSDAY, 19 JANUARY, 1893.

Present:—

DR. ASHBURTON THOMPSON (CHAIRMAN).

WM. M. HAMLET, Esq.

J. HOWELL, Esq.

J. THOMAS, Esq.

Mr. William Gilbert called and examined:—

- Mr. W. Gilbert.
19 Jan., 1893.
3228. *Chairman.*] What is your name? William Gilbert.
3229. What are you? A miner.
3230. Which mine do you work at? The Proprietary mine.
3231. *Mr. Thomas.*] How long have you been working at the Proprietary mine? Six months. I was working at Block 14 and British mines for about eighteen months.
3232. You were working six months at the Proprietary? Yes; and about eighteen months at the other mines.
3233. You have been two years on the Barrier, then? Yes—a short two years.
3234. And during the six months, at what part of the Proprietary did you work? I have been taking ordinary shifts at the mine, timbering mostly, at that part near McCulloch's.
3235. At McCulloch's? Yes.

3236.

Mr.
W. Gilbert.
19 Jan., 1893.

3236. You have not been working at Jamieson's? Yes; but most of my time at McCulloch's.
3237. You have changed? Yes.
3238. But most of your time at McCulloch's? Yes.
3239. You are a timber-man? Only at times.
3240. You have spent a good deal of time in timbering at McCulloch's? Yes.
3241. Have you ever been leaded? No.
3242. Never suffered from it in any way? No.
3243. Do you believe that a good many men were leaded in McCulloch's? I could not say.
3244. You have had very little experience at McCulloch's;—you have not spent above three months here? Probably four months.
3245. Still, your experience, as far as the "big" mine is concerned, would be a very limited one? Yes.
3246. You would not know very many men in six months? No; I am not given to making many acquaintances; I know a lot of men merely by facial expression.
3247. You would not know them to speak to? No; but I know them by facial expression.
3248. You say that you have actually worked six months in the Proprietary? Yes.
3249. You do not know, then, many instances of lead poisoning? No.
3250. How long did you work in Block 14? Three months; the greater portion of my time I put in at the British.
3251. Were there many men leaded while you were there? No, not many.
3252. Did you work in the face? Yes.
3253. In the lead the whole of the time? Yes.
3254. You had some mates with you? Yes.
3255. Did any of them get leaded? No; one or two of them have been away ill, but not leaded.
3256. What did they say was the matter with them? They had only been indulging.
3257. They did not complain of lead? No.
3258. They simply stayed home because they had been indulging? Yes; they stayed away longer than the usual time allowed at the mine, and the consequence was they were not required again.
3259. They had been drinking? Yes.
3260. *Chairman.*] You worked three months in Block 14? Yes.
3261. What provision is made for ventilation in that mine? The matter of ventilation, as far as I could see, generally speaking, as a miner, is carried on as is usual in any other mine.
3262. Did you see any provision for artificial ventilation? Yes; all that I thought was necessary.
3263. What did you see? There were pipes to bring in fresh air put in wherever it was thought it would be beneficial to the miners.
3264. In your opinion, as a miner, the ventilation was sufficient in those parts that came under your notice? Yes.
3265. What provision for drinking-water is made underground—any at all? Yes; I always take plenty with me myself. Whenever I chance to go short I have always been able to get it by going to the plat chambers.
3266. You have been working there three months? Yes.
3267. What were you doing? Mostly at the face breaking down the ore.
3268. How many were there in your gang? I could not say—perhaps four, six, seven, or eight, sometimes ten, working within a short distance of one another; sometimes not as many.
3269. But the same individuals worked together in the same place all the time? Yes; very nearly so in my time.
3270. *Mr. Howell.*] On what floors were you working in McCulloch's shaft—above the 200 or below it? I have worked above the 200, and below the 200; I have been all through McCulloch's.
3271. All through the different stopes? I have been in most of the lead stopes in McCulloch's.
3272. The stope, now what they call the big lead stope, is the most important lead stope on the line, and contains the greatest quantity of lead? Yes.
3273. Did you yourself work in any close drives running through that ore at any time, or do you know of others who were working in close cross-cuts or drives for the purpose of opening up ground? I could not name them, but I know them by facial expression; I could pick them out.
3274. You know that men do work there? Yes.
3275. It is the custom of the mine, when a drive like that is started, to open up a piece of ground for a little engine of compressed air to be put down there? Yes.
3276. It is very rarely that there is any bad air in that mine? Yes; as far as ventilation is concerned, I think that every precaution has been taken.
3277. Always plenty of ventilation in the stopes? Yes.
3278. Have you worked below the 300 in McCulloch's? Yes.
3279. That is pretty well a sulphide ore at 300? Yes.
3280. How often do you change from one portion of a mine to another? Usually every fortnight.
3281. You change from McCulloch's to the vicinity of Jamieson's? Yes.
3282. What is the character of the ore at Jamieson's? It is kaolin mostly.
3283. What they call a dry ore? Yes.
3284. Free from lead? Yes.
3285. Then you are quite certain that there is not any portion of the mine in which you have worked but what is, in your opinion, quite well ventilated? Yes, I should think so.
3286. How long did you work in Block 14? I think over three months.
3287. What is the character of the ore there? All lead-ore.
3288. As a matter of fact, lead-ore all over the mine? Yes.
3289. Did you notice much dust in breaking down that ore along the line of the 200 level, immediately above and below it, at McCulloch's shaft? Sometimes I have experienced a little, but I have always found water and buckets convenient, which I have always used.
3290. There is water all through the mine for that purpose? Yes.
3291. And men are allowed free use of it? Yes.
3292. You have not been laid off at any time on account of sickness? No.

[Witness withdraw.]

Mr.

Mr. Francis Daykin called and examined:—

- Mr. F. Daykin.
19 Jan., 1893.
3293. *Chairman.*] What is your name? Francis Daykin.
3294. What are you? A miner.
3295. What mine do you work in? Block 11, at the Proprietary.
3296. *Mr. Thomas.*] How long have you been on the Barrier? Five years.
3297. During the whole of that time have you worked in the Proprietary? I have worked in the Proprietary four years on and off out of the five years.
3298. Where were you working the remainder of the time? At the Pinnacles and other places.
3299. But during the whole of your time in Broken Hill you have worked in the Proprietary? No; I worked in the British for a short spell of about six months.
3300. You have been about four years in the Proprietary? Yes.
3301. Have you worked in any other portion of the big mine? Only Block 11.
3302. What is the nature of the ore in Block 11? Most of it is pretty loose ground, except in the ironstone.
3303. Is it kaolin or ironstone? In M'Gregor's end it is mostly all lead.
3304. But there are a larger number of faces of ironstone than of lead? Yes.
3305. Then a man could work (we will say) two weeks in the lead, and then the shift-boss would take him away and put him in the ironstone for six or eight weeks? Yes; the shift changes to kaolin, and from kaolin to ironstone before it goes back to lead again.
3306. If you are two weeks in lead you will be eight weeks out of it before you get back again? Yes.
3307. Have you ever been leaded? No.
3308. Ever had any mates leaded? No.
3309. Very few get leaded at Block 11? I have not heard of very many.
3310. Do you know many men among the miners in the town? A good many.
3311. Do you think many get leaded? I have heard of a few cases.
3312. How many? I might have heard of perhaps twenty or thirty cases altogether.
3313. From what mines? From different mines—from British, Block 14, and big mine.
3314. What part of the big mine would men be more likely to be leaded? In the north end.
3315. In M'Culloch's? Yes; all over that way.
3316. I presume you know some men who have worked at M'Culloch's? I could not quote an instance where a man has been leaded in any particular place in the mine.
3317. You have come across men during the four years who have worked in M'Culloch's? Yes.
3318. They have spoken of lead in M'Culloch's? Yes.
3319. You have met some who have been leaded? Yes.
3320. Would a man be less likely to be leaded in Block 11 than in any other portion of the big mine? Of course, the lead over there is damp. You can catch hold of handful of lead ore, and by squeezing it in your hand it will remain in a ball.
3321. You think a man working where lead is dry is more likely to be leaded? Yes.
3322. Do you think that this would have anything to do with it as far as M'Culloch's end is concerned? I do not know.
3323. At M'Culloch's men work two weeks in lead? I do not know. I never worked in M'Culloch's; I do not know what the rules are over there.
3324. You do not know that they work in M'Culloch's two weeks and two weeks in Jamieson's;—you never knew that? No.
3325. *Mr. Howell.*] I might say for your information, Mr. Thomas, if you will permit me, that the mine is divided into three sections, and the miners know very little about one another, except in their own section.
3326. *Witness.*] I have heard the men say that they have been working in lead or ironstone, but I have never asked them where.
3327. *Mr. Thomas.*] You say you have worked in the British for a while? Not in the lead part, but in the No. 5 shaft.
3328. No lead there? No.
3329. You have never stayed at home or lost any time from the effects of lead? No.
3330. Block 11 is considered one of the best places in the line? Yes.
3331. Why so? Because not so many men get laid up there and the ore is damp.
3332. And there is still a large amount of lead in Block 11? Yes.
3333. Are there a number of men working in the lead in Block 11? No; not a great many men at present.
3334. The majority of the men are, I believe, working in ironstone and kaolin at the present time;—that is, at Block 11? Yes.
3335. Of course, not many men working in the lead now; the time will come when there will be a number doing so? Yes.
3336. And so that when the iron and kaolin is finished there will be a greater proportion of men in the lead than there are now? Yes; quite likely.
3337. As soon as the iron and the kaolin portions of the mine are smaller the men would not be able to be out of the lead so long? No.
3338. Now they can stay out eight weeks, but if the iron and kaolin became less the men would have to be shifted back into the lead oftener, and they would be more liable to get leaded? Yes.
3339. When you go underground you take tea with you? No; I take water.
3340. Is there any water underground that you can drink? Sometimes there is a water-bag there.
3341. No pipes underground? Not for drinking purposes, but plenty for sprinkling about.
3342. But none for drinking in the pipe? No; I do not think the water in the pipes is good enough to drink.
3343. How long has that water been down in those pipes? It has been there since the strike.
3344. You did not see it before the strike? I do not know; the pipes were there, but I do not know whether the water was there.
3345. The men do not drink the water? I have not heard of anyone drinking it.
3346. Of course, it is for boring purposes? Yes; and for damping the levels.
3347. Of course, a man could wash himself with it? Yes.
3348. Do you think men use it much now for washing—say for washing their hands before crib? No; I do not think so.

Mr. F.
Daykin.

19 Jan., 1893.

3349. *Chairman.*] Why do they not? The water is in the level, and some distance from where some of men are working. They would have a long way to come.
3350. What do you call a long way? A man working up on the tenth or eleventh floor would have to come right down that many floors to the level to get the water.
3351. The floors are 6 or 7 feet apart? Yes.
3352. He would have a good many steps to go up and down? Yes.
3353. If water were conveniently provided, do you think men would take advantage of it? I believe some would, but others would not.
3354. Do you know what kind of ore it is that you are in at Block 11? It is carbonate of lead ore that I work in.
3355. *Mr. Howell.*] We are in sulphides in the 300-foot level.
3356. *Chairman.*] You think it is important to keep lead dust down? Yes.
3357. You are working in a moist kind of ground? Yes; no water, but merely damp—not quite so damp as clay.
3358. Still there is some sprinkling done in that part of the mine? Yes; the water is there for any one to use.
3359. Do they sprinkle it? Yes.
3360. Would the use of too much water for sprinkling lead to any other objectionable state of things? Men working in the floor underneath would be annoyed by the water running through the floor.
3361. Nothing else? No.
3362. You are a married man? Yes.
3363. You live in your own place? Yes.
3364. Have you taken advantage of the bath that has been recently put up? No.
3365. You have plenty of accommodation in your own house? No, not a great deal of accommodation; but I use water pretty freely on myself.
3366. At present you have plenty of water? Yes.
3367. Is your house connected with the water service? No.
3368. What did you do a year ago, when the drought was? We had to do the best we could without.
3369. You would still have to do without it if another drought came? Yes; you cannot afford to have many baths when water is 7s. or 8s. 100 gallons.
3370. You have no objection to using the baths put up by the Proprietary Company? No; the only thing is when you go there, you have to wait so long, there are so many after them.
3371. But I believe there are three tank baths and sixteen showers;—are they always full? Yes; every time I have been there I could not get in. I have been there three different times.
3372. After what shift has that been so,—day or afternoon shift? Any shift, and before I would go on the afternoon shift at 4 o'clock.
3373. I suppose the number of men coming off each shift is about the same? Yes.
3374. *Mr. Howell.*] A little more on the day than on the night shift, but far more men come off on the 4 o'clock shift than on any other shift during the twenty-four hours, as the day men or surface hands all knock off at that time. [*The Chairman examined witness' gums. He showed a slight blue line.*]
3375. *Chairman.*] How old are you? Thirty-three.
3376. Have you ever had any sickness? No.
3377. *Mr. Hamlet.*] Have you any children. One
3378. What is the age? Very nearly seven months old.
3379. How far is your house from the mine? I am living about 250 yards from Mr. Howell's place.
3380. Did you ever find, in your experience, that your wife suffered in any way from the smoke? She has not been up here long enough for that.
3381. Nor the child? No.
3382. What is the size of your house? 24 x 12.
3383. Two rooms? Yes.
3384. Do you think you have escaped lead-poisoning from anything you have done, or from having taken care of yourself, or is it simply because you were in a part of the mine where there was not much lead? I do not know. I have always taken plenty of medicine. I have kept myself well regulated. I think that has a great deal to do with it. I never abused myself in any way with drink.
3385. You knew when you first went to work at the mine that there was danger? Yes; I was frightened of it.
3386. So you have generally taken care of yourself? Yes.
3387. *Mr. Howell.*] Speaking about the quantity of lead in Block 11, you understand that the only body of carbonate of lead ore in that place extends from about M'Gregor's shaft 260 odd feet north of western side? Yes.
3388. The balance of Block 11, as far as you know, is either manganic iron or dry silicious ore? Yes.
3389. Quite a patch of it yet, below and above the 230-foot level? Yes.
3390. The ground is of a damp character, and very little dust? Yes.
3391. But all the balance of Block 11 is pretty much made up of kaolin ironstone and silicious iron? Yes.
3392. There was one time when nearly one-half of the men working in Block 11 were working in lead? Yes.
3393. That lasted for about two years? Yes; close on two years—not quite.
3394. You consider the ventilation good in all parts of the mine where you have worked? Yes; I consider the ventilation better now than it was before the strike.
3395. How do they produce ventilation in the cross-cuts? They have fans and pipes.
3396. They are always put up? Yes.
3397. *Mr. Thomas.*] You say that for two years in Block 11 about half the number of men employed there worked in lead? Yes.
3398. During that period then they would only work two weeks out of the lead and two weeks in? Yes.
3399. Can you tell me what two years they were? Two years ending last Christmas twelve month.
3400. That would be from Christmas, 1889, to Christmas, 1891? Yes.
3401. What portions of those two years did you work in Block 11? From the 24th _____, 1889, to 3rd April, 1892.

Mr. F.
Daykin.
19 Jan., 1898.

3402. During nearly the whole of that period there was half as many men in lead as out of it? Yes.
3403. How many weeks out of every four did you work in lead out of that time? I do not suppose I have averaged one week in four, nor would any man.
3404. How would that be worked then? They changed round, different men going on to lead for a fortnight, and then changed along to ironstone and kaolin for a fortnight each.
3405. But you said half the men were working in lead? I should think half the men were working in lead.
3406. You say you were only in lead one week out of four? Yes.
3407. Would not that mean that there were only one-fourth of the men in lead and three-quarters out of it, if you work one week out of four in it and three out of it? Others may be in the lead more than me.
3408. You said just now that not only you, but you did not think the men generally did;—you did not work in the lead more than one in four; you must have been favoured in some way? No; I do not think I was favoured much, as previously to that I had worked twenty-one months in lead.
3409. You could not have worked as much in lead during these two years as the ordinary run of men? No; not during that time.
3410. How was this? I do not know. One time I was twenty-one months in it, and never shifted out of it.
3411. But still you have not worked as much in lead in Block 11 as the average men? No; not for that two years.
3412. And during that time there was the greatest quantity of lead in Block 11? There is just as much always. Even the twenty-one months I was in the lead there was just as much then as in the two years.

