1893.

NEW SOUTH WALES.

NEW SOUTH WALES GOVERNMENT RAILWAYS AND
TRAMWAYS.

(ANNUAL REPORT OF RAILWAY COMMISSIONERS, YEAR ENDING 30TH JUNE, 1893.)

Presented to Parliament, pursuant to Act 51 Vic. No. 35.

Offices of the Railway Commissioners of New South Wales,
Sydney, 5th August, 1893.TO THE HONORABLE THE MINISTER OF RAILWAYS,—
SIR,

In accordance with the provisions of the 45th clause of the Railways Act of 1888, 51 Vic. No. 35, we have the honor to present, for the information of Parliament, our Annual Report upon the working of the Railways and Tramways for the year ending June 30th, 1893.

GENERAL REMARKS.

We have recently inspected the whole of the Railway lines and works, and beg to report that the property has been still further improved during the past year out of working expenses.

The year has been one of exceptional anxiety and difficulty in consequence of the great financial disturbance which has affected the colonies, and also in a smaller measure owing to the drought in the far west at the beginning of the season, and floods in the Hunter River district during the month of March last.

The financial result for the year may be stated shortly as follows:—

Total traffic, Railways and Tramways	£3,222,423
Total expenditure, Railways and Tramways	1,972,324

Net return after paying working expenses... £1,250,099

being an increase in net profit over last year of £556, and making an accumulated increase in net profits paid into the Treasury during the past five years of £1,724,126.

From this sum must be deducted £150,000, two instalments of £75,000 each, towards paying off the £1,000,000 vote under Act 53 Vic. No. 24, for reconstruction and improvement of rolling-stock and permanent-way, which fell due up to the 31st December last; after deducting this amount the Treasury will still have received £1,574,126 increased net earnings during the past five years. The

1893	49	295,367		61,550	

RAILWAYS.

The length of line open for traffic in July, 1892, was 2,278 $\frac{1}{4}$ miles. Since that date the following lines have been opened:—

	Miles.	Date of Opening.
Culcairn to Corowa	47 $\frac{1}{2}$	3rd October, 1892.
Milson's Point Extension	2 $\frac{3}{4}$	1st May, 1893.
Kiama to Nowra	22 $\frac{1}{2}$	3rd June, 1893.

Making a total of 2,351 miles at present in use.

The following lines will be opened before the close of the year:—

	Miles.	Expected Date of Opening.
Cootamundra to Temora	39	1st September.
Molong to Parkes and Forbes	72 $\frac{3}{4}$	1st November.

The following lines are also under construction:—

	Miles.
Lismore to The Tweed... ..	62 $\frac{1}{2}$
Marrickville to Burwood Road	5

The cost of the lines open for traffic on the 30th of June amounted to £34,657,571.

To meet this expenditure £29,210,480 has been raised by the issue of debentures and other stock, the balance having been provided out of the general funds of the Colony and by 'Treasury Bills.

Debentures of the value of £1,201,075 have been finally paid off.

The total cost of the lines upon which interest has to be paid, after deducting debentures finally paid off, is £33,456,496.

The revenue derived from working the lines during the year was £2,927,056, and the expenses amounted to £1,738,516, or 59.39 per cent. of the gross revenue, leaving a net revenue of £1,188,540 towards paying interest upon capital, or a return of 3.48 per cent. upon the total cost of the railways open for traffic.

The percentage the working expenses bear to the gross revenue shows a decrease of 7.30 per cent. since 1888.

The details of the revenue and working expenditure will be found in the Appendices, Nos. 4 to 7, pages 20 to 23.

The Railway revenue shows a decrease of £180,240; this is principally attributable to four causes, viz.:—

- (1) The exceptional financial disturbance.
- (2) February this year having only twenty-eight days as against twenty-nine (leap-year) in 1892.
- (3) Serious floods in the North in March last, causing the main Northern Line to be closed against through traffic for eight days.
- (4) Drought and ravages of rabbits in the Cobar and far Western districts.

Of this sum the Coaching traffic is responsible for £74,189, the 1st class Passenger traffic having decreased by £45,534 and the 2nd class by £14,736. The number of passenger journeys made increased by 13,787.

The

The revenue derived from the Goods Department shows an aggregate decrease of £106,051, the main items of decrease being General Merchandise, £45,486; Coal, £14,996; Other Minerals, £25,260; and Wool, £13,302.

The train miles run were 7,505,310, being a decrease of 850,786. The passenger train service was not curtailed to any appreciable extent, a saving of 15,307 miles only having been made in this direction.

The earnings per train mile show satisfactory results, every mile run having earned 7s. 9½d., as compared with 7s. 5¼d. in the preceding year. The expenditure per train mile has increased from 4s. 7d. to 4s. 7½d., leaving a net earning of 3s. 2d., as against 2s. 10¼d. last year, and 2s. 3½d. in 1888, being an increased net profit since 1888 of 10½d. per train mile.

The increased net profit of 10½d. per train mile on the 7,505,310 miles run during the year represents a sum of £328,357.

The following table, giving the earnings per mile of railway open, gross and net earnings per train mile, and the total and net earnings for all lines for the past nine years, shows the steady improvement in the net value of the property:—

Year.	Year ending	Average miles open.	Per Mile open.		Train Miles run.	Earnings per Train Mile.		Total Earnings.	
			Gross Earnings.	Net Earnings.		Gross Earnings.	Net Earnings.	Gross.	Net, after paying working expenses.

Can. den and Sans Souci Tramways included in this statement.

The floods in the Hunter River District in March last caused the Main Northern Line to be seriously damaged at various points between Newcastle and Muswellbrook, a distance of 80 miles, and the through traffic was suspended for eight days. This not only injuriously affected the earnings, but caused a large additional expenditure to be incurred in temporarily, and then subsequently permanently, repairing the damage to the embankments and bridges. All this exceptional expenditure has been included in the working expenses for the year. A sum of over £20,000 has been spent to repair damage caused by floods to the lines in various parts of the country.

SAFETY APPLIANCES.

The following return will show the progress made in extending the absolute block system of working, and the interlocking of points and signals:—

RETURN showing number of Miles of Line open for Traffic, number of Miles worked under **Absolute Block System**, also Number and Percentage of Places which have or have not **Points and Signals Interlocked**.

Date to end of—	Number of Miles of Line open for Traffic.				Number of Miles of Line on which the Traffic is worked under the Absolute Block System.			Number and Percentage of Places which have or have not Points and Signals Interlocked.				
	Quadruple.	Double.	Single.	Total.	Quadruple and Double.	Single.	Total.	Number of Places.			Percentage.	
								Interlocked.	Not Interlocked.	Total.	Interlocked.	Not Interlocked.
October, 1888	71½	2,042½	2,114	28	...	28	104	318	422	24.63	75.36
July, 1890	78	2,103	2,181	72½	189½	262	176	204	470	37.45	62.55
July, 1891	124	2,058½	2,182½	118½	207½	326½	234	262	496	47.17	52.83
July, 1892	8½	143	2,126½	2,278½	140	507½	656½	257	248	505	50.89	49.11
July, 1893	8½	149½	2,193	2,351	154½	910½	1,065	294	237	531	55.36	44.64

The working of the Webb and Thompson Electric Staff and Tyer's tablet instruments, now applied to about 900 miles of line, is most satisfactory, as not only is much greater security and expeditious working obtained, but the station officers are relieved of a great amount of anxiety in regulating the traffic, which has to pass over stretches of many hundreds of miles of single line.

It is satisfactory to record that the year has been practically free from any serious accident, the total amount of compensation paid during the year amounting to £1,701 only for passengers, and £1,889 for damage to or loss of goods.

All the vehicles used for live stock traffic have been fitted with the Westinghouse Automatic Quick-acting Freight Brake or pipe, with most satisfactory and economical results, the fitting of the ordinary goods stock with the same security is progressing.

RATES.

The system of conveyance of stamped parcels by passenger train, introduced on the 1st August, 1891, has answered our expectations, and notwithstanding the general depression a slightly increased revenue has been earned during the past year, and we hope that the low rates, combined with a cheap system of parcels delivery introduced in connection with Sydney and Suburbs on the 1st July last, will lead to a considerable further development.

The goods traffic for the year 1892 shows a slight decrease in the aggregate number of miles it was conveyed, the figures being—

						Ton Miles.
1891	240,791,664
1892	238,257,161

The average rate earned per ton per mile in 1892 was 1.63d., the same amount as in 1891.

The

The following return will give full particulars of the rates paid by all descriptions of traffic, and the distance each class was conveyed:—

Return of Ton Mileage for Year ending 31st December, 1892.

Description of Traffic.	Total Tons carried.	Total Miles carried.	Average Miles per Ton.	Earnings, exclusive of Terminal Charges.	Earnings per ton per Mile.	Percentage of each class to Total Tonnage.
				£	D.	per cent.
Coal and Shale... ..	2,303,299	40,008,075	17.37	123,097	'74	58.63

NOTE.—The earnings for 1879 and 1883 include terminal charges—1892 exclude.

The agricultural interest has received special consideration at our hands, the rates having on several occasions been reduced; but as the large areas suitable for agriculture situated in remote districts of the Colony can only be developed by giving exceptionally low rates for the carriage of produce to market, further concessions in this respect will be made as from the 15th instant.

The following table will give a few illustrations of the rates in this and the adjoining Colonies:—

* Nine months ending 30th June, 1893.

† Twelve months ending 30th June, 1893.

The Cobar and Culcairn-Corowa Lines, which have been opened since the 1st July, 1892, have not contributed much revenue. The Cobar District, however, during last season, suffered severely from drought and the rabbit pest. The coming season promises to be better than the last. The Culcairn and Corowa Line will be a great burden until more land is placed under cultivation. The low rates for agricultural produce should influence this movement.

Although we have in several of our reports pointed out that, in our opinion, part of the proceeds of the sale of Crown lands, enhanced in value by the construction of railway lines, should be devoted to providing moneys for the construction of such lines, nothing has yet been done in this direction. We would strongly urge that this subject should be dealt with in a way that would reduce the railway capital; as, while it is necessary to proceed gradually with the extension of the railways, it would be most unwise to add further to the unprofitable lines—in connection with which every effort is being made to work them cheaply—by continuing indefinitely a system of unassisted construction.

The views which we have put forward from time to time would, if adopted, be practically establishing the land grant system of railway construction, but the State would obtain the financial advantages instead of a syndicate.

The system of light Pioneer Lines of the standard gauge, as suggested in our report for 1890-91, should, in our opinion, be the policy of the future in the construction of railways in the pastoral districts.

ACCOMMODATION FOR THE TRAFFIC AND CONDITION OF LINES AND ROLLING-STOCK.

The accommodation for the traffic throughout the Colony is satisfactory.

The improvement of the 1 in 33 grades, north of Singleton, and the avoidance of the Lapstone Hill Zig-zag, by the opening of the direct line, considerably assist the work, and also enable a large saving in mileage to be effected.

The rolling-stock is now in an efficient state, and the powerful engines have enabled us to largely economise the train and engine mileage.

The Train Mileage has been reduced by ... 850,786 miles

And the Engine Miles by 2,207,457 ,,

(Engine Mileage includes Train Mileage, assisting trains with a second engine, shunting, &c.)

The Permanent-way has been considerably improved during the year by replacing worn-out iron rails with steel and in resleepering and reballasting. The whole of the cost of this work is debited to working expenses. A reduction in the expenditure under this head will be effected during the forthcoming year.

STAFF.

In consequence of the serious falling off in traffic the whole of the Staff has been carefully revised, and retrenchment effected wherever possible. In order to avoid dispensing with a considerable number of men from the Workshops Staff, the whole of the men were placed on short time—in the first place, by curtailing their time by half-a-day per week, and, subsequently, by a whole day. It was also found necessary, as from the 1st of July, 1892, to suspend the periodical advances usually granted to the Staff in the case of the higher-paid grades. Up to the 1st of January last all advances to the Wages Staff receiving less than 8s. per day were passed, and last month all advances to the Junior Staff not receiving more than 5s. per day were also passed. To the Salaried Staff, except in the case of the juniors and lowest-paid grades, no advances have been given for some time, except where change of position or additional responsibility called for special consideration. Overtime and Sunday-time for the Running Staff on the Railways and Tramways has also been curtailed with the view of giving work to men who would otherwise have been thrown out of employment.

Printed as an Appendix (page 24) is a comparative statement of the Staff employed in the principal grades in October, 1888, and in June, 1893, together with the rates of pay in both periods. This return will show that good wages are being paid to all classes of the Staff, and that, practically, in all grades the employés are receiving better pay than in 1888. The rates of pay are the most liberal in the Colonies.

The Appendices to the Report will give complete information regarding the railway traffic and expenses, and the reports of the Chief Mechanical Engineer and the Engineer-in-Chief for Existing Lines will give details regarding the condition of the rolling stock and lines.

Diagrams are also attached showing graphically the most interesting features of the working of the Department.

RESULTS OF THE WORKING.

RAILWAYS.

Year ending 30 June, 1893, compared with 1892 and 1888.

PARTICULARS.	1893.	1892.	1888.

Passenger Stock, Number of	1,053	1,054	1,039
Goods Stock, Number of	10,551	10,455	8,333

TRAMWAYS.

On the 30th of June, 1892, 48 miles were open for traffic, and on the 24th of October, 1892, a further section was opened from Merton-street, Balmain, to Gladstone Park, a distance of 1 mile, 8 chains making a total of 49 miles on the 30th of June, 1893.

The cost of the lines opened for traffic is £1,118,471.

A sum of £1,022,648 has been raised by the issue of debentures and other stock to the amount of £1,071,112, and the balance has been provided out of the general funds of the Colony.

The traffic upon the tramways has been, to some extent, affected by the financial depression, the revenue showing a decrease of £9,723. The working expenses, however, have been reduced to a greater extent, and the net return upon the capital invested, after paying working expenses, is 5·51 per cent., as against 5·28 per cent. last year.

Twenty tram-cars have been renewed out of working expenses during the year, making a total of 76 cars renewed out of working expenses during the past five years.

The serious depression in the Newcastle Coal District has considerably interfered with the earnings of the Plattsburg Tram-lines.

CONDITION OF EXISTING LINES.

The lines generally are in good running order, a fair amount of relaying and wood-blocking having been carried out during the past year, other necessary work of a like nature has been authorised, and will absorb a considerable sum of money during the ensuing year.

ACCOMMODATION FOR THE TRAFFIC.

With the exception of the terminal accommodation in the city, to which we have drawn attention in our two last Annual Reports, the accommodation for traffic is, at the present time, sufficient. We strongly urge the carrying out of our previous recommendation for giving relief at the Bridge-street terminus at the earliest moment the finances permit of such a course, as not only would the whole of the tram services be relieved but the financial return is undoubted.

The extension of the Plattsburg tram-line from Hunter-street, Newcastle, to the Railway-station, and a short distance beyond, is now approaching completion, and will be a great convenience to the public.

The

The duplication of 28 chains of the Forest Lodge Line, from the Junction to the Glebe Town Hall, which was brought into use on the 1st July, 1893, has permitted of an improved service being adopted for Balmain, and a considerable increase in traffic may be anticipated.

The working of the Tram Lines in sections is as under:—

CITY AND SUBURBAN LINES.	1893.	1892.	1888.

Maps showing Railway systems and Lines.

APPENDIX I.

New South Wales Government Railways,

Sir, Office of Engineer-in-Chief for Existing Lines, 21 July, 1893.

I have to report that the whole of the Lines and Works have been well maintained during the past year.

A distance of 98 miles 15 chains has been either completely relaid, reraild, or resleepered, 208 miles 15 chains have been lifted and reballasted, and the condition of the permanent-way has generally been much improved. The work of renewing the fencing has made fair progress.

Very heavy rains fell during the early part of March last, particularly in the north, where the lines suffered most severely. At Newcastle 11 inches of rain fell in twenty-four hours between the 7th and 9th of the month, and several sections of the road were submerged from 2 to 12 feet in depth. Between East and West Maitland, at Glennie's Creek, at 61 miles 20 chains, and at Bowman's Creek, as well as at many other points between Newcastle and Muswellbrook, portions of the embankment were washed away, and the bridges severely damaged, causing a complete stoppage of the traffic for eight days. The heavy rainfall also affected to a less extent the Illawarra, North Coast, and Mudgee Lines.

The lines were repaired and communication restored with the least possible delay, but considerable additional expenditure has been incurred.

The iron girder bridges over Solitary Creek at 113 miles 10 chains, 113 miles 25 chains, 114 miles, 115 miles 26 chains, 115 miles 75 chains, and 120 miles, on the Western Line, and over the Wollondilly, Barber's, Boxer's, and Mulwarrie Creeks, on the Southern Line, which were reported upon by a Royal Commission in 1885-6, have been strengthened.

Duplication Works.

The whole of the works in connection with the quadruplication of the Suburban Line between Redfern and Flemington, and the duplication of the Southern Line between Granville and Picton have now been entirely completed.

Deviations and Improvements of Grades.

The deviations and improvements of grades between Muswellbrook and Singleton, and the deviation of the line at Lapstone Hill, dispensing with the Zig-Zag, were completed and opened for traffic in December last.

The slewing of the main lines between Honeysuckle Point and Newcastle, rendered necessary by the proposed extension of the Tramway along Scott-street, has been accomplished.

The following new lines have been opened for traffic:—

Nyngan to Cobar, on 1st July, 1892.
Culcairn to Corowa, on 3rd October, 1892.
St. Leonard's to Milson's Point, on 1st May, 1893.
Kiama to Nowra, on 3rd June, 1893.

I have, &c.,

APPENDIX II.

Chief Mechanical Engineer's Report for the year ending 30 June, 1893.

Sir,

Excleigh, 25 July, 1893.

In submitting the annual statement of the working of the Locomotive, Carriage, and Waggon Department for the year ending 30 June, 1893, I have the honor to report that while the condition of the rolling stock, pumping plant, and workshop machinery has been fully maintained and improved, a decrease in the cost of working has occurred.

A very large reduction took place in the mileage executed during the year, which was largely due to the extended employment of more powerful engines, but by economies in the expenditure a saving of nearly 1 $\frac{1}{4}$ pence per train mile has resulted, when compared with the cost of last year. The whole of the new American engines have been at work throughout the year hauling loads of live stock and goods in single trains; for such loads two engines had to be employed previous to their introduction, and consequently their influence in the reduction of train and unprofitable engine mileage has been very substantially felt.

The

The following brief summary shows the mileage executed and the cost for the years in question:—

	1892.	1893.	Increase.	Decrease.
Train miles	8,356,096	7,505,310	850,786
Engine miles	12,362,105	10,154,648	2,207,457
Revenue... ..	£3,107,296	£2,927,056	£180,240
Expenditure	£793,247	£676,480	£116,767
Do in per cents. of revenue... ..	25.53	23.11	2.42
Cost in pence per train mile	22.783	21.632	1.151

Locomotives.

Three hundred and sixty-seven locomotives have passed through the repairing shops during the year; Eveleigh dealt with 211 of them and Newcastle with 39; the remaining 117 were repaired at the smaller depôts. Two hundred and fifty-nine out of the above total received heavy repairs and thorough overhaul; the remaining 108 received repairs of a medium character.

Ten tram motors were also dealt with at Newcastle; 3 of them were heavily repaired.

During the year 286 boilers were dealt with; 198 of them in Eveleigh and 48 in Newcastle, and the remaining 40 at the smaller depôts. One hundred and one of these boilers were internally examined, heavily repaired, refilled with tubes, and returned to their locomotives. Sixty-five stationary boilers were dealt with; 15 of them received heavy repairs at Eveleigh.

One new boiler has been taken out of store, placed in a locomotive, and charged against working expenses.

Carriages and Waggon.

One thousand two hundred and eighty-two passenger vehicles were repaired; 989 of them at Eveleigh and 293 at Newcastle. Three hundred and one of the above total were thoroughly overhauled and received heavy repairs.

Seven thousand four hundred and thirty-six waggons and vans passed through the Eveleigh and Newcastle shops during the year; 3,376 of them were heavily repaired.

In addition to the above, 45 vehicles were reconstructed in the Eveleigh shops at a cost of £5,075, and charged to working expenses. They consist of 12 live-stock vans, 2 meat vans, 1 covered van, 8 bogie waggons, 3 ordinary "D" trucks, and 7 heavy goods brakes, all of which were entirely new; and the following were rebuilt:—Bogie stock—2 sleeping cars, 1 first-class carriage, 2 second-class, 3 composites, 1 mail-van, 1 passenger brake-van, and 2 four-wheeled goods brakes.

In addition to the above, the following new vehicles were constructed and charged to capital:—6 open bogie waggons, 4 heavy goods brakes, and 1 "D" waggon with composite underframe.

One hundred and forty-nine defective axles have been withdrawn from traffic and replaced by stronger ones; 482 axle-boxes of defective design have been replaced by standard types; and light draw-gear on 47 waggons removed.

New Stock.

Twenty-six English express engines have been placed in service; 84 iron hopper-waggons added to the stock, and 25 new iron underframe "D" waggons were built by contractors for renewals.

I have, &c.,

W. THOW,

Chief Mechanical Engineer.

To the Secretary to the Railway Commissioners.

Junior clerks	170	£26	£120	£91/10/5	273	£30	£120	£72/17/-
Operators	142	£50	£250	£101/19/10	73	£30	£200	£106/8/3

Every servant, except salaried officers, is granted a day's leave on full pay for each proclaimed public holiday (averaging about twelve days each year). An equivalent in money is allowed if the holidays cannot be taken.

In addition to the above, engine-drivers, firemen, guards, signalmen, and gangers are allowed six good conduct holidays.

Expenses, averaging 3s. per day, are also allowed to drivers, firemen, guards, and all others, when away from their home station.

Lodging-houses, with attendants, are also provided at all the principal depôts, for drivers, firemen, and guards, free of charge.

Station-masters and Officers-in-charge are allowed free houses.

Salaried Staff allowed three weeks' holiday per annum on full pay.

Free passes are also allowed, when on leave, to each member of the staff, including wife and family, not exceeding three persons.

APPENDIX IX.

RETURN of the Total Amount paid for Wages on the different Branches of the Railways during the years ending 30th June, 1893, 1892, and 1888.

Branches.	1893.	1892.	1888.
RAILWAYS:—	£	£	£

4	1	Pass. run over.
4	1	Pass. slightly injured by leaving train in motion.
5	1	Pass. knocked down.
8	1	Shunter's hand crushed.
8	1	Porter's foot crushed.
11	1	Porter's hand crushed.
15	1	Head porter crushed between a cart and truck.
15	1	Pass. left train in motion; slightly shaken.
16	1	...	Shunter run over.
16	1	...	Porter crushed between carriages.
18	1	Child run over.
19	1	Shunter's hand crushed.
21	1	...	Trolley run into by a goods train 150 miles west.
22	1	Guard's thumb broken.
24	1	Pass. fell down a subway.
25	1	Pass. left train in motion; head and face cut.
28	1	Guard's hand crushed.
30	1	Boy's leg fractured.
30	1	Shunter crushed.
6 Aug	1	Pass. left train in motion; slightly injured.
8	1	...	Shunter scalded.
8	1	Guard knocked off the step of brake van; slightly injured.
11	1	Pass. fell off a truck and sustained a slight shock.
19	1	Pass. left train in motion and was slightly injured.
19	1	Fireman injured whilst punning down a brake.
22	1	Pass. leg crushed.
27	1	Employee knocked down.
30	1	Porter fell, cut his head, and injured his back.
31	1	Shunter crushed.
1 Sept..	1	1	Tram collided with a cart at Kogarah.
7	1	Fireman's head came in contact with bridge.
10	1	Pass. slightly injured his hand.
15	1	Pass. struck by an engine.
16	1	Guard injured.
24	1	Shunter's leg injured.
24	2	Driver and fireman slightly injured through derailment near Doughboy Hollow.
24	6	Through derailment of a portion of a train near Cartingford points neglected.
1 Oct.	1	Employee fell off truck and sustained a shock.
1	1	Pass. fell down a subway.
7	1	Man knocked down, slightly injured.
12	1	Pass. sprained his foot alighting from a carriage.
12	1	Boy knocked down by a coal train.
12	2	Gatekeeper and child run over.
14	1	Signalman struck by engine.
18	1	Woman run over.
19	1	Guard sprained his ankle.
21	1	Guard's arm crushed between buffers.
21	1	Porter knocked down.
24	1	Porter's head cut by truck door falling on him.
24	1	Porter's finger broken.
24	1	Guard fell and fractured his leg.
31	1	Signalman fell down steps.
31	1	Operator burnt owing to lamp exploding.
31	1	Pass. left train in motion.
1 Nov.	1	Employee slightly crushed by a bale of wool.
4	1	Ganger's foot injured by trolley running over it.
2	1	Fireman's foot crushed between buffers.
12	1	...	Junior clerk run over.
16	1	Pass. left train in motion.
16	1	Pass. left train in motion.
16	1	Lady sprained her ankle.
29	1	Pass. fell from train and injured his leg.
29	1	Station-master's finger crushed.
29	1	Pass. attempted to join train in motion.
30	1	Employee injured loading wool.
2 Dec.	1	Child run over.
8	1	Fetchler fell from shed platform.
9	1	Shunter injured his knee.
9	1	Man run over at 190 miles 63 chains West.
10	1	Porter's leg fractured.
12	1	Man struck by an engine.
12	1	Porter injured by bale of wool.
13	1	Pass. left train in motion.
14	1	Man run over.
16	1	Pass. left train in motion.
15	1	Porter fell when loading wool.

APPENDIX XXI—continued.

Date of Accident.	Passengers killed or injured.		Servants of the Department or of Contractors killed or injured.				Trespassers, &c.		Nature of Accident.
	Causes beyond their own control.	Their own misconduct or want of caution.	Causes beyond their own control.	Their own want of caution.	Killed	Injured	Own want of caution.		
1892.	Killed	Injured.	Killed	Injured.	Killed	Injured	Killed	Injured.	
20	1	..	Gatekeeper struck by a train.
23	1	Porter's hand crushed.
23	1	Man threw himself in front of a train.
24	1	Pass. left train in motion.
26	1	Pass. left train in motion.
26	1	Woman run over.
31	1	Pass. attempted to join train in motion.
1893.									
1 Jan...	..	1	1	1	Engine left the rails on the Blayney Line near Cowra.
7	1	..	Fettler run over.
9	1	Pass. jumped from train in motion.
10	1	..	Porter's leg injured while loading wool.
12	1	..	Guard crushed.
12	1	..	Man's foot crushed.
13	1	..	Porter's foot crushed.
14	1	Pass. attempted to join train in motion.
3 Feb..	1	..	Fireman jumped from train in motion.
4	1	..	Carriage examiner run over.
5	1	Pass. attempted to enter train in motion.
7	1	..	Watchman's arm fractured.
8	1	..	Car Conductor run over.
8	1	Man run over.
11	1	..	Ganger run over.
15	1	..	Porter's foot injured.
17	1	..	Engine-driver crushed.
20	2	Officer and guard injured at Como.
20	..	1	Pass. hand bruised through brake-van leaving the rails.
20	1	Pass. alighted from train in motion.
23	1	..	Shunter's arm crushed between buffers.
24	1	..	Porter injured.
25	1	Pass. attempted to enter train in motion.
28	1	Pass. fell from train and cut her head.
1 Mar...	1	Pass. injured knee attempting to join train in motion.
1	1	..	Porter's hand crushed while coupling trucks.
2	1	..	Shunter's hand crushed while coupling trucks.
2	1	Employee's hand crushed through sling breaking.
3	1	..	Guard's finger crushed.
3	1	..	Assistant guard's hand crushed at Zig Zag.
7	1	..	Porter's hand crushed during shunting operations.
8	1	Man struck by the engine of a coal train.
16	1	Porter had both thighs scalded by steam.
17	1	..	Night officer fell, and injured his lip.
21	1	Pass. attempted to join train in motion.
23	1	..	Fireman fell from engine, and fractured his skull.
24	1	..	Porter fell when unshunting a truck.
25	2	2 Pass. attempted to enter train in motion.
27	1	..	Shunter's arm crushed.
8 April.	1	Man run over.
9	2	..	Contractor's men run over.
12	1	Pass. left train in motion.
19	1	..	Man fell from platform.
20	1	Pass. sustained slight cut on right hand.
17	1	..	Porter crushed between waggons.
17	1	..	Oiler knocked down.
21	1	Pass. fell on platform through leaving train in motion.
24	1	..	Shunter's foot crushed.
25	1	Guard's leg scalded by steam.
1 May...	1	..	Fettler fell from truck and injured his head.
5	1	..	Porter crushed between buffers.
6	1	..	Shunter fell and was injured.
12	1	..	Employee fell from bridge.

APPENDIX XXVI.

Report of the Tramway Locomotive Superintendent.

To the Secretary to the Railway Commissioners,—

Sir,

I have the honor to submit the following report as to the condition of the workshops, machinery, rolling stock, &c., for the year ending 30th June, 1893.

CITY AND SUBURBAN STEAM LINES.

Workshops and Machinery.

These have been efficiently maintained, and are now in a satisfactory condition.

Locomotive Engines.

No addition has been made to the stock during the past year. The following motors have been repaired during the year:—General overhaul, 55; intermediate overhaul, 100; repairs ranging from two to six days, 143; repainted and varnished, 119; and ten boilers were removed, two of which were renewed and eight thoroughly repaired; six new boilers have been completed out of working expenses, and ten more are in hand. The whole of the stock has been maintained in good order and the demands of traffic fully met, 77,104 train miles more than in the previous year having been run.

Cars, Trucks, &c.

Twelve additional cars have been supplied, and the following repairs have been executed during the year:—Repainted, 95; repaired and partially repainted, 201; thirty-two trucks have been passed through the shops and been thoroughly repaired. One sample Trail Car for the Ocean-street Cable Tramway, one Standard Car (Renewal), and one road watering tank have also been constructed.

NORTH SHORE CABLE TRAMWAY.

The cable referred to in my former report continued in service up to the 3rd December, 1892, and during the time it was in use (371 days) 74,926 train miles were run; a new cable was brought into use on the 4th December, and is now in excellent running condition.

The whole of the plant and rolling stock has been maintained in good condition. Eight cars (three dummies and five trailers) have been added to the stock to meet the expected increase of traffic from the extension of the present line, and the Military road section shortly to be opened.

PLATTSBURG TRAMWAY.

The engines on this line have been considerably improved, and the cars kept in fair working order. Four new cars have been added to the stock.

SANS SOUCI TRAMWAY.

The locomotive branch of this line was placed in my charge on the 1st May. The motors have been overhauled, and the traffic requirements fully met.

I have, &c.,

GEO. DOWNE,

Locomotive Superintendent.

Randwick, 22nd July, 1893.

APPENDIX XXVII.

Report of Tramway Engineer.

Tramway Department,
Office of Engineer for Tramways, July, 1893.

To the Secretary to the Railway Commissioners,—

Sir,—

I have the honor to submit my annual report on the condition of the Existing Tramways for the year ending 30th June, 1893.

During the year an extension of the Balmain line from Merton-street along Darling-street to Gladstone Park, a distance of 1 mile 8 chains, has been opened for traffic.

A portion of the Forest Lodge line, from the junction to the Glebe Town Hall, has been duplicated the length being 28 chains.

The roads have generally been well maintained, and less difficulty is now experienced in keeping the macadam in good repair since the adoption of hand-broken in preference to machine-broken metal.

In Devonshire-street 16 chains of single track has been re-cubed, and 42lb. rail-guards substituted for those originally laid down.

Phillip-street has also received special attention, the road having been re-spiked and having guard-rails put in.

Oxford-street, Paddington, from Dowling-street to Point Piper Road, a distance of 74 chains, has been relaid, and wood-paved from kerb to kerb, the whole of the work being carried out by this Branch, a proportion of the cost being borne by the Works Department and the Municipal Council. The levels of the street have been much improved, and advantage has been taken to lower the grades, and cut out or increase the radii of the curves.

In Moore Park, on the Randwick line, 62 chains of single track has been relaid with 60lb. T rails. This completes the relaying through the park, and we now have a first-class double track from the entrance to the park at Park Road to the Randwick Racecourse, a distance of 1 mile 52 chains.

Glebe Point Junction has also been relaid.

The aggregate length of sharp curves, &c., renewed is 20 chains.

Although a great deal has been done to relay and generally improve the condition of the Permanent-way, more will require to be done, especially in George-street West, and on the Newtown Road between Forbes-street and the Enmore terminus. Approval having already been given for this work, it will be carried out during the ensuing year.

On the North Shore cable line the work of strengthening the slot-rails has been extended. When completed, this line will be in very good order.

During the year a modification of the railway interlocking and electrical signalling apparatus has been brought into operation at the Newtown, Glebe, and Forest Lodge Junctions, the facing-points at all three junctions being controlled from one signal-box.

The appliance is working very satisfactorily, and a considerable saving is being effected over the previous method of working.

I have, &c.,
G. R. COWDERY,
Engineer for Tramways.

1892	37	65,299,063	1,613,443	279,321	229,145	41.55	34.09	82.04	50,176	932,907	5.54
1893	38	63,588,885	1,651,232	271,041	214,824	38.60	30.67	79.26	56,217	947,775	5.94

* The line was opened for three and a half months only in 1879, and for part of this period was worked with horse-power.
† Up to the year 1885, 3d. cash fares and 2d. tickets were counted as single fares; from 1886, inclusive, all tickets issued were at 1d. values, and cash fares paid are in this Return calculated at same rate.

APPENDIX XXXVII.
TRAMWAYS.

RETURN of the number and nature of Accidents, and the Injuries to Life and Limb, which occurred on the Tramways from 1st July, 1892, to 30th June, 1893.

Date.	Servants of Department.		Passengers.		Other than Passengers.		Nature of Accident.
	Killed.	Injured.	Killed.	Injured.	Killed.	Injured.	
1892.							
4 July				1			Passenger's arm broken; leaving car in motion.
6 "				1		1	Man injured; wheel of cab caught in rail groove.
16 "				1			Passenger's toes crushed; leaving car in motion.
26 "				1			Passenger's arm broken; leaving car in motion.
2 August				1			Passenger's arm injured; fell from car.
10 "					1		Trying to enter car in motion.
20 "				1			Passenger slightly injured; fell from car.
4 September				1			Passenger's foot crushed; leaving car in motion.
11 November				1			Passenger's leg cut off; entering car in motion.
15 "					1		Child killed; ran in front of car.
2 December				1			Passenger slightly injured—leaving tram in motion.
4 "						4	Slightly injured; buggy collided with tram.
14 "						1	Man slightly injured; cab broke down on line.
27 "						1	Man slightly injured; cab broke down on line.
1893.							
14 January						1	Man's arm broken; knocked down by motor.
18 March	1						Fireman killed; shunting cars, Moore Park.
3 May					1		Man killed; trying to enter car in motion.
25 "				1			Passenger's toes crushed; leaving car in motion.

NEW SOUTH WALES.

RAILWAYS AND TRAMWAYS.

(REPORT OF RAILWAY COMMISSIONERS FOR THE QUARTER ENDING 31st DECEMBER, 1893.)

Presented to Parliament, pursuant to Act 51 Vic. No. 35, sec. 44.

Offices of the Railway Commissioners of New South Wales,
29 January, 1894.

To THE HONORABLE THE MINISTER OF RAILWAYS,—

Sir,

In accordance with the provisions of the 44th clause of the Railway Act of 1888, 51 Vic. No. 35, we have the honor to submit, for the information of Parliament, our Report, for the quarter ending 31st December, 1893, upon the subjects specified, viz. :—

- (I.) "The state of the traffic returns, with the approximate cost and earnings of trains per ton per train mile, in respect of goods and passengers, respectively, carried during the past quarter."
 (II.) "The general condition of the lines, and accommodation for the traffic."
 (III.) "The special rates (if any) which have been made, and the reasons for making such rates."
 (IV.) "The appointments and removals, with the circumstances attending each case."

II.—CONDITION OF THE LINES.

A report as to the condition of the lines will be found as an Appendix, page 4.

III.—SPECIAL RATES.

A statement of the special rates, and the reasons for making the same, will be found attached, page 4.

IV.—STAFF.

These returns are given as an Appendix, pages 5 and 6.

GENERAL REMARKS.

The line from Molong to Forbes, a distance of 72¾ miles, was opened for traffic on the 18th of December; this brings the total mileage of the Railways open for traffic up to 2,462½ miles.

The earnings for the quarter show an increase of £576. It is satisfactory to be able to report even this small increase, as for the past five quarters continuous decreases have had to be recorded.

The more satisfactory condition of the revenue is, to a considerable extent, owing to the wool traffic having come forward earlier this year, the increase in the wool revenue amounting to £26,228; the live stock traffic also shows an increase of £10,875. Coal and other mineral traffic shows a decrease of £8,640, and general merchandise, £3,978.

The net result of the traffic for the quarter stands as follows:—

Goods traffic	Increase—£25,980
Coaching traffic	Decrease—£25,404
Net Increase	£576

The passenger traffic continues to fall in the most serious manner; this arises in consequence of a considerable decrease in the long distance travel, and also owing to a considerable portion of the former first-class passengers availing themselves of the second-class accommodation. During the quarter the decrease in first-class traffic amounted to £13,979, and in the second-class to £10,206. The number of passenger journeys decreased to the extent of 286,435.

The decrease in the number of tons of coal and other minerals carried for the quarter amounted to 68,722 tons; but it is hoped that the reduced selling price of coal which has recently been decided upon will have the effect of bringing back some of the lost trade to the Colony.

The working expenses have been reduced to the extent of £31,144, and the earnings per train mile have been slightly increased; the net earnings per train mile, after paying working expenses, now stand at 4s. 6 $\frac{3}{4}$ d., as against 4s. 2 $\frac{1}{4}$ d. in the corresponding quarter a year ago.

The percentage of expenditure to earnings for the quarter stands at the low figure of 50·08 per cent.

The policy inaugurated by us of employing more powerful engines for the heavy grades on the main lines, and cutting out some of the exceptionally heavy grades that affected the loading of trains, has had the effect of very materially reducing the working expenses, particularly during the last eighteen months. It is desirable that this work of improving the grades should be continued from time to time as funds are available.

CONDITION OF THE LINES AND ACCOMMODATION FOR THE TRAFFIC.

The work of relaying, resleepering, and reballasting the lines has been continued, and the lines are in excellent running order.

The accommodation for the traffic is satisfactory.

TRAMWAYS.

The Extension, Hunter-street, Newcastle, to the Military Reserve, a distance of 62 chains, was opened for traffic on the 23rd December.

The Tramway Traffic shows a falling off of £5,867.

The Expenditure shows an increase of £2,007.

The falling off in the traffic is owing to the general depression, and the increase in working expenses arises in consequence of so many unprofitable sections of road having been handed over to us within the last few years.

We have the honor to be,

Sir,

Your most obedient servants,

E. M. G. EDDY,
Chief Commissioner.

W. M. FEHON,
Commissioner.

CHARLES OLIVER,
Commissioner.

APPENDIX I.

NEW SOUTH WALES GOVERNMENT RAILWAYS.

REPORT upon Condition of Lines for the quarter ending 31st December, 1893.

Sir, Office of Engineer-in-Chief for Existing Lines, 12 January, 1894.

I beg to report that the whole of the lines and works have been thoroughly maintained during the past quarter.

Relaying, Reballasting, &c.

Steady progress continues to be made in relaying, rerailling, and resleepering, and the road generally has been considerably improved.

New Lines Opened.

The extension from Molong to Forbes, a length of 72½ miles, was opened for traffic on the 18th December last.

I have, &c.,

WILLIAM T. FOXLEE,

Engineer-in-Chief of the Existing Lines.

The Secretary to the Railway Commissioners.

APPENDIX II.

NEW SOUTH WALES GOVERNMENT RAILWAYS.

RETURN of Rates approved for the Quarter ending 31st December, 1893.

Article.	Rate.	Reason for rate.
Chilled Meat	From Narrandera to Darling Harbour to be charged at the rate of £21 per refrigerating car, provided 40,000 carcasses of sheep are sent within a period of six months.	To secure traffic.
Wool	From Bundaleer Station to be charged the same rate as wool from Thurulgoona.	do do
Stock	Stock consigned from Hay to Narrandera, and afterwards reconsigned to Darling Harbour in the shape of chilled meat, to be charged the same rate per mile as stock from Hay to Darling Harbour, plus a shunting charge of 2s. 6d. per truck.	do do
Solawater Gas-tubes.....	When empty to be charged at the same rate as returned empty pipes ..	To equalise rates.
Coal	The Pacific Co-operative Steam Coal Company to be allowed a rebate of 1d. per ton on coal hauled from Teralba to the Dyke, provided 90,000 tons per annum is forwarded by rail.	To secure traffic.

APPENDIX III.

1894.

NEW SOUTH WALES.

RAILWAYS AND TRAMWAYS.

(REPORT OF RAILWAY COMMISSIONERS FOR THE QUARTER ENDING 31st MARCH, 1894.)

Presented to Parliament, pursuant to Act 51 Vic. No. 35, sec. 44.

Offices of the Railway Commissioners of New South Wales,
Sydney, 30th April, 1894.

TO THE HONORABLE THE MINISTER OF RAILWAYS,—

Sir,

In accordance with the provisions of the 44th clause of the Railway Act of 1888, 51 Vic. No. 35, we have the honor to submit, for the information of Parliament, our Report, for the quarter ending 31st March, 1894, upon the subjects specified, viz. :—

- (I.) "The state of the traffic returns, with the approximate cost and earnings of trains per ton per train mile, in respect of goods and passengers, respectively, carried during the past quarter."
- (II.) "The general condition of the lines, and accommodation for the traffic."
- (III.) "The special rates (if any) which have been made, and the reasons for making such rates."
- (IV.) "The appointments and removals, with the circumstances attending each case."

I.—STATE OF THE TRAFFIC.

Expenditure per train mile	2/2¼	1/11
Percentage—Expenditure to earnings	68·89	67·33
Number of fares collected	17,744,663	16,994,526

II.—CONDITION OF THE LINES.

A report as to the condition of the lines will be found as an Appendix, page 4.

III.—SPECIAL RATES.

A statement of the special rates, and the reasons for making the same, will be found attached, page 4.

IV.—STAFF.

These returns are given as an Appendix, pages 5 to 8.

RAILWAYS.

GENERAL REMARKS.

The great depression in trade of all descriptions, following upon the financial troubles of the first half of the year 1893, has made itself more seriously felt during the past quarter than in any of the preceding quarters.

The traffic for the quarter shows a decrease of £78,530; £17,307 of the decrease arising in the passenger department, and £61,223 in the goods, mineral, and live stock department.

The working expenses have been reduced by £18,120; and it must be borne in mind that for the corresponding quarter of a year ago the working expenses were reduced by no less a sum than £61,846, making an aggregate decrease as compared with the March quarter of 1892 of £79,966.

The train mileage for the quarter has been reduced by 162,513 miles.

The most rigid economy is being exercised in the administration of the Department in all branches, and the general result for the nine months closed by this Report is as follows:—

Traffic decrease	£98,389
Decrease in Expenses	£99,586

The percentage the working expenses bear to the gross earnings for the nine months being 55·44 per cent.

CONDITION

CONDITION OF THE LINES AND ACCOMMODATION FOR THE TRAFFIC.

The work of thoroughly maintaining and, where necessary, improving the buildings and lines, has been continued, and the rolling-stock and permanent-way have been kept in an efficient condition. A large amount of replacement of iron rails by steel rails of greater weight, and renewal of sleepers with the best class of iron-bark of larger scantling, have been carried out during the nine months closed by this Report, a sum of £67,800 having been debited to working expenses for materials alone in connection with the permanent-way and works in that period. With regard to the rolling stock, for the repair and renewal of engines, carriages, wagons, &c., £209,021 has been charged to working expenses during the same period, a sum slightly in excess of that spent during the corresponding time of the preceding year for the same purposes; it will be thus seen that the value of the property is being well maintained.

TRAMWAYS.

GENERAL REMARKS.

The extension, Denham-street to Bondi Beach, a distance of 45 chains, was opened for traffic on the 19th of February last.

The tramway traffic shows a decrease of £2,578, but the working expenses have been reduced by £2,907.

The relaying and wood-blocking of the lines in George-street west is being proceeded with, and the tramway property generally is being kept in good order.

We have the honor to be,

Sir,

Your most obedient servants,

E. M. G. EDDY,
Chief Commissioner.

W. M. FEHON,
Commissioner.

CHARLES OLIVER,
Commissioner.

APPENDIX I.

NEW SOUTH WALES GOVERNMENT RAILWAYS.

REPORT upon the Condition of Lines for the quarter ending 31st March, 1894.

Sir,

Office of Engineer-in-Chief for Existing Lines, 13 April, 1894.

I have to report that the whole of the lines and works have been maintained in a thoroughly satisfactory state during the past quarter.

The heavy rains which fell in March caused an interruption of the traffic on the Northern Line between Newcastle and Maitland for two days, viz., the 7th and 8th, a considerable portion of the embankment on the northern side of Thornton having been washed away. Slight washaways also occurred at Quipolly and Gunnedah on the North-western Line, and slips on the Illawarra Line near Clifton, and on the Mudgee and Western Lines. The damage, however, was promptly repaired, and the lines are now in good order.

Satisfactory progress has been made with relaying, resleepering, renewing fences, and other improvements.

I have, &c.,

WILLIAM T. FOXLEE,

Engineer-in-Chief of the Existing Lines.

The Secretary to the Railway Commissioners.

APPENDIX II.

NEW SOUTH WALES GOVERNMENT RAILWAYS.

RETURN of Rates approved for the Quarter ending 31st March, 1894.

Article.	Rate.	Reason for rate.
Tallow, Sheepskins, and Casks.	Narrabri to Darling Harbour to be charged £2 4s. per ton (minimum 6 tons per four-wheeled truck to apply to tallow, 5 tons to sheepskins). The empty return tallow-casks, filled with tins, to be charged at B rates and conditions.	To secure traffic.
Glue Pieces	To be charged A rates in lots of 6 tons per four-wheeled truck.....	do do
Fruit.....	Albury to Sydney, by mail train, to be charged at goods rates at owners' risk.	do do
Flour, Bran, and Pollard ...	Murrumburrah to Bourke, to be charged at the same rate as from Cootamundra.	do do

 Plan II. Railway from Narrabri to Moree—showing approximately the Betterment Area.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RAILWAY FROM NARRABRI TO MOREE.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of railway from Narrabri to Moree, such work to be subject to the provisions of any Act that may be passed dealing generally with the 'betterment principle' with regard to public works," have, after due inquiry, resolved that it is expedient the railway should be constructed, and in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

1. Departmental action in connection with the proposed railway dates back as far as 1883, when a rough estimate, based on the results of a trial survey, represented the cost of construction as £539,500, or sixty-seven miles at £8,053 per mile. At that cost the line would be of the substantial character of the railway system generally of the Colony, and it was thought that a more lightly-constructed railway would meet requirements. Further investigation was therefore made, with the result that the estimate of cost was considerably reduced, and on the Loan Estimates for 1884 a sum of £336,500 was voted for the line under the heading of "Light Lines." Two years afterwards the plan, section, and book of reference of the proposed railway were approved by the Legislative Assembly in a division of fifty votes to four; but further progress was interfered with by the Legislative Council, when the matter came before that House, referring the line as proposed to a Select Committee for inquiry. This inquiry was not completed in the session during which the line was referred to the Select Committee, and it was not afterwards resumed. The matter remained in abeyance for a time, and then was again brought into notice by the Parliamentary representatives of the electorates particularly concerned in it. The Railway Commissioners also expressed themselves favourable to the railway being constructed, and in 1889 pointed out its advantages to the districts in the neighbourhood of Moree, and to the Colony. The line might, the Commissioners thought, be laid down as a cheap railway on a basis suggested by Sir John Fowler in a report made in March, 1886, the cost being stated in this report at about £2,500 per mile. On that basis, and with little or no fencing, inexpensive though ample station accommodation, and the running of trains in the daytime only, the line, they were of opinion, would prove remunerative. In April, 1889, they visited the district, and as a consequence of their inspection suggested that from Narrabri the line should go westward to Gurleigh Point, and thence northwards to Moree. This deviation to the west from Narrabri was also recommended in 1891 by Mr. R. E. Jones, Temporary Examiner of Public Works Proposals. It was, however, afterwards found to be undesirable,

History of the proposal to construct the railway.

undesirable, by reason of the fact that a much better and less costly crossing of the Namoi River was discovered nearer Narrabri, and on the route ultimately decided upon and referred by the Legislative Assembly to this Committee. While the investigation and recommendations in regard to the line were proceeding, the estimated cost was further reduced, and in 1892 the Railway Commissioners, in a minute to the Minister for Railways, advocated the construction through purely pastoral and level country, where the traffic would be light, of "pioneer lines," not so substantial as "light lines," and yet sufficient for the work expected from them, the cost of which should be about £1,750 per mile, exclusive of bridges, waterways, and station accommodation. This estimate the Engineer-in-Chief for Railway Construction thought too favourable, but on further consideration, he found that by adopting the route referred to the Committee the cost, exclusive of land and compensation, would not exceed £153,000, or about £2,409 per mile.

Description
of the pro-
posed railway.

2. The proposed railway (coloured red on the plan) is 63 miles 50 chains in length, and is almost straight. Leaving the North-Western Railway near Narrabri station, it crosses the Namoi River and the Narrabri Creek on two wooden bridges a little to the south-east of the ordinary road crossing, and then skirting the southern and eastern boundaries of the town of Narrabri it proceeds in a generally northern direction to Moree, terminating on the southern side of the river Gwydir. The country traversed is mostly flat, consisting largely of black soil, and crossed by several creeks, which have their sources in the Nandewar range of mountains some 15 miles to the west of the line. Being flat, the country in wet seasons is more or less flooded, but protection to the railway line will be afforded by waterways, boxdrains, and culverts wherever they may be necessary. As the railway is regarded as what is termed a "pioneer line," or the first of a cheaply-constructed system of railways, it is proposed that the ballasting be very much less than is ordinarily carried out. On ordinary lines from 2,000 to 2,200 cubic yards of ballast per mile are put down, but in the present case, to save first expense, the usual quantity of ballast has been reduced to 1,200 cubic yards per mile, or 3 inches of ballast under the sleepers, a quantity which is about one-half or two-thirds less than is generally used. Also, to save expense, it is intended that the rails used shall be mostly double-headed re-rolled rails which are in stock in the stores of the Department of Public Works and the Department of Railways, and some second-hand rails in fairly good condition which will be taken from the main railway line, the balance being made up of some 71½ lb. steel flat-bottomed rails. Forty-eight miles 30 chains of the line will be laid with the re-rolled rails, 12 miles with the second-hand rails, and 4 miles 70 chains with new rails. These distances being a little beyond the total length of the line, allow something for sidings. The sleepers, like the ballast and the rails, are to cost less than is usually spent upon them. They will not be the ordinary rectangular sleepers, but will be roughly hewn and round on the top; the sapwood being left on in all cases where, when the way is cut to fix on the chairs, there is a sufficient width of hardwood to take the bearing. The bridges erected will be of timber and while substantially built will be as plain as possible. Fencing will only be carried out at the railway stations and where absolutely necessary, so that virtually the line will be unfenced. Fencing is regarded as unnecessary from the circumstances that the maximum speed of the trains will not exceed 15 miles an hour, and they will not run at night. The rolling stock used on the line will be of the lightest kind. Stations will be placed between the termini at Edgeroi, 16 miles from Narrabri; Woolabrar, 28 miles; Gurley, 41 miles; and Tycannah, 49 miles. The grade of the railway will be "1 in 100 against Newcastle and 1 in 75 outwards."

Other routes
for the rail-
way.

3. Three routes by which a railway may be taken from Narrabri to Moree, other than that set forth in the proposal referred to the Committee, have been informally before the Committee in their inquiry, and are represented on the plan showing the route it is proposed shall be adopted. The proposed route is coloured red. The three other routes are shown respectively in blue, green, and yellow. That coloured blue, and known as the permanently staked route, was decided upon some years ago, and subsequently abandoned because the river-crossing near Narrabri connected with it was bad, because it passed Narrabri 2 or 3 miles away to the west; and because the earthworks upon it were likely to be unnecessarily heavy.

heavy. It is, however, the most direct and the shortest route that could be adopted. The route coloured green is called the travelling stock route, from the circumstance that the line would follow the route used by drovers for almost the whole of the distance from Narrabri to Moree. Leaving Narrabri on the west the railway would by this route proceed by the travelling stock route, first in a north-westerly direction to a point $4\frac{1}{2}$ miles east of Millie, and thence north-easterly, still keeping to the travelling stock route, to Moree. The yellow route is what is known as the Gurleigh Point route. It starts from the present terminus of the North-Western railway, and going westerly, with a slight inclination to the north, along the south bank of the Namoi River, crosses the river at Gurleigh Point, $6\frac{1}{2}$ miles east of Wee Waa, and then, proceeding northwards, joins the travelling stock route on the south side of Boggy Creek, about $28\frac{1}{2}$ miles from Narrabri station. The travelling stock route and the Gurleigh Point route being considerably more to the west than the route proposed for the railway, are regarded as those which are most in the interests of population and trade in the western and north-western districts.

4. The estimated total cost of the railway is £153,000, or about £2,409 per mile. The first $3\frac{1}{2}$ miles of the line are the most expensive, as in that distance are included bridges across the Namoi River and Narrabri Creek, and a new railway station at Narrabri. Dividing the total cost into two parts, the Engineer-in-Chief estimates that the first part, comprising 3 miles 56 chains of line at the Narrabri end and including the bridges and the new railway station, will be constructed for £17,500, or £3,866 per mile. The second part, a length of 59 miles 74 chains, will cost £135,500, or £2,267 per mile. The estimated cost of the line does not include land and compensation, but the amount that may be paid for land resumption and compensation is not likely to be very large. Estimated cost.

5. The railway is recommended by the Railway Commissioners on the ground "that it will tend to largely develop a considerable tract of valuable country, and will be an extension of the existing North-Western Line in a direction which will probably at a future date warrant a continuation to the Queensland border." They are favourable to the line also because, to a large extent, it has been designed in accordance with views they "have from time to time expressed on the subject of extensions into the pastoral districts." Their estimate of the annual cost of the railway and of the probable traffic returns, shows a slight loss at the commencement, but the profitableness of the line in the near future they do not doubt. According to their report the working expenses per year would be £7,000, and adding this to the amount of interest on the capital expenditure, calculated at 4 per cent., which would be £6,120, the estimated total annual cost is £13,120. Against this the traffic estimate shows £2,300 for passengers and mails, and £9,915 for goods, or in all £12,215, a deficiency of £905. In 1892 the Commissioners urged upon the Government the importance of constructing this railway. In a minute, dated 4th November, 1892, and addressed to the Minister for Railways, they say: "Referring to the conversations the Chief Commissioner has had with you on one or two occasions respecting cheap lines through pastoral country, we beg to state that in our opinion the most urgent lines to make at the present time are those from Narrabri to Moree, and from Bourke to a point on the Queensland border northward of Bourke. . . . Unless these lines are made . . . a large traffic we have enjoyed for many years will be abstracted from us." Railway Commissioners' Report.

6. The inquiry which the Committee have made respecting the proposed railway has been very searching. Nine meetings have been held by the Committee for the taking of evidence, and at those meetings twenty witnesses were examined. Nine meetings were also held by a Sectional Committee, who visited the Narrabri and Moree districts, and at those meetings sixty-one witnesses gave evidence. In all, eighty-one persons have expressed their views upon the subject of the railway to the Committee, and as the evidence given deals with the alternative routes for the line as well as that in the proposal referred to the Committee the information obtained is very complete. The taking of evidence relating to the routes other than that specially before the Committee became necessary by reason of The Committee's inquiry.

of pressing requests to be heard being received from representative organisations, as well as individuals, in important centres of population and trade. To decline to hear the advocates of a route different from that proposed by the Government would not only be unfair to many local residents, but would materially lessen the means available to the Committee for arriving at a right decision. The case generally as regards the railway was very fully explained to the Committee by the Under Secretary for Public Works, and following him there were examined: the Chief Draftsman, Department of Lands; the Engineer-in-Chief for Railway Construction; the Secretary to the Railway Commissioners; the Railway Goods Superintendent; the surveyor of the Railway Construction Branch of the Department of Public Works, who was employed in the survey of the proposed line; the District Surveyor, who superintends the Crown land business of the Narrabri district; an officer from the Stock Branch of the Department of Mines; an engineer of the Roads Branch of the Department of Public Works, who, in 1891, as Temporary Examiner of Public Works Proposals, reported on the subject of the proposed railway; and a number of other witnesses, more or less acquainted with the country, population, and trade which would be affected by the line, who desired to give evidence, and appeared before the Committee at their own request. Immediately the departmental evidence had been heard a Sectional Committee was appointed, and they, visiting the Narrabri and Moree districts, examined witnesses at Narrabri, Millie, Moree, and Wee Waa.

Sectional
Committee's
report.

7. The Sectional Committee's report is favourable to the construction of the railway as proposed, but they are of opinion that in view of the importance of the trade in the districts west and north-west of Narrabri and Moree a full exploration and survey should be made of the country towards Collarendabri, with the object of running a branch line in that direction.

The evidence.

8. The evidence given in the inquiry both before the Committee and the Sectional Committee is conflicting, many of the opinions expressed and statements made being largely influenced by local interests; but the Committee arrived at a decision upon those points in the case which are the most important. These are:—

- (1) Objects in view in constructing the railway.
- (2) Expected traffic.
- (3) Suitableness or otherwise of the route.
- (4) Question of cost.
- (5) Method of construction.

Objects in
view in
constructing
the railway.

9. The principal object in view in constructing the railway is, as indicated by the Railway Commissioners, to retain for the railways of this Colony a traffic from the districts near the southern border of Queensland which legitimately belongs to New South Wales, and which, unless railway communication be extended northwards from Narrabri, will go elsewhere. Another reason for constructing the line is the desirableness of developing more rapidly than can take place in existing circumstances a large tract of country, which for natural richness and for productiveness, is equal to country in any other part of New South Wales. The Sectional Committee explain in their report that the area of this country "extends approximately from Inverell on the east to beyond Angledool on the west, and from the Namoi River on the south to the boundary of the Colony on the north."

Expected
traffic.

10. The traffic expected on the line is principally wool, but also stock, general merchandise, and passengers; and the traffic estimate appears to have been very carefully made. For this purpose the district was specially visited by the Railway Goods Superintendent, and only trade certain to come to the railway was taken into account. Anything at all doubtful, the Committee are assured, was omitted. It is, therefore, very probable that the actual traffic will exceed the estimate. Mr. Harper, the officer who obtained the information upon which the estimate is based, seems from his evidence to be well acquainted with the country which the railway will serve, its products, and its trade requirements; and no reason is apparent why his figures should be doubted. The railway rates upon which the revenue part of the estimate is calculated are the ordinary rates at present charged on the railways of the Colony.

11. The route of the railway has been chosen because it is direct, is not to a serious extent affected by floods, and presents a good crossing over the Namoi River. Witnesses examined before the Committee have stated that the alleged immunity from flood-water is incorrect, and that the crossing over the river is not the best that can be found. The Engineer-in-Chief for Railway Construction is satisfied that the route is what it is officially represented to be, and from his and other evidence the Committee do not see sufficient reason to doubt this statement. Some of the land about Narrabri, the Engineer-in-Chief admits, is subject to floods, and the water spreads itself over the land near various creeks; but he has provided for that, and there will be sufficient get-away for the water in the vicinity of creeks and other watercourses by means of bridges, drains, and culverts, to prevent any accumulation of flood-water about the railway. There is a good crossing place over the Namoi 5 or 6 miles to the west of Narrabri, but it is undesirable for the line as proposed, because the main North-western Railway now stops at Narrabri, and the object of extending to Moree is to go as directly northward as possible. And while laying out the line over country presenting a suitable river crossing and comparative freedom from flood-water, efforts have been made to keep it as much as possible from land which would have to be resumed and paid for. "In laying out the line," the Engineer-in-Chief states, "I have taken care to run through Government reserves wherever possible, and a reference to the Land Office map will show that the line for the greater part traverses Government reserves." Certain weight must, of course, be given to the evidence of private persons residing in or acquainted with the country through which the line will pass, but unless there be some clear and forcible reason for doubting the testimony of the expert officers of the Government that testimony must be accepted. There is not at the present time much settlement along the route, but during 1895 many of the leases held in the district by pastoralists will expire, and it is anticipated that a large quantity of land will in consequence be taken up by small settlers. The land itself is of an excellent description, fit for profitable pastoral occupation or for agriculture, including the growth of wheat.

12. The estimated cost of constructing the railway is less than in the case of any Government line previously constructed in New South Wales. The cost of maintenance, it is stated, will also be considerably below what it has hitherto been. The railway is regarded as a cheap line, but, from an engineering point of view, a very good one, and fully capable of doing the work expected of it.

13. Different as the construction of this railway will be from what has been followed in the case of the existing lines of the Colony, there is no reason to think that the line will not be workable and safe. With the exception of the ballasting and formation it will not be less substantial and permanent than other lines. The proposal to limit the ballast to three inches under the sleepers appeared to the Committee from the first to be a somewhat doubtful proceeding, and their opinion regarding this part of the work was strengthened by the inspection which the Sectional Committee made of the route. This limit of ballast assists materially in reducing the cost of construction, but may make the line unsafe, the black soil over which the sleepers and rails will be laid being in places very soft and spongy. It seemed to the Committee essential that the ballast should be increased. The Engineer-in-Chief for Railway Construction expressed himself as satisfied that the quantity he proposed to use would be sufficient, but admitted that as traffic extended more ballast would have to be put down. The doubt felt by the Committee led them to examine the Engineer-in-Chief for Existing Lines, and by him, and subsequently by the Engineer-in-Chief for Railway Construction, the matter was satisfactorily explained. The three inches of ballast represents 1,200 cubic yards per mile of line. By somewhat narrowing the width over which the ballast extends, and laying down the ballast judiciously, the quantity which would give only three inches under the sleepers by the ordinary system may be made to give six. The reduced width can be adopted in the case of this railway, because the line is comparatively straight and without sharp curves.

14. The proposed railway, it will be seen from the resolution of the Legislative Assembly referring the work to the Committee, is to be "subject to the provisions of any Act that may be passed dealing generally with the 'betterment principle' with regard to public works," and the Committee were very desirous of learning through

through the Under Secretary for Public Works, as the representative of the Minister for Public Works, what the views of the Government are upon this subject of betterment as applied to this line. A map published with this Report shows the extent of country which it is considered the railway will more or less serve, and which might come under the operation of the betterment principle; and the evidence of Mr. J. Barling, Under Secretary for Public Works, explains, as far as can be done at present, the manner in which it is proposed that the principle should operate. Generally it would operate in accordance with the provisions of the Bill before the Legislative Assembly last Session, under the title "The Public Works Act Further Amendment Act of 1893." Clause 8 of that measure provides that—

"the Governor, after an investigation has been made by officers appointed for that purpose, may prescribe the limits of the improvement area and declare that owners of land, within the limits of such improvement area, shall be liable to pay an improvement rate, to be assessed in the manner hereinafter provided, for the purpose of repayment of the proportionate cost of such land and work."

Clause 9 states that for the purposes of the Act the occupier of land shall be deemed to be the owner, and that the word "owner" shall include "occupier"—

"Provided always that the improvement rate shall be borne equitably by the occupier or lessee, and the lessor of the said land, as may be agreed upon between them; and in default of agreement the proportion of the said rate payable by either party shall be determined by the Land Appeal Court, according to such regulations as the Governor shall prescribe."

Other clauses of the Bill bearing upon the question as it relates to this railway and the intentions of the Government were described by the Under Secretary as follows:—

"Clause 10 provides that within thirty days after the improvement area has been proclaimed the Constructing Authority shall cause a plan to be deposited at some place within the police district wherein the lands affected are situated, showing the extent of the improvement area, and giving particulars as to the owners of the land, the amount of the improvement rates which every owner will be required to pay, and the period over which the payment will extend, together with the amount of each instalment and the date upon which it must be paid. Clause 11 provides for the publishing of the notice in the *Government Gazette* and the local newspapers, and also gives power to amend the plan already referred to, provided that similar notice is published. Clause 12 provides that the Constructing Authority, in determining the rate to be paid by each owner, shall take into account the position of the land and 'the degree of permanent enhancement in its capital or annual value which the authorised work may reasonably be expected to produce; and such rates shall be payable by half-yearly instalments spread over a number of years to be determined by the Constructing Authorities.' The number of years over which the payment is to be spread is not to exceed 100, nor to be less than fifty. Provided always that the whole amount of improvement rate to be paid by the owner shall not exceed 75 per centum of the cost of such work."

This 75 per cent. seems excessive, but it is explained that it is necessary to fix a high limit, as the Government may have to carry out under the Act works which will be to the very large interest of private persons and only slightly in the public interest, and while 75 per cent. is the maximum contribution under the betterment principle, there will probably be cases where a much smaller percentage is justifiable. The object of the Government appears to be to safeguard the public interest as far as possible. By another clause in the Bill—clause 13—the owner of property assessed under the Act has the right of appeal against the action of the Constructing Authority, or Minister, in regard to all the proceedings which principally affect him:—(1.) The inclusion of his property within the improvement area; (2) the amount of improvement rate to be paid by him; (3) the period over which the repayment of such rate is to be spread. The appeal, as provided by clause 9, is to be made to the Land Court. The Minister thinks that as there is in existence a Land Court, which is a highly competent body, it would be better to constitute it an Appeal Court in these matters than to allow an appeal to the Supreme Court or to arbitration. The decision of the Land Court is to be final, and the costs of appeal are to be in the discretion of the Court. By clause 15 of the Bill it is necessary that the first half-yearly instalments of the betterment rate shall be paid at the end of six months from the date of the publication of a notice in the *Government Gazette* and local newspapers.

"Clause 16 provides that notice may be given of lands not included or not finally assessed at the time of the publication of the notice referred to in the preceding clause, and that the first payment is to be due and payable 'as from the expiration of six months from the date of the publication of the notification of the completion of the authorised work.' Clause 17 provides that a charge of 6 per cent. will be leviable upon all overdue payments; and clause 18, which is a very important one, provides for the formation of a sinking fund, for the repayment of loans from which the work was constructed. It reads as follows: 'All sums of money paid under the authority of this Act shall be paid by the Constructing Authority into the Treasury

Treasury to the credit of the Consolidated Revenue Fund, and the Colonial Treasurer shall keep a separate account for each authorised work and the amounts in respect of same. And all such payments shall be used to form a sinking fund for the repayment of loans from which such authorised work was constructed, according to such regulations as the Governor shall think fit.' Clause 19 is as follows: 'The foregoing provisions shall apply to all Crown lands, and to all lands occupied by or vested in any department of the Government: Provided that no improvement rate shall be payable from unoccupied Crown lands until such lands are purchased, leased, or occupied under any Act in force relating to the purchase, lease, or occupation of Crown lands, but nothing herein shall be taken to diminish the amount chargeable on such lands.' Clause 20, which is the last clause of the Bill, provides that, for the purpose of this Act, the Secretary for Lands shall be deemed to be the owner of all Crown lands."

It is, of course, possible that the Bill which contains these provisions will not be passed into law; and that contingency occurring to the Committee, the Under Secretary was asked whether, presuming the measure was not passed, the Bill authorising the construction of the railway would bring it under the provisions of any future Betterment Act. The Under Secretary was not able to answer the question definitely, because, he said, he had not put it to the Minister exactly in that form. But it was clear, he went on to say, that the Minister, when he referred this work to the Committee, had determined that it should be subject to the betterment principle. He supposed it would depend very much upon the conclusion arrived at by the Committee as to whether the Minister would proceed with the construction of the railway in the event of the Betterment Bill not being passed, but he could not say definitely how the Minister would act in that case. The manner in which the betterment principle may affect property-holders in the districts served by this railway was explained as follows:—

"Suppose, for the sake of illustration, the betterment area was fixed at 6,000,000 acres, and we charged half of the cost of the line to the owners of the land. That, allowing something for the land which must be resumed, might be put down at £80,000. I make the whole cost of the line £160,000 instead of £153,000, as estimated, in order to provide for the land which will have to be resumed. Suppose also that the owners of the land benefited by the construction of the railway had to repay one-half of its cost to the State, and an average rate were charged, it would only amount to something like three-tenths of a farthing per acre per annum."

But, the Under Secretary said later on, "we shall have to make the most careful investigation before proclaiming the betterment area, or determining the amount to be paid by the owners of land." There are represented to be in the district 890,000 acres of freehold land, 1,804,000 acres of conditionally-purchased and leased land, 985,000 acres of reserves, and 3,615,000 acres of Crown lands.

15. It will be seen from the evidence that many witnesses urge the construction of a line from Narrabri in a westerly or north-westerly direction. Though admitting that Moree is entitled to railway communication they contend that the line as proposed will be of no benefit to the districts west of it, which have a claim to railway facilities at least equal to the districts around Moree. Any route to Moree westward of the one referred to the Committee would be longer, much more expensive, and more liable to the effects of flood-water than that proposed. A westward or north-westward line would undoubtedly be, as the Sectional Committee point out in their report, "advantageous to a large area of country, and a very considerable population," but a line in either of those directions could not be made to effectively serve Moree and the country north or east of it. The Sectional Committee came to the conclusion that if the whole area of country concerned in this railway question is to be properly served it can only be done by two lines—"a northern line following the route submitted to the Committee, and a western line following the driest belt of country, which is apparently south of Thalaba Creek, and eventually reaching Collarendabri. Any attempt to deviate from the direct route," they say, "will entail a permanent disability on the northern trade without conferring a fully compensating advantage on the western trade." They were of opinion "that in view of the importance of the western trade, it would be well if a full exploration and survey should be made of the country towards Collarendabri, apparently the best place to start a survey from being a point between Narrabri and Edgeroi, thus utilising the bridge which will be constructed over the Namoi on the direct route."

Opposition to the proposed railway.

16. After a careful consideration of the evidence, and from the inspection made by the Sectional Committee, the Committee have arrived at the conclusion that the proposed railway, as referred to them by the Legislative Assembly, should be

Resolution of the Committee.

be constructed, but they recommend that the work be not undertaken until a Betterment Act is passed. Their decision is shown in the following extract from their Minutes of Proceedings, of Tuesday, 9 January, 1894:—

Mr. McCourt moved,—

“That, in the opinion of the Committee, it is expedient that the proposed railway from Narrabri to Moree, as referred to the Committee by the Legislative Assembly, be carried out.”

Mr. Davies seconded the motion.

Mr. Trickett moved, as an amendment,—

“That all the words after the second word ‘that’ be omitted, with a view to inserting the following words: ‘a railway should be constructed to connect Narrabri with Moree, but that the weight of evidence is in favour of a line to the west of the proposed Government line and in the locality of the Gurleigh Point line, or travelling stock route, forty-three out of sixty-eight witnesses having testified in favour of a western deviation; one strong objection to the Government line being that it would not serve a large area of country to the west of Millie and Narrabri, whilst a deviation to the westward, as before suggested, would, in addition to connecting Narrabri and Moree, be advantageous to a large area of country and a considerable population to the west. The Committee recommend accordingly.’”

The Committee divided on the question—“That the words proposed to be omitted stand part of question,” with the following result:—

Ayes, 6.	Noes, 4.
Mr. Suttor,	Mr. Trickett,
Mr. Hoskins,	Mr. Wall,
Mr. Humphery,	Mr. Neild,
Mr. Davies,	Mr. Dawson.
Mr. Ewing,	
Mr. McCourt.	

The amendment was, therefore, negatived, and the motion was passed on the following division:—

Ayes, 6.	Noes, 4.
Mr. Suttor,	Mr. Trickett,
Mr. Hoskins,	Mr. Wall,
Mr. Humphery,	Mr. Neild,
Mr. Davies,	Mr. Dawson.
Mr. Ewing,	
Mr. McCourt.	

J. GARRARD,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 12 January, 1894.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM NARRABRI TO MOREE.

TUESDAY, 14 NOVEMBER, 1893.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.	WILLIAM CHANDOS WALL, Esq.
The Hon. JAMES HOSKINS.	WILLIAM McCOURT, Esq.
The Hon. FREDERICK THOMAS HUMPHERT.	JOHN CASH NEILD, Esq.
The Hon. JOHN DAVIES, C.M.G.	EDWARD WILLIAM O'SULLIVAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	CHARLES COLLINS, Esq.
THOMAS THOMSON EWING, Esq.	HENRY DAWSON, Esq.

The Committee proceeded to consider the proposed Railway from Narrabri to Moree.

Joseph Barling, Esq., Under Secretary, Department of Public Works, sworn, and examined:—

1. *Chairman.*] Have you a statement to make to the Committee? Yes, it is as follows:—The first departmental action taken in connection with this proposed line appears to have been in the year 1883, when Mr. F. A. Wright, then Minister for Public Works, gave instructions for a trial survey to be made. A rough estimate was then made of the cost of the work by Mr. Mr. John Whitton, which amounted to £539,500, or 67 miles at £8,053 per mile. On the Loan Estimates for 1884 a sum of £336,500 was voted for the line, under the heading of "Light Lines." In April, 1886, Mr. Lyne, who was then Minister for Works, laid before the Assembly the plan, section, and book of reference of the proposed line. In September following, on the motion of the same Minister, the House approved of these by 50 votes to 4. The Legislative Council, however, by 22 votes to 4 referred the matter to a Select Committee, which, in a progress report, recommended the resumption of the inquiry during the next session, as time had been too limited to enable them to take evidence. The Committee do not appear, however, to have issued any further report. The matter, for a time, then remained in abeyance; but in 1886 Mr. Hassall, M.P., presented a petition from the residents of Moree, urging the immediate extension of the line from Narrabri; and from that time to the present the construction of the line has been pressed with increasing urgency by Mr. Hassall, M.P., Mr. Sheldon, M.P., Mr. Collins, M.P., and others interested. Particulars of the various steps which were taken will be given in the *précis* which I will subsequently hand in. The whole matter finally culminated by the present Minister for Works, Mr. Lyne, moving in the Legislative Assembly, on the 1st instant, that the matter be referred to this Committee for report, the terms of the motion being as follows:— "That it be referred to the Parliamentary Standing Committee on Public Works to consider and report upon the expediency of constructing a line of railway from Narrabri to Moree, such work to be subject to the provisions of any Act that may be passed dealing generally with the 'betterment principle' with regard to public works." Six different proposals have been made with respect to the route for this line. The earliest, known as the "permanently staked line," was made by Mr. F. B. Wickham in the latter part of 1883 and the beginning of 1884, and Messrs. Carter and Harwood commenced to permanently stake this route in 1884. This work was suspended in order to make a trial survey of a line *via* the "travelling stock route," which may be looked upon as the second proposal. This left the route of the first line about 3½ miles from Narrabri, and junctioned with it again about 6 miles from Moree. This latter survey was completed early in 1885. The permanent staking of the direct route (the first) was resumed, and finished about the middle of 1885. Messrs. Carter and Harwood also made, in April, 1885, a short trial survey *via* Gundamain, which left the trial line to Walgett, *via* Wee Waa, about 4½ miles from Narrabri Station, and junctioned with the permanently staked line about 14 miles from the latter point. Early in 1886 the fourth trial survey was made by Mr. Wickham *via* Rocky Crossing. This left the North-western Railway about 5½ miles short of Narrabri, and followed the route of the old trial survey to the Queensland Border at Mungindi, the plans of which were destroyed in the Garden Palace fire. This junctioned with the "permanently staked line" at 6½ miles from its commencement. There was a deviation tried on this line through Narrabri township. The fifth survey was undertaken towards the end of 1889, *via* Gurlough Point, and was made by Mr. J. J. Jamieson. This is a continuation of the existing line along the south side of the Namoi River, in the direction of Wee Waa, its nearest point being 6½ miles from that place. It crosses the river at Gurlough Point, and junctions with the travelling stock route line on the south side of Boggy Creek, about 28½ miles from Narrabri station.

station. The object of the survey by the travelling stock route was to take advantage of Crown lands, but this advantage, as I shall explain later on, is very much minimised by the application of the "betterment" principle. The other surveys had in view improved crossings of the Namoi River, or accommodation to the township of Narrabri, the present station being about 2 miles from the centre of the town. Further examination of the country showed that these latter objects could be best attained by the sixth and adopted route now before the Committee. This line leaves the North Western Railway east of the present Narrabri station, crossing the river at Cooma, and the Rocky Crossing line at the township, meeting the "permanently staked line" 20 miles from Narrabri. The trial survey of this line was undertaken, at the beginning of this year, by Messrs. Paul and Sams. The latter worked on the route just described, and the former amended the staked line northward from the point of junction to Moree, principally with the object of improving its alignment with regard to Crown and private land, but keeping generally to the same line of country, which is freer from flooded country than the travelling stock route. The advantages of this line may be summarised as follows:—It has a better river crossing; serves the town of Narrabri better; goes through the best country, from an engineering point of view; and is the shortest to Moree as compared with the "Gurleigh Point" and "Travelling Stock" routes. The official description of the line is as follows:—

LINE FROM NARRABRI TO MOREE.

Single line; length, 63 miles 50 chains; estimated cost, £153,000, for a light line of railway, exclusive of land and compensation.

The proposed extension leaves the North-western Railway, near Narrabri station, at 251 miles 32.56 chains from Newcastle, and after crossing the Namoi River and Narrabri Creek reaches the township of Narrabri, skirting its southern and eastern boundaries. Thence it proceeds in a generally northern direction to Moree, where it ends on the southern side of the Gwydir River at 315 miles 3 chains.

The Namoi River and Narrabri Creek require moderately-sized bridges, otherwise the engineering works are light. The country being mostly flat, a surface line has been obtained, its slight departure from a straight line being chiefly to minimise interference with property.

The steepest grade of any considerable length is 1 in 100 against the up traffic, and 1 in 76 against the down. The sharpest curve is 20 chains radius.

As to the necessity for the construction of this line, I may, perhaps, be allowed to make the following quotation from a report by the Railway Commissioners, dated 4th November, 1892. The Commissioners say:—"Referring to the conversations the Chief Commissioner has had with you (the Colonial Treasurer) on one or two occasions respecting cheap lines through pastoral country, we beg to state that, in our opinion, the most urgent lines to make at the present time are those from Narrabri to Moree, and from Bourke to a point on the Queensland border northwards of Bourke. Unless these lines are made a large traffic we have enjoyed for many years will be abstracted from us. As will be seen, the carriage of merchandise as well as wool, in one case 350 miles and 503 miles in the other (Bourke), is exceedingly valuable, the rates being good ones for this class of traffic, and the distance the traffic has to be carried being very considerable. We will be exceedingly glad if the Government can come to a decision at an early date on this subject." With regard to the question of light or "pioneer" lines, a very great deal of attention has been bestowed on the subject by Mr. Secretary Lyne, and as will be seen by the estimate I shall presently give, a great advance has been made in the direction of the reduction of cost. While the standard gauge has of course been maintained, the earth-works and ballasting have been made as light as can be done consistent with safety and the work required of the line. Fencing has been almost wholly omitted, and the stations provided of the simplest and cheapest kind possible. The station at Moree will be similar in point of accommodation to that at Forbes, but will be considerably cheaper in construction. The particulars will of course be supplied by the Engineer-in-Chief when he is before you. I will now read the report which the Commissioners have forwarded in accordance with the terms of the Public Works Act:—

Office of the Railway Commissioners of New South Wales, Sydney, 13th November, 1893,

Proposed Line of Railway from Narrabri to Moree, 63 miles 50 chains.

In accordance with the provisions of the "Public Works Act of 1888," section 13, we beg to report as under:—

Cost of construction—

The Engineer-in-Chief estimates the cost of construction of a pioneer line (exclusive of land and compensation) at £153,000

Annual cost—

Capital expenditure at 4 per cent. £6,120

The estimated cost of working would be as under—

Permanent way..... £4,000

Traffic 1,500

Locomotive..... 1,500

Total working expenses £7,000

Total annual cost £13,120

Traffic estimate—

Coaching and mails £2,300

Goods 9,915

£12,215

The construction of a line of railway from Narrabri to Moree is recommended upon the ground that it will tend to largely develop a considerable tract of valuable country, and will be an extension of the existing North-western Line in a direction which will probably at a future date warrant a continuation to the Queensland Border.

The line has been designed by the Works Department to a great extent as a pioneer line, in accordance with the views we have from time to time expressed on the subject of extensions into the pastoral districts.

The Seal of the Railway Commissioners of New South Wales was hereunto affixed this 13th day of November, 1893, in the presence of—
H. MCLACHLAN.

E. M. G. EDDY,
Chief Commissioner.
W. M. FEHON,
Commissioner.
CHARLES OLIVER,
Commissioner.

It

It is, of course, difficult to estimate exactly the area of country which will be served by this line. It may, however, be put down roughly at 6,000,000 acres, extending from Warialda on the east to Mungindi on the west, a distance of a little over 100 miles. When the witnesses for the Railway Traffic Department are before you, they will probably give a larger area; but in talking over the matter in the office we came to the conclusion, that, as it was proposed to apply the "betterment" principle to this line, it would be advisable to reduce the area likely to be affected to the minimum.

2. Does this take in the land right up to Mungindi? Yes, though the estimate is only an approximate one. With the permission of the Committee I will read reports by Mr. District-Surveyor Poate and Mr. District-Surveyor O. M. Wood, both dated 31st October of this year, giving a description of the country:—

Sir,

District Surveyor's Office, Tamworth, 31 October, 1893.

In accordance with instructions contained in your letter of the 24th instant, Misc. Dep. 93-8,874, enclosed, asking for a special report in regard to the county of Jamison in connection with the consideration of the question of construction of a railway from Narrabri to Moree, I have the honor to forward herewith a lithograph of the county of Jamison, on which the recently resurveyed route of the proposed railway is approximately shown by firm, broad, black band, and to report as follows, under the various heads specified in your letter:—

1. *General character of the land, both alienated and unalienated on leasehold and resumed areas.*

The county is bounded on the east by the Nandewar Range, from which it runs down through hilly and rolling downs country into rich alluvial plains lying between the Namoi River on the south and Thalaba Creek on the north, and extending beyond the western boundary of the county.

The eastern limit of these rich alluvial plains, which have been principally formed by the denudation of the Nandewar Range aforesaid and the hilly country immediately adjoining it, is approximately the Narrabri-Moree road, shown on litho. by firm broad green band, as, although there is a large extent of plain country east of that road in the parishes of Wangan, Coorong, Boorah, Bibil, and Dobikin, it is neither so rich in quality nor the same class of soil.

This rich plain country, almost a dead level, may be generally described as a vast "park," in which the predominating feature is black soil of the richest description, clothed in all ordinary seasons with a wealth of herbage and feed for stock, and ranging through open plains, myall plains, belts of belar and open coolabah forests. Throughout this vast "park" are scattered small extents of red soil country, slightly elevated above the ordinary level, which are valuable as catchment areas for tanks, and as furnishing refuges for stock in times of flood.

The remaining part of the country east of the Narrabri-Moree road, where not plain as already specified, may be described as "rolling downs" until the hilly country is reached, the approximate westerly limit of which is travelling stock reserve 1,172, shown by broad blue band.

This hilly country is at present unoccupied and is practically worthless.

2. *Suitability for wheat growing or pastoral purposes.*

With the exception of the last described unoccupied country at the eastern end, the whole of the county is used for purely pastoral purposes, and comprises some of the finest country of that class in the Colony. All the red soil country is suitable for wheat growing, and also comparatively limited areas along the banks of the Namoi above Wee Waa, and along the various creeks throughout the county; but the country is essentially a pastoral one, and it has hitherto been found in practice more profitable to utilise these areas for such pursuits. A large flour mill was built at Narrabri some ten or twelve years ago, but it failed to induce the cultivation of these lands, and as the supply from the wheat farmers in the counties of Nandewar and White was insufficient it was closed a few years afterwards.

3. *Possible stimulus to selection of Crown lands.*

The only lands at present available for selection within the radius of the proposed railway are too limited in extent and too scattered for profitable occupation, and the construction of the railway will have little or no stimulating effect in their selection, with perhaps the exception of a few areas in the immediate vicinity of the line. The Crown lands at present held under pastoral lease will, when available, be rapidly selected for pastoral purposes, whether the railway be constructed or not, with the exception, perhaps, of such small extents of country as those now remaining on the resumed areas.

4. *Probable appreciating influence on the value of all Crown lands.*

With the exception of the land in the parishes of Manamoi, Woolabrar, Moema, and Doyle, which is of no special value, and of the practically worthless land east of travelling stock reserve 1172, the whole of the lands in the county of Jamison are at present worth from 30s. to £4 per acre for pastoral pursuits, and the construction of the railway will not in my opinion have any appreciable effect on these values. These prices, however, cannot in the existing circumstances be realised to any great extent, but the remedy lies, not in railway construction, but in amended land legislation, as indicated in my report No. 93-342 of this date.

Having dealt with the various matters specified in your letter of instructions, I may now perhaps be permitted to point out that if the railway be constructed in the position at present contemplated—see litho.—it will fail to secure the traffic of the rich plain country, which will be intercepted by the Narrabri-Moree road, and carried by teams along that road to Narrabri. The loss of this traffic and the collateral loss of outward traffic will make an appreciable difference in the earnings of the railway, which can only be obviated by carrying the railway as far west as possible (with the western boundary of the parish of Gommel as a limit) before it strikes northward from the Namoi, and the farther west (to such limit) the railway can be taken the more likely is it to secure the traffic of the plains.

I have, &c.,
FRED. POATE,
District Surveyor.

Sir,

District Survey Office, Moree, 31 October, 1893.

In obedience to instructions contained in your letter of the 24th instant (papers Misc. Dep. 93-8874), I have the honor to submit the following report upon the lands within the Moree and Warialda Land Districts:—

In the Moree Land District the country generally is almost level; it is chiefly either open plain or thinly timbered forest. The soil is rich throughout and of either a strong black or friable red description. This description applies to both alienated and unalienated lands.

In the Warialda Land District the country varies from gently undulating on the west and north-west sides to hilly and rough in places on the east and southern sides. The country is chiefly forest, parts being densely timbered and parts scrubby. The soil is either rich black of basalt formation, red, or sandy; either of the first two soils is suitable for agriculture, and there is little doubt that the sandstone formation overlies the coal measures; indeed, coal has been found in several places.

2. Although there has been more wheat grown in the Warialda than in the Moree District, still it has been proved that the soils, rainfall, and climate, in both districts are suitable for wheat growing, but hitherto it has not paid to grow wheat, owing to there being no local market and to the cost of sending it to any other.

3. Settlement in the whole of the Moree District and in the western and northern parts of the Warialda District would be greatly stimulated by the construction of a railway to Moree.

4. Crown lands on the leasehold and resumed areas would also be greatly enhanced in value.

I have, &c.,
W. H. O. M. WOOD,
District Surveyor.

The

Authority in regard to these points:—(1.) The inclusion of his property within the improvement area; (2) the amount of improvement rate to be paid by him; (3) the period over which the repayment of such rate is to be spread. Clause 14 provides for an appeal to the Land Court. I referred to it earlier because it dominates the whole Bill. The decision of the Land Court is to be final and conclusive on both parties, and the costs of appeal are to be in the discretion of the Court. Clause 15 is practically the same as clause 10, and provides for the publishing of notices in the *Gazette* and local newspapers. It also provides that the first half-yearly instalments shall be payable at the end of six months from the date of the publication of the notice. Clause 16 provides that notice may be given of lands not included, or not finally assessed at the time of the publication of the notice referred to in the preceding clause, and that the first payment is to be due and payable "as from the expiration of six months from the date of the publication of the notification of the completion of the authorised work." Clause 17 provides that a charge of 6 per cent. will be leviable upon all overdue payments, and clause 18, which is a very important one, provides for the formation of a sinking fund, for the repayment of loans from which the work was constructed. It reads as follows: "All sums of money paid under the authority of this Act shall be paid by the Constructing Authority into the Treasury to the credit of the Consolidated Revenue Fund, and the Colonial Treasurer shall keep a separate account for each authorised work and the amounts in respect of same. And all such payments shall be used to form a sinking fund for the repayment of loans from which such authorised work was constructed, according to such regulations as the Governor shall think fit." Clause 19 is as follows: "The foregoing provisions shall apply to all Crown lands, and to all lands occupied by or vested in any department of the Government: Provided that no improvement rate shall be payable from unoccupied Crown lands until such lands are purchased, leased, or occupied under any Act in force relating to the purchase, lease, or occupation of Crown lands, but nothing herein shall be taken to diminish the amount chargeable on such lands." Clause 20, which is the last clause of the Bill, provides that, for the purpose of this Act, the Secretary for Lands shall be deemed to be the owner of all Crown lands.

J. Barling,
Esq.
14 Nov., 1893.

9. *Chairman.*] Presuming that the Bill is not passed, will the measure authorising the construction of this work bring it under the provisions of any future Betterment Act? I am unable to answer that question, because I have not put it to the Minister exactly in that form; but it is clear that the Minister when he referred this work to the Committee had determined that it should be subject to the betterment principle. I suppose it would depend very much upon the conclusion arrived at by the Committee as to whether he would proceed with the construction of the railway in the event of the Betterment Bill not being passed. I cannot say definitely how he would act in that contingency.

10. I understand from what you have said that the need for this railway has been urged upon the Government by the Railway Commissioners? Yes, very strongly.

11. They show that the annual loss upon the line will be only something like £800? A comparatively small sum.

12. Very little land will have to be resumed by the Government? Very little. Suppose, for the sake of illustration, the betterment area was fixed at 6,000,000 acres, and we charged half of the cost of the line to the owners of the land. That, allowing something for the land which must be resumed, might be put down at £80,000. I make the whole cost of the line £160,000 instead of £153,000, as estimated, in order to provide for the land which will have to be resumed. Suppose also that the owners of the land benefited by the construction of the railway had to repay one-half of its cost to the State, and an average rate were charged, it would only amount to something like three-tenths of a farthing per acre per annum.

13. Have the people of Wee Waa made any representation or movement in favour of the line *via* Gurleigh Point? You will find a reference to that in the *procès* which I hand in.

14. Has there been any representation from the people of Millie? That is also referred to there. I think a public meeting was held at Millie.

15. Is it not a fact that the Railway Commissioners, in 1889, recommended that this line should go *via* Gurleigh Point in order that it might tap more country? A report was made somewhat to that effect; but I forget whether they recommended the line exactly on that ground. It was thought at that time that we could get a better crossing at Gurleigh Point, but the crossing which we have selected now is better than any we found before. The Gurleigh Point line has been entirely put aside by the Commissioners, and by the Department.

16. The Commissioners also recommended that the line should be taken out towards Keramingly, and thence to Moree because of the reduced cost? That proposal is entirely done away with now, because of the intended application of the betterment principle.*

17. Are we to understand that the Wee Waa trade is to be considered rather in connection with a line to Walgett than in connection with a line to Moree? I should not like to give currency to the idea that the Minister has any intention of proposing the construction of a line from Narrabri to Walgett. Walgett would be better served by the locking of the river, and the Minister is now making inquiries with a view to constructing locks which will give a navigable channel to Walgett. Thinking that such a question would be asked of me I got a report upon the subject from the Chief Engineer for Water Conservation, and in the concluding paragraph of that report he says: "Nothing has yet been done towards clearing the Barwon or Darling between Walgett and Mungindi, yet as stated above a steamer succeeded in reaching the latter place this year, and steamers have repeatedly been at Collarendabri, and occasionally at Mogul. The fall in the river from Collarendabri to Walgett is at the rate of about 6 inches per mile, and as there is no material difference in the velocity between the former place and Mungindi the rate of fall cannot be materially different. There would be no difficulty in making the river permanently navigable to Mungindi." I hand in Mr. McKinney's report.

18. That goes to prove that the probability of the construction of a line from Narrabri to Walgett is very slight? Yes.

19. Therefore would it not be better to take this line to Wee Waa in order to increase the traffic? No, I do not think so, because the traffic from that district is almost certain to come to our railways at Narrabri. What we have to consider more particularly is the country to the north of Moree. Why should the produce from that district be dragged 16 miles out of its way in order to serve one or two places which are already served by the railway, and the traffic from which would in any case belong to us?

20. Do the same reasons hold good with regard to Millie? Yes; Millie would be very well served by the proposed line. It would be only 12 or 15 miles distant from it. 21.

* NOTE.—This refers to the Stock route, which is Government land.

- J. Barling,
Esq.
14 Nov., 1893.
21. *Mr. O'Sullivan.*] Is it the intention of the Department to make a railway from the Western line which will tap the Walgett district? No determination has been come to on the matter. I spoke to the Minister about it; but no determination has been come to as far as Walgett is concerned, except in regard to the locking of the rivers.
22. But such a line has been mooted? Yes.
23. A line to Walgett *via* Coonamble? Yes; junctioning with the Western line at Dubbo.
24. You explained to the Chairman just now that the area upon which a betterment tax would have to be paid will be fixed by the Governor in Council? Yes.
25. Can you give us any information as to what it will be? No; the most careful investigation will be required before it can be arrived at.
26. Is it expected that this line will compete with the Inverell line? I think not.
27. It will serve an entirely different country? Yes; it is just possible, however, that a portion of the area to which I have referred may be affected by the Inverell line, but I hardly think so. I considerably curtailed the area which it was estimated this line would serve, and you must remember that the country declines from Inverell towards the proposed line. Any traffic to Inverell would have to go up hill.
28. Moree is over 40 miles from Inverell? Eighty miles.
29. That being so, this line cannot very well compete with the Inverell line? It could only compete with it just at the border of the traffic area, and you cannot determine exactly where that border is. Since the country falls towards Moree, that would tend to bring the traffic to the proposed line.
30. *Mr. Davies.*] Do I understand you to say that a loan of some £300,000 has been raised to pay for this line? I did not say that the money had been raised; I said that it had been voted.
31. Has it been raised? I cannot tell you; that is a Treasury matter.
32. You do not know of your own knowledge? I could not say for certain.
33. I think you stated that the first estimate for a line from Narrabri to Moree was £500,000? Yes; but that was a very rough estimate, and it was made before there had been any survey.
34. Four or five different surveys have been carried out, and the same number of estimates have been made? Yes.
35. On each occasion the estimated cost of construction has been reduced? Yes.
36. The estimate before us is the lowest that has been made? Yes.
37. In your judgment the best route has been obtained? In the judgment of the Department the best route has been obtained.
38. The estimate before us is £153,000; that does not provide for land resumption and compensation? No; but I imagine that the amount to be paid for compensation and land resumption will not be very large.
39. You expect that it will be met by the betterment tax? Yes; I think I am correct in saying that there will be no land to resume at Moree, while a gentleman has offered to give us the land we require for a station at Narrabri.
40. In many cases where the betterment principle is applied the Crown will receive money from landed proprietors which will go towards paying the cost of any public work? Yes; but the payment will be spread over a period of from fifty to 100 years.
41. In the estimate of £153,000 have you taken into consideration the probability that you will get back a certain amount from the landed proprietors of the district? £153,000 is the estimated cost of the line. We have not deducted from that what we expect to get back from the landed proprietors.
42. Have you any idea of the amount that is likely to be received from them? No; it is impossible to estimate it at the present time. We shall have to make the most careful investigation before proclaiming the betterment area, or determining the amount to be paid by the owners of land.
43. What is the lowest rate to be struck? No rate has been struck. I was merely putting a hypothetical case.
44. You strongly recommend the construction of this line as a reproductive work? Yes.
45. It would be so almost from the start? Almost from the start.
46. And it will act as a feeder to the main line? Yes.
47. *Mr. Hoskins.*] The figures you have put forward in regard to the application of the betterment principle for this district are not given upon authority, inasmuch as the Minister could not decide what rate Parliament would fix? No.
48. Parliament alone will fix the amount? Yes; the maximum amount.
49. Is this work to be proceeded with only in the event of the passing of the Betterment Bill? That is stated in the terms of the resolution which referred it to the Committee.
50. It is understood that if the Betterment Bill does not pass this work will not be proceeded with? It might not be proceeded with in such case; I cannot say that it will not.
51. It must be within your recollection that this Committee, in reporting upon the proposal to construct a railway from Glen Innes to Inverell, recommended that sufficiently high rates should be charged upon all produce and merchandise carried upon the line to pay interest upon the cost of construction? Yes.
52. If the Betterment Bill were not passed do you think it would be a good thing to make such a recommendation in regard to this proposal? I should think it might, but I cannot give any ministerial decision upon the point. We know, however, what opposition there is to differential rates.
53. This district is very sparsely settled? According to a report which was made two or three years ago the population is 7,691, though it is probably larger now. The town of Millic, as far as I can make out, has a population of about 300, while the Government Statistician informs me that the population of the incorporated area of Narrabri is 1,977 and of Moree 1,143.
54. That shows that the country is sparsely settled. The land is used principally for sheep? For sheep and cattle, I think.
55. Under these circumstances, do you think it would be possible, if the ordinary rates were charged, to make the line pay interest upon the cost of construction? I think if you consider the matter further you will see that it would be a most dangerous thing to increase the rates with respect to this line. I do not think I need give the reasons why.
56. *Mr. Trickett.*] Can you tell us whether the betterment principle is the subject of general legislation in any country? I do not know that I can give you a very accurate answer, but I am informed that the principle applies in New Zealand and in Canada.
57. That is generally? I think so.

- 58, *Mr. Hoskins.*] And in the United States? I think it also applies in the United States. The most recent case of its application that has come under my notice is the London Improvement Bill. I have looked up the debates upon that measure, which was passed by the Commons and sent on to the House of Lords on the 25th July. On the motion for the second reading, the Earl of Onslow moved—"That this House, before assenting to the second reading of the Bill, desires to express its opinion that proposals for the assessment of capital values instead of annual values, and for creating new and arbitrarily defined areas of taxation such as are contained in clause 41 of the Bill (the betterment clause), ought not to be embodied in a private Bill; but if found just and equitable, should be based on general principles laid down by Parliament." The Bill to which I have been referring completely answers that criticism, because it applies the principle generally. The Earl of Onslow's motion was agreed to by 55 votes to 36. On the 10th August, in the House of Commons, Sir John Lubbock, who, I believe, introduced the Bill as a private measure, moved to disagree with the action of the Lords, and his motion was carried by 221 votes to 88 votes. On 31st August the matter was again before the House of Lords, and Lord Hobhouse moved that "this House do not insist on its amendment." After discussion this motion was lost by 50 votes to 27, and the House then agreed to a motion by Lord Onslow "That the House do insist upon the amendment made." During the discussion which took place Lord Onslow stated "he was not opposed to the betterment principle himself." He objected to the Bill because—firstly, it would inflict a great injustice upon a body of poor people (*e.g.*, the particular land owners affected by the Bill); secondly, because the arbitrators proposed by the Bill would not be able to carry out their duty; and thirdly, because the question ought to be settled on broad and general principles, and not introduced in a private measure. The Marquis of Salisbury said he had "no metaphysical or *a priori* objection to the principle of betterment . . . it was a well known principle . . . the principle was reasonable and just." His objection was to the method in which the County Council chose to apply it. I have taken this information from the *Times* report. The Committee will see that the objection taken to the Bill is not because of the principle it embodied, but the application of that principle in a private Bill.
59. *Mr. Trickett.*] Did the Bill apply to London only, or to the whole of England? Only to London, I believe.
60. Do you know of any Act having been passed applying the principle generally? No; except in the cases I have mentioned.
61. The Bill to which you have referred applies only to the county? Yes, as far as I know; though I may be mistaken on the point.
62. You say that the probable annual expenditure upon this line will be £13,120, and the probable income £12,215; leaving a deficiency of £905;—have you gone into the question of returns at all? I have not. I took my figures from the Railway Commissioners, who have infinitely better means of making an estimate than we have.
63. Can you tell us whether the traffic on the proposed line is likely to be constant, or will it be spasmodic? I could not tell you that; but Mr. Harper, who visited the district in order to inquire into this matter, will appear before you.
64. Supposing, according to your calculation, the 6,000,000 acres to which the betterment principle will apply were assessed at 3-10ths of a farthing per acre per annum, the return would be £1,825, and if that amount were added to the receipts of the line there would be a surplus of nearly £1,000 a year? Yes; but the revenue derived from the line will be distinct from the betterment rate, which is intended to form a sinking fund to pay off the capital cost.
65. The return from the land will not be mixed up with the earnings of the line? Certainly not. The Bill provides that they shall be kept apart, and that the return from the land should go to form a sinking fund as the Governor may by regulation prescribe.
66. The two amounts will be kept quite separate? The Act provides in a most specific way for that.
67. It is intended that there shall be no fencing along this line;—are you aware if other lines have been left unfenced? I think so, but I am not quite sure.
68. It was proposed not to fence the Cobar line, but I do not know if the proposal was carried out? Mr. Deane will be able to tell you.
69. Is the estimate of revenue which has been put before us based upon ordinary rates? I imagine so. I believe it has been made up on the basis of the rates charged on other lines. I had a conversation with Mr. Harper on the subject, and I understood from him that he had not included any possible traffic, such as grain; although it is almost certain that grain will be carried upon the line. The revenue has been calculated upon the basis of existing traffic.
70. You call this a pioneer line? That is a term used by the Railway Commissioners to denote a railway which is lighter than an ordinary light line. There will be very little earthwork and ballast.
71. Will the ordinary rolling-stock be able to run on it? Yes.
72. There will be no need to change the trucks? No.
73. *Mr. Neild.*] There seems to have been an unusual number of surveys made of this line? I do not think that the number is unusually large.
74. Can you give us any idea as to what these surveys would cost? Not at the present moment; but I could get the information for you. Although a survey may be pretty expensive, it is far better for us to incur the expense than to make the mistake of putting a line in a wrong locality.
75. I understood you to say, with reference to the junction of the proposed line with the existing line at Narrabri, that an owner of land at Narrabri has offered to present the necessary land to the Government? I believe so, though I have not had the offer in writing. The gentleman in question is Mr. Lillyman.
76. Has any estimate been made of the cost of the 317½ acres which will have to be resumed? No; but it will not be very great.
77. I suppose the land required for a station at Narrabri would be the most expensive? It would be given to us. I believe that at Moree there is no alienated land required.
78. The line will pass through pastoral properties? Yes.
79. Will it go through any agricultural properties? I do not think so. There is very little agriculture carried on at the present time.
80. Is it not usual in cases of this kind to make an estimate of the value of land that must be resumed? It is usual; but not at this stage. It would be rather difficult to make the estimate now; but I could give you some idea of what the land would cost. Mr. Poate values the land in the county of Jamison as worth from 30s. to £4 an acre for pastoral pursuits, but I cannot help thinking that the estimate is excessive.

J. Barling,
Esq.
14 Nov., 1893.

- J. Barling, Esq.
14 Nov., 1893.
81. Could you give us any information as to the cost per mile of maintaining the roads in this district? I can tell you the cost by referring to the road map, where I have the mileages marked and the amounts voted set down.
82. I want to set off the saving and road maintenance against the possible loss in connection with the railway? I think that matter has been raised before. I should not reckon upon any saving in the maintenance of the roads, and I should consider it an evidence of the success of the line if there were an increased demand for road votes. If a railway is constructed it will be to our interests to open up as many roads as possible to give access to it, so that there may be an increase of traffic upon the line.
83. What might be saved upon the main roads would be swallowed up in making roads to the different stations? I should not like to say that. I think it is very likely, though I cannot say for certain, that if the line is constructed we shall have to increase our road expenditure; but that would be because of the increase of traffic.
84. While there might be a diminution in the traffic upon the main road, there would be an increase of traffic upon the cross roads? Yes. I had a talk with Mr. Hickson as to the cost of making a good macadamised road from Narrabri to Morce, and he put it down as £150,000, at the very least; in other words, nearly as much as the railway. A metal road would cost £2,500 a mile.
85. At present there is only a track across the black soil? Yes.
86. Do you know the country personally? I have never been there.
87. *Mr. Wall.*] You state that the area of land which will be benefited by the construction of this line is 6,000,000 acres? That is roughly speaking.
88. What is the area of Crown land in the vicinity of the railway line? There are in the district 890,000 acres of freehold land, 1,804,000 acres of conditionally purchased and leased land, 985,000 acres of reserves, and 3,615,000 acres of Crown lands.
89. Half of the land benefited by the construction of the line is Crown land? Yes.
90. In submitting this proposal to the Committee, does your Department think that the line should be constructed? Most decidedly. We have the strongest evidence possible that it should be constructed. Not only have the Commissioners written in the strongest possible way, but they have verbally pressed the consideration of the railway upon the Department.
91. Its prospect of paying is as good as that of any other line which has been constructed? Yes, with the exception, of course, of suburban lines.
92. Are we to understand that the construction of this line is contingent upon the passing of a measure which is not now law? The wording of the resolution carries that meaning.
93. The resolution says that the line shall be subject to the provisions of any Bill coming into force for that purpose. What I want to know is, does your Department recommend the construction of this line apart from the passing of that measure? I should not like to answer that question without referring to the Minister; but if you wish it, I will put the matter before him, and will let the Committee know his reply.
94. Our general policy in regard to railways is to construct lines where there is a prospect of their paying? Yes.
95. If the owners of land who benefit by the construction of the line are willing to pay the cost of it, would it not be desirable to construct lines all over the Colony? I should think so, if there were a possibility of their paying. What you mean is, that if a line would not pay on its own earnings, and the people benefited by it were willing to bear the cost of its construction, should the Government construct it. I should say yes; but there is not much possibility of that occurring.
96. I take it that the Department regard this as a line which has every appearance of being remunerative, and they intend to ask those benefited by its construction to pay for it? To pay a part of the cost.
97. Seventy-five per cent.? I cannot tell you what proportion they will be asked to pay in this case. Seventy-five per cent. is the maximum provided by the proposed Bill.
98. If the 3,615,000 acres of Crown lands are afterwards purchased by private individuals, will the betterment principle apply to them? To a certain extent it will, of course; but these are details which have not been worked out.
99. If the Committee recommend the construction of this line, will your Department have it carried out? I shall endeavour to get an answer to that question.
100. Have you taken into consideration the enhanced value which the construction of the line would give to the Crown lands in the district? We have not taken anything of that kind into consideration yet. I cannot tell at this early stage how the betterment principle will apply in this particular case.
101. Do you think that the construction of this line will have the effect of promoting settlement upon Crown lands? Mr. Harper will be better able to give you an opinion upon that point.
102. *Mr. Dawson.*] You tell us that the route before us is the best that has been surveyed? In the opinion of the Department it is the best.
103. Why has this line been so long delayed in favour of other lines? We have not submitted any other routes to the Committee.
104. Why was it not submitted before lines such as that from Jerilderie to Deniliquin, or from Glen Innes to Inverell? I do not know that I can answer that question.
105. This line will cost £153,000, while the line *via* Gurlcigh Point, which has been abandoned, would cost £360,000? Yes.
106. Will there be any necessity for charging special rates upon this line? I should think not. It would be highly injudicious to charge special rates upon it.
107. Do you know the loss upon the Narrabri line? No; I do not. That is a traffic matter which I have not looked into.
108. Do you know if the line to Narrabri is paying? I could not tell you without turning up the Commissioners' report.

110. Will you state the exact areas of the lands shown on the map? Freehold land is tinted red, and of it there are 890,000 acres; conditionally purchased and leased land is tinted blue, and of it there are 1,804,000 acres. There are 985,000 acres held in reserves, which are tinted green. The rest of the map which is uncoloured, shows Crown lands, the area of which is 3,615,000 acres.
111. What is the area embraced by the map? The area which it is supposed the proposed railway will benefit.
112. How far does it extend from the railway line? Roughly speaking, the map takes in all the land within a radius of 60 miles from Moree.
113. What is the general character of the country? I am not personally acquainted with it.
114. Can you inform the Committee if much settlement has gone on there of late? There has been a great deal of land conditionally purchased within the resumed areas.
115. Is this land in the Central or in the Eastern Division? In the Central Division.
116. Has the settlement you speak of taken place recently? Within the last nine years I should say.
117. The district may be regarded as a progressive one, as far as settlement is concerned? As far as conditional purchasing is concerned. We have no guarantee, however, that the original selectors still hold the land.
118. Has much of this land been thrown up because of high rentals, and so on? I do not think so.
119. What is the character of the reserves? They have been made for a variety of purposes. The largest reserves are timber reserves.
120. Do you know anything of the nature of the timber there? No.
121. *Chairman.*] You have merely prepared this map from data in the office? That is all.
122. The local district surveyor will be able to give us information as to the character of the country, and so on? Yes.
123. *Mr. Neild.*] Are we to understand that your Department keeps no record of the character of the land which it surveys? A report has been sent in by each of the district surveyors, giving the general characteristics of the country.
124. That information is in the office, but it is not in your possession at the present time? I supplied the Under Secretary for Works with this information.
125. *Mr. Suttor.*] Is any land in this district in the Western Division? No.
126. *Mr. Neild.*] The map comprises land within about 20 miles of Inverell? Yes, but it only goes about 15 miles east of Warialda.
127. Is the alienation in this district similar to that round about Inverell? Somewhat similar, in the eastern part of the district.
128. *Mr. Ewing.*] Is the land marked blue land which has been conditionally purchased, or simply land held by conditional purchasers? Land that has been conditionally purchased. The probability is that a very large part of it has changed hands.
129. You do not know who holds it now? No. That could be ascertained by referring to the records of the Department.
130. Notice has been given that the squatting leases will cease at the end of two years? That is in connection with some provision in the Act of 1894, but many lessees have applied for an extension of lease under the Act of 1889. There is a possible right of extension.
131. Do you regard land held in that way as Crown land? Yes.
132. What is the duration of the scrub leases shown on the map? They are probably twenty-year leases.
133. The land will revert to the Crown at the end of that time? Yes.

C. J.
Saunders,
Esq.
14 Nov., 1893.

WEDNESDAY, 15 NOVEMBER, 1893.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.
The Hon. JAMES HOSKINS.
The Hon. FREDERICK THOMAS HUMPHRY.
The Hon. JOHN DAVISS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
THOMAS THOMSON EWING, Esq.

WILLIAM CHANDOS WALL, Esq.
WILLIAM MCCOURT, Esq.
JOHN CASH NEILD, Esq.
EDWARD WILLIAM O'SULLIVAN, Esq.
CHARLES COLLINS, Esq.
HENRY DAWSON, Esq.

The Committee further considered the proposed Railway from Narrabri to Moree.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

134. *Mr. Davies.*] The line now before the Committee is the last surveyed by your staff? Yes.
135. Had you anything to do with the previous surveys? Yes.
136. How many different surveys have there been for a line from Narrabri to Moree? You might say that there have been three complete routes surveyed, together with some deviations.
137. The route submitted to the Committee is the shortest? In the matter of mileage it is not quite so short as the route marked blue—the permanently staked line—but it is the shortest desirable route.
138. And the least expensive in construction? It is the cheapest and most economical route.
139. What are the objections to the permanently staked line? The objections to that line are that the river crossing is bad; that it leaves out Narrabri, passing 2 or 3 miles to the west; and that the earthworks would be greater than on the adopted route, because so much attention is not devoted to following the surface. The route now submitted skirts Narrabri, and gives a suitable site for a station.
140. What is the character of the country through which the suggested route runs, as far as earthworks are concerned? Nearly all surface forming.

H. Deane,
Esq.
15 Nov., 1893.

H. Deane,
Esq.
15 Nov., 1893.

141. What will it cost to construct per mile, according to your estimate? The estimated cost for the whole distance of 63 miles 50 chains is £153,000, or an average cost per mile of £2,409 9s. I have, however, for the purpose of easier working, divided that estimate into two parts. In the first part is comprised the cost of 3 miles 56 chains of line at the Narrabri end, including the bridge over the Namoi, and the new station at Narrabri, which comes to £17,500 or £3,866 per mile. The second part is the cheaper, and comprises a length of 59 miles 74 chains, the estimated cost of which is £135,500, which, providing for station buildings, water supply, and other contingencies, runs out at £2,267 per mile.

142. What do you estimate the cost per mile of sleepers, rails, and the necessary appliances for laying the line, including ballast? In estimating the cost of the permanent-way I have taken advantage of the fact that there are in stock, in the stores of the Public Works Department and of the Commissioners' Department, a quantity of double-headed rerolled rails, which the Commissioners would be very glad to see used, and which would be suitable for this line. These rails the Commissioners have undertaken to deliver at Narrabri at a certain price, but there will not be enough of them to go right through. To make up part of the balance it is proposed to use some second-hand rails in fairly good condition, which will be taken from the main road. In addition I propose to use some of our stock of 71½ lb. steel flat-bottomed rails to make up the balance.

143. Can you give the Committee the length of the three different sections of rails? There will be 48 miles 30 chains of rerolled rails, 12 miles of second-hand rails, and 4 miles 70 chains of new rails. Those distances add up to more than the whole length of the line; but they allow something for sidings.

144. The single-headed rails will be used at the Moree end? No; I propose to use the new rails at the Narrabri end.

145. Are they as heavy as the rerolled rails? No; they are rails such as we have been using for some time past, and weigh 71½ lb. to the yard. The rerolled rails weigh 75 lb. to the yard.

146. How much will the new rails cost per mile? Including fastenings.

147. Fastenings, sleepers, and ballast? Taking the steel and iron fastenings, they come to £924 11s. per mile.

148. That includes sleepers? No; it does not include sleepers. I estimate them separately. The second-hand 71½-lb. rails will come to £605 per mile, while the 75-lb. rerolled rails, for which there are two prices, will come to £773 16s. 2d. per mile, and £714 16s. 3d. per mile. The total cost of the permanent-way material reckoned in this estimate is £48,351 12s. 9d.

149. That is including sleepers? No; it does not include sleepers.

150. Nor ballast? No.

151. Does it include the delivery of the rails? It includes their delivery at Narrabri for the contractors' use.

152. It includes fish-plates, bolts, and chairs? All fastenings. I have estimated the laying of the line at 1s. 3d. per lineal yard; the ballasting of the first section I put down at 2s. 6d. per lineal yard, and of the second section at 3s. 6d. per lineal yard. The prices are low, because it is proposed to use only a small quantity of ballast. On the ordinary lines we use from 2,000 to 2,200 cubic yards per mile, but on this line, to save first expense, we shall put only 3 inches of ballast under the sleepers. The quantity of ballast per mile has been reduced to 1,200 cubic yards, so that I think that the work of ballasting can be done for something near the prices I have named.

153. You intend to use about half as much ballast as you generally use? A little more than one-half—somewhere between one-half and two-thirds. The sleepers being of a rougher description than are usually taken, I have put them down at 2s. 6d. a-piece, for which I think they can be very well obtained. The Railway Commissioners have been paying as much as 4s. 4d. for sleepers at Narrabri, but they are the large sleepers—9 feet by 10 inches by 5 inches.

154. There is a large forest of timber near Narrabri? There used to be: but it is getting worked out. You have to go nearly 20 miles from Narrabri in order to get large sleepers.

155. Will you have the sleepers dressed? No; they will be round on the top.

156. Half round sleepers? Round on the top. They will be roughly hewn. Instead of the contractor being required to supply a perfectly rectangular sleeper, he will be allowed to leave the sapwood on, so long as when the way is cut to fit on the chairs there is a sufficient width of hardwood—4 or 5 inches—to take the bearing. I made inquiry some time ago about this class of sleeper, and I have very good reason for believing that they can be delivered for the price I have named, and that they will answer the purpose required of them very well.

157. Are the various kinds of rails you have mentioned of uniform length? The rerolled rails are, I think, in lengths of 18 and 21 feet.

158. What is the length of the steel rails? The steel rails and the iron rails would generally be 24 feet in length. The last rails indented have been sent out in 30 feet lengths; but I do not propose to use them, because 24 feet lengths will be more convenient. There is a stock of 24 feet rails on hand.

159. Is the ballast supply easily accessible? Fairly so. There is ballast in the Namoi River.

160. Sandstone? No; river gravel. There is a ballast hill in the neighbourhood of Narrabri, about three quarters of a mile from the line, and about 2 miles from the centre of Narrabri, where they are getting good road metal. I think that the gravel ballast to be found in the district will be fairly suitable for the line. Some distance from Narrabri we go through undulating ground, consisting of a kind of gravel which will probably be suitable for ballast.

161. Do you, in your estimate, provide for fencing as well as for station buildings? Only a small sum is provided for fencing.

162. What length of fencing will there be? I have not made a definite item of the fencing. I only propose to fence at the stations and where necessary. The line generally will be left unfenced.

163. Have you constructed any other lines without fencing them? Yes; the Nyngan to Cobar line.

164. Has any complaint been made by stock-owners and residents of the district because the line is unfenced, or has any accident arisen in consequence? I have not heard of any.

165. As far as your knowledge goes that line answers fairly well without being fenced? Yes; I do not think there can be any serious objection to leaving a line of this character unfenced so long as the trains run in the day time.

166. Are the trains running between Nyngan and Cobar used only in the day time? Yes.

167. If traffic develops on the proposed line would you recommend that it should be fenced? I am sure that if the trains had to be run at night the Commissioners would find it desirable to fence the line. Otherwise sheep would be sure to lie on the ballast.

168. You do not apprehend any danger if trains are run only during the daytime? No; especially as it is proposed to run them slowly.
169. At what price per ton do the rerolled rails stand in the Commissioners' books? At £5 10s., I think.
170. Did they not cost more than that to reroll? I believe that they did; but a certain value has been written off.
171. Then the proposed line will get the benefit of the reduced cost? Yes.
172. Have you been over the whole length of the line yourself? No; I have only been over a few miles of it.
173. At the Narrabri end? Yes.
174. Personally you know little of the country? I know the district pretty well—at least I know the class of country very well, because I lived in the district during the construction of the Gunnedah-Narrabri line, and I am therefore able to judge of its suitability for railway making.
175. Are you of opinion that this line if constructed would serve most of the district you speak of? I think it is a very good line from an engineering point of view.
176. And would serve the district well? I should say so.
177. You have no great knowledge of Moree? Moree being the centre of the district the object is to make the shortest and most direct route there, and that has been done in this case.
178. *Mr. McCourt.*] What would be the difference in cost between this and a better class line;—would it be large? A better class of line would probably cost more; but I have not gone into the question.
179. You could not say how much more? No; I have made no calculation.
180. You only propose to put 3 inches of ballast under the sleepers: but the Commissioners may afterwards find it necessary to reballast the line? As the traffic increases the Commissioners will have to put on more ballast. I think that they are quite aware of that, and prepared to undertake the work.
181. Therefore we have not the real cost of the line before us? If the ballast is increased later on it will, I presume, come out of revenue, and be charged to working expenses.
182. The cost of the line would be increased? But if more ballast was put on the line would become more valuable.
183. What you say practically amounts to this, that we have not the real cost of the line before us? I think you have, because it is only proposed to work the line in a certain way. The line is to be made for a certain purpose which, if carried out as I estimate, it will serve. It is a cheap line, because it is nearly the extreme extension of the North-Western line. If it were a main line, upon which there was a lot of through and quick traffic, it would be desirable to spend more money on it.
184. Would it not be better to make it a permanent line in the first instance, instead of having it altered by the Commissioners? I do not know that it would. There has been a call for lines of this character for some time past, and it is a very desirable thing to make cheap lines.
185. Provided that they will do the necessary work? Provided that they will do the necessary work.
186. But you say that this line will not do the work, that as soon as the Commissioners take it over they will have to ballast it? I did not express myself quite in that way. I said that probably as the traffic increased it would be necessary to improve the line; but I believe that as proposed to be constructed, it will answer all purposes for some time to come.
187. How much will it cost per mile for bridges? Taking the first section, there will be the river crossing at Narrabri Creek, which I put down at £5,261 17s. 6d.
188. That would be a wooden bridge? Yes.
189. *Chairman.*] Is there not a double waterway there? Yes; but the estimate provides for both bridges. In addition there will be some openings and culverts which will cost £1,319 15s., so that the waterways on that length will come to £6,581 12s. 6d., or £1,644 per mile. On the second section the cost of the waterways, box drains, and culverts will come to £14,392 12s. 6d., which, divided by the whole length of the section, gives £240 a mile.
190. *Mr. McCourt.*] Roughly speaking the bridges will cost altogether £21,000? Yes, very nearly.
191. Is any of the country between Narrabri and Moree subject to floods? Some of the land between the present station and the old station is subject to floods, and the water spreads itself over the land near various creeks; but I have provided for that.
192. Have you an estimate of the earthworks? I shall keep the earthworks above the flood-level everywhere.
193. What will they cost per mile? On the first section they will come to £1,717 10s., or £464 per mile, and on the second section £17,979 5s., or £300 per mile.
194. *Mr. Wall.*] The total cost of this line is about £2,800 per mile? £2,409 per mile.
195. What was the cost of the Cobar line? A little over £3,000 per mile.
196. That is a heavier line than this? Yes; there are more earthworks on that line, though I think it would have been constructed within the original estimate, or at a slight increase upon that estimate, if the grades had not been altered during construction. That added very considerably to the cost.
197. On that line you used new material altogether? Yes; 60-lb. rails.
198. What was the estimate for the Cobar line? £2,560 per mile was the first estimate.
199. Was not that estimate reduced? No; when tenders came in they exceeded it.
200. What is the estimated cost of station buildings upon this line? £4,520 for the whole line.
201. How many stations are there? The stations are marked upon the map. There will be the new station at Narrabri, one at Edgeroi, one at Woolabrar (for Millie) one at Gurley, one at Tycannah, and the terminus at Moree. At Edgeroi, Gurley, and Tycannah there will merely be sidings; but at the other places more accommodation will be provided in the shape of waiting sheds and so on.
202. Is your estimate of the cost of fixing the rails upon the sleepers above or under the ordinary cost of that work;—will it not be more difficult to fix the rails on the half-round sleepers than to fix them on square sleepers? I think not. They will all have to be run through a machine to plane off the top surface.
203. How does your estimate compare with the ordinary cost of fixing the rails on to square sleepers? It is a little above what we have paid in one or two cases, and a good deal below what we have paid in other cases. I propose to give the contractor the utmost facilities for getting on with this work by allowing him to use the rails as he goes on, in order to run his material and ballast ahead. Up to the present

H. Deane,
Esq.
15 Nov., 1893.

- H. Deane, Esq.
15 Nov., 1893.
- present the contractors have not been allowed to put an engine or waggons upon the road until a certain amount of ballast has been laid down; but in this case I propose that the contractor shall be responsible for the condition of the rails, and be allowed to run out with the rolling stock over "formation," as they say. That will increase the chance of getting the work done cheaply.
204. Have you considered the question of letting this work in small contracts—some reference has been made to that? I am pretty sure that if the work is let in small contracts it will not be done so cheaply. I think the only way to get it done cheaply is to give it to one contractor, who will make a rush and go right through with it. He will be able to throw up the earthworks a little in front, and follow up with the ballast immediately.
205. Do you not think that the keener competition which would result if the work was let in small sections, would allow it to be done more cheaply? I do not think so. The plate-laying is the principal part of the work, and it would have to be started from one end. Take the second section for instance; the earthworks are £300 per mile, and if you let them to earthwork gangs, pure and simple, they would not be able to do anything with the bridges or box-drains, which will cost about £240 per mile, or four-fifths of the cost of the earthworks, while the plate-laying will cost twice as much as the earthworks.
206. I understood from the remarks made by the Minister when moving that this line be referred to the Committee, that it was the intention to let it in small contracts, and I was anxious to know whether his remarks were based on information received from his Department? I have received no instructions on the matter. Of course, if the Minister wished the work to be let in small contracts, the best would have to be made of it; but I should not recommend its being done, either for cheapness or speed.
207. You do not think it would tend to lessen the cost? No.
208. What would be the grade on this line? The ruling grade will be 1 in 100 against Newcastle, and 1 in 75 outwards.
209. The haulage power of an engine on this line would be nearly double its haulage power upon ordinary grades? Yes.
210. *Mr. Neild.*] You say you know something of this locality;—have you seen the recommendation of the Tamworth district surveyor that the line should be carried as far west as possible; that the present route should not be adopted? I think I may say that I have. The Under Secretary mentioned it to me.
211. Would the cost of the line be materially increased by taking it further west, either because of the increased distance, or because of the heavier works that would be necessary? The distance would be increased, and the work would be increased somewhat. No doubt the route recommended is the cheapest that has been surveyed. The further you go down these creeks, the more they spread out. I believe that if the travelling stock route had been adopted, it would have been found necessary to raise the line in order to keep it out of the water, while the ground there is not quite so sound.
212. Notwithstanding the statement that more traffic would be obtained by taking the line further to the west, you consider that the advantages given by this line would override the advantage of increased traffic or increased public convenience? I have only studied the matter from the engineering point of view, and I think that this would be the cheapest and most direct line.
213. Have you estimated the cost of the travelling stock route? Not under present conditions.
214. Can you give us any idea as to what the difference in cost would be? I am afraid it would be a mere guess; but from what I have heard, and the reports which I have read, I should think it would cost £300 or £400 a mile more, because the waterways are larger and the earthworks would have to be increased to keep the formation dry.
215. A more westerly route would involve increased expenditure, not only on account of the additional length but also on account of the increased earthworks? Yes.
216. What would be the difference in mileage between the travelling-stock route and this route? About 6 miles.
217. Did I understand you to say that the sleepers you propose to use will be dressed by a sleeper-dressing machine? They will be dressed in the same way that higher class sleepers are dressed. They will be run through a machine and adzed for the width of the rail, or of the chair, as the case may be.
218. You have given information in regard to the Queensland railways over which you have travelled, and of which you expressed yourself somewhat favourably, because of their cheapness;—would it not be better, in the case of this railway, to use sleepers such as are used on the Queensland lines; that is, sleepers which have been simply split and adzed? Those are what I would use.
219. The sleepers used in Queensland are not put through any dressing-machine? That machine is only to adze them.
220. You mean that they are put through the machine simply to make a groove? Yes; it is cheaper to use a machine than to employ hand labour. We just cut out the width of the rail or chair.
221. Do you think it would be economical to take up half-worn rails from the existing line to use on this line? Those rails have still a considerable amount of life left in them, and would answer the purpose very well for low speeds.
222. At what rate of speed do you propose to run upon this line? I think it is proposed to run at the rate of about 15 or 16 miles an hour.
223. That is a very low rate? I have not got the Commissioners' report with me, but the line is intended to carry out the suggestion made by the Commissioners in their report of last year. They suggested that pioneer lines should be constructed, and trains run upon them at low speeds. On a line such as we propose to construct I do not see any necessity for limiting the speed to 15 or 16 miles an hour; but high speeds should be avoided.
224. What would you regard as a high speed—30 miles an hour? Under these conditions I should regard from 25 to 30 miles an hour as a high rate of speed.
225. If it were found desirable to work the line at a higher rate of speed, would it be necessary to entirely remodel it? No.
226. What would be necessary—new sleepers or new rails? The sleepers will last as long as any others, because I should have nothing but ironbark; but you would have to put on more ballast, and raise the line.
227. Would it be necessary to change the rails? No; not until they wore out.
228. Do I understand that the only difference between the proposed line and a full service line lies in the direction of ballast? The difference is in ballast and formation.

H. Deane,
Esq.
15 Nov., 1893.

229. What would be the difference between this rather second-class line and a line capable of being worked as our ordinary lines are worked? It depends upon what you understand by a line of the ordinary type. In country such as this you might have a really good line upon which you could run large loads without the wear and tear being very heavy. It would not be necessary at any time to run the heavy Baldwin engines over these lines; indeed, the Commissioners do not run those engines out on the level country now.

230. What would be the difference in cost per mile between the proposed line and a line that could be worked at from 25 to 30 miles an hour? I should say, £500 or £600 a mile.

231. That would be for additional ballast? You ask me what would be the difference in cost; suppose I were designing a line to suit the ordinary traffic.

232. I am asking you the difference between the cost of the proposed line and the cost of a line upon which trains could be run at 25 or 30 miles an hour? In level country, such as this, I do not think the difference would be very large.

233. Then, do you not think it would be as well to incur the extra expense in the first instance;—would it not cost more to raise the line at some future date than to put on more ballast now? Yes, if you had to raise it throughout; but all that would be required would be a little more ballast, which could be put on by means of hopper waggons, and the road could be lifted without incurring any material expense.

234. It would not cost much to make the line suitable for more rapid traffic than it is proposed to run on it? No.

235. *Mr. Dawson.*] Where will you get the ironbark sleepers? They will probably have to come from the Narrabri end. I am aware that the first-class sleepers used by the Railway Commissioners on the main lines can only be got at some distance from Narrabri; but I believe that the class of sleeper which I propose to use can be got very much nearer. These sleepers can be obtained from trees out of which you could not get first-class sleepers.

236. Does any red-gum grow on the Gwydir? There is red-gum on the Namoi.

237. Has it been tried? Yes; it was tried on the Gunnedah to Narrabri line, but it was not very satisfactory.

238. For what reason? There are too many gum-veins in it, though it is capital timber if you can get it good. A man there took a contract for grooving sleepers out instead of sawing them, and they were splendid sleepers—you could not get anything better. A contract was made between the contractor for the line, and some one else to saw the timber, but the rejections on account of gum-veins were very large—25 or 30 per cent.

239. In making your estimate, which route have you had under consideration—that marked red, or the permanently-staked line? The red line. The reason that the other is marked "Permanently staked," is that it was approved of by Parliament and permanently staked.

240. The red line is the one which can be made most cheaply? Yes.

241. *Mr. Collins.*] Have you inspected the crossing of the permanently-staked line? Yes.

242. Would it be much more expensive than the one now proposed? Very much more expensive, because there are several miles of flooded land which would have to be crossed.

243. You have personally inspected the proposed crossing? Yes.

244. Did you choose it yourself? It was mentioned by the residents of Narrabri, and I went out and inspected it.

245. Do you think it is the best crossing that could be got on the Namoi near the town? I believe so, undoubtedly.

246. Do you know how far Bingera would be from the proposed line? The distance from Bingera to the proposed line is 48 miles. From Bingera to Narrabri, by road, *via* Edgeroi, is 68 miles.

247. Do you know if this line would serve that town, seeing that some of the Bingera traffic now comes 80 miles to Narrabri? That depends upon the roads. I cannot give any information about the matter.

248. Do you know if this line goes through a timber forest? There is a timber reserve there, but the timber would be of no good for constructional purposes.

249. It could not be used for sleepers? No.

250. You say that there is ballast along the line, and also at Narrabri? Yes.

251. *Mr. Humphrey.*] Your estimate of £153,000 is exclusive of the cost of resumption and compensation? Yes.

252. What do you estimate that to be? I have not estimated it at all. It does not come within my duties.

253. Who can give us information upon the point? I presume the Under Secretary has already given it. In laying out the line I have taken care to run through Government reserves wherever possible, and a reference to the land office map will show that the line for the greater part traverses Government reserves.

254. Are you able to tell us if the cost of resumptions is an important item? I think it ought to be very small.

255. Shall you be obliged to resume any house property at the terminus at Narrabri? I think not. The land between the present station and the new station is all alienated. I do not know what arrangement can be made about it, but the owner of the land where it is proposed to put the new station has offered it to us free.

256. Do you think that the cost of resumption at Narrabri would be a serious item? I should not think that it would.

257. The estimate, then, will not be very greatly increased by the addition of the cost of land resumption and compensation? Certainly not. The most costly part, as far as I can judge, will be the first 2 miles.

258. Will this line be similar to the Nyngan-Cobar line in almost every respect? It will be cheaper than that line.

259. Will the ballast be the same? There will be less ballast.

260. Is the Nyngan-Cobar line working satisfactorily? So far as regards maintenance, it is working very well.

261. Is it carrying the traffic satisfactorily? Yes; it could carry a lot more traffic than it gets.

262. Have you any reason to doubt that this line will serve the traffic for many years? No; I believe it will answer the purpose thoroughly.

- H. Deane,
Esq.
15 Nov., 1893.
263. You appear to hesitate—have you any misgivings about the matter;—is there a weak point in the line? No; but I want to answer your question in a fair manner. I consider that this line will answer the purpose. If it is a little weak, that is chiefly because the foundation will be weak, and that is a defect which can easily be remedied by putting on more ballast as time goes on. I would not recommend a weakness which was not curable.
264. Would the addition of extra ballast strengthen the line for all traffic? Yes.
265. If it is discovered that more ballast is necessary, that ballast can be put on without interfering with the traffic? Without interfering with it in the slightest degree.
266. And without raising the rails? In putting on more ballast the rails will have to be raised; but that will not interrupt the traffic.
267. What would be the cost of the work per mile, as far as you can estimate it? That would depend very much as to how much was done. I do not know that I could give an estimate very well.
268. If the whole length had to be strengthened by the addition of ballast, what would the work cost? I should rather give an estimate after I had seen the effect of the working upon the line. I have estimated that the ballast will cost 3s. 6d. a lineal yard, and for another 2s. 6d. a lineal yard a good job could be made of that part of the work.
269. What would it be a mile? £220 a mile. If the ballast appeared low in places, a little more could be put on. The work could be done gradually, without interfering with the traffic.
270. In estimating the cost of the ballast at 2s. 6d. per yard, do you include the cost of labour? Yes.
271. Do you think that anything more besides ballast would be necessary to make the line sufficient for all traffic? I do not see the objection to this line, because of its being of a lighter character than the main line. There will be no difficulty in working it. There will be less done to the formation of this line and the banks will be kept lower than on the Werris Creek to Narrabri line, so that you can never make it a line of the same character, but it will answer all traffic purposes very well.
272. I am speaking of the line being sufficient for the probable development of traffic between Narrabri and Moree? So far as I can tell, I think it could be made suitable for any traffic at a cost of from £200 to £500 per mile.
273. You think there is no other contingency, except the possibility of additional ballast being required, that need be taken into consideration by the Committee? No.
274. *Mr. O'Sullivan.*] Mr. Robert E. Jones in his report to the Under Secretary argues very strongly in favour of the Gurleigh Point route. Are there any engineering objections to that route? No; and I was strongly in favour of it myself until this new crossing was found. There is a very good crossing on the Gurleigh Point route, but it is further down the river, and it is stated that a good deal of the low-lying country along the route is inundated at flood time.
275. But the proposed line will run through country likely to be inundated? Not much after passing the Namoi.
276. Will it not have to cross a great number of creeks? Yes.
277. Are they not subject to floods? They all spread out a little.
278. Mr. Jones, in his report, speaks about the route generally being subject to floods? Wherever you go you are likely to meet with floods, small or great.
279. Does this line traverse for any distance the range of mountains shown on the map? The mountains are about 15 or 20 miles away from the line.
280. There is no doubt about a good crossing having been discovered? No doubt at all.
281. It is maintained here and elsewhere that the best crossing is on the Gurleigh Point line? Some years ago I went to Narrabri in order to examine the river. I started from Narrabri and went down the island which lies to the west of the town between the Narrabri Creek and the Namoi River. Then I followed the river below where the purple line crosses, as far as Mollie, where I think the road-crossing shown on the map is. The floods spread very widely over all that country, and the whole of the island to which I refer, except perhaps to one or two small spots, is covered in the highest floods. The Sectional Committee will, of course, see this place themselves, and they will notice where the proposed line crosses there is a patch of land which is never flooded. The class of vegetation itself shows that, because if the flood-water went over it it would be killed. The ground I refer to is quite high, and is the only place near about which is dry during the highest floods.
282. Why was the line not taken to Narrabri before? I imagine that it was expected that any future extension would be to Walgett.
283. If you took the line *via* Gurleigh Point, Narrabri proper would be deserted, and a new town would be created at what is called Narrabri West? There is a town there now. A lot of land has been sold there.
284. But if the line were taken *via* Gurleigh Point, Narrabri would be destroyed as a market for the Moree trade? Yes, certainly.
285. *Chairman*] There is a crossing 5 or 6 miles to the west of Narrabri, where the purple line crosses the river; is it a good one? Yes.
286. If the railway had not already been taken to Narrabri West, and you were making a line from Werris Creek to Moree, would you cross there, or would you go up to Narrabri? I should cross at the rocky crossing.
287. It is because a railway already goes to Narrabri West that you cross where you do? Yes.
288. How is it that this new crossing was never found before? I cannot say.
289. You went down to Gurleigh Point, 17 miles away, to obtain a good crossing when there was one at your very door? Yes. It was never supposed that this crossing existed. The residents of Narrabri seemed to be unaware of it.
290. How did you test it—by sinking holes? No; I have not sunk any trial shafts or made any borings.
291. Is the river so narrow that you can span it without putting in supports for a bridge? No; but I know what the character of the river is. We have borings on the permanently staked line, so that I know the general character of the river bottom. There is no doubt that it is quite safe.
292. Are the Committee to understand that the Gurleigh Point route was suggested in order to obtain a good crossing, rather than with the view to taking the line further west? A little of both, I should say. There was a better crossing on that line, and, of course, the fact that there was more traffic from the west may have been taken into consideration.
293. I think Mr. Paul was the engineer who surveyed the line from Moree to Woolabrar? Yes; the top part of the line.

294. Is he in the office now? Yes.
295. Is the engineer who surveyed the line from Narrabri West to where Mr. Paul ceased his labours available? No; Mr. Sams is not in Sydney.
296. You have seen this crossing yourself? Yes.
297. I presume that he could not give us any more information about it than you have given? I do not think that he could.
298. All the facts and data were laid before you for consideration? Yes.
299. *Mr. Dawson.*] Is the red line less liable to be flooded than the others? Yes.

H. Deane,
Esq.
15 Nov., 1893.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, sworn, and examined:—

300. *Mr. Hoskins*] Can you say of your own knowledge whether the Railway Commissioners are in favour of the construction of the proposed line from Narrabri to Moree? Yes.
301. Can you give me their reasons? They consider that it will practically pay interest upon the cost of construction. In their report they recommended it, "Upon the ground that it will tend to largely develop a considerable tract of valuable country, and will be an extension of the existing north-western line in the direction which will probably, at a future date, warrant a continuation to the Queensland border." By the figures they have given you will see that the line will practically pay interest upon the cost of construction.
302. Do the Commissioners consider that it will obtain traffic which would otherwise not come to the railway? I could not say that. The estimate is based upon the traffic that we already receive.
303. If the line is constructed is it anticipated that it will take some of the traffic that would otherwise gravitate to Inverell? I consider it would.
304. *Mr. McCourt.*] You estimate the goods traffic at nearly £10,000? Yes, goods and live stock. That is borne out by the existing traffic. I understand that you are to examine Mr. Harper, who collected the estimate. The estimate is based very largely upon the traffic of Narrabri. The Commissioners know the direction from which that traffic comes.
305. The Commissioners estimate the total working expenses at £7,000? Yes.
306. The length of the line is 63 miles? Yes.
307. Are you aware that the estimated working expenses of the Jerilderie line, which is only 45 miles long, are £8,500? I do not recollect what that estimate was.
308. How do you account for the difference? I only know that this estimate has been carefully considered by the Commissioners.
309. Will Mr. Harper be able to give us the information? Perhaps you might get it from the Commissioners. I do not recollect the facts.
310. I have got it before me that the Railway Commissioners estimated the working expenses of the Jerilderie line at £8,587, namely, locomotive expenses, £1,800, permanent-way expenses, £5,625, traffic expenses, £1,162. In the case of this line, however, the Commissioners put down the permanent-way expenses at only £4,000? Yes; there is a difference of nearly £1,600 in the permanent-way expenses; but I cannot say, from memory, how that comes about.
311. Will you have the information supplied to the Committee? I will ask the Commissioners for it.
312. *Mr. Wall.*] Have the Commissioners considered this line, irrespective of the application of the betterment principle? Yes.
313. They would recommend its construction whether the betterment principle was applied or not? Yes.
314. In making their estimate of receipts have they charged special rates, as upon the Cobar line, or have they based it upon the ordinary rates? Upon the ordinary rates. I do not think that the question of special rates has been considered.
315. What rates are they charging on the Narrabri line? The ordinary rates. The Commissioners' views, in regard to the betterment principle, are laid down in their report for 1891, and also in their report on the Lismore to the Tweed railway.
316. It is recommended that this line should be constructed upon the betterment principle? That is a matter of policy which they would not go into.
317. *Mr. Collins.*] Do you know if the Commissioners are prepared to take the line over under the conditions put forward by the Engineer-in-Chief? The Engineer-in-Chief consulted them, and I understand that they are quite satisfied with his proposal.
318. You do not consider that any local rate will be necessary upon this line? That has not yet been determined.
319. Seeing that the Narrabri to Werris Creek line pays so well, would it be necessary to impose higher rates upon this line? That would be a matter for the Commissioners to determine. So far they have not come to any decision with regard to it.
320. If the ordinary rates were charged there would be only a loss of £800 or £900 a year? Yes.
321. There was a considerable loss upon the Werris Creek line at first? I think so, in the earlier years; but the last report shows a small profit.
322. After the interest has been paid? Yes.
323. *Mr. Ewing.*] The Commissioners' views are set forth in the representation made by them to the Works Department on the 30th September? Yes.
324. *Mr. Humphrey.*] The Nyngan to Cobar line is not fenced? I think not.
325. It is not proposed that this line should be fenced? No.
325. Can you say whether any difficulty has been experienced in working the Nyngan to Cobar line because of the absence of fencing? This will be a line worked in the daytime. I think the Commissioners' views on the subject of construction have been put before the Committee by Mr. Barling.
327. Do you not think that it would be necessary to fence the line? Not for the present at any rate.
328. Has the ballasting on the Nyngan to Cobar line been found to be sufficient? The Cobar line was a dearer one than this.
329. I think it was estimated to cost £2,500 per mile? I think it cost over £3,000 per mile.
330. That was because the grade was reduced? I think an additional cost of £20,000 had to be incurred in regard to that line.
331. What is the grade on the Cobar line? One in 100.
332. The first estimate was for a grade of 1 in 75? One in 70 I believe.

H.
McLachlan,
Esq.
15 Nov., 1893.

H.
McLachlan,
Esq.
5 Nov., 1893.

333. *Mr. Davies.*] How far does the differential rate system extend on the Northern line? There are no differential rates on the North-western line. Differential rates were only charged beyond Glen Innes on the Northern line.
334. Do you know anything of the country through which the proposed line will go? Nothing, except of the country that I have seen around Narrabri. Mr. Harper, however, has been over it within the last ten or fourteen days.
335. What kind of traffic is expected upon it? Largely wool and live stock towards Narrabri, and general goods to Moree.
336. What would be the distance from Moree to Sydney? About 414 miles.
337. What would be the freight upon wool? All that information is published in the general-rate book. No doubt a good deal of the wool would go to Newcastle, or to Morpeth. Moree would only be about 314 miles from Newcastle, which is not much more than the distance from Dubbo to Sydney.
338. How far is Bourke from Sydney? Five hundred and four miles.
339. Is there any probability of wheat being carried over the line? That traffic may develop; but at present very little wheat is grown in the district. I have heard people say, though I do not know how far they are correct, that wheat will be grown in the district.
340. In the estimate of earnings you have not taken wheat into account? No.
341. You simply deal with wool and live stock? And with general goods—the ordinary traffic of to-day.
342. The Commissioners strongly recommend the construction of this line? Yes; in the report that has been submitted to you.
343. Believing that if the line can be constructed for £153,000 the earnings will be sufficient to cover the cost and interest? Yes, practically.
344. From the first? From the first.
345. *Mr. Neild.*] At what rate of speed do you anticipate running over the line? The Commissioners put down 15 miles an hour as the maximum.
346. Would that enable you to compete with the teams? Sometimes a team cannot travel at all. I have known a four-horse coach to take nearly two days to go 44 miles in that country.
347. You already have to bear a considerable amount of competition with the teamsters? Not any great amount.
348. *Chairman.*] In your estimate of expenses you have allowed for interest at 4 per cent., while in previous estimates you have reckoned the interest at 3½ per cent.? The Commissioners thought that 4 per cent. would be a fairer charge.
349. In all the other proposals put before us the estimate was based upon a charge of 3½ per cent.? A few years back you could get money on more favourable terms.
350. This is the first time that 4 per cent. has been charged? I think so.
351. Who are the officers responsible for the estimate of the cost of maintenance? The Commissioners are responsible.
352. But who is the officer immediately responsible? They consulted with the engineers; but they are responsible for the estimate. It is their estimate.
353. Then why could you not answer Mr. McCourt's question as to why you allow so small a sum for maintenance in connection with this line as compared with the Jerilderie line? I did not expect that the question would be asked, and I should not like to give an answer to it without consulting the Commissioners.
354. This is the first of what you term pioneer lines? Yes.
355. You put it on a different footing from lines which have previously been constructed? Yes.
356. What would you call the Jerilderie line; it was not a pioneer line? It was brought forward as an ordinary light line, and was to cost from £2,500 to £3,000 a mile.
357. Will you consult with the Commissioners and be in a position to inform us to-morrow as to why there is this disparity in the two estimates? Yes.
358. How do the Commissioners justify their advocacy of this particular route when in 1889 they recommended the deviation from an even straighter line—that marked blue? They did not recommend a deviation, they simply recommended that a survey should be made for a deviation. When they made their report in 1889 it was thought that it would be difficult and costly to get a crossing at Narrabri, but since then a cheap and convenient crossing has been found close to Narrabri. It was on account of the difficulty of getting a suitable crossing that they recommended that the line should elbow out a bit.
359. It was not in order to get more trade, but simply so that a better crossing might be obtained? Purely that.
360. So the Commissioners took it upon themselves to teach the Constructing Authority, and left the matter of trade altogether out of the question? They simply recommended another survey, because they understood that it would be inconvenient to get a crossing at Narrabri, and they pointed out, as a compensating advantage for taking the line further west, that it would go nearer Millie.
361. Were the Commissioners in power when the Werris Creek line was made? No; that line was opened before 1883 or 1884.
362. Can you tell us why it was taken to West Narrabri? No; the work was done before the appointment of the Commissioners.
363. You have been in the Railway Office for a long time;—do you know why the line was taken to Narrabri West; was it in view of a possible extension to Walgett? I do not know.
364. We have been informed by Mr. Deane that if the line had not been taken to Narrabri West he would have crossed 3 or 4 miles further down the river? That is a matter of which I have no knowledge, nor do I think the Commissioners have any.
- 365-6. If this line was continued to Narrabri would the West Narrabri station be shut up? No; there will be a small station at Narrabri for booking and local goods; but the stockyards will remain at old Narrabri. At Maitland we have no less than three stations, and we have also East and West Tamworth.
367. But there the line goes straight on, and here you double right round? The line, if extended, would go nearer to the township and be handier for passenger traffic.
368. Did I understand you to say that you expected that the Warialda traffic would be diverted this way? I do not think I was asked the question.

369. Do you know if the Warialda traffic comes to Narrabri? The traffic from that district is split up a great deal—some of it goes through Inverell, some to Tamworth, and some to Narrabri. I think a good deal of it would go to the new line. From Moree to Newcastle is only about 314 miles, while Glen Innes is further away than that.

370. The only thing you have considered in your estimate is the trade which now comes to Narrabri from the district to the north? And we have provided for a small increase, made up by the traffic that now goes to Tamworth and Inverell.

371. So you are robbing Peter to pay Paul? A small quantity of that traffic would be diverted, but we should get the longer mileage as against Tamworth.

372. But not as against Glen Innes? Mr. Harper will be able to give you all this information, but you will find that there will not be a great deal in the estimate of traffic diverted.

373-4. Has Mr. Harper been in the district more than once? I think he has. At any rate he was there a fortnight ago.

H.
McLachlan,
Esq.
15 Nov., 1893.

THURSDAY, 16 NOVEMBER, 1893.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.
The Hon. JAMES HOSKINS.
The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JOHN DAVIES, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
THOMAS THOMSON EWING, Esq.

WILLIAM CHANDOS WALL, Esq.
WILLIAM McCOURT, Esq.
JOHN CASH NEILD, Esq.
EDWARD WILLIAM O'SULLIVAN, Esq.
CHARLES COLLINS, Esq.
HENRY DAWSON, Esq.

The Committee further considered the proposed Railway from Narrabri to Moree.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, sworn, and further examined:—

375. *Mr. McCourt.*] Your attention was called yesterday to the difference between the estimate of the working expenses of the Jerilderie line and the estimate of the working expenses of this line—have you anything to say in explanation of the matter? I spoke to the Commissioners about it, and they point out that everything depends upon the character of the line and the nature of the traffic. This line has to be considered as a pioneer line. I do not know if Mr. Barling put the views of the Commissioners on the subject of pioneer lines before the Committee. The Commissioners reported upon the matter.

376. Will you kindly read the report? It is as follows: "That the country is right in insisting on cheaper railways where it is a question of 'a railway or no railway,' there is no doubt; but it would, in our opinion, be absolutely wrong to introduce a different gauge from the standard gauge. We do not think it is practicable or desirable to construct a subsidiary trunk line, or a line likely to convey any amount of traffic upon it, on cheaper principles than that recently carried out in connection with the Cobar line, the cost of that line, including all construction charges, being about £3,300 per mile. There is no doubt, however, that for purely pastoral and level country, where the traffic would be exceedingly light, a line capable of carrying a light locomotive with the ordinary class of rolling stock, at a speed of about 15 miles per hour, in daylight only, could be constructed, exclusive of bridges, waterways, and station accommodation, which latter should be of the most simple nature, for about £1,750 per mile, money being voted later on, when the traffic had increased sufficiently to justify a better class of line, to raise the line to the ordinary standard. This could only be considered a 'pioneer railway,' and would be altogether different from a standard railway line even of light construction, such as that to Cobar; it would be simply a line to carry traffic with reasonable speed at a lower rate of charge than it is now carried by road. The rates for such lines, on whatever scale fixed, would bring about a material saving to the users of it, as compared with the rates now paid for carriage by road, and the scale of charges fixed should be such as to avoid any material loss to the country in connection therewith. Lines of this character would avoid the great disadvantage of break of gauge; they would cost scarcely anything more in the first instance than a narrow-gauge line, and the whole of the ordinary rolling stock, exclusive of engines which could be selected from the lightest types existing in the service, could pass over them."

377. That report seems to be only upon the question of gauge? No: it gives a description of what the Commissioners mean by a pioneer line of railway.

378. This is what I want to get at: The Commissioners estimate that the maintenance of the permanent-way of this line will cost £4,000, while they estimate the maintenance of the permanent-way of the Jerilderie line, which is 20 miles shorter, at £5,625—why is there that difference? All lines previously dealt with were considered in the light of standard lines, and we know that the maintenance of the permanent-way upon the main lines and the principal branch lines is a certain sum, which depends entirely upon the character of the traffic. If trains are run upon a line at high rates of speed, the cost of maintenance is thereby increased; while if they are run at low rates of speed, the cost of maintenance is lessened. Besides, since the Jerilderie estimate was made, the cost of maintenance has been reduced in various ways, and greatly by the increased use of tricycles, which enable the men to do more work, by allowing them to get from place to place more quickly. We are getting out a tricycle now which will carry more than one man and the tools, and in this way, time, which would otherwise have to be spent in walking from place to place, can be spent at work. Then this line is essentially different from the Deniliquin line. All these matters were considered in making the estimate.

379. How many maintenance-men are there to the mile on the Cobar line? One to about every 3 miles.

380. On the Werris Creek line how many men are there to the mile? I do not know these details. The Commissioners did not expect that the Committee would go into details.

381. But this is not a matter of detail? It is a matter of railway management. The Commissioners think that the 63 miles of permanent-way could be maintained at an annual cost of £1,000.

382. Previous estimates given by the Commissioners have made it appear that certain lines would not pay because of the working expenses, and I want to know if this estimate has been purposely lowered? This is quite a different line from others which have been considered, and is simply intended to carry traffic at a slow speed.

H.
McLachlan,
Esq.
16 Nov., 1893.

- H. McLauchlan, Esq.
16 Nov., 1893.
383. It will not be so good a line as the Cobar line? We are not going to run so fast upon it.
384. But if it is not so good will that not make the cost of maintenance about the same? I do not think so. The Commissioners think that the line can be maintained for the expenditure which they have estimated, and they have experience to guide them—experience of other light lines.
385. Who are the officers who usually supply these estimates? This is a matter largely thought out by the Commissioners. They consult the engineers.
386. Who are the engineers they consult? The Engineer-in-Chief for maintenance, Mr. Foxlee, would be one.
387. You state that the permanent-way maintenance throughout the Colony has been cheapened since the Jerilderie estimate was made? That estimate was made shortly after the Commissioners were appointed, and it was based upon figures obtained from the Engineer in office at the time.
388. How much has the maintenance of permanent-way been cheapened—10 or 20 per cent.? I could not answer that.
389. How many trains a day is it proposed to run over this line? It is proposed to run a daily train in and out.
390. You estimate the cost of running that train at £1,500? Those are the locomotive expenses.
391. On the Jerilderie line it was proposed to run three times a week? Yes.
392. And the estimated expense was £1,800? But probably the same staff of men would be required to do the work. On the Temora line we have one set of men to see to the running of a train three times a week, and probably the locomotive expense would be the same if we were running six trains a week.
393. Then the men on the Jerilderie line are often idle? They can be used about the goods sheds and pumping stations. They can be used profitably in one way or another. But it is difficult for the Committee to go into these details. The Commissioners have thought the whole matter out, and they are responsible. They are inclined to think that in these matters the responsibility rests with them, and that it is unnecessary for them to give detailed information.
394. I think we are entitled to have detailed information; at any rate previous estimates given by the Commissioners have been excessive? I think the Jerilderie estimate might be reduced as far as the permanent-way is concerned.
395. Would not the same remark apply to all cases; take the Inverell line, for instance? No; that is a comparatively recent estimate, and the line passes through altogether different country. The country there is heavy.
396. At any rate these estimates would be cheapened if the Commissioners had to make them now? Yes, the estimates made by the Commissioners directly after they were appointed. The Jerilderie estimate was made early in 1889.
397. Mr. Foxlee supplied the estimate before us? No, he did not supply it; the Commissioners only consulted him. It is their estimate.
398. Did the Commissioners visit this district before they made their report? Yes.
399. Recently? Not very recently.
400. They made their report without having recently seen the district? They have not been there during this year.
401. Do you know how long they were in the district—were they there one day, or a week? I think they were there two or three days.
402. Is this the first report they made, or did they make two reports? They made a previous report.
403. Did they visit the district before making the first report? I think so.
404. Will the construction of this line largely increase the traffic on the Werris Creek line? I do not know that it will to a very large extent—at any rate, not to start with.
405. I suppose the character of the construction has been referred to the Commissioners; they know that only 3 inches of ballast will be used, and they approve of that being done? Yes. This is purely an experiment; but they think that the line can be satisfactorily worked. The country is level.
406. They are prepared to incur any extra expense which may be occasioned? Yes. If the traffic increased an additional vote could be taken to raise the standard of the line. This is an experiment. A similar line has not been made in the Colony before, but the Commissioners think that it will answer.
407. You are aware that only 3 inches of ballast will be used instead of 6? Yes.
408. Suppose the Commissioners find it necessary to put 3 inches more upon the line, to what account will the cost be charged—to the revenue account, or to the capital account? That is a matter which has not been considered further than stated, but it would seem right, if it were desired to make the line a standard line, to get a further vote to pay for the improvements.
409. But what is the practice? This is the first line of the kind which we have had. When we improve an existing line it is usual to debit the cost to working expenses, because it is really maintenance. A line is always kept up to its normal standard of strength.
410. Then if you had to put 3 inches of ballast upon this line you would charge the cost to working expenses? I do not say that. If we have to spend £50,000 in bringing the line up to the standard and making it fit for high speeds it would be only reasonable that a vote should be taken to pay for the improvements.
411. But do not the Commissioners follow out a settled practice? The maintenance of a line is always charged to revenue, unless it is of an unusual character. Everything is debited to revenue; but if you put up a new station that would go to the capital account.
412. But if you replaced an old station? That would generally go to working expenses.
413. You are aware that three classes of rails are to be used in the construction of this line? No, only two I think—double-headed rails and flat-bottomed rails.
414. If, after the opening of the line, one class of rail does not work, and new rails have to be procured? I do not see how that could happen. I do not think it is worth while discussing a supposititious case.
415. Suppose it did happen? If we renew rails upon the existing lines the cost is charged to working expenses.
416. But what about this line? The matter has not been considered, but the Commissioners do not think that such a possibility comes within practical working.
417. It is a very important matter for us to know whether, if the rails on this line had to be renewed, the cost would be charged to working expenses? I think it would.

H.
McLachlan,
Esq.

16 Nov., 1893.

418. *Chairman.*] Has your attention been drawn to the estimate in connection with this line prepared by the Commissioners in 1889? Yes.
419. In that estimate the locomotive expenses are the same as in the present estimate, the traffic expenses are reckoned at £1,660, or an increase of £160, and the permanent-way expenses are put down at £7,000—an increase of £3,000? I think the answer which I gave to Mr. M'Court shows the reason for that. That estimate was prepared for a standard line, and at the time it was prepared the cost of maintenance was somewhat higher than it is now. The Commissioners have been able to introduce various economies to cheapen the cost of maintenance, and these two things have combined to bring down the estimate. There is no comparison between a pioneer line and a standard line. When the first estimate was made it was also proposed to fence the line.
420. But the annual expense of maintaining fences is very small? Still it all comes in.
421. But since this will be a less substantial line, is it not reasonable to suppose that the wear and tear will be more? A great deal depends upon the speed at which the trains are run, and it is intended to run the trains on this line at a low rate of speed. The Commissioners have recent experience to guide them in this matter, and they are quite satisfied with their estimate, and will endeavour to keep the expenses down. I may give one instance as to how the cost of maintenance has been lessened. On the Cobar line the cost of maintenance is not £50 a mile, while the estimate is £63 a mile in the case of this line. The two lines were not considered together, however. I only give this as an instance of how the cost can be cheapened.
422. But on the Cobar line you run three trains a week, while on this line you propose to run a daily train? But on the Cobar line the trains are run at high rates of speed, which would more than compensate for that.
423. At what rate are they run on the Cobar line? I think they sometimes run at 30 miles an hour. The ordinary rate of speed is run there.
424. Is it because the trains will be run at a low rate of speed and the rolling-stock will be comparatively light, that you will be able to save in permanent-way expenses? Yes.
425. *Mr. Neild.*] What rates do you propose to charge on this line—the ordinary ones? The estimate has been based upon the ordinary rates.
426. In the report which you read this afternoon, special attention is drawn to the possibility of its being desirable to charge special rates? The report refers to the desirability of charging such rates as will make the line pay; but the Commissioners estimate that it will pay working expenses and interest upon ordinary rates.
427. You said just now that you did not think that the proposed line would increase the traffic upon the existing line to Narrabri? The estimate does not provide for any material increase. It does not provide for a new development of traffic to any great extent.
428. I think evidence has been given to the effect that the Commissioners very strongly recommend the construction of this line, regarding it as a profitable one? Yes.
429. According to your evidence it will be profitable merely as a local line;—it will not be profitable as a feeder to the main line? It no doubt will develop traffic; but the Commissioners in their estimate have not taken any great value for that development. Their estimate is based very largely upon the traffic that exists to day.
430. It is a line that as far as revenue is concerned will practically stand distinct; it will pay its own way, though it will not specially feed the main line? It must tend to the development of country, but how far is problematic. Many people are sanguine that it will open up a grain district. The local residents will tell you that.
431. Most of the country is liable to flood? Oh! no—only about the creeks.
432. Will not the line have to be specially constructed to provide against floods? Only in one or two places so far as my knowledge goes; but the engineers could give you that information.
433. *Mr. Davies.*] Did I understand you to say that it was less expensive to maintain a cheap and practically effective line than to maintain a permanent line? As a rule that would apply, because—
434. It is easier to maintain a cheaply constructed line? Simply because there would be less traffic on this line, and trains would be run over it at a low rate of speed. Two great elements in the cost of maintenance are speed and weight. There can be no comparison between the wear and tear occasioned by running a heavy engine over a line at 50 miles an hour and running a light engine over it at 10 miles an hour.
435. But if the road is defective from want of ballast? It is not defective.
436. If it is not up to the usual standard it must certainly be more expensive to maintain than a road which has been properly made? So it would be if you ran over it at the same speed and with the same rolling stock.
437. You know that the country through which the line would pass is subject to floods? Yes.
438. And that it is a rotten kind of ground when wet? The Commissioners are aware of that.
439. Still you are of opinion that the cost of maintenance will not be more than £60 a mile? The estimate is £63, and the Commissioners are sanguine that it will not be exceeded.
440. What would the maintenance of the main lines cost? On an average about £200 a mile.
441. So that this estimate is very low? If you took sectional estimates they would not all be so high. On the Cobar line, for instance, the maintenance only comes to £50 a mile.
442. But there only three trains a week are run? But they are heavy trains, and run at a fair rate of speed.
443. What load would you be able to take upon the proposed line? That I could not say; but the country is level, and we should probably be able to take all the traffic.
444. How many tons of wool could a train take? I should think 150 or 200 tons.
445. What would be the weight of the locomotives used on this line? The Commissioners speak about using the lightest rolling stock we have. Some of our engines weigh as much as 92 tons, while others only weigh 30 or 40 tons. The Commissioners would use the lightest class.
446. You would not use any weighing less than 50 tons? That would be somewhere about the weight I should say.
447. Do you think the line will be strong enough for rolling-stock of that weight? The Commissioners think it would be suitable for the lighter kind of rolling-stock.
448. *Mr. Trickett.*] It is not proposed to fence in this line? No.

- H. 449. What other lines are unfenced? Only the Cobar line.
 McLachlan, 450. What has been the experience there; have there been any accidents with stock? I do not
 Esq. recollect any.
 16 Nov., 1893. 451. Had there been any I suppose they would have come to your knowledge? Yes.
 452. You do not know of any? I do not recollect any.
 453. *Mr. O'Sullivan.*] What would be the cost of working eleven additional miles of railway;—what would
 the traffic and locomotive expenses be? That I could not answer off-hand.
 454. I suppose it would be proportionate to the whole length of the line? I think so.
 455. The permanent-way expenses then, would come to about £650? I think it would be a fair thing to
 take a proportion.

John Harper, Esq., Goods Superintendent, Department of Railways, sworn, and examined:—

- J. Harper, 456. *Mr. McCourt.*] Have you visited this district lately? Yes.
 Esq. 457. You estimate the goods traffic at £9,900? I have not taken it out in that way. I estimate the
 16 Nov., 1893. total traffic at £12,000.
 458. How is your estimate made up? From the goods actually taken to and from Narrabri Station during
 the last twelve months.
 459. What was the nature of them? Wool, that is outwards from Narrabri, and inwards general
 goods.
 460. Most of it would be wool? All the outward tonnage from Narrabri would be wool, except about
 200 tons of sheep-skins and general merchandise.
 461. Have you taken into consideration the increase which the construction of the line would be likely to
 bring about? No; I have simply taken the bare figures as they stand in the books to-day.
 462. Do you think that the construction of the line will cause an increase in the traffic? I think that it
 naturally will.
 463. To what extent? You could scarcely gauge that.
 464. Do you know that country through which the line runs? I practically followed the route which it
 takes.
 465. Is there any settlement along the route, or are there only two or three stations? There is nothing
 that you can call settlement. The land is held in pastoral holdings, though there are a few selectors.
 466. How many pastoral holdings are there between Narrabri and Moree? I think about four.
 467. There are very few selectors? Very few selectors, that is along the route. I did not go away from
 the surveyed route.
 468. You do not know whether the best route has been surveyed? I simply dealt with the figures in the
 books at Narrabri Station, going through every clip of wool coming in there.
 469. What do you estimate the passenger traffic at? At 6,000 passengers a year.
 470. What would that be in money? £2,000, charging 1½d. per mile.
 471. Have you anything to state with regard to the construction of the line? No; nothing beyond the
 estimates submitted by the Commissioners.
 472. Do you think it is a desirable line to make? I do.
 473. If it were constructed would it increase the traffic on the main line? I think it is necessary to
 construct it to preserve what we have.
 474. If it is not constructed will you be in any danger of losing traffic? I think so.
 475. *Mr. Trickett.*] Did you visit the district yourself to get these statistics? Yes.
 476. In what radius is the district comprised from which the traffic will be drawn? The traffic will come
 from Mungindi and places beyond it in Queensland. We already have that traffic.
 477. How far is Mungindi from the proposed railway? It is about 70 miles from Moree.
 478. You think the traffic from there would come to this line? It already comes to Narrabri.
 479. What station on the proposed line would it come to? To Moree.
 480. Have you considered the question of rival routes? No; it scarcely came within my province.
 481. Can you give the Committee any information about the line which follows the travelling-stock route?
 I think, on general grounds, that the straighter you make a railway to an objective point the better.
 482. Regardless of the country it goes through? I think so, especially in country of this character.
 483. Supposing a straight line would go through very few properties, while a slight deviation would enable
 you to go through very good country, would you make the deviation? Decidedly; but where there is
 good country beyond to be served, I should not burden it with added mileage.
 484. To what extent—would you make a limit of 5 or 10 miles? I should not increase the mileage
 further than was necessary, if I wanted to connect two points.
 485. What rates are proposed to be charged on this line? The ordinary rates. My estimate has been
 made up on an added mileage from Narrabri beyond Newcastle on the ordinary rates.
 486. Does it include the coaching traffic from Narrabri to Moree? From Narrabri to Moree, and the
 intermediate district.
 487. Is the travelling between the two places mostly done by coach? No; there is a great deal of buggy
 travelling.
 488. Did you take it into consideration? Decidedly. Our estimate was arrived at from experience of a
 somewhat similar district.
 489. You have taken into consideration the probable number of people who now drive their own vehicles?
 Yes.
 490. The trains on this line will travel at a slow rate of speed;—did you take that into consideration?
 That is a matter which has been dealt with by the Railway Commissioners, I believe.
 491. But so far as the convenience of the public is concerned? I think the line will serve them very
 well. There will be a 15-miles an hour service, and that, I think, would serve them very well.
 492. The railway will be a decided improvement upon the coaches? Yes.
 493. Would the goods traffic be constant, or only partial? At present it lasts during five months of the
 year. The stock traffic is a constant one.
 494. Which would be the largest item? Wool would produce the most. It would give us a revenue of
 about £3,000.

495. What would the other items produce? Roughly, the revenue from the cattle traffic would come to about £500; from sheep to about £2,800; from inwards goods, that is supplies, to £2,800; from mails, £800; from parcels, horse carriage, and dogs, £150; and from passengers, £2,000.

J. Harper,
Esq.

16 Nov., 1893.

496. You put down £3,300 for sheep and cattle traffic? Yes.

497. Is that a class of traffic that pays? It does under certain conditions.

498. Under what conditions would it pay on a line like this? Certainly, because we could get a good load.

499. You must have a big load for each train to make it pay? Yes. For instance, from Bourke we can haul 100 trucks at a time.

500. Does it pay there? Decidedly, when we can haul 100 trucks at a time.

501. And you fancy that on this line the stock traffic would be a payable one? Yes.

502. *Mr. Wall.*] You have some knowledge of the traffic on the Cobar line? Yes.

503. Is the bulk of that traffic very heavy? Not very heavy, unfortunately.

504. At what rate of speed do the trains travel—about 20 miles an hour? They are timed to travel about 20 miles an hour, I think.

505. Did you submit a report in regard to the amount of traffic that was likely to take place on the Inverell line, supposing it was constructed? Yes.

506. Would this line, if constructed, take any great portion of that traffic? Not very much of it, as I have made out my estimate. I had regard to the Inverell estimate in preparing this one.

507. Can you say from your knowledge of the place whether this traffic is likely to increase? I should think so.

508. Evidence has been given to the Committee which shows that if the leaseholds were thrown open the land would probably be taken up freely? I should imagine that that would happen; but the matter is out of my province.

509. If the leaseholds are not thrown open where do you expect an increase of traffic to come from? If railway communication is given to the district the people holding property there will probably be forced by circumstances to get better results from it. We find that that has occurred on the Jerilderie line.

510. You anticipate that the principal source of revenue will be the stock traffic, and you think that the people of the district would increase the number of their stock if the line were constructed? Yes. My estimate is based upon what we are actually dealing with now.

511. Would the sheep traffic be fat sheep or store sheep? Fat sheep.

512. *Mr. Dawson.*] Have you based your estimate upon the traffic carried during the last two or three years? Yes.

513. Have we not had favourable seasons during that time? Yes; I suppose they can be considered as generally fair seasons.

514. If there were droughts you would carry no stock at all? We hope that the country would stand a drought now much better than it has ever stood it before, so that I do not know that that would be so.

515. Are there any boiling-down establishments about Moree? There is one at Narrabri.

516. That would not affect the traffic, except that stock might be brought to it from Moree? Yes.

517. That traffic you cannot calculate? No; I have allowed nothing for it. I have simply based my estimate upon the existing traffic.

518. *Mr. Ewing.*] I think you told Mr. Wall that we need not take into consideration the possible extension of the railway from Glen Innes to Inverell? I have not considered it at all.

519. You do not think that it would compete with this line in any way? I should not like to give an opinion about that. I have only been asked to make an estimate of the probable traffic on the line.

