1482. And the special danger of the Zigzag is, that you leave part of the train standing on the road where it might be run into? Yes; and there is the other risk of having to push the train in front of the engine on the intermediate section of the Zigzag.
1483. What would be the difference in the power required to take the same load on a 1 in 50 grade, on a curve of 8 chains or a curve of 12 chains? The curve does not mean very much in friction at slow speed. Curves on level lines mean a good deal; but curves on heavy grades do not mean much, because the resistance to gravity is the great thing on a heavy grade; therefore, that becomes the limit of your power. It is a very different thing when dealing with levels where you want to know the tractive power over a level and over a level with curves. Then the curves add considerably to the tractive power required on a level; but here, where our speeds are low, and the effect of gravity is considerable, a curve is not a very important element. On a 1 in 42 grade, where the Zigzag is for every ton that we lift up there, we have to exert 53½ lb. to lift it. That is due to gravity alone. On a 1 in 50 grade we would have to exert 45 lb., and on a 1 in 60 about 37½ lb. That is due to gravity. I do not suppose that the difference between an 8 and a 12 chain curve on such a line as that would add 5 per cent. of additional resistance.
1484. *Chairman.*] What load would you be able to take up a 1 in 60 as against a 1 in 50 grade? At present our most powerful engines would take thirty-three waggons over grades 1 in 42.
1485. Presuming you had the help of a push-up engine to the face of your long tunnel, how many trucks could one engine drag up the long tunnel—up the 1 in 50 grade? About forty.
1486. What could it drag on a 1 in 60 grade? About forty-six.
1487. *Mr. Humphery.*] How many trucks do you take now over the Zigzag? Our heaviest engines take thirty. That is owing to the shortness of the wings.
1488. Assuming No. 1 scheme to be carried out, instead of taking thirty trucks you will be able to take forty? Yes.
1489. I understand you to say that if the No. 1 scheme is carried out, instead of using three push-up engines at Lithgow Valley you will only use one? Yes.
1490. Can you say what the percentage of difference would be between the No. 1 and the No. 3 schemes? I think in all probability the trains would be hauled over No. 3 scheme in the same time as over No. 1.
1491. So that although No. 1 scheme is shorter there would be very little, if any, saving in time? In all probability the time would be the same.
1492. I think your evidence is that the average earnings is 7s. 9d.? Yes.
1493. And the average cost is 4s. 8d.? Yes.
1494. Supposing you cut out 2 miles you would lose the earnings on the 2 miles, if you saved the cost? That depends entirely on how the rates are fixed.
1495. But assuming you cut out 2 miles of line you lose the average earnings of 7s. 9d. and you save the average cost of 4s. 8d.? Supposing the charges made are fixed on the mileage, that would be the case.
1496. But you estimate the average earnings and the average cost now at per mile? No; as far as my evidence goes I have not touched the receipts at all, except in giving to one member of the Committee the earnings per mile. We have not made any comparison in the statements that have been got out as regards the earnings of the line. All that we have done has been to show what amount of money would be saved in the working expenditure.
- 1497.

W. Thow,
Esq.
19 Mar., 1894.

1497. Without deducting from the £10,000 estimated saving the possible loss by shortening the line? Without taking that into account at all, because that was not part of our instructions. We were looking into the saving as regards working expenditure.
1498. In the No. 3 and No. 1 schemes there is a difference in length of 2 miles. The 2 miles at present earn at the rate of 7s. 9d. per mile. That would be 15s. 6d. on the 2 miles, and you estimate a saving of 4s. 8d. per mile; that is 9s. 4d.; so that one practically neutralises the other? Yes, it would more than neutralise it, looking at the matter in that way.
1499. After all would this be the actual difference in the tunnel and the No. 3 line—that the No. 3 line would have a better grade in the first instance? Yes.
1500. The time of passing traffic over the two will be the same? Yes, on account of the limitation of load by 1 in 50.
1501. And the saving of time would only be on the down journey? Yes.
1502. In favour of the No. 1 scheme? Yes.
1503. And apparently the only advantage between the existing Zigzag and the proposed deviation would be that the trains would not be divided in ascending the Zigzag? There is a saving due to the difference in mileage.
1504. But supposing that is neutralised by the loss of earnings you come back to the one point? Of course, if you say there is to be a loss of earnings it would be neutralised.
1505. Then, would not the only advantage be this—that it would be more convenient, and there would be less risk in having the deviation than in working the line as at present? That would be the great advantage, no doubt.
1506. *Mr. O'Sullivan.*] I suppose it would be impossible to improve the grade between Dargan's Creek and Bell? It would be possible to do so by a deviation; but I am afraid that it would not be possible to improve the grade as it stands without considerable cost. It depends entirely upon the country. If it is simply a ridge which the line runs over—and I rather think it is—it would be a difficult thing to improve that grade. It might only be improved by taking the deviation in another direction.
1507. Supposing the line could be taken down Hartley Valley, would a descending grade of 1 in 50 for 8½ miles, and an ascending grade of 1 in 50 for 8½ miles—would that be too severe working for your engines? No; I take it that the great question coming in there, will be as to what length of line between given points will that grade necessitate. For instance, if it caused a greater mileage between Eskbank and Mount Victoria than the present line, we should lose by it.
1508. There would actually be a reduction in distance of 5½ miles? Yes.
1509. Would that, in your opinion, be a superior line to any of those now before us? I should want to know the whole of the features before giving an answer.
- 1509½. Would there be tunnels? One short tunnel of 30 chains.
1510. I am speaking of the proposed line between Mount Victoria and Bowenfels, on which there is only one short tunnel of 30 chains? I think any line which shortens the distance is an advantage, so long as it is not too severe.
1511. The engineer who laid out this line has suggested that the long pull of 8½ miles might be relieved by having flat places on the line? Yes; wherever we can introduce a level on a long grade, it is an advantage.
1512. You, as the head of the Locomotive Branch, do not anticipate any great difficulty from these two long lengths of 1 in 50 grade? No; because immediately after an engine gets on a grade of 1 in 50, or anything as severe as that, it settles down to its work at once. It does not go upon the grade far before it is working on the collar, and the speed is even right through. It is only a question then of giving the engine sufficient fuel to keep up the steam.
1513. Has the cutting out of the Lapstone Zigzag by means of the tunnel met your anticipations as to reduction in the cost of running? Yes; it is a great advantage. We can bring the loads down without dividing.
1514. Is that where the principal saving comes in? Yes; we bring the heavy loads right through.
1515. Can you take up any bigger load? No; the load is the same, the grade being the same.
1516. The only benefit is that you have not to divide your train owing to the shortness of the wings of the Lapstone Zigzag? Yes.
1517. *Mr. Humphery.*] You have shortened your distance on the Lapstone? There is very little difference.
1518. *Mr. Hoskins.*] How many loaded trucks would a Baldwin engine take up the present Zigzag? They do not take any more than thirty. That is not the limit of their power, but the wings are too short. They could take thirty-three.
1519. *Chairman.*] Can you give us any idea of what you have saved on the Lapstone? I could not say.
1520. *Mr. Neild.*] With regard to the estimated saving of £3,000 in wages over this piece of line;—is not that £3,000 included in the general estimate of 4s. 8d. per mile;—does it not go to make up the total which, divided by the mileage, makes the 4s. 8d. per mile? It does; but at this particular place we have the saving located. Our men would be able to do more work in a day by having a straight run before them than at present. Whilst the engines are standing waiting for each other, we are paying our men and burning our fuel; and the expenditure is located at this particular place. I think that it is fair to take that into account and to make a proportion as we did on the basis of mileage.

Frederick Bowdler Gipps, Esq., Civil and Hydraulic Engineer, sworn, and examined:—

1521. *Mr. Hoskins.*] Will you kindly state what is the proposal you have to make for disposing of the Zigzag at Lithgow? My proposed deviation starts from Rooty Hill, 26 miles from Sydney, on the Great Western Line, runs a south-westerly course for 16 miles over easy country to the Nepean River; after crossing which, it intersects the divide of the Nepean and Werragamba rivers by a tunnel of about 40 chains. Then runs up the Werragamba Gorge to junction of Cox River; then follows the left bank of that river for about 4 miles, when it crosses it at 33 miles from Rooty Hill on to one of the spurs of the Kowmung Range, which it follows to the Main Dividing Range to Mount Werong, 80 miles from starting point. Thence it runs along the slopes of Main Divide to Shooter's Hill for another 8 miles; then follows a long westerly spur descending by a gentle slope to Blayney, about 152 miles from Rooty Hill. By adopting the German balk system of railways this line could be constructed for £680,000, or at an average of £4,500 per mile. The steepest grade would be 1 in 60, and the sharpest curve 12 chains. The first 33 miles could be constructed for an expenditure of £190,000. It would tap a large mineral field,

F. B. Gipps,
Esq.
19 Mar., 1894.

- F. B. Gipps, Esq.
19 Mar., 1894.
- field, including iron, coal, and kerosene shale, and an extensive pastoral and agricultural country, including the Kanimbla, Cox, and Wollondilly Valleys. The next section of 47 miles to Mount Werong could be constructed for £250,000 on the Balk system, and would develop a large gold and silver country, besides an extensive area of good agricultural and pastoral country, besides approaching both Jenolan and Wombeyan Caves; and the last section of 72 miles crossing easy sloping country could be constructed for £240,000, and would also tap and develop a large area of mineral and agricultural country. By a well-concerted plan of village settlements fully 4,000 people might be settled on Government lands during the construction of the line, whilst the mineral prospects would induce as many more to try their fortunes there; consequently a large passenger and freight traffic would shortly be ensured, independent of the settlers on the Cox and Wollondilly Valleys, whilst it would relieve all the traffic west of Blayney. The sale of township and agricultural land would cover the cost of the line.
1522. The Committee are not appointed to inquire into a proposed new line of railway, say, from Emu Plains, in the direction of Bathurst, but simply to inquire as to the propriety of making a short deviation, 2 or 3 miles in length, to avoid the present Zigzag to Lithgow, which would entail a limited expenditure? This is a deviation.
1523. But you commence at Rooty Hill, and you go distances which are not proposed to be served by the deviation at all? But with this the other would be unnecessary.
1524. But we are not empowered to make an inquiry into the propriety of making any line other than a short one of 2 or 3 miles in length, to avoid the present Zigzag. We cannot go beyond that? But it is a deviation from the present line.
1525. But we are not authorised to inquire into any deviation of the present line, excepting in regard to that portion at the Zigzag. What would be the cost of your proposed line? It would cost £689,000 for 152 miles.
1526. *Mr. Neild.*] You referred just now to the German Balk system;—will you explain what it is? The Balk system admits of continuous bearings with which the rail can be used at half the weight of rails on transverse sleepers, the joints are fished to prevent rocking, and the rails are tied with iron bars.
1527. In other words, it would be a continuous sleeper? Yes; they carry engines there with 12,000 lb. on each wheel, and they run at the rate of from 20 to 25 miles an hour.
1528. Are they six-wheeled engines, or eight-wheeled engines? Four-wheeled and six-wheeled.
1529. What is the weight of the line engine? They are smaller than those we use here.
1530. Smaller engines would not be able to draw the loads we draw? There is no steeper grade than 1 in 60 on the whole of my proposed line.
1531. Then a lighter engine would be sufficient? Yes.
1532. Would they take as heavy loads as we take over the 1 in 40 and 1 in 42 grades? Undoubtedly. The cost of constructing the line together with rolling stock, is only about £1,700 a mile in Germany; I estimate the average cost here at £4,500 a mile.
1533. So you say the rails are tied together with iron bars? Yes.
1534. What is the size of the bars? They are round bars of about 1½ inches.
1535. How long has this system been in vogue in Germany? Eight or ten years.
1536. For what gauge are these lines used? They could be used up to 4 feet 8½ inches.
1537. What is the common gauge in Germany where this method is adopted? It varies from 3 feet 6 inches to 4 feet 8½ inches.
1538. Are you confident about the 4 feet 8½ inches? I cannot say that I have seen it, but there is no reason why it should not be used.
1539. How are the rails connected with the sleepers? They are pinned down.
1540. Is this system in vogue in any place outside Germany? Not that I know of.
1541. Are they used for private or Government lines? Government lines.
1542. Are they used for the military lines? For military purposes chiefly.
1543. What do you estimate to be the difference between the cost of lines constructed and a line of ordinary sleepers? Through ordinary country it would be about £1,500 or £1,600 a mile.
1544. In favour of the Balk system? Yes.
1545. Are you advocating the application of the Balk system to the Blayney line? Yes.
1546. And have you based your estimate on the adoption of that system? Yes.
1547. Have you any tunnels on that line? The longest tunnel we have is on the intersection ridge of the Warragamba to Nepean River; that is 40 chains.
1548. How near would your line run to Eskbank from Lithgow? Not within 35 miles.
1549. And what are your shortest curves? Twelve chains.
1550. Would there be many as short as that? Yes; a good many going up the Kowmung Range which abuts on the Cox River about 5 miles above its junction with the Wollondilly.
1551. You notice from the proposals of the Railway Commissioners that there is to be a tunnel 2,816 yards in length. Is there to your knowledge any such tunnel in Australia? None that I know of.
1552. *Mr. Davies.*] What will be the length of your suggested line from Rooty Hill to Blayney? One hundred and fifty-two miles.
1553. What is the distance now from Rooty Hill to Blayney by the existing line? One hundred and forty-nine miles.
1554. So that there would not be any saving as far as distance is concerned? No; but it would reduce the grades to 1 in 60.
1555. Have you made a survey of the suggested route? I have made one to prove I can get a grade of 1 in 60 up the Kowmung Range.
1556. How have you arrived at the estimated cost? From a rough estimate.
1557. Not at all reliable? No; only a rough estimate.
1558. Have you gone over the whole route? Yes, several times; twice with Government officers, and two or three times by myself.
1559. You are aware that the reference to the Committee affects the present Zigzag, and not a new line of railway? But I still think it is a great waste of public money to carry it out.
1560. But you can give us no evidence with regard to the proposed deviations before the Committee? No; except that I cannot understand where the saving of £10,000 comes in.
1561. Have you made yourself acquainted with the proposals before the Committee? Through the newspapers.
1562. But have you not seen the plans until to-day? No.
1563. And you are not conversant with the different schemes? No.

1564. The only scheme you are conversant with is the one you have suggested? Yes.
1565. *Mr. Humphery.*] What is your reason for questioning the estimated saving of £10,000 a year? In the first place the ruling grade would still have to be 1 in 40. You could not avoid that, because there are several grades of 1 in 40 between Bathurst and Lithgow. Therefore, I do not see what saving there would be to the country by adopting the proposed line. The saving of £10,000 is estimated on train miles, but unless you could show that you had the traffic to give effect to these train miles the saving would vanish; and according to the last report I have seen, the traffic from Lithgow, instead of increasing, is actually falling off. For instance, the difference in traffic between 1892 and 1893 shows a decrease of £6,762 7s. 5d. from Eskbank, and £192 16s. 8d. from Lithgow.
1566. *Chairman.*] But does not all the traffic on the Western line come over the same Zigzag? But the only saving in train miles would be affected with the 1 in 50 which they propose to give.
1567. *Mr. Humphery.*] If the distance be 2 miles shorter as estimated, there will be a saving of 4s. 8d. for each train mile? According to Mr. Price's last report the present line should be able to run 1,490,000 tons a year, which is based on the running of twenty-four trains with a trainload of 160 tons a day.
1568. *Chairman.*] But our witnesses are those who have been actually running the traffic? Could they not run more on the present line?

F. B. Gipps,
Esq.
19 Mar., 1894.

TUESDAY 20 MARCH, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.	WILLIAM CHANDOS WALL, Esq.
The Hon. JAMES HOSKINS.	WILLIAM McCOURT, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	JOHN CASH NEILD, Esq.
The Hon. JOHN DAVIES, C.M.G.	EDWARD WILLIAM O'SULLIVAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	CHARLES COLLINS, Esq.
THOMAS THOMSON EWING, Esq.	HENRY DAWSON, Esq.

The Committee further considered the proposed Deviation to avoid the Lithgow Zigzag.

William Theodore Foxlee, Esq., M. Inst. C.E., Engineer-in-Chief for Existing Lines, Department of Railways, sworn, and examined:—

1569. *Mr. Neild.*] How long have you occupied your present position? I have been in the Colony a little over four years, and have occupied the position of Engineer-in-Chief for Existing Lines since September, 1891.

W. T.
Foxlee, Esq.,
M.I.C.E.

1570. Had you any experience in the construction of railways before coming to this Colony? Yes, I had very considerable experience. Before coming to this Colony I was with the Great Eastern Company for about four years, and there I had charge of the construction of the set of railways in the Eastern Counties known as the Essex Lines. Previous to that, I was with the London North-Western Company for twelve and a half years, and, before that again, I was with the London South-Western Company. Altogether I have had about twenty-seven years' experience in railway engineering.

20 Mar., 1894.

1571. You designed what is known as the No. 1 deviation which is shown on the plan in puce, and has a tunnel 2,816 yards in length? Yes.

1572. Did you make the surveys for that line? They were prepared under my instructions.

1573. There has previously been a proposal for the construction of a tunnel in that locality? As far as my knowledge goes the Construction Department were asked in the latter part of 1890, to consider the question of cutting out the Zigzag, and the matter was then looked into in a cursory way; but in April, 1892, Mr. Burge was sent by Mr. Deane to inquire into it still further. He submitted a report on the subject, and that report contemplated the construction of a very long tunnel.

1574. Longer than that which you propose? Yes; a tunnel 2 miles, or a little more in length. The estimate of the cost of the scheme for a single line was £260,000. The matter, however, was allowed to drop again until June of the same year, because it was thought that such a scheme should not be taken in hand. I should mention that Mr. Burge's report was accompanied by a plan, but as no section was prepared, the estimate submitted was only approximate. The Commissioners then asked me to have a section taken over the proposed route in order that we might see, with some degree of exactness, what the length of the tunnel would be. I accordingly had a section taken, and it turned out that the tunnel would be quite 2 miles long, while it appeared that the expense, something like £300,000, could not be faced. The matter was then allowed to remain in abeyance until last year, when, I understand, Mr. Eddy had a conversation with the Premier about the desirability of providing remunerative work to the unemployed, and the cutting out of the Zigzag was referred to. I was asked to look into the matter again; I did so, and the scheme marked No. 1 is the result of my deliberations.

1575. Your deviation would save 2½ miles on the length of the existing line, I understand? The saving in length would be about 2 miles 71 chains.

1576. Do you consider that the scheme could be improved upon by a deviation;—have you under consideration any other proposal to avoid the Zigzag? The scheme before the Committee was submitted to the Commissioners and was considered in their opinion the best, and in my opinion it is so still. After the plans had been sent to the Works Department, however, it was suggested that a better route could be obtained by commencing the deviation somewhat nearer Eskbank, carrying the line up Farmer's Creek, and bringing it round towards Bell, at the top of the 1 in 50 grade.

1577. That would be on the north side of the line? Yes; this appeared to be feasible, and as it was thought by the Commissioners to be in the interest of the country that the route should be examined, we are now examining it; but, unfortunately, the weather has been so bad that we have not yet completed our investigations. Otherwise I should have been in a position to give the Committee some information in regard to it.

1578. When do you think it likely that, weather permitting, you will be able to complete your investigation? In the course of a week or ten days from now, if it is fine; but it is impossible to do any work while the weather continues as it is. So far as we know, the scheme before the Committee is the best; but we thought it right that this suggested alternative scheme should be looked into.

W. T.
Foxlee, Esq.,
M.I.C.E.

20 Mar., 1894.

1579. You are aware that the Commissioners have sought to have the investigation of the No. 1 scheme stopped, pending the completion of the survey to which you allude? Yes; pending the completion of the preliminary investigations.

1580. Can you give the Committee any idea of the probable length of the line which you are now surveying? I do not think it would be longer than the existing line. The proposal is to start at the foot of the 1 in 40 grade, near Eskbank, and go up Farmer's Creek, passing near the trigonometrical station to the north of Clarence tunnel, and join the existing line again at the top of the 1 in 50 grade at the 85th mile post, about $1\frac{1}{2}$ mile on the western side of Bell station. The effect of that deviation would be to cut out the 1 in 42 grade leading up to the bottom points, to cut out the Zigzag, to cut out the 1 in 33 grade from Dargan's Creek to Clarence siding against trains going westward, and to cut out the 1 in 50 Bell bank against loads going eastward. It would also get rid of a number of reverse curves.

1581. But I understand, from your statement, that you hardly consider the proposal a feasible one? I do not say that, because I am not able to express a definite opinion upon it. If we could carry it out for a reasonable amount, it would be worth considering seriously.

1582. There will be no saving in length by it? There are two routes under investigation, one of which will be about as long as the existing line, and the other possibly $1\frac{1}{2}$ mile shorter. Both of these routes would improve the existing line to the extent I have mentioned, and both are on the north side of it.

1583. *Chairman.*] Would the shorter one start from the same point as the other? Yes; and terminate at the same point.

1584. *Mr. Neild.*] Would either of them contain tunnels? Yes; both of them would.

1585. Tunnels of any special length? I cannot say; but from half a mile to a mile long.

1586. Are you carrying out this investigation with a view to the construction of a double line? The information obtained would be applicable to the construction of either a single or a double line.

1587. But these surveys having been completed, do you intend to submit your proposals as double or as single lines? I am certainly of opinion that whatever deviation is carried out, a double line should be constructed. It would never do to construct single line tunnels, and a few years hence ask the contractor to come on the ground again. That, in my opinion, would be a mad thing to do.

1588. You desire all these proposals to be looked upon as double lines? In my opinion they should be looked upon in that way. We have a length of double line from Bowenfels to the bottom points at the present time, and whatever alteration is made, should be in the direction of extending the double line, to afford additional facilities for working the traffic.

1589. Have you made any inquiry into proposals Nos. 2 and 3, marked respectively red and green on the plan? I have not had an opportunity of doing so. I know in a general way what Mr. Deane's proposals are; but I have had no opportunity of examining the plans. I know that the No. 2 scheme contemplates a spiral line, and that the circuitous route marked No. 3 is an alternative route; but I have had no opportunity of considering either of them.

1590. You are not in a position to make a comparison, for the information of the Committee, between your proposal and that of Mr. Deane? I understand that the No. 3 route—and as far as I can judge from the cartoon it would be so—saves about half a mile on the existing line, as against the 2 miles 71 chains saved by the Commissioners' deviation; but it seems to be a very crooked line. It has, however, a grade of 1 in 60, as compared with a grade of 1 in 50 on the Commissioners' line. Beyond that I know nothing, and any opinion I expressed without having had the plans and sections before me, and having gone over the ground, would be worth nothing. I would point out, however, that there is not much advantage gained in adopting a grade of 1 in 60, when the same load would have to be dragged up a 1 in 50 grade immediately afterwards. I would also point out that in the Commissioners' scheme there is a length of about three-quarters of a mile of down grade of $\frac{1}{2}$ chain at the Sydney end of the tunnel and a length at least over which trains would pass before facing the 1 in 50, known as Bell bank. That was put in advisedly, to give the engine breathing time, if I may so express it.

1591. Have you had any experience in connection with tunnels in this climate? Yes.

1592. Did you construct the Lapstone tunnel? Yes; but the plans were prepared by the Works Department.

1593. Do you regard that tunnel as a success from a traffic point of view? Yes, a decided success. It has effected a great saving.

1594. The length is something over 700 yards? The length is 32 chains—a little over 700 yards.

1595. Are you aware that it has been a subject of complaint by travellers, because of the steam and sulphur fumes in it? I have heard people complain of going through it, though it only takes about one and a quarter or one and a half minutes to do so in an ordinary passenger train, but people do not like travelling through tunnels; they do not like going into the dark. I have not, however, heard any very serious complaints.

1596. And how much time would be occupied in passing through your proposed tunnel, 2,816 yards long? It would probably take three or four minutes for a train to come up from the bottom points to Dargan's Creek, and about two minutes for a train to pass through it in the opposite direction; but you cannot speak of the two tunnels in the same breath. The proposed tunnel is for a double line, whereas the Lapstone tunnel is for a single line. The tracing which I have here will show you the difference in area between a single line tunnel and a double line tunnel. In a double line tunnel the air space is more than double. Take the Woy Woy tunnel for example. Accustomed as I am to travelling over these railways, I have been through that tunnel at night without knowing it.

1597. How long does it take to pass through that tunnel? I should think about two and a half minutes.

1598. But the grade is not 1 in 50? No; it is 1 in 150.

1599. That makes a very considerable difference in the speed? I cannot tell you to within half a minute how long it takes to go through these tunnels; I am only speaking approximately. With regard to the ventilation of the tunnel, I am sure the Committee need not have the least concern on that score. If we were proposing a single line tunnel I could understand your questioning me; but, with my experience of railway work, I cannot understand any question being raised in regard to the ventilation of this tunnel, seeing that we propose to make it for a double line. There are tunnels all over the world 3, 4, 5, and 6 times as long as this where no artificial means of ventilation are used. The Mont Cenis tunnel, for example, between Modane and Bardonnèche, is 7 miles 78 chains long, and has a grade of 1 in 43.5 from the north-end rising towards the middle of the tunnel, with down grades of 1 in 2,000 and 1 in 1,000 and 1 in 70.3 falling towards the Italian frontier. There is machinery there for providing compressed air, and pipes furnished with cocks which can be turned on by the employees, run through the tunnel.

W. T.
Foxice, Esq.,
M.I.C.E.
20 Mar., 1894.

1600. Are they ever turned on? I daresay they are; but you must remember the much greater length of that tunnel compared with the tunnel proposed at Lithgow. Then there is the St. Gothard tunnel, 9 miles 20 chains long; the Arlberg tunnel, 6½ miles 29 chains long; the Hoosac tunnel, in the United States, 4¼ miles long. No artificial ventilation is provided there.

1601. I suppose you recognise the great difference between the condition of the atmosphere at Woy Woy, and its condition in the vicinity of the proposed tunnel? I recognise the great difference, inasmuch as one is practically at sea level, and the other is over 3,000 feet above it. My own feeling is, that this tunnel would be one of the coolest and best places for sitting in on a hot day.

1602. But do you not get a great deal more fog on the mountains than you get at Woy Woy? There are fogs in the mountains certainly at times.

1603. Do not fogs produce greasiness of the rails? Yes; but they occur all over the mountains.

1604. Is there not a greater risk of the rails becoming greasy in the proposed tunnel than in the Woy Woy tunnel? I do not think so. When you are in close proximity to the sea you get much greater moisture. We find that our rails rust much more quickly when they are laid close to the sea. They have not half the life that similar rails have away from the seaboard, even though subject to fogs and what not.

1605. Is the Clarence tunnel a dry tunnel? A fairly dry tunnel.

1606. And you believe that although the proposed tunnel is a great deal longer and wider, it will be a dry tunnel? The width has very little to do with the dryness of a tunnel, though it has a great deal to do with the ventilation of it.

1607. Do you think that the rails in the proposed tunnel would become dangerously greasy? I am perfectly certain that they would not.

1608. You base that belief on your engineering knowledge? Upon my twenty-seven years' experience of railway work.

1609. You mentioned some tunnels in the old world which are of great length; is special fuel used for working them? No.

1610. Is the fuel used exactly the same as that used on an ordinary line? Precisely the same. In addition to the tunnels I have already mentioned, I might call your attention to the Lyttleton tunnel (a single-line tunnel) in New Zealand, which is 1 mile 50 chains long—over one mile longer than the proposed tunnel. I have not noticed any difficulty there as far as the ventilation is concerned. Then there is the Box tunnel upon the Great Western Railway in England, 1 mile 65 chains; the Standege tunnel upon the London and North-western Railway, 3 miles 3 chains; and the Kilsby tunnel, also on the London and North-western, 1 mile 30 chains in length.

1611. Do you propose to line your tunnel? Yes, with concrete.

1612. Throughout? Yes; and if you ask me why, I will tell you. There is a tendency in sandstone to blow or crumble when it is exposed to the air, so that it is better to line it with concrete, say 18 inches in thickness.

1613. Do you prefer concrete to brick? Yes; because the work can be done more cheaply. The stone excavated from the tunnel would answer admirably for the purpose.

1614. You propose to ventilate your tunnel with two shafts? Those shafts are provided not so much as a means of ventilation as for the purpose of facilitating construction. When they are sunk there will be six faces at which to work instead of only two. I believe it is almost the universal experience that shafts do not very materially assist the ventilation of a tunnel, unless they are provided with ventilating machinery.

1615. Is there a tendency for air entering the mouth of a tunnel to pass up the shafts and leave the middle part unventilated? It has very often been found that shafts interfere with and confuse the circulation of the air.

1616. Then I understand that you propose shafts for facilitating the construction rather than the ventilation of the tunnel? Yes, mainly; though, no doubt, they would assist somewhat in clearing the tunnel between trains. I should not rely upon them, but upon the difference in elevation on the two ends of the tunnel for the ventilation.

1617. Do you feel convinced that there will be no necessity for providing artificial ventilation? I am perfectly certain that you will not require any artificial ventilation for that tunnel, and to me it is astonishing that the question should be asked.

1618. But if the Committee have had the evidence of an eminent authority to the effect that such ventilation might be necessary, perhaps it would moderate your astonishment? It would moderate my astonishment at being asked the question; but it would not alter my opinion. It is, of course, for the Committee to decide whether my opinion is of any value or not.

1619. Have you taken any interest in the calculations made with a view to showing the financial advantages of your scheme? Naturally, as an engineer, I take great interest in the financial part of the business.

1620. Have you gone through the calculations which have been made as to the saving in train mileage consequent upon the saving in length? I am aware that calculations have been made, and I know the result of those calculations. But such matters pertain more to the work of the Traffic Department, and the officers of that Department, no doubt, would be able to give you more information about them than I can.

1621. You would not be prepared to answer questions on the subject? I think it would be better to refer to the traffic officers. The cost of maintenance, however, affects me, and it makes me fight shy of the No. 3 proposal at once, because I know that if it were carried out it would increase the cost of maintenance very considerably. Although on the Commissioners' deviation, we should have a double line, the working expenses will not be increased to any extent, in fact we shall save in maintenance.

1622. Do you know that it has been estimated by officers of the Commissioner's Department that supposing the No. 1 scheme were adopted there would be an annual saving of £3,488 in the mileage? I know that, if the Commissioner's proposal were adopted, the saving in working expenses would be £3,000 per annum more than the saving effected by the adoption of the No. 3 proposal.

1623. That was not quite Mr. Thow's evidence? Well, that is what I understand.

1624. Can you tell us, approximately, what the total annual saving to the Department will be by the adoption of your scheme? Roundly, £11,262.

1625. Would you be surprised to hear that the detailed figures given by Mr. Thow come to something like £1,400 less than that? I was not present when Mr. Thow gave his evidence, but I know that the sum I have named is the estimated saving.

1626. Are the rates now charged for the conveyance of passengers and goods on a mileage basis? I believe so.

1627.

W. T.
Foxlee, Esq.,
M.I.C.E.
20 Mar., 1894.

1627. Have you the particulars which go to make up the £11,000? Yes; but I believe they have already been given to you. The sum of £1,635 which is included in that £11,262 would be saved by not requiring a push-up engine in the tunnel. I think I am right in saying that a push-up engine will not be required in the tunnel, because, even to-day in the open, we do not use a push-up engine on the 1 in 50 Bell bank, where there are a number of snake-like reverse curves. If we do not require the services of a push-up engine on that piece of line, we shall not be likely to require them in a straight tunnel. There is, of course, a great resistance on curves, especially when they happen to be reverse curves.

1628. The present freight charges are on a mileage basis, and, according to the Commissioners' last report, the earnings per mile for all trains was 7s. 9½d. Now, over 6,000 trains pass over this line in a year, and if your scheme were carried out, each of these trains would run nearly 3 miles less; so that there would be a constant loss to the Department of between £3,500 and £7,000 per annum? I must take exception to that, though the question of charges does not come within my province. I anticipated from what I read in the newspapers, that I might be asked questions of this character, so I may be permitted to mention that in Great Britain it is customary, upon the construction of exceptional works to give special facilities for traffic, to authorise the imposition of increased rates to pay for the expenditure.

1629. But the railways there are private lines. We have nothing before us to show that it is the intention of the Commissioners to alter the existing mileage rates? This is an exceptional work, and should be treated in an exceptional way; and I am desirous of putting before the Committee a few instances of how similar cases have been treated in Great Britain. In the case of the Mersey railway, 5 miles additional were allowed by Act of Parliament—48 and 49 Victoria, cap. 198, section 45—for the Mersey tunnel; on the North British Railway, under their Forth Bridge Act of Parliament—41 Victoria, cap. 64, section 14—they were allowed 10 miles additional upon traffic from certain districts, and 15 miles additional for other traffic; on the Great Western Railway, they were allowed under the Act of Parliament—35 and 36 Victoria, cap. 53, section 45—12 miles for the Severn tunnel in lieu of 4 miles 29 chains, the actual length; and on the London and North Western Railway they were allowed by Act of Parliament—24 and 25 Victoria, cap. 128, section 61—9 miles for the Runcorn bridge, in place of 14 chains, the actual distance. There are many other instances which could be cited, amongst others the high-level bridge at Newcastle, where exceptional works have been compensated for by allowing exceptional mileage.

1630. All this goes to show that in your estimation a special charge should be made upon traffic passing through this tunnel? No; we propose to levy the rates that are in existence to-day.

1631. When you say that you will leave the charges as they are to-day, do you mean the charge for the whole distance or the charge per mile? I mean that the charges made to-day will be maintained after the tunnel is completed.

1632. The charge per mile, or the charge for the whole distance? Whatever it is now. The existing charges will not be altered.

1633. Suppose the distance between Sydney and Bathurst is 125 miles, your proposal is to reduce the distance by 3 miles. Am I to understand that you propose to retain the existing charge on the 125 miles, or the existing charge per mile for 122 miles? To make it clear let me put it this way: the charge for a truck of goods from Sydney to Bathurst will be the same after the tunnel is constructed as it is to-day.

1634. *Mr. Humphrey.*] That is to say, you will call 2 miles 5 miles? We shall maintain the old mileage.

1635. *Mr. Neild.*] That will be maintaining a fiction? I do not think that it will be a fiction. You have never had a case like this before in the Colony; it is an exceptional work, and we have plenty of precedents for dealing with it in the way proposed.

1636. You have talked this matter over with the Commissioners? I have had a little conversation with them upon the subject, and that I gather is their view. It is not a matter for me, however, to speak upon authoritatively.

1637. Although you make the distance between Sydney and Bathurst 3 miles less, you intend to charge upon the present mileage? Yes; because to save that 3 miles we shall have to incur an exceptionally heavy expenditure.

1638. What is the estimate? Our estimate is £213,000, which includes 5 per cent. for contingencies. I would not be surprised, however, if in the present state of the labour market the work were done for £200,000.

1639. Does that include the permanent way? Yes.

1640. Ballasting? An 80-lb. steel road upon full sized ironbark sleepers, ballasted complete.

1641. Do you propose to use the permanent way now being used upon the Zigzag? No; because as I think as you will see, the Zigzag must be kept open for traffic until the last moment.

1642. But you will remove the rails, sleepers, and ballast now in use, and will be able to take credit for them? I have not taken credit for them, because, although I do not know what the Commissioners' views are on the subject, I think that, in all probability, Clarence station will be worked as a siding, and therefore, it will be necessary to allow the 1 mile 30 chains or thereabout of existing line from Dargan's Creek to Clarence to remain.

1643. Do you think that that is likely? I cannot speak positively; but I should think it is extremely likely that will be done.

1644. Would a siding there be useful to the Department in working the line? The portion of the old line between Dargan's Creek and Clarence would be of no use to us, except to bring in local traffic. It is on a grade of 1 in 33, and would be useless to us for standing purposes.

1645. If it was retained, it would be useful only for local traffic? Yes, quite so.

1646. If your scheme were carried out, there would be a shorter length of permanent way to maintain; but I suppose, the line being double, would prevent any saving in maintenance? There would be a slight saving; but it is not worth mentioning, because we should have a greater length of double road to maintain than at present.

1647. Will you give the Committee a brief *resumé* of the advantages of your proposal? The advantages of the Commissioners' proposal are these. In round figures, it will save the country £11,000 a year on the working of the present traffic—that is not taking into account any extension of traffic. Then the Zigzag with its attendant disadvantages and possible dangers, will be cut out, as will also the 1 in 42 grade up to the Clarence tunnel against loads coming towards Sydney, and 1 in 33 from Dargan's Creek to the Clarence tunnel against loads going westward. There will also be a saving in the time of journey, both of goods and passenger trains.

W. T.
Foxlee, Esq.,
M.I.C.E.
20 Mar., 1894.

1648. What will the saving in time be? I think the traffic officers would be able to speak more positively than I can; but seeing that a distance of about 3 miles is saved, and the sec-sawing operation now carried on on the Zigzag would be avoided, there would probably be a saving of about fifteen minutes by down, and twelve and a half minutes by up passenger trains, and about fifty minutes by goods trains in both directions.

1649. What would be the difference in cost between concreting your tunnel and bricking it? I will supply that information to the Committee.

1650. Will you let us know the cost of lining the sides with concrete and providing a brick archway, as compared with the cost of lining with concrete throughout? I will send the information to the Secretary.

1651. *Mr. Trickett.*] Is it not the practice of engineers to adopt short tunnels where possible in preference to long ones? Other things being equal, it is, of course, desirable to have short tunnels rather than long ones; but it is by no means an unusual thing to have long tunnels. I should not call this a long tunnel, however; I should call it rather a short tunnel.

1652. It is long for this Colony? Yes, no doubt.

1653. Where tunnels are of any considerable length, is it not usual to have them on easy gradients, if possible? As a rule, where you have a tunnel you are crossing a ridge, and there must necessarily be a gradient, and it is often a steep one in order that the tunnel may be short. Tunnels are most frequently approached on a gradient, and it is no uncommon thing to run the gradient right through.

1654. There is no hard and fast rule or practice? Not at all. The tunnels through the Alps are generally on gradients varying from 1 in 40 downwards. The Otford tunnel has a gradient of 1 in 40, and most of our tunnels are upon gradients. It is rather an advantage in one way to have a tunnel on a gradient, because it facilitates drainage. We never build a tunnel quite level.

1655. We have had it in evidence that it is undesirable to have a steep gradient in a tunnel, because on the up journey the powers of the engine are so strained that there is an increased consumption of coal, and the consequent combustion tends to foul the atmosphere very much; is that the case? Yes; but you cannot carry out this work without having a fairly steep grade. I do not think that 1 in 50 is an objectionable grade.

1656. But is it not objectionable where the engine is straining itself, and there is a large consumption of coal? I do not think any inconvenience would be experienced with a double line tunnel.

1657. What do you think of the statement that a single-line tunnel is desirable, because a train passing through a single tunnel drives out the air at one end and sucks it in at the other, thus making a current and keeping up the ventilation? I think the person who made it should visit Otford tunnel.

1658. Do you agree with it? I do not. I think the statement perfectly ridiculous.

1659. I do not see that it is; the larger the tunnel the more smoke will stay in it, and it will become more difficult to dissipate the smoke? But there will be a larger quantity of fresh air to dilute the smoke.

1660. But a train going through a double tunnel would not have as much power to dispel the air as a train going through a single tunnel? All experience tells us that wherever a tunnel is of considerable length it should be built for a double line.

1661. That is your experience? That is my experience.

1662. Have ventilating shafts been a great success? No; the general experience is that they are of little or no value in improving the ventilation of tunnels.

1663. We have also had it in evidence that it is desirable to avoid long tunnels where short tunnels can be made, because of the time taken in constructing long tunnels, and the consequent greater outlay;—I suppose that is correct? Of course a long tunnel takes longer to construct than a short one takes; but seeing that we have done without this deviation for twenty-six years, I think I am right in saying that a delay of a few months would be of little moment if in the end a better result were obtained.

1664. *Chairman.*] Except that the money raised to carry out the work will be lying idle? Yes; but surely it is better to carry out a scheme that will give you the greatest return, because of the shorter mileage, rather than a work that will not return so much though it may take less time to execute.

1665. *Mr. Trickett.*] We have heard very great objections made to the Zigzag;—I suppose there is no danger so far as the line itself is concerned? No; it is a very fine piece of work indeed, and I am glad to have the opportunity of saying so. There has been a great deal of talk about its being an engineering blunder, and I feel that it is due to the late Engineer-in-Chief, Mr. John Whitton, to express my opinion on this subject. It is very easy to carry out any sort of work if you have the money; but if you are limited in funds, you cannot do exactly as you otherwise would, and, having regard to the expense attached to tunnelling in the early days, I have no hesitation in saying that Mr. Whitton did the right thing in this case. He is a much older man than I am, and has had much experience; but I cannot understand the nonsense that has been talked about a blunder having been made in the construction of the Zigzag. It is only fair for me, as a brother engineer, to take this opportunity of expressing my admiration of what I consider is a very fine piece of work.

1666. I suppose the Commissioners cause frequent examinations to be made of it? Every portion of the lines is thoroughly examined constantly.

1667. I am referring to this particular portion? Yes.

1668. As far as you are aware, it is a substantial structure? It is in thorough repair, and is a splendid piece of work.

1669. *Mr. McCourt.*] You said just now that £1,600 would be saved by dispensing with a push-up engine, but would not that engine be used for other work on other portions of the line? It would be constantly employed as at present in pushing trains up from Eskbank to the bottom points.

1670. The whole time of the engine would be so occupied? I believe I am right in saying that.

1671. If the deviation is made, will there be any saving in the maintenance of the permanent way? £200 or £300 a year, but I have not taken that into account in my estimate.

1672. *Mr. Wall.*] Is it not a fact that a tunnel on a grade of 1 in 50 is more easily ventilated than a tunnel on a grade of 1 in 100? The difference in elevation is an advantage. In the case of the St. Gothard tunnel, which is 9 miles 20 chains long, they never use the pipes which convey compressed air through it, except when an equilibrium is established between the atmosphere at the two ends of the tunnel. The tunnel we are considering is a mere culvert compared with the St. Gothard tunnel.

1673.

W. T.
Foxlee, Esq.,
M.L.C.E.
20 Mar., 1894.

1673. *Mr. Suttor.*] How long would it take to carry out the Commissioners' proposal? About two years.
1674. You could not make the time less? I have made some calculations, the result of which was that one year and nine months would be required to carry out the work; but all sorts of unforeseen things happen, and I do not think it would be safe to put it down at less than two years.
1675. *Mr. Dawson.*] Is it a fact, as reported, that your position here is due to a recommendation from Mr. Whitton? It is not a fact. I never had a recommendation from Mr. Whitton, and I never saw that gentleman, nor did I know him until I came to the Colony.
1676. *Mr. Ewing.*] You have already said that, so far as you know, you are prepared to adhere to the Commissioners' proposal? Yes.
1677. There may be some subsequent development of which we will hear, if you regard it as satisfactory? That is so.
1678. You say that there is no objection, so far as you know, on the part of the public to travelling through tunnels? You misunderstood me there. I said that the public generally preferred to ride in the open rather than to go through tunnels; they do not like to go underground.
1679. But once they are in the train they have no alternative? That is so, of course.
1680. With reference to Mr. Trickett's question about the air in the tunnel being expelled by the train, does it not appear that if the air were expelled by the train the vacuum created would be filled with the smoke? That is so, as I have already stated.
1681. Then there cannot be much in the statement he quoted? When a train goes into a tunnel, it creates a vacuum, and the steam and smoke rush in behind and take the place of the air that is expelled.
1682. It is not possible to have a following trail of air? No.
1683. Mr. Trickett also put some questions to you with regard to the effect of an engine working on a grade;—is it not perfectly clear that if a train going through a tunnel leaves smoke and steam behind it, the more smoke and steam it emits the more there will be left in the tunnel, and as an engine gives forth more of these products on a grade, there must be more smoke and steam left in a tunnel on a steep grade than on a level grade? Undoubtedly.
1684. Therefore, if you were considering the travelling public alone, it would be better to have the tunnel as level as could be, consistently with good drainage? Yes; the nearer approach to level, the better, other things being equal.
1685. Therefore, if the tunnel were 1 in 60, that would be better than 1 in 50? Yes, other things being equal; but if, to get a grade of 1 in 60, I had to make a line 2 miles longer, I should say I was buying gold too dearly.
1686. This is a commercial enterprise, and the public must put up with a little inconvenience if you cannot afford to make a better tunnel? Yes; but the inconvenience will be reduced to a minimum if the Commissioners' proposal is carried out. I am sure it would be a good thing for the public travelling between Bathurst and Sydney to suffer a little inconvenience—though I do not admit that there would be any—to avoid the risk which must necessarily be connected with the working of the Great Zigzag. The down trains, I may point out, will run through the tunnel without any expenditure of steam, and consequently they will have a very powerful effect in clearing the tunnel of impurities.
1687. With regard to the ventilation of tunnels, you tell us that railway engineers have not regarded it as a matter seriously worth considering? I did not say that at all. I said that tunnels far longer than this have been constructed, and that no inconvenience has been experienced in working them.
1688. What usually causes engineers to remedy abuses—public opinion, is it not;—abuses do not exist until public opinion finds them out? I do not at all agree with you there. We engineers have the character for being men of common sense, and we know well enough when abuses exist.
1689. But when you know that tunnels $1\frac{1}{2}$ miles long are objected to by the public because of the want of ventilation in them, you, as an engineer, endeavour to provide against bad ventilation? If you mean would I run the risk of spoiling my reputation by constructing a badly ventilated tunnel, I say, no. I would never think of proposing a tunnel such as the public would be likely to complain of.
1690. As an engineer, do you know any cheap scheme by which tunnels can be ventilated? No, I do not.
1691. You think no engineer does know of any? I do not say that. Of course, I know what has been done in the way of ventilating tunnels, but I think it is better to construct tunnels which do not require artificial ventilation.
1692. You know how they ventilate mines? Yes.
1693. Such modes of ventilation are not applicable here? It would be quite easy to provide a ventilating fan.
1694. Or a fire? Yes; but you would not want it in a tunnel like this.
1695. How many trains go over the Zigzag in a day? From the figures before me, it appears that about fifteen trains go over the line each day, not including specials.
1696. Would that be a heavy traffic for a single line? Not particularly heavy; but there are times when there are a great number of specials.
1697. Would twice as many be heavy? Yes; especially where you have to work it over a Zigzag.
1698. But without a Zigzag? Yes; with grades and curves such as we have on the mountain line.
1699. So that a single line would not deal with the traffic if it became twice as great as it is now? I know that there is great difficulty in working the trains over the mountains at certain seasons of the year, and it would be foolish, in undertaking this work, not to provide a double line.
1700. Are you aware that the pollution of the Mont Cenis tunnel at one time almost became an international question? I know that the ventilation was rather bad.
1701. The ventilation was so shocking that two nations were going to deal with it as an international question? Yes; but it is possible to-day for trains to run through that tunnel without artificial ventilation being constantly required, and it is nearly five times as long as our proposed tunnel. It has also a gradient which rises towards the centre of the tunnel, and has no ventilating shaft of any kind.
1702. *Mr. Collins.*] Did you say that you concurred in the design of the Lapstone tunnel? I do not think I mentioned it.
1703. Had you to carry out that work? Yes; but the plans were prepared by the Construction Department.
1704. How is it that it only provides for a single line? The Commissioners considered the question, but they thought that it would be of very little use to have a double line there, when they could not take

W. T.
Foxlee, Esq.,
M.I.C.E.
20 Mar., 1894.

- take it as far as Penrith. At that time they could not see their way to ask the country to give them the large sum of money required for widening the line to Penrith.
1705. Would that have cost a great deal more money? Yes; a great deal more. A double line costs almost twice as much as a single line.
1706. The Lapstone tunnel cost £40,000? Roundly, £45,000. We have not, however, quite settled the matter yet. There are a few items in dispute.
1707. There may be a possibility of the line being widened between Bathurst and Penrith as you suggested? I do not think I suggested that. I said that in constructing the proposed tunnel it would be better to make a double line, because two lines might be required in the future.
1708. It would be much costlier to enlarge the Lapstone tunnel than it would have been to provide for a double line first? Yes; but it would have been of no use to provide for such a short length of double line, when it could not be continued to Penrith.
1709. *Mr. Humphrey.*] You are confident that the Commissioners' proposal would be entirely satisfactory? I have no doubt about it.
1710. What advantage do you hope to derive from the surveys now proceeding with a view to discovering a better route on the northern side of the existing line? It was suggested that a route could be found which, besides giving the advantages provided by the Commissioners' line, would cut out the 1 in 42 grade between the bottom points and Eskbank, and the 1 in 50 grade known as Bell bank.
1711. But that would mean a very much longer line? It would be longer than the Commissioners' deviation, but not longer than the existing line.
1712. By the survey now in progress, it would it would be necessary to cut out about 9 miles of the existing line? From $8\frac{1}{2}$ to 9 miles.
1713. What would you substitute for that? A similar length. There are two deviations, one about as long as the existing line, and the other 1 mile or $1\frac{1}{4}$ miles shorter. These deviations are to cut the 1 in 42 grade from Eskbank to the bottom points, and the 1 in 50 from Dargan's Creek to Bell.
1714. Thereby saving the services of a push-up engine altogether? Yes; and enabling heavier loads to be taken, because the ruling grade for loads coming east would then be 1 in 60.
1715. Suppose you are able to discover a practical route which will accomplish what you hope to achieve, will there be any annual saving? Yes; but the scheme is *in embryo* at the present time. There would, of course, be an annual saving over the present working, owing to the flatter grades.
1716. But a grade of 1 in 60 is to be obtained on Mr. Deane's line, with a shorter mileage? Yes; but his scheme commences at the top of the 1 in 42 grade, which would be retained, and ends at the foot of the 1 in 50, so that there would be no material advantage.
1717. Assuming that you obtain a practicable route on a reduced grade on the northern side of the line, would the advantages be greater than those given by the No. 1 proposal, that is in point of economical working and saving of time? I am afraid the scheme is not sufficiently advanced for me to be able to express a definite opinion; but you can see, yourself, that if we could substitute a 1 in 60 grade from Eskbank, that would really be the ruling grade over the mountains for loads coming towards Sydney.
1718. And you would prefer that, if you could get it, to the tunnel scheme? Yes; if we had not to pay too much for it.
1719. You would have the advantage of a continuous 1 in 60 grade, as against a varying grade of 1 in 42, and 1 in 50? Yes; that is so. The route was said to have such advantages that we thought it right to ask you to hold your hand until we looked to it.
1720. Then you think that the inquiry of the Committee is a little premature? It is not my business to say that. I think you are right to inquire into the schemes before you.
1721. But do you think that further inquiry should be deferred until you have information in regard to this suggested route? I think it would be desirable for you to have the results of our investigations upon the alternative route.
1722. Is there really any greater danger in passing traffic over the Lithgow Zigzag with the precautions you now adopt than in working any other part of the line between Penrith and Eskbank? It is a very objectionable thing to have to propel a passenger train, and it is unavoidable there.
1723. I want you to answer the question, Yes or No, and to give me your reasons? Yes, I think it would be desirable to cut out the great Zigzag, because I think that more danger attends the working of it than attends the working of the other portion of the line where the engine is in a leading position.
1724. *Mr. O'Sullivan.*] Have you given your attention to the proposal to take the line from Mount Victoria to Lithgow or Bowenfels? I have not. I was with the Commissioners about two years ago when a deputation on the subject met them at Mount Victoria. They then said that the matter concerned the Works Department, and referred the deputation to the Minister. I have not given any attention to the scheme.
1725. You have shown the advantages of your scheme over the existing line, but you have made no comparison between it and Mr. Deane's scheme? I am not in a position to speak of Mr. Deane's proposal, except in a general way. I believe that it saves about half a mile in distance over the existing route, and has a grade of 1 in 60, instead of 1 in 50 in the Commissioners' proposal; but I have pointed out that that would be of little value, inasmuch as there is a grade of 1 in 50 a little further on. It would be absurd, however, for me to express an opinion upon Mr. Deane's scheme until I have had an opportunity of examining the plans and seeing the ground.
1726. According to the figures placed before us, Mr. Deane's scheme will cost £186,000, while the Commissioners' will cost £225,000, a difference of £39,000? £225,000 was an outside figure given to the Minister. The estimate of the cost of the work is £213,000, which includes 5 per cent. for contingencies; and that, I am sure, is enough.
1727. There would be a large saving if we carried out Mr. Deane's proposal? I am not in a position to speak about his proposal. Four per cent. interest on £30,000 would be £1,200 a year, but what is that compared with the additional distance which every train would have to run, and the additional length of line which would have to be maintained for all time.
1728. Would the cost of maintaining the extra 2 miles of Mr. Deane's line be more than £1,200 a year? I think figures have been placed before the Committee showing that there would be a saving of £3,000 a year more on the working of the Commissioners' scheme over the working of Mr. Deane's scheme.
1729. In making that up, did you allow for the £1,200 interest which you just mentioned? No; that is merely the saving in the working expenses, not taking into account the difference in cost.

- W. T. Foxlee, Esq., M.I.C.E.
20 Mar., 1894.
1730. But you do not take the difference in cost into account? Of course that must be done; but I do not know what Mr. Deane's scheme will cost. I cannot tell what his estimate includes, while I know what is contemplated by my own.
1731. But assuming that his is right? Then there would be a saving of £2,000 a year more in carrying out the Commissioners' scheme.
1732. You claim that the saving in working expenses is more than you lose in interest? Undoubtedly.
1733. You claim that by carrying out the Commissioners' scheme you will save £11,262 a year;—have you taken the interest into consideration in making that statement? No; merely the cost of working.
1734. Should you not also take into account the interest on the £167,000 that will lie dead if your scheme is carried out? I do not think that we should.
1735. *Mr. Davies.*] Is the existing line between Penrith and Bowenfels sufficient for the present traffic? At certain seasons of the year it is very difficult to get the traffic over the road.
1736. It is a single road to Eskbank? From Penrith to the bottom points it is a single road; but from there, through Eskbank to Bowenfels, it is a double road.
1737. I presume that you have explored the survey for the Commissioners' scheme? I have been over the route.
1738. And you have made a complete examination of all the detailed plans and working plans which are ready for carrying the work into operation? The whole thing is not ready to be carried into operation yet. Plans and sections, however, have been made, and they could be used for contract purposes.
1739. You could call for tenders within a very short space of time? The quantities have not yet been taken out accurately; they are only approximate. There would be the specification conditions, and so on, to prepare before the contract could be let.
1740. How long would it require to take out the quantities? It would take a month or two before you could let the contract.
1741. That is taking into account the time occupied in advertising? Yes.
1742. You, as the Constructing Engineer for railways, advised the Commissioners that the No. 1 proposal was the best route that could be adopted? It is the shortest, and I still think that it is the best.
1743. You advised them to that effect? Yes.
1744. If the Commissioners were to have authorised the carrying out of the work, you would immediately have called for tenders? We were not ready to call for tenders immediately—some length of time would have had to elapse before we could be in a position to do so.
1745. What length of time? Perhaps a month.
1746. The work would have been in full swing within a few weeks had the Commissioners decided to carry it out? Yes.
1747. The Commissioners agreed with you that your scheme was the best? They believed it to be the best.
1748. Do they still hold that opinion? With this proviso, that having heard of an alternative route, they think it is desirable that that route should be looked into.
1749. Having heard of another route, they conceive it best to wait a little while? Naturally. This route seemed feasible, and they thought it should be looked at.
1750. When did that occur to the Commissioners? Something like six weeks ago.
1751. After your scheme and Mr. Deane's had been submitted to the Committee, or before that? I think it was before our scheme was submitted to the Committee. I am under the impression that the matter had not actually come before the Committee when we thought of the alternative scheme.
1752. *Chairman.*] The date of the Commissioners' letter to the Minister for Public Works asking that the inquiry should be deferred was the 2nd instant? We were at work on the alternative route before that.
1753. *Mr. Davies.*] You stated that there are two alternative routes which you may submit? The exact route has not yet been fixed. There are two deviations, either of which it might be desirable to adopt, but we cannot tell which.
1754. You admit that if this work had not been referred by Parliament to the Committee, you would have been ready to have called for tenders in a few weeks? Yes.
1755. You still hold the opinion that your proposal is the best? I have no hesitation in saying that it is, so far as I know at present.
1756. Your proposed line is 2 miles 53 chains in length, and of that 1 mile 52 chains is tunnel, so that the greater part of the line is underground? Yes, the tunnel 3 chains in length.
1757. The grade in the tunnel is 1 in 42? One in 50.
1758. But the short tunnel is 1 in 42? Yes, the tunnel is 3 chains in length.
1759. The long tunnel has a grade of 1 in 50? That is so.
1760. Then you get on to a down grade of 1 in 75? There is a bit of level, and then a down grade of 1 in 75, which will be of great service in working the line.
1761. The grade you wish to cut out is 1 in 33? One in 33 against loads going west, and 1 in 42 against loads coming east.
1762. What great advantage will accrue to the traffic if your deviation is carried out? It is proposed to continue the present 1 in 42 grade from Eskbank to the bottom points through the small tunnel, and up to the end of the long tunnel, where it will at once change to 1 in 50, and the push-up engine, which will be used as at present from Eskbank to the bottom points, will drop off.
1763. You will require a push-up engine? Certainly; there will be over a mile of 1 in 42 from Eskbank to the bottom points.
1764. I thought you said that you could dispense with a push-up engine? Yes; through the long tunnel.
1765. But you would want it for the short tunnel? Yes. The figures that I have just given—£1,635—have reference to the tunnel, and not to the 1½ mile from Eskbank to the bottom points.
1766. The saving of £1,600 only refers to the large tunnel? Yes; that is the amount that would be saved by dispensing with the push-up engine there.
1767. You would always require a push-up engine for the 1 in 42 grade? Yes; whether the Commissioners or Mr. Deane's scheme be adopted.
1768. What really would be the saving effected in rolling stock, rails, and permanent way, if your proposal were adopted? I can only give you the figures that have been put before me. There will be a considerable saving in wear and tear from having a straight road instead of a curved one, though it is impossible to state exactly what it would amount to. It has been estimated at between £200 and £300 a year over the existing line, as I previously stated.

W. T.
Forlee, Esq.,
M.I.C.E.
20 Mar., 1894.

1769. But you can tell the life of an 80-lb. steel rail on a grade such as you propose to have here? The life of a steel rail varies all over the Colony. It depends upon whether the road is straight or curved, the nature of the ballast, the speed of the trains, the climate, temperature, and a variety of other conditions.
1770. But taking the proposed road, and comparing it with a road having a grade of 1 in 30? I cannot tell you exactly what the saving in maintenance would be. We are not taking it into account, though it will come to between £200 and £300 a year I dare say.
1771. No very large saving will be effected? No; because of the greater length of a double line, which makes up for the shorter distance.
1772. Will the scheme you are now exploring start from the same point as the No. 1 scheme? No; it will start below the 1 in 42 grade near Eskbank, and rejoin the existing line at the top of the 1 in 50 grade on the western side of Bell's station.
1773. You are not in a position to give an estimate of the probable cost? I cannot give you that at present.
1774. Nor to state what the grade will be? It is suggested that a grade of 1 in 60 can be obtained.
1775. But the line has not been sufficiently surveyed for you to be able to give a definite opinion? That is so.
1776. Both the deviations you are exploring start pretty well from the same point? Yes; and end at the same point. The one hugs the existing line a little more than the other, and will consequently be shorter.
1777. Having been summoned to give evidence here, is it not your duty to make yourself acquainted with Mr. Deane's proposal? I think I am right in saying that the Commissioners asked that the plans relating to Mr. Deane's proposal should be submitted to them, in order that they might have an opportunity of judging of its merits.
1778. When was that? I think it was a week or two ago. I pointed out to the Commissioners the impossibility of my expressing an opinion on any route when I had neither the plans, nor sections, nor any of the necessary data before me. I only know in a general way the length and ruling grade of Mr. Deane's proposal.
1779. But as both you and Mr. Deane serve the same master—the public—was it not your duty to make yourself acquainted with his scheme? I acted under the direction of my employers—the Commissioners—and I represented to them the desirability of seeing the plans and sections of Mr. Deane's proposal, and I believe I am right in saying that they applied to the Works Department for the plans and sections, but in any case it was not for me to do so.
1780. I presume you expected to be asked your opinion of Mr. Deane's proposal? I thought it not unlikely that I should be asked the question. It is a very natural one for the Committee to ask.
1781. But you have been exploring the country through which Mr. Deane's line will go, and your proposed line practically leaves the existing line at the same point as Mr. Deane's? The two lines go in opposite directions, and a walk over the ground in country like that would be of very little service unless I had the plans and sections.
1782. You did not apply to Mr. Deane yourself for them? No; it was not my business to apply for them, except through the Commissioners. As a matter of fact, Mr. Deane showed me a section of his proposal on tracing-cloth; but beyond that I have not seen either plans or sections. It would not have been professional etiquette to have pressed Mr. Deane to show me his plans and sections.
1783. Has Mr. Deane shown any indisposition to give you information? Not at all. I think at the time I happened to see the sections of the proposal he said that the plan was in the field, or that it was being worked up, or something like that. Mr. Deane has never shown the slightest disposition to withhold information, and I am happy to say that we work amicably together.
1784. When you were applied to by the Works Department to send in all your working plans and surveys, I presume you sent them in? They were sent to the Commissioners' office, and I know the Commissioners sent them on.
1785. Do you think it would have been a breach of professional etiquette to have yourself applied for similar information? I think the Commissioners applied for the information. I wish it to be clearly understood that so far as Mr. Deane and myself are concerned we work amicably together, and I have always found him most ready to give me any information I may ask for.
1786. Are you sure that application was made by the Commissioners? I am under the impression that it was.
1787. Do you know anything about the scheme brought under the notice of the Committee by Mr. Rock? I have read of it in the newspapers; but beyond that I know nothing about it.
1788. Do you know anything of the country through which he goes? Only by travelling along the existing line.
1789. *Mr. Hoskins.*] Do you consider that curves constitute a difficulty in the working of a railway? I think they are to be avoided; a straight line is better than a curved one.
1790. An official yesterday said that on an up-grade curves were of no consequence? Curves are to be avoided wherever possible. There is, of course, a great resistance to be overcome where there are sharp curves.
1791. Lateral resistance? No; a direct resistance against the pull of the engine.
1792. In reply to a question by Mr. Neild, you justified the imposition of an extra charge per mile over the proposed deviation, following the precedent of what has been done in England? I do not think I justified it, because it is out of my province to express an opinion on the subject. I simply pointed out that where works of an exceptional character had been undertaken by railway companies in Great Britain, it was usual to allow them to charge additional mileage to cover the cost.
1793. Do you know that here the charge is made *pro rata*, per mile, for the different classes of passengers and goods? I believe that it is.
1794. Seeing that the railways belong to the country, do you think the public would stand any special charges? I am not in a position to answer that question, because it is out of my province. I am here to give you any engineering information in my power that you may desire.
1795. Are there any ventilating shafts in the Lapstone tunnel? No.
1796. I understood you to say that you attached very little importance to them? They are of very little importance for ventilating purposes.
1797. Are you not aware that there are ventilating shafts in connection with the London underground railways? They are openings rather than ventilating shafts.
1798. Is there not one in Queen Victoria-street, and another on the Thames Embankment? There are one or two chimneys; but, speaking generally, the roof is left off to let the smoke out. They are not shafts properly so called.

W. T.
Foxlee, Esq.,
M.I.C.E.
20 Mar., 1894.

1799. Have you not heard serious complaints from engine-drivers and firemen in regard to the suffocating state of the Lapstone tunnel? No; though I have heard other people complain of its stuffiness, and in travelling through it is natural to put up the window to prevent the steam and smoke coming into the carriages. Complaints from the drivers would not be likely to come before me.

1800. You do not think that it is objectionable to have steep grades in a tunnel? The flatter the grade the better, but I do not think it is objectionable to have a grade of 1 in 50 in a tunnel like that which the Commissioners propose in the case under consideration.

1801. *Chairman.*] It has been stated in a return that a saving of £8,000 a year is effected in the working of the Lapstone tunnel. Do you know what saving was estimated before the work was begun? I do not. The preliminary investigations leading up to the construction of that tunnel did not pass through my hands, the plans and sections being prepared by the Works Department.

1802. You have told us, in regard to the proposal to take the line *via* Hartley Vale, that the Commissioners considered it outside their province, and, therefore, gave no definite reply to a deputation which waited upon them. We have it in evidence here, however, that the Commissioners stated that they had already made inquiries on the subject, and that the work would probably prove far more costly than was anticipated by the deputation. Did the Commissioners make their inquiries from you? We had a surveyor on the ground at the time looking into the proposed deviation for cutting out the Great Zigzag and—

1803. This deputation waited on the Commissioners on the 20th August, 1892? We had, as I have just said, a surveyor then in the field preparing a section of Mr. Burge's line. He was asked to look at the map, and to say, from his knowledge of the country and the levels, whether the line spoken of by the deputation was practicable; but no one was sent over the ground by us. I think I asked, "What are they proposing?" The reply to which was, "They propose to take a line across from Mount Victoria to Eskbank; but it would require a tunnel 7 miles in length."

1804. That is how the Commissioners got their information? Yes, so far as my memory serves me, and I am nearly sure that I am right.

1805. Did you say that the Works Department suggested to you that a line could be taken *via* Farmer's Creek? No.

1806. Where did the suggestion come from? From one of our own officers.

1807. After the plans of the proposed deviation had been passed over to the Construction Branch? Just so.

1808. You spoke just now of professional etiquette. Do you not think that it was rather a straining of professional etiquette, when, after handing over certain work to another department, you send out surveyors to poach on their inamor? The Commissioners have always held the opinion that these deviations should be carried out by them, and that this proposal, or any modification of it, was in the position of a deviation. It is scarcely for me to censure the action of my Commissioners. I merely act upon their instructions.

1809. I understand that you were instructed in the matter? Undoubtedly. This alternative route was brought under my notice, and I thereupon saw the Commissioners, who instructed me to have it looked into.

1810. I think you said it would be better to suspend this inquiry, to enable you to further test the deviation to which you have referred? I think that it would be in the interests of the country.

1811. And, if the weather permits, you will probably be ready in ten days' time to give us definite information as to the desirability of carrying it out? As to whether it is practicable. I could not furnish you with detailed plans and working drawings in that time; but I could tell you if the route is practicable, or whether it would be a waste of your time to consider it further.

1812. *Mr. Humphery.*] If the No. 1 scheme were adopted, would it be possible to improve the grade of 1 in 42 from Eskbank to the bottom points? I have looked into it, and I think that it would be a very costly matter to do so, because the alteration would have to commence at the mouth of the proposed tunnel, and the line would have to be lifted from that part to Eskbank station, and thus interfere with the station-yard. Altogether it would be so costly as to be almost impracticable.

1813. Then the adoption of the No. 1 proposal would mean the retention of that grade for all time? It would.

WEDNESDAY, 21 MARCH, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTON.

The Hon. JAMES HOSKINS.

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JOHN DAVIES, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

THOMAS THOMSON EWING, Esq.

WILLIAM CHANDOS WALL, Esq.

WILLIAM MCCOURT, Esq.

JOHN CASH NEILD, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES COLLINS, Esq.

HENRY DAWSON, Esq.

The Committee further considered the proposed Deviation to avoid the Lithgow Zigzag.

Edward Fisher Pittman, Esq., Government Geologist, Department of Mines, sworn, and examined:—

E. F. Pittman,
Esq.

21 Mar., 1894.

1814. *Chairman.*] How long have you occupied your present position? About two and a half years.

1815. But you have been connected with the Department of Mines for a long while? Yes, for about fifteen years.

1816. I presume you know the Lithgow Valley and the country about there well? Yes.

1817. Can you tell us, from your knowledge of the geological features of that district, whether there is a larger area of mineral-bearing land in the Hartley and Kanimbla Valleys than there is in the Lithgow Valley. The Committee are desirous of knowing whether the Lithgow Valley seams which are served by the existing line are limited in extent, or in some degree worked out, as compared with the unworked seams on the Hartley side, which would be served by Mr. Rock's proposed deviation? Really, it is a very open question. No doubt a great deal of work has been done in the collieries at Lithgow; but all the country to the north or the north-east is coal-bearing.

1818. As a matter of fact, are not a great number of the collieries working into the hills which intervene between the Lithgow Valley and the Kanimbla Valley? Yes.

1819.

1819. Are there not only two collieries which are working in a northerly direction? Yes, the Hermitage, and probably the Zigzag Colliery. E. F. Pittman,
Esq.
1820. I suppose the mineral deposits now being worked on the southern side of the Lithgow Valley go right through into the Kanimbla Valley? I think so, undoubtedly. The general dip of the coal measures there is north-east. 21 Mar., 1894.
1821. Then those collieries working on the northern side of the Lithgow Valley have to go down on their face, while those on the other side of the valley have a rising grade, and are therefore more easily drained and worked? Yes, that is so.
1822. I presume that that is one reason why they are working more on the southern side than on the northern side? It may be; though it is possible to work to the rise by putting the shaft as far towards the dip as possible.
1823. How far do the coal measures extend north-east of the Lithgow Valley? Practically as far as Maitland. That is the westerly extremity of the Newcastle, Sydney, Illawarra, and Western basin.
1824. But not the seams they are working at Lithgow? Yes; they are part of the Newcastle measures.
1825. Is there not a difference in the quality of the coal? Yes, undoubtedly. It is more of a steam coal, though it contains a greater percentage of ash. The latest opinion is that these are the upper coal measures or the continuation of the Newcastle beds.
1826. We are to understand that the coal measures on the northern side of the Lithgow Valley may extend to Maitland? Perhaps it would be more correct to say that they extend to Newcastle.
1827. How far south do they extend in the direction of the Kanimbla Valley? In a true southern direction they do not go very far, because you come on to the paleozoic rocks, on the Cox River, at Hartley, for instance.
1828. The mineral deposits, as far as the Kanimbla Valley is concerned, are bounded by the hills—they do not go into the valley? Yes; that is correct.
1829. We may take it that the coal measures which are being worked at Lithgow, and which you believe to be part of the Newcastle coal measures, crop out on the northern side of the Kanimbla Valley? Yes.
1830. Are there any other coal measures or mineral deposits in the valley below? No; the coal rocks undoubtedly thin out as you go towards the west, and the consequence is that there are no workable seams there, except those which I have already said are the equivalent of the upper coal measures. The same remark applies to those in the Lithgow Valley.
1831. With reference to the kerosene shale deposits worked at Katoomba, they are being worked across the valley, but in higher ground? Yes; they are under the escarpment.
1832. How do you account for the Berrima measures;—do they belong to a different series? No; they belong to the same series of beds. The Newcastle, or upper-coal measures, the Lithgow coal measures, the Berrima coal measures, and the Bulli coal measures are all the same. They are supposed to be one continuous seam.
1833. Under varying local conditions? Quite so.
1834. So far as the great Kanimbla Valley is concerned, there are no kerosene mineral deposits there? We believe not. It is possible that there may be small patches, but we do not think so.
1835. Presuming that the traffic life of any railway in that district were dependent upon the mineral production, a railway down the Lithgow Valley would have a longer life by reason of the greater volume of trade than a railway down into the Kanimbla Valley? I think you are making more out of what I said than I intended. No doubt there is a general dip to the north-east; but the question whether there is more mineral wealth on the northern side than on the southern side depends upon how much of the coal measures are present. There is only one set of seams workable on the south and on the north. It is the same seam in both instances; but the question how much there is could best be answered if I had a geological map here with the line marked on it.
1836. But you have told us that the coal measures on the northern side of the Lithgow Valley virtually extend to Newcastle, which is roughly 150 miles away? Yes.
1837. And that the same measures on the southern side merely go through the ridge that intervenes between the Lithgow Valley and Kanimbla Valley, a distance, I presume, of only 2 or 3 miles? Yes.
1838. So that on your own showing there would be a larger area of coal-bearing country to the north than there would be to the south of the Lithgow Valley? Yes.
1839. *Mr. Ewing.*] Is the best shale deposit in the Kanimbla Valley? The best shale deposit undoubtedly has been there. The Hartley shale is the best we have ever found, and at the present time we know of none equal to it.
1840. Is there any on the line between Mount Victoria and Eskbank? No; I know of no shale immediately on the line; but all the country to the north is more or less shale-bearing. If you take a line from Clarence Siding up to Glen Alice, to the north-east of Capertee, you will find shale land in patches all the way.
1841. And you say that the existing line, so far as your knowledge enables you to speak, probably goes through a larger area of shale land than Mr. Rock's proposed line? Taking the question just as it stands, I would say undoubtedly, because it is a longer line.
1842. Would it be any advantage to the mineral deposits there if the line were taken as Mr. Rock proposes to take it? A very slight advantage. It might facilitate the working of the Hartley Shale Company.
1843. You regard the advantage as immaterial? To a great extent immaterial.
1844. *Mr. O'Sullivan.*] Are there any gold or silver deposits in Hartley Vale, or in that direction? No, I know of none about there.
1845. Have any finds of gold been reported recently anywhere within a fair radius of Hartley Vale or Big Hartley? No, I do not know of any recent finds. There was a rush for silver to a place between there and the Jenolan Caves some two years ago, but nothing came of it.
1846. Is it a country likely to carry either gold or silver? Yes; it is south of the coal measures. I examined a piece of land for gold on Mr. Wolsey's run, which is only 8 miles from Mount Victoria. You can get right down to the paleozoic rocks, below the coal measures, within 7 or 8 miles of Mount Victoria. Mr. Wolsey was prospecting for gold and silver on some reefs there, but it came to nothing.
1847. Do you think that the neighbourhood is ever likely to become a large mineral field for gold and silver? I can only say that from the formation it is quite possible that it may be auriferous and argentiferous. It is in the paleozoic rocks, where all our big gold and silver deposits have been found.

- E. F. Pittman, Esq.
21 Mar., 1894.
1848. I understand that the best shale deposits in New South Wales are at Hartley Vale? The best shale we have had came from there and from Joadja Creek. Speaking exactly, perhaps the best shale came from Hartley Vale.
1849. I presume that the shale is pretty widely scattered; its occurrence is not confined to the spot where the company is working? The occurrence of the shale is in patches—a few hundred acres in extent. You may trace the same formation for miles and miles, and find it barren; but, perhaps, 10 miles or 50 miles away, you may come across another patch.
1850. Are there not many indications of shale in that valley besides the patch which is being worked by the Hartley Vale Company? None that have ever been proved to be much good.
1851. *Mr. Wall.*] Is it a fact that the only accessible route to the Kanimbla Valley is from Mount Victoria or Katoomba, points on the Sydney side of the contemplated deviation? Yes; but it would be quite possible to make an elevated tramway.
1852. Would not the easiest point of access from the Megalong Range, Isolated Mountain, and the other places there containing shale, be on the eastern side of the deviation? Yes.
1853. Therefore, the proposed deviation would not affect the development of such seams? Possibly not.
1854. Do you think it is likely, in view of the recent developments in connection with coal near the metropolis, that fresh mines will be opened up in the Blue Mountains for many years to come? I do not think it is at all probable. I do not think they would be paying concerns.
1855. In the event of the development of trade in the western district, is it not likely that the coal required there will be taken from seams in the vicinity of Lithgow? I think so.
1856. Taking into consideration the fact that these coal measures extend 80 or 90 miles to the west in the direction of Tombong and past Wallerawang? I do not know the first locality, but I know that they extend beyond Wallerawang.
1857. Do you know Cox's coal-mine on the other side of Rylstone, at Tombong? I do not know the mine, but I know that the measures run out there.
1858. It is likely that the mines further west, because the carriage will be less, will furnish any coal which is required out there? I think it is very probable that what we call the Lithgow coal, will be used out west rather than in the metropolis; but I do not think there is a great extent of workable coal out beyond Lithgow and Marrangaroo.
1859. The existing line fairly commands all the mines at present opened, with the exception of the Hartley Vale shale mine? Yes; all the mines to the west of the Zigzag Colliery, which is the most easterly of the lot.
1860. *Mr. Davies.*] Do you know the land owned by the Hartley Vale Oil and Shale Company? Yes; they hold mineral conditional purchases.
1861. Do you know the extent of their holding? I have been on their property, but I do not know the extent of it.
1862. Have you been in the mine? Yes.
1863. Have you seen their workings? Yes.
1864. About 40 acres is what they have worked and are working? I could not tell you the area with any degree of certainty.
1865. Do you know if the shale still exists there in payable quantities? I believe they are working it now where it is found to have been faulted, and has been thrown down on the floor of the valley. That is really all they are depending upon now. I do not fancy that they have a great deal more shale on their property besides that.
1866. You do not think there is much more shale in their 4,000 acres than what they are working at, which is the faulted portion? I do not think so.
1867. Therefore a railway taken through Hartley Vale would not be required to serve the trade of that company? I think they have undoubtedly seen their best days.
1868. *Mr. Neild.*] Focusing the whole matter, do you think a line constructed from Mount Victoria through Hartley Vale, to say, Bowenfels, would be the means of opening up any very large mineral traffic? No; I do not think there is any great possibility of that.
1869. Do you know the tunnel immediately to the south of the Clarence tunnel;—is it mineral country? Yes; I believe so.
1870. Coal bearing, or shale bearing, or both? Some shale was got there, I think, but I do not recollect what the quality was. I do not fancy that it was very good.
1871. Are the coal measures there important? Just about as important as they are over the whole of the area to the north-east, but not more so.
1872. Would the deposits there be similar to the deposits at Eskbank? Yes; I imagine that they would be.
1873. Would the coal supposed to underlie that land give a value to it which it would not possess in the absence of coal? Yes; I think we may take that for granted.
1874. You would take into consideration the presence of coal in valuing the land? Yes.
1875. About what is the thickness of the seams in that locality? The workable seam of coal at the Vale Colliery is about 450 feet below the Zigzag platform, which, I think, is 3,270 feet above sea level.
1876. You do not remember the thickness of the seam? There is about 5 feet 6 inches of workable coal in the Lithgow Valley, that is to say, they work 5 feet 6 inches out of the lowest seam.
1877. The same seam would underlie the land in the vicinity of the Clarence tunnel? I should expect so.
1878. I suppose you have included the Mount Hay coal-fields in the evidence you have given about the district? Yes.
1879. *Mr. Humphery.*] Did you examine the mine which Bates and party discovered in the Jamieson Valley, between Lawson and Wentworth—shale and coal? The question was raised should the trustees of the common allow a lease of the land to enable the coal to be worked.
1880. Did you examine the coal measures there? Yes.
1881. Did you report upon them? No; I reported merely upon the likelihood of the reserve being injured by the working of the coal.
1882. Assuming that those coal measures possessed any commercial value, would that portion of the valley be served by a line from Mount Victoria to Bowenfels, *via* Hartley? I do not think that such a line would make any difference to them.
1883. They would not be served at all by it? I do not think so.

TUESDAY, 27 MARCH, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.	WILLIAM CHANDOS WALL, Esq.
The Hon. JAMES HOSKINS.	WILLIAM McCOURT, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	JOHN CASH NEILD, Esq.
The Hon. JOHN DAVIES, C.M.G.	EDWARD WILLIAM O'SULLIVAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	CHARLES COLLINS, Esq.
THOMAS THOMSON EWING, Esq.	HENRY DAWSON, Esq.

The Committee further considered the proposed Deviation to avoid the Lithgow Zigzag.

George William Townsend, Esq., sworn, and examined:—

1884. *Chairman.*] You are a civil engineer? Yes.
1885. You were engaged for some time in connection with the Construction Branch of the New South Wales railways? Yes.
1886. You are now engaged in the Water Conservation Branch. Yes; with regard to artesian boring.
1887. *Mr. Wall.*] Some time ago you surveyed a line up the Colo Valley? Yes.
1888. And submitted a report on that line to the Department? A complete survey and estimate and report.
1889. At that time, were you connected with the Department? I was employed by the Railway Department.
1890. Did you report in favour of the construction of that line? Decidedly; very strongly.
1891. Speaking with regard to the Great Western line, do you think it is at all likely that the Colo Valley line will ever be constructed? I think it is merely a matter of time. I feel confident that eventually the Colo Valley line must be constructed.
1892. Could you explain to the Committee any reasons why that line should be constructed? I think I can give very good reasons. The principal reason why I thought that an alternative line should be constructed was because of the grades on the Great Western line. These may have been subsequently improved by the deviations and the tunnels; but at the time I made my estimate a heavy engine would only take from Penrith to Mount Victoria 13 loaded trucks, with a limiting grade of 1 in 30. From Mount Victoria to Lithgow the same engine would only take 13 loaded trucks with a limiting grade of 1 in 33; and from Lithgow to Bathurst the same engine—heavy goods—would only take 17 trucks, with a limiting grade of 1 in 33; and from Bathurst to Orange, 17 trucks, with a limiting grade of 1 in 40; and from Orange to Wellington, 17 trucks, with a limiting grade of 1 in 40; and from Wellington to Dubbo—comparatively flat country—17 trucks, with a limiting grade of 1 in 40; and from Dubbo to Narramine, 28 trucks, with a limiting grade of 1 in 50; and from Narramine to Bourke, 60 trucks, with a limiting grade of 1 in 50. This was information obtained from the Locomotive Department at the time I was drawing up this report. Considering that the limiting grade on the Colo Valley survey was shown by section to be 1 in 100, with all grades reduced on curves of 20 chains radius, so as to equalise the haulage between the straights and the curves, and seeing that from Narramine to Bourke an engine could take 60 trucks, and comparing that with the foregoing information, I think that is a strong reason why an alternative line should be constructed.
1893. With regard to the cost of that line, did you furnish some report in regard to the working expenses of the line? I did.
1894. And also in regard to the working expenses on the mountain line? I have got that somewhere, but I do not know just now where it is. I think that Mr. Goodchap worked that out more than I did, if I remember rightly.
1895. Do you remember what the saving was that you estimated? I think Mr. Goodchap showed that we could save the whole cost of the line in something like twenty years. I think I estimated it at forty years. I am confident it could be saved in forty years, after making up interest on the outlay.
1896. In that report, did you make allowance for the interest that would have to be paid on the line over the Blue Mountains—that portion of the line now constructed? No; only on such portions of the existing line as we should use.
1897. What is your estimate of the total cost of that line? £2,695,000.
1898. Was that the total cost of the construction of that line from its deviation at Penrith to Narramine where it connected again? No; I believe that it was £3,500,000 through to Dubbo, but I cannot find it here—I have not seen these papers for some time.*
1899. Some comment was made in regard to your report by Mr. Whitton, who was then Engineer-in-Chief—I think you will find it on page 13 of that report? There are a good many comments made by Mr. Whitton.
1900. That is with regard to the correctness of your estimates? Yes. As to that, I place my estimate for a single line at £2,695,000. Mr. Whitton, in an attempt to swell the estimate, makes his estimate for a double line £6,148,000—a little more than double the amount.
1901. Now, with regard to the construction of this line, have you any doubt whatever in your mind that this line could be constructed for £2,695,000? I am not only sure that it could be constructed for that, but I am prepared to say now, from a subsequent examination of the country contiguous to that previously explored by me, that a very large saving could be effected—at least, £500,000—and the distance could be shortened, I believe, about 10 miles. That is the total distance from Sydney. Instead of going from Emu Plains along the banks of the Hawkesbury for many miles, and then tunnelling through above Wheeny to Colo, we would start from Parramatta with a short tunnel through the Castle Hill ridge, and then along the Dural ridge to the junction of the Colo River with the Hawkesbury, then an easy line up the Colo, giving much simpler and less construction difficulties than my original line would have done. I am confident it would save, at least, £500,000, and 10 miles in distance.
1902. When you submitted your report, were the quantities and the cost of the work revised by any officer of the Department? I had two men in the office helping me with it.

G. W.
Townsend,
Esq.

27 Mar., 1894.

* NOTE (on revision).—See Q. and A., 1918.

G. W.
Townsend,
Esq.
27 Mar., 1894.

1903. But were they disputed by the then Engineer-in-Chief? I believe not. All that the Engineer-in-Chief said is in these papers, and I am not aware that he ever disputed the quantities—
1904. Well, how was this difference in cost made out? Mr. Whitton estimated for a double line, and I estimated for a single line.
1905. Did you make an estimate at all for a double line? No. In my first exploration I stated that certain portions of the line should be double. Subsequently, as is explained here, I withdrew that and estimated for a single line, excepting the bridges which were all estimated for double line, after I had made a complete survey.
1906. *Chairman.*] That refers more particularly to the tunnel-work? Yes. I increased the tunnel-work very largely. I think I put in between 12 and 13 miles of extra tunnelling in order to avoid landslips.
1907. You increased your tunnelling work, but reduced the tunnels from double to single? Yes.
1908. *Mr. Wall.*] Is this Committee to assume that Mr. Whitton concurred in your estimate of the cost of a single line, but increased the cost to nearly £6,000,000? The Committee may assume what they like. It is here in the papers. Mr. Whitton insisted on giving his estimate for a double line, although the then Minister for Works, Mr. John Sutherland, referred the papers back to him, stating that my estimate was for a single line.
1909. The Great Western Line was then, of course, a single line? It was altogether a single line, and mostly is still.
1910. You say you think it is only a matter of time when that line will be constructed? I am convinced of it.
1911. Do you think it will be advisable to lay out any large sums of money in reducing the grades on the Blue Mountain line, in view of the fact that it is probable that that line will be constructed at some future time? Well, my opinion is that no amount of money laid out on the Blue Mountain line would ever make it a line capable of doing great duty, on account of the heavy grades. The common opinion is that the Zigzags are the cause of the obstruction of the Western line, but the fact of the matter is that the enormous heavy grades in between the Zigzags are the real obstruction. In all my railway experience I never knew a train stuck up on the Zigzag, but on the heavy curves and grades between the Zigzags the engines have been stuck up.
1912. *Chairman.*] That is between the Lapstone and the Lithgow Zigzags? Yes, between the Zigzags.
1913. *Mr. Wall.*] You are prepared to stake your professional reputation that that line could be constructed as a single line for £2,695,000? Yes.*
1914. With a grade not exceeding what? One in 100.
1915. First of all your starting-point was from Emu Plains? Yes.
1916. Starting from Emu Plains, and connecting at Narramine, the line could be constructed for £2,695,000? Yes.
1917. Since you furnished that report, on reconsideration you have adopted a different route, namely, from Parramatta;—for how much less could that line be constructed? £500,000 less.
1918. From Parramatta to Narramine a single line could be constructed for £2,695,000? Yes.†
1919. What would be the length of that line? I cannot remember exactly what the length would be. It is 278 miles by the present line to Dubbo, and that line would save 40 or 42 miles; therefore by that line the distance from Sydney to Dubbo would be about 236 miles, instead of 278.
1920. It would effect a saving of some 40 miles between Dubbo and Parramatta? Yes.
1921. You have been engaged in connection with other railway surveys? Yes.
1922. And you have always found them, if carried out, correspond with your estimate? Fairly. I never had any fault found by Mr. Whitton with any of my previous work—in fact, I can show you a memo. from him in which he mentions myself and some others specially for an increase of pay lest he should lose the services of some of the best surveyors in the Department.
1923. I understand that it was with the concurrence of Mr. Whitton that you were instructed to carry out that survey? I cannot say that.
1924. You received your instructions from the Minister? I received my instructions from the Minister, through Mr. Goodchap, to report to Mr. Whitton—to carry out that survey under Mr. Whitton.
1925. You are not in a position to say whether Mr. Whitton approved of that survey being initiated? No, I am not.
1926. *Chairman.*] Is it true that after you had left the Railway Construction Branch, and had joined the Existing Lines Branch, you obtained leave of absence from the Commissioner for the purpose of exploring the Colo Valley with a view of constructing a different line from that going over the mountains? It is better, perhaps, that I should reply to that question by reading from these papers. It is put here very concisely, as that very point was raised by Mr. Whitton. I wrote:—
- The facts of this matter are as follows:—In 1880 my services with Mr. Whitton were dispensed with, as the work on which I was engaged was finished. In the early part of 1882 I was re-appointed by Mr. Whitton, at the same salary as I had formerly received.
1927. Is it true that after leaving the Railway Construction Branch, and whilst in the Existing Lines Branch, you obtained leave of absence from the Commissioner to explore what is known as the Colo Valley scheme? Two years afterwards I did.
1928. Two years after joining the Existing Lines Branch you obtained leave of absence? Yes, I did.
1929. Did you make a report to the Commissioner for Railways, upon which the Minister subsequently ordered a fuller survey? I did.
1930. That survey would be carried out by you under the engineer for construction, Mr. John Whitton? It was first of all intended that a survey should be carried out under the Existing Lines Department. Subsequently it was ordered that it should be carried out under Mr. Whitton.
1931. *Mr. Wall.*] On submitting your report to Mr. Whitton, Mr. Whitton did not, you say, find fault with your estimates for a single line? At first he did.
1932. In what respect did he differ from you in regard to that estimate? No particular respect, but generally. Subsequently he found fault with the whole thing, and put in his estimate for a double line.
1933. Did he at any time agree that your estimate for a single line was a correct one? He never agreed that anything was correct—that I was, or anything else.
1934. From what I can understand, your estimate for a single line was not concurred in by Mr. Whitton? Well,

* NOTE (on revision):—See Q. and A., 1918.

† NOTE (on revision):—This should be £3,500,000, then the saving by change of route of £500,000 will leave £3,000,000 as total cost of line from Parramatta to Narramine.

Well, tacitly it was, for he refused to give his estimate for a single line to compare with mine, and insisted on giving his estimate for a double line to compare with my estimate for a single line, as these papers show.

G. W.
Townsend,
Esq.

27 Mar., 1894.

1935. Can you point out to the Committee any other lines you have been engaged upon where you have made estimates? No; because, as a rule, the railway surveyors do not make their own estimates—the estimates are made in the office.

1936. Have you made any estimates while engaged in the department here in connection with any deviations, works, or surveys in connection with the railway lines? I made the estimate for the duplication between Parramatta and Penrith.

1937. Was that estimate borne out by the results? Yes; the work was carried out from it.

1938. I understand from a reply you gave to a question a little while ago that Mr. Goodchap at that time approved of the construction of the Colo Valley line? Yes.

1939. Did Mr. Goodchap make any estimate as to what would be gained by the department by that line? I believe he did. I cannot find it, looking hurriedly through these papers, but I believe he estimated that the cost of the line would be saved in a certain number of years. I estimated that it would be saved in forty years, and I believe that Mr. Goodchap estimated that the cost would be saved in less time than that.

1940. You are quite convinced as to the correctness of your estimate now? Perfectly.

1941. Have you made any surveys or examinations in connection with the present Western line? No.

1942. You are not in a position to inform the Committee to what extent the grades you refer to on that line could be reduced, and what would be the cost of reducing them? No.

1943. You furnished the Committee with the number of trucks hauled? That is information obtained from the Locomotive Department at the time of making the estimate.

1944. You have made no personal inspection of the line, and are not in a position to inform the Committee what would be the cost of a reduction of the grades, so as to make this a trafficable line? No, it is simply impossible. On examination of a section anybody could see that at once.

1945. You think that no expenditure on the Western line would make it as good a line as the Colo Valley line would be if constructed? Not a chance of it.

1946. *Mr. Collins.*] If the line which you advocate were constructed what communication would towns such as Orange and Bathurst have with it? None whatever. They would have to deal with the present line, which would be the main line between Sydney and Orange.

1947. You would have to keep the existing line still going? Yes. The proposed new line would not have the slightest effect on any of the high-level towns, such as Bathurst and Orange. On account of the shortening of the distance from Dubbo to Sydney by the new line it would pay to run a train from Wellington to Dubbo, and to use the new line instead of bringing it up the present line to Orange, so Wellington could come under the new system.

1948. You would have to have the same line from Bathurst to Parramatta, as now exists? Exactly.

1949. Then the present line would not have to be taken up at all? No; that line would not be interfered with in any way.

1950. You would have to have two lines of railway? Yes.

1951. Would the Colo Valley line open up any good country? A great deal of coal and shale, and on the table-lands a great deal of good orchard land. In fact, according to my new proposal to go by Dural, it would open up all the Dural country for which a railway has been proposed recently.

1952. Is it Crown lands? I think it is mostly alienated now. A great number of acres have been taken up within the last seven years, I know.

1953. The betterment principle would apply to that line, and the people on the line would have to pay for it? Certainly.

1954. *Mr. Ewing.*] Do you know the railway system of the Colony fairly well? Pretty well.

1955. Do you believe that the Western line will continue to be the main artery of traffic to the west? I am sure it will not. I am sure the Colo Valley line will have to be made. There is no shadow of doubt about that, although I may not live to see it. I am not very young now.

1956. You believe that whilst there is a level road to be obtained the whole traffic of the west will not continue to be worked over an elevation of 3,670 feet? Never.

1957. *Mr. Humphery.*] Have you had any experience of railway construction anywhere outside New South Wales? Yes; in India.

1958. Can you express any opinion as to the advantage or disadvantage of the proposed tunnel in No. 1 scheme as compared with No. 3 scheme of the proposed deviation from Clarence tunnel? I know but little about it. I have been over Bell's line, but I know too little about the particulars of the case to say anything. I have never seen a survey nor a section of any of it, and I should not like to venture to give an opinion about it at all.

1959. *Mr. O'Sullivan.*] I see that Mr. Whitton, in his second reply, dated 1st March, 1888, says that your proposal would cost £6,148,393? Yes.

1960. And he makes the difference up by going into all the details? Yes.

1961. He states here, in a letter in reply to you, that your first estimate was for double line, tunnels, bridges, and viaducts? My first estimate was made, as I have explained here, on a mere exploration of the country proposed for a double line, and with only a comparatively small amount of tunnelling. Subsequently, when I had made the survey, and found that I should have to introduce a long length of gallery tunnelling to avoid landslips, I thought it better to reduce it to a single line, and I made my estimate for a single line, and Mr. Whitton insisted subsequently on making an estimate for a double line, to compare with my estimate for a single line.

1962. There is an enormous difference between your estimate and his? Yes; because he estimated for a double line and I for a single line.

1963. He makes the cost nearly three times as much as you make it? No; very little more than double.

1964. Would a double line cost twice as much as a single line? It depends a great deal on the works. The cost of a double line tunnel is very nearly twice the cost of a single line tunnel. For cuttings and banks a single line should cost about three-fifths, or from that to two-thirds of the cost of a double line.

1965. Would your line serve Bathurst and Orange? No.

1966. Dubbo? Yes.

1967. What route would you take in going down from the mountains? We do not get on to the mountains at all.

1968.

G. W.
Townsend,
Esq.
27 Mar., 1894.

1968. What route after leaving the Colo Valley? Through Mudgee to Dubbo, or to Coonamble, as has been since mooted. In case of going to Coonamble, we would junction with the Werris Creek line, and would connect with Dubbo.
1969. I suppose you would leave the old line to serve Bathurst and Orange? Yes; the old line would serve the high-level towns—Bathurst, Orange, and intervening towns, and also the Blayney-Cootamundra line.
1970. So your line of railway would really be to serve the Mudgee district and the far west? The Mudgee district, and west and north-west.
1971. *Mr. Davies.*] What is the total length of the suggested alternative line you speak of? It is about 40 miles shorter than the present line to get to Dubbo.
1972. Did Mr. Palmer, then of the Construction Branch, go through and examine in detail your first estimate? Not the whole of it. He went through a portion of it with me.
1973. Did he not report against you? Not entirely.
1974. What do you mean by not entirely? Partly in favour of and partly against me.
1975. Will you tell me what part of your project he reported in favour of? I should have to look through the papers; I cannot remember now. It is about eight years since.
1976. At what did Mr. Palmer estimate the cost of your 14 miles of tunnelling? I do not think that he ever made an estimate at all of the tunnels; I never heard of it.
1977. Did he not make an estimate that your 14 miles of tunnelling would cost £80 a yard, or a total of £2,000,000? I do not remember.
1978. You do not remember his reporting to the Engineer-in-Chief that the 14 miles of tunnelling itself would cost £2,000,000? He may have, but it is not in the official papers so far as I can recollect.
1979. You do not reckon that reporting against your recommendation? I say he reported partly in favour of it and partly against it. He was up on the line with me, and we spent a night or two there, and had a long talk about it. I was not put in possession of all the official papers, and he may have reported something to Mr. Whitton which I may never have seen.
1980. You do not seem to be familiar with the reports made in those days; you have not, I suppose, refreshed your memory as to what took place? With the work I am thoroughly familiar, but with the reports I am not.
1981. Mr. Palmer occupied a very important position? He was Engineer for Railway Surveys.
1982. Can you remember that the whole of the papers, surveys, and quantities were referred to him by the Engineer-in-Chief? Before the whole was finished, I think that Mr. Palmer was away in England, and Mr. Deane was dealing with the matter.
1983. I do not see that Mr. Deane had anything to do with it? I had to see Mr. Deane about it. I do not remember any distinct report of Mr. Palmer's about it, but if you like I will look through the papers to see.
1984. *Mr. Hoskins.*] You have spoken of the line you surveyed as an alternative line; what do you mean as an alternative line? Other than the one that was first spoken of.
1985. What was first spoken of? The Western line to carry all the traffic for the west and north-west. That is another line to carry the same traffic without going over the mountains.
1986. Then your alternative line was a line which you suggested to do away with the present Great Western Railway altogether? Not at all. It was only with regard to the traffic beyond Orange. The whole of the Western line would still be required as much as ever, and its carrying capacities would be taxed to its utmost to deal with the traffic between Orange and Sydney.
1987. How much of the existing line do you propose to do away with? Not to do away with any of it.
1988. *Mr. Trickett.*] In making this alternative line then to connect at Narramine, in estimating the earning properties of that line, how do you think that would affect the present line from Sydney to Orange—would that be a paying line by itself? Yes; the heavy grades of the Western line are such that the less carried on it the better it will pay, for all the goods carried on it at ordinary rates are carried at a loss.
1989. That is only to a certain extent? You may put on special rates through high-level country on account of the heavy grades, but when you extend beyond those grades hundreds of miles into flat country, people reasonably ask, "We have all this flat country, why should we be taxed on our light-grade line to pay for the extra haulage on heavy-grade lines?"
1990. But the Western line is a paying line, is it not? Yes; but we are very heavily taxed. I am told that people are carrying goods in drays and waggons, and competing with the Western line.
1991. Is that not more attributable to the good season, because they are able to get feed for their horses cheaply? There is no doubt about that.
1992. You said a little while ago that the difference between your first and subsequent estimate in the cost of your proposed line was caused by reason of a double line being proposed instead of a single line? Yes.
1993. Well, at page 17 in this report, Mr. Sutherland said:—
- Mr. Townsend explains that his rough estimate has been exceeded chiefly because he has found it necessary to provide for 21 miles of single tunnel instead of 6½ miles of double tunnel, as originally contemplated by him.
- That is putting it in a reverse position, is it not? No; 6½ miles of double tunnel would not come to anything like 21 miles of single tunnel.
1994. But are not the two statements quite different? Yes; but there are other things to be considered.
1995. According to Mr. Sutherland's summary, he makes it appear that the difference in the two prices is by reason of your having to construct 21 miles of tunnelling instead of 6½, whereas you now tell us that the difference in the two prices was because one line was to be a double line and the other a single line? No; I only said what I did to explain the discrepancy between Mr. Whitton's estimate and my estimate. Mr. Whitton's estimate is for a double line and my estimate for a single line. I am not referring in that to my previous report at all. In the first report I stated distinctly to Mr. F. Wright, who was then Minister for Works, that I objected to give an estimate at all on a mere exploration, but I was urged to give an approximation to an estimate, and I did so under protest, and the cost I hurriedly estimated as I did. Then Mr. Whitton wished subsequently to bind me to an estimate for a double line, although I distinctly stated I proposed a single line.
1996. As an engineer, what are your views with regard to a steep gradient in a tunnel of nearly 2 miles in length? I think that on all main trunk lines steep gradients should be avoided at almost any cost.
1997. I am speaking of grades in a tunnel? It would not make any difference in a tunnel. It is worse in a tunnel, perhaps.
1998. Especially on a mountain line;—is not the line in a tunnel apt to get greasy? Yes; it is worse in a tunnel; but it is so bad to have heavy grades at all that they should be avoided almost at any cost.

G. W.
Townsend,
Esq.

27 Mar., 1894.

1999. Then you do not think it is desirable to have a tunnel nearly $2\frac{1}{2}$ miles in length, with a grade of 1 in 50? Well, 1 in 50 on that line is so much better than many parts of the line that it might be regarded as a light grade, for you have 1 in 30, and miles of 1 in 33 and 1 in 40. You can only reckon good grades on lines comparatively.

2000. Have you had any experience in constructing railway tunnels? No; I have never been in charge of one.

2001. Or as to their working—as to their getting foul? Yes; I have.

2002. With regard to fouling, is it better to have a large tunnel or a small tunnel—a single-line or a double-line tunnel—which is likely to get the less foul from smoke? I should think about equally. In a double-line tunnel you would have the same sectional area in proportion to the traffic as you would have in the others. I do not think there would be much difference between them.

2003. Well, how do you account for the tunnel at Lapstone Hill getting so foul? I have only been through it as a passenger, but some of the old drivers say it is almost suffocating to go through it. I believe that part of the reason is that it is on an S curve. That will always be a bad tunnel, because ventilation will be so bad in it.

2004. *Mr. Neild.*] Your estimate for your proposed line was made somewhere about six or eight years ago, was it not? Six years ago.

2005. At that time was not the cost of engineering works much greater than it is now? Much the same, I believe.

2006. Has there been no reduction in the cost of tunnel making? I think there is some. No reduction on what I then proposed, but a reduction on what was then carried out. The cost of works such as those carried out was greater then than now, but it is about now what I proposed then, and for which the work could have been done then.

2007. So any alteration that may have taken place as to the cost of constructing lines, would not affect your estimate? Rather favourably than otherwise.

John Whitton, Esq., sworn, and examined:—

2008. *Chairman.*] You were Engineer-in-Chief for Railways in New South Wales for many years? Yes. *J. Whitton, Esq.*

2009. *Mr. Suttor.*] When did you commence operations on the railway line from Sydney to Bathurst? About 1860, I think. I was here first in 1856, and at that time there was a proposition to make tramways on the public roads, 4,000 miles, at a cost of £4,000 per mile, and one of those lines was to go from Emu Plains to Bathurst. The proposition was made by Sir Wm. Denison. Some years after that I reported on those proposed tramways, and I think about 1860 we commenced a survey. *27 Mar., 1894.*

2010. Who were the surveyors employed under you in marking out the route over the mountains? Mr. Barton had charge of the surveys.

2011. Were there any other surveyors employed? We had a number of other surveyors—many in the Colony now. They were the sappers, and as a rule, I believe the best surveyors I ever had. There was Kennedy, Melrose, Francis, and several others. I do not remember all their names just now.

2012. Can you give us any information in reference to this proposed deviation of the Zigzag? I should be very sorry to say that any deviation is necessary. My own impression is that we could have nothing better than the present Zigzag which, in my opinion, could be used for the next twenty years.

2013. We have before us a proposal to avoid the Zigzag. Will you look at the map? I have looked at all the proposals, but I do not think that a single deviation proposed is as good as the original line, taking the coal into consideration. One I saw was 2 miles of tunnel at a cost of about £250,000. The only improvement on the Zigzag, as far as I can see, is that the incline of the tunnel is 1 in 50, whilst on the Zigzag it is 1 in 42, and I think the Zigzag will work quite as well with 1 in 40 as the line in the tunnel with 1 in 50. There is no doubt that there will be some facility in working. I mean the officials then will have less to do, but beyond that I cannot see that there is the least difficulty in working the Zigzag, which has been in use twenty-four years. I have never heard of any serious accident upon it, and if any accident has happened it has been more from the carelessness of men in working in it than from the Zigzag itself, and it is certainly not a dangerous line.

2014. Your opinion is that there is no necessity whatever to make an alteration? Yes; I think there is no necessity whatever to make an alteration. We were years in making surveys. They were made in many directions. When we got to Dargan's Creek the question simply was whether there should be a zigzag or a tunnel, for there was no possible chance of getting a direct line down the mountains. The termination of Mount Clarence was so precipitous that we could not take a line down, therefore I thought it desirable to have a zigzag instead of a tunnel. The proposal was to have a tunnel about 2 miles in length, and there was no contractor in the Colony who would have undertaken such a work, and the cost would have been very large if it could have been made at all. Another reason was that I could see no means whatever of getting the bricks up the mountains to line the tunnel with. About 10,000,000 bricks would have been required, and if made at Lithgow or anywhere else, I could not see how, by any means whatever, they could have been conveyed to the tunnel. Therefore, there was nothing left for it but the Zigzag, and as that cost about £170,000 in round numbers, and the tunnel, if it could have been made at all, would have cost at least £400,000, I do not see how there can be the slightest objection to my having taken the cheapest line instead of taking the tunnel. Besides, I could see no limit whatever to the time the tunnel might take to make. It might have been four years in hand, and we should have kept the remainder of the line blocked up because the tunnel was not finished. There was no reason why the tunnel should be attempted, and, of course, I did not attempt it.

2015. *Chairman.*] I suppose that an expenditure of £400,000 for a work of that kind at that time would have staggered any Minister for Works? Yes; I do not think I dare have mentioned it to anybody. The Zigzag cost £170,000, and if it be done away with the debt will still remain, and the interest will still have to be paid. The proposal now—a deviation by tunnel—is to cost £250,000, which, at 4 per cent., will be £10,000 a year interest. The total interest would thus be £16,800 a year, with an additional £250,000 expenditure, which, of course, would have to be paid off at some time or other; and I do not see that the tunnel, if made, would make the line much easier to work than it is at present. There certainly is the question of time, but I do not think that can be of such very serious importance. I saw the

J. Whitton,
Esq.
27 Mar., 1894.

the other day an account of a goods train being an hour late in arriving at Mudgee or Bathurst. Supposing goods trains are an hour late, that does not make much difference. It is no reason why £250,000 should be thrown away in making what I look upon as a useless work. Instead of your having the Zigzag, costing £170,000, you would have a total cost of £420,000. If you destroy the line you cannot get rid of the payment that has been made, and added to that would be £250,000, which would make £420,000 instead of £170,000, the present cost. I was certainly startled when I saw in the papers that it was proposed to dispense with the Zigzag, but I was horrified when I saw that we were to do that in order to find work for the unemployed.

2016. *Mr. Hoskins.*] You require a special sort of labour for that? You require skilled men to work in a tunnel—not pick and shovel men.

2017. *Mr. Suttor.*] Your opinion is that there is no necessity to alter the Zigzag at all? That is my distinct impression. There might be a slight alteration of the wings, and the Zigzag could be worked for the next twenty years. That would reduce the labour of the officials, who are, perhaps, a little hard worked, but beyond that there is no occasion whatever to touch the Zigzag. I do not think that they profess to say that there would be anything beyond the saving of time and a little extra trouble in the working.

2018. *Mr. Ewing.*] You made a remark with regard to some alteration of the wings of the Zigzag;—what do you mean? I mean the top wing of the Zigzag might perhaps be lengthened; but I spoke to Mr. Deane about it just now, and he said he did not think it could, but if it cannot be lengthened it is still an easy matter to work the Zigzag. With a long train two engines come out from Lithgow, and there is no reason why, at the bottom points, they should not divide the train, and let the first engine push the first part up the middle line of the Zigzag past the upper points, and then straight on towards Clarence tunnel. The other engine can haul the other part of the train to the top of the wing, and back it up to the first portion of the train. I do not see any difficulty whatever in working the Zigzag. Spare engines are kept for the purpose.

2019. You think that there would be two engines even if you had the tunnel? Yes; most decidedly. I do not think the tunnel would be so easy to work with an incline of 1 in 50 as the Zigzag would be with an incline of 1 in 42. There must be a certain amount of condensation going on in a tunnel, the rails must become slippery, and I do not see how one engine could take a full load up an incline of that sort. But even assuming that the tunnel would be perfectly dry, the only saving by the tunnel would be in the time of running.

2020. That deals with the present, from your point of view? Yes.

2021. You have pronounced a definite opinion that it should be left alone? Yes.

2022. Now, look to the future. If this continues to be the main Western line all the traffic to the west for all time would have to go over an elevation of between 3,000 and 4,000 feet. Have you any knowledge at all as to any other route by which you could cheaply approach the west by better grades? You can only approach the west by better grades by No. 3 line, recommended by Mr. Deane, in the event of another line being required at all.

2023. I am not speaking of this deviation in detail, but of the whole Western line. Is there any way to approach the west except by that line? No.

2024. What of the Colo Valley? I should not like to express an opinion of the Colo Valley. I think there would be something like 24 miles of tunnelling on that line. There is no means of making use of any portion of that railway if it were constructed. I am afraid to say how much it would cost.

2025. You might say too little? I might say too little.

2026. You say it opens up no country? Yes.

2027. And is prohibitively expensive? Yes.

2028. You say that, after going into the surveys and plans and everything connected with it? I do not think that there was anything in the plans to justify me in any action, except in condemning the whole thing as perfectly useless and absurd.

2029. I speak in a limited sense, of course, but you think that there will be no time when a line of easier grades to the west will be found—we shall always have to go over that great mountain, 3,000 and more feet high? Yes; unless you make tunnels. It was suggested at one time to make the whole line a tunnel from Penrith to Mount Victoria, but I never could see the force of it.

2030. You think that even by choosing another locality it is not possible to get a better approach? I am sure it is not.

2031. You believe that for all time the Colony will have to make use of that mountain range? I do.

2032. If you are going to do that for all time it cannot do much injury to cut out the grades? You cannot cut them all out. There are inclines at the present time of 1 in 33 to Mount Victoria, and you cannot cut them out. There are certain grades you must have from Emu Plains to Blackheath.

2033. You believe they will never be cut out? No.

2034. That no lengthening of the road will do it? No. You may go to enormous expenditure in trying to cut them out, but I do not see why you should trouble much about inclines of 1 in 33, when between Emu Plains and Mount Victoria you have the worst incline on the whole of the line. If you work an incline of 1 in 30 I do not see why you should trouble about altering 1 in 33.

2035. You believe that for all time the country will have to have a railway with bad grades as its main artery of traffic to the west? They are comparatively bad grades no doubt, but I do not see any chance of improving them. I do not think you can, at any expense, without making an enormous length of tunnels.

2036. You see it would be quite out of question to spend much on the present line unless it is to be a permanent line, and if it be a permanent line you say that no work to improve it is justifiable, even from a future point of view? It might be, but of course there must be a limit to that. If you go on improving the line you may spend too much in doing so. Grades of 1 in 33 are not bad. There are far heavier grades than that being worked in different places, and I do not see why they should not be worked here.

2037. You prefer to use more engine-power to spending more money in reducing the grades? Yes; more engine-power, or reducing the weight of the trains.

2038. You state distinctly that to consider the Colo Valley at all as a line to the west eventually is out of the question? Perfectly out of the question.

2039. *Mr. Collins.*] Are you aware that £40,000 has been spent on the Lapstone Zigzag? I have heard that.

2040.

2040. And there is a saving of £8,000 a year by spending that? I do not know that I have heard that. J. Whitton, Esq.
2041. We have it from the Works Department that that is the case; and if there were a saving of £1,000 a year after paying interest on the capital of £250,000, would you recommend the deviation should take place? No; certainly not, because you saddle yourself with £250,000 on the Loan Votes, and you cannot get rid of that. If you could show the deviations proposed would not only pay the interest on the money expended in making them, but also pay sufficient to pay off the whole of the capital in a certain time, then there might be some reason for adopting the proposal; but the proposal now, to make a tunnel with inclines of 1 in 50, which might lessen to a small extent the expenses, would not be a justifiable expenditure. 27 Mar., 1894.
2042. You think it would be justifiable if it paid off the capital and interest? It would not be justifiable in this case at all, because I do not think you improve the position in any way.
2043. *Mr. Humphery.*] Have you carefully studied the Railway Commissioners' proposal, and No. 3 alternative route? I do not know that I have carefully studied them. I have seen the Commissioners' proposal of the tunnel and No. 3, Mr. Deane's alternative route, and this, in my opinion will be a far better line than the tunnel.
2044. Would you kindly state your reasons for preferring the No. 3 to No. 1? Well, instead of one long tunnel and an incline of 1 in 50, you have a number of tunnels with perfect ventilation and a better incline, 1 in 60, for working them.
2045. No. 3 line would be double the length of No. 1 line? I daresay it would.
2046. Do you think that the better gradients and short tunnels would neutralise the greater length of the line? I think so; I think it would be a much better line, in fact I do not think the long tunnel would be any advantage at all, and if a deviation had to be made I should say that the No. 3 proposed by Mr. Deane, would be a better line than the tunnel.
2047. You had, I think, about sixteen years or more experience of the Zigzag during the time you occupied the position of Engineer-in-Chief? I was chief engineer the whole time, and it was constructed under my superintendence.
2048. During what period was it worked? From 1869, and I did not leave the Colony till 1889.
2049. So you had twenty years experience of the working of the Lithgow Zigzag? Yes.
2050. Can you say what, during that time, was the cost of accidents which may be considered due entirely to the peculiar nature of that work? I do not know of one. The only accident that I remember occurring during the time I was here was very shortly after the line was opened. An engine was running tender foremost. We had not the Westinghouse brakes in use then. It was assumed, and afterwards proved, that the engine-driver had had more drink than was good for him, and when he got to the top points of the Zigzag he was not able to pull up the train, and it ran into a cutting at the end. The fireman was on the engine, and in trying to sand the wheels of the tender he put his foot outside on the end of the tender, and when the train ran into the rocks at the end of the wing his foot was cut off. That is the only accident I remember there.
2051. During the whole twenty years? Yes. There may have been other accidents, but they never came under my notice if there were any.
2052. In your opinion is there any greater danger to the public in passing over the Lithgow Zigzag than over any other portion of the line with steep gradients between Emu Plains and Bowenfels? No; I do not think so. I do not think there is the slightest danger in working the Zigzag. It makes the officials, perhaps, more careful in working that portion than any other portion of the line, but I do not see that there is the slightest danger in working the Zigzag as it present exists.
2053. You do not think the mere saving of time would be a sufficient advantage to the country to justify an expenditure so large as would be necessary to make the proposed deviation? I do not.
2054. With regard to the estimated saving upon the line, you mentioned that it would be necessary to provide a sinking fund for the lost money spent on the portion of the line to be cut out in the event of the deviation being made, but the Commissioners put it before the Committee in this way. They say there will be a saving of £10,000 a year in the working expenses. The estimated cost of the deviation is £225,000 which, at 4 per cent., would be £9,000, and this, deducted from the £10,000, would leave £1,000 profit, while the earnings on the railway would continue; so the actual profit would be £1,000. Do you take the same view of it? I do not take that view of it at all, for you have £16,800 interest to be taken off.
2055. But the earnings already provide a certain amount of interest: the earnings will not be diminished? But supposing the earnings were £10,000, and you paid £16,800 for interest, I do not see where the saving comes in.
2056. I think you do not take quite the view of it that has been placed before the Committee—it is not a matter of increased earnings, but of lessening of expense to the extent of £10,000 per annum, and after providing 4 per cent. on the cost of the deviation there would be £1,000 left? I think not.
2057. Well, that is the way it is placed before us? I say the tunnel will cost £250,000. In addition to that you must add £170,000 for the line you destroy, and therefore the total cost of the line would be £420,000, and the interest would be £16,800.
2058. But the interest on the portion of line proposed to be destroyed will be paid by the earnings as at present;—the earnings of the line continue, but they propose an additional expenditure of £225,000, and that additional expenditure will lead to a saving of £10,000? I do not quite follow that. If you assume—which I do not quite see myself—that they would save £10,000 by taking out the present Zigzag you cannot get rid of the fact that you would have to pay £6,800 interest for the line you destroy, and £10,000 interest for the line you create. That makes £16,800 altogether, which you would have to pay for interest alone, besides saddling the Colony with a debt of £250,000.
2059. *Chairman.*] You get £8,000 from traffic and £10,000 from savings on working expenses? That would be all it would be. You would still have the cost of the tunnel, £250,000.
2060. *Mr. Wall.*] Are we to assume that if the Commissioners spend £10,000 and earn £11,000 they are losing money? If they make £1,000 of course they make £1,000.
2061. *Mr. Humphery.*] This is Mr. Barling's evidence on page 1:—

They estimated the whole cost of the work at about £225,000, which at 4 per cent. would mean an annual cost of £9,000; but they estimated that in addition to the great facility to the working, and the avoidance of the continual risk which now takes place, the expenses would be reduced by about £10,000 per annum, so that as a commercial investment the money would be well spent.

That

- J. Whitton, Esq.
27 Mar., 1894.
- That is a statement of an estimate, and estimates can be made somewhat elastic if you try to make them fit your own case. I do not say they have done that, but I say that can be done. The fact is that you spend £420,000, and in my opinion you do not get a much better line than you have now with the expenditure of £170,000, therefore I do not think it would be worth while to throw away £250,000.
2062. Do you differ from the witnesses who have stated that there will be a saving of £10,000 on the expenses? I have not gone into the question of savings at all.
2063. Well, assuming that there will be a saving of £10,000 on the working expenses, and that £9,000 would have to be provided for interest on the cost of constructing the deviation, there would be left a profit of £1,000 on the whole work; there is a difference of opinion as to whether there will or will not be a profit of £1,000, and it is as well to make that matter clear if possible; the present line has cost £170,000, and the working expenses you may assume at present are £10,000 greater than they will be if the deviation is made, and if there is £10,000 saved, does it not appear to you that there will be an actual surplus of £1,000 after providing interest on the outlay? That is on the assumption; but supposing the outlay to be £250,000—which I have not the slightest doubt it will be, and probably more than that—you still have to provide interest, if you construct the line, to the amount of £16,800. If you had no expenditure beyond the present Zigzag, and could save £10,000 in working no doubt there would be a profit beyond the interest, but I do not see how the profit would come in if you take into consideration the cost of the tunnel at £250,000.
2064. *Mr. O'Sullivan.*] Has the proposal to take the line from Mount Victoria to Eskbank or Bowenfels been brought under your notice? I have heard of it, but it has not been brought particularly under my notice. Originally surveys were made down Mount York, in the same position as this surveyed by Mr. Rock. We intended to go to Hartley, but when we got to the Cox River we found that we should have a tunnel 2 miles in length, from the Cox to Bowenfels—the direction we were thinking of taking the line at that time.
2065. You did not make a very exhaustive survey of the country at that time? At that time we thought it was an exhaustive survey, but I did not like the idea of going down Mount York. We had to go round twice to get into Hartley Valley.
2066. Assuming that the line could be taken in the direction Mr. Rock states, from Mount Victoria to Bowenfels, and save $5\frac{1}{2}$ miles distance between Bowenfels and Mount Victoria, do you think it would be worth the while of the State to consider the advisability of carrying out that line? No, indeed I do not. You would then be destroying the whole of the line from Mount Victoria to Lithgow. Whatever might be the value of that line it certainly would not be worth while to adopt it now. But I have not gone into it at all, and do not care to pronounce an opinion about it.
2067. I gather from your evidence that you prefer to see the Zigzag remain as it is? Decidedly, unless a very much better line in some direction at very much less expenditure can be found.
2068. Twenty-four years' experience has shown this to be by no means a dangerous line, and you think it can be worked as easily as a 1 in 50 grade tunnel? I think so.
2069. Mr. Foxlee, the Commissioners' engineer, tells us that a 1 in 60 grade would be of no advantage, because there is a 1 in 50 grade between the end of Mr. Deane's line and Bell? Well, I think we may say that if 1 in 60 would be no advantage over 1 in 50; then 1 in 50 would be of very little advantage over 1 in 42. Therefore, I do not see the use of having a tunnel, even in that light.
2070. I gather from your evidence that the cost of the old Zigzag—£170,000—and the cost of the proposed work would total £420,000? Yes.
2071. And there would be interest to pay on that amounting to £16,800? Yes.
2072. The Commissioners say they could save £10,167 per annum—can you conceive of any other profit that would cover the extra £6,800? No. Besides that, some one appears to lose sight of the fact that you are saddling the Colony with £250,000 debt, which must be paid. You do not get rid of a capital account by paying the interest, and the capital has to be provided at some time or other. Therefore, if the line will only pay interest, I do not see the use of making a deviation of that kind.
2073. We are told they can guarantee £10,167 in lesser working expenses:—that would still leave £6,800 interest lying dormant to be covered? Certainly.
2074. Therefore, instead of there being a commercial profit, there would be a commercial loss? No doubt.
2075. I should like to know if there is any other source from which the Commissioners could possibly get the amount of that interest lying idle? I do not think so.
2076. There will be no difference at all in the traffic through the tunnel from what there is now across the Zigzag? No.
2077. Where is any extra traffic to come from? From nowhere that I can see; besides, it is not only the interest you have to provide for; you have the capital to pay off some time or other. You borrow money and pay the interest, but surely at some time or other you expect to refund the capital.
2078. Then, from the standpoint of traffic, so far as you can see, there can be no £6,800 forthcoming to cover that interest? No; because I cannot see how, by making that tunnel, you increase the traffic at all in any shape. You are, in fact, at a loss of £250,000, and why money should be borrowed simply to pay interest on that, I cannot possibly see.
2079. From your experience of the working of the Zigzag, do you think that the traffic can be taken as safely and as expeditiously over that as it could be through the proposed tunnel? I would not say as expeditiously, but certainly as safely as anywhere else. There is a little time longer in working the Zigzag on account of extra length and shunting, but it is as safe as any other part of the line.
2080. How much time do you think would be saved? I cannot say. I think the traffic manager said the other day sixty minutes in one instance.
2081. There are other zigzags in the world, I believe? I think there are, but not many.
2082. Is there not one in India? It is hardly a zigzag in India. The engine and train are run into a dead end siding, and the engine taken over a loop to the rear of the train. That is on the Great Indian Peninsula.
2083. Was your design an original one? I had never seen one at the time this was made.
2084. The one in India has been working successfully many years? Yes.
2085. But it is not so long as this one? You come down to a point, and, instead of backing the engine, you take the engine from the front to the back; that is the only difference.
2086. Has any attempt been made to alter that Zigzag? I have never heard of any; but I do not say that there has not been.
- 2087.

2087. You know that on some of the American lines out west, especially some of the lines going towards California, some very difficult mountain engineering work has been done? Yes. J. Whitton,
Esq.
27 Mar., 1894.
2088. All those are working successfully, are they not? So far as I know, they are. I have never heard of any trouble about them; but I do not see how anyone can suppose there can be any danger in working the Zigzag. You are more careful in working that part of the line than any other, and I do not see how any accident can happen upon it except from carelessness. Proof of that is that it has been worked twenty-four years without serious accident, and I have no doubt that any accidents that have occurred have been occasioned by carelessness on the part of those working the line.
2089. *Mr. Davies.*] How many years were you connected with the Construction Department as Engineer-in-Chief? Thirty-three years.
2090. How many miles of railways were constructed in the Colony during your term of office? A little over 2,000 miles.
2091. And included in those 2,000 the Zigzag was a portion of the lines constructed under your supervision? Yes.
2092. Before you entered upon the construction of the Zigzag, I presume you had surveyors out and explored the whole of the country as to the most desirable route that could be obtained? Yes; I think surveyors were out five or six years.
2093. You had a number of flying and trial surveys made? Yes; everywhere. Wherever a line was suggested at all likely to make a good line to Bathurst we always surveyed it.
2094. Then you were thoroughly familiar with the whole of the country near, and some distance from, the present Zigzag? Yes; I thought so, at all events.
2095. Since the construction of the Zigzag have you heard or do you know of any better route than that which has been adopted by the Department? No; I do not.
2096. You do not know a better route at the present time? No; I do not.
2097. Do you think it possible that any better route could be found than the one along which you constructed the Zigzag? I do not think so. I know of no better route. Of course, you may make another line at considerably increased cost, but I do not believe that any line to the west could have been made at a cheaper rate or better than the present Zigzag.
2098. The works are of a permanent character? Yes; all of them.
2099. Do you remember the cost of the line from Lapstone Hill right through to Eskbank? No; I could not tell you the cost of the line.
2100. Have you been over the first Zigzag since the tunnel was constructed? I went through the tunnel the other day.
2101. The line alongside that tunnel has a very steep grade, has it not? The line up to where the tunnel is put in is 1 in 30. Through the tunnel there is, I believe, a grade of 1 in 33.
2102. Do you regard an alteration in that respect as of great commercial advantage in the working of our railways? It is of some advantage, no doubt, for the wings of the Zigzag were very short.
2103. That was the only difficulty in working the goods traffic? Yes; but I think that in constructing the tunnel, a mistake was made in not making it for a double line. When the lines were first proposed, a tunnel was shown on the original drawings, and I intended to carry it out, but we were so short of money that I could not do it, and I put in the Zigzag to reduce the cost.
2104. The principle that guided you in the construction of the mountain line was one of funds? I was to get a direct line if possible to Bathurst at the cheapest possible cost, no matter how made. I made one of the best permanent ways in the world for it, and the savings were effected by putting in sharp curves and steep inclines. I do not think that all those inclines could be improved even at considerable cost.
2105. Coming now to the schemes which have been submitted to the Committee, you have seen the plans Nos. 1, 2, and 3? I have.
2106. You have seen the plans showing the Commissioners' proposal to cut out that portion of the Zigzag at Dargan's Creek, and avoiding the Clarence tunnel? Yes.
2107. And constructing a tunnel of $1\frac{1}{2}$ miles in length out of a piece of line a little over $2\frac{1}{2}$ miles long, the main portion of the deviation being a tunnel? Yes; that is the Commissioners' scheme for getting rid of the Zigzag.
2108. They propose to start at the mouth of the tunnel with something like 1 in 42? That is, I think a portion of the present line, below the bottom points near Lithgow. There is an incline of 1 in 42 there.
2109. And a grade of 1 in 50 through the tunnel? Yes.
2110. Do you, as an engineer having had charge of the construction of most of our railways, think that a deviation of that kind would be a wise one to make? I certainly do not.
2111. Apart from the cost? Apart from the cost. I would not make any alteration in any line to alter the grade from 1 in 40 to 1 in 50. To spend £250,000 in merely improving an incline from 1 in 40 to 1 in 50 is not justifiable.
2112. During the time you had the construction of our railways, you advocated open lines as far as it was possible to obtain them? Yes; tunnels were only constructed where you saved money by doing so.
2113. They were only adopted by you in any case where you could scarcely avoid it? Yes; except where it made the line cheaper altogether.
2114. You are entirely opposed to No. 1 scheme as a deviation to give a better grade to the mountain line? I think it is very undesirable to make a tunnel line at all.
2115. More particularly when a long tunnel is proposed in a short deviation? Certainly.
2116. You had twenty years' experience after the construction of this line over the mountains, and during that long term of office you do not remember any serious accident arising from the working of the Zigzag with the mountain trains? No, I do not; but I remember an immense number of people coming from all parts of the world to look at the Zigzag, and it was considered as fine a piece of engineering work as had ever been constructed—certainly the finest in the Southern Hemisphere.
2117. So far as the commercial working of the traffic is concerned, you are not aware of a great amount of money being paid as compensation to persons injured by accidents? I do not remember any at all. The only man injured was an unfortunate fireman, and he, being in the Department, was, no doubt, compensated.
2118. Taking the mountain road and a corresponding length of line on any other portion of our railway system, would it compare favourably as regards the absence of accidents or damage to rolling stock with the

- J. Whitton,
Esq.
27 Mar., 1894.
- the Southern or Northern line? There are portions of the line on which we have never had an accident. There are other portions of the line that have cost thousands of pounds, not from working anything like the Zigzag, but from broken rails, axles, or tyres. You may have accidents of that kind anywhere.
2119. Taking the same length of line, any other portion of our railway system would be liable to the same accidents as on the mountains? I think so.
2120. And returns of twenty years show that the mountain traffic has almost been free from accidents? I think it is very safe indeed.
2121. You never have, and you do not at present regard it as necessary to spend £250,000 to make this deviation? I do not. I should regard it as a great waste of public money.
2122. The Commissioners represent that they will save in the cost of train mileage so many thousand pounds a year on the traffic—in fact, about £10,000—by dispensing with additional motive-power; that by getting an easier grade or a tunnel they will be able to dispense with two push-up engines, and use one instead of three. They represent the train mileage at 4s. 7½d. per mile, and suppose they will, in the working of the line, effect a saving of something like £10,000 a year, and that the results of their traffic will be as it is now, so that the savings and the amount of money that is earned at the present time would make £17,000 or £18,000 a year on this portion of the line;—did you understand, when Mr. Humphery put a question to you, that, taking the savings and earnings together, they would make £17,000 or £18,000 a year? I do not know that I did thoroughly understand that.
2123. Well that is the way it is put before us by the Commissioners, but if they did that the capital cost of the Great Western line would be increased by the expenditure of this proposed deviation, and we would have to pay that? Yes.
2124. So we could not escape from the capital cost of this proposed deviation; that is, if the deviation cost £250,000 that would be added to the original capital cost of the line? Yes; and I cannot see myself where the savings come in.
2125. At what would you estimate the savings on train mileage? I think 4s. 7½d. is too high a rate of savings that would be effected over that line. I do not think it matters much about shortening the line. There might be a saving in running to some extent, but not, I think, to the extent named.
2126. You think an estimate of 4s. 7½d. rather a high rate of saving per train mile? I think so. I should like to see the details, and I do not think you could make out such a saving for ordinary running. The engines are there in steam, and if they have not employment enough in running they are employed in shunting.
2127. The only advantage you can see of this deviation will be a little saving of time? Yes.
2128. So far as safety and the working of the line are concerned it would be of no great advantage in your opinion? I do not think it would.
2129. If the Committee want an expression of your opinion in reference to Mr. Deane's suggested deviation of the two schemes you prefer that if we are to have a deviation? I should prefer that, if you are to have a deviation at all; but I do not think that the expenditure on that line is at all justifiable at present. If you had a larger goods and passenger traffic you might perhaps have a deviation, but if you had it should be a deviation having more distinct advantages, and not one that merely provides for a grade of 1 in 50 instead of 1 in 42.
2130. But if there is to be a deviation you prefer Mr. Deane's scheme to the other? Yes, so far as we know at present. So far as the two schemes before the Committee are concerned, I think that Mr. Deane's scheme is the better, if a deviation is to be made at all.
2131. But you still hold the opinion that the present line is sufficient for all purposes for years to come? I think so.
2132. Quite able to serve the traffic we have at the present time, and shall have for many years to come? I have no doubt at all about it.
2133. *Mr. Hoskins.*] It has been stated in evidence by the Secretary for Railways that in estimating any savings that they might make in working the railway by dispensing with a portion of it, and having another portion in lieu of that, the Commissioners do not take as a set-off against any estimated savings the interest on the money expended on the road disused;—do you think that is a fair way to calculate? Certainly not. The interest on the £170,000 for the Zigzag is £6,800, which must be paid whether you destroy it or not.
2134. Therefore that legitimately ought to be made a set-off against any estimated savings on the other line? No doubt it should.
2135. At the time you took charge of the lines, when it was determined to make a railway to Bathurst over the Blue Mountains, were you not instructed by the Minister, and was not an opinion expressed by the Legislative Assembly frequently that you were to make a line, even although there might be steep grades and sharp curves, as cheaply as possible consistently with having a safe line to work over? Certainly.
2136. Therefore I take it that if there had been a larger amount of money placed at your disposal by Parliament to make a line to Bathurst, you would have had easier grades, and would have dispensed with a good many of the sharp curves? No doubt; but there must, at all events, have been steep gradients on the line, in consequence of the elevation from Emu Plains to Blackheath, but some of the grades might have been somewhat eased.
2137. A good deal has been said before the Committee and in the community about the steep gradients on this line—1 in 30, 1 in 33, 1 in 36, and so on;—are you not aware that even in England, where the population served by the railways is estimated to be 2,000 persons to the running mile as against 400 persons to 1 mile here, there are a number of steep gradients, as steep as there are here? On some of the lines in England gradients were years ago steeper. There are only two inclines of 1 in 30 in this Colony, one on the Western line and one on the Southern. There are a good many miles of 1 in 33.
2138. Is it not a fact that in England, with the great advantages they have there of the large amount of realised wealth to be invested in any enterprise likely to yield good interest, owing to the character of the country generally, there are many lines as steep as 1 in 30 or 1 in 36? I know there were such lines, but I do not know whether they have been altered or not. On the original line to Oldham there was a grade of 1 in 27, and on the line between Bristol and Birmingham there was a grade of 1 in 37 worked for a number of years, and I am not sure that it is not worked now.

2139. Are you aware that on the Western and North-western lines, running to South and North Wales, there are steep inclines? There were steep inclines, but I should not like to say that they are there now, because they may have been altered.

2140. However, grades of 1 in 33, 1 in 36, and 1 in 42 are not uncommon in many other parts of the world besides New South Wales? I do not think they are uncommon, but I do not remember at the present moment any of the lines you allude to as having inclines of that kind, and I should not like to say unless I was positive that it was so.

2141. During the progress of the sittings of the Committee I called upon the Commissioners, through the Secretary, who was examined, for a return of the number of accidents that had taken place on the Lithgow Zigzag, the number of persons injured, the nature of the injuries, the amount of compensation paid to the persons injured, the injury caused to the rolling-stock, and the amount that was expended in placing the rolling-stock in as good a condition as it was before it was injured, and this return is given in the Secretary's evidence; but he stated that they could only give a return for five years, that is, since the Commissioners have had charge of the railways—and that during those five years the amount of money spent by the Railway Department in the repair of rolling-stock and paying compensation to persons injured, and for damage to goods, and so forth, amounted only to £1,630 19s. 5d.;—is that anything extraordinary, considering these steep grades and the amount of traffic for five years? I think not, and if you take into consideration that it is not the fault of the Zigzag, but some mishap on the part of the officials.

2142. You know as a matter of fact that before you gave up the charge of the railways there were very few accidents on the Zigzag? Very few indeed.

2143. And never any serious ones? I do not think so.

2144. I find this in the record of accidents—that on the 13th April, 1892:—

Double-train backed into dead-end top points; the rear engine stopped suddenly whilst other engine was giving steam; trucks buffer-locked and derailed.

Was it not gross carelessness on the part of the men driving the rear engine to give steam when the other engine had stopped? Yes; it was the cause of the accident, no doubt.

2145. Is it right to characterise such accidents as incidental to the working of the Zigzag? Certainly not.

2146. That might happen anywhere else? Yes.

2147. A push-up engine is used from Emu Plains to Katoomba? From Emu Plains to the first station. They ascend up an incline of 1 in 30.

2148. We have it in evidence that there are push-up engines used all the way to Katoomba? There might be the same accidents as on the Zigzag, if the same carelessness were exhibited.

2149. The other two accidents were of the same character. If instructions are given to engine-drivers, as I believe they are, not to go down the Zigzag faster than 10 miles an hour with a train, do you think, if those instructions are carried out, and Westinghouse or other continuous brakes are used, there is greater danger, or even as great danger, in descending a grade of 1 in 42 as in passing over some of the long inclines with grades of 1 in 33? Certainly not. There is no chance of accident in descending those grades at a speed of 10 miles, or even greater speed, with a Westinghouse brake, for you can check the speed at any time if necessary.

2150. An accident might occur through engine-drivers not carrying out their instructions, but with a speed of 10 miles an hour the chance of accidents would be very remote? Yes.

2151. Do you think, from your long experience, that there would be as great a chance of accident in descending the incline from Mittagong to Picton as on the Zigzag? Far more chance.

2152. And as great a probability of accident in descending the long incline down to Peat's Ferry bridge? No doubt. That is a steep incline, and would be a dangerous part of the road if the engine-drivers were careless.

2153. If proper care is exercised you do not consider there is any great danger in going down the Zigzag? I do not.

2154. From the evidence you have given I gather that there were few accidents on the Zigzag before you resigned the general supervision of the railways of the Colony, and during that time our rolling-stock was not fitted with Westinghouse brakes? No; I introduced the Westinghouse brakes, in the Colonies.

2155. Therefore, there are still greater opportunities of preventing accidents now in taking trains down the Zigzag, seeing we have continuous brakes attached to our trains, than there were in the early working of the line at that place, when there were scarcely any accidents? Yes; and on any parts of the line the Westinghouse or some other good brake is a necessity in working any of the steep grades.

2156. All the passenger and stock trains have Westinghouse brakes and the goods trains are being rapidly fitted with them as well. Would the fact of having these brakes fitted to almost all our railway stock ensure a reasonable and fair immunity from accidents on the Zigzag, consistent with the dangers incidental to railway traffic everywhere? Yes, no doubt. Of course the Westinghouse, or some other good brake, is a necessity in working all steep inclines; in fact, all lines, whether steep or not, require a good brake of some kind or other. At that time we were working all trains without any such brakes.

2157. It has been stated in evidence that they have Baldwin and other goods engines so powerful that they take thirty loaded trucks up the Zigzag;—is not that a fair-sized train? I should think it was. I saw the other day that they said an engine did not take its full limit up the Zigzag; it only took thirty trucks, and they said the limit was thirty-three; therefore, it took very nearly its full limit up the Zigzag.

2158. Would not thirty trucks be considered a very fair load for an engine to take up any incline? Yes; but you want to know the number of tons taken up.

2159. But thirty trucks, laden with 6 tons of coal, would be a pretty good load? Yes.

2160. *Mr. McCourt.*] For some years after the construction of the Western line, do you remember the number of trucks the engines used to take up the mountains? I think they took ten trucks each.

2161. Do you remember ordering that they should take twelve? I think I did, and I think the engine-drivers did take twelve.

2162. You are aware that the improved engines which we have now take up thirty loaded trucks? No, I am not aware.

2163. Having larger and stronger engines, does that not materially cheapen the traffic on the mountains? It should do so, no doubt; but I have my own doubts about the new engines taking thirty trucks up.

2164.

J. Whitton,
Esq.
27 Mar., 1894.

- J. Whitton, Esq.
27 Mar., 1894.
2164. Well, if they do not take thirty trucks, they take up double what the old engines used to take? While they take more, they are double the weight.
2165. And would not that cheapen the traffic on the mountains? No doubt.
2166. Supposing that during the next ten years engines will take forty or fifty trucks? Well, there is a limit to the weight of an engine. If you increase the weight of engines, you must increase your permanent way and bridges. Therefore, there is a limit to what engines ought to take, and I do not think it is always desirable to get the heavier engines, for they do more injury to the permanent way, and to the bridges, and to themselves. But there is a certain weight you must have to take loads profitably.
2167. But, on account of the heavier engines, the mountain is not such a bar to traffic as it used to be? A heavier engine can, of course, take more goods than a smaller engine. The load taken depends on the weight and steam power. You cannot get a light engine to take the same weight as a heavy one.
2168. That would not be possible? No; I do not think so.
2169. *Mr. Wall.*] In the working expenses of a line, is any allowance made for the cost of replacing the line at any time? No. You mean, I suppose, a sinking fund to replace the line. The repairing of the permanent way and all things connected with it are paid for yearly out of the railway revenue.
2170. So the annual expenditure on the permanent way covers the cost of replacing? Yes; I do not know that it always does, but it ought to do.
2171. So if a line were constructed and continued to work until the end of time, the depreciation by wear and tear on the line would be compensated for by the annual expenditure on the permanent way? Yes; and the same with the rolling-stock. It is always repaired out of revenue.
2172. That being the case, there would be no necessity for the establishment of a sinking fund? No.
2173. You stated, I think, that there was a limit to the age of a line? I do not know that I said that.
2174. I inferred that it could not last for ever, and that the £250,000 cost of the line would at some period become a charge? No; I said that if you borrowed capital to construct a railway you not only had the interest to pay but the capital to refund at some time or other.
2175. The interest on the present line is now being deducted from the Commissioners' accounts, and the construction of a new line, costing (say) £9,000 per annum, and turning in £10,000 per annum, must necessarily effect a saving of £1,000 a year, must it not? I was not aware the Commissioners were paying interest on the loan account.
2176. In their account of the working expenses of the line they include interest on the cost of construction, and it is deducted in their account from the annual earnings;—I am only speaking of figures they have given to us? I have not seen the figures.
2177. The figures submitted to us are to this effect—that the annual interest on the capital required would be £9,000, and the return would be £10,000, leaving a profit of £1,000 per annum? Yes; but then you have got to do what I wish to point out. You must pay the interest, and you have the debt also to repay at some time or other, and that £1,000 will go a very small way towards that.
- 2178-9. Having had charge of the construction of lines in this Colony for many years, I should like to ask you whether you would, in the capacity of Engineer-in-Chief, think yourself justified in recommending the construction of a line that conferred no advantages excepting the earning of £1,000 a year—that opened up no new country, or made no new connection—would you feel justified in recommending the expenditure of £250,000 for a deviation that would simply turn in £1,000 a year?
2180. *Chairman.*] You spoke in no measured terms, condemning the Colo Valley proposal;—had you a proposal from Blacktown to Blayney—I think Mr. Gipps' line—did you give some consideration to that while you were in office? Yes; I made a report on it. My impression of that line and Mr. Gipps' impression appear to be very different. I have an impression that I reported differently from what he stated to the Committee the other day.
2181. Comparing the two proposals, namely, *via* Colo Valley, to join the main line at Dubbo, and Mr. Gipps' scheme from Blacktown, to join the main line at Blayney—do you think either of them were feasible or worth considering? I do not think so.
2182. You would put those both in the same class, as being visionary? I think I did. I think I did not speak so favourably of Mr. Gipps' proposal as he spoke of it himself here the other day.
2183. *Mr. Dawson.*] You say there would be 24 miles of tunnel in the Colo Valley line;—would that make much difference if the line were used for goods only? Well, I think you should look at the expense of tunnelling. But 24 miles of tunnelling is quite sufficient to condemn any line.
2184. You object to it on the ground of expense? I do not think it practicable; and even if it were so, it would open up no new country, or be in any way a substitute for the Western line.

MONDAY,

Note (on revision):—I beg to furnish the following statement as to the grades:—The following is an extract from the proceedings of the Institution of Civil Engineers, April 6th, 1856:—Mr. Hawksshaw, V.P., was anxious to correct a statement which might have the effect of misleading those who were unacquainted with the railway system of this country. It had been asserted that the Lickey and the Dainton were the only inclines worthy of notice. There were a great number of inclines on the English and Scotch lines, and they were increasing every year, for railways were continually in course of construction through hilly districts which were formerly regarded as impracticable. Even before the construction of the South Devon line there were numerous inclines which were worked with a large passenger traffic. Halifax, for instance, had an incline of 1 in 44, and thirteen years ago (in 1843) twenty-two passenger trains, together with heavy goods trains, were daily, without difficulty, conveyed over it. The change in the views of the engineers on this subject has been very great. . . . Steep inclines were, therefore, no novelty in railway engineering nor were the performances cited greater than those which had been accomplished for years past in this country. The gradients mentioned by Mr. (now Sir John) Hawksshaw are:—

Dainton	1 in 45	Halifax	1 in 44
Lickey	1 in 37	Hunts Bank	1 in 49
Oldham	1 in 27	Bradford	1 in 50
Leeds	1 in 50		

In the proceedings of the Institution of Civil Engineers, January 16th, 1877, vol. 48, p. 43, a table of the gradients of the Great Western Railway is given. They include the following:—

Steeper than 1 in 40	Miles.
1 in 40 and steeper than 1 in 45	6.0
1 in 45 " " " 1 in 50	13.3
1 in 50 " " " 1 in 60	25.9
1 in 60 " " " 1 in 70	60.9
1 in 70 " " " 1 in 80	85.6
	72.7, &c.

MONDAY, 2 APRIL, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.	WILLIAM CHANDOS WALL, Esq.
The Hon. JAMES HOSKINS.	WILLIAM McCOURT, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	JOHN CASH NEILD, Esq.
The Hon. JOHN DAVIES, C.M.G.	EDWARD WILLIAM O'SULLIVAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	CHARLES COLLINS, Esq.
THOMAS THOMSON EWING, Esq.	HENRY DAWSON, Esq.

The Committee further considered the proposed Deviation to avoid the Lithgow Zigzag.

William Theodore Foxlee, M. Inst. C.E., Engineer-in-Chief for Existing Lines, Department of Railways, sworn, and further examined:—

2185. *Chairman.*] When you were last before the Committee, you anticipated that within ten days you would have sufficient evidence at your command to be able to express an opinion as to whether the further deviations which you were surveying were beneficial or otherwise, as compared with No. 1 scheme; are you in possession of that information? I can give you in a general way the result of our investigation. The alternative scheme commences at the 85th mile post, on the western side of Bell station, takes a route along the northern side of the existing line passes through two tunnels and then down Farmer's Creek, and rejoins the existing line near Eskbank. The length of the line would be a little over 8 miles, and the ruling grade will be 1 in 60. The two tunnels will be about 1,600 yards long and 682 yards long respectively; and the estimated cost of a double line throughout is approximately £250,000. It was only this morning that I received the approximate plan and section, and I have since hurriedly put some figures together in order to make an approximate estimate of the cost. The Commissioners have not yet had time to look into the scheme; but they will do so no doubt, and inform the Committee of the saving which they anticipate will be effected if the deviation were carried out.

2186. What is the distance between the point where you leave the line and the point where you rejoin it? Along the existing line, about 9 miles.

2187. You save 1 mile? The saving would be about 1 mile, 10 chains on the existing route.

2188. Is 1 in 60 the tunnel grade as well as the ruling grade? Yes; I have no doubt in my mind that the scheme is perfectly feasible and that it can be done for the amount I have named.

2189. That cuts out the grade of 1 in 42 on the Lower Zigzag? Yes, and the 1 in 50 from Dargan's Creek to Bell, and 1 in 33 from Dargan's Creek to Clarence siding.

2190. Are there not any very important watercourses to cross during the length of 8 miles? The most important one that we shall have to deal with is Farmer's Creek, near Eskbank. There will be some heavy work there, but I consider that in the estimate of £250,000 ample provision has been made for the watercourses. Although the ground adjacent to the creek is somewhat rugged, there is not a large quantity of water passing down it.

2191. Will you interfere to any great extent with private properties, such as collieries or anything like that? No.

2192. Unless you make a very great diversion to the north of your line, so as to get your distance, I do not see how you are going to cross the present 1 in 42 grade on the level? It starts sufficiently far back to cross the existing line about on the level at the 93rd mile post.

2193. You are gradually ascending on a grade of 1 in 60 upon a portion of what is now a grade of 1 in 50? Yes.

2194. Where would you cross the line? About the 93rd mile post. Care has been taken to avoid any interference with any colliery sidings or workings.

2195. Do you think you have allowed sufficient for 8 miles of new line with 2,282 yards of double tunnel? I am sure I have. I have also added a percentage for contingencies. I know the estimate is sufficient.

2196. It is only a little over £25,000 more than the cost of your No. 1 scheme? No; that line we estimated to cost £213,245.

2197. I thought you had a certain amount for contingencies? That is included in the sum. I should mention that a large portion of the line at the Bell end will be very light indeed—practically a surface line. There is a ridge which will be pierced with a main tunnel near the trigonometrical station, and having passed through the ridge the line will be very light indeed until it reaches the main line at the 85th mile post near Bell. That accounts for what may appear to be a low estimate, taking the total length of the line. The heavy work lies between the trigonometrical station and Eskbank; until you get to the trigonometrical station, there is very little work. The deviation has also the advantage of cutting out a number of 8 and 10 chain curves.

2198. What is your sharpest curve? Fifteen chains radius.

2199. It will cut out a lot of 8 and 10 chain curves which you consider very objectionable? Yes.

2200. With this information before you—rather startling information, I should think—are you prepared to express an opinion as to whether it is desirable to adopt this route at a cost of £250,000, with all the advantages you have mentioned, in preference to the No. 1 route at a cost of £213,000? Personally, I am still of opinion that No. 1 scheme is the best; but the traffic officers are going into the question of the saving which would be effected by this alternative route, and no doubt the result of their investigation will be known shortly. I am still strongly of opinion the No. 1 scheme will turn out the best.

2201. But if with No. 1 scheme you still have the objectionable grade of 1 in 42 at the bottom points, and a grade of 1 in 50 between Dargan's Creek and Bell, and also an extreme length of tunnel, as tunnels go in this country, do you think that the advantages to be derived from the line which you have described to us will more than counterbalance the disadvantages connected with that scheme? That is my opinion. Of course the great advantage which we have in the No. 1 route is that is the shortest possible route. That tells by reducing train mileage. There we save 2 miles 71 chains upon the existing route; here we save 1 mile 10 chains only. That is where it comes in, and I should not be in the least surprised to find that after all you will consider No. 1 route to be the best. We shall see when the traffic officers have gone into this alternative scheme, the plans of which, as I have just said, have only just come up this morning.

W. T.
Foxlee, Esq.,
M.I.C.E.
2 April, 1894.

W. T.
Foxlee, Esq.,
M.I.C.E.
2 April, 1894.

2202. Just at present your view is that because No. 1 scheme is so much shorter it is the best, but when the Commissioners have inquired into the scheme from the traffic point of view it may be desirable to take the last surveyed line? It may be; I cannot say definitely.

2203. Do you hand in a detailed estimate of your No. 1 scheme? Yes. (*Vide Appendix.*)

2204. You were asked on a former occasion to acquaint yourself with the details of Mr. Deane's scheme, with a view to giving the Committee your opinion on the scheme;—you have been furnished with the details which you required? I received the plans on Saturday morning. I should explain that quite unexpectedly I had to go with the Commissioners on their western tour to Bourke last week. I did not get back until the end of the week; but your secretary was good enough to let me have the plans on Saturday morning, with the details of Mr. Deane's scheme. I am sorry that I have not been able to go over the ground; but still I am, I think, in a position to make some remarks upon his scheme. I want the Committee to understand that what I am going to say is in the most friendly spirit towards Mr. Deane. I am going to give my opinion upon the figures which have been put before me. I think his estimate is rather low. Take first of all his earthwork. I think I am right in saying that to compare like with like, his formation for a double line has been taken in cutting at 26 feet; ours has been taken at 28 feet; that should add £2,600 to his estimate. Then his tunnel is put down at £53 16s. per yard; ours is put down at £58; that will make a difference of £6,994. Then I do not see any item in his estimate for sanctuaries or recesses in the sides of the tunnel. These, put down at the figure at which they are included in my estimate—which is practically the same as Mr. Deane's—will be £616. Then there is no allowance for tunnel fronts in his scheme. That, in my estimate—I have estimated them, I think, as cheaply as they can be built in concrete, and there are a good many of them—will amount to £2,800 in his scheme. Then he has not included anything for signals. I have allowed £500 for signals at Dargan's Creek. Altogether making an addition of £13,510; and adding 5 per cent. for contingencies to the whole amount, which I have done in my own estimate, would bring his estimate up to £192,602. Of course I have not been over the ground, and I cannot speak quite definitely; but in addition to that some provision must be made for crossing the deep gullies—60 feet, 65 feet, 110 feet, and 85 feet below such level—by providing waterways, either in the shape of culverts or viaducts. We have all of us in our recollection, I am sure, the terrible accident which occurred at Bell three or four years ago, through the slipping away of the embankment. The accident was caused by the embankment becoming saturated. The gully crossed was a comparatively small one—and the bank could not be more than 25 or 30 feet deep—yet the whole line slipped away. I think it will be quite evident to the Committee that in the case of the gullies I have indicated on the plan, some provision will have to be made for passing the water under the embankments. The sum of £4,026 for culverts and box drains seems extremely small. A culvert of moderate size in one of these embankments would cost that money. I should have thought that £14,000 would be nearer the mark than £4,000 for these works.*

2205. As you have not been over the ground, perhaps I may state that these gullies have very little watershed area? That may be. The bank at Bell had very little watershed area—not much more than twenty times the size of this room—yet it melted away and allowed the train to roll down and kill one or two people.

2206. Do you find that in Mr. Deane's estimate there is no provision made for that? I find that there is a sum of £4,036, which I do not think anything like sufficient. Of course, I may be wrong, but looking at that section it does not look enough. Making these additions, and allowing 5 per cent. for contingencies, I bring his estimate, as I have just stated, up to £192,602, without adding anything to the item for culverts or viaducts.

2207. It really comes to this: that Mr. Deane's scheme will cost practically the same as No. 1 scheme proposed by the Railway Commissioners? I have very little doubt in my mind about that.

2208. Have you any other points to mention? I have not any other points to which I would wish to direct the attention of the Committee.

2209. In addition, of course, to the cost being somewhat similar to the cost of your own No. 1 scheme, there is the additional length of line? There is a considerably additional length of double line to be maintained.

2210. *Mr. Humphrey.*] Have you estimated how long it will take to complete this new deviation? It could not possibly be done under two years.

2211. In the same period which would be occupied in carrying out your No. 1 scheme? Yes. Although the main tunnel is somewhat shorter the line is longer; therefore, I think it would not be safe to say it would be constructed in less than two years.

2212. In giving your opinion that the No. 1 proposal is the preferable, have you taken into consideration that your new proposal would have the effect of cutting out the whole of the objectionable grades for a distance of 8 miles? I have taken all that into account. I wish you to understand that it is only my own opinion that I give.

2213. Do you not think that a greater saving will be effected by reducing those grades to 1 in 60? That is met by the increased distance which the trains would have to travel.

2214. By reducing the grades on the whole length of 8 miles, do not you think a greater saving would be effected than by merely constructing a tunnel for 2 miles, and still leaving the objectionable grades? I do not think so. I think the advantage will be found to lie with No. 1 scheme, but the tunnel is only 1 mile 49 chains in length.

2215. You think an additional length of 1 mile 70 chains would neutralise any advantage which would be gained by the improvement of the grade? I do.

2216. By constructing the No. 1 deviation, you will have for all time a grade of 1 in 42? That is so.

2217. It would be impossible to cut that out except at great expense? Yes.

2218. By this new proposal you would get rid of $1\frac{1}{4}$ mile of 1 in 42 grade which otherwise must be permanent? Yes.

2219. What view do you take of that? That means the employment of a bank-engine, the cost of which we can estimate. I mean to say that if we retain the 1 in 42 grade to the mouth of the main tunnel on the No. 1 proposal, it means the retention of the bank-engine at a certain sum per annum. I considered that before expressing my opinion to the Committee.

2220.

* NOTE (on revision):—Since giving evidence I have seen Mr. Deane, and, although he admits that the tunnel fronts and sanctuaries are not specifically mentioned in his estimate, he states that they are included in the price of the tunnel.—W.T.F.

2220. Do you say that in point of economy the No. 1 proposal should be preferred to this new proposal? I am strongly of opinion that it will work out so, when it has been gone into by the traffic officers. They are considering the matter now. W. T. Foxlee, Esq.,
M.I.C.E.
2 April, 1894.
2221. *Mr. O'Sullivan.*] As your new proposal commences at the 85th mile post, just below Bell, it would cut out all the line between that point and the Clarence tunnel, as well as the Zigzag? Yes.
2222. Is there not some trade done in timber between Bell and Clarence tunnel? I believe there is a small local trade at Clarence siding, but I do not think that it amounts to very much.
- 2222½. Would it be necessary to leave the old line for the service of that traffic? That is a traffic matter upon which I am hardly in a position to speak, but I should scarcely think so.
2223. *Mr. Davies.*] Have you been over this last deviation? I have been over the greater portion of it.
2224. Was it discovered by Mr. Suttor, a member of your staff? Mr. Suttor, one of our staff, gave us the information. He informed us that his father had told him that the stock from his station used to be brought round somewhere in the direction of the proposed deviation down Farmer's Creek.
2225. Practically, it was he who discovered this route? He gave us the information.
2226. He was the first man, I presume, who passed over the route? He gave the information to the Department, and I believe he was the first to give the information to me.
2227. He was the first to give the information to the Department, as far as you know? I think so. I am not quite sure that Mr. Suttor did not tell me that he informed the Department, before the Commissioners took office, that his father had told him that there was a practicable route round that way,—that the stockmen used to take their cattle round the shoulder of the hill on the north of the present line, and down Farmer's Creek.
2228. He made the survey? He has been assisting in making the survey.
2229. He is your principal surveyor? Mr. Baxter is my principal surveyor, and Mr. Suttor has been working with him.
2230. Have you any tracing or plan of your proposed deviation to show the Committee? I have no tracing at present. We have a rough plan, but I am not in a position to put it before the Committee until the Commissioners have had a chance of looking at it. It was only brought to town this morning, and the Commissioners have had no opportunity of seeing it.
2231. As you were summoned to give evidence on this question, you should have brought the plan with you? I am in the hands of my Commissioners.
2232. You are in the hands of this Committee at the present time? I am here to give evidence, but I am not here to produce plans which have not been submitted to my Commissioners.
2233. Are you aware that this Committee is the highest court of inquiry which has been constituted by Parliament in respect of the construction of public works? Yes, but I am here to a certain extent as the mouthpiece of the Railway Commissioners, and I do not consider it is my duty to bring forward any plans and proposals of which they are not cognisant.
2234. Are you not aware that the Committee, through the Chairman, can summon you to produce any plans or documents that may be in your possession? I am; but I am sure that the Committee would not care to be misled by plans which do not represent the views of the Railway Commissioners.
2235. What is the value of your evidence without the plans of your proposal? That is for the Committee to determine.
2236. You are here as a witness, and as a public officer you ought to be prepared to give this information to the Committee? I am here to give information readily and freely, as far as I can, but I am not here—I may be misinterpreting my position—to bring forward something of which the Commissioners may not approve.
2237. Will you give a detailed statement of your alternative route—the No. 4 scheme? My estimate of £250,000 is only an approximate one. We are not in a position to give any details at present.
2238. How many thousand cubic yards of cutting would there be? I have not the details before me.
2239. What amount of sidings would there be? I have given £250,000 as a round and approximate figure;—perhaps it would have been better for me to have said that I could not give any information as to cost. I am, however, as I have just said, not in a position to give the details to-day.
2240. You stated that there would be 2,282 yards of tunnelling in your scheme; what would it cost per yard? If you refer to the detailed estimate of the No. 1 proposal which I have handed in, you will see that I put it down at £58 per yard, and the cost would be the same on this route.
2241. You propose to cut out 9 miles of the existing line;—do you know the capital cost of that portion of the line? No.
2242. Your estimate is simply an estimate of the cost of constructing 8 miles of line? Yes.
2243. You do not take into account the capital cost of the length of line you cut out? I merely give an estimate of the cost of the proposed deviation; and when the saving estimated to be effected by that deviation has been ascertained, the Committee will be in a position to decide whether it is advantageous to carry it out or not.
2244. You state that the proposed deviation of 8 miles could be carried out at a cost of £250,000, yet you cannot give me any details in regard to the side-cuttings, or the quantities of earth which would have to be moved? No. You must only look upon that figure as a round or approximate figure.
2245. You might as well say £500,000? Oh, no; you might not.
2246. But to get the approximate cost, certainly there ought to be some details available? When the scheme has been submitted to the Commissioners, I have no doubt I shall be in a position to supply you with the details of the estimate.
2247. You cannot tell the number of culverts? I cannot give you any details.
2248. You can only tell us you are going to cut out about 9 miles of line, and that you hope to make the railway shorter by a mile and 10 chains at a total cost of £250,000? Yes; and I have pointed out the advantage that will be gained by doing so. I am sorry that I am not in a position to give the Committee any further information. I should have been glad to have been in a position to bring the plans; but I have been away from town, and it was only this morning that they came before me.
2249. As the Engineer-in-Chief for Existing Lines, do you think the Commissioners would be warranted in spending £250,000 on this deviation? I cannot express an opinion on a question of general policy. I think it would be out of place for me to do so.
2250. You do not care to express an opinion? I would rather not. 2251.

W. T. Foxlee, Esq.,
M.I.C.E.
2 April, 1894.

2251. What are the commercial advantages of this proposed deviation which you mention? I think I have pointed out that the effect would be to cut out the 1 in 42 from Eskbank to bottom points, the Zigzag, the 1 in 30 against loads going west, and the 1 in 50 against loads coming east, known as Bell Bank, and a number of very sharp curves. By reducing the ruling grade, the loads can of course be increased.
2252. What saving do you think it will effect? I cannot tell you; that question is being gone into now.
2253. You cannot tell the Committee whether it would be justifiable to spend this money? No.
2254. *Mr. McCourt.*] Have you had a discussion with Mr. Deane as to which route is the best, and as to the cost? No. We have not gone into the thing together; but as soon as the plans of No. 1 proposal were sent to Mr. Deane, we spoke in a general way of what the advantages would be, and he said that he thought he could find a cheaper route. But beyond that we really have not had any conversation upon the matter.
2255. Did he say that he thought that he could get a cheaper and a better route? He said that he thought that he could get a cheaper route, but I am not sure whether he said a better one.
2256. I suppose you are both aiming at the same thing—the best route? Yes, of course; we want to do the best thing for the country.
2257. Do you not think it would be in the interests of the country if you were to discuss the matter with Mr. Deane? As far as I am personally concerned, I should be delighted to meet him and to do so.
2258. Why is it not done; who is preventing it? I am not aware that it has been suggested before.
2259. Do you not think it would be in the public interest if you and Mr. Deane were to discuss this matter? I am quite sure that it could do no harm, and it might lead to some good. I want it to be understood that Mr. Deane and I are on the most friendly terms.
2260. Although you are on the most friendly terms, still you are picking each other's work to pieces? That is hardly so. I made a proposal, a challenge was thrown down by Mr. Deane, and I naturally took up the challenge, and expressed my opinion upon his counter proposal.
2261. *Mr. Neild.*] With reference to the new line which has been surveyed on the northern side of the railway, has that proposal turned out as well as you anticipated? From an engineering point of view, I think so, as far as I can judge at present.
2262. You have got as good a grade as you hoped to get? Yes.
2263. And the line is no longer than you expected it to be? No. I think, from an engineering point of view, it turns out quite as well as we were led to believe it would.
2264. If it has turned out as well as you expected, and you still prefer the longer tunnel or the No. 1 scheme, what was your object in asking for the delay, which you pleaded so hard for in order that this survey should be completed? A route was suggested as feasible, and I, having one object in view—namely, the interests of the country—thought that it would be desirable to examine it. It has been examined, and the Committee will probably be apprised of the result shortly.
2265. *Mr. Wall.*] Have you compared this new route with the other routes before the Committee? Not so far as the working of the line is concerned.
2266. Without making such comparison, you cannot say whether it is better than the routes which have been suggested by the Public Works Department? I am not in a position to say that at present.
2267. Prior to initiating the survey of this new route, did you recommend the construction of the No. 1 scheme of the Commissioners? I did, believing it to be the best route.
2268. In the interests of the country, did you think it would be desirable to carry out that line without any further survey? I believed it to be the best and the shortest route.
2269. Are we to infer that if you had not recommended the alternative proposal, we should not have had this proposal put before the Committee? I am not quite sure that it is right to say that I recommended its construction. The Commissioners, after some investigations had been made with a view to cut out the Zigzag, instructed me to look into the matter, and No. 1 proposal is the result of my examination. Other people had been over the ground a good deal before me, and that appeared to me to be the best scheme. I laid it before the Commissioners, and of course left it to them to decide whether it should be adopted or not.
2270. Was it not, as a matter of fact, upon your report, that they decided to construct No. 1 scheme? I believe that is so, after consultation with the traffic officers to ascertain what the advantages would be if it were carried out.
2271. Since they decided to carry out that line, another route was recommended by the Public Works Department? A suggestion was made that a better route could be found.
2272. But since that suggestion was made the Commissioners have had a survey made of this line which you now submit? That is not quite the fact. The alternative suggested by their own officers came before us before Mr. Deane's counter proposal.
2273. Are you in a position to compare this proposal with the other proposals which are indicated on this plan? No.
2274. The Commissioners are not in a position to say whether the two schemes which have been submitted by the Public Works Department are better or worse than the alternative scheme which you are now recommending to the Committee? We are not in a position to say whether this alternative scheme is better than any of the others, inasmuch as we have not gone into the question of the working.
2275. Do you not think that the interests of the country would be served by the Commissioners investigating the schemes submitted by the Department of Public Works? I quite think they would; but if I understand aright, the Commissioners have applied for information in regard to these alternative routes to be placed before them in accordance with the provisions of the Railway Act, but have not been supplied with it. It was only on Saturday morning that I got from your Secretary the details of the "green" or No. 3 scheme, although I believe I am right in saying that the Commissioners had applied for information regarding it some weeks ago.
2276. Are we to understand that the reason why we are deprived of your valuable services in recommending any of these routes is because the Commissioners could not get certain information from the Department? I do not know positively, but I have understood that the Commissioners have not been supplied with information regarding the alternative routes suggested by the Department.
2277. Can you say whether the Commissioners have applied to the Department? I cannot say positively, but I believe it is a fact that they have.
2278. And as a result of not obtaining the information they have submitted an alternative scheme of their own? Not as a result of not getting that information. Soon after we had prepared the plans for our No. 1 scheme, it was suggested by an officer of our Department that a better route could be got; we thought it right to investigate it, and an investigation was begun straight away.
- 2279.

2279. *Mr. Suttor.*] Why is it necessary to have a double line on the northern side of the railway if the grade is only 1 in 60? In carrying out a work of this kind it would never do to construct a single line, and when the traffic increases in the course of a few years, to bring the contractors on the ground again. Further than that, there is a tunnel nearly a mile in length, which, for the purposes of ventilation, should be a double one, and while we are about the work, whatever scheme is adopted, it ought to be a double road through the tunnel.