[Witness withdrew.]

Mr. J. Christopher called and examined:—

Mr. J.
Christopher.
19 Jan., 1898.

3413. *Chairman.*] What is your name? J. Christopher.
3414. What are you? A miner.
3415. Where are you working? In the Proprietary Mine.
3416. Which part? In Jamieson's; in fact, all over it.
3417. *Mr. Thomas.*] How long have you been on the Barrier? Rather over two years.
3418. And during that time what mines have you worked at? Only at the Proprietary.
3419. Then you have been practically working two years at the Proprietary? Yes.
3420. And during that time you have been working on M'Culloch's and Jamieson's end? Yes; I have taken my turn right round.
3421. You have not worked in Block 11? No.
3422. The custom in that end is to work two weeks in M'Culloch's and then two weeks in Jamieson's? It has been.
3423. It is not now? Yes; as far as I know.
3424. And you have changed regularly? Yes.
3425. M'Culloch's is the lead end, is it not? Yes.
3426. But Jamieson's? Is the kaolin. Of course, there is a little lead.
3427. Not enough to affect you? No.
3428. If you had your desire, would you change from M'Culloch's to Jamieson's, or would you prefer to remain the whole time in Jamieson's? I believe myself in the lead end the air is better.
3429. Which would you prefer? I would not care what end I was in.
3430. Why would you not prefer altogether to stay at M'Culloch's, what advantage is there against that? There are gases in both ends, and changing from one end to another is like change of climate. I would just as soon stay in one end as another.
3431. You gave us some reason that in M'Culloch's the air was rather better? Yes.
3432. Which end would you prefer to remain in permanently? I could not say that I would prefer one end in particular to the other.
3433. But still the air is better at M'Culloch's;—why do you not prefer to remain in M'Culloch's? I would as soon stay in M'Culloch's as Jamieson's.
3434. Do you think that the majority of men would rather be in Jamieson's;—why would you not prefer to remain in M'Culloch's, seeing that the air is better? I do not know that men change for that. There is a difference in the working of the stuff. In working in lead you get into sand; in the other end you are not. Of course, it is unpleasant for a man when sweating to be covered with dust. It would be uncomfortable.
3435. You think there is less of that uncomfortable feeling in Jamieson's? Of course, it does not hang about the body the same there.
3436. So you think that advantage goes against the better air in M'Culloch's end, and you would just as soon be in one as another? The unpleasantness of working in M'Culloch's takes away a little of the advantage of better air? Yes.
3437. You have had a number of mates during that two years? A good many; of course, a lot of these have left.
3438. Have you any reason why they have left you during the two years? I do not know, only that they have gone back to their homes.
3439. Have any of them gone away ill? No, not one of them.
3440. Is it the custom at the big mine if a man is leaded to give notice of it to the time-keeper, and then go away for a short holiday, and then when he comes back start work again? I never heard of that.
3441. You never came across a man who left the big mine leaded and came back to work again? I have come across men who have gone away for a holiday, and who have come back again; of course, whether they went away leaded, I could not say.
3442. They have left their work, have gone away, and have come back and went to work again? Yes.
3443. You have not met one of your acquaintances that has gone away, who, as far as you know, was leaded when he went? No, not one.
3444. Can you have all the water that you require underground? Yes.
3445. How long has that been so? In fact, all along.

Mr. J.
Christopher.
19 Jan., 1893.

3446. Do you use that water for drinking purposes? I carry my drinking water with me.
3447. Is there any water under ground that you could have for drinking purposes? You can always send to the surface for it.
3448. There are no pipes laid down underground that you can go to for drinking water? No, not for drinking water; there is other water.
3449. What is it used for? For wetting levels and boring.
3450. If you want any drinking water you send to the surface for it? Yes.
3451. You put your can in the skip and send it to the bracceman? Yes; but the understanding generally is that each man takes enough water for drinking purposes down below in his can.
3452. *Chairman.*] You said this moment that you are expected to take enough water with you? We generally take our can with us, and that filled generally lasts us out a shift. It is always understood that men are supposed to take enough drinking water into the mine with them. If a man runs short he can get it down from the surface.
3453. *Mr. Thomas.*] There is no pipe in any of the places underground to which you could go to for water for drinking purposes? No.
3454. But there is water for boring purposes or sprinkling? Yes.
3455. How long has that pipe been there? I do not know.
3456. You have been there two years? Yes.
3457. Was it there when you came? I could not say.
3458. Was it there twelve months ago? I do not know.
3459. You are sure it was there six months ago? I would not swear. I remember some of the pipes coming down as the level was continued.
3460. Do you think they were there three months ago? Yes, longer than that, I think.
3461. Do you think six months? Yes.
3462. Are these pipes carried out into the main levels? Yes; right along the main levels.
3463. Are you a married man? Yes.
3464. Have you any children? Five.
3465. All enjoy good health? Yes.
3466. For about three months there was no work going on here, and no fumes going over the town;—do you think the town was healthier then? I could not say. I have never felt anything up with me since I have been on the Barrier.
3467. But did you feel any better during that three months? No.
3468. Do you think the men looked better? Yes; some of them looked a bit better.
3469. You go into the street sometimes? Very seldom.
3470. Where do you live? Brown-street, North Broken Hill.
3471. So that by the time you get home you are rather tired;—you do not mix up with men much? No; I do not go down the street at all.
3472. *Mr. Howell.*] Do you find much dust in the ore in the neighbourhood of M'Culloch's shaft? Not a great lot now, there was a time when there was a lot of dust.
3473. The ore is not nearly so dusty now as it was formerly? No; it is all damp now.
3474. The ore is increasing in dampness the deeper you sink? Yes.
3475. Do you think that the ventilation through the mine is sufficiently good for all purposes? Yes; I do not think they could better the ventilation.
3476. *Mr. Hamlet.*] Did you know when you went on to the mines that there was certain mining regulations in force? Yes; I saw them posted up at the shafts.
3477. Do you notice the men reading those regulations, and do they understand them? Yes; as far as I know.
3478. And when you first began working on lead-mines had you any idea that there was any possible danger of working in them? Yes; I was told about them. I was told to be very careful in the way I eat my food, not to take it in my hand, to keep it in the paper, and also to wash my mouth out before I had a drink, and not to fill my pipe in the mine.
3479. You have tried to do that? Yes.
3480. Did you ever see any men suffering from lead in any way? I have seen men who have complained of being ill; of course, the doctors have said it was lead.
3481. If you thought that you were leaded what would you expect to find wrong with yourself? I would certainly go to a doctor and inquire.
3482. But have you any idea as to how it would be likely to affect you? No; I have never felt any effects from lead yet.
3483. How did you feel the first six months after you started working? Just the same as I do now at the present time.
3484. You have never felt any different? No; I am only a little shorter in my wind.
3485. That is the only difference? Yes.
3486. You told us you had five children? Yes.
3487. Are they all alive and well? Yes.
3488. You live a good distance from the mines? Yes; about one and a half mile.
3489. What do you generally drink? I always drink water underground.
3490. And at home? I drink tea, and have a glass of beer occasionally when I feel inclined for it.
3491. You smoke? Yes.
3492. Do you smoke underground? Sometimes.
3493. With regard to washing, what is your practice? To wash myself thoroughly after work.
3494. Have you the convenience to wash at home? Yes; I have a large tub; generally in the summer time I go down once a week to Silverthorne's dam, and have a plunge and shower bath.
3495. If you came home hot and dry and dusty you have the convenience at home to wash all over? Yes.
3496. Some men in Broken Hill have not the convenience—if they had a little bit of a place they cannot do it very well, but you have? I do not know; a man with a tub can wash himself all over with it anywhere.
3497. Have you used the new baths? No.
3498. Is that because you have got your own convenience for washing? No.
- 3499.

- Mr. J. Christopher.
19 Jan., 1893.
3499. Why is it? Because it is just as handy to have it at home.
3500. The fact is, when you have done your work you want to get home? Yes; and have a little clean up.
3501. Is there much blasting going on now in the place where you are working? Yes, sometimes, in certain places; of course I am not always working in the one place.
3502. How many shots do you think would be fired in a place where you are working while you are down there say eight hours? I suppose men will bore from 8 to 10 feet a shift, and have got to shoot for everything.
3503. Which do you think is the worse—the smoke from the blasting, or the dust? I think myself the dynamite is equally as bad as the lead.
3504. Of course a man is not forced to go into his face just as the shot is fired? He has time allowed him for the dust to settle before he is expected to go into the face.
3505. In firing the shot there is a good deal of dust stirred up? Yes.
3506. There would be more dust then than by the ordinary work of picking? No; I think myself I prefer shooting a mine to picking, especially on a lead face.
3507. Is that because you are close to it;—of course when a shot is fired you go away from it? Yes.
3508. How long after firing a shot before you go back? After the smoke has gone.
3509. How long would that be? Ten minutes; perhaps seven or eight minutes; it all depends upon the air; sometimes the air won't carry the smoke away so quickly as at other times; some places you can go directly in after the shot is fired, and there is no smoke there; it depends upon the ventilation.
3510. But, in spite of the dust and the firing of shots, you have never been laid up? No; I was laid up with quinsy once, but that had nothing to do with the lead.
3511. *Mr. Howell.*] Are you working on contract? Yes, I have been, off and on.
3512. Did you work on contract before the strike? Yes.
3513. And now you are working on contract? Yes.
3514. How many are working with you? Six of us.
3515. You have never heard any complaints since working on contract about any increased sickness amongst the men? No.
3516. *Mr. Thomas.*] You have a contract, in what part of the mine? The one we are doing at the present time is at Wigg's, at the 85 level, on No. 2 stope.
3517. There is no lead? Not much where we are.
3518. It is mostly kaolin-ore around Wigg's? Yes, kaolin and ironstone.
3519. No lead? A little lead.
3520. *Mr. Hamlet.*] Are you related in any way to Henry Christopher, who died in Broken Hill? No.
[*See Appendix, Table . . .*]
3521. You never had and illness here at all? No.
3522. Have you got any relatives? I have a brother here who is working up in the mine.
3523. Has he a family? Yes; four children.
3524. Has he lost any of the four children? Only one, years ago.

[Witness withdrew.]

Mr. Thomas Ellery called and examined:—

- Mr. T. Ellery.
19 Jan., 1893.
3525. *Chairman.*] What is your name? Thomas Ellery.
3526. What are you? A miner.
3527. Where do you work? I am in Jamieson's end this week.
3528. *Mr. Thomas.*] How long have you been on the Barrier? I came on the 17th March, 1888.
3529. Nearly five years? Yes.
3530. During that time, have you been working underground the whole of the time? No, not the whole of the time. During the strike we were not working underground.
3531. But barring that? A few months before that I was not working underground for a short period.
3532. But you have been working about the whole of the time underground? Yes.
3533. Have you been working at the big mine the whole of that time? I was working at Block 10 for six months.
3534. You were the whole of the time at the big mine excepting six months? Yes.
3535. What portion of the big mine? Block 11, Jamieson's, and M'Culloch's, from one end to the other. I am at Wigg's end now.
3536. What portion of that time did you work in Block 11? I could not exactly say. Most of my time I put in at Jamieson's and M'Culloch's.
3537. There they change over regularly? Yes.
3538. You are a fortnight in Jamieson's and a fortnight in M'Culloch's? Yes.
3539. This present fortnight you are in Wigg's? Yes.
3540. That would be Jamieson's end? Yes.
3541. You have never been leaded? No.
3542. You have had several mates during the time you have been working? Only two.
3543. Has either of them ever been leaded? One had fever. They said it was lead, but I did not think it was.
3544. What reason have you for not thinking that it was not lead? The other men thought it was, but I did not think so.
3545. Did he see a doctor? I suppose he did.
3546. He had the fever? Yes.
3547. And he suffered from lead too? I could not say whether he suffered from lead too.
3548. You presume he saw a doctor? Yes.
3549. As far as drinking water underground is concerned, can you have any amount of drinking-water underground? I always take my own water.
3550. Suppose you are working in a very hot place, and you finish the water in your billy-can, what would you do then for some? Go to the platt, and send to the surface for it. We can always get water.

3551.

Mr.
T. Ellery.
19 Jan., 1893.

3551. You cannot get it in the platt? I never noticed. I have seen bags hanging in the platt.
 3552. But no pipes from the surface underground? Yes.
 3553. Bringing drinking-water? I do not know.
 3554. Is it good enough to drink? Yes, I think so.
 3555. Why do the men send up to the surface for it, then? I do not know.
 3556. They could have this water from the pipes if they liked? Yes.
 3557. But they do not do that—they send up, and the bracceman gets it? Yes. I do not know their idea for sending up to the surface for it, unless for getting it cooler out of the bags.
 3558. You say there are bags underground? There used to be bags underground, but I have not noticed them lately, because I always take a water-bag myself.
 3559. Do you know a number of men in Broken Hill? I know two or three.
 3560. Are you a married man? No.
 3561. Do you knock about the streets? No. I might on a Saturday night take a walk into town, but as a rule I spend my time elsewhere.
 3562. You would have an ordinary number of acquaintances? Yes.
 3563. Have you met men who have been leaded? I have met one, I think, who said he was leaded. I helped to treat him. He was bound up.
 3564. Where had he been working? In Block 14.
 3565. In moving about amongst the men, do they discuss lead-poisoning at all—do they speak of it as one of the ills of Broken Hill—do you hear men say that there is such a thing as lead-poisoning going on? Yes; all through the streets.
 3566. They talk a great deal about it? Yes.
 3567. Do you ever hear them say what mines are the worse to work in? Yes—Block 14.
 3568. Then, although you have had no experience yourself there, from what you have heard people say, you would fancy that a number of men do get leaded in Block 14? Yes.
 3569. Very few get leaded at the big mine? Very few; ventilation is so good.
 3570. You simply infer that ventilation is not so good at Block 14? I know nothing at all about Block 14. I never worked there.
 3571. But you would infer that ventilation is not so good at Block 14? I could not infer at all. I can only speak of where I have been working.
 3572. But still it is generally understood that more men are leaded in Block 14 than in the big mine? I do not know. You hear a lot of men talking sometimes when they have no occasion to talk.
 3573. Do you know anyone that has died through lead-poisoning? No; I do not.
 3574. You have never heard of anyone being leaded at Block 11? No.
 3575. At Jamieson's? No.
 3576. At M'Culloch's end? No.
 3577. *Mr. Howell.*] As a matter of fact, would not the miners going down below prefer to take their water with them than get it out of the pipes? Yes.
 3578. How long has that pipe been in the mine? I could not say exactly. It has been there a good while.
 3579. For a year, do you think? Yes—longer, I think.
 3580. That water is used for the purpose of sprinkling and drilling? Yes.
 3581. Are you working on contract now? Yes.
 3582. At what part? Wigg's.
 3583. Have you worked on contract in any of the lead stopes? I have worked on 316, at M'Culloch's, between M'Culloch's and Wilson's—working in a rise.
 3584. How high did you run it up? From 316 to 216.
 3585. How were you furnished with air? We had a machine and fans there.
 3586. They were driving the air up to you? Yes.
 3587. That is invariably the case where they are running a rise? Yes.
 3588. Do you think that the air is as dusty now as it used to be above the 200 level? No; it gets more damp as you get down.
 3589. As far as you are concerned yourself, you have never experienced any inconvenience from the effects of lead? No; I have always enjoyed good health.
 3590. Do you hear the men complaining about dynamite fumes? Yes; we all know that that is equally as bad as lead, if not worse; that is my opinion on the matter.
 3591. But there are very few places in the mine but what the ventilation is sufficiently good to drive those fumes out, and the men have sufficient time allowed them to let the fumes get away? No one ever forces me back before the fumes have gone out.
 3592. So far as your own knowledge is concerned, you do not know of any spot, of any portion, where you have been working, where the ventilation could be improved? No; the ventilation is very good.
 3593. *Mr. Hamlet.*] Can you account for the reason why you were not leaded? I cannot; but I have always been accustomed to have a bath, and besides I always take porridge every morning. I do not know whether that makes any difference.
 3594. Porridge and milk? Yes; I have recommended it to a good many young fellows, and they all consider that it has improved them.
 3595. And that is generally the precaution that you have taken? Yes; I had a box of pills when I first came here, as they were recommended, but I found that the sooner I left them off the better. I always take porridge, and I recommend every man to take it every morning. I know it has acted very well on me.
 3596. With regard to ventilation in the rise;—a rise is an upright channel from one level to another? Yes.
 3597. When the ventilation becomes bad in a rise it is customary to put in a fan? Yes.
 3598. The fan is always there working? Yes; that is the case with me.
 3599. What is the size of the pipe that brings down the fresh air? Ten inches in diameter.
 3600. You could not work on the rise, and have the air going up full force—it would be too smart? Yes.
 3601. How do they prevent candles going out? We regulate the engine accordingly.
 3602. On the other hand, did you ever see ventilation so bad that the candle would go out? No; I have seen the air blow it out many a time in the drives and stopes.