520. But if a railway were made to Inverell, would it, in your opinion, draw off any of the traffic? It would not withdraw any of the traffic that I have credited to this line.

521. *Mr. Humphery.*] To what distance on either side of the line will the country be served by this railway? I think that in that country every mile of railway communication you can give as against road communication will be a consideration to the residents.

522. But can you say how many miles the traffic would come from? No, I cannot.

523. Have you taken into consideration the fact that the present traffic goes along a formed road to Narrabri? It goes via the stock route.

524. The Works Department have provided for four stations upon the line;—will it be necessary to open up approaches to these stations? No; you will notice that the travelling stock routes go through them. They are practically roads. In all cases the stations will be upon Crown land reserves.

525. Take Tycannah—is there an approach to that station from both sides of the line? Yes, a travelling stock road passes through it.

526. What about Gurley? It is the same.

527. And Woolabrar? The travelling stock route passes through Woolabrar and goes out towards Millie.

528. What about Edgeroi? There is practically a road running through that station. I have driven along it myself.

529. So that there would be no additional expense in connection with the roads of approach to the stations? That is so.

530. *Mr. O'Sullivan.*] If you were laying out this railway, for purely local purposes, would you prefer the proposed route to the Gurley Point route? What do you mean by local purposes?

531. If you were making a line for the local trade merely? If I were asked to provide for the Millie trade I should take the railway through Millie; but it would first be a matter for consideration what the Millie trade was worth.

532. Would Millie be better served by the proposed route than by the Gurleigh Point route? The Gurleigh Point route would probably mean 10 miles of additional haulage for them.

533. If the railway were purely for local trade you would take the western route? I should take the most direct route to the trade centre.

534. That would be one of the western routes—either the Gurleigh Point route or the travelling stock route? Yes.

535. But since this line is to go to Moree, and may possibly be extended still further, you would not study the local aspect so much as the national aspect, and in studying the national aspect you would recommend a direct route? Yes.

- J. Harper, Esq.
16 Nov., 1893.
536. You lay great stress upon the sheep traffic which will take place;—is it not a fact that nearly all the sheep on this country are what are known as store sheep? No; last year we trucked 632,000 fat sheep at Narrabri, of which 55 per cent. came from this district, and during the present year we have trucked nearly 1,000,000 fat sheep from here.
537. Do they come principally from the stations served by the proposed line? From all along the line of route, and right away from Queensland. Our biggest supply comes from Narrabri.
538. It would not pay to truck store sheep? They would not truck store sheep—we rarely carry them.
539. If the leaseholds were thrown open it is possible that a considerable amount of settlement may take place along the line;—I suppose you bore that in mind in making your recommendation? Yes.
540. Are the leaseholds there fit for settlement? I think that a lot of the country under the Nandewar Range, which will be served by this line, will develop into very good agricultural country. The conditions of rainfall are suitable for agriculture, and the soil is basaltic. It is different soil from that on the plains. I expect to see a good deal of settlement there.
541. Do those remarks apply to the land on the west side of the line? No; you get more out on to the plains there. I think agriculture will be developed upon the eastern side of the line.
542. Is it a fact that much of the Crown land which would be served by this line is very scrubby? There are occasional belts of timber. Eckford's forest is the biggest of the lot, though I do not know what its area is. That country, however, is not necessarily bad.
543. But the scrub would be a bar to settlement if it cost much to clear? The pine scrub country in the south and west has proved to be some of the best wheat country we have.
544. You hold the opinion that when the leaseholds are thrown open the line will go through settled country? I think so.
545. Have you travelled along the route of the line? I crossed and recrossed the line about half a dozen times I suppose. Leaving Narrabri I went through Edgeroi out to Gurley station. Mr. Firth was with me, and we were looking for ballast. Then we crossed the line again at Tycannah.
546. You kept within a reasonable distance of it all along? Yes.
547. So that you are able to form an opinion of the engineering difficulties to be encountered? Yes.
548. Is it not a fact that there are twelve dangerous creeks to cross? There are a lot of creeks, though I do not know that they are dangerous. There is a lot of flooded country.
549. Is there likely to be a catastrophe in connection with any of them, such as there was at Cootamundra? I do not think so. There will never be the heavy rush of waters that there was there.
550. What would be the effect upon the existing line to Narrabri if the line were taken *via* Gurlough Point to Moree? If I were a resident of Narrabri and that were done, I should feel very much aggrieved at being left out in the cold.
551. You think that the effect upon the town would be disastrous? Yes; they are now 3 miles away from the station, and if the line were taken *via* Gurlough Point, they would be cut off from it for all time.
552. If the line were taken *via* Wec Waa along the Gurlough Point route it would serve the country from which the present trade of the town of Narrabri is practically drawn? I do not know that it would have much effect upon it. Assuming that in twelve or eighteen months the Walgett trade goes to Bourke, I do not think it will. That trade is already beginning to go to Bourke, and it is only a matter of months, unless the railway is taken to Walgett, before it will find its way down the river.
553. Mr. Davies.] On your return from your visit to Moree did you furnish the Commissioners with a report? Yes.
554. Have you a copy of it with you? Yes.
555. Would you mind reading it? I should prefer not to read it. I take it that the Commissioners are the officers responsible to this Committee, and whilst there is nothing in the report that the Committee might not see I would rather not read it. There is a certain element about it that I think the Chairman will understand which makes it undesirable that I should read it.
556. Were you sent by the Railway Commissioners to Narrabri and Moree for the purpose of reporting to this Committee? For the purpose of estimating the traffic.
557. With a view to furnishing information to the Committee as well as to the Commissioners? Yes.
558. The information which you have acquired appears in your report? Yes.
559. You have already furnished the Commissioners with a copy of the report? Yes.
560. Then what objection can you possibly have to furnishing it to the Committee? I am here to give evidence upon the report, and to answer any questions put to me by the Committee. Of course it is not for me to discuss the matter with you, but I am ready to give any evidence which is asked for.
561. Can you give us the purport of the report? I think that that has already been given in the recommendation of the Commissioners.
562. The principal commodity carried on the line will be wool and live stock? Yes.
563. Is there a very large settled population in Moree? One thousand one hundred or one thousand two hundred, I should think.
564. Is it a growing or progressive place? Very progressive. At no place where I have been lately is there so much work going on.
565. You strongly recommend the construction of this line in preference to any of the others which have been surveyed? Yes.
566. Have you at any time examined any of the previous surveys? No; though practically, I have been over both routes. I have returned by way of the travelling stock route.
567. You see the blue line; it runs very close to the proposed line? Yes; I think they are about 8 miles apart.
568. Do you think the red line is preferable to the blue line? That is rather an engineering question, but I believe there were engineering difficulties in the way of getting an absolutely straight line.
569. You have not been over the blue line? No.
570. The only line you have been over is the red line? And the green line.
571. What is the character of the country through which the green line passes? Open plains, and belts of timber.
572. Mr. Neild.] I think you informed the Committee that an officer of the Department and yourself had been searching for ballast? Yes.
573. Did you find a good supply of ballast? Yes; at a place named Bald Hill, just this side of Waterloo Creek.

J. Harper,
Esq.

16 Nov., 1893.

574. Was it gravel? No, basalt. There is gravel in the river at Narrabri, and also at Moree.
575. There is no timber along the route? None that would be of value for railway purposes.
576. How far would they have to go for sleepers? I think the Commissioners are getting their sleepers now within 15 or 20 miles of Narrabri, and there is supposed to be timber out on the Nandewar Ranges at the back of Gurley.
577. I understand that you have based your estimates upon the ordinary rates? Upon an extension of the through rates.
578. That is without any reference to the differential rates? Yes.
579. Do the differential rates apply to the existing Narrabri line? No; ordinary rates are charged there.
580. How far does the differential rate system extend? The differential rates practically commence at Glen Innes on the Northern line.
581. Has there been any large development of the traffic to Narrabri within the last two or three years? An extraordinary development.
582. The Narrabri line is one of those which pay fairly well? Yes. There has been an extraordinary development of the sheep and cattle traffic since the Hawkesbury bridge was made.
583. Have you any examples of a similar development in other parts of the country? No; I think it is the most extraordinary development we have had. No doubt the opening up of direct communication with Sydney has largely contributed to it.
584. The extension of the line to Moree will increase that development? I think so, or at any rate it will maintain the trade we have.
585. You strongly advocate the construction of the line which has been submitted to the Committee? Yes.
586. *Mr. Hoskins.*] How far is it from Moree to Mungindi? Seventy miles.
587. And from Mungindi to Inverell? I could scarcely tell you.
588. Is it more than 70 miles? Yes; twice that.
589. Mungindi is on the main travelling road, to the extreme north-western part of the Colony? Yes.
590. Would this railway not provide accommodation for a great deal of the country between Moree and Inverell? Yes; the Warialda district would be affected by it, and some traffic would come from the Bingera District.
591. The probability is that the railway would take all the traffic from the Warialda and Bingera districts? I do not think it would take all.
592. A good deal of it? Some of it probably.
593. What do you mean by portions of those districts? Where the road carriage to Moree was cheaper than the carriage to Glen Innes or Inverell the traffic would come to Moree.
594. As a matter of fact, would not the people who are settled in the extreme north-western part of the Colony be better served by a railway to Moree than by a railway to Inverell? Yes; because a railway to Moree would be more direct.
595. *Mr. Collins.*] What sort of country does the line go through generally? Splendid country; improving to the east as you get under the mountains.
596. Do you know of your own knowledge that the five stations which it traverses are the best stations in that part of the district? I should judge so from their clip, and from the annual rental which they pay on their leasehold property.
597. Can you tell us what rent they pay? I could not tell you what they are paying now. My information only goes up to about two years ago.
598. Do you know that on the eastern side of the line there is a lot of country which is fit for agricultural purposes? That is my impression.
599. You are not aware, of your own knowledge, that wheat is grown underneath the Nandewar Range? No; I am not.
600. If the line were opened, and wheat were grown in the district, there would be an increase of traffic? Yes.
601. How far would Millie be from Woolabrar Station? If you scale it off on the map it is only about 12 or 14 miles.
602. You think that that station would serve most of the properties to the west of the line? Yes.
603. Gurley would serve those to the north-west? Yes, and places like Terry-Hie-Hie.
604. There are a lot of places to the east of the line out towards Bingera which would come into Gurley and Tycannah? Yes.
605. Have you been to Bingera? No.
606. You do not know of your own knowledge that there is a large agricultural and mining population there? I do not know it of my own knowledge.
607. Seeing that Bingera is about 40 miles from the proposed line, do you not think that the traffic from there would come to the railway? I think a certain proportion of it would, except where the range intervenes to prevent it.
608. Since some of the traffic now goes to Narrabri, 80 miles distant, is it not likely that it would come to the proposed line? Yes, it is fair to assume that it would; but a lot of it goes to Tamworth, and would continue to go to Tamworth.
609. In your opinion will there be a large increase of population, both pastoral and agricultural, when the leasehold areas are thrown open? Yes.
610. *Chairman.*] Presuming that this line was constructed, and that the line from Glen Innes to Inverell was also constructed, where would you fix the dividing line between the traffic for the two places? At Warialda and Bingera.
611. And running up north you would include Bengalla? I should expect the traffic from the whole of the district north of Moree to come to Moree, because the mileage would be less.
612. You would expect the traffic to come to Moree, even if the railway were constructed to Inverell? Other circumstances being equal I think the shortest route would be adopted.
613. If the Inverell people anticipate getting the Bingera traffic they are likely to be wrong? I do not think that they anticipate getting it. At all events, when I estimated the probable traffic upon that line I did not take it into account.
614. Where does the Warialda traffic go to now? Some of it comes to Narrabri, and some to Tamworth, while a little of it goes to Glen Innes. The bulk of it comes to Narrabri.

- J. Harper, Esq.
16 Nov., 1893.
615. Supposing the Glen Innes-Inverell line was not constructed, and the line which we have now under consideration was constructed, how much further eastward would you put the line of demarcation between the Glen Innes and Moree traffic? I should not go very much beyond Warialda. They have a considerably shorter route to Tamworth, and comparatively good country to travel over. Anything to the south of Warialda would go to Tamworth, and anything to the east would go to Glen Innes.
616. So that if the Glen Innes line were made it would not affect the line of demarcation? I think not.
617. Have you visited Wee Waa? No.
618. Is this the first time that you have visited Moree? No; but I never visited it before with the distinct object of estimating the trade.
619. Does any traffic come now from Pilliga? Yes.
620. The whole of it? Not all of it. I understand some goes by river to Walgett, and thence to Bourke.
621. Is the trade from Pilliga gradually being diverted down the river? I think it has been affected during the last year or two.
622. Is that state of things likely to continue? Yes; if my information is correct, there will be a big diversion of trade in the future.
623. But if the traffic goes to Bourke you get a longer mileage? Yes.
624. And so you are not very anxious that the Pilliga traffic should come to Narrabri? No.
625. Is it only when the river is navigable that the Pilliga traffic goes to Bourke? Yes.
626. Do you think it is worth while, with a view to getting more of the trade to the west of Wee Waa, to adopt the Gurleigh Point route? I do not. I think the best way of getting to Walgett with the railway would be to go from Dubbo or some western station.
627. How does the Wee Waa traffic compare with the traffic of places further on, such as Edgeroi? The greater part of the traffic comes from the north-west. Out of 66,000 bales of wool last year, I think 40,000 came from that district.
628. If the proposed route is adopted you will not lose any of the traffic that now comes from the direction of Wee Waa and Pilliga? No. If the other route, however, were adopted, the town of Wee Waa would probably cease to exist and another town would spring up further to the east.
629. But you would still have the traffic from Wee Waa to Narrabri West? Yes.
630. You do not think, however, that the people to the north should be put to the disadvantage of an additional 10 miles of haulage? No.
631. Did you visit Millie? I passed within sight of Millie; but as I got better accommodation further on I did not stay there.
632. If the proposed line is constructed it will pass within 10 or 12 miles of Millie? Yes.
633. Do you think that that is sufficiently close? It would save the people there 28 miles of road carriage I daresay.
634. You do not think it desirable to divert the line nearer Millie in order to get more traffic from the west? I do not.
635. Is the country over which the proposed line runs more out of the reach of flood than the travelling stock route? That was the general statement of the people there. Mr. Firth was making inquiries on the subject, and, although I was not studying the engineering question, I kept my ears open, and I found that the general impression was that as you went west the water-courses opened out.
636. You spoke of the possibility of agricultural settlement on the Nundawar Ranges to the east of the proposed line? Do you think that the possibility of the development of traffic from that place would warrant us in taking the line more to the east? If you went more to the east you would not get such a direct line to Moree.
637. You think it is better to aim at the trade of the district of which Moree is the centre, than to aim at any possible trade to the east or west, and consequently you advocate the more direct route? That is so.
638. You see the land office plan? Yes.
639. Have you paid any attention to the area likely to be benefited by the railway, and which should come under the operation of the betterment principle? No; that matter is outside my province.
640. If the Public Works Department had taken Moree as the centre, and estimated that the influence of the railway will be felt to a distance of 60 miles, do you think that that is too far? I do not know. I would rather not express an opinion about the matter. It is very hard to say how far the effect of the railway would be felt. Of course even a mile makes a difference if you can carry over it for 2d. what otherwise it would cost 1s. to carry.
641. If you were a land owner residing 60 miles to the west of Moree, and this railway were made, would you consider it fair to include your property in the betterment area? If I were a land-owner I should be prepared to pay higher rates of road-carriage to show that my property had not been improved by the construction of the line.
642. Do you think that the area to which I have referred will be influenced by the railway? I think so.
643. If the proposed route is adopted will the station at Narrabri West be done away with? No; that is not the intention of the Commissioners.
644. You would keep that station for goods traffic? Yes.
645. Presuming that you were making a line from Werris Creek to Moree *via* Narrabri you would not think of putting a goods station at West Narrabri, and a passenger station at Narrabri? No.
646. It is only because you have the buildings there that you propose to utilise them? Yes.
647. Does that mean that two staffs will have to be kept up—one to deal with goods traffic and the other to deal with passenger traffic? I think that we may be able to distribute the work so that the staff at one station will do the work for two.
648. Will they go about on tricycles? Not necessarily.
649. The more you can concentrate a staff the more economical it is? That holds good as a general principle.
650. Is it because you are afraid that there might be a local agitation there that you intend to keep the station at West Narrabri? No; it is because a lot of public money has been spent there which we think ought not to be wasted.
651. That would counter-balance any extra cost in providing for an additional staff;—no local influence has been brought to bear to keep the station open? I have not heard of any—none has been brought to bear upon me. I have not heard a voice from the people of West Narrabri upon the subject.

652. You know where it is proposed to put the passenger station at Narrabri? Yes.
653. Do you think that the position is a good one? I do not think the Commissioners have expressed an opinion on the subject. I think they would rather see a permanent survey made first. The position shown on the plan is only approximate.
654. Do I understand that you rather doubt the advantage of the position? I think that further inquiry might show that there is a better site.
655. *Mr. Neild.*] What settlement is there between Moree and Narrabri along the proposed route;—is there any? No; the land is practically all comprised in large pastoral holdings.
656. It consists of two or three large estates? There are four or five altogether.
657. Would the same remark apply to the land more to the west? I do not know. I could not speak about the holdings there.
658. Have you seen Mr. Jones' report upon this subject? Yes.
659. He states that the Gurlcigh Point line would serve Wee Waa, Pilliga, Millie, Moree, Palnellawa, Yetman, Boggabilla, and a number of other places. Would the same number of towns be served by the proposed line? Yes; if you except Wee Waa and Pilliga, which are down the Namoi, they would probably be wiped out. All the other places are to the north, and either line would serve the whole of them.
660. You do not think anything would be gained by deviating from the direct route? I do not think that any of the other places in the district are of sufficient importance to warrant a deviation.
661. The proposed line goes through a saw-mill at Narrabri;—is that an establishment of any importance? It is not a very big one. Mr. Firth and I looked over that part of the line. Only a trial survey has been made, and I believe that it can be improved, and that they will be able to get over the river without going through the saw-mill.
662. *Mr. Suttor.*] What was the profit upon the Narrabri line at the end of June, 1892? The comparison is made with the year 1887. In 1887 the loss upon the working was £14,946, and in 1891 there was a profit of £907; in 1892 there was a profit of £9,432; and in 1893 there was a profit of £14,000.

J. Harper,
Esq.
16 Nov., 1893.

Carrick Paul, Esq., surveyor, Railway Construction Branch, Department of Public Works, sworn, and examined:—

663. *Chairman.*] How long have you been engaged in the department? Three and a half years.
664. Where did you obtain your experience? In New Zealand and in England.
665. Principally in connection with railways? Yes; I have had about fifteen years' experience.
666. Do you hold any certificate or diplomas? Yes; I am a member of the Surveyors' Institute, and a licensed surveyor.
667. Of England? No; of this country.
668. You served your articles in England? Yes; with the Great Eastern Railway Company.
669. What railway work did you do there? I was engaged in construction work between Banbury and Cheltenham. I was engaged on half-a-dozen different surveys there.
670. Were you engaged on railway construction work in New Zealand? Yes; on the Te Arawa and Morneville line, and on one or two light lines in Otago.
671. What lines have you been engaged on in New South Wales? On the Molong to Parkes line, the Kiama to Nowra line, the Nowra to Jervis Bay line, the Wolumla to Cathcart line, and the Narrabri to Moree line.
672. You have a fair knowledge of the country traversed by the lines to which you refer? Yes.
673. How long were you engaged upon the line from Narrabri to Moree? About seven months.
674. Are you conversant with the whole of the line? Yes.
675. Which end did you start from? I commenced at the Moree end, and worked towards Narrabri. But before doing that I went over the route two or three times from end to end.
676. What is the character of the country between Moree and Tycannah? Flat black soil country.
677. Is it suitable for the construction of a cheap line of railway such as that proposed? Yes.
678. As far as Tycannah there is not much difference in the routes? Yes.
679. Have you surveyed the various routes from Tycannah to Narrabri? No; I did not survey the travelling stock route, but I have been over it three or four times.
680. Taking the proposed line first what is the general character of the country between Tycannah and Narrabri? The greater portion of it is open country; but we go through the Eckford Forest reserve for 7 or 8 miles.
681. The country is comparatively level? Yes.
682. And easy for railway construction? Yes.
683. What would be the steepest grades on the line? I think 1 in 75, and 1 in 100 on the up line. There is only a very short stretch of the 1 in 75 grade.
684. How long is it? Only about 11 chains, I think.
685. Is there only one such grade? Yes; the grades are very flat, taking them all through.
686. They are principally 1 in 100? Rather 1 in 500, or 1 in 1,000.
687. Do the brown markings on the map represent spurs? No; they show the boundaries of the black soil country.
688. Will you name the most difficult creeks that have to be crossed, starting from Moree? I do not consider that there are any difficult creeks until you come to the two rivers at Narrabri.
689. Except close to Narrabri the creeks will not be troublesome? No.
690. They can be spanned by wooden bridges, I suppose? Yes; but that is a matter for the Engineer-in-Chief to decide.
691. Do you know if it has been taken into consideration? I believe so.
692. The bridges are to be wooden ones? I believe so.
693. Will they entail the expenditure of large sums of money? No.
694. Can you tell us what each of them would cost? No.
695. What creeks and rivers have you to cross close to Narrabri? The Namoi River and the Narrabri Creek.
696. What do you think will be the cost of constructing suitable bridges over those water-courses? I cannot tell you. You must get that information from Mr. Deane.
697. You have not gone into figures? No.

C. Paul,
Esq.
16 Nov., 1893.

C. Paul,
Esq.
16 Nov., 1893.

698. You would not like to say whether the work could be done for £5,000? No; I should not.

699. You wish to confine your evidence chiefly to the character of the country and the practicability of making a railway through it? To the country and to the survey.

700. Can you say what the line will cost? We know the cost.

701. What will it be per mile? I know that it will cost considerably less than £3,000 a mile. I have seen the estimate, because it was got out in the office.

702. You did not work it out? No.

703. This is what is called a pioneer line;—have you had any experience in constructing lines of this character? Yes; in New Zealand. They have light railways there.

704. Is the country to be traversed suitable for the construction of a light line? Yes; in my opinion it is.

705. What quantity of ballast will be required upon the line? I would rather not give an opinion upon that subject.

706. Still, since you have had experience in connection with lines of this character, the Committee would be glad to know if you consider that a thin layer of ballast would do? My chief will give all that information.

707. *Mr. Ewing.*] You are not the engineer for this line—you have only done the surveying work in connection with it;—is not that your position? Yes.

708. *Mr. Trickett.*] How does the country traversed by the proposed route compare with the country traversed by the travelling stock route? It is similar, as far as the soil is concerned, but the country to the east is higher and the natural drainage is better. Along the travelling stock route there are great basins, which for a week or two after rain has fallen are practically small lakes.

709. Then the travelling stock route is more likely to be flooded than the proposed route? That is the conclusion I have formed.

710. With regard to the country served how do the two routes compare? I think that one would be as good as the other.

711. Is there more settlement upon the travelling stock route than upon the proposed route? Yes.

712. There are more settlers living there? Yes; but there is not much settlement on either route.

713. Is not the country held by two or three people along the proposed route? Yes; though a considerable amount of it has not yet been alienated.

714. If you object to state your opinion on the character of the line which it is proposed to make what other evidence have you to give us? The evidence I can give to the Committee is simply with regard to the location of the line and its position for construction. I think that the direct route is to be preferred to the travelling stock route, because the natural drainage is better, the mileage is less, and ballast and timber are nearer at hand.

715. Did the question of ballast form part of your inquiry? Yes.

716. Was Mr. Firth with you when you made the investigation? No; I was by myself. As you go further west you come to a vast plain; but as you get up towards the ranges the country rises a little, and the drainage is better.

717. Is the country along the travelling stock route so bad that it is likely that a line there would be injured by water? I think so, unless you resorted to a considerable amount of banking.

718. Would a line, as light in character as that proposed, answer satisfactorily if the travelling stock route were adopted? I think not. At any rate it would not be so satisfactory.

719. You think a more expensive line would have to be constructed along the travelling stock route than along the proposed route? I do.

720. What about going more to the east;—have you any suggestions to throw out concerning that? Nothing would be gained by going further to the east. The proposed route is practically a direct one, though slight deviations have been made to avoid going through private property, and to suit the grades and curves.

721. *Mr. Ewing.*] You say that there are 15 chains of the 1 in 75 grade? I think there are 11.

722. Why cannot you cut it out? No doubt that may be done when we make the working section.

723. If the rest of the line has a grade of 1 in 100 it is a pity to allow that grade to remain? Yes; it might be taken out by doing a bit of cutting.

724. It is about 10 miles from the travelling stock reserve to the proposed route? Yes.

725. The water runs from the proposed route to the travelling stock reserve? Yes.

726. Therefore the travelling stock route must be a good deal lower? It is lower.

727. *Mr. Neild.*] Have you had any experience in constructing railways upon loose black soil such as this? No; not upon soil exactly the same as this, though I have constructed railways over low-lying swampy country in New Zealand.

728. Narrow-gauge lines? Three feet six inches.

729. When you spoke just now of having had experience of light lines in New Zealand did you refer to narrow-gauge lines? Yes.

730. What weight of rails was used there? Forty and 50 lb.

731. Do you know the weight of rail intended for this line? No; I do not.

732. What depth of ballast was used upon those rails? Only about 12 inches.

733. But here it is proposed to use only 3 inches with 70-lb. rails? I have not dealt practically with any of this black soil country.

734. Who can give us any information with regard to the question of ballast? I think the Engineer-in-Chief is the best authority.

735. But Mr. Deane has not been over the line? No, but Mr. Firth has.

736. Where is he now? In Sydney. He is the Inspecting Engineer.

737. What is the difference between the country on which you used 40-lb. rails and 12 inches of ballast, and this country? The New Zealand country is swampy—this is not.

738. But I suppose earthworks were thrown up there? To some extent, but we really got over the difficulty by making drains on each side of the line, and carrying the water away.

739. Had not those drains the effect of creating an embankment? Yes.

740. But you required 12 inches of ballast to give a bed for the rails? That was the opinion of the Chief at the time.

741. Do you know what the life of that line would be? No; but I believe it is still in existence.

742. Do you know if it has cost much for repairs? No.

743. You do not know if it has been found necessary to take it up, and reballast it? No; but I believe it has stood well.

C. Paul,
Esq.
16 Nov., 1893.

744. What was the nature of the soil after it was drained ;—was it sandy? It was peaty soil.
 745. Somewhat similar to this? It was, and it was not. This is hardly a peaty soil.
 746. It is more greasy? Yes.
 747. It is a soil that rapidly absorbs heavy weights? Yes.
 748. I understand that you do not like to express an opinion as to whether the proposed depth of ballast would be sufficient? No.
 749. You would rather not answer that question? I believe it would be sufficient.
 750. Is the proposed route liable to floods? Portions of it, where the natural fall of the ground is so slight that when there is a heavy fall of rain the water cannot run away quickly enough; but it is only a matter of raising the line a few inches to clear it.
 751. Would not that state of things be increased by the construction of an embankment? We should cut waterways through the embankment.
 752. Would they have to be very frequent? They are shown on the plan. They will not be very frequent.
 753. The tendency of an embankment, however slight, would be to keep back the water rather than to allow it to escape? Yes.
 754. The black soil rapidly absorbs water? Yes.
 755. If water were lying alongside the embankment would it not undermine it to a certain extent? Yes; but a drain will be cut on the east side of the line, which will carry the water to the nearest opening.
 756. You do not anticipate that it will obtain any lodgment? Not because of the embankment.
 757. Have you seen any stone along the line which would be suitable for ballast? Yes; there is gravel wash on one part of the line, and within a few miles of the line we shall be able to get good stone.
 758. Three inches of gravel wash would not do for ballasting? They would have bigger stone at the bottom.
 759. Is there any timber there? Not within 15 miles of the line.
 760. It would have to be drawn by drays over the black soil? Yes.
 761. It could not be approached by rail? It would be a question whether it would pay the contractor to do that.
 762. You do not think there would be sufficient demand for it? I do not think so with only one contract.
 763. *Mr. Collins.*] Why was the blue line abandoned between Boggy Creek and Tycannah, since it is the straighter of the two? The main reason was to go through the reserves. The blue line cuts slightly into freehold property in an awkward fashion, while the red line will skirt that property.
 764. If 3 inches of ballast is sufficient for the proposed line how much would be required for the travelling stock route? I think it is not so much in the ballast as in the draining.
 765. Do you think the travelling stock route would cost more? I think so.
 766. The country traversed by the proposed line is as good as that traversed by the travelling stock route? It is similar to it.
 767. Do you think that if the leaseholds in the Central Division are thrown open a large population will settle in this district, and give traffic to the railway? Of course mine is an outside opinion; but I think that that is probable. Whatever land was available would be taken up.
 768. Have you seen any country to the east of the line which is fit for agriculture? Yes.
 769. It is not opened up yet? No; it is all occupied for sheep runs.
 770. You think it is good agricultural country, and fit for wheat growing? Yes.
 771. *Mr. O'Sullivan.*] How far is the proposed line from the Nundewar Mountains? I think 15 or 20 miles, on the average.
 772. Is there much danger of the creeks flooding? No. The floods there are caused wholly by the immediate rainfall, and two or three days after the rain has ceased the water evaporates. We do not get immense bodies of water rushing down from the mountains, because we are too close.
 773. Where would there be the greater danger from floods;—upon the proposed route, or upon the travelling stock route? Upon the travelling stock route, because there are great basins there in which the water would lie.
 774. The water lies longer there than it does near the proposed route? Yes.
 775. Is there any danger of washaways because of the creeks coming down from the mountains? No; I think not.
 776. Ample provision will be made to prevent them? Yes.
 777. *Mr. Ewing.*] Where is the 1 in 75 grade? It is near the Eckford Forest—about the 287 mile-peg. That is where we go through the gravel-wash.
 778. Is it near Waterloo Creek? Between Waterloo Creek and Myall Hollow.

TUESDAY, 5 DECEMBER, 1893.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.	WILLIAM CHANDOS WALL, Esq.
The Hon. JAMES HOSKINS.	WILLIAM McCOURT, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	JOHN CASH NEILD, Esq.
The Hon. JOHN DAVIES, C.M.G.	EDWARD WILLIAM O'SULLIVAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	CHARLES COLLINS, Esq.
HENRY DAWSON, Esq.	

The Committee further considered the proposed Railway from Narrabri to Moree.

Robert Richards, Esq., grazier, sworn, and examined:—

779. *Chairman.*] What are you? Grazier, meat exporter, and carcass butcher.
 780. You have a place of business at Riverstone? Yes.
 781. *Mr. O'Sullivan.*] You are in the habit of obtaining much of your stock from the Narrabri-Moree district, are you not? Yes.

R. Richards,
Esq.
782. 5 Dec., 1893.

- R. Richards, Esq.
5 Dec., 1893.
782. You have a leasehold estate there? We have two stations—one at Moree, on which a portion of the town is situated, and one on the Namoi, about 20 miles above Walgett.
783. What is the name of the station at Moree? Tyreel.
784. And that near Walgett? Yarraldool.
785. So that you know the district well? Yes; I have lived there twenty years.
786. In your opinion, which would be the better route for a railway from Narrabri to Moree—that known as the direct route, or the Gurleigh Point route? I should favour the Gurleigh Point route, because it would enable the people settled in the best part of the country to truck their stock to Sydney more conveniently than they can do it at the present time. Stock coming from the lower Namoi and Pine Creek would truck near Wee Waa, or a few miles from there, towards Millie, out on what they call Gunnedah Creek. In flood time my drivers invariably select that route. They are sometimes blocked near Wee Waa by the Gunnedah Creek, but they can invariably get to a point on the other side of the creek. All the stock fattened on the Upper Narran, and the whole of that district where the water spreads after it leaves the Baloone, comes into Collarendabri, along the Thalaba Creek, and by way of Millie.
787. By which route does the stock that you use at Riverstone come? Invariably through Wee Waa, and up the Thalaba.
788. Is it not a fact that at times they have to come by what is called the Millie route? That is up the Thalaba. Nine-tenths of the stock *via* Collarendabri come in there. This year, between January 3rd and December 4th, I sent 1,135 trucks of sheep from Narrabri and Boggabri. About 10,000 of them were bought just beyond Moree, at a place called Midkin, but all the rest, if the line had been constructed that way, would have been trucked below Wee Waa or Millie. The country round about Moree, and down below Midkin towards Mungindi is very good; but, as a fat stock buyer, my business does not take me beyond there. It invariably takes me to where the waters break out from the Baloone into the Narran, Birrie, Culgoa, and Bokhara. That is a good fattening district, from which the direct route is to Collarendabri. I have also a station just over the border in Queensland, at what I call the top of the good country, just where the waters break out at the junction of the river. I could come into Mungindi from there, and then on to Moree; but there is no road, and I should have to get permission to travel through the Australian Pastoral Company's land. At present I come down to Mogil Mogil, and then on to Collarendabri, and through Millie.
789. If the proposed line were constructed, would your stock go to Narrabri, or through Thalaba to Millie? They would go to Narrabri. It does not pay you to go out of your way to get to the railway, when you can save 40 or 50 miles of rail carriage by travelling ahead for two or three days more.
790. What part of the country is best settled by graziers—the western part towards Collarendabri, or the country to the north of Moree? My knowledge of the country north of Moree is very limited, because there is not sufficient fat stock there to take me that way. My business takes me where the fat stock are. I have, however, a very good knowledge of the country around Moree. It may be splendid agricultural country or fair grazing land, but there is nothing like the quantity of fat stock available there. The principal fat stock comes from round about Moree and round the Lower Mehi, and the road leads into Millie from there. If I were thinking of my own personal interests I would say, "Give me as short a line as you can get from Narrabri to Moree."
791. Which would best suit the district out about Collarendabri—the Gurleigh Point route, or a branch line from Narrabri? A direct line from Narrabri would, in my opinion, serve the best interests of this Colony in any case, independently of Moree. I have no station at Collarendabri, and I have a station at Moree, but I should say that the best line would be to Collarendabri.
792. Would a line to Collarendabri be of any use to the people on the Wee Waa side? I take it that it would go near Wee Waa.
793. Would it not go further north? I do not think it would. The line I should favour would go near Wee Waa; but as I am not an engineer, I cannot tell you what it would cost to bridge the river. I have travelled the country in pretty near all weathers, and I have been there during two or three of the biggest floods. I was down there in the 1887 flood, when I thought it would be impossible to get anywhere, but with the assistance of a guide I managed to get along by way of Wee Waa. They took me to a place that Pat Quinn had once.
794. If the line went in the direction of Collarendabri, you say it would best suit the graziers in that part of New South Wales? I think so.
795. At the same time you would not object to the line going from Narrabri to Moree? Not a bit. To my knowledge there is no better land than that around Moree, and Moree itself is pretty closely populated. My idea is that if you take the line to Moree you should run it out near Millie, because in doing so you will make part of the line which will some day have to be taken to Collarendabri and out towards the Narran, Culgoa, Birrie, and Bokhara districts. If it can be shown that it is worth while to construct a railway in order to carry stock, that is the best route I know of.
796. Your stock *via* Collarendabri comes by way of Millie in preference to coming by way of Wee Waa? Yes.
797. Why is that? Because it is the direct route. The stock that go through Wee Waa have been bought on a place called Pine Creek, where the Barwon junctions with it, and on the Lower Namoi. It is all good fattening country from Moree to Walgett.
798. *Chairman.*] The country you describe lies south of a direct line from Moree to Collarendabri? Yes; and extends from Moree right through to Walgett.
799. Your stock comes by two routes, namely, through Millie and through Wee Waa;—on being asked why they come through Wee Waa, you say that stock coming from districts lying south of a line from Narrabri to Collarendabri would come through Wee Waa, whilst stock from districts north of that line would come through Millie? Yes; the Collarendabri stock invariably come through Millie.
800. If the railway were constructed out towards Collarendabri, do you think it would draw the trade from the Australian Pastoral Company's stations in Queensland? Two-thirds of it would certainly be taken by a line to Collarendabri. The southern portion of that land is very much the better. My station adjoins the Australian Pastoral Company's land, and lies to the north of it, at the junction of the Baloone.
801. *Mr. Davies.*] You sometimes send your stock direct to Homebush from the Narrabri district? Very seldom. I send them for slaughter to Riverstone.

802. Do you send them by road? Cattle from the Hunter district invariably come by road, but not stock from out west. R. Richards,
Esq.
803. Does any of the stock from the Narrabri district come by road to your slaughter-yards? Yes, sometimes in the spring months. This season we sent two draughts. 5 Dec., 1893.
804. What number of stock would come by road? Draughts of about 200 cattle.
805. What is the greatest number that you have sent by road? This spring only 400 have come by road, but I daresay that last year we sent 1,000. I have not the least doubt that we have sent 1,000 during the last twelve months by road.
806. The Sectional Committee were informed by the drovers in the district that you send a large proportion of your stock by road? In the spring we send the cattle by road.
807. Do you send sheep by road? No; I sent one lot last year as an experiment, but I have not continued the practice.
808. What number of fat cattle did you truck? I sent 140 trucks from Narrabri between the 28th February and the 22nd November.
809. Where did the stock come from? Some of it from the Balooone, north of the Australian Pastoral Company's land, and the balance from down the Namoi and about Pine Creek. A portion came from the district lying south of the line drawn from Narrabri to Collarendabri, and the remainder from beyond Mungindi, in the direction of St. George. There is a 15-mile stretch of country there without any water upon it, which the drovers avoid. They follow the Narran to a point opposite Mogil Mogil, thence to Collarendabri.
810. Do you frequently receive large numbers of fat stock from Queensland? No; except what comes into Bourke. I get some from my own place, but they invariably come in through Collarendabri.
811. Have you travelled to Moree along the stock route? Yes.
812. And to Millie? To Millie more often than to Moree.
813. Can you tell the Committee what, in your opinion, is the character of the country traversed by the proposed route and by the travelling stock route? With the exception of the belar scrub on the proposed route it is all very good plain country.
814. You regard it all as good fattening country? Yes.
815. Do you think it would be wise for the Construction Department to adopt the travelling stock route, which is some miles longer than the direct route, in making a line from Narrabri to Moree? Considering that the country to the west is so valuable, and would prove such a feeder to the line, I should say that it would be better to go by the travelling stock route.
816. Supposing that the cost of that line would be £500 a mile more, without taking into consideration the additional mileage? You will pick up very little stock between Narrabri and Moree by the proposed route. I know that in my own case nine-tenths of the stock trucked will still go to Narrabri.
817. In order to save the expense of train carriage, you would not mind being three or four days more on the road? I should not go out of my way to get to the line.
818. But supposing you had all the trucking appliances at a station nearer than Narrabri, would you not go there? A 12-miles journey would take me to the line, but there would be the freight into Narrabri.
819. Do you consider that it would be cheaper to take your fat stock by road to Narrabri than to truck them at some place like Woolabrar;—what do you think is a reasonable distance to expect stock to come to the railway? With stock you come to the nearest point that you can strike; but a good deal depends upon the season.
820. Would stock owners consider 15 or 20 miles a reasonable distance to travel with stock? People would be very lucky to be within 50 miles of the line.
821. Do you think that a railway would be of service to the settlers living within 15 miles of it? Yes.
822. Would you send your stock and produce to the nearest station within 50 miles? Yes; but I would not go 15 miles out of my way to get to the line. If the country were anything like suitable I would prefer to continue on 40 miles by road than to go 15 miles out of my way to strike the line and have to pay for that length of train carriage.
823. What would it cost to carry sheep or cattle 40 miles by train? The cost of train carriage is about 300 per cent. more than the cost of driving. If it would cost £5 to drive a lot of sheep from Millie to Narrabri it would cost £20 to take them by train, though, of course, if they were taken by train there would be a saving of condition, which would have to be taken into consideration.
824. If the railway were constructed to Moree you would use your own discretion and avail yourself of it, or continue to drive your stock—whichever you thought best? Yes; I would certainly not go 15 miles from Millie to the railway if the country was in good condition; I would go on to Narrabri. At the present time I sometimes travel stock which I have bought at Coonamble into Mudgee, although I could reach Dubbo more quickly, because the Mudgee route is better, and I save 4d. per head in train carriage.
825. Do you send wool away from your stations? We nearly always make the sheep carry it. Any wool we have we send to Narrabri.
826. How much have you sent down during the present season? We shorn about 35,000 sheep, and all that wool went to Narrabri.
827. Where did it come from? Yarraldool, 35 miles from Walgett.
828. By what route did it come? Across to Wee Waa.
829. Through Wee Waa? Yes. It goes along the northern side of the river as far as Gunnedah Creek, and crosses over the bridge at Wee Waa.
830. Does the stock from the Walgett district come by the same route? Yes.
831. It comes through Wee Waa? Yes. I take it that if the line is constructed along the Gurlleigh Point route it will pick up the whole of the stock coming from down the river.
832. That would mean 15 miles additional length;—do you think the country would be justified in spending so large a sum of money as would be necessary in order to construct that line? I think so, because it would serve a large producing district. Moree does not produce anything; it is the country round about Moree. I look upon these country towns as a sort of parasite;—you can make a country town anywhere.
833. But you told the Committee that the Moree country was very rich? Yes; and so is the Millie district. I am not here to run down the Moree district, because there is no richer district than it is. The Thalaba district is very good, but if I have any preference it is in favour of the Moree district. I look upon the Moree district as as good as any patch out there.
- 834.

- R. Richards, Esq.
5 Dec., 1893.
834. As good as any in Australia? Just about as good as any in Australia. I look upon the proposed route as a one-sided affair, because you will not pick up any traffic on the right-hand side of the line.
835. Will not the conditional leases be available next year for free selection and settlement? Yes.
836. Will not settlement come about? Yes, no doubt; but there is not a great area of country on the north east side of the line. Then, too, while the land might be taken up by small settlers, you must remember that it would cost a small settler as much to drive in 200 sheep as it would cost me to drive in 2,000 sheep.
837. You think that the route does not lie sufficiently north-west? Yes. I do not say that Moree is not entitled to a railway, because I think it is; but while I should like to have the line as straight as possible, I think it would be better to take it to the west, because it would then serve more country. It must be remembered that there is a mountain range on the right-hand side of the line, which limits the area of good land.
838. You do not regard the distance of 20 miles between the railway and the mountains as sufficient? No. It would be better to have the line 40 or 50 miles away from the mountains. With every mile that you go west you give additional facilities to the best producing districts.
839. Is not the country more to the north-west subject to floods? Yes.
840. Do you think it would be a good thing to construct a railway through flooded country? The country is flooded, but it is not impassable. Besides, the floods are not so heavy at Wee Waa as at Narrabri.
841. You admit that the country is flooded? The whole of the country is flooded.
842. But the proposed line runs through higher land than the route which you suggest, because it is nearer the mountains? Yes.
843. And therefore the country is not so subject to flood? The creeks there rise higher than they do further down. Lower down they spread themselves out, and the water is sluggish.
844. But would it not be easier to make a culvert over a creek than to take the line across the flooded flat? I do not know that the country which the proposed route would traverse is less subject to flood than the rest of the district.
845. Would you oppose your opinion to that of the engineers? Certainly not; but the road from Boolcarrol into Wee Waa is the road which my drovers invariably take. I asked one of them this morning why he went that way, instead of coming in by Thalaba, and he said that the Boolcarrol route was the best.
846. You regard the whole of the district as a good one? Yes; from the mountains to Moree, and right away to Walgett.
847. You admit that Moree is entitled to railway communication with the metropolis? I believe that it is entitled to a railway.
848. Have you anything further to state? No; but I say that if the line were taken 15 miles more to the west it would serve a greater number of people.
849. What would become of Wee Waa if the Gurleigh Point route were adopted? It would die a natural death.
850. Then the line, although it would be of no service to Wee Waa, would be a good one for the district? Yes; I believe that a town would spring up on the other side of the river towards Boolcarrol.
851. *Mr. Neild.*] The sum of your evidence is this, that a line some distance to the west of the direct route between Narrabri to Moree would serve a larger area of country, and lead to a larger amount of agricultural development? Yes. I cannot speak as to the agricultural development. It is principally grazing country there.
852. But such a line would serve a larger extent of country than the direct route? Yes; it would serve as much more of the district to the west as the distance between it and the direct route.
853. The direct route runs within 20 miles of the mountain range on the east? Yes.
854. If the line were taken 15 or 20 miles further westward, the railway would have a much larger amount of traffic? Yes; a very much larger amount.
855. Do you speak of passenger traffic, or of goods traffic, or of both? Of both.
856. Do you think that if the direct route line is constructed there will be much passenger traffic from stations between Moree and Narrabri? No.
857. Would the people of Millie drive to Woolabrar Station, or would they go to Narrabri? No doubt the people coming up from Thalaba to Millie would drive through Woolabrar; but they are only part of the whole population.
858. Would wool coming into Millie go to Woolabrar, or to Narrabri? I question very much whether it would not travel to Narrabri rather than pay the extra train carriage. A passenger, of course, studies his own convenience first, and travels as quickly as he can; but, with goods and live stock, the question of pounds, shillings, and pence, has to be considered.
859. Do you know the nature of the country along the two routes—the Gurleigh Point route, and the proposed route? I know the country well from Narrabri to Gurleigh Point, and on the other side right out to Millie.
860. Is the risk of floods greater upon the Gurleigh Point route than upon the direct route? I do not think so.
861. You told us just now that your sheep have travelled further west than the travelling stock route in wet weather, in order to escape the danger of floods? Yes; they came through Wee Waa past Gurleigh Point.
862. Where do they start from? From Collarendabri. They originally started from within 15 miles of Mungindi. They came across the Queensland border from a homestead lease near the boundary of Bagott's old run.
863. Is there much settlement in the way of homesteads between Narrabri and Moree? Not very much.
864. Are there any free selections? There are some, but not very many. The free selectors live principally out to the west.
865. Are they great in number out to the west? Yes, until you get to Moree.
866. There are more on the route which you advocate than on the direct route? Very many more.
867. *Mr. Wall.*] Do you think that stock in the Birrie and Culgoa districts would be likely to patronise the line if it were taken in the direction which you propose? Yes; it would come into Millie.
868. How far down the Birrie would they be likely to utilise this line? Pretty nearly down to a line west from Walgett.
869. That would be about Narran Lake? Just above there. I think the people at Narran Lake would very likely make towards Nyngan.

R. Richards,
Esq.

5 Dec., 1893

870. If the line were taken to Walgett, do you not think that the people round Goodooga and just about the lake would be likely to send their wool to Walgett instead of sending it to the proposed line? Goodooga is nearer to Collarendabri than to Walgett.

871. But would it not be better for them to send to Walgett? It would suit the people below Goodooga to send to Walgett, but when there were no fences they invariably came in from Collarendabri.

872. If a railway were constructed to tap the Darling at Walgett, and also at Brewarrina, a great portion of that part of the country would be served by it? Yes; that is the country below Goodooga—20 or 30 miles below it.

873. Supposing the line were taken to Oonamble? Part of the trade round about the Narran Lake and Gilgoa would very likely go to Walgett.

874. You stated that you would not say that the places along the proposed route are not entitled to a railway, but that it would be better to take the line further to the west? The western route would be 15 miles longer, but I do not think that that affects the question. I admit that the people of Moree would be put to a disadvantage in having to pay for 15 miles additional railway carriage; but the people out in the western district, who are more numerous, and who control a larger area of good country, would get a distinct advantage.

875. Suppose a line were made to Moree, and another to Walgett, would not they, with the existing line to Bourke, serve that part of the Colony very well? Yes; but the country to the north of the Namoi would not go to Walgett. It is almost impracticable to go to Coonamble now, because of the difficulty of crossing the creeks.

876. Have you purchased any stock in the vicinity of Cobar? No; I have purchased a great number about Nyngan.

877. Are you aware that the people in that district drive their stock along the road in preference to trucking it? I do not care about buying sheep at Cobar. I do not care to buy them below Nyngan.

878. If you had stock 20 or 30 miles below Moree, would you take them to the nearest point on the proposed line, or would you go to Narrabri? I should not go out of my way to take them to the railway.

879. You would go to the nearest trucking point to the market to which you were sending your stock? Yes.

880. If you were 15 or 20 miles from the proposed line, you would, in all probability, send your stock to Narrabri? If I were to the west of Millie I certainly would.

881. Is there not a tendency, in that part of the country, to erect boiling-down works? Yes.

882. Do you not think that the surplus stock of the district will eventually be boiled down? No; if prices are low, no doubt the ewes will be boiled down; but if you can make other use of the ewes they will not be boiled down. Wethers are not likely to be boiled down, because they will give a better result either in the Sydney market or in the home market. I was instrumental in starting a boiling-down establishment at Narrabri to get rid of the old ewes that could not pay 1s. 6d. train fare.

883. They would not boil down ewes unless they were fat? No.

884. A great quantity will be boiled down? Ewes will often be boiled down. If a ewe will give 6 lb. of tallow it will pay to boil her down.

885. I suppose you know that they are selling fat ewes there at 1s. 6d. per head? No; I would give you 4s. for them if fat.

886. If boiling-down establishments are erected, they will be erected on the river? Yes; to the nearest point to which stock can travel.

887. And the tallow will probably be taken away by the river steamers? What is the good of talking of the river steamers. You could not let your tallow accumulate for three months while you were waiting for the river to rise. You can get your wool away, because the Darling is generally navigable after the winter rains.

888. Have you ever known the Darling not to be navigable as far as the Barwon? Yes; for two years I have known people not to be able to get up it. I went to the Darling when I was a boy of sixteen, and for four years you could not get up it.

889. You are aware that a steamer has been up to Mungindi? Yes; the steamer went up to Mungindi once.

890. You are aware that the Government propose to lock the river? No; I am not.

891. Some of the Government engineers have reported in favour of the scheme? I was not aware of it, but if there were railway communication the owners of boiling-down establishments and meat-preserving works will avail themselves of it. If you trusted to an intermittent steamer service, you would have to let your tallow accumulate for four or five months, and thus lose the interest on the money, besides running the risk attendant on keeping an inflammable article like tallow in store. I like to get my tallow away every two or three days if I can.

892. You know Messrs. Rich, at Bourke? Yes; I think they are at Brewarrina, too.

893. Have you ever heard of them getting merchandise up the river? Yes; two or three times.

894. And guaranteeing a return cargo of wool? No.

895. Do you know that those are the conditions under which they get their merchandise up at the present time? Will they guarantee their wool for the next season. They might guarantee it when the river is in flood. I would guarantee to supply you with meat for two months, but not for twelve months.

896. You know what the condition of the river has been during the last three or four years? Yes; it has been very good, because we have had unprecedentedly good seasons, but I have very often known it to be not navigable.

897. I want to know whether produce from this rich pastoral country will be taken down the river, or by the railway? It would go by the railway if that were cheaper.

898. If the river were locked, and made permanently navigable, it would monopolise the tallow, and produce of that character? I think that it would very likely come by rail.

899. If the railway were taken to Walgett a great part of this district would be to the west of the line? Yes; some of it would.

900. All the country round the Narran Lake would go to Walgett? That would be the direct route, no doubt.

901. *Mr. Suttor.*] What is the average number of cattle that a truck will take? Nine or ten.

902. How many sheep will a sheep truck hold? From eighty-six to 100, according to the length of the fleece.

903. You sent away 140 cattle trucks from this district? Yes.

904. And how many sheep trucks? 1,135, carrying 105,467 sheep.

905. Did they all come from Narrabri? They all came from Narrabri; but a few of them were trucked

at

- R. Richards,
Esq.
5 Dec., 1893.
- at Boggabri. About one truck in ten came from Boggabri. They were congested at Narrabri, and to relieve the congestion I drove some of them on to Boggabri.
906. *Chairman.*] Had there been no congestion, you would have trucked them all at Narrabri? Yes.
907. *Mr. Dawson.*] I suppose you send between 350 and 400 bales of wool from Yarraldool? I cannot tell you; I have never looked into the matter. I leave that business to the station manager.
908. That wool, you say, went to Narrabri direct? Yes.
909. If the line had been made to Gurleigh Point would the wool have gone there? Of course it would.
910. Would it have gone through Millie? No; it would have gone direct to Gurleigh Point.
911. If the proposed line had been made, would the wool have gone to any of the stations on it? No; any stock coming up the Namoi would go direct to Gurleigh Point.
912. You know the Boolcarrol Run? Yes.
913. Do you know how many bales of wool they send from there? No.
914. Would any of it go on to the proposed line? It would all go to Narrabri. Everything to the west of the Thalaba Creek would go to Narrabri.
915. Would not stock routes branching off to each of the stations on the proposed line be required before any stock was taken to them? Yes; you would have to make roads to them.
916. And tanks every 6 miles? Yes; if you wanted to have good travelling roads. You must have suitable roads to travel stock on.
917. If the proposed line were constructed, it would be necessary to make three or four stock routes, branching off the present stock route? Yes.
918. Unless that were done, it would be impossible for anyone to get to the railway? Yes; people could not get to the line if there were no road.
919. You think that the Collarendabri traffic would come through Millie, and instead of going at right angles to meet the line, would continue on to Narrabri? Yes.
920. *Mr. Collins.*] If the line were constructed to Gurleigh Point, and you were sending stock from Yarraldool station to Narrabri, or to Sydney, where would you truck it? At Gurleigh Point, or on the other side of the river if I could.
921. If you were coming through Millie, you would not go to Gurleigh Point to truck this stock? I would continue on until I met the line. If the line went *via* Gurleigh Point, I should have to go right past it, and I would not go 15 miles out of my way to save 20 miles of train carriage to Narrabri.
922. Do you know as a fact that when wool has been put on to the drays, it generally goes direct to the nearest station? Of course, which, if the line went *via* Gurleigh Point, would be Gurleigh Point in my case.
923. Is there much settlement to the west of the line? Yes; there are a good many selectors.
924. Considering the nature of the country, do you think that it is fairly well settled? Yes.
925. We have evidence before us to the effect that some of the selectors own from 10,000 to 20,000 acres each;—do you consider that good settlement? I thought the holdings were limited to 2,500 acres.
926. If the evidence is as I have stated, would you call the settlement good? No.
927. If a direct line were taken from Narrabri to Moree, and the selections on that line were smaller than those to the west, would not the line serve more interests than a more westerly line? Smaller selections would, no doubt, give a larger passenger traffic, but not such a large stock traffic.
928. The direct line would be the best in the interests of the settlers along it? Yes.
929. Did you say that you thought a line ought to go to Mungindi? By no means.
930. To Collarendabri? That is the direct line which I would favour from Narrabri.
931. You think there ought to be a main trunk line to Collarendabri, and a branch to Moree? Yes.
932. *Chairman.*] I think I understood that you were well acquainted with the country south of Mungindi on to Walgett? Yes.
933. You have only an imperfect knowledge of the country between Mungindi and Goondiwindi? Yes.

Henry Septimus Badgery, Esq., stock and station agent, sworn, and examined:—

- H. S.
Badgery,
Esq.
5 Dec., 1893.
934. *Chairman.*] You are a stock and station agent? Yes.
935. Are you familiar with the project before the Committee? Yes.
936. *Mr. Humphery.*] Will you explain to the Committee the route which you favour, and your reasons for favouring it? I was over the mail coach road from Narrabri to Moree not very long ago, but I have not been to Wee Waa. I favour a line from Narrabri to Wee Waa because I think the more you go to the west the greater the extent of country which you benefit. There is a large extent of good country out in the direction of Walgett and Collarendabri, and a line more to the west would have the effect of opening up the Narran country. Of course if all that is desired is to make a line from Narrabri to Moree in the shortest possible way, all I would ask is, "what are the respective costs of the two lines." But if you ask me, from my knowledge of the country, and of the stock sent from there into this market, which would be the best route to take, I should say "keep away from the Nandewar ranges."
937. *Chairman.*] It is estimated that the direct line would cost £150,000, or, in round figures, less than £3,000 a mile, while the other route will be 15 miles longer, and will cost at least £400 a mile more? If the line is intended to give accommodation to the producers of the district I should favour the westerly route. The people living towards Wee Waa raise a large quantity of stock; and there are a great number of small settlers there. I do not, at the present moment, know any small holders on the eastern side of the proposed line who are sending stock to market.
938. *Mr. Humphery.*] In your opinion the district would be best served by a line 15 miles more to the west along the Namoi? I did not say how much to the west, but the further you go west the more country you open up and the more people you serve.
939. Would more people be served along the route which you propose than along the direct route? I have not been along the direct route; but I know that the other country is good, and that there are a number of selectors on it.
940. You have not travelled between Narrabri and Moree, or between Wee Waa and Moree? I have travelled from Narrabri to near Moree, not to Wee Waa or to Moree itself.
941. There is considerable settlement and production around Moree? Yes.
942. If the line were taken by the route you suggest the people of Moree would have the continual burden of 15 miles additional carriage? Yes.
943. Do you think there would be compensating advantages? I do, because if you kept the line to the east

east the people out in the west would ask for a line to Collarendabri, so that you would have two lines: whereas, if you took this line more to the west, the one line would do.

944. Notwithstanding the greater cost of the deviation and the increased distance, you still advocate the western line? I do; because while the Moree people would have 15 miles further to travel, the railway would benefit others who also require accommodation. If you made the direct line a great number of people, who would be served by the more westerly line, would not be benefited by it at all.

945. The people who would use the Gurleigh Point line, would not use the proposed line? Up towards Millie the people would come into the proposed line rather than go to Narrabri.

946. You think the people coming into Millie would use the proposed line at Woolabrar or Gurley? I think they would come to Woolabrar.

947. You think that Woolabrar would serve the Millie traffic if the line were not made further west? Yes; but they would rather have a line to Millie than travel 12 miles to the proposed line.

948. Is it your opinion that stock would continue to go to Narrabri? In travelling stock a great deal depends upon the state of the road and of the markets. We have to be guided by that. If the market was very low, and the country was good, we would say, "Travel on to Narrabri, because the market may improve." But in any other case we would say, "Truck at the nearest station."

949. Assuming that stock had reached Millie, would it go on to Narrabri if the country were good, or would it go to Woolabrar? It would depend upon the market. Sometimes, when we are on the railway line, we truck part of our stock, and travel the balance on to the next station.

950. It depends very much upon circumstances whether you would use the railway or the road? It depends upon circumstances to a great extent, but, generally, when we have a railway, we send stock by it.

951. Is there anything you would like to add in support of your opinion that it would be better to take the line through Gurleigh Point, than to take it direct to Millie? I think that the direct route keeps too close to the ranges. If the line were more to the west it would open up more country and give more accommodation, because it would go nearer to a very large producing district, which is as much entitled to a line as Moree is. I give it as my opinion that if the line runs out in the Gurleigh Point direction, and then on to Moree, as far as you can take it without making a right angle, it will serve a large producing district, which is as much entitled to railway communication as the Moree district. The country I speak of is very fine, and is likely to be thickly populated. My knowledge of it is gained from an intimate acquaintance with the stock which comes from all parts. I contend that the stock agents here know more about the country than the people who live on it. We know the relative fattening merits of different parts of the country by the way in which butchers buy stock coming from them, better than the people who live there, and who can only judge by appearances.

952. In your opinion, the earnings of a line going through Gurleigh Point, would be greater than the earnings of the direct line? I think that the earnings of the proposed new line would be greater, but the earnings of the whole line from Narrabri to Sydney might not be. These people, if they cannot get a railway to Gurleigh Point, will have to go to Narrabri. I think it would have been better if the map had given a better idea of the settlement along the route.

953. *Mr. Wall.*] You know something of the overflow from the Balooone? Not personally.

954. Do you think that country lying between the Culgoa, Birrie, and Bokhara, would send its stock past Walgett to Narrabri or Moree? If there were a railway to Walgett.

955. If there were a line from Coonamble to Walgett? No; it would be trucked at Walgett.

956. Do you think that the whole district would be fairly served by a line to Bourke, a line to Walgett, and a line to Moree, especially if they were carried to the Queensland border? Yes.

957. But any line to the west of this line would deprive it of a portion of its traffic? Of course, station-owners would consider which was the cheapest line for them to use.

958. Is a pastoral property fairly well served if the railway comes within 20, 30, or 40 miles of it? Yes.

959. Assuming that it is contemplated to make a line from Narrabri through Moree on to the Queensland border, do you think it would be wise to make the deviation you speak of? I do not think that a few additional miles would weigh very much when you can, by making a deviation, tap a highly-productive country. I do not believe that the country between Narrabri and Moree on either route is going to be a pastoral country for ever, and that is a matter which must be taken into consideration. It is a different thing to haul produce by teams to a railway line from simply driving stock there.

960. Would not the deviation you speak of simply give local accommodation, seeing that it will only be a matter of 15 miles? Although the country is good on both routes, I think the Gurleigh Point line would serve a much larger area than the other line.

961. But seeing that the deviation is so small, would not the district be as well served by the direct line? The people out towards Gurleigh Point are fairly well served as it is, but they would be better served if they had a railway. I should like an idea of the cost of the first mile or two of the line from Narrabri, and also of the Gurleigh Point line.

962. *Chairman.*] We have it in evidence that the crossing to the south-west of Narrabri is far better than the crossing at any other point which they have been able to find on the river, and that it will be much less costly?

963. *Mr. O'Sullivan.*] It would cost about £70,000 more to take the line *via* Gurleigh Point than to follow the direct route;—which, in your opinion, would be the best thing for the State to do, to make the Gurleigh Point line, or to make the direct line from Narrabri to Moree, and devote the £70,000 so saved to the construction of a branch line to Collarendabri, *via* Boolcarrol? I would sooner spend the money in constructing a branch line towards Boolcarrol. That is an important part of the country to open up by railway. If you can serve the district by a deviation it would be a wise thing to make that deviation, but if you can make a direct line to Moree and another line to Boolcarrol, the people will not complain.

James Moseley, Esq., sworn, and examined:—

964. *Chairman.*] You are a grazier, are you not? Not at the present time.

965. You are familiar with the plans before the Committee, and with the official evidence taken in connection with this inquiry? I think so.

966. *Mr. Trickett.*] You have resided in the district for a very large number of years? Nearly forty.

967. Whereabouts? I have lived at Gurley, Edgeroi, Millie, Tibbercenah, Boolcarrol, Wee Wee, Gundemaine, and Baranbah.

968. You are familiar with the whole of the country between Narrabri and Moree? With every inch of it. I have either owned or managed nearly every acre of it.

- J. Mosley, Esq.
5 Dec., 1893.
969. Which of the three routes marked on the plan do you consider would be the best to adopt? I can hardly answer that question without asking what is the railway for. Is it to open up the district, or is it to connect the town of Narrabri with the town of Moree? If it is intended to effect the latter object, then the straighter you make it the better; but if it is intended to open up the district and convenience producers, it should go as far to the west as you can take it. Do not let me be understood, however, to advocate the Gurleigh Point route, because there is not a worse crossing place on the river than that. Whenever there is a flood there is a regular congestion of water there. The Gurleigh Point crossing is bad, and the Narrabri crossing is bad; they are both very bad.
970. How can you avoid them? It is the engineers' duty to look for better crossings.
971. You venture the opinion that these are the worst crossings? During the floods of 1857, 1864, 1870, 1873, 1890, and 1893 the water was very many feet over the banks at both places. I do not advocate the Gurleigh Point route, because I know the crossing is particularly bad there.
972. Could you point out a better crossing at Narrabri than the one suggested by the Engineer-in-Chief? I do not know that I could; but in 1864 the water was about 15 feet over the banks at the spot which has been selected. It was up to 5 feet all over where the town of Narrabri is.
973. How has it been after recent heavy rainfalls? In 1890 the water was just awash of the road and of the bridge with one heavy storm in the mountains.
974. Is not all the country about there liable to flood? Certainly; at these two places. A great number of streams meet at these two places, and make the river particularly high.
975. Is the place which has been selected a place where a railway bridge could be cheaply constructed? I only speak as a civilian, but I cannot conceive how the construction of a bridge there would be otherwise than most expensive. During a flood which occurred about five months ago, there was fully half a mile of water to be crossed, taking the river and creek together. And I leave it to the Committee to judge whether a bridge could be constructed cheaply or not. I have boated on the river, built bridges over it, taken stock across it, and know it thoroughly. There is a tremendous rush of water at both places I have mentioned.
976. If it has been stated that a bridge could be constructed very cheaply at this spot, you do not think the statement is correct? I cannot conceive that half a mile of water, which is running very quickly, can possibly be bridged cheaply. An estimate given some years ago went up to £40,000 or £50,000.
977. Could you indicate a better crossing than the one which has been adopted, either to the east or to the west? Yes; I could to the west.
978. Whereabouts;—could you point it out on the plan? No; because the plan does not show enough of the country to the west. I was not with the Sectional Committee when they were taken over the river, but I believe that they were taken over near to the site which I would recommend for the bridge. An old friend, Mr. Quinn, assured me that in 1840 the land was not covered; it was not covered in 1864, when he lived there; in fact, it has never been covered by any flood.
979. *Chairman.*] You speak of a place about 2 miles east of Wee Waa? Yes; I believe that it is very close to the site for a bridge. I should advise to go a little bit higher up or a little lower down, because starting from the bridge straight out you would run into a lagoon. We had a bridge near there for crossing stock, and we used it for many years.
980. Can you give us the name of the place? Welbon or Yaralblucy. The latter place was where Quinn's house stood.
981. *Mr. Trickett.*] After you pass that crossing and go on towards Gurleigh, is the country subject to flood? I think you misunderstand me. Gurleigh is higher up the river. This crossing we are now speaking of is below Gurleigh.
982. Which do you think would be the better of the two routes from a traffic point of view? The further you go to the west the better.
983. If we adopted the Gurleigh Point route we might as well go right through Millie, as $4\frac{1}{2}$ miles to the east of it? Yes; and much more so if you go further down the river.
984. I understand that the line keeps a little to the east in order that it may pass through Government land? If you went more to the west you would cross some conditional purchases and conditional leaseholds, but very little freehold land.
985. The holdings there are very large? According to the evidence given at Wee Waa, various of the conditional purchasers seem to have joined and so made family holdings, so that many of them own 5,000 acres, and even more.
986. *Chairman.*] You would take the Gurleigh Point route on the south of the Namoi about 3 miles further west, and crossing the river, would go in a northerly direction to Millie, and thence in a fairly straight line to Moree? That is so.
987. *Mr. Trickett.*] But if the line went that way it would have to go through conditionally purchased land? Yes; from what I know of the country, and according to the map, it would cross conditionally-purchased or leased land in some places.
988. That is really alienated land? Yes; but we do not generally call it purchased land.
989. It would be better to go through land which has not been conditionally purchased? I should think so, unless the betterment principle were applied. But the conditional purchasers specially desire the western route.
990. What great advantages has the western route? It would tap the whole of the traffic coming up the Namoi through Wee Waa, Bookarrol, Collarendabri, Pian Creek, and Thalaba Creek, while the "red" line would not touch that traffic at all. I think that the western line would get fully two-thirds more traffic than the direct line.
991. The country to the west is very thickly stocked? Yes.
992. A large quantity of sheep and cattle are sent from there? Yes. I have before me the returns made up in Mr. Bruce's office of the owners of cattle, sheep, and horses in that neighbourhood.
993. How does the settlement of that part of the country compare with the settlement along the proposed line? By going as far as you could to the westward you would receive at least two-thirds more traffic than you would get on the proposed "red" line. Of course, Moree will be a centre, but that traffic will come in in any case.
994. All parties seem to be agreed as to the necessity for a line from Narrabri to Moree; the only question is, what route should be taken? Yes.

THURSDAY, 7 DECEMBER, 1893.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).	
The Hon. WILLIAM HENRY SUTTOR.	WILLIAM CHANDOS WALL, Esq.
The Hon. JAMES HOSKINS.	WILLIAM McCOURT, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	JOHN CASH NEILD, Esq.
The Hon. JOHN DAVIES, C.M.G.	EDWARD WILLIAM O'SULLIVAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	CHARLES COLLINS, Esq.
HENRY DAWSON, Esq.	

The Committee further considered the proposed Railway from Narrabri to Moree.

James Moseley, Esq., sworn, and further examined:—

995. *Mr. Trickett.*] When the Committee adjourned last Tuesday you had given it as your opinion that the capabilities of the Gurleigh Point line were superior to those of the direct "red" line proposed by the Government? What am I to understand by "capabilities"?

J. Moseley,
Esq.

996. What traffic will the line carry;—will you amplify your answer by telling us, as far as you know, what amount of traffic would come to the "red" line and what would come to the Gurleigh Point line? What I said was that two-thirds more of the stock and wool of the district would come to the Gurleigh Point line than to the other "red" line. I have since worked out the figures, and I find, taking the stock returns of the several districts, that there would be about 1,256,340 sheep and 52,443 head of cattle within reach of the country traversed by the "red" line. I do not say that that number of stock would come to the "red" line, but they would be within reach of it. On the country traversed by or within reach of the line which I would suggest, there are 2,656,566 sheep and 55,000 head of cattle. The large proportion in the number of cattle is accounted for by the large number of cattle kept in the Moree district. My figures correspond very closely to the statistics of the traffic passing through and trucked from Narrabri last year.

7 Dec., 1893.

997. In order to arrive at your figures, how far would you go east of the "red" line;—40 miles? No; as in many places the mountains are only 15 miles from the "red" line.

998. You would go up to the mountain range? Yes. There is only one large station that would be within reach of the "red" line on the eastern side of the line, and that is Terry-Hie-Hie. The line is an irregular one, because the mountains run back in some places 15 miles, and in others 25. I have taken into calculation all the stations on which I know the stock would be within reach of the "red" line.

999. The district on the east side of the "red" line would be bounded by the mountain range, and would vary in width from 15 to 25 miles? In no place would it be as much as 25 miles across, except at Terry-Hie-Hie. It would vary from 10 to 20 miles, but very little of that land is available. The good land is alienated—the rest is scrub or mountain.

1000. How far would the district extend on the west side of the line? About 10 miles. That corresponds with the evidence which the Committee have heard, and with what I know of the country myself.

1001. The people within 10 miles of the line on the western side would avail themselves of it? Exactly. Of course a run might be a little further back than 10 miles, but that would be a fair average. It would be sometimes more and sometimes less.

1002. If people living within 10 or 15 miles on the eastern side of the line will avail themselves of it, why should you fix the boundary of the western district at 10 miles distance? I throw in all the runs lying on the east side of the "red" line, and between it and the mountains; but I think that the stock on the western side of the line beyond or to the west of the travelling stock route, would follow that road instead of crossing to the "red" line, because the stock road is better. It is metalled in bad places. There are bridges over the creeks, and generally water in the creeks, and where there is no other water the Government have provided tanks.

1003. Can you give us similar information with regard to the Gurleigh Point route? Before doing so I must tell you that as regards either route a great number of the stock from the south of Narrabri must be left out of consideration, and I have, therefore, cut off about 100,000. The Tarriaro stock and wool all go to Narrabri direct. The Baranbah stock and wool would truck at Baranbah. Then there is Thorobry Jacques' station. His stock and wool would truck at Boggabri. I have left 100,000 head of stock out of the calculation, because they would not come to either line in any case. This will account for any apparent discrepancy in the figures.

1004. How far do those runs extend from Narrabri? Tarriaro is 8 miles south of Narrabri, and Baranbah is about 20 miles. Jacques' station is nearer Boggabri about 25 miles from Narrabri.

1005. Will you now tell us about the more westerly route—the Gurleigh Point line? The Committee will understand that I do not recommend the Gurleigh Point line, because the crossing is not a good one. In taking into consideration the amount of stock likely to be sent to a more westerly line, I throw out the stations between Narrabri and Gurleigh Point and all those on the "red" line. All to the west of the line of which I am speaking, however, would come to a line near to Gurleigh Point, because they would have to cross it at one point or another.

1006. I understand that you give the Gurleigh Point line no credit for stock pasturing on the eastern side of the "red" line? Not until it gets to Millie.

1007. When the Gurleigh Point line gets as far as Millie, the people on the eastern side of it will avail themselves of it? Yes.

1008. South of Millie along the "red" line you do not think that more than 15,000 head of stock will be trucked? Owners situated as the Eckfords, who are within a few miles of Millie, would send there, but all the other stations along the "red" line would send to Narrabri, as they do now. Tycannah, perhaps, would send to Moree, but Gurley and Edgeroi would send to Narrabri.

1009. All the stations on the southern half of the "red" line would send to Narrabri? Yes.

1010. They would not avail themselves of it? Of course, if the railway were taken along the "red" line, the people there would use it, but I understand you to assume that the Gurleigh Point line is now under consideration for construction.

1011. If the Gurleigh Point line were constructed the people owning stock along the "red" line would drive them into Narrabri? Yes, from the above named stations.

1012. All south of Millie would do that? I think Tycannah would be the only station which would not, and that would not affect the number of sheep very materially.

1018.

- J. Moseley, Esq.
7 Dec., 1893.
1013. Would these people south of Millie continue to drive their stock to Narrabri, whichever line was constructed? I think so. I do not think that that would make a difference of more than 10,000 sheep.
1014. North of Millie what traffic do you expect would be attracted to the line, independently of the traffic between Millie and Moree;—I want you to tell us how the Gurleigh Point line would be availed of by the people between Millie and Moree? More to the westward?
1015. Yes? In the Moree district there are 1,463,300 sheep. In round figures, about 463,000 sheep would belong to the stations in the Moree district, the owners of which have given evidence to the effect that that they are now sending, and will continue to send, *via* Millie, or Boolcarrol, or Wee Waa. I have therefore credited the western route with 463,000 sheep which would use the Gurleigh Point line from that district.
1016. How far does the Moree district extend;—does it fill in the gap between Moree township and Millie? I do not think the stock district is marked on the map before the Committee.
1017. Cannot you tell us of your own knowledge;—what does the district you have just mentioned embrace, starting on the “red” line, a little to the south of Gurley Station? I believe that Gurley Station would be in the Moree district; that is accurate enough.
1018. The district commences somewhere about there, as on the map, and extends northerly and then westerly near to Moree? Of course, Moree is in it.
1019. Then it extends 70 miles to the north of Moree? Yes; about 60 miles to the Queensland border; but the boundaries are very irregular.
1020. The district extends north nearly to the Queensland border? In one part it extends in the north to the Queensland border.
1021. How far does it extend west? It goes nearly to Mungindi.
1022. How many miles would that be? In one part it runs about 30, and in another from 50 to 60 miles.
1023. In talking of the Moree district, do you refer to the district as marked upon the plans? Yes; but the stock districts are not marked on the plan. Only, as I have told you, and as you heard from Mr. Hill and other witnesses, the traffic from the south-western portion of the district goes *via* Boolcarrol or Wee Waa to Narrabri, and would not feed the railway marked by the “red” line at all; therefore I did not take that portion into consideration when speaking about the probable traffic on the proposed line as by the “red” line.
1024. *Chairman.*] But it would come to the Gurleigh Point line? Quite so. That traffic would amount to the output from about 400,000 head from the south-western portion of the Moree stock districts, and the output from about 1,000,000 head would come from near Moree.
1025. *Mr. Trickett.*] In your opinion, as an old squatter, what distance to the west of the Gurleigh Point line and north of Millie do you think runholders would avail themselves of a railway rather than drive their stock to Narrabri? As far north as and beyond the Queensland border. All the stock and wool from that part of the district, and even some from the Peel River Company's stations in Queensland come *via* Collarendabri and Boolcarrol, which is, practically, *via* Wee Waa, because some of it goes in to the river at Wee Waa, and some at Gurleigh Point. I have made what I think a low estimate. I think that a little more than one-third of the stock from the Walgett district would cross the Barwon, and the stock from the Pilliga district would all come *via* Wee Waa. All their stock and wool come that way now. Some of the Barwon wool stock comes to Millie; but, as a rule, it comes up Thalaba Creek *via* Boolcarrol or Pine Creek, so, of course, it comes up the Namoi.
1026. Which would be the largest source of traffic—wool or sheep? Of course we can only go by what occurred last year. In certain seasons there might be larger traffic in one than the other, but I think you can safely go by precedent. Last year 65,249 bales of wool were sent away, and 634,666 sheep. This year I believe there are 70,000 bales of wool trucked at Narrabri already; and it will probably increase each year.
1027. Then wool would be the largest item? That would have to be worked out by reference to the freight book. There are different rates for the trucking of wool and sheep, and a large proportion of the wool is shipped at Newcastle.
1028. Which do you think the best country, and the most progressive as regards population—that traversed by the “red” line, or the country traversed by the Gurleigh Point line? If by the best, you mean the best for grazing there is not one penny worth per acre of difference. I have owned or managed nearly the whole of it.
1029. You mean right away from the range out to the west? Close to the range you have very bad scrub, and though, no doubt, any country that will grow trees will grow vegetables, it would take £10 an acre to clear that land. As far as grazing is concerned, one part of the country is as good as another. The land on the Gurleigh Point route may be a little heavily grassed, though, practically there is no difference. The “red” line passes through a great deal of scrub. There is scrub from near Narrabri to Spring Creek, and a belt about 2½ miles at Tarlee Creek, and a belt of 6 or 7 miles near Woolabrar to the other side of Waterloo Creek.
1030. *Chairman.*] How far do those belts extend east and west? That at the back of Narrabri, near Spring Creek, almost connects with the mountain scrub. The Tarlee Scrub connects with the mountains, but the scrub on the other side of Waterloo Creek, as it is improperly named on the map, because it is really the Menamoi Creek, is quite different. It is there called Eckford's Scrub, and is entirely surrounded by the plains, about 50 miles round.
1031. *Mr. Dawson.*] It is belar scrub? Belar and box, and some round-leaved ironbark.
1032. *Mr. Trickett.*] Then, in regard to the grazing capabilities of the land through which they pass, one line would be better than the other? You must put the scrub land out of calculation, because, while, no doubt, any country which will grow trees, unless it is an inferior description of sandy country like that along the Hawkesbury and Newcastle railway, will grow grass, it costs money to clear it. No doubt on country of basaltic formation you can always get grass by clearing the land.
1033. There is no scrub on the western route? No scrub at all.
1034. Then the western route has that advantage? Certainly.
1035. On which route are there the most people—on the “red” line? You may say that there are none on the “red” line; perhaps there are two or three conditional purchasers on Gurley station, and about the same number at Edgeroi and other places—not a dozen altogether.
1036. How about the Gurleigh Point line? It would run chiefly through conditionally purchased and conditionally leased land.
1037. Is not that land in the hands of a very few people? I heard at Wee Waa that it was, and that the holdings in some cases went up to 10,000 acres; but such holdings are held by men with large families—people like the Murphys, who have selected their holdings before the 1884 Act, and since.

J. Moseley
Esq.
7 Dec., 1893.

1038. You are aware that the Gurleigh Point line will involve an extra expenditure of £70,000, and will be more than 15 miles longer than the other line;—what is your view of that estimate? Of course on this matter you will get better information from the engineers. I am a practical dam maker, and I cannot see that there will be an iota of difference in the cost of shifting a yard of muck at Gurleigh Point and a yard of muck on the “red” line. I have shifted many thousands of yards in both districts, and the price never varied a farthing at either place. I have paid as much as 2s. 6d., and as little as 6d. a yard at both places, which has been wholly dependent on the seasons and the value of labour at the time.

1039. I do not wish you to consider the matter in that way; I wish you to take into consideration the fact that the “red” line will cost £70,000 less than the Gurleigh Point line? That must be on account of the estimate of labour, as the estimate of the cost of construction of the Gurleigh Point line was made some ten years ago when labour was fully 50 per cent. more costly than at the present time.

1040. But it will be 15 miles longer? In that case, the estimate of £70,000, for the 15 additional miles would signify that it would cost more than £4,000 a mile, while the “red” line is only estimated to cost £2,000 a mile. I cannot conceive such to be a fact.

1041. I understand that the more you go to the west the more sloppy the country becomes? That is entirely untrue, and the Committee have been misled in the matter. It is very wrong that such evidence should have been brought before you. I say this, because I have forty years’ experience of the country and have travelled through it during flood time day after day. I know that such is not the case.

1042. Do you say that a railway constructed along the Gurleigh Point route would not have any greater engineering difficulties in regard to embankments, piling, and so on;—that the engineering difficulties would be the same on the Gurleigh Point route as upon the “red” route? That is more a question for an engineer to answer. The soil is the same along both routes with the exception of the scrub country on the “red” line. In the scrubs the soil is lighter, but against that you must remember that you would have to cut away the stumps. I had a good deal to do with the making of the line to Narrabri, and when a young man had several contracts, and I know that it is more expensive to shift soil in a scrub because of the stumps.

1043. Is not the country towards Gurleigh Point softer and wetter than that along the direct route? No; it is not. The black soil country is all alike. The scrub soil is decidedly lighter, and if there were no trees could be shifted at a lower rate; but when you come to shift the stumps it will cost you a great deal more. I may say that Mr. Gray, who gave evidence at Wee Waa, has written to me saying that he was very sorry that he had omitted to tell you that on the plains —

1044. *Chairman.*] We cannot receive his evidence in this way? Then I will give you my own evidence on the subject.

1045. *Mr. Trickett.*] Do you remember an inquiry being held by the Land Board at Gurleigh Point into the character of the country there;—I am told that the leaseholders in the vicinity of Gurleigh Point—I suppose the inquiry had something to do with the rents that were charged—gave evidence to the effect that the country was subject to floods which seriously affected its value? I do not know that, but I can quite understand it. You can understand that a man who is pleading for a reduction in his rent, will see all the worst features of the country. Gurleigh Point, as I told you from the first, is not a good site for a crossing, and no doubt during floods a good deal of the land is covered with water; but if a person took the trouble to look about him, as we do when we are travelling, he would find that he could pass over it, without being interrupted by the floods. There are warranbools, and a man might say that his land was flooded, and not be far wrong.

1046. You think that that evidence should be qualified? I have never heard a man pleading for a reduction in his rent who did not give all the reasons he could why it should be made as low as possible.

1047. But you do not think that there is any serious objection to the line going in a westerly direction? Undoubtedly not.

1048. Have you considered the question of the line going further on towards Queensland? In which direction?

1049. From Moree? Like everything else it has been discussed. It has been mentioned in conversation that some day there might be a connection from Moree or somewhere else. I have not heard anything else about it.

1050. Having in view the possibility of an extension to Queensland, which would be the better way to take the line—direct to Moree, or along the Gurleigh Point route? The Gurleigh Point route would go near to Millie and then on to Moree, and of course you would have stations near to Wee Waa and Millie. That being so, a few years would prove which would receive the most traffic—Moree, Wee Waa, or Millie; and I suppose the probabilities are that the line would then be extended from the place where the most traffic was received.

1051. You clearly say that you are not giving evidence from a selfish point of view? Not in the slightest. I do not own a hoof or an acre of ground in any of the districts. I am simply giving you the result of nearly forty years’ experience in keeping stock during flooded seasons on all the country now under discussion.

1052. You are pronouncedly in favour of a railway to connect Moree with Narrabri? Decidedly.

1053. Which would you sooner see constructed—the direct line to Moree and a branch to serve the western country, of which you think so much, or a circuitous line like the Gurleigh Point line? I think I answered that question at the commencement. If Narrabri and Moree are only considered, and to be cheaply connected the straighter the line is taken the better it will be; but if the line is to be a remunerative one, and one that will serve the districts, the more west it goes the better, providing you do not compete with the connection which will hereafter be made between Walgett and Dubbo.

1054. I suppose that if we had heaps of money to spend you would say, “Go straight to Moree, and then make a branch line out to the west”? Where would the line branch from?

1055. From about Narrabri? Then the two lines would, for some distance, run very nearly parallel.

1056. *Chairman.*] Not if the branch line were aiming at Collareendabri? It would entirely depend upon circumstances. Do I understand you to say that the branch line would go direct from Narrabri to Collareendabri?

1057. *Mr. Trickett.*] That is the idea? Of course, such a line would go much more to the west than the line I thought of. I was thinking of the line going more towards Millie.

1058. *Chairman.*] We mean a line through Boolcarrol? Yes; but even such a line would, for some distance, run very close to the Moree line.

1059. *Mr. Trickett.*] Do you think that the line from Narrabri to Moree, whether taken along the “red” route or along the Gurleigh Point route, would compete with the Glen Innes to Inverell railway? Not until you got to Moree. In the first place there is an impassable belt of scrub and mountains dividing the two districts, and the natural features of the country, as well as the distance, would prevent it.

J. Mosley,
Esq.
7 Dec., 1898

1060. But after it got to Moree? Moree by that time would have got a halo of traffic around it.
1061. The Moree district is a very progressive one? Certainly, as far as I know.
1062. It has been a progressive district, independently of Narrabri or of any other place? Very progressive, but I might say exactly the same of any other place out in that rich country.
1063. *Mr. Davies.*] You gave some figures just now as to the quantity of wool trucked at Narrabri;—where did you get your information? From the station-master at Narrabri, and also from the agents. It is correct because I have had it verified.
1064. You are aware that we have already got information from the Traffic Department;—I think you were present when the station-master gave his evidence? No; I was not.
1065. You are simply repeating the figures given by him? I do not know what information he gave; but I know that my figures are correct to within a bale or two of wool, and the number of cattle and sheep trucked.
1066. You state that you got your information from him? Partly from him and partly from the agents.
1067. I suppose you admit that the information of the Traffic Department would be most likely to be correct? Not when the station-master says that only 10 per cent. of the traffic comes from the north-western district.
1068. That is not the question I asked? You can get even more correct returns from the Works Department.
1069. But surely we must get the truth from the Traffic Department? Yes, so that if my figures are wrong they may be proved so in an instant.
1070. You have learned that it was stated that only 10 per cent. of the traffic coming to Narrabri came through Wee Waa? Yes.
1071. Do you think that the station-master was correct when he made that statement? No; the statement is quite incorrect. I have seen him since, and he told me that he entirely misunderstood the question. He thought that he was merely asked what was the trade to Wee Waa town, not from it, and in saying 10 per cent. I think he would be about right, because, while there might be a little trade to Wee Waa, the trade from it would be very much more.
1072. You think the station-master must be mistaken in the evidence which he gave? Quite mistaken. He said himself that he did not intend to make a statement which would leave any such impression.
1073. The same remarks would apply to the stock traffic? Of course. If you remember, evidence was taken at Wee Waa which went to show that one station alone sent 62,000 sheep away from Boolcarrol station, and as only 634,000 sheep were trucked at Narrabri, that is almost 10 per cent. of the total stock traffic, and it leaves out the sheep sent in by the selectors and all other station-holders. Some 60,000 or 70,000 would be sent in from Mr. Richards' stations alone, as you have heard from him in his evidence.
1074. You think that the station-master was in error? The question was quite misunderstood by him. I know him to be a thoroughly reliable man, who would not intentionally waver in the slightest.
1075. I think you said that you favoured the extension of the line by way of Gurleigh Point to Moree? Gurleigh Point has a particularly bad crossing. I would say go as far west as you can.
1076. You would go west of the travelling stock route? A little to the west of it, meeting it at Millie.
1077. Is the crossing to which you refer the crossing that the Sectional Committee examined? I believe very close to it. The present bridge is within a very few hundred yards of where Mr. Quinn had his bridge, which stood about twenty years, and lasted right through the 1864 flood. We ourselves had a bridge near there afterwards.
1078. That is about the highest point on the river bank? The flood-marks of 1840, the greatest flood we ever had, were shown me by an old resident, and I was there at the time of the 1864 flood. I lived in Wee Waa and Boolcarrol, and travelled over the district continually. In 1857 there was a very severe flood, and we crossed about 500 bales of wool on ropes. There were floods in 1864, 1870, 1873, 1878-9, 1890, and 1893. Mr. Quinn, during the 1864 flood, had about 2,000 sheep on the land to which I refer, and did not lose one of them.
1079. *Chairman.*] On which side of the river? On the south side. I will speak about the other side presently.
1080. *Mr. Davies.*] If the Committee saw flood-marks on the trees 2 ft. 6 in. to 3 feet up very close to that spot there must have been some mistake? I do not know exactly where the Committee went. Straight out from the present bridge you would run into a lagoon, as I have already stated, which you would miss by keeping higher up or going lower down, and after that you would not need to go through any flooded ground on either side of the river.
1081. I am speaking of a place about a quarter of a mile down the river, nearer to Wee Waa? I cannot say where the Committee went, as I was not with them.
1082. If the Committee saw the wash and *débris* within a foot of the highest point there, what should you say? I should not dispute it. I can only say, and people still living can vouch for the truth of my statement—Mr. Quinn's sons are still living—that what I have told you is correct.
1083. If the Committee were taken to the spot you speak of as the best place for a crossing, and told by the residents there that it had been flooded, and, further, had seen the *débris* and wash for themselves within a few inches of the highest point, would you think of disputing the evidence? Certainly not, because I would value the Committee's opinion as much as my own. On the ground that I speak of—that is, towards Yarralbluey, there could be no wash or *débris*, as there never was a flood there.
1084. Do you recommend that the line should go as near Wee Waa as possible? Not in the least. Let the engineers be shown by the old residents what they consider the best crossing-place is, and let them judge.
1085. You would go as near the north-west as possible? I would go as far west as possible, so long as I was not likely to interfere with the Walgett connection.
1086. You would cross the river somewhere near the place you speak of? Yes.
1087. And you would then go on to Millie? I would go as near to Millie as I could. Perhaps you noticed that a little below Millie one bridge would span three creeks.
1088. Do you not, as a practical man, think that it would cost a great deal more to take the line along the route you suggest than to take it along the proposed route? Certainly not. It could not cost a penny a mile more. These estimates making it so much more were worked out when labour was 50 per cent. dearer. I understand that what is proposed at the present time is a line so cheap as to be almost an experiment, but the estimates for the other line were made ten or twelve years ago, and were made for more costly work.
1089. The estimate made about ten years ago was for over £500,000? So I have heard; as well as that the direct line would be £400 a mile cheaper, but the two estimates have not been estimated or compiled in the same way.
1090. *Chairman.*] I think you are confusing the statement made to the Committee some weeks ago by the Engineer-in-Chief for Railways? I am merely speaking of what I know. I did not hear the Engineer-in-Chief's statement.

1091. *Mr. Davies.*] The difference in cost between a line going along the travelling stock route and the proposed line would be about £400 a mile, and, as it is 15 miles longer than the other, it would be much more expensive to construct? I cannot see how there would be a difference in the cost, because the country is just the same. Navvies clearing tanks for me have charged exactly the same in one part of the district as in another. All earthwork throughout the district is the one rate.
1092. You have admitted that the country round Moree is particularly rich for agricultural and pastoral purposes? The whole district, except where there are scrubs, is good, whether you take the Gurleigh Point route or the "red" route.
1093. You favour the deviation because it would serve the settlers better than the direct route? Yes; and instead of being a losing line, as it is estimated that the "red" line will be, it would receive such a large traffic that it would be a good paying line at once.
1094. The railway at the present time gets all the stock and wool from the district at Narrabri? Yes; but if the line were taken *via* Millie to Moree it would have the profits of 20 or 30 miles of additional rail carriage on stock and wool from the western portion of the districts.
1095. It would get all that at the Moree end? You must recollect that the traffic which is talked about as converging at Moree from Queensland is not in fat stock, but in store stock, which goes to Muswellbrook, and would not use a railway.
1096. *Mr. Hoskins.*] What about the wool—is there a great deal of wool coming from Queensland? I think the Sectional Committee saw that the road which turns off at Boggy Creek is as little used as any. We did not see a dray upon it.
1097. *Mr. Davies.*] The Sectional Committee saw twenty-seven drays coming from Moree loaded with Queensland wool? That is twenty-seven drays; but I do not think that they would be sufficient to make the line pay. But at Wee Waa you had evidence of 100 drays loaded with wool passing in one day.
1098. I am talking of what we saw in one day—we saw wool coming in from the same direction on other drays? On all these matters it is far better to take the evidence of the agents. We (the Sectional Committee and myself) did not meet a wool team between Narrabri and Boggy Creek, and I did not see one when returning, while there were very few tracks. That is a distance of 60 odd miles. There was not one fresh track along the road.
1099. From a national standpoint, do you think it would be wise to take the shortest and most direct route to Moree, or would it be prudent to go 15 miles round, in order to convenience settlement, before coming to Moree? If Narrabri and Moree are to be connected without taking into consideration the settlement and nature of the country the straighter the line the better.
1100. *Mr. O'Sullivan.*] You are not an advocate of the Gurleigh Point route? That is because there is such a bad crossing at Gurleigh Point. Four creeks come nearly on top of one another there; but the engineers took no trouble to make inquiries, and surveyed right across. The water there rises very rapidly, and runs very swiftly.
1101. That route is 15 miles longer than the direct route? I understand that it is about that.
1102. You prefer a route nearer Wee Waa? A more westerly route; but I should not take the town of Wee Waa into consideration.
1103. You would go within a few miles of Wee Waa? I only spoke of Wee Waa because I was asked about a crossing-place.
1104. Would you prefer to take the crossing-place near Wee Waa? Yes.
1105. That would make the route about 5 miles longer than the Gurleigh Point route? I do not think it would.
1106. *Chairman.*] Wee Waa being $6\frac{1}{2}$ miles further to the west than the Gurleigh Point crossing, and your proposed crossing being $1\frac{1}{2}$ or 2 miles to the east of Wee Waa, the line you suggest would have to go at least 4 miles further west? It may at first sight appear so, but I do not think that it need be 4 miles longer.
1107. You propose to go due north to Moree? No; that is just what I do not propose to do. The route, as surveyed, makes several curves, and in parts, follows the travelling stock route, but instead of doing that I would go as direct as possible from Millie to Moree.
1108. *Mr. O'Sullivan.*] How much longer do you think your proposed line would be than the direct "red" route? I should think less than 17 miles longer.
1109. Looking at it from a national point of view, could not the money which the construction of that additional length would cost be more advantageously laid out in the construction of a branch line from Narrabri through Boolcarrol to Collarendabri? Would you go from the terminus or from the town of Narrabri?
1110. From the town? Then you would have to run right down the river bank to get the Wee Waa traffic, which you would lose if you went straight to Boolcarrol.
1111. Which would be the best thing to do in the national interest—to construct the line you suggest, and which would be 17 miles longer than the proposed line, or to construct the proposed line together with a branch line from Narrabri, going as far as you could towards Collarendabri? I cannot see that there need be any doubt on the subject. It is 30 miles to Boolcarrol, and if you constructed a branch line it would need a double staff of men for two lines who would only do the work of one line if taken more to the west.
1112. Your proposed line would not serve the Boolcarrol and Collarendabri district so well as the branch line I speak of? It would serve Boolcarrol as well, because it would be practically a straight line to it, and it would, as nearly as could be, go straight towards Collarendabri.
1113. Would not a line running out to Boolcarrol serve Wee Waa? Only partly so, as there is the south side of the river to consider.
1114. And a line running out towards Collarendabri, *via* Boolcarrol, would serve the Wee Waa district? It would serve the Wee Waa district to the north of the river, but not to the south of the river, because the people there would have to go about 12 miles to get to a station near Boolcarrol, and then have 30 miles of railway journey, or 42 miles altogether, while they could drive to Narrabri in 22 miles.
1115. Which is the more important—the Wee Waa traffic or the Collarendabri traffic? The traffic between Wee Waa and Collarendabri. The best portion of the district begins about Wee Waa and goes on to Collarendabri to the Queensland border, and into Queensland itself.
1116. Which, in your opinion, is the most important district? One acre in one part is as good as in another part.
1117. What is the volume of traffic? That would be shown by the figures I gave you.
1118. I want you to say which is the more important—the traffic from the Wee Waa district or the Collarendabri traffic? It depends upon what you embrace in the Wee Waa district. The district begins directly you cross the river, and extends through Collarendabri to the Queensland border.

J. Moseley,
Esq.
7 Dec., 1893.

1119. I am talking of the country likely to be served by your proposed line, and also of the country likely to be served by a branch line from Narrabri towards Collareendabri? First of all let us take the line crossing near Gurleigh Point. That line going to Boolcarrol will take pretty well all the traffic on the north side of the river.
1120. I will put my question in another way;—if the line were taken along the route you suggest it would cost £80,000 more than if it were taken along the direct route;—in view of that fact, which would be the better for the State to do—to follow your route, or to follow the proposed route and expend the £80,000 so saved in making a line out towards Collareendabri? I should have to work it out. Taking the cost of a branch line at £2,000 a mile, you would be able to construct 40 miles for the £80,000; but while a line going towards Boolcarrol would serve the country to the north of the river, it would not serve the country south of the river. All the traffic from the country south of the river would go to Narrabri, because that would be 22 miles shorter.
1121. Which would be the best thing for the State to do? It is a very difficult thing to say. I should imagine that it would be best to make only one line as far as Boolcarrol.
1122. If the line you propose were constructed, it would run from Narrabri West out to Wee Waa, and then on to Moree, leaving the town of Narrabri out of the question altogether; that town has interests for which we must have some regard, and your line would avoid it altogether? Yes; it would be taken from Narrabri West.
1123. Do you think that we should be justified in injuring the town of Narrabri by taking the line out towards Wee Waa, when we could serve the traffic out towards Collareendabri by a branch line from Narrabri proper? I cannot see that Narrabri will be hurt any more than Maitland, Singleton, Muswellbrook, and Quirindi were hurt by extending the northern line. Whenever a railway passes through a town, and goes on further, the town must feel it to a certain extent. I may say, however, that when I owned a large amount of property in Narrabri, I advocated the line which I now advocate, and the people of Narrabri unanimously petitioned in favour of having the terminus of the line where it now is, in view of a possible extension in a north-westerly direction. Mr. Collins was one of those who signed and requested me to take the petition round for signature.
1124. *Mr. Humphery.*] In a report furnished to the Secretary for Public Works, it is stated that half the traffic on the extension from Narrabri to Moree will come from Moree;—can you express any opinion in regard to that statement? I cannot conceive it to be possible that half the traffic will come from Moree, because Moree is certainly not the centre of more than one-third of the district which contributes trade to Narrabri. No doubt a good deal could be taken to Moree in the shape of stores and goods; but I cannot conceive that half of the trade will come from there. The agents, however, could give you better information than I can.
1125. *Mr. Neild.*] You have been asked what is the character of the country about Millie—I want to ask you almost the same question in an opposite form;—does the “red” line possess any advantage in its security from floods over a line running nearer to Millie? No; certainly not.
1126. Is it a fact that the storm-water channels and creeks along the travelling stock route, and in the vicinity of Millie, are wider and more often flooded than the water channels and creeks on the “red” line? They are narrower, and they are not so much flooded.
1127. Then there would not be so much engineering work in making provision for the storm-waters on that line? There would be less, and it would not be so expensive.
1128. You have a large knowledge of this country? Yes.
1129. The answer you have just given is the result of your personal experience extending over a long period? Yes.
1130. If the Committee are informed that a line *via* Millie would be more expensive than the direct route, because extra provision would have to be made for storm-waters, that statement is inaccurate? Certainly, and I would specially call the Committee’s attention to the fact that large and costly dams have been repeatedly washed away in all the creeks near where the “red” line crosses.
1131. You made reference to the scrub land lying between the “red” line and the ranges. Can you give the Committee any idea of the proportion it bears to the country generally? You mean, going back to the crests of the ranges; you would not stop at the foot of the hills. In that case, I should say that you might safely estimate them at about one third.
1132. About one third of the land lying between the “red” line route and the mountains would be scrub land, which you say cannot be cleared and rendered useful for occupation for less than £10 an acre? Yes; until you reach Nundi Creek.
1133. You passed a very severe stricture upon the proposed crossing in Narrabri? Yes.
1134. What is your objection to that crossing? I owned all the land between the Namoi and Narrabri Creek, through which the “red” line passes, for twenty years, and during that time I had my fences washed away twenty times. I have seen all but about 200 yards of that land inundated five or six times.
1135. Then it would be necessary, in order to avoid the floods, to construct very expensive viaducts there? Yes; to take the line out of the reach of the floods.
1136. You have seen your fences in the immediate vicinity of the proposed crossing washed away once a year, on an average for twenty years? I think I am a long way within bounds when I say that. I do not mean to say that there has been a flood every year, because we have had droughts, but sometimes they have been washed away four or five times in one year. There were floods in 1864, 1870, 1873, 1879, 1890, when little or no land was not under water along the “red” line between the river and the creek.
1137. Did the water remain upon the land for any length of time? From two or three days to a week on each occasion. The 1893 flood did not come so high, but the 1890 flood was higher, and in 1870 and 1873, the waters nearly met. In 1864 there was not an acre of land uncovered by the flood waters.
1138. Besides these floods the water has risen sufficiently to destroy the fences on many other occasions? More than twenty times.
1139. What depth of water was there at the crossing place during the floods which you have mentioned? Do you mean over the banks of the creek and river?
1140. How much was it over the ordinary summer level? In summer time, the river is sometimes dry.
1141. Take the depth of the water at the bank then? The bank of the creek and the bank of the river are of different levels. Over the river bank the water would be about 10 feet deep, while over the creek bank, it would be from 12 to 14 feet deep.
1142. What is the current in the river in times of flood? The river is not so rapid, but a great deal of timber comes down it. The creek is very rapid because it is more direct.
1143. Does much timber come down the creek? Not so much, but there is some. In constructing a bridge over the river it would be necessary to make a special provision for timber. In 1890 there were gangs

gangs of men watching both the river bridge and the creek bridge day and night. They had to cut away the hand bridge, part of the creek bridge, and to protect the end of the main bridge with bags of soil.

1144. The same troubles would threaten the railway bridge? Yes, because the site is only about 800 yards higher up the stream.

1145. You prefer to take the line west in order to serve the existing population of producers? Quite so.

1146. *Mr. Collins.*] You spoke just now of a petition which was got up at Narrabri;—are you aware that at the time it was prepared there was some talk of the line going on to Walgett? There was some talk of its going in a north-westerly direction, but I did not understand that it was determined to take it to Walgett or anywhere else. You and I always wanted it to be taken to Collareendabri.

1147. It was for that reason that the petition was got up, and not to prevent the railway from going to Narrabri? It was never intended to take the railway into Narrabri. There are one or two things which I think the members of the Committee have passed over, and which I should like to make clear. I should like to speak first with regard to the country on the north side of the river out to Boolcarrol from Wee Waa, which I have several times heard spoken of as dangerous and liable to flood. I lived on the Gundemaine run, on Boolcarrol, and on Tulladonna from 1856 to 1876, and during those years I frequently, generally twice a week at least, had occasion to travel between Boolcarrol and Wee Waa, but I was never inconvenienced except by the river. Sheep were kept on that country during the whole of the time, and not one hoof was ever lost. A fence which was erected in 1864 was not washed down by that flood, and another fence which was erected in 1868, and crosses the whole of this so-called flooded country, has never been washed down. I have also heard a good deal about the timber in this district, and I should like to say that for many years I was a timber-getter and contractor myself, but I never saw one narrow-leaved ironbark in Eckford's Scrub. You might get a few railway sleepers near to Killarney, but very few. Gurley Creek and Bumble Creek have been spoken of as very easy for bridging, but I have seen the water there on many occasions half a mile wide, and running like a mill-stream. Mr. Vickery, Mr. Charles Lloyd, Mr. John Donald McCansh, and Captain Smith can verify my words when I say that dams worth £30,000 have been washed away by those creeks. I have had the making and repairing of some of these dams. The Committee heard so much about the good timber on the south side of the river that I do not think it is worth while referring to the matter again. But the supply there for sleepers and other railway purposes is inexhaustible. Nor do I think you want to hear any evidence as to the nature of the road between Galathera and Millie. I owned Millie Station, and I used to ride over that road nearly every week, although you were told at Narrabri that it was almost impassable. Throughout upwards of thirty years' constant travelling over that route I never saw it to be so.

1148. *Chairman.*] Do you know of any better crossing within a few miles of Narrabri than the proposed crossing? That is a matter I would rather leave to the engineers. Of course you would not think of going as far back as the Broadwater. That is the only place on the Namoi that you can bridge with very high approaches on both sides.

1149. How far is it above Narrabri? Ten miles. The ridges come in on both sides and you could cross the river well out of reach of any flood, but the bridge would be a very expensive one. There was an idea once of taking the line there, but it was abandoned.

1150. Is it not a fact that your services and local knowledge have been availed of by the officers engaged in making investigations in connection with railway proposals? I do not think so on any occasion, and most assuredly not on the present. I should have advised Mr. Jamieson, who surveyed Gurleigh Point route, to go lower down the river, but he had not any option. If you ask me which is the best crossing-place I will tell you, as I think it must have been apparent to the Committee. I speak of the present road crossing from the railway station into the town of Narrabri, which is higher and less liable to floods than the route as by the proposed "red" line.

1151. Have you taken any levels with instruments? I take my levels by the floods. Levels taken with instruments cannot always be relied on. For instance, while my house at Tibbereedah by levels is higher by 7 feet than Cooma, the flood of 1864 did not reach Cooma, but was 5 feet in my house, showing a discrepancy of 12 feet in 3 miles.

1152. A flood is affected by local disturbances? Yes, and that is why we are often able to cross a water-course which a surveyor's instrument would say was uncrossable.

1153. The present road crossing from Narrabri terminus to Narrabri town is a better one than that by the "red" line? Undoubtedly so.

Francis William Bacon, Esq., grazier, sworn, and examined:—

1154. *Chairman.*] What is your occupation? I am a grazier.

1155. Whereabouts is your holding? At Dumble, Goodooga.

1156. Where is Goodooga? About 85 miles from Walgett.

1157. Higher up the river? No; it is on the Bokhara, a tributary of the Balloone, and is near the Queensland border.

1158. North-west from Walgett? Yes.

1159. Where do you send your wool and fat stock at present? Some of the stock to Dubbo and some to Narrabri.

1160. Some to Dubbo, *via* Walgett, and which way do you send to Narrabri? *Via* Collareendabri.

1161. How much do you send to Dubbo, and how much do you send to Narrabri? Last year I sent a greater quantity to Narrabri and Gunnedah, because we had a better market there owing to the operations of the Aberdeen Freezing Company.

1162. Where does most of your wool go? We have been in the habit of sending our wool to Bourke, because we have had the river during the last two or three years, but this year the Carriers' Union at Narrabri broke up, and the rates of carriage were so much lower that it was cheaper to send to Narrabri.

1163. If the Carriers' Union got into power again you might again send down the river? Yes.

1164. Is this the first season that you have sent to Narrabri? No; we always send to Narrabri. We used to send to Gunnedah twelve years ago. It was better to send there until the railway got to Bourke. The Darling river, which has been running for the last few years, has helped us.

1165. Do you put any embargo on the carriers as to the route which they shall take? No; they can take whichever route suits them best.

1166. All you say is, "Take the wool from our station to Narrabri?" By the most practical route.

1167. You leave that for them to decide; you do not lay down any hard and fast rule? No.

1168. Can you tell us what road they go? *Via* Collareendabri and Boolcarrol principally.

J. Moseley,
Esq.
7 Dec., 1893.

F. W. Bacon,
Esq.
7 Dec., 1893.

- F. W. Bacon, Esq.
7 Dec., 1893.
1169. Was the season a wet or a dry one? It was a good season. There was plenty of grass along the road.
1170. Are there times when that road is somewhat impracticable, owing to the wet weather? Yes.
1171. Do they then go *via* Millie? Yes; but if the road was impracticable about Collarendabri, it would also be impracticable about Boolcarrol. They would not be able to cross the warrambools.
1172. Are there times when they can travel from Collarendabri to Millie when they cannot travel to Boolcarrol? No; there is a high ridge all the way to Boolcarrol, which you can travel at any time and in any flood.
- 1173-4. The difficulties you would have to contend with would be in and about Collarendabri? Yes.
1175. The greater part of the wool that went to Narrabri went *via* Collarendabri and Boolcarrol? Yes.
1176. You do not know that any of it went *via* Wee Waa? No; I do not think any of it did. I do not wish, however, to speak particularly about our own clip.
1177. You have been sending your fat stock of late to Aberdeen? Yes.
1178. You truck them at Narrabri? Yes.
1179. Invariably? No; sometimes it has suited us to travel on to Gunnedah.
1180. Because the feed has been better? Yes; and to save the railway expenses.
1181. If the feed is good you will not truck at Narrabri but go on to Boggabri, or even further? Yes.
1182. On the other hand, if feed is scarce, you truck at Narrabri? Yes.
1183. Which route does the stock take to Narrabri? They go across the 60-mile track to Collarendabri, and then through Boolcarrol to Narrabri.
1184. Do you know if that is the usual route for sheep to take going from Collarendabri to Narrabri? That is the invariable route.
1185. If it has been asserted that a great part of the stock travelling from Narrabri to Collarendabri go *via* Millie, you think that is a mistake? A large number go that way. The route taken depends upon the state of the road. If a great many sheep have already travelled over the road, and feed is scarce, stock coming after go the other way. Then, too, the drovers may have a reason for delaying.
1186. Do your neighbours use the same route as you use? Yes; the neighbours above us. The stock from the Peel River Company's station comes that way.
1187. Your place is near Bokhara? Yes; Bokhara is Goodooga.
1188. Can you tell us where the people of Angledool send their wool and stock to? Invariably to Narrabri.
1189. By the route you have just described? Yes; it is 30 miles shorter to go through Collarendabri and Boolcarrol from Narrabri than to go through Walgett; and then it is a better road from Goodooga. We reckon the distance as 200 miles and 230 miles.
1190. It will depend upon the Carriers' Union and the state of the river whether you continue to send your wool to Narrabri or take it to Bourke? I am speaking for myself. I live on the dividing line, and it is just a question which is the cheapest way for us to send our produce. Our neighbours out towards Angledool and Curriwillingham invariably send to Narrabri.
1191. The neighbours to the north and north-east of you invariably send to Narrabri? Yes.
1192. But you and your neighbours to the south-east go to the river? Yes.
1193. You know the proposal before the Committee? Yes.
1194. I judge from what you say that you favour the construction of a line to the west of the proposed line? Yes; I think the line should come something like 16 miles more north-west and then branch east to Moree. The proposed route is too much under the mountains, and would not intercept any of the north-western traffic.
1195. The western and north-western traffic would be intercepted about Boolcarrol? Yes.
1196. So that it would only travel 15 or 20 miles along the railway? Yes.
1197. Do you think the country north of Moree should be handicapped with 15 or 16 miles of additional railway carriage in order that the traffic to the north-west might be served? Yes; because the country to the north-west is five or six times as large, and very rich, fattening country. A very large proportion of the Queensland wool comes down the Moonie, past Mogul, to Collarendabri. The Australian Pastoral Company have 1,000,000 sheep upon a station lying between St. George and the border, and all that wool comes into Collarendabri.
1198. Is it not a fact that a large part of that traffic comes in through Millie? It all depends upon which the carriers think the best route.
1199. If they got to Millie, and were within 12 miles of the proposed line, would they not be served by it? If they got to Millie they would not go to the proposed line to discharge their wool—they would go on to Narrabri, in order to get the back loading.
1200. *Mr. Dawson.*] They would not go at a right angle to get to the line? No; because by so doing they would not get any back loading.
1201. *Chairman.*] Has the wool trade into this Colony been affected by the duties lately imposed by the Queensland Government? Only to a slight extent. I understand that the Australian Pastoral Company paid the duty (£2 10s.) because the carriers offered such exceptionally good terms.
1202. Do you know anything of the country to the north, north-east, and north-west of Moree? Yes.
1203. You assert that the country to the west of the proposed line is larger in area and more productive than the country to the north of Moree? In area it is ten or twenty times as large. About 30 or 40 miles from Moree you get into mountainous country. That country is not fattening.
1204. How long is it since you were at Moree? Two or three years. I have often been there.
1205. How long is it since you have been north of Moree? I have been towards Talmar.
1206. Have you been to Goondiwindi? Yes. The country there is not good, fattening country.
1207. Have you been to Kunopia? No; but that is not good country. There is only a cattle station there.
1208. You have frequently been to Mungindi? I have been there. That is inferior country.
1209. Is it a fact that produce from there goes *via* Moree to Narrabri? I believe so, but the trade is inconsiderable. The country is sandy and scrubby, like that between Narrabri and Burraddeen, with only a few scrub cattle and wild dogs on it.
1210. It is similar to that on the southern bank of the Namoi, about Pilliga? Yes; the good country lies west of Moonie. The Australian Pastoral Company own a large extent of country there, which they have stocked with sheep, but it is not sheep country, properly so called.
1211. Is not the number of sheep that a country will carry a pretty good criterion as to its value? There is no better criterion.
1212. You think it is quite right that the people of Moree and of the district west of it should have to bear the expense of 15 miles of additional carriage so that the western country may be better served? Yes.

1213. Do you think that if the line were carried in the direction you suggest it would serve the trade of the northern and western districts, or would those districts require more railways in the near future? I think that in future the line would have to be extended to some point on the Barwon—say, Collarendabri or Mogil.

F. W. Bacon,
Esq.
7 Dec., 1893.

1214. Supposing the difference between the cost of the proposed line and a line such as you would suggest would pay for 25 miles or 30 miles of line out towards Collarendabri, *via* Boolcarrol, would not it suit the western country better than the proposed line? Of course, you might ask me if a line 50 miles further would not suit us better. So it would; but we are thankful for small mercies, and 10 or 15 miles is an advantage. We prefer the bird in hand to the bird in the bush.

1215. If the route you suggest were followed you would only gain the advantage of 15 miles of railway carriage, whereas a branch line would give you 25 miles of railway carriage? Yes.

1216. You say that a line to serve that country should go out in the direction of Collarendabri along the high ridge from Boolcarrol? Yes; but I would not make any suggestion as to a river-crossing.

1217. You leave that to the engineers? Yes. I should say the best place is somewhere about Narrabri. We could then go 14 or 15 miles down the river and branch out.

1218. Supposing it was thought desirable to have a branch at Collarendabri, would it not be better to take that branch off from the main line at a point about 5 miles from Narrabri? Then the western people would be handicapped by having to go round on the Moree line.

1219. You object to 5 miles unnecessary railway carriage yourself, while you think the people of Moree should have 15 miles unnecessary railway carriage to pay for? I am thinking of the greatest good to the greatest number. The district which a line such as I suggest would tap is the richest and the largest fattening district in the Colony.

TUESDAY, 12 DECEMBER, 1893.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.

The Hon. JAMES HOSKINS.

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JOHN DAVIES, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM CHANDOS WALL, Esq.

WILLIAM McCOURT, Esq.

JOHN CASH NEILD, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES COLLENS, Esq.

HENRY DAWSON, Esq.

The Committee further considered the proposed Railway from Narrabri to Moree.

Francis William Bacon, Esq., grazier, Goodooga, sworn, and further examined:—

1220. *Mr. O'Sullivan.*] I understand from your evidence that you are in favour of this line being taken as far west as possible? Yes.

F. W. Bacon,
Esq.
12 Dec., 1893.

1221. You are aware that to carry it by any route towards Wee Waa would considerably add to its cost? That is because the line would be longer.

1222. It is estimated that it would cost at least £80,000 more to take the line that way; a line *via* Gurleigh Point would be 15 miles longer than a direct line, while a line by way of Wee Waa would be about 20 miles longer? Would the 15 or 20 additional miles cost £80,000?

1223. It is calculated that 20 additional miles will add about £80,000 to the cost of the railway? A line out west would not cost more per mile than the direct route.

1224. We are told that such a line would cost £300 a mile more because the country is more difficult? I do not think it would cost as much. The proposed line would go through a lot of very thick oak scrub—belar scrub. There are several patches of very thick belar scrub, and the clearing and earthworks through that scrub would be expensive.

1225. You are a practical grazier and stock and station agent? Fifteen years ago I was a stock and station agent at Gunnedah, and also a carrying agent.

1226. Would it be more advantageous to the State and to the district to spend £80,000 in constructing a line from some point near Narrabri out towards Collarendabri than to spend it upon the Wee Waa route? £80,000 would probably pay for 30 or 40 miles of line, but you would have to bridge the river twice unless you started from the 5-mile peg, as the Chairman has suggested. In my opinion two-thirds of the traffic to Narrabri comes from the western district and Queensland, and one-third from Moree.

1227. Supposing you branch off from the proposed line to somewhere north of Narrabri? Then there would be 5 miles of extra haulage.

1228. Five miles of extra haulage for the western people; but if your proposal were adopted there would be from 15 to 20 miles extra haulage for the northern people? Comparatively little trade would go to Moree proper.

1229. Putting aside these 5 miles additional haulage, would it not be more advantageous for the State to run a branch line out from the 5-mile peg on the direct route towards Collarendabri than to follow the Wee Waa route? It certainly would be better to be 40 miles nearer Collarendabri than to be only 15 or 20, if the line could be taken there for the same money.

1230. If you were asked to choose between a direct line to Moree, with a branch to Collarendabri, and the circular route through Wee Waa, which would you choose? I should certainly choose your proposal, if it would not be throwing up the substance in the endeavour to grasp the shadow. I regard the proposed route as bad in many ways. It runs right under the Nandewar Ranges, where there is no settlement, and where there is not likely to be any. No traffic will come to it at any intermediate point until you reach Millie, a distance of 45 or 50 miles, because the stock route runs almost parallel to the line, and the carriers will prefer to go to Narrabri, the terminal station, so that they may get back-loading. Then, too, the creeks near their heads rush down very rapidly, and would, I think, occasion a good many washaways.

1231. *Mr. Davies.*] How many miles are you from the Narrabri station? About 200 miles *via* Collarendabri; but in spite of the fact that the freight on wool is 7s. a ton more from Narrabri to Sydney than it

F. W. Bacon, Esq., it is from Bourke to Sydney, it pays us better to send to Narrabri, because the carriage by road is less at present. The rate from Narrabri to Sydney is £4 7s. a ton for a distance of 350 miles, while from Bourke, a distance of 500 miles, it is only £4 a ton.

12 Dec., 1893.

1232. How many miles would you be from the nearest point on the proposed line? I do not think we should strike it at any point nearer than Narrabri. We might save 10 or 15 miles by coming in at Millie; but Millie is too high up. The carriers would not go from Collareendabri to Millie except for some exceptional reason, such as the better character of the feed. As a rule they go straight to Narrabri.

1233. You are 190 miles from Millie? Yes.

1234. A distance of 10 miles would not count with you? No; the carriers would not go that way.

1235. At present all your wool and fat sheep go to Narrabri? Nearly all. Occasionally we send to Dubbo, and we have even sent sheep to Bourke, to be boiled down.

1236. If the proposed line were constructed, you would still send to Narrabri? Yes; the proposed line would be of no service to us or to the people of the western districts. It would be better if it went along the stock route. If the line crossed the river at Narrabri, and then went 8 or 10 miles further west, it would be of more service to us.

1237. If the line were taken along the travelling stock route, how far would it be from your station? I suppose that would bring it 10 or 15 miles nearer.

1238. That would be of no advantage to you? Not very much.

1239. You would continue to send to Narrabri even if the line were taken along the stock route? I think so. The carriers would go to the terminal station for the same price, because, even if they unloaded the wool at a side station, they would have to go on to the terminal station to get back-loading.

1240. So that neither the direct route nor the travelling stock route would be of any service to you? Practically none. In either case the line would be 175 or 180 miles away from us.

1241. The only line that would be of service to you would be an altogether independent line, leading away towards Mungundi? An alternative line running 15 or 20 miles towards Wee Waa would be of service to us, as the extension of a line which would ultimately go to Collareendabri.

1242. What would you regard as a reasonable railway service for a station such as yours? A reasonable distance to be from the railway?

1243. Yes? If we were within 80 or 100 miles of a railway we should consider that we were fairly well off.

1244. You would send your wool and fat stock to a station within 80 or 100 miles of you? Yes, of course.

1245. How far do you think the proposed line is from the mountains at the nearest point? The mountains are not shown on the map before the Committee; but I know that at Killarney they are very close.

1246. How near are they? I should think that at Killarney they must be within 4 or 5 miles of the line.

1247. Would you be surprised to learn that they are only within 15 or 20 miles of the line? I certainly should.

1248. You stated that there was not likely to be any settlement along the line to the east? No; the line goes through large estates there, and the best part of the land has been purchased.

1249. Is not a great part of the land included in the conditional leaseholds which will fall in next year? That land is no good. The best land was purchased before the 1884 Act was passed.

1250. Very nearly every person examined by the Sectional Committee stated that he would take up that land immediately it was available. Those were men who already held land in the district—selectors? I know that there cannot be any great quantity of leasehold land there. On Gurley and Edgeroi there is a good deal of freehold land; on Gurley there are over 100,000 acres of freehold land. There is a good deal of scrub land.

1251. You have no idea as to the area of land that will be available next year when the leaseholds fall in? No; I have not gone into the matter, but I know from the amount of settlement that has taken place in the past that there cannot be a large area of good land available. Of course the construction of the railway would cause people to take up land which under other circumstances they would not look at.

1252. Then the construction of the railway will be the means of creating settlement? Yes; people will take up even inferior land when there is a railway.

1253. Do you regard the land through which this line would pass as inferior? Yes.

1254. Is it not as good as any that can be found in the district? The line passes through a great deal of freehold land—land which is not the property of the State—that is good, and will increase the value of the four or five large estates which it traverses.

1255. According to the Land Office map, the line will serve a large quantity of land which is not now occupied? It will go through Eckford's forest, but that is not good land. It is heavily timbered, and is comprised in a forest reserve.

1256. Is not Eckford's land well watered? No, except for the tanks and dams which he has made. It is a dry country there.

1257. But the land is very good? Eckford's freehold land is very good.

1258. But does he not lease some good land? No; the good land was secured years and years ago.

1259. You are of opinion that the land through which the line passes is not of much value? No; and my opinion is confirmed by a reference to the Lands Office map before the Committee.

1260. If the line were taken more to the west, as you suggest, would it not still pass through alienated country? Not to so great an extent, because the settlement there is of a later date.

1261. Do you know that country? Yes; it is open plain country—Boolecarrol is splendid country. There is not a better run in Australia than that. I do not, however, think that there is any great point about that, because not very much land would be available.

1262. Do you think that the Crown land available for settlement would be largely increased in value by the construction of a line either along the direct route or along the route suggested by you? Undoubtedly it would. I would rather pay 1s. an acre for land nearer a railway than 2d. an acre for land where I live. It cost us, if we send through Bourke, £9 a ton for our wool, and if we could get it down for £4 a ton, that would make a saving of £1,000 on a clip of 200 tons, which would pay a greatly increased rent.

1263. What is the present value of the land through which the railway passes, and what would its value be if the railway were constructed? I do not think there would be very much difference in the value

value of Crown land. The only block of Crown land available is Eckford's reserve, which is within a reasonable distance of Narrabri now. Of course the construction of the line would add to its value; but I cannot say that it would make very much difference to it. The quality of the land being inferior, there would have to be a railway constructed before the people would take it up. The only reason that it has been left so long is that it is no good. Every bit of good land has been already taken up.

1263½. The other day we saw lots of good land that will be available? I am very much astonished to hear it.

1264. If the railway were taken more in a north-westerly direction, would it increase the value of the land through which it passed? Its construction would certainly justify the Government in charging higher rents.

1265. I gather from your evidence, that you are entirely opposed to the direct route? Entirely.

1266. Notwithstanding, that it can be constructed as cheaply as £2,500 a mile, you think it would not be prudent to make it? I think a line can be made just as cheaply, and indeed, more cheaply by keeping further to the west. In my opinion, the cost of clearing the scrub and making earthworks will be much greater on the proposed line. The Deniliquin-Moama railway only cost £2,500 or £2,600 a mile, and has been running seventeen or eighteen years. That line has paid good dividends, though there is not nearly so much traffic there as there would be on the proposed line. There they carry about 30,000 bales of wool a year, and this year 70,000 bales of wool have already been sent from Narrabri.

1267. Is not the country better for the construction of a railway? It is better than the country on the proposed route, but not better than the country on the stock route. The Deniliquin country is a dead level, while this is rolling downs country; but I do not think there is much difference.

1268. The Deniliquin country is not so rotten as this? I do not know; I have been often bogged in the plains there.

1269. Could you make an ordinary macadamised road half a chain wide through this country for £2,400? I am not sufficiently up in road-making to be able to say.

1270. *Mr. Hoskins.*] Is it your opinion that the land traversed by the proposed line is not equal in quality to the land further to the west? Decidedly.

1271. A witness has been examined before the Committee who lived in the district forty years, and who stated that the land on the proposed route is similar to that further west? I am sure that it is not. You have only to look at the map to see how little Crown land is left on the western route. The only patch of Crown land is timbered land.

1272. Your only criterion of the value of land is the extent to which it has been alienated? That is a very good criterion. That land was taken up in the free selecting days, when the whole of the runs were thrown open. I admit that the freehold land on the proposed route is similar in quality to that further west; we have only to look at the map to see that the bulk of the land on the proposed route has been sold.

1273. You said, in reply to Mr. O'Sullivan, that no settlement had taken place on the sides of the Nandewar range, and that none was likely to take place there? Not very much settlement has taken place in the past, because the leaseholders bought the best land years ago, that is, the land near the roads and the creek frontages. Wheat-growing has never been taken up to any extent out there, and the people who have gone in for sheep-farming have naturally taken the best country, that is, the plain land with the richest grass. They will not take up scrub-land.

1274. Do you not think that if the proposed line was made, the land on the slopes of the Nandewar range would be taken up? I think that it would be taken up in course of time, as land got scarce. It is inferior land.

1275. In what way? It is stony, rocky, and barren. Of course, there are patches of very rich land where the *débris* has been washed down from the hills.

1276. That land has not been taken up? I cannot say that altogether. It does not look by the map as if there was very much land available. In my opinion the patches marked Crown lands are scrub. I know that there is a great deal of scrub at Pycannah.

1277. If land in the vicinity of a railway were scrubby would that prevent people from using it? No; people will take up any land near a railway. Scrub land on the Murray, which people would not look at twenty years ago, is now eagerly taken up. A railway will cause inferior land, which otherwise would not be taken up, to be used.

1278. As a great deal of land to the west of the proposed line has been purchased and forms part of large estates, does it not appear to you that the land which has been left in the vicinity of the line, even though it is scrubby land, may be taken up? Yes; and I think it would be if a railway were constructed.

1279. *Mr. Neild.*] With reference to the land lying east of the proposed route, have you any knowledge of it? I could not say yes or no to that question. I have been through those runs but I have not seen the proposed line marked out on the ground.

1280. Is there much scrub land in that locality, within 20 miles of the range, on the westerly side of it? There are patches of scrub land at intervals. I know that there is a good deal of scrub on Dobikin.

1281. That land has been described by a preceding witness as constituting a third of the whole area lying between the proposed line and the range;—do you think it is as much as that? I think so.

1282. Would it be expensive to clear such land? Yes; because most of it is heavily covered with belar.

1283. At that rate the land to the east of the line would not be as valuable as land to the west of it, where there is less scrub? No.

1284. It would not be so productive at the same expenditure? No.

1285. Would it pay to clear it for pastoral purposes? I do not think it would. It might pay to ring-bark it if one had a long lease. Belar dies very quickly, and grows on good land.

1286. Have you a knowledge of the effect of rainfall upon the country which the railway will serve? Yes.

1287-8. In your opinion would it be necessary to make more ample provision for storm waters along the travelling stock route or the Gurlcigh Point route than along the direct route? I think there would be most risk of washaways on the direct route, because, near to the range, the water would come down with a greater rush.

1289. You think that railway works on the direct route would run the greatest risk of destruction? Yes. I have seen the same thing at Gunnedah,—the line from Gunnedah to Breeza runs along under the range, and it has been washed away several times.

1290.

- F. W. Bacon,
Esq.
12 Dec., 1891
1290. On the plains the water is not so rapid? No; it spreads out more.
1291. Is there anything that would lead you to suppose that the cost of construction would be more per mile on the western route than on the direct route? Certainly not. I think the western route would be a shade cheaper than the other route.
1292. If it has been stated that the western route would cost £300 or £400 a mile more than the other route, that evidence is against your knowledge and experience of the country? Certainly.
1293. Are you aware that it is proposed to put only 3 inches of ballast under the sleepers? No.
1294. You know the size to which railway ballast is usually broken—2½ to 3 inches, is it not? Yes.
1295. So there would be the depth of one stone under the sleepers? Yes.
1296. Do you think that that would be sufficient on the black soil? No, I do not.
1297. Of course, the soil will be banked up more or less, but you still think that more than 3 inches of ballast will be required to prevent the sleepers from subsiding? I do.
1298. Would the water be likely to undermine the embankments, and cause them to liquify, so to speak? No; I do not think so. That black soil is very tough stuff.
1299. It is not likely to dissolve? I do not think so.
1300. You are aware that accidents have happened on our railways through the action of water on soils of a pipeclay character? Yes.
1301. But you do not think there is much risk with black soil? I do not.
1302. Do you know anything of the proposed new crossing at Narrabri? No, I do not. I know where the bridges are.
1303. You could not say if the proposed site was liable to be greatly flooded? No; that is a matter I cannot speak about.
1304. You are in favour of a line to the west, because it would serve a large existing settlement, and would probably serve a larger future settlement than the direct line? Yes; I should like to emphasise the point that such a line would also serve the great Queensland trade. I mentioned the other day that the Australian Pastoral Company owned 1,000,000 sheep. The Queensland Government are making tremendous efforts to get that trade, and have put a tax of £2 10s. upon all wool exported into New South Wales, and the company are, therefore, going to erect sheds on our side of the Border, and shear their sheep there.
1305. A duty is not imposed on wool on the sheep's back? No. Their other sheep will be sheared in Queensland, but the wool will be sent into New South Wales in order to take advantage of the cheaper carriage and the better market.
1306. Does that company sell any of its wool in the colonies? No; but I believe that they contemplate doing so.
1307. I suppose there would be a better market in Sydney than in Brisbane? There is no market in Brisbane.
1308. The whole of the wool sold in the colonies for foreign shipment is sold in Sydney or in Melbourne? Yes.
1309. *Mr. Hoskins.*] And in Adelaide? Yes.
1310. *Mr. Neild.*] But that is not much? No; only South Australian wool is sold there. Queensland wool goes to Sydney or to Melbourne.
1311. At one time wool was sold in Newcastle? Yes; it was tried for a season or two, but buyers would not attend.
1312. The supply was not large enough? No.
1313. The foreign buyers coming here find it necessary to centre their operations as much as possible? Yes.
1314. Is there any prospect of a market being opened in Brisbane for wool for foreign shipment? There is no doubt that there will be ultimately.
1315. But you do not think there is likely to be a market there for some time to come? No.
1316. The time is not sufficiently near to be worth taking into consideration in connection with the proposal before us? I do not think it is; but what I wish to draw attention to is the fact that the company to which I have referred pay the duty in order to send the wool to New South Wales, and take advantage of the cheaper carriage.
1317. Has any of the Australian Pastoral Company's wool gone to Melbourne? They have not sold any of their wool either in Melbourne or in Sydney. It has all been shipped home.
1318. From Sydney, or from Newcastle? Probably from Newcastle as it went to London; but I cannot say positively. Then, again, a great many of the people in the northern districts get their supplies from Maitland.
1319. From the Maitland houses? Yes.
1320. How far would that trade extend? Right up to St. George. When I was a carrying agent in Gunnedah we frequently sent up large quantities of supplies to Fisher's station and to Munro's station; in fact, right up to Boomba, which surrounds the town of St. George.
1321. Was that trade carried on prior to the extension of the Queensland line, or after it? Not entirely. The Australian Pastoral Company have during the last few years got the bulk of their supplies *via* Narrabri.
1322. If the line were taken westward from Narrabri to Moree, would the extra length of, say, 15 miles, prejudicially affect that trade? Oh, no. No doubt the Queensland Commissioners will make another effort next year to secure it. That trade, however, does not come to Moree.
1323. Where does it come to—to Millie? Mainly through Boolcarroi, and in some cases through Millie. It mostly comes down the river to Mogul.
1324. And the further the line is taken west, the more the trade will be inconvenienced? Yes.
1325. Moree is not a factor at all then? No; it is quite out of it.
1326. You would prefer the Gurleigh Point route to the travelling stock route? Yes.
1327. You would cross the Namoi as far west from Narrabri as possible; that is, within due limits? That is a matter for the engineers to decide.
1328. But for the convenience of the trade of the district, you would like to cross the Namoi as far west of Narrabri as possible? It would not matter; wherever the most suitable place was.
1329. But, still you want the line to run fairly west from Narrabri for some distance? Yes.
1330. As a matter of fact, you are less interested in Moree as a railway centre than you are in a line of railway running west of Narrabri? Yes; Moree would be of no use to that part of the country at all; it would be no use to any of the country lying west of Mungindi.
- 1331.

F. W. BACOR,
Esq.
12 Dec., 1892

1331. Your interest in the railway practically ceases within a few miles of Narrabri; you want the line to go as far as possible to the west—the further to the west, within about 40 miles, the better? Yes.
1332. If a line were taken to Walgett it would suit you better than a line from Moree? Yes.
1333. You advocate a westerly extension from Narrabri, rather than a northerly one? Yes.
1334. *Mr. Wall.*] I presume you regard the proposed line as a permanent one? Yes.
1335. On what part of the Bokhara is your station situated? Just where the Birrie joins it very near to the border.
1336. How far is your station from Walgett? From 70 to 80 miles.
1337. You are 50 or 60 miles from Brewarrina? Seventy-five miles from Brewarrina.
1338. How far is your station above Tallywalka? Forty-five miles.
1339. What distance is it from Moree? One hundred and eighty or 190 miles. It is very nearly as far from Moree as from Narrabri.
1340. Since you are 75 miles from Walgett you would be 100 miles nearer that town than you would be from the proposed line, even if a deviation of 15 miles were made? Yes.
1341. In that case an extension of the line to Walgett would serve you better than a deviation on the proposed line? Yes, it would serve that particular part of the country better; but I am speaking very little in my own individual interest. Our station is right on the border, and this line would not be sufficiently near us to be of any great service.
1342. Do you regard the overflow of the Balloone as a very superior pastoral country? Yes; some of the best land in the country is there.
1343. That country would not be served by the proposed railway if the line were taken to Walgett? No; that is, the country within 30 or 40 miles of us.
1344. If a line were taken from Coonamble to Walgett, or from Bourke to Brewarrina, it would serve you better than the proposed line? Yes; but it would not serve the country round Collarendabri and Mogul.
1345. And Angledool? Yes.
1346. But that country would be better served by a line to Walgett than by a line to Moree? Yes; that is, the country on the west of Collarendabri.
1347. You are under the impression that a branch line would serve the district better than a deviation of the proposed line? Yes; because I anticipate that £80,000 would pay for the construction of 30 or 40 miles of railway, which would suit us better than only 15 miles.
1348. But the working expenses of the proposed line are estimated at £7,000 per annum, and a branch line would mean increased working expenses? Yes.
1349. *Mr. Dawson.*] You consider that if the line were taken *via* Gurleigh Point, or out towards Wee Waa, it would form part of the main line to Walgett? Yes; but that is a point I have not brought forward at all. Such a line would serve the country between Walgett and Wee Waa, and would be so much of the Collarendabri line made.
1350. What traffic in wool and fat stock would there be on the westerly route as compared with the traffic on the proposed route? I think that two-thirds of the traffic comes from the west and north-west as against one-third from Moree. The country served by Moree is comparatively small.
1351. *Chairman.*] What proportion of the traffic from the west and north-west would use any part of the line from Narrabri to Moree? I do not think that it would go to the proposed line, which would be miles out of its way.
1352. *Mr. Dawson.*] What area of country, and what quantity of stock in the Walgett district would be benefited by a line going in a north-westerly direction from Narrabri? I should say there were 2,200,000 sheep in that district, and 1,500,000 would use the line, though, of course, if the rivers were in flood, and the steamers could come up to Walgett and Collarendabri, as they have done, the wool would go that way, but the rivers cannot be depended upon.
1353. Then a little over two-thirds of the sheep in the northern district would come to the proposed line? Yes.
1354. *Mr. Collins.*] Is there much settlement between Wee Waa and Walgett on the south side of the river? A considerable lot.
1355. What sort of country is that? There is a great deal of inferior country from Wee Waa to Pilliga.
1356. Is there much settlement there? Not a great deal. The country there is mostly forest country.
1357. Then a line from Pilliga to Wee Waa would not assist settlement much? No. There is a great deal of inferior land there which was abandoned because of the heavy rentals, but which would be taken up again if the line were constructed.
1358. If land were not taken up, there would be no settlement for a railway to serve? There is not a great deal of what you might call small settlement, but all the leasehold areas round Walgett have been taken up within the last two or three years.
1359. Do you know that the resumed areas on all the runs between Wee Waa and Pilliga have been thrown up? I should not be surprised to hear that the leaseholds had been thrown up.
1360. Consequently they would not assist the line very much if it went to Wee Waa? That is only a matter of 20 or 30 miles; but if this inferior land were offered at 4s. or 5s. a square mile, it would be taken up in improvement leases.
1361. It would have to be taken up in large areas? Yes; areas of 2,560 acres.
1362. If it were cut up into 10,000-acre blocks, there would not be much settlement? I think there would be. That country would grow wool if it were ringbarked and cleared.
1363. Would there be fifty 10,000-acre blocks between Pilliga and Wee Waa? Yes; there are more than 500,000 acres there.
1364. At present there is no settlement of any account between Pilliga and Wee Waa? No; because the country is inferior.
1365. Are you aware that stations like Goangra send their wool to Walgett when the river is up? I never heard of the Goangra people sending their wool to Walgett, but I have no doubt they would do so.
1366. If the rivers were navigable they would;—if you lived there where would you send your wool? I would send it by whichever was the cheapest route.
1367. If the wool from Goangra and Euroka went by the river, there would not be much to send on the line from Wee Waa to Pilliga? But Euroka is altogether out of the question; you should take stations like Yarraldool.

- F. W. Bacon, Esq.,
12 Dec., 1893.
1368. That is on the north side of the river? Yes. The wool would go by the river.
1369. Do you know the country up towards Boolcarrol? Yes.
1370. Have you ever been there when the river was in fresh, or when there was a flood? I have seen a pretty fair flood.
1371. Which would be the best place for the railway to cross? I could not give you an opinion on that subject, because I never looked at the place with the idea of finding out.
1372. Was there a very high flood when you were there? Just an ordinary fresh. The banks there are very high.
1373. Would the country between Boolcarrol and Wee Waa be flooded? I never saw it flooded, but it looked as if it might be. The whole of the Namoi country is flooded occasionally.
1374. All the country within a certain distance of the river would be likely to be flooded? Yes.
1375. It would be difficult to construct a railway through that country? Yes; but there is not much flooded country above Wee Waa; the river breaks out down below. It is all high red ground.
1376. You said there was a large quantity of belar scrub on this route? Yes.
1377. Do you know that from your own observation? Yes; I have been at Edgeroi, and at Eckford's place, and also at Dobikin, buying sheep.
1378. Have you been all along the surveyed route? No; I do not know where it is.
1379. You do not know whether it goes through scrub or not? No; not having seen the route marked out; but from the way the scrub runs out in the range it must cut through it.
1380. Do you know through how much scrub land the line runs? No; I could not say what the area is.
1381. *Mr. Dumphery.*] I did not quite gather from your evidence about the traffic of the railway whether you intended the Committee to understand that the proposed route would earn about one-third of what would be earned, supposing the railway were taken towards Millie by the Gurleigh Point route—is that your meaning? Yes.
1382. In other words, if the railway were taken along the Gurleigh Point route, the earnings would be three times what they would be along the proposed route? Yes; but if the proposed route were constructed, the remaining two-thirds would still go to Narrabri.
1383. Why do you think that? Because I know that the carriers would not care to go out of their way to get to the line. They would just as soon go on to Narrabri, although it might be 10 or 12 miles further, in order to get back loading.
1384. There would be very little traffic between Narrabri and Moree? Very little. The first of any account would come in at Millie.
1385. The bulk of the traffic would come in at Moree? One third of the traffic would come from Moree; but the bulk of it, two-thirds, would go to Narrabri.
1386. You said that much of the land along the proposed route was good land, but that it was in the hands of private owners? Yes; there can be no doubt about that, if the map is correct. The line will go principally through four large estates.
1387. But the produce of those estates would go to the line? Yes; of course.
1388. Would not the produce of 50 miles of country be of any importance? It would come to the line in any case; but it would not be enough to make the railway pay.
1389. Would not the earnings of those stations be appreciable? Their produce would amount to a few hundred tons in a year.
1390. But it would be nothing in proportion to the traffic on the other route? No.
1391. *Mr. Collins.*] It would not be possible to construct a cheap line over the 15 or 20 miles of country from Boolcarrol to Collarendabri, because of the floods? There would have to be more bridges.
1392. *Mr. Wall.*] If the line were taken along the proposed route, would it bring in more trade than now comes to the Narrabri station. Would the whole of the trade between Narrabri and Moree come to Narrabri? Yes; every bit of it.
1393. Therefore the construction of the proposed line would not bring about an increase of traffic, except in the country between Moree and the Queensland border? No; when the lines gets to Moree, it is quite possible that a few of the stations beyond Goondiwindi, which now trade with Brisbane and the Darling Downs, may send into New South Wales.
1394. Would the trade be extensive? Not very. There are only two or three good stations there, such as Callandoon and Welltown.
1395. There is no extensive trade to be attracted to this line beyond the trade from the district between Moree and the Queensland border? That is so, because the country lying north of the McIntyre is inferior sandy scrub country; it is not sheep country, and never will be. The trade from the south of the McIntyre has always come into Narrabri. You may get the trade of a few stations about Goondiwindi.

Frederick Poate, Esq., District Surveyor, Department of Lands, sworn, and examined:—

- F. Poate, Esq.,
12 Dec., 1893.
1396. *Chairman.*] You are district surveyor in charge of the Tamworth district? Yes.
1397. Tamworth is about 60 miles east-south-east of Narrabri? It is nearly 100 miles from Narrabri in the direction you say.
1398. How far does your district extend west or north-west? About 75 miles due west of Narrabri.
1399. That is your western boundary? Part of the western boundary.
1400. How far north of that do you go;—is Bingara in your district? No; it is not.
1401. How far is it north of your northern boundary? About 30 miles. My line follows the Nandewar ranges northerly, and the boundary of the county of Jamieson.
1402. Crossing the proposed railway line, about 40 miles from Narrabri, north? About Gurley station. It follows the Thalaba Creek down to the north and south line to which I have already referred.
1403. Then comparatively little of your district is shown on the Land Office map? Very little.
1404. The greater part of your district being to the south and south-east of Narrabri? Yes.
1405. How long have you been in charge of that district? Four-and-a-half years; but prior to that I was there for three years.
1406. So that you have an intimate knowledge of it? Yes.
1407. Have you a knowledge of the country north of your own district? I know that country to the north-west, in the direction of Angledool, Brewarrina, and Bourke.

1408. *Mr. Davies.*] What quantity of land available for settlement in your district would be served by the proposed railway? Do you mean at the present time?

1408½. I mean the land available now, and the land that will be available when the leaseholds fall in at the end of the leases? Not a great deal. I should think there would be from 80,000 to 90,000 acres along the railway line.

1409. Within an easy distance of it? Adjoining the direct line.

1410. What, in your opinion, would be the increased value given to that land by the construction of that line? I do not think that the construction of the line would make any appreciable difference.

1411. Is the land through which the proposed line will pass good land? A great deal of it is very fair, while a lot of it is almost worthless. In the parish of Cowimangarah there are 15,000 to 16,000 acres of unoccupied land.

1412. *Chairman.*] How many miles to the east of the proposed line? About 10.

1413. And about 15 miles from Narrabri? Yes, about that.

1414. *Mr. Davies.*] That land is available for selection, but has not been taken up? Yes; it has not even been held under pastoral lease or annual lease.

1415. What is the character of it? Rough mountainous country, covered with dense scrub.

1416. It is not likely to be occupied? Not under any tenure that can be given at the present time.

1417. In your estimate of the area of Crown lands available for settlement, you take in the forest reserves, the railway reserves, and everything else? Yes; but the estimate is only a rough one.

1418. Do you include the land that will be available in the future and that is now held under lease? Yes.

1419. That land will be available when the leases fall in? Yes.

1420. Is not most of that land good land;—I mean the land now held under lease? Not on the east of the proposed line.

1421. But taking both sides of the line? How far would you go to the west?

1422. How far do you think the holders of land on either side of the line would be served by it? With the exception of Edgeroi, Dobikin, and perhaps a little of the country around Millie, all the traffic on the west of the line would go to Narrabri by road.

1423. How far would the country be served on both sides of the line—say, at Woolabrar or at Gurley? I do not think that any of the country west of the stock route would be served by the line.

1424. In your estimation of 80,000 or 90,000 acres do you include the land to the west of the line? There is very little to the west.

1425. What proportion of the leases that will fall in lie on the western side of the line? I should say that on Edgeroi about half the area that would be available lies on the western side of the line, while practically the whole of the leasehold area of Dobikin lies on the western side of the line.

1426. How many acres would there be? I should think about 50,000 or 60,000 acres; but those leasehold areas extend considerably to the west of the stock route, and those parts of them would not be served by the proposed line.

1427. What distance would the Edgeroi station be from the Edgeroi run? The station would be on the run. The selectors on Edgeroi live west of the stock route. There are practically none out on the east until you get near Gurley.

1428. What distance will it be from where the selectors are on the west to the proposed line? It would be 12 miles to the boundary of the selections.

1429. Do you regard that as too long a distance for people to send their produce to the railway station? No; but, instead of going that 12 miles, they might just as well go straight into Narrabri.

1430. How many miles would it be from the point you speak of to Narrabri by road? About 20 miles.

1431. Eight miles further? Yes. They would continue to use the road which they use at present. Twelve miles is the distance which they would be from the railway in a direct line, but by the road they would probably be more.

1432. You are of opinion that they would continue to go into Narrabri, even if the railway were constructed? Yes.

1433. Do you know the original survey along the stock route? I know the stock route.

1434. You have also a knowledge of the country there? Yes.

1435. Do you regard the country along the proposed route as better for railway construction than the country along the stock route? No; I do not think it is better.

1436. Is the country along the stock route more subject to floods? I should say not.

1437. Is not the country along the proposed route higher than the country along the stock route? In one sense it is; but from a flood point of view I should say that it was not. I think that is what you wish to know.

1438. You think that although it may be higher, it has no advantages for the purpose of railway construction over the travelling-stock route? The hills on the eastern side of the proposed line have well-defined gullies; but when the water gets out of these gullies it has no defined channels, and spreads out over the country until it gets down near the stock route, where the creeks are more marked, and the water flows in between banks again. If the country along the direct route were higher, the teamsters, when the whole of the country was open for them, would have gone that way. Last June I was on Dobikin, and at a place 3 miles west of the proposed line I saw fence posts which had been washed across the plains for 3 or 4 miles. I saw nothing of that sort along the stock route.

1439. Have you ever seen anything of the kind more to the east? No.

1440. How far would these fence posts be to the east of the stock route? About 5 miles. They came either from the eastern side of the proposed route, or from just on the proposed route. That route had not been marked out at the time.

1441. Have you traversed the whole of the proposed route? I know the whole of it as far as the boundary of my district.

1442. But you do not know the whole length? Not the part that traverses the Moree district.

1443. Do you regard the country through which the line has been surveyed as fairly good? From a pastoral point of view?

1444. Yes? With the exception of the belar scrub and the forests.

1445. Is there much scrub country that would be affected by the railway? There is the Tarlee forest reserve, and the Eckford forest reserve.

1446. What is the extent of the scrub land? There must be very nearly 38,000 acres of belar country.

- F. Ponte,
Esq.
12 Dec., 1893.
1447. With the exception of that land, you think the country very good for settlement? The Cowman-garah country is bad.
- 1448-9. How much of it is unfit for settlement? Since that land has been available for settlement ever since 1861 and has not been used yet, I think we may say that it is worthless.
1450. But if it is served by a railway, will not that give it an advantage over country wanting railway communication? That country will never be improved unless the lessee can obtain it at a nominal rent for a long tenure.
1451. It is not at present served by the line to Narrabri? Practically.
1452. Is it not as well served by the present line as it would be by the proposed line? The proposed line would be a little closer to it, but not much.
1453. Do you favour a direct connection between Narrabri and Moree, or do you think the line should be taken along the stock route, or through Wee Waa, or some place more to the west? Knowing what I do of the country, of its occupation, and of the nature of the traffic there, I consider that the best line to make would be one crossing the river at Narrabri, and running down practically to Gurleigh Point, only on the north side of the river, and then following the Gurleigh Point route.
1454. From what part of the town would you propose to start? I believe that the crossing that has been selected for the direct route is one of the best that could be found there.
1455. In your opinion it is one of the highest points? I believe it is.
1456. *Mr. Neild.*] You have given some fairly lengthy reports with regard to the value of the country in the district traversed by the proposed line? Yes; I furnished a report on the subject.
1457. In your opinion, what would it cost to clear the belar scrub country and place it on an equal footing with land which is free from scrub? For railway construction?
1458. No; for agricultural or pastoral occupation? It would be sufficient to ringbark it for pastoral occupation.
1459. What would that cost? One shilling and threepence an acre.
1460. What would it cost to clear it for agricultural purposes? It would be necessary to remove the stumps. If you allowed the timber to die you could get rid of it by burning at from 10s. to 15s. an acre, but otherwise it would cost from £5 to £6 an acre to clear it.
1461. You consider that railway works upon the proposed route would be more likely to be interfered with by storm-water than railway works on a route further west? That is practically my opinion.
1462. You would not expect to hear that evidence has been given by officers of the Railway Department to the effect that a westerly line would cost £300 or £400 a mile more than the direct line? I should certainly not expect to hear that. In my opinion, the direct line would cost more than a line further west, because it would go through belar scrub, and you would have to pay for clearing away the timber, and ballast is not so easily obtainable as on the line I have indicated.
1463. I presume that it is more expensive to construct earthworks in timbered country than to construct them in open country? Certainly. You must clear the timber out of the way before you can start the earthworks.
1464. In timbered country you would have to deal with stumps and roots? Yes.
1465. Can you give us any idea of the difference in cost per yard between removing earth in open country and removing earth in timbered country? It would cost about £80 more per running mile to clear the timber.
1466. But would the cost of removing earth be greater? That would allow for the increased cost of moving the earth. That amount of money would clear the timber out of the way and leave the land ready for the plough.
1467. Can you give us any idea of what increase in value, if any, the construction of the line would give to land in the locality occupied solely for pastoral purposes? The difficulty in answering the question is this: at the present time the Government does not get the value of that land.
1468. By selling or by leasing? By selling it under the free selection principle. If we cannot get the value at the present time the increased value given to it by the railway will not make any difference.
1469. Would land within an area of, say, 25 miles, occupied mainly for pastoral purposes, be increased in value? Twenty-five miles on each side of the line?
1470. Yes? No; not as far as that.
1471. Well, take land within 10 miles of the line? I do not think it would make any difference to land occupied for pastoral purposes.
1472. You think that the saving in the cost of driving stock or carrying wool within a limit of 25 miles would be so slight as not to increase the value of the land? That is my opinion.
1473. You would be puzzled to know how to assess the enhanced value given to the land by the railway? Yes.
1474. Will the same remarks apply to land occupied for agricultural purposes? No.
1475. There would be no difficulty in determining the increased value of such land by the large quantities of produce sent to the line? No difficulty at all.
1476. Is there more settlement to the west of the proposed line than along it? Practically the whole of the settlement is to the west—that is, in the county of Jamieson.
1477. In taking the line further to the west you would be able to allot a betterment charge more easily than you would be able to allot such a charge in connection with land along the proposed line which is used wholly for pastoral purposes? Yes. It is at present under consideration to acquire about 20,000 acres of land from the Edgeroi Estate—that is, land in the parishes of Galathera, Gommel, and Gundemain. That is some of the best land in the Narrabri district.
1478. It is contemplated to resume that land? To acquire it by way of exchange.
1479. For what purpose? Under the 46th section of the Act of 1889.
1480. To throw it open for agricultural purposes? Yes; that is some of the best agricultural land in the district, and an unlimited supply of water is to be obtained by sinking 50 feet.
1481. What is the land to be exchanged for? It is to be thrown open for selection in special areas.
1482. In advocating the extension of the line to the west, you have in view the possibility of settlement upon the land to which you have referred and its occupation for agricultural purposes? Yes.
1483. You expect that if this scheme is carried out there will be a large settlement in that locality, and that a great deal of agricultural produce will come from there? That will eventually become the farming part of the Narrabri district.
- 1484.

F. Poate,
Esq.
12 Dec., 1893.

1484. Is there any prospect of agricultural settlement along the direct line? Practically none.
1485. On what grounds do you make that statement? The land is not suitable for agriculture. You cannot do anything with the black soil country.
1486. Why? It is too heavy to work. You cannot get a plough into it. In wet weather it rolls into mud, and in dry weather it is as hard as iron—you cannot break it up.
1487. In your opinion, the country traversed by the direct line must always remain in pastoral occupation? Until the forces of nature have broken it up.
1488. That is many years to come? Thousands of years to come.
1489. You deem the only valid reason for the construction of the direct line to be the object of getting to Moree as quickly as possible? Yes.
1490. Is there anything except the shorter distance to be urged in favour of the direct line? Nothing whatever.
1491. Do you know the amount of ballast that it is proposed to place under the sleepers? I have heard it said that 3 or 4 inches are to be used.
1492. Do you know the size to which metal is broken for ballasting purposes? Yes.
1493. What is it? Two or 3 inches.
1494. From $2\frac{1}{2}$ to 3 inches—about the size of road metal or a little larger—that would give you a little over the depth of one stone under the sleepers? Yes.
1495. Would that be sufficient to bear the weight of passing trains in this black-soil country? No; the ballast would disappear after the first spell of rainy weather.
1496. Irrespective of the weight of the train? As soon as the soil got thoroughly wet the weight of the trains would make the ballast disappear.
1497. Are you aware that the soil would be banked up 2 or 3 feet? No; but that would make a considerable difference, because if it were banked up the soil would take a long time to get wet. If the soil once gets wet the ballast will sink when the trains pass over it.
1498. Would water make its way through these embankments and destroy them? This black soil has one peculiar quality. If you took a lump of it as big as your fist, which it would require a hammer to break, and put it into a bucket of water, it would almost disappear.
1499. It is soluble; therefore water lying against an embankment would be absorbed by it, and would destroy it? It would be very liable to do so.
1500. An extra depth of metal would not provide against that contingency? No; but I suppose that what would be done would be to cut large drains to keep the line dry.
1501. There would have to be a considerable number of culverts, I suppose? Yes, on the direct line; otherwise it would be washed away.
1502. Would the same answer apply to the line further west? I do not think that it would require as many.
1503. Why? Because the channels of the creeks there are better defined.
1504. On the direct line you would require a large number of culverts, while on a more westerly line you would require a large number of bridges? I would hardly say that you would require more bridges, because you have to cross the same number of creeks on the direct line, and in addition you would have to provide getaways for flood-water.
1505. What meaning do you attach to the word "getaway"? When the water gets out of the gullies on to the level land it spreads out, and it would be necessary to provide channels to conduct it to the other side of the railway line. If you put an embankment across the country, without making sufficient channels to carry the water off, it would act as a big dam, and in order to let the water away you must have a greater number of openings than you would require if there were large natural channels.
1506. You use the term "getaway" as I use the term "culvert"? Yes.
1507. You think that the same number will not be required on a more westerly route, because the creeks there are better defined? Yes; and they would carry off the bulk of the water.
1508. Is the soil along the westerly route the same black soil as that along the proposed route? Yes; it is very much the same.
1509. Is the force of the flood-water as great on the western route as it would be on the proposed route? No; it has not the same effect on the fences.
1510. While fences are destroyed by flood-water along the proposed route they are not so liable to injury further west? Yes, that is so, up to what is known as Gurleigh Point.
1511. The water is more slack there? Yes.
1512. Have you made any personal examination of the proposed crossing at Narrabri? No.
1513. Have you heard of the crossing advocated by Mr. Moseley, about 2 miles to the east of Wee Waa? I know the river, but I did not know that it was proposed to cross it.
1514. Do you know if the proposed crossing at Narrabri is much subject to flood? I understand that the line has been selected as being above flood-level, but I do not know that positively.
1515. If Mr. Moseley's evidence is to the effect that the flood-water rises 8 feet above the line there, would that surprise you? We do get exceptional floods. I have seen flood marks that would almost seem incredible.
1516. Mr. Moseley's evidence was to the effect that the fences in the vicinity of the proposed crossing had been washed away on an average once a year for twenty years? I have no knowledge of that. If it were so, what would happen to the people living there. All the people who have lately settled in Dangar Village would be washed away. It seems hardly likely that people would live there with the knowledge that their fences would be washed away every twelve months.
1517. *Mr. Wall.*] Are you a railway engineer? No; I am a district surveyor.
1518. Have you taken the levels on either of the routes? No.
1519. If the officers of the Railway Department have stated that the direct route would not be subject to floods, would you be inclined to question their statement? If they only go by the levels they have taken I do not think they are in a position to say whether the line will be flooded or not.
1520. Have you known of any instances where lines have been constructed without proper provision being made for drainage? Yes; there was the Bourke line.
- 1520½. That line was affected by an exceptional overflow of the river;—the tenor of your evidence seems to question the reports of the officers of the Railway Department; but you are not competent to offer a scientific opinion with regard to matters of railway construction? I think I am fairly qualified to do so.

F. Poate,
Esq.
12 Dec., 1893.

1521. If the officers of the Railway Department who have surveyed this route, and told the Committee that it will not be subject to inundations because they have made proper accommodation for drainage, their evidence is not correct? If they have made proper drainage accommodation there will be no difficulty. I said that the proposed route would require more getaways than a route further west.

1522. *Mr. Collins.*] Are you aware that during very wet weather teams and other vehicular traffic coming into Narrabri go to the east of the proposed line? I was not aware of it.

1523. Do you know of any teams that go that way? I have not known any teams to go that way.

1524. If it has been stated that teams go that way in very wet weather, it shows that the proposed line would be better than the travelling stock line? Yes; if you have evidence to that effect it would. I have seen no traces of teams travelling that way.

1525. You said that the land to the east of the proposed line was not fit for agriculture? Only to a limited extent. I did not say that none of it was.

1526. What area of it would there be between the mountains and the railway line? Very little of it.

1527. You have not been further north than Dobikin? My district ceases at the Dobikin boundary.

1528. You do not know if the land from Dobikin to Moree will be fit for agriculture? I do not know that country at all.

1529. If it has been stated that it is good red chocolate soil, do you think that it is fit for agriculture? Yes; in that case it would be first rate agricultural land.

1530. Do you think that the line ought to cross the river at Narrabri, and then follow the river down on the west to Gurligh Point? Yes; towards Collarendabri, with the intention of making it a part of the line to Collarendabri, following the Pian Creek road.

1531. It is not necessary to go to Collarendabri? No.

1532. *Mr. Humphery.*] You think the direct line will not serve anything like the area that would be served by a more westerly line? I think a line along the route I suggested would carry 20,000 more bales of wool than the proposed line.

1533. Do you think that the advantages of the line you indicate would justify its construction at a cost of 50 per cent. more than the cost of the proposed line, with the disadvantage of 15 miles additional length? If it is intended to carry the line to Collarendabri, I think the present line should be taken in the way I suggest. In my opinion, a line from Collarendabri should be looked on as the main line of the district. I think that more stock and wool would come in along the Collarendabri line than along the Moree line.

1534. In your opinion, it would be better to abandon the proposed route, and to take the line by way of Gurligh Point? Yes; on the northern side of the river, to follow what is known as the Pian Creek road towards Boolcarrol. If that is done, I think the railway will get at least 20,000 more bales of wool and more return traffic than the proposed line will get.

1535. Is it your opinion that the cost of construction per mile will not be greater on the western route? Yes; it will probably cost less than the direct route.

1536. *Mr. O'Sullivan.*] You appear to hold the belief that the floods will be more dangerous and destructive on the proposed route than on a westerly route? So far as my own district is concerned.

1537. Do you know Mr. W. H. O'Malley Wood, the surveyor of the Moree district? Yes.

1538. Are you aware that in 1891 he was unable to get his furniture up by the travelling stock route, and that he got it up by the eastern route? I do not know of any eastern route.

1539. The road that goes towards the mountains and comes out by Gurley station? Mr. Wood drove from Narrabri to Edgeroi, and from there he got on to the stock route, I believe.

1540. I am speaking of the time when he got up his furniture;—he was unable to get it up by the travelling stock route, and he got it up by the road that goes towards Bingara, and then across Gurley into Moree? I was not aware of that.

1541. Have you ever heard that the mail coaches have been stuck up for considerable periods on the travelling stock route, and that the mails have had to be taken across from Narrabri to Moree on horseback? I have no doubt that it has occurred sometimes. It will occur on all black soil country.

1542. Does not that go to show that the floods must be more dangerous towards the bottom of the basin than they are at the top? I think myself that a proof that the stock route is the better route, is the fact that the teamsters took it when they could have gone any way they chose. They have made it the main road.

1543. Might not the fact that it is more level have encouraged them to take it in preference to going along the mountain road? There may be something in that, but I do not think that it would have any great weight.

1544. I gather that you would prefer to see the line go to Collarendabri rather than to Moree? No; but I should like it to form part of a line to Collarendabri if the traffic from the lower part of the Namoi is to be secured. If, however, there is no intention of securing that traffic, let the line go direct to Moree.

1545. Suppose we had to choose between your proposal or the Gurligh Point proposal, and a direct line to Moree with a branch to Collarendabri, that would only cost the same amount, which would you advise us to take? The line I am advocating. The only traffic you would get on the direct line would be from Edgeroi and Dobikin, whereas on the proposed line you would not only get that, but you would also get the produce of the selectors and that of the people on the Pian Creek and on Thalaba Creek.

1546. Would you not get that traffic by running a line to Pian Creek from the 5-mile peg on the proposed line? You would get a good deal of it.

1547. If you could get that traffic by making a branch line and saving 15 miles of carriage to the people north of Moree, would it not be a wise thing to make the branch line? I think that a greater part of the produce would come from the north-west, not from the north.

1548. That branch line would be served by the line towards Collarendabri? Yes.

1549. Having served that traffic by a branch line, would it not be possible to make the line to Moree as direct as possible in order to save them unnecessary haulage? Then you would have an extra 16 miles requiring the services of a double set of men and rolling-stock.

1550. But you would have an extra 15 miles on the Gurligh Point route, which would be just the same? That line would also serve the Collarendabri trade.

1551. What we have to consider is this:—would it not be better to take a direct line to Moree, with a branch to Collarendabri, than to make a line which would only serve one of the two places? So far as my

my district is concerned the direct line to Moree and the branch line would not go through any settlement, whereas a line down the river, striking the stock route about Boggy Creek, would go through settlement. I take it that a railway to pay must go through settlement, or where there is a prospect of settlement.

1552. Would not a branch line running almost parallel to the line you propose serve that settlement? Yes; but then it would make the direct line, as far as my district is concerned, a non-paying line.

1553. Why would it? Because there would be no settlement there. We have practically two districts, the western and the northern districts, and it is very clear that one line cannot serve them both properly.

1554. Having an amount of money at our disposal, would it not be wiser to run a direct line to Moree and a branch across Boolcarrol, towards Pian Creek, than to take a line towards Gurleigh Point? That would make more mileage than if you took the line towards Collarendabri first of all. The nearer you can strike off at a right angle to Moree in another line the shorter you will make a total mileage.

1555. You propose to take a branch line to Moree from a line to Collarendabri? Practically, you might put it that way.

F. Poate,
Esq.
12 Dec., 1893.

Edward Christopher Weller, Esq., Chief Clerk, Stock Branch, Department of Mines, sworn, and examined:—

1556. *Chairman.*] You are connected with the Stock Branch of the Mines Department? Yes; I am E. C. Weller, chief clerk in the Stock Branch.

1557. At the request of the Committee you have compiled a return showing the stock in certain districts in and about Moree? Yes.

1558. District No. 1 embraces roughly, starting from Moree, the country comprised by a line out to Mogil Mogil, then following the McIntyre to Boggabilla, then by a line south to Warialda, and west from Warialda to Moree? Yes.

1559. In that district there are 4,463 horses, 47,692 cattle, and 1,592,000 sheep? Yes, that is correct.

1560. No. 2 district, taking Moree as the starting-point, is included in a line west of Mogil Mogil, down the Barwon to a point about 20 miles south of Collarendabri, then south-east to Pilliga, and east from Pilliga to Narrabri, and from Narrabri due north to Moree? Yes.

1561. In that district there are 3,417 horses, 31,308 head of cattle, and 1,480,402 sheep? Yes.

1562. Your next district is embraced in a line, taking Moree as a starting-point, going east to Warialda, south to Bingara, thence south-west from Bingara to Narrabri, and north from Narrabri to Moree? Yes.

1563. In that district there are 1,874 horses, 23,812 head of cattle, and 391,059 sheep? Yes.

1564. You put in a statement showing the details from which those figures are arrived at? Yes. In the case of small holders I have made an estimate of the quantity of stock they are likely to have. For instance, I estimate that in No. 3 district the small owners possess 300 horses, 100 head of cattle, and 3,000 sheep.

1565. You have accurate figures in regard to the runs, but you have only made an estimate of the possessions of small holders? Yes.

E. C. Weller,
Esq.
12 Dec., 1893.

WEDNESDAY, 13 DECEMBER, 1893.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.

The Hon. JAMES HOSKINS.

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JOHN DAVIES, C.M.G.

The Hon. WILLIAM JOSEPH TRICKEFF.

WILLIAM CHANDOS WALL, Esq.

WILLIAM McCOURT, Esq.

JOHN CASH NEILD, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES COLLINS, Esq.

HENRY DAWSON, Esq.

The Committee further considered the proposed Railway from Narrabri to Moree.

Hugh Millar, Esq., Inspector of Pastoral Properties for the Australian Mortgage, Land, and Finance Company, sworn, and examined:—

1566. *Chairman.*] What is your occupation or profession? I am an inspector of pastoral properties.

1567. You have an intimate acquaintance with the country immediately surrounding the route of the proposed railway, I understand? I have, more especially of the country on the western side of the proposed route.

1568. You desire to give evidence as to its capabilities and so on? Yes.

1569. For whom are you acting? For the Australian Mortgage, Land, and Finance Company.

1570. *Mr. Hoskins.*] Do you think it would be a great advantage to the people in that district, and also to those living further north, towards Queensland, if the railway were constructed? It would be more to the advantage of the general public if the railway were taken further west.

1571. If the proposed line were constructed, it would be an advantage to the residents in the neighbourhood of it, and also to the people living in the northern part of the Colony, because it would give them cheap carriage for their produce and merchandise? Yes.

1572. Have you been in Moree? Yes.

1573. Is it a thriving place? It was when I was there last.

1574. How long ago is that? About three years ago.

1575. How long is it since you were in the district last? I have travelled through it frequently. I was there eight or nine months ago.

1576. Is the country on the direct route between Moree and Narrabri taken up by graziers, large or small? There are three or four very large estates there.

1577. Are there any medium class graziers there? Not very many.

1578. There are not many small graziers in the district? Not on Edgeroi and Gurley, but there may be on Tycannah. There are two very large freeholds just out from Narrabri.

1579. Do you know the country to the east of the proposed line? I have been through it.

1580. Is it good country? There is a considerable amount of belar scrub when you get a bit off the main stock route. I think the proposed line will go through that scrub.

H. Millar,
Esq.
13 Dec., 1893.

1581.