W. T.
Foxlee, Esq.,
M.I.C.E.

2 April, 1894.

2280. The line over the mountains is virtually a single line from Penrith? Apart from the question of tunnel ventilation, which is a very serious matter, it is desirable, while we are about it, to make a double road. At certain seasons it is even now extremely difficult to work the traffic over the road.

2281. What would be the cost of a single line? I have not gone into the matter sufficiently to say, but I think it would be a pity for either route to consist of a single line.

2282. Do you think it is best to make a double line? Certainly. We have a double line from Eskbank, to the bottom points, and it would be folly to substitute a single line for a double one even for a portion of the distance.

2283. Can you give us an estimate of the cost of a single line? That can be prepared, although I would not recommend it.

2284. *Chairman.*] Approximately, what percentage would the cost of a single line bear to the cost of a double line? That is rather too wide a question to ask. I can tell you that a single-line tunnel would cost from £35 to £40 per yard, and a double-line tunnel about £60 per yard.

2285. Can you say that a single line over the same country would cost approximately, say, 40 per cent. less than a double line? I would rather not give a general answer of that sort. I can tell you in every given case, with the greatest ease, what the difference in cost would be.

2286. *Mr. Suttor.*] Will you furnish an estimate of the cost of a single line? Certainly.

2287. *Mr. Dawson.*] Have you read Mr. Whitton's evidence? No; I have not seen it.

2288. If he states that as far as he knows neither line is required; that the old line can do all the work and is perfectly safe, and would be much cheaper, and that he could not advise the country to go to the expense of making a deviation, would not the opinion of an engineer of his experience and standing be worth having? I think his opinion would be worth having, very much indeed; but that is only his individual opinion, and I personally differ from him.

2289. You think it is necessary to have one or the other? I think it is very desirable to avoid the Zigzag as soon as the country can see its way to do so. It was all right in its day, but no doubt the time is coming when it will be desirable to have a straight through run.

2290. Do you mean that the time is coming in the immediate future? I cannot tell; it is for the Commissioners and the Parliament to decide.

2291. You have a knowledge of the traffic; do you think that at the present time it would be desirable to do away with the Zigzag? I think it would be a very desirable thing to do away with the Zigzag.

2292. Does the present traffic warrant the cutting out of the Zigzag? I think it would be very desirable to cut it out. It would very much facilitate the working of the traffic.

2293. *Mr. Collins.*] Do I understand you to say that you prefer No. 1 scheme to No. 4 scheme because it is shorter, although the grades on No. 4 are better? Yes.

2294. The Department will get a greater amount of revenue from traffic over the extra mile? No. It is not proposed, I believe, that there should be any alteration of existing rates. The old mileage will be adhered to if the present scheme is carried out.

2295. Do you think that would be done if the line were lengthened considerably? I am not in a position to say; but I do not think the Department would propose a deviation which would increase the present distance.

2296. *Chairman.*] How long will it be before you are prepared to put before the Commissioners the whole of the details of your alternative scheme? It can only be a question of two or three days. I want the Committee to understand that the plans and sections which have been made are merely preliminary plans and sections, but sufficiently accurate to enable a judgment to be formed upon the value of the route. They are not what are known as working plans and sections, which would take some months to prepare, but they are sufficiently near to enable an opinion to be expressed definitely upon the desirability, or otherwise, of adopting the scheme.

2297. With the data you have before you the Commissioners can decide at once? I think it can only be a question of a few days.

2298. Do you know if it is the intention of the Commissioners to at once consider the question? I believe the plans are now under consideration. The plans only came up this morning, and really there has not been proper time to look into them.

2299. Are you aware whether a Departmental Board is now considering the question of the saving to be effected on the line? The question of the saving to be effected is being considered by the traffic officers.

2300. This Board is reviewing the estimate which was made in regard to the No. 1 route, and considering the saving which may be effected in connection with the alternative route? That is so, I believe.

2301. *Mr. Davies.*] Perhaps the reason why you only received the papers and plans from the Engineer-in-Chief for Railways on Saturday morning was owing to your absence from Sydney? It may have been. There would have been no advantage from the plans being in my office earlier in the week, inasmuch as I was absent in the west. When I spoke of plans and information not having reached the Commissioners, I referred to an application which I believe they made some weeks ago.

2302. I understand that the plans and information which you received on Saturday were waiting in this room for some days prior to your return to Sydney? I have no doubt they were; but even so, I think it is not unreasonable to expect the information to be sent to me.

2303. You think that the plans should have been sent before you returned to Sydney? No; but I do not think it is unreasonable to expect that the plans should have been sent over to my office.

2304. *Chairman.*] I may state that the plans were sent over to your office on Thursday by the Secretary to the Committee; it was the detailed estimate which was sent to your office on Saturday morning? Yes.

TUESDAY, 3 APRIL, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTON.
 The Hon. JAMES HOSKINS.
 The Hon. FREDERICK THOMAS HUMPHREY.
 The Hon. JOHN DAVIES, C.M.G.
 The Hon. WILLIAM JOSEPH TRICKETT.
 THOMAS THOMSON EWING, Esq.

WILLIAM CLANDOS WALL, Esq.
 WILLIAM McCOURT, Esq.
 JOHN CASH NRILD, Esq.
 EDWARD WILLIAM O'SULLIVAN, Esq.
 CHARLES COLLINS, Esq.
 HENRY DAWSON, Esq.

The Committee further considered the proposed Deviation to avoid the Lithgow Zigzag.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, sworn, and further examined:—

H. McLachlan, Esq.
 3 April, 1894.

2305. *Chairman.*] You received a request from the Secretary to this Committee, asking you to furnish us with the details of your estimated saving of £10,000 on the No. 1 route, and also to give us any information you might have as to the probable savings or otherwise on the No. 3 route. Have you got that information with you? Yes. It is contained in two letters, and a statement attached to one of those letters, which I now produce and read:—

Sir,

Government Railways of New South Wales, Secretary's Office, Sydney, 3rd April, 1894.

In response to the request made in your letter of 28th March that the Railway Commissioners would furnish the Public Works Committee with a statement of the details of the saving to be effected by the cutting out of the Lithgow Zigzag, I am directed by the Commissioners to forward statement attached to this letter, from which it will be seen that the actual savings as worked out by their principal officers, on the train-mile basis, would amount to about £18,000 per annum. The Commissioners desire me to state that the actual facilities to the working of the Western Line traffic—which must become greater and greater year by year—cannot be gauged in figures, as the whole mode of working can be altered to much advantage, and the result to the Railways will be greater than expressed by the foregoing figures.

With regard to the request that the Commissioners should furnish a statement to include:—

- (1.) The total approximate earnings;
- (2.) The total approximate expenses;
- (3.) The total interest on the proposed new expenditure; and
- (4.) The total interest on the cost of the line which, if the deviation be carried out, will be abandoned.

The Commissioners desire me to say that the earnings would be precisely the same as over the present line, as they propose to charge the same rates for traffic passing over the new line as are charged over the existing line. The expenses will be reduced as shown in paper referred to in previous paragraph. The total interest on the proposed new expenditure will in all probability be from £8,000 to £9,000 per annum.

With regard to the total interest on the cost of the line which will be abandoned, the Commissioners are unable to give any information on this point, as the line was constructed long before they took office, and they have no data upon which they can give the information. The Commissioners would, however, point out that in their opinion the real question is: How much additional interest will have to be found annually in connection with the Railway capital to effect the savings and advantages which will accrue from carrying out the great improvement in the working of the railways by this scheme, including the important advantage of cutting out the Zigzag and the 1 in 33 grade by which it is approached from the eastern side.

The financial position is, so far as can be at present estimated, that by an expenditure of £8,000 or £9,000 per annum, £18,000 per annum, and probably more, will be saved.

I have, &c.,

H. McLACHLAN,

Secretary.

The Secretary, Public Works Committee.

Proposed Lithgow Zigzag Deviation.

During the year ended 31st October, 1893, there were run:—

2,370 Down goods trains, and
 2,192 Up " " "

Total, 4,562

By cutting out the Zigzag and the 1 in 33 grade against traffic going west which now exists between Dargen's Creek and Clarence Siding, not more than 1,420 down and 1,624 up goods trains (total, 3,044) would be required to haul the same aggregate number of waggons; hence there would be a saving of 1,518 trains × 11½ miles (the distance between Bell and Eskbank)=17,647 train miles, which, at 4s. 8d. per mile, would effect a saving of	£4,117
In addition to the foregoing, in consequence of the shorter route, there would be saved on each of the remaining 3,044-trains 2½ miles per train (total, 8,751 miles), each at 4s. 8d. per mile	2,042
A similar saving would be effected on 1,401 regular passenger trains=4,036 miles, each at 4s. 8d. per mile	912
Saving in connection with non-use of push-up engines, it being proposed by the Commissioners to use engines which will take full load without assistance on 1 in 50	1,500
Estimated saving due to the shorter time of engine-drivers and guards being on duty, to the avoidance of delays to trains, and to the practicability of men being run through on goods trains from Penrith to Bathurst and vice versa without incurring unreasonable hours or overtime (one hour each way)	3,000
At the present time it is the practice to take the same load through from Eskbank to Penrith, owing to the inconvenience of breaking up trains, consequent loss of time, &c., and serious delay to traffic rendering the alteration of load at Bell and Katoomba undesirable; if the load is increased from Eskbank, it would be taken through from Eskbank to Penrith, and the benefit of this proposal would be practically that between Bell and Katoomba 568 ordinary trains would be saved, equal to the train mileage of 9,656, which, at 4s. 8d., would be equal to	2,253
Between Katoomba and Penrith the adoption of the larger through train loads as against the limited loads of to-day would mean a saving of 18,176 train miles, equal to a further saving of	4,240
Or a total of	£18,094

Sir,

Government Railways of New South Wales, Secretary's Office, Sydney 3rd April, 1894.

In reply to your letter of yesterday, asking the Commissioners to add to the statement they are preparing for the information of the Committee—their estimate of the value from a traffic point of view of the No. 3 suggested route for the deviation to avoid the Zigzag, I am directed by the Railway Commissioners to state that the savings as worked out by the principal officers on the train-mileage basis would amount to about £15,100.

I have, &c.,

H. McLACHLAN,

Secretary.

The Secretary, Parliamentary Standing Committee on Public Works.

2306. A Board of your officers sat yesterday to go into this matter? There was no Board. One or two of our officers met.

2307. Did they take the No. 4 scheme into consideration? No.

2308. They had not that scheme before them at all? Practically not.

2309.

2309. Have the Commissioners had the details of that survey placed before them yet? No.

2310. They have had no reports from the engineer upon it? They have had nothing more than a personal interview with Mr. Foxlee.

2311. Have they ordered the information to be furnished to them within a certain time in order that they may come to a decision upon the matter? At the first their instructions were that the survey was to be expedited as much as possible. It has taken more time than it was expected to do, because of the unfavourable weather.

2312. Can you give us any idea when the Commissioners will have this information before them, and come to a decision upon it? No, I cannot; but as far as any saving is concerned, the principle shown in the figures I have just handed in would be the same.

2313. Did you preside over the meeting of officers held yesterday to go into the details of the survey? We had no conference; the officers were just asked to come together.

2314. But as a matter of fact your officers came together and compared notes? They had a chat about the matter.

2315. You were not present? I was.

2316. If Mr. Foxlee informed us that in his belief this Board, or whatever you term it, would consider the probable saving on the No. 4 route, he was under a misapprehension? Yes, because we had not the facts before us. It was spoken about generally, but the figures were not worked out.

2317. How long would it take to compile an estimate of the probable saving on the No. 1 route, the length of which would be 8 miles—a saving of 1 mile 10 chains on the existing line—and the maximum grade 1 in 60? I think the Commissioners would like to see the full details before giving an opinion upon the scheme. No plan has been put before them yet. All they know is, that in all probability a grade of 1 in 60 can be obtained.

2318. But the officers who compiled the information you have just given us did not go into the question of capital cost? No.

2319. It seems to me that if they know the grades and the length of the line that is all they require? They could give an estimate of the saving on the No. 4 line, and it probably would not differ much from that which I have just submitted. While we should save more by discontinuing the push-up engines entirely, we should lose in train mileage.

2320. You cannot tell us when the Commissioners will be ready to come to a decision on the No. 4 proposal? No; I thought Mr. Foxlee would have been able to give you that information as to time survey would be complete.

2321. *Mr. O'Sullivan.*] Why have you left out of your calculation the interest on the £167,000 expended on the old Zigzag? The Commissioners thought that that was not a matter for them to consider. The Commissioners say that by spending a certain sum of money they can save so much; but if the Committee like to add the cost of the original line, of course they can do so.

2322. But you practically propose to throw away £167,000? Yes; part of the existing line would be rendered useless.

2323. *Mr. Hoskins.*] How do you make up your estimate of 4s. 8d. per train mile? It is made up from various items, such as the wages of drivers, firemen, and cleaners, stores, oil, water, wear and tear on the locomotives, repairs to engines and carriages, traffic expenses, &c. As a matter of fact, if the proposed deviation were made, we could close two or three stations, such as Clarence siding and the platform at the bottom points. That would save six or seven men.

2324. Do you think it would be fair to people who have taken up land there to do that? What we have to consider is that at the present time we require signalmen there to work the through traffic, and they could be withdrawn if the deviation were made.

2325. The 4s. 8d. per mile applies to the whole of our railways? Yes; and our officers say that the proportionate expenditure is higher on this part of the line than on the lines as a whole. The consumption of fuel is greater, while the traffic expenses are heavier, because the stations are closer together than they generally are in other places.

2326. But are there not grades, not only on the western, but even on the southern lines, longer and steeper than those on the Zigzag? In our 2,500 miles of line there are, perhaps, 40 miles of 1 in 33, and of that, one mile is situated at the point we are talking about. Therefore, the grade there is disproportionately heavy, compared with the whole of our lines. Of course, there are steep grades elsewhere—coming up from Ema Plains, for instance.

2327. Therefore we are to understand that the fuel required for working the Zigzag with a grade of 1 in 42 is not more than is required in other places? It is proportionately, if that length of line is compared with the lines as a whole. The train-mile is worked out for the whole of our lines; not for any single section.

2328. You say that if the Zigzag were avoided, you would dispense with two or three stations, for instance Clarence siding? We would dispense with the men who are now employed there to work the through traffic. We could possibly work the Clarence siding if it were kept open without a permanent staff, though that is a matter which the Commissioners have not considered. Clarence siding is the only place where there is any population.

2329. *Mr. McCourt.*] Who were the officers who made this estimate of £18,000? Principally Mr. Thow and Mr. Richardson.

2330. Who estimated the saving of £10,000? The same officers; but the first estimate was to some extent a general one, and was prepared to show that the interest would be covered by the saving. When the Committee challenged that estimate, the Commissioners asked these officers to go into the matter more closely and see if the saving was not much in excess of what they had stated.

2331. Did not Mr. Thow take every detail into consideration in making his estimate? No; the principal item which makes the difference is the saving which would be effected by running trains right through to Penrith, and that was not taken into consideration at first.

2332. Then £10,000 was a misleading statement? That was an under estimate. All that the Commissioners wished to show was that the interest would be covered by the saving.

2333. *Mr. Trickett.*] In the statement you handed in to-day you state that if the deviations were made 3,044 trains would do the work which is done by 4,562 trains at the present time, but on page 45 of our evidence you will see that Mr. Richardson, when asked about this matter, said that 3,276 trains would be required.

Esq.

3 April, 1894.

H.
McLachlan,
Esq.
3 April, 1894.

required to do that amount of work—which answer is correct? The answer that I have just given. The Commissioners asked Mr. Richardson, when he was going into this matter again, to take into consideration what would be the saving, supposing the more powerful engines which it was intended to use on the mountains were used, and he thereupon worked it out as I have given it to you.

2334. Is not £8,000 a very large margin to leave? Yes; but it is nearly all accounted for by this new item, which amounts to over £6,000.

2335. Which item is that? The estimated saving in running trains right through from Eskbank to Penrith. I think when our officers were here before, they stated that there were other savings which need not be considered. In my opinion if the matter were thoroughly worked out, the total saving would be even greater than I have just stated. For instance, I do not think the saving between Katoomba and Eskbank going west, was considered. I think you could take larger loads than they have taken into consideration.

2336. That is, if you used more powerful engines; but would not their use entail heavier working expenses? Not more than have been given.

2337. Would it not create extra expense in wear and tear on the permanent way? I think not, because the engines are better balanced. They are on more wheels, with no greater weight on each axle. But, of course, these questions are more for a locomotive engineer to answer. I do not pretend to be an expert in regard to the details of working.

2338. In answers to question 1041, you say, "The line which will be cut out has cost the country, say £165,000? Yes; but by working the old line you would make no saving." How then can the Commissioners say in the letter which you have handed in, that they have no data as to the cost of the existing line? The sum mentioned there was stated by some member of the Committee. The Commissioners could not father it as their statement.

2339. Further on, question 1082, you were asked, "Therefore, if the line which it is proposed to dispense with cost £160,000, the interest upon that is not to be calculated as an expenditure as against the estimated gain on the new line? It is not calculated."—I see that the Commissioners still adhere to that view of the case? Yes.

2340. Although that money is apparently lost to the country, it is not to be taken into consideration in calculating the earnings of the proposed line? No; the Commissioners think that the practical question is this; "You are going to spend a certain sum of money to save so much, what interest will you get on your expenditure?"

2341. *Mr. Wall.*] In making a calculation regarding the saving on the proposed deviation, you assume that a stronger type of engines will be used? Yes; the powerful engines which were obtained for the mountain traffic.

2342. Are those engines used on the existing mountain line? Not generally.

2343. If they were used would not the earnings on the existing lines be greater than they are now? You mean that the saving would not be quite so great.

2344. Yes? That would be so. We should have a slightly higher average train load.

2345. You have put in a tracing showing the alterations that have taken place on the mountain line; is it not a fact that that line has been altered since the Commissioners took charge of it, curves having been taken out, and grades having been reduced? Yes; in a number of places.

2346. Does not that lead to the inference that the line was originally laid out in the wrong place? I could not say that. Railway companies all the world over, improve their lines as years go by in different ways. At first you want to spend as little as you can.

2347. Is it not a fact that the improvements effected by the Commissioners have been made at less cost than the original cost of the line? I should think so, because material and labour are cheaper than they were when the line was originally made.

2348. Is it not a fact that although the lines have been straightened, and the grades reduced, a lesser quantity of earth has been removed? I am not in a position to say.

2349. *Mr. Ewing.*] You preface your evidence by the statement that the saving is still problematical? It is an estimate, and estimates are not strictly accurate.

2350. Do you mean that the saving will be even greater than is now shown? The Commissioners think that it will be greater rather than less, when we come to work the line.

2351. *Mr. Collins.*] Was it at the request of your Department that this inquiry was adjourned for some days, for the purpose of getting information? The inquiry was not adjourned, although we asked that it might be adjourned.

2352. Did your Department wish that the inquiry should be closed until we got information about the new scheme? I do not know that that was being considered, but I think the Committee have now got sufficient evidence before them as a matter of principle, because the No. 4 scheme is somewhat the same as the No. 2 scheme.

2353. Mr. Foxlee has stated that under all circumstances, he would prefer the No. 1 scheme, until he found that the other was cheaper? The details have not been submitted to the Commissioners, so that I could not say what their opinion in regard to it is.

2354. *Mr. Humphery.*] Can you explain in what way a saving would be effected on the deviation in trains running between Penrith and Katoomba? It can be explained in this way. At the present time, a train leaving Eskbank is limited as to load by the Zigzag, and to avoid the delay to goods which would ensue if we joined these trains at the top, they are run right through, whereas, if the deviation were made, we should run longer trains through, and there would consequently be a saving, not only on the deviation, but on the line right through to Penrith.

2355. That saving would be on the up train, not on the down train? Yes, a saving of about £6,000.

2356. *Mr. Hoskins.*] If the £6,800 per annum, which is the interest on the money expended in making the existing line were added to the £9,000 per annum, which will be the interest on the cost of the proposed deviation, that would bring the total amount of interest to be paid up to £15,800, which was to be set against your saving of £18,000? Yes.

2357. Therefore, the Commissioners suggest that the country should incur an expenditure of £250,000, to save about £2,000 a year? Well, we look at it in a different way.

Henry Deane, Esq., M.Inst.C.E., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined :—

2358. *Chairman.*] Since you were last examined by the Committee, you have had an opportunity of reviewing the proposal put forward by Mr. Rock? Yes.

H. Deane,
Esq., M.I.C.E.

2359. Are you prepared to make a statement in connection with it, or do you desire that we should question you in regard to it? I can tell you what has been done in the matter. Mr. Rock has furnished me with an outline plan, and a section of his line from Mount Victoria to Eskbank. In his description of the line he says that it

3 April, 1894.

Commences at a point on the Sydney side of Mount Victoria station, close to the bridge, and runs thence close below the stationmaster's house, across the approach to the station and the road on the ground below the Grand Hotel, and on until Piddington's house is reached; thence below the school, through the grassy track above Piddington's dam, about 5 chains above same; thence below the Eltham Park Estate, until the point known as Titania's Glen is reached at 143 chains.

Here I might say that I find that there would be a tunnel required at 85 chains from the commencement, about 34 chains in length. Mr. Rock's section is here rather undefined; but it is clear that a tunnel will have to be made.

Thence round this bluff and Bentley's Gully, until at the head of this gully a tunnel is necessary. This tunnel passes under the old Hartley Vale Road close to its junction with the Mount York Road, then further on under the same Mount York Road, and ends on the Kanimbla side of the spur at 217½ chains.

That tunnel is shown on the section as 40 chains in length.

The line runs thence along the spur round the point of same into the gully known locally as Tabrett's. After heading this it follows the opposite side until it reaches Armstrong's selection, where it crosses the road to Hartley Valley township, about 60 chains from the Post Office.

I notice by the section that at about 270 chains, that is 3 miles 30 chains from the commencement of the line, another tunnel will, apparently, be necessary.

2360. Is that on the Mount Victoria side of Hartley? Yes. That tunnel will be about a quarter of a mile in length.

2361. Whereabouts will it come in? In descending Mount York, going along the sidling.

Thence through the flats for a distance of 70 chains to the River Lett; thence on the flat belonging to Flood into Oad's ground, known as Mount Clarence Farm; thence round Blackman's Creek Gully and along the range until the Doctor's Gap is reached; thence by a tunnel through this gap under the Lithgow Road at the point where this latter and the Doctor's Gap Road meet.

2362. Can you give us the length of the tunnel there referred to? About 1¼ miles.

Thence along the swamp at the back of the Vale of Clwydd and on until a curve joins the main line near the coaling station on the Eskbank side of same, and about 30 chains from the station.

To this description the following note is attached :—

The flat from the Hartley Vale Road, to and beyond the River Lett, necessitates a large amount of filling if the line of survey is adhered to. By running the route a little further up the valley in the direction of the township, this filling could be saved to a large extent, and the extra length could be applied to casing the grade. The point where this deviation would take place would be 600 chains. The point of departure for a line to Bowenfels would be 737 chains.

I notice that some parts of Mr. Rock's line are very difficult of construction, and on asking him for information on the subject he said that those parts were very short. If the ground were, as he shows it to be, hard and rocky, no doubt a viaduct could be made; but a bank could not be made, because the slope is too steep. Without going over the line, or having anyone to carefully go over it, I cannot vouch for the accuracy of Mr. Rock's survey; but I think it may fairly be taken to show a practicable route. I think, however, that he has very much under-estimated the difficulties of some parts of the line.

2363. When you say a practicable route, what grade would you have? His own grade, 1 in 50, although there might be some difficulty in this way—you might come on to ground which would give you no support. In the particular place to which I am referring, if it were all loose ground, it would be almost impossible to make the line. The only way would be to keep closer in to the side of the hill, which might bring you into tunnelling, and thus greatly increase the cost of the line.

2364. While Mr. Rock, in placing his proposal before the Committee, said that there would be two tunnels, 1 mile 40 chains in length, you say that there would be four tunnels with a length of 2 miles 34 chains, and the possibility of other tunnels being required in order to get sound ground? Yes; with regard to the last part of the question, Mr. Rock tells me that, in his opinion, the ground is sufficiently good; but I think it not unlikely that when it came to be examined, it might not turn out as favourable as he considers it. His traverse was not along his proposed centre line. He has traversed along a convenient route and taken cross sections, from which he has plotted his longitudinal section.

2365. Have you arrived at any conclusion as to the cost of such a line? It is impossible to give an estimate without further information.

2366. You know his estimate—£345,000 for a double line? I consider that that estimate was too low. I believe Mr. Rock would find himself under the necessity of lengthening his line, because of the difficulty in the way of getting down the side of Mount York. It would, perhaps, be necessary for him in some cases to put in flat pieces, and he would thus lose fall, and have to increase his distance. As a consequence, he would have to cross the River Lett at a much higher point, which would add to the cost of the line.

2367. What difference would the extra tunnelling be? It would depend very much upon the material through which the tunnel went. I find it very difficult to make an estimate of the cost of the work. No doubt part of the line would be similar to the line going down to the Hawkesbury; and judging from the cost of works similarly situated, I do not think it could be constructed for less than £500,000.

2368. Have you anything further to say about it? I should like to add that lines have been run through there before. When a route for the Western line was being looked for, the surveys were made down Mount York, and the practicability of such a line that way was proved, so that really we have gained very little extra information from Mr. Rock's survey.

2369. Have you anything further to state in regard to his proposal? I do not think so.

2370. Did Mr. Rock put before you any information concerning his proposed deviation from the River Lett towards Bowenfels? I had some conversation with him about it. He acknowledged that he had not been over the route, but had simply been along the road. He had not taken any levels, nor run any traverse from which a fair judgment of the line could be made. I have been round that road myself, however, and my impression at the time was that it would be very difficult country for a railway. It is very much scored with water-courses, and on a steep slope for a good part of the way. The contour is not at all smooth, and I think it would be very difficult to get round there. It is possible that one might

H. Deane,
Esq., M.I.C.E.
3 April, 1894.

come upon gaps where there was no supporting ground. The possibility of getting over some of the gulleys could only be proved by an actual survey. It would seem rather an extraordinary thing if, at the time all the original surveys were made, that line was not tried, or that there is no information about it. I think that the probability is that the line was tried and the surveyors gave it up. There is nothing on the plans to show that a line was ever run through the Bowenfels Gap. It is impossible to give any further opinion about the proposal without an actual survey.

2371. Mr. Rock did not furnish you with any more detail than he had already given to the Committee in regard to the proposed deviation to Bowenfels? He only discussed the matter with me, and I pointed out what I considered would be the difficulties of the case. It is only fair to Mr. Rock to point out, in justification of the view he has taken, that levels taken at some distance apart apparently show that the line could be made. If you have a drop of 200 feet in two miles that shows, apparently, that you can get a grade of 1 in 50; but it might turn out that you could not get proper supporting ground in between where you wanted it.

2372. Will you now give us your detailed estimate of the proposed No. 1 route; or perhaps you have a statement to make in connection with the whole matter showing what has been done as between yourself and the Commissioners? I should like to show what has actually been done, but I will make my remarks very short. On the 25th January, 1894, I reported to the Minister as follows:—

I have the honour to report for the information of the Minister that the exploration of the country now being made by Mr. Surveyor T. Kennedy proves the existence of more than one alternative route, which may turn out to be equal to, or better, than the direct tunnel scheme proposed by the Railway Commissioners. As it is a matter of vital importance that the best scheme, as regards economy of construction and traffic, should be laid before the Parliamentary Standing Committee on Public Works, I strongly recommend that the Committee be requested to defer the inquiry into the matter for a month, so as to give me time to get together all the necessary plans and sections.

To which the Minister replied:—

The Committee must fix its own time for the investigation.

On the 30th January, I wrote again—

Mr. Burge reports to me that the Minister, in my absence yesterday, sent for him and gave him instructions to put another surveyor on this work, in order that the plans might be ready for the inquiry by the Public Works Committee this day fortnight. It was my intention to put an extra hand into the field as soon as he could be profitably employed, but I thought it premature at present. Every effort will be made to get the whole matter completed at the earliest possible date, but I doubt the possibility of getting all surveys made, plans completed, and the matter carefully weighed and discussed with the Railway Commissioners by the date mentioned. It would be a great pity if, for the sake of a week or a fortnight, the matter should not receive the attention it deserves. My view is, that the best scheme should be picked out for recommendation to the Public Works Committee, and not that every scheme, either emanating from this Department or the Railway Commissioners, should be submitted for the Committee to choose which they like to adopt. All schemes will, of course, be laid before them; but I imagine that the Department should be prepared to advocate one particular scheme, and stand by it, and this can only be done if sufficient time is allowed to consider the matter thoroughly.

That minute was submitted to the Minister, who wrote:—

The statements in the above minute denote the course to be taken, but I am very anxious the Department should be ready by the day named.

I had already acquainted the Railway Commissioners verbally with what was being done, and had shown them sketches. When I had the plans and estimates fairly ready, I took them over to the office of the Commissioners and showed them to them. The Railway Commissioners saw the plans, but I was given to understand that they thought the matter had better stand over, as there was no extreme urgency, and they were investigating a line which would give very much better results than any of the proposals hitherto inquired into. Mr. Foxlee also saw my plans, and we talked the matter over together; but neither he, nor the Commissioners, seemed to trouble much about them afterwards, as they had such great expectations of a new route which was being tried, and which it was said could be made much more cheaply than the No. 3 route. Mr. Foxlee has always had ready access to my office, and I have put myself out over and over again to meet him. Appointments have been made and broken, because Mr. Foxlee has not been able to appear, and then fresh appointments have been made, as, I think, Mr. Foxlee will acknowledge.* When Mr. Eddy spoke to me during my interview with the Commissioners, he mentioned the No. 4 scheme, and gave me an outline of what was expected from it, namely, that it would cut out the 1 in 50 grade, and the whole of the 1 in 42 grade, and he added, that he believed that the work would be done at a low cost. I said that if such a scheme could be carried out for a moderate amount there was no doubt that it was well worth considering; but its scope was very much larger than that of the scheme before the Public Works Committee, and no doubt might be considered an improvement on that account.

2373. The Committee are to understand that you have, from time to time, placed before the Railway Commissioners the information at your command concerning both the No. 2 and the No. 3 route? Yes. The occasion to which I have referred was the last, I believe, upon which I had any conversation with the Commissioners about these matters, and since that time their attention seems to have been entirely absorbed in the new proposal.

2374. So that if Mr. Foxlee has stated that he is under the impression that no details of your scheme were ever submitted to the Commissioners he is in error? Yes. I should now like to make a few observations with regard to the No. 3 estimate which Mr. Foxlee criticised yesterday. Mr. Foxlee evidently entirely misunderstood that estimate. Why, I do not know, except, perhaps, that he may have had too little time to go into it, though that must have been his own fault, because I was always ready to see him, and could have given him any information he might have wanted. But as I have said before, his whole attention was taken up with the other scheme, and therefore he did not investigate this scheme any further. My estimate of cost for the No. 3 scheme, given to the Public Works Committee, was £186,318, inclusive of permanent way. That estimate embraced the cost of excavating and lining the tunnels, and the cost of the tunnel fronts and sanctuaries, though I understand that Mr. Foxlee yesterday stated that it did not do so.

2375. He stated that he could not gather from the information submitted to him, if any provision was made for these sanctuaries and fronts? The information was in Mr. Foxlee's hands. He must have misread it.

2376. Is there any definite statement as to sanctuaries? There is a detail which includes sanctuaries.

2377.

* NOTE (on revision):—This does not specially refer to the Zigzag matter, but I mention it to show how, at all times, I have done my very best to meet the convenience of Mr. Foxlee and the Railway Commissioners.

2377. But are the sanctuaries specifically mentioned? Yes, on a sheet attached to each estimate—the No. 3 estimate, and the No. 1 estimate. H. Deane,
Esq., M.I.C.E.

2378. And is there also a definite statement in regard to the tunnel fronts? Yes; I have put down for the tunnels £90,098, which is made up of £87,048 for lining, £320 for sanctuaries, and £2,730 for tunnel fronts. The details of the estimate, which I have furnished in black ink, totalled up to £181,072 10s., leaving a margin of £5,000 when compared with the estimate I had previously furnished the Public Works Committee. The estimate which I furnished the Committee for Mr. Foxlee includes earthworks at 2s. 6d. per cubic yard, culverts and box drains, £1,036, which I maintain is ample, the treatment of the stream diversion at the bottom of the lower points, £2,000; for level crossings, fencing, road diversion, and so on, £491; and tunnels, £90,098. The contingencies which I added, and which I understood Mr. Foxlee to say had not been added, amounted, in all, to £7,652, which is rather more than 5 per cent. on the whole, giving a total of £156,254 10s. To that I added £3,500 for supervision, giving a further total of £159,754 10s., to which I added the cost of permanent way, £21,318, making in all a total of £181,072 10s. The cost of the tunnels included the cost of sanctuaries and fronts. The price I put down for excavation was 10s. per cubic yard, and with such short tunnels the work can certainly be done for that. I put down the price of concrete at 36s., and of brickwork at 40s. per yard, and those prices are higher than we have already paid for the same work. As I had a margin of £5,000, and I thought those prices might be cavilled at; I have in a new estimate added an extra 4s. to the brickwork and concrete, putting down the brickwork at 44s. per yard, and the concrete at 40s. per yard, bringing the total estimate up to £186,911 19s., which is practically the same estimate as I gave to this Committee. I do not think that there can be any doubt whatever about the possibility of carrying out the work for my estimate. Mr. Foxlee yesterday appears to have referred to the accident at Bell. I never inquired into that matter, because I was not asked to do so, and, therefore, I cannot give any definite information about it; but I see that on the original working section of the line a 2-foot culvert was provided for. Now, I have provided nothing less than 3-foot and 4-foot culverts, and from the experience I have had in connection with lines in similar places, such as that going down to the Hawkesbury, for instance, I am quite sure that my estimate for waterways is more than ample. I am very sorry that Mr. Foxlee took upon himself to criticise the estimate, because I think it was entirely unnecessary. Although at first I did not care about saying anything of the estimate of the No. 1 scheme, now, since I have been distinctly challenged, not yesterday, but when mention was made about putting things on a proper basis, I have made out an estimate on my own account of that proposed deviation. Considering the difficulties of the case—the difficulties of the excavation and the heavy grade, which is heavier than the grade on the No. 3 line—there is not the slightest doubt that the prices asked for by the contractors on No. 1 line would be very much higher than those asked in connection with a line where there are short tunnels. I have obtained the opinion of contractors on this subject, and I am convinced that the prices I have put down for the No. 1 scheme, are, if anything, under the mark. I wish it to be understood, however, that I have not run willingly into this comparison. I was content to leave Mr. Foxlee to his own estimate, and I expected that he would leave mine alone. I have had charge of a good many works, and know what has been paid for them. I have a clear record in my office of all prices paid to contractors, and I am in a position to form a very fair comparative estimate of what work can be done for. All the information in my possession has been at Mr. Foxlee's disposal, and if he wanted to criticise my estimate he might have come to me and criticised it in my office, instead of criticising it here. My estimate for deviation No. 1 is over £240,000. It is rather difficult to fix prices for a long tunnel such as Mr. Foxlee proposes, because the conditions are unusual. In regard to what was stated some time ago that long tunnels were frequently made on heavy grades, I would point out that that is a mistake, because nearly all the long tunnels in the world are on easy grades. Perhaps a little bit at one end may be on a steeper grade; but as a rule these tunnels are on easy grades. This particular tunnel, however, has a grade of 1 in 50, and while some portion of the waste material will be taken out at the bottom end, the bulk of it will have to be lifted up through the shafts, or taken to the top end of the tunnel against the grade. It must, therefore, be clear to anyone of common sense that the cost of the work will be heavier than where you can tip the stuff down a bank at the mouth of the tunnel, or even half a mile away. One contractor told me that in his opinion the excavation of the long tunnel would cost four shillings a yard more than the excavation of the short tunnels, while the lining would be about the same. Another told me that the cost of the lining would be materially increased, and a third with whom I spoke dilated on the difficulty of the work, the troubles in regard to ventilation, and so on. I furnished yesterday, or on Friday, a detailed estimate of the No. 1 scheme based on the following prices:—Excavation, 12s. 6d. per yard, instead of 10s. a yard, which is undoubtedly too low; brickwork, 55s. a yard, and concrete 50s. a yard. That brings the total up to £240,489 1s. Taking the opposite extreme, however, and assuming that the contractor was right who said that the cost of the brickwork and concrete would not be increased, I have run over the estimate again, and put down the brickwork at 44s. a yard, and the concrete at 40s. a yard, as in my last submitted estimate for No. 3, allowing 14s. for the excavation, and charging the whole of the cost of the extra difficulty to it, instead of dividing it over the various operations. The cost of the tunnel per lineal yard reckoned in that way comes to £67 16s. 10d., as against £68 16s., reckoned the other way. So that applying the revised prices to fronts, sanctuaries, and so on, I bring the total up to £240,117 15s. 9d. That is considerably over Mr. Foxlee's estimate. As I said before, I did not want to make this comparison. I would sooner have discussed the matter in my office, but I have not seen Mr. Foxlee there for some time. He has been entirely engaged on this new scheme. I am quite sure that if comparative tenders were called for the two lines and they were both worked up to the same extent, the proportionate amount that would be put in by the tenderers would be about what I have given.

2379. Then you have come to the conclusion that the No. 1 scheme would probably cost £240,000, while the No. 3 scheme could be constructed for the amount you originally put before the Committee—£186,900? Yes.

2380. Have you any information concerning the No. 4 scheme? No; I do not know anything about it.

2381. Mr. Foxlee yesterday told us that the proposed No. 4 deviation would leave the main line at Bell, skirting the ridge until it reached the trigonometrical station, or somewhere near there; then tunnelling to the head of Farmer's Creek, and running down that valley until it joined the main line on the flat piece at the end of the 1 in 50 grade. The length of this line would be 8 miles, cutting out 9 miles 10 chains of existing line, and doing away with the 1 in 42 grade up the Zigzag, the 1 in 50 grade up the Bell bank, and the 1 in 33 grade on the down journey. The maximum grade would be 8 miles, and the estimated total cost £250,000 for a double line. There would be two tunnels, having a total length of about

H. Deane,
Esq., M.I.C.E.
3 April, 1894.

about 2,300 yards. Upon such data as that, would you care to express an opinion as to whether the line could be constructed for the sum named? I could not give you an opinion; but I think it is to be very much regretted that the Railway Commissioners did not ask me to do the work, because I could have proved the practicability of the line in three days, though I do not say that I could make a survey in that time. A surveyor proved the practicability of the No. 3 route in one day.

2382. As a matter of fact, your surveyor did commence to explore the route, but finding the Commissioners' surveyors already in the field, he was withdrawn to save even an apparent conflict? Yes. I do not know, however, that I should have searched as far north as the Commissioners have gone. I would not say that the new line would have been discovered by my surveyors, because the desire seemed to be to improve the line between Dargan's Creek and the lower points, though it is possible that the surveyor might have suggested something else. If, however, the Commissioners had asked me to look into a suggested route, starting from Bell, and running along to cross into Farmer's Creek, I should have been very glad to have done so, and with the experienced officers I have, I could have proved its practicability in three days.

2383. I suppose if the details furnished to Mr. Foxlee to enable him to come to the conclusion which he has come to in regard to the line were furnished to you, you could arrive at an opinion as to its probable cost, and so on? I should require to see the plans and sections probably, because I know that the work going up Farmer's Creek would be very heavy. Starting where Mr. Foxlee's surveyors do, from the 93 miles, that is, about a quarter of a mile below the 1 in 42 grade, and running up Farmer's Creek, you would have to commence with a very big bank. I do not know how steep it would be, because I have not the levels; but I should think it would be from 50 to 80 feet high.

2384. Suppose you received instructions to try the country between Bell and the 93 miles, *via* Farmer's Creek, how long would it take you to get the information necessary to put such an estimate before the Committee as they should have? It would depend very much upon the difficulties. I spoke just now about the easiness of forming an opinion as to the practicability of the line, though that apparently has only been proved within the last day or two, and from what Mr. Foxlee says, he evidently prefers the No. 1 proposal. It is a pity that so much time should, under the circumstances, have been lost in making this survey.

2385. If, at a cost of £250,000 you could cut out all the existing heavy grades and curves, would the expenditure be worth it? I am not in a position to give an opinion on that point; but if it would be worth while spending £225,000 on the No. 1 scheme, it would be much more worth while to spend an additional £25,000 on the No. 4 scheme. If the No. 4 line could be carried out for £250,000, I think that it is probably the line which should be adopted.

2386. Is there anything else that you would like to state to the Committee? I do not think so.*

WEDNESDAY, 4 APRIL, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTON.

The Hon. JAMES HOSKINS.

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JOHN DAVIES, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

THOMAS THOMSON EWING, Esq.

WILLIAM CHANDOS WALL, Esq.

WILLIAM MCCOURT, Esq.

JOHN CASH NIELD, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES COLLINS, Esq.

The Committee further considered the proposed Deviation to avoid the Lithgow Zigzag.

Henry Deane, Esq., M.I.C.E., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

H. Deane,
Esq., M.I.C.E.
4 April, 1894.

2387. *Mr. O'Sullivan*] Mr. Foxlee, in his evidence, laid stress on the fact that your proposed culverts or waterways would not be sufficient to take off the water from the gulleys you propose to cross, which he seemed to think would require some very extensive viaducts, increasing the estimated cost of the culverts from £4,000 odd to £14,000. I should like to hear your opinion upon the matter? It is quite a mistake. I mentioned, when previously examined, that there would be one high bank; but it is no higher or heavier than one of the banks on the line to the Hawkesbury, and consequently there can be no more difficulty in constructing it. The amount allowed for culverts is £4,036, which is in addition to what I have put down for the cost of the stream diversion, and the stream tunnel at the lower end, that is to say, I have allowed £1,000 for the waterways between Dargan's Creek and the top end of the long tunnel, or nearly £1,000 a mile, which is a larger average estimate than has been found necessary in connection with any other line which we have constructed. When it is considered that there are no long water-courses bringing down a large volume of water to cross, it will be seen that the provision is ample. In similar country small waterways have been usually made with small stone culverts, about 2 feet square. On the Hawkesbury line there are a great many such culverts. The larger waterways are dealt with by means of brick culverts, and there is one stone culvert. On this line, however, I do not propose to use anything less than a 3-foot culvert.

2388. Mr. Foxlee laid stress on the Bell accident, and mentioned that the culverts there were only 2 feet wide. I understand that you propose to make your culverts more than 3 feet wide? The smallest culvert is 3 feet wide.

2389. You think that such culverts will be ample to carry off the water coming down the gulleys? I am sure of it.

2390. There will be no occasion for expensive viaducts or work of that character? No. I have provided sufficient in the earthworks to fill up all the embankments. Embankments, I might point out, are far better

* NOTE (on revision) :—I should like to add that I have been given to understand that Mr. Foxlee stated that I had taken 26 feet as the width of my formation instead of 28 feet. If he made that statement nothing can have been more uncalled for. Mr. Foxlee knows that my practice is to use a width of 18 feet for single line and therefore 29 feet for double. These widths have been adopted on all the newest railways, the Kiama to Nowra, Lismore to the Tweed, Cootamundra to Temora, Molong to Parkes and Forbes, Milson's Point Extension, and Marrickville to Burwood Road Railways. It will be observed that my formation is thus 1 foot wider than Mr. Foxlee's.

better, more secure, and more durable than any class of viaducts. A stone or a brick viaduct will last a very long while; but there could be nothing better than a stone embankment, and this embankment will be composed of broken stone.

H. Deane,
Esq., M.I.C.E.
4 April, 1894.

2391. It has been pointed out, I think by Mr. Foxlee, that your grade of 1 in 60 will be of no greater advantage than a grade of 1 in 50, because there will still be the hill between Dargan's Creek and Bell to climb? I am surprised to hear that idea expressed. The practice in engineering, where you have a ruling grade, is not to put that grade in wherever you can, but to cut it out wherever you can do so and get the best grade possible. Where the grade is good you can get along better, because there is less strain on the engines, couplings, and so on. As I pointed out before a grade of 1 in 50 in the open is better than 1 in 50 in a tunnel, because the same engine will not draw the same load at the same speed in a tunnel, where the rails are probably greasy, as it will draw in the open. The greasiness of the rails makes an immense difference to the load which an engine can draw, and it is most desirable, not only on that account, but also because of the inconvenience caused by the extra production of smoke and other products of combustion when an engine is exerting its full power, to avoid constructing a tunnel upon the ruling grade.

2392. Mr. Foxlee holds the opinion that the addition of culverts and other improvements which would be necessary upon your line would bring up the cost to probably £200,000, while he contends that his estimate may be reduced eventually to about the same amount? I said yesterday that I did not want to attack Mr. Foxlee's estimate or to have anything to say in regard to it. It is the estimate which has been submitted to the Legislative Assembly, and I did not wish to refer to it; but since my estimate has been attacked I must make a comparison. I consider that Mr. Foxlee was very unwise to attack it, because it leads me to show that he is utterly in the wrong. I think I have already explained that it is not at all necessary to add to my estimate, because I have included everything that could be included, with, perhaps, the exception of the signalling arrangements, the cost of which Mr. Foxlee puts down at £500, but which ought not to cost so much. The removal of the existing signals, and their erection at Dargan's Creek, could be done for very much less than £500. While £500 might be the cost of providing entirely new signalling arrangements, it could not be the cost of refixing or renewing the present arrangements. Mr. Foxlee seemed to be under the impression, or chose to look at it from that point of view, that the construction of short tunnels, where the grade is lighter and the disposal of the spoil easy, would cost as much per cubic yard as the construction of a tunnel $1\frac{1}{2}$ miles long with a steeper grade, where all the stuff would have to be taken up that grade, or lifted up shafts 300 or 400 feet deep. The thing to me is so absurd that I cannot understand anyone taking that view.

2393. You are confident that your estimate will not be exceeded? I am confident that my estimate is a fair one, and that there is no necessity to add any further items. I have included everything, and my estimate of £186,000 will compare with the estimate of the No. 1 scheme which I submitted yesterday—£240,000.

2394. One of the reasons for the origination of this work was the possibility of finding employment for those out of work. How many men could find employment on the No. 1 and the No. 3 schemes respectively? I will furnish you with a statement giving that information*.

2395. In your opinion, how long will it be safe to work the Zigzag? I consider that it will always be safe, but it is rather a matter of convenience in working the traffic. With precaution, it will be as safe in the future as it has been in the past; but every year, as the traffic increases, it will be more inconvenient.

2396. I understand that you think that it will always be safe to run over the Zigzag if ordinary care is taken? Yes.

2397. But, looking at the matter from the traffic standpoint, you think that as years roll by the inconvenience will increase? Yes.

2398. We have it in evidence from Mr. Whitton, who was very strong on the point, that he sees no necessity for a change, that the Zigzag would be quite as good in the future as it has been in the past. Do you agree with him? I have officially no information as to the traffic there.

2399. It would appear from the experience of the last twenty-four years that the Zigzag is by no means dangerous? No, I should say not.

2400. Ordinary care being taken, the Zigzag is no worse than any long, steep grade? When you say ordinary care, you mean care considering the construction.

2401. Yes; care such as is taken now? Yes.

2402. Mr. Davies.] You see no reason to alter the opinion you stated yesterday that Mr. Rock's scheme would cost at least £500,000? I have not been able to go into the matter further, because I have had nothing more than Mr. Rock's plan and section to go upon.

2403. Having examined all the details furnished to you by him, you have arrived at the conclusion that the line would cost somewhere about £500,000? I do not think I put it in that way. I said that I thought it would scarcely be done for less. It might cost more.

2404. Do you know of any advantage which his suggested route has over the other routes, which have been submitted to the Committee? No. I think it would be a great pity to do away with such a long section of the existing line as he proposes to cut out. If there had been no difficulties to encounter, the line would probably have been taken in that direction originally; but no doubt the cost of tunnelling prevented it.

2405. You do not see any good reason for adopting his suggestion? No.

2406. I think you stated that Mr. Rock's survey was part of an old survey made by the Railway Construction Department? I said that the Department had had surveyors out there, and that lines had been run down Mount York. The sides of Mount York have been utilised for getting down into the Hartley Valley.

2407. Can you say why the line was not carried that way? It must have been the cost of the tunnelling.

2408. You do not recommend Mr. Rock's scheme, because of its expense, and the large section of existing line which it would cut out? That is so.

2409. Do you regard 4s. 8d. per train mile as an excessive or as a reasonable amount to take in estimating the saving to be effected by cutting out the Zigzag and adopting the No. 1 deviation? That is a matter upon

* NOTE (on revision) —I am of opinion that the number of men, miners, or rockmen and labourers, which could be employed shortly after the work commences, would be,—in the case of No. 1 scheme, about 200 men, and in the case of No. 3, about 600.

H. Deane,
Esq., M.I.C.E.
4 April, 1894.

upon which I have some diffidence in expressing an opinion. I do not know the whole of the circumstances, but as a rule, if a small portion of a line is cut out—say, a mile or two—the whole cost per train mile is not put against it; but it may be correct to charge it where you do away with a whole section, such as that between Bell and the lower points. If it was merely a question of cutting out a small portion of the line, such as the Zigzag itself, making no alteration in the length or number of the trains, it would be excessive to charge 4s. 8d. I have not the particulars before me; but I believe it has been stated that the doing away with the Zigzag will reduce the number of trains required by the Department, and I do not know that I am prepared to advance any objection against the charging of 4s. 8d. for the trains which are got rid of; but when you come to compare the running of the same number of trains over a line which happens to be a mile or two longer, it is decidedly wrong to charge 4s. 8d. for the extra mileage.

2410. Then you would regard 4s. 8d. as an excessive charge against the cutting out of the Zigzag? I do not say that. To part of that estimate I am not prepared to offer any objection; but when you compare one line with another which is a mile or two longer, it is not fair to charge 4s. 8d.

2411. You prepared a detailed estimate of the whole of the work necessary for carrying out the No. 3 scheme? Yes.

2412. Do you know the quantities to be taken out of the cuttings and excavations? They have been taken out in detail; the total is very easily obtainable from the estimate. If the total cost of the excavation is multiplied by eight, it will give the number of cubic yards excavated.

2413. Do you remember what was Mr. Foxlee's estimate for the tunnel per cubic yard? 10s. for the excavation, and that is the price to which I principally object. 10s. is the price for which we have had tunnel work done, and which I have put down for the short tunnels on the No. 3 line; but it is quite clear that it would not be enough for the No. 1 tunnel.

2414. Has 10s. been the usual price paid by your Department for this work? We have had various prices.

2415. Have you had the work done for less than 10s.? No; 10s. is the lowest price.

2416. On the No. 3 scheme there are a number of short tunnels giving a great many faces, and that is why the work will be done more cheaply than on the No. 1 scheme? Yes; and there will not be so far to haul the stuff.

2417. The grade would be easier? Yes.

2418. On the No. 3 scheme there are seven small tunnels? Yes.

2419. That would be fourteen faces, while there would only be two faces for the long tunnel on the No. 1 scheme? There would be more faces than that, because each shaft would give two faces; but they would lead to extra expense, because the stuff that came out of the headings would have to be lifted up the shafts.

2420. That would increase the cost of the large tunnel? Yes. Then in the long tunnel the ventilation would have to be looked to very carefully, while with the short tunnels it is probable that no special ventilation would be required.

2421. You based your estimate of Mr. Foxlee's scheme upon the ruling rates, which you used in connection with your estimate of the No. 3 scheme? Yes. I put the cost of lining down as the same in each case, though I am of opinion that it would cost more in the long tunnel; but I made a difference of 4s. a cubic yard, or about £12 10s. per lineal yard, in the cost of excavation.

2422. But generally you applied the same rates as you applied to your own scheme? Yes, except for the tunnel excavation. Of course, if you get other opinions in regard to this matter, some experts may say, "You should put a little more on to the cost of the lining, and take a little off the excavation"; but you will find that the prices I have put down provide for a fair comparison.

2423. I suppose you saw Mr. Foxlee's statement that you were very short in many of your items? Yes.

2424. You are still of opinion that you fully estimated the probable cost of the No. 3 scheme? Yes. You see, I did not leave out the items which Mr. Foxlee thought had been left out. I am sorry he did not come to see me in regard to the matter. Whenever there has been a difference of opinion between us, Mr. Foxlee has generally come to see me in regard to it; but on this occasion he did not do so.

2425. *Chairman.*] You have already explained that the items were down on the list which you furnished to him? Yes, and if he did not understand the sheet, it would have been very easy to ask me to explain it. It is so clear that I have taken into consideration the costs of fronts and sanctuaries that it should not have been overlooked.

2426. *Mr. Davies.*] Have any representations been made to you by the Traffic Department in regard to the inconvenience arising from the Zigzag? Of course; it has always been looked upon as a desirable thing to get rid of the Zigzag, and some time ago a survey was suggested, but, after some little inquiry, the matter was allowed to stand over.

2427. Were representations made to the effect that the traffic had very largely developed, and the present road was not sufficient to carry it? I do not remember what was said at the time.

2428. There have been no representations made to you to the effect that the existing line is not sufficient for the traffic? No, not to me. I presume representations have been made from time to time, or else the idea of cutting out the Zigzag would not have originated.

2429. Is it not a fact that the object of cutting out the Zigzag is to save working expenses and haulage, rather than to facilitate the carriage of goods and traffic? I do not think it is proposed so much in the interests of the senders of goods or of passengers as in the interests of the traffic.

2430. To reduce the cost of haulage in working trains across the mountains? Yes.

2431. You do not care to express an opinion as to whether the existing line is sufficient for the traffic? No. I can see many advantages to be obtained by cutting out the Zigzag, but I cannot say whether they would counterbalance the expense. It is a matter I have not been consulted upon.

2432. *Mr. McCourt.*] If Mr. Foxlee says that you threw out a challenge to him over this matter, is his statement correct? I should like to know how I could throw out a challenge to him. My office is that of Engineer for Railway Construction, while Mr. Foxlee is Engineer for Existing Lines. If Mr. Foxlee, who is not Engineer for Railway Construction, stated that he had thrown out a challenge to me, it would have been a different thing.

2433. Do you think that it would be an advantage to have the Construction and Maintenance Branches of our railway system under one head? That is a matter of general policy upon which I would rather not give an opinion.

2434. *Mr. Neild.*] Would the No. 3 scheme cost less if it were carried out on a grade of 1 in 50? That would not make a great difference in the cost. If a grade of 1 in 50 were adopted I could reduce the

- the length of the 768 yards tunnel, but it would not make any real difference in regard to the other tunnel. I consider that 1 in 60 is the most economical grade. H. Deane,
Esq., M.I.C.E.
2435. If the grade were 1 in 50, would it make a difference of £5,000? I doubt it. I think the only real difference it would make would be in the length of the lower tunnel and in the cutting. 4 April, 1894.
2436. While the tunnels might be a little shorter, there would be more embankment to make? Yes.
2437. So that the saving would not be very great? No; I do not think it would be more than £2,000 or £3,000.
2438. Which would be more than counterbalanced by the increased facility of working given by a 1 in 60 grade? Yes.
2439. You are acquainted to some extent with the new northerly route which has been found by Mr. Foxlee's surveyors? Yes.
2440. Do you think it superior to your No. 3 route? I could not say until I had seen the details. What I said yesterday was that if the line could be taken that way for £250,000, that route would be preferable to the No. 1 route.
2441. But would it be preferable to the No. 3 route? That depends upon whether the advantages turn out to be as great as are hoped for. I have no data upon which to form an opinion, however.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, sworn, and further examined:—

2442. *Chairman.* You were asked yesterday to furnish the Committee with a statement of the probable savings which would be made if the No. 4 route were adopted. Have you got that information? Yes; it is contained in the following letter, and accompanying statement, which I will read:— H.
McLachlan,
Esq.

Sir, Government Railways of New South Wales, Secretary's Office, Sydney, 4th April, 1894. 4 April, 1894.

In compliance with the wish of the Public Works Committee that information might be afforded as to the saving likely to be effected under the No. 2 scheme being investigated for the Railway Commissioners, I am directed to say that owing to the unforeseen delays occasioned through the inclement weather retarding the completion of the surveys, the country also being of a very rough character, the Commissioners have only had submitted to them rough plans and estimates in connection with the alternative scheme in question.

Speaking generally, the cost is estimated to range from £200,000 to £250,000; but it is hoped that careful inquiry may show that the work could be carried out at the lower sum.

With regard to statement relative to the effect on the traffic working, I have to attach a return compiled by the principal officers on the same lines as the previous one, based on the approximate results of the scheme so far as at present can be ascertained from the progress survey. I have, &c.,
H. McLACHLAN,
Secretary.

The Secretary, Public Works Committee.

Proposed Lithgow Zigzag Deviation.

During the year ended 31st October, 1893, there were run:—

2,370 Down goods trains, and
2,192 Up " "

Total, 4,562

No. 2 Scheme.

By cutting out the Zigzag and the 1 in 33 grade against traffic going west which now exists between Dargan's Creek and Clarence siding, not more than 1,420 down and 1,624 up goods trains (total, 3,044) would be required to haul the same aggregate number of waggons; hence there would be a saving of 1,518 trains x 11½ miles (the distance between Bell and Eskbank)=17,647 train miles, which, at 4s. 8d. per mile, would effect a saving of	£4,117
In addition to the foregoing, in consequence of the shorter route, there would be saved on each of the 3,044 remaining trains 1½ mile per train (total, 3,424 miles), each at 4s. 8d. per mile	799
A similar saving would be effected on 1,404 regular passenger trains=1,579 train miles, each at 4s. 8d. per mile	368
Saving in connection with non-use of push-up engines, it being proposed by the Commissioners to use engines which will take full loads without assistance on 1 in 60	2,345
Estimated saving due to the shorter time of engine-drivers and guards on duty, to the avoidance of delays to trains, and to the practicability of men being run through on goods trains from Penrith to Bathurst and vice versa without incurring unreasonable hours or overtime (fifty minutes on up and down journey)	2,500
At the present time it is the practice to take the same load through from Eskbank to Penrith, owing to the inconvenience of breaking up trains, consequent loss of time, &c., and serious delay to traffic rendering the alteration of load at Bell and Katoomba undesirable; if the load is increased from Eskbank, it would be taken through from Eskbank to Penrith, and the benefit of this proposal would be practically that between Eskbank and Katoomba 563 ordinary trains would be saved—equal to the train mileage of 9,656, which, at 4s. 8d., would be equal to	2,253
Between Katoomba and Penrith the adoption of the larger through train loads as against the limited loads of to-day would mean a saving of 18,176 train miles, equal to a further saving of	4,240
	£16,622
Less for extra maintenance on the 16 miles of double line as against 11½ of single line at present, at £230 per mile	1,035
	£15,587

NOTE.—The above estimate of saving upon present working is based upon the assumption that the load of up trains will be limited to forty waggons.

Harry Richardson, Esq., Out-door Superintendent, Department of Railways, sworn, and further examined:—

2443. *Chairman.* Since you were last examined by the Committee, you and other officers of the Railway Department have consulted together as to the probable savings which would be effected if the No. 1 route were adopted, and you have amended your original estimate so that the saving is now estimated at £18,000 per annum instead of, as formerly, £10,000 per annum? Yes. H.
Richardson,
Esq.
2444. *Mr. Humphery.* In arriving at the revised figures had you the advantage of consulting the Commissioners or any of the officers of the Department? Yes. 4 April, 1894.
2445. Will you give the names of the gentlemen who have assisted you in arriving at the revised estimate? Yes; Mr. Foxlee, Mr. McLachlan, Mr. Thow, and Mr. Stanger.
2446. Mr. Stanger is an officer of the Department, I suppose? Yes.

2447.

H.
Richardson,
Esq.
4 April, 1894.

2447. Do you think that £18,000 may be regarded as a fairly correct estimate of the saving which would be effected if the No. 1 proposal were adopted? Yes.
2448. In your former statement you estimated the saving at £10,000, but you confined your calculations to the section between Eskbank and Bell; now your calculations extend to the whole line between Eskbank and Penrith? Yes; the revised estimate includes a consequential saving which represents the advantage gained by taking an increased load over a longer distance.
2449. Will you explain how you make up the difference between £10,000 and £18,000? Yes. The practice hitherto has been to take on the average twenty-nine trucks on each train from Eskbank to Penrith; but if the Zigzag were cut out we should be able to take forty trucks, or eleven trucks more than we take now, which would result in a saving of 568 trains between Bell and Penrith.
2450. And that is estimated at what? £6,493.
2451. There is still £2,000 to account for? In giving my former estimate I included the cost of the services of a push-up engine right through the long tunnel; but, upon going into the matter again with our professional gentlemen, I found that they were of opinion that, with the engines which would be used, we could dispense with the services of push-up engines and save £1,500.
2452. You would dispense with push-up engines altogether? Not altogether. We propose to use them on the I in 42 grade, and as far as the mouth of the tunnel.
2453. You would still require a push-up engine as far as the mouth of the tunnel? Yes; one. We have three such engines now.
2454. You would effect the saving by leaving the train at the western end of the tunnel, instead of pushing it up to Dargar's Creek? Yes.
2455. So that your estimate of savings has been increased by £8,000. Will you show how that amount is divided between the traffic, the locomotive, and the permanent way departments? We have taken the average cost per train mile for the whole railway system, 4s. 8d. The permanent way charges amount to something like 15d. or 16d. a mile, the locomotive charges to 1s. 10d. a mile, and the traffic charges to be between 16d. and 17d. a mile.
2456. In an estimate submitted by Mr. McLachlan yesterday, £3,000 is put down as the estimated saving "due to the shorter time of engine-drivers and guards being on duty." I understand that there will be a saving of about an hour on the journey? Yes.
2457. Would that time be taken into consideration in the estimate of 4s. 8d. per train mile? Yes, that is the average cost for all our lines.
2458. Then are you not charging it twice? I do not think so. This is an exceptional piece of line, and it takes us more than twice as long to work over ten or eleven miles here as it does to traverse a similar length anywhere else. The delays occasioned by breaking up the trains at Bell slowing down the Zigzag, and remmarshalling at Eskbank make up more than an hour, and are quite apart from the ordinary train running.
2459. I understand this to be the case: that, although in the average cost of 4s. 8d. the time of journey has been taken into consideration, yet, owing to the exceptional nature of the service over the Zigzag, you are entitled to take credit for an additional saving. Is that so? Yes.
2460. I wish to know how you make up the estimated saving of £8,000 on the Lapstone tunnel? During the last fourteen and a half months we have reduced the number of trains running between Katoomba and Penrith by 1,033, which is equal to a reduction in the train mileage of about 85,191 miles.
2461. Has the volume of traffic been the same? Yes. I am now speaking of actual returns. Had we taken the same average number of trucks per train for the previous fourteen and a half months, we should have needed 1,033 more trains.
2462. And that makes a saving of what? £8,200.
2463. The cost of cutting out the Lapstone Zigzag, you said, amounted to £40,000? I think that was about the cost.
2464. Assuming it to have been £50,000, the interest at 4 per cent. per annum would be £2,000, so that the actual saving would be £4,780 per annum? Yes; we should have to spend that amount more if the Zigzag had not been cut out.
2465. You are quite clear about these figures. You can be under no misapprehension in stating that the country benefits to the extent of £4,780 per annum after providing interest on the cost of cutting out the Zigzag? Yes. In my office I have a record showing the number of trucks taken by every train going over the line.
2466. And you have worked out the figures in detail? Yes.
2467. Now let us pass to the Commissioners' second proposal. You are aware that that proposed line would do away with the existing line between the 85 and 94 miles, substituting 8 miles of new line with a grade of 1 in 60;—have you estimated what would be the saving on that line? Yes. My figures are similar to those handed in by Mr. McLachlan.
2468. You estimate that the probable saving will be £15,587 per annum? Yes.
2469. Were you present when the estimate was being discussed by the officers of the department? Yes.
2470. Did you take into consideration the advantage which would be gained by passing a larger number of trucks over a grade of 1 in 60? No. We have put down the load as the same in each case.
2471. But on the new line you could take a larger number of trucks than on the No. 1 line? Certainly,
2472. How many more? Eight more a load.
2473. Would there be any advantage gained by taking forty-eight trucks over the Commissioners' No. 2 line instead of forty trucks over the No. 1 line? No; because we consider forty trucks the maximum load for a train coming over the mountains. If we took forty-eight trucks over that particular piece of line we should have to take off eight of them at Katoomba, which, if we were carrying live stock, would not do. We endeavour, as far as possible, to get a ruling load from one point to another, and we have taken forty as the ruling load for that section.
2474. What is your maximum load on the up journey as far as Eskbank? Thirty-five from Bathurst to Eskbank with the assistance of a push-up engine from Wallerawang to top of Marrangaroo Bank.
2475. Do you never bring more than thirty-five trucks to Eskbank? Yes; we have brought up as many as thirty-eight and forty-one trucks from Wallerawang to Eskbank.
2476. Then what advantage do you hope to gain by being able to take forty trucks from Eskbank to Penrith? We can always get coal at Eskbank, so that if we brought thirty-five trucks of wool from Bathurst we could make up our load at Eskbank with five trucks of coal.
2477. In making up your estimate have you confined your attention to the traffic from Eskbank? Yes; nothing west of Eskbank has been taken into consideration.
- 2478.

H.
Richardson,
Esq.
4 April, 1894.

2478. You have not taken credit for the traffic right through? We have not taken credit for a truck beyond Eskbank.
2479. You estimate that you will always have a load of forty trucks over the mountains? Yes.
2480. Therefore it will be no advantage to be able to take forty-eight trucks over any particular part of the line? That is so, because we should only have to detach them further on.
2481. If the Commissioners' No. 2 proposal were adopted you could take forty-eight trucks from Eskbank to Katoomba? Yes.
2482. Would there be any advantage in doing so? There would be very little advantage?
2483. Then there would be no great advantage in getting a grade of 1 in 60 through the tunnel instead of a grade of 1 in 50? There would be an advantage, because there would not be so much pulling for the engine to do. It is better to have a 1 in 60 than a 1 in 50 grade if you can get it.
2484. Assuming that the curves on the Commissioners' No. 2 proposal are 15 chains radius, which do you think would be the better for traffic purposes—the No. 1 proposal or the Commissioners' No. 2 proposal? If we confine ourselves to loads of forty trucks, I would prefer the No. 1 proposal, because of the shorter distance.
2485. For purposes of traffic, which do you think would be the better? The No. 1 proposal.
2486. Will you explain why? Because it would mean a saving in distance, and to the down traffic the tunnel would be no disadvantage. The little disadvantage that it would be to the up traffic would be more than counterbalanced by the advantage it would be to the down traffic.
2487. How many trucks do you think you could take through the tunnel on the No. 1 route without the help of a push-up engine? I have no hesitation in saying that we can take forty-five, but forty would be our load. I have been up the bank from Dargan's Creek where there are 8-chain curves, and got over the summit of the hill, with forty-eight trucks, at a speed of nine miles an hour.
2488. At Katoomba you split the train? I am speaking of a trial train which was taken over the line at the time of the Baldwin engine inquiry.
2489. *Mr. Ewing.*] By a Baldwin engine? Yes.
2490. *Mr. Humphery.*] What is your estimate for the saving occasioned by dispensing with push-up engines on the Zigzag? £2,345.
2491. You have taken that into consideration in your estimate? In estimating the Commissioners' No. 2 proposal I have taken credit for £2,345, but I have only taken £1,500 in estimating the saving in connection with the No. 1 proposal, allowing £800,800 for the services of push-up engines.
2492. What would be the saving on the No. 3 proposal, crediting it with all the items comprised in the revised estimate of the saving on the No. 1 proposal? £15,100.
2493. In round figures, £3,000 less per annum than on the No. 1 proposal? Yes.
2494. Have you taken into consideration the additional interest which would have to be met on the No. 1 proposal? I do not know the estimated cost of the No. 3 proposal.
2495. Then you have not taken it into consideration? No.
2496. Supposing the difference in cost was £60,000 in favour of the No. 3 proposal, the interest upon which would be £2,400 a year, the actual annual saving upon the two lines would be almost the same? Yes.
2497. Assuming this to be the case, which would be the better line for traffic purposes? I do not see much difference between Mr. Deane's and Mr. Suttor's line, so far as the amount of saving of money is concerned.
2498. But take Mr. Foxlee's line? I think it is the best.
2499. How is it better than the No. 3 line? Because there is the saving in distance.
2500. But have you not taken that into consideration in your estimate? Yes.
2501. Where then does the superiority of that line come in, seeing that you have already taken full value for the saving in time? By the increased saving of train miles.
2502. Leaving out the advantage in distance, because you have already taken credit for it, in what other respects do you consider the No. 1 proposal superior to the No. 3 proposal? In no other respect.
2503. Then, so far as savings go, the No. 1 proposal possesses no advantages over the No. 3 proposal? No.
2504. Therefore, the Committee may regard the two lines as on the same footing in that respect? Yes.
2505. *Mr. O'Sullivan.*] Do I understand that you have added the consequential saving already referred to to your estimate for the No. 3 line as well as to your estimate for the No. 1 line? Yes; all the estimates are on the same basis.
2506. What did you estimate the saving on the No. 3 line before? I did not give any figures, I confined myself to the No. 1 proposal.
2507. In making your calculations, have you taken into consideration the interest on the cost of that portion of the original line which will be rendered useless? Yes, in our earnings. We do not propose to reduce the earnings. Assuming that we are now paying a certain sum for interest charges, and adding £8,000 to that sum, we still get a saving providing the working expenses are reduced, as shown in our estimate. I do not know what else we have to consider.
2508. But you did not touch the question of the money lying idle? I do not think that has anything to do with it.
2509. It seems to me that you and your colleagues are not taking the interest on the cost of the Zigzag into account? No.
2510. *Chairman.*] Because the earnings of the line will meet it? Yes.
2511. *Mr. O'Sullivan.*] In giving an answer to Mr. Humphery in regard to the saving effected by the construction of the Lapstone tunnel, you made no allowance for the interest on the cost of the original Zigzag? No; we only take the new interest, which we put against the reduced expenditure.
2512. In speaking about the Commissioners' No. 2 proposal, had you something like definite data to go upon? Yes; we have been furnished with certain information. I was told that that line would have a grade of 1 in 60, though I have not seen any sections or plans.
2513. The plans have not yet been worked out, and so far as we can gather, the cost of the line is a mere approximation? I have not seen the plans, sections or estimated cost.
2514. *Mr. Davies.*] The only way in which you appear to be able to reconcile your evidence of to-day with that of a fortnight ago is by saying that you have discovered that in running trains through from Eskbank to Penrith, the saving is larger than if you only take the deviation into consideration? Yes; we take credit for increasing the train loads as far as Penrith.
2515. Had you not the same information before you when you last gave evidence as is now in your possession? Yes; but I then confined my remarks to the saving that would be effected between Bell and Eskbank. I did not take any consequential saving into account.

H.
Richardson,
Esq.
4 April, 1894.

2516. Did not the officers who prepared the first statement meet to prepare the new statement? Yes.
2517. They had the same information at their disposal on the first occasion as was before them the day before yesterday? Yes; they had the same figures to go upon.
2518. Whose idea was it to step out of the ring and include the running as far as Penrith? I do not know whose idea it was; but the suggestion was made that we should take credit for the running right through.
2519. Would not the same principle apply if you went as far as Parramatta? No; because beyond Penrith we take on another ten trucks.
2520. By reason of the easier grade between Penrith and Parramatta? Yes.
2521. During the time you have had charge of the Western line, have you had occasion to make representations to the Commissioners about the road over the mountains not being equal to the traffic? Yes.
2522. When did you make those representations? Attention has been drawn to the congested state of the traffic on several occasions, and I have had diagrams prepared showing how it is congested.
2523. What is the greatest delay which has taken place? I could not say without looking at the books, but there have been serious delays—whole hours.
2524. But is it not usual to have such delays when trains have to meet? There are delays where trains have to meet, but, where there are several trains meeting one another, if one train loses time, it puts all the others out. I have a diagram here showing the working of the trains on this line.
2525. Could not the Commissioners prevent that congestion by putting in sidings? That has been done.
2526. Where? At two or three places. An additional crossing-place was put in at Linden, though I cannot say if that was done since the Commissioners came here. There have also been additional crossing places put in at Woy Woy, Wyee, and other places to prevent delays.
2527. Have any new sidings been put in on the mountains? I cannot recollect that any new sidings have been put in there.
2528. Would it not facilitate the traffic very much if additional sidings were put in there? No doubt shorter sections on some parts of the line would facilitate working.
2529. Would it not very much assist the traffic and prevent delays on the mountains? No; for the simple reason that we are tied up by the Zigzag. When we get through there we are alright; but we cannot get the trains through there easily.
2530. How long does it take the trains to go through after you have divided them? It takes on the average ninety minutes to get a goods train through from Bell to Eskbank.
2531. Is that two divisions or one division? One division. And when we can only get one down goods train through in an hour and a half, and there are a lot of up trains, you can see what trouble occurs.
2532. What is the greatest number of trains you have ever had to deal with there? We have had as many as thirty-five goods and passenger trains through in a day.
2533. But how many at one given time? Only one in each direction, because we block them back. We only allow one train on a section at a time.
2534. Then there is no delay at the Zigzag? Well, the delay is occasioned by the Zigzag.
2535. But do you not so regulate the starting of the goods trains that they will not interfere with each other? Yes; but a goods train may miss its crossing by 10 minutes, owing, perhaps, to a hot box or other cause.
2536. Might not that occur on the level? Of course; in fact such a thing as a hot box would be more likely to occur on the level, because there they travel more quickly.
2537. At what speed do the goods trains travel over the Zigzag from Eskbank? We are limited to 10 miles an hour down the middle road, and 5 miles an hour on the wings.
2538. You have represented that the wings are not sufficiently long for the trains to stand upon them. Is there no possibility of clearing that defect? The principal wing has been lengthened since the Commissioners took office. It is now a little longer than the bottom one.
2539. Will it hold forty trucks? No; but it will hold as many trucks as we can bring up with one engine. Twenty-seven is the maximum number of "D" trucks which we can bring up, or twenty-one stock trucks.
2540. How do you arrive at your estimated saving of £3,000 in wages;—how many men are employed on each goods train? Five on some and three on others.
2541. That would give an average of four men who would be employed an hour each. How many trains a day are there? Fifteen or sixteen goods trains, though we have had many more than that.
2542. But that would be the average, taking good and bad seasons? Yes.
2543. How much would those four men receive? They would receive about 6s. or 7s. amongst them.
2544. The passenger trains would not require so many men? No, I am not counting them; because the delay is not so great with them.
2545. Then it is upon the goods trains that you base your estimate of £3,000? Yes; we must also take into consideration the engine expenses, fuel, and so on—everything connected with the train. The wages are only a portion of the expense. During the time that is occupied in getting over the Zigzag, we might be running 12 miles towards Bathurst.
2546. Then you go into the capital cost of the rolling stock? I could not well give you the details which make up the estimate of £3,000. I take that as an approximate estimate.
2547. As an old railway official, do you approve of tunnels in connection with mountain lines? I do not prefer a tunnel to an open road.
2548. Are you of opinion that the No. 1 tunnel scheme would be a great advantage, as compared with the existing line? Yes, any of the schemes would be of great advantage as compared with the existing line.
2549. Would the No. 1 scheme be an advantage equal to £250,000? Yes, if you could save the interest on that by reduced working expenses.
2550. How would the tunnel scheme compare with the No. 3 scheme? I said that there is not much to choose between the two.
2551. Is the difference in grade an advantage? It would mean easier working.
2552. Would it be a great advantage? No; because forty would be our maximum load in either case.
2553. Do you consider that the present line, if properly maintained, will be able to take the mountain traffic with safety for some time to come? It will take it for a little longer; but ultimately the Zigzag must be cut out.

H.
Richardson,
Esq.

4 April, 1894.

2554. But it will meet the traffic for some years to come? I cannot say that. If there was a very large increase in the traffic, as there might be with good seasons and a development of trade, the Zigzag would occasion great inconvenience and expense.

2555. *Mr. Hoskins.*] As a matter of fact, the traffic this year has decreased? Yes; although we have never known busier months than September and October last.

2556. Do you mean to say that while a push-up engine is required to take a goods train up the 1 in 42 grade in the open, it would not be required in a tunnel $1\frac{3}{4}$ miles long, with a grade of 1 in 50? I am sure it would not.

2557. Why do you use a push-up engine on the 1 in 42 grade? In order to get up with a load of 40 trucks. Thirty trucks is the load laid down for a train with one engine on a grade of 1 in 42, as against 45 trucks on a grade of 1 in 50.

2558. But I suppose you know that in a tunnel the rails are more greasy than they are in the open, and therefore the adhesive power of the engine is less? I believe that that is so.

2559. As there is only a difference of 8 feet between a grade of 1 in 42 and a grade of 1 in 50, do you not think that if a push-up engine is required on a grade of 1 in 42 in the open it would be required on a grade of 1 in 50 in the tunnel? I do not think so. We only propose to take forty trucks through the tunnel, which is five trucks less than the load laid down for a grade of 1 in 50.

2560. How many trains go over the Zigzag in a day, including passenger trains? We have had as many as thirty-five.

2561. Have you had experience in the working of railways in other countries besides this? No.

2562. What induced you and other officers of the department to confer together after having already made a statement to the Committee? I was requisitioned by the Secretary in the usual way to attend a conference to discuss this matter.

2563. Was any reason assigned? Yes; to furnish details of saving for the information of this Committee.

2564. Are you prepared to admit that the estimate you formerly gave was unreliable? It was quite reliable so far as it went; but we took no credit for the consequential saving to which I have referred.

2565. If the Zigzag were dispensed with, one engine would take forty loaded trucks from Eskbank to Penrith? Yes.

2566. Is the Zigzag the only obstacle in the way of that. Are there no other steep gradients? No.

2567. Is there not a steep gradient between Mount Victoria and Katoomba? Yes; a grade of 1 in 55.

2568. Are not engines frequently required to help trains up there? We have had trains stuck up there. It is what they call Soldiers' Pinch.

2569. Is it a short or a long grade? A short grade.

2570. Then if the Zigzag were dispensed with, a train of forty trucks might still be stuck up on the mountains? No, because we should use bigger engines. Now, owing to the length of the trains being limited we use small engines. We have never been stuck up with a big engine.

2571. Where do you use your large engines? Some of them on the mountains, some between Bathurst and Dubbo, and some between Eskbank and Bathurst.

2572. Do you not use them between Eskbank and Penrith? Only a few of them. It has not been economical to use them there, because the loads have been limited owing to the Zigzag, and we could not get full value out of them.

2573. How is it that the department saves £4,780 a year by dispensing with the Lapstone Zigzag, seeing that there is still a grade of 1 in 33 there? That is gained on the trains going down hill.

2574. There is nothing gained on the trains going up hill? About three trucks a train. We have increased the average train load from twenty-four to twenty-seven and three-quarter trucks.

2575. *Mr. Trickett.*] Is there any way by which you can get at the approximate earnings on the line between Dargan's Creek and Eskbank? I do not know. All those accounts are kept by the accountant. I think he keeps the section between Penrith and Bathurst distinct.

2576. In reply to a letter sent at my instigation to Mr. McLachlan asking for these particulars, that gentleman has entirely shelved the question? I believe the accountant keeps the earnings between Penrith and Bathurst distinct, and from that you could find out the average earnings for 11 miles.

2577. *Mr. Neild.*] When last examined you stated that the reduction in the number of goods trains, if the deviation were made, would be 3,276, but the secretary to the Railway Commissioners puts it down at 3,044;—how does that come about? In the first place I simply took into consideration the average loads taken by small and big engines, but when the Zigzag is cut out, we shall use big engines almost exclusively.

2578. You also stated that the saving in train mileage would be 14,950 miles, it is now stated that the saving would be 17,647 miles? By increasing the train-loads from thirty-five to forty trucks we make a saving in mileage and number of trains.

2579. While you show 200 trains less, you show a saving in mileage of nearly 3,000 miles? Yes. Since fewer trains will be required, we shall save so many more miles of running.

2580. I suppose the alteration has been due to this special committee meeting? Yes.

2581. While there is this saving in connection with goods trains, there will be very little saving in connection with passenger trains? We shall not be able to reduce the number of passenger trains.

2582. I understood from your answer to Mr. Davies, in connection with the item of £3,000 appearing on your list of savings, that between £1,500 and £1,600 will be for wages, and the rest will be saved in coal, rough the non-use of engines now employed? Coal form part of the saving, as well as stores, and the non-use of the engine.

2583. Is that a fair estimate;—is there not a very large number of engines necessarily in depot throughout the country? Yes; but, if the Zigzag is cut out, we shall be able to do more work with present engines.

2584. In reference to the meeting which has been referred to, did you not set to work to swell your previous estimate? No.

2585. Was that not the result of the meeting? Yes.

2586. What was the purpose of the meeting, if not to try to make the estimate larger? A memorandum came from the Committee asking, I understand, for certain particulars and details, and we were called together to go into the details and show every saving that could be effected.

2587. What is the difference between the load taken over the Zigzag by the larger and the smaller engines? The larger engines take thirty trucks and the smaller engines nineteen trucks.

2588. Does it not take more to run a larger than to run a smaller engine? Yes, there is an extra fireman.

2589.

- H. Richardson, Esq.
4 April, 1894.
2589. Have you made allowance for that? It is included in the 4s. 8d. per mile.
2590. Is that a fair way of doing it, considering the extra fuel and the extra wages which will have to be met? I think 4s. 8d. is a fair average right through.
2591. You are putting the possible earnings of the big engine against the present earnings of the little engine, and yet you do not take into account the extra man and the extra fuel required by a big engine? There is an additional fireman employed on the big engines, but this cost is included in the 4s. 8d. per mile.
2592. *Chairman.*] Can you give us any idea as to how long it would take an engine to run from the bottom points to Dargan's Creek—2 miles 53 chains—over a grade of 1 in 50? From nine to ten minutes.
2593. And how long would it take to run over the No. 3 route—4 miles 55 chains—with a grade of 1 in 60? It ought to be done in about five minutes more.
2594. Would it take five minutes more in view of the fact that the grade would be flatter? Yes.
2595. Do you not think that an engine would take a load over the longer but flatter route in about the same time as it would take it over the shorter but steeper route? It would not do the longer journey in the same time as the shorter.
2596. You told us just now that the maximum number of trucks taken from Katoomba to Penrith was forty. Was that maximum fixed before the goods trains were provided with continuous brakes? No.
2597. It was fixed after the continuous brakes came into use? Yes.
2598. With a full knowledge of the power of those brakes, the Department came to the conclusion that forty trucks should be the maximum train load? Yes; the matter has been very carefully considered. Forty trucks is considered the maximum for safe working.
2599. How many sections are there between Sydney and Bourke? From Bourke to Narramine I have taken a load of eighty trucks; but we can only bring fifty from Narramine to Dubbo, and thirty-one from Dubbo to Bathurst. The ruling grade there is 1 in 40.
2600. What do you take from Eskbank to Penrith? Twenty-nine and a half is the average load, but we require a push-up engine as far as the Clarence tunnel.
2601. Would the wings on the Zigzag allow you to increase the length of the trains between Eskbank and Katoomba? Yes; we could take as many as forty-five trucks on them by dividing the train at bottom points.
2602. Then your limit is the pulling and pushing power of the engines? Yes; but the trains are cut in half at the bottom of the Zigzag, and sent up in two divisions because the wings will not hold more than twenty-seven trucks.
2603. Will you kindly furnish a statement to the Committee showing the total tonnage of goods and the number of passengers carried in 1889 over the Western line, and the same information for last year? I think I can get it, though my books will not show the 1889 traffic.
2604. Would the Commissioners annual reports give the information? No; they only show the tonnage from each station. Bathurst might be shown as sending away 10,000 tons, but of that traffic only 1,000 tons might go over the Zigzag. I will obtain the information if it can be obtained.
2605. If you can, will you make out the return for the traffic between Penrith and Eskbank, both ways? Yes.
2606. *Mr. Neild.*] You told Mr. Hoskins that last year there was a decrease in the traffic. Under those circumstances is there any pressing necessity for this work? I think so. I hope we shall get a revival of trade shortly, and it must be remembered that the work will take a considerable time to complete.
2607. How has the reduction in traffic come about chiefly—in coal? The mineral traffic has fallen off. The Commissioner in to-day's paper points out that the falling off has been in the mineral and passenger traffic.

THURSDAY, 5 APRIL, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.	THOMAS THOMSON EWING, Esq.
The Hon. JAMES HOSKINS.	WILLIAM CHANDOS WALL, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	WILLIAM McCOURT, Esq.
The Hon. JOHN DAVIES, C.M.G.	JOHN CASH NEILD, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES COLLINS, Esq.

The Committee further considered the proposed Deviation to avoid the Lithgow Zigzag.

William Thow, Esq., Chief Mechanical Engineer, Department of Railways, sworn, and further examined:—

- W. Thow, Esq.
5 April, 1894.
2608. *Chairman.*] I understand that since you were last examined before the Committee the heads of various branches of the Railway Department have met in conference to review the estimate of the probable saving on the proposed deviations? Yes; there has been some further consideration of the question.
2609. The saving now totals £18,094? Yes.
2610. *Mr. Davies.*] How do you reconcile the present estimate of £18,000 with that of £10,000 which you gave us about a fortnight ago? When first we considered the saving that would be effected by cutting out the Zigzag we confined our inquiry to what would be saved between Eskbank and Bell, and it was only after that estimate was called in question that we recognised the fact that the employment of longer trains would cause an economy between Bell and Penrith. That economy would apply, of course, to any scheme which would cut out the Zigzag. Our first object was to compare the deviations, in order to ascertain from them the maximum economy obtained. There can be no doubt whatever that if the Zigzag was cut out, not only would we be able to bring longer trains from Eskbank to Bell, but we should also be able to take them on to Penrith, and the additional saving which will thus be effected is shown in the last two items in the revised estimate.
2611. Two thousand two hundred and fifty-three pounds will be saved between Bell and Katoomba? Yes. That amount would be saved on the up journey chiefly.

2612.

- 2612 I want to know how you have made up the item of £3,000, the saving of overtime in the wages of drivers, guards, and firemen? I think I explained when last examined that that is already in the 4s. 8d. a train mile, but the work being located in this particular place we thought it only fair that cognizance should be taken of the saving of time, and that £3,000 in addition would be a proper amount to represent the economy derived in that way. W. Thow,
Esq.
5 April, 1894.
2613. It is only a representative figure? Yes; it is not an estimate of which we could give details. Looking at the whole question, with what figures we had to guide us, we thought that £3,000 would be a fair sum to put down for the saving in time, due to a shorter continuous run.
2614. That is for overtime? The overtime would be reduced, because trains would be able to go through more quickly than they do now. The Zigzag might be compared to the neck of a sand-glass—we have to dribble the traffic through it because of the awkwardness of the road. If the Zigzag were cut out we should get our traffic through sooner, and should save a good deal in the wages of men, engine fuel, and other waste that now takes place. That figure is only approximate; it was not arrived at by detailed investigation. It is not so accurate as the other estimates, which have been based upon the cost of train mileage, which is saved by taking the number of waggons hauled in any one year and dividing them by the number in the train.
2615. Do you take loaded and unloaded trucks together? We reduce them all to loaded waggons; that is, if there are a number of empties we consider them as a less number of loaded trucks.
2616. Has your attention been called to the Commissioners' No. 2 scheme? Yes.
2617. Are you in possession of the information which Mr. Foxlee has given to the Committee? I had the matter explained to me verbally.
2618. You have seen no plans or detailed information? No. I saw a hand-sketch showing the direction in which it was proposed to take the line.
2619. In your new estimate do you propose to dispense with any more push-up engines, or do you retain the same number of push-up engines? We reduce our estimated cost of push-up engines from £2,345 to £1,500.
2620. That is the cost of one engine? A little more than that.
2621. Do you propose to use more than one such engine? With the No. 1 scheme we should require the services of a push-up engine as far as the mouth of the tunnel.
2622. At present you use three push-up engines? Some days we use more, and on other days less. A little more than three is the average.
2623. A Baldwin engine would take forty-two loaded trucks? We have allowed for their taking forty trucks. They could really take more, but we take forty as a fair load.
2624. On a grade of 1 in 50? Yes. Their load is tabulated as forty-five trucks between Clarence and Bell, where there is a grade of 1 in 50. When we have stock-trucks or coal-waggons we take fewer than forty-five. Forty is a fair average.
2625. What would be the gross tonnage of forty loaded trucks? About 350 or 380 tons.
2626. What number of trucks could a Baldwin engine take over the Zigzag? The load is limited by the wings. I think it is thirty trucks for a Baldwin.
2627. Would it be possible to extend the wings to take a larger number of trucks? I daresay it would be possible; but the load would not be increased very much. I think thirty-three trucks would be the longest train that you could have there, and it would scarcely be worth while to go to heavy expense for so small an advantage.
2628. What would be the gross tonnage of thirty loaded trucks? About 250 to 280 tons without engine and tender.
2629. The heavier load which you could take would be the main advantage obtained for cutting out the Zigzag? That would be the main advantage.
2630. What number of trucks do the Baldwin engines take at the present time from Bathurst to Eskbank? The loads vary from forty-five to thirty-one to suit the grades.
2631. Is there a larger number of trains composed of thirty trucks coming from the west to Eskbank than of trains composed of forty-five trucks? The loads I have given you are what the engines can take; but, in practice, I think they average about thirty-five.
2632. If you broke up a train of thirty trucks to take it over the Zigzag, it would make it very small? We only take twenty-two trucks through at a time by one engine; a longer train has to be divided over the middle portion of the Zigzag.
2633. But supposing a train containing thirty trucks came from Bathurst to Eskbank? Then we should break it up and haul twenty-two vehicles by the train engine, and the balance by the push-up engine over the middle portion of the Zigzag.
2634. How many trains come from the west in a year containing only thirty trucks? That I could not tell you; it does not come before me in any way. The Traffic officers could give you the information. All we do is to tell them by our tables what loads they must not exceed, and we undertake to run the trains to time if those loads are not exceeded. They are quite justified in loading up the engines within our limits; but I am not prepared to tell you what loads they bring.
2635. *Mr. Hoskins.* Is not thirty trucks an average train load in the western district, except during the busy season of the year? I do not think you can look at it in this way. The economy is effected by putting a number of short trains together, and drawing them with one engine.
2636. Do you get a sufficient number of loaded trucks from the western district to enable you to provide forty-truck trains? Undoubtedly we do. There is nothing to prevent us from bringing any number of waggons in one train, if by doing so we can save money. There is nothing to compel us to run a certain number of trains, so long as we bring the waggons through to Sydney that are intended to come.
2637. Is not thirty trucks considered an average train load upon the mountains? I should think that on the average thirty trucks would be a very good train load; but we are at present working with a number of light engines. If we had the convenience of a straight run, we could put heavy engines on the road and reduce the number of trains.
2638. How many of the heavy Baldwin goods engines have you? Twenty.
2639. And they will take thirty-five trucks up these inclines? The heavy Baldwin engines would take forty-five trucks up a grade of 1 in 50.
2640. Looking at the fact that the inclines on the Zigzag are not so severe as some in other parts of the line, would twenty engines suffice for the goods traffic? I think we could work that portion of the traffic with twenty Baldwin engines.
- 2641.

- W. Thow, Esq.
April, 1894.
2641. I think I understood you to say that if the Zigzag were dispensed with, the saving would be on the up traffic rather than on the down traffic? Yes; there would not be so much saving on the down traffic, though at present the traffic is delayed on both journeys.
2642. If your large engines can take thirty loaded trucks up the Zigzag safely, is not any delay that may be occasioned similar to that which is occasioned in connection with the loops which you have on the western line;—the delay in transit on the western line is not occasioned solely by the Zigzag? A certain amount of it arises from the system of working the line by means of loops; but the Zigzag occasions more delay than any of the loops.
2643. How would the delay occasioned by the Zigzag compare with the delay which takes place on the loops? I should think that the delays at the Zigzag are two or three times as long as those on the loops.
2644. You cannot give us an idea of the average delay caused by the Zigzag? I cannot; but it has been estimated that if it were cut out we should save about an hour on the average per train.
2645. Does it take an hour to draw a train over the Zigzag with a Baldwin engine? The delays occur at the end of the Zigzag.
2646. If a Baldwin engine can take thirty trucks over the Zigzag would there be any delay between Eskbank and the top? Yes. The delays which we have estimated for are constantly occurring.
2647. Are there not heavy gradients on the line between the top of the Zigzag and Sydney? Yes; there is a grade of 1 in 50 near Bell, and a grade of 1 in 55 between Mount Victoria and Blackheath. Those are the two steepest places as far as Katoomba.
2648. Is it not a fact that you have occasionally to use push-up engines on those banks? No. Occasionally we send our engines up to Bell to pick up waggons going towards Bathurst; but we do not use push-up engines beyond Clarence siding unless there is an engine returning, and we can make use of it in that way.
2649. Do you believe that if the No. 1 project were adopted, an engine could draw forty-two trucks through the tunnel without the assistance of a push-up? I think the heavy consolidation engines would easily take forty trucks through the tunnel. The only difficulty that could arise would be from the slipperiness of the rails caused by the tunnel being wet; but I do not think it would be wet, and there would therefore be no necessity for push-up engines.
2650. But is it not a fact that the rails in tunnels, and especially in long tunnels, become greasy? That is not so in all cases. For example, in the Woy Woy tunnel, which is a long one, the rails are perfectly dry, the reason of that being that the tunnel was made for a double line, and the ventilation is very good.
2651. *Mr. Neild.*] Your second estimate is based upon the supposition that, in the event of the Zigzag being cut out, you would be able to use Baldwin engines? Yes.
2652. How many men are employed on the engines now in use? Three men on the Baldwin engines and two men on all other engines.
2653. Have you taken the additional man into consideration? It would be only a very small item—simply the wages of a fireman at 8s. a day.
2654. You have twenty Baldwin engines;—that would make the cost of the additional man equal to £1,200 a year or even a little more? Perhaps so. Of course if one went into very minute detail I believe the saving could be shown to be very much greater than it now appears to be. There is not the least doubt that the widening of the neck, through which the traffic now has to dribble, would effect a saving on all the western traffic.
2655. Your estimate of savings includes an item of £942, yet a little matter of £1,200 or £1,500 you have left out of consideration. Surely if it was worth while to account for £900, £1,200, or £1,500 cannot be considered an infinitesimal amount? That amount might be considered.
2656. Why should the saving between Katoomba and Penrith be estimated twice over, as it appears to be in the statement handed in by Mr. McLachlan. He puts down £2,253 as the saving between Eskbank and Penrith, and then £4,240 as the saving between Katoomba and Penrith? The saving in the first case appears to be shown as between Eskbank and Penrith; but it is really on the train mileage between Bell and Katoomba.
2657. That means that you are going to make up the train at Katoomba? No; the same train will run right through.
2658. But I see that you have estimated that with a saving of 568 trains between Eskbank and Katoomba a saving of 9,656 train miles would be gained, while between Katoomba and Penrith there would be a saving of 18,176 train miles, leading one to suppose that the saving in trains would be about 1,000? The additional saving in train mileage is due to the longer distance between Katoomba and Penrith as compared with the distance between Bell and Katoomba.
2659. Why should the estimate have been made up in two sections in this way? I do not know. It might just as well have been made one item.
2660. You speak of an hour being saved by doing away with the Zigzag;—how much of that hour is taken up in running now, and how much in waits? Roughly, about 40 minutes is occupied in running and the rest of the time is taken up in waits at either end of the section—at Bell and at Lithgow.
2661. Do the two sections of a train follow each other at an interval of twenty minutes? We should save a great deal by not having the Zigzag. The bulk of the saving would be gained by being able to run right through instead of having to stop our trains three different times.
2662. How soon after one division of a train leaves Bell does the other follow it? The second division starts as soon as the first division gets off the section.
2663. What is the length of the section? The section is the distance between Bell and Clarence. I think that is the arrangement.
2664. Does safety require that there should be such a long interval between the trains? I think so. It is only on the ground of safe working that such a system would be adopted.
2665. Then forty minutes is occupied in traversing the distance between Clarence siding and the lower points? No. I was referring to the journey from Bell to Eskbank. Most of the time is lost in zigzagging up and down, and in having to stop on three unnecessary occasions.
2666. You refer to the detention on the wings? Yes.
2667. *Mr. Wall.*] What is the steepest grade between Penrith and Katoomba? One in 30.
2668. Is that on the Lapstone Hill? The tunnel there is on a 1 in 33 grade, and there are several other pieces of it on each side of the tunnel.
2669. Is there not a minute in the Department regulating the number of trains that are to go down the Lapstone Hill? I do not remember such a minute.

2670. What is the ordinary train which an engine can take down a grade of 1 in 33? Our present practice is to take thirty-five trucks on that grade. W. Thow, Esq.
2671. Are you aware if a minute was in existence prior to the Commissioners taking office limiting the number of trucks to be taken down there to fifteen? No; but prior to the cutting out of the Lapstone Zigzag, the limit was twenty-two, because the wings would not hold a longer train. Since the Zigzag was cut out, we have increased the load to thirty-five trucks. 5 April, 1894.
2672. The limit is imposed now by the grade instead of being checked by the Zigzag as heretofore; otherwise you might bring down any length of trains? It is limited by our brake-power. Then, too, there is a small bank which we have to climb 16 miles after leaving Katoomba which imposes a check. At the present time all our waggons are not fitted with the continuous brakes; we have only those brakes on some of them.
2673. What would be a reasonable limit on a 1 in 33 grade, if you had continuous brakes, and maintained the present rate of speed? There are a great many things that enter into the handling of trains besides the mere question of brake-power. Our idea is that there would be no difficulty in working a train of from forty to forty-five waggons from Katoomba, if the present Zigzag were removed, and we could bring them up to Katoomba.
2674. That is, providing that continuous brakes were fitted to the trains? Provided that the brake-power was what we intend that it shall be.
2675. Is it the intention of the Department to so improve their brake-power as to enable them to bring forty-five trucks down the Lapstone Hill? I think there would be no difficulty about that.
2676. I want to know if it is the intention of the Department to so regulate their brake-power as to allow it to be done? Yes; but we could not do it just now.
2677. You intend to do it if the Zigzag is cut out? I think so; whatever load we take to Katoomba we shall bring on to Penrith.
2678. Will not the number of trucks you bring down be regulated by your brake-power? The intention is that if we take forty trucks from Eskbank to Katoomba, we shall bring them on to Penrith.
2679. But, in a report which has been submitted to us, it is stated that you will bring forty-five trucks from Eskbank to Penrith;—is it not forty trucks? My evidence was to the effect that the engines were equal to bringing forty-five trucks; but that we had estimated for forty trucks.
2680. It is mentioned in this report that it is the intention of the Commissioners to use stronger engines—engines which will take a full load without assistance on a grade of 1 in 50? These are our twenty Baldwin engines.
2681. Are they running on this particular line at present? Some of them are, and some of them are running west of Bathurst.
2682. It is a pity that the evidence of the Department should be so conflicting;—we have been informed that these engines were not used here, although they are in possession of the Department? Some of them are now running between Penrith and Bathurst.
2683. And if the Zigzag were cut out, and you were to take the maximum load, it would be necessary to use these engines? Yes.
2684. The smaller engines would not give the results you require? No.
2685. The present statement of earnings has been compiled from the working of both large and small engines; but if large engines were used altogether, would that not make a difference in the returns? I do not think so, because, if we ran those engines to the top of the Zigzag, and coupled them to trains with forty trucks, which were waiting to go to Penrith, we should have to bring those trains up the Zigzag by means of the smaller engines, so that we should not gain anything like so much as one might suppose.
2686. Then, if you used the strong engines now entirely, you do not think any saving would be effected because of the disconnection of trains that would take place on the Zigzag? That is so. We should still feel the crippling effect of the Zigzag on the traffic.
2687. Could you give us an estimate of the total cost of the push-up engines now used between Eskbank and the Clarence siding? I think they cost about £2,345 per annum.
2688. If you bring a load from Eskbank to Clarence siding with the help of push-up engines, that entails a certain expense upon the Department which is represented by the fuel and other expenses in connection with the engine used and the loss of time? It would be quite impossible to give you an idea now of the value of the time required by working the big engines as you suggest. These engines at present bring a load through from Bathurst to Eskbank and come on to Penrith, and it would require a very careful estimate to ascertain what could be saved if we worked the big engines only between the top of the Zigzag and Penrith.
2689. If you used the stronger engines, you would have to use them right through to Bathurst? Yes; we should run them right through between Bathurst and Penrith.
2690. The obstacle in the way of using them now is the Zigzag? Yes; because they can only draw thirty waggons on the Zigzag.
2691. Why have you not taken credit in your estimate for the saving which would be effected by hauling larger loads between Bathurst and Eskbank? That might be done; but that saving would depend entirely upon whether we used a light engine to Eskbank or took a heavy engine right through.
2692. And you do not know whether it is the intention to use these engines right through to Bathurst, or whether an advantage would be gained by taking them right through? The advantage to be gained would depend entirely upon the requirements of the traffic; but there is no doubt that if the heavy engines were used between Eskbank and Penrith the saving which would be effected is legitimately expressed by the figures which have been given.
2693. *Mr. Collins.*] Have you seen any estimate in connection with the Commissioners' No. 2 scheme? An estimate has been made in reference to that scheme.
2694. Did you make it? No; I was not concerned in it, but I do not see anything in it that is not perfectly correct.
2695. Do you think that, from an engineering point of view, it would be better to construct that line than the No. 1 deviation? No doubt from an engineering point of view it would be a great advantage to cut out the grades of 1 in 42 and 1 in 50, and do away with the long tunnel.
2696. Therefore it would be an advantage to adopt the Commissioners' No. 2 proposal? Well, those advantages would have to be set off against the longer distance.
2697. Against the longer distance would have to be set the less cost in working? The working would cost less. 2698.

W. Thow,
Esq.
5 April, 1894.

2698. Then, in your opinion, the Commissioners' No. 2 proposal is better than the Commissioners' No. 1 proposal? I prefer a line in the open, and it would be an advantage to cut out the grades of 1 in 42 and 1 in 50.

2699. *Mr. Ewing.*] Do you regard this as an urgent work? It is not urgent in the present state of the traffic.

2700. It is a work which can be done without for a year or two? Unquestionably. The traffic has not increased so materially as to necessitate the cutting out of the Zigzag, but whenever the Zigzag is cut out there will be a considerable economy in the working of the road.

2701. But you do not regard it as a specially urgent work at the present time? No; we can do without it, and continue to carry the traffic through as we have been doing.

2702. *Chairman.*] Is there anything else you wish to state? I think not.

2703. *Mr. Neild.*] Do the savings represented in the first item, and in the last item but one in Mr. McLachlan's statement overlap each other, or are they separate? The meaning of the last paragraph but one is that we shall be able to dispense with 563 trains, and multiplying that by the distance between Bell and Katoomba, it gives a saving of 9,656 miles. That saving is made between Bell and Katoomba, and it would have been better to have said Bell instead of Eskbank.

2704. So that the latter paragraph should read, "Practically between Bell and Katoomba 563 ordinary trains will be saved"? Yes.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Deviation to avoid the Lithgow Zigzag.

APPENDIX.

A.

[To Evidence of J. Barling, Esq.]

PRECIS OF PAPERS RELATING TO THE PROPOSED DEVIATION ON THE GREAT WESTERN RAILWAY TO AVOID THE LITHGOW ZIGZAG.

It would appear that the proposal to construct a deviation on the Great Western Railway, to avoid the Lithgow Zigzag, was first prominently brought forward in the latter part of 1885, by Mr. W. S. Targett, who was then Member of Parliament for Hartley. On the 11th September, 1885, he asked the following question in the House—"When will a survey be authorised of the Great Western Zigzag to see if it is expedient to construct a tunnel from Dargan's Creek to Bottom Points?" To this Mr. Dibbs replied: "This survey will be carried out at an early date."

The matter was referred to Mr. John Whitton, the then Engineer-in-Chief for Railways, who, in a report to the Minister on the 16th of March, 1886, stated that the tunnel proposed from Dargan's Creek to the lower points of the Lithgow Zigzag would be about 2 miles in length, and, for a double line, would cost about £400,000. As, however, it would only dispense with $1\frac{1}{2}$ miles of incline of 1 in 33, and 2 miles 35 chains of 1 in 42, he did not think it would be judicious to incur so large an outlay for so small an improvement in the line.

Mr. Targett, by the Minister's instructions, was informed to this effect on the 3rd of April; but he was not, apparently, satisfied with the answer given, and, on the 7th of April, he addressed the Minister, stating that Mr. Dibbs had promised in the House that a survey should be made, and he urged that this should be carried out. Mr. Secretary Lyne, who was then Minister, on the 22nd of April, gave instructions for a survey to be made accordingly. In connection with the matter, Mr. Targett submitted a plan of a route for the deviation suggested by Mr. P. Finn, a surveyor, and a resident of the district. A survey was made, and the route selected was the same as that suggested by Mr. Finn; and Mr. Whitton reported to the Minister on the 29th of October respecting the matter, as follows:—"By the route suggested the length would be $8\frac{1}{2}$ miles and slightly in excess of the existing line. There would be, according to the surveyor's section, at least $2\frac{1}{2}$ miles of tunnelling, and quite 3 miles of an incline of 1 in 40, whilst the earth work quantities and the expense of constructing retaining-walls and viaducts would be excessive." "The proposed route," he added, "does not compare at all favourably with the line as constructed," and he recommended that no further expense should be incurred in the matter. Mr. Targett was furnished with a copy of Mr. Whitton's report; and the matter then appears to have been allowed to remain in abeyance for some years.

In October, 1890, Mr. E. B. Price, then acting as a Temporary Examiner of Public Works Proposals, was instructed to report on alternative routes which had been suggested for relieving the congestion of traffic on the Great Western Railway. In his report he dealt at length with the proposed line from Blacktown or Liverpool to Blayney, and also the line from Richmond to Eskbank, and amongst the conclusions he arrived at, were the following:—

- "1. That it is necessary to take steps to relieve the congestion of traffic on the mountain section of the Western Line.
- "2. That it would be more economical and better serve the interests of the country to duplicate the present track, and construct branches than to make either the Blacktown—Blayney or Richmond—Eskbank alternative lines."

This report was laid upon the table of the House and ordered to be printed on the 5th November, 1890.

On the 15th of March, 1892, Mr. H. Deane, who had succeeded Mr. Whitton as Engineer-in-Chief for Railway Construction, reported to the Minister that the Railway Commissioners were desirous of testing the possibility of connecting the Western Line at Dargan's Creek with the lower points of the Zigzag, traffic considerations rendering the cutting out of the Zigzag desirable if it could be done at a reasonable cost. He therefore asked the approval of the Minister to a thorough investigation being made into the matter by the surveyors of his Branch. The Minister, on the 1st of April, minuted that the matter was one entirely for the consideration of the Commissioners; but he added that should they be desirous of testing the practicability of a deviation, he had no objection to the Engineer-in-Chief carrying out the survey.

On the matter, however, being again referred to the Minister for approval to the expenditure of about £300, he ordered it to stand over, and in consequence, the surveyors who had been instructed to proceed with the work were recalled.

It should be here stated that Mr. J. P. Sharkey, who had been formerly employed as a surveyor in the Railway Construction Branch, put in a claim that he was the discoverer of the route in question, and urged that he should be given the work of carrying out the survey.

Mr. Deane, however, in regard to this claim, pointed out that Mr. Sharkey's contention could not be sustained, and referred to the matter having been brought forward by Mr. Targett, M.P., and reported on by Mr. Whitton in 1886, two years before Mr. Sharkey carried out the survey when he claimed to have discovered the route.

The information in the possession of the Department, appears to have been sufficient to enable Mr. Burge, the Engineer for Trial Surveys, to submit a scheme to the Engineer-in-Chief. On the 26th of April, 1892, he suggested two alternative proposals, one to start the deviation at about 93 miles 70 chains which would show a length of about 4 miles 42 chains, as against 7 miles 20 chains of the present line, thus effecting a saving of 2 miles 58 chains. This would involve a viaduct, short in length, but about 70 feet in height over Farmer's Creek, and also considerable tunnelling, the extent of which could not be determined until a survey had been made. The other line he proposed would start at 93 miles 30 chains, and would be about 52 chains shorter than the first one, and increase the saving in through mileage to 2 miles 70 chains. The main tunnel would however, be longer, and the viaduct over Farmer's Creek, though not so high, would be longer, being over a wider part of the valley.

A third scheme he proposed, was merely a continuation of the present line on from the bottom points through a tunnel to Dargan's Creek. Mr. Burge pointed out that the objection to all the routes was the great length of the main tunnel on a steep grade, and that it was impossible to predict which was the best without a careful survey of each. He also appended an estimate which amounted to £260,000.

A copy of this report was forwarded by Mr. Deane to the Railway Commissioners, and in so doing he stated that as the surveyors were withdrawn before any real work was done, he was not in a position to offer any opinion on the report.

On the 14th of April, 1892, a letter was received from W. O. Reynolds, trustee for M. A. Reynolds, stating that, in the event of the proposed deviation being constructed, they would claim damages to the extent of £20,000. The writer did not state the nature of the damage for which compensation would be claimed.

On the 24th November, 1893, the Railway Commissioners addressed a communication to the Minister for Railways, the Honorable John See, in which they stated that ever since they had been in office, the disadvantage of passing traffic over the Lithgow Zigzag had been continually before them, as well as the continual risk in the working consequent on trains loaded with passengers having to be propelled both up and down over the intermediate section of the Zigzag. The cutting out of the Lapstone Zigzag had so greatly facilitated the working, that they felt justified in asking the Government to

to consider the expediency of providing sufficient money to carry out a further alteration of the line to permit of the Lithgow Zigzag being avoided. The work, they stated, would in all ways be beneficial, and more than return interest on the capital expended. The scheme they proposed was one for leaving the existing line at a point near Dargan's Creek about 86 miles 45 chains, and proceeding by a route through cutting and tunnel north of the existing main line to the bottom points of the Zigzag, where the existing double line of railway would be connected with. This line would be 2 miles 53 chains in length, 1 mile 52 chains being in tunnel. They proposed that the line should be a double one because of the difficulty of properly ventilating so long a tunnel if only a single line were constructed. The grading through the tunnel would be a continuous ascending one from the bottom points to Dargan's Creek, of about 1 in 50, the existing line being on varying grades of 1 in 33 and 1 in 42. The 1 in 33 grade was, they pointed out, against trains going to the West, and extended from Dargan's Creek to Clarence siding, a distance of 1 mile 32 chains, and was a great obstruction to the whole of the traffic going from Sydney to the West. This would be entirely got rid of by their proposal and thus materially assist the working of the Western-going traffic.

They estimated the whole cost of the work at about £225,000, which at 4 per cent. would mean an annual cost of £9,000; but they estimated that in addition to the great facility to the working and the avoidance of the continual risk which now takes place, the expenses would be reduced by about £10,000 per annum, so that as a commercial investment the money would be well spent. The Minister for Railways referred the matter for the advice of the Attorney-General as to whether the work could be carried out without reference to the Public Works Committee. On the 28th of December the Honorable G. C. Heydon submitted his advising and stated that he had come to the conclusion that the work need not necessarily be referred to the Parliamentary Standing Committee on Public Works, and for this opinion he gave his reasons at length. The matter was referred to Cabinet on the 2nd January, 1894, and it was then decided that the matter should be referred to the Public Works Committee as soon as convenient. The necessary resolution was accordingly, in pursuance of this decision, submitted by Mr. Secretary Lyne to Parliament on the 25th of January, and duly passed. In the meantime the sum of £250,000 for the work was noted for placing on the Loan Estimates.

In a minute of the 8th of January, 1894, the Minister stated that the Cabinet had decided the work should be carried out by this Department; and he directed that the Railway Commissioners should be asked to forward, for the use of the Engineer-in-Chief for Railway Construction, the plans and sections they had taken in connection with the matter. A letter to this effect was accordingly addressed to the Commissioners for Railways on the same date.

On the 6th of January Mr. Deane, in accordance with the Minister's instructions, submitted a statement of the cost of the work on the existing line, between Dargan's Creek and the lower points of the Zigzag, the total cost shown being £167,004 1s. 4d., the length 5 miles 14 chains, giving £31,157, as the cost per mile. He also gave an estimate of what it would have cost at the time the line was made; had a direct line with a single-line tunnel been constructed in lieu of the Zigzag, the sum being £324,862 14s. 2d., and a double-line tunnel would, he stated, have cost £445,055 14s. 2d. He pointed out that these estimates were based on the prices actually paid for the work, which in those days were extremely high; and he also said, that, even if it had then been considered desirable to construct a direct line, he thought it doubtful whether any contractor could have been found in the Colony to undertake the piercing of so long a tunnel, tunnelling work not being by any means so easy a matter then as now. He showed that, by the adoption of the Zigzag, the saving effected at the time was £157,858 12s. 10d. for a single-line tunnel, and £278,051 12s. 10d., for a double-line tunnel, which sum, he considered, was sufficiently large to justify the adoption of the Zigzag, as was done.

On the 22nd of January, the Railway Commissioners forwarded, in compliance with the request which had been made to them, plans, sections, &c., in connection with the scheme which they proposed. They also forwarded a report from Mr. Foxlee, accompanying the plans, &c., in which, he stated, that the estimated cost of the deviation proposed by him was £225,000, exclusive of land and fencing. That the length of the proposed deviation was about 2 miles 53 chains, the ruling grade 1 in 50, and the sharpest curve 12 chains radius. The tunnel would have a length of about 2,840 yards. In forwarding the plans, the Commissioners wrote the following minute:—"As the scheme is one that has been devised and worked out in detail by Mr. Foxlee, the Commissioners think that he should be associated with Mr. Deane in the carrying out of the work."

With regard to this, Mr. Secretary Lyne minuted the papers as follows:—"Divided authority in such a matter as this would not do at all, and there is certainly some error regarding the 'complete devising and working out of the plans by Mr. Foxlee.' I have no doubt that Mr. Deane will consult Mr. Foxlee—if he considers it desirable—upon any special point that may present itself to him."

On the 18th of January, Mr. Deane addressed a minute to the Minister, pointing out that in his opinion the deviation proposed by the Commissioners should not be definitely adopted until further surveys had been made, and referred to a conversation he had had with the Minister a few days previously, when he mentioned how, by means of a spiral, the necessary tunnel construction could be spilt up and shortened, the cost lightened, and effective ventilation rendered possible. He forwarded a tracing showing the position of the line he suggested, the cost of carrying out which would, he said, probably not be greater than £130,000 as compared with £225,000 mentioned as the Railway Commissioners' estimate. He also stated that there might be other alternative lines with even greater advantages than the one he then suggested, and that he had sent Mr. Surveyor Kennedy to the spot to get further information in the way of levels. After the return of this officer he hoped to be in a better position to report on the whole question.

It should be here stated that a proposal to construct a deviation was received from Messrs. E. M. Munford and Company, their offer being dated 1st of January, 1894. They stated that they were prepared to carry out the deviation, make certain roads, &c., and receive payment in debentures. The Minister directed that they should be informed that whatever was done in connection with this matter would be carried out by the Government.

On the 22nd of January, Mr. Burge, Engineer for Trial Surveys, brought under the attention of the Engineer-in-Chief a scheme which he said would not only limit the maximum length of any one tunnel to 1,076 yards, but also, without involving additional length either to the existing railway or to the line proposed, would reduce the grade in the open to 1 in 50, making that the ruling grade, against the heavier traffic between the engine stations of Eskbank and Penrith of 1 in 42; and, in the tunnels to 1 in 60. He estimated that the cost of this line would be £214,000. He proposed to utilise the present Clarence tunnel, as well as the present line down to near the entrance of the new third tunnel, at 90½ miles, for the purpose of the new down line when the duplication was made, the line to join the second line in the third tunnel, this and the remaining three tunnels being double ones. Mr. Burge went on to say that the 1 in 33 grade at the east approach to the Clarence tunnel could be got rid of, if necessary, by a deviation which would not cost more than £15,000, so that £230,000 would provide a substitute for the Zigzag, giving a series of short, easily ventilated tunnels, considerably less also in total length than the tunnel on any direct line, and rendering for these reasons the whole work capable of much quicker completion; reducing the ruling up grade between Eskbank and Penrith to 1 in 50, and doing away with the 1 in 33 east approach to the Clarence tunnel. Mr. Burge was, he said, convinced that either this scheme or the one previously proposed by him would be the best solution of the question, and he urged that they might be further investigated.

On the 25th of January, Mr. Deane reported to the Minister that the exploration of the country which was being made by Mr. Surveyor Kennedy, proved the existence of more than one alternative route which might turn out to be equal to or better than the direct tunnel scheme proposed by the Commissioners; and he urged that the investigation of the matter by the Public Works Committee might be deferred for a month to enable full investigation to be made. To this the Minister replied that the Committee must fix its own time for the investigation.

On the 29th of January, the Minister instructed that another surveyor should be put on to the work in order that the plans might be ready for the Committee within a fortnight. Mr. Deane, in regard to this, again urged that as much time as possible should be afforded him for the investigation, as he was anxious that the Department should be in a position to advocate the best proposal possible.

Subsequent action in the matter is fully detailed in the statement and evidence of the Under Secretary for Public Works before the Committee.

5/3/94.

J. BARLING.

A1.

THE RAILWAY COMMISSIONERS TO MINISTER FOR RAILWAYS, PROPOSING THE DEVIATION.

Office of the Railway Commissioners of New South Wales, Sydney, 24 November, 1893.

To the Honorable John See, M.P., Minister for Railways,—

Lithgow Zigzag.

EVER since we have been in office the great disadvantage of passing traffic over what is known as the Lithgow Zigzag on the western side of the Blue Mountains, has been continuously before us, as well as the continual risk in the working, consequent on trains loaded with passengers having to be propelled, both up and down, over the intermediate section of the Zigzag.

The cutting out of the Lapstone Hill Zigzag, on the eastern side of the Blue Mountains, has so greatly facilitated the working that we feel that we are justified in asking the Government, when dealing with the question of expenditure in connection with public works, to consider the expediency of providing sufficient money to carry out an alteration of the line to permit of the Lithgow Zigzag, which is a great obstruction to the working of the traffic on the western side of the Mountains, being avoided. The work would in all ways be beneficial and more than return interest on the capital expended.

Various schemes for effecting this object have been under our consideration for a considerable time past; but the cheapest and best plan which we have had before us is one for leaving the existing line at a point near Dargan's Creek, about 86 miles 48 chains, and proceeding by a route through cutting and tunnel north of the existing main line to the bottom points of the Zigzag, where the existing double line of railway would be connected with. This line would be 2 miles and 53 chains in length, 1 mile 52 chains being in tunnel. It is proposed the line shall be a double one, because of the difficulty of properly ventilating so long a tunnel if only a single line is constructed. The gradient through the tunnel would be a continuous ascending one, from the bottom points to Dargan's Creek, of about 1 in 50, the existing line being on varying grades of 1 in 33 and 1 in 42. The 1 in 33 grade is against trains going to the West, and extends from Dargan's Creek to Clarence siding, a distance of 1 mile 32 chains, and is a great obstruction to the whole of the traffic going from Sydney to the West. This would be entirely got rid of by the proposal, and thus materially assist the working of the Western going traffic.

The estimated cost of the whole work is about £225,000, which at 4 per cent. would be an annual cost of £9,000; but it is estimated that in addition to the great facility to the working and the avoidance of the continual risk which now takes place, the expenses would be reduced by about £10,000 per annum, so that as a commercial investment the money would be well spent.

It may be pointed out that nearly the whole of the money would be expended in labour, as with the exception of the rails and machinery required for the work, the whole expenditure would be for excavation and construction.

There are several other smaller grades on different parts of the line and also some curves in the Blue Mountains, the cutting out of which would greatly facilitate the working; and we would be glad if the Government could see their way to obtain a vote from Parliament for the sum (including the £225,000 previously mentioned) of £250,000, on account of grades and curves.

The construction of the tunnel would occupy from eighteen months to two years, and therefore the expenditure of the £250,000 would be spread over a period of quite two years.

Attached hereto is sketch plan* showing the route of the existing line, and of the proposed line.

* *Vide plan.*

E. M. G. EDDY,
Chief Commissioner.
W. M. FEHON,
Commissioner.
CHARLES OLIVER,
Commissioner.

I shall be glad to be advised by the Hon. Attorney-General whether this work can be carried out without reference to the Public Works Committee.—J.S., 28/11/93. The Secretary to the Attorney-General.—F.K., 28/11/93. Submitted.—W.W.S., 30/11/93. This is a matter which should be reserved for my successor.—E.B., 9/12/93. Resubmit when new Attorney-General has been appointed.—W.W.S., 14/12/93. Resubmitted as requested.—H.M., 15/12/93. Opinion herewith on separate paper.—G.C.H., 28/12/93. The Under Secretary for Finance and Trade.—W.W.S., B.C., 29/12/93.

A2.

COST OF THE EXISTING RAILWAY BETWEEN DARGAN'S CREEK AND THE LOWER POINTS OF THE ZIGZAG.

Department of Public Works, Railway Construction Branch, Sydney, 6 January, 1894.

Subject :—Great Western Railway, Zigzag Deviation.

IN accordance with the Minister's instructions I have had the cost of the works on the Western line between Dargan's Creek and the lower points of the Zigzag got out as carefully as possible. The total is £167,004 1s. 4d., the length 5 miles 29.14 chains, giving £31,157 as the cost per mile. These figures may be taken as fairly accurate, although very great difficulty has been experienced in getting them out owing, in the first place, to the works being carried out as part of two different contracts, and from the fact that the measurement books have been lost.

I have further estimated the cost at which the direct line could have been made at that time between Dargan's Creek and the lower points, including a tunnel nearly 2 miles in length. The prices in those days were extremely high, and those used in the above estimates are taken from the actual ones paid; but I wish to point out that even had it been looked upon as desirable to construct this line, it is very doubtful if any contractor would have been found in the Colony to undertake piercing of so long a tunnel. Tunnel making in those days was not the easy affair it is now, as may be seen from the high price paid per cubic yard, for the Clarence tunnel, which is a short one, viz., £1.

The cost, then, of the direct line, with a single-line tunnel, would have been £324,862 14s. 2d., and a double-line tunnel which would, no doubt, have been declared necessary, owing to the necessities of ventilation, would have cost £445,055 14s. 2d.

It will thus be seen that the saving to the country by the adoption of the Zigzag was £157,858 12s. 10d., as against the single-line tunnel and £278,051 12s. 10d., as compared with a double-line tunnel, sums sufficiently large to justify the adoption of the Zigzag. At the present time the connecting line with double-line tunnel can no doubt be done for about £225,000.

H. DEANE,
Engineer-in-Chief.

The Under Secretary.

Copy may be forwarded for the information of the Railway Commissioners.—J.B., 9/1/94. Approved.—W.J.L., 22/1/94. Copy forwarded to the Secretary for Railways, 30/1/94. Mr. Deane.—D.C.M'L., (*pro* U.S.), B.C., 2/2/94.

[To Evidence of H. Deane, Esq.]

DETAILED ESTIMATES OF COST.

Great Western Railway—Great Zigzag—Deviation No. 1.

Amended estimated cost of a double line of railway 2 miles 48 chains in length.

Description.	Estimated cost.	Average per mile.
	£ s. d.	£
Earthworks.....	11,355 0 0	4,367
Timber bridge and culverts.....	661 17 6	255
Tunnels No. 2, 2,893 yards in length	205,491 17 0	79,035
	217,508 14 6	
Contingencies—Tunnels, 2 per cent.....	£4,109 16 9	
Other items, 10 per cent.	1,201 13 9	
	5,311 10 6	2,043
	222,820 5 0	
Permanent way, at 51s.	11,668 16 0	4,488
Supervision.....	6,000 0 0	2,308
	240,489 1 0*	
Average cost per mile	92,495 15 9

* Say, £240,500.

Great Zigzag—Deviation No. 1.

Amended cost of one lineal yard of Tunnel, 4-ring circle—Lining composed of one-third brickwork and two-thirds concrete.

Excavation, 63 cubic yards at 12s. 6d. 14s.	44 2 0	39 7 6
Brickwork, 3·7 " " 55s. 45s.	8 6 6	10 3 6
Concrete, 7·3 " " 50s. 40s.	14 12 0	18 5 0
Centre drain, 1·0 lineal yard at 20s.	1 0 0	1 0 0
	£68 0 6	£68 16 0
One front brickwork, 97½ cubic yards at 55s.		268 2 6
One sanctuary excavation, 5½ cubic yards, at 12s. 6d.		3 5 7½
Concrete, 3 cubic yards, at 50s.		7 10 0
		£10 15 7½

Tunnel No. 1—Length, 2,816 yards (Long tunnel).

2,816 lineal yards, at £68 16s.	193,740 16 0
Fronts No. 2, at £268 2s. 6d.	536 5 0
Ventilating shafts, 200 lineal yards, at £30	6,000 0 0
No. 76 sanctuaries, at £10 16s.	820 16 0
	£201,097 17 0

Tunnel No. 2—Length, 77 yards.

77 lineal yards, at £52	4,004 0 0
2 fronts, at £195	390 0 0
	4,394 0 0

Total tunnels

	£205,491 17 0
Permanent way, 2 miles 48 chains = 208 chains = 4,576 lineal yards, at 51s.	£11,668 16 0

Great Western Railway—Great Zigzag—Deviation No. 3; 1 in 60 grade.

Amended estimated cost of a double line of railway 4 miles 60 chains in length.

Description.	Estimated cost.	Average per mile.
	£ s. d.	£
Earthworks, at 2s. 6d.	51,977 10 0	10,942
Culverts and box drains	4,036 0 0	850
Stream diversion and tunnel at lower end	2,000 0 0	421

C.

[To Evidence of W. Thow, Esq.]

STATEMENT SHOWING PLACES WHERE PUSH-UP ENGINES ARE EMPLOYED BETWEEN PENRITH AND BATHURST.

*Down Journey from Penrith to Bathurst.**Emu Plains—Katoomba:* Mileage, 35·43½ to 66·21½—All goods trains leaving Penrith having over 90 tons in weight are pushed up from Penrith to Katoomba by a Penrith engine.*Dargan's Bank:* Mileage, 86·40 to 88·20—Trains conveying goods or empty stock trucks are assisted between Bell and Clarence by an Eskbank engine, attached in front, if they have a greater load than the train engine is capable of hauling up Dargan's Bank. With average traffic this occurs on about two-thirds of the down freight trains.*Marrangaroo Bank:* Mileage, 97·10 to 100·72—Freight trains are pushed up by an Eskbank shunting engine from Bowenfels to mileage 100·72 when there is sufficient down traffic to warrant it. This is only an occasional practice.*Up Journey, Bathurst to Sydney.**Raglan Bank:* Mileage, 142·40 to 139·20—Goods trains are pushed up from Kelso to Raglan by a Bathurst shunting engine, except on trains controlled by the Westinghouse brake, in which case the push-up engine is not used.*Marrangaroo Bank:* Mileage, 103·10 to 100·72—When the traffic is sufficiently good to render it necessary, goods trains are pushed up from Wallerawang to mileage 100·72 by a Wallerawang engine. This only occurs once per day at present.*Lithgow Zigzag:* All goods, mineral, and live stock trains are pushed up from Eskbank to Clarence Siding Station by an Eskbank engine. About two are required at present, but in busier times three and four engines are necessary for push-up work.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RAILWAY FROM TEMORA TO WYALONG.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of railway from Temora to Wyalong," have, after due inquiry, resolved that it is expedient the decision upon the proposed railway be deferred for six months; and, in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

1. The official description of the proposed line shows that the railway would begin at the termination of the Cootamundra to Temora line, at 291 miles 63 chains 95·8 from Sydney, and that it would go thence to Barmedman and from Barmedman to Wyalong, a distance of 331 miles from Sydney. The total length of the line between Temora and Wyalong, according to the official description, would be 40 miles; but subsequent to the description being handed in it was found that the length could be reduced to 38 miles 46 chains. To within about 4 miles of Barmedman the route of the line is chiefly along the side of the main road. It passes on the west side of the township, and then proceeds almost direct, mainly along the public road to Wyalong. For nearly the whole distance the country is flat, and no expensive engineering works are necessary. The steepest grade is 1 in 100.

Description of the proposed railway.

2. The estimated total cost of the railway is £104,430, or £2,707 per mile, exclusive of the cost of land and compensation.

Estimated cost.

3. At the commencement of their inquiry the Committee found that the available information concerning the proposed line was not complete. This was due to the proposed work having been somewhat hastily submitted to the Legislative Assembly in the desire to assist as quickly as possible the large population which at the time had assembled on the Wyalong gold-field. The line had some time before been surveyed as far as Barmedman in connection with a project for establishing railway communication with the Lachlan River districts, but, up to the time of the reference of the work to the Committee, no survey beyond Barmedman, in the direction of Wyalong, had been made, and no report had been obtained from the Railway Commissioners upon the traffic prospects and expenses of the proposed extension. Desirous, however, of proceeding with the inquiry as expeditiously as possible the Committee examined the Under Secretary for Public Works, the Engineer-in-Chief for Railway Construction, the Chief Draftsman of the Department of Lands, and the Chief Inspector of Mines; and also appointed a Sectional Committee to inspect the route proposed for the railway and to take evidence in the district. Subsequently they

The Committee's inquiry.

they examined Mr. McLachlan, Secretary to the Railway Commissioners; Mr. Harper, Goods Superintendent, Railway Department; Mr. Pittman, Government Geologist; Mr. Shellshear, Divisional Engineer, Department of Railways, Goulburn; and Mr. Firth, Acting Engineer-in-Chief for Railway Construction. In the course of their inquiry the Committee have held six meetings at which nine witnesses were examined. In addition to this, the Sectional Committee's inquiry comprised five meetings, at which the evidence of thirty-one witnesses was taken; and every effort has been made to procure complete information upon the project. By the examination of Mr. Harper, the Committee obtained valuable information with regard to the traffic prospects on the proposed line of railway, and the data supplied by him will be found in the appendix to his evidence. The question of light and cheap railways, referred to in the report of the Railway Commissioners as "pioneer" railways, received considerable attention, and in this connection the Committee examined Mr. Shellshear (Divisional Engineer of the Railway Department at Goulburn), who recently visited America to inquire into matters of general railway construction, as to the mode adopted in the United States of constructing light and cheap lines. In endeavouring to arrive at a proper conclusion with regard to this proposed work particular attention was also given by the Committee to the probable permanency of Wyalong as a gold-field, and upon this point Mr. Pittman, Government Geologist, who recently visited the district, was examined, and a copy of his report to the Department of Mines is attached to the evidence.

Sectional
Committee's
inquiry.

4. The Sectional Committee, who were accompanied by a surveyor of the Railway Construction Branch of the Department of Public Works, made a careful inspection and inquiry. At Barmedman, Wyalong, and Temora witnesses, including some from Hillston and Cargellico, were examined. The Sectional Committee were of opinion that under existing circumstances it would be premature to construct a railway simply to serve Wyalong, but having regard to the facility with which, from an engineering point of view, the proposed line could be constructed, they felt "justified in recommending its construction, if viewed as a section of a main line to the Lachlan at Hillston, *via* Cargellico," but at the same time they considered "that the question of ultimate extension to the Lachlan should first be decided." Unless it should be the settled policy of the country to extend the Cootamundra-Temora branch to the Lachlan, the Committee felt they would not be justified in recommending the immediate adoption of the proposal under consideration.

Railway
Commissioners'
Report.

5. The report of the Railway Commissioners, received by the Committee very late in their inquiry, is not favourable to the immediate construction of the proposed railway. In their estimate the Railway Commissioners do not adopt the figures supplied by the Department of Public Works, but a cost estimated by themselves, based upon a suggestion for the construction of cheap pioneer lines made by them to the Minister for Works in 1892. The estimated cost of construction put before the Committee by the Engineer-in-Chief for Railway Construction was £104,430; the estimated cost stated in the Railway Commissioners' report is £85,000. Taking this estimate of cost, the annual interest at 4 per cent. would be £3,400, and the cost of working £3,550, (*viz.* :—traffic expenses £800; permanent-way expenses, £2,000; and locomotive expenses, £750—total £6,950 per annum). Regarding the probable revenue from the line, the Commissioners say nothing definite can be stated. "In railway construction," the report says, "the proposal, from a traffic point of view, is unique, as the future entirely depends upon the permanency of the gold-field at Wyalong, which it is understood is the basis of the extension. There is country adapted for agricultural purposes around Wyalong and *en route* thereto, but there is no present necessity for providing it with railway communication while there are large areas suitable for the purpose contiguous to existing lines available." The present population of Wyalong the Commissioners do not regard as permanent; but basing an estimate of traffic "on the assumption that there will be a permanent settlement at Wyalong to the extent that now exists at Temora—about 1,800"—the value of the annual revenue from the railway would not exceed £2,800, leaving an annual deficiency of £4,150. Considering the "great uncertainty of the future of Wyalong," the Commissioners recommend that the proposal to construct the railway be "deferred for six months, or until such time as there can be no reasonable doubt as to the future of the place."

6. Prominent among the various points in the inquiry to which special consideration was given, were:— The evidence in the inquiry.

- (1) The proposal viewed as a portion of a future extension to Hillston, *viâ* Barmedman and Cargellico.
- (2) The most suitable route by which to tap the Lachlan Valley.
- (3) The permanence of the field, and its future population.
- (4) The traffic prospects between Temora and Wyalong, as a present terminus.
- (5) Whether the requirements of the population demanded the immediate construction of the proposed line.

A perusal of the evidence given by the Under Secretary for Public Works shows that prior to the discovery of gold at Wyalong, a survey had been made from Temora to Barmedman, the Department having in view a possible extension of the railway from Temora, *viâ* Barmedman and Cargellico, to Hillston, as the best route, by which to reach the Lachlan Valley, the desirableness of this route being to a great extent emphasised by the subsequent influx of a large number of people to Wyalong. Another possible route suggested to the Committee in the course of their inquiry was one by way of Forbes and thence to Hillston, and on the whole the evidence indicated this as the better route of the two. The evidence given on this point tends to show that the former route could only be justified by the township of Wyalong becoming a permanent and successful field, and not on account of the actual traffic which might reasonably be expected. The Committee, however, while directing particular attention to the proposal submitted to them by the Legislative Assembly, found it also necessary to consider the question in view of the traffic which might be expected from either of the routes mentioned. It was elicited that although good land for agricultural purposes existed in the country to the north-west of Wyalong, large areas contiguous to the Temora line remained uncultivated. In his evidence on this point, the Secretary to the Railway Commissioners says, "the country between Wyalong and Hillston is now used entirely for pastoral purposes and the traffic from that district comes to the railway now, so that no new traffic would be developed by the extension of the proposed line."

7. The evidence obtained from witnesses competent to express a reliable opinion on the permanency of the gold-field pointed to the likelihood of the population being reduced unless further developments were made in the near future. The permanency or otherwise of the field. "The evidence of experienced miners"—the Sectional Committee's Report states—"confirms the opinion freely expressed by local residents, and endorsed by the Chief Inspector of Mines, that even should no further discoveries be made, remunerative employment will be found for upwards of 1,500 people for a considerable time to come." Additional evidence upon which to base some reasonable estimate of the future prospects of the field was furnished in a report made by the Government Geologist, who after an exhaustive examination of the various claims already in existence and the country in the immediate vicinity, gave it as his opinion that the present prospects of the field were exceedingly favourable, but at the same time he pointed out that there was little doubt that mining operations would be more difficult and expensive as a greater depth was attained, as harder granitic formations would probably be reached.

8. In arriving at a conclusion with regard to the proposal submitted to them, the Committee have had due regard to the important interests involved. There are reasonable grounds for assuming that the construction of a railway to Wyalong would be followed by a fair amount of agricultural settlement, and the Committee have been supported in this assumption by the results of the extension of the line from Cootamundra to Temora, which has paid, since its opening, working expenses and over $3\frac{3}{4}$ per cent. towards interest; but the evidence furnished by competent witnesses, while favourable to the prospects of Wyalong, is not conclusive as to the permanency of the field, the general opinion being that, until further development takes place it could only support a population of about 1,500 persons. There has

Decision of the Committee.

has also been the question as to which route the extension to Hillston should take, and this, too, must, in the opinion of the Committee, depend largely upon the future of Wyalong. Under all the circumstances, the Committee are of opinion that the further consideration of the projected railway should be deferred as shown in the following extract from the Minutes of Proceedings of the meeting held on Tuesday, 22 May, 1894 :—

Mr. Trickett moved,—“That the Committee proceed to consider the evidence on the proposed Railway from Temora to Wyalong, with a view to reporting on the subject to the Legislative Assembly.”

The motion was seconded by Mr. Davies, and passed.

Mr. Trickett moved,—“That, in the opinion of the Committee, it is not expedient the proposed Railway from Temora to Wyalong, as referred to the Committee by the Legislative Assembly, be carried out.”

Mr. Collins seconded the motion.

Mr. Humphery moved,—“That the motion be amended by the omission of the word ‘not.’”

The amendment was passed on the following division upon the question,—“That the word proposed to be omitted stand part of the motion” :—

Ayes, 5.
Mr. Garrard,
Mr. Hoskins,
Mr. Trickett,
Mr. McCourt,
Mr. Collins.

Noes, 7.
Mr. Suttor,
Mr. Humphery,
Mr. Davies,
Mr. Wall,
Mr. Neild,
Mr. O'Sullivan,
Mr. Dawson.

Mr. Humphery moved,—“That the motion be further amended by the insertion of the words ‘that the decision upon’ after the word ‘expedient.’”

The amendment was passed on the following division upon the question,—“That the words proposed to be inserted be so inserted” :—

Ayes, 9.
Mr. Garrard,
Mr. Suttor,
Mr. Hoskins,
Mr. Humphery,
Mr. Trickett,
Mr. Wall,
Mr. McCourt,
Mr. Neild,
Mr. Collins.

Noes, 2.
Mr. Davies,
Mr. O'Sullivan.

Mr. Humphery moved,—“That the motion be further amended by the omission of the words ‘carried out.’”

The amendment was passed on the following division upon the question,—“That the words proposed to be omitted stand part of the motion” :—

Ayes, 2.
Mr. Davies,
Mr. O'Sullivan.

Noes, 9.
Mr. Garrard,
Mr. Suttor,
Mr. Hoskins,
Mr. Humphery,
Mr. Trickett,
Mr. Wall,
Mr. McCourt,
Mr. Neild,
Mr. Collins.

Mr. Humphery moved,—“That the motion be further amended by the addition of the words ‘deferred for six months.’”

The amendment was passed on the following division upon the question,—“That the words proposed to be added be so added.”

Ayes, 9.
Mr. Garrard,
Mr. Suttor,
Mr. Hoskins,
Mr. Humphery,
Mr. Trickett,
Mr. Wall,
Mr. McCourt,
Mr. Neild,
Mr. Collins.

Noes, 2.
Mr. Davies,
Mr. O'Sullivan.

The motion as amended,—“That in the opinion of the Committee it is expedient that the decision upon the proposed railway from Temora to Wyalong, as referred to the Committee by the Legislative Assembly, be deferred for six months,” was passed on the following division:—

Ayes, 9.
 Mr. Garrard,
 Mr. Suttor,
 Mr. Hoskins,
 Mr. Humphery,
 Mr. Trickett,
 Mr. Wall,
 Mr. McCourt,
 Mr. Neild,
 Mr. Collins.

Noes, 2.
 Mr. Davies,
 Mr. O'Sullivan.

J. GARRARD,
 Chairman.

Office of the Parliamentary Standing Committee on Public Works,
 Sydney, 28 May, 1894.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

PROPOSED RAILWAY FROM TEMORA TO WYALONG.

MONDAY, 9 APRIL, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTON.
The Hon. JAMES HOSKINS.
The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JOHN DAVIES, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.

THOMAS THOMSON EWING, Esq.
WILLIAM CHANDOS WALL, Esq.
JOHN CASH NEILD, Esq.
CHARLES COLLINS, Esq.
HENRY DAWSON, Esq.

The Committee proceeded to consider the proposed Railway from Temora to Wyalong.

Joseph Barling, Esq., Under Secretary, Department of Public Works, sworn, and examined:—

1. *Chairman.*] You propose to make a statement to the Committee concerning the proposed work which has been referred to it by the Legislative Assembly? Yes; the proposal before the Committee was so referred by Parliament on the 29th March, the following being the terms of the resolution:—"That it be referred to the Parliamentary Standing Committee on Public Works to consider and report upon the expediency of constructing a line of railway from Temora to Wyalong." The early history of this proposal is involved in that of the extension of the railway from Cootamundra to Temora, so that I need not refer to it in any detail. Taking Hillston as the terminal point for the present, four different routes have been advocated. In speaking of Hillston as the terminal point, I do so for the purposes of the comparison I am about to make. I cannot say it has been absolutely determined by the Minister that the railway should be extended from Wyalong to Hillston, because there is another proposal extending the railway to Hillston *via* Forbes along the Valley of the Lachlan. But the discovery of gold at Wyalong has come as a surprise upon the Department, and as far as we can see at present the connection with Hillston will probably be *via* Wyalong. 1st. From Coolaman. This of course must be at once put aside, as the starting point has already been fixed at Cootamundra, and extended 38½ miles to Temora, so that this proposal is entirely disposed of. 2nd. The extension from Temora *via* Mandamah, leaving out Barmedman, and taking a direct route to Hillston. 3rd. The extension to Hillston *via* Barmedman, and thence in a direct line to Hillston. 4th. The direction of the line now proposed, *via* Wyalong, Lake Cargellico, and on to Hillston. Whatever doubt there may originally have been as to which route should be adopted is now in all probability set at rest by the discovery of auriferous deposits in the neighbourhood of Wyalong, which, accompanied by the fact of the splendid agricultural country which is common to all the routes, determines the balance of evidence undoubtedly in favour of the fourth or Lake Cargellico route. Independently, however, of the reason I have referred to, *viz.*, the discovery of gold deposits, there are others in favour of the Lake Cargellico route, which may be briefly summarised in the words of Mr. Surveyor Kennedy, whose report I will presently hand in. He says: "I think that the proposed line *via* the lake would be much easier to construct, open up better country (as against the direct or No. 3 line), and suit most people; the extra length by deviating to the lake would not at the greatest exceed 12 miles." There are other interesting remarks of Mr. Kennedy's pertinent to the subject, and which, with the permission of the Committee, I will read. He says: "On the whole line there would be no earthworks of any importance; in fact, there would only be forming for the whole distance, the curves need not be sharper than 20 chains radius. . . . Almost the whole of this line has the bright chocolate soil, the same as sample No. 1, along its route; with the exception of that portion along the Humbug Creek marked as sample No. 3, this soil is principally found in the Myall and Belar scrubs. The whole of the route is well settled, and the land is being rapidly taken up and cleared for agricultural purposes. Occasional belts of ironbark, gravelly ridges are passed along the route, and enough timber for sleepers could easily be procured close to the line; splendid ballast can be found adjacent to the line at the head of the Humbug Creek, Lake Cargellico, and the Willantry Bluff." I will hand in the same surveyor's report on the direct line (No. 3). It will give some interesting details to the Committee which I need not further refer to. I may mention, however, that in February of this year the Department received, through Mr. Rae, M.P., a letter from the Hillston Railway League conveying a resolution in favour of the direct route from Barmedman. This letter I will hand in. I have already pointed out the reasons for selecting the Cargellico route, and in all probability the real reason for the opposition of the people of Hillston is that they are afraid the line will stop at Lake Cargellico instead

J. Barling,
Esq.
9 April, 1894.

J. Barling, Esq.
9 April, 1894.

instead of going on to Hillston. With regard to the character of the country and its capabilities for settlement, I have obtained a report from Mr. McKinney, the Chief Engineer for Water Conservation, which, as it bears directly on the subject before the Committee, I will read. It is dated the 3rd instant:—

TEMORA TO LAKE CARGELICO.

Geological formation.

From Temora to Lake Cargelico, is a distance of about 96 miles in a direct line. For fully two-thirds of this distance the country is geologically of silurian formation, with extensive outcrops of eruptive rock. Throughout the greater part of the remaining distance, and extending to Lake Cargelico, Tertiary deposits are found. Quartz-veins are met with at Lake Cargelico, and it was at one time believed that there was a promising gold-field there.

Soil.

Throughout by far the greater part of the entire distance from Temora to Lake Cargelico the soil is a rich chocolate loam, covered as a rule with a dense growth of scrub. The valuable nature of this land is shown by the great progress of settlement throughout the district in recent years. The resumed areas of pastoral holdings have to a very large extent been taken up by selectors. For instance, in the case of the Hiawatha Run alone, an area of more than 40,000 acres was thus alienated within a period of eighteen months. The quality of the soil as to agricultural production has been tested thoroughly, and it has been proved that the soil is highly suitable for wheat and other crops.

Development of the district by irrigation.

Lake Cargelico is now a permanent source of water supply, and as the lake proper has an area of more than 4,000 acres, and much of the soil in its neighbourhood is well suited for irrigation, considerable development of the capabilities of the soil by this means may be looked for. Near the river Lachlan the soil is rich grey alluvium, sufficiently uniform as a rule to require little or no grading. The success of the Willandra Weir, which, besides diverting a large supply of water into the Willandra Billabong, holds back the water in the river Lachlan to a distance of about 14 miles, shows what can be done in the way of conserving the waters of the river Lachlan, and making them available for irrigation. The richness of the soil is exceptionally great, but this very feature makes the bush tracks almost impassable in wet weather. In the absence of railway communication the productiveness of the soil and the comparative abundance of water can be availed of only to a limited extent.

H. G. McK., Chief Engineer.

As the Minister informed Parliament, when submitting the resolution to refer the proposed line to this Committee, I saw Mr. Warden Slec, and I should like to read the few remarks made by that gentleman on the subject:—

THE proposed route is almost a level between Temora and Wyalong. No engineering skill or bridges required, with the exception of a few culverts.

The land will tap a large area of auriferous country as well as agricultural lands.

At present the population is about 12,000, but he thinks (say) about 1,500 would be ample for present prospects. Nevertheless there are great possibilities of alluvial ground being discovered within a few miles of Wyalong in a southerly and northerly direction.

Of course the future extension of the line would certainly tap the Lachlan River.

He is of opinion that sooner or later a large mining and agricultural population will inhabit these parts.

The permanency of the field will greatly depend on further development. His private opinion is that reefs at a greater depth will be found too small.

He considers that the line would tap an area of 20 miles on each side.

There is very little agricultural land at Wyalong, but there is really very fine land some little distance away—in fact, good country extends all the way to Mount Hope in the one direction, and Hillston in the other.

Mr. Slec feels confident that in the Wyalong district alluvial diggings will also be discovered. This is simply a part of a large auriferous country, and he thinks at any moment very much better reefs may be struck.

The average return of gold is at present about 2 oz. to the ton.

There are about thirty claims which have struck payable stuff, giving an average of six men to each claim, which means that 180 men are making wages now, and the others are just prospecting over the ground.

There are at least 1,000 at the present moment engaged prospecting, with every hope that something better will soon be discovered.

Gold has been struck over an area of 6 miles in length by 2 miles in width, and Mr. Slec considers there is an auriferous area of at least 30 miles in length by 10 miles in width, extending from Wyalong to Hillston, in which alluvial and reef gold may be struck at any moment.

Agricultural prospects.—There is a large area fit for wheat-growing extending over the whole of the district; that is to say, right on to Hillston, for at least 20 miles on each side.

Wyalong may be considered to be as the roof, as it were, of the dividing water-shed between the Murrumbidgee and Lachlan Rivers.

Of course, the evidence of Mr. Slec will be available, so I need not enlarge on his statements. I also hand in a map prepared by Mr. Saunders, the Chief Draughtsman of the Lands Department, which shows the land, starting 5 miles from Temora, and situated 20 miles on either side of the proposed line, and 20 miles to the north of the terminal point. The particulars are as follows: Freehold land, 112,750 acres; conditional purchases and conditional leases, 442,120 acres; reserved land, 260,750 acres; remaining Crown land, 451,100 acres; or in other words, of the whole area affected, 56 per cent. is Crown lands. The areas given are approximate. This map also shows that, with the exception of a little land at Temora, practically no land will have to be resumed for the entire length of the line from Temora to Wyalong, so that the question of land compensation may be entirely put aside. I have also obtained from Mr. Hickson a detailed estimate, giving the approximate cost of the construction of a road from Temora to Wyalong. The estimate is £69,100, and in the report Mr. Hickson says: "The country is very flat, so that draining on both sides will be necessary for the greater part of the distance." We have allowed a double track. The formation will be 20 feet, and the metalled portion 18 feet wide. The width of a single track roadway will give 12 feet of metal. It should here be noted that while this expenditure of £69,100 would produce no revenue, the construction of a railway, a greatly superior means of communication, would be at once revenue-producing. Mr. Russell, the Government Astronomer, has kindly supplied me with particulars of the rainfall, as noted at stations in the district affected by the proposed line. They are as follows:—

No. of years' observations.		Average Annual rainfall.	Greatest.	Least.
7	Cootamundra	26·34	40·78	12·07
11	Coombaning	21·16	37·08	10·75
11	Kildary	18·68	27·70	8·38
11	Wyalong	21·07	30·32	9·62
13	Temora	21·11	31·10	11·31
6	The Reefs	22·47	35·81	11·89

I will now give the official description of the proposed line, which is dated 29th March:—

J. Darling,
Esq.
9 April, 1894.

The line begins at the termination of the Cootamundra to Temora line, at 291 miles 63 chains 95·8 from Sydney, and passes through the town common at 293 miles 30 chains; thence it will occupy a portion of the main road to Barmedman up to 309 miles 10 chains, where it diverges from it to avoid rising ground. Barmedman Creek is crossed at 310 miles 63 chains, Crown land being traversed up to 311 miles 70 chains, where Barmedman Town Common is entered. To get a suitable site for the station the line bends westward, and passes through the unalienated township sections Nos. 21, 11, 10, and 1 successively. From thence it strikes generally in a direct line for Wyalong at about 331 miles.

A section has only been completed up to date to 312 miles, showing a surface line with easy grades and curves. No detailed estimate of this portion has been made, but it will not exceed £2,500 per mile. The ruling grade is 1 in 100.

As regards the rest, the section is not yet complete, but, judging from Mr. Kennedy's report, the cuttings will be light, and except at the south-west corner of Barmedman township, where a moderate cutting is encountered, and one other of shallow depth, it will also be a surface line. Three thousand pounds a mile should be sufficient for this portion, and the estimate, when the full information is to hand, will probably be less. The grades will be easy.

This survey is a portion of the Barmedman to Hillston, *via* Lake Cargellico, now being surveyed.

The length of this line is about 40 miles, and the further extension to Lake Cargellico is 66 miles, while that from Lake Cargellico to Hillston is 53 miles.

The total estimated cost is £110,000 to Wyalong.*

With regard to the survey of the line, the portion between Temora and Barmedman, a distance of 22½ miles, has been surveyed.

A line between Barmedman and Wyalong has also been surveyed to within 10 miles of the latter place, and in about another week the whole line to Wyalong will be marked out, but this will, of course, be subject to modification.

It will be observed by looking at a map of the Colony, that the line now proposed admirably spaces the country as between the Lachlan River and the Junee-Hay extension. The nearest point from Wyalong to the line of the Forbes to Wilcannia survey is 48 miles, and to the nearest point on the Junee-Hay line, 64 miles. As it may perhaps be useful to the Committee, I will give a table of the distances in connection with the proposed line. They are as follows:—

	Miles.
Sydney to Cootamundra.....	253
Cootamundra to Temora.....	35½
Temora to Barmedman.....	22½
Barmedman to Wyalong.....	17½
Wyalong to Hillston, <i>via</i> Cargellico.....	120
Forbes to Wyalong.....	60
Wyalong to the nearest point on the Forbes to Wilcannia.....	48
Wyalong to the nearest point on the Junee line.....	64
Forbes to Lake Cargellico and Hillston.....	144
Sydney to Wyalong.....	331½
Wyalong to Melbourne.....	401½

I am also to say that the Minister contemplates that the construction of the line shall be subject to the betterment principle, and that he hopes before the present Session is over the Bill giving effect thereto will have passed into law. I have one or two memoranda with regard to the subject of the wheat crop, which may be of some interest to the Committee. Mr. Coghlan has kindly given me some information on the subject. I have a letter from Mr. C. Wood Davis, a well-known economic writer in America, addressed to Mr. Coghlan, in which he deals with the wheat crop of the world, and which has a rather important bearing on the subject before us. In the first place, I may mention that the wheat-crop of the world, according to Mr. Coghlan's book, is 2,249,000,000 bushels. The production of the whole of Australasia is only 40,000,000 bushels. That is according to Mr. Coghlan's last returns, but I know it has been exceeded a little since then. That would only give 1½ per cent. of the whole wheat production of the world. I mention this to show how very little our production at present affects the market of the world. I find also that about 200,000,000 bushels are required by the importing countries of Europe, and it is an acknowledged fact that in the United States the growth of the population is proportionately greater than the increase of the area sown of this cereal. In Russia and Central Europe the consumption of wheat is also increasing. Of course it is well known that America is the great wheat-producing country of the world. Of the 2,249,000,000 bushels of wheat produced I see the United States production is 408,000,000 bushels. The letter of Mr. C. Wood Davis, reads as follows:—

My Dear Sir,

Peotone, Kansas, U.S.A., 24 February, 1894.

Permit me to thank you for copy of the *Wealth and Progress of New South Wales* you were so kind as to send me.

Enclosed I beg leave to hand you a recent communication to the *New York Sun*, in which the movement of population is shown by the increase in the number of farms during the last forty-three years. I have long desired to make this showing, but the Census figures relating to farm increase during the ninth decade are but now available.

I think this will interest you, as it shows the complete exhaustion of the arable portion of the public domain, and that the United States will soon have all it can do to supply food and fibre for its own people; hence will cease to compete with Australasia in supplying the wants of other peoples, and thus leave a wider field, that ensures high prices, to the other exporting countries.

I have just mailed to the *Sun* an article, in which I show by an analysis of official data that, with average crops, hereafter our export power must be confined to such products as cotton and tobacco.

I also enclose another article—appearing as an editorial in the *Sun*—in which I attempt to show that the industrial and commercial depression is due to the loss of purchasing power by the farmer. This is, I believe, the only logical conclusion, as it affects alike freetrade, protected, and gold and silver using countries. What else could result from abnormally low prices when half the labour of civilised people is employed in agriculture?

Yours truly,

C. WOOD DAVIS.

E. A. Coghlan, Esq., Government Statistician, Sydney, New South Wales.

I think that shows that the wheat industry is exceedingly promising in this country. I am well aware that at the present time the price of wheat is lower than it has been for something like two centuries, but the prospects show that there is every hope that the wheat industry here will improve and become one of our most promising industries. The following is from the *Sun* of 10th September, 1893:—

With prices of farm products again such as to afford fair remuneration for the labour and capital employed in production, as they presently must be by reason of the elimination of the world's acreage excess, the purchases of the 30,000,000 upon our farms will help to keep every spindle busy; labour in the towns will, at least for a time, be well employed; hoarding will cease, confidence will be restored, money become abundant, and an era of prosperity will result from the operation of that natural law which is the ultimate arbiter in determining the price of nearly every product of labour.

I quote this to show that there is every prospect that the wheat industry of the world will prosper. There is one other interesting fact which I may mention with regard to our wheat crop. I see that the area under crop with wheat in 1892-3 was 452,920 acres; in 1893-4, 622,320 acres—an advance of 169,400 acres, or nearly 40 per cent. increase. That is as far as the land is concerned. But as far as the

* NOTE (on revision):—Mr. Deane's revised estimate is £104,429 10s. 8d.

J. Barling,
Esq.
9 April, 1894.

the wheat production is concerned, though the figures I have given show an increase of about 40 per cent.—the actual figures being 37·4 per cent. over last year—the increased yield is only 15 per cent. greater. From this it seems that even with a very largely increased area of land, we are still 35 per cent. behind supplying our own needs.

2. *Mr. Wall.*] You have given us a return of the cost of constructing a road from Temora to Wyalong? Yes.

3. Do you know that there is a very large field opening up in Temora with a population of 7,000 or 8,000 people;—can you tell us how long that field was in existence before any money was expended on the roads? I could not answer that, but I know very well that we should not have spent anything like that amount of money there.

4. The Department states that this is an undulating country composed of chocolate soil? Yes.

5. This estimate is to construct a metal road, the whole of the distance from Temora to Wyalong? Yes.

6. Do the officers of the Department report on the necessity of the construction of a metal road for the whole of the distance? I do not think it will be necessary to construct a road at that cost, unless the Wyalong gold-fields become permanent.

7. Has such a thing ever been done in the Colony before in connection with any gold-field which has been opened? I do not remember.

8. We have the estimate of £69,000 for one work against £110,000 for the other;—are we to understand that it is intended to carry on the work? It all depends, of course, upon the developments which take place. There are 11,000 or 12,000 people at Wyalong now, and if the field turns out to be a permanent one, it is possible such an expenditure will be contemplated, but I cannot say it is contemplated now.

9. Do the officers of the Department point to the necessity of any such expenditure as that mentioned being required on the road? Not at present. I have merely given the cost of a road as compared with the cost of a railway.

10. Take the road from Temora to Cootamundra, which has been used for many years, has that amount of money been expended upon it? I should think not.

11. And it is a somewhat similar country? Yes. I did not wish to urge the argument, that if we do not construct the railway we shall have to construct an expensive road. Of course, that will depend very much upon future development.

12. Can you obtain from the officers of the Roads Department a report showing the actual urgent expenditure required at the present time on the road to make it trafficable? Yes. I think I have a report now. The Minister has granted a sum of £500 at the present moment.

13. Are we to infer from the report submitted to us that the construction of this line will cause a special development of the wheat industry in that particular part of the country? I should think it would stimulate the production of wheat there, but the main argument at present in favour of the line is the opening up of the gold-field. That, in conjunction with the probable extra supply of wheat, has determined the Minister in submitting the line for investigation.

14. Then we are to take it that the urgency of the construction of the line is to provide facilities to Wyalong, in consequence of the opening up of the field, and not for the purpose of wheat production? I have not the smallest doubt that this line would, in course of time, been have recommended purely from an agricultural point of view.

15. Of course, that is one of the prospective advantages, but that is not one of the reasons for the construction of the line? It is partly.

16. Do you know whether it is proposed to increase the price of land adjacent to the railway, as has been done in other cases where railways have been constructed? That is a matter for the Lands Department; but I may mention that immediately on the line being brought before the House, by the direction of the Secretary for Public Works, I addressed this note to Mr. Houston:—

My Dear Houston,

Department of Public Works, 30 March, 1894.

Mr. Lyne wishes me to ask you to move Mr. Copeland to reserve at once a mile on each side of our proposed line between Temora and Wyalong. The matter is very urgent indeed, in view of the resolution arrived at by the Assembly last night to refer the proposed work to the Public Works Committee for investigation.

Will you oblige Mr. Lyne by bringing this under Mr. Copeland's attention immediately?

Yours, &c.,

J. BARLING.

W. Houston, Esq., Under Secretary for Lands.

This is the reply:—

Sir,

Department of Lands, Sydney, 3 April, 1894.

With reference to your letter of the 30th ultimo, urging that a mile on each side of the proposed line of railway, Temora to Wyalong, be reserved, I am directed by the Secretary for Lands to inform you that a reserve already exists within one mile on each side of the line from Temora to Barmedman, and the line from Barmedman to Wyalong is almost wholly within leasehold areas, reservation of which is at present unnecessary. The Crown land in the immediate vicinity of Wyalong has been reserved from conditional purchase for gold-mining purposes.

I have, &c.,

WM. HOUSTON,

Under Secretary

(Per R.H.D.)

The Under Secretary for Public Works.

17. Has any request been made to the Lands Department to reserve land within 20 miles of the line? No.

18. With regard to the suggestion or request of the Under Secretary for Lands to reserve land within a mile, is not that the usual request preferred on the initiation of any line? Yes; it is done, I think, as an extra precaution.

19. And is not the object of that special reservation on each side of the line in order that the Government may realise a greater price for it? Undoubtedly; but with the Betterment Bill before the House I do not think the importance of the reservation is as great as it was before, because we shall be able to tax any alienated lands, provided the Bill is carried.

20. Speaking of those reservations—they exist in regard to most of the lines which have been constructed? I think so.

21. Are you aware that this, instead of promoting settlement, has had a tendency to prevent it;—has that been brought under the notice of your Department? I think it has; but, as I said before, I think the introduction of the betterment principle will take away from the argument against our reserving lands, because if the Bill were passed it would, I think, be quite safe to sell the lands.

22. You state that the object of reserving the land is to obtain a higher price for it in consequence of the railway facilities afforded, and the object of the betterment principle is to throw 75 per cent. of the cost of construction on the people who take the land;—if they do not take it under present circumstances without the betterment principle being in existence, is it likely that they will take it for settlement when they have to pay 75 per cent. of the cost of construction? Seventy-five per cent. is the maximum. I do not know what percentage will be fixed.
23. Is it intended to establish special rates along this line;—is that a matter which rests entirely with the Commissioners, or has the Department considered it? We have nothing to do with special rates; we do not take them into consideration at all.
24. Then you rely on the Department being recouped for any losses which may be entailed in connection with the construction of the line by the adoption of the betterment principle along with the special rate? I may mention a fact which occurred in connection with the Glen Innes to Inverell line, that the resolution was passed by Parliament with the provision that the betterment principle should apply, and that special local rates should be levied until the line paid working expenses.
25. Apart from the recent discovery of gold at Wyalong, did the Department regard the proposed line as an immediately important work? I should not like to say it would not have been taken up now if there had been no gold discovered. The surveys we have made from Barmedman to Hillston show that we have thought the construction of the line to be of sufficient importance to justify a survey being made.
26. Have you any idea of the present settlement in and around Hillston? No. I have the population apart from the extraordinary population which has recently arisen. At Temora the population is 915, at Barmedman, 176. I should say that it is less at Hillston, but the total population of the whole county of Bland is 4,571. That, of course, was before the gold rush took place.
27. Can you tell us whether the Temora line is paying? I have asked that question, but I have not received an answer yet.
28. What was the cost of the Temora line per mile when completed? About £4,000; but the country to Wyalong will be very much easier. Again, I do not think it is proposed to fence the line between Temora and Wyalong, whereas the Cootamundra to Temora line is fenced.
29. *Mr. Davies.*] I understand you to say that the whole of the lands through which the line will pass will be Crown or leased lands? Yes.
30. So that there can be no claim for compensation? There will be just a little at Temora.
31. Would the leaseholders be entitled to some compensation for severance? I do not think so. In this case it is all reserved land. There will be no compensation of any kind. There will be no charge or cost incurred for the resumption of land.
32. What is the total estimated cost of the line? £110,000 for 40 miles of line from Temora to Wyalong.
33. The Crown lands will be much increased in value by the construction of the line? There is no doubt about that.
34. Is it intended that the trains over the line shall run at the ordinary speed or at a reduced speed? We shall have 60 lb. rails on the line. We do not propose to fence it. Certainly if the trains run at night they would have to do so at a reduced speed.
35. Can plenty of sleepers be obtained? Yes.
36. Will the line be of the same gauge as the existing line to Temora? Yes.

J. Barling,
Esq.
9 April, 1894.

Henry Deane, Esq., M.I.C.E., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

37. *Chairman.*] Do you propose to make a detailed statement as to the line before the Committee proceed to examine you? I have already made a report, which I think the Under Secretary for Public Works has embodied in his statement. I might, perhaps, read a description of the line. I have more information now than I had when the line was submitted. The length is reduced a little. From Temora to Wyalong it will be 38 miles 46 chains. The estimated cost of constructing this as a light line of railway is £104,480, or £2,707 per mile, exclusive of cost of land and compensation. This line begins at the termination of the Cootamundra to Temora line, at 291 miles 64 chains, and runs chiefly along the side of the main road to within about 4 miles of Barmedman. It passes on the west side of the township, and thence strikes almost direct, mainly along the public road, for the township of Wyalong, where it ends on its southern boundary at 330 miles 30 chains from Sydney. The country is nearly flat throughout, and there are no expensive works. The steepest grade is 1 in 100.
38. What are the authorities going to do for a road when you have monopolised it for a railway? The road is 3 chains wide, so that there ought to be room for both.
39. *Mr. Hoskins.*] Have you had careful surveys made of the proposed line between Cootamundra and Barmedman? Yes; the survey goes nearly along the road the whole of the survey.
40. Are there any streams of water or creeks to cross? Nothing of any importance.
41. Then ordinary sized culverts will carry off the water? Yes; small timber openings, and what are called open waterways and box drains will be sufficient.
42. Is there plenty of timber in the neighbourhood suitable for sleepers—ironbark or blue-gum? Yes.
43. How far will the timber be from the proposed line? A good many of the sleepers which were used on the Cootamundra to Temora line came from the neighbourhood of Barmedman, and I think the ironbark which exists about there will be sufficient to afford sleepers for the proposed line. I propose to use a cheaper kind of sleeper than was used on the Temora line. The Temora line had rectangular sleepers. I propose to use a class of sleeper, such as has been supplied at Narrabri lately under a contract there, mostly round on the top. The sap wood has not been stripped off. They are at least 9 inches wide, and some of them are wider. There is a large quantity of timber, and they make capital sleepers, and are much cheaper than the ordinary kind.
44. Do you believe that if those sleepers were used they would be no more liable to shift than the ordinary square sleepers? They are quite as good in that respect.
45. What depth of ballast do you propose to put on the line? It will work out to about 5 inches—the same as that I propose for the Morco line—1,200 cubic yards per mile.
46. And you intend to have 5 inches of ballast under the sleepers? Yes; and it runs a little way up the side of the sleeper.