Mr.
T. Ellery.
19 Jan., 1893.

3603. What clothes do you generally have on when working in the mine? I generally pull my shirt off, and work in my flannel; that is generally the way with all miners.
3604. I suppose if the blast was too strong, you would object to it? We have the engine under our control, and we can go down and turn the blast off.
3605. You can regulate it yourself? Yes, it is in our own hands; it is placed there for us.
3606. So if you find a place becoming more hot and stuffy than usual, you could go and put on a greater blast if you liked? Yes; we always put on an extra blast when we fire to blow the smoke out.
3607. How long does it take for the fumes to get away, so as to be able to get back to work? I have seen it ten minutes.
3608. It depends upon the place you are working in? Yes.
3609. *Chairman.*] On what ground are you so confident that men would prefer to carry water below with them? Because they think it is purer; you know what you are getting then.
3610. And lots of men carry tea with them? Yes; some cannot drink water.
3611. No man who takes his water or tea below, when he gets through it, hesitates to send his billy up to the surface to be filled? No; I have had many a drink from the surface, it has always been good water; you can get a drink any time you like.
3612. I suppose if a regular arrangement for bringing drinking water underground were made that would remove any doubt the men may have about its being pure? I never heard the men say it was not pure; I have heard some of the men say that they have drunk the water out of the pipes.
3613. If some recognised arrangement for furnishing men with water were made, they would not, I suppose, be so anxious to take it down below themselves? I could not say; I suppose they would have a drink, if they saw pure clear water.
3614. You say they drink it now, because they like to know what they are drinking? Yes; it is the custom on all mines to always bring your own water. I have never seen a mine where they have provided water for the men. In the coal-mines in Newcastle you always bring your own water.
3615. What do you carry water in? A water bag.
3616. Are these commonly used? Most of them carry their water in bottles and tins.

[The witness withdrew.]

TUESDAY, 7 FEBRUARY, 1893.

Present:—

DR. ASHBURTON THOMPSON (CHAIRMAN).

WM. M. HAMLET, Esq. | J. THOMAS, Esq.

Dr. T. R. Belgrave recalled and examined:—

Dr. T. R.
Belgrave.
7 Feb., 1893.

3617. *Chairman.*] We have thought it necessary, Dr. Belgrave, to recall you in order to ask you the names of the women and child mentioned by you in answer to questions 2076 to 2081? The name of the woman is Jones. I have lately seen her again. She is at this present moment still suffering from lead. She would have come with me, but she has lately been confined of twins, and does not like to go out. She has been suffering from lead for nearly three years. As regards the baby named Forde, she was removed by her parents to a distance, and has recovered perfectly.

[The witness withdrew.]

Dr. C. E. Thompson recalled and examined:—

Dr. C. E.
Thompson.
7 Feb., 1893.

3618. *Chairman.*] I understand that you have lately come across a case of leading in one of the townspeople such as you had not met with when you gave evidence before? Yes.
3619. Would you kindly give the Board some account of it? The patient was a child, four years of age, living in Crystal-street, nearly opposite to the south smelters. She presented well-marked symptoms when I saw her of lead poisoning. She was anæmic, and was suffering from colic. Her mother stated that she had suffered from colic and want of appetite and vomiting fourteen days before I saw her. The symptoms yielded to treatment readily, but she is still anæmic. She has been removed from the place where she was. I handed to Mr. Hamlet some water out of the tank that the family drinks from for examination, and he reported $5\frac{1}{2}$ grains of lead to the gallon. Of course the sediment was well stirred up, and the water they had been drinking would not contain so much. That is the only case of leading among the townspeople that I have met with, with the exception of those mentioned previously.

[The witness withdrew.]

Dr. W. Blaxland recalled and examined:—

Dr. W.
Blaxland.
7 Feb., 1893.

3620. *Chairman.*] I understand, Dr. Blaxland, that since you gave evidence last, you have come across a case of leading in some person not engaged at the mines? Yes.
3621. Would you be good enough to tell the Board about it? The patient is a little boy nine years of age.
3622. Where does he live? He lives just north of the British concentrator, close under the British Mine.
3623. On the north side of the hill? Yes.
3624. How did he suffer? Wasting, loss of appetite, and pain in the abdomen, also vomiting.
3625. Has he recovered under treatment? Not yet; he is still under treatment.
3626. Had he any blue line? Yes. Not a line exactly, but a blue mark at the base of one of the central incisors, and at the point of junction between the lip and the gum immediately below this, and on the mucous membrane of the gum, there is a small blue patch.
3627. Does he live in any particular street? No; he lives on the British Lease.
3628. Do you know if he went to school? I should think he would be old enough to attend school.
3629. You did not hear whether he did or not? No.
3630. To what do you ascribe his leading? I consider it due probably to the water partly. They have been drinking the water they have caught from the roof. I tried to see the other children, but they were away

away at school when I was there, and I could not see them. I saw one of the elder ones; she shows a slight blue mark at the base of the teeth, but she has not suffered from colic or anything.

3631. How old was that child? About 14 or 15 years of age.

3632. Not doing any work? She is working in the house.

3633. A female? Yes. The mother said the little boy was very fond of playing about up close to the mine, but I do not know whether that would make any difference. I advised them not to drink any more of the roof water and they are not doing so now.

3634. In answer to questions 215 to 217, whether you had met with any case of plumbism among the general population, that is, among persons not in any way connected with the mines, you answered that you had only one case, about which you had not made up your mind when the patient disappeared? Yes.

3635. Now you have this case, which is well marked, and in the same family apparently another case not so well marked, but also one of lead poisoning;—are these the only cases you have met with among the general population? Yes.

3636. Suppose such cases were only met with within a certain distance of the smelters and to the leeward of them, is it not possible that there might be a good many of the townspeople affected with lead living in those places who yet might not have come under your observation? Yes.

3637. Suppose that other practitioners said they had met with a good many cases of leading among the townspeople, is it not possible that they may have more patients among those who live thus near the mines than you happen to have? Probably the bulk of them have gone to other people, you mean?

3638. Yes;—that there is a number who suffer, but since they live in particular streets may possibly not have applied to you for advice? Certainly, it is possible; but I am attending a good many people close to the mines, and have been doing so all the time.

3639. And those are the only cases that you have seen? Yes.

[The witness withdrew.]

Dr. W.
Blaxland.
7 Feb., 1893.

LEAD POISONING INQUIRY BOARD.

APPENDIX.

APPENDIX A.

WEDNESDAY, 16 AUGUST, 1891.

Legislative Assembly.

11. MR. CANN *to ask* THE SECRETARY FOR MINES,—Will he cause an inquiry to be made as to the effect of lead upon miners and others working in silver and lead mines at Broken Hill and other places?

Department of Mines, Sydney, 28 September, 1891.

THE serious effects of lead dust upon the health of persons, especially young people, employed continuously at sorting ore in silver mines, demand most careful consideration with a view to measures being adopted to minimise the dangers to which such persons are exposed.

There are a number of instances on record in which severe illness has followed such employment, and several deaths in this Colony are also directly traceable to the effects of the continual breathing in of air contaminated by the presence of lead dust.

In the silver-mining industry, which may be said to be in its infancy only in this Colony, there is likely to be at no very distant date a much larger number of persons employed than now, and the question that I have brought under the notice of my honorable colleagues is one of great moment to the mining community. Especially is it so to the miners of Broken Hill and Sunny Corner; and I therefore propose, with the sanction of the Cabinet, to appoint a Board of Inquiry consisting of a medical man, an intelligent representative of the miners, and an analytical chemist, to investigate the matter at Broken Hill, and present a report giving the most reliable information obtainable as to the amount of sickness and the percentage of fatalities due to the present conditions of working in these mines, and the measures they would recommend to be taken to overcome, as far as possible, the unsatisfactory state of matters now existing.

S. SMITH.

EXTRACT from a Report on the sanitary state of Broken Hill, October 3 to 9, 1891.

(Cf. Minutes of Meeting: Introductory, p. 3.)

The Chief Medical Inspector to the President of the Board of Health.

"12. *Plumbism*.—Although this appears as a registered cause of death only twice in the record of 1890, I have reason to believe that lead-poisoning is a frequent cause of serious illness here, and that all the cases do not fall under medical treatment within the town. Men sometimes come to work from a distance, expect to fall ill, and at the approach of symptoms retire to their own neighbourhoods. Besides this, it seems to be an established fact that cats and dogs cannot be kept within a considerable distance of the mines, but invariably die; while it is certain that milch-cows kept in the town become poor, have staring or rough coats, and sometimes die, while they recover from these symptoms soon after removal to a short distance away. It appears to me that this matter is one of great general importance. Lead poisoning does not, as a rule, speedily cause death, but it very often, indeed, causes permanent damage to the constitution, and is an indirect cause of death; and, when the sufferer survives, it often incapacitates him from getting his own living. It is, therefore, desirable that in a town which contains so many persons who are directly exposed to the danger of lead-poisoning, as well, perhaps, as others less directly exposed to it, an attempt should be made to ascertain the degree in which it exists here, and the circumstances under which it arises; with a view of making the facts known if they should turn out to be of sufficient importance, and of taking such precautionary measures as may seem useful and practicable."

J. ASHBURTON THOMPSON.

Sir,

Department of Mines and Agriculture, Sydney, 18 January, 1892.

It having been approved by the late Government of the appointment of a Board to inquire into the cases of lead poisoning at the silver-mines in the Barrier Ranges District, and as such Board is to consist of a medical man, and analytical chemist, and a representative of the miners, I have the honor to request that you will be good enough to select the medical man and the analytical chemist.

I have, &c.,

HARRIE WOOD,

Under Secretary.

The Secretary to the Board of Health.

See reply to Mines Department, 22/1/92.—E.S.

Sir,

Board of Health Office, 127, Macquarie-street, Sydney, 22 January, 1892.

In reply to yours of the 18th instant, respecting the appointment of a Board to inquire into the cases of lead poisoning at the silver-mines in the Barrier Ranges District, I have the honor, by direction, to suggest that, Dr. J. Ashburton Thompson, M.D., D.P.H., the Chief Medical Inspector of this Department, and Mr. W. M. Hamlet, F.I.C., F.C.S., the Government Analyst, should be appointed on the proposed Board, and that Dr. Thompson should be the Chairman of such Board.

It appears desirable that the report of the proposed Board of inquiry should be made to the Board of Health, in order that the latter body may be in a position to furnish the Minister for Mines with such remarks thereon as may appear necessary.

It will be necessary that the sanction of the Colonial Secretary should be obtained before Dr. Ashburton Thompson and Mr. Hamlet are appointed.

I have, &c.,

EDMUND SAGAR,

Secretary.

The Under Secretary, Department of Mines and Agriculture.

Sir,

Amalgamated Miners' Association of Australasia, Broken Hill, 1 February, 1892.

I have to inform you, in reply to yours of the 18th January, ref. No. 91-21,201, that Mr. R. Sleath has been appointed on behalf of the Miners' Association on the Commission appointed to inquire into cases of lead poisoning amongst the miners on the Barrier.

I have, &c.,

M. BOURKE,

President, A.M.A., N.S.W.

The Under Secretary for Mines.

Sir,

Department of Mines and Agriculture, Sydney, 5 February, 1892.

I have the honor to inform you that the late Minister for Mines and Agriculture approved of a Board being appointed, which was to consist of a medical gentleman, an analytical chemist, and a representative of the miners to inquire into the cases of lead-poisoning at the silver-mines in the Barrier Ranges district, and, with a view to the appointment of such a Board, the Board of Health and the Secretary of the Miner's Association were asked to nominate gentlemen for those positions, and in response to the Department's request the Board of Health nominated Dr. J. Ashburton Thompson and Mr. W. M. Hamlet, F.I.C., F.C.S., the Government Analyst, as the medical gentleman and the analytical chemist respectively,

buildings of brick and stone, and the proportion of such houses to temporary structures is now so considerable that the town has in great part assumed a usual aspect. In 1891 another drought was experienced, but for a time the state of the townspeople was not so bad as in 1888 because some large dams had been constructed which yielded a fairly good water at reasonable rates, and when these gave out water was brought by rail from the nearest available point, and distributed under supervision of the corporation; besides which the state of the town area as regards cleansing had been very much improved. During the latter half of 1892 a water conservation scheme was completed at Stephens' Creek and the town reticulated. At the end of the year a large supply was in store.

During the whole of this time supplies of food were always sufficient; but down to 1889 or 1890 vegetables and milk were deficient in quantity and rendered articles of luxury to most of the residents by their price. During two years past matters have much improved in this respect.

There is a considerable circulation of people through the town and district; the number of passengers carried on the railway, which forms practically the sole channel of communication, fairly illustrates this:—

Year.	Number of Passengers carried.
1887
1888 49,551
1889 47,057
1890
1891 78,362

But it is supposed that the resident population does not greatly fluctuate, nevertheless.

Under all the circumstances here briefly glanced at, it is not possible to present a fuller analysis of the death-records than follows below. It is, indeed, highly creditable to the organization of the department of the Registrar-General that the details should be as fully recorded as I found them to be. The first two Tables were compiled by me from the records in 1891 in the course of an ordinary official tour; the other two in the course of and for the purposes of the present inquiry. I am indebted to the District Registrar (Mr. R. Mends Gibson) for much information and assistance.

TABLE XII.—Particulars of Deaths ascribed to Lead Poisoning during the five years, 1888-92.

Date.	Name.	Age.	Registered cause of Death	Occupation.	Remarks.
1889—April 2	Joseph Bennetta.....	12	Lead poisoning, epilepsy, 3 days...	Ore-picker.	See Q. 2070
" 2	Henry Christopher.....	13	Epilepsy, 9 days.....	Child (ore-picker)	
July 25	James Patrick Durkin..	54	Heart disease, accelerated by lead poisoning.	Miner.	
1890—Jan. 3	Abraham Olds.....	26	Lead poisoning, 9 days	Miner.	See Q. 2701
July 23	John Bent	25	Acute anaemia and exhaustion, lead poisoning, 3 weeks.	Miner.	
Sept. 6	Marion Lane	2 y. 8 m.	Lead poisoning, 8 weeks	Child.....	
Dec. 26	Samson Hall	62	Lead poisoning, 4 weeks	Miner.	See foot-note
1891—May 17	Edward Giles	23	Lead poisoning, 40 hours	Miner.	
" 18	Edgar Stephen Plane...	25	Lead poisoning, 7 days	Miner.	
Oct. 15	William John Grigg ...	50	Extreme debility through chronic lead poisoning, several months.	Miner.	See foot-note
Dec. 28	John Davies*	56 (or 62, as given in the depositions).	Epilepsy, the result of chronic lead poisoning, accelerated by excessive heat (Magisterial inquiry).	Boilermaker.	
1892—June 21	Charles Tytherleigh ...	49	Chronic lead poisoning; acute do., 5 days.	Miner.	