- H. Millar, Esq.
13 Dec., 1893.
1581. What is the character of the scrub land? It is good country when it is improved. There is a lot of stony country there too, which is no good.
1582. There is land in the scrubs which would be suitable for settlement if it were cleared? Yes; if it were improved.
1583. Do you think that the route proposed by the Department is the best for connecting Narrabri and Moree? Is it a question of expense?
1584. Which would be the least expensive route? I think a deviation to the west would be less expensive than the proposed route.
1585. Will you tell the Committee why you think so? Because of engineering difficulties—such as creeks to be crossed.
1586. Would not the proposed line cross the creeks nearer their source than a more westerly line would do? But they junction further down, at Bulleroi. In the Thalaba Creek you have them pretty well in one water.
1587. To cross that water would necessitate the construction of large bridges? Only one bridge, and that would not be a very big one, because the water is deeper and does not spread so much. I am speaking of a place below what they call the lower water.
1588. How far is that locality from the proposed line? I should say that it was 24 or 25 miles west of Millie.
1589. Does it not stand to reason that since at this point the creeks would have drained a larger area of country bigger bridges would be needed to cross them? There are one or two creeks on the proposed line which are up quick and down quick.
1590. Still they are small creeks? Not at times.
1591. Does it not stand to reason that when the creeks have run 34 miles further on, they have drained a larger area of country, and would, therefore, require larger bridges to cross them than in the vicinity of the proposed route? Only one bridge would be needed at the place I speak of.
1592. How long would that bridge be? Not more than a quarter of a mile, I suppose.
1593. Would it not cost a good deal of money? I have seen many of the other creeks half a mile wide.
1594. Do you mean to the east of the proposed line? No; just on the line, or a little to the west of it.
1595. I suppose you know that a bridge a quarter of a mile long would cost a good deal of money? Perhaps I am exaggerating when I say that the bridge would have to be a quarter of a mile long. It would not have to be so much.
1596. You would like the line carried more to the west than the surveyed route goes? Yes.
1597. Can you tell us why? Because I think it would serve a greater traffic. It would get a great deal of the wool that at present goes to Dubbo and down the river.
1598. Wool is sent down the river when the river is favourable because the freights are cheaper? My experience is that that is not so. We are connected with one station 30 miles below Bourke, but we cannot afford to send our wool to Adelaide, because the insurance is too heavy.
1599. If the rivers were favourable, could not wool be sent to Bourke by steamer, and thence by train to Sydney, more cheaply than it could be sent from Narrabri to Sydney? I have figures here which show that it cost us £6 10s. a ton to send greasy wool from Dunumbrel to Sydney, and £7 10s. a ton for scoured wool. On the top of that there is 2s. for the sheep's back insurance policy. From Dungalar it cost us £6 12s. 6d. to send greasy wool to Sydney, and £7 12s. 6d. to send scoured wool, with 2s. for the sheep's back insurance, and 20 per cent. for river insurance.
1600. I gather from what you say that the conveyance of wool by railway is cheaper than the conveyance by river where stations are some distance from the river? The stations I speak of are right on the river frontage.
1601. Is it not a fact that the charges you speak of were high because of the union among the carriers to keep up the rates? No. As a matter of fact, the contractors lost money on the Dunumbrel wool.
1602. How far would you deviate to the west from the proposed route? I propose to take it in the direction of the north-west corner of the Colony, out towards Goodooga. Moree could be a branch from that line, and the trunk line could afterwards be continued on to Mogul, Collarendabri, or wherever was thought most advisable.
1603. How far would you suggest that the railway should be taken to the west, always bearing in mind that Moree must be reached? I should say that it might be taken to a point somewhere between Boolcarrol station and Bulleroi station.
1604. How many miles would that be? About 40 miles from the proposed line diagonally.
1605. How far would it be from Narrabri to Moree by the route you suggest? I could not tell you without entering into a calculation.
1606. Would your suggested line be 20 or 30 miles longer than the proposed line? I should say between 20 and 30.
1607. Do you think it would be fair for the people of Moree and for those living north of Moree to make such a lengthy detour, and charge for the extra mileage? I think the country would benefit by it in the future. I do not know anything about the people of Moree.
1608. Would it be fair to them to take the line in that way? If you are only considering the people of Moree, it would not be fair to make the deviation.
1609. Would it be a fair thing to put the country to the expense of the 20 or 30 additional miles? I think it would.
1610. Have you any idea of what the expense would be? Well, you would save a good deal in bridges, and as the country is better, the line would not cost so much to construct.
1611. Will you have the kindness to tell the Committee why there would be a saving in connection with bridges? With the proposed line starting at Narrabri we have to cross the creek and the river, which necessitates two bridges. Then there is Spring Creek to be crossed, and several other creeks further on. If you went down the river, however, you would only have one bridge to construct. You would not require any more bridges until you got to Thalaba Creek.
1612. And from there? You would have to cross the Moomin, and there are some other small creeks which would have to be crossed in any case.
1613. That being a flatter and a lower country, would not the line you suggest be more liable to flood than the proposed line? I do not think the water runs on it as much as it does higher up. If you took an intermediate route you would have a lot of water to cross.
- 1614.

H. Millar,
Esq.

13 Dec., 1893

1614. I should like to know how it is that although this country receives the drainage of 30 miles more than the country higher up, we should have less difficulty in dealing with the water? That is simply owing to the natural features of the country.

1615. Is it not all flat country? Yes; but some parts are higher than others, and there is a dry stretch of land where I speak of.

1616. Is the country not dry during droughts, and liable to floods during heavy rains? I do not think so; but between the line I suggest and the proposed line (say) from 5 miles west of Millie to close to Bulleroi, you would have miles and miles of water to go through.

1617. It has been stated that that country was flooded in 1890;—was not the country over which you propose to take the railway at that time flooded to a greater extent than the country higher up near the Nandewar Ranges? I do not know. I was not there at the time; but I should say that it was not.

1618. You think that the country lower down is not so likely to be flooded as the country higher up? Not just at that particular spot, because the water is gathered together there.

1619. But it must still drain over the country;—would not that country be inundated? You would be down below where the water converges from several creeks.

1620. You cannot tell us how much longer your suggested route would be than the proposed route? No, I cannot tell you definitely.

1621. You see no injustice in making the people of Moree and north of Moree pay for 20, 30, or 40 miles of additional carriage in order to take the line further west? They would have to use the railway, and the general public would benefit more than if the proposed line were constructed. If the proposed line is for the Moree people alone, I have no more to say.

1622. What are your principal reasons for suggesting this deviation? I know that considerably over one half of the wool traffic comes in from the west, and the sooner the people out in the west get cheaper carriage by means of railways the more the country will be benefited.

1623. If the Government have determined to construct a railway to Moree, would it not be more desirable, instead of making the deviation you speak of, to construct a branch line for the accommodation of the people out in the west? I think the trunk line should go out to the north-west.

1624. Where would the trunk line go to? The main trunk line should go to the north-west, and a deviation might be made at any point to Moree.

1625. You propose that Moree should be served by a branch line from some main line which you have in view? Yes.

1626. Where would you wish the trunk line to be taken? Eventually, or at the present time?

1627. Now? As I have said, about 40 miles north-west of Narrabri.

1628. *Chairman.*] On the south side of the river? No, I would cross the river.

1629. At Narrabri? No, further down.

1630. *Mr. Hoskins.*] Where would you propose to cross the river? Between Molly and Wee Waa. Molly is about 16 miles this side of Wee Waa.

1631. *Chairman.*] I understand that you propose to extend the existing line along the south bank of the Namoi to some point between Molly and Wee Waa, then to cross the river and run in the direction of Collarendabri or Mogul? Yes.

1632. *Mr. Trickett.*] When the line got out to Boolcarrol would you stop there, or would you go further on? I would not suggest any particular stopping place. I would stop either there or further to the north-west.

1633. You see the route on the map marked yellow, that is called the Gurlough Point route, and after a time joins the travelling stock route, and follows it to Moree; that line would be about 12 miles from the proposed line and, I understand from you, would not be a desirable one to construct? At Millie there is a creek that would take a lot of stopping. I think you would have to go down below what they call the lower water. You get there about 5 miles down the Thalaba Creek. I have ridden through 10 miles of water near there, and then come on to dry ground. There is also dry ground on the south side of the Thalaba Creek.

1634. You do not think that a line somewhere about Millie would be desirable? No; because it would have the same disadvantages as the proposed line, except that higher up the creeks might not be so big. I do not think that the Gehan Creek is very deep where the proposed line crosses it, but it is a good sized creek at the travelling stock route.

1635. Therefore, if a line goes west at all, it should go 40 miles west? You should go down to the lower water between Bunna Bunna and Bulleroi.

1636. How far from the proposed line? Thirty or 35 miles.

1637. Do you know much of the country round about Moree? Yes; I have been through the district.

1638. Is it good country? Yes; very good.

1639. Independent of the traffic along the proposed line, what right do you consider Moree has to a railway? I think that Moree is quite entitled to a railway.

1640. Independent of the country to the west? Yes.

1641. Because of the good country that surrounds it? Certainly, but I think that other interests might be served at the same time.

1642. Do you know the proposed line of railway from Glen Innes to Inverell? I have been along the road.

1643. If the proposed line were constructed, would it compete with that line? Everything from Warialda would come to Moree, and everything in a straight line north of Warialda would come to the proposed line; but you are not a great distance from the border there.

1644. In regard to the proposed line, what are the prospects of trade from Queensland? We have a prohibitive duty on our wool now.

1645. Will that affect the trade? I think so, to a great extent. Some of our wool which generally goes to Sydney, would not stand the £2 10s. duty, and so we send it to Brisbane now. It is a matter of £. s. d.

1646. From what part of Queensland does that wool come? From about St. George. It used to come into New South Wales. On the other hand, however, the Australian Pastoral Company's wool has paid the duty this year. They are on the Mooni. The other man is a little bit further west, and he sent his wool to Brisbane.

1647. Will that wool ultimately come to Sydney? Yes; it is shipped at Brisbane and sold here.

1648.

- H. Miller, Esq.
13 Dec., 1893.
1648. Then it has to pay the duty just the same? Wool sent away by sea has not to pay a duty.
1649. What is the distance between the Australian Pastoral Company's station and your station? The Australian Pastoral Company shear about 1,000,000 sheep, and occupy a vast extent of country. They have several stations, and I could not tell you without referring to the map how far their line extends; but it comes close up to St. George, starting from Mungindi. I think there is about 100 miles between the two places.
1650. I want to find out if it is a question of distance? It is in the first instance to a certain extent. Before the duty was levied, the wool always came in direct to Narrabri.
1651. But they are sending it to Brisbane now? Yes; the duty has made it prohibitive to send it into this Colony, though the Australian Pastoral Company have found it to their advantage to pay the duty.
1652. You do not know why that is? No.
1653. *Chairman.*] Is your station the nearest to that owned by the Australian Pastoral Company? If it is not the nearest, there is not more than one station in between. The other man is west of St. George a few miles. The dividing line almost runs through St. George.
1654. *Mr. Hoskins.*] Has not the Australian Pastoral Company some stations in this Colony? Yes.
1655. Did you hear that they were going to shear in this Colony next year, in order to evade the duty? No; I did not hear that.
1656. *Mr. Trickett.*] You have told us that you strongly advocate a line 35 miles to the west, but such a line would entail a very much larger expense, because the extra mileage would be considerable;—without working it out, you could not say what the extra expense would be? No.
1657. Do you think the extra traffic would justify the deviation? I think it would, because if it were made, a lot of wool which now goes to Dubbo would come into Narrabri, though perhaps after all that is as broad as it is long.
1658. What are the prospects of settlement in this part of the country? I think that when the leases are thrown open—if they are thrown open—they will all be taken up; that is, all in the Central Division.
1659. Is the country suitable for small holdings? Yes; I know men there with 2,500 acres who are doing better than men with 100,000 acres. They are freer from debt, and are doing better.
1660. What country are they on? There are some on the country round about Boolcarrol.
1661. Have they been there any time? They have been there for some years.
1662. And they are improving their position? I think they are living comfortably.
1663. Do you think the Gurleigh Point route would be a difficult one to construct? No; I do not. I think it would be cheaper than the other route.
1664. You said that the line was likely to be washed away by rushes of water? I do not think I said that. You would have to cross the Namoi in any case.
1665. I am not speaking merely of the crossings;—is the character of the country such that very high embankments would be required? I do not think so; not at any distance from the river.
1666. Do you know the country round about Gurleigh Point? Yes.
1667. What has been your experience in regard to the flood-water there? The water comes out below Molly. There is a bit of low country there.
1668. Does it do much injury? I do not think so.
1669. It has been stated that the fences in that locality have been washed away nearly every year, and that great damage has been done? That might happen along the main road and near the river bank; but it would not happen a mile or so out from the river.
1670. Can you tell us any particular place at which it would be best to cross the river? No; I could not.
1671. *Mr. Wall.*] From what part of the country does the wool come which goes to Dubbo? From just below Walgett. The wool sometimes comes to Narrabri.
1672. *Mr. Collins.*] You mean that it goes to Bourke? No.
1673. *Mr. Wall.*] What about Goodooga? That wool comes to Bourke.
1674. Do you think that if the proposed line were taken 40 miles further west it would command that wool traffic? It would make a difference, but I think that traffic is too far away to be affected.
1675. A deviation of 40 miles would make the whole length of the line 100 miles instead of 63 miles, as now proposed? Yes.
1676. Do you know any reason why Moree should be made a terminal point? No.
1677. If it were contemplated to extend the line in a north-westerly direction, would it not be better, instead of going the way you propose, to go 100 miles straight out? Yes; but Moree is a populous district. There is more settlement there than there is out to the north-west at the present time.
1678. You propose that the line should go from Narrabri 40 miles west, and then work back to Moree? Yes.
1679. Making almost a right-angled triangle with the proposed line? Yes.
1680. If the line were extended from Dubbo to Coonamble and Walgett, would it not command the whole of the trade of the north-west? Yes; if a trunk line were not taken out from Narrabri.
1681. But would it not do so in any case;—would not a line to Walgett or a line to Brewarrina take the whole of the traffic from the overflow of the Balloone? Yes.
1682. The distance from Goodooga to Moree is about 190 miles, is it not? Somewhere about 200 miles.
1683. From Goodooga to Brewarrina would be 40 miles in a direct line? Yes.
1684. So that if either of the lines I have referred to were constructed, they would be 100 miles nearer Goodooga than the deviation you suggest? Yes; but to get their produce to the sea-board from Brewarrina they would have a much longer railway carriage than if they sent from Narrabri.
1685. Is it not a fact that a large quantity of that wool would, under any circumstances, be taken down the river? Not as a rule. It is only taken to Bourke. Below Bourke, when they get out of range of the railway, they have to be considered.
1686. Do you know that Rich and Company are making arrangements to get their goods from Adelaide to Bourke, guaranteeing a return trip of wool? Yes; but they have to send down the river for it. They cannot get it within 40 miles of Bourke.
1687. For the last four years the river has been navigable throughout the whole of the wool season? I think so.
1688. All the stations lying within 40 or 50 miles of the river would have 150 miles less of land carriage than if they took their produce to the proposed line, even if the deviation you suggest were made? Yes.
1689. If it is intended to construct a trunk line right through that part of the country, would it not be better to continue the line from Walgett out? Yes.
- 1690.

H. Millar,
Esq.

13 Dec., 1893.

1690. You spoke just now about having a shorter railway carriage to Sydney;—if the line were taken from Dubbo to Walgett would not the railway journey be less from Walgett to Sydney than from Moree? Yes.

1691. How much less? I could not tell you from memory.

1692. The northern line makes a detour to get to Newcastle, whereas a line from Walgett through Dubbo would go nearly straight? Yes; but you would get your goods to the seaboard in a shorter distance by the Narrabri line.

1693. By shipping at Newcastle? Yes.

1694. Nearly all the wool shipped at Newcastle is brought on to Sydney by boat? Yes; it is shipped at Morpeth, as a rule.

1695. The wool that you speak of, if it were brought to Newcastle, would not be reshipped to Sydney to be put into the ocean-going vessels there? Some of it would, and some might go direct from Newcastle, through Gibbs, Bright & Co.'s agency.

1696. Even though a deviation were made, you think the line would still go to Moree at the present time? Yes.

1697. Your proposal would practically mean the construction of two lines—one of 40 miles, out into the country to which you have referred, and the other a branch line, at right angles to Moree? Yes.

1698. One of the advantages which it is hoped to gain by the construction of the line is a reduction in the cost of carriage;—are you not aware that if the line were 100 miles in length, instead of 60, the charge on the Moree people would be increased? No doubt.

1699. If Moree is entitled to a railway, and can support a railway, it should have direct communication? There are deviations on the Northern line, that have been made for the purpose of getting trade, which are nearly as great as that which I suggest.

1700. How far on each side of it would this line command the trade? Where there are no railways trade will come from almost any distance, but the closer you can get the line to your door the better it is for you.

1701. *Mr. Suttor.*] For what firm are you inspector? The Australian Mortgage, Land, and Finance Company.

1702. What company is that? It is a mortgage company, in Spring-street.

1703. What stations do they hold—I suppose some in Queensland, and some in New South Wales? Very few in Queensland; they are mostly in New South Wales.

1704. What stations have they in New South Wales? There are some in which they are only interested, while others they hold wholly and solely.

1705. Can you give us any idea of the number of sheep in which they are interested in this Colony and in Queensland? I could not tell you? There are some Melbourne accounts over which I have no control, but I should say 4,000,000 or 5,000,000.

1706. In New South Wales? Yes.

1707. And in Queensland? Not very many; perhaps a million.

1708. Where do you send your wool? We send it home, as a rule. Our clients can elect to sell here if they like, or we will ship home for them.

1709. How many bales of wool have you sent away? Up to last week we had received 29,000 bales.

1710. Has that been shipped to England? Some of it has, and some of it is in the stores still.

1711. I suppose it will all be shipped? Some of it may be sold here, but eventually it must all be shipped home.

1712. *Mr. Collins.*] Are you aware that this year carriage is 50 per cent. cheaper than it was last year? I know that it is cheaper, but I could not say that it is 50 per cent. cheaper.

1713. It is considerably cheaper? Yes.

1714. Do you not think that that is the reason why stations which usually send by the river have sent their wool to Narrabri this year? No; I do not.

1715. You said that the contractor for the Dunumbri wool lost by it? Yes.

1716. If union rates were charged and the river were up, would the carriers be able to compete against the river? If the river were up and no transshipment at Brewarrina were necessary I do not think they could; but under present conditions they can.

1717. It is only because carriage is cheap that they can do it? Carriage is comparatively cheap, but it may never be any dearer.

1718. Do you not think that one of the reasons why it goes that way is that they have differential rates on the Western line which they have not got on the Northern line? Yes; no doubt. That acts on the stations below Bourke, who send their wool to Bourke because they get a concession on the through rate.

1719. You say that a lot of traffic would be drawn on to the Dubbo line if the Narrabri line were extended west to Collarendabri? Yes.

1720. What traffic would be diverted? Very likely the Wingadec traffic.

1721. Near Coonamble? The shed is 30 miles north of Coonamble.

1722. How far would it be from the extension you suggest? Not more than 80 miles.

1723. How far is it from Dubbo? One hundred and thirty.

1724. If a railway were constructed from Coonamble to Walgett, where would they send their wool? Such a railway would very likely go through their property.

1725. In that case the traffic would not be diverted to the line you suggest? Certainly not.

1726. You say that it would be better to take the proposed line down the river to Wee Waa instead of crossing at Narrabri? Yes.

1727. Why? Because of the engineering difficulties.

1728. What are they? You have the Narrabri creek and the river, and I suppose eight or nine other creeks on the proposed line.

1729. But near to Narrabri? There would be the creek at Narrabri.

1730. Do you not know that going further west the Boena Creek would have to be crossed? Yes.

1731. That is a creek you have forgotten? Yes.

1732. Consequently crossing lower down would be just as expensive as crossing at Narrabri? Yes; there would not be any difference in that. The Boena Creek is 5 miles from Narrabri.

- H. Millar, Esq.
13 Dec., 1893.
1733. *Mr. Humphery.*] What distance would Moree be from the nearest point on your suggested main line? I should say from 40 to 45 miles.
1734. How many miles from Narrabri would the starting point to Moree be situated? About forty.
1735. That would make the distance from Narrabri to Moree about 35 miles, as against 62 miles on the proposed line? Yes.
1736. Would it not be better to construct the line as proposed than to make the branch line you speak of? But you would have so much of the main line done.
1737. The only disadvantage would be the perpetual charge on the Moree people for 25 miles of additional carriage? Yes.
1738. *Mr. O'Sullivan.*] You admitted just now that there was more settlement in the Moree district and to the north than there is in the north-western district where you wish the line to go? Just at present there is.
1739. Are you aware that according to the returns supplied by the Stock Department there are 500,000 more sheep, 40,000 more cattle, and 2,200 more horses in the northern district than in the western district? How far does the district extend?
1740. To Kunopia and Mungindi, and away past Warialda to the east? I do not think that that is the case.
1741. The Stock Department ought to be able to form a good opinion on the subject, ought they not? Of course; their figures are reliable.
1742. If the population to the north is greater, and there are more sheep, cattle, and horses there than there are to the west, should not the line go north? Yes; but if a deviation were made to the west, you would serve a large additional population, and you would get the stock traffic, whatever it might be. When you got up to Bingara stock would be of no use to the railway. It would only get the wool.
1743. There are thirty-two stations and three towns served by the direct route, that is, taking the district as far north as Mungindi; while in the western district, from Collarendabri South to Pilliga, and thence to Narrabri, there are only seventeen stations and three towns to be served;—do not those facts support the contention that the direct line should be made in preference to the western line? Perhaps they do. Moree is what I call a settled district, and the population is closer there than it is out west, but I hope that in a few years the population out west will be equally close.
1744. Suppose it would cost £80,000 more to take the line *via* Gurleigh Point than to take it direct, and for that £80,000 you could construct a branch line out to the north-west, which line would you construct? I think I should go for the deviation, because I would get traffic on it.
1745. Notwithstanding what I have said about the population, stock, and number of stations in the two districts, you still prefer the deviation towards Wee Waa? Yes.
1746. Would it not suit the interests of the State better if a direct line were made to Moree, and a branch line taken out about 40 miles from it, instead of constructing a boomerang-shaped line as you suggest? The western country would not be any better served in that way.
1747. If a branch line were taken as far as Pian Creek it would serve all the country which you wish to serve by a westerly deviation? I do not think it would.
1748. Would it not serve a large part of it better than your deviation, by going straight towards Collarendabri, which seems the natural stock route? The natural stock route and the natural wool route is on the proposed deviation. I think more wool comes into Narrabri from the west than from the north.
1749. From what point does it come? It comes from beyond the Barwon.
1750. By way of Collarendabri, along Thalaba Creek and Pian Creek? Yes, and from Walgett.
1751. There will be a line to serve Walgett in the future;—you must confine your remarks to the country that will be served by a line from Narrabri to Moree? If the railway is to be constructed only for the benefit of the northern districts and Moree, the deviation may not be worth the expense. We have no evidence that a line is going to be taken to Walgett.
1752. You know that lines from Dubbo to Walgett, and from Mudgee to Walgett, have been advocated for years past;—if either of those lines were constructed it would take a great deal of the trade which you say would come to the Moree line? Yes; but in the meantime, you would be getting revenue from it.
1753. *Mr. Davies.*] Did I understand you to say that the company you represent shorn something like 12,000,000 sheep last year? Yes, directly and indirectly.
1754. In New South Wales alone? I think so; but I cannot give you definite figures. Some of our clients have their accounts in the Melbourne branch, and I cannot give you the statistics as to them.
1755. You believe that your company is directly and indirectly interested in about 12,000,000 sheep? I think so.
1756. *Mr. Humphery.*] That would be about 140,000 bales of wool, taking 90 fleeces to the bale? But wool does not go 90 fleeces to the bale every year.
1757. Well take it at 100 fleeces to the bale? There are considerably over 30,000 bales down here now from this side alone; but I will not swear to the figures.
1758. *Mr. Davies.*] Is 30,000 bales the total clip? No.
1759. What proportion of that clip came from the Moree end of the proposed line, or from places along the route of it? There were 4,000 bales from the west. That wool would come from Narrabri in any case, whether the deviation were made or not, unless the rates of carriage became high, and it were sent to the river.
1760. What other wool comes from there? I suppose 1,000 or 1,500 bales come from the Moree district; 5,500 bales have come, or will come from Narrabri.
1761. That is from stations over which your company has control, or in which it has an interest? Yes.
1762. Could you name the stations from which the wool comes? I do not think I am at liberty to disclose the names of our clients.
1763. Did any of the wool come from St. George? No, it came from close to Moree.
1764. If the line were taken to Moree, would it serve the people right up to St. George? Yes; but I do not think that the wool would come across the border.
1765. Why? Because of the duty.
1766. Does it not come now? Some of it, but that is exceptional.
1767. Is it not a fact that the Australian Pastoral Company have arranged with the carriers to send the whole of their wool to Narrabri at £3 10s. a ton? Yes, I believe so; but that is a very low rate.
1768. Is it also a fact that they propose to erect shearing sheds on the New South Wales side, and drive their sheep across the border, in order to evade the duty? I do not know. 1769.

H. Millar,
Esq.

13 Dec., 1893.

1769. That could be done? Certainly.

1770. Do you think it likely that other pastoralists near the border will do something similar? They might not have country on this side. That would prevent them.

1771. Is it not customary for squatters to make arrangements with one another with regard to shearing sheds? Not as a rule. In isolated instances it is.

1772. Do you think the duty imposed by the Queensland Government will be a bar to the development of a very large additional trade? Yes.

1773. Although the railway may be extended to Moree, the duty will prevent the development of the trade from Queensland? It will prevent a very great development.

1774. Sixty-two miles of railway carriage would be a great advantage to the people at the Moree end? Yes, and for the whole of that district.

1775. Although most of the wool at present comes to Narrabri by road, it would come by rail if the line were constructed here? Yes.

1776. Would you send your wool to the nearest station? Not always.

1777. Where there was a difference of 60 miles? Yes, certainly, where there was such a difference as that; but if the railway were 100 miles away on a bad road and 150 on a good road, the carriers would be likely to take the good road. A lot of wool from Inverell and about there, instead of going direct into Glen Innes, goes into Tamworth.

1778. I should like you to ascertain definitely what number of sheep your company are interested in; 12,000,000 sheep is almost one-fourth of the entire number of sheep in the Colony? I think I must have overstated the number, but I will look into the matter again and make my statement correct.

1779. You stated that you were familiar with the travelling stock route? Yes.

1780. If the railway were taken along the travelling stock route would it serve the country better than the direct line? I think so.

1781. You would not advocate the construction of a line along the travelling stock route? No.

1782. You favour the Gurlough Point route in preference to either of the others? Only as far as Gurlough Point.

1783. *Mr. Humphery.*] That is, as part of your suggested line north-west? Yes.

1784. *Mr. Davies.*] Are you aware that the Department say that that line would cost more than the proposed line? Yes.

1785. Do you think it would be wise for the Government to make 20 or 30 additional miles of railway at a cost of something like £500 a mile? I do not think that the line which I propose has been surveyed.

1786. Three or four surveys have been made, though not exactly along the route that you propose; the first was estimated to cost £500,000, while the proposed line will cost £153,000. I do not know anything about the figures.

1787. Do you not think it would be prudent to take the line to Moree in the most direct way? If Moree alone is to be served.

1788. If the country to the north is to be served? Yes, and if you do not want to take the country to the west into consideration.

John Harper, Esq., Goods Superintendent, Department of Railways, sworn, and further examined:—

1789. *Mr. McCourt.*] You made an estimate of the revenue likely to be obtained by the proposed line? Yes.

1790. I suppose you know the amount of wool coming into Narrabri from each station? Yes; approximately.

1791. A large number of witnesses have stated that all the traffic to the west of Millie down to Narrabri, instead of coming on to the proposed line would continue to go to Narrabri by road? I am very much inclined to doubt it. The wool will be carried by train for 2d. a mile, while it would cost 6d., 8d., and 1s. a mile to take it by road. I feel sure that the cheaper rate would be availed of.

1792. Do you base that opinion on the experience which you have obtained in connection with other lines in similar country? Yes.

1793. What do you estimate will come to Gurley station? Two thousand tons of wool.

1794. And to Woolabrar? Six hundred tons.

1795. And to Edgeroi? That wool is included in the 600 tons.

1796. Would any wool come in from runs on the eastern side of the line? Some would come from Terry-Hie-Hie, and the stations as far down as Warialda. That wool we do not get now at Narrabri.

1797. Will you name the runs on the eastern side of the line which would send to Gurley? Terry-Hie-Hie and Gurley. Binuguy will probably come into Moree or some station further north. Yaggaba would come in either at that point or further down.

1798. That is all on the east? Yes; there are some further north-east which would come into Moree.

1799. What runs on the western side would send to Gurley? I expect that Malaraway, Minnaminane, Mungyer, Bunna Bunna, and Milton Vale would send to Gurley, and so probably would Oyreel; but I have not allowed for Oyreel, although it sends away 3,500 bales. It is closer to Gurley than anywhere else, but I have regarded it as a bit doubtful, and have excluded it. I have also excluded all the stations on the river frontages. I should fancy that Collymongool would probably come in, but it is hard to say how the north-western stations beyond the Barwon would be affected by the line, and whether they would come into Gurley or into Moree.

1800. How far to the west would the furthest station be from Gurley? About 70 miles to the Namoi.

1801. How far from Narrabri? About 93 miles.

1802. You think it would send 70 miles to Gurley and pay for 45 miles of railway carriage rather than send 93 miles to Narrabri? Yes; because the railway would carry the wool for 2d. a mile. The teamsters could carry it as cheaply as that.

1803. What holdings would send into Woolabrar? I base my estimate on the mileage. I estimate that 4,000 tons would come 64 miles—the whole distance—2,000 tons 45 miles, and 600 tons 32 miles. That breaks up the distance proportionately.

1804. If the holders of some of these properties had sworn that they would continue to send to Narrabri, what would you say? I should be sorry to say that what some one has sworn to would not occur.

1805. You think that when the line is constructed their practice may be different? I fancy that they will take advantage of the railway at the nearest point. That has been our experience in the past.

1806.

J. Harper,
Esq.

13 Dec., 1893.

- J. Harper, Esq.
13 Dec., 1893.
1806. You are now speaking of wool alone? Yes.
1807. Have you estimated that any fat stock or store stock will come to the stations along the line? No; I have estimated that rather in a general way. I have taken less than the total mileage and reckoned the whole of the stock in the district. I have put the cattle traffic down as 400 trucks at 21 and 100 trucks at 15—the one is for the through distance and the other is for the intermediate distances. Sheep I have put down as 2,000 trucks for the whole distance and 1,400 trucks for the intermediate distances. I have based my estimate on the quantity of stock that came into Narrabri during the last twelve months. Every consignment of stock is accompanied by a travelling permit, which is handed into the station-master, and we are thus able to tell where the stock comes from.
1808. Have you returns in your office showing the stations from which the wool comes? Yes. The following is a return of the wool that actually came from Narrabri last year from these districts:—

Statement of wool despatched from Narrabri, season 1892-3.

Station.	Bales.	Station.	Bales.	Station.	Bales.	Station.	Bales.
Burbah	700	Combadello	597	J. A. Woolshed ...	116	Terala	437
Bullamon	239	Collymongle	736	Laural Vale	121	Tery-Hie-Hie	470
Burren Burren	174	Cowra	151	M.	130	Tarieari	519
Belle Vale	162	Dumeindi	159	Meroc	235	Woodlands	221
Bangate	753	Dobikin	402	M. L. Y.	539	Warby	150
Bulyeroi	141	Dunumbial	774	Mungyer	1,000	Whalan	439
Bunna Bunna	1,203	Doondi	73	Midkin	2,645	Webolabola	417
Bogumildi	1,019	E. W. D., Moree... 348		Moorelands	223	Willarie	247
Boolooroo	172	F. & A. G., Moree.. 100		Migan	376	Werrina	393
Bunaba	536	Goonal	646	Mungie Bundie... 1,184		Wirral	1,464
Cubbie	815	Glenroy	416	North Benarba... 300		Welbon	1,366
Coln Lee	148	Gurley	1,865	Noondoo	2,456	Welbondonyah... 848	
Crothers, H. A. 294		G. & J. Jurd..... 264		O'Glerie	111	Werribilli	122
Conroy Ketah	207	Groolamein	212	Piongobla	244	Yarawa	804
Carrington	100	Groolanna	587	Rosewood	105		
Currawilngghi	543	Jew's Lagoon	191	Talaba	114	Total	33,639
Curragundi	399	Jaw Ba	230	Tycamah	437		

To that total has to be added all clips under 100 bales which are not included in the list, and 4,000 bales from the Australian Pastoral Company, which went in another direction the year for which this return was made out, but which this year has come to Narrabri, making the total number of bales 39,000.

1809. How much of that wool came from the district north of Narrabri? Practically the whole of it. None of the stations having frontages to the river are included. Oyreel is not included.

1810. Would any of the wool come from south of Gurley? Yes; the Edgeroi wool would. There are several stations south of Gurley; Dobikin is one of them.

1811. Would not the wool from any station south of Gurley be likely to go to Narrabri? The Killarney wool would go to Narrabri, because their sheds are only 5 miles from Narrabri. The Edgeroi wool would be trucked on the line, because there will be a siding at Edgeroi.

1812. Would the people to the west of Edgeroi come into Narrabri? No; Bunna Bunna and Dobikin will come into Woolabrar.

1813. Are they west of Woolabrar? A little north-west.

1814. How far would that be from Woolabrar? Twenty-six miles, approximately.

1815. They would not be much further from Narrabri? They would be about 42 miles from Narrabri. I got my information as to where the wool would come in from the carriers' agents, who know the roads and the trend of the trade. Having located the stations, I asked them how the wool would come in. I was particularly careful in selecting among my informants a gentleman whom I knew to be adverse to the construction of the line. He gave me Oyreel amongst others as likely to send into the line, but I rejected it, because other carriers' agents said that it would not come in.

1816. The carriers' agents practically determine where the wool shall come in? They have a better knowledge than anyone else could have.

1817. But they determine what station the wool shall go to? To a certain extent they do, but that is determined more by the rates of carriage than anything else.

1818. You have estimated the passenger traffic at 6,000? Four thousand at 7s. 6d.—1½d. per mile—and 2,000 at 5s.

1819. That would be from Moree? That is the whole distance; but the rate would be higher than that.

1820. Have you estimated what passenger traffic will come in at Gurley and the other stations? No; I have estimated the traffic for the whole distance, and taken a reduced rate to balance the short mileage.

1821. That must be a haphazard estimate? You mean as far as the numbers are concerned?

1822. Yes? No; I do not think it is. It is based on our experience in connection with districts similarly situated as regards population.

1823. You estimate that there will be about twenty passengers in the day? About eighteen a day.

1824. Are you aware that there is only one coach running now? I do not take much notice of that, because the railway generally develops that traffic. At the present time a great many people use their own vehicles.

1825. You do not think that you have over-estimated the traffic? No.

1826. You only propose to have a passenger station at Narrabri proper? Yes; but I do not think that the Commissioners have arrived at any definite decision.

1827. If the railway is constructed, do you think that the people at Narrabri proper will be satisfied with a passenger station;—will they not, after the line has been opened a few months, demand a goods station? No doubt they will have one for the town traffic.

1828. Its construction will entail further expense? I think a siding and a small shed have already been arranged for.

1829. So that facilities will be given for the local goods traffic? Yes; I know that that was contemplated. I have not seen the estimate since.

1830. *Mr. Davies.*] In making the inquiries on which you base your estimate, did you place yourself in communication with the holders of station property and the people residing in the district which will be served by the railway? Not generally. I was able to get the information from the books at the railway stations.

1831. You did not put yourself into communication with the local people? I did along the line of route.
1832.

J. Harper,
Esq.

13 Dec., 1893.

1832. Whom did you see? Mr. Gordon at Edgeroi, and several people at Narrabri. I considered that the carriers' agents were the best people from whom to obtain information as to the trend of the traffic. I also called at Gurley station.
1833. *Chairman.*] Did you see the carriers' books as well as take their statements? Yes.
1834. *Mr. Davies.*] Did you see Mr. Murphy, a large selector holding 30,000 acres at Jew's Lagoon? No.
1835. Did you see Mr. Halse, the secretary to the railway league? No; I did not see him. I had nothing to do with the various routes which have been suggested; I simply reported on the probable traffic which would be earned by the proposed route. I got my information whenever I could from our own books, and that, after all, is the most authentic information.
1836. You rely more on the information obtained from your own books than upon what you could obtain from the people along the route? Yes; I made a general observation of the country to ascertain whether there were any natural or physical obstacles which would prevent the traffic from finding its way to the line.
1837. You do not usually make inquiries from the people who are likely to use the line? Not when I have other sources of information. It would take up too much time, and the information would not be so accurate as that which we can get from our own books. We take just as much local knowledge as will assist us in coming to a conclusion. It is not necessary to see everyone.
1838. But in travelling you see the country and meet the people who are likely to be served by the line? If you attempted to see all the people I am afraid you would not get as good a result as if you saw only two or three well-informed individuals. By the aid of our books and the books of the carriers' agents we can identify the consignees of every hundredweight of goods passing over the line.
1839. What freight would be charged on wool from Narrabri to Moree? Two-pence per ton per mile is about 10s. 6d. for the whole distance.
1840. At present they are paying what? In some cases about 1s. a ton. Freights are a bit lower now than the Union is broken up. Probably they are as low as 8d. or 10d. now.
1841. What freights were charged before the Union was broken up? The Central Australian Union charged £1 10s. for the first 100 miles. I think, in the Moree district, the rate was 1s. a ton per mile up to 60 or 70 miles.
1842. Two-pence a mile a ton would make the railway rate 10s. 6d. for the whole distance, while at 1s. per mile per ton the rate would be £3 10s. to £4? Yes.
1843. The Department, therefore, think that the wool will come whichever way is cheapest? Yes.
1844. You are strongly of opinion that cheapness and speediness of transit will induce people to send their produce by the railway? Yes.
1845. You have already expressed your opinion about the direct route? Yes; on general grounds.
1846. You recommend it as the best for general purposes? Yes.
1847. *Mr. Humphery.*] I think you estimated that 2,000 tons of wool would go to Gurley;—how many tons would go to Moree? Four thousand tons.
1848. How many to Woolabrar? Six hundred tons. We should get altogether 6,600 tons, and 800 tons which at present go to Glen Innes from the neighbourhood of Boggabilla.
1849. You give Moree credit for nearly twice as much as the intervening station? Yes.
1850. *Chairman.*] How far down the river do you think trade will come to Moree—from Mungindi and Mogil Mogil? I think it will come into Mogil Mogil, but I have excluded most of those stations. That wool would come into Gurley.
1851. Do you think that traffic from Mungindi would go to Moree? Yes.
1852. Between Mungindi and Mogil Mogil, some might go to Moree and some to the station nearest Millie? Yes; to Gurley.
1853. You have not reckoned the traffic from places south of that, towards Collarendabri? No; I have not included it.
1854. Are you aware that the traffic now comes from Boolcarrol to Narrabri? Yes.
1855. You have not taken it into consideration as feeding the proposed line? No; I have not considered it at all.
1856. Has much traffic come to Narrabri this year from the north-western district which did not come before;—you mentioned the Australian Pastoral Company's wool, but is there any other? None of any consequence that I can think of, but I should not get the returns in till the end of January.
1857. You attribute that extra trade to the breaking up of the Carriers' Union at Narrabri, and also to the fact that the river facilities are not so good? The wool I speak of never went on the river at all. I think the Queensland wool-owners strongly resent the action of the Government in imposing a duty upon exported wool, and, things being nearly equal, they have shown their feeling by sending their wool to us.
1858. As a matter of fact, does not a lot of the wool about Collarendabri avail itself of the river when suitable to get to Bourke or Brewarrina? Twelve thousand bales were taken from Walgett last year. There have been five or six boats up the river, and 2,000 or 3,000 bales must have gone down from the Barwon above Walgett.
1859. The line of demarcation is somewhere between Walgett and Collarendabri? Yes. Boats have been up to Mungindi.
1860. But that is very exceptional? It is, under existing circumstances. I was speaking to a gentleman to-day who is interested in the business, and who said that next year, if circumstances are the same, he will exploit it much more thoroughly, and he is already making preparations with that object.
1861. Having had time to still further consider your estimate, you do not wish to modify it in any way? No.
1862. *Mr. Humphery.*] In making your estimate, have you carefully excluded all traffic that would go direct to Narrabri, even if the proposed line were made? Yes; all that I thought might reasonably be expected to go direct to Narrabri.
1863. *Mr. O'Sullivan.*] In order to make this matter clear, I should like to ask whether you expect any traffic from a number of stations which I should name, and which lie to the west of the line—Molly? I have excluded Molly.
1864. Wee Waa? That is excluded.
1865. Drildool? That I have excluded.
1866. Millie? That I have excluded.
1867. Boolcarrol? That I have excluded.

- J. Harper, Esq.
13 Dec., 1893.
1868. Nowley? That I have excluded.
1869. Pilliga? That I have excluded.
1870. Bunna Bunna? That I have included.
1871. Merah? That I have excluded.
1872. Meroc? That I have excluded.
1873. Mungyer? That I have included.
1874. Oyreel? That I have excluded.
1875. Collymongle? That I have included.
1876. Mercadool? That I have excluded.
1877. Bugilbone? That I have excluded.
1878. Yarraldool? That is chiefly a cattle station. There are only about 1,200 sheep on it.
1879. Goangra? That I have excluded.
1880. Eurie Eurie? That I have excluded.
1881. Gorian? That I have excluded.
1882. You have only taken in three of the stations to the west? That is all.
1883. *Mr. Neild.*] Would not the greater number of those stations be convenient if the line were extended further to the west, instead of being taken along the proposed route? Yes; no doubt the greater number of them would.

THURSDAY, 14 DECEMBER, 1893.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.

The Hon. JAMES HOSKINS.

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JOHN DAVIES, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM CHANDOS WALL, Esq.

WILLIAM MCCOURT, Esq.

JOHN CASH NEILD, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES COLLINS, Esq.

HENRY DAWSON, Esq.

The Committee further considered the proposed Railway from Narrabri to Moree.

John Taylor, Esq., Glen Alvon, Murrurundi, sworn, and examined:—

- J. Taylor, Esq.
14 Dec., 1893.
1884. *Chairman.*] You are engaged in pastoral pursuits? Yes; a little.
1885. And have been for a number of years? Continuously since 1857.
1886. Are you familiar with the country through which the proposed line passes, and which will be served by it? I am.
1887. Is your knowledge of a recent date? I have known that district for twenty years—ever since I went there from the Murrumbidgee.
1888. Have you any interest there? I do not own an acre of ground there,* but my sons hold Dobikin, which I gave them as a gift a few years ago. I used to have a station at Mungindi, which some years ago I sold to Mr. Lomax. I had a station at Walgett for some time, and another a little further to the west, and I used to drive all through the country at the time when the railway did not come further north than Murrurundi.
1889. Will you tell us whether you think the line should be constructed as proposed, and if the route suggested is the best in the interests of the country? The direct line seems to me one that could be cheaply made and easily worked, but there are only two or three people interested in the country through which it passes, and I have come here to try to prevent its construction. We have already in the Colony a large number of lines which do not pay, and I advocate the construction of this line where the good country is. By the proposed route you first go through Killarney; but no one on that station will use the line, because it is so near to Narrabri. Then you come to Edgeroi, which is not very far from Narrabri, though of course the people there will use the line, and Dobikin will use it and be glad to get it. The next property passed through is Gurley, and the line will benefit them. Tycannah too, will use the line, and then you get to Moree, the terminus. There is no one to the east of the line. It will go through bad country and scrub for 10 or 12 miles. That country will not grow wheat. The soil is a sort of laminated stone, which gets as hard as cement. The belar country is no good. I had some fenced in for many years, but there was never anything but wallabies on it. There are no selectors towards the mountains, but wherever you go to the west you will catch the people. The people down about Millie, and near Walgett, and down near what they call the Big River, and at Mehi and Mungindi, will, if the proposed line is constructed, traverse a road parallel to it until they get into Narrabri. If, however, you take the railway *via* Gurleigh Point or the travelling stock route, they will come to it and take their loading off there instead of going on to Narrabri. What is the good of making a railway for one or two people?
1890. Your objection to the proposed line is that it only goes through four properties, which are sparsely populated? Yes.
1891. And that if the railway were taken further to the west, *via* Gurleigh Point or the travelling stock route, a greater number of people would be served? Yes.
1892. Presuming that the line is to be constructed primarily to give access to the country north of Moree, your objections to the proposed route fall to the ground? I cannot see why you should help the north and leave the west out.
1893. That is not the point;—I say, presuming that the railway is to serve country near Moree and to the north it? There is certainly country to the north of Moree that the railway would serve, but it would serve it better by going to the west.
1894. If you were a run-holder to the north of Moree, would you not object to have to pay for 15 additional miles of railway journey? No. When I had a station at Mungindi my teamsters and all the trade from there went straight to Millie. That was the point we used to make for when going to Narrabri. We used to leave out Moree altogether; we never looked at it.

1895.

* NOTE (on revision):—I have 424 acres 2 roods C. P. transferred to me. I did not think of this at my examination.

1895. If you held country at Moree or to the north of Moree, would you not object to having to go 15 miles out of the way in order to go to Narrabri? How could I have any distance to go out of my way? I would be at the starting-point.

J. Taylor,
Esq.

14 Dec., 1893.

1896. What I mean is, would you not object to a route which was 15 miles longer than the proposed route? That is another thing, and no doubt a man looks to his pocket nowadays; but, in my opinion, that 15 miles would bring in more to the railway than the whole distance on the proposed route. If I were a millionaire, and you said to me, "Build a railway for your own advantage," although perhaps I would save £100,000 by taking the line direct, I should make £200,000 by going 15 miles to the west. At any rate, that is my opinion.

1897. Do you think it would be any great advantage to the country out west if the line were taken *via* Gurleigh Point? I think it would be into their very hands. It would help every one of them.

1898. Would not the principal portion of that trade be intercepted at Gurleigh Point? Not at all. That trade would come to the line at other points. The people there would come into Millie. Millie would be the great station.

1899. Do you know what direction the traffic takes from Collarendabri and the district a little to the north and south of it, in order to reach Narrabri;—does it go *via* Millie, or *via* Boolcarrol? Through Boolcarrol, about 25 miles from Narrabri.

1900. The great bulk of the trade from the west reaches Narrabri *via* Boolcarrol, and not *via* Millie? It does now; but it would not do so if the Gurleigh Point line were made. It would then come to Millie or Gurleigh Point. The Walgett traffic would run up the Pian Creek, which is the direct line to Millie.

1901. Your opinion is that if the railway were constructed *via* Gurleigh Point, it would intercept the western and north-western traffic near Millie, and not at Boolcarrol? You would have a very fair station near Boolcarrol. The Walgett traffic would come that way, and you would get it. They could not pass the line without crossing it, and in that case they would unload their goods when they came to it; but if the proposed line were constructed they would run parallel with it, until they came to Narrabri.

1902. If the proposed line could be constructed for £70,000 or £80,000 less than a line *via* Gurleigh Point, and an annual loss is estimated even upon it, what would you say? I would rather pay the £80,000 extra and go to the west. It would pay better in the end by serving more people and opening up good selecting country. There is no selecting country available to the east of the proposed line.

1903. Would not a branch line from the proposed line, starting 15 miles north of Narrabri, and going in the direction of Collarendabri *via* Boolcarrol serve the western country better than a mere deviation *via* Gurleigh Point? I would go to Collarendabri. That is the real line to construct. By going there you would get the Queensland traffic.

1904. You consider that the traffic out from towards Collarendabri is of very much larger magnitude than the traffic from Moree and the country to the north of it? I do.

1905. You would construct a line in the direction of Collarendabri and a branch from it to Moree? No. I understand that you are going to Moree; therefore I say, do not go straight there, but go more to the west and get the western traffic. You might take a branch from that line if you wanted to do so; but you must get to where the people are now.

1906. You have given it as your opinion that the volume of the traffic from the Collarendabri district which now comes to Narrabri *via* Millie and *via* Boolcarrol is of very much greater magnitude than the traffic from the north of Moree? You will get plenty of traffic from Moree; but in my opinion there is more to be got by going to Collarendabri.

1907. Therefore, you think that the first extension of the line from Narrabri should be in the direction of Collarendabri? Yes.

1908. Do you think that the present and future trade of the country lying north of Moree justifies the construction of a railway to Moree? I think it does.

1909. But you think that there is not only a justification for a line to Moree, but also for a line going out in the direction of, but not actually to, Collarendabri? I would rather keep lower down. In the meantime you will get the Moree traffic, although it will have 15 miles more to go, and you can wait for the next twenty years to run a branch line to Collarendabri.

1910. By doing that would you not be loading Moree and the country to the north of it with 15 miles of unnecessary carriage for all time? I do not pity them a bit, because I think they would be very well off in any case. We should not be handicapping them at all.

1911. As a matter of fact, would you not be loading the Moree trade with 15 miles of extra haulage? No; they have nothing to fear. It would pay them well to use the line; and I say let them pay for those 15 miles. Other people have to pay for a much greater haulage; and we, who are making the railway, have a right to see that it will be profitable. It will not be profitable if taken in any other direction.

1912. Do you wish to modify your evidence at all in regard to the requirements of Moree;—I asked you just now whether the importance of Moree and the country north of it justified the construction of a railway to Moree? It would not do so unless the line went down to help the people to the west.

1913. You do not think there is sufficient trade from the Moree district and the district to the north of it, either now in existence or to be developed, to justify the construction of a direct line; but that there would be justification for the construction of a line more to the west? Yes.

1914. How long did you reside in this district? Well, if I have not actually been residing there continuously, I have been constantly through the district for the last twenty years, up to the present time.

1915. Have you seen any floods there? Yes, all the floods that have occurred, big and little, but none of them have been very big. I have seen floods round Narrabri; but never any out the other way.

1916. If witnesses have stated that the country further to the west is more liable to inundation than the country on the proposed line, do you agree with them? I do not. When there is heavy rain the water runs more rapidly near the mountains, because there is a greater fall there; but lower down it spreads out more. Where it would be a foot deep there it is not half an inch deep 10 miles down.

1917. Is it not a fact that on the eastern side of the line the water is confined by channels, while to the west it spreads out over the country? You have more channels to the east than to the west, but the channels to the west are bigger. On the country to the east there are a number of little creeks; but they converge into one or two big creeks, so that to the west only one or two bridges would be required.

1918. Witnesses have stated that the channels to the east are more defined and more easily negotiable than those to the west? The channels to the west are deeper and not so numerous. While on the proposed line there may be fifteen or twenty watercourses, there will not be more than five or six lower down.

1919.

J. Taylor,
Esq.
14 Dec., 1893.

1919. Where does the water go? The smaller channels converge into larger ones. Just as the Murray takes all the water from a number of rivers, so here a few channels to the west take the water from a number of channels to the east. At Millie there is a deep creek; but on the east of the proposed line the creeks are not so well defined. They are up in an hour and down again, and would completely wash away the railway without a large number of culverts.

1920. If witnesses have stated that the water to the west of the travelling stock route spreads over the country in undefined channels, you do not agree with them? No, I do not. They have better channels lower down.

1921. We understand that you do not think that there would be any justification for connecting Moree with Narrabri by a railway unless the line tapped some of the western country? I should say not.

1922. Would you go further than Gurleigh Point to the west? The more you go that way the nearer you get to Walgett, which will want a railway some day.

1923. Are you not aware that the Walgett trade goes down the river and to Dubbo? That is only now and again; and whenever there is a bit of a flood the steamers strike against the bridges.

1924. Are you aware that none of the trade from Walgett comes to Narrabri? It must do so. If the trade does not come from Walgett it comes from the immediate neighbourhood of that place—from stations not more than 5, 6, or 10 miles from Walgett. Would you have them go to Dubbo over bad country and a very bad track; you must come towards Narrabri, and the construction of a line towards the west would help that traffic.

1925. *Mr. Davies.*] Does the proposed line go through your run? I believe so, from end to end; but according to the map before the Committee Dobikin lies to the west of it.

1926. Is that one of your objections to the proposed line? No; its construction would benefit us; but I shall be dead in a few years, and the railway will be there when the whole of us will have passed away; therefore I wish it to go in the best direction.

1927. You are aware that the betterment principle is to be applied to all property within a certain distance of the line? Yes; but I think we should all pay alike. Those living near the old line should pay as well as those living near new lines.

1928. Would you, as a property-holder, acquiesce in the application of the betterment principle, should this line be constructed? I do not know that I understand the principle sufficiently well to be able to say yes or no. As I understand it, if a railway goes through the property of a man who owns 100 acres he will have to contribute something each year towards its cost.

1929. Yes, a charge extending over 100 years? People coming after him will have to pay too. I say to that, that if a man is benefited by the construction of a line he should pay for it.

1930. You think that the principle should be applied to the construction of all future railways? I do.

1931. You have already told us that the proposed line would not serve the settlers on the north-west? It will not serve them on the west but will on the north-west.

1932. Because it would not reach the settled portions of the district? That is so.

1933. If the primary object of Parliament is to reach Moree, which would be the better thing to do—to take the longest, or the shortest route? I should take the longest route.

1934. Although it would entail a greater expenditure? It would be the best in the long run, and would serve most people. If I were spending my own money I should take the line to the west.

1935. What is the general character of the country along the proposed route? You go through good country for a bit. The country for 10 miles round Narrabri is farming country, with a loamy soil. Then you get on to the black soil, and on Dobikin you have 10 or 12 miles of scrub that is not good for anything.

1936. Not even if it is cleared? No; it is a sort of cement.

1937. Beyond that scrub the country is fairly good? You come on to fair land again; but not farming land.

1938. Is it as good as the land to the north-west? When you get on to Gurley the land is as good as you could wish for; but to the west every acre is good. There are patches of farming country, but no farming is done there.

1939. It does not pay because there is no access to market? Yes.

1940. What wool did you truck from your station last year? Five hundred bales.

1941. That found its way by road to Narrabri? Yes.

1942. If the proposed line were constructed, would you send your wool to Woolabrar station? We should tumble it on to the train at the nearest station.

1943. Is not the train carriage cheaper than the road carriage? I am not sure of that. I have had stuff taken from Dobikin to Gunnedah for £2 a ton, and it costs nearly as much as that now to take it to Narrabri.

1944. How many miles is it from Woolabrar to Narrabri? Thirty miles.

1945. The railway charge is 2d. per mile for wool? The teams cut it down cheaper than the railway; but we want a railway.

1946. Are you aware that it would only cost 10s. 6d. to take wool by train from Moree to Narrabri, whereas the teamsters charge from £3 10s. to £4? The teamsters are carrying it for £2.

1947. Well, there is a great difference between £2 and 10s. 6d.? People will pay more to a railway because it is quicker.

1948. But railway carriage is much cheaper? I do not think that it is cheaper.

1949. There is a big difference between 10s. 6d. and £2 a ton? Do you mean to say that the railway carriage would be cheaper than the teamsters charge at the present time?

1950. Yes? I think the railway carriage would be more at the present time. The carriers charge £2 a ton from Moree to Narrabri just now. They will take back loading for that.

1951. According to the railway authorities they would only charge 10s. 6d. a ton—you would rather pay that to a railway than £2 10s. to the carriers? Certainly.

1952. You would send your wool from the nearest point on the line? That would not be more than 2 miles away, but if the railway were to come past my door I would not advocate the proposed line.

1953. What do you regard as a proper train service? The proposed line would suit us; but I have come here to show you how a line could be made which would suit a lot of people better. Everyone will have to bear the cost of this railway in some way or other, and we should try to find out what is the best way to take it.

1954. Do you think that you are better informed in regard to these matters than the railway officials? Yes; the railway officials and people in Sydney know a great deal, but they do not know everything. I know what I am talking about. I am like a soldier who has fought out a battle.
1955. *Mr. Wall.*] You mean to tell us that if this line were taken 10 miles west of the proposed route it would gain a considerable amount of traffic? Yes.
1956. Do you think it is too much to ask people to bring their goods 10 miles to a railway;—the proposed line will be only 10 miles from the line you propose, and yet you say that the trade will not come to it? I do not think it will. The people will run right into Narrabri.
1957. *Mr. O'Sullivan.*] Would you kindly tell the Committee how many acres of freehold there are on Dobikin? I think about 20,000 acres have been secured there.
1958. How many acres are there in the leasehold area? There are 65,000 acres altogether on the run.
1959. How much of that land is held in reserves? A good deal.
1960. What is the area of the reserves? I do not know, but I suppose it would be 5,000 acres. I cannot carry those things in my head.
1961. *Mr. Dawson.*] Do you think a man travelling along a road would go 10 miles out of his way to get to a railway, instead of continuing on 20 or 25 miles? No. He would go right into the terminus, and make a little more money by doing so.
1962. It is not a fact that a man will always go to the nearest station? No; a man wants to come to town to get things from there.
1963. *Mr. Neild.*] With reference to the application of the betterment principle, would the construction of a railway enhance the value of land used solely for pastoral purposes? I do not think it would enhance it very much, but it might increase the value of it a little, though you could not afford to pay the extra money in order to grow wool. You might, if you went in for farming.
1964. A railway would improve the value of land used for agriculture? Yes; it is an advantage to have produce carried by it.
1965. Pastoral land would not be improved, because pastoral produce being either live stock or wool, can be easily removed long distances by road? Yes.

J. Taylor,
Esq.
14 Dec., 1893.

Robert Edward Jones, Esq., M.I.C.E., Divisional Engineer, Department of Roads, and Bridges, sworn, and examined:—

1966. *Chairman.*] You for some time acted as Examiner of Public Works? Yes.
1967. While so acting you furnished a report, under date 17th June, 1891, on the group of proposed railways from Dubbo as far north as Narrabri? Quite so.
1968. *Mr. Neild.*] You appear to have reported on three proposed lines to connect Narrabri with Moree, and, according to your report, the longest line would be the least expensive;—you reported on a line, *via* Gurleigh Point, of which the length was to be 70 miles, and the estimated cost, £252,000; upon a direct line, 61 miles in length, and estimated to cost £283,000; and upon a line, *via* Rocky Crossing, 66 miles, and estimated to cost £268,000;—how do you account for the extra cost of the direct line; do you attribute it to the expense of crossing the river at Narrabri, or to the character of the country which it would traverse? These are not my estimates; they were furnished to me by Mr. Deane. For all the other lines into which I inquired I made my own estimates.
1969. You took the figures as they were given to you, without any investigation? Yes; but I happen to know that the increased cost of the direct line was very much due to the expense of bridging the waterways on it.
1970. The cost of bridging the waterways on the direct line was much in excess of the cost of similar works on the Gurleigh Point line? I speak of the estimates furnished to me. The direct line on which I reported is the permanently staked line. I did not inquire into the proposal now before the Committee.
1971. Did you go over the country? Yes.
1972. Did you go over the proposed line before the Committee? No.
1973. But, in going over the permanently staked line, you practically went over the proposed line from Edgeroi to Moree? I crossed it at different points.
1974. Did you go over the Gurleigh Point route? Yes.
1975. And over the travelling stock route? Yes.
1976. Is the soil alike on the three routes? Very much alike, though perhaps there is more basaltic soil on the direct route than on the Gurleigh Point route.
1977. Where are the water channels best defined—on the direct route, or on the Gurleigh Point route? On the direct route.
1978. You stated that it would be more expensive to cross the water-channels on the direct route than on the Gurleigh Point route? I was referring to the original direct route now known as the permanently staked line, not to the line before the Committee.
1979. Is the country more subject to flood on the direct route than on the Gurleigh Point route? I should say that the country on the Gurleigh Point route was slightly more subject to flood than the country on the proposed route.
1980. You form that opinion from your own personal observations, or from information which you have obtained? I have been over this part of the country several times. The district forms part of my road division, and I am in it repeatedly. I have not been there at the time of any high floods, though I examined these routes in 1891 just after the occurrence of a very big flood.
1981. Perhaps you will kindly state the limit of your division? It extends from Branxton to Tenterfield; then follows the Queensland border to Goodooga and Brenda; then goes to Brewarrina, Coonabarabran, Cassilis, and back to Branxton.
1982. Are you able to visit this portion of your division often? I think I have been to Moree three times this year.
1983. Is it customary for you to go there so often? I try to get across every four months.
1984. If Mr. Poate states that the water-channels are better defined along the Gurleigh Point route than along the direct route, you differ from him? I am talking of the water channels in time of flood, not under normal conditions. The Namoi, with its two banks, is well defined at the present time, but we have to deal with the channels in flood time: and the country to the west being very much flatter than the country to the east, a greater extent is flooded when the water gets over the banks of the creek.
1985. Would a greater sum be required for culverts, viaducts, and bridges on the proposed line than on

R. E. Jones,
Esq., M.I.C.E.
14 Dec., 1893.

- R. E. Jones, the Gurleigh Point line? It is rather difficult for me to say, because I have not seen a section of the water-ways on the proposed line. I saw the sections of the three lines on which I reported, but I have not seen the section of the line before the Committee.
- 14 Dec., 1893.
1986. Is the current of the creeks on the proposed line stronger than on the western line? That is a difficult question to answer.
1987. Are you aware of any difference? No; I am not.
1988. You do not know if the risk of washaways would be greater on one line than on another? No; I should say it would be about equal. In the country to the west, when the water gets over the banks, it spreads, and a great deal of it becomes still water.
1989. Would the same remark apply to water on the direct line? No; about Narrabri, where you would have to cross both the Namoi and Narrabri Creek, the water is more confined, and the velocity consequently greater.
1990. The velocity would be greater in streams flowing from the hills? The greater the fall in proportion to the distance the greater the velocity.
1991. We are told that about one-third of the land between the proposed line and the ranges to the east of it is scrub land;—would that be so? I should think that is somewhere near it.
1992. Is that land in any useful occupation? It is used for pastoral purposes.
1993. Does any grass grow on it worth speaking of? There is not so much grass, but there is very good timber. There is good ironbark at the back of Terry-Hie-Hie.
1994. That is to the east? Yes.
1995. Are there not some important forests along the river to the west of Narrabri? Yes; on the south side of the river, at the back of Wee Waa and Pilliga, there are some very good ironbark forests.
1996. Would the Gurleigh Point route give access to those forests? Yes.
1997. The proposed route would not? No; not to the forest about Wee Waa.
1998. Would the forests you speak of be likely to give an important traffic to the railway? I cannot say that they would give an important traffic. They are very extensive, and you would want to go through the heart of them to serve them. Pilliga is 64 miles from Narrabri, and these forests extend beyond that, so that even a line to Gurleigh Point would not do very much towards opening them up.
1999. To secure that timber it would be necessary to take the line much further west? Yes; 15 miles would not do much where there are long sticks of timber to be carried.
2000. We understand that there is more settlement on the western line than on the direct line? That is so.
2001. I think you took it into consideration in making your report? Yes; the settlement and the cost were the main things governing my recommendation.
2002. You reported in favour of a line to the west in place of a direct line? Yes.
2003. You considered the amount of existing settlement; but did you take into consideration the probability of future settlement? Of course that is only hypothetical, and everyone must have his own idea about it.
2004. From your knowledge of the district do you think that, in the future, settlement on the Gurleigh Point line will be greater than settlement on the direct line? I may say that I do.
2005. Why? Because there is more Crown land, and the land is of pretty well equal value all through, and, therefore, I think, capable of carrying a larger population than there is likely to be on the direct route, where at least half of the holdings are freehold. I do not think there would be very much settlement towards the mountains.
2006. The whole trend of settlement is westward? Yes.
2007. You seem also to have paid a great deal of attention to the prospect of trade to and from existing towns, and in your report on the line from Narrabri West to Gurleigh Point, you mention a considerable number of towns that are likely to be served by that line;—would an equal number of towns be served by the direct line? No; for instance Wee Waa would not be served, and neither would Pilliga, and Millie would be very imperfectly served. The other towns mentioned in my report lie north of Moree, and, with the exception of Collarendabri, would be served by it. I could scarcely say that Collarendabri would be served by the proposed line, and you would also have to exclude Warialda, especially in view of the probable construction of a line to Inverell.
2008. If that line is constructed, the Warialda trade need not be taken into consideration? That is so. I am referring, however, more to the district than to the town.
2009. If the railway is taken to Moree, and also to Inverell, will those places compete for the Warialda traffic? Only for traffic north of Yetman, and that only to a small degree.
2010. If the line is taken to Moree, and not to Inverell, will any trade that would otherwise go to Inverell come to Moree? Yes.
2011. And *vice versa*, I suppose;—would a line to Inverell take any of the Moree traffic if there were no railway to Moree? Yes, a small amount. It would take traffic from some of the stations lying north-west of Warialda, such as Gunyerwarildi, Yallaroi, and Tooloona. Those stations would possibly send to Inverell.
2012. *Chairman.*] The line of demarcation would depend upon which railway was made first? Yes.
2013. *Mr. Neild.*] It would also depend on the seasons? Yes, and the state of the roads. At present some of the traffic north of Yetman goes through Strathbogie on to Deepwater. The differential rates commence at Kentucky, so that instead of joining the line at Glen Innes, some of that traffic has gone through Vegetable Creek.
2014. There is a very good road that way? It is very good from Strathbogie to Deepwater; but not much has been done to it beyond that.
2015. You are aware that it is proposed to charge the proprietors of land in the vicinity of the line some part of its cost, the charge being spread over a number of years? Yes.
2016. Would the construction of the proposed line materially enhance the value of the properties through which it passed? I should not like to say that. It is a very difficult matter to deal with. In my report I have simply dealt with the enhanced value of Crown land. I could not touch the freehold land. Of course the Betterment Bill has altered all that.
2017. Would a railway increase the value of land used for agricultural purposes more than the value of land used for grazing purposes? Yes.
2018. That, I suppose, is due to the fact that the volume of produce from an agricultural district is infinitely greater than the volume of produce from pastoral land? Quite so; and the value of wheat per bushel is very much more in proportion to its bulk than is the case with wool.
- 2019

2019. And in one case you drive a great deal of your produce to market, while in the other you cannot do so? Yes.
2020. Consequently a railway is of more value to an agriculturist than to a pastoralist? Quite so.
2021. Have you any reason to suppose that the construction of the proposed line would lead to the cutting up of any large estates? There is land on them suitable for agriculture, and the construction of the line ought to lead to such subdivision.
2022. A great deal of the soil is black country, is it not? Yes.
2023. Is it of any value for agricultural purposes? The intermittent character of the rainfall is against agricultural pursuits, but near the hills the rainfall is greater.
2024. Do you know of any black soil country being used for agriculture? The river flats on the north coast are used for the production of maize.
2025. But that is not the same soil as this? No.
2026. Is not the black soil too sticky to plough when wet, and too hard when dry? The ordinary black soil would be so, but on Gurley and at other places along the route there is soil upon which, I believe, wheat could be grown if the rainfall were sufficient.
2027. You are referring to volcanic soil? Yes; and sandy soil.
2028. Are these patches extensive? I think I passed through some miles of such country.
2029. In the aggregate or separate patches? Separate patches.
2030. Is the country you speak of Crown land? I am not able to say, because I do not know where the division between the leaseholds and the purchased lands comes. I took out the acreage of every run when I was making my report. There are over 103,000 acres of alienated land on Gurley, and on the resumed area there are only 55,000 acres, so that the good land will be mostly freehold.
2031. Assuming that the Gurleigh Point route is 15 miles longer than the proposed route, and would, according to the estimate of the Engineer-in-Chief, cost £300 a mile more to construct, would the extra trade which it would get, and the extra advantages which it would confer on the settlement and prospective settlement, warrant its construction? According to my figures, the Gurleigh Point line is only 8½ miles longer than the proposed line. The Gurleigh Point line is 71 miles 62 chains, while the proposed line is 63 miles 50 chains.
2032. You consider that the present and prospective traffic on the Gurleigh Point route would justify its construction, although it is 8½ miles longer than the proposed route, and would cost £300 a mile more? As far as I can make out, the extra distance and the increased cost of construction would make it cost £43,200 more than the proposed route.
2033. Are you of opinion, under the circumstances, that the present and prospective traffic that it would serve warrant its construction? I would point out that in addition to the traffic on the Gurleigh Point line you would get 9 miles more haulage from Moree.
2034. That would be an extra charge on the people of Moree? Quite so. If the line were made they would have to pay for the 72 miles of haulage.
2035. Do I understand that the question is one which you feel disinclined to answer? I should have to work out the figures, and ascertain what the additional revenue would be.
2036. Do you think that the trade on the Gurleigh Point line would warrant us in constructing a line which is 8 miles longer than the proposed line? I must confess that I am inclined to think that it would.
2037. Is it customary in this Colony to seek the nearest connection between two towns, irrespective of all trade considerations? I do not think it is.
2038. In your knowledge has that plan been adopted in connection with the majority of our railways? I am not prepared to say.
2039. Has it not been rather the practice to take lines where they will serve the greatest population? I think that is generally the practice.
2040. It would be a new departure to consider the directness of a line and nothing else? In making my investigations I tried to ascertain which would be the best line for the collection of traffic.
2041. You hold that the Gurleigh Point route would gather a larger quantity of traffic, and more valuable traffic than the direct line, and you therefore prefer it? Yes, assuming that it would be 8 miles longer than the direct line. If it were 15 miles longer I should have some doubt on the subject.
2042. You studied these matters rather from the standpoint of the public interest than from an engineering standpoint? Yes.
2043. *Mr. Collins.*] How far is Gurleigh Point from Narrabri? Fifteen miles.
2044. What sort of country does the surveyed route go through? Not very good country.
2045. Would it not have been better to cross the river at Narrabri and go along on the north side of it? I am not sure as to the cost of crossing the river. It is not very large now; it has been greatly reduced.
2046. It was estimated that the cost of crossing the river would be £80,000, but the present estimate is between £5,000 and £6,000;—what do you say in that case? If you go westward to get this traffic there is no reason why you should not go on the north side of the river.
2047. Seeing that the country on the north side is better? Yes.
2048. Is there much settlement between Gurleigh Point and Boolcarrol? No; but there are a lot of selectors on Boolcarrol run.
2049. A sufficient number to warrant the construction of a railway there? Not to that particular place. When we speak of the line going westwards, it is not to tap any particular spot. You have to think of the Pilliga traffic, and the traffic from Wee Waa, Pian Creek, Jew's Lagoon, Thalaba Creek, and until some better communication is given by the Barwon, Collarendabri, and even Angledool.
2050. Do you not think that some consideration should be shown to the 3,000 inhabitants of Narrabri? Yes; I have stated in my report that Narrabri must suffer very much.
2051. *Mr. Naild.*] Wherever the line is taken? Yes.
2052. *Mr. Collins.*] But more particularly, if it is taken to Gurleigh Point? Yes; because if the proposed direct line were constructed, most of the traffic now coming into Narrabri would continue to come there.
2053. Did you not recommend a line from Coonamble to Walgett? Yes.
2054. Would not the traffic from a number of the places you have mentioned go to that line? No.
2055. Would not the Pilliga traffic go there? Pilliga is further from Walgett than it is from Narrabri.
2056. Would it not go to Coonamble? I do not think so.
2057. Pilliga is only 40 miles from Coonamble? I take Pilliga as the line of demarcation, and I was assuming that the Gurleigh Point line would be constructed, which would go nearer.

- R. E. Jones, Esq., M.I.C.E.
14 Dec., 1893.
2058. If the river were made navigable to Collarendabri, would not the traffic from that part of the district go by it? Wool traffic would probably do so. It is difficult to say what the charges and insurance would come to; but if the river charges were cheaper than the road charges the traffic would go that way.
2059. Seeing that they have differential rates on the Western line from Bourke, it would be cheaper to go there than to Narrabri? But a lot of the wool would go to Newcastle, and the rate to Newcastle is only £3 5s. 1d. The rate from Bourke is far more than that.
2060. You say that there is good agricultural country on the proposed line? Yes.
2061. If the reserves there are thrown open, would a large settlement be created? If the runs were subdivided settlement would be created.
2062. Which do you think would be better;—for the line to be taken direct to Moree with a branch to the west, or for the Gurleigh Point route to be followed? What you propose would answer the same purpose as the Gurleigh Point route; but the working expenses would be more.
2063. But a direct line would be more advantageous to the people about Moree and the district to the north of it? Yes, because they would not be handicapped by any extra mileage.
2064. I understand you to say that if the crossing at Narrabri will cost between £5,000 and £6,000, the line might cross there instead of at Gurleigh Point? It would be far more expensive to cross at Gurleigh Point than, according to Mr. Deane's estimate, it would be to cross at Narrabri.
2065. *Mr. McCourt.* You have had a considerable amount of experience in road-making in this district? Yes.
2066. What depth of metal do you put on roads there when you are forming them? Nine inches at the least, but with the narrow tires and the tremendous loads that they have there the wheels cut through like a knife.
2067. When a road is formed and the soil thrown up in the middle, does it get very hard? Yes; some time after rain it gets very hard.
2068. During flood time, when it gets soaked, does it dissolve? Generally, in dry weather, it gets very hard, and opens out in fissures in many places, keeping a hard crust.
2069. But if it is flooded after it has consolidated does it dissolve? It becomes very soft.
2070. And almost dissolves? It is boggy.
2071. Do you think that 3 inches of ballast would be sufficient under the sleepers there? I was employed on railways all my life till I came out here, and this is an experiment which I should be very glad to see tried. The quantity of ballast proposed is far less than I have ever known to be used; but I take it that the 3 inches will be placed under the sleepers.
2072. There will be only 3 inches of ballast altogether? A train passing over a line has not the same effect as a waggon drawn by horses. The narrow wheels of a waggon plough up the surface of the road, while the weight of a train is not transmitted directly to the soil because of the sleepers and rails.
2073. But the engines would weigh 60 tons? I understand that they will be lighter than that—about 30 tons.
2074. Do you think that 3 inches of ballast would be sufficient? I am not prepared to say that I do. I should like to see more used.
2075. *Chairman.*] You are aware that the speed of the trains will be limited to 15 miles an hour? Yes.
2076. Would that affect the stability of the road to a less degree? The oscillations would be less.
2077. *Mr. McCourt.* Would you advise the use of an extra number of sleepers? Yes. There is no doubt that ballast in this case will be a very expensive item.
2078. Would you advise the use of sleepers 18 inches apart? I would not have them as close as that; I would say 2,000 to the mile.
2079. *Mr. Dawson.*] What do you mean by the answer that you gave to Mr. Collins with regard to the injury likely to be done to Narrabri? If the line is taken *via* Gurleigh Point the traffic which now comes to Narrabri will go there no longer, except traffic from the east, such as that from Terry-Hie-Hie, Rokeby Creek, and so on. If, however, the proposed route be followed, the traffic from Wee Waa, Pilliga, Pian Creek, and Jew's Lagoon, will still come into Narrabri.
2080. Into Narrabri West? No. Much of it comes by way of Gundamine, by Ironbarks, into Narrabri, and then crosses the bridges to Narrabri West.
2081. Do you know the Narrabri Creek and the Namoi River? Yes.
2082. Do you think that a railway bridge could be thrown across those watercourses at a cost of £6,000? I am not prepared to say. I have not seen the details or sections, nor do I know what the length of the bridges will be. I am not in a position to criticise the estimate.
2083. The former estimate was £80,000? Mr. Collins said £80,000.
2084. That is what the estimate was? I presume that that was for a very much heavier style of line. The weight that has to pass over a structure materially influences its strength provisions.
2085. *Mr. O'Sullivan.*] There are two districts which we have to serve—one to the west and one to the north; do you think it would be possible for one line to serve those districts for all time? That is very difficult to say. The Collarendabri people consider that they ought to have a railway to themselves, and the Mungindi people, no doubt, would like a railway to themselves.
2086. You reported upon a branch line from Gurleigh Point out towards Collarendabri and Angledool? Yes.
2087. I presume that some day such a line will have to be constructed? I do not think so.
2088. Do you think that it will never be constructed? Yes. The engineering difficulties are very great, and the cost would be enormous. If the railway is taken to Moree and another line to Walgett, and increased facility is given for trading on the Barwon, there will be no necessity to make a railway to Collarendabri or Angledool.
2089. Could you not safely take the line a portion of the way, say as far as the flood-waters? Yes; you could do that.
2090. We have a certain sum of money to expend, and we know that the Gurleigh Point route will cost a great deal more than the direct route. Which would be the better for us to do, in the interests of the State—to make a direct line to Moree, and a branch line to Collarendabri, or to follow the Gurleigh Point route? I consider that the loop-line would be the best, because it would give greater facilities for settlement.
2091. You prefer the Gurleigh Point route to the direct line, with the branch which I have suggested? For

For this reason, that it gives increased facilities to the country that a branch—I do not know where you propose to make it from—would not give. A line by Gurleigh Point would give relief to Wee Waa and, perhaps, Pilliga, though there is a bridge over the river at Bugilbone. A line *via* Boggy Creek would not give relief to the Wee Waa traffic.

R. E. Jones,
Esq., M.I.C.E.
14 Dec., 1893.

2092. I am not suggesting such a line; suppose the branch line left the proposed line 4 or 5 miles beyond Narrabri, and went out *via* Boolcarrol to Collarendabri, would it not, in conjunction with the proposed line, benefit the district more than the Gurleigh Point line? Yes; because the direct line would not handicap the Moree people with increased mileage, while the branch would give facilities to other parts of the district.

2093. *Mr. Hoskins.*] You stated that you have had considerable experience in railway construction, and that you have never seen railways constructed with as little as 3 inches of ballast under the sleepers; but are you aware that in America there are hundreds of miles of railway without any ballast at all? Not of my own knowledge, but I have read of them. They are not constructed according to the English practice.

2094. Do you not think that 3 inches of ballast under the sleepers would be sufficient in level country, where the traffic was light and the rate of speed run very low, if the line was well drained and culverted, and locomotives of only 15 to 20 tons weight employed? Possibly so, if you only used locomotives of 15 tons weight, but there would be some difficulty in getting water there, and an engine, to be of much use, must be at least 30 tons in weight. I think the American practice is to have the sleepers very much closer together than they have them in England, which, perhaps, compensates for the want of ballast.

2095. If the maximum speed run on the line were 15 miles, and the engines only weighed 30 tons, would 3 inches of ballast be sufficient, supposing the drainage were good? Yes, if you made good drains and culverts; but that is a matter of some expense in flat country like this, where the water lies upon the ground. In many cases, where ballast can be easily got, it is best to increase it. Where the sleepers are placed far apart, instead of getting elasticity in the road, it becomes uneven, and gets out of order very quickly.

2096. Do you consider that if only 3 inches of ballast is placed under the sleepers the working of the railway will be unsatisfactory? No. I should be very pleased to see the experiment tried.

2097. You look upon it purely as an experiment? I do. I should certainly go in for a greater depth of ballast, because I think it would save the maintenance. The road would require more attention if only a small quantity of ballast were used than if a greater quantity were used, especially after rain.

2098. But if you had a greater depth of ballast, and the line was not properly drained, would not a flood have an equally bad effect upon it? Not an equally bad effect, because the water would pass very quickly through the ballast.

2099. *Mr. Davies.*] Is ballast easily obtainable on the proposed line? I think the various routes are equally situated as regards ballast, though possibly there is something in favour of the proposed route, because there is ballast at Little Mountain, near Narrabri.

2100. What does it cost you to put metal on the roads of that district? The cost varies very much. At Walgett we have to use vitrified clay, which costs 20s. per cubic yard, while at Narrabri we get metal for about 12s. per cubic yard.

2101. Is that drift from the river? No; there is a quarry at a place called Little Mountain, within 2 miles of Narrabri.

2102. Do you know of any ballast that could be procured within easy distance of the proposed line? Yes; on the way to Gurley you cross a basalt outcrop.

2103. What would the cost of that metal be per cubic yard placed on the railway? In a suitable size for ballast. What distance on each side would you take?

2104. Say 15 miles on each side? Not less than 17s. or 18s. per cubic yard, that is with an average cartage of 10 miles.

2105. Do you think that any ballast could be procured at 2s. 6d. a cubic yard? I doubt it.

2106. You doubt if ballast could be placed on any part of the proposed line at 2s. 6d. per cubic yard? Well, I do not know how close the line will go to Little Mountain.

2107. What would you consider the average cost for the whole line from Narrabri to Moree? Well, you must remember that in constructing a railway they lay down a temporary line before they put on the ballast at all, which reduces the cost very much. I have been estimating for road haulage, which makes a very material difference.

2108. Taking that into account, what do you think the ballast would cost? I do not think you could put it on at an average cost of less than 7s. per cubic yard for the whole line.

2109. That includes breaking? Yes; and the cost of engine power.

2110. Do you take into account the gravel to be got from the Namoi and the Gwydir? Yes; it would have to be screened.

2111. And would cost about 7s. a cubic yard? Quite that.

2112. Do you know if the direct line passes through any quarry or gravel pit? It passes very close to Little Mountain, and must pass over a basalt outcrop running from the Bald Hill over towards Gurley.

2113. Would that be within easy distance of the proposed line? Yes; both places would.

2114. If metal is got from the Little Mountain and from the basalt outcrop, it will cost, including haulage, 7s. 6d. a cubic yard? Yes.

2115. That is a general average? Yes. It is very probable that instead of getting it from any of these places they will get it directly on the line at some point near Narrabri, when the cost would be very little compared with the cost of road haulage. Possibly any estimate that has been made has been on that assumption.

2116. What does it cost you for breaking, as a rule? About 2s. 6d. a yard, 3-inch measurement, and sometimes less. It all depends on the hardness of the metal. Basalt would cost 2s. 6d.

2117. What is the lowest price you have paid? I have paid as little as 1s. 3d.

2118. For what—sandstone? Yes.

2119. You are speaking of the cost of breaking by hand? Yes.

2120. You have paid as much as 2s. 6d. and 3s.? Yes.

2121. You have stated that there is a good supply of timber along the line? Yes, on the hills to the east of the line at the back of Terry-Ilie-Ilie. I suppose the nearest point to the line where the timber could be got would be 15 miles out.

- R. E. Jones, Esq., M.I.C.E. 2122. What is the general character of the timber? We have been getting girders for bridges there.
2123. In any quantity? No; the best of the timber has been culled.
- 14 Dec., 1893. 2124. What would you consider a fair value for half-round sleepers taken from this forest? Ironbark?
2125. Yes? What size?
2126. Nine by 4, sawn or split, but undressed? I should say that you might get them landed on the railway for 2s. 6d. each.
2127. I am speaking of undressed sleepers? You might get them lower than that; I daresay you would get them for 1s. 6d., including haulage, though not, of course, in the wet season, when the haulage would be a great deal higher.
2128. That is haulage for 15 miles? Yes; not exceeding that.
2129. You said that in your opinion there would be abundance of timber to supply the railway? For that purpose there would.
2130. In your report you estimate that a large area of Crown land would be served by the line;—has there been any change since you made that report? There has been a change in Moree itself. There has been a great deal of progress there, and I know that settlement has increased in the district; but settlement has been retarded somewhat because the resumed areas are very limited in extent.
2131. There has been a great improvement in the settlement at the Moree end? All over the north-western portion of the line.
2132. What proportion of Crown land would be served by the proposed line? I think that over 3,000,000 acres of Crown land would be served by it.
2133. What radius would you take on each side of the line? That is going right up to the Queensland border, to Goondiwindi, the junction of the McIntyre and the Barwon, taking Yetman as the point of divergence on the east, going close to Warialda, avoiding Bingara, taking the ranges as the boundary down to Terry-Hic-Hic, and across to Narrabri. On the other side excluding Wee Waa and the district I have already referred to, Mogul, and from there following the Barwon to Mungindi, and on to Goondiwindi. That is excluding the Queensland trade.
2134. Do you think that this large block of Crown land would be largely increased in value by the construction of the line? I do, chiefly because it is impossible to make a road to Moree, and a railway would serve the traffic at all times. At present during flood time the cost of haulage is enormously increased, and sometimes you cannot get stuff taken at all. If the district is brought 70 miles nearer Sydney it must increase the value of all land there.
2135. What would it cost per mile to take a macadamised road, half a chain wide, through this country? It would cost £2,500 a mile.
2136. As much as it would cost to construct the proposed line? Yes; and the maintenance would be excessive.
2137. From the one the Crown would get no return, while from the other it would? Yes.
2138. As far as your knowledge of the country generally and of the desire of the Legislature to reach Moree goes, do you approve of the direct line in preference to any other? If you aim at serving Moree and the country north of it, of course the best route to adopt is the cheapest and shortest, so that the people who wish to use it will not be handicapped to the slightest extent.

TUESDAY, 19 DECEMBER, 1893.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN.)	
The Hon. WILLIAM HENRY SUTTOR.	WILLIAM CHANDOS WALL, Esq.
The Hon. JAMES HOSKINS.	WILLIAM McCOURT, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	JOHN CASH NEILD, Esq.
The Hon. JOHN DAVIES, C.M.G.	EDWARD WILLIAM O'SULLIVAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	CHARLES COLLINS, Esq.
HENRY DAWSON, Esq.	

The Committee further considered the proposed Railway from Narrabri to Moree.

John McElhone, Esq., sworn, and examined:—

- J. McElhone, Esq. 2139. *Chairman.*] I believe you are a wool-buyer? Not now. I can hardly tell you what I am at the present time.
- 19 Dec., 1893. 2140. I understand that you know this district well, and know the different routes which have been suggested for a railway from Narrabri to Moree;—what are your views as to the direction the line should follow? It is a good many years since I was in that country. I used to go there stock buying, but of late years I have not been past Narrabri.
2141. How many years is it since you were there last—five years? Fully fifteen, I think.
2142. You know the direction which traffic takes upon the area of country depicted on the Lands Office map before the Committee? From what I have heard a great part of the land about Killarney was purchased years ago, but it is not so with the country lower down. I think there is hardly the same area of country in New South Wales as good as that.
2143. Are you referring to the country on the southern side of the river, or to that on the northern side? The country down towards Wee Waa and Millie—all that country. It is all magnificent saltbush and myall country.
2144. That is from Boolcarrol, north? Yes; I have been told that the owners of Killarney scoured all the land they could years ago; but the land lower down the river was Crown land until the passing of the Stuart Land Act, and that is why there is so much settlement down there. If it is true, as I have been told, that the great body of settlement is down there, I have no hesitation in saying that although the route may be longer, that is the line which would pay the Government.
2145. You have no personal knowledge of the settlement which has taken place there? I tell you distinctly that I have not been there for many years. I have been told that the land was taken up since the passing of the Stuart Land Act, which allowed free selectors to hold their land undisturbed, and therefore they have become thick and strong there, and are likely to stop. 2146.

J. M. Elhono,
Esq.
19 Dec, 1893.

2146. Are you aware if many of them have sold out to the squatters? That is beyond my knowledge altogether, but I know that some of the men there are not likely to sell to the squatters, because they have been able to get a sufficiently large area of land, and are therefore likely to stop.
2147. From your knowledge of the fertility of that district, and from what you have heard of the settlement which has taken place since you visited it, you think that if the line were taken more to the west, it would be to the interest of the country? Such a line would be longer, but it would be more in the interests of the country, since it would suit population generally, and not a few landholders only.
2148. Suppose the primary intention of constructing this line is to tap the country to the north of Moree, do you not think that any deviation to the west will give unnecessary mileage? There is another reason why the line should go more to the west. Wee Waa, if I recollect, is 20 miles from Narrabri, and in going towards Wee Waa, you are on the road to Walgett, to which place you are bound to make a railway sooner or later, because you cannot make a road there.
2149. But you have not answered my question;—presuming the proposed line is primarily for the purpose of tapping the country north of Moree? Out towards Warialda?
2150. Kunopia, Goondiwindi, and that district;—would it not be unfair to load traffic from those parts with some miles of additional haulage? I do not think so.
2151. You think that the greater traffic to be developed on the western line would more than compensate for the deviation? I am sure of it. If the proposed line was constructed the people out to the west would continue to bring their wool and fat stock in by road to Narrabri.
2152. Do you know anything of the country north of Moree? No; except out towards Bingara and Barraba, and the country out that way.
2153. Therefore, you cannot compare the country north of Moree with that to the west of the proposed line? No; I suppose you would call Warialda north?
2154. No; that would be east? Because the Inverell railway would suit those people. Every acre of the country to the west—Lode's station, Richards' station, Yarraldool, the Eckford Brothers' station, Millie—is magnificent land. There is not an acre of bad land there.
2155. We have it in evidence that some of the traffic from the country you refer to comes to Narrabri, *via* Boolcarrol, and the rest of it *via* Millie, and while some witnesses are of opinion that the traffic coming *via* Millie would use the proposed line, others think that it would not? That is a matter for the people themselves to determine; but I fancy that a line towards Wee Waa would catch all the traffic from the west, which the proposed line would not get, together with the traffic coming to the proposed line.
2156. If there is sufficient traffic in the country north of Millie to pay for the construction of the proposed line, would it not be unfair to handicap the people living there with 15 miles of additional railway carriage? So far as I can judge, a line to the west would pay better than the proposed line, because it would serve more traffic. All the country there is magnificent. I have travelled over a good deal of New South Wales, and I do not know any part of it where there is more good, rich grazing land than there is here. I am speaking of grazing land only.
2157. How would you compare the land out towards Bingara and the hills with the land you speak of? It is beautiful agricultural country. You cannot beat it for agriculture.
2158. Is that the general character of the country between the proposed line and Bingara? All round Inverell and Bingara, and out towards Warialda, the country is magnificent.
2159. The country east and west of the proposed line is similar, and is good country? There is a great deal of good country both ways. It is nearly all good country.
2160. But there is a large area to the westward, because there are no hills? There is a larger area there open to conditional purchase. Until lately there was no land taken up there at all. I think I am right in saying that all that land was taken up since the 1883 Act passed. Take the case of Mr. John Walsh. Out of 500,000 acres leased, which he had there, but a comparatively small area (1,280 acres) had been purchased when the place was bought. Virtually, nine-tenths of these runs were Crown land before the selectors went out there to take up any land that would suit them for grazing stock, and enable them to keep a family.
2161. Do you think that it would be better to make a diversion to the west? I do not know anything about the paying capabilities of the country, but I think that a line to the west is more likely to pay than any other line. If you ask me, I do not think that any line would pay for some time to come.
2162. Is there any other point on which you wish to enlighten the Committee? No. I may say that I have no interest in this matter. I am indifferent as to where the line will go, but, knowing the district, I am of opinion that a line to the west would be best.
2163. Were you ever in that district during very heavy floods? Yes; I have had cattle swimming all the way from Goondiwindi to Narrabri, except for the sand hills here and there. That was in 1870. The creeks spread all over the plains during heavy floods.
2164. We have been told by the Railway Construction Department that one of the reasons for keeping the line to the east is that it will pass through country less liable to floods than that further west? The creeks on the proposed line are as much liable to heavy floods, and spread over the plains, as much as the creeks lower down. It is almost a dead level from Narrabri to Moree, whichever way you go.
2165. If we have been told that the proposed line could be constructed for £400 to £500 a mile less than a line to the westward, leaving out of consideration its saving in length, do you think that is a matter which could be taken into consideration? I do not think so. I believe that the crossing at Narrabri will require one of the most expensive bridges; it is one of the worst crossings on the Namoi River.
2166. The engineers say that they have adopted the cheapest and best crossing suggested to them? I do not place much confidence in them. Many millions of money have been fooled away in this country on scientific fads. In my opinion, as expensive a bridge will be required on one line as on the other, while if you go towards Wee Waa you are getting near Walgett, where you must make a railway some day or another. I am told that selectors are taking up the whole of the land round Walgett, and will greatly increase when leases in the Central Division fall in.
2167. As a matter of fact, none of the Walgett traffic comes into Narrabri now? That I do not know.

Ingham Suttor Clements, Esq., sworn, and examined:—

2168. *Chairman.*] You were at one time surveyor in charge of the Inverell-Moree district? Yes.
2169. How long ago is that? Thirteen years ago.
2170. How long were you in charge of that district? About nine years.
2171. Can you give us roughly the boundaries of that district? It is bounded on the west by the Namoi River, on the east by the Nandewar Ranges. It is bounded by Bumble Creek on the north, and then goes down to Walgett.

I. S. Clements,
Esq.
19 Dec., 1893.

- I. S. Clements, Esq.
19 Dec., 1893.
2172. Are you familiar with the country right out to Walgett? No; I never went to Walgett.
2173. Do you know anything of the country north of Moree? I know the country within the boundaries of my district; but I never went out of the district unless sent out of it—that is, to do surveying work.
2174. You know the route of the proposed line? The proposed route, I believe, is a straight one, while the others turn further down the river.
2175. Which route, in your opinion, is the best for the purposes of railway construction—which keeps out of the reach of floods most? I think the proposed route keeps out of reach of the floods best.
2176. The more you go to the west the more the country is liable to be flooded? Yes.
2177. Which route passes through the best land, from an agricultural or pastoral point of view? Either of the western routes passes through better country than the proposed route; but the proposed route taps better agricultural country—not that there is a great deal of agricultural country there.
2178. You are of opinion that the proposed route passes through drier country than the western route? I think that if a railway were constructed along the proposed route it would cost less for repairs, and would be more durable, and less liable to accident than any other. The good land lies principally up the gullies, off the plains. There are some very good patches up various creeks. Of course the proposed line keeps near the foot of the ranges.
2179. It is 15 or 20 miles from them? I mean near by comparison.
2180. Were there any serious floods in the district while you were stationed there? Yes; there were some big floods. You can generally reckon on a big flood once in fifteen years.
2181. From your experience during such times, you think that the proposed route is the best for the purposes of railway construction? I think so.
2182. Would it be possible, without very considerable expense, to take the line along either the north or south branch of the Namoi? I think it would be a waste of time to take the line along the river bank, because it would be a foot underground after the occurrence of a flood, through the deposit of silt, or it would be washed away altogether.
2183. The river banks here and there are subject to floods? Yes; though very often in the flat country the immediate bank of the river is higher than the country beyond.
2184. Do you know Gurleigh Point? Yes.
2185. Is the bank there bold, or is it liable to be flooded? It is low compared with the country above, which we are speaking of.
2186. You said that the proposed line would pass through country more suitable for agriculture than any of the country to the west;—how do you account for that? The country to the west is decomposed trap. It is more recent, I should think, than the country to the east. Up the gullies the soil is alluvial, and the land generally is more arable than the ordinary black soil country.
2187. Do you know if there is any considerable difference between the rainfall immediately at the foot of the ranges, and, say, 30 miles out on the plains? The rainfall may be slightly more on the ranges; but I do not think that the difference is great.
2188. That would make the land better for agriculture? You do not want much rain to grow wheat, but you want to get it at the right time.
2189. Is there anything you would like to add? I do not think that there is anything else. I might say that about Myall Hollow, 30 or 40 miles from Narrabri, they got water at from 40 to 60 feet; but I do not think they can get it at all on the travelling stock route, because there is solid basalt underneath. There is also a good deal of metal there which would be useful for ballast.

William Henry Moseley, Esq., solicitor, sworn, and examined:—

- W. H. Moseley, Esq.
19 Dec., 1893.
2190. *Chairman.*] You are now practising as a solicitor? I am a solicitor.
2191. You were at one time engaged in pastoral pursuits in and about Narrabri? Yes; I was living at Boolcarrol.
2192. How long ago is that? During 1871, and at Tibbereenah from the beginning of 1872 until the end of 1876.
2193. Will you briefly give the Committee your views in regard to the route of the proposed line? You will clearly understand that it is seventeen years ago since I left the district, and in that period the conditions of the country have very much changed. When I went there Boolcarrol and Talladulla had not a selector on them, but now the tide of selection has flown down Pian Creek and out to the west; thus I cannot speak of the traffic in that part of the country.
2194. If it has been asserted that the proposed route is better for railway construction purposes, owing to the country being sounder and less liable to floods than the country to the west, do you agree with the statement? Certainly not, for the simple reason that it is proposed to cross the river at Narrabri, where the line, for at least the first 2 miles, would be liable to very severe floods. I was there during the flood of 1873, which was not so high as the flood of 1864. During the flood of 1864 the water was up to the wall-plates of my house; but in 1873, although boats came up to the verandah, the water never absolutely entered the building. Between Narrabri West and the proposed new station, however, there was what was practically a roaring torrent, and there was hardly any place where the water was not 10 feet deep, except at isolated spots.
2195. Suppose the engineers have secured one or two of these spots, what then? They could not use them, because, instead of running athwart the stream, they run parallel to it.
2196. Have you ever taken the flood-levels? I have seen the marks on the trees, and they are about as good as any levels you could get. Besides, I was there during the flood.
2197. If the engineers swear that the proposed crossing is the best that has been shown to them at any point of the river between Gurleigh Point and Narrabri, would you set your opinion against theirs? Yes; because I have seen the height to which the water has risen, while the engineers have not.
2198. Have you ever seen the river in flood at Gurleigh Point? I have.
2199. Is there a wide stretch of water there? There is everywhere on the Namoi when the river is in flood.
2200. You have told us that the river was 2 miles wide at the proposed crossing;—how many miles of water would you have to cross at Gurleigh Point? I could not tell you, but 10 miles of water where it is only up to your horse's girth is not so dangerous as 2 miles where it is 30 feet deep, and is bringing logs of timber down.

2201. Do I understand that the river is 10 miles at Gurleigh Point and only 2 miles wide at Narrabri? I did not say that the river was only 2 miles wide at Narrabri. I am speaking of the 2 miles of country between Narrabri West and the proposed new station. W. H. Moscley, Esq.
19 Dec., 1893.
2202. You have told us that you have seen at least 2 miles of water at the proposed crossing, and I want to know the width of water at Gurleigh Point during the same or at similar floods? But I omitted to tell you how far the water spread out beyond Narrabri. It is impossible to say how far the water spreads out when the Namoi overflows its banks, and it is difficult on the plains to say which is river water and which is creek water. The country for miles and miles back from the river—for 10 miles, probably, in some cases—was under water.
2203. With here and there an elevated spot? Yes; there are the sand ridges.
2204. I understand all that, but I want to know, for the purpose of comparison, what was the width of the flood-waters at Gurleigh Point, irrespective of the back water? I could not possibly tell you what the width of the actual flood-water was. It would all depend on the lie of the country; but in some places the water would go back 10 miles.
2205. Was that at Gurleigh Point? The water was comparatively shallow except in the actual bed of the river. I could not tell you how wide the river was.
2206. You cannot give us any idea as to the width of the river there? It would be only guess work. I should say that the real bed of the stream at Gurleigh Point would probably be about 500 yards wide; but it is so long ago since I was there that I could not tell you definitely. You must also understand that we could not go very close to the river. We had to keep a good way back in order to get across the country.
2207. So far as the river crossing and the soundness of the country is concerned, you think the Gurleigh Point route would be just as good, if not better, than the proposed route? Yes; I should say that it would be the better of the two for soundness of country, because it keeps on the southern bank of the river, which is a high dry bank all the way until you come to the crossing.
2208. What about the country on the north side of the river;—is it not more liable to flood than the country on the proposed line? Certainly not. There is only the same body of water, but on the proposed line there are a number of creeks coming down from the mountains.
2209. Would not Boena Creek have to be crossed between Narrabri West and Gurleigh Point? Yes; but it is a small creek compared with those coming from the mountains, because it comes through ridgy country. There is no watershed there to yield a large body of water. It is a fairish creek, but nothing to compare with the other creeks.
2210. Is it not a fact that the watercourses on the proposed line are more defined than those on the travelling stock or Gurleigh Point routes? I suppose they are more defined, because they bring down a very much larger body of water in flood times, and that cuts out their channels. Lower down the country is flatter, and the creeks spread out more, and the water is shallower.
2211. Would not the country that you speak of have not only the water brought down from the east but also that falling on the ground between it and the proposed line? Of course the river has to carry off all the flood-water, but I do not think that it is any worse there.
2212. There is a greater volume of water there, although it may not be confined to such small channels? It is not so confined.
2213. It spreads out more, and is therefore not so dangerous? It is not so dangerous.
2214. But it would attack a railway at a greater number of points if it were more confined? Yes; but it would be easier to deal with, because it does not bring down the same amount of timber.
2215. It is only as to the nature of the country and the floods that you can speak? Practically I know the whole of the country traversed by the proposed line; but I am not well acquainted with the country to the south. There was no selection at all when I went there, but the country has been very much taken up since.
2216. Do you know anything of the country to the north of Moree? No.
2217. Have you been far out west from Narrabri? Never beyond Moree. I have gone east New England way.
2218. How far west have you been from Narrabri? Never lower down than Pilliga. Of course I know the lie of the country from Pian Creek, and towards Nowley.
2219. Is there anything you would like to add? No, I do not think so.

William Theodore Foxlee, Esq., M. Inst. C.E., Engineer-in-Chief for Existing Lines, Department of Railways, sworn, and examined:—

2220. *Chairman.*] Has the proposal into which the Committee are inquiring been before you in any shape or form? No; not until Mr. Lyne called upon me the other day, and informed me that I should be required to give evidence before the Committee in regard to the ballasting. W. T. Foxlee, Esq., M. Inst. C.E.
19 Dec., 1893.
2221. Prior to that you were not consulted by the Commissioners, or by the Construction Department, in regard to the matter? No; excepting as to the probable cost of maintenance.
2222. Are you familiar with the project before the Committee? I think fairly so.
2223. You know nothing of the country through which the line passes? I do not know the country between Narrabri and Moree; but I think I understand the nature of the country through which the proposed line is to go.
2224. You think you have been through similar country? I understand that the country through which the North-western line passes is similar.
2225. That is the line from Werris' Creek to Narrabri? Yes; and I am told that the country, in parts of the South-western line, from Junco to Hay, is similar to it.
2226. The line has been put before us as what is called a pioneer line; it is proposed to do without fencing, to use sleepers of a less expensive character than are used on the ordinary lines, viz., half-round sleepers, and to put only 3 inches of ballast under the sleepers;—from your knowledge of this country—it is black soil country—do you think that that quantity of ballast would be sufficient, bearing in mind that the trains will run at a speed of only 15 miles an hour, and that because the grades are very flat, the engines

W. T. Foxlee, Esq.,
M. Inst. C. E.
19 Dec., 1893.

engines and rolling-stock are to be of a light description? I understand that the line under consideration is altogether different from other lines which have been constructed in this Colony, not excepting the Cobar and Temora lines. It is to be a Pioneer Line, and to be looked on more as an experiment than anything else. The speed run upon it, I understand, is to be limited to about 15 miles an hour; the engines are to be light, having something like 12 or 12½ tons on each axle, and, since the running will be done chiefly by daylight, the line is not to be fenced. I understand that the quantity of ballast which will be used has been decided upon by the Commissioners, after consultation with Mr. Deane, the Engineer-in-Chief for Railway Construction, and, on referring to Mr. Deane, I found that he had allowed in his estimate for 1,200 cubic yards of ballast per mile of line. If that quantity of ballast is judiciously placed, I cannot see any objection to the limitation. I have been thinking the matter over, and I find that there will be no difficulty in giving 6 inches of ballast under the sleepers, if the ordinary width is somewhat narrowed—carrying the ballast 2 inches up the sleepers, and giving a projection of 9 inches at each end. There may be places where the formation is good, and where a little less ballast would do; but, speaking generally, a depth of 6 inches is as little as you could do with. Where the ground is solid you might be able to save a little ballast, and that would enable you to give a little more—say 8 or 9 inches—where the bottom is soft. If the ballast were arranged as I suggest, I have no hesitation in saying that the line would be perfectly safe, and if the traffic came to warrant it, there would be no difficulty in increasing it afterwards.

2227. Where the ground is fairly sound, 3 inches under the sleepers would be sufficient? I would rather not put it in that way. The average depth should be 6 inches, and 1,200 cubic yards per mile would give that depth. Of course I do not know the country; but there may be places here and there where a little less could be used, and in that case you would have a little more to dispose of where the ground happened to be exceptionally soft.

2228. Why is the spread of ballast usually wider than you suggest? Where country is uneven, and lines curved, it is necessary to have more ballast at the ends of the sleepers to prevent the road from getting knocked out of line, which it is apt to do if the ballast is scanty. To meet this extra ballast is used. On this line, however, there are no curves sharper than 20 chains, except at the junction at Narrabri, where there is a 12-chain curve.

2229. Because the curves are not sharp, and the line is comparatively straight, you can do away with the extra width which you ordinarily have? Certainly.

2230. So that you could narrow the ballast as you propose without any danger at all? With perfect safety.

2231. Is there any other point in the proposed construction of the line upon which you would like to offer an opinion? No; I have had this matter of ballasting brought under my notice, and have consequently thought it over.

2232. *Mr. Hoskins.*] How long have you had charge of the Existing Lines? I came to this country three years ago last February, and I have had charge of the Existing Lines as Engineer-in-Chief for two years from last September.

2233. You took over the Nyngan to Cobar line after it was officially opened? Yes; I have charge of that line to-day.

2234. You took charge of it immediately after it was officially opened? Yes; and I took over the maintenance as soon as the contractors were relieved of that charge. We did not take it over directly it was opened for traffic; the contractors maintained it for a short time.

2235. The gradients there are very easy? Quite easy. The line is comparatively level.

2236. What is the depth of ballast under the sleepers there? Six inches.

2237. All through? Yes.

2238. Have you increased the depth of ballast since the line was opened? No.

2239. You are still running with 6 inches of ballast under the sleepers? Yes.

2240. There are easy gradients on the Temora line, are there not? Yes; it is similar in character to the Cobar line.

2241. What is the depth of ballast under the sleepers there? The same—6 inches.

2242. An average of 6 inches right through? Yes.

2243. Have you increased the depth of ballast since that line was opened? No.

2244. Have you found those lines to work satisfactorily with 6 inches of ballast under the sleepers? Quite satisfactorily.

2245. Is the amount which you have expended to keep those lines in order in excess of the amount expended to keep the main lines in order? I should like to explain that you cannot compare lines like those to Cobar, Temora, and Corowa, and this proposed line to Moree, with the main lines, because the circumstances are entirely different. I have brought with me a few figures, in case you might wish to know the difference in the cost of maintenance of different sections of the New South Wales railways. On the suburban line from Sydney to Flemington we have four lines of rails, and the cost of maintenance per mile per annum, including labour and material, averages £1,731. From Flemington to Granville, a double line, costs £391 per mile per annum, including the extensive marshalling yard at Clyde. From Granville to Picton, on the Southern line, we have two sets of rails, costing £293 per mile per annum for maintenance. From Picton to Goulburn there is a single line for the most part, costing £202 per mile to maintain. On the Illawarra line, from Eveleigh to Kiama, we have a single line most of the way—the double line only going as far as Waterfall—and it costs £200 a mile to maintain; but on that line we have had extensive landslips to deal with in the neighbourhood of Clifton. The line from Nyngan to Cobar costs £43 per mile per annum to maintain.

2246. *Chairman.*] Does that embrace the period of two years? No; that has been the average cost during the past year. The Temora line has cost us, since it was opened, at the rate of £38 per mile per annum; so that you will see that the cost of maintenance depends on circumstances—the nature of the country, the extent and character of the traffic, and so on.

2247. *Mr. Hoskins.*] Can you tell me the cost of maintenance per mile on the line from Cootamundra to Gundagai? I have not the figures before me, but it would be probably something like £70 or £80 per mile. I would point out, in connection with the Nyngan to Cobar line, that there the trains only run three days a week, so that on other days the maintenance men can do their work without the interference of the traffic. There is no protection of trollies necessary, nor have any flagmen to be sent out. When trains are running, however, we have to protect the men by means of flagmen, and the work is interrupted

interrupted. I believe that it is intended to run trains on the Moree line every day of the week, and on certain days no doubt there will be special trains. In estimating the cost of maintenance, you have to take all these circumstances into account.

2248. Trains run on the Temora line every day in the week? No; only on three days in the week.

2249. What about the Corowa line? There we only run trains upon three days in the week.

2250. You have not found any difficulty in working light lines of railway in this Colony, with a limited quantity of ballast, where the gradients are easy? No difficulty at all, where the rolling stock used is light, and the trains are run at a low rate of speed. Those are the conditions.

2251. I suppose you know the gradients on this line? I have seen the section.

2252. Do you think the line could be worked successfully without any ballast at all? I do not say that.

2253. I presume that you are aware that in America some hundreds of miles of railway are worked without ballast? I believe that is so, but I should be very sorry to recommend such a thing in connection with this line.

2254. Not even where the gradients would be very easy, and the traffic small? I should never think of recommending such a thing.

2255. *Mr. McCourt.*] You are aware that the Commissioners have given an estimate of the cost of maintaining this line? I am.

2256. They did not refer to you in the matter? Yes. The Commissioners referred to me in reference to the cost of maintenance.

2257. Then you supplied the estimate? I conferred with them on the subject before the estimate was given.

2258. How many men are there employed in the gangs on the Cobar line? There are three men in each gang; but we locate the two gangs together, so that in case of emergency or for special work, six men are available. Each gang looks after a length of 10 miles.

2259. So that six men would have to look after 20 miles of line? Yes. With regard to the cost of maintenance I would point out that it is a matter which has received a good deal of attention at the hands of the Commissioners, and we have provided the men in charge of lengths of line with tricycles. We are now arranging to supply them with specially geared trolleys, to enable a gang of men to travel, and take their tools and material easily and rapidly from place to place. We have in this and other ways reduced the cost of maintenance.

2260. Have the Commissioners expended large sums of money in making alterations to the Cobar line since it was taken over? We have only given slightly additional siding accommodation here and there; but speaking generally, there has been no expense in connection with the running roads.

2261. There has been no considerable alteration? No.

2262. You are aware that it is proposed to use some old rails in the construction of the proposed line? I understand that some re-rolled rails are to be used, and also that some old iron rails are to be used.

2263. Is it not a fact that your Department have sold all their rails to the Menindie tramway? I am not aware of any such arrangement.

2264. You are aware that it is proposed to run trains on this line at a speed of 15 miles an hour? I am aware of that.

2265. Is the speed limited on the Corowa line? The speed is limited to 25 miles an hour on the Corowa, and also on the Temora line.

2266. Do you find that the drivers keep to that speed; do they not frequently travel at 40 miles an hour? If they do we deal with them.

2267. But what is your opinion? If you ask me whether we can control the speed, I say that we can.

2268. *Mr. Hoskins.*] They have to run to time? Yes; and the time given for running between two stations does not exceed the limit of speed we have laid down.

2269. *Mr. McCourt.*] Are you aware that the cost of maintaining the Jerilderie line, which is 45 miles in length, was estimated at about twice the cost of maintaining this line, which is 63 miles in length? I have not the least idea what the estimate for the Jerilderie line was, but the Commissioners have been considering the charges for maintenance, and these have been reduced in the way I have pointed out, as well as in other ways.

2270. The difference would be explained by the statement that the cost of maintenance has been reduced? We have reduced the cost of maintenance very considerably. As we improve the roads we find that we can reduce the charge on this account.

2271. You are aware that half-round sleepers will be used on this line? Yes.

2272. Will they pack in the ballast as well as square sleepers? I take it that the sleepers will be laid with the flat side downward, and therefore they will pack as well as the square sleepers.

2273. *Mr. Suttor.*] What is the average distance between the sleepers? It varies. I understand that it is proposed to put the sleepers a yard apart on this line. The distance apart of sleepers on these railways varies from 2 feet 4 inches and 2 feet 5 inches to 3 feet, according to circumstances. If a line happens to be a light one, you can put the sleepers further apart; but on main lines, where the ordinary rolling stock is used and high speeds are maintained, you have to reduce the bearing of the rails, and must put your sleepers closer together.

2274. *Mr. Hoskins.*] Do you think it would be judicious to put the sleepers 3 feet apart on the proposed line, seeing that only about 6 inches of ballast are to be used, while on the other lines, where the sleepers are only 2 feet 6 inches apart, 9 inches of ballast are used? I think so, because we are going to run at a low rate of speed with light engines.

2275. What do you mean by light engines? Engines weighing from 50 to 60 tons.

2276. That is the engine and tender? Yes; with a load of something like 12 or 12½ tons on each axle.

2277. *Mr. Davies.*] Have you had to strengthen the permanent way on the Cobar line since you took it over? No.

2278. Is it not true that £30,000 or £40,000 has been spent on that line by your Department since you took it over? It is certainly not true.

2279. *Mr. Humphery.*] When you speak of light rolling-stock, do you mean a light engine and ordinary trucks? Yes.

2280. Trucks such as are used on the main lines? Yes; it is only the engines that are lighter.

2281. One thousand two-hundred cubic feet of ballast to the mile would give a depth of 6 inches and a width of 13½ or 14 feet? No; it would give you a width of 9 inches of ballast at each end of an 8-foot sleeper; making a total width of 9 feet 6 inches at the top, and a slope of 1 in 1. The depth, as I have already stated, would be 6 inches under the sleepers.

W. T.
Foxlee, Esq.,
M. Inst. C.E.

19 Dec., 1893.

- W. T. Foxlee, Esq., M. Inst. C.E., 19 Dec., 1893. 2282. What would be the width at the bottom? Ten feet 10 inches.
2283. Without any additional cost in the construction of this line, a uniform depth of 6 inches of ballast could be obtained, instead of 3 inches, as previously estimated? That is so, if the ballasting is done in the way I suggest.
2284. *Mr. Dawson.*] Have you seen the estimates for the bridge over the Narrabri Creek and the Namoi at Narrabri? No; I have not. I have merely looked into the question of ballast, because I was told that I should be asked some questions in regard to it. I have had no opportunity of going into the estimate in detail.

Charles William Lloyd, Esq., sworn, and examined:—

- C. W. Lloyd, Esq., 19 Dec., 1893. 2285. *Chairman.*] You have preferred a request to be examined in connection with this railway proposal;—you know the salient points of the proposal? I think so.
2286. What is your occupation? I have been engaged in squatting pursuits for the greater part of my time, but I am not so engaged at present.
2287. You have resided in this district for a number of years? For the greater part of thirty years.
2288. How long is it since you were there? Since I resided there?
2289. Yes? I have not resided there since 1884.
2290. You have been away from the district since 1884? I have been in the district, but I have not resided there since 1884.
2291. You have occasionally visited it? Yes.
2292. Whereabouts were you residing when you were in the district? For many years I resided near Gunnedah, at a place called Burburgate, and after that I resided near Narrabri, at a place called Tarriaro.
2293. Have you lived any further out than that? No; but I used to go to Gurley, which was one of our stations.
2294. From your knowledge of the district, do you think the country traversed by the proposed line is suitable for railway construction? I should say so, as far as my experience goes.
2295. If it has been stated that if the line were to be taken further west, by the travelling stock route, or Gurleigh Point, it would have to traverse country more liable to be flooded, do you agree with that statement? I think it would pass through country of a more swampy nature.
2296. Do you know anything of the various crossings on the Namoi? There are a number of creeks on the proposed line. I know most of the creeks between Narrabri and Moree; but I do not know the creeks beyond that, in fact, beyond Gurley Creek I might say.
2297. Is it a fact that the creeks are better defined where the proposed route crosses them, than they are further to the west? I think they are. They have higher banks.
2298. Do you know anything about the crossing at Gurleigh Point;—is it liable to be flooded? Very much so.
2299. Is there a greater spread of water there during flood-time than there is higher up the river? Yes; the water breaks out there.
2300. Do you know anything of the country out towards Goondiwindi, Kunopia, and Mungindi? I know the country between Moree and Goondiwindi.
2301. Do you think that the country north of Moree is as good carrying country as that to the west of the proposed line, out towards Collarendabri? The country between Moree and Goondiwindi is good for stock; but I am not very much acquainted with the country to the west.
2302. How far does your acquaintance with the country to the west go? I have not been more than 10 or 20 miles out from the main road, but there is a great sameness in that country. As far as I could see, when I have travelled over it, there is a great similarity about the different places.
2303. Do you think from your knowledge of the country out towards Moree, that there is at present, that there is likely in the near future to be sufficient trade to justify the construction of a line at a cost of £153,000? I could not tell you. I have no knowledge of the present state of the country.
2304. Is there anything else you would like to tell the Committee? There are two or three considerable creeks between Narrabri and Moree; Gurley Creek is the principal one.
2305. Can you give us any information about the proposed crossing near Narrabri;—you know where the present road bridge crosses the river? Yes; that is very low land and liable to flood.
2306. The proposed railway crossing is roughly a quarter of a mile above that;—do you think that that is as good a place as could be chosen? Higher up the river the crossing is better.
2307. The higher up you go the better the crossing? Yes; there is one very good crossing-place called the Rocks.
2308. That is very much higher up? Four miles higher up, I think. I believe it was originally intended to cross there.
2309. If you were constructing a railway to connect Moree and the country north of it with the present line at Narrabri West, would you take the direct route, or a route more to the west? I would take the proposed route. I do not see that there would be any advantage gained by taking the line to the west.
2310. Have you any personal interest in any of the country through which the line will go? Not the slightest.
2311. *Mr. Wall.*] You state that the country along the proposed route is equal to that along the travelling stock route? There is a greater variety of country there. I know the district between the proposed line and Wee Waa thoroughly.
2312. Can you tell us why, in making the travelling stock route from Narrabri to Moree, they went 15 miles out of the way? They followed the old track, because there were more water-holes there. This is a badly-watered country,
2313. The travelling stock route was not made that way because the country on the proposed line was not suitable? No. In my time the travelling stock route did not go through Gurley—it crossed Bumble Creek.
2314. *Mr. Dawson.*] Do you know the Eckford scrub? Yes.
2315. Do you call it good country? It is convertible into good country. There used to be thousands of cattle in it which could not be got out.
2316. Were you there in 1864? I was there immediately after the flood of 1864.

2317. Do you know how high that flood was? It was the highest flood in the district of which there is any record. The water rose 5 or 6 feet in the house that I afterwards lived in at Tarriaro. C. W. Lloyd, Esq.
2318. Were you there in 1873? Yes. There was a very high flood then, but not so high as the flood of 1864. 19 Dec., 1893.
2319. Where was the town of Narrabri then? It was nearly all under water. The principal hotel had, I think, 5 feet of water in it.
2320. If the proposed line is made, and a flood like that of 1864 comes, a lot of it will be under water? I should think so. I think that in the 1864 flood every house in Narrabri must have been flooded.
2321. *Mr. Collins.*] There were no houses there then? Yes, there were; but in 1854 there were not. I put up the first house in Narrabri in 1856.
2322. Do you know the Gurley and Ten-mile Creeks? Yes.
2323. How wide are they at the time of heavy floods? Several hundred yards wide. The 1864 flood water was nearly up to the Gurley old station. It was inside the garden fence, and as that side is much higher than the other side of the creek, the water must have been a quarter or, perhaps, half a mile wide.
2324. Do you know the country between the proposed line and the Nandewar ranges? Yes.
2325. Is it any good? Yes; it is rich soil. All the soil under the Nandewar ranges is good.
2326. *Mr. Humphery.*] Would it be possible to select a route for the extension of the line from Narrabri to Moree which would be free from flood? I do not think it would. The creeks come down from the mountains with an immense rush.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department Public Works, sworn, and further examined:—

2327. *Chairman.*] In the proposal before the Committee you have made allowance for only 3 inches of ballast under the sleepers? Yes. H. Deane, Esq.
2328. Do you think that that would be sufficient for a country so liable to flood? I have allowed a little reserve. I have given 1,200 cubic yards to the mile. I prefer to put it in that way, so that if there is any sinking in any holes there will be a reserve of ballast above the level of the bottom of the sleepers. 19 Dec., 1893.
2329. What is the usual width of ballast? Eleven feet 9½ inches on the formation level is the ordinary width.
2330. Do you intend to have the ballast here the ordinary width? No; I should narrow it. I intend to make it about 10 ft. 6 in. at the bottom.
2331. With that depth you could make it deeper than 3 inches? Yes; and it will allow us to pack up the sleepers as the road goes down.
2332. So that while in portions of the country 3 inches will do, this narrowing of the ballast will enable you to spare a little more for spongy places? Yes; it will do very well that way.
2333. Have there been careful and reliable levels taken in regard to the crossing of the Narrabri Creek and the Namoi? You are referring to flood-levels?
2334. Yes? I think so.
2335. From a personal inspection of the place, you consider the proposed crossing the best that has been suggested to the Department? I have not a doubt of it.
2336. That is, of course, putting Rocky Crossing out of the question? Yes. It is impracticable, because it is too far back.
2337. We have been informed that during the occurrence of floods there have been 2 miles of water between Narrabri West and Narrabri proper;—would your bridges be above the level of such a flood? I have not provided for 2 miles of waterway, and I do not think it is necessary to do so. I have provided for the highest flood that is known to me. We might occasionally—say once in fifty years—have a slightly higher flood;—a very much higher flood you could not have, and I think we may take the risk of that, because very little damage will be done.
2338. What is the highest flood you speak of—the 1864 flood? I have not the date here; I am relying on the surveyor's information.
2339. Floods usually leave pretty well defined marks, irrespective of the recollection of local residents? If they are comparatively recent you can always trace them by the marks on the trees, and so on. In this case I think the residents have shown the surveyors' marks which are perfectly reliable.
2340. Presuming that your belief, that the best crossing has been obtained, is sound, do you think that you can construct the bridges for the amount you have estimated? That is to say for £5,250?
2341. Yes? Yes; the work can be done with the waterway that I propose to adopt; I have no doubt about that. If on further consideration it were found necessary to add to the waterway I consider that the total estimate would be sufficient to cover the extra cost.
2342. Does the same remark hold good in reference to the various creek crossings between Narrabri and Moree? Yes.
2343. *Mr. McCourt.*] Can you tell us the cost of the various surveys that have been made in connection with the line from Narrabri to Moree? No; but I will get you the information if possible.*
2344. Would the amount spent in that way be included in the cost of this line? Not if it were charged to trial surveys; but if it has been charged to the Vote for a line from Narrabri to Moree the charge would probably be transferred to the new Vote, unless proper representation was made. My estimate does not include the cost of previous surveys.
2345. Do you not think it would save a considerable sum of money if, before a survey was made, the route was referred to this Committee for approval? That is, I think, a matter which the Committee might consider and make a recommendation upon. I am scarcely in a position to give an opinion in regard to it. Such a course would, however, cause a good deal of trouble, because sometimes a route would be advocated and be apparently the best, and then another route would be suggested and would have to be examined. I do not think that the Committee would ever finish dealing with the various proposals.
2346. Does not the same thing occur now—every route referred to the Committee has its advocates? Yes. 2347.

* NOTE (on revision):—The following amounts have been expended:—Prior to 1884, £315 7s. 9d., charged to Trial Survey Vote; since then, £4,006 11s. 4d., charged to vote Narrabri to Moree.

- H. Deane,
Esq
19 Dec., 1893.
2347. You estimate that you can get metal supplied to you at 2s. 6d. a yard? Two shillings and sixpence for the first section, and 3s. 6d. for the second.
2348. That is hard broken blue metal? No; gravel.
2349. River gravel? River gravel, if possible.
2350. Is round river gravel as good ballast as broken metal? It all depends. The Namoi gravel is very good. A great deal of the North-Western line is ballasted with it. The line from Moonbie up the range to the McDonald River, and beyond there right up to Uralla, is, if I remember right, ballasted with river gravel, and it is one of the best roads in the Colony. Some gravel is too free, but the Namoi gravel is very good.
2351. *Mr. Dawson.*] You have estimated that the bridge over the Namoi and Narrabri Creek will cost £5,250? Yes. It would be mostly a small timber viaduct, and it will be made very cheaply—about £3 a foot run.
2352. What would it cost to put an ordinary bridge there upon which you could take over a load of wool? It would cost quite as much as a railway bridge, in fact it will cost a good deal more; because it would have to be broader. Although the main spans of a railway bridge may be more costly than the main spans of a road bridge, when you come to the viaduct approaches at each end the railway bridge is very much cheaper.
2353. How was it that some time ago the bridge was estimated to cost £80,000? I am not responsible for that estimate.*
2354. *Mr. Collins.*] Do you think that a better crossing could be found near the road bridges? No; I think it would be very inconvenient to cross there. You could not get out of the station-yard properly, and you would have to widen the roadway and erect a new bridge, because the existing bridges are not strong enough.
2355. You do not think that that crossing would be better than the one selected? No; I am of opinion, after seeing the ground, that the place selected and shown on the map is by far the best.
2356. *Mr. O'Sullivan.*] The proposed line is selected by the officers of your Department and yourself? Yes; after due consideration and consultation with the residents.
2357. I understand that you proposed that route because there is less danger of flood than on the plains further west? Yes; that is one reason.
2358. The evidence of some of the local residents goes to show that the streams from the hills being stronger, the water would do more damage to the proposed line than to a line further west, on the plains;—would that be so? I am inclined to think that I answered that question before. It is far better to cross a river where the water-way is confined. If you cross lower down, where the water is almost at a standstill, you have to provide a very lengthened water-way in order to let the water cross at the slow rate which is natural to it there. If the water-way were only equal to what would be required where the current was stronger, the water would be backed up by the embankment, and would overflow the line. As a rule nothing more is required in foundation where the water is stronger than where the water spreads out.
2359. These remarks would apply in a minor degree to the crossings of all the creeks between Narrabri and Moree? Yes.

* NOTE (on revision) :—It is understood, of course, that my estimate is for a timber bridge throughout.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway from Narrabri to Moree.

APPENDIX.

A.

[To Evidence of J. Barling, Esq.]

PRECIS OF PAPERS RELATING TO THE PROPOSED RAILWAY FROM NARRABRI TO MOREE.

The first action in connection with this proposed line appears to have been taken in the year 1883, when Mr. Secretary August, 1883. Wright gave instructions for a trial survey to be made.

In April, 1884, a letter was received from the Department of Lands to the effect that 21,280 acres had been set apart in the counties of Nandemar, Jamison, and Couralic, for the purposes of this railway. In July of the same year a deputation, introduced by Mr. W. R. Campbell, M.P., waited upon the Minister to urge the carrying out of the work. The cost was then approximately estimated by Mr. Whitton at £539,500 (or 67 miles at £8,053 per mile.) In a letter dated August, 1882 (which however does not appear to have been received in this office until July, 1884), Mr. Campbell supported a suggestion by G. R. Walker, of Mungindi, for a line from Narrabri to that place *via* Moree.

On the Loan Estimates for 1884 the sum of £336,500 was voted for the work under the heading of "Light Lines."

In August, 1885, a petition was presented by Mr. Campbell from residents of Moree and neighbourhood, urging the following reasons for going on with the work:—

1. The opening of many new lines of trade, and increase of business, in anticipation of the new railway.
2. The impassableness of the roads in wet weather, owing to the nature of the soil greatly retarding the teams, and the traffic generally, which it was pointed out was very large, and also greatly delayed the mails and passenger traffic.

In October, 1885, Mr. Commissioner Goodchap directed the Traffic Manager to make inquiry regarding the traffic likely to be produced by a line from Narrabri to Moree, which he considered would serve to develop the resources of the districts traversed and command the trade beyond.

The Traffic Manager, on the 26th of same month, reported that in his opinion very little new traffic would be created. He was then directed to report more fully and give statistics. Accordingly, on the 20th November, 1885, he submitted a report which was much to the same effect as his previous report. He estimated that if the line were constructed a sum of not more than £5,908 12s. 10d. in excess of earnings from the mileage then open would be realised, while he estimated the working expenses at £9,727 17s. 8d. He thought, however, if the line were extended to the Queensland border a good deal of traffic which went to Brisbane would be attracted to our lines.

In April, 1886, Mr. Secretary Lyne laid before the Legislative Assembly (as Exhibits only) the plan, section, and book of reference of the proposed railway.

In September following, upon the motion of Mr. Lyne, the House approved of these by fifty votes to four. The Legislative Council however, referred (by twenty-two votes to four) the matter to a Select Committee, which, in a progress report, recommended a resumption of the inquiry during the ensuing session as the time was too limited for taking the necessary evidence. No subsequent report appears however to have been issued.

Mr. Hassall, M.P., presented a petition from residents of Moree urging the immediate extension of the line from Narrabri to Moree. They referred to the large quantities of wool forwarded to Narrabri for conveyance by rail, and stated that when the line reached Moree this would be greatly increased from districts close to the Queensland border.

In a paper prepared in 1889 by the Railway Department, it was stated that the proposed line would pass through "an exceedingly level and rich country," and could be constructed at a small cost (£325,447.) The extension, if sanctioned, could eventually be carried on to Mungindi, or to a more easterly point on the Queensland border. It was further stated that the cost of construction might be reduced by laying down the line as a cheap railway on the basis suggested in a report of Sir John Fowler made in March, 1886. In addition fencing might be omitted, inexpensive but ample station accommodation provided, and trains run during the day-time only, while by running mixed trains the working expenses could be largely reduced. Such a line, it was thought, would prove remunerative, and "at the same time tend to draw still further to this Colony the trade of Southern Queensland." A large saving would, moreover, be effected in road expenditure; as the railway would convey the traffic, there would be little or none on the main road. The progress of the district was, the report said, retarded owing to the want of a convenient means of transit, and at times when it was suffering from drought, severe hardships were inflicted, but by direct communication produce could be cheaply and quickly sent there, while portion of the stock could be removed to, at the time, more favoured districts, to be returned with the recurrence of good seasons. Statistics were given with this report, showing that the district affected by the line contained about 2,500,000 sheep, representing 25,000 bales of wool.

Towards the end of the year, Mr. Hassall, M.P., moved in the Legislative Assembly that any scheme of railway proposals submitted to Parliament should include this line, but withdrew the motion on the assurance of Mr. Secretary Sutherland that he would lay the matter fairly before the Government when any railway schemes were being considered.

In March, 1889, a meeting was held at Narrabri to urge the survey of a line by the travelling stock route *via* Killarney, Edgeroi, and Gurley. The following month the district was visited by the Commissioners for Railways, and a deputation, which waited upon them, expressed the hope that they would recommend the granting of rail communication between Narrabri and Moree.

The Commissioners in their report of inspection suggested that, with a view to save the cost of an expensive viaduct in leaving Narrabri, a survey should be made of a westerly course as far as Gurleigh Point, that the Namoi should be crossed at or near that place, and that the line should proceed thence to Keramingly and Moree. Mr. Deane reported favourably upon the proposal, and the report was referred to the Railway Commissioners, who recommended that the altered route should be adopted, and Mr. Bruce Smith approved on 15th October, 1889, of the survey being carried out.

In October, 1889, Mr. Hassall was informed by the Department that the trial survey *via* Gurleigh Point was completed, but that the plans and book of reference were not ready. He wrote early in the following year to ask when the plan and book of reference would be brought before the Cabinet, and was promised that they should be submitted before the meeting of Parliament. In June, he forwarded a letter from the Moree Railway League in regard to the rumour that Messrs. Fisher and Co. had decided to remove their wool-washing establishment from Darvel, involving serious loss of traffic on our lines; and was informed, in reply, that the proposed railway would be again submitted to Cabinet. During the following year he kept the matter in evidence, but the bad financial prospects prevented its being brought before Parliament.

In June, 1891, Mr. R. E. Jones, Temporary Examiner of Public Works Proposals, was instructed to report on certain proposed railway extensions, including this line. He dealt with the various suggested routes, and recommended the adoption of that *via* Gurleigh Point, giving his reasons. (See pages 24 and 25 of his report.)

Messrs. C. Collins and J. Sheldon, M's.P., forwarded copies of resolutions passed at a public meeting at Narrabri, condemning Mr. Jones' report as "unreliable and incomplete, misleading and incorrect as to the comparative flood-levels of the country, and palpably wrong and injurious to the best interests of the district."

Mr.

- 16/7/91. Mr. Deane reported to the Minister, in July, 1891, regarding certain proposed alterations of route, which were,—
- (1.) To abandon 6 miles of the existing line, cross at the Rocky Crossing, and skirt the town of Narrabri;
 - (2.) To adopt the so-called direct route, involving bridges over the main river and the Narrabri Creek; and
 - (3.) To follow the left bank of the river, and cross at Gurleigh Point.
- (1.) The disadvantage of this route lay chiefly in the abandonment of a portion of the existing line, and the loss of a good deal of traffic likely to use the Gurleigh Point line;
- (2.) While the second route would pass through long tracts of flooded land, and not be of advantage to Narrabri;
- (3.) The third route had the best crossing over the Namoi; was the cheapest, and would take the traffic from Wee Waa and Collarindabri. This was also recommended by the Commissioners for Railways. The estimated cost was £257,450, or £3,585 per mile.
- 27/2/92. Mr. Hassall continued to urge the advisability of constructing this railway, and on his forwarding a communication from the Railway League (Moree) was informed that the line would be brought forward at the earliest possible date, although it would not be dealt with during the session. The matter being pressed by the League, a letter was written to Mr. Hassall stating that this line would be included in the list of railway proposals to be brought before Cabinet. Mr. Hassall, during the next month, asked in the Legislative Assembly if the line would be amongst the railway proposals to be presented to Parliament for reference to the Public Works Committee, and received a similar reply.
- 6/9/92. An entirely fresh aspect of the question was (10th October, 1892) brought under notice by a minute by the Commissioners for Railways to the Minister for Railways, on narrow gauge railways, in which they advocated the construction of "pioneer lines" through purely pastoral and level country, where the traffic would be light, at a cost of about £1,750 per mile, exclusive of bridges, waterways, and station accommodation. The Engineer-in-Chief for Railways considered, however, that this was too favourable an estimate; and that the lowest cost per mile for a line on the standard gauge and fit to carry existing rolling stock through an agricultural district would be about £3,443, and through a pastoral district £2,808.
- 6/10/92. On the 4th November, 1892, the Railway Commissioners wrote referring to conversations the Chief Commissioner had had with the Minister on the subject of cheap lines, and stated that in their opinion the extension from Narrabri to Moree and from Bourke to the Queensland Border were the most urgent lines. Unless they were made, the Commissioners said a large traffic would be transferred from the railways in this Colony to those in Queensland.
- The Minister then communicated with the Commissioners, and asked that, as the Chief Commissioner would shortly be in the district, he would give his opinion as to the application of the principle of light lines as laid down in the Commissioner's minute of 10th October, to the line from Narrabri to Moree, as from the nature of the country to be traversed it probably afforded a favourable opportunity for testing the principle. In reply, the Commissioners stated that, as they had no authority by law to deal with estimates and plans for the construction of railway lines, they felt the best method would be for the Minister to instruct Mr. Deane to prepare plans and estimates on the lines laid down in their minute, obtaining from the Commissioners their assistance and advice as to the minimum cost for which a "pioneer" line could be constructed from Narrabri to Moree.
- Upon this the Minister minuted that he was not prepared to act in the manner suggested, but in order to enable the Commissioners to prove that cheap lines could be constructed at the price stated in their minute, he was prepared to approve of any course suggested by them for the purpose. He asked whether the Chief Commissioner was prepared to submit an estimate with plans of the line, and if so, he would be prepared to consult the Cabinet as to the desirability of constructing it.
- In reply, the Commissioners pointed out that they had no staff available for the purpose, besides which, the work was outside their functions. They further said that the class of line which they considered could be constructed for £1,750 per mile, exclusive of bridges, stations, &c., was not a "light line," but a "pioneer line," not capable of doing what a "light line" could.
- The Minister then minuted: "As the Railway Commissioners do not seem to have any desire to carry out this 'pioneer line,' the matter must be submitted to me at an early date for further consideration."
- 25/11/92. In a minute of this date the Engineer-in-Chief for Railway Construction, replying to a communication addressed to him by the Railway Commissioners, forwarded alternate estimates of the two routes, viz., the "direct" route and the "Gurleigh Point" route, one being for construction on the ordinary lines, and the other allowing less ballast, cheaper sleepers, fencing almost entirely abolished, and, in fact, cut down in every possible way. These estimates are as follows:—
- | Ordinary System of Construction. | Cheap Lines. |
|---|---------------------------------------|
| Direct Route, £250,392 11s. 3d. or £4,143 per mile..... | £179,982 17s. 6d. or £2,978 per mile. |
| Gurleigh Point Route, £261,332 15s. 6d. or £3,641 per mile..... | £204,774 1s. 6d. or £2,853 per mile. |
- Mr. Deane pointed out that if any attempt were made to cut the earthwork bridges or ballasting down any further great difficulty would be experienced in keeping the line maintained at all over the black soil plains.
- 12/12/92. By a minute of this date the Minister directed the Engineer-in-Chief for Railway Construction to take steps at once to reconsider the line with the view of cheapening it as much as possible, consistent with efficient working, the "direct" route being selected by the Minister for the purpose.
- 1/3/93. The Engineer-in-Chief reported the result of inspections he had made in connection with the carrying out of the Minister's instructions referred to in the previous paper. He dealt particularly with the question of the river crossing, which is a large item in the cost of the line, and stated that he had given instructions for the investigation of a new route for connecting with the line at Narrabri, which, he thought, would turn out to be far better than any before proposed.
- 12/10/93. On the 12th October, 1893, Mr. Collins, M.P., asked the Minister, in the House, whether, before deciding on a route for this line, he would cause a survey to be made from Narrabri to a point near the township of Wee Waa, from thence to the travelling stock route, *via* Millie, to Moree. In reply, Mr. Lync stated that as it would involve a deviation from the direct route of something like 20 miles, he did not see that any good purpose would be served by having a trial survey made.
- 24/10/93. A communication dated 20th October, 1893, was received from Mr. John H. Murphy, of Jurs Lagoon, Millie, in which, on behalf of persons residing north-west of Narrabri and Moree, he submitted reasons in favour of the line being constructed by a route starting from the Railway Station at Narrabri West, *via* Gurley Point, Boggy Creek, and thence to Moree.
- 10/11/93. Mr. Sheldon, M.P., presented a letter from Mr. J. Halse, Hon. Secretary of the Millie Railway League, asking that the Public Works Committee be requested to visit Millie when on their way from Narrabri to Moree, to hear evidence as to the desirability of the line being constructed on the travelling stock reserve *via* Keraningly. They urged that this reserve was already fenced, and that splendid material for ballast could be obtained at Boggy Creek, at which place a splendid quarry of blue metal could be obtained.
- Mr. Deane's final report on the matter has been submitted. He recommends the adoption of a route leaving the North-western Line east of the present Narrabri Station, crossing the river at Cooma, and the Rocky Crossing line at the township, meeting the "permanently staked line" 20 miles from Narrabri, the distance being 63 miles 50 chains, and the estimated cost £153,000, exclusive of land and compensation.
- 10/10/93. The Railway Commissioners were asked by the Minister to submit their report on the line, as required by the Public Works Act. This report was submitted on the 13th November.
- On the 1st November the Legislative Assembly, on the motion of the Minister for Public Works, assented to the matter being referred for the consideration of the Public Works Committee, on the conditions that the line should be carried out under the terms of the proposed "Betterment Act."
- 13 November, 1893.
- J. B. BURLING.
- P.S.—Mr. Sheldon, M.P., handed in an extract from the *Narrabri Herald*, of the 11th November, giving an account of a meeting held at Wee Waa on 3 November to urge the Government for a survey and inspection of a route to cross the Namoi a short distance from Wee Waa. A Railway Committee was appointed at the meeting.
- The same extract contains an account of a meeting held at Millie on the 4th November. It is stated that the meeting "were unanimous in their strong condemnation of the last surveyed route, and affirmed, in no measured tones, that the line should be made on the travelling stock reserve *via* Keraningly. They also considered that the Public Works Committee should sit at Millie and take evidence, as the owners of about 1,000,000 sheep, as well as cattle and horses, were affected.
- J. B.

APPENDIX.

81

A1.

POINTS CONNECTED WITH IMPORTANCE OF HAVING PERMANENT NAVIGATION FROM BREWARRINA TO THE QUEENSLAND BORDER.

Water Conservation, Irrigation, and Drainage, 14 November, 1893.

1. The distance by river from Brewarrina to Walgett is 160 miles, from Walgett to Collarindabri 81 miles, and from Collarindabri to Mungindi on the Queensland border 74 miles, thus making a total of 315 miles by river from Brewarrina to Mungindi.

2. In 1879 the steamer "Brewarrina" went up as far as Collarindabri.

3. During the present year a steamer has gone to Mungindi.

4. As a very large proportion of the land in the Walgett and Moree districts consists of black soil, and is subject to inundation, ordinary roads are almost impassable after heavy rains. This fact adds additional value to river and railway communication.

5. To a certain extent the proposed railway from Narrabri to Moree will compete with a navigable river from Walgett to Mungindi, but excepting in this respect it will have little effect on the river trade between Walgett and Brewarrina.

6. Owing in a large measure to the favourable character of the seasons, settlement in the Moree and Walgett districts has increased very rapidly in recent years, and all that is wanted to make that settlement permanent is improved communication.

7. On 31st December, 1890, the number of sheep in the Walgett Land District was 1,795,764, while on the 31st December, 1891, it had increased to 2,330,000. This was attributed by local authorities as being due in a large measure to increased settlement.

8. In 1890, seventy applications were received at Walgett for conditional purchases of land, and in 1891 one hundred and three applications. The deposits on such applications amounted to £4,000 in 1890, and to £7,000 in 1891.

9. The distance from Walgett to Sydney being nearly 160 miles less than from Bourke to Sydney, there is no doubt that all the river-borne trade from Mungindi downwards will eventually come direct from Walgett; and if Walgett be connected with the railways before Brewarrina, there will be a large river traffic from Brewarrina up to Walgett. Brewarrina is a most important centre as regards the part of Southern Queensland which is now being watered from artesian bores, and a great increase of the trade from it may be regarded as a certainty.

10. Nothing has yet been done towards clearing the Barwon or Darling between Walgett and Mungindi, yet as stated above a steamer succeeded in reaching the latter place this year, and steamers have repeatedly been at Collarindabri and occasionally at Mogul. The fall in the river from Collarindabri to Walgett is at the rate of about 6 inches per mile, and as there is no material difference in the velocity between the former place and Mungindi, the rate of fall cannot be materially different. There would be no difficulty in making the river permanently navigable to Mungindi.

H. G. MCKINNEY,
Chief Engineer.

The Under-Secretary, Department of Public Works.

A2.

TABLE OF DISTANCES.

Moree	to Mungindi	65 miles.

[To Evidence of H. Deane, Esq.]

RAILWAY FROM NARRABRI TO MOREE—DISTANCES.

	Miles.	Chains.
Length of railway route <i>via</i> New Narrabri station and the travelling stock route to Moree.....	60	70
Distance of Bingara from the proposed line—direct	48	0
Length of road from Couralli station to Bingara <i>via</i> Terry-hic-hie—about	62	0
Length of road from Moree station up the Gwydir River to Bingara <i>via</i> Paramellowa and Guncraai—about ...	50	0
Narrabri to Bingara by road <i>via</i> Edgeroi—about	68	0

The above distances were asked for during my examination before the Committee.

H.D., 17/11/93.

C.

[To Evidence of H. McLachlan, Esq.]

COST OF WORKING THE RAILWAY IF ELEVEN MILES LONGER.

Government Railways of New South Wales,

Secretary's Office, Sydney, 16 November, 1893.

Dear Sir,

Mr. O'Sullivan, M.P., at the Public Works Committee to-day, asked what would be the increased cost of working the Moree line if it were made 11 miles longer. I stated it would be difficult to give an answer off-hand, and I may point out that while the estimated maintenance expenses might be proportioned, it would not do to follow the same rule in regard to the traffic and locomotive, as, in regard to the former, the 11 miles might mean the introduction of one or two stations, necessitating staff being kept and consequent expense; while in the case of the loco. the present estimate is based on certain men now employed being able to take in an additional mileage.

The 11 miles additional (22 miles return) would introduce a disturbing factor and probably render the service daily too great for the staff in view, and perhaps necessitate arrangements which would mean an expense more than proportionate to the additional mileage.

The Secretary, Parliamentary Standing Committee on Public Works, Sydney.

Yours faithfully,

H. McLACHLAN,
Secretary.

D.

[To Evidence of E. C. Weller, Esq.]

RETURNS OF STOCK IN THE DISTRICTS TO BE SERVED BY THE PROPOSED RAILWAY.

Department of Mines and Agriculture,
Stock and Brands, Sydney, 6 December, 1893.

Sir,
I have the honor to forward herewith three lists, showing the number of horses, cattle, and sheep in the districts marked 1, 2, and 3 on tracing forwarded by you to this Department with your letter of the 4th instant.

The lists include all the pastoral lessees, and the small owners so far as they can be located from the Sheep Brands Directory, and tracings of the sheep districts.

An estimate of the number of stock held by owners who cannot be located is added to each list.

I have, &c.,

HARRIE WOOD,

Under Secretary.

The Secretary, Parliamentary Standing Committee on Public Works.

No. 1.

Name	Address.	Horses.	Cattle.	Sheep.
Hooper and Barnett	Merriwa	60	500	12,000
Phillips W. O.	Merriwa	11	9	978
Gordon R. D. and S.	Melton Ridge	5	6	4,400
Brown Bros.	Boggabilla, Coppymoranbilla	60	1,200	44,000

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

RAILWAY FROM NARRABRI TO MOREE.

REPORT.

THE Sectional Committee appointed on the 15th of November, 1893, to whom was referred the duty of examining the local witnesses, and the inspection of the route and country to be served by the proposed Railway from Narrabri to Moree, have the honor to report to the Parliamentary Standing Committee on Public Works:—

That the Committee, namely, Mr. J. Garrard, M.L.A. (Chairman), Hon. W. H. Suttor, M.L.C., Hon. John Davies, C.M.G., M.L.C., Mr. E. W. O'Sullivan, M.L.A., Mr. W. M'Court, M.L.A., Mr. T. T. Ewing, M.L.A., and Mr. H. Dawson, M.L.A., left Sydney by 6.15 p.m. train on Sunday, 19th November, 1893, arriving at Narrabri the following morning.

At 10 a.m. on Monday, 20th November, the Committee, accompanied by Mr. Paul, railway surveyor, proceeded to inspect the starting point of the proposed line near the Public School, Narrabri West, viewing the site of the railway bridges across the Namoi River and the Narrabri Creek, also the island between the two streams; then followed the surveyed line from the site of the proposed Narrabri station (fronting Maitland-street) to near the crossing of the Bingara road.

At 2.15 p.m. the Committee opened the inquiry at the Court-house, Narrabri, and examined the following witnesses:—Mr. G. S. E. Dale, solicitor, and mayor of Narrabri; Mr. C. A. Ross, contractor, and member of the Local Land Board; Mr. W. Gould, railway station master; Mr. G. Gregory, senr., farmer; Mr. T. Morath, sawmill owner; and Mr. J. MacNamara, road contractor.

On Tuesday, 21st November, at 10 a.m. the examination of witnesses was resumed, and evidence taken from the following persons:—Mr. D. Roche, retired police officer; Mr. E. P. Huxley, butcher; Mr. J. T. Ward, sen., farmer; Mr. W. M. Borthwick, grazier; Mr. G. Burney, journalist; Mr. J. Healey, bushman; Mr. J. Gately, storekeeper, and chairman Progress Committee, Narrabri West; and Mr. A. Martin, bushman.

At 9.30 a.m. on Wednesday, 22nd November, the Committee left Narrabri by special coach for Millie, *via* the main travelling stock route, reaching the Government tank, Galathra (15 miles), at 12.30 p.m.; Boggy Creek (30 miles), at 3.15 p.m. (at which place a detour is made from the travelling stock route), and arriving at Millie (40 miles), at 5.30 p.m. From 8 till 10.30 the same evening the Committee sat at the "Royal Mail Hotel," Millie, and examined Mr. J. Halse, grazier, and secretary of the Railway League, and Mr. A. Hill, manager of Mungyer Station.

On Thursday, 23rd November, at 9 a.m. the examination of witnesses was continued, and the following persons gave evidence:—Mr. R. Cribb, drover; Mr. J. Fingleton, hotel proprietor and grazier, Little Bumble; Mr. J. Duff, hotel proprietor and grazier, Millie; Mr. J. H. Murphy, grazier; Mr. J. A. Wilson, selector; Mr. F. C. Stavelcy, storekeeper and surveyor, Collarendabri; and Mr. Wm. Duff, grazier. At 12.30 p.m. the Committee continued their journey to Moree, *via* Keramingly (or Little Bumble), at which point there is a Government tank, and the travelling stock route is rejoined, arriving at Big Bumble (13 miles), at 2.30 p.m.; the Government tank, Tycannah (21 miles), at 4.15 p.m.; and Moree (33 miles), at 6.15 p.m.

At 10 a.m. on Friday, 24 November, the Committee continued their inquiry at the Court-house, Moree, and the following witnesses were examined:—Mr. J. Cornell, builder, and Mayor of Moree; Mr. W. H. O'M. Wood, district surveyor; Mr. J. T. Crane, stock and station agent, council clerk, and acting secretary to the Stock Board; Mr. C. O'Hara, contractor; Mr. A. B. Lomax, grazier; Mr. J. Jurd, selector; Alderman S. L. Cohen, land agent; and Mr. H. Joseph, manager of brewery, and secretary to the Railway League. The Committee adjourned at 5 p.m. On Saturday, 25th November, at 10 a.m., the inquiry was resumed, the following witnesses giving evidence:—Mr. R. F. Chambers, Crown Lands Agent; Mr. T. F. Moore, grazier; Mr. A. M'Intosh, storekeeper; Mr. J. Munro, post and telegraph master; Mr. F. W. Kirkby, storekeeper; and Mr. C. B. Keene, manager of Gurley Station. Mr. W. H. O'M. Wood was re-examined, and at 12:45 p.m. the examination of witnesses at Moree was concluded. During the afternoon an inspection was made of the sites proposed for the railway station at Moree, and of the crossing of the river for any extension of the railway northerly.

On Sunday, 26 November, the Committee remained in Moree.

At 10:15 a.m. on Monday, 27 November, the Committee, with the exception of Messrs. Ewing and Dawson, left Moree for Millie, *via* Big Bumble and Keramingly, arriving at 4 p.m.; and on the following day at 8 a.m. they left Millie in buggies for Wee Waa, *via* Jew's Lagoon (10 miles) and Boolcarrol (20 miles), reaching the northern bank of the Namoi (32 miles) at about 1 p.m. The Committee crossed the river by Mr. Brennan's small suspension bridge, and after inspecting what is locally considered a good site for a railway bridge, proceeded to Wee Waa (about 2 miles), where they arrived at 2 p.m. At Wee Waa they were joined by Messrs. Ewing and Dawson, who for the purpose of examining the country had, from Moree, taken a more westerly course *via* Mungyer, and crossed the Namoi at the bridge 3 miles west of Wee Waa.

At 4:30 p.m. the Committee met at the court-house, and examined Mr. L. Brennan, selector; Mr. J. A. St. Clair, selector; Mr. A. C. Fenwick, selector; and Mr. J. Maiden, drover; adjourning at 7 p.m.

At 8:30 a.m. on Wednesday, 29th November, the inquiry was resumed in the Wee Waa Court-house, and after taking further evidence from Mr. J. Maiden, the following witnesses were examined:—Mr. W. Mackenzie, drover; Mr. P. Rafferty, sheep buyer; Mr. J. Gray, contractor and selector; Mr. P. J. Ryan, drover; Mr. R. B. Mills, manager of Nowley Station; Mr. S. Dempsey, selector; Mr. S. Powell, selector; Mr. A. Copleson, storekeeper; Mr. W. Bennett, selector; Mr. A. L. Harding, selector; Mr. W. T. Mitchell, selector; Mr. A. Mackenzie, manager of Wee Waa Station; Mr. E. W. Jeffery, leaseholder; Mr. A. Hamilton, hotel proprietor; Mr. W. W. R. Holcomb, selector; Mr. C. Kelaher, selector; and Mr. J. W. Doherty, builder, and secretary of the Railway League. The examination concluded at 12:30 p.m.

At about 3 p.m. the Committee left Wee Waa for Narrabri, some members travelling on the south side of the river *via* Gurleigh Point and Narrabri West, and the others taking the north side *via* Gundamain and Ironbarks. Narrabri (24 miles from Wee Waa) was reached at 6:30 p.m. At 8:15 p.m. the Committee took the evidence of Mr. L. Malone, newspaper proprietor; Mr. E. H. Wall, grazier; and Mr. G. McFarlane, grazier; concluding the inquiry at 9:45 p.m.

On Thursday, 30 November, the Committee left Narrabri West by the 9:10 a.m. train, and reached Sydney at 11:5 p.m. the same day.

During the inquiry 17 witnesses were examined at Narrabri, 9 at Millie, 14 at Moree, and 21 at Wee Waa; a total of 61.

The area of country under consideration extends approximately from Inverell on the east to beyond Angledool on the west, and from the Namoi River on the south to the boundary of the colony on the north, together with the trade relations with such portions of Southern Queensland as may reasonably be expected to utilise the railway system of New South Wales.

The region lying east from the Nandewar Range—which range lies from about 15 to 20 miles west of the direct route—or further to the north, taking Warialda as a western limit, appears to be more intimately connected with the Inverell district, and the trend of traffic will be mostly towards the main northern line. The country
lying

lying between the Nandewar Range on the east, and extending west to beyond the Barwon River, is principally extensive open plains, interspersed with belts of timbers, consisting of belar, box, myall, and coolebah. The pasture consists of such herbage as is peculiar to the western portions of this colony, being blue-grass and coolah, intermixed with salt-bush and other salsolaceous herbage.

That portion of Queensland immediately to the north of the Macintyre, taking Kunopia as a centre; has been described by witnesses as poor country extending to within a short distance of the Queensland railway system, in which country, apparently, no great further development can be expected.

The evidence with regard to the inundations to which large portions of this country are periodically subject is very conflicting, but apparently the only portion seriously affected is an area of say 6 miles north from the Namoi, flooded by Namoi waters. Each of the smaller creeks—the Thalaba, Boggy, and Waterloo—floods, but not sufficiently to be a menace to settlement, or to be more than a very temporary inconvenience. From the Mehi on the south towards the Queensland border, embracing what is locally known as the “water-course” country, is an area in which inundations are apparently frequent, while a tract of country, lying between Thalaba Creek and the Namoi, passing south of Bulleroi and extending to within a few miles of Collarendabri, is apparently a fairly dry belt.

The main produce of the district is wool and fat stock. A little cultivation is carried on, and the gardens, where properly tended, appear fruitful, but beyond the pastoral industry and trade incidental thereto there is very little produce which is worth considering as being likely to furnish much traffic to the proposed railway.

The trend of traffic is to Narrabri West, the present terminus of the railway system. Some freight, principally adjacent to Walgett, finds its way down the Barwon to the Darling. The approach to Narrabri from Goondiwindi, Kunopia, and Mungindi, and that portion of Queensland lying immediately to the north of those places, is through Moree. South of Mungindi, embracing Angledool, and from that portion of Queensland lying north from Angledool, Mogil Mogil, and Collarendabri, down towards Walgett, the traffic finds its way to Narrabri by Wee Waa, Boolcarrol, and Millie; and it appears likely that much of it will continue so to do, for not only is the distance from Collarendabri to Moree almost equal to that from Collarendabri to Narrabri, but on the direct route to Moree a tract of country—low lying and subject to inundation, known locally as the “water-course” country—has to be partly traversed.

In the event of the railway system being extended to Inverell, and the navigation of the Barwon being improved, the trade area, of which Moree is the depôt, will be somewhat contracted, but will still remain sufficiently important to be entitled to the cheapest and most direct communication to market.

Although the industry of the district is almost wholly pastoral, still in a locality with good soil and a rainfall of over 20 inches it appears almost certain that with proper means of communication, and a likelihood of a reasonable return, large areas will be placed under cultivation.

The evidence with regard to timber is also very conflicting. A large forest of suitable timber exists to the south of the Namoi, and there is also a fair supply apparently at Terry-Hie-Hie; but we have no certain information that it is adjacent to the proposed line. In fact some witnesses are of opinion that no great supply of suitable timber can be obtained within 20 miles of the direct route.

It also appears doubtful whether the proposed small amount of ballast—3 inches—will be sufficient in a country which is partly subject to inundation, and the Committee would strongly urge that further departmental consideration be given to this question.

The main objection to the route submitted to the Committee is that it will fail to serve a great area of the country lying west from Millie and Narrabri. It is perfectly clear, as was testified to by many witnesses, that any trade south and west from Millie, such as traffic going through Bulleroi or Wee Waa, and probably also from Angledool, Mogil Mogil, and Collarendabri, will still make for Narrabri as being the most accessible railway station. A deviation *via* either Gurleigh Point or Wee Waa would be advantageous to a large area of country, and a very considerable population. The

The proximity of the Nandewar Range—which for the present at least lessens the area to be developed towards the east in some places to not more than 15 or 20 miles—would make it desirable, if possible, to thrust the line further to the west. But if the whole area under consideration is to be properly served it can only be done by two lines—a northern line following the route submitted to the Committee, and a western line following the driest belt of country, which is apparently south of Thalaba Creek, and eventually reaching Collarendabri. Any attempt to deviate from the direct route will entail a permanent disability on the northern trade without conferring a fully compensating advantage on the western trade.

In favour of a direct line we find:—

- (1.) That Moree is the depot for the great body of traffic lying east from that place towards Warialda, north to and beyond Goondiwindi, Kunopia, and Mungindi, and some distance also to the west of Moree—so great that it is entitled to the shortest and best way to market.
- (2.) That if railway communication be contemplated in order to develop the western country, it can quite as cheaply be performed by a direct line which would not entail extra carriage to the people of the Moree district.
- (3.) That it will be the cheapest line to construct.
- (4.) That in the construction of public works, if it is possible to retain an old centre of trade, without incurring serious loss or large expenditure to the country, it is well to do so rather than by establishing a new centre, inflicting needless injury on old trading interests, and uselessly expending the energy of the people in the creation of a new trading depôt.

It appears probable that the expenditure necessary for the construction of a pioneer line of railway need not greatly exceed in this country the amount required to construct a first-class road.

We are of opinion that in view of the importance of the western trade, it would be well if a full exploration and survey should be made of the country towards Collarendabri, apparently the best place to start a survey from being a point between Narrabri and Edgeroi, thus utilising the bridge which will be constructed over the Namoi on the direct route.

Sydney, 5 December, 1893.

J. GARRARD.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM NARRABRI TO MOREE.

[TAKEN BEFORE THE SECTIONAL COMMITTEE.]

MONDAY, 20 NOVEMBER, 1893.

[The Sectional Committee met at the Court-house, Narrabri, at 2.15 p.m.]

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.

The Hon. JOHN DAVIES, C.M.G.

THOMAS THOMSON EWING, Esq.

WILLIAM McCOURT, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

HENRY DAWSON, Esq.

The Sectional Committee proceeded to consider the proposed Railway from Narrabri to Moree.

Mr. George Samuel Evans Dale, solicitor, and Mayor of Narrabri, sworn, and examined:—

Mr. G. S. E.
Dale.

1. *Chairman.*] You are a member of the legal profession, practising in Narrabri? Yes.
2. And also Mayor of Narrabri? Yes.
3. How long have you resided in Narrabri? Thirteen years.
4. How long have you been connected with the Borough Council of Narrabri? I have been Mayor for six years.
5. How long has the town been incorporated? Ten years.
6. During the term of your residence, has the town increased very largely in size and importance? Considerably. It is at least three times as large as it was when I came here—that is not including Cooma subdivision, or Narrabri West, or Newtown.
7. Which do you call Newtown—Dangar Village? No; Newtown is the north-east part of the town.
8. You were here of course before the railway was extended to Narrabri West? Yes.
9. Did Narrabri West exist prior to the railway coming here? No.
10. It is because of the railway terminating at that point that Narrabri West has sprung into existence? Yes; also Cooma subdivision. Really in consequence of the railway we have Narrabri West, Cooma subdivision, and Dangar's Village. These places were not in existence when I came here. There were not more than three houses between here and the railway station when I came here.
11. Cooma subdivision is on the western bank of the Namoi—in other words, south-east of Narrabri West? Yes.
12. And Dangar Village is on what is called an island between the Namoi and Narrabri Creek? That is so.
13. Are you familiar with the various projects which have been propounded for connecting Moree or the northern portion of the Colony with the railway system? Yes.
14. As a resident of this district, and putting aside, if possible, for the moment, all considerations for the town of Narrabri, which of the lines depicted on yonder map do you think is the best one to adopt? I have not traversed much of the lines myself.
15. But you know the country generally? I do. I understand that the direct, or "red" line, is the better. I understand that it passes through better country, and that the facilities for getting ballast and such things are better. But that is only hearsay.
16. Which line do you think would serve the largest proportion of the population between Narrabri and Moree? I certainly think the "red" line would.
17. That line will leave the Millie people at some considerable distance? I understand that it will leave them at a distance of only 12 miles.
18. With regard to the proposal to bring the railway from Narrabri West and skirt the town of Narrabri, do you think that is about the best connection which could be made for Narrabri? I am quite sure it is.
19. You would not advocate that it should be brought more on a line with the road bridge into the centre of the town? No; I have no doubt that this is the best line.
20. Is it not a fact that surveyors have been in the district frequently looking for a crossing over the river? I do not know how it was that we did not find this crossing before. We passed the place day after day, but we never seemed to recognise its suitability as a crossing place until it was pointed out by Mr. Sams. Everybody was surprised that we had not found it out before, but I suppose it was not noticed because it was against our doors.
21. You think you are voicing the opinion of the majority of the people in stating that it is the best crossing? Yes. We used to think that Rocky Creek was the best place, but after seeing this place there is no question about its being the best, because the banks are so high and firm, and the crossing is so narrow, that the expense of building a bridge will be completely minimised.
22. What has been the growth of the population of the town since it was incorporated? The council clerk will supply that information. It has increased at the rate of three to one during the last thirteen years.
23. Do you know anything of the Wee Waa country? Yes.

- Mr. G. S. E. Dale.
20 Nov., 1893.
24. Do you not think that the Wee Waa people deserve to have a railway brought nearer their doors than the "red" line would go? Of course every man would like to have a railway against his own place.
25. I suppose you recognise that the "yellow" line in the direction of Gurleigh Point means leaving Narrabri out in the cold? As far as I am individually concerned I do not see that it makes much difference. If the railway is going to pass Narrabri it makes very little difference whether it passes the town one way or another. As a professional man I do not think it would affect me to the extent of one farthing which way it passes.
26. Do you think it will affect the town generally? I do not think it will.
27. *Mr. Davies.*] I gather from your evidence that it is a matter of very little concern to the town of Narrabri by which route the line leaves Narrabri West? A number of the townspeople do not think so, but my opinion is that if the train is going to pass the town it matters very little whether it passes through the town or passes a little way from the town. The passengers will not get out of the train to look at us for the mere sake of looking at us.
28. Do you think that the junction that is proposed would bring your trade nearer your town? I suppose that with certain traffic it would do so.
29. You know the crossing which is indicated on the plan? Yes.
30. You are of opinion that it is the best possible crossing, and the most inexpensive? There is no doubt that it is.
31. But as far as the town is concerned you think it makes very little difference to the town by what route the line goes? I do.
32. Whether it goes more to the west or follows the "red" line is a matter of little concern to the town? That is my opinion, but it is not the opinion of a great many people.
33. You hold a representative position, and you speak I suppose, to a large extent, for the ratepayers? I have not consulted the ratepayers—I am merely giving my own opinion.
34. You can hardly separate yourself from your official position of Mayor of the town? Exactly; but I have not consulted the ratepayers.
35. Do you think you are expressing the opinion of half of the ratepayers? I would not say that, as I have not consulted them.
36. I presume you entirely favour the extension of the railway to Moree? I think the Moree people are entitled to a railway.
37. But on public grounds? I think it should be extended.
38. You are aware of the cheap character of the proposed line? Yes.
39. That it is to cost very little more than an ordinary macadamised road? Yes.
40. And that it is the first line of this character which has been proposed in the Colony? Yes. I advocate the construction of the "red" line, because I believe that route is the more direct and the cheaper, and will be of more benefit to the country generally.
41. *Mr. O'Sullivan.*] Narrabri may be regarded as a progressive town? Considerably so.
42. What is its population? Within the borough proper we have about 2,200 souls.
43. There is every indication of progress in the number of the population and the value of the rates? Last year alone the electoral roll was increased by 300 names. About thirty new buildings are waiting to be rated, and others are going up all round. The town is very progressive.
44. How do you stand in regard to your overdraft? I think it is the most solvent borough in the Colony. We owe nothing, except £3,000 for the Town Hall, and I think we have a very considerable asset in that building.
45. It is likely to pay for itself? I think so. Considering that the black soil has involved a large expenditure in making the streets, and that every man has a good road to his house; considering that the borough has been in existence only ten years, and that we do not owe anything, except £3,000 for the Town Hall, I think we can look upon ourselves as being fairly solvent.
46. Have you gas-works or water-works? Not yet. I have been agitating for some time—I think with every reason of success—and expect we shall light the town very shortly.
47. What rate do you pay here? Only the shilling rate.
48. What did the Town Hall cost? £3,000. The site was a grant.
49. If the railway were taken *via* Wee Waa would it detrimentally affect the town of Narrabri? I dare say it would.
50. Would it benefit the town of Wee Waa if it were taken up to the point where it turns round? I suppose it would to some extent.
51. Would it be likely to establish a rival town at that point to the detriment of Wee Waa? Oh, certainly.
52. If it went to Wee Waa it would benefit that town, but if it went within a certain distance of that town it would not, and another town would rise up? Yes.
53. Do you know anything of the country between here and Moree? Yes.
54. Do you know if there is much Crown land between the two points? I could not say.
55. Do the Wee Waa people agitate to have the railway taken to Wee Waa? I believe there is some agitation to have the line taken to that town.
56. Are they agitating to take the line into the town, or are they content to have it taken *via* Gurleigh Point? I understand that they want it to be taken into the town of Wee Waa. There was a considerable agitation all over the district. Some people wanted the line to go *via* Gurleigh Point, and others *via* Wee Waa; in fact every man wanted the line against his own door.
57. Are there many people in Narrabri who are opposed to this railway? Not to the railway itself. I think we fairly recognise that the Moree people are entitled to a railway. Any man who has travelled on this line would not be honest if he did not make that admission.
58. Are there many people who prefer to see the terminus remain where it is for many years? I do not think so.
59. They are patriotic enough to allow the line to go on to Moree? I think so, as far as I understand the feeling of the people.
60. If it were a purely local line between Moree and Narrabri, would you recommend the Gurleigh Point route in preference to the direct route? I do not see what is to be gained by going to Gurleigh Point at all.

61. Is there not a much larger population along that route than along the direct route? I do not think so. That country is so low. Mr. G. S. E.
Dale.
62. Are there not more selectors along that route than along the "red" route? I do not think there are, but I am not prepared to say so positively. 20 Nov., 1893.
63. According to the map on the wall there are far more selectors and conditional lessees along the Gurleigh Point route than along the direct route? I do not think it is so. Further to the west there seem to be a good many conditional purchasers and conditional lessees.
64. Would not the Gurleigh Point route serve more conditional purchasers and conditional lessees than the direct route? I should not say so.
65. On the map the freehold land is tinted red, conditional purchases and conditional leases are tinted blue; the reserves are tinted green, and all the other Crown land is uncoloured. Judging by that map it must be evident that the Gurleigh Point route would serve a larger number of conditional purchasers and conditional lessees than the direct route, as it would be nearer to them on the west? It would seem to serve a number just there. I do not know that it would serve a greater number.
66. Against that fact I want you to put this fact:—that in order to serve these conditional purchasers and conditional lessees on the west you would have to go by way of Gurleigh Point, and therefore you would have to avoid the town of Narrabri and also lengthen for all time the journey to be travelled by persons coming from Moree and beyond that town;—in the national interest which line do you think would be the better one to adopt—the Gurleigh Point route, in order to serve the selectors, or the direct route, which may go to the Queensland border hereafter, and shorten the distance to be travelled for all time? Of course the direct line will most undoubtedly be the best, because it will tap the Queensland traffic more quickly.
67. The direct line goes through a good deal of Crown land;—do you think that when the pastoral leases expire in the course of two or three years, those lands will be selected, and that a considerable population will spring up along the direct route? I am quite sure of that. I have a number of clients who are waiting to get country.
68. You have fairly good evidence to the effect that when the leases are thrown open they will be selected? I am quite sure they will.
69. *Mr. McCourt.*] Have the people of Narrabri, by petition or public meeting, asked for the extension of the railway system to Moree? I do not think we have had any meetings either for or against this proposal.
70. The people of Narrabri have never asked for this extension? We have neither asked for the extension nor opposed it.
71. There have been no meetings held to favour the construction of this line? No; a number of people take the view that we do not want the extension, but at the same time the general opinion is that it is not fair to oppose the proposal.
72. There have been no meetings held on the subject? No.
73. The principal agitation for the line has come from Moree? Yes; as far as I am aware.
74. Supposing that the betterment principle were applied to the construction of this line, the people of the town would be called upon to contribute towards its construction;—do you think that they would be in favour of contributing, say, half the cost? I do not suppose they would. Speaking of them as a bulk, they do not want the line at all, but, as a matter of justice to Moree, they say they cannot honestly oppose the proposal.
75. It was in the past they had that opinion? I believe it is their opinion in the present. I do not say that the people of Narrabri are sufficiently patriotic to say, "We are prepared to pay a tax to benefit Moree."
76. Are you aware that this line is to be built subject to the application of the betterment principle? Exactly.
77. If that principle is to be applied, do you think the people of Narrabri will favour the construction of the line? I do not think they are anxious to have a line to Moree for the sake of paying a tax.
78. I desire to have a direct answer to my question? No; not with the knowledge that if the line goes to Moree they will have to contribute to a betterment fund.
79. They are not in favour of the line being constructed on that condition? I should not think so. Mind, we have not had any public meetings, and I am only guided by the conversations we have had in the town.
80. *Mr. Ewing.*] You know the traffic which comes into Narrabri? Yes.
81. Does more traffic come in from Moree than from Walgett? My opinion is that more traffic comes from Walgett way.
82. What do you expect this railway to carry principally—the produce of the country? Yes; wool, principally, and stock. I suppose it would carry fat stock.
83. Sheepskins, and things of that sort? Yes; everything incidental to the pastoral industry.
84. You think that more of that will come from Walgett than from Moree? I think so. I am not a forwarding agent, and I speak only from my personal experience.
85. It all goes to the Sydney market? Yes; but a good number of sheep go to Aberdeen.
86. Is the river navigable to Walgett? It never has been since I have been here.
87. Is it your opinion that if a railway were built from Narrabri to Walgett the people from that part of the Barwon would always come through this way to Sydney? I do not think they would.
88. Is the river navigable to Walgett? Very frequently, I believe; and when it is, a lot of their loading goes down by steamer.
89. If a railway were built to Walgett and the river happened to be navigable that year, would the wool go by the railway through Narrabri, or would it go down the Darling? That I am not prepared to say; it just depends upon the railway freights.
90. You do not know those freights? No.
91. How far is it from here to Walgett? About 130 miles.
92. Supposing the means of getting down the Darling when the river was up were as good as the means of going through Narrabri by train; the traffic would cease to go by Narrabri and would go down the Darling River? I think a good deal would go down the Darling.
93. If the whole of the stuff from Walgett were to come through Narrabri more would come to Narrabri from Walgett than would come from Moree? I think so. 94.