H. Deane,
Esq., M.I.C.E.
9 April, 1894.

- H. Deane, Esq., M.I.C.E.
9 April, 1894.
47. Have your officers made any explorations with a view of ascertaining whether there is good material for ballast in the neighbourhood? No, I do not think that has been done; but ballast could be obtained from the Temora line, and I infer that there will be ballast in this neighbourhood as well.
48. And even if it is not very plentiful, you could bring some of it from the neighbourhood of the Temora line? Yes.
49. What kind of station buildings do you propose to have? I put down a certain amount for station buildings, but it will have to be left to the Railway Commissioners to decide exactly what class shall be constructed. I based my estimate on those on the Narrabri to Moree line, and there timber is used. The cheapest possible description of buildings will be put up.
50. Then you propose, subject to the approval of the Railway Commissioners, to have weather-board stations and goods sheds? Yes.
51. Do you know whether there are quantities of suitable timber to be obtained at a reasonable price in the vicinity of the proposed line? I think there is some pine.
52. And the pine obtained in that locality and on the Lachlan is very efficacious in restricting the ravages of white ants? Yes.
53. Then the surveys which have been made between Temora and Barmedman are sufficiently accurate, I suppose, to enable the Department to call for tenders for the construction of that portion of the work in how long a time? There is no reason why tenders should not be called in a very short time. It would not be possible to stake out the line in the usual manner. I think, if Parliament required that the tenders should be called very shortly, I should have to make certain provisions in the specification to give the contractor a certain amount of latitude, limiting him as to the height of bank and so on—that is to say, to make him put a minimum of bank; but I could not, within a very short time, give him levels all the way along the road and pegs in the usual manner.
54. Can you give an idea as to the time in which you can have tenders called, if Parliament sanctions the work, for the construction of a line from Temora to Barmedman? If it were looked upon as an urgent matter, and the work had to be done in that way, I think I could call for tenders within a month—certainly as soon as a line could be passed by Parliament—perhaps a little sooner, if necessary.
55. You think then that if Parliament sanctioned the construction of the line or a portion of it, you might be able to call for tenders for the construction of the line between Temora and Barmedman within a month? Within a month from to-day, if I had instructions to do so.
56. What description of rail do you propose to use? Sixty-lb. steel rail, flat bottomed.
57. Do you propose to use chairs? No; the rails will rest on the sleepers.
58. Then the idea is that there will have to be a moderate or slow rate of speed, say 15 or 16 miles an hour as a maximum? Yes; it would be to all intents and purposes a very good line, but it would not be a high speed line.
59. Would it be safe to run at the rate of 20 miles an hour? I think so.
60. The surveys of the proposed line from Barmedman to Wyalong are not in such an advanced state as those from Temora to Barmedman? I received a section of the line this morning, and I hope in a few days to be able to furnish it to the Committee.
61. Supposing the Committee recommended Parliament, and Parliament approved of their recommendation, to construct a railway from Barmedman to Wyalong, how long do you think it would take you to have the line in a sufficiently advanced state to call for tenders for it? I should like another month for that.
62. Could the ordinary rolling stock run over the proposed line safely? Yes; I should say I would very much prefer to have a proper section and proper pegs put in in the usual manner, because it would in the end be a saving in constructing. But if it were pushed, it could be done as I state.
63. How long do you think it would take you to stake out the road, in order that you might let the contract in the usual way between Temora and Barmedman? By putting on a number of surveyors, I think it could be done in two or three months more.
64. *Chairman.*] What is the grade of the line? One in 100.
65. Is there not a steeper grade than that going into Barmedman? No; it can be cut out.
66. *Mr. Trickett.*] How does the country the line has to traverse compare with the country from Cootamundra to Temora? It is much-smoother, easier, and less expensive for the construction of the line. For instance, the first part to Barmedman is a surface line throughout until you get close to Barmedman. There is not a cutting in it.
67. Will not that, being very level, necessitate considerable expense for draining? I think not. Where there are little watercourses we can run the water across the line by putting down box drains, or open watercourses at frequent intervals.
68. And those are inexpensive? Yes.
69. You have not the section from Barmedman to Wyalong? No.
70. Is that much more undulating country? It is very much the same. There is only one rise where there will be anything of a cutting.
71. When the line from Cootamundra to Temora was authorised the Committee imposed a condition that it should not exceed a certain sum per mile—I think it was £3,300? Yes.
72. Was that exceeded? Yes.
73. To what extent? It has cost between £3,800 and £3,900.
74. Why was it so much more expensive? It was impossible to make it for less. My estimate, if I remember rightly, was £3,650, and I expected to be able to do it for that. But there have been some increases of side cutting which have been necessary to keep the formation up. This is in soft country where the embankments have compressed the ground underneath. I was rather concerned about one portion because the quantities were running up so high, and I sent an officer down specially to examine, measure, and report. That is one reason, but there are others. The accounts have not yet been made up, and therefore I have not investigated the matter thoroughly.
75. Do you think £2,700 will be the ultimate cost per mile of the proposed line? Yes; it can be kept down to that. In fact, with the Temora line I would have limited the earthworks and let the banks go down. I do not think there would have been any serious consequences. In the case of the proposed line the work would be let at so much a chain or so much a mile, and the contractor would see that not more than the quantities estimated for are put on.
76. It is not proposed to fence the line? No.

77. Is the nature of the soil similar to that between Narrabri and Moree? No; there is more red soil.
78. But I mean in regard to the ballast required;—would the ballast sink in? There would be the same fear, because certain portions of the Narrabri to Moree line are over black soil.
79. Do you think 5 inches of ballast would be sufficient? Yes. I should like to express the same opinion about this kind of construction for the proposed line as I did about the Moree line. I should prefer to make it stronger, but to meet the demand for cheap railways I think it can fairly and safely be done in this way.
80. Have you seen the line which was constructed from Broken Hill to Tarrawingee? Yes.
81. Is that a ballasted line? Yes; I think it is sand ballast chiefly, or fine shingle or coarse sand from Stephen's Creek and other watercourses.
82. That is a surface railway, is it not? It is not so much a surface railway as this would be. There are banks and cuttings in places. A portion of the country is very level, but there are banks and cuttings upon the line.
83. The estimated cost of the Narrabri to Moree line was, I think, £2,400 a mile? Two thousand four hundred and seventy pounds was the estimated cost of the last portion.
84. Does it not strike you that the proposed line should be a less expensive one than the line from Narrabri to Moree, considering the difficulties in the shape of floods and washaways on the Moree line? I will explain where the difference comes in. One cause of difference is the difference in length, so that the terminal arrangements are divided over a greater length than in the case of the Moree line. Some of the items are less.
85. Are parts of the Narrabri and Moree line much more expensive than other parts? I divided that line into two sections. In the first section the average per mile came to £5,056, and the other portion was £2,470—something like the proposed line. The permanent way materials for the proposed line I have put down at a little more, and the reason for that is that special arrangements were made with the Commissioners about freight, and so on, in regard to the Narrabri-Moree line; and, pending similar arrangements being made in the present instance, I have taken the freight on the permanent way materials at the recognised value of 2d. per ton per mile. My arrangements with the Commissioners have been chiefly that freight is to be charged at 2d. per ton per mile unless there is return freight. If there is return freight only 1d. is to be charged; but in this instance, if the work is to be pushed on, I think it would not be fair to expect the Railway Commissioners to use the 1d. rate, because there would be no return freight.
86. And that makes a considerable difference? That makes a good deal of difference. On the other hand, the prices of materials in England have gone down, and it is possible that I may be able to lower the estimate accordingly.
87. You think it possible, then, that you may construct the line for less than £2,700 per mile? I might possibly be able to lower the cost of the permanent way materials. The next item where I have an increase of about £100 a mile is in the laying and ballasting of the sleepers. I put the laying down at a little more—1s. 6d. instead of 1s. 3d., and I have put the sleepers rather higher—3s. instead of 2s. 6d. Taking it altogether I should not consider the Temora district as good a district for getting sleepers as the Narrabri district. The timber is not so good nor so straight as it is in the forests near Narrabri, and I think it would be fair to put a little more on the price; but even sleepers at 3s. would be very cheap. Several small items divided by the mileage of the Wyalong line bring a higher result than in the case of the Moree line. For instance, it would be necessary to make provision for water supply. I have not made up my mind yet where water is to be obtained, but in the case of Moree I have put down £3,000, and I put down £3,000 in the case of Wyalong, there having to be in each case two water stations on the road. Three thousand pounds divided by 60 is only about two-thirds of what it is if divided by 40. That makes a difference of £27 per mile.
88. And those are the chief items of difference? Yes.
89. Considering that this work, if constructed at all, may be regarded as a very urgent one, what time would you say should be allowed for construction from Temora to Wyalong? If we had the rails and a pushing contractor I think we could do it in six months.
90. That would be something very uncommon in railway construction? Yes. The Temora line was done in thirteen months; that is the quickest piece of work up to the present, and this is about the same length.
91. *Mr. Neild.*] Do you think it absolutely essential to use ballast on the line, seeing that there is a large mileage in America where no ballast is used? Yes; I prefer ballast.
92. Have you given any attention to the system which is in operation on some parts of the Continent known as the Balk System, with longitudinal sleepers and iron ties? Yes; the longitudinal sleepers are not anything so good as the cross sleepers; you do not get the same amount of bearing surface.
93. But there would be a considerable diminution in expense? I very much doubt it, because with longitudinal sleepers you have to trim the timber all the way along, and then you have to fix your ties. Where you have transverse sleepers you run them through a machine and you have the grooves made for the rails to fit in; and having such good hardwood timber it would be out of the question to use soft wood. If you attempted to use hard wood for longitudinal sleepers they would curl about frightfully. You would soon have a track which would be quite useless.
94. You do not propose to fence the line? No; I have only included a small sum for fencing.
95. Do you not think there would be considerable inconvenience to vehicular traffic on the road by reason of the trains running along the road without a fence? I propose to put the line close alongside the boundary of the road, so that the rest of the road, being over 2 chains wide, would practically be quite clear for the other traffic.
96. Then you do not think the line would materially interfere with the road? No.
97. Are you not likely to have accidents with teams scared by the trains passing so close without any intervening fence? I think not.
98. I suppose the line would cross and recross the road in places, necessitating the construction of a good deal of roadway to make up for the portions occupied by the tracks? No; the road is pretty straight nearly all the way. There are few curves, and they can easily be managed.
99. Then you think the construction of the railway would not necessitate any large expenditure upon the present roadway? I do not think it would. The road is a very straight one.
100. Do you know the country from Wyalong to Barmedman? Yes; but I have not been over it.
101. Has the line from Cargellico to the Lachlan the best approach? The line *via* Cargellico would be the best approach to the Lachlan.
- 102-3. Better than the southern line shown on the map in pencil? Yes. The dotted red line on the plan practically avoids all the difficult country.

H. Deane,
Esq., M.I.C.E.
9 April, 1894.

- H. Deane,
Esq., M.I.C.E.
9 April, 1894.
104. In your opinion, then, if there is an extension to Wyalong, you think it will follow the dotted line on the plan to the Lachlan? Yes.
105. *Mr. Humphery.*] In what respect will the proposed extension differ from the line from Cootamundra to Temora? The country is very much easier for the railway construction. The country between Cootamundra and Temora for the most part is undulating.
106. I am speaking of the difference in the weight of rails and sleepers? I should use the same weight of rails and the same number of sleepers to the mile, but I should use sleepers of an inferior quality—of ironbark, of course, but not so carefully shaped, and less ballast.
107. When you say inferior quality, do you mean that the timber itself will be inferior? No; I shall spend less money upon dressing it.
108. Will the durability of the sleepers be lessened? No; it will probably be exactly the same.
109. In what respect will they be inferior? Being less shapely they cost less money.
110. Will the stability of the line be affected by substituting the sleepers for those you propose to use for those generally used? No.
111. It will be an equally good line? I cannot say it will be an equally good line because the rails do not have the same amount of bearing surface, but it is quite good enough for the traffic.
112. Will it cost more to maintain and keep in repair? I do not think so—not on account of sleepers; and I do not think it need cost much more to repair on other accounts if the speed is kept down. A line that is deficiently ballasted, of course, would be liable to greater charges for repairs than one that has plenty of ballast and good formation. Cheapness of construction as a rule means higher maintenance charges. That is very well understood.
113. Having understood that, I wish to know from you in what respect the line would be more costly to maintain than the line from Cootamundra to Temora. I imagine that if the traffic were exactly the same over the Cootamundra to Temora line as over the Temora to Wyalong line, the maintenance would be higher on the Temora to Wyalong line, because it would require more attention.
114. What do you think is the rate of speed which should be traversed over the proposed extension, and the weight of the engines which should be used? From 15 to 20 miles an hour would be sufficient. I think the engines should be limited to those which have an axle load of between 10 and 12 tons.
115. Do you know what engines are being used between Cootamundra and Temora? No.
116. Therefore you are unable to say whether they could be safely used over the proposed extension? No.*
117. *Mr. Collins.*] Seeing that the line from Temora to Wyalong will cost more to keep in repair than the line from Cootamundra to Temora, do you think the Railway Commissioners will be agreeable to take it over on those conditions? The Railway Commissioners have, for the last two or three years, advocated cheap lines.
118. Notwithstanding that they cost more to keep in repair? I suppose they have looked at it from every point of view.
119. *Mr. Davies.*] I think you say your previous surveys have not gone beyond Barmedman? Yes; Mr. Gillett has been working between Barmedman and Wyalong.
120. Before the gold-field was discovered you had made surveys in a different direction, had you not? No; Mr. Gillett commenced to work under instructions to work towards Lake Cargellico?
121. He was not sent out to run a line to Wyalong, but to run a line to Lake Cargellico. Some time ago the Minister authorised an examination of the line from Barmedman to Hillston. I sent Mr. Kennedy, and he recommended the line *via* Lake Cargellico. As a result of his report, I recommended to the Minister that the line should be run from Barmedman to Lake Cargellico, and thence to Hillston. The Minister approved, and I sent Mr. Gillett to Barmedman to start from that end, and Mr. Marshall to Hillston to start from that end to meet him.
122. What was the character of the surveys made from Barmedman to Hillston, not by way of Wyalong, but the previous survey? The ordinary trial survey.
123. Did they pass through the same character of country, or was it better country than that which it is proposed to tap by going *via* Wyalong? It is reported not to be so good, and the construction will be more costly. As you see from the plan, you have to pass about three ranges.
124. What is the cost of 60-lb. rails per ton? Hitherto, it has come to about £6 per ton, delivered in Sydney.
125. Has not the Department recently been able to secure a large line of steel rails at a very low rate? A very favourable quotation was received.
126. At what price? With all charges, it will come up to £4 10s., delivered in Sydney. I might say that it is not quite clear whether the rails offered are from Cleveland ore. I presume they are from hematite ore; but if the tender is accepted, it will have to be on the condition that the rails are made from hematite ore, with the usual acknowledged specification.
127. Will this be the cheapest line of railway, with a 60-lb. rail, you have been able to secure at any time? Yes.
128. At what did you calculate the price per ton of the rails laid between Narrabri and Moree? The new rails were reckoned at £6 per ton. The others were re-rolled rails. Some of them we had taken over from the Commissioners' account at £5 10s.
129. What will be the difference in the rails on the proposed line, taking them at £4 per ton, as against £6 per ton on the Moree line? The cost of the rails, reckoning the most recent quotation in Sydney, would be £20,171—that is, without freight. The freight, at 2d. per ton per mile, would be £255 17s. 1d. per mile. The cost of the 60-lb. rails, taking it at £6 2s. 6d. per ton, which was one of the most recent calculations, comes to £674 per mile, and taking it at the newer calculation, it comes to £522 per mile, so that there is a saving of £150 per mile.
130. You propose to lay your sleepers on 5 inches of ballast? Yes.
131. What ballast do you propose to put between the beds of your sleepers? It will come half-way up the sleepers.
132. Is it to be broken ballast, or drift from the river beds? It will probably be broken ballast. There may be some quartz obtainable from the ridges. We had some on the Temora line.

TUESDAY,

* NOTE (on revision):—I believe instructions have been given only to use, on the Temora line, engines having a maximum axle load of 12 tons.

TUESDAY, 10 APRIL, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.
 The Hon. JAMES HOSKINS.
 The Hon. FREDERICK THOMAS HUMPHREY.
 The Hon. JOHN DAVIES, C.M.G.
 The Hon. WILLIAM JOSEPH TRICKETT.
 THOMAS THOMSON EWING, Esq.

WILLIAM CHANDOS WALL, Esq.
 WILLIAM McCOURT, Esq.
 JOHN CASH NEILD, Esq.
 EDWARD WILLIAM O'SULLIVAN, Esq.
 CHARLES COLLINS, Esq.
 HENRY DAWSON, Esq.

The Committee further considered the proposed Railway from Temora to Wyalong.

Joseph Barling, Esq., Under Secretary, Department of Public Works, sworn, and further examined:—

133. *Chairman.*] You are aware that the Public Works Act provides that in the case of a proposed railway or tramway the Department shall submit to the Public Works Committee a map or plan of the proposed line, together with a book of reference, and a report from the Railway Commissioners, giving an estimate of its probable cost, together with the cost of maintenance, and so on;—that report was not put in yesterday? I am not in a position to say when it will be ready; but I hope to have it next week.

J. Barling,
Esq.
10 April, 1894.

134. Is not the Chief Commissioner at present absent in Tasmania? Yes; but I do not think he will be there very long.

135. Then the report will have to wait over until he comes back? Yes. The Commissioners, I believe, have not had time to make their report yet, and I understand, though I am not certain on the point, that they wish to visit the district through which the proposed line will pass. That, however, will not take very long. The peculiar circumstances of this case demanded that we should do all we could to get it before the Committee because Parliament will soon come to a close, and unless we advance the work at every stage as far as possible, it cannot be dealt with. We are doing our very best, and I hope to be able to furnish the report next week.

136. Knowing the feeling of the Legislature in regard to it, the Committee have taken up this work out of its turn, and no delay will occur through our action? Yes; but I think we have done all we could towards pushing it on.

Charles James Saunders, Esq., Chief Draftsman, Department of Lands, sworn, and examined:—

137. *Chairman.*] The Committee understand that you have prepared a compilation of county maps in the Temora and Wyalong district, upon which the freehold land is shown coloured red, the conditionally purchased and conditionally leased lands as blue, the reserves as green, and the Crown land unalienated and not dealt with in any way as white? Yes.

C. J.
Saunders,
Esq.

10 April, 1894.

138. The map takes in an area extending 20 miles on each side of the proposed line, beginning 5 miles north of Temora, and extending about 20 miles north of Wyalong? That is so.

139. The area shown upon it is—Freehold land, 112,750 acres; conditionally purchased and conditionally leased land, 442,120 acres; reserves, 260,750 acres; unalienated Crown land, 451,100 acres; a total of 1,266,720 acres;—is that so? Yes; that is the case.

140. Is this return, so far as you are concerned, up to date? I think it can be regarded as fairly up to date.

141. How long is it since you last received information from the local Land Office? We are generally within a few weeks of the local offices.

142. You know nothing of the country yourself? Nothing personally.

143. You have never been there? No.

144. Would you like to give the Committee an opinion as to what you think would be the increase in value of Crown land in the district if the proposed line were constructed? I do not think I could venture on that.

145. Do you know if a request has been made to your Department by the Works Department to reserve the land along the proposed line? A request was sent to us.

146. Asking you to reserve how much? To make the usual reserve of 1 mile on each side of the line.

147. There was no request from the Works Department to reserve from sale the whole of the land shown on the coloured part of your map pending the completion of this inquiry? I have not seen a request of that sort.

148. Do you know whether the Lands Department have taken any steps on its own motion to make such a reservation? I am not aware of such a reservation having been made. A couple of large reserves have been made in the neighbourhood of Wyalong.

149. Are they shown on the plan? Yes.

150. You are not aware whether the Secretary for Works or the Secretary for Lands have taken steps to comply with what appeared to be the general request of the Assembly, namely, to reserve the whole of the land in the district pending the decision of this Committee? I am not aware that they have, but of course steps might have been taken without my knowledge. Most of the Crown lands in this locality lie within the leasehold areas. The existing leaseholds terminate in 1895, and in the majority of cases applications have been made for an extension of lease. Those applications have not yet been disposed of.

151. Has the Department decided on its policy with respect to the leases in the Central Division? No; I think the matter is awaiting further legislation.

152. You do not know anything as to the direction of that legislation? Nothing at all.

153. *Mr. Neild.*] Is it customary for your Department to raise the price of land through which a railway has been taken? I believe that it is customary.

154. By creating reserved areas? By proclaiming special areas.

155. Unless special areas are proclaimed the price of the land is fixed by statute? Yes.

156. *Mr. Wall.*] Can you give us, approximately, the area reserved at Wyalong for gold-mining purposes? Looking at the map, I should say that about 50,000 acres have been reserved.

- C. J. Saunders, Esq.
10 April, 1894.
157. Are those reservations made subject to alienation under the 48th section of the Act, or is the land entirely reserved from conditional purchase? The land is reserved from conditional purchase and conditional lease.
158. You are talking of the land in the vicinity of Wyalong? Yes; land in the immediate vicinity of Wyalong.
159. That land will not be open for selection or settlement until the reserves have been revoked? That is so.
160. *Mr. Trickett.*] I suppose you know what quantity of land has been alienated within the last three years between Cootamundra and Temora? I cannot say that I have taken particular notice of that locality.
161. One of the recommendations in favour of the line from Cootamundra to Temora was that settlement and cultivation would follow its construction;—can you say whether that has happened? I feel certain, without having looked into the matter, that nearly all the land in the vicinity of the line has been sold.
162. Since the construction of the railway? I should not like to say that.
163. Have you any knowledge as to the nature of the settlement? I could not tell you anything in regard to it.
164. What officer would be able, from local knowledge, to give us information on the point? Most of that land is dealt with by the District Surveyor at Forbes, but the land between Cootamundra and Temora is dealt with by the District Surveyor at Wagga.
165. Will you kindly get us, as soon as possible, a return showing what area of Government land has been alienated between Cootamundra and Temora since the construction of the railway, the average price paid for it, and the increase in settlement there? Within 20 miles on each side of the line?
166. Yes? I will.
167. *Mr. Wall.*] Can you tell us what area was reserved along the Temora line when it was being constructed? I think we reserved the land within 1 mile of the line.
168. Has that land, or any portion of it, been alienated since the construction of the line; if so, what price was paid for it? I will find that out for you.
169. *Mr. Ewing.*] This land is in the Central Division, you say, and most of the unalienated Crown land forms part of the leasehold areas there; but are not the rights of the pastoral holders to this land now under dispute? What rights—the right to an extension of lease?
170. Or something further? I do not know what further rights they may have.
171. The pastoralists may, under the existing law, be entitled to hold that land for some time? That is the matter which is hung up at the present moment.
172. So that in 1895 this land may not come into the occupation of the Crown? It may not. The leaseholders may get an extension of their leases.
173. You do not know how the land will stand? No one can say now how it will stand then.
174. *Mr. Humphery.*] Can you tell me if the gold-field reserve at Temora, or any portion of it, has been thrown open to selection? I could not say without looking into the matter.
175. Do you know if there are several reserves between Temora and Cootamundra? Yes.
176. Were there some at the time the Committee recommended the construction of the Temora line, four years ago? Yes; there must have been some large reserves then.
177. Can you say whether any of them have been thrown open for selection? I think some of them have been.
178. Will you supply us with information showing what reserves have been thrown open for selection, and the area selected since April, 1890, within, say, 20 miles of the line between Temora and Cootamundra? Yes.

William Henry John Slee, Esq., Chief Inspector of Mines, Department of Mines, sworn, and examined:—

- W. H. J. Slee, Esq.
10 April, 1894.
179. *Mr. Wall.*] You recently visited Wyalong? Yes.
180. And furnished a report in regard to the gold-field there? Yes.
181. Have you any doubt as to the permanency of that gold-field? None whatever.
182. I think you stated in that report that the auriferous belt extends over a tract of country 5 miles by 2? That is the belt at present being worked.
183. There have been some crushings on the field? Yes.
184. From how many different lines have those crushings been taken? They have been taken from thirteen different claims, and several different lines of reef.
185. What is the size of the reefs? They are very small.
186. Have they been decided to any depth? They have not. The deepest sunk upon is about 100 feet.
187. They have continued to that depth? They have continued to that depth.
188. Have they cut out in any case where they have been sunk on? No.
189. The Lands Department have reserved, I believe, about 50,000 acres in the vicinity of Wyalong;—was that reserve made on the recommendation of the Mines Department? It was not made on my recommendation. I am not aware whether it was made on the recommendation of the Mines Department.
190. Are you aware that 50,000 acres of land there have been locked up from settlement? I am not aware of it.
191. You think it is necessary for the development of the mining industry there that such a large area of land should be locked up from settlement? I think it could be locked up to a certain extent, because there are miles and miles of auriferous country to which a rush might take place at any moment.
192. But has not the Department, under the 48th section of the Act, power to deal with the whole of that land so that it may be available for both mining and agriculture? It has power to give permits to search for gold, but not power to give a title.
193. If the land is proved to be auriferous, the Department has power to resume it upon paying compensation? Yes; compensation according to the Land Board's decision.
194. Has any alluvial discoveries been made at Wyalong? I believe not, up to date.
195. Several prospecting shafts have been sunk? Yes.
196. At what depth have they reached the rock? About 35 feet is the deepest I have known, although they have sunk through the rock, thinking at the time that it was not bed-rock.
197. What is the nature of the rock? Decomposed granite.

198. Is not decomposed granite considered rather below the stratigraphical position in which permanent reefs are discovered? Not necessarily; but it is very seldom that reefs in granite formation carry down to any depth.

199. Unless the granite hardens? There is a great probability of the reef pinching out, or becoming refractory.

200. Do you regard this as part of the belt of country which extends to Hillston? It extends to Hillston, Billy's Lookout, Wollongough, Melrose Plains, and right out to Burra Burra. I have been through it for miles.

201. Is it of the same nature as the country round Yalgogrin? It is not the same in geological formation at Yalgogrin. The ground there is composed of quartzites, also slates and granite.

202. We were told yesterday that the country you have described extends in the direction of Mount Hope? Yes.

203. Would it go so far as Cobar? No; but it goes to Lake Cowal, Billy's Lookout, Yalgogrin, and Melrose Plains. A rush might take place to that country at any moment.

204. Mr. Wilkinson furnished a report some time ago with regard to the alluvial deposits in that part of the country? Yes; at Billy's Lookout.

205. He did not anticipate that any considerable deposits would be found there, because of the limited denudation? But at the same time he stated that further to the south, where Wyalong is now, deposits might be discovered.

206. What is the nature of the rock they struck at a depth of 100 feet? Decomposed granite. There is also diorite at Wyalong; but no reefs have been found in it.

207. Did you not report on some field on the southern line recently? You mean the Grong Grong field? No; I have not been there.

208. You regard Wyalong as a field likely to furnish employment for a large number of miners for some time to come? Yes, for years to come. I believe that better reefs will be discovered, and that more reefs will be worked in a short time.

209. The reefs opened up in the vicinity of Barmedman have been rather erratic in their character? Yes.

210. Are there any that can be termed permanent reefs? No.

211. The same may be said with regard to the reefs at Temora? The heavy flow of water has greatly hindered the reefs at Barmedman from being worked.

212. Considerable amount of reefing is done in the vicinity of Temora? Yes.

213. That is also a granite and diorite country? Yes.

214. Those reefs were very promising to a shallow depth? Yes. Some of the shoots were, perhaps, 6 feet in length, whereas the reef showed 100 yards in length.

215. In the reefs opened up at Wyalong the enclosing stratum is soft;—there will be no difficulty in testing those reefs? None whatever.

216. Have those who are prospecting there evinced a desire to test the reefs to a depth? Most of those reefs are not in the hands of mining men. They are in the hands of selectors and farmers who have not done much mining work.

217. You have dealt with a good many disputes at Wyalong arising out of the administration of your Department? Yes.

218. Is there any truth in the rumour that has been circulated that practically the whole of Wyalong has been taken up by a syndicate from Barmedman, and that in consequence of their names appearing on so many applications the Department asked them to substitute other names? No; I believe not. One party, perhaps, have applied for several permits, and the Department, through my recommendation, has asked them to substitute other names to prevent what might be considered a monopoly. I have not heard of any syndicates there.

219. But would not this privilege of substituting other names have the effect of placing the field in the hands of a few persons? No. As soon as the permits are granted the cancellation of the selections will take place, and each party must make his title good by a miner's right, and must, therefore, employ a large number of persons.

220. But I understand the position to be this:—Several persons have made applications for a number of permits, and they will have the privilege of substituting other names for their own? I believe so.

221. Will that not enable a small number of people to hold a large part of the field? It will give them the right to do so if they provide substitutes to work for them. The people coming there do not come from Barmedman alone, but from all parts of the country.

222. Is the selection on which gold was discovered at present in course of cancellation? Yes.

223. Is the greater part of it covered by permit applications? I believe that about one-third of it has been applied for, and that two-thirds of it will be available when cancellation takes place.

224. Any that remains will be Crown land, subject to application in the usual way? Yes; very little prospecting is carried on until application permits have been granted.

225. Is it the intention of the Department to give persons holding permits the right to apply for leases or to give them ordinary claims or prospecting claims? So far as I know they are to have ordinary claims held under a miner's right; but I cannot say for certain.

226. If claims are held in that form, employment must be given to a large number of people? Yes; I have recommended that the land should be taken up under miners' rights.

227. You have no doubt that the present development warrants you in stating that the field is likely to be a permanent one? Taking the whole of the surroundings I think the field will be permanent.

228. Is there any difficulty in obtaining water for machinery and the necessary treatment of the stuff? I believe that water for crushing purposes can be obtained by sinking no distance from the present reefs on Crown land within a mile of the surveyed township.

229. Is there any truth in the statement that has been circulated in the press that there is only one water catchment at Wyalong? No; there are several water catchments there.

230. You do not think any delay in the development of the field is likely to be caused by the want of water? I do not think so. During the last forty years I have seen fields much worse off for water than this is.

231. When visiting Wyalong which way did you go? From Sydney to Temora and through Barmedman.

232. Did you find the road in a very bad condition? The road between Barmedman and Wyalong is very bad.

- W. H. J. Slec, Esq.
10 April, 1894.
233. Are the bad parts of the road continuous, or is the road bad only where the water has lodged? The country is nearly level and the road has not been drained, so that the water sinks down into the road wherever the drays have been along it.
234. Is there no undulating country? Not much; it is nearly all level country. I do not think there would be a cutting more than 7 or 8 feet deep on the line.
235. In speaking of the permanency of the field, I suppose you rely solely upon the reefs which have been opened up? Not necessarily. I formed my opinion from what I saw in travelling over the country for miles on former occasions. In a report dated August of last year, I referred to the country between Yalgogrin and Barmedman as being more auriferous than Yalgogrin itself.
236. I wished you to confine yourself to the discoveries already made, and to separate them from the prospective development of the field. Do the present discoveries warrant you in saying that a large population can be maintained at Wyalong for some time to come? The present discovery would warrant me in saying that the field can support a population of about 1,500 for some years to come.
237. And you think there is a great probability of further development taking place? Yes.
238. That is in reefing? Yes.
239. You also think it probable that alluvial deposits will be found in the vicinity of Wyalong? I think that both southerly and northerly alluvial deposits will be discovered within a few miles of Wyalong. Wyalong is on the watershed of the Lachlan and the Murrumbidgee, and that, no doubt, is why the ground there is so shallow.
240. *Mr. Trickett.*] Have you any statistical information which you can give us as to the number of miners' rights, residential areas, and mineral leases granted at Wyalong during the last twelve months? I know that over 1,000 miners' rights were taken out at Barmedman in one month, and there must have been 1,500 taken out since the discovery at Wyalong.
241. No mineral leases? No mineral leases.
242. Have any permits been taken out? Permits to dig and search for gold?
243. Yes? Some hundreds.
244. How is it that only about 1,500 miners' rights have been issued, when there is such a large population there? A large number of men bring their miners' rights with them. A right can be issued and holds good for any part of New South Wales.
245. Most of the people there have gone to search for gold? Yes; or for business purposes.
246. Do you know the number of residential areas there? There were none when I left the field.
247. How long ago is that? I left the field on the Wednesday before Easter.
248. Is this a place where residential areas would be applied for in the ordinary course? They would, in time, but at present it is very likely that the warden will object to them.
249. Why? Because they might be put right on to the land where prospecting was being carried out.
250. Then does the population squat down where it chooses? The people there can go where they like; but I have refused to give them the right to reside at what is known as the main camp, so as not to prevent miners from sinking there. Business people, as a rule, go where they can find the miners close at hand.
251. All the people who occupy residential positions at present have no title to their holdings? They are there merely on sufferance, under their business license.
252. The reason why residential areas have not been taken up is that the Department will not allow them? Residential areas have been taken up in the new surveyed town. People are allowed to go there and get a title to their land. That is within a quarter of a mile of the nearest claim, and about $1\frac{1}{2}$ mile from what is known as the main camp.
253. Can you tell the Committee whether there are indications there of other minerals besides gold? One or two of the reefs have copper associated with their free gold. There may be other minerals besides gold in payable quantities there.
254. Were there not prospects of tin being obtained in that part of the country? Yes; about 20 miles miles away.
255. Not sufficiently close to be an argument in support of this proposal? No.
256. Do you think there are good prospects of mineral finds along the proposed line from Barmedman to Wyalong? I think that in time to come we ought to have larger mineral discoveries within 20 miles of the line.
257. What are your ideas about the Temora gold-field;—do you think it is retrograding? I reported upon that field in 1880, and I believe what I then said has come pretty true.
258. What was that? I said that the quartz reef at Temora would never be much good, and that the alluvial would be greatly confined to a certain lead. That was published in the Annual Report for 1880.
259. Those who advocated the construction of a line from Cootamundra to Temora said that the mines at Temora had not had fair play—that they had not been systematically worked, but had been muddled and scamped? I think that the whole of our mining fields have been scratched over. We have not done our work as we should have done it.
260. Can you tell us with regard to the Temora mine, whether that is the reason of their not having gone ahead, or is the reason to be found in the absence of gold? The reason of the Temora field not doing well is that the shoots of gold were too short, and the country very hard to follow up.
261. I suppose that when you went from Temora to Wyalong you made a pretty close observation of the country you traversed? Yes.
262. Did you notice a very fine belt of ironbark within about 10 miles of Temora? There is some very good timber at no distance from Temora.
263. Is there not a small forest of ironbark? Yes.
264. Would not that timber be suitable for railway sleepers? I am not able to say; but I should think so.
265. I want to know if that is not a prominent feature in favour of the construction of the line? There is very good timber between Barmedman and Temora.
266. And a considerable quantity of it? Yes.
267. The proposed line is estimated at a cost of about £104,000, upon which the interest, at 4 per cent., would amount to about £4,000 a year;—suppose the working expenses of the line are put down as another £3,000 or £4,000, do you think the prospects of the field would justify the expenditure? I could hardly say, not being a railway engineer.

W. H. J.
Slee, Esq.
10 April, 1894.

268. I am putting the questions to you, not as a railway engineer, but in your ordinary capacity;—do you think that the prospects of the field are such as to justify a charge on the country of from £7,000 to £8,000 a year? I think so. I think that in a very short time we shall have a very large agricultural and mining population within some miles of Wyalong—that is, including Burra Burra and the whole of the district.
269. A fixed mining population? A fixed mining population. At Burra Burra there are now 500 men making a living where, two years ago, there was a wilderness.
270. Are the reefs at Wyalong more marked than those of Temora, which you speak of as being too short? They are in quite a different geological formation. We have a tract of saucer-shaped country through which the auriferous strata run.
271. That indicates permanency? Yes.
272. *Mr. Suttor.*] What do you think are the present prospects of Wyalong? I think the present prospects are over-rated by a number of people. I consider that 1,500 people will be enough to develop the field for a long time to come. I think it will be able to support 1,500 people for some years without any further discoveries.
273. *Mr. Humphery.*] Is the formation at Wyalong similar to that at Barmedman? Not at Wyalong proper, but in parts of the district the formation is similar to that at Barmedman.
274. Is the tract of country, 5 miles by 2, of which you spoke, similar to the country round Barmedman? No; it is granite country, whereas the Barmedman country is porphyry.
275. Do you know the Fiery Cross and the Hard-to-Find claims at Barmedman? Yes.
276. Are they still being worked? One is working, and the other is going to start again. The present machinery is not powerful enough to cope with the flow of water.
277. How many claims are now being worked at Wyalong? About thirty.
278. Are there any buildings of a permanent character in course of erection there? There are some buildings going up in the surveyed township, and also at the main camp right among the workings.
279. Have you been over the country between Cargellico and Wyalong? Yes.
280. Over the whole of it? Yes.
281. Is it auriferous country? The country round Lake Cargellico is somewhat similar to the Wyalong country.
282. And between Cargellico and Hillston? The country is the same right through.
283. Do you think it probable that gold discoveries will be made between the localities I have mentioned? Yes; I think so.
284. Is the whole of the land between Barmedman and Cargellico suitable for agriculture? A good deal of it has been taken up for agricultural purposes, but I think that gold will be found there.
285. Is it used for grazing at the present time? Most of it is.
286. Round Wyalong? Round Wyalong it is all mallee scrub; but a short distance away from there there is good agricultural land.
287. How far from the town of Wyalong? Within a mile of the surveyed town.
288. In a northerly direction? Yes; towards Wollongough.
289. Is there any good land between Barmedman and Wyalong? There is very good land through there.
290. And between Wyalong and Cargellico? Yes. You can get good agricultural land within 20 miles of this line.
291. For the whole distance? Yes.
292. You are referring to the proposed line to Wyalong, and the extension to Cargellico? It is the same country right through.
293. *Mr. Wall.*] Is not the land locked up in these reserves? I presume that the reserves have only been made for a short time.
294. *Mr. Humphery.*] Has the Temora gold-field reserve been thrown open in agricultural areas since the railway was taken there? Some of it has. There are some large wheat-growing farms within 6 miles of Temora. Of course, a great deal of that land has been thrown open.
295. Has all that has been thrown open been taken up? It has been taken up for agricultural purposes.
296. There are some other reserves around Temora;—do you know if they also have been taken up in agricultural areas? I know that a large number of them, though I cannot say exactly which, have been thrown open, as these reserves always are after a gold-field has been established.
297. They were gold-field reserves, and since the construction of the line they have been thrown open? I believe so; but I cannot say positively.
298. *Mr. O'Sullivan.*] You mentioned at the beginning of your evidence that there is a belt of auriferous country reaching from Barmedman to Melrose Plains? Yes.
299. Whereabouts are those plains—what town are they near? There is no town nearer than Condobolin, which is 60 miles from Wyalong. Melrose Plains, by way of Burra Burra, would be about 35 miles from Condobolin, and from 50 to 60 miles from Wyalong.
300. Burra Burra is where the rush took place last year, and where you say there are 500 men? Yes.
301. Are they making good wages? I would not say that. They are making a living.
302. In your opinion this line by going to Wyalong will materially aid in the development of that auriferous belt? Yes; it will aid in the development of the whole of that auriferous tract of country.
303. Just as the Cootamundra line developed the Temora mines, so the Wyalong line will develop mines further out? Yes. The railway is going into a tract of country requiring development, and which is at present almost waterless.
304. When you spoke of Wyalong being able to support 1,500 people, did you mean 1,500 workers? No; 1,500 people taking everyone—that is, supposing there is no further development.
305. In a population of 1,500, there would only be 500 or 600 miners? There would be 1,000 miners, and 500 people making their living from the miners.
306. But the wives and children would have to be taken into account? Yes.
307. So far as I can gather, there have not been many reefs opened up yet? I have formed my opinion from my forty years of mining experience in Victoria and New South Wales. I was only a boy of 17 when I commenced.
308. You have seen such good indications of reefing country round Wyalong that you think the field will maintain 1,500? Yes; taking into consideration its geological formation and everything else.

W. H. J.
Slee, Esq.
10 April, 1894.

309. It is probable that there will be an extension of the field out and beyond Wyalong? Yes.
310. When asked just now if there was as good agricultural ground around Wyalong, you said, "No, that there was a lot of mallee scrub there"? That is where the present workings are.
311. Is not mallee country always good agricultural country? Not there; because the rocks are on the surface.
312. I suppose that there can be no doubt that the 50,000 acres which have been reserved at Wyalong will be found to be to some extent auriferous? I believe that that country will to a great extent be found to be auriferous.
313. I suppose the officers of the Department have taken care to pick out what they consider auriferous country? Yes; these reservations are always made on the recommendations of officers who are supposed to know the nature of the country.
314. In the early days of Lambing Flat, and of the Young gold-field, the miners suffered from want of water, and mining was retarded by it? Even at Mount Browne the miners suffered a great deal from want of water; but they soon made tanks, and sunk wells, and that is what they will have to do at Wyalong.
315. I suppose they can be left to take care of themselves, so far as the conservation of water is concerned? I do not say that. When Peak Hill was opened, I went there as warden, and we had very little water at first, but the people soon made dams, and now they are never short. At Mount Browne, in 1880, we had no water; but now you can always get plenty of water on the field. The miners must make dams for their crushing and puddling machines.
316. Do the Government aid them by sinking artesian wells? That is a matter I have nothing to do with.
317. You know that there is good agricultural country about Temora? Yes.
318. Is it anything like the country towards Wyalong? Some of the Wyalong country is as good as the Temora country.
319. And further on towards Cargellico, you say it is very good? It is a perfect Garden of Eden in some parts, on towards Wollongough.
320. In the event of the Wyalong field failing, there would be ample agricultural resources to help to make the railway pay, and I presume the large population now at Wyalong would leave some of its members behind as tillers of the soil? I believe that the mining there will be permanent, and the miners will require people to produce the food they consume.
321. Barmedman is a town which has been kept alive by mining? Barmedman was entirely a mining town until selectors took up land there, and made it the centre of a farming district.
322. In the same way the rush of miners to Wyalong may bring about settlement upon the land there? Yes; I could point to a score of towns in Victoria and New South Wales which originated in the same way.
323. Is Wyalong on the route to Cargellico? Yes, directly, and directly on the route to Hillston.
324. Is it on the route usually travelled by stock and wool teams? Yes.
325. If the proposed line is constructed these will go to Wyalong instead of to Temora, thus giving work to the railway? Yes.
326. They come now from Cargellico to Temora? Yes; but if the proposed railway were made they would go to Wyalong.
327. Which is the proper route from Hillston to Barmedman? Through Wyalong and on to Wollongough.
328. Whereabouts is that? A little to the north of Wyalong.
329. But that is not on the road to Hillston? A line going on to Hillston would tap the Wollongough country.
330. You mean the proposed line from Wyalong to Hillston, *via* Cargellico? I mean the proposed line from Wyalong to Hillston, *via* Wollongough.
331. But putting that aside, will the proposed line to Wyalong attract traffic from Wollongough? All the traffic from Wollongough will come to Wyalong.
332. And I presume that the people at Hillston would send their traffic that way; they go now to Coolamon on the Narrandera line? Yes.
333. It would be much shorter to come to Wyalong? Yes.
334. So that it is possible that traffic will come from the Hillston district as well as from the Cargellico district? Yes; I have no doubt that the whole of the traffic from that district will come to Wyalong.
335. Then we may conclude that at the very worst, if the mines should fail, there will be an agricultural development which will help the railway, and, at the back of that, pastoral traffic from the Cargellico and Hillston districts? I think so.
336. Under these circumstances, you have no hesitation in expressing your opinion in favour of the proposed line? I think that a railway to Wyalong would be beneficial to the country.
337. Do you care to say whether you favour the line or not? I am not an engineer, and would not like to express an opinion about the line; but, as Chief Inspector of Mines, I say that it would be beneficial to the country at large.
338. Taking a common-sense view of the matter, you would recommend it for the reasons stated? Yes. I think it would be a great feeder to the Temora line, which will then pay better than it does now.
339. *Mr. Davies.*] What extent of auriferous land has been proved to exist on the Wyalong field? A tract of about 5 miles in length by about 2 miles in breadth has been proved to be auriferous, and, since I have left the field, gold has been discovered 7 or 8 miles further out.
340. What extent of land has been taken up under miners' rights? Men were working 10 or 12 miles further out under miners' rights; but the claims which have been found payable have been on the tract of land to which I have just referred. There are miners working all over the district.
341. What number of miners' rights are in existence in connection with the tract of land to which you have just referred? At the lowest computation from 800 to 1,000.
342. What is the largest holding of any one miner on that particular portion of the field? Each miner can hold 60 feet along the line of reef by 400 feet in breadth.
343. Are the miners on the land you speak of in full work, or are the holders of the land waiting for other people to prove it? There are miners all over the place prospecting. Their pegs come close together.
344. There is no idle ground? There may be. Men may be there one day and gone the next, because the miners can pull up their pegs and re-mark.

W. H. J.
Slee, Esq.
10 April, 1894.

345. Then the land has all been proved? It has not been proved. They are prospecting.
346. Can you tell us what quantity of gold has been raised from the piece of land which you describe as 5 miles by 2? I could not say exactly; but I should think about 600 oz. up to Easter.
347. Are there any large crushing plants on the field? There are two plants being erected.
348. How was the stone which gave the 600 oz. of gold treated? It was taken to Barmedman by bullock teams, and crushed at the Barmedman crushing machine.
349. Can you tell us the names of the principal claims from which that gold was obtained? Yes. There is Neild's Claim No. 1, Cassin's Claim, Conway's, Keith's, Neild's No. 2, Perry's, Fraser's, Gormay's, Smith's, MacMahon's, Lasery's, Jamieson's, and Taylor's.
350. They are all on gold? They are on gold.
351. What is the greatest depth of any of these claims? One hundred feet.
352. Has the reef widened, or has it contracted, at that depth? The reefs are about the same at 100 feet as they are when first cut.
353. What is the nature of the walls? Granite.
354. What quantity of stone is at grass or yarded? When I left there was very little stone at grass—perhaps 200 tons altogether. Very few claims were working.
355. Is the whole population idle? No; but they were obliged to get permits before they could do any work. They were working with as few hands as possible.
356. Do you know who were erecting the crushing plant? I believe one crushing plant is being erected by Messrs. Gough and Turling, another by Mr. Plumb, and a third by a man named Grange, an engineer from Sydney.
357. Are these crushing plants being erected on the 5 mile by 2 area? Yes.
358. You regard Wyalong as likely to be an extensive field? Yes.
359. For what distance has the reef been traced? These reefs run in particular blocks, and may be traced for miles.
360. Have they been traced for miles? Yes.
361. Do you know the greatest depth which the prospectors have obtained at the greatest distance from the centre of the discovery? From 40 to 50 feet is the deepest shaft far away from the first prospectors' claims.
362. Are those people on gold? Yes.
363. How many miles are they from the centre of the 5 miles by 2 miles tract? Four miles.
364. Each way? Yes.
365. Are you satisfied that the reef is of the same character as that which is being worked by those who have already got gold? In one of the selections the formation is rather more favourable as regards permanency than it is close to the first workings at Wyalong.
366. Have you any hope of discovering payable alluvial gold? Yes.
367. Near to the centre of the field, or at some distance away? Out away from the field, 4 or 5 miles north or south of Wyalong. I certainly expect that we shall get payable gold there.
368. What arrangements have the Government made for the sanitation of the central camp? As warden, I took the police there with me, and turned off all the men who were living near the drains going into the tanks; but I believe that they have since gone there again.
369. All the water for the supply of the residents has been polluted? There is a tank there which really belongs to Mr. Blyth, the holder of Wyalong Run. I have recommended the Government to resume that tank.
370. Has the water been polluted by the people residing in the camp? It was when I first came there, but I turned every one off the drainage area. I have heard, however, that they have since gone close to the drainage area again.
371. You did your part to prevent the contamination of the only water supply existing? Yes; the tank was fenced in, and I put up a notice that it was to be used for purely domestic purposes.
372. Was there much sickness when you were on the field? Very little, if any. Of course there is always a certain amount of sickness on new fields, because of the way in which the men there have to live.
373. Have you made any representations in regard to the water since? I have recommended that a certain tank should be resumed for domestic purposes, and another for stock purposes. I have recommended the resumption of three tanks. With regard to the sickness, I have not thought it of sufficient importance to make any representations on the subject. I have had charge of gold-fields where the number of sick people has been very large, but this field has been very healthy.
374. How will a supply of water be got for the use of the machinery? Tanks will have to be made or wells sunk. I believe that water will be obtained by sinking, perhaps 200 feet or more; but that is not likely to be water which will be useful for domestic purposes—it will be slightly brackish.
375. Do you think a good supply of water for a crushing plant would be obtained by sinking 200 feet? I think a supply of water might be obtained in that way; but they could make large tanks or dams on the watershed.
376. The machinery cannot be used until water is obtained? One party bought a tank full of water from Wyalong station.
377. What quantity of water is there there? I believe from 3,000 to 4,000 yards.
378. Is it usual to find good agricultural land in auriferous country, and where you have porphyry? Yes; at Lambing Flat, now Young, for instance, you have good agricultural country.
379. But was not the gold there alluvial? Well, at Grenfell there is more quartz than alluvial gold.
380. Is it possible to find good land where there are simply quartz reefs? Not necessarily, and that is why I think we shall get alluvial gold here.
381. Usually good land is found upon alluvial fields? Yes.
382. And not where there is quartz? At Peak Hill there is quartz; but there is extraordinarily good agricultural land there.
383. In the flats? Yes; away from the hills. Wyalong is on a table-land, one side of which drains to the Lachlan, and the other to the Murrumbidgee, and directly you get off it there is good agricultural land.
384. Like the Parkes and Forbes country? Very similar to it.
385. Holding the views you do in regard to this field, you will be in favour of the construction of a cheap line of railway from Temora to Wyalong as the best kind of road? Yes; I think it will do good to the whole country.

- W. H. J. Slee, Esq.
10 April, 1894.
383. And you believe that eventually the line would pay? I think so.
387. *Mr. Hoskins.*] Is Barmedman as large as Temora? Latterly it has improved very considerably, and is becoming as large, or even larger, than Temora. There is a Lands Office there now.
388. There are plenty of stores and public-houses there? I think there are four or five hotels and seven or eight stores, also private buildings. There is a quartz-crushing machine there.
389. What are their customers—gold-miners, farmers, or squatters? There are large wheat-growing districts outside of Barmedman. Within 4 or 5 miles of the town there are some thousands of acres of land under cultivation.
390. Then we are to understand that the customers of the storekeepers and hotel-keepers are persons cultivating the land in the neighbourhood of the town? Their customers are either miners or farmers.
391. Is there a large farming population in the neighbourhood of Barmedman? Yes; right out to Yalgogrin.
392. *Chairman.*] How long were you at Wyalong? Thirteen nights.
393. Was that the first time you had visited it or the district? It was the first time I had visited Wyalong; but I have been through the district several times.
394. The Barmedman district? The Barmedman and Yalgogrin districts. You have to pass Wyalong to get to them.
395. I suppose you frequently visit the Temora district? Yes; very frequently.
396. When was your earliest acquaintance with Temora? I was the first official to report on the field for the Department.
397. What was the nature of the road communication between Cootamundra and Temora at that time? Very bad.
398. As bad as it is between Temora and Wyalong now? I think so.
399. Did they propose a railway then to take the miners to the field? I do not know.
400. How long ago was it? In 1880.
401. Is the road between Temora and Wyalong worse than is usual where there is a sudden rush of this kind? I think it is one of the worst roads I have seen, because of the gilgai holes. There is no room to go in between them, and you must pass them. Between Peak Hill and Tomingly there is a short distance nearly approaching it; but this road will certainly be a very bad one to make.
402. Gilgai holes are shallow water-holes? Yes, without hard bottom.
403. Is there no means of draining them? No.
404. You have to go round them? You would have to go miles round to escape them.
405. What is their size? Some are, perhaps, as large as this room. There may be 6 or 7 feet of embankment between them.
406. Do they extend right across the 3-chain road? Yes; you must go through them; you cannot go round without going many miles out of the way.
407. Is there fairly good timber and scrub along the road? Yes.
408. Would it not be possible to make a bottom by cutting down the brushwood and putting it on the road? I daresay a road engineer could make a good road.
409. But it is the large number of people who have gone over this road in exceptionally wet weather that has made it so bad? The heavy traffic going over it makes it bad.
410. And has not the weather been exceptionally wet since the Wyalong field was opened? No. While I was at Wyalong the weather was dry, though letters which I received stated that there had been heavy rain at Sydney.
411. Then no unusual quantity of rain fell at Wyalong? The only rain we had fell on the 19th March last, and it made the road almost impassable.
412. How far do these gilgai holes extend—all along the road? No; within a radius of 5 miles.
413. Then there is only 5 miles of road which are very bad for travelling? No; the rest of the road is bad.
414. What is the matter with it? The country is nearly level, and the water lodges in the tracks made by the drays.
415. The road is cut up by the thousands of people who have travelled over it lately? Yes.
416. You tell us that there is only room for 1,500 people there? That is, with the present discoveries; but I believe there will be a large mining and agricultural population in that district.
417. Is it not usual, after the first rush, for people to find that there is not the room which they anticipated, and to make a stampede back? That very often happens.
418. You do not think that the population of 10,000 or 12,000 which is there now will be maintained? No; it is likely to dwindle down, but I believe there will be a population of a few thousands there for many years to come.
419. Knowing what you do of the place, how many people do you think will settle within 9 miles of Wyalong? If there are no further discoveries, I should think about 2,000. If there are further discoveries, we may get a better set of people there than we have at present.
420. A greater number of people? Yes; more of a mining population.
421. You mean there will not be such a sudden rush, but a gradual filling up of the country? If the mines at Wyalong were in the hands of working miners or of mining men, instead of being principally in the hands of selectors and selectors' sons, who are not used to mining, they would support a larger population.
422. Do you ever remember a case where it has been proposed to take a railway to a gold-field to which there was a rush? No; I do not.
423. Are the gilgai holes to which you have referred between Barmedman and Wyalong, or between Barmedman and Temora? Between Barmedman and Wyalong.
424. Are they nearer to Wyalong than they are to Barmedman? They are slightly nearer to Wyalong.
425. I understand that the road between Temora and Barmedman is fairly good? In parts.
426. From Barmedman to Wyalong it is bad, especially where the gilgai holes are? Yes; the road is pretty bad right along.
427. Do you think that if a population of 2,000 had gone over the road it would have been as much cut up as it has been? Perhaps not. Of course, the people there now require more stores, and so on.
428. Presuming that there were a population there of 1,500 or 2,000, there would not be the heavy traffic over the road which there has been? I believe that in time to come we shall have a population of several thousands there, though the present discoveries will not support more than 1,500 people.

429. Suppose the whole of Wyalong were in your hands, and it was necessary to have a fairly good road to Temora, what do you think you could do the work for? I should not like to say; I am not a road engineer.
430. Do you think that £200 a mile, if expended between Wyalong and Barmedman, would get rid of the gilgai holes? No; I think it would take far more. You often get gilgai country in which the holes are far apart, so that you can take a road between them; but here you may have one wheel in the gilgai hole and the other on solid ground.
431. What do you think it would take to deal with the gilgai holes? I could not say; I am not a road engineer, and I do not wish to go beyond my province.
432. Is the brush which you have mentioned close to the gilgais? Yes.
433. Have you ever heard of a new gold-field like this having a railway taken to it? No; I do not know of such a thing being done.
434. While you were at Wyalong did you go about the district much? Every day.
435. How far from Wyalong? I have been, perhaps, about 20 miles away from there.
436. Is the country over which you went good agricultural country? Yes; very good agricultural country.
437. Where do the people from the direction of Forbes come into Wyalong? They come Marsden way.
438. They do not go through the gilgai country? Yes, partly; others come on to the 16-mile Tank, on the Wollongough Road.
439. You expressed the opinion just now that if the line were taken to Wyalong, the people of Hillston, instead of going to Coolamon, would come to Wyalong; but if they did that the Commissioners would lose 70 or 100 miles of freight? I believe they would lose to a certain extent.
440. So that the proposed line would take money from the coffers of the Commissioners? It might, to a certain extent.
441. Have you any maps in your Department showing the geological formation of the country in and about Wyalong? I believe such a map has been issued within the last fortnight.
442. What area does it take in? I do not know—I have not seen it.

W. H. J. Slice, Esq.
10 April, 1894.

WEDNESDAY, 16 MAY, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.	WILLIAM CHANDOS WALL, Esq.
The Hon. JAMES HOSKINS.	WILLIAM McCOURT, Esq.
The Hon. FREDERICK THOMAS HUMPHERT.	JOHN CASH NEILD, Esq.
The Hon. JOHN DAVIES, C.M.G.	EDWARD WILLIAM O'SULLIVAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	CHARLES COLLINS, Esq.
HENRY DAWSON, Esq.	

The Committee further considered the proposed Railway from Temora to Wyalong.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, sworn, and examined:—

443. *Mr. Davies.*] The Railway Commissioners have furnished the Committee with a report on the proposed Temora to Wyalong railway. What are the chief grounds actuating them in recommending the postponement of the construction of that line for six months? The uncertainty that it will be a payable one. The reasons for their recommendation are clearly set forth in the report.
444. Did the Commissioners take into account the probable extension of the line to the Lachlan? Not to my knowledge. So far as I am aware, that question was not brought before them.
445. If a railway were taken to Wyalong, and thence to Hillston, would it not open up splendid agricultural country? I do not think the Commissioners went over the Hillston country.
446. They confined their inspection and inquiry to the country between Temora and Wyalong? Yes.
447. Without taking into account that the line would probably develop a large traffic beyond Wyalong? Yes; so far as I am aware.
448. Have the Commissioners formed their opinions from the doubtful condition of the settlement at the Wyalong gold-fields? Yes; and having regard to the population along the surveyed line. You must recollect that the country between Wyalong and Hillston is now used entirely for pastoral purposes, and the traffic from that district comes to the railway now, so that no new traffic would be developed by the extension of the proposed line.
449. Traffic coming from the district between Temora and Wyalong comes to Temora? Yes; to Temora now, but before the Temora line was opened, some of it used to go to other stations such as Old Junec. Still, it all came to the railway.
450. Has the traffic on the Temora line increased? The line has only been opened a short time, and during the last four or five months the passenger traffic has been abnormal owing to the rush to the gold-fields, while a great deal of building material has also been sent up there.
451. But was the traffic increasing prior to the discovery of gold at Wyalong? I do not think one could form a very good opinion upon that point, because the line had been under construction for some time, and a fairly large quantity of wheat was kept back pending the opening of the railway. Mr. Brunton, I know, kept a large quantity of wheat back. Then, too, the first few months after the opening of the line were busy months, when all the wool and the wheat were being sent down. The line has not been open long enough to enable us to compare the earnings of any particular month in one year with the earnings of the same month in another year.
452. The Commissioners doubt the stability of the traffic on that line? Yes, the passenger traffic and the amount of building material sent over the line is somewhat exceptional.
453. I gather that the Commissioners doubt the wisdom of constructing the proposed railway until there is some permanency about the character of the settlement? Yes; that is their report.
454. Has the Temora line paid? It has paid more than the working expenses since it has been opened. In answer to a question asked by Mr. Hoskins, a return was laid on the table of the Legislative Council a few nights ago, showing that the total cost of the line up to date has been £185,000 and the revenue derived from it has been £5,831, while the working expenses only came to £1,934.

H. McLachlan, Esq.
16 May, 1894.

H.
McLachlan,
Esq.
16 May, 1894.

455. Then you do not put down that line as one of the non-paying railways? It would not quite pay interest; but it is more than paying working expenses. The return was made up from the date of the opening of the line to the 31st March last.

456. The Commissioners recommend the suspension of the consideration of the proposed line for six months in order to give time for it to be seen whether the gold-fields will be permanent? Yes, they recommend the consideration of this proposal being held over for six months.

457. *Mr. Hoskins.*] From a paragraph in the Commissioners' report, I take it that they consider that this line should be constructed, if carried out, in the way described by the Commissioners in a paper dated 10th October, 1892? They recommend that if it be constructed, it should be constructed in a similar way to that in which the Narrabri to Moree line is to be constructed.

458. Do you know if Mr. Deane has been instructed, in travelling through America, to observe and report upon the character of the light lines there? No, I do not. I saw a statement on the subject in a newspaper; but I do not know of my own knowledge.

459. Seeing that a line from Temora to Wyalong would travel through similar country to that passed through between Cootamundra and Temora, and in view of the return which has been made by the Temora line, would it not be well to carry out the proposal before us in the cheap manner suggested by the Commissioners? No; because you must recollect that the Temora line does not only its own local traffic, but the traffic from Wyalong as well. A line from Wyalong to Temora would get nothing of the traffic passing over the line from Temora to Cootamundra, though its traffic would help to swell the returns of the Temora line.

460. Would not an extension of the existing line give railway communication to a larger tract of country specially adapted for wheat-growing, and also obtain some of the Lake Cargellico traffic? It might open up a new district; but is there any necessity for doing this, considering the cost. There is any quantity of land available for settlement along the lines already opened up. For instance, the Culcairn to Corowa railway passes through an agricultural district which has been already opened up; but it does not pay working expenses. The country of which you are speaking is well served for pastoral purposes. We get all the wool that comes from that district now.

461. Are you not aware that nearly all the land between Culcairn and Corowa is in the hands of private individuals? Yes; but it is cultivated, and we get the traffic from it. There is a good settlement of German farmers along that line, and a good deal of the land is under wheat.

462. Are we to infer that if a railway were taken through a wild and uncultivated district, and the land through which it passed were afterwards cultivated, that cultivation would not contribute towards its return? Of course, it would pay something; but it might not pay sufficient. The country between Culcairn and Corowa is one that has been already opened up, and on which there is a fair amount of settlement; but last year the earnings on the railway there were only £3,900, while the working expenses amounted to £4,200, so that the receipts do not balance the working expenses, leaving the question of interest out of consideration altogether.

463. Are you sure that a great deal of the land along the line is cultivated? Yes; I have been over the line. We know that a great deal of the wheat there passes through Culcairn.

464. That line cost £4,000 or £5,000 a mile? It cost £215,000, or a little over £4,000 a mile.

465. If the proposed line to Wyalong were made a pioneer line, do you not think that it would not only encourage settlement, but that it would lead to increased cultivation and consequent development of trade? Would not its construction simply be robbing one district to benefit another? Between Blayney and Harden we have an immense area of land which has not yet been settled, although it is provided with a railway; and the same thing may be said of the land on the Southern line, and on the South-western line. We know the results which have been obtained from the Culcairn to Corowa line, which passes through an agricultural district already developed. In the case of the Wyalong district, you are only assuming that it will be settled.

466. From your evidence, I gather that agricultural produce does not pay the railways. Is that because it is carried at so low a rate? If you give railway accommodation to a district which is close to a large population, the land there will be taken up at once, because of its proximity to a market; but here you are 300 miles away from a market, and people naturally prefer land which is more accessible.

467. Is it not a fact that land nearer Sydney has nearly all been alienated? There are millions of acres not yet cultivated.

468. Do you know that a great deal of the land which has been taken away from the original pastoral lessees, not only about Wyalong, but even out towards Cargellico and Hillston, has been selected by people coming from Victoria? I dare say a good deal of it has been taken up, and, if it paid to do so, the people owning it would cultivate it.

469. I suppose you have not read the evidence given before the Sectional Committee who visited Wyalong? No.

470. That evidence shows that people would cultivate much larger areas of land if they had railway accommodation, because wheat-growing would pay better than wool? At the same time, however, there are immense areas of uncultivated land alongside the existing lines.

471. I take it that the Commissioners would not object to the construction of the proposed railway if it could be constructed for £2,000 a mile? They say clearly that they recommend the postponement of the whole question.

472. Do they not say in the second paragraph of their report that if the railway could be made as a pioneer line, at a cost of £85,000, it should be carried out? No.

473. If the line could be made for that amount, would they still oppose its construction? Yes.

474. *Mr. McCourt.*] Unless there were a settled population at Wyalong, the Commissioners would oppose the construction of the proposed line? Yes.

475. Is there much margin of profit on the carriage of wheat? I really could not say.

476. Is not wheat carried at a very low price? It is carried at the lowest rate that we carry anything at.

477. Therefore there is not a great deal of profit made out of it? No.

478. I notice that the Commissioners' estimate of traffic expenses is much less than in any previous estimate put before us? I understand that they have simply estimated the actual cost of working the line.

479. This estimate is considerably less than the estimate for the Moree line? I do not recollect what the figures were in connection with the Moree line, but this line is much shorter.

480. At any rate, the Commissioners arrived at this estimate in the usual way? Yes. It is an estimate of the actual expenses. No cost of supervision or anything like that has been added.

481. Ought not the cost of supervision to be estimated? Well, the same general expenditure as is incurred now would cover the working of this line.

482. I suppose the cost would be divided between the proposed line and the Temora line? No; it would be debited against the existing line generally. We should not require a new traffic manager, or any officer of that sort for the proposed line.

483. *Mr. Trickett.*] I suppose in the course of the inquiry made by yourself and the Commissioners—? I have not made any inquiry myself. My information is obtained from the Commissioners' report. Mr. Harper went through the district and obtained a good deal of valuable information.

484. I suppose it has been the experience of the Commissioners and yourself that the population of a new gold-field always dwindles down very materially after a certain time? Yes. That may be said now of Coolgardie. A large number get the fever, and a tremendous rush to a place ensues, and then most people are sorry that they have gone, and come back again.

485. That is the universal experience in connection with gold-fields, as far as one may judge? Yes. Of course an alluvial field becomes worked out in time, and with reefing fields people come away after a time.

486. That is one of the reasons why the Commissioners wish to wait a bit before going on with this proposed work? Yes.

487. The Commissioners estimate that if a permanent population of 1,800 or 2,000 people settles at Wyalong, the revenue of the line will be about £2,800, and the consequent annual loss in working expenses and interest will be about £4,000 a year? Yes.

488. That estimate is based on the assumption that the line will only cost £85,000? Yes. With regard to the carriage of grain, I would point out that it is charged for at a diminishing rate. The longer the distance, the less the rate. For the journey from Temora to Cootamundra, a distance of 38 miles, all we get is 6d. a ton.

489. *Chairman.*] But that traffic feeds your main line? The rate is the extension of the main line, diminishing with the distance.

490. *Mr. Hoskins.*] You are referring to full loads—6-ton trucks? Yes.

491. *Mr. Wall.*] What is the length of the proposed line? About 40 miles, practically the same length as the Temora line.

492. The Commissioners estimate the earnings on the proposed line at £2,800, while the earnings up to date on the Temora line have been £5,831;—why should they not estimate the earnings on the proposed line at the same rate as the earnings upon the Temora line? Well, on the Temora line, we get not only the local traffic, but also the through traffic from Wyalong. Then, too, the traffic on the Temora line has been abnormal since the rush to the gold-field, and cannot be taken as a fair criterion.

493. If the country between Temora and Wyalong is similar in character and population to that between Wyalong and Lako Cargellico, do you think there is any justification for assuming that the revenue of the line will be only £2,800? The Commissioners considered the matter before making their report.

494. In other estimates which have been put before the Committee, the passenger traffic has been estimated as bearing a certain proportion to the population? The passenger traffic is very difficult to estimate. Of course, the nearer the district is to a big centre of population, the more people there travel.

495. Is this estimate submitted in accordance with the general rule heretofore observed, or is it merely a general estimate of the probable revenue? It is a general estimate.

496. I suppose the Commissioners were aware that the question of sending the railway to Hillston had been under the consideration of the Works Department? Not that I know of. The further extension of the line had not been referred to them, and they do not, as a rule, report on or consider matters not referred to them. They were asked to report on a proposed line from Temora to Wyalong.

497. Were they aware that the line was submitted to this Committee as a section of a contemplated extension to Hillston? No; I think not.

498. Has any officer of the Commissioners' Department been at any time asked to report on that extension? Not to my knowledge. Surveyors from the Works Department have probably been over the country; but no officer of the Commissioners' Department has been sent there.

499. The Commissioners have not considered the question of extending the line to Hillston? No.

500. Will the officer who has been inquiring as to the probable revenue of the line, be able to give us any information as to the quantity of traffic likely to come from Hillston? I do not know that he will be able to do that.

501. I suppose the Commissioners regard the advantages derived from railway construction as represented purely by the cash balance remaining at the end of the year? To a large extent that would be the way in which they would look at the matter.

502. Is it not a fact that part of the country through which the proposed railway would go is specially adapted for the cultivation of wheat? Personally, I have no knowledge of it.

503. You have spoken of the immense areas of uncultivated land alongside our railway lines. Can you say whether these areas have been reserved for special prices, or whether they are available at ordinary upset prices? I could not tell you that.

504. You could not say whether the increased price put upon these lands has tended to lock them up? No.

505. Has there been a great increase in the passenger traffic on the Temora line since the rush to Wyalong commenced? There has been a big increase.

506. The trains on that line only run three times a week? Yes.

507. Are you aware that on the days when trains are not running, four coaches, fully loaded, ply between Cootamundra and Temora? No. I know that a coach runs with the mails on the off days; but I did not know that there were four running. I am inclined to doubt the accuracy of the statement.

508. If the Committee saw them they ought to know? Have you any idea of the number of passengers that would be carried by the four coaches daily?

509. Do you think that if, at the end of six months, the Wyalong gold-field proves capable of maintaining double the population estimated for by the Commissioners, they would recommend the construction of the proposed line? I could not say, though of course they would then be prepared to reconsider their report.

H.
McLachlan,
Esq.
16 May, 1894.

- H. McLachlan, Esq.
16 May, 1894.
510. *Mr. Neild.*] Have the Commissioners taken any steps to ascertain the prospects of the field? At the present time there is a doubt as to its permanency. I do not think that they went further than to ascertain that there was such a doubt.
511. Do you know how many claims there are on payable gold? No.
512. The Commissioners were not concerned with matters of that sort when drafting their report? Certainly; the Commissioners were on the field themselves.
513. How long ago? I think they were there last Monday week.
514. Prior to the drafting of their report? Certainly; the report was written on Friday last, after their return.
515. Do teams compete with the Temora railway? Not to my knowledge.
516. You have not been officially informed of such competition? I do not recollect hearing of it. I know that on the off days, a coach runs to carry the mails.
517. I am referring more particularly to the goods traffic. You do not know of such competition? No.
518. Do you anticipate that the competition which exists in certain other localities is likely to be serious? I do not think that it is assuming such proportions, or likely to affect our revenue.
519. In the letter of the Commissioners in regard to narrow gauge railways, they refer to the greater running cost of a slow line;—would what they say there apply to the proposed railway to Wyalong? To a limited extent it would.
520. The proposed line is intended for slow traffic? Yes. The Commissioners propose to run over it at the maximum rate of 15 miles an hour.
521. And a slow rate of speed necessarily involves increased expenditure? It practically doubles the running wages which have to be paid, in that the men would be longer on the road.
522. Does it make any difference in regard to fuel? To some extent, because the engine would be twice as long on the road as if you ran at the rate of 30 miles an hour.
523. Would that exceed the greater consumption which would take place with a forced draught? I think so.
524. Towards the end of their letter the Commissioners speak of a pioneer railway as a line to carry traffic with reasonable speed at a lower rate of charge than it is now carried by road;—would that apply to the proposed line? I have just given you an instance of how it would apply. We take wheat over the Temora line at 6d. a ton, and I do not think teams could compete with us at that rate. As a matter of fact, the team competition is not very large.
525. *Mr. Dawson.*] Do you know whether persons coming from Cootamundra, Tumut, Murrumburrah, and those places in private conveyances would use the railway, or would they go straight on? Local people would probably not use the railway; but I think Mr. Harper could give you more information on that point.
526. Have the Commissioners allowed for the carriage of ore between Wyalong and Barmedman? The Commissioners say that they would not attempt to make an estimate of the probable revenue of the line. I understand, too, that persons are putting up crushing plant at Wyalong, so that there would not be much ore sent by the railway.
527. Have the Commissioners taken into consideration the fact that there is plenty of ironbark close to the proposed line, and that sleepers could be got from there for the purpose of supplying other lines more cheaply than they could be got from other places. You have to take them from Bargo Brush now? There is a certain amount of ironbark about Cootamundra, and we have used a few red-gum sleepers on that part of the line. You get a great deal of red-gum along the rivers. In Victoria they use pretty well all red-gum.
528. *Mr. Collins.*] The Commissioners are losing between £8,000 and £9,000 a year upon the Culcairn to Corowa line? Yes, including interest.
529. Do you think that that line is ever likely to pay? I could not say—the revenue has not shown any signs of improving.
530. Is the country there similar to that between Temora and Wyalong? I could not say. It is good country.
531. The cost of that line was over £4,000 a mile? Yes.
532. And this line will cost? Say £2,000 a mile.
533. Could a cheaper line have been constructed between Culcairn and Corowa? Yes, on the system proposed for this line.
534. Do you think such a line would have paid? No, because the present line does not pay working expenses.
535. *Mr. Humphery.*] The Temora line has been open seven months, I believe? About seven months.
536. What do you estimate the annual interest on £185,000 to be? At 4 per cent., £7,400.
537. Then what rate of interest has that line been earning between September and March last? Less than 4 per cent., and, of course, the traffic has been abnormal.
538. Do you know of any other branch line which at present yields 4 per cent.? Not a line newly opened, such as this. The Narrabri line pays a little more than 4 per cent.
539. Do you know any line which has paid 4 per cent. from the time of opening? I do not recollect any.
540. Therefore, you cannot say that at the present time there has been any loss on the Temora line? Not at the present time.
541. In considering their report, had the Commissioners the plan of the proposed extension now before the Committee? No; though, of course, they had all information about the proposed line.
542. Do you not see that on the plan before us, an extension of the line to the Lachlan is marked out? To some extent that plan seems to me to be misleading, because in order to properly consider this matter, you should know the character of the country to the north, so as to be able to decide whether the extension should not be made from Forbes.
543. In reporting upon the proposed line, do you not think that it was absolutely necessary to take into consideration the probability of getting traffic from the Lachlan eventually, if the line were constructed? That traffic comes to the railway at present.
544. Are you prepared to express an opinion on behalf of the Commissioners as to whether the railway should be extended to the Lachlan from Forbes? That is a matter which I have not considered.
545. Do you not think it is essential, in considering the proposal before the Committee, to also take into consideration the proposed extension to the Lachlan? That is a matter which I think the Committee should consider.

546. Is it not also a matter for the Commissioners to consider? No; I think they have laid it down all through, that they do not enter into the policy of constructing any line other than that referred to them. They have never considered either rival or alternative routes.

547. Should they not have given consideration to this matter, not as a question of alternative routes, but as affecting the earnings of the railway? They would have borne it in mind in framing their report; and they have recommended that the matter should be postponed.

548. Are the Commissioners familiar with the traffic coming to the railway from the Lachlan? They know the stations from which it comes.

549. Do they know the volume of that traffic? Yes; we know what amount of traffic comes to the railway at the present time.

550. I suppose you have not taken into consideration whether any of the Lachlan traffic, which is now supposed to go to Victoria, would be obtained by extending the railway to the Lachlan? As a matter of fact, the traffic from the country between Wyalong and the Lachlan practically goes to our line now—none of it goes to Melbourne.

551. What about the traffic to Carrathool and Whitton? Those stations are a long way from the proposed line.

552. Are they so very far from Hillston? They are a good distance away, and on the Murrumbidgee, which differs not only in name but also in natural characteristics from the Lachlan.

553. Some of the witnesses who were examined by the Sectional Committee said that the traffic reaching Carrathool and Whitton found its way to Victoria;—is that correct? So far as I am informed a great part of that traffic comes along our way; but I believe Mr. Harper could give you more complete information.

554. *Mr. O'Sullivan.*] I gather from your evidence that the Commissioners have looked upon this line simply as a line to Wyalong? Yes; they were asked to report upon such a line, and they did so.

555. Did they take into consideration the probability of a large settlement taking place at Wyalong, in consequence of the throwing open of the leases in the Central Division? They would consider that in a general way.

556. There is no mention made of it in their report? They would have it in their mind in making the report.

557. You are aware that that land is admirably suited for agriculture, and especially for wheat, and is likely to be taken up as soon as the leases are thrown open. That being so, is there not a possibility of a great amount of traffic coming from the district, even apart from the gold-field? Yes; but in the opinion of the Commissioners, that development was too problematical to justify the present construction of the railway.

558. When the construction of the Temora line was recommended, the Temora gold-field had practically ceased to exist. The line was recommended as one likely to develop an agricultural district? Yes; but there was a certain amount of mining going on there and at Barmedman.

559. If the construction of the Temora line was justifiable, on the ground that it would serve an agricultural district, would not the construction of the proposed line be justifiable for the same reason? The Commissioners have fully considered the matter, and they do not recommend the construction of the line.

560. If the line were extended to the Lachlan, would it not take a great deal of the traffic that now goes to Melbourne *viâ* Carrathool and Whitton? It would gain no new traffic.

561. I understand that a great deal of the traffic in that district goes down the Murrumbidgee to Echuca and scarcely uses our railways at all; but if a line were made to the Lachlan, or even to Wyalong, would not a great deal of that traffic come to Sydney, and thus give a return to our railways? So far as I am advised, there is not a great amount of traffic from between Hillston and Wyalong going to Victoria.

562. *Chairman.*] In the seven months, during which the Temora line has been opened, it has paid working expenses, and almost interest charges as well? Yes.

563. But you consider the traffic upon it abnormal, owing to the fact that a large quantity of produce was kept back in anticipation of the opening of the line, and because of the rush to the Wyalong gold-fields? Yes; I ought to mention that the months immediately following the opening of the railway—October, November, and December—are the fat months of the year. May, June, and July, are lean months.

564. So that the traffic during the remaining five months of the year would be very light compared with what has already taken place? Yes; it would be rather misleading to take the returns up to date as a criterion of the probable traffic of the line, because of the favourable circumstances which have attended its opening.

565. Has that fact weighed with the Commissioners in recommending the postponement of the proposed work? To some extent it has.

566. When the Commissioners were asked to report upon the proposed line, were they furnished by the Construction Branch with an estimate of its probable cost? I do not recollect.

567. As a matter of fact, on what were they to base their estimate of the probable net revenue of the line, if they did not know what it was to cost? I think the cost was stated by Mr. Deane to be about £110,000.

568. Is it not the invariable custom for the Construction Branch to furnish the Commissioners with an estimate of cost? Yes; we generally get their estimate, and the Commissioners usually state in their report that the Engineer-in-Chief fixed the cost at so much.

569. Why then have the Commissioners ignored the estimate of the Construction Branch in this case, and worked on an estimate of their own? They have not ignored the estimate of the Construction Branch; but they say that they would recommend a pioneer line, and give an estimate of what they think the pioneer line would cost. The same thing was done in connection with the Moree line.

570. That statement is not borne out by facts. In reporting upon the Moree line the Commissioners took the estimate of the Engineer for Railway Construction, and has it not been their invariable practice to base their report upon that officer's estimate? As a rule, of course, the Commissioners' reports are based upon the estimates of the Constructing Branch. The Moree estimate given was much amended on the original sum.

571. Is not this the first time that the estimate of the Construction Branch has been put on one side? I think this is the first time in which the Commissioners have given their estimate of cost in this way.

H.
McLachlan,
Esq.
16 May, 1894.

- H. McLachlan, Esq.
16 May, 1894.
572. Can you give us any reason why the estimate of the Construction Branch should be ignored? I do not know that it has been ignored.
573. Can you find any reference to the estimate of the Construction Branch in the Commissioners' report? Mr. Deane seems to have made an estimate for an ordinary line, and the Commissioners give it as their opinion that the work could be done much more cheaply.
574. As a matter of fact, the Commissioners were informed that the Engineer-in-Chief estimated that the proposed line would cost £110,000? I am not sure. Mr. Deane mentioned to me that the line would cost £104,000.
575. The Commissioners in their report have ignored Mr. Deane's estimate, and have made an estimate of their own, putting the probable cost of the line at £85,000? Yes; they think the line could be made for that.
576. The proposal put before us was for the construction of a line to cost £104,430, and in basing their report upon an estimated cost of £85,000, the Commissioners have not reported upon the proposal put before the Committee? Of course, that is a matter for the discretion of the Committee to determine. I do not know if Mr. Deane considered that this line should be similar to the line from Narrabri to Moree, and made his estimate for a light line, instead of for a pioneer line.
577. That has nothing to do with the fact that the Commissioners had Mr. Deane's estimate before them? The Moree line was originally estimated to cost £300,000, I think.
578. That was not the estimate put before this Committee, and it was upon the estimate put before the Committee by the Engineer for Railway Construction that the Commissioners based their report. I wish to know why, in this case, they have ignored the estimate put before us, and have based their report upon an estimate of their own? The Commissioners have not ignored the engineer's estimate; but they think that the work should be done for £85,000. I might say that Mr. Barling, in giving evidence upon the Moree line, stated that the original estimate of cost for the line was £500,000.
579. Is it a fact that during the last twelve months three railway officers have visited America with a view of reporting on the construction of cheap lines, and the general running of railways there? Three railway officers have visited America within the last few months for the purpose of reporting on railway matters.
580. Have they reported to the Commissioners? Yes.
581. Have those reports been published? No, they are private reports. These officers did not go to inquire only into the construction of light railways.
582. Was Mr. Shellshear one of them? Yes.
583. Is it a fact that he devoted his attention principally to railway construction? He is one of the engineers for existing lines, and dealt with the character of the lines in America, and, of course, to some extent with their method of cheapening lines.
584. And Mr. Parry with signalling and traffic matters? Yes.
585. And Mr. Howe with mechanical matters? Yes.
586. Is Mr. Shellshear in Sydney? I think not.
587. Where are his headquarters? At Goulburn.
588. Was there anything in the reports of these officers which it would be undesirable to make public? Not that I am aware; but in managing a big Department such as theirs, the Commissioners do not publish everything in the press.
589. At all events, these reports have not been made public? No.
590. *Mr. McCourt.*] You stated that the working expenses on the Temora line for seven months amounted to £1,900. For the remaining five months they would not be so heavy? I do not think there would be any difference.
591. So that in a year the working expenses would come to about £3,500? I suppose so.
592. When the proposal to construct that line was before the Committee, the Commissioners estimated that the working expenses would come to £7,497 per annum, or double the actual amount? In one way and another the cost of maintenance and other traffic expenses have been very much reduced since the first reports were made. The actual cost and maintenance on branch lines is now about £50 a mile. When the Commissioners took office their maintenance was estimated at £125 per mile, and that would make a big difference in 40 miles.
593. So that the Commissioners have reduced the cost of working the lines by about one-half? They have made considerable reductions, and if they were making an estimate to-day they would reduce it considerably.
594. It would follow from that, that the estimates of working expenses previously put before the Committee have been too high? Many of them could, I think, be reduced.
595. Largely reduced? On a branch line they could be largely reduced.
596. *Mr. Humphery.*] If the railway were extended to Wyalong, would there be any increase in wages? Naturally.
597. In what respect? You would have to have more maintenance men.
598. But as far as the management of trains was concerned? Yes; because the distance would be increased by about 40 miles, or 80 miles there and back.
599. How long would it take to do the journey? Three or four hours each way, and then a driver has to get his engine ready. I think we should have to put on a double set of men to work the line from Cootamundra to Wyalong.
600. You estimate the working expenses of the line at £3,500, about the same as the actual cost of working the Temora line? Yes.
601. Do you not think that that estimate is excessive? I think not. The Commissioners made it after consideration.
602. Now that the trains run only three times a week on the Temora line, are the men paid full wages? The maintenance men lose three-quarters of a day a fortnight.
603. I am referring to the men on the trains? As far as possible, when they are not working on the Temora line, their services are used in other ways.
604. *Mr. Neild.*] What do the engine-drivers do on the off days? Work is found for them in one way or another; but I do not know exactly how they are employed.
605. *Chairman.*] You have based your estimate of working expenses upon a cost of £85,000; but if the line

line were to cost £104,000, and were of a more substantial character than that you suggest, would not the working expenses be reduced? I think not.

606. Is there not more wear and tear on a cheaply-constructed line than there is upon a more substantial line? There might be a little less wear and tear, but that would be compensated for by the slow speed at which trains would travel over the cheaper line. Over one line you would travel at the rate of 15 miles an hour, while on the other line you could travel at 25 or 30 miles an hour, if necessary.

607. *Mr. Davies.*] The receipts on the Temora line show that that line is paying working expenses and more than $3\frac{1}{2}$ per cent. interest on the capital cost;—what interest is paid on the money borrowed for that line? Loans are not raised for any particular line.

608. But you do not pay more than $3\frac{1}{2}$ per cent. interest on any loan? Yes, we do. We reckon the average interest at about 4 per cent.

609. *Mr. Neild.*] I understand that your estimate is based upon a service three times a week;—if the trains run six days a week, would the working expenses be double? No.

610. How much would they be increased? I could not say off-hand; but they would not be doubled.

611. *Mr. Wall.*] Could not the staff now engaged on the Temora line be used to work the Wyalong line? I think not.

612. Do the trains run from Cootamundra to Temora and return to Temora on the same day? Yes.

John Harper, Esq., Goods Superintendent, Department of Railways, sworn, and examined:—

613. *Chairman.*] You have visited the country round and beyond Wyalong, I understand? Yes.

614. *Mr. Hoskins.*] I suppose you have, on many occasions, travelled between Cootamundra and Temora? Yes.

615. Is that country pretty well settled? Only comparatively well settled—there is not much population there.

616. What is the character of the settlement;—is the land settled by farmers, by squatters, or by small graziers? There are two or three squatters, and the rest of the land is agricultural country, in the hands of selectors.

617. Is much wheat sent over the railway from Temora to Cootamundra? About 40,000 bags during the season—that is, to Cootamundra and to other points along the main line.

618. Have you been in that locality lately? Yes.

619. Have you been beyond Wyalong? Not recently.

620. Have you ever been beyond Wyalong? Yes; I have been up in the Hillston and Cargellico District.

621. Is the country between Temora and Wyalong, and beyond Wyalong, similar to that between Temora and Cootamundra? I think the country between Temora and Cootamundra is better than that between Temora and Wyalong.

622. For grazing, or for agriculture? For agriculture and for grazing too.

623. Is the country beyond Wyalong, out towards Cargellico and Hillston, as good as that between Cootamundra and Temora? Yes; it improves as you go out towards the Lachlan. It is good country out there.

624. Where does that good country commence? I should think within 10 or 15 miles of Cargellico, say, 20 or 30 miles the other side of Wyalong. The country there is more favourable, I should imagine, for settlement.

625. Has any settlement been made in that district by selectors who have taken up large areas of land, and combine pastoral with agricultural pursuits? Yes; to a limited extent.

626. In what locality? Between Temora and Wyalong, there has been settlement of that kind. About forty people have taken up land there, and some of them have put in wheat; but the results last year were not very successful. About 1,300 acres of land were put under wheat, and the yield was about 10,000 bushels.

627. Was the season against them? They say that the season was against them.

628. Is the country beyond Wyalong settled? There is more settlement out in the neighbourhood of Cargellico.

629. How far from Wyalong? I suppose about 35 miles.

630. What are those settlers—are they vigneron, agriculturalists, graziers; or do they combine agriculture with grazing? They combine agriculture and pastoral pursuits on small holdings.

631. Do they seem to be fairly prosperous? I could not say. It is nearly two years since I was out in that neighbourhood, and then I did not go there with the view of making any inquiry into the nature of the settlement.

632. Have you heard the people in and about Wyalong express the opinion that when the Central Division leases expire, a large amount of settlement will take place in that part of the country? I have heard that said, wherever I have been in New South Wales.

633. Have you heard it said in that part of the country? I cannot say. I can scarcely recollect conversations of no moment to me which occurred two years ago.

634. Do the people beyond Wyalong suffer in consequence of the dryness of the climate and the absence of surface-water? Of recent years they have not suffered much from the dryness of the climate, and the pastoralists have made a lot of artificial water. What their reasons are for complaining about their lot, I do not know.

635. How do the people away from Lake Cargellico manage;—do they make tanks and dams? Yes.

636. Is it good holding ground for water? That I could not say.

637. Do you think from the information you have gathered from your recent journey, that if the railway were extended to Wyalong, a large additional area of land would be put under cultivation? I am very doubtful about it, under existing conditions, such as the price of wheat, and the discouraging circumstances of the last year or two.

638. You did not hear any of the settlers say that if they had the benefit of railway communication, they would cultivate wheat, because, at present prices, it would pay better than wool? I daresay I have heard them say that; but people will say anything to prove that they ought to get a railway.

639. What is your own opinion? I am rather inclined to be doubtful about it.

H.
McLachlan,
Esq.
16 May, 1894.

J. Harper,
Esq.
16 May, 1894.

- J. Harper, Esq.
16 May, 1894.
640. Doubtful about what—the propriety of making a railway? Of the extent to which agriculture will be gone in for.
641. You will not express any opinion as to the propriety of making a railway? I prefer not to do so.
642. You do not consider that a large additional area of land would be placed under cultivation, if the railway were extended to Wyalong? I do not see any reason for supposing that there will be more cultivation there than there is along existing lines closer to Sydney. For instance, between Cootamundra and Temora the area which has been put under crop owing to the construction of the railway to Temora is comparatively limited. There are still large areas of land there available for agriculture.
643. Is not the cultivation of land between Cootamundra and Temora increasing, having regard to the fact that the line has only been constructed a few months? It does not take long to put that land under cultivation, and the line has been under construction two years.
644. The country beyond Wyalong is not expensive country to clear? Not the country out towards the lake and the river. That country is not so expensive to clear as is the country between Temora and Wyalong.
645. If the line were extended to Wyalong, would it attract wool which now goes to Carrathool and Whitton, and thence down the Murrumbidgee to Echuca and so to Melbourne? I do not think so.
646. Why? Because nothing will bring that wool this way. Certain clips of wool in that district would have to go to Melbourne under any circumstances, unless their exportation were prohibited.
647. Why is that? Because the financial interests of the stations are in Melbourne.
648. Suppose we gave those stations increased facilities, in the way of cheap and rapid transit, do you think the wool would come to Sydney? We do that now. We offer low rates and rapid transit from Carrathool, Hay, and the stations on the Murrumbidgee; but, notwithstanding that, they cross the railway line, and avail themselves of the low transit provided by the steamers.
649. Do you not think that that is because the steamer freights are cheaper than the railway freights? That has something to do with it; but there are other reasons.
650. As a rule, the conveyance of railway produce does not give much profit to the railway? No. As a matter of fact it involves us in a slight loss.
651. Am I to infer from your evidence that you do not think that if the line were taken to Wyalong, or even farther west, the quantity of wool and wheat carried on the New South Wales railways would be increased? I do not think any new traffic would result. Of course, I am leaving the population now at Wyalong out of consideration, because it is problematical whether it will increase or decrease.
652. *Mr. McCourt.*] Could you make an estimate of the traffic in the Wyalong district which would go over the proposed line? Yes; I estimated that at £2,764. The following is a copy of my report, to which I have appended a list of the stations which would probably send their wool by the proposed line. [*Vide Appendix.*]

THURSDAY, 17 MAY, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTOR.

The Hon. JAMES HOSKINS.

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JOHN DAVIES, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM CHANDOS WALL, Esq.

WILLIAM MCCOURT, Esq.

JOHN CASH NEILD, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES COLLINS, Esq.

HENRY DAWSON, Esq.

The Committee further considered the proposed Railway from Temora to Wyalong.

John Harper, Esq., Goods Superintendent, Department of Railways, sworn, and further examined:—

J. Harper, Esq.
17 May, 1894.

653. *Mr. Trickett.*] In your memorandum, dated 23rd April, 1894, you say that the line we are considering is proposed to form part of a scheme of railway construction to Hillston, on the Lachlan, *via* Lake Cargellico. Yesterday, however, Mr. McLachlan stated that that extension did not form the subject of any part of the Commissioners' report? Certainly. I only mentioned the fact because I thought it was one to which I ought to draw the attention of the Commissioners. My estimate was based solely upon the probable traffic of a line to Wyalong.
654. Whose proposal is it to extend the line to Hillston? I gathered that that was the intention, from the report of the surveyor engaged on surveying the route.
655. A surveyor from the Works Department? Yes.
656. Has your memorandum been before the Commissioners? Yes.
657. Can you tell us what is their view with regard to this very important proposal to extend the line to Hillston? Of course, I do not know; but I do not think they have gone into the question. I have not done so on their behalf.
658. Do you not think that that extension is one of the most important features in connection with the matter under consideration? That I cannot say. As far as my knowledge goes, the Commissioners have merely dealt with the proposed line to Wyalong.
659. Did you go to Hillston in the course of your inquiries? No.
660. Have you been in the district at all? I have been there twice. On the last occasion I was there about two years ago.
661. Did you not find that the traffic was being fairly well carried on by the teams along the road? Yes.
662. And that the road, in ordinary weather, was in fairly good condition? Yes. The first time I was up there, they had nearly 4 inches of rain, but when last I was there, the weather was dry.
663. With the exception of where it passes through the gilgai country, and could be repaired by the use of sapplings and metal, I suppose the road is as good as most country roads? Yes; it is a good back country road.
664. While in Wyalong, did you ascertain the views of the people with regard to the proposed railway? The people I spoke to in Wyalong did not appear to trouble themselves very much about the railway. They were more concerned with their mines.
665. The feeling in regard to it was certainly not keen? No.

666.

J. Harper,
Esq.
17 May, 1894.

666. At the present time, I suppose, the road traffic gives employment to a very large number of teamsters, farriers, hay and corn merchants, and others, who, if the railway were constructed, would probably lose their business? Yes; there are a large number of teams employed on the road.
667. Do you know what they are paying for carrying between Wyalong and Temora? From 30s. to £2 a ton. £2 a ton is about the most they are paying.
668. Is that for carriage both ways? That is from Temora. Nothing is being carried back as far as Temora; but they carry ore to Barmedman, at from 10s. to 15s. a ton.
669. Did you find that the people at Wyalong were suffering hardships through not being able to get provisions up? No; I found everything remarkably cheap there. I only paid 1s. 6d. a feed for each of my horses.
670. You estimate the total possible goods and coaching traffic on the proposed line at £2,764 in round figures? Yes.
671. Is not that a pretty liberal estimate? Yes; because while I have only dealt with the railway to Wyalong, I have included the traffic from stations right out on the Lachlan, though it is doubtful if that traffic will come to the line.
672. *Mr. Neild.*] Do you anticipate that teamsters will compete much with the proposed line? I can hardly say; the teamsters are prepared to do such extraordinary things now-a-days. There might be some competition in high-class traffic. Our maximum rate would probably be about 4d. a mile; but there have been cases in which teamsters lately have been carrying for 2d. a mile.
673. The fact that teamsters are able to compete with the railway is largely due to the good seasons and abundance of grass which we have had lately? Yes.
674. In bad seasons, when teamsters had to carry their own feed, I suppose competition would be absolutely impossible? Yes; all but impossible.
675. Is there, in a good season like the present, a fair supply of grass along the road from Temora to Wyalong? No; the teamsters have to carry feed for the last 10 or 12 miles at the Wyalong end. There is scarcely enough grass there to keep a bullock alive.
676. When you speak of high-class traffic, I suppose you mean wool? No; 3d. a ton would be the local rate of wool.
677. You do not shut your eyes to the possibility of teams competing with this line? Well, I have ignored such competition, because in making out these estimates I believe in crediting the line with all the traffic to which it is entitled. Under ordinary circumstances we assume that it would have that traffic.
678. Then in good seasons you estimate that it might reasonably be discounted to the extent of the teamsters' competition? Yes; but the traffic would have to go to Young or Coolamon, or some other point upon the railway, so that we should not lose it altogether.
679. At present on none of your lines do you run at so low a rate as 15 miles an hour? No; 18 miles an hour is our lowest speed, including stoppages.
680. On what line is that? That is the average speed of a mixed train on the Cooma line.
681. In making your estimate, have you based it upon the existing current rates? We have local rates in operation on the Temora line, and I have credited the proposed line with an extension of those rates.
682. How much higher are the local rates than the ordinary rates? On wool they would be a 1d. a mile higher than the other ordinary through rates.
683. Have you taken into consideration the fact stated by the Secretary to the Railway Commissioners yesterday, that a slow train service is more expensive than a rapid service, inasmuch as the time occupied in running the trains over the line is almost doubled? I have not considered that.
684. But assuming that that statement was correct, the ratio of earnings to expenses would be reduced? Decidedly.
685. Is the Temora line worked at a slow rate of speed? No, at an average rate. The trains travel nearly 20 miles an hour.
686. With a slow rate of speed on the proposed line, while the earnings would be the same, the traffic expenses would be higher? Yes; the net earnings would be less.
687. Do you know if it is proposed to use the lighter class of engines upon the proposed line? No, I do not. I have not gone into that matter.
688. You do not expect that the traffic will necessitate the use of heavy engines? You can always move a limited load with a light engine, no matter what the weight of the trucks may be. For a light engine you would reduce your train weight, not your truck weight.
689. Is the loading likely to be sufficiently heavy to necessitate the use of heavy trains? I scarcely think so, though you might have exceptional cases during the wool season.
690. You say that about 10 miles from Wyalong there is little grass? Yes; because there you get into mallee and thick scrub—there is no herbage at all there.
691. Have you travelled beyond Wyalong? No. I have been to Hillston, and through Cargellico; but I do not know the country between Wyalong and Cargellico.
692. How did you get to Hillston? From Carrathool and from Hay. I have been there twice.
693. From the information you obtained there, did you come to the conclusion that the present population of Wyalong is likely to be permanent? I heard so many different opinions that I am in doubt as to what the character of the population would be. Some people thought the field was everything that was good, while others held contrary opinions.
694. The feeling of uncertainty about the permanency of the population would lead to a feeling of uncertainty in your mind about the prospects of the line? Yes.
695. From your knowledge of roads in this country, which I assume to be very extensive, do you think that the condition of the highway between Temora and Wyalong is likely to cause serious inconvenience to the traffic? I do not think so; and they are improving it every day. They now make a detour through Christie's Paddock, on Wyalong Run, to avoid the worst of the gilgais. There is a splendid track there, and I travelled over it in a buggy at the rate of 8 miles an hour.
696. How is the road between Barmedman and Temora? It is cut up a good deal; but it would be possible to improve it.
697. That road runs through pine scrub? Yes; but if you go off the track into the bush it is not a bad running road.
698. When I drove over it, ten or twelve years ago, it was difficult to traverse, because of the numerous

- J. Harper, Esq.
17 May, 1894.
- little pine stumps sticking up like so many cobbler's pegs. Is that its condition now? No; I drove from Barmedman to Temora with the Commissioners at night. The road is practically clear now, the ruts being the worst thing about it.
699. In making your estimate, you have given the proposed line the benefit of the doubt in all cases? Yes.
700. *Mr. Wall.*] If the Commissioners state, through their secretary, that they have no knowledge of the intended extension of the line to Hillston, they cannot have read your report? What I take them to mean is that they have no knowledge of the extension, so far as being prepared to give evidence in connection with it.
701. You state that the rates chargeable on this line, if constructed, would be the same as those now charged on the Temora line? Yes; local rates, which are higher than the through rates. We charge through rates from Sydney to Cootamundra, and from there to Temora we charge a local rate.
702. The rates on the proposed line would be the same as you are now charging on the Temora line? Yes.
703. Have you any knowledge of the settlement between Wyalong and Lake Cargellico? No; I have not been over that country.
704. In investigating this matter, did you make any inquiries as to the settlement existing within a certain radius of Wyalong that will be served by the proposed line? No; for the simple reason that there was no one at Wyalong who had time to give me the information, or whose interest it was to do so; but I did what I considered would be more satisfactory: I reckoned upon all the traffic within 50 miles one way, 60 miles another, and 40 miles another.
705. If the settlement between Wyalong and Lake Cargellico is as great as that between Barmedman and Temora, it is reasonable to suppose that there will be as much traffic from that part of the country? Yes; assuming that that country were served by the proposed line.
706. If there was an equal area of land under cereals in the vicinity of Wyalong, that produce would be brought along the proposed line? Yes.
707. Assuming that the population of Wyalong will be as great or greater than that at Temora, is it reasonable to infer that the goods and passenger traffic on the proposed line, apart from the produce carried, will be at least equal to the traffic on the Temora line? Decidedly.
708. Can you give the Committee any information as to the normal volume of traffic on the Temora line previous to the Wyalong rush? Yes.
709. Will you give us the monthly cash returns? Yes; though before doing so I should like to point out that they are rather misleading, because during the first few months that the line was opened all the wool and wheat traffic of the season came over it. The total traffic for September was £622; for October, £1,132; for November, £1,161; and for December, £708.
710. The rush commenced about the beginning of January? Yes.
711. And from January on, what were the earnings? In January, £533; in February, £632; and in March, £1,039. That is the last return that I have.
712. Do those figures represent the total earnings inwards and outwards? Yes.
713. Taking the average of the three months since January, there has been a falling off in the returns attributable to the failure of the wheat and wool traffic? Yes; but there were other causes. We had a truck rate to Temora of £32 10s., and the result was that we were drawing the Young traffic there, consequently we had to put Young on the same footing as Temora.
714. Did you visit Hillston to inquire into the volume of traffic going *via* Carrathool? To try and draw that traffic this way, if I could.
715. Was there much traffic going in that direction at the time? There was some wheat going from Gunbar to Carrathool and Whitton.
716. Was there any wool? Yes.
717. Was the survey of the proposed extension to Hillston made prior to your report? I made no report. I simply went there canvassing, to try and get the stations there to send their wool to Sydney.
718. Your visit had nothing to do with the construction of any line? No.
719. Do you know whether the proposed line from Temora to Hillston was surveyed before your visit to that part of the country or afterwards? I do not know. I did not hear of the surveyors being out when I was there.
720. You are not in a position to say whether the proposed extension has been under the consideration of the Commissioners? No; it has never been under my consideration.
721. You stated yesterday that the average production of wheat in the Wyalong district was about 9 bushels to the acre? Yes; that was according to the returns.
722. Are you aware that the decrease in wheat is to be attributed to the failure of the crop at Temora, not to the failure of the Barmedman crop? The return which I obtained from the local police officer showed that 9,000 bushels of wheat had been obtained from 1,300 acres.
723. Are you aware that Barmedman is included in the land district which extends to Temora? I cannot speak as to that; but I have a list of places where wheat is grown.
724. Are you aware that a large quantity of the wheat grown in the vicinity of Barmedman was cut for hay? Yes.
725. The evidence of the farmers examined by the Sectional Committee at Barmedman went to show that the average yield was 15 bushels to the acre? I can only quote the official returns.
726. You did not make any inquiry among the farming community as to what the yield was, you simply took the returns furnished to you by the police at Barmedman? That is so.
727. If the population at Wyalong were as great or greater than the population of Temora, would it not give a return to the railway equal to that furnished by Temora? Decidedly. I may mention that the returns of the inward tonnage there is based upon two months of analysed Temora traffic, as distinguished from traffic coming to that place from Young and other districts.
728. Does the train from Cootamundra to Temora return from Temora to Cootamundra the same day? Yes; coming back at night to meet the mail. The engine is stabled at Cootamundra.
729. Does the train remain at Cootamundra the next day? No; It runs to Gundagai on the alternate days.
730. *Mr. Humphery.*] What was the cost of carriage from Temora to Cootamundra prior to the opening of

of the railway? Rates were very high everywhere, then; but they have gone down since the breaking up of the Carriers' Union. I should imagine that at that time they amounted to between £2 and £3 a ton.

J. Harper,
Esq.

17 May, 1894.

731. What was the cost of carrying wheat from Temora to Cootamundra? I can scarcely remember; but I should think about 5d. or 6d. a bushel. That is about the usual rate for the distance.

732. Are we to understand that the Commissioners carry wheat from Temora to Cootamundra for ½d. a bushel per mile? Yes. The rate would be 6d. from Barmedman, and 9d. from Wyalong. That is the through rate. It does not matter where the wheat comes to, it is charged for at that rate. For instance, if it were milled at Cootamundra, and then came on to Sydney, it would be charged the extended through rate.

733. Do you not think that in view of the great benefits given to the district by the railway, the rates might have been fixed somewhat higher? No; the policy of the Commissioners has always been to encourage agriculture, because they think that if indirectly they get an advantage from the increased production, they are rendering a benefit to the country.

734. Do you think it is possible for any branch railway to pay if you carry wheat for one-twenty-fourth part of the amount which teamsters charge for carrying it? I think so, if there is sufficient population in the district.

735. What are you charging for wool? I have given the line credit for 3d. a ton per mile.

736. But what do you charge between Temora and Cootamundra? Three-pence a ton per mile is the local rate.

737. That is about 10s. a ton for the 40 miles? Yes.

738. What was the rate before the line was opened? I could not say; but I should imagine that it was about 1s. a ton a mile.

739. So that it is now carried for a fourth of what was charged before the opening of the railway? Yes.

740. What is the present rate charged by teamsters? You can hardly tell. I have known them to take loading for 2d. a ton per mile.

741. But what is the ordinary rate? The ordinary rate up to 50 miles is about 1s. a ton. Beyond that it is about 10d. a ton.

742. So that producers of wool in the Temora district have benefited to the extent of 9d. in the 1s., and producers of wheat to the extent of 5½d. in 6d., by the opening of the railway? Yes, that is the position.

743. You are familiar with the whole of the district between Forbes and Hillston? Yes; I know it all pretty well.

744. Are you familiar with all the stations beyond the Lachlan? Yes; I have been on many of the stations between the Lachlan and the Darling.

745. From your knowledge of the present traffic on the New South Wales railways, can you say if the extension of the railway from Temora to Cargellico, and on to Hillston, would serve a district not at present served by the Hay railway? I do not think it would. I think that relatively all these districts are pretty well served. It is good travelling country at the time they want to travel,—that is, during the summer months.

746. Are you of opinion that much of the traffic on and beyond the Lachlan would come to an extension of the proposed railway to Hillston? I do not think so.

747. Why? Because, as I pointed out yesterday, most of the stations there are owned and controlled by Victorian financial agents, so that the wool naturally goes down the Murrumbidgee.

748. Which of the railway stations receive most of the traffic from the stations on and beyond the Lachlan? Carrathool, Whitton, and Hay deal with most of that traffic.

749. And traffic going to those stations mostly continues on to Victoria? Yes.

750. Going down the Murrumbidgee to Echuca? Yes.

751. What is the reason for that? I think most of those properties were taken up by Victorian financial institutions, which exercise a very strong control over them still, and they feel indisposed to send their wool to Sydney under any circumstances. I have a very interesting map here which shows our position on the Lachlan.

752. From what part of the Lachlan district does the traffic find its way over to Victoria instead of coming to Sydney? Nearly all the traffic in the district having Marfield, Yallock, Yathong, and Coon Downs for its northern boundary, and Huntawong, Cowl Cowl, and Gunbar for its eastern boundary, finds its way to Carrathool and Hay. All the frontage stations send their produce to the Hay line.

753. Are you of opinion that if the Temora line were extended to Hillston *via* Lake Cargellico, the wool from the district you have just mentioned would make use of that extension instead of going into Victoria? No; I think that the bulk of it would still go down the river.

754. You do not see any prospect of such an extension becoming profitable by reason of any fresh traffic which it would gain for the New South Wales lines? No; I might mention as bearing on this point that this year we offer a special rate of £3 5s. a ton, which is little more than half the ordinary rate, for the wool coming from a station within 60 miles of Cobar, in order to induce them to use our railways; but we could not do so generally.

755. From what you know of the Lachlan district, do you think that eventually the line should be taken from Forbes as far as Cargellico and Hillston? I think that would be a better strategical line, because it would intercept the traffic better, and would run parallel with the Cobar and Hay lines. If such a line were made, it would intercept a great deal of the wool going to the river, and would have a chance of getting that traffic.

756. Are you of opinion that the earnings of such a line would be much greater, or at any rate greater than the earnings of a line from Temora to Hillston and the Lachlan? That is a very difficult question to answer without having gone into the matter.

757. I am asking you from your knowledge of the various stations out there, and the probable traffic that would come to the New South Wales railway system? Personally, I should prefer a line down the Lachlan.

758. From Forbes? Yes.

759. Are you of opinion that for the profits of a line to Wyalong we should have to depend wholly upon the traffic of the district between Wyalong and Cootamundra? No; and you will notice that in my estimate I have allowed for the produce of stations so far away as Uabba, which is 60 miles from Wyalong;

- J. Harper,
Esq.
17 May, 1894.
- Wyalong; though I think it extremely improbable that that wool will go to Wyalong. I think it will continue to go to Whitton; but still I have credited the Wyalong line with it. Similarly I have credited that line with the Ungarrie produce, though that station is 40 or 50 miles from Wyalong.
760. You have credited Wyalong with produce which will probably still continue to go to Carrathool or Whitton? Yes. To make it a little bit clearer to the Committee, I may mention that I have based my estimate at 82s. 3d. a ton for greasy wool as far as Wyalong, while the rate to Coolamon is 70s. a ton, to Cowra 60s. 3d., and to Carrathool 64s. 9d., a difference of nearly £1 a ton in favour of Carrathool, which is a big consideration with the teamsters in that dry country.
761. What is the difference in mileage? Carrathool is 420 miles and Wyalong 331; but, of course, the competitive rates are in operation at Carrathool. Our rate to Carrathool for ordinary merchandise is £30 for a 6-ton truck; but I have credited Wyalong with earning £36 8s. for a similar load, so that practically a carrier would gain £1 on his wool and £1 on his merchandise by sending his produce the longer distance. The unfortunate part is that we compete with our local rates on the south-west line.
762. *Chairman.*] But the competitive rates must be maintained in order to keep what you have got, without taking anything else into consideration? Yes.
763. If the trade on the proposed line increased to such an extent as to justify you in imposing ordinary rates, what effect would the Carrathool competition have then? Practically the Wyalong rate is almost a competitive rate in itself, as compared with the rates to other places. The Temora rate is a competitive one, because it comes into competition with the Narrandera rate. There are competitive rates in operation as far as Narrandera, and also to Junee; and so, practically, we will have to have competitive rates to Temora.
764. Can you tell the Committee where the produce of the county of Dowling goes to—does it find its way *via* Hillston to Carrathool, or does it go to Forbes or to Temora? Most of it goes to Whitton or to Carrathool, though some of it goes to Forbes and to Cowra.
765. Then, you take that country as the competing ground of the three routes? Yes.
766. *Mr. Humphery.*] Has the Temora line interfered at all with the earnings of the Young branch? Yes; it affected them very considerably, owing to the operation of the competitive rates. The rate to Young until recently was £36 for a 6-ton load, the distance being 250 miles, whilst to Temora it was £32 10s., the distance being 292 miles.
767. During the winter you will not get much wheat or wool on the Temora line? No; that traffic has practically ceased for the year.
768. Then we may anticipate the average earnings for the next three or four months to be much lower than the earnings of the summer months? The earnings will be scarcely anything just now.
769. *Mr. O'Sullivan.*] I gather from the important evidence which you have just given us that, until we can adopt some means of diverting the wool from the Victorian railways, we must merely treat this proposal as a line to Wyalong? Yes.
770. We need not look for new traffic beyond a few miles from Wyalong? There will be no new traffic.
771. You estimate that about 10,000 bales of wool will be sent to the line from the stations named in the list you handed in yesterday? Yes.
772. That would give a good local traffic? Yes; I have given the line full credit for wool.
773. I suppose your estimate is a very liberal one? Yes.
774. I gather from what you have said that you are somewhat doubtful about the permanent character of the Wyalong population? Of course, everyone is bound to have their doubts about a gold-field until the place is fully tried.
- 774½. Have there not been some very encouraging telegrams from there recently? Yes; but I have had the pleasure of reading Mr. Pittman's report, and I should like the prospects to be stronger than they are.
775. I presume it is upon what you have seen and read and learnt from others that advice has been tendered to the Commissioners to suggest the postponement of this work for six months? You have my report before you, and I suppose they based their recommendation upon it. Beyond that, I do not know anything of their action in the matter.
776. *Mr. Davies.*] In the event of the Temora line being extended to Hillston, would it take any of the traffic down the river to Victoria? No; it could not do so.
777. I presume you paid visits to the thirty stations named in your list? No; but I was able to obtain their clips from our knowledge of what they sent last year.
778. Not from personal inquiry? No. We know what was booked last year.
779. Can you tell the Committee what is the gross number of sheep on those runs? About 900,000.
780. And you estimate that those sheep produce something like 600 tons of wool? Yes, about 10,000 bales.
781. Is that a fair average return? My figures are taken from the sworn returns of the stations, as well as from our books.
782. Do you not think that £165 is a very small estimate of the value of the wool traffic from Wyalong to Temora? That is for the wool traffic from Barmedman, and, in addition, I have allowed £536 for 6,700 bales of wool and sheepskins coming from Wyalong. In connection with the Moree line, I only allowed 2d. a ton per mile; but here I have allowed 3d.
783. You estimate 1,000 tons of wheat at 6d. a ton;—does that cover the 38 or 40 miles between Temora and Wyalong? No; it covers the through mileage. Practically, the basis of all wheat rates is the distance to Sydney. If the wheat is milled and converted into flour at Cootamundra, or elsewhere along the line, it is still allowed to come on at the through rate, instead of paying two local rates. The local rate is made up of 49 miles added to the distance from Sydney to Temora.
784. Then, if a farmer sent 100 tons, you would charge him £2 10s.? That is what the through rate would be. If the wheat only went from Wyalong to Temora we should charge a higher rate.
785. What would it cost to bring wheat from Wyalong to Sydney? Fourteen shillings and sixpence a ton.
786. And from Cootamundra to Sydney? Thirteen shillings and sixpence a ton.
787. That is a difference of a 1s., which I suppose would be made up of a 6d. a ton to Temora and another 6d. to Wyalong? Yes.
788. Do you regard the carriage of wheat as profitable? No; it does not pay in itself.
789. How do you make a profit then? That is a very intricate matter to explain. Of course, in framing rates,

- rates, we must have regard to a good many things. First, we must study what charge an article will bear, because if the rates were too high it could not be produced. J. Harper, Esq.
790. Have the rates for the carriage of produce ever been lower than they are now? No; they are lower now than ever they were before. 17 May, 1894.
791. Another commodity which I suppose does not pay the Department for carrying is coal? There is a very narrow margin of profit in connection with coal.
792. Is the rate on coal lower than the rate on wheat? It is higher than the rate on wheat; but of course it is hauled for shorter distances.
793. Wool gives a fair return, does it not? Yes; it is one of our biggest sources of revenue.
794. Does it pay better than most other articles of produce? It pays better than any other article of produce.
795. You also take into account 250 trucks of live stock? If that estimate had been based on the actual traffic from Temora it would have been a good deal lower; but I took into consideration the fact that the Temora line has not been open very long, and people may not have got into the habit of sending their stock along it; but in any case the estimate is very high. During the seven months that the Temora line has been opened we have only taken 58 trucks of live-stock along it.
796. Do you think that there will not be a very large number of sheep coming to Sydney? No; because there is not much fattening country out there. The country is not held for fattening purposes.
797. You allow £425 for passenger traffic—do you not think that that is a very small estimate? It is based, as I explained yesterday, upon the number of passengers carried on the Temora line under normal conditions.
798. Do you think the estimate a liberal one? Yes, a very liberal one.
799. Is the country between Temora and Wyalong country through which a railway could be cheaply constructed? Yes.
800. That being so, and the roads there being very defective, would it not be advisable to construct a cheap line of railway? That opens up a very large question. A cheap railway costs more for maintenance than a better line.
801. Could not an abundance of ballast be obtained in the district? Yes; but that is rather an engineering question.
802. But you know whether it is an expensive country for railway construction? It should not be expensive country.
803. You think that the construction of the railway might stand over for a time? That is my opinion.
804. The Commissioners' report was based upon your recommendation? It would be, so far as the earnings of the line were concerned; but the Commissioners went over the country themselves.
805. If the construction of the railway is postponed for six months, do you think it will greatly inconvenience the people between Wyalong and Barmedman? I do not see how it could with the existing low rates of carriage.
806. Even at the special rates you propose would you be able to carry freight between Temora and Wyalong for less than half what is paid to teamsters now? Yes. Our highest charge would be 4d. per ton per mile.
807. The same might be said with regard to the ore going to Barmedman? That would be charged for at the rate of 1d. per ton per mile.
808. Then, would not the railway be a means of developing traffic? I do not think so. It would not cause a single additional bale of wool to be produced, and I do not think they would continue to send ore to Barmedman. They would be more likely to take up the Barmedman battery and send it to Wyalong.
809. But then there are supplies to be taken to the gold-field? A railway there would not make any difference to the consumption. When I was in the district we could get things more cheaply at Wyalong than at Temora.
810. But would they not get them still more cheaply if there were a railway? I do not think the traders would reduce their prices so much.
811. *Mr. Hoskins.*] Are you familiar with the country between Forbes, Hillston, and Cargellico? Yes; I have been up both sides of the river.
812. Are there not one or two towns in that district? Yes; Condobolin and Euabalong.
813. A railway from Forbes to the Lachlan would not only serve the district traffic, but would also the trade of those two towns? Yes; it would be closer to those towns than the proposed line.
814. Is not the country between Forbes and Hillston better than that between Wyalong and Hillston? It is generally regarded as better country along the river frontages.
815. Do you not think that a line from Forbes to Hillston would offer more facilities for trade than the proposed line, and would intercept traffic now going to Carrathool and Whitton? Yes; I think that where a line intercepts traffic it is not likely that people will cross over it to go elsewhere.
816. *Chairman.*] You said that the traffic during the months immediately following the opening of the Temora line was abnormal, because of the quantity of wheat and wool that had been held back. How do you reconcile that with the fact that the returns for September were only £632, while in October they reached £1,132, and in November £1,161? October and November were the two wool months. In September no wool was moving. The wheat traffic makes very little difference to the returns.
817. How many bags of wheat were sent from Temora to Cootamundra last season? About 45,000 bags were sent from Temora altogether last season.
818. Was your estimate of the traffic coming from the country between Wyalong and Lake Cargellico based upon the traffic now coming to Temora from that district? Do you refer to the wool traffic?
819. To the traffic generally? As far as the wool traffic is concerned, some of it goes to Carrathool and Coolamon, and some of it goes to Temora. Each clip was taken out and corrected to the last returns.
820. *Mr. Humphery.*] What would be the freight paid on the 45,000 bags of wheat going over the Temora line, assuming that all went to Sydney? Roughly, about £3,400.
821. How much would you credit the Temora line with? The sectional returns are not prepared by me; but they would credit that line with $\frac{2}{3}$ of the total freight.
822. Which would be approximately how much? £450. Some of that wheat, however, may not have gone to Sydney, so that the proportional earnings might be higher.

MONDAY, 21 MAY, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTON.

The Hon. JAMES HOSKINS.

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JOHN DAVIES, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM McCOURT, Esq.

JOHN CASH NEILD, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES COLLINS, Esq.

HENRY DAWSON, Esq.

The Committee further considered the proposed Railway from Temora to Wyalong.

Edward Fisher Pittman, Esq., A.R.S.M., Government Geologist, Department of Mines, sworn, and examined:—

- E. F. Pittman
Esq.,
A.R.S.M.
21 May, 1894.
823. *Chairman.*] You have recently visited the Wyalong gold-fields, and the country adjacent thereto? Yes.
824. You have furnished a report, a copy of which you hand in? Yes. (*Vide Appendix.*)
825. How long were you in the district? Nearly three weeks.
826. Is the conclusion you have arrived at that it is difficult to say whether Wyalong will be a permanent field or not? I have reason to believe from the surface evidence that it will be a permanent field.
827. Are there as many indications of it being a permanent field as there was of Temora itself? I think more so. Temora was mainly an alluvial field; but in this case the best evidence of its permanency is in reefs. No alluvial has been discovered yet.
828. Would you liken or compare it with any other field which has been in existence for some years? I have never seen a field in which the conditions of the occurrences of gold were exactly the same.
829. Does not that make it difficult to prognosticate whether it is likely to be of a permanent character? Not necessarily.
830. Take Peak Hill for instance. Was it not expected that there would be a permanent field there when it was first discovered? The area which was discovered at Peak Hill was a very limited one—nothing like the extent of Wyalong.
831. *Mr. Neild.*] Are you of opinion that there is any serious risk or large probability of the country hardening at a depth, and the veins now being worked pinched out? I think the country will harden; but I do not think it necessarily follows that the veins will be pinched out.
832. Is the same formation being reached at a depth as that which exists on the surface? It is exactly the same formation.
833. And what is that? Decomposed granitic rock.
834. Is that showing signs of hardening as the sinking proceeds? No.
835. What leads you to expect greater hardness at a depth? Because the rocks have been decomposed by the action of the atmosphere, chiefly, and also by the percolation of water from the surface;—in other words, the decomposition has extended downwards from the surface, and I have every reason to believe that at an unknown depth you will reach the limits of the decomposition.
836. And you anticipate that the gold-bearing veins will be found to exist in that harder granitic rock? Yes.
837. The veins at present are rather narrow in their limits? No; they are narrow in places, but not narrow as a rule.
838. What width do they run? From a few inches up to 5 feet. One of their peculiarities is that they keep on widening and narrowing. Wherever they narrow you may expect them to widen again, and *vice versa*.
839. Is the rock likely to harden to such an extent as to render the cost of working unduly great and unprofitable? There is no doubt we must expect that that will be so in some cases, but not necessarily in all.
840. That is not a feature which you would regard as being in any way fatal to the success of the field in the future? I think it will influence largely the future of the field; but I cannot say which reefs it will pay to work when they get into the hard granite, and which it will not pay to work. I think a great many will not pay—certainly not so many as will pay under the present conditions.
841. That, of course, and the future profitableness of working, will necessarily affect the population? Undoubtedly.
842. Do you anticipate the opening-up of any alluvial ground in the district? Yes; I think we ought to expect alluvial ground will be found, although it will be very difficult to discover; the reasons I have mentioned in my report. The reason is, that the geological configuration of the country is obscured from its being a level plain covered by Pleistocene deposits. One does not know, therefore, where to look for an old valley, because one cannot see the sides of it in the shape of hills.
843. Then, altogether, you regard this as being a permanent field? I have every reason to believe it will be. I cannot see any reason why it should not be. I should like to explain a little more fully why I do not anticipate the reefs to pinch out. I have heard a good many people remark that they will probably pinch out; but I cannot see their line of reasoning at all. That decomposed granite which is now found on the surface was once undoubtedly hard granite. It was during the time it was hard granite that those fissures were formed in which the reefs now exist. In other words, the reefs are newer than the granite, but were formed before its decomposition commenced. Therefore, there is no reason why they should not exist down in the zone underneath the decomposed rock.
844. You say then that the gold having its origin from below was forced up from those fissures? No; I think the gold came in more from what we call lateral secretion, that is, that it was brought in by infiltrations through the walls.
845. Where a fissure existed in the original rock the gold would be likely to be found? Yes.
846. And there would be no reason to anticipate that these fissures were to be found only within a few hundred feet from the surface? Quite so.
847. They would be likely to continue downwards for a considerable depth? Yes.
848. Can you form any opinion as to whether any water difficulty may occur in connection with the mines? I should expect them to find water when they got down to the hard granite rock, because I believe the decomposition has been effected by the sinking down of water. 849.

849. Is there anything in that part of the country which would lead you to fear that the water difficulty might be excessive? I should not expect it to be excessive.
850. I suppose it is an open question? It is.
851. What is the greatest depth which has yet been worked? At the time of my visit 107 feet.
852. In going down do the reefs or veins improve or fall off in gold bearing qualities? I cannot say that there was any improvement or falling off, they seemed to be fairly consistent.
853. Is there much mining going on in the vicinity of Temora? Very little.
854. Are there any prospects of a permanency about Barmedman such as would give employment to a population which would require railway communication? I hardly think that, although at the time of my visit there were some negotiations going on for again floating the Barmedman mines.
855. The character of the country from Temora to Barmedman is practically repeated until you get near to Wyalong where a change takes place and a different class of country is arrived at? Yes.
856. And in the vicinity of Wyalong the country is not so good for agricultural purposes? I am not a competent judge; but I should have imagined that about Wyalong it was a very good agricultural land.
857. Did you pursue your investigations far beyond Wyalong? About 7 or 8 miles.
858. What was the character of the country? The same wherever I went, excepting that geologically it was slightly different. I got on a slate formation about 4 miles to the east of Wyalong.
859. Would you expect that to be gold-bearing? Yes.
860. Are there any workings in that class of country? Yes; one of the best reefs I saw was in a slate working about $1\frac{1}{4}$ mile from the surveyed township. There was granite on both sides of it.
861. That would be a likely place for expecting mineral deposits? Yes.
862. Does that slate country exist to any extent in the neighbourhood? Four miles east of the surveyed township you get the western boundary of the slate formation.
863. Has any gold been discovered there? I think so.
864. *Mr. Suttor.*] Can you give us any further information with reference to Wyalong? I do not think I can say any more than is contained in my report.
865. *Mr. Dawson.*] You say that the country between Barmedman and Wyalong is very similar to that between Cootamundra and Temora for agricultural purposes? I said that as far as I could judge Wyalong appeared to be a good agricultural country.
866. Do you think if the scrub were cleared off that the land about Wyalong is better agricultural country than that between Temora and Cootamundra? I should have thought so; but I do not pretend to give an expert opinion.
867. Do you know how many payable claims there were at Wyalong when you were there? I did not count them, but I believe as far as they knew there were between 40 and 50.
868. Has the field steadily progressed since then? I think so.
869. Do you think that the construction of a railway to Wyalong would give a greater impetus to mining there? Yes.
870. *Mr. Humphery.*] What area would give us a fair idea of the extent of the discoveries made up to the present time? I have given it in my report as about 7 miles by 7.
871. Would you consider that an extensive gold-field? That would depend on the amount of payable gold which had been discovered in it.
872. But having regard to the number of reefs discovered up to the present time? Considering the time they have been discovering the reefs I should say it was very good indeed.
873. In your report you mentioned that it is probable that when a depth of 200 feet is reached solid granite will be found. Before arriving at that depth do you think there would be employment for a large number of people for a number of years? Yes; I should certainly think there would.
874. It will take a considerable time to reach the solid granite? Yes.
875. Are you of opinion there will be a large settled population at Wyalong? As far as evidences go, one would be justified in expecting it.
876. You know the results of the various crushings which have taken place at Barmedman from stone carted there? Yes.
877. Are the results satisfactory or otherwise? Eminently satisfactory.
878. When you left Barmedman had provision been made for any machinery? Yes; I was given to understand that three machines would be shortly erected, in fact when I left I saw some of the machinery going to Wyalong.
879. You have no doubt that batteries will shortly be on the ground? Yes.
880. Do you think that the best stone has been sent to Barmedman? I do not. When I was there I saw some of the best stone which was being retained, so the owners told me, until the arrival of the batteries at Wyalong.
881. One would imagine that the best stone would be sent first? I think the best stone was sent in the first instance, but, subsequently, I think, the idea of the owners was that they would sooner have it crushed where it would be under their observation. They had an idea that the Barmedman battery was not quite up to date.
882. Do you think any quantity of picked stone is being kept back? Several people have told me they thought their stone was too good to send away. At the same time I do not anticipate there will be much higher results obtained than have been obtained in some instances. For instance one man crushed 16 or 17 tons for 4oz. 15dwt. per ton.
883. *Mr. O'Sullivan.*] In your report you say that up to the present time 488 tons of stone have been crushed for a total yield of 869oz. of smelted gold? Yes.
884. Do I understand that that was not picked gold? No; that included all the crushings—all that was sent to the mill, in fact.
885. You also state in your report that the field is about 800 feet above sea level, and there is every reason, therefore, to expect that in tertiary times the drainage from this area found its way to deep valleys and deposited therein the gold which was derived from the denudation of the reefs? Yes.
886. You mean, then, that there is alluvial gold at some depth? I mean to say that one would naturally expect it.
887. It is possible, then, that some rich alluvial may be discovered there, though at some depth? Yes.
888. Something similar to Gulgong? Yes. At the same time I would point out that the discovery of alluvial there is a matter requiring a great amount of patience, because there are no surface indications to guide one in looking for it.

E. F. Pittman,
Esq.,
A.R.S.M.
21 May, 1894.

- E. F. Pittman, Esq., A.R.S.M.
21 May, 1894.
889. You allude in your report to the presence of mispickel? Yes.
890. Does not that indicate sulphurous stone? Yes; sulphur and arsenic.
891. It will cost a good deal to treat that kind of stone? Yes.
892. That, you say, will have to be treated by chlorination? Yes; mispickel is about the worst form of ore to treat, even by chlorination.
893. Do the inclusions you refer to of country rock, known amongst miners as horses, indicate that the reefs there are what is known as shooty? No; the horse is merely an indication that when the fissure was formed a piece of the country rock fell into it.
894. It may be a good gold-bearing reef all the same? Yes.
895. You also state that one of the characteristics of the Wyalong reefs is that they thin out and make again at intervals. What does that indicate? I think I have described that in my report.
896. *Mr. Davies.*] Have you examined the reefs at Temora? Yes.
897. And at Barmedman? No.
898. Then you cannot say whether the same reef or reefs are found at Wyalong? I think it is extremely unlikely.
899. What is the character of the reefs at Temora—are they granite walls? No; the Mother Shipton, which is of any consequence there, is a large reef occurring in diorite.
900. You seem to regard the field at Wyalong as a permanent one? Yes; I can see no reason why it should not be.
901. And you believe it will be a payable field? I think so.
902. Have you any fear of the reefs pinching out at 200 or 300 feet? No.
903. Not to pinch out and make again? They will certainly do that.
904. What depth will they go before they make again? The reef makes immediately it thins out. For instance, in Gorman's reef, at 90 feet from the surface, I found in the shaft a reef about an inch wide. Ten feet on one side it was 4 feet wide, and 10 feet on the other side of that it was 2 feet wide, as far as it had been opened, and was probably as wide again.
905. If the walls are granite it will be expensive working? Yes.
906. Still the returns, so far, indicate a payable field? Yes.
907. Which way do the reefs run? I observed three different courses, but the most common one is north, 20 degrees east.
908. Is that the best one on that field? Yes. There are also rich ones running east and west.
909. What is the greatest thickness between the walls of the reefs you have seen at Wyalong? Five feet.
910. Defined granite walls? Yes.
911. Do the walls seem to make as they sink? No; good walls are not a characteristic of the field—as a rule they are not well defined.
912. The widest reef, you say, is about 5 feet? The widest part of a reef I saw was 5 feet.
913. To what extent was that stripped? I saw it in the shaft—it was 5 feet wide for 3 or 4 feet in depth. They were sinking along it. Following it down to about 60 feet at the bottom of the shaft it was 4 feet wide, about 35 feet down it was 5 feet wide.
914. Was that all carrying gold? Yes; that was Neeld's prospecting claim.
915. Was that the deepest claim? No; Taylor's shaft is 107 feet, but the reef is not quite as wide.
916. How far is that removed from Neeld's? About half a mile.
917. Is that the same reef? I do not think so.
918. In consequence of that I suppose you have come to the conclusion that there are a large number of reefs running parallel? Yes.
919. *Mr. Hoskins.*] Did you observe any permanent water on the ground? No; there is none.
920. Therefore, all the water which will be required for domestic purposes as well as for crushing, will have to be conserved there? Yes.
921. *Mr. McCourt.*] How long will it take to prove the permanency of the field beyond all doubt at the present rate of working? It depends on what you mean by proving. I cannot lay down an absolute rule. Take, for instance, Mount Morgan, which is not so good as it was, but I think every one will allow that it has been a permanent mine.
922. This field then may give out in a day, a week, or a month? I do not anticipate it.
923. You cannot place the matter beyond absolute doubt? No; I cannot go so far as to say it will yield so many hundreds or thousands of ounces. So far as my judgment goes it is likely to be permanent.
924. Would you be in a better position to say whether it will be permanent if you visited it in three or six months' time? Undoubtedly.
925. And even then it would only be a matter of opinion, and that is all it can be? Yes.
926. *Mr. Trickett.*] You say that the gold is probably deposited by the percolation of thermal waters? Yes; by that I mean hot waters. The waters down some depth in the crust of the earth carry silica in solution.
927. Is the deposit upward or downward? It is supposed to be a lateral deposit.
928. How is the stuff which is being obtained from the mines being treated? By crushing and amalgamation.
929. Are they getting the gold out well by that means? Yes, I think so; although there has been no proof as to what they are losing in the concentrates and tailings. I do not think that the battery at Barmedman is sufficiently gold-saving to warrant the continuance of its use without the people knowing what they are doing.
930. Then you do not know whether the best means are being adopted for getting the gold out of the quartz? No.
931. Your report indicates that as the field goes on the stuff will become much harder, and probably will have to be treated by the chlorination process? Yes.
932. Is that an expensive process? It is more expensive than amalgamation. It is the process adopted at Mount Morgan.
933. It is recognised there as being very expensive? Yes. They have got it as low as 19s. 6d. a ton, but as a general rule, it will cost more.
934. Do you think that this is likely to be a poor man's field? At present it is undoubtedly, because the sinking is so extremely soft, and the gold is so very free and plentiful.

935. As developments make it more difficult to work, is it not probable that the population will fall off considerably? Possibly. I do not think it necessarily follows, because if it were in the hands of companies they would probably employ a large amount of labour.

935½. *Chairman.*] How many men were on the field when you were there? I could not say.

936. Were they leaving the field or not? There are always some leaving it. When I went there there were more leaving than coming, but I have seen since that the rush has recommenced.

937. Can you form any idea as to the number of men employed? That would depend on the class of men who went there. The people I saw coming away were those who expected to find gold on the surface.

938. Leaving them out, can you form any idea as to what population could be supported there by the present developed field? No.

939. Although you do not anticipate that the gold will get any less, you think the difficulties, after you get below 200 feet, will be increased? Quite so. They might be.

940. They might be so great as to make it not pay? It might be so. I would like to explain, however, that the 200 feet is an arbitrary figure.

941. Do you not think that a gold-mine, with a railway within 30 miles of it, is fairly well served? Yes.

942. Did you ever know of any place where it was proposed to run a railway to a gold-mine upon its first starting—like Wyalong? I cannot say I have ever known a similar case.

943. Were provisions dear when you were there? Extremely cheap.

944. Was there any difficulty in getting teams to and from Temora and Wyalong? Only in very wet weather.

945. Is it a fact that they have found a better route to avoid the gilgais? Yes; I came back that way myself.

946. And it would not be a great hardship for the people of Wyalong to travel over a road of that kind to Temora? I should think not.

947. *Mr. Neild.*] Is timber necessary in the present sinking? Yes.

948. Can it be got in the vicinity, or would the construction of a railway line facilitate the supply? There is plenty of timber in the vicinity at present, but how long it would last if the field were largely increased, I could not say.

Walter Shellshear, Esq., M.I.C.E., Divisional Engineer, Department of Railways, Goulburn, sworn, and examined:—

949. *Chairman.*] How long have you been connected with the Railway Department? Twelve years and three months.

950. During the last year you have visited America, and reported to the Commissioners on the mode of working cheap lines of railway in that country? Yes; I left in August, and returned at the end of December. I was accompanied by Mr. Parry, of the Traffic, and Mr. Howe, of the Locomotive Department. I was looking into the question of the construction and maintenance of roads, and other matters in connection with railway business. I was seven weeks in the United States.

951. What railways came immediately under your notice? I travelled over 7,000 miles, most of which belongs to short companies. All the American lines are in private hands.

952. Were any of the lines which you passed over what may be called pioneer lines? More than half the lines I passed over were of that character.

953. Was the nature of the country difficult or easy for the construction of railways? I went over every class of country. I was three times over the Rocky Mountains on different lines; then on the level country of the prairies. Then I went to the country on the delta of the Mississippi; also, on the black soil country in the cotton districts, and then I saw the first-class lines in the Eastern States.

954. I suppose the Rocky Mountain line would not be a very cheap one? I might explain that the great point with all their lines is the extraordinary amount of care which is taken with their surveys. When it is decided to construct a line between two points, the greatest possible care is taken to secure the best line the country can afford. The country is thoroughly explored. There is a class of engineers known as locating engineers who undertake that work, and their value is estimated by the ease with which they get over bad country with easy grades and light works.

955. Are these locating engineers employed by the projectors on salary or by contract;—is there any inducement held out to them beyond their salary? I am not prepared to say. I believe in some cases they contract to make the survey, and in other cases they are on a salary.

956. Is the black soil country pretty flat? It is practically level.

957. What does it cost them to construct lines in that country per mile? It is very difficult to get at any accurate cost, on account of the incidental expenses in getting their charters through and floating their stock. All the lines there are very heavily loaded beyond the actual cost of construction.

958. What is the gauge on the lines? The gauge in the States is now almost universally the standard—4 feet 8½ inches. A large mileage of narrow gauge lines was constructed some years ago, but as fast as possible they are widening them to the standard gauge. For instance, the Rio Grande was on the 3-foot gauge, and they have widened it to 4 feet 8½ inches, the object being to allow through communication between all the lines.

959. In the first instance, when developing new country, do they run out a line of narrow gauge, and subsequently when trade allows, widen it to the standard gauge? No; they seem to be completely set against narrow gauges at the present time.

960. In constructing lines for the development of new country, do they make their works of a less stable character at first, with a view to improving them when traffic warrants it? As a matter of fact, their pioneer lines consist of a mound of earth, a few temporary trestles and wooden boxes, to carry them over the water-courses. The rails are closely timbered, the sleepers being close together. The lightest rails they use now are 50-lb. steel rails, but the general opinion of the engineers there is that nothing lighter than 60 lb. is expedient on account of the weight of the stock.

961. How close are the sleepers? Sixteen to a 30-foot length, that is 2,816 per mile.

962. What is the average here? Eleven and 12 to a 30-foot length, or 1,936 and 2,112 to the mile.

963. Do I understand that the roadway is merely a mound of earth without any ballast? Ballast is quite unknown there until you get on the heavy traffic lines.

- W. Shollshenar, Esq., M.I.C.E.
21 May, 1894.
964. What is the usual height to which the earthwork is made up? It varies very much according to the class of country, but you might assume that the rail level is about 18 inches above the ordinary surface. The object of keeping it up is to ensure good drainage, because without ballast it is absolutely necessary that the road should be properly drained.
965. As a matter of fact, then, there are no earthworks brought from a distance, but merely the material taken from the gutters on either side to form the mound? Not strictly speaking, because they are very careful there not to have any heavy grades, on account of the excessively heavy trains running, and it is therefore necessary in some cases to bring earth from a distance.
966. What do they consider a good grade? About 1 in 150 on level country.
967. What is the ruling grade over the Rockies? Some of them are as steep as 1 in 25—that is exceptional.
968. And on the Rio Grande? In some parts 1 in 30.
969. Are any of the companies with heavy grade-lines expending money in cutting them out? As far as the Rockies are concerned, the country has been so carefully explored, that they have got the best line the country can afford, but in the eastern states they spend vast sums in cutting out the grades, because it is ruinous to haul the very heavy traffic they have there over the heavy grades.
970. Does that apply also to curves? With the American rolling-stock curves are a second consideration. Bogeys are entirely in use there, and their engines are beautifully equalised for running over rough roads. I travelled round curves as sharp as $5\frac{1}{2}$ chains on the Rocky Mountains in a 70-foot Pullman car.
971. At what rate of speed do their trains run over the black soil country? I am afraid the speed of the trains there is limited to the rate at which they can drive the wheels, because they run at an excessive speed on the worst possible road. Their bogey rolling-stock and their central-couplers enable you to travel over the road at high speed, which with the English pattern of vehicle it would be unsafe to do.
972. Is there a centre-buffer? There is no side-buffer. There is a central coupling and buffer, which enables them to take the curves with perfect freedom, and at the same time mitigates the oscillation common with a slack-coupled vehicle.
973. Is this a combination of coupling and centre-buffer, or are the two separate from each other? It is a combined device.
974. Do you think it is applicable to our railways? Unfortunately it is not applicable to our stock, in which we have a large sum of money invested.
975. Presuming we were beginning afresh, would you advocate the use of such central-buffers and couplings? I would say they are incomparably better than ours.
976. I suppose it would be almost impossible to work the central buffer in connection with our present stock? Almost impossible.
977. Did you come to any conclusion as to what one of these pioneer lines would cost per mile on the black soil country? Excluding bridge and culvert work and the permanent-way, it would come to £400 or £500—that is in putting up the mound. The permanent-way is worth from £1,000 or £1,100 per mile for a 60-lb. rail.
978. Are you allowing for the extra sleepers? Yes; and I have allowed for the extra strong fish-plate which they use in America very largely. My estimate is exclusive of fencing and waterways.
979. What would the fencing add to the cost? About £100 per mile.
980. What sort of sleepers do they use? The sleepers are the great trouble in America—they are mostly pine and oak, but the life of them does not average more than six or seven years. Something like 15 per cent. of the total number of sleepers is renewed annually on their line.
- 980½. Do they spend as much labour upon them in squaring them as we do, or do they use them in a rough form? Some of them are sawn timber, and some of them are level on the two sides. The oak sleeper is simply a small tree levelled off at the top and bottom.
981. I suppose the mound is banked up to a certain extent on the sides of the sleepers? Yes; to an inch over the centre of the sleepers, and rounded off on each side.
982. Do you know the country in the Narrabri district? No; but I know some of the country in the Richmond River district. It is about the same as the black soil country in America.
983. What about the rainfall on the black soil country in America? It is not so heavy as our coast rainfall, but it is heavier than our up-land rainfall.
984. Is it an element of danger in washing away the mounds? Of course their roads very often do get washed away in heavy storms.
985. Do they travel over these lines at night-time? Yes; their engines are provided with a very large lamp, almost amounting to a search light.
986. What do you consider a safe speed to run over a railway built on the system to which you have been referring? It depends upon what rolling stock you have upon it.
987. With our rolling stock? Twelve or 15 miles. Most of our rolling stock has been designed on the English pattern, and it has not the elasticity or flexibility which the bogey stock has.
988. Does not the flexibility of the American stock give it a shorter life? I cannot say much about that.
989. As a matter of fact, it gets rickety sooner than ours? The American engine, as a rule, has not the life of an English engine, because it has not the same amount of workmanship in it.
990. Then, if one of our engines ran over a line of that kind, it would not be safe to go at more than 15 miles an hour? No.
991. At what speed could the American pattern of engine travel over it? I travelled up to 50 miles of an hour. The roads were straight and level.
992. Do you know the Temora district? I have been to Temora, but not beyond it.
993. Do you think the country between Cootamundra and Temora easy country to make a line over? I do not see any difficulty.
994. Would you think it possible to make a line between Cootamundra and Temora on the £1,600 a mile basis? No. It is a question of more earthworks than on the plains, and that means expense.
995. Is the black-soil country to which you have been referring free from obstacles in the way of scrub? It is densely timbered and swampy.
996. Do they find it safe in swampy country to make lines of the character described, and to run trains over them at the speed to which you refer? They do it.
997. Have they many accidents? They have a large number, but in proportion to the business done I do not think you can call them excessive. You must remember that they move nearly 400 times the tonnage we do. America having half the railways in the world, you may reasonably expect to see half the accidents in the world take place there.

993. On the 10th October, 1893, the Railway Commissioners recommended that, for pioneer purposes, lines might be constructed at the rate of £1,750 per mile—that is exclusive of bridges, waterways, and station accommodation; this estimate comes out somewhat similar to the one you have referred to of lines over the black-soil country? The difference is that there is a certain amount of ballast allowed for in the Commissioners' estimate. I have not allowed for ballast in mine, but for a few extra sleepers to give the necessary bearing area for the road.

W. Shellhear,
Esq., M.I.C.E.
21 May, 1894.

999. *Mr. Sattor.*] What is the general impression you have formed of these light lines in America;—are they serviceable? They carry very heavy traffic on some of the lines, and they certainly do a large amount of business, and with suitable rolling stock, I think, they are the best thing which can be devised for new countries.

1000. *Mr. Collins.*] Were you upon these lines during wet weather? I was on them during pretty heavy rain.

1001. Do the engines sink upon them? No.

1002. Do not heavy loads make any impression at all? Not to a serious extent. Of course, where the traffic is heavy it becomes necessary to ballast.

1003. Do you think it would be necessary to ballast pioneer lines in this country? Not for one or two trains a day running at the speed proposed if the lines are properly drained.

1004. Do their roads cost much for maintenance? There was difficulty in getting reliable information on account of the great trouble with the timber. Fifteen per cent. of the sleepers have to be renewed every year, and a large amount of the time of the fottlers is taken up in renewing sleepers.

1005. Is there much wool or stock traffic on those lines? It is mostly cotton lumber, and there is also a good deal of fruit, meat, and fish carried in refrigerating cars. There is a limited amount of live stock carried.

1006. Are yards erected in which to put the live stock? Yes; cattle yards, the same as we have.

1007. Have they goods sheds? Yes, where necessary; but as a matter of fact, they run their lines through, and when they have constructed it they add these things as they require them at the terminal point. They are erected of timber.

1008. At what rate do they travel on the pioneer lines? Twenty or twenty-five miles an hour.

1009. What sort of bridges have they? Open tressle and wooden culverts.

1010. *Mr. Humphery.*] Are the lines in agricultural districts fenced? Where the stock is run then they fence the roads, because when they are not fenced they have to pay compensation for cattle killed. They fence when the cost of compensation becomes more than the value of maintaining the fence.

1011. How do they arrange for taking up and setting down traffic? They run what we know as the American car, and they are provided with a flight of steps at the rear, so that people may step down upon the rail level. They have no platforms beyond a few planks to cover the side of the ditch. The trains stop at fixed points according to the time-table.

1012. Are there any waiting sheds? In some places. At others there is nothing but a signboard stating that the trains stop there.

1013. Our timber being superior to that of the United States, would it be necessary to have a smaller number of sleepers than what they use there? If you do without ballast you must have close timbering, otherwise the sleepers will go down and the earth will come up.

1014. Presuming earthworks were made, are you of opinion that our lines might be built for less than £2,000 a mile? It depends on what creeks or waterways have to be crossed, and what earth works there are. There is plenty of country in the plains where you could build lines at £2,000 a mile.

1015. And they would be suitable for agricultural districts? Yes; a line similar to what I saw over there would answer every purpose of agriculture.

1016. Could you use upon those lines the ordinary rolling stock? At the speed of 15 miles an hour ordinary rolling stock could be used.

1017. With what weight of rails? Nothing lighter than 60 lb.

1018. *Mr. O'Sullivan.*] Notwithstanding the heavy cost of replacing the 15 per cent. of the sleepers, the lines you refer to are worked cheaper per annum per mile than ours? No, not as far as maintenance charges are concerned.

1019. I mean working expenses? I would not like to say they are; but most of them are doing a much larger business than on our lines, and of course, you could handle a large business cheaper than a small one.

1020. But they employ a lesser number of men per mile than we do? No, they have rather more men per mile on the maintenance of their roads than we have.

1021. I refer to the working of the line by porters and others attached to stations? Of course upon some of the lines absolutely no one is employed beyond the telegraph operator at wayside stations, but the trains are heavily manned, because they carry their staff with them.

1022. I believe they trust a good deal to luck in the working of the lines? They have a system of rules for working them.

1023. Did you hear of any serious accidents there arising from the rivalry of different drivers employed by different companies in reaching certain points? No; because their rules define where they are to cross, and they are not allowed to go beyond the points which they are directed.

1024. I suppose the lines in the old settled States in the east are constructed as well as ours? Yes; the Pennsylvania road is equal to anything in the world as far as the condition of the road itself, works, stations, and rolling-stock are concerned. The New York Central is almost as good.

1025. *Mr. Davies.*] What is the cost of maintenance per mile on our existing lines? It varies. On the outlying branch lines it is less than £100 per mile per annum.

1026. What would it be per mile in the black soil country of the States? The disturbing element of the cost of the renewal of sleepers comes in. The maintenance runs to about £150 per mile, but you have to consider the enormous number of sleepers they have to renew.

1027. Supposing cheap pioneer lines were constructed here, what would be the probable cost of their maintenance? Not more than £100 per mile per annum until the sleepers commenced to decay.

1028. What is the life of one of our ironbark sleepers? From seventeen to thirty years. I have taken many up perfectly sound after thirty years' service.

1029. You would not anticipate any great additional expenditure in respect of sleepers? No.

1030. Will your visit to America result in a reduction in the cost of maintenance here? There are very many points over there which are suitable in this Colony, and which will result in a decided saving in the maintenance of the lines.

1031.

- W.Shellshear, Esq., M.I.C.E. 1031. In ballast or sleepers? More in matters of detail in connection with working and management.
- 21 May, 1894. 1032. Is there any line in our system which would compare with the one you spoke of near Mississippi? No; there are many lines I travelled over which would compare more with the Junee to Hay and the Jerilderie line.
1033. Where? On the prairies.
1034. You believe branch lines could be constructed here at a cost of only £2,000 per mile? That is exclusive of fencing and waterways.
1035. *Mr. Hoskins.*] Supposing it is desirable to make pioneer or light lines here, would it not answer instead of having squared sleepers to have them half round with notches for the rails to rest upon? Half round sleepers such as you describe would be cut out of small young timber. Our ordinary sleepers are cut out of mature large size timber, and as a matter of necessity they are much sounder and more durable than the sapling timbers. It would be a question whether you could get those timbers sufficiently cheap to make it pay to have one or two renewals of them as compared with the life of one first-class sleeper.
1036. What is the average cost of the square ironbark sleeper? We are paying from 4s. to 5s. 3d. for 9 feet ironbark sleepers.
1037. What would half round sleepers, with a notch to bear the rails, cost? Where you have to bring timber from a considerable distance it would always pay to use the best you can get. Where you run a line through a timber country where there is a suitable class of sapling for half round sleepers it might pay to use them, but considerable allowance would have to be made for additional cost of maintenance on account of the speed at which they rot. The life of half round stuff is nothing like the life of the solid matured ironbark.
1038. Supposing they cost 1s. only, and the others cost 4s., and you renewed them twice, you would be a gainer? You would be a gainer, no doubt, in that case; but it would be a question of transferring the charge from the capital to the maintenance.
1039. The object of having pioneer lines being to have a cheap means of railway locomotion, would not the half-round sleepers answer the purpose for some time? Undoubtedly.
1040. Did you see any of the Baldwin engines, similar to those you have here, in America? I saw some similar, and some a little bigger.
1041. Was any special danger considered to attach to running them over the light lines of railway? They run them over there without quibble.
1042. Is it not a fact that they construct railways there with heavy grades as well as light? I have travelled over railways there with grades of 1 in 25. Speaking from memory, the rails were 65-lb. rails. The sleepers were spaced at 2,816 per mile. In some places the line was ballasted, and in some places it was not.
1043. *Mr. McCourt.*] Do heavy Baldwin engines run on the cheap lines in America? Yes.
1044. What is the weight of the engine and tender? Up to 90 and 95 tons. The tendency in America is to run excessively large engines on all lines. I have seen as many as three or four engines on one train with as much weight as it could stagger under.
1045. *Mr. Hoskins.*] But is not the weight equally distributed so that there is no inordinate weight on one pair of driving wheels? That is the great point about the American construction. The spring-gear is almost perfect, so that it is impossible to get any excessive weight in any one part.
1046. *Mr. Trickett.*] Did you see any of these lines being constructed? No.
1047. Are they constructed very quickly? Yes, as a rule. They have special scoops for taking out the side ditch and forming it, and they put on large gangs for the construction of the road.
1048. Would these scoop appliances be suitable for this country, where there are so many stumps? Yes, just as suitable as for other countries.
1049. Would the tressle bridges be suitable for this country? Yes; in fact our timber being so much better, we should get a better job.
1050. Do you think you could safely recommend these light lines of railway for a trial here? Yes, in many parts of the country. If we do not do something of the sort the railways will simply swallow themselves up with the interest you will have to pay on the capital.
1051. Would Wyalong be a suitable road to try it on? I have not been over the country; but the western plains is a class of country where they could be tried to great advantage.
1052. *Mr. Neild.*] I understand that the banking up of the earth on the American lines covers the sleepers in the centre, and leaves the end exposed? Yes.
1053. Do you think that the necessity for renewing the American sleepers is due in any way to the laying of the sleepers upon earth and covering them with earth? Not necessarily. My remarks with reference to renewals apply equally to the ballasted roads. The life of the timber is very short, even in the ballasted roads.
1054. Supposing the same method of covering the sleeper with earth were adopted in this country, do you think it would affect the life of our sleepers? Not materially.
1055. But timber lying on a good bed of sound ballast would surely last longer than timber laid on soil, or covered with soil? But the object of that particular form of mounding up is for drainage, and the timber, under those conditions, is not like timber more or less sodden in the ground.
1056. Are not our lines constructed very much on the plan of the American lines—are not water tables formed, and a bed raised upon which the ballast is raised? Yes.
1057. Does not that give you practically the same drainage as the American system, plus the superior drainage of your ballast? The difference is that if you put ballast upon a new embankment, when you start to run, that ballast sinks into the embankment, and the embankment forms a dam which holds the water in it. In many cases, if the line has been in use a little time the ballast gets completely destroyed for drainage purposes by the amount of material which gets forced through it.
1058. Are we to understand that the method of forming water-tables and embankments in America is superior to our method of construction? It is superior for that particular class of construction. For instance, in soft country their width of cutting is 24 feet for a single line; the width here is 15 feet.
1059. Supposing you get into self-draining country, how then;—would the American method of road-making compare with ours, apart from ballast? The two methods are practically one and the same, apart from the question of ballast.

1060. You spoke just now of the ballast settling down into the soil;—when one of our lines is thoroughly W.Shellshear, consolidated does that proposition apply? You are dealing with a consolidated concern, and not with a Esq., M.I.C.E. pioneer line. If you have heavy traffic ballast is essential, because with an earth-road the action of the traffic in wet weather will churn it into a state of puddle, but where you run one or two trains a day, the ballast, according to their experience, is unnecessary. 21 May, 1894.

1061. Were you not able to arrive at any conclusion as to the cost per mile of the pioneer lines, apart from the flotation and other expenses? It would depend upon the class of country—from about £2,000 in the easy country to £3,000 or £4,000 per mile, according to the amount of earthworks.

1062. You do not think there would be much constructed on a 4 ft. 8½ in. gauge in America under £2,000 per mile? I do not think there would be any of it constructed under that amount.

1063. I want to ascertain the practicability of using split sleepers from the matured tree without squaring, but treated in the manner indicated by Mr. Hoskins, namely by grooves being cut with a machine upon which to lay the rail? A sleeper of that sort, provided it was of equally as good quality as a finished sleeper, should have almost a correspondingly long life unless the fibre was opened out in the action of splitting.

1064. And it would be less expensive? I do not know, because the extra weight of it would add to the cost for the carriage and handling.

TUESDAY, 22 MAY, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTON.

The Hon. JAMES HOSKINS.

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JOHN DAVIES, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM CHANDOS WALL, Esq.

WILLIAM MCCOURT, Esq.

JOHN CASH NELLID, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES COLLINS, Esq.

HENRY DAWSON, Esq.

The Committee further considered the proposed Railway from Temora to Wyalong.

Thomas Rhodes Firth, Esq., M.I.C.E., Acting Engineer-in-Chief, Railway Construction Branch,
Department of Public Works, sworn, and examined:—

1065. *Mr. Suttor.*] You have seen the evidence which Mr. Deane gave before the Committee? Yes. T. R. Firth,
Esq., M.I.C.E.
22 May, 1894.
1066. Have you anything to add to his evidence, or any information to give which you think would strengthen it? I do not know that I have. No information has come in from the surveyors since Mr. Deane was examined which would alter his evidence in any way.
1067. Have the surveyors examined the line since Mr. Deane gave his evidence? They were at work when Mr. Deane was examined, and they are still out there.
1068. How many surveyors are there out there? Four—Mr. Kennedy, Mr. Calvert, Mr. Gillet, and Mr. Cummings.
1069. Have you any information as to the probability of the line paying? That is a question which I have not gone into; I have left it entirely to the Railway Commissioners and the Committee. We simply carry out our instructions.
1070. *Mr. Humphery.*] Have you formed an estimate of the probable cost of the line? I have gone into Mr. Deane's estimate, and I do not see any reason to differ from him.
1071. Have you any personal knowledge of the country? No; I have not been beyond Temora.
1072. What is the lowest estimated cost of a pioneer line through comparatively level country? I think such a line could be made for about £2,500 a mile—that is, if we got the rails carried at low rates. The Commissioners usually charge 2d. per ton per mile, unless they got return freight. If they charge at reduced cost there would be a saving of £150 a mile.
1073. How is your estimate of £2,500 per mile made up? I have estimated for earthworks, including box-drains, bridges, level-crossings, and a very small portion of fencing, £486 per mile; for permanent-way material, freight, laying, ballasting, and sleepers, £1,490 per mile.
1074. *Chairman.*] What would the weight of the rails be? They would be 60-lb. rails, thus making a total of £1,976 as the cost of the line alone. Then, for station buildings, water supply, and supervision, I allow £455 per mile, and adding 5 per cent. for contingencies, the total cost comes to £2,553 per mile.
1075. *Mr. Humphery.*] What have you allowed for freight? Two hundred and fifty-five pounds per mile. I have assumed that we shall get the rails from the last indent, which is at a much lower rate than we have got them before, and indeed, the lowest rate at which they have been delivered in the Colony.
1076. Then, without freight, and excluding the cost of station buildings, &c., your estimate comes to about £1,700 per mile? Yes; about that.
1077. *Mr. O'Sullivan.*] I think you heard the evidence given yesterday by Mr. Shellshear? Yes.
1078. I presume that what they have done in America in level country, your Department could do here? Yes.
1079. That is, making allowance for difference in conditions and circumstances? Yes; there is no reason why we should not.
1080. Have you noticed the low estimate given by the Commissioners for the line as a pioneer line? Yes; and I believe that the reason why the Commissioners' estimate is lower than ours, is that they propose to deliver the rails for from £3 to £3 10s. a ton, while they would charge us £2 8s. a ton for freight alone.
1081. Three pounds or £3 10s. a ton includes the cost of the rails? The cost and everything. We have a little over £3 a ton more to pay for our material than they offer to deliver it at.
1082. But that would not make up all the difference? Then they propose to leave out ballast, which would come to £300 a mile, and would make a difference of about £20,000 in the whole estimate.
1083. Making these allowances, your estimate is practically the same as that of the Commissioners? Yes; about the same.
1084. What the Commissioners would do for their own line they ought to be prepared to do for a Departmental line? Yes. 1085.

- T. R. Firth, Esq., M.I.C.E.
22 May, 1894.
1085. If they did so your Department would construct the line as cheaply as they propose to construct it? Yes; within a few pounds, if they supplied satisfactory material at the price they name.
1086. I presume that such a line would fit in well with the character of the country round Wyalong? I suppose it would. It would carry a light, slow-speed traffic. I believe they intend to supply old second-hand rails.
1087. Where will they get them from? They would be rails which they are now taking up as unfit for heavy traffic. They would get their rails for nothing.
1088. Those rails would be available for your Department if the proposed line were authorised? Yes; the Commissioners have made such an arrangement in connection with the line from Narrabri to Moree, and it becomes a question whether they would have a sufficient number of rails for the two lines, supposing that both were being constructed at once. I am not sure that they would.
1089. Was the line from Nyngan to Cobar constructed as a pioneer line, or as a strong line to form part of the railway to Broken Hill? It was first intended to be a light line. Then, at the request of the Commissioners, the gauge was altered from 1 in 75 to 1 in 100. After the work had been going on for about nine months, I went up there, and I found that, owing to the wet weather, miles of the line had been washed away, and the ground was so soft that you could not walk on it. I made arrangements for the embankments to be raised out of the wet, and the subsoil to be drained by a drain on each side. That work, of course, has increased the cost of the line very considerably, but now we have a good line, and one that will stand in almost any sort of weather.
1090. Can you recollect what the additional cost of the line was above the contract price—something like £40,000 was it not? I think it was quite that.
1091. That line would not be regarded as a pioneer line? Not now.
1092. But even at first? To some extent it was. It was to be a cheap line, but the gradients were kept down, having in view the possibility of its becoming the main line to Broken Hill.
1093. Do you think that if a pioneer line were made to Wyalong, you would have to go over it and strengthen it? That is very likely. In these flat districts, once you make an embankment by depositing ballast, you stop the water which runs over the surface, even though the volume of water is so small that you cannot see it, and this water washes the embankment away. The ground is so flat that you cannot get enough fall to drain the line unless you raise up the embankment. If the embankments are made on the surface of the ground, we must naturally expect them to be washed away after heavy rain.
1094. But they have similar deluges in America? Yes; and I suppose with similar results.
1095. Anyhow they find it safe enough to work these light lines there? We hear nothing of trains being delayed every week or two. Such a line might work here for twelve months without being stopped.
1096. If the line were carried out on the estimate supplied by the Commissioners, it is quite probable that it might be worked for a considerable time without any alteration at all? Yes; it might be.
1097. *Mr. Davies.*] Would such a line carry ordinary traffic at a slow rate of speed? Yes, during fine weather.
1098. The rolling-stock used on the main lines could be used on the line you have been speaking of? Yes; such a line would carry any of the ordinary rolling-stock, provided the Commissioners did not use very heavy engines upon it.
1099. How much ballast did you allow for? Seven-and-a-half inches deep; that is, 5 inches under the sleeper in the middle, and 2½ inches up the sides.
1100. Is that in excess of what Mr. Deane allowed? No; it is just the same.
1101. Is not 3s. 6d. a yard a very high estimate for ballast? I do not think so. I have not been over the line, and I do not know where the ballast would be got from; but the price would be rather a low one, if the ballast had to be carried any distance. We generally pay 4s., 4s. 6d., and 5s. a yard for ballast.
1102. Is not 1s. 6d. a very high price for laying the road? I do not think so. We must bear in mind that that includes the cost of taking material right through from Temora, spiking the road, lifting and straightening it, curving the rails, re-drilling fresh holes in rails, and a lot of contingencies. 1s. 6d. is the cost of laying the rails alone, apart from the ballast.
1103. Is not the cost of sleepers very high? Until the present time, we have never had them delivered at the price named; but we are getting some delivered at Narrabri station now, for 2s. 6d. They, however, have yet to be taken on to the line.
1104. Are you aware that the estimate for half-round sleepers in connection with the Moree line was about 1s. 6d.? I never heard of that estimate; I do not know who made it.
1105. It was made by Mr. Deane? I think there is some mistake about that.
1106. These are dressed sleepers that they are getting for 2s. 6d.? No; half-round sleepers, dressed on the bottom side.
1107. You do not regard the prices as excessive for a cheap line of railway? No; I do not.
1108. Would you advocate the construction of lines, such as Mr. Shellshear described yesterday? I should not.
1109. More especially in our black-soil country? I should prefer to put ballast under the sleepers in any kind of country. I think that in wet weather the sleepers must work into the soft material. Apparently, in America, they put them so close together that they really make a corduroy road. Even then they must work into the soft mud.
1110. You would use ballast in preference to an additional number of sleepers? Yes; the additional number of sleepers referred to by Mr. Shellshear would cost £142 per mile, while the ballast would cost £308.
1111. So that the saving would not be very great? There would be a saving of about £150 a mile in first cost.
1112. But the cost of maintenance would be heavier? Much heavier, and I think stoppages would be much more frequent.
1113. While traction over a properly-formed road would be safer? Yes. I may say that we have altered the shape of our formation from the original drawings, in order to give it more drainage. We have always had a convex surface to the formation; but now we have sloped the sides more, so that the ballast may be even better drained.
1114. Do you think that the present rolling-stock could be run over a line costing £1,700 a mile, at a rate of 15 to 20 miles an hour? Yes, up to 20 miles an hour.
1115. Is the Temora line fenced in on both sides? Yes; but in the estimate for the Wyalong line very little fencing is allowed for. We should probably have to fence, in cases where the line went through private allotments and round the station yards.