* A medical witness testified, but he had not seen the patient alive. After reading the depositions I concluded without hesitation that, in the absence of any post mortem examination, the finding should have been "death from natural causes."—J.A.T.

J. ASHBURTON THOMPSON.

APPENDIX C.

EXAMINATION OF PUBLIC SCHOOL CHILDREN, February 6th, 1893.

Central Public School: master, Mr. Dwyer; average attendance, 800; time of inspection, morning school.

Lower section of Infant School: mistress, Miss Ferguson; contained about seventy pupils. Miss Ferguson stated that she had herself noticed that children who lived outside the town were as a class much healthier than the children as a class who lived within the town. Having looked at the scholars, I picked three out of many pallid children. On inquiry it appeared that two of them lived in Crystal-street and one in Chapple-street.

In the upper section of the Infant School, of two pallid children chosen from many, one was found to live on Central Blocks, and one in Argent-street, not quite as far north as the British Mine. Miss Beryman, in charge of this class, had not noticed any difference between children such as was mentioned by Miss Ferguson.

The Junior Infants: On two children being picked out at hazard from among several who were manifestly pallid it was found that they had lived in Argent and Chapple Streets respectively. Another pallid child was found to live in Gaffney-street, but she was too young to say exactly whereabouts.

Lower second class, Boys' School: Of two pallid boys, one lived at Crystal-street, and one in Beryl-street.

In the higher classes one pallid boy who was interrogated lived on Billy-goat Hill. Another lived in William-street Lane, near the North School. He was very anæmic; gums pallid, showing a deep red line at the margin; said he was in good health. Another pale boy picked out said he lived in Pell-street.

Among the girls, the pale children picked out at hazard lived in Crystal, Argent, Mica, Slag, and Beryl Streets.

South School: master, Mr. M'Phic; average attendance, about 600; time of inspection, afternoon school.

All the class-rooms were visited, and the children inspected *seriatim*; not more than three showed any pallor, and their general appearance was ruddy, although many seemed to be not strong. Their faulty physical conformation, however, showed that this was due to no local or temporary condition.

North School: master, Mr. Wallace; average attendance, about 500; time of inspection, afternoon school.

The remarks made in the case of the South School apply on the whole; perhaps the appearance of the children was not quite so good, but they still formed a strong contrast to the children at the Central School; than whom one teacher, who had formerly taught there, thought they were decidedly healthier, and not much below classes she had taught in other parts of New South Wales (but 75 per cent. or more of the children at Broken Hill are South Australians by birth).

Waters analysed at the Central School.—Examinations of waters used for drinking purposes at this school will be found in Appendix L. That in tanks attached to the school-rooms was free from lead; that in one attached to the teacher's residence had one-fourth of a grain of lead in each gallon. The explanation of this discrepancy is that the former had been cleaned out at the end of a long drought, and had recently been refilled by heavy falls of rain; but the latter had been saved up through the drought as a source of drinking-water of supposed purity. All these tanks are exposed to the same source of contamination, namely, flue-dust from neighbouring smelters, and are stores of dangerous drinking-water; they should be immediately removed, and the premises connected with the public water-mains.

J. ASHBURTON THOMPSON.

APPENDIX D.

* Note.—Probably this would be the best way to supply water.

BROKEN

CENTRAL BROKEN HILL SILVER MINING COMPANY, LIMITED.

Quantities of Ore despatched.

	1890.	Tons.	cwt.	qrs.
To Dry Creek, silver and lead ore	21,898	19	3	
„ Sydney „ „	366	4	2	
1891.				
To Dry Creek, silver ore	1,461	19	1	
„ Wallaroo „	1,127	12	0	
„ Sydney, sulphides	562	18	0	

Quantities of Ore treated at Company's Smelters, Broken Hill, 1891.

Carbonates, 20,776 tons. Silver Ore, 25,110 tons. Sulphides, 2,744 tons.

BROKEN HILL PROPRIETARY COMPANY.

Memo. of men employed, &c.

Underground.—984 miners; 76 brace and platmen; 318 truckers and labourers. Total, 1,378 men.

Surface.—14 foremen; 41 carpenters; 5 tinsmiths; 18 blacksmiths; 17 blacksmiths' strikers; 33 turners and fitters; 6 boiler-makers; 9 masons; 39 ore-shunters and truckers; 16 horse-drivers; 250 labourers. Total, 448 men.

Smelters.—39 tappers; 39 feeders; 132 slag-wheelers; 162 charge-wheelers; 57 labourers (on dumps and bins); 45 labourers handling slag, buebori, &c. Total, 474 men.

For year ending May 31, 1891, there were 219,146 tons ore mined, averaging 27 per cent. lead, 37 oz. silver, smelted in quantities of about 50 per cent. lead, 36 per cent. kaolin and silicious, 14 per cent iron ore.

The ore is oxidised-carbonate ore.

BLOCK 10 COMPANY.

„ 1891.....	50,006	14	2	12 „	

June 28, 1892.

JOHN WARREN,
General Manager.

BROKEN HILL SOUTH COMPANY.

DURING the early part of the year 1890 the mine was in a very small way, only about fifty men being employed. As the year wore on the number was increased until about 130 men were employed. During 1891 this number was increased to 300, and on the starting of the smelters in August, 1891, a further increase to 400 took place. The following were the approximate numbers employed in each department:—Miners, 205; truckers, 55; platmen, 12; smelters, 86; ordinary, surface, &c., 42. Total, 400.

The ores broken from the various parts of the mine are of similar character to those of the other mines, consisting of carbonate, oxidised and sulphide ores. The carbonates, generally speaking, are of a massive nature, breaking freely in blasting with comparatively little dust. The average contents of a.g. and p.c. vary considerably from 10 to 40 per cent. p.b., and from 15 to 50 oz. a.g. (sulphides average is not included in this). Until the past six months more than half of the miners were employed in work of an exploratory nature—through hard barren ground for the most part. Generally speaking the ventilation in the mine is good, and miners in consequence enjoy good health, very little time being lost through sickness. Quantities of ores raised can be obtained from the ordinary half-yearly reports issued by the company.

APPENDIX H.

STATEMENT showing number of men employed at the Broken Hill Silver-mines during the fortnight ending the 19th December, 1892;—

Total for last two years, 17.04 inches. Southerly winds prevailed.

APPENDIX K.

APPARATUS FOR SEPARATING DUST FROM AIR.

I.

LAKE'S apparatus for separating dust from air was designed chiefly for use in flour-mills, but might perhaps be adapted to the present purpose; I therefore give a reference to the specification of patent, and a brief description of its principle and construction. The former is the tendency of dust to settle out of still air; and the latter is such that dust is conveyed out of a moving atmosphere into a still one. This is effected by the following means:—The air to be freed from dust is forced by a fan through a flue, in the course of which a cylindrical chamber is inserted. Within this chamber beaters, whose extremities very nearly touch its wall, are caused to revolve with great rapidity, and the cylinder is so constructed that in section its wall is seen to be louvred. If this were all the apparatus, then the dusty air would be forced through the flue by the fan, it would be violently carried round in the cylinder by the beaters, part would be forced outwards between the slats to mingle with the general atmosphere, and part would escape by the continuation of the flue; thus there would be no separation of the dust. But the cylinder is enclosed in a perfectly air-tight case of small capacity. Within this case the air is at rest, for the beaters can force no more into it; for the same reason, the air passing into the cylinder by the flue entirely escapes by the continuation of the flue. But it is otherwise with the dust particles floating on that air; these are so whirled by the beaters that the centrifugal motion imparted to them carries them out of the cylinder, between the slats, and into the still air beyond, which is contained by the case; when, of course, they settle to the bottom thereof, and can be removed periodically by a suitable air-tight valve, which allows this to be done without opening a passage through the case, and thus causing a current of the air contained in it. (Specification No. 4,038, February 27, 1884; printed by order of the Board of Trade, and published at the Patents Office, Sale-branch, London, E.C.)

II.

Goodfellow's is another apparatus, in use at English lead-works, and constructed as follows:—The flue-gases, &c., pass first through a screening chamber, where the coarser particles are detained, and then are forced by a fan into a hollow axle, which carries arms or beaters; at the base and in front of each beater is an opening to the interior of the axle by which the said gases escape. The axle is many feet long, and is caused to revolve rather rapidly within a closed brick chamber, at the bottom of which a few inches of water stand; and as the beaters nearly reach the walls of the chamber the result is that the air in it is thoroughly impregnated with a fine watery spray, which, moreover, is brought into intimate contact with the solid particles contained in the flue-gases. A comparatively small iron flue of no great height serves to carry off all that issues from the chamber, including some watery vapour; and I have been assured that it was found in practice that the water was thus made to wet the fume-particles and so to retain them, which, as is well known, is very difficult to do, and a source of the failure which usually attends on such inventions.

APPENDIX L.

APPENDIX L.

INTERIM REPORT UPON CHEMICAL ANALYSES MADE BY MR. W. M. HAMLET, F.I.C., F.C.S.

30 August, 1892.

DURING the intervals between the various sittings of the Lead Inquiry Commission all the information possible was collected with a view towards the elucidation of the chemical aspect of the question.

The kinds of ore met with in our preliminary visits underground were chiefly cerussite, or * white lead ore (lead carbonate); galena, lead sulphide; blende, zinc sulphide—all more or less rich in silver; native silver in kaolin or China clay, together with a great variety of less frequently occurring minerals of more interest to the mineralogist than to the practical smelter. These include phosphates, sulphates, arsenates, carbonates, chlorides, iodides, bromides, chloro-bromides sulphides, and selenides of lead, silver, zinc, iron, copper, manganese, mercury, and antimony.

The prevailing ores are, however, the sulphides and carbonates of lead containing silver, together with native silver disseminated through kaolin or decomposed felspar.

The carbonate of lead was found to be easily disintegrated to a fine powder, and the proprietors of some of the mines evidently were aware of the danger to life from inhaling the dusty lead ore, to counteract which the workings were kept sprinkled with water. A sweetish-astringent and somewhat metallic taste was observed as I passed through some of the workings, especially where lead carbonate ore most abounded. From such workings it transpired in evidence that most of the cases of lead poisoning originally came.

On coming into the stopes, and more particularly in those places where new bodies of ore were being opened out, the air was found to be close, warm, and stuffy. Where blasting was carried on this state of things was much more unpleasant, the air in the stopes where such shots were fired could only be described as being very oppressive and close.

The air in some of the stopes visited was tested to see what proportion of carbonic acid existed.

The following estimations of the quantity of carbonic acid present in the underground workings were made actually within the lead stopes:—

	Volumes of carbon di-oxide in ten thousand volumes.	Per cent.
Lead stopes—No. 1.....	6½	·065
„ No. 2.....	5¾	·057
„ No. 3.....	6	·060
„ No. 4.....	7	·070
„ No. 5.....	6½	·065
„ No. 6.....	6	·060
Above ground.		
At the blast furnaces, tapping floor	4 ¹ / ₁₀	·041
On the charging floor	4	·040
In the assay office	3 ⁸ / ₁₀	·038
Fair quantity in good air	4	·040
Hurtful quantity	7-8	·07 to ·08
Noxious limit	10	·10

In consequence of the strike among the miners, many further tests, including the following important data and analyses had to be abandoned:—

- (1.) Quantity of lead in the fumes arising from each nest of blast furnaces.
- (2.) Quantity of lead given off in the fumes at each operation of tapping. (This was in progress on the day preceding the strike, the analysis being quite spoiled by the cessation of work.)
- (3.) Quantity of lead in the dust floating in the air near where the men are at work.
- (4.) The same with regard to different varieties of ore.
- (5.) Quantity of lead in the expired air from miners' lungs.
- (6.) Quantity of lead in excretions, sputa, &c., while miners at work.

Some flue dust obtained from one of the mines yielded upon analysis 30·74 per cent. of metallic lead, no arsenic, and 26 oz. 15 dwt. 16 grs. of silver per ton.

Samples of soil were obtained from several points from the middle line of the hill, all of which were found to contain varying quantities of lead ranging from a quarter of a per cent. to four and three-quarters per cent. of metallic lead.

Samples of Soil.	Percentage of metallic lead.

Water Supply at Broken Hill.

At the time of our visit the mains were being laid to connect Broken Hill with the new water supply from Stephen's Creek.

The actual supply, however, was from the little rain water collected from the galvanised iron roofs of the houses, supplemented by water brought by rail from other places. Nearly all the samples here enumerated were collected by me personally, and whilst going round to the different houses. It was very generally understood by the people that the first water caught from the roof was to be discarded as quite unfit for either washing or drinking purposes, such water having a hard metallic or enkered taste. The practice of most house-wives was to divert the shoot or gutter leading from the roof into tubs, and throw away the first two or even the third tubful before allowing the water to flow into the storage tanks. Many people even suspect arsenic from the lead fume, and when their tanks are empty, which is a frequent occurrence, the tanks are carefully cleaned out prior to the expected rainfall. In more than a dozen houses in Crystal-street, which is only 22 chains distant from the principal mine, I found no trace of lead in the drinking water.

Underground tanks have the disadvantage of not being cleansed very readily, and most of the waters found in such tanks were very dirty and often contained lead.

Samples

* Somewhat similar in composition to the article of commerce known as white lead, and which is recognised to be a fertile source of lead poisoning.

Samples of water examined for lead only, no opinion being given of the character of the waters from possible animal impurities.

Lead in the bodies of Animals suffering from Plumbism.

A favourite dog belonging to Dr. Blaxland having died a few days before leaving Broken Hill, the viscera was removed and taken to Sydney. Upon chemical analysis lead was distinctly recognised in all the organs. The liver was found to yield one-fifth of a grain of metallic lead, besides traces of iron, manganese, and copper.

The gizzard of a fowl was found to contain no trace of lead.

A horse's stomach forwarded to Sydney by a veterinary surgeon contained no lead.

WILLIAM M. HAMLET.

FURTHER AND FINAL REPORT OF CHEMICAL ANALYSES &C., MADE BY MR. W. M. HAMLET, F.I.C., F.C.S.

THE scientific aspect of the question of lead-poisoning on the Barrier Ranges silver-field, although beset with some difficulties, is simple in character, and resolves itself into a chemical and metallurgical inquiry touching the following points, namely:—

- (i) The variety and nature of the ores worked.
- (ii) Methods of mining and smelting.
- (iii) The environment of the men whilst engaged at their work.
- (iv) The disposal, both of economical and of waste products.
- (v) Meteorological conditions.

The Barrier District yields the most wonderful variety of mineral wealth. Excluding the country district, and confining one's attention to the Broken Hill lode alone, the minerals hitherto discovered may be classed into five distinct groups:—

1. Iron-ores and manganiferous iron-ores.
2. Native silver and silver-ores associated with kaolin and silica.
3. Lead-ores and argentiferous lead-ores, including blende.
4. Native copper, with copper and zinc ores.
5. Other minerals occurring in small quantities, and which may be termed the rare ores of the lode.

The first group, forming the cap of the lode, is rapidly being used up as a flux. The entire top of the hill, known as Broken Hill, is now being quarried away, and to such an extent as to lay bare the old workings of the mine, the timbers from which are being used over again.

The second group includes free metallic silver (the so-called "slugs") and silver in plates, laminae and wire, embedded in pure white kaolin; horn silver, or kerargyrite, occurring in dense masses of silver chloride, which change by the action of light from the original green colour to a dark gray, and which is composed of nearly theoretically pure silver chloride; embolite (silver chloro-bromide), containing 60 to 70 per cent. silver; silver bromide, or bromargyrite; silver iodide, or iodargyrite, both found in kaolin, silicious iron manganese ores, and in garnet sandstone.