- Mr. G. S. E Dale
20 Nov., 1893.
94. I want to find out, with absolute certainty, whether, in your opinion, we could depend on getting that trade? I do not think so.
95. From here to Wee Waa—how far is it? Twenty-three miles.
96. From Wee Waa to Moree, how far? I could not say; that is across country.
97. Do you think it is 70 miles? I should think it is less.
98. Do you think that from Narrabri to Moree *via* Wee Waa would be 100 miles? I really do not know.
99. Do you know anything about the traffic:—do you know what portion of the country Moree is properly the business centre of—as far as Warialda? I do not know.
100. Therefore, although you believe that more stuff does come from the west than from the other direction, you do not know why you believe that? Yes, I do; because I know that a lot comes round by Inverell and Bingera.
101. It might come to Narrabri if the railway went to Moree? That I do not know.
102. The point is, whether it is worth while to bring a lot of stuff 20 miles further in order to catch the western traffic or not? I do not think you would get another ton by taking it that distance.
103. You know nothing about the circumstances of Moree? No.
104. *Mr. Dawson.*] How do you understand the betterment principle to apply to the construction of this line? I understand that every man through whose land it will go will have to contribute a certain rate for a certain number of years.
105. That is, supposing a man's land is improved in value, he has to pay a certain amount every year? I take it to mean that every man through whose land it went would have to contribute something. I am not versed in the matter.
106. Whether it benefited him or not? That was my opinion when I answered the question of Mr. McCourt.
107. Do you think that if a man's land were increased in value by the railway from £10 to £15 per acre, he would not object to contribute to the betterment fund? Not if his land benefited. My answer was that a man would not like to pay a tax for the sake of benefiting Moree. We are not sufficiently patriotic to pay money to benefit other people, but if you can show us that it would benefit us we should have no hesitation in paying the tax.
108. Have you been over either of the proposed routes? Some portions of them.
109. Do you think the Crown lands along the "red" route will be taken up by settlers? I believe that these lands will be taken up as soon as they are available. I have people now waiting to take up land.
110. Do you know that of your own knowledge? Yes.
111. Where will they get timber about here? The Government have been sending up here for sleepers for the rest of the Colony. The Sleeper Cutters' Union was stationed here.
112. Those sleepers were required for certain portions of the railway system; you did not send sleepers to Hay or Jerilderie? I do not know personally, but I believe they are required all over the Colony. A large union has been stationed here cutting sleepers for the Commissioners.
113. Would it be cheaper to get the timber on the "red" route than on the other route? That I could not say, but I should think it would be cheaper on the "red" route, because there is some timbered country along there. The further you go west you get into plain country. In the west you may travel 20 miles and hardly see a tree.
114. *Chairman.*] Is there any further information which you desire to give? No; except some statistics with regard to the borough. The estimated population of the borough is 2,306; the total value of improved property is £109,418; the total value of unimproved property £16,781; and the annual value of improved property £14,362.
115. *Mr. Davies.*] The annual income and the annual expenditure? I will furnish that information to the Committee.

Mr. Charles Alexander Ress, contractor, and member of the Local Land Board, sworn, and examined:—

- Mr. C. A. Ross.
20 Nov., 1893.
116. *Chairman.*] You are a member of the Local Land Board? Yes.
117. You are also a contractor? Yes.
118. How long have you resided in Narrabri? Nine years.
119. *Mr. Suttor.*] Have you considered these lines at all? I have. I have resided in the district for thirty-three years.
120. Which do you think would be the best line to construct? The "red" line I consider would be the most direct and the cheapest.
121. Have you any objection to the other lines at all? I cannot say that I have any objection, but I consider that the "red" line would be the most beneficial one.
122. What do you think of the "blue" line, called the permanently-staked line? I do not quite know where that line would go.
123. It goes straight from Narrabri West? That would cross the island, which is liable to be flooded.
124. What about the other line which starts from Narrabri West and goes down through the stock route? The travelling stock route is not nearly as high a piece of country as the other.
125. Is it subject to floods? It is subject to floods; it is not naturally drained. After we have had some rain the water remains on the land for a long time compared to the land along the "red" route.
126. Taking everything into consideration, you are satisfied that the "red" line is the best? I think so.
127. Would the Gurleigh Point line get the Wee Waa trade at all? I should imagine it would. I fancy it would anticipate the traffic which now comes up to Narrabri West.
128. Is there much traffic coming from Wee Waa to that line? I cannot say; I do not know much about the traffic on the road.
129. It diverges very much from the straight line; it is some 20 odd miles distant? Yes. After crossing the Namoi it would get into very low and flooded country.
130. *Mr. Davies.*] As a contractor you know something of public works? A little.
131. Have you traversed the "red" line? I traversed that line in the first instance with Mr. Surveyor Paul. I may state that for eleven years I lived at the place where Woolabrar station is marked on the map. I managed that pastoral property for eleven years.
132. Is the road which is shown on the plan and meets the main road still in existence? I believe it is, but I think it has been somewhat interfered with by conditional purchases.

133. It joined the travelling stock route? Yes. There is a travelling stock route from Woolabrar to Millie.

134. From your general knowledge of the country you think that the "red" line is the best which can possibly be adopted? That is my opinion.

135. And the cheapest? Yes; by far the cheapest.

136. Are you aware of the estimated cost of construction? No.

137. The estimated cost is £153,000; and as a contractor and a practical man, I presume you think that that would be one of the cheapest lines which could possibly be constructed? It is the cheapest I ever heard of.

138. Do you think the extension of the railway system to Moree will open up much additional trade for the Department? I think so.

139. And that it will induce settlement? I think it will induce settlement largely.

140. What will the line be used for principally? Wool and stock, I should imagine.

141. Will any of the trade that now goes to Queensland come this way if our railway system is extended to Moree? Yes, and a good deal of the traffic which now travels by dray to Tamworth I fancy would be diverted to Moree.

142. Then the Railway Commissioners would get the additional haulage on that traffic? Yes.

143. The traffic from the Lower Macintyre, and that part of the country which now goes chiefly by way of Tamworth, would be diverted to Moree as being much closer to the railway system? Yes.

144. Is there much settlement along the proposed line? A great deal of land has been conditionally purchased. There is a good deal of land along the "red" line which is admirably suited for agricultural settlement, but it is rather heavily timbered. It has not been taken up yet, but no doubt with additional advantages it would be taken up.

145. Whose runs will the line pass through? Edgeroi belonging to the Namoi Pastoral Company, Dobikin belonging to Taylor Brothers, Gurley belonging to Mr. John Simpson of Melbourne, and Tycannah which used to belong to Mr. Pierce, but which was held in trust for a while, and then I think it touches Wee Bolla Bolla, belonging to Mr. Munro.

146. Are there any selections along the route of the "red" line? Yes; on each side.

147. To what extent on each side of the route would settlement be served? It would be served for a distance of from 15 to 20 miles on the eastern side, and from 30 to 40 miles on the western side.

148. Would the "red" line draw to Narrabri any of the trade which now goes to Inverell? I do not know what traffic goes to Inverell. You are thinking of the Upper Macintyre trade. I think most of that trade goes through Warialda and Inverell to Tamworth.

149. You stated that the "red" line would serve a population on either side to the extent of 30 or 40 miles—that would draw additional traffic to this line, and would be the means of inducing additional settlement to take place? Yes.

150. The land you say is all suitable and fit for agricultural settlement? Yes; especially to the east, where there is a lot of good agricultural land.

151. You are strongly of opinion that the "red" line should be constructed, as it will serve the people better than any of the other routes? Yes.

152. *Mr. O'Sullivan.* Where will you get your passenger traffic between Moree and Narrabri, if the railway is taken by the direct route? The people would have to go to the station of course.

153. Do you think that people, having once got into their buggies, would drive 12 or 15 miles from Millie and other places to the west to the train? I should imagine they would take the shortest route to the nearest station.

154. Would there not be a much larger passenger traffic if the line went by Gurleigh Point? Possibly there would be a larger passenger traffic, and they would pick up passengers coming by the river.

155. Should we be justified in recommending the construction of a line, which would cost nearly £100,000 more by the Gurleigh Point route, in preference to the "red" route? I should not think so.

156. Do you consider that the people who will be within 12 or 15 miles of the "red" route will be fairly served by a railway in that direction? I think so.

157. During your residence of thirty-three years in the district you have seen a considerable rush of settlement take place? I have indeed.

158. Of what character was it? Nearly all pastoral settlement—selectors taking up large areas for the sake of sheep-farming.

159. What is the average size of a selection up here? 2,560 acres when that area is available.

160. Wherever they can get a full area they take it up? Yes.

161. Is there room for many of these selections on the leasehold areas, which will be thrown open in the course of two years? There will be a good many when the leases are thrown open.

162. You think they will be rapidly availed of? Yes; every acre will be taken up.

163. That will provide a population along the direct route for the railway to serve? Yes.

164. Bearing in mind that this line will some day tap the Queensland border, should that fact weigh against the possibility that a better local line would be by way of Gurleigh Point for two or three years to come? I should think it advisable to tap the Queensland trade as early as possible.

165. You recommend that that should be done as directly as possible? Yes.

166. In order to save the extra trainage which would have to be paid if it went by the "boomerang" route? Yes.

167. Do you think that if the line went by Gurleigh Point it would materially affect the town of Narrabri? I should think it would affect the town, but I do not know whether it would be materially affected.

168. Would it benefit the town of Wee Waa? I do not think it would.

169. Is it likely to cause the establishment of a rival town at the point where it turns to go north? I think it would be certain to do that.

170. On the whole, you think the advantages are in favour of the direct route? I think so.

171. *Mr. Ewing.* What is the rainfall here? The rainfall in the Narrabri district is from 25 to 26 inches.

172. Is the soil good enough to grow wheat? Yes.

173. Is a rainfall of 25 inches enough? Yes.

174. Is there any wheat grown here? Wheat has been grown here. I have had some little experience myself. The average yield for some years was 20 bushels to the acre.

Mr.
C. A. Boss.
20 Nov., 1893.

Mr.
C. A. Ross.
20 Nov., 1893.

175. Is there much wheat grown here now? No.
176. Why not? I can hardly explain, except perhaps that they find that other crops pay them better.
177. Wool is easier to produce, I suppose? The tendency here is all for sheep.
178. There is no reason why wheat should not be produced? No. There is very good wheat-growing land in the district.
179. And between here and Moree? Yes.
180. Do you know anything of the traffic going into Narrabri? No.
181. Is the Barwon navigable to Walgett frequently? It has been navigable frequently of late years, but at long intervals. It is not navigable beyond Brewarrina.
182. How far is it from Walgett to Brewarrina? 100 miles.
183. You cannot depend on the river being navigable to Walgett? No.
184. If the river were open to Walgett, would the traffic go by that way or through Narrabri? The traffic is mostly by the river, I fancy, when it is open.
185. In your opinion, I gather that Walgett is already provided for by the river? It is only partly provided for.
186. For many seasons the river is not navigable at all? For two or three years I have known no steamers to come from Brewarrina.
187. There is no certainty that if the railway did go to Walgett the traffic would always come this way? No.
188. The traffic would come this way when the river would not allow it to go the other way? Yes.
189. It follows, therefore, that the freight from Walgett, *via* the river to Sydney, would be cheaper than by a railway, *via* Narrabri, to Sydney? Yes.
190. For 50 miles from Walgett towards Narrabri the traffic would stick to the river? I should say about 30 miles.
191. Therefore the railway at all times can only control the traffic 50 miles west of Narrabri, supposing your river to be open for about 80 miles—that, you believe, is the real state of the case? Yes.
192. Taking Moree, would the Warialda wool come this way? I think so.
193. Taking that stretch of country of which Warialda is the centre, supposing that a railway were built from Narrabri to Moree would the wool from that country travel through Warialda to Moree? Yes.
194. From the north to the Queensland border, do you think that the whole of the produce of that country would come down to Moree? Yes.
195. From Mungundi? Yes.
196. From Goondiwindi right round to Mungundi? Yes.
197. Is that a larger stretch of country than the country between here and 80 miles towards Walgett? Yes.
198. Is it a very much larger stretch of country? It is considerably larger, and it is far more populated.
199. Would there be more produce from that country? Certainly. The country between here and Walgett on one side is very sparsely populated indeed.
200. On which side? On the south of the Nannoi.
201. Is that *via* Wee Waa? Yes. On the south the country is very sparsely populated indeed. A great deal of it is abandoned.
202. If the great body of the traffic is coming down through Moree to Sydney, *via* Narrabri, ought it to come by the most direct route? I think so.
203. Why do you think that the direct route is the best route? I think a line could be constructed at a cheaper cost by that route, and the traffic coming by that route would be so large that it would be hardly fair to ask people to pay the extra haulage which the adoption of any other route would entail.
204. If the railway is taken *via* Wee Waa a man from the north would have to pay 20 miles extra haulage, but you have another section of country to the west towards Walgett, and the people in that country would be benefited by getting the railway brought 20 miles nearer to them? Certainly they would.
205. Therefore we have to consider which is the bigger area of country? The area to the north of Moree is far before and far larger than any area which could be served beyond Wee Waa.
206. That would be the main body of the traffic? Yes.
207. You have stated that if the river is open frequently to Walgett it will disturb the certainty of the traffic coming this way? It commands a great deal of the traffic when it is navigable.
208. *Chairman.*] What is the character of the land between the "red" line and the mountains? It is rolling downs of black volcanic soil, and along the foot of the mountains there is a fringe of rich chocolate soil, heavily timbered, very good land for wheat cultivation.
209. If they have good land right against their door 20 or 40 miles from Narrabri, how is it that it has not been brought into cultivation? It is too heavily timbered, and people have been able to get land without timber which requires no outlay in the first instance, and have been able to go into sheep farming which, up to the present, has been the more profitable industry, as it requires less labour and less oversight.
210. This line, if constructed, would be very likely to develop an agricultural industry on the eastern side? I think it would. I think before long that the whole of that country will be taken up. I may say that the Land Board are endeavouring to deal with land which is very heavily timbered, with the view of allowing people to occupy land on more favourable terms. There is a great deal of land which can be fairly classed as good land, but still it is so heavily timbered that people cannot afford to take it up.
211. It is a fact that there is a very large cattle traffic from Walgett towards Millie, and thence by the travelling stock route to Narrabri? I cannot say.
212. I think you expressed the opinion that the travelling stock route would be a more difficult route for a railway than the "red" route? It would be wetter, and more liable to flood.
213. *Mr. O'Sullivan.*] Why would a line by Gurleigh Point route or the travelling stock route be more subject to flood than the direct route? The direct route is almost at the head of the various creeks. Where the line crosses these creeks there is a fall of 20 feet to the mile. The country is of an undulating character, and is rapidly drained after a heavy rain. To the west you gradually get on to flat country. The creeks have very little fall. The watercourses get big and spread out into swamps.
214. That country is the bottom of a basin in which the water lies for a considerable time? Yes.
215. *Chairman.*] Have you any personal interest in the line or any property along the route? Not a morsel.

Mr.

Mr. Walter Gould, railway station-master, Narrabri West, sworn, and examined:—

216. *Chairman.*] You are the railway station-master at Narrabri West? Yes.
217. How long have you held that position? I have been stationed at Narrabri for three years.
218. *Mr. Davies.*] What is the nature of the goods traffic to your station? Inwards it is general goods, and outwards wool and stock are the heaviest items.
219. What is the total value of the freight received from stock and other sources? The total freight we collected was from £15,000 to £50,000 a year.
220. That is to say, the revenue which has passed through your office? Yes; the major portion of the freight was paid at the other end of the line.
221. Where does the major portion of your trade come from? I think the major portion of the wool comes from the north.
222. What part of the north? Right into Queensland.
223. By what route does it come? Some by the Moree route, and some by the Collarendabri route.
224. Where does that come in? From Millie.
225. A large proportion of the trade comes to your station from Millie? A good deal of it does.
226. What proportion do you think comes from Millie—a third or a half? Perhaps 20 per cent.
227. That 20 per cent. is collected principally at Millie? No; it comes in from Queensland.
228. It comes from Queensland and beyond Moree by way of Millie to Narrabri? Yes.
229. Where do you get the balance of your trade from;—do you get any from Wee Waa? That traffic is very light.
230. What percentage of your trade comes from Wee Waa? I do not believe that it is more than 10 per cent.
231. Within what radius does that 10 per cent. of your traffic come from? Within the boundaries of the district of Wee Waa.
232. Where does the other proportion of your traffic come from? I think, including the Collarendabri traffic, it would be about 20 per cent. That would be the Millie traffic you spoke of.
233. Do you know the country which is traversed by the "red" line? No.
234. You could not express an opinion as to whether it would serve these different points from which your trade comes? I should imagine it would from the fact that it comes closer to the centres of population.
235. What distance would the people from the Queensland border have to traverse with their wool and stock to reach Narrabri by way of Millie now? If it is near the border, I think it would be about 150 or 160 miles.
236. Do you get wool from beyond the border? Yes.
237. Much? Yes; a good deal comes from there.
238. Is that trade increasing? It is not. It would have increased considerably, only for circumstances.
239. Would the value of that trade be increased very largely by the construction of this line to Moree? I think so.
240. You think it would be likely to develop a much larger trade in wool and stock from the Queensland border? I do not think there is any doubt about that.
241. Consequently it would increase the traffic on the line from Narrabri? I think so.
242. What passenger traffic do you get annually from outside and beyond Narrabri? That is hard to estimate.
243. Can you give a rough estimate? About 50 per cent. from outside the town itself.
244. Do they come from any great distance? They come right away from Mungundi and Moree.
245. Is it likely that there will be a large increase in the passenger traffic, as well as the goods traffic, if the line is extended? I have no doubt that there will be an increase if the population are served.
246. You see the proposed stations on the line depicted on the map;—do you know the localities at all? No.
247. *Mr. Ewing.*] If the distance from Millie to Woolabrar is 12 miles, and the distance from Millie to Narrabri West is 35 miles, would the wool coming from Collarendabri, when it got to Millie, draw up to Woolabrar station;—it would make to the railway at the nearest point? Undoubtedly.
248. *Chairman.*] Are you quite sure that the wool from Collarendabri comes through Millie? The traffic comes *via* Millie or *via* Wee Waa as the watercourse permits—mostly *via* Millie.
249. Is there not a road from Narrabri West to Collarendabri, *via* Wee Waa? I do not think the wool comes in by that road.
250. How did you gain your information as to the road by which this traffic came in? From the agents.
251. Excepting that you had some conversation with the agents, you only know from the marks on the bales the direction from which the wool came? I could tell the station from which it came, but not the route by which it came.
252. What proportion does the wool received in Wee Waa bear to the wool received *via* Moree? It would be impossible for me to say at the present moment.
253. Could you not tell by your books? I could not tell the route by which it came.
254. You would know whether the stations were to the north or west? The proportion is very small from down the river.
255. From Wee Waa or Pilliga? Yes.
256. Is there much stuff coming from Pilliga? Very little.
257. Not much from Wee Waa? No.
258. Any cattle from there? No; from Queensland.
259. They would come down the travelling stock route, through either Millie or Moree;—is there much wool coming from Warialda to your station? No; I have seen very little.
260. Is it increasing? I do not think so.
261. Does much come from Bingera? No; only very small consignments, and that only occasionally.
262. There is no perceptible growth in the volume of trade from those directions? Not at present.
263. Knowing the general position of Warialda and Bingera, do you think that this "red" line would have any influence in increasing the volume of trade? I do not know the distance.
264. Is there anything else you would like to state to the Committee? No.
265. It has been stated in evidence that if the proposed line is constructed it is proposed to keep the goods station at Narrabri West, and the passenger station at Narrabri;—would not that mean two staffs? Yes. If passengers only are taken at Narrabri the staff would be very small.

Mr.
W. Gould.
20 Nov., 1893.

- Mr. W. Gould.
20 Nov., 1893.
266. I suppose it is very much more economical to have one staff if possible than two staffs, however small they may be? Undoubtedly.
267. Have you every facility at Narrabri West to deal with the goods traffic? Yes, generally speaking.
268. Do you think there will be much objection on the part of this volume of trade which comes from the north to unloading at Narrabri West? I think they would want to unload at Narrabri.
269. Because they had to go 2 or 3 miles further? It is only natural.
270. It is a good road? Yes.
271. You do not think there would be much in their objection? I do not think so.
272. Is not the last 2 or 3 miles of the journey generally considered the worst? I think so.

Mr. George Gregory, senior, farmer, Deep Creek, sworn, and examined:—

- Mr. G. Gregory.
20 Nov., 1893.
273. *Chairman.*] What is your occupation? I am a farmer at Deep Creek and Bullawa Creek, 6 miles east of Narrabri, under the foot of the Nandewar range.
274. How long have you resided there? I have resided there twenty-three years, and I have been in the Narrabri district thirty-four years.
275. *Mr. O'Sullivan.*] You know the district thoroughly? I believe I do.
276. What is the character of the country between Narrabri and Moree, to the east of the "red" line? I have travelled that country on several occasions, and I have found that it is good agricultural land, fit for growing any crop.
277. What coloured soil is it? The greater part of it is chocolate soil. There are patches of black soil, very strong and heavy.
278. Is it heavily timbered? A great deal of it is, but we find that that is first-class land.
279. Are the Crown lands heavily timbered there? Yes.
280. What would it cost per acre to clear those lands? I could not say. The Government reckon that they would allow me £10 an acre for what I have cleared and ploughed and cropped.
281. That must have been allowed by some person who had a knowledge of the matter? Yes.
282. From that fact we may assume that it will cost £10 an acre to clear this heavily-timbered Crown land? On an average it might be £5. Some land is improved, some has no timber, and some is very heavily timbered. As a general rule we take the most heavily timbered land, on account of its being the strongest land.
283. For agricultural purposes you prefer the most heavily timbered land? Yes; because it is the best growing land.
284. In the event of the leaseholds being thrown open within the next two or three years, will that heavily timbered land be selected? I think so. I think that if the leases were thrown open now it would all be selected. Everyone is crying out for land and no one can get any.
285. From your knowledge of the district and your experience as a settler you have no doubt that there will be a rush for settlement when the leases are thrown open? No; I have reared a family of ten by agriculture in the district, and I know pretty well what it is.
286. There is a road leading from Narrabri to Moree, on the east of the "red" line? Yes.
287. There is also a road leading from Narrabri to Moree, on the west of the "red" line? Yes.
288. Have you not local names for these roads; have you not a road for dry weather and a road for wet weather? Yes.
289. Which is the wet weather road? The one running under the mountains, on the east of the "red" line.
290. And the road running on the west side of the "red" line is the dry weather road? Yes.
291. Why is it called the wet weather road? Simply because we can keep out of reach of the water when the river is over its banks.
292. In dry weather you take the lower road, and in wet weather you take the higher road? In wet weather we take the higher road, because the lower road is all under water.
293. That points to the fact that the best thing is to keep as near to the foot of mountains as possible? Yes.
294. Is that one reason why you prefer this direct route to Moree? No. My simple reason is that there is agricultural land along that route. A great deal of settlement will take place if the railway is taken through agricultural land; but if it is taken by Gurleigh Point that land will lie vacant for years and years.
295. That is a very good reason;—have you any other reason in the fact that the country through which the dry weather road passes would be the wettest country for the railway to go through? The country which could be travelled by the direct line could be kept in repair for a great deal less, it would be out of flood reach.
296. Do you know many of the selectors in the district? A great many.
297. Are they fairly prosperous? I believe they are.
298. What sized holdings have they? From 40 acres up to 2,560 acres.
299. Are there many men holding the maximum area? I find that the small holdings are the most prosperous.
300. Are there many men holding 2,560 acres in the district? Yes; mostly on the western side of the line. On the eastern side under the foot of the mountains the holdings are mostly small agricultural ones.
301. Do you think there will be a rush for settlement when the leases are thrown open? Yes.
302. There are not very many inhabitants to the east of the "red" line at present? I do not know. Narrabri post-office pays a mail to run 16 miles up Deep Creek and Bullawa Creek twice a week. It crosses Bullawa Creek and runs up Eulah Creek.
303. There is sufficient population to maintain a bi-weekly service? Yes. There are some thousands of acres under cultivation.
304. What do they cultivate? Wheat, oats, corn, potatoes, beans, peas, cabbage, turnips, and fruits of all descriptions. I believe we can get fruit here two months before it can be got in Sydney.
305. Where do you sell your produce? At Narrabri generally.
306. You have a local market for nearly the whole of your produce? No; for the greater part of it we have. What we send away mostly goes to the Moree and Collarendabri districts.

Mr.
G. Gregory.
20 Nov., 1892.

307. I suppose you command a fair price out to the north and west for your surplus? A very good price.
308. Do you take it out yourself? No; it is generally sent out by the carriers, and the squatters often send in and purchase what they want.
309. Which route do the carriers take to go to Collarendabri? Generally by Millie.
310. Why do they go by Millie when there is another route from Narrabri West by Wee Waa? I believe they are frightened of the river. I have been down with teams, and I have been caught, and I did not like it.
311. They take the road *via* Millie, because it is the safer one? If a thunderstorm comes up one of those creeks you are jammed, perhaps, for a fortnight. You have to keep out back.
312. That accounts for bringing all the wool and stock from Collarendabri by way of Millie, although the road is longer? Yes.
313. If the line were constructed, all that traffic would strike the railway at a point somewhere near Millie? I think Millie would be about the central point from what I know of the country.
314. *Mr. Dawson.*] How many acres have you got? Four hundred and sixty-four acres.
315. For how many acres were you allowed £10 per acre for clearing? The Government, according to their reckoning, when I first settled on the land, allowed me £10 an acre for clearing about 25 or 30 acres.
316. Was it fenced in and grubbed? It was cleared and ploughed, and I had a house and some buildings. I believe I have over £1,000 worth of improvements on the same land.
317. You would not have benefited personally, if they had allowed you £50 an acre for clearing the land? It did not matter, as long as we had sufficient improvements on the land to comply with the Act.
318. Had you not enough improvements without the £10 an acre? I had. I simply asked the Government officer what did he allow, and he said for such improvements as that he allowed £10 an acre. I did not need it. It was very heavily timbered land, and after it was cleared it was worth that much.
319. Is it worth while to take up land and pay £10 an acre for clearing it, when you can get land for less? I do not know. The Government are putting £2 an acre reserve on the land at my place, which is not worth 25s.
320. Why is that? It is in small blocks. Not 10 acres in every 50 were any good.
321. Supposing your land was put up for sale at auction, would it bring £5 an acre? It would not bring more than about £5.
322. It is a dead loss to take up all this land and clear it? It is not a dead loss. If a man takes up sufficient to keep himself and family and makes a little extra he will do very well. There are some 30,000 or 40,000 acres out in my district which is well worth taking up, but it is all locked up.
323. If this railway is constructed will any of that land become any more valuable, or will it be taken up in greater quantity than now? Of course it will; because it will be considerably nearer the railway.
324. Along this "red" line which you favour there is a good deal of land which is valuable and fit for selection? A great deal. I believe that all the way between here and Moree there is a great quantity. As for wheat-growing, they say there have been two reapers and binders cutting there for the last five weeks. Up the creek they are cutting wheat every day. I believe they are cutting hundreds of acres of wheat and corn with the reapers and binders. I suppose we can grow as good wheat as any part of Australia. We proved that when the mill was going. It does not pay us to grow wheat in large quantities until the mill resumes operations.
325. Does not the fact that the mill is shut up prove that you did not grow wheat profitably? No. We are trying to get the mills started again. I grow 700 or 800 bushels a year to keep the thing going, and plenty did the same. Wheat can be grown here equal to any wheat grown in the country—30 or 40 bushels to the acre.
326. I suppose you grow oats equal to New Zealand oats too? Yes.
327. You have the same cold climate as New Zealand? I have grown oats in New Zealand as well as here.
328. *Mr. Davies.*] Are your sons selectors? Not now; but they have been.
329. You have grown almost all kinds of crops on your selection? Yes.
330. And you find a local market for almost all you could raise? Yes.
331. The surplus produce which you sent to Moree and Collarendabri was taken out by teams which had brought in wool from the stations? Yes.
332. Have the selectors in your district done fairly well? Yes; they all seem to be fairly well off.
333. How long have you held your selection? My present selection I have held twenty-two years.
334. And your original selection? I selected near Narrabri; but the land close to the town was of too tough a nature, and I got further away under the foot of the mountains.
335. You think a railway constructed by the "red" route would be the means of opening up a large portion of the country? It would induce great settlement.
336. And it would increase the trade and produce of the district? Yes.
337. You favour the "red" route? I do, because it would benefit the public, and would be beyond the reach of flood-water.
338. Have you any sheep? Seven hundred or 800.
339. I presume that wheat is not grown now because it pays better to grow wool? No; the mill ran for two or three years and then it fell through. It is being reconstructed, and as soon as it starts again there is no doubt that any quantity of wheat will be grown.
340. Will it give as good a result as sheep-farming? A little better—double.
341. It is very singular that they do not grow wheat;—have you no consumption, no outlet? Our only outlet was to send the wheat to Tamworth to be ground, but it would have cost at the very least from 1s. to 1s. 3d. a bushel to send the wheat to Tamworth and get the flour returned, and we could not afford to pay that price. If there was a mill on the spot we could afford to grow wheat and reap a benefit.
342. You sincerely believe that it would pay to grow wheat? Yes; the ground is adapted for wheat-growing in every sense of the word, as I have proved myself.
343. Did you grow wheat? I grew 30 or 40 acres at times.
344. What did it average? From 30 to 40 bushels an acre.
345. What price did you get? 3s. 6d. for the last lot I sold of about 600 bushels.
346. That would give you a very good return on your labour? Yes; but the mill closed, and then we had no alternative but to stop growing wheat.
347. You prefer the "red" route to any other route? Yes.

- Mr. G. Gregory.
20 Nov., 1893.
348. You would not advocate the construction of the line by the travelling stock route? Not by the lower route. I believe in keeping as near the mountain as possible, so as to keep clear of all water. That would be the least expensive line to maintain.
349. Would it not be less expensive to construct a line of 62 miles than to construct a line of 72 miles? Yes.
350. Would not the producers have to pay less freight on a line of 62 miles than on a line of 72 miles? Of course they would.
351. Those are good reasons why the railway should be taken by the shortest route? I believe in keeping as near the mountains as you can, for the sake of opening up the good land.
252. *Chairman.*] Is there any other information that you desire to give? No.

Mr. Theodore Morath, saw-mill proprietor, Narrabri, sworn, and examined:—

- Mr. T. Morath.
20 Nov., 1893.
353. *Chairman.*] What is your occupation? I have a saw-mill in Narrabri.
354. How long have you resided in Narrabri? Since 1865, with the exception of twelve months, when I took a trip Home.
355. *Mr. Dawson.*] Are you in favour of the construction of a railway to Moree? I do not care whether a railway is made or not.
356. On which side of the proposed line is your mill? It is about 200 or 300 yards from here, in the centre of the borough.
357. Why do you not care whether a railway is made or not? I should like the railway to be constructed as cheaply as possible, and in the best place.
358. Where is that place, in your opinion? By the "red" route.
359. Will that serve the greatest number of people? I believe it will, by a long way.
360. Were you here when Mr. Jones visited this district? I was.
361. Did he wait upon you? A gentleman who went up to Rocky Crossing four or five years ago did. Many gentleman have come up here. I had an interview with the Railway Commissioners when they returned from Walgett.
362. Where do you get your timber from? Both sides of the town.
363. Where is your trade? Mostly in the town. I send some out to Millie.
364. Will the construction of this railway benefit your business? It will not benefit me.
365. There is a mill half-way to Moree? Very likely they would send the timber to Moree on the line.
366. There is timber about 20 miles from here? Yes.
367. It would give a trade to the railway? Yes.
368. Do you know the country between here and Moree? In the 1864 flood I travelled by Wee Waa to Collarendabri. You could see what sort of a country it was then. I have not travelled across it since. It was terribly boggy in that year. The country between Wee Waa and Boolcarrol had been flooded all the way to a depth of from 3 feet to 1 foot. There were 10 miles of flooded country. The main water-course ran for 10 miles. The water travelled very slowly. We had to ride on horseback for miles through the water. I think that if you were to construct a line down there you might dam up a lot of water. It would not do the people much good to do that, and it would not be a good line to keep in repair. It would be a dangerous line to travel in flood-time.
369. You think it might bank up the water for miles? It would make a swamp of the country. If that country ever gets populated, it will be by having a canal made to Walgett to drain the country, and give them water carriage. A canal would be cheaper than a railway.
370. Do you know the country through which the "red" line goes? Yes.
371. What sort of country is it? It is good country.
372. Suitable for railway construction? Yes.
373. Is there any likelihood of settlement taking place along there? It is splendid growing country. There are very rich patches; some sandy country, but not much. Most of it is first-class country for settlement. I have grown wheat for hay.
374. *Mr. Ewing.*] What timber do you cut? Ironbark, apple-tree, pine, and sometimes box.
375. Only for local demands? Mostly. I do not send any to Moree.
376. You know a good deal about the timber in the district? I do.
377. Is there much red-gum here? We have red-gum, but it runs very veiny. It is not a profitable timber to cut.
378. Is it fit for railway sleepers? You can get some good sleepers, but I do not think it will ever pay anybody to cut them, unless the price is higher than it is. There is too much waste.
379. The red-gum here is too faulty? Yes. Along the lower line I do not think there is any timber fit for railway construction. On the upper line there is some ironbark.
380. How far down the Namoi have you to go for red-gum? There is red-gum all along the river. There is red-gum to Walgett.
381. But no good forest? There is no red-gum worth much. I am satisfied it will never be used until the ironbark is used up.
382. What is the apple-tree used for? For wheelwrighting, mostly.
383. Only for local demands? Yes.
384. And the pine? It is splendid splitting timber. I think they send pine to Newcastle sometimes. It is used for lining and ceiling boards.
385. Is it in much demand? When trade is brisk. Everything is dull just now.
386. What do you get per 100 feet for pine now? Eleven shillings at the mill in the rough, and 13s. 6d. tongued, and grooved, and planed.
387. It pays you to send it away? I do not send any myself. It pays those alongside the railway.
388. Is there much pine in the district? Any amount. It is getting cut out. There have been three mills in Narrabri for seven or eight years. There are three mills here now. A good many million logs have been cut up. We have not to go beyond 10 or 12 miles.
389. I believe there is a forest which extends for 90 or 100 miles out west? Yes.
390. Where does the ironbark come from which we saw on the railway line this morning? It comes from 8 or 9 miles away from the railway, on the south side of the Namoi.
391. Do you mean the Pilliga Forest? It runs down to Pilliga, I believe, and it runs right up to Boggabri. It is splendid ironbark. I do not think it could be surpassed.
- 392.

Mr.
T. Morath.
20 Nov., 1893.

392. Where do the sleepers come from for the railway? Mostly from there.
393. Where does that timber go? The sleepers are sent all over the country by the Commissioners.
394. That timber is for the use of the Railway Commissioners? Yes.
395. *Mr. Dawson.*] The white ants do not eat this native pine; No. It is a very valuable timber for building. I have pulled down buildings which had been up for twenty years; but I could see no sign of the white ant or of any decay. It is quite different timber from the Richmond pine or Baltic deal. It is a little harder to work.
396. *Mr. Davies.*] Do you know where the proposed line crosses the river? I believe it crosses at the pumping-shed.
397. You believe that to be one of the best and easiest crossings for the railway? I think there is only one place where there is a better crossing, and that is about 15 miles up the river. I think that was the proper place to cross the river, in order to keep out of the flooded country; but of course you will never take the railway there now.
398. In what direction is it? It is between here and Boggabri.
399. Has that site ever been examined by the railway surveyors? I cannot say. The railway runs within 2 miles of that place now.
400. The surveyed crossing is the best you know of? Yes.
401. And the railway will avoid all the flooded land? All but 2 miles in the town.
402. Does the railway go through any portion of your land? I cannot say. They have surveyed line after line. Some years ago they put some marks in my land. I hope they will not go through my land.
403. Have you not seen some pegs in your property at the present time? I hope they will keep out of my paddock. I make use of my ground, and I do not want to sell any.
404. You were originally a free selector? I was a selector in 1870, but I sold the selection, and bought it back when I returned.
405. Do you cultivate it? I cultivate some ground on this side of the selection.
406. Do you graze sheep? I have my teams to fetch my logs, and I keep some cows.
407. You think the "red" line will be most beneficial to the whole district? I think it will be a much safer route than the other. It is more solid ground.
408. It is very good country? It is good country.
409. *Mr. O'Sullivan.*] How far away is this forest of ironbark at Pilliga? There is a forest running on this side. It keeps a good way back from the river—in places 8 or 10 miles. It runs round from the railway-station to Pilliga.
410. Would a railway to Moree, *via* Gurleigh Point, serve that forest at all;—would it give any considerable traffic to a line at that point? I cannot say, but I should think the Commissioners have derived a good many thousand pounds from the timber traffic between here and Tamworth.
411. Is there likely to be any timber traffic to the north of Moree if this line is constructed? I have been in Queensland, and there is no timber out there fit for a mill. If they want any heavy timber for bridge-work they either have to come here or to Terry-Hie-Hie, about 20 miles to the east of the line.
412. They would have to draw it in 20 miles? To the next station.
413. Would it not pay them better to draw it in from Pilliga and send it up from Narrabri? It is 72 miles from Narrabri.
414. Where does the forest of ironbark begin? I think it begins up near Boggabri; but no matter by which route you take your line, to Moree you will leave that forest.
415. As far as the timber reserves are concerned, you do not gain much by going *via* Gurleigh Point? You gain nothing, because we have a forest nearer.
416. In the event of a timber trade arising in the north, it would be more advantageous to ship the timber at Narrabri than at any point on the Gurleigh Point route? Yes.
417. Is there much demand for pine towards the north? There is a tremendous lot of pine cut and sold.
418. Is it impervious to the white ant? I have had a sawmill for seventeen years, and I have never known the white ant to touch any pine about here.
419. *Chairman.*] Have you any interest in this line at all? No; I have only an allotment in Narrabri West, in Dangar Village, and in the borough. I have no allotment away from the town.
420. You are clearly of opinion that if we were constructing a line from Werris Creek it should cross the Namoi 15 miles higher up? Yes.
421. Is it an exceedingly good crossing at that point? It is very good.
422. It might be worth while to consider the question of taking up the line for 15 miles, and adopting that route? I do not think you could do that.
423. Why not;—could you not use the sleepers and the rails? Yes.
424. If a railway can be constructed above flood-level by crossing the river at a point 15 miles higher up, would it not be far better to take up the line to Narrabri West and put it over on this side? I do not think it would pay.
425. Why? It is too far. You have paid some hundreds of pounds for ground there. That line was built with a view of being extended to Walgett.
426. If that line were not in existence at all, and we were considering the question of constructing a line from Werris Creek to Moree, it would be far better, in your opinion, to cross the river 15 miles higher up? No doubt it would.
427. You are not quite sure whether it would pay the Government to take up the line 15 miles from West Narrabri, and put it on this side? I am sure it would not pay them—there is too much to be taken up.
428. Is it not proposed to go across the river by a more expensive and difficult crossing? I do not think it is much more expensive. I do not know anything about engineering questions. I think that the further you go down the river the more expensive you will find it to bridge the flooded country.
429. I suppose the West Narrabri people would not like the railway to be taken up in order to get a less expensive crossing at a point higher up? I do not know. It does not matter much to me which way it goes.
430. *Mr. McCourt.*] Have you supplied any railway sleepers to the Government? No.
431. At what price are they supplied? At 4s. or 4s. 3d. for squared sleepers. There have been no sleepers sawn here since the railway was built—they are squared with the adze.

- Mr. T. Morath.
20 Nov., 1893.
432. If it is estimated that split sleepers can be obtained at 2s. 6d. each for this line, do you think that they can be got for that price? I do not know what they are getting now. There is ironbark at Killarney, 4 miles out. If they can get enough in that forest they can do it at 2s. 6d. It is the cartage which makes them expensive.
433. You can get sleepers split in the forest for 2s. 6d. each, and delivered at various points along the line? At some places, but not everywhere. You can get them where the line goes through the timber, but not if you have to cut at any distance.
434. As far as Edgeroi station, do you think that sleepers can be supplied at 2s. 6d. each? I think they can get enough without going any distance from the line at 2s. 6d.
435. Split and delivered at that price? At some parts of the line, but not everywhere. Probably they could do it at the price all through.

Mr. James MacNamara, contractor, Narrabri, sworn, and examined:—

- Mr. J. MacNamara.
20 Nov., 1893.
436. *Chairman.*] What is your occupation? I am a contractor. I have been engaged in road-contracting for sixteen years in this district.
437. *Mr. Ewing.*] In your opinion, which is the best route for this railway to go? By the last surveyed route, because it will go through the soundest country, will be the shortest line, and will be nearest to ballast and timber.
438. You heard the evidence of Mr. Morath;—do you believe that there is an unlimited supply of pine? Yes.
439. And that that pine will be required not only for local consumption, but also in Sydney and Newcastle? And out north too. I daresay there will be an immense amount of pine sent out to Moree for building purposes when the line is constructed.
440. There is a fair sale for the pine? A good sale.
441. What is the apple-tree used for? Generally for flooring, ceiling, and making naves for drays and waggons.
442. More for local use? Principally.
443. Do you know anything about the red gum? There is very little red gum here. It is very faulty—it has lots of veins. I had to send down to Singleton for stuff to build culverts with.
444. Where is the ironbark in this district? It is very good. For good ironbark you have to go 20 miles. Between here and Moree there is a very large forest at a place called Terry-Hie-Hie, about 10 miles east of the "red" line. There is a good supply of ironbark, red gum, and slaty gum there.
445. Is not Terry-Hie-Hie more than 10 miles away from the "red" line? I do not think it is.
446. You are speaking of Terry-Hie-Hie forest, and not of the station itself? Yes.
447. What would it take per mile to form and metal road which would carry traffic in any season to Moree? It all depends upon what part of the road it is. If it were within a mile or two of the town it would cost about £1,600 or £2,000 a mile, and further out fully £3,000 a mile, for a good macadamised road, that is a road with 12 inches of metal and drained.
448. You believe that to form, drain, and metal a road that would carry the traffic in any weather from here to Moree, it would average £2,500 a mile? I believe it would average more.
449. The maintenance would be considerable? Yes; I believe a railway would be far cheaper, though I have been out of work myself for the last eight months.
450. You think a railway would be as cheap as a road? Yes.
451. *Mr. Davies.*] Where did you get your material for road-making? For about the town, I got it from the Little Mountain generally, and the gravel I got out of the river.
452. Where would a contractor get his ballast along this proposed line? The nearest point is about a mile and a half from Moree. At a place called the Little Mountain there is an everlasting supply of ballast. It is basaltic rock. There is a very pebbly gravel.
453. For how much per cubic yard could it be raised? In the town, for the metal we got from 8s. to 13s. per cubic yard, according to the distance; and for the gravel, out 5 miles, I have got 7s. per cubic yard. It is of a very hard nature; it has to be blasted.
454. At how much per cubic yard could 2½ inches ballast be placed on this proposed line? At about 7s., if there were a light line running into the ballast-pit.
455. Not for less? No. This stone is of a very hard nature. 5s. per cubic yard is given for breaking 2½-inch metal.
456. The gravel-pit you refer to is north somewhere? It is about 1½ miles away.
457. At what price could river gravel be brought and spread on the proposed railway in lieu of ballast, with the aid of a temporary line? At 2s. 6d.
458. At what price could sleepers be delivered on the line ready for use? It depends upon the class you want.
459. Undressed, half-round, ironbark sleepers? At about 2s. 6d. or 2s. 9d.
460. You know the country well between the terminal points of the line? I have worked in all those creeks—from Hall's Creek to the present station-house.
461. Do you strongly advocate the construction of the "red" line? Yes.
462. Do you prefer the "red" route to any other route that has been surveyed? I do.
463. Do you think a railway can be constructed by this route cheaper than by any previously surveyed route? 100 per cent. less.
464. Do you believe a line along the "red" route will serve the general public and the district better than any other route would? I do. I believe that it will lead to very large settlement of small farmers between Narrabri and Moree, in certain portions of the Nandewar Ranges where I know there is good agricultural land. There are very large pockets of land between the rivers where men of small means could settle down and get a good living.
465. Do you believe that this line would develop settlement and trade? I do; and I believe it would be a great feeder to the present line.
466. *Mr. McCourt.*] Have you any knowledge of railway construction as well as road-making? I have a fair knowledge.
467. If it is proposed to put only 3 inches of metal between the sleepers as a foundation, is that sufficient, in your opinion? I do not think it is sufficient for any line.

468. What do you think would be sufficient? I think that between 5 and 6 inches is the very least ballast that you can put on. You want a little more than the depth of your sleeper, and nothing less.
469. Nothing less than 6 inches would be of any use? No.
470. It is only intended to maintain a speed of 15 miles an hour on this line;—would 3 inches of ballast be sufficient to run a train at that speed? No; suppose you go over a rocky point with 3 inches of ballast, your sleeper would lie on the solid rock, and when you go into an embankment your sleeper would sink on three inches of ballast. It is too little—there is no stay in it.
471. Is there any other place where you can get ballast along the line? Yes; at several points, and cheaper. At the Moree end there is an everlasting supply of gravel which could be supplied cheaper than at this end.
472. You are convinced that 6 inches of ballast would be required on this line? Yes.
473. *Chairman.*] Have you ever had any experience of railway construction? I have. I have travelled on all the lines in this country. I worked a little on this line, and also a little on the Bathurst line.
474. Plate-laying? No; only at formation.
475. As a ganger on the permanent-way? No.
476. What is the usual depth of ballast on the Bathurst line or on this line? I think it is 15 inches.
477. Very heavy loads are run over that depth of ballast at a great rate of speed? Yes.
478. If it is proposed to work this line with light rolling-stock, and to run the trains at a speed of only 15 miles an hour, it will make a considerable difference as regards the depth of the ballast? Yes.
479. You think that if only 3 inches of ballast is to be used it is insufficient? It is not sufficient.
480. Presuming that 3 inches of ballast were put down, and that after running the trains it was found to be too weak, all you expect would be the trouble of raising the line and putting a little more ballast under it? You would want to have more men to maintain the line.
481. What ballast do you think is required on this line? Six inches.
482. Supposing it were run along the travelling stock route, which country you say is of a more spongy nature, what ballast would you require? Fifteen inches.
483. At a speed of only 15 miles an hour with light rolling-stock? Yes.
484. Do you know anything of the country beyond Moree? I have not been more than 7 miles out. I have been as far as Pilliga, on the main line to Walgett.
485. Any trade coming from Walgett? Not as much as used to come.
486. You do not think it is desirable for the purpose of commanding that trade to take the railway by the travelling stock route? I do not think so.
487. You think it is desirable, with the view of fostering agricultural settlement to the east, to bring the line further east instead of west? The more easterly you go the more settlement you will have.
488. Do you think the railway should go by the "red" route? Yes.
489. Have you any interest in the line? I do not own more than an acre of land in the country.
490. What roads are there between Narrabri and Moree running east and west of the line? There is a road called the Little Mountain Road, which junctions 1 mile from Narrabri, and there is the main road to Bingara.
491. What roads are there leading to the proposed stations on the line to the east? None; there is no settlement.
492. What roads are there to the west? The Millie Road and the Boolcarrol Road.
493. The roads which are marked on the plan are only roads on paper? That is all.
494. Is there any other point you desire to bring before the Committee? Nothing more, except that I think the Narrabri station ought to be erected at some point near the cemetery.
495. Would not that be rather far to the east? No. There is a piece of land there belonging to the Government, and it is the nearest point to the post-office, and to the principal buildings in the town.
496. Is not your portion of an acre out that way? It is.
497. Where is the site you speak of? It is between the racecourse and the cemetery.
498. That would be virtually going past Narrabri for the purpose of running back to it? It would be about on the junction of Doyle and Lloyd Streets. The post-office and town-hall are not more than about 30 chains from where I propose the station should be built.
499. You propose to bring the line on this side of the racecourse? Yes.
500. Are you aware that the line, as proposed, goes at the back of the racecourse? Yes.
501. You propose not only to alter the position of the station-house, but also the direction of the line so as to bring it to the west of the racecourse? Yes. There is a very high portion of ground on the west of the proposed line—that is, through the old show-ground. It is right along the top street of the surveyed township of Narrabri, and stops at a point on the other side of the cemetery bridge, mostly parallel with Doyle-street and Lloyd-street.
502. Are you aware that there is only about a difference of a foot between the levels of which you are speaking and the paddock immediately adjoining Maitland Road? It is never known to be flooded.
503. Would it not mean the resumption of more land to go through the town rather than by the side of it? I suppose it would.

TUESDAY, 21 NOVEMBER, 1893.

[The Sectional Committee met at the Court-house, Narrabri, at 10 a.m.]

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.

The Hon. JOHN DAVIES, C.M.G.

THOMAS THOMSON EWING, Esq.

WILLIAM McCOURT, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

HENRY DAWSON, Esq.

The Sectional Committee further considered the proposed railway from Narrabri to Moree.

Mr. Denis Roche, freeholder, Narrabri, sworn, and examined:—

504. *Chairman.*] What is your occupation? I am a freeholder, living on my means.

505. *Mr. Dawson.*] How long have you lived here? Over thirty years.

506. What occupation have you followed?—I was in the police force.

Mr. J.
MacNamara.

20 Nov., 1893.

Mr.
D. Roche.

507. 21 Nov., 1893.

Mr.
D. Roche.
21 Nov., 1893.

507. Then I suppose you know the district well? As well as any other man in the district, I think.
508. You know the travelling stock reserve from Narrabri to Moree, and also the "red" or direct route from Narrabri to Moree;—which route do you think would be the better one to adopt for the proposed railway? A route as near the mountains as possible.
509. Why do you think that route would be the best? It would open up better country—better agricultural country—than would a line by the other route. There is no agricultural country on the other route. All that place could grow crops, and there would be a market for the produce. It would open up country to a great extent.
510. Do you know of your own knowledge whether the country is open for selection under the ranges? I believe it is.
- 510½. From your practical knowledge of the district, and an experience of over thirty years, do you think that people here would take up land along that route, if they had facilities for carriage? I do; and from the other side of the range too.
511. How many families do you think could be settled on that land, that is within a reasonable distance of market on the other side of the line? Perhaps 100. On Bullawah Creek and Eulah Creek there are seventy selectors.
512. Knowing these different routes, do you know any other reason why the "red" line should be constructed? I know it will be by far the cheapest line. I have experienced floods in this district.
513. Would it be a drier or a wetter line than the other line? It would be much drier. For about 18 to 20 miles there is nothing but water, where a horse could not travel in a wet season.
514. I suppose that is the road generally used? Yes—going to Moree.
515. You cannot well travel by the other road? No.
516. It has been known here as the dry road? Yes.
517. Have you been much about Moree during your time? A good deal.
518. Do you know much about Warialda? I was stationed out there. I know every station in the district. I had to collect the electoral rolls and returns.
519. Would the "red" line be better for the Warialda people and the people north of Moree? Yes.
520. In what way? It is a good growing country.
521. Is the country about Warialda likely to be improved or settled upon more, if the railway goes to Moree? Part of it.
522. Not near the township? It is barren country round the township of Warialda.
523. But as regards the other side, would it create more settlement? I think it would. It is good growing country from Boggabilla.
524. You think it would be better for the people to have as little freight to pay for as possible? Yes; they send a great deal of wool from those stations which are further back.
525. Supposing a railway were made from Glen Innes to Inverell, would not that take a lot of the traffic which you think would come this way? I do not think it would take a great deal.
526. A certain portion of the traffic would go to Inverell? Very little. Traffic would come by this way from the following stations: Reedy Creek, Gragien, Gullengutter, Graman, Arthurseat, Wallangra, Gournama, Bogamildi, Coolatai, Trigamon, Yetman, Tuccato, Gunyer, Warildi, Yallaroi, Tooloona, Coppymurrumbil.
527. Do you think there is any land on the ranges which will grow wheat or cereals of any sort? I do.
528. Have you known wheat to grow about there? There is only one settler close to the line, and he has perhaps the nicest farm in this part of the country.
529. Do you think that many other farms like that would be established there? It am sure there would.
530. Do you think the "red" line will be the best line for getting timber and ballast? It will be much cheaper. You will want a lot of ballast for the other line.
531. Why? Because the country is so wet. I think you would have to raise that line 3 feet for over 20 miles.
532. Is there very good timber on this line? Yes.
533. Do you think there will be any increase in the timber trade? I am sure there will. They have to cart that timber to Moree; in wet weather it is very difficult and expensive.
534. You think that if this line is constructed there will be an increase in the timber traffic? There will.
535. Is there good timber along the line? There is good pine not 2 miles away from the line, and the ironbark might be a little further away.
536. Do you know where this line is to cross the river—at what they call the Rocky Crossing? Yes.
537. There was a very big flood there a great many years ago? Yes.
538. Were you here then? I was at Wee Waa, but I was here in very big floods.
539. You have seen the marks of the big flood which occurred before you were here? Yes.
540. Do you think the "red" line would have to be raised to any great extent to avoid the flood;—do you think there will be any danger of the line being washed away? I think it is as high a place as I know of.
541. You do not anticipate any difficulty of that kind there at all? No.
542. You feel certain that if it is constructed it will get a great deal of the wool and produce of Warialda which is not brought to Narrabri now? Yes.
543. Where does it go to now? I think a lot of it goes to Tamworth.
544. Does any go to Inverell? I do not think so. Inverell is 42 miles from Warialda, and there is no consumption for it.
545. Do you know any of the stations which send their wool to Tamworth, and get their stores sent by that road? I do not know of any.
546. How many bales of wool which now go to Tamworth would come to Moree, if the line were constructed from Narrabri to Moree? A great many bales.
547. Five thousand bales? I think so. There are very big stations out that way.
548. Have you any idea of what the tonnage in goods would be? No.
549. The big stations do use something, if they do not require many people? The large stations on the McIntyre employ a good many people.
550. *Mr. Davies.*] Were you in the police force during the whole of your residence here? I was, until I was superannuated.
551. You have not gone in for selecting? No.
552. Have you traversed the whole of the proposed line? I have not.

Mr.
D. Roche.
21 Nov., 1893.

553. But you know the country through which it goes? I have been through the whole of that country; I have been camped out there.
554. Do you think a line could be constructed more cheaply by the "red" route than by the travelling stock route? I do.
555. What difficulties would there be on the travelling stock route? In a wet season the river has backed as far as 14 miles.
556. There are several creeks to cross on the "red" line? Yes; but dry creeks.
557. Are you aware that the travelling stock route would be much longer than the "red" line? Yes.
558. About 10 miles longer? Yes.
559. Would a railway by the travelling stock route go through more settlement than the proposed direct line? I think so.
560. The "red" line would pass through several stations? Yes.
561. A line by the travelling stock route would go through several settled districts—Millie and several other districts? Yes.
562. Is there not a larger population in those districts than there is along the "red" line? Yes.
563. More selections? Yes.
564. More freeholders? Yes.
565. Still you say the country through which the "red" line goes has already a settled population? Yes.
566. Is it anything like equal to the population along the travelling stock route? I think there is more on the travelling stock route.
567. Do you know the population of Millie? The town consists of only two houses—a public-house and another house.
568. How many free selectors are there? A good many.
569. Would the "red" line which you seem to advocate serve the people at Millie? It would.
570. As well as if they went by the travelling stock route? I think so.
571. Quite as well? Yes.
572. Not so near to them? Not so near.
573. How far do you think the station at Woolabrar would be? I suppose it would be about 8 miles away.
574. You think that the residents of that portion of the district would suffer no inconvenience if the railway is constructed by the "red" route which is depicted on the plan? I do.
575. The greater portion of the land through which the "red" line will run is good agricultural land, fit for settlement? Yes.
576. Do you think that the "red" line, if constructed, would increase the settlement and the productions of the district? It would very much.
577. Consequently it would increase the traffic of the railway to Narrabri? Yes.
578. As one of the oldest residents of this district, you strongly advocate the construction of this line? Yes.
579. *Mr. O'Sullivan.*] Is it not a fact that there is a very much larger population on the Gurleigh Point route than on the direct route? At one or two points on the Gurleigh Point route.
580. Where are those points? Close to Gurleigh Point. Between Gurleigh Point and Millie there are two selections.
581. According to yonder map the portions tinted blue are occupied by selectors, therefore it must be evident that there is a larger number of selectors on the Gurleigh Point route than on the direct route? There is. I am well aware of that.
582. Then the direct line would not at first serve as large a population as a line along the Gurleigh Point route? Not at present; but in the course of a few years it would.
583. Your evidence is given more in the prospective sense than in the present sense? Yes; I think that all the land which is available has been taken up on that route.
584. Do you think the agricultural land you speak of will be speedily occupied when the leasehold areas are thrown open? I do.
585. In the event of the leasehold areas being thrown open, will there be a larger population on the direct route than on the Gurleigh Point route? Double, I should think.
586. Is there any truth in the statement that the land you refer to as agricultural land is so heavily timbered and scrubbed as to be too costly to be worked by a selector? No.
587. What kind of country is it? It is good loamy country. Of course the mountains you cannot work, but in the creeks and gullies it is all good growing land.
588. You think that, notwithstanding the timber and scrub, it will be readily settled on when the leases are thrown open? I am sure it will.
589. From what you know of this district, would it cost more to maintain a railway on the Gurleigh Point route than on the direct route? It would cost a great deal more to maintain a line on the Gurleigh Point route.
590. Why do you think so? From the lay of the country.
591. Is that route more liable to floods than the direct route? By far. I do not see how the other route will be flooded. The Gurleigh Point route will be flooded for about 18 or 20 miles. I have known the river to back there as far as 14 miles.
592. Is Gurleigh Point the bottom of the basin? I do not know.
593. Is it the lowest land on the watershed? It is as low as any.
594. Therefore, being the lowest land, the water collects there and floods the country? Yes.
595. Would not the Gurleigh Point route serve the western side very much better than the proposed direct route? It would.
596. Does not a large amount of the traffic which comes to Narrabri from the western side come from Collarendabri and other places to the west? Yes.
597. If the Gurleigh Point route were adopted it would be nearer to that traffic? It would, but a great deal of traffic comes down the other road; nearly as much as comes by Wee Waa.
598. Does more traffic come from Moree direct than from Collarendabri and the west side? I do not know that there is much difference in the traffic.
599. On the whole, I gather from your evidence that you prefer the direct route? Yes.
600. *Chairman.*] Have you any land on that route? No.
601. Any land in the town of Narrabri? Yes.

- Mr. D. Roche.
21 Nov., 1893.
602. Do you know where it is proposed to build the station at Narrabri? No.
603. Where is your land situated? In different parts of the town—at both ends and also in the centre.
604. You cannot tell us anything about the crossing between Narrabri West and Narrabri? No.
605. Have you ever been out to Walgett? Yes, often.
606. Is the country between Millie and Walgett all of the same character? It is.
607. It is very much liable to be flooded? Yes.
608. As you get to the east you get on to higher land? Yes.
609. You spoke of one settler on this agricultural land;—how far would he be from the "red" line? I do not suppose he would be 2 miles away.
610. Does the line run as near the foot of the hill as that? I think so.
611. You know exactly where the line goes? I have an idea. I have not travelled over the route, but I know the country well.
612. Is it not a fact that just about Millie, or below Millie, there is a large population settled on the creeks? I am not aware that there is. There are some selections and two stations close to Millie.
613. Of late years, I suppose you have not travelled much about the district? Not for four or five years

Mr. Edward Prosper Huxley, butcher, Narrabri, sworn, and examined:—

- Mr. E. P. Huxley.
21 Nov., 1893.
614. *Chairman.*] What is your occupation? I am a butcher at present, carrying on business in Narrabri.
615. How long have you been engaged in that business? On and off about twenty-two years.
616. In Narrabri all that time? I have resided here twenty-three years continuously. It is thirty-three years since I first came here.
617. Does your business require you to go into the surrounding districts? I know all the country pretty well.
618. You are familiar with each railway project that is depicted on the plan? I know all the country which is traversed by the "green" and "blue" lines.
619. Which project do you think is the best one to adopt in the interests of the country? I would prefer the travelling stock route myself, because there are very many more residents on that route than on the other route at the present time.
620. Whereabouts along the travelling stock route? All the way along the route about Ten-mile Creek, Boggy Creek, Millie Hollow Creek, and Bumble Creek.
621. Evidently those people are not afraid of being washed out? I do not think so.
622. Is it not a fact that the travelling stock route is very much better than the "red" route? There is no doubt it is. It is very much lower, but the nearer you go to the river the lower the land gets.
623. But for the sake of serving more people you think it would be preferable to adopt that route? At present.
624. There are more residents there at the present time? No doubt, when the runs are thrown open, there will be a good deal of settlement on the "red" line.
625. And also to the east? Yes; because the land is probably taken up on the travelling stock route now.
626. If we are looking to the future we will adopt the "red" line? Yes. I should be in favour of that.
627. Do you know anything of the country about Wee Waa? Yes, well.
628. Is there much settlement there? There is a good deal about Wee Waa.
629. You see the survey known as the Gurlough Point survey? I know all the line well.
630. That line would be very much more convenient for the Wee Waa people? It would suit the Wee Waa people right enough.
631. You think the trade, present or prospective, of Wee Waa is sufficient to warrant a deviation of 12 or 15 miles? I do not think so.
632. You think Wee Waa is out of the running? I do.
633. Do you think the present and prospective population in and about Millie would warrant a deviation in that direction of some 10 miles? It would get a good deal of the traffic which comes through Millie.
634. Do you think that a good deal of the traffic which comes in from the Barwon through Millie would come to the proposed railway at Woolabrar, instead of going to Narrabri? Yes.
635. It would serve that? Yes.
636. What is the distance from Millie to Narrabri? Forty-two miles.
637. You think that they would intercept the railway at Woolabrar? Yes.
638. You think the people would prefer to go 14 miles to 40 miles? Rather—on those plains.
639. So that this line would be a benefit to all the trade going through Millie? Yes.
640. They would not have much to complain of, after all? I do not think so.
641. Is there much settlement to the east of the "red" line? Not a great deal. On Bowman's Creek and over that way there are a good few selections.
642. Do you know anything of the country or trade beyond Moree? Pretty well. I know the country right out to the Queensland Border, and beyond that.
643. Supposing a line is constructed to Moree, how far to the north would it draw trade? I think it would draw trade all the way from the Barwon, Goondiwindi, and St. George's Bridge.
644. You think it would command the trade within that area, and far beyond that? Oh, yes.
645. Is any trade coming from St. George to Moree and Narrabri now? Yes, nearly all the way. Fisher and Company's station, Booramine, is only 70 miles from St. George's Bridge.
646. How does it come—*via* Millie? It all depends on the weather. Some carriers have their favourite roads.
647. In wet weather they head up the creeks? Yes. Others go round by Collarendabri. They go by whichever way they fancy is the best for the time.
648. You do not think the designer of this map has drawn upon his imagination too much as regards the area of the trade to be drawn by this railway? I do not think he has.
649. Do you know anything about the crossing between Narrabri West and Narrabri? Yes.
650. As a local resident, do you think that is about the best crossing which can be obtained? Yes, by far.
651. Can you give us any idea as to why the surveyors never hit upon this particular crossing against your door before? A lot of the surveys have been a ridiculous waste of time, I reckon.

Mr.
E. P. Huxley,
21 Nov., 1893.

652. Did you know of this particular point—did you ever think it was an excellent crossing before? I always did, because I owned property where it crossed the Namoi River at one time.
653. Did you ever put your views before the surveyors? I did not interfere in any way.
654. Was it because you were afraid that you would be charged with having a personal interest in the matter? Not in the slightest. I never interfered at all.
655. You believe the point they have chosen for crossing the river from Narrabri is the best which can be found up or down the river for some distance? It is by far the best. It has high land on either side.
656. Is it before the rocky crossing a few miles higher up the river? Very much. There is a lot of flooded land on this side of Rocky Crossing.
657. You would only have one crossing? Yes; but I think the expense of a bridge would be quite as much as in this case.
658. During your residence, have you ever known a flood which would detrimentally affect this particular crossing? No. The 1864 flood was very high. It was over all the land. It was some feet deep in the town.
659. After the water gets as wide as that there is not much rush? It is steady then, it just spreads.
660. Supposing the line were being made from Werris Creek to Moree *via* Narrabri, I suppose it would cross the Namoi at a point very much higher up than the proposed point? Yes. It would go through better country too.
661. More up towards Boggabri? Crossing by the Rock.
662. Do you think it would be well to take up all the line between about Boggabri and Narrabri West, in order to cross at that point? No.
663. Have you any interest over at Narrabri West? Not the slightest. Some of my customers live over there.
664. You have an interest? Slightly. I have an interest in both places as far as my business is concerned.
665. You condemn that line as really a waste? It should never have been taken there in the first place.
666. Now that it is there, you would not like to deprive these people of it? Well, it has to go on sometime or other, and when it goes on it should go through Narrabri.
667. Do you think it is at all likely that the railway will ever go on to Walgett from Narrabri West? I do not think so. I do not think it should.
668. Was there any Narrabri West before that railway was opened? Yes, only one house. I built the first house over there.
669. Owing to the terminus of the railway being fixed there a township has grown up as a rival to Narrabri? Yes.
670. If it has been ascertained that there is a considerable trade from Wee Waa, Pilliga, and places in that direction, which would be served by the Gurligh Point line, and it is decided to take the railway in that direction, will that detrimentally affect Narrabri proper? Very much; I think it would ruin the town.
671. I suppose it will not increase the town very much by taking the line on to Moree? No; it will do the town harm whichever way it goes. But it will do the town very much more harm by going *via* Gurligh Point.
672. You think Narrabri will be snuffed out when the train goes on to Moree? No; there will not be the work and business for so many people. Some people will have to move on, or settle on the land.
673. Instead of Narrabri being the terminus, it will be a station on the line? The town will not go back as much as that. It will lose a bit for a time, but once the runs are thrown open, and people take up the land, the town will right itself again.
674. As regards the "red" route and the travelling stock route, do you think that one route is more expensive than the other? I do not think there would be a great deal of difference in the nature of the country. Of course the land on the travelling stock route is a bit lower. You would have a number of creeks to bridge.
675. Do not the creeks break out into a great number of branches on the travelling stock route? Not until they get below the travelling stock route; then they begin to spread out.
676. Every mile you go to the east you decrease these difficulties? Yes; you get on to higher land, because all these creeks lead from the mountains.
677. Therefore your opinion is that in the interests of both the trade north of Moree, and the future settlement on the route, and to the east, it would be better, perhaps, to adopt the "red" route? I think so.
678. Although at present there is slightly more population on the travelling stock route? Yes; of course once the runs are thrown open, there will be a great deal of settlement along that line.
679. Where does the fat stock come from which are trucked here for Sydney? Principally off the plains.
680. What do you term "the plains"? All the way from here to Moree, Pian Creek, and down that way.
681. Does much fat stock come from north of Moree? A good deal from between there and the Barwon.
682. They would be trucked at the nearest station? Yes.
683. You are aware that this railway, if constructed, is to be subject to what is known as the betterment principle, if such principle is enacted? No; I did not know it was to be constructed on that principle. I heard some talk about the matter.
684. Do you think that if those persons who are agitating for the construction of this line, and who are embraced within the betterment area which is depicted on that plan, were thoroughly seized of that fact, they would be as anxious as they are that it should be constructed? I do not know that they are anxious to get their pockets touched at all.
685. Speaking as a citizen of this country, do you not think that people whose pockets are benefited by the construction of a national work ought to bear some direct proportion of the cost? There is no doubt about a railway increasing the value of a property through which it goes, and being a convenience in every way.
686. And as long as there was a fair placing of the burden on those who deserve to bear it, you think that no one has a right to complain? No; as long as there is not too much for the people to bear.
687. If the question of determining the contribution to be paid by each person is left to the Land Court, do you think that that would be the best and most satisfactory way of arriving at a settlement? I think it would.

- Mr. E. P. Huxley.
21 Nov., 1893.
688. The Land Boards and Land Courts are giving general satisfaction throughout the country? I think so, generally. Some of them may make mistakes.
689. But you think the Land Court would be the best tribunal for determining the contribution to be paid by each landowner? Yes; so long as there was proper evidence obtained.
690. I suppose the people in and about Narrabri would hardly think it fair that they should be taxed for the construction of this railway? Not about the town, I think, because the railway is pretty convenient for the town at the present time. It is not likely that they would want to pay any more.
691. Still property adjoining the proposed station at Narrabri proper would be increased in value? It would increase the value of land in Narrabri pretty well I should think.
692. Do you know anything of a forest on this route? Yes; you do not get into much forest until you get out to Eckford's Scrub, towards the Gurleigh Point line.
693. How far is it off the "red" line? I think a portion of the "red" line goes through or near the scrub.
694. What is the nature of the forest? It consists of different kinds of timber—rosewood, belar, box, pine, ironbark, but belar principally.
695. That would not be good for sleepers? No.
696. Is there any timber of a marketable character there? Further back, on Bowman's Creek, there is any amount of ironbark.
697. Is it likely to give a trade to the railway? Yes; there is plenty of pine and ironbark.
698. *Mr. Suttor.*] Have you any idea of the cost of the "red" line? No.
699. It is to cost £153,000;—do you know what the cost of a line by the travelling stock would be? A few thousand more I should think.
700. How many thousands? I should say £2,000 or £3,000 more.
701. Twenty thousand pounds or £30,000 more? I should not think it would take that much.
702. The proposed line is intended to be a light pioneer line? I should not think it would cost anything like that, because there would be only the extra distance to consider.
703. What would that be? I could not tell.
704. Twenty miles longer? Looking at the map, I think it must be 20 miles.
705. The railway by the "red" route is estimated to cost £2,500 a mile, and if the travelling stock route is 20 miles longer than the "red" route the expense of the work would be increased by £50,000, would it not? That is a lot of money. I do not think it is necessary to spend that much.
706. Are you quite satisfied now that the "red" line would be the cheapest? By far the cheapest.
707. *Mr. Davies.*] If the railway is extended from Narrabri to Moree, as proposed, will it be the means of developing any additional trade? I think it will bring a lot of the Queensland border traffic which does not come here at all.
708. To what extent? I could not say, but I should think a good deal.
709. A large proportion of that traffic? Yes.
710. In the shape of stock and wool? Yes, and passengers.
711. It would greatly increase the traffic on the present railway? I am sure it would.
712. Would a railway by the "red" route increase the settlement in that direction? Yes, when the land is available for selection. It is all good land except in odd places.
713. What is it taken up for principally? There is some agricultural land, but it is taken up principally for grazing.
714. Is there much land under cultivation on that route? No, next to nothing close to the line. It is more back under the mountains, over towards the creeks.
715. How far back? Twenty miles.
716. Would those people be served by the line? That would be the nearest place for them.
717. How far from a railway do you regard as a convenience to a selector? I should think from 15 to 20 or 30 miles.
718. You think that the produce of the district within a radius of 30 miles will find its way to the railway? Certainly.
719. Further than that? I think it is very convenient to have a railway within 30 miles of your door in the bush.
720. If a line is constructed to Moree, what distance do you think wool and stock will be brought to Moree station? From Goondiwindi, about 90 miles.
721. Stock and wool? Yes. They travel here now from that station with their wool and stock.
722. That is to say, they travel 60 miles more than they would have to travel with a railway? Yes.
723. It may be inferred that a very large additional trade will be developed at that end? Very large.
724. A large proportion of the Queensland traffic will find its way in by way of Moree and Narrabri to Newcastle or Sydney? Yes.
725. There is no doubt in your mind as to the great advantages the district will derive from this railway? Very great.
726. From a national standpoint, it will be a great advantage to the district, as well as to the country? Yes.
727. You regard the line as a very cheap one? I do not think it is a dear line at all. It is level country all the way from here to Moree. All you have to contend with are the little creeks, and these are very narrow.
728. And dry? Except in wet weather; but the water runs down in a few hours.
729. What description of ballast would be available for the construction and maintenance of this line? About 19 miles from here there is a splendid lot of blue-metal, at a place called the Bald Hill.
730. Close to the surveyed line? Four or 5 miles away.
731. Is there any quantity of this blue-metal? Yes, and at Boggy Creek too.
732. Within easy access of the line? Yes.
733. Any number of trees for sleepers? I think they would probably have to come out of the mountains, and on the other side of the river.
734. At both ends of the line? In these mountains there is any amount of timber fit for sleepers.
735. What influence would a railway from Narrabri to Moree have on the town of Narrabri? No doubt it would hurt the town a little for a time, but it would recover its position.
736. It would improve the town very much eventually? I think so.

Mr.
E. P. Huxley.
21 Nov., 1893.

737. It would bring a lot of settlement to this place? Yes.
738. And develop a much larger trade? Yes, after a time.
739. The town would permanently recover itself? Yes.
740. You have no misgivings about recommending the adoption of the "red" line? No.
741. You strongly favour the construction of the "red" line as speedily as possible? Yes.
742. *Mr. O'Sullivan.*] Have you ever heard of any flocks of sheep or herds of cattle being stopped on the travelling stock route by floods? Not cattle. Sheep may be stopped—they are very easily stopped in flood-time.
743. Does this frequently happen? No.
744. Is the mail-coach ever stopped there by the floods? No; not of late years, since the bridges have been put over the creeks. Of course the coach is behind time for a couple of days sometimes, but that is on account of the heavy state of the road.
745. You refer to the stock route to Millie? Yes.
746. This morning the coach was four hours late—was that owing to the rain last night? I suppose it was owing to heavy rain, but not to flood.
747. Does that frequently happen? Yes.
748. Supposing a line were constructed by Gurleigh Point or the travelling stock route, would it benefit the people of Wee Waa? Of course the Gurleigh Point route would bring the train within 5 miles of Wee Waa.
749. Would it be likely to start a rival town at the turn in the route? There is not the slightest doubt that it would.
750. Would that be beneficial or detrimental to Wee Waa? Detrimental. Unless it can be taken right into the town, the people of Wee Waa are better without the railway, I should think.
751. You appear to be very favourable to the construction of a railway by any route? No; I do not care whether it goes or stays.
752. You are not against the proposal? No; because I believe it will do good to the people of Narrabri after a time, and to the people on ahead.
753. Is there not a feeling abroad amongst your people that it will injure the town of Narrabri? I, as a business man, think that it will make the town dull for a time, but I believe it will recover itself after the district is properly settled.
754. Why did you keep this good thing so long in the dark? I did not keep it. It was welcome to go whenever it liked, as far as I was concerned.
755. *Mr. Ewing.*] How far is St. George over the Border? It is 90 miles from Mungindi.
756. How far is it from the nearest Queensland railway station? It is 120 miles from St. George to Yulibar.
757. The nearest Queensland railway station is 120 miles from the New South Wales border? Yes.
758. You think this railway might tap the traffic 80 miles beyond the Queensland border? Yes.
759. Geographically, you think this is the right place for the line to go? I think so.
760. Will the border taxation affect the line? I could not say. It all depends upon what duty they impose. If the duty is very heavy it cannot come this way.
761. If it were allowed to go the way it should go, it would come here? Yes.
762. You believe the railway should go by the travelling stock route, but ought to cross above the town? Yes.
763. Your idea of the best route is to cross the river above the town, go to the north of the town, turn west, and then go by the travelling stock route? Yes.
764. You stated that the railway ought not to go from Narrabri West to Walgett;—why not? On the other side of the river, for 60 miles, all the country is very inferior.
765. There would be no local traffic by the railway? No.
766. It is not good enough, from your point of view, to take it that way? No; they have water communication to Walgett.
767. Does the Walgett wool come this way? Yes.
768. Sometimes? It always does, except when the river is up, and then it goes by steamers.
769. In your opinion, the legitimate get-away from the Walgett country is by the river? Yes; a power of wool goes that way by steamer.
770. If there were a railway to Walgett, and the river were locked so that the steamers could get to Walgett, it would get away down the river? It would all go down the river, because water carriage is much cheaper than railway carriage.
771. The right way to develop that country is to keep the river permanently navigable, if possible, to Walgett? Yes; if you do that, they would have any amount of accommodation without the train.
772. Do you regard that as a difficult matter? Some parts of the Barwon are bad, except when the river is over the banks, but below Brewarrina it is right enough.
773. The Walgett people would not be helped very much by the navigation to Brewarrina? No; they can go to Brewarrina quite easily.
774. *Mr. Dawson.*] Is it or is it not a fact that a lot of the land which is depicted in blue colour on the map as selected land, has gone back into the hands of the squatters? There is no doubt that the majority of it has. I know every settler on the line.
775. On the travelling stock route there is not so much land held by conditional purchase as this map would lead a person to believe? No; there is nothing like that much. All the settlement out that way is along the travelling stock route and to the north of it.
776. But a great deal of the land has reverted to the original holder? Yes.
777. *Chairman.*] Have you any interest in any land in or about the district? Not at present.
778. Only in and about the town? That is all.
779. Is there anything else that you desire to say? No; I think I have been pretty well exhausted.

Mr. James Thomas Ward, senior, farmer, Eulah Creek, sworn, and examined:—

780. *Chairman.*] What is your occupation? I am a farmer at Eulah Creek, about 16 miles to the east.
781. *Mr. Suttor.*] Can you give any information about the cattle-stations in this part of the country? I have been fifty-two years in this district. I was on Gundemaine for thirteen years.

Mr. J. T.
Ward, sen.
782.
21 Nov., 1893.

- Mr. J. T. Ward, sen.
21 Nov., 1893.
782. What is the character of the country about Gundemaine? It is the next station to Narrabri. It formerly belonged to Mr. Lloyd. It is grazing country.
783. Is it fit for anything else but grazing? No. There might be odd places where you could grow a good bit of stuff if it were a good season.
784. What is it carrying now? It is carrying both sheep and cattle.
785. How many? I do not know. We used to have 25,000 cattle on it in my time.
786. Of course it has increased very much since you were there? Yes. It is chiefly taken up by selectors now.
787. Do you know any other cattle or sheep stations in the neighbourhood? Yes; Gurley and Millie, and all these places.
788. What do they run on Gurley now? The cattle used to run back from Gundemaine and Galathera to Gurley, and we had to go out there to collect them.
789. I suppose you have no personal knowledge of what the stations carry? No. In fact, in those days there were very few sheep, except on Gurley. There were no sheep on Gundemaine; it was a cattle-station.
790. Mr. O'Sullivan.] Do you know anything about the floods which occasionally occur here? I think I should remember them, for I have been washed away twice at the Broadwater.
791. Where is that? It is up at Turrava. It was formed into a township afterwards.
792. In what direction from the "red" line? It is 15 miles up the river—towards Gunnedah.
793. Can you tell us anything about the floods in the district that is likely to be served by the proposed railway? I droved for Mr. Lloyd for thirteen years, and we never could work the bights on the river from Gundemaine to Tulladunna, when I used to gather cattle while it was in a flooded state.
794. In your opinion, what portion of the country is most devastated by the floods? I think this side of the river is the worst side—from Gundemaine down to Tulladunna.
795. I am talking of the country which runs parallel with the proposed railway, say, for example, the Gurleigh Point route or the travelling stock route;—is that portion of the country more subject to floods than the portion to the east of the line? I do not know where the railway runs. I do not understand the map on the wall.
796. One line is proposed to go along the travelling stock route;—is that portion of the country subject to floods? I have never been along there.
797. Do you know much about the country at all between Narrabri and Moree? Yes, a bit. I have been over it.
798. Which lines have you travelled? From here to Millie, and from there to Moree along the main road.
799. You know the old coach-road well? That is the road I have been used to travel.
800. Is that road liable to floods? No, not particularly—only in very wet weather from Boggy Creek and Ten-mile Creek.
801. You have two roads from Narrabri to Moree—a dry-weather road and a wet-weather road? That is since my time of travelling.
802. You have not travelled those two roads? Not that I know of.
803. Mr. Dawson.] Supposing a railway were to go through Edgeroi, Woolabrar, and Gurley Stations, and right up on the rising ground near the Nandewar Range;—would that be a good route to take? I think it would be beneficial to the population in the future.
804. Do you think that a line going through Edgeroi, Woolabrar, Gurley, and Tycannah would be a good line? I am certain it would be for the population to come, for farming purposes.
805. There is very good land there? Yes; I suppose there is no better in the world.
806. Is that land open for selection? I think so. I do not think it is much populated.
807. There are a lot of reserves on those runs? I do not know.
808. Of the three lines—through Edgeroi, by the old main road, or round by Gurleigh Point—which line do you think would be the best? Through Edgeroi, certainly.
809. You know these three routes pretty well? Yes; I have been all over them.
810. Do you know anything about Warialda and the country on the other side of Moree? Not particularly.

Mr. William Murray Borthwick, grazier, Boggy Creek, sworn, and examined:—

- Mr. W. M. Borthwick.
21 Nov., 1893.
811. Chairman.] What is your occupation? I am a grazier, residing at Boggy Creek.
812. Mr. Davies.] How long have you resided there? Four years.
813. What is the size of your holding? Two thousand five hundred acres.
814. What number of sheep do you run? My brother, sister, and mother have selected that area, and we run together about 10,000 sheep.
815. What road do you take to Narrabri? We follow the travelling stock route to Galathera, and turn off there. It is just opposite Edgeroi, on the travelling stock route.
816. How far would it be from Edgeroi? It is 4 miles to Galathera.
817. How far would your holding be from the proposed station? I should think it would be about 15 miles.
818. What distance is it by the road from your holding to Narrabri? About 25 miles.
819. So that a railway by the "red" route would mean a saving of 10 miles haulage to you? Yes.
820. It would shorten the distance by 10 miles? Yes.
821. Which of these three surveys do you think would be the best to adopt in the public interest, and in the interest of this district? I think the travelling stock route would serve more people.
822. At the present time? At any time, I think.
823. Supposing it were constructed by the travelling stock route, is the settlement likely to increase very largely? I think so. The country to the west of the travelling stock route is as good as anything to the east, and there is land that will be open for selection directly the leases are thrown open.
824. Would not that apply also to the "red" line? Yes, it would; but then, of course, the country near the "red" line is very much smaller in area.
825. Is it not better country? Certainly not.
826. Is it not drier country? I do not think so. It is exactly the same kind of country as along the travelling stock route.
827. Would it be easier and cheaper to construct a line by the "red" route than by the travelling stock route? I do not think so; they are equally dry, as far as I know. 828.

Mr. W. M.
Borthwick.
21 Nov., 1893.

828. Which is the drier line? Of course, the "red" line is the drier. There is a general slope from there to Walgett on to the river—the water falls that way. The stock route, being a little further west, would be lower, but it would not make any difference in the construction of the line. The ground would be just as good for that purpose. There are creeks and things to carry the water off.
829. Supposing the Engineer-in-Chief for Railways estimates that a line by the travelling stock route will cost £500 a mile more than a line by the "red" route, do you think it would be wise, in the public interest, to spend £500 a mile more? I think it would.
830. You prefer to spend £500 a mile more on that route rather than go along the "red" route? I do, because it would not only serve more people, but would catch a lot of the traffic which comes in from Boggy Creek and Millie to Narrabri West.
831. Would not the traffic of Millie find its way across to Woolabrar? Some of it might, but the line will miss a great deal. Anything west of Millie it will miss.
832. How far is it from Millie to Woolabrar? About 20 miles.
833. Did you hear a witness swear this morning that it is only 8 miles? I did.
834. Who is correct? I think I am.
835. You know the locality better? I think so; I live there.
836. It is not 14 miles? I do not think so.
837. Have you travelled from Millie to Woolabrar? Not directly, but I know the country and the line. I have been to Dobikin, and I know the position from there. I think it would be within a few miles of twenty.
838. Do you know the length of the proposed line? I should think it is about 63 miles.
839. It is 62 miles. Do you know the distance by the travelling stock route? Yes. The distance *via* Ironbarks would be 74 or 75 miles, but I think the line by the travelling stock route does not go by Ironbarks; it cuts off the corner, which would make the distance considerably less.
840. It is about 72 miles? Yes; by road.
841. Do you think it would be wise to spend the sum necessary to construct 10 additional miles of railway along that route, so as to serve the settlers already residing on the travelling stock route? I think it would.
842. To pay an extra £500 for the construction of that line? Yes; I think it will save the erection of a line from here to Collarenebri hereafter.
843. I gather that you are in favour of the proposed line by the travelling stock route? Yes.
844. Even if it costs £500 a mile more than the "red" line? Yes.
845. Because there is a more settled population along the travelling stock route than along the red line? Yes.
846. You are not taking into account the large settlement which must take place along the direct line, if the leases are thrown open for settlement? I am taking that into consideration.
847. Would the people in your district—Millie, and all the surrounding country through which the railway will pass—even if it be constructed by the travelling stock route, be prepared to contribute their proportion of the cost on the betterment principle? Yes; if it benefits them.
848. That is to say, if the railway is constructed within easy access of their holdings, the property-owners in the district would be prepared to pay their proportion of the cost on the betterment principle? They would.
849. You are aware that that is one of the conditions on which the line is to be constructed? Yes.
850. With a full knowledge of that condition, you are here to give evidence that if a line were constructed by the travelling stock route, they would all be fully prepared to pay their proportion of the cost extending over a great number of years? I believe they would.
851. *Mr. McCourt.*] Is there any cultivation in your neighbourhood? None at all.
852. Is the land suitable for cultivation? I think it is. It only wants water. In a good season you can grow wheat there just as well as anywhere else. I have seen it growing in the gardens in small patches.
853. If it were found hereafter that wheat would pay better than sheep, you could grow wheat? I would.
854. I suppose the good season you refer to would be a dry season for wheat? Not particularly. We want plenty of rain in certain seasons for wheat.
855. What is the annual rainfall? I think the average rainfall is about 25 inches.
856. That rainfall would be suitable for wheat-growing? I think it would. If we had the water the ground is right enough. It might want irrigation.
857. Do you think that in the future there is any possibility of wheat-growing being gone into largely in this locality if a railway is constructed? I think there is.
858. *Mr. Ewing.*] You live at Boggy Creek, and if a line is brought by Millie it will suit you better? Yes.
859. You say it will just do the amount of injury to a man to the east that it does good to a man to the west? Yes.
860. You say also that the Moree people will have to pay more freight? Yes, and I think they have a right to pay that.
861. And notwithstanding that the whole of the Moree people and the people to the east will pay a larger freight you think that the railway should go by Millie? I do.
862. *Mr. Dawson.*] How far are you off the railway line now? About 25 miles from Narrabri.
863. How much nearer will you be if it goes by Millie? About 20 miles.
864. How far would you be off if it went by the "red" line? It is about 15 miles from the house to the line. Our land would front the travelling stock route.
865. If it goes by the travelling stock route you would be 4 miles off, but if it goes by the "red" route, how far would you be off? Between 12 and 15 miles, I suppose.
866. Do you not think a man is well served who is within that distance of a railway? Yes; provided that it suits the rest of the district too.
867. Where would you join the railway? At Edgeroi station.
868. You would save about 10 miles of carriage? Yes; but I would have to send my stock to Narrabri just the same. There is no water there, no accommodation, no reserves.
869. Those things are made after the railway is constructed;—the straight route would suit you better than any other settler on the west? It would.
870. *Chairman.*] Your place at Boggy Creek is some distance from Millie? It is 10 or 12 miles.

Mr. W. M.
Borthwick.
21 Nov., 1893.

871. I think you stated that the distance from Millie to Woolabrar station would be 20 miles? I think it is.
872. If the Department states that Woolabrar station would be within 13 miles of the Millie people at the outside, will you put your view of the distance against theirs? Certainly not. I say as far as I know it is 20 miles.
873. Do you not think the Millie people will be fairly well served if they are brought within 13 miles of a railway station? The people in the immediate vicinity may be, but most of the settlement is to the west of Millie.
874. Where do the people west of Millie strike the travelling stock route? At Boggy Creek.
875. Do they come through Millie to do that? A great many of them do.
876. In other words, coming from the west of Millie, they go to Millie and travel the old coach-road south until it joins the travelling stock route at Boggy Creek? The people north-west and north of Millie do.
877. You see a road or travelling stock route marked on that map from Woolabrar station to the travelling stock route;—is that road in existence? I do not know.
878. Do you think that if that road were available it would be a very good cut-across to the railway for the Millie people, and the trade beyond Millie? I do not think so. It would serve Millie itself well enough, but it would not serve the settlers to the west.
879. I presume it would due west? I do not think so.
880. The people next to Millie all come by Boolcarrol, along the Namoi, with their stuff? They come in at Ironbarks.
881. Do they come in at Boggy Creek? No—on the main road to Ironbark, which is 5 miles down the river from Narrabri.
882. They would still go that boggy road? I think they would.
883. How far would they have to go to travel to Narrabri by this Ironbarks road? Different distances. I suppose the nearest to Millie might have to go 30 miles, or perhaps 35 miles.
884. In what direction from Millie is that? Due west.
885. Would they come to Millie? They would come in by Boolcarrol and Ironbarks, I think.
886. Do you not think they would aim for the nearest railway station at Woolabrar? I do not know. They have the roads they have been using for years. If they take their stuff to the nearest railway station they would have to pay some freight, and the freight by dray is as cheap as the freight by rail.
887. You think that instead of going to the expense of putting in a connection with Woolabrar, it should be done away with? Yes—except for the people immediately around.
888. You say that while you would use Edgeroi station to carry your produce, you would drive your cattle in by road to Narrabri? I would, because there would be no accommodation for them at Edgeroi—no water or reserve for them.
889. Unless these facilities are given on this road, it would be far better for you to travel the road to Narrabri West? Yes.
890. Could not these facilities be given? I do not know.
891. *Mr. O'Sullivan.*] What is the average size of the selections out your way? From 2,500 to 5,000 and 10,000 acres.
892. No selector can hold 10,000 acres? No.
893. You mean a "family" selection like your own? Yes.
894. I am talking of a single holding? About 2,500 acres.
895. Have all the selectors got the maximum area? Most of them have.
896. Are there many of that class around Millie? A great many.
897. And to the west of Millie? There must be 100 or more.
898. How far out would the 100 go to the west? I can give you the names of the stations if you like.
899. Do they go along the Moomin River and out towards Collarendabri? Yes.
900. Where do they go for their stores—to Wee Waa or Narrabri? I daresay a good many go to Wee Waa.
901. Any stores at Millie? There is a store, but not much of a store.
902. You think that settlement is likely to be permanent? Yes.
903. Have you heard of many selling out to the large landholders? No.
904. Is Millie the point which stock from the west strike when they are making for Narrabri? Yes, from some parts of the west. They come by that road when there is any uncertainty about crossing the river by the lower road.
905. Which road do you term "lower road"? There is the upper road from Collarendabri, which goes north and turns away west into Millie. There is the lower road, which comes from the south-east of Collarendabri towards Narrabri. The south-east road is at times avoided, because of the uncertainty of crossing the river. Whenever that happens, stock from Collarendabri generally take the upper road and strike Millie.
906. I suppose they do that because there is no other road for them to go by? Yes.
907. Have you heard of very much stock travelling that way? I cannot say very much about that.
908. When the leasehold areas are thrown open, two years hence, on the south side, through which the direct route passes, do you think that that land will be selected by men of your own stamp? I am sure it will.
909. Is it not possible that you will have 100 or 200 selectors to the east? The land will all be taken up; but there is not as large an area for them to take up as there is on the west.
910. There is a larger area of Crown lands on the east than there is on the west side? I do not think so.
911. When these Crown lands are thrown open, will you not have a large population along the "red" route as well as along the Millie route? The land will be taken up wherever it is open; but I do not think there is sufficient area for them to take. The area between the route and the mountains is limited, and the mountainous country is useless.
912. Why? Because it is all scrub. You can scarcely ride over that part.
913. We have evidence to the effect that it is splendid country, fit for agriculture, and not heavily timbered or scrubbed? It is all scrub, except a few holes or gullies between the mountains.
914. Have you been through the country to the east of the proposed line? Yes.

915. In your opinion it is not at all suitable for production? Decidedly not, except that portion between the line and the mountains.
916. How do you account for this contradictory evidence which has been given? I do not know. Of course, the country at the foot of the mountains is good enough—as good as any in the Colony.
917. I am not speaking of the country in the mountains, but of the country between the railway and the mountains? That is good country, but the distance is very short from the railway to the mountains.
918. About 10 or 15 miles? Yes.
919. There are 10 or 15 miles of country on that side compared with 150 or 200 miles of country on the other side? But a great deal of the country on the left-hand side is already settled.
920. But there seems to be very little Crown land left on one side within 20 miles of the line? That seems to be a good reason why it should be served with a railway.
921. You think the line should be taken where the existing population is? As near as possible to them without doing an injustice to Moree.
922. Can you state the population within a radius of 10 miles of Millie? I could not.
923. How many settlers are there around Millie? I think, within a radius of 20 or 30 miles of Millie, there are over 100 selections.
924. Millie itself consists of only two houses? That is all.
925. So that we cannot take the town of Millie into account? No.

Mr. W. M.
Borthwick

21 Nov., 1893.

Mr. George Burney, journalist, Narrabri, sworn, and examined:—

926. *Chairman.*] What is your occupation? I am a journalist.
927. Have you resided in the district long? About twenty years.
928. *Mr. O'Sullivan.*] What reasons do you advance for the construction of the direct route in preference to any other route? The direct route is not only the shortest route, but from my knowledge of the place I believe it will be likely to benefit the greater number of people. In the next place, it will entail less burden upon the taxpayers to have the shorter route. I believe it should be the policy of the Government to have as short a route as possible, so as to lessen the taxation, if the railways are to be constructed for the benefit of the people.
929. You look at the subject from a national point of view? From that point of view I condemn railway construction.
930. Is it not a fact that the Gurleigh Point route would serve a larger population? I do not think it is a fact. A larger population would be settled in the mountain range, which, although scrubby, is nevertheless beautiful soil, which would grow any crop.
931. What effect would a line from Narrabri West, *via* Gurleigh Point, have on the town of Narrabri? It would be ruinous, first to Narrabri and Narrabri West, and secondly to Wee Waa. It would be an everlasting injury to the people of this place to take the railway by Gurleigh Point. I cannot understand that idea at all. I believe it emanated from a gentleman who is living in the district, and who influenced Mr. Jones.
932. You do not approve of Mr. Jones's report in favour of the Gurleigh Point route? No; there was a public meeting called to protest against that report.
933. Would not the Gurleigh Point route serve the country to the west, from which you derive a large portion of your traffic, much better than the direct route? I do not think we get such a very large quantity of traffic from that westerly direction. I think the biggest portion of our traffic comes from the other direction—from Millie and that direction.
934. Do you not derive a considerable amount of your business from the Collarendabri district? I do not think we do to any great extent. We certainly get it, but we do not get as much as we should get otherwise.
935. Supposing that you get a third of your business from that neighbourhood, could that be set off against the advantages of the direct route? I do not think so. I believe the direct route is the best and the cheapest.
936. I presume that in making that statement you are sweeping aside all consideration of the future? That is the point I am considering. I believe a railway ought to be constructed right through from one end of Australia to the other—right through to Adelaide.
937. If the line goes on to Goondiwindi, you think it will be wrong to load that traffic with 13 miles additional tonnage, owing to the adoption of the Gurleigh Point route? I think it would be an everlasting injustice to make the people out there pay higher rates. We have to pay high enough rates as it is.
938. You have been settled here for some time? About twenty years.
939. You have seen a rush for settlement take place? I have seen too great of a rush unfortunately for the district. As that map plainly points out, the greatest portion of the land that was taken up was afterwards resold to people who have the whole country at their command. The land tinted blue is principally in the hands of stations who employed men as dummies to take it up.
940. Do you think a rush for selection will take place in the country which is uncoloured on the map, when the leases are thrown open? There is not the slightest doubt but that people will take up land wherever it is available. I know that people are anxiously awaiting for land to be thrown open. But it is to be hoped that the Government will devise some means of preventing them from making the same use of it as they have made in the past—from taking up land and selling it.
941. Have you heard of any inquiries for land in that direction? Yes; from any number of people. There is not an acre which would not be taken up to-morrow, if it were open.
942. The probabilities are that by the time the railway is constructed, if it should go by the direct route, there will be a population already settled there? I do not know that there will be a population settled there straight away. I know very well that people have the idea that the railway is going to make so much settlement. I do not believe that a railway has any tendency to make settlement. I believe it has a tendency to bring people's goods a little cheaper.
943. I suppose you prefer macadamised roads to railways? I suppose they would have a greater tendency towards settlement. The betterment principle should be applied to make people pay for roads to these places instead of railways.

Mr.
G. Burney.

21 Nov., 1893

- Mr. G. Burney. 944. You heard the evidence of the gentleman from Millie, who stated that there are 100 selectors in the neighbourhood? There might have been that number at one time.
- 21 Nov., 1893. 945. Are there not 100 selectors there now? I do not believe there are 100 selectors in any part of the district.
946. How long is it since you were at Millie? It is a good while ago.
947. Have you heard of many selling out? Why, Mr. Mulcahy sold out his selection the other day, and he is now living in the town. He had a big selection out there. He could not find a bit of land which would suit him, and he would be glad to get his selection back now for a little more than he sold it for.
948. Do you think that within a reasonable period, when the leasehold areas are thrown open, there will be as many men settled along the main "red" route as there will be along the Millie route? I am quite satisfied that there will be more. Wherever land is available the people will have it. I consider there is more land available on this side than on the other.
949. Mr. McCourt.] You are in favour of the shortest and most direct route to Moree? Yes.
950. Is not the "blue" line depicted on that map shorter than the "red" line? If it is the shortest line, by all means have it.
951. It would not go into Narrabri? I do not see what is to prevent it from going into Narrabri, although it may be the shortest.
952. At any rate, you would be in favour of the "blue" line? The "blue" line. I am in favour of running a line as direct as possible to a place; as straight as a die if it can be made.
-
- Mr. John Healey, bushman, Narrabri, sworn, and examined:—
- Mr. J. Healey. 953. Chairman.] What is your occupation? I am a bushman.
- 21 Nov., 1893. 954. How long have you resided in the district? Twelve months.
955. Mr. McCourt.] What have you been engaged in? In splitting and squaring sleepers, principally for the railways.
956. At what price have they been supplied? The Commissioners paid 4s. 4d. a sleeper for the contract for 25,000 sleepers that we had.
957. That is for squared, adzed sleepers? For dressed sleepers, delivered on the railways.
958. At what price would you split similar sleepers without being adzed? The timber would not split into a practical piece which would do to lay under the rails.
959. Therefore you could not get split sleepers in the rough? No; I could not promise them at any price. The Engineer-in-Chief wants two flat sides.
960. If the Engineer-in-Chief reckons that he can get sufficient split sleepers of the size required at 2s. 6d. each, you think he will not be able to get them at that price? I think they will cost just as much as the ordinary dressed sleepers.
961. You could not get these sleepers at 2s. 6d. each? No. The cartage of the sleepers would make up the difference in the price. It would necessarily drive the men another 30 miles out into the bush.
962. Why? The timber is getting cut close to stations. The carting is getting longer, and more must be paid on it.
963. Where do you get the timber now? Close to the railway line.
964. You would have to go further out to get the sleepers for this line? Yes. For the 25,000 we cut last year we had to go out 24 miles.
965. Is there not a good deal of work in squaring the sleepers? There is—a good deal of work.
966. Does it not cause more work to get squared sleepers than to deliver split sleepers in the rough? I have never seen any split sleepers used, except a few.
967. Have you had much experience in bush-work? About twenty years.
968. In this district? Not exactly.
969. Have you never seen split timbers put in the railways or tramways? I have seen them used in New Zealand, but they were thrown away again. They were only 7 feet long there. They abandoned the idea there.
970. You think that if it is estimated to get split sleepers at 2s. 6d. each for this railway, they cannot be supplied at that price? I do not know; they might be supplied.
971. Could they be so supplied, in your opinion as a bushman? In my opinion they would not.
972. How much more would they cost? In my opinion they would cost 3s.
973. Mr. Ewing.] You are being paid 4s. 4d. by the Commissioners to deliver squared sleepers at Narrabri station? Yes.
974. How do you make up that amount—part for carriage and part for work? About one-half for carriage.
975. Therefore 2s. 2d. goes for the carriage;—if the sleepers were cut close to Narrabri station you could supply them at 2s. 2d.? If they were close to the station.
976. Do you know the country where this line is going? I have made special inquiries to find out if there is any timber on the line fit for public works. I have never been over the country myself.
977. Do you know anything of the country? I hear that there is no timber on the country fit for public works.
978. Will you swear that? I cannot.
979. Supposing that there is timber along the line the sleepers will be supplied there at 2s. 2d., will they not? They will be supplied at the stump at that price.
980. So that your statement that they will have to pay 3s. right through for sleepers will not come out quite correct? I have no doubt they will be supplied here at the stump for 2s. 2d.
981. You base your estimate of the cost of the sleepers partly on carriage? Yes.
982. Therefore if it turns out that on portions of the line there is not much carriage, your estimate of the cost will be wrong? There is no ironbark timber along the line.
983. But if you find out that there is ironbark from people who have been along the line, they may be obtained there for 2s. 2d.? Yes; I think that if the Commissioners will call for separate tenders for the sleepers, apart from the earthworks and all that, they will be able to get them much cheaper than they otherwise would do.

Mr. John Gateley, Chairman, Narrabri West Progress Association, sworn, and examined:—

984. *Chairman.*] You are Chairman of the Narrabri West Progress Association? I am.
985. You, on behalf of your Association, and a number of its members, expressed a desire to be examined? Yes.
986. Are there any other members of the Association besides yourself here to give evidence? No.
987. Do you desire to make a statement? As a body, we are in favour of the direct route. We consider that it is the shortest and cheapest route. It traverses the highest land, and I think it is very likely that it will open settlement.
988. Do you know anything of the proposed crossing over the Namoi? No.
989. How long have you resided at Narrabri? About twelve years in Narrabri West.
990. What is your occupation? I am a storekeeper.
991. Any other reasons that you desire to give? I do not think it will be a benefit to the Narrabri district if the line does go to the north. I consider it will deprive 500 carriers and their families of their livelihood.
992. Will it not mean that they will have to go further north? I do not see where they will have to go.
993. Why? The line is not likely to terminate at Moree, as far as I can hear, but will go on to the border.
994. If the carriers are now employed in carrying from places 100 miles north of Narrabri to Narrabri, and the terminus of the railway is shifted to Moree, 60 miles further north, is it not fair to assume that they will still be able to do 100 miles of travelling? That country is supplied with carriers already.
995. What is? One hundred miles north of Moree there are sufficient carriers to do all the carrying.
996. If we now draw a trade to the railway from 100 miles north of Narrabri, and we extend our railway terminus 60 miles further north, is it not reasonable to suppose that we shall draw a trade from 100 miles north of Moree, and that some carriers will be employed in that way? But there are carriers there now.
997. Do not the people of West Narrabri desire the railway to be extended *via* Gurleigh Point? No.
998. As a storekeeper at Narrabri West, can you state whether there is much trade coming in from the Wee Waa and Pilliga districts? There is a very fair share of trade.
999. What proportion would it bear to the trade coming from Collarendabri—a fourth, a sixth, or a fiftieth part? I could not answer the question, honestly.
1000. Is there anything else that you would like to add? No.

Mr.
J. Gateley.
21 Nov., 1893.

Mr. Ambrose Martin, bushman, Narrabri, sworn, and examined:—

1001. *Chairman.*] What are you? I am a bushman.
1002. How long have you resided in the district? Two years.
1003. Did you hear Mr. Healey give his evidence as to the sleepers? Yes.
1004. Do you concur in the views he expressed? I endorse his views pretty well.
1005. Have you any knowledge of the timber-bearing qualities of the land between here and Moree? No further than Narrabri itself.
1006. You have nothing more to add to what the previous witness said? No; I simply want to endorse his statement about splitting sleepers. Yesterday two witnesses gave evidence that split sleepers could be delivered on the line at 2s. 6d. each; I consider that that statement is ridiculous.
1007. Did you not hear the last witness confirm that evidence? No; I heard him say that they would be squared sleepers.
1008. Have you had any experience of getting half-round split sleepers? In New Zealand; but their sleepers are split out of a different kind of timber.
1009. Is it not practicable to get half-round split sleepers out of this forest near Narrabri? As a practical man, I know it is not.
1010. Supposing that it is possible to run a saw through the timber? It must either be sawn or hewn.
1011. At present you have to get a good lump of a tree to make a squared sleeper? You can get a lot of sleepers out of a lump of a tree.
1012. I suppose if you get a tree about 18 inches in diameter, or even less, and saw it down the middle, it would make two sleepers? Certainly not.
1013. Why? Because they will not be sufficiently wide to come up to the dimensions.
1014. You are thinking of squared sleepers;—if it is proposed to use half-round sleepers, and not to be so particular about the quality of the wood, as you are in regard to squared sleepers, what then? It is impracticable to make a railway with split sleepers out of the timber which is growing in this district.
1015. Have you ever been in Queensland? No; but I know the sleepers split out of Queensland timber.
1016. You are only speaking of ironbark here? There is no other timber here suitable for sleepers.
1017. No blue or red gum? Not in any quantity. Ironbark is the only timber suitable for sleepers.
1018. Have you a contract to split sleepers? No.
1019. What do you think is the lowest price at which sleepers could be delivered on this line, taking into consideration that they are not to be squared, and are not necessarily to be of the very best timber? I daresay about 2s. 6d. each.
1020. Not far off, after all, then? No.

Mr.
A. Martin.
21 Nov., 1893.

WEDNESDAY, 22 NOVEMBER, 1893.

[The Sectional Committee met at the "Royal Mail Hotel," Millie, at 8 p.m.]

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.

The Hon. JOHN DAVIES, C.M.G.

THOMAS THOMSON EWING, Esq.

WILLIAM MCCOURT, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

HENRY DAWSON, Esq.

The Sectional Committee further considered the proposed Railway from Narrabri to Moree.

Mr. James Halse, grazier, and Secretary to the Millie Railway League, sworn, and examined:—

Mr. J. Halse. 1021. *Chairman.*] What is your occupation? I am a grazier, residing at Molton, 8 miles north of Millie.

22 Nov., 1893.

1022. How long have you resided in the district? Since Easter, 1872.

1023. You are the Secretary to the Millie Railway League? Yes.

1024. How long has it existed? About three or four weeks.

1025. It has not contributed to any agitation with reference to a railway heretofore? It contributed towards the agitation when we found that the railway was going in such a way that the place would be completely left out in the cold, and, as it is to be constructed on the betterment principle, we thought we might as well bring forward our views.

1026. Do you think the "red" line would benefit the largest number of people in the country through which it goes? I am sure it will not.

1027. What is your objection to that route? My first objection is, that along that route there are just about three selectors that are benefited. I, as a selector representing a large body of selectors, certainly take a strong objection on that ground. I have a return from eighty-three selectors, which shows that during last year the selectors within 40 miles of Millie trucked 102,119 sheep, using 1,134 trucks, and as the rate for 40 miles, according to the Commissioners, is £1 6s. 8d. per truck, that will give a total of £1,512 for sheep trucked.

1028. You are going on a basis of 40 miles? If the railway goes round by the travelling stock route—by Little Bumble—they would travel 40 miles, otherwise they would go to Narrabri.

1029. Your contention is that if the "red" line is constructed all this traffic which now goes from Millie to Narrabri West, but which would go along the travelling stock route if a railway were constructed by that route, will still go by road to Narrabri West? Yes.

1030. Are you aware that Woolabrar station, on the "red" line, will bring that point of Millie on the travelling stock route within a distance of 10 or 13 miles? Even so, it is only 40 miles from Millie to Narrabri. How far would it be from Woolabrar Station to Narrabri?

1031. About 30 miles? Rather than drove sheep for 18 miles, and then have to pay 30 miles trainage, I should prefer to drove them 40 miles.

1032. As a matter of fact, do not the sheep or cattle which are trucked for the metropolis go to the nearest point on the railway? Not always.

1033. Can you cite a case in point? I could cite a number of cases where they have gone to Boggabri, Breeza, and Gunnedah.

1034. Sheep from this district, instead of being trucked at Narrabri West, have gone on to Boggabri? Yes.

1035. How long ago? Cattle going to Sydney frequently go that way. I have known any number of instances, but I did not consider it worth my while to make a note of them. I believe the majority of the drovers, unless there were very good trucking-yards established at Woolabrar, would prefer to go on to the permanent trucking yards.

1036. Will you resume your statement? A road is proposed from Kerramingly to Woolabrar; but are you aware that it is proposed through dense scrub, which would first have to be cleared?

1037. The Department proposes to give you a road to connect the travelling stock route with the railway station? I am a selector, and unfortunately I know the value of Government promises at times.

1038. It is not likely that the Government would give you a railway without providing a road to the station;—all the sheep you mentioned as going through Millie were not the product of the Millie district? Within 50 miles of where we stand.

1039. Fifty miles west? Generally west.

1040. Do you think that any of those sheep that now go through Millie, if the proposed line were constructed, would go to Gurley station, or any station north of Woolabrar? It entirely depends on the nature of the station, and of the conveniences provided for trucking. If these conveniences are not provided, I think that anyone would prefer to go the other way.

1041. How many of the 102,000 odd sheep that you mentioned came from north of Millie? Probably a few.

1042. What proportion—a third? No; there might have been 15,000.

1043. How many came from the west? I could not state exactly, but a considerable number came.

1044. Roughly speaking, how many? I should say 70,000.

1045. And the balance, consequently, came from the south? Yes.

1046. The district from which the 70,000 would come would be from south-west to north-west? Yes; 10,000 would come from only 9 miles to the south-west.

1047. How far north would those that came from the north come? I think about 10,000 would come from about 8 miles north.

1048. They would not be likely to go to Gurley station, for instance? It would depend entirely on the accommodation. In trucking sheep and cattle, especially wild cattle, we would not go to paltry yards, but to substantial yards.

1049. That would be a very small number compared with the greater number which would come from the west through Millie;—do you think that 10,000 are likely to go to Gurley station? I do not think they would, for this reason, that there is no water there or travelling stock reserve.

1050.

1050. Do you know, fairly well, the country through which the proposed railway runs? I had a good ^{Mr. J. Halse:} experience of the scrub at one time; I was nearly lost in the scrub.
1051. Is it not a fact that the land through which it runs is higher than the land about the travelling ^{22 Nov., 1898:} stock route? Some may be low.
1052. Is it not a fact that the travelling stock route is sometimes impassable, owing to the flooded nature of the country? I have never heard that it is.
1053. Only difficult to travel, but not impassable? I have never heard of the country being impassable. It is very difficult to travel at times.
1054. It is very difficult at times? I have ridden over it at different times, but I have never seen it in that state.
1055. You admit that the country through which the "red" line goes has a slight advantage in being higher than the travelling stock route? In places, I believe it is, but as far as the scrub is concerned it is very soft and spongy there. I would prefer to go through the plain in wet weather.
1056. If it has been asserted that one of the reasons for taking the railway by the "red" route—that is, to the east of the travelling stock route—is that it heads the creeks higher up, and gets away from a number of branches lower down, in your opinion would that be a correct assertion? I do think there would be danger. I have seen these creeks in such a state that they were not perfectly safe.
1057. If the Engineer-in-Chief has sworn before the General Committee that it would cost at least £500 a mile more to make a railway along the travelling stock route, besides the cost of the increased haulage, would you put your opinion against his opinion? Not being an engineer, I cannot give a professional opinion, but I should think that he might make a mistake.
1058. Presuming that the travelling stock route is adopted, do you think that what is known as the Gurleigh Point deviation should also be taken in? That means that the railway at Narrabri West would still remain there.
1059. Presuming that the travelling stock route is taken from Moree, would you propose that a deviation should be made from the travelling stock route with the view of going *via* Gurleigh Point to Narrabri West? I think it would get more revenue.
1060. Do you think it would be preferable to make it in that direction? I could not say that.
1061. Do you know the country on the Gurleigh Point route? Not as well as on the other route.
1062. While you think you may get more revenue, you cannot give a definite opinion? Not to decide on the merits of the two proposals.
1063. Have you ever been far north? I have been as far as Roma, in Queensland.
1064. If it has been contended by some witnesses that if a line is made, irrespective of the direction it goes, between Narrabri and Moree, it will get a considerable portion of the Queensland trade, do you agree with their contention? If it is proposed that the railway to Moree shall go straight-out to Boggabilla, I consider it very unwise.
1065. I am not talking of an extension of the railway from Moree;—I ask if the railway is extended from Narrabri to Moree, irrespective of the course it takes, will it draw trade from Queensland? It may draw some. It is an open question.
1066. You would not like to give an opinion as to whether it would? I believe it would bring a little trade, but I do not think it would bring such a lot.
1067. I think you asserted just now that some of the sheep which come to Narrabri West, come from as far as Mungindi? Below Mungindi—between Mungindi and Collarendabri.
1068. Do you think any sheep from the north-east of Mungindi come down this way? I think they do. The sheep from the north-east generally come down by there. I do not think they come out of Queensland.
1069. If we take the railway 60 miles further north from its present terminus, is it not reasonable to suppose that we shall tap the country further north? Yes. You may tap some country, but I think that by going by another route you would get a lot more, and still get the traffic you speak of.
1070. You mean, to go by the travelling stock route? Yes.
1071. Will it make a material difference? Yes. We have a tremendous traffic, which will never go on the line if it goes by the "red" route.
1072. I am speaking of the northern traffic—that is, the traffic north-west of Mungindi? A line north of Moree will take you up between Kunopia and Boggabilla. The produce you would get from that part of Queensland would not be worth very much to you. It is very barren, scrubby country right through that part.
1073. So that if the paying capabilities of this line have been based upon the probability of getting more trade in that direction, you do not think that those anticipations would be realised? It would bring more trade, certainly.
1074. But if the authorities are depending upon getting that trade to any great extent, you do not think they are warranted in so doing? They certainly would have whatever traffic there was, but of course we do not know what the Government of Queensland may do.
1075. Have you been up there lately? I have been at Kunopia, but not lately. I was there in 1886.
1076. There may have been some alterations there since that year? There may have been, but it is not nice country out there. But coming in from Mungindi a considerable quantity of traffic would come from about Mungindi, but not north.
1077. Have there been any very serious floods during your residence;—have the floods at any time affected Millie? Not to my knowledge.
1078. Have they affected the travelling stock route to any appreciable extent? Not to my knowledge. There are bridges over all the creeks but one.
1079. What other facts do you desire to give the Committee? I wish to refer again to the eighty-three selectors from whom I obtained the returns.
1080. Whereabouts are the selections situated? The selections are within 50 miles of Millie, some to the west and some to the north-west.
1081. On what creeks are they situated? A lot of them are on the Moomin Creek and Thalaba Creek, and then of course on the country back from those creeks.
1082. Has there been any large increase in their number during late years? Yes; they are increasing every day.

- Mr. J. Halse. 1083. Is it likely that a very large area of land will be taken up when the leases in the central division are thrown open? I am sure there will.
- 22 Nov., 1893. 1084. Especially on the banks of the creeks? Yes; between Moomin Creek, the Mehi; and the Thalaba.
1085. Will you continue your statement? Last year these eighty-three selectors shore 4,026 bales of wool, being equal to 718 tons, which, at 15s. 3d., the rate for 40 miles, would amount to £555 9s. The back loading which they received weighed 684 tons, which is equal to a freight of £521 12s. A number of these selectors have no sheep at present, but are going to put some on, and they have no back loading, and a lot of the returns which I received are incomplete. I think the revenue will be much larger next year and in every future year than it has been in the past.
1086. Always supposing that you do not get any droughts? We have to put up with the droughts.
1087. But the railway is always there? From the people who had sheep suffering in the drought-stricken country the Commissioners would derive a larger revenue than they would at any other time. It would be better for the Government and worse for the holders. As regards the large holders, who would be benefited between Millie and Angledool, three times as much traffic, three times as many sheep, and three times as much back loading would be derived from those large holders as would be derived by the railway from the eighty-three selectors.
1088. How far is Angledool from Walgett? I should think it is 100 miles.
1089. Does the Angledool trade come through Millie now? I believe so.
1090. All of it? I believe it would if the railway were taken there. Of course this is a little bit beyond my experience, and a witness who comes from Collarendabri will speak of that part of the country. The total revenue which I estimate would be derived from the eighty-three selectors by the railway would be £2,589 1s.; the revenue which they would get from the large holders in that direction would be £7,767 3s., and the revenue which would be derived from the towns of Angledool, Collarendabri, Mogil Mogil, Meroe, and Mungindi, £2,589 1s., and from passengers and mails, if it goes *via* Kerramingly, £1,000, or a total revenue of £15,945 5s., as against the revenue of £9,915, which is estimated by the Commissioners for the whole line. I am not a surveyor, but I contend that it is only 5 miles 48 chains further round this way.
1091. How do you arrive at that opinion? From a tracing which I obtained from the Survey Office. The additional length of 5 miles 48 chains, at a cost of £3,000 per mile, would involve an outlay of £16,800, and according to the evidence which was given in Sydney it would take £616 2s. 2d. per annum to keep that length in repair. On the "red" route there is no timber suitable for railway purposes to my knowledge.
1092. How do you know that there is no timber there fit for railway construction? I have been over the country.
1093. And as a bushman, you say that there is no timber on that line fit for railway construction? Yes. The timber which would be large enough is belar, but that is of a perishable nature, and could never be used for piles, or anything of that kind. Now, if you take a direct line from Narrabri to Moree, why should you not take a direct line from Narrabri to Collarendabri, and tap all that traffic?
1094. In your opinion, if a railway goes direct from Narrabri to Moree, a railway should go direct from Narrabri to Collarendabri? I believe it would take as much traffic as a railway to Moree.
1095. You would have two railways. Where would you propose to have your Collarendabri junction? At Kerramingly.
1096. Mr. Dawson.] You mean to say that instead of going to Moree you should go to Kerramingly? No; if a line should go direct to Moree a line should go direct to Collarendabri.
1097. Chairman.] Do you not want to put the thing in this way: That if the railway is to go direct from Narrabri to Moree there should be a junction from that line at Kerramingly to Collarendabri? Yes. According to the evidence which was reported in the Sydney papers, if the railway goes from Narrabri to Moree it will beneficially affect 7,000,000 acres. My opinion is that only 2,392,000 acres will be beneficially affected, and that the remaining 4,608,000 acres will be beneficially affected by a railway going more westerly. It will not be worth their while to use the railway. I have spoken not to scores, but to a hundred people at least, and they say that they will not use this railway, but will go through Bulleroi into Narrabri. There is a road through Bulleroi and Boolcarrol.
1098. If this railway is to be built subject to the betterment principle do you consider that the Land Boards and the Land Court will be the best tribunal for deciding to what extent the various lands are benefited? I could not say.
1099. Is it not a fact that the Land Boards and Land Court give general satisfaction in dealing with land questions, such as the fixing of the rents, and so on? I have experienced the reverse, especially when Mr. Copeland was formerly Secretary for Lands. The Land Boards do not always give satisfaction.
1100. Do you know of any other tribunal which would deal more satisfactorily with the application of the betterment principle to these holdings than the Land Boards and the Land Court? I cannot make a comparison, as there are no other tribunals in existence.
1101. If it is proposed that the Land Boards and the Land Court shall fix the various zones for the application of the betterment principle, do you not think that that would be a satisfactory way of determining the contribution of each person to the fund? I could not say how it would act.
1102. If, as you say, only 2,250,000 acres will be benefited by the "red" line, how does your contention pan out that if the railway is brought by the travelling stock route it will exercise an influence on trade 60 or 70 miles to the west? I can only go by what the people themselves say they will do. They say they will go by Bulleroi and Boolcarrol.
1103. Have you not already stated that the trade comes through Millie, towards the nearest point on the railway system—Narrabri from even as far as Mungindi? Most decidedly, when grass is scarce.
1104. Therefore, to some extent, the people of Mungindi have been benefited by the extension of the railway to Narrabri? They have come in by Meroe.
1105. If they have come in from Mungindi to Narrabri West, does not that prove that to some extent they have benefited by the extension of the railway to Narrabri? Yes.
1106. Consequently if they have benefited by the extension to Narrabri, ought not they to be included in the betterment area? I could not say how far the area extends.
1107. If the "red" line is constructed you think that instead of 6,000,000 acres being benefited or brought within the betterment area only 2,000,000 acres will be? Two million five hundred and fifty thousand acres.
1108. Will you resume your statement? I consider that not more than 20,000 fat sheep would be trucked at the stations along the "red" line—that is between Moree and Narrabri—in the course of twelve months.
- 1109.

1109. Have you an estimate of the number that would be trucked at Moree? About 211,555 fat sheep. *Mr. J. Halse.*
I also say that 33,833 bales of wool will be trucked at Narrabri, as before.

1110. Practically it would have no effect on the sheep which are now trucked at Narrabri? Yes; those trucked at Moree and along the line would have a material effect on the number trucked at Narrabri. Six hundred and thirty-four thousand six hundred and sixty-six sheep were trucked at Narrabri last year up to the 30th June. I reckon that not more than 10,000 bales of wool will be trucked at the stations between Narrabri and Moree on the "red" route; that 21,416 bales will be trucked at Moree, and that 33,833 bales will still go to Narrabri from this westerly direction—from round and about Millie, and even a few miles to the north. Sixty-five thousand four hundred and twenty-nine bales of wool were sent from Narrabri West for the year ending 30th June last. There is another important item to consider: From my knowledge of the country there is no water provided for any one who wishes to take his stock to these places. You cannot take sheep in the height of summer to these places and truck them without water. At neither station do I know of any deposit of water. That is one of my reasons for saying that sheep will not go to these stations. I would not take my sheep; in fact it would be cruelty to animals to do so. Now, at Kerramangly there is a Government tank of 12,000 cubic yards, a township marked out, with allotments ready for sale, a Court-house, police barracks, and a large reserve, originally 10,240 acres, but now about 5,000 or 6,000 acres, but nevertheless a valuable reserve for the future. I have been supplied by the selectors with the area of their holdings, the approximate cost of their improvements, the number of their sheep and cattle, the number of bales of wool they shorn, the number of stock they trucked, and the quantity of back loading they received. The first return shows that thirty-one selectors, on a total area of 127,040 acres, have made £37,580 worth of improvements; grazed 115,245 sheep and 1,201 cattle; shorn 1,739 bales of wool; trucked 35,000 sheep last year; and received 257 tons of back loading on the railway. The second return shows that twenty-six selectors, on a total area of 91,100 acres, have made £19,880 worth of improvements; grazed 60,960 sheep and 314 cattle; shorn 738 bales of wool; trucked 32,733 fat sheep; and received back loading to the extent of 141 tons. The third return shows that twenty-six selectors hold a total area of 132,810 acres. As regards the other particulars which I quoted, I may explain that from a number of the selectors included in this return no information has been received. But taking no notice of all the blanks, the return shows that these twenty-six selectors have made £32,258 worth of improvements; grazed 109,830 sheep and 1,576 cattle; produced 1,651 bales of wool; trucked 34,786 sheep; and got a back loading of 286 tons.

1111. Do you think that, in view of the trade to be drawn to this line from the north of Moree, with all these contributing sources, the people to the north should be asked to run 5½ miles more than is necessary for their purpose? If all the lines are to be run straight, probably it may not be right to ask them.

1112. Do you think the trade to the west is of such a volume that it would materially affect the revenue on this line? I am quite sure on that point.

1113. *Mr. Davies.* Would the selectors in whose behalf you prepared these returns be within a radius of 60 miles or 50 miles of this place? They are within 50 miles, principally to the west and south-west.

1114. Which is the nearest section that would be served by the "red" line? There is a selection within 3 miles of this spot, and a lot more at the back.

1115. Would these selections be served best by the "red" line? No; they would not be served by that line. I think that very few, if any, of those I speak of would use that line.

1116. How far would your selection be from the "red" line? About 15 or 16 miles.

1117. What distance from a railway, in your opinion, is a reasonable distance to serve a selector or pastoral tenant? A distance of 15 or 20 miles would serve if there was water for the stock; but if you send teams with wool, or take sheep and cattle, or went for supplies, the railway would be of no earthly benefit without roads, grass, and water.

1118. You do not regard 10 or 15 miles as a reasonable distance for a railway to serve a holding? As far as that is concerned, it is a reasonable limit.

1119. Would not the major portion of the selectors you refer to be served by the "red" line? No. A considerable number of selectors would be nearer a road going straight to Narrabri through Boolcarrol and Nowley.

1120. Which line is that? It is a road or reserve, but they go that way with stock and mails. There is a road running from Narrabri to Bulleroi.

1121. Do you wish to convey to the Committee the impression that the selectors and pastoral tenants within a radius of 25 miles would prefer to go direct to Narrabri, rather than go to a station at Woollabrar or Gurley? A lot of these would use the station if water and other conveniences were provided. It would require to be a good station, but I gather from the reports I have read that the station will be of a very light or trumpery character. The railway will be of no use unless there is abundance of water, not with a stretch of 15 or 20 miles. You cannot drive sheep on a hot day more than 5 miles.

1122. Is not the district through which the "red" line goes;—in fact is not the whole district between here and Moree well watered? I have seen the time when there was not a drop of water in the whole of the creeks. I have seen Big Bumble Creek so dry that you could drive tons across it.

1123. As regards the travelling stock route does not the same difficulty exist? There are Government tanks all along the route of from 12,000 to 20,000 cubic yards each.

1124. Do I understand that your primary objection to the "red" line is that the country is not watered? That is not a primary objection on the part of the whole of these selectors. Some of them are not near the direct route. They would not come up unless the line were nearer this way.

1125. Do I understand you to advocate that a line should be taken by the travelling stock route, although it means the construction of an additional length of 5½ miles at an additional cost, according to the estimate of the Engineer-in-Chief, of £500 a mile? Yes. Under the betterment principle the money will not come out of the pockets of the Government, but out of the pockets of the private individuals whose properties will be served. I contend that if that principle is to apply the line should go along the travelling stock route.

1126. Even if it costs £500 a mile more than the "red" line? Yes, as it will come out of our pockets.

1127. And even if it involves an additional haulage of 5½ miles? Yes: I am advocating the line principally on the ground that we shall have to pay for its cost under the betterment principle. I think that we should have a say in the determination of the route under these circumstances. Another reason

- Mr. J. Halse.** I would urge in favour of this route is that in all the country to the east of the "red" line there is no one to be benefited. At the top of Killarney, Edgeroi, and Gurley there is a dense scrub.
- 22 Nov., 1893. 1128. Would the "red" line go through that? It is not far to the east of that line.
1129. What is the character of the land through which the "red" line will go? For 8 or 10 miles where it goes through the scrub it is valueless.
1130. That is good land? It is good after it is made good.
1131. You admit that it is fairly good land? When it is cleared. It takes a tremendous lot to clear scrub; it is very thick.
1132. Do I understand you to say that the land through which the railway would pass is fairly good agricultural land? Except the scrub land.
1133. That, of course, excepting that it wants to be cleared, is good land? Yes. My contention is that a line by the travelling stock route would settle the country more evenly. There is no country to the east of the "red" line. Nearly all the top end of Gurley is purchased. I do not think that, for love or money, you could get 100 acres there that are not purchased. As regards Edgeroi it is the same.
1134. You also object to the "red" line, because it does not serve the settled portions of the district? Yes.
1135. But if it were taken by the travelling stock route it would serve a larger population? It would.
1136. But if the "red" line is constructed, and the leasehold areas are thrown open, will not a very large settlement be introduced? Yes; but a much larger settlement to the west of the line. To the east of this line there is no land to be thrown open. I do not believe that a full selection will be taken up on Gurley station at any price, not even when it is thrown open.
1137. Do you know what quantity of Crown lands will be available? There are about 215,000 acres on Gurley altogether.
1138. Is that the only Crown land which will be available? I am speaking of the runs through which the railway will go. There will be very little land to be obtained when the runs are thrown open. Gurley, for instance, is nearly all purchased. I do not believe that anyone will get a full selection on that station.
1139. If you had the decision of the question would you dispense with the construction of a line from Narrabri to Moree by the "red" route, if you are not to have a railway by the travelling stock route? It would be scarcely unselfish on my part to say I would not. I do not see why I should be asked that question. I am only speaking for myself.
1140. I want to know your opinion? I would sooner go to Narrabri West with my stock and wool, and for my back loading, than go to the stations you refer to under the circumstances.
1141. So that if the railway is extended by the "red" line, you will not use it? Unless, as I said, there is abundance of water, a place to turn out the teams, and an area thrown open for the stock, I could not use it.
1142. Although it would be within 15 miles of your station? Yes. You cannot work stock without water. There is no water to my knowledge; in fact I have never seen any water in Gehan Creek and Waterloo Creek except in flood time.
1143. Of the eighty-three selectors you referred to, how many would be served within a radius of 15 miles of the "red" line? Of this list of thirty-one selectors I suppose only two.
1144. Within a radius of 15 miles? They are all over 15 miles. There are only two out of this lot who are within 15 miles. I may be wrong, but that is my honest conviction.
1145. What would be the greatest distance of any of them? Fifty miles from Kerramingly.
1146. Where do they send their stock now? To Narrabri. There is a road coming in from Boolcarrol and Bulleroi.
1147. How long does it take them to travel that distance? I could not say. I have never gone through Boolcarrol. It must be further than going to Millie, because they all want the railway to come round by this way.
1148. I should like to know the exact distance? Mr. Hill who lives down there will give the exact distance.
1149. How did you obtain all this information? I sent a circular to each holder asking for certain information, and I compiled this condensed statement from the various returns I received. I have all the returns at hand.
1150. What is the nearest selection out of those in the first return? I suppose about 15 miles.
1151. What is the next? They average from 15 up to 40 or 45 miles, I suppose.
1152. If you had a railway within a distance of from 15 to 40 miles, would not that be a good service? My principal objection is that there is no provision for the stock at the station, and, consequently, that the stock would not go 20 miles to Woolabrar station. I am within 15 miles of the station, and I would not go there under the circumstances.
1153. It is not only a question of railway construction but also a question of water conservation? Yes; there are already tanks provided at suitable distances along the travelling stock route.
1154. Your statistics apply to a radius of 50 miles? No; to a semicircle. I am taking a radius of 50 miles on this side of the circle.
1155. You think that within that zone a railway at a distance of 25 miles would not be a satisfactory service? Not with the absence of water.
1156. No matter how close the railway is constructed? If you can go through in a day and back again—7 or 8 miles. Yes.
1157. Unless the line is constructed by the travelling stock route, you prefer that no railway should be constructed? Unless water is provided, most decidedly.
1158. You do not favour the construction of the "red" line? No.
1159. You would rather dispense with the line if it is to be constructed in that way, unless a supply of water is provided? Because in the estimate, nothing is said about providing water. There is no water at Woolabrar.
1160. *Mr. Suttor.*] What is the character of the scrub on the "red" line? It is thick belar scrub. I have not been up where the line is to go. I do not know whether it is above Dobikin.
1161. *Mr. McCourt.*] What is the size of your holding? Five thousand five hundred acres.
1162. How far is it from the nearest station on the line? I should think about 16 miles.
1163. Supposing you wanted to truck sheep at that station, how long would it take you to go? At 6 miles a day it would take two and a half days.

Mr. J. Halse.
22 Nov., 1893.

1164. And you would have your sheep in Sydney in three days? I would, if I could get them there.
1165. You say you would prefer to go to Narrabri rather than truck your sheep at Woolabrar? I would prefer to go to Narrabri, using the tanks as I go.
1166. How long would it take you to truck sheep at Narrabri? Six days.
1167. As against two and a half days at Woolabrar? Yes.
1168. Is it not a most important thing to get your sheep into Sydney quickly? Not at all times; only to hit a market.
1169. As a rule do you not start your sheep to hit a market? Yes.
1170. Therefore the sooner you get them to Sydney the better? I do not think it makes much difference now when you get them there. Of course three and a half days would be a consideration.
1171. Is it not a most important thing to get your sheep into market in three days as against six days? Yes.
1172. Would you not pay a little extra for that accommodation or go to a little extra trouble? I would, but I would never starve my sheep.
1173. Do you not think that the Commissioners would provide water? They would want a large tank.
1174. Have they not provided tanks along the line anywhere? I am not aware of any. I have never travelled on the New South Wales railways.
1175. Supposing that they did provide a tank for Woolabrar station would you use it? Very likely I would.
1176. As against going to Narrabri? Yes.
1177. Therefore the line could be a benefit to you? If there was a water supply.
1178. In that case the people living out there would not object to be included in the betterment area? Certainly not, if you could make use of the railway.
1179. You say that if there is water you can use the line? Yes; but not all those people I speak of.
1180. You think that a number of the people you refer to would object to be included in the betterment area? If it goes by the route proposed I am sure they would.
1181. *Mr. O'Sullivan.*] How much a yard do you pay for tanks up here? I think the Government paid 1s. 3d. per yard for the tank at Kerramingly.
1182. What size tank would be required at Woolabrar station to serve the sheep traffic there? A tank of 20,000 cubic yards.
1183. One thousand two hundred and fifty pounds would not be a very large outlay to provide you with an absolutely essential supply of water? It would suit me right enough.
1184. So that we would only have to load up the cost of the line with £1,250 to provide the accommodation which you and others require? You would; but another little essential would be required—you would want to throw open an area for the stock to graze upon. I do not know exactly on what run Woolabrar station is situated.
1185. It is on Dobikin;—supposing a good reserve and a tank are provided, it would be an inducement to those who desire to truck their sheep to go to Woolabrar? If it is within a reasonable distance,—yes.
1186. Is the settlement trending out towards Collarendabri, or Moree? I think it is trending out towards Collarendabri—it will do when the runs are thrown open.
1187. Will there not also be land thrown open on the direct route between Moree and Narrabri? But there are no lands there to be thrown open. I do not believe you could get a selection on Gurley if it were thrown open to-morrow.
1188. The uncoloured portions of this map represent Crown lands in the possession of pastoral tenants; about two-thirds of the way up from Narrabri there is a good deal of the map uncoloured? That is exactly the same land that would be served by the travelling stock route too.
1189. One of your contentions is that a great deal of land would be taken up towards the Collarendabri district;—I ask, would not some land be also taken up on the direct route when the leasehold areas are thrown up? Judging by that map there would, but there does not seem to be a very large area of land there.
1190. But still there is room there for a considerable amount of settlement if the railway is constructed? There is.
1191. Do you notice a considerable number of reserves on that map marked green? I see none on Gurley.
1192. Do you see any on Killarney? There are some to the right which I would not like to have.
1193. Do you see any on Edgeroi? I do not see very much on Edgeroi.
1194. Do you see any on Dobikin? Yes; there is a little piece.
1195. You see a large reserve marked green? I think that is scrub. I see a forest reserve—Bekford's Forest reserve is all scrub land.
1196. You say there is very little on Gurley and very little on Tycannah? Yes; according to the map.
1197. But still there is a good deal of uncoloured land to the eastward which would be served by the "red" line? To the eastward is the Cap and Bonnet. All to the east of that is vacant. The top ends of Gurley, Edgeroi, and Killarney are all scrub.
1198. Is not the land to the eastward considered good agricultural land, although there may be scrub in some parts? I could not tell you. There are a few people on these portions who seem to drag out an existence. Whether it is bad agricultural land, or whether it is held by bad agriculturists, I do not know.
1199. Do you think that the construction of a railway near them would induce further agricultural settlement and make it a profitable industry? I do not think so, because they are near enough to Narrabri to make it profitable.
1200. By which route do you want the railway to go? I want the railway to come out round Kerramingly, whether it goes straight along the travelling stock route or round by Gurleigh Point.
1201. You will take it either way? Yes; as far as I am concerned.
1202. Your contention is, that that line would serve a larger population and open up some of the leasehold areas for future settlement? Yes.
1203. You dropped a remark as to the necessity for constructing a branch line to Collarendabri;—supposing a branch line were run out from Woolabrar or Gurley to Collarendabri, would not that serve all the country you spoke of? Yes.

- Mr. J. Halse. 1204. That would achieve the object you have in view? That would do right enough.
- 22 Nov., 1893. 1205. You are well aware that for a long time past there has been an agitation for the construction of a line from Narrabri to Collarendabri in preference to a line to Moree? Yes. There would be a lot of splendid country tapped by that line.
1206. I understand you to say that there are eighty-three selectors within a fair distance of Millie, and that all these selectors will be better served by a railway by the travelling stock route or Gurleigh Point route? They would.
1207. Are all these selectors likely to be permanent? I think so.
1208. Have many sold out lately? Not to my knowledge. They seem to be more inclined to stay. They are often taking up selections as opportunity offers.
1209. They are a fairly well-to-do class? Some of them are very well-to-do.
1210. Holding 2,560 acres each, mostly? Fully that. To give you an idea of the size of the holdings, I will quote the area of the first few holdings in this return: 5,260 acres, 160 acres, 2,560 acres, 2,560 acres, 4,560 acres, and so on up to 12,020 acres.
1211. Are you aware there are two roads from Narrabri to Moree, one called the "dry weather road" and another called the "wet weather road"? Yes.
1212. Why is the expression "dry weather road" used? It is a long time since I have been amongst sand, but as far as my memory serves me the sand bakes hard and forms a good road in wet weather.
1213. You refer to the mountain road to the east of the "red" line? Yes.
1214. Why is the road to the west of that line called the "dry weather road"? It is very hard for vehicles to get across this black soil when it is wet, even over the route by which the railway goes.
1215. The road you refer to goes close to the travelling stock route, and over a portion of it? Yes.
1216. Is that subject to inundation? Not to my knowledge.
1217. Is traffic ever stopped on that road? Not to my knowledge.
1218. Did you ever hear of any flocks of sheep being taken off by the floods? No.
1219. Did you ever hear of the mail coach being kept behind? Just at the back. That would not occur if they went by the stock route—by Kerramingly.
1220. There must be some great impediment on the road in wet weather, otherwise people would not go by the mountain road, which is much longer in wet weather. There are any number of people who, I do not think, ever go by the mountain road. It is only a portion of the people who travel by the mountain road.
1221. Which, in your opinion, would be the more expensive line to construct and maintain, a railway by the dry weather road, or a railway by the direct route? I do not think there would be much difference. For instance, coming along the travelling stock route, although it is black soil all along the plain at Bald Hill and Boggy Creek, there is any amount of ballast at Boggy Creek. There is, I suppose, one of the finest quarries of blue metal to be found in the colonies. If that quarry were utilised it would be just as easy to maintain a railway by the travelling stock route as a railway by the other route, where none of these things exist to my knowledge.
1222. If the Gurleigh Point route were taken out the line would go to Narrabri West, and avoid the town of Narrabri? Yes.
1223. Do you think that if the effect of that was likely to be disastrous to Narrabri, we should be justified in constructing a line which would start from Narrabri West, and possibly serve a few more selectors on that side, in preference to a line by the direct route, which would still serve Narrabri West and Narrabri? I really believe the Narrabri people are to blame that there is a Narrabri West to-day. They got up an immense petition to have the terminus where it is.
1224. Do you think we should be justified in giving the preference to the eighty-three selectors you refer to, with the full knowledge that we should almost destroy the trade of Narrabri, and possibly detrimentally affect Wee Waa? I do not see how it would be detrimental to Wee Waa. It would go 18 miles nearer to that town. This line is within 6 miles of Wee Waa, where it turns round.
1225. Does it not stand to reason that a rival town will spring up at that turning point, to the detriment of Wee Waa? I scarcely think so. I think they have an idea that it would be continued, in the near future, to Walgett. Sixteen miles of that line would be already constructed then.
1226. You are aware that the Government intend to construct a line from Mudgee to Walgett, *via* Coonamble? No.
1227. Mr. Dawson.] You said that there is no road from Millie to Woolabrar or Gurley? I will explain why I said that there is no road to Gurley.
1228. Is there, or is there not, a road? I really cannot say. Within the last month the station people took a team of bullocks out of there, and impounded them for being on the road. I scarcely think that the manager would have taken that course if there was a road.
1229. If the "red" route is adopted and a station is built at Gurley and Woolabrar, will it not be necessary not only for the people of Millie, but also for the people further west, to have a travelling stock route a quarter of a mile wide like the other travelling stock route to each station? A wider travelling stock route would be more beneficial.
1230. But a travelling stock route a quarter of a mile wide would be absolutely necessary? It would.
1231. Otherwise it would be better to go to Narrabri West? Yes.
1232. Because you have the Government stock tanks on the different routes? Yes.
1233. Is the country between Millie and Woolabrar or Gurley watered? Neither Gehan Creek nor Waterloo Creek is watered.
1234. Would it not be necessary for the people here and further west to have not only two travelling stock routes a quarter of a mile wide but also tanks at a distance of 6 miles apart? Yes.
1235. Two tanks on each road? Yes.
1236. In all four tanks would be required? Yes.
1237. What is land worth an acre here? I should think it would be worth a couple of pounds an acre.
1238. Is the land between here and Woolabrar or Gurley alienated, either by selection or conditional lease or freehold? I believe some of it is alienated.
1239. Are you aware that to provide a travelling stock route a quarter of a mile wide for a distance of 13 miles 2,080 acres would be required, and that £4,000 would be required to compensate the owners for the land? Yes.
1240. And four tanks of 20,000 cubic yards each, at a cost of £1,250 each, would mean an expenditure of £5,000? Yes.

1241. Would you be surprised to hear that half-a-dozen men who know this line well—timber-getters and other persons—have stated that one of its advantages is that not only can timber be got cheaper, but that very suitable timber can be got all along the line? I would be awfully surprised, because that is not the fact. There is no suitable timber along the line.
1242. No ironbark? No; not one stick. I have never seen ironbark there.
1243. You are speaking of the land within a reasonable distance on each side? No; all the timber is in the scrub.
1244. Is there no ironbark at all at the foot of the Nandewar Range? I think not; only apple-tree, I think.
1245. You stated that you believe that if the "red" line is constructed the sheep, the cattle, and the wool from about Bulleroi and Boolcarrol will still go to Narrabri West? I believe it will.
1246. How far is Boolcarrol from Narrabri West? It is about 30 miles.
1247. How far is it from Boolcarrol to Millie? About 19 miles by the Black Point.
1248. As a matter of fact Boolcarrol is nearer to Narrabri West than to the nearest part of the line here? Boolcarrol would never come here.
1249. If the line were made to Kerramingly would you get the Boolcarrol wool or stock? I could not say. If it was equi-distant they would scarcely come here.
1250. *Mr. Ewing.*] When do you usually get your rains? In February and March we get our heaviest rains, but generally in February.
1251. When does the wool come in? From August up to Christmas.
1252. Therefore your wool is usually coming in in dry weather? Yes.
1253. You have no doubt on that point? No.
1254. Have you any knowledge that the Government intend to put down artesian bores? I did hear that an artesian bore was likely to be put down somewhere.
1255. Have you any knowledge of the formation of this country;—can you express any opinion as to whether the artesian bores will be a success? No.
1256. Have you been at Angledool? No.
1257. At Collarendabri? No.
1258. At Mungindi? I have been within 20 miles of that place.
1259. Have you been above the Darling? From top to bottom—from Beemery right down below Menindie.
1260. Have you been from Collarendabri down to Brewarrina? No.
1261. Therefore all the evidence you have given about that portion of the country is from hearsay? It is gathered from correspondence which has taken place since this question cropped up.
1262. Do you know that at times the mails have to be carried by horseback round by coach to Narrabri? I know that when there are heavy rains the black soil becomes so sticky that a vehicle cannot go through. But I do not think that since Mr. Chartres has had the contract the mail has been packed fifty times during the last three years.
1263. You believe it has been due to the incompetency of the mail contractor rather than to the roads? I do not say that. I would like to state that all the timber we use for our houses, from my place right down to Narrabri, comes out from Wee Waa and Pilliga. I have just received about 8,200 feet of pine from Wee Waa direct.

Mr
J. Halse.
22 Nov., 1893.

Mr. Alfred Hill, grazier, near Millie, sworn, and examined:—

1264. *Chairman.*] You are a grazier? Yes. I manage Mungyer Station for Mr. Vickery.
1265. *Mr. Ewing.*] Where is the station situated? It is 30 miles west-north-west of Millie.
1266. Do you know the direct route from Moree to Narrabri? Well.
1267. Can any timber suitable for railway sleepers be found on that route? There may be a few trees, but not sufficient, I think, of the proper timber.
1268. Your opinion is, that sufficient timber of a suitable quality will not be found along that route? I am certain there will not. The ironbark is broad-leaved. It is good for fencing, but not for sleepers, as it is hollow. All the sleepers for the line will have to come from the other side of Narrabri.
1269. Up to the present the trend of traffic from the north-west portion of the district has been to Narrabri? Yes.
1270. You recognise that if the railway terminates at Moree, and not at Narrabri, it will have a great effect on that traffic? It will have a great effect on the traffic north of Moree.
1271. At present a man starting from Mungindi for the terminus of the railway is making for Narrabri? Yes.
1272. If the terminus is extended to Moree would Mungindi stuff go to Moree? Undoubtedly.
1273. Would Boggabilla stuff go to Moree? Undoubtedly.
1274. Would Kunopia stuff go to Moree? Undoubtedly.
1275. Everything to the north and north-west of Moree would go to the terminus at Moree? Yes.
1276. Therefore, in the interests of that section of the country, the more direct the route is the better? I presume it would be.
1277. A person coming from Angledool or Collarendabri is making for Narrabri West? Yes.
1278. All the traffic from Mogil Mogil would come by Collarendabri? The produce from Mogil Mogil might come through Millie.
1279. As a rule, it does not? Last season it came through Millie, simply because there had been heavy rains on the usual roads. It has been drier by the Millie road, but, as a rule, it does not come by this way.
1280. From Mungindi down to Mogil Mogil where would that stuff make for? All for Narrabri.
1281. You think Mogil Mogil stuff would come to Narrabri? I am certain it will.
1282. How far is it from Mogil Mogil to Narrabri? It is about 25 miles from Mogil Mogil to Collarendabri, and I think it is about 90 miles from Narrabri to Collarendabri.
1283. It is 115 miles from Mogil Mogil to Narrabri;—how far is it from Mogil Mogil to Millie? From 90 to 100 miles.
1284. Therefore a man from Mogil Mogil to the west making to Moree would pay 90 miles road carriage and 63 miles rail carriage down to Narrabri? They could not very well go to Moree, because there is a river without a bridge.

Mr. A. Hill.
22 Nov., 1893.

- Mr. A. Hill. 1285. The Angledool, Collarendabri, and Mogil Mogil traffic would unite at Collarendabri, and go direct to Narrabri West? Exactly, it would go within 30 miles of Millie.
- 22 Nov., 1893. 1286. That would come through your station? No; it would come within 8 miles of our station.
1287. Would that traffic make for Millie? No; for Narrabri West.
1288. It does not come down the travelling stock route? No; not by Millie as a rule. Last season when the country out that way was flooded a bit and was rather wet the major portion of the traffic came by Millie into Narrabri that way.
1289. Supposing the river were locked, and made navigable as far as Mungindi, where would the traffic go then? Probably to Adelaide.
1290. Always supposing that no tax is imposed on the produce;—geographically it would go to Adelaide? Certainly.
1291. If the river were locked do you believe that all the traffic of the country within 50 miles of the river would trend to the river and go to Adelaide? It would go to Bourke, but the railway and water carriage, together with extra handling, would make the freight tremendous. It would be cheaper to go into Narrabri than to take it down the river to Bourke, and thence by rail to Sydney.
1292. Eventually, if the river is made navigable from Mungindi it will go down the river unless there is something to prevent it from going that way? Yes.
1293. What effect will the extension of the railway to Moree have on the Queensland wool? I do not think it will make a great difference to the Queensland wool. It is bound to make some difference, but not a great difference, because the major portion of the Queensland wool comes in by Collarendabri now. Mind a duty of £2 10s. a ton is levied on wool coming over from Queensland into New South Wales, and I am told that it is likely to be doubled.
1294. Queensland wool which comes through Boggabilla or Kunopia at present to Narrabri would take the train at Moree—the effect of the railway would be simply the effect of the difference between the freight by carrier and the freight by train? Exactly.
1295. Do you believe that the direct route is the right route from Narrabri? Certainly not. It is radically wrong.
1296. Perhaps you will tell us why you think it is? Our station is 30 miles from Millie. This year I sold 30,000 sheep, sent away 1,500 bales of wool, and sold 3,000 cattle. If the railway comes to Millie all that produce would come to Millie, but I would never think of sending it to a station on the "red" line, because I would have to send it 50 miles by road to the station, and then have to pay the extra carriage by rail (40 miles) to Narrabri, making a total distance of 90 miles, whereas the distance from our station to Narrabri direct is 60 miles.
1297. How did you send it this year? Into Narrabri West.
1298. By which road? By Boolcarrol.
1299. All? A portion of it went by Boolcarrol to Gurleigh Point and up the river that way, and a portion went through Millie, but it is an unusual thing to send it by Millie. It is only in an exceptional case that it comes this way. In all other years it has all gone by Boolcarrol and Gurleigh Point.
1300. From Mungyer to Narrabri it is 60 miles; from Mungyer to Millie it is 30 miles; and from Millie to the railway it is—how far? I suppose it is 15 miles. I would have to send my stuff 45 miles from the station to the railway, and 40 miles by train to Narrabri, as against 60 miles by the road from the station to Narrabri West. It would not pay me to do that. It would not be feasible for me to send my stock or produce on to the straight line at all. I would prefer to send it to Narrabri West.
1301. In your opinion, does that also apply to the Angledool, Collarendabri, and Mogil Mogil traffic? Undoubtedly so. I am satisfied that they would not take advantage of the straight line, but would rather send their stock and wool into Narrabri West. But if a railway were constructed from Narrabri as far west as it could be taken, they would all take advantage of it. Within a radius of 50 miles of my place there are at the very least 10,000 bales of wool coming in.
1302. You realise, however, that it would mean a longer carriage for the stuff to the north of Moree? I think they could well afford to pay the larger freight, because the greatest number in this district would reap the benefit of the railway by this route.
1303. You believe the western traffic is more important than the other? Yes; the richest and best-populated portion of the district is the country to the west of Millie.
1304. Of course, the locking of the Darling would alter all that? It would do us no good. It would injure the country to do it.
1305. Have you any knowledge of the formation of this country—is it a cretaceous formation? I think it is doubtful.
1306. Are there any artesian bores in the district? None nearer than between Collarendabri and Angledool.
1307. Is that a success? Yes; but it was a doubtful bore when the Government put it down.
1308. It has been a success though? Yes.
1309. You regard any statement with respect to artesian water as being problematical? Undoubtedly so.
1310. *Mr. O'Sullivan.*] You appear to think that the arguments for the travelling stock route or Gurleigh Point route are very much stronger than the arguments for the direct route? Undoubtedly so, because so large a number of stock and so many more persons would be able to take advantage of the railway.
1311. Do you think a larger trade will be done by that route than by the direct route? Far larger.
1312. As a set-off against that route you would load the cost of taking wool and stores, say to the Queensland border, to which point the line may eventually go, by about 6 miles more carriage on the one side and 13 miles on the other;—do you think the advantages which are offered by the superior district to be served by this route would be counterbalanced by that disadvantage? Yes: from a national point of view I think that the greatest number ought to be served. In my opinion the policy of the Government should be to construct a railway for the convenience of the public and for revenue purposes. I think a railway brought westward in the direction you indicate would serve both these purposes.
1313. It must be palpable that a line by the Gurleigh Point route would very materially affect the welfare of the town of Narrabri? I think that is problematical. I think it is fairly arguable whether it would or not.
1314. Does it not stand to reason that if it starts from Narrabri West, and misses Narrabri, Narrabri will be left out in the cold, and become isolated? I do not think so. The railway must come past Narrabri at some time or other. I think that in constructing the railway the convenience of the public should be studied.

1315. At the same time do you think it is right and proper to take the line in such a way that it may utterly destroy a thriving town, simply to serve a few more people out in the west? But I do not think it will utterly destroy a thriving town. I think it is a very arguable point whether it will affect Narrabri in any form. Mr. A. Hill.
22 Nov., 1893.

1316. Would it not inevitably affect its trade? It might for a time, but it would get back to its proper position. It affected Singleton, Quirindi, and all those towns for a year or two, but they afterwards got back to their proper position. There is good country out to the east of Narrabri, and the Narrabri district would become self-supporting.

1317. Is there not a marked difference between the cases of Singleton and Quirindi, which are both on the railway line, and the case of Narrabri, which will be left 2 miles distant from the line? It would go through Narrabri West.

1318. It might create a town at Narrabri West, but if it did it would be to the detriment of Narrabri proper? I do not know. Two Farmers Unions' sales are held weekly in Narrabri, and the produce comes principally from the east of Narrabri.

1319. I ask you, as an old colonist, whether the general interest of the people would not be better served by the direct route, with a branch in the future, from Woolabrar to Collarendabri, to serve all the district in which you say greater progress is being made, than by this "boomerang" line *via* Gurleigh Point? No: I think that in the interests of the public, and from a national point of view, the proper line to construct is a line *via* Gurleigh Point. After a residence of thirty years in the district, and with a thorough acquaintance with its interests in every respect, that is my honest and firm opinion.

1320. *Chairman.*] Are you familiar with the country on the east of the "red" line? I know it well.

1321. Right up to the ranges? Yes.

1322. What is the nature of that country? It is not very good. It is scrub country generally.

1323. It is higher than the country on the west of the line, and consequently is likely to be drier? There is a greater rush of water at the heads of these creeks than there is down here. It comes down with a great rush, but spreads gradually over the land here. I may say that a larger number of sheep were lost in the vicinity of Gurley in the 1890 flood than about here.

1324. That implies that it would be more easy to bridge the streams where they are confined within the banks than to construct viaducts over a number of miles of flooded country? We cannot call this country, from here to Narrabri, flooded country.

1325. Your remarks seem to imply that there is a great rush of water at the heads of the creeks, but that to the west of the line the water spreads out and loses its velocity? There is such a large area for the water to spread over.

1326. I suppose you believe that the "red" line would be less expensive to construct than a line by the travelling stock route? If the Commissioners for Railways say that it will I will bow to their opinion at once.

1327. Do you think that if the "red" line is constructed, the land to the east will be brought into occupation for agricultural purposes? A portion of it might, but I do not think that any great area will be brought into use.

1328. You think that at the present time, and for all time to come, the land to the west will yield a greater quantity of produce than the land to the east? I am certain it will. It is different country altogether up that way. The richest country we have in the district is to the west of the "red" line.

1329. Do you know from how far north the present trade comes to Narrabri station? It comes from Bulamon station *via* Mungindi.

1330. How far is that into Queensland? About 25 miles.

1331. Taking a line more due north from Moree, how far into Queensland do you draw trade now? I think you only draw trade from one station further north—from Weiltown.

1332. How far is that inside the border? It is about 12 miles. I do not know of any other station further north from which you get a bale of wool.

1333. Suppose we extend the terminus to Moree, which takes the railway system 60 odd miles further north, do you think that we shall push our trade a corresponding distance further into Queensland? The country is all bad, and there is no stock there to push out for.

1334. You think we are drawing to our extreme limit—the Queensland trade? I do; there are only two stations between Mungindi and St. George now. The country on the Queensland side of Goondiwindi is all scrub, useless for sheep and all that sort of thing, and they get within 150 miles from Goondiwindi with their own railway.

1335. The great volume of Queensland trade would come in, *via* Collarendabri? You get a tremendous quantity of Queensland wool by that way, whereas you get a comparatively small quantity by Mungindi and Goondiwindi.

1336. You think that if the railway system is extended it should go in a westerly direction rather than in a northerly direction, towards Collarendabri rather than towards Goondiwindi? I consider that from the nature of the country, and the considerably severe floods that have occurred in that portion of the border country between Moree, and Mungindi, and Goondiwindi, it would be impossible or nearly impossible to put a railway out there. I may say that in 1890 two or three stations adjoining Mungindi lost 200,000 or 300,000 sheep by floods alone.

1337. Do you think that the extension of the railway to Moree is likely to greatly increase the products of our own territory between Moree and the border, or is that country fully developed now? It is fairly fully developed.

1338. Is it capable of very much expansion? If the leases are thrown open I think it is fairly capable of expansion.

1339. To the extent of 100 per cent. more than it is developed? I should say about 50 per cent. would be the greatest expansion which could be expected.

1340. If we are to look to future development in the direction of Collarendabri, and the trade to Queensland is not likely to be increased, and within the border trade is likely to be increased by only 50 per cent., does not that point to the desirability of only extending the line as far as Gurley station or Kerramngly, and branching off with a line towards Collarendabri? No; to my mind it points to quite the opposite thing, because the branch line would be constructed at a right angle to the main line.

1341. If you construct a line to Gurleigh Point, and from Gurleigh Point come within a mile or two of where we stand, you would get all the Waigett traffic, all the Pian Creek traffic, all the Thalaba Creek traffic, and

- Mr. A. Hill. and all the Moomin traffic? I may say that on our stations within the last two years 80,000 acres of land have been alienated, and not one of these selectors would derive a particle of benefit from the "red" line, while they would derive an immense advantage from a line *via* Gurleigh Point.
- 22 Nov., 1893. 1342. If your present contention is correct, then a line should be constructed from Narrabri West, *via* Gurleigh Point, to a point not further north than Millie, and then branch off towards Collareendabri? No; it should branch off from Gurleigh Point.
1343. That would leave Millie out? No; it would go on to Millie and Moree.
1344. Does not Collareendabri lie almost due west from Millie? Yes; about 80 miles west.
1345. Therefore, if you are going to Gurleigh Point, Collareendabri from that point would lie in a north-westerly direction? I think it would. What I propose is a line to go from Narrabri West, *via* Gurleigh Point, and the travelling stock route to Moree, with a future extension from Gurleigh Point to Collareendabri. I think it would be better to take the Collareendabri branch further north to escape the floods on the Barwon. In my opinion, the line from Gurleigh Point ought to come within a few miles of the west of where we are.
1346. Would not that be doing what you said just now was objectionable—would it not be taking the line at a right angle from Kerramingly to Narrabri? No; it would not. It would go from Gurleigh Point to Collareendabri, and not from Millie.
1347. You have been pointing out that the volume of trade now is all west of Millie? Yes.
1348. And that it is towards Collareendabri we ought to look for an increase in the volume of our trade from the Queensland border? Exactly.
1349. If that is so, why should we go any further than Gurleigh Point in this direction—why should we not aim for Collareendabri, *via* Gurleigh Point, from Narrabri West, instead of going up north? I believe there is a difficulty on account of the floods in getting to the Barwon about Collareendabri.
1350. Therefore you propose to go further north with the view of escaping the flooded country? Yes; and by going further north bringing it nearer to Moree and certainly nearer to Millie.
1351. The Moree people would be better served, would they not, if the line were only extended, whether by the travelling stock route or this route, as far as Kerramingly? No; I think it ought to go to Moree.
1352. But if the volume of trade is not from the north, why should we run out that extra 20 or 30 miles of line? This country is unsuitable for making roads, and the cheapest possible road you can provide between here and Moree is a railway. This is one of the largest and best pastoral districts in New South Wales. It has contributed an immense amount to the revenue, and it is really impossible for us to make a road except in the form of a railway.
1353. You do not anticipate that if a railway is made there would be any saving to the State in the way of a decreased subsidy? We have had nothing spent on the roads. If we had had our just due, like some districts have had, it would be a very great saving, but we have had very little money spent on the roads. The mud along the travelling stock route after an inch of rain is so tenacious that it is hardly possible to get along on wheels, while by going up into the mountains there is a large quantity of sand and gravelly country where they can travel.
1354. Are you aware that this district has consumed from £5,000 to £6,000 per annum in connection with its roads? The Liverpool Plains district or the Gwydir district, but not the district of which Millie is the centre. That is a very small sum, however, to spend in comparison with the large area of the district.

THURSDAY, 23 NOVEMBER, 1893.

[The Sectional Committee met at the "Royal Mail Hotel," Millie, at 9 a.m.]

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTON.
The Hon. JOHN DAVIES, C.M.G.
THOMAS THOMSON EWING, Esq.

WILLIAM McCOURT, Esq.
EDWARD WILLIAM O'SULLIVAN, Esq.
HENRY DAWSON, Esq.

The Sectional Committee further considered the proposed Railway from Narrabri to Moree.

Mr. Alfred Hill, grazier, near Millie, sworn, and further examined:—

- Mr. A. Hill. 1355. *Chairman.*] I understand that you desire to amend your evidence? The line I advocate starts from Narrabri West, *via* Gurleigh Point; goes to the westward of Millie $1\frac{1}{2}$ miles, and then goes on to Moree, with possibly, in the future, a branch from Gurleigh Point to Collareendabri. I believe I stated last night that it was 35 miles from Mogil Mogil to Collareendabri. I find that the distance is from 15 to 18 miles.

Mr. Richard Cribb, drover, Millie, sworn, and examined:—

- Mr. R. Cribb. 1356. *Chairman.*] What is your occupation? I am a drover.
- 23 Nov., 1893. 1357. Have you been in the district long? I have been travelling on this side of the country since 1853.
1358. *Mr. Suttor.*] You desire to give some information with regard to the different roads that run from Moree to Narrabri? I never knew any dry-weather road. We have never had a dry-weather road.
1359. It was stated by a witness at Narrabri that there is a road known as the dry-weather road? I have not heard of it.
1360. It was also stated by this same witness that there is a road known as the wet weather road? I have been travelling this road off and on since 1853, and I was never stopped with sheep, except, of course, when the water was up in the creeks. You can always get sheep along from here to Narrabri.
1361. You are not prepared to admit that there is a dry weather road or a wet weather road? No. There is no main road under that range that you can travel. They can stop you at any point until you get past Edgeroi on to a piece of road they cut to go over to Rocky Creek. They can stop you on Gurley and Edgeroi.
1362. Have you ever travelled the travelling stock route from here to Narrabri in wet weather? Yes.
- 1363-4 And you have always been able to get along, except when the creeks were flooded? Yes. The water does not stop long.
- 1365.

1365. How long? According to what rain has fallen in the ranges. Sometimes you may have to wait two or three days—perhaps not more than twenty-four hours. Mr. R. Cribb.
1366. The delay is never very great at any time? No. 23 Nov., 1893.
1367. The travelling stock route, except in very wet weather, is virtually an open road for stock travelling from here to Narrabri? Yes.
1368. Do you know anything about the floods which have occurred in other parts of the district? Yes; I remember the floods in 1870 and in 1864.
1369. Did those floods do a great amount of damage? Yes; in places.
1370. In what places? There was some great damage done over here in the ranges. A man and his team were washed away.
1371. *Chairman.*] What do you call "in the ranges"—Terry-Hie-Hie? Between here and Gurley. Lots of sheep have been drowned on Edgeroi and Gurley by the great rush, and I believe a lot of sheep were drowned on Tycannah.
1372. In what floods were those sheep drowned? In the 1890 floods.
1373. That was the flood which was all over the Bourke country? Yes.
1374. That is the last big flood you have had? Yes. There is a great rush of water down from the mountains. The closer you get to the mountains the greater the force of the water. When it gets down here it spreads—it has no force.
1375. *Mr. Davies.*] What is the largest number of sheep you have ever taken to Narrabri? Two thousand seven hundred.
1376. How long did it take you? It is according to whether I have to push along or not. I could go from here to Narrabri in about five days very nicely, but as a rule I take about seven days.
1377. Would that be in fine weather? In any weather it can be done in seven days.
1378. You have never been absolutely blocked in taking your sheep through? The last time I was blocked it was on the plains on this side of Narrabri. I could not get over to the boiling-down works. You could not get near Narrabri.
1379. Is there very much difference between the character of the country along the travelling stock route and the character of the country in the mountains? Yes. Up there, if the creeks were up, the water would wash things away very quickly; but down here it spreads over the flat, and becomes shallow and quite still.
1380. Do you know anything about the proposed line? Yes; I know a good deal of the ground.
1381. Which route, in your judgment, would be the best one to serve the district? The travelling stock route.
1382. You are aware that the travelling stock route is a great deal longer than the "red" route? It is not a great deal longer.
1383. Supposing it is $5\frac{1}{2}$ or 6 miles longer, which route do you think would be most likely to afford the greatest convenience to the holders and settlers in the district? The travelling stock route.
1384. As regards the cost of construction, is there any great difference between the character of the country on the travelling stock route, and the character of the country on the "red" route? Yes.
1385. It is represented that the travelling stock route passes through rotten country, which is lower, and is therefore more subject to flood than the country along the "red" route;—is it not rotten country? You bog for a certain distance, but still you can get along. On the sandy country when it gets thoroughly wet stock will bog. You could not drive a railway over the rotten sandy country in wet weather.
1386. You know the country through which the proposed line goes thoroughly? Yes.
1387. It is much higher than the travelling stock route? It is higher in places, but not a great lot.
1388. But it is higher? In some places it is a little bit higher, but in other places it is level.
1389. You favour the travelling stock route? Yes; because it is better than the other.
1390. Because you think it would serve a larger number of free selectors and settlers? Yes.
1391. *Mr. O'Sullivan.*] I understand you to say that, although you have been here since 1853, as a drover, you have never heard any one talk of a dry weather road or a wet weather road from Narrabri to Moree? Not until I heard it mentioned last night.
1392. You, as a drover, have travelled principally the present road to Moree? I have travelled from Moree to Narrabri down the Thalaba.
1393. Has wet weather prevented you from travelling the present road from Narrabri to Moree? No.
1394. You are still able to travel the road in wet weather? Yes.
1395. If any one has sworn at Narrabri that a distinction is made between the two roads, and that the roads are known as the dry weather road, and the wet weather road, he has simply given his own opinion? Yes; I never heard of any such distinction being made.
1396. Do you know much of the country to the west of Millie, going towards Collarendabri? A good deal.
1397. Have you travelled that road very much? Yes; from here down to the Barwon, and up all those creeks.
1398. Does the country improve as you go out further? Yes.
1399. Are there more settlers out that way? There are a good few settlers and squatters.
1400. Are there many of them, whether they be squatters or selectors? There are a good few squatters and selectors all down Burran Creek.
1401. Is it the kind of country in which settlement is likely to go in the future? Yes.
1402. Is it more likely to go to that side than to the east side—towards the mountains? Yes.
1403. Do you know the mountain country pretty well? A good deal of it.
1404. Have you travelled through the scrub? Yes.
1405. Is the country near the scrub, or anywhere adjacent, fit for agricultural settlement? I do not think it is much good for agriculture. I never knew any one to cultivate at any of the stations.
1406. Is the country towards the mountains as fit for settlement as the country towards the west? Bless you, no.
1407. *Mr. Dawson.*] Do you know Terry-Hie-Hie? Yes.
1408. This "red" route goes through that station, does it not? There is the road, you know, which was marked and cleared to go to Rocky Creek. You can get on to Bowman's Creek, and get down to Terry-Hie-Hie.
1409. You know the country on the range? Yes.
1410. Have you ever known that country to be very wet or flooded? It gets very wet at times.

- Mr. R. Cribb. 1411. You say that when it gets wet it is even worse than the plains? Yes; it is boggy.
 1412. It is what they call "spewy" land? Yes.
 23 Nov., 1893. 1413. It is like mountain country generally in New South Wales? Yes.
 1414. *Mr. Ewing.*] Do you know the direct line which has been surveyed from Moree to Narrabri? I have never followed the line right through, but I know all the country.
 1415. Can you tell us definitely whether any timber suitable for railway sleepers can be got adjacent to the "red" line? No; you could not get a tree.
 1416. Within how far could it be got? You might get some at Bowman's Creek.
 1417. How far is that? I suppose it would be over 20 miles.
 1418. Bowman's Creek is a tributary of Wee Waa or Tycannah Creek? Yes.
 1419. Having an intimate knowledge of the locality, you are perfectly sure that there is no timber to be got within 20 miles of this line? No; you can get belar which is no good, and the coolabah is hollow.
 1420. Were you ever in Goondiwindi? Yes.
 1421. And Kunopia? Once.
 1422. Do you know the Queensland country beyond that? No; I do not know much of the country except going straight along towards St. George.
 1423. Is that good country? No; it is barren scrub with little ridges.
 1424. Taking a line from Mungindi on the west, and a line from Goondiwindi on the north-east, do you know that part of the country in Queensland lying between those two points? I do not know much about it.
 1425. You cannot say whether much traffic would come from that country? A good deal of stock comes from that way.
 1426. You do not know it intimately? No.
 1427. Supposing you were at Mungindi, and the terminus of the railway was at Moree, and you were bringing sheep down, where would you make for if the sheep were going to Sydney? Narrabri.
 1428. Even although the terminus was at Moree? Yes.
 1429. Why? Because there would be a better road to travel.
 1430. How far is it from Mungindi to Moree? I could not say exactly.
 1431. Supposing it were twice as far to Narrabri as it was to Moree? It would all depend on whether the owner of the stock was in a hurry to truck them or not. It pays the owners sometimes to delay stock on a good run.
 1432. But as a rule you make to the nearest place? If you want to hit a market quickly.
 1433. And if it is half the distance from Mungindi to Moree that it is from Mungindi to Narrabri, you would go to Moree, I presume? Yes, if it were only half the distance. If it were anything near the distance I would sooner go to Narrabri.
 1434. Do you know Mogil Mogil? No.
 1435. Angledool? Yes. A great lot of sheep come from Angledool.
 1436. More than come from the north? I think so.