1116. Are you aware that it is contemplated that the trains shall only run in daylight? I am not aware that the Commissioners will be bound down to running their trains in daylight; but I suppose that restriction would be advisable by the want of fencing. T. R. Firth,
Esq., M.I.C.E.
1117. Would there be any occasion for fencing, if the trains ran only in daylight? Of course, the want of fencing always increases the danger of running trains. 22 May, 1894.
1118. Would there be much danger if the trains only ran at the rate of 15 miles an hour? Perhaps not much danger; but still there would be some.
1119. More than there is with our street-trams? Of course, there is danger with them; but then we do not have cattle running about the streets here.
1120. You do not know anything about the Wyalong gold-field? No.
1121. You do not know whether it is desirable to construct a line? No.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.
Railway from Temora to Wyalong.

APPENDIX.

A.

[To Evidence of H. Deane, Esq.]

ESTIMATED Cost of a Single Line of Railway 33 miles 46 chains in length, with 72 chains of Sidings—60-lb. rails.

Description.	Estimated cost.	Average per mile.
	£ s. d.	£
Earthworks	11,677 10 0	303
Box drains and timber bridges	5,563 7 6	144
Level crossings	1,000 0 0	26
Permanent way materials	34,578 9 0	896
Ballasting, at 3s. 6d.	£11,831 2 0	
Laying, at 1s. 6d.	5,091 18 0	
Sleepers, at 3s.	11,572 10 0	
	28,545 10 0	740
Station buildings ..	£4,440 0 0	
" works ..	3,750 0 0	
Sidings, 72 chains ..	1,580 0 0	
	9,770 0 0	253
Supervision and engineering expenses	4,821 17 8	125
Water supplies	3,000 0 0	77
Fencing	500 0 0	13
	£99,456 14 0	
Contingencies, 5 per cent.	4,072 16 8	129
	£104,429 10 8	
Average cost per mile	£2,707 3 8

If the quotation for rails lately received can be made use of, the estimate can be reduced by about £150 per mile—£5,786 5 0

H.D., 9/4/94.

B.

[To Evidence of C. J. Saunders, Esq.]

RETURNS OF LAND ALIENATED BETWEEN COOTAMUNDRA AND TEMORA AND BETWEEN TEMORA AND WYALONG.

RETURN showing land alienated within 20 miles on each side of the Railway from Cootamundra to Temora since the date on which the construction of the Railway was authorised by Parliament, viz., 25 September, 1890, and the average price obtained.

	Area.	Average price per acre.	Total amount that may ultimately be realised.
		£ s. d.	£
Taken up under ordinary conditional purchase and conditional lease	34,500 acres	1 0 0	34,500
Taken up under conditional purchase within special areas	35,000 "	2 0 0	70,000
Country lands sold at auction	1,941 "	2 15 0	5,322
Town and suburban lands sold at auction	144 "	23 10 0	3,390
Total area alienated	71,585 acres	£113,212

NOTE.—It has been assumed in this return that land conditionally leased will eventually be converted into conditional purchases at £1 per acre; this, however, is a privilege which may or may not be exercised by the conditional leaseholders. Payments for conditional purchases are made by instalments extending over a period of thirty-three years with interest payable on the outstanding balances.

C.J.S., 20 April, 1894.

RETURN showing land taken up between Temora and Wyalong since the passing of the Cootamundra to Temora Railway Act, viz., 25 September, 1890, within 20 miles on each side of the proposed route; and the average price obtained.

	Area.	Average price per acre.	Total amount that may ultimately be realised.
		£ s. d.	£ s. d.
Taken up under ordinary conditional purchase and conditional lease	About 83,839 acres	1 0 0	83,839 0 0
Taken up under conditional purchase within special areas	20,455 "	2 0 0	40,910 0 0
Country lands sold by auction	641 "	1 15 0	1,121 15 0
Town and suburban lands sold by auction	12 "	76 5 0	915 0 0
Total area alienated	104,947 acres	£126,785 15 0

NOTE.—It has been assumed in this return that land conditionally leased will eventually be converted into conditional purchases at £1 per acre; this, however, is a privilege which may or may not be exercised by the conditional leaseholders. Payments for conditional purchases are made by instalments extending over a period of thirty-three years with interest payable on the outstanding balances.

C.J.S., 20 April, 1894.

In

In reply to a question from the Under Secretary for Lands as to whether the construction of the railway line from Cootamundra to Wagga Wagga has had the effect of stimulating settlement on the land in the vicinity of the line, Mr. William Orr, the district surveyor at Wagga Wagga, reports as follows:—"The construction of the Cootamundra-Temora railway had very powerful effect in stimulating settlement in the vicinity. Settlement commenced soon after line was mooted, and out of six hundred and fifty-six conditional purchases made during last four years at least five hundred were made owing to railway. The town, Temora, increased by about eleven hundred persons during same period, and Crown derived full benefit improved prices of land alienated." C.J.S., 20 April, 1894.

"Since April, 1890, the date on which the Public Works Committee recommended the construction of the Cootamundra to Temora railway, an area of about 87,000 acres, previously included in reserves within 20 miles on each side of the railway line, has been made available for selection, of which about 67,000 acres have been selected up to date. About 10,000 acres of this area were thrown open to ordinary selection at £1 per acre, and the residue in special areas at prices averaging about £2 per acre." C.J.S., 24 April, 1894.

C.

RAILWAY COMMISSIONERS' REPORT.

Proposed extension of the Cootamundra-Temora Branch Line to Wyalong.

Sir, Office of the Railway Commissioners of New South Wales, Sydney, 11 May, 1894.

In reply to your letter of the 29th March, I am directed by the Railway Commissioners to inform you, for the information of the Secretary for Public Works, that they have, at the earliest possible moment (having regard to other pressing matters of business), inspected the proposed extension from Temora to Wyalong.

It is estimated that the line should, if constructed as a pioneer line, as described by the Commissioners, in a paper dated the 10th October, 1892, and referred to in their Annual Report for the year ending June, 1894, be made, and all necessary accommodation provided, at a cost of £85,000.

The estimated annual cost would, under these circumstances, be:—

Interest on estimated cost of construction at 4 per cent.	£3,400
Estimated cost of working:—	
Traffic expenses	£800
Permanent-way expenses	2,000
Locomotive expenses	750
	£3,550
	£6,950

As regards the probable revenue, really nothing definite can be stated. In railway construction the proposal, from a traffic point of view, is unique, as the future entirely depends upon the permanency of the gold-field at Wyalong, which it is understood is the basis of the extension. There is country adapted for agricultural purposes around Wyalong, and *en route* thereto, but there is no present necessity for providing it with railway communication, while there are large areas suitable for the purpose contiguous to existing railway lines available.

The present population of Wyalong (about 5,000) cannot be accepted as any indication of the future. Everything there at the present may be said to be in an abnormal condition, as was the case at Peak Hill, where, it is understood, there were, when the field was first discovered, 12,000 people, the present population being 1,500; however, basing the estimate of traffic on the assumption that there will be a permanent settlement at Wyalong, to the extent that now exists at Temora—about 1,500—the value of the annual revenue will not exceed £2,500.

In view of the great uncertainty of the future of Wyalong, the Railway Commissioners recommend that the proposed extension of the Cootamundra-Temora branch line be deferred for six months, or until such time as there can be no reasonable doubt as to the future of the place.

I am to add that the Commissioners have ascertained that both passengers and goods are being carried at reasonable rates between Temora and Wyalong, and therefore no hardship would be consequent upon the postponement suggested.

I have, &c.,

H. McLACHLAN,

Secretary.

To the Under Secretary, Public Works Department.

Submitted.—J.B., 12/5/94. Forward to the Public Works Committee.—W.J.L., 12/5/94.

Extract from Annual Report of the Railway Commissioners for the year ending 30th June, 1891.

We would suggest for consideration in dealing with railway extensions in districts like Jerilderie and Deniliquin, Narrabri and Moree, Byrock and Brewarrina, where the country is practically level and the traffic will be very light, that lines to be designated "Pioneer Railways" be constructed at a cost of about £1,750 per mile, exclusive of bridges and land (which latter we hope can be dealt with as suggested on page 7), the trains to be worked at a speed of about 15 miles per hour, and during daylight only. Later on, when the traffic has developed, and will justify the class of line being raised, a capital vote to be granted as to make the line capable of carrying the traffic under the same conditions as on other parts of the railway.

NARROW-GAUGE RAILWAYS.

Office of the Railway Commissioners of N.S.W.,

Sydney, 10th October, 1892.

To the Honorable the Minister for Railways.

As the Public Works Committee, in dealing with the Eden-Bega Railway proposal, has been taking evidence with regard to the introduction of narrow-gauge lines into the Colony, and as the question is of such vital importance, we deem it our duty to place before the Government clearly our views upon the whole question of narrow-gauge lines.

If the question had to be settled afresh as to what the gauge for railways in Australia should be, the whole gauge question might, perhaps, be open for discussion; but now New South Wales has practically over 2,500 miles of the universal gauge open or under construction, the introduction of a break of gauge within ourselves could only be looked upon as a national calamity. The fact that the various colonies have departed from uniformity of gauge is already causing grave inconvenience.

We may mention that the question of the adoption of narrow-gauge lines in this Colony was thoroughly considered about 1870, and we think that a perusal of the evidence and facts produced at that time should satisfy everyone as to the wisdom of adhering to the decision then arrived at of not departing from the 4-ft. 8½-in. gauge.

There is a grave misapprehension in the minds of many people in regard to the comparative cost of narrow-gauge and standard-gauge lines, and this has been brought about by comparing the cost of narrow-gauge lines *versus* the ordinary gauge without consideration of the difference between the character of the lines constructed. If a narrow-gauge line and an ordinary-gauge line were made through the same district under the same conditions as to weight of rail, amount of ballast, &c., the difference in the cost per mile of the two systems would be much smaller than is generally thought. A Royal Commission, which reported upon Irish Public Works in the year 1888, and which was composed of some of the ablest men in the country, gave the difference between the relative cost of a 3-ft. and 5-ft. 3-in. gauge (the Irish gauge) estimated on a length of about 200 miles of railway, as about £500 per mile. The New South Wales gauge is the standard gauge, 4-ft 8½-in., and the difference in cost would, therefore, not be so considerable. Sir George R. Bruce, the President of the Institution of Civil Engineers in 1890, in a discussion before the Institution in that year, estimated the difference in connection with the metre (3-ft. 3-in.) and standard gauge (5-ft. 6-in.) of India at about £200 per mile, assuming, of course, that the construction was of a light character in each case.

But when we come to consider that the introduction of the narrow gauge would necessitate the creation of a new class of rolling stock, and would add very largely to the cost of transit by transshipping of goods, the saving thus effected would be practically extinguished by these additional costs and disadvantages. In the daily working of a narrow-gauge line

line there is a far heavier cost in wages per ton of traffic, as the men employed on the locomotive engines and the guards would have to be paid the same wages as on the ordinary-gauge road, although the load that could be hauled would be very much less, and at a lower speed, this latter point also causing a greater staff to be employed. The engines would also be of a smaller character, and the smaller wheels, and consequent greater friction, would lead to greater cost in repairs and consumption of fuel. Rolling stock to meet the maximum traffic of each branch would have to be provided, and a great proportion of this would probably be lying idle for the greater part of the year, as rolling stock could not be drafted from other parts of the system to meet the exceptional pressure of the busiest times, as the standard-gauge road would intervene. There would, therefore, be an unnecessarily large amount of rolling stock provided, which would be standing idle for a great part of the year, and this would in itself be a considerable set-off against any reduced cost in the original construction of the line.

With regard to the cost of transshipping, in the division of through rates in England where break of gauge intervened, an allowance of 20 miles was granted to the company that undertook the transferring of the traffic from the vehicles of the one gauge to the other. In England wages are low as compared with those given in this Colony; in fact, our wages are more than double those paid in England. Practically, therefore, we should be adding at least a cost equal to the conveyance of goods an additional 40 miles on all traffic so transhipped. As bearing on transshipping, nearly the whole of the traffic carried on any connecting narrow-gauge line would have to be transhipped, as there is very little purely local traffic on our country lines; nearly the whole of it is live stock, wool, or produce for Sydney or Newcastle, and merchandise sent in the reverse direction.

In a new country it is impossible to foresee the great changes which may come about even in twenty years; therefore it would be most disastrous to introduce sections of narrow-gauge lines. In England, the last of the exceptional gauge on the Great Western Line was swept away in May last, and in North America nearly the whole of the narrow-gauge lines have been abolished and converted to the standard gauge, until at this moment 94 per cent. of the lines in North America are of the same gauge as in this Colony.

That the country is right in insisting on cheaper railways where it is a question of "a railway or no railway," there is no doubt; but it would, in our opinion, be absolutely wrong to introduce a different gauge from the standard gauge. We do not think it is practicable or desirable to construct a subsidiary trunk line, or a line likely to convey any amount of traffic upon it, on cheaper principles than that carried out in connection with the Cobarr line, the cost of that line, including all construction charges, being about £3,300 per mile. There is no doubt, however, that for purely pastoral and level country, where the traffic would be exceedingly light, a line capable of carrying a light locomotive with the ordinary class of rolling stock, at a speed of about 15 miles per hour, in daylight only, could be constructed, exclusive of bridges, waterways, and station accommodation, which latter should be of the most simple nature, for about £1,750 per mile, money being voted later on, when the traffic had increased sufficiently to justify a better class of line, to raise the line to the ordinary standard. This could only be considered a "Pioneer Railway," and would be altogether different from a standard railway line even of light construction, such as that to Cobarr; it would be simply a line to carry traffic with reasonable speed at a lower rate of charge than it is now carried by road. The rates for such lines, on whatever scale fixed, would bring about a material saving to the users of it as compared with the rates now paid for carriage by road, and the scale of charges fixed should be such as to avoid any material loss to the country in connection therewith. Lines of this character would avoid the great disadvantage of break of gauge; they would cost scarcely anything more in the first instance than a narrow-gauge line, and the whole of the ordinary rolling stock, exclusive of engines which could be selected from the lightest types existing in the Service, could pass over them.

In summing up the whole question, we think we cannot do better than to quote the words of the Royal Commission on Irish Public Works in connection with the subject, viz. :-

"We are persuaded that if the outlay which is required on a narrow-gauge line to provide for extra rolling stock, repairing shops, transshipping sheds and cranes, be deducted from the additional first cost of constructing the line on the standard gauge, the excess will disappear or be very largely reduced, and if the annual expenses and permanent drawbacks, to which we have referred, be set against any additional interest on the balance, the result will show that there is no real saving in adopting the narrow-gauge for extensions in Ireland. The inconvenience of two gauges has already been felt, but in our opinion it will become more and more serious, and will greatly detract from the value of the extensions both from a public point of view and considered as the property of those who make them."

E. M. G. EDDY,
Chief Commissioner.
CHARLES OLIVER,
Commissioner.

D.

[To Evidence of John Harper, Esq.]

PROJECTED RAILWAY—TEMORA TO WYALONG.

New South Wales Government Railways, Goods Superintendent's Office, Sydney, 23 April, 1894.

Projected Railway—Temora to Wyalong. Length, 39 miles. Estimated cost, £104,000, including station buildings.

As directed by the Commissioners, I have traversed the course of the proposed line, and made such inquiries as were necessary as to probable traffic and accommodation.

I may incidentally remark that owing to the extremely unsettled opinion which prevails as to the permanency of the gold-field, and the abnormal influx of population which its discovery has introduced to the district, any estimate of traffic is extremely subject to future conditions of settlement, which at present can scarcely be gauged on anything like good grounds.

Although the proposal submitted to the Commissioners simply embraces the extension to Wyalong, and the facts and figures I have elicited are confined to the area of country likely to be served by this extension, it is, I understand, proposed to form part of a scheme of railway construction to Hillston on the Lachlan *via* Lake Cargellico, the distance being :-

	m.	c.
Temora to Wyalong	38	46
Wyalong to Cargellico	67	50
Cargellico to Hillston	54	0
Total	160	0

The more direct route, Temora to Hillston *via* Barmedman, is 150 miles. The only existing township between Temora and Wyalong is Barmedman (22 miles) which has a population of between 300 and 400 engaged in mining and agricultural pursuits in a small way. The country is almost exclusively devoted to pastoral pursuits.

In the Barmedman district 78,000 acres have been taken up by about forty selectors, but the total area which has been cropped only amounts to 1,235 acres, and this with uncertain results. The production last year was about 9,000 bushels of grain. The country is thickly timbered with worthless scrub, belah, box, mallee, with isolated clumps of pine and rather inferior ironbark, and is necessarily expensive to clear; so that although some of the soil is good, the uncertain rainfall and initial expenses of preparing the ground for the plough does not appear to promise very speedy agricultural settlement.

The following list of annual rentals paid by lessees of country through which the line passes will in some degree serve to illustrate its value for pastoral purposes :-

Upper Wyalong	1 $\frac{2}{3}$ d. per acre.
Upper Wyalong No. 2	1 $\frac{2}{3}$ d. "
Upper Wyalong No. 3	1 d. "
Buddigower	2 $\frac{1}{2}$ d. "
Mandamah	1 $\frac{2}{3}$ d. "

There is at present a population of about 5,000 or 6,000 on the gold-field, and it is claimed that it will continue to support a population of about 1,000 or 1,500 for some time to come. Up to the present the yield of gold has been under 1,000 ounces. Estimate

Estimate of Traffic.

As I have stated, the abnormal influx of population, accompanied by stores and building material, causes even an estimate of the traffic taken to Temora to be an uncertain guide. During the seven months ending March the sectional earnings of the Temora branch have amounted to £5,830; but it must be borne in mind that this period not only embraced the whole of the wheat and wool seasons, but also the unusual traffic of the gold-field.

The wool and wheat alone yielded nearly £11,000 of through earnings, and whilst the average number of passengers per month during October, November, December, and January booked to Temora was only 182, it reached 1,695 during March, and the goods tonnage also doubled itself.

For the purposes of my estimate of goods traffic, given under the most favourable circumstances, I propose to consider Wyalong as a town which will carry a population of 1,500 people (Temora is said to contain 1,800), and allot a proportionate goods and passenger traffic to that dealt with at the latter station during the normal condition of its trade, and taking into consideration its outlying natural business as a distributing centre.

The clips of wool as per list attached embrace all that it is likely to carry, and possibly more. I have extended the area likely to come in for between 40 and 50 miles from the proposed station site at Wyalong in a north-westerly direction, towards the Lachlan, in order that the proposed line may have the full advantage of any possible traffic.

Of course our competitive rates on the South-western will always tend to induce these clips in that direction, especially in view of local rates on the Temora branch. I have also allowed 250 trucks of stock, but as this is not a fattening country the estimate is more than liberal. The allowance of about thirteen passengers per day, based on a tri-weekly service is also ample. I have allowed for 2,000 tons of wheat.

The rates on goods are based on an extension of existing Temora rates, and assuming that the existing truck rate of £32 10s. will be increased proportionately.

[To Evidence of H. McLachlan, Esq.]

PASSENGER TRAFFIC BETWEEN COOTAMUNDRA AND TEMORA.

Sir, Government Railways of New South Wales, Secretary's Office, Sydney, 17 May, 1894.

During the course of my examination before the Committee yesterday, questions were asked with regard to the passenger traffic between Cootamundra and Temora on the days the railway was not open; and I submit hereunder copy of a wire from myself to local station-master, together with reply in regard to the same.

As bearing upon the exceptional traffic created by the Wyalong rush, I may point out that in January of the present year the total bookings of passengers from Sydney to Temora was 43, but in March the traffic was 708. This is again dropping down, as from the 1st to the 16th of the present month 141 passengers only have been booked.

I have, &c.,

H. McLACHLAN,

Secretary.

The Secretary, Parliamentary Standing Committee on Public Works, Sydney.

Telegram from Secretary to Station-master, Cootamundra.

REPRESENTED there is considerable coach traffic between Cootamundra and Temora on days train is not running; four regular coaches said to be running. Please wire facts at once.

Telegram from Station-master, Cootamundra, to Secretary.

Re coach traffic between Cootamundra and Temora.—No coach running, only double-seated buggy on days train does not run; no accommodation whatever for passengers as all room taken up by mails. Not the slightest foundation for the representations made.

F.

F.

[*To Evidence of E. F. Pittman, Esq., A.R.S.M.*]

REPORT BY MR. EDWARD F. PITTMAN, A.R.S.M., ON THE WYALONG GOLD-FIELD.

Geological Survey, New South Wales, Department of Mines and Agriculture, Sydney, 10 May, 1894.

Sir, I have made a geological examination of the Wyalong goldfield, and have the honour to hand you the following report:—

Situation.

The Wyalong goldfield is situated on the Wollongough Road, about 40 miles in a north-westerly direction from the terminus of the railway at Temora.

Topographical and Geological Features.

The country where the gold has been discovered consists of level plains covered with dense mallee scrub, and occasional belts of ironbark and box, while at long intervals are seen low ridges covered with cypress pine.

The surface of the plains consists to a depth of 2 feet or 3 feet of red and black clayey soils, of Pleistocene age, with ironstone pebbles and occasional subangular fragments of quartz.

The pine ridges in the vicinity of the Government township of Wyalong are formed of hard rocks, consisting of hornblende granite, diorite and felsite, with slates, sandstones, and quartzites, the three latter probably of Upper Silurian age. The hornblende granite, the diorite, and the felsite appear in the form of intrusive dykes, which have burst through, tilted, and transmuted the slates and sandstones, while the diorites and felsites have also intruded the granites. Some of the sedimentary rocks in the surveyed township are garnetiferous; and, generally speaking, it may be said that the rocks over this area show great evidence of metamorphism. About two miles west of the main camp there is a low ridge upon which there is an outcrop of solid micaceous granite. A large lode of quartz with much tourmaline occurs here, and contiguous to it is a narrow belt of pure mica schist. There is another outcrop of solid micaceous granite about $3\frac{1}{2}$ miles north of the Main Camp, near the north-west corner of conditional purchase portion 4, Gagic's selection. In the granitic rocks, hard, white, irregularly-shaped nodules of magnesite (carbonate of magnesia) are occasionally found.

Immediately underneath the two or three feet of Pleistocene clay, which form the surface of the plains, decomposed granitic rocks occur; and herein is one of the most interesting features of the gold-field, for whereas the rocks forming the pine ridges are all of a very hard nature, the decomposed granitic rocks underlying the plains are so soft that no explosives are necessary for mining operations, and all the work of excavation has hitherto been easily done with the pick and shovel. These decomposed rocks are of various shades of grey, yellow, brown, and red, and while some of them have evidently been micaceous granites, others are probably decomposed felsites and hornblende granites, the brown or red colour being caused by the peroxide of iron resulting from the decomposition of the hornblende. It is also probable that the felsites and hornblende granites are of later age than the micaceous granite.

The decomposition of these granitic rocks over such a large area, and to a very considerable depth, is a matter of much interest. It may probably have been caused by oft-recurring inundations of the plains during Pleistocene times. The flood-waters were probably never more than a foot or two in depth, so that the low ridges where the hard rocks still occur were not covered or affected, and as the surface of the granite on the plains became gradually softened by the action of the water and of the atmosphere, successive flood-waters carried down into it carbonic and other acids in solution until the decomposition reached a considerable depth.

Mode of Occurrence and Character of the Reefs.

The reefs are found underneath the Pleistocene deposit in the surface of the decomposed granitic rocks, where they generally appear as narrow threads, which widen out as they are followed down. Occasionally, however (as in Pettaford's claim, Stanley's Blow and others), they are found to be of considerable width at the surface, and as a rule they are then found to thin out, and eventually "make" or widen again as they descend. In fact, the reefs of this district are of the variety known as lenticular reefs, such as are commonly met with in granitic rocks. The quartz has been deposited in fissures in the granitic rocks by the percolation of waters carrying silica in solution. The lens-like form which the reefs have in section is due to the fact that when crystalline rocks such as granites are fractured, the resulting fissure follows a more or less curved, rather than a straight line, and as the fracture is accompanied by a movement downwards of one of the walls, the resulting fissure will consist, not of a space between two planes, but of a series of more or less regular lens-shaped spaces. The formation of these reefs can best be illustrated by laying a sheet of paper on the table and drawing the point of a sharp knife across it in an undulating line, so as to separate it into two portions with curved edges. If one of the curved edges be then moved along the other, several lenticular spaces will be formed.

One of the characteristics of the Wyalong reefs therefore is that they "thin out" and "make" again at intervals, and this variation in width may be expected as a recurring feature in their horizontal course, as well as in their downward extension.

The general course of the reefs is about north 20 degrees east, and as a rule they have an easterly dip. In and around the Main Camp there appear to be at least eight approximately parallel lines of reef following this course. A few others, however, have a north-easterly course, while a few others again, such as The Pioneer, The Dead Rabbit, Bolte's Reef (on Bolte's selection), Saunder's Reef, &c., strike about east 20 degrees north, and have a northerly dip.

Some of the reefs, notably those in Stanley's and Pettaford's claims, are of solid white quartz, containing a considerable amount of mispickel (arsenical iron pyrites), but as a rule they consist of more or less vesicular quartz, much stained with peroxide of iron, and easily broken down with a hammer and gad.

Many of the principal reefs, such as those in Neeld's prospecting claim (Mallee Bull line), Gorman's shaft and others, are characterised by a considerable amount of black oxide of manganese.

Mispickel is of common occurrence in most of the reefs, and in Neeld's prospecting shaft (Mallee Bull line) small quantities of galena and iron pyrites were also seen. Gold can be seen in a considerable number of the reefs. It is mostly of a fine character, and has the appearance of having been set free by the decomposition of pyrites. In several of the reefs, such as Bolte's, Conway's, &c., ironstone nodules occur. These nodules when broken in two are each seen to consist of a nucleus of mispickel (arsenical pyrites), surrounded by an envelope of limonite or brown iron ore (resulting from the decomposition of the mispickel), in which fine gold can be seen freely. In one instance the kernel of one of these ironstone nodules was found to consist of finely crystallised gypsum.

The greatest width observed on the field was in Neeld's prospecting shaft (Mallee Bull line) where, at a depth 35 feet, the reef has a thickness of 5 feet for a short distance, where a change of dip occurs. In Stanley's Blow the width of the reef at the bottom of the shaft is nearly 4 feet, and a similar width was observed in Gorman's reef at a depth of 90 feet. In the latter case, however, it was found that in a horizontal distance of about 10 feet the reef had pinched to a few inches, while on the other side of this point it was making again rapidly. Speaking generally, the reefs may be said to vary in width from an inch or two to several feet.

Inclusions of country rock, known amongst miners as "horses," are of common occurrence in these reefs, and "faults" or "heaves" are also frequently met with.

There is one instance on the field of a reef occurring in a belt of slate. The reef referred to is situated rather more than a mile in a southerly direction from the surveyed township. The belt of slate is here very narrow (about 20 feet wide), and is bounded by dykes of diorite. In the prospector's claim this reef was 15 inches wide, and showed good gold. In Doyle's claim, adjoining the prospector's, on the north it had a width of only 10 inches, at a depth of 5 feet from the surface, but appeared to be very rich; while in No. 2 north, Critten and Party, auriferous stone had also been struck, the reef appearing as a narrow thread and widening out as it descended.

This belt of slate or a parallel one extends through the surveyed township of Wyalong, and is surrounded by intrusive rocks, which have separated it from the main body of sedimentary rocks, the western boundary of which may be seen 4 or 5 miles to the eastward.

Outlying

Outlying Discoveries.

During my visit a rush occurred at a place called the Nine-mile, in the parish of Hiawatha, county of Gipps, about 9 miles in a north-east direction from the Main Camp at Wyalong. Several reefs were discovered here, but very little work has been done upon them. One of these reefs (Gagie's claim) showed good gold, but was cut off by a fault, and they are now driving with the object of recovering the lost or heaved portion of the reef. This reef was also characterised by the occurrence of the nodules of limonite, containing kernels of mispickel, which have already been described. The reefs at the Nine-mile rush occur close to the junction of the main body of sedimentary rocks (just referred to) with decomposed granitic rocks similar to these at Wyalong. Gagie's reef and several others are in the latter formation, but other reefs have also been found in the slate. A small patch of tertiary drift (probably pliocene) consisting of well-rounded pebbles of metamorphosed rocks, occurs on the side of a small ridge at the Nine-mile rush.

On Lange's selection, portion 11, parish of Wyalong, about 4 miles west of the Main Camp, a vertical reef having a width of 4 feet, has also been discovered in similar decomposed granitic rocks. I was informed by the owners, West and Party, that specimens showing gold had been taken down to Sydney from this reef, but on the occasion of my visit I could not see any. Comparatively little work has been done on this reef pending the granting of a permit to mine.

About 2 miles north-east of the surveyed township of Wyalong a reef (the Little Darling) has been discovered by Barker and Party. This was 6 inches wide just beneath the surface, and showed good prospects. Here again, and for a further distance of at least 2 miles eastward, the country consists of the same decomposed granitic rocks covered by pleistocene clays.

About 2 miles to the south of Wyalong on George Bolte's conditional lease, portion 21, parish of Wyalong, is another reef showing good gold. This reef, which is being worked in the prospecting claim by Bolte and Party, bears east 20 degrees north, and dips north 20 degrees west at an angle of about 44 degrees. It is nearly 3 feet wide in places, and prospects well. The formation in which it occurs is again the same decomposed granitic rocks.

Extent of Auriferous area already prospected.

It will thus be seen that the area in which auriferous reefs have already been proved to exist in the same soft rock extends for at least 7 miles in a north and south direction, by a similar distance east and west. Only the central portion of this area, or about 1 square mile, has been anything like systematically prospected; while the outlying discoveries, such as the Little Darling Reef on the extreme east, the Nine-mile Rush to the north-east, West and Party's reef on Lange's selection to the north-west, and Bolte's reef on portion 21 to the south, appear to point to the probability of many other auriferous reefs existing within the area bounded by them.

Difficulties in the way of Prospecting.

The outlying reefs just described must not be regarded as the ascertained boundaries of the gold-bearing area, but merely as the extreme limits to which prospecting had been carried at the time of my visit. The extremely level nature of the country and the occurrence of a continuous surface covering of pleistocene clays renders it a very difficult matter to define the limits of the auriferous area. In fact it is only by digging costeaning trenches or sinking shafts that the presence of reefs can be discovered, and hence it is that prospecting on this field becomes purely a matter of patient and careful work, there being little or no surface evidence to guide the miner.

Credit is undoubtedly due to the Neeld family for the manner in which they have developed the field. They came there without any experience in mining, and their success must be entirely attributed to their industry and determination. The method followed by them was to break and examine any fragment of quartz which they saw on the surface, and whenever they saw colours of gold in the stone they sank through the 2 feet or 3 feet of clay or soil. In most instances they succeeded in finding the reef immediately below, and in this manner they become the owners of some of the most promising reefs at Wyalong. Their example might be advantageously followed by many men whom I saw on the field.

Conditions of Mining.

It has already been stated that, with one exception, viz., where an auriferous reef occurs in slate country, the Wyalong reefs are found in decomposed granitic rocks, and these are so soft that no explosives are required for mining purposes.

In addition to being very easily excavated this decomposed rock appears to "hold" fairly well, or in other words, does not require a very great amount of support in the shape of timbering.

It is evident, therefore, that at present the reefs are being worked under the most favourable conditions for economical mining.

The question as to the limit in depth to which these decomposed rocks may be expected to extend is one of considerable interest, as it will influence in no small degree the future of the field. In Taylor's shaft, which at the time of my visit had reached the depth of 107 feet, no perceptible difference could be observed in the character of the country rock, nor had the reef shown any alterations worthy of note, beyond the variations in width, which have already been alluded to as characteristic of all the reefs on the field. Moreover, I was informed that in a shaft which had been sunk on a selection 4 or 5 miles distant from Wyalong a depth of 192 feet had been attained without striking water, and without getting below the limits of the decomposed granitic rocks. It may fairly be assumed, therefore, that the same favourable conditions as those under which the reefs are at present worked will obtain to a depth of about 200 feet. But, on the other hand, there can be little doubt that the decomposed rock will eventually give place to hard granite, and when this is reached the cost of excavation will be a very much more expensive matter. In addition to this, when the hard rock is reached, it is probable that water will be met with to some extent, and the gold will be found (partly, at any rate) in a more or less complex ore. Much of the gold showing at present has the appearance of having been set free by the decomposition of pyrites, and, therefore, it is fair to assume that below the water level roasting and chlorination, or some analogous process, will be required for its extraction from the sulphurous ores.

Possibility of Alluvial Deposits being Found.

Mention has already been made of the level nature of the country at Wyalong, and the covering up of its geological features by a uniform deposit of pleistocene clays. Owing to these conditions the discovery of old river valleys or alluvial deposits is rendered even more difficult than the discovery of new reefs. Judging by the shafts already sunk, the bed rock appears to come within a nearly uniform distance of the surface around the Main Camp, and there does not seem to be a very good prospect of alluvial drifts being discovered in the immediate vicinity. The field, however, is about 800 feet above sea level, and there is every reason, therefore, to expect that in tertiary times the drainage from this area found its way into deep valleys and deposited therein the gold which was derived from the denudation of the reefs. The search for these old valleys will probably require time and patience, but in the meanwhile it appears to me that one of the most likely looking outlets, viz., between the 16-mile tank and Doyle's claim (south of the surveyed township) has been scarcely prospected.

Source of the Gold.

There is, I think, little doubt that the hornblende rocks may be regarded as the immediate source of the gold at Wyalong. The hornblende granites, as well as the diorites, are probably of later age than the micaceous granites and sedimentary rocks, which they have burst through in the form of dykes. These eruptive rocks when in a molten condition probably carried a small proportion of gold from great depths, and it was subsequently leached from them and deposited in the reefs by the gradual percolation of thermal waters. The occurrence of such hornblende rocks in proximity to gold-bearing reefs is characteristic of New South Wales gold-fields.

Up to the present date 488 tons of stone from Wyalong have been crushed for a total yield of 869 oz. of smelted gold.

Summary.

In conclusion I may state that while the Wyalong reefs may all be expected to vary considerably in width, I can see no reason why they should not be persistent in depth. On the other hand at a depth of 200 feet or thereabouts the decomposed rocks in which the reefs are now being worked may be expected to give place to solid granite, and it is obvious that the cost of mining will then be materially increased, while the gold will probably be more difficult to extract.

In the meanwhile a considerable number of reefs have been proved to contain gold, which should certainly be payable while the present conditions of mining obtain, and there seems to be every reason to suppose that the auriferous area will be considerably extended.

Preparations were being made for the erection of three batteries at Wyalong when I left the field.

I have, &c.,

EDWARD F. PITTMAN, Assoc. R.S.M.,
Government Geologist.

The Under Secretary for Mines and Agriculture.

PARLIAMENTARY

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

RAILWAY FROM TEMORA TO WYALONG.

REPORT.

THE Sectional Committee appointed on the 11th April, 1893, to inspect and take evidence and report on the proposed railway from Temora to Wyalong have the honor to report to the Parliamentary Standing Committee on Public Works :—

That the Committee, accompanied by Mr. Surveyor Kennedy of the Railway Construction Branch, left Sydney by train at 9 p.m. on Wednesday, 11th April, and arrived at Temora at 9.30 the following morning. From Temora they immediately continued their journey by special coach to Barmedman which was reached shortly before 3 p.m. The Committee opened their inquiry at the Court-house, Barmedman, at 7.30 on the same day, when the evidence of local witnesses, which was generally favourable to the construction of the proposed railway, was taken. The Committee left Barmedman for Wyalong early on Friday, 13th April, and arrived at the Government township at 1 p.m. During the afternoon they visited what is known locally as the Main Camp, where most of the present population is located, that place being in close proximity to the principal mines. They were afterwards driven through the outlying district and inspected a number of the more important claims. At 7.30 p.m. the Committee held a meeting at Spring's Hotel, Government township, when witnesses from Hillston and Cargellico were examined, adjourning at 9.30 p.m. until 10 a.m. the following day. The Committee accordingly met at Jacob & Co.'s store, Main Camp, at 10 a.m. on Saturday, the 13th April, and examined several working miners and a number of local and district residents. It seemed to be the general opinion of the witnesses that the mines would give employment for a considerable population for some time to come, and that if the land around Wyalong were thrown open for selection and the railway extended to Wyalong a great deal of land would be put under cultivation. The members of the Committee were driven to the New Rush where new discoveries had been made during the previous week, and they met again at 9.30 a.m. on Monday, the 15th April, at Spring's Hotel, and examined Mr. Plumb, who intends erecting crushing machinery upon the field, and Mr. Cassin, a prominent resident of Barmedman, at present engaged in mining operations at Wyalong. Both these witnesses were in favour of the proposed extension. At 2 p.m. the Committee commenced the return journey to Barmedman. They stayed the night at Barmedman, and left there early on Tuesday morning for Temora. A meeting was held at the Court-house, Temora, at 2.30 p.m., and the evidence of local Government officials showed that the settlement of the district was increasing and that it had received considerable help from the opening of the railway from Cootamundra.

Since the proposed line, after leaving Temora, follows the main road very closely almost all the way to Wyalong, the Committee were able to form a good idea of the nature of the country traversed by it, which presents no engineering difficulties. The country through which it passes is very slightly undulating, covered for the most part with box, and a close scrubby undergrowth with occasional belts of belar and pine until near Wyalong where the mallee is reached. There are also in places clumps of ironbark which if suitable for sleepers will be easily accessible. The soil is mostly a rich red loam, and, according to a report by the Agricultural Department upon a

sample submitted to them by Mr. Surveyor Kennedy, of high chemical and mechanical value. Most of the land which is not in the occupation of large pastoralists under lease has been taken up in blocks of from 2,560 to 7,680 acres, the latter being what are called family selections. Smaller holdings are the exception, because owing to the distance from market and the low price now obtained for wheat it has not been found profitable to cultivate much more ground than will produce sufficient for local requirements; the settlers have consequently turned their attention almost entirely to the raising of sheep. The road travelled by the Committee, although broken in places, is fairly good as far as Barmedman, but would not carry continuously heavy traffic in wet weather. The same may be said of the road between Barmedman and Wyalong, with the exception of about 2 miles, where it passes through gilgai country and is dangerous for wheel traffic. Owing to the sticky nature of the soil it is extremely heavy after rain. It is understood that the Roads and Bridges Department have put in hand the formation of corduroy roadway through the bad country, work which is rendered necessary by the ceaseless traffic to and from the gold-field.

Temora, the present terminus of the western Cootamundra branch railway, came into existence with the discovery of gold on Temora station, and is now supported by the settlement which has continued after the exhaustion of the alluvial deposits, and the failure of the few reefs which were regarded as likely to be payable. Since it was decided to extend the railway to Temora, there has apparently been a steady progress in the business of the town and the development of the surrounding district. Local statistics disclose the fact that during the last twelve months the population of the place has grown from 1,500 to 1,700, while the area under wheat has somewhat increased and is still increasing.

The first place of any importance that the proposed railway will serve is Barmedman, a small township 23 miles from Temora. Some years ago, the discovery of gold-bearing quartz there led to the expenditure of considerable sums upon mining operations in its immediate neighbourhood, and the erection of a crushing plant of 25 stampers, which is now used principally in crushing stone sent to it from Wyalong. The town, however, has until recently been supported chiefly by the surrounding stations and selections.

Wyalong, which will be the temporary terminus of the proposed extension, can hardly yet be called a town, although buildings are being speedily erected in all directions. It has at present a population of about 5,000. With regard to its prospects as a gold-field, the evidence of experienced miners confirms the opinion freely expressed by local residents and endorsed by the Chief Inspector of Mines, that even should no further discoveries be made, remunerative employment will be found for upwards of 1,500 people for a considerable time to come, though sufficient work has not yet been done to enable anyone to speak confidently as to the permanency or otherwise of the reefs. So far eight parallel reefs have been discovered, distributed over an area of about a mile in width by 5 miles in length. Further discoveries have also been made at a place called the New Rush, 7 miles to the north of Wyalong, though as the reefs there have not been opened up to any extent the character of the find remains doubtful. Rumoured discoveries have also been made in other directions. In the mines in which the reef has been followed to any depth the stone has been found to be of varying thickness, though in no case does the reef exceed 2 feet in width, the average being from 8 to 12 inches, and the crushings have produced from 2 oz. to more than 4 oz. a ton. About 200 tons have been carted to and crushed at Barmedman up to date, and have yielded 670 oz. of gold. It is expected that a similar quantity of stone which is now at Barmedman awaiting treatment will give even better results. The soil in and around Wyalong is similar to that which has already been described, and it is estimated that it could be cleared and put under cultivation at a cost of from 30s. to 40s. per acre. Much of it, if available, would be readily taken up, and it is thought that many of the miners would form homesteads, and thus even should Wyalong not prove to be a permanent gold-field, an industrious and desirable class of selectors are likely to become permanently settled near the recently surveyed township. It may be incidentally mentioned that the prices of provisions in the district are very moderate, so that the cost of living is less than in the metropolis.

Although

Although the discovery of gold, and the sudden rush of large numbers of people to Wyalong have brought about a great development of trade in the district, it would be premature under existing circumstances to construct a railway simply to serve Wyalong.

The Committee are of opinion that the proposed grade of 1 in 100 could be obtained with scarcely any cutting, that sleepers could be procured near the line at a minimum cost, and that the railway is one which could be very cheaply constructed. Having regard to these considerations and to the agricultural and pastoral capabilities of the country which the proposed railway will serve, the Committee feel justified in recommending its construction, if viewed as a section of a main line to the Lachlan at Hillston, *via* Cargellico; but they consider that the question of ultimate extension to the Lachlan should first be decided. Unless it be the settled policy of the country to extend the Cootamundra-Temora branch to the Lachlan, the Committee feel that their recent inquiry would not justify them in recommending the immediate adoption of the proposal now under consideration.

In connection with their suggestion that the proposed line should only be constructed as part of the main railway to the Lachlan, the Committee would point out that much of the traffic from the stations beyond the Lachlan now going to Whitton and Carrathool passes into Victoria, and does not appreciably swell the returns of the New South Wales railways.

In conclusion it may be added that witnesses whose holdings would be affected by the railway, readily assented to the equity of applying the betterment principle to the properties thereby benefited.

F. T. HUMPHERY,
Chairman.

Sydney, 24 April, 1894.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

PROPOSED RAILWAY FROM TEMORA TO WYALONG.

[TAKEN BEFORE THE SECTIONAL COMMITTEE.]

THURSDAY, 12 APRIL, 1894.

[The Sectional Committee met at the Court-house, Barmedman, at 7.30 p.m.]

Present:—

The Hon. FREDERICK THOMAS HUMPHERY (CHAIRMAN).

HENRY DAWSON, Esq.

WILLIAM CHANDOS WALL, Esq.

The Sectional Committee proceeded to consider the proposed Railway from Temora to Wyalong.

Henry Becroft Copeland, Esq., Crown Lands Agent and Clerk of Petty Sessions, sworn, and examined:—

1. *Chairman.*] What is your position in the public service? I am Crown Lands Agent and Clerk of Petty Sessions at Barmedman.

2. How long have you occupied that position? Since the 22nd of September, when the Lands Office was first opened here.

3. And previously to that? I was Land Agent at Taree for three years.

4. Then before last September you knew nothing of this district? No.

5. Can you tell us how much land is in occupation between Temora and Barmedman, and, say, within a radius of 10 miles of Temora? There is very little land open for selection between here and Temora. My district commences 6 miles this side of Temora.

6. Well, what settlement is there between Temora and Barmedman? With the exception of a few small blocks, the whole of the land within 5 or 6 miles of the proposed railway on each side is occupied.

7. Has it been taken up in large holdings? As a rule the holdings are large; there are some which have been taken up as special areas of 320 acres, but as a rule they are 2,560 acres.

8. Is there much settlement beyond Barmedman in the direction of Wyalong? No selection has taken place along the proposed line from Barmedman to Wyalong, except in one or two instances where people have taken up land within about three miles of the line.

9. Have you been over the selections between here and Temora? No.

10. Can you speak as to the settlement which has taken place here? No, only as it is shown on the map.

11. You do not know from your own observation whether the land is being used for agricultural or for pastoral purposes? I could not say, though the Police Stock and Crop Report for the Barmedman Division would give a fair idea as to how the land is being used in this portion of the district.

12. Will you be good enough to give us the figures that have been collected? The area of freehold and conditionally purchased land is 49,291 acres. That is, in the police district.

13. *Mr. Wall.*] Is the police district comprised in your land district? Yes.

14. *Chairman.*] Between what points? I cannot speak for certainty as to the area covered by the police district.

15. You cannot say how many miles it goes west and north of Barmedman? Not with certainty.

16. Will you tell us the boundaries of your district? It starts six miles from Temora, and extends south to the parish of Mimosa; then north by west through Buddigower, Drumston, Mildil, Bolygamy, Hiawatha, Wyalong, Mugga, Back Creek, and Binabulla; and is bounded on the east by the Bland Creek down as far as the parish of Moonbucka, and so south.

17. *Mr. Wall.*] How far east of Temora is Bland Creek? About thirty-two miles from the southern boundary of my district. The number of acres under wheat in the district is 1,235, producing 9,072 bushels. The total area held under conditional lease and pastoral lease is 201,315 acres.

18. *Chairman.*] Can you separate the pastoral leases from the conditional leases? There are five pastoral leases, containing 133,500 acres.

19. The rest of the land is conditionally leased? Yes.

20. What stock is raised on the conditionally leased land? I cannot say; but the totals are, 534 horses, 1,262 head of cattle, and 145,391 sheep.

21. You cannot say how many sheep are owned by the pastoral lessees? Yes, 92,565.

22. Can you give us similar information with regard to cattle and horses? Yes; there are 140 horses and 650 head of cattle on the pastoral leaseholds.

23. The balance would be on the selections? Yes.

24. How much land has been taken up in your district since you have been here? Eight conditional purchases, having an area of 1,658½ acres, and seven conditional leases, having an area of 3,796 acres, or altogether 5,454½ acres. The total amount of revenue collected between the 22nd of September, 1893, and the 31st March, 1894, amounts to £9,458 15s. 9d. According to the census returns, the number of sheep in the district is 194,466.

H. B.
Copeland,
Esq.
12 April, 1894.

25. Have you been over the country between Barmedman and Wyalong and Wyalong and Lake Cargellico? I have been from Barmedmen to Wyalong; but I only know the country along the road.
26. *Mr. Wall.*] The proposed railway passes right through your district? Yes.
27. What is the distance from your north-east boundary to the proposed line? About 30 miles.
28. And from your south-west boundary? About the same distance.
29. Can you furnish the Committee with any information as to the approximate quantity of land available in your district within 20 miles of the proposed line? Of course, all the leaseholds will be available next year.
30. Is the whole of the land marked white on the plan leasehold land? Yes.
31. Do you know whether preparations have been made in the district, since the construction of the railway to Temora, to bring land under cultivation? Only from hearsay.
32. What is the nature of the information which you have received? Several selectors have prepared land to grow wheat next year, and others are extending their area.
33. Have any large contracts for clearing been let in the district, to your knowledge? Not to my knowledge.
34. This is not essentially a wheat-growing district at present? No.
35. The area under cultivation does not represent the maximum contained in any one conditional purchase? No.
36. Can you tell the Committee how much of the resumed portion of the runs it represents? No; I cannot.
37. The area is not indicated on the map? No; of course the conditional purchases and conditional leases have been taken out of the resumed area.
38. You are not in a position to say what amount of land in your district, within 20 miles of the proposed line, is available for conditional purchase--that is, irrespective of the pastoral leaseholds? Comparatively speaking, very little. Since I have been here I have had several inquiries for land situated within the leasehold area.
39. Have you any information about a gold-mining reserve of 50,000 acres in the vicinity of Wyalong? Yes.
40. Before the land was reserved was it available for selection, or has it been taken out of the leasehold area? Within the parish of Wyalong the land was open for selection.
41. Then this reservation locks it up? Yes.
42. I suppose you are aware that the Lands Department propose to reserve a mile on each side of the proposed line from Temora to Wyalong? The land has been reserved between Temora and Barmedman.
43. But between Barmedman and Wyalong? There will be no need to make a reservation, because the railway will run through the leasehold area.
44. Does the amount of revenue which you have just given us represent the total annual payments, or are there any arrears due in respect of conditional purchases? Some of the payments are due and overdue; but, as a rule, the land has been paid for up to date.
45. *Mr. Dawson.*] In what position was the land at Wyalong before the reservation? The parish of Wyalong was open for selection.
46. That is 50,000 acres? Yes.
47. Has this been a favourable season for wheat here? I should think so; but I could not speak from my own knowledge, because I know nothing about it.
48. The season has been fairly wet. Do you know whether the crops were spoiled? I have not heard of such a thing.
49. Do you not think that an average of $7\frac{1}{2}$ bushels to the acre is very small? I could not say.
50. If this has been a fair season, and the average crop has been less than $7\frac{1}{2}$ bushels to the acre, it would not pay to sow wheat here? The rain only came after Christmas, when the wheat crop was finished.
51. The small yield to the acre may be the reason why there are only 1,235 acres under cultivation here? Well, that is all the land under cultivation. I should like to add, in regard to a previous answer, that the stock returns I quoted do not comprise Mimosa, West Mandemah, Kildare, Buddigower, Ariah, Bygo, Yalgogrin, Bolygamy, and ten or twelve other stations.

Mr. Joseph Charles Wentworth, storekeeper, Barmedman, sworn, and examined:—

Mr. J. C.
Wentworth.
12 April, 1894.

52. *Chairman.*] How long have you been in Barmedman? I have been about fifteen or sixteen years in the district, and it is going on for three years since I settled in the town.
53. And before you came here? I was living on Barmedman station.
54. *Mr. Wall.*] What has been regarded as the principal industry here? Pastoral pursuits, until within the last eight or nine years.
55. Are there many small holdings in the district? Yes; a good few.
56. Can you give us the number approximately? No; I cannot.
57. I suppose all the selected land is comprised in small pastoral holdings? They are hardly pastoral holdings.
58. Has much of the land in the district been alienated in the interest of persons holding large pastoral leases? I do not think so.
59. You think all the settlement has been *bonâ fide*? Yes; a great number of the selectors have been *bonâ fide*.
60. What is the average crop which the land here is capable of producing? With a fair season, I should think about 15 bushels to the acre, on the average. I do not think that that is an over-estimate.
61. How long have you known land in the district to be under cultivation? I know one paddock within 3 miles of this place which has been under cultivation for over twenty years.
62. What has been its average production? I could not tell you. As a rule the crop has been used for hay, though last year it was stripped.
63. What did it give last year? Of two paddocks at this particular place, the lowest yield was something like 15 bushels to the acre.
64. Can you give the Committee any idea of the average cost of clearing land for cultivation here? I let a contract for another person not long ago for 15s. an acre. It was certainly old ringbarked country; but the men had to clear it fit for the plough, grubbing out the stumps so that the plough could go 6 or 7 inches deep.

Mr. J. C.
Wentworth.

12 April, 1894.

65. How long must the timber have been rung before you can let a clearing contract at prices ranging up to £1 an acre? Three or four years, I should say.
66. What is the cost of ringbarking? On an average I should think 1s. an acre. That does not include cutting away the scrub and undergrowth.
67. For how much could you bring the land about here under cultivation, and what time would it take? Supposing you commenced to-day and finished four years hence, I should say that, taking the whole of the district within a radius of 10 miles, the work ought to be done for £2 an acre. That is taking in the mallee and everything. It might cost a little more.
68. Do you think the construction of the railway will bring much land under cultivation? I do. I have heard a great number of selectors say that if they had the means of getting their wheat to market they would put in a great deal more than they have put in hitherto. This year there has been a great deal more clearing.
69. What has been the effect of the construction of the Temora line;—have any large contracts for clearing been let in the vicinity of Temora or on the Sydney side of it? I do not know much about Temora; but I know that a large quantity of land in this district has been cleared within the last few months which would not have been cleared had not the railway been brought to Temora.
70. But according to the land agent here there are only about 1,200 acres under cultivation in the whole district? I heard what Mr. Copeland said; but I know that one man within 2 miles of the town has a 200-acre paddock, and another man has 100 acres, under cultivation. There is only a road between them.
71. What number of sheep will the land carry to the acre, taking an average? On the Barmedman run they have something like 30,000 sheep, besides cattle and horses, and I think they are only using about 40,000 acres. Then on Wyalong No. 3, I do not think they can have more than 20,000 acres, and they carry 20,000 sheep. I believe that this year they leased some land.
72. Do you regard this as fairly good pastoral country? There is no doubt about its being good, sound country.
73. If that is so, is it not more likely that the land will be held for pastoral purposes than that it will be brought under cultivation? No, I think it would be more profitable to bring it under cultivation. It is only the distance from railway communication that has prevented cultivation. For instance, up to last year at Barmedman station they only grew a bit of hay for themselves; but last year they had something like 70 acres under wheat, and that they stripped, and sent the wheat to be made into flour. This year they have cleared another 70 acres; but that would not have been done had the railway not been brought within 23 or 24 miles.
74. Are any other crops besides wheat grown in the district? Yes; oats have been grown, though wheat is the best crop here.
75. Is there much business connection between this place and Lake Cargellico? No.
76. There is a considerable pastoral population located between this place and Lake Cargellico? Yes.
77. And the construction of the proposed line would command the whole of the traffic? No doubt. There are a great many selectors to the north of Wyalong who would be prepared to go in largely for cultivation if they could be brought near a railway.
78. Having been for some time engaged in pastoral pursuits here, can you say what quantity of land in the resumed area was available for selection when the division of the runs took place? A large amount.
79. Has much of that land been selected since? Very nearly all of it, I think, immediately round here. Take Barmedman run, for instance.
80. Can you give the Committee any information as to the number of people that have been employed here in connection with the mines? There have not been a great number of late years; but a few years ago, when the Barmedman United Gold-mining Company was in full swing, a large number of men were employed here.
81. How long was that company in full swing? For three or four years, perhaps more.
82. I suppose you are aware that the company spent £16,000? I do not know what they spent here; but I believe it was a fair sum.
83. You cannot give the Committee any information as to how much they got out of the mines, or whether they were maintained by contributed capital brought here? No; but I know that a large amount of gold has been won here.
84. At the present time the mines are not working? They are working about 1½ miles out on the proposed line from Temora to Barmedman—I refer to the Princess Edith Company.
85. The mining population here is not sufficient to justify the construction of a railway? Not at the present time.
86. The railway must depend for traffic upon the development of other local resources? Barmedman, as regards mining, is not at its worst. Every man that could possibly get away has gone to Wyalong. The people working on the Hill when Wyalong broke out threw down their tools and went right away. One small crushing just before that time won 4 oz. to the ton.
87. I see, on referring to the evidence given in connection with the inquiry into the extension of the line to Temora, that the number of men then employed here was very limited? It would be, about then. During the last four or five years the number of men employed here has considerably diminished.
88. Why is that;—is it because of the inability of the mine-holder to cope with the water in the mines? Partly that, and partly because of the want of means.
89. You have some knowledge of the character of the reefs that have been worked here? Very little. I am no miner. The general report is that they have left good stone under the water.
90. *Chairman.*] Can you speak generally as to the progress of the district, confining yourself to the period subsequent to the recommendation of the Temora line in 1890? The district has improved since that.
91. In what respect? In an all-round manner. There is more population here, and we have had four or five very good seasons, which have helped us along.
92. Has more business been done in Barmedman? Yes.
93. Was that so before the Wyalong rush commenced? Yes.
94. Has the population increased? It must have done so, from the number of selectors who have come here during the time.
95. Do you know if the number of stock has increased? It must have done so.

- Mr. J. C. Wentworth.
12 April, 1894.
96. Do you know, as a matter of fact, that it has? Yes.
97. Are you familiar with the holdings of the various selectors in the district? With some of them.
98. Can you say what area of new land has been placed under cultivation since the railway was opened last year? Yes; I know of one paddock containing nearly 100 acres which was placed under cultivation.
99. I mean, speaking generally; I do not want you to specify any particular selection? I should say that immediately round about here, there were 400 or 500 acres of new land cultivated last year, if not more—that is, within 8 or 9 miles of Barmedman.
100. Have the settlers any difficulty in conserving water? None whatever, if they make tanks. I do not think there is better country in the Colony for holding water, if you make the tanks deep enough.
101. Do you know of any permanent water in the district? Yes.
102. Where? Three miles to the south-east you get springs. Certainly they are very small ones; but they are permanent. There is one spring at Trungley, 7 or 8 miles from here, which I do not think has ever been dry. I have known it for sixteen or seventeen years, and it has never been dry in that time.
103. When did the Fiery Cross Mining Company cease operations? I could not tell you.
104. Before you came here? Before I settled in the township.
105. Is the Hard-to-Find Mining Company still carrying on work? That is what we call the Princess Edith Company.
106. How many men are employed there? I do not know; but there must be over twenty men there, including those out in the bush getting firewood.
107. Mr. Wall.] Mostly, when people have selected in this district they have had to conserve water, have they not? Yes; unless they took up land on which tanks had been put by the run-holder, and for which they would have to pay compensation, which would come to the same thing.

Mr. Patrick McRoberts, pastoral lessee, Barmedman, sworn, and examined:—

- Mr. P. McRoberts.
12 April, 1894.
108. Chairman.] How long have you been in the district? Eight or nine months.
109. And previous to that? I was residing in Sydney.
110. Mr. Dawson.] Can you give us any idea as to how the proposed line, if constructed, is to earn enough to pay interest on its cost? I believe it will open up land suitable for cultivation, but I think it will mainly depend upon the Wyalong gold-field and the intermediate traffic. I think they will get gold right along here. That is my opinion from the inquiries I have made.
111. Have you any personal knowledge of gold mining? I have had a good deal to do with it, but I have not seen very much of it in this district. When last I was at Wyalong I looked more into the mining going on there than I have done since I have been in the district. I was there about five days.
112. I suppose all the wool in the district goes to Temora? Yes.
113. Do you not think that a station 25 miles from a railway is fairly well served by it? A station in such a position would have nothing to grumble at, and I have known people to send in wheat from a much greater distance and not grumble. Personally, I am served well enough; but I think the railway would be a good thing for the country. It would open up a lot of land.
114. You have heard that the average wheat production of the district is not quite $7\frac{1}{2}$ bushels to the acre? Yes; but last year the season was bad.
115. Mr. Wentworth said that on the average it would take about £2 per acre to clear this land fit for the plough? It all depends upon the timber upon it. If it has been rung for six or eight years, and the fire will run through it, you can get the work done for about 15s. an acre; but where the timber is green I should be sorry to take anything like that.
116. Could the clearing be done for £2 an acre? I do not think it could be done for £2 an acre.
117. Of course you know something about the price of wheat? Yes. This year it was very low. I think that was because of the over-production.
118. Then, even if you get a railway, how are you going to make a wheat crop pay? I could not answer that question.
119. I suppose you know something of the country between Temora and Cootamundra? Yes; I have seen a little of it.
120. I suppose that is equally good, if not better, land than the country between Temora and Wyalong? In my opinion, yes, for agricultural purposes.
121. Can you tell us why that land has not been put under cultivation for wheat? I think I can, though I am only giving you my experience. My opinion is that it is because they cannot get a price for wheat. It seems to me that every year wheat gets cheaper. Last year they wanted to buy wheat here for 2s. 7d. a bushel, landed in Cootamundra. I had no wheat to sell, but a traveller called at my place and told me that he was buying wheat at that price.
122. Do you think it at all probable that if the proposed line were constructed any land would be put under wheat? Yes.
123. How much land do you think would be put under wheat? I could not say. I have heard people speaking about putting more land under cultivation.
124. Can you give us an idea of the probable yield within a few hundred bushels? No; I could not give you an idea as to what it would be.
125. Do you think there would be enough wheat grown to pay anything like interest on the proposed line, supposing it were made for £2,000 a mile? Well, it would not depend upon the wheat alone, because there would be the station produce and all that.
126. How much wool would be sent from here? Last year I sent a little over 57 tons.
127. It costs 2d. a mile to send wool from Temora to Cootamundra? Something like that.
128. Where would you load your wool? At Barmedman.
129. Suppose you sent away 60 tons, the freight on that for 23 miles would be about 4s. per ton, or £12 altogether—that is all the railway would get out of you? But there would be the things that I should get up by it.
130. Would you bring up 60 tons? No, I should not; but you must remember that there are others who would send away more than I send.
131. The interest on the cost of the line would be £5,000 a year, so it would require 500 people to send 60 tons over the railway each way to meet that, without paying working expenses; do you think anything

thing like that could be done? Putting it in that way, I do not think it could; but of course if the Wyalong gold-field turns out to be permanent, there will be a great amount of traffic there.

132. We want to get evidence as to whether it is going to be a permanent field or not? Well, if the Government do not make a railway they will have to put the road in repair. I do not know what it is like between here and Barmedman; but to put it in repair between here and Wyalong would cost more than half of what it would take to build a railway.

133. But a road would not produce revenue? No.

134. Of course the passenger traffic on the proposed line would be nothing at all, except so far as Wyalong was concerned? I cannot say what it would be like; but I do not think it would be very great.

135. I understand that you have to conserve water here? Yes.

136. That is easily done? Yes, you cannot beat this for holding country.

137. How many sheep have you here? About 22,000 I think.

138. And they cut a good fleece in sound country like this? Yes, very good.

139. Do you send many fat stock away? Yes, we send a good many.

140. If you had better means of communication with the metropolis, would you be likely to fatten and send away more? That would entirely depend upon what the market was like. If we had the Sydney market, the railway would not keep us from sending the stock.

141. Is the country between here and Wyalong similar to that between here and Temora? I have not been along the road to Temora. I go from Trungley to Temora.

142. But is there not a great similarity in all this country? Well, on the road from Trungley to Temora the country is very different. It is not so scrubby.

143. Is there much ironbark between here and Wyalong? Not that I know of, immediately on the line; but there is off it.

144. Good ironbark? What I saw was very fair. There is an ironbark ridge down here, I believe.

145. You have no idea as to what sleepers would cost, I suppose? No; but I think you could get them pretty reasonably.

146. It is proposed, instead of having square sleepers, to have half-round sleepers. They could be got much more cheaply? Yes, a great deal more cheaply than the sleepers we have been using hitherto.

147. Do you think an extension of the present line on through Wyalong to Cargellico and Hillston would constitute a main trunk line by which this portion of the country would be fairly well served? Yes; I do.

148. Have you any personal knowledge of the character of the country towards Hillston;—is it reputed to be good pastoral land? It is reputed to be very good pastoral land all the way pretty well. It is many years since I was on the Lachlan, but I know it to be good pastoral country.

149. If the line were constructed, do you think it would interfere with the renewal of the pastoral leases? I could not say.

150. Has there been any agitation in the district against the renewal of those leases? Not that I am aware of; but there may have been.

151. I suppose you are aware that it is a vexed question whether any renewals should take place in the western and central divisions? Yes, I am aware of that.

152. Can you say whether the small holdings carry more sheep proportionally than the large holdings? I do not think they do.

153. Do you think this country would be more profitably occupied if held in areas of 2,560 acres than if held in areas of 10,000 acres? I do not think the areas ought to be less than 2,560 acres, because in this part of the country, after a bit, most of the people will go in for pastoral pursuits.

154. If the Wyalong gold-field proves a success, do you think it will have the effect of settling an agricultural population along the proposed line? That I could not say.

155. The settlement of an agricultural population between Temora and Barmedman would depend upon the cancellation of the leases? It would depend a good deal upon that.

156. Of course people cannot select upon the leasehold area? Not at the present time.

157. And most of the land is held under lease? Yes.

158. Therefore the expansion of the agricultural industry will depend upon the non-renewal of the leases? Exactly; but then, again, there is any quantity of land to be improved at present under the same conditions—thousands of acres.

159. The land agent informs us that there is very little land available here for settlement? The land is taken up, but it is not cultivated.

160. The land is held under lease? Yes; but there is a lot of land that has been selected.

161. But the selection area could not be increased unless the leases were cancelled? Certainly; there is not much other land available.

162. Therefore, unless the leases were cancelled the population of the district could not increase very much? Not very much.

163. Do you think that the discoveries at Wyalong are likely to be of a permanent character? Well, I cannot make out the formation of the reefs. Most of them are jumbled up. There are two or three good claims there, but they have not run into a reef yet. They call them reefs, but I never saw reefs like them.

164. How many reputedly payable claims were there when you were at Wyalong? I believe there are eighty.

165. They have not all crushed, I believe? No.

166. Have you any knowledge of the present population of Wyalong? They compute it at from 7,000 to 8,000.

167. Are there many leaving the field? Yes; lately a good many have left for the new rush, 7 miles from Wyalong.

Mr. Herbert Bertram Christie, manager of Wyalong No. 2 Station, sworn, and examined:—

168. *Chairman.*] Who are the owners of the station managed by you? Mr. T. F. Knox is the owner.

169. What is the area of the run? About 19,000 acres of leasehold and about 5,000 acres in the resumed area.

170. Have you any freehold? Yes, about 1,200 acres.

171. How many sheep do you carry? At present we are carrying very few. It is not advisable to carry many with the number of people there are roaming about the paddocks.

Mr. P.
McRoberts.

12 April, 1894.

Mr. H. B.
Christie.

12 April, 1894.

- Mr. H. B. Christia.
2 April, 1894.
172. What is the carrying capability of the station? Well, there is a great deal of mallee upon the run, but I think it will carry a sheep to 2 acres.
173. What distance are you from the nearest railway station? We are 37 miles from Temora.
174. Do you send your wool there? Yes.
175. Before the line was opened to Temora, where did you send it? To Cootamundra.
176. How long have you been in the district? Three years.
177. And before that where were you? In the Cobar district.
178. How long have you been engaged in pastoral pursuits? For nearly ten years.
179. Can you speak as to the progress of this district since you have been here? I think considerable progress has been made in the last three years.
180. In what respect? The country is far more settled now. The greater part of Wyalong No. 2 has been selected since I have been here.
181. Has there been any very considerable increase in the population? I think so. I think that most of the selections to the north-west of Wyalong have been taken up within the last four years.
182. Can you say that the settlers are in a fairly prosperous condition? I think a great number of them are.
183. Are they putting their land under cultivation, or are they combining pastoral with agricultural pursuits? They are combining pastoral with agricultural pursuits. A good number of them have started putting in crops.
184. Would you like to make a statement to the Committee showing reasons for the extension of the railway from Temora to Wyalong. No, though I am quite willing to answer any questions.
185. Have you considered in what way the railway could be made to pay working expenses? No, I have not. I do not know what the line would cost or what the working expenses would be.
186. Have you noticed whether the traffic between Temora and Barmedman has increased since the railway to Temora was opened? I live between Barmedman and Wyalong, so I could not say much about the country between Barmedman and Temora.
187. Do you know anything of the mining that has been carried on in this district during the past three years? No, I know nothing about mining.
188. Mr. Wall.] Can you tell me what was the extent of the resumed area of your run at the time of the division? I think about 19,000 acres.
189. Then about 14,000 acres has been selected there? From 12,000 to 13,000 acres have been selected there.
190. Can you give me any information as to the grazing capability at which your run was appraised? No; I have no knowledge on the subject.
191. Have you any knowledge of the country between Barmedman and Cargellico? I know the country from Barmedman to about 12 miles the other side of Wyalong—that is, I know portions of it.
192. Is it all regarded as good pastoral land? I think a lot of it is more suited for agriculture; but there is a large area of country on the Bland and Lake Cowal which would all be served by the railway, and which I suppose is second to none in Australia for pastoral purposes.
193. You cannot give us an idea of the value of the coaching traffic between Barmedman and Temora? No, I cannot.
194. Mr. Dawson.] If the railway were taken to Wyalong, would it get any of the Bland traffic? I think it would get a considerable amount of the traffic from there and from Lake Cowal.
195. I see that Forbes is 40 miles and Wyalong 22 miles from Lake Cowal? Yes.
196. How far would Wyalong be from the Bland country? Ten or fifteen miles.
197. Where does the wool from the Bland go to now? The greater portion of it would go to Young.
198. How far is that? Young is about 60 miles from Marsden.
199. How far would that be from Wyalong? About 40 miles. The Marsden traffic if it goes to Young now would then come to Wyalong.
200. Then the Wyalong railway, if constructed, would only take traffic from the Young line? You might say of any line that it was robbing some other line; but a railway to Wyalong would give much better communication to the district.
201. Where does the Lake Cargellico wool go to? I know that a great deal of that wool goes to Temora.
202. And would be carried by the proposed line? Yes.
203. A good deal of wool comes from Lake Cargellico and Lake Cowal? I cannot speak as to Lake Cowal; but a tremendous lot of wool comes from Lake Cargellico.
204. And that wool would come to Wyalong if the railway were taken there? Yes, all the wool from Bolygamy, about 20 miles from Wyalong, comes to Temora now, and would be carried by the proposed line.
205. Do you think the people here would be satisfied with a light line of railway over which trains could travel at a speed of from 10 to 15 miles an hour? I think they would be only too glad to get such a railway, if they could not get a faster line.
206. If a line costing from £2,500 to £3,000 a mile, upon which trains could run at the rate of 15 miles an hour, were constructed, would that serve the traffic for seven or eight years to come, allowing for a great increase in the wheat production? Not if the Wyalong gold-field went ahead. They would want faster trains then. What speed do they travel at on the Temora line?
207. About 22 miles an hour, I believe? I think that would be ample.
208. But suppose Wyalong turns out to be, what in mining parlance is termed, a duffer? At any rate the line would open up a large area of country.
209. And will cause a great increase in settlement? I think so.
210. If Wyalong turns out to be a good thing the line must pay at once, because the passenger and goods traffic will be very considerable, independent of the outlying country? Yes.
211. Chairman.] Is there much cultivation at present on the Bland and Lake Cowal? No. What I know of Bland country is not very suitable for agriculture. It is good fattening country.
212. What about Lake Cowal? Part of that is very good agricultural land.
213. But it is not at present under cultivation? No, not at present.
214. Mr. Dawson.] I suppose that is from want of a market? The distance from market is too great.
215. Mr. Wall.] If the proposed railway is constructed, do you think the holders of land within a certain zone would be willing to pay 75 per cent. of the cost? No, I do not.

216. You think they would object to pay such a tax? Yes, most strongly. I do not think they would be able to pay it. Mr. H. B. Christie.
217. The payments would extend over sixty years? Yes, but I do not see where these men could find the money to pay more than they are now paying. 12 April, 1894.
218. Do you think they would regard it as unreasonable to be charged freight, and at the same time to have to pay three-fourths of the cost of the line? Certainly. We must have carriage pretty low to make the production of wheat payable.
219. *Mr. Dawson.*] You think it right that the State should make a railway through your property and through mine, and that we should pay nothing in return? I do not think property here would be benefited anything like 75 per cent. by the construction of a railway.
220. Supposing it increased 50 per cent. in value, should not part of that increase be returned to the State? That might be fair; but at the same time the man who is employing labour to put in crops is benefiting the State more than the State is benefiting him. I think it is the duty of the State to build railways to open up the back country.

Mr. Denis Byrne, farmer, Barmedman, sworn, and examined:—

221. *Chairman.*] What is your occupation? I combine grazing with farming.
222. Did you obtain your land by conditional purchase? I bought it from a conditional purchaser.
223. How many acres have you? 2,560.
224. Where is your farm situated? About 7 miles west of Barmedman.
225. How many acres have you under cultivation? This year I am putting in about 140 acres.
226. Of wheat? Well, about 10 acres will be sown with oats.
227. How many acres had you under cultivation last year? Seventy-five.
228. And the year before? I have only been about three years in the district. The year before I had 4 acres of hay.
229. What was the result of last year's crop? We got about 15 bushels to the acre.
230. Where did you send it? To Temora.
231. What did you pay for carriage to Temora? About 4d. a bushel, which is about what it costs to send it from Temora to Sydney.
232. Then it costs you, in all, 8d. a bushel to send to Sydney? About that.
233. If the railway were constructed where would you send your wheat? To Barmedman.
234. What would be the cost of taking it to Barmedman? Very little; I suppose about 3d. a bag.
235. Do you keep sheep? Yes; I have about 2,800.
236. Do you send your wool to Temora? Yes.
237. Are you familiar with this district? Yes; I know it fairly well.
238. What portion of it are you familiar with? I know all the land to the west and south-west pretty well, together with the country on the Bland, and out north beyond Wyalong to Bolygamy.
239. That is on the way to Lake Cargellico? Yes; but it would be a few miles off the line.
240. What is the character of the land between here and Wyalong? The proposed line just about divides the agricultural from the pastoral country.
241. On which side of the line would the pastoral country be? To the east and north-east—the Bland country. I have gone 30 or 40 miles to the west, and four-fifths of that country is agricultural land of the best quality.
242. Similar to the land you possess? Yes.
243. Can you give any reason for the low average of production here? The past year was a very bad one for crops throughout the colony generally; but we had a higher average, or at least as good an average, within 15 miles of this place as in any other part of the colony.
244. You heard Mr. Copeland's evidence that 9,000 bushels of wheat were obtained from 1,200 acres of land—a little over 7 bushels to the acre? Yes.
245. But you say that you got 15 bushels to the acre? Yes; and I know of several paddocks that produced more, up to 18 bushels to the acre.
246. In that case a great deal of land must have yielded considerably less than 7 bushels to the acre? I think that that land lies nearer Temora. I know a great many of the farms there, and I do not think they produce anything.
247. Can you give any reason for the failure? There was no rain here until the middle of November.
248. Then why were you not similarly affected? It must have been because of the soil, and we happened to get rain in time to save the crop. In places like this the rain is very patchy. We may get rain, and 5 or 10 miles away there may be none. As it happened, we got a fair rainfall, not enough to benefit the crops as much as they might have been benefited, but sufficient to save them. That was between the 1st and 15th of November.
249. You attribute the success of your crops and the failure of other crops in the district to the partial rainfall? Yes. We had not anything like our average rainfall.
250. Can you say how the earnings of the proposed line would meet the working expenses, suppose the Wyalong gold-field were not permanent? I think the proposed line would encourage agriculture to a very much greater extent than its extension to Temora did. When I came here three years ago, a farmer named Clements had 80 acres under cultivation, and now he has 250.
251. Where is his farm? About 4 miles west of Barmedman.
252. Can you speak as to the effect of the opening of the Temora line upon the country within 10 miles of Temora and on each side of that line? Yes; I think the area under cultivation there has been very much increased.
253. Have you been over that portion of the district recently? Not over the country within 10 miles of Temora.
254. How long is it since you were in that part of the district? Eighteen months.
255. Then I suppose you were speaking from hearsay? Yes. I know that all the land under cultivation round here was put in since the railway was started. I had at first only 6 acres; but when I knew that the railway was coming I increased the area to my present acreage. A neighbour of mine who now has 150 acres had only 5 acres twelve months ago.
256. Are you interested in mining? Not at all. 257.

Mr.
D. Byrne.
12 April, 1894.

- Mr. D. Byrne.
12 April, 1894.
257. *Mr. Wall.*] Were the results you obtained last year sufficient to warrant you in continuing to increase your cultivation area? Yes, if I get means of transit.
- 257½. With the present prices, would you get more from the land by growing wheat than by using it for pastoral purposes? Yes.
258. I presume that a great deal of the wheat here has been grown for hay? Yes.
259. That would account for the small average yield per bushel? A great many of the crops have been cut for hay, and that would reduce the average yield. My experience of several paddocks is that they all yielded from 14 bushels upwards.
260. Have you been in the habit of sending in returns? Yes.
261. I suppose the custom is to state the area actually under wheat and the amount of grain produced, without taking into consideration the yield of hay? Yes.
262. How many sheep do you graze? Since I have been here I have been grazing from 2,800 to 3,000 sheep, together with horses and cattle.
263. Is it your intention to increase the area under cultivation? Yes; I have very good farming land, and it is my intention to go in principally for farming. This year a good deal of land would have been out under cultivation had not the rush broken out.
264. What, in your opinion, will be the cost of making this land fit for the plough? Well, I get my land cleared for £1 an acre.
265. How long had the timber been ringbarked? It was ringbarked by the lessee years ago, and a great deal of it is going back to its natural state.
266. What do you consider the average cost per acre of making land fit for cultivation? Taking green timber and all it would be from 30s. to £2 an acre. In favourable localities you could get it done for 15s. an acre.

FRIDAY, 13 APRIL, 1894.

[The Sectional Committee met at Spring's Hotel, Wyalong Township, at 7.30 p.m.]

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (CHAIRMAN).

WILLIAM CHANDOS WALL, Esq.

HENRY DAWSON, Esq.

The Sectional Committee further considered the proposed Railway from Temora to Wyalong.

Mr. Thomas Pearce, solicitor, Hillston, sworn, and examined.

- Mr. T. Pearce.
13 April, 1894.
267. *Chairman.*] How long have you resided at Hillston? Nine and a half years.
- 267½. Do you desire to make a statement in connection with the proposed railway from Temora to Wyalong, which is likely to form part of an extension *via* Cargellico to Hillston? Yes. I think it is necessary to take the railway to Hillston; but I think it should go direct from Wyalong to Hillston?
268. Without touching at Cargellico? Yes. One reason I have for saying this is that on the Lachlan there is already a great quantity of purchased land, and the remaining Crown land there would naturally be selected, even if no railway is constructed, while the direct line to Hillston would pass through what I believe to be the best agricultural land in New South Wales. At any rate the last 60 miles on the Hillston side would pass through what is unquestionably the best agricultural land, taking into consideration its area, in the Colony. Of course you may get small pieces of land in other places, but taking the area into consideration, it is not to be surpassed.
269. What is the distance from Wyalong to Hillston? One hundred and thirty miles. The whole of the land is good, but on the last 60 miles from Hillston the land is exceedingly good.
270. Is it tolerably level? It is very level, except at one or two places, such as Mona Gap.
271. Do you not know that the country between here and Hillston on the direct route is very rough? No, it is very smooth.
272. Do you not know that a direct line would make a very considerable difference to the grade of the railway? I do not think it would.
273. Have you travelled the whole distance? Yes. Another reason why I think the line should go direct is that the Lachlan country is very heavily infested with rabbits, and the only thing that will destroy them is population. A direct line would open up the land for at least 40 or 50 miles on each side of it, and that land would be immediately taken up by selectors, who would destroy the rabbits and keep them in check. Suppose, however, the line went to Cargellico, and then down the river, it would be impossible for settlers to send grain or hay from the land of which I am speaking, and it would consequently become infested with rabbits, which would breed there and spread all over the Colony. I am not prepared with statistics in regard to Hillston, because I only knew, half an hour before I left, that I was to come here; but I am fairly acquainted with the neighbourhood from my long residence there, and from having been about it a good deal. Last year there were between 13,000 and 14,000 acres under cultivation in the immediate neighbourhood of Hillston, and this year I think the area will be 14,000 or 15,000 acres.
274. What is the crop? Wheat. If the farmers there could get a market for their produce there would be hundreds of thousands of acres under cultivation; but at present they have to send their grain between 70 and 80 miles to get to the nearest station.
275. Which is? Carrathool. The average rainfall for the last four or five years has been fully 15 inches, and the rain, as a rule, is seasonable for wheat, falling in April and May and early in the spring. That starts the wheat and ripens it.
276. Do you know the country between Cargellico and Wyalong? No, I have never been through it.
277. Do you know Cargellico? Yes.
278. Do the conditions exist there which you have described as existing at Hillston? I should say that there was better agricultural land close to Hillston than there is round Cargellico, but the Cargellico land is very good.
279. You said just now that the land between Cargellico and Hillston had been taken up? Not all of it; but a great quantity of it is freehold land.
280. What is it used for? Partly for grazing and partly for farming.

281.

Mr.
T. Pearce.
13 April, 1894.

281. Why do you consider the fact that the country there is already settled a reason for not giving the settlers along the banks of the Lachlan railway communication? I do not say that it is a reason, but I say that to do good to the greatest number the line should go direct. The land on the river has a water frontage and will always be taken up.
282. The people having settled there, should we not give them railway communication instead of denying it to them? Not in my opinion. I think a railway should be made to induce people to go out there.
283. And that those already settled there should be neglected? I do not say that they should be neglected. They would have communication to a certain extent, but in any case population would remain there, because of the river frontage, while the railway would spread population over new country.
284. How would the people at Cargellico be served by a direct line to Hillston;—what distance would they be from it? About 31 miles, which would not be too far, considering that they have a water frontage.
285. Do you think a direct line to Hillston would serve the Cargellico population? I think so, and a direct line would open up far more country.
286. Where is the wool sent to now from stations in the vicinity of Hillston? To Carrathool, which is 80 miles away. The selectors are on the south side of Hillston, and are, therefore, a little nearer to the railway.
287. Do you know the quantity of wool sent from Hillston to Carrathool? No, I am not prepared with the figures.
288. Can you give the Committee an idea of the probable amount of the Hillston traffic if the railway were taken there? A railway would draw all the wool from a considerable distance to the north of Hillston towards the Cobar line, and also from out Mossgeil way, where they have a great number of sheep.
289. Besides wool what else would be sent by the railway? Wheat and live stock. It is utterly impossible in time of drought for stations to get their live stock away under present conditions. The stock routes are always eaten bare, so that the stock would die on the road if travelled along them. With railway communication, however, stock could be sent to market or to the hills where there was feed.
290. When you speak of the hills where do you mean—beyond Cootamundra? Yes, and out Tumut way.
291. You think that the line would be used to transfer sheep in dry seasons? Yes.
292. Do you wish to give any other reasons in support of your suggestion? The strongest reason in favour of a direct line is that it would bring a great number of settlers on to what is very good land. If, however, the railway is not taken direct, the whole of that country will be over-run with rabbits. Wire netting will check the rabbits, but it will not destroy them.
293. If the line were taken *via* Cargellico, would Hillston be served? Hillston itself would be served.
294. Do you know what difference it would make in the length of the line to take it to Cargellico? I am informed that it would make a difference of 10 miles.
295. Do you think that that would make a material difference, when, by taking the line to Cargellico, it would serve two places instead of one? I think a direct line would serve the country better, and would save 10 miles. It would bring population into the district, and be the means of checking the rabbits. The land between the railway and the Lachlan would be filled with selectors, and they would stop the rabbits.
296. Are you not expressing somewhat parochial views;—are you not in favour of a direct line simply because you reside at Hillston? No; I wish to do good to the greatest number.
297. *Mr. Dawson.*] How often do you have droughts in this “best country in New South Wales”? We have not had a drought since 1888.
298. Are the droughts here very severe? The 1888 drought was very severe. There was a failure in the crops then.
299. Have you ever seen the Liverpool Plains? I know the country there.
300. Is this country better than that? From what I have heard, I should say that it was, for agriculture.
301. I mean generally? I would not say that, but there is a greater area of good country here.
302. But how much of the good country is taken up? I do not know exactly. The selectors hitherto have gone entirely for open country.
303. How many selectors are there on this land? Very few.
304. Would not the line you suggest go through any amount of land held by large stations? No; the leases will expire in 1895.
305. Then this land is held under lease? Yes.
306. Do you know if many selectors went on to the land when the leases were divided in 1889? Not very many. Some selectors took up land; but the want of a market for produce prevented others from doing so, and some of those who had taken up land threw it up and left the district.
307. Surely a man could make a living on 2,500 acres of really good country with sheep? The land on this side of the Lachlan is not so suitable for pastoral purposes as the land on the other side of the Lachlan; but it is more suitable for agriculture.
308. Is it lightly timbered? It is heavily timbered with box, myall, mallee, yarran, various sorts of scrub, and a great deal of pine.
309. Is it anything like the Carrathool country? No; it is different country altogether. I resided in Hay for nine or ten years, so that I know the Hay land as well as the Hillston land.
310. Do you not think it would be better, instead of taking the railway direct to Hillston, to serve the people who have already taken up land in the district? No; because if you take the line direct it will run between the selectors to the south and the selectors to the north, while if you take it to the Lachlan the selectors to the south will not be benefited by it, and it will not benefit an additional number of selectors on the north side of the Lachlan, because the land there is not suitable for selection nor available.
311. It is only the land on the Cargellico side that is suitable? Cargellico is on the southern side of the river.
312. Is there a fair amount of settlement between Lake Cargellico and Hillston? Not a great deal, though there is a fair number of selectors round Cargellico.
313. Much more than on the line you advocate? Yes; taking it all through. There are a number of selectors on the last 20 miles of the route which I recommend.
314. How far from the proposed railway? Some would be close to the railway and others would be 30 or 40 miles from it.

Mr.
T. Pearce.
13 April, 1894.

315. You are perfectly satisfied that the railway should be taken from Temora to Wyalong? Yes; that would be a move in the right direction. I do not know much about the country down here, but the line would be coming towards good agricultural land.
316. You are perfectly satisfied that there should be a railway to Wyalong? It is part of the line which should be constructed.
317. Would you sooner have the line taken direct from Temora to Hillston without touching at Barmedman or Wyalong? I could not say. I have travelled from Wyalong to Hillston, and I know that for about 30 or 40 miles out from Wyalong the land is not so suitable for agriculture as it is on the last part of the journey.
318. Although you advocate a direct route, you say that at present there is not much settlement along it, and that the land is not suitable for sheep? It is not so suitable as the land on the northern side of the river.
319. Fifteen inches of rain is not sufficient for wheat unless you happen to get it just at the time you state? I go by the crops that have been grown.
320. What is the average yield per acre? Fifteen bushels was the average last year. I may say that I have grown about 20 acres of wheat for the last three years, and I have never had less than two tons of hay to the acre. One year I had three tons.
321. Suppose the line were made, do you think a yield of 15 bushels to the acre would pay at the present price of wheat? Yes; if that were the average.
322. What price do you get for wheat? 2s. 6d. a bushel.
323. It brings 2s. 7d. a bushel in Sydney and 2s. 1d. a bushel in Melbourne? I believe they were getting something near 2s. 6d.
324. That means that you have to plough, sow, and harvest, for £1 17s. 6d. an acre, and that that would pay you? Yes, it does pay. I have spoken to a great number of selectors, and they are perfectly satisfied if they get 2s. 6d. a bushel. I know one man who has 1,500 acres under cultivation, and who carts his produce 50 or 60 miles to the railway station. He says that if he gets 2s. 6d. a bushel he is perfectly satisfied, and he has done very well so far. He had 1,000 acres under cultivation, last year, and he has put in 500 more this year.
325. What does it take to clear the land? Most of it is easy to clear; but some of it is mallee, and although that is good land, it is difficult to clear. I do not know the actual expense of clearing.
326. Can you get 2s. 6d. a bushel for wheat, this year? I believe that most of them realise something like 2s. 6d.
327. Where is that? By taking it to Carrathool, and sending it on to Sydney.
328. Where do they get the 2s. 6d.—in Sydney? Yes. They get something like that.
329. What would it be to them net? Well, they get a little more in Sydney.
330. It would cost 6d. a bushel to send wheat from Carrathool to Sydney, and I suppose from 4d. to 6d. a bushel to deliver it at Carrathool? But most of them cart it down themselves.
331. But if a man uses his own labour and horses, and gets 2s. 6d. a bushel for his wheat, that is not 2s. 6d. net. His own labour is worth something, and it seems to me, that at that price he would be about 3d. in debt when he had finished? No, they are perfectly satisfied if they can realise 2s. 6d. a bushel, in Sydney, and are able to make ends meet. If the railway went to Cargellico and then down to Hillston, the selectors to the south, who are quite as numerous as the Cargellico selectors, would be in the same position as the Cargellico settlers are now, and the land there would consequently soon become a rabbit warren.
332. Mr. Wall.] I suppose you recognise that this line has not been proposed simply for the purpose of serving Hillston? Perfectly.
333. There is a national object to be gained? Yes.
334. You state that construction of a direct line would open up more country on the banks of the Lachlan? No; it would open up all the country through which it passed. Land on the Lachlan will be taken up because of its water frontage, even if the people have to go some distance to get the railway.
335. Would not a line to Cargellico, and thence to Hillston, afford more facilities to settlers than a direct line? To some extent, I dare say there would be a little more land taken up if the line ran down the Lachlan; but I believe that the land there would be taken up whether the railway were constructed or not.
336. Railways are conducted on commercial lines, and unless there is some possibility of a line paying its expenses it is not the custom of the Government to construct it, nor is it probable that in such a case they will construct this one? That is exactly why I advocate a direct line. I think it would pay better than a line *via* Cargellico. As far as I am personally concerned, I do not mind which way the railway goes. I should like to see an extension from Parkes.
337. To what extent would you consider this back country served by railway communication? It is all according to the character of the country through which the railway passes, and depends upon whether the selectors use the line for agricultural or for pastoral purposes. I should say that if a farmer were within 40 or 50 miles of a railway station he would be near enough.
338. He would be fairly well served? He would be fairly well served.
339. Are you aware that a direct line would be running parallel to and not 35 miles from the Hay line, so that the people you desire to serve are already well served? The two lines may be only 35 miles apart at the commencement; but the distance between them broadens out to about 100 miles.
340. Would not the line proposed by the Department serve the country better? I do not think it would pay as well as the line which I suggested.
341. You advocate a line running almost parallel with the Hay line? It is 50 or 60 miles from the Hay line, pretty well all through.
342. Is the Cargellico land fair for agricultural settlement? Yes.
343. Is there any permanent water in the vicinity? Yes.
344. Is the rainfall there greater or smaller than the rainfall at Hillston? I am not able to answer that; but I should think it would be about the same.
345. What distance would the direct line be from the line proposed by the Department? Thirty-one miles, I think.
346. That would be at its furthest point? I suppose the average distance would be 15 or 16 miles.
347. The proposed Government line would be about midway between the Hay line and the Cobar line, while the line you suggest would only be from 30 to 60 miles from the Hay line? It would run through the best country. As far as Hillston itself is concerned the Parkes line would be the best.

348. You recognise that there is not much probability of a second line intersecting the tract of country between the Cobar line and the Hay line? I do not know about that.

349. Well, assuming that the Department intended to construct only one line to intersect that country, which line would you suggest? I think a direct line would benefit the greatest number of settlers, and therefore pay best, besides there is every prospect of gold being discovered in that country. There are a great number of people at Yalgogrin now; I was there this morning.

350. Do not men always take the best land available? Yes.

351. Then if the land in the neighbourhood of Lake Cargellico has all been taken up, does not that show that it is the best land? No, because selectors will not go out 30 or 40 miles by themselves where they have no chance of selling their produce.

352. Inferentially we must arrive at the conclusion that if they prefer to go 30 miles away from the railway, they regard the land on which they have settled as the best available? They have gone there because the district was already populated. People living there have written to their friends, and thus the land has been taken up in a block. If the proposed line is taken direct, however, thousands of acres of new land will be taken up.

353. Would a greater actual settlement be served by the Departmental proposal than by the line of which you speak? Yes; it would serve a few more.

354. What is the population of Hillston? Roughly speaking, about 1,000.

355. Is it incorporated? Yes.

356. Can you give us any information as to the value of ratable property? I think about £450 a year. That, of course, is exclusive of Government endowment.

357. And is based upon annual values? Yes.

358. Have you a Lands Office there? Yes.

359. Can you give us any information as to the amount of land selected in Hillston during last year? No; I cannot.

360. Is Lake Cargellico within the land district of Hillston? Yes.

361. So that any returns would show the settlement in the vicinity of Cargellico, as well as that in the vicinity of Hillston? Yes.

362. I suppose you recognise that at the present time the people of Hillston are better served by the railway than the people at Lake Cargellico? Yes; I think they are a little nearer the line. I think the Cargellico people go to Whitton.

363. If the proposed railway were constructed, would the freight and passenger traffic pay interest on its cost? I think so. I know that I would take a good many shares if we were allowed to make a light line ourselves.

364. I suppose you are aware that it is proposed to construct this line on what is known as the betterment principle? So I understand.

365. Do you think people would take up land in this vicinity if they thought they would have to pay a proportionate share of the cost of the line? I feel certain that they would be prepared to pay part of its cost; but I do not know how much they would be prepared to pay.

366. The payments would be spread over a very long period, and the tax would perhaps be very small;—do you think there would be any objection to the construction of this line on the betterment principle? I do not think so; I am certain that if the tax is not very heavy, the line will bring a tremendous population here, provided, of course, that the pastoral leases are thrown open when the railway is finished. I would not be in favour of throwing them open until the line is constructed.

367. How far would the country of which you have been speaking be from the Departmental line? The distance would vary from next to nothing to about 60 or 70 miles.

368. If the Department took the line through unsettled country, do you think people would take up land 20 miles from it to avoid coming under the provisions of a Betterment Act? No; because I believe that the increased facilities which they would have if they were nearer the railway would pay any betterment tax.

369. You cannot give any information as to the number of stock in the district of which you have been speaking? No; I cannot.

Mr. James George Carroll, land agent, Hillston, sworn, and examined:—

370. *Chairman.*] How long have you been in Hillston? Over seventeen years.

371. Have you a knowledge of the surrounding country, the extent of the pastoral holdings there, and the number of stock carried? I am not able to tell you the number of stock upon each station; but I know the country for nearly 100 miles round Hillston.

372. You desire to make a statement in connection with this proposal to take the railway from Temora to Wyalong, and perhaps extend it to the Lachlan? Yes, I have been sent here by the people of Hillston and the surrounding districts to advocate their right to a railway. I may tell you that they are not particular what way the railway comes, so long as it suits the greatest number of people, and is a line that will benefit the Colony generally.

373. Do you agree with Mr. Pearce that the line should go direct to Hillston instead of touching at Cargellico? I was not sent here to advocate any particular route.

374. From your knowledge of the country, and the extent of the existing settlement, and having regard to the traffic which would be created by a railway, do you think the Government proposal a better one than that suggested by Mr. Pearce? I must say that the proposed line would benefit more people.

375. Do you know Cargellico? Yes; my knowledge of that district is considerable, because I acted as land agent for them for a number of years.

376. Has the land been taken up in large areas? In 2,560-acre blocks.

377. How much land is under wheat there at the present time? There is not so much at Cargellico as at Hillston. They do not go in for farming so much there, they go in more for stock.

378. The selectors are using their land for grazing? Yes; they do not go in for agriculture so much.

379. Where do they send their produce at the present time? I think they consume it locally pretty well, and a little of it goes out back.

380. It does not go to Sydney? I do not think so. Of my own knowledge I do not know where they send the local produce.

Mr.
T. Pearce.

13 April, 1894.

Mr.
J. G. Carroll.

13 April, 1894.

- Mr. J. G. Carroll.
13 April, 1894.
381. Where does the wool go to? It goes to Whitton. The wool from the other side of Cargellico, out Mount Hope way, also goes there.
382. Do you know the country between Wyalong and Cargellico? I know the country from Cargellico to Merringreen.
383. About how many miles from Cargellico? About 50 miles. It is near the Humbug Creek.
384. Can you speak as to the settlement of that part of the country? There were not a great number of selectors along the road I came, but I understand that towards Galore, and in the Condobolin Land District, there are a number of selectors. I have only been connected with the Hillston District; but I understand that at Galore there are 60,000 acres under settlement.
385. Would they be served by a railway from Wyalong to Cargellico? Certainly.
386. Within what distance of the railway would they be, approximately? I do not know; but they would be served by it.
387. Can you say for what purpose the land to which you are referring could be profitably used? The land from Galore to Merringreen is all yarran country, and excellent country for sheep.
388. Is it suitable for agriculture? Yes, and it is well adapted for sheep.
389. It is better suited for pastoral than for agricultural use? It is suitable for either; but I consider that while there is land better adapted for agricultural purposes, it would be a pity to cut it up.
390. Can you speak as to the land round Lake Cargellico? Yes.
391. Is it superior to this land, or of similar character? It is red chocolate, and they have not much boree on it. The timber is pine, and growth of that kind.
392. Hillston, you say, is now partly served by Carrathool? Yes; it is 80 miles from Carrathool.
393. How many sheep are there within 50 miles of Hillston, the wool of which at present goes to Carrathool? Hillston would serve Mossgiel, which is 60 miles away from it, Ivanhoe, which is 35 from Mossgiel, Whealbah, which is 22 miles south-west of Hillston, and Cooble Station, and all stations between Ivanhoe and Hillston.
394. How many sheep would be shorn in that district? I am not able to say how many sheep they shear; but I should say that they shear over 100,000 sheep at Trida Station, which is considered a very large shed. I cannot say what they are carrying now, but they have carried 100,000 sheep. Mossgiel would carry 150,000 sheep, Willandra, to my knowledge, has shorn over 200,000 sheep, besides running a number of horses and cattle, though it is now being subdivided.
395. Cattle and horses would not help the railway to any extent? Cattle would, because they send fat cattle to Melbourne. I should say that Bundarra Station runs 100,000 sheep, and Merungle about 80,000.
396. Are those the principal stations which would be served by the line? Yes, and there are others. Cowl Cowl, which is on this side of the river, has shorn 150,000 sheep. I have not mentioned half the stations which would use the railway.
397. Are we to understand that the stations you have mentioned would be directly served by the extension of the railway to Hillston? Yes.
398. And the wool would be sent from Hillston to Sydney? Yes; the stations I have mentioned send their wool on to the Hay line, while out beyond they go to Balranald.
399. Would there be an increase of revenue to the railway if the wool was sent from Hillston to Sydney, instead of coming as it does now? Yes; because when they go to Carrathool they can choose between sending by train to Sydney or by steamer to Victoria. Wool passing through Hay goes mostly to Victoria.
400. There would be an increase in railway revenue if the wool went to Hillston? Yes; if it came to Hillston it would have to go on to Sydney, whereas now the greater part of it goes to Victoria.
401. Do you wish to give any other reasons in support of this line? I consider that the land between Hillston and Ivanhoe is equal to any of the land in the Western Division. It is certainly the best pastoral land in that division, and their sheep have for years topped the Melbourne market. Sheep from there have brought as much as 17s. 6d. in the olden times. The wool, too, fetches a good price, coming as it does from very superior land. Portions of that country, too, are well adapted for cultivation. A Mr. Thomas, who has lately taken up land near Hillston, told me that he had travelled a great deal through the Colony, and that he considered that, with the exception of the land round Narrandera, it was the best wheat-growing country he had seen. He had seen Mildura, Wentworth, and those places, having travelled for a land syndicate, but he settled near Hillston, considering that land to be the best he could obtain.
402. How many coaches are there running between Hillston and Carrathool? There are two a week to Carrathool, one to Hay, and two to Booligal.
403. And to Cargellico? There are two a week each way, and a weekly mail.
404. How many teams are there on the road? A great number. One storekeeper stated to the Commissioner that he got up 600 tons of goods in the year.
405. I am speaking of the average number of teams on the road between Carrathool and Hillston? There are a great many; but I could not say how many.
406. Mr. Wall.] How long has your railway league been established? We have been advocating a railway for a number of years.
407. Were any representations made to the Minister prior to the opening of the Wyalong gold-field? There was no deputation, but we have had plenty of communications with the Minister.
408. Can you tell the Committee where the boundary of the Western and Central Divisions would be intersected by the proposed line? The Lachlan is the boundary between the Western and Central Divisions.
409. Then the proposed line would not go into the Western Division at all, though it would serve a large portion of it? Yes; it would serve Euabalong, which is about 15 miles from Cargellico.
410. Would it not serve Coan Downs and the country to the north? Yes.
411. Can you give us an idea of the number of adult settlers that would be served by the construction of this line, taking the population of Hillston, Lake Cargellico, and the intervening country;—what would be the probable value of the passenger traffic on the line? I cannot say. Most people travel in their own conveyances now.
412. Can you give us any idea of the number of people who would be likely to avail themselves of the railway in order to get to Sydney? At Mossgiel there are about 400 people, and about 1,000 at Hillston and just immediately around it.
413. Is that the adult population? No.

414. Can you give us an approximate idea of the number of settlers that would be served by the proposed line? The line would serve every settler already in the district; but I cannot tell you how many there are. I may say, however, that when the land was thrown open by the 1884 Act, the largest area of land in the Colony but one, was taken up near Hillston. Mr.
J. G. Carroll.
13 April, 1894.
415. Can you give us any idea as to the number of people between Hillston and Wyalong, or Cargellico and Hillston, who would be served by the line? I could not tell you how many would be served by it.
416. Has settlement in the vicinity of Cargellico and along the proposed line increased during the last few years? Very little; it has gone off.
417. As a rule, has the land been taken up in the *bonâ fide* interests of those who selected it, or have many of the selectors sold it to the large pastoralists? Latterly not much land has changed hands in that way. I think there are very few selections which are not genuine.
418. Has there been any petition by persons requiring land for settlement against the renewal of the pastoral leases? The feeling has been against their renewal. The people are waiting for a new Land Act which they hope will be more liberal than the last. That is why there has not been much settlement.
419. Do you think that the division of the holdings would have a tendency not only to increase population, but to increase the carrying capacity of the land? Subdivision would certainly increase the carrying capacity of the land.
420. You think that, proportionately, the land held by selectors in the vicinity of Hillston carries more stock than that held by pastoral lessces? Yes. I know one selector with 640 acres of land who runs 800 sheep, and they are now so fat that he can hardly get a poor one to kill. His land has carried over a sheep to the acre because of the subdivision.
421. I suppose you know the old soldier's motto, "Guns overcharged recoil the most"? Well, I know he has been there over twenty years, and is likely to remain there.
422. Can you give us any idea as to the returns received in a year by the Lands Office at Hillston? They have been very good indeed until lately; but there has been a falling off this year.
423. This year has been worse than other years? Yes; very little land will be taken up until a new Act comes into force.
424. You think that the construction of a railway would have a tendency to increase settlement? I am sure of it. If the line is not constructed at an early date a great number of people will desert the back country.
425. *Mr. Dawson.*] If the leaseholds are thrown open to selectors, is there not a great likelihood of the pastoralists securing the whole of them? It would depend upon the conditions under which they were thrown open.
426. Under conditions under which you and I or anyone else could take them up? Not if you had continuous residence, and one man one selection, insisting upon a certain amount of cultivation.
427. Would you hamper selection with all those conditions, and then say that poor people should take up the land? Certainly. If poor people want land, they will put a house upon it and cultivate it.
428. But poor people cannot do all that you refer to? That is how they get a living.
429. Is the man who owns the 800 sheep the only one in the district who has got such sheep? No.
430. More than a sheep to the acre is the general thing in that district? No. The man to whom I was referring has a river frontage. My experience is that sheep in small lots get quiet, and do not run about and lose their condition.
431. Is it the feeling of the people in this district and round about Hillston that all the land should be thrown open? The majority of the people whom I meet are in favour of no renewal of the leases until the public get the first cut at the land.
432. I agree with you that the public should have the land, but do you not think that the pastoralists will get their share along with the others? If you pass workable and liberal Land Acts and construct a railway, you will have any number of prosperous and successful people in the back country. I know people who have used the plough there most successfully, small as is the price of wheat.
433. If the country is as you have described it, and will carry 800 sheep to 640 acres, could they not all live by fattening sheep? The river frontages are so good that a small area of such land is sufficient for a man, but back in the timbered country it takes three or four and perhaps even ten acres to carry a sheep. That land could be profitably cultivated.
434. Would you compel a man to take up land such as that and cultivate it? Yes; because it will grow better wheat with less rainfall than the land nearer the river. Further away the land is sandy and loamy.
435. It must be wretchedly poor land if it takes five acres to feed a sheep? Well, the resumed area of the Cowl Cowl run, which they reckoned to carry a sheep to ten acres was abandoned, but now a man has selected there and cleared the land, and has got a crop of thirty-two bushels of wheat to the acre. This year he got a good crop of wheat and twenty-four bushels of oats to the acre. That land is not suitable for stock but it is suitable for cultivation, and there are hundreds of thousands of acres of such land about Hillston.
436. Is it open? Yes.
437. Then why is it not taken up? Because there is no railway by which to send away produce. I have heard men say, as Mr. Pearce has told you, that they would be satisfied with 2s. 6d. a bushel. I was there before any wheat was grown in the district, and I know that the 1888 crop has been the only one to completely fail. Wheat this year has brought from 2s. 3d. to 2s. 5d. at the flour mill in Hillston, and at Carrathool they get 2s. 7d. for it delivered at the railway station, or at least that is what I have been told.
438. You say that it is really good wheat-growing land, and that if the railway is made, hundreds of thousands of acres will be put under wheat? I consider that where there is one acre now, there would be ten if the railway were made.
439. How many acres are there under cultivation now? They are all taking in fresh land every year. One man who cultivated about 800 acres last year is putting in 1,500 acres this year.
440. Can you tell us what area is under cultivation now? About 12,000 acres this year.
441. Then there would be about 120,000 acres under cultivation if the railway were made? Yes.
442. This land would be held by smaller men? Yes; in blocks of from 1,400 to 2,500 acres chiefly.
443. Is anything else likely to be grown;—how does barley grow there? Barley will grow, but it has not been cultivated there. Oats were put in for the first time last year, but that was a particularly dry year, and I am certain that land which would give thirty-five bushels of wheat last year would give over forty

- Mr. J. G. Carroll.
18 April, 1894.
- forty bushels in a good year. Potatoes and onions grow there, and I think the onions on the Lachlan are the finest in the Colony. Fruit, too, does remarkably well, and the grapes and peaches are equal to anything in the Colony. They are a month earlier than the Albury fruit.
444. Is there any wine-making there? No. There is land on the Lachlan which is suited for vine growing and for all sorts of fruit.
445. Except apples and cherries? Apples grow well at Booligal, and cherries grow well at Hillston, and I think the peaches are equal to anything in Australia.
446. But you do not get cherries and peaches together? I have seen good apples to come from Booligal; but the peaches are equal to anything I have tasted in the best shops in Sydney. The country there is capable of producing anything, and is free from disease. There is no disease among the sheep, cattle, or horses. Now and then there is a little complaint about a horse, but we have neither fluke nor pleura.
447. *Chairman.*] Mr. Pearce expressed the opinion that the railway would be serviceable for the removal of stock in times of drought, is that your opinion? Yes; the stock routes are completely eaten away; they are let and sub-let, and it is really impossible in the summer months to get stock to market. I know men in the back country who, if they move their fat stock, can only get them to market as stores. If there were a railway, however, they could send them to other places where there was grass, or take them direct to market, and get full value for them.
448. *Mr Wall.*] Do you not think it would have materially assisted you if you could have submitted an estimate of the probable inward and outward tonnage on the proposed line? Certainly; but I did not get sufficient notice, and I have been travelling night and day to meet the Committee. Had we got more notice, instead of there being two witnesses from Hillston, there would have been ten.
449. But in making previous representations do you not think that that would have assisted you? The Department have got it all in print. Mr. Gilliat was down there and helped in the inquiry.
450. Have any recommendations been made in connection with the deputations which have waited on the Minister as to the produce of the district? I think so; but I would not be quite sure. We have been working hard in connection with the matter for some time.
451. Have you any statistics at your disposal which you could forward to the Central Committee, in Sydney, giving an approximate estimate of the probable tonnage which would be carried by the proposed line? Yes, we could give that information.

Mr. John Brett, selector, Molonglo, sworn, and examined:—

- Mr. J. Brett.
18 April, 1894.
452. *Chairman.*] How many miles are you from Wyalong? About 30.
453. In what direction? Towards Cargellico.
454. Near the route of the proposed railway? Not far off the direct line.
455. How many acres do you farm? I have a family selection—three selections.
456. How many acres have you altogether? A little over 7,000 acres.
457. How many acres have you under cultivation? I only grow enough for my own use.
458. How much is that? I have about 10 acres under cultivation.
459. How do you use the rest of the land? For grazing purposes; but there is very little grass on it until it has been improved.
460. How many sheep have you? About 4,000.
461. Where do you send your wool? To Sydney.
462. By what railway? From Temora.
463. What do you pay for carriage? It is pretty expensive to Temora.
464. Can you say how much a bale? It used to cost £6 a ton to Coolamon; but we get it taken to Temora for about £4 a ton.
465. How many bales do you send away? Sixty or seventy.
466. That would be 10 or 11 tons? Yes.
467. You would be served by an extension of the line *via* Wyalong to Cargellico? It would be almost immaterial to me which line was made. I consider that this is the very cream of the country.
468. How long have you resided on your selection? About four years.
469. Why have you not put more land under cultivation? Because the produce would not pay for carting away.
470. Did you hear Mr. Pearce's evidence? Yes.
471. It would not pay you to grow wheat? No. I should never have selected, but for the expectation of a national line some day.
472. What is the character of your land? Magnificent country. It wants improving; but it is all limestone country.
473. In what way does it want improving—by manuring? By clearing. The land itself is good. It could not be better land.
474. Is the rainfall sufficient? The rainfall is quite sufficient, but for an exceptional year. The country does not require so much rain as poorer country.
475. Is there much settlement round you? Yes; there is a large amount of settlement.
476. Is the land held in large areas like yours? Yes; it is principally held in large selections, because small selections would not do much good there.
477. Is there much land under cultivation? Not much. It is only cultivated for the use of the selectors.
478. You are nearly all sheep farmers out there? Yes; we combine that with a little agriculture.
479. But the extension of the railway will enable you to put the land you are now using for grazing under cultivation? Yes, most of that country will be put under agriculture.
480. It could be profitably used for agriculture if you had better railway facilities? Yes.
481. *Mr. Dawson.*] You came from Victoria? Yes.
482. From what part? From Warrnambool.
483. That is particularly good country? Yes.
484. Then, I take it, you know what you are talking about? Yes; I went all round New South Wales before I settled down, I have been in New England and at Tamworth.
485. You know Tamworth? Yes.
486. Is your land as good as that on the Peel River? Fully as good.
487. And you say that the line proposed by the Government goes through the cream of that country? I have not the slightest doubt of it.

Mr. J. Brett.
13 April, 1894.

488. A good deal of land would be taken up there if the road was good? It would be eventually taken up if there were a railway.
489. You want a market for your produce? Yes.
490. If the railway is taken from Wyalong to Cargellico and then on to Hillston, the land through which it passes will be used for agriculture instead of having sheep running over it to the end of time? It will all be taken up. There are 75,000 acres in a gold reserve there, which are as good as anything between here and Sydney.
491. As a practical man you have no hesitation in making that statement? Not the slightest.
492. If this land is settled upon and taken up in small areas the settlers will be able to run sheep upon it as well as use it for agriculture? It will, when improved, carry a sheep to the acre.
493. And no doubt people will get store sheep and fatten them after the crops are off? Yes. The land is so far from market that agriculture and pastoral pursuits will be combined.
494. The climate is something like that of Tamworth? Yes.
495. Would lucerne grow there? Yes.
496. If you could get lucerne to grow, you could raise five times as much stock as you raise now? Yes.
497. If the railway were taken through your property, would you be prepared to pay a fair amount to the State for its construction? Certainly, I would be in favour of paying a fair amount.
498. You think it fair that if a man's land is benefited by the State he should pay part of the benefit back to the State? Certainly, because he reaps the benefit indirectly.
499. *Mr. Wall.*] You pay about 2s. a bushel to send wheat to Temora? About that.
500. The agricultural development of that country would be impossible without a railway? Yes. A great many people have gone there with the expectation of getting a national line some day.
501. If the railway were constructed, would you bring a large area of land under cultivation? Certainly, because it would pay better.
502. Do you think the other settlers in the vicinity would follow your example? Yes. There are a great many cultivating there now. Mr. Smith has 400 or 500 acres.
503. *Mr. Dawson.*] I suppose you are aware that in England wheat has not been so cheap for two centuries as it is to-day, owing to the good seasons which they have had all over the world. What is the lowest price at which you could profitably produce wheat, if the railway came within 3 or 4 miles of your land, allowing for labour, use of teams, cost of seed, and so on? Not much less than 2s. 6d. a bushel.
504. That is delivered at the station? Yes.
505. *Chairman.*] Is Mr. Lowenthal your neighbour? Yes, his property adjoins mine.
506. Is he a selector? Yes, a selector and manager.
507. How many acres has he under his control and management? About 30,000 acres.
508. How many sheep does his land carry? He owns something like 30,000 sheep.
509. Has he any land under cultivation? Yes; he grows artificial grasses principally.
510. How many acres has he under artificial grasses? About 20 acres.
511. Do you know where he sends his wool? By teams to Temora, and then on to Sydney.
512. Do you wish to add anything to your evidence? No further than that it is a magnificent little estate he has got there. It is reckoned a small estate in that part of the country.
513. Is it a freehold? A great portion of it is; but part of it is Crown land.
514. How much is freehold? About 5,000 acres.
515. And the rest is held under lease? Yes.
516. Will the lease expire in 1895? I think so.
517. Do you wish to say anything as to the character of the land? It is very good land.
518. Is it all suitable for the production of wheat? Not all. A great portion of it is boree country, which is first-class grazing land.
519. But not so suitable for agriculture? But not so suitable for agriculture.
520. Unless the railway were extended beyond Wyalong could agriculture be profitably undertaken? A great many small holders would go in for agriculture if the railway came to Wyalong, because it would then be within 30 or 40 miles of a great many of them.
521. You think they would bring more land under cultivation then? Considerably more land would be brought under cultivation, even if the railway came only to Wyalong.
522. But to serve you and your neighbours the line would have to be taken past Wyalong? Well, if it came to Wyalong it would make a difference of £2 a ton in regard to our wool.
523. Do you know anything about Cargellico? Yes.
524. Did you hear the evidence which has been given in regard to the character of the settlement, and the nature of the soil there? I heard Mr. Pearce's evidence; but I do not think any Government would be justified in running a line direct to Hillston.
525. Do you know the country between Wyalong and Hillston in a direct line? Yes.
526. Do you think it is as good for railway construction as the country along the proposed route? I think the proposed line runs through the cream of the country.
527. *Mr. Wall.*] Can you give the Committee any idea of the cost of clearing boree and yarran country? The cost of clearing boree country would be very little.
528. About how much an acre? I think you would get that country grubbed for 10s. an acre.
529. Are there any blocks of country along that line where 20,000 acres could be selected suitable for village settlements? Only in the vicinity of the lake, which will become a great district for creameries if the railway goes there. I think it will be one of the greatest cream districts in the Colony.
530. Do you think that if the railway were constructed a 20,000 acre block could be obtained? The only drawback would be the water supply; but there could be no better land.
531. Is there that quantity of land available? There are hundreds of thousands of acres available where the line runs. There are 75,000 acres on the gold reserve alone, from what they call Four Corners to Lake Cargellico.
532. *Chairman.*] Do you know the country in the elbow formed by the line near the lake? Yes.
533. There is a large basin there supplied with water from the lake, which is estimated to contain from 20,000 to 30,000 acres? There is fully that.
534. Have you ever seen it dry? I have seen it pretty well dry.
535. What kind of land is there there? It is very good land—splendid country.

- Mr. J. Brett. 536. Would that land be suitable for agriculture;—if a dam were put across the lake, it would be dry in a couple of years? Yes.
- 13 April, 1894. 537. Would that land be suitable for agriculture? Yes, it is black soil.
538. Could it be irrigated from the lake by means of a pipe passed through the embankment? Easily.
539. Would it be possible to have a village settlement under those conditions? Yes; that is just the place for one.
540. With complete irrigation? Yes.

SATURDAY, 14 APRIL, 1894.

[The Sectional Committee met at Jacob and Co.'s Store, Wyalong, Main Camp, at 10 a.m.]

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (CHAIRMAN).
HENRY DAWSON, Esq. | WILLIAM CHANDOS WALL, Esq.

The Sectional Committee further considered the proposed Railway from Temora to Wyalong.

Mr. Thomas Pearce, solicitor, Hillston, sworn, and further examined:—

- Mr. T. Pearce. 541. *Chairman.*] You desire to correct a portion of the evidence you gave yesterday? I desire to say with regard to my evidence as to the price of wheat, that there is a local market at Hillston, and when I mentioned 2s. 6d. a bushel, I meant that the farmers would be satisfied with that price either at Hillston or at Carrathool.
- 14 April, 1894. 542. That is the local price? Within a certain radius for carrying.
543. It is the ruling price? This year it was about the ruling price. The price varied from 3s. 6d. to 2s. 5d. at Hillston itself.
544. Is there anything you wish to add to your evidence? No; I do not think so.

Mr. Robert Edward Moore, farmer, Youngie Plains, sworn, and examined:—

- Mr. R. E. Moore. 545. *Chairman.*] Where is your place located? About 14 miles from the surveyed township of Wyalong.
- 14 April, 1894. 546. How far will you be from the railway as shown on the plan? I should think Wyalong would be the nearest station to me.
547. Would Wyalong be as near as the 340 mile post? That might be within 10 miles of me.
548. You would be served by the railway if it came to Wyalong? Yes; I should be quite satisfied with a railway within 20 miles.
549. What is the area of your holding? 2,560 acres.
550. How do you use it? For agricultural and pastoral purposes.
551. How much land have you under cultivation? Over 200 acres this year.
552. In wheat? Wheat and oats.
553. How many sheep do you graze? About 2,500.
554. Did you grow wheat last year? Yes.
555. How many bushels did you get to the acre? Last year it averaged about 20 bushels to the acre.
556. How many acres had you under cultivation last year? 120 acres. I have grown wheat for the last four years.
557. Where do you send it? I sent part of it this year to Sydney.
558. To what station on the railway? To Temora.
559. How far are you from Temora? About 52 miles.
560. What is the cost of carriage? About 2s. 6d. a bag. I sold one load of sixty-four bags at Temora at 2s. 9d. a bushel. The Sydney wheat is not sold. They store it.
561. Has the construction of the railway to Temora led to a large increase in the area under wheat? There can be no doubt about it. If there were a railway to Wyalong I should have at least 500 acres under cultivation.
562. Did you sell your wheat last year? Yes; principally for local consumption at 3s. a bushel.
563. You did not send any to Sydney? No; this is the first year that I have sent any to Sydney.
564. Did you send your wheat in the direction of Cargellico? No; I sent it all to Temora. Temora is the nearest railway station.
565. *Mr. Wall.*] How much did you send to Sydney this year? About 104 bags.
566. Nearly 500 bushels? Yes.
567. Are there many other farmers growing wheat in this vicinity? Yes.
568. What was the total tonnage forwarded by you last year to Sydney in the shape of wool and wheat? Last year I forwarded 104 bags of wheat and about 5 tons of wool.
569. What number of selectors within 20 miles of Wyalong in each direction would be served by the proposed line? There would be a vast number of selectors served by the line shown on the plan. That line taps some very good country.
570. Is there much land available for settlement? Very little now; but when the leaseholds are resumed there will be a lot of agricultural land available.
571. Suppose they are not resumed? The rest of the land is nearly all taken up.
572. Can you give us an idea of the number of conditional purchasers who would be served by a line from Wyalong to Cargellico? No; I have not had time to get the information.
573. You say that the construction of a railway would induce you to put a larger area under cultivation? Yes; and all my neighbours would go in for agriculture.
574. Would it pay them to forward wheat to Sydney at 2s. 6d. a bushel? It would not pay at the present price.
575. Have the majority of the selections between Wyalong and Cargellico been taken up in the interests of those who made them? That is a question I am not prepared to answer.

576. You cannot express an opinion upon it? Most of the selectors in my immediate neighbourhood, that is on Hiawatha, Lake Cowal, and so on, are *bonâ fide* men.

577. But is there not a current rumour that a large quantity of land in that district is being alienated in the interests of pastoralists? That question I am not prepared to answer.

578. Has there been any great demand on the part of people requiring land for settlement that the leases shall be thrown open? Yes; I have had several inquiries from Victoria within the last three months from *bonâ fide* men who would use the land for agricultural purposes, asking when the leases would be thrown open.

579. Have you been agitating for a railway for any length of time? I only selected on the 3rd of April, 1890. We have been agitating for a railway during the last two years.

580. Has there been a general effort on the part of the settlers to induce the Government to take a line through this country? Yes, there is a general feeling in favour of it.

581. Have you never taken the trouble to prepare statistics showing what the probable traffic on the line would be? I do not know if our league has done so, but the league at Barmedman took that trouble some time ago.

582. And how have the local farmers endeavoured to make their voices heard;—have they made representations to the Minister? There was a deputation at Cootamundra upon the occasion of the opening of the Temora railway; I was present upon that occasion. That was the last deputation from this district so far as I am aware.

583. Do you know of the character of the country through which the proposed line would pass? Yes, for most of the way.

584. For how far along the line? As far as Lake Cargellico.

585. Is the land generally good? The line marked on the plan could not go in a better direction to open up agricultural land.

586. Do you think it goes through land which would yield 15 bushels to the acre? I do, honestly.

587. I suppose you are aware that this railway has been proposed subject to the application of the betterment principal? Yes.

588. Would you, as a landholder, be prepared to contribute towards the cost of the line? Yes, very freely, because it would enhance the value of my property and give me access to market. At present we cannot afford to grow wheat, and send it to Sydney for the price given.

589. Is that the general feeling of the farmers who would be served by the construction of the line? Yes.

Mr. Miles Nicholson Carter, manager of the Billabong holding, sworn, and examined:—

590. *Chairman.*] Who are the owners of your station? Mr. Henry Ricketson is the holder.

591. How long have you been in the district? Twenty-three years.

592. Have you been managing during the whole of that time? Yes.

593. *Mr. Dawson.*] What is the extent of your run? One hundred thousand acres, counting in the resumed area as well as the leasehold area.

594. Is there any freehold? Yes, about 18,000 acres of freehold.

595. What leasehold is there? About 35,000 acres.

596. And the balance is what? The balance forms part of the resumed area.

597. That is about 50,000 acres? Yes; the resumed area is 46,000 acres.

598. Is your country pastoral or is it agricultural? The land adjoining this township is altogether of an agricultural character, while on the Bland it is pastoral country. The two districts are quite distinct in character—that round here is agricultural land, while the other is salt bush and myall plain.

599. But both of their class are good? Yes.

600. The Bland country is very good for pastoral pursuits, and this is good for agriculture? Yes.

601. Do you go in for agriculture? No, except to grow hay for our own use.

602. How many sheep do you run? From 50,000 to 70,000.

603. Where do you send your wool? To Sydney. Last year we sent to Temora; but before that we used to send to Young.

604. If the railway were brought to Wyalong, to which station would you send? We should be within 8 miles of Wyalong.

605. And all your wool would come here? Yes; all our business would be done here.

606. If the railway were brought to Wyalong, would you part with any of your land? Yes, under certain conditions. We have here about 10,000 acres in the resumed area, and about 26,000 acres in the leasehold area—all splendid agricultural country. Our land, however, has been very much cut up by the diggers, and our tanks have been used by them. Three or four of our tanks have been resumed by the Government, and I would suggest—though I have no authority from Mr. Ricketson for making this offer—that for full compensation for our improvements and lease we should throw up our lease for the benefit of this township and the railway.

607. Do you mean, throw up the whole of your lease? The 26,000 acres of leasehold, and the resumed area, receiving compensation for improvements and lease. While I suggest that this country should be thrown open for selection, I have no authority for making the offer.

608. These 26,000 acres, if thrown open to the public, would be settled upon? At once.

609. By *bonâ fide* men? Yes.

610. You would not suggest to Mr. Ricketson that he should get any of it back? The station would not take an acre of it back. We have had several such blocks as that of which I am now speaking, and we have asked that they might be thrown open for selection in exchange for other land. The offer was so highly thought of by the District Surveyor and the Chairman of our Land Board, Mr. Edwards, that they fell in with the suggestion, and highly recommended that it should be carried out.

611. You would concentrate your holding by throwing open this land to the public? Yes.

612. But it is a matter of arrangement between Mr. Ricketson and the Government? Yes.

613. Suppose the land were taken up, what would be the average crop per acre obtained from it? Not being a farming man I should not like to give an opinion on the subject.

- Mr. M. N. Carter. 614. Do you know what the people round you are getting? There has only been an agricultural population settled here for a very few years, so that I could give you no idea.
- 14 April, 1894. 615. As an old resident of the district you believe that if the railway were brought to Wyalong, a vast amount of country would be used for agriculture? I have no doubt whatever about it. I am positive that the country to which I have referred would be selected within a month if the construction of a railway were assured.
616. How many sheep would this country carry, if selected;—would its carrying capacity be materially increased? It would depend upon the season, but it would make a difference of from 10,000 to 12,000 sheep.
617. Where do you send your surplus fat stock—to Homebush or to Melbourne? To Homebush.
618. How many do you send away in a year? This station is worked with Baratta, and we send our store sheep down there.
619. And then they go to Melbourne? Yes; and any fat stock we have we send to Homebush.
620. How many store cattle have you? Eight hundred or 900 at present. As a rule we do not have over 100.
621. How many store sheep do you send away from here? Something like 10,000 a year.
622. The railway will make no difference to them? I have no doubt whatever that if the railway were made we could send our sheep to Sydney, fat, quite as well as Mr. Ricketson would send them from Baratta.
623. Then you would have from 5,000 to 10,000 fat sheep to send to Homebush if the railway were made? Yes; it would entirely alter the management of the runs. The reason that the fat sheep go to Baratta is that there they are nearer to the railway. We have quite as good fattening country here as they have there.
624. I suppose if a railway were constructed it would make this estate much more valuable? Yes.
625. Do you think Mr. Ricketson would object to pay a proportion of the cost of the railway as a betterment tax, the tax extending over a period of about seventy years? I could not tell you. I do not know what Mr. Ricketson's opinion on the subject is.
626. What else does the district produce? I think that if a railway were made a great many things would be grown here that are not grown now.
627. I noticed a lot of very fair ironbark timber round here yesterday;—could railway sleepers be got from them in any quantity? There is a great deal of ironbark all round here, and there is very good pine.
628. But pine is not good for sleepers? No; but it is good for other purposes.
629. Is the ironbark close to the proposed line? Well, it is a few miles off here.
630. Do you know anything of the country between Wyalong and Lake Cargellico? No; I only know it as far as Hiawatha.
631. What is that country like? It is similar to this.
632. Is it good land? It is our resumed area, and you can imagine what it is like, when I tell you that the whole of it has been selected, with the exception of 10,000 acres.
633. By *bonâ fide* men? Yes.
634. I suppose you can tell us better than anyone else whether they are *bonâ fide* men or not? I believe they are all *bonâ fide* men. As regards this station, there are none but what are *bonâ fide*.
635. You heard Mr. Moore say that all his neighbours would increase the area they had under cultivation if the proposed railway were made? Yes. I know Mr. Moore's land very well indeed, having had charge of the same country for years, and I believe it to be excellent agricultural land. I believe there would be a very large agricultural population there.
636. Do you know anything about the growing of barley? No; I do not know anything at all about it.
637. If the land were used for agriculture, I suppose a great many more sheep could be fattened by the farmers and sent away? Yes; because the areas would be smaller.
638. Can you give us any idea of the tonnage you get inwards for station purposes? For station purposes alone, not including wire netting or anything like that, we get something like 25 tons a year, and with fencing material we have had as much as 50 tons a year.
639. If the railway were made, would you get other commodities up, such as rock-salt? Yes; and suppose the Government were to favour my suggestion, we would have to improve our place very much by cutting it up into smaller areas.
640. Mr. Wall.] Do you think that if the Government were to adopt your suggestion, a large amount of land would be cultivated in the vicinity of Wyalong? I feel certain that it would be taken up at once.
641. Are you aware that the Government have issued a proclamation reserving 50,000 acres in the vicinity of Wyalong for mining purposes? Not on our leasehold.
642. You know the proclamation? Yes, I saw it.
643. Is the land referred to in it of an auriferous character, and likely to be required in the interests of mining? I could not tell you.
644. I suppose you are aware that it would not be required for agricultural purposes? The 10,000 acres is the only portion that has been resumed. The 26,000 acres has not been resumed.
645. It is the intention of the Department to resume the land within a mile on each side of the line, and to dispose of it in special areas at an increased price;—do you think the construction of the line will enable the Department to get an increased price for land so reserved? Yes, I think so.
646. Is there any great quantity of vacant land between Wyalong and Lake Cargellico adjacent to the proposed line? I do not know any of the country between Hiawatha and Lake Cargellico.
647. Is there much land available for settlement close to the proposed line between Wyalong and Hiawatha? It has nearly all been selected.
648. Do you think the railway would fairly serve the pastoral country between Cowen Downs and Cargellico, and Cargellico and Hay? It would be of immense benefit in time of drought, because stock could then be moved from the dry country towards the mountains.
649. Do you think the pastoral interest would be fairly well served if the country were intersected by a line going nearly midway between the Cobar line and the Hay line? I think that such a line would be of untold benefit to the sheep farmers in the district, especially in dry seasons.
650. And is it your opinion that the more central that line was, the better the pastoralists would be served by it? I imagine that would be so.

MINUTES OF EVIDENCE—RAILWAY FROM TEMORA TO WYALONG.

651. Have you any knowledge of the approximate number of sheep depastured within 30 or 40 miles of the line as far as Cargellico? No; I have not.
652. Is it customary for pastoralists here to shift a large part of their stock in times of drought? Yes; or else the stock would die.
653. Do you think the railway would be used for that purpose? I feel certain of it. In times of drought we have had to shift nearly all our sheep to another place owned by Mr. Ricketson.
654. *Chairman.* At what do you value your freehold at the present time per acre? Really I do not know. We gave from £1 to 25s. an acre for it, and we have improved it very largely, so that it is of great value now. We have only three miles of permanent water, and as we run 40 miles back, we have had to conserve water all over the place. The land would have been totally useless otherwise.
655. Could you put a price upon the land in the vicinity of Wyalong? We have no freehold in the vicinity of Wyalong; it is all leasehold.
656. How far away is your freehold land? Nine or ten miles from here.
657. Would it be served by the railway? It would be all served by the railway.
658. I want to know what the increased value of your land would be if the railway were constructed? It would not increase the price so much.
659. Would it increase the value of the land £1 an acre? No, it would not make any difference to the carrying capacity of the land; though of course it would benefit us to have nearer railway communication.
660. You would save in the cost of carriage? We should save about 30 miles of carriage. Our nearest station now is either Forbes or Temora.
661. Have you in past seasons been obliged to send many stock from here to the mountain district? Yes.
662. Is that in the direction of Gundagai? You pass through Gundagai to get to it.
663. Do you use the railway to Gundagai? We have not had to send stock away since that railway has been opened.
664. You have had good seasons since then? Fair seasons. It would scarcely be worth our while to truck sheep over the 30 miles from Cootamundra to Gundagai.
665. But from here? That would make a considerable difference.
666. Would it be worth your while to use the railway from here for that purpose? It would.
667. And would the railway be equally serviceable to stockowners in the neighbourhood of Hillston? It would.
668. Do you know the locality proposed as a site for a tank on No. 12? Yes; I have a tank there now.
669. I believe it is the intention of the Government to resume that land? So the surveyor told me.
670. Do you know the area which it is intended to resume? We have a purchased block there of 225 acres.
671. Do you think the whole of that will be resumed? Mr. Wade told me so the other day, together with another tank to the east.
672. Will it be a suitable site for a tank? Yes; if the catchment area is sufficient.
673. What is the catchment area? It must be 300 acres.
674. What do you think should be the capacity of a tank that would serve the town? It would all depend upon the number of the inhabitants.
675. I think it is proposed to have a tank of 10,000 yards capacity? I scarcely think that would be sufficient. This is a very dry part of the country, our rainfall being, I suppose, from 15 to 20 inches in the year.
676. Can you say what quantity of water could be conserved by means of a 10,000 yards tank? I really do not know. Mr. Wade said that the Government would resume a tank of ours about a mile and a half or two miles to the east of this one. The tank has a capacity of 13,000 yards, and I should not think it at all too big.
677. Is the evaporation here very great in summer time? Yes; and the earth which is excavated should be built up to a great height around the tank.
678. Have you had great experience in making tanks? Yes.
679. Can you offer any suggestion as to the best shape and mode of construction? I have a great objection to square tanks, because the smaller the surface is the better. Oblong tanks are the best, and you cannot have them too deep.
680. Would it be possible to construct a tank of that description and obtain the benefit of the whole drainage area? Yes, and the tank which is there now could be used as a silt tank.
681. What are the dimensions of the existing tank? About 2,600 yards.
682. What is its shape? It is nearly square.
683. You propose to lengthen the tank? I would not use that tank for the purpose of supplying the township. I should use it to catch the silt.
684. You would make it a filter? Yes; that is what I do with all my tanks. The water would settle in the first tank before running into the big tank. I have always found these small tanks very beneficial.
685. You mentioned that there had been a considerable amount of selection near to you. Has the land been taken up in large or in small areas? That is on the resumed area. The full quantity has been taken up.
686. Two thousand five hundred and sixty acres? Yes. I think there are only two or three who have not taken the full quantity.
687. Can you say whether they are using the land for pastoral purposes only, or for agriculture, combined with pastoral pursuits? They have not been there long enough yet to clear the land for cultivation.
688. How long have they been there? I do not think it is more than four or five years since the first selection was taken up there.
689. It is since the Temora railway was recommended? That is just about the time.
690. Of course, you know the site selected for the new township? Yes.
691. Are you of opinion that it is the most suitable site for the purpose? Yes; I think it is very suitable.
692. Do you know of any better site nearer to the Main Camp? No; I do not.
693. Do you know the difference in elevation between here and the Main Camp? No, I do not; but I do not think it would be much. I should say it would be from 15 to 20 feet.
694. Have you travelled the road between here and Temora? I have gone once or twice from Barmedman to Temora, but never from this township to Barmedman.
695. What road do you use? A road which goes from Marsden; the stock route to Barmedman.

Mr.
M. N. Carter.

14 April, 1894.

- Mr. M. N. Carter.
14 April, 1894.
696. Do you go to Temora? We go through Barmedman, striking the road about 5 miles from here.
697. Do you get your stores by the same road? Hitherto we had always got them from Grenfell. The Temora line has only lately been opened, and our supplies came up before it was opened.
698. Do you think it probable that a railway to Wyalong would create a traffic in addition to that now existing, which would pay interest and working expenses? I have no hesitation whatever in saying that it would.
699. *Mr. Wall.*] Do you know if the railway to Temora is paying expenses? I do not; but I should scarcely think so.
700. Do you think there would be better prospects of the railway paying if it were extended to Wyalong? Yes; prospects would be still better if it were taken further west.
701. Has there not been a fall in the value of pastoral property during the last ten or twelve years? Pastoral properties now are nearly unsaleable, and so is produce.
702. *Chairman.*] I suppose this depression has been common through all the colonies? Yes.

Mr. William McFadyean, builder and farmer, Cargellico, sworn, and examined:—

- Mr. W. McFadyean.
14 April, 1894.
703. *Mr. Wall.*] How long have you been at Cargellico? Twenty-one years.
704. Has the growth of that place been rapid during the last two years? No, it has not; its progress of late has been very small.
705. What is the number of buildings in Cargellico, approximately? There are three or four stores and three hotels. I suppose the population is about 500.
706. Do they do a large business in most of the stores? Lately they have done very little.
707. Is there much settlement in the vicinity of Lake Cargellico? There has not been a great deal during the last two or three years.
708. Is there much land available for settlement there? Very little of the resumed area is available.
709. What justification is there in asking for an extension of the railway to that part of the country, having regard to the prospect of its paying interest on construction? Mount Hope is 40 miles away from Cargellico, and all the traffic from Sydney there would come over the proposed line, and there would also be the traffic back. We are from 110 to 108 miles from Whitton, and the traffic that now goes there would come over the proposed line.
710. Do you know the distance between Mount Hope and Herbertdale on the western line? No. I am not as much acquainted with that country as I am with the country on this side.
711. You say that all the traffic from that country would be taken by the proposed line. Do you know the extent of that traffic? No; but if I had known that I was to appear before you to-day I should have been prepared with an estimate of it.
712. I suppose you know that the Mount Hope mines are now practically closed down, and have been for some years? They are open again.
713. They are let on tribute? Yes.
714. Do you know what the output of the tributors has been during the last few years? I cannot say what it has been.
715. You are not aware that the balance-sheet showed a very serious loss on last year's operations? I was not aware of that.
716. I suppose you are not aware that the mines would have been closed altogether had it not been for some compensation paid by the Government, which has enabled them to defray their expenses? No; but I am not connected with the mines. I should like to point out that it is all good agricultural country within 10 or 12 miles on the other side of the Lachlan.
717. Do you think the construction of the proposed line would bring about a large agricultural settlement? I am sure of it, because it is all agricultural country from here to there.
718. Have you any idea of the cost of growing wheat there? Yes; at present there is no market for wheat.
719. What is the cost of cultivation per acre? It all depends upon how the land is worked. The small areas which the farmers are now cultivating are worked at twice as much as it would cost to work 500 or 600 acres.
720. What is the cost of clearing that land? From £1 to £2 an acre; it all depends on the timber upon it.
721. I suppose the soil is fairly light; they could use double-furrow ploughs upon it? Yes.
722. Have you any knowledge of the area of land available near the existing railways, and nearer to the metropolis than the land of which you are speaking;—can you give us any reason why that land has not been taken up? I do not know much about other land, because I have always been living near the Lachlan.
723. You say that the land in the vicinity of Lake Cargellico would be cultivated? Yes; all the resumed portion is taken up already.
724. For pastoral purposes? It is to be used for pastoral purposes. There is no market for produce.
725. Can you give us any idea of the return per acre from that land when used for pastoral purposes? No, I could not at present.
726. If we were told that that land would carry more than a sheep to the acre, and it is utterly impossible to find one of them poor enough for killing, is that your experience of it? No.
727. Do you think that this land could be better used for cultivation than for raising stock? I am sure of it.
728. And has there been any strong desire to have the leases in that part of the country thrown open for settlement? There has been a unanimous desire of late.
729. Almost an agitation? Yes.
730. You do not think that the throwing open of the leases would bring about the defeat of settlement? I am sure it would not.
731. Can you say whether, as a rule, the land will carry more when held in small areas than when held in pastoral lease? Yes; it seems to carry about four times as much.
732. And you think that not only would the population be greatly increased if the pastoral leaseholds were thrown open, but that the carrying capacity of the land would be quadrupled? I am sure that it would.

Mr.

Mr. Edward Townsend, station overseer, Lake Cargellico, sworn, and examined:—

Mr.
E. Townsend.
14 April, 1894.

733. *Chairman.*] Who is the owner of your station? Mr. D. Mackellar.
 734. What is its area? It was originally 300,000 acres.
 735. How much purchased land is there? Something over 20,000 acres.
 736. And the rest is leasehold? Leasehold and resumed area.
 737. You are using it under an occupation license? We are not using the resumed area.
 738. What stock are you carrying? I do not know what they are carrying now. I have left there.
 739. But when you were there? 40,000 sheep.
 740. Where was the wool sent? To Whitton.
 741. *Mr. Dawson.*] Does it take 7½ acres to keep a sheep? In some cases it does.
 742. How far are you from the country where 800 sheep are fattened on 600 acres? I never heard of that country, though I have seen country that would do that for a time. There are odd places within 100 miles of us that would do it.
 743. Would the grazing and agricultural capabilities of the land be increased to any extent by the construction of a railway? Yes.
 744. Do you know a better route for the line than that proposed by the railway? I do not know how you could get a better route.
 745. You do not know anything about the engineering difficulties along the route? No.
 746. To what extent would the grazing and agricultural capabilities of the district be developed by the construction of a railway? To my knowledge they would be more than doubled.
 747. That is, if the land were cut up into small holdings? Even if the land were left as it is. Half of that country will carry a sheep to 3 acres. The country that only carries a sheep to 7½ acres will never be occupied.
 748. How far is that bad country from the railway? One corner is about 5 miles south of the line.
 749. Is it no good at all? It is like the country behind here, but the soil is sandier.
 750. Could not that country grow wheat if the mallee were cut down? Yes; but there is plenty of other country which would be taken up first, unless the land were classified.
 751. *Chairman.*] How far is your station from Whitton? One hundred and ten miles.
 752. What do you pay for railway carriage from Whitton to Sydney? I never had anything to do with that part of the business. I was simply the sheep overseer.
 753. How long were you there? I was in the district twenty years.
 754. Where is the most settlement? Around Lake Cargellico.
 755. Will the proposed line serve most of the selectors? Most of the selectors are east from Lake Cargellico.
 756. Along the proposed line? Yes.
 757. How far out from Lake Cargellico are they—in a north-westerly direction? About 15 or 20 miles.
 758. They will all be served by the proposed extension? Yes. Then there are a number of settlers to the south and south-east.
 759. At what distance from the proposed line? The nearest would be only 5 or 6 miles away.
 760. And the more distant? Fifteen or 20 miles. There are also a number of selectors about 20 miles to the north of the 380-mile post.
 761. They would be served by the proposed line to Cargellico? Yes.
 762. Do you know the country in a direct line from Hillston to Wyalong? No.
 763. Have you any knowledge of any other part of the country, from a pastoral point of view? I just know a few of the stations around.
 764. Do you know anything about the Barwon country? No.
 765. You could not make a comparison between this and any other place in regard to productiveness? No; I know nothing at all about other places.
 766. Do you know anything at all about the Hay country? I have only passed through it. A large industry would be opened up by the railway in the sending of pine from Cargellico to Sydney.
 767. How could that district compete with Narrabri and Boggabri? Well, the Lachlan pine is white-ant-proof.
 768. Is any of it sent to Sydney now? No.
 769. *Mr. Dawson.*] What could it be sent for? I do not know.

Mr. Alexander Gordon Huie, labourer, Cargellico, sworn, and examined:—

770. *Chairman.*] How long have you been residing at Lake Cargellico? About eleven years.
 771. What have you been doing there? I take any work that I can get. I have been working at the building of a bridge over the river.
 772. Do you know of any reason for the construction of the proposed railway;—is there any prospect of its paying interest on the cost of construction? I should say that there would be a very considerable amount of settlement on both sides of the line if it were constructed.
 773. Is that land available for settlement now? Most of it is not. For instance, the leasehold on Wheyo run will not be available for selection for twelve months.
 774. Have you had experience of cases where great promise of settlement has been held out before the construction of railway, but where the land still remains a wilderness? I have been along the Hay line, and I know that there is a large amount of land there which is not used; but I think a great portion of that land is locked up in large estates. I think that all the land along the proposed line should be leased in suitable areas, which would be a guarantee that it would be used.
 775. Do you think the character of the country is such that the people would settle upon the land if a railway were constructed? Yes.
 776. Has the place gone ahead much during the last few years? Not recently. They feel the depression here as well as elsewhere.
 777. Is this regarded as a good district by those who are settled here? Yes.
 778. Have many of those who have selected here parted with their land? Yes. Some of them took it up with that intention, but others still hold it. These people would go in for farming if they had a market.
 Their

Mr.
A. G. Huie.
14 April, 1894.

- Mr. A. G. Huie. Their only market at present is Mount Hope, where they send chaff. The rest of their produce is consumed locally.
- 14 April, 1894. 779. But they grow very good hay and chaff in the vicinity of Mount Hope? Not such a great deal. I know a man who has been sending chaff up there as long as I have been in Cargellico.
780. They grow good wheat and chaff there? They grow some, but very little.
781. But wherever cultivation has been tried it has been fairly successful? I believe so.
782. Is there a very large area of land available in that vicinity? I believe the leases there have a great many years to run.
783. Do you think it is likely that if there was any great demand for produce at Mount Hope they would send to Lake Cargellico, when they could grow it near at hand? It is 35 miles from Gilgunyah to Mount Hope.
784. But if they had tried to grow it closer to Mount Hope, would not the experiment have been successful? No doubt, if the season had been good; but the season is not certain there.
785. You do not suppose that a very extensive market would be opened up for the sale of produce in that district? Not a very extensive market; but that is the only market they have.
786. Have many transfers of selections taken place during the last year or two? I could not say; but some have.
787. Do you know if the scarcity of these transfers is attributable to the *bonâ fide* nature of the selection, or to the impecuniosity of the pastoral tenants? If the pastoral tenants had had more money, they might have taken over more land.
788. Can you say whether those who have taken up land near Lake Cargellico are, as a rule, *bonâ fide* men, and make a fair living in depasturing stock there? I should say that the bulk of them were *bonâ fide* selectors.
789. And you think they are doing fairly well with their selections? There are not many of them who make a living from the land alone, though some of them do. Others get outside work, such as contracting, or carrying, or working in a sawmill.
790. As a matter of fact, then, they are not all small pastoralists? As a rule they put in a small crop, and they run sheep.
- 791-2. And carry on the roads? Yes.
793. Do you think that if the railway were constructed a great number of them would live on the land? Yes; I think a great many selections would be taken up if the railway were constructed, because they would then be able to get their produce away. With regard to what Mr. Townsend said about the export of pine, I may mention that pine has been taken to Whitton, a distance of 24 miles, and if it pays to send it there, surely it would pay to send it to Sydney if the proposed line were constructed.
794. Was that pine taken to Whitton for any special purpose? It was taken to Whitton and sent along the line. I should say that the betterment principle should be applied to the proposed railway.

Mr. Edward Thomas Clark, selector and farmer, Hiawatha, sworn, and examined:—

- Mr. E. T. Clark. 795. *Chairman.*] What is the area of your holding? 2,560 acres.
- 14 April, 1894. 796. When did you take it up? In 1891.
797. For what purpose are you using it? For pastoral and agricultural purposes.
798. How much have you under cultivation? About 100 acres this year.
799. Had you any under cultivation last year? About 40 acres.
800. How many sheep are you carrying? About 1,500 sheep.
801. What distance are you from the route of the proposed railway from Wyalong to Cargellico? About 6 miles.
802. Out from the 350-mile post? Yes; about there.
803. Can you speak as to the settlement in that locality? Yes; nearly all the land in that district is settled upon.
804. Is it held in large blocks similar to yours? Yes; about the same.
805. Are all the selectors following pastoral pursuits, combined with agriculture? Nearly all are going in for agriculture, combined with pastoral pursuits.
806. All to the same extent? Some are going in for agriculture more than others.
807. Would the whole of that district be served by the proposed extension? Yes; but I believe that if the line were bent up from Wyalong so as to go in a more northerly direction, it would serve more country than it will if bent to the south.
808. Do you know if there would be any difficulties in its construction? I am not aware.
809. Are you familiar with the country there? No; but I think the country is level.
810. By keeping the line in a southerly direction, it is not necessary to have a bridge over the Humbug, while, if you went north, you would require a bridge. With that explanation, do you think the best route has been selected? Yes, I think so.
811. Would you like to make a statement in reference to the proposed railway from Temora to Wyalong? The district between Wyalong and Woolengough is nearly all settled upon, and the most of the settlers there would go in for agriculture, if they could make it profitable. They do so now to a certain extent; but if a railway were constructed they would largely increase the area under cultivation.
812. You think that land could be profitably used for agriculture if the railway were extended to Wyalong? Yes; providing a fair price could be obtained for wheat.
813. What do you regard as a fair price, in Sydney? 3s. a bushel in Sydney.
814. You think wheat would pay at that price? Yes.
815. I suppose you produce other things besides wheat? Yes, hay. We get from 30 cwt. to 2 tons an acre.
816. *Mr. Wall.*] Did you take up your land yourself? Yes.
817. *Chairman.*] What are you paying now for cartage to the nearest railway station? £2 a ton. I find that my selection would be only about 2½ miles from the proposed line.
818. And how far from Wyalong? About 16 miles by the road.
819. How far would it be by the proposed railway? Five or 6 miles.
820. Has any land in your locality changed hands within the last three or four years? No.
821. I suppose people are not in a position to transfer their land? None of them are certificated yet.
822. Would the construction of a railway make any difference to the value of your land? Yes; from 10s. to 15s. an acre.

Mr. Robert Gagie, selector and carrier, near Wyalong, sworn, and examined:—

Mr. R. Gagie.
14 April, 1894.

823. *Chairman.*] Where is your holding? About 3½ miles from where we are now.
 824. How far from Wyalong township? Five miles.
 825. In what direction? North-west.
 826. Would you be served by the proposed railway from Temora to Wyalong? Yes.
 827. What is the area of your holding? It is a family selection.
 828. How many acres have you? 7,500 acres.
 829. How much land have you under cultivation? Twenty acres.
 830. The rest you use for pastoral purposes? Yes.
 831. How many sheep do you run? 4,500 sheep, and 100 cattle.
 832. Where are you sending your wool? By team to Temora.
 833. What does it cost you per bale? I take my own.
 834. But suppose you had to pay somebody else, what would it cost? £2 15s. a ton.
 835. There are five or six bales to the ton? Yes; five and a half bales on the average.
 836. Is the surrounding country all settled? Yes.
 837. Has there been much selection? There has been a good deal of selection to the north; in fact, all the selection is to the north of where we are; there has been none to the south.
 838. Will the selectors be fairly served by the proposed line? Yes.
 839. Do you think its construction will lead to an increase in the area cultivated for wheat? I think so. I am prepared to do a little when the railway comes there.
 840. Have you formed an opinion as to what price is required to make wheat pay? At Wyalong, or in Sydney?
 841. At Sydney? 3s. 6d. a bushel.
 842. You do not agree with a former witness that 3s. a bushel would pay? No.
 843. Do you find it more profitable to grow wool than to cultivate wheat? Yes.
 844. Do you wish to make any statement in reference to the proposal now under consideration? The construction of the railway will cause a lot of traffic to spring up. All the people within 20 miles of the line would go in for agriculture, and, no doubt, vineyards would be started here. At the present time, because of the distance from market, these industries do not pay.
 845. But the land is suited for agriculture? Yes; it is suitable for the vine. I knew the Albury district for eighteen years, and I have some vines here two years old, which are as healthy as any in the Albury district.
 846. *Mr. Wall.*] Do those engaged in pastoral pursuits here find their occupation fairly remunerative? Fairly remunerative.
 847. Do you think that if the land now under lease in this district were thrown open for selection, it would readily find occupants who would engage in pastoral pursuits on small holdings? I think so.
 848. Do these small holders depasture more stock proportionately than the large holders? Yes; a great many more.
 849. And they improve their land to a greater extent? Yes. On the land I now hold they used to run 2,500 sheep; but I run 4,000 sheep and 100 cattle.
 850. I suppose the improvements you speak of invariably consist of ringbarking? Ringbarking and scrubbing.
 851. Are those improvements made to any extent on the leaseholds? No; the leaseholds have gone back.
 852. The grazing capabilities of the land are considerably increased by them? Yes.
 853. Do you think the Government would be justified in constructing this railway in the expectation that it would receive sufficient traffic to pay interest on the cost of construction? I think so.
 854. You think that the district will compare favourably with other parts of the country where railways have been constructed? I think so.
 855. With what other parts of the country are you conversant? I know the Hay district.
 856. Do you think the settlement in this district is as great as the settlement was in the Hay district before the railway there was constructed? Yes; it would be more.
 857. Do you think there is as much justification for constructing this line as there was for constructing the Hay line? There is more settlement in this district now than there was in the Hay district when the railway was taken there.
 858. Do you think there is as good a prospect of settlement increasing here as there was of its increasing in the Hay district? That depends upon how the land is thrown open.
 859. Assuming that the leases will be thrown open? Yes.

Mr. James M. Jamieson, conditional purchaser, near Wyalong, sworn, and examined:—

860. *Chairman.*] Will you point out on the plan where your holding is? Yes; it is about 16 miles north-west of Barmedman. Mr. J. M. Jamieson.
 861. How far from the proposed railway? I should say about 10 miles. 14 April, 1894.
 862. Would you go to Barmedman if there were a station there? Wyalong would be nearer than Barmedman.
 863. But you would have less freight to pay if you went to Barmedman? It would not make much difference.
 864. What is the area of your holding? 2,560 acres.
 865. When did you take it up? Four years ago.
 866. After the Cootamundra to Temora line was decided upon? Yes.
 867. Did you take it up because of the known intention of the Government to make that line, or had you decided before to take it up? I took it up because I thought the railway would come through.
 868. Where did you come from? From Cootamundra.
 869. You were at Cootamundra then when the Public Works Committee inquired into the advisability of taking the line to Temora? Yes.
 870. How are you using your land? For sheep; and I have cultivated a little.
 871. How much have you under cultivation? About 40 acres.
 872. And how many sheep? About 3,000.
 873. I suppose the land under cultivation is growing wheat? Yes. My children have selections alongside mine. 874.

- Mr. J. M. Jamieson.
14 April, 1894.
874. What is the area of all the selections? About 6,000 acres.
875. And you have 3,000 sheep on the whole selection? Yes.
876. And what area under cultivation? All the land under cultivation is on my selection.
877. What has been the yield of wheat? About 15 bushels to the acre.
878. Have you any land under lease? Not from the Crown.
879. Where are you sending your wool now? To Temora.
880. What do you pay for carriage? About £2 a ton.
881. What distance are you from Temora? Forty miles.
882. Can you say whether the proposed line will serve the whole of the settlement near you? Yes.
883. What is the greatest distance any of your neighbours would be from the proposed line? From 20 to 25 miles, I should think.
884. Do you think they would be fairly served by it? Yes.
885. And in the event of the line being constructed, do you think it probable that you would put more land under cultivation? Yes.
886. At what price would wheat pay you? At about 3s. a bushel.
887. Three shillings in Sydney? 3s. 6d. in Sydney. If you sold locally at 3s. it would be much about the same as selling in Sydney at 3s. 6d.
888. *Mr. Wall.*] How far is your place from Temora? Thirty-eight or 40 miles.
889. That is the nearest point on the railway? Yes.
890. Has the construction of the railway to Temora promoted settlement in the vicinity of the line? Yes.
891. Can you say to what extent the wheat production of the district has increased since the construction of the railway? I could not go into figures, but I know that it has increased very much.
892. Is there a general tendency on the part of people holding land close to the railway to bring it under cultivation? Yes; at Barmedman there has been a great increase in cultivation since it was known that the railway would come to Temora.
893. You have been practically engaged in pastoral pursuits? At present I could not do anything else; but I used to do farming in the Cootamundra district.
894. Are we to infer that those who have taken up land here in small holdings are making a fair living from pastoral pursuits? My experience is that it is best to combine agriculture with pastoral pursuits.
895. Can you point to any case where increased areas have been put under cultivation by people living in the vicinity of Temora because of the construction of the Temora railway? I could not name anyone.
896. But you say generally that there has been an increase in cultivation? There is one farmer named Clements who used to only grow a little hay, but he has now about 200 acres under hay.
897. Is that hay used for local consumption or is it consigned to Sydney? All the hay he grows he sends to Barmedman for local consumption.
898. Does it pay to send hay from this district to Sydney? I do not think he has sent any hay to Sydney. I think he has sold all his produce locally.
899. Has there been any tendency on the part of holders of agricultural land to increase their agricultural area with a view to disposing of their produce in the metropolitan market? Yes, I believe so.
900. No doubt everyone in this district would advocate the construction of a railway? Yes, because they have no market now.
901. Do you think the construction of a railway would promote settlement in the district to such an extent as to make it pay? I do.
902. You feel convinced that the railway would be remunerative, and that its returns would meet the interest on the cost of construction? Yes, if the pastoral leases were thrown open for selection.

Mr. Donald Hugh Rankin, conditional purchaser, near Wyalong, sworn, and examined:—

- Mr. D. H. Rankin.
14 April, 1894.
- 902½. *Chairman.*] In what direction is your holding? It is about a mile and a half from the Government surveyed township, in a southerly direction. It is a little bit off the road.
903. What is the area of it? 1,900 acres.
904. Is any of it under cultivation? Not yet. I have not been here sufficiently long to cultivate it.
905. When did you take it up? Two years ago.
906. What improvements have you put on it? I have a dwelling-house, kitchen, store-room, buggy shed, fences, and two tanks.
907. Have you any stock? Not at present. I had before the rush took place; but the location of a large population at Wyalong has given me facilities for disposing of it.
908. What induced you to take up land here? I thought the land was good enough to make a home on.
909. What family have you? I have a family of five.
910. Are you able to live by the profits of your selection? I have not been here long enough to test that question, but I think I shall be able to do so.
911. You intend giving it a fair trial? Yes.
912. You will be served by the proposed line? Yes.
913. Do you wish to make any statement or give reasons for the construction of the line;—do you think its earnings will fairly cover the interest on construction and working expenses? In my opinion the land is good enough for settlement; and if the Government deal with the leases about to be thrown open in a way that will bring about their occupation by an agricultural population, there will be a large amount of traffic.
914. The settlement would then be in smaller areas? Yes.
915. Do you think the people here have taken up more land than they can manage? No; but if there were a railway people could live on smaller holdings than they have now.
916. What is the smallest holding that a man could live on? A 640-acre selection, if he were within 10 miles of the proposed terminus.
917. I suppose you can give us no information as to the average yield of wheat here? No. I have been farming for the last nine years, and I came here with the intention of farming, even before the railway was proposed. If the railway were constructed I would make a certainty of it.
918. Where were you farming before? At Junec.

919. Can you speak as to the suitability of the land near the proposed railway for agriculture? Yes; not from my own experience, but from what I have seen on other selections. The land is scrubby and more heavily timbered, and consequently harder to clear than the Junee land, but it is equal to it in every respect. Mr.
D. H. Rankin.
14 April, 1894.
920. Was your land cleared when you took it up, or have you been clearing it since? What I have got cleared has cost me about £2 an acre.
921. That is to get it ready for the plough? Yes.
922. What does it cost you for seed and harvesting? About 12s. an acre for ploughing, sowing, and harrowing, and about 3s. an acre for seed.
923. And for bagging? For stripping and all that—it could be stripped for 8s. an acre.
924. What do you estimate the total cost per acre of taking your produce to the nearest railway station? At the present time?
925. Yes? It would all depend upon the yield.
926. What would be the cost of labour, irrespective of the yield? I suppose something like £3.
927. With the clearing it would cost you £1? Hardly £1; but it would all depend upon circumstances. The more a man cultivates the less the proportionate cost. If a man cultivates a small piece, he has to employ as many men as if he cultivated a large piece.
928. Suppose he cultivated 100 acres? At the present price 100 acres would hardly pay.
929. What would be the smallest area you think would pay? About 200 acres.
930. What do you estimate the cost per acre of all operations, including bagging? It depends a good deal upon the crop.
- 931-2. Taking an average crop? About 18s. per acre.
933. What does it cost for bags and stripping? Fivepence three farthings for bags and about 8s. an acre for stripping.
934. Then it costs you altogether about 25s. an acre? Very nearly; £1, speaking from memory.
935. How many bushels an acre would you consider a fair average yield? About 16.
936. At what price could you sell at a profit? For 2s. 8d. a bushel.
937. Two shillings and eightpence in Sydney? No, in Temora. We always sell in the local market.
938. What would you deduct from that for carriage and selling? About 6d. a bushel.
939. So you think that that 2s. 2d. is a very fair price? I could live on that.
940. That would give you 31s. or 35s. an acre? Yes, and it would leave me about 10s. an acre profit.
941. Would that pay you? Yes; if I had 200 acres under cultivation.
942. One hundred pound would provide interest on your outlay and pay for your own labour? I dare say if I went into the thing very particularly, and charged for my own labour, I could not possibly do it for the price; but so long as we have a surplus at the end of the year we are satisfied.

Mr. John Richmond, Staff Surveyor, Department of Lands, sworn, and examined:—

943. How long have you been in the Department? About 15 years.
944. Were you told off specially to report upon the land and the nature of the water conservation in the Barmedman district? To report upon the character and value of the land and the facilities for settlement in this district. Mr.
J. Richmond.
14 April, 1894.
945. Have you received special instructions with regard to Wyalong? I have received instructions to inspect the whole of the country around here and to go through the leasehold area of every run.
946. How long have you been engaged on this special work? Since last October.
947. Have you furnished your report? I have furnished several on the country between here and Temora.
948. What is the date of the latest report sent in by you? The last I sent in on 31st January.
949. Since you have been here have you recommended that any area should be resumed for a township? Do you mean at Wyalong?
950. Yes? Yes; I selected the site for a township, and a plan of it is now being prepared.
951. How many acres have been reserved? About 500.
952. How many have you surveyed for a township? About 400.
953. How many allotments are there? About 280.
954. What is the area of each allotment? A quarter of an acre.
955. Has that land been taken up? Yes.
956. The whole of it? I believe so.
957. For business sites chiefly? For business and residence purposes. Other land has been pegged out under miners' rights.
958. Have you provided any reserves in the new township? One-fifth of the whole—100 acres.
959. Have you put any value upon the surveyed portion? I have not yet recommended what price should be charged.
960. Have you made an estimate? I have estimated that the allotments should be valued at from £5 to £15—an average of £10.
961. That would give a value of very nearly £3,000 to the whole of the surveyed portion? Yes.
962. And what would the other land cost at the same rate? About £2,000 more.
963. So that the value of the town would not be less than £5,000? It would not be less. Those values are under rather than over.
964. And have you made any provision for water? I examined and inspected the whole country, and recommended as far as possible the resumption of Carter's tank on No. 12, referred to by him in his examination.
965. The resumption of what area? I would recommend that about 320 acres in the catchment area should be reserved.
966. Would that comprise the whole of the catchment area? I think it would take the best of it.

- Mr. J. Richmond. 967. Have you made any recommendations as to the commencement of the tank? Not yet. I suppose it would not be less than 10,000 yards.
- 14 April, 1894. 968. What quantity of water would that hold? 1,500,000 gallons.
969. Do you think that that would be a sufficient supply for the town? I should think so, because the people would not depend entirely upon it; they would have their own supplies as well.
970. Have you discovered any other place within a reasonable distance of the town which you think would be suitable for water conservation? Yes; there are good catchments in all directions—that is, good catchments for this country.
971. So that if it is ascertained that the supply to which you have referred is insufficient, there will be no difficulty in obtaining a further supply? No; another tank further on, of about 13,000 yards capacity, is a good one.
972. Why did you recommend the existing site for the Government township instead of the place we are now in? Because it was more suitable, from a sanitary point of view; more central, having regard to the future of the place; and nearer to the course of traffic. This place to a certain extent, is out of the way, because most of the traffic comes along the main road from Barmedman and Marsden, and the Government township will be near to that.
973. Is the Government township higher than the main camp? Yes; apparently it is.
974. What is the difference in elevation? I have not measured it exactly; but I think 20 or 30 feet, not more.
975. What was your reason for recommending that the main camp should not be surveyed for business sites? I did not report against it, because I have not been asked to report about it at all. My instructions were to choose the best site for a town.
976. And you believe you have chosen the best site? Yes.
977. Can you speak as to mining matters? No.
978. You think that the site you have selected for a town will be central as far as the mines which are at present being discovered are concerned? I think so—more central than the main camp.
979. Mr. Wall.] Have you any connection with the Water Conservation Department? Not any.
980. What do you estimate will be the fixed population of this place within the next twelve months? Do you mean the population of the town or the main camp?
981. Of the gold-field generally? I estimate that there will be at least 800 men working here, besides their wives and children and others dependent upon them.
982. Taking an average of five to a family, that would represent a population of about 4,000? Yes.
983. Do you not think that 300 acres is a very small water catchment for a population such as that? It seems to me sufficient.
984. Have you any idea as to what rule engineers follow when estimating the supply of water required by country towns? Yes; I have had to do with catchment areas before.
985. What is the maximum and minimum supply allowed by the officers of the Country Towns Water Supply Branch? That I do not know.
986. You have examined the country around here pretty fairly? Yes.
987. Is there any place where you could get a larger table drainage for a tank than the place you have recommended should be reserved? Yes, where there is a tank about 1½ mile further on, on the same slope.
988. What would be the area drained by that tank? I do not know. It would be very large.
989. Sufficient to meet the requirements of the place? More than sufficient.
990. Would the water supply be sufficiently close for the Railway Department to avail themselves of it, supposing the railway were brought to Wyalong? I think the Railway Department would require a tank nearer the line. I do not think they could make use of the tank that I have been speaking about, because it would not hold enough. There would be nothing to prevent another tank being put there, however.
991. Were your instructions definite in regard to the laying out of a town, or have you acted upon your own judgment as regards the permanency of the field;—did you consider it necessary to lay out a town? I acted upon my own judgment in selecting a place, and then obtained the approval of Wardens Slee and Sharp.
992. Did you recommend the laying out of a township here? No.
993. Do you know who recommended it? No one. I am responsible for it, and my recommendation was approved of by the two wardens.
994. Acting upon your own judgment as to the permanency of the place, you have laid out a township 2 miles away from here? Yes.
995. And you are taking steps to resume a tank to supply water to a population of 4,000? Those steps are being taken by the Water Conservation Department, who were represented here by Mr. Wade. He was here yesterday or the day before to report upon the matter.
996. Has he inspected the locality where you propose to resume the tank? Yes.
997. Does he regard it as likely to suit the requirements of the place? I believe so.
998. Has he so expressed himself? I think he told me that he considered that it would do; but I am not certain, because we discussed such a great many things that I do not remember exactly.
999. Is he preparing a report for the Water Conservation Branch? Yes; it is probably in now

Mr. Walter Barnet, miner, Wyalong, sworn, and examined:—

- Mr. W. Barnet. 999½. Chairman.] How many years have you been mining? Thirty-five or thirty-seven years.
1000. When did you come to this district? At the end of January.
- 14 April, 1894. 1001. Mr. Wall.] Have you any interest in the place? Yes.
1002. What number of claims are you interested in? I am, with my sons, interested in three claims. We have a claim each.
1003. What are the names of the reefs on which the claims are situated—are they all on the one line of reef? I am No. 3 north of the original prospectors, and No. 4 south of the Niddergold.
1004. Are those claims on the one line of reef? Yes.
1005. Can you give the Committee any accurate information as to the number of lines of reef which have been opened up since the discovery of this field? I should think there are about eight lines of reefs.

Mr.
W. Barnet.
14 April, 1894.