The foregoing are technically called "dry ores," not from their freedom from water or moisture, but because they require the addition of lead or lead-ores to render them easily fusible in smelting. They may again be classed as non-poisonous ores, for in practice they are not found to exert any noxious effect on the miners who hew them.

The lead-ores are, *par excellence*, the poisonous ores, and consist of carbonate, sulphide, arseniate, sulphate, phosphate, and oxy-chloride of lead. The most commonly-occurring ore is cerussite, white lead ore, or carbonate of lead, and which differs only in composition from the very well-known poisonous pigment white-lead, in the fact that the latter is merely hydrated lead carbonate, or a mixture of hydrate and carbonate, whereas cerussite is simple crystallised lead carbonate. Associated with this compound is found silver in varying proportions; indeed, the argentiferous cerussite occurs in vast bodies of ore, and is generally known as "carbonate ore," although it may contain a number of other metals and silicious gangue. Besides the carbonate ore, there is found native copper, with oxide, iodide, carbonate, and silicate; zinc sulphide, carbonate and silicate, together with mercury, manganese, antimony, arsenic, sulphur, selenium, gallium, and indium, which form a group of rarer metals present in varying quantities along the lode.

For the purpose of this inquiry, the chief feature of the carbonate ore is that it is very friable—easily broken down into a very fine powder, which lodges on the walls and floor, and in every cranny of the underground workings, easily blown about in the form of an impalpable dust. This dust being highly poisonous, it follows that where there is much dust, no sprinkling, and imperfect or no ventilation, there will be the most favourable conditions for lead-poisoning.

Ordinary mining-shafts are sunk into the hill at various points on the different mining properties, at depths from 100 to 700 feet. Branching off at right angles, are the many "drives" and "cross-cuts" leading to the large masses or "bodies" of ore; the horizontal gallery or opening cut into a body of ore is known as a "stope," and is the locality where the miners are to be found hewing and raising ore. The solid front or mineral mass is technically known as the "face," against which the miner is discovered at work with picks, shovels, and drills. After large masses of ore have been removed

* All the tanks used by the children had been empty and cleaned out before the rain came in May-June, 1892.

removed by blasting with dynamite, heavy logs of timber are placed into position, forming square chambers, each called a "set." The gases given off by the gunpowder or dynamite compel the men to retire until sufficient fresh air has entered the working-place or stope. Besides this, there are found sometimes natural cavities termed by the miners "vuggs" or "vughs." When these are opened, considerable volumes of carbon-dioxide are liberated, which are sufficient at times to extinguish the candles. Frequently the men have to retire until the air is good enough to resume work.

In visiting the stopes I found that the lead-dust from the ore, the choke damp or carbon-dioxide from the enclosed cavities, together with the expired air from the men's lungs and the gases from the explosives used, all combine to render the air intolerably hot and impure. Happily, in some instances the mine managers recognise the danger to which the men are thus exposed, and forced ventilation is made use of by means of fans worked by compressed air; water is laid on and sprinkled over the "face" to lay the dust, while air-passes are provided to bring fresh air from some neighbouring air-shaft.

For the percentage of carbon dioxide in stopes see particulars given in my interim report.

Temperature in the stopes would be, moreover, a simple and reliable guide as to the extent of the impure air and need for ventilation.

SMELTING.

The extraction of the silver and lead is effected in water-jacketed blast-furnaces, rectangular in shape, and constructed to hold charges of upwards of 80 tons each. The charge is wheeled from the ore-bins and shovelled into the furnace-mouth from an upper floor called the charge-floor. It consists of silver-lead ore, manganese iron-ore, coke, and limestone, together with as much slag, flue-dust, and skimmings as is deemed necessary, the proportion being controlled by the skilled metallurgists, regulated by frequent assay and analysis of the materials.

The reduced metal is allowed to run through a syphon into the lead-well, which is situated at the base of the furnace, on the tapping-floor. From time to time at frequent intervals the liquid slag is drawn off from the surface of the molten metal, and received every few minutes into cast-iron pots on wheels and wheeled off to the edge of the "dump" or slag-heap, where the slag is allowed to run down over the steep edge of the dump, and forms a conspicuous and characteristic sight after dark.

A powerful blast is urged through each set, or nest of furnaces, and the products of combustion, particles of unconsumed coke, ore, flux, smoke and lead fumes, pass away up through the smelter-stacks out into the atmosphere.

The highest of these chimneys discharges its smoke at a height of not less than 300 feet above the level of the streets, and the immense volume of smoke is the constant and most characteristic feature in the landscape at Broken Hill. The smoke is easily discernible for fully 15 miles around.

The men employed on the mines are subject to the fumes arising from the oxidation of molten lead and flue-dust if working on the surface; while those who work as miners underground are in constant danger of inhaling lead-dust, more particularly so in the lead-stoppe, or where carbonate ore is being mixed.

These lead-stoppe are usually spaces or chambers cut in the earth, measuring 6 feet in height, and varying from 10 to 50 feet in width, according to the quantity of payable ore met with.

The fine dust settles everywhere on timbers, tools, ore-waggons, and upon the men's bodies and billycans, and upon the parcel of food in the men's coat-pockets awaiting "crib-time." Some of the dust obtained from one of the lead-stoppe was analysed and found to contain 8 and 15 per cent. of lead respectively, while some sputum obtained from miners, contained 2.0, 1.6, and 1.8 grains of lead respectively. Many men strip to the waist while working, but the majority worked with singlet and trousers on.

Some of the air in the stoppe was found to contain .58, .40, and .51 grains of lead per cubic foot in suspension as dust or solid particles. In places where no work was going on only the merest trace of lead was found. It is easy to see that under the usual conditions of warmth, moisture, and carbon-dioxide, the lead-dust could easily be absorbed into the men's bodies; and especially by rubbing up their tobacco in dusty hands, and by allowing their food and drink to become contaminated by the poisonous dust.

The disposal of the economical as well as of the waste products, in other words, what becomes of the minerals is a wide and important matter, whether approached from the commercial or the sanitary aspect of the question.

The disposal of the lead, argentiferous copper matte, antimonial lead, Doré silver, fine silver, and the silver bullion generally calls for no special remarks, since these products are shipped to London or the continent of Europe.

From some of the mines ores are regularly sent away to the seaboard, where they are smelted, and the products find their way into European markets. The disposal of the waste products, however, is of far greater importance from the sanitary point of view, and these, moreover, are not so satisfactorily disposed of. The slag, copper matte, and lead bullion are run out of the furnaces in the molten condition in contact with air. Chemical union of the lead and the oxygen of the air produces lead oxides, and, in the presence of sulphur, chlorine, iodine, and bromide, sulphates form haloid compound of lead. The familiar example of the metal magnesium and its oxide, formed by burning the metal in air is an analogous phenomenon; a fume containing magnesium oxide is produced.

The lead fume may be always seen whenever a furnace is tapped either for metal or for slag, or whenever the hot lead bullion is skimmed in the lead-well, or whenever an escape occurs from the throat of the furnace, or whenever a furnace is shut down for repairs. At all times, whenever a slag-pot is emptied over the dump, lead fume is produced. But the quantities of volatile lead escaping from the tapping and feeding floors, or from the slag, is very insignificant compared with the immense volumes of lead fumes that are allowed to pass out into the atmosphere through the smoke-stacks. The evident intentions of the mine managers was to construct tall chimneys so as to convey the fumes away from the town, and to prevent lead-poisoning in the town. One notable example is that of one of the stacks delivering its fumes 300 feet above the town-level. In this, and in all other instances, mere height is inadequate to cope with the evil.

A parallel case is that of the alkali manufacture in Great Britain, where tall chimneys were built with a view of carrying off the fumes of muriatic acid. The nuisance was not abated; the fumes were merely deposited further away. A law was passed compelling the manufacturers to condense. The result was that both the interests of the manufacturers as well as that of the people was well served, since the former condensed and saved a valuable commodity. At Broken Hill the fumes consist of volatile lead bullion, which at present is lost along with the smoke.

Two methods were adopted to arrive at an estimate of the lead passing away into the atmosphere, and thus polluting the air of the town.

The fume passing up the stack was drawn through pure dilute nitric acid into an aspirator of 1 cubic foot capacity. Another method was to expose plates covered with glycerine to the air at various distances from the smelter. It was thus proved beyond all doubt that lead, silver, and arsenic were being discharged over the town, the former in quantity. Samples of the air were tested from a point distant 22 chains from Block 14, and somewhat more than one twentieth of a grain of lead (.052) was obtained from 1 cubic foot, equivalent to 52 grains per 1,000 cubic feet of air.

Glycerine-coated plates exposed on the verandah of the "Freemason's Hotel," in Argent-street, for eight hours, were found to collect $3\frac{1}{2}$ grains of lead and traces of arsenic per square foot of surface.

On 31st January the smoke from the British and Block 14 was blown downwards, immediately over the town, and was found to pollute the atmosphere very considerably. As much as 165 grains of lead was estimated per 1,000 cubic feet.

The quantity of lead-fumes noticed on the tapping-floor of the Proprietary Mine was very slight; never in any case exceeding 28 grains per 1,000 cubic feet, while in no instance was any observed on the feed-floors at the same mine. On the feed-floors of both Block 14 and the British, frequent gusts of lead-fumes issued from the throats of the furnaces and from the cracks in the charging-floors.

The lead-smoke was very offensive on very many occasions, and the existing arrangements are quite inadequate to suppress the nuisance. The prevailing winds, coming from the south and south-west, blow the fumes directly over the town, which is, unfortunately, so situated as to be constantly enveloped in the smoke. Lead-fume is the volatile metallic vapour arising both from the contact of atmospheric air with the molten metal, as well as from the metal itself, at the high temperature of the hot zones of the blast-furnaces, which has been estimated to be as high as 1,200°C*.

A very considerable quantity of the lead-fume is condensed in the flues and chimneys, and settles down along with minute particles of matter driven out by the blast, which is known as flue-dust. This is collected and returned again to the smelters, but in spite of which large quantities escape and fall to the ground, or on to the roofs of the houses, eventually contaminating the soil, and the water collected in the rain-water tanks.

Flue-dust consists of small particles of coke, argentiferous lead and iron ores, quartz, and limestone, together with partially-reduced globules of metal, oxide, and sulphate of lead, and traces of arsenic. No

* Melting point of lead, 830° C; of silver, 1,000° C.

No exact determination of the amount of lead escaping into the atmosphere as lead-fume and flue-dust could be arrived at, since it was only possible to ascertain the lead per cubic foot at the base of the stacks. This would obviously be greater than the actual escape at the top of the stack, since condensation is being effected all the way up the chimney.

The means adopted was to insert a long tube with a bulb-tube at the end of it into the centre of the chimney through the port at the base of the stack, whereby the lead-fume is collected, afterwards dissolved in pure nitric acid, and the amount estimated; the lead being then found according to the equation:—

$$L = Q D^2 0.7854 V.$$

Where L = lead in grains per cubic foot per second.

„ Q = grains of lead found in tube.

„ D = diameter of the stack.

„ V = velocity of the lead-smoke per second.

One of Guyard's conclusions* regarding smelting operations at Leadville is "that the quantity of lead completely lost in the atmosphere is sensibly twice as large as the quantity of lead caught in the dust-chambers generally used."

Seeing the large quantities of flue-dust raked out of the dust-chambers of the Broken Hill furnaces from time to time, it became necessary to estimate the amount of lead passing out of the smelter-stacks. An air-meter was used in ascertaining the velocity of the flue-gases, and the following values were obtained:—

12.5 feet per second.	
12.5 " "	
14.8 " "	
15.0 " "	
22.0 " "	}
24.0 " "	

6) 100.8

16.8

Excluding the two extremes, taken during an exceptionally high wind, we have a mean of 13.7. The average of the two means gives:—

13.7
16.8

2) 30.5

15.2

Or an average velocity of 15 feet per second, which very nearly agrees with results obtained by previous observers.

The diameters of the north and south smelter-stacks were 8 and 7 feet respectively, inside measurements.

The quantity of lead found on aspirating the flue-gases through asbestos and cotton wool, and dissolving in pure nitric acid, was as follows:—

Grains of lead per cubic foot in the lead-fume—

North smelter	3.5
Do	2.0
Do	3.5
South smelter	3.2
Do	1.0
Do	3.0

Mean = 2.7

16.2

These observations were made at the base of the smelter stacks on the Proprietary Mine, and may be reasonably assumed to be twice as much as would reach the top, since it was found that lead compounds were being continually condensed, falling down the stack in a fine powder. I consider that one grain per cubic foot would be a fair average, as the quantity varies with the degree of draught in the flues, and with the kind of ores used. The finer the ore the more difficult would be the blast in passing up through the furnaces.

Taking the velocity at 15; the amount of lead escaping at the top of the chimney as 1 grain in a cubic foot, then the amount of lead from the two sets of smelters on the Proprietary Mine would be as follows:—

<i>South Smelters.</i>			<i>North Smelters.</i>	
Log 0.7854	1.89509		Log 0.7854	1.89509
„ D. = 7 x 7	1.69020		„ D = 8 x 8	1.90618
„ V. = 15	1.17609		„ V = 15	1.17609
„ 60 x 60	3.55630		„ 60 x 60	3.55630
„ 24	1.38021		„ 24	1.38021
„ 7	0.84510		„ 7	0.84510
	8.54299			8.65897
„ grains per ton	7.19535		„ grains per ton	7.19535
„ tons per week	1.34764 = 22		„ tons per week	1.46362 = 20

Accordingly, the total lead in the fumes from the two nests of blast furnaces on the Proprietary Mine is:—

North smelters	29 tons per week.
South „	22 „
Total	51 „

The quantity of flue-dust collected weekly (average for the half year ending 2nd June, 1892), amounted to 93½ tons; assuming as a fair average that the flue-dust contains 30 per cent. of lead, then the quantity of lead collected per week in flue-dust = 28 tons, so that Guyard's conclusion for lead-smelting with open chimneys is nearly realised in practice, especially as I am of opinion that the results here given are more probably underestimated rather than exaggerated. The lead in the flue-dust collected amounts to an average of 28 tons weekly, and the lead found in the smoke at the lowest estimate is 51 tons per week.

In addition, there is the lead fume from the smelter floors each time the furnaces are tapped, and at every discharge of the slag-pots, besides that coming from the lead-wells.

These fumes escape into the air, and are diffused over the town—falling upon the roofs of houses, and finding their way into water-tanks and, above all, covering the ground, and any scanty herbage that may be found. This is amply confirmed by many analyses of the soil taken from different parts of the town, all of which contained lead from traces up to as high as 4.8 per cent. in the surface soil from Crystal-street in a line with Block Fourteen.

Total quantity of lead in the fumes passing over the township:—

Name of Mine.	No. of Blast Furnaces.	Tons of lead escaping per week.
British	2	8
Block Fourteen	4	28
Proprietary	15	51
Central	5	15
South	2	7
From slag-pots and tapping floors	28	1
Total		110 tons.

A

* "Mining Industry of Leadville, Colorado, U.S.A." (section 12).

A sample of water furnished by Dr. Emilius Thompson contained as much as $5\frac{1}{2}$ grains of lead per gallon.

The question raised by one member of the Board that the lead may have been originally present in the soil before the mines were worked, caused me to have a hole dug some 5 feet into the soil inside a dam at the corner of Wolfram and Iodide Streets, and 23 per cent. of lead was found. But as this may have been brought there by water, another hole was dug in the ground off Chloride-street, with the result that no lead was found. Having heard that an ironstone lode occurred at Corona, having a remarkable resemblance to the Broken Hill lode, I visited the spot, situated about 60 miles from Broken Hill. Four samples of the soil were analysed, but no lead was found in them, while there was lead in some of the minerals found in the neighbourhood.