Mr. James Fingleton, publican and grazier, near Millic, sworn, and examined:—

- Mr. J. Fingleton. 1437. *Chairman.*] What is your occupation? I am a publican and grazier, at Little Bumble, 5 miles off.
 23 Nov., 1893. 1438. *Mr. Davies.*] Are you an old resident? I have resided here forty-two years.
 1439. Then you know every part of the district? I believe so.
 1440. Are you familiar with the the "red" line? Fairly well.
 1441. You know the country through which it passes? Yes.
 1442. You know the travelling stock route well? Yes.
 1443. Is there much difference between the character of the country on the two routes for railway making? There is a little. There is a lot of timber on the "red" route, but there is no timber on the travelling stock route.
 1444. But the country is much the same? It is not quite so good on the "red" route as it is on the travelling stock route. There is not so much of the country—there is more barren land on the "red" route.
 1445. Do you think a line by the travelling stock route would cost very much more than a line by the "red" route? I do not think so. I cannot see why it should.
 1446. Is the land much lower and subject to flood on the travelling stock route? Not very much.
 1447. Would you be surprised to learn that the Engineer-in-Chief for Railways estimates that a railway by the travelling stock route would cost at least £500 a mile more than a railway by the "red" route? I am not aware of his estimate, but I know that there is any amount of timber fit for sleepers opposite Gurlough Point, whereas there is no timber on this line.
 1448. What is the nature of the timber you spoke of? It is no good for sleepers.
 1449. Is there no ironbark on the "red" line? Not fit for sleepers. You cannot get a pile for a bridge.
 1450. Your roads through the district are very indifferent? In wet weather they are.
 1451. Would it not be very costly to make roads through a district of this character? It would.
 1452. Would it not be much more practical and cheaper in the end to make a light railway through the district? I believe it would.
 1453. As a main road rather than a macadamised road? Yes.
 1454. Are you aware that the "red" line is estimated to cost £2,400 a mile? I read a statement to that effect in the newspapers.
 1455. Do you think a good macadamised road could be made for that money? I have had no experience in making roads or railways. I know there is nothing to make roads with hardly.
 1456. There is no ballast to be got? There is any amount at Galathra and Bald Hill.
 1457. What is the greatest flood you have had during your time? The 1864 flood was the greatest general flood we have had. It was all over the country.
 1458. To what extent was the travelling stock route affected by that great flood? In no way; I travelled it in 1864.
 1459. You got through? Easily.
 1460. Were you travelling with sheep, or were you travelling on horseback? I was on horseback. I have resided on this creek for fourteen years, and in 1890 in the height of the flood I could ride across the creek
 1461.

Mr.
J. Fingleton.
23 Nov., 1893.

1461. Where does it empty itself? Into Waterloo Creek.
1462. Where does Waterloo Creek empty itself? Into the Moomin or Thalaba; some goes into one and some into the other.
1463. The water distributes itself pretty well over the whole surface? Yes.
1464. It is no great depth? No.
1465. On the higher lands there would not be the same volume of water? There would be a greater rush of water and more danger.
1466. But the water would be more confined within the creeks? I believe it would. I know that in 1890. Terry-He-Hio station was nearly washed away, and a man was drowned. I live 20 miles below that station, and I had sheep on the creek, but I lost no sheep because the water spread out.
1467. Where were you located on the creek? Between here and Big Bumble.
1468. You suffered no inconvenience from the floods? No; I was on the travelling stock route.
1469. You think that there will be no great practical difficulty in constructing a railway along that route? I am sure there will not.
1470. You think that a line by that route will give more satisfaction and be a greater convenience to the people who are settled in the district? I think so; according to this map, it is all conditionally purchased land.
1471. You think it is by the map? All that blue tinted portion of the map is occupied land; every occupier is a *bona-fide* selector. I saw a statement to the effect that the selections had reverted to the original holders, but I assert that not 1 in 50 has.
1472. Can you tell us anything else which would be of service to the Committee? The travelling stock route between Moree and Narrabri is a good road with water? I think that stock will always travel that way, although the railway may go the other way.
1473. You think that notwithstanding that the railway may be taken direct from Narrabri to Moree the drovers and owners will prefer to go along the travelling stock route? I do. Messrs. Richards and Williams, of Tyree station, travelled their cattle from Moree to Homebush. A drover above my place, after delivering a lot at Homebush, started yesterday with another lot.
1474. What is the distance? Four hundred miles.
1475. What sort of stock? Fat cattle.
1476. Would it improve the stock to travel that distance? I do not know.
1477. How often in a year can they travel that distance with stock? They will always be able to go to Narrabri, because there will be no carriers on the road to eat the grass.
1478. *Mr. O'Sullivan.*] Do I understand you to say that all this alienated land, according to the map, is still in the hands of the selectors? I believe that not one out of every fifty has sold out. I could mention a great many of the selectors. I know that they are substantial and good holders.
1479. Have you ever heard of any of them selling out? No.
1480. As far as you can judge they are *bona-fide* selectors, and likely to be permanent? I am sure that a good many of them are. I could mention a great many of them if you like.
1481. Are they all doing well? As far as I know they are.
1482. They have nearly all the maximum area of 2,560 acres? Three times that area most of them have.
1483. But each man can have only 2,560 acres? Some have 10,000 acres.
1484. You refer to a family group? Yes.
1485. Everyone is anxious to get the full limit? Not a single one has a single selection.
1486. They find it more advantageous to work that way? Two thousand five hundred and sixty acres is hardly sufficient for a man to get a living on.
1487. Have they a ring fence? Yes.
1488. Are there dividing fences? Where they have to put them, and they are fully improved.
1489. In reality these large family selections are moderate sized runs? Yes.
1490. That is the kind of selection which appears to thrive best in the district? I believe so.
1491. Do you know the country to the west of Millie towards Collarendabri? Yes.
1492. Is it good country for grazing settlement? It could not be beaten.
1493. Is there likely to be rapid settlement out that way as soon as the leases are thrown open? I am sure there will.
1494. Is there any land left there which is open to selection? I suppose there is; but I have not noticed the maps.
1495. Why has that land not been settled upon? People are not going out there. It is too dry.
1496. Will not that cause operate in the future, as it does now, to prevent settlement? Yes, it may. Still they are settling every day on it.
1497. Why is it that we have all this uncoloured portion on this map? It is a long way back.
1498. Are they picking out the best pieces now? Certainly.
1499. I suppose that as soon as the leaseholds are thrown open they will make a rush for the best pieces there? I am sure they will.
1500. Therefore you anticipate some rush of settlement? Yes.
1501. You are quite certain in your own mind that this is *bona-fide* settlement, and that not more than two out of every 100 are dummies? Yes.
1502. Did you ever hear of any dummies up this way? Certainly.
1503. In which direction? Out on Liverpool Plains, and all along the Namoi, where they have all sold out.
1504. I mean away to the westward? I have heard of it there, but I have never seen it proved yet.
1505. Did any one else ever see it proved? I have heard of it, but I do not know that it has been proved.
1506. You do not think that this settlement is settlement by dummies, and that more than two out of every 100 are selling out? That is my opinion.
1507. *Mr. Ewing.*] When does the wool usually come down by the teams? It commences to come down about August.
1508. It comes down between August and Christmas? I have seen it come down in March and April.
1509. As a rule it does? Every year I have seen wool come down in March.
1510. When is the wet season here? That is very hard to say. We do not get rain regularly.

- Mr. J. Fingleton. 1511. Would it be wet from March to August, or from August to March? We never have too much rain here unless it is in the winter.
1512. Your winter months are your wet months? I suppose so.
- 23 Nov., 1893. 1513. Does the wool come down in the spring and summer, and is the winter, as a rule, the time you get your rain? I suppose we do get more rain in the winter. The wool, of course, comes in the wool season—from July to March.
1514. *Chairman.*] Is there anything else you would like to state? No.

Mr. James Duff, hotelkeeper and grazier, Millie, sworn, and examined:—

- Mr. J. Duff. 1515. *Chairman.*] You are a hotelkeeper and a grazier residing at Millie? Yes.
1516. How long have you resided in the district? About twenty-seven years.
- 23 Nov., 1893. 1517. *Mr. O'Sullivan.*] During your long experience have you ever heard people distinguish between these roads by calling one the wet weather road and the other the dry weather road? Never; and I have been droving stock for so many years.
1518. In a wet season, is it possible for stock and travellers to get along the road at a fair rate of speed? Without the slightest trouble, unless you come to a creek which is in flood, and you have no bridge.
1519. There is a road at the back, along the foot hills of the mountain, that leads to Moree? Yes. I have heard of it, but I have never travelled it.
1520. Is it travelled at all? Very seldom, I think.
1521. Do people go to Moree by that way? No. They simply go round there when they are not sure of getting grass here.
1522. Do they go to Bingara by that way? Yes.
1523. That road appears to join another road coming out from Moree at the back of Gurley? Yes; it is merely a road for grass in flood time.
1524. In flood time, does the water collect on this plain country here, and offer any serious impediment to travelling? No.
1525. Does the water lie long on the low land? Not to my experience, which extends over twenty-seven years. It might lie there for a few hours; twelve hours, or thereabouts.
1526. Can you say anything about the timber in this neighbourhood? A good deal. There is no timber at all in this district.
1527. Not even in the mountains? I mean between here and Gurley. All the scrub between here and Gurley and Dobikin I have searched, and I have had to ride perhaps half a day to get a couple of dozen posts for a gate.
1528. Where is the nearest timber to the eastward? The only place I have heard of is over the Namoi.
1529. That would be to the south-east or south? Yes.
1530. You refer to the Pilliga Forest? Yes.
1531. Is there any ironbark at all up here? Nothing worth mentioning; not as much as you can get a round post out of. I have ridden every inch of the country between Gurley and Dobikin and here. I have not ridden over the country between Gurley and Terry-Hie-Hie to a great extent, but there is no such thing as getting a couple of posts in this country.
1532. How far is the furthest point of Gurley from this line? I presume it is about 28 miles.
- 1532½. How far is Terry-Hie-Hie? We call it 35 miles from here.
1533. I understand you to say that from your long experience, having travelled on the other side of the line and knowing the country well, you are of opinion that there is no timber which could be utilised in the construction of a railway? Not one stick, I believe.
1534. You have never seen any ironbark here? Not a stick that would be of any use.
1535. I understand you to say that that applies to the country at least 13 miles from the other side of the line—would 13 or 15 miles from the other side of the "red" line take you to the foot of the mountains? I think it would take you very near the mountains.
1536. Have you been to the mountains? Right up to them.
1537. Is there any timber there? No; very little. I have ridden over the mountains before there was ever a fence between here and there.
1538. *Mr. McCourt.*] Have you had any experience in splitting railway sleepers? No; not a deal.
1539. Are you aware that the railway construction branch propose to use split sleepers instead of dressed sleepers on this line? No.
1540. Do you think that they can get undressed split sleepers delivered at 2s. 6d. on the line as they estimate? No; not in this part of the country.
1541. Not anywhere along the line? No; I am quite confident they could not.
1542. At what price do you think they could get split sleepers supplied? The timber is not there for them to get the sleepers.
1543. At what price do you think unadzed ironbark sleepers of the usual size may be supplied? That is out of my latitude. I am positive they could get no timber there.
1544. If you think that they cannot get the sleepers supplied at 2s. 6d., at what price do you think they can be got? I am not well enough up in the subject to say.
1545. You are well enough up in the subject to say that the sleepers cannot be supplied at 2s. 6d.—surely you can form an estimate of the price at which they can be supplied? I do not think they can get the sleepers for twice that sum.
1546. If two sleeper-cutters at Narrabri have sworn that sleepers can be supplied at 3s. in the rough, that statement is not correct, in your opinion? I do not believe it is.
1547. *Mr. Dawson.*] Could sleepers be got at 3s. for that line anywhere about Narrabri? I think there is plenty of timber to be got about Narrabri. There is a beautiful belt of timber in that district.
1548. You mean to say that they might get sleepers at 3s. from there, but that it is not possible to get them anywhere between Narrabri and Moree? Yes.
1549. The sleepers may be got elsewhere, and delivered on the line at 3s.? Yes, at Narrabri end only.
1550. *Chairman.*] You constructed a dam lately near your place? Yes.
1551. And the mail coaches run over it? Yes.
1552. Is that bank so consolidated that it is perfectly safe in wet or dry weather to run vehicles over it? Yes.

1553. Does any embankment of this black soil soon dry and make a hard road in wet or dry weather? *Mr. J. Duff.*
Yes; it is perfectly safe in wet or dry weather.
1554. If the railway is constructed along the travelling stock route, and a small embankment is thrown up, and 3 inches of ballast are put under the rails, do you think that will be sufficient to make a good, solid road for the train to run over? Yes. *23 Nov., 1893.*
1555. You do not think that in wet weather 3 inches of ballast would disappear into the embankment? No.
1556. What other traffic goes over the dam? A lot of loaded wool teams.
1557. In wet weather does it cut up very much? No.
1558. Your experience is that if the railway is taken by the travelling stock route with an ordinary embankment, and with 3 inches of ballast, it will be sufficient to secure the safe running of the trains? Yes.
1559. You have had a large experience in dealing with black soil? I have.
1560. Although your water supply depends largely on the dam, you have no hesitation in allowing vehicular traffic to pass over the dam in any weather? None whatever.
1561. If the "red" route is adopted, and you desire to use the railway, which station would be the most convenient for you—Woolabrar, Gurley, or Tycannah? I would certainly tap the line at Narrabri.
1562. Why? Because I consider that if the line runs straight through from Narrabri to Moree it will be ruination to the whole district.
1563. Would you prefer to go 40 odd miles by road to Narrabri rather than go 15 miles to the "red" line? I would; because the difference in carriage by team would more than compensate for difference in distance to railway station, and a distance of 20 miles more or less is of little account by team though expensive by rail.
1564. Is not that rather like cutting off your nose to spite your face? No. I consider it would be ruination if the line went under those mountains, as the country is of no use to anybody.
1565. But you must be utterly ruined now, when you are 40 miles away from the terminus, if you call 15 miles away from a line ruination? I would tap the line at Narrabri.
1566. Is there not a good deal of sentiment in that statement;—is it reasonable to suppose that you would not avail yourself of a railway within 15 miles of your door? No.
1567. *Mr. Dawson.*] Why would you go to Narrabri? I often send 8,000 or 10,000 sheep from here in a year, and if I had stock to go I would prefer to send them straight to Narrabri.
1568. Surely you can give an intelligent reason for that preference;—is not this the reason—that if you went to Narrabri you would have water all the way, and that if you went the other way there would be no water? That has something to do with it. On one route I would have water and a travelling stock route, but on the other I would have neither, unless it were provided.
1569. Where was the timber got for the different culverts and bridges between Narrabri and Moree? I think it was got out of the district—at Boheena, on the other side of Narrabri.

Mr. John Hannan Murphy, grazier, near Millie, sworn, and examined:—

1570. *Chairman.*] What is your occupation? I am a grazier, residing at the Jews Lagoon, 9 miles to the south-west of Millie. *Mr. J. H. Murphy.*
1571. How long have you resided in the district? About twenty years. *23 Nov., 1893.*
1572. *Mr. McCourt.*] What is the size of your holding? Between my family and myself we hold a little over 30,000 acres.
1573. Is it all selected land? Ten thousand acres were purchased, and 20,000 acres were selected.
1574. How many are there in your family? I have only three children living with me, and three children are married.
1575. Do you know the proposed routes for this railway? Yes.
1576. Which route do you think is the best to serve the whole district? If agreeable to you, gentlemen, I would make a remark before I give an opinion. About four weeks ago, I wrote an official letter to the Chief Commissioner of Railways, advocating the Gurleigh Point line in preference to this "red" line.
1577. For what reasons? Because I consider that it would be more suitable to this large district, and more beneficial to the Colony at large.
1578. Would it get more traffic or serve more people? It would get more traffic, and it would serve more people. On the eastern side of the "red" line you have Gurley station. There is very little land of any use to a person on that run, it is all useless country. All the valuable land on that station has been secured. Twenty years ago I made a large dam for the station, and then, to my own knowledge, all the valuable land had been taken up by purchase and selection—nine-tenths of the station. I consider that if the "red" line is adopted, the purchase of the land through Gurley, Killarney, and Tycannah, would cost much more than the construction of the line is estimated to cost.
1579. Do you know what the resumption of the land is estimated to cost? I consider that the estimate is exaggerated. I do not consider that one-sixth of it would be of any use to the public, because all the good land lies on this side.
1580. Would not a considerable portion of this land go through reserves and Crown lands? Yes; but it is worthless.
1581. You say the resumption of the land will cost as much as the construction of the railway? I believe it will.
1582. Do you notice that for the most part this line goes through Crown land? That Crown land is worthless.
1583. Therefore no land will be required to be resumed;—are you aware that it is estimated that the land along the line will cost only £7,000? I do not know. I know that their estimates are not always correct.
1584. Would not the Gurleigh Point line be more expensive than the "red" line? It would be much less expensive, because the facilities it offers for railway construction would reduce the expense. It has a supply of suitable timber for sleepers and the railway fence between Gurleigh Point and Baradine.
1585. The "red" line is not to be fenced, therefore, it would be so much cheaper? But it will require sleepers.
1586. Have you any other reason for supporting the Gurleigh Point line? Yes. For the last fourteen years I have been calling for improvements to be made on the road. We have never got a shilling spent

Mr. J. H. Murphy. on the road between here and Narrabri, but we always got the promise of a railway. This projected line it appears, however, is to be placed in the scrub 20 miles out of the district where there is no valuable land worth speaking of.

23 Nov., 1893.

1587. If the "red" line is constructed, will you use it? Never.

1588. You would still continue to go to Narrabri? I would go on the main road such as it is.

1589. Even if it costs you more to drive your stock? I know that is the most expensive line.

1590. Supposing that it would cost you more to send your stock to Narrabri than to take them to a point on this line, you would still continue to go to Narrabri? If I were to send the stock to Narrabri, I should reduce the distance by the railway. If I were to take them to Gurley scrub I should have to pay for their carriage to Narrabri. I would prefer to take them direct to Narrabri.

1591. Have you any other statement to make? I consider that, owing to the great settlement of the people in this part, and the support which one and all would give to the Gurleigh Point line, it will pay 50 per cent. better than the "red" line. The "red" line would receive only what support will come from Gurley station and a few miles from Terry-Hie-Hie, whereas here during last August and September, when I was at the shed getting my sheep shorn, I counted as many as 40, 70, 80, and 100 loads of wool coming by this road every day in succession, which would support the line if there was a station at Boggy Creek. You could have another station at Big Bumble, and another at Tycannah. I know the whole district. I worked at Moree for three years. I worked on Gurley station for six months, making a tank. At that time they put down a large well to a depth of 120 feet, but the water was quite worthless. The water with which the tanks would be filled at night would be salty in the morning.

1592. What experience have you had of railway construction? I have ballasted miles of line.

1592½. You know the country through which the "red" line will pass? Yes.

1593. It is proposed to put only 3 inches of ballast under the rails,—will that be sufficient? There is a portion of the line which would take 9 inches.

1594. How long is that portion? It runs for a considerable distance through the scrub. It is sandy loose country; 10 miles would have to be consolidated according to the way I saw the line on the south and west constructed.

1595. But this is only a pioneer line? I know what it is. It will depend upon the burden which is placed upon it. In five years they may say that it will carry more and more until they make a smash of it.

1596. If it is proposed to run light engines at a speed of 15 miles an hour, will 3 inches of ballast do for the rest of the line? No. There is a portion between Gurley and Tycannah which is much more swampy and boggy than any other part of the line.

1597. That length of line will require how much ballast? It is a length of 9 miles. That part and the sandy reach through the scrub are the worse pieces on the line. No portions of the line will be so difficult to construct as those portions.

1597½. How much ballast would it require in your opinion? It might take 11 inches—5½ inches of 4 inch ballast and 5½ inches of 2 inch ballast—the ordinary quantity that is used on the permanent way.

1598. Do you know anything of the supply of sleepers in this district? I never did any of that work myself, but I have a good idea. I know that sleepers can be procured quite close to Gurleigh Point sufficient to construct the whole line, and perhaps a line from the border to the Colony.

1599. Supposing the "red" line is adopted, at how much do you think the Commissioners will be able to get sleepers supplied, that is, sleepers not sawn or adzed, but half round? It will depend upon the state of the labour market.

1600. When you speak of swampy country on this line, do you refer to Gurley homestead station or to Gurley railway station? The rotten country I speak of lies between Gurley head station and Tycannah, going in towards Moree. I could not drive a cart through this country with a light load.

1601. Are you aware that the "red" line is 6 miles west of Gurley head station? No.

1602. If it is, it would be on better country? It may, but the difference will be very little.

1603. Do you think the Commissioners can get half-round sleepers at 2s. 6d. each? I do not think they can get sleepers in any part of the Colony at that price unless they can get people to work at 3s. a day.

1604. At what price do you think the Commissioners can get sleepers? It depends on the size of the sleepers.

1605. The sleepers are to be split, half-rounded sleepers of the usual size? They should get sleepers of that kind at about 3s. It will depend principally on the inspector.

1606. If the line you want were constructed, how far would it be from your holding? I consider that the nearest part of the line would be between 8 and 9 miles distant.

1607. Are you aware that if the "red" line or the other line is constructed, it will be constructed subject to what is known as the betterment principle, and that you will be required to pay towards its construction, say, half the amount? If they construct the "red" line, I shall claim and insist that the people of this district shall be exempt from the application of the betterment principle.

1608. You will object to be included in the betterment area? Yes. But if they strike Gurleigh Point, I shall be quite agreeable to pay whatever may be required to the betterment fund.

1609. *Chairman.*] What about the other fellows to the east? That line is not useful to the public or beneficial to the Colony at large.

1610. *Mr. McCourt.*] The people to the east would be left out in the cold? Where are they; they are not alive yet.

1611. There is no settlement to the east at all, then? The land is not adapted to settlement. It is occupied principally by wallabies and kangaroos about Terry-Hie-Hie.

1612. In your opinion there will never be settlement about there? Not in my time, unless you put a tunnel through the mountains.

1613. You favour the Gurleigh Point route and condemn the "red" route? Unquestionably, because it will be a dead loss to the Colony at large. It will receive nothing to maintain it, but merely what it will get at Moree and from the country out towards Goodiwindi. But this line will be the best paying line in the Colony owing to the amount of settlement and land taken up.

1614. If the Commissioners estimate that by the construction of the "red" line, they will get traffic and goods to the extent of £12,000 a year, do you think that their estimate is a correct one? No. I consider they have been misinformed. If they had come here and made themselves practically acquainted with the requirements of the district, they would never have dreamt of putting a line direct from Narrabri to Moree.

1615.

1615. If the Commissioners have reckoned upon getting the traffic of the people round your neighbourhood by the "red" line, they are mistaken? Not immediately around my neighbourhood but for 100 miles out north-west. If the "red" line is constructed, they will never go through the Gurley scrub; they will prefer to go straight into Narrabri.
1616. *Mr. Davies.*] You have a very large holding? A very small one, I consider, when it is divided into six or eight parts.
1617. Between yourself and your family you hold 30,000 acres? About that area.
1618. You have good reason then to venerate and respect the memory of Sir John Robertson? Sir John Robertson was a very good man, but I have very good reason to thank myself for attending to my business and leading a hard life for 40 years.
1619. How many sheep do you shear? It all depends on the season, and how many I dispose of—from 15,000 to 20,000.
1620. Where do you send your wool? To Sydney.
1621. Direct from Narrabri? To Newcastle by rail, and thence by steamer to Sydney.
1622. If the railway is extended as it is proposed, would you still continue to send to Narrabri? Unquestionably.
1623. What would be the difference to you as between the nearest station to you on this line and Narrabri west? There would be no difference to me, because the line does not come near my place. It would not be worth my while to unload the wool.
1624. How far would your holding be from the nearest station on this line and from Narrabri West? A station on this projected line would be about 10 miles nearer, but it would be much more expensive.
1625. The haulage is a question of no difference? Very little. If it were constructed to-morrow it would never have a load of wool belonging to me.
1626. Because it does not go through your property? No; in the interests of the Colony at large.
1627. Is it not the fact that because it does not go near your property you prefer to send your wool by team to Narrabri? I have been living for fourteen years in the expectation of getting a railway.
1628. I ask you is it or is it not a fact that because it is not constructed nearer to your property, you prefer to send your wool by team to Narrabri? I could not answer that question without perjuring myself, because the line would be a dead loss to the country.
1629. Where would you send your fat sheep to market? To Narrabri.
1630. Though it might be only 15 or 20 miles to the nearest station on this line, you would prefer to go right away to Narrabri? Yes; because I would save the extra carriage by the train.
1631. Does your stock improve by travelling? That all depends on the grass. If there is good feed you will improve them.
1632. Do I understand you to say that there is no advantage in getting your stock to market as early as possible—two or three days sooner than you otherwise would? If there is good feed I would prefer to send them by road to Sydney.
1633. Is it not an advantage to get your sales effected two or three days sooner and the money in your pocket? Of course it is an advantage if I require the money badly, but a delay of two or three days would make very little difference to any man.
1634. *Mr. Dawson.*] As a matter of fact, you may start your sheep, but not truck them until you get to Breeza or Gunnedah, on account of the market being down? Yes; and also on account of not being supplied with trucks. Lately I have had to keep them back for a week for that reason.
1635. *Mr. O'Sullivan.*] Do the people in this district run store sheep or fat-sheep? Both.
1636. They would not be likely to truck many store sheep? No. They are getting them boiled down.
1637. If they wanted to take them to another part of the country, they would drove them to Narrabri? Yes; perhaps the whole distance.
1638. Are there more fat sheep than store sheep here? Probably more fat sheep if they could only get them to market at a reasonable rate.
1639. You stated that you have seen from forty to seventy waggons a day come down this road from various parts of the country? They came up from Thalaba, and in to Narrabri station.
1640. From what districts? Principally from Collarendabri, Mungyer, and all those stations out at the back.
1641. Would not these teams, if there was a railway station within a distance of 15 miles, be likely to make to that station instead of going to Narrabri? That would depend on circumstances. If there were good feed on the road, possibly they would prefer to go to Narrabri. At the same time if a station holder sent his wool to a railway station the carrier would be compelled to take it there.
- 1641½. What rate do the carriers charge? There are various charges, according to the season. Their charges are very low this season.
1642. Do they charge at per day, or per week, or per mile? At so much a ton.
1643. They would not be likely to charge the same to convey wool from Collarendabri to Woolabrar, as from Collarendabri to Narrabri? I do not know.
1644. Would the teamsters charge as much to one place as to the other? They might not, because Woolabrar would be 15 miles nearer.
1645. Would they not receive an instruction from the grazier to take the wool to the nearest railway station owing to the smaller charge? They mostly do. It would depend on the railway charge.
1646. Would not that induce the traffic to make for Woolabrar, instead of for Narrabri? If they could get the railway to take it in at a smaller rate they would take it in to the nearest station.
1647. Would that traffic be likely to come to the proposed station at Woolabrar? It would all depend on the season.
1648. Is not the road by way of Gurleigh Point a very uncertain one for teams—the road which comes down from Collarendabri past Wee Wee and Gurleigh Point? I have never travelled that road.
1649. Is it not a fact that the carriers have, after arriving at Collarendabri, to go north to Mogil Mogil, and then come round through Millie to Narrabri? That I do not know.
1650. Do they not often do that? Not to my knowledge.

Mr.
J. H. Murphy.
23 Nov., 1893.

Mr. John Vaughan Wilson, grazier, near Millie, sworn, and examined:—

- Mr. J. V. Wilson.
23 Nov., 1893.
1651. *Chairman.*] What is your occupation? I am a grazier, living about 12 miles to the west.
1652. How long have you been in the district? About fifteen years.
1653. *Mr. Ewing.*] Which, in your opinion, is the better line? The travelling stock route.
1654. You are not an engineer? No.
1655. Therefore you can give us no opinion worth having, as to the cost of construction? No.
1656. You do not pretend to offer advice in regard to the cost of construction? Certainly not.
1657. You deal, therefore, with the trend of traffic which will best suit the public? Yes.
1658. Do you know anything about the direct line; is there any timber on that route? I have been across the direct line in several places, but never along it.
1659. You cannot give us any definite information as to that route;—why do you think that the travelling stock route is the better route for the public, and for the better development of the country? I think the travelling stock route is the better route for all the western community, because it is a nearer point for all the traffic coming up, and as far as I know there is no accessible road to the other line, or water. I may say that I was managing at Bunna Bunna for Dangar Brothers for about ten years, and for the last four or five years very little traffic has come up this way. All the traffic from Collarendabri and thereabouts has come by Bulleroi, and gone in via Gurlough Point. If the line were constructed by the travelling stock route, I think it would draw nearly all that traffic to this point.
1660. You recognise that at present Narrabri, as the terminus of the railway, is the point to which they make? Yes.
1661. Presuming that the terminus was shifted to Moree, would there not be a tendency to make to that point if the distance were shorter? Certainly not. All the traffic from Angledool and Collarendabri, I think, would come by Thalaba Creek to this point.
1662. You think that even if the line were extended to Moree, the Mungindi men would still make for Narrabri? I daresay the Mungindi traffic would go into Moree to a very great extent; but the traffic from the west and south of Mungindi would come in here.
1663. Do you know the railway freights? No.
1664. What would it cost to take wool by team from Moree to Narrabri? I cannot say.
1665. In point of fact, you believe that a person who had got as far as Bulleroi would go into Narrabri rather than make to Gurley railway station? Certainly.
1666. You believe that consideration affects the whole of the western traffic? I do.
1667. You believe that the whole of the traffic south of Mungindi, if the direct line be constructed, would still make to Narrabri? Yes.
1668. Does it not strike you as a remarkable thing that a distance of 15 miles would make all this difference—that they would rather go to Narrabri than go to Gurley? Well, as I explained, if the railway were constructed by the travelling stock route it would be 15 miles nearer, but if it is constructed on the proposed route they would sooner turn off at Bulleroi, and go in by road than go the extra 15 miles from here.
1669. You believe they would rather come to Millie by Bulleroi, and so into Narrabri, than make for the nearest railway station, Gurley? Yes.
1670. You believe that if the “red” line is constructed the whole of the western traffic south-west of Mungindi would still go to Narrabri? I think it would.
1671. Do you know the Warialda district? I have been through Warialda several times. I do not know a great deal about it.
1672. What sort of a district is it between Warialda and Moree? It is not particularly good country, I should think. I have been through it.
1673. You realise that in bringing the line 12 miles in this direction you would saddle the whole of the northern and eastern portion of this area with the extra carriage over that length? No; not all the north.
1674. You advocate a longer line from Moree to Narrabri? Yes.
1675. All the trade which comes to Moree you would saddle with extra carriage? Most decidedly.
1676. You think, in the interests of the great volume of trade from the west, it is a fair thing to do that? Yes.
1677. Although you think it will not suit them quite so well? Yes; I think it is only fair.
1678. *Mr. Sutor.*] Where do you send your stuff now? To Narrabri.
1679. By which way? Sometimes it comes here, and sometimes we get permission to go through Boolcarrol, which is shorter.
1680. How many sheep do you shear? On an average, about 7,000.
1681. How many bales of wool do you send away? I think we sent away eighty-six bales.
1682. *Mr. Davies.*] Which station on the “red” line would be nearest to your holding? I suppose Woolabrar would be. I would be 22 or 23 miles from the station.
1683. If the line were to come by the travelling stock route you would be about 10 or 12 miles distant? A little over 12 miles.
1684. It would serve your holding very much better if the line were taken by the travelling stock route? Most decidedly.
1685. The settlement along the travelling stock route is much larger than the settlement along the “red” line? As far as I know, it is.
1686. In your own neighbourhood, and all round there? Yes.
1687. Do you know any good reason why it should be much more costly to construct a line along the travelling stock route than along the “red” line? I cannot see any reason, but I do not pretend to be an engineer-in-chief.
1688. But you know the country well? Yes.
1689. Is there much difference in the character of the country on each line? I do not think so.
1690. But it is lower land on the travelling stock route? I suppose it is.
1691. It must be lower? But very little.
1692. It is more subject to flood than is the higher land? I do not think so.
1693. You do not know of any great difficulty, as far as your judgment goes, in the construction of the line? I have been at Bunna Bunna for the last fifteen years. I have been sending stock in—I suppose as much as a good many round about here—and we certainly have never been blocked or had any stock lost on the travelling stock route.
1694. You have never suffered any inconvenience? No.
1695. How far would it be from your station to Narrabri by the travelling stock route and through Millie? About 40 miles.
- 1696.

1696. If the line is constructed by the "red" route it would be 22 miles from your station? Yes. Mr.
1697. So that there would be a considerable distance in your favour if you use the straight line? Yes; J. V. Wilson.
- as far as distance goes.
1698. Also as far as haulage and expenses are concerned? I do not think the expense would be as much to take our goods direct to Narrabri as it would be to take them by team to the "red" line, and then pay the railway freight to Narrabri. 23 Nov., 1893.
1699. There would be a difference of 10 miles? It may be 10 miles.
1700. On the round trip it is equal to 20 miles;—would not that be some advantage to you? I do not think it is 10 miles.
1701. But if it is, do you not think that it is some advantage to you? No; decidedly not. I would certainly send all our goods by team to Narrabri in preference to going on that line.
1702. You would scarcely use the line at all? I do not know that I would use it in any shape or form.
1703. Have you any other reasons to adduce in favour of a line by the travelling stock route? Yes; you can get on to the travelling stock route. It is a very good road for grass and water, whereas if you had to go across to the "red" line, I do not know that there is either grass or water on the way.
1704. Have you any other reason to assign why it should be constructed along the travelling stock route? I think it would serve the western community a great deal better, and it must be borne in mind that they represent a very large proportion of the population of this district.
1705. Would it serve the people of Moree as well as the shorter and more direct line? I do not know that it would serve them exactly as well, but taking into consideration the proposed deviation of $6\frac{1}{2}$ miles, I think they should suffer that deviation, and give the people of this western part a show.
1706. I gather from your evidence that, although a line by the travelling stock route may be $6\frac{1}{2}$ miles longer than a line by the "red" route, and may cost £500 per mile for its construction, you favour its construction? Yes.
1707. Mr. O'Sullivan.] You have a knowledge of the traffic from Collarendabri? Yes; a very fair knowledge.
1708. Is it a fact, as has been stated in evidence, that sometimes, when the lower road—the road by Wee Waa—is uncertain, teams and traffic go through Collarendabri to Mogil Mogil, and then make their way to Millie, and down by the travelling stock route? I have never heard that they do.
1709. Did you ever hear of any stock coming that way? Never.
1710. Is it a fact that Mr. Richards, of Rivorstone, sends his stock by that way? He may, but I never heard of any stock coming by that way.
1711. Mr. Ewing.] Supposing that the Barwon were snagged, and steamers could use the river, from how far east would stuff gravitate to the river? I know very little about that part of the Colony.
1712. Then you can express no opinion on that point? No.
1713. Chairman.] Is there anything else that you desire to add? No.

Mr. Frederick Charles Staveley, storekeeper, Collarendabri, sworn, and examined:—

1714. Chairman.] What is your occupation? I am a retired land surveyor, at present keeping a store in Collarendabri. Mr. F. C. Staveley. 23 Nov., 1893.
1715. How long have you been at Collarendabri? I have not been permanently residing in Collarendabri more than four or five years. I have been in the district about thirteen years. I know the district thoroughly from one end to the other.
1716. To what point does the trade from in and about Collarendabri now gravitate;—does it go down the river or does it go to the nearest railway station? To Narrabri West.
1717. Does the wool and live stock come through Millie? Not generally; by Bulleroi, and as direct as possible to Narrabri. We have what we call a direct line of road, and the coaches are travelling on that line now. I think the traffic generally comes in that direction.
1718. The ordinary road round from Collarendabri to Narrabri West is very little used, but the travelling stock route between the two points—which is more direct—is now used by the travelling stock and by the mail coaches? I think so.
1719. The ordinary road between Collarendabri and Wee Waa makes a considerable detour to the south-west? Yes.
1720. And the road now used—the travelling stock route—is the more direct? Decidedly.
1721. Does the whole of the trade of the Collarendabri district go to Narrabri West *via* Wee Waa? Not *via* Wee Waa, but *via* Nowley.
1722. Nearly all your trade comes from Collarendabri to Narrabri West *via* Gurleigh Point? I think so.
1723. Is there any trade or stock coming from Collarendabri *via* Millie to Narrabri? No.
1724. What proportion of the trade, alive and dead, do you think, comes *via* Millie as against *via* Gurleigh Point? I should think very little.
1725. Would it be an eighth? I should not think 5 per cent.
1726. Ninety-five per cent. of the trade of the Collarendabri district comes to Narrabri *via* Gurleigh Point, and 5 per cent. comes *via* Millie? Possibly; but that is an approximation.
1727. How do you account for that 5 per cent. coming *via* Millie? I do not know. I said 5 per cent., but that is only mere guess on my part.
1728. Practically the whole of the trade comes *via* Gurleigh Point? That is so.
1729. If this railway were constructed, bringing Millie within 15 miles of a railway station, do you think the Collarendabri traffic would go *via* Millie then? I do not think so.
1730. You think they would continue to use the old road *via* Gurleigh Point? I think so. I have some memoranda which I desire to place before your Committee. I represent the Upper Barwon Progress Association, and in this matter, of course, I am representing the whole district.
1731. Will you be good enough to make any statement you desire to make? This proposal came upon us very suddenly. We had not time to make any preparation. As soon as we got seized of the matter, a meeting of our association was called, and a good many of us met and talked the thing over. I am informed by all the people living out there that if that particular line is constructed (the "red" marked line) our trade will still continue to go to Narrabri West without any exception. We have a number of sheep on nearly all the places in our neighbourhood, and from these sheep, of course, a great deal of wool comes.

Mr. F. C.
Stavcley.
23 Nov., 1893.

1732. Taking what place as a centre? I am taking in the country from Millie to Angledool. We wish to show that nearly all the traffic I have mentioned would not go to the parallel line, but would go on to Narrabri West.

1733. You have prepared a return showing the stock on the runs in what you consider is your district—the wool sent away annually and the inward goods? Yes.

1734. Will you indicate the boundaries of your district? The district embraced within this return is bounded approximately on the east by Millie, on the north by Mungindi, on the west by Angledool, and on the south by about Dunglear.

1735. Would Collarendabri be about the centre of that district? Fairly central.

1736. Will you give the total number of the sheep? We have 1,336,000 sheep within a moderate radius of Collarendabri, and 1,500,000 sheep at the Angledool end, including nearly all the Australian Pastoral Company's sheep, that will come this way. We have 2,836,000 sheep in and somewhat beyond that district in Queensland. Reckoning twelve bales of wool to 1,000 sheep, we get an output of 33,960 bales approximately in the year. This output weighs 6,443 tons, allowing $3\frac{1}{2}$ cwt. to the bale, and it represents 1,288 loads of 5 tons each. Approximately we load outwards from Narrabri West, reckoning 3 tons for every 10,000 sheep, 849 tons or 170 loads. Then there are all the towns to be supplied. One of the storekeepers told me that he pays railway freight to the amount of £900 a year. If he pays that amount, others will do about the same, so that a considerable freight is derived from this source. It includes Collarendabri, Mogil Mogil, Goondablue, Mungindi, Angledool, and Goodooga, because their supplies would all come in our direction if certain things were done. With regard to the settlement in our neighbourhood, we consider that there are about fifty homestead leasees on the north-west side of the Barwon. We reckon that the average cost of their improvement is £1,000. The leases are not all improved up to the necessary requirements, but this is in course of being done, and they are all, as far as I know, *bonâ fide*. Then all the holders on the south side of the Barwon have full areas. We do not know the number of the holders, but there are a large number of people settled near Merkeadooe, on Thalaba Creek. I may state that the Land Board puts through about sixty cases each sitting at Collarendabri, and it comes two or three times a year. I hand in a return, showing the number of sheep on each station in the district.

1737. You think that if the line were so constructed that Millie would be the nearest point to that district, all the sheep and traffic from the district would come this way rather than go down *via* Gurley? I think so, because we simply want to get the nearest point to Narrabri.

1738. Are you aware that by the adoption of the "red" route the railway would be brought within 12 miles of the point at which you say it would be convenient for you to ship? Yes.

1739. Would that distance of 12 miles from the travelling stock route make all the difference between your using the railway and your not using it? It would, because when a man gets a load of wool or anything else on his waggon he can go a dozen or 20 miles, and it saves him the trouble of unloading. Besides, there would be only a very small amount saved in connection with the railway.

1740. Thirty miles of road carriage? Yes, as against railway charge; but once a man gets his load on it is very little trouble to move on with it.

1741. If the line were constructed *via* Gurleigh Point and the travelling stock route, to what place would all this trade gravitate—to Millie, or to Gurleigh Point? I suppose it would go to the nearest point if there were a station. What we have been asking is that there should be a station provided at the nearest point to the Barwon, and then a large station would be required. We have been asking for a railway direct from Narrabri to Angledool, *via* Collarendabri.

1742. Going out by Gurleigh Point? By Gurleigh Point and Nowley.

1743. If it has been suggested by a witness that the line from Narrabri to Moree should go *via* Gurleigh Point and the travelling stock route, with a possible branch in the future from Gurleigh Point to Collarendabri, do you think that would be just what the people in your district would like? Yes; they would like that very much, with this difference—that our line would not be a branch, but a main line. It has an immense area of splendid land and water prospects which no one knows the value of.

1744. In the meantime until it is decided to take the line into Collarendabri from Gurleigh Point your district will be fairly served by a line going along the travelling stock reserve which you would intercept at Millie? Just so.

1745. Is very much of the trade going down towards Walgett? Nothing at all.

1746. Is it not a fact that the navigation of the river has been improved very considerably of late? When the river is up, of course, there is some traffic, but I am unaware of any improvements.

1747. When the river was up the railway would be idle? I do not think so. There is no danger of the river keeping up all the year round unless locks are put in. If the river were locked and weired then a traffic would spring up in consequence of the watering of the land.

1748. Do you know if any of the trade which you have included in your district would gravitate when the line is constructed? Not a very great deal of it.

1749. Where does the Mungindi traffic go to now? To Narrabri.

1750. The removal of the terminus to Moree would not intercept that traffic? It would, to a small extent, but not largely.

1751. Is settlement going on pretty largely out your way? All around it is, but the town itself is not much yet.

1752. Is your district very subject to floods? No. We had 2 feet of water over the township once within the last century, I believe. Our place is free from floods, as a rule, although we have heavy ones sometimes.

1753. Mr. O'Sullivan.] You say your district is not subject to floods? Not largely, but they are heavy sometimes.

1754. Is that not the region where the great "warrambool" exists? There is a warrambool between here and Collarendabri.

1755. We have a report by Mr. Jones, in which he says that 40 miles out of 60 miles of road were under water between Collarendabri and Angledool,—was that so? Beyond Collarendabri and Moongoola there is what you may call a swamp with watercourse which is flooded sometimes. It is situated between Angledool and Moongoola on the 60-mile track-swamp and watercourse, but I think it is only shallow at any time, and not more than (say) 10 miles across. Horses and even the mail coach managed it nearly all last winter.

1756. Where does the traffic from Angledool go? Through Collarendabri mostly.

1757. Down to Narrabri? There has been more wool going through Collarendabri this year than anyone would scarcely believe was possible. It has been a most remarkable year for traffic.

1758. If the railway is constructed *via* Gurleigh Point at some point on that line all this wool would be shipped and the stock trucked? Undoubtedly most of it would be. A good many remarks have been made that stock is not always trucked at the nearest station by a long way. I get dozens of notices of stock, and many go right away to Rylstone to truck instead of going to Narrabri.

Mr. F. C. Staveley.
23 Nov., 1893.

1759. *Mr. Ewing.*] The end in view is the development of the country? Decidedly.

1760. You, as a Collarendabri man, I gather, would bring the railway to Collarendabri, and put weirs or locks on the Darling? And the Barwon—yes; and extensive settlement would follow.

1761. Supposing that were done, where would the traffic go? We should not pray for a line, but should demand a direct one to Narrabri, and then a great deal would come this way.

1762. Supposing the Darling were locked, would the produce of the district go down the river? Not much of it. Why should it go right round to get back to Sydney or Newcastle?

1763. Are you aware that from Bourke, or rather further up the Darling, wool goes to Adelaide? No; it goes to Bourke, and is sent on to Sydney.

1764. You do not believe that any locking of the Darling would take the produce of that portion of the district right past Bourke; you believe it must develop by railway communication? It must be benefited by the locking of the river, and by railway communication. The district has a great future before it.

1765. You believe that if the river were locked the produce of the district would not go down the river? Not much; for the river would of course be worked continuously.

1766. What is the good of locking the river then—to get water to put on the land? Yes; I am a great irrigationist, and have been for many years.

1767. Not with the idea of using the river as one of the highways of traffic? No; I am not in favour of locking the river for navigation, because I think we have a better use for the water.

1768. You have stated that a tremendous quantity of Queensland wool has come through Collarendabri, *via* Angledool, this year;—what effect did the export duty on Queensland wool have on the traffic? I do not know. All I can say is that we have had an immense traffic—more wool than ever we thought would have gone down this way.

1769. Notwithstanding the imposition of a duty on wool by the Queensland Legislature? Perhaps it occurred before the duty was imposed. Personally I was not aware there was a duty.

1770. Has wool come very recently from Queensland? Not necessarily from Queensland. We get nearly all the company's station wool.

1771. *Mr. O'Sullivan.*] Is it a fact that steamers are going up to Collarendabri from Bourke and taking wool down to Bourke? Not from Collarendabri. The latest steamers have gone up to Walcott. They have not gone beyond Walgett for the last four months. The last wool taken down was from Dunglear. Mr. Campbell told me that he sent all his wool down by that way. It has cost £7 10s. to get wool to Sydney.

1772. Your contention is that all the wool and all the stock go to Narrabri? Yes.

1773. *Mr. Ewing.*] Do you know the river rates per ton for carrying wool? I have heard of them.

1774. Can you get them for the Committee? I think I can. I think the rate is £2.

1775. *Chairman.*] Is there anything else you desire to say? No.

Mr. William Duff, grazier, Millie, sworn, and examined:—

1776. *Chairman.*] Are you a brother of the proprietor of this hotel? Yes.

1777. What is your occupation? I am a grazier.

1778. Have you lived in the district long? Eleven years.

1779. What evidence do you desire to give? I will answer as clearly as possible any questions that may be put to me.

1780. Did you hear the other witnesses give their evidence? I did.

1781. Is there any other point which you wish to touch upon? Yes.

1782. Will you state the point? I have not heard any witness point out that in order to reach Woolbar station on the "red" line there are about 8 miles of scrub to go through in a distance of 13 miles. It is utterly impossible to ride a horse through parts of that scrub.

1783. Mr. Halse gave the Committee that information? I was not aware that he did. With regard to getting timber between Narrabri and Moree I have a thorough knowledge of the country, and I am prepared to state that between Narrabri and Moree, no timber can be got more cheaply than it can be brought from the other side of Narrabri on to this line.

1784. Have you ever been engaged in timber-getting? I have had a good deal to do with it.

1785. Have you ever done any sleeper-cutting? I have done a bit of splitting.

1786. From an intimate acquaintance with the country to the east of this line, you are prepared to assert that timber can be got quite as cheaply from Narrabri West railway station as from any point along the line? Far cheaper.

1787. Is there any other point you desire to bring out? No; only those two points.

Mr. W. Duff.
23 Nov., 1893.

FRIDAY, 24 NOVEMBER, 1893.

[The Sectional Committee met at the Court-house, Moree, at 10 a.m.]

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTON.

The Hon. JOHN DAVIES, C.M.G.

THOMAS THOMSON EWING, Esq.

WILLIAM McCOURT, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

HENRY DAWSON, Esq.

The Sectional Committee further considered the proposed Railway from Narrabri to Moree.

Mr. James Cornell, builder, and Mayor of Moree, sworn, and examined:—

1788. *Chairman.*] What is your occupation? I am a builder, and I am also Mayor of Moree.

1789. How long has Moree been incorporated? This is the third year. The municipality covers an area of 12½ square miles, contains 200 dwellings, and has 214 voters on its roll. The capital value of the property

Mr. J. Cornell.
24 Nov., 1893.

- Mr. J. Cornell.
24 Nov., 1893.
- property within the borough is estimated at £110,494. The population is estimated at 1,285 souls. The metalled roads measure 8 miles 20 chains and the cleared roads 25 miles 60 chains, making a total of 34 miles. The revenue this year is estimated at £501.
1790. Is that independent of the Government endowment? Yes.
1791. What is the expenditure? It is between £1,000 and £1,100 per annum.
1792. Have you any debt? £500.
1793. It has been expended on your roads? On the drainage of the town principally.
1794. It is secured, of course, on the rates? Yes. It is payable in 1895, and bears interest at the rate of 8 per cent.
1795. Is it payable to a bank? To Mr. Hill, of Mungyer.
1796. Is it contemplated by the borough to raise a further loan? Not at present. We do not require any additional loan.
1797. How long have you lived in the district? Eighteen years last September.
1798. You have seen a considerable growth take place? I have.
1799. Has the growth been more marked since the incorporation of the town? Decidedly.
1800. Do you know the route of the "red" line? I know the country generally.
1801. Do you know whether the "red" route is less liable to flood than the route called the travelling stock route? That I could not say.
1802. Do you know which route would serve the largest present population? I think the "red" line would.
1803. Is it not a fact that the "red" line only goes through about four large holdings? Yes.
1804. Is it not a fact that there is a considerable population a little to the west of the travelling stock route? Yes.
1805. Does it not follow, therefore, that the travelling stock route would serve a larger present population than the "red" route? It is very questionable whether the travelling stock route would, but I may say that I know very little about the land.
1806. Do you know anything about the land to the east under the hills? Nothing whatever of the land between the Namoi and the Gwydir.
1807. Do you know anything of the country to the north-east or north-west of Moree? Nothing whatever.
1808. Do you know if there is any marketable timber within a reasonable distance of Moree? Yes.
1809. In what direction is it? Towards Warialda and the Terry-Hie-Hie Ranges.
1810. How far would that timber be from Moree or the nearest point on this line? To Terry-Hie-Hie, perhaps 35 miles, and to Redbank, at the outside, 37 miles.
1811. What is the nature of the timber? It is ironbark.
1812. Is it of good quality and abundant? I have not seen any from the Redbank, but I am given to understand that it is high-class timber—the best that can be obtained.
1813. You have not seen the forest itself, but have seen the product? From Terry-Hie-Hie, I have.
1814. You have been in the forest at Terry-Hie-Hie? Yes; I have been in the mill.
1815. Which would be the nearest station to Terry-Hie-Hie? I think Tycannah would be. The mill is on Bowman's Creek.
1816. How far in a straight line would it be from that particular station—25 or 30 miles? I think between 20 and 30 miles. I understood the mail man to say it was 25 miles.
1817. There is an abundance of good ironbark there? Yes; in the ranges; hardwood is to be found there too.
1818. Moree is supplied from there now? Principally. It has been for a number of years.
1819. With all its ironbark? With all its ironbark and pine. Pine principally is the local material.
1820. Do pine and ironbark occur in the same ground? Yes.
1821. Are there any other forests within a reasonable distance of Moree? Not that I am aware of.
1822. I suppose you have no fear of Moree suddenly collapsing during the next few years? That is scarcely likely.
1823. It would be very awkward for the State if it spent £150,000 on a railway to Moree, and the bottom then dropped out of Moree? It would indeed. I may state that this last year private buildings alone have been erected in Moree to the value of £25,000. Considering that it has been "reconstruction" year, I think you will admit that it is not very likely that Moree will have its bottom knocked out.
1824. You think that it is likely to go on? I have every reason to believe it will continue. There does not seem to be any abatement.
1825. Moree is the nearest town of any importance to the Queensland border? Yes; it is the central point between Narrabri and the border.
1826. Have you given any consideration to the question of the betterment principle? Yes; I read the remarks which Mr. Lync made either in the House or outside.
1827. Do you think it is a correct and proper principle to adopt? It appears to me to be a very just one.
1828. Do you think that the people of this district who will be brought within the betterment area which is depicted on that map will be willing to accept the principle? I have every reason to believe that they will.
1829. Have you heard of anyone who objects to the application of the principle? No.
1830. Because, for instance, the other fellow got his line for nothing? No; none whatever.
1831. They are sufficiently patriotic, as well as anxious, for the construction of the railway, to be willing to be brought under the betterment principle? Yes.
1832. Are the people of the district generally prosperous? I think so.
1833. You have a number of banking institutions here? Yes—three.
1834. Have the people credit balances or overdrafts? I can only speak for myself; they did not reconstruct with any of my money.
1835. You would rather not express an opinion as to the possible trade to be drawn from the north-west, but will leave that question to be dealt with by other witnesses? Yes.
1836. Is there any timber to be got nearer than the places you refer to which would do for railway sleepers—not sleepers almost squared and polished, but split sleepers half-round and undressed? I have every reason to believe that you could obtain sleepers much nearer than the places I am speaking of. I think you could obtain sleepers at Dobikin scrub.
- 1837.

Mr.
J. Cornell.
24 Nov., 1893

1837. You have had no experience in providing sleepers? No.
1838. Your ordinary pine is considered the best timber for building? It is the best grown in the Colony.
1839. It is impervious to the white ant? Yes.
1840. Are all these buildings which you said are going up being built of pine? Yes.
1841. The framework and everything? Yes. It is a splendid timber. It only wants to be introduced to lead to a great trade.
1842. Is it true that the greater part of the timber for Moree is supplied from the south and south-west of Narrabri? Not the greater part of it, but a lot of timber has come here from Narrabri.
1843. As Narrabri is some 70 miles distant by road, and the forests are from some 10 to 20 miles south of Narrabri, how is it that you get your timber from Narrabri and south of that place, when you have forests within 30 or 35 miles of Moree? The proprietors of the mills regulate that.
1844. There is a ring even in this part of the world? Yes, something similar. We can put timber in Moree from Narrabri at about the same cost as we can get timber from the local mills. I do not mean timber in its rough state, but in its wrought state. Timber after it has passed through the planing machine at Narrabri, can be landed here at from 20s. to 20s. 6d. per 100 feet, and it costs a like amount to land timber from the local mill.
1845. I suppose that is because they have better appliances down Narrabri way? I suppose that is the reason.
1846. If the railway is constructed Narrabri will be able to supply you very much more cheaply, and that will put your local forest out in the cold still further? Yes; but the local forest will be available for different places.
1847. We shall not be able to reckon on getting the products of this forest for the railway? It is a certainty that if you construct the railway more timber will come from Narrabri than from the local mills.
1848. We cannot reckon on the timber you refer to as being likely to contribute to the railway revenue? Only the timber coming direct from Narrabri to Moree. I have had timber come from Narrabri to Goonall, which is only 32 miles from here. It paid better to get the timber from Narrabri than from Moree.
1849. Do you think the people of Moree would raise much objection to the line being diverted nearer to Millie, so as to catch the trade from the west? It would increase the length of the line.
1850. The Engineer-in-Chief estimates that it will cost £500 a mile more to take the line by the travelling stock route, besides 6½ miles extra haulage for all time;—do you think the people of Moree, and the district generally, which will be served, would object to that? I should think they would. It would be a terrible handicap for them to bear.
1851. But supposing that the greatest volume of trade will come from the west of Millie, and that it is absolutely necessary to get that trade in order to make the railway pay, what then? Is it a certainty?
1852. I am supposing that it will be the case? I have no reason to see why it should be the case.
1853. You believe the trade of Moree, and the district of which it is the centre, is by far more important than any other trade? I think so.
1854. *Mr. Dawson.*] Have you been much about Millie? Yes.
1855. How far would it be from Millie to Gurley or Woolabrar on the "red" line? I have not been to either station. I have only been to Millie, and right along the road to Narrabri. I have done very little travelling.
1856. Do you know the character of the country between Millie and Gurley, or Woolabrar? No. I think it is similar in character to the country between Millie and Dobikin.
1857. Is there any scrub between those places? No, only a few belar trees.
1858. If it has been stated that it is 13 miles between Gurley and Millie, and 13 miles between Woolabrar and Millie, and that there are 5 miles of scrub to go through in that distance, do you think the "red" line would get this traffic, or would it go on to Narrabri? The scrub is nothing to speak of. You can drive a team through it anywhere. But I hope you will bear in mind that it is some seventeen years since I was there.
1859. Would it be necessary to provide a travelling stock route to these different stations? Really I could not give you an opinion. I know nothing about stock.
1860. The travelling stock route, that is marked green on the map, is about 6 miles longer than the "red" line;—if it becomes necessary to provide travelling stock routes and tanks for stock coming from Korrangly to Gurley, or Tycannah, or Woolabrar, do you think the people here would object to having the line taken by the travelling stock route, and paying the extra 6 miles carriage? The handicap is placed not only on the people here, but on the people beyond Moree.
1861. If you handicap them with an extra 6 miles carriage for all time it would mean a handicap of 1s. a ton? That is a big handicap on the enormous amount of wool which comes from the Queensland border.
1862. On the other hand, if the people coming to Millie and coming along the travelling stock route, had to go through country with fat cattle without a travelling stock route, and they went on to Narrabri, you would lose all that traffic;—which would be the better of the two? They would be no worse off than they are now. They have creeks there.
1863. Might they not be a great deal better off with a line by the travelling stock route? The question is would it pay any better to bring it by the travelling stock route—I really could not give an opinion.
1864. *Mr. Davies.*] In the event of the line being constructed by the direct route, you think it would be the means of developing additional trade? I am sure it would.
1865. Do you anticipate a very large development of trade? I think you can make sure that there will be no loss of £900, as is estimated.
1866. Do you know the length of the road you would have to travel with stock and produce? I have always understood that it is 75 miles.
1867. Have you travelled the road yourself? I have travelled from Narrabri to Moree by the main road, and also round by Millie, which is not a main road.
1868. Do you know anything of the traffic which would be likely to be served by a line from Moree towards the Queensland border? No.
1869. Do you know anything about road-making? Only from the experience I have gained in the Council.

- Mr. J. Cornell.
24 Nov., 1893.
1870. The estimated cost of this line is £2,400 a mile;—do you know the cost per mile of an ordinary macadamised road? I should take it to be more than that sum.
1871. You regard a railway at a cost of £2,400 a mile as a very great advantage? Indeed I do. It costs 12s. 6d. to take a load of gravel—2½ cubic yards—to Tycannah, which is 12 miles from Moree, and the contract has to be a large one in order to get the gravel delivered at that price. That fact will give you an idea of what it would cost to make a road. There is no shingle suitable for road-making between Narrabri and Moree, except at the Bald Knob.
1872. Is there an abundant supply of this gravel? Any quantity here.
1873. The cost of gravel ballast for the line would be very reasonable? The Council have the gravel put on the road for 1s. 2½d. a yard.
1874. You have no broken ballast? This gravel makes splendid concrete, as you can see if you wish.
1875. It would do well for ballasting an ordinary line of railway? I think so.
1876. And it could be laid on the line at about 1s. 6d. per cubic yard? For less, I should imagine. If we can get it laid on the streets at 1s. 2½d. per cubic yard, in small contracts, I should imagine it could be put on the railway line at a considerably lower price.
1877. You are aware that the ballast is a very large item in the construction of a railway? Yes; I think we are favoured in this district.
1878. Are you aware that it is not only to be a cheap railway, but a railway which will not be worked at the usual rate of speed? I am.
1879. At a speed not exceeding 15 or 20 miles an hour? I suppose that would do us.
1880. Will a speed of 15 miles an hour serve the district well? I think so. I think the people of Moree and the district will be satisfied for some years to come with a speed of 15 miles an hour when it has taken them over three days to go 30 miles. I have known the coach to take three days and three nights to go from Millie to Moree. That fact will give you an idea of what the roads must be at times.
1881. The cost of maintaining the roads between Moree and Narrabri must be very great? Yes; perhaps you noticed, as you came along the road, that it is very little that the Department has done.
1882. I suppose if they did it would pass away? It would be throwing money away to put gravel down on this black soil plain.
1883. After the first heavy rains it would pass out of sight? Some gravel on our main road has gone out of sight.
1884. You favour the direct route as being the shortest and cheapest? It is the most suitable for Moree and the district.
1885. *Mr. O'Sullivan.*] When you say you favour the direct route, are you expressing the opinions of the people of Moree, or your own? My own, and what I have heard, of course.
1886. Have you had any public meetings? Yes; one on Wednesday evening.
1887. Did it decide in favour of the direct route? It was held to arrange for the evidence to be brought before this Committee.
1888. Has any resolution ever been carried to show that the people generally prefer the direct route? No; nor has a resolution been carried to show that they do not.
1889. You have a Railway League here? Yes.
1890. Is the League in favour of the direct route? That I cannot say. The Secretary of the League would be able to say.
1891. Is there a feeling abroad that they would be glad to get a railway by any route? Any way at all; from expressions I have heard the people would be very glad to get a tramway.
1892. The people will be glad to get a railway by any way, but you and others prefer a line by the direct route? I think so. I am speaking for the people to the north of Moree and out towards Mungindi. An enormous lot of wool comes in from that neighbourhood. It would be a great handicap on these people, and would divert the wool traffic to Queensland, as it was diverted before from the want of roads. Amos Brothers sent their wool by another road instead of by Moree, because the roads were impassable, and they could not get their wool to market quickly enough. If the railway is carried from Narrabri to Moree, and the route is 10 miles longer than the "red" line, it is reasonable to suppose that they would not pay 10 miles extra carriage if that payment could be avoided by sending their wool to Queensland.
1893. Moree is the natural centre for all these outlying places? Yes.
1894. And it is on the direct road to the nearest point on the railway? Yes.
1895. Therefore, all the graziers and selectors send their produce down by this way and get their stores back by this way? Yes.
1896. Does the Australian Pastoral Company, which has stations near the border, send its produce down this way? That I could not say.
1897. *Mr. McCourt.*] You stated that some gravel which had been placed on the road between Moree and Narrabri, and also on your streets, had disappeared? Yes.
1898. What thickness of gravel did you put on your streets—6 inches? A foot at starting. If you put on only 6 inches you would not see it at all soon.
1899. That thickness would be useless? Yes.
1900. Nothing less than 1 foot of gravel would carry any weight? I can show you one road which would be a very good guide to the Committee. It is about the worst land that you would have to go through from Moree to Narrabri for road-making. We have put 2 feet 6 inches of gravel on Dover-street, and it is almost impossible to see any now.
1901. That is the general character of the country between here and Narrabri? Yes; it is rotten land.
1902. If the Railway Construction Branch propose to put only 3 inches of ballast on this line, you think it is too little? I suppose they have some other way of doing it.
1903. If 1 foot or 2 feet will not carry ordinary wool traffic, do you think 3 inches will carry a 30 or 40-ton engine? We have no sleepers.
1904. Do you think that 3 inches will be sufficient on the line? I cannot offer an opinion about the ballast for a railway.
1905. At any rate, it takes 1 foot to do an ordinary road? For that particular road, bear in mind.
1906. That is a sample of the ordinary roads on which you put 1 foot of gravel? Yes, generally when we are starting to make a road.

1907. Otherwise they would be of no use? It depends on the nature of the land. You would be surprised at the amount of gravel that this particular road has taken.

1908. *Mr. Ewing.*] You have said that a station belonging to Amos Brothers, which used to send to Narrabri, now sends to Queensland? I understood that they were. I know that they were sending their wool by this way. They had nine, ten, or twelve teams coming along at once, and they used to bring their fodder out at Narrabri, leaving a portion at Moree, and going out with the remainder, and feeding back to Moree. I have been told that, instead of sending their wool down here, it is being sent by the Queensland road.

1909. Are you aware that the Queensland Legislature has imposed a duty in order to prevent Queensland wool from coming this way? Yes.

1910. It is since that duty was imposed, I presume, that Amos Brothers have sent their wool by the other way? No; I think it is some years since they commenced.

1911. It is possible that the Queensland Legislature may so legislate that Queensland wool will not come to Moree? Yes.

1912. Do you know anything about the Inverell or Warialda traffic? I have been there.

1913. What effect will a railway to Inverell have on Moree as a depôt? I do not think it will affect Moree in the slightest.

1914. Have you been to Goondiwindi? No.

1915. To Mungindi? No.

1916. To Collarenebri? No.

1917. To Walgett? Yes.

1918. What effect will the snagging of the Barwon have on Moree as a depôt? It cannot have the slightest effect.

1919. Do you not think that stuff which comes through Moree may go down the Barwon if it is snagged;—would Angledool wool pass over the Barwon and come here if the river were snagged? It would not come this way.

1920. Would Mungindi wool come this way? Mungindi wool and all out that way would come.

1921. But supposing it could go down the river in barges? I still think it would come this way.

1922. I suppose your attitude is that Moree is a depôt for a very large portion of this country, and that you should have the most direct line that it is possible to have to Narrabri? Yes.

1923. *Chairman.*] Is there any other information which you desire to give? No.

Mr. William Henry O'Malley Wood, District Surveyor, Moree, sworn, and examined:—

1924. *Chairman.*] You are the district surveyor, stationed at Moree? Yes.

1925. How long have you been stationed here? A little over three years.

1926. How far does your district extend? It is bounded on the north by the border of the Colony, on the west by the Narran River, on the south by Little Bumble Creek, and on the east by the eastern boundary of the Warialda land district.

1927. Is that far east? Fifteen or 20 miles.

1928. *Mr. Dawson.*] Do you know the three railway routes which are marked on this map? I do not know the Gurleigh Point route; I know the travelling-stock route; I have never followed the "red" route, but I know pretty well how it runs through the land in my district.

1929. You know the general character of the country? Yes.

1930. Is there much settlement at present on the "red" line? No; not very much.

1931. Is the character of the country such that if the line were constructed, people would be likely to settle there? The soil is all good, and the country valuable, but a large portion of that country is purchased by the Edgeroi Company, and the owners of Gurley.

1932. That map, as it is tinted, shows that a great deal of this "red" line goes through reserves? Some of that is out of my district.

1933. As far as your district is concerned, very little land along the line is alienated? As soon as the leasehold areas are thrown open, they will be very valuable land open for selection. The white patches represent valuable land.

1934. Is it likely to be settled upon? Yes; it will be rushed.

1935. What is the character of the country under the ranges, say 10 or 15 or 20 miles east of the line? The bulk of the country to the east of the road through Terry-Hie-Hie to a point known as the "wineshop," about 18 miles from Narrabri, is of a very inferior quality. There are some hills of inferior quality to the west of it, but there is a great deal of land of very good quality also.

1936. Unalienated? Yes; it is not in large areas, I think; it is in small patches. You would have to take bad country with good.

1937. I wish you to answer generally. Will it be sufficiently valuable to induce people to settle, and settle profitably there? Between the road quoted, and the railway line, it could be profitably settled upon.

1938. If the railway were constructed? Yes.

1939. Would the land grow grain of any sort? I believe it would; but it has not been used much for that purpose. There has been very little market for corn. In some places corn has been grown there.

1940. The land is locked up and will be thrown open at the end of next year;—supposing the railway is not constructed, will the people be likely to go there if the land is good? They would select the land certainly.

1941. Whether the railway is there or not? Yes.

1942. I take it that the railway will not create any more settlement there than if it is not constructed? It will be settled in either case, but some of it might be sold as a special area if the railway were constructed. More land might be sold as a special area than could be done if it were not constructed.

1943. You have gone 18 miles;—what is it from this point, 18 miles, towards Narrabri? It is outside my district, and I know very little about it.

1944. Do you know anything of the timber on the land in your district? From Terry-Hie-Hie, about 12 miles up the creek, the bulk of the timber is box-forest. There is a little ironbark through it, and near the road it is fairly open ground.

1945.

Mr.
J. Cornell.
24 Nov., 1893.

Mr. W. H.
O'M. Wood.
24 Nov., 1893.

- Mr. W. H. O'M. Wood.
24 Nov., 1893.
1945. Do you think you could get sleepers—not adzed sleepers, but half-round split or sawn sleepers for which you would not want so many large trees? I think you could get a certain number, but I cannot speak very positively on that point. I think you could get some timber at any rate suitable for the purpose.
1946. What would the sleepers cost, do you think, delivered on the line? I think they would cost from 9d. to 1s. a piece.
1947. From 9d. to 1s.? No, 9d. I was thinking of morticed posts when I said 1s. There is some carting to be paid.
1948. But a sleeper is a good deal bigger than a post? It is, but then it is not morticed. We pay 1s. for morticed posts. But my opinion on this subject is not worth as much as that of some other persons.
1949. Do you know the country about Millie and to the west of Millie? Not immediately to the west of Millie.
1950. Do you know the character of the country between Millie and the railway line? Not very well.
1951. Or between Millie and Gurley, or Woolabrar? I think I know it pretty well. I have not been carefully over it with a view of inspecting it. I know it is chiefly black soil.
1952. It is 12 or 13 miles from Millie to the line at either place? I have not been across that country. I could not give you any reliable evidence.
1953. For all the stock coming from the west you have a tank every few miles on the travelling-stock route from Moree to Narrabri? Yes.
1954. Would you have to put tanks between the travelling stock route and the "red" line? I think you would.
1955. That is for the stock to get on the line, say, at Gurley or Woolabrar? Yes; I think a water supply would have to be provided for travelling stock.
1956. Would the stock routes to the line have to be of the same width—a quarter or half a mile—as the travelling-stock route? On the main road the width varies very considerably;—in some places it is nearly a mile wide.
1957. Would it be necessary to have a travelling-stock route to each station? Undoubtedly. I may explain that the road leading west from Woolabrar station is outside my district. It would be necessary to have a travelling-stock route leading to Woolabrar. The accommodation already exists to Tycannah, but I am doubtful whether there is sufficient accommodation up to Gurley.
1958. Is there not a travelling stock route on Courallie Creek? The travelling-stock route is the nearest to the creek.
1959. I suppose there will be no difficulty in putting travelling areas there if you adopt the route? I think not.
1960. Which do you think, from a national point of view, would carry most stock, and, of course, make most money, independent, of course, of the people of Moree or to the north? I am inclined to think that the travelling-stock route would be the most advantageous route—it gets further away from the mountain ranges, and admits of reaching settlement so much further to the westward.
1961. You think the extra 6 miles which the Moree people and those north of Moree would have to travel would be amply compensated by the railway getting a great deal more traffic? In view of the short distance from Moree to the border I think it would, but if the border were many hundred miles further north I should not think so.
1962. The more stock you carry the lower the fares and the freights would be? Yes. The chief advantage I can see in going to Millie is that the line will run more through the centre of settlement; the "red" line will hug the hills a little closely for settlement.
1963. Do you think the people about Millie will go to Woolabrar or Gurley, a distance of 13 miles, and truck their stock, or go to Narrabri? I think they will go to Narrabri, a distance of 35 miles, and save the railway freight from Woolabrar to Narrabri.
1964. *Mr. Davies.*] How many acres of unalienated land in your district will be served by this railway? I cannot say without referring to the maps and records.
1965. Can you not give a rough estimate from the map on the wall? It would be merely a guess.
1966. Can you not state approximately the number of acres that will be available for sale or selection, taking into account the leases which will fall in in 1895? I can supply the exact information to-morrow morning.
1967. What will be the increased value given to the land in your district which will be available for sale by the construction of this railway? I think the Crown lands, within, say, 12 miles of the railway on each side, will be increased by about one third.
1968. What value do you place on the land, supposing it were available? The land within that distance of the line as we sell it in special areas, and so on, is, I think, worth 30s. an acre. Some has brought as high as £2.
1969. You say, that if the railway is constructed, the land within a radius of 12 miles from the line would be worth £4 or £5 an acre? No; I think that land worth 30s. an acre would be worth about 40s. an acre.
1970. It would only increase the value of the land to the extent of 10s. an acre? Except in special places. In favoured places it would bring more. It would bring £2 10s., or £3 an acre.
1971. The increased value would extend to all those holdings which will be served by the railway? It spreads outwards from large figures to such small figures, that it will be most difficult to estimate.
1972. Coming back to the "red" line, do you think it will serve the settled population along the route? I do not think it would serve the settlement as well as the travelling-stock route.
1973. What do you think would be a fair service to the selectors and pastoral tenants on either side of the railway—15 or 20 miles? Those engaged in the pastoral industry would, I think, be well served up to 25 miles, and fairly served up to 50 miles.
1974. And in regard to selectors? With agricultural selectors it would be different, for every mile makes a difference in the cartage of their cereals.
1975. Is it not a fact, that most of the selectors along the proposed line are small pastoralists? Yes.
1976. Practically, these selectors are the same as squatters, but in a smaller degree? Yes.
1977. A railway within 20 miles would serve any pastoralist, or practically, any settler? Yes.
1978. Very little agriculture is carried on here? Very little.
1979. Not much wheat is grown? No; it has only been grown in a few places as an experiment.
1980. They prefer sheep-farming, because it pays best? Yes; there is no market, except the local market for hay or grain.

1981. During your residence you have had an opportunity of forming an opinion as to the prosperity of the settlers? Yes. Mr. W. H. O'M. Wood.
1982. They have had fairly good seasons in your time? Except in 1890, when they suffered more or less from floods. 24 Nov., 1893.
1983. It is a fairly prosperous live district? It is a very prosperous district.
1984. And a very great impetus would be given to the prosperity of the district by the railway? Yes; more particularly with reference to the settlement of the leasehold areas throughout the whole of the country to the east of the Barwon.
1985. You stated that it would be better to adopt the travelling-stock route, so as to serve a larger number of settlers;—but supposing that the direct line is in many cases only 12 or 14 miles distant from the settlers, and that it is the shortest and cheapest route, and that, in your opinion, 25 miles from a station is a fair service for ordinary settlers, do you think it would be any great inconvenience to the settlers if they had to go from Millie to Woolabrar—a distance of from 12 to 15 miles? Well, supposing the band through which the railway passes is 50 miles wide, I think we would take in within that 25 miles of the line a large piece of mountain country.
1986. Do you know the country well through which the “red” line passes? I have never followed the route along. I have crossed the route in various parts, but have not made a special inspection of it.
1987. Is it the highest and driest land through the district? I am inclined to think it would be higher and drier than any land to the west.
1988. The land all along the travelling-stock route is very much lower? As you near the hills you get the slopes from the hills.
1989. The land on the travelling-stock route is lower, and is more likely to be subject to floods? It is lower, and it is more likely to be wet and sloppy.
1990. Any fall must go in that direction? Yes.
1991. It would be more expensive to construct a line through such country than on the higher and drier land? Of course you would have more water to accommodate.
1992. Your primary objection to the “red” line is that it hugs the hills too much? Yes.
1993. But still it has the advantage of being dry and solid for railway construction? It is drier. One could not tell, without making a careful examination of the country, whether it would be very much less expensive. I think the probabilities are that it would be more expensive.
1994. It is estimated that a line by the travelling-stock route will cost £500 a mile more than a line by the “red” route;—are you aware that that estimate has been made by the Engineer-in-Chief? I was not aware of it.
1995. In your opinion, is that a high or a reasonable estimate? I do not think that my opinion would be worth anything. I really could not express an opinion without seeing the figures or some data.
1996. Do you think it would be wise to lengthen a cheap line to the extent of $6\frac{1}{2}$ miles, by adopting the travelling-stock route at an additional cost of £500 a mile for the total length? If it be a question of serving the country and settlement I should think it would be wise. But if it were a through line I should express a very different opinion.
1997. Would you handicap the people of Moree, and the people in the district of Moree, with the additional expenditure on the line, and with the increased freight and fare? I am inclined to think it would be warranted, owing to the fact that we should get more traffic from the west.
1998. You are of opinion that it would be wise to adopt the travelling-stock route, notwithstanding the increased cost and increased length of the railway? Yes; owing to the increased trade which might be brought to the railway.
1999. You know the district of Moree thoroughly, I presume? My occupation takes me about in all parts.
2000. Supposing the railway is extended by either the direct route or the travelling-stock route to what extent would it develop traffic and trade in this district? It would be very difficult to estimate what increase would take place in the traffic and trade. This is not a matter that I should ordinarily bother about, but I did make some inquiries during the last few days at Boggabilla, and I found that from our side the McIntyre some 3,000 bales of wool have gone up during the last three years by Warwick to Brisbane for transshipment to Sydney.
2001. How far is it from the McIntyre to Warwick, and thence by train to Sydney? I was told that it is 145 miles from Warwick to Goondiwindi.
2002. Would it not be more direct to send the wool *via* Moree to Newcastle or Sydney? I was told that the Railway Commissioners in Queensland have given the station people some special advantages. But even with these advantages that they have got some of the lessees I spoke to, and a big scourer told me, that they would send their wool this way if the railway were extended to Moree.
2003. You think that a large additional traffic would be created by the railway? Yes; but that increase does not represent all the increase which would take place. A good deal of trade would come in from the other side of the border. The country to the north of the McIntyre is very much flooded. Until a Queensland railway is constructed to Goondiwindi, the chances are, I think, that we would get a considerable portion of the Queensland goods traffic.
2004. *Chairman.*] Provided that no official barriers are placed in the way? Yes.
2005. *Mr. Davies.*] You think that a large additional traffic would come from the Queensland side if our railway system were extended to Moree? I think so. It would also lead to a great increase to the railway revenue in this sense; that a great deal of the fat stock and wool which now go to Tamworth, and to stations much further down the Northern line, would come here, and the railway would get the benefit of the additional trainage.
2006. *Mr. O'Sullivan.*] You have to travel to Goondiwindi as well as towards Collarenebri? To both.
2007. What is your opinion of the character of the settlement—is it permanent? Where it is *bona fide* it is permanent. Where the selectors select in their own interest, there is no doubt that they can live on the land, and do well.
2008. Do you think there is much settlement which is not *bona fide*? I think that occurs all over the Colony.
2009. Do you think it is particularly strong up this way? I do not think it is particularly strong, but it exists here as well as everywhere else.
2010. Is it stronger here than it is in other districts? I think not.

Mr. W. H.
O'M. Wood.
24 Nov., 1893.

2011. Is there much room for settlement out towards Collareendabri? There is a great deal of room, but the country is not nearly as good. The rainfall is lower, the country is more flooded in high floods, and there is less prospect of agriculture in that district than in the Boggabilla District.*

2012. How far does settlement extend from Millie out that way? There are selections taken up right to the Barwon—right over to Collareendabri.

2013. Would the selectors out there be likely to come into this line, or would they go to Narrabri? If the railway were extended by the direct route, I think the bulk of them would go to Narrabri.

2014. You stated just now that the land towards Collareendabri is inferior;—did you compare that land with the land round Moree, or with the land out towards Goondiwindi? It is inferior to both. It has a rainfall of only 18 or 19 inches, as compared with a rainfall of 24 inches at Moree and 26 inches at Goondiwindi. But in addition to all that, it is nearer to the Barwon, and is flooded by the waters from the Barwon. If the Barwon is in flood, large tracts of country on the frontage to the river, and extending miles back, are submerged for some days.

2015. Consequently, the land to the north is less liable to be flooded than the land about Collareendabri? Not nearly so. Some of the country west of a line produced north of Moree is very much flooded.

2016. About what point? A good deal of the Gil Gil country is flooded. The Whalan country is flooded.

2017. Is the Gil Gil country as badly flooded as the country about Collareendabri? I think it is, or very nearly so. I am referring to the lower Gil Gil; the higher Gil Gil is not.

2018. In referring to the Gil Gil country, you do not mean the upper Gil Gil country, but the country towards the Barwon? The country in a north-westerly direction from here.

2019. Do you think the selectors and graziers you speak of between Millie and Collareendabri would be induced to come into a railway station at Millie in the belief that 13 miles would make all the difference? If a station were placed at Millie, on the travelling stock route, they would have to go there. They go in by that way in going from Collareendabri.

2020. They have another road to Narrabri? They have; but a great deal of the traffic goes past Millie, and I think they would all go to Narrabri if the railway station were placed at Woolabrar.

2021. Having come so far to Millie, do you not think that they would be inclined to go another 12 or 13 miles to tap the railway at Woolabrar instead of going on to Narrabri, a distance of 35 miles? They have 20 miles more, you see, to go with the teams; they have a travelling stock route all the way; they would save the carriage on the railway up to Narrabri, and I think the probabilities are that they would go to Narrabri.

2022. Would not the graziers have to pay more for the carriage of their wool by road to Narrabri than *via* Woolabrar to Narrabri? They might have to pay a little more. I could not tell unless I knew what the figures were.

2023. I presume that if the carriers got instructions from the graziers to strike the line at the nearest station they would be compelled to go there? Of course they would.

2024. And they would be likely to get those instructions if the carriage by team was less than the freight by rail to Narrabri? I think it is purely a matter of cost.

2025. Which do you think would serve that district best—a line by the travelling stock route from Narrabri to Moree, or a line by the direct route with a branch from Woolabrar out towards Collareendabri before it reaches the flooded country? I think the latter would answer better than any other arrangement. I think it would be the most suitable arrangement possible; because the very country I would wish to spread the line westward for would be served by such a line, and the traffic from Moree would be saved the carriage over the extra length of 6½ miles, and the cost of constructing the extra length would be saved.

2026. Such a line would not only give better accommodation to the people west of Millie, but it might also attract trade down by way of Angledool? Yes; more particularly in dry seasons.

2027. Reverting back to Goondiwindi,—there is ample room there for settlement? There is not very much on the resumed areas, but there is on the leasehold areas.

2028. According to the indications on this map there is a good deal of leasehold land there? Yes; but a lot of the land which is shown as white is scrub country with very rich soil. A great deal of it is red and chocolate soil suitable for wheat-growing. It would ultimately be very valuable land.

2029. If the railway should be extended from Moree to Goondiwindi, it would possibly open up a good wheat-growing country? I think it is very probable. Cultivation has been practised more in the neighbourhood of Boggabilla than anywhere about here.

2030. Do you know the stations of the Australian Pastoral Company—Darc-Dareel? It is across from Mungindi.

2031. The company have some very large holdings representing some millions of acres? Yes.

2032. Do they send their wool by way of Moree, or Brisbane? I could not say. I think the line you suggested towards Collareendabri would reach that traffic. I think it would probably go without that line past Mungindi to Moree.

2033. Have you ever heard the expressions “dry-weather road” and “wet-weather road” used to indicate two different roads to Moree—one to be travelled in dry weather, and the other to be travelled in wet weather? I never heard that expression used.

2034. In dry weather it is better to travel the travelling stock route, but in wet weather it is advisable to take the mountain road? In the winter of 1890 nearly all the heavy traffic which came to Moree came by the mountain road.

2035. That winter, when there were such severe floods, would be a very good test of the character of the two roads in wet weather? Yes.

2036. If the people were compelled to travel by that road owing to the floods, is it not possible that a flood may come and wash away a railway line on the travelling stock route? It was not so much the floods which prevented the traffic from going along the travelling stock route, but the nature of the soil. The black soil was wet and sodden during that winter. Rain had followed rain.

2037. The water does not flow very rapidly, but lies a long while on the ground? Yes. The rains followed so soon after each other that it could not dry.

2038. The travelling stock route is almost in the very basin of that country? I could not say that. The water flows westerly to the Barwon. You are crossing the watershed going all the way from Narrabri to Moree.

2039

* Note (on revision):—I intended to compare land at Collareendabri with that at Boggabilla, which is on the eastern side of the district.

Mr. W. H.
O'M. Wood.
24 Nov., 1893.

2039. Between the red line and the mountains, are there any thick scrubs? There are some, but chiefly on the east side of Terry-Hie-Hie road.

2040. How far would that be from the proposed railway? About 16 or 17 miles at the widest point.

2041. Do the scrubs extend very far? It is scrub right up into the hills.

2042. Some of these scrubs are on the leasehold areas? Some of the leasehold and the resumed area still left is scrub.

2043. Do you think these scrubs would impede settlement at any time? For a time, certainly. While there is good open land people will not take up scrub country, but ultimately I believe all that land will be selected, with the exception of the poor, rocky country.

2044. What would it cost per acre to clear it? If cleared as a scrub lease, it ought to be cleared, I think, for 5s. or 6s.—perhaps 5s.; but to root up the trees and destroy them straight away it would run into pounds. To clear for cultivation straight away it would cost not less than £4 or £5 an acre, I think, probably a good deal more.

2045. Suppose these scrub lands were offered on scrub leases, do you think they would be availed of? They are open now to scrub lease. An application was lodged a short time ago for a lot of this country on a scrub lease, but it was withdrawn, as the applicant had suited himself by buying another property.

2046. I suppose we shall have to wait until all the good land is selected before we are likely to see the scrub lands settled on? They can be taken up on scrub leases. They are not likely to be taken by conditional purchasers or conditional lessees until the other land is selected.

2047. If the scrub were cleared it would prove pretty good agricultural country? The land is very rich. There are some sandstone spurs of poor quality. Some of the knobs are of basaltic formation, but too rocky to cultivate.

2048. What colour is the soil? It is black chiefly; there is some chocolate.

2049. *Mr. McCourt.*] What is about the average size of the selections in your district? The selections nearly all run in family groups. I think the average size of a family holding would not be less than 5,000 acres—probably between 5,000 and 7,000 acres.

2050. The individual selections are nearly all of the maximum area wherever it is possible? There are some families holding as much as 10,000 and 20,000 acres.

2051. Taking a radius of 10 miles around Moree, how many of these holdings would there be likely to be? It would be very hard to answer the question, even approximately.

2052. Is Warialda in your district? Yes.

2053. Would much of the Warialda traffic come into Moree? If there were no railway to Inverell it would.

2054. But if a railway were constructed to Inverell, would the whole of the Warialda district traffic go to Inverell? I think the whole of the traffic of the township of Warialda would go to Inverell, but not the whole of the traffic of the district.

2055. From about how far on the other side of Warialda would traffic be attracted to Moree? I do not think more than about 20 miles beyond Warialda, assuming that there is no line to Inverell. That would be about halfway between here and Glen Innes. I think the traffic halfway would come here, because we can provide them with better accommodation for travelling stock than they can in the settled districts. Otherwise, I think they would gain a little in distance by going to Glen Innes.

2056. Presuming that this line were not constructed to Moree, and that a line were constructed to Inverell, how far would that line attract traffic from this way? As far as Yetman—perhaps a little further down the McIntyre; and it might go, perhaps, from 24 miles on this side of Warialda.

2057. If the Inverell line, as well as the Moree line, were constructed, those lines would be essentially competing lines for the traffic over that 40 miles of country? I scarcely know whether they would compete very much. Wherever you are in the country you go to the nearest line.

2058. If both lines were constructed, would they not compete for the traffic of this 40 miles of country? I do not fancy that there would be any competition. It is not as if the lines were constructed by private enterprise.

2059. But you have stated that if the Inverell line were not constructed, and the Moree line were constructed, the latter would draw traffic from 20 miles east of Warialda, because Moree would be nearer than Glen Innes? Yes.

2060. Supposing that a railway were constructed to Inverell, would you not lose the traffic of 20 miles of country? Yes.

2061. So that they would be competing lines? We would be competing to that extent that we should lose something.

2062. *Mr. Ewing.*] I presume you would favour a railway to Moree, because it is a depôt for a certain portion of country? Yes.

2063. The country for which it is the depôt at present would be bounded on the east by a line halfway between here and Glen Innes, on the north by the McIntyre, on the west by the Barwon, and perhaps west of the Barwon? Yes.

2064. You would get as much Queensland traffic as Queensland legislation would permit you to get? Yes.

2065. Moree being a depôt for such a large area of country, do you think it is fair to ask all that produce to go 6 miles further round to reach Narrabri? Of course it is a loss, but you have to look at the other gain. In view of all the gain, I think it would be advisable to make it by that route.

2066. If you have one territory to the west, and another territory to the north, does it not appear to be reasonable to deal with those territories by two lines rather than by one? Yes; if you do that it will save the necessity for a curved line.

2067. Is the territory which you have described, and for which Moree is now the depôt, sufficient to justify the adoption of the nearest route to market? If the branch line referred to were made, I think it would be.

2068. Railways are not built for to-day only, but with regard to the development of the country for all time? Yes.

2069. If the country towards Collarenebri is sufficient to ever justify the construction of a railway, it is best to put this railway in the position which will always be the best position? Yes.

2070. Therefore it appears that the direct line would be the better one? I think that a branch line would be the best service for the whole district.*

2071.

* NOTE (on revision).—I meant here that a direct line to Moree, and branch to Collarenebri, would be the best service.

- Mr. W. H. O'M. Wood.
24 Nov., 1893.
2071. In the immediate future it is probable that a railway will be constructed to Inverell, and it is also probable that the Barwon may be snagged. Do you expect to see boats go permanently to Mungindi? If the river were snagged and locked, undoubtedly they could go with safety.
2072. Do you believe the Barwon is of sufficient importance there to lock it? Yes.
2073. You regard that in the immediate future we shall have a different state of things with a railway to Inverell and the Barwon snagged? Yes.
2074. How will the area for which Moree is the depôt stand then? Moree then will be bounded by a line halfway between Moree and Inverell on the east. The river would only take goods traffic. It would never take stock. It would be hard to say how far the trade line would come up towards Moree, but I think you may say a line about halfway between the Barwon and Moree, because water traffic is much less than railway traffic as a rule. It would come fully halfway for the goods traffic, but I think the stock traffic would still remain as it is.
2075. Therefore, Moree becomes a depôt for trade 40 miles to the east and about 50 miles to the west and north? Yes.
2076. That appears to you to be the reasonable development of the country? Yes.
2077. The Moree district, in your opinion, is still large enough to be entitled to a direct way to market? Yes. When that time arrives, I think the amount of fat stock traffic along the Moree line will be very greatly increased. Again, in the times of drought, stock going through this centre to New England will be very considerable.
2078. I presume, that you can give no opinion with regard to the effect of Queensland legislation? No.
2079. Do you know anything about artesian water in the district? There have been no experiments tried on this side of the Barwon.
2080. It is problematical? It is. Close to the Barwon they have struck artesian water at a great depth.
2081. You do not know the formation? No; the formation to the east of Moree—some 14 or 15 miles—is, I think, sandstone. The sandstone formation is deep, but it has been struck in wells.
2082. You arrived at your opinion with regard to railway-sleepers from a comparison with posts? Yes.
2083. That may be altogether misleading? Yes.
2084. You know nothing, in point of fact, about this timber, to give an opinion as to railway-sleepers? No, not in that locality.

Mr. John Thomas Crane, Council Clerk, Moree, sworn, and examined:—

- Mr. J. T. Crane.
24 Nov., 1893.
2085. *Chairman.*] You are the Council Clerk of Moree? Yes.
2086. You are also the Secretary of the Stock Board? Acting Secretary.
2087. *Mr. Suttor.*] Have you considered the question of this line from Narrabri to Moree? I have considered the question chiefly in connection with the trade which will come from across the border and the Boggabilla portion of our district, but which now goes to Cambooya or Warwick, on the Queensland railways.
2088. Where is Boggabilla? It is a New South Wales township, 5 miles from Goondiwindi.
2089. What trade do you expect to get from there by this line? Within our own Colony, about 3,000 bales of wool.
2090. Any sheep or cattle? Yes; but the stock trade we get now pretty well. It is wool chiefly which goes out of the Colony.
2091. Have you any other trade besides? I think the wool from such stations as Callandoon and Welltown, which graze about 200,000 sheep, will also come this way, unless the border-tax is raised.
2092. Where are those stations? On the Queensland side of the McIntyre, below Goondiwindi. Last month I saw some wool going through which had paid the border duty in order to come this way. It came from Dareel—not the company's Dareel, but the leasehold of Dareel.
2093. Do you think a great deal more wool would come to Moree if this line were constructed? Yes.
2094. How much more? I think that about 3,000 bales of New South Wales wool which now goes across the border to Cambooya would come this way. I also think that about 2,000 bales of Queensland wool, which goes chiefly to Cambooya and Warwick, would come this way.
2095. What is Cambooya? It is a trucking-place on the Charleville line. Warwick is the trucking-place on the other line. I have visited most of the properties on this side of the border during shearing time, and I know from the owners themselves that they would send to Moree.
2096. Have you any idea of the number of bales which would be likely to come here to be shipped to Sydney, other than those you spoke of on this side of the border? I think on this side of the border about 3,000 bales.
2097. Are many sheep and cattle likely to be trucked here? A number of sheep and cattle which come from that part, and which now truck at Narrabri, would truck here, but it would not be new business altogether, such as the wool, which all goes out of the Colony. The sheep and cattle chiefly go to Narrabri now, on account of the better stock route.
2098. *Mr. Davies.*] Have any of the pastoral tenants who you say are likely to send their wool by this railway been summoned to give evidence before this Committee? We have not had an opportunity to communicate with any of them since we were apprised of the exact date on which the Committee would sit here, but there is a gentleman here from that locality who will give evidence.
2099. Your statements, of course, are only hearsay? What I have been told by the people themselves.
2100. Would it not be better that some of these gentlemen should give evidence themselves? There is a gentleman here who lives amongst them and sees their wool coming over this way.
2101. Can you give the names of the owners, and the area of their holdings? On this side of the border Carrigan Brothers—the firm of J. P. Carrigan, and O. E. Carrigan and the firm of J. F. Carrigan and A. N. Carrigan—shear 17,000 sheep.
2102. Have you personally seen the persons whose names you are about to quote, and been informed by them that in the event of this line being constructed to Moree they will send by this way the wool which they now send to Queensland? Yes.
2103. Will you now give the other names? Robert Cook, 4,000 sheep; R. Y. Holmes, 5,000 sheep; R. D. Gordon, 4,000 sheep; Hooper and Barnett, 25,000 sheep—whether that wool would come this way would

would depend a good deal on the McIntyre being fordable; they can get to Warwick station. C. W. Bailey, 2,500 sheep; A. Knauf, 1,000 sheep; Brown Brothers, 60,000 sheep; estate of the late Mr. Walker (Borong), 30,000 sheep; Allan Brothers, 6,000 sheep; Holmes Brothers, 2,000 sheep; McMillan and Ryan, 5,000 sheep; Wilson Brothers, 7,000 sheep; the estate of the late Mr. Woods, 2,000 sheep; Phillips, 2,000 sheep; John Walsh, 5,000 sheep; Robertson and Brady, 4,000 sheep; and Boobera station, about 30,000 sheep.

Mr.
J. T. Crane.
24 Nov., 1893.

2104. Any others? Those are all selectors and squatters on this side of the border.
2105. Who at present send their wool to Queensland? Yes.
2106. Have you made up the total number of bales of wool? I include in my estimate Welltown station, which has about 150,000 sheep, and Callandoon station, which has about 30,000 sheep—on the other side of the border—as they are only 70 miles from Moree as against 140 miles from the nearest station on the Queensland railway. These persons hold about 395,000 sheep in all.
2107. How much wool do you think goes to Queensland from those sheep? About 5,200 bales.
2108. In the event of this railway being constructed, it would come to Moree and be shipped to either Newcastle or Sydney? Yes.
2109. From your position as acting Secretary of the Stock Board, you are sure of the accuracy of these figures? Yes. Some of the figures are only approximate, because the holdings are in the Warialda district; but they are within 1,000 or 2,000 of the proper number.
2110. Do you know the country through which the "red" line runs? I have never followed the line, but I have a general knowledge of the country.
2111. You also know the travelling stock route? Well.
2112. Are you aware how much the latter route is longer than the former? About 6 miles.
2113. Do you think the squatters and selectors to whom you have just referred would be willing to pay the additional freight for those 6 miles, or do you think they would prefer to have a direct line which would shorten the distance and reduce the freight? They would certainly prefer the shortest and cheapest line.
2114. Do you think a line by the travelling stock route would have any influence in preventing some of the wool and stock you have mentioned from coming to Moree? I cannot say that it would with regard to those properties I have mentioned, but certainly the shorter and cheaper the route the more trade you will draw from that quarter.
2115. You believe the shorter and cheaper route is most likely to influence the squatters and selectors to send their produce direct from Moree to Sydney? Yes.
2116. You favour the direct line in preference to the line by the travelling stock route? From a national standpoint the direct line is the best—for this reason, that I do not think that the increased traffic at Millie would pay the interest on the cost of the deviation.
2117. Do you think that the trade which might be got at Millie, supposing the railway were taken in that direction, would be equal to the trade which might be induced from our own border by a direct line? Yes.
2118. Do you think the influence in favour of the shorter line, and the trade that would be drawn from beyond Moree to the Queensland border, would be greater than that which might be obtained if it went round by Millie? Yes. I think that what you will drop at Millie you will pick up at Narrabri.
2119. Would the one compensate for the other, or would the trade of Moree be much larger than what you might lose at Millie by taking the direct route? I think you would gain as much at this end as you would lose at Millie. You might possibly lose some clips altogether by making an expensive line to Narrabri.
2120. You would only lose the difference in the freight from Millie to Narrabri? Yes; the freight for 45 miles.
2121. From a national standpoint you think that the direct route is more likely to develop a larger trade and secure the whole of the trade proper to the district of Moree than would a loop line? Yes.
2122. Are you aware that the Engineer-in-Chief estimates that a line by the travelling stock route will cost not less than £500 a mile more than a line by the direct route, which is estimated to cost £2,400 a mile? I have heard a statement to that effect.
2123. Do you think that in order to serve the people of Millie that expenditure would be justifiable? No; I do not think the increased trade got at Millie would pay the interest on the increased cost of constructing the line by that route.
2124. How long have you been council clerk? Two years.
2125. What has been the increase in the value of the properties in the borough during this year as compared with the previous year? I have not the figures at hand; but as regards the rates I may say that as against a revenue of £459 from this source last year we have received £501 this year. In a good many cases the assessment has been reduced, owing to the depression. The land is not so valuable as it was twelve months ago, in my opinion. I valued the properties. The increase in the revenue is due to the increase in the number of the buildings within the township.
2126. How many buildings, shops, and dwellings have been erected this year? I could not tell you without reference to the books, but there has been a large increase.
2127. Is it likely to continue? I think there will be an increase from time to time, but not so large an increase as we have had during the last year, and which, I think, has been largely in anticipation of the railway coming here.
2128. What rate do you strike? One shilling in the £.
2129. Has it been reduced? No; we are in debt.
2130. Has there been any marked depreciation in the value of property during the last twelve months? No.
2131. Although only three years in existence, the borough has a debt of £500? As against a loan of £500 we have a credit balance at the bank of £300, so that we really owe only £200.
2132. You receive the Government subsidy of £ for £? Yes.
2133. You are getting no interest on your credit balance? Not at present.
2134. That is rather bad financing? At the end of the year we propose to reduce the debt of £50 by £150. There are works in operation which will absorb the balance of the credit balance.
2135. Is there a great abundance of river gravel here? Yes.

Mr.
J. T. Crane.
24 Nov., 1893.

2136. How much per cubic yard does it cost to lay and spread gravel on your streets? It costs from 1s. 3d., for streets adjacent to the river, up to 1s. 9d. or 1s. 10d.—even 2s. for streets in the far end in the municipality.

2137. Would 2s. 6d. be regarded as a fair and reasonable price at which to get gravel ballast for the railway within a reasonable distance? It would depend on the means of carriage. If carried by carts for 8 or 10 miles it would cost a great deal more, but up to a distance of about 3 miles it could be done at 2s. 6d. It is considerably lower than it has been done of late years, as there are numerous carters wanting work.

2138. Do you know of any timber fit for railway sleepers in the district, or on the route of the railway? I do not know anything of the timber exactly on the line.

2139. Have you any further reason to advance in favour of the railway? I have only to point out that a number of stations which now send their wool to Tamworth or Glen Innes would send their wool here, and the difference in the freight between Narrabri and Sydney would go to the railway.

2140. Have you any idea of the quantity? I think it would be about 500 tons.

2141. It would come to Moree from these stations? Yes.

2141½. *Mr. O'Sullivan.*] Are they fat or store sheep that are brought down from the Queensland side through Moree to Narrabri? I have never seen store sheep trucked.

2142. They are not likely to travel on to Narrabri, even if the line goes to Moree? I do not think so.

2143. Is the country between Moree and Narrabri very expensive country to travel stock over? Yes; on account of the numerous public watering-places.

2144. The country between Moree and the border is pretty well supplied with natural water? Yes.

2145. But the country between Moree and Narrabri is supplied with water from Government tanks, for which water the drovers have to pay? There has been plenty of natural water during the last four or five years, but they have had to pay just the same.

2145½. That will be an argument to go to show that the stock will be shipped at Moree if the terminus is shifted to that town. Do you know anything about the Australian Pastoral Company? I know the locality of their stations.

2146. Where do they send their wool now? I have seen some of their clips going through Moree. I have met some of it crossing the "Watercourse," about 60 miles from Moree, and going to Narrabri. But I believe the greater quantity of their wool goes to Brisbane.

2147. You think the construction of this railway will bring that trade here? It will bring a good deal. It will bring all the wool grown on the land about Mungindi. I think the wool which is grown lower down the river will not come here unless the "Watercourse" is dry.

2148. Are they not talking of erecting large sheds and appliances at Dareel? I am not aware that they are.

2149. This district is very free from diseases in sheep? Very free.

2150. The sheep have had no very serious attacks, at all events? No. I have not heard of any serious disease in sheep during the last seven years, since I have been in the district.

2151. It may therefore be regarded as a very reliable pastoral district? Yes.

2151½. You stated that some 3,000 bales of New South Wales wool went across the border to Cambooya or Warwick. As it is much shorter to Brisbane by rail than it would be to Sydney, you think the shorter distance would not still attract that wool to Brisbane? From the stations I named to Cambooya—the distance is 140 miles, and all these stations are within a distance of from 65 to 90 miles of Moree. There is a new road being opened to Boggabilla, which is 18 miles shorter than the present road.

2152. Moree is 400 miles from Sydney, Cambooya is about 146 miles from Brisbane, and I suppose Warwick is about 160 miles from Brisbane? I am not sure of the distance.

2153. Will not the shorter distance to be travelled on the Queensland railways always give Queensland an advantage in the competition for the carriage of this wool? Certainly, it will give them an advantage, but I do not think that it will give them sufficient advantage to attract wool over the border. The owners of 200,000 sheep I named are on this side of the border.

2154. Moree will become their trucking place without a doubt? Yes.

2155. *Mr. McCourt.*] You stated that 500 tons of loading which now goes to Tamworth would go by this railway if it were constructed. Where would that loading come from? Tullooona runs 110,000 sheep; Yallaroi, 80,000 sheep; Gunyerwarildi, 30,000 sheep; and selectors on Gunyerwarildi, 50,000 sheep. These 270,000 sheep produce about 3,510 bales, equal to 526 tons, on which, in my opinion, a gain of about 30s. per ton in freight would be made on the difference between Moree and Tamworth; that is, allowing 18s. as the carriage from Moree to Narrabri. From Narrabri to Sydney the freight is £4 7s. 1d. per ton; from Tamworth to Sydney it is £3 15s. 10d. per ton, and if we allow another 18s. per ton from Moree to Narrabri that would be equal to a revenue of £789 per annum for the carriage of this wool.

2155½. You think that they would pay the extra freight and come this way? Certainly; Gunyerwarildi would travel 45 miles to Moree as against 130 miles to Tamworth, and Tullooona 58 miles as against 170 miles to Tamworth.

2156. *Chairman.*] Do you desire to make any further statement? Yes; with reference to the evidence of Mr. Wood on one point. As stock agents for the last seven years our firm has consigned a vast number of sheep to Sydney for sale. In my opinion the sheep at Millie would not go on to Narrabri but would truck at Woolabrar. The district surveyor stated that the sheep would rather go to Narrabri, but I think I am stating the opinion of every stockowner in saying that they would not go to Narrabri.

2157. If the stock owners to the west of the line, coming in *via* Millie, assert that they would still go on to Narrabri, and would not avail themselves of this line at Woolabrar, what do you say to that? I would say that if the sheep were mine, they would go to Woolabrar, knowing how fat sheep are knocked about, and how difficult it is to truck owing to the crowded state of the Narrabri station. I am sure that the owners of all the sheep would rather drive them 13 miles to a station on this line and pay the extra freight than submit them to the knocking about which they must suffer at Narrabri.

2158. That is always provided that there are conveniences at Woolabrar for trucking sheep? Yes; I know that a number of sheep were sent from here to Breeza, because that is a quieter place for trucking. There are no dogs, towns, or lanes to go through near the trucking place. These sheep were sent up the river by Barraba, Manilla, and Carrol, across to Breeza.

2159. That is a long distance? It is a long road, but in the ordinary state of things there is no grass from Boggy Creek to Narrabri. A day or two before market, when you want your sheep to get a little, there is no grass and they are trucked hollow and empty, and they are a couple of days in the trucks.

2160. Owing to the dearth of feed on the stock route between Millie and Narrabri, you think that all the stock coming from the west through Millie would tap the nearest station on the proposed line? Mr.
J. T. Crane,
24 Nov., 1893.
Undoubtedly.
2161. Can you give an idea of the volume of traffic on the north, as compared with the traffic on the west,—is it a half or a third? More than a half from the north.
2162. So that the western traffic is of considerable importance to this railway? Certainly.
- 2162½. If the statement I mentioned is correct, and there will be no traffic coming to the line from the west, it will have a very detrimental effect on its paying prospects? If the traffic does not touch the line at Millie or Woolabrar, it must touch the line at Narrabri.
2163. But that has nothing to do with the paying qualities of this section of the line? No.
- 2163½. Are there no other stock or station agents here besides your firm? Two other firms.
2164. Do you do the largest business? I cannot say.
2165. Is the business fairly distributed? I believe it is.
2166. Can you state the quantity of stock passing through your hands which would be carried by this railway? I can on reference to my books.
2167. Can you state the quantity approximately? I would not attempt to do so, without referring to my books.
2168. Yesterday, between Kerramingly and Moree, the Committee passed twenty-three waggon-loads of wool—would that all come through Moree? Yes.
2169. From what direction—north-east and west? From the north chiefly. That would be wool from stations towards the border, to which places carriers would not get until they had cleared all the wool out here.
2170. Is any stock shipped at Narrabri coming from as far north-west as Mungindi? Yes.
2171. By what route do they travel? They travel through Moree generally. There is another road used by Messrs. Bucknell Brothers of Yarrawa and Burrandoon, and then they travel in by Meroe and Millie. They strike a line at Millie generally. Yarrawa sheep come here. Other persons could not use that road, because it passes through private lands.
2172. With the exception of that station, which can travel its stock through its own holding, the great bulk of the stock coming from Mungindi for shipment at Narrabri, comes through Moree? The whole, with that one exception.
2173. Does stock to the south and west of Mungindi, aiming for Narrabri, go through Moree? They would go by Collarendabri.
2174. Anything south of Mungindi would probably go to Narrabri *via* Collarendabri? South of Mungindi I fancy they would not go to Collarendabri. They would go across the watercourse to Moree. They would not get so far west as Collarendabri.
2175. Do you know Mogil Mogil? Yes.
2176. There is a line of road from Mogil Mogil to Moree, and about half-way along there is a branch road to Millie? Yes.
2177. Is that the road you refer to? Mogil Mogil stock, instead of going by that road, would go by Thalaba Creek, and would strike for Millie or Narrabri; I believe they would go to Narrabri.
2178. Down towards Wee Waa? They do not get so far south as Wee Waa.
2179. They make as straight as they can for Narrabri. Yes. Their nearest point on this railway would be Woolabrar.
2180. Would any of the stock which now goes through Moree tap the line at any point nearer Narrabri than Moree? The Mungindi stock would still tap at Moree.
2181. Does any Queensland stock come across there now and go on to Narrabri? Yes.
2182. Would the extension of our railway system to Moree enable us to extend our trade operations the same distance further into Queensland than we do now at Mungindi, bar the interposition of artificial barriers? Bar the border tax I believe it would.
2183. But even now, independent of the border tax, you are getting Queensland stock? Yes, and Queensland wool.
2184. So that it is reasonable to suppose that if we extend our railway to Moree we shall extend our line of trade the same distance further into Queensland? Yes, if the tax is kept as it is. I believe you will extend your trade just 60 miles.
2185. On the other hand if the tax is increased it will mean a diminution of our trade? They could impose a prohibitive tax.
2186. There would be less trade over this line to carry? Less Queensland trade.
2187. That holds good with reference to all Queensland trade from Mungindi right round to Goondiwindi? Yes.
2188. Can you give any idea of the trade that we are getting from Queensland—say between Mungindi and Goondiwindi, and which goes down through Moree to Narrabri? Your trade to Narrabri extends on the Goondiwindi route a distance of about 48 miles in this direction.
2189. Are we not now, with the exception of those stations you quoted this morning, and whose produce goes to Warwick, at different points attracting Queensland traffic to Narrabri, *via* Moree? That is on the Mungindi route, not on the Goondiwindi route.
2190. Where do we leave getting Queensland trade going up the McIntyre from Mungindi? From Mungindi you get the wool from Messrs. Livingstone and Paltridge leasehold, and the Australian Pastoral Company send their wool which is shorn anywhere adjacent to Mungindi.
2191. Do we go up the McIntyre as far as Kunopia? Yes.
2192. Opposite Kunopia, how far do we extend into Queensland? That is just about as far as we do extend. Opposite Kunopia there is a holding called Newinga which has sent its wool this way. But when you get higher than that point it pays to send wool to Cambooya or Warwick.
2193. Is the Queensland trade that we now get at Narrabri *via* Moree between Mungindi and Kunopia? Any Queensland trade more to the north-east goes to Cambooya.
2194. And anything to the south-west of Mungindi would go down *via* Mogil Mogil or Collarendabri? Yes, and into Millie.
2195. It would have no effect upon the railway, except that it would not come *via* Millie? Yes.

- Mr. J. T. Crane.
24 Nov., 1893.
2196. From your evidence, the western trade which it may be presumed will come through Millie is of considerable importance as regards the paying capabilities of this line? The stock trade—yes.
2197. The wool, of course, too? Wool might possibly be hauled to Narrabri by team, but I do not think there is any doubt that all the stock would truck at Woolabrar.
2198. Have you travelled the road between Moree and Narrabri frequently during bad seasons? I have seen it in a bad state.
2199. Have you ever been compelled to go by the Foot Hill Road or the wet weather road on the east of the "red" line? I have travelled that road—not on account of the muddy state of the travelling stock reserve, but because it suited my business to go by that way on those occasions.
2200. As regards the travelling, is there very much difference between the travelling stock reserve and the "red" route? That line is about half-way between the mountain or wet weather road and the travelling stock route.
2201. That line runs virtually about 10 miles from the travelling stock route? In my opinion, the black soil along the "red" route is not so loose as it is along the travelling stock route.
2202. And the watercourses are more confined? The watercourses are more defined. They shallow and open out over the country as you get lower down. As you get to the mountain the creeks are more defined, as you get to the plain the watercourses become shallow and water overflows.
2203. From that point of view, irrespective of having a direct line, you think it desirable to construct the railway on that better country? In my opinion, it could be constructed at less expense there.
2204. And made and worked at less expense? Certainly.
2205. You see the black dots on the map showing the proposed stations along the "red" line;—from your knowledge of the runs, do you think the stations are placed at convenient distances or points to tap whatever traffic may come from the east or west? They appear to be.
2206. Do you think Edgeroi, Woolabrar, Gurley, and Tycannah Stations are pretty well situated? Yes. I do not know the exact locality of Gurley Station or the distance from Bumble. There would be a good deal of traffic to Bumble which is on Courrallic Creek.
2207. In a direct course, it is about 8 miles from the travelling stock reserve? I think it is well situated.
2208. If it is thought by the departmental officers that the traffic from the west *via* Millie would be best served by a junction at Woolabrar, do you endorse that view or do you think it would be served better at Gurley? Woolabrar would be the station for the Millie and western traffic. It is more suitable than Gurley.
2209. Will it be necessary to provide as ample a water supply at these various stations as there is on the stock route? I think the department has incurred a lot of unnecessary expense in providing water on the travelling stock route.
2210. The drovers do not think that? They do; they are going mad over the rates which they are charged. They are kicking up a great row.
2211. They are not complaining about the water being provided, but only that the cost of maintaining the water supply involves very high rates? Some of the tanks were never asked for or required.
2212. It would be very awkward for the travelling stock if the tanks were not there? I refer to the tank at Tycannah where there is natural water which will last as long as the grass on the road will last.
2213. As regards the others? The tank which was put down last and against which all the outcry was raised was never asked for.
2214. In the opinion of yourself and many other persons the water supply at Tycannah is useless inasmuch as there is always plenty of natural water there? In my opinion it was an unnecessary expenditure of money. The people cannot afford to pay the rates—they are paying so many on the route—particularly a small man who has his 1,000 sheep to send in.
2215. It is better to be taxed to preserve the sheep than to lose them? When there was not any natural water there was no grass to sustain stock. The public watering department has taken possession of the natural water holes.
2216. In view of the large number of stock which may go to Woolabrar station, would not the Government have to provide large watering accommodation? They would have to provide watering accommodation of some character, but I do not think there is any occasion to incur such expense as has been incurred on the other line.
2217. You think Woolabrar is the station, next to Moree, at which most trucking will take place? Most trucking of sheep which will strike the line at Millie.
2218. And whatever water accommodation is required at the other stations will be comparatively small and inexpensive? At present there are very few settlers at either station.
2219. You heard the evidence of Mr. Wood as to what he thought was the trade line as between this railway and the proposed railway to Inverroll—do you agree with his views on that point? Yes; that is a line about 20 miles this side of Warialda.
2220. Do you think the betterment principle is a fair principle to introduce? Yes.
2221. You think the people of the district would be content to come under the betterment principle so as to get a railway? I cannot say what their feeling is in the matter.
2222. Presuming that the principles applied to the construction of this railway, do you think the land boards and land courts would be the best tribunal to fix the various zones for the operation of the betterment principle? I do.
2223. Better than the ordinary law courts or arbitration? I think the land boards would be the proper tribunal to deal with the question primarily, of course with the right of appeal to the higher courts.
2224. The land boards give general satisfaction, don't they? Yes.
2225. Would you like to express an opinion as to the *bona fides* or otherwise of the land which has been taken up and which is tinted blue on this map? I do not know anything about that question, I am not a land agent. I confine myself entirely to stock.
2226. I think you stated that if the line is constructed a very large increase will take place in the trade in a very short time? I anticipate a very large increase.
2227. Presuming that in the future it is thought desirable to extend the railway system towards Collarendabri for the purpose of securing the trade more effectually, at what point do you think it would branch from the main line—at Narrabri or at Woolabrar *via* Millie? From my knowledge of the country I think from Woolabrar *via* Millie, because it would pass a great number of settlers.

2228. Is the country from Collarendabri *via* Millie to Woolabrar less liable to flood than the country from Collarendabri *via* Gurleigh Point to Narrabri West? My knowledge of the country about Gurleigh Point is not sufficient to warrant me to answer the question.

Mr.
J. T. Crane.
24 Nov., 1893.

2229. You have had no experience of road-making? Only what I have gained as council clerk during the last two years.

2230. Is it true that one particular street in the town has swallowed up 12 or 24 inches of river gravel? I cannot say that it has. If about 6 or 9 inches of gravel are put on black soil and a good heavy waggon passes along the wheels will go through the gravel and naturally bring up in the spokes black muck, and the result is that with waggons continually passing along the road you have all muck on top.

2231. That would be in some low portions of the town where there were no water channels? Where there was no drainage.

2232. With water channels a small amount of gravel on black soil will make a fair road? It will if it is not cut into before it sets.

2233. If it is proposed to put 3 inches of river gravel or ordinary ballast under this line with, of course, proper waterways on either side, will that quantity be sufficient? I am not a railway engineer. A railway is entirely different from a road, on a railway the weight of the train is distributed over sleepers but on the roads the weight of the waggon is concentrated on a 3 inch tyre.

2234. You think it is possible that the line might be worked with safety and economy with 3 inches of metal on the surface of the land? I could not express an opinion about what ballast the line may require.

2235. Is there any other point on which we have not touched? Owing to the establishment of all these water reserves on the travelling stock reserves from Moree to Narrabri the route is a very expensive one to travel. In ordinary seasons there is no doubt that all the sheep which are going to market would be trucked. I think that hardly any sheep would pass from Moree and travel by the route even in exceptionally good seasons we have water rates to pay and that makes travelling very expensive.

2236. Unless they have some reason to keep the sheep back and not to get to market? Yes.

Mr. Charles O'Hara, contractor, Moree, sworn, and examined:—

2237. *Chairman.*] What is your occupation? I am a contractor. I have resided in Moree eleven years.

Mr.
C. O'Hara.
24 Nov., 1893.

2238. *Mr. Davies.*] What contracts do you carry out? I contract for bush work—repairing Government bridges or sinking wells for water.

2239. Where do you generally get the timber for your bridges? It depends on the character of the bridge. If we require very long timber we have to go beyond Narrabri, but short timber such as 20 feet long we get at Terry-Hic-Hie.

2240. Can you get sufficient timber for this railway anywhere in the locality? There are any amount of sleepers at Terry-Hic-Hie and Bogamiddi, which is on the Warialda Road, about 30 miles distant.

2241. Is that the same place that the Mayor spoke of as "Redbank"? Almost.

2242. You think there will be no difficulty in getting sleepers? Not for an ordinary light line.

2243. Not squared sleepers but half-round split sleepers? To get half-round split sleepers there would be no trouble whatever.

2244. What would it cost to deliver sleepers of that character at certain points on the line? Half-round sleepers sawn in two will, I think, be delivered at 3s. per pair. Hewn sleepers would cost 9s. a pair.

2245. That estimate would include the carriage of the sleepers from the stump to the various points on the line? Yes.

2246. Ballast can be secured, I presume, readily for this line? I think the ballast would have to be brought from the Namoi.

2247. Gravel ballast? I believe you can get gravel ballast much more cheaply from the Namoi than metal ballast.

2248. What will it cost per cubic yard to deliver this ballast at different points? I am not prepared to answer that question.

2249. There will be no difficulty in getting a quantity of the ballast? None.

2250. Have you frequently travelled the travelling stock reserve? Yes.

2251. Do you know the country through which the "red" line goes? Yes.

2252. Do you know the difference in the length of the two routes? Only from the plan on the wall.

2253. From a national standpoint, which line do you think would be the best to serve this district and secure the trade of our own Colony as well as the portion of the trade of Queensland? Looking at the question in a broad sense, I think, the permanent survey would meet the requirements of the community better. I am acquainted with the district within a radius of 200 miles, and the only agitation against the permanent survey is on the part of the Thalaba people, and the people north-west of the Barwon. I am prepared to allow that the wool from the Lower Barwon and across the Barwon can be brought to Woolabrar at less expense than to Narrabri. It will be shorter for instance to bring the wool from Burdeoboreena and Dunambal stations to the stations on this line than to Narrabri.

2254. What is the difference in the distance? A distance of 44 miles as against a distance of 55 miles.

2255. Are you of opinion that the squatters and selectors would prefer to shorten their journey by 20 miles? I think they would be very foolish if they did not.

2256. You think it is a natural consequence that they would go to the nearest point to truck their sheep? That would depend on circumstances. It might be 18, 20, or 30 miles. It would pay them better to drive them 30 miles with plenty of water and feed than to drive them 20 miles without feed and water.

2257. The line would secure the carriage of the wool? Certainly.

2258. They can drive their sheep, but the carriage of the wool is a very different matter? Yes.

2259. You think that the distance would secure pretty well all the wool which comes from that direction? Yes.

2260. Do you expect a large increase in the trade if the railway is extended to Moree? Yes. On this point I have a few figures which I will state for the consideration of the Committee. Previously to the imposition of the prohibitive duty on Queensland wool, all the wool from the Australian Pastoral Co's. stations over the border came to Narrabri through Moree; but since that duty was imposed it has gone to Yuelba, the terminus of the southern line in Queensland. The five stations of the Australian Pastoral Company

Mr.
C. O'Hara.
24 Nov., 1893.

Company shear about 1,000,000 sheep—they might shear 1,250,000. All this wool is taken to Dareel station and scoured. Previous to the imposition of the Queensland duty it was sent *via* Moree to Narrabri, but since it has been imposed it has been sent to the nearest Queensland railway station, a distance of 200 miles. If the railway is extended to Moree from Narrabri that wool will be sent here, a distance of 85 miles—it is 75 miles to the border, and 5 miles across the border to Dareel station. There would be a saving of 100 odd miles in favour of coming this way. I instance Dareel as being the largest station on that side of the border. Of course there are many selectors.

2261. Who shear from 50,000 to 80,000 sheep? From 25,000 to 50,000 sheep.

2262. As regards the trade on this side of the border, how would it be affected by the construction of this railway? We will gain.

2263. To a considerable extent? All the north-western trade instead of going to Narrabri will come here, except down Pian Creek, from which some wool will go to Narrabri.

2264. *Chairman.*] What is your definition of the "north-western district"? North-west from the present point.

2265. From Mungindi south? Yes.

2266. *Mr. Davies.*] You regard Moree as the central dépôt for receiving the whole of the produce pretty well from the Queensland border and across that border? Yes; take Tullooona and Gunyerwarilda. It is 65 miles from Moree to Tullooona, and I suppose about 56 or 57 miles to Gunyerwarilda, but it suits these stations to send their wool to Tamworth. The road from Moree is a very expensive one to travel—you have to pay for water and feed; you do not get anything for nothing on this line. That wool would come to Moree instead of going to Tamworth if the terminus were extended to Moree. The Commissioners would get additional trainage on that wool.

2267. What does it cost per 1,000 to travel sheep from Moree to Narrabri? I do not know, I have never travelled sheep on this line, but I know that it is a very expensive line.

2268. *Mr. O'Sullivan.*] How long is it since the Australian Pastoral Company stopped sending their wool down here? This year is, I believe, the first since the duty was imposed. They have not stopped all the wool from their stations down this way. I could not say whether any wool has gone through this year—I believe none has gone through.

2269. Do they contemplate shifting their shed into New South Wales and shearing here? I could not say.

2270. Have you heard a report to that effect? No.

2271. Do you know anything of the Collarendabri country? Well.

2272. Do you think a branch line running out from Boggy Creek, at Woolabrar, up to the end of the flood-waters would serve that district well? Yes; it would serve the convenience of a few, I believe, but I could not say that it would pay.

2273. Would it be likely to attract traffic from Angledool and out that way? From my knowledge of the country I think a line to Walgett would be more likely to attract traffic from the Queensland border at Angledool and the other stations.

2274. Until a railway is constructed to Walgett I presume it will come towards Narrabri from Angledool? Decidedly.

2275. Then a short branch from this line which would serve Millie and go out westerly would be likely to receive a large portion of that traffic? That is a difficult part of the country to speak of with certainty. If the Barwon River is high the steamers take the principal portion of the wool. It all depends upon the state of the river as to which way it will go. If the river is a banker they avail themselves of the chance, but if it is a dry season they haul their wool.

2276. If the river were high the wool would go to Adelaide? Yes.

2277. But still a branch from this line would serve the country within 20 or 30 miles of Collarendabri? Decidedly.

2278. Between Collarendabri add say 20 miles out the country is subject to floods? No. Once you cross the Thalaba you are pretty free from floods. It is very rarely that the river is over the banks at Collarendabri.

2279. Have you travelled much by the mountain road to Narrabri? Yes; I have travelled along to Gurley by Myall Hollow Road.

2280. Did you ever hear that in wet weather the traffic comes by that way from Narrabri to Moree? In 1890 nearly all the goods came by that way.

2281. Because the travelling stock route was too flooded? Not altogether too flooded, but too heavy. It is impossible to drive a team in this country when it is thoroughly wet.

2282. I presume the floods would be likely to impede the railway traffic also? No; not with a fairly good service.

2283. Supposing the railway were extended by the travelling stock route and you had a flood like the 1890 flood, would the flood-waters be likely to damage the permanent-way and impede the traffic on the line? I do not think so. There is no rush of water on the travelling stock route as it is as level as this floor. It would be merely a matter of leaving sufficient openings for the water to drift west. It runs slowly west.

2284. You would require to have a large number of openings? I believe you would.

2285. More than on the "red" line? Yes; but I do not say that they would be as expensive as on the "red" line. You would require to build some substantial culverts on the "red" line, because there are numerous creeks to cross. The culverts would have to be 20 feet high at the very least—across Waterloo, Myall Hollow and these creeks.

2286. I understand that there will be no difficulty in getting the sleepers from Terry-Hic-Hie and adjacent places? No; we can get any amount from Terry-Hic-Hie and other places along the edge of the mountains.

2287. *Chairman.*] Is there any timber to the west of the "red" line? No suitable timber.

2288. Would any of the timber to the east go in straight to Narrabri by the railway, or has Narrabri plenty of its own? I think it has a fair supply of sleepers.

2289. Not for building purposes? It has plenty for building purposes. For railway construction I do not think this timber is much good, it is not long enough.

2290. I think you said the direct route is the best for the district? I believe it is the best to serve the interests of the whole community.

2291. Do you think that at least half the trade which is expected to be run over the line would come from the west of Millie? Yes.

2292. If that is so, will it not be desirable in the interests of that trade to take the line a little further west? I did not quite catch your previous question. I consider that three-fourths of the trade will come from Moree and only one-fourth from the west.

2293. Do you think that the trade from the north of Moree will grow more quickly than the trade from the west? I am certain it will.

2294. There is more room for expansion to the north than to the west? Yes.

2295. Is the country generally between Moree and the Queensland border less liable to flood than the country west of Millie out to Collarendabri? I think it is about equal. From here to within about 8 or 9 miles of Mungindi it is fairly high ground; from Narrabri to Burran it is flooded country, and from there to Collendabri it is high ground.

2296. When you get down to Mungindi and all the way down to Collarendabri it is more or less liable to flood? Yes.

2297. Which route do the stock now take going from Mogil Mogil to Narrabri? Up the Thalaba.

2298. That is *via* Millie? Sometimes they go *via* Millie and sometimes *via* Nowley and Boolcarrol.

2299. Presuming you wish to tap the Collarendabri trade, would you go from Narrabri *via* Gurleigh Point or from Woolabra? I should certainly start from Millie.

3000. Is there any other evidence you desire to give? No.

Mr.
C. O'Hara.
24 Nov., 1893.

Mr. Augustus Bernshaw Lomax, grazier, near Moree, sworn, and examined:—

3001. *Chairman.*] What is your occupation? I am a grazier, residing about 20 miles west of Moree.

3002. On the Mogil Mogil Road? Off the Mungindi Road.

3003. *Mr. O'Sullivan.*] What is the size of your holding? With my family we hold 10,240 acres of selected land.

Mr.
A. B. Lomax.
24 Nov., 1893.

3004. Ring-fenced, I suppose? No; it is subdivided.

3005. Do you confine your operations solely to grazing? Yes.

3006. How many sheep do you carry to the acre? Over a sheep to the acre.

3007. You can rely on that in a fair season? Always.

3008. Do you cultivate anything at all? This year I have cultivated 25 acres. Eighteen acres of wheat, an acre of prairie grass, and 6 acres of oats.

3009. Is the wheat for milling or for hay? For hay for our own use, and any surplus we may sell.

3010. Does it produce wheat well? It has produced a magnificent crop this year.

3011. Free from any trouble? There is a little rust, but not much in the crop.

3012. How many tons to the acre? I reckon it is 2½ tons to the acre, but other persons think it is more.

3013. You have shown some samples of the wheat to the Committee? Yes.

3014. Is the soil of the country round about similar to your own? There is a great deal of it. We have, ourselves, about 2,000 acres of the same soil that would do for cultivation.

3015. What colour is it? The bulk of our soil is black soil.

3016. Any chocolate soil out there? Not really chocolate. We have hard sandy ridges.

3017. Is there much land out there for fit for cultivation? Plenty.

3018. You think that in the future, when population is more numerous and the markets are better, that land will be cultivated? Tens of thousands of acres in this district.

3019. The soil is fit for growing cereals, and the rainfall is sufficient to produce them? The soil is fit to grow anything.

3020. What is the rainfall? Last year it was about 27 inches.

3021. Do you send your sheep and wool through Moree into Narrabri? Yes.

3022. A railway to Moree would serve you admirably for trucking your sheep or despatching your wool? Yes.

3023. And what would suit you would suit all your neighbours? I think so.

3024. Are there any *bona fide* selectors out that way? A good many. All through the district there are plenty, many of them with large holdings.

3025. Is there likely to be any rush for land when the leases are thrown open? Certainly.

3026. Have you heard of any inquiry for land out there? Yes. I have heard it stated that when the leases are thrown open there will be a great rush for land.

3027. Are there many young men in the district ready to take up land? I think there are a certain number, but I believe that most of them will come from other districts.

3028. There have been men from Victoria up this way inquiring for land? Numbers.

3029. Do many of your neighbours cultivate? No; except in small areas. From 2 to 6 acres have been put in this year for the first time.

3030. I suppose it is more profitable at present to run sheep? Yes.

3031. Do you cultivate any fruits? I have a garden about 2½ acres in area.

3032. What fruits flourish there? Oranges, lemons, apricots, peaches, grapes, almonds, and nearly all fruits.

3033. I suppose what would grow about Inverell would grow up here? I fancy so. The crop may not be so reliable on account of the drier climate, but anything will grow.

3034. I suppose there is no doubt about the settlement out your way and round this region being of a permanent character? I think not.

3035. It is stated that if a block of country is open it is applied for by from fifteen to thirty persons, and that most of the selectors out this way have taken up the maximum area? Yes; where it can be got. I may say that I have property within the Queensland border. It is close to Dareel, and is about 15 or 16 miles from Mungindi.

3036. Would you bring the produce of that property down this way? Certainly.

3037. You are not doing so now? Last year I did, but this year I sold the sheep in the wool. This is our shipping-place if we can ship here.

3038. If the railway is extended to Moree will you ship the produce of that station here? Certainly.

3039. Always provided that our friends across the border do not erect a barrier? It would suit us better to pay a moderate duty in order to ship here. I brought my sheep over last year and shore on this side, and I can do the same again.

- Mr. A. B. Lomax.
24 Nov., 1893.
3010. If the railway is extended to Moree do you think that other persons at that particular point will send their produce over here? I think the Australian Pastoral Company will study their own interests and get to the nearest railway station.
3041. I suppose that in view of the trade coming from the north you think that the most direct line to Narrabri ought to be adopted? It seems to me that it is a matter of policy for the Government and not for us to consider.
3042. Does not the 6 extra miles of carriage touch your pocket too? The shortest route would suit us best.
3043. You know something of the people in and to the west of Millie? To the north of Millie.
3044. Knowing the country and the settlement is it desirable to bring the railway nearer to the Millie people, or would the direct route be best for all concerned? The direct route would not be best for them. It would be best for us.
3045. Is the trade going to Moree equal to the trade going to Millie? I think the trade going to Moree will be much larger.
3046. Very much? Yes; if ever a line goes to Walgett the Collarendabri traffic would go there.
3047. We should lose it from here? You would lose a good deal of it down this line, but I do not see much gain in deviating from the straight route.
3048. But presuming that no railway was constructed to Walgett, for some considerable time, do you think the Collarendabri traffic would go through Millie and tap this line at Woolabrar station? I do.
3049. You do not think that it would continue to go to Narrabri? No.
3050. Some people seem to like the mud? I do not.
3051. Is there any other point you desire to touch on? I think that when the railway is constructed to Moree the character of the stock grazed will be very different. I fancy it will pay better to go in more for fattening when we can get our stock taken away. Our trouble now is to get the stock taken away. It is expensive to travel them down, they lose flesh and the returns are uncertain; but if we had a railway and we could send two or three trucks of stock at a time it would pay us to go in for fattening.
3052. By what road do you bring your produce from your Queensland station to Moree? By Mungindi.
3053. Does not that road follow Gil Gil very closely? Yes.
3054. Is it a very wet road? In flood-time for about 20 miles from Mungindi it is wet. We have a number of creeks and rivers to cross.
3055. After that it is fairly good? Yes.
3056. As good as the road between Moree and Narrabri? About equal. The same class of country, but more timber and the same sort of mud.
3057. You think that any railway communication in the direction of Collarendabri should go from Walgett rather than from the Narrabri or Moree line? I do not say that. I think a branch off this line would serve them well.
3058. Do you think that that they would be better served by a branch off this line at Woolabrar or a line from Narrabri West, *via* Gurleigh Point? From Woolabrar. The bulk of the the country there is good high dry country.
3059. Higher than on the more southern route? Yes.
3060. Is there anything else you desire to say? No.

Mr. John Jurd, selector, near Moree, sworn, and examined:—

- Mr. J. Jurd.
24 Nov., 1893.
3061. *Chairman.*] What is your occupation? I am a selector living about 16 miles west from Moree.
3062. *Mr. McCourt.*] What is the size of your holding? About 7,000 acres.
3063. Are there many selectors around you? Yes; I have also a holding near this line on the mountain side.
3064. Do you know the country to the east of the line? I do.
3065. Of what nature is it? There are many different kinds of land. There is a good deal of good agricultural land and there are patches of grazing land. There is some fine timbered land, and there is some scrub.
3066. Would this "red" line lead to any increase of production in the country round about you? I think it would, because the distance from market is the principal reason why no soil is cultivated.
3067. The distance from market regulates the cultivation, but the land is suitable for cultivation? It is as good as any on this side of the range.
3068. Are all the holdings round you of about the same size? No; 6,000 or 7,000 acres to the west of Moree, and about 1,200 acres up there.
3069. What is the smallest area on which an ordinary family could live about here—say within 20 miles? It all depends on what they went in for. If they went in for cultivation in a favourable season it would not take a deal of land. I think that 80 or 100 acres for cultivation would be quite sufficient to keep any family in a favourable season.
3070. But taking one season with another? I think that is as much as any family can cultivate.
3071. For grazing purposes, how much would it require to keep a family? They would want to take up a couple of thousand-acres.
3072. You think that 2,000 acres would be enough? I think that they could make a living in a favourable season with that area.
3073. In the event of the large holdings being cut up would there be a demand for the land? Yes; it would soon be gone.
3074. If the large owners were to sub-divide their estates into 1,000-acre blocks and were to sell the blocks on terms they would find purchasers? I think so.
3075. Would the construction on this line bring that about in any way? I think it would.
3076. *Mr. Ewing.*] I presume you only want to speak in regard to the farming capabilities of the district? Yes; as to the quality of the land on the eastern side of the line.
3077. You do not know anything about railway construction? Nothing.
3078. You know nothing about the effect of floods on railway line—the height or the velocity of water? I could form a good idea.
3079. I suppose you would not express an opinion without definite information? I do not think there would be any danger of the water interfering with a railway from Moree to Narrabri.
3080. Any expression of opinion from you, not being a professional man, on that point would be idle? Yes.

Mr. J. Jurr.
24 Nov., 1883

3081. Have you heard the land on the east of the "red" line described as being poor? No.
3082. From the foot hills to the "red" line, what is it as a rule? It is very rich land. The richest in the Colony, I think, is to be found on Gurley, Edgeroi, and Killarney, principally Edgeroi.
3083. Quite as good as the rest of the district? I think it is superior to most of the district.
3084. How far is it from the foot of the hills to the railway? It would vary from about 12 to 20 miles.
3085. In ascending the hills does the soil get poorer? Yes: the hills are composed of sand and rock, but there are valleys running between the hills where the soil is very rich. No richer land could be cultivated.
3086. What you wish us to understand is that there is a valuable tract of country to the east of the red line? Yes, for cultivation.
3087. Is it as extensive as that to the west? It is more adapted for grazing to the west.
3088. I presume you would like the most direct route to market? Yes.
3089. You regard the district as a good one? I do.
3090. It is capable of great development? Yes.
3091. This railway would help to develop the district, I presume? Yes.
3092. *Mr. Suttor.*] Which do you consider the best route to adopt? The direct route.
3093. You have not considered the other routes at all? Yes, often. I have always been in favour of the direct route.
3094. *Mr. Davies.*] How far off is your property on the east of the "red" line? The nearest point, I think, would be 16 miles. It is on Terry-Hie-Hie Station, at the head of Terry-Hie-Hie Creek. It is about 10 or 11 miles in a direct line from Edgeroi.
3095. Would you consider a railway station within a distance of 12 or 15 miles from your holding a good service? Yes. It would not make such a great difference to me or any one there. It is only 34 miles to Narrabri. It would not benefit my holding to any great degree compared with what it would benefit the holdings on this side where there are a good many selectors.
3096. You regard any settler within 12 or 20 miles of a railway station as being fairly served? Certainly.
3097. What are you doing with your land on the east of the "red" line? I have a son and a brother-in-law cultivating the land for me, I have cattle on it.
3098. It is being partly cultivated and partly run with cattle? Yes.
3099. Fat stock to send to market? Yes.
3100. Is the country on that side good for fattening stock? Yes; the country ringbarked is very good.
3101. Is your land cleared? Some of it is.
3102. On the west, how far is your holding from the Moree terminus? Sixteen miles due west.
3103. So that you would be served by the line at either end? Yes.
3104. Do you know that a line by the stock route would be much longer than a line by the "red" route? Yes.
3105. Would you regard the "red" line as a national or pioneer line? I believe it would be the better line to serve Moree and all the country to the north east and west of Moree.
3106. The bulk of the produce—stock and wool—must come from Moree? Yes.
3107. Would it be a fair thing to construct a line which would be 6 or 6½ miles longer than the "red" line at a considerably increased cost? I believe it would be very unjust to all the people to the north-east or west to construct a line 6½ miles longer than it need be.
3108. It would be unjust to the producers because they would have to pay a higher freight? Yes.
3109. Do you think a line to Moree would largely increase the traffic? I think that if ever there is inter-colonial freetrade you will get a deal of Queensland wool brought into this Colony.
3110. But if the railway system is extended to Moree by the "red" route, will it secure the produce of our own Colony? As you have done at Narrabri, so you must do at Moree.
3111. But a large portion of the traffic finds its way to Tamworth? I do not think that any great deal goes—only from up Yelman and Warialda way.
3112. That would not come here if the line were constructed? I believe a good deal of it would come.
3113. You think the "red" route is drier and better of the two? Yes; but the other route is dry enough. I think it would be a far more convenient line to construct. You would be likely to get water by sinking.
3114. Do you think the Millie people would be very much inconvenienced if they were 12 or 14 miles from the railway? As for the way which is proposed for the Millie people to strike this railway they might as well go on towards Narrabri.
3115. What is the distance between Millie and Narrabri? About 40 miles.
3116. The difference between 40 miles, and 12 or 15 miles from Millie to Woolabrar would be a considerable advantage to them? From Millie alone I do not think it would make much difference; but from anywhere below Millie it would pay them to go to the nearest point.
3117. Is it not a natural thing to go to the nearest point with wool or stock? Yes.
3118. How far are you from Millie? About the same distance as I am from Moree; about 30 miles.
3119. *Chairman.*] Where do you send the cattle you rear on your eastern selection? I trucked them to Narrabri the other day.
3120. Would you truck them at any station along this "red" line? Certainly, if there were a trucking yard at Edgeroi.
3121. There is a good deal of settlement on the creeks to the west of Millie? Yes.
3122. I suppose if you were located to the west, you would like to have the railway dragged over a bit towards you? Certainly.
3123. But being located to the east you do not want it to be taken any further away from your selection? No.
3124. Do you think the line will lead to a large development of the country to the north of Moree? I do, although it is all pretty well developed now. There is very little land but what has been secured.
3125. Do you think the development of the country is likely to be more rapid and extensive to the north of Moree or to the west of Moree? I could not say. The country is equally good. It is a matter of opinion.
3126. Is the country to the west of the river generally more liable to flood than the country to the north of Moree? I do not think we have anything to fear from the floods on the other side. A very severe

- Mr. J. Jurd. severe flood might cover some of the country, but there has never been any loss about the western district. About the border there were some floods in 1890.
- 24 Nov., 1893. 3127. If the departmental officers make a strong point of taking the line by the "red" route, rather than by the travelling-stock route, because the former would go through higher country and be less liable to flood, do you think they are correct in their opinion? I do not think there has ever been a flood on the travelling-stock route that would injure a railway. I am satisfied that there have been no floods on that route, nor would there be on the other.
3128. I suppose the travelling-stock route would be more liable to flood than the other route? Yes.
3129. The water-courses on the "red" route would be more defined and would not spread out so much? Yes. The line goes so very close to where they take their head from that you could negotiate them better.
3130. *Mr. O'Sullivan.*] You stated that the holdings on the east or the "red" line are small? Principally.
3131. Is it because a portion of that country is in the eastern division? It is not in the eastern division, but in the central division.
3132. Why are the holdings small? Most of them rely on cultivation, principally.
3133. Therefore they have not taken up the maximum area? No; up to 80, 100, or 200 acres.
3134. Does it arise, too, from the fact that much of the land is scrub? There is a good deal of scrub, but the scrub land is the very best land for cultivation.
3135. How much an acre would it cost to clear that land? It is not heavily timbered—it is not all scrub.
3136. Supposing the land is fairly well scrub land, what will it cost to clear the land for cultivation? I suppose about 50s. or 60s. an acre.
3137. Have you heard of any of this land being taken up in scrub leases? No. I do not know where it is open.
3138. Do you think it is likely that after all the good land is gone there will be some settlement on the scrub land in view of the fact that it will cost only 50s. an acre to be cleared? I believe it will all be taken up for cultivation before many years.
3139. You are a practical farmer as well as a grazier? I have done a good deal in both lines, at one time.
3140. What will it grow over there? I have seen as good corn as ever I saw up that creek. I have had over 100 bushels to the acre on 2 or 3 acres.
3141. Was that a fair specimen of the land? It was exceptionally good, and I happened to have a good season.
3142. I suppose a fairly good piece of land would give about 60 or 70 bushels to the acre? About 40 bushels very fair land will yield. With a good season the yield will be double.
3143. Is it good for growing wheat? I have seen wheat grown there, but it has always been turned into hay. It is too far to do anything else with it.
3144. It does not pay to grow wheat for milling? No.
3145. But with the aid of this railway you think it will pay? I do.
3146. *Chairman.*] Is there any other evidence that you desire to give? No.

Mr. Samuel Lewis Cohen, alderman and land agent, Moree, sworn, and examined:—

- Mr. S. L. Cohen. 3147. *Chairman.*] What is your occupation? I am a land agent.
- 24 Nov., 1893. 3148. Are you also a stock and station agent? No.
3149. You are an alderman of the town? Yes.
3150. *Mr. Ewing.*] How long have you lived here? Nearly eleven years. I was Crown lands agent for seven or eight years.
3151. You have been in private practice for four years and have a full knowledge of the district and its land transactions? I think so.
3152. You know the railway route under consideration? I know the route by the plan—it is within our district.
3153. Can you offer any opinion as to the best route to adopt? The travelling-stock route is longer and I do not think, unless embankments are constructed, a railway could go over certain parts of that route in flood-time. I think that if the line were laid at a low level in places the water would be high enough to get into the engine. I have seen the water up to a horse's belly on the other side of Tycannah Creek.
3154. I ask you whether you knew anything about the routes and you are describing the stock route—do you know the other route? No.
3155. You can express no opinion in regard to the body of water on that route? No.
3156. You speak of the water being very deep on the travelling-stock route, is it in some depression or approach to a creek or anything of that kind? No; away from the creek. Tycannah Creek overflows on to swampy ground. It runs up 3 or 4 miles to a place called Hold Fast.
3157. You are perfectly sure that the department is right in believing that with a huge body of water at times on the travelling-stock route a railway by that route would be expensive? I think so. The closer you get to the hills the higher is the ground.
3158. Would it be better for the people in Moree to have the "red" line? Better, most decidedly, as there will be less haulage.
3159. The "red" line is better than the other because the haulage is shorter? Yes.
3160. Do you approve of the Government constructing the line as a road? Yes.
3161. Is the settlement fairly general in the district? Yes.
3162. The people, as a rule, hold on to their land if they can? Yes.
3163. Is there much transfer of land going on? No; there never was a great deal in this district.
3164. Do you think, as a rule, the people are trying to hold on to their lands? I have been in thirteen or fourteen land districts and I have noticed here that the people when they get hold of a piece of land, if it is good, are more inclined to stick to it than are the people in other places.
3165. The settlement is as genuine here as in any other part you have been in? Yes.
3166. You believe the construction of this railway will develop the district considerably? No doubt it will.
3167. Is it possible that a good deal of agriculture will be carried on here? Yes; I think there is a good tract of land that can be cultivated; but of course the majority of good land—what I should call agricultural land—has been bought at auction years ago, and the land which might be fit for agriculture and the

which the selectors would take up unfortunately the Government are proclaiming as reserves from sale other than auction sale, and the selector has not a chance.

Mr.
S. L. Cohen.
24 Nov., 1893.

3168. You believe there is good agricultural land in the district, but the selector does not get a chance to take it up? Yes.

3169. Is Moree the depôt for an area of country large enough to justify its connection with the main line? I think so.

3170. Do you think that by going to Millie it would enable Millie to pick up much of the western trade? If they do not go to Millie they would go to Woolabrar.

3171. *Chairman.*] Do you know where it is proposed to terminate the line in the town of Moree? Yes.

3172. In your opinion is it a suitable place? Eminently suitable.

3173. Would that position give the department the command of a fairly good crossing in the event of any future extension to the north? Yes.

3174. You have heard no objection on the part of the townspeople to the proposed position of the railway station? No.

3175. Are not many of these selections mortgaged? I think a good many of them are.

3176. You are of opinion from your extensive knowledge that in this district settlement is not only *bona fide*, but is profitable if not more profitable than in other places which you know of? The areas are larger. In Riverina the people were satisfied to confine themselves to small areas—to 1,200 and 1,000 acres. But here the majority go in for the maximum area.

3177. Does that infer that people have had to find accommodation somewhere? Yes, in many instances.

3178. Is there any other point you desire to bring out? I think that by the construction of this railway all the vacant lands, especially those lands within a radius of 5 or 6 miles of the town, would be a very valuable asset to the State. I think it would be increased in value threefold. I know that land out of the town that could be bought two years ago for £2 an acre is bringing £20 an acre. I think that if the lands were thrown open and the people were given an opportunity to take up a selection, the Crown would be able to get £4 or £5 an acre, because the people would be able to cultivate the land and get their produce away.

3179. In the event of the railway being constructed to Moree, and its further extension to the north being desirable, to which point should it aim—Mungindi or Goondiwindi? I think the land from Moree to Mungindi is all pretty high, and there are a lot of settlers out towards Goondiwindi at Boobera.

3180. Do you think the extension should go between the two places or towards Boggabilla? I have not a personal knowledge of the country, but I should think that with the leasehold areas thrown open it should go about midway between Boggabilla and Mungindi.

3181. About Kunopia? You would have to keep up above that country, because it is all flooded.

3182. Subject to necessary deviations from an engineering point of view to escape the floods? Yes.

3183. *Mr. Dawson.*] What sort of land is this which you say would bring £5 an acre? That would be agricultural land.

3184. What would it grow? If you got a good season it would grow anything in the world.

3185. Is it any better than the land at Breeza? Breeza is all black soil plain.

3186. Is it any better than the land about Murrurundi? No.

3187. Do you know Wombi near Singleton? No.

3188. What would a selector grow on land for which he gave £5 an acre? He can grow corn and hay, and on the river frontage, lucerne, fruit.

3189. On the river frontage? On the back ground too.

3190. You would sell the land to strangers coming into the district. You would not sell it to a resident of the district at that price? I think a resident would buy it too. I think that strangers coming with a bit of capital from Victoria have taken up large areas.

Mr. Henry Joseph, manager of a brewery, and secretary to the railway league, Moree, made an affirmation, and was examined:—

3191. *Chairman.*] You are the secretary to the Moree Railway League? Yes.

3192. Are you following any occupation? I am the manager of a brewery.

3193. You desire to make a statement? I desire to make a statement principally with reference to the revenue that has been computed by the Commissioners. I have every reason to believe that their estimate is far less than we will receive. The estimate I have been able to make with the assistance of the Commissioners is also based on the existing trade. In 1891 I sent out a circular to every person who is likely to use the railway line, and I got 110 returns. These returns, so far from being exaggerated, I can prove to be far less than what is sent from the district now. For instance, the returns show that 175,000 sheep would be trucked over the proposed line, whereas I have a statement from the Railway Commissioners' department that 685,000 sheep are already trucked at Narrabri, and that of that number 55 per cent. come from this district likely to be served by the extension.

3194. Are you making sufficient deduction for those sheep which would go to Narrabri independent of the proposed railway? There is a very large margin. The estimate of 55 per cent. was made by Mr. Harper the officer who was sent up to inquire into the trucking. My original estimate was less than what the Commissioners estimate now. Their estimate then was £8,738, but their estimate now is £9,915. I calculate that the revenue will be very much larger, because not only as regards the sheep, but the returns in other directions that I sent down to the Commissioners were much less than likely to be realised. For instance, I sent down as the traffic from Sydney to Moree 2,563 tons of general merchandise. My return shows that two storekeepers alone receive over 1,100 tons. So that you will easily perceive that so far from my returns being exaggerated they were very much under the mark. The Commissioners have been cautious in estimating the probable revenue, and so far from the line being likely to lose £900 a year there is every chance of the Commissioners making a very large profit.

3195. Always supposing that the cost of line is not materially increased? Basing it on the expenditure they compute.

3196. I suppose that when Mr. Harper was up here recently on behalf of the Commissioners you were in communication with him? Yes.

3197. What means did he take to check the statements that were made to him—did he go to the storekeepers

Mr.
H. Joseph.
24 Nov., 1893.

Mr.
H. Joseph.
24 Nov., 1893.

keepers himself? No; he told me the figures I had sent in, as far as he could ascertain, were largely under the actual results. But as regards the tonnage, perhaps I had a better idea of computing it than he had himself. The passenger traffic they estimated at 2,300 persons. That is a very low estimate, I think. I believe the fares paid by coach total more than that number.

3198. Does not the coach run sometimes without a passenger at all? It does; but on the other hand it has five or six passengers a day. I think a fair average would be three passengers each way.

3199. We met the coach going back empty yesterday? That may be the case one day, but on another day there may be eight or nine passengers on board. Six passengers a day would be 1,800 passengers a year, which at 25s. each would give a larger revenue than the Commissioners estimated.

3200. The people of Moree would not pay 25s. each by rail would they? No; I know the Commissioners have computed the passenger traffic from the returns of Nevertire Station, but that is not an analogous case. We are surrounded by contiguous large towns whereas Nevertire is not. I think there is every likelihood of the Railway Commissioners' estimate being exceeded by 25 per cent.

3201. Of course, the Commissioners admit that they have not reckoned for any increase of trade in their estimate, although there is likely to be an increase, and you desire to point out, in your opinion, their estimate would be very much exceeded? There would be an enormous traffic without allowing for any increase.

3202. How long have you been in the district? Nearly four years.

3203. I suppose, you have not moved much about the outlying portions of the district? Yes; I have been to Mungindi, Goondiwindi, Warialda, Bingara, and between here and Narrabri, by different roads on several occasions.

3204. You heard Mr. Woods' evidence as to where the line of trade will be drawn as between Moree and Inverell—do you agree with his statement? No; I think he is entirely mistaken. I am under the impression that the proposed railway from Glen Innes to Inverell was recommended by the Public Works Committee conditionally on the introduction of local rates which would be much larger than the ordinary rates charged by Moree. I have every reason to believe that so far from the traffic from this side of Warialda going to Inverell it would come from the other side of Warialda to Moree.

3205. What Mr. Woods said was that, presuming that the Inverell line were constructed and the Moree line were not constructed, then the Inverell line would draw traffic from 20 miles on this side of Warialda, but that, presuming that the Moree railway were constructed and that the Inverell line were not constructed, the Moree line would draw trade from 20 miles on the other side of Warialda? I was not aware of that.

3206. You would put the trade line further towards Inverell, because the Inverell line, if constructed, would be worked under a special rate system? Yes; I believe the Commissioners would far sooner have the traffic over this line on account of the grades and curves.

3207. They would get more haulage on the other line? I was informed by an officer in the Railway Department that the Commissioners would sooner have the traffic on this line.

3208. You have heard the evidence which has been given to-day on various points; is there any other matter on which you differ from any witness or that you think wants elaborating? I think there can be no comparison between the two routes. In the first place a line by the travelling-stock route would cost, according to the estimate of the Commissioners or the Works Department, which I have no reason to doubt, £54,000 more for its construction than the "red" line. That capital expenditure at 4 per cent. would involve an annual interest of £2,160; there would be a tenth or eleventh on the cost of maintenance to be added, which would bring the amount up to about £2,500. I feel sure that although there may be a little traffic which may possibly not come on to the direct line, yet it would never compensate, if it did, for the extra interest and cost of maintenance.

3209. Do you agree with the witness in thinking that the trade north of Moree is about equal to the trade west of Millie? The trade north of Moree would exceed the trade west of Millie to a very great extent.

3210. By how much—by as much again? A great deal more, judging from my returns nearly treble.

3211. From Millie to Sydney, you estimate that you would get 7,065 bales of wool—is it not a fact that since you got those returns, a large amount of wool comes in from the west through Millie which may not have come in through Millie at that time? I cannot say.

3212. Your returns show the relative trade in 1891 as being 7,000 bales of wool *via* Millie to Sydney, and 19,997 bales from Moree to Sydney, but not inclusive of the Queensland wool;—does that exclude all Queensland wool? I do not think I had a single return from Queensland.

3213. Have you not heard any evidence to-day that up to last year or so a large quantity of wool came in from the Australian Pastoral Company's property in Queensland beyond Mungindi? I tried very hard to get their returns, but they would not give any information. I am sure no Queensland wool is included in this return,—if there is it would be a very small percentage indeed.

3214. Is any New South Wales wool excluded? There would be a lot excluded. Some people never sent in any returns, even stations close at hand.

3215. You did not draw upon your imagination for the balance of your facts? No. The papers are signed by the runholders and selectors. With regard to the border tax, it is within my knowledge, although I cannot give the names of the stations, that wool does come over here, for I was at Mungindi recently, and I saw wool coming over. And naturally if they are enabled to get their wool cheaper to the railway terminus they will be enabled to pay a larger tax than £2 10s.

3216. Have you any idea what difference the carriers will make between carrying wool from Mungindi to Moree as against carrying wool from Mungindi to Narrabri? Fully a third.

3217. Would the wool going from Mungindi to Narrabri all go *via* Moree by road? I do not know, but I know that several pastoralists contemplate shearing their wool on this side of the border in order to avoid the payment of the tax.

3218. And bring their wool to Moree if the line is constructed? They will send it by road in any case.

3219. You do not think that any wool coming from the north of Moree would, for the pleasure of travelling over the travelling-stock route, pass by the railway station at Moree? I think it is bound to ship here.

3220. Will the same hold good with reference to fat stock? I think so. I have several letters stating that people have to sell their fat stock locally, but that if the railway were extended to Moree they would truck it.

3221. Do you think the people who tell you in all their returns that they would send their produce by the line would alter their opinion if they knew that they have to contribute towards the cost of the construction of the line under the betterment principle? I do not think it would make any difference, because if they were included under the system it would be a secondary consideration whether they would send their stock over. I do not know whether the betterment system would apply beyond a certain radius of the town.
3222. That has to be decided, but it may embrace a very large area? A station owner on the Queensland border told me that he expected to save £500 a year by the railway coming to Moree. On the other hand, people may be injured by the line—the carriers for instance. It is possible that a carrier who has a little homestead here may have to shift his homestead, and yet his land will be subject to the betterment principle.
3223. That applies to the carriers whose base of operations is at Narrabri—they would have to make Moree the hub of their efforts? It all depends on circumstances. It depends upon where they trade from.
3224. Is it not the natural tendency as we extend the railway to force the carriers further back? I believe to the terminus. But there are carriers with their homes here who may be compelled to go on further.
3225. Do you think the betterment principle is a right one to adopt? I think it would be very difficult of application.
3226. I mean as a principle? I think a more equitable means of confiscating the contraband increment than the betterment system can be found.
3227. Presuming that the betterment system is applied, do you think the Land Boards and the Land Courts will be the best tribunal which could be used to arrive at an equitable decision as to how and to what extent the various parts of the district are benefited by the line? I do not know of any better body.
3228. They have given general satisfaction in dealing with land matters? As far as I am able to ascertain
3229. Have you heard any very serious objections to the application of the betterment principle in the district? Only from one gentleman. But I think the majority of those who will be served by the railway will be content to pay under the betterment system sooner than not have the railway, though they may think it a little harsh on them.
3230. I suppose the people in the district generally are awake to the fact that if the line is to be constructed at all, it is to be constructed under the betterment system? A great number of the persons I have spoken to are aware of that fact, and they are quite reconciled to pay a very small amount. I have heard only one person make an objection, and I think he is likely to explain his views to the Committee.
3231. It is estimated, after making due allowance, that about 6,000,000 acres will probably come within the betterment area, and although it is not intended by the Act to saddle the whole cost of the line on the district which is so benefited, it may be necessary to charge up to 75 per cent. Is there any other point on which you desire to express your views? With regard to the post office returns, I would remark that as regards gross revenue Moree Post Office stands twenty-eighth on the list for the Colony, exclusive of the metropolitan offices, and that in point of excess of revenue over expenditure it stands thirteenth on the list. Its revenue is within £40 or £50 of the revenue of the Narrabri Post Office.
3232. If in the near future you erect a palatial post office at a large cost, you will not be able to show such economical results then, will you? That will not enter into the income. In considering the relative returns the cost of the post office is not considered.
3233. Only the business which is actually done? Yes.
3234. How is it that if there is such a large and growing business done in connection with mail matter, the mail contract for the next two or three years has been let at a fifth less than it was let before? That is a very good point in favour of the railway. It shows that there must be a largely increased passenger and parcel traffic, especially as they intend to carry larger parcels than they formerly did by post. We have exported beer regularly to Mungindi, where it pays a duty of 37½ per cent., showing that the natural way for goods is evidently through this district rather than through Brisbane.
3235. *Mr. O'Sullivan.*] The Committee have observed many indications of progress in this town in the shape of new buildings, new banks, and larger hotels. Are these buildings the result of a belief in the coming of the railway, or the result of a natural growth and expansion of trade? I certainly think the very large business which they have been doing has warranted them in putting up the buildings. I believe the townspeople had no idea that the railway would come here in the near future when they put up those buildings. There is no doubt that the trade warranted the erection of those additions.
3236. How long is it since you have taken this forward stride? I have only been here during four years, but during all that time it has been progressing at the same rate.
3237. The people appear to be in comfortable circumstances? They do—more so than in any other town I have been in.
3238. Notwithstanding the prostration which was caused by the failure of the banks and the reconstruction of those institutions, the people seem to be enjoying all the good things of life here? Yes; very well indeed.
3239. Are you quite certain, as the secretary of the railway league, that the returns you furnish are perfectly reliable? The returns furnished are perfectly reliable, and the figures are quite under the mark.
3240. Your estimate is not like the estimate of the Progress Committee at Crookwell, which on examination had to be reduced from £35,000 to £9,000 a year? No.
3241. As far as you are concerned the figures are *bona fide*? Yes.
3242. And as far as you know, the persons entrusted with the work did their work honestly and faithfully? It was done directly between those interested and myself. Each return is signed by the person really interested.
3243. I presume the people know that if they have to pay a betterment tax they will have the benefit of the increment? Certainly. Most of the men have bought for a rise.
3244. Therefore in paying the betterment tax they are throwing out a sprat to catch a mackerel? One gentleman does not think it should be applied here for the first time, although he certainly approves of the principle.
3245. Are you satisfied with the position of the railway station? Yes. A meeting was held and the townspeople were unanimous that the station should be erected on the site which has been selected.
3246. In point of fact, you would leave the whole of that matter to the Government? Yes.

3261. Except as regards the mortgages, they seem to hold their own very well? I think so. A number of large estates have been formed, principally in regard to selections, prior to 1884. On large stations a number of selectors have been bought out, but still a very large number are holding the selections that they took up.

Mr. R. F. Chambers.
25 Nov., 1893.

3262. Can you state the number? Not very well, but from turning over the leaves of the books and glancing at the records in that way, it seems clear that a great number still have their holdings, and many of them have enlarged their holdings. They have taken up selections through the members of their family and so on.

3263. *Mr. Davies.*] Can you state how much land is available for selection within the district? Not very well. That information can be supplied better by the District Survey Office. The maps are not under my control, but are kept at the Survey Office.

3264. You think the revenue will increase in this district? It will depend a good deal on the character of the legislation which is passed. Of course if the whole of the leasehold areas are thrown open in 1895, it will result in an enormous increase in the revenue. It will result in the business being trebled at least.

3265. The selectors and settlers are in a fairly good condition? They are a very prosperous class indeed.

3266. Do you know anything about the routes for the railway? I could not express an opinion that would be of any value to the Committee.

3267. *Mr. O'Sullivan.*] Are the transfers of land registered in your office? Yes.

3268. Can you not tell by the transfers where the land has gone? Without drawing up a return, which would occupy some time, I could not very well say. Of course I speak more particularly in regard to what has occurred during my time—fifteen or eighteen months. There has been very few transfers comparatively where the ownership of the land has distinctly changed. There have been a few transfers for the purpose of securing an advance on mortgage, but very few transfers for the purpose of changing the ownership in my time.

3269. I suppose the mortgages are not more numerous than in other districts? I should say not as numerous as in some districts I have been in.

3270. The money is generally raised to get fresh lands to carry on their operations? Yes.

3271. It would not be an indication that because a selector mortgages his land, he is necessarily in an oppressed or pushed condition? No.

3272. There is nothing like an unusual number of mortgages here? Not at all.

3273. I notice that many of the selectors have very large areas—do you think they are overreaching themselves in taking up too much land? I would require to have some pastoral experience to be able to answer that question. We have had a succession of good seasons of late years and they would not be likely to come to grief while that state of things continues.

3274. Do men get involved here by taking up too much land? I have not noticed that they do.

3275. Why is it that people are unable to find out by application to an office like yours where land can be selected? The system under which the maps of the Colony are drawn up prevents that from being done. But I am in a different position from many Crown land agents. There is a Survey Office in the town, and when people come to take up land they go round to the Survey Office and look at the maps. The officers of the Survey Department point out to them what land is available if they indicate the locality to which they wish to go.

3276. But all over the Colony there seems to be a bar by which people are prevented from obtaining information, even at headquarters in Sydney information is not always forthcoming? I do not think they have any trouble here.

3277. In the event of other selectors coming over by going direct to the District Survey Office, could they obtain the necessary information to place them on the land? Undoubtedly, provided that they indicate at the Survey Office the locality to which they would like to go—for instance, the name of the parish or the run where they would like to select. The maps are kept charted up to date.

3278. *Mr. McCourt.*] What is the average rent fixed for a conditional lease in your district? I should imagine it would be from 2½d. up to 4d.

3279. Fourpence would be the highest? In some cases it would be as high as 6d. and possibly 7d. for pastoral purposes. In cases near important towns being required for annual leases and not open to selection the rent may probably go up as high as 3s., 4s., or 5s. an acre having regard to the relative position of the lands to the town.

3280. Possibly 2½d. would be the lowest then? There have been cases where it has been fixed at 1½d. and 1¾d.

3281. But what is the rent on the leasehold area? I could not say.

3282. *Mr. Ewing.*] Do you regard the conditional leasehold in most instances as ever likely to become Crown land again? I should say that in the majority of instances it would not. I should imagine the selector would take advantage of his preferent right to purchase.

3283. To all intents and purposes it is alienated now? In the bulk of cases I should imagine it is.

3284. But while a man can rent land at 4d. an acre he is not likely to buy the land at 1s. instalment? Sometimes they come in a batch of a dozen, and select their leases.

3285. If they pay 1s. instalment it goes in part payment of the purchase money? Yes.

3286. You believe they would all purchase? Yes, in the bulk of cases.

3287. *Chairman.*] Is there anything else you desire to say? No.

Mr. Thomas Fitzgerald Moore, grazier, near Moree, sworn, and examined:—

3288. *Chairman.*] What is your occupation? I am a grazier. My holding is situated about 50 miles north of Moree. I came from Victoria.

Mr. T. F. Moore.
25 Nov., 1893.

3289. *Mr. Davies.*] What is the extent of your holding? My brothers and I took up four full areas eight years ago.

3290. What is the total area? Twenty thousand acres.

3291. What would be the nearest point on this line to your holding? Moree.

3292. Would a station within 50 miles serve your holding? I have no other place to go except over the border.

3293. You are just on the border? No; from 40 to 50 miles to the south.

- Mr. 3294. Do you think that a railway to Moree will be the best means to give you a market? Yes.
- T. F. Moore. 3295. Where does your wool go? To Narrabri by road. It is a few shillings less by Narrabri than by
 25 Nov., 1893. Goondiwindi. The stock agents made arrangements to get the wool round by Goondiwindi, but we found that it was a few shillings a ton cheaper to get it by this way. From about 20 miles to the north of us all the wool goes to Queensland.
3296. Do all your neighbours send their wool across the border, or does it all come this way? It all comes this way.
3297. Would the extension of the railway to Moree bring more traffic to the railway? Most decidedly.
3298. Do you know the travelling stock reserve which is depicted on this map? I have travelled along the route several times by coach to Narrabri.
3299. Of the "red" line and the "boomerang" line which line do you think would serve the district and the people of the district best? I should say the "red" line for various reasons.
3300. It is shorter, and consequently it will be cheaper for haulage? Yes.
3301. If the direct line is constructed would it induce a large number of the people in your district to send their wool to Moree and thence to Sydney or Newcastle? Our neighbours all send their wool to Narrabri, but from about 20 miles further north it all goes to Cambooya or Warwick through Goondiwindi.
3302. Would that wool come by this way if the line were constructed? I am almost certain it would.
3303. We would get the wool not only from your neighbourhood, but also from 30 miles to the north? Yes; probably 50 miles.
3304. How many sheep do you shear in your joint names? About 21,000.
3305. The railway will make a considerable difference to everyone in your locality, instead of having your teams on the road for many weeks? Yes; it will be a great consideration.
3306. How long does it take to go by team from your station to Narrabri? It depends on the state of the weather. In ordinary weather it takes seventeen or eighteen days. Sometimes it may be done in ten days, but I think it is nearly four weeks before they get back again.
3307. Do you send fat sheep to Narrabri? Yes.
3308. How long does it take? It might take seventeen days.
3309. How long would it take you to drive your sheep from your station for Moree for trucking? About six or seven days.
3310. The railway would make a very great difference to you in regard to the stock? It would make a difference of about 1½d. per sheep, perhaps 1½d.
3311. And your sheep would be of better quality in the market? Yes.
3312. Have you anything further to say? Some questions were asked yesterday as to whether stock would travel from Millie by the travelling stock reserve in place of going to Woolabrar. It would take three or four days longer to go from Millie to Narrabri than from Millie to Narrabri *via* Woolabrar. From my knowledge of the two tanks on the route it would cost £1 a day; therefore I think they would make for Woolabrar station.
3313. You are strongly of opinion that the people of the Millie district would prefer to go to Woolabrar with their sheep? I have never been in the Millie district, but I think that if I were living there I should have no hesitation in saying that I would sooner send my sheep to Woolabrar than travel them down the road and risk the lanes of Narrabri west, and the chance of being caught in wet weather.
3314. Is there anything more you wish to say? Yes; with regard to the vacant land to the north. On Welton there are about 100,000 acres of magnificent land locked up; the leasehold of Tulloona is all fine country, and there is a great lot of belar country which may be ringbarked at from 1s. 6d. to 2s. an acre. The belar is easily killed. It is magnificent soil and the grass grows soon. When the open country is gone, that country will be taken up.
3315. The extension of the railway to Moree will open up that country? It will in time. It will not be taken up now, because it is too expensive. Making a rough guess, I should think, that there are from 300,000 to 400,000 acres within 50 miles of Moree which will be settled when the leases fall in.
3316. *Mr. O'Sullivan.*] You spoke of the graziers of the north who send their wool to Queensland *via* Cambooya;—are these large men who ship direct to London or who consign to wool buyers in Brisbane? There is only one large station on the border—I do not know where Willtown wool goes, I think it goes to London—which does not sell its wool in Sydney.
3317. Is it much more advantageous to sell in Sydney than in Brisbane, owing to the presence of foreign buyers and the provision of better accommodation in the latter place? Yes; there are no sales in Brisbane.
3318. Therefore, if any inducement were offered to bring this trade in from the north of your place, they would be likely to be swayed by the fact that they would get this greater accommodation in Sydney, and therefore come by this way? Yes; the people of Goondiwindi told me last week that a considerable traffic would come this way.
3319. Do you think that the attraction that I spoke of would be greater than the attraction of the shorter railway journey into Brisbane? But they have also to pay sea carriage to Sydney.
3320. Do they pay more in Brisbane than in Sydney for the carriage of their wool to London? I cannot say.
3321. If these lands were thrown open, do you think there would be a rush of settlers of the same stamp as yourself? If they knew that there was such rich country they would all be here.
3322. What part of Victoria do you come from? From West Wimmera.
3323. I suppose many of the selectors up about Horsham, Dimboola, Donald, and St. Arnaud who find their holdings too small would be likely to come over to this country where they can get larger holdings? Yes.
3324. They are generally men who have made money? Yes.
3325. I suppose you work your holding like a family holding? Yes.
3326. With a ring fence? It is all subdivided. The law will not allow a ring fence in the case of brothers, but only in the case of father and children.
3327. *Mr. Ewing.*] What do you think of the future of this country? I think it has enormous resources.
3328. Is it to be a sheep walk or will it grow wheat? My opinion is that in the course of time as population increases it will become an agricultural district.
3329. You see no reason why it should not be a great wheat-growing district eventually? No.
3330. *Chairman.*] How far is your holding from the Queensland border? In a direct line it is about 16 miles. It is over 40 miles from Goondiwindi.
- 3331.