1006. Let us start from the most westerly;—what is the name of that? Gorman's.
1007. How far is it from Gorman's to the next line of reef? The next is the Two-up—about 200 or 300 yards.
1008. And how far is the next to the east? Another 200 yards.
1009. What is the name of it? I think they call it Fraser's line of reef.
1010. What will be the next, still going east? The next is the original prospector's, Neeld Bros.
1011. And further east again? The line of reef known as Stanley's Blow.
1012. And east of that? Erwin and Party's, and east again there is Thompson's.
1013. What is the course of these reefs? They run parallel, varying a little north-east.
1014. What would be the distance from Fraser's line to Neeld and Party's line? About a quarter of a mile.
1015. And from there to Stanley's Blow? That might be about a quarter of a mile, the line strikes due east.
1016. And from Stanley's Blow to Erwin and Party's? Three hundred yards, I suppose.
1017. And from Erwin and Party's to Thompson's line? As far as my judgment goes, about 300 yards.
1018. What is about the distance from Thompson's line of reef to Gorman's line of reef? I suppose it must be over a mile.
1019. Has there been any crushings from Gorman's line of reef? Yes; the first crushing was 42 tons.
1020. From what claim? Gorman's claim. It went 2 oz. 7 dwt. to the ton.
1021. Have any other claims on that line of reef reported gold? Lynch and Party have a line of reef, but whether it is the same as Gorman's line I do not know. There are so many intersecting veins.
1022. Are there any more claims on gold on that line of reef? I do not think so.
1023. To what depth has the reef on Gorman's line been tested? About 50 feet. They are deeper now.
1024. Have there been any crushings from the Two-up line of reef? I do not know.
1025. How many claims on it have reported payable gold? About four.
1026. To what depth has the reef been tested? To various depths—20, 50, and 60 feet. I think there has been a crushing from Elderbranches.
1027. What is the reputed average thickness of the reef? From 4 to 18 inches, or 2 feet.
1028. I am speaking of the reef on the Two-up line? I think it averages from 6 inches to a foot.
1029. What would be the average thickness of the reef on Gorman's? From 1 foot to 18 inches.
1030. You cannot speak from your own personal knowledge? No; I have been down and seen it, but I have not been down since they sunk the new shaft. I hear that it is now about 18 inches.
1031. Have there been any crushings from Fraser's line of reef? Yes; I believe they got 3 oz. 12 dwt. to the ton.
1032. Do you know how many tons were crushed? I do not, but I believe 20 tons were crushed.
1033. How many claims are there on gold on that line? I could not say. I am not always there. They may be getting fresh gold every week.
1034. Have there been any crushings from Neeld and Party's line of reef? No; Neeld's Prospectors' Claim has not crushed.
1035. What is the average thickness of the reef? It goes from 8 or 9 inches to 4 feet. I have been down 68 feet, and it is 4 feet wide at that depth.
1036. Have any claims along the line of reef, besides Neeld and Party's, reported gold? No. 4 is supposed to have payable gold; but they have not crushed yet, and No. 1 is on very rich gold—ironstone. Neither of them have crushed yet.
1037. What is the distance between the Prospectors' Claim and No. 4 where gold has been obtained? About 400 yards—500 yards altogether. There are three claims.
1038. Then the reef has been proved to be gold-bearing for a distance of 400 yards? Yes, to my knowledge. They have got it further on, too, but I have not seen it.
1039. Has there been any crushing from Erwin and Party's line of reef? Yes; they got 3 oz. 6 dwt. to the ton.
1040. How many claims on that line of reef have crushed? Only Erwin's.
1041. How many tons did they crush? I think 40 tons.
1042. Has gold been discovered in any other claims along the line of reef? I believe so.
1043. How far along? I think No. 3 got gold this week.
1044. At what distance? About 300 yards ahead of Erwin's.
1045. Then that line of reef has been proved for a distance of 300 yards? Yes; it has been proved to be gold bearing.
1046. What is the average thickness of the stone? They took the first crushing out 2 or 3 feet in thickness.
1047. And it yielded 3 oz. 6 dwt.? Well, at any rate, over 3 oz. I am not quite certain about the penny weights.
1048. Now coming to Thompson's line of reef? There has been no crushing there. They have a paddock of stone, but I cannot say what it will go.
1049. How many claims on that line of reef are raising stone? Only one at present.
1050. That is the most easterly line of reef? Yes. Stanley's has not been crushed yet.
1051. What is the average thickness? Last time I saw it, it was from 4 to 6 feet wide, and carrying very good gold.
1052. But there has been no crushing? No; No. 2 from there crushed, and the stone went 1 oz. 2 dwt. to the ton.
1053. Then there has been a crushing in Stanley's line of reef? Well, if you call it a line. It is north of Stanley's.
1054. To what distance along that line has gold been discovered? As far as No. 3 claim—about 300 yards along.
1055. Can you point to any other discovery? Thompson's has not crushed yet.
1056. Are there any lines of reef lying east from Thompson's? Not that I am aware of.
1057. Now we will come to the reefs which have been opened up in other directions? Then we come to the south-east—Conway and Party's.
1058. That is regarded as a separate line of reef? It is, in my opinion, and I have had some experience.

- Mr. W. Barnet.
14 April, 1894.
1059. Have any other reefs been opened up in the belt of country between Gorman's and Thompson's lines of reefs? There are reefs in every part. The intersecting veins run east and west, and some nearly north and south.
1060. The other discoveries, if I understand correctly, occur within these parallel lines? Yes; and north and south of them.
1061. At the present time it is not known whether they are continuations of those lines of reefs? It is not proved yet; but I should say they were, as near as practicable.
1062. Starting from Gorman's line, can you give me the distance north and south to the next series of reefs that have been opened up? Several other reefs have been opened up, but I could not give the names of the parties working them.
1063. How far south of Gorman's have the most westerly of these other reefs been opened up? South-west, and in the mallee here. Reefs have been opened up to the west of late, though I cannot say to what extent, because I have not been there. I hear, however, that they are getting very good gold. About three quarters of a mile south-west of Gorman's there are some who are getting very good gold.
1064. You are not in a position to say whether they are on a continuation of Gorman's reef or not? No; it is not proved yet.
1065. Taking Thompson's line and bearing south, have any discoveries been made there? Not that I am aware of. Lots of reefs have been discovered in the mallee south of Thompson's, and they run in all directions—east, west, north, and south.
1066. How far south of Thompson's? From a quarter of a mile to $1\frac{1}{2}$ mile that way.
1067. Taking a line north and south from Neeld and Party's claim, and bearing south, how far is it to the furthest reef that has been opened up? There would be seven claims.
1068. What distance would that be? Seven hundred or 800 yards.
1069. What is the distance from Neeld's to the furthest discovery bearing south? There are about six claims, and each claim averages 100 yards, so that the distance would be about 600 yards.
1070. What is the distance from Neeld's to the furthest discovery that has been made north of it? As far as I can hear, payable gold has been obtained in No. 4, and, I believe, No. 5 has also got gold.
1071. That would mean, practically, that a belt extending 900 yards has been proved? Yes; that has been proved. There are 960 feet on a prospecting claim, and there are four or five claims from Neeld's to the north.
1072. That would give an area upon which gold has been discovered of about 1 mile in an easterly and westerly direction, and something over 1,000 yards in a line bearing north and south? Yes; on that line of reef. Conway's is rather longer than that.
1073. Which way does Conway's line run? Nearly north and south, bearing a little to the east of north.
1074. I want now to ascertain the furthest discoveries that have been made north and south, taking Neeld's, say as a centre? The last southerly discovery of what is supposed to be payable gold is called the Mallee Cow, which would be about $1\frac{1}{2}$ mile from Neeld's.
1075. Can you give us the furthest discovery north? That is the last new find which, I suppose, in a direct line, would be about 7 miles.
1076. Are there any other discoveries in a northerly direction between the new find and Neeld and Party's? There are several claims working on gold. I was out looking at the new find, and I saw gold there. I have heard since that it has been opened up and looks very well.
1077. Can you give the Committee approximately the number of claims reported to be on payable gold? I should say there must be from 70 to 80 claims on payable gold.
1078. What is your opinion as to the permanency of these reefs, speaking from your experience as a miner? I think there is a great future for this field. The country is not hard, and the further you get down the better the find becomes. I have been down Neeld's and several others, and they are looking well at the bottom.
1079. What do you think the inclosing rock is? Decomposed granite.
1080. Have you had much to do with reefing? I have been reefing for thirty years.
1081. What fields have you been reefing on? I have been in Victoria, at Wood's Point, Buckland, Crooked River, and in all parts of New South Wales nearly.
1082. Have you known permanent reefs to continue for any distance in granite? Yes.
1083. Where? In Victoria, at the Evans.
1084. At what depth have the reefs been worked to on the Evans with a granite formation? The Home-ward Bound was working at a depth of over 300 feet.
1085. Was the granite soft? The granite was hard there.
1086. What is the formation in which permanent reefs usually occur? Slate and granite. There are different formations in different fields; but I have never seen anything like this before in all my travels. At Grenfell the stone was a kind of porphyry, but it was hard and more like granite.
1087. Is not granite below the stratigraphical position in which reefs usually occur? Granite is supposed to be the bottom; the Silurian rock generally rides over the granite.
1088. Has this granite continued soft to any depth? In some places it has. I have been working at depths of between 200 and 300 feet.
1089. From the surface? Yes.
1090. In granite? Yes; through decomposed granite walls. One side is generally a great deal softer than the other. It is generally the seam that carries down alongside the reef that is the softest.
1091. Is it not characteristic of granite that the cleavage should be very imperfect, and the reefs vary in size? Yes; the reefs vary in size, sometimes pinching in to 2 or 3 inches, and perhaps widening out again to 3 or 4 feet. You can never get a reef to run true.
1092. What is the prospect of an alluvial discovery here, seeing that gold is being found so close to the surface? Alluvial has been got within a few miles of this place, but not close at hand. Between here and Billy's Lookout, and Buddigower, there ought to be alluvial obtained.
1093. Has any prospecting for alluvial been done in the district? Not much between here and Billy's Lookout; but a good deal has been done at Billy's Lookout. This formation carries right through for some 20 miles—from Billy's Lookout to Buddigower.
1094. Have there been any indications of drift showing that a denudation of country has taken place at any time? Yes; a slight amount of wash has been found at different places. Good prospects have been got here and there, but nothing to continue.
- 1095.

Mr.
W. Barnet.
14 April, 1894.

1095. The reefs of which you have spoken have not been tested longitudinally;—they have been picked up at different sections? Yes.
1096. Have you been down any of the claims that have had crushings? Yes.
1097. What is the extent of the stoping along the reef? Some have stoped for 20 to 30 feet. Some have driven shafts for 12 feet, or even 6 or 8 feet, and have taken out the whole body of stone from the surface right down to the bottom. In none of the claims have I seen 1 cwt. of stone on the surface; it has all been taken out and crushed.
1098. The country appears to be very regular in its gold-bearing formation? Yes. You will not see many rich specimens, but the gold is pretty regular right through.
1099. Do you not think that with the limited amount of prospecting that has been done on the field it is rather premature to speak as to its permanency yet? I think so; but I judge it to be permanent.
1100. From present indications you regard its prospects as good? I do. I do not think any miner on the field has ever seen such a surface show before, considering the intersecting veins and the main lines of reef that have been opened up.
1101. How long do you think the working of the respective reefs will maintain anything like the present population? They ought to maintain from 1,000 to 2,000 people for the next five or six years, and perhaps be better then.
1102. You are speaking of the present discoveries and the prospects of further developments? I do not think half the reefs have been found yet that will be found out towards Billy's Lookout and Buddigower.
1103. When you speak of a population of 2,000, do you mean a population of miners, or a general population? I mean that when the country is properly opened up, and the men are at work, there will be from 1,500 to 2,000 miners here.
1104. You have told us that there are seventy or eighty claims on gold? Well, I am under the mark; there must be more than that.
1105. I suppose you infer that connections will be made on the line of reef between the claims which are now getting gold? Yes.
1106. What do you think will be the number of miners maintained by these eighty claims? There are from four to eight men on each claim.
1107. Suppose there were eight men on each claim, that would afford employment for 640 people altogether? The claims are what are called eight men's ground, six men's ground, and four men's ground; but most of them on this field are eight men's ground.
1108. If gold is found along the reef between the various claims in which it is now being worked, you think the field will maintain a population of from 1,500 to 2,000 men? Yes, and probably more.
1109. Do you mean working miners, apart from the business people? Yes.
1110. Is any machinery going up here now? There are two lots of machinery being erected, and it is expected that a third lot will be put up.
1111. Do you think there will be any difficulty in obtaining water for the machinery erected here? I do not think so.
1112. Are there any catchments? There are any number of splendid catchments.
1113. Has not some discovery of water been made by sinking here? Not that I know of. I think we are about 200 feet higher than Barmedman. They get water there at a depth of 90 feet. I was working there for some years.
1114. You have been on all the rushes in New South Wales? On nearly all the rushes in New South Wales.
1115. I suppose it is a most usual thing to undertake the construction of a railway to a place directly gold has been discovered there? I think so.
1116. Do you think the prospects of this field would warrant a departure from the usual custom? I should not think they would.
1117. I suppose you are aware that it is proposed to proclaim a mining reserve of 50,000 acres; that land will be locked up from settlement? I think there is a vast amount of auriferous country for miles around,—from here to Lake Cargellico.
1118. Do you think it is necessary to lock up so much land for mining purposes? I do. I think the land ought to be thrown open to the diggers.
1119. Do you think an arrangement might be arrived at by which both agricultural and mining operations could be carried out together, giving people speedy access to the land? Well, the selectors and miners generally clash, and the miners have always found it difficult when they have found gold on private land to get permits to mine there. They have been kept off such land for three, six, and even twelve months, and perhaps after finding gold they have not been allowed to go on the land to mine for it.
1120. Assuming that the power of dealing with this matter were vested in the warden, and applications to mine upon conditionally purchased land could be granted by him, these permits could be obtained at once? Yes, and then things would be different.
1121. Do you think that that system would tend to ease the friction which now exists in the relations between miners and free selectors? Yes; if the miners could get on to the land in a week.
1122. I suppose you are aware that in the Mining on Private Lands Bill applications will have to be lodged with the warden, who will have full power to give permission immediately without reference to the Minister;—do you think that under that system agricultural and mining industries could be simultaneously developed here? I think so.
1123. Has it not generally been the case with respect to gold-fields that men who have made money on the fields have had afterwards to go to other districts owing to the land been locked up, even though they desired to settle there? So they have.
1124. If a system were introduced by which miners could get ready access to any land alienated in the vicinity of Wyalong, do you think this field would be the means of establishing an agricultural population there? I think so.
1125. Have there been any crushings on Conway's line of reef? Yes; there have been two crushings on that line of reef.
1126. Do you know what quantity of stone has been crushed? Twenty-two tons, yielding 103 oz.
1127. What is the average size of the reef? It varies from 6 inches to 1 foot.

- Mr. W. Barnet. 1128. To what extent has gold been discovered along the line of reef? For one and a half mile.
 1129. Do you think that if greater facilities were given to the miners to go upon the land here this field would be developed more than it is now? I do. Many of the men would have got good claims, and perhaps have formed homes for themselves.
 1130. Do you think that the development of the field has been retarded by administrative delay? I do.
 1131. And that the progress when those obstacles are removed will be very much greater than it has been in the past? I do.

Mr. William Bowman, miner, Wyalong, sworn, and examined:—

- Mr. W. Bowman, 1132. *Chairman.*] How long have you been at Wyalong? Since the 2nd January.
 1133. *Mr. Wall.*] Have you heard the evidence given by the previous witness? I have.
 1134. Do you agree with his evidence? I do, in every particular.
 1135. Is there any additional evidence you would like to give in reference to discoveries that have been omitted? There have been a few discoveries omitted—that is outside, to the south.
 1136. What discoveries have been made, apart from those already referred to? A discovery was made about $4\frac{1}{2}$ miles from here, in a south-easterly direction.
 1137. What is the nature of the country? Diorite.
 1138. Have they got payable gold there? They say they have; but there has been no crushing there.
 1139. Have you seen any of the stone? Yes.
 1140. What is your opinion of it? I believe that it is payable stone.
 1141. Is it in a well-defined reef? Yes; between two hard walls.
 1142. What is the width of the reef? About 2 feet 6 inches.
 1143. Have you inspected any of the reefs that have been opened up on the field? I have seen them all.
 1144. Do you consider that they are fairly well-defined reefs, and likely to be continuous? Some of them are better defined than others.
 1145. From your experience as a miner, do you regard the eight lines of reef referred to by the previous witness as likely to be payable? I think they have pretty well proved themselves so.
 1146. What is your opinion in regard to them;—do you think they are fairly well-defined reefs, and likely to be continuous, or are they merely patches which may run out? They are not patchy; but whether they are continuous is more than I can say.
 1147. Are you working in any claim here? Yes.
 1148. In what claim? The Santa Claus, on Conway's line.
 1149. Have you had a crushing? No.
 1150. Has there been any crushing on that line? Yes; for Conway and Party's claim.
 1151. What distance are you from there? Eight hundred yards.
 1152. Have you discovered gold? Yes.
 1153. Do you regard it as payable? I do.
 1154. What do you say it will crush? I reckon it will go 3 oz. to the ton; it might go more.
 1155. What is the width of the stone? It varies from 4 and 8 inches to a foot.
 1156. What depth has it been tested to? Sixty-eight feet perpendicular.
 1157. Have you only opened it up in one place? In two places.
 1158. At what distances apart? About 40 yards.
 1159. Do you regard it as the same line of reef as Conway is working on? Yes.
 1160. Are there any surface indications by which it can be traced? Yes; you can trace the surface-stone; in fact all the claims right through from Conway's have got the gold.
 1161. But there has been only one crushing from that place? There have been two crushings.
 1162. Do all between where you are and Conway's regard their discoveries as payable? I think they do.
 1163. Do you regard this field, taking it as a whole, as likely to support a large population for any length of time? As nearly as I can estimate it will support 2,000 miners.
 1164. For how long? For four or five years, but it may be longer. I can see that there is over two years of working in our claim.
 1165. Do you think there will be any difficulty in erecting machinery here to treat the stone? I do not think there will be any difficulty.
 1166. Is there a good water catchment? Yes, if we only get rain.
 1167. At present you have to take your stone to Barmedman? Yes.
 1168. That militates against the testing of the various claims? Yes.
 1169. Has there been any prospecting done in the district for alluvial? Yes, a little.
 1170. What is the general opinion with regard to the discovery of alluvial here? It has been discovered about 5 miles from here.
 1171. Has there been much drift discovered? There has been no washes yet immediately round the field, except a little ironstone wash. There has been no quartz wash.
 1172. Has any prospecting been done for surface gold? No; except at one place on Conway's line.
 1173. I suppose the development of the field would have been much greater but for the difficulty of obtaining permits? Yes.
 1174. Had the discovery been on Crown lands the place would probably have been further developed than it is? Yes; because the men would have had to work their claims or get someone to do the work for them.
 1175. *Mr. Dawson.*] Do you know of any crushings which Mr. Barnet omitted to mention? Yes; there have been several other payable crushings. There has been one from the Mallee Bull.
 1176. What number of ounces have been got from the Mallee Bull claim? Cusack and Party got an average of 2 oz. 7 dwt. from 27 tons, and the Mallee Bull claim gave an average of $1\frac{1}{2}$ oz. to six tons.
 1177. Is the stone easily got? Very easily got.
 1178. What would be the least result that would be payable? About 15 dwt.
 1179. I am speaking of the field as a whole? I do not believe that there is one claim on the field on gold where the stone is not payable.
 1180. How many do you know to be on payable gold? Between 70 and 80 claims are on payable gold.
 1181. How long have you been mining? Twenty-two years.
 1182. Whereabouts? This side of Gulgong.
 1183. *Chairman.*] Do you know the total quantity of gold produced to date? I could not tell you that.

1184. Have you any idea of the quantity of stone now at grass? I dare say there are over 600 tons on the field.

Mr.
W. Bowman.
14 April, 1894.

1185. That is payable stone? It is nearly all payable stone.

Mr. Ernest Joshiah Polkinghorne, miner, Wyalong, sworn, and examined:—

1186. *Chairman.*] For how many years have you been a miner? For eight or nine years.

Mr. E. J.
Polkinghorne.
14 April, 1894.

1187. You have heard the evidence of Mr. Barnot and Mr. Bowman with reference to this field; do you confirm their evidence? Yes, in every particular.

1188. Do you desire to add anything which they may have omitted, and which you think will be useful to the Committee in considering their report? They omitted to report the latest find, about 7 miles north from here. I believe there are 500 or 600 men there; but what they have done I cannot say. Several men who have claims there, however, speak very highly of the place, and three or four of the claims are already raising stone. They are on what is known as Gagie's Find. I would also like to add that Mr. Barnet was a little bit mixed in regard to the most westerly reefs. He put Gorman's first, and the Two-Up second; but between there is what is known as the White Reef, one of the best-defined reefs in the place.

1189. What distance is it from Gorman's? About 150 yards.

1190. That would make eight reefs? Yes.

1191. Gold-bearing stone has been obtained from that reef? Yes; they have had one crushing from what is known as O'Brien's. They got 21 oz. from 6 tons of stone, and since then they have sent away 10 tons more. This stone has been sent to the Clyde chlorination works, and treated there.

1192. Do you agree with the previous witnesses in regard to the area covered by the eight lines of reefs? Yes; if anything, they were under rather than over the mark.

1193. Do you think there has been any other inaccuracy in their evidence? No; in other respects their evidence was accurate.

1194. *Mr. Wall.*] To what depth has the White Reef been tested? The party who have already had a crushing are down about 55 feet; but we are adjoining them and down about 80 feet, and the reef looks better than it did higher up.

1195. What is the width of the reef? From 9 to 15 inches, carrying splendid walls.

1196. To what distance has the reef been tested along the line? About a quarter of a mile.

1197. Is it fairly continuous? So far as one can tell. There is similar stone in all the claims which are considered to be on the reef.

1198. How many claims are on gold? Five.

Mr. Frederick Channon, miner, Wyalong, sworn, and examined:—

1199. *Chairman.*] You heard the evidence of the two previous witnesses? Yes.

Mr.
F. Channon.
14 April, 1894.

1200. Do you confirm their evidence? I do in every particular.

1201. Have you any additional information which you can supply to the Committee? I have been acting as reporter for the *Tumut and Adelong Times* since the 15th January, and I have the original entries of crushings written down in my pocket-book.

1202. Will you read them to us? The first crushing recorded in this field was for Taylor and Party's claim.

1203. On what line of reef? It would be on the Two Up line—to the extreme south-west of the Two Up claim. They crushed 6 tons and got about 2½ oz. The next crushing is from Cassin and Party's claim, on Conway's line, who, from 12½ tons of stone, obtained 9 oz. 3 dwt. of gold. Then Neeld's No. 2 prospecting area, an east and west line, crushed 13 tons for 26 oz. 4 dwt. Conway and Party crushed 22 tons for 103 oz. Keith, who is on about the Two Up line, crushed 14½ tons, and got 35 oz. Neeld's Pioneer claim, an ironstone reef, running east and west, crushed 17 tons for 72 oz. 14 dwt. Perry's claim, which is on the Two Up line, so far as I can judge, crushed 22 tons for a result of 2 oz. 12 dwt. to the ton. Fraser's claim*, on the Two Up, or slightly to the east of it, crushed 10½ tons for 39 oz. 6 dwt. McMahon and Party, who have an east and west reef to the east of Conway's, crushed 3 tons 5 cwt. for 9 oz. 19 dwt. Gorman and Party crushed 38 tons, getting 2 oz. 4 dwt. to the ton. Hilderbrand and Party*, on the Two Up line, crushed 9 tons, getting 3 oz. 11 dwt. to the ton. McDonald and Party, of the Mallee Bull claim, crushed 6 tons 12 cwt. of surface stone or spuds, and got 1½ oz. to the ton. From a second crushing in Barmedman, Taylor and Party got 2 oz. per ton for from 15 tons. Then Davis and Party, on the Two Up line, from 10½ tons, got 2 oz. 12 dwt. to the ton. Cusack and Party, on the Mallee Bull line, for 13 tons got an average of 2 oz. 7 dwt. to the ton. Pettyfoot and Party, on Stanley's blow line of reef, crushed 40 tons for 42 oz. 12 dwt. J. King and Party, crushed 14 tons for 2 oz. 3 dwt. a ton; they are on Taylor's line. Thomas O'Brien and Party, crushed 6 tons at the Clyde Works, for 17 oz. Arthur Hassock and Party also crushed at the Clyde Works, 6 tons for 21 oz. 11 dwt. There are between 50 and 60 tons of stone at Barmedman, or on the road there—2 to 3 oz. stone.

1204. So that, in round figures, about 700 oz. of gold has been obtained from the field? Yes; and the gold has not been obtained from picked stone. A lot of headings and other rubbish has been crushed. They send everything from the surface to be crushed.

1205. *Mr. Wall.*] Can you give the Committee any idea as to the number of claims on gold? About forty or forty-one proved payable, while there are about eighty between them, which, I have no doubt, will prove payable when they have had a crushing†.

1206. Can they not discover the gold by dollying? Yes; the stone crushes well in the dolly.

1207. Other witnesses have estimated that there are about eighty claims on gold; is that estimate in your opinion excessive? Well, I reckon that there are about 120 claims on good gold, but they have not been proved. I reckon there are about forty which are certain, and about eighty others which will prove payable in the course of a week or two, after the stone has been crushed.

1208.

* NOTE (on revision): Fraser and Party and Davis and Party are all one and the same.

† NOTE (on revision): Sixteen claims have proved payable by crushing, twenty-five claims are raising stone, which is almost certain to prove payable when crushed, while there are from thirty-eight to forty more in various stages of development on the different lines, the holders of which seem confident that at a certain depth they will strike payable quartz.

Mr.
F. Channon.
14 April, 1894.

1208. Do you think there are a sufficient number of claims on gold to support a considerable population for some time to come? Yes; I believe that in the near future this will turn out to be a great agricultural district. I have travelled round a good part of the country, and I know that the soil in the mallee here is very rich. From my experience, it is second to none in New South Wales; and taking that fact into consideration, together with the existence of the gold-fields, I think you would be perfectly justified in running a line of railway to Wyalong.

1209. But the absence of the railway would not in a great measure retard the development of the field? It would not retard it, but it would greatly assist it. The fact of a railway being constructed will greatly assist development. I think the field will go ahead in spite of the want of a railway.

1210. You say that you have no doubt that a railway here would promote a very large amount of settlement? I have no doubt of it.

1211. Does it not usually happen that agricultural settlement is greatly retarded by the reservation of land for mining purposes? I think there is any amount of agricultural land besides that which it is proposed to reserve for mining purposes.

1212. It is proposed to reserve 50,000 acres here? So I heard a little while ago.

1213. And it is proposed to reserve the land for a mile on each side of the proposed railway from here to Hillston? Yes.

1214. Do you not think, from your experience as a miner, that some satisfactory arrangement must be come to whereby wardens could authorise immediate entrance upon private property? Yes.

1215. Do you think a compromise could be come to whereby it would be possible to develop agriculture and mining simultaneously? I do.

1216. Do you think that persons desiring to go in for agriculture would object to take up land upon which miners had the right to search for gold? I do not. I think such an arrangement will be beneficial to both parties.

1217. I suppose it will be of great advantage to the selectors to be close to a large mining community? It has been proved so already. The selectors have done remarkably well out of this little rush to Wyalong.

1218. Can you give the Committee any idea as to the approximate number of claims on Gorman's line of reef? Between five and six have found gold on it.

1219. You have already given the Committee some information with regard to the crushings from the Two Up line; can you give us an idea of the number of claims on gold on Fraser's line? There are five or six on that line; but it is difficult to determine which is the line, because the mallee is so dense.

1220. Then there are Neeld and Party's, Erwin and Party's, and Thompson's lines of reef; do you think they are fairly developed? Yes, and every week I visit them I find some improvement. A miner understands his business, and by questioning him you can get to know pretty correctly what he is doing. They all agree that the reef is improving as they go down, both in width and in quality.

1221. Do you think that if the selection here was resumed, it would expedite the development of the field to a great extent? Yes, and from 1,000 to 1,500 more miners would be employed.

1222. What is your opinion about the site of the new township? It is generally known as Slec's Mistake.

1223. Did you not hear that the land there is higher than this land, and that provision is to be made for the conservation of water there? It is a beautiful site for a township; but if people will not go there to live, you cannot force them to do so. The population has settled at the White Tank, and the business people have followed them there, and now no one can force them to move. I might say that I was introduced to Mr. Wade by Mr. Polkingborne. He stated his business to us, and we hired a trap and took him round to pretty well all the tanks in the district. We also took him out to a water catchment about half a mile or three quarters of a mile on Bolte's conditional lease which he acknowledged to be one of the best catchments he had seen on the field, and he informed me he would report favourably upon its resumption as a Government tank for the use of the field.

1224. How far would that be from the present camp? Half a mile or three quarters of a mile.

1225. Have you seen the water? Yes, I have waded in it.

1226. You are not using that water at the present time? The water has dried up now; but there is a natural catchment there formed by a blind creek.

1227. A dam could be made there and sufficient water conserved to supply the whole field? Yes, if the tank were large enough.

1228. Did you hear from Mr. Wade his reason for not recommending the resumption of that land? I did not know that he had not done so.

1229. Do you know that he has not recommended its resumption? No, I do not. As far as I know he may have done so. I took him out to Carter's tank, and he told me that he was trying to make arrangements with Carter to allow the miners to use his tank temporarily.

1230. But there is a legal difficulty in the way? Yes.

1231. Have you heard anything about the new rush? Yes.

1232. Can you give us any information about it? Not authentic information, because you cannot rely upon what you hear on the field. You must visit the place and make personal inspection before you can give a correct account of it. I would like to add that James Channon, of Beaconsfield, Concord, and John Plumb, of 60 King-street, have purchased a boiler and engine and have ordered rollers from the foundry for the erection of machinery on the field. They intend to establish chlorination works here.

Mr. Armand Thierman, miner, Wyalong, sworn, and examined:—

Mr.
A. Thierman.
14 April, 1894.

1233. *Chairman.*] You desire to give evidence in regard to some machinery you intend to erect on the field. Will you tell us the value of that machinery and its nature? The machinery my syndicate propose to bring here is new machinery, and negotiations are now pending to have it made at a foundry in Sydney; but I do not know which foundry is making it. One of my syndicate was up here a little while ago, and on my recommendation it was decided to bring new machinery here instead of second-class plant.

1234. Do you know what the probable cost will be? Somewhere about £1,500.

1235. Has the order been given for the machinery? I cannot tell you. I should have had word to-day we are excavating a tank for it.

1236. You have procured a site? Yes.

1237. Have you any doubt about the machinery being sent here? No, I have no doubt about it.

1238. *Mr. Wall.*] Is it crushing machinery? Yes; I recommended a 10-head battery with concentrating appliances. Mr.
A. Thierman.
1239. What sort of concentrating appliances—fulvanners? No; because the percentage of pyrites is too high. 14 April, 1894.
1240. Have you formed a syndicate for the express purpose of erecting this machinery? Yes.
1241. With a capital of £1,500? The capital of the syndicate is not limited to £1,500; the capital will be what it costs to erect the machinery.
1242. If you require more money you will call it up? Yes.
1243. You do not expect to erect machinery here with concentrators for £1,500? Yes; it can be done. Machinery is a lot cheaper now than it used to be.
1244. Are you excavating a tank? Yes; we have got about 2,000 yards out already. The tank-sinkers are still at work.
1245. Do you think that the prospects of the place are sufficient to warrant such an expenditure? Yes; as far as present indications go. The field is almost certain to be a permanent one.
1246. Your machinery is in course of manufacture at Sydney? My syndicate wrote to me asking certain questions with regard to it, and it is certain that it will be made.
1247. *Mr. Dawson.*] You are a working miner, I suppose? I have been connected with mining in New South Wales for fifteen years.
1248. Getting syndicates together to buy machinery is not being a miner. Where were you working? I was four years at Broken Hill.
1249. Were you working there? Yes, and I erected several batteries for Alfred Bennett at Peak Hill. I let out his tanks and fixed his machinery.
1250. I suppose you have got a great many promises of support when the machinery is erected? Yes; but promises do not count for much. Good machinery will carry the day here.
1251. *Mr. Wall.*] You would not require many promises for a 10-head battery? Only 80 or a 100 tons a week.

Mr. John Neeld, miner, Wyalong, sworn, and examined:—

1252. *Chairman.*] Are you one of the original prospectors? No. Mr. J. Neeld.
1253. What information can you give which you think will be of assistance to the Committee in deciding upon the matter now under their consideration? I have been about the district a good deal, and have noticed the country right through from here to what they call Rankin's Springs, a distance of 60 miles. I have also travelled from Broken Hill through Wilcannia, Cobar, Lake Cargellico, and Eubalong to Wyalong. Then I have been from Barmedman to Woolengough. Close to Wyalong and out towards Rankin's Springs there is ironbark which I think would be suitable for sleepers. 14 April, 1894.
1254. Could the sleepers be obtained at a reasonable price? Yes.
1255. Have you any idea of the price at which half-round sleepers can be obtained? No; but I know that a large quantity could be got within 15 miles from here.
1256. Have you any other information? I can give information with reference to the cost of settlement here. If the land were thrown open, people would come over from Victoria and settle here. Between Lake Cargellico and Wyalong the land is very suitable for agriculture and pastoral pursuits, and when I came here first I was so much taken with the country that I wrote to my father and brothers and advised them to come here and select.
1257. How long ago was that? A little over twelve months ago. After they selected here other people followed to see the country, and they considered that the land was as good as the Goulburn Valley land from which they had come, and that is the finest land in Victoria.
1258. But is there not a better rainfall there? No.
1259. What is the rainfall? It has been as low as 5 or 6 inches.
1260. But the average rainfall? It is something about the same as this.
1261. About 18 inches? Yes. We came as close as Wyalong simply to be near the railway, and as the full area could not be obtained, only one brother selected, the other six following to take up land as soon as it was thrown open. I have no hesitation in saying that as soon as the railway comes to Wyalong a tremendous lot of land will be taken up between here and Lake Cargellico.
1262. Do you think the land is suitable for agriculture as well as for pastoral pursuits? Yes.
1263. And if the anticipated mining population were to settle at Wyalong, the surrounding farmers would be able to supply all necessary provisions with the exception of tea and sugar? Yes.
1264. Is there anything else you would like to add? On my way to Lake Cargellico from Cobar I passed through Mount Allen, where they have just discovered good gold. There was no water in the district then, and there has been no water since; but I have no hesitation in saying that there is a good gold-field there. At Cargellico I bought some peaches and grapes, which were as good as I had ever seen before. The gentleman from whom I bought them said that he grew them on the bank of a creek from 4 or 5 miles on the other side of the Lachlan, where he has a homestead of 2,560 acres. He had a lot of sheep with him at the time, which he was taking to Mount Allen to kill. He said it was too far to send to Sydney, and, therefore, he thought it better to open a butcher's shop, and dispose of his sheep in that way.

Mr. Thomas Andrew Crowe, Editor of the *Wyalong Star*, Wyalong, sworn, and examined:—

1265. *Chairman.*] Have you any other occupation here besides that of journalist? No. Mr.
T. A. Crowe.
1266. You have heard the evidence given by the various witnesses. Do you generally confirm their opinion? Yes; as far as I have been able to judge, they are correct. 14 April, 1894.
1267. Can you give any additional information which you think would be of assistance to the Committee? When I came here three weeks ago, there were only a certain number of claims on gold; but in my visits round the field I found the number increasing, and a calculation I have made to-day, shows that it has just about doubled itself. With regard to the list of crushings given to you by Mr. Channon, I think he has given one crushing twice over, because Fraser and Party's, and Davis and Party's crushing was only one crushing.
1268. Then his return of gold is incorrect by about 30 oz.? Yes; I might also say, that to my knowledge, there are very nearly 100 tons of stone either at Barmedman or on the road there. That is as near as I can

- Mr. T. A. Crowe. can judge, by seeing the loads that have gone away; and in visiting the claims from which crushings have taken place, it seemed as if the men had gathered up all their stone, expecting gold to be in it, and sent it away. There was no evidence of any stone having been picked.
- 14 April, 1894. 1269. You think that fair average stone was sent away? I think that all the stone was sent away from claims which had crushings.
1270. So that the results obtained from further crushings will be better than those obtained hitherto? The opinion among the miners is that the returns from the next crushing will exceed those which have hitherto been obtained. I know that claims which, when I first came here, were only turning up moderate stone are now getting splendid stone. In my opinion, the quality of stone on the field is improving.
1271. Mr. Wall.] Can you give us any idea of the number of crushing plants in course of erection? I only know of Mr. Gough's; but Mr. Plumb and Mr. Channon have called for tenders for the excavation of large tanks, because they intend to erect machinery here.

Mr. Charles McHardy, Mining Registrar, Wyalong, sworn, and examined:—

- Mr. C. McHardy. 1272. Chairman.] You wish to hand in a return? Yes. The number of miners rights issued since the 19th March, is 970, in addition to a large number previously issued at Barmedman. Twenty-five business licenses have been issued, and over 100 surveyed town allotments have been conditionally registered. About fifty more have been applied for. Three hundred and twelve quartz claims have been applied for since the 19th March, and from seventy to eighty applications for permits to mine on conditionally purchased and conditionally leased land have been lodged at the Mining Registrar's Office here since that date. Previous to the 19th March, a large number of permits were applied for at Barmedman.
1273. What amount of revenue have you received since the 19th March? About £580. These figures are very nearly accurate.
1274. The information has been compiled from records in your office? Yes.

MONDAY, 16 APRIL, 1894.

[The Sectional Committee met at Spring's Hotel, Wyalong Government Township, at 9.30 a.m.]

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (CHAIRMAN).

HENRY DAWSON, Esq.

WILLIAM CHANDOS WALL, Esq.

The Sectional Committee further considered the proposed Railway from Temora to Wyalong.

Mr. John Plumb, grazier, Marrickville, Sydney, sworn, and examined:—

- Mr. J. Plumb. 1275. Mr. Wall.] How long have you been on this gold-field? I first came here about two months ago; but I have not resided here continuously.
- 16 April, 1894. 1276. You have been largely interested in mining in this Colony? Yes.
1277. For how long? Over twenty-five years.
1278. Did you visit this field to engage in mining pursuits? Partly with that object, and partly to introduce machinery here if the prospects of the field would warrant it.
1279. You have had a fair opportunity of judging of the merits of the field? Yes.
1280. Do you think it likely to be a permanent field? Yes; that is my impression.
1281. Have you received sufficient encouragement to warrant you in undertaking the erection of machinery here? Yes; my friends and myself have ordered machinery, and I have let a contract since I came here for the excavation of an 8,000-yard tank.
1282. Where do you propose to excavate your tank? Just below Neeld's prospecting claim, on his conditional lease.
1283. What work will be done by the machinery you propose to erect? At first we shall erect machinery which will do about 150 tons weekly; but ultimately, as the field develops, we shall increase our plant until we can do 300 tons or more each week.
1284. You have been for some years engaged in mining in the Carcoar district? Yes; and in the western, southern, and northern districts. I have been in nearly all the districts in the Colony.
1285. Comparing the prospects of this field with those of others in which you have been interested, do you think it likely to be permanent? That is my impression, otherwise I should not have embarked my money, and that of my friends', in a venture here.
1286. What population do you think is likely to be located here for any length of time—say two or three years? I imagine that if the reefs were developed, they would employ 500 or 600 miners, and they, together with their families and tradesmen, would form a population of about 2,000.
1287. The present development of the field warrants you in coming to that conclusion? That is my impression. Of course the place is practically untried yet in many parts, and there is a prospect of further developments.
1288. It is possible that the reefs may go down 200 or 300 feet? Yes; I saw Mr. Taylor when he was down about 120 feet, and he told me that the reef was then looking as well as it looked before, and showed no signs of giving out.
1289. What line of reef is his claim on? It is in the Mallee, south of Neeld's No. 2 prospectors' claim.
1290. Mr. Dawson.] Do you know how many of the claims are on payable gold? I could not say accurately; but I should estimate that there are between twenty or thirty on really payable gold.
1291. It has been stated that between thirty and forty are on payable gold, and that eighty had struck gold? That is quite possible. I have been away from that place for some time and developments have taken place in my absence.
1292. Suppose eighty claims have struck payable gold, they would employ more than 600 men? Yes; if they went vigorously to work.
1293. Do you feel perfectly satisfied that you are justified in expending your money here? Yes.
1294. What do you think is the extent of the auriferous belt which has been opened up? From what I have been given to understand this particular belt is 2 miles in width by 5 or 6 miles in length. There

is another belt more to the west, out towards Lang's selection, which I do not know much about. That, I think, is distinct from this. Mr. J. Plumb.

16 April, 1894.

1295. The 2-mile by 5-mile belt takes in Conway's line of reef? Yes.

1296. *Chairman.*] In addition to the machinery you have already ordered, is it your intention to establish chlorination works here? Yes; if the prospects of the field warrant it, and we get sufficient patronage. I think they will be necessary soon because of the nature of the ore here. Some of it is pyrites will have to be treated in that way here or else they will have to send their concentrates to Sydney.

1297. In round figures, what do you propose spending here? The cost of complete chlorination works will be about £5,000; we should be working very economically to put them up at that.

1298. Their immediate expenditure will be how much? From £2,000 to £2,500.

1299. *Mr. Dawson.*] Do you think it would be advisable to construct a light line of railway from Temora here? I think so with the ultimate object of extending it to the river. I think it would be much cheaper than the cost of a good road.

1300. Have you made an offer to construct such a line? Yes; after my first visit to this field, I wrote a letter to a friend of mine, and asked him submit to the Government a proposal to construct a railway from Temora to Wyalong, which should be a sort of object lesson to people in other parts of the country, that is to say, we should use the present roadway, and old Government rails and fastenings, putting down rough sleepers. I estimated the distance at 40 miles, and proposed that the Government should allow us to use some of the light tram motors. With the consent of a firm of contractors, I offered to complete such a line within three months, at £500 per mile, using box and ironbark sleepers, rough split and flattened on the top and bottom.

1301. Were the contractors *bonâ fide* men? Yes; and they were quite prepared to enter into any reasonable guarantee or bond.

1302. *Chairman.*] Would the formation of the permanent-way be undertaken by yourself and friends? Yes; the permanent-way would have no ballast, and in some places there would be no formation. The sleepers would be laid flat on the earth.

1303. What kind of sleepers? Sleepers such as I have just described, 8 or 9 inches wide, and the regulation length.

1304. Do you not think that in wet weather the sleepers would sink? Possibly they might; but they could be raised a little above the surrounding country. The ballast would sink a little. I think it would be possible to use steel rails, which are now of no value at all. They would be good enough for carrying light tram-motors, running at a speed of 8 or 10 miles an hour, and only in the daytime.

1305. Do you think you could ensure the use of hardwood sleepers all through? Yes; from what I can learn from people in the district. I was speaking to Mr. McGregor, of Merringanowrie, and he told me that he has box on his property which was put up forty years ago, showing that it is durable wood.

1306. Do you think it is sufficiently durable for sleepers? I think so.

1307. In the event of your offer being accepted, what would you expect from the Government in the way of materials? Rails, fastenings, and everything necessary for the line, except labour and sleepers.

1308. Would you find all the necessary labour? Yes. Of course the Government would have to put up station buildings, if they were required.

1309. But you would find all the necessary labour, if the Government contributed the material you have described? Yes; they would complete the survey, and then would merely have to supervise the construction of the line.

1310. *Mr. Wall.*] What would be the gauge? The ordinary gauge.

1311. Do you not think it would be risky to run trucks over a line laid on the earth? It might if the trucks were heavy; but why not run light trucks?

1312. That would necessitate the construction of special trucks? I think that in this dry country, where it is only at odd times that there is heavy and continuous rain, sleepers laid at a distance of from 18 to 20 inches from centre to centre would hardly sink.

1313. Can you give us any information regarding the cost of a light line such as the Government have constructed to Cobar, and the extent to which such a line would meet the requirements of this district? I have not considered the matter, though I have read what those lines have cost. They, however, are ballasted, and are much heavier and more permanent than the line I suggest would be.

1314. Do you know of any place, either here or elsewhere, where the Government have constructed railways such as you refer to? I have not heard of the Government constructing such railways; but in America sleepers are laid on the ground, and the same thing is done here in connection with mine tramways. Of course the rolling stock used is not so heavy; but they serve the purpose for a time.

1315. *Chairman.*] You would regard this as a temporary, not as a permanent line? Not as a permanent line. If it lasted for five or ten years, it would have served its purpose in opening up the country, and a permanent line could afterwards be put down more cheaply, because the sleepers and the material intended for it could be carried on the temporary line.

1316. *Mr. Wall.*] Is it not a new thing to propose to construct a railway to a place immediately gold is found there? Yes; but seeing that the land both here and further on is good land, I think the line has been proposed more with a view to open up the country at less cost than that of a macadamised road.

1317. Have you any idea of the amount of agricultural land available close to existing railways? I could not say what the extent would be.

1318. Can you tell the Committee whether the construction of the Temora line has increased the settlement round about Temora? I have been told by residents in the place that it has increased the acreage under cultivation.

1319. Then you think that if the construction of a line to the Lachlan is justifiable, the development of this field will be sufficient to warrant its construction as far as Wyalong as a matter of urgency? If it were to meet the requirements of Wyalong only, I should say no; but with the ultimate object of making a national line to the Lachlan, I should say, "Yes; go on with the work."

1320. You think the development of Wyalong a strong justification for the immediate construction of this section? Yes.

Mr. Robert Cassin, miner, Wyalong, sworn, and examined:—

- Mr. R. Cassin. 1321. *Mr. Wall.*] How long have you been on the field? I came here the day on which the gold was reported—the 18th December last.
- 16 April, 1894. 1322. You have been engaged in mining pursuits in this district for some time? Yes, for ten or eleven years.
1323. Have you any interest at Wyalong? Yes, I have an interest in one mine.
1324. You have a general knowledge of the field and its development? Yes.
1325. What is your opinion with regard to its permanency? I think, from the number of blocks of stone that have been found, and the extent to which the reefs have been proved, that this will be a good wages field for perhaps 1,000 men for five or six years.
1326. Can you say anything as to the cost or difficulty of getting supplies from Temora;—what is the cost of cartage at present? About £2 per ton. It has been as high as £3 10s. per ton; but when the roads are good you can get your stuff carted for £2 a ton.
1327. Do you think there will be any difficulty in getting supplies if the wet season sets in? I think there will be considerable difficulty; but it is possible that supplies would only be stopped for a fortnight or three weeks, and even within that period it might be possible to bring up something by the road.
1328. Have you any knowledge of the country in the direction of Cargellico and Hillston? Yes; I travelled over that country when working at my trade as a saddler after leaving Wagga Wagga.
1329. Do you regard the proposed extension of the railway from Temora to Hillston as likely to open up a large extent of country? My knowledge of the settlement between here and Yalgogrin is not recent. I knew the country a number of years ago, when no settlement had taken place there.
1330. But there has been a considerable amount of settlement since then? Yes; but I have not been there.
1331. Then you cannot say much as to the value of this line, regarding it as part of an extension from Temora to Hillston? Only from the communications which I have received from people along the route, urging its construction in order that they may be able to use their land.
1332. Do you regard the land which it will traverse as good agricultural land, which would support a large population if the railway were made? There are large belts of land on either route which could be put to agricultural use; but the line would serve a larger population if taken *via* Cargellico, and would also go through better land. Then, too, at Cargellico there is water which might be used for irrigation.
1333. You are managing some crushing machinery at Barmedman? Yes.
1334. Several crushings have been put through there? Yes.
1335. You heard evidence given on Saturday with regard to the results obtained? Yes.
1336. Were those statements correct? There were only fractional differences; but I will furnish the Committee with the correct returns within a few days, showing the weight of stone, and the amalgam retorted, and afterwards smelted.
1337. Do you regard the Wyalong stone, crushed at Barmedman, as better than anything that has been opened up in the district before? Yes. The development of this field will employ more people than Barmedman and Temora put together. I think there is a better mine in Barmedman than any of those here; but there we have to contend with water, and it will take a considerable amount of capital to develop it.
1338. You look upon the average yield from Wyalong stone as satisfactory? It is very satisfactory. I made a calculation in connection with the various crushings, and I found that sometimes the men earn £15 a week for the time they work. In only two instances did they not earn wages. As a rule, they earn from £2 10s. to £8 and £15 a week.
1339. Are the different claims in which gold has been discovered regarded as generally satisfactory? The miners express themselves as very well satisfied with the returns which they have obtained.
1340. *Chairman.*] Can you give us any information in regard to the coaching traffic between Temora and Wyalong? Before the rush, it was not worth considering, because the people living about here use their own vehicles, and in fact, there was no regular coach, which could be depended upon. There was a mail coach once or twice a week; but it started at an hour which suited nobody.
1341. And since the rush? Since the rush there has been such a number of coaches running that I could give you no idea of the traffic.
1342. What was the fare before the rush? There was no stated sum; but as it was 7s. 6d. from Temora to Barmedman, I should think you could have got here for 15s.
1343. What is the fare now? It was £1; but I believe it has now come down to 10s.
1344. Is the traffic very great? Yes; it is considerable.
1345. Are there many teams along the road? Yes; I should think there are as many as forty or fifty on the road.
1346. Do you wish to add anything to the evidence you have already given? Yes. Several witnesses were asked if they thought the Government were justified in making mining reserves here, and if such reserves were detrimental to settlement. With regard to that matter, I should like to say that I think it was very wise to make the reserve which has been referred to, because, had it not been made, there would have been a rush of selectors here to pick out the eyes of the place, some of whom would probably have taken up the full area. In my opinion, 2,560 acres is too much to give to a man near a population such as there is here.
1347. *Mr. Wall.*] I asked if the agricultural interest would be affected by reserving 50,000 acres here, and if some system might not be adopted whereby agriculture and mining could be simultaneously developed? When the Department has had time to look round, they can revoke such reserves as are suitable for agriculture. That would tend to develop the field more profitably in the long run.
1348. I suppose you are aware that when once these reserves are created, it often takes years before they are thrown open again? Yes; but at Barmedman we succeeded in getting some of them thrown open. There are others that will be thrown open as soon as the requirements of the Railway Department are understood.
1349. How long is it since these reserves were first proclaimed? When Barmedman was first a gold-field; but some of them were revoked three years afterwards, and were sold as special areas.
1350. How long is it since Barmedman came into existence? Ten or eleven years.
1351. And some of these reserves are only about to be opened now? They have all been surveyed; but, since it was not certain what route the railway would take, they have not yet been thrown open.

1352. Were any of the reserves thrown open until the greater part of the population left the field? No; Mr. R. Cassin. the diggers would have protested against the land being thrown open, because the feeling of the mining population would have been that land was being closed on which alluvial mining existed. The land, however, would not have been taken up with a view to obtaining compensation for its resumption, but because there was a population close at hand. 16 April, 1894.

1353. Do you think that the area allowed to a man should be smaller in the vicinity of population? Yes; or alongside a railway. Two thousand five hundred acres is too much in such a case.

1354. Do you know of any instance where, when large blocks of land in the vicinity of a gold-field have been locked up in reserves, they have been thrown open again before the mining population left the field? I have had no experience in that respect.

1355. I suppose you are aware that something like 100,000 acres were locked up at Gulgong? Yes.

1356. And that hundreds of miners who had made sufficient money on that field to enable them to become independent settlers had to leave the district because they could get no land there? I believe so; but I think some system could be adopted by the Department which would enable men to go upon the land and settle on it, and allow others to mine under it.

1357. If the simultaneous development of agriculture and mining could be allowed to take place, that would have a greater tendency to establish settlement than the present system? I do not hold with locking up the land for a long time, and I do not think that mining and agriculture are antagonistic industries; but still I am of opinion that it would have been unwise not to make these reserves. I have been speaking to the settlers in the district, and I find that they are anxious for a market to be provided for them, so that they may go in for farming. There is a very fair class of selectors here; the men are not land jobbers. I formed that opinion from hearing them speak, and from the fact that since the extension of the line to Temora they have made a marked effort to clear land and get ready for increasing their income by means of farming instead of continuing to depend solely upon the raising of sheep, which most of them find does not bring in enough for them to live on and to pay their instalments.

1358. *Chairman.*] Are you the owner of much land round Barmedman? No, I have a very nice selection; but the Bank has the best hold of it.

1359. What is the area of your selection? One thousand two hundred and ten acres.

1360. Had you that selection at the time of the projection of the Temora railway? Yes; I had it cleared and fenced and subdivided, and I built houses and put a garden, orchards and dams upon it. In the first year after the railway came to Temora, I cleared 40 acres; but I found that I was likely to lose it, and therefore I did not spend any more upon it.

1361. Was that land suitable for the production of other crops besides wheat? I grew very nice fruit on it, and I had every prospect of making a good orchard there. An adjoining neighbour grows very nice oranges, grapes, and other fruit of a similar description.

1362. Can you say whether the land beyond Temora has been taken up for *bonâ fide* settlement, or merely for speculative purposes? I only know two men who have sold out, except those whom the Banks have compelled to sell. There was only one land jobber who came to Barmedman, and he did better than the genuine men, I think. I do not know a man in the district who is considered to be a dummy.

1363. You know that the land has been taken up in very large areas? Yes; in blocks of 2,560 acres, and in some cases where men have selected for their sons and daughters who are not of age, the holdings are as large as 7,000 or 8,000 acres.

1364. Do you think the land has been selected so that people may settle upon it, or has it merely been taken up so that it may be sold to the pastoral lessee? Except in one case, I think, men have taken it up in order to make homes and keep their families around them, and, of course, they get as much land as they can. The danger is, however, that they may not be able to work it profitably, and that the Banks will then come in.

1365. Do you think they have taken up more land than they can possibly use? I am certain of it. Their capital is exhausted by the time they have got their fencing and scrubbing done, and they cannot complete their improvements without borrowing. If they could do without borrowing, they would be able to make good homes for themselves; but being short of capital, when their instalments have to be paid, at the end of three years, they have not got the money to stock with, and are thus placed at a disadvantage. They probably buy their sheep on bills, and then, in order to meet these bills, have to sell the sheep again at what is, in a measure, a forced sale, because they have to look for a customer within a given time.

1366. As soon as their instalments become due, men who have taken up large holdings find themselves in such a crippled condition that they are obliged to sell at the first opportunity? Yes; they cannot pay their instalments from wool. The payment of 1s. per acre, if a good crop can be put in, is nothing; but when the money has to be paid out of wool, the selectors are not able to do it. They might get through if they farmed a good part of their land.

1367. And is it your opinion that the land in this district should not be thrown open in such large areas? I think that people should either not be compelled to pay their instalments until a railway is brought within a given distance of them, or that they should be compelled to remain leaseholders. In my opinion 2,500 acres is enough for a family, if the children are not of age. As a matter of fact, when a large family selection is taken up, the head of the family becomes the owner of it.

1368. *Mr. Wall.*] Seeing that the people who came to the district as pioneers were compelled to turn their attentions to pastoral pursuits, and were only allowed to take up 2,560 acres, it would be possible for a man, if a railway were made, to get his living on a smaller area? I would prevent men from taking up more than 2,560 acres; but I would not compel them to pay their instalments until a railway had been brought somewhere near them.

1369. Do you think that if the Government were to clear the land alongside the railway, and subdivide it, they would have any difficulty in letting it to farmers who would be willing to pay rent for it? I do not think there would be the slightest difficulty about that.

1370. You attribute the failure of the existing settlement to the want of capital;—if people could obtain a lease of the land alongside the railway, so that they would only have to put their labour into it, and would not require capital, do you think there would be any difficulty in getting tenants for it? Not the slightest.

[The Sectional Committee met at the Court-house, Temora, at 2:30 p.m.]

Present:—

The Hon. FREDERICK THOMAS HUMPHERY (CHAIRMAN).

HENRY DAWSON, Esq.

WILLIAM CHANDOS WALL, Esq.

The Sectional Committee further considered the proposed railway from Temora to Wyalong.

Mr. John Richardson, relieving station-master, Temora, sworn, and examined:—

Mr. J.
Richardson.
16 April, 1894

1371. *Chairman.*] How long have you been here? Thirteen days.
1372. Have you had access to the railway returns at Temora from the time of the opening of the line? Yes.
1373. Are you in a position to give the Committee information as to the volume of traffic here? I received a telegram from the Committee this morning, asking me to prepare information in regard to goods and passenger traffic, but as I have not had very much time the returns are only approximately correct.
1374. What would the difference be—a few pounds one way or another? Yes; the difference would not be more than £5 at the outside.
1375. Will you hand in your returns? The revenue received here since the opening of the railway has been £4,130.
1376. Outwards and inwards included? Yes.
1377. How many tons does that represent? Four thousand seven hundred and sixty-four tons. The outward traffic has been very heavy, but we get no revenue from that, because it is collected at other places.
1378. The amount you have stated was received at this end? Yes; it includes both passenger and goods takings. What we send from here is collected at Sydney or Goulburn, or at other places, and what they send here we collect at Temora.
1379. *Mr. Wall.*] Are we to understand that £4,130 are the earnings of the line between Cootamundra and Temora, or is it the amount collected upon goods conveyed from other places to this station? That is it.
1380. Can you give the Committee any idea of the value of the traffic on this branch line alone? No, I cannot; but you could get it from the Commissioners.
1381. What has been the classification of the tonnage? It would take a week to get out a return classifying the tonnage; but in Sydney they make out returns of what they call sectional expenditure, so there would be very little difficulty in getting the information from the Commissioners.
1382. The earnings on this section of line would be much greater from here to Sydney than from Cootamundra here, because on the up journey they would represent a contribution to the main line? Yes.
1383. *Chairman.*] What is the charge between Temora and Cootamundra? Third class, £1 3s. 7d.; second class, 17s. 8d.; first class, 14s. 7d.
1384. Under what head would the bulk of the traffic come? It would be second and third class.
1385. If over 4,000 tons of goods passed between Temora and Cootamundra, the earnings upon this branch line would probably exceed £4,000 for goods alone? Yes.
1386. Has the coaching traffic been heavy? It has been very heavy during the last six weeks—since the rush to Wyalong broke out.
1387. Can you say what it was before the Wyalong rush? Well, in January, the number of passengers from Cootamundra to Temora was 190, and from Temora to Cootamundra 187. In February, it was 1,400 from Cootamundra and 217 from Temora; in March, it was 1,250 from Cootamundra and 303 from Temora, and this month we have had 450 from Cootamundra and 250 from Temora. Great numbers of people are returning from the rush.
1388. *Mr. Wall.*] Can you give us any information in regard to the increase or decrease of goods traffic? The revenue for January was £582 16s. 11d.
1389. From goods? No, the total revenue.
1390. Can you give us the tonnage for the respective months? Yes; the inward tonnage in January was 152 tons, in February, 195 tons, in March, 555 tons, and in April 345 tons.
1391. *Mr. Dawson.*] Does that include parcels and everything? No.
1392. *Mr. Wall.*] So that the inwards traffic was nearly four times as great in March as in January? Yes.
1393. Is not January considered rather a busy month? No, December is considered to be a busy month, and January is supposed to be a quiet month, after the rush of Christmas traffic.
1394. What is the rate for third class goods from Sydney to Temora? £7 5s. a ton.
1395. And from Temora to Sydney? It is very much higher than that; but I do not know exactly what it is.
1396. Has there been a gradual increase in the traffic of the line since it was opened? Yes.
1397. I suppose that would be accounted for mainly by the fact that the cereal crops came in at the end of the year? It would be attributable largely to that.
1398. Can you say whether there has been an increase in general merchandise? It has been about the same all through.
1399. Has much grain been sent from Temora since the railway was opened? Yes. I was given to understand by my predecessor that they had something like 30,000 bags of grain stored here awaiting the opening of the line.
1400. It is reported that a large quantity of grain is stored here now awaiting a rise in prices; is there any truth in that rumour? I cannot give you any information about that.

Mr. John Maurice Foley, Post and Telegraph Master, Temora, sworn, and examined:—

Mr.
J. M. Foley.
16 April, 1894

1401. *Chairman.*] How long have you been in the district? I have been connected with the office here since 1880.
1402. You have watched the growth of the district since then? Yes; it has been very great.
1403. Will you give us what information you can in regard to the Post and Telegraph Office returns here? I have only got them from August last.

1404.

1404. That was the last month before the opening of the railway? Yes; the sale of postage stamps has increased to the extent of £50, being £80 this month as against £30 in August. There has been a steady increase in the returns, and the telegraph revenue has increased to the extent of £20 a month. The Savings Bank business has also greatly increased; but I could not say from memory to what extent. The amount of revenue transmitted to Sydney between the 11th August, 1893, and the 16th April, 1894, was £5,907, which greatly exceeded the returns of the previous six months. We receive and despatch about 800 letters more a month now than we did before the railway was opened, and we now transmit nearly 400 telegrams a month, or 200 a month more than we used to transmit.

Mr.
J. M. Foley.
16 April, 1894.

1405. Has the population of Temora increased? Yes; we can tell that in the increase in Post Office business.

1406. *Mr. Wall.*] Can you tell us the amount of revenue you received in August last? No, I cannot.

1407. You have been giving us the totals to date? Yes.

1408. Has not the rush to Wyalong greatly helped to increase the revenue of your Department? Yes.

1409. Can you give us a return comparing the business of January with the business of August, and showing the increase which has come about since the construction of the railway? No, I cannot.

Mr. John Joseph Buckley, Sergeant in charge of the Temora police station, sworn, and examined:--

1410. *Chairman.*] How long have you been at Temora? About ten years.

1411. Do you collect the statistics here? Yes, for the Temora portion of the Young electoral district.

Mr.
J. J. Buckley.
16 April, 1894.

1412. Can you speak as to the progress of the district during the past four or five years? It has progressed materially. Last year the population of Temora proper was about 1,700, while the year before it was 1,500.

1413. Over what area does your district extend? We are very near the extreme boundary of the Young electorate, so that the district extends a good way in one direction, and not far in the other. The population of the district this year is 2,326, made up by 2,291 Europeans and 35 Chinamen.

1414. Can you speak as to the population that would be fairly served by the railway? There has been considerable increase in the population.

1415. An increase of how much per cent.? I should say an increase of from 8 to 10 per cent.

1416. Since the construction of the railway was commenced? Within the last three years.

1417. *Mr. Dawson.*] Is the population of the district increasing by reason of fresh arrivals, or because children are born here? In both ways. Last year the railway works were in full swing, and that brought a large number of people to the town; but, notwithstanding the fact that that railway is now completed, the statistics show that the population of the town has permanently increased.

1418. Can you speak as to the number of stock raised in the district, and the area under cultivation? Yes; both have increased considerably. Farming pursuits have increased fully 10 per cent.

1419. Then the district has materially progressed since the construction of the railway was determined upon? The railway gave a great impetus to farming operations in the district. If I said that they had increased 15 per cent. I would be nearer the mark.

1420. Can you add anything to your evidence which you think would be useful to the Committee in considering this proposal? I think the construction of the proposed railway would open up a tract of good agricultural country out towards Wyalong and Condobolin. I have not been out further than Woolengough. It seems all good agricultural and pastoral land out there, except for a few belts of mallee; but even that is good country when cleared.

1421. You have not been on to the Lachlan? No.

1422. *Mr. Wall.*] Have you any returns showing the area under cultivation this year and last? No; all the statistics we collect we send to Sydney. We do not keep any record here.

1423. Have you collected any statistics in regard to the quantity of wheat produced this year or last? Yes; but they have been sent to Sydney.

1424. Has there been an increase in the production? Yes.

1425. Has there been any tendency on the part of persons holding large areas of land before the construction of the railways, to bring them under cultivation? Yes.

1426. Can you mention any special case? Yes; there is Prior's, at Sebastapol. I think they had 500 acres under cultivation last year.

1427. How much did they add on to what they had before? They must have added 100 or 150 acres to their farm, and there are several such instances. At almost every season of the year they are extending their agricultural area.

1428. Was the same sort of thing going on prior to the construction of the railway? Yes, but not in such a marked degree. A tremendous lot of wheat was brought to the railway station last year; but when I came to Temora, ten years ago, there was very little agriculture.

1429. Do you know whether there is much land available for agriculture here? Yes; there is no dearth of land.

1430. *Mr. Dawson.*] Is this likely to be a fruit-producing place? Yes.

1431. Is it a fact that the grapes can be grown here to perfection? To great perfection.

1432. And figs? Yes; and they grow beautiful apples here.

METROPOLITAN BOARD OF WATER SUPPLY AND SEWERAGE.

(ANNUAL REPORT FOR 1893.)

Presented to Parliament by Command.

To the Honorable the Secretary for Public Works,—

Sir,

21 February, 1894.

The Board of Water Supply and Sewerage have the honor to submit to you their Sixth Annual Report.

WATER.

2. The average consumption of water per estimated head of population supplied is the same as last year, viz., 32·12 gallons per day, the average daily supply being 12,533,652 gallons, and the estimated population supplied 390,182. There were 2,362 houses connected during the year, bringing the total number supplied to 81,288.

3. Owing to want of funds only about 16 miles of extensions were made, 8 screw-down hydrants and 343 ball hydrants fixed. A little over 26 miles of pipes were cleaned. The total length of pipes now laid and under the jurisdiction of the Board is 745½ miles, and 1,451 screw-down hydrants and 14,232 ball hydrants.

4. Prospect reservoir has been kept full throughout the year, and solely from water from the Cataract River, the valve on the Nepean having been kept closed.

5. Some necessary repairs to the lining of the canal, below Prospect reservoir, were carried out during the year, reducing the estimated leakage from 3½ millions of gallons per week to about 300,000; this work is still being carried on. The eight large wrought-iron pipe aqueducts above the reservoir were scraped and painted, both inside and out, for the first time since they were erected some twelve years ago.

6. Towards the latter end of the year No. 3 Waverley engine was erected at Crown-street, and has worked most satisfactorily. This engine was designed and constructed by Mort's Dock and Engineering Co. (Ltd.), and its duty is to raise 100,000 gallons per hour to a height of 219 feet, and a further duty of raising 40,000 gallons per hour to a height of 239 feet. This latter duty is for the purpose

of raising the water to a tank above the Waverley reservoir, so as to supply the buildings that are situated in the immediate vicinity at about the level of the reservoir.

7. Over 50 per cent. of the water brought into the city has to be pumped to the various reservoirs, which was done at a reduction on cost, as compared with the previous year, of 32 per cent. The cost of raising 1,000 gallons 100 ft. high was $\cdot 324$ of a penny, as against $\cdot 480$ of a penny in 1892, or, in other words, from £2 per million gallons to £1 7s. This means that 3,086 gallons were raised 100 feet high for one penny. The amount pumped was 2,360 millions; therefore any reduction per million means a large saving; for instance, the cost in 1890 was £3 2s. 6d. per million, or £1 15s. 6d. per million more than 1893, which means a saving on the present pumping cost, as compared with 1890, of no less a sum than £4,189. No further proof is required of the wisdom of the Board's actions in sweeping away the old engines and small rising mains and replacing them with the present engines and adequate rising mains.

8. The Board are unable to carry out their scheme in its entirety for reducing the pumping cost till a large reservoir is built in the position approved of by the Public Works Committee, viz., in the Centennial Park, between Queen-street and Ocean-street. This would enable the pumping to be carried on continuously and not intermittently; at present the pumps have to stop every few hours on account of the smallness of the reservoirs. The saving in the pumping cost would be no small factor in paying the interest on the outlay, to say nothing of the other strong reasons which induced the Board to recommend, and the Public Works Committee to approve, of its construction. It is to be hoped that this work will be submitted to, and approved by, Parliament at an early date, and a vote taken for carrying out the work.

9. During the year the Board decided to introduce a system of renting meters of one approved pattern. This was forced on the Board on account of the multiplicity of different kinds of meters that were in use and continually being added to year by year, the repairs to which necessitated the Board keeping a stock of all parts of the different makes and sizes of meters, which meant a great expense to the consumer. It was decided that no other make of meters of less size than 2 inches should be allowed to be affixed to services supplied with water by the Board after 1st March, 1894, but those obtained from the Board either by purchase or by rental. The following rental was decided on:— $\frac{1}{2}$ -in. 7s. per annum, $\frac{3}{4}$ -in. 9s., 1-in. 11s., $1\frac{1}{4}$ -in. 13s., and $1\frac{1}{2}$ -in. 15s., the rental covering all charges, including use of meter, removing and reconnecting, testing, and repairs, under certain conditions. There is no doubt that this system will be largely availed of by the public.

10. About 40,000,000 of gallons of water were supplied free to the various hospitals and charitable institutions, which quantity is about the same as the previous year.

11. The duplicate 48-inch trunk main was completed by the Harbours and Rivers Department and transferred to the Board, thus making the city practically safe from water famine by any accident to the main supply, and releasing the Board from any need of the old Botany supply.

12. Consequent on this the Board decided to lease the right to take water from the Botany ponds and the use of the adjacent lands for wool-washing or other innocuous trades, and having divided all available land into four allotments, called
for

for tenders. One lot only was leased, at £404 per annum, as the tenders received for the others did not come up to the Board's valuations; these will shortly be readvertised. The lessee only has a right to draw water from the ponds, ample provision being made to prevent fouling the ponds.

13. During the year the water supply works of the town of Richmond were completed by the Public Works Department, but as this work had been started by that Department since this Board was constituted, there was no legal provision of the transfer of same to the Board. The Board were requested to manage this work till legal powers have been obtained to vest same in the Board. To this the Board consented, and have managed same accordingly.

SEWERAGE.

14. There were 7.43 miles of sewers and storm-water drains transferred to the Board, which had been constructed by the Government. The length of sewers laid by the Board was only 4.35 miles, the want of funds limiting the Board's operations. The total length of sewers now under the jurisdiction of the Board is 182.34 miles, of which length 81.43 miles are ventilated. The total length of storm-water drains now under the jurisdiction of the Board is 9.1 miles. The number of houses connected during the year was 4,660, making a total of 36,062 houses connected, and an estimated population served of 173,097.

15. Towards the latter part of the year contracts were let for 22½ miles of sewers in the districts of Glebe, Waverley, Randwick, Petersham, and Marrickville.

16. Repairs to the sewers of the old City system were continued, and some of the lengths were found to be in very bad condition, notably those old sewers in Loftus-street, Tank Stream, north of Martin-place, Bridge-street, and Castlereagh-street; the engineer reports that in some instances the invert and crown had to be entirely removed. A portion of the arch of a sewer in Woolloomooloo gave way and was at once repaired. Manholes were raised and fitted with proper iron castings, and wooden manhole covers were removed and replaced with cast-iron frames.

17. There were 2,500 tons of silt removed from the City sewers, and conveyed, in the Board's punt, to the reclamation works being carried out by the Harbours and Rivers Department. This large deposit of silt in the old City system is caused chiefly by the outlets of same being below high-water mark, the sewers thus being tidelocked twice in the twenty-four hours. The quantity of silt removed from the main outfall sewers was 950 tons from Bondi sewer, 400 from Botany sewer, and 100 from the silt-pit at the University Park. These figures show a great reduction on last year. The engineer attributes this fact to the increase of the daily flow from extensions, causing greater scouring power.

18. All the cleansing and flushing of the main branches in the City is now being carried out during the night-time, so as to cause the least possible inconvenience to the public.

19. The smoke tests being applied to some old drains, about which complaints had been received, revealed several most serious defects endangering the health of the occupants; in other cases drains were found to be stopped up by grease or roots of trees; in all these cases notices were served to reconstruct. Of these notices 866 were

were served, and 526 were attended to, and until the Amending Bill, which is now before Parliament, becomes law, the Board are practically powerless to amend the defective drainage of these premises at the expense of the owner, and recover the cost of same.

20. The system that the Board has of issuing certificates, that the sanitary work of a building has been faithfully carried out according to the By-laws and Regulations of the Board, meets with general favour, and it is now becoming almost a recognised fact that the owner will not pay any licensed plumber or drainer for work performed by him, until he receives the Board's certificate; 1,413 of these certificates were issued during the year for drainage, and 1,387 for sanitary plumbing.

21. The ventilation of the sewers has been carried on systematically, and, by the adjunct of water sprays, has worked most efficiently. The system of ventilation by heat, as patented by Mr. M'Kenzie, one of the Board's officers, was tried in the Macdonaldtown district, and was a success in creating a strong draught, and cremating the noxious gases. The test by acetate of lead papers, and the anemometer showed that the patent performed all that the patentee claimed. The Board, not content with this, requested Mr. M'Garvie Smith to make a bacteriological examination of the air in the sewers; his report, together with those of Mr. Smail, the Board's Sewerage Engineer, are attached. The ventilation of the sewers system pursued by the Board may be summed up in an endeavour to dilute the sewer air as much as possible with fresh air, keeping the air constantly moving, and thus rendering the chances of danger as remote as possible. The concensus of opinion of science at the present day is that the more the noxious germs are diluted either in air or water, the more exposed they are to the attacks of overwhelming numbers of germs that are not noxious but are the greatest enemies of the noxious germ.

SEWAGE FARM.

22. The amount of sludge removed from the screening chambers and deposited on the farm was 879 tons, which is a very large decrease on the amount removed during the previous year. The quantity of lime used for cleaning the walls of the Inlet House was 12 tons. The area of the farm under treatment, viz., 34 acres, was not increased. The average discharge of sewage on to the farm was, in midsummer, 1,450,385 gallons, and in midwinter 1,576,877 gallons from a drainage area of 1,079 acres. The effluent water retains its high character of purity, the chemical analyses of which are attached.

23. The revenue from the farm was £359 19s. 9d., and the expenses £968 8s. 2d.

24. The live stock, cattle and pigs, have done well and have paid for themselves; the present stock are, therefore, a clear profit. More applications were received for the agistment of horses and cattle than could be complied with.

25. The Board, having shown what can be done on the farm, have come to the determination to lease it for a term of years, and are now entertaining propositions to that effect. Farming will not pay with men receiving Government pay and working Government hours, but worked as a private farm there is no reason why it should not pay a handsome return.

FINANCIAL.

FINANCIAL.

WATER.

26. The following table shows the working of the Water Branch :—

Year.	Revenue.	Working Expenses.	Capital Debt.	Percentage of Working Expenses to Revenue.	Percentage of Working Expenses to Capital Cost.	Percentage of Revenue on Capital Debt.	Interest on Capital Debt after Paying Expenses.
	£	£	£				
1888	*69,938	19,205	3,004,557	27.46	0.64	2.32	1.68
1889	138,923	36,568	3,088,068	26.32	1.18	4.49	3.31
1890	145,990	34,788	3,189,080	23.82	1.09	4.57	3.48
1891	165,831	38,291	3,306,649	23.09	1.16	5.01	3.85
1892	155,886	45,078	3,394,581	28.91	1.33	4.59	3.26
1893	157,426	37,141	3,409,721	23.59	1.08	4.61	3.52

* This item is exclusive of £55,547 of arrears handed over by the City Council.

27. It is satisfactory to record that not only is there an increase of revenue of about £1,500, notwithstanding a falling off in the returns from metres of about £3,000, attributable to wet seasons and depression in trade, but also a decrease in the working expenses of about £8,000, though 26 miles of mains were cleaned, which expense is, of course, charged to working expenses. Only about 16 miles of new mains were laid, which will account in some measure for the small increase in the revenue.

28. The capital debt was increased by the small sum of £15,140, which was expended on extensions of new mains and erection of No. 3 Waverley engine at Crown-street.

29. There is a debit balance on the year's transactions of £1,413 17s. 11d.

30. The reduction of the percentage of working expenses to revenue to 23.59 is very satisfactory, especially when it is understood that more than 50 per cent. of the water consumed had to be pumped to reservoirs at heights varying from 73 ft. to 230 ft. above Crown-street reservoir.

31. The interest on the capital debt, after paying working expenses, has been raised to 3.52 per cent.

CAMPBELLTOWN AND LIVERPOOL.

32. The towns of Campbelltown and Liverpool, which are fed from the canal above Prospect, are now debited with their proportion of the capital cost of the main work and their proportion of the head office annual expenses. To arrive at the proportions to be respectively charged the following plan has been adopted. As the scheme was carried out for the supply of water to Sydney, the whole cost of the work was divided by the milage; the result was multiplied by the distance Campbelltown or Liverpool is from the head works to their respective off-takes, and a proportion of the result was taken, as the population of the town of Campbelltown or Liverpool bears to the population of the metropolis. The proportion, therefore, charged to Campbelltown is £3,357, and to Liverpool, £12,331; both of these towns can, therefore, congratulate themselves on the small amount a permanent and efficient water supply has cost them. Liverpool is some 6 miles from the canal, and the cost of the pipe supplying the town is included in the amount for reticulation, which makes it appear to be high.

33. The following are the tables worked out on the above plan :—

CAMPBELLTOWN WATER SUPPLY.

Year.	Proportion of Capital Cost and cost of Reticulation.	Interest at 4 per cent.	Maintenance (including proportion of Head Office expenses).	Total Charges.	Revenue.	Percentage of net revenue on Capital Cost.
1889.....	£ s. d. Proportion of Capital Cost..... 3,357 0 0 Reticulation..... 2,175 0 0	£ s. d. 221 0 0	£ s. d. 129 8 0	£ s. d. 350 8 0	£ s. d. 128 18 0	Nil.

	£25,328 0 0					

RICHMOND.

34. For reasons previously stated, the Board are much restricted in their actions in managing this water supply, as they can only rate premises upon which the owner has signed an agreement with the Board that he will take the water and pay for it.

The accounts are kept entirely separate from the Metropolitan Water Scheme.

35. The following is the table :—

RICHMOND WATER SUPPLY.

(Date of Transfer to Board, 26th May, 1893).

Year.	Capital Cost.	Interest at 4 per cent.	Maintenance (including proportion of Head Office Expenses).	Total Charges.	Revenue.	Percentage of net revenue on Capital Cost.
1893.....	£ s. d. 12,340 0 0	£ s. d. 493 12 0	£ s. d. 314 16 1	£ s. d. 808 8 1	£ s. d. 399 15 3	.68

SEWERAGE.

36. The following table shows the working of the Sewerage Branch :—

Year.	Revenue.	Working Expenses.	Capital Debt.	Percentage of Working Expenses to Revenue.	Percentage of Working Expenses to Capital Cost.	Percentage of Revenue on Capital Debt.	Interest on Capital Debt after paying Expenses.
	£	£	£				
1890	71,280*	22,249	1,281,045	31·21	1·74	5·56	3·82
1891	81,302	25,411	1,447,287	31·25	1·75	5·61	3·86
1892	87,927	27,305	1,606,948	31·05	1·70	5·47	3·77
1893	93,661	27,092	1,691,462	28·92	1·60	5·53	3·93

* This item is exclusive of £10,519 of arrears handed over by the City Council.

37. There is an increase in the revenue of about £5,500, and a small decrease in the working expenses, and a reduction in the percentage of working expenses to revenue of 2·13.

38. The capital debt has been increased by about £84,500. Of this the Government expended £66,300 on works which they transferred to the Board; the balance, £18,200, was spent by the Board on reticulation works.

39. The capital debt now stands at £1,691,462. Of this amount the Government has expended £25,646 on stormwater drains in districts where there are at present no sewers, but which will eventually form adjuncts to the sewerage system. This amount is not properly a charge against the Board until they are in a position to collect revenue thereon, and a Bill is now before the Legislature to enable the Board to do so.

The Government have also expended £60,055 on sewerage works in North Sydney and Glebe districts, to which no reticulation works have as yet been constructed.

Notwithstanding these extra charges, at present non-revenue producing, the interest on capital debt, after paying working expenses, is 3·93 per cent.

WATER AND SEWERAGE.

40. The following table shows the working of the two branches taken together :—

Year.	Revenue.	Working Expenses.	Capital Cost.	Percentage of Working Expenses to Revenue.	Percentage of Working Expenses to Capital Cost.	Percentage of Revenue on Capital Cost.	Interest on Capital Cost after paying Expenses.
	£	£	£				
1890	217,270	57,037	4,470,125	26·25	1·28	4·86	3·58
1891	247,133	63,702	4,753,936	25·77	1·34	5·20	3·86
1892	243,813	72,383	5,001,529	29·68	1·44	4·87	3·42
1893	251,087	64,234	5,101,183	25·58	1·25	4·92	3·66

41. The capital debt of the Board is £5,101,183, and the net revenue, after deducting working expenses, returns in interest 3·66 per cent. on that amount, which may be considered very gratifying to all interested.

GENERAL.

GENERAL.

42. The amount of revenue outstanding on December 31st was £29,775, as against £35,446 for the previous year, showing a decrease of about £5,600.

The amount outstanding is made up as follows:—Government, £2,856; domestic rates, £11,421; churches and charities, £3,928; meters, £7,858; plumbers, drainers, &c., £3,712.

43. The convenience which the Board provides for suburban ratepayers to pay their rates at a neighbouring Council Chamber, where a cashier of the Board attends to receive same on certain advertised dates, which are also printed on the rate notices, does not seem to be generally availed of, for the amount received from ninety-one visits to twenty Municipal Council Chambers was only £4,250, which was collected at an average cost to the Board of a little over 1 per cent.

44. The gross receipts paid into the Treasury were £254,025. Legal proceedings had to be taken to recover £12,445 of this amount, or less than 5 per cent. of the total receipts.

45. During the year there was an increase of 3,389 premises which became liable for Water Rates and 3,986 for Sewerage Rates, making the total number of properties rated for water 85,895, and sewerage 39,655. Notices to the number of 220,247 were delivered on these properties in connection with water and sewerage, or the usual average number per property of 2·5.

46. The Waste Water Inspectors served 3,621 notices for infringement of the by-laws; and 87 leaky taps were repaired by them without cost to the consumers.

47. The Comptroller of Stores reports that 3,603 orders were drawn on him for 12,610 items, amounting in value to £13,461 0s. 1d.; the value of goods received into stock was £13,969 5s. 11d., leaving a balance of stock on hand of the value of £40,833 16s. 1d.

48. The receipts of the meter testing and repairing and tap testing department were £1,579 9s. 6d., and the expenses for labour and material £1,404 14s. 2d. The department might, however, be credited with a certain amount of work performed on behalf of the Water and Sewerage Branches of the Board, so that the testing department may be looked upon as self-supporting.

49. The Medical Adviser to the Board in his report, which is attached, states that the death rate from typhoid fever in the suburbs fell from 2 per 10,000 in 1892 to 1 per 10,000 in 1893. The total number of deaths in the metropolis from this disease was seventy-six.

Since the Board assumed control of the Water and Sewerage systems the death rate from enteric fever has fallen from 3·79 per 10,000 of the population of the city to 1·41.

The health of the employees engaged in sewer maintenance has been so good during the past year that not one single case of sickness arising through exposure to sewer gas has been reported.

Notwithstanding the severe epidemics of measles and scarlet fever which occurred during the year, the zymotic death rate stood at ·9 per 10,000 at the end of December, the lowest zymotic death rate for some years past.

50. On the 1st May the Board entered into their new offices, which had been specially erected for them, and the improvement in the convenience to the public and to the health of their employees has been most marked. The total cost of the building was £35,722, and land £23,207; total, £58,929. This amount, at 4 per cent., would equal a rental of about £2,360. The Board paid £2,000 per annum for the offices they have vacated, and £50 per annum as lodging allowance to their head messenger and caretaker, and, owing to the vitiated atmosphere of the basement, where fifty-two clerks were working continuously under gas burning all day, the payments to clerks absent through sickness averaged over £500 per annum. Taking all this into consideration, the present offices are cheaper to the Board than those they rented.

51. During the year Mr. Trevor Jones, the Water Engineer, who some years ago had the misfortune to lose the sight of one of his eyes, found that the other was becoming seriously affected, and, to enable him to acquire complete rest and be under medical care, the Board granted him leave to the end of the year. His duties were performed by Mr. J. M. Smail, the Sewerage Engineer, in conjunction with his other duties.

52. It is with deep sorrow and regret that the Board record the deaths of two of their colleagues during the year—that of Mr. Benjamin Palmer, Vice-President of the Board, representing the city, on 5th October, and that of the Hon. J. D. Young, M.L.C., the other representative of the city, on 16th November.*

53. The election, by the City Council, to fill the vacancy on the Board caused by the death of Mr. Palmer, took place on December 5th, when Mr. John Taylor was returned.

54. The vacant vice-presidency was filled by the election by the Board of Mr. Joseph Graham, who had represented the Suburban Councils since the constitution of the Board.

55. Besides the various meetings for the purpose of visiting works under their control, the Board held sixty-five meetings at their offices, the attendance at which is shown by the following table:—

MEETINGS OF BOARD DURING 1893.

	Jan.	Feb.	Mar.	April.	May	June.	July.	Aug.	Sep.	Oct.	Nov.	Dec.	65 Meetings.

56. Enclosed herewith are the reports of Mr. J. M. Smail, Acting Engineer for Water and Engineer for Sewerage, and the various heads of branches, together with the balance-sheet; also a comparative table of the revenue and working expenses of Water Companies in Great Britain, United States, and Australia.

C. W. DARLEY, M. Inst. C.E.,
President.

REGINALD BLOXSOME,
Secretary.

Description

* NOTE.—Since the year closed we have also to record the death on 21st January, of a third member, viz., Mr. Joseph Graham, representing the suburbs, and who was elected to the position of Vice-President on the death of Mr. Palmer.
† Deceased, 5th October, 1893. ‡ Deceased, 16th November, 1893. § Elected, 5th December, 1893.

Description of Sydney Waterworks at end of 1893.

THE source of supply is from the Nepean River, and two of its tributaries, the Cordeaux and Cataract Rivers. The catchment area is about 354 square miles. Across the Nepean River is built a concrete dam 10 feet high, which is designed to divert a portion of the stream only into the tunnel, and lift it to level of crown of the same. The water is then taken by a tunnel $4\frac{1}{2}$ miles in length to the Cataract River. Another concrete dam, similar to that on the Nepean, is thrown across this river just below the outlet of the tunnel from the Nepean, and the water is thence conveyed by a tunnel for about $1\frac{1}{2}$ mile, and then by a series of open canals and tunnels, making a total distance from the source of about $40\frac{1}{2}$ miles to the Prospect Reservoir. There are $11\frac{1}{2}$ miles of tunnels, and about $28\frac{1}{2}$ miles of open canal from the off-take to the Prospect Reservoir. Several gorges are crossed, some by inverted syphons, others by pipe aqueducts.

Prospect Reservoir.

This reservoir covers an area, when full, of 1,261 acres, and has a capacity of 10,812,313,000 gallons.

The dam is earth with a clay puddle core, and is 7,300 feet long, maximum height 84 feet, with slopes of 3 to 1 on the water side, and $2\frac{1}{2}$ to 1, with two 15-foot berms, on the outer side, and is 30 feet wide on the top; the water face is covered with heavy bluestone pitching. When quite full there is 6,744,343,000 gallons available by gravitation.

The water is drawn off from the reservoir through a valve-tower into pipes placed in a brick tunnel, carried outside and round the northern end of embankment, and is discharged through controlling valves into a basin (at the end of this basin is placed a gauge weir, from which can be read the quantity passing over daily), from which it then proceeds by an open canal for 5 miles to the Pipe Head Basin, situated $16\frac{1}{2}$ miles from Sydney, and is then conveyed by a wrought-iron pipe, 6 feet in diameter, to Potts' Hill, a distance of 5 miles.

Potts' Hill Balance Reservoir.

The water is delivered here into a 100,000,000-gallon tank, built partly in excavation, partly in bank, the bottom of which is lined with hydraulic lime concrete, and the sides, which are laid to slopes of 1 to 1, are lined with dry coursed rubble. This work is designed to tide the city over any interruption of supply from Prospect, as well as to prevent fluctuation of head of pressure.

Screening Tank and Trunk Mains.

This screening tank is of brick, built in two concentric rings. The water is delivered into the outer ring, and passes through a series of copper gauze screens of 840 meshes to the inch. These screens are arranged so that the orifice which they fill can be closed, and the screen taken out and scoured. From these tanks the water passes into two 48-inch cast-iron mains.

The 48-inch main first laid continues with same diameter to Lewisham, where it bifurcates, one branch (48-inch) leading to Petersham Reservoir, the other (42-inch) to Crown-street Reservoir. The new 48-inch main was completed this year, and is now worked alternately with the old. A connection between the two trunk mains has been made in New Canterbury-road, Petersham.

Crown-street Reservoir and Pumping Station.

Crown-street Reservoir top-water level is 141 feet above high-water mark, and is built of brick, and contains 3,250,000 gallons. At this place is situated the main pumping plant, consisting of two compound high-duty Worthington Engines. Engine No. 1 is capable of raising 500,000 gallons per hour with very great economy to the Paddington Reservoir, a height of 70 feet above the pumps; engine No. 2 is capable of raising 210,000 gallons per hour to Woollahra Reservoir, a height of 140 feet above the pumps, and also of raising 200,000 gallons per hour to Waverley, a height of 220 feet above pumps. The pumps are larger than are necessary for the present supply, and, owing to the small storage capacity at Paddington and Woollahra, the engines are not being worked to their greatest advantage, as they have to start and stop at short intervals. The above plant has, this year, been supplemented by the addition of the No. 3 pumps, designed and erected by Mort's Dock and Engineering Company. The plant is of the horizontal compound condensing duplex rotative direct-acting type. The pumps can raise 100,000 gallons per hour to a height of 219 feet. The pumping plant at Crown-street may be said to be now complete.

Four 142-h.p. Babcock and Wilcox boilers generate the requisite steam.

Paddington Reservoir.

Paddington Reservoir, top-water level of which is 214 feet above high-water mark, or 73 feet above Crown-street, is built of brick, and contains 2,000,000 gallons, and is supplied by a 36-inch cast-iron main from Crown-street pumps, and distributes the water through a 24-inch cast-iron main, *via* Begg-street, and a 36-inch, *via* Park Road.

Woollahra Reservoir.

Woollahra Reservoir, top-water level of which is 232 feet above high-water mark, or 141 feet above Crown-street, is built of brick, and contains 1,000,000 gallons, and is supplied by a $24\frac{1}{2}$ -inch wrought-iron main from Crown-street, and distributes the water through a 20-inch main.

The old pumping plant at this reservoir, which in the past pumped water to Waverley, is about being dismantled.

Waverley

Waverley Reservoir.

Waverley Reservoir top-water level is 360 feet above high-water mark, and 78 feet above Woollahra, is built of brickwork, and contains 1,087,000 gallons. It distributes the water through a 15-inch main. A contract has just been let for the erection of supplemental tanks in Waverley Park, at an elevation of 20 feet above the present reservoir, in order that the upper zones of the district may be better supplied.

Petersham Reservoir.

This reservoir is built of brick, and contains 2,157,000 gallons. The top-water level is 166 feet above high-water mark, and receives its supply by gravitation from Potts' Hill through a 48-inch cast-iron main, which branches off the 48-inch main at Lewisham, and distributes the water through two 18-inch outlets.

North Sydney Supply—Ryde Pumping Station, Ryde Hill Tank, and Chatswood Tanks.

North Sydney, which was supplied from Paddington by a sub-marine pipe up to the end of 1891, has since received its supply from Potts' Hill, the water being delivered through a cast-iron pipe partly 24-inch and partly 20-inch diameter into a balance reservoir, near the Ryde Railway station. Here a pair of powerful pumps raise the water through a 24 $\frac{1}{2}$ -inch wrought-iron rising main into a 1,000,000 gallon wrought-iron tank to Ryde Village, at a level of 234 feet above high-water mark, and by a continuation of the same main into a pair of each 1,500,000-gallon wrought-iron tanks at Chatswood, at an elevation of 370 feet above high-water mark.

From the first-named tank the whole of Ryde, Gladesville, and Hunter's Hill get their supplies, and a 9-inch branch was extended over the Parramatta River and Iron Cove Bridges for the supply of the heights of Balmain.

The pair of iron tanks at Chatswood afford a liberal supply to Willoughby, North Sydney, and Mosman.

Campbelltown.

Campbelltown is supplied direct from the main canal by gravitation, a 6-inch pipe from the canal at 16 miles 40 chains being laid to the town, a distance of 2 $\frac{1}{2}$ miles, and the reticulation consisting chiefly of 4-inch mains.

Liverpool.

Liverpool receives its supply by a 9-inch pipe from the main canal at Cecil Hills, which is extended as far as Mount Young, and thence by a 6-inch main to the town. In order to tide over any possible interruption to the flow in the canal a 4,000,000-gallon earthen reservoir has been constructed close to the canal, and is filled from the canal.

Granville, Auburn, and Rookwood.

Granville is supplied by gravitation through a 15-inch main laid along Woodville Road, a distance of 2 $\frac{1}{4}$ miles from the 72-inch wrought-iron trunk main.

Rookwood and Auburn receive their supply by means of a 12-inch main along Joseph-street from Potts' Hill.

Ashfield.

A part of Ashfield is too elevated to receive a supply by gravitation from Potts' Hill level; therefore the loftier parts are supplied from the Woollahra Reservoir by the Petersham trunk main, which conveys the water to a 100,000-gallon tank of wrought-iron, erected on a brick circular support, at an elevation of 223 feet above high-water mark.

Hurstville, Kogarah.

The bulk of the supply to Kogarah is given by gravitation from 12-inch mains connected with the Petersham Reservoir system. The higher portions of this district are supplied with water from Penhurst, where is erected a 20,000-gallon cast-iron tank, built on brick piers. The water is pumped from Carlton Station by the small steam pumping plant (Blake's duplex), which was formerly erected at North Sydney to supply that district, prior to the completion of the Ryde pumps. The gas engine is still occasionally used.

Richmond.

In July last the Board assumed the temporary management of the Richmond Water Works, which were completed in 1892, and had since then been worked locally by the Richmond Municipal Council. The scheme, which is entirely unconnected with the Sydney supply scheme, consists of a small pumping plant—two horizontal 6-horse-power engines, coupled and geared, working two brass lined single barrel deep-well pumps (Tangyes), fixed 61 ft. 6 in. below floor of engine room—erected on the left bank of the Hawkesbury River, just below the confluence of the Grose and Nepean; a circular brick service tank, 60 ft. in diameter, having a capacity of 225,000 gallons; a 6-in. supply main to Richmond, 4 miles in length; and 5 $\frac{1}{2}$ miles of reticulation mains, 3 in. and 4 in. diameter, within the town.

Description of the Metropolitan Sewerage System.

THE Metropolitan Sewerage System, under the control of the Board of Water Supply and Sewerage, comprises the old and new systems, the former having been initiated by the old City Commissioners in 1853, and was carried out by their successors, the present City Council, which was incorporated in 1857. The City Council had control of the water and sewerage works within the city until the year 1888, when the waterworks were transferred to the Board. The transfer of the existing sewerage works followed in 1889.

The old system comprised four main outfalls, with subsidiary sewers along the principal streets, which in turn received the reticulation sewers of the minor thoroughfares. The four main outfalls discharged the sewage of the city into the various parts of the harbour at Blackwattle Bay, Darling Harbour, Sydney Cove, and Woolloomooloo Bay respectively. This system was designed on the principles of what is termed the "combined system." The pollution of the freshness of the harbour, by the discharge of the sewage of the city and consequent danger to public health, led to the appointment of a Commission to inquire into the best means of diverting the sewage from the harbour and otherwise disposing of same. The new intercepting system was the outcome of the labours of the Commission. The main works were carried out by the Government, and on completion were transferred, with all other existing works, to the control of the Board by Act of Parliament. The system, which is on the lines of the partially "separate system," intercepts all sewage, which heretofore was discharged into the harbour, at a level of 40 feet above high-water mark. This is termed the gravitation zone. The sewage from the low level area, *i.e.*, between high-water mark and 40 feet contour, will eventually be pumped into the gravitation sewers, and discharged into the ocean or into the sewage farm.

The system consists of two main outfalls, named the northern and southern respectively, the former discharging into the Pacific Ocean, at a point named "Ben Buckler," at Bondi, and the latter discharging into a sewage farm at "Webb's Grant," on the shores of Botany Bay. These works are of considerable magnitude and have not been constructed without considerable difficulty and outlay.

Northern Outfall.

The northern system commences at "Ben Buckler," where a large chamber was constructed in the sandstone rock. From this chamber two channels bifurcate so as to ensure a free discharge during the prevalence of either northerly, easterly, or southerly gales. From the chamber a shaft extends to the surface for ventilation and escape of air when the sea breaks into the discharge channels. The dimensions of main outfall at chamber is 8 ft. x 7 ft. 6 in., and decreases by decrements to 6 ft. 10 in. x 5 ft. 10 in. at Oxford and Liverpool Streets junction. At this point is a large chamber into which three different branches discharge, *viz.*—the northern branch, which passes under Hyde Park to Castlereagh-street, where it bifurcates, one sub-main intercepting the sewage from main outfall at Macquarie Point, and the other intercepting the sewers discharging at Queen's Wharf. 2nd. The western branch, which extends along Liverpool-street to and along Kent-street to Miller's Point, intercepting the sewage which discharged into Darling Harbour. 3rd. The south-western branch, which passes under Belmore Gardens, Benevolent Asylum, and along George-street West to Carlton-street, where it bifurcates into two sub-mains, one passing through Darlington, University Grounds, to Camperdown, Newtown, and Petersham, intercepting old city sewers and draining new areas; the other sub-main passing along George-street West by a long syphon, on account of a depression. Connected with this syphon is a scour chamber and valves for periodic cleansing. This branch extends to the Glebe and boroughs of Balmain and Leichhardt. The whole of the sewage above the 40-foot contour line, which formerly flowed into Blackwattle Bay, is intercepted by this branch and discharged into the ocean.

The work was carried through varying formations—in some instances the stratum was indurated sandstone, in others shale, clay, and water-charged drift sand. Concrete enters largely into the construction of the works, the lining of rock tunnels being principally bluestone concrete rendered with cement mortar. Wherever the outfall sewer crossed natural creeks or watercourses offset and scour valves were provided. An overflow sewer discharging into Rushcutter's Bay is connected with the main outfall to take surplus water during heavy rain storms. This sewer was carried across low-lying swampy land on arches and circular piers; the latter were constructed on the same principle as carried out in India.

Southern Outfall.

The southern main outfall commences at the inlet chamber, which is constructed on the north bank of Cook's River, near its junction with Botany Bay. The sewer is 5 ft. 6 in. in diameter, constructed of concrete, with brick lining rendered with Portland cement. In places the sewer is above the level of the adjoining land, and in others it passes through low sand-hills and swampy ground. Where natural watercourses are passed over, concrete culverts and overflow chambers and valves are provided. The outfall sewer extends to Botany Road, where the size is decreased for a short distance, to 4 ft. 6 in. x 3 ft. 6 in. Hawksley Section: From Botany Road the sewer extends along Bourke-street, through the boroughs of Waterloo, Redfern, and the City of Sydney to Nobbs-street, where the sub-mains from different districts join. This outfall drains the southern watershed of the city and boroughs of Redfern, Waterloo, Alexandria, Macdonaldtown, and Newtown.

Inlet House.

The sewage passes from the main outfall into the straining chambers of inlet house. The chambers are in duplicate and controlled by inlet valves, so that when one series is in use the other is being cleaned out. The sewage is strained by means of three circular screens; the mesh varies from 3 inches to 1 inch. The screens are worked by one central shaft, with gearing fixed on the platform at one end, and intercept all

all extraneous matter before the sewage passes into the syphon well. From the syphon well the sewage passes under the bed of Cook's River by a cast-iron syphon 3 ft. 9 in. in diameter laid in a trench and surrounded with concrete. The syphon is connected with a well in outlet house on south side of river, from which the sewage flows along a main carrier, and is distributed over the irrigation beds and settling tanks by valves. The valves are of simple construction, and the distribution of the sewage is easily controlled by the farm manager.

Sewage Farm.

The Sewage Farm is situated on a neck of land called Webb's Grant, the formation of which is raw drift sand, originally covered with low dense scrub. For agricultural purposes, to be worked at a profit, the soil is useless, but as a filter for crude sewage—this being the state in which the sewage is distributed over it—it cannot be surpassed. The farm is laid out on one side in irrigation beds, at different levels, so as to enable the manager to command the whole area. On this area the sludge, which is dredged from the inlet house, is conveyed in trucks by a small locomotive to the various beds, and is used as manure. On the other or southern side the ground is laid out in a series of filtering tanks, the number admitting of the sewage being dealt with intermittingly. At times, when circumstances admit, these tanks are cultivated, which assists in keeping the ground clean, and improves the soil as a filter. Cattle and pigs are reared and fattened on the surplus products of the farm. The styes are built in concrete, and kept clean by daily washing. Cattle and horses are also taken for agistment. The daily discharge on to the farm is 1,518,631 gallons; this is disposed of over 35 acres of land.

Western Suburbs.

The sewerage system for this district is now being carried out by the Government Sewerage Department under a special vote as regards the main ducts. The outfall works are nearly completed, and the eastern branch sewer is now in progress. This sewer drains portions of Marrickville, Petersham, and Leichhardt, and will also receive the sewage from low level system which will be pumped into it at Meeks' Road Pumping Station. The system will also discharge on a portion of the Sewage Farm area upon the western side, further resumption of land having been made for that purpose.

Washing Vehicles.

- (x) The Board may supply water for the washing of vehicles with a hose, without meter, at the rate of 5s. per annum for each vehicle.

In all cases where special fees are charged, the Board reserve to themselves the right of insisting upon a meter being fixed at any time, notwithstanding the fact that the special fee may have been paid. All special fees are in addition to the assessed annual rate of the premises on which such fees are charged, and are payable in advance. All premises on which water is used for other than domestic purposes, and upon which special fees are paid, shall be open for inspection by the Inspectors of the Board at any reasonable hour.

2. Assessed rates shall be paid half-yearly in advance, whether a meter is used or not. In the case when a meter is used, the meter account will be rendered only when it is in excess of the assessment. Cheques and post-office orders will be received in payment of rates; but if the cheque tendered by any person as payment for rates due is dishonored, the Board may cut off his service, and proceed for the recovery of the amount by warrant for distress or otherwise. Cheques and post-office orders must be crossed in favour of the Board.

3. The minimum charge for water, whether supplied through meter or otherwise, for domestic purposes and for purposes other than domestic, is the assessed annual rate. If the water is supplied by meter, and the meter account exceeds the assessment (calculated at the rate of one shilling per 1,000 gallons), then such excess shall be charged in addition to the assessment.

4. One meter may be allowed to supply several tenements when such tenements are occupied by one person or firm as a place of business or abode, and the meter account will be credited with the assessments of all such tenements. One service only will be allowed under these conditions, upon which the meter will be fixed, and all the water for such tenements must pass through such meter. Where peculiar circumstances entail a departure from the above, and two services are absolutely necessary, then there shall be a meter on each service pipe.

Building Charges, &c.

- (xi.) The charge for water supplied for building and plastering purposes, for buildings to be used either wholly or partly as dwelling-houses, shall be at the rate of one half-penny per cubic yard on the cubical contents of each building. The Board will supply water for all other buildings either by meter or at the rate above mentioned per cubic yard on the cubical contents of each building as the Board shall determine: Provided that before any water shall be used through meter for building purposes such meter shall be submitted to the Board in each case for examination, and must pass the sensitive test; and the minimum charge in each case for water so supplied through meter shall be ten shillings.

(1.) The charge for water supplied for plastering rooms only shall be two shillings and sixpence for each room, and for the building of wash-houses, water-closets, coppers and chimneys only, two shillings and sixpence each.

(2.) The charge for water supplied for making and mixing of concrete for foundations of wooden blocks, stone cubes, or other form of permanent roadway or pavement, shall be at the rate of twenty-one shillings per 1,000 square yards by superficial measurement of road surface, and for all other concrete, brickwork, or masonry, at the rate of three half-pence per cubic yard, as measured on the work.

- (xii.) Any person who maintains horses or cows may be supplied with water, without meter, from the domestic service for the sum of five shillings per annum for each animal, in addition to the assessed annual rate of the premises on which such animal is maintained or supplied with water.

- (xiii.) All lands or premises actually supplied with water by the Board, on which any one or more head of horses or cattle shall be kept or maintained, shall be liable to an extra rate or charge (beyond and in addition to the assessed annual rate of the premises) of five shillings per head for each head of horses or cattle kept or maintained on such lands or premises. And where such lands or premises are not actually supplied with water by the Board they shall be liable to an extra rate or charge (beyond and in addition to the assessed annual rate of the premises) of two shillings and sixpence per head for each head of horses or cattle kept or maintained on such lands or premises.

- (xiv.) The Board may supply water for gardens (and for such purpose may permit a hose and stand-pipe to be used) without meter, at the rate of ten shillings per annum per 1,000 square feet superficial area, or part thereof, and two shillings and sixpence for every additional 250 square feet superficial area, or part thereof, in addition to the assessed annual rate of the premises to which such garden belongs or is attached.

•
SEWERAGE RATES.

1. The following rates and charges are those which the owners and occupiers of houses, tenements, or lands shall pay for or in respect of sewerage, or for or in respect of the liability of such houses, tenements, or lands to rates and charges for sewerage, that is to say:—

- (i.) Where the premises are of the assessed annual value of seventeen pounds or under, ten shilling per annum.
- (ii.) Where the premises are above the assessed annual value of seventeen pounds, a rate of seven-pence for each pound sterling on the amount of the valuation.
- (iii.) Vacant or unimproved lands of the assessed annual value of twenty pounds or under shall be subject to a rate of five shillings per annum, and vacant or unimproved lands of the assessed value of over twenty pounds shall be subject to a rate of threepence for each pound sterling on the amount of the valuation.

FOR

FOR COUNTRY DISTRICTS IN COUNTY OF CUMBERLAND.

For water supplied for domestic purposes otherwise than by measure:—

- (i.) On every house, tenement, or land of £10 assessed annual value and under, 10s. per annum.
- (ii.) On every house, tenement, or land above the assessed annual value of £10, a rate of 1s. for each pound sterling on the amount of the valuation.
- (iii.) Vacant or unimproved lands of the assessed value of £9 and under shall be subject to a rate of three shillings per annum, and vacant or unimproved lands of the assessed value of over £9 shall be subject to a rate of 4d. for each pound sterling on the amount of the valuation.
- (iv.) The like rates as those above mentioned shall be charged on all lands, tenements, and hereditaments not included in any valuation by any Borough or Municipal District, and on all lands for the time being valued by any such Borough or Municipal District at a sum less than the true value thereof.

For water supplied by measure:—

- (v.) The charge for water supplied by measure shall be one shilling per 1,000 gallons for all water consumed up to twenty million gallons per annum, and ninepence per 1,000 gallons for all water consumed in excess of twenty million gallons per annum. Her Majesty's Navy will be supplied free of charge.

MONTHLY ANALYSIS of the Sydney Water Supply; by WILLIAM M. HAMLET, Government Analyst, Government Laboratory, Sydney.

Date.	Marks or Number of Sample.	Description.	Expressed in Grains per Gallon.				Expressed in Parts per Million.				Appearance in standard 2 foot Tube.	Poisonous Metals.	General observations on character of water.	
			Total Solid Residue, dried at 220°	Chlorine as Chlorides.	Nitrogen as Nitrates and Nitrates	Phosphates from animal impurity.	Free Ammonia.	Albuminoid Ammonia.	Oxygen absorbed in 15 min.	Oxygen absorbed in 3 hours.				
1898.		SYDNEY WATER SUPPLY.												
30 Jan.	..	Near Inlet, Prospect Reservoir	0.16	2.4	Trace	None	None	.08	.38	80	Clear	None	The samples from Crown-street Reservoir and Randwick, approach very closely the maximum degree of purity obtainable in the supply; and the water generally is of its usual excellent character.	
"	"	Basin, head of canal	0.16	2.4	do	do	do	.08	.38	80	do	do		
"	"	Service Tap, Randwick	0.16	2.4	do	do	do	.05	.28	60	do	do		
24 Feb.	..	Crown-street Reservoir	0.16	2.4	do	do	do	.05	.28	60	do	do	The water maintains its usual excellent character, and ranks as a first-class drinking water.	
"	"	Crown-street Reservoir	0.15	2.10	do	do	do	.06	.36	72	do	do		
"	"	Service Tap, Randwick	0.72	2.40	do	do	do	.06	.36	72	do	do		
"	"	Near Inlet, Prospect Reservoir	0.30	2.35	do	do	do	.08	.36	80	do	do	The organic matter in this water has undergone oxidation by running through open conduits, and thence flowing into the mains; the change is well illustrated this month by the diminution in the amount of the albuminoid ammonia; whereas, the chlorine not being subject to oxidising influences, remains a fixed quantity from the time it leaves the Reservoir until it reaches the consumer. The solids at Randwick is, for some unexplained cause, more than usually charged with oxide of iron.	
"	"	Basin, head of canal	0	2.35	do	do	do	.09	.36	80	do	do		
17 Mar.	..	Crown-street Reservoir	5.88	2.35	do	do	do	.18	.35	66	do	do		
"	"	Service Tap, Randwick	4.86	2.35	do	do	do	.04	.35	60	do	do	The monthly analysis shows that no important change has taken place, the water maintaining its usual degree of excellence.	
"	"	Near Inlet, Prospect Reservoir	4.10	2.35	do	do	do	.10	.35	70	do	do		
"	"	Basin, head of canal	6.10	2.35	do	do	do	.10	.36	80	do	do		
14 April	..	Crown-street Reservoir	6.30	2.35	do	do	do	.06	.32	66	do	do	There is nothing to call for special comment beyond the fact that the water is undoubtedly of excellent quality.	
"	"	Service Tap, Randwick	6.44	2.36	do	do	do	.05	.32	66	do	do		
"	"	Near Inlet, Prospect Reservoir	6.15	2.35	do	do	do	.10	.35	73	do	do		
"	"	Basin, head of canal	6.30	2.35	do	do	do	.10	.35	73	do	do	The quality and composition of the water supplied to the City of Sydney was ascertained after a careful analysis of average samples taken at various points along the line of delivery, as well as from the chief storage Reservoir. These results indicate a water of great organic purity, fit for drinking and all household purposes.	
15 May	..	Crown-street Reservoir	6.30	2.40	do	do	do	.06	.30	70	do	do		
"	"	Service Tap, Randwick	6.02	2.40	do	do	do	.06	.30	70	do	do		
"	"	Near Inlet, Prospect Reservoir	5.06	2.40	do	do	do	.07	.35	72	do	do	The monthly analysis for July, shows that the Sydney Water Supply maintains its usual high standard of excellence as a drinking water.	
"	"	Basin, head of canal	6.00	2.40	do	do	do	.07	.35	72	do	do		
13 June	..	Crown-street Reservoir	6.16	2.35	do	do	do	.06	.35	76	do	do		
"	"	Service Tap, Randwick	6.72	2.35	do	do	do	.06	.35	76	do	do	These results indicate a water fit for drinking, and all other domestic purposes.	
"	"	Near Inlet, Prospect Reservoir	6.04	2.80	do	do	do	.08	.40	78	do	do

Sydney, 12th February, 1894.

MELBOURNE GREEN,
Accountant.

Report by Engineer on Ventilation of Sewers by McKenzie System.

Sydney, 1 March, 1892.

THE improved system of sewer ventilation by the agency of heat, as applied by Mr. McKenzie, was demonstrated by an experimental model of a reticulating system of $\frac{1}{2}$ scale, also on a section of the sewer on the Zeland Estate, Waterloo. The experiments, as carried out, were satisfactory so far as showing the power of draught caused by exhaustion and the application of same in exhausting the air from house drains and fittings, as well as from main and subsidiary sewers.

The application of heat as a factor in ventilation has been tried many years ago in England by lofty shafts with furnaces and other means, but were not generally considered a success, although there are instances where this method has been used successfully. A shaft with a coke furnace was erected at Rocdean; the effect of this was felt 3 miles away from the main shaft, the tested velocity showed at the rate of 100 feet per minute. The sewer, however, was practically sealed, as there were very few openings or junctions into it.

Ventilation by means of shafts containing a chamber, in which was a small furnace heated by a gas jet, in some cases at the top of the pillar, in others at the base, have been tried in a tentative way, and it is reported that the "extractor" is used by the London County Council, Richmond Corporation, and two Local Boards. The arrangement of the latest system, "Holman's," consists of a 6-inch shaft with a brass atmospheric burner, with a regulator and a patent burner protector, the whole enclosed in a series of ribbed cones and chambers of cast-iron so arranged as to retain the heat of the burner, in what is practically a furnace, forms a series of circuitous passages, through which the sewer air drawn from the sewer must pass, and is rendered harmless; this cone is superimposed by an outer cone of asbestos to prevent the radiation of heat. The foregoing represents the latest form of "exhauster."

Mr. Stayton, in his report to the New South Wales Government, states that the hot shafts tried in England affect the sewers for a short distance only—50 to 60 yards—and that they were rejected in Croydon recently, as they were found to be impracticable on account of the large quantity of gas consumed.

Mr. McKenzie's system consists of a shaft with a furnace placed in the base. The furnace consists of a fire-clay spherical shell perforated, and into which asbestos is loosely packed, below is placed an atmospheric blow-through burner consisting of a series of automatic blow-pipes. The chamber in which the shell is placed is also composed of fire-clay, the lining of shaft to full height is also composed of the same material, and external casing of iron annular space with asbestos packing completes the apparatus. Every precaution seems to have been taken to prevent radiation of heat. The patentee states that when the furnace is lighted the shell and asbestos is brought to a state of incandescence, and the furnace can be kept at a temperature of 1,200°. The work of the shaft in working order is stated to be 500,000 cubic feet extracted from the sewers in 24 hours, at a cost of 1s. 8d. per 24 hours at the present price of gas, viz., 5s. 6d. per 1,000 cubic feet. The work of the "Holman" extractor shaft is given at 60,000 cubic feet per 24 hours, at a cost of 6d. per 24 hours. The comparison as to the cost of extracting 50,000 cubic feet per 24 hours by the "Holman" would be as 4s. 2d. to 1s. 8d.

Mr. McKenzie states that one extractor of his system will serve effectually 1 mile of sewer 9 inches in diameter with house drains. If the shaft is capable of doing the work assigned to it the air of the mile of sewer, with lateral branches, would be changed every fifteen minutes. This would be a high state of efficiency if it could be obtained. This, however, has not yet been practically demonstrated.

From an examination of the working model, and observing the tests made, and with regard to the principles on which the system is based, I think it is an improvement on the existing system of sewer ventilation, which, although good results have been obtained from same, as shown by recent tests, it is, like all other systems, dependent upon natural forces, capable of improvement, and as sanitary science is a progressive one, I feel that if a system can be found which is not dependent upon a variable force for its effective working, such system might be tried in a tentative manner.

The patentee claims that the application of his system will result in a saving to householders as well as to the revenue of the Board; if these claims can be borne out by actual practice an important result will be attained. I would, however, point out that this system, like all others where heat is the medium of exhaust, must be carefully applied and carried out in all the details; for instance, the air inlets must be carefully proportioned, otherwise there would be a danger of the system being inoperative at the furthest limits also, if the sewer at any time became surcharged the air supply would be cut off, and the effect of the furnace would be nullified. The whole of the manholes and lampholes must be as airtight as possible; this would be more of an advantage than otherwise, especially in narrow streets. These are, however, contingencies which no doubt the patentee has provided for.

As there is every indication that the system would be an improvement, and could be successfully applied, I would suggest that a trial shaft be erected in connection with the Macdonaldtown and Newtown system of sewers. This system is not yet dealt with as regards ventilation, and is connected to the main sewer by a separate pipe, the limit of effect of the exhauster could be readily observed, and the efficiency and cost of the system be ascertained before being generally applied.

The Secretary.

J. M. SMAIL.

Further Report by Engineer on Ventilation of Sewers by McKenzie System.

23 November, 1893.

IN continuation of my former report on McKenzie system of sewer ventilation, I beg to submit the results of a prolonged system of testing in connection therewith. The time taken in the investigation was necessary in order to thoroughly investigate the efficiency of the system.

In order to have a practical test, a shaft, of neat design, was erected on the 24-inch outfall sewer in Macdonaldtown Park, with the consent of the trustees, and after some preliminary trials and alterations, incidental to all new systems, the patentee reported that the shaft was ready for testing. The tests were carried out by the officer-in-charge of ventilating shafts, comprising—anemometrical readings—temperatures of sewer and on surface, humidity of atmosphere and air, in sewer and shaft; tests for condition of sewer air *re* presence of hydrogen sulphide, also an examination by Mr. Smith as to presence of germs in air of sewer and air flowing from shaft. I have endeavoured to make the investigation as far reaching as possible, and feel confident that the efficiency of the shaft as a ventilating power and germicide has been fully thrashed out.

Area of locality dealt with.

The area traversed by the branch sewers and controlled by the shaft is about 20 acres, the sizes varying from 9 inches to 24 inches in diameter, the aggregate capacity being 9,000 cubic feet. The grades being all towards the shaft.

Condition of Sewers when shaft is not working.

I personally inspected the sewers when shaft was not working, the manholes being kept closed down for some time so as to bring the sewers into a condition of "unventilated." The outflow of air through shaft by natural ventilation, as tested by anemometer, was 11,400 cubic feet per hour—the condition of same being very offensive. This would equally apply to the air in the sewers. Test papers moistened in a solution of acetate of lead were hung in different points of the sewer. These showed conclusively that hydrogen sulphide was present to an extent dangerous to health.

Any draught which existed was close to the shaft, and points remote from same the air was quite stagnant. There would be periods when there would be no draught due to natural causes, when the temperature of sewer and atmosphere would approach equality in the absence of wind, as on a calm day.

Condition when furnace was working.

I also personally examined the sewers under conditions when shaft was working, and found a marked change, although I have no doubt the comparison would have been better if furnace had been working for a longer period prior to my inspection. The conditions of ventilation were very much improved, and the absence of any noxious smell was verified by submitting test papers, previously referred to, to exposure to sewer air; the air issuing from outlet of shaft was warm and entirely free from odour. The air currents were well defined by anemometrical observations. The humidity of sewer was considerably less after shaft had taken up the work as compared with same when shaft was not working, the humidity in the first instance varying from 86 to 87, while that in the latter varied from 89 to 100, or saturation point.

The greatest difficulty was in ascertaining the correct temperature of the furnace chamber, a suitable pyrometer not being available; after some trouble an instrument was obtained, which gave fairly correct results. On one trial at which I was present the registered temperature *over* the furnace was 700°, this, however, rapidly decreased as the outlet was approached. Midway temperature was 220°, at outlet the temperature varies from 140° to 172°.

The temperature of 700° would represent the radiant heat from furnace rather than that of the air passing up the shaft, and I do not think that the average temperature could be taken higher than 188° to 200°. This point is important in considering the shaft as a germicide.

As a means of ventilation the accompanying table shows very favourably. The limits of effect were determined after several trials, and the most remote were found to be on railway premises about 24 chains distant from shaft, the average air-flow being equal to 2,044 cubic feet per hour. This line is almost in a direct line from shaft. In other cases where the lines are more ramified the results are better.

The table also shows the number of times the air of sewers on zone under investigation is calculated to be changed. It will be observed that depth of flow of sewage on the main pipe sensibly increases the flow of air towards the shaft, thereby assisting it. The calculated period of change over 40 acres is 2.25 times in the hour or about every 26 minutes. I do not think that this could be maintained as a general thing, as at times there are retarding influences at work in sewers which would reduce this, but even if the air were changed only once in the hour the condition of the sewer air would not be unsatisfactory.

The question of minimising the consumption of gas for furnace was prominent all through the investigations, and the results shown are from an expenditure of an average of 37.5 cubic feet per hour—a small amount in comparison to work done,

As already stated, the air of the sewers dealt with was free from hydrogen sulphide and other noxious smells, and, in order to push investigation further, the air in sewer and issuing from shaft was examined by Mr. Smith, who has been engaged in a biological examination of the Board's sewers. The results show that, while furnace was working, on first test the number of organisms were reduced from 35 to 26, or nearly 26, per cent.; on second trial the reduction was from 30 to 23 organisms, or little over 23 per cent.; third trial, furnace not working, the number in sewer was two less than previously, viz., 28, and air at base of shaft showed 25, or a reduction of 3, or little over 10 per cent. That the shaft does not fulfil the conditions of a perfect germicide is placed beyond a doubt by the mere fact that the velocity of the air, due to the heated column, does not admit of an exposure of sufficient duration to destroy the whole of the germs, the minimum measured velocity entering shaft below furnace being 11.31 per second; this, however,

however, would be the same with any similar contrivance. According to an authority on the subject high temperatures are destructive of the lower fungi; the effect of heat depends on the degree of temperature, and on its duration. The temperature necessary to cause the death of the organism varies also very greatly according to the other conditions of life, and more especially according to the resisting power of the species in question. The chief difference is found between bacteria, which do not form spores, and those which are spore-bearing. The former are, as a rule, killed when in a moist state or in fluids by exposure for one or two hours to a temperature of 118° to 140° Fah. Hot air at a temperature of 248° Fah. does not completely destroy spores of mould fungi after half an hour's exposure. Another authority states that spores of bacilli are destroyed after exposure to hot air for four hours at a temperature of 220° Fah., also that the effect of passing sewer air through a heated chamber is to break up the contained gases and promote the tendency of the individual elements in their nascent state to seize upon the oxygen contained in the air, and as there is always a certain amount of humidity in the air of sewers the dilute gases all the more readily break up. That the action of the furnace on the air brought in contact with it is to break up the gases is evident from the chemical test to which the air was submitted, and the reduction of the number of germs as compared with air in sewer might indicate that same were destroyed in coming into close contact with the incandescent material, which showed by pyrometer to be at a temperature of 700° Fah. The residents in the immediate locality of the shaft complain of the smell from same when furnace is stopped, but when working the complaints cease.

As before stated, the consumption of gas was kept at a minimum in order to lighten cost of system, and, for comparison, I have had a statement of cost of various installations prepared, viz. :—

- (a) McKenzie system combined with water sprays.
- (b) Plenum vacuum system combined with water sprays.
- (c) Plenum vacuum.

The statements are on the basis of dealing with 100 acres. Capacity of sewers, 20,000 cubic feet.

- (a) It is found that it would be more economical to work the furnace in conjunction with the water sprays, as air feeds at terminal points. The first cost is estimated at £254. Repayment in fifty and fifteen years. Maintenance and gas consumption, £95 7s. 6d. per annum.
- (b) Plenum vacuum and sprays combined. First cost, £219. Repayment in fifteen years, and maintenance £26 13s. 11d. per annum.
- (c) Plenum vacuum system. First cost, £900. Repayment in fifteen years, and maintenance £95 19s. per annum.

The cost per acre per annum being (a) 19s., (b) 5s. 4d., and (c) 19s. 2d.

It is, however, pointed out that the consumption of water in connection with the spray inducts will be, with McKenzie system, 2,761,900 gallons, and with plenum vacuum and sprays, 4,419,000 gallons. If the systems were generally carried out over the area under the Board's jurisdiction the quantity of water used annually would be a serious item in periods of prolonged drought, when it would not be advisable to use the water supply for such purpose. If such contingency arose we would have for a time to depend upon the natural forces for air-feeds to exhaust shafts.

I do not see that it is possible to adopt the "furnace" shaft as a general system, as it would be impossible in some localities to obtain sites in places where it could be worked to the best advantage, without incurring considerable expense. The existing city system, with its numerous untrapped inlets, could not be adapted to it, as the limited effect under such conditions would not justify the cost. I am of opinion, however, that in the suburban areas where configuration of the ground will admit of sections of the system flowing into one outfall being grouped, as in Macdonaldtown, the system can be applied with advantage. The main outfall to Bondi presents a favourable place for the erection of shafts of this character. The ventilation of this line must be taken in hand in the near future, and the erection of exhaust shafts on same without some means of destroying the noxious gases, which must necessarily be discharged from the sewer, will, I fear, meet with much opposition from the public in the locality of same. Providing means for destroying the gases will admit of comparatively low shafts being constructed at a reduced cost, as compared with tall shafts, and obviate opposition. The same applies to the Botany outfall, but in this case the country is more open than portions of Bondi line, and the necessity for more ample ventilation is not so pressing. With the aid of the tunnel water, now utilized for inducing air into the Bondi outfall, and two shafts of same character, but in proportion to the work to be done, the Bondi sewer could be effectively ventilated.

Mr. McKenzie informs me that he has expended a considerable amount of money and time in investigating and perfecting this scheme, and has been granted patents for it in America, England, and the Colonies. The Board is no doubt aware of the preliminary trial made some time back, and the working models then shown to illustrate the system, which would give a fair indication as to the money expended. He has placed under offer to the Board the right to construct the McKenzie Combustion Ventilator in connection with sewers within the county of Cumberland, during the currency of the letters patent, with the right to all improvements which might be made to same without any charge whatever, for the sum of £100.

This sum is but a small proportion of the amount which the inventor has expended in bringing the system to its present stage, and could only be looked upon as a contribution towards expenses of investigation, and not in the light of a commercial transaction.

In conclusion, I would recommend that the system be adopted as a means of ventilating the Board's sewers, where circumstances are favourable for the erection of shafts. In some districts this system will be more economical than existing one, but conditions will be reversed in others. The amount of remuneration is recommended for favourable consideration.

The Secretary.

J. M. SMALL.

Investigation of the Composition of the Air in the Sewers of Sydney, with Special Reference to the Presence of Germs, by J. McGarvie Smith.

Sydney, 18 September, 1893.

To the Chairman of the Metropolitan Board of Water Supply and Sewerage,—

Sir,

I have the honor to furnish my report on the sewer examination undertaken on the subjoined lines laid down by yourself, viz. :—

- (a) Presence of germs in sewer air, ventilated and unventilated, if injurious or otherwise.
- (b) Examination of film or sides of sewer between maximum and minimum flow lines, moist and after exposure to draught by water sprays.
- (c) Examination of air in exhaust shafts.
- (d) Examination of air before entry to "cremating shaft" and at outlet.

The liquid refuse, faecal and other waste matters, and the surface water—often as foul as sewage proper—of our Metropolitan District are collected in a reticulated system of sewers, and discharged at two points—one, the Sewage Farm; the other, a main outlet into the ocean at Bondi.

Aware of the generation of poisonous gases in a closed sewer, the Board has sought to make provision for their dilution by periodically flushing the sewers with their own stream water and by the use of inlet and outlet shafts for ventilation. So far, this great work reflects credit on its sanitary engineers; but of very late years, and owing to the development of a comparatively new branch of physiological science, it has been discovered that the danger of sewer-poisoning and disease dissemination is not inorganic but organic—a discovery of paramount importance which has advanced sewage sanitation from the domain of chemistry to that of biology. If the dangerous elements to be controlled were solely of a chemical nature, as until recently supposed by sanitarians, the safeguards against atmospheric and water supply pollution above referred to would have been considered efficient. But the Sydney Sewerage Board finds itself in the same position as the guardians of public health in other great cities, at the present time confronted with a problem in entirely new terms. The modern revelation that zymotic diseases such as phthisis (always with us), small-pox and Asiatic cholera (against the introduction of which a seaport in these days of quick runs can hardly be guaranteed), typhoid, scarlet fever, measles, and diphtheria are caused and spread by specific germs, teaches that attempts to limit these disorders should take the direction of germ-destruction. The sewer is the inevitable receptacle of the germs of any disease prevalent in the city, and the offensive odours hitherto regarded as a chemical danger but capable of being rendered harmless by dilution are germ-products, and as such a warning evidence of the presence of germs.

To disperse the product instead of destroying its cause is analogous to the action of a doctor, who should treat the symptom in place of the disease itself. It is therefore apparent that measures for the purification of a sewer, the dangers of which are organic, must be vital, not mechanical, and only on this enlightened principle can we aim at a prevention of infectious disease, so effectual that the dangers of an epidemic are minimized beforehand. That the Board is scientifically informed, and recognises in this new aspect of public hygiene, a demand for responsible Health Authority to destroy the micro-organisms with which a sewer teems, not content itself with discharging them into the atmosphere for broadcast dissemination, is evident from its action in constructing the "cremating shaft" at Macdonaldtown Park, and requisitioning the services of a bacteriological expert to determine the danger of germs and advise upon the best means of destroying them.

In order to place the Board in possession of all the facts on which my report is based, I was careful to keep a diary of my twenty visits underground in the course of which I secured and examined no fewer than thirty-two samples of air. These notes, giving the following classified particulars, will be found detailed in the appendix :—

Size of sewer.

Condition of sewer.

Flow and silt.

Draught.

Odour.

Temperature.

Humidity.

Number and kinds of organisms per litre of air.

The method of taking the samples of sewer-air, and the processes by which the contained germs were collected, cultivated, and determined—processes involving delicate and prolonged bacteriological manipulation are now given.

Preparations.—As provision for the large number of germs to be dealt with 2,000 test-tubes were sterilized ready to be charged as required with a medium of germ cultivation, the media or "soils" selected being respectively :—

Nutrient gelatine agar.

Nutrient gelatine.

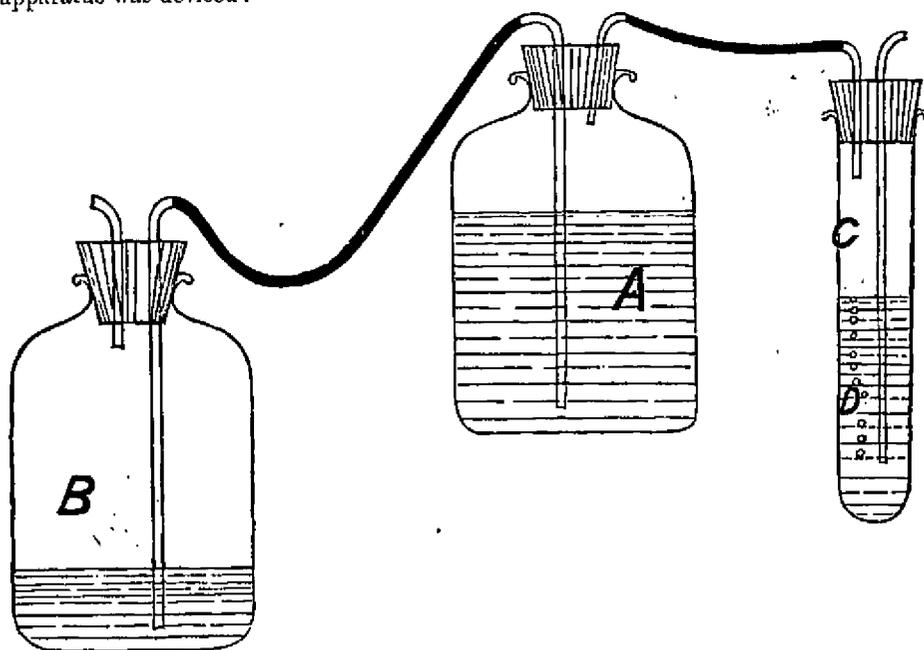

Nutrient agar agar.

Potato.

Method

Method of Sampling Sewer-air.

It was necessary that a measured quantity of air should be passed through a measured quantity of fluid, not only that all the germs in that volume of air should be retained in the fluid, but that a measured quantity of the fluid, say one cubic centimetre, should be the standard quantity for what is termed a plate-culture, and therefore equivalent to the germs contained in a litre of air. For this purpose the following apparatus was devised:—

One litre = 1,000 cubic centimetres.
 One litre = 61.029 cubic inches.
 One litre = 1.760773 imperial pint.

A and B, two litre flasks, so fitted with tubes that the water in A, when syphoned into B, draws a litre of air through a sterile solution D, measuring exactly ten cubic centimetres in the test tube C. By repeated syphonings ten litres of air are passed through C, so that the germs in one cubic centimetre of solution D will represent the number of germs contained in one litre of air. In order that the solution D should preserve alive, without multiplying, the germs present during the short time intervening between taking the sample and making the plate-culture, sterilized distilled water containing 0.6 per cent. NaCl, was used. If a nutrient medium were employed the germs would multiply too rapidly (particularly at summer temperature of 80° F. and over) for the plate-culture to yield anything like an estimate of their original number.

Cultivation.

Each sample of sewer-air was subjected to the following tests:—A tube of sterile nutrient gelatine agar, or gelatine, having been liquefied, one cubic centimetre of solution D, containing the germs in one litre of air, was thoroughly incorporated with the gelatine, and the whole poured upon a sterile glass plate (about 5 inches in diameter), allowed to set, placed in a moist chamber, and transferred to the incubator for forty-eight hours or longer, when each individual germ would have propagated itself into what is termed a colony. This process is known as a "plate-culture." A computation having been made of the number of colonies (each representing a single germ in the original fluid D), sterile tubes of nutrient agar, agar gelatine, gelatine, and potato respectively, were inoculated from isolated colonies on the plate, thus narrowing the process of germ determination into what is known as "pure cultures." On the plate germs are propagated into colonies of their kind, by pure culture individuals are isolated for examination and general classification under the microscope.

For details of my replies seriatim to the queries contained in my commission, I must refer you to the appendix to my Report.

(a) (1) Presence of germs in sewer air. (2) Ventilated and unventilated. (3) If injurious or otherwise.

(a) (1) In the diary it will be seen that ten litres of air were taken on each visit, and that the number of germs present varied between twenty-eight and two thousand two hundred and sixty per litre. The minimum sample was taken (*Tour 8*) in Bourke-street (main Botany sewer) the draught being very strong; the maximum (*Tour 2*) near the Benevolent Asylum, the draught erratic, *up and down stream*, not sufficient to deflect a candle flame or to disturb the anemometer. In the latter case the water spray was working. As an instance of the fluctuation of the number of organisms at a given spot and as evidence that the spray has no beneficial influence, I quote the results of other visits to the spot from which the maximum sample was taken:—

Tour 1: One hundred and fifty organisms; draught feeble.

Tour 6: Ninety-five organisms; water spray, 100 yards off, turned off for fourteen hours previously. Same tour, three-quarters of an hour later, the last twenty minutes of which the spray had been working, 146 organisms.

Tour 13: Three hundred and twenty-six organisms, 10 a.m., draught nil, spray off for twenty-four hours previously. Same visit 12.30 p.m., 385 organisms, draught feeble, sometimes up, sometimes down stream, spray turned on for an hour and a-half previously.

(2) The figures as to ventilation are also unsatisfactory.

Tour 4: Two hundred and thirty-six organisms; dry, ventilated, draught very strong and steady.

Tour 5: Two hundred and eighty organisms; ventilated.

Tour 7: One hundred and six organisms; ventilated, draught nil.

Tour 3: One hundred and sixty organisms, dry, *not* ventilated, very strong draught.

(3) As noted in my diary, I classified the organisms found in each sample of air, and found them to include moulds, sarcina, bacilli, micrococci, streptococci and torula. To diagnose incontestably all individual germs in a class would be a labour extending over many months, and in the case of pathogenic germs, involving the inoculation of a living subject and artificial cultivation of the disease from that subject. Nor, even if time permitted, would such a demonstration be possible, say with typhoid, because it is only pathogenic in man.

There is however no need of experiment to determine what proportion of germs found in a sewer are seeds of disease, because acknowledged facts have established the assumption that whatever infectious disease exists in a city, the specific germ of it will find its way into the sewers. The continued presence in sewer-air of any one variety of organism is of the greatest uncertainty; and the foul odour, although indicative of the presence of germs, is no proof that they are pathogenic germs, (for instance, typhoid and tubercle in cultivation have no offensive odour nor does the former liquify gelatine). But there is no possible right to assume that such a germ-focus as a city sewer (the recipient of hospital as well as general drainage) in a centre of population where phthisis is always and other communicable diseases frequently present, and the odours of which are fœtid with micro-organic products, offers hospitality to a harmless mould and refuses it to a tubercle or a typhoid bacillus.

(6) Examination of film on sides of sewer between maximum and minimum flow-lines, moist, and after exposure to draught by water sprays.

(b) As noted in diary, cultivations from the slime on the top and sides of sewer, proved in every case, to be a compact mass of micro-organisms. When recently flushed there was less slime, and when dry, the roof was in places covered with mould fungi. As a rule, the top and sides of the sewer were fairly clean.

(c) Examination of air in exhaust shafts. (d) Examination of air before entry to "Cremating shaft," and at outlet.

(c) (d) My attention having been most concentrated on the Macdonaldtown Park shaft, the air of which I have tested when the gas was not burning as well as when it was, I take these points together and offer for comparison the following samples of air from sewer and surface.

Tour 13: Three hundred and twenty-six and 385 organisms respectively; from main sewer opposite Benevolent Asylum. Do. surface, 17 organisms.

Tour 17: Fifty-four organisms from main sewer opposite Benevolent Asylum. Do. surface, 8 organisms.

Tour 18: Forty-nine organisms, main sewer, Forster-street. Do. surface, 12 organisms.

Tour 19: Thirty-seven organisms Inlet House, Botany. Do. surface, immediately above the delivery point of sewer 31 organisms. Do. surface, between Inlet House, Botany, and man-hole north of it, 7 organisms.

The "Cremating Shaft" at Macdonaldtown Park is 20 ft. high, with a 9 in. flue leading into the sewer beneath. In the flue at the base of the shaft is fitted a circular gas burner, consuming about 36 ft. of gas per hour.

Tour 14: Thirty-five organisms, in sewer 60 ft. from shaft; draught 15,752 cubic feet per hour.

Tour 14: Twenty-six organisms; at top of shaft gas burning for nineteen hours prior.

Tour 14: Eighteen organisms; surface 100 yards from shaft.

Tour 15: Thirty organisms; in sewer leading to shaft; draught 16,599 cubic feet per hour.

Tour 15: Twenty-three organisms; top of shaft gas burning.

Tour 15: Eleven organisms; surface about 100 yards from shaft.

Tour 16: Twenty-eight organisms; in sewer, 60 ft. from shaft, draught very slight.

Tour 16: Twenty-five organisms; base of shaft, gas not burning.

Tour 16: Nine organisms; surface about 100 yards from shaft.

From the figures of Tours 14, 15, and 16 it will be seen that the "Cremating Shaft" failed to destroy the germs in the air which passed through it, the loss sustained being rather less than the proportion of one-third.

General Remarks.

While desirous of fully acknowledging that the Sydney system of sewers has been designed and executed on the most favourable terms of sanitary engineering as then understood, it is to me, as a bacteriologist, an added cause of gratulation that the Board, which has already done so much, should recognise that further safeguards than chemical and mechanical ones are necessary to cope with the dangers of sewage exhalations. The bacteriological investigations of the composition of the air in the sewers made by the Board's instructions fully endorses its view, and although the tentative effort at germ destruction made in the Macdonaldtown Park shaft is not calculated to achieve the desired result, a more effectual use of heated air would, in my opinion, do so. The general conditions of the sewers is that they are heavily charged with micro-organisms and the foul odour characteristic of some of them.

With little or no draught, an average humidity of say 80° (saturation being 100), and a temperature of 75° to 86° F., the sewers present ideal conditions for the growth of micro-organisms, and those sewers which are never flushed, having on sides and crown a film of filth which is found to be chiefly organic matter, can only be regarded as huge culture chambers. Cultures made from the various samples of sewer-air taken from the top of the shaft prove that the germs are carried out into the atmosphere, and this may be taken as typical of the many exhaust shafts throughout the city. Koch and others having abundantly demonstrated the longevity of germs, their dissemination by air-currents, and their infectiousness by inhalation, the dangers to public health of closed channels pervading a city and in which the germs of all zymotic diseases present in that city collect, multiply and are discharged into the atmosphere, are manifest, while in the event of any epidemic such a method of distribution would tend to spread the particular disease to an alarming extent. Every exhaust shaft discharges its quantum of germs, putrefactive and pathogenic, but to close these shafts and force the sewer-air to the Bondi outlet, a distance of only one mile and a-half from the centre of the city, would be a doubtful improvement, for the moist north-east winds and the winds prevailing during the summer months (the season most favourable to the growth of micro-organisms) would merely blow the germs back over the city and its environs. The latter plan would certainly ensure a more general and equitable distribution of disease, but what is needed is not any scheme for germ dispersion, but an effectual mode of germ destruction. In flushing the sewers with

their

their own stream the deposit of bacterially-fecund filth above the flow level cannot be avoided; I therefore recommend (1) flushing frequently with sea or fresh water, especially in the summer; (2) the closing of all exhaust shafts; (3) the construction, at intervals, of reverberatory furnaces. These furnaces, burning coke or coal, should have a grate area equal to the volume of air to be treated, and a horizontal hearth or flue, say 40 to 60 feet long, leading to a stack high enough to cause the required draught. It is only by means of such a furnace that the ascending germs would be kept in a heated zone sufficiently long to cause their destruction, together with their products. The first cost of construction would be the only considerable outlay, as one man provided with a light cart could attend to the firing of all the furnaces needed, and I know of no other method to be applied to sewer-air, at once so economical and efficient, for the prevention of the spread of zymotic diseases and the safeguarding of the city from epidemics.

I have the honor to be,

Sir,

Yours obediently,

J. McGARVIE SMITH.

APPENDIX.

Tour No. 1.—7th December, 1892.—Main Sewer opposite Benevolent Asylum.

Entered main sewer by man-hole in street opposite Carter's Barracks, and travelled this line of sewer for a distance of 400 yards to a spot opposite the Benevolent Asylum where I obtained samples of sewer-air. The water spray in man-hole 100 yards down stream working.

Size of sewer.—5 ft. 6 in. x 4 ft. 6 in. oviform.

Condition.—A "wet sewer," sides and crown wet and coated with a thick film of slime. This sewer is never flushed.

Flow and silt.—16 inches.

Draught.—Very slight and erratic in its course, sometimes against and sometimes with the stream. Candle flame deflected not more than 20°.

Odour.—Very foul.

Temperature.—Not taken. (On surface, 87° F.)

Humidity.—Not taken.

Number of germs per litre of sewer-air.—150, comprising bacilli, micrococci, torula, sarcina, and mould fungi.

Tour No. 2.—12th December, 1892.—Main Sewer opposite Benevolent Asylum.

Entered sewer by man-hole in Benevolent Asylum enclosure and obtained samples of sewer-air and film from sides of sewer from same place as those taken on 7th December. Water spray in man-hole 100 yards down stream working.

Size of sewer.—5ft. 6in. x 4ft. 6in. oviform.

Condition.—Sides and crown wet and coated with thick film of slime.

Flow and silt.—Flow, 11 inches; silt, 6 inches.

Draught.—Very feeble, sometimes against and sometimes with the stream, candle-flame deflected not more than 20°.

Odour.—Very foul.

Temperature.—Not taken. (85° F. on surface).

Humidity.—Not taken.

Number of germs per litre of sewer-air.—2,260, comprising bacilli, micrococci, torula, sarcina, streptococci, and mould fungi.

Made cultivation from film from sides of sewer, which proved to be a compact mass of organic matter, comprising bacilli, micrococci, torula, sarcina, and mould fungi.

Tour No. 3.—10th January, 1893.—Sewer in Wattle-street.

Entered sewer by man-hole in Wattle-street, off George-street, a "dry sewer" not ventilated and obtained samples of sewer-air.

Size of sewer.—6ft. x 4ft.

Condition.—Sides and crown dry and clean, man-hole showing height of last storm-water.

Flow and silt.—6 inches.

Draught.—Very strong, candle-flame at right angles.

Odour.—Very foul.

Temperature.—Not taken. (On surface 82° F.)

Humidity.—Not taken.

Number of germs per litre of sewer-air.—160, comprising bacilli, micrococci, and mould fungi.

Tour No. 4.—10th January, 1893.—Sewer in Boundary-street, Darlington.

Entered sewer by man-hole in Boundary-street, rear of "Britannia Hotel," Darlington.—A "dry sewer" ventilated.

Size of sewer.—4 ft. x 3 ft.

Condition.—Sides and crown dry and clean; man-hole showing height of last storm-water.

Flow and silt.—14 inches.

Draught.—Very strong and steady.

Odour.—Very foul.

Temperature.—Not taken. (On surface, 82° F.)

Humidity.—Not taken.

Number of germs per litre of sewer-air.—236, comprising bacilli, micrococci, and mould fungi.

Tour

Tour No. 5.—10th January, 1893.—Sewer in Ivy and Boundary Streets.—“Ventilated Sewer.”

Entered sewer by man-hole in Ivy and Boundary Streets, and took samples of sewer-air.

Size of sewer.—4 ft. 6 in. x 3 ft.

Condition.—Sides and crown dry and clean.

Flow and silt.—20 inches.

Odour.—Very foul.

Temperature.—Not taken. (On surface, 82° F.)

Humidity.—Not taken.

Number of germs per litre of sewer-air.—280, comprising bacilli, micrococci, and mould fungi.

Tour No. 6.—12th January, 1893.—Main Sewer opposite Benevolent Asylum.

Entered sewer by man-hole in Benevolent Asylum enclosure, and took samples of sewer-air from same place as those taken on 7th and 12th December. Water spray in man-hole 100 yards down stream turned off for fourteen hours prior to taking sample.

Size of sewer.—5 ft. 6 in. x 4 ft. 6 in. oviform.

Condition.—Sides and crown wet, and coated with a thick film of slime.

Flow and silt.—15 inches.

Draught.—Very feeble and erratic; sometimes against and sometimes with the stream. Candle flame deflected not more than 20°.

Temperature.—Not taken. (On surface 79° F.)

Humidity.—Not taken.

Number of germs per litre of sewer-air.—95, comprising bacilli, micrococci, torula, sarcina, and mould fungi.

Remained in sewer and took samples of sewer-air from same place as previous samples three-quarters of an hour later with the water spray (situated in man-hole 100 yards down stream), turned on for twenty minutes prior to taking the sample.

Draught.—Very feeble and erratic, sometimes with and sometimes against the stream, and no stronger than when taking sample with water spray stopped. Not strong enough to be registered by the anemometer.

Odour.—Very foul.

Temperature.—Not taken. (On Surface 79° F.)

Humidity.—Not taken.

Number of germs per litre of sewer-air.—146, comprising bacilli, micrococci, torula, sarcina, and mould fungi.

Tour No. 7.—17th January, 1893.—Sewer in Abercrombie and Hudson Streets, Redfern.—“Ventilated Sewer,” Bondi line.

Entered sewer by man-hole in Abercrombie and Hudson Streets, and took samples of sewer-air

Size of sewer.—4 ft. 6 in. x 3 ft.

Condition.—Sides damp, covered with slight film.

Flow and silt.—14 inches.

Draught.—Nil.

Odour.—Very foul.

Temperature.—78° F.

Humidity.—81°.

Number of germs per litre of sewer-air.—106, comprising bacilli, micrococci, and mould fungi.

Tour No. 8.—17th January, 1893.—Bourke-street Sewer, main Botany line.

Entered sewer by man-hole in Bourke-street, and took samples of sewer-air.

Size of sewer.—5 ft. 6 in.

Condition.—Sides and crown dry and clean.

Flow and silt.—13 inches and very rapid.

Draught.—Very strong.

Odour.—Not very offensive.

Temperature.—75° F.

Humidity.—78°.

Number of germs per litre of sewer-air.—28, comprising bacilli and micrococci.

Tour No. 9.—8th February, 1893.—Bourke and Chelsea Streets Sewer.

Entered sewer by man-hole in Bourke and Chelsea Streets, and took samples of sewer-air.

Size of sewer.—3ft. x 2ft.

Condition.—Sides and crown damp but clean.

Odour.—Foul.

Temperature.—78° F.

Humidity.—85°.

Number of germs per litre of sewer-air.—37, comprising bacilli and micrococci.

Tour No. 10.—8th February, 1893.—Main Sewer at Deep Deen.

Entered sewer by man-hole in vault, and took samples of sewer-air.

Size of sewer.—7ft. 6in. x 6ft. 2in.

Condition.—Sides and arch clean.

Flow and silt.—Flow 20 inches, silt 10 inches.

Draught.—Slight.

Temperature.—79° F.

Humidity.—86°.

Number of germs per litre of sewer-air.—48, comprising bacilli, micrococci, and mould fungi.

Tour No. 11.—17th February, 1893.—Macquarie-street Sewer.

Entered sewer by man-hole in Macquarie-street North, and took samples of sewer-air.

Size of sewer.—3ft. 6in. x 2ft. 4in. oviform.

Condition.—Sides and arch dry and covered with mould fungi.

Flow and silt.—5½ inches.

Draught.—Nil; candle flame upright.

Odour.—Very foul.

Temperature.—77° F.

Humidity.—80°.

Number of germs per litre of sewer air.—34, comprising bacilli, micrococci, and mould fungi.

Diagnosed bacillus fluorescence, micrococcus rosaceus, and yellow bacterium.

Tour No. 12.—17th February, 1893.—Main Sewer, Woolloomooloo.

Entered main sewer by man-hole in Palmer and Riley Streets, and took samples of sewer-air.

Size of sewer.—8 ft. x 5 ft. 6 in.

Condition.—Arch and sides (of stone) clean; the arch is flushed by every small downpour of rain.

Flow and silt.—18 inches.

Draught.—Nil; candle flame upright.

Odour.—Very foul.

Temperature.—Not taken.

Humidity.—Not taken.

Number of germs per litre of sewer-air.—29, comprising bacilli and micrococci.

Tour No. 13.—27th February, 1893.—Main Sewer opposite Benevolent Asylum.

Entered sewer by man-hole in Benevolent Asylum enclosure at 10 a.m., and took samples of sewer-air and film from sides of sewer from same place where those of 7th and 12th December and 12th January were taken. Water spray situated in man-hole 100 yards down stream stopped for 24 hours prior to taking samples.

Size of sewer.—5 ft. 6 in. x 4 ft. 6 in.

Condition.—Sides and crown wet, and covered with thick film of slime.

Flow and silt.—16 inches.

Draught.—Nil; candle flame upright.

Odour.—Foul.

Temperature.—82° F.

Humidity.—82°.

Number of germs per litre of sewer-air.—326, comprising bacilli, micrococci, torula, sarcina, and mould fungi. Diagnosed yellow sarcina, mycoides, yellow bacterium, orange sarcina, bacillus fluorescence, micrococcus cinnabareus, and pink torula.

Re-entered sewer at 12:30 p.m., and from the same place, visited at 10 a.m., took samples of sewer-air. The water spray situated 100 yards down stream having been *turned on* one and a half hours prior to taking this sample.

Draught.—At times nil, sometimes with and sometimes against the stream; not strong enough to be registered by anemometer.

Odour.—Foul.

Temperature.—75° F.

Humidity.—82°.

Number of germs per litre of sewer-air.—385, comprising bacilli, micrococci, torula, sarcina, and mould fungi.

Made cultivations from film taken from sides of sewer, which proved to be a compact mass of organic matter, comprising bacilli, micrococci, torula, sarcina, and mould fungi.

Air in Carter's Barracks.

Took samples of air from the surface in Carter's Barracks, about 100, in direct line from man-hole in Benevolent Asylum enclosure.

Weather.—Cloudy, no wind.

Temperature.—86° F.

Humidity.—36°.

Number of germs per litre of air.—17, comprising bacilli, micrococci, and mould fungi.

Tour No. 14.—14th March, 1893.—"Cremating Shaft" in Macdonaldtown Park.

"Cremating shaft" in Macdonaldtown Park is 20 feet high, having a 9-inch flue leading into the sewer beneath, in the flue at the base of the shaft is fitted a circular gas burner, consuming 36 feet of gas per hour.

Took samples of sewer-air coming from top of "Cremating Shaft." The gas in shaft having been alight for 19 hours prior, and still burning.

Temperature of air coming from top of shaft.—162° F.

Number of germs per litre of sewer-air passed through burner.—26, comprising bacilli, micrococci, and mould fungi.

Sewer leading to "Cremating Shaft" in Macdonaldtown Park.

Entered sewer by man-hole in street, about 60 feet from "Cremating Shaft," and took samples of sewer-air, gas in shaft still burning.

Size of sewer.—2 ft. 6 in. (circular).

Condition.—Sides and top clean.

Flow and silt.—5 inches.

Draught.—15,752 cubic feet per hour by anemometer.

Odour.—Not very offensive.

Temperature.—74° F.

Humidity.—86°.

Number of germs per litre of sewer-air.—35, comprising bacilli, micrococci, and mould fungi.

Air

Air in Macdonaldtown Park.

Took samples of air in Macdonaldtown Park about 100 yards from "Cremating Shaft."

Weather.—Fine.

Temperature.—82° F.

Humidity.—50°.

Number of germs per litre of air.—18, comprising bacilli, micrococci, and mould fungi.

Tour No. 15.—21st March, 1893.—"Cremating Shaft," Macdonaldtown Park.

Took samples of sewer-air from top of "Cremating Shaft," *gas in shaft burning.*

Temperature of air coming from top of shaft.—172° F.

Velocity of air in shaft.—18,194 cubic feet per hour by anemometer.

Number of germs per litre of sewer-air coming from shaft.—23, comprising bacilli, micrococci, and mould fungi.

Diagnosed micrococcus rosaceus, yellow sarcina, and yellow bacterium, 11 colonies liquefying the gelatine.

Sewer leading to "Cremating Shaft," Macdonaldtown Park.

Entered sewer by man-hole about 60 ft. from base of "Cremating Shaft," and took samples of sewer-air; *gas in shaft still burning.*

Size of sewer.—2 ft 6 in. circular.

Condition.—Top and sides clean.

Flow and silt.—4½ in.

Draught.—16,599 cubic feet per hour by anemometer.

Odour.—Not very offensive.

Temperature.—76° F.

Humidity.—86°.

Number of germs per litre of sewer-air.—30, comprising bacilli, micrococci, and mould fungi.

Diagnosed yellow sarcina, bacillus fluorescence, 14 colonies liquefying the gelatine.

Air in Macdonaldtown Park.

Took samples of air in Macdonaldtown Park, about 100 yards from "Cremating Shaft."

Weather.—Fine and clear, slight wind.

Temperature.—80° F.

Humidity.—52°.

Number of germs per litre of air.—11, comprising bacilli, micrococci, and mould fungi, 5 colonies liquefying the gelatine.

Tour No. 16.—11th April, 1893.—"Cremating Shaft," Macdonaldtown Park.

Took samples of sewer-air from "Cremating Shaft," *gas in shaft not burning.*

Odour.—Very foul.

Temperature.—79° F. } On surface.

Humidity.—25°.

Number of germs per litre of sewer-air.—25, comprising bacilli, micrococci, and mould fungi, 17 colonies liquefying the gelatine.

Sewer leading to "Cremating Shaft," Macdonaldtown Park.

Entered sewer by man-hole in street about 60 feet from "Cremating Shaft," and took samples of sewer-air, *gas in shaft not burning.*

Size of sewer.—2 ft. 6 in. circular.

Condition.—Sides and top clean.

Flow and silt.—5 inches.

Draught.—Very feeble, not sufficient to be registered by anemometer.

Odour.—Very foul.

Temperature.—78° F.

Humidity.—85°.

Number of germs per litre of sewer-air.—28, comprising bacilli, micrococci, and mould fungi, 20 colonies liquefying the gelatine.

Air in Macdonaldtown Park.

Took sample of air in Macdonaldtown Park about 100 yards from "Cremating Shaft."

Temperature.—79° F.

Humidity.—25°.

Number of germs per litre of air.—9, comprising bacilli, micrococci, and mould fungi, three colonies liquefying the gelatine.

Tour No. 17.—17th May, 1893.—Main Sewer opposite Benevolent Asylum.

Entered sewer by man-hole in Benevolent Asylum enclosure and took samples of sewer-air from same place as those taken on 7th and 12th December, 12th January and 27th February.

Size of sewer.—5ft. 6in. x 4ft. 6in.

Condition.—Sides and top wet and covered with thick film of slime.

Flow and silt.—14½ inches.

Draught.—Very slight in direction of man-hole 100 yards distant which was open.

Odour.—Foul.

Temperature.—66° F.

Humidity.—81°.

Number of germs per litre of sewer-air.—54, comprising bacilli, micrococci, torula, sarcina, and mould fungi.

Air

Air in Benevolent Asylum enclosure.

Took sample of air from surface within 50 yards of man-hole in Benevolent Asylum enclosure.
Weather.—Fine, no wind.
Temperature.—66° F.
Humidity.—26°.
Number of germs per litre of air.—8, comprising bacilli, micrococci, and mould fungi.

Tour No. 18.—31st May, 1893.—Main Sewer in Forster-street.

Entered sewer by man-hole in Forster-street, and took samples of sewer-air.
Size of sewer.—5 ft. 6 in. x 4 ft. 6 in.
Condition.—Sides and top of sewer clean.
Flow and silt.—18 inches.
Draught.—Feeble but steady in direction of man-hole 100 yards distant, which was open.
Odour.—Foul.
Temperature.—66° F.
Humidity.—89°.
Number of germs per litre of sewer-air.—49, comprising bacilli, micrococci, and mould fungi

Air in Forster-street.

Took samples of air from surface in Forster-street, about 60 yards from man-hole, entered to take sample of sewer-air.
Weather.—Cloudy with slight rain.
Temperature.—63° F.
Humidity.—78°.
Number of germs per litre of air.—12, comprising bacilli, micrococci, and mould fungi.

Tour No. 19.—5th July, 1893.—Main sewer near Inlet House, Botany.

Entered sewer by man-hole north of Inlet House, Botany, and took samples of sewer-air.
Size of sewer.—5 ft. 6 in. circular.
Condition.—Sides and top of sewer damp; marks of last flushing on sides.
Flow and silt.—9 inches.
Draught.—Very strong in direction of stream.
Odour.—Foul.
Temperature.—58° F.
Humidity.—85°.
Number of germs per litre of sewer-air.—37, comprising bacilli, micrococci, torula, sarcina, and mould fungi twenty-five colonies liquefying the gelatine.

Sewer and Inlet House, Botany.

Took samples of air in Inlet House immediately above delivery point of sewer.
Odour.—Foul.
Temperature.—58° F.
Humidity.—83°.
Number of germs per litre of air.—31, comprising bacilli, micrococci, sarcina, torula, and mould fungi, twenty-three colonies liquefying the gelatine.

Air between Inlet House and man-hole north of it, Botany.

Took samples of air between Inlet House and man-hole north of it, strong wind blowing across line of sewer.
Temperature.—58° F.
Humidity.—40°.
Number of germs per litre of air.—7, comprising bacilli and micrococci, three colonies liquefying the gelatine.

Notes by Engineer on a Biological Examination of Sewer Air conducted by Mr. J. McGarvie Smith.

21 November, 1893.

In carrying out the biological investigation of sewer air approved of by the Board, Mr. Smith's attention was directed to certain sections of the old and new systems which could be taken as fair samples of both, and kept within the limits fixed by the Board.

I accompanied Mr. Smith on several of his tours, and had opportunity of observing the state of sewer with regard to odour and temperature, and with respect to some of the notes of observations on the character of the air I do not agree, as the term "foul" would not, in my opinion, apply, in a comparative sense, to the air found in the sewers at time of observation, although I am prepared to admit that there is room for improvement.

The number of tests made, and after-work in the cultivation and examination of the germs, necessitated an amount of careful work in preliminary preparation and in the laboratory to obtain the results recorded in the report. The extent of laboratory investigation was under the Board's observation during their visit. I am not aware of any similar record being in existence in connection with any other sewerage system.

The results vary in remarkable degree with regard to the old and new systems. For instance, in the old outfall sewers in Macquarie-street and at Woolloomooloo Bay the number of germs per litre were thirty-four and twenty-nine respectively; whereas in the south-west branch of main Bondi outfall, new system, the number per litre ranged from 2,260 (on one occasion) to fifty-four. In the former the sewers are large and convey not only the sewage from low-lying zone but all the storm-water from the drainage area, the effect of rainstorms being to thoroughly sweep the sides of the sewer, and, being near the outlets, have the beneficial effects of the winds when blowing in at the mouth of the sewer. In the latter the sewers only take a small proportion of the storm-water and the whole of the sewage above 40 feet contour, the sewage under such circumstances not being so diluted. The comparison would indicate that at certain periods flushing by clean water would be beneficial. The quantity and periods of flushing would vary according to circumstances and locality. In the branch under consideration, viz., S.W. branch of Bondi outfall, the conditions are, if anything, worse than in any other section, as it receives the discharge from Prince Alfred Hospital, Benevolent Asylum, and from two large breweries, the effluent water from the latter being very often offensive and at a high temperature. The brewery effluent might account for the increased number of germs as compared with other sections.

The action of the water spray referred to can be explained by the fact that it is off an old main on low-level supply, and the pressure fluctuates considerably during the day, and as the work done by water spray is in proportion to the pressure, it is quite possible that, at certain periods, the air is not quite so diluted as at others. The practical proof of the beneficial effects of the induced current of air is to be found with the experience of the men working in the sewer—the condition of the air when spray is not working is found to be very different than when in operation. The difficulty on this line has been to obtain positions for high outlet shafts which would induce a greater draught, the surface openings of manholes not being available owing to complaints from the public. This section is capable of improvement as regards flushing, and, owing to the investigations, provision is being made for fixing of flushing appliances.

The other sections, some on the old system, show fairly well; others, especially the Bondi and Botany outfalls, very well, the number of organisms in the latter being not more than forty-eight and twenty-eight respectively. This favourable result I attribute to the aerating action of the wind, which has more direct effect on same than on sections more remote, together with greater scouring power, due to increased flow; this has the effect of clean sweeping side-walls and preventing the accumulation of slime and filth, which Mr. Smith has shown to be veritable breeding-grounds for micro-organisms.

The many tests made at Macdonaldtown indicate (as referred to in another report) that the furnace shaft, in addition to the draught power, accounts for a reduction in the number of organisms between inlet and outlet points.

The practical lessons to be learned from this investigation are—

- (a) *Preventing as far as possible accumulation of slime and other germ-breeding material on sides of sewers.*—This can be effected by flushing by water in the smaller, and a combination of flushing and sweeping sides by mechanical means in the larger arterial branches. This will be carried into effect by increasing the present means for flushing by provision of stop-boards, which has been found by experience to be not only the best for results, but more economical than complicated flushing valves. An experiment was tried by fixing adjustable brushes to sides of maintenance trucks to cleanse sides of sewer between maximum and minimum flow-lines; the apparatus was found to be effectual. The water for flushing purposes must be obtained from the mains as it can be spared; to institute an installation of sea-water flushing would incur an expense on the rates for pumping plant, mains and tanks, which would make it prohibitive, and, as a sanitary measure, salt water is not considered a good flushing medium for sewers.
- (b) *Reduction of temperature.*—This is a question which cannot be brought within arbitrary limits, as local causes will at times interfere with the object aimed at. As the temperature of the sewers rarely exceed 70° a reduction of same will greatly contribute towards prevention of germ-breeding, this can best be obtained by inducing motion to the air in the sewers, and the system now carried out tends in this direction.
- (c) *Destruction of germs by heat as far as practicable.*—This question presents considerable difficulties if the destruction of all pathogenic germs is to be insisted upon. One of the principal authorities on this subject states that the effect of heat depends on the degree of temperature and on its duration.

“Continued

"Continued action on relatively low temperatures produces the same result as a short action of high temperature. The temperature necessary to cause the death of the organisms varies also very greatly according to the other conditions of life, and more especially according to the resisting power of the species in question. The chief difference is found between bacteria which do not form spores and those which are spore-bearing; the former are, as a rule, killed when in a moist state or in fluids, by exposure for one or two hours to a temperature of 48° to 60° C., when they are dry the temperature must, as a rule, be continued for a longer time. Even spore-forming bacteria may be killed by these relatively low degrees of temperature if the heat is applied on repeated occasions, and if, in the intervals between its application, the organisms are placed under the most favourable conditions of existence, so that any spores that are present may sprout and form bacilli. If the latter are killed by the subsequent application of heat before new spores are formed, we may be certain that after the heat has been applied five or six times no living spores exist, and all the adult organisms are destroyed. . . .

"It is much more difficult to kill quickly the spores of the mould fungi. Hot air at a temperature of 120° C. does not completely destroy them after half an hour's exposure. They are not certainly killed unless they are exposed to a temperature of 110 to 115° C. for an hour and a half." *Flügge*.

To collect the sewer air at points and expose same to the highest temperature before referred to, which is equal to 218° F. for half an hour, would seriously interfere with the question of ventilation, and it is open to argument if the destruction of any pathogenic germs would be attained. This uncertainty, and the attendant expense, would place it beyond practical limits in dealing with a large sewerage system, in the light of combining a ventilating shaft with a germicide.

The same authority states where a dry zone exists the conditions are most favourable for the detachment and carrying away of the bacteria of the soil by currents of air. It is only in that case that this most important mode of transport comes into play. If this statement can be applied to the interior of the sewers it follows, by parity of reasoning, that if the walls of sewers are moist bacteria will not be detached and carried into the atmosphere, and if, on the other hand, they could be brought into the condition of dry soil the dispersion of germs by air-currents would ensue. As the walls of sewers are never in an absolutely dry state there is no danger of germs being detached and dispersed into external atmosphere. The only means by which bacteria would be detached would either be by flushing or sweeping sides of sewer. In either case they would be carried away by the flow to the outfall entangled in the water.

With regard to recommendations made by Mr. Smith, the first I fully concur with, the second I think unnecessary, and the third I consider would be found more expensive and difficult to work than is anticipated, as one man could not possibly attend to the furnaces if carried out on the lines suggested.