Soils and waters from three dams were examined from points situated about 2 miles south of Broken Hill, and no lead was discovered, from which it follows that the lead is present in the soil, having been deposited by the lead fume from the mine stacks. Soil, water, vegetation, all prove the presence of lead. This being so, there can be no difficulty in accounting for the inevitable attacks of "leading" in dogs, and animals that take their food from off the ground.

Meteorological conditions.

For a general description of the conditions of life at Broken Hill see Appendix B, page 101.

Mr. Whysall's observations:—Rainfall, about 8 inches annually, and droughts frequent; winds, S. and S.W.

During the summer months the heat is very trying, the temperature found in my bed-room on three days in the week ending 4th February, 1893, was observed to be as follows:—

6 a.m.	82 deg. Fah.	3 p.m.	103 deg. Fah.
8 "	85 "	6.15 p.m.	100 "
10 "	88 "	8 p.m.	95 "
Noon	90 "	10 "	90 "
2 p.m.	100 "	11 "	90 "
2.15 p.m.	101 "			

Some of the medical men find they cannot use the clinical thermometer in the hot weather.

In times of drought, when water is scarce, people wash themselves but seldom, and cases have come under my notice where many months passed, during which time some men have not washed more than their hands and faces.

The fine dry red dust must also be mentioned, which penetrates the houses and clothes of the people. The dust is blown about in whirlwinds, and it is no uncommon sight to see these dust-cyclones approaching the town while yet miles distant.

WILLIAM M. HAMLET. F.I.C., F.C.S.,
Government Analyst.

APPENDIX M.

INSPECTION OF SURFACE WORKINGS, BRITISH BLOCKS, 23RD JANUARY, 1893.

THE Board visited the feed floor and saw the throats of two smelters; there was a slight escape of lead fumes at both, but rather more escaping from one of the throats than from the other. A considerable amount of dust caused from the fall of slack from the hoist. The flue dust mixed for the charge well moistened. Visited the smelting floor; saw two furnaces in operation; noticed that no provision was made for the ventilation of the back of the room. Saw a considerable amount of flue dust stacked; very imperfectly wetted. Flue doors open into smelting-shed. Not room enough on the smelter floor, between the flue and the back of the smelters. The flue dust at the back of one of the smelters was perfectly dry. Noticed heaps consisting of ore flux and flue dust all mixed up together. Doors into the flue placed rather high.

Upon questioning one of the workmen on the smelter floor, the Chairman elicited the following information from him:—"They obtain their drinking water from the condenser; sometimes it is very good, at other times it has an oily disagreeable taste, but nothing to complain of. They are not always served with condensed water, but sometimes with dam water, which is always very good."

There were two water-bags in the smelter-shed; they had rough canvas covers, which were insufficient. The dippers were hung up on the bag and not covered. Discovered a large heap of flue dust at the base of the stack about seventy loads; this dust was dry.

INSPECTION OF SURFACE WORKING, BLOCK 14.

THE smelter-shed contains three smelters, the shed facing easterly; the angle between feed floor and flue closed; the flue doors as usual opening on to smelter floor.

The Chairman observed a good deal of dust raised in carefully handling the flue dust so as to wet it.

There was no great accumulation of flue dust. The water-bags were open and the dippers lay about on the bullion, or were hooked on copper wire attached to the bags. The water supplied to the bags came from the condensers, and it was said to be not always cold. Stevens Creek water is already laid to the British and to the South Mine, and there is no difficulty now about laying it to all the mines on the line.*

The Board visited the latrine on the edge of the slag dump. It contained three stalls, and was practically a cesspit. A large accumulation of matter in it, and very offensive smell. Arrangements not proper, and should be altered.

The length of the flue from the first furnace to the base of the stack is 125 feet, the height of the stack is about 130 feet, and the total height from the last smelter about 185 feet.

The feed floor was a little more open than others; there was an opening at the ridge, partly closed up by sacks, which was said to be on account of the sun streaming in. The water bags on feed floor were also open. Saw a slight escape on feed floor from the throats of the furnaces. Hose suitably fixed to sprinkle down the contents of the bins.

INSPECTION OF SURFACE WORKINGS OF THE CENTRAL MINE.

Feed Floor.—The mine is closed down at the present time. The smelting-shed is built against the side of a hill, as usual. It contains three 80-ton furnaces, one 100-ton furnace, and one matte furnace. The bins have a tramway running over them. The shed is open at the ridge, the opening covered to keep out the wet. The floor is rough, not doubled, and open at the joints. All the water-bags on this floor are enclosed, with canvas spouts at the bottom.

Tapping Floor opens south-easterly. The roof is closed at the back over the flue. The flue doors are placed, as usual, opening into the smelting-shed. Water-bags on tapping floor the same as on feed floor. The smelting-shed about 200 feet in length; the stack about 100 feet in height. No accumulated flue dust on the tapping floor. The changing-room is between the store and the engine boiler-house, near the main shaft; partly iron and partly brick, with engine-house forming one of the sides. Form running round three sides. Of the floor, one half is planked and the other half natural surface. Battens along the wall, with nails in them to hang clothes upon. Dimensions of changing-room, 23 feet x 16 feet.

NOTES IN CHANGING-ROOM AT THE SOUTH MINE.

The changing-house is 22 feet by 12 feet, rubble; roof, iron; boarded floor; form all round. Batten round the walls, with nails to hang clothes upon. The washing-trough, which had been nailed down during the strike, has not been put in order again by the men since returning to work. But on one form a kerosene tin, with water in it, and soap beside it, also two towels upon pegs, and a certain number of clothes hanging up. This changing-room is in use. Two, or perhaps three, suits hung at one end, and appeared to have been changed the same day.

APPENDIX N.

* Vide page 118.

APPENDIX N.

7, Coffee Palace Buildings, Broken Hill, New South Wales, 23rd September, 1892.

Dear Dr. Thompson,

Enclosed is my corrected evidence. I should be glad to have the accompanying additional evidence or recommendations inserted, if possible, as I feel certain of the necessity of making *compulsory* arrangements for the medical attendance or superintendence of the miners, as the majority neglect measures of precaution, and are too frequently almost destitute when lead-poisoning overtakes them.

Resumé of preventive measures suggested.

1. That dressing-rooms and lavatories be provided for underground workers.
2. That warm baths with sulphurated potash be provided for the men by the companies.
3. That men be forbidden to eat their meals underground or in places where there is much lead dust.
4. That means be provided for laying the dust in rich lead mines.
5. That in underground workings, where there is much dust, an interval of time sufficient to admit of its being laid 'be allowed between two shifts.
6. That fines be inflicted for inattention or neglect of precautionary measures officially enjoined, the monetary outcome to accrue to a Sick Fund or the local hospital.
7. That wherever practicable, a change of occupation or residence be facilitated in cases of poisoning.
8. That a pamphlet containing the rules for the prevention, &c., of the complaint be given to every new hand.
9. That in silver-lead mines a moderate but sufficient sum be deducted from wages, such as 6d. a week in the cases in unmarried workers and 1s. in those married, the whole, minus 1d., to accrue to the medical residents of the township of proportion to the number of patients attended by each; every patient being at liberty to select his own doctor and to change him at pleasure at the end of any quarter.
10. That in silver-lead mines or districts there be compulsorily deducted 1d. per week from each Medical Fund payment for hospital purposes; every accumulated pound of such payments to secure the usual rights of hospital treatment and residence and votes at elections of medical and other officers.
11. That in the case of silver-lead mines, a copy of the measures adopted for the prevention of lead-poisoning and the arrangements in connection with provision for medical attendance and hospital treatment, whether at the cost of the companies or of the men, accompany each application to the Mines Department for renewals of licenses.

Chairman, Lead Board.

Faithfully yours,
T. R. BELGRAVE, M.D.

APPENDIX O.

CORRESPONDENCE concerning obstruction offered by the Managers of Block 14 and of the British Mine to the Board's visits of inspection.

I.

Sir,

Broken Hill, 23 January, 1893.

I have the honor to make report as follows, and to request advice how to proceed in this matter. It is necessary to premise that this inquiry mainly touches the Proprietary, Block 14, and British Mines (though not exclusively), and that the evidence thus far taken shows that the two latter are probably the places where most cases of poisoning occur, and that Block 14 supplies more of such cases in proportion to the workmen employed than any other.

Extract from proceedings of Board, first visit, page 4 of Report:—"At 2 o'clock on the 21st June, 1892, the Board (after having requested permission in writing) paid a visit to Block 14 Silver-mining Company's Mine. The Manager (Mr. Z. Lane) was not in his office, and the Chairman of the Board was informed by the officer in charge (Mr. Rodda) that Mr. Lane had gone rifle shooting, and had left instructions that no one was to be allowed to go down the mine in his absence."

Subsequently the following letters were addressed to the Manager of Block 14. He had not then categorically refused to allow inspection of the mine, nor to give evidence:—

"Dear Sir,

Office of the Lead Poisoning Board, Council Chambers, Broken Hill, 27 June, 1892.

"I am instructed by the Chairman of the Lead Poisoning Board to request you to be good enough to attend at the Town Hall, on Wednesday, 29th instant, at 2 o'clock p.m., for the purpose of giving evidence before the Board on the subject of lead poisoning in the mines of the Barrier Ranges District. I am also to ask that you will bring with you the statement showing the number of men employed in the various departments of your mine, which in a former letter I asked you to be good enough to supply for the information of the Board.

"I have, &c.,
"A. VIALOUX,
"Secretary."

"Dear Sir,

Office of the Lead Poisoning Board, 30 June, 1892.

"I am instructed to request that you will be good enough to be present at a meeting of the Lead Poisoning Board, to be held on Monday, the 4th proximo, at 11 o'clock a.m., to give evidence on the subject of lead poisoning in the mines of the Barrier Ranges District.

"I have, &c.,
"A. VIALOUX,
"Secretary."

"Z. Lane, Esq., Manager, Block 14 Mine, Broken Hill.

In answer to the first of these letters, Mr. Lane replied that he would be "engaged in Court all day"; to the second no answer was received; and he did not give evidence as requested.

In view of these occurrences, before leaving Sydney on the second visit, I asked that I might be furnished with formal authority for every member of this Board to visit all mines in the Albert Mining District, and on the 19th January I received authorities accordingly.

In the meantime, having no reason to expect any other opposition, I had, on the 14th January, caused the following letter to be addressed to the Manager of the British Mine:—

"Sir,

Lead Poisoning Inquiry Board, Broken Hill, 14 January, 1893.

"I am directed by the Chairman of the Lead Board, to inform you that the Board with the exception of Mr. Howell, intend paying the British Mine a visit on Monday next, at 10 a.m., when they will make an inspection in connection with the above inquiry.

I have, &c.,
"W. J. LITTLE,
"Secretary."

"Cecil Morgan, Esq., Manager, British Broken Hill Mine.

And the following answer was received to it on the same date:—

"Sir,

The British Broken Hill Proprietary Co. (Limited), Broken Hill, 14 January, 1893.

"You will be good enough to inform Mr. Chairman that, with the exception of a Mr. J. Thomas, a man recently removed from the Bench by the Government, and who is, I understand, a member of your Board, I shall be glad to welcome the other members.

"I wish to state absolutely that Mr. J. Thomas shall not go down the British Mine under any consideration whatever.

"I have, &c.,
"CECIL C. MORGAN,
"General Manager."

"W. J. Little, Secretary, Lead Board.

In

In consequence, on the 20th January, I directed the following letter to be sent to the Managers of Block 14 and of the British :—

“ Sir, “ Lead Poisoning Inquiry Board, Broken Hill, 20 January, 1893.
“ I am directed to inform you that the members of the Board of Inquiry into lead poisoning at Broken Hill, will visit your mine on Monday morning, the 23rd instant, at or about 11 o'clock, to visit such parts of the mine as they or any of them may wish to see.
“ I am to add for your information that they are duly authorised in this behalf by the Honourable the Minister for Mines, under clause 9 of schedule 10 of the Mineral Leases Regulations, made under the Mining Act of 1874.
“ I am, &c.,
“ W. J. LITTLE,
“ Secretary.”

“ Cecil Morgan, Esq., Manager the British, Broken Hill.

[Also sent to Z. Lane, Esq., Manager, Block 14].

On the 23rd the following reply was received from the Manager of the British Mine :—

Sir, “ The British Broken Hill Proprietary Co. (Ld.); Broken Hill, 21 January, 1893.
“ I have to inform you again that if the members of your Commission include Mr. Josiah Thomas I shall not allow them to go underground in the British Mine.
“ I wish you to take this for a final answer, and another thing you may as well understand, that the other members shall only go down my mine when it suits my convenience, and the request must be made in a very different tone than of your two last letters.
“ I am, &c.,
“ CECIL C. MORGAN,
“ General Manager.”

“ W. J. Little, Esq., Secretary Lead Poisoning Inquiry Board, Broken Hill.

On the same day the Board proceeded, as appointed, to Block 14, and found the Manager in his office. I formally announced the object of the visit, and mentioned the authority under which the Board was acting. The following shorthand note shows what happened thereafter :—

“ The Board at 11 o'clock proceeded to Block 14, and interviewed the manager, Mr. Lane. He refused to allow Mr. Thomas to enter his mine, but was quite willing to allow the remainder of the Board to make an inspection; thereupon, the Chairman produced the authority issued to Mr. Josiah Thomas, and Mr. Lane read it through. He, however, still refused, stating that he would have to place himself in communication with the Directors, also with the Minister for Mines and the Colonial Secretary. He would have to receive the consent of the Directors before he could allow Mr. Thomas down his mine, and he would communicate with the Minister, as he had evidently only heard one side of the case, and he would lay the other side before the Minister. He would tell him that Mr. Thomas did not want to go down his mine for any good purpose, as, already, he had made most damaging statements with regard to the mine.”

The Board then retired.

The following is a transcription of the shorthand notes of the visit paid by the Board to the British Mine, immediately after having left the Manager's office at Block 14 :—

“ The Board proceeded to the British Mine, and inquired for the Manager in his office, but he was absent. A clerk was desired to tell him that the Board were on the mine, whither they then went.”

“ The Chairman required the bracedman (Mr. Hallett) at the main shaft to send them down the mine, but he stated that he had been freshly instructed not 10 minutes before the Board's arrival (but in the usual terms, and without verbal reference to them) not to allow any person to descend the mine without a written order from the Manager.”

“ The authority issued to the members by the Minister was shown to Hallett, but he still declined to allow the Board to descend the mine.

“ At the same time the Board saw the Under-ground Manager (Mr. Retallick), who also refused to allow the Board to descend without written order from the Manager. The Chairman produced the authorities to the Underground Manager and explained what they were.”

I take leave to repeat that apart from every other consideration it is essential to this inquiry that the Board should have opportunity of further inspecting the British Mine, and of inspecting Block 14 which they have not yet seen at all.

I have, &c.,

To the Under Secretary for Mines and Agriculture, Sydney.

J. ASHBURTON THOMPSON,
Chairman.

II.

Sir, “ Lead Poisoning Inquiry Board, Broken Hill, 31 January, 1893.

I have the honor to communicate the following in continuation of my letter of the 23rd instant on the same subject.

On the 26th January the following letter was received from Colonel Morgan :—

“ Dear Sir, “ Broken Hill, 26 January, 1893.
“ My directors have granted permission to your Commission visiting the British Mine in a body, but will not allow members going singly to inspect or collect evidence.
“ I can only assure you again that any information I can give Mr. Hamlet or yourself I will give with the greatest possible pleasure.
“ Your Commission has, therefore, permission to visit the British Mine as a body at any time convenient to it.
“ Yours, &c.,
“ CECIL C. MORGAN,
“ General Manager, the British Mine.”

“ The Chairman, Lead Commission, Broken Hill.