Mr.
T. F. Moore.
25 Nov., 1893.

3331. You say that the people 20 miles to the north of your holding send their wool to Cambooya, therefore I take it that in your opinion the line of trade between Goondiwindi and Narrabri is within 20 miles of you.
3332. If the terminus of the railway is brought some 70 miles further north, how much further north will that line of trade be driven? To the other side of Goondiwindi.
3333. That will go into Queensland territory. Do you think there is a reasonable probability that all the New South Wales settlers north of you who now send their produce *via* Queensland, and some of the southern Queensland people will send to Moree? Most decidedly.
3334. That applies to all kinds of produce—both wool and fat stock? Yes.
3335. Is your land due north or north-west? It is due north.
3336. Is it liable to flood? It is fairly dry. I am conserving water.
3337. Have you travelled much over the district east and west of your holding? I have been east and north, but not very far west.
3338. Is the country to the north and east of the same character as the country where you live? To the north it is a little bit inferior.
3339. As you go north? There is a bit more timber on the land.
3340. From the pastoralist's point of view it is a little more inferior? Yes, because it is heavily timbered.
3341. Is the country in South Queensland as good as your country? No; not from the pastoralist's point of view.
3342. Is the country to the east as good as your country? Yes, bar large patches of scrub.
3343. Is the country to the east less liable to flood than the country to the west of you? I do not know that you could call any of it liable to flood, except when the water comes down in the watercourse. It is all wet in winter time.
3344. It has been stated in evidence that the country to the east of this line which goes to the headwaters of the river is less liable to flood than the country to the west, and I was wondering whether the country to the east of you is less liable to flood, the waters being confined within reasonable bounds than it appears to be further to the west. Is not the country round about Gil Gil very much liable to floods? No, except where it approaches the Barwon or the McIntyre, perhaps 20 miles from Mungindi.
3345. Have you ever been to Mungindi? No; I have been a long way down the Gil Gil.
3346. Knowing this country somewhat well to the north, in the event of the railway being extended north from Moree, for what place, in your opinion, should it aim—Goondiwindi, Mungindi, or some point between those places, of course putting out of consideration your own holding? I should not like to offer an opinion because I do not know what the country is on this side of Mungindi.
3347. How far towards Mungindi have you been? About 20 miles.
3348. Taking the country you know of, 20 miles to the east of Mungindi, and through to Goondiwindi, in which direction do you think the extension should go with the view of conferring the greatest benefit, not only on the particular individuals who may be there now, but on the State? Perhaps Goondiwindi. The country to the north at Kunopia and across there is inferior.
3349. Going towards Goondiwindi, we should come more quickly in competition with the Queensland railway system? That depends upon how the country on the other side of Goondiwindi becomes settled.
3350. At present the nearest station to Goondiwindi is Warwick? Yes.
3351. If our railway goes in that direction it virtually goes to meet the present Queensland railway system, while if it goes more to the north or north-west, it goes away from their system and consequently is liable to tap more of their country? Yes; but I am afraid that it will be very inferior country.
3352. Do you think the country to the north of Kunopia is inferior? Yes.
3353. The good country in southern Queensland is towards Goondiwindi and Mungindi? I do not know anything about Mungindi.
3354. You think that if the railway is extended to Moree and the fact is communicated to so many of these poor struggling selectors in Victoria there will be a great rush for your country? I believe they will. They have no idea of what the country is like in New South Wales.
3355. We may reasonably expect that this railway will extend our line of trade, at least its own length further north? Yes.
3356. Which is the worst piece of country to travel—between your place and Moree or between Moree and Narrabri? There is not much difference.
3357. The only difference would be that perhaps the road is more travelled south of Moree? ¹Yes.
3358. If the same traffic were carried on both roads, the result would be much the same? Yes.
3359. Is it black soil all the way to your place? Yes; with occasional belts of scrub.
3360. What is the price paid for ringbarking this scrub? Some persons would tackle the work at from 1s. 6d. to 2s. 6d.—it depends on the deposit.
3361. Is there any marketable timber between Moree and your place or between here and the border? No.
3362. What do you use for your ordinary fencing? Pine. There are no pine forests, but clumps of pine.
3363. Do you find that timber useful? It is the best we have.
3364. *Mr. Dawson.*] Do you tar the bottoms? No.
3365. *Chairman.*] I suppose you have no intention of giving up your holding? Not the slightest.
3366. Is there anything else you desire to state? No.

Mr. William Henry O'Malley Wood, District Surveyor, Moree, sworn, and further examined:—

3367. *Chairman.*] You desire to correct a portion of your evidence? I do. The relative merits of the travelling-stock route and the direct route had never come under my notice until yesterday when I was in the witness-box. Upon giving the two routes further consideration I feel satisfied that the direct route would be the best, for a branch line can be made from the direct line down to Millie for a less sum than the difference between the cost of the two lines. That branch line would serve the traffic from Collarendabri, just as well as the curved line.

3368. Is there any other point you desire to submit? Mr. Davies asked me yesterday to ascertain as nearly as I could the area of Crown lands in my district which I think would be benefited by this railway.

3369. You gave us the boundaries of your district yesterday? Yes; but some lands within the boundaries of my district would, perhaps send their goods to Inverell and by that way to Glen Innes. My area does

Mr. W. H.
O'Malley
Wood.
25 Nov., 1893.

Mr. W. H.
O'Malley
Wood.
25 Nov., 1893.

not agree exactly with the area which is given on the map on the wall. The total area would be 3,739,070 acres approximately. I hand in a return which shows the area in each leasehold and resumed area which will be benefited in a greater or lesser degree by this railway.

3370. It does not quite tally with the aggregate area given at the foot of the map on the wall? The boundaries I took do not exactly coincide with the boundaries on the map.

3371. The boundaries on the map on the wall embrace a larger area than the country in your district? Yes.

3372. But even in some of them you are not including the benefits, as you think the stuff will go to Glen Innes? In the north-eastern corner the stuff will probably go to Glen Innes. The roads leading towards Glen Innes are hilly and better drained, and I think the chances are that a certain amount of the traffic will go to Glen Innes.

3373. You gave an opinion yesterday as to the trade between the two districts;—you do not desire to alter that opinion? No.

3374. The only correction is, that on further consideration you think that, perhaps, the direct line will be the best, especially as the saving in the cost will provide, if necessary, a branch line to Millic, from some point on this line? Yes.

3375. Do you hand in a tracing showing the various runs within the influence of this railway? I do.

Mr. Alexander M'Intosh, storekeeper, Moree, sworn, and examined:—

Mr.
A. M'Intosh.
25 Nov., 1893.

3376. *Chairman.*] You are a storekeeper in Moree? Yes.

3377. *Mr. O'Sullivan.*] How long have you been established in business in Moree? Fifteen years.

3378. Is this large store and apparently flourishing business the outcome of fifteen years' operations? Yes, and 14 years previous hawking in the district.

3379. You appear to do business round the whole of this district? Yes; chiefly east, north, and north-west; very little towards Narrabri.

3380. How far out does your trade extend to the north? As far as Mungindi to the north-west; and as far as about 45 miles to the north.

3381. Have you customers out at Mungindi? A few—small men generally.

3382. Any towards Collarendabri? None.

3383. Or lower down that way from Mungindi? Down towards Moree a few.

3384. Any out towards Warialda? None to speak of.

3385. Any to the east of the town? Up the branch of the Big River, towards Bingara.

3386. How far south does your business connection extend? About 20 miles, to Bumble, and not much that way either.

3387. As you have been established fifteen years, and therefore have had a fair chance to get a business connection around the district, I suppose we may take the sphere of your business as representing the commercial sphere of Moree? Yes.

3388. It is probable that the people who are settled within that radius would all do their business in Moree? Yes, that will be about the radius.

3389. I presume from these monuments of your industry you have found your business to be of a satisfactory character? Yes.

3390. We may look upon this district as a sound one? Undoubtedly.

3391. Have you had many bad debts in your time? Not many. Of course that depends on persons.

3392. The business appears to be, generally speaking, of a sound character? Yes.

3393. Has your business been extending rapidly of late? I cannot say rapidly, but it has always been extending.

3394. It is a very sure and growing business? Yes.

3395. I suppose that what is your case may be regarded as the case of every business-man in the town, in a smaller degree? Yes.

3396. I notice you have a number of papers in your hand;—do you propose to make a statement to the Committee? I wish to assist you in arriving at a determination as to the paying capabilities of the proposed line—not in advocacy of or in opposition to the construction of the line.

3397. Will you please make your statement? I have a freight account with the Railway Commissioners. I have brought my returns for the twelve months from the 1st November to the 31st October, and the amount which was paid to the Railway Commissioners was £2,212 10s. Nearly all my goods come from Newcastle and Morpeth—chiefly from the latter place. I have also a freight account with the Hunter River Company. I have brought the returns for the same period, and my freight account with that company was £249 12s. 1d. That represents rather over 500 tons in measurement and dead-weight. That will give you a good idea of the amount of freight which comes from Morpeth. With the exception of a few hundred cases of spirits, very little comes from Darling Harbour.

3398. Do you find it cheaper to have your bulk goods brought by steamer to Morpeth and thence by rail? Yes.

3399. Do the large graziers in the district obtain their goods from Moree, or Newcastle? Chiefly direct from Sydney.

3400. As a rule, they do not do a large business with the local storekeepers? No.

3401. By which road do they obtain their goods after leaving Narrabri? To Mungindi on the north, 45 miles, by this route. But I think no Tullooona goods or wool comes this way. I think it all goes to Glen Innes. If the train were brought to Moree no doubt that wool would come here, but the Railway Commissioners would not benefit, because the freight would be about the same as it is from Glen Innes.

3402. Do many of these large graziers obtain their supplies by way of Tamworth, and thence by carriers to the station? I do not think so.

3403. None of those to the eastward? Only those who would not be served by a line to Moree.

3404. If this line is constructed to Moree, will they be likely to bring their goods by rail to Moree rather than by rail to Tamworth, and thence by team to their stations? I think the most of them would. On this side of Gineroy they are all supplied from this line. But anyone at Bingara or in that vicinity would still send to Tamworth, because he would have 133 extra miles by rail, and there is a good road from Tamworth.

Mr.
A. M'Intosh.
25 Nov., 1893.

3405. I suppose that of late you have not travelled over the country? Not of late, but in the early days I saw a good deal of the district.

3406. Is the country to the west well settled? No; very sparsely settled.

3407. I mean the country towards Collarendabri? I believe it is very sparsely settled out that way.

3408. In what direction, as it is indicated by your business, has settlement been trending since you have been here? It has been trending a good deal north and north-west towards Mungindi.

3409. Those are the two points which would be served by way of Moree? Yes, chiefly.

3410. If the Commissioners estimate that they will receive £10,000 per annum from the goods traffic on this line, do you think their estimate will be realised? I think it is a very moderate estimate. Take my returns alone. I paid £2,212 in a year, and I might safely put down my traffic on this proposed section at £500 a year.

3411. *Chairman.*] More than that? That is a moderate estimate. I usually send down for my summer supplies in September, but this year I did not go down until the latter end of October, and they are all coming up this month. If the committee had visited the town a month later of course my returns, including this month, would be £2,600, or over. I expect that my railway account this month will be over £400.

3412. *Mr. McCourt.*] You think your estimate is a very moderate one, and is likely to be exceeded? Yes. I cannot pretend to state exactly the amount of goods that come here. I do not think I get a third of the total; but assuming that I do, it will show that the general traffic of this town alone will be worth £1,500 a year to the Railway Department.

3413. If they estimate that they will receive in passengers and mails £2,300? I think that is a moderate estimate. I think the Commissioners stated that they do not calculate on the Warialda trade at all. But I think the whole of the passenger traffic of Warialda would come to Moree. The mail leaves Warialda at 10:30, and is due at Tamworth at 11:30 on the following day. But by leaving at 6 it would be here at 7 o'clock at night; the passengers would have a night's rest, and go on by train next morning. Of course, the fare would be a little less. The distance from Warialda to Tamworth is 144 miles; from Tamworth to Werris Creek it is 27 miles, while from Moree to Werris Creek it is 160 miles, so that there would be a mileage gained of 133 miles. Taking a moderate estimate of one passenger daily, that would be 16s. 8d. for each passenger, or £500 a year. I cannot pretend to give an estimate of the passenger traffic from Warialda, but I think all the passenger traffic would come here. The mail would leave here daily for Warialda, instead of bi-weekly as at present, and the daily service to Bingara might be made a weekly or bi-weekly service.

3414. Do you think the Commissioners did not include the Warialda traffic in their estimate? I do not think they did.

3415. Few passengers come from Warialda? At present one may safely estimate that the traffic is one passenger each way a day on an average. That would be twelve passengers a week, or 600 a year. Now 600 passengers at 16s. 8d. each comes to £500. I believe, according to the report, they have not taken that amount in their estimate at all.

3416. Do you think the goods traffic will come? I think a little will come—a good deal in time, perhaps. Of course, there are many lines which will come up—salt, woolpacks, and other things. It would pay them better to get these things from Moree than from Tamworth, and no doubt they would get other things up at the same time. If they wanted goods up very quickly no doubt they would use this line, as it would mean 55 miles of road carriage as against 134 miles.

3417. If the railway system were extended from Glen Innes to Inverell, and from Narrabri to Moree, which way would the Warialda passenger traffic go? I should imagine that most of it would go to Inverell. It would depend on the difference in the cost. I should think that Inverell would be the nearest place.

3418. *Chairman.*] How many other storekeepers are there in Moree besides yourself? Four at present—five until recently.

3419. Can you give the Committee any idea of the traffic which the other storekeepers would have by this railway. No; but I suppose it would be twice as much as I receive.

3420. Your estimate is that your trade would be equal to a third of the total outward trade? I do not know that it would.

3421. Do you send anything to Sydney—do you buy produce and send it on? Very little. All that would come from here is chiefly live stock and wool. But, as you know, live stock pay the Department much better than agricultural produce.

3422. You do not send any? No; I send some wool.

3423. To what extent? It varies. I sent very little this year. Last year I sent over 100 bales—sometimes 150 bales.

3424. Are you a wool-producer or do you trade in wool? It is purchased wool. But I never require to take wool in payment of my accounts; it is simply a matter of buying with me.

3425. You are aware that if this line is constructed, it is to be constructed subject to the betterment principle? Yes.

3426. It is estimated that the country which will be served by this line, and which will come, perhaps, within the betterment area, is comprised within a radius of 50 or 60 miles of Moree—do you think that the country for that distance will feel the influence of this railway? Not to the eastward.

3427. How far east will the country be served? Thirty miles east.

3428. How far north? Forty-five miles.

3429. No more? No; because they can get their goods to Glen Innes just as cheaply as to Moree.

3430. It is stated in evidence that the trade would be influenced right up to the Border, and would come to Moree? I think Tullooona wool will come here, but it will not be a gain to the Railway Department. It is now going to Glen Innes, and I think the distance from either station would be about equal.

3431. You state that the area which will be benefited by the railway, and which is likely to come within the betterment area, extends 30 miles east, 45 miles to the north—and how far west? To Mungindi—nearly 80 miles.

3432. Have you given any consideration to the betterment principle? I have.

3433. Do you think it is a fair principle to adopt? I think it would be fair if it had been adopted at the outset of railway construction. In all the suburbs of Sydney thousands of acres of land have been bought

Mr.
A. M'Intosh.
25 Nov., 1893.

at a few pounds per acre, and sold at nearly as many pounds per foot. That is where the principle should be applied. All these lands should have paid for the construction of the suburban lines. They have extended the trunk lines and constructed branch lines without applying the principle, and it seems unfair now that it should be applied to the construction of a light line. I think the evidence is strong that this line will pay from the start, not only the working expenses, but also the interest on the capital expenditure. If it pays the interest the capital need never be paid off. It has a State guarantee of 4 per cent. The State can issue Narrabri-Moree railway bonds, and as long as there is a State guarantee of 4 per cent. those bonds will always be worth their money.

3434. You do not believe in the principle of paying off the principle and interest? Not in the case of railways as long as they pay.

3435. You admit that the betterment principle is a correct principle to adopt, and your only objection is that Moree happens to be the first place to which it is to be applied? Yes.

3436. If it is a right principle to adopt, as we must make a start at some time or other, why should not a start be made here? Because there is a reasonable prospect of the line paying from the start.

3437. If it should be decided by Parliament that the betterment principle should be applied in this district, you would be in favour of not having the railway, rather than have the principle applied? As regards the construction of the railway, I can assure you that it is a matter of perfect indifference to me. I think it would benefit the district greatly, but I fail to see the justice of making the Moree land owners pay for such lines as the Mudgee line, the Hornsby line, the Molong line, the Cobar line, and the Lismore-Tweed line—all dead losses to the country. If the Moree line pays from the start the money that is raised under the betterment principle in the district will go to pay off those lines.

3438. You think that the people in other parts of the Colony have no interest in your public lands? They have not the same interest.

3439. It all belongs to you? Not at all. We have no interest in these lines. All the land alongside the Hornsby line is bringing much more than it did, yet it is not subject to the betterment principle. I suppose the Mudgee line would not have been constructed if it had been subject to the betterment principle. We are not interested in those lines except as colonists.

3440. Assuming that the betterment principle is to be applied to the construction of the Moree railway, do you think that the land boards and land court will be the best tribunal to judge of the application of the principle? I think so.

3441. They have given general satisfaction in administering the Act have they not? I should imagine so.

3442. You would rather have these bodies to fix the various zones within the betterment area than resort to the ordinary tribunals? The former are in a much better position to determine the matter.

3443. You have been out Mungindi way? Within a few miles of the town.

3444. Have you travelled much about the district north and west? Chiefly east, south, and north—not a great way north.

3445. The country north, west, and east is very similar to the country between Moree and Narrabri? It is all fine fattening country.

3446. Less or more liable to flood than the land between Moree and Narrabri? Some of it more liable—down the Gil Gil.

3447. The higher you get up the river the less liable it is? Yes.

3448. Is there any other information which you desire to give to the Committee? No.

Mr. John Munro, post and telegraph master, Moree, sworn, and examined:—

Mr. J. Munro.
25 Nov., 1893.

3449. *Chairman.*] You are post-master and telegraph-master stationed at Moree? Yes.

3450. How long have you been here? I have been in the service of the department seventeen years; but previous to my appointment I had been in the district about fifteen years.

3451. Will you describe briefly the various mail services which radiate from Moree? The service from Moree to Narrabri—a daily service—cost for the last three years £570 per annum, but a contract has been let for a term of three years at £450 per annum.

3452. Is this service very frequently interrupted by the bad state of the roads? Yes; the heavy state of the roads prevents the mails from running to time. The mails are often twenty-four, sometimes forty-eight hours, behind time.

3453. What is the time allowed by the contract? Twelve or thirteen hours.

3454. Does it frequently happen in the course of the year that the mails are twenty-four hours late? In wet seasons with a scarcity of grass they are generally later than in good seasons.

3455. Have you ever known the coaches, owing to the flooded or heavy state of the roads, to have to go to the east rather than come by the travelling stock route? They must come by that way, because they have to tap Millie and other places.

3456. Has there ever been an occasion when the coaches could not travel, and the mails have had to be carried on horseback between Moree and Narrabri? Occasionally; not from the floods, but from the bad state of the roads principally.

3457. It is continuous showery weather which makes the road very heavy? Yes; perhaps a week's rain.

3458. Will you state the next mail route? The next is from Moree to Eulourie and Cobbedah. It is about 100 miles to Cobbedah. It goes within 12 miles of Barraba. It goes once a week by a light buggy, and the annual cost is about £135 a year.

3459. The next route? The next mail is from Moree to Bingara. It goes twice a week in a two-horse coach.

3460. Is the mail matter increasing? It is not very heavy; it is principally for the convenience of the road residents.

3461. There is not much actual communication between Moree and Bingara, but between Moree and people on the road to Bingara? Yes; it is a cross-country mail. They have a direct mail from Tamworth.

3462. Is that mail growing? Slightly. It used to be a weekly mail a few years ago. It has only been established during the last three or four years.

3463. The next mail? It is to Warialda *via* Pallamallawa. It goes twice a week.

3464. Is it growing in importance? By the settlement along the way it is.

3465. It is very much in the same position as Bingara? Yes. It is a direct outlet for Inverell for cross-country correspondence. It is a bi-weekly service.

3466.

3466. The next service? It is from Moree to Mungindi with three branches. It is a bi-weekly service Mr. J. Munro.
to Mungindi. It is the most important coach-line in the district.
3467. Off that line you have three mail services? Yes; a branch to Kunopia, a branch to Boggabilla 25 Nov., 1893.
and Goondiwindi, and a branch to Gil Gil. We make up the mails direct for these places, and for residents along the lines in private bags. The mail from Wallow Creek up the Gil Gil is a horse-mail going once a week, it is growing. The mail from Welbon to Boggabilla and Goondiwindi is a bi-weekly horse-mail. It is growing, as a great deal of settlement is taken place along the line. The mail from Garrah to Kunopia on the Barwon is a very small mail. Several gentlemen from Victoria and other parts of the country have taken up land along this line.
3468. What other mail services are there? There is a mail to Talmoi, 40 miles west—it serves a number of selectors. It is a horse-mail going once a week. It is growing in importance. I believe it is the intention of the Department to shortly double the service.
3469. Is it growing more rapidly than some of the branch lines off the Mungindi line to the north? Not more.
3470. The country along these lines is not adapted for vehicles? No.
3471. Any other mail services? From Moree to Burrendoon *via* Meroe. It is about 55 miles distant. It has a vehicular service twice a week. There is another line from Moree to Telcraga. It is a horse-mail running twice a week.
3472. The only coach service therefore are to Bingara, Cobbedah, Warialda, Mungindi, and Meroe? Yes.
3473. Has there been any marked growth during the last five years in the business done at Moree post office? Yes. There has been a marked increase in the work since then. To give you an idea of the number of the residents along the Mungindi line, I may say, that I prepare thirty private mail bags for that line, and several of these bags supply a number of neighbours.
3474. Has the telegraphic business grown to any very great extent during the same period? I cannot say that it has grown so much. But there has been a reason for that. We were remarkably busy three or four years ago. The stock agents occupied the line for a length of time. There has been a marked decrease in their business, but the ordinary business has kept well up.
3475. How do you account for the falling off in the stock business? It is owing to the depression which has been felt all over the Colony.
3476. There has been no diversion of trade? No.
3477. With your intimate acquaintance with the surrounding district, do you think there is a steady, not to say a very large growth going on all around? It is not very rapid; it is continuous. For instance, while in 1880 the sale of stamps amounted to £260, this year it has risen to over £1,700.
3478. Can you state the total revenue for telegraphic purposes during the same time? Last year the sale of stamps amounted to £1,746, and for telegrams we received £709. A year or two before the telegraphic revenue was slightly in excess of that, but it was owing to the activity of the stock agents business.
3479. Any money order business? No particulars are given on this list of that branch, but making a rough estimate it was between £8,000 and £9,000 last year, and the Government Savings Bank between £3,000 and £4,000.
3480. There is a gradual growth in all these branches of the revenue? Undoubtedly.
3481. You have no fear of the bottom dropping out of Moree? Not in the least. I have been in Moree since it consisted of only one house—about thirty-three years ago.
3482. *Mr. Davies.*] Do you know anything of the country through which the railway will pass? Yes.
3483. Do you know the travelling stock route? Yes; it is the only one I do know.
3484. Do you recognise the surveyed line on the plan? Yes.
3485. Do you know that country? I have not been in there much, therefore I cannot speak of that country.
3486. Which route do you favour—the direct, or the “boomerang” line? I think the direct line would suit all parties best, it would mean less haulage and quicker transit.
3487. At what period during your term of office has there been a greater growth in the business, as compared with previous years? There has been no sudden jump, it has been a gradual growth all along. There has been a gradual settlement in the district—people are continually coming to the district from all parts of the country.
3488. What staff have you? I have five assistants.

Mr. Frederick William Kirkby, hotelkeeper, Moree, sworn, and examined:—

3489. *Chairman.*] What is your occupation? I am a hotelkeeper in Moree.
3490. *Mr. McCourt.*] How long have you resided here? Thirty-three years in the district—twenty-eight Mr.
of that in the town. F. W. Kirkby.
3491. Are you also a land-owner? I have two or three selections, perhaps a couple of thousand acres. 25 Nov., 1893.
3492. What is the average size of the selections within a radius of 10 or 12 miles? Six hundred and forty acres, as a rule. Some have the full area of 2,560 acres, but not many have close to the town.
3493. Are you all engaged in sheep farming? Nearly every one.
3494. Will that occupation continue here, or will the land be cultivated at any time? There is not the slightest doubt that a great part of the land will be put under cultivation. I myself grow a good bit; nearly enough hay and corn to keep myself.
3495. Is the land very suitable for growing corn? It is very good indeed, more so to the east than to the west.
3496. Supposing that the people were to go in extensively for corn growing, where would they get a profitable market? It would be down the country.
3497. Down Sydney way? Yes.
3498. You spoke of some suitable land for wheat-growing to the east;—where is it situated? From Moree towards Warialda it is all wheat-growing country. Mr. Solling has grown some splendid wheat. All up the Big River they can grow buck-wheat, but they do not, on account of the market being so far away. They grow it for hay, chaff, and forage. They do not grow much for the market until you get up to Orton, where they grow it for Bingara. 3499.

- Mr. F. W. Kirkby. 3499. Has there been any disposition shown to adopt agriculture during the last few years? They are all going in for it a little. There are very few of the selectors who do not grow what they want for themselves—potatoes, and anything like that.
- 25 Nov., 1893. 3500. In a few years, the probability is that sheep-farming will be combined with agriculture? That is my belief.
3501. Do you think it can be carried on with a profit? Yes.
3502. Does the Warialda traffic come here now? Yes; they bring a great deal of flour from Bingara and Inverell, also corn and chaff. I bought some yesterday which had come from Bingara. They bring it down from the Orton much cheaper than it can be got by any other way.
3503. If this line is constructed you think you would get the passenger and goods traffic of the Warialda district? I believe we will.
3504. You know the country between the two routes well? Pretty well.
3505. Do you think the "red" line would serve the greatest number of people? It would suit this district best, because it would cost far less to construct it in the first place, and less for the transit of stuff in the second place.
3506. Does it not go too close to the mountain ranges? I do not think so. It is higher ground along the ranges.
3507. Do the people own too much land here? They cannot get it.
3508. Do those who have got land hold too much? I do not think so. I do not think any man can carry on sheep-farming with less than 2,500 acres.
3509. He can live well on that area? I think he can make a very profitable living, provided that he gets good ground, and keeps good stock.
3510. Where they have 7,000 or 10,000 acres, they have too much for one family. Would it not be better if it were all cut up in 2,500-acre blocks? No doubt it would be better for the district—it would create a larger population.
3511. Is there any disposition amongst the large land-holders to subdivide and sell? I have never heard that there is.
3512. Do you think that the construction of this railway would encourage the subdivision of large estates? There is no doubt the railway would cause a greater population to come here. The country is second to none as far as its growing and grazing capabilities are concerned. I have travelled about the district for thirty two years—I have been carrying and droving—and I never saw anything better.
3513. If the leases are thrown open there will be a rush for land? Undoubtedly.
3514. You think that, on the whole, a line by the "red" route will pay? I do. I think, as I have always thought, that it will be one of the cheapest and best paying lines in the Colony.
3515. *Chairman.*] Do you know where they propose to locate the stations here? No.
3516. I suppose it is not a very burning question to the people of Moree? I could not say.
3517. All they want is a railway, and they do not care where the terminus is? I know that where the terminus is proposed to be put the land is reserved.
3518. Do you think it is a suitable place for the terminus? Yes.
3519. You have not heard any complaints on the part of the people, that it is too far from the centre of the town? No.
3520. It could not go very much further without crossing the river? I do not think it could go much further without going into the houses.
3521. Do you know anything of the country about Wee Waa? I have not been at Wee Waa for thirty-five or thirty-six years.
3522. In those days it was considered an important town? It was. In 1857, when it was reckoned a good town, I think there were two houses there.
3523. I suppose you think that Moree has a bigger future than Wee Waa? I think it has a bigger future than any place in the northern district.
3524. You have heard some of the witnesses give their evidence? I heard one or two witnesses give their evidence yesterday morning.
3525. Is there any point as to which you do not concur in their evidence? Not materially.
3526. Is there any other information you wish to give? Not that I know of.

Mr. Charles Bodeley Keene, station manager, Gurley, sworn, and examined:—

- Mr. C. B. Keene. 3527. *Chairman.*] What is your occupation? I am a station manager at Gurley.
- 25 Nov., 1893. 3528. *Mr. O'Sullivan.*] Who owns Gurley? Mr. John Simson.
3529. Have you a thorough knowledge of the country through which the proposed line will go? Yes; I know it very well.
3530. What is the character of the country generally between Moree and Narrabri? From Moree to Tycannah it is plain country—flat, good sound country and not very heavy black soil; from Tycannah to Woolabrar it is slightly undulating country. Crossing those creeks which are marked on the plan it is not at all flooded except at the creeks. A few good sound culverts would be all that would be required at the creeks, I should think. From Woolabrar to Killarney it is rather plain—more black soil between Woolabrar and Edgeroi than on the other part of it, and from Edgeroi to Narrabri it is high country, slightly undulating.
3531. How far to the east does that description apply? The country gets more undulating towards the mountains, and higher altogether as it goes east.
3532. Will it bear the description which you have just given? The greater part of it is rolling downs—black soil downs.
3533. Are there any thick scrubs between the "red" line and the mountains? The nearest heavy scrub is about 12 miles. Narrabri is the nearest poor country. About 4 miles east of Narrabri you get into sandy country.
3534. We are told that towards the mountains there are some thick scrubs which would cost £10 an acre to clear off? Not within about 15 miles of the line. Then you get into heavily timbered country.
3535. What would it cost to clear that scrub? I dare say about £5 an acre.
3536. What is the character of the timber in these scrubs, and out on the eastern side? It is pretty well all heavy timber, such as ironbark, yellow jack, gum.
- 3537.

Mr.
C. B. Keene.
25 Nov., 1893.

3537. Plenty of ironbark? Yes; a great portion of the timber is ironbark.
3538. Which would be the nearest station to the ironbark forest? I think Woolabrar—any point between Gurleigh and there.
3539. How far from the station would that forest be? About 20 miles.
3540. Out towards Terry-Hic-Hie? Yes; that would be up Tycannah Creek, or Bowman's Creek, as it is called. There is plenty of timber up there—ironbark, yellow jack, pine, gum, apple-tree, and all sorts.
3541. Is there much ballast along that line of country? After crossing Waterloo Creek, for about 2 miles, it would go through a red gravel ridge—a hard, cement-like gravel. It is pretty hard to sink post-holes about there.
3542. Is it south of Waterloo Creek? Yes, on the Narrabri side.
3543. Does that refer to a portion of what is called Eckford Forest? Yes.
3544. Is that very heavily scrubbed? Heavy belear, and some box on this ridge.
3545. There would be plenty of ballast there for the railway? Plenty.
3546. Would it be better than ordinary gravel? I do not know whether it would be considered better than gravel for railway construction. It is close cemented stuff, which would make good road metal.
3547. Is the land through which the proposed line goes subject to floods? Not at all, except at the creeks, where the water is confined within the channels. There is very little swampy country or places where the water lies at all.
3548. Would any of these creeks prove dangerous to the railway in the event of a flood? Not if there were proper crossings.
3549. Is the country to the east of the railway, or a fair proportion of it, fit for agricultural purposes, provided that it is cleared? Yes.
3550. Do you think that when the population grows more numerous, and with the existence of the railway, and the possibility of commanding better markets, any agricultural development will take place there? I think a great portion of the land to the east is well suited for agriculture.
3551. What kind of soil is it? It is light loamy soil.
3552. Any chocolate soil? Principally about the mountains, and at the heads of the creeks, there is chocolate soil.
3553. It would seem to be a likely place for wheat cultivation? I think so. It would grow good corn.
3554. Is it fit for growing grapes, figs, oranges, and lemons? Yes.
3555. *Mr. McCourt.*] What is the size of Gurleigh holding? About 270,000 acres, of which 100,000 acres are freehold, and 50,000 acres leasehold.
3556. *Mr. Davies.*] How many sheep do you shear on your run? One hundred and fifty thousand last season.
3557. Where does the wool go? Through Edgeroi, by the road to Narrabri. It would strike the main road at Galathera.
3558. What would be the nearest station on the "red" line for your wool or stock? Gurley. It would be about 1 miles from the head station wool-shed.
3559. The whole of your wool would go by that route? Yes.
3560. What saving would it effect in your case? I do not know what the railway rates would be for wool.
3561. What would the difference in the mileage be to you? It would be about 45 miles by road.
3562. The railway would serve you well if the station were provided with the necessary appliances for trucking stock and sheep? Yes.
3563. Would any other run near Gurley be equally well served by Gurley railway station? I suppose that Edgeroi and Tycannah would be served in the same way.
3564. I understand you to favour the "red" line rather than the travelling-stock route? I should think it would be far less costly than the other, as it is nearest to the ballast and the sleepers.
3565. At what price per cubic yard do you think gravel could be delivered on the line? I do not know.
3566. What would it cost to get half round sleepers, 10 feet long, from this forest? I should think you could get plenty of them at 1s. 3d. each.
3567. Is the timber in the forest good enough for sleepers? Yes.
3568. *Chairman.*] If the people about Millie and to the west of Millie who reach the travelling-stock route by Millie have stated that they would not use this railway, but would travel their stock to Narrabri, do you think that is what you would do if similarly situated? No.
3569. If you had a railway station within 12 miles of the travelling-stock route, and you were managing a station to the west of Millie, would you send your stock and wool by road to Narrabri, or would you ship it at Woolabrar? I think I would put it on at Woolabrar.
3570. You would like to get to the nearest point on the railway? I think so.
3571. Do you carry your own wool, or do you arrange with carriers? I arrange through an agent as a rule with a carrying company.
3572. What does it cost you to carry per bale or per ton? It is arranged by the weight for the total distance.
3573. How much does that pan out per ton per mile? It is £2 15s. a ton for 15 miles.
3574. Supposing that the distance were doubled, would there be any decrease in the cost? Yes.
3575. The longer the distance the smaller proportionately is the charge per mile? Yes, usually.
3576. Would not that go to substantiate what the Millie people said, that having got their wool on, and the saving being only 20 miles, they would go on 20 miles rather than take the railway? The railway freight would not compare with the carriage by team.
3577. You think it is reasonable to suppose that they would tap the line at Woolabrar? I think so.
3578. As far as flood-water is concerned, is there much difference between the travelling-stock route and the "red" route? The travelling-stock route is much lower.
3579. Consequently is more liable to flood? It is not liable to flood, but the water lies on the ground very much longer. It is boggy and heavier. The water lies in swamps for miles for a long time.
3580. Supposing that Gurley station were to the west and not to the east of the travelling-stock route, would you still think that the "red" route was the best route? I think, as far as the country is concerned, it would be the cheapest and most direct line.
3581. And it would go through higher country for railway construction? Yes; better country for railway construction. Personally I would sooner see the line go along the travelling-stock route. It would be quite near enough for us, it would not interfere with us.

- Mr. C. B. Keene. 3582. What distance from a railway station do you think is a convenient distance—15 or 20 miles? Twenty-five miles.
3583. You think that a pastoral property is fairly well served if it is within 25 miles of the station? Yes.
3584. *Mr. McCourt.*] Are there any selectors on Gurley? Five.
3585. Is the resumed area all Crown lands yet? With the exception of these five selections it is. It would amount to 150,000 acres on Gurley.
3586. What is the area of Gurley station? 100,000 acres freehold, 50,000 acres leasehold, 50,000 odd acres resumed area, and the reserves.
3587. Would the construction of this railway tend to increase the value of those Crown lands or cause them to be selected? I think they would be selected in any case. I do not think it would make much difference. Wherever selectors have been able to get land it has been taken up.
3588. Why have they not taken up the land on Gurley, if there are 50,000 acres in the resumed area? The greater part of that land is belar scrub.
3589. If the railway were constructed it might be taken up? It would give greater facilities for carriage.
3590. For what purpose could the timbered country be most profitably used—for grazing or for agriculture? For grazing, I suppose. It is all heavy black soil. It would grow crops, no doubt, in a good season. It wants rain only.
3591. You do not think that agriculture would pay there? It would pay there, as well as in a great many other places on the line.
3592. But would it pay? I do not think so, taking one season with another.

TUESDAY, 28 NOVEMBER, 1893.

[The Sectional Committee met at the Court-house, Wee Waa, at 4:30 p.m.]

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTON.

The Hon. JOHN DAVIES, C.M.G.

THOMAS THOMSON EWING, Esq.

WILLIAM MCCOURT, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

HENRY DAWSON, Esq.

The Sectional Committee further considered the proposed railway from Narrabri to Moree.

Mr. Lawrence Brennan, selector, near Wee Waa, sworn, and examined:—

- Mr. I. Brennan. 3593. *Chairman.*] What is your occupation? I am a selector, residing near Wee Waa.
3594. How long have you been in the district? About two and a half years.
3595. Your selection is on both sides of the river? Yes; it consists of 2,750 acres.
3596. How many sheep do you graze, or what stock do you carry? At present I have 5,000 sheep. Altogether I hold 3,200 acres for grazing. I have about twenty head of cattle and ten horses.
3597. Where do you send your produce and fat stock? By Narrabri West to the Homebush market.
3598. By which road do you travel? I have travelled by the cleared line on the southern side of the Namoi.
3599. The line that makes a detour from Wee Waa to Narrabri West? It is almost a direct line. The "blue" line is the more direct line. I have gone by the river road a time or two.
3600. If the railway is constructed by the "red" route, you would be no nearer to any point on that line than you are to Narrabri West? No; it would be of no benefit to me.
3601. Would a line by Gurleigh Point route bring you any nearer? Yes.
3602. How far would the nearest point on that line be from Wee Waa? About 6 miles.
3603. Would a line along the travelling stock route direct from Narrabri be of any benefit to the people of Wee Waa? I do not think so.
3604. The only line of the three, therefore, that will be of any use to the people of Wee Waa and the district belonging to the town is the line *via* Gurleigh Point? Gurleigh Point line, or any line more westerly.
3605. It is hardly possible to get more westerly? Not on that map.
3606. What other line would be more westerly? A line by Wee Waa itself would be more westerly than a line by Gurleigh Point.
3607. If you had your way you would take the railway from Narrabri West along what you call the direct road to Wee Waa, and cross the river a little to the east of Wee Waa at a point near your holding? No. The line which would take the most westerly course would serve the greater number of the people.
3608. Is there a good crossing at Gurleigh Point? No.
3609. Is there a better crossing at any point further west of Gurleigh Point crossing? No.
3610. What you desire to say, therefore, is that, without giving any consideration to the crossing of the river or otherwise, the line should be brought as far west as possible, so as to serve Wee Waa and the district beyond? I would say particularly the producers north-west of Wee Waa.
3611. Does much of the traffic from the west of Wee Waa, say out Walgett way, come through Wee Waa to Narrabri West? I think that the greater part of the traffic comes through Wee Waa or by Wee Waa.
3612. There is no produce which comes from Walgett by this way? I could not say.
3613. If the station-master at Narrabri West has sworn that, compared with the trade from the north, comparatively little trade comes to the railway from the direction of Wee Waa, what is your opinion on that statement? My opinion is that the station-master must have understood only the traffic which went by the cleared line to be Wee Waa traffic, whereas the roads on the other side of the river, within 2 or 3 miles of Wee Waa, are used, as well as the cleared line. He may have taken the cleared-line traffic, and I daresay that in some seasons that may not exceed one-tenth of the volume of trade to Narrabri railway station.
3614. Then the bulk of the Walgett trade, or the trade coming from that direction, would go along the road on the northern side of the river, and through Narrabri, in order to get to Narrabri West? I am quite aware that a great deal of it does. The carriers prefer the other side because the pasture there is better

better for their teams than on the southern side. I have seen a great quantity of wool and fat stock come up that way to market within 3 miles of Wee Waa. I have seen large quantities coming in by another road a few miles further out known as the Boolcarrol Road. If the station-master credited all this which passes through Narrabri to the north, he may imagine that only a tenth of the traffic comes from this way.

Mr.
L. Brennan.
28 Nov., 1893.

3615. It is only in very dry seasons that the trade from the direction of Walgett goes along the northern side of the river, and in wet seasons it goes to the south of the river? Yes; the carriers are divided in their opinions, some preferring going one side and some the other. I have seen great quantities go down on the other side, where there is better pasture for teams. In very wet times they would have to go by the cleared line.

3616. Do not the records of the railway station at Narrabri West show whence the produce come? I could not say. I only speak from what I have seen.

3617. You have no idea of the volume of trade which goes along the travelling stock route from Moree? No.

3618. Therefore you are hardly in a position to compare that trade with the trade which comes from Walgett way, whether on the north or on the south of the river? Not to make a definite comparison.

3619. Is not the country in and about Wee Waa very much liable to flood? Yes.

3620. Is it not a fact that in 1890 a very large area of this country—nearly all along the Namoi—was under water? I believe it was.

3621. Was much stock destroyed or drowned at that time? I do not think there was any drowned. But I can only speak of what has occurred since 1890. It was in 1891 that I came here, and I did not hear of any stock being drowned. In 1891 I purchased my property, and I would not have made the purchase if I had considered that it was dangerous land for stock. It goes right through the worst flooded country in the district.

3622. You have not suffered materially? No; I have never lost anything.

3623. There have been no serious floods since 1890? That was not a serious flood. I am told that the flood last year was within from 9 to 12 inches of the 1890 flood.

3624. Have you been any great distance to the west of Wee Waa? Not more than 15 miles.

3625. As far as you have gone to the west, is the country more liable to flood than the district immediately about here? I could not say that it is.

3626. Is it much about the same? It appeared to me to be much about the same.

3627. Does the river branch out into numerous creeks? No; an overflow takes place here, and the water travels sluggishly over the ground on either side of the river; and when it does break over there is such a large area to cover that there is no current.

3628. Does the water lie long on the runs? No; immediately the river falls, within a couple of days the country is fit to carry stock again sometimes.

3629. *Mr. Suttor.*] Do you send much fat stock to Sydney? Yes.

3630. How many annually? I have sent 2,100 fat sheep off this small place of mine within the last twelve months to Homebush, and about 14 tons of wool. I am not dealing with any stock. I am a breeder. That is a legitimate outcome in a good season. I am stocked up now.

3631. Do you get a fair return for the sheep you send to Sydney? I got a fair return. I have got from 12s. up to 18s. a head for merino wethers. I have generally got far above the average price ruling in the Homebush market, and my neighbours have done the same. I think the stock journals would show that.

3632. Do you know anything of the country through which the "red" line would pass? No.

3633. Do I understand you to say that the "red" line would be of no service to you? Yes.

3634. And that the only line which would serve you would be a direct line from Narrabri to Wee Waa? No; a line which would take a more westerly course, would serve me more or less.

3635. Would a line by Gurleigh Point serve you? Yes.

3636. Would it serve a larger population than the "red" line? From my knowledge of the country, I feel confident that it would.

3637. Are you aware of the difference in the length by that route? I believe there is a deviation of about 10 miles. The river bears northerly from Narrabri to Gurleigh Point, and that favours the deviation.

3638. You would have to cross the river twice by taking that route? No; the river has to be bridged in any case, to get to the northern side. I believe that one bridge would do, that is, if the "red" line is intended to serve the producers of the country.

3639. Do you think that the difference in the number of selectors and settlers who would be served by the line you suggest would warrant the Parliament in incurring the increased expenditure? I do; because from my limited knowledge of the "red" route, it appears to be very convenient to the mountain, or what we call barren country down this way, while the other line would go through country which I know to be very valuable and fertile pastoral country.

3640. You have not been long resident here, and you have simply a knowledge of the country in which you are principally engaged? The country I have travelled over.

3641. Not much towards Moree? Not towards Moree.

3642. How would Millie be affected by taking the railway by the route you suggest? I have suggested that it should take a westerly direction, but I do not think my knowledge would warrant me in suggesting a definite route.

3643. You would rather dispense with railway communication than have a line by the direct route? Unless the people to the north-west could get an independent line, I would. If it would block a line from going to the north-west, in the interests of the country I would like to see it blocked.

3644. You think it will be possible to have a branch from this line? I consider that is the branch. The main north-west line should go more towards Collarendabri, or more north-westerly.

3645. *Chairman.*] Rather than the Moree line? The Moree line, in my judgment, would be the branch line. The main line would go more to the north-west.

3646. *Mr. Davies.*] Where would you tap the line so as to make a junction to reach Moree? I would not tap the line at all. I think the main north-west line should take a more westerly course. The "red" line might be an independent branch line. I do not say that the Moree people are not entitled to a railway, but if they are entitled to have a railway by the "red" route I believe the people in the north-west

Mr.
L. Brennan.
28 Nov., 1893.

are entitled to have an independent line from Narrabri West. But if the one line is to serve both Moree and the north-west, I would say it would want to take as north-westerly a course as the engineers would like it to take.

3647. Do you think the estimated cost of this line—a cheap line through level country—is a fair and reasonable one? I could not venture to offer an opinion; I do not know anything about that question; I do not know sufficient of railway construction to know what it would cost.

3648. How is the district situated for sleepers? I know some of the timbered land between here and Narrabri West. For sleepers there is ironbark.

3649. Is there an abundance of gravel and metal for ballast? Not to my knowledge. I have heard a report that there are gravel-beds, but I have not seen them.

3650. You know very little about the materials necessary for the construction of the line? Only the sleepers.

3651. Is there any other information which you desire to give in support of your views? Yes—with regard to the adaptability of the land for cultivation. I believe the timbered country within a few miles of the railway line from Narrabri West to any point on the river would be brought under settlement before very long. I believe it is far more valuable than it is generally supposed to be; it is suitable for agricultural settlement.

3652. It has not been taken up? No; it is vacant Crown land.

3653. While people can get land which is cleared to the north-west, they would not take land which is timbered to any great extent. Have you anything further to say? No; only that the country on the northern side compares favourably with any pastoral country I have seen. I travelled the Murrumbidgee, Riverina, and the Lachlan before I came here. I took land on the Namoi in preference to land which was offered at the same price at Narrandera, within a few miles of the railway, and I have not regretted my choice.

3654. A point some distance on this side of your bridge which we crossed this morning was pointed out to the Committee as a point where the river might be crossed. Supposing a crossing were made at that point, where would the railway strike the proposed line? Out Boolcarrol way.

3655. That would be practically a branch from this line in the direction of Wee Waa? The line would go from Narrabri West, cross the river at the point you speak of, and pass on probably to Moree.

3656. Do many of the residents favour that point as a very good place for crossing the river? I think it may be found to be a good crossing. I am not very friendly to it, because it will do me an injury if the line comes through my land. I want the railway as close as I can get it without going through my land.

3657. You regard the site as a good one? I know that the banks are above flood-mark. If the railway could be constructed by that way it would be a benefit to this part of the country. Of course I would not try to oppose its construction.

3658. Your land would be subject to the betterment principle;—are you quite prepared to pay your share of its cost? I am, but I think the principle ought to be made retrospective. Those who have railways should pay as well as those who are to get railways.

3659. You have no objection to the application of the principle, even if it is applied to the construction of this railway, as long as the line will serve your district? No.

3660. *Mr. O'Sullivan.*] The map on the wall which illustrates the settlement in the district to be served by this railway does not give the settlement around the town of Wee Waa or in its vicinity? No.

3661. Is there much land selected around Wee Waa? A good deal.

3662. On which runs? Gundemaine, Wee Waa.

3663. Any upon Mara? I could not say. I believe there are a good few, but I am not acquainted with the run.

3664. Any upon Drildool, Boolcarrol, and Nowley? Yes.

3665. Are there many settlers within a fair radius of the town of Wee Waa—say within 15 or 20 miles? Within 15 or 20 miles there is a fair number of *bona fide* settlers, who are likely to remain.

3666. Have you heard of any selectors selling out up here? Not one since I have come.

3667. In which direction is settlement trending from the town of Wee Waa? North-west, as far as I know.

3668. Towards Collarendabri? Yes; and more down the river, if land is available—between that and the Namoi. I have been written to from the place from which I came to know if land is open for settlement here, and I have replied that when the runs are dealt with there may be land open for settlement.

3669. From which district did you come? Tumut.

3670. You say that there are settlers in that district, although it is a good agricultural district, who are anxious to come up here and settle as graziers? Yes.

3671. Do you think they are likely to come up when the leases are thrown open? Some would come if they could get the land.

3672. Would they prefer to come here, or to go on the leaseholds between Narrabri and Moree? I would not say that they would refuse to go Moree way. I think that district may be as good as this district. I am sure they would come to this district to the north-west of Wee Waa.

3673. You do not pin yourself to any particular route, but you prefer the railway to go by a more westerly route than the "red" route? Yes; as far to the north-west as the engineers say it can be taken.

3674. *Chairman.*] Is there any other point you desire to mention? No.

Mr. James Andrew St. Clair, selector, near Wee Waa, sworn, and examined:—

Mr.
J. A. St. Clair.
28 Nov., 1893.

3675. *Chairman.*] What is your occupation? I am a selector, residing about 10 miles to the north-west. My holding is 2,560 acres. I have resided here eight or nine years.

3676. *Mr. Suttor.*] What stock do you carry annually? About 3,500 sheep.

3677. What do you do with them? I fatten them, as a rule.

3678. Do you send many annually to Sydney? A good deal. I truck all my fat sheep. They do not all go to Sydney. In the twelve months, I suppose I sent away about 3,000—perhaps more in a good season.

3679. Do you send much wool to Sydney? Not much wool; I generally send the sheep down in the wool. I send from twenty-five to thirty bales of wool every year, sometimes more. I have sent sixty bales.

3680. How many sheep do you carry in a good season? It is very difficult to say. This is a good season, but still the grasshoppers are here. Mr.
J. A. St. Clair.
3681. I suppose the seasons vary here very much? Yes; we have had very good seasons for the last three or four years. In good seasons we can carry considerably over a sheep to the acre. 28 Nov., 1893.
3682. Is the price you get for your sheep in Sydney satisfactory? This year I have not sent many to Sydney. I have sent most of them to Aberdeen.
3683. What price do they give you at Aberdeen? So much per lb. It depends on the amount of wool. For twelve months' wool they gave 2d. for merinos, and 2½d. for cross-breeds.
3684. Do you think that a very good price? It is a satisfactory price.
3685. Do you send many there every year? I have only sent them there this season. I have sent nearly 2,000 there within the last two or three months.
3686. How do you send them? By train from Narrabri.
3687. Who pays the trainage? If they are sold by the lb., I pay the trainage, but if they are sold at so much a head, the company pays the trainage.
3688. The sheep are frozen at Aberdeen, and shipped at Newcastle for England? I suppose so.
3689. Have you any idea what profit the company makes out of them? No.
3690. *Mr. Davies.*] Are you familiar with the country through which the "red" line goes? I cannot say that I am. I have been along there.
3691. What point on the "red" line would be the nearest to your holding? I could not say. I should fancy it would be Narrabri, though possibly Edgeroi might be as near.
3692. It would not be an advantage as far as your property is concerned? No; if I went to Edgeroi, I would have to pay extra carriage to Narrabri.
3693. That line would be of no possible service to you? I do not think I would use it.
3694. It would be just as far to Edgeroi as to Narrabri? Practically.
3695. Do you know the travelling stock route? I have been along it.
3696. Would a line by the travelling stock route be much nearer to your holding? I daresay you could get a point on the travelling stock route a few miles nearer.
3697. But not sufficient to induce you to consign your stock or wool by that line? No.
3698. You would still go by road? I believe so.
3699. No line which has been surveyed according to this plan would be of any practical service to you? The Gurleigh Point route would be of service.
3700. Would it come nearer to you? Yes; it would benefit me still more, and benefit a larger number of people if it would go still more to the west. The further north-west it goes the more people I should imagine it would benefit in this neighbourhood.
3701. Is the settlement to the north-west very large, as compared with the settlement on the travelling stock route—is it much larger? I could not say of my own knowledge what settlement there is to the east of that line, but I fancy that there is a great deal more settlement to the north-west than to the east.
3702. I presume that nearly the whole of the produce of the Wee Waa district finds its way to Narrabri by road? Yes.
3703. Have you any idea of the gross number of the sheep and cattle within the police district of Narrabri? No.
3704. Have you any knowledge of the wool which is sent by road to Narrabri station from this part? No.
3705. You know very little beyond your own part of the country? No.
3706. Is there any other information which you would like to give with reference to this proposal? I think it would pay much more than the interest on the extra mileage if it were brought round by Wee Waa, as it would catch so much more loading.
3707. You think that although the line might be 10 or 12 miles longer than the red line, it would be justifiable to expend £40,000 more, by reason of the additional traffic which it would get? I believe so.
3708. *Mr. O'Sullivan.*] I presume that if a railway were constructed somewhere near Wee Waa it would be utilised as a trucking-place generally? I am pretty sure it would.
3709. But you know some drovers travel their flocks along the road until there is a rising market? I believe they do, but still the road on this side of the river is so bad that stock deteriorate greatly between here and Narrabri. There is very little feed. I [am sure that if there were a trucking-station drovers and owners of stock would far sooner truck here than travel the longer distance to Narrabri.
3710. It would be more advantageous to truck here than to travel to Breeza or some point further down, as they often do? Yes.
3711. Sometimes they have to travel along the line, because they cannot get trucks at Narrabri? Yes.
3712. *Mr. McCoirt.*] If the line were constructed by Gurleigh Point, at what point would you use it? If there was a station at the crossing of the river, it would be the nearest point to me.
3713. You would use the line at that point in preference to going on to Narrabri? Yes.
3714. *Mr. Ewing.*] How far do you drove your sheep now? To Narrabri, about 33 or 34 miles by the nearest way.
3715. Do you regard that as a very great distance to drove sheep? They do not improve on the road; they deteriorate.
3716. But still it is not a very great distance to drove them to a trucking-yard? Comparatively speaking, it is not; but it is a good distance to drove fat stock in the summer, especially if there is no grass.
3717. I presume your contention is that a railway due north gives no consideration to the western traffic? Not so far as I know.
3718. If you can get to Narrabri quite as easily as you can get to the direct line, you will still go to Narrabri? Yes, sooner than take stock anywhere along the "red" line.
3719. Therefore it is valueless to you? Yes.
3720. Does the same thing apply to all the western men? I should say so.
3721. All the western men who are far enough south to get to Narrabri? I should say so.
3722. *Chairman.*] Of what sort is the country to the east of the "red" line? When you get back east of the railway 10 or 15 miles you get into the mountains.
3723. What is the character of the country from this line to that point? Close to the line I should say that it is good agricultural land.
3724. Higher up the foothills is it fit for agriculture? There might be patches of agricultural land here and there, but not much. 3725.

- Mr. J. A. St. Clair.
28 Nov., 1893.
3725. It becomes less valuable as you get near the hills? Yes.
3726. This line, which is estimated to cost £153,000, is estimated to incur an annual loss of £905;—if the engineers consider that if it is brought by the travelling stock route it will cost at the least £400 a mile more, which would mean a larger annual loss, what then? The travelling stock route would be of no more benefit to us than the "red" route. I know that I would not use the travelling stock route. I do not know whether others would.
3727. How does the Collarendabri traffic get into Narrabri? I believe that some goes up this line.
3728. From the Walgett road? I could not say of my own knowledge.
3729. Do you know the country to the north of Moree? No.
3730. Have you ever been to Mungindi? No.
3731. To Collarendabri? No; I have been as far as Moree, but I have never been further west than 30 or 40 miles.
3732. Is there anything else which you desire to state? No.

Mr. Arthur Clayton Fenwick, selector, near Wee Waa, sworn, and examined:—

- Mr. A. C. Fenwick.
28 Nov., 1893.
3733. *Chairman.*] What is your occupation? I am a selector, about 11 miles to the north-west of Wee Waa. The area of my holding is 2,560 acres, but I have a brother with me, and we have two full areas.
3734. *Mr. Davies.*] Are you an old resident of the district? Seven years.
3735. Do you know the "red" route? Not until after it gets past Gurley station. On this side of Gurley I know nothing of the country.
3736. Do you know the travelling stock route? I have travelled that route fairly often.
3737. Would a railway by that route serve your holding much better than by the "red" route? Decidedly.
3738. How far would it be from your holding? I could get to Millie in about 23 miles.
3739. How many miles are you now from Narrabri? Thirty-six miles.
3740. For the sake of saving that short distance you would truck your sheep? Decidedly.
3741. Would you be prepared to pay 40 miles' trainage from Millie to Narrabri for your stock and wool? For fat stock, certainly. Look at the time you save.
3742. For wool? I have not gone into that question. We do more in fat stock than anything else.
3743. You would give the preference to the railway, although it means a difference of 13 miles? Yes.
3744. If the "green" line went by the travelling stock route, you would send your fat stock? I would.
3745. That would be 23 miles from your holding? Yes.
3746. At the present time the railway, if constructed by the "red" route, would be of no service to you? I do not think so, not knowing the country.
3747. Would you continue to send your fat stock by road to Narrabri if the "red" route were adopted? Yes. I think that if the railway were brought by this way it would bring in far more traffic—goods, sheep, and passengers. There are more people living out this way than there are up that way.
3748. Do you think it would serve the larger number of settlers? Certainly.
3749. What class of country is it—good pastoral country—from Gurley to Moree? Yes.
3750. Is it fairly settled? I do not know anything of the settlement, except from going along the road, and from station to station.
3751. On what run is your selection? Boolcarrol.
3752. Do you know that a large quantity of wool comes from Moree along the road to Narrabri? Yes.
3753. It forms a very large proportion of the wool that goes to Narrabri? Certainly not.
3754. Would you be surprised to hear that the station-master at Narrabri West (who has a record of all the wool that has passed through his station) has sworn that a very large proportion of the total comes from that direction—that only 10 per cent. of the whole comes from your district? I do not think he asked the carriers if they came from Wee Waa. I should think a third go through on the other side of the river.
3755. Would not the station-master know from the brands on the bales? There are two roads which pass this way.
3756. But would it not be known from which direction it came? Certainly. All wool coming from the north-west must come this way—it would not go round by Moree.
3757. It passes this way? It passes, perhaps, on the other side of the river.
3758. Would not the bales show who consigned the wool? Certainly.
3759. Would not the station-master be in as good a position as anyone else to know whence it came? He ought to be.
3760. As he has no interest to serve other than the public interest—as he is not concerned about the route of the railway—he must be taken as an independent witness? I am pretty certain that a little more—not much more—comes from Moree than comes from this way.
3761. You place your opinion against the station-master's? He must know better than I do. I know it was with some wonder that I read his statement that only 10 per cent. of the whole traffic came from Wee Waa; I could not make it out at the time.
3762. How many selectors in your district would be served by a railway along the travelling stock route? I do not know the number, but it would be a large number.
3763. Do you know the quantity of stock and wool that would be sent to market? No.
3764. You do not know anything about your neighbours? No.
3765. Have you anything further to say? No; but a line from Narrabri to Gurleigh Point would, I think, serve a bigger section of the people than a line along the travelling stock route. I think the extra traffic would more than pay the interest on the increased cost.
3766. Do you think it would be fair to the people of Moree, and beyond, to charge them with 10 or 12 miles of additional haulage, as well as the interest on the extra cost? I do not say that; but I say that the traffic and the goods would pay the interest on the cost of the extra 10 or 12 miles, and pay the Commissioners.
3767. Do I understand you to say that the traffic which would come from Gurleigh Point would be larger than the traffic which would come from Moree? No. I say that the traffic from round here by Gurleigh Point would pay the interest on the extra 10 miles.
3768. You do not consider that the people of Moree would have to pay additional trainage and additional interest

interest on the cost of construction? Certainly. What I look at is, that if by bringing the line 10 miles round this way the Government can get a bigger revenue, it is worth their while to come this way, and these people to the north will have to pay a little extra trainage.

3769. You think it would be quite fair to charge the people along the line beyond your district additional mileage and additional interest on the cost of construction, so as to secure the trade of your district? I would not say that.

3770. Is not that what I understand you to say? No; I say that the returns from the additional 10 or 12 miles would pay the interest on the extra capital.

3771. *Mr. O'Sullivan.*] On what portion of Boolcarrol is your selection? I know we are 6 miles from Boolcarrol head station.

3772. That would be about the centre of the resumed area? I have not studied the map.

3773. You are 22 miles from Millie? Yes, by going through selections and properties with the leave of our neighbours.

3774. For the conveyance of fat stock you would use the railway station at Millie? I think so.

3775. It would pay you better to use that railway station than to drive your fat stock to Narrabri? I do not say that it would pay us better, but we should save time.

3776. When you spoke of taking your fat stock to Millie, you meant to the bend of the railway nearest to Millie, if the line went by the travelling stock route? Of course I spoke of Millie; I do not know how far the curved line goes from Millie Post Office.

3777. It is about 3½ or 4 miles? Of course we should have to consider whether the extra carriage would do. If they went to Millie, and the market was good, and we could get them in quickly, it would pay us to send them by rail from that point.

3778. With regard to the stock and wool which come down from the north-west, via Wee Waa, and go on to Narrabri—is it a fact, as has been stated, that in certain seasons of the year, when the lower road is not workable, they take the road via Millie into Narrabri? I do not know anything about the north-west.

3779. Coming anywhere north of Orel and Mungyer? That is out of my district, but I should imagine that they would go into Millie.

3780. Have you ever considered the possible effect which a railway via Gurleigh Point might have on the town of Wee Waa—has it ever struck you that where it turns to go north a rival town might spring up to the detriment of Wee Waa? Yes, it might. I said Gurleigh Point, but of course the nearer it comes this way the better for us.

3781. I suppose you would prefer the railway, if possible, to be brought to Wee Waa? Yes.

3782. I presume the conditional purchase settlement around you is of a substantial and permanent character? Yes.

3783. Have you heard of any selectors selling out to large station-holders? There have been cases, but they occurred some years ago.

3784. There are a few cases, I suppose, of selectors selling out to each other? Yes.

3785. But there is nothing like a general clearing out by men who have failed? No.

3786. *Mr. Ewing.*] Have you cultivated anything at all? No.

3787. You have only grown wool? Wool and fat sheep.

3788. You can get to Narrabri, I presume, as easy as to the direct line? Yes.

3789. Therefore, if the direct line is made, Narrabri is still your nearest place? Yes.

3790. Would you send more stock and wool if the line went more to the west, do you think? It all depends on the season. I would send as much as I could.

3791. The seasons will still be the same whichever way the railway go. Yes.

3792. The productiveness of the land is a matter of season? Yes.

3793. The question whether the line is taken nearer to you, or will still travel from Narrabri, will make no difference to you in the aggregate? No.

3794. What has the railway to do with the fattening of stock or the growing of wool? It has a good deal to do in an agricultural district? Yes; I do not know anything about agriculture.

3795. *Chairman.*] How far to the north of your holding are you familiar with the country? I have been from my holding to Moree and on to the Barwon.

3796. At what point on the Barwon did you aim? Kunopia.

3797. You did not go to Moree to go to the Barwon? I did. I have been down the Barwon from Goondiwindi to Mungindi.

3798. Have you been down towards Walgett? I have been from Bourke down to Mildura, but not between Bourke and Mungindi.

3799. How long is it since you were up that way? Seven years. I was out at Kunopia twelve months ago.

3800. Is there much trade going to Narrabri from there? I should think so—it is the main road in through Moree.

3801. Is there a large and good area of country between Moree and Kunopia? Yes.

3802. Do you think that country is more capable of large development than the country immediately around about Wee Waa? No; I think this is the better land of the two.

3803. The products are more likely therefore to increase than in the country up towards Kunopia? Yes.

3804. Does the same hold good with reference to the country towards Goondiwindi? It is all flooded country out that way.

3805. Is not this flooded country? No; not to be compared with that country up there.

3806. What about the country towards Mungindi? It is all good grazing country.

3807. But comparing the country round this district with the country about Mungindi, Kunopia, or Goondiwindi, you would give this country the preference? Yes.

3808. Did you examine that country before you settled down here? I have an interest at Kunopia now.

3809. Do you think the volume of trade from Narrabri to beyond Moree is likely to be largely increased by a railway to Moree? I am not in a position to say, because I know very little about the other side of Moree—I only know about my own holding.

3810. You say you have an interest out at Kunopia? Of course, all our stock and wool will go to Moree because it will be the nearest point on the railway to us.

3811. At present you go to Narrabri? It passes Moree, and goes to Narrabri.

3812.

Mr. A. C.
Fenwick.
28 Nov., 1893.

- Mr. A. C. Fenwick.
28 Nov., 1893.
3812. Do you know whether from further north than Kunopia trade finds its way down to Narrabri? No.
3813. Mr. Ewing.] Do you know the Queensland country to the north of Kunopia;—have you ever been over in Queensland? I have been over about the country.
3814. Do you know by repute what kind of country it is? I hear that it is good country.

Mr. James Maiden, drover, Wee Waa, sworn, and examined—

- Mr. J. Maiden.
28 Nov., 1893.
3815. Chairman.] What is your occupation? I am a drover residing at Wee Waa. I have lived at Wee Waa twelve years, and resided in the district twenty-five years.
3816. Mr. O'Sullivan.] How is it that Wee Waa, one of the first towns on the Namoi, has not progressed at the rate which might have been expected? The land was in the hands of a few persons, who would not let it. These persons have been holding on in anticipation for the railway coming.
3817. Were not all these runs divided under the Act of 1884, and the resumed areas thrown open for settlement? Yes.
3818. Why was there no rush of settlement here, as there appears to have been further north to Morce? I think all the land has been taken up. It is all gone.
3819. But still the town of Wee Waa appears not to have progressed at that rate at which it should have progressed, considering the large area which is open for settlement around it? I could not tell you the reason why it has stopped.
3820. It is the oldest town on the Namoi? Decidedly. It was known long before Narrabri.
3821. It appears to have made more progress during the last year or so? It has.
3822. Which districts do you travel? I travel principally from Queensland in this way.
3823. By which route? I always come from St. George to Mogul Mogil, thence to Collarendabri, and thence straight by the lower road to Narrabri *via* Wee Waa.
3824. Can you always come by the lower road with stock? I have never been stopped.
3825. Have you ever heard of flocks of sheep being driven round by Millie into Narrabri instead of going by the lower road—the road nearer to Wee Waa? Never, because they could not travel. They might have gone there to suit their own convenience. They could have come this way if they wished.
3826. Is it a fact that the sheep of Mr. Richards, of Riverstone, travel by Millie? I think they did on one occasion. I do not know why they should.
3827. In what way to suit their convenience? If the trucks are not available at Narrabri West they cut the time out. I have been sent round for that particular purpose.
3828. Have you ever heard that the crossing on the river prevents them from coming this way? Yes; because there is a bridge wanting at a small creek out here.
3829. May that not be the reason why some flocks are driven by way of Millie? Yes.
3830. You refer to a crossing 6 miles from here, down towards Naraabri? No; on the north-west of Wee Waa on the road to Collarendabri.
3831. Have not you any bridge up this way? There is the bridge over the river, but no bridge across the creek. I have not heard of any one being blocked by the river.
3832. Does the wool always come this way from Collarendabri and Mogil Mogil? No.
3833. By what road does it come? It turns off one road back about 40 miles, and comes in at the river about 6 miles above here. It is a detour from what we term the main Collarendabri road. For about 15 miles they make a bit of a detour by Bulleroi.
3834. As an old and experienced drover you assert that this is the natural road for the stock and wool which come from the St. George district in Queensland and from Mogil Mogil and Collarendabri to Narrabri? Decidedly. I may add that beyond St. George they are all cattle stations. There is no wool there at all after you pass the Australian Pastoral Company's stations.
3835. Do you know the company's properties? Yes; the bulk of their wool goes to Yeulbah.
3836. Do not they send some over here? Yes.
3837. By which road does it come? By whichever road they think is the best. This is their natural road. The lower road is the best.
3838. The company's shearing sheds are at Dareel? No; about 40 miles further west.
3839. They propose to erect their shearing sheds at Dareel? I was speaking to the manager a short time ago but he never expressed any intention to that effect. The company have their scour at Dareel.
3840. Have you heard any talk of the company shifting their shearing sheds to New South Wales? No. When I saw the manager he expressed his intention of shifting the sheds 40 miles to the north-east, towards Warwick.
3841. That would be an evidence that they intend to send their wool to Brisbane *via* Warwick? Warwick is east from the Australian Pastoral Company's properties.
3842. Is it not a fact that Sydney offers very much more accommodation and many more advantages than Brisbane to those persons who wish to sell their wool in the colonies? It may, but I think it is just a matter of freights. If they can get it sent cheaper by Brisbane to Sydney they send it by that way.
3843. Do not those who desire to sell their wool to Sydney, where all the foreign buyers attend, send it down through New South Wales in preference to sending it *via* Brisbane? They send a lot of it by Brisbane, and thence it goes to Sydney. Some maintain that it is cheaper to send the wool by that way, while others contend that it is not. I have heard it stated that there is a saving 10s. a ton in sending the wool by Brisbane.
3844. Do you think a railway *via* Gurlough Point to Millie would attract that trade? I do not think so.
3845. They would still be guided by the cost? Decidedly.
3846. Is the country more settled out towards Mogul Mogil, say going from Wee Waa? There is hardly an acre which you can get, except a piece which is of no use. The settlement is of a permanent character. An odd one may sell out, but the majority will not sell at any price.
3847. Do you think there will be a rush of settlement out there when the leasehold areas are thrown open? I am very much afraid that they will take a lot when it is thrown open. I am afraid that it will be swamped.
3848. In considering this question we ought not to be guided by the mere traffic of to-day, but the prospective traffic? Decidedly. From a national standpoint I am looking at the question.

Mr.
J. Maiden.
28 Nov., 1893.

3849. As a man of considerable experience, do you think the interests of the country generally would be better served by a line *via* Gurleigh Point than by a line by the red route? I think the further west it goes the better it will be for all parties. I maintain that there is a larger traffic to be served to the west.
3850. The cost would be very much more, and the annual interest and working expenses would be considerably more. With that knowledge do you think the extra traffic would more than compensate for the additional cost of the line? Decidedly so.
3851. You contend that notwithstanding that it will be a longer line, it will in the end pay the country better than a "red" line? I should think so. It will command a larger amount of traffic.
3852. Would a line by Gurleigh Point be of any use to the Collarendabri district? It would serve them very well, but the further they came this way the better. If they could not take it any further west I suppose they would have to put up with it. The proposed line would be utterly valueless to them.
3853. Which line, in your opinion, would serve the district out towards Collarendabri—not the submerged portion of the district—a line by Gurleigh Point or a branch from either Boggy Creek or Woolabrar *via* Millie? The Gurleigh Point line, decidedly.
3854. *Mr. Ewing.*] You know Boggabilla, Kunopia, and Mungindi? Well.
3855. Taking these towns as points on the MacIntyre, is the country to the north in Queensland perfectly valueless—is it poor country? It is worse than the country to the south of the Namoi.
3856. You have no doubt whatever about that? Not the slightest.
3857. How far north does it extend from the McIntyre? A distance of 140 miles—to within 15 miles of Dalby.
3858. Does the Queensland railway run as far as Dalby? Yes.
3859. Until you get within 15 miles of the Queensland line the country is perfectly valueless? It is.
3860. Are we justified in believing that from that tract of country no great amount of traffic will come? No; they are all cattle stations.
3861. Would the cattle be driven this way? They are all stores which come from that portion of Queensland.
3862. You believe that there will be no traffic done? No.
3863. The Mogil Mogil traffic joins with the Collarendabri traffic at Collarendabri and comes over the bridge? Yes.
3864. At present all from the north and north-west is making for Narrabri, that being the terminus? Yes.
3865. Presuming that the terminus is moved to Moree, would the Mogil Mogil traffic and the people go to Moree? I think they would; because there is very little difference in the distance.
3866. Do you think the Angledool people would go? I think so. There is a difference of 30 miles.
3867. From Collarendabri to Moree is 30 miles less than from Collarendabri to Narrabri? It is between 25 and 30 miles.
3868. At present the traffic is making to Narrabri? Yes.
3869. Supposing the terminus is moved from Moree, where will the Mogil Mogil people go then? I think they will still go to Narrabri West.
3870. Although from Collarendabri it is 30 miles less to Moree than to Narrabri? Yes. I may say that there is a tract of country there for about 25 miles which is practically impassable. It is all reed beds and the traffic could only get down in dry weather.
3871. You are perfectly sure of that? Yes; I have lived there.
3872. At present, coming from the Angledool and Mogil Mogil, crossing the bridge over the McIntyre, you go through Bullerai to Narrabri West? No.
3873. Coming from Mogil Mogil and Angledool which road do you travel to get to the railway station? They strike the river at Gurleigh Point and follow the river up on the north side.
3874. Supposing the railway were deviated through Millie, do you think the traffic from Angledool would go to Millie? I think it would if the line were taken to that side.
3875. If the line ran 15 miles east of Millie, would the Angledool traffic go to Woolabrar station? No; I think it would go to Narrabri, because of the difference in the distance.
3876. Supposing the difference is over 20 miles? I think they would take 20 miles of road carriage and save the railway freight for 40 miles.
3877. With fat stock? I could not say. It would be purely a question of hitting the market. My experience of fat stock is entirely guided by the state of the market.
3878. You travel along until you have made arrangements for them? Yes.
3879. Does any traffic come here from Walgett? A considerable amount.
3880. Does it come when the river is up? No; it goes by steamer, then to Bourke, and thence to Sydney.
3881. Do you think that more produce will come to Moree as a depot from the north-west and north-east, or is there more coming from the direct west? I think there is more coming from the direct west. There is a larger scope of country out there.
3882. Your evidence goes to prove that in your opinion the "red" line would be of no value to the western country? Decidedly.
3883. How far does the flood come east from Mogil Mogil and the bridge coming from Angledool? From about 5 miles due west of Moree it starts to overflow, and it overflows for miles and miles. I have known it to be 60 miles wide with very slight islands. The Gwydir runs out 5 miles below Moree, and floods right down to the Barwon.
3884. Going south, does the Moomiu overflow? Yes; it is practically the same water.
3885. How much water would there be over an ordinary country, say going due north of Wee Waa? You would not touch that flood-water going from here to Moree.
3886. It would be all west of direct line from Wee Waa to Moree? Yes; it would not touch any of the flood-water I am referring to.
3887. Have you ever seen the travelling stock route from Moree to Narrabri under water? Not from flood-water.
3888. Never? In heavy rains I have seen water lodged in places.
3889. It is not back-water from the river? No.
3890. Were you ever stopped on that road? Never.
3891. How far would it be west of Millie before you reach the flood-water coming down the Gwydir, Mogil, and Barwon? At a place called Jack Shay's Camp, 8 miles west-north-west of Millie.
3892. The road from that point to the Barwon is flooded? It is.

Mr.
J. Maiden.
28 Nov., 1893.

3893. Is it seriously flooded? It varies from 18 inches to 3 feet. It is on the Mungindi trial survey. In flood time it would all be under water, on an average, a couple of feet.
- 3893½. How far south does that go? That diverges in again above Collarendabri.
3894. How far north of the track you use from Angledool to Bulleroi? About 12 miles north. That is the limit of the flood-water.
3895. Going south of Millie it goes within 12 miles of Bulleroi? About that.
3896. How far is Bulleroi from Millie? About 28 miles.
3897. The flood-water therefore goes 16 miles south-west of Millie and 8 miles north-west of Millie? Yes; as nearly as possible.
3898. Does it flood this track at all as you come from Angledool? No.
3899. You spoke of a creek 6 miles out from Wee Waa? That is flooded from the Namoi.
3900. *Chairman.*] The boundaries you have been giving embrace only the floods from the Gwydir? Yes.
- 3900½. *Mr. Ewing.*] Taking a point 20 miles along the road from Angledool to Bulleroi or Wee Waa, how far north would the flood go? I should think about 9 miles.
3901. Would it keep about that distance off the roads? Yes; it commences to come in there.
3902. But at no part of the road does it cross over? No.
3903. Taking it from Wee Waa, how far out does the flood go to the north when the Namoi is in flood? It varies considerably, according to the time the flood may last.
3904. Taking the highest flood you have known? I was not here in 1890. The highest flood I saw was eight months ago.
3905. How far did the flood-waters extend north of Wee Waa? I met them 6 miles from here at that creek. I never saw any overflows till I got here.
3906. How far north did it go? Six miles—not over the country, but in the creek. It is in creeks and billabongs.
3907. Speaking of the Gwydir flood, you mean that the whole country is covered? I do.
3908. But here only billabongs and depressions are filled? Yes.
3909. And 6 miles north? Yes.
3910. As you go down the Namoi, is the width 6 miles? It varies at distances. It comes in and runs out again. There is very little traffic down the river road. The traffic all keeps out.
3911. It goes by the Namoi towards Narrabri? No; it is not flooded towards Narrabri.
3912. Between the Gwydir water and the Namoi water there is an elevation which you never saw flooded? Yes.
3913. Therefore, if the railway were taken to the west it would have to be taken by that route? Yes.
3914. You believe there is dry land going to the west? I do.
3915. And that it is never flooded? There may be slight depressions flooded, but I believe that is caused by local rains.
3916. *Mr. Davies.*] You stated that, looking at the question from a national standpoint, you could not approve of the construction of the direct line, because it would not serve the settlers in the district, but that you would favour the construction of the line by a route which would serve the settlers and producers of the Wee Waa district? I said that if the traffic on the Moree line warranted the construction of a railway I considered that the traffic on this line warrants the construction of a railway even more. Personally I am averse to railway construction—I do not consider it is necessary.
3917. What becomes of your consideration of the question from a national standpoint? If according to the staff in Sydney it would pay to go to Moree, it would pay far better to come by this way, I think.
3918. Why are you averse to the construction of railways personally? Well, from reading a good deal, I find that the railways are not paying. If a line will not pay, I say "do not construct it".
- 3918½. Do you think that this railway will not pay if it is constructed by the "red" route? I do not.
3919. If the Commissioners and the officers of the Government have ascertained the probable amount of the trade and traffic that will be carried on the direct route, do you think that their estimate is of no value, or do you think that they are competent to form an opinion? I have seen estimates given in regard to other lines, and the estimates have fallen very considerably short of the actual expenditure.
3920. The lines to which you refer cost £8,000, £10,000, or £15,000 a mile, but the cost of this railway is estimated at £2,400 a mile, the cost of an ordinary macadamised road. Do you think that a good macadamised road could be formed, made and metalled at a cost of £2,400 a mile in the country to which you refer? I really could not tell you.
3921. It will be a very economical line if it can be constructed at that price? Decidedly.
3922. Would not a railway constructed at a cost of £2,400 a mile, and worked at a speed of about from 10 to 15 miles an hour be of far greater advantage to the district it traversed than an ordinary macadamised road from which the country would get no return, whereas from the railway they would get the freights, and some return on the capital expenditure—which work would you prefer to be carried out at the public cost? A railway, decidedly.
3923. I presume there is scarcely a man in the district who knows the country through which the survey has been made better than you do? I do not think so.
3924. You have traversed it many a time over many years? Yes.
3925. Your business brings you in contact with the road, and causes frequent visits to St. George? Yes.
3926. Are you aware of the large amount of wool which has come from that district beyond Moree and all along the road in the district of Moree, even in the present season? I know what leaves Narrabri West.
3927. Have you not seen thousands of bales of wool coming along the road to Narrabri station? I have.
3928. Would it not be of very great service to the producers to be able to send all that wool by a cheap line from Moree worked at a speed of 15 miles an hour? It may promote settlement.
3929. It would pay the consignees to send the wool by rail rather than by team, would not a railway 62 or 63 miles long be an advantage to the consignees? From that standpoint, it would.
3930. Would they not have certain transit when the market was advantageous? Decidedly.
- 3930½. Do you not think that a railway constructed at a cost of £2,400 a mile would secure a much larger traffic and trade than is brought to Narrabri? Yes; but my experience is that estimates are always considerably below the actual cost. I do not know a railway which has been built for the estimated sum.
3931. You will admit that if the line can be constructed at anything like £2,400 a mile it will be cheaper than a road? Decidedly.
3932. Even if it were to cost £3,000 a mile it would be better than a road? It would. 3933.

Mr.
J. Maiden.
28 Nov., 1893.

3933. And this district might be served in some other way by a branch to that line? I do not think so.
3934. You are still of opinion that the surveyed route would not tap the trade here, that it would all filter to Narrabri? Yes.
3935. But the distant traffic would be secured by the railway? I think so.
3936. A good deal of country would be opened up by the railway? Decidedly.
3937. Is there anything else you would like to state? With reference to Mr. Gould's statement that only 10 per cent. of the traffic comes from Wee Waa. My experience is that he has no idea as to where the stations are situated. He gets the names of the stations on the bales, but he has no idea of the districts from which they come.
3938. Do not the weigh-bills show who sent the wool? It would give the name of the station, but not the names of the towns it came through. It would not give you any idea, unless you had a personal knowledge of the country.
3939. Would it not be possible to get some one who has a practical knowledge of every holding in the district to go through the weigh-bills? They could.
3940. Do you know whether any portion of the country through which the "red" line goes is timbered? It is timbered about half-way out.
3941. Is it good timber? No, scrub.
3942. Do you know if there is any timber fit for sleepers? I do not.
3943. Do you know of any ballast or gravel along the surveyed route? I do not.
3944. You do not know whether material exists either for ballast or sleepers? There is none that I am aware of.
3945. Is there not a good ironbark forest near Narrabri? Not that I am aware of. I know the forest you refer to, but I could not call it good timber. They never go there for timber, they come out here.
3946. Where did they get the 25,000 sleepers for the Railway Commissioners? Principally on Bohenna Creek on this side of the river.
3947. *Chairman.*] Knowing the travelling-stock routes, and the district well, can you state at what point most of them converge? They principally all converge here.
3948. Do you think that more travelling-stock routes converge at Wee Waa than at any other point within a radius of 60 miles? I think so—not exactly at Wee Waa, but at a point within 4 or 5 miles of Wee Waa. They come in at different points on the river.
3949. How long is it since you were at Goondiwindi? About two years.
3950. Where you travelling stock then? Yes; I was going over to Forbes.
3951. Do any stock travel from Goondiwindi to Narrabri? Not many, an odd lot of store cattle.
3952. How long is it since you were at Kunopia? Nine years.
3953. Where you travelling stock then? I am sorry to say I was going to Walgett with store sheep.
3954. What direction did you take? I was going down the river.
3955. Did you go all along the river? I did on the Queensland side of the MacIntyre.
3956. When were you last at Mungindi? About twelve months ago. I was going out for travelling stock there. I do not come in that way. I go out that way.
3957. Roughly, you have been limiting your operations as regards stock from St. George, *via* Collarendabri, Mogil Mogil, and Wee Waa? Yes; I may say that I principally drove store stock from Queensland.
3958. Is your preference for the road *via* Wee Waa to Narrabri caused by your household goods being located in Wee Waa? Decidedly not.
3959. It is because you found that was the very best road that you afterwards fixed your residence here? I found that it was the most central one for me.
3960. It gave you the command of a larger area of country than any other point? It did.
3961. Have you many interests in Wee Waa or in this community? I have none, but some members of my family have in town lots.
3962. In stock? No.
3963. Presuming that Collarendabri is to be connected with the railway system, and it is a fact that the dividing line between the watersheds of the two rivers is practically a straight line drawn from Edgeroi Station on that map to Collarendabri, would that not be the best direction in which to take a branch line? I do not think so.
3964. In what direction ought the branch line to go—first to escape as much as possible the flooded country, and secondly to secure grist for the mill? I think that the line should continue from Narrabri west on the south side of the Namoi to a point near Wee Waa, cross the river at that point and take a direct course to Collarendabri.
3965. That, in your opinion, would escape most of the flooded country on the Namoi and the Gwydir, and would also be convenient for tapping the traffic? I think so.
3966. Putting this extension out of consideration altogether? I should say it ought to go by the way I have suggested.
3967. If, on survey, it were found that the highest line above flood-mark between Narrabri and Collarendabri was *via* Narrabri and Edgeroi and then due west, would that modify your opinion? It would not, because there would be such a large detour.
3968. If it has been asserted at Millie and other places that the bulk of the traffic from Collarendabri and the country surrounding that town comes to Narrabri *via* Millie, you do not concur in that opinion? I do not.
3969. Of the trade of Collarendabri and district, what proportion, do you think, goes *via* Millie to Narrabri as against *via* Wee Waa to Narrabri West; or better still by the lower road? I should think that over 80 per cent. of the traffic goes by the lower road.
3970. Is there any left to go *via* Moree, supposing the railway is extended to that town? I do not think you would ever get any of the Collarendabri traffic at Moree.
3971. You might get some of the Mungindi traffic? You might.
3972. If the "red" line is constructed some of the Mungindi traffic might go to Moree terminus? It would; but if the country were dry you would not get the traffic for the simple reason that it is only 95 miles from Mungindi across the old trial survey to Narrabri, and it is 72 miles direct to Moree.
3973. Can you describe where that old trial survey starts from, and crosses over into Narrabri? It is a duo direct line. I know there is not a turn in the line.

- Mr. J. Maiden. 3974. Where did it go along at Narrabri? It came to the south of the travelling-stock route. I could not tell you exactly; but it came somewhere in the town.
3975. Do you also hand in a list of the stations which will be served by this route? I do.

28 Nov., 1893.

WEDNESDAY, 29 NOVEMBER, 1893.

[The Sectional Committee met at the Court-house, Wee Waa, at 8:30 a.m.]

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).	
The Hon. W. H. SUTTOR.	WILLIAM McCOURT, Esq.
The Hon. JOHN DAVIES, C.M.C.	EDWARD WILLIAM O'SULLIVAN, Esq.
THOMAS THOMSON EWING, Esq.	HENRY DAWSON, Esq.

The Sectional Committee further considered the proposed railway from Narrabri to Moree.

Mr. James Maiden, drover, Wee Waa, sworn, and further examined:—

- Mr. J. Maiden. 3976. *Chairman.*] In the course of your travels through the district have you frequently struck the old trial survey from Mungindi to Narrabri? Yes; I was with the surveyor when he ran the line. I was interested in a property that he ran it through.
3977. From Narrabri right on to Mungindi? No; about 45 miles from Narrabri I joined him. I showed him the way through the water-course country which is the overflow from the Gwydir.
3978. Does the line follow the highest portion of ground between Narrabri and Mungindi? Down as far as Jack Shay's Camp, when it goes into the overflow country.
3979. You cannot approach Mungindi from any position without getting into this overflow country? No. The surveyor reckoned that it would take piles for about 30 miles.
3980. Does similar country to that country exist near Collarendabri? No. It diverges and the rivers reform. They run in again in the proper channels.
3981. It would be less difficult to make a railway to Collarendabri than to Mungindi? Decidedly.
3982. The rivers are more defined at Collarendabri? They are within their proper banks.
3983. Would the difficulties you have described against making a line to Mungindi operate as much if it were made from Moree to Mungindi as from Narrabri to Mungindi? They would not have quite as much to contend with.
3984. The country from Narrabri to Mungindi direct is more liable to flood and overflow than the country from Moree to Mungindi direct? Yes.
3985. In drought, does not a large quantity of stock come from the direction of Mungindi towards the mountains? They continue up the MacIntyre.
3986. And do not come across country here? Stock from this way have to go, but other stock can be taken up the river.
3987. We may take it then that starving stock, south of Collarendabri, would go this way to get to better pasture? Yes.
3988. But that north of Collarendabri they would go higher up the MacIntyre rather than go across country? That is the natural course, the shortest and most direct.
3989. In that case if the line were being constructed for the purpose of dealing with starving stock, it would be better to go to Collarendabri than to Mungindi? Decidedly.
3990. It would pass through more sheep bearing country, and would tap a greater sheep-bearing country beyond? It would.
3991. Is there any other point we have not touched upon? Only one. I may mention that there is an inexhaustible supply of sleepers at the back in this forest for railway bridges or anything of that sort.
3992. How far back—how far would you have to go for timber? I suppose you could commence at 5 miles and go as far as you like.
3993. Can they be obtained any nearer to Narrabri than Wee Waa? It continues out a bit, but not very far.
3994. Is there plenty of material for ballast? There is any quantity of ballast about 8 or 9 miles up the river towards Narrabri.
3995. Do you put in a list of the selectors in the various runs in the district? I do.
3996. Will you state how many selectors you know personally to be on each run? Merah No. 1 and No. 2, 36; Drilloom, 14; Gorian, 9; Burren, 14; Wee Waa, 14; Bugilbone, 23; Millie, 12; Gundemaine, 19; Nowley, 10; and Keelendi, 18.

Mr. William Mackenzie, drover, near Wee Waa, sworn and examined:—

- Mr. W. Mackenzie. 3997. *Chairman.*] What is your occupation? I am a drover residing mostly at Yaraldool station on the Namoi.
3998. Do you furnish a list of the selectors on the Cuttabri, Bullerawa, and Yaraldool stations? I do. [Vide Appendix.]
3999. How many selectors are there on each run? On Cuttabri, 5; Bullerawa, 3; and Yaraldool, 13.
4000. You know the selectors very well? I do.
4001. You know that these selectors are still on their selections? Yes.
4002. *Mr. McCourt.*] Have most of them finished their five years' residence? A few, but not all.
4003. Do you know the country which the "red" line traverses? Yes; pretty well.
4004. Is it good for settlement? I do not think it is.
4005. Do you know the runs through which it goes well? Very well.
4006. Do you know the Gurleigh Point route? Yes.
4007. On which of these routes is there most Crown land available? I should think on Gurleigh Point route.
4008. To what extent? To a very considerable extent.
4009. Would the value of those Crown lands be increased by the construction of a railway by the Gurleigh Point route? I should think so, considerably.

4010. Which road do you take from Collarendabri? I always come across the Thalaba, in here at Pian Creek, and straight in this way

4011. Do you ever come through Millie? I have been in through Millie, but I never take stock by that way. It is too dry.

4012. In very wet weather would you come through Millie? No. There is nothing on this other road to stop me.

4013. Wet or dry you would come by Wee Waa? Undoubtedly.

4014. You desire to make a statement? I am under the impression that the further west the railway goes the better it will be for the country. All along the "red" route it is what you may call barren country—it is wretched along the edge of the mountain. I do not see that it is of much use for anything.

4015. If several witnesses have sworn that the land is good to the east of the line towards the mountains they are not correct? I should not think so. I cannot say within a few miles of the line, but if it runs very close to the ranges the country on the other side is no good.

4016. Do you know about how far it is from the "red" line to the mountains? It is only about 24 miles.

4017. It is from 15 to 20 miles to the foot of the mountains? Well, the country within that distance is not very good, for there is a considerable lot of scrub.

4018. Not nearly as good as the Crown land on the Gurleigh Point route? Nothing like it—it is all good land this way.

4019. I suppose all the Crown lands on the Gurleigh Point route that are available have been taken up? Yes, every acre, I think, except what is in the leasehold area. There might be an odd reserve or two.

4020. Was the land on the Gurleigh Point route proclaimed a railway reserve? I could not say.

4021. Do you take stock from anywhere else besides Collarendabri? I have been droving pretty well all over New South Wales during the last seven or eight years.

4022. Which way do you generally take stock? I have been in part of Queensland, and pretty well all over New South Wales. I was two years with a surveyor. I know every inch of the Barwon up to Kunopia.

4023. If you were droving stock from Mungindi towards Narrabri which way would you go? I would go down the Barwon to Mogil Mogil in across the Thalaba and down this way. As regards the other road it is only an odd time that you can get any water there.

4024. Suppose the railway were taken to Moree, and you were taking stock for Mungindi? Of course that would make a great deal of difference in the length of the journey, but I do not know whether it would not pay them to bring sheep into Narrabri provided that they could get grass all the way as it is much cheaper to travel by road than rail.

4025. Would it pay to bring fat sheep this way? Certainly. You can drove fat sheep—in fact any sheep—far more cheaply than a railway can deliver them. The only thing which blocks stock from coming in is that they can not get sufficient ground.

4026. If the railway were constructed *via* Gurleigh Point instead of bringing them to Moree you would bring them to Gurleigh Point? I think it would be far cheaper. It would be better for the stock, but if they wanted to hit a market they would certainly go to Moree.

4027. Where would you take them from Kunopia or Angledool? It is somewhat the same.

4028. *Chairman.*] Do you mean to say that you would go past the terminus at Moree for the purpose of droving your stock down that way? If there was grass, I would.

4029. And if the stock can be driven any more cheaply than by the railway? Drovers can drive them more cheaply from Kunopia to Narrabri than the railway can carry them.

4030. According to you it is of no use to construct the line? I do not say that. I think that is the proper route for the line to go. It opens up country. The country in this direction is far more valuable than the country at Moree. On the other side of the Barwon towards Goondiwindi it is all useless country.

4031. As a matter of fact, do not the drovers aim at the nearest point on the railway? No; it is against their interests to do it.

4032. But the owners of the sheep? Not always. As long as they could get grass they would rather take their sheep by road. I went in to Sydney last March with sheep.

4033. As a rule, do they not want to get their sheep quickly into market? Not always. If they can get grass and water they would far sooner send them in by road than truck them. It is far cheaper to take that course. They can save a shilling a head from Narrabri to Sydney. It does not cost 1s. to deliver sheep by road from here to Sydney, whereas it costs about 2s. by train.

4034. *Mr. Dawson.*] Do you know Tyreel? I have been over it.

4035. Does Mr. Richards send direct to Sydney or does he truck? He sends them mostly by the road on the other side of the river.

4036. From what place did you take sheep last March? From Bugilbone down the river, and on to Homebush.

4037. You had plenty of pasture and water on the road? Yes; at that time—it was a good time.

4038. How many sheep have you trucked at Narrabri compared with what you have driven to Sydney? I have been in only once with sheep to Sydney. I am constantly going from Yarraldool or wherever Mr. Richards buys sheep. I dare say I have trucked 20,000 at Narrabri and Boggabri this year.

Mr. Peter Rafferty, sheep-buyer, sworn, and examined:—

4039. *Chairman.*] You are not a resident of the district? No.

4040. You have no interest in the district? No.

4041. But you have large dealings within the district? I buy a good many sheep.

4042. *Mr. Dawson.*] How long have you been dealing with the district? I suppose about twenty years.

4043. How many stock do you send away in a year, as a rule? I buy along the North-Western line. I buy on Liverpool Plains mostly. I buy a good many here. This year I trucked from Narrabri about 18,000 sheep.

4044. Do you buy much from the north-west here? Oh, yes; all west of Gurleigh Point, with the exception of one lot.

4045. Supposing the railway were extended by the "red" route, would any of the sheep you buy use that line? I have never bought sheep where the "red" line goes, with the exception of one lot, a very small lot, which I bought this year near Gurley from a selector named Manning.

4046.

Mr.
W. Mackenzie.
29 Nov., 1893.

Mr.
P. Rafferty.
29 Nov., 1893.

- Mr. P. Rafferty.
29 Nov., 1893.
4046. Would that line be used by him at all? I do not think it would. For any sheep I would buy west of Gurleigh Point I would not go by that way but would truck at Narrabri or the nearest trucking station.
4047. If that was Edgeroi you would use it, I suppose? I do not think I would.
4048. Why not? It has no travelling stock route, and you would have to go through private property.
4049. But supposing a travelling stock route is made and that water is provided? I suppose if I got sheep near the line I would truck them to the nearest point.
4050. If proper facilities were given for getting grass and water across the country from the travelling stock route, you would probably use that station? I always use the nearest point for trucking.
4051. From a national point of view which route would serve the country best? As far as I know about that "red" line I do not think it would be a paying line.
4052. Would it be used at all by the north-west people? Except those who are very close to the line.
4053. I mean for general traffic right out here? There is no one west of Gurleigh Point who would go there to truck.
4054. If there were a station at Millie or anywhere near there they might? They would be going out of their road.
4055. Is it not a fact that in dry seasons that is the only road by which they can possibly go from out back with any degree of safety? The nearest way.
4056. You say it is the general rule for a man to go to the nearest station when he wants to truck his stock? A man who wants to get them in in good condition does.
4057. If you have 20 miles to a railway station along a bad road and 50 miles along a good road, you go 20 miles along the bad road? We have done it here. This cleared line from Wee Waa to Narrabri is a bad road for stock, but I certainly would truck at perhaps Gurleigh Point, which is 6 miles from here, in preference to going any further.
4058. Do you buy the sheep yourself and take delivery on the station? I buy the sheep and take delivery. I pick the sheep and I have my own drovers.
4059. When you buy a lot of sheep you make up your mind on the station as to which way you will take them? Yes.
4060. It all depends on the state of the country;—you take them by what you think is the best road at the time? I take them by the best road. I would go by the nearest road to the trucking station.
4061. *Chairman.*] Is there any other point you desire to mention? On this side of Gurleigh Point I buy most stock. I very seldom buy any on the other side.

Mr. John Gray, selector, Wee Waa, sworn, and examined:—

- Mr. J. Gray.
23 Nov., 1893.
4062. *Chairman.*] What is your occupation? I am a contractor and selector. My selection is about 2 miles up the river. It consists of two 640 or 1,280 acres. I have been residing here about six years. I resided about ten or eleven years here and in the Moree and Mungindi districts. I have been connected with timber work for thirty years.
4063. Do you know the timbered country along Terry-Hie-Hie? Well. I have had men there time and again getting timber for me. It was used for a bridge over the Big River, at Boolooroo, and for a bridge at Ashley, and other bridges.
4064. It was for bridge work in and about Moree that you sent to Terry-Hie-Hie for timber? Yes.
4065. Did you find sufficient timber there for your purpose? I got timber there, but I have had great trouble latterly. I have had parties there three or four times for each bridge in succession, perhaps getting a few dozen sticks of sound timber.
4066. Is there any timber there suitable for sleepers? There may be large quantities got there.
4067. But none for bridgework? No.
4068. All the timber for bridge work would have to be brought from Pilliga Forest? Round about the south of Wee Waa. From here to Moree you would get none fit for bridge work. At Narrabri West the drawing is very heavy. I have had men out there several times.
4069. How far would you have to go from Narrabri to get sound timber fit for bridge work? About five or six years ago I had to go 30 miles from Narrabri.
4070. How far would you have to go from Narrabri West to get timber fit for sleepers, not ordinary sleepers, but half-round split sleepers? I have not been there since the last contract was let, but I should think about 15 miles.
4071. Supposing the railway were taken *via* Gurleigh Point, do you think it would lead to a large timber traffic to Moree and other parts from Pilliga Forest? Yes; there would be a great deal of pine sent that way. Hardwood is not so much in demand, unless for government work, but it can be got in quantity. Sleepers and pine can be got in any quantity.
4072. For sleepers the nearest timber would be obtained at Terry-Hie-Hie? The nearest sleeper timber to Moree would be obtained at about 25 miles towards Terry-Hie-Hie.
4073. But for bridge timber they would have to go to the forest to the south of Wee Waa and the south-east of Narrabri? Exactly. It is so difficult to get that some has been got from the Clarence and taken up from Newcastle. It is getting very scarce there.
4074. Do you know anything about the ballast? One of the strongest points in favour of the "red" line is that they can get ballast in that country. But they could get ballast at the Bald Hill, which would come in for another line within a reasonable distance of it.
4075. Do you know the country well which is traversed by the "red" line? I have been along that country several times.
4076. Do you know the travelling stock route to the west and the country still further to the west? I know the country to the west fairly well too.
4077. Which is the soundest country for railway construction—the country marked with a broad band, or the country on the travelling stock route, or more to the west of it? The country on either line would be equally as good, or nearly as good, from a constructive point of view, with the exception of the ballast. I do not think the flood-water would be serious by either route beyond the crossings of the river and a short distance back. I do not think it would affect the railway.
4078. As a matter of fact, the further you go west the more water there is to deal with;—does it not split

up into more channels? There is no water leaving the river of any account until you get a short distance below the railway crossing on the other side.

4079. I am speaking of all these creeks we see crossing the line. Is it not a fact that where the "red" line crosses the creeks the channels are fairly well defined, but that further to the west—10, 15, or 20 miles—the creeks spread out into a number of channels? Some of them spread out a bit but not seriously. I do not think they would be any great impediment to the railway.

4080. Would it not be more expensive to construct a line in that country than in country where the channels are defined? Well, close to the range probably there would be less bridging.

4081. If the Engineer-in-Chief estimates that owing to the spreading out of these creeks to the west a railway by the travelling stock route would cost several hundred pounds a mile more, would you controvert that opinion? No; I think that along there it could be made cheaper, but it would not be so useful.

4082. Do you know anything about the country at the crossing by Gurleigh Point? I am well acquainted with that country. I live not very far from there.

4083. Is it a fact that on both sides of that crossing there is a considerable area of flooded country? On the north side of the river at Gurleigh Point there is little or no flood. On this side of the river there would be for a short distance to the river. It would be a very high flood which would show along there at all. There is no water leaving the river above that.

4084. Do you think that if the railway were brought further west it would obtain more traffic than if it were taken by the direct route? The line under the foot of the ranges would have no feeders at all to the east. All would have to go from the west of the line. The question is whether the difference in cost would not be more than compensated by having feeders on the right and left, and they would be sufficiently well supplied with railway facilities as well as those on the range too. By taking the railway by the Gurleigh Point route all the Walgett traffic and the like would be secured; in fact, all the traffic of the district would be caught up by the branch.

4085. On the other hand, you would entail on the people of Moree and the people beyond that town 15 or 16 miles of extra haulage? There would be extra haulage for the people of Moree. If the railway be intended exclusively for the benefit of the two towns, the "red" line would be decidedly the best. But if it be intended for the benefit of the district and the Colony as a whole, I decidedly think that the other would be the best, for it would secure traffic from either side all the way.

4086. Have you formed any idea as to what proportion the traffic from the districts north of Moree bears to the traffic from the districts to the west of Millie—from what quarter does the greatest volume of trade come? If the railway went to Moree a good deal more of the Queensland traffic would be secured than is secured at present. I am not certain as to how much would be secured if it went Collarenebri way. I think there would be a great deal of Queensland traffic secured because you are a great distance from the Queensland railway. I have been out as far as St. George, and I was a good long while about Mungindi, where I built one or two bridges. I know all the country fairly out that way. I believe that you may get a good deal more of the company's wool by going that way with a railway.

4087. Presuming that a railway is constructed to Moree, never mind by which route, and that it is proposed to have an extension, in which direction should it be extended with the view of getting the largest amount of traffic—to Mungindi or Kunopia? I am hardly familiar enough with the country to say.

4088. Have you anything else to state? I have little more to add beyond to point out the advantage of making a branch line and securing all the Walgett traffic. It would be a boon to that district. If you make it round this way, the possibilities for this black soil, by farming as well as grazing, are very great. I have been putting in crops there for the last six years. On the black soil where I am, I get from 2 to 2½ tons to the acre of hay. Of corn, I get fair crops. Although twice in the dry season I had to make ensilage, I have never lost a hay crop. I have no doubt that when the leases are thrown open there will be settlement there very similar to what I have now. I think that by combining stock with cultivation there might be a deal of settlement there. That would be an important item, again, for a railway. Where there is a boundary rider now there might be 100 farms, perhaps averaging five or six persons each.

4089. You think there is a possibility of agricultural production here? I feel quite sure that if you combine farming and stock there will be a large production of that character.

4090. That holds good with reference to all black-soil country, I suppose? There are patches here and there very sticky and hard. I find that when I lime it it makes real good soil in small patches. I am going to try large patches. I have got from 20 to 25 bushels of wheat to the acre.

4091. Any rust? I had rust about five years ago, but not badly. I sow in April or early in May, and I have cut for hay at the beginning of September or the latter end of September and October.

4092. Then along the higher portion of the black-soil country you think the land would be suitable for agricultural production? I think it would. I sent down a sample to the Agricultural Department, and got it analysed. It is very rich—good at every point, although it is of stiff mechanical texture. They said the lime would correct that—it would do without manure for many years.

4093. If there are other parts of the Colony quite as suitable for wheat cultivation as the plains, and very much nearer to large centres of population, while you, apparently, have to add some ingredients to the land, how do you think you are going to make it pay? It is a question of what the future will be. I have no doubt that plenty of them have much better soil to work. This is hard to work unless limed. The wheat market will probably rather extend than otherwise. America, by-and-bye, may not be able to raise enough wheat for herself.

4094. It is only the higher portions of the land which you think would be suitable for agricultural production, and the future of this country you think will depend on a combination of pastoral pursuits with agricultural pursuits? Yes. I think they would do best that way, growing partly for stock and partly for market.

4095. Is there any other point you desire to mention? No.

Mr. Patrick Joseph Ryan, drover, Wee Waa, sworn, and examined:—

4096. *Chairman.*] What is your occupation? I am a drover living in Wee Waa. I have lived in the town ten or eleven years.

4097. Have you any interest here in the way of a selection or anything? I have an interest in a selection on Boolcarrol station.

4098. *Mr. Suttor.*] Where do you drive sheep from? For the last fifteen months from Boolcarrol station for the owners.

Mr.
J. Gray.
29 Nov., 1893.

Mr.
P. J. Ryan.
29 Nov., 1893.

4099.

- Mr. P. J. Ryan.
29 Nov., 1893.
4099. Where did you truck the sheep? At Narrabri.
4100. How many sheep did they send the last twelve months from Boolcarrol? From 50,000 to 53,000.
4101. How many years did that number extend over? I drove that number of sheep in the last fifteen months.
4102. Have you never driven sheep beyond Narrabri? For other stations, but not for Boolcarrol. I have driven for Merah station. I have driven stores for Mr. Fletcher, a gentleman in Queensland, and several other persons about this district. I have driven chiefly to Narrabri, sometimes to Sydney by road.
4103. From what part of Queensland do you take stores? From various points—sometimes off the Namoi to Queensland, beyond Ipswich, close to the border, and all round the Darling Downs.
4104. Where do you take them to? I have taken them to a station called Ballendeen, within 15 miles of Stanthorpe. I was driving for seven years for that gentleman, chiefly stores.
4105. Do you ever drive from any place to the west—about Collarendabri or Mungindi? From Mungindi I have driven for Mr. James Fletcher. I drove 8,000 store sheep he bought from Mr. Lomax.
4106. Have you ever driven for Mr. Lomax? No.
4107. Did you take them through Narrabri? No. Of late I take them to Queensland by the Gil Gil, across by Welbon, and Tulloona, and Goondiwindi.
4108. When you drive stock to Narrabri by which road do you bring them from these other places? It all depends. From anywhere below Mungindi, of course, they would chiefly come in this way.
4109. Which way do you travel from Mungindi to Narrabri? You would come in by Millie and take the travelling-stock route to Narrabri.
4110. Have you driven for any stations round this neighbourhood? I have driven for Messrs. Fenwick Brothers, Mr. Sinclair, and Mr. Mackenzie, the lessee of Wee Waa station.
4111. Where do they truck, at Narrabri? Sometimes I have driven them by road to Rylestone, and sometimes right into Homebush.
4112. Supposing the "red" line were constructed to Moree, where would you take your stock to from Mungindi? I think it would be almost as near to bring them to Narrabri as to take them on to the "red" line.
4113. Why? I know the travelling-stock routes pretty well, but I do not know of a travelling-stock route going west of Millie to get up to that "red" line.
4114. Supposing one is made from Millie to the line? I think it would almost suit the owner of stock to send them to Narrabri unless he was in a hurry.
4115. What route do you take from Collarendabri to Narrabri? You can come by either Wee Waa or Boolcarrol.
4116. Each road would bring you to Narrabri? Yes.
4117. It would be of no advantage to you to have the "red" line at all? No. It would be dry country to go across to that line. West of Millie I do not think it would benefit any of the holders.
4118. Are there many other drovers living in Wee Waa? There are more living in the town. I do not know whether they are at home.
4119. Are they pretty fully employed? Pretty well.
4120. How many are there in Wee Waa? I think there are five or six who get their living at driving chiefly.
4121. *Chairman.* Did you drive all the sheep from Boolcarrol within the last twelve months? No; other drovers were employed, but I took the biggest portion of them. I drove about 52,000.
4122. How many did the others take? Three other drovers were employed, but they only took an odd lot.

Mr. Richard Brier Mills, manager of Nowley Station, near Wee Waa, sworn, and examined:—

- Mr. R. B. Mills.
29 Nov., 1893.
4123. *Chairman.*] What is your occupation? I am manager of Nowley Station, 36 miles north-west of Wee Waa.
4124. *Mr. Davies.*] How long have you been in the district? About twenty-four years from Gunnedah down—eleven years on Nowley Station.
4125. What number of sheep do you run? About 35,000.
4126. How many did you shear last year? About 34,000.
4127. How many did you send to market last year? We did not send any straight in to market, we sell to the companies, we sold about 14,000.
4128. You had nothing to do with trucking the sheep? A lot of them were trucked.
4129. What wool did you send? We sent 525 bales by Boolcarrol to Narrabri West.
4130. You are pretty familiar with the country, I suppose? With a good part of it.
4131. Are you familiar with the country through which the "red" line has been surveyed? As far as opposite Millie. I have been over to Moree, but I could not give evidence about the country between Millie and Moree.
4132. Do you know the country between Wee Waa and Millie, and between Narrabri West and Millie? Pretty well.
4133. What is the general character of the country through which the "red" line passes? It is of different sorts—some good country and some scrubby.
4134. Much scrub land? You go through a good deal on Killarney and the lower end of Edgeroi.
4135. Is there much settlement along that portion of the line? I have not been along there for the last five or six years. I do not know what has taken place since I left Edgeroi.
4136. Looking at the question from a national point of view, do you think the "red" line would serve the country best? I think not.
4137. Which line do you think would? If you were considering Moree only, the "red" line would be the best I should say, to serve the country all round about Moree.
4138. I mean to serve the stations and selections out west? That would not serve them at all.
4139. In what direction would the line have to be taken to serve the country in a north-westerly direction? Of course the more westerly course it takes the better.
4140. You have not a sufficient engineering knowledge to say how far we can go in that direction? No.
4141. You could not say whether it would not increase the cost of construction very much? I would not attempt to discuss that question.
4142. You have never made a study of railway construction? No.

4143. You would not hazard an opinion as to whether the railway authorities could go very far to the north-west and secure a cheap line? No.
4144. Do you regard £2,400 per mile as a reasonable sum for a cheap railway? I cannot say.
4145. You do not know anything about road-making? No.
4146. Do you know whether the country along the line contains any timber or ballast for road making? I do not think you would get any timber for sleepers along that route. I think you would have to go to this side of the river.
4147. You would not get anything towards Narrabri West? Yes; on this side of the river.
4148. Would you get any ballast along the route? Of course, in towards the mountains you would, but once you got down towards the river I do not think you would get much.
4149. Have you ever travelled along the travelling-stock route as far as Millie? I have travelled along the main road to Moree.
4150. Supposing that route were adopted for a railway, would it serve your district any better than the "red" route? I should think so. It would bring a lot of the traffic which comes on to the river now. It might go to Millie and thence to Narrabri.
4151. But the line might be extended from Millie to Moree? Yes.
4152. Coming from Millie the whole of the stock and produce would filter through this travelling-stock route away from Narrabri? Yes.
4153. The travelling stock route would not be sufficiently north-west for your district? It would be so much nearer to us for anybody who cared to go.
4154. How far would Edgeroi be from Wee Waa? I cannot say.
4155. Supposing the railway is constructed along the travelling-stock route and taps the "red" line up towards Moree, would it serve this portion of the country better than the direct route? It would not serve just about here, but further west it would.
4156. It would be no advantage here? Not very much advantage—very little more advantage than the "red" line. Of course they would have to go to Narrabri West either way.
4157. Do you know the Gurleigh Point survey? No; I do not know much of the river bends at all.
4158. Having seen the Gurleigh Point survey marked on this map, would it serve your district better than the other surveys? It would be so much nearer to me and others behind me.
4159. Are you aware that it would be very much longer than the "red" route? Certainly.
4160. Would Parliament be warranted in incurring the additional expenditure? I think so. A great deal of wool comes in by Boolcarrol now, and it could be loaded so much nearer.
4161. You think it would come in that direction? Yes; in preference to going to Millie even.
4162. Does not all that wool come to Narrabri West? Yes.
4163. It would take a few miles off if it came in at that particular point? Twenty miles, I think.
4164. As a rule, do station holders and managers strike the line at the nearest point? I think they would in a case of that sort.
4165. Do they, as a rule, do that where they can save 20 miles? If it does not entail too much carriage on the railway.
4166. It is always an advantage to get to the nearest railway station with stock and wool? Yes.
4167. What distance from a railway is a fair service for a holding? I could not say.
4168. Twenty or 25 miles on each side? I should think so.
4169. I suppose you would regard a railway within 25 miles of your station as a good service, and would send your wool straight to the line? Yes. I have never been that close to a railway.
4170. Would you regard it as a good service? It would be of use to me.
4171. For the people who are settled on the land, and producing wool and sheep, would 25 miles be regarded as a reasonable service? I think so.
4172. That service would be equal to a radius of 50 miles from the line? Yes.
4173. Would you regard that as a reasonable service for your station? I do not exactly see the point.
4174. Would you regard that as a reasonable service for your station? It would suit me.
4175. Would it, in your opinion, serve anyone in a similar position? I think so.
4176. So that no one would have any cause to complain who is within 25 miles of a railway station? I do not think so.
4177. You do not know much of the Moree district? No.
4178. You know very little of the country beyond Millie? I have been across it.
4179. You are more familiar with the country on this side? Yes.
4180. Is there anything else you would like to say? No; except that I leave others who know more of the country to say what is to be said.

Mr. Stephen Dempsey, selector, Millie, sworn, and examined:—

4181. *Chairman.*] What is your occupation? I am a selector on Millie run, about 36 miles west.
4182. *Mr. O'Sullivan.*] How long have you held your selection? Eleven years.
4183. Are there any settlers like yourself settled there? Very nearly all the selectors on Millie have settled about the same time as myself; a few have come on since 1882. I was the first selector in 1882; five or six others settled there after I did, and they have been there ever since.
4184. How long is it since the last man selected? Three years.
4185. Were any of the selectors formerly employed on the station? No.
4186. They are all, apparently, selecting for themselves? Yes.
4187. Is that the case generally in this district? I think the majority of the selectors are *bona fide*.
4188. That is to say, the majority of those that are left? No; the majority of those who are on the selections.
4189. I suppose a good many have become absorbed in the estate? A good many left years ago.
4190. All those who have survived for the last five, seven, or ten years are *bona fide*? I believe so.
4191. You mean to say that the majority of those who are now on the land are *bona fide* selectors? Yes.
4192. What makes you say the "majority"? All I know. There may be some who are not *bona fide*. There are some I am not acquainted with; I could not say whether they are *bona fide* or not.

Mr.
S. Dempsey.
29 Nov., 1893;

- Mr. S. Dempsey.
29 Nov., 1893.
4193. As far as you know the selectors are *bonâ fide*? Yes.
4194. How many acres have you? Between my brother and myself we have about 8,000 acres. We have selected twice.
4195. Are the selections generally out this way as large as yours? I think most of them are; a good many of them have taken up as much land, and some a good lot more.
4196. They have nearly always got the maximum area? All who could did.
4197. What do the smaller men do? Some I know are carrying and some are droving.
4198. You carry on grazing alone, I presume? Yes; I have another place on this side of the river. I rent a run of 15,000 acres.
4199. What is the difference between you and a squatter? I cannot tell you; I have hardly got the same position as a squatter.
4200. Where do you truck your sheep? At Narrabri. All our stock goes through Wee Waa to Narrabri West.
4201. Do the selectors generally truck there? All the selectors down our way do.
4202. Do they send their wool there also? Yes.
4203. Where, in your opinion, should this railway go—to serve the majority of the people up this way and to conserve the best interests of the State? I should think it ought to go as far west as possible to serve the people up this way.
4204. To what point? As far west as possible.
4205. You would like to see it go to Wee Waa if possible? Yes. I think it would be a great benefit to all the country and all the people down this way.
4206. Supposing that from the “red” line a branch were run out, say from Boggy Creek about 30 miles west towards Collarendabri—would that serve you and men like you in this district? No.
4207. You would still prefer to go into Narrabri? I think so.
4208. A branch off the “red” line to Moree would not serve you as well as Narrabri? No.
4209. Would it serve the Collarendabri people or the settlers out west from Millie? Of course it would serve the Collarendabri people better.
4210. Would it serve them better than a line to Wee Waa? It would.
4211. Have you any knowledge of the stock routes in the district? I have a little knowledge of some of them.
4212. At what point do they converge up here? I think there are three stock routes converging at Wee Waa.
4213. Some miles above Wee Waa? Hereabout. Two come in about the bridge within a mile of Wee Waa.
4214. Where do the stock come from that use these routes? From all out west. I think that they come principally from down Walgett way.
4215. From Walgett also? Yes; and wool too.
4216. Does not that point to the fact that this is the natural stock route? Yes.
4217. That being so, a station at Wee Waa or about here would tap all that traffic? Yes.
4218. Would it tap the bulk of that traffic as well as a station say 10 or 15 miles beyond Millie? I think a station at Wee Waa would catch the traffic best; it would catch all the down the river traffic.
4219. Do you know anything of the leasehold areas up your way? I know some of them.
4220. Is the land of such a character that it is likely to be rapidly settled when the runs are thrown open? Yes.
4221. Have you heard of anyone making inquiries for land up that way? A good number are only waiting for the land to be thrown open.
4222. They are waiting here now for the leaseholds to be thrown open? Yes.
4223. There seems to be ample room for settlement if the land is good? There is plenty of room, and it is all good land on the north side of the river.
4224. Do the Namoi floods affect you very much? No.
4225. Do you ever lose any stock up that way? No.
4226. Were not a large number of stock lost in the 1890 flood? Not down our way.
4227. Higher up, towards the Barwon? Some out on the Moomie and the Barwon, and lower down, towards Walgett.
4228. You are never short of water up your way? No.
4229. You have a pretty fair rainfall? Yes.
4230. Is there anything that we have not elicited? No; except as to sleeper-cutting.
4231. Do you concur generally with what has been stated by the other witnesses? Yes, with reference to the timber and other points.

Mr. Sydney Powell, selector, sworn, and examined:—

- Mr. S. Powell.
29 Nov., 1893.
4232. *Chairman.*] You are a selector? Yes; my selection is situated about 30 miles to the west.
4233. *Mr. McCourt.*] What is the size of your holding? It is a family concern, in which three of my sons and myself are interested. I have one son deceased. With the conditional leases and conditional purchases we have about 9,500 acres.
4234. What quantity of stock and wool do you send away in a year? I generally send away about one lot of fat sheep—from 1,400 up to 1,800—and for the last few years I have sent from 100 to 150 bales of wool direct to Narrabri.
4235. Which route do you favour, the Gurleigh Point, or the “red” route? I am not in favour of the “red” route, as it would be entirely useless to me and to this neighbourhood. I favour a line which would come as near as possible to Wee Waa, and then proceed to Millie and Moree.
4236. Do you think Moree is entitled to a railway? Yes.
4237. Is it fair to make them travel 11 miles more than is necessary? I do not think it is fair altogether, but that line, as it is surveyed, would be entirely useless to us, and we should always have to go to Narrabri West.
4238. Do you know the country about Moree? It is some years since I was there, but I suppose it has not altered materially since I saw it. It is very good.
4239. Do you know the country between Moree and Inverell? I was never any further than Gravesend on the Big River, but it appeared to me to be all good country in that direction.
- 4240.

4240. Have you anything further to say? To favour Moree and Narrabri with a railway, and leave Wee Waa without a railway until goodness knows when, would not be fair, because there is a far larger settlement in this district, and the settlement is likely to be increased by a line to the west. I suppose 70 per cent. more than what would occur outside Moree and to the east of the "red" line.

Mr.
S. Powell.
29 Nov., 1893.

4241. But all round your neighbourhood the people would go to Narrabri in any case? Yes; I think it is most preposterous to take the line back across the river above Narrabri. I would strongly object to a line being sent back from its natural terminus at Narrabri West, and taken across the river and creeks by costly bridges. Leaving this district out of the question, I think it would be most unfair to take the line by the "red" route.

4242. Would you not be better served by a line from Narrabri West to Walgett? Decidedly.

4243. Do you think Moree might be connected by way of Inverell with the railway system, and a line constructed from Narrabri West to Walgett;—would not that arrangement suit the country best? I am certain of it, and also think the Moree district is deserving of a railway.

4244. Do you think it can be connected by way of Inverell, and a line can be taken from Narrabri West to Walgett? I am not acquainted with the geographical features of the country. I was never at Inverell, but I think that there is some proposal to construct a railway from Glen Innes to Inverell.

4245. Would it suit the country best to continue the line from Inverell to Moree, and give you a line from Narrabri West to Walgett? I think the extra distance would not suit the Moree people.

4246. Would it be any extra distance? I think it would.

4247. Do you know the country north of Moree? Down in the direction of Weibon and out to Kunopia, then across in what they call the "Watercourse" the spread out of the Big River, and from there on to the Namoi, I am well acquainted with.

4248. Would not the traffic of that district come into Moree? Not according to the "red" line.

4249. Why? From Kunopia down to Mogil Mogil. I have no doubt that it would come to Moree.

4250. *Chairman.*] As far as Mogil Mogil? I think so. I think from there all the traffic and trade would come here by vehicles, direct to Narrabri West. I could not say for certain whether it would extend as far as Mogil Mogil.

4251. Which would be the best for future settlement—the country between Mogil Mogil and Kunopia, or the country to the south? The country to the south is by far the best.

4252. Do you know the country between Kunopia and Goondiwindi? I was never out in that direction.

4253. Is the country between Mogil Mogil and Kunopia subject to floods? Occasionally when extra rain falls, as is any other part of the country.

4254. Is it worse than the country down to the south? I do not think it is. In 1890, the water fell so heavily in a certain locality that it caused the water to run down the Moomie and overflow—a thing which was never known to occur before.

4255. Do you know the country to the east of the "red" line? In the direction of Killarney, and just across into Edgeroi, but no further. I have not been along the mountains. The road, I took was from Narrabri to Millie, and from Millie to Moree—the coach road.

4256. You object to the railway crossing the river at Narrabri? Strongly.

4257. Why? Simply because it is very costly, and it is going back again.

4258. More costly than to cross at Gurleigh Point? But there would be only one bridge to construct.

4259. Is there not flooded country on this side of Gurleigh Point? It is very slightly flooded. In the heaviest of floods, I do not believe there is a foot of water on the country.

4260. If the Railway Construction Branch state that the crossing at Narrabri is cheaper and better than the crossing at Gurleigh Point, do you think they are correct, after having examined the country? They ought to be able to form a very correct opinion.

4261. You think they would be more likely to be correct than yourself? I should think so. They ought to have a good knowledge of the matter.

4262. Did you live on the eastern side of the "red" line? I have lived at a place called Billyeena on Maul's Creek, about 30 miles from Narrabri.

4263. What is the nature of the country about where you lived? It was open forest—there was very little pine.

4264. Good for agriculture or grazing? It was suitable for both grazing and agriculture.

4265. Do you know the distance from the "red" line to the mountains? No.

Mr. Albert Coppleson, storekeeper, Wee Waa, sworn, and examined:—

4266. *Chairman.*] You are a storekeeper residing at Wee Waa? Yes; about three and a half years.

4267. Has the Wee Waa district made much progress in that time? A great deal of progress.

4268. Did you reside in any other part of the district? I have been travelling all about the district for the last seven or eight years.

Mr. A.
Coppleson
29 Nov., 1893.

4269. Do you get your goods from Narrabri West? Yes; mostly by the cleared line.

4270. Principally by the river road? Sometimes it comes up the river road, and sometimes it comes by the cleared line; that is, the stock route.

4271. Do you know anything of the country through which the "red" line passes? Mostly all the country. I know from Killarney to Edgeroi, and about Gurley right up to Moree.

4272. Have you been north of Moree? Yes; to Goondiwindi, Kunopia, and Mungindi.

4273. Have you been to Collarendabri? Yes.

4274. You are familiar with all the country which is embraced within the betterment area of this map? Not to the east.

4275. You are not familiar with the country to the east of the "red" line? No. I have been to Bingara, but I went through Moree and Warialda.

4276. With the view of serving that large area of country which is depicted on the map, do you think the "red" route is the best which could be suggested? I do not think a line along the mountains would serve the country, except the stations I mentioned. There are no other settlers that it would serve.

4277. There are very few settlers on the east of the line between Narrabri and Moree? Exactly.

4278. Most of the settlement is to the west? To the west and north-west.

- Mr. A. Coppleson.
29 Nov., 1893.
4279. Do I understand you to advocate that the line should be brought to the westward? More this way.
4280. Do you prefer the Gurleigh Point route? It would serve more people down here, although it would not be in favour of Wee Waa. The town would suffer, but it would certainly serve a lot more people than would the direct line.
4281. But if it is brought *via* Gurleigh Point, will that not mean creation of a rival township at Gurleigh Point? Yes.
4282. In that case, Wee Waa would disappear? It might, to a certain extent.
4283. That would be rather antagonistic to the people who have invested their money about Wee Waa township? It would to a certain extent. If the line came here it would serve, I believe, more settlers. The goods which go through Wee Waa would be sufficient to pay the interest on the cost of the extra few miles.
4284. Do you think it would serve a greater number of people to take the line still further west? I do.
4285. Where would you locate a line further west of Gurleigh Point? Any route which would go near Gurleigh Point would serve more people. There used to be a good many settlers on the other side, between Edgeroi, Terry-Hie-Hie, and Bowman's Creek. There were a good few farmers over there growing wheat and corn, but that was from eight to ten years ago.
4286. Has there been more settlement to the west than to the east? Yes. I do not think it would be any exaggeration to say that for every selector to the east there are 100 selectors to the west.
4287. Which is the most important place on the Queensland border—Mungindi, Goondiwindi, or Kunopia? I think Mungindi is about the most important—as important a place on the border as any.
4288. If you had the placing of the line, would you say that it should go from Narrabri to Mungindi, and as directly as possible, or that it should deviate to the west? I would say that the line would be more beneficial if it went from Narrabri to Collarendabri.
4289. How do you reconcile that with your statement that Mungindi is about the most important place on the border? Mungindi is the most important place now on account of the road. There are a main road and a travelling stock route and a bridge over the Barwon River at Mungindi; consequently, all traffic goes by Mungindi now from Queensland, whereas if they were to go by Mogil Mogil it would be a bit of a round, and they cannot always be sure of crossing the Barwon. If the line is constructed to Collarendabri it will get the Queensland traffic to Collarendabri, and, by Mogil Mogil, through Goondiwindi, and it would open very rich country in New South Wales.
4290. Is not that country more liable to flood than the country through which the line is surveyed? The country about Mungindi and Collarendabri, of course, is liable to more floods than the country about Moree.
4291. Is it not a fact that the Mungindi traffic now goes to Narrabri, *via* Moree? Most of it goes through, but not all. Most of it goes through Moree on account of their being harassed by the people through whose land they would have to go from Mungindi. I heard a lot of carriers say that they would prefer to come in by the other way, because it is so much shorter.
4292. But if this railway is constructed to Moree do you think the Mungindi traffic would then undoubtedly go to Moree? Yes.
4293. Do you think any traffic from the south of Mungindi would go to Moree, presuming that a line is made to Moree (say) from Mogil Mogil? Not so far south as that.
4294. You think Mungindi is the most southern point from which the traffic would go direct to Moree? Yes.
4295. All the trade south of that would still go down, *via* Collarendabri, to Wee Waa and Narrabri West? They might get some of the Collarendabri traffic.
4296. In view of your expression of opinion that Collarendabri is the place which should be aimed at, you consider that the country to the west of the line is far more important than all the country to the north of Moree? Yes; any line which goes more to the west would be more beneficial to the country and to the Railway Department. One day I counted over seventy teams of wool going down through Wee Waa to Narrabri.
4297. From the district in and about Collarendabri? I do not know where it came from.
4298. That was exceptionally large, I suppose? I did not always count them. I was attracted by a good many teams going through.
4299. Had they been stuck up at any particular creek and collected there? I could not say.
4300. That is possible? It is likely.
4301. Was it after wet weather? No; it was pretty fine weather.
4302. Do you think there is sufficient trade to make the "red" line pay? Perhaps the traffic beyond Moree would help to make it pay, but with the traffic between Narrabri and Moree I do not think it would pay.
4303. Have you been in Moree lately? About ten months ago.
4304. It is a live town? It is pretty good; it is going ahead.
4305. Do you know of any town in the district within a radius of 100 miles which is as much alive as Moree? I do not.
4306. Wee Waa for instance? Wee Waa would go ahead, too, if they had not made the terminus of the railway so close—at Narrabri.
4307. You are nearer the terminus than Moree? It is having the terminus so far away that has sent Moree up. It was not as big as Wee Waa six or seven years ago. It had not a two-storey building then.
4308. Does not all that tend to show that it is the centre of a very much larger amount of traffic than Wee Waa? I do not know. The district of Wee Waa is, I believe, better than the district of Moree, but then again some people do business with Narrabri, and some who do business direct with Sydney do not even stop at Narrabri. The Wee Waa district made Narrabri as much as it is. Goods sent direct from here to Sydney do not even stop at Narrabri.
4309. What trade goes direct from here without stopping at Narrabri? A lot of people get their goods direct from Sydney, Maitland, or Newcastle. At Moree they cannot do so well.
4310. They have to get them from Narrabri all the same? Yes; but mostly through the Moree business people.
4311. Supposing the "red" line is constructed, and it is afterwards thought desirable to go out in the direction of Collarendabri, from what point on this new line should that branch be taken, or should the railway be continued from Narrabri West? I do not know. If this line is constructed and they afterwards want a line to Collarendabri, I think it would be best to take the railway from Narrabri West.
4312. Would not that mean that you would have to cross the river, which had already been crossed at Narrabri? If they go anywhere from Narrabri West to Collarendabri, near the river, they would get the

the traffic on this side of the river; and whatever traffic there is, I suppose, would help the line along, while, if they constructed a branch line. I do not think they would get the traffic—it would be too far away, perhaps.

4313. You think the extra haulage from Narrabri West would more than compensate for the deviation and the crossing of the river at this particular point? Not from Wee Waa itself, but from the district right down to Walgett.

4314. Is there any other point you wish to mention? No

Mr.
A. Copleston.
29 Nov., 1893.

Mr William Bennett, selector, sworn, and examined:—

4315. *Chairman.*] You are a selector on Bugilbone Run? Yes.

4316. *Mr. Suttor.*] What is the size of your holding? Between myself and my three sons we hold 10,240 acres.

4317. What do you do? We run sheep.

4318. Have you any land under cultivation? I have not commenced to cultivate with the exception of a 2-acre garden that I have fenced in.

4319. How many sheep have you? Last season we shored over 9,000 sheep, but this year we did not shear so many—we sent some to market.

4320. How much wool did the 9,000 sheep give? About 100 bales.

4321. Did you send any fat sheep to the Sydney market? Yes, over 2,000 within the last nine months.

4322. Have you considered the railway routes from Narrabri? I see the routes marked on this map.

4323. Do you know anything of the country through which the "red" line goes? I know a little of the country to the east of Narrabri. I have been along what they call the "wet weather road" from Narrabri to Moree.

4324. What sort of a country is it to the east of the line? It is scrubby—very poor country.

4325. How far is the poor country from the mountains? I could not say

4326. Do you know the country to the west? I have been along part of the coach road from Narrabri to Moree; that is all I know of it.

4327. Do you know anything of the holdings in that part of the country? No; only by the Namoi.

4328. In what direction is your holding? North-west.

4329. Which line do you think would serve the people best travelling from Narrabri West? The more the line would go westward the greater the number it would serve.

4330. Which line do you refer to? The Gurleigh Point line, and if it goes further west all the better.

4331. To what place should it be continued from Gurleigh Point? Anywhere round about Wee Waa.

4332. Running north of Moree? Yes.

4333. You consider that Moree is entitled to a railway? Yes; Moree may be entitled to a railway, but as the Government seem inclined to run a line from Glen Innes to Inverell I think it would be better to serve Moree with an extension from Inverell than to deprive the people who are residing down to the north-west of the convenience of railway communication. A line to Collarendabri would suit much better, and to tap the Queensland border in that direction would pay much better, I think, than a line through Moree out to Goondiwindi. I believe the line which is running to the Queensland border hardly pays, and to run another line within a radius I suppose of 100 or 120 miles to the border would, I think, be only making bad worse.

4334. I suppose you know that a line from Sydney, *via* Inverell, to Moree would be much longer than a line from Sydney, *via* Narrabri, to Moree? I do not know the distance to Moree exactly.

4335. The line you favour much would be a line from Narrabri West to Gurleigh Point and on to Moree? That would suit a great number of people down this way. There is more settlement to the north-west than there is on the proposed line.

Mr.
W. Bennett.
29 Nov., 1893.

Mr. Arthur Leslie Harden, J.P., selector and grazier, sworn, and examined:—

4336. *Chairman.*] You are a selector and grazier on Boolcarrel Run? Yes.

4337. *Mr. Davies.*] How long have you been in the district? A little over five years. I have just completed my conditions of residence.

4338. What statement do you wish to make? I consider that every mile the railway runs to the west of the "red" route, though that route may be the more direct and more economical, it will be more beneficial to the country, and will serve a great many more *bona-fide* settlers and settlement generally. I maintain that no selector on a small area can exist for any length of time when he is over 50 miles from a railway.

4339. How far would the "red" line be from any point of your holding? The nearest point would be about 30 miles. I suppose it would be Woolabrar; but it would be only about the same distance as we are from Narrabri.

4340. There would be a small distance in favour of Woolabrar Station? No; a line *via* Gurleigh Point, or to the westward of that point, would be much more beneficial to the holders of black soil country where you cannot make roads.

4341. You are 35 miles from Narrabri by road and 34 from Millie or Woolabrar—about the same distance approximately,—you would not trouble to use the railway by the "red" route? No; it would not be of the slightest use to us.

4342. Would a line by the travelling stock route be nearer to you? It would be more beneficial for trucking sheep—it would be nearer.

4343. It would be nearer to you, and more beneficial to you and your neighbours? Decidedly.

4344. It would bring the railway within 15 miles? Yes; but a vast number of small *bona-fide* holders would be benefited.

4345. What distance from a railway station do you regard as a fair and reasonable service for settlers and selectors? About 20 or 25 miles. A selector cannot exist with any hope of doing much if he is over 50 miles from a railway. The larger the scale on which they carry on, the more they can afford to pay for carriage.

4346. Twenty miles would be a fair service? Of course the nearer they can get the better. Twenty miles would be a fair service.

4347. The "red" line would not be of any service to you or your neighbours, and you would prefer to go to Narrabri rather than to Woolabrar, because the distance would be about equal? Yes; as far as we are concerned.

Mr.
A. L. Harden,
J.P.
29 Nov., 1893.

- Mr. A. L. Harden, J.P.
29 Nov., 1893.
4348. Do you know the country through which the "red" line has been surveyed? I know the country at the Moree end. I have not been very much in the middle of that country.
4349. Is it fairly good country? For the first 25 miles from Narrabri the country on the east of the line is very inferior.
4350. What is it on the west for the first 25 miles from Narrabri? It is good country, but the really money-making country starts on the west.
4351. It is timbered country to the east? It is timbered, scrubby country, it runs into the ranges. I used to go frequently down through the gap from Bingara some years.
4352. You favour the Gurleigh Point route? Yes, or any route to the west, because it would benefit the people. It may be a little more expensive by that route, but I take it that the extra haulage would compensate the Government for the additional outlay.
4353. If the Railway Department and the Construction Branch have made all these inquiries? Ah! but have they.
4354. I say, if they have made all these inquiries, and they have based their calculations on the information which they procured in that way, and they represent that the railway will pay if it goes by the surveyed route, what about your opinion? It will probably pay, because Moree is a very good town, and the latter portion of the line passes through very good country. But if it pays, then I contend that deviation of 20 miles will also pay well.
4355. You would handicap the people at the other end with 20 miles additional haulage? Undoubtedly, the largest benefit for the greatest number.
4356. You would make them put up with that handicap? Justly too.
4357. Have you any other reason to offer? It has been asserted by the Department that the Gurleigh Point route is a flooded route, and that it would be hard and awkward, as well as more expensive, to construct a railway by that route. I contend that it is not a bit more flooded than the Breeza line was. All flat country is liable to flood. I knew the Breeza country before the line ran across, and the Department got over that difficulty safely enough. I maintain that this difficulty in the case of Gurleigh Point can be got over just as easily. There is no current in these floods.
4358. Do you think it could be constructed at a cost of £2,400 a mile, notwithstanding that it is very wet country? Yes; notwithstanding that it is flooded once in every seven years.
4359. If the Gurleigh Point route were adopted would it not mean the establishment of a new township? We know that wherever a railway station is placed to a certain extent a township is formed.
4360. Would it not wipe out Wee Waa? Every township has to take its chance.
4361. It would suit you to take the line by Gurleigh Point? Anywhere west of the line would suit me. Every mile that they traverse the black soil with a railway they benefit the selector and grazier.

Mr. William Thomas Mitchell, selector, sworn, and examined:—

- Mr. W. T. Mitchell.
29 Nov., 1893.
4362. *Chairman.*] What is your occupation? I am a selector on Gunnedra Creek, on the Pian Creek Road.
4363. *Mr. O'Sullivan.*] What is the size of your holding? It consists of about 2,000 acres. It is situated 7 miles from Wee Waa.
4364. Are there many selectors round your neighbourhood? Yes—so many that you could not get a 40-acre piece.
4365. Does the settlement appear to be of a *bonâ fide* and permanent character? Yes, undoubtedly.
4366. Is Pian Creek remarkable for the number of settlers it carries? Yes; it is all taken up.
4367. Does the settlement trend away to Collarendabri, and north-west of these points? Yes; the land is all taken up where it is available.
4368. By what road do the settlers out in that direction drive their stock and receive their stores? From Pian Creek to Wee Waa, and by the cleared line to Narrabri West.
4369. That is your natural road to Narrabri? Yes.
4370. How would the "red" line affect the people out your way? It would not serve them in any way. It would not be used by them—too far east.
4371. Would they be likely to use a branch line run out from Boggy Creek, say, 30 miles in that direction? There are a few people on the plains and about Boggy Creek who might use it.
4372. How far would you be from a terminus at a point 30 miles from Boggy Creek to the west? About 25 miles.
4373. Would a branch to that point serve you better than (say) a branch to Wee Waa? No; it would be very inconvenient. There is no travelling stock route out that way.
4374. Supposing a branch line went from Narrabri West to Wee Waa, would it tap all the country you refer to? Certainly.
4375. Would it serve the Collarendabri Road better than a branch from the "red" line? Certainly. I know the Collarendabri Road, and also the road under the mountains to Moree.
4376. Have you heard of any men transferring their selections to the large land-owners? Not for some years.
4377. I suppose all those who did select in the interest of the stations have transferred their holdings, and that the land has become absorbed in the stations? Yes. Many a person—myself for one—had he not persevered, would have had to sell out to the lessee of the run. They used to surround the selections in my time. I selected in 1877. I have been thirty years in the district.
4378. They surrounded you with other selections? Partly, to force me to sell out.
4379. Partly to make it very hard for you to work your holding? Yes.
4380. But that sort of procedure is practically stopped? The Land Board has done away with a great deal of that sort of thing.
4381. Do you know if there is any good land to be selected, if the leaseholds are thrown open? A good deal on the leasehold areas on Merah and Weetawa. I have selected on Weetawa run—it has a frontage of 10 miles to the Namoi. Merah has 7 miles frontage to the Namoi.
4382. With regard to the other runs, do you think they will be selected when they are thrown open? Yes.
4383. Do you know anyone who is prepared to take up land? Yes; I have three or four sons, and I am waiting for the land to be thrown open for them to select.
- 4384.

4384. I presume that there are other young men in the district who are waiting to select? Yes; many of my neighbours are waiting to select.
4385. Would not that argument also apply to the leasehold areas on the direct route, and will not population spring up along the direct route when the runs are thrown open? That is very likely, but most of that land has been secured.
4386. All that land between Narrabri and Moree which is marked white on this map is still Crown land—leasehold—and all the green represents reserves, many of which, of course, will have to be thrown open. Does not the map seem to imply that there is room there for settlement? No; the "red" line runs too near the mountains. It does not run through the centre of the population.
4387. It runs at a distance of 13 or 14 miles from the mountains, therefore, it runs through lands which are likely to be settled upon when the leasehold areas are thrown open? There is very little land, from what I can learn, on the east of the "red" line. There is far more land on the west side.
4388. You think there will be a greater rush of settlement on the leasehold areas towards Collarendabri and Mogil Mogil than between Narrabri and Moree? Wherever the land is thrown open it will be selected.
4389. Are not many of these runs flooded by the waters of the Namoi? Nearly all of this low country is flooded, but we are very glad to see a flood.
4390. Occasionally? Yes; every six months we would like it.
4391. A flood refreshes the land, and appears to be no impediment to grazing pursuits? Not a bit. As long as you have some high land to put your stock on.
4392. *Chairman.*] Can you state your experience of high-water mark in the 1864 flood? It was from 1 foot to 2 feet deep about Wee Waa, and from 4 to 5 feet at Narrabri.
4393. In Wee Waa township? Yes.
4394. Has there been any higher flood than the 1864 flood? No. The oldest aboriginal informed me that this was the highest flood ever known to the aboriginals. I observed the blacks making stages in the trees. They were very much frightened at the time.
4395. They found that their stages were not above flood-mark? The stages they made were much above flood-mark. They had not seen a high flood till 1864.
4396. Does not that go to show that they expected the flood to come up higher? But it did not come as high as they expected. That was the only flood in thirty years of my residence that was so high.
4397. It was the highest flood known? Yes. It was 4 or 5 feet high in Narrabri.
4398. Did it do very much damage? Not a great deal.
4399. How far was the 1890 flood off that flood? I suppose about a foot; some places 2 feet.
4400. Did it do much damage? It did cause a bit of damage.
4401. You do not look upon a flood as an unmitigated nuisance or danger, but rather as a benefit on the whole? Yes. I am very glad to see a flood now and again.
4402. Do you know the site which was pointed out to the Committee as a good site for the railway to cross the river? I do. I have resided there many years.
4403. Was that under water in the 1864 flood? It was approachable on both sides. We had a canoe stationed there to cross the river.
4404. After crossing the river on either side, within a few hundred yards, you came into flooded country? Quebri station, on the other side, was flooded with water about 2 inches high.
4405. When you got away from the river bank, on the northern side, some few hundred yards, did you not come into flooded country? There was a little water over that way in the 1864 flood—not just at the river bank, but away from the current of the Namoi.
4406. If the Committee saw flood-marks, 3 or 4 feet high, on the trees along the Walgett Road, would you call that a little water? There was no flood 3 or 4 feet high at the crossing I have been asked about. It is 6 or 7 inches above flood mark.
4407. Not at the crossing, but a few hundred yards to the north, on the other side, where the Walgett Road runs along? There is a swamp there, and the road runs through it, but along the river bank it is high land.
4408. Higher than 300 or 400 yards north of the crossing—what you now call a swamp, through which the Walgett Road runs—was flooded at that time? Yes. The surface fall of the land is 1 foot in a mile.

Mr. Allan Mackenzie, manager, Wee Waa station, sworn, and examined:—

4409. *Chairman.*] You are manager of Wee Waa station? Yes.
4410. *Mr. McCourt.*] What statement do you desire to make? I desire to say that there is no timber on the "red" line fit for railway sleepers.
4411. Did you live on that line? Yes; for about twelve years on Edgeroi station.
4412. How long have you lived on the west? Fifteen years.
4413. Have you ever been over there since you left? I have just been across there.
4414. It is all scrub country? Yes.
4415. Not suitable for settlement? No.
4416. Is the land up Gurleigh Point more suitable for settlement? I think so.
4417. Is there more Crown land along the Gurleigh Point route? Better land.
4418. Some of it? Yes.
4419. Do you know the country to the south at all? Yes.
4420. What is the nature of that country? All scrubby country, but good timbered country—good ironbark for railway purposes.
4421. Is it very scrubby country? Yes, in parts; some of it is open.
4422. Is it good country, usually, where ironbark grows? Yes; if the country is rung.
4423. Is there anything else you wish to add? No.

Mr. W. T.
Mitchell.
29 Nov., 1893.

Mr. A.
Mackenzie.
29 Nov., 1893.

Mr.

Mr. Edward William Jeffery, selector, near Wee Waa, sworn, and examined:—

- Mr. E. W. Jeffery.
29 Nov., 1893.
- 4424-5. *Chairman.*] You are a selector, near Wee Waa? No; I am leasing country near Wee Waa, with right of purchase.
4426. You came from Victoria? From Gippsland.
4427. *Mr. Ewing.*] Do you desire to make a statement in regard to the probable increase in the population when the leaseholds are thrown open? Yes.
4428. You have a statement which you wish to read? It contains a lot of evidence which has already been given.
4429. What point would you like to touch on? With regard to the statement of Mr. Gould that only 10 per cent. of the total traffic to Narrabri West station comes from Wee Waa. I have trucked three lots of sheep since 30th June;—before that time a man always drove them up for me,—and on that date ninety-two trucks were despatched from Narrabri. The *Stock and Station Journal*, in this paragraph which is marked with red ink, shows that of those 92 trucks 62 trucks came past Gurlieigh Point, or the proposed line to Wee Waa. On the 18th July I was up at Narrabri West with another lot. On that occasion 105 trucks were despatched—the greatest number of trucks which had been despatched on a single day from that station. I have a record of the consignments on that occasion:—Bingle Gully, 22; Mr. Rafferty, 13; Boolcarrol, 10; myself, 10; Mr. Radcliffe, 6; and Mr. Sinclair, 6; or 67 out of 105 had to pass Gurlieigh Point to go to Narrabri; this is 65 per cent.; not 10 per cent. With reference to the 1,100,000 acres of so-called inferior land, extending from Narrabri to Pilliga, I was out at Mr. Hawthorne's place, which is 3 miles from here in the scrub, I saw maize growing higher than I could reach—a crop which would gladden the hearts of farmers on Tambo and Mitchell flats, in Gippsland, who pay a rent of £3 an acre. Most of this country is similar to the Goulburn Valley and Wimmera districts, in Victoria, which are supposed to be the best wheat-growing districts in Australia.
4430. It really is not inferior? Not for agriculture, but for grazing it is. If it were brought before the notice of the Victorian farmers, and the facts were advertised in the newspapers, men would come over here, and they would produce enough wheat on these acres to supply New South Wales.
4431. Do you know of any selectors who would come from the other colonies? I know of eighteen or twenty families in Omeo, a mining and grazing district, who are waiting for Crown lands in this district to be thrown open to come over and select.
4432. You believe that population will greatly increase? Certainly. I enter a most emphatic protest against the construction of any other line except a deviation to Wee Waa. The haulage from Wee Waa and the other side of the river would be almost, if not quite, equal to the whole of the traffic from Moree on the rest of the line. Last Friday, on the Boolcarrol Road, in about 1½ mile, I counted sixteen teams, loaded with over 500 bales of wool, going to Narrabri. The busiest portion of the season is over by a long way. Along that road, by which you came in at the back of my place, in the height of the wool season there is a continuous stream of teams, let alone the traffic which comes up here. The Wee Waa line does not suit me, as it would go through the property I lease—the Gurlieigh Point line would suit me better—but I believe, for the good of the country, it ought to go to Wee Waa. If the line is to be constructed to pay, it should go round Wee Waa. If the other line paid, it would be through the traffic to and from Moree, and just a little country between the line and the ranges. All the traffic from the west and north-west would not touch that line at all. A question was asked Mr. Maiden yesterday about the Collarendabri traffic. If the line we now propose were constructed *via* Wee Waa, it would be almost a direct line out towards Collarendabri. The first section of the Narrabri-Moree railway would be so many miles of the Walgett line already constructed; in fact, that first section of the Moree railway would serve the Moree line, the Walgett line, and the Collarendabri line. I believe that section of the Narrabri-Moree railway would be the best paying line in the Colony. All the traffic from the west and north-west passes Gurlieigh Point to go up to Narrabri now. As to the population down below, a bi-weekly mail goes up the country to the east, and two bi-weekly mails pass along the Boolcarrol road—one to Collarendabri, which proves that that is the direct road to Collarendabri.
4433. *Mr. Ewing.*] Supposing that you can make a direct line to Moree, and also to the Barwon at Collarendabri for the same money as you can make a line by Wee Waa, and then junction off that to Moree, with a branch going up the Boolcarrol Road to Collarendabri, what would you say? I should say the line as far as Boolcarrol, or across the river here, would serve both lines. It would answer the two purposes, let alone the Walgett railway. As for land being for sale about here, before I left Omeo three years ago two or three parties asked me to let them know if I saw any country about here which would suit them. But during the two years I have been here I have not heard of a single block being for sale in the district. The place I have would not have been for sale, for the land is good, but Mr. Hall, the owner, died, and Mrs. Hall, being unable to manage the property was obliged to dispose of it. It is not through any fault of the country that I am getting the property. I do not suppose that a block of land can be bought in the district, except at a high price.
4434. The people are doing well without a railway? Yes; I am paying a rent of £375 a year for 3,200 acres for grazing purposes only. This year I shall contribute about £380 to the railway revenue, and most of the persons in this district whose names you have got to-day will contribute a much larger sum than I shall.
4435. Have you anything more to say? No.

Mr. Andrew Hamilton, hotelkeeper, Wee Waa, sworn, and examined:—

- Mr. A. Hamilton.
29 Nov., 1893.
4432. *Chairman.*] You are an hotelkeeper in Wee Waa? I am, and also a selector in the district.
4437. *Mr. Dawson.*] How long have you been in the district? About twenty years.
4438. Do you know the various routes which have been projected for this railway? I have never been very far out. I know the two roads coming in this way.
4439. Do not you know anything about the "red" route? No; I have been over Inverell way, across the mountains. I have never been up to Moree; I have been as far as Tycannah, on the travelling-stock route.
4440. You do not know whether there is good country on each side of the "red" line—good timber or good agricultural land? No. I have been over the mountains, but I saw no timber there.
4441. Can you give us any idea of the western traffic? No.
4442. Then what would you like to say about the line? As far as the population is concerned, there are the most people living down there, and they have the most stock, and where there is most population, of course there is most money.
- 4443.

Mr.
A. Hamilton.
29 Nov., 1893

4443. Is there much traffic coming through Wee Waa? A great deal.
 4444. Would any of that traffic go to the proposed line? No.
 4445. You favour a line *via* Gurleigh Point, then? As far as it would come to the west.
 4446-7. The nearer the better? Into the town, if you can get it.
 4448. Would not a line by Gurleigh Point, being only 6 or 7 miles from Wee Waa, affect this town? It would not do it any good.
 4449. Why not? It is very likely that another township would spring up.
 4450. Would that be a great national loss, or would it interfere only with the people here? It would interfere with the township, but not with the people to the west.
 4451. Would it not benefit a great many to the west? It would.
 4452. You will admit that if the nation benefits to a large extent, the few in Wee Waa must suffer for the good of the many? Yes.
 4453. Do you think that this place would be served by a railway within a distance of 3 or 4 miles? It would not do a great deal of harm.
 4454. Would not the people come into Wee Waa, and drive over in the morning to catch the train? If they had not a great distance to go they might stop here, but if they were within a day's journey of Gurleigh Point, and there is accommodation there, they will go there.
 4455. Up Gurleigh Point way will there be any land available for selection when the leases are thrown open? Plenty.
 4456. It would be taken up? Every inch of it; it would be balloted for.
 4457. We may hope that it will settle a good class of people? I think so.
 4458. Have you any dummies in the district at all? I think they have melted like the froth on the river.
 4459. I suppose it would scarcely pay a man to keep dummies? There are too many *bona fide* settlers.
 4460. It gets too warm for them? It is pretty often found out; but, unfortunately, a dummy can get a piece by ballot.
 4461. Is there anything else you would like to add? I would like to say something about the Pilliga side:—The timber is very good; it consists of ironbark forest and pine. There are pieces of dense scrub; but as a whole it is all fertile country for agriculture, but not for grazing.
 4462. It would want to be cleared before it could be cultivated? Yes.
 4463. If it were cleared and ringbarked it would be good for pasture? It would.
 4464. What you mean to infer is that you would have to spend a certain sum and that by the time the land was made fit for grazing it would be too valuable, and that you would have to devote it to agriculture? My meaning is to settle the people on the land in farms.
 4465. If it took 10s. or 20s. to make the land fit for agriculture, and it is fit for grazing, it would be better to put the land under sheep? I do not think so; there is too much grass seed out there for sheep. With regard to floods, the highest flood I have seen was in 1879. It occurred when the Boolcarrol shearing was going on. I had to come into Wee Waa every week, but I went through it the whole time. There was only one place that was above the horse's knee, and that was on the other side of Little Dunna Dunna paddock; all the rest of the way to Boolcarrol is high ground.
 4466. That is where there is a little bit of a billabong—about a mile from the old house? Yes.
 4467. Was there a bridge over the river then? No; I had to swim the river. I left my clothes on the other side and I swam over. I had a suit on the other side to go home with.

Mr. Walter William Richard Holcombe, selector, sworn, and examined:—

4468. *Chairman.*] You are a selector on Pian Creek? I am nearer the river on Weetawa Run, 9 miles west of Wee Waa. Mr. W.W.R.
Holcombe.
29 Nov., 1893.
 4469. You have heard the evidence which has been given;—can you give any fresh information to the Committee? I have a garden and a little farm, and I have an idea of the capabilities of the country. I have some 5 or 6 acres of grape vines, which are doing well.
 4470. In the black soil? In sand. There is a sand ridge.
 4471. You get this black soil on Pian Creek? On Pian Creek there is a ridge of sand in a good many places, but it is good country all the same. There is a large amount of land on the Pian Creek which is suitable for grape vines, but at present we have no market, as it is so far to the train. We can grow wheat. I have grown wheat at my place, but the same applies to maize. I have let some of it seed to see how it would do, and it has done very well. We grow a lot of hay, but it cannot be sold, as we have no market. Then we come to grazing, on which we have to depend. The "red" line would be of no use to any one on the uncoloured land. There are a great number of people living to the north and south of the river. If you are driving your sheep to Narrabri, for the last few days they have to go through scrub country, which means that they have no grass. They are put on the market in very poor condition compared with what they would be if there were a railway station at Gurleigh Point or Wee Waa. If the railway were brought to Gurleigh Point the whole of the stock would go by rail.
 4472. You are on the north side of the river, and you go down through barren country when you go along the Walgett road? It is much further to go round by the other side on account of the bends in the river. It bends north, and the country is taken up a good deal and the lanes are narrow—in many places a chain wide. That means putting sheep through a lot of small holdings. In delivering our wool with our teams we have a bad country to travel. We have black soil to here, and for a long time we have to go by the cleared line on account of the wet. We have two or three days through sandy country. The draft stock are perishing at the same time.* The whole of the people in this part which is not coloured have to come by this way, and of course a great many on the other side, from anywhere south-west of Collarendabri, have to come up this way. If it comes to a question of the residents being permanent, I know of no one who is not. I should be bound to buy land for my sons, no Crown land being open.
 4473. In spite of all these difficulties of getting to market you have lived, increased and prospered, and are prepared to extend your holding? Yes; my family is increasing, and they want to take up land.
 4474. In your opinion the railway should be extended towards Wee Waa as far as Gurleigh Point at least, and if the line is to be constructed to Moree it should go in that direction? Yes.
 4475. Do you know anything of the country between Wee Waa and Moree? Yes; I have been across the country. It is all good to Moree. I know nothing of the country to the north of Moree.

4476.

* NOTE (on revision) :—Meaning—We have black soil to here (Wee Waa); then on account of floods two or three days through sandy country. The draft stock are perishing while on the sandy country.

- Mr. W. W. R. Holcombe.
29 Nov., 1893.
4476. If this line is referred to the Committee with view of serving the country to the north of Moree, rather than any country intervening between Narrabri, what then about this deviation? We are speaking of the traffic down here. For my part, I consider that we ought to have a railway straight from Narrabri down this way. If we cannot have that, let it deviate from here.
4477. You say the district in and to the west of Wee Waa is so great and important that it is entitled to railway communication with Narrabri? Yes.
4478. And that if the first extension is to be in the direction of Moree, it should deviate to Wee Waa or Gurleigh Point on the way to Moree? Yes.

Mr. Cornelius Kelaher, selector, sworn, and examined:—

- Mr. C. Kelaher.
29 Nov., 1893.
4479. *Chairman.*] You are a selector on Pian Creek, about 13 miles out? Yes. My selection consists of over 1,600 acres.
4480. *Mr. Suttor.*] What do you run? Sheep and cattle.
4481. Have you any land under cultivation? About 5 acres.
4482. How many sheep have you? At present about 4,000.
4483. Four thousand sheep on 1,600 acres? No; I have other land, which I rent.
4484. How much land do you rent? I could not say exactly. I daresay the sheep run over 3,000 acres altogether.
4485. How much wool do you take off? This year, 10 tons 6 cwt.
4486. Where do you send your wool? To Narrabri West.
4487. Do you truck many sheep from there? Not very many; this year, 800.
4488. How is your holding situated from here? The nearest point is 14 miles from Wee Waa. It is on Morah.
4489. Have you considered the question of these railway routes? Yes.
4490. Which route do you consider would serve the country round your neighbourhood best? Of the three lines, the Gurleigh Point against the world. Gurleigh Point is about 20 miles from my place. I live on one of the main travelling stock routes going up Pian Creek. I thought I might be able to give you a little idea of the travelling stock, and the loading which go up past my place.
4491. Will you kindly give the information? They have to "notice" me on each occasion. In one week I received notices of about 30,000 sheep and three lots of cattle—800, 1,000, and 1,200. Nearly every day I receive notices of travelling stock coming up to my place.
4492. What would be the average number passing your place in twelve months? I have no idea. There is a constant stream of stock coming up. I have been speaking to some drovers. It seems to have increased lately very much. I asked the reason why so much came this way, and they said, "There is no road talked of so much out back as Pian Creek Road."
4493. Where does that road come from? From Walgett, Collarendabri, and out in that direction.
4494. Just as much wool coming past your place? A constant stream of wool. In the busiest times the teams are in sight of each other. I have no idea of the quantity that passes by. I know that a great number of wool teams go by. One year I was droving wool for myself and brother-in-law, Mr. Knight. On one occasion I was in Narrabri West, and sufficient trucks could not be got to take the wool away. I was told there were between 200 and 300 teams in and about the yards waiting for trucks. I know a great number of the carriers very well, and I can assure the Committee that fully one-half of the carriers travel the Pian Creek Road right up to Namoi or the road which comes in by Gurleigh Point.
4495. *Chairman.*] How many carriers are there—100? I daresay there are.
4496. Do 75 per cent. or 50 per cent. of the carriers come by this road? Very nearly all on this line.
4497. Do you think you are safe in saying that 80 of the 100 carriers you know come down this road? Yes.
4498. *Mr. Suttor.*] Do you know anything about the travelling stock route? I have a little idea, but not much, of the country.
4499. You think the line which would serve you best would be the Gurleigh Point line? Yes; or any line going further west.
4500. How far do you think it ought to go further west than Gurleigh Point to suit the people on Pian Creek? Anywhere west of Gurleigh Point.
4501. Have you any idea how many sheep to the acre the land out there generally carries? It all depends on the season. In a good season you cannot overstock it. I do not know how many it would carry on an average. It might carry two sheep to the acre.
4502. That would be in a specially good season? A fairly good season.
4503. Have you any further statement to make? No.

Mr. James William Doherty, builder and contractor, Wee Waa, sworn, and examined:—

- Mr. J. W. Doherty.
29 Nov., 1893.
4504. *Chairman.*] You are a builder and contractor residing in Wee Waa? Yes.
4505. You are also secretary of the Local Railway League? Yes; conjointly with Mr. Maiden.
4506. *Mr. Davies.*] How long have you resided in the district of Wee Waa? Twenty-six years.
4507. Then you know the district well? Not to a great extent. I have not been far out. I know the country to the west and north.
4508. I presume that a good deal of information which has been given to the Committee has been prepared by you as secretary of the League? Yes; I asked these persons to attend and give evidence.
4509. Did you send to the different selectors for information as to the number of their stock, and the carrying capacity of their holdings? No; I asked them to come and give evidence. I did not try to get any information from them.
4510. Have you any fresh evidence to offer? No. From what I do know of the district, I think that a railway should go to Moree, and if it can be brought by a north-westerly route it would be much better for the district. The further west it could go the better it would suit the town and the settlers.
4511. You endorse the opinions of previous witnesses? Yes; I know there is splendid timber to the south of the place. A splendid timber trade could be opened up in ironbark and pine. There are two saw-mills—one 9 miles up and one in the town. The mills are continually going, and they send timber up to Collarendabri.
- 4512.

4512. Do you know anything about the ironbark forest towards Narrabri? Yes.
4513. Have you ever had timber out of that forest? No; but from the south I get splendid timber about 12 miles out.
4514. Do you know that there is an abundance of timber for sleepers or bridge work? Yes.
4515. You do not know anything of the country through which the "red" line goes? No.
4516. Your district can only be served by a railway coming from Narrabri in this direction as far westerly as possible? Yes. As regards the floods, I can speak of the flood-water on the other side of the river. I suppose the Committee have seen the traces of the flood over there. It is not long since there was a flood there; the rubbish is deposited on the fences, but the river banks were perfectly high above flood-water.
4517. Have you anything further to add which has not been stated by any previous witness? There are two or three good lots of gravel in the bed of the river in different parts which could be used for a line coming in this direction.
4518. Anything else to add? One day while I was minding a store, I thought I would take a note of the wool that was passing. It was on a Monday, which is usually a big day in the wool season, because on the Sunday the teams are drawing up all day close to the township, and they all go through on the Monday. I have counted over a 1,000 bales passing the town in one day.
4519. Where did it come from? Merkadool, Angledool, Eurie Eurie, Cryon, Burran, Drildool, Bugilbone, Come-by-chance, Keelendi, and several other stations whose names, I cannot remember. I have seen wool passing from a station called Cubbie in Queensland.
4520. Have you anything to say, as the secretary of the League, in favour of the construction of a north-westerly line other than what has already been said? I do not think so.
4521. You have summoned a great many witnesses, a number have given their evidence, and many others would be prepared to corroborate that evidence if necessary? Yes.

Mr. J. W.
Doherty.
29 Nov., 1893.

WEDNESDAY, 29 NOVEMBER, 1893.

[The Sectional Committee met at the Court-house, Narrabri, at 8:15 p.m.]

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

THE HON. WILLIAM HENRY SUTTON.
THE HON. JOHN DAVIES, C.M.G.
THOMAS THOMSON EWING, Esq.

WILLIAM MCCOURT, Esq.
EDWARD WILLIAM O'SULLIVAN, Esq.
HENRY DAWSON, Esq.

The Sectional Committee further considered the proposed Railway from Narrabri to Moree.

Mr. Luke Malone, newspaper proprietor, Narrabri, sworn, and examined:—

- 4521 $\frac{1}{2}$. *Chairman.*] What is your occupation? I am a newspaper proprietor at Narrabri.
4522. *Mr. O'Sullivan.*] How long have you resided in Narrabri? Over twenty years. I know the district and the people thoroughly.
4523. You have had opportunities of knowing by which route trade comes into the town from the west and north? Yes.
4524. Which route, in your opinion, would best serve the interests, not only of the district, but of the community generally? The northern route.
4525. Why do you prefer the direct route? The land is better for settlement, is less liable to flood, and is fairly well timbered.
- 4525 $\frac{1}{2}$. Is there not a considerable trade from the west which could be tapped by the proposed line? There is a fair volume of trade by the more western roads.
4526. Which route, in your opinion, brings in the larger trade to Narrabri—does it come from the Moree district or from the Wee Waa and Collarendabri districts? There is no comparison between the two trades. The Moree trade is very much the larger of the two.
4527. Which of the two routes is settled the best? The travelling stock route at present, I should think.
4528. Is not Gurleigh Point route well settled by settlers and graziers? Fairly well settled.
4529. Much better settled than the direct route? It is.
4530. Where does your newspaper circulate the most—on the line of road between Narrabri and Moree, or on the Gurleigh Point route, taking it out as far as Wee Waa, and then going northerly to Moree? In the whole of that district it circulates, but I do not know that there is any material difference at present. The more easterly route, as I said, is not so well settled as the more westerly.
4531. Do not most of the drovers bring in cattle by Wee Waa? A great number come in by that way, and also by the travelling stock route.
4532. By which route, in your opinion, does the larger number come in? I think by the travelling stock route. A great many cross at Wee Waa when the feed and the travelling are good.
4533. It seems to be a question of weather and feed as to which road they choose? Yes.
4534. Have you ever heard of the flocks and teams being blocked when attempting to come down by way of Wee Waa? Frequently. I have known teams and drovers to be blocked there for weeks by flood-water.
4535. Did you ever hear of flocks of sheep and teams which would otherwise come down by way of Wee Waa taking the road *via* Millie to Narrabri? I could not say.
4536. During your long experience as a journalist you have noticed, I suppose, the gradual growth of the town and its surroundings? I have.
4537. Do you consider Narrabri a sound and substantial town? I think it is very much so.
4538. It has grown very rapidly during the last seven or eight years? It has grown in a wonderful manner since I came here? It was only a small village fifteen years ago.
4539. What effect would a railway from Narrabri West to Wee Waa have on the town of Narrabri? It would blot Narrabri out, or very nearly so.
4540. On the other hand, what would be the effect upon Narrabri West of extending the railway through Narrabri to Moree? They would still retain a portion of the trade which comes by the river.
4541. It would still be patronised by the western and Collarendabri traffic? Not the Collarendabri traffic, but the trade which comes up the river.

Mr.
L. Malone.
29 Nov., 1893.

Mr.
L. Malone.
29 Nov., 1893.