The investigations carried out by Mr. Smith will form an important addition to the question of sewer ventilation, and the results of same will form a basis indicating where improvements can be made in the study of this important branch of sanitation. As the whole of the samples were taken personally at considerable inconvenience and risk, the laboratory work in making the numerous cultivations entailed a considerable amount of patient, laborious work which, had not Mr. Smith entered into the work *con amore*, could hardly be covered by a fixed fee. No investigation of the subject on the same scale exists in any reports or literature of sanitary works. I would, therefore, recommend Mr. Smith for a favourable consideration with regard to a fee for this work.

The Secretary.

J. M. SMAIL.

Memorandum on Mr. J. M. Smail's Notes on the Biological Examination of Sewer Air.

Sir,

Sydney, 12 February, 1894.

In the report of my investigations of the composition of the air in the sewers of Sydney, with special reference to the presence of germs, which I had the honor to render you on commission in September last, I furnished evidence by analysis of twenty-three samples of air, that the sewers are heavily charged with micro-organisms. On this it was my duty to inform the Board that germs are the direct agents for the propagation of zymotic diseases; that the germs of any such diseases present in a city must find their way into the sewer; that phthisis is always, and other communicable diseases frequently, present in Sydney; and that in the event of an epidemic, the sewer in its present condition would act as a huge culture chamber. I carefully examined the ventilating appliances in use in the sewers, including the tentative "crematory shaft" (reported by Mr. Smail ready for testing) in Macdonaldtown Park. I found that the water sprays do not appreciably affect the air current in the sewers, and that the exhaust shafts serve no other purpose than to discharge germ-laden exhalations into the streets. The Macdonaldtown shaft has claims as a ventilator, but none as a germicide. It induces a draught by heated air, but fails to provide a heated zone of high enough temperature and long enough duration to destroy diseased germs. As the Board is doubtless aware, the problem of safeguarding the public health from sewer dangers is a biological, not a mechanical one, and the most complete system for the dispersion of sewer air would only succeed in disseminating the contained germs. The object of sewer ventilation should be to draw the air to convenient points, where it may be safely discharged into the atmosphere through a furnace in which germs and other products perish. To ensure effectual accomplishment of this vital and only safeguard at the smallest outlay and with the least disturbance of the existing conditions of the sewer, I recommend:—

1. More frequent flushing with water to prevent accumulation of bacterially-framed filth.
2. The closing of all exhaust shafts.
3. The construction at intervals of reverberatory furnaces with a grate area equal to the volume of air to be treated, having a horizontal hearth providing a heated zone sufficiently long to ensure the absolute destruction of ascending germs, together with their products, and a stack high enough to cause the required draught.

The condition of the air in the Sydney sewers disclosed by my investigation is naturally disquieting to the Board. I should have been glad to confer with any other bacteriological expert or experts whom it might have consulted, but I must confess astonishment that my report should have been officially submitted to a gentleman, who, however, proficient in his own profession of engineering, could not be expected to advise on a biological matter. It would not occur to Mr. Smail to defer to me on a point of engineering, and with every respect to his judgment in his own department, neither should I think of consulting him in a question of physiological chemistry. It would be easy to reply to his notes seriatim where, not being an expert in this subject, his errors are precisely what one would expect, but I content myself at present with remarking that Mr. Smail's desideratum is germ dispersion not germ destruction, although he advocates on Mr. M'Kenzie's behalf what he deprecates on mine.

It is obvious that as long as the Board was unaware that the air of the sewers teems with micro-organisms, some of which are infectious by inhalation, its responsibility to the public was in this respect less than it now is. It has now before it a practical suggestion to minimise the present health danger and the contingent danger of epidemics. In requesting it to submit the whole matter to the Board of Health, I am actuated only by a sense of its importance to the health of Sydney, I have no personal interest except as a citizen and a scientist on the matter, no patent to push, nor profit to seek.

I have, &c.,

J. MCGARVIE SMITH.

Alleged Dissemination of Pathogenic Germs from Board's Ventilating Shafts.

DURING the past week several paragraphs and articles have appeared in the daily papers in connection with a biological investigation of the air of the Metropolitan sewers, which was undertaken by Messrs. Smith and Pound at the request of the Board. The latter gentleman only carried out a portion of the investigation; the report was finally submitted by the former. The report was forwarded to me in the usual official routine, and upon which I submitted certain notes of conclusions drawn from the results of the investigations. The report with notes were ordered by the Board to be printed as an Appendix of the Annual Report to be laid before Parliament.

The statements in the papers are identical with the confidential report furnished to the Board, and the use of such report without the cognisance of same was, in my opinion, highly improper. The report was submitted by Mr. Smith on or about 15th September, 1893. My notes on same were submitted on 21st November, and, as before stated, the report was ordered to be printed.

The report contained three recommendations, viz. :—

- (a) Flushing with sea or fresh water, especially during the summer. This I fully concurred with as far as the use of fresh water. The use of salt water would entail the installation of pumping plant and reticulation mains with the necessary staff to attend the same. This would become a serious charge upon the rates without achieving any corresponding benefit. The use of salt water for sewer flushing is not recommended. The question, which cropped up in England, was submitted to two eminent professors of chemistry, and they reported against the use of such water on the following grounds, viz. :—

“As to its use for flushing sewers.” Its use is inadvisable,—

1. Because the solvent action of salt water on organic matter is very inferior to that of fresh water.
2. Because where organic matter is in a state of solution in fresh water the addition of brine (sea water) will effect the precipitation of the organic impurities.
3. Because (it follows as a consequence of 1 and 2) if salt water be used for flushing, the quantity of suspended matter will be increased and the deposit in the sewers will be likewise increased.
4. Because salt water has an energetic action on metals and cements.
5. Because the sulphates, which are present in large quantity in sea water, are certain to be reduced by fermentative action whilst from the resulting any acid will generate sulphuretted hydrogen. Thus the nuisance arising from flushing sewers with sea water may be considerable.

I would point out that at present fully 50 per cent. of the maintenance staff are employed in removing silt from the city sewers, and it is therefore obvious that any further deposit brought about by an expensive installation of sea-water flushing would mean an increase in the expense of maintenance and interest. There is ample fresh water for sewer-flushing purposes where required in the larger arterial branches, but experience has shown that no amount of flushing will remove the heavier silt. The principal object, as I understood Mr. Smith when investigating the sewer-air question, was the removal of the film of slime and filth which adhered to the sides of the sewers between maximum and minimum flow line. Every attention is given to this recommendation and additional flushing points are being provided. I would however point out, to prevent misapprehension, that provision for flushing is always a part of the design of a properly-constructed system; as a matter of fact every working manhole on reticulation branches is a flushing station; on the main lines they are not required so frequently, as the increased volume gives a velocity sufficient to keep solid matter in suspension on the move, except where heavy silt, such as triturated road metal, &c., passes into the old city sewers. The whole system is divided into sections and placed in charge of gangs, the number in each varying according to the work to be done, so that it will be seen that this portion of sewer maintenance is adequately attended to.

- (2.) The second recommendation was that all exhaust shafts should be closed.

This recommendation I could not concur in, as I considered there was nothing disclosed in the report to justify such a drastic departure from a system which has hitherto been adopted in all properly devised sewerage schemes and is scientifically correct.

The recommendation, as well as terms of report, states the ventilating shafts are means for disseminating germs and are calculated to be a fruitful source of spreading disease in the event of an epidemic. The special diseases mentioned in report are phthisis, smallpox, Asiatic cholera, typhoid, scarlet fever, measles, and diphtheria.

The only shaft dealt with was the experimental one at Macdonaldtown Park, fitted with combustion chamber, and it appears that the sweeping denouncement of shafts in general is based on observations at same. It will be as well to give briefly the results as contained in the report, but it will be necessary to point

point out that the conditions of draught at Macdonaldtown shaft and others erected in the city and suburbs are not analogous.

Tour 14: Germs in air issuing from shaft, per litre, 26; bacilli, micrococci, and mould fungi; gas burning.—Germs in air in sewer leading to shaft, per litre, 35; bacilli, micrococci, and mould fungi.

Tour 15: Germs in air issuing from shaft, per litre, 23; gas burning.—In sewer, 30: bacilli, micrococci, and mould fungi.

Tour 16: Germs in air issuing from top of shaft, per litre, 25; gas not burning.—Air in sewer, per litre, 28; germs same character as 14 and 15.

Tour 14: Air in Macdonaldtown Park, number of germs per litre, 18.

Tour 15: Number of germs per litre, 11.

Tour 16: Number of germs per litre, 9. Character of germs is given as bacilli, micrococci, and mould fungi, same as sewer shaft.

The list of names of germs given looks formidable, but in no case are they specially referred to as dangerous, and text books on the subject do not class them as such. The character of the germs found in the air of the park is given in same terms as those found in the air of shaft and sewer, and by parity of reasoning it must be concluded that the air of the park is no better than that of shaft or sewer except in the number of organisms being less.

Until the question as to whether the issuing of germs from the various shafts is inimical to public health has been settled beyond a doubt, I consider it would be extremely unwise to take the drastic steps recommended. The principle laid down in carrying out the new sewerage system is motion for water and air—no resting place for either—and this is but carrying out natural laws and using natural means for dealing with the question.

The system of ventilating sewers by shafts attached to buildings has been carried out in a desultory manner in connection with sewerage works in England and other places, but this is now becoming more common, the various authorities erect them wherever they can.

From returns furnished by town clerks of twenty-five British and American cities and towns, with populations varying from 1,110,000 to 25,000 the systems carried out are as follows:—

10 have surface openings and ventilating shafts.

15 surface ventilation only—that is, openings at crown of roadway.

The absence of legislative power precludes the authorities making the system general; the consensus of opinion, however, is that it is the best means of dealing with the difficulty.

The closing of the shafts to prevent dispersion of germs, leads up to a question which has occupied the minds of biologists for some considerable time, and as this is a matter which is beyond the domain of the engineer, I would refer to opinions expressed by persons who are considered authorities on the subject.

The largest number of germs which was found in what might be termed a bad section of the system, viz., the South Western branch, was 2,260 per litre, or 2.26 per c.c. Assuming the germs are not pathogenic—nothing is shown to the contrary—what possible danger would arise if they were dispersed in the air. Take a case of water supply, which if contaminated is more likely to cause dangerous conditions to be set up in connection with enteric fever or Asiatic cholera than presence of germs in the air. At Zurich, where the water supply is kept under biological observation, this is limited to determining the number of bacteria per cubic centimetre of water, the differentiation according to species being, for the purpose of water supply, both unnecessary and unreliable, unless an abnormal number of bacteria in conjunction with an unfavorable chemical analysis points to probable contamination. The cultivation of bacteria is conducted, according to Professor Koch's method, modified by Professor Cramer, of Zurich. The average number of bacteria in the water as distributed, in an average of four years, is 31 per cubic centimetre or 31,000 per litre. When being cultivated the bacteria is counted every day from their first appearance and the counting is stopped when the gelatine begins to liquefy.

Now there is a great difference between 2,260 and 31,000 per litre, if this is permissible in potable water there must be some cause underlying this standard. Professor Koch has stated a permissible limit of 100 germs to the cubic centimetre. Flüge, in his work on micro-organisms, states, in connection with the over-estimation of the danger of air germs:—"On the whole too great a rôle was formerly ascribed to the air in the spread of saprophytic and infective germs. By the experience obtained in bacteriological work and in surgical practice it has become evident that bacteria but seldom enter nutrient substrata from quiescent air; that even a simple cover, which keeps off the vertically falling particles of dust form, even in impure air, an extremely efficient protection, and that the entrance of bacteria occurs far more frequently from unclean objects, unintentional contaminations, &c., than from air germs. On the other hand, dusty air in active movement offers an excellent opportunity for the spread of bacteria, and it is remarkable in what numbers they may be deposited on a cool object—on nutrient materials placed in ice—along with the water vapour condensed at the time; but even then the pathogenic bacteria forms only a minute fraction as compared with the saprophytic. In fact, in the open air the dilution of the pathogenic germs soon becomes so very great that a direct infection is a rare occurrence; it is only from the air within dwellings and in the neighbourhood of the sick that infection occurs at all frequently." He further states "that neither the points of view nor the methods for the investigation of the air are at the present time so precise that it is possible to make definite statements as to the local and seasonable differences in the number of air germs, or that well-founded conclusions can be drawn as to the part played by the air in the spread of one or other of the infective diseases."

In the recent report of the Royal Commission on the Water Supply to the Metropolis of London the Committee refers to the question of microbes in water, stating that the water question has passed from the domain of chemistry into that of biology, for the next step in advance was the comparatively recent discovery that the matter to the presence of which drinking water owed its occasional power of disseminating infectious diseases was not, merely organic but living matter, consisting of microscopical vegetable organisms, known generally as microbes or bacteria, and divided by specialists according to their form

form into bacilli, spirilla, cocci, sheptococci, and the like. These microbes are not only infinite in variety and number but are ubiquitous. The air we breathe, the food we swallow, the water we drink teem with them. They swarm within our own bodies, and this to such an extent that it is said that six different species are invariably inside the human mouth while many other species are to be found there with more or less frequency. Fortunately the vast majority of these microbes are perfectly innocuous, many of them indeed are not only innocuous but serve useful necessary purposes, for it is by them that the breaking up of dead matter, animal or vegetable, and its reduction into inorganic substances is effected, and consequently by them that the purification of water or other media from organic matter is brought about. Many of them, moreover, act as actual preventives of infectious diseases.

There are however certain microbes that form exceptions to this general rule of innocuity, and that are capable of setting up more or less serious disease when introduced into the living body. These pathogenic microbes are given off from the bodies of animals or human beings already suffering from the special disease to which they respectively give rise, and, should they by any means find their way into the system of other animals or human beings that are capable of suffering from such diseases, communicate to them the infection. That this is the manner in which infection spreads from individual to individual has been established beyond all possible doubt for some diseases, and it is believed from analogy that what has been ascertained for some infectious or contagious diseases is probably due for the whole class. Now some of these pathogenic microbes, though their normal habitat is the living body, can maintain their existence for a longer or shorter period outside it, and can even multiply in water, or, if desiccated, can be carried, either themselves or their spores, in the air, and gain access to the body in the act of inspiration or otherwise.

The next question with which we have to deal is the alleged existence in rivers of numerous conditions which lead to the destruction or elimination of such pathogenic microbes as may have found their way into them. The natural habitat of pathogenic bacteria is the interior of the living body; when they pass from this into the outer air or water they are in an unnatural medium, in which they can only maintain their existence and power of multiplication for a limited period, during which they undergo more or less rapid attenuation or loss of virulence, and become generally weakened. Meantime the ordinary water bacteria, by which, if in the river, they are surrounded in innumerable multitudes, being in their natural habitat, thrive and multiply, and become more and more likely to obtain the mastery in the struggle between themselves and their weakened pathogenic adversaries. For it appears to be the generally accepted doctrine of bacteriologists that the pathogenic organisms and the ordinary river bacteria, to which the decomposition of organic matter is due, are naturally antagonistic, and that these latter undoubtedly exert an influence in diminishing the vitality of the typhoid bacillus, either actually consuming it or, as is more probable, giving rise to projects that interfere with its growth.

It is this antagonism of the non-pathogenic to the pathogenic bacteria that supplies an explanation of the otherwise unintelligible fact as to which all the bacteriological witnesses seem to agree, that pathological bacteria will live longer in distilled water, or in water that has been previously sterilised, that is, from which all other bacteria has been removed, than in ordinary river water. . . . It is found that exposure to direct sunlight destroys these bacteria, and even such a tempered amount of light as is present under ordinary conditions in Thames water injuriously affects their vitality. How important a germicidal influence is exercised by light is shown in the statement made by Dr. Sims Woodhead, "that in the laboratory we are compelled to keep all our pure cultures which are under favorable conditions of growth in a dark cupboard, otherwise they would die out rapidly, becoming weaker and weaker. The same, of course, must be the case where, as in water under the open air, organisms are exposed to light. . . ."

There remains the question of the dose of bacilli required for the production of disease. The general tendency of evidence, says Professor Odling, is to show that it wants a very considerable dose of a pathogenic organism to produce its characteristic. Similarly Professor Ray Lankester says:—It appears probable that any infection produced by these organisms must be by a certain volume—a certain number—that is to say, that one typhoid bacillus passing into, even arriving into the intestine would not be able to hold its ground. Again there is little doubt that Dr. Sims Woodhead in his statement that small doses of cholera bacillus, introduced into the alimentary canal of a man or animal, are destroyed so rapidly by the secretions, or it may be by actual contact with the living cells of the stomach and intestine, that no symptoms are produced in healthy individuals, however a very large dose of the bacilli with the accompanying poison may alter the secretion and paralyze the cells, so that the organism is enabled to grow in the nutrient medium contained in the alimentary canal, and an attack of cholera may result; and he further states that he is led to believe that the two organisms "that is, the microbes of typhoid fever and of cholera" act in somewhat the same fashion as regards the infection of the human body. There is, however, he elsewhere states, not nearly so definite knowledge in this matter, as regards cholera and typhoid fever, as there is in regard to anthrax and other diseases that can be inoculated directly into the tissues. The report further states that bacteriology is in its infancy, and, though the results obtained by experts in the science, in regard to the persistence or destructibility of pathogenic microbes deserve full consideration, as possessing a high degree of probability, it would be rash as yet to assign to them such a position of absolute certainty as would enable us to dispense with the evidence of experience.

With regard to the influence of light in pathogenic microbes, Professor Buchner demonstrated in a lecture delivered before the Munich Medical Union towards the close of 1892, that typhoid and cholera bacilli freely distributed in water, were destroyed by direct sunlight in from one to two hours. The disinfecting activity of light was so powerful that, for instance, water which contained in a cubic centimetre 100,000 germs of the bacillus colicomm was found, after one hour's action of direct sunlight, to be completely germ free.

Mrs. Percy Frankland, in an article in the *Sanitary Record* on "How Cholera may be spread in reference to cholera bacilli," states, *inter alia*, that "we have learnt that these cholera bacilli are very sensitive to a dry atmosphere, and it is possible that the action of the sun's rays (which is now known to have a most prejudicial effect upon micro-organisms), together with the dryness of the air, which usually prevails in the summer months, might combine to reduce their vitality or even destroy them. In the *Sanitary Record* of 9th September, 1893, it is stated that Dr. Rüger, in his interesting paper on the Hamburg Cholera Outbreak, clinches his argument from the experiment made on himself, in which he swallowed 100,000 bacilli from a pure culture without any bad effect, by a reference to the experience of the

the men who follow their calling on or beside the river Eibe at Hamburg, according to the Eldefeld doctor, among the thousands of beer brewery workmen, sailors, harbour labourers, boatmen and fishermen who pursue their avocations on the river itself or its banks, who use its water freely for drinking, cooking and washing, hardly any were attacked by cholera, and these people, who are inconsiderately reckless, who pay no attention to disinfection of the hands, and who are deplorably deficient in the matter of cleanliness, enjoyed immunity from the disease."

Dr. Ravenez sums up the question of microbes as follows:—By microbes we are to understand all the inferior beings belonging to animal or vegetable life whose presence has been revealed by the microscope as existing in a great number of diseases common to both the lower animals and man, and present also in certain organic products such as wine, beer, milk, eggs, &c.

These are the bad microbes, the pathogenic microbes, those which interest us chiefly from a hygienic point of view. But as we have already said, there are good and beneficial microbes; useful microbes. Of those are the ferocious Phagocytes, those who feed on the bad microbes; and there are those who find their way into our food, and are the ferments of different digestions, and without which our own digestion would be difficult of accomplishment. As Dr. Mounet so well says:—"Nothing that is made here below, nothing that is destroyed escapes from the incessant and inevitable action of the microbe. Without this infinitesimal creature life on this globe would be untenable and impossible. It weighs down the balance between life and death."

It is in this struggle against the pernicious pathogenic microbe that the conditions are attained which insure the prosperity of the individual and the species; it is in this struggle that the conditions are arrived at which are most favourable to man's development and preservation. The earth which in common supports us all; the water we drink and which enters largely into the composition of our food, which is used for our ablutions, and is the chief factor in cleansing our houses and streets; the air we breathe, which we absorb through the tegument of our skin, which bathes us so to speak and penetrates each orifice; the food we eat, be it animal or vegetable; our covering, whether fixed as the roof and walls which surround us or portable as our clothing—all these indispensable accessories of life are polluted by swarming microbes. The discovery of the microbe, its morphology, the study of the extraordinary rôle which this infinitesimal being plays has revolutionised biological science, particularly hygiene. This last is no longer a collection of common-place precepts based on vague ideas. It is an exact science, conceived, built up, and extended by Pasteur.

I have dealt at some length with this subject, because it bears upon the question at issue, and it is necessary to produce evidence to show that, even if pathogenic germs found their exit at the shafts, they would be transferred to a condition of life under which they would not be allowed to exist. It would appear that there is no resting-place except the dark cupboard of the laboratory. If they pass into the air they are either eaten up or become so attenuated that they cease to exist. If they find their way into water—and this is shown to be the only way in which human beings can be infected with cholera or typhoid bacilli—the water bacteria exert an influence over them for the good. It has also been shown that sunlight is inimical to the existence of the "unfriendly" germ. A leading bacteriologist has stated "that in the laboratory they are compelled to keep all pure cultures in a dark cupboard; otherwise they would die out rapidly, becoming weaker and weaker."

If we take Mr. Smith's analogy of the sewer, being a huge culture chamber, being dark and having favourable conditions for cultivation of germs, according to the above statement, to carry the analogy to its logical conclusion, directly the germs were exposed to the light, by having their exit from the shaft, they would die out. What then becomes of the germs which are having or are to have such dire effect on the public health.

Again, the largest number of germs which was found at one time only, after five different trials, was 2,260 per litre; and $\frac{1}{1000}$ gives—say, 3 per cubic centimetre—the highest number at any other time was 326 per litre—to get the number per cubic centimetre the germ would have to be divisible; in other words, with one exception the number is so small that they cannot be reckoned by the standard of cubic centimetre. It has been before stated that the water supply at Zurich is distributed, containing 31 germs per cubic centimetre, or 31,000 per litre; Koch's limit being 100 per cubic centimetre, or 100,000 per litre. There is also evidence that it takes a considerable dose of pathogenic germs to be injurious. If the foregoing be true, and it is in statements of bacteriologists of repute, what possible chance of danger is there, even supposing a few unfriendly germs did find their way into the atmosphere?

Moreover the sewers and branches leading to the shafts are never in a state of absolute dryness; and there is the probability that if germs are passing in the air, they would become entangled in the moist periphery of pipes and sides of sewer.

The foregoing is the theoretical aspect of the question, and the conclusion arrived at by the Royal Commission for Water Supply to London will apply in this case; it is as follows:—"Bacteriology is still in its infancy; and though the results obtained by experts in the science, in regard to the persistence or destructibility of pathogenic microbes, deserve full consideration as possessing a high degree of probability, it would be rash as yet to assign such a position of absolute certainty as would enable us to dispense with the evidence of experience. This must still be our main guide." This statement I think will be found to fit the present case notwithstanding the dogmatical assertions which have lately appeared in the public press. As a matter of fact, in the question of purification of water, the foregoing Commission states that on the bacteriological aspect of the question they could not make positive or dogmatical assertions, seeing that at present experts in the science of bacteriology are themselves avowedly holding their judgment in suspense. There does not appear to be any suspending of judgment in assertions which have appeared—the public have been informed that disease germs are being spread—if such is the case every cause must have an effect. We will now see what, in the light of experience, this effect has been on the public health, the preservation of which I will assume is the object of the statements in the public prints.

The erection of the ventilating shafts was commenced in 1890, after very careful tests and consideration. The first section operated upon was a notoriously ill-ventilated one, so much so that one of the workmen on opening a branch drain on the section was struck down with a severe form of tonsillitis. The manholes at the time were all closed down with close covers, and on removal the gas from same was overpowering; the system was not carried out by either the Government or the Board, but was taken over on passing of the Act. After the shafts were erected and systematic flushing instituted the improvement was decidedly marked. During the years 1890-3, the erection of shafts, with other adjuncts,

was

was proceeded with. The total number of shafts erected is 1,136. If Mr. Smith's assumption is correct, that the shafts are discharging disease germs into the city to the danger of public health, it is only reasonable to expect an increase, rather than a decrease, in our death-rate from enteric fever. The medical officer has furnished me with the following return:—

CITY OF SYDNEY—DEATHS FROM ENTERIC FEVER.

Year.	Population.	Deaths.	Rate per 10,000.
1883	112,980	77	6.82
1884	118,645	100	8.43

Sydney	2,226	106,380	47.3	1,679	157.7	15	1.4

At end of December the zymotic death-rate for month was .9 per 10,000, the lowest rate for years past.

The state of the air in the sewers needs no better testimony than that not one single case of sickness arising through sewer gas among the men employed in the sewers has been reported during the year. There is one man in the service who has been working for over twenty years in connection with the sewers, and who has not been on the sick list once. It will be seen from the returns that the death-rate for enteric fever has been gradually *decreasing* since the Board commenced operations in 1890; in the suburbs the rate in 1893 is reduced by half of that in 1892. The death-rate from phthisis also shows a gradual decrease. It will also be seen that the zymotic death-rate of Sydney is the lowest of the three cities given in table.

The figures quoted show that the operations of the Board, both in water supply and sewerage, have not had the baneful effects which have been attributed to them. The influence on the health of the city and suburbs is all the other way, and while such good results can be shown I fail to see the necessity of abolishing one of the means by which they are obtained.

The returns show that there was not the slightest ground for the statement that the shafts were disseminators of disease germs, or, if disease did pass out of them into the atmosphere, Nature's scavengers, "the friendly microbes," performed their appointed *rôle*.

I think it will be found that the report, if anything, shows the air of the metropolitan sewers not to be the dangerous element it is supposed to be; but, at the same time, as stated in my notes on the report, there is still room for improvement, and remedial measures are being taken in connection with same.

Until it can be proved beyond a doubt, from a biological standpoint, that the ventilation of sewers, as at present carried out, is inimical to public health, I consider it would be unwise and a waste of public money to alter the system to accord with opinions which have been shown to be founded on such debatable grounds. I maintain that there is no cause for alarm, and the attempt to raise the microbe bogie is calculated to do more harm than good.

(3.) The third recommendation was the construction of reverberatory furnaces at intervals. This I could not concur with. A study of the topography of the city and suburbs and plans of the old city system would be sufficient to convince an engineer of the unpracticability of the recommendation.

As germicides they would no doubt act locally, but as ventilators I question the utility. The question was discussed in England as far back as 1844, and later, in 1866, by Sir John Bazalgette and Colonel Haywood, and found to be entirely unsuitable.

Take the old city system, which is analogous to the London system at the time (1866), comprising 70 miles of sewers of various sizes, ramifying in all directions—up courts, lanes, and narrow tortuous streets—with innumerable “dead-ends.” Connected to these sewers are at least 9,000 untrapped house connections with the rain-water pipes connected direct to same; the length of house drainage aggregating 102 miles, or a total of 172 miles. In addition to these there are the main branches constructed by the Government, which intercept the old city branches. Now the furnaces to be of utility as ventilators must cause an air-movement in or about 182 miles of sewers of all sizes with innumerable angles and bends. Experience has demonstrated that furnaces connected with the system under such conditions have only a local effect, and would, therefore, as means for ventilation, not be worth the cost of construction, land, and maintenance, which would form a considerable item.

As germicide I consider, with the evidence adduced, they are not necessary.

I would also point out the adoption of them would necessarily entail an alteration of the existing house-drainage system carried out before the inception of the Board in very much quicker time than is adopted at present. This is a question upon which the property owners might take serious objection to.

As public attention has been drawn to the matter, and as it has resolved itself into one of a biological character, I think it would be advisable to submit Mr. Smith's report to the Board of Health for them to express an expert opinion as to whether the air discharged from the Board's ventilating shafts is dangerous to the public health as alleged; this is the only point of import to be inquired into.

J. M. SMAIL, 12/3/94.

The Secretary.

Influence of the Board's operations upon the Health of the Metropolis.

THE number of deaths occurring during the past year of 1893 is greatly in excess of the number for 1892; but, notwithstanding this fact, the influence of the Board's operations has been very marked during the past year.

The increase in the death rate is due to the severe epidemic of measles which raged during August, September, and October, and to the prevalence of scarlet fever during the whole year. These two diseases, with their sequelæ in the form of respiratory diseases, were the chief causes of the increase in the death rate; but as they cannot be ascribed to any defect in a water and sewerage system they may be regarded as accidental and beyond the influence of the Board's working.

There was also a slight increase in the number of deaths from diphtheria; but this disease, according to late authorities, is so peculiar in its distribution that its causes "should not be sought for primarily in any high development of civilisation, such as sewers, but rather in some condition associated with a more primitive form of life."—(Longstaff.) Water has never been demonstrated as conveying infection.

Diarrhœal diseases also show a slight increase in the number of deaths due to them. Building sites made of town refuse and damp soils are the most productive causes of these diseases, and although high temperature of the air has long been observed to be associated with a high diarrhœal mortality, still Mr. Ballard has shown that the temperature of the soil is the essential point. "The essential cause of diarrhœa lies ordinarily in the superficial layers of the earth, where it is intimately associated with the life processes of some micro-organism not yet isolated."—(Ballard.)

It is vain to hope that typhoid fever will ever be completely avoided, but during the past few years the disease has been so modified in its course that only 76 deaths occurred during the past year in the metropolis from this disease, and although it was very prevalent in the city during the month of December no deaths were registered for this disease. Although drainage defects tend to promote the existence of typhoid fever, it is often difficult to disassociate their influence from that of co-existent hygienic defects, such as want of personal cleanliness and impurity of soil. The extension of the Board's operations to the various suburbs has been attended with excellent results, the death rate from typhoid fever in 1892 being 2 as against 1 for 1893 per 10,000 of the population. A reference to the Table D will sufficiently show how marked has been the influence for good of all lately undertaken sanitary works in this city. If it were true that the air was laden with pathogenic germs which, floating over the city, were likely to cause disastrous epidemics, it would be reasonable to expect an increase rather than a decrease in our death rate from enteric fever.

Phthisis, which increases rapidly on damp soils, did not cause so many deaths last year as in former years, and there has been a marked decrease in the death rate from this disease ever since the institution of the present water and sewerage systems. Through the courtesy of Drs. Gresswell and Whittell I have been able to subjoin Table G, from which it will be seen how favourably with regard to the density of population the death-rate of Sydney compares with Melbourne and Adelaide, and in how much better a condition our city is than the others as regards typhoid fever being a factor of the death-rate.

At the commencement of the year 1893 the zymotic death rate of the city stood at 3 per 10,000 of the population, but it fell at the end of January to 1·4, and at the end of February stood at 1·5. At the end of March the prevalence of scarlet fever raised it to 1·6, but it fell again at the end of April to ·8, and at the end of May to ·7. At the end of June, owing to the spread of diphtheria, it rose to 1·8, and at the end of July it again fell to 1·4. During August the epidemic of measles made its appearance. The death rate at the end of this month rose to 2 per 10,000, and at the end of September, when the epidemic was at its height, the rate rose to 8. At the end of October it fell to 6·4, and at the end of November to 2·4. At the end of December, 1893, the zymotic death rate stood at ·9 per 10,000, the lowest zymotic death rate for some years past. With regard to the presence of germs in the sewers, all sewers contain them, but fortunately, where pathogenic or unfriendly microbes exist, there are also present phagocytes or friendly microbes, which resist the attacks of the former. Protracted exposure of pathogenic microbes to the influence of light and air tends to destroy most, if not all, of them, and it is highly probable that mere diffusion of a virus in the atmosphere renders it inert. Consequently there is no need for alarm; in fact the state of the air in the sewers needs no better testimony than that not one single case of sickness arising through sewer gas among the men employed in the sewers has been reported to me during the past year.

Putting aside, therefore, the uncontrollable epidemics, it is safe to say that the Board's operations have greatly improved the national health, and also in the case of the epidemics themselves these operations have limited the area of the diseases.

THEO. M. KENDALL.

Annual Report of Assessor's Branch.

Sir,

22 February, 1894.

I have the honor to submit my report for 1893.

The year has been one of depression almost without precedent in the history of the Colony, and during which period financial and commercial institutions and individuals have suffered alike. Property values in both the city and suburbs have depreciated in a very marked degree, while every description of building—warehouses, mercantile offices, pretentious mansions, and the humblest of dwellings—are unoccupied and idle on all sides. From authentic sources reports are heard that even where properties have been offered at rentals reduced by as much as from 30 to 40 per cent. they remain untenanted; hence the effect of the depression on all classes of property holders may be readily understood.

Notwithstanding the foregoing it must be gratifying to the Board that the receipts for the year exceeded those of the previous one by £8,146 6s. 11d.; also, that the amount of outstanding rates decreased by £5,670 17s. Whilst reviewing the circumstances consequent upon such depressed times these results cannot be accepted but with satisfaction.

The following is a summary of the work performed during the year.

Rate Notices.

219,547 notices were served during the year, being an increase of 11,340 over the number during 1892, and covers those for new mains, new sewers, and final notices for payment of rates.

New Mains and New Sewers.

3,979 properties became liable for rating during the year, namely, 646 from new mains and 3,333 from new sewers. It will be seen that there is a large decrease in the number of properties that become liable from new mains, and the reduction may be accounted for by the stoppage of funds required for reticulation works. The Richmond district water supply was placed under the control of the Board in June last.

New Assessments.

3,198 new buildings were assessed during the year, or 1,120 less than in 1892. This decrease can only be taken as further evidence of the depression, as many of the buildings were well advanced towards completion in 1892 but were not assessed by us till 1893.

Building Fees.

The amount received in payment of building fees for the year was £2,263 12s. 6d., as against £2,925 16s. for 1892, being a decrease of £662 3s. 6d.

Recovery of Rates.

The receipts for the year amounted to £254,025 8s. 1d., and the arrears outstanding on the 31st December amounted to £29,775 17s. 10d., and in which is included the sum of £7,858 9s. 5d. due on meters, the readings of which were only taken at the end of the year, and consequently could not be recovered till after the accounts had been rendered in January; £3,928 2s. 10d. due on churches and charitable institutions, for which no steps have as yet been taken to recover; and £2,311 10s. due by the Government on the 31st December. 27,089 final notices were served and 4,875 summonses issued, being a decrease of 4,737 and 769 respectively.

Summonses Issued.

SPECIAL

ASSESSOR'S REPORT—*continued.*

SPECIAL FEES :—Stock, Gardens, &c.

Fees were paid for 9,745 head of stock, or 435 less than the number paid for in 1892. This decrease is to a great extent due to the fact that so many persons have had no work for their horses that they have been compelled to turn them out in the country to avoid the expense of stable keep.

Fees were paid for 1,594 gardens, being an increase of 259 for the year.

Richmond.

The receipts for the portion of the year from the time the Board took control of the supply, amounted to £358 7s. 4d., leaving £41 7s. 11d. outstanding on the 31st December, as shown by the following statement:—

						£	s.	d.
Rates	135	10	9
Meters	81	18	2
New Mains	163	5	11
House Supply	2	18	10

HERBERT J. BEAUMONT, Assessor.

Annual Report of Stores Branch.

Sir,

Central Store Yard, Crown-street, 23 January, 1894.

I have the honor to submit the following particulars of the work done in this branch during the past year.

Annual Contracts.

These were satisfied as under :—

Article.	Contractor.	Rate.	Value.
			£ s. d.
Building material	Wales and Dawson	1 per cent. under schedule ...	200 12 4
Cartage	W. Codnor	21 " " " "	333 17 0
Coal	B. Byrnes	Quoted prices	1,825 2 7
Iron castings	G. and C. Hoskins	{ £10 5s. } per ton	302 10 6
		{ £16 (s.) }	
Iron pipes	Pope, Maher, & Co.	£7 10s. "	3,464 6 10
Lead	Gibson, Battle, & Co.	£11 15s. "	199 11 6
Stores, general	Briscoe, Drysdale, & Co ..	20½ per cent. under schedule..	1,040 10 0
Timber	T. Allen (cancelled in July) ..	12 " " " "	96 9 2
Do	Ritchie Brothers (from August) ..	18 " " " "	73 15 7
Uniforms	W. Henderson & Co.	Quoted prices	162 8 8

Tenders were invited for cement but the lowest offer, 11s. 1½d. per cask, was not approved by the Minister: our wants were therefore purchased in the open market at a saving of £25 8s. 8d. on that offer.

Stock-taking.

This was conducted as usual by the Examiner of Accounts in September, and showed the actual stock in hand to be worth £39,000 or £104 in excess of the value standing in the books to the debit of this branch.

Colonial Manufactures.

Importation of iron-pipes, special castings, and valves has ceased. Local foundries now supply all the wants of the Board as they arise. Such supplies for the past year amounted in value to £3,766 17s. 4d.

Freight.

£333 17s. was paid for cartage and £107 3s. 3d. for trainage of goods on issue from the various store yards to works.

Issues.

During the year 3,603 orders for goods were honored—each order had an average of 3½ items, giving a total of 12,610 issue transactions on stock.

Sale of Condemned Stores.

Formerly this was effected by auction, but during 1893 tenders were invited by advertisement, and the following sales resulted :—

	£	s.	d.
Cast iron, at 42s. 6d., 55s., and 57s. 6d., per cwt...	49	5	0
Wrought iron	1	2	6
Scrap brass, at 3½d. per lb...	24	10	0
„ gunmetal, at 4½d. per lb.	30	4	6
„ India-rubber, at 1d. per lb.	2	5	0
Total	107	7	0

Tenders to purchase further quantities of brass and gunmetal were rejected as offering insufficient value, and for like reason there are now 200 tons of scrap iron awaiting sale.

Old pipes, &c., taken out of ground.

The work of overhauling old material taken out of the ground on replacement by new and fettling and recoating those selected as suitable for reissue, was formerly done by men under the Inspector of pipe-laying; those men were discharged in June, and the work since done by store labourers in slack moments of routine duties; 23 tons were thus treated to the saving of about £23 had special labour been employed on the work.

Manufacture by Board's Operatives.

Such urgent works as rough carpentering and smithy jobs that cannot be scheduled nor delayed by the formalities of contract labour must necessarily be done by mechanics in the Board's employ, to whom raw material valued at £236 7s. 3d. was issued, and goods made therefrom to the value of £523 16s., the increased cost representing the amount of wages spent on the work.

Statement

COMPTROLLER OF STORES REPORT—*continued.*

Statement of Receipts and Issues.

The total value of goods received during the year was £13,969 5s. 11d., and the issues from stock amounted to £13,461 0s. 1d. as set forth in detail on the annexed tables. This is exclusive of goods delivered for obvious economy direct to works in progress and accounted for separately by the Board engineer.

ABSTRACT.

Description.	Balance on hand 31st December, 1892.	Receipts.	Issues.	Balance on hand 31st December, 1893.
	£ s. d.	£ s. d.	£ s. d.	£ s. d.
A. Water pipes	24,472 18 9	6,124 16 3	5,663 9 4	25,244 13 1
B. Stop valves	3,267 3 6	262 1 6	560 4 9	2,844 0 6
C. Special castings	10,554 16 10	995 16 2	1,495 2 7	9,997 17 3
D. General stores.....	1,903 11 3	6,586 12 0	5,742 3 5	2,747 5 3
Total.....	40,198 10 5	13,969 5 11	13,461 0 1	40,833 16 1

The difference of £126 19s. 11d. between the sum of receipts and 1892 balance, and the sum of issues and 1893 balance, is due to variations in prices of goods received, the goods issued in the year being priced out at a uniform rate.

A. ELLICE FLINT,
Comptroller of Stores.

The Secretary.

Engineer's

Engineer's Report.

Engineer's Department, 3 February, 1894.

Sir,

I have the honor to report, for the information of the Board, on the working of the Engineer's Department, embracing the branches of water supply and sewerage, for the year 1893.

WATER SUPPLY BRANCH.

Canal and Prospect Reservoir.

The canals and tunnels from Pheasant's Nest to Prospect Reservoir are in very fair order. During the year various works, comprising painting inside and outside of aqueducts, repairs to cottages, erecting fences, renewals of flumes across canal, lining with concrete the shaft at Cataract tunnel, surface drainage, and other minor works have been carried out by the Board. Relief drains have been constructed on the outer slope of Prospect Reservoir dam by the Harbours and Rivers Department, this work then being under that control. The Dam now being transferred to control of the Board, the action of drains will be kept under observation, and, if necessary, the system will be extended. A new fence has been erected at what is known as the boiling down paddock, for agistment purposes.

Supply from Prospect Reservoir.

The supply from Prospect Reservoir for the year amounted to 4,574,782,838 gallons, averaging 12,533,632 gallons per day, or 32.12 gallons per head of population.

Works below Reservoir.

Sections of the canal in embankment have been repaired during the year, work consisted of cutting out cracks and refilling with cement mortar, relining with concrete, and making good puddle backing. The repairs effected are substantial in character, and have considerably improved the imperviousness of canal. The reduction in leakage has been estimated by the Superintendent at from 3,568,000 gallons to 300,000 gallons per week. It is intended to continue the attention to this canal length during current year when soakage will be further reduced. The balance of works to Pott's Hill are in good order and require no special comment, further than that in the near future the 6-ft. pipe line will have to be examined internally.

Pott's Hill Reservoir.

The reservoir, screening chambers, &c., are in good order, requiring no special attention during the year.

Trunk Mains.

The duplicate main from Pott's Hill to Crown-street Reservoir is now in operation. A connection located about midway between above places has been made between the two trunk mains, thereby securing a constant supply to Crown-street Reservoir under any conditions which might occur.

Quality of Water.

The monthly analysis of Government Analytical Chemist shows that the water retains its high character.

Pressure in Reticulation Mains.

With the exception of elevated zones at Waverley, Randwick, Balmain, and Hurstville, the pressure in the mains has been uniformly good, and their capacity found to be ample. Remedial works would have been carried out at the majority of the districts above referred to had not the action of the Board been hampered by the want of funds. Works have, however, been now put in hand, and when complete the Metropolitan water supply will be second to none.

The slackness of supply to the higher zones is at times aggravated by shutting off the water for the purpose of tapping mains for house services. Cases have been under the officers' observation where a whole block has been deprived of water until a new service has been connected. Circumstances like the foregoing lead to the consideration as to the advisability of introducing a system which will obviate the necessity of shutting off the water when tapping mains. The system of tapping mains under pressure is not only advisable for reasons of water supply, but on hygienic grounds also; and in such an important system as the Metropolitan supply any process by which the house service will not be interfered with, and all possibility of contamination be eliminated, should be adopted.

General Reticulation.

The mains throughout the system are in good order. During the year the operations of the Board in reticulation work were considerably restricted for want of funds on Loan Account. This naturally decreased the earnings of the branch towards maintenance of, and paying interest on cost of, main works.

About 16 miles of mains of various sizes were laid, and 26 miles cleaned. There was a marked diminution in the number of leaks during the year as compared with previous period, the number reported and attended to in 1893 being 1,000; the number reported in 1892 was 1,812. Details are shown in accompanying statement. The number of hydrants fixed were: screw-down, 8; ball, 343.

House Services.

The number of drillings for house service was 3,139, and 6,248 extensions from existing services, were carried out. The number of Plumbers' Permits issued was 10,795. Other services are shown in summary of work.

Meters.

ENGINEER'S REPORT—*continued.*

Meters.

The number of meters now fixed is 4,642. During the year 148 were disconnected, the net increase for year being 216.

The Board having decided that on and after 1st March next all water meters of sizes from $\frac{1}{2}$ -inch to $1\frac{1}{2}$ -inch diameter should be supplied by them to consumers, it became necessary to adopt a suitable type as a standard. The meter adopted by the Board was the Turbine meter designed by the Hydraulic Department of South Australia.

The meter is of gun-metal and brass, is simple of construction, its parts are all interchangeable and it is expected that its life will exceed any yet submitted to the Board.

Tenders for the supply and manufacture within the Colony of 925 meters of various sizes of above type were invited in July last. The tender of Messrs. Danks and Son (Limited) was accepted, the rates being satisfactory. The meters are to be delivered during current year, and, judging from the progress made, it is possible that the work will be completed within specified time. In order to provide extra room for repairs, &c., which will naturally develop under new system, the engine-room of old rotative engine will be converted into a workshop, and boiler-house will be devoted to work connected with same branch. The system to be adopted with regard to meters from $\frac{1}{2}$ -in. to $1\frac{1}{2}$ -in. diameter is that the Board will supply same at a yearly rental according to size of meter. The consumers' plumbers will be permitted to fix the meter in the first instance, but afterwards the fitting is under the sole control of the Board, the consumer being under no expense for repairs, except under certain conditions. The meter remains the property of the Board and cannot be disposed of by consumer. Meters of sizes above $1\frac{1}{2}$ -in. diameter can be provided by the consumer if of approved pattern.

The system of reading meters by classification has been, after a trial since 1891, found to be satisfactory. The saving effected by the system, which was introduced by the secretary, being equal to £320 per annum.

The revenue from meter supply, like all other sources dependent upon trade has been affected by the late depression, many manufactories being closed, or only working half-time.

Water Troughs.

Notices have been served during the year on all owners of water troughs which were found defective, to the effect that if same were not put in good order the free supply of water would be discontinued, and that a meter would have to be fixed and water charged for. This will have the effect of all unsuitable troughs being removed.

Meter-testing.

The number of meters tested and repaired during the year was 877—of this number 191 meters were received from country districts—these figures show a decrease as against last year of 372.

Water Fittings.

The number of water-supply fittings tested was 69,253, of the number 67,630 were tested and stamped, 1,103 were returned as defective, and 520 were condemned. The figures show an increase in fittings tested, and decrease in condemned fittings, as compared with previous year. Details of work done are shown in accompanying statement.

Free Supply of Water.

The quantity of water supplied gratis to charitable and other institutions during the year amounted to 39,805,000 gallons, being about the same quantity for previous year.

Fire Supply.

During the year 252 fires have occurred within the reticulated area. In nearly every case the reports of turncocks show that available supply was satisfactory.

Reservoirs, Tanks.

The whole of the reservoirs and tanks are in good order, no defects of any import having been reported. It is intended to repaint and repair the woodwork of the reservoirs during the current year.

Pumping Plant.

Main pumping station, Crown-street. The Worthington pumps Nos. 1 and 2 have been working regularly throughout the year, with exception of temporary stoppage to No. 1 engine for effecting repairs to one of the plungers; the work to Paddington being taken up by No. 2 engine. Periodical examinations have been made of both engines, and repairs and renewals incidental to wear and tear were effected. The main steam pipe joints as well as stop-valve chest in boilers became very bad and had to be repaired throughout. This was done without interfering with the pumping.

The Waverley, or No. 3 pumps, were erected by Mott's Dock and Engineering Company, and were officially started in the presence of the Hon. Minister for Public Works, on 25th September last, and have been regularly worked since 17th October last. The maintenance term expired on 26th January, and the pumps have been taken over from contractor. The plant was manufactured in the Colony, and the quality and general finish of the work is very creditable.

A brief description of the pumps will be of interest.

The contractors, who are also the designers, were required under contract to supply plant capable of raising 100,000 gallons of water per hour through a rising main, composed of 60 feet 15 inches new cast iron pipes, 10,000 feet of wrought-iron pipe, 24 inches diameter, and 5,800 feet of 18-in. cast-iron pipe, to a height of 219 feet; also a further duty of raising 40,000 gallons per hour to a height of 239 feet, to an elevated tank to be built adjacent to Waverley Reservoir.

The plant is of the horizontal compound condensing rotative direct acting type, and consists of a pair of engines placed side by side, each working a double action pump. The H.P. cylinders are 15 inches in diameter, and L.P., ditto, 30 inches in diameter. The stroke is 33 inches. The initial pressure of steam

ENGINEER'S REPORT—*continued.*

Botany Pumping Plant and Reserves.

There being no further use for the old Botany pumps, now that the duplication of the trunk main from Pott's Hill has been completed, the Board decided to lease certain portions of the Botany Water Reserve in sections suitable for wool-scouring and similar trades. One section only has, so far, been taken up. The lessees have erected extensive sheds and large scouring plant, and have already put through hundreds of bales of wool. The water for scouring is drawn from old engine pond, and, after being used, passes off by a drain to Cook's River, clear of the dams and possibility of contamination. The balance of the land will be submitted for public tender prior to season commencing. With lease is attached certain water rights, and term of lease is limited to ten years.

Length of Mains under control of Board.

The total length of mains, exclusive of trunk lines under the control of the Board, is 745½ miles. The total number of screw-down hydrants fixed in city and suburbs is 1,451; the total number of ball hydrants fixed is 14,232.

Old Material taken up and Cleaned, &c.

The value of material taken out of ground, cleaned, and coated ready for reissuing during the year is £2,104 3s. 9d.

Expenditure on Loan Vote.

The expenditure on construction of new works, &c., during the year amounted to £14,751 12s. 2d., as against £94,789 11s. 9d. in 1892. The amount was expended as under:—

	£	s.	d.
New mains, &c.	10,932	16	0
Machinery	3,818	16	2
	<hr/>		
	£14,751	12	2

Expenditure on Revenue Vote for Maintenance.

During the early part of last year considerable reduction was made in the maintenance expenses of the Branch. The Assistant Engineer, Mr. C. W. Smith, submitted a report on the whole matter of supervision and book-keeping; the recommendations contained therein were generally adopted by the Board. The estimated amount of saving which would be effected annually by the recommendations has been more than realised. The amount in first instance was £6,132. The year's work shows that on salary sheet a reduction has been made from £2,000 to £1,610 per annum. Prospect staff pay-sheets from £3,666 16s. to £3,274 per annum, and the wages-sheet for maintenance and supervising labour for the fortnight from £605 3s. 2d. to £350, the aggregate amount being equal to £7,412. A simple and effective check on expenditure was also introduced by a system of debit orders, and the cost of every work can be ascertained by reference to one set of books.

The records of reticulation system generally were not in a satisfactory condition; and as the information necessary for extending mains was not available in a connected form, a recommendation was made to the Board to have proper records for this, and also for sewerage branch undertaken, the Board having approved of same, the work will be taken in hand early this year.

Country Town Supplies under Board's Control.

On the Campeltown and Liverpool systems the extensions during the year amounted to 212 yards only. During the latter end of last year, the supply for Liverpool was drawn from the storage dam, constructed at the off-take, during the time that water was cut off from canal pending the painting of the interior of aqueducts. Owing to complaints as to quality of water, which were borne out by analysis, the water in dam was let off and bottom and sides cleaned of weeds, &c., the dam was refilled from canal and town supplied from same. It was, however, found necessary to let water down and supply from canal—the painting of aqueducts being pushed on so as to admit of this being done. Under existing circumstances it would not be wise to depend upon the supply from dam, and information is being obtained so as to improve existing works. As there will be no necessity for cutting off supply from canal for a considerable period there will be ample time to devote to improvements.

Richmond Water Supply.—The Board assumed the management of this system in July last, it having been carried out by the Harbours and Rivers Department. The system consists of a pumping plant erected on the banks of the Hawkesbury River below the confluence of the Grose and Nepean Rivers; a service tank having a capacity of 225,000 gallons, from which a 6-inch supply main extends for 4 miles to the town of Richmond, together with 5½ miles of reticulation mains 3 and 4 inches diameter. The demand for water is rapidly on the increase, and with good management the system may be made a paying one. During the half-year 3,838,000 gallons have been pumped with a consumption of 21 tons of coal.

General Work.

The Report of the Clerk of Works shows that a considerable amount of detached work has had to be supervised in connection with engine foundations, additions, erecting and repairing of pumping plant.

Reports and Statements.

The Reports and Statements in detail from the several sub-branches are forwarded herewith.

METER

ENGINEER'S REPORT—continued.

Meter Branch—Returns for 1893.

Crown-street Depôt, 27th January, 1894.

Water-meters.

THE total number of water-meters tested and repaired during the year was 877. Of this number 191 were for country districts, leaving 686 for the metropolitan area. The total number for last year was 1,058, showing a decrease of 372 in the metropolitan area only. This, I think, is duo to the continuous rain during the year, and the privilege to ratepayers *re* special fees for gardens, &c.

For the country meters there is a slight increase in the repairing of meters only. This, I think; can be accounted for by the Hunter River District Water Supply and Sewerage Board erecting testing tanks, &c., at their head office, for the purpose of testing all new meters for the districts under their control. A number of old meters are still sent in for repairs to these shops.

Water Fittings.

The total number of water fittings passed through this Branch during the year was 69,253. Of this number 67,630 were tested and stamped, 1,103 were tested and returned on account of slight defects, to be remedied, and returned for retesting and stamping, and 520 were condemned.

At the beginning of the year about 4,700 old class water fittings of various makers, were tested on behalf of the Hunter River District Water Supply and Sewerage Board, for the various importers at West Maitland and Newcastle. After the usual examination and test they were stamped with a special steel stamp provided by the Hunter River District Water Supply and Sewerage Board. About 2 per cent. were condemned as useless.

Last year the total number tested was 64,120. Of this number 62,631 were passed and stamped, 679 returned as defective, and 810 condemned. The increase of stamped fittings passed this year is 5,133 (including those referred to for the Newcastle and Maitland importers). There is an increase in the defective fittings of 424 (these defects are not of a serious nature, being easily remedied, and are due to carelessness on the part of the makers), and a decided decrease in the condemned fittings of 485.

Electrical Indicators, &c.

The electrical recording instruments in connection with the various reservoirs and the pumping stations have during the year worked satisfactorily; also all the water-level gauges, &c., in connection with the reservoirs and tanks.

The Bristol main-pressure recording instruments work satisfactorily, and by their means any unusual draught on the water-mains is detected.

The staff in connection with this branch have been fully employed in the repairing and testing of water-meters, and testing water-fittings and various other mechanical work in connection with the department.

W. J. ADAMS,
Meter Tester.

METERS, 1893.

New Meters tested before connection, and defective Meters repaired during the year 1893.

ENGINEER'S REPORT—*continued.*

Plumbing Branch, Annual Return for 1893.

Sydney, 17 January, 1894.

As instructed I beg to submit annual return on drillings, extensions of gas engines, horse troughs, gully shafts, to which Board's water has been laid on during year, and a list of total number of permits issued by this Branch for the like period.

Seven hundred and forty-three inspections have been made by Assistant Plumbing Inspector, and 261 by myself.

Numerous complaints as to insufficient supply of water have been made by occupants of large terraces throughout the city; on being investigated it has been found that corrosion to the extent of complete stoppage has been the cause, and in each case dealt with, a renewal of service resulted in a plentiful supply being obtained.

	Drillings.	Extensions of Water Services	Horse Troughs Supplied	Gas Engines Supplied.	Gully Shafts Supplied.	Number of Permits Issued.		Drillings.	Extension of Water Services	Horse Troughs Supplied.	Gas Engines Supplied.	Gully Shafts Supplied.	Number of Permits Issued.

J. B. WOOD,

Inspector of Plumbing.

Report

ENGINEER'S REPORT—*continued.*

Report of Progress in Meter Clerk's Department during 1893.

Sydney, 8 January, 1894.

The number of new meters fixed is as follows :—

Sydney and Suburbs	352 (26 for B.P.)
Richmond	2
Government	10
							<hr/>
							364
Disconnected in 1893	148
							<hr/>
Net increase	216
							<hr/> <hr/>

The number of meters in operation at present time is :—

Sydney and Suburbs	4,468
Campbelltown and Richmond	32
Government	142
							<hr/>
							4,642
							<hr/> <hr/>

Total from commencement :—

Sydney and Suburbs	6,403
Government	192
							<hr/>
							6,595
Total disconnected	1,953
							<hr/>
							4,642
							<hr/> <hr/>

Three hundred and forty-eight meters became inoperative from various causes during the year these were in nearly all cases promptly repaired and refixed.

I think the progress in this department would have been greater but for the fact of its becoming known that the Board would supply meters at a rental in 1894. This will be a great inducement to those who cannot well afford to purchase.

The revenue from meters is still suffering from the depression in trade, many manufactories being closed, or only working half-time.

The new system of reading meters by classification, as introduced by the secretary in 1891, has been now two years on trial, and is working well; not the least advantage being a saving of £320 per annum.

E. R. ABSELL,
Meter Clerk.

ENGINEER'S REPORT—*continued.*

Prospect Works—Superintendent's Report.

Prospect Reservoir, Prospect, 15 January, 1894.

I HAVE the honor to submit for your information the following works, which have been done out of the contingent vote for 1893, viz. :—

Making cottage habitable for maintenance man (G. Dobson) at Potts' Hill.

Putting in new concrete at a slip which occurred in No. 5 concrete lined embankment for a length of 42 feet.

Cutting out all cracks for a length of 1,410 feet, and filling in again with cement concrete; also 1-inch cement rendering for a distance of 480 feet in length of the worst part of No. 3 concrete lined embankment.

Cutting out all cracks and filling in with cement concrete the whole length (195 feet) of No. 2 concrete lined embankment.

Cutting out all cracks and filling in with cement concrete; also putting on a 2-inch coat of cement rendering, owing to concrete being inferior, for the whole length (231 feet) of No. 1 concrete lined embankment.

Opening out and making good puddle core in embankments Nos. 3, 5, 6, 7, and 9.

Previous to the above works being done the leaks represented a weekly loss of water to the amount of 3,568,000 gallons. It is now reduced to 300,000 gallons, and after doing some more rendering, which is intended to be carried out this year, I hope to further reduce the waste.

The reservoir embankment has been under repair by the Harbours and Rivers Department, of which you have a report.

A new fence has been erected at what is called the boiling down paddock, for taking in stock for agistment.

The works performed on line of conduit above reservoir, from contingent vote are as follows :—

Renewing two 10-ft. and one 3-ft. 6-in. oregon timber flumes, and replacing with wrought iron ones and concrete aprons.

Diverting water from over bridges and approaches, two in number, by fixing wrought iron flumes over canal with concrete aprons. These approaches are now in good order and can be kept so for the future.

Putting in concrete shaft to the cataract tunnel, found necessary owing to the timber having decayed and given way.

Painting aqueducts above Kenny Hill. The first four were well in hand at the end of the year.

The works in general on the whole length of canal, from Potts' Hill to the Pheasant's Nest, are in very fair order.

W. WAKEFORD.

ENGINEER'S REPORT—*continued.*

Pumping Plants.—Report of Mechanical Engineer.

Crown-street, Sydney, 8 January, 1894.

I HAVE the honor to make the following report upon the working of the pumping engines, &c., and water supply, for the year ending 31st December, 1893.

One of the plungers of No. 1 engine became loose on rod, and that necessitated its stoppage for twenty-two (22) hours, to enable its being drawn and made good—the water supply to Paddington being kept up by No. 2 engine—otherwise the engines have been kept going daily throughout the year.

Periodical examinations have been made, and renewals to air pump valves incidental to ordinary wear and tear have been effected, viz:—In September one (1) set of V I valves to No. 2 engine (8), at intervals when stopped; also two (2) head valves and four (4) bucket V I valves had to be renewed in No. 1 engine in October; repairs to feed pump, valve chest, and new driving stud pins; otherwise nothing beyond the ordinary routine work of examinations, repacking, and renewals have been required to the engines. The main steam pipe joints became very bad, necessitating their being remade all throughout; also stop valve chests on boilers, and which was done without interruption to the pumping.

The No. 3 pumping engine, supplied by Mort's Dock Engineering Company, was officially started on September 25th, 1893, and was put on doing the whole of Waverley supply pumping on the 17th October, 1893, which duty it has been doing uninterruptedly up to the present time, taking advantage of stoppages to renew defective vulcanised india-rubber pump valves where required. At Botany works the banking of fires was discontinued on July 1st, 1893. Having a duplicate water supply main from Potts' Hill, it was not deemed necessary to keep the fires banked at Botany. I have made periodical calls of inspection throughout the year to the several pumping works, and reported accordingly:

The fire-extinguishing appliances in connection with reservoir buildings have been tested monthly, and seen to their being in efficient and working order. The quantity of water pumped at Crown-street works to Paddington during the year is 1,515,949,800 gallons, showing an increase of 190.3 million gallons on the previous year; and in the pumping of the last quarter of the year an increase of nearly 83.5½ million gallons on that of the corresponding quarter of the previous year.

The quantity of water pumped to Woollahra reservoir during the year was 393,094,500 gallons, being 14.5 million gallons more than the previous year, and in the pumping of the last quarter of the year an increase of 14.72 millions on that of the corresponding quarter of the previous year.

The quantity of water pumped to Waverley reservoir during the year was 177,265,102 gallons, giving an increase on that of the previous year of 32.51 million gallons, and in the pumping of the last quarter of the year an increase of 17.87 million gallons on that of the corresponding quarter of the previous year.

The quantity of water pumped by the Ryde pumps during the year was 262,848,000 gallons, and in the pumping of the last quarter of the year an increase of nearly 11.8 million gallons on the corresponding quarter of the previous year.

The pumping to Penshurst was continued twice a day with the gas engine pump at Carlton throughout the year as the tank is too small to contain a day's supply, and in some very hot days the pump being taxed to its fullest limit. The Blake pumps having been dispensed with at North Sydney they were removed to Carlton and erected in November last, it being nearly the double pumping capacity of the gas pump, and will take up the duty of that pump about the commencement of the ensuing year.

J. FYFE,

Engineer of Pumping.

RETURN of Water pumped and Coal consumed for year ending 31st December, 1893.

From.	To.	Water pumped.	Coal consumed—banking included.

CHARLES W. SMITH,

Assistant Engineer for Water Supply.

SEWERAGE

ENGINEER'S REPORT—*continued.*

SEWERAGE BRANCH.

Transfer of Sewers from Government.

THE following Sewers and Storm-water Drains, constructed by the Government Sewerage Department, have been transferred to the control of the Board, in accordance with the provisions of Amended Sewerage Act of 1889:—

Sewers—

Waverley and Woollahra Branch Sewer.
Glebe Main and Submains.
Elizabeth Bay Branch Sewer.
Camperdown Branch Sewer.

Storm-water Drains—

Iron Cove Branch Channels.
Long Cove Creek.
Minimi-street to Shea's Creek.
Macdonaldtown.

Total length of sewers, storm-water drains transferred to 31 December, 1893, is shown in Appendix A, aggregating 7.43 miles.

Surveys, &c., New Works.

During the year surveys and plans have been prepared for extending sewerage system to suburbs, the length of sewers dealt with aggregates 19 miles. It is intended this year to push on surveys in connection with Western Suburbs System, including low level zone of Macdonaldtown and St. Peters. In the Eastern Suburbs the portions of Waverley and Randwick, which can be drained into existing outfalls, will be taken in hand, as there is a prospect of funds being available for the works when ready for contract.

New Sewers.

The length of sewers constructed during the year did not aggregate more than 4.45 miles, viz., 4.35 miles of foul water sewers, 10 miles of storm-water ducts. The operations of this branch were entirely suspended as regards constructive works owing to funds not being available, although there were ample balances in the different loan votes. The effect on the revenue by stopping the reticulation works was referred to in my previous report.

Arrangements were, however, made with the Treasury, and the Minister approved of the acceptance of tenders at the latter end of the year to the amount of £37,750—the length of sewers comprised in contracts being 22½ miles. The districts interested are Glebe, Waverley and Randwick, Marrickville and Petersham. No time was lost in starting works, and the whole are now in operation, and I hope to see a section of same revenue bearing in the first half of this year. The total length of the sewers under the jurisdiction of the Board is 182.34 miles. Sewers, &c., constructed by Board are shown in Appendix marked B.

Transfer of certain Storm-water Sewers from Government to Board objected to.

During the year objection was raised by the Board to taking over storm-water channels or ducts from the Government except in districts which were revenue bearing, until such time as the Board was placed in a position to levy a drainage rate to cover the interest on the cost of same, otherwise the general revenue would be hampered with a load of dead capital. A further amending Act was introduced covering powers for above rating, as also other important measures, and will shortly pass into law.

According to the Act the drainage-rate will be charged within areas drained by the several ducts. This rate will merge into the general sewerage rate when the various districts are reticulated.

Outfall Sewers.

The northern and southern outfall sewers have been examined by the Assistant and District Engineers and found to be generally in good order. In some instances the rendering has been worn away by the attrition of road metal and debris. I do not consider this of much import, as the quality of the bricks used in lining will withstand the wearing referred to. It was found necessary to make provision for safety of men engaged in the lower parts of the northern outfall sewer, as in the event of their being caught in a heavy rainstorm loss of life might occur. The Board approved of refuges being placed in deep shafts and life-chains at lower end of outfall. The various penstocks, valves, &c., have been attended to during the year and are in good working order.

Suburban Sewers.

The whole of the suburban systems are in good order, being regularly flushed once a week, in the low-lying portions of Alexandria and terminal points of sewers in Randwick automatic flushing chambers have been constructed, the working of same has been very satisfactory. The chambers have a capacity of 200 gallons, and are fed by a dribble from tap; the discharge is by a vertical annular syphon, the pipe being 6 inches in diameter. The syphon is made of galvanized iron, with fixing clips at bottom, and costs a few shillings. The sewers have fulfilled the object for which they were laid. No complaints were received of flooding through surcharging of same. In the early part of last year it was found that the painting of aqueduct across Shea's Creek required renewing; this was done by maintenance men as time permitted.

The

ENGINEER'S REPORT—*continued.*

The whole of the Randwick sewers which were transferred to the Board have been carefully inspected, and where necessary man-hole, lamp-holes, and flushing stations established; this work has decreased the cost of maintenance.

Removal of Silt from Outfall Sewers.

The quantity of silt removed during the year from the main outfall sewers was 950 cubic yards from Bondi Sewer, 400 cubic yards from Botany Sewer, and 100 cubic yards from silt pit at University Park—this is a considerable reduction in last year—the quantities being 1,312, 630, and 120 cubic yards respectively. This, I think, can be mainly attributed to the fact that the daily flow is increasing through the gradual extension of the system, and greater scouring power being obtained, the silt is carried on to the outfalls.

No successful claims have been made on account of flooding of premises—in every case when investigated the cause has been found to be due to choking of streets, gullies, and defects in road construction. I dealt with this matter in my previous report.

Repairs to City Sewers Old System.

The following sections of old city system have been repaired and put in good order during the year, viz., Loftus-street from Macquarie Place, Southwards, Tank Stream, north of Martin Place, Bridge-street, Castleragh-street. Some lengths of the above sewers were in a very bad condition, in some instances the invert and crown had to be entirely renewed. Old man-hole shafts have been raised to the surface and fitted with iron covers to facilitate working in the sewer. There still remains the brick sewers in Pitt-street, Phillip and Elizabeth Streets, also the Wolloomooloo Bay system. In one of the sewers in the latter district it was found that a portion of the arch had given way. The repairing gang was set to work at once on the damaged length. The Elizabeth-street sewer is reported to be all open-jointed, the original mortar which was made with shell lime having disappeared. The sections will be taken in hand this year, and I trust to see same completed, or nearly so.

The repairing work done since commencement is shown as under:—

Northern Section.	Invert repaired, feet super.	Pointing, feet super.	Arches repaired, feet lineal.
1893	10,212	33,072	59
1890-1-2	15,354	143,013	68
Total	25,566	176,085	127

The following pipe-sewers have been repaired:—King-street, Burton-street, Hordern's Stairs, Hunter-street, Devonshire-street, and Grantham-street Stairs.

Fourteen man-holes have been raised to the surface, and twelve were fitted with castings. Nineteen old and damaged wooden man-hole covers were removed as dangerous, and replaced with cast-iron frames, &c.

Six old iron man-hole covers were replaced with new type castings.

The quantity of silt removed from the city sewers old system during the year was 2,500 tons—this is disposed of on reclamation works by the Board's punt, the Harbours and Rivers Department doing the towage.

The removal of silt from the sewers is always a heavy charge against the revenue. All the outlets are below high-water mark, and sewers being tide-locked twice in the twenty-four hours leads to deposit of silt.

The intercepting points between old and new systems being of a size favourable to admission of silt into intercepting sewers, the whole of the openings are being restricted so as to provide for daily sewage and exclude storm-water as much as possible.

The whole of the cleansing and flushing on main branches in the city has been, by order of the Board, carried out at night. The mud barge has been docked, bottom-cleaned, and hull painted by the Harbours and Rivers Department for the Board. Owing to want of funds the proposed abolition of silt pit at Darling Harbour, and extension of sewer through same could not be carried out. The work will, however, be taken in hand this year, which will result in a reduction of silt to be removed.

Outlet Works.

The buildings—screening chambers, valves, &c., are in good order. The cottages are all occupied, and in good condition; the trees are thriving and growing well. The foreman reports that the sludge removed from screening chambers, &c., during the year amounted to 879 cubic yards, showing a decrease of 811 cubic yards as compared with 1892. This is satisfactory, considering the increased amount of sewage during same period.

The quantity of lime used for cleaning and washing walls was 12 tons as against 15 tons in 1892.

The locomotive and trucks are in good running order.

The bridge over river has been repaired, the worst of the piles which had been affected by *teredo* have been removed, defective girders, head-stocks, and corbels are being renewed where required. The repairs were anticipated in my previous report, and can only be considered as of a temporary character until some more substantial means of access is provided.

In order to cleanse pits more rapidly as compared with hand crab and oil, engine the "Capitaine" was purchased, and a contract let to Pope, Maher, & Co. to attach same to existing crab with other fittings. The engine has been tried and found to do its work successfully. The agent instructs the foreman in the working of same. The staff of four men will be reduced to three, as I consider, with the improved lifting gear, three men including foreman will be ample for the work.

ENGINEER'S REPORT—*continued.*

Sewage Farm.

The filtration and irrigation areas still continue to act well; the manager reports they perform the work as well as when first laid down.

Last year being favourable for agriculture, fodder and vegetables were abundant and cheap, so that there was no great demand for the farm produce.

Plans have been prepared for laying a section of the scrub lands westward of farm into grass paddocks and spare filtering tank, as referred to in previous report. No funds being available the work was not pushed on, and as negotiations are now pending for leasing the farm and scrub lands, it is a question as to whether Board should expend any more funds in improvements, or leave it to lessee to extend the cultivated area.

The cattle-sheds and piggeries are in good order, and Board's stock in good condition. The agistment stock have been put into filtering-beds and keep down the grass growing in same, upon which they thrive very well and look in good condition.

Some time ago the Board approved of purchasing horses and drays to do the work on the farm instead of hiring as heretofore. This system has proved most profitable, as the horses are in splendid condition and have more than paid for themselves.

The truck provided for carrying carts and stock across the river has proved a great convenience; the transport is made without any hitch or difficulty. The revenue received from the farm during the year was £333 9s. 11d., as against £217 14s. 3d. last year. There is also a considerable quantity of produce on farm to be disposed of, and £25 agistment fees outstanding.

The sorghum was sold by auction and realised £10 per acre. The manager states that he will have a second crop of same area, so that the return for sorghum crop, if same price is realised, will be equal to £20 per acre. In addition to this there is the winter crop of vegetables.

The pigs are a good source of revenue, and the stock in hand stands in the books as paid for. All increase is profit to the account.

Gaugings were taken of the flow of sewage in main carrier during winter and summer seasons, with the following results:—Winter, dry weather flow 1,576,877 gallons, and summer, ditto, 1,450,385 gallons per diem. The maximum flow is lower than last year, and as the measurements were taken under precisely same conditions, and same formula used, I can only account for the difference by the possibility of former gaugings being affected by subsoil water, even in minute quantities, finding its way into the many miles of sewers at the numerous junctions.

The effluent water maintains its reputation for purity as an effluent. The reports from the analytical chemist, however, on one occasion showed that the effluent from a new bed contained more albuminoid ammonia than usual. On inquiry it was found that the sample referred to was taken from one of the new beds, which received very little sewage. The effluent drain was laid below the level of subsoil water, which is of a putrid character, and would account for the adverse report. The subsoil drain has, however, lowered the level of ground water, and future analysis will not be affected by same. Copy of analyses is shown in Appendix.

The farm was visited by the Hon. the Premier, Sir George Dibbs, President of Health Board, and other gentlemen interested in public affairs, who expressed their satisfaction at the manner of disposal of the sewage, and the luxuriant growth of crops.

The number of houses connected with the Metropolitan and Suburban sewers, under the supervision of the Board's officers, is as under:—

	1890.	1891.	1892.	1893.	Total.
City	961	541	1,070	1,223	3,795
Suburban.....	3,804	3,578	3,448	3,437	14,267
					18,062
Number connected to City sewers, prior to passing of Act					18,000
Grand total					3,6062

The totals shown for city are principally reconstruction of old drainage and new buildings, erected in lieu of old ones. The analysis of house drainage for the year shows the number as under:—City, 1,223; Camperdown, 554; Glebe Point, 67; Erskineville (late Macdonaldtown), 113; Newtown, 1,208; Petersham, 81; Paddington, 358; Redfern, 173; Randwick, 30; Waterloo, 240; Waverley, 54; Woollahra, 214; North Sydney, 18; Total, 4,660.

Compulsory Drainage.

Owing to the depression and absence of power to arrange for payment of costs of work when carried out, the Board did not push the operations of the compulsory clause, except in cases where consideration of public health necessitated action being taken. Legislative power will shortly be granted to the Board to arrange with owners of property to defray cost of work by a system of deferred payments where the whole amount of demand cannot be discharged at once.

I have no doubt but that this system will be largely availed of by the poorer classes, and the general health of the suburbs will be correspondingly improved.

During the year 36 houses were connected under compulsory clause of the Act, viz.:—City, 4; Alexandria, 9; Paddington, 1; Redfern, 1; Woollahra, 21; total, 36.

The total number of houses dealt with since passing of the Act of 1889 and cost per house is shown as under:—

	1890.	1891.	1892.	1893.	Total.
City		19	6	4	59
Suburbs		245	240	32	517
Cost per house		£14 14s.	£12 10s.	£18 14s.	
Average cost.....				£15 6s.	

The cost for 1893 is higher than previous years, owing to the fact that the excavation was chiefly rock. Drainage

ENGINEER'S REPORT—*continued.*

Drainage Plans.

The number of drainage plans, prepared with fees paid, is shown as under :—

	1890.	1891.	1892.	1893.	Total.
Plans prepared	2,212	2,303	2,485	2,669	9,669
Fees paid ...	£1,033	£1,088 15s.	£1,087 13s. 6d.	£1,106 7s. 6d.	£4,315 16s.

Drainage Certificates.

The number of certificates issued to the public in connection with house drainage, since inception of the system, is, viz. :—

	1891.	1892.	1893.	Total.
City	251	272	265	788
Suburbs.....	1,140	843	1,148	3,091
Grand total				3,879

The demand on the part of owners and architects for the certificates is increasing, in fact it is the rule now that persons employing licensed drainers specify that payment will only be made on production of Board's certificate. The system is gradually commending itself to the public, as they recognise the protection afforded by the certificates.

Defective Drainage.

The work of examining defective drainage in the city is being pushed on, the inspectors served 866 first, and 477 final notices to reconstruct or repair, of the number, 526 were attended to. The further Amending Act, will enable the Board to deal with recalcitrant owners or those not in a position to incur the expense of alterations. There were 327 chokages in private drains in the city system reported, of which only 14 were connected to sewers constructed under the Board, the obstructions being in the intercepting trap were easily removed without expense. In other cases drains had to be dug up to remove obstructions, grease and roots of trees forming the greater part of same. Notices are always served to "reconstruct" in such cases.

A large number of drains were smoke tested, and in every instance serious defects were found which endangered the health of the occupants.

The suburban inspector reports 79 chokages in private drains connected under Board, these were found to be due to carelessness on the part of the occupants, as the fault existed at yard gullies or "intercepting" traps. The number is small compared to the houses connected to suburban sewers, viz., 14,267, or '55 per cent.

Sanitary Plumbing.

The work of this sub-branch still continues to increase, and it is satisfactory to note that the public are becoming more educated in this important matter, and the experience of the Department is that what was considered a short time back as an unnecessary demand by the Board is now looked upon as a necessary provision. I attribute a good deal of this change to the tact and intelligence exercised by the Board's inspectors in dealing with the public; their advice is now sought in such matters where formerly the plumbers generally were consulted.

The testing of all new soil pipes in position is still carried on, and many serious defects have been discovered before work was passed. The hydrostatic test detects faults that no other system could, some of the defects found consists of honey-combed cast-iron pipes, defective caulking of joints, and in one case the lead had been dressed into branch pipe under water-closet instead of soldering; this part being out of sight could not have been discovered by other means.

The inspectors' notes of inspection of some of the city buildings reveal a state of things hardly creditable. These notes are of interest to show the necessity of careful inspection of places used for residential purposes.

In one case, in one of the oldest residential hotels, the following defects were found: lead traps of W.C's with slip joints into lead soil pipe, in another place the branch from soil pipe was partly open, the soil pipe was made of galvanized iron and completely eaten away, and a disused closet was found with the water seal evaporated—this was situated near a bed-room. In a large boarding-house a 4-inch cast-iron soil pipe laid diagonally near bed-room windows with an opening on top of pipe 18 inches long and 1 inch wide.

In a block of buildings where typhoid fever had broken out, the soil pipe was found to be of galvanized iron, unventilated and whole of sanitary fittings in a very bad state. In a large assembly-room, the soil pipe inside building was found to have open joints; on several occasions the drain was choked and sewage backed up and leaked through open joints. Many cases have been found where plumbers have fitted the V.P. on the house side of bath trap, and vent pipes from W.C's have been carried up and left open between ceiling and roof. The foregoing are only a few of the cases which have been dealt with, and clearly shows the necessity of proper supervision in this important work.

During the year, 347 notices were served to alter defective sanitary fittings, 297 of which were attended to by owners.

The number of houses inspected was 3,960. Number of certificates issued, 1,387, and 180 soil pipes tested.

Among the various large jobs supervised by Board's inspectors are :—Sydney Hospital, Royal Mint, City Bank, Bank of New South Wales, St. Andrew's College, and Women's College. The class of work executed in the above places is highly creditable to the licensed plumbers carrying out same, and will compare favorably with like work anywhere.

Ventilation

ENGINEER'S REPORT—*continued.*

Ventilation of Sewers.

The various shafts erected in connection with main and subsidiary sewers have been tested with satisfactory results; the returns are shown in tables referred hereto.

Several heavy gales occurred during the year, and, with exception of two instances, no damage was done to the many shafts erected, although some are in very exposed positions.

Complaints have been made as to bad smells from the shafts, but on being investigated, and air of shaft tested, the cause was found to be due to other causes.

The special shafts connected with chimney stacks have been found efficient; the following table shows results:—

	Cubic feet per hour.			Remarks.
	1891.	1892.	1893.	
	ft.	ft.	ft.	
Tooth's Brewery, 9-in. connection.....	40,286	29,348	42,064
Cameron's Tobacco Factory, 6-in. connection.....	5,369	7,068	5,971	Exhaust steam used.
Cornwell's Brewery, 6-in. connection.....	4,522	7,265	5,971	do
New York & Brooklyn Tobacco Factory, 6 in. connection.....	7,030	7,418	7,147
Old Pumping Station, Crown-street.....	6,857	27,456	1,610
New Engine House.....	4,444	1,507	3,124
Horden's Factory, Redfern.....	8,154

Owing to funds not being available, the work of erecting vent shafts made very little progress during the year, and shafts were only erected in isolated cases, or where the health of the district was threatened.

The water sprays which were fixed are acting satisfactorily, and, if funds are available for 1894, the number will be increased. A contract has also been prepared for proposed operations in 1894, and it is to be hoped that funds will be placed at the Board's disposal for this important part of the sewerage system. The necessity for the shafts is now generally recognised, and the Board meets with little opposition in attaching them to buildings. If the owner objects to the site fixed by Board's officers, a concession in the way of slight alteration of site removes the difficulty. The erection of the shafts requires the exercise of tact and knowledge of the principles of ventilation on the part of the Board's officers, and so far I am pleased to state that the officers have succeeded.

Watersprays.

	Cubic feet per hour.	
	1891.	1892.
Police Barracks, 16-in. induct.....	58,492
Busby's Bore, induct.....	11,284 (Cover on)	106,677 (Cover off.)
Obelisk, Hyde Park Exhaust.....	101,461	97,811

Expenditure out of Loan Votes.

The expenditure out of loan votes for the year was by contracts, £18,063 7s. 8d. In addition to this amount, small extensions were carried out by Board's staff to the amount of £151 1s. 6d.; total, £18,214 9s. 2d. Owing to stoppage of funds, the whole of the inspecting staff, with one exception, was dispensed with as contracts were completed.

Drawing Office.

The work performed in the drawing office and heliographing rooms shows a considerable increase during the year, as compared with previous years, as shown as under.

RETURN of work executed in Drawing office and Heliographing and Photographing rooms:—

	1890.	1891.	1892.	1893.	Total.
Drawings prepared.....	95	200	135	90	520
Tracings prepared.....	325	172	281	220	998
Drawings mounted.....	1,086	1,609	1,553	969	5,277
Helotypes printed.....	610	1,061	875	927	3,473
Photographs printed.....	124	124
Record Plans charted.....	65	65

ENGINEER'S REPORT—*continued.*

Diagrams.

Diagrams of death-rates, &c., are given—this question, however, is dealt with in Medical Officer's Report.

Diagrams of temperature of surface and in sewers 10 ft. and 40 ft. respectively, also humidity.

Diagrams of detail work as carried out under certain conditions—in continuation of previous plates.

Diagrams showing cultivation beds and filtering tanks on sewerage farms.

The information and returns supplied by the Government Astronomer and Government Statistician have been of greatest assistance to the Department, and I take this opportunity of returning my thanks for the courtesy.

The change in the administration of the Engineering Department by having one head engineer has necessarily led to more work devolving upon the assistant engineers, and I wish to record my thanks to these gentlemen, as well as to the draftsmen, district engineers, and inspectors, for their cordial assistance in the discharge of the various duties of the service.

I have, &c.,

J. M. SMALL, M. Inst. C.E.,

Engineer for Sewerage, Acting Engineer for Water Supply.

APPENDIX.

Government Laboratory, Sydney, 18 July, 1893.

RESULTS of Analysis of Potable and Polluted Waters, Effluents from the Sewage Farm, Botany.

	Results expressed in	
	Grains per Gallon.	Parts per Million.
Appearance in the standard Two-foot tubes... .. Brown and turbid, but not unpleasant...
Chlorine as Chlorides	{ 1 2	3.9 7.5
Phosphates from Animal Impurity
Nitrogen as Nitrates and Nitrites.....
Total Solid Residue, dried at 220°.....	{ 1 2	21.84 29.54
Free Ammonia	{ 1 2 2.6 8.0
Oxygen absorbed in 15 min.	{ 1 2 6.68 5.80
Albuminoid Ammonia	{ 1 2 1.30 .50
Oxygen absorbed in 3 hours	{ 1 2 14.00 12.00

General Observations on the Character of the above Effluents.—Although heavily charged with organic matter undergoing oxidation, these effluents may, in my opinion, be allowed to flow into tidal rivers or water-courses not used as sources of town water supply.

WILLIAM HAMLET,
Government Analyst.

ENGINEER'S REPORT—continued.

APPENDIX B.

SEWERS and Storm-water Drains constructed by the Board.

THOS. GRIFFITHS,
Assistant Engineer.

ENGINEER'S REPORT—*continued.*

Report on Repairs to City Sewerage.

The work carried out in the city is as follows, viz.:—

Subsidences.—Of these there have been thirty opened out and made good. In Upper William-street (1), Bowman-street (1), Goulburn-street (1), George-street West (2), Harmer-street (1), Riley-street (1), Roslyn Gardens (4), Forbes-street (7), Kellett-street (1), Mitchell-street, Glebe (2), O'Connor-street (1), Clare-street, Glebe (1), Campbell-street, Glebe (1), Lyndhurst-street, Glebe (1), Hunter-street (1), Bradley's-lane (1), Athlone-place (1), Kensington-street (1), and Turner-lane (1).

Choked Sewers.—Of these there have been nineteen cleared, viz.:—Kippax, Jerry, George, Wilmot, Barrack, Palmer, Brougham, Quay, Matthew, Mill, Napoleon, and Foster Streets, Wellington-place, Penny's, Moorgate, Buckland, and Schlinker's lanes, George-street North, and Bayswater Road.

Manhole Shafts Carried Up.—Of these fourteen have been carried to surface and No. 19 castings put on twelve of them, viz.:—Castlereagh-street (5), O'Connell-street (1), William Henry-street (1), Wentworth Park (3), Moorgate-lane (2), and Bridge-street (2).

Manhole Castings Raised.—Of these seventeen, viz.:—Chippendale (1), Loftus-street (1), Abercrombie-place (1), Brougham-street (1), Grafton-street (1), Liverpool-street (3), King-street (1), Wattle-street (1), Pymont Bridge Road (1), Pitt-street (1), and Bridge-street (2).

Broken Manhole Casting.—One over Bondi sewer in George-street replaced with a No. 19 casting.

New Manholes.—One shaft sunk and built in George-street, near Bathurst-stairs, and one built with brick in Gasworks yard, Kent-street, for public ventilator.

Sewers Extended.—Harvey-street, Pymont, 76 feet 6-in. earthenware, and in Domain-terrace there was laid 42 feet of 9-in. earthenware pipe sewer.

Broken Manhole Cover Stones.—One pair replaced in Bourke-street, Woolloomooloo.

Pipe Sewers Repaired.—In King-street, Burton-street, Hordern's-stairs, Hunter-street, Devonshire-street, and Grantham-street stairs.

Sewer Lifted and Re-laid.—Nine-inch pipe sewer in lane off Gloucester-street.

Gully Pipes Lifted and Re-laid.—On account City Council in Onslow-avenue.

Lamphole Castings.—Of these there were lowered in Hutchinson-street (2), Kent-street (2), and Moore-street (1); and there were raised in Phelp's-lane (1), and King-street (1).

Junctions.—Of these there were put in nine, viz.:—North-lane (1), Riley-lane (1), Victoria-street (1), William and Victoria Streets (1), George-street (1), Liverpool-street (1), Regent-street (1), Roslyn Gardens (1), and Barrack-street (1).

Public Ventilators.—For these there were pipes laid in Charles-street, Forest Lodge (Public School), Wattle-street, Park Road, District Court, Short-street, Mint, and Elizabeth-street.

Lamphole Castings put on in.—Omnibus-lane (1), Kent-street (1), Rapier-lane (1), George-street (1), Lane off Mill-street (1).

Wood Manhole Covers.—Of these there were replaced by iron castings 19, viz.:—Oxford-street, Busby's bore (3), Erskine-street (2), George-street (6), Quarry-street (1), Forbes-street (1), Duke-street (1), Brougham-street (1), Druitt-street (1), Kent-street (1), and Pitt-street (2).

Old Iron Manhole Covers.—Six of these were replaced, viz.:—York and King Streets (1), Abercrombie-place (1), and Pitt-street (4).

Sewer Silt.—There has been removed from sewers and sent off by punt two thousand five hundred and forty tons during 1893.

Repairs to Sewers.—The repairs to the Tank Stream sewer were completed on 17th January, 1893; Bridge-street on 15th April, 1893; Loftus-street on 13th July, 1893; and the repairs to Castlereagh-street sewer, as I have already stated, will be completed about the second week in January, 1894.

The total amount of repairs for the year being as follows, viz.:—4,505 lineal feet invert = 10,212 superficial feet; and 4,556 lineal feet pointing = 33,072 superficial feet.

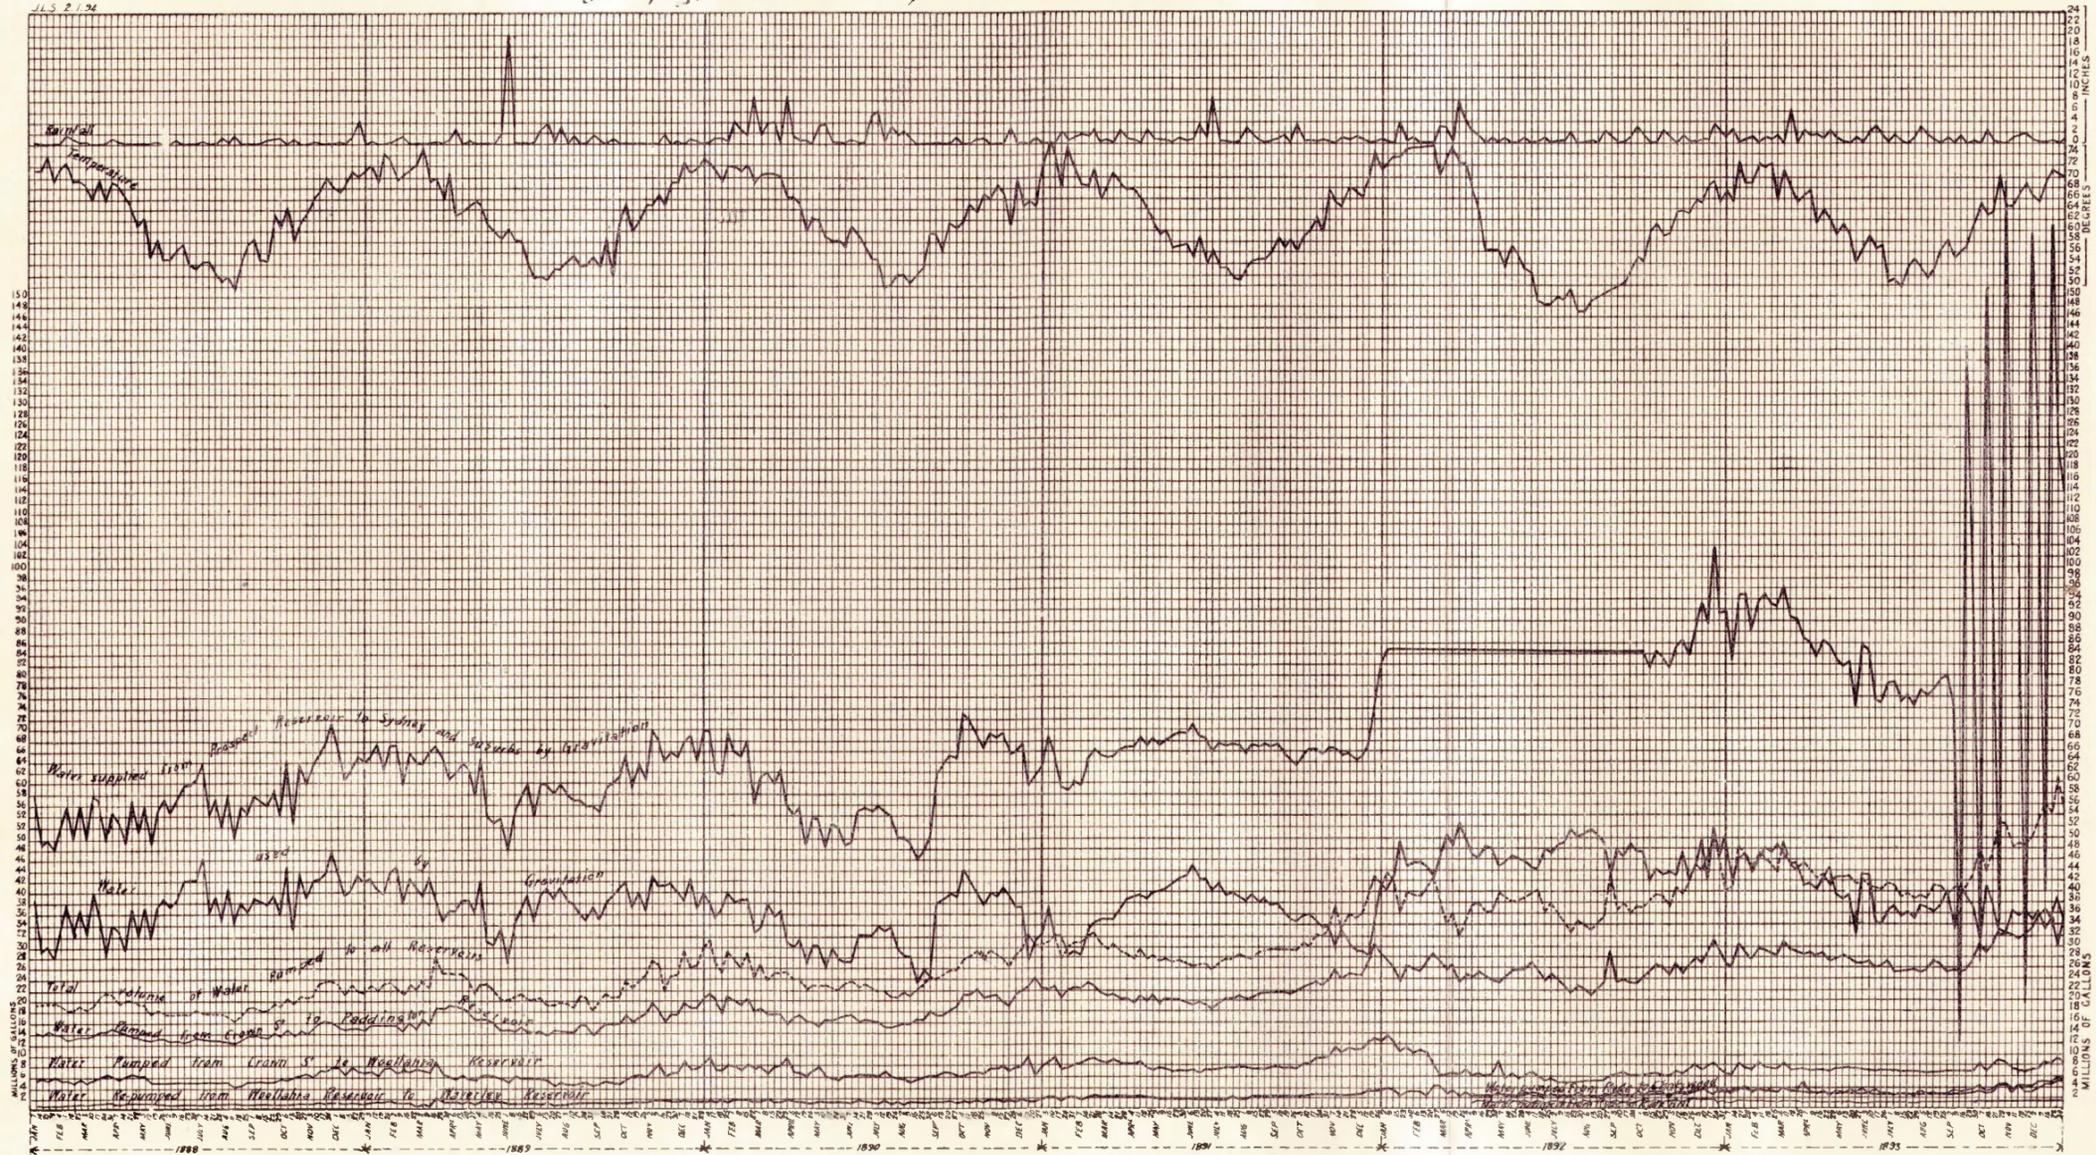

C. RHODES,
Inspector City Sewers, 30/12/93.

The Engineer for Sewerage.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

METROPOLITAN WATER AND SEWERAGE ACT
EXTENSION BILL.

(MESSAGE NO. 11.)

Ordered by the Legislative Assembly to be printed, 24 January, 1894.

Message No. 11.

R. W. DUFF,
Governor.

In accordance with the provisions contained in the 54th section of the Constitution Act, the Governor recommends for the consideration of the Legislative Assembly the expediency of making provision to meet the requisite expenses in connection with a Bill to make more effectual provision for the recovery of rates, charges, costs, and expenses payable under the Metropolitan Water and Sewerage Acts of 1880-1889; to provide for vesting in the Board certain storm-water drains and sewers and land and buildings used in connection therewith; to authorise the Board to impose rates and charges in respect of those drains and sewers within certain areas; and for other purposes.

Government House,
Sydney, 23rd January, 1894.

1894.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

HUNTER DISTRICT WATER SUPPLY AND SEWERAGE BOARD.

(REPORT BY THE PRESIDENT ON THE WORK OF).

Ordered by the Legislative Assembly to be printed, 14 February, 1894.

Minute Paper.

Subject:—Estimates for 1894.

Department of Public Works, Sydney, 10 February, 1894.

As the Estimates of Expenditure for your Board for 1894 will come on for discussion in Parliament on Wednesday evening next, the 14th instant, will you kindly furnish, for the information of the Minister, a concise report as to the work of your Board since its constitution on 1st July, 1892, its present state and future prospects, more especially as regards the revenue likely to be collected. In the absence of your Annual Report, a statement of the revenue already received, showing the principal heads of income, should be furnished with any other particulars of public interest.

J.B.,

The President, Hunter District W. S. and S. Board.

Under Secretary for Public Works.

Minute by The President to The Under Secretary for Public Works.

Subject:—Short Report for the Hon. the Minister in connection with the Estimates for 1894.

I AM directed by the President to furnish you with the following short Report, for the information of the Hon. the Minister, as requested in your minute of the 10th instant (No. 94/62).

Revenue.—The Board came into existence on the 1st July, 1892, and the statements attached show the amount of (a) Revenue struck, (b) actually collected, and the (c) balance outstanding, by which you will notice that a large amount of rates is owing by colliery properties. As you are aware, the Board have lost no time in taking the necessary legal procedure for the recovery of these rates, but the unavoidable delays of the Supreme Court have prevented the test cases being set down for hearing earlier than next month. It is anticipated that the issues which govern the whole of the cases will be then determined, and the outstanding rates received before the close of the present half-year. Taking into consideration the high rate struck, and the great depression in trade, the Board think that the amount of rates outstanding is not excessive, and have been able to attain a satisfactory result in this respect without pressing unduly upon the ratepayers. The greatest leniency has been shown by the Board in their proceedings for the recovery of revenue, and the right to pay by instalments has been readily granted in all deserving cases.

Expenditure.—The expenditure of the Board to the 31st December, 1893, was as shown in the Statement attached. The greatest economy has been exercised in both working and management expenses, and I am directed by the President to state that, as already explained by him personally to you, the staff is a small one, and the duties of the officers are heavier in consequence. At the initiation of the Board, the necessity of rigid economy, rendered necessary by the high rate which the Act compelled the Board to strike, was kept well in view and the Board have no hesitation in saying that the work of the Department could not be carried out on more economical lines than have been adopted; and further, that the officers have carried out their duties in a thoroughly satisfactory manner. All the works in connection with the water supply have been maintained in a thorough working order, and had it not been for the depression in this district, in common with other parts of the Colony, a much larger number of ratepayers would have connected with the mains, and the amount of outstanding rates would have been smaller. The Board have already drawn the attention of the Hon. the Minister to the necessity of providing for the construction of the duplicate suction and rising mains and connections, also the drain in connection with the storage reservoir, and extensions of reticulation. The number of houses connected with the water at the time of the initiation of the Board was 3,018, and this number has been increased by 600 up to the 31st December last. The total population of the district contiguous to the water mains is about 61,000, and the number in reach of the mains about 55,000, of which only one-third are actually consumers. Included in the assets transferred to the Board was a quantity of reticulation pipes and fittings,

ittings, valued at, roughly, £15,000; in order to make this asset interest, bearing the Board have initiated several extensions, which will, when complete, return a revenue of from 10 to 25 per cent. on the cost, and when funds are made available further extensions will be gone on with.

Compulsory Connections.—The Board have not exercised the powers given under the Act, enabling them to compel connections to the mains, owing to the depression.

Amendment of the Act.—The views held by the Board in connection with the urgent necessity of amending the Act have been fully placed before the Hon. the Minister, and hardly need recapitulation, beyond stating that the ratepayers of the Hunter District would, if the Board's views were adopted, have £6,549 per annum less to provide than at present, which would, of course, mean a considerable reduction in the rate. From the statement of revenue and expenditure it will be seen that the result for the eighteen months ending 31st December last has been very satisfactory, the surplus of revenue struck over expenditure amounting to £626 6s. 2d. If the present Act were based on the lines indicated by the Board, the rate struck, viz., 1s. in the £, would have given a surplus of £10,450 9s. 5d. for the eighteen months.

Summoning.—The number of summonses issued since the commencement of the Board are (to 31st December last): District Court 49, and Small Debts Court 776, making a total of 825. In five cases only have executions been issued by the Board, and in two cases only the President's warrant, and these on application of the landlord. There are at present fifty Small Debt verdicts outstanding, and the greater part of them are being reduced by instalments.

Outstandings.—The total amount of revenue outstanding on the 31st December last was £13,833 2s. 10d.; of this sum £6,200 is owing by the colliery properties referred to previously, and Government Departments £800. The balance is not excessive when the fact that the Board do not summon for the current half-year's rates is taken into consideration, and consequently a large amount of the rates struck for the half-year ending 31st December last remains unpaid on that date.

Future Prospects.—The depression in trade will, no doubt, affect the revenue for the current year to a considerable extent, and the consumption of water by the Railway Commissioners is also on the decrease. It is anticipated that the revenue for 1894 will reach £26,000, as against estimate of £29,800 for 1893.

ALEXANDER BROWN,
President.

ALFRED E. FRY,
Secretary.

STATEMENT showing Revenue of the Hunter District Water Supply and Sewerage Board from 1st July, 1892, to 31st December, 1893,—period of eighteen months. Referred to in President's Minute to Under Secretary, dated 13th February, 1894. No. 94—37.

Head of Receipt.	Struck.	Actually Received.	Outstanding.
	£ s. d.	£ s. d.	£ s. d.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

COUNTRY TOWNS AND HUNTER DISTRICT WATER SUPPLY
AND SEWERAGE ACTS AMENDMENT BILL.

(MESSAGE No. 22.)

Ordered by the Legislative Assembly to be printed, 13 March, 1894.

R. W. DUFF,
Governor.

Message No. 22.

In accordance with the provisions contained in the 54th section of the Constitution Act, the Governor recommends for the consideration of the Legislative Assembly the expediency of making provision to meet the requisite expenses in connection with a Bill to amend such of the provisions of the "Country Towns Water and Sewerage Act of 1880," the "Country Towns Water and Sewerage Act Extension Act of 1887," and the "Hunter District Water Supply and Sewerage Act of 1892," as deal with the repayment of the cost of works of water supply and sewerage, and to extend the period of such repayment; to empower the Board established under the said "Hunter District Water Supply and Sewerage Act of 1892" to connect premises with the water-mains under their control, and to recover the expenses of such connections; to provide for the carrying out of such connections by the said Board on deferred payments; and to make other provisions subsidiary to or in connection with the objects aforesaid.

PUBLIC WORKS ACT OF 1888.
(RESUMPTION OF LAND FOR PARKES WATER SUPPLY.)

Ordered by the Legislative Assembly to be printed, 29 May, 1894.

**NOTIFICATION OF RESUMPTION OF LAND UNDER
THE "PUBLIC WORKS ACT OF 1888," 51 VICTORIA
No. 37.**

NEW SOUTH WALES,) Proclamation by His Excellency The
to wit. { Right Honourable Sir ROBERT WILLIAM
(L.S.) DUFF, a Member of Her Majesty's Most
Honourable Privy Council, a Knight
Grand Cross of the Most Distinguished
Order of Saint Michael and Saint George,
Governor and Commander-in-Chief of
the Colony of New South Wales and its
Dependencies.

WHEREAS I, Sir ROBERT WILLIAM DUFF, the Governor aforesaid, with the advice of the Executive Council, have directed that a certain public work, that is to say, Supply of Water to the town of Parkes, in the said Colony, the estimated cost of which does not exceed twenty thousand pounds, shall be carried out under the provisions of the "Public Works Act of 1888" as an authorised work by the Minister for Public Works as Constructing Authority; and that the land described in the Schedule hereto, which is in my opinion required for carrying out the said work, shall be acquired by taking the same under the "Lands for Public Purposes Acquisition Act," as adopted by the "Public Works Act of 1888": Now, therefore, I, the said Governor, with the advice aforesaid, in pursuance of the "Public Works Act of 1888," do declare by this notification, to be published in the Government Gazette, and in one or more newspapers published or circulated in the Police District wherein the said lands are situated, that the Crown Land comprised within the descriptions set forth in the Schedule hereto has been appropriated, and the private property within such descriptions has been resumed, for the public purpose aforesaid, to the intent that upon the publication of this notification in the Gazette, the said lands described in the said Schedule hereto shall forthwith be vested in the said Constructing Authority as a corporation sole on behalf of Her Majesty, for the purposes of the said "Public Works Act of 1888," for an estate in fee simple in possession, freed and discharged from all trusts, obligations, estates, interests, contracts, charges, rates, rights-of-way, or other encumbrances whatsoever; and to the further intent that the legal estate therein, together with all powers incident thereto or conferred by the said last-mentioned Act, shall be vested in such Constructing Authority as a Trustee: And I declare that the following is the Schedule of the land hereinbefore referred to:—

1. All that piece or parcel of land situate in the parishes of Kamandra and Parkes, county of Ashburnham, and Colony of

New South Wales, being part of travelling stock reserve 7,286 (now a reserve for occupation, &c., notified 25th July, 1893) in the first-named parish, and part of camping reserve 1,112 in the parish of Parkes: Commencing at the north-west corner of W. T. Barker's portion 125 of 7 acres 2 roods 21 perches in the parish of Kamandra, at the Billabong Creek; and bounded thence on the east by part of the west boundary of the said portion 125 bearing south 153 feet 3 inches; thence by a line crossing the said Billabong Creek and by the north boundary of John Kenworthy's portion 231 of 1 acre 3 roods 30 perches bearing west in all 685 feet 4 inches; thence by part of the west boundary of the said portion 231 bearing south 65 feet 4 inches; thence by a line bearing south 44 degrees 41 minutes west 398 feet 1 inch; thence south 4 degrees 40 minutes east 201 feet 5 inches to the Parkes-Orange Road; thence by part of the north side of the said road bearing north 89 degrees 5 minutes west 274 feet 8 inches; thence by a line bearing north 13 degrees 39 minutes east 2,072 feet 9 inches; thence by a line bearing south 72 degrees 43 minutes east 1,089 feet; and thence by a line south 17 degrees 17 minutes west 1,036 feet 10 inches, to the point of commencement,—containing 36 acres 2 roods 87 perches or thereabouts, and said to be in the possession of the Crown.

2. All that piece or parcel of land situate in the parish of Parkes, county of Ashburnham, and Colony of New South Wales, being part of John Kenworthy's portion 231 of 1 acre 3 roods 30 perches on the Billabong Creek: Commencing at the north-west corner of the said portion 231; and bounded thence on the north by part of camping reserve 1,112 bearing east 65 feet 4 inches; thence on the south-east by other part of the aforesaid portion 231 bearing south-westerly 92 feet 4 inches; and thence on the west by other part of the said camping reserve 1,112 bearing north 65 feet 4 inches, to the point of commencement,—containing 7½ perches or thereabouts, be the said dimensions a little more or less, and said to be in the possession and occupation of John Kenworthy.

In witness whereof I have hereunto set my Hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this sixteenth day of May, in the year of our Lord one thousand eight hundred and ninety-four, and in the fifty-seventh year of Her Majesty's Reign.

By His Excellency's Command,

WILLIAM JOHN LYNE.

GOD SAVE THE QUEEN!

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

ARTESIAN WELLS AND GOVERNMENT TANKS WITHIN
THE COLONY.

(RETURN RESPECTING.)

Ordered by the Legislative Assembly to be printed, 12 April, 1894.

[Laid upon the Table of this House in answer to Questions Nos. 8 and 9, of 3 April, 1894.]

Question.

- (8.) ARTESIAN WELLS WITHIN THE COLONY:—Mr. WILLIS asked THE SECRETARY FOR MINES,—
- (1.) How many artesian wells have the Department put down within the Colony?
 - (2.) How many have been successful?
 - (3.) How many have been failures?
 - (4.) What is the total cost of construction, including regulating out-flow pipes and cost of management?
 - (5.) How many contracts are now let; what is the aggregate amount of money for such contracts; who are the contractors; and when will the contracts expire?
 - (6.) What is the revenue derived from these artesian wells since the commencement?
 - (7.) What has been the total expenditure for office management or supervision?
 - (8.) How many acres of land (if any) under crops, trees, or vegetables?
 - (9.) How many bores are leased; and to whom; and what is the rent derived from same?

Answer.

- (1.) Twenty-one are completed: ten are in progress; representing 40,000 feet of boring.
- (2.) Nineteen are flowing wells: five are sub-artesian, yielding pumping supply.
- (3.) One, the Bourke Trucking-yards Bore, has been an absolute failure.
- (4.) Cost of bores completed, including casing, regulating valves, carriage, caretakers' wages, &c., £52,303.
- (5.) Contracts are let for the following additional bores:—
Four bores, Ivanhoe-Menindie Road, J. H. Stubbs, contractor—Contract time expired 15th June, 1893; an extension has been granted.
Three bores, Box Creek-Arumbo Road, J. H. Stubbs, contractor—Contract time expired 15th June, 1893; an extension has been granted.
Four bores, Hay and Ivanhoe districts, Petrolia Boring Co., contractors—Contract time expired 14th November, 1893, but was extended.
Two bores, Morce-Boggabilla Road, C. E. Mayes, contractor—Contract time expired 6th January, 1893, but was extended.
Three bores, Milparinka-Wanaaring Road, William Pickering, contractor—Contract time expired 10th June, 1893, but was extended.
Thirteen bores, Bourke, Walgett, and Angledool districts, Petrolia Boring Co., contractors—Contract time will expire in 1896.
The aggregate estimated amount of the above contracts is £69,000, including casing.
- (6.) Revenue collected by caretakers, £752 7s. 8d.; annual revenue from tenants, £450
- (7.) This expenditure, as nearly as can be approximately gauged, has been from 1890 to March, 1894, about £7,100.
- (8.) Sixty-four acres. The areas are being increased by the tenants.
- (9.) Eight are leased, yielding £450 per annum, to the following tenants:—Reynolds, Buckley, King, Davey, Howatson, Jenkins, M'Caughy, and Manser.

Question.

- (9.) GOVERNMENT TANKS WITHIN THE COLONY :—Mr. WILLIS *asked* THE SECRETARY FOR MINES,—
- (1.) How many Government tanks have the Department made within the Colony?
 - (2.) What is the total cost of construction and cost of management?
 - (3.) How many contracts are now let; what is the aggregate amount of such contracts; who are the contractors; and when will the contracts expire?
 - (4.) What is the revenue derived from these tanks since the commencement?
 - (5.) What has been the total expenditure for office management or supervision?
 - (6.) How many acres of land (if any) under crops, trees, or vegetables?
 - (7.) How many tanks are leased; and to whom; and what rent is derived from same?

Answer.

- (1.) Twenty-four have been constructed by the Public Watering Places Branch.
- (2.) Cost of construction, caretakers' wages, &c., £34,887.
- (3.) Three contracts are in progress, embracing two tanks and one well; £1,423; Messrs. Welsh, Best, and Drummond; the contract time for the several works expired on 6th, 11th, and 16th January, 1894, respectively.
- (4.) Revenue collected by caretakers, £610 5s. 1d.; annual rental from tenants, £270.
- (5.) This expenditure, as nearly as can be approximately gauged, has been from 1890 to March, 1894, about £10,500.
- (6.) Approximately, 1,600 acres cultivated, 2,000 ready for plough, 4,000 scrubbed and ring-barked.
- (7.) Four of the above twenty-four are leased to Messrs. Fingleton, Gunn, M'Keown, and Farquharson; annual rental, £270.

1894.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

ARTESIAN WELLS IN THE BULLOO AND DARLING
RIVER BASINS.
(PROGRESS REPORT ON).

Ordered by the Legislative Assembly to be printed, 2 May, 1894.

The Chief Engineer, Water Conservation, &c., to The Under Secretary for Public Works.

Artesian Bores west of the river Darling.

THE accompanying report by Mr. Czarlinski is the outcome of a request made by the Minister that a competent officer should be sent to inspect all artesian bores in the north-western district. The only official report previously available was a compilation of information and statistics from various sources. On such an important subject as that of artesian boring the value of a report prepared after careful inspection of the bores and inquiry into the circumstances connected with them was obvious.

Some of the facts brought to light in Mr. Czarlinski's report are of great importance, and show the necessity for dealing in a scientific manner with the construction of artesian bores.

It is necessary to explain that the numerous excellent photographs* which accompany the report were taken and enlarged by Mr. Czarlinski personally. In addition to this, the chemical tests to determine the hardness of the waters were applied by Mr. Czarlinski, who carried out all the arrangements of his tour single-handed, and thus brought its cost to the lowest practicable limit.

Regarding the conclusions arrived at, and the information furnished, a brief statement of their outline is necessary. In the basin of the Upper Darling we have what may be compared to a great sea of alluvial deposits. This sea of alluvium extends far north of the Queensland border. The alluvial deposits extend up the river valleys like estuaries, and in many cases cover part of the watersheds. Beneath this sea of alluvium are the hills and valleys of former geological periods. These points are well illustrated in the ideal section included in Mr. Czarlinski's report, which explains all the ordinary phenomena of artesian flow. Among important matters brought to light in the report is the necessity for care in obtaining approximately the level of a site before starting an artesian bore. The importance of this is well illustrated by the success of Messrs. Killen, of Elsinora, who, in view of the experience gained from two bores which did not overflow, fixed on a lower site in the same neighbourhood, and obtained a large overflowing supply.

It is clear from the report that the precaution taken in this case would have been useful if adopted in others. Another point explained in the report is the advisability of not putting bores too near one another, and not putting down bores in the immediate neighbourhood of mud springs. The necessity for properly gauging the flow of artesian bores is shown by the incorrect and contradictory reports on this subject, which have been published from time to time.

Among other points dealt with in the report are the importance of charting the correct position of bores, the objection to allowing water to run to waste, the objections to carrying the casing too high above the ground, the permanency of the supply of water, and the small proportion of absorption area required to account for the artesian flow. Regarding the last two points it is sufficient to state that there is every reason to believe that only a small fraction of the available artesian supply in this Colony has yet been tapped.

Among the more important conclusions to be drawn from Mr. Czarlinski's report are:—

- (1.) That in selecting sites for bores the relative level of the ground should be at least approximately determined.
- (2.) That sites of bores should be accurately charted on record maps.
- (3.) That the supply from artesian bores should be accurately gauged periodically.
- (4.) That there should be a law under which the following points should be provided for:—
 - (a) That sites for bores should be approved before boring is allowed to be started.
 - (b) That in fixing sites care should be taken not to have them too near mud springs or other bores.
 - (c) That waste of water should be prohibited.
 - (d) That all owners of artesian bores should be required to furnish returns giving details of the bores, and of the amount of the supply of water, and the uses to which it is put.

* It has not been deemed necessary to re-produce these photographs here.

Mr. Czarliński was instructed to collect as much information as possible regarding the natural features of the district in which his duties lay. In attending to this he has afforded the necessary data for charting on the maps numerous features in the basins of the Bulloo and Paroo Rivers. Mr. Czarliński's report is a very valuable one, and will be most useful for reference in connection with bores yet to be put down.

H. G. MCKINNEY,
Chief Engineer.

28th February, 1894.

Progress Report on Artesian Wells in the Bulloo and Darling Rivers Basins.

BEFORE proceeding with the description of the artesian wells visited by me, I think it will be found convenient and necessary to touch upon current but wrong theories on the subject of the flow of artesian waters, as well as to give in a concise introductory note the theory as it is accepted by scientists, and which has been proved true on mathematical principles as well as by practical experience.

My reasons are the following:—

- 1st. A wrong conception of the phenomena connected with the artesian flow of water, and principally of the acting force, is apt to lead—and in the course of my inspection I have found has led—to unnecessary expenditure on bores, private as well as Governmental, in places which some knowledge of the subject would have shown *a priori* to be unsuitable.
- 2nd. In my observations I have been guided by the theory adopted by professional men, and in condensing it here, many tedious repetitions will be saved in the course of my account of these observations and deductions from the facts elicited.

Wrong theories.

The fact of the considerable rise of the water in the bores, and in many instances to such a height as to cause an overflow above the surface from depths reaching 3,000 feet, has been attributed to various causes incompatible with known physical laws. Thus one of the theories is that at the beginning of the solidification of our globe, water may have gathered under the cooling surface, in a basin of gigantic dimensions, and that the motive power throwing the water up, when tapped by a bore, is the compression this same water has had to undergo in consequence of the contraction of the earth crust through the cooling process. Propounders of this theory are naturally led to the belief that the water discharge is only temporary, and will fail as soon as there is sufficient relaxation of the compression. The premises being erroneous ones, the consequences cannot happen through such a cause. Water being incompressible the earth crust would have burst first. To the incompressibility of the water, the power of the hydraulic press is due.

Others while admitting the water to have its origin in the rain now falling, believe it to be thrown up by the centrifugal force engendered by the rotation of the earth. If this be true, it is perhaps a wonder why our buildings, ourselves, and everything else on the surface of the earth, where this force is greatest, are not subjected to the same law.

A theory which may look more rational at first is the one attributing the rising of the water to steam pressure engendered through the heat at great depths. Supposing the water in reaching these deep regions to be turned into steam, it would naturally rise at first in the form of steam, but in the passage upwards the steam would get condensed and return to the form of water. The centre steam bubbles cooling slower and being lighter would therefore find their way through the heavier water to the top. If we take the instance of a steam boiler, everybody knows that the steam is engendered nearest to the heating surface, and that the steam bubbles rise through, and to the surface of the water, and that if the pressure of the steam rises above a certain tension, the steam escapes into the air through the safety-valve, but no one has ever seen the steam remain inside and throw out the water, for the simple reason that what is lighter goes to the top.

There are, probably, other extraordinary explanations in the minds of persons trying to unravel a mystery long solved in the most simple way, and by the aid of such a simple and well-known law of nature as that of gravity.

Theory accepted by scientists.

Based on this law alone, Dupuit and Darcy, two engineers with world-wide reputations, have expressed the flow of artesian waters in a mathematical formula, and the results obtained have been fully proved to be correct for all practical purposes by direct experiment.

Imagining a number of cups of different sizes placed one inside the other, and the spaces left open between them filled with water, then a hole pierced in the centre, it is evident that the water will spout out with the tendency to attain its hydrostatic level. Successive layers of the earth from the surface towards its centre, strata permeable to water alternating with impermeable ones, have been curved by the rising of the mountains. The raised ends of the strata crop out on the slopes of the mountains that tore them up, the oldest being nearest to the summit. The permeable strata there absorb a portion of the rain water. As they fill up the open space in the strata they come to a position of imprisonment between the over and underlying impermeable strata. They then have realised the conditions of flow in closed conduits, but of very great dimensions, and with a motion restrained by the presence of materials through which they must filter. Tapped by a bore they must rise, and will flow over the surface where the hydrostatic level is higher than the surface. Such waters are artesian, and the described conditions are necessary to make them so.

Diagram No. 1.

Diagram 1 shows a section from near the foot of the mountains, to the sea, and which though ideal and of course not to scale, I have designed from conditions I have found on my tour of inspection. In reality it is not necessary for the artesian water-bearing strata to empty into the sea; they may discharge at the bottom of rivers, or end in natural artesian springs or mud springs. The Youleen Springs in the Paroo Basin, of which particulars will be given further on, are undoubtedly a group of such springs. Plate 8 represents a photographic view of one of these, and plate 9 a large reservoir in Youleen Creek filled from these springs. Plates 10, 11, 12 show mud springs.

Curves of pressure.

If a series of bores were executed in the direction of the flow (*Diagram 1*), and the water allowed to rise in tubes of indefinite height, and then lines were drawn through the points at which it stops rising, the curves obtained measure the pressure of the water for each stratum. The curve A B C D will always be below the horizontal A E, a result due to the loss of head through friction of the filtering mass of water, the amount of loss being measured by the difference of level from point to point. Uniformity of section throughout a conduit filled with materials of the same co-efficient of permeability, would give a uniform loss of head which would reduce the curve to the straight line A D. The

The last conditions are, however, never realised, the permeable strata are found sometimes wide, sometimes contracted, here thin, there deepening into hollows. The filling material is of various porosity; gravel offers different facilities to the motion of the water from sand or any other material. Again, the space may be free from obstruction altogether, as in a grotto or a pipe which may be syphon-shaped, and acting like one. This variety of condition of shape and matter cannot but seriously affect the form of the curve, or more correctly surface of pressure.

Under the first artesian stratum there may be one or more similar strata. Considering their necessarily more elevated area of absorption, it will seem probable that their water-yielding capacity should be superior, or that the water should rise higher. This is, however, not always so, everything depending upon the variation of their respective sections. In two bores in close proximity to each other, and drawing on the same artesian strata, the difference in the height to which the water will rise cannot be great, as the relative height of the mountainous country to the development in length of the plains is insignificant.

As said before, problems in relation to artesian bores may be solved by calculation. A consequence of the facility offered to the water to escape through a bore will be an immediate modification of the original form of the surface of pressure. If the bore tube is cut some distance under the surface of pressure determined by the point P (where the water stops flowing), a discharge will take place which must be proportionate to H (Diagram 2).

The water converging from all around the bore towards its lower opening, the surface of pressure will assume the form of a convex-shaped cone, with the outflow opening of the bore tube as its summit. It is the meridian of this cone that has been expressed in an equation. One of the factors is the distance from the bore to the point of junction of the curve with the primitive line of pressure, which is evidently at the point where the influence of the discharge from the bore ceases—a very important point to know, and which can only be accurately ascertained by experiment. This distance in the case of the Paris Grenelle and Passy bores has been found to be $2\frac{1}{2}$ miles (4,000 metres). From that formula is deducted another, for the calculation of the discharge.* Notwithstanding the difficulty in the way of using these equations their results are of great importance, as they undeniably show that:—

1. The curve of the surface of pressure is independent of the discharge, the thickness of the filtering stratum, and the co-efficient of permeability.
2. The discharge is dependent on the thickness of the water-bearing stratum, the head—that is, the height from the outflow to the original surface of pressure and the degree of permeability. This last result clearly shows the mistake so often made with some bores in this country, in unnecessarily letting the water flow out a great height above the ground.
3. The diameter of the bore does not materially affect the discharge, as in doubling it the flow obtained is only increased about 8 per cent., which is no gain if the great increase in the cost of boring and casing is considered. The diameter must, however, not be too small, as it would produce great friction in the ascensional movement in the bore. With the proper diameter the loss of head due to this friction is only about 2 per cent. of the loss due to filtration. Some engineers, however, doubt the correctness of the theory under this point, as they consider that the distance (L) may not be so great in proportion to the diameter as believed, but the following practical instance fully confirms the theory. The lower part of the tube in the Grenelle bore having been bent, a considerable loss in the discharge was noticed, due to accumulation of debris which could not be cleaned out. To remedy the evil, the casing was pierced at the bend, and a second pipe lowered to the water bearing stratum; however, as to some height at the bottom of the bore an empty space had formed itself, this second pipe, unsupported on the sides, gave also signs of deviation. It was then decided to fix the tube in the solid ground by means of an iron point at its lower end. This was done, and although the water now has no access from the bottom, but only by slots cut in the side of a pipe of smaller radius, and although this pipe is, moreover, obstructed by a square bar of iron in its centre, the discharge has increased to its former volume.

It has been seen that the effect of a bore is to lower the curve of pressure over a certain distance L (Diagram 2), this distance then measures the area inside which the bore will exercise an influence over the flow of any other bore. Supposing a second bore C has been pierced, it will not discharge any water unless the outflow is allowed to take place, below the curve of pressure due to the first bore. Thus, if the pipe were cut at the point "A" there will be no discharge although there would have before the existence of the first bore. In C, there will be a flow, but immediately the flow from the older bore will be affected, and this last will stop running altogether if the pipe of the second bore is cut in C, as the curve of pressure produced by the new bore will pass through the opening of the first bore.

If, as represented in Diagram 3, a number of wells are bored on a circle round a central bore "O," and the water let rise in pipes in indefinite lengths, the water will assume, in each of these new bores, levels corresponding with points on the meridian of the surface of pressure created by the flow of the central bore. Of course these levels, A, B, C, and D will be lower than the original surface of pressure, and their relative heights will depend upon the radius of the circle and the position of the bore. If now the pipe of the central bore is sufficiently lengthened to stop the flow, the effect of the then raised surface of pressure will be to cause flows from all the bores in the circle, and the sum of their total discharges will be a little less than the volume discharged by the single central bore.

If all the surrounding bore-pipes were cut sufficiently low the central bore, or any group of inside bores would cease running, and, of those on the perimeter, those on the upstream side will give more water than those on the down stream side.

$$2\pi RH$$

* $Q = \mu' \log \frac{\lambda}{R}$ in which "Q" stands for discharge, "Z" mean thickness of stratum, "λ" mean distance in lieu of "L," "R" radius of bore, and " μ' " = $\frac{\mu}{m}$ in which " μ " coefficient of permeability, " m " proportion of empty to filled space in the permeable strata, "H" for head. This clearly proves the small influence the diameter of the bore has on the total discharge, for "λ" being always an enormous quantity in proportion to "R," $\frac{\lambda}{R}$ is always a very great number; but the difference of logarithms of great numbers is always very small.

The influence of bores on one another, sometimes even when separated by considerable distances, has also been proved true in several cases—notably the reduction of discharge from the Grenelle well by the Passy bore, the distance between the two being $2\frac{1}{4}$ miles.

Protection of bores by legislation.

The circumstances are perhaps such as to call for legislation to protect existing bores in this country. Private bores executed by pastoralists in the resumed areas are generally protected by a 10,240-acre reserve. This may not be sufficient, as even when the bore is placed in the centre of the area, the distance from the boundary would only be 2 miles, which is somewhat less than the distance separating the two Paris bores mentioned, and it has been by no means yet proved to be the extreme limit of reciprocal action. In any case this is sufficient indication to conclude that the minimum distance between two bores should not be under 5 miles. In several cases on pastoral holdings I have found the bores situated right in the corner of the reserve, as for instance Brindigabba No. 2 bore with an outflow at the height of about 18 feet above the surface. A bore put down close to it, and allowed to run out above the surface would ruin this bore.

Experiments with Colonial bores.
Appendix A.

A great opportunity of making experiments in this Colony in that direction has been missed when Toorale bore No. 5 was made. It is 45 chains distance from Goonery Government bore, on the Bourke to Wanaaring Road. (See sketch.) Toorale No. 1 bore, although at the greater distance of $5\frac{1}{2}$ miles, might possibly yet, by simple, but careful observation, be found to be situated in the mutual influence sphere of these three bores.

The Government and Toorale No. 5 bores yield trifling supplies. Toorale No. 1 is an important water source of 360,000 gallons per day. All three are shallow bores. From now obtainable data it is impossible to draw accurate conclusions. In the Chief Inspector of Public Watering Places' report for 1891, on folio 12, the discharge of Goonery bore is stated to be 24,000 gallons. According to the Appendix 15 to the same report, it is, however, only 1,000 gallons, but by the information I gathered before I started on my tour of inspection, from the Government Statistician's Office, as supplied to that office by Mr. Boulton, the discharge is 12,000 gallons. I found it to be last August 2,460 gallons per day, and a licensed surveyor, who, at the time when the bore was completed, was engaged in that district, informed me that the bore then yielded 2,500 gallons, or practically the same as I found it to yield myself.

Bores close to mud springs.

For similar reasons, with regard to position of bores, the sites should not be chosen too close to mud springs, as these are natural artesian outlets.*

The Goonery, Warroo, and Youngarina Government bores are within a few chains of such outlets. The Goonery bore I have stated to be insignificant. The Warroo and Youngarina bores I was prevented from measuring, as reported. In Mr. Boulton's report, folio 12, the Youngarina bore is stated to yield 175,000 gallons per day, although, from section , Appendix 9, it would appear that a supply of half a million was struck. The Warroo bore is stated to give 17,000 gallons. However, several gentlemen engaged in pastoral pursuits, and others in the district, assured me that these bores only yield these supplies after having been shut off for some time, but that, when running, the supply very soon falls off. I intended, therefore, to gauge these bores in the evening and regauge the flows the next morning after a whole night's flow. Important information would thus have been obtained. If, in some instances, bores close to mud springs afford a good permanent supply, this will be due to circumstances which I have not had the opportunity to study. In any way the majority of cases speak against the placing of bores under the influence of mud or other artesian springs.

Importance of correct charting of position of bores.

It also follows from what has been said before that the actual position of bores should be defined as accurately as possible, otherwise, the falling off or total failing of such wells might be ascribed to causes not existing in reality. Referring to Appendix 40 in the report already named, the Wangamana Station bore is situated 27 miles east of the 75-mile post, on the Bourke to Wanaaring road. This is a position about 4 miles west of Toorale bore No. 2, and about 5 miles a little east of north from Toorale No. 1 bore, and on Toorale territory. Toorale No. 2 bore I found to yield 20,000 gallons per day, and I was informed that it had dwindled down to that quantity from over 200,000 gallons. An idea of its present small discharge might be gathered from the photo. given with the description of the bore. A perfectly legitimate conclusion to arrive at in an office in Sydney, would be that the Wangamana bore has ruined Toorale No. 2 bore. In reality the Wangamana bore is $29\frac{1}{2}$ miles, by a line bearing 294 degrees 50 minutes away from this bore, or $12\frac{1}{2}$ miles true north from the said 75-mile post. The position here now indicated has been fixed by accurate survey.

Permanency of supply.

The supply from artesian bores does vary but very little, whatever the extreme limits between dry or wet seasons might be. They consequently never fail, except from causes already dwelt upon, or through silting up at the inflow, or other obstructions gathering in the ascensional tube, and which are generally removable. When the artesian supply is freshly struck, it generally gives for a short period a discharge superior to that which would be found some time later. It is the supply which may be called normal that varies little. At this place I intend, however, to confine the remarks to the influence of seasons, and endeavour to dispel some wrong ideas about the great height of mountains, and voluminous rainfall thought to be necessary to give the magnificent flows already obtained here, and in other parts of Australia. It is not necessary to search for our source of supply in New Zealand or Asia. In connection with the Grenelle bore, it has been found that the loss of head due to filtration in the stratum is only about 172 feet.

Supposing a whole year's rainfall fell in one day, we would be able to gauge the extreme limits of variations of the level of the artesian strata.

This height will correspond to the absorbed portion of rain multiplied by 2, 3, 4, 5, or 6, co-efficient of permeability of the soil. Taking a yearly rainfall of only 10 inches at the mountains, we can certainly admit that if this rain came down in one day 5 inches would be absorbed, for the particular strata we have to consider are naturally very porous. Thus, with a rainfall of 10 inches, the extreme variation of the level would be about 30 inches. With a rainfall of 30 inches, the extreme variation would be about 8 feet, or only a very small portion of the head of pressure. In reality the rain is divided over a certain number of days, and although these may be far apart, the variations of the rain have a much smaller influence

*They soon cease to run after the outburst, which is accompanied with detonations audible in a radius of 15 miles. However, they continued to discharge water, which was absorbed by evaporation from the moist mud on the top, where a small quantity of water can always be drained off. I have seen in the Queensland portion of the Paroo Basin whole valleys covered over an area of several square miles with these mud mounds, notably on Boorara Station.

influence on the variations of the level of waters feeding the artesian strata; consequently the head of pressure and the discharge must remain about the same. There is, however, the condition that the outflow of the bore is sufficiently low in regard to the upper level of the water. This furnishes another reason why bores should be placed on low ground, and the tubing not unnecessarily elevated above the surface.

An instructive lesson might, perhaps, be learned from a comparison of the quantity of water discharged through an artesian flow with the amount of rain absorbed by the infiltration area, as it might serve as an indication of the possibilities in the dry back country. The limits of the geological formation at the heads of our artesian supplies are not by far yet sufficiently defined to allow of an Australian example. Referring then, again, to the Paris basin, the area of infiltration feeding the bores is known to cover 2,125 square miles, equal to about one-fourteenth of the whole area of the basin, which is 30,380 square miles. The supply of a whole year from one bore discharging 1,000,000 gallons daily will cover that infiltration area with a sheet of water 0.118 of an inch; in other words, 5 inches of rain absorbed would feed 423 wells flowing continuously at the rate of 1,000,000 gallons per day.

With the same quantity of rain absorbed by the infiltration area and a similar proportion of this area to the whole of the Bulloo River basin, 208 such wells would flow in the New South Wales portion of that basin.*

The supposed quantity of 5 inches is evidently much below reality, as it corresponds to the minimum falls in the driest parts of the basin, while the rain to be considered is that at the heads, where it is not an uncommon occurrence to get that much rain in a day or two. At present the flowing wells in that basin total only six, two in Queensland, and four in New South Wales. Of these, the most abundant—the Thargomindah bore—gives out 1,000,000 gallons per day. I have no particulars of the other bore in Queensland. It is said to yield about 200,000 gallons per day. Of the New South Wales bores, Elsinora No. 2 discharges about 500,000 gallons per day; Binjiwilpa bore, on Yancannia Station, 130,000 gallons; the Gilwapa, or Yancannia No. 2, and Salisbury Downs No. 2 bores yield small supplies of 1,440 gallons and 2,160 gallons respectively.

Passing to the consideration of the position the bore should occupy with regard to the configuration of the surface of the soil, and the influence exercised by the relative position within the boundaries of the artesian basin on the flows and depths of bores, it will be noticed on diagram I that in the position marked 1, near the head of the aquiferous stratum, or in any other position near the outskirts of that stratum, the bore will be comparatively shallow and no other waters will be met with. A flow will be obtained, and it might even be copious, as the curve of pressure passes sufficiently high above the surface of the ground.

In II, first, some water from local or neighbouring soakage, but not, or only slightly rising, will be pierced. It is often salt. The next water struck is the upper artesian, which will just rise to the surface as the curve of pressure of that stratum just cuts the level of ground. But a good flow can be obtained from the lower artesian strata.

In position III the depth of bore will be much less, a good flow being obtained from the first, and a still greater from the second water stratum.

In position IV, near the centre of the basin, no flow will be obtained, although the well was bored to the greatest depth, and the same artesian strata tapped; but a comparatively slight displacement to the right would have brought the possible outflow above the ground, below both curves of pressure.

In V, with a bore of medium depth, a good supply will result from the upper artesian stratum, while from the lower one the water might, through reasons already stated, either not rise to the same height, or increase the supply only very slightly, as here the difference of the two curves of pressure cannot be great.

On the diagram the curve of pressure has been given a position ending in the sea level, which will happen as a rule when the waters are discharged into the sea. If the level be superior, the result will be a fresh water spout through the salt water. But if it empties into rivers, or water-holes in rivers, the curve will coincide with the respective water-level, or, if higher, produce a geyser. We have no such in this country.

From the sections and descriptions of the particular bores, an idea might be gathered to which of the described types they belong. But it is appropriate to say here that to the injudicious choice of bore sites is due the theory about the absence of artesian water on the west side of the Paroo River. In fact, from none of the Government bores between Wanaaring and Milparinka and at Tibooburra has, so far, a flow been obtained.

Nor were Salisbury Downs in three, Bootra in one, Urisino in two, and Elsinora stations in one bore more fortunate. The desire to get flows at certain distances on a road or at the corner of four paddocks is natural, but there are other considerations to guide in the choice of sites for bores. At 7 miles west of Wanaaring begins the ascent of ridges that form the division between the Bulloo and Paroo Rivers watersheds. Between the 124th and the 125th mile-posts, or about 13 miles from Wanaaring, seems to be the highest point; thence to the 82nd mile-post extends a table-land of almost level plains, with only slightly rolling downs now and then, or over a distance of about 46 miles. At the 76, 78, 80, and 82 mile-posts again, higher desert sandstone ridges are crossed by the road, which runs almost straight east and west. Although so slight is the fall on the great plains that in Urisino territory no water-courses or depressions indicating such are observed, the general fall is from south to north—as parallel with the Milparinka Road, and on its south side run the divide of the waters draining north to the Berawinnia Creek. This creek, although very much silted up at its lower end, must, nevertheless, be recognised as a tributary of the Bulloo. On the south side the drainage is towards water-courses feeding, in times of thunderstorms, Yancannia Creek. This empties into Lake Yantara, a remaining depression of a once much larger receptacle of all the waters of a watershed closed on all sides, and in which the Bulloo River is the most important channel. From the description it will be gathered that the road over the table-land occupies almost the highest position in the whole district. Right on it, at about 121, 107, and 91 mile-posts Government bores have been sunk, the last mentioned is yet in progress, but although already approaching a depth of about 2,000 feet, no flow has, as yet, been obtained. A much better site could have been found about half a mile away from the present one.

Four

* Total area of the Bulloo basin is approximately 32,560 square miles; it is therefore a little greater than the Seine basin. Thirteen thousand six hundred square miles are within the territory of New South Wales.

Four miles south of the 83-mile distance is situated Urisino No. 2 bore; artesian water has been struck, but rising only to 85 feet beneath the surface.

Six miles on the north side is situated Urisino No. 1 bore; no flow is obtained, but the water rose to within 17 feet of the surface. Mr. Killen, of Elsinora Station, having a well bored, in which the water rose from a depth of 1,240 feet (*see Diagram*) to 65 feet from the surface, and hearing of a rise of water in Urisino bore to such short distance off the ground, before engaging in a new boring operation, took levels from his bore No. 1 to Urisino No. 1. He found a difference of 40 feet, his being the higher situated bore. He then decided to fix the new site at 61 feet lower than Urisino No. 1, and 101 feet lower than Elsinora No. 1. The result is a flow of half a million gallons 6 feet above the surface. From an examination of the diagram it will be seen that the main artesian veins struck in the three bores are the same. They rise to points on the same surfaces of pressure, as I was informed by the gentleman who executed the bore that the water rose in a test tube to some 30 feet above the ground. He was good enough to make this experiment at my request when I visited the bore before the supply was struck. The sketch also shows that bores Elsinora No. 1 and Urisino No. 1 are in the condition of type IV.

I am aware that several geologists advised to place the bores on top of ridges, on the plea that the sinking would be shallower. First, this is by no means certain, as the underground strata do not always even approximately follow the fall of the surface ground, over certain distances at least, although they do in a general way from the heads of the rivers, in the direction of the flow of the surface waters.

In the case of the Grenelle and Passy bores, the artesian conduit falls in the opposite direction, to the inclination of the surface soil. At Passy the bore is about 48 feet higher than at Grenelle, and the same aquiferous stratum was found to be 42 feet lower, or in total, 90 feet more boring was necessary to reach that stratum. In the second place, and not the least important besides geological considerations, there are, as I have endeavoured to show, other factors to be consulted.

Before closing these considerations on the question of artesian bores, I must yet mention a very simple graphical method of determining points of the curves of pressure. The method is illustrated in Diagram 4. On the vertical line, the heights of outflows are marked from which discharges of the same bore have been gauged, opposite in the horizontal direction are measured off to scale corresponding discharges. By joining the ends of these, and prolonging the line, the point of intersection with the vertical will fix the height at which the bore will stop flowing. In reality the line should be parabolic, but the difference with the straight is so slight, that for all practical purposes the straight line is sufficiently exact. If constructing such diagram the point of intersection is much lower than that found by mathematics, or the curve of pressure already known from another bore fed by the same strata, this would be an indication of escape in the casing. Diagram 5 illustrates the case. With bores of small flow the point could be found directly by screwing on an extra length or two of piping, and measuring the elevation of the water-level above a peg driven in the soil, which could easily be connected to by survey. Valuable information would now be to hand if the graphic method (by pipe lengthening) had been applied to each bore already existing in the country; as, in time, from the points so obtained, a whole network of curves, measuring the pressure of our artesian currents, could be plotted. From this, and the surveys and levels taken by this Department, a fairly accurate idea could be gathered of the suitability or otherwise, of sites for intended wells.

While it would be advisable to have a valve on each bore, the total failing of bores under a sufficient head of pressure is not to be feared. From what I said of their permanency of supply, it follows that they cannot be worked out like a gold or silver mine. But I have seen bores, the shutting down of which would mean their ruin. Such are bores, either with notable escapes at some point in the casing, or especially where water comes outside the casing right from the bottom. This would undoubtedly happen to Brindigabba No. 3 bore, and the Government bore at Kelly's Camp, on the Bourke to Hungerford Road, where the water outside the bore brings up with it fine sand drift. I would perhaps not have noticed this but for the bore being shut down.

At each bore there should perhaps be provided a fixed arrangement of appliances, according to local circumstances, for a periodical, easy, and accurate gauging of the flow. Out of the sixty bores visited I found it in two cases impossible to take the measurements, as the ground was too level over too great a distance to allow of the making of a prismatic channel for the measurement of the velocity or of taking proper sections. I could also not resort to the method of filling recipients, as there were none of any sort, nor was it possible, without a long ladder, to reach the top of the bore for putting a hose on.

Geological formations looked to for artesian strata are the cretaceous, the jurassic and the triassic. Any of these may be overlain by newer beds. The fact of the surface crust being composed of tertiary deposits does not render the particular locality unsuitable for a bore, if any of the artesian water-bearing formations can reasonably be expected to lie underneath. But to gain this knowledge, an inspection of the locality only would obviously be insufficient. The scientific data upon which the forecast of the chances must be based, can only be derived from a thorough study of the geological constitution of the soil over a great extent of country. That is why, in studying the artesian water possibilities in this Colony, it is necessary to also gain a good knowledge of those parts of Queensland where all the northern tributaries of the Darling and the Bulloo Rivers rise.

Tertiary, and even more recent deposits, overlies, in great patches, the cretaceous area on both sides of the Darling.*

Oolitic beds, of the middle or brown jura, by reason of their great porosity, absorb such volumes of rain, that where they are overlain by neocomian deposits (of which there is a great extent in New South Wales) they are capable of bursting these clay beds.

So far no indications have been found of existence of oolitic beds in this Colony.

Such deposits seem to exist in Queensland.

A bore, carried down into the triassic formation at the Naval Hospital at Rochefort (France), yields a flow of about 50,000 gallons per day, the temperature of the water being 108° Fahr. The comparatively small supply is perhaps due to the nearness of the sea. There are beds of the trias in New South Wales.

The water from an artesian source is generally very clear, by reason of the natural filtration it passes through. The deeper, however, it goes, the warmer it gets, and sometimes through dissolving great quantities of carbonic or sulphuretted hydrogen gases, it easily absorbs considerable quantities of mineral salts, which it still contains when it comes to the surface.

Rev

* In a report published as an appendix to the final report of the Water Conservation Commission, I expressed, seven years ago, the opinion that the presence of artesian water on this side of the Darling is undoubted.

Appendix B.

Shutting down of bore.

Gauging.

Artesian water-bearing formations.

Quality of water.

Few waters are so bad as to be detrimental in irrigation. However, acid waters are not favourable to vegetation; such as are heavily charged with sulphate of iron, while they are very injurious to grasses, may be used with advantage on calcareous soils for certain vegetation.

Waters containing great quantities of salts of lime and magnesia are liable to kill vegetation by choking the cells. Those containing abnormal proportions of carbonate of soda and common salt may be found unsuitable, at least for surface irrigation, by depositing it on the soil. However, a calcareous ground will be benefited by alkaline, and argillaceous soils by calcareous waters. It is therefore advisable to have the soil analysed as well as the water. In any case, the waters are more injurious when allowed to remain stagnant than when flowing. An irrigation field to be well laid out must permit of the water flowing over it steadily, and in equal quantities. I have found the waters of several bores—I may say the majority—to be heavily charged with carbonate of soda; in these cases a system of underground watering should perhaps be resorted to, as the deposit would chiefly take place in the feeding drains; these should be arranged so as to allow of the deposits of soda and salt being removed periodically.

For domestic purposes and boilers a much smaller quantity of salts of lime in the water is admissible. According to some authorities in chemistry, the limit for a drinkable water is 35 grains of solid residue per gallon. In France, a water for dietetic purposes must not mark over 20 hydrotimetric degrees, which corresponds to 11 grains, of lime or magnesia per gallon.

A very ready, and for practical purposes, very valuable test of the waters may be made by the hydrotimeter. It is an improved method based on Dr. Clarke's soap test. I have applied it to the waters of the bores visited, and the results will be found with the descriptions of the particular bores. One hydro-metric degree corresponds to 0.70 grains of salts of lime or magnesia, or both combined per gallon. The presence of carbonate of soda neutralises a portion of the salts of lime, and consequently such waters will mark a lower degree of hardness. Test by the hydrotimeter.

To illustrate the effect of the soda, I may mention that an English engineer residing in Paris is the patentee of a filter, which, by the addition of soda, reduced to 4 degrees a water marking originally 11 degrees and destroying a steam boiler. The owner of the boiler testifies that since he uses the so-treated water the incrustations have ceased. Reduction of hardness by soda.

The use of the hydrotimeter has to me been serviceable in choosing waters as types for complete analysis. The results of these made by Mr. Hamlet, the Government Analyst, will be attached to my final report, and a classification of all the waters will then be possible.

To the hydrotimeter is also due the important discovery that the quality of bore waters fluctuates with the seasons. Thus a diagram of weekly records of the hardness, and underneath, of the daily heights of the rivers at the head of the artesian strata, kept up for about three years, shows the hardness of the same water to vary from 9 to 12 degrees, corresponding to an increase of 25 per cent. in earthy salts. The minimum occurs after wet and the maximum after dry seasons. The effect made itself felt between six to twelve months later. Quality of water not constant.

I now proceed to the description of the bores, positions of which will be found on the accompanying sketch map. They have also been marked on the office county maps, the much larger scale of which permits a more accurate location.

2nd Part.—Description of the bores.

1. Basin of the Bulloo River.

UNUSINO Pastoral Holding No. 1 is situated on the plateau described in connection with the consideration generally of position of bores. The immediate surroundings are a level plain of hard, slightly sandy, red soil, timbered with mulga trees and scrub, white wood, fuschia, turpentine, emu, and other bushes, with a few scattered moolley apple-trees called in other districts grey. In the north-east, about a mile away, is visible a hill of rocks. I passed a similar stony outcrop between the bore and the 83-mile post on the Milparinka-Wanaaring road. The bore starts at the bottom of an 8-ft. x 8-ft. shaft 29 feet 6 inches deep. The depth from the surface to the bottom of the bore is 1,680 feet. The main water supply rises from a depth of 1,680 through 1,500 feet of 5-inch casing to heights varying between 14 and 19 feet (mean 16 feet 6 inches) of the surface of the soil. The variation of the level has been observed by several persons, but no accurate notice has been taken of its periodicity. It is simply attributed by some to the ebb and flow of the sea; by others, I saw in the Sydney press, it is taken as a proof conclusive of the variation of supply from bores. To my mind, neither of the two theories is correct. The sea has such effect only on subterranean waters when they are sufficiently near to the sea. This possible influence of the rising and receding of the sea level is well known, but the explanation is not called for here. If the other suggestion were true, Elsinora bores Nos. 1 and 2 should be similarly affected, as I have shown that the three bores are fed from the same stratum, or, in any case, from branches of the same main stratum. The phenomenon observed in the position of this bore indicates in the subterranean conduit the existence of a hollow from which the water is further discharged by a conduit of a shape and with the action of a syphon, discharging more water than the hollow receives in the unit of time, for, as the water is lowered in the hollow, the syphon ceases to act till the hole is again filled to the level of the high point of the syphon. Such configuration of the underground stratum in the neighbourhood of the bore would there produce the oscillation of level without affecting the levels of the other bores situated further away.

Experiments at two different times on the water-yielding capacity of the bore have been made by Mr. Fowler, the manager of the station, and Mr. L. V. d'Apice, licensed surveyor; they are represented graphically in the diagram here attached.* * Appendix C.

In comparing the curves representing the time occupied by the rise of the water per foot, it will be seen that the velocity in Mr. Fowler's experiment was constant—3 minutes per foot up to 7 feet, then 3 minutes 6 seconds per foot up to 10 feet from the bottom of the bore. Mr. d'Apice's experiment began at the height of 4 feet 6 inches above the pipe, but for corresponding heights he obtained much smaller velocities, as from 0 to 4 feet above his starting level they oscillate between 4 minutes 10 seconds and 4 minutes 20 seconds per foot; then they first very gradually decrease to 5 feet 4 inches; then rapidly to fill the last foot in the shaft it takes 29 minutes 15 seconds. The supplies available calculated on the basis of the two experiments are naturally different; while during Mr. d'Apice's the yield was 135,500 gallons at 21 feet 6 inches from surface, according to Mr. Fowler's velocity the discharge would have been at that height about 192,000. Altogether the curves of time and discharges are abnormal and prove the reality of the oscillation in the supply of this well. The

At 640 feet fresh water was struck in 20 feet of grey sand. At 1,325 feet from surface a water-bearing drift was struck, 125 feet thick. The water rose to within 56 feet of the surface. Most probably it is the Urisino and Elsinore stratum. No more water was found underneath. I found the hardness of the water to be 8 degrees. The water was, however, very muddy from the drilling.

There are some other Government bores in the Bulloo basin, namely, at Milparinka and Tibbooburra. I did not visit these, as, if the object of the bores was the obtaining of artesian flows, no money should ever have been spent on them, the formation belonging to the oldest in the country. It is perhaps obvious that no flows were obtained.

SALISBURY DOWNS Pastoral Holding No. 1.—Situation, on the west edge of a cane-grass flat, in sandy and undulating salt-bush plain, with sandy ridge on the east side. The total depth of the bore is 1,365 feet. The water rises in 1,315 feet of 5-inch casing to within 16 feet of the surface. There are three outer strings of casing left, viz., 850 feet 6 inches, 420 feet 8 inches, 100 feet 12 inches. The water flowed at the rate of 200 gallons per day just to surface. A pump in a few minutes lowered the level so much that the supply became intermittent, and yielding only about 2,800 gallons per day. Then the 6-inch casing was perforated at 840 feet over a length of 6 feet, and the present pumping supply of 45,000 gallons per diem was obtained, but at the same time the quality of the water was deteriorated, as the upper water is brackish.

The degree of hardness of the mixed water is $22\frac{1}{2}$, or unsuitable for domestic purposes or boilers. On the spoil heap from the bore I found blue clays, green sandy marls, and pieces of gypsum. The temperature when pumping is 108 degrees.

The bore has not been sunk deep enough, and it is also intended to deepen it, which is always a precarious and delicate operation; but in the position of this bore, only a short distance from the Bulloo flood-waters, a good supply should be expected.

The bore was put down in 1888, at a cost of about £3 per foot, by the Ontario Boring Co., of which the station afterwards acquired the whole plant.

No. 2 is situated in a wide salt-bush plain, with clay pans and broken sand hummocks. Coming from the south, on the east side of the bore, it turns northward to join the Bulloo flood-water country, which itself is there about 15 to 20 miles wide.

By this plain the Tiltabrinna Creek waters meet the Bulloo water in very heavy floods.

The total depth of bore is 1,568 feet; at 440 feet struck water very salt, which rose to 18 feet from the surface. At 495 feet, more of similar water was met. Fair water, said to have flown over the surface at the rate of 14,400 gallons (by Appendix 37 of Mr. Boulton's report, 17,000 gallons), was struck at 940 feet, increasing at 990 feet, but it got salt through salt-water getting in through the casing. The fresh water was struck at 1,568 feet, in a coarse sand with quartz pebbles under a bank of green sandstone 25 feet thick. The bore was lowered 2 feet in the sand. The flow is said to have been 21,000 gallons, which soon went back to 7,000 gallons per day, it is now 2,160. The loss may be due either to escapes, or, more likely, by some rough pebbles obstructing the inlet. This supply runs into a timbered tank with galvanised iron lining of 6 ft. x 20 ft. x 20 ft., through 1,513 feet of 5-inch casing resting on the green sandstone.

The supply from the upper water runs out at the surface from the outer 8-inch pipe 520 feet long. It runs away over the plain, and it is heavily charged with sulphuretted hydrogen gas, which burns freely on the surface. I found this water to mark in the hydrotimeter 158 degrees. The fresh water, of a hardness of $8\frac{1}{2}$ degrees, not yielding enough for the supply of stock; a pumping-station is built, the whole arrangement of which is represented on plate 17.

The temperature of the naturally-flowing fresh water I found $103\frac{1}{2}$, and that of the salt water 100. I was informed that the flow of the deeper water was preceded for about one hour by the flow of black oil. There is no reason why the bore should not have been proceeded with deeper down.

Down to 1,340 feet the boring was done by contract, when the station bought the plant. Cost about £2 15s. per foot; date of boring, 1889.

No. 3, about 3 miles west of Nunga Creek; it is in the centre of a basin formed by low ridges all round, and being towards the heads of drainage, it is too high up. The red sand-soil plain about the bore is open mulga, white wood, turpentine, &c.

The bore is 1,404 feet deep; at 825 feet small supply of very good water was struck in 10 feet of green sand. The water, rising to 120 feet from the surface, comes from 210 feet of micaceous sand-drift, forming the bottom end of the bore. It is very good in taste, and shows only 3 degrees of hardness. The temperature is 103, and said to get warmer after longer pumping.

The pumping arrangements consist of a 3-inch pump and 8 horse-power engine, with a stroke of 22 inches, and about thirty-eight to forty-two revolutions per minute, corresponding to a supply of about 35,000 gallons per day, drawing at a depth of 300 feet, the pumping will lower the level 20 feet, when it remains stationary.

The site for the bore has been chosen by consideration of convenience to water several paddocks, Appendix D. as shown on the sketch.

The bore is represented on plate 18. Started on the 5th October, 1891, the boring was stopped 10th July, 1892. Borers, Messrs. Dean and Chappel. The casing left in the bore is 12 feet of 12-inch, and 1,400 feet of 5-inch.

No. 4, or Limestone Well bore, started in October, 1892, was in progress at the time of my visit in last October (1893). It starts at the bottom of a shaft 6 feet by 3 feet and 98 feet deep. This was an old well in which the water was standing 40 feet from the surface. During the boring the well water disappeared in dry sand-drift passed through. Finally, as I was later informed, at 1,310 feet water was struck in a sand-drift. Till then none had been met with. The bore was continued to 1,344 feet in slate. Pumping at the rate of 40,000 gallons per day during one week, the level of the water, which rose to 140 feet from the surface, was only lowered 4 feet. The casing left in the bore is 150 feet of 5 inch, and 1,278 feet of 6 inch.

The bore is situated on a wide red-soil box flat, being part of one of the head tributaries of Yancannia Creek. The surrounding country is slightly scrubby, with higher stony ridges, and over a great extent unsuitable for a bore if a flow is desired.

No previous information has been published on the last two bores which have been put down with station plant at the rate of 12s. 6d. per foot to 1,000 feet, 15s. to 1,600 feet, the station supplying wood, water, and casing.

BOOTRA Pastoral Holding.—One bore located towards the heads of a creek on scattered box and mulga-tree plains. No detail record of strata passed; they are stated by Mr. Dean (the bores) to have been grey and blue clays and shales, with bars of quartzite. I have found that very often the rock so called is desert sandstone, and was by one borer designated "basalt."

The total depth of the bore is 1,100 feet. It starts at the bottom of a well 6 feet by 3 feet and 300 feet deep. The only water besides the surface well water met was at 960 feet, in 4 feet 6 inches of white sand-drift, with light green sandstone above, and grey "cretaceous formation" (*sic*, probably shale), with bars of "quartzite" underneath. The water rose to 80 feet from the surface; 820 feet of 5-inch casing stands out 26 feet above bottom of well. The water is lifted by a whim, as shown on plate 20.

The water-test, after reducing the water level by 5 feet, marked 5 degrees hardness.

The bore was commenced 11th June, 1891, and finished 10th September, 1891.

There were no previous records published of this bore. The position of the bore is not advantageous, but once started it should certainly not have been left off in the middle of the cretaceous beds.

YANCANNIA Pastoral Holding No. 1, or "Binjiwilpa" bore, is situated on the north-eastern side of an old man salt-bush swamp, in which, by sinking at a depth of 9 feet, fresh water can be got anywhere; but there is no natural spring, as marked on the county maps. A hole made by the blacks may have been mistaken for such. The depth of the bore 203½ feet. The water struck at this depth under grey sandstone being quite sufficient for the watering of stock, the boring was stopped. The flow rises by a 10-inch pipe through the bottom of, and into a 200-gallon tank; thence it is led by an iron flume 200 feet long to a drain on the side of a rise on the edge of the swamp. By this drain it reaches Maroola Creek, which itself drains towards Lake Altaboolka, but the creek is so level that the bore water, when required, is let run in the opposite direction; the soil is so porous as to cause great loss.

The water carries an enormous quantity of gas, which will burn for some time under the cover of the tank.

I found this supply, estimated in Appendix 54, Mr. Boulton's Report, at 480,000 gallons, to be 130,000 gallons. Possibly the water might escape through the pipe not being tight in the tank. However, the embankment supporting the tank and iron flume showed no signs of such being the case. The hardness of the water is 11 degrees, and the taste is slightly salt. Temperature, 85 degrees. Bore, commenced 7th January, 1891, was finished 7th February, 1891.

No. 2 bore (plate 21) is on the side of a sandhill, near the left bank of main channel of Yancannia Creek, although it is called Cockulby Creek, and near a tank excavated in the channel of the creek, into which the small supply of 1,440 gallons per day is let run. The total depth of the bore is 1,130 feet, of which the last 628 feet are through rock, declared, it appears, in Melbourne as "bed" rock. The water comes from a depth of 485 feet. It is in taste similar to that of No. 1, and also marks 11 degrees of hardness, but the temperature is only 80. The position of this bore is I think much higher than No. 1. This bore was commenced in March, 1891, and terminated June, 1893, with nine months' interruption. There are 500 feet of 6-inch casing.

About 150 feet north of this bore, in a shaft of 15 feet x 12 feet x 4 feet, two other bores were tried. One, 270 feet in sand-drift, was abandoned through inability of getting through with the 8-inch casing. When the other, 5 feet from the last, was down 120 feet, the soil between the two bores caved in, and, meeting with the same difficulty, the plant was removed to the position of the present bore. On the spoil heap I found yellow clay, kaolin, and pieces of gypsum, although the last is not mentioned in the records of strata passed.

No. 3, on sandy plain interspersed with swamps, the bore was, when I visited it, in progress at a depth of 665 feet. At about 440 feet water was struck, which rose to within 80 feet of the surface. It was very salt and bitter, and marked over 200. I have learned since from Mr. Reid, of Yancannia, that no progress had been made since, owing to the departure of the borer, but that it is intended to go deeper.

THARGOMINDAH Queensland Government bore, situated in the centre of the Bulloo Basin, in which it is the deepest bore, is about 60 chains a little west of the north of the town, on a level, stony, and gravelly plain, covered with thin and small mulga scrub. The red, strong loam of the surface is only about 2 feet thick, with a hard, sandy cement, mixed with oxide of iron. The bore is 2,650 feet deep, out of which flows the water at the rate of 1,000,000 gallons per day through a 3-inch elbow, about 4 feet above the ground. There is a flow-regulating valve, but it is almost always full on. From the bore the water runs all over the plain in small drains, of which two cross the town, and empty into the Bulloo River. As it is polluted by pigs and all kinds of animals the residents do not use it at present. About 300 yards from the bore some of the water is stored in a reservoir formed by an earthen dam. It is there allowed to cool for several hours, when it is led on to a 9-acre crop of oats. The irrigation is laid on in a very rudimentary style, the water running hither and thither; and the whole preparation of the soil consisted of one ploughing. The result is, therefore, very patchy, but where the proper amount reached and flowed the crop was unrivalled.

The Chinamen complain that the bore water mixing with the river water used by them is killing their melons. Somewhere else a certain creeper suffers from the water, the leaves all curling up, while another, of a wax plant kind, is growing luxuriantly, and young pepper-trees in a dying condition were brought back to life by the use of the bore water.

Its temperature I found 160 degrees, and the hardness 3 degrees, with a good but slight mineral taste. The water leaves on the edges a black, seemingly iron, deposit.

The first water was struck at about 2,450 feet, flowing at the rate of about 40,000 gallons per day; at 2,510 feet the sandstone yielded about 200,000 gallons; at 2,550 feet, about 400,000; and the supply increased to the last. The residents desired to have the bore made deeper still by another 50 feet, the Divisional Board offering to pay the expenses. The Government did not fall in with the proposal.

The bore is now rented by the Divisional Board for £50 for nine months, at the end of which it is intended to either purchase the bore or to get a long lease, when the water will be laid on properly to the town. Photograph plates 23 and 24.

2. Basin of the Darling River, watershed of the Middle Paroo River and Cuttaburra Creek.

WANGAMANA Pastoral Holding.—The bore is situated in a level red soil plain surrounded at some distance by stone and sand ridges. The country is open—mulga, corkwood, bloodwood, box, and beefwood. The position is near the outer edge of the country, of which the surface waters would be drained into the Cuttaburra Creek, and at a height of 386 feet above sea-level. The bore starts at the bottom of a shaft of 10 ft. x 4 ft. x 6 ft. in clay. The shaft is not timbered. A small supply was struck at 1,050 feet. The next water flowing over the surface was met with at about 1,270 feet in sand and gravel drift. The bore was continued to the depth of 1,605 feet, but no more water being obtained, it was stopped there and slots cut in the casing at the 1,270 feet level, where the present supply is drawn from. Appendix 40 to Mr. Boulton's report gives the discharge as 224,000 gallons and as coming from the 1,600 level. My measurements of the flow give 12,960 gallons per day, and Mr. Howatson, the owner of the station, stated that he had never known the flow to be over 33,000 gallons. He had noticed the falling off, and attributes it to some obstruction at the perforations for letting in the water. The outflow from 6-inch casing is about 2 feet above the ground. The water is let into a trough at which 25,000 sheep were watered for four months.

The temperature is 100 degrees, and the hardness 3 degrees; the taste of the water is very good. Vegetables have been raised with it with great success.

The bore was commenced in December, 1888, and completed only in March, 1890, through some trouble to pierce a boulder with the 6-inch casing. The 5-inch casing was then used. The total length cased is 1,500 feet. Total cost, £2,800.

TINCHBROOKA Government Bores.—They are both in the same shaft, about 2 feet apart. The shaft is situated about 25 chains north of 75 miles 25 chains (Bourke-Wanaaring Road) on the western edge of Wirra-warra Creek. Both sides of the creek are slightly undulating, with sandy loamy slopes, well grassed and park-like, timbered with mulga and gidgia trees.

The supply of the older bore, probably, is given in Mr. Boulton's report, folio 12, as 33,000 gallons. I was informed, that intending to deepen the bore, the casing was being taken out when it broke, and that ultimately the bore got choked up, and the present bore was put down alongside. Another version is that there was an escape in the old bore, and that the waters were falling off. The flow from the new bore reaches the creek (which is dammed lower down) by means of a pipe under the ground.

The discharge is 40,500 gallons per day. The list of Government bores obtained from the Government Statistician's Office mentions one bore at 75 miles on Bourke-Wanaaring Road (probably the new one) giving 75,000 gallons. The new bore would thus also be falling off, if the above measurement was correct.

The temperature is 96 degrees Fahr. Hardness, 9 degrees, somewhat salt. The depth of the old bore was about 976 feet. The new one is 1,231 feet deep.

KULKYNE Government Bore.—The bore is situated on the west bank of the Kulkynne Creek, on a sand ridge between the creek and the flood channel, about half-a-mile north of the main Bourke-Wanaaring Road. The outflow of 6-inch pipe is flush with the ground, and the water is led by a drain into a small dam, thence into the creek just above the Government tank, which backs up the rain-water in the creek as represented on Plate 25. The discharge is 1,800 gallons per day. The hardness I found to be 58 degrees, and the taste salt and disagreeable. Carcasses of dead kangaroos were lying about there, said to have died from the effects of this water. The water is really so bad, that when the Government tank is emptied the water for the caretaker is carted from a tank 9 miles away. The bore was finished about December, 1892, or January, 1893. It is intended to put down a second bore.

In the list obtained in August last, the bore is mentioned as "in progress; small supply, 2,500 gallons."

CUTTABURRA Government Bores.—Situation about 2 miles west of the Cuttaburra Creek, and 11 miles east of Wanaaring. There is one bore flowing at the rate of 5,760 gallons per day, the delivery taking place through a 5-inch pipe, bent at 8 feet above the soil. The temperature of the water from this bore is 92 degrees. The taste of the water, which is 33 degrees hard, is salt and sulphurous; the depth of the bore, 965 feet. A new well is being put down about 150 feet east of this bore, the rig of which is shown on plate 26. At the time of my visit, in September last, the depth reached was 1,150 feet. At 255 feet some salt water was struck, and at 385 feet, in 5 feet of white sand-drift, brackish water which rose to the surface, just trickling over. By Mr. Boulton's report, fo. 12, the old Cuttaburra bore gave 24,664 gallons. In the list mentioned previously, the new one alone appears as being in progress and giving out 22,464 gallons.

WANAARING Pastoral Holding.—Number 1 bore is situated on buddah and mulga covered red sandy soil level plain, about 20 feet more elevated than the ground at No. 2 bore. The delivery pipe (6 inches), is carried about 2 feet above the ground, and empties into an iron trough for the watering of stock; thence it runs over the plains. The discharge is 10,322 gallons per day. The water stops running 6 feet above the surface of the soil; the temperature is 100 degrees; hardness is 23 degrees; taste is somewhat salt, and salt deposits are visible in the trough.

Number 2 bore is situated near one of the Cuttaburra branches, on a red sandy rise, with open buddah and mulga. The water stops running 18 feet above the ground level; the 6-inch casing is bent about 18 inches below the surface, and in that position it delivers 142,000 gallons per day.