On the 27th instant, I received the following telegraphic message from you :—

“ COLONEL MORGAN, General Manager, the British Blocks, has wired to the effect that Chairman and members of Lead Poisoning Board occupied the time of mine manager, foreman, and himself a whole morning underground already, and that the whole mine workings are delayed by these visits, and also that orders have been given to let the Commission down as a body, on presentation of authority. I am to request you to see that the work is not unnecessarily delayed.
“ HARRIE WOOD,
“ Under Secretary for Mines.”

27th January, 1893.

I pointed out to you in reply, that the allegation that the whole work of the mine was interrupted by such visits of the Board was absurd *à priori*, and as regarded the particular visit referred to was without foundation in fact.

On the same date the following letter was received from Mr. Lane, Manager of Block 14 :—

“ Dear Sir, “ Broken Hill, 27 January, 1893.
“ Having fully explained the position to the Minister, and with his sanction and approval, I now withdraw my opposition offered to Mr. J. Thomas going down the mine, but must state for your information that I am to be held blameless in case of any accident, owing to the exceptional circumstances and to the strong and bitter feeling existing amongst a section of the men against Mr. Josiah Thomas.
“ I am, &c.,
“ Z. LANE,
“ Manager, Block 14 Mine.”

“ To the Chairman, Lead Board.

I should be glad to be informed in what way Mr. Lane has, as he says, “ explained the position,” and whether the information with which his letter concludes has in reality the “ sanction and approval ” of the Minister. In the meantime I venture to point out that on receiving this communication it was thought by other members of the Board and by myself to convey a covert threat of personal violence; but, as the sequel shows, we were mistaken, and in all probability it merely meant that while ostensibly withdrawing his opposition to Mr. Thomas' descent he was privately prepared to continue it by collusion with his own servants.

I thought it well, for reasons into which I need not enter, to accept this letter at its face value, but also by way of precaution, to request the Inspector of Mines to accompany us. Accordingly we went this morning to the office on the mine; we did not find the manager there; we saw a gentleman who I believe was the accountant, and I asked him whether on going below, I should find a guide who would conduct us over the workings. He replied that he knew nothing whatever

whatever about it. We then went over the surface workings, and at last approached the main shaft. I desired the bracceman to send us down, and explained who we were, and that Mr. Lane had informed us that he no longer opposed our descent. The bracceman replied that he had had no instructions at all, and that he could not send us down without a written order; and this statement appeared to us to be made in the ordinary course of business.

While we were talking with the bracceman, however, the driver of the winding engine went out of his way to call him to the window of the engine-house, and when he returned he told us that the engine-driver had said that "unless Thomas had permission in writing from the manager he was not going to send him down the shaft," and he also called out to the men to run their trucks into the cage and to get on with their work.

After consultation with other members of the Board I decided that we had again been illegally obstructed in our endeavour to act on the authority vested in us, and, consequently, we withdrew.

I venture to repeat my opinion that Mr. Lane's opposition is in reality to the Board and not only to Mr. Thomas; that he stands entirely alone among managers in that opposition—Colonel Morgan's action probably not having originated with himself; that the course taken by him is subject of ridicule among the other managers; and that there is not, either among the men employed on Block 14 or elsewhere the kind of opposition to Mr. Thomas which Mr. Lane hints at, nor, as far as I can ascertain, any opposition at all.

I have, &c.,

J. ASHBURTON THOMPSON,

Chairman.

The Under Secretary for Mines and Agriculture.

III.

Lead Poisoning Inquiry Board, Broken Hill, 7 February, 1893.

Sir, In continuation of my letter of the 31st January, I have the honour to write as follows:—On the 2nd instant I received the following telegram from you:—

"MR. LANE wires that he does not concur in action of men; on the contrary that he notified the Board that all opposition has been withdrawn, but that on Tuesday, when the Board visited the mine in Lane's absence, he not having been notified, after being shown over the surface you demanded to go below, but the engine-driver refused to lower Mr. Thomas down, and he cannot discharge driver and have a strike; he is powerless as regards engine-drivers, but Board can, if they choose, enter mine, and see every part by means of tunnels and ladders, independent of drivers.

"HARRIE WOOD,

"Under Secretary for Mines, 2/2/93."

And on the same date I made the following reply:—

"MR. LANE'S telegram, transmitted by you is a misrepresentation from beginning to end; do not be deceived. I have not the slightest hesitation in speaking thus bluntly. Wait receipt of my letter to-morrow. Do you know whether Lane's directors have any idea of what is going on?"

"J. ASHBURTON THOMPSON,

"Chairman, Lead Board, 2/2/93."

On the 4th instant I received the following telegram from you:—

"THE following wire was sent to Mr. Lane and directors, Block 14 Company:—'Absolutely necessary that all obstruction to the Lead Poisoning Board visiting your mine in terms of authority, should be at once withdrawn, or unpleasant consequences may result. Kindly arrange with Chairman at once.'

"HARRIE WOOD,

"Under Secretary for Mines, 4/2/93."

On Monday, the 6th instant, I had the following letter from Mr. Lane:—

"To Dr. A. Thompson, Chairman, Lead Board,—

"Dear Sir,

"I am again writing you to say that I have no desire to prevent the Board from inspecting the mine, and would like to see you personally on the subject, if possible, for it must be plain to you that such public utterances as Mr. Thomas saw fit to make on Thursday night, are not only cowardly, but still further complicate matters.

"Awaiting the favour of your reply, if you can make an appointment, either at your hotel or elsewhere.

"I am, &c.,

"Z. LANE."

The public utterances of Mr. Thomas referred to in the above letter are contained in the following sentence from a speech in favour of a candidate for election to the Town Council:—

"It was not every man who was in the happy position of the engine-drivers at Block 14, of being able to dictate to the manager."—*Barrier Miner*, 3 February, 1893.

No others have been published or made.

To this letter I caused the following reply to be sent:—

"Sir,

"I am directed to acknowledge receipt this morning of your letter dated the 4th instant, and to say in reply that, as the sole question at present is whether you will or will not fulfil your conditions of lease, it seems to the Chairman that there is nothing to be gained from a personal interview.

"I am to add that by a telegram received to-day from Sydney, the Board learn that all obstruction to their visiting Block 14 has been withdrawn, and to ask you whether this is correct, and whether you will undertake that the Board shall not be further obstructed if they present themselves for the purpose of visiting the underground workings of your mine.

"I have, &c.,

"W. J. LITTLE,

"Secretary to Board."

"Z. Lane, Esq., Manager, Block 14 Silver-mine, Broken Hill."

On the same date I received the following message from you:—

"RE Block 14 Mine, all obstruction has now been withdrawn, and the mine is open for inspection by Board, and a message has been received from acting secretary of company in Melbourne, stating manager has been instructed to have all obstacles removed.

"HARRIE WOOD,

"Under Secretary for Mines, 7/2/93."

At the same time you transmitted this copy of a message sent to you by Mr. Lane:—

"THE following is a copy of a wire just received from Mr. Lane:—'In accordance with your wire of third instant, I immediately wrote Chairman, Lead Board, asking him make appointment to arrange re inspection. He declined to do so. There is no obstruction whatever offered. Any statements made to the contrary are untrue, as I am anxious to carry out your wishes.'

"HARRIE WOOD,

"Under Secretary for Mines, 7/2/93."

In the course of the afternoon, therefore, some of the members of the Board, including Mr. Josiah Thomas, and accompanied by the Mining Inspector, went to Block 14, saw Mr. Lane, and were by him taken to the main shaft and sent below. We inspected the mine, and then proceeded to the British Blocks. There we found that Colonel Morgan had instructed the bracceman and the underground manager that we were to be sent below upon making request. We went below.

I have, &c.,

J. ASHBURTON THOMPSON,

Chairman.

The Under Secretary for Mines and Agriculture.

MINING.

(RETURN RESPECTING AMOUNTS GRANTED OUT OF THE PROSPECTING VOTE 1892, FOR THE CARCOAR AND MUDGEES ELECTORATES.)

Ordered by the Legislative Assembly to be printed, 15 November, 1892.

[Laid upon the Table of the House in reply to Question No. 10, of 15 November, 1892.]

Question.

10. EXPENDITURE OF PROSPECTING VOTE FOR 1892:—MR. VAUGHN *asked* THE SECRETARY FOR MINES,—
- (1) How much money has been granted out of the Prospecting Vote for 1892 to be expended in the Carcoar electorate?
 - (2) What are the names of the several persons to whom sums have been paid, and the amounts paid to each?
 - (3) The same respecting the Mudgees electorate?

Answer.

(1.)

CARCOAR ELECTORATE.

AMOUNT granted in this electorate from the 1892 Prospecting Vote.

This includes application made in 1891 and 1892. £4,700.

(2.)

RETURN showing the amount expended, and the persons to whom the money was paid in the Carcoar electorate from 1st January to 14th November, 1892.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

MINING LAWS.

(PETITION FROM CERTAIN RESIDENTS OF ROCKLEY, LONG GULLY, &c., SUGGESTING THAT CERTAIN CLAUSES SHOULD BE EMBODIED IN ANY NEW MINING ACT WHICH MAY BE PASSED.)

Received by the Legislative Assembly, 6 September, 1892.

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales.

Gentlemen,

It having come to our knowledge that with this session a new Mining Act will be introduced, we, the undersigned, herewith pray that you will embody the under-mentioned clauses, for without them the mining industry cannot withstand the strain now existing between the Lands and Mining Departments, for the former has all the control over the gold-fields, misnamed temporary commons, and means to convert them into pastoral leases by hook or crook, while the latter has no power, except to grant gold and mineral leases temporarily:—

- Clause 1. That from the passing of this Act all lands containing gold and other minerals shall be withheld from sale, lease, or free selection, and left entirely under the control of the Mines Department, which shall have power to grant homesteads in fee simple of 5 acres maximum, with a tax of 2s. annually, and no miner shall be allowed to hold more than that portion.
2. That all those lands previously described shall be put under a board of trustees, duly elected by ballot publicly, which shall have power to pass by-laws to suit each locality, and by whose recommendation homestead may be granted, in conjunction with the Warden, on dedicated lands, without encroaching on the rights and privileges pertaining to mining whatsoever.
3. That whenever and wherever payable gold or minerals have been found to exist, such land to be resumed and added to the nearest gold-field, subject to all conditions contained in the Act.

Praying that you will take the above into your earnest consideration, your Petitioners, as in duty bound, will ever pray.

[Here follow 40 signatures.]

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

STOCKTON COAL MINE.

(RETURN RESPECTING.)

Ordered by the Legislative Assembly to be printed, 27 April, 1893.

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 20th April, 1893, That there be laid upon the Table of this House,—

“Copies of the Reports made by the three officials—viz., Messrs. M’Kenzie, Dixon, and Humble, in reference to the dangerous state of the Stockton Mine.”

(Mr. Scott.)

Further Report on the condition of Stockton Colliery.

Sir,

Coal-fields Office, Newcastle, 2 March, 1893.

We have the honor to report that we, yesterday, made an inspection of that portion of the Stockton Colliery workings, of Gardiner’s heading district, where a fall of roof occurred on the 17th ultimo and liberated a large quantity of water, sand, pebbles, clay, and shingle, and find that although water is still to some extent flowing from the fallen ground, the inrush of sand, &c., has been stopped by the close packing of bags of sand behind barricades of slabs and upright props, and the erection of brick dams, one of which is 13 feet in thickness, and the others 10 feet and 4 ft. 6 in. in thickness, respectively, the latter being strengthened by a few feet of arching.

These dams are built from floor to roof, and set in cement, and each is provided with a 6-inch iron pipe to allow the water to flow. Thus, in our opinion, the danger arising from this source has been removed.

But there are other circumstances in connection with this colliery, which, in our opinion, precludes us from stating that the mine is safe, which we beg to give as follows:—

1. Throughout the whole of the Gardiner’s heading district, and the districts adjoining, comprising the innermost northern workings, water is freely shedding from the roof in nearly all the bords and headings, or cut-throughs.

This, to us, is an evidence that the rock cover, between the top of the coal seam and alluvial deposits, is thin, and not only thin but very much broken by the cleavage at right angles to the horizontal bedding, and by igneous dykes, which, in the main headings, have given, and are now giving, off regular quantities of water.

This rock appears to us to be of a texture unable to resist any great pressure from the overlying alluvial deposits of sand, clay, gravel, &c., but would rather of itself add to the dead load over every excavation, whether bord or heading.

2. During our inspection yesterday of the old bords, in the workings abovenamed, we noticed much of the timber, which had been set to support the roof, broken, and men were engaged renewing some of the broken timber in bords adjacent to the late fall.

In very many places the roof shows signs of weakness, and several falls of roof have already taken place, some of which have been secured.

Under such conditions further falls of roof in other bords and headings may at any time take place, which, in every instance, might be expected to liberate considerable quantities of water. &c., similar to the late fall.

882—

[770 copies—Approximate Cost of Printing (labour and material), £1 13s. 4d.]

3. Should any further fall of roof take place, and cause a large opening or cavity, the inrush of water might be so great as to almost at once find its way on to the main road; and seeing that at one portion of the main road, about 22 chains from the bottom of the shaft, there is a swell or depression of about 5 feet below the level of the shaft bottom, this portion of the road would in all probability be speedily blocked by the volume of water, and all egress to the shafts cut off.

4. In addition to the above, we may here point out that another source of danger arises from the fact that the bottoms of the main and upcast shafts are both about 100 feet below the level of the innermost working districts, and consequently the approaches to both shafts (as they are not far apart) could be flooded before the innermost workings would fill with water.

This, in our opinion, is a matter for serious consideration in the absence of an opening to the day or surface in the immediate vicinity of the present rise workings, whereby the persons employed in the mine could find a ready means of exit in case of a panic, caused by a large flow of water into the mine.

5. We further beg to state that, according to provings by boring on the Stockton peninsular, there cannot be a doubt of the existence of thick alluvial deposits all over the present workings of the Stockton Colliery, and as in our opinion such deposits are to a great extent water-logged, we consider this to be a continual menace to the safe working of the colliery.

6. In conclusion, we have also to inform you that before leaving the colliery the Manager (Mr. M'Auliffe) asked us whether the water-bailers could, on the following day, commence drawing the water out of the men's places, so that the men could commence getting coal. We replied that we could not write a report in the book at the colliery stating that the mine was safe. Also, that our report of that day's inspection would be made and forwarded to you next day.

We have, &c.,

JOHN MACKENZIE,
Examiner of Coal-fields.
JOHN DIXON, and
WILLIAM HUMBLE,
Inspectors of Collieries.

The Under Secretary for Mines and Agriculture,
Department of Mines, Sydney.

1892-3.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

STOCKTON COAL-MINE.

(REPORT BY MESSRS. DIXON AND HUMBLE ON THE INSPECTION OF GARDINER'S AND KELLY'S HEADINGS.)

Ordered by the Legislative Assembly to be printed, 2 May, 1893.

[Laid upon the Table of the Honorable the Legislative Assembly of New South Wales by the Secretary for Mines and Agriculture in reply to Question of Mr. Scott, M.P., dated 26 April, 1893, re Report of Messrs. Dixon and Humble on the Stockton Colliery.]

Stockton Colliery Inspection—Special Inspection to see if the Mine was at work.

Sir,

Coal-fields Office, Newcastle, 18 March, 1893.

We have the honor to report inspection of the districts known as Gardiner's and Kelly's Headings yesterday.

Arriving at the colliery about 11 a.m., we found the mine at work drawing coal. Accompanied by the manager, we descended the shaft about 11.30 a.m., and found that, notwithstanding the fact of no report having been entered in a book at the mine "by the examiner or inspector stating it to be safe," the bulk of the miners had been readmitted into the mine for the purpose of getting coal.

We counted forty-seven men and boys coming out from the workings to the shaft, and found thirty-eight miners and water-bailers at work in the Gardiner's and Kelly's Heading districts, all such being engaged in their ordinary employment.