4542. The trade which comes from the direction of Walgett? Yes.
4543. But does not most of the Collarendabri traffic come into Narrabri West now? Yes; except when the river is up, and then the steamers go up to Collarendabri and take it away.
4544. Narrabri West would be likely to retain a fair share of that traffic? I think so.
4545. Even though the railway were extended from Narrabri to Moree? I think so.
4546. Have you had any land agency in connection with your paper? No.
4547. I presume you can judge by the advertisements and other means as to whether there is a demand for land in this district? There is a very large demand. There are numbers of people here who are waiting to take up land.
4548. Do you know of anyone who is waiting to settle upon the direct route when the leaseholds are thrown open? I know that any number of inquiries are being made about the land, but I do not know exactly as to the place they are going to select on.
4549. Are the people here waiting to take up land? Yes.
4550. Is no portion of the resumed area left for settlement? They are waiting for the leases to be thrown open.
4551. Is there no good land on the resumed areas? No, not much. The areas are not large enough for pastoral purposes.
4552. Have you heard of many selections being transferred to large property owners? A great many.
4553. That is not a very good evidence of the *bona-fides* of the settlement in the district? No; I know that a great many selections that I saw marked on the map the other day are not good indications of the settlement on the more western route.
4554. And the portions marked blue on the map did not indicate the fact that that settlement has been of a permanent character?
4555. A great many of the selections thus marked have been absorbed into the large properties? A great many.
4556. I presume that many of these selections were really taken up in the interests of the stations? I daresay they were, but I know nothing of the matter, except that they have gone back to their original source, as it were.
4557. On which route is the larger number of abandoned selections—on the direct route or the Gurleigh Point route? I think that very few on the direct route have gone back to the original holders, except on Killarney, perhaps where selectors have been bought out.
4558. Most of the conditional purchases which have been absorbed into the large stations are upon the Gurleigh Point or western route? Yes; there is a good deal of *bona fide* settlement there too, but still there are a great number of blue patches which have gone back into the stations.
4559. Has the town of Wee Waa progressed much of late? Within the last five years it has progressed considerably.
4560. It was for a considerable number of years almost stationary? For many years.
4561. During the last few years it has taken a stride ahead? It has.
4562. What has caused that progress? Various causes. Increased settlement in the neighbourhood, no doubt, has had some effect on the town.
4563. A good many settlers have gone out that way during the last few years? Yes.
4564. In which portion of the district do most of the drovers that bring in flocks and herds into the town reside? A great number of the drovers of Queensland stock are Queensland men. Some go out from here and bring stock back. Some live down the country. There are a few living about here.
4565. Is it a fact that Wee Waa is largely settled by local drovers? Mr. Maiden and Mr. Woods are the only two, I think, who live about Wee Waa.
4566. *Mr. McCourt.*] Have you advocated in your paper the construction of the line from Narrabri to Moree? No.
4567. You have not expressed any opinion in your paper? No; except as to its going to Moree at all.
4568. Did that express the opinion of the people of Narrabri? I think so. They do not want the railway at all. They do not want the railway to leave here.
4569. Were you established here when Parliament voted a sum for the construction of this line? I was.
4570. Did you approve of the route for which that money was voted? We never approved of the railway going from here.
4571. By any route? By any route.
4572. Therefore, the people of Narrabri do not want the railway? They do not want it to leave here. I feel certain that I am voicing their opinion.
4573. *Mr. Dawson.*] Can you instance any transfers on the western side? I could not from memory, unless I saw a map with the names of the original holders.
4574. What percentage do you think there would be? That I could not say with any degree of certainty.
4575. If other people have stated that there has been no system of dummeying in the west, and that they are all *bona fide* men they have made a mistake? Oh! there are a number of *bona fide* men there to-day but a number of men who were apparently settled down there at one time, have sold out to the stations and gone elsewhere.
4576. Have you ever been over the country along the "red" line? Over a good portion of it. I have not been along the survey, but I know the country well.
4577. Do you know of anyone that has been along the survey? Yes; Mr. Wall and Mr. Ross went with the surveyors or with Mr. Harper a little time ago.
4578. Do you know the country between Millie and Woolabrar or between Millie and Edgeroi? Yes.
4579. Is it practical to get a travelling stock route to take stock to the line there? I daresay it is.
4580. Is or is it not all belar scrub with no water whatever? There is not much water on that country. There is no living water, as it were. The water is all made.
4581. It is from 14 to 15 miles from Millie to Edgeroi or to Woolabrar;—is it or is it not a fact that unless a good big travelling stock route is made, and a water tank is put down, people would never go to those stations? I daresay there would be.
4582. You do not know whether for 8 miles of the distance it is belar scrub? I know there is a very large scrub there called Eckford's scrub.
4583. A person would have to go through that scrub to get on the line? I believe the surveyed line goes through

Mr.
L. Malone.
20 Nov., 1893.

- through part of the scrub. There is excellent timber for building and railway purposes along Terry-Hic-Hic.
4584. This district has been settled some time, there has been a big rush for land here? Yes.
4585. How is it that comparatively little of that land has been taken up along the "red" line? The lower country is better pastoral country. They were anxious to get on to the river frontages. They had permanent water along the river; then they had the watercourse forming lagoons and swamps on the low lands and travelling stock routes towards the river. That is why they rushed the river country and black soil.
4586. If the "red" line is made all the water would have to be made, and the land is thrown open, will they not have to make permanent water? By sinking. They cannot get much on the travelling stock route in many places. They tried at Boggy Creek at a depth of several hundred feet but did not succeed.
4587. There is a good tank at Boggy Creek? Yes.
4588. But on the "red" route they would have to make permanent water either by wells or by tanks? Yes. They get water fairly easily by sinking. All the farmers along there have permanent wells.
4589. They would have to clear the land for agriculture? Undoubtedly.
4590. What areas would they have to take up to make a decent living on? I know a farmer named Meppem who has about 800 acres; but he uses a large portion of his holding for pastoral purposes. He competed for the prize which was offered by the Agricultural Department for the best farm. Mr. Croker, who was sent up to examine his farm, told him that it was some of the finest land he had seen in Australia.
4591. He would be a poor judge if he did not say that of any land about here? I do not know about that. He told me that he had been twenty-two years in the Cootramundra district, and that this land was some of the finest land he had seen in Australia.
4592. Did the farmer get the prize? Mr. Croker spoke very highly of the farm, but the orchard was not in sufficiently good condition to beat the others in the competition.
4593. How far is the farm from the "red" line? Fifteen miles from here, on Killarney run.
4594. How is it that others do not take up all the good land which is there? There has not been a good market for produce, I think, of late. It has paid people to go on pastoral lines; in that way they can make a living much more easily.
4595. No matter by which way the line may go it will do Narrabri no good as a town? No.
4596. Where is the market to come from? When the leases are thrown open there will be a large amount of settlement.
4597. Do you know anything about the Pilliga scrub? I have seen parts of it.
4598. Would it be good if cleared for agriculture? No.
4599. Would you be surprised to see corn 8 or 10 feet high growing there? Yes.
4600. *Chairman.*] You recognise that the people of Moree and beyond that town are entitled to railway communication? No.
4601. Why? Because I do not think it would pay to take the railway there. I do not think there is a sufficient volume of trade in the whole district.
4602. If the officers of the department who have inquired into the trade which comes along the road from Moree have estimated that there will be an annual loss of £900 on the line, do you not think they would be the best judges of its paying qualities? I daresay they would, but I give you my opinion all the same.
4603. Do you think the town of Narrabri would be very much injured if the railway were extended from Narrabri West to Gurleigh Point? I do.
4604. That was your reason, I presume, for saying that it should not go beyond Narrabri? No.
4605. From which quarter does the larger proportion of the traffic to the railway come—from the north or the west of Narrabri? The north.
4606. Would it be, say, two-thirds from the north and one-third from the west? I think that would be a fair estimate.
4607. What do you mean by the north? Moree, Millie, and intermediate places.
4608. Do you include anything on the northern side of the river in the western trade, or do you call all from the north side of the Namoi the northern trade? No. I would strike a line at Millie and Moree.
4609. Millie as being the most southern point of the northern area you have referred to? Yes.
4610. Is it not a fact that a very large amount of produce, especially wool, comes from the direction of Collarendabri, *via* Gundemaine and Ironbarks? A good lot comes from that way.
4611. Do you think you have given full credit for all that comes? I think so. I think fully two-thirds come by Millie and from Moree direct.
4612. Do you know whether any produce comes *via* Millie to Narrabri? Some come by Millie—some by Bulleroi and Boolcarrol.
4613. Of the Collarendabri traffic, how much comes from Millie, and how much by Buleroi and Boolcarrol? I could not say.
4614. Does more come by the southern road than by the northern road? I think a great deal more comes by Millie.
4615. If the people in that district beyond Boolcarrol and out there assert that the greatest volume of the trade from the west comes *via* Boolcarrol and Wee Waa rather than by Millie, do not you think they are likely to be correct? They may have better means of ascertaining exactly than I have, but I doubt it very much.
4616. Do you move about the country very much? I used to move about a good deal. I have been over very nearly all the district at different times.
4617. How long is it since you were out towards Collarendabri? Two or three years, probably more.
4618. There may have been a very large development since then? I think I would know of it without going out.
4619. As regards the proposed crossing from Narrabri West to Narrabri, is that the best crossing which can be obtained? I think it is.
4620. And the route generally—encircling the town? Yes.
4621. Have you any idea why that practical crossing was not discovered earlier? No. I heard some wonder expressed by the Engineer-in-Chief, too, on that matter.
4622. Are you aware that that has been the difficulty about crossing this river for several years? That may have been one difficulty, but I do not think it was all.
4623. Is there anything else we have not touched upon? I do not think so.

Mr.

Mr. Edward Hart Wall, grazier, Narrabri, sworn, and examined:—

Mr.
E. H. Wall.
29 Nov., 1893.

4624. *Chairman.*] What is your occupation? I am a grazier. I live in Narrabri, but am interested in some country outside town as a grazier. I have lived in the district off and on since 1858, and I have been living in Narrabri and district eighteen or twenty years.
4625. *Mr. McCourt.*] What is your opinion about the extension of this railway? I am of opinion that the Moree people are entitled to a railway, but I am also of opinion that in getting their railway they should not hurt hundreds of families who have laid out the savings of a lifetime in making homes in this place.
4626. How do you mean it would "hurt" them? It would hurt them to elbow the line in the way suggested.
4627. You mean by the Gurleigh Point route? Yes.
4628. You are against that route? Personally, if I wished to do my own pocket good, that is the route for me, as it goes through our ground. I could make a lot of money if it went by that route.
4629. Where is your land situated? Between Gurleigh Point and Millie—not far from Gurleigh Point. I think it goes for 6 or 7 miles through and alongside the properties of myself, my brother, and my son.
4630. What is the size of your holding? Between my brother, my son, and myself we have 13,000 or 14,000 acres.
4631. On what run is your selection situated? On old Gundemaine run.
4632. Do you know how the "red" line is surveyed? I have been along both lines.
4633. You approve of the "red" line? If it is to go to Moree—that is to do justice to the people of Moree, the people towards the Queensland border, the people of Narrabri, and the people along the route where there is a grand lot of country left.
4634. Is it fit for settlement? Yes; it is beautiful country, as nice country as ever I rode over.
4635. Have you any interest to the east of the line? None whatever between Narrabri and Moree.
4636. Have you anything else to say? I think it is much cheaper country to run a line over. It is also a shorter route than the Gurleigh Point route. Some seventeen years ago I built a house on the highest patch I could get out there—the line is surveyed close alongside the house—and the water ran into the house. I had sheep drowned there three or four years ago, and had not a dry patch on the plains for the balance of my sheep to stand on. I had to get my son to lay out £200 odd to make a tank in order to get dry land for the sheep to exist on.
4637. For how many miles would the Gurleigh Point line go through flooded country? For 7 or 8 miles it is all flooded country.
4638. What is the greatest depth you have seen? I could touch the water when riding a fair horse with the stirrup iron. In some places it would be a foot deep and in other places 3 feet deep.
4639. Would not the Gurleigh Point line go through or near more selections than a line by the other route and pay better? There cannot be any more. All the land on that line, except between our place and Bald Hill is secured, all but a patch between the road and my son's.
4640. How many acres would there be in that patch? There may be 10,000 acres.
4641. All the land along the line, except that area, is taken up? It is all secured that I know of right on to Boggy Creek from Gurleigh Point—even the reserves which were thrown open were taken up the very day they were thrown open.
4642. You do not think it would pay the best? I do not say anything about the paying capacity of the line, because one line may pay equally with the other line, but I know it would not pay the country as well.
4643. It would be a more expensive line to construct? Yes; as well as a much longer line to work.
4644. If, as you say, the people of Moree are entitled to a railway, do you not think the people of Wee Waa and beyond there are equally entitled to railway communication? I daresay they are entitled to a railway too.
4645. And, if they are, would it not be better to take a line even further west than Gurleigh Point in order to suit them? I do not think so. I do not think that some thousands of persons who live at the end of this straight line should be handicapped with 20 or 30 miles of railway travelling. I do not think the line would ever pay the country or be profitable to the people at the other end and right away to the Queensland border. I think the Queensland traffic would be lost.
4646. How do you propose that they should be served with a railway if you would not elbow the line out in that direction? I should say they are entitled to a railway, but that the line should not be bent so much out of its course to suit them, as in any case the railway would not be very distant from them.
4647. Do you think they are entitled to railway communication? I would not pass an opinion as to whether any man is entitled to railway communication; but I know that if I lived there, I should like to have a railway to my door.
4648. You have stated that Moree is entitled to railway communication because it is a grand district, and that further out, on the other side of Moree, it is as good soil as you have ever ridden over. Is not Wee Waa district equally as good as Moree district, and therefore entitled to railway communication? I think it is as good on one side of the river, but as a whole it is not so good as Moree.
4649. Is the north side as good? It is, but on the south side it is very bad—very barren.
4650. You think they are entitled to railway communication? I say Moree is, but I am not passing an opinion as to whether Wee Waa is or not. If I lived there I should like to get a railway to the place.
4651. Do you know that district well? Yes.
4652. Do you know that there are a large number of farmers out there? Yes; selectors rather.
4653. Do you not think they would be entitled to railway communication? I suppose they would.
4654. If that is so, should the railway be extended from Narrabri West to Gurleigh Point? No. It would run through valueless land on one side,—land that would not feed a wallaby; but on the other side, the land is very good, as good as there is in the Colony.
4655. Is it not a fact that a large amount of produce, wool and stock, comes through Wee Waa from Collarendabri and the country around into Narrabri? A good deal comes in here from Collarendabri.
4656. But not as much as comes through Wee Waa? I do not think any of it comes through Wee Waa. It must be very lately that they have taken to coming through Wee Waa.
4657. You are not aware that wool comes in from Collarendabri *via* Wee Waa? No. I have known them to come in by Boolcarrol and Millic. They may have come in by Wee Waa, but I am not aware that they have.
4658. If a railway were constructed to Wee Waa, and the district beyond, would not Narrabri lose a lot of trade and traffic? Yes.

Mr.
E. H. Wall.
29 Nov., 1893.

4659. And this is the reason why some of the Narrabri people are opposed to the railway going by that way? Yes.
4660. *Mr. Dawson.*] Do you know where Boolcarrol is? Yes.
4661. What sort of country is it there? Very good.
4662. How many bales of wool do they shear? I do not know how many bales, but I know they shear about 130,000 sheep.
4663. Where does that wool go? It comes in here.
4664. Supposing the "red" line were constructed, would you get any Boolcarrol wool? We would get wool by Boolcarrol as usual.
4665. If it came here? Yes.
4666. All the wool about Wee Waa would still come into Narrabri West, and the Mungyer wool as well? That may be nearer to Edgeroi. I would not say anything about the wool. Probably it would come.
4667. The road from Coolarendabri goes through Boolcarrol, does it not? One road does. The main road from Collarendabri is round by Millie, but of late years they come in by Boolcarrol.
4668. The trade from that quarter would go direct to Narrabri? Yes.
4669. The passenger traffic from Wee Waa, and to the west of Millie, would come in here, so that it would be a very good thing for Narrabri? It would.
4670. Is the country to the east of the "red" line as good as Boolcarrol? Yes. There are no better properties in the world than Gurley and Edgeroi. The sheep on Gurley, I think, number 150,000. This line does not run under the mountains. There is a grand country between the line and the mountains.
4671. How is it that no one has taken up the land? Because it is locked up.
4672. When the runs of the Colony were divided under the Act of 1884, I suppose those runs were not favoured? The land out here was all taken up then. The people settled on places where they thought they would get water easiest. Between the mountains and the red line you can get water out with a billycan out of a well at Myall Hollow. I do not think that I ever saw a better well. The "red" line is within a mile of that very well.
4673. But that will only do for one family? There is plenty of water to be got all along the line. From Boggy Creek to the proposed station is a fair day's journey for a bullock team, and there are travelling-stock routes provided from Millie to either place, and they only want to be opened up by the Government. My experience, since I was a boy, has been that ten times as many cattle travel along the main road as travel along all the other roads.
4674. And sheep? Yes.
4675. *Chairman.*] The man in charge of the water-tank at Galathera or Boggy Creek would not know whether the sheep or cattle that were watering at his tank had come down the main travelling-stock reserve at Millie or whether they had come right through from Moree? No.
4676. Are you quite sure that ten times more cattle and sheep come from the north of Moree than from any other place to the west of the main travelling-stock reserve between Narrabri and Moree? I do not think that from the north of Moree. They travel that road. Some of them come on at Millie.
4677. Would there be ten times as many cattle for shipment by the railway from the north of Moree as from the west? I would not say that.
4678. Would it be 75 or 80 per cent.? I think fully 100 per cent. or even more.*
4679. Do you know the country to the north of Moree? Yes.
4680. Say along the Queensland border—Goondiwindi, Kunopia, Mungindi, Collarendabri? I know Kunopia and Goondiwindi. I was never in the town of Mungindi, but I have been very close to the place. I know from Collarendabri out to Goodooga very well.
4681. Supposing the "red" line were constructed, would the Mungindi traffic go to Moree, or would it go *via* Millie to Narrabri? I could not say. I think the distance from here to Sydney is a bit too far for the stock to travel. I think that if I lived at Moree or Mungindi I would travel stock and truck them at Narrabri.
4682. As a matter of fact do not people who are going to use the railway to get their live stock or wool to the metropolis, strike the nearest station? As a rule they do.
4683. Therefore, if the railway terminus is shifted 70 miles north, is it not reasonable to suppose that those persons will strike the line at Moree? Yes; but I have known people to pass by and truck stock at Breeza.
4684. That is exceptional? I have known it to be done.
4685. Under a certain set of circumstances, people may pass by Moree with their live stock, and go on to Narrabri, or even to Breeza, or Boggabri? They may.
4686. *Mr. Dawson.*] Do you know the biggest cattle station on the "red" line? There is no cattle station on the proposed line.
4687. Can you say whether any stock from Tyrell on the other side of Moree would be trucked at Moree? I cannot say.
4688. Do you not know that their fat cattle, to the number of thousands a year, are driven straight down to Homebush by road? Mostly.
4689. You have had a good deal of experience amongst stock? All my life.
4690. Supposing you had to send bullocks off a run, would you send them 300 or 400 miles by a stock train, or in a good season would you travel them? I think it all depends on the seasons, men and markets. I lost once by travelling down the road.
4691. *Chairman.*] Is there any other point you would like to mention? I do not care by which road you send the railway. I have certain stock here and certain stock down the other way, but none at all on that line. I was one of a party that tried to save a lot of sheep which were drowned at Gurleigh Point. I had 4,000 fat wethers, and 400 of them got drowned on the same route. That route is considerably longer and would be a handicap on the people at the other end. It would be ruination to some hundreds of families with comfortable little homes in this town who have not the means to go away and make homes elsewhere.
4692. You think the trade of Moree is such that it justifies extension of the railway to that town, but that the importance of the town of Narrabri does not warrant the line being taken along the southern side of the river from West Narrabri *via* Gurleigh Point to Moree, and that it should go round by the town of Narrabri and proceed as directly as possible to Moree? Yes.

Mr.

* NOTE (on revision):—When I said 100 per cent. or more, I only intended, as it were, to lay stress on my answer in answer 4673, *viz.*, that ten times as many cattle and sheep travel along the main road as along all the other routes put together.

Mr. George M'Farlane, grazier and selector, sworn, and examined:—

- Mr. G. M'Farlane,
29 Nov., 1893.
4693. *Chairman.*] What is your occupation? I am a grazier and selector on Millie Run, about 32 miles west of Wee Waa.
4694. *Mr. Ewing.*] How far from Walgett? About 60 miles.
4695. Do you graze sheep? Sheep and a few head of cattle.
4696. Your particular produce is what? Wool and fat stock. It goes to Narrabri.
4697. Does it ever go to Walgett? No.
4698. Although you are within 60 miles of Walgett? It is 52 miles from my place to Narrabri West. I am nearer to Narrabri than Walgett.
4699. You are pretty well half-way between the two towns, but it suits you better to send this way? Yes.
4700. By which way do you send your produce? By team through Wee Waa to Narrabri.
4701. Do you know anything of the direct route? No.
4702. Do you know anything of the country it traverses? Very little. I have been through Millie several times.
4703. Your experience of the district is limited to the West of Narrabri? Yes.
4704. By which way ought the railway to go? It does not matter to me by which way it goes. I do not know which way would be most beneficial to the country. I came here to give evidence about the floods down in Wee Waa.
4705. Are the floods very heavy at Gurleigh Point? Yes.
4706. On the south side of the Namoi will the land be within flood reach? Not exactly.
4707. Do you know the surveyed line? No. I have seen portions of it in travelling stock.
4708. You can only speak in general terms of the height of various localities? Yes.
4709. On the south side of the river, is it possible to go down as far as Gurleigh Point without getting heavily flooded? I do not know that that is very heavily flooded. There is more high ground on the south side than on the north side.
4710. It may be passable on the south side? Yes. I have seen it in very high flood when a person could get to Wee Waa keeping the high ground out in the scrub round to Bohanna Creek.
4711. How far the south of the Namoi must they go to make that circuitous journey? Eight miles in some places.
4712. Taking the country on the north side of the Namoi, is it heavily flooded on the northern bank? Yes; opposite Gurleigh Point and lower down.
4713. How high would the floods be? From 4 feet to about a foot for about 8 miles on the northern bank.
4714. Would the same thing apply right down to Wee Waa? No.
4715. It would not be so bad as you get further down? The further down you go, the water spreads out.
4716. Do you know the river intimately between here and Wee Waa? Yes.
4717. Is there any place at which the railway could cross between Wee Waa and Gurleigh Point without the ground being seriously inundated? No; I do not think there is.
4718. Would you swear that there is not? I believe I am on oath now.
4719. You qualified your reply? Yes.
4720. You do not believe there is any place? I do not.
4721. Suppose that other people state that there is, what then? They may say what they like, I am still of the same opinion.
4722. To the best of your belief, there is no place where the Namoi could be crossed without passing over flooded country for a considerable distance from either bank? No; I lived on Wee Waa for about fourteen years. I came on to Merah, on the Namoi, in 1841, and I have never been twelve months off the Namoi since. I have had a little experience of the floods, I know every inch of the ground. I have been driving cattle and I have been in nearly all the floods which have ever been on the Namoi.
4723. Taking, for instance, the country 3 miles away from the bank of the Namoi, would that be pretty still water or would there be a current? It would be running, but nothing to do any serious damage. I have seen the fences there from Henry Hall's, out along Heelibah for 1½ miles pulled down with the flood-waters in August, 1878.
4724. You have seen the fences swept away? It was a wire fence with a top-rail. It was all pulled out of the ground for 1½ miles.
4725. *Chairman.*] Where is Heelibah? It is between Tulladoona and Boolcarrol.
4726. You say there is sufficient run at times in the water to bear down the fences? Yes.
4727. *Mr. Ewing.*] Do you know the Thalaba? Yes.
4728. Across from the Namoi to the Thalaba? Yes.
4729. Between the Namoi and the Thalaba, is there a large area of country under flood-water? There is not a great deal, it was nearly all flooded in the big flood from Thalaba to Wee Waa.
4730. Would the Thalaba and Namoi waters meet in a big flood? Yes.
4731. You are sure? I know the water comes down from Boggy Creek to the Namoi water. You may come across little patches of rosewood scrub and hard ground between those waters, but you would not go half a mile before you would be in the water again. It is pretty nearly all under water in the big flood.
4732. In a big flood, you believe the Thalaba and Namoi waters will meet? Yes; in 1874, I was on the top of the Merrywiee Bond Stockyard for five days. We pulled some doors out of the old house and put them on the yard to camp on.
4733. Where is that place? On the Thalaba.
4734. Is that the highest land between the Thalaba and the Namoi? It is as about as high as most of it.
4735. Do you know the waters to meet? Yes. The waters all went across there—right out by Boolcarrol and away out by Bridgelow Tree down to meet the Thalaba water.
4736. Is there any difference in the levels between the Thalaba Flats and the Namoi Flats, and the watershed between the two? I do not think there is much difference. I think it is nearly all level.
4737. Do you know further north to Mehi? Yes.
4738. Is that level too? Yes.
4739. Will that all be flooded? They would get a few patches of ground.
4740. Right on to the Gwydir is it the same? It is all the same.
4741. You believe that it is pretty well flat from the Gwydir to the Namoi, and that in a big flood it is all under water? Yes.

4742. Will the flood come out to Millie township? No.

4743. When you were on the stockyard at Thalaba was it running there or was it pretty still dead water? ^{Mr. G. M'Farlane.} Not much current. There was a little but not enough to do any harm. No fences were washed away by the flood waters. _{29 Nov., 1893.}

4744. There was less current there than on the Namoi Flat? Yes.

4745. You think that somewhere between the Thalaba and the Namoi the water would be pretty still? Yes.

4746. And it would not wash anything away? No.

4747. *Mr. Davies.*] You are a resident of Wee Waa;—why did you not give evidence at Wee Waa? I had some stock coming up and I could not attend at the court-house to day. I called in yesterday as I came through, and waited some time, but as I could see no chance of being able to give any evidence I came on.

4748. That is the only reason you had for not being examined at Wee Waa? *Mr. Dobbie* and *Mr. Maiden* asked me to attend, and I said if I were not delayed too long I would.

4749. Do you favour the "red" route? The shortest and most direct. I do not feel anxious about the matter. I am disinterested as to which way it goes. I know all that country is flooded.

4750. You have no interest in the construction of the railway either one way or the other? I have no land in Narrabri or Wee Waa. If it goes by Wee Waa I shall get more benefit than I should if it goes by Narrabri. It would be nearer 24 or 25 miles to me.

4751. *Mr. O'Sullivan.*] If that country has been so subject to floods, how is it that they have been able to make such a success of grazing pursuits in that district? The floods never do much harm, wherever we can get some little patches of earth for the stock to go on. There is no great heavy current of water below Wee Waa.

4752. Have you elevated country enough to save all your flocks? Yes; I have got land enough to keep them alive.

4753. Then it may be that you have elevated country enough out there to carry a railway? You could not keep on this high ground all the way without going through water.

4754. Is it a fact that there is a sandy ridge running nearly all the way from Narrabri West to Wee Waa, and that the ridge is much higher than the surrounding country? Yes.

4755. Would it be possible to run a railway along these and place it above the reach of the flood waters? I think so. With the exception of 2 or 3 miles through the swamps.

4756. In 1841 was the town of Wee Waa in existence? No; I do not think it was started before 1849 or 1850.

4757. Why did the town remain stationary so long considering it was the first town on the Namoi? I cannot say.

4758. Was there not very much settlement in those days? No.

4759. When did the settlement begin to take place? About 1872 or 1874.

4760. Since that time the town has progressed? Yes.

4761. Is it a prosperous place now? It is a fairly prosperous place.

4762. Is the district well settled around there? Yes.

4763. And the graziers, large and small, appear to be prospering? Yes.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway from Narrabri to Moree.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAY FROM NARRABRI TO MOREE.

(PETITION FROM CERTAIN GRAZIERS, MERCHANTS, HOTEL-KEEPERS, AND RESIDENTS OF THE DISTRICT OF THE NARRAN RIVER, IN FAVOUR OF A TRIAL SURVEY FROM NARRABRI RAILWAY STATION TO GURLEY POINT.)

Received by the Legislative Assembly, 30 January, 1894.

To the Honorable the Speaker and Members of the Legislative Assembly, Sydney,—

We the undersigned, graziers, merchants, hotel-keepers, and residents in the districts of Narran River and Southern Border, Queensland, do most humbly petition and pray that before your sanction be given to the direct line of extension of railway from Narrabri to Moree, as approved by only a bare majority of members of the Works Committee, you would graciously be pleased to direct a trial survey to be made from present Narrabri Railway Station to a place on the Namoi River known as Gurley Point, some 4 or 5 miles from Wee Waa to cross Namoi there, and thence run through Boolcarroll to Millie or West Millie, and so on to Moree.

Your Petitioners would respectfully point out that by making the extension to Moree by route as above suggested, you would benefit Wee Waa, Pilliga, and Walgett, and secure traffic that would otherwise go by river; that you would bring railway some 50 miles nearer to Mogil, Collarendabri, Angledool, and Southern Queensland, and secure traffic that otherwise will be diverted to Brisbane; that should line run through Killarney, Edgeroi, Goorillie, and Tycannah, as by direct route submitted to Works Committee, we your Petitioners would not in any way be benefited by such extension; that as heretofore we must send our wool and produce to Narrabri, and drive there to meet train, and much business will be diverted from Sydney to Brisbane.

We beg of you to take these matters into your consideration, and to direct the trial survey we have above submitted to you.

And your Petitioners will ever humbly pray.

[Here follow 49 signatures.]

1894.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAY FROM NARRABRI TO MOREE.

(PETITION FROM CERTAIN RESIDENTS OF COLLARENDABRI AND SURROUNDING DISTRICTS IN FAVOUR OF A TRIAL SURVEY FROM NARRABRI WEST TO THE BARWON.)

Received by the Legislative Assembly, 30 January, 1894.

To the Honorable Members of the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned,—

HUMBLY SHOWETH:—

1. That a line of railway from Narrabri West, as direct as is found practicable, *via* Gurleigh Point, Wee Waa, Boolcarrol, Bulgeroi, on to the Barwon River, at or near Collarendabri, then on to the border of the Colony, at or near Angledool, is urgently required by your Petitioners and others using or occupying the land under the various provisions of the Crown Lands Act.

2. That a large influx of settlers has taken place within the last two or three years in the direction of your Petitioners, which will doubtless continue to increase year by year—as the land is known to be good—and possibilities for water culture exist which can scarcely be over-estimated.

3. That at present there is a large traffic in connection with the 3,000,000 (approximately) of sheep owned by your Petitioners and others; also there is other stock and traffic connected with the several towns and centres of population steadily rising into importance, which a direct line of railway would very largely increase, extending some distance even into the colony of Queensland.

4. That the outlet and inlet for the very large traffic connected with the district or territory of the Narran, Barwon, and part of the Namoi, is often hindered or rendered impossible, sometimes for the want of water and at other times from too much of it, to the great injury of your Petitioners and the loss of revenue to the State, which would be largely prevented by constructing the direct line of railway from Narrabri West in the direction stated.

5. That there is no material available at reasonable cost for making ordinary roads on the route mentioned, yet some provision must be made for all the traffic. Therefore your Petitioners submit that a line of railway will be by far the best and cheapest to ensure communication for this great territory with the world at large.

6. That a proposal has been submitted to the Committee for Public Works for a direct line of railway from Narrabri to Moree, regardless of the interests of your Petitioners and others living west of that proposed line, which your Petitioners submit should not be sanctioned, seeing that said line, if constructed, will serve very few persons west of it; and as there is but little "feeding ground" to the east thereof it must necessarily be made at a loss to the Colony.

7. That a line starting from Narrabri West terminus, going *via* about Gurleigh Point and as far west as is found practicable, on to the Barwon, &c., branching off to Moree where most favourable, would, by providing for two extensions, save large expenditure in construction (probably forty or fifty miles at per mile schedule), be the best for your Petitioners, and for the Colony.

Your Petitioners therefore humbly pray, for the above reasons and for others which might be advanced, that an immediate survey of direct line from Narrabri West, *via* Gurleigh Point, on to the Barwon, at or near Collarendabri, and to the border, at or near Angledool, be ordered; and that your Honourable House will insist that the same be made before anything is decided on regarding railway extension from Narrabri to Moree.

And your Petitioners, as in duty bound, will ever pray.

[Here follow 100 signatures.]

1894.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY FROM NARRABRI TO MOREE.

(PETITION FROM CERTAIN RESIDENTS OF CENTRAL AND LOWER NAMOI, IN FAVOUR OF A SURVEY ACROSS THE NAMOI, WEST OF GURLEIGH POINT.)

Received by the Legislative Assembly, 7 February, 1894.

To the Honorable the Speaker and Honorable Gentlemen of the Legislative Assembly of New South Wales, in Parliament assembled.

The prayer of your Petitioners,—

HUMBLY SHOWETH:—

1. That your Petitioners, who are residents of Central and Lower Namoi, desire that a survey may be made of a route for the Narrabri-Moree Railway, which will cross the Namoi a few miles west of Gurleigh Point.

2. That a very suitable crossing can be secured at which the banks are above the highest water-mark of any flood since 1840.

3. That the railway, by being constructed on this route, would serve a very large number of settlers on Central and Lower Namoi, Wee Waa, Pilliga, Wangan, Boolcarrol, Merah, Pian Creek, Burren, Bunna Bunna, Merrywhimbone, Drildool, Barwon, Collarendabri, Moonie, Cryon, Gorian, Millie, Bugilbone, Bullerawa, Mogil Mogil, Mehi, Combadello, Thalaba Creek, and the inhabitants of an immense scope of good country, which would not be at all benefited by the proposed extension from Narrabri to Moree if it be taken along the foot of the mountains.

4. That the land through which it would pass is at present occupied by many settlers, while that on the direct route is monopolised by a few large estates that are practically unpopulated.

5. That it would for some distance pass through an extensive ironbark and pine forest, in which great quantities of the sleepers necessary for its construction could be obtained almost on the line.

6. That the direct route is to a large extent inaccessible, owing to absence of roads leading to it, as it passes to a large extent through private lands; whereas our proposed route is crossed by numerous roads and stock routes.

7. That the construction of the line by this route, though slightly longer, would be a better investment than by the direct route, as the returns would be out of all proportion greater.

8. That the cost of construction would be reasonable, as the country is of such a level character that few engineering difficulties are presented.

9. That much less bridging is necessary than on the direct route, as very few creeks or water-courses have to be crossed.

And your Petitioners therefore pray that your Honorable House will be pleased to grant the survey asked for.

And your Petitioners, as in duty bound, will ever pray.

[Here follow 183 signatures.]

1894.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAY FROM NARRABRI TO MOREE.
(PETITION FROM CERTAIN RESIDENTS OF THE TOWN AND DISTRICT OF NARRABRI, IN FAVOUR OF.)

Received by the Legislative Assembly, 21 February, 1894.

To the Honorable the Speaker of the Legislative Assembly of New South Wales, and Members of the Legislative Assembly, in Parliament assembled.

The Petition of the undersigned residents of the town and district of Narrabri,—

HUMBLY SHOWETH:—

1. That we, the undersigned residents of the Narrabri district, are of opinion that the extension of the railway line from Narrabri to Moree should proceed by the direct route or red line as shown upon the map, and for the following reasons:—

- (a) That it is by far the shortest route.
- (b) That it will be much more cheaply constructed on account of its being naturally drained, and the land is of a good, sound character, and ballast is obtainable at a minimum cost throughout.
- (c) That the land through which it is proposed to take this railway is eminently suited for agriculture, and will be largely availed of for settlement when the leases are thrown open.
- (d) That Moree being the centre point of the northern and eastern traffic, it would be unjust to the residents to compel them to pay the higher rate of carriage consequent upon taking a circuitous route.
- (e) That the direct route if carried out would be the means of securing a very large proportion of the Queensland Border traffic.
- (f) That both the alternative routes are subject to flood and storm-water, and would consequently entail a very large expenditure both in construction and maintenance.

Your Petitioners therefore humbly pray that you will be pleased to advise Parliament to sanction the construction of the Narrabri Moree Railway extension, according to the recommendation of the Public Works Committee.

And your Petitioners, as in duty bound, will ever pray.

[Here follow 548 signatures.]

A similar Petition was received,—

On 21st February, 1894, from certain residents of Moree and District; 319 signatures.

1894.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

NARRABRI TO MOREE RAILWAY BILL.

(MESSAGE No. 37.)

Ordered by the Legislative Assembly to be printed, 25 April, 1894.

R. W. DUFF,
Governor.

Message No. 37.

In accordance with the provisions contained in the 54th section of the Constitution Act, the Governor recommends for the consideration of the Legislative Assembly the expediency of making provision to meet the requisite expenses in connection with a Bill to sanction the construction of a line of railway from Narrabri to Moree.

*Government House,
Sydney, 24th April, 1894.*

1894.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

EXTENSION OF LISMORE-TWEED RAILWAY TO
TENTERFIELD.

(PETITION FROM LAURENCE EDWIN COPE, MAYOR, CHAIRMAN OF A PUBLIC MEETING AT CASINO, IN FAVOUR OF.)

Received by the Legislative Assembly. 28 March, 1894.

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned Laurence Edwin Cope, Mayor of the Municipal District of Casino, Chairman of a Public Meeting held in Casino, on 10th March, 1894,—

RESPECTFULLY SHOWETH:—

1. That the extension of the Lismore-Tweed line of railway from Lismore to Tenterfield by the newly-surveyed route, connecting both the Clarence and Richmond River Districts with the tableland, would result in the immediate development of a very considerable trade and in the economical consolidation of the railway system of the Colony, and the construction of such a line is therefore of great national importance.

2. That as the first section of the proposed line, viz., from Lismore to Casino, has been approved of by the Sectional Committee on Public Works at an estimated cost of about £7,000 or £8,000 per mile, the claim of this district to be connected with the railway system is superior to that of any other portion of the Colony, more especially as the construction of this section must necessarily form the first step in any scheme of communication between the tableland and the North Coast districts.

3. That your petitioner considers that the Lismore-Casino section is deserving of earlier attention than other schemes which have not yet been approved of by the Public Works Committee.

Your Petitioner therefore humbly prays that your Honorable House will take the foregoing premises into your early and favourable consideration.

And your Petitioner, as in duty bound, will ever pray.

L. E. COPE.

PARLIAMENTARY STANDING COMMITTEE ON
PUBLIC WORKS.

REPORT

TOGETHER WITH

MINUTES OF EVIDENCE, APPENDICES, AND PLANS,

RELATING TO THE

PROPOSED DEVIATION

TO

AVOID THE LITHGOW ZIGZAG.

Presented to Parliament in accordance with the provisions of the Public Works Act,
51 Vic. No. 37.

SYDNEY: CHARLES POTTER, GOVERNMENT PRINTER.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

DEVIATION TO AVOID THE LITHGOW ZIGZAG.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of carrying out a deviation on the Great Western Line of Railway for the purpose of avoiding the Lithgow Zigzag" have, after due inquiry, resolved that it is not expedient the proposed deviation should be carried out; and, in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

1. According to the evidence before the Committee the idea of doing away with the Zigzag is not a recent one. As far back as 1885 the matter was mentioned in the Legislative Assembly, the suggestion being to make the deviation as now proposed between Dargan's Creek and the Zigzag bottom points. At that time Mr. John Whitton, then Engineer-in-Chief for Railways, disapproved of the proposal on the grounds of the great expense that would have to be incurred and the small improvement that would be effected. This led to the matter remaining in abeyance for some years, and it was not until 1892 that the subject again came into prominent notice. In that year it was reported to the Minister for Works by the Engineer-in-Chief for Railway Construction, Mr. H. Deane, that the Railway Commissioners were desirous of having the necessary deviation made if it could be done at a reasonable cost, and after some delay three schemes were suggested by Mr. Deane from reports submitted to him by his officers, and referred by him to the Railway Commissioners. In November, 1893, the Commissioners brought the matter under the notice of the Minister for Railways in a communication in which they mentioned the disadvantage to traffic and risk to passengers passing up and down the Lithgow Zigzag, and the beneficial effects which had followed the cutting out of the Lapstone Zigzag. The circumstances, they were of opinion, justified them in asking the Government to consider the expediency of providing the money necessary for doing away with the Lithgow Zigzag, and they proposed the scheme which subsequently was submitted to the Committee, and will be found referred to in this Report as No. 1 Scheme. The work, they stated, would in all ways be advantageous, and would more than return interest on the capital expended. A conversation which the Premier, Sir George Dibbs, had with the Chief Commissioner on the question of providing work for the unemployed, prior to the date of the communication addressed to the Minister for Railways, gave additional importance to the proposed deviation as one that might lead to the employment of a large number of men in ordinary pick and shovel labour. The Premier expressed a wish that the work should be put in progress with the least possible delay, and steps were then taken by the Commissioners to have the plans

plans of their scheme completed. Shortly afterwards the question was raised as to whether the work should be carried out by the Commissioners or by the Government through the Department of Public Works. If carried out by the Government a reference to the Public Works Committee was indispensable. The Attorney-General, to whom the matter was referred, advised that under the provisions of the Railways Act it was within the power of the Commissioners to make the deviation without inquiry by this Committee; but the Minister for Works, being of opinion that it was not contemplated by the Legislature, when passing the Railways and Public Works Acts; that any public work estimated to cost more than £20,000 should be constructed without first being investigated by the Public Works Committee, submitted the question to the Cabinet, and the Cabinet decided that the proposal should be referred by the Legislative Assembly to the Committee. This, and the subsequent reference by the Legislative Assembly, removed both the construction and the designing of the work from the Railway Commissioners. A letter, stating the decision of the Cabinet, was addressed to the Railway Commissioners on 8th January, 1894, and the plans and sections of their scheme were handed over by them to the Department of Public Works. As explained to the Committee by the Under-Secretary for Public Works, the Minister considers that, although the carrying out of such works as this deviation "might be technically in accord with the provisions of the Railways Act, yet it is entirely opposed to the spirit of legislation as embodied in the Public Works Act, which lays it down very clearly that no public work estimated to cost more than the sum of £20,000 shall be undertaken except after being reported on by this Committee, and subsequently sanctioned by Parliament." The proposed work was referred to the Committee on 25th January, 1894, and measures which had been taken by the Department of Public Works immediately the Cabinet decision was known, to have the country in the vicinity of the Zigzag explored for the purpose of finding the best route for the deviation, were pushed on rapidly.

Different schemes before the Committee.

2. As many as six schemes for deviating from the Western main line to avoid the Zigzag have, in the course of their inquiry, been put before the Committee. Two have been submitted by the Railway Construction Branch of the Department of Public Works, two by the Railway Commissioners, and two by private persons, one of these being put forward primarily in the interests of Hartley Vale. For convenient reference the schemes submitted by the Railway Construction Branch and the Railway Commissioners are numbered in the order in which they were prepared, from 1 to 4; the two others are respectively known as Mr. J. W. Rock's proposal, and a proposal by Mr. E. M. Munford. In addition to these, two lines, known respectively as the Colo Valley line and the Blacktown to Blayney line, were explained to the Committee, but as they are more of the nature of new and distinct railways than of mere deviations they do not in any material respect affect the real subject for consideration.

No. 1 scheme.

3. No. 1 scheme is that proposed by the Railway Commissioners in the first instance, and fully matured before the duty of preparing a definite scheme for the consideration of the Committee was, by the resolution of Parliament referring the proposed deviation to the Committee, transferred from the Commissioners to the Minister for Works. By this scheme the deviation would leave the existing line at a point near Dargan's Creek, about 86 miles 48 chains from Sydney, and proceed by a route north of the present line, through cutting and tunnel, to the bottom points of the Zigzag. The tunnel is the principal feature of the scheme. It would be 1 mile 52 chains long, the total length of the deviation being 2 miles 53 chains. Ventilation would be secured by making the tunnel large enough for a double line, and it would be assisted to some extent by two vertical shafts. The grade of the line through the tunnel would be a continuously ascending one of about 1 in 50 from the bottom points to Dargan's Creek. On the portion of the existing line proposed to be done away with, 5 miles 36 chains in length, the grades vary from 1 in 33 to 1 in 42, the ruling grade westerly towards Bathurst being 1 in 33, and the ruling grade towards Sydney 1 in 42. The first-mentioned grade, which extends from Dargan's Creek to Clarence Siding, a distance of 1 mile 32 chains, is a great obstruction to the traffic from Sydney to the west. By carrying out the tunnel scheme this 1 in 33 grade as well as a portion of the 1 in 42 would be got rid of, and the western-going traffic correspondingly benefited; while, in addition to this, the risk of

of accident from the necessity to descend and ascend the Zigzag would be permanently removed. The estimated cost of the work in accordance with this scheme was, in the first instance, £225,000, subsequently reduced to £213,000, which includes two lines of permanent way with 80-lb. rails.

4. No. 2 scheme is one prepared by the Railway Construction Branch, but afterwards withdrawn. It is coloured red on the plan, and is known as the "spiral" route. Its chief point is the idea of having three comparatively short tunnels instead of one long one. These three tunnels would be, respectively, 474 yards, 257 yards, and 977 yards. Through the two shorter tunnels the grade would be 1 in 50, and through the longest 1 in 77; or, without much additional expense, the grade in each could be made 1 in 60. The 1 in 33 grade ascending to the Clarence Tunnel would not be done away with by adopting the "spiral" route, but by a method shown on the plan this grade could, in connection with this scheme, be cut out, and at not much extra expense. The estimated cost of this No. 2 proposal is £108,000, exclusive of permanent way and of the cutting out of the 1 in 33 grade, and £127,000, including the excision of this grade. No. 2 scheme.

5. No. 3 scheme is the second of the two schemes prepared by the Railway Construction Branch, and that which the Department definitely proposed should be carried out. It is coloured green on the plan, and is referred to in the evidence as the "green" route. In length it is 4 miles 60 chains, the ruling grade being 1 in 60, and it shows during its course seven tunnels of a total length of about 1 mile, the longest being 768 yards. The estimated cost, exclusive of permanent way, is £165,000, and inclusive of permanent way, £186,318, subsequently reduced to £181,072. For an additional £45,000 it is estimated that the grade could be made 1 in 90. The distinguishing differences between this scheme and No. 1, or the long-tunnel scheme of the Commissioners, are the shorter tunnels and the more favourable grade. In total length it is rather more than 2 miles longer than the Commissioners' scheme. No. 3 scheme.

6. No. 4 scheme, the Engineer-in-Chief for Existing Lines states, would branch off from the present line on the northern side at 85 miles from Sydney, near Bell, and following the ridge to a point near the trigonometrical station would pass through the ridge by means of tunnels to the head of Farmer's Creek, down the valley of which it would proceed to the 94-mile peg, near the Eskbank coal-siding. The total length of this deviation would be 8 miles, and it would dispense with 9 miles 10 chains of the existing line. The grade would be 1 in 60, and the curves 15 chains. The tunnels would number two—one of 1,600 and the other of 682 yards. The estimated cost, providing for a double line, was given as approximately £250,000. The Engineer-in-Chief further states that this scheme would cut out the whole of the 1 in 42 grade in connection with the Zigzag, the 1 in 33 east of Clarence siding, and the 1 in 50 on the Bell bank. No. 4 scheme.

7. Mr. J. W. Rock's scheme, the outcome of an effort on the part of the residents of Hartley Vale to secure a line advantageous to that district, would cause the deviation to leave the existing line at Mount Victoria, and proceed via Hartley Vale to Eskbank, the length being 14 miles and 26 chains, and the grade 1 in 50. Two tunnels would be necessary, of a total length of 1 mile 40 chains. Mr. Rock's estimate for carrying out this scheme, with a double line, is £345,000, and for a single line £230,000. An amendment of this scheme, suggested by Mr. Rock, by which the deviation would be taken as far as Bowenfels instead of Eskbank, represented a line 17 miles long, with a grade of 1 in 50 for about half the distance, and 1 in 75 for the remainder. There would be one tunnel of 30 chains, and the total cost, as estimated by Mr. Rock, was given as £255,000. Mr. J. W. Rock's scheme.

8. Mr. E. M. Munford's proposal is to deviate from the main line at the coal-stage, Eskbank, and join it again at the Clarence Tunnel, and then, after keeping to the existing line for a short distance, leaving it by a straight route which would cut out the portion of the present line as far as the 86-mile post, beyond Dargan's Creek. He proposes as many as three routes from Eskbank to the Clarence Tunnel, but the details of the schemes are incomplete, and the proposal generally merits little attention. Mr. E. M. Munford's proposal.

9. In their inquiry respecting this proposed work the Committee have endeavoured to elicit the fullest information. It was necessary first to learn the reasons why it was proposed the deviation should be made, then to become acquainted with the details of the schemes suggested for effecting the object desired The Committee's inquiry.
and

and after that to carefully consider the advantages expected to be gained, and whether, admitting the importance of these advantages, the proposed work was of a character sufficiently urgent to justify the expenditure. The witnesses examined included all from whom evidence of value was obtainable, either by their being summoned before the Committee or invited to come forward by publicity given to the inquiry in the newspapers. The Under Secretary for Public Works, the Secretary to the Railway Commissioners, and the Engineer-in-Chief for Railway Construction were the first witnesses in the inquiry. Their evidence was necessary to have the proposed work before the Committee in the manner requisite to enable them to proceed with the investigation expeditiously and in order. These three official witnesses having been heard, the Committee, accompanied by a surveyor from the Railway Construction Branch of the Department of Public Works, made a visit of inspection to the Zigzag and the localities of the several routes submitted for the proposed deviation. The inspection was commenced at Mount Victoria on 9th March. At 85½ miles from Sydney an examination was made of the locality where the Railway Commissioners, through their officers, were carrying out their northerly survey, near what is known as Bell's line of road. Thence the Committee proceeded to Dargan's Creek, where they inspected the starting-point of Nos. 1, 2, and 3 schemes; and from Dargan's Creek to Clarence Siding. There the train by which they were travelling was left, and they walked in a southerly direction for about three-quarters of a mile to a spot from which they obtained an extensive view of the upper portion of the present Zigzag, and of that portion of No. 3 route which embraces the tunnel-work. Returning to the train at the Clarence Siding, they continued their journey for about 2 miles, a stop being then made for the purpose of again viewing the course of the No. 3 route. The top points of the Zigzag were next visited. There the precipitous character of the cliffs was examined, and a good view was obtained of the course of the spiral-tunnel scheme, and also of Farmer's Creek and Valley, where the Commissioners proposed to join the main line with their northerly survey. The Committee then descended to the bottom points, and proceeding up the valley, inspected the outlet of Nos. 1, 2, and 3 schemes. An inspection was also made of the principal points in the route surveyed by Mr. J. W. Rock in the interests of the residents of Hartley Vale. At Lithgow some local evidence was taken, and the Committee then proceeded to Hartley Vale, where the residents of that locality were afforded an opportunity to explain their scheme, and to become acquainted with the other proposals. Returning to Sydney, the Committee took further evidence. The Secretary to the Railway Commissioners, the Out-door Superintendent of the Railway Department, the Chief Mechanical Engineer, and the Engineer-in-Chief for Existing Lines were now examined and re-examined on all points of importance to the subject of inquiry, and particularly in regard to the actual results anticipated from doing away with the Zigzag. The Government Geologist gave evidence as to the mineral deposits in the district. The Engineer-in-Chief for Railway Construction was recalled for further examination, rendered necessary by the Committee's visit of inspection and the evidence taken during and after that visit; and Mr. John Whitton, late Engineer-in-Chief for Railways, was called as a witness, whose examination appeared to the Committee essential to making the inquiry complete. Two other witnesses, who appeared before the Committee, described the Blacktown to Blayney route and the route through the Colo Valley.

Reasons in support of the deviation.

10. The reasons advanced by the Railway Commissioners to justify the proposed work, shortly stated, are the difficulty and expense of working the traffic down and up the Zigzag, and the risk that is present to both passenger and goods trains. The obstacles to the expeditious and economical management of the traffic cannot be removed it is alleged without doing away with the Zigzag; the risk to trains may be reduced very largely by close attention to the permanent way and to the safe running of the trains over it. The cost of wear and tear from a locomotive point of view—that is, to engines, carriages, and waggons—is considered to be as high as 50 per cent. above other portions of the Western line. This is due principally to severe grades which render necessary the use of a second or push-up engine, and to passing over the Zigzag with short trains and at slow rates of speed; but though this is represented in the evidence, it is also shown that an accurate estimate of the cost of traction over the Zigzag portion of the line cannot be given, for an account

account of it is not kept. Generally stated, there is increased wear and tear of locomotives, increased consumption of fuel, and an increase in men's wages because of the extended time occupied in the running of the trains. Push-up engines are used from Eskbank to the top of the incline at Clarence. The risk attendant upon the working of the traffic over the Zigzag is due to the shortness of what are called the wings or lengths of the runs forwards and backwards, and to the liability of portions of trains—chiefly goods trains, which have to be divided—to break away. At night it is very difficult, it is said, to stop a train in the exact place necessary, and the curves, combined with steep grades, add to the uncertainty of a safe working of the traffic. To some extent the locality has been a constant source of anxiety, and, as put by the Chief Mechanical Engineer, the very nature of the place is such as to impart to an accident occurring there a very considerable character, which is not felt when dealing with comparatively level country. But while this may be so, steep grades and traffic difficulties necessitating the use of push-up engines exist on other portions of the Western line, and the doing away with the Zigzag would not make the line over the mountains, as a whole, much the easier or the safer to work. Push-up engines are as indispensable between Emu Plains and Katoomba as between Eskbank and Clarence, and the additional cost, in consequence, is much the same on both these portions of the line as it is in most places where push-up engines are used. A reason which, perhaps, more strongly supports the proposal to have the deviation made is the pecuniary saving that, it is said, would be effected by it. This saving, as stated to the Committee, is £18,000 per annum. At an early stage of the inquiry the amount was given as £10,000, but further consideration led the Commissioners to alter it to £18,000, the additional sum being the result of a determination to estimate the advantages from the deviation as from Penrith to Lithgow instead of from Clarence to Lithgow. This £18,000, after paying the interest on both the cost of the present line and of the proposed deviation, would leave a net profit of about £3,000, the whole of the saving being in working expenses.

11. If it were considered necessary that the Zigzag should be done away with by the carrying out of a deviation as proposed it would not be difficult to decide which of the several schemes put before the Committee is the most suitable. The value of the No. 1 or long tunnel scheme submitted by the Commissioners is materially affected by the efforts made by them to find and put before the Committee another, being No. 4, scheme. It suffers also in comparison with this other scheme, or with No. 3 scheme. This second scheme was not before the Committee in a complete condition, time and unfavourable weather preventing the surveys from being proceeded with in the ordinary way; but from the statements made by the Engineer for Existing Lines there is much to recommend it, if at some future time the Zigzag should be excised, and further investigation respecting this route justify the opinions entertained regarding it. This second route appears to have been to the Railway Commissioners an afterthought, and if the proposed deviation had not been referred to the Committee it is not improbable that the tunnel scheme would have been adhered to and carried out. The No. 1 or tunnel scheme is not regarded by the Committee as suitable. The great length of tunnel would be unpleasant to passengers, and the permanent way would probably be difficult for traffic in consequence of the greasiness or dampness of the rails. There is some doubt also as to whether the necessity for push-up engines would be very much reduced. No. 3, or the "green" route, has the advantages of better grades and short tunnels. It is 2 miles longer than No. 1 route, but according to the evidence that is not a serious objection, and the line could be worked easily and safely. Compared with No. 1 route it appears to be much the more preferable. Its advantages, however, do not equal those indicated by the No. 4 route, or the second proposal of the Commissioners. The great improvement in grade, the cutting out of objectionably sharp curves, and the saving of distance, in addition to avoiding the Zigzag, as represented by this route, are strong recommendations in its favour. The possibility of finding a desirable route in the locality of this No. 4 scheme was known to the Engineer-in-Chief for Railway Construction as well as to the Engineer for Existing Lines, and it was only the presence of the surveyors of the latter in the field and a desire on the part of the Engineer-in-Chief for Railway Construction not to have what might appear as two rival parties at the same work that prevented him from having the country properly explored.

The various schemes.

Question of
urgency.

12. But however much one or two of the schemes may be deserving of consideration, it is clear from the evidence of the railway officials examined that a deviation to avoid the Zigzag is not a matter of urgency. It can very well remain in abeyance. The traffic over the Western line is showing signs of decrease rather than of increase, and the decrease may be lasting. It relates chiefly to the carriage of coal, and a revival in the Western coal trade which would improve the volume of traffic over the line is not looked for. The late Engineer-in-Chief for Railways is of opinion that the Zigzag may be used with safety and advantage for the next twenty years. The Engineer for Existing Lines states that there is no danger to be apprehended from the line itself. It is, he says, a splendid piece of work, and is in thorough repair. The Chief Mechanical Engineer does not consider the deviation to be absolutely necessary, and admits that the Department could go on working the Zigzag for years to come with safety, though the deviation, in his opinion, would be an advantage. Generally, the evidence indicates an absence of urgency in relation to the proposed work; and considering this, together with the fact that the probable expenditure would amount to about £250,000, there seems to the Committee to be strong grounds for not recommending the construction of the work, for the present.

The
Committee's
decision.

13. The professional, as well as much of the evidence generally, indicating that the proposed deviation is not a matter of urgency, the Committee are of opinion that it is not expedient that the work be carried out. There is undoubtedly some risk of accident with the traffic over the Zigzag, but it is and can always be reduced to a minimum by careful management. It is the fact that though the Zigzag has been in existence for twenty-five years, no accident of a serious nature has occurred there in connection with passenger trains, and none to goods trains which careful working could not have avoided. The anticipated reduction in working expenses claims attention, but is not considered by the Committee to be so important as to justify the expenditure of a quarter of a million of money and the abandonment of a portion of the existing line which has cost the country about £170,000. At the same time it appears to them that the estimate of this saving is somewhat speculative. In the future traffic necessities may make the cutting out of the Zigzag imperative. If the traffic should increase very largely, and the increase prove to be permanent, the Zigzag will have to go, but before the question again comes forward the Department of Public Works will have been able to thoroughly investigate the apparent advantages of No. 4 Scheme, and also to ascertain whether even that scheme shows the best route that can be found. The Committee took the evidence given before them into consideration on the 5th instant, and passed, without division, the following resolution:—

“That, in the opinion of the Committee, it is not expedient that the proposed deviation to avoid the Lithgow Zigzag, as referred to the Committee by the Legislative Assembly, be carried out.”

The Railway
Commissioners and
the Department
of
Public Works.

14. Before closing this Report the Committee think it desirable to say that when any proposed public work, in which the Railway Commissioners are concerned, is referred by the Legislative Assembly to the Committee for consideration and report, the respective positions of the Railway Commissioners and their professional officers, and the Department of Public Works and its professional officers, in relation to such work, should be strictly observed; and that while this is done there should also be every effort made to act together in the public interest. In this inquiry the Department has not received from the Commissioners the recognition of its position in the matter to which it was entitled.

J. GARRARD,
Chairman.

Office of the Parliamentary Standing Committee on Public Works, .
Sydney, 16 April, 1894.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

DEVIATION TO AVOID THE LITHGOW ZIGZAG.

TUESDAY, 6 MARCH, 1894.

Present:—

	JACOB GARRARD, Esq. (CHAIRMAN).
The Hon. WILLIAM HENRY SUTTOR.	THOMAS THOMSON EWING, Esq.
The Hon. JAMES HOSKINS,	WILLIAM CHANDOS WALL, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	WILLIAM MCCOURT, Esq.
The Hon. JOHN DAVIES, C.M.G.	JOHN CASH NEILD, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	EDWARD WILLIAM O'SULLIVAN, Esq.
	CHARLES COLLINS, Esq.

The Committee proceeded to consider the proposed Deviation to avoid the Lithgow Zigzag.

Joseph Barling, Esq., Under Secretary, Department of Public Works, sworn, and examined:—

1. *Chairman.*] Do you desire to make a statement in connection with the matter now under the consideration of the Committee? I do: it is as follows:—The proposal before the Committee is that described in the resolution which was passed by the Legislative Assembly on the 25th of January last, on the motion of Mr. Lyne, Secretary for Public Works; namely, "That it be referred to the Parliamentary Standing Committee on Public Works, to consider and report on the expediency of carrying out a deviation on the Great Western line of railway, for the purpose of avoiding the Lithgow Zigzag." I do not propose to go into the earlier schemes which have been suggested for avoiding this Zigzag. The *précis* which I hand in [*Vide Appendix*] will, I think, give a pretty full account of the early history of this movement, and will obviate any necessity for me to refer to the matter at length. The question was brought to a practical issue by the Railway Commissioners, on the 24th of November last, addressing a communication to the Minister for Railways, the Honorable John See, in which they stated that ever since they had been in office, the disadvantage of passing traffic over the Lithgow Zigzag had been continually before them, as well as the continual risk in the working, consequent on trains loaded with passengers having to be propelled both up and down over the intermediate section of the Zigzag. They further said that the cutting out of the Lapstone Zigzag had so greatly facilitated the working, that they felt justified in asking the Government to consider the expediency of providing sufficient money to carry out a further alteration of the line to permit of the Lithgow Zigzag being avoided. The work, they stated, would in all ways be beneficial, and more than return interest on the capital expended. The scheme they proposed was one for leaving the existing line at a point near Dargan's Creek, about 86 miles 46 chains, and proceeding by a route through cutting and tunnel north of the existing main line to the bottom points of the Zigzag, where the existing double line of railway would be connected with. This line would be 2 miles and 48 chains in length, about 1 mile 52 chains being in tunnel. They proposed that the line should be a double one, because of the difficulty of properly ventilating so long a tunnel if only a single line were constructed. The grading through the tunnel would be a continuous ascending one from the bottom points towards Dargan's Creek, of about 1 in 50, the existing line being on varying grades of 1 in 33 and 1 in 42. The 1 in 33 grade was, they pointed out, against trains going to the west, and extended from Dargan's Creek to Clarence Siding, a distance of 1 mile 32 chains, and was a great obstruction to the whole of the traffic going from Sydney to the west. This would be entirely got rid of by their proposal, and thus materially assist the working of the western-going traffic. They estimated the whole cost of the work at about £225,000, which at 4 per cent. would mean an annual cost of £9,000; but they estimated that in addition to the great facility to the working and the avoidance of the continual risk which now takes place, the expenses would be reduced by about £10,000 per annum, so that as a commercial investment, the money would be well spent. The point they arose as to whether the work could be carried out without reference to the Public Works Committee, and on the 28th of December, the Honorable G. C. Heydon, the Attorney-General, to whom the question was referred, submitted his advising, which, perhaps, seeing the importance of the subject, it would be better for me to read to you at length. It is as follows:—

I have come to the conclusion that this work need not necessarily be referred to the Parliamentary Committee on Public Works.

From sections 12 and 13 of the Public Works Act of 1888 (though they are not at all plainly expressed) I think it appears with sufficient clearness that any work which the Railway Commissioners are authorised to carry out pursuant to the Government Railway Act of 1888, may be executed by them without reference to the Public Works Committee, notwithstanding such work may cost over £20,000.

J. Barling,
Esq.
6 Mar., 1894.

Sub-section 11 of section 23 of the Railway Act of 1888, specifies the works which the Railway Commissioners are authorised to carry out. After carefully considering that section I am of opinion that such a work as the one now contemplated comes within it. It is certainly an "alteration of a line," and it is also, I think, a "partial reconstruction of the roadway of an existing line." The section does not say "existing roadway" but "existing line"; and it seems to me clear that the line may still be the same line even if a portion of the roadway is taken over new ground.

In this case the deviation is merely for the facilitating of traffic. No question of policy of turning aside from one centre of population or producing district, and opening up another, is involved. The tract of country concerned is, I believe, barren, mountainous, unpopulated, and unproductive.

The question is one of gradients, distances, and curves—not of launching out into a new line, but solely of improving and shortening an old one.

I assume, of course, that it "appears to the Commissioners that this work is 'necessary' (which does not mean absolutely indispensable, but only that it will necessarily and materially promote the end in view) for the purpose of maintaining (which again includes the meaning of 'promoting,' 'facilitating') the traffic on an existing line." Unless they entertain this opinion, the work cannot be done at all.

This answers the question put to me, but I should like to add, that a difficulty appears to me to arise from the fact that some land will apparently have to be resumed.

Section 19 of the Public Works Act says, that the Governor may direct land to be acquired for "any authorised work," and work which may be done under the Railways Act is not (it appears to me after careful consideration) "authorised work" under the Public Works Act. However, after the money has been voted, it will be easy to bring in a short Bill declaring the work "an authorised work" and appointing the Railway Commissioners the Constructing Authorities. This is only what would have to be done, and is always done, when a work has been reported upon favorably by the Public Works Committee.

Of course, this work *could* be submitted to the Public Works Committee, but my opinion, as above, is, that it is not at all necessary to do so.

CHAS. G. HEYDON.—28/12/93.

To sum up Mr. Heydon's opinion, it was that he did not think the work need necessarily be referred to this Committee; but, on the matter being submitted to the Cabinet in January of this year, it was decided that the question should be so referred; and, in this connection, I am desired by Mr. Secretary Lyne to express his opinion, that all works of the kind should be brought before the Public Works Committee, in accordance with the Public Works Act. Mr. Lyne thinks that, although the carrying out of such works might be, technically, in accord with the provisions of the Railways Act, yet it is entirely opposed to the spirit of Legislation, as embodied in the Public Works Act, which lays it down very clearly that no public work, estimated to cost more than the sum of £20,000, shall be undertaken except after being reported on by this Committee and subsequently sanctioned by Parliament. Mr. Lyne considers that it was never for one moment contemplated by the Legislature that, while a Minister, who is directly responsible to Parliament should be required to submit public works proposals of any magnitude, to the criticism of the Committee, a body of gentlemen, who are not directly responsible to Parliament, should be relieved from this necessity. Mr. Lyne wishes me to take this opportunity to express his opinion on the matter, as this is the first occasion that a reference has been made to the Committee of a work connected with lines already opened, and under the management of the Commissioners; and he trusts that a precedent is now laid down which will be invariably followed in future. To come back again to the specific object of this inquiry, I may point out that the various proposals which have been submitted all have the object, in the first place, of cutting out the Zigzag and, secondly, the grade of 1 in 33 ascending to the Clarence tunnel. They all start at bottom points of the Zigzag, and they join the main line at approximately the same point, about the crossing of Dargan's Creek. The original line between these two points is 5 miles 40 chains in length including portions of Zigzag wings worked over; the ruling grade westerly, towards Bathurst, 1 in 33; and the ruling grade towards Sydney, 1 in 40. The first proposal, which may be called the No. 1 or "purple" route, is that proposed by the Railway Commissioners. It has a length of 2 miles 52 chains to middle of bottom wing, and, therefore, shows a considerable shortening as compared with the present line. The grade in the long tunnel is 1 in 50, and the cost, as estimated by Mr. Foxlee, is £225,000, which includes two lines of permanent way, with 80-lb rails, and a length of 2,893 lineal yards of tunnelling, or nearly 1½ miles, of which 2,816 yards are in one length. Two ventilating shafts are proposed, 12 feet in diameter. Proposal No. 2, or the "red" route, and which may be called "the spiral scheme," was suggested by this Department. In this case the length would be about the same as that of the existing line, no saving in that way being effected. The tunnelling is divided into three separate tunnels of the following lengths, viz.—tunnel No. 1, 474 yards, No. 2, 257 yards, and No. 3, 977 yards. The grade through tunnels Nos. 1 and 2 is 1 in 50, and through tunnel No. 3, 1 in 77, but without material additional expense could be made 1 in 60. This proposal alone, does not touch the 1 in 33 grade ascending to the Clarence tunnel, but this could be easily cut out at a small expense by the method shown on the plan. The estimated cost of this proposal, exclusive of permanent way, is £108,000, exclusive of the deviation to cut out the 1 in 33 grade ascending to the Clarence tunnel, the cost of which is estimated at £19,000. This would make the total estimated cost £127,000. Proposal No. 3, which may be called the "green" route, and which is the one adopted by the Department, has a length of 4 miles 60 chains. The ruling grade is 1 in 60, and includes a total length of about 1 mile of tunnelling, cut up into seven different tunnels, of a total length of about 1 mile, the longest being 768 yards. The estimated cost, exclusive of permanent way, is £165,000. The grade could be made 1 in 90, but the estimated cost would be then increased to £200,000. The proposal thus placed before you is, to a certain extent tentative, because examinations of the country are still being made, which may result in a modified proposal eventually being adopted; and to further explain this, I may mention that, on the 2nd instant, the Minister received the following letter from the Railway Commissioners:—

Office of the Railway Commissioners of New South Wales, Sydney, 2 March, 1894.

The Hon. W. J. Lyne, M.P., Minister for Public Works,—

Referring to the conversation the Chief Commissioner had with you yesterday in regard to the proposals for cutting out the Lithgow Zigzag, as intimated, another scheme which has special features of advantage in connection with it, has for some weeks been under examination by the officers of the Department; but owing to the great natural difficulties of getting over the country (the surveyors having to cut their way through the very dense bush), the plans are not in such a forward state as would enable us to say that the proposal is one that we can submit to the Public Works Committee for consideration, but from what can be seen of it, it will work out satisfactorily.

We should, therefore, be glad if it could be arranged for the Public Works Committee to postpone their investigation of the subject for a few weeks, until the proposal is further advanced.

E. M. G. EDDY,
Chief Commissioner.
W. M. FEHON,
Commissioner.
CHARLES OLIVER,
Commissioner.

And

And thereon, the Minister made the following minute:—

The route suggested by the Railway Commissioners was, I think, examined in 1886 at the suggestion of Mr. Targett, and then—for what reason I do not know—not adopted. The Public Works Committee might commence their investigation without delay, and if the Commissioners desire to submit another scheme—it can be taken later on in the inquiry.—
W.J.L., 3/3, 94.

J. Barling,
Esq.

6 Mar., 1894.

In pursuance, therefore, of the determination of Mr. Secretary Lyne, I now have the honour to bring the proposal of the Department before the Committee, which may be denominated, as I have previously said as the No. 3 or "green" route. I have only just touched upon the necessity for carrying out the proposed deviation because it will be the function of the Railway Commissioners to satisfy you on this point. I also hand in the Commissioners' original letter, on which the scheme was brought forward (*Vide Appendix*), a copy of Mr. Deane's report in regard to the cost of that particular portion of the existing line (*Vide Appendix*), and a small sketch plan which may be convenient for lithographing (*Vide Appendix*). With regard to the quantity of land likely to be resumed I may say that No. 1 route goes through 103 chains of private land, and the No. 2 route through 41 chains of private land, and the No. 3 route through 156 chains of private land. On the first of the three routes we shall require 58 chains of Crown land exclusive of railway reserves, on the No. 2 route no Crown land, and on the No. 3 route 165 chains of Crown Land. I have no estimate of the value of the land referred to, but it would be a very small item.

2. The Committee are to understand that the proposal put forward by the Commissioners is the one that they intended to have carried out had not this work been sent on to the Committee? All I can say is that the No. 1 scheme was the route they suggested in the report handed in, but they have since given an intimation that another route may be found.

3. Having passed the matter over to the Construction Branch with the recommendation of what they consider to be the best scheme for doing away with the Zigzag, how can they now bring forward an alternative scheme. Does not the duty of discovering alternative schemes devolve upon the Construction Branch? The Construction Branch would, undoubtedly, have to bring forward any alternative scheme.

4. We may now look upon any further project from the Railway Commissioners as somewhat of a rival to the proposal of the Construction Branch? I should not put it in that way, because I am sure that if the Commissioners found a better line, the Minister would be prepared to recommend its adoption. At present we do not know that there is such a line.

5. Did the Commissioners in the first instance consult the Constructing Branch as to whether, in their opinion, they were adopting the best route? I think not. I imagine that at that time they supposed that they would have to carry out the work themselves, as they carried out the Lapstone tunnel.

6. They did not avail themselves of any knowledge which the Construction Branch might have had as to a better route? I believe that Mr. Deane has been in communication with the Commissioners for some time past; but I am not in a position to say whether they actually consulted him before they propounded the scheme. Mr. Deane himself will be able to give you information on that point.

7. You propose to leave it to the Commissioners, or their representatives, to give evidence as to the necessity of this work from a commercial point of view? Quite so. It is not like a new railway, the recommendation of which we should have to justify ourselves. This proposal has been brought forward at the request of the Commissioners, who will put before the Committee the commercial reasons for suggesting an alternative line.

8. Has there been any official communication between your Department and the people of Hartley, with regard to another deviation? I believe that there have been such communications, but I do not think they were in writing. I know that Mr. Rock has seen Mr. Deane in connection with his scheme, which is shown very roughly on the plan which I have before me.

9. Have you had any official communication with Mr. Rock, or from the people of Hartley? I am not aware of any, except verbal communications.

10. Is there any reference to the matter in the *précis*? No; because we are not bringing Mr. Rock's scheme before the Committee. His line would go from Mount Victoria to Hartley Vale, and the length of it would be about 14 miles.

11. Has Mr. Gipps' project, the details of which were laid upon the table of the House some time since, to run a line of railway up the Cox Valley, come before your Department officially in any way? Yes; but I have not brought any of the papers connected with that proposal.

12. Mr. Gipps' scheme was to avoid crossing the mountains by taking the railway from Blacktown to Blayney along the Cox Valley? Yes; and Mr. Price, an officer of our Department, was instructed to report upon the scheme. His report was laid upon the table of the House on the 5th November, 1890. In it he says—

As the result of my investigations I have arrived at the following conclusions:—

- (1.) That it is necessary to take steps to relieve the congestion of traffic on the Mountain section of the Western Line.
- (2.) That the Blacktown-Blayney Line would not divert a sufficient proportion of the traffic to give permanent relief, or the saving in working expenses and wayside traffic be sufficient to justify its construction.
- (3.) That the traffic-producing districts opened up by the Blacktown-Blayney Line could be more economically served by branches from the main line.
- (4.) That the line from Richmond to Eskbank would divert fully half the traffic of the whole Western system, and therefore its point of connection is geographically correct.
- (5.) That the ruling grade of the Richmond-Eskbank Line would be so little superior to that of the present line that the consequent working expenses would be a little reduced.
- (6.) That the saving in working expenses on the Richmond-Eskbank Line, together with the wayside traffic, would not pay interest on its cost of construction.
- (7.) That it would be more economical, and better serve the interests of the country, to duplicate the present track and construct branches than to make either the Blacktown-Blayney or Richmond-Eskbank alternative line.
- (8.) That the construction of a branch from Liverpool to Mulgoa and from Perth to Rockley is well worthy of consideration.
- (9.) That the extension of the Richmond Line into the Kurrajong would eventually pay interest on the cost of the construction of a cheap railway, and, therefore, no permanent concessions should be granted to any private company.

13. *Mr. Neild.*] Have you any particulars with you as to the grades on the line between Mount Victoria and Glenbrook? No; but if you wish for the information I will ask Mr. Deane to have a table prepared showing the grades all along the line.

14. I understand that the "green" route—No. 3—possesses the best grade, and, roughly speaking, contains about the same length of tunnelling as the "red" route? Yes.

- J. Barling, Esq.
6 Mar., 1894.
15. The "red" route—No. 2—possesses a better grade than the No. 1 route? Yes, if you include the deviation.
16. And is the cheapest line of the three? Yes.
17. The Commissioners' line—the No. 1 route—has the worst grade, and would cost the most money, besides being at a disadvantage in having a tunnel 1½ miles long, which would be a longer tunnel than any we have in the Colony at the present time? Yes; I do not think we have a longer tunnel than that.
18. But it is the shortest route? Yes.
19. The No. 2 route comes next in length? Yes, as regards new construction but not as regards through distance.
20. And the No. 3—the official route—is the longest? Yes, as regards new construction.
21. I suppose the lengths you have given are the lengths that have to be constructed, apart from any of the existing line that may be taken in? Yes, quite so.
22. You propose to destroy the existing line by taking up the permanent way, and to abandon it? The Commissioners will be able to answer that question.
23. Have representations been made to the Department to the effect that if one of the proposed routes is adopted rather than another, claims for compensation will be made? Yes; a claim has been made by Mr. Reynolds for a very large amount. The matter is referred to in the *précis*.
24. And if one of the routes is carried out in preference to the others, private owners will give their land free? I think there have been such offers as that.
25. Is the fact disclosed in the statement which you have just handed in? I am not sure; but the value of the land is really so small that it is hardly worth taking into consideration.
26. I suppose the "green" route will be the best from a tourist's point of view? Do you mean as regards the scenery along it?
27. Yes? I cannot answer that question as I have not been over the ground.
28. Mr. Hoskins.] On what grounds has the claim for compensation, to which you have referred, been made? I have not gone into the matter; but I suppose it is made on the ground that the railway will be taken away from the claimant's property. The whole thing strikes me as very absurd.
29. Mr. Humphery.] On the 25th January, Mr. Deane asked for a further survey;—has that survey been made, and, if so, who made it? The survey in question was made by Mr. Cumming and Mr. Kennedy.
30. Has any route been recommended as the result of that survey? Yes; the "green" route is the outcome of the survey to which you refer.

WEDNESDAY, 7 MARCH, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.

The Hon. JAMES HOSKINS.

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JOHN DAVIES, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

THOMAS THOMSON EWING, Esq.

WILLIAM CHANDOS WALL, Esq.

WILLIAM MCCOURT, Esq.

JOHN CASH NEILD, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES COLLINS, Esq.

The Committee further considered the proposed deviation to avoid the Lithgow Zigzag.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, sworn, and examined:—

- H. McLachlan, Esq.
7 Mar., 1894.
31. Chairman.] Are you prepared to make a statement on behalf of the Railway Commissioners giving their reasons for proposing this deviation? I may say in reference to this matter that the Chief Commissioner, a few days ago, had an interview with the Minister for Works concerning the deviation proposal, the outcome of which was the following letter:—

Office of the Railway Commissioners of New South Wales, Sydney, 2 March, 1894.

The Honorable W. J. Lyne, M.P., Minister for Public Works,—

Referring to the conversation the Chief Commissioner had with you yesterday in regard to the proposals for cutting out the Lithgow Zigzag, as intimated, another scheme which has special features of advantage in connection with it, has for some weeks been under examination by the officers of the Department; but owing to the great natural difficulties of getting over the country (the surveyors having to cut their way through the very dense bush), the plans are not in such a forward state as would enable us to say that the proposal is one that we can submit to the Public Works Committee for consideration, but for what can be seen of it, it will work out satisfactorily.

We should, therefore, be glad if it could be arranged for the Public Works Committee to postpone their investigation of the subject for a few weeks, until the proposal is further advanced.

E. M. G. EDDY, Chief Commissioner.

W. M. FEHON, Commissioner.

CHARLES OLIVER, Commissioner.

That letter deals with the second proposal of the Commissioners. In regard to their first proposal they addressed a letter, which was practically the initiation of the matter in a definite form, to the Minister for Railways, on the 24th November, 1893. It was a joint letter, signed by the three Commissioners.

32. That letter has been placed before us, and the Committee wish to know the commercial reasons for recommending the proposal? I was going to say that the Commissioners, in the last paragraph of the letter I have just read, asked the Minister for Works if he could arrange for the postponement of this inquiry for a few weeks.

33. We want to get back to the starting point;—what was the reason for bringing forward the project in the first instance? Unfortunately I am not in a position to give any evidence on that matter to-day, because the Commissioners anticipated that the inquiry would be postponed until their second scheme could be worked out. I have not consulted them, or had any interview with them in regard to the inquiry.

34. Did not the Commissioners mature a certain scheme, known as No. 1, which was to cost £225,000, and every detail of which had been worked out;—that is the project which has come before us, and we want to know why it was put forward? The Commissioners now think that they have got a better scheme.

35. But we want to know why any deviation was suggested? The Commissioners recommend the deviation on two grounds—the economical and the safe working of the line. Unfortunately, however, I did not think the matter would be taken up to-day, and, therefore, I have not had an interview with the Commissioners in regard to it. I presume that you would like to have their evidence, not mine; but at present I cannot give you their views.

H.
McLachlan,
Esq.
7 Mar., 1894.

36. Are the Commissioners away now? The Chief Commissioner is, and I think this is a matter upon which all the Commissioners would like to confer.

37. Are we then to understand from you, the mouthpiece of the Commissioners, that, although they were prepared to go on with a certain project, they had really decided upon it without holding any consultation at all amongst themselves? Not at all; because they made a minute which contains their reasons for recommending it; but they now think that they can, if a slight delay is granted, obtain a better route, which will save perhaps £50,000 or £60,000.

38. Will you read their first letter? Yes; it is as follows:—

Office of the Railway Commissioners of New South Wales, Sydney, 24 November, 1893.
To the Hon. John See, M.P., Minister for Railways,—

Lithgow Zigzag.

Ever since we have been in office the great disadvantage of passing traffic over what is known as the Lithgow Zigzag, on the western side of the Blue Mountains, has been continuously before us, as well as the continual risk in the working, consequent on trains loaded with passengers having to be propelled, both up and down, over the intermediate section of the Zigzag.

The cutting out of the Lapstone Hill Zigzag, on the eastern side of the Blue Mountains, has so greatly facilitated the working that we feel that we are justified in asking the Government, when dealing with the question of expenditure in connection with public works, to consider the expediency of providing sufficient money to carry out an alteration of the line to permit of the Lithgow Zigzag—which is a great obstruction to the working of the traffic on the western side of the mountains—being avoided. The work would in all ways be beneficial, and more than return interest on the capital expended.

Various schemes for effecting this object have been under our consideration for a considerable time past, but the cheapest and best plan which we have had before us is one for leaving the existing line at a point near Dargan's Creek, about 86 miles 48 chains, and proceeding by a route through cutting and tunnel north of the existing main line to the bottom points of the Zigzag, where the existing double line of railway would be connected with. This line would be 2 miles and 53 chains in length, 1 mile 52 chains being in tunnel. It is proposed the line shall be a double one, because of the difficulty of properly ventilating so long a tunnel if only a single line is constructed. The gradient through the tunnel would be a continuous ascending one, from the bottom points to Dargan's Creek, of about 1 in 50, the existing line being on varying grades of 1 in 33 and 1 in 42. The 1 in 33 grade is against trains going to the west, and extends from Dargan's Creek to Clarence Siding, a distance of 1 mile 32 chains, and is a great obstruction to the whole of the traffic going from Sydney to the west. This would be entirely got rid of by the proposal, and thus materially assist the working of the western-going traffic.

The estimated cost of the whole work is about £225,000, which, at 4 per cent., would be an annual cost of £9,000; but it is estimated that, in addition to the great facility to the working and the avoidance of the continual risk which now takes place, the expenses would be reduced by about £10,000 per annum, so that, as a commercial investment, the money would be well spent.

It may be pointed out that nearly the whole of the money would be expended in labour, as, with the exception of the rails and machinery required for the work, the whole expenditure would be for excavation and construction.

There are several other smaller grades on different parts of the line, and also some curves on the Blue Mountains, the cutting out of which would greatly facilitate the working, and we would be glad if the Government could see their way to obtain a vote from Parliament for the sum (including the £225,000 previously mentioned) of £250,000 on account of the grades and curves.

The construction of the tunnel would occupy from eighteen months to two years, and therefore the expenditure of the £250,000 would be spread over a period of quite two years.

Attached hereto is sketch plan showing the route of the existing line and of the proposed line.

E. M. G. EDDY, Chief Commissioner.
W. M. FEHON, Commissioner.
C. OLIVER, Commissioner.

39. We understand from that letter that the Commissioners came to the conclusion upon the reports of their officers, and also as the result of their own observation, that it would be desirable, on the ground of safe and economical working, to do away with the Lithgow Zigzag if possible? Yes

40. With that object in view, they instructed their engineers to prepare plans of suitable routes? Yes.

41. Several were submitted, but eventually they decided to adopt what is known as the No. 1 route, at a cost of £225,000? They recommended that route three or four months ago as the best before them at the time; but since then what seems a better scheme has been brought under their notice, the details of which are not quite complete, although it seems to have advantages over the first scheme, and they would, therefore, like to put it before you. A few weeks' delay does not seem to them to be a very great matter.

42. As a matter of fact, were not the Commissioners prepared to carry out this project when the Cabinet stepped in and decided that the work should be carried out by the Construction Department? I could not say anything as to that.

43. In the minute which you have just read the Commissioners say that they are prepared to carry out the work? They would recommend it, but I do not know who would carry it out.

44. As a matter of fact, are you not aware that it has been decided by the Cabinet that the Construction Department are to carry out this work? No; I do not know what has been done.

45. Is it not a fact that the Works Department have requested the Commissioners to hand over all plans, sections, &c., in connection with this proposal to the Construction Branch? That request has not been made to my knowledge. I know nothing of the details of this matter, because I did not anticipate any examination, and I have not spoken to the Commissioners in regard to the evidence they wish me to give.

46. Have you been on leave lately? Yes; for three weeks.

47. Therefore, you are not acquainted with the details of this matter? That may account for my not having seen some of the letters going through.

48. Is there no record in your office of the Commissioners having been informed by the Construction Branch that they are to carry out the work, and, therefore, that all plans, &c., in their possession must pass over to the Construction Branch? I have not seen any such letter; but, of course, if a request were made, it would go before the Commissioners officially.

49. May I direct your attention to the *précis* of the case put before us by the Under Secretary;—after reciting the minute to which you have just referred, and in which the Commissioners inform the Colonial Treasurer of the desirability of cutting out the Zigzag, Mr. Barling goes on to say,—

The Minister for Railways referred the matter for the advice of the Attorney-General as to whether the work could be carried out without reference to the Public Works Committee. On the 23th of December the Honorable C. G. Heydon submitted

H.
McLachlan,
Esq.
7 Mar., 1894.

submitted his advising, and stated that he had come to the conclusion that the work need not necessarily be referred to the Parliamentary Standing Committee on Public Works, and for this opinion he gave his reasons at length. The matter was referred to Cabinet on the 2nd January, 1894, and it was then decided that the matter should be referred to the Public Works Committee as soon as convenient. The necessary resolution was accordingly, in pursuance of this decision, submitted by Mr. Secretary Lyne to Parliament on the 25th January, and duly passed. In the meantime the sum of £250,000 for the work was noted for placing on the Loan Estimates. In a minute of the 8th of January, 1894, the Minister stated that the Cabinet had decided the work should be carried out by this Department, and he directed that the Railway Commissioners should be asked to forward, for the use of the Engineer-in-Chief for Railway Construction, the plans and sections they had taken in connection with the matter. A letter to this effect was accordingly addressed to the Commissioners for Railways on the same date —

You know nothing about that? I do not recollect anything about it. The Commissioners made no claim to carry out the work themselves.

On the 22nd of January the Railway Commissioners forwarded, in compliance with the request which has been made to them, plans, sections, &c., in connection with the scheme which they proposed. They also forwarded a report from Mr. Foxlee, accompanying the plans, &c., in which he stated that the estimated cost of the deviation proposed by him was £225,000, exclusive of land and fencing. That the length of the proposed deviation was about 2 miles 33 chains, the ruling grade 1 in 50, and the sharpest curve 12 chains radius. The tunnel would have a length of about 2,840 yards. In forwarding the plans, the Commissioners wrote the following minute: "As the scheme is one that has been devised and worked out in detail by Mr. Foxlee, the Commissioners think that he should be associated with Mr. Deane in the carrying out of the work." With regard to this, Mr. Secretary Lyne minutes the papers as follows: "Divided authority in such a matter as this would not do at all, and there is certainly some error regarding the 'complete devising and working out of the plans by Mr. Foxlee.' I have no doubt that Mr. Deane will consult Mr. Foxlee, if he considers it desirable, upon any special point that may present itself to him."

50. Is it not rather strange that you are not aware of the facts which are mentioned there? I was not in the Colony at the time, and I have not familiarised myself with the case.
51. In the absence of the Chief Commissioner, have you communicated with his colleagues in regard to this matter? I mentioned to them that I had a letter from the Public Works Committee, asking me to go before them, and they referred me to the letter which had been sent to the Minister on the 2nd March, asking that the inquiry should be postponed, which seems to them such a reasonable request.
52. That is not the point;—the Commissioners decided upon a certain work, and, presumably, had it not come before this Committee, they would have gone on with it before now? No; they simply say that, if the work was to be carried out, they would like Mr. Foxlee to be associated with Mr. Deane in carrying it out.
53. We are to understand that, owing to the absence of the Chief Commissioner, his colleagues have instructed you to say that they are not in a position to give any further information? I did not say that at all.
54. You tell us that you are not in a position to give any information on the matter? Yes.
55. Then what does your answer amount to? It is simply this, that the Commissioners thought that the inquiry would be postponed, and the Chief Commissioner went away with that belief.
56. Are you not in a position to give the reasons of the Commissioners for proposing a deviation, irrespective of what route may be chosen? No; I am not, at the present time.
57. Did they come to their conclusion from the reports furnished to them by their Traffic Manager, their Locomotive Superintendent, or by whom? I can only repeat that, anticipating that the reasonable request of the Commissioners for the postponement of the inquiry would be complied with, I have not gone into the matter at all.
58. Does not what I have read to you from the *précis* prove that this matter has gone out of the hands of the Commissioners into the hands of the Public Works Department; that being so, what have the Commissioners to do with it, except to explain their reasons for suggesting the deviation? If the matter is entirely out of the hands of the Commissioners, why should they be called upon to give evidence in regard to it. The first scheme that was put before them was to cost over £300,000, but with that they were not satisfied, and said, "Make it less." The cost was then brought down to £225,000, and now they think that it can be brought still lower. I should think it would be the object of the Committee to assist the Commissioners in getting a cheaper route.
59. It is not for you, Mr. McLachlan, to advise the Committee. As a matter of fact, you say the first proposal put before the Committee was to cost over £300,000? Yes.
60. Did they at that time make any definite proposals to the Minister for Railways? No.
61. It was not until they brought the cost down to £225,000, and had had all the details of the scheme worked out that (*vide* minute) they put it before the Minister? Yes.
62. You cannot tell us whether, at that time, they intended to carry out the work themselves? No; I cannot.
63. You stated that, owing to the absence of the Chief Commissioner, neither his colleagues nor yourself are quite ready to place the facts of this proposal before us? I did not say that. What I said was that the Commissioners had sent a memo. to the Public Works Department asking for the postponement of the inquiry, and, anticipating that their request would have been complied with, I have not come prepared with any evidence.
64. But, as a matter of fact, you were summoned to give evidence on this matter, in spite of the memo.? Certainly.
65. Was that not sufficient notice that the whole matter would be gone into? Not under the circumstances, because the Commissioners considered that the position is to some extent altered by information which has been placed before you since, I think, the date of your letter.
66. It does not matter what route the proposed deviation is to take—whether you take the trains up in a balloon, or go down to the very centre of gravity—there must be reasons necessitating a deviation, and these reasons you are not in a position to give us? No.
67. Do I understand that when the Chief Commissioner returns you will, after consultation with him, be in a position to give us the reasons for the proposed deviation? Yes. I do not say the Chief Commissioner necessarily; but this is an important matter, upon which all three Commissioners would like to confer before directing me to give evidence.
68. When will the Chief Commissioner be back? He will be back early next week.
69. Will he not be back on Friday? I am not certain. I do not think that he will be back until Saturday or Monday.
70. If we postpone your evidence until Wednesday next, an opportunity will be presented to the Commissioners of conferring together, and you may obtain the result of their deliberations? I think so; the Commissioners

Commissioners wish to put pretty complete evidence before you, and they intend to ask you to call leading officers who have gone into the matter from the locomotive point of view, from the traffic point of view, and from the engineering point of view. I think that the evidence which the Commissioners are prepared to put before you will be very full.

H.
McLachlan,
Esq.
7 Mar., 1894.

71. *Mr. Hoskins.*] I wish to ask you if, when you are next examined, you will, if possible, furnish us with information in reply to the following questions:—What number of accidents have taken place at the Zigzag since the line was opened to traffic: what number of persons were injured therein; what was the nature of the injuries to individuals caused by the same; and the amount of compensation paid by the Government in each case; what was the damage caused to the rolling-stock by each accident, and what expense was incurred in repairing damages? Yes; I will do so.

72-3. *Mr. Humphrey.*] I should like some additional information in regard to the Lapstone Zigzag—the cost of the deviation, including everything, and the saving effected by the Department in working the line during the year 1893.

Henry Deane, Esq., M.I.C.E., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

74. *Chairman.*] How long have you been connected with the Department? A little over fourteen years.

H. Deane,
Esq.,
M.I.C.E.
7 Mar., 1894.

75. You were not engaged upon any portion of the Great Western line over the mountains? No.

76. It was all constructed before you joined the Department? Yes.

77. You are familiar with all the various projects that have been put forward for the purpose of avoiding the Zigzag? Yes; and I have been over the country myself with the surveyors, and have examined it carefully.

78. You furnished a statement to the Minister for Works showing the actual cost of the existing line from Dargan's Creek to the lower points of the Lithgow Zigzag? Yes.

79. You also made an estimate of what it would have cost to construct a tunnel somewhat similar to that suggested by the Commissioners in their scheme for a single line, and also for a double line? Yes.

80. I think you estimated that at the prices then ruling, a tunnel for a single line would cost £321,862, and for a double line, £445,055? Yes; I believe those are the figures.

81. Are there no records in your office to show whether the desirability of making a long tunnel instead of constructing the Zigzag was ever considered? No; I think not. There is nothing earlier than Mr. Targett's first proposal. I understand—but I only speak from hearsay, because I was not in the Department at the time—that a tunnel was not contemplated in those days, because it was considered impracticable, and would have taken too long to make.

82. They had very much less efficient means of making tunnels in those days than they have at the present time? Yes.

83. We understand that there is a grade of 1 in 33 between Dargan's Creek and Clarence Siding? Yes.

84. Was it because of the expense of constructing tunnels in those days that they left that severe grade? I expect it was that they thought that as there was a 1 in 33 grade on this side of the mountains, a similar grade there did not matter.

85. That grade could have been got rid of by making the Clarence tunnel longer? No; by lengthening the line before getting to the tunnel. I have no doubt that they adopted the present line because it was the shortest.

86. A *précis* has been furnished to the Committee by the Under Secretary showing the connection of the Department with these various proposals; I understand that the first line suggested by the Department was one proposed by Mr. Burge, which left the existing line at about 9½ miles, and went in a more northerly direction than any of the lines shown on the plan? Yes.

87. Another route was put forward, going in a very similar direction, but a few chains shorter? Yes.

88. How long is it since the Commissioners proposal—the No. 1 route—was put before your Department? I could not tell you the exact date. I think I got the plans just about the time, or a little before the time, when the matter was being brought before the Assembly. It is only very recently.

89. Your action on receiving instructions, and examining the plans, was to say that the line could be improved, I presume? Yes.

90. I understand that the first alternative proposal that suggested itself to you and your officers was what was known as the No. 2 route? Yes; that is the "spiral" route.

91. It leaves the existing line at the top of the Zigzag, and by a series of tunnels joins it again at the lower points? Yes.

92. There is also a deviation on the eastern side of Clarence tunnel to escape the 1 in 33 grade? Yes.

93. Since then you have had officers in the field surveying the No. 3 route? Yes; I have had both the "red" and the "green" routes surveyed.

94. You put the "green" route before the Committee as the one you prefer above both the others? Yes; I prefer it, because it has better grades and short tunnels.

95. Will you give us, concisely, your reasons for preferring the "spiral" route to the No. 1 route, and for preferring the No. 3 route to both the No. 2 and the No. 1 route? I do not make any comparison between route No. 1 and No. 2. Of course, the No. 2 route has the advantage that it is the cheapest way of getting rid of the Zigzag; but I am not prepared to say that it is a better route than No. 1, except in that particular, and because the tunnels are shorter. Instead of there being a long tunnel of nearly 1½ miles, as on the No. 1 route, you have three tunnels, the longest of which is a little over half-a-mile. The No. 2 route is put upon the plan more as a matter of history, to show the Committee the various steps of the investigation; but my attention has been turned particularly to the No. 3 route.

96. Will you give us a comparison of the No. 3 and the No. 1 route. The Committee does not require you to discuss the policy of making a deviation, or to deal with the matter from a commercial point of view? It is the custom in most countries to get an opinion from the engineer in such matters; but I am not in a position to give you such information, so that, should the Committee ask me for an opinion on the subject, I should be obliged to decline to give one. There is one little matter, however, to which I might refer, and it is a traffic consideration affecting the No. 3 route. That route is 2 miles longer than the No. 1 route, and will, therefore, be apparently more costly to work, because every train would have to go over 2 miles of line more than on the No. 1 route; but, in comparing the two routes, it would be unfair

H. Deane,
Esq.,
M.I.C.E.
7 Mar., 1894.

unfair to debit against the No. 3 route the full cost of the train mile set down by the Commissioners—4s. 7½d. according to the last report of the Commissioners—because that includes central expenses, office expenses, management and so on, whereas no extra expense has to be incurred on that score where it is a mere question of lengthening the line by a couple of miles. The trains will merely have to run two additional miles over easy gradients and under the best possible conditions. There will be no stations to stop at, so that it will be merely a question of adding an extra five or six minutes to the journey, and that cannot cost very much.*

97. In other words, you say that the No. 3 route should not be debited with twice 4s. 7½d. a mile for running expenses, but with a lesser amount, because there are no sidings, stations, or anything of that kind upon it? Yes. The trains would only have to run another 2 miles on flat grades. There would be no extra station staff or central staff required for the working of these 2 miles, and if they were cut out the Commissioners would not receive less than they receive now, nor would any of the office staff, while there would be no fewer station hands—porters, clerks, and so on—required. All that would happen would be that the locomotives would take five or six minutes more to run from point to point, and you would have to estimate the value of the services of the driver, firemen, and guard for that period.

98. Would not a train do the distance in less time because of the grade being flatter? Well, I am putting the worst possible case. There is one charge, however, that will make a definite increase, and that is the maintenance of the permanent way. Mr. Foxlee informed me that the cost of maintaining the permanent way between Penrith and Wallerawang was rather heavy, and I can understand that it is, because, with the heavy grades, the trains going down with the brakes on, drag the road about, and the climatic conditions may possibly be against the line. On the other hand a great deal of the road is old, and some of the old ballast has never been renewed, and consequently the line has frequently to be picked up and repaired. If a new line were made, the maintenance charges on it would be comparatively small. Then, on the No. 3 line, the ruling grade is 1 in 60, as compared with a ruling grade of 1 in 50 upon the No. 1 line. Now I think a tunnel on the ruling grade is to be avoided, because the tendency is to load up the trains and give the locomotives as much as they can possibly drag behind them, and consequently, on the ruling grade, tunnel, or no tunnel, their power will be strained to the utmost, and there will then be the maximum consumption of coal, and the maximum products of combustion given out, which, happening in a tunnel would tend to foul it very much. In most of the long tunnels in the world the grades are easy, and where any trouble is caused by the smoke, ventilating apparatus of some kind or another has been adopted. Ventilating shafts, however, have not proved very efficient, and I do not think they would be altogether a success in this case. But it will be clear that, whatever difficulties might be caused by smoke, and the want of ventilation in a long tunnel on the ruling grade, such difficulties would not exist in a much shorter tunnel—a tunnel of less than half a mile in length, on a grade less than the ruling grade, namely 1 in 60.

99. Where does the 1 in 50 grade come in on any portion of the old line? One in 50 towards Sydney is practically the ruling grade between Eskbank and Sydney, because, although there is a 1 in 42 grade from Eskbank, an additional engine is used to work it. Even if the long tunnel scheme were adopted, an additional engine—so I was informed by the Chief Commissioner—would still be used to help to get the load up the incline. One in 50 is practically the ruling grade for a single engine.

100. A second engine would be used on the lower Zigzag in any of the projects? Yes; unless the load were regulated for a 1 in 42 grade. Another possible difficulty in connection with a long tunnel is the greasiness of the rails—that condition of the rails when they are neither thoroughly wet, nor quite dry. That would be against having ruling grade in the tunnel.

101. Can you tell us the length of the 1 in 42 grade on the Lithgow side? About 1½ miles. It starts at about 93½ miles. Another reason for preferring short tunnels is the lighter cost of the work, and the less time it would take to complete it. The probability is that a long tunnel like that on the No. 1 route would take a year longer to construct than the tunnels on the No. 3 route, the earthworks included. In fact, the whole line would probably take a year longer. That, of course, would mean, if a saving of £10,000 a year is to be effected by doing away with the Zigzag, that £10,000 would be lost—that £10,000 which would be saved if the No. 3 route were carried out, would not be saved if the No. 1 route were carried out. I went into a calculation as to the time it would take to make these tunnels, and I found that at the Otford tunnel, which is a long tunnel for a single line, the progress of the heading was about 1½ chains per month at each face, so that it is very easy to calculate how long the work would take in this case. After the heading has been done the general section of the tunnel has to be broken down, and then there is the lining to do. The Otford tunnel took over three years to construct, but there was some delay in connection with the supplying of the bricks.

102. What is the length of the Otford tunnel? It is nearly a mile long.

103. What is the length of the longest tunnel on the No. 3 route? Seven hundred and sixty-eight yards. In making a comparison between route No. 3 and route No. 1, I should have to criticise route No. 1 to some extent, and that I do not think it would be fair to do. I think the No. 1 proposal has been worked out in a proper manner, and is a very good line as far as it goes. The only objection I have to it is the formation that it is laid to. It starts on a 1 in 42 grade, which I think is a pity. The 1 in 42 grade at present terminates at the points, but in the No. 1 proposal it is carried on through the short tunnel up to the face of the long tunnel. That might very well be obviated, but at an increased cost. If I had been laying out the line I should have started the 1 in 50 grade for the top of the grade at the lower points, or I should have continued the 1 in 66 grade that is shown on the plan.

104. But there is no 1 in 66 grade on the lower points now? Not below the lower points; but there is a grade of 1 in 66 on the tongue of line which is common to the two lines. In the Commissioners' scheme it is proposed to raise that 1 in 66 and continue the 1 in 42 up from the points. It is not possible to show that on the wall, however. According to their scheme, the 1 in 66 will be done away with. 105. It will be made 1 in 42, so as to tally with the grade at the commencement of the tunnel? Yes.

106. How far does it continue into the tunnel? Right through the short tunnel, up to the face of the big tunnel—14 chains.

107. Does that include a grade of 1 in 66? Yes; it is 14 chains from the lower points of the Zigzag up to the face of the big tunnel.

108. That is where they begin the 1 in 50 grade? Yes; at the face of the big tunnel.

109. They carry that grade right through the long tunnel? Yes.

110.

* Note (on revision):—See Wellington on Railway Location, 1888 edition, p. 207.

110. There is also a down grade after getting through the long tunnel? Yes; it is 1 in 75.
111. I understood you to say that the proposed ventilators would not act very well? I doubt if they will be altogether satisfactory, and I would sooner have short tunnels. There are many long tunnels which are ventilated with shafts; but the ventilation is extremely unsatisfactory, and many engineers consider that the ventilating shafts are a mistake—that they cause a disturbance of the ventilation of the tunnel. What I am afraid of is that if you construct the long tunnel it may be necessary to use an engine to work a ventilating fan.
112. Is there any other point in the No. 1 proposal which you think calls for criticism? I do not think so.
113. I take it that you do not approve of a grade of 1 in 50 in the long tunnel where the rails are likely to be greasy and wet? Yes; I do not approve of the tunnel on the ruling grade if you can get anything better.
114. But the long tunnel will not be on the ruling grade, because the ruling grade on the Lithgow side would be 1 in 42? Yes; but I have already explained that it is customary to use an additional engine there.
115. You refer to the ruling grade for one engine? Yes. I think that some day or other, if one of these schemes is carried out, the Commissioners will find it desirable to cut out that 1 in 42 grade separately, and, in that case, the tunnel would be actually on the ruling grade.
116. Coming now to the route you propose;—you tell us that it will be 2 miles longer than the Commissioners' route? Yes.
117. And that the aggregate length of the seven tunnels on that route would be equal to the length of the long tunnel on the Commissioners' route? No. Their total length would be 1,674 yards, or less than a mile.
118. What would be the length of the long tunnel? Two thousand eight hundred and ninety-three yards.
119. Would there be any difficulty in ventilating the tunnels upon the No. 3 route? I do not think they will want ventilating. The short tunnels will, of course clear themselves, and I think it will be an easy matter for the long tunnel, which is 4 chains short of half a mile, to clear itself.
120. Do I understand that on both routes provision is made for a double line of rails in the tunnels? Yes. In the estimate which I gave Mr. Barling I did not include the cost of the permanent way, because it seemed to me a little doubtful whether that should be charged against the work. I can, however, give that information to the Committee now.
121. We will take the information later on. Does the Commissioners' line run over an embankment or through a cutting between Dargan's Creek and the long tunnel? There is a little bit of an embankment, but the rest is cutting.
122. Is the embankment and cutting to be wide enough for a double line? Yes.
123. Then all the works upon both routes are for a double line? Yes.
124. You have not merely made the tunnels broad enough for two lines, but every portion of the work upon both routes is for a double line? Yes.
125. You were about to explain the reason why you did not charge the cost of the permanent way in your estimate, although it is included in the estimate of the No. 1 route? I left it to be added afterwards: but I can give it to the Committee now if it is required.
126. What were your reasons for omitting it? I did not quite think that it should be charged to any of the proposed routes, because, although we cannot take up the rails upon the existing line and use them for the deviation, we can, after putting down new rails upon the deviation, take up the rails upon the existing line, and credit the deviation with them, though something, of course, should be charged for the work of taking up the old line and laying down the new line.
127. Will you, for the sake of comparison, give us the estimated cost of the No. 3 scheme, adding to it the cost of the permanent way which was omitted in the first instance, together with the estimated cost of the No. 2 scheme, adding to it the cost of the permanent way? Yes. Mr. Foxlee proposed to use 80-lb. rails upon the No. 1 route, and sandstone ballast, which he reckoned would cost 25s. 6d. per lineal yard, or 51s. for a double line, making the total cost of the permanent way for the No. 1 route £11,668 16s. The No. 2 route is a very short one, and the permanent way on it would cost only £6,507 12s., making its total cost £133,507 12s. The cost of the permanent way on the No. 3 route would be £21,318, which is a larger sum than the others which I have mentioned, because the line will be nearly twice as long, making the total cost £186,318. I do not know if you wish me to refer to the cost of the modification of the No. 3 route, which would have a grade of 1 in 90, because a grade of 1 in 60 would be more economical, and would, no doubt, be preferable.
128. Could you get a 1 in 90 grade all through? The 1 in 90 grade would come out somewhere about the middle of the 1 in 156, and from there it would practically be level as far as Dargan's Creek.
129. What would be the additional cost of that modification? It was given by Mr. Barling yesterday.
130. Would it increase the length of the line? By only 11 chains. I mentioned it because I thought it was just as well that the Under Secretary should include it in his statement. When the line was first suggested to me by the surveyor, and I told him to report upon it, he thought that he could get a 1 in 90 grade all through, the cost of which would not be greater than the cost of the Commissioners' route. It seemed to me, however, that it would be more economical to adopt a grade of 1 in 60; but for the purpose of comparison, and in order to prove the value of the suggestion, I had the cost of the modification worked out. Without the permanent way, I put it down as £200,000, and adding the permanent way, it comes to £221,935. That does not differ materially from the estimated cost of the Commissioners' route—£225,000.
131. But the line would be a little longer, and you would have a 1 in 90 grade as against the 1 in 50 grade? Yes; a grade over which you could run at a high rate of speed.
132. Would you have to increase the length of the tunnels to get the 1 in 90 grade? Yes.
133. To what extent? If I remember rightly the length of the tunnels would be 1 mile 30 chains, though the length of the longest tunnel would not be increased.
134. The length of some of the other tunnels would be increased? Yes; and there would be an additional tunnel at the summit.
135. There are a number of viaducts across the water-way;—how would they be constructed? I do not propose to make any viaducts; I intend to fill up the embankments.

- H. Deane, Esq., M.I.C.E.
7 Mar., 1894.
136. With the spoil from the tunnels and cuttings? Yes. There will be nothing there worse than the banks upon the Hawkesbury line, where at Deep Creek there is an embankment about 100 feet above the creek, the outer side of which runs down to a salt marsh at a depth of about 150 feet.
137. I suppose these creeks do not drain any very large area? No.
138. There is no danger of a bank being washed away by the rush of water? No; and very little provision would have to be made for water. The peculiarity of the eastern ridges is that very often directly you get on to the top they begin to slope back so that practically there is no drainage from the top.

THURSDAY, 8 MARCH, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.	THOMAS THOMSON EWING, Esq.
The Hon. JAMES HOSKINS.	WILLIAM CHANDOS WALL, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	WILLIAM MCCOURT, Esq.
The Hon. JOHN DAVIES, C.M.G.	JOHN CASH NEILD, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	EDWARD WILLIAM O'SULLIVAN, Esq.
	CHARLES COLLINS, Esq.

The Committee further considered the proposed Deviation to avoid the Lithgow Zigzag.

Henry Deane, Esq., M.I.C.E., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

- H. Deane, Esq., M.I.C.E.
8 Mar., 1894.
139. *Chairman.*] You come prepared with a statement showing the various grades on the line from Penrith to Dargan's Creek? Yes; I hand it in. [*Vide Appendix*].
140. You also produce a section showing that it is possible to get a 1 in 90 grade on the No. 3 route? Yes; I referred to that route in my evidence yesterday, and the Under Secretary also referred to it.
141. Although it is possible, you do not recommend it—you prefer the 1 in 60 grade? Yes, because it would be more economical; but if I had to choose between the 1 in 90 grade and the Commissioners' proposal, with the long tunnel, I should prefer the 1 in 90 grade.
142. I may add that the total length of the tunnel on the 1 in 90 grade line would be 2,459 lineal yards.
143. There would be more tunnelling on the No. 3 route with a grade of 1 in 90 than with a grade of 1 in 60? Yes. I mentioned that fact yesterday; but I had not the exact particulars with me then.
144. *Mr. O'Sullivan.*] I understand that you propose filling up the gullies between the hills through which you tunnel, instead of constructing bridges or viaducts? Yes.
145. Will there be any danger of the culverts being carried away by floods? None whatever. There will be very little water to be provided for.
146. You will make due provision for carrying off all water? Yes.
147. *Mr. Davies.*] What will be the length of the No. 3 route? There is a slight difference between the comparative lengths and the lengths actually to be constructed. The comparative lengths of line for working are as follows:—Original line, 5 miles 36 chains; No. 1 route, 2 miles 50 chains; No. 2 route, 5 miles 40 chains; No. 3 route, with a grade of 1 in 60, 4 miles 55 chains, and, with a grade of 1 in 90, 4 miles 67 chains.
148. *Chairman.*] In a statement handed in by Mr. Barling the length of the existing line appears as 5 miles 14 chains? I think I can explain how that occurs. The length of the existing line between Dargan's Creek and the lower points of the Zigzag depends a little upon the way in which the ends of Zigzag are reckoned. For the purpose of this comparison I have taken the distance from a certain point at or near Dargan's Creek to the middle of where the trains would stand on the upper points of the Zigzag, and to the middle of where the trains would stand on the lower points of the Zigzag, so in that way the length I have given you is exactly correct.
149. *Mr. Davies.*] In your calculation of the cost of constructing the deviation, have you taken into account the original cost of the 5 miles of existing line which will be abandoned? The cost of the original line was £167,000 odd.
150. What do you estimate the cost of the deviation you suggest, including the tunnels? With a grade of 1 in 60, £165,000, plus the cost of the permanent way for two sets of rails, £21,318, or a total of £186,318.
151. I presume that your estimates are based on prices paid for work of a similar character to that which is being carried on at the present time? Yes.
152. You are of opinion that the deviation could be carried out for a sum not exceeding the amount of your estimate? Yes.
153. I presume that you have examined the No. 1 scheme, and that you have all the sections and plans in your office? Yes; I have also been over the ground.
154. As an engineer, do you think the scheme as practicable as the one you propose? It is quite practicable; but I do not like the long tunnel or the grade.
155. What is the difference in grade? The grade on the No. 1 route is 1 in 50, and on the No. 3 route 1 in 60.
156. You entirely object to the tunnel, which will be $1\frac{3}{4}$ mile in length? Yes.
157. Do you know if it is the practice in the old country now, when carrying out the construction or deviation of railways, to do away with tunnels where it is possible to get another road? I am not aware of that; but I know of tunnels being made to shorten lines.
158. But not tunnels anything like so long as this tunnel? The big tunnels through the Alps—the Mont Cenis and the St. Gothard tunnel—you may take as attempts to shorten lines, and so also is the Severn tunnel.
159. Have you any idea of the length of the tunnels to which you refer? The Severn tunnel is about $3\frac{3}{4}$ miles long; the Mont Cenis tunnel is about 8 miles; and the St. Gothard, about $9\frac{1}{2}$ miles.

160. I gathered from your evidence yesterday that it was impossible to properly ventilate long tunnels? I referred to tunnels on the ruling grade. One in 50 would be the ruling grade on the No. 1 route, and although the proposed tunnel is very much shorter than many of the long tunnels in the world, I am afraid it would be exceedingly difficult to ventilate it properly.

H. Deane,
Esq.,
M.I.C.E.

8 Mar., 1894.

161. Do you know how they effect the ventilation of the long tunnels to which you have referred? Sometimes by fans, sometimes by forcing in air. In the Mont Cenis tunnel they force in air, but the system is not very satisfactory. The natural currents that are produced under certain conditions of the atmosphere seem to clear the tunnel better than anything else.

162. Have there been great complaints about these long tunnels? I could not give you instances; but I know from hearsay, and from the reports that reach me, that the ventilation of some of the tunnels is very unsatisfactory, even where they have ventilating shafts.

163. I think another objection you had to the proposed tunnel on the No. 1 route was that the rails would be kept wet and greasy by the steam and smoke? Yes; and that would be particularly noticeable with a tunnel on the ruling grade, where the locomotives were being forced to do their utmost. Where a tunnel was not on the ruling grade it would not have the same effect.

164. Suppose the grade were 1 in 60, as it is on the No. 3 route, would the same objection apply? Greasiness of the rails has the effect of lessening the adhesion, and thus reduces the load which a locomotive can draw behind it. On the ruling grade this is a very serious matter, because the engine is then strained to its utmost, but on a grade less than the ruling grade it is not of so much consequence, because there is a margin to spare.

165. What would be the length of the longest of the seven tunnels on the No. 3 route? Seven hundred and sixty-eight lineal yards.

166. What is the character of the formation—is it sandstone? It is all sandstone.

167. Coming down to Dargan's Creek the grade is very steep on the No. 3 route, is it not? A grade of 1 in 61 is shown on the map, but it could easily be modified, and made a little flatter.

168. That would give a ruling grade right through of 1 in 60? Yes.

169. Have you, in your calculation of capital cost, taken into account the value of the rails and sleepers on the existing line which could be used elsewhere? No; I have not.

170. Do you propose to use them in any way, or would they go back to the Commissioners? I think that the cost of the deviation should be relieved of the value of the permanent way materials on the old line.

171. They would be credited to the Construction Department? Some arrangement would have to be made about that. It would depend which store account they were placed in.

172. What weight of rails do you propose to use on the No. 3 route? I have made provision for an 80-lb. rail, because I believe the Commissioners wanted it, and I have taken the prices given by Mr. Foxlee in his estimate of £225,000, so as to make the comparison of more value.

173. Is 80 lb. to the yard the weight of rails generally used on the existing line? I believe that the rails on the existing line are 75 lb. to the yard.

174. Is it necessary to use a heavier rail on a grade of 1 in 60 than on a grade of 1 in 42? I have no particular opinion to express on that subject. As a rule, I prefer a heavy rail to a light one. I consider that the 71½-lb rail which we have been using so much is a very satisfactory rail, and if I had been laying down this line I should have used it, but I see no objection to adopting a heavier rail.

175. If an error, it would be on the right side? Yes.

176. What is the difference in cost per ton between 71-lb. rails and 80-lb. rails? I have no figures with me, but the difference in cost would come to about £100 a mile.

177. I suppose you propose to use the same kind of sleeper as you use now? Yes; on that portion of the line large sleepers are used wherever the permanent way has been renewed, and I think it would be desirable to use them here—sleepers, 9 feet long by 10 inches by 5.

178. Do you provide for the lining of the tunnel with brick? No, I would line the tunnels with concrete at the side, and brick at the top, just as the Hawkesbury tunnels are lined. I think Mr. Foxlee proposes to use sandstone concrete all through; but I should prefer to have brick for the top. I have used bluestone concrete for single-line tunnels; but for double-line tunnels I think brick makes a more satisfactory arch.*

179. Your estimate provides for the lining of all the tunnels? Yes.

180. *Mr. Hoskins.*] What is the length of that portion of the line between the top of the first incline on the Zigzag and the reversing station at the end of it? Do you mean from the summit at Clarence tunnel down to the top points? That would be a little under 3 miles.

181. But the incline at the Zigzag does not commence near the Clarence tunnel. I am talking of the descending gradient at the commencement of the Zigzag? The line falls all the way from Clarence Siding right through Clarence tunnel, with the exception of a short length of level track.

182. What is the length of the second incline on the Zigzag? Roughly, it is nearly a mile.

183. What is the length of the third incline? That is about 1½ mile from the bottom points, down towards Eskbank.

184. Now will you tell me what are the grades on those inclines, and the length of each grade? The principal grade is 1 in 42.

185. On what part of the line is that? The greater part of the upper portion of the line has a grade of 1 in 42. Roughly, there is about 1½ mile of that grade. Then there is about ½ of a mile of 1 in 40, while the rest of the line is made up of two grades of about 1 in 66, and a small length of level.

186. Then the steepest grade on the three inclines is 1 in 42? As a matter of fact, it is 1 in 40.

187. That is only a very short length? Yes; and of very little consequence, because the train could rush it, I think.

188. Having visited the locality a great number of times, and being an engineer of great experience, have you observed that there is any special risk attaching to the working of the Zigzag beyond the usual risk attaching to the working of lines with steep grades and sharp curves? I wish you would excuse me from answering any questions relating to the traffic. I have no doubt that every precaution is taken to minimise the risk. I do not think there have been many accidents there, if that is what you mean.

189. I hold in my hand a return which you have handed in [*Vide Appendix*], giving a list of the grades steeper than 1 in 60 between Penrith and Dargan's Creek, and I find that there is 1 mile 62 chains of 1 in 30, and 13 miles 2 chains of 1 in 33. Those are steeper grades than the steepest grade on the Zigzag, and

* NOTE (on revision):—In any case sandstone concrete is objectionable. I do not allow sandstone to be used myself.

H. Deane,
Esq.,
M.I.C.E.
Mar., 1894.

and I ask you, as an engineer, whether there is any greater risk in working the inclines at the Zigzag, with a grade of 1 in 42, or 1 in 40, than in working other inclines in a grade of 1 in 30 or 1 in 33? No; I do not consider that the so-called risk of the Zigzag is due to the grades at all. Of course, perhaps, the steeper the grade the greater the risk, but the safety of a train depends upon the strength of its couplings, and you can make it as safe upon a very steep incline as it would be upon a flat one.

190. Therefore, if a train is furnished with Westinghouse or other continuous brakes, and the brakes are in good order, there is no greater risk in working the line between here and Bathurst than there is in working a mountain line anywhere else? I did not expect to be examined upon this point; but there is one thing I should like to say. The risk at the Zigzag is not a question of grade. It is due to the fact that trains have to be backed, and especially that they have sometimes to be backed up a hill. When a train is being pulled, the draw-bars are strained in their proper direction; but when it is being pushed up a hill with a steep grade and sharp curves, another set of conditions come in. Where there is a curve, and an engine pushing, the tendency is to drive the train off the road; but where the engine is in front, and is pulling, the tendency is to keep it on the road.

191. Is it not a fact that the inclines at the Zigzag are comparatively straight—that they are only slightly curved? No; they are very much curved.

192. But the long incline from Clarence tunnel down to the first points is pretty straight? No; it is not very straight, as you will see by looking at the map. There are sharp S-chain curves there.

193. Is that on the Zigzag itself? Yes.

194. I find, according to the return you have handed in, that there is one incline of 1 in 33, 1 mile and 26 chains long;—can you say whether long lengths of steep gradients like that have sharper curves than there are on the upper portion of the Zigzag? They have the curves usually adopted on the mountain line—S-chain curves are the sharpest there. In some cases these curves have been cut out; but some still remain.

195. Are there any S-chain curves on the Zigzag? I think I can show you that there are.

196. If one of the reasons for dispensing with the Zigzag is the steep gradients upon it, what advantage should we get from a deviation, seeing that there are upwards of 13 miles of steeper gradients between Penrith and the Zigzag? I think I can explain that. The heavy gradient which is mentioned in the Commissioners' report, and which they specially desire to get rid of, is the 1 in 33 near the Clarence tunnel. In order to get up that incline, trains have frequently to be divided at Bell, the old Mount Wilson platform, but in working the long series of inclines from Emu Plains to Katoomba, the Commissioners make special arrangements, and employ extra hauling power. They make that portion of the line a special section, and run on from there.

197. They use extra locomotive power where there are grades of 1 in 30 and 1 in 33? Yes; and then they run on with less locomotive power as far as Bell. If the 1 in 33 to which I have referred were cut out, they would be able to run on to Eskbank, or even beyond that place. The 1 in 33 grade is so objectionable, because it is the only heavy grade between Katoomba and Eskbank.

198. Could it not be cut out without dispensing with the Zigzag? Yes; by the deviation shown on the map by a dotted red line, at a cost of £19,000.

199. If the inclines on the Zigzag are not excessive, and the real obstacle to the successful working of the line is the gradient of 1 in 33 east of the Clarence tunnel, would it not be sufficient to cut out that gradient without going to the large expense of making a deviation such as you propose? Not altogether; because, although trains might be able to run right through if that gradient were cut out, there would be no room at the ends of the Zigzag for long trains. There would not be room for them to stand there before the points were opened, so that they could go down the lower line.

200. Could not the difficulty be obviated by using some of the spoil from the overhanging banks to make a roadway? It could easily be obviated at the lower points; but it would be a difficult thing to do at the upper points.

201. What would be the difficulty? If you cut through the little bit left at the end of the line there, you would drop into a gorge. The available length there is very small.

202. Could you not make a road by using the spoil from the high banks there? The line would not be safe unless you had a very effective stop-block. There would be a very real danger then.

203. If you lengthened the reverse incline, so that the trains would be reversed with the steep incline against them, would not that arrest their momentum? That would mean an extra length of itself, because, of course, a train would not stand at the reversing place.

204. It would while it was being reversed from one line to another? Perhaps by dropping down the brakes very quickly it might; but I do not think there would be room for that.

205. Even supposing that there is a deep gulch on the other side of the cutting, could not the difficulty be got over by the erection of an iron culvert? No; because you would have to go, perhaps, three-quarters of a mile before you got on to the ground again. The Commissioners in recommending the cutting out of the Zigzag have referred to the cost of working it. There are signal-boxes at both the top and bottom points, and this necessitates the employment of labour and increases the time of running.

206. Will you kindly furnish, as an appendix to your evidence, a statement showing the grades from Dargan's Creek to Eskbank, together with the number of curves and their radius—that is, on the existing line? I will have that information carefully made out.

207. From your knowledge of the working of railways here and in other parts of the world, do you consider that there is less, or that there is more danger in running an ordinarily laden train down an incline of 1 in 50 than in running it down a shorter incline of, perhaps, 1 in 42? I do not think there would be very much difference if you had efficient brakes. The safety of a train depends upon its brake-power.

208. I may summarise your evidence by saying that you do not consider that there is more than ordinary danger with steep gradients and sharp curves, provided a train is properly equipped with continuous brakes? I think so. There is a slight element of danger with sharp curves; but it is surprising how few accidents occur.

209. The curves are got over by adopting different rolling-stock and bogeys? Yes.

210. *Mr. Neild.*] The danger of pushing trains is partly due to the fact that the carriages being lighter than the engine they are more likely to leave the rails when they are in front? Yes; there is a greater chance of lifting.

H. Deane,
Esq.,
M.I.C.E.
8 Mar., 1894.

211. Is there more risk in propelling trains with one engine pushing and the other pulling than where there is only an engine pushing? Yes; because where there is only one engine, and that is pushing, the risk extends over the whole length of the train. If there is one engine pushing and another pulling you may assume that each engine does about half the work of propelling the train—the hind engine pushes up half the train while the front engine pulls up the other half.
212. So that the risk is minimised? Yes.
213. I suppose on the steep gradients between Dargan's Creek and Penrith, when two engines are used, you have always one pulling? I am not sure how that line is worked, but I do not think that they have pushing engines there, but double engines.
214. You have submitted a modification of the No. 3 route, with a grade of 1 in 90, leaving a little bit of 1 in 60 at the Bathurst end. Is the portion of 1 in 42, which is shown on the first plan of the No. 3 route, cut out? That 1 in 42 grade is not touched by any of the deviations.
215. So that if the 1 in 90 grade were adopted it would bring you up to a piece of 1 in 42 forthwith? Yes.
216. Is there much of the 1 in 42? About $1\frac{1}{2}$ mile below the lower points.
217. Do you know if it is intended to cut out any part of the 13 miles of 1 in 33 between Dargan's Creek and Penrith? No.
218. Has that matter come before you officially? No; it would be a very expensive thing to do, and would mean an entirely new line.
219. So that while it is now sought to get rid of 5 miles of 1 in 40, there will be 13 miles of 1 in 33 left behind? The proposition is perfectly sound. The grouping of heavy grades is a recognised practice in railway management. When heavy grades come together like that, there is not the same objection to them as when they are scattered, because pushing engines can be used to advantage. In the case of the mountain line these heavy grades are near Penrith, and there is only a comparatively short run up to Katoomba and back. If they were scattered all over the line there would be a long additional distance to be run.
220. Is it not proposed to make a considerable alteration in the line at Linden, cutting out the S curve and changing the grade? I do not know what the Commissioners propose to do there; but a great many changes have been made. I started laying out some myself.
221. But this matter does not come before you as Engineer-in-Chief for Railway Construction? No.
222. I think you stated yesterday that it was an open question with engineers whether the introduction of ventilating shafts did not interfere with the natural ventilation of a tunnel? Yes.
223. Are we to gather from that that, supposing the tunnel on the No. 1 route were constructed with direct ventilating shafts, there would be a tendency for the air going in at each end to pass up the shafts, leaving the middle of the tunnel unventilated? That might happen under some conditions of the atmosphere. This is a matter which has been reported upon several times; but there still seems to be great uncertainty about it.
224. Had you anything to do with the construction of the tunnel at Lapstone Hill? I laid out that line, but I did not construct it.
225. You have travelled through the tunnel? Yes.
226. Have you noticed that in certain states of the wind passengers experience a sensation of suffocation in the tunnel? It is very hot sometimes, even if you shut the windows.
227. Have you noticed that the sulphur produced by the combustion of coal has a suffocating effect there? Yes; but it is the same in many other tunnels—Oxford tunnel, for instance.
228. What is the length of the Lapstone tunnel? About 35 chains—770 yards.
229. That would be 2,000 yards shorter than the tunnel on the No. 1 route? Yes; but you must recollect that it is a single-line tunnel.
230. A double-line tunnel would be better ventilated? Yes; the products of combustion would not foul the larger body of air in a double-line tunnel as they would foul the air in a single-line tunnel.
231. You spoke of lining the tunnels on the No. 3 route with brick arches and concrete at the sides;—is there any truth in the popular idea that concrete has a tendency to detach itself from live rock? I do not think it would matter particularly if it did.
232. You think it would be kept in place by the weight of the brickwork? Yes.
233. What would be the thickness of the concrete? Eighteen inches.
234. And of the brickwork? That would also be about 18 inches.
235. The bricks would be set in cement? Yes.
236. Would you use pressed bricks or ordinary bricks? I should use a good, sound, strong brick.
237. You have no preference for the pressed bricks? Pressed bricks look very nice; but some of them are very brittle. If I got a good strong brick I would accept it, even if it were not so pretty to look at.
238. Would the brickwork be set wet or dry? All wet.
239. Do you use mortar for such work? Not lime mortar. There is a great deal of work done in England with lime, but it is hydraulic lime. There is no such lime out here, or at any rate it is not marketable. There is New Zealand lime.
240. If you fill up the gullies with the material excavated from the tunnels, that will minimise the cost of the tunnelling to some extent, because you will not have to remove the debris any great distance? Yes.
241. As a very large portion of the traffic on the Western line, especially as far as Lithgow, is tourist traffic, which of the three proposed deviations would be the best from a passenger point of view? As to comfort, I think No. 3 would certainly be the best, and would give some good views of the Hartley Valley.
242. Do you think the tunnel on the No. 1 route, especially in this hot climate, would be a deterrent to the passenger traffic? I am afraid that the cutting out of the Zigzag will deter many people from travelling down there. At times a good many people travel from Mount Victoria, Katoomba, and those places simply to look at the Zigzag, and if we can give them something in exchange for it that will, perhaps, be so much gained.
243. A tunnel $1\frac{3}{4}$ mile long would be a very bad exchange? Yes.
244. I understand that you do not put the No. 2 proposal forward for investigation? I do not recommend the No. 2 proposal, though I think it provides a very nice method of getting rid of the Zigzag, if that is all you wanted.
245. Would there not be a very sharp curve between the second and third tunnels on the spiral? No; they are all 15-chain curves.
246. Why do you recommend specially large sleepers for this work? Because of the heavy traffic.

- H. Deane,
Esq.,
M.I.C.E.
8 Mar., 1894.
247. Suppose the No. 3 route were adopted, would not the traffic be lighter than it is now? It would; but you would have the same heavy engines going over the line, and it is far better to have heavy sleepers, because they make a safe road. If I had to relay the whole of the mountain line, I would put down big sleepers.
248. You put them down wherever an alteration is made? Yes; if I were making an alteration in any part of the line, I would put down the best class of permanent way as far as sleepers, ballast, and rails went.
249. Notwithstanding that the No. 3 route would cost something like £50,000 more than the No. 2 route, you prefer it? Yes.
250. Do you think that its advantages more than outweigh the additional £50,000? Yes; because it is such an improvement to the line.
251. And the improved grades and reduced cost of the No. 3 route are a very sufficient set-off to the shorter length of the No. 1 route? Yes. I should like to say in regard to the No. 2 route, that although it is much shorter and less expensive than the others, it leaves a great length of the line unduplicated. On the No. 1 and the No. 3 routes a double line is provided for right through.
252. The tunnels are constructed for a double line; but will you lay a double line of rails in them? Yes; that is included in the estimate.
253. And will you lay a double line of rails between the tunnels? Yes; there will be a double line right through.
254. *Mr. Wall.*] Do you regard the mountain line as likely to be the main line of communication to the west in the future? Yes.
255. Reference has been made from time to time to alternative routes up the Colo Valley from Blacktown to Blayney, do you think it likely that these lines will be made? I do not think so;—not as competing lines.
256. Do you know for what distance an additional engine is used in connection with the Zigzag? I think the pusher engines are run up to Clarence Siding and then run back again.
257. Have you any idea of the number of engines used for that work at the present time? No; I have seen no return.
258. Would the construction of the proposed deviation do away with the necessity of employing those engines? They would still have to push the train up to the lower points.
259. Over the 1 in 42 grade? Yes.
260. Do you know how many trucks an engine is supposed to be able to haul on the mountain grades without the assistance of a pushing engine? I would rather you got that information from the Traffic Manager.
261. I presume you have only regarded this proposal from an engineering point of view. You cannot say whether the deviation is necessary as a matter of economy? No; I have not entered into calculations of that kind.
262. I understand that the deviation will save time which is now wasted on the Zigzag, and will avoid danger. Can you tell us what will be gained by the saving of time? No; I cannot.
263. Speaking as an engineer, is there any great risk in running over the Zigzag? I do not think there is very much risk. It is more an inconvenience to the traffic, I should say.
264. You think that the present line is comparatively safe? Yes, if proper precautions are taken.
265. Such as have been exercised in times past? Yes.
266. You think the only advantage to be gained by making the deviation would be the saving in time? Yes; and in hauling power.
267. Is there any advantage in increasing the hauling power of an engine at one particular part of the line when there are steep gradients in several other places? Not if the steep gradients are scattered; but if they are grouped together there is. It is advantageous to cut out an isolated gradient.
268. Do you know the estimated cost of the extra engine power required for goods traffic on the mountains per annum? No; I have no particulars.
269. What saving in distance will be effected by the construction of No. 3 route? Sixty-one chains.
270. And by the construction of No. 2 route? There will be no saving there. The distance is approximately the same.
271. The only advantage to be gained by the construction of No. 2 route would be the lessening of the gradients, and the avoidance of the Zigzag? The avoidance of the Zigzag is the one advantage.
272. What saving in distance would be effected by the construction of the Commissioners' deviation? About 2 miles 66 chains.
273. A little more than 2 miles more than the saving on the No. 3 route? Yes.
274. I understand that the grade on the Commissioners' deviation is 1 in 50;—have you examined the plans and sections of that proposal? Yes.
275. Do you think that the line could be constructed from its starting point to its point of convergence with the main line with no steeper gradient than 1 in 50, the present 1 in 42 grade being done away with? That would make it more expensive, because it would bring the formation lower down.
276. What do you think would be the extra cost? I do not know, because I have not gone into the matter.
277. This 1 in 42 grade would remain, even if either of your proposed deviations were carried out? It is shown on the plan of the No. 2 route; but I do not recommend that route. I have simply put it before the Committee to show a certain stage in the progress of the investigation.
278. Taking into consideration the fact that pushing engines will accompany the trains up the gradient of 1 in 42, while single engines will take them over the 1 in 50 grade, may we not say that the work would be as well performed by two engines on the 1 in 42 grade as by one engine on the 1 in 50 grade? Yes; but I do not know what the Commissioners propose to do in this matter, or how far they will run their pushing engines, but I believe to Dargan's Creek. It would not be absolutely necessary to run an additional engine further than the top of the 1 in 42 grade.
279. Would not a grade of 1 in 50 compare very favourably with other grades on the Blue Mountains? All the other grades in that direction are 1 in 50; but in the tunnel the bad ventilation would be a disadvantage.
280. Would not an engine which could draw a load up the 1 in 50 grade in the tunnel be able to take it over the stiff gradients already existing on the line? Yes; 1 in 50 being the ruling grade, if an engine could

could take a train through the tunnel, it could take it up any other grade on the line, unless there were very unfavourable conditions elsewhere.

281. If an engine could take a train through the tunnel on a 1 in 50 grade, do you think it would be wise for him to lengthen the tunnel in order to lessen the grade? The difficulty of dealing with the smoke would be very great. I think that if it were an open line a grade of 1 in 50 would do very well.

282. The great objection to the Commissioners' proposal is the difficulty of properly ventilating the tunnel? Yes.

283. Do you think it probable that at some future time the mountain grades will be uniformly reduced, or, at any rate, reduced to a very great extent? I doubt if very much could be done in the way of cutting out the 1 in 30 and the 1 in 33 gradients on the eastern side. It looks as if the mountains had actually been made for those gradients.

284. When you speak of the ruling grade on the mountains being 1 in 50, I take it that you include several steeper gradients, which, however, are only short, and which the engines can therefore deal with? I am speaking of the ruling grade in one direction only.

285. Are we to infer that an engine which could take a train up a 1 in 50 grade, could take it over any portion of the mountain line? Yes; in an easterly direction, with the exception of the 1 in 42 grade on the western side of the Clarence tunnel. There is a grade of 1 in 50 on the Sydney side of Dargan's Creek, running for about $1\frac{1}{2}$ miles.

286. Have you any idea as to the cost of running engines per train mile? Over this line?

287. Yes? You could get that information from the Department. The Commissioners, in their last report, say that the average cost of working the railways over all the lines per train mile is 4s. 7 $\frac{1}{2}$ d., and from the report it would be easy to work out what any particular part of the expense of running a train is.

288. What is the distance from the point where the pushing-engine ceases to run now to the point where it would cease to run if the deviation were made? That would depend upon the working of the line.

289. Assuming that it went over the 1 in 42 grade, what is the distance from the 1 in 42 grade to the Clarence siding? The steep grades run up to the Clarence tunnel.

290. But I am supposing that the Commissioners' proposal is carried out? The steep grade will then terminate at the lower end of the big tunnel.

291. I want to ascertain what distance would be saved in the running of the pushing-engines by the construction of the deviation? I should think about 4 miles, unless they run to Dargan's Creek.

292. I take it that the distance from the lower points to Clarence siding would be saved? Yes; from the 88 miles down to near the 92 miles.

293. *Mr. Collins.*] How long has your Department had this matter in hand? Since about the beginning of the year.

294. Do you think you have exhausted all means of getting the best route? I believe that the line I suggest will prove to be the best line; but I gave instructions to Mr. Kennedy, the gentleman who surveyed and suggested the line, to look on the north side of the existing line, because it was suggested some years ago that a line could be taken down Farmer's Creek. When he had run No. 3 line, and had time to go into the matter more fully, he reported to me that some of the Commissioners' engineers were down there, so I left the matter as it stood, only telling him to take a few aneroid levels.

295. Your Department is not working against the Commissioners? I am not working contrary to the Commissioners. I am trying to get the best line for them.

296. If the Commissioners should find a better line, would you adopt it? Certainly; but I think it rather a pity that young men without experience should have been sent out. I am certain that if some of my men had been sent up I could have got reliable information long before this.

297. *Mr. Ewing.*] This is simply a matter of route, is it not? Yes.

298. It is a matter of the best way to get through a piece of difficult country? Yes.

299. Looking at the time-table, you will find the height of Mount Victoria given as 3,422 feet; then we come to Hartley Vale, 3,318 feet; Bell, 3,478 feet; Clarence siding, 3,658 feet; and there you are upon the crest of the ridge? Yes.

300. Then, when you get down to the water of the Cox, you have 3,470 feet at the bottom of the Zigzag, 3,033 feet at Eskbank, 3,006 feet at Lithgow, 2,972 feet at Bowenfels, and then you are on comparatively level country again? You are in the valley there.

301. Your difficulty is to cut out the 588 feet between the crest of the hill and the waters of the Cox? You mean from Clarence Siding down; but we do not start there.

302. I know that; you start at Dargan's Creek? Yes; Dargan's Creek is about 230 feet lower.

303. All the way from Katoomba to Blackheath you are on the watershed between the Colo and the Cox? Between the Grose and the Cox. You only get the Colo River when you come to Bell.

304. But it is the same water. You want to get off that table-land down to the water of the Cox. Now if you follow along the red line marked on the map, showing "constructed lines and trial surveys" which is before you—the trial survey from Richmond to Wallerawang—to near the 90 miles, you have headed the water of the Cox, following it down on the northern side, and that gives you a long run into Eskbank, enabling you to cut out the 300 feet which you now cut out by the Zigzag? That is very rough country, and the range rises along there.

305. But the map appears to show that if there is a route to be found through there it will be found on the northern side of the existing line? I do not altogether see that.

306. I grant that there may be local reasons why such a route would not be practicable, but if you keep on the ridge between the waters, until you get a long run down into Eskbank on the northern side of the creek, you get all that you want? I can see that that looks possible on the map. That is where you would naturally look for a good route, and I believe the matter has been inquired into.

307. You think it has been looked into? I have not the slightest doubt of it from what I have been told, but it was before I had anything to do with the line.

308. You have no personal knowledge of it? That is so.

309. You do not know what caused them to build the Zigzag in the first instance? No; if you called Mr. Whitton I believe he would be able to tell you all about it.

310. You know nothing about a route from Eskbank following up the northern side of the Cox water? Nothing, except this, that generally speaking, the range, instead of becoming lower, rises. There may be some gaps or short saddles through which it would be possible to get, but in the main the country rises.

H. Deane,
Esq.,
M.I.C.E.
8 Mar., 1894.

- H. Deane,
Esq.,
M.I.C.E.
8 Mar., 1894.
311. What fall is there in the Commissioners' tunnel from end to end—about 170 feet? Yes; I suppose about that, roughly.
312. You get rid of that fall by following round a kind of plateau to the south? Yes; it is a very old idea, that of going through, and is one that naturally suggests itself. I pointed out to Mr. Eddy, soon after he came here, that it would be possible to get through there by means of a tunnel.
313. *Mr. Humphery.*] You were asked some questions by Mr. Davies about tunnels. I notice that in Whittaker's Almanac there are several long tunnels mentioned. There is one under the Severn, on the Great Western line, nearly $4\frac{1}{2}$ miles long;—do you know that tunnel? I know it by repute. I have an account of it in the office.
314. Then there is the Totley tunnel, on the Midland line, 6,200 yards long; the Standege on the North-western, and the Woodhead on the Manchester and Sheffield, each between 5,000 and 6,000 yards long. Can you say if the conditions under which the proposed tunnel would be constructed differ very materially from the conditions under which those tunnels were constructed? Yes, they do. I have not seen the Severn tunnel, but I believe that they have artificial means of ventilating it. The Totley tunnel has easy grades, but I believe the Standege and the Woodhead tunnels have been very troublesome as regards ventilation.
315. Do you know what means are employed for ventilation? I believe they use a fan for ventilating the Severn tunnel. The Woodhead tunnel has a ruling grade of 1 in 200.
316. Is it for a double line? I expect so. I am inclined to think that Mr. Eddy told me that the Standege tunnel was a troublesome one to ventilate.
317. The No. 1 route is about 2 miles shorter than No. 3 route;—what would be the difference in annual cost in favour of the No. 1 route? That would depend upon the number of trains going over the line.
318. Taking the present traffic as a guide in your calculation? I believe that the average number of trains in both directions is eighteen or nineteen a day. It would be very easy to make a calculation.
319. Will you make an approximate calculation, taking the traffic as twenty trains a day? That would be about 6,260 trains a year, taking six days a week, so that an extra mileage of 12,520 miles would have to be run.
320. What would be the average cost per mile? It would not be fair to charge the full train mile estimated by the Commissioners.
321. *Chairman.*] Have you arrived at any idea as to what would be a fair charge per mile? I do not think myself that the cost per mile will be more than 2s.—it would be something between 2s. and 2s. 6d., because the "green" line is a better and more favourable line in every respect.
322. *Mr. Humphery.*] Two shillings and sixpence a mile would give about £1,500 a year in favour of the No. 1 line in the matter of haulage expenses? Yes, it would be about that. I find that in Western Australia, where they have been going in heavily for improving the grades, the Engineer-in-Chief put down the cost of running at 2s. per train mile, so that 2s. 6d. would be a very fair estimate here. It is not a question of cutting out stations or cutting down the staff—it is merely the shortening the actual running of the trains on better grades.
323. Two shillings and sixpence is a liberal estimate? I think so, under the circumstances.
324. *Mr. Neild.*] You would do away with the station at Clarence Siding? I think there would be a station on the top, but that would be the same in each case.
325. *Mr. Humphery.*] Is there any other feature in the No. 1 proposal which would reduce the annual expenses, as compared with the No. 3 proposal? I do not think so. The advantage would be all the other way. If the tunnel were troublesome and very smoky there might be an annual charge for maintaining ventilating machinery.
326. The saving in annual cost which you have mentioned is the only advantage that the No. 1 scheme has over No. 3? Yes; in my opinion it is.
327. What advantage has the No. 3 scheme over the No. 1 scheme in the matter of saving? There would be the saving of the interest on £40,000, which would be the difference in the cost of construction.*
328. What other saving would there be? It is rather difficult to put the saving in actual figures, but you would save in being able to use the line earlier. If £10,000 a year is to be saved by the use of a deviation, you would commence to save that money a year sooner by adopting the No. 3 scheme than you would save it by adopting the No. 1 scheme, because I am quite sure there would be very considerable difficulties in connection with the carrying out of No. 1 scheme.
329. Is there anything else? There is the problematic saving in ventilation, but that I cannot give you.
330. You cannot get figures to represent that? No; nor can I give you figures showing the greater comfort to be derived by the passengers.
331. *Mr. Davies.*] What is the distance on the existing line from Clarence tunnel to the top of your proposed deviation? A little over 1 mile.
332. Is there any settlement along the existing line? No, there is no settlement there. There is a house belonging to Mr. Munford near the $89\frac{1}{2}$ miles.
333. No injury will be done to existing settlers or landed proprietors by the deviation? I should not think so, but letters have been sent in to the Department threatening claims. You will find that mentioned in the *précis* handed in by the Under Secretary.
334. The residents on the existing line are likely to put in claims for compensation if the deviation is made? They say so, but they would have very great difficulty in showing that they were under a disadvantage.
335. I presume that you do not regard that as a serious charge against the proposal? No.
336. *Mr. Humphery.*] Were any claims made by the people of Lucasville, because of the deviation at Lapstone Hill? I was not engaged in that work.
337. Did you hear of any? No; but I did not make inquiries.

FRIDAY,

* Note (on revision):—Provided always the estimates are right, but I am inclined to think that Mr. Foxlee has made far too little allowance in his prices for the difficulties of executing such a long tunnel on such a steep grade.

FRIDAY, 9 MARCH, 1894.

[The Committee met at the Council Chambers, Lithgow, at 7 p.m.]

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).	
The Hon. WILLIAM HENRY SUTTOR.	WILLIAM CHANDOS WALL, Esq.
The Hon. FREDERICK THOMAS HUMPHREY.	WILLIAM McCOURT, Esq.
The Hon. JOHN DAVIES, C.M.G.	JOHN CASH NEILD, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	EDWARD WILLIAM O'SULLIVAN, Esq.
THOMAS THOMSON EWING, Esq.	CHARLES COLLINS, Esq.

The Committee further considered the proposed Deviation to avoid the Lithgow Zigzag.

Edward Merigold Munford, Esq., sworn, and examined:—

338. *Chairman.*] What is your occupation? I have no business at the present time.
339. Are you in any way a professional man? I have been. I was on the survey with Mr. Whitton at the time he was surveying from Bathurst to Rydal. I was also with him when he made the tunnel—from twenty-five to thirty years ago.
340. Are you a licensed surveyor? No.
341. Do I understand that you were engaged under Mr. Whitton in the laying out of the line? Yes; I was with the party of Mr. Ashplant, who was surveying the line from Bathurst to Rydal, and from Rydal to Lithgow, without emolument.
342. What are we to understand by that? I joined them for the sake of having something to do, and knowing something about the country and engineering. Being a Canadian, I knew something of the Pacific Railway.
343. You were not a surveyor, but you joined the surveying party? Yes.
344. What as? I acted then as staff man for the purpose of gaining information.
345. You have been residing in this district for some years? About thirty-five years in the Bathurst and Hartley districts.
346. Whereabouts is your residence? On the Great Zigzag. I am interested in the Mount Edgecombe estate with others—very much interested, having a great opinion of the vast beds of minerals it contains.
347. We understand from a letter which you have sent to us that you have forwarded a communication to the Minister for Works in connection with this matter? Yes.
348. When was that—in February last? I think it was.
349. Do you know if the Constructing Department has made any inquiries into the feasibility of your proposed scheme? I am not aware, except that one line has been surveyed. I found the pegs the other day on the top of the hill above the New Vale line as proposed by me.
350. How did you arrive at the details contained in your letter? From the Government levels, which I took myself, and from observations; I know every ravine and gorge in the vicinity for miles around.
351. You have just taken the different heights shown on the various points of the existing line, and made your deductions from them? Yes.
352. You have done no work with instruments? None whatever; but I think you will find my details correct.
353. Your proposed deviation is from about the 86-mile post to the Clarence tunnel in the first instance? Yes; a direct line from the 86-mile post to Clarence station—slightly curving.
354. Would there be any tunnelling in that piece? Not any; it would be all cuttings and fillings.
355. The deviation would shorten the line between those two points? Yes, very much; at least 1 mile.
356. Your next deviation is on the south side of the Clarence tunnel. How far south of the tunnel would you leave the main line? About a mile and a half from Clarence station.
357. One of your routes comes down the Vale, as you call it? It comes down to the New Vale colliery direct under the village reserve of 513 acres. It follows that for 56 chains.
358. That is tunnelling? Yes.
359. Then you have another project called the Vale of Clwydd deviation? Yes.
360. Which turns off where? About a mile from the main line, or this side of Clarence station.
361. On the second deviation? Yes; terminating at the Eskbank coal and water stage on the main line.
362. That is also a tunnel? There are two tunnels, each 25 chains long. The rest of the line is all cutting and filling. The total distance is about $2\frac{3}{4}$ miles to the intersections of the main line.
363. Might I ask how you are able to state definitely that the length will be so many chains, without having used any instruments upon the ground? I took the levels from the Government marks at Clarence Siding, at the bottom points, and at the Eskbank platform. From these I find that the fall, 633 feet, gives a gradient of 1 in 47. You could not be mistaken in regard to the Government heights at those places.
364. But how did you arrive at the distance between the various points? Taking out the Zigzag, which we know makes a difference of 2 miles in the line, it makes the distance 5 miles from Clarence station to Eskbank, or less.
365. That is a very rough way of calculating? Well, it is only an approximation; it might be even more.
366. You are not aware whether the constructing authorities have sent an officer to report upon your scheme? No.
367. Have you had any reply from the Works Office in regard to it? No; and I have not urged the matter too much. I was willing to go to expense myself to show the Government that there might be a route, and a more useful one, and less expensive in construction.
368. Not being a professional man, you could not give us any idea of the cost of your proposals? I should be very pleased to take a contract at £25,000 a mile for a single line of railway. The public opinion here is that the Zigzag should not be done away with. Let the Zigzag or present line be only a down line.
369. But if the Commissioners who are working the line are of opinion that it is an obstacle to the efficient, not to say the safe working of the traffic, do you not think that they are the better judges? That is a question very possible; but we have fewer accidents on the Great Zigzag than on any other part of the line, because greater care has been taken there, and the road is in a perfectly good state. The beds of the viaducts are thoroughly settled, and there is nothing to show but what the line is perfectly safe in every respect.
370. What is the approximate length of the deviation which you would be pleased to construct at £25,000 a mile? From the coal-stage to Dargan's Creek?
371. Yes? Altogether it would be about 5 miles. There would be $1\frac{1}{2}$ miles of the old line used, the deviations coming out at the levels where we were to-day. The total distance would be $6\frac{1}{2}$ miles from Eskbank to the crossing at Dargan's Creek by the proposed deviation in contemplation as suggested by me.

E. M.
Munford,
Esq.
9 Mar., 1894.

E. M.
Munford,
Esq.
9 Mar., 1894.

372. What grade would you get between Dargan's Creek and the Clarence tunnel? I did not calculate that in particular, but it would be 1 in 43, approximated from the Government levels.
373. Are you aware that between those two points on the existing line, although the distance is longer than your proposed deviation, the grade is 1 in 33? I am aware that it is 1 in 33 at the present time; but the deviation would be 1 in 43 or 1 in 45, as near as possible from the 86-mile post to Clarence station.
374. How do you manage to get a flatter grade in a shorter distance without tunnelling? That is very simple—by the viaducts being heightened. If you build the viaducts up high, you, of course, have to bring your works up to them.
375. That would be at Dargan's Creek? Yes; a high level viaduct.
376. But it would alter the grades to the east of Dargan's Creek, would it not? Not at all. It would reach the 86-mile post at Dargan's Creek on the opposite side. The grade there, where it struck the main line, would be 1 in 66 going to Bell station.
377. Do you know what the grade is now, running down to Dargan's Creek from Mount Victoria? It is 1 in 66, 1 in 70, and 1 in 81, and I think 1 in 45 near the crossing at Dargan's Creek.
378. Is it an ascending or a down grade? It is a down grade, except for a dead level of 2 miles. Then there is a descent of 1 in 66, 1 in 43, and 1 in 33. There is a level and an up-grade of 1 in 33 to Clarence station.
379. Then, coming westward, it is an ascending grade of 1 in 33? Yes.
380. You propose to get a shorter route and a better grade by raising the bridge over Dargan's Creek? Yes; it would be very easily done, and there would be a beautiful spot to land upon.
381. Did you make an offer to the Department to construct these deviations? I did.
382. Did you give any substantial guarantee? Well, to get the money is, of course, a guarantee. There is a big firm in Sydney who say that they would supply the money and build the line, taking Treasury notes for five or six years in payment.
383. On such an approximate estimate as this? Exactly. Of course, we should have to have a survey. We could not do without that, and our guidance would be by the cost of other works in approximating.
384. And if the instruments were more accurate than your fancy, the scheme might tumble to pieces? Of course. I would not say but it might, though I do not think so. The offer to the Government was conditionally.
385. You heard me describe the proposal of the Railway Commissioners to make a tunnel from Dargan's Creek to the bottom points. Are you in a position to give us any information as to whether that is a good proposal? It is a very bad one for all those who own property on the mountains.
386. Why? In the first place I have travelled often through the tunnel at Lapstone Hill, and I can assure you that, some day, passengers with weak lungs will be found dead there. On one occasion, when I was coming through, two ladies fainted away before we got out of the tunnel. I do not believe in tunnelling at all, if it can be helped. In this case, with a 66-chain tunnel, I should certainly advocate the construction of two or three air-shafts, if not more, 20 chains apart.
387. Do you think that that would effectually provide for ventilation? Yes, greatly; it would depend upon the size.
388. Then there is not so much difficulty in providing ventilation? It would cost a lot of money to do the work. Cavity air shafts, 4 feet by 8 feet, would cost £100 each. All would depend upon thickness of cutting for shaft.
389. Are you aware that all these proposals contemplate a double line? It is not stated whether the line is to be double or single. If double, the cost would be one-third more.
390. Yes; it is so stated. Are you aware if it is easier to ventilate a double tunnel than to ventilate a single tunnel? It is a great deal more expensive to ventilate a double tunnel.
391. On what grounds do you arrive at that conclusion? In the first place there is the foundation to the air-shafts. Unless pillars were built in the centre that could not be done. I have travelled a good deal in my lifetime, and I have seen some splendid railways in Canada, and other parts of the world.
392. It is only because a double tunnel would give you a less secure foundation for your proposed air-shafts that this ventilation would be more expensive? Well, that could be obviated by building from the bottom, and running shafts, called cavity air-shafts, up to the top of the tunnel, on each side.
393. Are you aware that engineers generally think that it is a far easier matter to ventilate a double-line tunnel than a single-line tunnel? Of course, I have never gone into that matter properly myself. These air-shafts did not concern me, but may do so some day.
394. Does it not commend itself to your common sense that since the volume of air in a double-line tunnel is greater than that in a single-line tunnel it must be purer? No doubt a double-line tunnel would be an improvement in that way, and double the quantity of air would be in circulation.
395. Is that the only objection you have to the Commissioners scheme? That is the only objection, together with the expense and damage to resident owners of property by the deviation. The public, if money is to be expended, would like to see the results of the expenditure. We do not want it to take place underground. On the Great Pacific Railway, wherever they could show scenery that would induce people to travel over the line, they did so, and the evidence taken before committees in Canada was principally from the Hudson Bay Company, and from hunters. The Indians themselves gave the greatest amount of evidence in regard to those lines, and the railway officers were always pleased to obtain the information.
396. Then you think that the primary object in constructing railways is, not to give speedy communication between various places; but to allow people to look at scenery? Yes; it is the passengers who pay for the railway, not the produce that is sent along it altogether; to wit, the mountain tours.
397. Do you know what proportion of travellers go over this mountain line by night? No; I could not say what it is, but many, if not all, return by day trains to view the Zigzag.
398. I suppose the night passengers do not stop in order to see the beauties of the country? I have travelled by moonlight, and seen a great many people enjoying the Zigzag. Thousands of people have come to this part of the country for the purpose of seeing the Zigzag. When it was opened by Lady Bolmore, it was the greatest sight that was ever seen in this country.
399. But is it not a fact that by your deviations you propose to take people underground where they now go overground? I only proposed a single line, so that the Zigzag may be used as a down line. Passengers are not afraid of being killed on the Zigzag by any means.
400. Do you know anything about the No. 3 route? I do not.
401. I think you accompanied the Committee in their inspection to-day? Yes.
402. Did you see the plans? I could not get a proper look at them.
403. Then you have no knowledge of the route? No; except what I saw on the ground.

404. Suppose the No. 3 route will serve a larger area of country, give more extensive views, and require less tunnelling than your route, what would you say? I do not think it could, and neither would it. Quite to the contrary.
405. During your employment under Mr. Whitton, and your residence in this district, have you explored the country at the top of the mountains? Yes; for miles and miles.
406. Do you think it practicable to secure a route, starting (say) from Dargan's Creek, or just this side of Bell, and following Bell's line, coming down Farmer's Creek? There is nothing impossible about it, but it is very improbable.
407. You are not aware whether the country offers special facilities? No; I am not. I know the head of the Wollongabbie, and I know the Colowell and the Walgan. If the Clarence tunnel is cut out we shall not be able to get away from there; but if the Clarence Siding station remains, we shall be able to open tens of thousands of acres of the finest land in the country.
408. Is it because the carrying out of either of the proposed deviations would do away with the main line from Dargan's Creek to the bottom points, and cut you off from railway communication, that you object to them? Yes. If the deviation were constructed, it would cut me, and others, off from railway communication. The land I refer to contains very large quantities of ores, coal, and shale.
409. Is there anything else you desire to state? I do not know of anything else. There are only three practical routes for a deviation, and they must be single lines, the Zigzag being utilised as the down line, from Sydney to Bourke.
410. The three practical routes are those which you have suggested? Yes.
411. They must be single lines? They can be double lines if you go to the expense.
412. *Mr. Suttor.*] Where do you propose to start your line? About 10 chains to the west side of the 86-mile post from Sydney.
413. How far is that from your place? It would be about $1\frac{1}{2}$ mile from Clarence Siding, passing through the Mount Clarence Estate, which is owned by Mr. Reynolds.
414. Where is your estate? It adjoins Mr. Reynolds.
415. Is your line a straight one from the 86-mile post to the Clarence tunnel? Yes; from that spot we would leave the present line to the Clarence tunnel to the north of the one proposed by me in 43 grades.
416. You have three different routes? Yes; they are marked on the plan which I have submitted.
417. *Mr. Humphery.*] You estimate the cost of a single line at £25,000 a mile? Yes.
418. What would be your estimate for a double line, including the cost of enlarging the Clarence tunnel? I can hardly say; but it would be about one-third more.
419. Then it would only cost you £8,000 a mile for enlarging the Clarence tunnel? That tunnel cost £27,000.
420. Could you enlarge it for £9,000, making provision for a double line? At the present time I could. When it was made it was very inconvenient to work, and a great deal was spent in getting stone for the casing.
421. Should you require a viaduct over Dargan's Creek? Yes, it must be done with a viaduct, and filling in from both sides.
422. What would be the cost of filling in? I did not estimate that.
423. What would be the cost of the viaduct? The three viaducts would cost about £30,000.
424. But the viaduct over Dargan's Creek? It could be built very nicely for £10,000, and its junction with the main line would add greatly to the value of land in the neighbourhood.
425. Where would the next viaduct be? In the valley opposite the levels.
426. What would be the cost of it? £10,000, and the one at Isandula Creek would cost the same.
427. What is the distance from the 86-mile post to the Clarence tunnel by your route? Less than 2 miles in a direct line with a slight curve.
428. Then you use $1\frac{1}{2}$ mile of the existing line, and afterwards make a further deviation? Yes; and I have $3\frac{1}{2}$ miles to take me down to the coal stage of easy construction.
429. So you would have five additional miles to construct? Yes; using $1\frac{1}{2}$ mile of the existing line.
430. That would give you about $6\frac{1}{2}$ miles, as against the Railway Commissioners' proposed 2 miles? They could not do it in 2 miles; they might do it in $2\frac{1}{2}$ miles.
431. It is 2 miles 53 chains? I suppose it is about $2\frac{1}{2}$ miles.
432. The No. 3 scheme would cover 4 miles 65 chains. You have had that scheme explained to you by the Chairman;—do you think that it would cost more than yours? I do not know; I could not tell you.
433. Do you think that the double line, taken along the No. 3 route, would be more costly to construct than your line? I have made no calculations for a double line.
434. But from your general observation? I should think it would be. No doubt it would be a very nice line, and would show some very nice scenery. I do not think there is any line that could be built underground more cheaply than that proposed by me; in fact, I am certain of it.
435. *Mr. O'Sullivan.*] Are you aware that since the Zigzag was opened only one accident has taken place upon it, and that that was the fault of the man who was injured by it? There have been one or two accidents, but they have been the fault of the men themselves.
436. That being our experience of twenty-three years' working, do you think it is worth while to construct another line? I do not think so. I think it is preposterous to alter the line at all. We have a great many visitors coming here to see the Zigzag. No one can say that it has not been a very great draw, and a great source of revenue to the Government outside of haulage of products.
437. Bearing in mind the fact that the Zigzag is a safe line, that they are able to carry their freight waggons up there very well with the aid of an engine pushing behind, and also that the Zigzag is one of the great sights of the country, do you think it is worth our while to construct another line to supplant it? No; I think it has always been a grievance with many people in the district that the rates of carriage have increased so much. They think some other line should be adopted—a single line, allowing the Zigzag to remain for the down traffic. Almost everyone objects to the Zigzag being done away with if it can be avoided.
438. Your idea and their idea appears to be that while another line might be constructed for the purpose of relieving the traffic, the Zigzag should be allowed to remain? Decidedly. I think all here will join me in saying that it should be retained. Hundreds of people visit the watering tanks and scenery on picnic days and holidays. I have seen 500 people there from Orange and Bathurst and other places. They make it a practice yearly to do so.
439. You have suggested a route for this relieving line? Yes. I suppose they are determined to change the route if possible, and we know that the traffic on the line is increasing to such an extent that something should perhaps be done in part, and a single up line would be quite sufficient.
440. Has any skilled officer reported upon your route? No. I have never asked anyone to do so.

E. M.
Munford,
Esq.

9 Mar., 1864.

441. So far we have only got your own opinion in favour of it? You have only my ideas of what can be done. If a Government officer comes up I shall be pleased to tell him all I know about the line suggested.
442. If you have not been able to get skilled information in support of your proposal, may it not turn out that you have been carried away with enthusiasm for your own idea? I am not carried away by enthusiasm nor the idea simply. I thought over the matter before ever it was determined to alter the Zigzag. There is a tunnel just above the 93-mile post, which was commenced by Mr. Whitton. They had gone in 150 feet when word came from Sydney that the Government had decided to make the Zigzag—a wise decision.
443. From the enthusiastic way in which your letter is written, I should think that you might be liable to be led away by too strong a regard for your own proposal? I might be, but others are interested as well as I am, and who would suffer quite as much by the deviation.
444. If you have this good route—and you certainly have not hid your light under a bushel—why is it that the skilled officers of the State, who are paid to look into these matters, have not taken it up and reported upon it? There have been so many routes submitted by persons who do not know anything about the country. The Government officers never take the trouble to ask private individuals about these matters, as they do in other countries. When the promoters of the Canadian Pacific Railway desired information they asked the residents of the districts about it, and even the Indians.
445. But you have brought this project under their notice by letter, therefore they must be well aware of your discovery; why, then, have they not taken it up and endeavoured to obtain the route which you have referred to? I am sure I do not know; but engineers and others do not like to solicit information from private individuals for fear of being displaced in their own opinions.
446. We can only regard your project as a suggestion; it does not come before us as a practical scheme? No; but I offered, if the Government would not take the trouble to survey the ground, to bring up an English engineer, who would survey it and tell you all about it, and pay him myself; but I do not want to interfere with our colonial engineers, because I do not think it is my place to do so until the last moment.
447. *Mr. Neild.*] I understand that one strong objection which you have to doing away with the Great Zigzag is that your property and some of the adjoining properties would be left without the railway communication which they now possess, and which probably influenced you in purchasing the land? Yes; we purchased the land because the railway was there, otherwise I would not give 1s. an acre for it, because there are no means of access provided.
448. You consider that the proposed deviation would seriously injure you? And others, yes. I would not take £130,000 for the Mount Edgecombe minerals at a royalty of 6d. a ton from what I know of the estate, though if the railway were not there I would not give 1s. an acre for it. It would be a ruinous thing if the railway were taken away from it and from other estates in the vicinity.
449. Is your land described as bounded by the railway? Yes. There is a road reserved to Mount Victoria and another to Eskbank; but we have no chance of using them, because of the nature of the country.
450. Did you buy your land from the Crown? Yes.
451. Did the adjoining owner buy from the Crown? I think he bought part from the Crown and part from a private individual in order to make the estate up to 880 acres.
452. Is the Clarence platform upon your property? No; it is upon Government land.
453. Is it in the immediate vicinity of your property? It adjoins the property known as Mount Clarence—*Mr. Reynolds'* estate.
454. Has your estate a frontage to the station? No; I am 1½ miles from the station. *Mr. Reynolds* has a frontage to the line, except in regard to about 25 acres which is reserved for railway purposes.
455. Have you made any representation to the Government to the effect that in the event of the line being altered you would expect compensation? Decidedly.
456. Have you received any reply? I have.
457. Have you any objection to state the nature of it? The nature of the reply was that the matter would be duly considered.
458. From your knowledge of Government matters, I suppose you regarded that as a stereotyped reply? I took it for what it is worth. I do not intend, nor does *Mr. Reynolds* intend, to allow the Government to take the line from us without compensation.
459. *Mr. O'Sullivan* asked you how it was that your proposals had not been investigated by Government surveyors; but your letter is only a fortnight old? That is all. It was only when I found that something would be done that I thought it would be better to make a statement.
460. I suppose you did not expect that a proposal so important as yours would be investigated forthwith? Not at all. Some time would have to be taken up in investigating it.
461. And although you have not been informed that your proposal will be investigated, you do not regard that as evidence that it will not be considered? I do not, because it is possible that it may be investigated. I would very much like the Government to order a survey of the three routes by their own officers. I shall give them every assistance in my power.
462. This afternoon you were with the Committee when they visited a piece of rising ground to the southward of the Clarence tunnel, and you then saw roughly, part of what is known as the No. 3 route? Yes.
463. Supposing that route were followed, would you have railway communication? We should not; I understand that it is 250 feet from the top of the incline to where the line would be in the gorge of the river Lett.
464. You would be above the line? Yes; it is only just possible that I could get to it.
465. Would that be a disadvantage in working coal measures? Yes.
466. But is not your coal a long way below the surface? The coal is at a depth of 450 feet; but there is no ground to work upon, nor flats for machinery and sidings.
467. Would it not be possible to communicate with the line by means of a tunnel? No; it could not be done.
468. Would the No. 3 route give access to *Mr. Reynolds'* property? No; it would spoil his property, as well as my own; in fact, all other interests.
469. If that line were constructed, both *Mr. Reynolds'* property and yours would be deprived of the railway communication which you now enjoy? Yes.
470. That is your chief objection to the Government proposal? It is, in one sense of the word, and doubly so in others.
471. Suppose part of the existing line were left by way of a siding, would that suit you? It could only be done at great expense; and you would have to make either *Dargan's Creek* or *Eskbank* the depôt, which would mean so much extra hauling.
472. Not as compared with the present route? No; but if the route were altered, we should lose the line altogether.
473. Was your claim for compensation made to the Government before 23rd February, or subsequently? It was made a year ago.

474. Have you revised your original claim? I have not, because I have consulted with my friends, and they think it better to try to avoid any unpleasantness or any lawsuit. The Government can fight any private individual, and I am a loser by them now to the extent of £10,000. I do not intend to lose any more by them.

E. M.
Munford,
Esq.

9 Mar., 1894.

475. *Mr. Trickett.*] Have you a large holding? Six hundred and eighty acres of freehold, and nearly 1,380 acres of leasehold.

476. What is the extent of the Mount Edgcombe property? Six hundred and eighty acres.

477. Did you buy it the other day? No.

478. Did you bid for it? Yes; it is held by two or three gentlemen; but the whole of it is in my name.

479. I am not talking of the property you have got, but of the property which you proposed to buy the other day? We wanted to see what it would bring at public auction, while the doing away with the Zigzag was in contemplation; but we did not get a bid the second time.

480. Did not you, yourself, bid for it? Yes.

481. What did you bid for it? £1,100.

482. Why did you not complete the purchase? I found that it would be better for me not to do so.

483. Did the vendor let you off? Yes; he acted most honourably about it when he saw the result.

484. You said a little while ago that you were prepared, with the aid of some persons, to construct the line you suggest for £25,000 a mile? Yes.

485. Who are associated with you in that offer? I am not at liberty to mention names, but a big Sydney firm.

486. You decline to tell us who they are? I am bound not to mention any names until the thing is settled.

487. But you mean to say that certain gentlemen would construct that line for £25,000 a mile? Yes.

488. You want this Committee to believe that a certain number of gentlemen in Sydney have agreed to construct this line for £25,000 a mile, although you have stated that you have not made a detailed survey and have none of the details of the line prepared? No; it is merely an approximated proposition. The suggestion was made by me, and they said, "Very well; if it can be done for that, the money shall be forthcoming."

489. Then it is quite a conditional offer; nothing definite has been done? Yes; it is a definite offer. I have only spoken of a single line, because I did not suppose that the Government were going to destroy the Zigzag.

490. But you apparently admit that it is desirable to have a new line to carry the traffic going towards Sydney? Yes; for the heavy traffic towards Sydney by a single line.

491. You admit that? Yes; there would always be a shove up to Dargan's Creek.

492. You admit that it is desirable, in the interest of the heavy traffic going towards Sydney, to construct a new line, but, for the benefit of your own property, you wish the Zigzag to be retained? Not at all. It is no benefit to me at all at present; but it brings to the district persons who are travelling for pleasure from all parts of the world. It will probably be a large manufacturing town in the future.

493. You have coal on your property? Three very valuable seams, and a fine iron mine; also paint pigments and graphite.

494. How long have you had it? Since 1881.

495. How much coal have you taken out of it? None; because the matter of dealing with the Zigzag is in so undecided a state. We could not get a bid for the land the other day because of the proposed alteration.

496. The deviation is a proposal that has only been made during the last four or five years? During the last five or seven years. Years ago, when I found that something was going to be done, I thought it my duty to state my claims. I will sell the land to the Government if they give me £10,000 for it. That is what has been expended upon it. I daresay Mr. Reynolds would be glad to sell his property.

497. Did you not offer only £1,100 for 680 acres? Yes.*

498. And yet you want the Government to give you £10,000 for land which is 1½ miles from the station? That has nothing to do with it as to its prospective value.

499. Is not your suggestion purely a selfish one, from your own showing? Not at all.

500. Are you not deeply interested in this matter? I acknowledge that.

501. If you had not lived up here you would not have bothered at all about it? I do not think I would; it would have been none of my business.

502. *Mr. Wall.*] You value your property at £10,000? I would take that for it to-morrow, and be very glad to get it.

503. Do you know, as a matter of fact, that this property has been offered to a dozen people for £1,000? Yes; I was told so.