A drain carries the water to a tank $1\frac{1}{2}$ miles distant. Two acres of ground have been ploughed for lucerne to be irrigated from the bore. The depth of the bore is about 1,400 feet. The discharge does not seem to have decreased. Local persons even say it has increased. The aggregate flow of the two Wanaaring bores has, however, been stated in the list mentioned to have been 215,000 gallons. The temperature of this water is 112 degrees. The hardness is 21 degrees, and the water is so heavily charged with gas that it will burn in the elbow of the pipe till put out.

NOCOLECHE Pastoral Holding.—Number 1, or Mallara bore, is situated at the foot of a slight rise of good, red, sandy loam. The bore is 916 feet deep. At 860 feet, the supply was struck which it is said was 200,000 gallons, but which I have found to be 73,400 gallons per day, flowing out at 3 ft. 6 in. above the ground from a 5-inch pipe. The water stops rising 15 feet above the surface of the ground. The water runs by a galvanised iron trough into a clay pan, where it forms a shallow lake of about $\frac{3}{4}$ mile in circumference.

circumference. A good crop of wheat was grown by watering with this water, which eats away the iron in the trough. The temperature is 94 degrees, the hardness is 10 degrees, and the taste of the water is slightly salt. The bore was started 10th September, 1888, and was finished on the 18th of December, 1888.

No. 2 bore is situated between the hills of the divide between the Bulloo and Paroo Rivers waters. It is 1,700 feet deep. Several water strata were met. The main supply is the one struck at 1,300 feet. It rose to within 13 feet from the surface. Now it stands at 66 feet from the top of the bore. The lowering of the level may be attributed to escape, possibly caused through pulling out 800 feet of casing, of a total length of 1,300 feet.

The water was only once used by pumping for stock in the drought of 1892. With the pump down to 120 feet, the water supply appeared insufficient for the 3-inch pump, worked with an 8 horse-power engine. Lowered to 160 feet, blue mud came up for about an hour, when the water was abundant enough to supply 18,000 gallons per twenty-four hours. The hardness was 1 degree, and the taste of the water was soft and fresh. This bore was commenced on the 12th of February, 1889, and finished on the 28th September, 1889.

The bottom rock is said to have been of green stone, pronounced by geologists bed rock, but Mr. McMillan, the borer, is not quite sure from what depth the specimen submitted came, as it was a piece of caving.

No. 3, or "Numbardi bore," is situated on a bank of the Kulkynie Creek, at the north-east corner of a tank excavated in the channel.

The water is let run either into the creek above the dam of the tank, or into the tank over the embankment, by a flume of corrugated iron. (*See Plate 27.*) The surplus water from the tank is led in a drain 3 miles long, in the bed of the creek to another tank. The drain is 18 inches wide on the top and 6 inches deep. The fall being very small, the flow is sluggish, spreading out over the banks, resulting in great waste of water chiefly through evaporation. The land on the south side of the creek is well suited for irrigation from the tank, but this is not done. Another drain is being branched off the main drain to lead the water to another tank.

The bore is 1,227 feet deep. At 50 feet stationary salt water was met with. At 910 feet water rose from 10 feet of sand drift to within 35 feet from the surface. Water met with at 1,090 feet came over the surface. At 1,130 feet the second supply of fresh water was struck, and at 1,200 feet the main supply, which flows out of the 6-inch pipe 8 feet 6 inches above the ground, delivering there 600,000 gallons per day. When struck, it was measured at 4 feet above the surface, where it is said to have flowed at the rate of 725,000 gallons per day. The temperature was 107 degrees; hardness, 3 degrees; taste, slightly mineral. The bore was commenced 5th November, 1889, and terminated at New Year, 1890. The cost was at £1 per foot to 1,000 feet, and 30s. below that depth, with water and fuel carted and plant and casing found by the station.

NEW SOUTH WALES.

PARLIAMENTARY STANDING COMMITTEE ON
PUBLIC WORKS.

SECOND REPORT

TOGETHER WITH

MINUTES OF EVIDENCE, APPENDICES, AND PLAN,

RELATING TO THE

PROPOSED SEWERAGE WORKS

FOR

PARRAMATTA.

Presented to Parliament in accordance with the provisions of the Public Works Act,
51 Vic. No. 37.

SYDNEY: CHARLES POTTER, GOVERNMENT PRINTER.

MEMBERS OF THE COMMITTEE.

LEGISLATIVE COUNCIL.

The Honorable WILLIAM HENRY SUTTOR, Vice-Chairman.
 The Honorable JAMES HOSKINS.
 The Honorable FREDERICK THOMAS HUMPHREY.
 The Honorable JOHN DAVIES, C.M.G.
 The Honorable WILLIAM JOSEPH TRICKETT.

LEGISLATIVE ASSEMBLY.

JACOB GARRARD, Esquire, Chairman.
 THOMAS THOMSON EWING, Esquire.
 WILLIAM CHANDOS WALL, Esquire.
 WILLIAM McCOURT, Esquire.
 JOHN CASH NELD, Esquire.
 EDWARD WILLIAM O'SULLIVAN, Esquire.
 CHARLES COLLINS, Esquire.
 HENRY DAWSON, Esquire.

GENERAL INDEX.

Report by the Committee.
 Minutes of Evidence taken by the Committee.
 Appendix.
 Plan.

LIST OF WITNESSES.

	PAGE.
Joseph Barling, Esq., Under Secretary, Department of Public Works.....	1-2
Charles Napier Bell, Esq., M.I.C.E.....	2-17
George Chamier, Esq., M.I.C.E.....	17-22
William Wilkinson Wardell, Esq., M.I.C.E.....	22-26
Edward Bellingham Price, Esq., M.I.C.E., supervising engineer, Department of Harbours and Rivers.....	26-31
Thomas Peter Anderson Stuart, Esq., M.D., Professor of Physiology, University of Sydney, Medical Adviser to the Government.....	31-40
John Moore Smail, Esq., M.I.C.E., Engineer for Sewerage, Metropolitan Board of Water Supply and Sewerage.....	40-46
John Carruthers, Esq., Acting Superintending Engineer of Dredges, Department of Harbours and Rivers.....	46-47
James Walter Grimshaw, Esq., M. Inst. C.E., supervising engineer, Department of Harbours and Rivers.....	47-48
George Henry Stayton, Esq., M.I.C.E.....	48-58
Robert R. P. Hickson, Esq., M.I.C.E., Commissioner and Engineer-in-Chief for Roads and Bridges and Sewerage.....	58-63, 70-77
John William Withers, Esq., Mayor of Parramatta.....	63-67, 81-83
Charles James Saunders, Esq., Chief Draftsman, Department of Lands.....	67
Alexander Brown Portus, Esq., Assoc. M.I.C.E., Superintending Engineer of Dredges, Department of Harbours and Rivers.....	68-70
Herbert James Beaumont, Esq., assessor, Metropolitan Board of Water Supply and Sewerage.....	78-81

PLAN.

Parramatta Sewage Farm.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SEWERAGE WORKS FOR PARRAMATTA.

SECOND REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was remitted for further consideration and report "the expediency of constructing sewerage works for the town of Parramatta," have, after further inquiry, resolved that it is not expedient the proposed works should be constructed, and in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly :—

1. A detailed description of the proposed Sewerage Works and of their estimated cost was given in the First Report of the Committee, and need not be repeated here; but a short description taken from that Report will enable this Second Report to be the more easily understood. The proposed works are designed to drain an area of 1,383 acres, 803½ of which are on the north side and 579½ on the south side of the Parramatta River, but for the present it is intended to provide for the sewerage of only 929 acres, 421 on the north side and 508 on the south side of the river. The works consist of main, storm-water, and subsidiary sewers, a pumping-station, and a sewage farm. The area of the sewage farm is 62 acres, 22 of which are above, and 40 below high-water level. The portion below high-water it would be necessary to reclaim by filling it in with silt and river sand enclosed within fascine embankments. Cereals and other crops would be grown upon the farm, and practically it would be dealt with as is done at Webb's Grant, Botany, in connection with the drainage of the western suburbs of Sydney. The estimated total cost of the proposed works is £75,926, of which amount £16,000 has already been spent or arranged for. The annual cost of the works is estimated at £4,268, which is made up as follows: Interest and payment of principal in sixty years at 4 per cent. on £76,000, £3,040; coal and stores for the engine-house, £162; wages and expense of working the sewage farm, £860; repairs to engines calculated at 5 per cent. on the total cost, £206.

2. The First Report by the Committee with reference to these proposed works, dated 4 October, 1892, represented "that it is not expedient the proposed Sewerage Works should be constructed, for the reason that, in the opinion of the Committee, the sewage farm included in the proposed works is too small for the purpose, and the sewage should be dealt with at the proposed pumping-station at Clay Cliff Creek, by a system of precipitation and filtration or other effective modern process."

Reason for the further consideration of the proposed works.

3. On 1 February, 1894, the Legislative Assembly, on the motion of Mr. Lyne, passed the following resolution:—

That it is expedient that the Report of the Parliamentary Standing Committee on Public Works upon the proposed construction of Sewerage Works for the Town of Parramatta be remitted to the said Committee for its further consideration and report, for the following reason: That since the said report was made, a Commission of Experts has reported favourably upon the scheme proposed by the Department, subject to certain modifications, a consideration of which report might lead the Committee to arrive at a different and more favourable conclusion.

As explained to the Committee, in evidence, by the Under Secretary for Public Works, the "Commission of Experts" was appointed in consequence of a report by the Engineer-in-Chief for Sewerage, dated 12 November, 1892, in which he dissented from the conclusion arrived at by the Committee in their first inquiry, and urged that no action should be taken in the matter by the Minister for Public Works until the scheme had been further investigated by a board of engineering experts. The Minister concurring in this recommendation, a board, consisting of Messrs. W. W. Wardell, M.I.C.E., G. Chamier, M.I.C.E., and C. Napier Bell, M.I.C.E., was appointed, and they reported in favour of the scheme as submitted to the Committee with the exception that they advocated, in connection with the sewage itself, the adoption of the separate system instead of the partially separate system.

The second inquiry.

4. In carrying out their second inquiry, the Committee have had before them the reports of the Engineer-in-Chief for Sewerage and the Board of Experts, as well as other documents, and have examined a number of witnesses including the Engineer-in-Chief, the members of the Board, the Medical Adviser to the Government, the Engineer for Sewerage, connected with the Metropolitan Board of Water Supply and Sewerage, Mr. G. A. Stayton, M.I.C.E., who, in their first inquiry the Committee engaged to make a special examination of the scheme and to report upon it, the Assessor to the Metropolitan Board of Water Supply and Sewerage, and the Mayor of Parramatta. They have also made a second visit of inspection to the site of the proposed sewage farm at Parramatta, and to the sewage farm at Webb's Grant, Botany.

The Engineer-in-Chief's Report.

5. The report by the Engineer-in-Chief on the conclusion arrived at by the Committee in their first inquiry, consists largely of quotations from statements and writings by sanitary engineers and public bodies in Europe and America on the subject of sewage farms, favorable to sewage farming whenever the circumstances justify it. Before dealing with "the main question" in the Committee's Report the Engineer-in-Chief draws attention to a statement in the Report indicating that it was only in the late stages of the inquiry that the Department appeared to have anything like a proper conception of the portion of the scheme relating to the sewage farm. With regard to this he asserts that, "before submitting the scheme to the Committee, the Department had carefully studied the applicability of all the known arrangements for sewage disposal and utilisation, and had worked out the details of the farm as fully as was necessary to arrive at a just conclusion." But, "in presenting a report to a non-professional committee," he proceeds to say, "it was deemed unnecessary to enter upon such details, and these were omitted not only in the description of the sewage farm but of the main works." Summarising his report he submits that he succeeds in showing, "First—that it is only under exceptional circumstances, such as the impossibility of procuring suitable land for filtration, that precipitation should be allowed; second—that no such difficulty exists in the case of Parramatta; third—that the site selected and purchased at Duck River is suitable for a farm, while that at Clay Cliff Creek is not, and that the material of which it is proposed to construct the farm is proved to have qualities superior to any other for destroying all noxious matter hurtful to life and health; fourth—that land irrigation and filtration is the only known means of procuring a pure effluent; fifth—that all sanitarians agree, and statistics show, that sewage farms, properly managed, are not injurious to health, nor do they create a nuisance; sixth—that the area resumed will be amply sufficient for requirements, not only of the present, but for the prospective population in twenty-five years, and, with modification of arrangements, for the ultimate population of 48,500 also."

The Report of the Board of Experts.

6. The Board of Experts state in their report that all the conditions necessary to make sewage-farming successful are present in the case of Parramatta, and that the

the portion of the area comprising the farm which it is necessary to reclaim, when filled in with the sandy material proposed to be used, would be "amply large enough to meet the requirement of the sewage of Parramatta for many years to come." The more elevated portion of the total farm area, consisting of 22 acres above high-water mark, it will not be requisite at the present time, in their opinion, to bring into use. With this reduction in the initial cost of preparing the farm area for the reception of sewage, and the diversion of all rain water from the sewers, which would reduce the size and cost of the mains and reticulation, the Board approve of the departmental scheme.

7. Had the official evidence given in the present inquiry respecting the sewage farm and sewage farms generally been put before the Committee in their first inquiry it is possible that instead of passing a resolution opposed to the carrying out of the works without certain extra provisions to ensure their effectiveness, the scheme, as far as it relates to the disposal of the sewage, would have met with the Committee's approval. But, as the report of the Engineer-in-Chief for Sewerage upon the Report of the Committee shows, information necessary to enable the Committee to arrive at a right conclusion in their investigation was not placed before them. Evidence, too, respecting the presence of microbes and their action in relation to sewage has been given in the present inquiry with a fullness of detail not supplied in the first inquiry, and from authorities whose testimony necessarily carries considerable weight. The principal witness on this subject was the present Medical Adviser to the Government, whose evidence must have an important bearing on sanitary questions in which the Government are concerned. In the first inquiry the Medical Adviser to the Government was examined, but the gentleman then occupying that position did not explain to the Committee this microbe theory in a manner which gave it any special significance in connection with the disposal and treatment of sewage, probably because the investigations of the scientists, who are the authors of the theory, were not at that time so complete as to attach to it the importance it now appears to bear. Added to these omissions from the inquiry when the proposed works were first referred to the Committee was the fact that until the first inquiry had proceeded almost to its close the Department had not an adequate knowledge of some of the most important details of the scheme; and when, as the inquiry drew to a close, certain matters were stated which should have been put before the Committee at the opening of the inquiry, the explanation was given in such a way as to impart to the information much less importance than under other circumstances would have been attached to it. During the inquiry it was represented by the Department that 40 acres of the area proposed to be used for the sewage farm were above high-water mark and, with the exception of sub-soil drainage, ready for the reception of sewage, and 22 acres were below high-water mark and would have to be filled in and raised; whereas the 40 acres were below high-water mark and the 22 acres above. The Committee also understood until a late stage of the inquiry that the filling in would not be carried to a height more than 18in. or 2ft. above high-water, and the nature of the material to be used for this purpose was, as described in the evidence, both indefinite and unsatisfactory.

8. These important matters have been more satisfactorily explained in the present inquiry, but the effect this explanation might be expected to have upon the deliberations of the Committee is nullified now by other evidence of equal importance to a right decision in the case. In their present inquiry the Committee have learned that it is proposed to set aside the 22 acres of land forming that part of the sewage farm area above high water, and to use for the disposal of the sewage the 40 acres now below high-water mark, filling in this portion to a height of 5 feet above high water with silt and sand of a kind well suited to the purpose. These 40 acres, in the opinion of the Board of Experts, are amply sufficient for the reception and treatment of the sewage of Parramatta for many years to come, and in this opinion the Engineer-in-Chief concurs. Prepared in the manner described, this area would probably dispose of the sewage unobjectionably, except, perhaps, for the occasional odours which appear to be inseparable from sewage-farming. Some method of precipitation and filtration, as recommended in the Committee's First Report, would, undoubtedly, promote the greater efficiency of the scheme, but with land prepared as now explained this is not so necessary as it was in the circumstances of the first inquiry.

Matters upon which the question of carrying out the works depend.

9. The question whether the proposed works should be carried out depends now, however, on evidence which relates to matters other than either the nature of the farm or the method of dealing with the sewage. With the additional details of the proposal which this second inquiry has elicited, it is doubtful whether the scheme has been adequately considered. The estimated cost (£75,926), large as it is, does not include the whole of the intended expenditure. The filling in of the farm is proposed to be done at the expense of the Department of Harbours and Rivers, though it is as much a part of the cost of the scheme as any other portion of the expenditure. With the cost of the filling-in added to the estimate of the cost of the other works, the total amount would be something like £90,000, a serious amount to expend in connection with the municipality of Parramatta. But a stronger objection to the scheme is evidence brought out in the present inquiry, that Parramatta is neither willing nor able to pay the rate necessary to provide the interest on the expenditure, and does not, in fact, want the proposed works.

The position of Parramatta in relation to the scheme.

10. The position of Parramatta in relation to the scheme was stated to the Committee by the Mayor, who was twice under examination. On the first occasion, though declaring the town to be healthy, with an efficient pan system in operation, he asserted that the people would willingly pay the rate chargeable on the cost of the proposed works, in order to put a stop to the pollution of the river by sewage from the Government establishments. He spoke, however, with some hesitation, as he thought the estimated total cost excessive; but of the amount required for interest he expected the Government to contribute a large part. Before his second examination took place a meeting of the Municipal Council of Parramatta was held, at which a resolution was passed affirming the necessity for the Council to know its exact position with regard to the cost of the proposed works, and the amount of sewerage rates to be paid by the Government, and adjourning the meeting for a month to afford time for obtaining the information. In the meantime, the Committee called before them the Assessor of the Metropolitan Board of Water Supply and Sewerage, for the purpose of ascertaining from him the system under which the Board assess Government institutions in Sydney for sewerage rates, and from that system judging the amount the Government would probably pay for the asylums and gaol at Parramatta under the proposed sewerage scheme there. This officer carefully considered the whole matter, and from his evidence it appears that, by adopting the Board's ordinary system of valuation, and fixing the sewerage rate to be charged at Parramatta at 11d., the lowest rate that, under the circumstances, could be charged, the Government's contribution to the annual cost of the scheme would be about £820, leaving nearly £3,500 to be found by the people of Parramatta. Possibly the rate would be higher than 11d., for as about 10 per cent, of the property in the municipality would not be served by the sewerage scheme that proportion would escape the liability to be rated, and the duty of finding the requisite amount of money would consequently press the more heavily upon the remainder. The rating of Government institutions in Sydney by the Board of Water Supply and Sewerage is based upon what is considered to be a fair average rental of the buildings, the Board taking the assessment of the Municipal Councils if there be any, and making their own valuation, subject to appeal as in municipalities, if there be not. Visiting Parramatta in order to make the information desired by the Committee as complete as possible, the Assessor valued the Government institutions and land there, and found the total annual ratable value of these properties to be, according to the Board's system of valuation, £17,511. This amount was made up as follows:—Gaol, £3,500; Industrial School, £1,000; post office, North Parramatta, £36; post office, South Parramatta, £350; school and residence in Macquarie-street, £300; school and residence, North Parramatta, £300; court-house, Parramatta, £600; police barracks, £500; Lunatic Asylum, £7,000; George-street Asylum, £2,000; asylum, Macquarie-street, £800; asylum, Harris-street, £250; Cottage Homes, £200; land resumed for court-house, £425; land at corner of Windsor-street and George-street, £250. This list does not include the two railway stations at Parramatta. Railway properties are exempt from certain rates and taxes, and are not liable for sewerage rates unless connected with the sewers; but if so connected the Parramatta railway stations would pay on an 11d. rate the sum of £18 6s. 8d. a year, a little more than half what they are now paying the Council under the pan system. This £18 6s. 8d. forms part of the

£820 represented by the Assessor to be the utmost amount likely to be obtained from the whole of the Government ratable property in the town. On being made acquainted with these figures the Mayor, when before the Committee the second time, at once stated that Parramatta could not pay the amount which it appeared would be expected from the people, and in the circumstances would rather be without the scheme. During the Committee's first inquiry with reference to these proposed works the then Mayor of Parramatta appeared to be satisfied with the scheme and the obligations connected with it, and the Municipal Council, the Committee were informed, had expressed their approval of it; but from the evidence of the present Mayor in this, the second inquiry, it is clear that the matter had not been fully considered, and that throughout it has been very imperfectly understood. The financial position of the Municipal Council of Parramatta is not such as to indicate ability to incur any new heavy liability. The municipality is in debt to the extent of £56,000, upon which it pays 6 per cent. interest, and has borrowed up to its limit. The people are rated to the extent of 2s. in the £, and in addition, under present circumstances, have to pay a charge for the pan system. In this condition of affairs the Mayor is quite sure the people would not be inclined to pay £3,000 a year for sewerage, and that now, knowing what the proposed scheme is likely to cost them, the Council will speedily rescind any resolution they have passed approving of it.

11. In view of the evidence given the Committee decided against the construction of the proposed works. Doubtless where there is any large population suffering from insanitary conditions in which the Government are concerned it is the duty of the Government to do what they can to remove or mitigate the evil; but it is not desirable for elaborate and expensive works to be carried out at the public cost for a municipality unwilling to accept the responsibility and consequent liability. The principal grievance in the matter of defective drainage which the residents of Parramatta complain of, at any rate so far as their views are expressed through the Mayor of the municipality, is the pollution of the river, which, it is asserted, is caused by drainage from the Government institutions in the vicinity. If that were stopped, the Mayor states, there would be no necessity for any new sewerage system for the town. The whole of the evidence in the inquiry was taken into consideration by the Committee on the 13th instant, and they decided that it was not expedient the works as proposed should be carried out. Their resolution will be seen in the following extract from their Minutes of Proceedings:—

Conclusion arrived at by the Committee.

Mr. O'Sullivan moved—

“That, inasmuch as the evidence with regard to the sewage farm in connection with the proposed works at Parramatta, and in relation to sewage farms generally, has in the present inquiry been placed before the Committee with much more detail and force than in the first inquiry, the Committee now consider it expedient that the proposed Sewerage Works for Parramatta, as referred to them by the Legislative Assembly, be carried out—provided, 1st, that the surface level of the sewage farm be raised with suitable material at least five feet above high-water mark; 2nd—that on completion the whole of the works be vested in the Metropolitan Board of Water Supply and Sewerage.”

Mr. Garrard seconded the motion *pro forma*.

Mr. Humphery moved as an amendment—

“That all the words after the word ‘That’ be omitted, with a view to insert the following words: ‘in the opinion of this Committee, it is not expedient that the proposed Sewerage Works for Parramatta, as referred to the Committee by the Legislative Assembly, be carried out.’”

Mr. Davies seconded the amendment.

On the question, “That the words proposed to be omitted stand part of the motion,” the Committee divided, with the following result:—

Ayes, 2.
Mr. Garrard,
Mr. O'Sullivan.

Noes, 10.
Mr. Suttor,
Mr. Hoskins,
Mr. Humphery,
Mr. Davies,
Mr. Trickett,
Mr. Ewing,
Mr. Wall,
Mr. McCourt,
Mr. Neild,
Mr. Collins.

The

The words proposed to be inserted were then inserted, and the motion as amended was passed on the following division:—

Ayes, 10.
Mr. Suttor,
Mr. Hoskins,
Mr. Humphery,
Mr. Davies,
Mr. Trickett,
Mr. Ewing,
Mr. Wall,
Mr. McCourt,
Mr. Neild,
Mr. Collins.

Noes, 2.
Mr. Garrard,
Mr. O'Sullivan.

J. GARRARD,

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 22 March, 1894.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

PROPOSED SEWERAGE WORKS FOR PARRAMATTA.

WEDNESDAY, 7 FEBRUARY, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.
The Hon. JAMES HOSKINS.
The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JOHN DAVIES, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
THOMAS THOMSON EWING, Esq.

WILLIAM CHANDOS WALL, Esq.
WILLIAM MCCOURT, Esq.
JOHN CASH NEILD, Esq.
EDWARD WILLIAM O'SULLIVAN, Esq.
CHARLES COLLINS, Esq.
HENRY DAWSON, Esq.

The Committee proceeded to consider the proposed Sewerage Works for Parramatta.

Joseph Barling, Esq., Under Secretary, Department of Public Works, sworn, and examined:—

1. *Chairman.*] Will you kindly recount to the Committee the various steps which have been taken in regard to this matter since the Committee last reported upon it, together with the reasons for again submitting it for investigation? Yes. On the 14th September, 1892, this Committee came to the conclusion, with regard to the proposal which was then before them as to the expediency of constructing sewerage works for the town of Parramatta, that it was not expedient to carry the work out for the reason that, in the opinion of the Committee, "the Sewage Farm is too small for the purpose, and that the sewage should be dealt with at the pumping station at Clay Cliff Creek, by a system of precipitation and filtration, or other effective modern process," and in due course the report of the Committee was laid before Parliament. On the report being printed and distributed, it was brought under the attention of Mr. Hickson, the Engineer-in-Chief for Sewerage, and this officer then submitted a long report, dated 12th November, 1892, in which he gave his reasons for not concurring with the opinion of the Committee, and he concluded by strongly urging that no action should be taken in the matter until a further investigation by engineering experts had been carried out. [*Vide Appendix.*] As the result of continued agitation on the part of the Member for Parramatta, Mr. Hugh Taylor, who was no doubt set in motion by the municipal authorities, Mr. Secretary Lyne approved of the appointment of a Board to further consider the whole matter, and on the 15th July, 1893, a Board consisting of Messrs. Wardell, Chamier, and Bell, Civil Engineers, were appointed to investigate the subject. For the information of the Committee I will read the letter setting forth the terms under which these gentlemen were appointed:—

J. Barling,
Esq.
7 Feb, 1894.

Gentlemen,

Department of Public Works, Sydney, 15 July, 1893.

I am directed to inform you that Mr. Secretary Lyne has been pleased to appoint you a Board, for the purpose of inquiring into the proposals which have been made for the construction of Sewerage Works for the town of Parramatta.

From the papers which are forwarded herewith, you will see that the Parliamentary Standing Committee on Public Works has reported on the subject, and has come to the conclusion that it is not expedient to carry out the scheme proposed by the Department, for the reason that in their opinion the Sewage Farm is too small for the purpose, and that the sewage should be dealt with at the pumping station at Clay Cliff Creek, by a system of precipitation and filtration, or other effective modern process.

The Engineer-in-Chief for Sewerage however adheres to the recommendation he has already made on the subject, and has entered very lengthily into his reasons for so doing. As the matter involves questions of a highly technical character, which only experts can properly determine, the Minister has come to the conclusion to appoint a Board of experts to fully review the evidence already given, and, after inspection, to call such further evidence as they may think necessary; and, after thus fully and diligently inquiring into the premises, to advise him on the merits of the whole question. I am therefore to request that you will undertake this duty. The fees will be 50 guineas each, with an additional fee of 6 guineas to Mr. Bell, as he has had to travel from Melbourne, specially, to undertake these duties; and I am to add that Mr. Secretary Lyne has been pleased to appoint you, W. W. Wardell, Esq., Chairman of the said Board.

I have, &c.,

J. BARLING,

Under Secretary.

W. W. Wardell, G. Chamier, and C. N. Bell, Esqs., C.E.

The Board at once entered upon the inquiry entrusted to them, and after investigation presented their report, dated 28th July, 1893, to the Minister. The conclusion of this report was, that subject to a suggestion made therein, viz., that the system be a "separate system" instead of a "partially separate system," as proposed by the Department, their judgment and experience confirmed the recommendation of the Department, supported—to quote their words—"by the opinion of those who are accepted as the best authorities in Europe on this branch of the science." I do not think I need further enlarge upon this matter as I hand in a copy of the Board's report [*Vide Appendix*], together with Mr. Hickson's

J. Barling, Esq.
7 Feb., 1894.

comments thereon, dated 27th September, 1893 [*Vide Appendix*]. It will be seen by a reference to the report that the Board estimate that the cost of constructing the works would be reduced by 25 per cent. if their proposed modification be carried out. I shall probably be asked by the Committee what is the Minister's view on this particular point, and if so I am to say that Mr. Secretary Lyne has no particular opinion on the matter, other than that he wishes to see the best scheme carried out. The question is one of a highly technical character, and as the point of relative cost is not a question on which will hang the adoption or otherwise of a sewerage scheme for Parramatta, I am to say that in the event of the scheme being passed, and on the details being worked out, it is found that the large saving mentioned by the Board can be effected, their proposal will be adopted. Mr. Hickson whom I have seen on the subject, is, however, doubtful whether this large saving will result. He points out that it is hardly possible that 25 per cent. could be saved on the total amount, and he thinks that the Board must have meant 25 per cent. on the cost of the works above the Pumping Station; that is to say, on about £45,000, or roughly, a saving of £11,500. As, however, the members of the Board are to be examined by the Committee, I would suggest that their evidence on this point be obtained direct. With regard to the attitude of the Municipal Council on the question, I may mention that in addition to the continual representations made by Mr. Taylor as to its urgency, the following letter, dated 25th September, 1893, was received by the Minister from the Council:—

Sir,

Town Hall, Parramatta, 25 September, 1893.

I am directed by his Worship the Mayor, to inform you that at a special meeting of the Council of the borough of Parramatta, held on the 14th instant, the following resolution was passed, viz:—

"That his Worship the Mayor cause a letter to be forwarded to the Honorable the Minister for Public Works, informing him that this Council approves of the scheme for the sewerage works for this borough being carried out as submitted in the report from Messrs. Wardell, M.I.C.E., G. Napier Bell, M.I.C.E., and G. Chamier, M.I.C.E., and asking him to cause all necessary steps to be taken forthwith so that tenders may be invited for the construction of all necessary works."

And to request that you will kindly give the matter as contained in the foregoing resolution your most favourable consideration.

I have, &c.,

S. WICKHAM, Council Clerk.

The Honorable the Minister for Public Works.

On the 6th February a further letter was received, practically to the same effect, which I will also read:—

Sir,

Town Hall, Parramatta, 6th February, 1894.

I have the honor to again urge upon you the great necessity of commencing as quickly as possible, the sewerage scheme for Parramatta.

The report from Messrs. Wardell, M.I.C.E., G. Napier Bell, M.I.C.E., and G. Chamier, M.I.C.E., having been adopted by the Council, at a meeting of Council held on the 14th September, 1893, should convince the Public Works Committee of the necessity of sanctioning the work or some other which will afford the same relief. The river is greatly polluted with sewage from the Government establishments, and it is absolutely necessary that something should be done immediately to abate the nuisance and prevent disease.

I have, &c.,

CHARLES BYRNES, Mayor.

The Honorable the Minister for Public Works.

I might say, with regard to the last sentence, that we certainly object to the statement that the river is polluted by the sewage from the Government establishments. It may be polluted by the sewage to a certain extent; but I am advised that the pollution is chiefly caused by the sewage from the town.

2. *Mr. Hoskins.*] Evidence has been given showing that the Government establishments deal with their own sewage? Yes; though I am not prepared to say that none of it goes into the river. Still we have taken great care to prevent the pollution of the river. For the foregoing reasons Mr. Secretary Lyne, on the 1st February, submitted the following Resolution to Parliament:—"That it is expedient that the Report of the Parliamentary Standing Committee on Public Works upon the proposed construction of Sewerage Works for the Town of Parramatta, be remitted to the said Committee for its further consideration and report, for the following reason:—That since the said report was made, a Commission of Experts has reported favourably upon the scheme proposed by the Department, subject to a certain modification, a consideration of which report might lead the Committee to arrive at a different and more favourable conclusion." This was passed by the House, and in pursuance thereof the matter is again brought before the Committee.

3. *Chairman.*] You have nothing to add to that statement? No; I have nothing to add to it.

THURSDAY, 8 FEBRUARY, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.

The Hon. JAMES HOSKINS.

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JOHN DAVIES, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

THOMAS THOMSON EWING, Esq.

WILLIAM CHANDOS WALL, Esq.

WILLIAM MCCOURT, Esq.

JOHN CASH NEILD, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES COLLINS, Esq.

HENRY DAWSON, Esq.

The Committee further considered the proposed Sewerage Works for Parramatta.

Charles Napier Bell, Esq., M.I.C.E., sworn, and examined:—

C. N. Bell,
Esq.,
M.I.C.E.

8 Feb., 1894.

4. *Chairman.*] How long have you been a member of the Institute of Civil Engineers? Since 1867.

5. You are a full member, of course? Yes.

6. Are you practising your profession in New South Wales? No, in New Zealand mostly, and also in Tasmania. I have been here for some little time, off and on.

7. I suppose you were first engaged in civil engineering in the old country? I have been engaged in my profession in many countries—in Russia, Spain, Germany, and South America.

8. The Committee would like to hear, briefly, your history as a professional man. Would you mind telling us where you served your articles? I first served with Messrs. Bell and Miller, of Glasgow, who are dock engineers. As a young man I made surveys and did other work in connection with docks and patent slips. I carried out land surveys, and did various work of that kind. I made surveys in the towns of Edinburgh and Glasgow. After perfecting myself in my profession as well as I could, I went to

to

to London, and immediately obtained employment on railway works in Brazil. I was employed in Brazil for about nine years, on railway works chiefly, right through from the Argentine up to Pernambuco, on harbour works in Buenos Ayres, and on harbour works and tramway works in South Brazil. Leaving Brazil, I went to Germany and Holland, where I was engaged on railway works. I also went to Russia for an English company, in connection with the obtaining of a concession for gasworks and waterworks. Then I was employed in Spain, in going over railway routes which were proposed to be made by English companies. As I have said, I was engaged for two years or more on railway works in Holland and Germany. I afterwards came to New Zealand, and was connected with the first public works carried out there. I have been connected with most of the railways of New Zealand, and have also been connected with their harbour works and sewer works, and have made innumerable reports on engineering subjects both for the Government and private individuals.

C. N. Bell,
Esq.,
M.I.C.E.
8 Feb., 1894.

9. Was it in New Zealand that you first had anything to do, directly, with sewerage works? Yes; I carried out the sewerage of Christchurch. That was a large work, and is connected with a sewage farm. I also designed the sewerage for Napier, which has been carried out for a long time, and also the sewerage for Westport, which I think is now under construction. I have revised other sewerage works—one for Hastings, and other smaller works.

10. Have you been engaged in Australia in connection with sewerage works? No.

11. The Committee are to understand that your experience in connection with sewerage works has been confined to New Zealand? Yes.

12. At Christchurch the sewage is treated on the farm? Yes.

13. Is it dealt with in the same way at Napier? No; there is no suitable land available there.

14. Then what is the system of disposal? It is discharged into the harbour.

15. You, together with Messrs. Wardell and Chamier, formed a Board which reported upon the proposed sewerage works for Parramatta? Yes.

16. The unanimous conclusion of the Board was that the scheme was a good one, and that the area of land proposed to be set aside for the purpose of a sewage farm was ample. You also stated that you thought that the 40 acres which were to be filled up with dredging material, such as sand or silt, would be sufficient for the reception of the sewage for some time to come, and recommended that the 22 acres of natural soil—if I may use that term to distinguish it from the reclaimed land—should not be used for some years? That was the purport of our report.

17. You also recommended that, instead of the adoption of what is called the partially separate system, the whole of the storm-water should be excluded from the sewers, in order to reduce their size, and, consequently, their cost? Yes.

18. Are the Committee to understand that all three members of the Board were favourable to what is called the separate system of dealing with sewage? I think so; as far as I know the minds of the other two.

19. Is that the system adopted in Christchurch? Yes; strictly. There no rain-water is allowed into the sewers, and if I mistake not, people who let rain water run into the sewers are prosecuted.

20. You are aware that the whole of the sewerage system of Sydney is carried out upon what is known as the partially separate system? Yes; that is the general custom in sewerage works.

21. You are also aware that the quantity of flood-water to be admitted into the sewers at Parramatta is less than that admitted into the sewers at Sydney? Yes; considerably less.

22. Do you think that the Department might go a step further and entirely exclude all storm-water? The quantity of water proposed to be admitted into the Parramatta sewers is merely one cubic foot per minute per acre, but I think a great deal more than that will be admitted, only when it gets to the pumping-station it will be, I believe, overflowed. I think that is the system adopted in Parramatta.

23. You are under the impression that a great deal more than '92 cubic foot of storm-water is allowed to enter the sewers, and that when the water reaches the pumping-station, some of it is got rid of in order to lessen the pumping? Yes.

24. So that really only '92 per cent. is pumped on to the sewage farm? I believe that only 0'92 cubic foot is allowed to reach the farm.

25. The Board was unanimous in recommending the separate system? Yes. I know of no good reason for letting in the rain-water, especially in a town like Parramatta, which has a water supply, and which is situated on nice sloping land, so that the rain-water can readily find its way into the river, as it does now. If the rain-water is kept out of the sewers they can be greatly reduced in size, and thus their cost is lessened, while the cost of pumping is not so much, and the sewage which goes on to the land is more concentrated, and more easily dealt with.

26. But would not a greater fall per mile be required, because of the increased density of the sewage? I do not think the filthiness of the sewage would make the slightest difference in its flow on a gradient. What would obstruct it would be the fungus growth sticking to the pipes.

27. And would that vary according to the density of the sewage? It would probably be greater if the sewage were very dense; but the sewers should be flushed regularly with water.

28. How would the flushing be done; would all sewage matter be excluded for a time before the drains were flushed? Christchurch is a perfectly flat town, and presents great difficulties in connection with sewerage. There, at what is known as the "dead" end of every sewer, there is a concrete tank, generally holding about 1,200 gallons, and as there is no water supply in Christchurch, an artesian well is sunk in the bottom of each tank and keeps it full of water. The flushers, of whom three are employed for the whole district, go round, I think, three times a week and pull up the flap, allowing the water to go down the pipe. It is stopped at the next pipe and used to flush the next system, and so on from one to another, until it reaches the pumping-station. The flushing, however, could be done automatically, without the services of the flushers.

29. From your experience of Christchurch, you think that a greater fall would not be required, because of the density of the sewage? I do not think there is any necessity to consider the gradients in connection with the density of the sewage. The Christchurch sewers are set at as low a gradient as it is possible to set them, but they have been kept perfectly clean for ten years.

30. To get a greater gradient would increase the cost of sinking the sewer-pipes in the streets? If you made the gradients steeper I suppose the trenches would have to be deeper, or you would have to bring the pipes nearer the surface, and that is always objectionable.

- C. N. Bell,
Esq.,
M.I.C.E.
8 Feb., 1894.
31. If it were necessary to have a sharper grade, the outlet at the pumping-station would have to be very much deeper too? Yes.
32. Consequently, there would be a greater lift for the pump in bringing the sewage up to the delivery-pipe? Yes.
33. What you would lose in quantity, because of the exclusion of storm-water, would be made up by the increased height which you would have to lift your sewage? No; I would not allow that argument, because there is no reason for increasing the gradients on account of the density of the sewage. It is necessary to make the gradients steeper where the sewers have to carry what is called road-grit—heavy sand and silt washed off the roads, which it is extremely difficult to get down the pipes. But where there is no sand or grit, the very lowest gradients given by authorities such as Bailey Denton are sufficient, and the Department have used those gradients in laying down the sewers in Parramatta.
34. You think that if the separate system were adopted, and storm water entirely excluded, perhaps 25 per cent. could be saved on the cost of the works above the pumping-station? Something like that. I got them to take it out again and they made it 30 per cent., but I think it is better to put it down at about 25 per cent.
35. And in view of the smaller quantity of sewage to be delivered from the pumping-station to the farm, there would be a slight decrease in the cost of the main outfall? That is included.
36. You estimate that there would be a saving of 25 per cent. on all works above the sewage farm? Yes, on the sewers, the delivery mains, and, I think, the reticulation ought also to be included.
37. Twenty-five per cent. would be the saving on the initial cost;—would there be any reduction, and, if so, how much, on the annual cost of pumping and dealing with the sewage? That could be reduced by the less interest which would have to be paid upon the capital cost, and also by the smaller volume of sewage to be handled; but there would not be a large reduction.
38. The largest reduction would be in the interest on the capital cost? Yes.
39. How long has the Christchurch system been in operation? I completed the work and left there eleven years ago.
40. So far as you know there has been no breakdown of the system, nor have complaints been made as to its effectiveness? No. I have always heard the Christchurch system spoken of as perfection, and there has not been a single word of complaint against it. There was no end of prognostications that it would be a failure, and that the farm would pollute the neighbourhood. There was a tremendous fight over the matter, which lasted a year or more, but eventually the work was carried out, and I may say that it has been an unqualified success.
41. So far as the question of flushing is concerned, Parramatta would be in a better position than Christchurch, because of its water supply? Yes; we had no water supply in Christchurch.
42. You had to create a water supply for flushing purposes there? When I say that there is no water supply I must add that we have artesian wells.
43. You had to sink artesian wells in order to carry out your flushing arrangements? At first we did not make very much provision for flushing, but after a month or two the smell from some of the sewers was so bad that I put flushing tanks at the blind or top-heads of all the sewers. In some cases land springs were let in and used instead of artesian bores. After that the sewers were flushed regularly three times a week, and there was not the slightest trouble with smells.
44. The Board of which you were a member personally examined the proposed site for the Parramatta sewage farm? Yes.
45. To what depth were you informed that the Department proposed to place silt or sand on the reclaimed land? The site it was proposed to reclaim was enclosed by a fascine bank, and divided by one or more cross banks. As I understand the proposal, the land is to be filled up to high-water mark with anything which the dredges deliver there, and from high-water mark to 5 feet above it, it will be filled in with sand similar to that which we saw being put upon the reclaimed land at Neutral Bay. That would make the land 5 feet above high water.
46. Do you think that that would provide sufficient sand for filtration purposes? I think it would be enough, especially if the area were broken up by a number of cross drains.
47. Is the reclaimed land intersected with cross drains? If it is not intersected with cross drains, the only drainage will be round the border by the river, where the water will leak out. If the land is cut up by one or more drains, the drainage will be more thorough.
48. The water will drain out to the river below high-water mark, instead of being confined to high-water mark? The effective drainage will be somewhat below high-water mark; it will be at nearly the mean sea level, because there will be some hours when the tide is below high-water mark, and some hours when it is above it.
49. I understand that up to high-water mark the stuff deposited on the land will be more or less impervious to wet, and that only the upper stratum of 5 feet of sand will form the filter bed? The soil will be saturated up to the water mark. That we can infer without experimenting.
50. Would it be very expensive to intersect the land by drains? Not very. The area is not very large.
51. Was an estimate of the proposed cost of the various works connected with the sewage farm put before the Board? Yes, we had all that information before us.
52. Did the Board come to the conclusion that in those estimates reasonable amounts were allowed? We did not take into account the estimated cost of reclamation, because we were given to understand that the Harbours and Rivers Department would do that work free of charge.
53. But I mean estimates for draining, and so on? I made out an estimate myself of what the cost of reclamation would be, but that was only for the higher part of the ground, which is clayey soil.
54. You mean that you estimated the cost of properly preparing the upper 22 acres, to make it fit for dealing with sewage? Yes.
55. But your Board recommended that that land should be put on one side altogether, and no expense incurred in connection with it, while silt and sand were to have been deposited upon the lower forty acres? Yes.
56. I asked you, had the Board put before it the departmental estimate of the cost of various works in connection with the reclamation of this land, and if so, do you think that the estimate gives the probable cost. Your answer is, that you understood that the reclamation was to be done for nothing
- by

by the Harbours and Rivers Department. I refer, however, to the cost of draining, and doing other work in connection with the scheme? The departmental estimate for that was £40 an acre.

57. Did the Board agree that that was a reasonable estimate? Yes.

58. Do you say that you made a calculation yourself as to the probable cost of preparing for use the 22 acres above the reclamation limit? Yes; I made out an estimate in detail.

59. Did it correspond with the departmental estimate? I do not remember that we had a departmental estimate for that work apart from the reclamation work.

60. Will you kindly give us your estimate? My estimate for preparing the clayey land came to £84 an acre. The details are as follows:—

	£	s.	d.
Excavating and spreading soil, 400 cubic yards	23	6	4
Carting and filling sand	17	0	0
Two-inch tiled drain-pipes	17	6	8
Ti-tree fascine bundles to put in the drains over the pipes ..	12	6	0
Stumping and grubbing the land	3	0	0
Ploughing 18 inches deep	1	8	0
Cross-ploughing twice	0	8	0
Harrowing three strokes	0	5	0
Outlet pipe to river, 16 chains long, 9 inches diameter	6	12	0
Sewage carrier ditches and bank over the land, 6 chains at 8s. a chain ...	2	8	0
Total	£84	0	0

The departmental estimate of the cost of preparing the reclaimed land is £40 per acre.

61. But you have told us that you did not take into your calculation the cost of preparing the reclaimed land? I have not got the details, because the Department made out the estimate.

62. Did the Board consider the departmental estimate of £40 an acre a fair one? Yes; we considered it fair enough, considering that there is only the dressing-up of the land and the making of banks to be done.

63. Excluding the first cost of the material, whatever it may be? Yes, it seems fair enough. You have only to deal with sand which is perfectly level, so that there is nothing to be done but to make-up the different ditches and banks forming the plots which are going to be used.

64. How long were you connected with the Christchurch sewerage system after its completion? The sewerage of Christchurch was designed by Mr. William Clark, who designed some of the Sydney sewerage. As I was, at the time, the engineer of the Local Drainage Board, I carried out the work, and Mr. Clark's designs were considerably modified. He allowed for a certain quantity of rain water going through the sewers, but we excluded the rain water altogether.

65. While, in carrying out the Sydney sewerage scheme, Mr. William Clark's recommendations were closely followed, in carrying out the Christchurch scheme, you had the courage to go beyond his recommendation to some extent? Yes; we excluded the rain water altogether, but we let in the sub-soil water in a great many cases where it was found beneficial to land upon which houses were situated to do so. That also brought down the sub-soil water all over the area immediately.

66. Had you charge of the Christchurch system after it was completed and in proper working order? Yes, from 1876 to 1883.

67. During that time were there any complaints of a nuisance arising from the deposit of sewage upon the farm? The complaints were more in the nature of anticipations of what would happen. There were numerous complaints of that kind.

68. You have already told us that you had a big fight about the matter, and I want to know if, after the scheme was in operation, serious objection was taken to any nuisance arising from the deposit of sewage upon the farm? No, there has never been a complaint of that kind. The complaints made at first were more in the nature of anticipations, but as the work went on they subsided, and now we never hear them. No one ever dreams of complaining now.

69. Is the Christchurch sewage farm worked at a profit? I think not, but I do not think that the loss, if any, is very great.

70. Is it true that since the farm was established it has been surrounded more or less thickly by residences? Yes, there are a considerable number of residences there. The suburb of Linwood, which lies $1\frac{1}{4}$ miles to leeward of the farm, has grown very much.

71. Why do you speak of it as to leeward? Because in summer time the wind is north-east, and this place lies to the south-west of the farm.

72. No objection has been taken to it by the inhabitants of Linwood? I never heard of any.

73. How long is it since you were in Christchurch? I went over the farm with the Scientific Congress which met at Christchurch in 1891 or 1892; and in 1892 I also went over it with the engineer.

74. What is its area? The Board possess 470 acres.

75. At present they only use about 42 acres? That is the area which has been horse-shovelled and laid out into plots. It receives the drainage of about 30,000 inhabitants. In summer time the farm does not receive enough sewage to keep the 42 acres going, because of the dry weather. But of course in winter time there is enough.

76. What is the nature of the soil? Loamy or discoloured sand, with a small amount of earth below.

77. It is not such pure sand as you have at Botany? It is very like it. The Botany sand has layers of silt below.

78. In your opinion is pure sand better adapted for the work of a sewage farm than sand mixed with loam? Pure sand is supposed by the authorities, to be the best, and it answers exceedingly well in Christchurch.

79. Knowing the position of the proposed farm in Parramatta, do you think it would be likely to create a nuisance which would be detrimental to Granville and to the people on the other side of the river? I think that if the farm is attended to with proper and ordinary care, there will not be the slightest nuisance.

80. Have you considered the various mechanical and chemical methods used for dealing with sewage? I have made myself acquainted so far as I can, with all the methods for purifying sewage that have come up from time to time, but they are almost innumerable, and every year presents several new ones.

C. N. Bell,
Esq.,
M.I.C.E.

8 Feb., 1894.

81. All more or less short-lived? After a few years they are generally put aside for some novelty.
82. Have you given any attention to what is known as the International system? I have read all I could about it, but I have not seen it in operation. It has not been adopted in these colonies.
83. Do you know from your reading whether it has been tried anywhere upon a sufficiently large scale to allow of a proper judgment being made as to its utility? I have read that there are several places in England where it has been tried and approved of, but I have also read of one or two places where it has been tried, and the results have been thought doubtful. The preponderance of evidence, I think, is that it is satisfactory.
84. Are you of opinion that where a suitable site for a farm for dealing with sewage is available, it is preferable to put the sewage upon the land rather than to treat it by chemical or mechanical means? I should always be inclined to recommend a natural means of dealing with it, instead of an artificial means. The only instance where I remember seeing the result of a mechanical process was at Rio de Janeiro, but there they had unlimited trouble. They found, as would certainly be found to be the case in these colonies, that it was impossible to sell the sludge, and when I saw them last they were obstructed with a mountain of sludge with which they could do nothing, but which they did not like to throw into the harbour. That sludge is of low manurial value, and the farmers prefer to use bone dust, guano, and super-phosphates. In Christchurch a private firm made a much more concentrated manure than is proposed to be made by the International system, but it could not get a sale for it.
85. Suppose this scheme were carried out, and the area of land was found to be not sufficient to deal with the sewage, and that a nuisance was caused, would it be possible to supplement the farm treatment with a chemical treatment at the pumping-station;—if the sewage farm was found not to be meeting expectations, could we add that system to the present system? Certainly; except that you would have thrown away the farm and the carriers, which lead the sewage from the pumps to the farm.
86. Could not the sewage be dealt with at the pumping-station by chemical methods, and purified to a certain extent, and then be sent on to the sewage farm? You could turn the effluent from the precipitation works on to the sewage farm, but it would be unnecessary, because the effluent would not be much more than common water if it had been thoroughly purified at the International works.
87. Mr. Hickson, in a report which formed the basis of your examination, states that these artificial or chemical methods do not actually destroy the objectionable matter in sewage, but merely clarify it, so that there is still a danger of the effluent developing unpleasant, if not dangerous, microbes? I should not be too positive in my assertion about that, as there seems to be some amount of contrary opinion. Those who are patenting and selling the International process say that it clarifies everything; while others assert that it does not do so. We know very little about the International process, except from the patentees; but it cannot, in any case, do more than sand does in the filtration of sewage.
88. It is only a question of using a chemical process instead of a natural one? Yes. When sewage is spread upon the land, not only do the microbes, but even the plants attack it and live upon it. They both feed on its impurities. With a chemical process, however, you make a sludge of very slight manurial value which it is difficult for farmers to deal with because of the bulk, and that has to be put on the land, so that you have a complex process, instead of a simple direct one.
89. What is grown upon the Christchurch farm? The chief crops are rye-grass, and red clover, from which very large quantities of hay are made. They also grow vegetables—carrots, mangels, and turnips.
90. For home consumption? No. The farm carries about 100 head of cattle, and they are always buying store cattle, and selling them fattened.
91. The produce of the farm is used to feed the stock run upon it? Yes. Nothing that is produced there is consumed by human beings. There are a large number of cattle, and a few sheep, and they eat up almost everything. The farm authorities sell some hundreds of pounds worth of hay every year.
92. Is it because it is feared that evil consequences might arise from the consumption of these carrots by human beings, that they are not sold to outsiders? No; I do not think that. It is because you cannot grow grain upon the soil, because it is so saturated with water. Then, too, carrots, mangels, and turnips are not readily saleable in large quantities.
93. Does the farm only grow enough to feed the stock? Some of the land is divided into small plots and devoted to the growing of mangels and carrots, but three-fourths of it or more is devoted to the growth of rye grass and red clover.
94. Are no vegetables grown for the use of the employees upon the farms? Each man has a little garden, but I notice that they keep their gardens away from the sewage.
95. Do you think that it would be unwise for them to use the sewage on their own plots? No; but the sewage plots are drowned with water every now and then, and you could not very well deal with a small garden plot under those circumstances.
96. You do not anticipate any danger to their health? I do not believe for a moment that in the process of growth, microbes and injurious organisms can be passed through the tissues of a plant.
97. You would have no objection to consuming vegetables grown upon the farm? Not the slightest. The only danger is that if there were injurious microbes, such as typhoid and diphtheria present, they might lodge on the surface of the leaves and the animals might eat them, but they could not enter into the tissues of the plants.
98. If due care is taken the sewage need not be allowed to get upon the leaves of the plants? But it does sometimes. A plot ought not to be flooded so deeply as to submerge the crop, but it does happen sometimes.
99. *Mr. Humphery.*] Do you think it would be well to follow out the suggestion of the Board and use the 40 acres of reclaimed land before dealing with the 32 acres of land which are not subject to tidal influence? I am inclined to think that the 40 acres would be sufficient; but if I had the means, I think I would bring in the 22 acres also.
100. Which portion would you recommend should be dealt with first? That which is easiest got at and trenched—the sandy portion.
101. The 42 acres which are subject to tidal influence? Yes.
102. You would not use the 22 acres until the increasing sewage rendered it necessary? If there were the means of bringing it under cultivation, I should use it at once.
103. At Christchurch were you engineer to the Government or to the Local Drainage Board? The Drainage Board.

C. N. Bell,
Esq.,
M.I.C.E.
Feb., 1894.

104. Can you say what the cost of the system was when banded over complete, that is, including reticulation? It is difficult to say. The total cost of the drainage system was about £275,000, but that included the cost of a large quantity of rural drainage. Great ditches had to be dug in the fields to carry off the storm-water, though they had really nothing to do with the sewerage system. The Drainage Board there has control over the whole of the country side round about for a great distance. The sewerage scheme proper only applied to Christchurch and its thickly peopled suburbs, where there is a population of about 30,000, and it cost, I think, a little over £130,000.
105. Is that including the mains as well as the reticulation-pipes? Everything: the pumps, the reticulation, and the sewage farm.
106. How is the cost of maintenance and interest upon the outlay made up? I am not certain what the cost of maintenance is, but if I remember rightly, it comes to about £700 a year, exclusive of interest.
107. That is the total cost of maintenance? That pays the attendance on the farm, the flushers, and the people who look after the pumps, and provides coal, oil, waste, and repairs.
108. That is the total annual cost of maintenance, exclusive of the interest upon the outlay? Yes; it comes to between £700 and £800.
109. Did you examine the silt at Neutral Bay? Yes.
110. Do you think it suitable for drainage purposes? I thought it was a very good kind of material for sewerage purposes. It is dirty sand, with streaks of silt in it.
111. You think it would be quite suitable for sewerage purposes? I think so; I do not know any reason why it would not do.
112. Do you approve of the proposal to raise the land now subject to tidal influences to a height of 5 feet above the highest tide by using this Neutral Bay sand? I think it will be entirely satisfactory if it is kept up to the height of 5 feet above high water, and is divided into smaller sections by one or two drains.
113. There is no doubt about the suitability of the silt? I reason by the analogy of the Christchurch farm, where the subsoil water was considerably less than 5 feet from the surface. In some places I do not think it was more than 3 feet below the surface. That is in the central parts, away from the drains.
114. So that a height of 5 feet would be more than ample? I have no doubt that you would not get more than 3 feet. The water will stand below the surface at a depth of about 3 feet, unless you cut up the land with drains, because, as I have said, the water will rise in the sand from high-water mark at the river side to a height determined by the water angle in the sand.
115. You mentioned just now that 470 acres had been reserved at Christchurch for the purpose of a sewage farm;—upon whose recommendation was that large area set apart? As soon as we found that Mr. William Clark was going to recommend a sewage farm, some reserves were at once claimed from the Government. About 470 acres of sand hills were got in this way without costing the Board anything.
116. You think that such a large area is quite unnecessary, and that 42 acres would be ample for all purposes for years to come? Well, 42 acres were laid out there originally, and they have never increased the area, because in summer time they have not enough sewage.
117. From that you reason that 60 acres would be ample to serve a population many times greater than the present population of Parramatta? From my experience of the Christchurch sewage farm, and from what I have seen of the Botany farm, I infer that it is ample for the small population of Parramatta.
118. You are speaking of the present population, but are you aware that the population of Parramatta has doubled itself within the last ten or twelve years;—have you taken the natural increase into consideration? We have taken into consideration the proposed increase up to 48,000; but I do not think the population will increase to that extent. My experience of towns in New Zealand is that while loan money is being spent, and everything is booming, a town will grow fast, and then will subside again.
119. The mayor of the adjacent borough has objected to the proposed sewage farm on the ground that it would be a nuisance, and would depreciate the value of property? These are *pro forma* objections, made simply as a matter of precaution. We had innumerable objections of that kind in Christchurch, but they all subsided when the work was carried out.
120. You have heard of no objections since the work was carried out? No. At first innumerable objections were preferred to the Board by various bodies, but these objections are generally put forward *pro forma* in order to stave off any responsibility.
121. Are there many houses close to the Christchurch sewage farm? There are one or two very nice villa houses close to the farm, and a good many cottages. The buildings have increased in number since the farm was established.
122. Are those buildings situate within the borough? The farm is outside the borough, and these buildings are situate upon land round about the farm—some of them very close to it. The farm is surrounded by a double belt of pine trees.
123. What is its distance from the nearest borough? The town of Linwood is about $1\frac{3}{4}$ miles distant, and I think the borough of Linwood has a population of 4,000 or 5,000, though there were very few people there when the farm was started.
124. *Mr. Hoskins.*] Are we to understand that you consider sand the most suitable soil to ensure the success of a sewage farm? As far as my small experience goes, I think sand is the best soil for a sewage farm, but these farms are made of every sort of soil. The soil on the Adelaide sewage farm is a red loamy clay, and the 8,000 acres which they are preparing for a sewage farm at Melbourne, are composed of a tough, ferruginous clay. They are breaking up the clay with deep-furrow ploughs 2 feet deep.
125. Have you seen Mr. Hickson's report of the 12th November, 1892, in which the opinion of a number of experts in regard to the disposal of sewage is given? Yes; I have read it.
126. Have you noticed that all the engineers quoted in the report recommend sand as the soil upon which sewage should be cast? Yes, and the most exhaustive experiments have been carried out in Massachusetts, U.S.A., in regard to the filtration of sewage, the report of the Massachusetts Board of Health being that sand is superior to all other soil.
127. Are you of that opinion? I have not had experience myself of other soils, but I presume that what they say is true.
128. What was the soil on the sewage farm at Christchurch? Sand.
129. What depth of sand is there? All sorts of depths. Some considerable distance down the soil becomes loamier and loamier until you get into hard silt, but there is sand to a considerable depth.
130. Have you seen the sewage farm at Adelaide? No, I have not. I only know it from what I have heard about it.

C. N. Bell,
Esq.,
M.I.C.E.

8 Feb., 1894.

131. Do you know of your own knowledge that the surface soil there is not sand but clay? I only know what I have been told, and I have heard that the soil there is red loamy earth.
132. Can you say whether any nuisance or disagreeable effluvium is experienced there because the surface is not composed of sand? I heard of complaints being made a long time ago about the Adelaide sewage farm, but I have been told that it is working satisfactorily now. I think the complaints that were made referred more to the state of the sewers than to the state of the farm.
133. You say that the soil of the Melbourne sewage farm is not sand? No, it is a tough, ferruginous clay.
134. Have you ascertained if they intend to cover it with sand? They do not propose to do anything of the kind. On the contrary, they are going, at a great expense, to break it up as small and as carefully as they can. They can only break it up to a depth of about 2 feet, but they intend to cross-plough it and harrow it until they get it somewhat into condition.
135. They intend to cross-plough it with a view to making the clay more absorbent than it would otherwise be? That is the only way they have of making it absorbent.
136. I am to infer that you confirm the opinions embodied in the report that sand is the best soil for a sewage farm? I think that it is.
137. Have you seen any of the sewage farms of England? I do not remember seeing any of them in England, though there are a great number there. I have read about them all.
138. Have you seen any of the sewage farms on the continent of Europe,—at Berlin, or Paris? No. The Berlin farm, I think, has a sandy soil.
139. In your reading on this subject, have you observed that there is a considerable difference of opinion amongst engineers as to whether disagreeable effluvia are not emitted from sewage farms even in England, and have not great complaints been made on the subject? There have been great complaints.
140. Do you not know that complaints are being made now? There have been great complaints, but I do not know whether they have been satisfied yet.
141. After several years experience of sewage farms, complaints have been made by residents living near of the nuisance created by them? Occasionally that has been so, but as far as I have read, such complaints have generally been caused by neglect in dealing with the sewage properly, owing to the economy practised by the various Boards of municipalities who have had charge of the work.
142. Do you not know that in England the Local Government Board are clothed with sufficient power to compel corporations and others who have control of sewage farms, to abate the nuisance caused by these farms? I suppose that when a nuisance becomes intolerable the Government Board steps in and compels the people to do away with it, which they accordingly do.
143. I suppose you know that there is a difference of opinion amongst engineers and sanitary authorities as to whether sewage farms are a nuisance or not to the neighbourhood in which they are situated? I think that the general opinion amongst engineers is that sewage farms are the best means of disposing with sewage yet known.
144. I am not asking you the opinions of engineers, but the opinions of sanitary authorities? Sanitary authorities also agree that they are the best means of disposing of sewage.
145. You are aware that there are great differences of opinion among them? I acknowledge that there are great differences of opinion among them.
146. I suppose you are aware that nearly all the surface soil of the 22 acres at Parramatta, which are above high-water mark, is clay? There are only 10 inches of soil on that land, and then you come to 2 feet of weathered earthy clay. Below that is a strong ferruginous clay, so that there is about 4 feet of disposable material altogether. The soil is weathered, and in a loose condition.
147. But the sub-soil is not suitable for a sewage farm? No; the subsoil is 3 feet down, and it is a very tight clay.
148. In reply to a question by Mr. Humphery you advised that this land should be made available for the disposal of sewage, and you said that you proposed to plough it and cross-plough it, and take other steps to prepare it, at a cost of £84 per acre? Yes. That includes the cost of draining it.
149. Having prepared the land by ploughing, sub-soil ploughing, and cross-ploughing, would you deposit sand on the surface as the best material to receive the sewage? No.
150. Would you put the sewage straight on to the clay? The clay would be ploughed, cross-ploughed, and harrowed, and by that means the 10 inches of soil would get into it and make it friable. If it was then allowed to absorb the sewage, and plants were grown upon it, it would, I presume, become similar to the soil on the Adelaide farm.
151. Suppose the clay was almost impermeable, would it not in time become so charged with sewage and so impure as to be a nuisance to the neighbourhood? It will not become impure or overcharged with sewage if it were not dosed too much, and if it were regularly drained.
152. Where do you propose to drain it? Into the river. I have provided for those drains in my estimate of £84.
153. Even supposing it were drained, the solid matter would be left, and would that not make the land impure and cause the farm to be a nuisance in a climate like that we have here? The clay soil would be no more subject to that contingency than sand would be, unless you overdosed it, and neglected to drain it. The microbes and the plants together would destroy the impurity, and if the land were properly pulverised for the reception of the sewage, would turn it into pure earth or *humus* again. As to the depth of the sub-soil, 3 feet is quite sufficient. Below that is the impervious clay with which you cannot deal, as, in the same way, below the 5 feet of reclaimed land is the standing water with which you cannot deal. Each piece of land is in the same case. If the 3 feet of soil on the higher piece of land is properly drained and not overdosed, and plants are allowed to grow on it, it will not be any worse than the sandy piece.
154. Is it not a fact that sewage is so improved by the action of sand that in course of time it becomes innocuous as regards smell, whereas if it is deposited on soil of a non-absorbent character, noisome exhalations are emitted that would not come from the sand? The clay would be absorbent, though not to the same extent as the sand. If you drained the clay, it would become perfectly absorbent, and all impurities in it would be consumed by the plants growing on it. If it were properly ploughed and drained, it would be under the same conditions as regards purification as the sandy soil, and I am sure that it would deal with the sewage as satisfactorily as the sand, though I do not think it would take anything like so much.
155. You admit that this friable clay would not take so much sewage as an equal area of sand would take? I do not think it would; but I am not talking of my personal experience.

156. If your views were given effect to, and these 22 acres of clay were ploughed, cross-ploughed, and properly prepared, would not the land be more expensive to keep in order than the reclaimed land? I do not know the grounds on which you make that supposition.

157. Would it not require a great deal of attention to keep the soil stirred and prevent the emission of disagreeable smells? The drains being underground drains would not be supposed to require any maintenance, while the surface of the ground would have to be ploughed from time to time, as would also the sandy portion.

158. But the sand would not require to be ploughed so frequently as the clay? There are means of dealing with this earthy land which are perfectly feasible, however tight the ground may be. It has been proved by experiments in England and elsewhere, that if you make trenches 10 or 12 feet apart, and fill them with sand or gravel, the land becomes highly porous.

159. Does not that infer the feasibility of my suggestion that it would be better to put sand on top of the land? Of course it would be better, but the expense would be large.

160. Would the sand not prevent a nuisance? I think, if trenches 1 foot wide were made and filled up with sand, they would be as efficacious as you could desire. If the land were trenched in that way, it would become highly porous.

161. You admit that the 22 acres of clay, whatever process they might be subjected to, would be more liable to cause a nuisance than the sand on which it is proposed to deposit the sewage;—that being so, do you not think it possible that the municipality of Granville, which adjoins the farm, and municipality of Rydalmere on the other side of the river, may make complaints and obtain an injunction from the Supreme Court, preventing the Government from allowing the nuisance to continue? I have no doubt that they will make complaints, whether there is a nuisance or not. That is my experience.

162. If, after the Government have gone to great expense in establishing the farm, these municipalities obtained an injunction from the Court preventing the Government from going on with the work, the country would be saddled with an enormous useless expense? That might happen. It has happened before.

163. I ask you if, after your experience of Christchurch, you think it advisable that the country should run the risk which the expenditure of money upon a sewage farm would entail, if other means could be adopted for getting rid of the sewage? My experience is, that no end of complaints will be made at first, but that when the farm is in operation they will die out, and you will hear no more about them.

164. You have been to the Botany sewage farm? Yes.

165. You know the nature of the soil there—sand? Yes.

166. According to the best authorities, and according to your own evidence, that is admittedly the best soil on which to deposit sewage? Yes.

167. When you visited the farm did you perceive an offensive smell coming from the sewage deposited upon the ground? No; I perceived nothing to which I could take exception. Close to the sewage there is a slightly nauseous smell, but a short distance away there is no perceptible smell. I found nothing to object to there.

168. I suppose you observed that the situation of that farm was especially suitable, inasmuch as there are not many residences near it, and there is a large area reserved for future use? I think there are people living in the neighbourhood, across the river.

169. That is a considerable distance away? Not very far off.

170. I suppose you admit that the circumstances surrounding the proposed farm at Parramatta are different from those surrounding the Botany farm, seeing that at Parramatta there are several townships in the immediate neighbourhood and no great depth of sand as there is at Botany? The two places are not very different.

171. Seeing that the land at Parramatta is very flat, that the district is an old settled one, that there are a large number of people living near the proposed farm, and that the soil is very different from the Botany soil, do you not think that the Government should proceed with great caution in considering the proposal? I do not know what influence the people of the district may bring to bear to prevent the project being carried out, or to ruin it, but my opinion is that it will not be a nuisance to anybody, however close he may live to it. There are three or four families of children living upon the sewage farm at Christchurch, and the people working there tell us that the children have never experienced better health elsewhere. I also heard that at Botany the people were perfectly healthy; and the statement that these farms have an injurious effect upon health has been disproved in Europe times out of number.

172. But you have not answered my question: While at Botany the Government own a large tract of land composed entirely of sand, at Parramatta the area is limited, and the soil very different, while the farm is situated close to a settled locality;—under these circumstances, do you not think that the Government should exercise great caution in dealing with this matter? If the Government expect that influence will be brought to bear to ruin the project, or to burst it up after it has started, of course they should use great caution.

173. What is the minimum depth of sand which you think ought to be spread over the 40 acres to insure that the sewage cast upon it will not cause a nuisance? It is impossible to say what should be the minimum, but I should think that 5 feet would do well enough. Of course if you had 8 feet it would be much better.

174. *Mr. Davies.* Did I understand you to say, in reply to the Chairman, that you were a recognised sanitary engineer? There is no such distinction as you seek to draw.

175. Are you a sanitary engineer? Not properly so called. I have done all sorts of work, sanitary engineering included.

176. That is not an answer to my question? I have not devoted myself to sanitary engineering alone, but I have done a good deal of it.

177. The only works you can refer to are at Christchurch? I have designed other sewerage works, but the principal works on which I have resided, and which I have carried out, are those at Christchurch.

178. Those works, you say, have been successful? Yes.

179. You have made yourself acquainted with the situation of the proposed sewage farm at Parramatta? Yes.

180. Do you tell the Committee that you approve of a large quantity of crude sewage and fecal matter being cast upon 30 or 40 acres of land, and allowed to drain into the Parramatta River? When you say cast

C. N. Bell,
Esq.,
M.I.C.E.
8 Feb., 1894.

cast upon the land, you should add, "With the precautions which constitute a properly-kept sewage farm." If you cast the sewage on the land, and take no care how you do it, you may create a great nuisance.

181. Do you think that the river mud, silt, and sand, which is to be put upon this land, are the proper ingredients for the filter-bed of the sewage farm? I think that sand and sandy silt are very good materials for a sewage farm.

182. Would silt and sludge already charged with sewage matter make a good filter? If only silt were used, care would be required; but you could make a sewage farm of even the toughest clay.

183. If this land is reclaimed and raised 5 feet above high-water mark, there can be no possible objection to placing crude sewage upon it, supposing it is drained in the way you speak of? No.

184. There would be no smell? The smell will not extend much beyond the boundaries of the farm—at least that is my experience of the sewage farms at Christchurch and Botany, where I could not perceive the smell at a short distance away.

185. You saw the crude sewage on the land at Botany? Yes.

186. Do you tell the Committee that no smell comes from it? There is a smell close to the plots on which the sewage is spread, but I could perceive no smell beyond the limits of the farm.

187. Do you mean to tell the Committee that there is no smell from the sewage when you are in such close contact with it as you were at Botany? There is a smell when you are on the land itself. There is always a mawkish smell.

188. Has not the fecal matter always a vile smell? No; it loses its fecal smell when it falls down the drains, and mingles with the other sewage. The well-known smell of sewage has nothing to do with the proper fecal smell. The smell of a water closet has not the slightest resemblance to the smell of crude sewage.

189. How do you account for that? Because of the organic changes which take place.

190. Would there be no smell from a bed of fecal matter under the hot sun of this Colony? There would be the smell of fresh sewage, which is not a fecal smell, properly so called.

191. Would there not be a very vile smell, and a vapour arising from the sewage-beds? There is a mawkish, sourish smell peculiar to sewage noticeable where the beds are soaked with it, but the smell is not strong, and does not extend far. I know of no reason to suppose that it is unhealthy; in fact it is not unhealthy, and has no influence at all upon health.

192. I suppose it is quite possible to become acclimatised to anything? It is not the smells or gases, such as sulphuretted hydrogen, that affect the health. What do affect the health are the dried bacilli found in the sewage. If they blow about and get into the system they become injurious, but the smell has no bad effect.

193. You regard the scheme submitted to you and your colleagues for report as a perfect scheme? I can conceive of conditions which would make it more perfect.

194. In what respect? Nothing in this world is quite perfect. If instead of 40 acres we had 400, that would be an improvement.

195. You think then that the area of the farm is not sufficiently large? On the contrary, we have evidence to show that it is sufficiently large.

196. But you say that if you had 400 acres the system would be more perfect? No doubt the greater the area the better it would be. But there is ample room at Parramatta. The farm can be extended to an area of 167 acres by the same means as are to be used for reclaiming the 40 acres. There is abundance of land, and it is only a question of filling it up, and erecting fascine banks.

197. Did you and your colleagues make a calculation as to the probable cost of increasing the area? We looked at the plan to see if it were possible to increase the area, and I think we saw that about 160 acres could be reclaimed there.

198. Can you point out to the Committee what land you think could be reclaimed? The land lying on the left hand side of Duck River could be reclaimed for a considerable distance around. We reckon that nearly twice as much could be got by extending the farm round that way with the same kind of reclamation as it is proposed to carry on there.

199. I understand that you and your colleagues came to the conclusion that it is quite possible to increase the area to 160 acres by reclaiming the land along the Duck River? Yes.

200. Do you think the farm would be improved if more land were reclaimed? No doubt the more land you have, and the less number of people draining upon it, the more easily is your farm managed, and the less trouble it would be to keep it clean.

201. That was the reason that prompted you and your colleagues to make an inquiry as to whether it was possible to get a larger slice of land? Yes.

202. You say that the river mud and silt were shown to you as the proposed material for making the reclamation? I was given to understand that the reclamation would be made by material similar to that which we saw at Neutral Bay, where the lower parts are being filled up with gravel, tough clay, black mud full of shells, &c. The top part was covered with various kinds of sand, some of it exceedingly fine, and some very coarse, with a little gravel or silt mixed in with it. They showed me that as a sample of the material to be used at Parramatta, and I think the rest of the Board came to the conclusion that it would do very well.

203. Did you see the silt and mud that had been raised by the dredges at Homebush Bay, close to the site of the proposed farm? Yes.

204. Do you think that it would be useful for filling-up purposes? Anything would be suitable for raising the land to high-water mark, and that does not come into the question at all. What we have to consider is, the character of the material to be used in raising the land from high-water mark to the 5 feet proposed by the Department. That material must be good, but the stuff on which it is placed is of no consequence.

205. The filtration will be done above high-water mark? It cannot be done below the water mark.

206. And it should be sharp sand? The purer the sand the better. With regard to the twenty-two acres of land which has been referred to, there is clay below 3 feet of top soil, but it is of no use our considering that. All we have to use is the 3 feet. In the same way, it does not matter what you put upon the 40 acres below the water level. It is what you put upon the high-water level which matters.

207. Do you know what provision is made for the drainage? No, I cannot remember.

208. Is it not absolutely necessary that there shall be a thorough system of drainage? At Botany there are

are no drains, and I believe they get satisfactory results there; but if the land were cut up with drains, it would facilitate the drying of the soil, and would get the sub-soil water as low as possible.

209. The liquid matter runs into the side drains? Yes, and the more side drains you have, the lower you reduce the water level.

210. They have no system of drainage at Botany? No; there are no drains there.

211. Are there not side drains for taking away the water after the land has been flooded? There may be a drain at the back of the plots and the river at the front, but the land is not cut up by drains. In Christchurch the sub-soil water rose and made ponds upon the surface, and we had to make drains 7, 8, and 9 feet deep in order to lower the water. These drains are maintained with great difficulty.

212. How were they constructed? They were dug out with a shovel and faced with fascines of manuka. That immediately lowered all the sub-soil waters in the farm.

213. You regard the Parramatta sewerage system as a fairly perfect one? I think it is the best that could be proposed.

214. And it would be effective? I am not partial to manufacturing processes, because you are never certain of the improvements that are constantly cropping up. Improvements have cropped up since our report was made six months ago, which threaten to totally do away with the ferozone process, which was so much advocated four or five years ago. That process was very popular for a short time, but there is no saying what other improvements may crop up any day.

215. Are you aware that most of the opinions quoted on this system are very old, going back to 1865? Opinions about what process—the International process?

216. Opinions upon the whole question? I think Mr. Hickson brings them up to date.

217. Most of them are very ancient? The ferozone process is one of the last, but other new processes have cropped up lately.

218. Who is the most reliable of the authorities quoted by Mr. Hickson? They are now treating sewage very successfully by means of electrolysis, about which they boast a great deal.

219. Do you regard that as the latest development in the treatment of sewage? I have not much confidence in the system of treating sewage by electricity, but I have not had enough experience to be able to talk about the subject.

220. You pin your faith to the farm system? I think that is the most natural way of dealing with sewage. I have very little confidence in manufacturing processes.

221. *Mr. Trickett.* Do I understand that the stuff you inspected at Neutral Bay is intended to be put below the water-line or above it? The filling up at Neutral Bay is composed of mud, and silt, and clay to about high-water mark, and is topped off with 5 or 6 feet of sand and gravel, which is above high-water mark.

222. It is the upper part that will do the filtering? Yes; only the upper part, because there can be no filtration below high-water mark.

223. In the report of the Board, dated the 28th July, you say: "We visited the Reclamation Works at Neutral Bay and Long Cove to ascertain the nature of the material which is to be obtained, and its suitability for sewage farming uses." I want to know if that filling up is similar to the filling up which would be used for the sewage farm? We were shown the Neutral Bay filling up under the supposition that similar material would be used at Parramatta.

224. And you thought it would be effective? We thought that the material which we saw at Neutral Bay was very good.

225. Did you make any experiments with the soil on the upper portion of the proposed sewage farm? There is no soil with which to make experiments on the part which it is proposed to reclaim, and I have already referred to the character of the soil on the other part.

226. I think there must be some soil worth experimenting with, because on page 69 of the report of the Public Works Committee Mr. G. H. Stayton says: "Of the two bottles of effluent, which were submitted to the Committee on Tuesday, the clearer effluent came through soil taken from Parramatta; the other came from soil taken from Webb's grant. Webb's grant is not expected to take more than the sewage of about 800 persons per acre. If sewage through Parramatta soil takes six times as long to go a depth of only 6 or 8 inches, as was explained to the Committee, I would ask the question, how long would it take to go through 3 or 4 feet, even with the subsoil drains 20 feet apart?" So that Mr. Stayton must have taken some soil from the 20-acre piece and tested it? Yes.

227. Have you made any experiments to prove the correctness of his test;—Mr. Stayton tries to show that filtration through the Parramatta soil will be so slow that it will not be able to treat the quantity of sewage it is intended to deal with? No; but I presume that the soil he treated had never been worked; that it was in its original condition.

228. Samples of the soil from each place were put in similar utensils, and it took six times as long for sewage to filter through the Parramatta soil as it took for it to filter through the Webb's Grant soil;—if that is the case, would not the filtering process at Parramatta be very slow? It would be very slow unless the soil were worked up and prepared as I propose to prepare it, at a cost of £84 an acre. When that amount of money has been expended upon it the sewage would probably percolate four times as fast as it can do now.

229. But the soil must have been pretty well broken up in the journey from Parramatta to Sydney, and in putting it into the filter? I do not know how Mr. Stayton did it.

230. Was not that a very good test of the filtering properties of the two soils? I should not lay too much stress upon a small test like that. It might lead you astray as to what would happen on a large scale. As a matter of fact, farms are made of that kind of soil and do well. The soil on the Adelaide farm is similar. Of course it would not be necessary to touch that 22 acres if it were thought that it would not make good soil, because it would not cost much more to reclaim 22 additional acres.

231. But the proposal is to reclaim 40 acres, and to use this 22 acres, and I take it that those who are responsible for this scheme say that the 22 acres will be quite as good as the reclaimed portion? There is not much importance to be attached to that if it can be shown that 22 more acres of land can be reclaimed, and that is undoubtedly the case.

232. Do you advise then that these 22 acres shall be abandoned? I should certainly try the soil first.

233. You would experiment with a small area, I suppose? With an acre or two.

234. You say that it will have to be treated;—in what way will it have to be treated? It must be ploughed,

C. N. Bell,
Esq.,
M.L.C.E.
8 Feb., 1894.

C. N. Bell,
Esq.,
M.I.C.E.
8 Feb., 1894.

- ploughed, cross-ploughed, and drained, either with tiled drains and faggots, or perhaps by making trenches down to the bottom clay, and filling up with sand. You must arrange these trenches to converge to a 9-inch drain pipe opening into the river. I provide for such a pipe in my estimate.
235. You have read Mr. Stayton's evidence, I suppose? Yes; I read all that evidence.
236. Mr. Stayton says on page 70, "The sewage of 800 persons per acre is too much, and is an utterly unknown amount, where purification by irrigation is desired." Will you kindly give the Committee your opinion upon that statement? The Rivers Pollution Committee in England, after taking a great deal of evidence, fixed the maximum at 2,000 per acre, I believe.
237. Was that where the sewage was purified by irrigation? Yes; or by other methods, such as downward filtration.
238. Mr. Hickson makes that statement in his report, but I want to know if you can tell the Committee of any place where purification by irrigation is carried on and more than 800 persons to the acre are served? I have no evidence of a population so dense as that being served, except in the instance of the Botany farm where the population is greater. At Christchurch an area of 42 acres receives a drainage of 30,000 people, which is about 720 to the acre.
239. Then, excepting Botany, which takes the drainage of 1,200 or 1,400 people per acre, Mr. Stayton's statement, so far as you know, is correct? Yes; I do not know of any place where there are quite so many as 800.
240. Then the circumstances are more favourable on Webb's grant than at Parramatta. At Botany they have not had to build up a filter-bed; they have pure sand there to an unlimited depth? They cannot go to a greater depth than the high-water mark, but I am not certain how high the surface of the land is above high-water mark. I do not think it is more than 5 or 6 feet.
241. When you visited Webb's grant, was the weather wet, or was it fine? It was fine, but it had been wet the previous week.
242. Did you elicit any information as to the effect of wet weather upon the farm? All I remember eliciting was that rainfall is admitted to the Botany sewers, and that when a storm comes they let the whole discharge into the river.
243. Is that not rather a primitive way of disposing of the sewage? Well, where you admit rainfall, and provide storm over-flows, it comes to the same thing. In London, and in most of the English towns, they admit a great deal of rain-water, and sometimes they have to let it overflow. Of course it ruins the sewage for farm purposes.
244. Does it not make the river rather objectionable? Yes; but after a heavy storm a river is charged with mud and silt in greatly enlarged volumes.
245. But not with excreta and all the filth of the town? That makes very little difference. The dirt off the roads in a big storm is, perhaps, quite as bad as sewage highly diluted with rain-water.

TUESDAY, 13 FEBRUARY, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.

The Hon. JAMES HOSKINS.

The Hon. FREDERICK THOMAS HUMPHERT.

The Hon. JOHN DAVIES, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

THOMAS THOMSON EWING, Esq.

WILLIAM CHANDOS WALL, Esq.

WILLIAM MCCOURT, Esq.

JOHN CASH NEILD, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES COLLINS, Esq.

HENRY DAWSON, Esq.

The Committee further considered the proposed Sewerage Works for Parramatta.

Charles Napier Bell, Esq., M.I.C.E., sworn, and further examined:—

C. N. Bell,
Esq.,
M.I.C.E.
13 Feb., 1894.

246. *Mr. Trickett.*] You stated last Thursday that you carried out the sewerage of Christchurch;—when was that work completed? It was commenced towards the end of 1876, and was finished about the end of 1882. I think 1882 was the year I left it.
247. And when was the Napier sewerage scheme carried out? In 1879, I think.
248. Have you had any practical experience in sanitation or sewerage works since that time? I have designed, investigated, and reported upon several sewerage works.
249. Where? In England? No; in New Zealand, at Christchurch, Napier, Westport, and Wellington. I was appointed consulting engineer for the corporation of Wellington in 1880 or 1881, to revise several schemes of drainage put before it.
250. Was your scheme of drainage carried out in Wellington? I did not propound any scheme. I had to look over a number of schemes proposed to the Council, which I did, and had them all rejected.
251. How long is it since you were in England? A long time. I left England to come out on the Public Works of New Zealand in 1871.
252. And you have not been there since? No.
253. In the report of the Board of which you were a member, upon the Parramatta Sewerage Scheme, you advocate the keeping out of all rain-waters from the sewers? Yes; especially as the sewage is to be pumped.
254. You say, "We would also advise the diversion of the rainfall." That means its total exclusion? The entire exclusion of the rain-water.
255. And you still think that it will be best to keep the rain-water out? I think so. I think that is the best policy in all schemes where the sewage has to be pumped. If not in every scheme.
256. Have you carefully considered the gradients which prevail at Parramatta? I have carefully looked over the gradients at Parramatta proposed for larger sewers, and I would recommend that they be not touched, even though the sewers are diminished in size.
257. You think those gradients amply sufficient for smaller sewers? Yes; for smaller sewers, because I have put in great lengths of similar pipes upon similar gradients, and after working ten years in Christchurch they are perfectly clean now.

258. Without any rain-water going into them? No rain-water is admitted; I may explain, however, that in certain places some of the subsoil water is purposely admitted in order to dry the ground, and some artesian water is admitted on payment of a fee. The people in Christchurch use artesian water to drive rams, and the discharge is permitted to go into the sewers on payment of a certain sum per annum. The artesian rams are so low that they cannot discharge at the surface, although they can discharge into the sewers. C. N. Bell, Esq., M.I.C.E. 13 Feb., 1894.
259. There would be no provision of that kind at Parramatta? That is not a provision.
260. But it is a means of flushing the sewers? It is a means of diluting the sewage, which is rather a harm than a benefit.
261. Then, am I to infer that the more solid the sewage the more easily it flows? Of course if the sewage is as thick as treacle it will not flow easily, but it never is so thick as that.
262. Can you explain to the Committee why it is a disadvantage to admit rain-water? Rain-water going into a sewer is a great disadvantage in the first place, because it increases the volume to be pumped; in the second place because it increases the size of the sewers which would be necessary to carry it, and in the third place because the less the quantity of sewage you have to deal with on the farm the better. One of the reasons why farmers object to taking sewage on their land is that it is so drenched with rain, and so thinned down, that it spoils their crops.
263. I am not seeking information on that part of the question,—I mean with regard to the flow of the sewage through the pipes. Is not a certain quantity of water necessary in order to cause the sewage to flow? The liquid condition of sewage is always sufficient. Sewage never goes beyond a certain degree of thickness, and within the limits to which sewage from houses is usually diluted, its liquidity does not affect the gradient.
264. Have you heard of any recent failure of the separate system in England? No; I have heard of no such failure. All I have heard is that several systems claiming to be better than the International system have now come forward.
265. Have you heard that the separate system has proved a great failure in Dorking, Surrey? No, I do not know anything about that.
266. Have you not heard that the pipes there have all had to be taken up, and that it has been necessary to resort to what is called the partially-separate system, because of the prevalence of fever? I do not see how that can be from the cause attributed. The sewers are most troublesome in the driest weather, and at such times they derive no assistance from the rainfall.
267. If it is a fact that the separate system in Dorking has had to be wholly reorganised, because of the collection of drainage in the pipes, and the escape of gases, should we not be very cautious in adopting a similar system at Parramatta? If that were the case, but I do not believe that that is the cause of it. They must either have been careless in flushing, or they must have been careless in looking after the sewers, which very often require looking after in some of these towns.
268. What care should they take? The sewers might have irregular gradients, or they might be obstructed with weeds. Very often roots of trees get in. Then too, they might have been carelessly or infrequently flushed, in which case they would become a serious nuisance. These evil consequences would occur, however, even if the rain-water were admitted, because if there is a three months drought, or rain falls but slightly during that period, all sewers are under the conditions of the totally separate system.
269. Is it not a matter of every day occurrence that the heavy rains which fall in Sydney and the suburbs are of great advantage in flushing out the sewers? Yes; because no other arrangements have been made in Sydney for flushing. If you have the separate system, you must flush the sewers systematically with the aid of your water supply.
270. You say that trouble may have arisen in Dorking, because of irregular grades in the pipe line;—will there not be irregular grades in the line we are now considering? I do not mean irregular grades of that kind. I referred to the irregular laying of the pipes, whereby the grades are interrupted by bumps or depressions. That often happens with carelessly-laid sewers, and in Christchurch we had some trouble through some of the pipes having been laid below the gradient line, and others above it, the sewage accumulating in ponds in such places. We had to adjust the pipes in several places.
271. In the report of the Board, you say that by the adoption of the separate system the cost of the Parramatta scheme would be reduced to 25 per cent.? Yes.
272. If the cost were reduced to that extent, I suppose a really new scheme, one totally different from that now before us, would have to be carried out? There would be no difference, except that the size of the pipes would be reduced.
273. That is a very material difference? But the work has not been commenced yet, so that the reduction in size would only have to be done on the plans, and would involve no loss of any kind.
274. The pipe lines would be exactly the same? Everything would be the same except the size of the pipes.
275. What difference in size would you advocate? With sewage only, the discharge would be about 833 gallons per minute; but if an inch of rain upon the roof surface, as contemplated in Mr. Hickson's report, were admitted, the discharge would be 1,500 gallons per minute, or very nearly twice as much; and the size of the sewers, although it would not require to be doubled, would have to be increased considerably to accommodate the increased volume of the sewage.
276. Can you tell us what sized pipes would be required for the separate system? There are a great many pipes of all sizes, every one of which would be reduced; but I asked the officers of the Department to get out the requisite sizes under the two conditions in question.
277. That is for the separate and partially separate systems? Yes; but they only gave me the results in money.
278. But could not you, as an engineer, give us the information? It is a very difficult thing to do without calculation and reference to the necessary tables; but in general I might say that a 12-inch pipe would be reduced to about 9 inches, and a 4-foot by 2-foot main sewer would be reduced to a 2-foot diameter main sewer.
279. What is the size of the main pipe towards the outlet? The largest sewer in the system is 4 feet by 2 feet 8 inches.
280. That is just before you come to the pumping-station? Yes, that is the largest sewer.
281. Could it be reduced by a foot? It would be reduced about 2 feet 6 inches, or 2 feet diameter. I could not tell you exactly off-hand what the reduction would be, but the pipes would be considerably reduced in size. 282.

C. N. Bell,
Esq.,
M.I.C.E.
13 Feb., 1894.

282. You are prepared to stake your professional reputation on the statement that a 2-foot pipe would be sufficient to carry off the sewage, if the separate system were adopted? Certainly. The number of the inhabitants being reckoned, and the quantity of water they receive given, that would be the size of the pipe and no other, because nothing else would go into it. It is only when you admit rain-water that the size of a pipe becomes ambiguous. Under Mr. Hickson's proposal 1 inch of rain on 200 square feet for every individual is provided for. In a family of five persons, that means the roof of a house 33 feet by 30 feet, and taken generally, the whole roof surface of the town. But if a town is fairly built over, its roof surface is about half of its area, excluding streets, parks, and open places, so that 1 inch of rain over half the area of the town is admitted to the sewers. But we have no means of keeping the quantity down to 1 inch. If a fall of 4 inches or 2½ inches occurred all the water would go into the sewers, and would have to overflow at places specially provided. When the sewage came to the pumps, it would be again overflowed until it was reduced to 1 inch over the whole roof area; but even then it would be drenched with water, and the effect would be that in rainy weather the farm would have to take, not only the rain falling upon it, together with the sewage, but five times as much from the roof area of the town.
283. *Chairman.* Besides throwing more work upon the pumps? No; no more work would have to be done by the pumps, because the sewage would be allowed to overflow until it was brought down to the specified quantity. Everything coming down in a heavy fall of rain would overflow into the river.
284. *Mr. Trickett.* That is what happens at Botany? Yes; I think, if I am not mistaken, when a heavy fall of rain occurs there, they let everything go into the river.
285. How often would you propose to flush the sewers under the separate system? In Christchurch, where the sewers are very flat, they are flushed, I think, three times a week.
286. Are they flatter than the proposed sewers will be? Yes; they are generally flatter than those. Christchurch is the flattest town I have ever heard of.
287. In addition to the flushing they have artesian water occasionally flowing through them? Many of the sewers take artesian and sub-soil waters; but a great many get none at all. All, however, are regularly flushed. When the sewers were completed they began to be a nuisance by creating foul smells at the man-holes, so I immediately put in flushing-tanks at the top ends of all of them, and arranged, by means of artesian wells, for keeping the tanks always full. Three times a week a man goes round, hauls up a chain, and discharges the contents of these tanks into the sewers. The water is caught by flushing-doors, and passed on from sewer to sewer, until the whole system is washed out.
288. Do you propose to adopt that system here? With the separate system you must flush the sewers, either automatically or by sending a man round. When a sewer is flushed automatically there is generally a tank which receives water from the water supply until it becomes full, when it overturns and discharges its contents into the pipes, and then falls back again. There are several automatic flushing systems.
289. Would the flushing add to the expense of the system? No; there is not much expense connected with it. All the sewers in the scheme are provided with man-holes.
290. Where there is a water supply, flushing is a simple and inexpensive matter? Yes. Without a water supply you could not attempt to carry out the separate system; but Parramatta has a water supply which is amply sufficient for the purpose of flushing.
291. Notwithstanding the fact that Mr. Hickson recommends the partially separate system, you adhere to the separate system? I do.
292. And you are convinced that it would be a success? Yes. With your permission, I will read a few remarks made by the Hon. W. F. Taylor, M.D., M.L.C., at a meeting of the Royal Society in, I think, 1892. He mentioned the system of sewerage introduced at Memphis, on the Mississippi, U.S.A., "as the best illustration of the separate system, differing from ordinary usage in the following particulars—storm and surface water rigorously excluded from the sewers, pipes to be so small as to be never less than half-full of sewage, automatic flushing tanks of 120 to 150 gallons at top end of each line of pipes. Has been in operation for four years with perfect satisfaction. Memphis is a town of 50,000 people. The drainage is for foul water and sewage only; drains are 6 feet deep; average house pipes are 4 inches diameter, and sewers are 8, 10, 12 and 15 inches diameter. By adopting the separate system, and excluding the rain, a saving had been effected of £280,000 in the drainage of Memphis."
293. *Mr. McCourt.* Before or after your appointment to the Board, did you consult Mr. Hickson or any of his officers on the scheme? Mr. Hickson submitted all his reports to us.
294. Did you consult him or any officer of his Department personally on the subject? Consult them—in what way?
295. Did you get information from them by questioning them in any way? I got a great deal of information from them as to the cost of their system, and as to the reduction of cost which would follow a reduction in the size of the pipes, and the annual cost of running the system, and a lot of information of that kind.
296. Did you get any information from them as to the efficiency of this scheme? They have no information to give as to the efficiency, because it has not yet been carried out.
297. Had you any conversation with Mr. Hickson before you were appointed to the Board—how did you come to be appointed to the Board? Mr. Hickson told me that he would like to get my evidence on a subject that was in dispute about the sewerage of Parramatta.
298. Did you go to Mr. Hickson, or did Mr. Hickson look you up? I did not go to him. He told me that he would like to get my evidence on the subject. Then I went away to Melbourne.
299. Did you talk the matter over when he told you this? No doubt. I would talk it over with any person with whom I could interchange ideas on the subject.
300. Did you talk the matter over with Mr. Stayton? No; I never saw Mr. Stayton. I should have done so if I had known him.
301. Did you read his evidence? Yes.
302. Did you not think that his evidence on the subject was rather important? I did not agree with his evidence.
303. Therefore, you did not think it worth while to examine him, or to talk with him on the subject? I do not know Mr. Stayton. I do not think he was here when I was here first.
304. As a member of the Board, were you not empowered to take evidence if you thought it necessary? We gave our reasons for not taking evidence.
305. But were you not empowered to take evidence? Yes; we were.

306. You did not think it worth while to examine Mr. Stayton? No; because there was ample evidence in the documents put before us. Everything that could be said had been said.

307. Though you disagreed with Mr. Stayton, you did not think it necessary to question him? I presume that, whether questioned or not, he would not alter what he had said in his reports.

308. You did not think it necessary to question him? We did not think it necessary to go outside the documents furnished to us.

309. Yet you consulted Mr. Hickson? I talked with him as a friend, because I have known him a long time; but I did not consult anyone but myself.

310. But you talked the matter over with him? Yes.

311. *Mr. Wall.*] Have you calculated the quantity of filling in which the sewage farm will require? No.

312. Have you made an estimate, apart from the documents, as to the cost of the whole work? I took the cost as given to me by the Department. I had no means of working it out myself. The Department possess all the plans, and the necessary knowledge of prices.

313. Would not the sewage be more likely to create a nuisance if discharged in a crude way upon the farm, than if an intermediate system were adopted? No; because the land cleanses and purifies the sewage. The stronger the sewage the more fitted it is for the cultivation of the farm.

314. Have you any knowledge of the International system of disposing of sewage? Only from reading about it.

315. You have made some reference to the ferozone system;—have you considered the advisability of having an intermediate station between Parramatta and the sewage farm for the purpose of purifying the sewage? Before putting it on the land?

316. Yes? I consider that it would lead to entirely unnecessary expense. There are better means of purifying it than that.

317. What way would you suggest? There is one arrangement which is not required for purifying the sewage, but simply for removing the sludge from the land, and that is the employment of settling tanks. In Christchurch the sewage is passed through settling tanks, and some portion of it is settled out before it is put on to the land. That is not done at Botany, and it is a question whether it is worth while to do it at all. I did it in New Zealand, so that the surface of grass land might not be encrusted with the scum of dry sludge which is often found on these farms, causing the land to require more frequent ploughing than is required, if you separate most of the sludge out first.

318. You have seen Mr. Hickson's reply to the report of the Parliamentary Standing Committee on Public Works? Yes; I have read it.

319. In the third paragraph of that document he says:—"With reference to the question of the relative advantages of chemical precipitation and land filtration, I can, without hesitation, say that at the present time no sanitary engineer of eminence in Europe or America will be found who will give unqualified preference to the former";—Does not that infer that the system of filtration or precipitation is looked upon favourably by most of the eminent engineers of America and Europe? From my experience, gathered by reading during many years past of all that has appeared in works on sewage, I have come to the conclusion that most of the eminent authorities of Europe would only resort to precipitation works where land was not to be had at all, or where it was very dear. Wherever land can be had, they unanimously recommend the farm system.

320. The only reason for employing the precipitation system is the insufficiency of land for the disposal of the sewage? I believe that is the only reason. There is no advantage in adopting the precipitation system if land can be obtained at all reasonably.

321. You think the area of land reserved at Parramatta will be sufficient to satisfactorily dispose of the whole of the sewage there? In Santo Crimp's work on sewage, that very eminent English authority speaks as to the quantity of land required for dealing with certain quantities of sewage, and also the quality of the land and the depth of drainage. In considering the Parramatta scheme, I have put the volume of sewage per day at 800,000 gallons. Now Santo Crimp says that 22 acres of land would be sufficient for dealing with that quantity of sewage if the land were free and sandy, and available to the depth of 4 feet. If it were available for a depth of 5 feet he says that 16 acres would be sufficient. However, taking the mean, because it is just a question whether you have 4 or 5 feet of subsoil, free from water in the proposed embankment, we arrive at 18 acres, which according to Santo Crimp would be sufficient.

322. Did I understand you to say in a previous part of your examination that the disposal of sewage was brought about more by oxidation than by filtration? The sewage is filtered and micro-organisms consume its impurities. These micro-organisms grow with immense vitality where the impurities are supplied to them.

323. But I think you said that their operations did not extend more than 6 inches below the surface? They extend as far as the air penetrates. If the sewage is put on intermittently, the air will go 2, 3, and 4 feet below the surface; while, if it is continually being supplied in great quantities, the air cannot get down at all, and the land consequently fails to purify the sewage.

324. *Mr. Neild.*] In the estimate which you gave the other day you put down £84 per acre for the preparation of the 22 acres of clayey ground;—that is a little more than double the estimate of the Department? The departmental estimate applies to the embankment of which there are 44 acres.

325. Is there no departmental estimate of the cost of preparing the clayey ground? I think it must all have been included in the estimate of £40 an acre. You will observe that the report of Messrs. Wardell, Chamier, and myself, states that the 40 acres to be reclaimed will be sufficient; therefore, it is not necessary to take this other land into consideration.

326. Not immediately necessary? I hold that it never will be necessary.

327. If it will never be necessary to use more than 40 acres of land, why have you taken into consideration the desirability of extending the farm to the extent of more than 100 acres? I do not think it will ever be necessary to take in the 22 acres, which will cost £84 an acre to prepare, because double that area could be made by means of an additional embankment.

328. If, at some future time, the 42 acres of embankment are found to be insufficient, you would recommend the reclamation of more land rather than the preparation of the 22 acres of clay land in the manner indicated by you? Yes, that would be preferable, if you could get the work done under the same conditions.

329. You practically suggest that the Committee should put the 22 acres out of consideration altogether, and deal only with the 42 acres? I do not think you would require to touch the 22 acres. It would be preferable to reclaim 22 acres of low land and build it up with sand.

C. N. Bell,
Esq.,
M.I.C.E.

13 Feb., 1894.

- C. N. Bell,
Esq.,
M.I.C.E.
13 Feb., 1894.
330. In your estimates of improving the clayey land, why do you propose to use 2-inch tiled drain-pipes instead of the 4 inch diameter agricultural pipes suggested by the Department? It is only a question of how far apart the pipes are to be placed. In my estimate I assume that the pipes will be very close together. I provide for the trenching of the clay land to a depth of 3 feet, the trenches to be filled up with sand, the 2-inch pipes having been placed at the bottom of them.
331. Instead of using 4-inch drain-pipes you propose to place 2-inch tiled drain-pipes at the bottom of the drains, putting ti-tree fascine bundles on the top of them, and sand upon the ti-tree? Yes; that provides for the thorough drainage of the land.
332. How far apart do you propose to put the drains? I have not kept my notes, and it would be a laborious thing to take it out by the cubic yard. I think, however, that they would be half a chain apart.
333. A little lower down you provide for ploughing the ground 18 inches deep, at a cost of £1 8s. an acre;—do you think it would be possible to do the work for that? Yes; they are doing it for less than £1 8s. an acre at Werribee, near Melbourne. I received a note from the engineer, Mr. Thwaites, telling me what the work cost there.
334. At £84 an acre the cost of preparing 22 acres would be £1,848, which would be very much in excess of the departmental estimate, taking the cost all round at £40 an acre? I do not know what they allowed for the preparation of the embanked land. That work would be done very easily. I presume that the £40 an acre is for the work all round.
335. You ascertained the departmental estimate for part of the work, not for the whole? They have taken an estimate for the whole.
336. But there must be a vast difference between the cost of preparing sandy soil and the cost of preparing this heavy clay land? I think it would be more than double.
337. Are you acquainted with Santo Crimp's work on the "Disposal of Sewage?" Yes; I have read it pretty well through.
338. In a table which bears the signature of the engineer, who is the borough surveyor for the Leicester corporation, this entry appears: "The remaining one-third being marly, a portion of it being stiff clay, and practically useless;"—are not those pretty nearly the conditions of the land at Parramatta? Pardon me, it is not stiff clay.
339. How do you describe it? As far as I remember, there are 10 inches of grayish black soil *humus* on top. Below that for 2 feet there is a weathered earthy clay; then you come to stiff ferruginous clay.
340. Is there not a considerable amount of pipe-clay on the soil? Three feet below the surface there is.
241. Does not your estimate of the cost of preparation show that the soil must be very stiff clay, and, to use the words I have just quoted, practically useless? It does not show that it is stiff clay, or that it is useless when prepared at the cost stated.
342. But you think it would be cheaper and more efficacious for the Government to reclaim land, filling it up with sand, than to utilise the 22 acres? I think it would be better to reclaim land, but I do not know that it would be cheaper. That would depend upon whether the Harbours and Rivers Department would do the work. If the Sewerage Department had to reclaim the land it would be very much dearer.
343. I think you stated that the land at the Christchurch sewage farm is sandy? Sand above, and sandy loam below.
344. I do not think you have told the Committee where the effluent discharges? It discharges into the Heathcote lagoon, which has an area of about 1,200 acres.
345. Is the water fresh or salt? It is salt.
346. Has the sea access to it? Yes; small ships enter the lagoon.
347. Does the water ever become impure? It is changed every tide. The tide rises from 6 to 8 feet.
348. Do you think the narrow and shallow channel of the Parramatta River opposite the site of the proposed farm is under no risk of being contaminated by the soakage from the sewage? My own personal experience, and the evidence which I have obtained by reading, must be of no earthly value if there is any risk of contamination. The supposition is that the effluent of the sewage farm is sufficiently pure to be allowed into the river.
349. Have you estimated the annual cost of the proposed farm to the ratepayers over and above its earnings? I got a statement of the cost of the system made out. I make out the annual cost of the farm to be £1,292, and the interest on the capital expended £1,755.
350. Does that include pumping? The total £3,047 includes everything. It is made up of the following items:—

Coal, 158 tons at 20s.	£158	0	0
Wages, engine driver and fireman	156	0	0
Oil and waste...	20	0	0
Repairs and renewals	150	0	0
Expenses of the farm	500	0	0
2 Flushers	208	0	0
Contingencies	100	0	0
Total	£1,292	0	0

351. You make no allowance for the cost of water for flushing purposes? No; there is nothing down for the cost of water.
352. Does this estimate apply to the 42 acres or to the 66 acres? It is meant to apply to the 42 acres.
353. You put the 22 acres of clay out of consideration? I put it on one side as probably not required.
354. How is it that you estimate the working expenses of the sewage system for Parramatta, where the population is only 12,000, at £1,292, when, according to the evidence you gave last day, the cost of a similar system for Christchurch, with a population of 30,000, is only £700 or £800 a year? I do not know, unless it be that the cost of the farm at Parramatta is too high. The Christchurch farm costs very little. In referring to the Christchurch scheme, however, I was only speaking from memory.
355. *Chairman.*] I suppose you have not put the produce of the Christchurch farm as a set-off against the actual cost? I am under the impression that that system costs between £700 and £800 a year, but I have no documentary evidence to prove it at the present time.
356. *Mr. Neild.*] I presume that at Christchurch no land had to be built up? No; but we had to shovel down the sand-hills with horse shovels.

C. N. Bell,
Esq.,
M.I.C.E.

13 Feb., 1894.

357. That would be cheaper? Much cheaper.

358. You had not to pay £16,000 for the land? We paid nothing for the land.

359. You would strongly advocate sand as superior to every other material for filtration purposes? Yes.

360. At page 108 of his work on the "Disposal of Sewage," Mr. Santo Crimp says: "In the report of the Rivers Pollution Commissioners, 1870, it is stated that 'whilst one cubic yard of sand or Hambrook soil cannot continuously and satisfactorily purify more than 4.4 gallons of London sewerage for twenty-four hours, one cubic yard of Beddington soil can cleanse 7.6 gallons, and one cubic yard of Dursley soil no less than 9.9 gallons in twenty-four hours.'" According to that statement it would appear that Dursley soil is capable of absorbing and purifying more than twice the quantity of sewage that sand can deal with;—have you any information as to what the Dursley soil is? You will probably find that there is a gradation there from fine to coarse sand, with fine gravel and gravel below. When that happens the facilities for draining are wonderfully increased.

361. Let me draw your attention to the statement of Dr. Lissaur, who says, "Dry loamy soil absorbs more than peaty soil, and gives up less, whilst dry sandy soil, on the contrary, absorbs less and gives up more." That does not support the contention that sand is the best filter? Probably neither of us understands what he means by "absorbing." Sand cannot absorb anything in its texture, because it is composed of crystals or quartz, whereas soil or earth will absorb through and through.

362. Under the heading "Absorptive power of the soil," Dr. Lissaur gives the results of fifty-one experiments? If you take a cubic foot of dry earth, and pour a gallon of water upon it, it will probably retain all the water like a sponge, having absorbed it; but if you do the same thing with a cubic foot of sand the whole of the water will drain away, and in ten minutes or so the sand will be perfectly dry. The sand strains and purifies the water, while the soil absorbs and upholds it.

363. On that account you consider that sand is best for sewage farms? I agree with the authorities who have written on the subject, and who say that sand is by far the best. I have only had experience of sand.

364. Do you think that drains should be laid down in the 42 acres, or will there be sufficient drainage without them? I think the drains should be put in to divide the land, and let all the water run into the river.

365. What kind of drains would you recommend—anything like those you recommend for the clayey land? I would put in 4-inch drains, leading in the direction of the Duck River, crossed, if necessary, by 2-inch tiled drains.

366. At what distance apart? In sand, I suppose, you would put them one chain apart, but I would not speak positively on that subject.

367. Do you think that £40 per acre would cover the cost of these drains? I think so. The cost would not come to a very large amount.

368. *Mr. Dawson.*] Are the figures which you have given us to-day your own, or were they supplied to you by the Department? I requested the Department to get out estimates of the cost of the two systems, the manufacturing International system, and the farm system.

369. Then you cannot personally vouch for the correctness of the figures? There are no better authorities than the officers of the Department for such estimates.

370. The estimates may be absolutely correct, but you cannot vouch for their correctness? No.

371. *Mr. Hoskins.*] Were you in charge of the sewage farm at Christchurch? No; I was in charge of the construction of the sewers. I laid out the scheme.

372. For how long did you reside near the sewage farm after its completion;—could you observe its working? I have lived in or about Christchurch from the day the scheme was completed until now, but I severed my connection with the scheme directly it was completed.

373. The farm has given satisfaction to those entrusted with its management? Great satisfaction.

374. The temperature at Christchurch in summer is much higher than the temperature of Sydney or Australia generally? There are many days in summer when the heat in Christchurch is as great or greater than it is here, but that does not often occur.

375. On the average, the summer temperature is not so high there as it is here? No; it is lower.

376. Therefore, the exhalation from the sewage farm (if any) would be less intense than it would be in a place such as Sydney, where the heat was greater? If the exhalation is due to the sun's heat, and of that I am not sure,—of course, the hotter the day the greater the exhalation.

377. *Mr. Ewing.*] With regard to the danger of sewage farms, do you think it is greater in a warm climate than in a cold climate;—have you any information on the subject? I do not see why it should be greater in a warm climate, seeing that the sewage is supposed to be purified by the growth of vegetation, which is stronger in a warm country than in a cold country. In countries where frosts are very prevalent, and the ground is frozen for part of the year, sewage farms are exceedingly difficult to manage; but in a country such as this, where there is practically no frost, and the vegetation is not even checked in winter, there is no difficulty. Here there is as great a growth in winter almost as in summer.

378. Vegetation is the great purifying medium? Yes.

379. Would you have a very luxuriant growth upon sand? I never saw red clover, rye grass, turnips, and mangolds grow so luxuriantly elsewhere as they do upon the Christchurch sewage farm.

380. And you think that in a warm climate, such a farm would be more successful than in a cold climate? Yes.

George Chamier, Esq., M.I.C.E., sworn, and examined:—

381. *Chairman.*] What is your profession? I am a civil engineer.

382. Are you a full member of the Institute of Civil Engineers? Yes.

383. Will you kindly give the Committee a brief outline of your professional history;—will you tell us where you served your articles and so on? I was articled to Mr. W. T. Doyne, a distinguished member of the Institution, and was first engaged on railway construction in Tasmania. I was engaged on the first railway constructed there. Afterwards I served in the Victorian Water Supply Department for 4 years, and was then connected as contractor's engineer with several important railways in Victoria and South Australia. I afterwards practised in Adelaide for 7 years.

384. Were you in the Government service during any of the time that you were engaged in railway construction in South Australia and Victoria? No; I was engaged either in private practice or as

G. Chamier

G. Chamier,
Esq.,
M.I.O.E.
13 Feb., 1894.

contractor's engineer. I have given the subject of sanitary engineering a great deal of consideration for many years past, and when in Adelaide I was appointed by the Government a member of the Commission to investigate and decide as to the best site for a sewage farm there. I afterwards had opportunities of seeing the whole of the Adelaide sewerage works carried out, so that I am well acquainted with the scheme.

385. The Adelaide sewerage scheme is the only work of the kind with which you have been directly connected? Yes.

386. How long have you been practising your profession in Sydney? Three and a half years.

387. You, in conjunction with Messrs. Napier Bell, and Wardell, were commissioned by the Government to report upon the proposed Parramatta sewerage scheme? Yes.

388. The finding of the Board as set forth in your report dated the 28th July, 1893, was that the separate system is preferable to the partially separate system? Yes.

389. Were the members of the Board unanimous in regard to the decisions stated in the report? Perfectly. On this point we had no difference of opinion whatever.

390. *Mr. Humphery.*] Did you make any estimate of the cost of the work, or did you take the figures supplied to you by the Department? We took the figures supplied to us by the Department, and we checked them in a general way by our knowledge of the cost of similar works. We did not go minutely into the cost of any particular item.

391. Did you and Mr. Bell compare notes before preparing the report, so as to agree upon all the main features of the system? We did.

392. Had you any differences at all with regard to the carrying out of the proposed scheme, or may the report be said to represent your ideas as well as Mr. Bell's? My opinion is that we have rather underestimated than over-estimated the saving that could be effected; but I am satisfied that in a general way the figures we gave are approximately correct. I did not go minutely into details, because that would have involved the taking out of quantities and a careful calculation, which we had neither time nor the opportunity to make. We simply had certain data supplied to us upon which we came to a general conclusion.

393. Have you ever been engaged on any sewerage works? Not professionally in designing them, except small works, but I was constantly on the works in Adelaide.

394. But you have never designed or carried out any sewerage scheme? No, though I have acted as consulting engineer for contractors who were carrying out different sewerage works.

395. Could you mention any sewerage farm concerning which you can give your own personal experience of the system carried out and the cost? I could give my experience of the Adelaide scheme, because I was employed by the Government to make an investigation into the site, and I saw the whole of the works from first to last. I was an intimate friend of Mr. Oswald Brown, and accompanied him frequently all over the ground, seeing as much as if I had been professionally engaged on the work.

396. Is this scheme identical with the Adelaide scheme? As regards the sewage farm it is.

397. What about the area in proportion to the population? Judging by the Adelaide standard the area is more than sufficient in proportion to the population.

398. Are the conditions in any way similar? The Parramatta scheme is rather the better of the two, because it has better drainage.

399. What about the nature of the soil? The soil at Parramatta is equally good. In Adelaide there is a light loamy soil, but I consider that the sandy material they have at Parramatta would answer quite as well.

400. Was it found necessary to raise the Adelaide farm by means of silt or sand? No; there was ample fall. The ground was sufficiently high to allow a good outfall.

401. Is the natural soil used? Yes; it was not altered in any way. It is a light loamy soil.

402. You know that it is proposed to put 5 feet or more of silt upon the land at Parramatta? Yes; I have seen the material that they propose to put on the land there.

403. Are you of opinion that it is suitable for the purpose for which it is intended? I think so. The published results of a great many experiments lately made in America go to prove that it is eminently suited for the purpose.

404. Silt? Silt next to sharp sand is the best soil for filtration purposes. River silt gave some of the best results in the experiments to which I refer.

405. Are you quite of opinion that there would be nothing offensive on the farm to justify an objection from an adjacent borough? Under proper management there would not be, but the farm would have to be carefully attended to.

406. Can you say what special management would be necessary? Well, the ground must be kept well open. In Adelaide, where the sewage has sometimes been turned upon portions of the farm which have not been properly looked after, and were overgrown with vegetables and grass, it would not percolate readily, and gave rise to offensive smells, but whenever due attention was given to the land the nuisance was removed.

407. Any neglect would be attended by a nuisance? Any neglect might cause a nuisance.

408. But with proper attention there need be no nuisance whatever from a sewage farm of the kind contemplated in this proposal? No; I have frequently been over the Adelaide farm in the hottest weather, and have noticed no smell. A stranger walking over the ground would not have known that it was a sewage farm.

409. *Mr. O'Sullivan.*] Have you read Mr. Stayton's objections to this proposal? I have read his report.

410. You think the suggestions made now would overcome those objections? I know of no objection which could be taken under proper management. All the nuisances which have arisen from these farms have been caused by some imperfection in the management, or in the preparation of the soil, or in the ventilation of the sewers, or something of that kind, and could be remedied with proper care.

411. I gather from your evidence that if these works are properly carried out and the farm attended to, it will not be objectionable, on account of the close proximity of population? I feel convinced, from what I have seen elsewhere, that it would not be objectionable.

412. In Adelaide is their population as close to the sewage farm as it would be at Granville and Parramatta? There are a good many houses within, I should think, a mile of the farm, but I should think that the centre of the city is about 3 miles distant.

413. *Mr. Davies.*] What is the area of the South Australian sewage farm? I could not tell you from memory, but a good deal more land was bought than is at present utilised.
414. Have you any idea as to how much land is used? The area is constantly varying, because they keep throwing open new fields as the requirements of the population increase. I think when I was there they had about 60 acres, more or less, under cultivation, but some of it was used simply as fields for pasturing cattle. Other portions of it were taken up with the growing of vegetables, and a small patch was used for what they call a filter-bed. When the bulk of the farm does not require any water, the sewage is turned on to the filtering-ground to be purified. A very small patch of ground will answer for the purpose of filtration.
415. As the beds become charged they increase the area? Yes; they keep on gradually opening up the ground. I could not tell you exactly how much has been opened up.
416. What quantity of sewage is daily delivered on the farm? Of that I can hardly speak from memory. It varies a good deal. I think that they reckoned it at about 30 to 40 gallons per head of the population. Every year they extend the system by taking in new suburbs. Since I left Adelaide they have connected fresh suburbs with the town, so that there is no fixture about the area of the farm.
417. One of the chief reasons for increasing the size of the farm is, that the land is so charged with sewage that it becomes necessary to open fresh land? The reason that they have extended the area under cultivation is that the sewage system has been extended.
418. Is it not necessary to make provision for opening up fresh ground by reason of the fact that the land under occupation becomes so charged with sewage? No. A certain area of land would meet the requirements of a certain population. Land does not get so charged with sewage as to make it necessary to break open fresh ground. The reason why they keep increasing the area at Adelaide is, that they are constantly extending the system by taking in new suburbs.
419. You cannot tell us the quantity of sewage delivered on to the farm, nor the area of the farm, although you had so much to do with it? I was a member of the Commission appointed to select the best site, but that is fifteen years ago.
420. What was the area first taken up? To the best of my memory, provision was made for 600 head of population to the acre, but I cannot tell you the precise acreage taken up, or what was looked forward to as the ultimate number of inhabitants. I think the area was within 200 acres.
421. And it has been vastly added to since? No, I do not think it has been added to. The area under cultivation has been increased. I am not aware that the Government have purchased any more land.
422. Do you tell the Committee that to cast crude sewage upon land, as it is proposed to do at Parramatta, is the best means of dealing with it? To my mind it is, undoubtedly, and I think nearly all the leading authorities on sanitary engineering agree on that point.
423. Can you cite any one such authority? Their number is legion. If you read the discussion that took place upon the Berlin sewerage scheme, at which many of the distinguished engineers of England were present, you will find that an almost unanimous opinion was expressed in favour of that system.
424. In favour of irrigating farms with sewage? Yes.
425. Under certain conditions? Yes—when the land is suitable and near to the town.
426. Do you regard the land at Parramatta as suitable? I think that it is very suitable. It is not far from the town, and it is remarkably well drained. The site is not built over or surrounded with homesteads.
427. Are you of opinion that there would be no disagreeable smell from the sewage if treated in the way proposed? Not under proper management; but any neglect of ordinary precautions would, undoubtedly, create a nuisance. I speak from my experience at the Adelaide farm, where, on certain occasions, very bad smells were produced.
428. Do I understand you to say that the casting of crude sewage upon the soil will not create a nuisance to people residing within a reasonable distance? The sewage thrown upon the soil simply looks like dirty water.
429. But what about the solid matter? There is very little solid matter. You could hardly distinguish the sewage from slightly discoloured water.
430. What becomes of the sludge and faecal matter? It nearly all becomes diluted. I have stood over the channel which carries the sewage of Adelaide, and you could simply describe it as slightly discoloured water. Occasionally there was a mawkish effluvium arising from it, but it was not nearly so dirty as ordinary gutter-water.
431. I would like to know how the solid matter becomes so diluted;—does it undergo an extraordinary change when passing through the conduit? The solid matter dissolves, and the bulk of water in comparison with the solids is so great that they do very little more than discolour it.
432. But you recommend a separate system? Yes; that is, the system in use in Adelaide. There we sometimes get four or five months without rain, so that it would have to depend solely upon the water supply.
433. If the separate system is adopted, there will be very little liquid matter passing through the sewers—it will nearly all be solid matter? No; it is reckoned that about 40 gallons of water per head of the population will go into the sewers, while the solids would represent a very small proportion of the total sewage.
434. Am I to understand that the solid matter, in its transit to the farm, becomes so diluted that it will pass on to the farm in liquid form without any treatment at all? Yes.
435. Have you been to the sewage farm at Botany? Yes.
436. Did you see the sewage matter distributed there? Yes.
437. Was it in liquid form? It was very much the same as in Adelaide.
438. Was there not a great deal of solid matter? Very little. When I was there the sewage was not offensive; it was only slightly discoloured.
439. You did not see solid matter spread upon the beds there? No, I did not, except a small quantity of sludge for distributing over the farm.
440. Did you not see solid matter in the shed where the sewage discharges itself into the conduit before going on to the farm? There was a little sludge, also a lot of paper and a few dead cats and things like those which occasionally come down the sewers. There is very little solid matter compared with the volume of fluid.
441. You say that the same treatment is in vogue in Adelaide? Yes.
442. When did you see the Adelaide sewage farm last? Between four and five years ago.
443. Are you aware that a great number of complaints have been made against the treatment of sewage there? Yes, I have heard the complaints.

G. Chamier,
Esq.,
M.I.C.E.
18 Feb., 1894.

G. Chamier,
Esq.,
M.L.C.E.

13 Feb., 1894.

444. Do you know that at the present time a great many complaints are made by citizens and people residing within easy distance of the farm? A considerable number of complaints were made when I was there, and I had occasion to visit the farm at the time, but I always found that the nuisance arose from want of attention to certain details. When these details were attended to the nuisance was abated.

445. What was the cause of the nuisance? Water was allowed to lie in stagnant pools upon ground which had not been prepared to receive it. I have seen water lying in pools upon parts of the farm which were overgrown with grass and vegetable matter, and festering in the sun, causing a very objectionable smell.

446. The ground becomes so charged with sewage matter that it will not take more? It is not so much that as that the surface of the ground had not been prepared and broken up. The pores of the ground must be kept open, so to speak. If you neglect to take that precaution and allow the soil to be overgrown with vegetables, it will not absorb so readily.

447. Do they grow vegetables there? Yes; Mr. Brown used to supply his table liberally with them, and he maintained that they were the best in Adelaide. At one time there were a number of cows depastured there; but they got up a popular cry against them. They also got up a popular cry against the vegetables.

448. The authorities are not allowed to sell any? No; there has been a tendency on the part of the public to decry the farm, and to object to its being turned to account.

449. Have not local medical men denounced the selling of the milk of cattle grazing upon the farm? There was an outcry against such milk being sold, but it was never proved that any harm arose from the use of the milk.

450. Was it not alleged by some medical men that typhoid and other diseases had been traced to the consumption of the milk of cows depastured upon the farm? That statement was entirely disproved, and I never heard it brought forward by medical men of any consequence.

451. But there was a strong feeling against selling the milk? Yes; but it arose because of what was considered the undue competition which the farm exercised against private growers. The milkmen were in arms against it.

452. Do I understand that you regard the proposal before the Committee as the best means of treating the sewage of Parramatta? I do.

453. *Mr. Hoskins.*] You stated just now that the general consensus of opinion all over the world was that it is best to dispose of sewage by discharging it on to sewage farms;—are you aware that the sewage of London is emptied into the Thames below Barking? Yes; but there are difficulties in the way of dealing with the sewage of London upon a sewage farm.

454. What are they? There is no available land to be had at a price that could be paid for it, while the bulk of the sewage is so enormous that engineers are doubtful how they could apply such a system under the circumstances. The matter has been frequently discussed, and the engineers who carried out the sewerage of London admitted that they would have preferred to adopt the sewage farm system, if it had been practicable.

455. Who are the engineers who admitted that? I could not give you the names, but you will find them in the Institute papers. They have made the admission in the discussions that are reported there.

456. Are the Committee to understand that you have not had any experience in the laying out or management of sewage farms, but that your observations are the result of what you have seen in Adelaide? That is all.

457. Can you say if the Adelaide sewage farm is worked at a profit? When I was there last they told me that it paid expenses.

458. But I gather from what you said that complaints are frequently made about the effluvia arising from it? They were made when I was there.

459. Have you been to the site of the proposed farm at Parramatta? Yes.

460. The surface soil of the Adelaide farm is loamy? A light loamy soil.

461. Have you tested the character of the soil which you met with at Parramatta? I was shown the stuff that they propose to put on the land there, but I have not tested it for sewerage purposes. I know, however, that similar material has been found to work satisfactorily elsewhere.

462. What is the material? It is mostly what you would call river-silt.

463. The land at Parramatta? No; the stuff they propose to put on it.

464. I asked you had you tested the soil at Parramatta? We saw a number of shafts sunk into it at different places.

465. Did you not notice that close to the surface the soil was clayey, and almost impervious to water? No; on the higher ground there is a sub-stratum of clay about 18 inches below the surface.

466. To ensure a reasonable prospect of there being no complaints about the farm, would it not be necessary to put a quantity of other material upon the land? No, because the surface soil could be made to answer, except as regards its level. It wants raising.

467. But it would answer without anything being put upon it? It could be made to answer as far as the soil is concerned.

468. The soil being clay? The soil I saw was not clay. The clay occurs at some distance from the surface.

469. Is it not a fact that there is a good deal of clay and pipeclay upon the surface? Not upon the surface.

470. Close to the surface? There is enough soil on the top of the clay to meet the requirements of a sewage farm.

471. I gather from what you say that there is no necessity for putting 4 or 5 feet of sand upon the land? That is necessary in order to raise its level. It is too low at present.

472. But the land could be drained as it is? I think not. A great portion of it seems but slightly raised above high-water-mark.

473. But still it could be drained? It might be drained.

474. I take it, that in your opinion, it is unnecessary to put 4 or 5 feet of sand on to the land? A portion of the land is too low to answer well as it is. I am not positive as to the levels, but judging from appearances, it is very little above high-water-mark.

475. Am I to infer from your answers that you consider the land suitable to absorb sewage without anything

anything being put upon it? Yes; as far as the character of the soil goes. It is only a question of levels. G. Chamier,
Esq.,
M.I.C.E.

476. *Mr. Trickett.*] Is the Adelaide system the separate or the partially separate system? It was intended to be the separate system, but a small quantity of rain water has to be admitted. They admit the water from back yards, for instance, and a portion of the water from roofs. 13 Feb., 1894.

477. Are the drains flushed? Yes.

478. How often? I could not tell exactly. I suppose that depends upon the inspectors. They have regular times for flushing, because they cannot rely upon the rainfall at all.

479. Is there an arrangement for flushing it by means of tanks? They turn on water under high pressure from the main.

480. Do you know what the expenses of the system are per annum? I could not tell you precisely, but the system is considered to have answered very well, and has met all reasonable expectations.

481. Do you know of any place where a sewage farm has been established on land adjoining tidal waters? I could not mention any particular locality right off.

482. Is there such a place? Yes; there are numerous places of the kind, because the system has been adopted almost universally now, both in America and in Europe.

483. On the banks of rivers? Everywhere; but generally near the sea-side, it is found cheapest to take the sewage bodily out to sea. The cheapest process of all is to discharge it direct into the sea, but that can only be done where the circumstances are favourable.

484. Would not that be the best system here to have the sewage precipitated and then run into the river? No; I think not.

485. Why not? The precipitation system is an expensive one, and never answers as well as the soil, which does the same work more cheaply and more effectually than any artificial system that can be devised.

486. There would have to be a pumping station to raise the sewage;—would not that be one of the large items of expense in the precipitation system? Having pumped the sewage up you must dispose of it, and I maintain that the simplest and most effective way of purifying it is to run it on to the ground.

487. Do you know of any instance where a sewage farm has been, so to speak, built up by silt and stuff dredged from below salt water? I could not at this moment give any instance from memory.

488. You could not, I suppose, give any opinion as to the quality of the soil for the purpose of a sewage farm? I am confident that the soil is suitable. Extensive experiments have been made in Massachusetts, U.S.A., in which various soils were treated, and river silt was found to be one of those which gave the best results.

489. Can you call to mind any case in England or elsewhere where the separate system has been a failure recently? No, I have never seen it stated that the separate system has been a failure; on the contrary, at the present day, it is being adopted for the largest schemes. In Berlin, where they have the largest and most complete sewage farm in the world, they have adopted the separate system. According to an official return the total quantity of storm water admitted into the pipes only represents from 7 to 10 per cent. of the outflow, which is an extremely small proportion, showing that it is rigidly excluded.

490. What proportion is admitted here? One hundred per cent. or more. By admitting the storm-water you more than double the quantity of sewage, and you double it at the time when the ground is least capable of taking it.

491. Have you heard or read lately that the separate system has been a failure in Dorking, England? No, I have not; but, of course, I may say that there is no absolutely hard and fast rule in these cases. Every particular case must be dealt with on its own merits, and there may be cases where the partially separate system would be preferable. At Parramatta, however, where the ground is sloping, and ample provision exists for the escape of storm-water, there seems to be no advantage whatever in connecting the down pipes with the sewers, and thus taking off the roof-water.

492. You are of opinion that the ordinary domestic slops and other refuse will be sufficient to help the sewage along the pipes? Yes; it will represent about 40 gallons per head, which is quite enough for all practical purposes. That has been proved in other cases.

493. Did you not make inquiry as to the expense of the Adelaide system? I did at the time, but I have not got my notes with me, and I cannot speak from memory.

494. You do not remember the cost per annum in round figures? No; I remember that it was considered satisfactory by the engineers, and that it came up to expectations.

495. Have you made any calculation in regard to the reduction in size of the pipes at Parramatta, which would be brought about by the substitution of the separate system for the partially separate system? Under the circumstances, half the capacity would be ample.

496. *Mr. Ewing.*] What caused you to choose the site of the Adelaide farm? We had the option of two or three other places, but we choose the present site, because of the character of the soil.

497. It was the most suitable soil? Yes; the other soil was more peaty and swampy.

498. Is the present site much above the level of the sea? It is sufficiently raised to allow of good drainage.

499. How much do you think it is above the level of the sea? I should think over 40 feet.

500. Was it possible to drain the sewage of Adelaide into the Gulf of St. Vincent? Yes. One of the proposals of Mr. Clark, who was originally consulted on the subject, was to take the sewage out to sea, but he gave preference to the farm system.

501. Would it have been more expensive to take the sewage out to sea? No, I do not think it would; but taking all things into consideration, he gave the farm system the preference.

502. It was in accordance with Mr. Clark's report that you chose the sewage farm? Yes.

503. How far is it from Adelaide? I think it is generally reckoned to be about 3 miles.

504. How far is Adelaide in a direct line from the sea? In a straight line it is not more than 6 miles—barely that in places.

505. Although you could have got right away with the sewage at pretty well the same cost, you chose the sewage farm? Yes.

506. *Mr. Neild.*] The soil of the sewage farm at Adelaide is a stiff red loamy clay, is it not? I should call it a light loam. There is not much clay in it.

507. By going a little further you could obtain abundance of sandy soil? By going further you could obtain sandy soil. 508.

- G. Chamier, Esq., M.I.C.E.
13 Feb., 1894.
508. Do you think that sand such as that at the proposed farm at Parramatta is preferable to soil of a loamier character? If you want to get a good agricultural return from the farm, no doubt the richer the soil the better. You will not get such good returns from sand.
509. But merely for the purpose of dealing with the sewage? Then sandy soil is equal, if not preferable to, any other.
510. In selecting the Adelaide site, you chose it with a view to its agricultural production? Exactly.

WEDNESDAY, 14 FEBRUARY, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.	WILLIAM CHANDOS WALL, Esq.
The Hon. JAMES HOSKINS.	WILLIAM McCOURT, Esq.
The Hon. FREDERICK THOMAS HUMPHRY.	JOHN CASH NEILD, Esq.
The Hon. JOHN DAVIES, C.M.G.	EDWARD WILLIAM O'SULLIVAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	CHARLES COLLINS, Esq.
THOMAS THOMSON EWING, Esq.	HENRY DAWSON, Esq.

The Committee further considered the proposed Sewerage Works for Parramatta.

William Wilkinson Wardell, Esq., M.I.C.E., sworn, and examined:—

- W. W. Wardell, Esq., M.I.C.E.
14 Feb., 1894.
511. *Chairman.*] You are a full member of the Institute of Engineers? Yes.
512. Will you give us a brief outline of your professional career;—will you tell us where you served your articles, and so on? It is a long time ago since I served my articles in London, where I practised as an architect and civil engineer. Then I came to Victoria, and shortly after my arrival I was appointed Inspector General of Public Works. That office I held for close upon twenty years, when a political crisis took place, and the services of a great many of us were dispensed with. That time was known generally throughout the colonies as Black Wednesday.
513. Did you practise in London after serving your articles? Yes, for some years.
514. In Victoria, I suppose, you were connected with the architectural branch of the Department of Public Works? No, I was the professional head of the Department, and had charge of all public works except railways and roads.
515. Did you design the public works as well as carry them out? Yes.
516. Since your connection with the Civil Service of Victoria terminated, you have been practising your profession in New South Wales? Yes.
517. Have you ever designed or carried out any sewerage work for any town or district? I have not carried out any large sewerage works, but I have had to undertake the sewerage of large public buildings.
518. You were chairman of the Board which was recently appointed by the Secretary for Public Works to inquire into the scheme for disposing of the sewerage of Parramatta? Yes.
519. Were the members of that Board unanimous in regard to the report which they furnished? Yes; but it contains one statement which I should like, with the permission of the Committee, to correct. It is stated that a saving of 25 per cent. would probably be effected by excluding the stormwater from the sewers. That is an error. It is needless to say how it arose; but we have corrected it, and we find that the saving would only be 16 per cent. The saving in the cost of working expenses we estimated at 25 per cent., and that we think on further consideration should stand at 20 per cent. The first mistake arose through the accidental omission of an item which came to between £4,000 and £5,000.
520. *Mr. O'Sullivan.*] The Board of which you were a member reported in favour of what is known as the separate mode of dealing with sewage? Yes; excluding stormwater from the sewage.
521. Did your Board thoroughly examine the objections lodged by Mr. Stayton against the proposed scheme? I never saw any objections of his against the proposal to exclude the stormwater.
522. Had you the evidence of Mr. Stayton before you? We read his evidence of course; but that is principally directed to the question of the advantage of the International system over the sewage-farm system. We reported that the International system under certain circumstances was a very valuable one. We thought Mr. Stayton's evidence conclusive on that point.
523. But having read his evidence, you do not think his objections apply to the proposal which you recommend? I do not think they are fatal to the sewage-farm proposal.
524. What are your reasons for thinking so? I think the sewage-farm system has been proved to operate beneficially wherever it has been used. The International system, though quite applicable to places where you cannot adopt the sewage-farm system, seems unnecessary where you can adopt it since the sewage-farming system is cheaper and better, and gives a better effluent.
525. You consider then that Mr. Stayton's proposal is not applicable to Parramatta? Not so applicable as the sewage-farm scheme.
526. You think it would be more economical and efficacious to carry out the proposal of the Department with the modifications which you suggest? Yes; I think so.
527. Have you any other reasons to give why we should accept your opinion? No; except that it is supported by the opinion of the principal engineers of England, whose opinions are of weight on the subject.
528. But the proposal advocated by Mr. Stayton seems to be more modern than the other? Still the sewage-farming system continues, and it is very much a question if the other will. I believe that doubts have already arisen about it.
529. You look upon Mr. Stayton's proposal in the light of an experiment which has not been fully tested? I would not say so. I think it is quite possible that Mr. Stayton's proposal might effect what he says; but I think we can obtain better results from a sewage farm at less expense.
530. I understand that you have had no practical experience of sewerage works except in connection with public buildings? No; but some of the public buildings for whose sewage I have provided are very extensive.

531. You are speaking more as a theorist than as a practical engineer? Yes, as regards a sewage farm. I have had no practical experience of sewage farms.
532. One of the members of your Board appears to have had some experience in that direction? If you refer to Mr. Napier Bell, I would say that he has had very considerable experience.
533. Do you think that Mr. Bell's opinion should be considered as weighty as that of Mr. Stayton? Decidedly I do.
534. May it not appear that Mr. Bell is somewhat out of date with his proposals, not having carried out any sewerage works of late years? I hardly think so. A man may keep himself very well up in what is going on by reading the professional journals and papers. We know here pretty well what was going on in London six weeks ago.
535. You are aware that Mr. Stayton recently took a trip to the old country, and made himself acquainted with the systems in vogue there? I should be sorry to say anything disparagingly of Mr. Stayton's opinion, but the question is, which system is the cheaper and more applicable in this instance.
536. As the result of your studies, and the information you have received from the other members of the Board, and from other sources, you think that the sewage-farm system would be likely to give better results at Parramatta than Mr. Stayton's system would give? I think so.
537. *Mr. Davies.* You, with your colleague, paid a visit to the locality where it is proposed to establish this sewage farm? We did.
538. You are aware that a large portion of the land which it is proposed to convert into a sewage farm is below high-water-mark? Yes.
539. Have you seen the material with which this land is to be reclaimed and raised 5 feet? Yes.
540. Where did you see it? At Long Cove and Neutral Bay.
541. What was the character of that material? Sand, with some silt in it.
542. Mud? No.
543. Silt? I saw a sample in the office just now.
544. I want to know the character of the stuff that is going to be banked up to form a filter-bed? I saw the stuff that they are getting at Long Cove and Neutral Bay, and it consists of sand, with a good proportion—probably one-third—of silt in it.
545. Do you think that that would form a suitable material for a filter-bed? I think it would be perfectly suitable.
546. Do you think that it is the best material that could be got for the purpose of making the embankment? I think so.
547. What, in your opinion, would it cost per acre to reclaim the 42 acres requisite for a sewage farm? Speaking from memory, I think we estimated it at about £40 an acre.
548. How was that estimate arrived at? From information which we got from the departmental officers.
549. You are aware that the land is to be raised 5 feet above the water-level? Yes.
550. To do that will require a large amount of filling? Yes; no doubt.
551. How many thousand cubic yards would be required for each acre? In round numbers, I should think between 14,000 and 15,000 cubic yards.
552. What would the filling be worth per cubic yard? I really could not tell you from memory. We got the information from the Department.
553. But you have a practical knowledge of the value of these things? Yes; but I could not tell you what the dredging would cost. From the information which we received, we thought that the whole cost would be £40 an acre.
554. You did not check the estimate? The only means we had of checking it was the information supplied by the Harbours and Rivers Department.
555. At 2d. a yard the work would cost over £100 an acre? Yes; about that.
556. Do you think that that would be an out of the way price for silt? I am afraid that I cannot give you a reliable answer. Those who are in charge of the dredging should be able to give this information.
557. You only took the figures of the Department? We simply took the figures of the Department as to the cost of dredging and landing.
558. Do you think that 2d. a yard would be an extraordinary price to allow for silt and sand? I could not say until I knew the cost of the working.
559. Would it not cost 2d. a yard to deliver the material with a sand-pump. I should not think so; but you could easily ascertain that as a fact from the Department.
560. You simply took the departmental estimate? No, we took their returns as to cost.
561. You have not gone into any calculation yourself? No.
562. Have you had any sewage farm under your observation at any time? No, except what I have seen here.
563. You mean by a casual visit to Botany? It was rather more than a casual visit; it was a very careful inspection.
564. A professional visit;—that is the only time that you have seen a sewage farm in your life? I saw that farm twice; but I have never seen any other sewage farm.
565. Therefore you have no knowledge of the treatment of crude sewage on such farms? One does not gain all one's knowledge from practical experience.
566. You have no practical experience? None of a sewage farm.
567. You have formed your opinions from reading the views of authorities connected with sewage farms? Yes, and from what I saw at Botany.
568. Do you approve of Mr. Stayton's proposal for treating the sewage of Parramatta? I think the sewage-farm system is preferable, for the reasons that I have already given.
569. Was there any smell at the farm at Botany when you visited it? None whatever.
570. Did you see any quantity of crude matter being put upon the beds? Yes.
571. There was no smell upon it? No smell whatever.
572. Do you think that if crude sewage is cast upon the proposed farm at Parramatta there will be no smell from it? I do not think there will.
573. Do you think there will be no smell or vapour created by the action of the hot summer sun? I think not of any consequence.
574. What is your opinion with reference to the area proposed to be reclaimed and resumed—62 acres altogether? It is proposed to reclaim 40 acres, leaving the remaining 22 acres for subsequent use if necessary.

- W. W. 575. Do you think the area is large enough? I think it is more than ample.
 Wardell, Esq., 576. You think there will be ample room for the treatment of the whole of the sewage of Parramatta?
 M.I.C.E. I think so.
- 14 Feb., 1894. 577. You are of opinion that the farm will not be offensive? Yes.
 578. And that it will not be injurious to the health of or cause discomfort to the people residing in the district? Yes.
 579. *Mr. Trickett.*] Have you studied the subject of the precipitation of sewage? No, except generally.
 580. Do you know that works have been carried out for treating the sewage of the city of Glasgow by precipitation? I was aware that they were to be carried out. I did not know that they had been carried out.
 581. The *Scientific American* of December 16th, 1893, says that "the total estimate, inclusive of land, of treating the sewage of Glasgow, will be £100,000";—is that not a very small amount compared with the estimate of cost in this case? It would seem so at first sight, but of course there is a great difference in the cost of labour.
 582. Parramatta has a population of 12,000, and Glasgow a population of 500,000? You cannot compare the two.
 583. The system seems to be very much cheaper than the sewage-farm system? Not knowing the circumstances, I cannot say.
 584. The Parramatta proposal is estimated to cost £75,926, while the precipitation process at Glasgow is estimated to cost only £100,000. Are you aware that Mr. Stayton, who has recently made inquiries on the subject in England, strongly recommends the precipitation process at Parramatta? I know that he has done so, and I pay great respect to his opinion; but, at the same time, I think that the sewage-farm system is cheaper.
 585. Can you tell us what number of gallons of sewage will be dealt with at Parramatta in the twenty-four hours? I think provision is made for treating 40 gallons per head of population.
 586. That would be 480,000 gallons a day. The amount to be treated at Glasgow is 10,000,000 gallons, so that if the statement of the *Scientific American* is correct, that process is much the cheaper? I could not say without knowing all the circumstances.
 587. Precipitation is an experiment at the present time, is it not? I think so. Everything of that kind is tentative. Things promise very well, but ultimately they are found not to succeed, and continual improvements are being made on the different schemes. The treatment by means of ferozone and polarite is I believe the best that has been found as yet, but how long it will last remains to be seen.
 588. Would you not think that in Great Britain they would require very strong evidence in favour of the precipitation system before adopting it at Glasgow? They could not find stronger evidence than has been given in favour of the sewage-farm scheme. If you look down the list of those in favour of it, you will find that they number nearly the whole of the authorities.
 589. You are referring to the list given in Mr. Hickson's report? Yes; that report gives a *resumé* of the opinions of the best authorities, and is a very valuable collection of them.
 590. A great many of Mr. Hickson's authorities seem rather ancient—they go back as far as 1865? I think the principal opinions in favour of the system were expressed last year at the conference upon the Berlin sewerage scheme, that is in 1893.
 591. Do you know of any locality similar to the proposed site at Parramatta that has been adopted for a sewage farm? No.
 592. So that the farm will, in a measure, be experimental? Hardly; I think its success is almost certain.
 593. The Botany farm has been stated to be unique in its advantages, the soil being composed entirely of sand, but I understand that at Parramatta the land would have to be built up, so that the circumstances of the two places are not quite similar? They are not perfectly alike.
 594. You still think that 5 feet of sand would be sufficient to filter and render unobjectionable the sewage of Parramatta? I do.
 595. Have you heard anything of the Dorking sewerage system? I have read of it, but I could not give you any of the details.
 596. Can you tell the Committee whether it has not had to be reconstructed lately? I could not.
 597. I have been informed that they had until recently the separate system; but, because of the accumulation in the pipes, offensive smells were given forth, and they had to reconstruct the system, and adopt the partially-separate plan? I did not understand that you were referring to the question of the diversion of storm-water.
 598. You have not read anything about it? Not as to that; but there is a great difference of opinion between engineers as to the propriety of diverting storm-water, and the same reasons do not apply in all cases.
 599. What is your particular opinion? My opinion is that at Parramatta there are hardly any difficulties in the way of diverting the storm-water.
 600. If you divert the storm-water, you have to constantly flush out the sewers? That can be accomplished in another way. If you do not divert the storm-water, you only occasionally get the sewers flushed; and they are flushed when perhaps they do not want it, and when they do want it there is no water available. There should be a permanent system of flushing always available.
 601. With the separate system the regular flushing of the sewers is necessary? I think it is desirable; but in our report we simply suggested the diversion of the storm-water as a matter for the Department to work out, as circumstances may guide them. They may find, when they go into details, that the separate system is wholly unfitted for the work.
 602. But in your report you make the saving which will be effected by it rather an important feature? That is supposing the system can be adopted.
 603. But you have not carefully worked out all the details? No; we could not go into details because we had not the time. We simply spoke generally as to the probable results.
 604. Which system prevails most—the separate system or the partially-separate system? I should say the separate system, except in places where it is inapplicable.
 605. The grades at Parramatta are somewhat level? No; there is a considerable fall there.
 606. Do you mean before you come to the pumping-station, or after. Is there a good fall from the town to the pumping-station? Yes.
 607. From the pumping-station to the farm it is flatter? Yes.
 608. You think that the fall would be sufficient to carry off the sewage if the separate system were adopted? I think so, as regards the storm-water.

W. W.
Wardell, Esq.,
M.I.C.E.

14 Feb., 1894.

609. What reduction in the size of pipes could be made if the separate system were adopted instead of the partially-separate system? I should say about one-third in round numbers; but that is altogether a matter of calculation.
610. You have not gone into it? No.
611. I should think that would materially affect the question of cost? I need not tell you that a Board appointed for the object is not expected to go into all the details of calculation. We merely threw out the suggestion to be worked out by the Department. If our idea does not work out with the saving we anticipate, it must fall to the ground.
612. *Mr. Neild.*] Would you name one or two of the principal schemes of sewerage you have carried out in connection with public buildings? I carried out the sewerage of the Parliament Houses and Government House, Melbourne, amongst others.
613. What is the nature of the sewerage works in connection with the Parliament House there? The sewage was all taken into a tank in a reserve and passed through filters, and was then allowed to run through a long sewer into the Yarra.
614. Are any chemicals used? None whatever. The sewage is filtered through gravel and sand. These works were carried out nearly thirty years ago, so I cannot be quite sure as to the details; but from memory I should say that the filter-bed was from 2 feet to 3 feet deep.
615. The effluent is discharged into the Yarra? Yes, below the Falls.
616. Is this system still in use? I believe so.
617. What is done with the residuum left after filtration? It is taken away by the ordinary carts.
618. Was the same system adopted at Government House? Yes.
619. Those works were designed and carried out by you? Yes. There is no sewerage whatever at Melbourne as yet, and I do not mean to say that this was the most scientific way of dealing with the sewage at the places mentioned, but at that time we could do nothing else with it.
620. What is the character of the effluent? It was very good indeed, though I cannot say that I should like to do what a gentleman did with some of the effluent at Botany the other day—drink it.
621. Do you know how frequently the filters have to be changed? I could not tell you from memory, but I do not think it is very often. It is five and twenty years ago since the works were done.
622. Would it be done twice a year? I do not think the filters were changed, but the tank had to be emptied once or twice a year.
623. Was it found necessary to change the sand and gravel used for filtration purposes? I think not, but I am speaking entirely from memory. If any credit is due to the system, I am not entitled to it, because it was suggested to me by a medical friend in Melbourne, the late Dr. Tracy, who carried it out in his own house.
624. Did you take into consideration the question of dealing with the more clayey portion of the proposed farm at Parramatta? To this extent, that we thought it would not be necessary to use that land for many years to come. We considered how it could be made available then.
625. Do you agree with Mr. Napier Bell that it would be desirable to reclaim land fronting Duck River to the south of the proposed farm if an additional area were necessary, instead of attempting to use the 22 acres of clay soil? I have not heard the suggestion before, but that strikes me as the better plan.
626. You have no very great regard for the clayey portion as adapted for the purposes of a sewage farm? No; I think the other land would be better.
627. Do you think Mr. Bell's plan would be cheaper, or that it would be better in practice? It would be better in practice.
628. In considering this matter, had you no regard for the cost of the work to the Borough? No.
629. You did not take into consideration the question of any revenue being derived from the farm? No; that matter was not referred to our consideration.
630. Is it customary for a material revenue to be derived from sewage farms? I think so. I have always understood that they can be made to pay a small interest, at any rate.
631. You saw a certain amount of cultivation at the Botany sewage farm? Yes.
632. Did it meet with your approval? I should not like to say, because I have no knowledge of farming. The farm seemed to me to be doing very well, and realising very good results; but I have no experience of such matters.
633. But you can give the Committee an opinion as to whether agriculture carried on at the proposed Parramatta sewage farm might be made to give a return which would reduce the cost of the work to the Borough? I have no doubt that it would; but I am afraid that my opinion on the subject is not worth much.
634. Have you paid any attention to the system of using osier-beds on sewage farms? No.
635. You are aware that osier-beds have proved very valuable in the old country, by absorbing a very large quantity of effluent? Yes.
636. At Parramatta you propose to run the effluent directly into the river? Yes.
637. Do you propose to adopt any filtration process? No; except the natural filtration through the soil.
638. When you saw the site of the farm, was it high or low tide? I do not remember, but I think it was high-water.
639. Was there much water upon the land it is proposed to reclaim? The tide was over it to some extent.
640. You saw some fascine-banks there? Yes.
641. Do you think they would bear the pressure of an embankment 5 feet above the water-mark, and the sewage which would be discharged upon it? I think so, if properly constructed.
642. There would be no fear of anything giving way? I do not think so; the water will be a support on the outside.
643. You are aware that the proposed farm is 20 miles from the ocean? Yes.
644. Therefore the tidal influence would be less effective there than near the sea? Yes.
645. Whilst the upper part of Parramatta and Duck Rivers would be drained by the ebbing of the tide, the tide flowing in in the lower portions of the harbour would drive the sewage back again instead of letting it escape? I do not think the effluent would have a bad effect upon the river.
646. There would be no fear of polluting the banks? None whatever.
647. Did you see any signs of fouling near the shores in the vicinity of the Botany farm? I did not.
648. Did you visit these shores? Yes; and there was no fouling on the Yarra from the Government House effluent.

- W. W. Wardell, Esq., M.I.C.E.
14 Feb., 1894.
649. Are you aware that in time of rain the whole of the sewage usually taken to Botany is let into the bay? No.
650. Would you approve of such a course being adopted at Parramatta? I think not.
651. You think there would be a chance of the banks being fouled if that were done? Yes.
652. Therefore you would recommend, if the works were carried out, that provision should be made for dealing with whatever came through the delivery pipes, irrespective of the rainfall? I think so.
653. Had you any difficulty of that kind in view when you recommended the separate system? No; but it occurred to us that there would be a manifest saving if the separate system could be applied, and that it was desirable that it should be carried out if the expense made it practicable.
654. Would you be surprised to hear that one of the members of the Board has given evidence to the effect that the saving would be more than 25 per cent.? I know that he thinks so, but I do not.
655. *Mr. Collins.*] Have you had much experience in farming land? No.
656. Do you know the description of the soil at Parramatta? The soil is to be built up there, excepting in one place which it is not proposed to touch.
657. When it is built up do you think it would be good land for farming purposes? Yes, so far as I know.
658. *Mr. Ewing.*] Your knowledge of the International process and sewage work generally is limited to your reading? Yes.
659. It is just the information that a professional man gets from his reading, rather than from practical experience? Yes; I have had nothing to do practically with sewage farms nor with the International system.

Edward Bellingham Price, Esq., M.I.C.E., supervising engineer, Department of Harbours and Rivers, sworn, and examined:—

- E. B. Price, Esq., M.I.C.E.
14 Feb., 1894.
660. *Chairman.*] Have you had anything to do with sewerage works during your professional career? Not since I came to this Colony. I had a little to do with such works in Ireland, in surveying and getting out plans. I have been looking through such matters, however, for my own instruction, since I went home.
661. What little you had to do with sewerage work before you came here was office work;—you were not connected with the initiation or the carrying out of any scheme? No, except for private houses.
662. How long were you so engaged in the old country? About a year.
663. In whose office? My father's.
664. What were the towns or places for which the sewerage was intended? Blackrock and Kingstown. They are both suburbs of Dublin.
665. What was the population of those places? About 25,000; that is, the portion we were going to drain.
666. You have recently visited England? Yes; I only came back on Saturday.
667. While there you availed yourself of the opportunities that presented themselves of inquiring into various engineering questions? Yes; I was looking after various things—water supply schemes, sewerage schemes, tramway construction, and other matters.
668. *Mr. Davies.*] What sewerage works did you visit when you were home? I visited the London sewerage works, the Barking Outfall as it is called. It is one of the most modern works at home, and the largest.
669. What method do they adopt there for the treatment of sewage? They precipitate it with lime and iron, and discharge it into the Thames.
670. What becomes of the solid matter? The very coarse solid matter is strained out and burned in furnaces. What is precipitated is pumped into steamers and taken down to the mouth of the Thames, and discharged into deep water.
671. *Chairman.*] Will you explain the process? The outfall sewer consists of three 9-ft. diameter sewers. Across them there are iron grids, which strain out the floating paper, straw, corks, and stuff of that kind, which are taken out mechanically and burned in a large furnace. The sewage then receives a charge of quicklime, which is mixed up with it, and then it flows on for a quarter of a mile.
672. *Mr. Davies.*] In an open conduit? In the closed sewer. It then receives a charge of sulphate of iron in solution, and flows another quarter of a mile, when it enters into long precipitating channels. There are thirteen of these channels, 1,000 feet long and 30 feet wide. It flows slowly through these, the overflow escaping over a weir into the Thames. After the sewage has been precipitating in these channels for fifty hours it is emptied into the Thames, and the watery sludge which remains is drawn off and pumped into settling tanks, where it is left about a day. The surface water is then again drawn off, and what still remains is pumped into hopper barges and taken out to sea. The sewage is settled as much as possible before they finish with it.
673. *Chairman.*] Is the weir employed in order to aerate the sewage? No; it is only intended to afford an opportunity for the surface water to escape. I do not think it is intended to aerate the water at all.
674. But does not aeration enter very largely into the purification of an effluent? Yes. The sewage runs out in a tremendous torrent.
675. *Mr. Davies.*] I understood you to say that the sewage was conducted through covered sewers? Yes.
676. What length of open conduit is there before the sewage discharges itself into the Thames? It is all covered. The precipitating chambers are all arched over. I went down into some of those that were empty. They are emptied alternately, and you enter them through a manhole. About 20 feet is the average depth; they having curved bottoms and arched tops.
677. What would be the fall? There is practically none. The precipitating chambers are practically level, but there is a slight fall back from the point of discharge in order to cause the sludge to run back.
678. But there is a slight fall into the Thames? Yes. The sewage keeps flowing along the conduits. There are two valves—an inlet valve and an outlet valve—and when a chamber is full the inlet valve is closed, and the outlet valve gradually opened from the top, so that while the water runs out the sludge remains behind.
679. The solid matter is taken away before the sewage passes into these long pipes? Only a very small portion of it—about 90 tons a week is all they catch—and that is principally corks, straw, and paper.
680. What is done with all that stuff? It is burnt in a furnace.
681. What is done with what is left over by the fire? There is a very large gas-works close by, and I think it is mixed with the spoil from the gas-works.
- 682.

E. B. Price,
Esq.,
M.I.C.E.
14 Feb., 1894.

682. What was the construction of the kilns used for burning the solid material? It did not seem to be very remarkable. There is just a large furnace, into the top of which the wet sludge is delivered, and it keeps smouldering away. There are about 12½ tons to be disposed of a day, and 90 tons had been disposed of in the week previous to my visit.
683. What number of people to the acre are provided for by this scheme? I could not answer that question without looking up the report on the subject.
684. What quantity of sewage is daily delivered at this place? The day I was there 119,000,000 gallons passed through. The total for the previous week was 833,000,000 gallons, but the weather was dry at the time.
685. Does the storm-water find its way into the sewers there? Not all; but a great portion of it does. They take as much as they can possibly get.
686. Does the drainage of the streets through the gully-shafts find its way in? Yes.
687. Do you know the capital cost of the work? It was over £5,000,000.
688. Do you know the annual cost? I cannot tell you that. These works have only been in existence three years. The former works were constructed by Sir Joseph Bazalgette. The sewage then was not precipitated at all, it was merely held in a large reservoir until the tide fell, and at low water it was let out. They had to modify the tanks to adapt them to the new system.
689. Under whose control is the work? It is under Mr. Bennie, the Engineer-in-Chief for the London County Council.
690. Can you tell us anything as to the income derived? No; I cannot, but a sewerage rate is levied.
691. What other sewerage schemes did you visit? A very modern system has been invented in Ireland by Professor Adeney and Mr. Parry. They call it the oxygen system, and it has been very successfully applied upon a small scale at the Dundrum Lunatic Asylum. Mr. Hickson heard of this system, and wrote home to ask me to look at it. I visited the place with Mr. Parry, and went to his office several times to get all the particulars I could.
692. Will you kindly describe the system? It is only being tried on a small scale at Dundrum, because the lunatic asylum only shelters about 250 people. The sewage is treated in a house about 25 feet long and 20 feet wide. There are three deep tanks in it going into a funnel at the bottom, and the sewage coming in turns a small water-wheel which operates little tap-valves, and lets in the chemicals as required. They use a little soda and a little nitre. If there is any sewage coming in the water-wheel lets in the chemicals, but when the sewage is not running the chemicals are not let in, so that there is no waste. The scheme is entirely automatic. The inventors have tried several experiments, but what they use principally is manganate of soda for precipitating, and nitre to put oxygen into the effluent.
693. *Chairman.*] It is an instance of chemical precipitation? Yes; but the effluent, after it has been charged with nitre will not go bad again. It is discharged into a stream running past some gentlemen's residences, and there is nothing nasty about it. It seems to carry the oxygen with it all the way down the stream. The nitre is put in to help the friendly microbes to eat up the others. The system had been in operation about one year and three months when I saw it, and there is no sign of the stream being polluted. Indeed if there was any pollution an action would be entered against the Government.
694. What about the cost? I tried very hard to ascertain the cost, but they would not give it to me. They said that they were patenting the system in Australia, and that they did not like to publish the details until they were quite sure of the proper proportions of chemicals. They have been trying a great many experiments. As I mentioned, there are three deep tanks, and the sewage after turning the water-wheel goes to the bottom of the first one, which is 7 feet square and 16 feet deep.
695. *Mr. Davies.*] Does not the wheel break up the solid matter in the sewage? No. It is only a light tin wheel.
696. Have you any idea of the cost of the system? I do not think it is expensive, because the chemicals they use are very cheap. The most expensive is the nitre which they put in at the last to help the friendly microbes. The manganate of soda is very cheap.
697. What do they do with the sludge? It is taken out and buried in the asylum garden. There is only a very small amount.
698. *Chairman.*] Where does the friendly microbe come from, seeing that the sewage does not flow over the soil which is their home? They occur in the sewage itself.
699. *Mr. Davies.*] The sludge is buried in ordinary trenches? Yes, and they grow cabbages and vegetables for the asylum on it.
700. Did the system strike you as an improvement on other systems which you have seen? I thought it would be a very good system for an isolated asylum which had no connection with any other sewerage scheme.
701. You do not regard it as suitable for a municipality like Parramatta? No. I may mention that I had a conversation with Mr. Bennie, the great authority on the subject in London, and also with Mr. Chatterton, who is a partner with Sir Joseph Bazalgette's son, and is carrying out a scheme for the drainage of Dublin, and they both thought that if land was available there was no system which could compare with the irrigation system. Everyone says, however, that land near London is so valuable that that system cannot be used there. Mr. Bennie holds about the first engineering position in England.
702. *Chairman.*] You gathered from him that where land was available the sewage-farm system was the best way of dealing with sewage? Yes; and he sent me specially to see some experimental filters of his which had been constructed of sand and coke breeze.
703. *Mr. Davies.*] Did you see any other system in operation? Yes, I saw the Croydon Irrigation Farm; I was there in August and November.
704. *Chairman.*] Will you briefly describe that system? Croydon is a town in Surrey. I could not be sure of the population, but I think it must be between 50,000 and 60,000. There they have an area of about 500 acres, which they bought for the purpose, but all of which they do not use as a sewage farm apparently. The sewage is pumped on to this land, and runs through it in ordinary drains.
705. It is drained down to the lowest point whence it is pumped on to the farm. How far is the pumping-station from the farm? They pump it for a distance of about two miles. The pumping-station seems to be in the town itself. The town is a very straggling one, and the scheme takes in several villages.
706. The pumping-station is in the lowest part of the town? It is close to the town. I could not tell you exactly what distance the sewage is pumped, because I do not know where the drain ends, but it is about

- E. B. Price,
Esq.,
M.I.C.E.
14 Feb., 1894.
- about 2 miles. The sewage runs through the farm in ordinary ditches. There is a ditch on each side of every field. Pumping is necessary only on the higher portion of the farm.
707. *Mr. Davies.*] How deep are they? About 4 feet by 3 feet. The whole farm is divided into paddocks, and they turn the sewage over in one paddock and let the land get a good soaking, and then they soak another paddock. After the ground has been well soaked the grass springs up rapidly, and they turn cattle in to feed upon it. Some of the paddocks are ploughed up.
708. Where does the sludge go? The sludge goes on to the land. Of course they strain out the coarse floating particles just as they do in London; but they are not very much. A great quantity of cabbages are grown on the farm, as well as wheat, oats, clover, and other green crops. They keep working round their paddocks in rotation, so that no nuisance is caused.
709. How close is it to population? There is population all round, and right through the middle of the farm. The farm is not in one block; it is broken up into two or three sections, and a railway runs through it. Croydon is only 13 miles from London. I was living within 1½ miles from the farm for some time.
710. How near is the most thickly populated village? A ¼ mile away.
711. Is that the nearest point at which the population is dense? The houses actually abut upon the farm.
712. Are those the houses of employees upon the farm? No; I was living close to the farm, and I used to cross it every day.
713. Did you notice a disagreeable smell? Only once, when they were flooding one of the paddocks just opposite a road I was passing. It was a grass paddock, and they had put a great deal of sewage on it which had not all been soaked up; but in the evening the smell was quite gone.
714. What is the character of the soil? Rather rich clayey soil overlying gravel. It is not all exactly the same, but the surface is very clayey.
715. Do you think it is likely to make a good material for filtering? Yes; but a much larger area is required than if the soil were sandy. The area there is far in excess of what they will want for many years to come.
716. That is the only other place you visited while at home? Those are the three places I went specially to look at, but I saw several others.
717. Do you know the site of the proposed sewage farm at Parramatta? Yes; very well.
718. Have you visited the locality since you returned from England? No; but I used to live at the other side of the river, and I know the locality well. If I remember rightly it is swampy.
719. You know that the Department propose to reclaim the land and fill it up to the height of 5 feet above high-water level? Yes.
720. Do you know the extent of land that will be available for sewerage purposes? I am informed that about 64 acres will be available.
721. Do you think that that would be sufficient for treating the sewage at Parramatta? Yes; if the land were reclaimed with sand.
722. Do you think that the silt and sand and stuff taken from the harbour would be good filtering material? Yes; if they used the stuff they got at White Bay, Johnstone's Bay, and other places, it would do very well—much better than anything I have seen in any other sewage farm.
723. Are you of opinion that no disagreeable smell would come from the farm if the departmental proposal were carried out? Not if it were properly managed. I think more depends upon the management than upon anything else.
724. What management would be necessary? It would be necessary to see that too much sewage was not placed upon any paddock. The farm should be divided into small lots, and each field should only get just as much sewage as would soak in. The smell at Croydon was only noticeable after apparent mismanagement.
725. Do you think the soil would become charged so that after a year or two it would not filter so much sewage as it did at first? No; I think that if a good crop was grown on it, such as corn, sown broadcast, cabbages and strong growing plants, it would rather improve. Plants take the manurial qualities out of the land and leave it as good for filtering as ever it was. I spoke to some people in the old country on the subject, and their experience is that sand filters are improved by use. The effluent is clearer and freer from bad properties after the filter bed has been in use for a year or so than it was at first. The water seems to go through the sand too quickly at first.
726. Have you visited the Botany sewage farm? Yes; I was there yesterday. I had been there before, but I thought I would go out yesterday and have another look at it.
727. Did you notice a disagreeable smell there? Yes; the Superintendent was laid up, and too much water had been allowed to run on to one of the paddocks.
728. Where should it have gone? It should have been put on to another paddock. They were continuing to put sewage on to land that was saturated.
729. Then you were rather disappointed at your visit? No; I was not. I examined a good deal of the soil of the filter-beds which were not flooded, and I found that it was beautifully clean and sweet. On one paddock, which has been in use for a good many years, the sand was hardly discoloured.
730. How did that farm compare with the Croydon one? The Botany farm is far superior to the Croydon farm, because at Croydon they have what you would call stiff clay.
731. Was there much smell at Croydon? Much the same as at Botany. At Croydon you only smelt the sewage when you got right on to the paddock.
732. I suppose the sewage will always be a source of annoyance when they are turning it on to the beds? No. My brother is a doctor, and has lived for four years alongside the Croydon farm, and he says that it is very seldom that there is any smell. The place is very healthy.
733. But it is quite possible that you can become acclimatised to any smell? One of the men engaged in cleaning out the precipitating tanks in London has followed the trade of cleaning sewers for fifteen years, and he is a fine strong man, who says that he was never ill in his life.
734. Have you made yourself acquainted with the plans of the Parramatta sewage scheme and the estimate of cost? I have only just read the papers. I did not know until a couple of days ago that I should be called.
735. Do you know anything as to the estimate of revenue? No; I have not gone into that.
736. Have you made any estimate of the cost of reclaiming the 42 acres? No; I have not, but it would be a very good spoil bank for the Harbours and Rivers Department, and would save them taking the stuff to sea, so that the reclamation ought to cost nothing for material.