We noticed that since the miners commenced work a few days ago some of the working places situated in the north-east corner of Gardiner's Heading district are now confined to the bottom coal between 5 and 6 feet thick, the top coal, of about 2 feet in thickness, being left unwrought to form a roof. This is, we understand, a precaution adopted by the management to avoid further falls of roof similar to the one that took place on the 17th ultimo, which released large volumes of water, sand, clay, pebbles, &c.

The volume of water now issuing through the pipes built into the brick dams is about the same as when last we saw it, and the dams are in good condition.

Since our last inspection, made on the 1st instant, a deal of additional timber has been put into the abandoned bords adjacent to the fall of roof from which the water is issuing, and several of the smaller falls of roof have apparently been secured by barricades of timber and sand-bags.

We have, &c.,

JOHN DIXON,
WILLIAM HUMBLE,
Inspectors of Collieries.

John Mackenzie, Esq., Examiner of Coal-fields, Newcastle.

1892-3.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

COKE.

(REPORT BY THE GOVERNMENT GEOLOGIST ON.)

Ordered by the Legislative Assembly to be printed, 12 January, 1893.

The Government Geologist to The Under Secretary for Mines.

Report by the Government Geologist on Coke.

Sir, Geological Survey, N.S.W. Dept. of Mines, Sydney, 22 December, 1892.

With the object of obtaining as much information as possible in reference to the coke at present being made in the Colony, I have inspected the following coke works, viz.:—(1) the Purified Coal and Coke Co.'s coke ovens at Wallsend, (2) the Singleton Colliery coke ovens at Rix's Creek, (3) the Vale Colliery coke ovens near Lithgow, and (4) the Bulli Colliery coke ovens at Bulli; I have also obtained samples of the washed and unwashed coal from which coke is at present being prepared, and also representative samples of the coke made at the above-mentioned coke ovens. These samples were collected by the inspectors of collieries and myself, and were analysed by Mr. Mingaye, F.C.S., Analyst to this Department. At my request Mr. Mingaye also subjected each sample of coal to a careful washing in the laboratory, and it may, I think, be assumed that the results obtained by this washing are about equal to the results obtainable by the best washing appliances used on the large scale at the present day in Europe. The accompanying table (A) of coal analyses shows the constituents of such coals before and after being subjected to the process of washing by hand in the laboratory, and it will be observed that in the two instances where the coal had been previously washed by machinery at the works (viz., the Purified Coal and Coke Co., Wallsend, and the Singleton Colliery) a still further reduction of the percentage of ash, amounting to '55 in the one case, and 2'75 in the other, was effected by the laboratory treatment.

In a sample from the Co-operative Colliery, the coal, which had not been previously washed by machinery, was treated in the laboratory, with the result that the percentage of ash was reduced from 6'85 to 3'85, and a firm coke obtained, containing 6'30 per cent. of ash. In another sample from the Mount Pleasant Colliery the percentage of ash in the coal was reduced (by washing in the laboratory) from 10'65 to 4'70, and a firm and lustrous coke was obtained, which contained 6'42 per cent. of ash.

The system of washing the coal before introducing it into the coke ovens is only adopted at four collieries, viz.: (1) The Singleton Colliery, (2) the Purified Coal and Coke Co., Wallsend, (3) the Vale Colliery, and (4) the Bulli Colliery. At the Singleton Colliery the washing process is of the simplest kind; the coal after coming from the tunnel is thrown upon screens of $\frac{3}{4}$ -in. mesh, and the smalls thus separated are carried in trucks to a hopper, whence they are fed into wooden sluice-boxes having a maximum fall of about 1 in 36, and the coal is separated from the shale and brass by running water. The cleaned coal is then further separated by screens into blacksmiths' nuts and fine coal, which is converted into coke in ordinary Beehive ovens. The method of washing here adopted is crude, and as already stated, it was found by experiment in the laboratory that the percentage of ash in the coal after washing at the works could be further reduced by about 2'75 per cent.

The Purified Coal and Coke Co., Wallsend, have a much more extensive coal-washing plant which, I understand, was designed by Mr. Taylor, the manager. The coal is delivered into a hopper, whence it is carried by an elevator to a pair of rolls. After being crushed, it is carried by another elevator to distributing troughs, which divide it amongst three pulsating washing machines. The shale and brass fall through a grating, and are carried away by a sluice, while the cleaned coal is carried forward by the water on to screens of $\frac{3}{4}$ -in. mesh, which separate it into blacksmiths' nuts and fine coal; the latter is carried downwards in a sluice with a perforated bottom, and thus reaches the next pair of rolls in a sufficiently dry condition. After being crushed fine between these rolls it is elevated to trucks, whence it is charged into Beehive ovens. The method of washing, as practised at these works, is quite automatic, and is perfect as far as it goes, but there is, I think, little doubt that it could be improved by the addition of another pulsating washer provided with a layer of felspar above the sieve. After the second crushing the small particles of shale or dirt which it liberates from the coal could be separated therefrom by a second washing in a machine such as I have referred to. As before stated, the percentage of ash in the coal which had passed through this washing plant was reduced by hand-washing in the laboratory from 5'20 to 4'65.

At

At the Vale Colliery, near Lithgow, a small coal-washing machine of American manufacture, and known as Diescher's coal and ore washing plant, is employed. The coal is first thrown on screens of about 1-in. mesh, and the smalls from these screens are then crushed between rolls with spiral corrugations. The crushed coal passes thence into a pulsating washing machine—the small dirt passes through a fine wire sieve with apertures of $\frac{1}{8}$ in. to $\frac{3}{8}$ in., the sieve having a slight inclination from back to front. The clean coal is washed over a lip in the front, and the pieces of shale or dirt which are too large to fall through the sieve escape through by a $\frac{3}{4}$ -in. aperture under the lip. As at present worked the process is far from perfect. The washed coal contains a good deal of dirt, and a considerable amount of coal is necessarily lost with the larger pieces of shale which escape through the $\frac{3}{4}$ -in. aperture. The Western coal contains a large amount of dirt intimately mixed with it, and it is questionable whether it is of sufficiently good quality to warrant the expenditure of such a sum as would be required for the erection of a washing plant capable of thoroughly cleaning it.

At the Bulli mine a Sheppard coal-washing plant has been erected. The small coal is raised by an elevator, and is then fed into a large pulsating washing machine; the clean coal is carried forward by the water and is washed over a lip, while the dirt and brass escape by an aperture which can be regulated by a valve. The clean coal is carried by a screw to an elevator furnished with a perforated bottom, and is delivered in a sufficiently dry condition to the rolls, where it is crushed, and again elevated to trucks, which convey it to the coke ovens. In this plant, as in the Purified Coal and Coke Co., Wallsend, there is no provision for a second washing after the coal has passed through the rolls, and consequently none of the dirt, which may be liberated by the fine crushing, is separated from the coal before charging into the ovens. It is in this respect, I am of opinion, that the principal improvement can be made in the coal-washing plants of the Colony. The New South Wales coals are inferior to the British only by reason of the fact that they contain a larger percentage of dirt intermixed with the coal. There is no doubt that the most perfect washing appliance in the world will not reduce the percentage of ash in coal below a certain limit, so thoroughly is a part of it incorporated with the fuel. At the same time much of the dirt besides that occurring in bands can be removed by alternate crushing, sizing, and washing, and the superiority of the modern coal-washing plants, such as the Lührig, consists in this, and in the final treatment of the finely powdered coal, which is washed in pulsating machines provided with a layer of felspar—a mineral intermediate in specific gravity between the coal and the dirt. With such improved coal-washing plants there appears to be no reason why colonial coke should not be made of a quality (so far as the percentage of ash is concerned) suitable for any smelting operations it may be required for, and if the more modern ovens of a rectangular form were adopted, a great saving of time and a corresponding reduction in the cost of manufacture would probably result.

The Bulli Company use a rectangular oven, which is a modification of the Coppée coke oven, and produces a dense coke capable of bearing a heavy furnace burden, but unfortunately the coal is very dirty, and the coke is consequently high in percentage of ash. The period required for making coke in these furnaces is considerably shorter than with the Beehive ovens, which are used at all the other works visited by me. The charge of coke is removed by a hydraulic ram, and is quenched in the open air by spraying water over it. The gases of combustion are caused to traverse flues built in the sides and floor of the oven, so that a minimum amount of the heat is lost, and altogether there is no doubt that these ovens are more economical than the Beehives.

With the object of comparing the imported cokes in actual use at Broken Hill with those now manufactured in the Colony, samples were at my request taken from the coke-stacks at the Broken Hill smelting works by Mr. Geological Surveyor Jaquet, and were analysed by Mr. Mingaye.*

The three samples taken were (1) Hood's (Welsh) coke taken from the Broken Hill Proprietary Company's smelting works, (2) Brancepeth (Welsh) coke taken from the Proprietary Company's works, and (3) Hood's (Welsh) coke from the Central Broken Hill Company's works. The first of these contained only 4.75 per cent. of ash, but the second and third contained 7.80 and 9.70 per cent. respectively. These percentages appeared to be so high compared with the composition claimed for the imported coke that I determined to check the results by an examination of the foreign cokes as they arrive at Port Pirie. With this object in view six samples were taken for me at Port Pirie by Mr. Hebbard, Inspector of Mines. The samples were analysed by Mr. Mingaye, and the results were as follows:—(1) Westport (New Zealand) coke, containing 7.15 per cent. of ash. (2) Hamburg (German) coke, containing 9.20 per cent. of ash. (3) Shamrock (German) coke, containing 7.30 per cent. of ash. (4) Brancepeth (Welsh) coke, containing 5.50 per cent. of ash. (5) Hood's (Welsh) coke, containing 8.20 per cent. of ash; and (6) Hood's No. 2 (Welsh) coke, containing 5.35 per cent. of ash.

The annexed table (B) shows the proximate analyses of the nine samples of foreign coke taken at Broken Hill and Port Pirie, together with that of fourteen samples of coke made in different parts of New South Wales. It will be observed that some of the Welsh coke used at Broken Hill contains a higher percentage of ash than the colonial coke made by either the Purified Coal and Coke Company, Wallsend, or the Singleton Colliery Company; also that the average percentage of ash, calculated from the nine samples of foreign cokes in use at, or in transport to, Broken Hill, amounts to 7.26, which is only 0.6 per cent. lower than is contained by the coke made at the Purified Coal and Coke Company's ovens, Wallsend. Also, having in view the improvements that are possible in the manufacture of colonial coke by the adoption of more complete washing plants, it will be seen, by reference to Table A, that two samples of coke, containing less than $6\frac{1}{2}$ per cent. of ash, were made in the laboratory from hand-washed coal from the Co-operative (Newcastle) and Mount Pleasant (Southern) Collieries, while a coke has been made from the Newcastle-Wallsend coal closely approximating, in the percentage of ash it contains (7.51), to the average of the coke used at Broken Hill.

With regard to the strength of coke, or its capacity for resisting the crushing weight of the ore burden in the furnace, it has been asserted that the colonial-made article is much inferior to the imported. It was proposed that a practical test of the relative merits in this respect of the colonial and foreign cokes should be made in the furnaces of the Clyde Smelting Works. It appeared to me, however, that to make such a test satisfactorily would be both difficult and expensive. The furnace would have to be run for several weeks with the same ore in order to ascertain the strength of each sample of coke to be tested, and

* A former report on the manufacture of coke in New South Wales by Mr. J. C. Mingaye, F.C.S., Analyst to this Department, together with supplementary remarks by Mr. Geological Surveyor David, B.A., F.G.S., was printed and laid before Parliament in October, 1890.

and I therefore decided to adopt a simpler method of testing, which, though not absolutely free from objections, may, I think, be taken as fairly conclusive in regard to the relative strength of the different cokes tested. I had cubes of some sixteen varieties of foreign and colonial cokes carefully cut on an emery wheel, and these were then forwarded to the University, where their crushing strength was ascertained in the testing machine. Professor Warren was good enough to devote a great amount of care to these tests, and the results, which are appended in Table C, are somewhat surprising. Four of the samples tried were foreign cokes, and twelve were of New South Wales manufacture, and the latter, with one exception, exhibited better pressure-resisting qualities than any of the foreign samples. The reason why only four of the foreign cokes were tried was that the balance of the other samples collected for me at Port Pirie were too small to allow of cubes being cut from them.

Without placing too much importance upon the results of these tests, I think they demonstrate beyond doubt that the average strength of the cokes made in this Colony is much superior to some (at any rate) of the imported cokes used in the smelting works of Broken Hill.

It will also be noticed that the Bulli coke, which is the only one made in rectangular ovens, is superior in strength to all the other cokes which are manufactured in Beehive ovens.

In regard to freight rates, there appears to be no doubt that the coke manufacturers of New South Wales labour under a disadvantage, so far as the Broken Hill trade is concerned, compared with the manufacturers of British and German coke. I have made inquiries from several shipping firms, and am informed that while the freight from British and German ports to Port Pirie is now about 16s. per ton, it has been as low as 9s. On the other hand, the cost of freight on coke from Newcastle to Port Pirie varies from 15s. to 18s. per ton.

The conclusions which I have arrived at may be summarised as follows:—

1. That there is room for material improvement in the manufacture of colonial coke, both in the direction of reducing the ash and increasing the density or capacity for resisting pressure, and these improvements can best be achieved by a more perfect system of coal washing and by the use of a more modern type of coke oven.
2. That some of the cokes at present manufactured in New South Wales are nearly equal (as regards ash) to the average of the imported cokes in use at the Broken Hill smelting works.
3. That several of the cokes at present manufactured in New South Wales are superior (as regards percentage of ash) to some of the imported cokes in use at Broken Hill.
4. That in regard to strength, or capacity for resisting pressure, the cokes manufactured in New South Wales are superior to some of the imported cokes at present in use at Broken Hill.

I have, &c.,

EDWARD F. PITTMAN, A.R.S.M.,
Government Geologist.

TABLE A.

TABLE showing analyses of washed and unwashed samples of New South Wales Coals.

Description of Coal.	Analysis of Coals as received.						Analysis of Coal after being washed in the Laboratory.					
	Moisture at 100 deg. C.	Volatile hydro-carbons	Fixed carbon.	Ash in coal.	Per. centage of coke.	Ash in coke.	Moisture at 100 deg. C.	Volatile hydro-carbons	Fixed carbon.	Ash in coal.	Per. centage of coke.	Ash in coke.*
Unwashed coal from the Co-operative Colliery's coke ovens	2.85	34.70	53.60	6.85	62.45	10.96	1.60	37.35	57.20	3.85	61.05	6.30
Unwashed screened coal from Mount Pleasant Colliery	0.95	24.90	63.50	10.65	74.15	14.36	0.65	26.20	68.45	4.70	73.15	6.42
Washed coal from Purified Coal and Coke Company's coke ovens, Wallsend	2.50	35.90	56.40	5.20	61.00	8.44	1.35	36.80	57.20	4.65	61.85	7.51
Washed coal from Singleton Colliery coke ovens	3.05	35.85	53.35	7.75	61.10	12.68	1.65	36.70	56.50	5.05	61.65	8.19
Unwashed unscreened coal from Mount Pleasant Colliery	0.85	23.85	64.85	10.45	75.30	13.87	0.75	26.10	67.15	6.00	73.15	8.20
Unwashed crushed slack from Unanderra coke works, Wollongong	1.15	24.40	64.40	10.05	74.45	13.49	0.55	25.90	67.25	6.30	73.55	8.56
Unwashed coal from Brown's Minmi Colliery	2.55	34.15	53.35	9.95	63.30	15.71	2.10	37.80	54.95	5.15	60.10	8.56
Unwashed small coal from Singleton Colliery coke ovens	3.40	32.60	48.60	15.40	64.00	24.06	2.20	36.80	55.45	5.55	61.00	9.09

* This represents the percentage of ash in the coke made by hand in the Laboratory from hand-washed coal. It is probable that better results could be obtained if the coke were made on the large scale in rectangular coke ovens.