504. And that it could be purchased to-morrow for that? No; it could not, only an interest, because they cannot get a title except through me.

505. You know that it has been repeatedly offered in Sydney for £1,000 by the people who hold a lien on it. Do you expect that the Government will give £10,000 for property that can be bought in the open market for £1,000? I am the only person who has a title, and I am going to keep it.

506. You submitted a proposed route to a firm of contractors in Sydney, and they have undertaken to construct it for £25,000 without knowing anything about it? Only from my statement.

507. But you know nothing about it, not having made any survey, or entered into details? I have gone into it pretty deeply; I am not mistaken.

508. But you are mistaken in the line which has been surveyed for the Commissioners. You state that the Commissioners are wrong in their estimate, which is based upon plans and sections; you state that they cannot make the line the length which they say it will be? Well, it is possible, and I may be 2 or 3 miles out; but I do not think I shall be when the whole line is completed.

William Mylecharane, Esq., licensed surveyor, sworn, and examined:—

509. *Chairman.*] You are a licensed surveyor by profession? Yes.

510. For some time you occupied a position in the Lands Department? Yes; from 1863 until 1867. I then passed my examination and was subsequently in charge of districts.

511. You are not now connected with the Civil Service? No.

512. You are engaged in private practice in Lithgow and the surrounding district? Quite so.

513. Are you familiar with the country here? I was born here in 1843. I have known it for fifty-one years.

514. Your professional duties require you to visit various portions of the district? Yes. 515.

W.
Mylecharane,
Esq.

9 Mar., 1894.

* NOTE (on revision):—For one gentleman's interest.

- W. Mylecharane, Esq.
9 Mar., 1894.
515. *Mr. Suttor.*] Do you know anything of the deviations before the Committee? Not having seen the plans I am quite at sea in regard to the whole of them, except the projected line *via* Hartley Vale. I know something about the tunnel deviation, but I am quite unacquainted with the alternative lines. [*The various routes were explained to witness by the Chairman.*]
516. Which do you think would be the best line to make. Take first the deviation proposed by the Commissioners, with a tunnel through the range? I must confess that my knowledge is limited to surveying rather than to engineering; but I should certainly favour that or the No. 3 route. I know that there are objections to tunnels, whilst certain arguments may be advanced in favour of open railways.
517. What about the No. 3 proposal? I think that the length would be objectionable, though the grade may be less. I should prefer the tunnel to it.
518. On what ground? There would probably be less compensation to start with.
519. But the work would cost more? Perhaps it would; but you have heard to-night something about compensation.
520. We are told that it would take a year longer to make the Commissioners' line than to carry out the No. 2 route. Does that modify your opinion with regard to their line? Of course, its earlier construction would be in favour of the No. 3 route.
521. We are told that there would be great difficulty in ventilating the tunnel on the Commissioners' line? Certainly there will be that difficulty to contend against. As a native of the place, and knowing the whole district, I am totally against Mr. Rock's line.
522. Upon what ground? That it passes through private property the entire distance, and opens up no Crown land at all.
523. *Mr. Humphery.*] You intimated to the Chairman that you desired to give evidence on this matter? I had no particular desire to give evidence. I was invited to do so.
524. By whom? By the Mayor.
525. Will you kindly give us any evidence which you think will be useful to the Committee in arriving at a decision with regard to the route? I should be in favour of any line that would avoid the heavy grade of the Zigzag, if it were shorter, or the same length as the existing line.
526. Do you know the physical features of the surrounding district? I do.
527. Can you suggest such a line? I have not practically explored the country, but I am told there is a line up where we are to get our water supply, which would do away with tunnelling; but I am very much of opinion that it is impracticable.
528. *Mr. O'Sullivan.*] Mr. Munford has submitted a plan of a new route which, upon paper, seems an admirable one. As you know the country well, being born and reared here, you can tell the Committee whether it will be a perfect route? I have not actually seen Mr. Munford's plan.
529. One of his routes, which appears to be the chief one, starts from the coal stage, and seems to strike the end of the Zigzag Reserve, and then goes through the Clarence tunnel, and takes a straight course away past Dargan's Creek? I could not give you any definite information in regard to it.
530. You know the country? Yes; but without anything tangible in regard to levels I am not in a position to give you any advice, no practical engineer having been over the route.
531. But as a surveyor who knows the general contour of the country, do you think it is possible to bring a line down from the Zigzag Reserve to the coal stage? I do not think so.
532. Do you think that it is possible to make the deviation marked with a straight line bearing eastward of Dargan's Creek? No, I do not.
533. *Mr. Wall.*] Have you any knowledge of the general desire for an alteration of the line. What is your opinion with regard to the necessity for altering the present Zigzag? The views I have generally heard expressed are that if the existing grades were eased, we should be able to do a better trade in our coal, because the haulage rates that we now pay are excessive as compared with other places.
534. You think that the doing away with the heavy grade would have the effect of lowering the rates? Yes.
535. If an easier grade would not increase the haulage rate, you think that people would have no objection to using the present line;—is the Zigzag looked upon as a dangerous line to travel? I have not heard it spoken of as more dangerous than elsewhere.
536. You think the result of the deviation would be to reduce the rate of haulage? Yes; I think so. It would give us some opportunity of competing with other places, but I do not know that it would bring about the desired result entirely.
537. *Mr. Trickett.*] As a professional man, would you advocate a line to Lithgow by way of the Zigzag, and a line to Sydney by a different route;—do you think that that would be desirable? I certainly do not.
538. *Mr. Ewing.*] You have already said that you know this country intimately? Yes.
539. Do you know the surveys that have been carried on in it? The engineering surveys?
540. The land surveys? Yes; most of them.
541. What is this "D 1, 681"? It is a feature survey.
542. Showing the crest of the main range? Yes; I think it is a topographical survey.
543. "M.S. 85" appears to be a road survey? Yes.
544. Also following the crest of the range? Yes.
545. That survey locates the crest of the range? Yes; pretty nearly.
546. It divides the rainfall between the Cox and the Hawkesbury? Yes; that is so.
547. From the railway at Bell, following along the crest of the range, what kind of country is it, presuming that these surveys are on Bell's line? They are on Maddock's line, the cattle route.
548. Following from the railway along Maddock's line on the crest of the hill, what sort of country is it? Tolerably level; much of a table-land, except in a few places.
549. Do you know of any approach from Eskbank up to the table-land? Not beyond what I have recently heard.
550. You know of no route up there? No. I have followed Farmer's Creek up to the corner of travelling stock reserve 148.
551. Do you know of any connection between that place and the table-land? No.
552. You know nothing of that? I cannot say anything of that.
553. *Mr. Collins.*] It has been stated that between £9,000 and £10,000 a year would be saved if a proper deviation were made;—do you not think that that should be taken into consideration? Yes.
554. Do you think it would be feasible, if a proper gradient were obtained, to take coal at a cheaper rate to Sydney? Yes.
555. That matter should be taken into consideration? Yes.
556. Therefore you think it advisable that a deviation should be made? Yes; that is so.

SATURDAY, 10 MARCH, 1894.

[The Committee met at the Oddfellows' Hall, Hartley Vale, at 1:30 p.m.]

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTON.	WILLIAM CHANDOS WALL, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	WILLIAM McCOURT, Esq.
The Hon. JOHN DAVIES, C.M.G.	JOHN CASH NEILD, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	EDWARD WILLIAM O'SULLIVAN, Esq.
THOMAS THOMSON EWING, Esq.	CHARLES COLLINS, Esq.

The Committee further considered the proposed Deviation to avoid the Lithgow Zigzag.

John William Rock, Esq., M.I.M.E., sworn, and examined:—

557. *Chairman.*] Where did you learn your profession? At Leith, in Scotland.
558. With whom? With Tennant & Co.
559. Of Leith? Yes; I afterwards finished it in Glasgow, at Napier's.
560. They are also mechanical engineers? They are also mechanical engineers.
561. Did you follow your profession in the old country? Yes; I then entered the service of Simpson & Co., well-known mechanical engineers in Pimlico. I afterwards went to Westminster, to a civil engineer's office.
562. What works were you engaged on there? Chiefly on water-works. I was engaged on the Canterbury water-works principally, and also in connection with the Adelaide water-works, the plans for which were originally prepared in London.
563. From there, where did you go? To New Zealand, where I was engaged upon other works. There I introduced the use of water-power from hydraulic mains, and practised my profession in regard to general engineering; but particularly in regard to hydraulic engineering.
564. How long were you there? About seven years.
565. Were you connected with any public works? I was managing foundries in Dunedin, principally.
566. How long have you been in this Colony? Nearly ten years.
567. Have you been practising your profession ever since you have been here? I have been entirely engaged in that way, except for a short time when I was sent home to England on business.
568. What is the nature of the works upon which you have been engaged in this country? I began with a purely mechanical line of business, but I gradually found that my work drifted largely into mining, and more generally, into civil engineering.
569. Have you had anything to do with the laying out of railways or tramways in the Colony? I never did any Government work, but I have laid out one or two lines in different parts of the country, including Newcastle.
570. Will you mention them? I completed the Northumberland Land and Coal Company's line.
571. That is a railway which has been actually carried out? Yes.
572. What is its length? About 1½ miles. It goes through country of the heaviest description.
573. Are there any others? I have also laid out a line for the New South Wales Shale and Oil Company. I laid out over a mile of private line, which I superintended and passed. Then I have done almost all the engineering work for the Lucknow mines lately. They are situated near Orange, and my work involved some railway construction.
574. Have the lines been actually constructed? Yes, and they are open for traffic.
575. Have you anything else you would like to say in reference to the works which you have carried out? I can only say that I am at present fully occupied with general, and, very largely, with mining-engineering works. I have been instructed to proceed to Western Australia to engage in work of a similar character there whenever I like to go.
576. Will you briefly tell us how you came to find this line, or to be requested to find it;—who were your employers? This is in no way a speculation on my part. I was requested by the gentleman who is the mouthpiece of an association here to find, or perhaps, re-find, from what I can hear in the neighbourhood, the line which was, many years ago, proposed to be a portion of the main line from Sydney westward. Into the merits or demerits of the existing line, or the proposed deviations, I need not enter. I received instructions to find a line which was to start from Mount Victoria and come out at Eskbank. My limits were that the grades were in no place to exceed 1 in 50, and that I should have no small curves or anything that would be a retrogression as regarded the engineering portion of the route. I started to work at the beginning of the year.
577. What are your curves? The smallest curve I have is 12 chains radius, and except in one place these curves could be enlarged by what I considered excessive earthworks, but which would not be really detrimental to the line. It was in order to do the thing on the most economical scale possible that I did not enlarge these curves. I ran the line from point to point, having first of all examined very much as a commission of one all the people who knew the place. I ran tentative lines along every route which they said could be taken, and I feel sure in my own mind, that the line which I proposed is the only practicable one. There has been no favouritism about this line. I have taken the most favourable route and the shortest route that could be obtained between the two points. The real engineering difficulties occur, of course, in getting down into the valley, and in getting out again. The route across the valley presents no difficulties, and when I once got down I took almost a bee-line from one point to another. Therefore, I have not considered the real wants of the people as any one who had been working from that object might have done. I have run the easy portion of the route in a direct line.
578. Will you briefly state the direction in which your line runs, either from Mount Victoria or from Eskbank? I leave the existing line at a point about 5 chains on the Sydney side of Mount Victoria station, and a curve of about 15 chains radius brings me right under the station-master's house, across the entrance to the station, and across the road which runs along the side of the railway to Hartley Vale siding, where there must be a small bridge. My route then runs along on the sidling ground below the "Grand Hotel," and below the school. It passes through the property of the late Mr. Piddington—all through sidling ground, and through the lower portion of the Eltham Estate, which is marked on the

plan,

J. W. Rock,
Esq.,
M. I. M. E.
10 Mar., 1894.

plan, "Piddington, Milson, and Roxburgh." Still keeping along the sidling ground, and along what becomes a high-level piece of ground, it approaches the well-known place of interest which tourists go to see, called Titania's Glen, to a point almost touching "water reserve 103," of 80 acres. Then it runs in what is really more than half a circle round the point. This is the only place on the whole route where I think it would be expensive to have a curve of more than 12 chains radius, but a curve of 12 chains radius can be obtained. Leaving there, the line goes through what is marked as Bentley's Selection, with a curve of 15 chains radius, and keeps on as far as a road in which a zigzag is marked on the map and which goes to Hartley Vale. Before quite getting to that point it enters a tunnel which runs the rest of the straight line, which you see marked on the plan. At a varying distance of from 5 to 10 chains from there the ground consists of a lot of rocks, which would involve a very large amount of engineering difficulty, and this tunnel is for the purpose of escaping this.

579. What is the length of that tunnel? Practically, 30 chains.

580. Is it on a curve? No; it is on a straight line, between two curves, and it might be shortened with a little engineering enterprise by blowing down a lot of these turreted rocks. The section marked "John Hay, junior," is in reality a precipitous rock, about 150 feet high, and the levels bring you out exactly at the bottom of it. The line comes out on to a clean face of rock, and from there starts a sidling cutting. That point is the extreme convergence of the Mount York Range and the ranges which run away into the Kanimbla Valley. You look down into the whole length of that valley. From there the line is hardly worthy of any comment. You run, perhaps, for about 20 chains at the foot of firm, vertical, solid rocks, and fall, by a grade of 1 in 50, until you get into an easy sidling of 10 or 12 degrees. You keep on until you get to Mount York itself, which you make round without any remarkable ground until you touch the corner of the recreation reserve. I had to take advantage of the valley lying at the back of Mr. Tabrett's house, in order to make distance. That valley is about 30 chains across, and you can get a large curve, the ground being a partly sidling of 10 or 12 degrees and partly level. You then keep on until you hit the main road at the very edge of A. Armstrong's property, which is the nearest approach this route makes to the township of Hartley Vale, which is 60 chains from here. Then follows a slight curve and a straight piece 70 chains long until you get to the river Lett, which is a very small stream, the water itself being about 10 feet wide, but it would require a bridge of about $1\frac{1}{2}$ chains and about 10 feet high to cover any flood. The line keeps straight on until, with a curve, it reaches the extreme edge of Thomas Morris's 98 acres. The whole of the 2 miles through which we have passed is thoroughly flat ground; but now you begin to rise, in order to get up into Eskbank, and pass along the gradually increasing spurs upon the ranges, first with a convex, and then with a concave curve, until you come to the 30 acres marked "M. J. Finn."

581. What about Morris's Creek? All the creeks that are marked on the plan mean culverts. There is nothing that means a bridge.

582. There is nothing larger than the Lett? Not half or a quarter the size of that river. Then you come to what looks the most remarkable piece of the whole line—that extremely deep curve which is shown on the plan. It is yet to be decided whether that piece will be put in—because it means nearly 100 feet of extra elevation—or whether we shall lengthen the tunnel. The ground rises so extremely gradually up to Eskbank station that every 10 feet of elevation means an immense decrease in the length of the tunnel. I ran that curve round in order to cut down the length of the tunnel. When I ran straight across my tunnel was so hopelessly long—about 180 chains—that I went back and reduced it to 70 chains. At the head of that gully there is a stream as big as the river Lett, and is, I should say, the most important piece of water we pass over. From bank to bank it measures, I suppose, fully 4 chains, and though, of course, the gully will be filled in, provision would have to be made for quite as big a stream of water as comes down the river Lett. Then you run again on a gradually steepening sidling until you come to Campbell Mitchell's 45 acres and Mackenzie's 40 acres, where you observe the road takes a V shape. That is nearly the top of Doctor's Gap. The tunnel begins 17 chains this side of that point, and ends just about the crossing of the road into Lithgow. After that the line simply runs down the flat, until, with a 20 chains curve, it joins the existing line near the Semaphore. The total length of the survey from end to end, which is, of course, subject to correction, in rounding off curves, and so on, is 1,146 chains, or 14 miles 26 chains.

583. And the ruling grade? One in 50.

584. Is that the best grade you could get? No; we could make it easier if we liked to lengthen the line up the valley.

585. Do you know the length of the existing lines between the two points connected by your line? Rather over 19 miles. If, instead of crossing the road, where I indicated, you were to run near the township, we could make the grade what we liked by increasing the length of the line. We have a certain distance to fall, and dividing the grade into that, we get the length.

586. Of course there are points on the line where it is almost flat for a bit? That grade is calculated to run right through, and I have 28 feet to spare.

587. But it is not a continuous 1 in 50 grade down and 1 in 50 grade up;—I suppose the 1 in 50 grade only occurs here and there? It occurs right through.

588. But from Mount York, for 2 or 3 miles west from here, you would have a much flatter grade? Starting at Mount Victoria, and coming out at the blazed tree at Armstrong's house, I have calculated that it would run a grade of 1 in 50 right through, and I have about 28 feet to the good—that is, I could afford to waste 28 feet in various places throughout the whole length. After that, of course, there is a long flat piece.

589. Your instructions were to find a practicable route with a grade of 1 in 50 between the two places you have mentioned;—I suppose you have not gone further and taken out sections in order to make an estimate of the probable cost? I have all the details ready and collated; but I had not time to make an estimate of the cost. I thought if I were allowed to give evidence on a future occasion I would have the information all ready. The only thing I can state is that there is no practical difficulty in the work, and I shall be able to get out all the quantities and give an estimate at a very early date.

590. You make the detour through Finn's and Mackenzie's for the purpose of decreasing the length of the tunnel. Presuming that piece were cut out, and you went in for a longer tunnel, how long would the tunnel be? Its length would be doubled.

591. Do you know, from your knowledge of the district and the contour of the country, whether it would be possible to strike the Western Line at a point further west than Eskbank, and avoid the tunnel altogether? Yes; we could then get more length, and, by running into Bowenfels, do away with the tunnel altogether.

592. If your instructions had been to take the line from Mount Victoria to Bowenfels, instead of to Eskbank, you could have made it shorter, and have done away with the tunnel? Yes; I could have done both.
593. Roughly, how much shorter would it be? I suppose I should save a mile on the total length.
594. And without a tunnel? I mean that the existing line to Bowenfels would be shortened by 6 miles, instead of by 5, as it would be by my proposed line to Eskbank, while a tunnel could be dispensed with altogether. It is in order to save Eskbank that I have run the line through there.
595. That would mean considerably less in total construction? Yes.
596. The tunnel-work being excessively heavy? Yes; the total cost would be less.
597. Could you obtain the same grades? Easily.
598. If you were doing that, whereabouts would you branch off from your present survey? From the knowledge I possess at the present time, I should say in Mackenzie's 40 acres. After making a detour I would keep more downwards.
599. Instead of commencing a tunnel, you would continue round the side of the hill? Yes; along the northern boundary of Mackenzie's 120 acres, where it touches the 40 acres, until you come to the boundary of Brown's Gap. Just there it would cross the Gap road, and you would require 1 chain, or perhaps 2 chains of tunnelling. Then, roughly speaking, it would run in a more northerly direction through the 61 acres belonging to the Lithgow Valley Colliery.
600. On which side? Pretty well northerly, going through Higgins, Waltons, and Gill's 320 acres, and then as much as practicable making a straight line to the round part of the curve between Bowenfels and Lithgow.
601. That would be a less costly line than a line to Eskbank? It would be less costly, because it would all be upon sidling cutting.
602. If the line were made from Mount Victoria to Bowenfels, the coal trade of the Lithgow Valley would all have to be brought down to Bowenfels Junction? There are two points to be considered in that. If the line were taken direct to Bowenfels, the portion of the existing line which would be left between Bowenfels and the bottom of the Zigzag would be turned virtually into a station-yard. That would be no disadvantage to Lithgow, but rather an advantage to the collieries there. Apart from that, a much wider view of the thing is this, that if the line were constructed to the point we have been considering, on the south side of the long tunnel where the narrow curve is, is the real outcrop of all the coal-seams, and the collieries would be worked by drives from there.
603. But are there not some on the other side of the Lithgow Valley, which could not get access from this side. For instance, have not the Vale Colliery Company all their land on the north-western side of the line, rather than on the south-eastern side? I cannot speak authoritatively on the matter; but in nearly every case they come over on to this side of the range.
604. At all events, independently of whether they work or could work on this side of the mountain range, you say that the fact of having to run down to Lithgow or Bowenfels would not be of great consequence, because of the great facilities for shunting there would be at Lithgow? Yes; and as regards the passenger traffic there need not be any disadvantage. I would suggest that the refreshment-room should be placed there, and the running in of any local people could be done during the refreshment-time.
605. *Mr. O'Sullivan.*] How long have you been on this particular survey? I began it two days before the new year. I spent about three weeks upon it then, and I spent another three weeks upon it afterwards.
606. I understand that you have gone over every possible route, and have selected this as the best of them? Yes; I have tried every possible route.
607. I presume you have been ready to receive suggestions from residents, even though they be laymen? Yes, I have. I requested interviews, both with those who said it was as easy as anything to find a line, and with those who said it was impracticable. Whenever anyone said there was an easier route, I tried it, not only by eye, but by running a line along it, to my great disappointment, and I am now certain that there is no other route.
608. Did you discover this route, or did anyone suggest it to you? I discovered it in this way. I found that unless I could get a fair start below the precipices at the junction of the Mount York road and the Old Hartley road, I might give the job up. The larger portion of my time was spent in getting a route to go down that depth. When I got that, the rest was comparatively simple. I ran the line completely round the ranges for about 8 miles the other way, so I have tried the thing very carefully.
609. You are confident of having overcome the difficulty of rounding Mount York? There is no question to be considered except the earthwork. There is no doubt the line can be constructed.
610. *Mr. Davies.*] Have you made yourself familiar with the proposals now before the Committee? No; I have not had the opportunity.
611. Have you seen the Commissioners' proposal? No; I had one glance at the map, but I do not know anything about the details.
612. Have you seen the proposal of the Construction Department? No; I have not seen any of them.
613. You have surveyed both the routes you speak of yourself? Yes.
614. You have no idea of there being any difficulty beyond the points you have already explained? No; it is a mere matter of cost. There will be no excess in the way of cost.
615. You can secure a uniform grade of 1 in 50? I have done that, and the grade might be made 1 in 60 without any great expense. It would only mean the lengthening of the line.
616. Are you aware that the Commissioners' proposal includes a tunnel $1\frac{3}{4}$ mile long? The only knowledge I have of it is what I read in the public newspapers.
617. You have no knowledge of it? No.
618. *Mr. Ewing.*] To the best of your belief, did any engineer ever look at the route you have described? The only thing that makes me know that it has been tried is that upon a lithograph given to me by the Engineer-in-Chief, there was marked, in green colouring, a line which got to about where my difficulties commenced, and then stopped, just as if the surveyors could not get any further. That is the only thing that makes me think that the line has been tried.
619. You saw no evidence of work on the ground? No.
620. You say that the more difficult part of the work had, apparently, been investigated? Instead of going from Mount Victoria downwards, I thought they had started from the flat, and that when they had got to the big grades, 5 or 6 miles from Mount Victoria, they had gone no further.

J. W. Rock,
Esq.,

10 Mar., 1894.

- J. W. Rock, Esq., M.L.M.E.
10 Mar., 1894.
- 621-2. Your lowest point, I presume, would be in the River Lett? Yes.
623. How high is Mount Victoria over that? Eight hundred and seventy feet.
624. How far is it from the bridge over the Lett to where you join the main line at Mount Victoria? Six hundred and eighty-one chains.
625. How many chains of level country would there be in that? None, except where they put in stations.
626. Then you have to rise 870 feet in 631 chains? Yes; that is a little better than 1 in 50.
627. The whole line is going to run on a grade of 1 in 50? In that case it would have to do so.
628. Would any of it be more level than 1 in 50? In that case it would not. I am taking right down to the water level, but I would propose to make the bridge perhaps 25 feet high, getting a help in that way.
629. You have told us that the grade would be 1 in 50. It is perfectly clear then that if some is less than 1 in 50 some of it must be more than that? Yes; but I picked out the route so that it might run 1 in 50 all through.
630. You believe that there is no flat country to be utilised? There is no flat country to utilise.
631. It will be cutting the whole way? It will be sidling country.
632. You have looked into it, and you believe you can do that? Yes.
633. *Chairman.*] Is there anything else you would like to add? I mentioned that I had literally fulfilled my instructions in finding a 1 in 50 grade, and in wasting no mileage. I think I also mentioned that by adding a little distance, say a mile, it would be quite possible to ease the grade off. If I crossed the road 30 chains from here, instead of 60 chains, I should have all that to spare.
634. If your route is not tied up too much you will be able to get length where you want it? We can run practically any distance in the valley and ease the grade.

John Francis Tabrett, Esq., auctioneer, sworn, and examined:—

- J. F. Tabrett, Esq.
10 Mar., 1894.
635. *Chairman.*] What is your occupation? At present I am an auctioneer.
636. Residing in Hartley Vale? Yes.
637. *Mr. O'Sullivan.*] Are you well acquainted with this district? Yes, very well.
638. I understand that you are a member of the Association who have provided for the survey made by Mr. Rock? Yes, I am Secretary to that Association.
639. What induced you to undertake the work? Well, I may perhaps claim to be the originator of the scheme.
640. What induced you to originate it? I saw the disadvantages the agriculturists were labouring under in this particular district, and I took a patriotic view of the question.
641. What are those disadvantages? They cannot get out of the valley without climbing up a hill, which is about 4 miles long, and has a grade in some places of as much as 1 in 8. People who have raised produce in the outlying districts have to face that mountain in order to get their produce away.
642. The road you refer to is near Clarence siding? No, I refer to the road to Mount Victoria. Hartley Vale is situated right in a valley; and besides Hartley Vale there are the other three Hartleys, Kanimbla, Liddleton, Lowther, and all those places. They have either to go to Mount Victoria, up a road with a very steep grade, or to Bowenfels, where the grade is not so heavy, but the distance is longer. They can also go to Eskbank, or to Hartley Vale station on equally heavy grades.
643. Are the districts you have named settled by agriculturists? Yes, to a certain extent, and I am positive, from what I know, that if the railway were constructed the population would be four times as great as it is now.
644. What produce do these agriculturists raise? They can raise any produce that can be grown in any other part of the country, even including corn.
645. Do they raise much produce? No, because they cannot get it to market. They can raise corn, wheat, oats, maize, rye, potatoes, pumpkins, indeed any kind of vegetable or cereal that can be produced in any other part of the country, except it is a tropical or semi-tropical district.
646. Is there room for much production here? Yes; there are at present 126,000 acres of land in the Lowther, Kanimbla, and Megalong Valleys. In addition to that, there are 8,000 acres in the Hartley District.
647. Do you mean Crown land? No; from what I can glean, there are about 30,000 acres of Crown land available for settlement.
648. The other land you refer to is already alienated? Yes, or leased.
649. You have one or two graziers here? Yes, we have Liddleton, Kanimbla, and Rose Vale.
650. Do they raise sheep, or cattle? Both.
651. What other industries labour under disadvantages in these valleys? There are none at present that I am aware of; but if a line is constructed we shall have coal, shale, timber, granite, silver, gold, and limestone, all of which would be worked.
652. Have you ever worked any silver mines in these parts? There have been some worked.
653. Have you had much gold-mining? No; there is one mine which is said to be a success. They sent some stuff down to Sydney to be assayed, and it has proved to be worth 3 ounces to the ton.
654. *Chairman.*] You cannot tell us where that is? It is at Liddleton, on Dean Marryat's land.
655. *Mr. O'Sullivan.*] Is there much of it? I believe that the reef they are working will extend for miles.
656. How would the railway assist the shale and kerosene industry? By opening up new fields. It would assist the Hartley Vale people, because, at the present time, they have to draw all their stuff up to the siding, a height of 400 or 500 feet.
657. But they have a tramway of their own? Yes.
658. Do you think they would abandon that tramway, and use the main line? I should imagine they would; but their manager will be able to answer the question.
659. You think that, as business men, they would use it? On a rough estimate, I believe that it would save them £1,000 a year.
660. Are there any other industries? Yes, shale would be opened up at the Sugarloaf Mountain. Shale has also been proved to exist on Delancy's property, and on other properties round here. At Hartley they have as good a granite as could be procured in any other part of the Colony. I am not speaking scientifically, but as a practical man, because I know what granite is.

661. You consider that this district has been languishing for the want of assistance which a railway would give it? I am positive of that.
662. And that a railway would give a great impetus to all these industries? Yes; and to agriculturists as well. Last year 2,000 fruit trees were planted in this valley near Hartley, and there will be more planted this year. If there were a possibility of the railway coming this way, however, instead of 2,000 being planted, 10,000 would be put in.
663. Who are the members of the Association to whom you refer? They are all local men.
664. They are likely to be interested in this railway? Every one of them are local men; but in addition to that, I may say that a great many of them are working men who do not own a foot of land in the district.
665. They have taken the matter up largely on public grounds, with a view to a public benefit? Yes. They consider, with myself and others, that if the railway were constructed, from 2,000 to 2,500 men could be employed upon it at one time, which would mean a great benefit, not only to Lithgow, but to all the districts right round, and it would also be the means of drawing from Sydney a large section of the unemployed.
666. Have you a timber industry to be developed? No; but we have as good timber in the district as you could imagine.
667. What timber? Principally ironbark and gums. There is cedar, but we have to go some distance down for it. This is the only outlet for the whole of the valleys south.
668. Is there any other point that you would like to bring out? You have had all the evidence with regard to the line itself. It would shorten the distance to Lithgow, and would place all the districts west of Eskbank in closer communication with the city.
669. I presume you hold also that instead of having a line for about 19 miles giving little or no freight to the railway, this line will give a considerable business to the railway? Yes. At the present time I am informed that the line between Mount Victoria and Eskbank, leaving out those two places, does not cover working expenses. If the line I suggest were constructed, however, I am positive that there would be a saving of at least £2,000 in wages alone. There are a great number of people employed as fettlers, signalmen, pointsmen, &c., on the present line, who would not be required on this line. That would mean a saving to the Department of at least £2,000, and some of us estimate it at £3,000.
670. *Mr. Davies.*] You are familiar with the project submitted by Mr. Rock? Yes.
671. You are one of those who employed that gentleman to find a deviation which would be an improvement upon the existing line? Yes.
672. Do you, and the gentlemen associated with you, approve of the proposal as submitted by him? Yes; his plans have been adopted by the Association.
673. Do you know anything about the Commissioners' proposed deviation? I only know what has transpired through the press.
674. Have you seen the plans showing the Departmental scheme? I have not.
675. Your great object has been to secure a better route with an easier grade and a shorter distance between Mount Victoria and Lithgow? Yes; and to open up this particular district.
676. For agricultural purposes? Yes. The district right through to the Jenolan Caves would be benefited by the proposed line.
677. The great advantage accruing would be the saving in haulage and mileage? Yes, and in working expenses, wear and tear, &c.
678. Besides that, you say that the line would lead to the development of additional industries? Yes, and I believe, from what I can learn, that it can be constructed for considerably less than any other route.
679. Having been engaged in building and that kind of occupation for a number of years, could you give us a rough estimate of the cost of the line per mile? My opinion, after seeing the plans, and going over the route with Mr. Rock a good part of the way, is that the work could be done at considerably less than £200,000.
680. You also stated that in your judgment, and in the judgment of those associated with you, there would be a saving of £2,000 year in working expenses? That is in the way of fettlers, pointsmen, and others; it has nothing to do with the wear and tear, which we cannot get at.
681. You also believe that a very great saving would be effected in wear and tear because of the easier grades? Yes.
682. Is there any other advantage which would accrue to the district? Yes. The Government have expended a very large sum of money in opening up the celebrated Jenolan Caves, and I believe that if the railway were brought here the number of people going to those caves would be increased, because of the distance being shortened by 5 or 6 miles, and there being no hill to climb.
683. Would any of the industries now being carried on in the district be affected to their disadvantage by the deviation? Not that I am aware of. I think it would be all to their advantage. The new Vale and the old Vale collieries would both work on this side, and in addition to that there are other properties where coal would be worked.
684. Are these industries in full operation now? I think not—they are languishing at the present time.
685. Are they affected by railway communication? I believe they are. I believe they are affected by heavy haulage rates charged for taking the coal to Sydney.
686. Would the coal companies you speak of be improved in position, if the deviation were made? Certainly, because in the first place, there would be 5 miles less freight to pay, while the wear and tear would not be so heavy, and the Commissioners ought, therefore, to be able to reduce the rates.
687. Would that apply to all the collieries and to the Shale and Oil Company? Yes; to every one of them. That was the object the Committee had in view when they recommended that the line should be taken down into the Valley and through Eskbank.
688. How would the properties be affected that did not come out on this side of the valley? They would be affected by getting a reduction in freight.
689. In the trainage on the other side? Yes; the shortening of the distance would affect them.
690. The only advantage they would have would be the shorter distance and easier grade? Just so.
691. Is there anything you think you ought to tell the Committee that would strengthen the opinion expressed by your professional representative in favour of the line? I believe it would be just possible to put down a double line for one and the same cost as a single line.

- J. F. Tabrett, Esq.
10 Mar., 1894.
692. Would that be so where nearly all the work was side cutting? The side cutting is very gradual.
693. Would it not entail the lifting and discharging of a very much larger quantity of material? No; I think it could all be excavated, and pitched over the side.
694. But you would not like to undertake a double line for the same price as a single line? Certainly not. I am speaking figuratively. I believe that in some of the other schemes it would be impossible to have a double line.
695. *Mr. McCourt.*] But Mr. Rock says that he could save a 70 chain tunnel and make a better line by junctioning at Bowenfels;—would your Committee agree to that? A resolution was passed by the Committee to this effect, that the object of the league was to get railway communication with the valley, and it was unanimously decided that the Committee did not care one iota which way the line went so long as it came into the valley.
696. Then you would not object to the junction being at Bowenfels? Not in the least.
697. You have already approved of it by resolution? Yes. We consider that our duty to the public and to the country is at an end, inasmuch as we have shown that a practical route exists which could be made use of. We think it is the duty of the State to bear the rest of the expense.
698. You did not bind Mr. Rock to junction at Eskbank? We did at the time. The instructions we gave him were to take a line into the valley with a ruling grade of 1 in 50, joining the main line at Eskbank and Mount Victoria.
699. Do you not think it would be an advantage to cut out the 70 chain tunnel and join at Bowenfels? I have not considered the matter. It certainly would not be an advantage to the Lithgow people.
700. Then you are considering the Lithgow people, not the cheapness of the line or the best line? I do not say that. I say that we have now procured a practical route which, in our opinion, is the best that can be made. We have not ascertained anything to the contrary.
701. If Mr. Rock says that he can cut out a 70 chain tunnel on his proposed line, do you not think that would be an advantage? Certainly.
702. Do you not think that the Committee would adopt his suggestion and pass by Eskbank? I could not say.
703. Was not the Committee formed to assist the general public? That would have to be new business.
704. Will your Committee consider the question? I cannot promise you that they will, inasmuch as they have an objection to incurring a fresh liability.
705. You do not care what happens so long as the line comes through the valley? So long as the line comes through the valley and communication is given to the outlying settlers.
706. *Chairman.*] You said just now that by the construction of the proposed line the Lithgow collieries would be at an advantage, having a better grade, shorter mileage, and so on;—would not the construction of the deviation load the capital cost of the main line? So will the Commissioners' deviation.
707. Where then is the interest to come from to pay for the deviation? I am only one of a very great many who believe that if the deviation is not made a calamity will happen which will perhaps cost the country a great deal more than a deviation would cost.
708. And, as a matter of fact, interest has to be paid on the money expended on the existing line, and will have to be paid on the construction of any deviation? Yes.
709. Therefore, how can the Commissioners reduce the freights between Mount Victoria and Eskbank when they have to pay interest on an increased capital cost? They would take it in the aggregate.
710. Load some of the other lines with it? Yes; because other people, right back to Orange, would get a great advantage from the deviation.
711. Suppose the Commissioners do not anticipate that they will be able to reduce the freights by cutting out these grades? If they had not to carry the produce so far, they would have to reduce the freights to correspond with the reduced mileage.
712. At any rate the Commissioners are the masters of the situation so far as rates are concerned? Perhaps too much so in the interests of the district.
713. Can you show how the interest on the increased capital cost would be provided for if the rates were reduced? Yes; by the natural increase in the freight to be carried.
714. That natural increase coming from the Vale district? Yes; from the outlying districts about here.
715. What area of land in this district do you think would be directly benefited by a line such as you suggest? If you confine yourself to Hartley, I should say about 8,000 acres.
716. The produce from that land would come to a station at Hartley Vale? I believe a line such as I suggest would serve about 500,000 acres, inasmuch as it would serve the people right out to Jenolan Caves, Megalong, Liddleton, Hartley, Irish Corner, Hampton, and other places.
717. Do you think those places would make use of a station at Hartley Vale? I do.
718. And that this large area of country which is now only partly used will largely increase its production? I am sure that it would. I formed that opinion from what was said by those who hold the land.
719. The large amount of produce sent by the railway would help the Commissioners to pay an extra £8,000 a year interest? I am positive that it would. A reduction in the first place would have to be set against the earnings. For instance, if they saved £5,000 in wages and wear and tear, they would have so much less to make up.
720. Is there anything else you would like to add? I do not think there is anything else.
721. *Mr. O'Sullivan.*] Nearly all the land along this route is in private hands, is it not? I think it passes through two freeholds.
722. Do you think that the owners of that land would be prepared to give the land required for railway purposes without compensation? Yes; and I believe that the people who are there would willingly submit to the betterment principle, if it were the law of the land.

William Hall, Esq., Manager, New South Wales Shale and Oil Company, sworn, and examined:—

W. Hall, Esq.
10 Mar., 1894.

723. *Mr. Davies.*] You are one of those who employed Mr. Rock to find a better route for the proposed deviation of the existing line? The matter was brought under the notice of the Board by the residents of the district, and they contributed their quota of the expense. I being a sort of *ex-officio* member of the Committee.

724. Your Company contributed through you towards the expense of the survey? Quite so. 725.

W. Hall, Esq.

10 Mar., 1894.

725. You have heard Mr. Rock's evidence, and his description of the proposed line? Yes.
726. Do you approve of his scheme? I believe that it is the only practicable scheme, comparing it with the other routes that have been submitted to us from time to time.
727. How long have you been in charge of the Company's works here? I am not located here—I belong to the Sydney Office. I have been connected with the Company for twelve years.
728. You know the surrounding district fairly well? Fairly well.
729. And make frequent visits to it? Weekly visits as a rule.
730. To what extent would your Company benefit by the carrying out of Mr. Rock's deviation? We should have to dismantle our incline and tramway, and it would probably cost us £2,000 or £3,000 to make another connection with the railway, but I do not think our people would object to that, if they could save in the mine expenses.
731. I presume that the working of the tramway is very expensive, because of the steepness of the incline? Yes. It is 3 miles altogether from the bottom of the incline to the main line.
732. If the deviation were carried out, would your Company be able to open up fresh workings? No; but we should have to make a fresh connection with the main line.
733. On the lower level? Yes.
734. Would you send your oil and shale from there by rail? We should have to do so, unless the Commissioners choose to keep the present standing at Clarence Siding. We should prefer to send our stuff away over the flat country, if we could get a siding there.
735. Would the deviation affect your output? Not at all.
736. You cannot increase it? We cannot increase it.
737. What is the extent of the Company's holdings? Four thousand acres.
738. How much of that has been worked out? About 50 acres are working, or have been worked. Most of the remainder is high land on the railway frontage, and other land in which there is no shale.
739. So you practically have only a small portion to work? Quite so.
740. At your present output, how long would your workings last? It is impossible to say; but we are living in hopes that they may last for ever. We have shale in sight for many years.
741. In the 50 acres? In the present holding.
742. Have you seen the plan of the deviation proposed by the Commissioners? I have not seen any plans, other than Mr. Rock's rough drawings.
743. You do not know anything about the Commissioners' proposal? Nothing beyond what I have seen in the daily papers.
744. The only scheme with which you are familiar is that propounded by Mr. Rock? Quite so.
745. You believe, from your local knowledge, that it is the best scheme that can be adopted? I do.
746. Is there anything you would like to tell the Committee to show how you came to that conclusion? I support the line on the broad grounds that it will benefit the whole of this valley, because I know the difficulties which the people have to contend with in bringing their produce from outlying districts to Mount Victoria. Even if they go to our siding or to Lithgow, they have these enormous hills to climb, which is a great drawback. You may see the deserted farms all about. These places have been left because the farmers have no means of getting their produce to market.
747. The railway at present is inaccessible, and that prevents the settlers from sending their produce to Sydney? Yes.
748. Does much of the local produce find its way to Sydney? Very little.
749. Most of it is consumed in the district? Most of it is locally consumed.
750. Have you any other reason for recommending the scheme? There are plenty of local people here who can speak for themselves. I speak because of my connection with others.
751. *Mr. McCourt.*] Does your Company make any complaints about the freight charges? We always try to get things as cheap as we can; but the freights are not a heavy burden upon us.
752. You are satisfied with them? We are not satisfied; but we are not complaining to any extent.
753. If Mr. Rock's line were constructed, do you think it would cheapen the rates? I do not think so. It is 4 miles from Hartley Vale to Mount Victoria, so that we should not save anything in mileage.
754. Would the coal mine proprietors save anything? Yes. The underground haulage means about 8d. a ton to them, which is a big item.
755. What is the haulage now? Seven shillings and nine pence a ton from Lithgow.
- 755½. One penny a ton per mile? It is on that basis.
756. You think you could get a better rate than that? Yes; provided the Commissioners did not put a little on.
757. *Mr. Ewing.*] Hartley Vale is about 8 miles from Mount Victoria? By road.
758. But by Mr. Rock's line? About the same.
759. How far is your siding from Mount Victoria? Four miles, and we have 3 miles of private line.
760. Therefore, if Mr. Rock's line were constructed, you would have to pay freight for 4 additional miles? Quite so.
761. But at the present time you have to lift your shale to the top of the mountains. How high is that? Six hundred feet approximately.
762. You have capital invested in your plant on which you have to pay interest, and there is the wear and tear and working expenses to be met? Yes.
763. If Mr. Rock's line were made, the Government would bear all those charges? Yes; and we could use Government waggons instead of our own.
764. What is it worth to you per ton to get your stuff up? I could not say that.
765. It is worth something considerable? Yes.
766. Supposing the line did come into the valley? Then it stands to reason that we should save something by avoiding all that haulage.
767. To lift anything 600 feet means money? Yes.
768. Therefore you could afford to pay the Government a little more? We should be paying 4d. a ton extra for haulage.
769. Do you think you could lift stuff 600 feet and pay for the wear and tear for 4d. a ton? I am not at liberty to say what it costs us to lift our stuff, but we could afford to pay 4d. a ton extra for haulage.
770. If you could put your stuff on to the Government railways on the flat, it would aid your enterprise? Yes; and that is the reason we support the proposal.
- 771.

- W. Hall, Esq. 771. *Chairman.*] I suppose you have no objection to telling the Committee what you pay to the Commissioners yearly on an average? For the last twenty years we have paid them about £9,000 a year.
- 10 Mar., 1894. 772. Has there been any increase during the last two years? The last twelve months have been very slack.
773. But until last year there was a gradual yearly increase? 1893 was a bad year; but in 1892 and 1891 we paid £10,000 a year.
774. Is there any probability of your trade lessening owing to the disuse of the materials which you manufacture? Things are a bit slack at the present moment; but that is due more to the general depression than to anything else. People are buying as little as they can possibly help.
775. Your manufactures go principally to other countries? Our shale does.
776. Where is your market for the refined products? New South Wales.
777. None are shipped away? No; there is no export of them.
778. You only export the raw material? Yes.
779. Do you think it is likely that there will be a steadily increased demand for it in foreign countries? It is one of the materials which they must have to enrich their gas. They are simply holding off now to get a lower price. If we do not get our price one half year we will get it the next.
780. You do not think there is any likelihood of the demand falling off? I do not think so.
781. Therefore, being large customers of the railway now, you will continue to be so? Yes; and with a little assistance from the Government we might do more. You asked Mr. Tabrett what interest he thought this locality would pay upon the cost of the proposed deviation. The fact is that at present from Dargan's Creek to the foot of the Zigzag practically nothing goes on to the railway, whereas if Mr. Rock's deviation were made the Department would get £9,000 a year from us alone. That would cover the interest on the outlay.
782. But you pay that amount now? Not on the deviation.
783. *Mr. O'Sullivan.*] How much do the Commissioners pay you for kerosene? Last year they paid £9,000 for lubricants of which the two shale companies here received £3,000, so that I dare say they paid us £2,000.
784. You said in answer to Mr. Davies that you were only working about 50 acres out of 4,000. You hold your land on lease? As a mineral conditional purchase.
785. I understand that you are working up to the fullest capacity? We were until we closed down.
786. Under more favourable conditions you could extend your operations? Our conditions would not help us unless the state of trade helped us. We only work for orders. If the orders are not coming in, we do not work the stuff.
787. But suppose you get a large order from the Commissioners? That would slightly increase our output; but it would not affect us to the extent you imagine.
788. *Mr. Davies.*] Have you any objections to telling the total value of your annual output of shale and oil? I have brought no statistics with me; but roughly speaking, £60,000.
789. Does it vary very much? In value?—no.
790. The lubricating oil you speak of is sold to the Commissioners? Both lubricating oil and kerosene. We have a contract with them for refined oil, and other contracts for lubricating oil.
791. Are you the only contractors for lubricating oil? No, the Joadja Creek Company joined us in the contract. American importers supply the bulk of the Government requirements; about £6,000 is paid to them.
792. Do they use any castor-oil lubricants? I believe that they are using it in a few instances; but they are trying to do away with it as much as they can. They are bringing the mixed oils more into use.
793. You get about £2,000 from the Commissioners? Yes.
794. And spend from £8,000 to £10,000 with them? Yes.
795. *Chairman.*] The Joadja Creek Company are not now working on the Southern line? Their oil-works are not in operation; but they have good stocks on hand.
796. Do they not own the works at Katoomba? Yes.
797. Where are their principal operations carried on? They have three works,—one at Katoomba, one at Joadja, and one at Sandown, in close proximity to Parramatta.
798. Is it not a fact that their greatest output is from Katoomba? They have a very large output there. Their area there is about twice as much as they have at Joadja Creek.
799. They are successful competitors with you? No; it is the case of the lion and lamb lying down together. We are working together. It is not on the question of freight on the minerals that we feel sore; but we are paying 22s. 10d. on refined oil now; and, although oil can be imported from New York for less than that, we cannot get any reduction.
800. You want a more intelligent tariff? We want a tariff laid down on commercial lines.

Mr. John William Berghöfer, farmer, sworn, and examined:—

- Mr. J. W. Berghöfer. 801. *Chairman.*] What is your occupation? I have been a farmer for the last six months.
802. Residing where? At the foot of Mount Victoria, on the Great Western road.
- 10 Mar., 1894. 803. *Mr. McCourt.*] Are you one of the Committee who induced Mr. Rock to make this survey? Yes.
804. Can you tell us what benefit the deviation would be to the district? Yes. Seeing in the public prints that the Commissioners were going to make a deviation, because the existing line is not suitable, we said that we could show them a deviation through here which would be better than any they could get the other way, and to back up our opinion we engaged Mr. Rock to survey the line.
805. But you bound him to connect two points, you did not tell him to look for the best line? We told him to find the shortest practicable route, with a 1 in 50 grade, from Mount Victoria to Eskbank, coming through the valley. He would have to come through the valley to shorten the line.
806. The route he suggests is, in your opinion, the best route? By a long way.
807. Would it open up any new country? Certainly.
808. How much? The country which would bring produce to a station here lies on this side of the Dividing Range, and extends from the western road to Lowther, Bindo, Megalong, and through Liddleton, Kanimbla, and the four Hartloys. The people who are living in this district now, have to go either to Mount Victoria, or to Bowenfels. In one case they have to climb up a very steep hill, and in the other they have twenty more miles of train carriage to pay.
- 809.

Mr. J. W.
Berghofer.
10 Mar., 1894.

809. It does not pay to convey produce up these steep hills at the present time? No; it does not. The price charged for carriage is so high that it prevents men from working land in the district. The man who does the carrying for the storekeepers on the Western Road between the River Lett and Mount Victoria charges 12s. a ton, and to that must be added the railway freight.

810. Roughly speaking, how many farms would there be within a 10 mile radius of the proposed line? About 120.

811. That is at the present time? Yes.

812. If Mr. Rock's line were constructed, would the number of settlers be increased? Yes; but it is not so much a question of the number of settlers as of the land that would be cultivated.

813. What is the average size of the holdings here now? From 40 up to 10,000 acres.

814. Have you anything else to state in reference to this line? Only that it would bring so much extra traffic to the railway by opening up fresh land for agriculture, and allowing minerals, shale, and coal, to be worked.

815. *Mr. Ewing.*] You offer no expression of opinion with regard to the route which Mr. Rock has laid out;—you believe it to be a good route, because he said it would be? I judge that his survey is correct.

816. You are not an engineer? No.

817. You advocate this line because you believe that it will open up the agricultural and mineral possibilities of the district? Yes.

818. It will give the people access to market? Yes, undoubtedly.

819. *Mr. Davies.*] Do you know anything of the other proposed deviations? Only what I have seen in the newspapers.

820. Do you know the country through which they would pass? Yes.

821. What is your general opinion in regard to them? That the country is very rough, comprising no arable lands, and I do not know what minerals it contains. There are only two mines working on the other side of the line, so that I cannot see that those deviations would benefit anybody.

822. But would it not benefit the country if the Commissioners could secure an easy grade, and a shorter route than they have at present? I do not know what the grades are, but I know that the country is very rough, and they cannot get a shorter route unless they go through this valley.

823. The grades are 1 in 50 and 1 in 60? And the distance?

824. Something more than the length of Mr. Rock's proposed line? Well, that would be an advantage to the Railway Department.

825. You do not know enough of the country to be able to say whether the Commissioners could construct a railway there at a fair and reasonable rate? They could make a railway, no doubt, but the expense would be enormous.

826. You are not an engineer, so you could not say what the cost would be? No.

827. You could not tell us what the cost of Mr. Rock's line would be? No.

828. Would there be as great difficulties to encounter in constructing that line? There would be difficulties, certainly, but of no great moment or cost of construction.

829. The great point in its favour is that it would give an opportunity to all the producers in the district to get their produce to market more easily than they can at the present time? Yes, that is one advantage.

830. What other reason is there for its construction? That it would shorten the line, and do away with three stations, viz., Bell, Clarence Siding, and Bottom Points on Zigzag.

831. *Chairman.*] How long have you resided in this district? Nineteen years.

832. Which part of it? I was 18 years on the Kanimbla Station, managing for Mr. Vickery, M.L.C.

833. You are very familiar with the whole of this valley? Yes.

834. You think that with proper means of access it could be made to blossom as the rose—that it is capable of producing a great deal more than it produces now? Yes.

835. If Mr. Rock's line were constructed, more produce would be grown? Yes.

836. How far is your holding from here? Nearly 4 miles.

837. In which direction? It lies at the foot of Mount Victoria, on Great Western Road.

838. How close would you be to Mr. Rock's line? Straight across, a little over a mile.

839. How far are you from Mount Victoria station? About 2½ miles.

840. But it is up above you? Yes, we have to go up a steep hill.

841. Has the population of this valley increased much of late years? No; and in fact you may see deserted farms, which years gone by used to be worked.

842. To what do you attribute their desertion? To the want of cheap communication with Sydney.

843. But is not communication now cheaper, or, at any rate, as cheap as it has ever been? Not as regards the conveyance of produce to Sydney.

844. Have the railway freights been increased since the line was opened? Not that I know of.

845. Are the freights now higher than they were before the line was opened? They had a local market then.

846. What has become of that? It has gone away with the bullock teams. When there was traffic along the road all the farms were worked; but since then there has been no local market.

847. Their constituents were the teamsters who travelled along the road? Yes; to a certain extent.

848. But that would be a very small constituency for a district like this? The demand then was a very large one. Now we have to compete with the Sydney market.

849. What are the stations, sheep or cattle runs? They run both cattle and sheep.

850. Do they truck their cattle to Sydney or drive them there? From Kanimbla Station we supplied the local market, and trucked other cattle to Sydney.

851. From where? From Mount Victoria.

852. Did others do the same as you—did they send by train or did they drive their cattle to market? They sent them to Sydney by train.

853. You can only express the opinion that if the line were constructed more produce would be grown and sent by railway to Sydney? Yes.

854. What is the extent of your holding? One hundred and thirty acres.

855. Is there anything else you would like to state? Only as to the advantage of shortening the distance between Sydney and the Jenolan Caves.

856. How much would the deviation shorten it? Well, it is not so much the shortening of the distance
as

Mr. J. W.
Berghöfer.
10 Mar., 1894.

as the doing away with the necessity of climbing the big hill. Most of the people coming from the caves have to walk up the hill very often.

857. If the line were constructed would the Jenolan passengers get out? I should say they would get out here.

858. Is there much traffic between Mount Victoria and the Jenolan Caves? Yes; I am told that there were 1,200 people there last year.

859. Presuming that they came to Hartley Vale, that would only give the railways seven more miles to charge for? But no doubt many people would go who do not go now, because of the necessity of walking up the big hill at times.

Mr. John Young, fruitgrower, sworn, and examined:—

Mr.
J. Young.
10 Mar., 1894.

860. *Chairman.*] What are you? I am a fruitgrower.

861. Where are you residing? At Little Hartley.

862. About $4\frac{1}{2}$ miles from here? Three and a half.

863. *Mr. Ewing.*] How long have you been here? About three years.

864. You offer no opinion, I presume, in regard to the engineering part of this work? No.

865. You simply want to tell us how much more productive the district would be if you had a proper way of getting your produce to market? Yes.

866. Where do you send your produce now? We cannot send it anywhere scarcely. It must be consumed locally.

867. What do you grow? All English fruits.

868. Where do you sell your fruit? We have to depend upon its being sold by the hawkers coming through the place; but that does not pay just now, and is one of the reasons why I am so anxious to see the railway start. It would open up a possibility for the industry which does not exist at the present time.

869. Where would you send your fruit if the railway were made? To Sydney. At present soft fruit gets destroyed by the long road cartage; but the same thing would not take place if it were carried by rail.

870. You believe that if you got the fruit to Sydney you would be able to sell it? Yes.

871. I presume you are aware that soft fruits are grown nearer to Sydney than Little Hartley? Yes.

872. But you believe that you could compete with those places? Yes; I believe this is the best district in New South Wales for growing English fruits.

873. You believe that you could best get rid of your fruit in the Sydney market? Yes.

874. You want to go there? Yes.

875. You cannot at present cart your produce to the railway? Not very well.

876. You want the railway to go through here in order that you may get your fruit away promptly? Yes.

877. You would increase your area under cultivation if the railway came here? Certainly.

878. A considerable quantity of land in this valley is suitable for the cultivation of fruit? Yes; there are many thousands of acres of suitable land, and the fruit industry, so far as I can understand, is still in its infancy.

879. Do you know anything about farming of other kinds? No.

880. Do you know anything about mineral matters? Only what I hear.

881. You offer no opinion upon them? I can only say what has been told to me by people who have been living longer in the district than I have. I have always understood that this district is very rich in minerals of all descriptions.

882. This is your case as a fruitgrower:—If the railway were constructed you would grow large quantities of fruit and send it by train to Sydney? Yes; and I know three or four gentlemen who would be quite prepared to take up land here if there were suitable communication with Sydney.

883. *Mr. O'Sullivan.*] Fruit here comes in later than it does on the coast? About a month later.

884. Therefore you would have the market to yourselves, if you could send to Sydney, and be certain of a price? That remains to be proved.

885. You would not have to contend with such keen competition as would be met in the full season? No.

886. Therefore there is a strong probability that the district would be considerably developed by the construction of a railway? I know that it will.

887. *Mr. McCourt.*] Do you grow apples here? Yes.

888. Have you sent any to Sydney? No, my place is rather new yet. The only fruit I have sent is strawberries.

889. Has anyone sent apples from here? No, not that I know of.

890. You do not know what the freight is per case? No.

891. *Chairman.*] Have your strawberries paid you? Not yet.

892. The strawberry is a delicate fruit to send any distance? I fancy the road carriage destroyed them.

893. Is there anything else you would like to state? No.

893½. You know generally the route of the proposed line? Yes.

WEDNESDAY, 14 MARCH, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTOR.
 The Hon. JAMES HOSKINS.
 The Hon. FREDERICK THOMAS HUMPHRY.
 The Hon. JOHN DAVIES, C.M.G.
 The Hon. WILLIAM JOSEPH TRICKETT.
 THOMAS THOMSON EWING, Esq.

WILLIAM CHANDOS WALL, Esq.
 WILLIAM McCOURT, Esq.
 JOHN CASH NEILD, Esq.
 EDWARD WILLIAM O'SULLIVAN, Esq.
 CHARLES COLLINS, Esq.
 HENRY DAWSON, Esq.

The Committee further considered the proposed Deviation to avoid the Lithgow Zigzag.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, sworn, and further examined:—

894. *Chairman.*] When you appeared before the Committee last Thursday. You were not quite prepared then to give us the views of the Railway Commissioners on this matter, owing to the absence of Mr. Eddy. Are you now in a position to give us their views as to the desirability of constructing a work similar to that which we have under consideration? Yes. Since I was last before the Public Works Committee, I have made myself acquainted with the circumstances under which a proposal was made by the Railway Commissioners for cutting out the Lithgow Zigzag, upon which it would appear from the questions put by the Chairman of this Committee on a previous occasion the Committee had not been fully informed, and I am directed by the Railway Commissioners to make the following statement:—

H.
 McLachlan,
 Esq.
 14 Mar., 1894.

Some years ago, at the suggestion of the Railway Commissioners, the then Minister for Works approved of an investigation being made in order to discover a practicable route for the purpose. It was proceeded with up to the stage of particulars of several schemes being submitted, the cost of which, however, appeared to the Commissioners to be too great. Further investigations were being made when, by the direction of the present Minister for Works, the officers were withdrawn, he having then expressed the opinion that the work was one which should be carried out by the Railway Commissioners.

In view of the decision of Mr. Lyne, the Railway Commissioners had some further investigations made in the direction of discovering a route for a short deviation which would be within their powers under the Railway Act, for the purpose of cutting out the Zigzag, and a scheme, which is now known as Scheme No. 1, was partly prepared, but was abandoned in consequence of there being no probability of the money being available for such a purpose.

Some few months ago, in a conversation the Premier, Sir George Dibbs, had with the Chief Commissioner, on the question of providing work for the unemployed, Sir George having expressed his determination not to approve of anything in the shape of relief works, but at the same time being desirous of providing work of a profitable nature, it was suggested by the Chief Commissioner that rather than undertake works of a doubtful character, so far as financial return was concerned, it would be well to carry out works of the nature of cutting out the Lithgow Zigzag.

The Premier at once recognised that this would be a work of a most desirable nature, which would employ a large number of men in ordinary pick-and-shovel work, and expressed a wish that it should be put in hand with the least possible delay. Steps were then taken to have the plans completed, and the line is the most direct one that can be made, and the economy in working will amount to more than the interest on the capital expended; and in view of the fact that the Commissioners had been urged to bring the matter forward at once, they made the proposal to the Minister for Railways as detailed in their letter of November, 1893.

Subsequently, the question of who should carry out this work was, the Commissioners are informed, raised by the Minister for Works, when he appears to have expressed directly opposite views to those laid down in his previous decision. Upon the wish of the Government upon this point being intimated, and the Commissioners being made aware of the altered views of the Minister for Works, the plans were completed and sent forward to the Department of Works.

While this scheme, which is merely a deviation, has received, so far as the Railway Commissioners are concerned, more attention than others, now that the question is one referred to the Public Works Committee, the range of the inquiry becomes broadened, and schemes for longer routes can be brought under review and dealt with as a new railway, which is altogether different from a deviation.

This being so, there is another scheme under investigation by the officers of the Commissioners, which it is thought may prove even better, both for working and financial results, so far as return on the capital invested is concerned, than any now before the Committee, and it is for these reasons that the Commissioners asked that the consideration of the whole subject might be so dealt with as to enable them to have the inquiries in reference to this route completed; and, as I stated at the last meeting, they consider that the request made was a reasonable one, and one which would commend itself for favourable consideration. It was hoped last week that some definite opinion upon this alternative route could be supplied to-day, but owing to the inclement weather it has been impossible for the surveyors to proceed with the work, and practically it has but very little advanced.

As bearing upon the question, and to show the views of the Commissioners on the point of a short deviation, versus avoiding lines several miles in length, I am directed by the Commissioners to quote their reply on the 20th August, 1892, to a deputation that waited upon them at Mount Victoria, on the subject of a line through the Hartley Vale, stated to be preferable to the Dargan's Creek deviation.

The Commissioners replied that they had already made inquiries on the subject, and that this proposal would probably prove far more costly, and less profitable, than the deputation anticipated; and as it would be, moreover, virtually the construction of a new line, they did not consider it a work which could be undertaken under the Railway Act. They did not propose to proceed any further in the matter themselves, and referred the deputation to the Minister for Public Works.

The position in which the Railway Commissioners have been placed in this matter is as I have described; but I am directed to point out that as the work, as a deviation, has been taken out of their hands, and is being dealt with as a new line of railway under the provisions of the Public Works Act, the duties of the Railway Commissioners in regard to the matter are clearly defined by Section 13, sub-section 1. By that section the Railway Commissioners are required, before such works are submitted to the Public Works Committee, to report upon the probable cost of construction and maintenance of such lines, and also their estimate of the financial result to the State therefrom; and had this course been pursued, the whole of the schemes now before the Public Works Committee would have received the careful consideration of the Commissioners, and a comprehensive report would have been made thereon, whereas they have been placed in the position of making a proposal which is now apparently being dealt with as in opposition to other schemes which were put forward without any previous reference to the Railway Commissioners, and they cannot give their opinion as required by the law on such schemes until the whole of the details are submitted to them, so that they may carefully consider their respective merits in connection with the object they wish to accomplish, as they have not only to look at the question of cost of the scheme, but whether it will accomplish the various results they had in view when suggesting the work.

The Commissioners now desire to ask that the proposed schemes may be submitted to them for report, as they should have been under the terms of Section 13, sub-section 1, of the Public Works Act. If, however, the Committee decide to disregard the provisions of the Public Works Act in this respect, the Commissioners are quite prepared, if the Committee will formulate clearly the information they require, to do their utmost to supply it, although without the schemes being submitted in their fullest details the Commissioners will be at a great disadvantage, and the information may not be of that accurate character which it would be if provided in the manner required by the Public Works Act.

The information asked for by the Hon. Mr. Hoskins and the Hon. Mr. Humphery is now prepared, and I now hand it in in the form of a return.

H. McLachlan, Esq.
14 Mar., 1894.

895. Have you the report with you? Yes.
896. *Mr. Hoskins.*] Will you kindly read it? It is difficult to go back to the earliest times, so far as accidents are concerned. The records are not kept so long; but I thought it would be wise to give you the particulars of the accidents which have occurred since the Commissioners took office—that is, for five years. During that period we have had three accidents on the Zigzag.
897. *Chairman.*] Could you not have gone back further than five years,—that seems to be a very short period out of twenty-six years? I do not know that the records have been kept and handed down.
898. But I presume that all papers connected with the working of the railways were handed over to the Commissioners when they took office? It would be difficult to say whether the records of an accident, say twenty years ago, are in existence. We know, however, what has happened since the Commissioners have taken office.
899. Then we will take what you have got? The following is the return:—

ACCIDENTS on, or resulting from, the Working of the Lithgow Zigzag:—

Date.	Particulars of Accident.	Injury and damage resulting from Accident.				Cost to the Department				
		Number of Persons.		Property.		Compensation.		Repairs to		Total.
		Injured.	Nature of Injuries.	Rolling Stock.	Live Stock or Goods.	Personal Injuries.	Damage to Goods, &c.	Rolling Stock.	Per. Way.	
8 Oct., 1891.	Down Goods Train became divided at top points; nineteen vehicles ran down middle road into the buffer stops at the bottom points.	1	Head cut, shoulder injured.	4 D's, 1 C.W.- and Brake-van smashed.	...	£ 30	£ s. d. 600 19 5	£ s. d. 1,000 0 0	£ s. d. ...	£ s. d. 1,630 19 5
6 Jan., 1892.	Double train pushing into dead-end top points pushed rear engine over buffer-stops.	3 employees	Slight injuries.	1 S.V. damaged; tender of engine damaged; 2 buffers of B.V. broken.	26 17 0	...	26 17 0
13 April, 1892.	Double train backing into dead-end top points the rear engine stopped suddenly, whilst other engine was giving steam; trucks buffer-locked and derailed.	1 C.W. smashed.	9 cattle killed.	...	45 0 0	13 0 0	21 10 0	79 10 0

900. *Mr. Hoskins.*] Those are all the accidents that have occurred during the last five years? Yes. Regarding Mr. Humphery's question I may mention that the cost of the Lapstone deviation to date is £44,637 9s. 5d. The account is not yet closed. There is a little dispute to be settled, but if the amount is put at from £45,000 to £50,000, it will, I think, be correct. I have a report from the Traffic Superintendent as to the working of the Lapstone tunnel, as follows:—

Out-door Superintendents' Office, Northern and Western Lines, Sydney, 10 March, 1894.
New South Wales Railways.

D. Kirkcaldie, Esq., Chief Traffic Manager, Sydney.—

I have to report that since the opening for traffic of the Lapstone tunnel, on the 18th December, 1892, to the 28th of February, 1894, a saving has been effected of about 679 up and 354 down goods trains, and 36,545 train-miles, between Katoomba and Penrith, in comparison with the past system of working over the Lapstone Zigzag.

The following is a summary showing the number of vehicles conveyed and the number of trains ran during the period under review, as compared with the old method of working:—

Summary.	Miles incurred.	Miles saved.
2,987 up goods trains conveyed equal to 80,637 loaded vehicles, averaging 27 per train, from Katoomba to Penrith, through the Lapstone tunnel, at a cost of 31 miles per train	92,597	
3,666 up trains would have been required to work the above vehicles, at an average of 22 per train, from Katoomba to Penrith, over the Lapstone Zigzag, at 31½ miles per train	115,479	22,882
2,316 down goods trains conveyed equal to 64,060 loaded vehicles, averaging 27½ per train, from Penrith to Katoomba, through the Lapstone tunnel, at a cost of 31 miles per train ...	71,796	
2,670 down trains would have been necessary to work these vehicles [64,060], at an average of 24 per train, from Penrith to Katoomba, over the Lapstone Zigzag, at 31½ miles per train..	84,105	12,309
		35,191
2,709 up and down passenger trains were worked through the Lapstone tunnel from the 18th December, 1892, to 28th February, 1894, on which a saving of ½ a mile per train is effected as compared with the old route, the Zigzag	1,354	
Approximate saving		36,545

H. RICHARDSON.

901. *Chairman.*] You have given us so many miles—the question is, what you charge? The cost per train-mile working is about 4s. 7½d., and the saving would come to £8,464.

902. *Mr. Wall.*] Does that cover the whole of the expenditure on the mountains? No; that is the Lapstone Zigzag.

903. *Chairman.*] You were subsequently asked by Mr. Lync for a return showing the cost of all improvements from Penrith to Baskbank? That is being prepared. I will send it into the Committee. The statement I have handed in is the statement of the Commissioners, and I do not know that I have any more evidence to offer.

904. I find by a *précis* which has been handed to us by the Works Department that there is a discrepancy in the historical record which you have given us. I think you told the Committee just now, first of all that the Minister for Works, some years ago, at the suggestion of the Railway Commissioners, approved of an investigation being made in order to discover a practicable route for the purpose of the deviation? Up to that stage several schemes had been submitted, the cost of each of which, however, appeared to the Commissioners to be too great. Further investigations were being made, when, by the direction of the present Minister for Works, the officers were withdrawn, he having expressed the opinion that the work was one which should be carried out by the Railway Commissioners. The statement of the Public Works Department is as follows:—

On the 15th March, 1892, Mr. H. Deane, who had succeeded Mr. Whitton as Engineer-in-Chief for Railway Construction, reported to the Minister that the Railway Commissioners were desirous of testing the possibility of connecting the western line at Dargan's Creek with the lower points of the Zigzag, traffic considerations rendering the cutting out of the Zigzag desirable, if it could be done at a reasonable cost. He, therefore, asked the approval of the Minister to a thorough investigation being made into the matter by the surveyors of his branch. The Minister, on the 1st April, minuted that the matter was one entirely for the consideration of the Commissioners; but he added that should they be desirous of testing the practicability of the deviation, he had no objection to the Engineer-in-Chief carrying out the survey. On the matter, however, being again referred to the Minister for approval for the expenditure of about £300, he ordered it to stand over, and in consequence the surveyors who had been instructed to proceed with the work were recalled. . . . The information in the possession of the Department appears to have been sufficient to enable Mr. Burge, the engineer for trial surveys, to submit a scheme to the Engineer-in-Chief. On the 26th April, 1892, he suggested two alternative proposals. . . . A copy of this report was forwarded by Mr. Deane to the Railway Commissioners, and in so doing he stated that as the surveyors were withdrawn before any real work was done, he was not in a position to offer any opinion on the report.

You seem to infer by your statement that the survey of these three routes was completed by the Construction Branch, and thought by your Department to be too large? I think you will find that the statement of the Commissioners is fully borne out. The Minister did approve of the survey. Mr. Burge did send in a report, and with that report an estimate was given, the figures being £260,000.

905. *Chairman.*] The *précis* to which I have referred states:—

Mr. Burge pointed out that the objection to all the routes was the great length of the main tunnel on a steep grade, and that it was impossible to predict which was the best, without a careful survey of each. He also appended an estimate, which amounted to £260,000.

Mr. Deane said nothing was complete? The Commissioners simply say that before the work was completed the surveyors were withdrawn, but the cost, so far the matter was before them, was too great—from £260,000 to £300,000.

906. Then you say that the matter was allowed to remain in abeyance until the question of the desirability of finding work for the unemployed was raised. You say—

Some few months ago, in a conversation the Premier, Sir G. Dibbs, had with the Chief Commissioner on the question of providing work for the unemployed, Sir George, having expressed his determination not to approve of anything in the shape of relief works, but at the same time being desirous of providing work of a profitable nature, it was suggested by the Chief Commissioner that rather than undertake works of a doubtful character, so far as financial return was concerned, it would be well to carry out works of the nature of cutting out the Lithgow Zigzag. The Premier at once recognised that this would be a work of a most desirable nature, which would employ a large number of men in ordinary pick and shovel work, and expressed a wish that it would be put in hand without the least possible delay. Steps were then taken to have the plans completed, and the line is the most direct one that can be made, and the economy in working will amount to more than the interest on the capital expended. And in view of the fact that the Commissioners had been urged to bring the matter forward at once, they made a proposal to the Minister for Railways, as detailed in their letter of November, 1893.

The information furnished to us by the Department is not quite in accord with your statement. The information furnished to us states:—

On the 24th November, 1893, the Railway Commissioners addressed a communication to the Minister for Railways, the Hon. John See, in which they stated that ever since they had been in office the disadvantage of passing traffic over the Lithgow Zigzag had been continually before them, as well as the continual risk in working, consequent on trains loaded with passengers having to be propelled both up and down over the intermediate section of the Zigzag. The cutting out of the Lapstone Zigzag had so greatly facilitated the working that they felt justified in asking the Government to consider the expediency of providing sufficient money to carry out a further alteration of the line to permit of the Lithgow Zigzag being avoided. The work they stated would in all ways be beneficial, and more than return interest on the capital expended. The scheme they proposed was one for leaving the existing line at a point near Dargan's Creek.

Are we to understand, then, that, before the Commissioners communicated with the Minister as to the desirability of cutting out the Lithgow Zigzag, this conversation with the Premier had already taken place? Yes.

907. You say in one part of your statement that the No. 1 scheme was only partially completed so far as being ready to go on with the work was concerned? It was what you might call merely a survey. The details for contract were not worked out.

908. You state:—

Steps were then taken to have the plans completed and the line is the most direct one—is the most direct one that can be made.

You came to the conclusion that No. 1 was the best which could be suggested? Yes; the plans gave that idea so far as they had been prepared.

909. I should like to draw your attention to this paragraph in the *précis* which has been put before you:—

On the 22nd January the Railway Commissioners forwarded, in compliance with the request which had been made to them, plans, sections, &c., in connection with the scheme which they proposed. They also forwarded a report from Mr. Foxlee accompanying the plans, &c., in which he stated that the estimated cost of the deviation proposed by him was £225,000, exclusive of land and fencing. That the length of the proposed deviation was about 2 miles 53 chains, the ruling grade 1 in 50, and the sharpest curve 12 chains radius. The tunnel would have a length of about 2,840 yards. In forwarding the plans the Commissioners wrote the following minute:—“As the scheme is one that has been devised and worked out in detail by Mr. Foxlee, the Commissioners think that he should be associated with Mr. Deane in the carrying out of the work.”

Does not that paragraph show that scheme No. 1 was absolutely completed? I do not think the working drawings and quantities were completed. The plans were completed sufficiently to enable an estimate to be given, but they could not start the work on the plans prepared.

910-11. The Commissioners say in their minute:—

As the scheme is one that has been devised and worked out in detail by Mr. Foxlee?

That is so far as showing the practicability and cost of the scheme. But in order to start the work you would require working drawings and quantities which, I understand, were not prepared. It is only a matter of detail.

H
McLachlan;
Esq.

14 Mar., 1894.

H.
McLachlan,
Esq.
14 Mar., 1894.

912. But sufficient detail had been obtained to enable an approximate estimate of the cost to be formed? Certainly; the cost, the grade, the practicability of the scheme, length of tunnel, and everything else.
913. From what you say, the Commissioners were of opinion that what they proposed was a mere deviation of the existing line, which they believed they were empowered to carry out under the provisions of the Railways Act? Yes.
914. Now they think the position is altered, owing to the Cabinet having decided that the work is one of those which must be carried out by the Construction Department? I do not say anything more than what the minute conveys—that it has gone into a wider and broader scheme.
915. May I ask the reason why the Commissioners, after having sent the whole of their plans and details to the Construction Branch in accordance with the minute of the Cabinet, have continued in the field surveying for other routes? I could not say.
916. I think you told the Committee during your last examination that between March or April, 1892, and November, 1893, the various schemes then suggested by Mr. Burge had been looked into by the Commissioners' engineers? I do not recollect mentioning that—not in that way.
917. But, as a matter of fact, all the details of any proposed deviation up to that date, namely, April, 1892, were sent to your Department by the Construction Branch, were they not? No. So far as I am informed, the construction plans and details have never yet been submitted to the Commissioners. That is why the Commissioners say they are not in a position to report on the whole of the scheme.
918. You are now referring to the later scheme. I want to know whether, in 1892, when, by order of the Minister for Works, the then surveys were arrested, the reports of Mr. Burge, and all the details then in the Construction office as to any possible deviation, were passed over to your Department? No; a copy of Mr. Burge's report was passed over, but I do not think the details of the plans were passed over.
919. Then you believe that in April, 1892, Mr. Burge's report on the then three possible schemes which he outlined, and Mr. Deane's report, were the only documents which came to you? I believe so. Mr. Deane, I think, brought a rough sketch plan round, but no details.
920. Are you aware whether the Construction Branch did pass over to the Railway Commissioners in April, 1892, all the information they then had at their command as to any possible deviation of the Lithgow Zigzag? No; I do not think they did.
921. If we have the assurance of Mr. Deane that all the information he had up to that point was passed over to the Department, would that modify your view? Yes; he ought to know.
922. Between the time you were in the possession of Mr. Burge's report, and of Mr. Deane's report of April, 1892, was anything done by your Department to test the proposed schemes submitted by Mr. Burge? Not that I am aware of.
923. Are you aware that the scheme which you have now submitted, which is called No. 1, is one of the schemes suggested by Mr. Burge? No; I am not aware.
924. Are we to understand that the engineers of the Department put the information contained in Mr. Burge's report on one side altogether, and started new ground? I could not say.
925. But you are able to tell us whether Mr. Burge's report and Mr. Deane's report were sent on to your engineer? I daresay the engineer saw them. They were sent to the Commissioners. I could not say where they went after that.
926. The Commissioners state that this matter having come before the Public Works Committee for consideration, they are of opinion that the aspect of the case is altogether altered, and that the proposed deviation is now being considered in the light of a new railway. Can you give us any reasons why the Commissioners view this work in the light of a new railway, inasmuch as it will tap no additional revenue-producing country, but is merely a proposed deviation to cut out a certain objectionable grade? Under the Railway Act the Commissioners have power to carry out the deviation. If it is to be considered in the light of a new line of railway, and referred to the Public Works Committee, their minute clearly shows that they ask that it should be dealt with in the same way as all other public railways.
927. But have you not already, in your evidence, given us all the information upon that point, namely, that the interest on capital to carry out your No. 1 scheme, would amount to £9,000 a year, and that it would save you £10,000 a year in working. There is no additional traffic coming in? But as a matter of fact, that is not the whole of the business. The Commissioners say that they believe they can get a better proposal than that if time is allowed them. Then, of course, there are other schemes before the Committee which the Commissioners say they would like to have submitted to them, so that they could give a comprehensive report as to which, in their opinion, is the best.
928. But as a matter of fact, is it the function of the Commissioners, in furnishing a report to Parliament upon any new line, to discuss which way that particular line should go, or is it their function to report on the estimated cost and the probable amount of traffic on a particular line of railway? It is their practice to report on a particular line; but this differs from an extension of a railway, because all the schemes practically bear to the same end. But there is a difference of opinion as to which is the best.
929. Have the Commissioners, in any of the reports which they have furnished Parliament on a proposed new line of railway, ever entered into the question of rival routes, or have they not confined their attention exclusively to the estimated cost of working a line, and the estimated revenue to be derived from it? As a rule—yes.
930. Is it not so invariably;—can you tell me of any instance in which there is a departure from that rule? In one or two cases they have suggested where slight deviations might be made; but, as a rule, the practice has been to report on a line as submitted to them.
931. You cannot give us any reason for considering this a new line of railway, and, therefore, to be brought under the provisions of the Public Works Act, other than the fact that the construction of it has been taken from the Commissioners' Department, and placed under the Railway Construction Department? I can say nothing more than what is contained in the statement.
932. *Mr. O'Sullivan.*] I understand from your evidence that the No. 1 scheme is altogether abandoned? No; I do not say that. The Commissioners want time to judge as to which is the best scheme, and to have all the details before them.
933. Although the Commissioners have not abandoned the scheme marked No. 1, they have sent out a party to survey another route? Yes.
934. What are the names of the gentlemen who are out surveying? Mr. J. B. Suttor and Mr. Baxter are the two principal officers.

H.
McLachlan,
Esq.

14 Mar., 1894.

935. Do you know what instructions they have received? To try and get the most practicable route between the points concerned.
936. But have they any particular route to take to the north or south? To the north.
937. Are they confined to the inspection of a route to the north? Practically.
938. And do the reports received from them favour the idea that they will obtain a more favourable route there than No. 1? Yes; a better grade.
939. Do you know what part of the valley that line will come out in? It will come between the bottom points and Eskbank. But the Commissioners are getting all the details, and it is rather anticipating. It is mentioned in the report that owing to the bad weather the officers have not been safe to push on as fast as the Commissioners expected.
940. You have put in a statement showing the number of accidents on the Zigzag in the last five years, in regard to which the cost totals up to £1,700 odd;—do you think that is a fair average statement as to the number of accidents which have happened since the Zigzag was opened twenty-six years ago? Of course the traffic increases every year. Each year you are more likely to have an accident on account of the greater volume of traffic. So far as my experience goes there have been more accidents recently. Still it would be difficult to strike an average so far back.
941. But do you think that is a fair average number of accidents for five years, dividing the twenty-six years by five? No; we ought not to have accidents at all. The number of accidents referred to is more than should happen. You will see that they have been due, practically, to the Zigzag.
942. But as a matter of fact, the Zigzag has now been opened twenty-six years? It was opened, I think, in 1869.
943. During that long period have there been many accidents other than those which you have mentioned as occurring during the last five years? There have been other accidents.
944. But have there been many accidents? Not a great number to my knowledge.
945. Is it not a fact that very few accidents have happened on the Zigzag? You could not call them very few. Three accidents in five years is rather a large number on a small section of the line.
946. But I am alluding to the time outside the five years referred to? I could not speak from recollection as to the number.
947. *Mr. Dawson.*] Have not all the accidents occurred since the Commissioners came into office? No. I recollect that we had an accident about ten years ago. There was a dispute as to whether it was due to the Zigzag or to bad couplings. A great deal of damage was done, and one man was killed. That was at the bottom points.
948. *Mr. Davies.*] I understood you to say in answer to a question put by the Chairman that the Railway Commissioners have a number of surveyors engaged in investigating some route other than the one which has been submitted by the Commissioners known as No. 1 scheme? Yes.
949. By whose authority are the Commissioners making this investigation? By their own.
950. Is it not the usual practice when the Constructing Department of railways has charge of a public work of this character to refer the whole matter to them, and that the only inquiry of a public nature which is made is made through that Department? In doing what they are doing the Commissioners are acting entirely within their province. As a matter of fact, when public works have to be carried out such as the Lapstone tunnel, for instance, the Commissioners have asked the Public Works Department to make a survey for them. The surveys and plans in connection with that were practically prepared by the Construction Department.
951. But that was a work carried out by the Commissioners? Yes; but the plans were made by the Public Works Department.
952. But you are aware that this work is not now in the hands of the Commissioners. It is, by the authority of Parliament, entirely out of their hands, is it not? Yes; it may be.
953. By what authority, then, do the Commissioners go behind the back of Parliament and make this inquiry of a public nature, with public officers? They make it with their own officers. The Commissioners think that they can get a cheap and a better route, and surely they are not open to censure for doing that.
954. Cannot they give the information, if they have a better route, to the proper construction officers of the Railway Department? From what we have heard this route was suggested to the construction engineers a couple of years ago, but it was not followed up.
955. You refer to the route suggested in 1892? Yes.
956. Is it not a fact that the Commissioners, through their officers, surveyors, and engineers, actually prepared the No. 1 scheme to cost £225,000? Yes.
957. Has not every detail been prepared ready for the calling for tenders to carry out that work? The details of construction have been prepared. The surveys have been made and plans have been prepared by the Existing Lines Branch.
958. And as a matter of courtesy the whole matter was submitted to the Minister for Public Works? To the Minister for Public Works.
959. And if the Minister for Railways had given his assent to the proposal in all probability tenders for the work would have been called for at the present time? I could not say that.
960. What was the object, then, of asking the Minister to give his assent. If you are not ready, why ask the Minister. If the work was not sufficiently ripe to be carried out, why ask the Minister for his authority? Certainly the work could have been carried out soon afterwards.
961. And it was the intention of the Commissioners to carry it out? I do not know whether that is so expressed. If they had been asked by the Government they would have done it. The letter of November, 1893, will speak for itself. They recommended it as a desirable work. As to the details, I could not speak positively.
962. But they have the details from their officers? Those details were passed over to the Department of Public Works.
963. And they were so satisfied with the details received from their officers that they recommended the work to be carried out, and submitted it to the Minister? Yes.
964. You tell us that they suddenly found that a better scheme can be submitted than the one which has been submitted? I do not say that. I say that they think that what might prove to be a better scheme is at present being explored and surveyed. Therefore, it would be wise to wait until the whole of the details have been got out, so that they can report as to which, in their opinion, is really the best scheme.

H.
McLachlan,
Esq.
14 Mar., 1894.

965. Do you not think, seeing that this matter is absolutely out of the hands of the Commissioners, by the authority of Parliament, and handed over to the Construction Department, that if you have any information at all to convey it should be conveyed to the Construction Department? I could not say that.
966. Then why should we have this divided authority? The Railway Act divides the authority of construction and the maintenance of railways. Of course, this work is largely associated with the maintenance of a railway. If it had been a new railway entirely, disassociated from an existing line, the Commissioners probably would never have interfered.
967. Then you regard this as part of an existing line? It is, practically. It is a deviation of an existing line.
968. In the statement which you have submitted to the Committee, you voiced the opinion of the Commissioners to the effect that they regard it now as a new railway? They say the matter is assuming a wider aspect than when first submitted—that they are going further away from the line. It is a matter of degree.
969. Do you think it is a proper or a prudent thing that the Commissioners, or any other public body appointed by an Act or by the authority of Parliament, or by the Government and Executive Council, should have authority to spend £250,000 without reference to the Public Works Committee? I do not think I could express an opinion on that point.
970. You are aware that the Public Works Act does not give authority for the expenditure of a larger sum than £20,000? Yes; outside the railways.
971. That is the will of Parliament? Yes; of course the Railway Acts gives the Commissioners power to maintain the railways.
972. But you are aware that the Act has been amended so as to give power to the Commissioners to spend a certain sum of money? Outside the Colony.
973. Evidently showing that the intention of Parliament was that no Department should spend a larger sum than £20,000 without the authority of Parliament? The Railway Act hands the whole management and control of expenditure on the railways to the Commissioners, subject, of course, to the lump sum to be expended being voted by Parliament.
974. You still think, notwithstanding that Parliament has taken this matter out of the hands of the Commissioners, and have referred it to the Committee as a work which, if recommended and carried out, should be carried out by the Construction Department;—you still think that the matter should be in the hands of the Commissioners? Certainly.
975. Coming back to the scheme submitted by the Commissioners to the Minister, you are aware that there is a tunnel of nearly 2 miles in length? Yes.
976. Are you in a position to express an opinion as to whether it is wise on the part of the Commissioners to have on a line of road a steep grade? One in fifty is not a steep grade, compared with others.
977. Do you think it is wise to have these long tunnels on a single line? It is not if you can avoid them, but there is no evil in them, and no risk. There are much longer tunnels than this in other places. They have a longer one on a single line in New Zealand.
978. Do you regard the first tunnel through Lapstone Hill as a success? Yes.
979. Have you no complaints from the travelling public? You always hear complaints about a tunnel.
980. Is there not a universal complaint against it? No; not that I have heard of. I have travelled through it frequently.
981. And you hear no more complaints than in regard to any other tunnel? Naturally, people do not like going through a dark place, and the smoke comes in.
982. And it is very hot whilst you pass through? You pass through in a minute and a half on the passenger journey.
983. What is the length of that tunnel? About 600 yards.
984. What was the cost of the work? From £45,000 to £50,000.
985. Was there not an estimate of some £60,000? No; I think not.
986. You are quite sure of that? Not to my recollection.
987. And you represent that the saving effected by the deviation on the first Zigzag in train mileage would be £8,000 or £9,000 a year? Yes; it is fourteen months since it was opened.
988. You estimate that, providing the deviation as proposed by the Commissioners is carried out, it will make a difference of £9,000 or £10,000 a year? That is the estimate of the officers.
989. A sum equal to that which would pay the interest on the capital cost? Yes.
990. What commercial advantage would it be to the Railway Commissioners if the deviation were carried out as proposed by them? You would do away with the Zigzag, which is an awkward section to work, and instead of being limited, perhaps to twenty-five trucks, you would be able to haul over forty. If at any time you stood at Clarence tunnel and saw a train pass up the 1 in 33 grade, you would notice the strain, wear, and tear. There is a great economic advantage, owing to the tremendously bigger load you can haul.
991. Would you be able to take a much larger load if the grade was altered as suggested in this deviation? Yes, very much larger. I think, in fact, if you got a 1 in 60 grade the load would be about double, so that one engine would do the work of two.
992. At the present time you have to use two engines? Practically, for a full load.
993. For a portion of the journey? Yes.
994. Would you be able to take a double load right to Sydney with one engine? You would have to stage it.
995. At the present time you have to do that? Yes.
996. So that the only advantage would be on a certain length of haulage? Yes, that is a great advantage.
997. As Secretary to the Commissioners, you strongly recommend a deviation of some character, so as to ease the grade? Yes.
998. Whether No. 1, 2, 3, or 4 scheme is carried out, you regard it as highly necessary that something should be done in the interests of the traffic across the mountains? Yes.
999. *Mr. Hoskins.*] How do you make out a saving of £9,000 a year in working the Lapstone Zigzag? We have saved so many train miles.
1000. You are given to understand, from information conveyed to you by the Traffic Department, that £8,000 or £9,000 a year are saved by the working of Lapstone Hill tunnel as against the Zigzag? Yes.

H.
McLachlan,
Esq.

14 Mar., 1894.

1001. Have the authorities conveyed to you the impression that by doing away with the Lithgow Zigzag there will be a saving in the cost of haulage on the line, between Mount Victoria and Bathurst? There will be a great saving.

1002. In what way? By increasing the train loads, and making one engine practically do the work of two.

1003. But there will be a longer length of railway? A shorter length of railway.

1004. Some of these schemes show a longer length of railway than the existing line, do they not? No; they are all shorter.

1005. Then there will also be a saving in the number of trucks which can be hauled? Yes, and a saving of course in time.

1006. If a saving is effected by a deviation of the Zigzag and a reduction of the grades, will that accelerate the traffic on the length of railway between Emu Plains and Bathurst? Certainly; because you can stage your traffic.

1007. But how can you take longer trains over a steeper gradient than the Zigzag? Because you can stage the traffic, and have depôts. You now get a certain load to Bell. You have to break the train there to take it into Eskbank on account of the 1 in 33 grade coming up the Clarence tunnel.

1008. But seeing that there are upwards of 13 miles with grades of 1 in 33, and $1\frac{1}{4}$ miles with grades of 1 in 30, you still will have to break up the train on those steep gradients? That is on this side of Mount Victoria.

1009. You will have to break up the train there, or run an extra engine? Yes.

1010. The gradients at the Zigzag have never caused the breaking up of a passenger train? No, not as a rule, because if you get a little over the load you would put on a second engine which means practically doubling the cost of the train, because you have an additional engine and second engine men.

1011. But that would apply equally to the steep gradients between Emu Plains and Mount Victoria? Yes; but if you could cut out a grade at one part of the road, and it gives you a clear run of 50 miles, instead of having to break up the train you save practically one engine over that distance.

1012. Am I to understand that the Commissioners consider that the Colony would be justified in expending £225,000 in dispensing with one or two steep grades on a certain line of railway, whilst at the same time they have a dozen more equally as steep or steeper grades, with which they cannot dispense? But they say it will be an economical advantage—it will pay for itself.

1013. Can you show how? The Commissioners have shown that in a practical way by the first Zigzag.

1014. I would like to see that in print and test it? It has been done on the Northern line, too. There was a small grade on the other side of Singleton which was cut out. Now instead of breaking up the train at Singleton you can run it through.

1015. I grant that if you cut down steep grades you can run longer trains, but if you cut down one or two grades in one or two places and leave plenty others in other places, I do not see how you can facilitate traffic much? But if by cutting down a grade at one point you can get a clear run for 20 to 50 miles, whereas previously you had to divide the train, you can see the advantage. If you run ten trains a day it means, say, a saving of 500 train miles a day, which represents 150,000 miles during the year, and as each mile would cost say 4s., there is a saving of £30,000 a year.

1016. But can you, by doing away with the Zigzag, and having gradients of 1 in 50 instead of 1 in 42, have a clear run of 25 miles without coming upon any steep gradients at all? I think you could run right away from Katoomba to Eskbank, where the stage would be, or even into Bathurst.

1017. Is there any steep grade westward of Mount Victoria? There is one of 1 in 55, between Mount Victoria and Katoomba.

1018. The proposal to do away with the Zigzag originated in 1893, with the idea of finding work for the unemployed? That is stated in the report. That is how the matter, cropped up, more particularly at that time.

1019. Can you say, of your own knowledge, what are the special reasons why the Commissioners are in favour of incurring this large expenditure, and doing away with the Zigzag? I can say nothing more than what is stated in their paper of November, and the one they have laid before you to-day.

1020. Amongst other things I understand that they think that it would facilitate the working of the railway, and also diminish risk? Yes.

1021. And the risk on the mountain line exceeds that on an ordinary line, especially where there are gradients of 1 in 30 and 1 in 33, and curves of 8 chains radius? There is always a risk on the Zigzag, owing to the manner in which we have to work. The matter is one of practical railway management with which the Commissioners claim to be thoroughly cognisant, and they say there is a risk, and they make that statement advisedly.

1022. The Commissioners, no doubt, are experts, but still this matter has to be inquired into by the Committee. The Commissioners have placed before the Committee the reasons why they wish the proposal to be carried out. Amongst the reasons which they assign is the expediting of traffic, and the avoiding of risks of accidents. I think it is fair to ask whether there have been unusual risks at the Zigzag at Lithgow any more than the risks incidental to working a mountain line of railway with steep gradients and sharp curves, and whether the risk is of such a character as to justify the large expenditure of public money? There is always greater risk in working on a 1 in 33 grade and sharp curves. If the Commissioners could cut them all out at a reasonable rate they would do so.

1023. You have given us a return showing us the number of accidents for five years? Yes.

1024. You have stated that some ten years ago a serious accident took place at the Zigzag and that lives were lost;—are you sure that that accident took place? I am sure an accident took place at the bottom points. There was a dispute as to whether it was due to the Zigzag, or to defective couplings. One of our employees was killed, and one or two were injured, and a good deal of damage was done. The trucks, I believe, ran right back to Lithgow.

1025. During the last five years the amount of damage by these accidents amounted to £1,700, and £30 was paid as compensation to some person who was injured;—having regard to the number of trains taken over the Zigzag in the course of a year, do you think that the return of accidents is an excessive one, and one which indicates that there is great danger and unusual risk attending the working of the line? It indicates that there is unusual risk.

1026. Have you not had worse accidents which have entailed six times greater cost? We had a greater accident recently, owing to the breaking of a rail, but that was not due to construction.

H.
McLachlan,
Esq.

14 Mar., 1894.

1027. Do you not think that some of these accidents were due to defective management;—take the one on the 9th October, 1891—

Down goods train became divided at top points. Nineteen vehicles ran down middle road into the buffer-stops at the bottom points.

Does not that indicate that the train was not properly and efficiently coupled? I think not; but I could not very well enter into details of the management.

1028. Here is another—

Double train pushing into dead-end top points, pushed rear engine over buffer-stops.

If there had been any proper regulations providing that the man in charge of one engine could signal to the man in charge of the engine assisting to push the train up, do you think it likely that the accident would have occurred? All these things are provided for by regulations and instructions.

1029. Therefore, these accidents occur through violation of instructions? If the Zigzag were done away with none of these double engines would be running there.

1030. Do you not use double engines between Mount Victoria and Emu Plains? Yes; but we are proposing to cut the 1 in 33 grade to 1 in 60, which would not require the use of a double engine.

1031. But have you not a number of 1 in 30 and 1 in 33 grades between Mount Victoria and Emu Plains? But that does not affect the matter at all. It means to stage the traffic.

1032. These accidents you say happen through using two engines? Yes; the two mentioned.

1033. But will you not use two engines on the steeper grades still? To carry the same load you would, but probably the trains will be divided. The Commissioners, as a matter of fact, do not like any of these steep grades. They would cut them all out if it was feasible.

1034. *Mr. McCourt.*] I presume the Commissioners estimated the saving per annum by what is known as the No. 1 scheme? That is the scheme which was worked out.

1035. What do they estimate the saving would be? About £10,000 a year.

1036. And they estimate the cost of the work at £225,000? I think the actual figures were £213,000.

1037. The Commissioners state that they estimate the whole of the work at about £225,000, which at 4 per cent. would mean an annual cost of £9,000; but they estimate that in addition to the great facility for the working, and the avoidance of the continual risk which now takes place, the expenses will be reduced by about £10,000 per annum? Yes.

1038. Whichever proposal is carried there will be 5 or 6 miles of line cut out of the present line? Yes.

1039. The cost of that line cut out would be practically a loss to the country? Yes.

1040. Would it not be a fair thing in estimating the saving and cost of the line, to add the cost of the line cut out to the cost of the new line? No; because you have to consider the saving on the present expenditure.

1041. The line which will be cut out has cost the country, say, £165,000? Yes; but by working the old line you would make no saving, whereas by spending a certain sum of money you are going to save a certain sum per annum.

1042. The Commissioners attempt to show a saving on the outlay? Yes.

1043. But they do not include the cost of the old line to the country? No.

1044. Do you not think it ought to be included? I think not.

1045. Will the cost of this deviation be charged to capital? Yes; I should think so.

1046. As well as what will be lost on capital? Yes.

1047. So that practically there will be no saving to the country? Yes; the saving on the line will be, as they calculate, £10,000 a year, by the expenditure of £200,000.

1048. There will be a capital cost to the country of £365,000? That is by adding the two together. Of course there will be 5 miles of dead money.

1049. Which the Commissioners do not take into account? No.

1050. And which you think they ought not to take into account? No.

1051. The Commissioners do not take any account of what will be lost to the country on the dead line? No.

1052. *Mr. Neild.*] The tunnel which the Commissioners have proposed has a grade of 1 in 50? Yes.

1053. Is it not a fact that immediately at the end of this new 1 in 50 grade, which is to take the place of a 1 in 40 grade, you find yourself brought up with a grade of 1 in 42? Yes.

1054. Will you not require additional engine power to get over the 1 in 42 grade? Yes; you will, one way.

1055. But is it not required only one way at present? No; the grade unfortunately dips both ways.

1056. What will the advantage be in getting rid of a grade of 1 in 40, and supplanting it with one of 1 in 50, whilst at the end of the tunnel you will have, as at present, a grade of 1 in 42. Will you not require additional engine power over the 1 in 42 grade as at present? Yes; an assisting engine, in part, coming this way.

1057. So that if the tunnel were built you would only get rid of the additional engine one way? Yes; unless the other scheme is carried out.

1058. Which other? The one the Commissioners are now having surveyed.

1059. Is that to the north of the line? Yes.

1060. What is the proposed length of that? About 9 miles, I think.

1061. That would be longer than the present route by the Zigzag? No; they may make a saving of a mile.

1062. Can you tell us, as a railway expert, the advantage of a 1 in 50 grade over a 1 in 42 grade? The engineer could give you the exact weight, in tons, which would be carried on both grades.

1063. Will you state whether the three accidents which have taken place on the Zigzag during the last five years were, in the opinion of the Commissioners, due to the engineering formation of the line, to defects in the maintenance of the line, to deficient couplings, or to want of care or skill in driving? I could not say. I hardly recollect enough of the details. The details show that they were, to some extent, due to having to work a Zigzag, because two of the accidents, if I recollect rightly, were due to engines overrunning.

1064. Were there any similar accidents on the Lapstone Zigzag? Yes; one or two. I remember Mr. Meeks, who was a member of Parliament, being injured through the train running over the top points.

1065.

1065. That was a preventable accident? Yes; but it would not have happened if there had been no Zigzag there.

1066. In the statement which you have put before the Committee is the following sentence:—

The Commissioners replied that they had already made inquiries on the subject, and that this proposal will probably prove far more costly and less profitable than the deputation anticipated; and as it would be moreover, virtually the construction of a new line, they did not consider it a work which could be undertaken under the Railway Act.

In another portion of the statement they say:—

I am directed to point out that as the work, as a deviation, has been taken out of their hands, and is being dealt with as a new line of railway under the provisions of the Public Works Act, the duties of the Railway Commissioners in regard to the matter are clearly defined by section 13, subsection 1.

Having, as the mouthpiece of the Commissioners, informed the Committee that the matter has been taken out of their hands, and is being dealt with as a new line of railway under the Public Works Act, will you explain why it is that the Commissioners are continuing to spend money in seeking for a new line for railway on the north side of the line? I do not know that I can give any further explanation than what I have given in the statement I have submitted.

1067. But the statement is very contradictory, is it not. You state, as the mouth-piece of the Commissioners, that the work has been taken out of their hands, and is being dealt with as a new line of railway; yet, notwithstanding that, you ask that the consideration of the matter may be so dealt with that a survey of the new line which you are making may be completed. You are treating that as a deviation, are you not? The Commissioners are simply making a preliminary survey. I do not know what their action may be when they get the result.

1068. Do you regard the tunnel scheme as a new line or as a deviation? Both are practically deviations.

1069. If they are both deviations why do you tell us it is a new line, and that the matter has been taken out of your hands? The Commissioners mention in their statement that the matter having been taken out of their hands, and the Government considering it as a new line, it has led them to ask that the matter should be dealt with by calling upon them for a report under the Act and showing certain results.

1070. *Mr. Wall.*] Was it the intention of the Commissioners to carry out the No. 1 proposal themselves, provided that the Minister had not referred it to the Committee? I could not say. I think the money would have been voted by Parliament.

1071. Since the matter has been referred to the Committee, this new survey has taken place? It is taking place.

1072. Did the Commissioners contemplate making a further inspection of the line before carrying it out—that is previous to the work having been submitted to the Committee? I could not say.

1073. *Mr. Suttor.*] Who is surveying the line? Mr. J. B. Suttor and Mr. Baxter are the principals.

1074. Where does it start from? From Dargan's Creek, I think. It runs as far out as what they call the Trigonometrical Survey Station; but Mr. Foxlee can give you the details.

1075. *Mr. Ewing.*] Can you make a clear distinction between what is a deviation and a new railway. Is this the distinction—that a deviation is work carried out by the Commissioners under the Railways Act, and upon which no report is made by them to anybody? Yes; that would be a deviation.

1076. And a new railway is a work upon which a report is made under the terms laid down in the Public Works Act? Yes.

1077. You regard the tunnel in the first instance as a deviation? Yes. It is rather a difficult matter. It is the first case of the kind we have had.

1078. Would you regard that as a deviation? I think, in the first instance, the Commissioners looked upon it as a deviation.

1079. But there is a limit to the work as a deviation? That is where the dispute comes in. It may be a deviation going from the Western to the Southern line, but still it would be a new line of railway.

1080. In the one case it may be a deviation and in the other a new route? Yes; you would call it a new railway if you went from Mount Victoria to Bowenfels. It is a difficult matter to describe where one commences and the other ends.

1081. *Mr. Hoskins.*] Do you know whether the Railway Commissioners consider as a set-off against any estimated gain they may make by having a deviation of the railway, the amount of interest which ought to be calculated upon the cost of the length of the line which will be disused? No; they have not taken into consideration the question of the cost of the disused line.

1082. Therefore, if the line which it is proposed to dispense with cost £160,000, the interest upon that is not to be calculated as an expenditure as against the estimated gain on the new line? It is not calculated.

THURSDAY, 15 MARCH, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.
The Hon. JAMES HOSKINS.
The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JOHN DAVIES, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
THOMAS THOMSON EWING, Esq.

WILLIAM CHANDOS WALL, Esq.
WILLIAM McCOURT, Esq.
JOHN CASH NEILD, Esq.
EDWARD WILLIAM O'SULLIVAN, Esq.
CHARLES COLLINS, Esq.
HENRY DAWSON, Esq.

The Committee further considered the proposed Deviation to avoid the Lithgow Zigzag.

John William Rock, Esq., M.I.M.E., sworn, and further examined:—

1083. *Chairman.*] You are now prepared to give the Committee the information they desire in reference to the probable cost of your proposed line? I am.

1084. I understand that you desire to correct your former evidence in some particulars? I do. You asked me to state, entirely without prejudice, where I thought a line to Bowenfels would come out, and I traced on the map what I thought the approximate route. Next day, however, I went over the country myself—I had never been over it before—and I found that there is a mountain range, not marked on any map,

J. W.
Rock, Esq.,
M.I.M.E.
15 Mar., 1894.

map, which would interfere with the route I then traced out. I have now discovered how the line would have to go in order to keep clear of the mountains.

1085. I think you told the Committee that if it were thought desirable to tap the existing line at Bowenfels, you would leave your proposed deviation at Doctor's Gap, and join the main line between Lithgow and Bowenfels. You desire to amend that answer? Yes; I find that I could get a shorter, and in every way a more favourable line, by branching off immediately after the crossing of the river Lett.

1086. Is there any other correction that you desire to make? Yes; I should like to state the reason for taking that route. You will observe, by looking at the plan, that the original route takes a very deep and short curve, in order to get height, before entering the range at Doctor's Gap; but that work now becomes quite unnecessary, and so also does the $1\frac{1}{2}$ mile of steep cutting. On the new route the line will run along through meadow land for three-fourths of the distance, to Bowenfels.

1087. You would avoid the tunnel at Doctor's Gap, and also the detour which is necessary to reach it? Yes.

1088. Would the new route make the distance between Mount Victoria and Bowenfels any shorter? Not proportionally. The great saving is in the cost.

1089. Have you any other correction or alteration to make in your previous evidence? No.

1090. Will you now give us your estimate of cost? Yes; I find, taking the first route, that it will cost £345,000 for a double line, finished in the most complete manner.

1091. That is the route to Eskbank? Yes; for a single line it would cost £230,000.

1092. Can you tell us what portion of that will be spent on tunnels, culverts, and so on? I would rather not give every detail, if it could be avoided, because the time has been so short that I have had to lump some of the items together; but to allow for want of time in working out the details, I have kept always on the liberal side.

1093. Upon what have you based your prices—upon similar work carried out by yourself, or have you ascertained the railway prices? I have taken them from the tenders of substantial contractors.

1094. Contracts for recent works? Yes.

1095. How did you arrive at your estimate? I took out the quantities as well as I could in the time, and I have allowed for every detail that occurred to me. I have allowed for the bridges that I referred to when last examined, for various culverts, and for a railway station. There will be 800,000 yards of earthworks.

1096. What price have you allowed for that? I have run it all through at 2s. 6d. a yard.

1097. Will not the bridge over the Lett cost a considerable amount? No; it will only be about 10 feet high, and can be constructed of timber.

1098. Have you any idea what it will cost? Yes, I have allowed £1,000 for it. The stream is only 12 feet wide.

1099. What about your tunnelling? The tunnels will cost £183,500.

1100. That is the two tunnels? Yes, the two tunnels.

1101. Allowing for a double line? Yes.

1102. Can you give us an estimate for a single line? I have not been able to do anything more than to take a percentage off for a single line.

1103. What percentage;—one-third? That is hardly enough to take off, so you see I am on the liberal side.

1104. Has the cost of resuming land entered into your calculations? No.

1105. If it were necessary to resume land, the money so expended would be an addition to your estimate? Yes.

1106. Does your estimate include the cost of permanent way? Yes; everything will be completed on the best scale.

1107. What have you allowed for your station buildings? I have allowed £1,500 for the platform and buildings in connection with the small station at Hartley Vale.

1108. You could not take one-third off that, if the line were a single one? No.

1109. What have you allowed for permanent way? If I were to add all the items up, it would come to about £3,600 per mile.

1110. That is the cost of the permanent way material and laying? Yes.

1111. Including the cost of sleepers, rails, fish-plates, &c.? Yes, and ballast.

1112. What quantity of ballast have you allowed? About 14 inches for the whole width, not taking anything out of the 6 feet.

1113. You have allowed for ballast to go right across between the two sets of rails, leaving no gutter? Yes.

1114. What would be the full width of the ballast? I think about 18 feet will be the width of the ballast.

1115. You provide for sleepers of the class used on the main lines? Yes.

1116. Have you allowed for bricking the tunnels? I have only allowed a contingency amount to pay for a certain quantity of bricking in places. The tunnels will not be bricked throughout.

1117. Do you think you will get sufficiently solid ground to be able to dispense with brickwork? Yes; we shall be more than 200 feet below the surface, and as the ground, as far as I can see, is pretty solid, we shall not require any great amount of bricking.

1118. What proportion of brickwork will you require? I should have to work that out.

1119. But you must have an approximate calculation that so much would be required for bricking tunnels? I have taken an average price for a number of known tunnels.

1120. I want to know, not so much your price, as what proportion of the length of the tunnels will be bricked? I am not prepared to say at this moment.

1121. Have you put any special sum down for culverts? Yes; I estimate them to cost £7,000.

1122. Irrespective of the bridge? Irrespective of three bridges.

1123. One thousand pounds does not cover the cost of the three bridges? No. The first bridge you come to is that crossing the narrow half-used road close to the station at Mount Victoria, for which I have put down £700. Then there is £1,000 for the alteration of the Vale of Clwydd road, and at the Hartley Vale station it will be necessary to put a small bridge to carry the road over the railway cutting. That bridge will cost about £400.

1124. Now, will you proceed with what you were going to say in regard to the advisability of taking the line to Bowenfels, instead of to Eskbank? Yes; I make the cost of such a line, for two sets of rails, and furnished in the same way as the other, £225,000.
1125. What would be the length of it? Seventeen miles, approximately; but I have not made a survey of the last 3 or 4 miles. 15 Mar., 1894.
1126. What would the grade be? The grade, as far as the bridge over the Lett, would remain 1 in 50; but further on I think it would be, say, 1 in 75.
1127. The ruling grade on the 8½ miles between Mount Victoria and the river Lett would be 1 in 50, while the ruling grade on the remaining 8½ miles between the river Lett and Bowenfels would be 1 in 75? I cannot say for certainty that it would; but I should think that that would be the average grade. I cannot speak positively of ground which has never had an instrument over it.
1128. Is there anything else you would like to state in reference to this route? Yes; I would like to point out that it saves £119,000—the cost of the Lithgow tunnel—together with the sharp curve which is necessary in order to gain distance. The line to Bowenfels runs through country which is in every way more favourable than the country through which the line to Eskbank runs.
1129. Where do you propose to join the main line—half-way between Lithgow and Bowenfels? No; at the Bowenfels station.
1130. What would be the cost for a single line of rails—I suppose we may take one-third off again? Yes; that would make it £170,000.
1131. Is there anything else you would like to say? No; I think not.
1132. *Mr. Humphery.*] You estimate that it would cost £90,000 less to take a railway from Mount Victoria to Bowenfels, than it would cost to take it from Mount Victoria to Eskbank? Yes; that would be the saving.
1133. The distance is 3 miles less? Yes.
1134. You could also dispense with a tunnel seven-eighths of a mile long by going to Bowenfels? Yes.
1135. If you only constructed a single line, the saving would be about £60,000. Yes; you could take off one-third.
1136. What would be the saving of distance comparing the line to Bowenfels with the existing line? Three miles.
1137. Would 1 in 50 be the continuous grade on the Bowenfels line? I do not think that the first 217 chains from Mount Victoria could be improved; but some slight improvement might be made further on. That is a matter that will have to be considered.
1138. Would the cost be greatly increased if an attempt were made to improve the grade? I do not think the cost would be increased proportionately. There would only be the extra distance to pay for.
1139. For the first 2½ miles you must have a grade of 1 in 50? Yes.
1140. Could you get a better grade for the rest of the distance without great additional cost? To get an easier grade we must have a longer distance; but that would not make an increase in the proportional cost.
1141. If you lengthened the mileage to get a better grade, the cost of the line would not be more than if you adopted the 1 in 50 grade? Not proportionately. In some cases such an alteration might take the line into very difficult ground, so that it would cost a great deal more in proportion; but in this particular case I do not think that it will be so. All that will be necessary will be to take the line right into Hartley Vale township.
1142. But at the present time you have a continuous grade of 1 in 50? Yes.
1143. Can you say if any existing traffic would be served by taking the line by the route you suggest? I am hardly prepared to give statistics because I was only retained for technical purposes.
1144. But having been over the ground, cannot you say whether the line goes near to any existing settlement which would be benefited by it? I think, with a little study, I could point out an area of about 130,000 acres on the map which is pretty well closed in now.
1145. That is land not at present occupied? There are a number of abandoned farms in the district; the people say that they cannot get their produce away. They are shut in by a hill from 700 to 800 feet high, which adds a day to their journey to market, and makes the carriage of their produce impracticable.
1146. *Mr. O'Sullivan.*] Will not the line from Mount Victoria to the river Lett be very awkward to work, because of the continuous grade of 1 in 50? I do not know; but I may say that I consulted a prominent Government railway official in regard to this matter, and he said that it would not. The best technical advice I can get is that that portion of the line would not be difficult to work.
1147. Do not railway managers, regard long distances on the one grade as detrimental to the efficient working of a line? I do not know; I am not acquainted with the business of running trains.
1148. But suppose a train got stuck up within a mile of the top of the grade, it would have to run back 7 or 8 miles in order to get another start? The idea would be to put in one or two flat pieces, and I have about 28 feet to spare for that purpose.
1149. Is it not the practice of engineers to put in flat pieces to lessen the momentum of the trains? Yes.
1150. You intend to do that? Yes.
1151. It would be the same on the other part of your line? On the other side of the Lett there would be no difficulties at all.
1152. You say that you saw the country between Doctor's Gap and Bowenfels for the first time the other day? Yes.
1153. Do you think you had time to make a proper inspection of it? Well, I am not giving you any definite figures. I said that my idea was that an average grade of 1 in 75 might be obtained, but that I did not commit myself to any figures.
1154. Have you had ample time to inspect the country so as to be able to say authoritatively that a grade of 1 in 75 could be obtained? Yes; I think so. I think I am sufficiently practised to be able by riding over a route to tell approximately what the grade will be.
1155. You have not had time to survey the line, but your observations lead you to believe that you are justified in stating that you can get a grade of 1 in 75? Yes; an average grade. Getting a grade is very much a matter of cost, and I have allowed a certain sum per mile to cover contingencies.
1156. *Chairman.*] Is it not also a matter of natural features? Yes, practically.
1157. *Mr. O'Sullivan.*] What would be the minimum if that is the average grade? I dare say that we should have to take advantage of a 1 in 50 occasionally. 1158.

J. W.
Rock, Esq.,
M.I.M.E.
15 Mar., 1894.

1158. Can you express an opinion as to the advantage of these two routes from a national point of view? Yes; as retained by my clients, I presented to you the first route, via Eskbank; but as an engineer I say that there is no comparison between the two lines. The Bowenfels route is no doubt the superior, both as regards construction and as regards working.
1159. Has it the recommendation of being likely to develop better country? It opens up a much larger area of country.
1160. *Chairman.*] As compared with the Eskbank line? Yes; I am making a comparison between my first and my second proposal, and I say that the second would be accessible to more country. The first line would in some places run at such an elevation that no road could get up to it.
1161. *Mr. O'Sullivan.*] You state that it will open up 130,000 acres? Yes.
1162. Do you refer to the land owned by Mr. Vickery or to Crown land? I have no idea who owns the land; I only know the area.
1163. One hundred and thirty thousand acres of good land would be opened up if a railway were taken by the route you suggest? That is the opinion I have formed in conversations which I have held with the people there.
1164. Apart from the engineering aspects, would you, as a man of common-sense, recommend the construction of a line to Bowenfels on the ground that it would open up a productive district? I would.
1165. You spoke of some abandoned farms;—do you know why they were abandoned? All I know about the district is that I have been requested to go to two or three public meetings which have been held at places some distance apart to help the advocacy of the line, I suppose, and at these meetings I have heard numbers of people state, not only that the line was required to open up fresh ground, but that ground had been abandoned because of the want of railway communication.
1166. Would not the tunnel at Doctor's Gap go through a sandstone hill? Yes, for a large part of the way. The rest of it would be through part of the coal measures.
1167. And it is that part which would require bricking? It would depend upon the formation. If the tunnel went through coal, it would have to be bricked; but coal-measures need not be coal; it might go through chert, for instance.
1168. But it would not be safe to leave a tunnel going through coal-measures unbricked? No.
1169. It would be safe to work a sandstone tunnel unbricked? Yes; if the sandstone was of any consistency. I should like to make an explanation with regard to some of my figures. When last examined I said that the Eskbank tunnel would be 70 chains long. I now find that it would be nearly 90 chains long.
1170. *Mr. Hoskins.*] Have you an intimate knowledge of the character of the sandstone rock in the neighbourhood of your proposed tunnel? Well, I have had to do with the sinking of shafts in the district.
1171. You do not know that the sandstone there is very jointy, and that in the construction of the existing line it was found dangerous to leave a tunnel with a rock roof? I did not know that.
1172. How long were you engaged in the survey of these proposed lines? About seven weeks on the first line. I have not surveyed the line to Bowenfels at all.
1173. Have you sunk any trial shafts? No.
1174. I suppose you took levels in places? I took the levels right through. For two and a half weeks I suppose my time was taken up in disproving other suggested routes.
1175. Have your levels been checked by any other engineer? No, they have not; but they check themselves, because I went from one known point at Mount Victoria to another known point at Eskbank.
1176. *Mr. McCourt.*] You propose to make a deviation from the Lott River? Yes.
1177. In that case, how far would Lithgow be east of the proposed line? About 2½ miles on the other side of the range. It would be quite cut off from it.
1178. Together with all the coal-mines? No; all those coal seams—The Vale of Clwydd, the Vale, and the contingent lines crop out on this side of the range.
1179. What arrangements would they have to make? They would have to construct about three-quarters of a mile of private line from the other end of their fields.
1180. They would have to open up their lines in another place, and move all their machinery? They would have to move their underground plant, which, of course, is nothing, and as they are already between 1 and 2 miles on the way, it would be much cheaper to do this, without taking into consideration the 6d. or 7d. saved in railway freight.
1181. Your line would practically ruin the township of Lithgow? I fail to see why.
1182. Lithgow is now on the railway line, but if your line were constructed it would be 2½ miles away? Their nearest point would be Bowenfels junction.
1183. Would not the value of property in Lithgow be depreciated if your line were constructed? I do not see why.
1184. Do you know the country well on both sides of the present line from Mount Victoria to Bowenfels? No, I do not. I have only been over it on the railway.
1185. If you had a free hand to construct the best line, from a national point of view, would you adopt the route which you now recommend? Yes.
1186. That is the Bowenfels line? Yes—my second proposal. If there were no line beyond Mount Victoria, I would recommend the continuation of the line along that route to Bowenfels.
1187. But do you think it is worth while to make the alteration under existing conditions? Well, I did not intend to answer these questions; but if I am forced into it, I would say that it appears that this line would open up productive country, to which the betterment principle could be applied. As far as I understand, the proposed deviations are not shorter than this line.
1188. But, apparently, you do not recommend any alteration of the existing line? I would recommend that if any line is to be made, mine should be made. I do not consider that my line is a deviation. It is a new line, and would mean the abandonment of 20 miles of the existing line.
1189. *Mr. Ewing.*] You see the red line, marked on the plan before the Committee, starting from Bowenfels, and passing through Andrew Brown's selection, until it makes the village of Bowenfels, then turning towards the east, and passing in an easterly direction through reserve 139, until it terminates at Lett's Creek? Yes.
1190. That is approximately your line, and you believe that it is the best line that could be obtained in the interest of Bowenfels? Yes; but I should like to prove whether it is not possible to make a shallower bend round Hassan's Walls.

1191. If we make a survey of that route we shall not be far off your line? No.

1192. *Mr. Humphrey.*] Will your line junction with the main line between Lithgow and Bowenfels, or beyond Bowenfels? On the Lithgow side of Bowenfels, in order to save the station—that is, if no engineering difficulties occur.

1193. What is the distance from Lithgow to Bowenfels? A little over a mile. I believe that it is 2 miles from Eskbank to Bowenfels.

J. W.
Rock, Esq.,
M.I.M.E.
15 Mar., 1894.

Harry Richardson, Esq., Out-door Superintendent, Department of Railways, sworn, and examined:—

1194. *Mr. O'Sullivan.*] The Commissioners are desirous of carrying out a deviation to avoid the Zigzag. Can you give us any reasons, from a traffic point of view, why this deviation should be made. Will you state the difficulties under which you now labour, and the advantages that would follow the construction of a deviation? Well, in the first place, if the deviation were made, we could do with many less trains which, on a single line, is a great consideration. I find that last year we took on the down journey,—that is, from Sydney—49,770 trucks over the Zigzag. A train is limited to 21 trucks just there, because of the 1 in 33 grade between Dargan's Creek and Clarence Siding, and the length of the wings on the Zigzag. On the up journey we took 64,976 trucks, and on the average 29½ trucks per train. On the up journey the trains are cut in half before reaching the Zigzag, and are brought up in two parts. When we get the half trains to the top, one engine is able to take the load on to Bell, because the grade is only 1 in 50. To cope with the traffic takes 4,562 trains. If, however, the Zigzag, and the 1 in 33 grade were cut out, we could take, on the average, from 35 to 40 trucks per train. Some of the large American engines would be able to take as many as 45 trucks. In that way we should be able to do as much with 3,276 trains as we do now with 4,562 trains, so that there would be a saving of 1,286 trains. There not only is the saving in the number of trains; there is also a saving in time. The time now occupied on the journey from Eskbank to Bell is 90 minutes, while 100 minutes is taken for the up journey. The distance is only a little over 11 miles; but, it must be remembered that we have to divide the trains, pin down the brakes before going down the grades, and back slowly down the Zigzag. We are limited by our instructions to a speed of 10 miles an hour on the middle road, and to 5 miles an hour on the wings of the Zigzag; but I estimate that if the Zigzag were cut out, the down journey could be performed in 30 minutes, and the up journey in about 40 minutes; that is, assuming that Mr. Foxlee's proposed deviation were adopted, and a banking engine were used for the tunnel.

1195. That saving would be between Eskbank and Bell? Yes.

1196. Can you give us any idea of what its value would be per annum? We should save about 11½ miles upon 1,286 trains, which would mean 14,950 miles altogether; and putting that down at 4s. 8d. per mile—the cost of the train mile according to the Commissioners' report—the saving amounts to approximately £8,488.

1197. *Mr. Humphrey.*] Will you show us how there is a saving of 11½ miles? At present we run 4,562 trains over the 11½ miles between Eskbank and Bell, but I estimate that if the Zigzag were cut out we could do the same work with 3,276 trains, a saving of 1,286 trains.

1198. *Mr. O'Sullivan.*] Would there be any other saving? All that I have said up to the present refers to the goods traffic. We ran 1,404 passenger trains over the line during the last twelve months, and we shall be able to save 2½ miles on the running of those trains, or a total saving of 4,036 miles.

1199. What would that come to in the year? About £942. That is the mileage saving. Now, let us come to the saving in time. Under existing conditions, owing to the length of time it takes to run between Ponrith and Bathurst, we are unable to make one set of drivers do the whole journey. Our day's work is 9 hours 10 minutes, and the running time on our tables is from 9 to 11 hours for a goods train, consequently we have to put on fresh men at Eskbank, and we do not get such a good run from the drivers as we would otherwise do. If the journey occupied so much less time as the cutting out of the Zigzag would enable us to do, the drivers could take the trains on to Bathurst.

1200. *Mr. Neild.*] But you would not save an hour in the running of the passenger trains? No; only about 15 minutes.

1201. *Mr. O'Sullivan.*] Will you kindly state what you would save? About 19 minutes on the down, and 12½ minutes on the up journey.

1202. *Mr. Neild.*] That would be a saving of about one-half? Yes; it only takes 15 or 18 minutes to run 8 miles on a straight road.

1203. *Mr. O'Sullivan.*] You might enumerate any other saving? We should save an hour on the journey of each goods train, which I estimate would be worth £3,000 a year. Then the push-up engines would not cost so much. Although we could take a full load from Dargan's Creek to Bell, I am doubtful if we could take that load through the tunnel, because I am not sure that the men could work as well in the tunnel. Therefore, I assume that we should have to continue to use the push-up engines, but they would not be used for more than an hour, whereas they are now used 1½ hour. There would be a saving of from £500 to £600 a year there.

1204. You would be almost certain to use these push-up engines? Not to anything like the same extent as we do now. Where we use three engines now, we should only use one, perhaps.

1205. *Chairman.*] Are the push-up engines used to overcome the grade between the bottom of the Zigzag and the lower points, or to overcome the grade higher up? They are used on both grades. We push the trains right up to the mouth of the Clarence tunnel.

1206. Then even though the tunnel were made you would still have to use a push-up engine? Yes; to the top of the 1 in 42 grade.

1207. And because of the difficulty of working in the tunnel, you would probably use a push-up engine right through? Yes.

1208. *Mr. O'Sullivan.*] Are there any other savings? No; I think those are about all.

1209. There will be savings in the maintenance of the permanent way? That is all covered by the saving in the train mileage.

1210. What is the total saving? £10,127.

1211. That is on existing trade? Yes.

1212. But you must put as a set-off against that the lower freights the public will pay for the reduced mileage;—have you taken that into consideration? I have not.

1213. I presume you will have to make allowance for it? I am not prepared to say.

H.
Richardson,
Esq.
15 Mar., 1894.

H.
Richardson,
Esq.
15 Mar., 1894.

1214. Do you think it is likely that the public will pay the same rates for the trip from Eskbank to Bell, along the deviation, as they now pay for the longer journey over the existing lines? I do not know whether the Commissioners would alter the rates.
1215. Do you know what the difference in distance would be? Yes; there would 2½ miles less to run.
1216. Do you not think that the public will make a demand to be let off so much of the present charge? I daresay they will.
1217. They are almost sure to do so if the rates there are on a mileage basis? There is no doubt about that.
1218. You would have to deduct that from the £10,000 which you say you would save? Yes, if the reduction in fares were made.
1219. The same thing would apply in regard to goods and stock? Yes.
1220. *Mr. Ewing.*] But you need not make that reduction unless you like? Yes. We should only have to put it down as a set-off if it were made.
1221. *Mr. O'Sullivan.*] Is there any difference made between the rates on the Southern and Western lines because of the increased cost of working the Western line? No.
1222. Then I presume that the practice which prevails on the Southern line of charging mileage rates will prevail on the Western line? I am not authorised to say;—I do not make the rates.
1223. Suppose a better route than Mr. Foxlee's were adopted, which would be more workable but a little longer, would the saving be increased? Yes, if the route were better and had an easier grade.
1224. So that instead of being £10,127 it might amount to £12,000? If I saw a plan and knew exactly what was going to be done, I might be able to answer your question. If the additional mileage absorbed whatever time might be saved on the 1 in 60 grade, there would be no advantage.
1225. Do you know the No. 3 proposal? I have seen a rough plan of it. [*The Chairman explained the scheme to the witness.*]
1226. Do you think a still larger saving would be obtained by adopting the No. 3 proposal, which is 2 miles and 3 chains longer than Mr. Foxlee's, but has a grade of 1 in 60? Well, if a bank-engine had to be used in the tunnel, I think there might be an additional saving in connection with the No. 3 scheme.
1227. It seems almost certain that you would have to use a pushing engine in the tunnel; but it is probable that you would not have to use it on the No. 3 deviation? You would have to use a push-up engine up the 1 in 42 grade at the commencement of the deviation. The same saving would be made in regard to the number of trains on either line, because the ruling grade between Dargan's Creek and Bell would govern the load which would be taken over either deviation. Mr. Deane's deviation does not take us beyond Dargan's Creek.
1228. Then you would still want a push-up engine? No, we should only require the push-up until we got to the top of the 1 in 42 grade; but we could not put a full load on the 1 in 60 grade because of the 1 in 50 on ahead. The two deviations would, therefore, be in the same position so far as the number of trains is concerned.
1229. It seems to me that it must be borne in mind that £167,000 was spent in constructing the Zigzag, and interest has to be paid on that money. Have you taken that into consideration as a set-off against any saving which you may effect? I do not see that that makes any difference. If we save £10,000 a year, and pay interest on the new line, I do not see how the cost of the old line affects the position.
1230. You would have to pay interest on the line which you intend to abandon? But we have to pay that interest now.
1231. But if a deviation is made, you will have to pay the interest on it as well? But if the interest on the deviation only comes to £9,000, and we save £10,000 in the working, we shall be all right.
1232. *Chairman.*] The interest on the £225,000 which it is proposed to expend on the No. 1 scheme would amount to £9,000 per annum, while your saving would be roughly £10,000 per annum. You have, therefore, £1,000 to the good, but you have also to pay the interest on the £167,000 expended on the line which you intend to abandon? Yes; but we have to pay that interest now.
1233. *Mr. O'Sullivan.*] Can you tell us anything else which would justify the construction of this deviation from the traffic standpoint? Besides the saving to us in actual money, I think it must be borne in mind that it would be a great advantage to the public to get their goods one hour sooner than they now get them. It must also be remembered that although the Zigzag has been worked almost without accidents, it cannot be denied that it is a dangerous place.
1234. Can you call to mind how many accidents have happened during the last five years other than those which were put before the Committee yesterday? No, I cannot.
1235. Did many accidents take place between 1869, the year when the Zigzag was opened, and five years ago? No.
1236. Can you call to mind more than one? Not more than one serious accident, which happened just after the line was opened, when one of the firemen got his leg cut off.
1237. So that in twenty-five years there have only been four accidents, of which only two have been of a serious character? Yes.
1238. Does not that go to show that the Zigzag is not by any means so risky a place as engineers would have us to believe? Perhaps it does; but a man might only make one slip, and he would run right over the end with a trainful of passengers.
1239. But you might say that of a good many callings. A man in command of a ship might make only one mistake, and the ship would be ashore? But it would be a good thing to prevent the possibility of accident.
1240. But the trains now are safer than they were in the early days, because of the continuous breaks? Yes.
1241. As a matter of fact we may acknowledge that the risk makes the men more careful, and possibly causes the management to put good men there? Yes; the best men are picked for that particular place, and of course they have their lives in their hands, and are not likely to risk them if they can prevent it.
1242. I think your testimony, and that of others shows that the Zigzag in the hands of careful men is by no means a risky place? So long as the men carry out their instructions there is no risk.
1243. Has there been any serious block of traffic on the Zigzag? Yes, that is the great difficulty. If we get a very busy day it is a very difficult thing to get the trains to cross one another on this part of the single road. I have no figures with me to show the delays; but they have been very serious.
- 1244.

H.
Richardson,
Esq.

15 Mar., 1894.

1244. Would not the same remarks apply to all the single roads in the country where there is a large traffic? Yes; but not to the same extent, for the simple reason that the trains have to be made smaller, because of the grades and the shortness of the wings, and it takes three times as long to travel over the line as it would take to travel over a similar length of line anywhere else. The trains have more trouble to get through there than they have at any other part of the mountains.

1245. I gather from your evidence that the Commissioners believe that from the standpoint of traffic it is very desirable to make the deviations? I believe the Commissioners do think that.

1246. *Mr. Hoskins.*] Have not continuous brakes been fitted to all the passenger trains running on the mountains? Yes.

1247. And to all the stock trains? Yes.

1248. And are they not being fitted to all the luggage trains? Yes; I think that in a few years every truck will be fitted with them. They are being fitted on every day.

1249. How long do you suppose it will be before they are fitted to all the trains? I could not say. It depends upon the amount of money the Commissioners have to dispose of. I know that they are losing no time.

1250. What progress are they making? I think they are fitting about fifty trucks a week.

1251. Then they will soon be all fitted? Yes, if the Commissioners have the necessary funds.

1252. If continuous brakes, under the control of the engine drivers, are supplied to all passenger, stock, and goods trains, will not the risk of accident upon the Zigzag be diminished? Yes.

1253. Are not push-up engines extensively used on the Western line between Emu Plains and Mt. Victoria? Yes, as far as Katoomba. Every down train has a push-up engine.

1254. There are curves of 8 chains radius on that line, are there not? Yes; and the curves there are sharper than the curves further on.

1255. And there are long descending grades from Mt. Victoria to Emu Plains? Yes; it is one long decline the whole way. There are only one or two little flat places, such as that near Faulconbridge.

1256. Do you not think there is a greater probability of accidents occurring where there are long descending grades, like those from Katoomba to Emu Plains, than on the Zigzag? No, I think not, because we are working the section between Katoomba and Emu Plains on the absolute block system. We never allow one train to go on to a section until another train has gone through it, and consequently, if the train did break away no harm would come to it, because the driver would have the road to himself. Running down from Clarence Siding, however, if the train went over the top wing of the Zigzag, it would be a serious matter.

1257. But are there not other places on the line where there are steep embankments and sharp curves, and a possibility of the trains running off? No. We have the block system at work on all the steep grades so as to prevent such accidents.

1258. Still accidents might occur even with the block system if trains ran away upon a steep grade? Yes.

1259. *Mr. McCourt.*] Is there not an officer stationed at Penrith who works the mountain traffic? Yes; there is a district officer.

1260. Only the reports go through your office? Yes; and I compile the time-tables, and arrange the working of the line.

1261. What is the name of the Penrith officer? Mr. Henson.

1262. Would he have more knowledge of the difficulties of working this line than you have? I do not know that he would. I have a knowledge of that line extending over twenty years. I admit that he would have a good practical knowledge of the line, because he is on it every day.

1263. You estimate the saving that would take place if Mr. Foxlee's deviation were made at £10,000; but supposing you said it was £15,000 what means would outsiders have of checking your statement? I have a return in my office showing every load taken over the line during the last twelve months.

1264. But would it not be a most difficult thing for an outsider to check your statement? I do not think so. If I give you the number of trains that went over the line, the mileage run, and the saving effected by having longer trains, I think it is a very simple thing to check my figures.

1265. *Mr. Trickett.*] You have had experience of working trains in long tunnels? Not outside of this Colony.

1266. The tunnel on Mr. Foxlee's proposed deviation would be the longest we have in New South Wales? Yes; I think the longest tunnel we have now is 1 mile 7 chains.

1267. Have we any very long tunnel with a continuous grade of 1 in 50? The Otford tunnel, which is about three-quarters of a mile long, has a grade of 1 in 40.

1268. Do the rails in these tunnels become slippery? The Otford tunnel is not liked by the men, because it is difficult to work.

1269. For what reason? The men get suffocated by the steam from the engines. The ventilation is bad.

1270. Does that affect the condition of the rails? The tunnel being full of steam must make the rails slippery; but that tunnel is not in my section, though I know that it is very difficult to work. I have to look after the Northern and Western lines.

1271. Is it not a fact that engineers object to tunnels with steep grades? You mean the engine-drivers—yes, they do.

1272. Do you not think a grade of 1 in 50 in a tunnel $1\frac{3}{4}$ mile long might possibly be detrimental to the working of the line? I do not like tunnels; but if there is a double road, and there are to be ventilating shafts, I do not think that it will make much difference. The tunnel at Woy Woy is over a mile long, and no difficulty is experienced in getting through it. It is a double tunnel, with a nice draught through it.

1273. Is it not comparatively level? Yes; but the goods trains go through it very slowly, because there is a grade of 1 in 40 before you get to it, on the down journey.

1274. Do not the rails on the mountains become more slippery than they are elsewhere? Yes, because that country is subject to fogs. In anything like a dull day they get fogs, and then the rails become slippery.

1275. Speaking generally you do not approve of a long tunnel with steep grades? I do not.

1276. Mr. Barling has told us that this tunnel is to have two ventilating shafts, 12 feet in diameter each. Do you think they would be sufficient to properly ventilate it? I should not like to offer an opinion. All I know is that it is very much easier to travel through a double tunnel than to travel through a single tunnel; there always appears to be plenty of draught through a double tunnel.

1277.

H.
Richardson,
Esq.
15 Mar., 1894.

1277. The Lapstone tunnel is a single one, is it not? Yes.
1278. What has been the experience of the Department with regard to the ventilation and the state of the rails there? We have had no trouble with it, though some of the men say it is very warm, especially the men on the push-up engine. We have never been stuck up there.
1279. What is the grade? One in 33, I believe.
1280. Is it supposed to be a well ventilated tunnel;—do you know how many air-shafts it has? I do not know that there are any. I might say that there would have been no advantage in making the grade 1 in 40, because the ruling grade as far as Katoomba is 1 in 33, though there are short pieces of easier grades here and there.
1281. But have you not heard many complaints on the part of the public with regard to the stuffiness of that tunnel? Yes; the public say that unless they put the windows up they get the steam in, and that makes them very uncomfortable.
1282. But, independently of that, you do not find that the state of the rails affects the traffic? No.
1283. What is the length of that tunnel? 638 yards.
1284. Only one-fifth of the length of the proposed tunnel? Yes.
1285. It has been stated that the cost of constructing that piece of line between Dargan's Creek and the lower points at Eskbank was £167,000;—what would the interest on that be at 4 per cent.? £6,680.
1286. It is estimated that the No. 1 deviation will cost £225,000;—what would be the interest on that at 4 per cent.? £9,000.
1287. Will you add those amounts together? Yes; they come to £15,680.
1288. What is the saving to be effected by carrying out the deviation proposed by the Commissioners? In round figures, £10,000.
1289. Will not the country then have a deficit of £5,680 in the working of the line? This is the same question as was put to me by Mr. O'Sullivan. There is, of course, that difference between the interest and the saving; but I cannot see that that amount will be lost, because we have to pay the £6,680 now.
1290. But how would you earn it if you abandoned the existing line? If a man is doing a business worth £10,000, and he pays £4,000 a year for interest, he is justified in increasing his capital to an extent that will not absorb that interest, if he can save £1,000 on its working expenses.
1291. But must he not include in the amount upon which he has to earn interest the money he first expended? I do not think so.
1292. *Mr. Humphery.*] With regard to this question about the saving on the deviation, is this the position: it will cost you £225,000 to make the deviation, and the interest on that will be £9,000? Yes.
1293. You will save £10,000 by carrying out the deviation? Yes.
1294. Deduct the £9,000 paid for interest, and you make £1,000 clear profit? Yes; we should be £1,000 better off than we are now.
1295. By losing the money at present invested you save £1,000? Yes.
1296. Besides doing so, do you also save time? No; that is included.
1297. Everything included, you would be £1,000 better off after providing interest on the cost of the deviation? Yes.
1298. Now, touching Mr. Rock's proposed line: his proposed route would take a line from Mount Victoria to Bowenfels, a distance of 17 miles, with a grade of 1 in 50; if that line could be constructed for less than the No. 1 deviation, do you think it would be an advantage to construct it and abandon the present line to Eskbank? Does Mr. Rock cut out Eskbank and the coal sidings there?
1299. He joins the main line at Bowenfels; there would be a long siding from there to Lithgow and Eskbank? I do not think that that would be an advantage. Some of the coal sidings are down near the lower points, so that the coal would have to be taken 3 or 4 miles to get to Bowenfels.
1300. Why do you not think it would be an advantage? Well, the traffic from Eskbank is very considerable.
1301. Would you not still get that traffic? Yes; but we should have to bear the expense of taking it down to the junction, whereas now we pick it up along the road.
1302. Would the additional cost of taking it down to the junction neutralise any advantage which you might gain in constructing a cheaper line? I do not know; I have not seen the line.
1303. You may treat it as a continuous grade of 1 in 50? Then it would be very expensive to work, and we should not save so many trains a day as would be saved on Mr. Foxlee's deviation. I think that either of the proposed deviations is better than that.
1304. Or the existing line? Or the existing line.
1305. Your objection is to the continuous grade? Yes.
1306. You think that that would be an insuperable objection? Yes.
1307. I understand that there is a continuous grade of 1 in 50 for $8\frac{1}{2}$ miles? That would be very bad; but I should like to see the sections before giving an opinion on the line. If the grade were a continuous one that would be against it; but if there were only bits of this 1 in 50, and the drivers had places where they could recover themselves, it would not be so objectionable.
1308. A continuous grade of 1 in 50 for 8 miles would be objectionable? Yes, certainly.
1309. Can you state the volume of the traffic coming from the Valley, as compared with that coming from beyond the Valley? When they are busy there I should say it is about one-fourth. We sometimes bring as many as 100 trucks a day from there.
1310. You consider that one-fourth of the western traffic comes from the Valley? Yes, quite that, when the mines are busy in the winter season.
1311. *Chairman.*] In volume and in value? Not in value.
1312. I mean value to the Department? No; because although it costs us as much to bring a truck of coal as to bring a truck of wool to Sydney, we get four times as much for the truck of wool as we get for the truck of coal.
1313. Do you get any profit from the coal? Not very much, but I have not worked the rates out.
1314. *Mr. Humphery.*] The No. 3 scheme has a grade of 1 in 60, and is about 2 miles longer than the Commissioners' deviation, which has a grade of 1 in 50, going through a tunnel; could you take the traffic over the No. 3 line at less cost for the whole distance than you could take it over the Commissioners' deviation, having regard to the difference in grades? As regards the up traffic, if we have to use a push-up engine through the tunnel, I should say yes; but with the down traffic we could get over the Commissioners' line in less time, because the distance is 2 miles shorter, and it would be as easy to run down a grade of 1 in 50 as to run down a grade of 1 in 60.

1315. But what about wear and tear? There would be more wear and tear on the longer line.
1316. The wear and tear would not be greater where the severer grade was? No, I do not think so, because there are no curves in that line. The wear and tear is greatest where there are curves.
1317. *Chairman.*] Although there may be fewer curves on the No. 1 line, there is one very sharp curve near the tunnel? Yes; but it is very short. I would prefer, however, that you should ask Mr. Foxlee, or some of the engineers, these questions.
1318. *Mr. Humphery.*] Knowing the difference in length and grade between the No. 1 and the No. 3 proposal, and knowing also that the longest tunnel on the No. 3 line is not more than 700 yards, which would you prefer? For the down traffic I prefer No. 1, and if the long tunnel on the Commissioners' line could be worked without a push-up engine for the up traffic, I should prefer the shorter route, though I do not like tunnels. The saving of 2 miles is a consideration.
1319. Suppose you could not use the long tunnel without a push-up engine? Then I should prefer the No. 3 line.
1320. Is it your opinion that it would be necessary to use the push-up engine on the Commissioners' deviation? I think Mr. Thow will be able to speak more definitely on that point. My opinion is that we should get most of the trains through there without it.
1321. *Chairman.*] Are you aware the approach to the tunnel on the Commissioners' deviation the grade will be 1 in 42? Yes; we should have to use a push-up engine there, but I think we could get the trains through the tunnel without it.
1322. *Mr. Collins.*] Is the trade from the western districts increasing? At present it is rather slack, but on the whole it is increasing.
1323. In all respects? Yes; the quantity of farm produce, wool, and stock sent over the line is increasing, though at the present time things are dull.
1324. If the traffic continues to increase the saving will be larger? Yes.

H.
Richardson,
Esq.
15 Mar., 1894.

MONDAY, 19 MARCH, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTON.	The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. JAMES HOSKINS.	THOMAS THOMSON EWING, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	JOHN CASH NEILD, Esq.
The Hon. JOHN DAVIES, C.M.G.	EDWARD WILLIAM O'SULLIVAN, Esq.
	CHARLES COLLINS, Esq.

The Committee further considered the proposed Deviation to avoid the Lithgow Zigzag.

William Thow, Esq., Chief Mechanical Engineer, Department of Railways, sworn, and examined:—

1325. *Mr. Davies.*] Can you tell us the different grades from Mount Victoria to Eskbank? I can give them from Bell to Eskbank, but I have not the grades from Mount Victoria with me. There is a rising grade from Bell station of 1 in 80. That is followed by a few short grades which are nearly level. There is a descending grade to Dargan's Creek of 1 in 50, and an ascending grade of 1 in 33 to Clarence Siding. Then there are descending grades of 1 in 66, a short one of 1 in 40, another 1 in 66, with a small piece of level, and again other heavy grades through the Zigzag which commence there, from 1 in 42 down to the bottom of the Zigzag at Oakey Park, when they run into 1 in 150 on to Eskbank.
1326. On what portion of the line which you have described do you regard the grades as the most dangerous and as likely to affect the wear and tear of rolling stock? The Zigzag portion—1 in 42 grades.
1327. Starting from where? They begin a little beyond the 89-mile. Then there is a piece of 1 in 40 on the Sydney side, with others of 1 in 66 on each side of it up to Clarence Siding.
1328. What difference in the cost of rolling stock do you consider that this portion of line entails upon the Department by reason of those grades? It would be very difficult to arrive at a calculation, because we have never kept the cost of this small portion of the line separate. There is no doubt that it is much heavier than our average.
1329. Take the length from Bell to Eskbank—could you give an estimate of what the cost of wear and tear would be, compared with any other portion of the Western Line? I should think it would be 50 per cent. greater—that is, as far as the locomotive cost is concerned.
1330. What about the rolling stock? I am speaking of the engines, carriages, waggons, and so on.
1331. Is that one of the strongest reasons in favour of the deviation of the line? I should think it was not the strongest reason. I may say, however, that I am not acquainted with the Commissioners' reasons for entering into this question at all. There is, however, a risk in the Zigzag which seems to me to be a very desirable thing to be eliminated.
1332. A risk to life and stock? Yes; without great care we should certainly have accidents there.
1333. Has there been any large number of accidents? Not a large amount, but it is a more risky piece of line to work than our ordinary line.
1334. Consequently, I suppose, greater care is exercised? It requires greater care.
1335. Have not the Commissioners conferred with you and other officers of the Department in view of the deviation? Only so far as to show what saving there might be in substituting these proposals for the present working.
1336. You are aware that they estimate to save something like £10,000? Yes.
1337. And that is made up of train mileage at 4s. 6d. a mile? Four shillings and eightpence.
1338. How do you arrive at the 4s. 6d. per mile? The permanent way charges are 15-10d.
1339. Is that the cost of maintenance and keeping the road in repair? Yes; that does not apply to this particular piece of road. That is the uniform charge right through. Then the locomotive charges are 17-83d., carriages and waggons 4-13d.
1340. How is the locomotive power made up? Repairs for engines, wages, charges connected with offices, repairs of machinery, everything which comes under my control. The traffic expenses are 16-93d.
1341. Can you distinguish between the severe grades on the Zigzag and some other portion, say, on the

W. Thow,
Esq.
19 Mar., 1894.

W. Thow,
Esq.
19 Mar., 1894.

Southern line with an easy grade of 1 in 100? Only by assuming, as I did just now, that the difference in cost would be 50 per cent.

1342. Can you separate from your general estimate the cost of traction over the Zigzag portion? No; we have not kept it.

1343. Do you estimate the cost of traction at a much higher rate as compared with the general system? Yes; as far as the locomotive power is concerned, I should think it would cost 33d. instead of 22d.—50 per cent. more.

1344. Would the cost of the permanent way be also increased proportionately over that particular track? I should think it would; but Mr. Foxlee would be able to give you an opinion. There is increased wear and tear of locomotives, increased fuel and men's wages, because they are longer on the journey. It takes them longer to get over this piece of road than on the level.

1345. I take it that the friction and wear and tear to carriages and rolling stock generally is greater on the Zigzag than on an ordinary line? The cost would certainly be greater.

1346. Do you regard it as absolutely necessary for the Mountain and Western traffic that there should be a deviation and easier grades made? No, I do not consider it absolutely necessary. We could go on working the Zigzag for years to come. But the deviation would be an advantage.

1347. You could go on for years to come with perfect safety? I think so; just the same as we have been doing.

1348. But it would make a hole in your earning if the cost of traction is so much higher than on an ordinary portion of the line? It would be a very great convenience to have a straighter line than the Zigzag, not only in regard to the cost of working, but also in regard to safety.

1349. Safety is one of the principal things which concerns you? I think so.

1350. Have you to use additional engines on this line to raise your loads from point to point? Yes; we use push-up engines from Eskbank to the top of the incline at Clarence.

1351. Is that a separate item? No; that would be included in the 4s. 8d. It would go into the general account.

1352. Can you give any idea of the actual cost of the mileage of this particularly bad portion which you speak of. Would it cost 10s. per mile including all accounts? I do not think so.

1353. What would it cost? About 7s. 6d.

1354. Not double the cost of the general average? I would not expect it to be double, but that is only an approximation.

1355. What would be the total amount saved on rolling stock, locomotives, and wages, if this deviation were effected? I have not gone into the matter simply from a locomotive point of view. I went into it with Mr. Kirkealdie and Mr. Foxlee, as a railway question, and our estimate was that we should save about £10,000.

1356. Have the three of you prepared a statement? Yes.

1357. Would you mind reading it? Taking the different items of saving, we made it out to be about £10,000. With regard to the number of trains that are at present at work—that is, going over the Zigzag. Leaving Sydney on the down journey, there are 2,370 passing that particular place, and on the up journey 2,192, or 4,562 altogether in a year. By either Mr. Foxlee's scheme, or Mr. Deane's scheme, that number could be reduced. Instead of a total of 4,562, 3,276 would be sufficient. That is to say, with either of the two schemes. I am speaking now of goods trains only. The mileage saved would be between Bell and Eskbank, on that reduced number of trains.

1358. What would be the mileage saved? The total miles would be 14,950, and taking that at the average cost of 4s. 8d. per mile, there would be a saving of £3,488.

1359. *Chairman.*] That is based on No. 1 scheme? That mileage is between Bell and Eskbank, and for either scheme.

1360. You said the mileage would be saved. Is that over the existing length? At present we carry certain trains on to Bell. There they are divided, and they run on to Eskbank. Coming the other way the same thing occurs, and that is occasioned by having this heavy piece of road. If the road is made easier, instead of dividing the train at Bell or Eskbank, we shall carry them right forward, so that we would save on those trains which would be unnecessary, 11½ miles on each train—that is the distance between Bell and Eskbank.

1361. But the only thing is that you are running your vehicles over the same length of road except to this extent: instead of having them in two trains you have them in one? We are running the same number of vehicles, but not the same number of engines. The engine power is less, and that is where the bulk of the cost comes in. The fuel is saved and that is a great item. That saving, I may say, is common to both No. 1 and No. 3 schemes; but there is a further saving in each scheme which is not alike. On the remaining 3,276 trains—those which would have to run—there would be a saving under Mr. Foxlee's scheme of 2½ miles over the present distance, and under Mr. Deane's scheme a saving of three-quarters of a mile. That saving would give a credit to Mr. Foxlee's scheme of £2,971, and to Mr. Deane's scheme of £573. With regard to the difference in grade you will see that it would not help us very much, because we have between Dargan's Creek and Bell 1½ miles of 1 in 50. So that the load that we could take up this piece of road between Dargan's Creek and Bell would be the limit. We could not take over Mr. Deane's scheme, although it is 1 in 60, any greater load than would go up 1 in 50.

1362. That is 1½ miles? Yes.

1363. What about the 1 in 42? The trains would have to be pushed up that 1 in 42. With either scheme we would use to have a push-up engine on the 1 in 42, but if that is done, the 1 in 60 scheme would not give us any advantage in point of load, because we must take the load up the 1 in 50, unless it is cut out. If that could be reduced to 1 in 60 there would be a considerable advantage.

1364. You credit Mr. Foxlee's scheme with some £2,000 saving? Yes.

1365. And Mr. Deane's scheme, by reason of the objections to which you have just now referred, would be only £500? Not on that account; but his distance is greater than Mr. Foxlee's, and these savings are due to the reduced train mileage.

1366. Not to the grades? No.

1367. But is it a fair set-off against the additional length of Mr. Deane's scheme, the saving which would be effected on the rolling stock which you state at 50 per cent? Yes; it would be a little easier in that way. The lighter grade to surmount would be easier on the engine; the fuel would be less.

1368.

W. Thow,
Esq.
19 Mar., 1894.

1368. Would not the wear and tear be much reduced? No doubt it would be a little less.
1369. At what do you estimate the difference between the No. 1 scheme and the No. 3 scheme. I refer to the wear and tear on the rolling stock? I think it might be taken at 4d. a mile. The probability is, that the difference will be made in the time. Being an easier grade the same coal would be spent, but the time would be shortened.
1370. That is Mr. Dean's scheme? Yes; being an easy grade the time would perhaps be the same as under Mr. Foxlee's scheme; that is to say, Mr. Deane might get over 2½th miles in the same time that Mr. Foxlee would get through his tunnel.
1371. You are aware of the length of the tunnel under Mr. Foxlee's scheme? About 1⅓rd mile.
1372. Do you think it would be wise to have a tunnel of that character on the Zigzag? It would not be wise to have a single-line tunnel.
1373. But supposing it is a double line? I should prefer the open.
1374. Even if it should be a little longer distance and an easier grade, you prefer the open? I think it would be better.
1375. *Mr. Hoskins.*] Can you tell me which is the steepest grade between Eskbank and Bathurst? I think there is a piece 1 in 33.
1376. Are the grades pretty long? Yes; but I cannot tell you the lengths.
1377. What do you consider are the special risks in working the Zigzag? At night it is a very awkward thing indeed to stop your train at the exact place; it is awkward in the day, but at night it is particularly so. The wings of the Zigzag are short, and then there is the risk of breaking away. We have had one or two accidents due to couplings parting, and the train running back. That has been a source of anxiety to everyone in working the Zigzag.
1378. With regard to couplings breaking and trucks running away, would not that be equally as applicable to steep gradients on the other parts of the line between Eskbank and Bathurst? Yes; but at the Zigzag we have so many curves combined with steep grades. Again, the very nature of the place must impart to an accident occurring there a very considerable character, which you do not feel when you are dealing with straight or comparatively level pieces of country.
1379. Are not the goods trucks connected with several couplings? Yes; they have side chains as well as the main couplings, but that does not prevent them breaking.
1380. Does it not often happen that couplings are snapped by engine drivers suddenly jerking their engines, or suddenly shutting off steam? It arises from different causes. Want of care is one of the main causes.
1381. We have it in evidence that there is a distance of 1 mile 62 chains with gradients of 1 in 30, and 13 miles 2 chains, with a gradient of 1 in 33 between Emu Plains and Katoomba. Does it not follow that the probability of couplings being broken and trucks running away, is as likely to occur on other portions of the line as on the Zigzag? Yes; but we push up at those places. We push up all our goods trains from Emu Plains to Katoomba.
1382. But do you push up all trains where there are steep grades except at the Zigzag? Not in every case, but we push up where you speak of on each side of Katoomba. We push up from Emu Plains to Katoomba, and between Eskbank and Bell.
1383. Therefore, the difficulties of working the line at the Zigzag in respect to the steep gradients necessitating increased haulage is not greater than on the other side of the steep inclines, inasmuch as you require push-up engines at both places? We wish to do without them where we can. It is too serious a matter to think of doing without them between Emu Plains and Katoomba. But here is a little bit of country which we acknowledge to be dangerous. In other words, it is risky, and it is very difficult to get through on account of the push-up engines having to return from the summit.
1384. But you say you use push-up engines between Eskbank and Bathurst. Are they not equally expensive? It is expensive wherever it occurs but we cannot get over the Zigzag so easily without them.
1385. In point of fact the desire for doing away with this piece of road and incurring the expense of a new one is not alone because you can do away with push-up engines, because you have got to deal with them on other parts of the line, but simply because it is thought to be risky? The engines which push up between Emu Plains and Katoomba are not the same that push up between Eskbank and Bell.
1386. Why? They do not go beyond Katoomba. The others go out of Eskbank shed, push up as far as Bell and go back again.
1387. But I am speaking of pushing towards Bathurst? Even then they are different engines.
1388. But even then engine power has to be used to assist to get the trains up the steep inclines in other places besides the Zigzag? That is quite true, occasionally; but it adds to our cost, because instead of employing three engines between Emu Plains and Bathurst for pushing up purposes, we might only employ two.
1389. But supposing you did away with the steep inclines at the Zigzag you still, of your own showing, would have to use push-up engines on the remainder of the line? But not the same engines. We would get rid of the cost of the push-up engines at the Zigzag entirely, and reduce the total number.
1390. Supposing No. 1 scheme, in which there is a long tunnel with a grade of 1 in 50 is carried out and there are greasy rails, and the approach to the tunnel is 1 in 42, in what way would you dispense with the push-up trains there? We should push up as far as the end of the 1 in 42, and if the rails were greasy through the tunnel we should have to push up through it.
1391. Therefore it is problematical as to whether you would be able to dispense with a push-up engine even if you had a new road? We think we would.
1392. But still you would not guarantee that you would? I could not guarantee that we would, because it depends on the condition of the tunnel.
1393. Under any circumstances, if you use push-up engines to assist trains up the other steep gradients to which I have alluded, you would only be able, if the Zigzag as it at present exists is done away with, to dispense with a push-up engine for a short distance? No; I do not think you apprehend the question exactly. The engine which pushes up between Emu Plains and Katoomba does not go any further. It goes back. The engine which pushes up from Eskbank to Clarence goes no further. It goes back and is ready for another train, so that we cut out these engines altogether, as far as Eskbank and Clarence are concerned.
1394. Therefore, you would be only saving the expense—and perhaps not saving it—of the push-up engines from the bottom points to the Clarence? Yes, on either of the schemes. 1395.

- W. Thow, Esq.
19 Mar., 1894.
1395. At the same time you would have to use push-up engines both east and west of the tunnel? Yes.
1396. You are familiar with the Western line? Yes.
1397. Are there not several places on the western line where there are steep gradients of 1 in 30 or 1 in 33, and curves of 8 chains radius on embankments? Yes.
1398. Is the risk of working this long gradient of 1 in 40 on the Zigzag greater than it would be on gradients of 1 in 33 on embankments with curves of 8 chains radius? I think so.
1399. Why? Simply from the awkwardness of the formation. Then we have to divide the trains. For instance, a train is pushed up as far as the bottom points. There it is divided, and we have two portions of that train standing on the road close together.
1400. Would not that apply equally to the other steep gradients on the line if the engine-power was not adequate to surmount them? Not in the way you are suggesting, because there we have only one train moving at the same time.
1401. But you have only one moving on the Zigzag Mountain? But we have another standing on the same road. If the first portion breaks away a collision would be certain with the second portion.
1402. You never divide trains to follow the long lengths of steep gradients? It rarely happens; but it is the constant practice on the Zigzag.
1403. Do you think there is any greater danger in working the Zigzag at Lithgow than in working the long length of steep gradients on the northern line going down to Peat's Ferry? Yes; I think there is.
1404. Why? Because at Peat's Ferry we take the whole of the train behind, and there is nothing standing on a portion of the road. We divide the trains at the Zigzag, and we have that additional risk.
1405. Do you divide the trains at the steep incline at Peat's Ferry? No; we generally push up with heavy trains there.
1406. Are there not the same dangers of couplings breaking, and so on, on some of the steep gradients of the Illawarra line? There is always that risk, but there is not the obstruction you get on the Zigzag, with a divided train.
1407. But have they not to frequently divide trains on other inclines? It does occasionally happen, but not often.
1408. You told Mr. Davies that the working of the Zigzag was 50 per cent. over the working of other portions of the line? As far as the locomotive power is concerned.
1409. Can you tell us how that is made out when there are other portions of the line on which push-up engines are required? I think you have mistaken me. I said to Mr. Davies that I thought there would be an increase of 50 per cent. at the Zigzag on the average cost over the whole system.
1410. Would not that apply equally to all steep gradients? It would apply to where we use push-up engines and move slowly.
1411. Therefore, it applies to the railway between Emu Plains and Katoomba? It does.
1412. And also to the railway between Eskbank and Bathurst? Some portions of it.
1413. *Mr. Trickett.*] When Mr. Barling was examined he gave an extract from a communication given by the Commissioners to the Minister for Railways on the 24th November, and he stated that ever since the Commissioners had been in office the disadvantage of passing traffic over the Lithgow Valley Zigzag had been continually before them, as well as continual risk in the working consequent on trains loaded with passengers having to be propelled both up and down over the intermediate section of the Zigzag. Will you kindly explain what that means? It means that the carriages have to be pushed over the intermediate length before the top and bottom points by the train engine.
1414. That, according to the Commissioners' minute, seems to be the chief feature of danger? It is a very considerable risk.
1415. Because the carriages are apt to be pushed off the line? Yes; and the enginemmen cannot see so well what is in front of him.
1416. You look upon it as a considerable feature in the risk? I do.
1417. Have you ever heard whether the construction of the Zigzag is faulty at all? No.
1418. *Mr. Neild.*] When you were answering Mr. Davies you gave one or two sets of figures which showed how the proposed or expected saving of £10,000 would be achieved; for instance, you gave us a sum of £3,488 for mileage saved at 4s. 8d. per mile. You gave us a further saving of £2,197 as a saving on Mr. Foxlee's line, making a total of £5,685. Can you give the Committee any information as to how the balance of £315 is made up? Yes; I did not finish the account. We have also the passenger mileage to consider.
1419. The figures you have already given relate only to goods? Yes, and live stock. Then we have the passenger mileage. We are running now 1,404 passenger trains per annum. That would not be altered. You cannot decrease the number of passenger trains, therefore, all we would get there is for running these trains over a shorter distance as compared with the present arrangements. There would be 4,036 miles saved as regards Mr. Foxlee's scheme and as regards Mr. Deane's 1,053. These taken at 4s. 8d. per mile give £942 to Mr. Foxlee's scheme, and £246 to Mr. Deane's scheme. Then we have the estimated saving due to shorter time of engine drivers and guards on duty. I may say a good deal of delay takes place in this way. A train will leave Bell, for instance, and it runs down to Eskbank, but no other trains are allowed to leave Bell until it gets to Clarence; so that if a train is standing at Bell or at Clarence in the meantime the men are idle.
1420. What do you estimate that at? In the case of Mr. Foxlee's scheme we should save about an hour on the journey each way, and by Mr. Deane's scheme we should save three-quarters of an hour each way. The saving of wages under Mr. Foxlee's scheme is estimated at £3,000, and under Mr. Deane's scheme at £2,250. Under Mr. Deane's scheme there is a certain saving due to push-up engines not being required, and that would amount to £1,635. If the tunnel is dry we shall not require to push up under Mr. Foxlee's scheme, therefore the same would be saved.
1421. But you would hardly hope for that? I should hope for it, but I do not know that I should get it. I think it is possible that the tunnel would be dry in that formation. Therefore I do not think the push-up engine would require to go beyond the 1 in 42.
1422. Supposing you do require a push-up engine? Then we should not save any of this amount on Mr. Foxlee's scheme.
1423. You estimate this at 4s. 8d. a mile. Is that the average cost of running on all the lines? Yes; that includes everything.
1424. Does that include wages. Yes.
1425. You will save 4s. 8d. everywhere possible and £3,000 a year in wages into the bargain? Yes; but that is due to delays on other trains, the reduction of overtime and so on. I think it is a legitimate saving.

W. Thow,
Esq.
19 Mar., 1894.

1426. Does the 4s. 8d. a mile include station charges? Yes.
1427. Are there any stations between these two points? There are men at Clarence, and then there are pointsmen at the top and bottom points.
1428. On the new line there would be no station provided? Very likely not.
1429. That would make some difference? Yes.
1430. Would it be large enough for you to estimate? I do not think so. I think the 4s. 8d. per mile is the fairest comparison we can make, unless we were to go into very minute detail. That might be done, but it would be a very heavy labour, and I am not sure that we should arrive at a fairer comparison than this.
1431. What are your average earnings per mile? Seven shillings and nine-pence half-penny.
1432. How many trains do you run over this piece of road in the year? At present 5,966.
1433. Does that include special trains? No; special trains would add to the number.
1434. I suppose there would be fully thirty-four special trains in the course of the year, so that we may take the number at 6,000? Yes.
1435. There would be a difference between the length of the present line which it is proposed to cut out, and Mr. Foxlee's scheme of $2\frac{1}{2}$ miles? We have shown from the information we had when this estimate was made that the difference was $2\frac{1}{8}$ miles.
1436. You made your estimate upon that supposition? Yes.
1437. That $2\frac{1}{8}$ miles, at 7s 9 $\frac{1}{2}$ d. per mile, would amount to over £6,000 a year lost in earnings? If they fixed the charges on the mileage basis.
1438. But are they not fixed on the mileage basis generally? I do not know what might be done in the case of this deviation.
1439. But what is the practice now? The practice is to fix it on the mileage basis.
1440. At the present rate per mile, the loss of earnings on $2\frac{1}{8}$ miles would represent quite £6,500? I cannot say whether that is the correct way to look at the matter. You would have to appeal to Mr. Kirkcaldie, and he might be able to show you that that would not take place.
1441. In estimating your savings in connection with the goods traffic, I think you estimated that the 4s. 8d. relates to the whole—engines and trucks—and you also admitted that a portion of the saving would be on the engine, whilst the same number of trucks would have to run? The same trucks would have to run.
1442. Would you also allow anything for wear and tear of trucks? I said to Mr. Davics that the locomotive cost would probably be increased 50 per cent., but we have not allowed that increase in the 4s. 8d. We thought it was a fairer way to look at it. Instead of adding to the cost on the one hand, and taking away from it on another, we thought it fairer to take the general average over the whole lines, and apply it to both schemes.
1443. Do I understand from that reply that if the tunnel were built, and Mr. Foxlee's scheme were carried out you would have 50 per cent. increase of work on the locomotives? Not over what we are doing at present. The cost of working this piece of road at present is probably 50 per cent. so far as locomotive costs are concerned, as compared with the cost of working the lines as a whole. I think I said that, instead of the cost of locomotive power being 1s. 10d., it might be 2s. 9d. over this particular road.
1444. You speak about the possibility of this tunnel being dry and clean;—is the Clarence a dry tunnel? No; it is a single-line tunnel, and a single-line tunnel will always be greasy.
1445. What double-line tunnels have we? There is one at Mullet Creek on the Newcastle line, and it keeps dry.
1446. Is that in a foggy locality? Not particularly; but I think it would be a wet tunnel if the line were single.
1447. Are there many double-line tunnels in Australia which would help you to form an opinion as to the prospects of this one as a double line tunnel? The only experience we have is on the Hawkesbury line. The tunnels to the Hawkesbury are all double, but they are all short, except the one at Mullet Creek.
1448. They are all north and south, practically? Yes.
1449. Are not the prevailing winds in this Colony north and south more than east and west? I do not think that would affect these tunnels. There may be some of these very tunnels running east and west. As a general rule, the direction on this line is north and south, but the curves at that part of the road might fetch the tunnels east and west.
1450. What is the length of the Woy Woy tunnel? About a mile.
1451. Would not an addition of three quarters of a mile, or almost of doubling the length, have a tendency to promote the greasiness of the rails? There is no doubt about that. A long tunnel is more likely to cause greasy rails than a short one.
1452. What is the gradient in the Woy Woy? It is very slight, indeed.
1453. I suppose that a tunnel with an easy gradient would be not only easier but safer to work than one with a grade of 1 in 50? I think so.
1454. Do you find the Lapstone tunnel inclined to be greasy? Yes; it is a single line, and that is the reason of it.
1455. Have there been any accidents on the Zigzag during your tenure of office? A few.
1456. Can you say whether they have been due to careless driving, through faults in the construction of the line, through faults in the rolling stock, or through unavoidable accident? I think through unavoidable accident. No doubt some of them may be due to careless driving, and others in bad welds in the couplings. I do not think any of them have been due to faults in the road.
1457. How many accidents have there been between Bell and Penrith during the last five years? Not many; there was one near Bell when the bank slipped away.
1458. And there was a substantial accident near Katoomba? There may have been three or four within five years.
1459. Have you any idea what has been the cost of them? No.
1460. Is it proposed to do anything with the heavy grades between Bell and Penrith? I do not think there is any suggestion of that kind.
1461. Is it not proposed to make some alterations in the curves and gradients at Linden? That may be as far as the straightening of the curves is concerned.
1462. But the straightening of the curves would not necessarily imply an alteration of the grade? No; I have not heard of any definite suggestion of that kind even at Linden.

- W. Thow, Esq.
19 Mar., 1894.
1463. You do not think that the difference in the grade between 50 and 60 between the tunnel and Mr. Deane's scheme would be any particular advantage to your Department? As long as we have that 1 in 50 grade between Dargan's Creek and Bell to get over, I do not think it would help us.
1464. *Mr. Collins.*] I understand you to say that even if the proposal of the Commissioners or Mr. Deane's scheme is carried out you would probably have to use a push-up engine? We should have to use it as far as the 1 in 42 grade, say into the mouth of the tunnel.
1465. And there is a possibility of your using it along the whole length of the tunnel. If the rails are greasy we shall have to use it through a 1 in 50 tunnel.
1466. Consequently there would not be any saving? There would not be the £1,635 saving which I have mentioned.
1467. The only thing to be taken into consideration, then, would be the risk of working the Zigzag? Yes; and the shorter mileage as far as the expenses are concerned.
1468. Do you think it would be advisable to spend £225,000 to avert the risk? I could not give any opinion. That is a matter of policy.
1469. *Mr. Ewing.*] An ordinary traffic engine will pull a full train from Sydney to Penrith? Yes.
1470. What happens after leaving Emu Plains? An engine is behind the train at Emu Plains, generally.
1471. Where does it go to? To Katoomba.
1472. What happens then? The train goes on alone to Bell, and is assisted in front by an engine to the top points, and then is divided on account of the Zigzag. The train is too long to get down the Zigzag. It goes by sections into Eskbank.
1473. What happens going on to Bathurst? The train goes on for some distance by the same engine, and if it is heavy enough it has a push-up engine over the Marrangaroo bank and is divided over that heavy piece of road—1 in 33 grade.
1474. A single engine takes it from Eskbank, between Rydal and Wallerawang? Yes.
1475. What happens then? A push-up engine is put on over a part of the road for up trains.
1476. Where does it go to? It is only a short distance. It goes out from Wallerawang, and assists over the Marrangaroo bank. I think I had better send in a statement of the working of the push-up engines on the Bathurst side of Eskbank.
1477. What is your opinion of a 1 in 50 grade, say, with a length of 8½ miles? It will be a very severe pull for an engine.
1478. Would you look upon it as a serious bar to traffic? No; it would probably limit the load more than the 1 in 50 does now.
1479. You say, then, that in the construction of a line you would not have that if you could help it? No; I should like shorter grades than that.
1480. You have worked the present line for some years, and the traffic is not too heavy to make the use of it dangerous in itself? I do not think it is. At least the risk has not increased lately.
1481. In other words the traffic has not increased? No; but with heavy traffic of course the risk would increase.