737. Do you think that £40 an acre would cover the cost? No; I do not think so, if you have to let a contract for the work.
738. What is a cubic yard of silt or sand worth, deposited at that place? I think they would bring the barges up and drop the silt into the bottom of the river, and then pump it up again with a sand pump. That would cost about 2d. a ton; at least, that is what it has cost at White Bay. I have not gone into the question myself, however.
739. Mr. Wardell, who is one of the members of a Board appointed by the Minister to investigate this matter, estimated that 1,4,000 cubic yards of stuff would be required for this work, and that at 2d. a yard would cost over £100 an acre? Without going into figures, I should think it would be about that.
740. You do not know the cost of the fascine banks? No; I have had nothing to do with them.
741. You are simply here to give evidence as to what you saw during your trip home? Yes; in regard to the Croydon and London works.
742. Of the three systems which you saw, which do you approve of most? That depends altogether on circumstances. If I had the land I would go in for the intermittent irrigation system, but if there were no land available, I would adopt a precipitating system. Lime works very well as a precipitating agent, and so does manganate of soda.
743. During your visit to England, did you see any place where the sewage of the town was treated by the International system? No; I did not. I was not near any towns where they treat sewage in that way. There are not many such towns.
744. Did you come into contact with any engineers that could give you information in regard to systems of treatment? Yes, it was to get such information that I called on Mr. Binnie and Mr. Chatterton. Mr. Chatterton is engaged in connection with the Dublin sewerage. The Dublin outfall sewer discharges into the ocean. The sewage is held in a large reservoir, and let out at low tide. I asked these gentlemen particularly about the International system, but Mr. Binnie told me that he did not think anything especially of the filter. He said that he had been trying experiments with their filters and with sand and coke filters. He is trying an experiment with a filter of about 1 acre in extent, composed of coke and sand on to which he runs 1,000,000 gallons a day.
745. Is that an inexpensive process? Yes; it is very cheap, because they get the coke for nothing. I saw the effluent myself, and took a sample in a bottle. It was beautifully clear. They run the sewage on to the land for three hours continuously, and then give the land a rest for three hours. They employ two filters alternately.
746. How long have these filters been in use? The particular filter I speak of, had only been in use sixteen days. Mr. Binnie was trying experiments for the London County Council, and he said that up to the present, the best filter was the coke and sand-filter. The sand is really sharp gravel. Mr. Parry, too, although he has patented a system of his own, says that where suitable land was available he would not use his own system.
747. *Mr. Hoskins.*] I gather from your evidence that the treatment of the sewage of large towns is still in an experimental stage;—sanitary Engineers are continually experimenting to ascertain whether they can treat sewage with better results than have hitherto been obtained? Yes; all the sanitary engineers I met at home were carrying on experiments. The chief drawback to all the systems is that the effluent putrefies after its discharge into the river. They want a filter that would prevent that.
748. Except where there is a big rise and fall of the tide, such as in the Thames, where there is a rise of 20 feet, it is difficult to get rid of the effluent? It is very difficult where the stream is a small one. At Dundrum the stream is smaller than the volume of the effluent.
749. In respect to what you said about the offensive smell at Croydon, do you not think that if a paddock here was similarly treated, the smell caused by the heat of the sun would be more prejudicial to the people in the neighbourhood than would be the case in England? No; I think it is just the reverse. They have found from experiments that strong sunlight has a very good effect upon sewage.
750. Are we to understand that the greater the heat of the sun, the less danger there is from the effluvia? The sewage farm at Croydon worked better in summer than in winter. The only time I noticed a smell there was in November. I was there in August during the hottest summer that they have had in England for many years past, and there was no smell at all.
751. Are we to understand that the difference in temperature between the two climates is rather in our favour? Very much so. The growth of vegetation in a hot climate is so great that the plants absorb and use up all the waste putrefying products in the soil.
752. The effluvia from a sewage farm would not be greater in a semi-tropical country like this than in the temperate climate of England? I think it would be much less.
753. Will you say that it is an axiom of sanitary engineers that the greater the heat acting upon the sewage farm, the less the likelihood of smells? Yes; because the heat promotes the vegetable growth upon which we depend for getting rid of the sewage. Of course light and air have a great effect in splitting it up.
754. Did you hear that the system of precipitation found much favour in Great Britain? Yes; a great many towns have adopted such a system.
755. Can you say of your own knowledge, or from information you have acquired, that the precipitation system is not as much used in England as the sewage farm system? Precipitation combined with a small sewage farm system seems to be the system universally adopted, for the simple reason that they cannot get the land for a large farm.
756. Are you aware that they are now carrying out an extensive precipitation system at Glasgow, the second most populous town but one in the United Kingdom? I have heard so. Of course, land is very hard to get there.
757. Have you closely inspected the land at the proposed sewage farm at Parramatta? I have seen it pretty often. It is swampy land, but that is not the land that will be used for the sewage farm.
758. A number of trial shafts have been sunk by Mr. Stayton? They must be below high-water mark.
759. No, they are on the 22 acres? I have not been there since the trial shafts were sunk.
760. Then you cannot offer an opinion as to the description of the clay there? I should say that it would be very bad for a sewage farm, and that the success of the scheme would depend entirely upon the material put upon the land. I do not think it would matter if there was solid rock below, as long as the material on top was sharp sand.

- E. B. Price,
Esq.,
M.I.C.E.
14 Feb., 1894.
761. How many feet of soil would you recommend to be placed on the land in order to ensure the effectual treatment of the sewage? Mr. Bennie's experiments show that 3 feet would be sufficient, but I would put 5 or 6 feet to make sure.
762. You consider that if the 22 acres are to be used the ground must be covered with sand? Unless it is kept constantly ploughed; but I would certainly cover it with sand if it is like what I think it is.
763. *Mr. Neild*] You made a remark just now with regard to the putrefaction of the effluent;—would what you said apply to the effluent from a sewage farm as much as to the effluent from the filtration process you were describing? No.
764. You do not think there would be any risk of the effluent from a sewage farm putrifying? No; I examined the effluent from the Croydon farm on several occasions, and found it to be perfectly pure.
765. Is the Croydon farm worked by ploughs? A portion of it is worked, and part is laid down in grass.
766. Is the sewage matter distributed broadcast over the grass? It runs right over the grass.
767. Without any ploughing? Without any ploughing at all.
- 767½. The Croydon soil would not be anything like so heavy as the soil on the 22 acres at Parramatta? I could not say from memory; but I should not call it a light soil.
768. Did you make any inquiries when at home in reference to the lighting of towns by electricity generated by the consumption of the town refuse as fuel? No; I did not.
769. You know that that has been done in some of the centres of population in the old country? No; I have not heard of any case.
770. *Mr. Ewing*] You have already said that you regard sewerage as a progressive science? Yes, so far as precipitation agents go. They have not yet ascertained what is the best chemical to use.
771. You have given it definitely as your opinion that irrigation is the best means to adopt? That is my opinion; but I got it from Messrs. Bennie, Chatterton, and Parry. Mr. Parry is about the greatest authority on the subject in Ireland, and Messrs. Bennie and Chatterton are some of the greatest authorities in London.
772. They have as good opportunities as any men in the world for forming an opinion? Yes; Mr. Parry has carried out an immense number of works in Ireland, and so has Mr. Chatterton in England, while Mr. Bennie has charge of the largest sewerage scheme in the world.
773. *Chairman*] And is experimenting from day to day? He is constantly experimenting.
774. *Mr. Ewing*] How much of the departmental scheme will become valueless in the event of a precipitation scheme being adopted? I suppose you might say that the pipe from Harris-street to the sewage farm could be dispensed with, but it would be valuable in a way, because even if the precipitation system were adopted I should like to discharge the outfall at Duck River.
775. I want to know how big a mistake we should have made supposing the sewage farm turned out to be a failure? That would entail a little additional expense for a precipitating tank at the sewage farm, but you could use the effluent to irrigate the land.
776. It is your own opinion that nearly the whole of the works would be valuable, even if science enabled us to adopt some better system than the sewage farm? I think so. A slightly additional expense would have to be incurred, but probably not more than £3,000.
777. Do you think that if we make a mistake, we shall not lose more than £3,000? You might have to increase the cost by about £3,000. The whole of the works at Dundrum only cost about £500. They are capable of treating about 12,000 gallons of sewage a day, and I suppose for double the cost they could treat 20,000.
778. Do you know of any town of 12,000 inhabitants in the old country that possesses an extensive sewerage scheme? I do not.
779. From your experience the towns that have carried out sewerage schemes have been well able to pay for them? Yes; they have been richer towns than that.
780. Incomparably richer? Some of the smaller towns in England have sewerage schemes, but they are mostly manufacturing towns. Croydon is a suburban town, and contains some fine villas.
781. The population there, you say, is about 50,000? I think so. Several adjoining suburbs use the farm.
782. You have no knowledge of what towns of 12,000 inhabitants do with their sewage? Most of them run it straight into the river.
783. As a rule, they do not have sewerage schemes? No. As a rule, they run their sewage into the river, which, if it has a good volume of water, purifies it, and takes it away.
784. The inference is, that towns of less size in other parts of the world do not think the time has come for incurring such an expenditure? I could not quite answer that question, but the necessity for sewerage systems there is not quite so great as it is here.
785. *Mr. O'Sullivan*] The Croydon you refer to is a suburb of London? Yes.
786. Does the farm you speak of treat any of the sewage of London? No. The Barking Works are north of the Thames, while Croydon is on the south side of the Thames.
787. *Mr. Humphery*] Have you given any consideration to the separate system as distinguished from the partial system of dealing with the sewage? I had a conversation with Mr. Parry on the subject, and he was of opinion that in isolated cases in Ireland, it was better to let in only part of the rainwater.
788. He recommended the partial system? He seems to let in only part of the rainwater. He lets in the water from the yards, but not from the roofs, or from the roofs and not from the yards.
789. Have you read the report of the experts to whom the evidence taken on this subject was submitted? I can hardly say that I have read it; I have simply looked through it.
790. They recommend the total exclusion of the rainfall; but from the evidence you have gathered, and from what you have seen, do you think that desirable? No; I do not. I think it will be very difficult to flush the sewers if you did not admit some of the rainwater. I would let some of it in. I know that at Blackrock, in Dublin, we had little weirs, so that if the rain was very heavy part of the water would run away, and was prevented from entering the sewers; while if there was only a little rain, the water would get in.
791. In your opinion, the suggestion of these gentlemen is not an important one? I do not think so. They probably thought of the saving of pumping, and the saving in the cost of pipes, but I think it would be better to let in some of the water.
792. Would you like to think over the matter? I do not think I should alter my opinion.

793. You have no doubt that it would be better not to exclude all the rainwater? I have never seen it done successfully in regard to country-houses and small works of that description. I have seen it tried but they have always had to let in the rainwater afterwards. E. B. Price,
Esq.,
M.I.C.E.
794. Speaking of the Barking Outfall, was there any land available there originally? No, most of the land has been reclaimed from the river. 14 Feb., 1894.
795. Was that why the precipitation scheme was adopted? It would have been out of the question to treat such a quantity of sewage upon a farm.
796. Have you considered whether 42 acres will be a sufficient area for the treatment of the sewage of Parramatta for a considerable time to come, allowing for the ordinary increase of population? I think that area will be sufficient. Every acre of that sandy soil should certainly treat the sewage of 500 people. At Croydon they have 200 people to every acre.
797. Therefore, in your opinion, it would be ample for a population of 20,000? Yes, quite sufficient.
798. The area would be ample, exclusive of the clay land? Yes. I think it could treat a great deal more; but it would be safe to say 20,000.
799. *Mr. Neild.*] You said just now that it was more necessary to provide elaborate methods of sewage here than in England because the climate was hotter? I meant to say that sewage run into a river in Australia would have a worse effect than it would have in England.
800. Because of the greater heat? Yes, and frequent droughts.
801. Did you not, a little time ago, say that the heat of Australia would render the sewage less obnoxious than it was in colder climes? Yes; when applied to a sewage farm, as it makes the sewage farm more beneficial, by encouraging the growth of plants.
802. You said that if it were found necessary to adopt a precipitation process at Parramatta the precipitation could be carried on somewhere near the pumping-station, while the farm would still be useful for getting rid of the liquid. But if a precipitation process were adopted there, could you not run the effluent straight into the river, and thus save the expense of pumping it on to the farm, and maintaining the farm? It would save that expense, but then you would have to filter the sewage.
803. But if you used a precipitation process could you not save the filtration? I do not know the levels well; but I think you would have to pump in any case.
804. Could you not carry out the precipitation at the pumping-station, and then run the effluent into the river? The tanks would be pretty deep, and the bottom of them would probably be below high-water mark.

WEDNESDAY, 21 FEBRUARY, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN.)

The Hon. WILLIAM HENRY SUTTOR. The Hon. JAMES HOSKINS. The Hon. FREDERICK THOMAS HUMPHERY. The Hon. JOHN DAVIES, C.M.G. The Hon. WILLIAM JOSEPH TRICKETT. THOMAS THOMSON EWING, Esq.	WILLIAM CHANDOS WALL, Esq. WILLIAM MCCOURT, Esq. JOHN CASH NEILD, Esq. EDWARD WILLIAM O'SULLIVAN, Esq. CHARLES COLLINS, Esq. HENRY DAWSON, Esq.
---	--

The Committee further considered the proposed Sewerage Works for Parramatta.

Thomas Peter Anderson Stuart, Esq., M.D., Professor of Physiology, University of Sydney, and Medical Adviser to the Government, sworn, and examined:—

805. *Chairman.*] How long have you held the position of Medical Adviser to the Government? About fourteen months. T. P. A.
Stuart, Esq.,
M.D.
806. How long have you been in the Colony? Eleven years.
807. Since you accepted the position of Medical Adviser to the Government, has the insanitary or sanitary state of Parramatta been brought under your notice? It has. 14 Feb., 1894.
808. In connection with the sanitation of the Government institutions, or of the town itself? In connection with the milk supply.
809. Has the proposal before the Committee been explained to you? I have read the evidence taken by the Committee during their previous inquiry; I have conversed with the Chief Medical Inspector and with the Government Analyst on the subject, and I have inspected the various sites, appliances, and material proposed to be used in carrying out the work. I think I know the scheme fairly well.
810. You have a general grip of the whole proposal? I think I have something more than a general grip.
811. *Mr. Hoskins.*] You inspected the site of the proposed sewage farm at Parramatta yesterday? I did.
812. I suppose you saw that there was not very much fall for the sewage from Parramatta to the pumping-station? I did.
813. Do you think that the site selected for the pumping-station is an eligible one, having regard to its proximity to Parramatta and the number of houses in the locality? I do.
814. Do you consider that a nuisance will be caused by the effluvium arising from the sewage when being pumped from this place to a higher elevation? I presume that the pumping-gear will be properly constructed. If it is properly constructed, it cannot be a nuisance.
815. Will you kindly state what you mean by the pumping-gear being properly constructed? That its construction will be of such a nature that the sewage will not be exposed to the air. If the sewage is enclosed everywhere, it is clear that no smell can come from it.
816. Presuming that the well into which the sewage will be emptied before being pumped to a higher level, together with the pumping machinery is properly enclosed, no effluvium will arise which would be prejudicial to the health or obnoxious to the senses of the inhabitants of Parramatta? Certainly.
817. Did you examine the land intended for the proposed sewage farm? I did, and I took away samples of the soil.
818. Did you examine the 22 acres of high land? I did.
819. Do you consider that that is suitable land on which to cast the sewage of Parramatta? I should not say that it is perfect, but I should not say that it is by any means unsuitable. 820.

T. P. A.
Stuart, Esq.,
M.D.
21 Feb., 1894.

820. It has been given in evidence before this Committee that sand is the best agent for purifying sewage and that less offensive odours arise during the purification of sewage by sand than arise during the purification by any other kind of soil. Do you think that the soil on the 22 acres is sufficiently absorbent to prevent offensive exhalations from the sewage cast upon it? If the sewage be cast upon it in proper measure and at proper times, I am of opinion that the soil of the 22 acres is by no means unsuited for the purpose intended. In addition to merely answering your question baldly, I would like to add that when I went to the place, after having read the evidence, I was under the impression that that soil was eminently clayey in its nature. It is difficult to say how I got that impression, but at any rate I had formed it, partly because of the slowness with which the superintendent of the Webb's Grant farm found sewage to filter through it, and partly from the positive statements of witnesses during the previous inquiry of the Committee. I did not care, however, to take their statements; I wanted my own evidence, and therefore I took the specimens of the soil at different levels, and had them analysed this morning. The results of the analysis I hold in my hand. These results come out very much in favour of the soil from the 22 acres, and I am bound to say that I was rather astonished at their favourable nature. The method of analysis adopted was to take 50 grammes of each sample of soil after having freed it from moisture; then the dried soil was put into a dish, and a gentle stream of water was allowed to flow over it, so that the fine particles of silt might in that way be carried off. The soil was treated exactly in the same manner as the gold-miner treats his prospecting samples. The result was that taking the top soil, and I mean by that the layer of loam, varying from 9 to 12, 13 and 14 inches thick, lying upon the surface, there was washed away exactly one-third, leaving two-thirds, of coarse heavy matter at the bottom of the wash basin. This shows that the superficial layer of loam is really a very porous soil. I also took specimens of the subsoil, which I procured from trenches which were, I suppose, 2 or 3 feet deep. I went to a greater depth than that, however, because I dug holes at the bottom of the trenches, and thus got my specimens from the various levels. I find that of the subsoil 12 per cent., that is, about one-eighth was washed away, leaving seven-eighths of coarser material lying at the bottom of the dish. Let us sum up these two results. The top soil had one-third washed away, and the subsoil one-eighth, showing that the amount of silt in the topmost layer is very much greater than the amount of fine clayey silty material in the deeper layer, and proving that on the 22 acres there is fairly good soil for the purposes of sewage purification. That result, I may add, was contrary to my expectation.

821. From the results obtained by testing this soil, have you come to the conclusion that it would be dangerous to health to cast upon the land the sewage of a populous locality, without first putting some other soil on the surface? I should plough up the surface so as to loosen the soil a bit, and then I should put on the sewage. I think the land is, with the precautions already mentioned, not unadapted for the purpose.

822. Do you, or do you not, think that if you did not put any other soil upon the surface of the land, the heat of the summer's sun acting upon the sewage would be calculated to cause offensive odours to be emitted? I repeat the words I used just now. If the sewage be put on the land in a proper way, there will be no nuisance. Of that I am sure.

823. Would you have any objection to state what you consider the proper way of putting sewage on to land? I wanted to get that question out. The proper way is this: You must not put the sewage on continuously. The science of recent years, that is of the last five or six years, shows us that the purification of sewage is not due, as is supposed by most people, to filtration. Incidentally, I may say, that the evidence given in your last report by almost every witness, if not by every witness, seemed to imply that it is by filtration that the purification is carried out. That is not so. The purification is carried out by means of a little organism which inhabits the upper layers of the soil. When sewage is put into the soil this little organism immediately begins to break it up, and after a sufficient time has elapsed, the sewage absolutely disappears. I can give you absolute proof of that from experiments made at Botany. Mr. Hamlet has prepared an analysis of the soil taken from Webb's grant at Botany. If you had seen a section of the ground there, you would have noticed that the uppermost layer is of a dark colour, while the layer underneath is pure sand. If you took some of the dark coloured soil, which has had sewage discharged upon it during five years, you would expect, as I expected, from the colour of it, and from the fact that sewage had been continuously applied to it for so long a period, that it would be highly charged with organic matter. Nothing of the sort. The analysis showed the presence of an increase of organic matter to the extent of .02 per cent.; in other words, after having received sewage continuously for five years, and after having been cropped all that time, the organic matter in the soil had only increased by 1-5000 part, showing that the organic matter of the sewage when poured over suitable soil in the proper way is destroyed by the agency of these organisms.

824. You, of course, admit that the strata of soil and sand at Webb's grant differ from those at Parramatta? They are not so very different. You would not think of putting as much sewage upon the land at Parramatta as you would put upon the land at Webb's grant; but if you only put on a suitable quantity, you would get the same result at Parramatta as at Webb's grant.

825. Whether a sewage farm at Parramatta would be likely to be offensive to the persons living in its vicinity would depend mainly upon the way in which the sewage was placed upon the land? Yes.

826. Then I take it, that it requires great care to properly manage a sewage farm? No, I would not say that. It requires a little experience; but anyone with any sort of intelligence at all—and I presume that the person put in charge of that sewage farm would have intelligence—could manage it properly. If the person in charge had not sufficient intelligence he could be made to do the work automatically by following directions. I would say, let the sewage flow on to the land for six hours, and then allow it to soak in for eighteen hours. If that plan were followed, as a general rule, it is probable that the farm would do its work efficiently for years without causing any nuisance.

827. You have been to Webb's grant, of course? I have been there four times.

828. You are aware that the features of the country, as well as the nature of the soil, at Webb's grant are very different from the features of the country at Parramatta; in the first place the land at Webb's grant is very much isolated, being almost, as it were, an island? So it is.

829. Under such circumstances, might not experiments in the treatment of sewage be carried out with a greater probability of success at Botany than at Parramatta where the land is comparatively level, and there are a number of residences in the vicinity? I do not quite see the drift of your question.

830. *Chairman.*] The isolation of Webb's grant, as compared with the proposed farm at Parramatta, would not make it a more suitable site? Not a bit. If no nuisance arises from the place, it does not matter where it is. If there be no nuisance, why should not people live alongside such a farm.

T. P. A.
Stuart, Esq.,
M.D.

21 Feb., 1894.

831. *Mr. Hoskins.*] Can you say, from your own knowledge, whether in many instances in the old country sewage farms have been found to be very offensive, and even a nuisance? If any nuisance has arisen from such places in the old country, inquiry has shown that the farm has not been properly managed. No matter what you have to do, if it is not properly managed it will be a failure.

832. Your own experience tells you that there is an offensive smell at Botany from the sewage cast upon the land there? That is because Webb's grant farm is not properly managed.

833. You do not consider that the Webb's grant sewage farm is properly managed? In one particular—no; and it is that which gives rise to the smell.

834. In what way is the management defective? It is a very small defect, easily removed; but it is not removed, and therefore there is a smell. The crude sewage comes down the sewer and through the screens, which take out the grosser solid particles. These grosser solid particles have to be scooped up and carried by means of little waggons across the bridge to the farm. When they get there the solid matter is dumped down on the surface of the ground, and is allowed to remain exposed to the air for 3 or 4 weeks before being dug into the soil. This nasty sludgy mass, which is practically all feces, is carried through the open air in these little iron waggons, and these waggons are not properly cleaned out when they are emptied, so that they stink furiously. They should, however, after they have been used, be cleaned out, and then they would not smell. It is a gross mistake to take this stinking matter over to the farm, and dump it down on the surface of the land. Trenches ought to be dug, and the solid matter put into them, and covered over with sand. If it were treated in that way there would be no smell, but it is not so treated, and consequently there is a smell.

835. If the course you suggest were adopted, would the fertilising properties of the sewage be dispersed over the various beds? The sludge, &c. would fertilise the soil where it is buried; but you must remember that a sewage farm is not a place where the utmost good is to be got out of the sewage as a fertiliser. It is intended to get rid of the sewage first, and then, if there can be a little return, well and good. Sewage farms are not established primarily for the purpose of profit.

836. If your suggestions were carried out at Botany,—and you have convinced me by what you have said—the expense of managing that farm would be largely increased? No; I think one man could do the whole additional work, which means, I suppose, £100 a year.

837. You noticed, I suppose, that at Parramatta the lower part of the proposed farm is partly covered with water? I saw the marks of the tide.

838. It is proposed to cover that land with sand, dredged from Rushcutters Bay, and elsewhere in the harbour. Do you think that if it were raised 3 or 4 feet above high-water mark it could be successfully utilised for the treatment of sewage? I am certain of it.

839. Without any offensive result? Quite so.

840. Do you think that not only the residents of the locality, but also people travelling by the tramway, would have no cause of complaint, because of the effluvium arising from the place? I repeat what I said before, that if the farm was properly managed—and I have told you what I mean by that—there would be no reason to apprehend any complaints whatever.

841. You say that you have read the evidence given before the Committee during a 3 years' inquiry;—did you read Mr. Stayton's evidence? Every word of it.

842. I presume that you will admit that Mr. Stayton is an engineer who has given a great deal of attention to sewerage matters? I do.

843. You noticed that he stated that having sunk trial holes, he ascertained that the subsoil was most unsuitable for the reception of sewage, that it would not absorb the sewage, and consequently the surface land would become foul, and the exhalations from it would be offensive to persons living in the locality? So he did.

844. Do you differ from him? I do, and I do not accept his statements.

845. *Chairman.*] Did the specimens you examined come from the holes sunk by Mr. Stayton? Very likely; but I do not know who sunk the holes.

846. *Mr. Hoskins.*] You differ from Mr. Stayton? I do; and in my opinion this is not an engineering question.

847. Mr. Stayton having been the officer principally engaged in carrying out the Western Suburbs Sewerage Scheme, I presume you consider that he speaks with some knowledge of the subject? I am not so sure about that as regards the disposal of the sewage, which is not an engineering question.

848. Did you notice that he stated that he had visited a number of sewerage farms in England? Yes.

849. Did you notice also that he stated that in several instances they were not a success? I can quite easily believe that.

850. Mr. Stayton advocated what is termed a precipitation system, the sewage being treated with chemicals, and the effluent allowed to flow down the river, the solids being dried and sold as manure;—which system do you prefer? I prefer to follow nature, and adopt the sewage-farm system. If we merely follow in the footsteps of nature in this matter, we shall do very well.

851. Can you give me an idea as to which will be the most expensive scheme—to convey the sewage by pipes on to the sewage farm, or precipitate it and dispose of the effluent at the pumping-station? It is an old saying that the shoemaker should stick to his last, and I think I had better not go into finance.

852. I presume you are prepared to say that neither scheme would be likely to prove a nuisance to the residents of the locality if properly managed? I think I may say that.

853. Would you advise the Government to utilise that portion of land you saw yesterday for a sewage farm? Unhesitatingly.

854. *Mr. Trickett.*] Where do you think the effluent from the farm would go—it would come out near the steamers' wharf, would it not? The effluent would get away in two different modes—first, there would be a certain amount of oozing all along the face of the embankment into the water of the rivers; but apart from the oozing, if subsoil drains are cut, a large body of effluent will flow directly through the drains.

855. Do you think that that would be at all objectionable? I am sure that it would not; and I have reason for saying that, because the analyses of the effluent at Botany pass through my hands every quarter, and every time I have visited the farm I have had samples of the effluent procured, so that I know exactly what I am talking of.

856. At times of heavy rain there would be a general overflow from the farm? Yes; but the area of the farm

T. P. A.
Stuart, Esq.,
M.D.

21 Feb., 1894.

farm is so enormously greater than is needed that, even in times of storm-water discharge, it would be far more than equal to the occasion.

857. The departmental proposal is not to utilise the piece of land which you examined so carefully, but to take possession of the big swamp which is to be filled in for the purpose? I think they are right.

858. Do you think that it can be made effective for the purpose of dealing with sewage matter? If it be filled in with the material we saw yesterday at Neutral Bay, I think it will do admirably. I should like to give my reasons for that. First, the material is a coarse sand, which everyone admits is one of the best possible materials for the purpose. Then the presence of a salifiable base is necessary for the activity of the organisms which destroy the sewage. To form that base lime and magnesia are both present in the Neutral Bay sand, for that sand is full of the debris of broken shells. At first I was rather apprehensive as to the salt in the sand. People who have built houses know that if a salt-sand has been used it keeps oozing out of the walls for many years, and consequently honest builders will not use it. I thought that the salt might stick in this sand so long as to impair its usefulness, but I do not think that now, because upon digging down 12 or 14 inches, and taking mouthfuls of the sand, I could not detect the slightest saline taste, and I do not think the amount of salt which I could not taste would be in any way hurtful to these organisms. Finally, when the farm is brought into operation, as I hope it will be, I think the sand ought to be levelled, and a little loam spread over the surface. When you bake a loaf of bread, you put in some yeast as a ferment; and so when you are going to use the sand to ferment the sewage, you ought to sprinkle a little loam over the surface to bring the sand into activity. Everyone who uses such sand-filters knows that for the first ten days or so, according to the temperature, they do not act. They only come into operation gradually; but you may bring them into operation more quickly by sprinkling a little loam over the surface of the sand. I have no doubt that under these circumstances the lower portion of the reclaimed land would be far better suited for the purposes of a sewage farm than the upper portion would be. If you had to procure the site now, I would say, "Do not buy the upper portion, but stick to the reclaimed land."

859. The Department propose to put about 5 feet of sand upon the land? That is above the highest spring tides? Yes.

860. Would that be sufficient for purification purposes? Amply sufficient. If you count the number of organisms that inhabit the soil you will find them mostly in the first few inches. As you get deeper down they become fewer and fewer, until about 5 or 6 feet down there are practically none left; so that if you have 5 feet of soil, you have the necessary thickness. Any soil deeper than that acts merely as a filter, and there is no use whatever for a filter there. A filter can only remove solid particles, which, in this case, have been left high up in the soil.

861. You do not seem to attach very much importance to the effect of the soil in purifying sewage matter? If you take soil and sterilise it, that is to say, if you heat it so as to destroy the organisms to which I have referred, or if you chloroform it so as to suspend their action, it has no longer any purifying effect upon sewage. It is because of the organisms in it that soil is an active agent in purifying sewage.

862. *Chairman.*] Are these organisms in the soil or in the sewage? They are in the soil. They cover the face of the earth, sewage or no sewage.

863. *Mr. Trickett.*] I asked that question because Mr. E. B. Price, who was before us the other day, stated that they had found from experiments at Croydon, in England, and in other places, that strong sunlight had a good effect in the purification of sewage? So it has, and for a very good reason, namely, that the organisms have their best effect at about the temperature of our blood, or at 96 degrees Fahrenheit. When the sun beats upon the surface of the land it warms it up and the nearer it is to that temperature the more perfectly and quickly do these organisms perform their work.

864. The sun does not draw up the offensive smell and spread it round; it rather keeps it down? Yes.

865. It works with the organisms in the soil? Yes; that is so.

866. The hotter the temperature the better for the disposal of the sewage? I do not say that, because the temperature must not be too high. The best temperature is 96 degrees Fahrenheit.

867. I believe that in Croydon, England, there are houses all about the sewage-farm? So I believe.

868. Therefore, it is not likely in this climate, where the average temperature is higher, that a sewage-farm, if a nuisance at all, would be so great a nuisance as it would be likely to be at Croydon? From that point of view, there would be less nuisance here than there. Of course, it must be remembered that I am always assuming that the gross particles will be screened out first. If you have pieces of faeces so big that they will not go into the interstices of the soil but remain on the surface, they cannot be readily dealt with by the organisms; but I assume that the gross solid matter is taken out first.

869. The process of pumping it will probably disintegrate the sewage very much? No doubt, but the big pieces should be screened out first as they are at Botany.

870. I have read in quite a recent number of the *Scientific American*, that they are adopting a precipitation scheme for the sewerage of Glasgow, could you tell us why they are doing that? I do not know anything about that particular scheme; but I think every one is agreed that where you have a sufficient area of suitable land you should adopt the sewage-farm system. If you cannot adopt that system you must fall back upon an artificial process.

871. Then I understand that of the three systems, filtration, precipitation, and farm irrigations you, if the circumstances were favourable, would advocate the farm irrigation? I should not divide them as you do. To use my own words, what I should recommend would be the combination of intermittent downward filtration with sewage farming proper. That is what we have at Botany.

872. There appear to be two systems of farming—broad-acre farming and filtration? Yes, broad irrigation and intermittent downward filtration.

873. In this instance, you recommend downward filtration? Intermittent downward filtration with surface cropping as at Botany.

874. But suppose they went in for broad irrigation? That would require broad acres.

875. And this portion of land would not be suitable? Do you mean the upper or the lower portion?

876. The lower portion? It would be suitable enough, but it would be wasting the land, because you do so much better with the downward filtration. If you can get the downward filtration by all means adopt it. Intermittent downward filtration is very much more efficient than broad irrigation, broad irrigation will not work for more than 100 to 200 persons per acre, whereas intermittent downward filtration at Webb's grant

grant is at this moment working for 1,500 persons per acre, and I have authorities who show that it might work for as many as 3,500 persons per acre. You see that intermittent downward filtration is so much more effective than broad irrigation, that when you can get it, you should by all means adopt it.

T. P. A.
Stuart, Esq.,
M.D.

21 Feb., 1894.

877. Do you think there is any fear of intermittent downward filtration so clogging and fouling the earth as to make it objectionable in time? I have already explained to you how the organic matter is destroyed. If it is destroyed it cannot remain in the soil, and if it does not remain in the soil there can be no clogging. For many years I lived not far from one of the oldest sewage farms in the world—Craigentinny, near Edinburgh. That farm has been in existence for over a century; but there is nothing to show that the inhabitants of the locality suffer from it. I have visited it frequently.

878. *Chairman.*] You were in robust health when living there? I was.

879. *Mr. Trickett.*] I suppose you have not studied the question of the separate and the partially separate system? I have studied it in a general sort of way; but the separate system is now so inapplicable to Sydney, that it is no use considering it further.

880. That is rather a reflection upon the three professional gentlemen who recommended the adoption of the separate system; but still it is more an engineering question? It is an engineering question.

881. *Mr. Hoskins.*] Do you not think it necessary in order to ensure the conveyance of all the solids on to the farm, that a good flow of water should be sent through the pipes? Yes; the more water the better, for this reason, that you will have such an excellent sewage farm that you can dispose of the whole of it. If you had not a good sewage farm, a surplus of water would be a nuisance; but in this case it will be no nuisance.

882. *Chairman.*] The filter will be so good? The filter will be so good. I think it would be wasting money to adopt the separate system. At all events, so far as I am concerned, it is chiefly a question of cost, and therefore an engineering matter.

883. *Mr. Trickett.*] You would go in for what is known as the partially separate system? No; I would go in for the holus bolus system.

884. *Chairman.*] You mean a system similar to that adopted in Sydney? Yes; but I would not send the sewage out into the ocean.

885. *Mr. Neild.*] You spoke of the very small amount of organic matter to be found in the soil at Webb's grant; do you not think that the small quantity observable there is very largely and indeed chiefly due to the cropping of the ground? I think it is—I think it is the small rootlets that have been left in.

886. That constitutes the organic matter? I think so very largely.

887. You think that all the solid matters in the sewage have disappeared? Practically they have all gone.

888. Has that disappearance been due to the sandy nature of the soil or to the growth of vegetation upon the ground? No; it is due to the presence of the organism known as *micrococcus nitrificans*. Your question was framed, I understand, to elicit my opinion as to the share vegetation has in the process?

889. Precisely? Vegetation is not necessary at all. You may have the sewage perfectly destroyed without the growth of the higher plants at all, but vegetation is a help.

890. Have you gone into the financial aspect of cropping sewage-farms? I have.

891. Do you think, in view of the statement you have just made, that you can get rid of the sewage without growing crops upon it, that it is desirable, in the interests of those who have to pay for the farm, to grow crops upon it? Yes, I think it is, because, although you do not get a very great return from the crops, the cropping of the surface helps the work of the organism. The organism and plants have been associated from the beginning, ever since soil was soil. The one helps the other, so although you can have the presence of this organism doing its purifying work without the growth of the higher vegetation on the land, if you have them both, they assist each other.

892. In the case of Webb's Grant, is it not a fact that there is a considerable belt of waste land between the beds on which the sewage is discharged and the water channels that receive the effluent? I do not remember the contour of the land sufficiently; but if there is that belt it is not necessary.

893. Would not the existence of a belt of that kind have some influence upon the purity or impurity of the effluent? It would, by lateral filtration; but if your vertical filtration was sufficient you would not want it.

894. But can you have vertical filtration where, as in the case of the proposed farm, there is, at best, but 5 feet of sand above the high-water level? I have said that the organism lives in that 5 feet, and that vertical filtration below that is not necessary.

895. Will not the presence of water up to 5 feet from the surface compel the transit of the effluent horizontally rather than perpendicularly? Yes; it will take a sloping course outwards.

896. Then you can scarcely, by any possibility, get the same amount of natural filtration at Parramatta that you get at Webb's Grant? Why not?

897. Because at Webb's grant the land is much higher above the water level? Not very much. I do not think it is much more than 8 or 9 feet above the water level.

898. Is not the bridge you spoke of just now quite 14 or 15 feet above the water? Yes, but then it is a good many feet above the land at Webb's grant.

899. That is just where you land, but on the north-western portion of the land the tramway practically traverses the field level? Yes.

900. Having on several occasions visited the farm at Webb's grant, do you know what depth of soil or sand there is free from underlying water? I have this knowledge, that at the place where the effluent is taken, a drain-pipe has been put in vertically. If you look down at the bottom of that pipe you will see water standing there, and without having actually measured it, I should say it was about 4 or 5 feet below the surface.

901. You have spoken of the favourable nature of the soil on the 22 acres and have carefully analysed it, but the tests you applied were necessarily applied to infinitesimal quantities? No. I took 50 grammes at a time. That was only a portion taken out of big lumps which I carried away in my pocket.

902. Is not the fact painfully present in the minds of most colonials that analyses of soils and minerals are scarcely ever borne out by practical results? It all depends—whether there is a mine to be floated, for instance; but the soil we are speaking of was faithfully chosen, faithfully mixed, and faithfully analysed. I think you may depend upon the results of these analyses.

903.

T. P. A.
Stuart, Esq.,
M.D.
21 Feb., 1894.

903. You notice that the Board of professional gentlemen appointed by the Minister to report upon this matter—Messrs. Bell, Chamier, and Wardell,—were unanimous in their condemnation of the 22 acres, and rather than attempt to use that land, they were prepared to reclaim the land south of the proposed farm, and facing Duck River? Yes; but I do not say that the upper portion of the land was better than the lower portion. The lower portion when finished will be very much better than the upper portion; but the upper portion is not so bad as to be useless.

904. You think that all that is necessary to be done to the upper portion is to plough it? I think so.

905. It is not necessary to put in deep drains, and bundles of ti-tree, filling it up with sand, as proposed by the Board? That depends upon the quantity of sewage you propose to put on the land. If you are only going to put a small quantity upon it, you need not make any drains; but if you put a large quantity of sewage upon it, you must drain it. But if you reclaim the 42 acres this upper part will not be required for many years to come. That is why I said that I would not buy the upper portion at all, because the lower portion will be better, and would be far more than ample for the requirements of the district for many years to come.

906. Will there not be a tendency for the effluent from the farm to be retained by the tide at the junction of the Duck and Parramatta Rivers? No; because the body of water there is very considerable. The flow of the tide up and down will take the effluent away.

907. You do not anticipate that the vertical soakage of the effluent would create a nuisance in the vicinity of the steamer's wharf? No.

908. Any fears on that score may be set absolutely aside? Yes.

909. *Mr. Wall.*] Would the discharge of sewage on the farm tend to increase or decrease the micro-organisms you have been speaking of? It would increase them; because it would supply food to them. There will be a time when the land will be absolutely teeming with them, and it will stay like that for centuries.

910. Then, the purifying power of the land would be increased by discharging sewage upon it? Yes. For the first week or ten days after the opening of the farm the land would not be of any use for purification purposes. It will come gradually into use, and will remain at a sort of level ever afterwards.

911. Do you think any bad effects are likely to arise from the consumption of vegetables grown upon the farm? There is not the slightest evidence that bad effects have ever so arisen.

912. The whole of the organisms would have been destroyed? They remain below on or in the ground.

913. At Webb's grant a great quantity of vegetables are inundated with sewage? I do not think so. If you notice, the sewage runs in the furrows between the vegetables, so that it gets into the ground without touching the leaves.

914. Supposing the sewage did touch the leaves of the vegetables, would it be undesirable to dispose of them by selling them? Not necessarily, because the organisms which produce disease speedily die when they are exposed.

915. *Mr. Collins.*] Did I understand you to say that you were residing near a sewage-farm near Edinburgh? No; I did not say that I resided near it, but I passed it frequently.

916. What system was in vogue there? Broad irrigation.

917. What was the area of the farm? I do not know, but the farm was a large one.

918. Did it take the sewage of Edinburgh? It is between Edinburgh and Leith. There is a great area of sea-sand there, just as there is at Webb's grant. The sewage is simply run over the land, which is kept in crop.

919. What do they do with the crops? They feed cattle on them. I do not think they grow anything but grass.

920. Were there any complaints about that farm? None whatever.

921. *Mr. Ewing.*] You have told us that sewage is simply water with a large quantity of organic matter in suspension? I did not say that. Sewage is water with a large quantity of organic matter in suspension and solution.

922. We have no cholera here, but we have bacterial disease—for instance, typhoid? Yes.

923. Typhoid is a bacterial disease? Yes.

924. Is diphtheria? Yes.

925. Is tuberculosis? Yes.

926. We have plenty of these diseases, the germs of which are found in the dejecta of the patients? Say that they are found in the patients. Tuberculosis may, in the latter stages be found in the dejecta.

927. Say in the sputum? In the sputum.

928. Or the dejecta? Say in the excreta.

929. At any rate they come into the sewage? Yes.

930. Water is a great distributor of germs? Yes.

931. Therefore the bacteria get as far as the sewage farm? They may.

932. They either get as far as the farm or disappear in the canals leading to it? Quite so.

933. Are bacterial microbes likely to leave water? No; but if the water is left until it dries up—

934. I wish to leave that aspect of the case until we get to the sewage-farm. These germs get as far as the sewage-farm? Perhaps so.

935. I understand that microbes if they leave the water must attach themselves to sticky walls; they cannot float in the air? No. They cannot rise into the air of their own accord, so to speak.

936. If you cover the walls of a hospital with glycerine, the air would be practically free of them? It might be.

937. The workmen employed in sewers are not affected by them, because they are under their feet, they do not rise? It may be. But suppose we stick to the sewage-farm.

938. I want to ascertain the theory on the subject. It is a fact that dogs and cows take some of these bacterial diseases—diphtheria for instance. The udder of the cow may show evidence of diphtheria? I would not like to answer that question off hand.

939. Would you be astonished to hear it? Not a bit, let us assume that it is so.

940. Well, let us imagine that these bacteria or microbes have got as far as the sewage-farm, it is likely or possible that they may be conveyed on to the leaves of vegetables, take lettuce for example? It is quite possible, but it is not likely.

T. P. A.
Stuart, Esq.,
M.D.

21 Feb., 1894.

941. Why not? Because the sewage is run in furrows between the ridges on which the vegetables grow.
942. But if they happen to flood the land with sewage, in which, from your own admissions, there can be no doubt there are microbes, the microbes would come in contact with what is to become food for human beings, or at any rate cows? Yes.
943. It is quite possible that they might then be introduced into the dairies and into the system of human beings; that is the theory, is it not? I am not going to say yes or no, because, for one thing, I did not say that they would be alive when they reached the sewage-farm. The conditions for the life of these lower organisms in the human body are such that it does not follow that when they leave it they remain alive. Some do, and some do not.
944. You say that, although they get to the sewage farm, and by bad management may get on to the food of cows, and diphtheria may appear among the people who drink the milk of those cows? I did not say that.
945. If the sewage is put upon the cow-feed, which at a certain period of the year is cut and sold to dairy-men, the microbes are there, and the cow may get them into her system, so that the person drinking her milk may contract a disease such as typhoid? There are such a lot of links in the chain, all of them connected by "may" and "if," that I cannot say. If you always argued like that, you would never eat an apple or a pear, and certainly not an ordinary salad. The one clear statement I wish to insist upon is that so far as I know no disease has ever been known to be communicated by vegetables grown on such farms.
946. The microbe seems of such infinite importance sometimes, while at other times he is of no importance at all? There are different kinds of microbes as there are races of animals. There are friendly microbes, and unfriendly ones.
947. *Chairman.*] The unfriendly microbe is presumed to be dead when it reaches the sewage-farm? If not dead when it gets there it very soon dies, in most cases, I think.
948. *Mr. Ewing.*] You say that these microbes get as far as the farm, and there they meet what you might call the bacterial scavenger, the friendly microbe, who is friendly because he attacks dead things, while the other is unfriendly because he attacks living things;—that is your theory? We will put it in this way. The conditions which are favourable for the one are unfavourable for the other, so that the friendly microbe goes on increasing unceasingly, while the other dies.
949. The sewage farm is a filter, and the microbes are either left on the surface or they get below the surface and die, because there is no oxygen there? We will not say that they die because there is no oxygen; we will say that they die.
950. There is no reason for saying that they can live without oxygen? There are two divisions—those which must have oxygen, and those which must not—the aerobic and the anaerobic.
951. You have told us that at 96 degrees Fahrenheit they live well enough? That is these friendly microbes. Your disease germs, your pathogenic organisms, if they are not dead when they get to the sewage farm generally die soon afterwards. The cholera organism, for instance, which you would think had a great amount of vitality, is a very tender organism, and if it is exposed dry to the air for an hour only it is done for.
952. Is it a fact that some microbes—unfriendly microbes—have been found to live five and six months when their environment has been satisfactory? Yes, and much longer than that.
953. They live in jelly for instance. You have not referred to any process which is likely to kill them in their passage down the sewers? No; but if you were under water for five or six minutes, what would you be at the end of that time?
954. But I am not a microbe? But the conditions of your life and its life are not so very dissimilar. The microbe which lives very well in my body, if you take it out and put it into sewage-water may very soon die.
955. Does being carried through the water kill him? It would kill a vast multitude of microbes. It takes two hours for the sewage to get down to Botany.
956. You are aware that the wells in India are very much polluted by cholera germs; these germs live in the water, so it does not appear to me to be clear that microbes are necessarily killed by water? I did not say that they were. I have said that there are microbes and microbes.
957. But you have described the cholera microbe as not having much vitality;—why then should he live after getting into an Indian well? Each microbe has its own conditions of vitality. The cholera microbe is very tenacious of life under proper conditions. It will live in water containing organic matter; but put it into pure water and it dies. If you put cholera microbes into pure running water, they will be dead in a short time; but if you put them into filthy water they live and multiply. In India the natives wash themselves and their clothes in the water of the tanks, and even perform their daily needs of nature in it, so that these tanks become beautiful places for the cultivation of microbes.
958. *Chairman.*] Could not the same thing be said of ordinary sewage water? Yes. The cholera microbe would get in there, and does get in and lives and multiplies there.
959. *Mr. Ewing.*] Suppose a micro-organism—one of these bad or injurious microbes—got in, and was flooded upon vegetable food, is there any reason why he should not get into the human system again? If the human being got the food sufficiently early there would be a distinct danger of it; but the human being either does not get the food, or if he does he probably does not get it sufficiently early.
960. As a scientific man, do you depend upon your sight and smell for detecting bad things;—would you see a microbe that would take your life on a piece of lettuce? Of course not.
961. Your ordinary senses are valueless to you for that purpose? Not entirely. As a rule, things that smell badly are injurious; but that is not the case with everything. Cheese, for instance, smells very badly at times, but I do not think that it is noxious. The sense of smell is a natural protection against noxious things, but it has its limit, beyond which it is, of course, useless.
962. There is no device that the ordinary man of the world can take to protect himself; his senses are valueless to him in dealing with things of this kind, and yet he has only got his senses to depend upon? No man depends upon his senses only. For instance, I very seldom eat a salad, but when I do I like to know where it comes from. I do not merely look at the vegetables and say that they are clean and fresh, but if they come from a Chinaman's garden I steer clear of them.
963. Why? Because it is said, and I believe it is true, that some Chinamen manure their lettuces with the offal from the slaughter-houses, and other organic material. They put the stuff into a tank, and after it has putrified a sufficient time they pour it over the lettuces. Solid matters such, for instance, as hydatid eggs, are very likely to get caught between the angles of the leaves, so that when you eat the leaves you might swallow the eggs, and duly get hydatids.

T. P. A.
Stuart, Esq.,
M.D.
21 Feb., 1894.

964. *Chairman.*] The leaves are watered instead of the roots? Quite so. When I buy lettuce to make a salad I take a brush and scrub the leaves below a water-tap; then I eat it with pleasure. What Mr. Ewing is driving at is this: that disease-producing organisms, if they do get down to the sewage farm alive, are not very likely to get on to the vegetables, and are certainly destroyed by the action of the friendly microbes in the superficial layers of the soil.

965. You would have no objection to eating vegetables coming from the farm? None whatever.

966. Would you drink the effluent? Not as a beverage.

967. *Mr. Humphery.*] It is quite inoffensive? It does not smell, and it has no colour; but there are lots of things that have no smell and no colour which are not good.

968. *Mr. Ewing.*] We have had it in evidence that a sewage farm in a warm climate is more satisfactory than a similar farm in a cold climate, because it can sustain more vegetation; you say that you do not agree with that reason;—do you say that a sewage farm is likely to be better managed in a warm climate than in a cold one? Certainly.

969. Is it less dangerous in a warm climate? Yes; because it is likely to be more efficient.

970. Why? First, because of the temperature. Owing to the higher mean temperature the friendly microbes are more active; secondly, owing to the higher temperature, vegetation continues active all the year round, because you have no real winter. In a cold climate you have frosts which crack the ground, and the unpurified sewage is very apt to go through these cracks untreated. In a climate where you have no frost, and the vegetal life is continuous, the probability is that the sewage will be dealt with quickly and completely.

971. You have stated that there would not be likely to be so many germs left undestroyed in a hot climate, because the higher temperature brings about a better growth of vegetation, and is satisfactory to the friendly microbes? The conditions which are good for the friendly microbes may also be good for other microbes.

972. Where you have your two conditions at the best, at places like the mouth of the Ganges, for instance, you have bacterial diseases endemic, notwithstanding the warm climate and profuse vegetation? But then there are other conditions. I only mention the conditions pertinent to the circumstances of the case. I am dealing with Webb's Grant sewage farm, not with the question generally.

973. You give the favourable conditions as to growth of vegetation and a high temperature? Yes; that is, for a sandy soil.

974. Is it not a fact that cold weather renders these organisms inert? No; it does not, but frost will. If you freeze them they become inert. Short of being frozen they go on working, though they do less and less as the temperature is lowered.

975. Get it low enough and you kill them? Get it low enough and keep it low enough for a long enough time, and the probability is that you will kill them. If you freeze these micro-organisms and then thaw them within a reasonable time, they are just as active as ever.

976. A typhoid microbe would not be? Provided they have not been too long frozen. It has been proved that typhoid has been conveyed by means of ice; therefore, it does maintain its vitality under freezing.

977. Yet it is generally supposed to be killed by cold? But because some retain their vitality, it does not follow that all retain it. One microbe after freezing might remain alive, and it might be quite enough to lead to the disease.

978. With regard to the difference between a cold and a hot climate, at the mouth of an Indian river it is warm, while the conditions are similar in regard to rivers entering the China sea; but these rivers contain cholera germs every summer, which die out in the winter; they seem to live only for half the year? Yes.

979. Therefore, in a cold climate the germs are likely to be inert for half the year? Yes; but the other conditions here are different, and I do not think you can properly make any comparison.

980. The point is that cold weather renders the germs inert, but still it is not a dominant thing? It is not absolutely dominant.

981. *Chairman.*] Are the friendly microbes a recent discovery? I think they have been discovered within the last seven or eight years.

982. How is it that while inquiries into the disposal of sewage have occupied previous Committees, this is the first time that the beneficent work of the friendly microbe has been made so prominent? That hinges upon a question put by Mr. Hoskins. I said that the matter of the disposal of sewage was not an engineering question. You have had engineers before you on previous occasions, but never a biologist. Engineers should merely carry out what the biologist teaches, in the actual disposal of the sewage, though it is entirely the business of the engineer to collect that sewage.

983. The general impression in regard to sewage farms has been that the vegetation is the prime cause in disinfecting and preventing injurious results? That is an entire mistake.

984. But it has been the general idea? Quite so. It is these organisms which prepare material for the plants. Hitherto people have believed that the plants could take the material up themselves, but now it would appear that they cannot. If you put a plant into sterilised soil it cannot grow, it only begins to grow when the friendly organisms come.

985. How do these organisms get into pure sand like that which you have at Neutral Bay? These organisms are floating about in the atmosphere. They are blown about by the wind, and a very few falling upon suitable soil will germinate and begin to multiply. Therefore, I said, sprinkle a little loam over the soil, so as to get the first seedlings of these organisms.

986. *Mr. Humphery.*] At Parramatta there are 42 acres of land to be built up, at very considerable cost, by the addition of some 5 feet of sand, which is to be obtained at Rushcutters' Bay? I am not aware of its being done at great cost. I understand that the work is to be done in any case. The sand may as well be deposited there as taken out to sea.

987. I understand you to say that there are at present 22 acres which could be utilised by ploughing for the reception of sewage? That is so; but that land, although it might be utilised, would not be so suitable as the lower portion when finished.

988. Would it be suitable for the immediate reception of sewage, assuming the Committee recommended the scheme placed before us? Yes; provided you did not put too much on.

989. What quantity of sewage could safely be discharged on to that land? Any answer I might give would be mere opinion.

990. What is your opinion? I should think that that land might receive the sewage of 500 people to the acre.

T. P. A.
Stuart, Esq.,
M.D.

21 Feb., 1894.

991. So that the 22 acres would receive the sewage of about 11,000 persons? Yes; the population of Parramatta is about 14,000 I believe.
- 992-93. We have been told that it is 12,000? Well you could nearly treat it all on the upper portion.
994. If you took a considerable time to prepare the 40 acres, the 22 acres could be immediately utilised. Would they be sufficient to take the drainage of Parramatta for a period of years? Yes; I think I would try the experiment; but the evidence shows that in the ordinary course of events the 40 acres could be filled in with the proper material to the proper level within 12 months. You must finish your reticulation before you can use the farm, and therefore the filling in is likely to be finished as soon as you are ready to use it. The sooner the land is filled in the sooner it will be washed by the rainwater, and therefore, the sooner it will become ready for a sewage farm.
995. Knowing the conditions, what do you recommend, that the 22 acres be immediately used, or that the 42 acres, which are at present subject to tidal influence, should be built up with sand to a height of 5 feet above the water-level, and made use of? I recommend the filling up of the 42 acres immediately, so that when the reticulation is complete it may be used for the purpose of sewage purification. I would not use the upper portion of the land at all, for it is not needed.
996. Knowing all the conditions under which it is proposed to make the sewage farm, and having read the evidence, you are of opinion that it will be better to use the 42 acres than the 22 acres? Clearly.
997. So that the 22 acres may be left alone until it becomes necessary by reason of the increase of population to extend the farm? Quite so. I would like to add that in the evidence something is said about the better kind of crops which you will get from the upper portion of land, but I have already pointed out that that really does not matter, because a sewage farm is not a commercial thing. One would not think of starting a sewage farm in order to make a fortune, and the crop grown should be regarded rather as a help to the process of purification, than as a means of making money.
998. With regard to the effluent that will flow into the Parramatta River, is there the slightest probability of its increasing the impurity of the water? I think that it will increase the purity of it, because the effluent will probably be nicer than the stuff that is there already.
999. *Mr. Davies.*] Yesterday you visited the locality of the proposed farm, and followed the proposed pipe-line, which is close to the present tram-line? I did.
1000. You saw the fascine embankment, about 2 feet high, which has been made by the Department? Yes.
1001. And you saw the embankment all along the tram-line;—I suppose you know that that is to form the embankment of the proposed farm? Yes.
1002. At present, it is about 2 feet high, and runs close alongside the tram-line right down to the steamers' wharf? Yes.
1003. You are aware that the Department propose to raise that embankment to about 5 feet above high water? No, they are not going to raise the embankment; they are going to raise the filling in behind the embankment.
1004. Are you not aware that they are going to raise the whole face of the farm 5 feet above spring-tide? I think it would be useless to do that, and I imagine that you are mistaken.
1005. You are aware that the land at the present time, is only 18 inches above high-water mark at the highest point? No; it is nearly 2 feet.
1006. It would be necessary to put 3 feet of soil upon that? Yes, 3 feet of additional soil behind the embankment.
1007. Not on the face of it? No; they are going to make a batter. The fascine bank is as high as it is going to be.
1008. Will there not be a large amount of percolation through this batter? No; I forget what the critical angle of sand is, but I think the batter will extend about 5 feet behind the embankment.
1009. Will not the effluent draining through the batter cause an injury to the tram-line? No, because the sewage farm will not be carried right up to the very edge of the land.
1010. Do you not think that the farm would greatly injure the adjacent property? No, not in the slightest degree.
1011. Have you read the report of the Commissioners who inquired into this scheme? No; I have not seen it, and never even heard of it.
1012. You are not aware that their report caused this matter to be again referred to the Committee? No.
1013. You have already been told that the Commissioners have recommended the separate system for the treatment of sewage? I do not think I have been told that.
1014. If they have recommended the adoption of the separate system for the sewerage of the town of Parramatta and the Government institutions there, because by keeping out the storm-water they will be able to reduce the size of the pipes, and in that way the cost of the work, do you think it would be wise for the Department to adopt their recommendation? You tell me that three gentlemen have made a certain recommendation, and ask if I approve of it. Before replying I want to know who the men are, what their qualifications are, and what the evidence before them was.
1015. They took no evidence themselves, but merely dealt with the evidence taken by this Committee during a previous inquiry. Here is a copy of their report? The Commissioners say, "But as all the conditions necessary to make sewage farming successful are present in the case at Parramatta, we found no difficulty in arriving at a unanimous decision in its favour, as we consider it the simplest, cheapest, and best method of meeting the requirements." So you see they are distinctly in favour of the sewage farm. The other question dealt with by them is an engineering matter, a question of pounds, shillings, and pence. If it is cheaper to have the separate system, I say have it; if it is cheaper to adopt the other system, adopt it.
1016. You believe that the separate system would be more effective? That is an engineering matter. I think I had better keep within my own province. It does not matter much to me how you get the sewage on the farm; it does matter how you treat it there.
1017. *Mr. Hoskins.*] You say, take as much water as you can? Yes; on the whole, dilute sewage is better than concentrated sewage.
1018. *Mr. Davies.*] You have several Government institutions at Parramatta under your control? No; my predecessor had; but he was Inspector-General of Insane.
1019. You are aware that there are a number of public institutions at Parramatta? Yes.
1020. Have you a knowledge of how they treat their sewage? Only a general knowledge. 1021.

- T. P. A. 1021. Do you regard the treatment as effective or defective? I do not know enough about it. They do not come under me at all.
- Stuart, Esq., M.D. 1022. You have told the Committee that you approve of this scheme generally, so long as the sewage is not put on to the beds too frequently? Yes, if it be carried out properly according to recognised principles.
- 21 Feb., 1894. 1023. Do you think that 42 acres will provide an effective sewage farm for a population of from 12,000 to 14,000 people? Yes, and for four times that number.
1024. You think that the people of Parramatta can bear the capital cost, together with the interest on the cost of management? I have nothing to do with that.
1025. Have you any knowledge of the probable cost? None whatever.
1026. Where there is abundance of land, you give the preference to the system proposed to be adopted at Parramatta? Certainly.
1027. You believe that there would be no possibility of injury to public health if this scheme were adopted? I believe that no injury would arise.
1028. There would be no inconvenience? How could inconvenience arise?
1029. From smells? There would be no smells.
1030. You must remember that hundreds of thousands of people travel on the railway line not very far from the farm? They would not be affected.
1031. The farm would not be offensive, nor would it be injurious to health? Not at all. I should like to hand in the analyses to which I have referred, and I should be glad to write out a distinct statement of my views on this subject, because questions and answers are sometimes difficult to follow, and not very satisfactory, and, of course, I have had only a short time to prepare myself.
1032. *Chairman.*] I think the Committee are very well satisfied with the way in which your evidence has been given; but if you wish to supplement it you can do so? I do not wish to supplement it; but I merely thought of preparing a carefully-written, properly-balanced statement, if it would make my views more clearly understood.

THURSDAY, 22 FEBRUARY, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.	WILLIAM CHANDOS WALL, Esq.
The Hon. JAMES HOSKINS.	WILLIAM MCCOURT, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	JOHN CASH NEILD, Esq.
The Hon. JOHN DAVIES, C.M.G.	EDWARD WILLIAM O'SULLIVAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	CHARLES COLLINS, Esq.
THOMAS THOMSON EWING, Esq.	HENRY DAWSON, Esq.

The Committee further considered the proposed Sewerage Works for Parramatta.

John Moore Smail, Esq., M.I.C.E., Engineer for Sewerage, Metropolitan Board of Water Supply and Sewerage, sworn, and examined:—

- J. M. Smail, Esq., M.I.C.E. 1033. *Chairman.*] You are engineer for sewerage under the control of the Metropolitan Board of Water Supply and Sewerage? Yes; I am acting engineer for the Board.
- 22 Feb., 1894. 1034. The sewage farm at Webb's grant, Botany, is under your care? Yes.
1035. *Mr. Trickett.*] On a former occasion you gave evidence before this Committee in regard to the proposed sewage scheme at Parramatta. You were then favourable to the proposal;—do your opinions remain unchanged? Yes.
1036. You still think that of the various processes in vogue for dealing with sewage which would be available at Parramatta the irrigation farm system is most desirable? Yes, the sewage farm system.
1037. Have you had charge of the Botany sewage farm from the beginning? Yes.
1038. Had you anything to do with preparing plans for it before the farm was started? Yes, but the beds were laid out by the late Mr. Oxley.
1039. The whole of the drainage upon the Botany farm was under your personal direction? Yes, I carried out the whole of it.
1040. At the start I think some doubt was expressed as to the size of the reticulation pipes being sufficiently large to carry off the drainage from Surry Hills? Yes; I believe there was some stir about the matter.
1041. What is the size of those pipes? The smallest size for street sewers is 9 inches.
1042. They are reticulation pipes connecting with the main sewer? Yes.
1043. Have they answered all requirements? Admirably.
1044. Do they receive storm-water as well as sewage? No; I eliminate the storm-water as much as I can.
1045. What proportion of storm-water goes into them? We calculate that on the southern slope about one-fourth is sewage, and three-fourths storm-water.
1046. How do you regulate the quantity of storm-water—by taking only the roofs, or by excluding the roofs? We take the backyards and the back roofs of the houses; but even that we throttle as much as we can.
1047. Do you think it desirable to cut off all the storm-water from the sewerage system? Decidedly not. Your question leads up to a vexed subject which has been debated for years.
1048. Which is the best system—the combined or the separate system? The separate system has been split up into the partially-separate system, which we carry out, and what some faddists call, the absolutely separate system, which takes nothing but slop-water.
1049. The question arises very distinctly here, because the three Commissioners appointed by the Government to inquire into the Parramatta scheme, say, in their report dated the 25th July, 1893,—that the total diversion of all rainfall from the sewers should be carried out? I could understand them saying, that there should be a total diversion of rainfall, that is, that the water should be cut off from the roads and streets; but certainly they do not mean to cut off the water falling upon the roofs.
1050. Yes, they do, as you will see if you read the last paragraph of their report, there they advocate the total exclusion of all rainfall? Their object in reducing the rainwater admitted, to the minimum quantity,

quantity is to lessen the cost of pumping; and then, too, the less water you have the smaller you can make your pipes. I think, however, that it will not be considered advisable for practical reasons to put a sewer down with a diameter less than 9 inches.

J. M.
Smail, Esq.,
M.I.C.E.
22 Feb., 1894.

1051. The Commissioners to whom I have referred were specially appointed to give the Government the benefit of their opinion, and, of course, it is entitled to considerable weight. I would point out that they say that by the exclusion of rainwater the cost of construction would be materially reduced, and also that the sewage would be much more valuable upon the farm if the rainwater were kept out? It is only in rainy weather that the sewage in a partially separate system would be diluted; under other conditions the two systems are alike. We have found out at the sewage-farm that the first shedding, as we call it, that is the first washing that comes down the sewer, is as filthy as the sewage itself.

1052. It contains washings off the streets? The washings from the yards and stuff taken out of the gutters, pigeons' droppings, and so on. That has been our experience at the inlet house, where we have had an opportunity of watching the sewage.

1053. Do you think the total exclusion of the rainfall, with a proper system of sluicing at regular intervals, would be desirable? No; I should say admit a small portion of the rainwater.

1054. With what object? To flush the drains.

1055. It is a very common remark at the time of heavy rain, "Oh, this will do a lot of good by flushing out the drains." The rainfall is admitted to the sewers with the object of flushing them? Yes.

1056. The Commissioners state in the last paragraph but one of their report that the exclusion of the rainfall will reduce the cost of the work by 25 per cent. Since then they have made the saving 20 per cent.;—do you think that their estimate is a correct one? I think that the proportion is a very large one; but I should not like to give an expression of opinion until I had seen the calculations. As a general principle, if you reduce the quantity of rainwater flowing into the pipes, you can reduce the cost of the larger mains; but I doubt if you can reduce the cost of the smaller mains, because, for practical reasons, it is not advisable to put down less than a 9-inch pipe.

1057. Unless there were a regular system of sluicing, is it not likely that the pipes would become foul? If no rainwater ever went into the pipes, you would have to provide flushing-stations, and supply fresh water to them from the mains.

1058. But if the rainwater were admitted, would you do without the flushing-stations? Yes; special ones. As a matter of fact, I use very little fresh water for flushing under the present system.

1059. At what intervals do you flush? In certain sections the sewers are flushed every week; but the system is so arranged that there is really no expense. You saw on the farm that by putting in stop-boards you could divert the water almost anywhere you like. We adopt a similar plan in the sewers. Each man has a section, and in the man-hole there is a groove cut down in which slides a board. When we want to flush, all the man has to do is to put down the board, and it backs up the water for, perhaps, a quarter of a mile. The men can tell directly when it is time to let go by watching the water rise to a certain point. The board is then pulled up, and the water runs along the sewer, flushing the lower section and cleansing the upper one.

1060. Have you any figures with you showing the increase of the population per acre served by the Botany farm since it was started;—when did it start? About six years ago. On the 31st December there were 34,816 people draining on it.

1061. How many were there at first? Six years ago there were no houses draining on to it.

1062. But I suppose the population has not actually grown very much? The whole of the district which would be served by the farm is not yet connected; but taking the houses already draining on to it, it serves a population of 34,816. The number will be greater at the end of this year, because more houses will be connected.

1063. What area of the farm do you use for treating this sewage? About 33 acres.

1064. Does that include the ponds or tanks, as you call them? Yes; that is the whole area. The population is about 1,024 per acre.

1065. It has been stated that the farm treats the sewage of 1,500 persons per acre? The population was made out at first on the area basis; but in this case I know the number of houses absolutely, so that I think my figures may be taken as correct.

1066. One thousand five hundred might be an over-estimate? Yes; but I daresay before the end of the year there may be 1,500 persons to the acre.

1067. At any rate the soil is quite capable of treating the sewage of 1,000 persons to the acre? Yes.

1068. If, during the next twelve months, the population increases to 1,500 per acre, will you utilise more land? I do not intend to increase the area. The farm is quite equal to treating the sewage of 1,500 persons per acre.

1069. What becomes of the water after going into the tanks if the tanks become surcharged and overflow? The sewage is let into the tanks by means of sluices, until there are about 2 inches of water on the ground. It is then cut off and filtered through the ground until, if it was put on to the upper bed, it sinks into the lower bed. There there is an effluent drain which, like an ordinary subsoil drain, catches the filtered water and discharges it into Botany Bay.

1070. The water ultimately oozes into Botany Bay? Yes; Botany Bay on the one side, and Cook's River on the other.

1071. The same process would take place on the reclaimed land at Parramatta? Yes; I presume so. When we started we were afraid to put in effluent drains, for fear that the filtration would be too rapid. The longer you suspend filtration the purer the effluent. At Parramatta the best way would be to put a margin drain round the fascine bank. That would intercept the water and discharge it into the river at two or three outlets, instead of letting it ooze through, as it would otherwise do.

1072. That would be a pipe-drain? Yes.

1073. *Mr. Neild.* A perforated drain? No.

1074. *Mr. Trickett.* Would it be very expensive? No.

1075. How far would the intervals be apart? The outlets would be 3 or 4 chains apart.

1076. How frequent would you have the inlets to the drain? There would practically be an inlet at every joint, because the drain would be so laid that the subsoil water running above it would filter through into the pipes, and flow along them until it met the main drain at the foreshore, from which it would discharge at the outlets into the river.

- J. M. Smail, Esq., M.I.C.E.
22 Feb., 1894.
1077. The drain round the edge would have to be slightly above high-water mark? It might be above high-water mark, but not necessarily so, because you could have double outlets to discharge either at low or at high water.
1078. But in that case, when the tide is up it would run in? No; you could have reflux-valves, and then when the tide was rising it would close the lower openings. We use these valves in the sewers, and there is no trouble.
1079. How are you situated at Botany with regard to the height above high-water mark? A portion of the land is absolutely below high-water mark, but it will all be reclaimed in the future. The dredgings from the river will be placed at the back of the fascine bank, and it will bring the surface 5 or 6 feet above high-water.
1080. Is all the land you are using above high-water mark—even the swampy tanks? Yes; it is all above high-water mark—that is, the portion utilized.
1081. How much is it above high-water mark? The bottom of the lowest tank would be 4 or 5 feet above high-water mark.
1082. How much would the bottom of the highest tank be? The top tanks, that is the filtering tanks, would be 8 or 9 feet above high-water mark.
1083. Though the lower tanks are continuously being made the receptacle of effluent water, do they still retain their property for purifying what goes into them? Yes, because we crop them occasionally to cleanse them, and aerate the soil. After we had flooded the lowest tank of all, we would probably not use it again for a fortnight, and as the water sinks through the soil the air follows it, and thus the ground becomes ready for another dose.
1084. I suppose in all sewage-farm schemes the intermittent system is generally carried out? Yes, and therein occurs the management. The ground would get foul if you were continually flooding it.
1085. How far is the sewage farm from the nearest populated place? Rockdale is the nearest township, and I should say that it was between 2 and 3 miles away. On the other side of the river is Botany village—it is not more than about a mile distant.
1086. Have you had any complaints from either of these places as to objectionable smells coming from the farms? The only complaint we have had has been from the Rockdale Council, and they were trying to find a smell. I went over the farm with the Inspector of Nuisances, who had been told that the people complained of a smell, and I suppose they naturally went to the sewage farm first.
1087. Was there a written protest from the Council? No; merely the statement that people complained. At Redfern, where I live, there is a smell worse than anything I ever experienced before. We have never had any complaints from Botany.
1088. You have never had any complaints followed up by legal proceedings, or anything substantial of that kind? Never since the farm was opened have we had complaints about it, except the Rockdale complaint, which I consider groundless.
1089. Could you tell us the yearly loss or gain from working the farm? We have to get rid of the sewage, and to prevent the farm from becoming a nuisance men must be employed there to dispose of it properly, by applying it intermittently to the various beds, and so on, keeping the farm clean. To help in this process of keeping the farm clean, and to employ the men, we use the land for raising certain crops. I think the expense of the farm last year was about £800, and the return from it, as supplied to me by the manager, was £333 9s. 11d. The difference between these two amounts is the actual expense.
1090. In estimating the cost of the farm, do you merely take the cost of keeping it going, or do you include the cost of any improvements that are made? Improvements in the shape of fencing would be included.
1091. And any enlargement of the area? No; that work is done by contract.
1092. *Mr. Neild.*] Would the £800 include the wages paid to the employees at the engine-house? No; only the cost of the farm itself.
1093. £800 then is really the expenditure on the south side of the river? Yes.
1094. *Mr. Trickett.*] It does not include the expense of the straining process? No; we keep the two accounts separate, so as to see how we get on with the farm.
1095. What is the expense of the straining? It comes to about £500; but I can let you have that accurately by referring to the pay-sheets.
1096. Have you ascertained what will be the probable expense of reclaiming the Parramatta site? No; I have not.
1097. You have not gone into the cost of the scheme at all? No.
1098. Do you think that that land, if filled in with material similar to that used at Neutral Bay, would be quite as effectual for the purpose of dealing with sewage as the land at Botany? Yes, if the place was properly managed. The whole thing depends upon that.
1099. Yesterday, a witness referred to the deposits of solid stuff upon the ground at Botany creating a nuisance;—would the same thing occur at Parramatta? No; I think not. The straining-basins, and in fact everything connected with the house on the Sydney side of the river, at Botany are necessary because of the syphon. If there were not a syphon the whole of the sewage matter would go straight on to the farm.
1100. *Chairman.*] Will not the pumping-station at Clay Cliff Creek act as a natural barrier against the solids? There they could introduce the system of aerating the sewage. They could force a current of compressed air through it, and so purify it by treating it with oxygen. That is the long process of river purification condensed into a short process.
1101. *Mr. Trickett.*] Is that not what Mr. Stayton advocates? I do not know what he advocates.
1102. He advocates that the system of purification should be adopted at the pumping-station? I do not say that it is absolutely necessary, but it could be done. The stirring up of the sewage will naturally free certain gases; but the sludge at Botany, you must remember, remains in the tanks for three weeks. At Parramatta you will have fresh stuff to deal with, and the sewage will be disposed of before decomposition has set in. Where they have a steam engine at work they could, with very little expense, force a current of air through the sewage, and so get rid of obnoxious smells.
1103. But under that system would not the sewage have to be treated in the open air? I have not looked through the plans; but I believe it would be treated in such a way as not to cause a nuisance.
1104. If some process, such as you recommend, is not adopted will not the pumping of the sewage render it very objectionable? If the sewage is allowed to remain quiescent for any length of time it would become

become a nuisance; but I assume that it will flow on to the farm in a continuous stream, and so long as you keep it in motion it will not decompose,—that is, within certain limits.

1105. The offensive sludge at Botany lies there for two or three weeks? It is three weeks before the tanks are cleaned out. Such a small quantity of sludge is intercepted that it does not pay us to start the engine and clean out the tanks every week.

1106. Would it not be very little more expense if you had the trenches ready dug to receive the stuff, and covered it up at once, instead of allowing it to lie exposed to the air? I consulted the manager of the farm, who knows more about farming than I do, on the subject, and he said that he would require another man if the sludge were treated in that way. It would be right enough if we sent the sludge across every day; but under present circumstances, since he requires the sludge on each bed, it would have to be covered over in the trenches, and then dug out again afterwards. I have got over the difficulty to this extent, that we cover the sludge with a material of which the trade name is ozophone. It is animal charcoal, and really acts as a manure.

1107. Do you think the management of the Parramatta farm would be more expensive or less expensive than the Botany farm? I think it ought to be worked at very much less.

1108. *Mr. Hoskins.*] Including the cost of the pumping-station? No; I do not include the cost of the pumping-station. I call the pumping-station part of the scheme, just as the sewers are part of the scheme. *Mr. Trickett.* I take it, is speaking merely of a farm where the sewage is treated before going into the river.

1109. *Mr. Trickett.*] When a very heavy fall of rain takes place at Botany, you let the sewage go right into the river? No. What we do is this: The men know what is the proper colour of the sewage—though I have an automatic gauge there now—and when a storm takes place they watch the flow until it becomes the colour of rain-water, when it is immediately turned into the river.

1110. That water would have to go through the pipes and the syphon? Yes; but the organic matter is all washed out before anything is turned into the river. The instructions are that when the sewage comes down clear it is to be allowed to go into the river, otherwise it would spoil the crops and the farm. I do not care what system you adopt, if you do not provide for the storm-water on the farm you must let it go somewhere else.

1111. Would it not be offensive to discharge the water into a narrow river like the upper portion of the Parramatta? I do not think so. I make a distinction between the first flow of water and the ultimate flow. The men can tell by the colour when the flow should be turned into the by-channel, so as not to get on to the farm.

1112. In your opinion, the success of a sewage-farm, and its unobjectionable character, greatly depend upon the way in which it is managed? There is no doubt about that. Some of the best sewage-farms in England have been spoiled by bad management; but that does not show that sewage-farms were not adapted for the purpose.

1113. I have lately noticed that precipitation systems are being adopted considerably in England for the treatment of sewage;—do you think that the precipitation system would be suitable for Parramatta? The conditions in England differ from the conditions in this Colony. There the Rivers Pollution Commission have fixed a certain standard for effluent water. No water is allowed to go into the rivers unless it has reached that standard. This is necessary because the people take their drinking water from some of the rivers, and they have to adopt all means in their power to prevent pollution. I suppose that about 120 patents for treating sewage have been taken out during the last twenty-five years; but my opinion has always been that where you are so situated that you can get land for a sewage-farm, the sewage-farm system is the best system to adopt. If you cannot get land you must adopt a chemical process.

1114. Are you prepared to stake your professional reputation upon the statement that, having regard to the narrowness of the Parramatta River at Duck Creek, its torpid character, and the large expanse of mud flat there, the farm is not likely to become a nuisance? I stake my professional reputation on this, that if a farm is properly managed, the effluent being analysed, as it is at Botany every quarter, and steps being taken to keep it up to a certain standard of purity, there will be no nuisance as far as the river is concerned.

1115. And you might say the same with regard to the surrounding district? On the same grounds, yes.

1116. You qualify your answer by saying that the farm must be properly carried out? I refer to the management.

1117. I suppose you mean carried out in the same way as the Botany farm has been carried out? In something the same way; but the soil at Parramatta would be different. You would have to consider the varying circumstances, but practically the two farms could be managed on the same lines.

1118. *Mr. Humphery.*] At Parramatta there are 22 acres above tidal influence, and 42 acres which are to be reclaimed by depositing sand upon them;—what difference would there be between the reclaimed land and the land at Webb's grant? Practically none. If you alluded to the farm as a whole, there would be a difference, because the land above high water is a gravelly clay.

1119. Then the conditions at Parramatta are as favourable as those at Webb's grant? Just so.

1120. You said that the storm-water passing through the pipes to Webb's grant was permitted to run direct into the river when it appeared to be clear;—could that be done at Parramatta, remembering that the Parramatta scheme is a pumping-scheme, not a gravitation-scheme? There would be no difficulty, because they could deal with the storm-water before it got to the pumping-station.

1121. You would recommend that the clear storm-water should be allowed to escape at Clay Cliff Creek before it could be pumped? Yes. I would not pump clean water on to the farm. Whether you adopt the International process or any other, you must get rid of the storm-water, because it is a quantity which you cannot control in the same way as a daily flow of sewage.

1122. Do you think there would be any danger of polluting Clay Cliff Creek between the pumping-station and the river? The overflow would not pollute a saltwater river.

1123. It would depend upon the care taken by the officers at the pumping-station in preventing sewage matter from going out with the overflow? Yes; that would be prevented by proper supervision.

1124. Under proper supervision there would be no objection to the scheme; but careful supervision would be necessary? Yes; but you might say that of any other scheme.

1125. *Mr. O'Sullivan.*] As you are aware, a tram-line runs past the site of the proposed farm;—is there any likelihood of its being damaged by the drainage from the farm, or of the farm becoming a nuisance to

J. M.
Small, Esq.,

J. M.
Smail, Esq.,
M.I.C.E.
22 Feb., 1894.

to those who travel by the tram, and thus allowing the owners of the line to claim compensation? If the tramway were in private hands the owner might claim compensation on very slender grounds; but it does not follow that the farm would be a nuisance because he called it one. I could not guarantee that no claim for compensation could be made; but I say that there would be no good ground for it.

1126. Do you think it likely that the drainage from a farm would damage the permanent way of the tram-line? You mean the soakage water?

1127. Yes? Oh dear, no.

1128. But the farm will be some feet higher than the tram-line? I could not tell you—I have not seen the cross-section.

1129. You think it is possible to take precautions by cutting drains which will prevent the water from getting on to the tram-line? You may be sure that the Construction Department will guard the Government against any possible claim for damage.

1130. If such a claim were made it might materially add to the cost of the work? I do not think there is any danger. The Construction Department will naturally see what is before them, and will take every care to prevent damage to the line. If they did not take proper precaution, they would deserve to have to pay compensation.

1131. You believe that there will be no offensive effluvia from the farm which would be a nuisance to tram travellers if the place were properly managed? I am speaking from six years' experience of the Botany sewage-farm. I do not think that the Committee would say that that is a great nuisance.

1132. I suppose you have read Mr. Stayton's report? I read it when I was first examined by the Committee; but I have not had time to look at it since.

1133. Do you think there is much in the point he raises, that clay is unsuitable for crude irrigation? No; I think it would be better for cultivation than the soil we have at Botany. The manager of our farm there, who is a farmer, has stated that he would be able to raise a totally different kind of crop from such land. What he cannot raise at one place he would be able to raise at the other. As regards the sub-soil, it would have to be drained.

1134. Mr. Stayton says that the filtration area would be likely to be surcharged and cease to purify from want of aeration? If you gave it too much sewage it would become choked.

1135. But that might be avoided? Precisely.

1136. *Mr. Davies.*] Do you regard the Webb's grant farm as being perfectly managed? I do.

1137. We are to take it, as we saw it the other day, to be properly and efficiently managed? Except in this one point, that we have some difficulty in dealing with the sludge, which you will not have at Parramatta.

1138. If a professional witness stated yesterday that he regarded the farm as very improperly managed, as far as the treatment of sludge is concerned, would he be correct? It is not so well managed in that particular as I should like; but we are getting over the difficulty by using a material called ozophone, which absorbs the smell. You must remember that the sludge is allowed to decompose for three weeks in the pits.

1139. Where do you treat the sludge? It is put into the trucks and spread upon the land. The sun dries the top part and absorbs the smell, after which the stuff is taken up again and dug into the ground.

1140. It is not spread upon the ground uniformly, but is dug into it? It is spread in heaps at first, and the men afterwards level it and plough it in.

1141. Then it is free from smell? Yes; you could take it away in your pocket. As Mr. Hamlet has said, the sun and the air are doing all the laboratory work for us.

1142. Where does the sewage come from? The particulars that I gave just now were got out by my draughtsman, who looks after the house drainage. In Paddington there are 1,900 houses.

1143. In what part of Paddington do you start? Up near the Queen-street entrance.

1144. Is not a large portion of the sewage from that locality drained into the ocean? Yes; the greater portion of it. We start from St. Mathias Church, taking the ridge going past the Victoria Barracks to Surry Hills and Strawberry Hills—all the southern slope.

1145. Not Bourke-street? Yes; Bourke-street, as far as Albion-street.

1146. The sewer laid under Mr. Bennett's supervision? Yes.

1147. Was that sewer not enlarged at his instance? No.

1148. Was not the main sewer put down for Shea's Creek enlarged? No; it is the same size now as it was when first designed.

1149. What size is it? Three feet three inches by 2 feet 2 inches, and 3 feet by 2 feet at the other end. It is egg-shaped.

1150. The system of which we are speaking is the partial system—the water from the house-tops is allowed to enter the sewer? Yes; except the water from the front roofs.

1151. You prefer that system to the system recommended by the Commissioners who reported upon the Parramatta scheme? Certainly.

1152. I suppose you have seen their report? I glanced over it just now. It seems to me that it is almost impracticable to carry out the absolutely separate system.

1153. According to the plan before the Committee, the fall of the sewers will be about 1 foot in 300? One in 600.

1154. Do you think that that would be sufficient under the separate system? I do not think that the fall has much to do with either system.

1155. Under a separate system will a fall of 1 in 600 allow the sewage to get away? Yes.

1156. The departmental proposal is to adopt a system similar to that in existence in Sydney? Just the same. We find the system to work admirably.

1157. The Commissioners say that the adoption of the separate system would reduce the cost from 16 to 25 per cent., because the pipes would be smaller;—do you think it would make that reduction? I think I said before that I could not give an answer, because I had not gone into the question; but it is a large reduction.

1158. Can you tell the Committee how it is proposed to raise the sewage at the well-hole, and pump it on to the farm. No, I have not gone into the details of the system; I merely know its general principles.

1159. Would it be possible to lift the sewage and force it on to the farm without creating a nuisance? I say that there should be no nuisance.

1160. The sewage would come on to the farm in its crude state? Sewage has a smell peculiar to itself, but it does not become offensive until it decomposes, and therefore should not be allowed to rest. If you keep it constantly in motion, and get it on to the farm within an hour or two, so that filtration can commence at once, there will be no nuisance.
1161. The sewage from the different houses and public institutions at Parramatta will find its way through the reticulation pipes to the well-hole; there it will have to be lifted several feet and forced on to the farm. Would not that cause a nuisance? There should be no nuisance under proper management.
1162. But there could be no possible treatment of the crude sewage up to its delivery into the well-hole? No; they would not treat it at all; they would take it as it came and pump it on.
1163. Would it be free from smell when so disturbed? I do not say that it would be absolutely free from smell.
1164. Do you not think that there would be a great nuisance when it was disturbed by the pump? I say that there would not be a great nuisance. Nuisance is a matter of degree. What you might consider a nuisance, I might not.
1165. You have nothing to add to the evidence you gave on a previous occasion? No.
1166. Your opinions have not altered in any way? No; and the analysis of the effluent confirm what I have previously said.
1167. *Mr. Hoskins.*] You stated in answer to Mr. Trickett that you believed the expense of managing the Parramatta farm would be less than the cost of managing the Botany farm. Do you make any reference to the cost of the pumping station? No.
1168. The cost of the pumping station at Clay Cliff, together with any disinfecting process they adopted there, would be in addition to the cost of the farm? It would be part of the sewerage scheme I take it.
1169. It would have to be added to the cost of the farm? Certainly not; the people who work at the pumping house will not work on the farm. You must keep your sewage farm account separate. Directly the sewage comes on to the farm it is charged to the sewage farm account.
1170. Though the pumping-station is a necessary part of the scheme? It is just as much a part of the scheme as the sewers are.
1171. *Chairman.*] When last before us I think you stated that, in your opinion, the land at Parramatta above high-water mark was suitable for the purposes of a sewage farm, but not so suitable as the reclaimed land would be? No; not as a filter.
1172. It would not take so much sewage, and would cost much more in the way of subsoil drainage? Yes; it would require subsoil draining, while the other land would not.
1173. Did I understand you to say, in answer to Mr. Trickett, that the smallest reticulation sewer you think desirable would be a 9-inch pipe? Yes; we never lay any smaller pipes, and I am confirmed in the opinion that it is not desirable to do so by the nature of the substances we occasionally take out of the pipes.
1174. With the experience which you have gained, do you think there is any point where you could reduce the expenditure of your farm? Yes; in this way. The Board have carried the farm beyond the experimental stage, and have found out what it can do; I should advise its being leased at so much an acre, one man being kept to see that the sewage is properly disposed of, and that the person who worked the farm did not create a nuisance.
1175. Do you think you would have offers for the farm if you proposed to lease it? We have had any number of offers for the farm at Botany. A gentleman called to-day and wanted to know if we would lease the farm; but at present it is under offer to the Agricultural Department.
1176. Your Department has placed it under offer to the Agricultural Department? Yes; at £200 per annum. They are to manage the whole place, and all we are to do is to employ a man to see that the thing goes on properly. Then a Board connected with a village-settlement scheme has offered to take the farm.
1177. Has the Agricultural Department expressed any opinion as to the rent you ask being too high, or too low? No; they have expressed no adverse opinion.
1178. Do you expect to receive £200 a year from them if they take it over? We do.
1179. Have you had any private offer to rent the farm at anything like £200 a year? Of course, you deal with a Government Department on different grounds from those on which you deal with the general public. It would not do for us to accept the offer of one man for the place. Assuming that our transaction with the Agricultural Department falls through, all we have to do is to throw the farm open to lease by tender, under conditions of which the Board shall approve. The man who takes it over will have to work the whole farm, we providing carriage of the sewage, and he must not create a nuisance. If we find that he is creating a nuisance, we shall have power to come in and terminate the lease.
1180. You would have to maintain the station on the northern side of the river? Yes.
1181. Is the Board favourably considering this proposal? Yes. It does not pay us, as a Government Department, to grow cabbages on the land with men working eight hours a day.
1182. You think that in private hands, the farm could be managed more economically? Yes with a profit to the man who managed it.
1183. *Mr. Neild.*] With reference to the pumping stations near Parramatta; would the pumping be done in such a way as to prevent the escape of smells and gases to the outer air, or would it be carried on in a hermetically sealed chamber? If they adopted the Shone system, the sewage would be dealt with in a covered vessel, hermetically sealed, except when the compressed air was let out by a valve, but that could be treated so as to cause no nuisance.
1184. How? It could be passed through the fire.
1185. There would be a smell if the Shone system were not used? It is a question of degree. Of course there would be a smell; there is a smell from a tub of soap-suds. There would not be any great nuisance.
1186. Would it be possible to have the pumping carried on in the immediate vicinity of private dwellings without creating a nuisance? I think so. Before concluding my evidence, I should like to correct a statement made by Dr. Anderson Stuart, in his examination yesterday. He said that the only nuisance that came under his notice during his visits to the sewage farm at Botany was the smell from the trucks which conveyed the sludge from the inlet-house to the farm. He gave it as the reason of that smell that the trucks were never washed; but that is not correct, because every day after they have been used, the trucks are washed out by means of stand-pipes which have been provided for the purpose.

J. M.
Smail, Esq.,
M.I.C.E.

22 Feb., 1894.

- J. M. Smail, Esq., M.I.C.E.
22 Feb., 1894.
1187. Professor Anderson Stuart suggested that the sludge should be covered over in trenches? No doubt that would be the proper way to treat it, but it would be very expensive. The quantity of sludge with which we have to deal is, however, decreasing, and in 1893, it was 800 tons less than in 1892.
1188. How do you account for that? A great many gulleys in the different municipalities were at one time connected with the sewers, more as a matter of convenience, but as the various Councils constructed their own storm-water drains we cut them off, and in this way we get rid of a great deal of silt.

John Carruthers, Esq., Acting Superintending Engineer of Dredges, Department of Harbours and Rivers, sworn, and examined:—

- J. Carruthers, Esq.
22 Feb., 1894.
1189. *Chairman.*] How long have you been connected with the Harbour and Rivers Department? For twenty years.
1190. Have you been connected with the dredging department all that time? Yes; and I have had to do with the tug boats.
1191. Do the dredge masters keep an accurate account of the quantity and quality of the silt dredged, and of the place where it is deposited? They keep an account of the quantity.
1192. And where the stuff is deposited? Yes.
1193. Do they make returns showing the cost of dredging and disposing of the silt? No; they do not keep any returns as to the cost. That is done in the head office.
1194. As Acting Superintendent of Dredges, can you furnish the Committee with the cost of disposing of silt at various points? It costs about 3d. a ton to take it from Sydney out to sea.
1195. After it has been delivered into the punts? Yes.
1196. That includes the wages of the punt crews, towage, &c.? This is the cost of towage only.
1197. What does it cost per ton to deposit it upon any reclamation area within Port Jackson (say) Neutral Bay? At Neutral Bay and other places it has averaged about 2½d. a ton.
1198. Was that work done by hand-barrow labour, or by pumping? By a sand-pump.
1199. Does the distance you have to tow the punts before disposing of the silt enter largely into the cost of disposal? Not very much. One or two miles do not matter much when you have a steamer towing.
1200. What is the 2½d. for? That is the cost of lifting the silt by means of a sand-pump, and putting it on the land.
1201. What does it cost to tow it from the dredges and dump it alongside the sand-pump? I suppose it would cost from 2d. to 3d. a ton; it would depend upon the distance it had to be taken.
1202. How far do you reckon it, (say) from Darling Harbour to your dumping ground in the Pacific Ocean? It would be about 12 miles.
1203. In and out? Twenty-four miles in and out.
1204. That costs 3d. a ton? Yes.
1205. How far do you call it to Neutral Bay and back? It would be 6 or 7 miles going and coming.
1206. Would the distance from where you are dredging, to the junction of the Parramatta and Duck Rivers, be equivalent to the length of the journey out to sea? About the same.
1207. Some dredging has been done lately off Darling Point, Rushcutters' Bay? Yes.
1208. Do you know whether they intend to dredge any more there? Yes; I believe it is intended to remove a quantity of sand from there.
1209. How far would you call it from there to the Duck River? I should think it would be 9 or 10 miles.
1210. The return journey would be 20 miles? Yes; it might be a little more or a little less.
1211. It would be much the same as going out to sea? Much the same.
1212. Roughly we may estimate the cost of delivering silt dredged up from Darling Harbour at the site of the proposed sewage farm at Parramatta at about 3d. a ton? Yes.
1213. Do you know the area that is to be reclaimed there? I have heard that it is about 66 acres.
1214. Can you tell us roughly how many tons of silt would be necessary to make the reclamation, carrying it up to a height of about 5 feet above high-water mark? I could not tell you just now.
1215. According to your estimate, it would cost 3d. a ton to take the silt alongside the sand-pump, and 2½d. to put it on the land by means of the sand-pump, or 5½d. altogether? Yes; or 8½d. for dredging, towing, and pumping ashore; but the cost would be increased if the sand-pump had to pump it more than 1,000 feet.
1216. What does it cost for the sand-pump to deposit the silt at Long Cove? It would cost a little more there because the distance is greater.
1217. Another farthing a ton? From a farthing to a half-penny a ton.
1218. Then it would be better for us to be on the safe side and say 3d. in the case of the Parramatta reclamation, making the total cost 6d.? Yes, for long distance.
1219. Now what would it cost you a ton for dredging? About 3d.
1220. Has much of the silt dredged from the harbour been taken out to sea lately? Not lately.
1221. It is practically all used for these reclamations? Yes.
1222. Not only because towage is cheaper, but also because of the value of the reclaimed land? Yes; when you are towing to sea there are a great many stoppages owing to the bad weather.
1223. *Mr. Humphrey.*] Are the dredging operations constantly proceeding throughout the year? Yes; but last year there was only one ladder dredge working in Sydney Harbour.
1224. Is there one dredge constantly at work in Sydney harbour? Yes.
1225. If you had not some place inside the harbour to deposit the silt you would have to take it outside? We should have to take it out to sea.
1226. The estimate of the cost of delivering the sand on to the proposed reclamation which you just gave was exclusive of the cost of building up fascine walls and the labour necessary to move the sand-dredge alongside the farm. You merely spoke of the cost of pumping and delivering the sand? My estimate is for all expense connected with sand pump, but exclusive of fascine dykes.
1227. Exclusive of any other work in connection with the farm? Yes.
1228. You have no information as to the cost of the other work? No.
1229. Where did you get the sand delivered on to the Neutral Bay reclamation? Principally from Rushcutters' Bay.

1230. Was any further work necessary at Rushcutters' Bay? Yes; It would be a great benefit to have the bank of sand which exists there removed, so as to enable vessels to anchor there in bad weather. A great many vessels go there to anchor in bad weather. J. Carruthers,
Esq.
22 Feb., 1894.
1231. How many tons a day can you deliver from a dredge? About 1,900 tons. Two of the dredges now working in the harbour would lift about 1,900 tons each.
1232. That would be nearly 4,000 tons? Yes.
1233. Could you deliver 4,000 tons daily at the proposed sewage farm at Parramatta? Yes. Of course, accidents might sometimes occur; but that would be about the regular thing.
1234. *Mr. O'Sullivan.*] In giving your estimate just now what description of dredges had you in view—sand-pump dredges or bucket dredges? I was thinking of the "Neptune," the sand-pump dredge which was employed at Neutral Bay.
1235. Is that the latest design of dredges? There is the "Groper." She is used more for breaking up fresh ground. The "Neptune" will only lift loose matter.
1236. How does her work compare in cost with the Von Schmidt dredge at Long Cove? We have not yet got the cost of that dredge worked out.
1237. Is it under your supervision? Yes.
1238. Do you find it a better and cheaper dredge than the ordinary sand-pump dredges? She is better adapted for breaking into new ground. She would cut her way through a stiff bottom when the others would not. If there were any clay amongst the silt the sand-pump dredges would not lift it.
1239. You get a better result and a larger amount of work done by the Von Schmidt dredge? I do not know that the result would be better in lifting pure sand.
1240. But you would lift more for the labour employed? I do not think there would be much difference.
1241. *Chairman.*] What dredge do you personally superintend? The "Sydney."
1242. What are the running expenses per day? I have never calculated them.
1243. Are not very elaborate reports and tables made out annually showing the cost of each dredge? I cannot carry them in my mind, but they could be obtained.
1244. Do you know what is charged when the dredges are hired by private individuals? I think that £30 a day is charged for the "Sydney."
1245. There are several grades are there not—£30, £20, and so on? Something of that sort. I have never been on the dredge when she has been hired out.
1246. Do the Department expect to make a profit from the hiring of their dredges? No; they simply pay working expenses, interest on capital and depreciation.
1247. Then £30 a day must be the cost of running your dredge? Yes; if that is what is charged. I think that is the charge.

James Walter Grimshaw, Esq., M.I.C.E., Supervising Engineer, Department of Harbours and Rivers,
sworn, and examined:—

1248. *Mr. Neild.*] I believe you have a knowledge of the cost of fascine work. Do you know the fascine work that has been done at the junction of the Duck and Parramatta Rivers? Yes.
1249. Was the work under your charge? It was under Mr. Williams' charge. I was his assistant.
1250. Can you give the Committee any particulars as to the cost of that work? 3s. to 3s. 6d. per cubic yard is the usual cost of fascine work including everything.
1251. What width do you usually build it? It varies very much indeed.
1252. What is the width of the fascine work already erected? I think in this instance, it is about 6 feet on the top, and about 15 feet at the bottom.*
1253. What is the depth? About 8 feet.*
1254. Would it average 8 feet all through? Yes.*
1255. That is 36s. per lineal yard? Yes; I could ascertain for you the exact cost of the work, which I think would be more satisfactory.*
1256. Does your answer apply to the fascine bank erected at the Duck River? It applies to fascine work generally. I believe it would apply to this work.
1257. In your experience, has the percolation of water a tendency to jeopardise the integrity of fascine work by undermining it? Yes.
1258. You cannot absolutely guarantee the integrity of fascine work? Yes, but accidents may always occur.
1259. Can you state an instance where slips have occurred? Yes; we have had a great deal of trouble with slips at Long Cove.
1260. What was the cause of the slip—the water percolating through and taking the sandy material with it? No, that can scarcely be said to have been the cause. It was more due to the nature of the bottom, which is a very soft slimy mud, and allows the bank to settle and slip forward.
1261. *Chairman.*] Was not the slip to which you refer caused by the dredge deepening the channel below the fascine bank? In some degree.
1262. *Mr. Neild.*] It is proposed to discharge the silt from the punts into the river in front of the fascine work, and then put it on to the land by means of sand-pumps. Will there be any risk of this operation causing the bank to slip in the way you have just referred to? It is just possible that a slip may occur, but not probable.
1263. By the injudicious use of the sand-pump? Yes; but it would not carry the whole bank away. It might affect 20 or 30 feet; but it would settle, and we could build it up again.
1264. But you lose your original line where a slip occurs? Sometimes; but usually we can get the bank back into line.
1265. By what process? By giving it rather more batter.
1266. You get the top back? Yes, we get the top line straight.
1267. *Mr. Humphery.*] Scaling it off on the map, how many running yards of fascine work would there be at the proposed site? I am not sure that there will be a fascine bank along the tramway company's land; I think that is an earth bank. According to the map there will be about a mile of bank, but the greater part is earth bank only.
- 1268.

J. W.
Grimshaw,
Esq.,
M.I.C.E.
22 Feb., 1894.

* NOTE (on revision):—Referring to questions 1252 to 1255, I find the average measurements are:—Top width 7 feet bottom width 19 feet, and height 9 feet; cost 35s. per lineal yard.—J.W.G., 27/2/94.

- J. W. Grimshaw, Esq., M.I.C.E.
22 Feb., 1894.
1268. Are we to understand that the cost will be about 36s. a yard? The work has been actually carried out, with the exception of a small gap, so I think it would be fairer to refer to the figures themselves.
1269. You could estimate pretty closely the exact cost of the fascine work shown upon the plan? No, I could not, because there are no soundings.
1270. But you could furnish a statement of what the work has cost, and what it will cost? Yes.
1271. *Mr. Ewing.*] Were you working at the fascine bank on the southern boundary of the farm? I think the greater part of that is an earth bank.
1272. *Chairman.*] Will you furnish the Committee with a statement of the cost of the fascine work up to date, and an estimate of the probable cost of completing what is yet undone? Yes.
1273. *Mr. Trickett.*] In making out your statement, will you separate the cost of the bank along the Duck River, because that would probably cost more than the rest. We do not want you to average the cost.
1274. *Mr. Collins.*] What is the life of fascine work in a place like this? Mr. Williams told me that on one occasion, when repairing a dam at Liverpool, he found that some of the fascines in the foundation were still perfectly good, although they must have been there from fifty to sixty years.
1275. Do you think that this work will last fifty years? I think it would last that time if it were repaired and kept in order; but if it was not touched, and no accident happened to it, it would possibly last twenty years. We have no actual experience that I know of.
1276. That is taking into consideration the sewage stuff that would get in amongst it? No; I have not taken that into consideration.
1277. *Mr. Neild.*] The air had probably been excluded from the fascine material in the Liverpool dam? Yes.
1278. If it had the action of the air and the elements to contend with, as is the case with the bank, it would not last so long? No doubt that would shorten its life. That is why I say that this work will probably live about twenty years.
1279. A fresh in the river might undermine the bank and bring it down? Yes; it might.
1280. Supposing the residuum of chemical works escaped from the sewage farm, might it not have an effect upon the ti-tree? Yes; but I do not know the full details of the scheme. I do not know whether chemicals would get into the fascines.
1281. Is there not a considerable discharge of chemical matter into the Duck River at the present time. Is not the upper portion of the river foul with chemical and manufacturing refuse? I have not noticed. Where we were working at its junction with the Parramatta River, this discharge was not noticeable.
1282. *Mr. Humphery.*] When you say that the life of fascine work is about twenty years, do you mean that it requires renewing every twenty years, or that it would have to be repaired at the end of that time? I think under ordinary circumstances it would be kept in repair, and if defects were noticed they would be put to rights. I think if the bank were filled in behind it would last twenty years.
1283. Would it be wholly destroyed in twenty years? I think it would be pretty well destroyed in twenty years if it was not repaired during that time.
1284. *Chairman.*] But applying the stitch in time theory, it might last for thirty or forty years? Yes; I think it would last pretty well for ever. This bank can at any time be faced with stone, should it be considered desirable.

TUESDAY, 27 FEBRUARY, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTON.

The Hon. JAMES HOSKINS.

The Hon. FREDERICK THOMAS HUMPHREY.

The Hon. JOHN DAVIES, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

THOMAS THOMSON EWING, Esq.

WILLIAM CHANDOS WALL, Esq.

WILLIAM McCOURT, Esq.

JOHN CASH NEILD, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES COLLINS, Esq.

HENRY DAWSON, Esq.

The Committee further considered the proposed Sewerage Works for Parramatta.

George Henry Stayton, Esq., M.I.C.E., sworn, and examined:—

- G. H. Stayton, Esq., M.I.C.E.
27 Feb., 1894.
1285. *Chairman.*] You were for some time connected with the Sewerage Department of the Public Service of New South Wales? Yes.
1286. You have frequently appeared before this Committee as a witness in connection with various schemes for dealing with the sewage of Sydney and its suburbs? I have.
1287. You were also examined by the Committee some fifteen months ago in connection with the scheme now under consideration? I was.
1288. Have you before you the evidence taken during the present inquiry? Yes; up to the 14th of February.
1289. Have you read the evidence of Professor Anderson Stuart? No; I had not seen it until a few minutes ago.
1290. In the evidence which we have taken, some doubts have been expressed, I think, concerning the theory you propounded during a previous examination? I gather that there has not been so much doubt as difference of opinion.
1291. Do you still adhere to the opinion that the sewage of Parramatta cannot be disposed of without creating any public nuisance, without an intermediate system? I am strongly of that opinion.
1292. Carrying out the original proposal, without the aid of precipitation? I am afraid I can hardly answer that question, because, I take it, the proposal now before the Committee is somewhat modified and improved, as compared with the scheme which was before them, when I was last examined. It is clearly stated now that there is to be not only a reclamation of the low-level area, but that the ground is to be raised to the height of 5 feet above high-water mark, by putting selected material upon it.
1293. If the reclamation takes place in the manner proposed, do you think the land will be capable of absorbing all the sewage of Parramatta, without creating any nuisance to the public? I think it is quite possible that it would take the sewage of Parramatta for some years to come, but I only say so on the ground

G. H.
Stavton, Esq.,
M.I.C.E.
27 Feb., 1894.

ground of expediency. What I mean is this:—According to the report before me, it appears that £6,000 has been already expended in acquiring the site of the proposed outfall works, and therefore the proposal might, on the ground of expediency, be more favourably considered. In saying that, however, I am bound to adhere to my original opinion—and I do so all the more strongly—that such a course would mean a large unnecessary outlay.

1294. You submitted an estimate of the cost of the International system of purification when last you were examined, did you not? I did; but I am afraid that I have not those figures before me now.

1295. Do you think the proposal of the Department would be more expensive than the International system which you recommended on a previous occasion? I do clearly.

1296. Have you any idea what the difference in cost between the two systems would probably be? I prepared an approximate estimate, and I think that between making this area of 60 acres fit for receiving the sewage of Parramatta for some years to come, and setting up the International process, as indicated in my report, there would be a saving of nearly £20,000 in the initial outlay.

1297. Have you any estimate of the cost of the proposed scheme before you now? Yes.

1298. Will you give it to the Committee? It is, as I said before, only an approximate estimate. I am taking, as nearly as I can, the figures that have already been placed before the Committee. It appears that £6,000 has already been paid for resuming the land, and for other work. It also appears that it will be necessary, within a few years, to prepare 42 acres, and to underdrain 20 acres more. It will be necessary, in addition, to fill in to the 5-feet level, which would be a very costly undertaking; but I understand that it is not to be charged to the sewerage of Parramatta.

1299. *Mr. Hoskins.*] Who says so? The evidence shows that the work is to be done by the Harbours and Rivers Department, and not charged for by them. In addition, there would be the construction of duplicate rising mains, which the evidence shows would cost about £15,000, bringing up the outlay in connection with the filtration area to £33,000. On the other hand, if the International system were adopted, there would be a saving of the cost of the rising mains, and a saving in connection with the pumping-station, because the lift would not be nearly so great, and therefore the power of the engines could be reduced proportionately. I put that down at the sum of £2,000. Upon the other hand, to establish precipitation works which would be sufficient for the population of the place for some years to come, would not entail an outlay of more than £15,000. Deducting from this the £2,000 to which I have referred, you get £13,000, and that, taken from £33,000, shows a saving of £20,000.

1300. *Mr. Wall.*] Do you question, in any way, the estimate of the Department? No.

1301. You think that the work could be carried out for their estimate? I have every confidence in the estimates and prices of the Department.

1302. Taking those figures as representing the cost of the work, you think the International system could be adopted at a cost of £20,000 less? I do, clearly.

1303. You have not made any estimate of the cost of the different works if the International system were adopted—any detailed estimate? I have to a certain extent, but I have not got it with me. I have some of the latest information with regard to the cost of the system as received from England. At Macclesfield, a town with a population of 40,000, it is proposed to adopt the International system in connection with their existing sewerage works. At present the discharge is into the river, and creates a great nuisance, and the authorities, therefore, propose to construct tanks to purify the sewage on the system to which I have referred, at a cost of £10,000.

1304. *Chairman.*] How is it being dealt with now? They have no tanks at all now. They had an irrigation system there which proved a failure. It fouled the river, and was the cause of complaints.

1305. You cannot give us any details as to their irrigation scheme—as to whether it failed from the unsuitability of the soil, or an insufficient area, or from any other reason? No; I am afraid I have not that information at my fingers' ends.

1306. *Mr. Wall.*] You know the site of the pumping-station? Yes.

1307. Do you think that the pumping of the sewage would cause any nuisance to the adjacent institutions? Not the least. I know several pumping-stations in England which have houses all round and close to them, and there has been no complaint whatever of any smell arising from the pumping. The sewage is not exposed at all.

1308. Then the whole question is reduced to the difference of cost between the two systems? No; there is a very important element beside, and that is efficiency.

1309. But I understood you to say that the proposed system, with the alterations outlined by the Department, would deal efficiently with the sewage of Parramatta? It would deal with it for some years to come. The system could be arranged in such a manner that the sewage could be so taken without creating any serious nuisance. But with regard to the relative merits of the actual purification done by the two systems, there is an immense deal to be said in favour of the International system. I have information here which, if the Committee wish to hear it, would inform them what is being done in this matter, and what immense strides have been taken since the subject of sewerage was last before them.

1310. *Mr. Hoskins.*] Will you kindly furnish the Committee with the information you speak of? I would remind the Committee that in the report I made in 1891 on the subject of sewage purification in England, after my visit to the old country, I mentioned the various systems in use there—irrigation, precipitation, and all the other systems at all known and commanding respect. I said that the International process had been invented in 1887, and had then been adopted in fifteen places. At the present time it has been adopted by over 100 towns and public institutions. Amongst the towns that have adopted this system—the members of the Committee will know that some of them are populous places, and some not so large, are Acton, Devizes, Hendon, Evesham, Loughton, Leicester, Nuneaton, Pendlebury, Norwood, Southall, Huddersfield, Reading, Worcester, Guildford, Bury, Oldbury, Birkdale, Stone, Sutton, Walsall, Maidenhead, Eton, Woking, Tenby, Adlington, and Horsham, and within the last twelve months the system has been adopted by a number of other places. In October last the city of Bath, which you know is a large town, adopted the International system for their outfall works. In August, Salford, after experiments with twenty different processes extending over several years, also adopted the system.

1311. *Chairman.*] Chemical processes? Chemical processes. The International Company offered to treat the whole of the sewage coming down at 30s. per 1,000,000 gallons. In October last, Conisborough and Keynshaw, and in December, Sutton in Ashfield, and Eiland in Yorkshire, also adopted the system.

- G. H. Stayton, Esq., M.I.C.E.
27 Feb., 1894.
- That shows that it has gone ahead by leaps and bounds, far and away beyond any other system that has been adopted in England since 1890.
1312. Any artificial system? Any other system at all.
1313. *Mr. Wall.*] Is it generally admitted by sewerage experts, that where land is available, the best method of treating sewage is to deal with it on farms? Undoubtedly so. I have said all along that where a sufficient area of suitable land is available, one of the best and simplest systems of purification is the sewage farm system. The various authorities on the subject, one and all, say that, given a sufficient area of suitable land, there is no system as simple, as good, and as effective.
1314. If we assume that when the reclamation at Parramatta is completed there will be a sufficient area there, the only question between the proposed system and the International system is the cost of procuring the land? Assuming that the first supposition is correct; but that is where I am at issue with the evidence which has been submitted to the Committee.
1315. There is one other point: When you were last before the Committee you submitted some tests that you had made in connection with the suitability of the sand or soil for filtration purposes; we have since had evidence before us showing that sewage is disposed of by certain micro-organisms which exist in the soil, and therefore the question of filtration is not of so much importance as it was reported to be; the evidence before us goes to show that if sewage is discharged upon land in sufficient quantities—not too much being put on at a time—the micro-organisms in the soil will dispose of it? Yes; I quite agree with that statement.
1316. In your previous evidence you say that the cost of both systems would be the same up to about the pumping-station, and that any saving would be effected between the pumping-station and the farm? Yes; the outfall portion.
1317. You estimate that saving at £20,000? That is so.
1318. If the International system were adopted, the effluent, after filtration, would be discharged into the river at or about the site of the proposed pumping-station? Close to there. The effluent would be perfectly clear—as clear as the water in the bottle upon this table.
1319. Does the £20,000 extra to which you have alluded include the cost of the sewage farm? Yes. As I explained just now, I include the cost of raising the land 5 feet.
1320. Assuming that the land was resumed at its market value, the difference between the two systems would be £14,000—that is, excluding the cost of the farm? No; I have excluded the £6,000 in my estimate.
1321. But the farm would remain as an asset to the Department—the saving would be £14,000? Yes; but the land would be an asset for what it is worth. That would make the saving £14,000.
1322. *Mr. Sutor.*] You visited the site of the proposed farm, and took away some samples of soil? Yes; but that was eighteen months ago.
1323. Can you give us any information as to how you treated that soil? I do not think I can throw any fresh light on the subject beyond what was stated during the previous inquiry. The soil was simply got from the holes on the ground and brought to Sydney and submitted to the Committee. I did not treat it, or make any experiments with it at all.
1324. *Mr. Ewing.*] When giving evidence on a previous occasion, you were of opinion that some chemical process of treating the sewage was necessary, and you favoured the International system? Yes; as being the cheapest.
1325. In preference to any broad irrigation scheme—in preference to a sewage farm, in fact? Only because of the way in which it was proposed to prepare the land. No one system can be given as the best in all cases. Every place must be considered on its own merits, regard being had to the local conditions. The conditions at Parramatta at that time were certainly not favourable to the treatment of crude sewage in the way proposed. I then tried to find out what would be the next cheapest and most efficient system to resort to, and, seeing what was being done in England, I recommended the International system.
1326. *Mr. O'Sullivan.*] I gather from your evidence that you think the scheme now before the Committee, with the improvements you have indicated, a suitable one for the purpose designed? It would be suitable for some years to come. I could not go beyond that.
1327. Is it worth our while to recommend a scheme only for a few years? One rule observed by all engineers in devising a drainage system for a town is to make preparation for at least twenty years ahead, and I say clearly that in this scheme proper provision has not been made for twenty years ahead—that is, assuming that the figures are correct, and that the population in the future increases at the same rate as it has done in the past. If the population does not increase at that rate, the land will take the sewage of the district for some years to come.
1328. I understand that even if 5 feet of sand is placed upon the land, and other improvements are made, it will not deal with the sewage twenty years hence, though it may do fairly well for a few years? That is so. It might be thought expedient to proceed however.
1329. That is, the land having been purchased, and various expenses incurred, you think it better to go on with the scheme, which may last for a few years, than to adopt a new scheme;—is that the position you take? That is the position, and it may very well be so considered by the Committee.
1330. Is it what you recommend? I am not going back on my own views, which are very clear on the point.
1331. Did you read the evidence of Professor Anderson Stuart? No; I have not had an opportunity of doing so, except so far as the newspaper report is concerned.
1332. I presume that you are posted up in the literature of the subject? I believe so. I have sufficient evidence here to keep the Committee going for a long time if necessary.
1333. Have you noticed the great stress which has lately been put upon the existence of organisms in the soil that are likely to prove destroyers of the sewage matter? Yes; I noticed what Dr. Anderson Stuart said on the subject.
1334. Do you agree with his theory? I think there is no question whatever that the sewage is attacked in the manner he has stated, but I do not quite see how it applies so strongly to this particular proposal. Every sewerage engineer knows that the evidence of thorough purification is the absence of smell on the sewage farm. You may talk as you please about microbes and bacteria, but it all comes back to the practical question, "Is there a smell?" If the farm is a nuisance, then, either the soil is not suitable, or too much sewage has been put upon it, or there has been neglect somewhere. I do not attach any special importance

G. H.
Stayton, Esq.,
M.I.C.E.

27 Feb., 1894.

importance to what has been said about microbes, though it is very interesting, and I have no doubt that we shall hereafter hear a great deal more on the subject from the chemist's point of view. In considering the matter from a practical and engineering point of view, the first test we have to apply is the presence of a smell.

1335. Who are likely to be the better judges on these matters—scientists like Professor Anderson Stuart, or engineers like yourself? I submit that one set of opinions ought to be put alongside the other, and both are deserving of equal consideration. In my own case, I submit that having from the time I was fifteen years old had daily acquaintance with sewage farming and sewage purification, I have the whole thing at my fingers' ends. A medical man may be ever so clever from a theoretical point of view, and his opinions in that way may have great weight, as I have no doubt they would have, but the practical experience and common sense of an engineer should also weigh very materially. I saw it stated in the press that Professor Anderson Stuart had said that it should be no part of an engineer's duty to consider what the soil was, or he gave some such answer as that. I was simply amazed when I saw the statement.

1336. *Chairman.*] I am sorry you have not seen the Professor's evidence, and I think it only fair to him, as well as to yourself, to point out that I do not think he put it in that bald way. He said that the constituents of soil would be better described by a medical man than by an engineer? Of course that is a very different thing. I only went by what I saw in the *Daily Telegraph*.

1337. *Mr. O'Sullivan.*] Do you think that a practical engineer like yourself, who has had a great deal to do with sewerage works, is a better judge of these organisms and their power, and the quality of the soil, and the influence of sewage upon it, than a man like Professor Anderson Stuart? I do not mean to say that I am a better judge of organisms, or microbes, or bacteria, than he is, because it would be impertinent of me to say such a thing; but I say that an engineer would be a better judge of successful purification and of the working of a sewage farm.

1338. Does not the whole thing hinge upon a knowledge of the power of these microbes; if their work is successful the purification must be complete, but if they are not successful the engineer may not have been correct in his calculations? This is a matter which has come to the front only within the last few years, and whatever else it has done it has not altered the fact that on most sewage farms there are at times smells. In some cases you will find the smells very bad indeed, and a very serious nuisance. I cannot myself see how it practically affects the matter, whether a medical man says that the microbes will thrive or purify better here or there, because we know from experience in what soils sewage purification is best carried on.

1339. But where a small smell has arisen may it not have been caused by bad management? Bad management would mean the setting in of putrefaction, and putrefaction causes a stink.

1340. But might not that be apart from the microbes or bacteria? It would show that there was something wrong on the farm requiring investigation, and an engineer of any standing would know at once what was the matter and how to rectify it.

1341. Dr. Anderson Stuart was so strong on this point that I should like to emphasise it; he admits that a smell may arise from these farms when they are improperly managed, but he contends that when properly managed there is no danger to health from them? I know most of the sewage farms in existence in England, and I can truthfully say that the smells on them are at times very bad. Even at the well-known Croydon farm at Beddington I have experienced the most foul smells.

1342. Notwithstanding these smells, is it not a fact that villas have been built on the hills overhanging what we would call the gullies situated on the farm? No; not the lower portion of the farm. There are very few houses there, and it is all flat country.

1343. But do not houses overlook the farm? They may overlook it; but they are at some distance from the place I am speaking of. I lived in the district for some years, and I know it as well as I know George-street.

1344. Did you visit it when you were in England last? Yes; several times.

1345. Mr. Price, who has just returned from England, tells us that there are residences quite close up to the farm? There are some, but not many. Dr. Dupré, F.R.S., the well-known chemist, lives at Sutton, and Mr. Dibdin, who is the chemist of the London County Council, also lives there. We were neighbours there, and used frequently to pass through the farm together. In the paper noticed by Mr. Hickson in his report on the Parramatta sewage scheme, Dr. Dupré, discussing the Berlin sewage farm, made this statement:—

It had been said that sewage farming created no nuisance. That might be the case in Berlin, but it would not be so in London. Beddington sewage farm had been brought forward as one of the best in England. When Mr. Dibdin and he, after last Tuesday's meeting, were on their return to Sutton on the line which passes through the sewage farm, and while they were engaged in conversation, not on the subject of sewage, they both suddenly exclaimed, "What is that?" It was a terrible odour coming in at the window as they were passing Beddington sewage farm. He had noticed that whenever he had passed Beddington sewage farm on a warm calm evening the smell was exceedingly offensive, and any inhabitant of Sutton going home in the evening would tell the same tale.

1346. Is the farm at Croydon as well managed and carried out as the farm at Webb's Grant? I have had no opportunity of seeing Webb's Grant for some years; but it is simply a huge filtration area, whereas at Croydon the system of broad irrigation is adopted—an altogether different system.

1347. *Mr. Davies.*] Did you read the report furnished to the Minister of Works by Messrs. Wardell, Bell, and Chanier? Yes.

1348. You noticed that they recommended the separate system? Yes.

1349. Do you approve of that system? I do not.

1350. They say that by its adoption from 16 to 20 per cent. would be saved in the cost of the reticulation pipes and sewers generally? Yes; I noticed that.

1351. Do you place any value upon such a recommendation for a town like Parramatta? I totally and emphatically disagree with the recommendation.

1352. You would not, under any circumstances, recommend the separate system for the treatment of the sewage of a place like Parramatta? I certainly would not.

1353. You would make the pipes large enough to take a portion of the storm waters in order to carry off the sewage? Yes, the partially-separate system.

1354. There is no point in connection with that report which you regard as of any great value in assisting this Committee to arrive at a conclusion? There is, to my mind, a very considerable difference, which I do not think is fully realised, in the quantity of sewage proposed to be put upon the land at Parramatta. That is where I join issue.

1355.

G. H.
 Stayton, Esq.,
 M.I.C.E.
 27 Feb., 1894.

1355. As far as your opinion goes, the whole objection is in regard to the want of sufficient area to carry on the system of broad irrigation? Of course it is well known that the sewage of only a certain number of people per acre can be dealt with under the broad irrigation system. With the intermittent downward filtration system, a very much larger quantity of sewage can be dealt with per acre, according to the quantity of the land. When last examined, I stated that the sewage from 100 to 200 persons could very well be disposed of by the broad irrigation system on an acre of land at Parramatta, but that nothing like 800 per acre should be thought of in connection with an intermittent downward filtration system, and I still adhere to that opinion.

1356. Would you be surprised to learn that we have had evidence during the present inquiry from the officer controlling the sewage farm at Webb's Grant that that land receives the drainage of from 1,000 to 1,200 persons per acre? I am not at all surprised to learn it, because I know that such a thing is perfectly practicable. But that system should not be continued for an indefinite period. In some of the towns in England where sewage has been similarly treated, the filter-beds have, after a time, become partly inefficient, and in some cases, the system has had to be entirely superseded. You can, for perhaps two, three or five years pour an enormous amount of liquid sewage upon the filters, but the time will come when you will have to desist, and in order to prevent mischief you should never exceed what is a fair quantity.

1357. That is to say, the filter-beds become so charged with sewage matter that they will not perform their proper functions? Yes; after a certain period they will not perform their proper functions.

1358. On the table before you are bottles containing a sample of the soil at Webb's Grant, which has never been treated with sewage, and another sample of soil which has been continually treated with sewage during five years;—do you detect any offensive smell from the second sample? No; I do not notice any difference between them.

1359. Taking the population of Parramatta at 12,000 or 13,000, and supposing this land were raised 5 feet above high-water level by sand being thrown upon it, what do you think would be a sufficient area for the proper and efficient treatment of the sewage of the place, not for a period of five, ten or twenty years, but for all time? My opinion is that the 62 acres of land at Parramatta would provide for a population of over 22,000, if treated partly by the system of intermittent downward filtration, and partly by broad irrigation.

1360. For all time? Until the population exceeded 22,000; but it has been estimated, if I remember rightly, that the population of the place will ultimately increase to 48,000.

1361. Have you checked the estimate of cost for the whole of the departmental scheme? Not a second time. I went over it before I was last examined.

1362. Do you remember the figures which you gave to the Committee when last examined? I am afraid that I cannot recollect them now.

1363. From your general knowledge of the scheme, can you give the Committee any idea of what the reticulation and preparation of the sewage farm, together with compensation will amount to? No, I could not do that, because I have not any of the plans or sections before me.

1364. You could not form any general opinion from the plan before the Committee? It would be impossible.

1365. You are not able to give the Committee any information on that score? No.

1366. You are aware that it is intended to pump the sewage on to the farm? Yes.

1367. I think I understood you to say that no smell would arise from the disturbance of the sewage at the pumping-shaft? There ought not to be any, nor do I think there would be any.

1368. And you think there would be no offensive smell or injury to health from the treatment of the sewage upon the farm? I think it extremely probable that there would be smells at times under certain atmospheric conditions, but if the population does not increase beyond 20,000, I do not think there would be any serious cause of complaint.

1369. Do you think that during the summer months the farm would be a nuisance to passengers by the southern and western trains? I do not think so; but it might possibly be a nuisance to passengers by the tram and steamer, though there ought not to be any serious nuisance.

1370. What course ought to be adopted to prevent or minimise the smell? I have already stated my opinion that the whole of the sewage of Parramatta could be otherwise treated, which could be done without creating the least smell.

1371. By the International system? Yes.

1372. But suppose the scheme before us were adopted, what should be done to secure the residents in the vicinity against any nuisance arising from the farm? It could be prevented by precipitation. The solids could be precipitated in the first instance, and only the effluent allowed to go upon the land.

1373. Where should the solids be precipitated—before the sewage got to the pumping-station, or after it had left it? At the head of the farm.

1374. That is to say, you would have a screening-tank there? No, a precipitating tank. Whatever ingredient was chosen for precipitating the solids would flow into the tank together with the sewage, and the solids would be deposited on the bottom.

1375. How could they be treated afterwards? They could be dried and pressed.

1376. And used on the farm? Yes; or sent away to agriculturists and gardeners.

1377. Would it not be necessary to use chemicals to destroy the offensiveness of the solid matter in the tank? No; all these operations could be carried on without any smell whatever. At Acton, where the International system was first adopted, in 1838, they are now building houses, bringing in a rental of from £40 to £50 a year, which is perhaps equal to a rental of £80 to £100 here, all round the works. That is proof positive that no nuisance arises from the treatment of the sewage.

1378. You are speaking of the International system now, not of the sewage farm system? Yes.

1379. I am asking you questions with reference to broad irrigation on the land it is proposed to reclaim and build up at Parramatta;—you say that the solid matter obtained by precipitation could be pressed and then taken away? It could be pressed into cakes by machinery, and then would be perfectly dry.

1380. And free from any offensive smell? Yes; and it would have a value.

1381. Which, in your opinion, would be the most costly, the International system, treating all the sewage near the pumping-station, and running it into the river after it had been filtered, or the departmental proposal? The departmental scheme.

1382. Which, in your opinion, would be most effective, and would cause least smell? The International system, unquestionably. It is a system that can be carried on in all weathers, whether it is dry or wet, cold or hot. Its effect is exactly the same under all these conditions, and I do not think anything stronger could be said in support of it, especially in view of the result of the important tests that have been made. It has been clearly proved that the purification is effectual. I have before me the result of a test instituted to ascertain the power of polarite to remove organic matter and disease germs. A filter charged with polarite was working for several months near Paris, and in October, 1892, samples were taken from the filter and sent to the Paris Municipal Laboratory. Mons. Girard reported, in regard to those samples:—

Bacterial colonies (including disease germs if present), per cubic centimetre..... 13,000.
Bacterial colonies, per cubic centimetre, after filtration through polarite None.

Polarite filters are working in Paris, and at several other places in France, and the experiments to which I have just referred proved clearly that impure water, containing bacterial colonies, passed through polarite, is quite cleared of them. I could give you recommendation after recommendation by distinguished engineers and chemists as to the absolute certainty of the system. It has never been given up when once adopted, and is gaining friends every day. I cannot say anything stronger in support of the system, and had I been designing this scheme I should not have hesitated to place it first.

1383. Then I gather that you are strongly in favour of dealing with the sewage of Parramatta by the International system as against any other process? I am; because I know of no system that would be so effective for that particular place. Of course, I could not say the same thing for the next inland town or any other town. Every place must be judged by its situation and requirements.

1384. Taking all the surroundings of Parramatta, you consider the International process the most effective for treating the sewage of that place? Yes.

1385. Of course you admit that the best way of treating sewage, when practicable, is to discharge it into the ocean? Yes; when that can be done without creating a nuisance.

1386. That is the cheapest and most effective way of dealing with it? Yes.

1387. *Chairman.*] Do I understand that if it were possible you would discharge the sewage into the ocean or some tidal water, and that next in order of preference would come the chemical system of treating it? No; that would be a contradiction of my former evidence.

1388. I understand that you would give the preference to a system of discharging it into the ocean where practicable, and next, if a suitable area could be obtained within convenient distance, the system of treating the sewage upon the land? Yes.

1389. If neither system could be followed, you would fall back upon a chemical system—the International system first? Yes.

1390. *Mr. Davies.*] But at Parramatta it would be impossible to put the sewage into the river without creating a nuisance, and that would not be prudent? That is so.

1391. But you say that if you had a sufficient area of land, the sewage of Parramatta could be effectively treated by broad irrigation? Yes; to a certain limit.

1392. But the best system under the circumstances is the International system? That is my opinion, emphatically.

1393. I think in your former report you recommended that the sewage should be treated at the site of the proposed pumping-station? At a point a little nearer the river.

1394. You propose to run the filtered sewage into Clay Cliff Creek? I did not propose to treat the sewage at the site of the proposed pumping-station; I intended rather to take the sewer along the road leading to the river.

1395. *Mr. Neild.*] You will not use the creek, but would lay a line of pipes down the road to the river? Yes; and discharge the sewage into the river below the water level.

1396. *Mr. Davies.*] The discharge would not create a nuisance? It would be similar to the effluent in the bottle upon the table.

1397. You know the tram-line running almost parallel with the pipe lines? Yes.

1398. If the proposed farm is reclaimed, and the land built up to 5 feet above high-water mark, will that tramway be in any way endangered or impaired? No; I should not think the reclamation would make the slightest difference to it.

1399. Would it not be affected by the percolation of the water? I think not. The difference between the 5-foot level and the present surface would be very gradual. I suppose it would run out at 30 or 40 feet. It would slope out very gradually, and the bank would probably be turfed, so that it would be scarcely appreciable at the margin.

1400. You do not think any injury would arise to the tram-line? No.

1401. Do you think that if an objectionable smell was created by the spreading of crude sewage on the farm, the shareholders in the tramway would be injured thereby? I have already stated that it is possible under certain atmospheric conditions there will be smells.

1402. *Chairman.*] But not of a serious character, you say? Not of a serious character.

1403. *Mr. Davies.*] I understand that you have, to a certain extent, modified some of your objections to the departmental scheme, because of the proposal to raise the embankment and to reclaim some 42 acres of land? I do not know that I have done that. If the Committee will allow me to read the fifth conclusion I came to when previously examined, it would pretty well state my position. What I said then was this:—

That if by reason of the land having already been resumed for the proposed farm at Duck River, it is considered necessary to adhere to the original proposal, I am strongly of opinion that such scheme should not be permitted, unless the method of treatment is supplemented by the before-mentioned process of precipitation and filtration, nor unless a satisfactory assurance be obtained that the reclaimed area will be filled in with suitable materials to a height of at least 5 feet above mean high-water mark, spring tides, as shown upon the accompanying sections.

1404. The evidence shows that that has been clearly provided for;—now comes the question, What population will the present scheme serve? I submit, after having given the matter great consideration, that it would not be safe to assume that the sewage of a greater number than 22,000 people could be poured upon the land. If the population of the place increased beyond that number, and possibly before that, it would be absolutely necessary, either to enlarge the farm, or to resort to precipitation, or some other process for reducing the density of the sewage before it was applied to the land.

- G. H. Stayton, Esq., M.L.C.E.
27 Feb., 1894.
1405. If the population became too big, and the International system had to be adopted, all that would be lost to the State would be the sewage farm? £14,000 would be lost.
1406. That is the farm, plus the reclamation work? No; the farm, plus the reclamation, would come to more than that.
1407. The reticulation and the sewer service in the town would be just as useful for the International system if the land on the sewage farm became surcharged with sewage and useless? Yes.
1408. *Mr. Hoskins.*] I gather from your evidence that in most places where there are sewage farms, there are occasionally, under certain conditions of the atmosphere, very offensive smells? That is so. No doubt the Committee have often heard of the Edinburgh farm, but I think they would have been shocked if they had seen the condition of the things there as I saw it. Still, although there is a very objectionable smell, no serious illness has arisen. The black sewage runs in a water-course right across the land, and the tenant, who has a long-standing lease from the authorities, takes what sewage he thinks fit. If he does not want the sewage, he allows it to run straight into the sea. That sort of thing could not be tolerated in this country, although it is allowed at Edinburgh. At three or four towns within the last eighteen months sewage farming has had to be supplemented by precipitation. They have gone on with the farm until they could go no further, and have then had to adopt another system. At my native city, Coventry, where the works were ample, they, within the last nine months, have had to entirely reconstruct their disposal works, and in several other places they have had to resort to the system which, it has been foreshadowed, will have to be adopted here, namely, the precipitation system.
1409. The experience of other countries is that in course of time sewage farms must be supplemented by other systems? Some of them have been. I could give you the names of several such places. It has been done at three or four places within the last twelve months.
1410. If many of these farms become a nuisance under the atmospheric conditions existing in the mother country, do you think that similar places would be more likely to become a nuisance under the much higher temperature of the atmosphere here? I think so, unless they were very carefully managed. I do not anticipate that there would be any trouble on such land as that at Webb's Grant for many years to come, because the amount of sewage delivered there now, compared with what will come down when the whole of the western suburbs scheme is in operation, is very small. They will eventually, however, have to deal with a large volume of sewage, and then great care must be exercised.
1411. *Chairman.*] They treat the sewage of 1,000 persons to the acre now? To my mind, that is very unwise, and should not continue. Mr. Roebling, speaking of the Berlin sewage farm, which is supposed to be the latest and an altogether model institution, and has been largely discussed and referred to throughout the sanitary engineering world, says:—
- There can be no doubt that the rest obtained by the land plays a most important part in sewage-farming, and too much stress cannot be laid on this fact, as upon it largely depends the success of any farm. From the experience gained on the Berlin farms, it may be concluded that not more than from 2,000 to 3,000 gallons of daily sewage flow should be allotted to each acre, a state of things which practically prevails on the northern farms.
- So you see that his idea as to the amount of sewage which you can put upon a farm is very different from the idea in regard to Webb's grant, and I am convinced in my own mind that the system pursued there will have to be very much modified as time goes on. At present you might apply the sewage of 2,000 persons to an acre of that land, and it would deal with it, but the time will come when you will have to go back. This all arises out of the question of the different climatic conditions. In Berlin, in the summer time, they have extremely hot weather—a much higher temperature, I believe, than we have in Sydney—while it is very cold in winter.
1412. Berlin farm is on a sandy plain? The farm to which I refer is of enormous extent—17,000 acres or something like it, and mostly sand.
1413. It therefore offers great facilities for the treatment of sewage? Yes.
1414. I gather from your evidence that you think the day is not very remote when extra care will have to be used at Botany to prevent the sewage becoming a nuisance? At any rate, extra care will have to be exercised to perfectly purify the sewage in the first instance. If that is not done it will be a nuisance; but the position of the Botany sewage farm and the position of the proposed Parramatta farm are very different.
1415. Did you understand, when you were first examined, that it was proposed to raise this land by depositing sand on it to the height of 4 or 5 feet above high-water mark? I did not understand that in 1892.
1416. Supposing sand was deposited on the land to the height of from 4 to 5 feet, how long do you think the area could be safely utilised as a sewage farm without its becoming so foul as to be of no value for purifying purposes? I think that under proper conditions it could be used with only occasional cause of complaint—no serious cause of complaint—until the population draining upon it numbered 22,000 persons. I could not tell you how long that would be. I take the number of persons, because that means a certain volume of sewage. I would not dream of designing a farm to take the sewage of, say, 1,400 persons per acre. It would be most unwise.
1417. You think, from the experience you have gained, that it would be most unwise to turn the sewage of 1,000 or 1,400 people upon an acre of even sandy land remote from the sea? Yes, permanently.
1418. Can you give the Committee an approximate estimate of the cost of preparing the proposed farm, including the cost of depositing the sand to a height of 4 or 5 feet, levelling it, and properly preparing it, the cost of the pumping station and everything connected with the scheme? I think I stated just now that I estimated the cost of everything below the pumping station, including the rising mains and the farm, together with the work already done and to be done, at £33,000.
1419. That includes the cost of depositing the sand to the proposed height? Yes.
1420. *Mr. Trickett.*] By reading the papers before the Committee you will see that Mr. Hickson advocates the partially-separate system, whereas the special commissioners advocate the totally separate system? I have observed it.
1421. You do not believe in the separate system? I have no faith in it as an efficient system.
1422. Do you approve of the partially-separate system? That is the system I approve of, and the system that has been adopted in connection with the western suburbs sewerage scheme and other schemes which have come before the Committee.
1423. And you advocate it for this work? Yes.

1424. Could you give the Committee any instance where the separate system has proved a failure? In my report on sewage purification, dated 1891, I referred to the Dorking sewage works. The following is a quotation dealing with the subject:—

G. H. Stayton, Esq.,
M.I.C.E.

27 Feb., 1894.

Dorking is in the county of Surrey, and contains a population of 7,000 persons. The sewers are on the separate system, but the total exclusion of rain water from roofs and yards caused considerable trouble to the working of the house drains and pipe drains at first. This has now been remedied by admitting part of such rainfall.

It is not more than two months since I read in a Surrey newspaper which was sent to me, an account of the completion of the rectification of the defects of the Dorking system. Fever and serious illness had occurred in the town entirely caused by the sewer gas generated in the house drains. It was stated in the paper, however, that everything has now been put right by the adoption of the partially separate system, and the scheme is working satisfactorily.

1425. Another witness, whom I questioned about the matter, thought that the failure of the separate system was in all probability attributable to the bad laying of the pipes;—can you say if that was the case? It certainly was not. The system itself was to blame. I went round the works with the officer in charge, but at that time I had not the remotest idea that a question such as this would crop up. I gathered from the report of the newspaper alluded to that they had tried the separate system originally, but had had a good deal of trouble with it, and were altering it.

1426. Experience proves that drainage matter will not go through the pipes properly without the aid of rain water to help it along? Yes. I should like to point out to the Committee that in the report which was handed in in connection with the western suburbs sewerage inquiry, I made a statement in connection with the separate system very clearly setting forth the objections to that system.

1427. *Chairman.*] Will you read the paragraphs to which you refer, and which you wish to incorporate in your evidence? The paper from which I wish to quote is an Appendix to the report of the Public Works Committee on the Western Suburbs Sewerage Scheme. There I say:—

The separate system *per se* is a method which necessitates one set of sewers and drains for sewage, and a second set for surface waters from roofs, paved yards, and streets, and for subsoil waters. In the few towns where the so-called separate system has been carried out, it has involved the construction of either a duplicate or triplicate set of channels, but in no instance has it been found practicable to rigidly exclude the rainfall from roofs and paved back yards.

The insanitary results of such a system in dry seasons must be obvious. The storm-water drains for conveying rainfall and surface waters from streets, roofs, and paved yards would practically become sewers. Washings from paved yards are so highly impregnated with organic matter that it is necessary to intercept such waters, and deal with them in the same way as ordinary sewage. The sides and inverts of the storm-water sewers would become fouled, and in dry weather the gases evolved would be nearly as offensive as in the case of a sewage sewer. Thus, the evil complained of would be duplicated.

I also quoted the opinion of Sir Robert Rawlinson, K.C.B., for many years Engineer-in-Chief to the Local Government Board in England, and a leading authority on sanitation. He was against the separate system, as was also Sir Joseph Bazalgette, C.B., who was for many years Engineer-in-Chief to the Metropolitan Board of Works, and who said, in reference to the Separate system:—

How to dispose of the rainfall is a question of considerable difficulty, and has given rise to much diversity of opinion. This arises from the fact that whilst in itself harmless, it sometimes falls suddenly in large quantities. *These considerations have induced theorists to advocate that the rainfall should not be allowed to flow off with the surface, but should be dealt with by a separate system of sewers. The theory is, however, most impracticable.*

Mr. James Lemon, M.I.C.E., a strong advocate of the Separate system, and a gentleman who has carried out several large works, says:—

The foregoing opinion of Sir Joseph Bazalgette, coming from so eminent authority, was a heavy blow to the Separate system.

He goes on to say, in a paper he read at an annual congress of the Sanitary Institute of Great Britain:—

“What is the ‘Separate system,’ so-called? Does it mean the *entire and absolute separation* of the rainfall from the sewage? If so, then I say at once that there is no town in England where it is carried out.” With regard to the sewerage of the city of Winchester, which he had recently carried out, he stated that he “knew of no town where there are such natural facilities for carrying out the Separate system in its integrity.” In the scheme, however, he excluded surface drainage, and provided for the sewage and a small quantity of rainfall from the houses, feeling confident that a margin for rainfall under the most favourable circumstances was necessary.

I also referred to Abingdon, where the Separate system is carried out, but there they admit the rain-water from the roofs and back yards, and have no less than three systems of drainage—one for sewage, one for storm-water, and one for sub-soil water—the consequence being, that they have to pay a drainage rate of 1s. 7d. in the £. I concluded by saying that:—

I think it has been clearly shown that the system contemplated (for the western suburbs, the partially-separate system) is not only in accord with common sense, but its efficiency must be obvious to all practical men.

1428. Can you give us any instance where the Separate system has been adopted of late years? I do not know of any place where the absolutely Separate system had been adopted. I take it that the Commission who reported on this matter advised the total exclusion of rainwater; but I am totally at variance with them. I think it has been clearly shown that it is a very dangerous system to adopt. There is one other point in connection with their report with which I should like to deal. I saw that Mr. Bell advocated the total exclusion of rain-water from the sewers, and he stated that he would not touch the gradients that had been devised by the department, though he would reduce the size of the pipes, probably, from 15 to 12 inches, and from 12 inches to 9 inches. I should here like to mention that a Mr. White, who read a paper on the separate system before the Institution of Civil Engineers some years ago—it is the latest report on the system—stated that the rain-water from roofs and back yards should be taken in. The separate system, as commonly understood, means, apparently, the exclusion only of street surface water, the water from roofs and back yards being admitted. Mr. White said also that the velocity of the low-level flow should not be less than 135 feet per minute. Applying that to the suggestion of Mr. Bell, and taking a 12-in. pipe, which, as was shown in the former evidence, it is proposed to lay down at a grade of 1 in 300, if the pipe was only half full of sewage there would be a velocity of 172 feet per minute. Reducing its size to 9 inches, the velocity would be only 147 feet per minute. If the pipe was only flowing one-quarter full, however, as it would be for the greater part of the day under the absolutely separate system, the velocity would be considerably less; it would, in fact, be only 111 feet per minute, and would not be self-cleansing. It is clearly laid down in all the reports on the subject that the minimum self-cleansing velocity of well-diluted sewage should not be less than 2 feet per second.

G. H.
Stayton, Esq.,
M.I.C.E.
27 Feb., 1894.

second. For Sydney I think Mr. Clark said 150 feet per minute, that is $2\frac{1}{2}$ feet per second. If Mr. Bell's proposal was carried out, however, the velocity would be not greater than 111 feet per minute for long periods during every 24 hours. That is one instance, and I could multiply such instances in dealing with the dimensions of other pipes, but I think what I have said will show the Committee the risk that would be incurred by substituting a smaller sized pipe for a smaller flow of sewage, without making the inclination greater.

1429. But in a hot climate like this, where baths are very much used, would not the bath-water help to cleanse the pipes? Most people take their baths between 7 and 9 o'clock in the morning, but the hottest period of the day is later on.

1430. You have no reason to alter your opinion in regard to the separate system? None at all.

1431. You strongly advocate what is known as the partially separate system? Yes. When I first commenced my professional career, at Coventry, we had to pull up some miles of pipe drains in one part of the city. When the sewerage there was originally carried out, some twenty-five or thirty years ago, there was a great craze for treating house sewage only, and using small pipes, and the consequence was that in a few years a number of the pipes had to be taken up, because they became partly choked with the sewage.

1432. *Mr. Neild.*] Would that apply to the 9-inch pipes laid throughout the suburbs? No; because they are probably laid at such an inclination that there is a self-cleansing velocity.

1433. *Mr. Trickett.*] During your last examination, page 43 of the Committee's report, Question 1233, you were asked:—

What do you make the total cost, abandoning the sewage-farm altogether?

To that you replied:—

I can put it in this way—that under the departmental estimate, the present outlay, and the prospective outlay for sewage disposal—that is, pumping and treating the sewage—amounts, according to the evidence, to £42,375.

Does that mean that your system of precipitation could be carried out for £42,375? That is the departmental estimate.

1434. Then I want to know what your estimate is for precipitating the sewage of Parramatta, and discharging it through a pipe into the river? I stated this afternoon that I put the cost of everything below the pumping-station in the departmental scheme at £33,000, and I added that by substituting the International system, and taking into consideration the less lift there would be for the pumps, and the consequent reduced cost of machinery, the difference would be £20,000.

1435. But what would the whole outlay be? I am afraid that I cannot tell you at the present moment; but supposing the cost of everything above and including the pumping-station was £50,000, that plus £33,000, the cost of everything below the pumping-station according to the departmental design, would make the total cost of that scheme £83,000; while, on the other hand, the cost of my scheme would be £50,000, plus £13,000. What the cost is up to and including the pumping-station, I cannot at this moment determine. Mr. Hickson, in answer to Question 68, says that the whole of the works are estimated to cost £75,926, but from his answer to Question 75, it appears that there will have to be an additional expenditure of £55,128 for future completion. Part of that money, no doubt, will have to be spent above the pumping-station, and part of it below the pumping-station. If the Committee will allow me to look into the matter I will send the information you require to the Secretary.

1436. Apparently the conclusion at which you arrive on page 85 of our last report on the subject has, in a measure, been swept away by the Government proposing to adopt some of your recommendations? Which conclusion?

1437. The conclusion which you read just now; there you advocate the system of precipitation and filtration? In that case it is earth filtration.

1438. Where would it take place—on the farm itself? Yes.

1439. Then you propose filtration on the farm, and an intercepting filtering station half-way down? No; the precipitation as well as the filtration would be done on the farm.

1440. You still believe in the necessity of precipitation and filtration? Yes, as I have previously stated, when the population increases sufficiently. This scheme was devised for a prospective population of 48,000. At present the population is not more than 14,000 or 15,000; but I think that when it reaches 20,000 or 22,000 precipitation should be resorted to.

1441. You say, as your third conclusion, "That the purification of the sewage could be more efficiently ensured by adopting the International process of precipitation and filtration?" I say so still, because the works can be carried out without any possibility of a smell or a nuisance arising, and the effluent is so clear, and is carried away at once.

1442. I understand that you are still of opinion that it would be better to adopt the International process than to have a sewage-farm? I have stated that already. I only admit the latter suggestion on the ground of expediency. I have guarded myself on that point all through.

1443. Mr. Hickson says, in his reply to the report of the Parliamentary Standing Committee on Public Works:—

The objections raised to all chemical precipitants yet known are based on very substantial scientific grounds. Their action is at the best partial. They act as clarifiers rather than purifiers of the sewers. Although the effluent may be discharged perfectly clear, it still retains nearly the whole of the salts originally found in the sewage, and, therefore, putrefaction must rapidly follow, unless the body of water into which it is discharged is sufficiently large to complete the process of oxidation.

Do you agree with that? No; I do not, and I have evidence here which is distinctly to the contrary.

1444. Could you give us the names of the scientific men whose views are not in accordance with Mr. Hickson's statement? I have a statement of the late Mr. T. Hawksley, F.R.S., and a few years ago President of the Institution of Civil Engineers. He said of it at an inquiry at Worcester, on the 14th December, 1892:—

I could not imagine a more complete system of treatment of sewage than that proposed. There would be no odour, nor any nuisance to anyone.

He was then referring to the International system of sewage purification. That was at a Government inquiry at Worcester, presided over by Colonel Ducat. In England, before a Town Council can carry out any large scheme of sewerage or water supply, a Local Government inquiry is held. At Worcester they had an inquiry in 1887 into the process of treatment with lime, which was rejected. In 1890 a process of treating with lime and aluminium was also rejected. Then the process of treating with ferrozone and polarite, backed up by recommendation of Mr. Hawksley, was adopted. At another inquiry at Birkdale, Dr. Frankland, F.R.S., gave evidence in support of

of the system, as also did Mr. Manserge, M.I.C.E., who advised upon a system for Melbourne and other places. Then, as to the opinion of chemists upon this subject, there is the report of Sir Henry Roscoe, M.P., F.R.S., one of the most eminent living chemists, Professor Davies, Dr. Arthur Angell, Dr. Carter Bell, and others in England and abroad. I have also before me the result of tests of sand and gravel filters compared with polarite filters. One engineer says, that though at first he was very sceptical of the process, he now thinks it the best system of purification. I have also evidence to show that where the effluent has been kept for over a year, and allowed to remain exposed in tanks, it has, at the end of the time, been found perfectly good, not having changed its colour, or altered its character in any way.

1445. So that, apparently, Mr. Hickson's statement does not accord with the opinion of recognised authorities? No. One of the latest reports on the subject is that written by the Director of Public Works, Philadelphia, in September, 1893, who tested and analysed the results of polarite filtration and sand filtration, and notes that the albuminoid ammonia left after sand filtration was '064, while after polarite filtration it was only '034, there being no turbidity, no colour, and no smell.

1446. Your opinion is that the effluent would be quite unobjectionable? I am quite sure of that from what I have seen myself, and from the opinions of eminent English engineers and chemists, which I have read.

1447. *Mr. Neild.*] Are the majority of sanitary authorities in the old world engineers, or are they biologists? There are some of each. The opinion of engineers like Sir Robert Rawlinson, Mr. Baldwin Latham, Professor Robinson, and men of that class, is quite as weighty as that of other gentlemen to whom I have referred, such as Sir Henry Roscoe and Dr. Dupré.

1448. In the old world is it recognised that engineers are competent to deal with questions of sanitary engineering? I am amused by such a question. The engineer and the chemist always go hand-in-hand in those matters.

1449. It has been stated here that engineers should simply carry out what the biologist teaches;—is that opinion supported by the practice of the old world? Certainly not. I never heard the point raised before.

1450. Engineers are recognised as authorities, not merely as executants of the ideas of biologists? Unquestionably that is so.

1451. Then you do not agree with Professor Anderson Stuart that engineers should merely carry out what the biologist teaches? No. I think that is an amazing assumption.

1452. I suppose you know all about the *micro-coccus nitrificans*, otherwise known as the friendly microbe? I have heard of him.

1453. You know all about the operations of the friendly microbes? I do.

1454. Is it recognised in the old country that in order to have a sewage-farm you must cultivate the growth of these microbes? I cannot say that it is. There are theorists who urge that view, but it is not generally accepted.

1455. Are you aware that efforts are made to breed the friendly microbes before a farm is considered to be of any value? I have only heard of them being bred in a chemist's laboratory; I never heard of such a thing being deliberately done on a sewage-farm in England.

1456. Is sewage farming in the old world recognised as the process of filtration through the soil, or as a process of breeding microbes to consume the impurities? I think we pretty well understand that both processes operate.

1457. Is it customary to put entirely out of consideration the effect of filtration, and attach all importance to the presence of the friendly microbe? I am not aware that the latter point is considered from a practical point of view.

1458. How do you look upon it? I look upon it as a theory which may develop into something useful.

1459. It is not recognised as a practical way of dealing with sewage? No.

1460. I will read you one little sentence from the evidence taken by the Committee:—

You do not seem to attach very much importance to the effect of the soil in purifying sewage matter? Yes; and for this reason, if you take soil and sterilise it, that is to say, if you heat it, so as to destroy the organisms to which I have referred, or if you chloroform it so as to suspend their action, it has no longer any purifying effect upon sewage. It is because of the organisms in it that soil is an active agent in purifying sewage.

Does that answer represent the present practice in the old world with regard to sewage farming, or does it represent the theories of the laboratory? I incline to the latter opinion.

1461. You know all about the 22 acres of high land;—you took samples, and tested them about eighteen months ago? Yes.

1462. In answer to one question we were told that that land was fairly good soil for the purposes of sewage purification;—does that answer coincide with your view on the subject? Yes; I rather like that soil, and I think I stated so in 1892. The 22 acres, if properly prepared, would purify the sewage better than the sand would do.

1463. You regard it as fairly good? Indeed I do.

1464. In answer to the next question the same witness says, "I think the land is admirably adapted for the purpose";—which of the two answers do you think most accurately describes the land? I think it can be truthfully said that it is good.

1465. You would not call it "admirably adapted"? No; I should not, but it is suitable for the purpose.

1466. In another answer the witness states that the 42 acres of reclaimed land would provide effectively for the sewage of 56,000 persons—four times the present population—that would be at the rate of about 1,333 persons per acre;—do you think it would be safe to attempt to deal with such a quantity of sewage to the acre? I am certain that it would not.

1467. We were told that the friendly microbe is the purifying agent in soil, and that until he is cultivated the process of purification is imperfect;—you said just now that after a time it was possible for soil to become so surcharged as to cease to act as a purifying agent? I do not think I said "cease"; it would very much deteriorate.

1468. Is any knowledge possessed by sanitary engineers or biologists which would fix the condition of things when these friendly microbes cease to operate; in other words, do they become choked out by the presence of too much sewage matter in the soil? I have no information whatever on the point. What I can say is, as the Committee are aware, that sewage farming and irrigation have been carried on in different parts of the world for many years past, but in some places, as you know, the system has partly failed.

- G. H. Stayton, Esq., M.I.C.E.
27 Feb., 1894.
1469. From there being too many microbes or too few? This happened before we knew anything about the microbe theory, and I want to know, now that that theory has been formulated, what practical difference it makes. To my mind the question resolves itself into a matter of plain common sense. If there is no smell on the ground, you need not trouble much about microbes or bacteria.
1470. *Chairman.*] Friendly or unfriendly? Friendly or otherwise. I picked up an extract from a newspaper a few days ago wherein the writer shows that if you carry out this theory to the fullest extent, no matter what you do you must run a risk. Two chemists found out some time ago that a couple of bank notes, which had been in circulation for a few years, contained, according to their estimate, 19,000 or more microbes each. We should be told, I suppose, that wherever there is dirt or filth there are these microbes. As far as sewage farming is concerned, this theory may lead to something practical by-and-bye, but what we have to consider is, microbes or not, is there likely to be a nuisance.
1471. Assuming that the evidence that we have had as to the presence of microbes being necessary to ensure purification is correct, I want to know how the theory will fit in with your statement that after a lapse of time the soil may become surcharged, and be ineffective for purification;—where is the line to be drawn? I take it that after a time land cannot be properly oxidised, and therefore the microbes cannot live.
1472. Have you any knowledge of the life of fascine work necessary to secure the filling in of this farm? No, I have not; I have had no experience of work of that kind, and my opinion in regard to it would be worth very little.
1473. *Mr. Humphery.*] Have you estimated what would be the total annual cost of maintaining your system? I have done so; but I have not the figures before me at the present moment.
1474. Will you add that to the estimate of cost with which you have promised to furnish the Committee, giving details? I will.
1475. *Mr. Neild.*] Adopting the International system, how would you deal with a large volume of storm-water;—would you turn it off, or pass it through your filters? It would pass through the filters. Of course there would be storm-water overflows as proposed in the departmental scheme, to provide for the safety of the sewers; but the ordinary storm-water coming in from the back yards and roofs would be treated in the same way as other sewage.
1476. Your filter-beds will be sufficiently large to cope with it? Yes.

WEDNESDAY, 28 FEBRUARY, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTON.	WILLIAM CHANDOS WALL, Esq.
The Hon. JAMES HOSKINS.	WILLIAM McCOURT, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	JOHN CASH NEILD, Esq.
The Hon. JOHN DAVIES, C.M.G.	EDWARD WILLIAM O'SULLIVAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	CHARLES COLLINS, Esq.
THOMAS THOMSON EWING, Esq.	HENRY DAWSON, Esq.

The Committee further considered the proposed Sewerage Works for Parramatta.

Robert R. P. Hickson, Esq., M.I.C.E., Commissioner and Engineer-in-Chief for Roads and Bridges and Sewerage, sworn, and examined:—

- R. R. P. Hickson, Esq., M.I.C.E.
28 Feb., 1894.
1477. *Chairman.*] You gave evidence before the Committee when this work was being considered by them about fifteen months ago? Yes.
1478. *Mr. Suttor.*] Have you any further information to give us with reference to the total cost of the scheme? No, except, of course, that prices have so altered now that I think that if the work were put on the market at once a considerable saving could be effected. I have not taken that into account, however. I have made a fair estimate of what the work should cost. Of two large sewerage works that have been let within the last three months one has been let at 17 per cent. below our estimate, and the other at as much as 30 per cent. below it.
1479. Do you recollect what estimate you gave for this work when you were last examined? £75,926.
1480. That does not include an additional cost which, I understand, will have to be incurred? There will be no additional cost.
1481. You are satisfied that the work could be carried out for that amount, with the probability of some reduction being made? I am quite satisfied of it. If we were prepared to put it upon the market during the next few months, we could get it done for much less.
1482. *Mr. Ewing.*] Does the amount you have just given us include the cost of the sewage farm? It includes everything.
1483. The fascine work? Yes.
1484. The pumping of the sand? No.
1485. How much more would that make it? Nothing at all, because the work will be done by the Harbours and Rivers Department. They want a depot for their material.
1486. It is a convenience to them to be able to send the stuff there? So Mr. Darley told me yesterday, and it has, therefore, not been taken into our estimate.
1487. Have you made an estimate of the cost of maintaining the scheme after it has been carried out? In my previous examination I said that the cost of maintenance, together with the interest on the outlay, would come to £4,268.
1488. You regard that estimate as ample? It is too much, because we know from what is about to take place at Botany that the sewage farm will not cost us anything. I have allowed for the working of the sewage

R. R. P.
Hickson, Esq.,
M.I.C.E.

28 Feb., 1894.

sewage farm on the assumption that we should get no return from it; but now the Water and Sewerage Board are dealing with two parties—I do not know that it would be right to give you the terms, as the matter has not been finally settled—who are prepared to take the farm off our hands and pay us rental for it, and I think that the cost of the Parramatta farm might be reduced in a similar way.

1489. This estimate of the yearly expenditure takes it for granted that the pipes and syphons will work properly—there is nothing put down for repairs? It is estimated that the amount will pay off the whole cost in sixty years. Of course, in addition to that, there are the working expenses and the cost of repairs to engines, and so on, to be met.

1490. That is, supposing the pipes do not choke and the syphons work all right? There are no syphons.

1491. There is nothing of that kind. It is a gravitation scheme right through? There is a rising main from the pumping-station to the farm, but there are no syphons.

1492. You take it for granted that there will be no leakage in the pipes or anything of that kind? The whole thing will pay itself off in sixty years, and the estimate includes the cost of any ordinary repairs which may be necessary during that time.

1493. Do you desire to alter your previous evidence at all? As to cost?

1494. As to anything? I do not think so.

1495. Judging from a communication which we have had from you lately, your opinion in regard to sewage farms has been strengthened? Yes; very much strengthened.

1496. *Mr. Collins.*] What would it cost to fill up the 42 acres, if the Harbours and Rivers Department did not give the sand free? That is a question which I could not answer. Mr. Darley says that it would cost him as much to take the material out to sea as to deliver it there.

1497. The working of the dredges is charged against the department? The Harbours and Rivers Department pay for that work. Up to a couple of years ago, they used to send whatever they dredged out to sea, and it costs them a certain amount—I cannot tell you how much—but Mr. Darley tells me that it would not cost any more to put it on the site of the proposed farm.

1498. What has been the cost of the fascine work? We have paid £1,089 for what has been done.

1499. What would it cost to keep the fascine work in repair;—it would want repairing every year, would it not? I could not say; but it would be only a very small item.

1500. Is it included in your estimate? It was not specially taken into account.

1501. What would it cost? A very small sum, judging from what has occurred at Cook's River, where the work has been standing for eight years without anything being done to it.

1502. How long do you think this work would remain without repair? I could hardly say. It would last for years and years.

1503. Do you think it would last twenty years? I think that if it were properly made it would. The only accident that could take place would be caused by the bank slipping, owing to dredging that might be going on alongside. Under other circumstances the bank would last for years.

1504. If sand was put behind it, would it be likely to be forced out by the sewage matter? No; it would be strong enough as a retaining wall.

1505. *Chairman.*] How many tons of material would have to be placed on behind the fascine banks for the purpose of raising the land to the required height? About 600,000 tons.

1506. That would be an average height above high-water mark of 5 feet? Yes; 5 feet.

1507. In some places, I suppose, 9 or 10 feet would have to be filled in? I should say that the deepest place would be 9 feet, running off to nothing.

1508. You think that that estimate is approximately correct? Yes; the quantity was taken out a few days ago.

1509. The Harbours and Rivers Department would be able to give us full information as to the cost of landing the soil;—it does not come within your department? No.

1510. We understand, from the answer given to Mr. Suttor, that the total cost of the proposed work will be £75,926, and, according to the evidence you gave when last before the Committee—page 6, Question 72—the work above the pumping-station—mains, reticulation, and so on—will cost £53,416;—is that so? Yes.

1511. And the balance—£22,510—would be for the works at the pumping-station and the sewage farm? Yes.

1512. Was it the intention, when this scheme was first put before the Committee, to raise the sand-banks to a height of 5 feet above high-water mark? Yes.

1513. Can you point to any evidence given in the early stages of the inquiry, which would leave that impression? Yes; I think so, though the depth is not directly mentioned.

1514. May I direct your attention to Questions 60 and 61 in the evidence taken in 1892:—

60. I understood that 49 acres were resumed, and that the other is to be made up with silt? Forty acres have been resumed, and 22 acres 1 rood 2½ perches have been included in the fascine bank which is put in. It did not require to be resumed, because it is Government property. The whole area contains 62 acres 1 rood 3½ perches, the western portion of which is above spring-tide level, while the eastern portion is below mean high-water level.

61. About how much? About a third. The latter has been already enclosed with fascine embankments, and is to be filled in with sand pumps from the river above highest spring tide, after which it will be divided by raised roads running north and south, and east and west.

Is it not a fact that only one-third is above high-water level? There is a mistake there. We originally thought that we should have to resume only 49 acres. It was supposed that the rest of the land was Government property, being under the influence of the tides; but, as a matter of fact we had to resume 62 acres 1 rood 13½ perches.

1515. How comes it that the Government had to resume land below high-water mark;—have grants of land ever been made to any private individual, giving rights to land under the sea? That is a question I could not answer. The matter was dealt with in the resumption branch. All I can tell you is that the land had to be resumed, and it has been paid for.

1516. As a matter of fact, the ordinary boundary of private land is high-water mark? I always thought so.

1517. That is the invariable custom and law? Yes, as far as I know.

1518. But in this case, for reasons of which you have no knowledge, compensation had to be paid for land below high-water mark? Yes.

1519. Coming back to the questions to which I have just referred you, instead of about one-third of the total area of 62 acres being subject to tidal influence, nearly two-thirds of that area is so subject? Yes.

1520.

R. R. P. 1520. Will you now look at Question 62, "Are you going to put in clean sand or silt? Ordinary river
Hickson, Esq., sand." There is nothing there about any proposal to raise the farm 5 feet above high-water mark. Now
M.I.C.E. turn to page 9, Questions 167, 168, and 169:—

28 Feb., 1894. 167. What is the height above water-mark of that portion of Webb's Grant which you have under cultivation. I should say from 4 to 6 feet.

168. Assuming that sand does not actually absorb, but acts as a filter for sewage, the opportunities for getting rid of sewage matter would be very much greater at Webb's Grant than on the proposed farm at Parramatta, the height of which is so much lower? It will practically be the same when it is finished.

169. To what extent do you propose to fill in to cover the portion which is now above high-water mark? The fascine bank we have made around the farm is of the same height above high-water mark as the fascine bank in Cook's River, so that the finished level of the farm at Parramatta will be within a foot or so of the same level as the farm at Webb's Grant.

Do you think it could be gathered from that evidence that it was your intention to raise the land 5 feet above high-water mark? Yes; I think so; but the first part of the reply to Question 169 is certainly wrong, though I suppose I gave it that way. As a matter of fact, the concluding portion—"The finished level of the farm at Parramatta will be within a foot or so of the same level as the farm at Webb's Grant"—really governs the sentence. That land runs from 4 feet at the lowest part to 6 feet.

1521. I presume you will admit that the answers just quoted are capable of being misunderstood? Yes; I think they are. The first portion of the answer to which I have referred is certainly not correct.

1522. Now turn to page 48, when you were re-examined after Mr. Stayton had reported upon the proposed scheme, Questions 1370 and 1371:—

1370. *Dr. Garran.* In the report which you have been good enough to make on Mr. Stayton's report, you say, "I contend, therefore, that his conclusions, being based on incorrect assumptions, are of no value, and are quite misleading." Will you state, categorically, what the incorrect assumptions are? The incorrect assumptions are, that the level of the sewage farm will be 1.88 feet—practically 2 feet—above high water, and further, that he has taken samples from a portion of the land that will not be used as a filtering medium.

1371. Do you agree with him that we want not less than 4 feet of good filtering soil? Yes; I have said so in my evidence. I was then referring to my answer on page 9.

1523. Which, to say the least of it, is a very vague one;—do you admit that this is the only evidence given by you which refers, even in an indefinite way, to the necessity of raising the land 5 feet high; do you know of any more definite statement? I could not say that there is a more definite statement without going through the evidence from beginning to end.

1524. In a reply to the report of this Committee, which you furnished to the Minister, you stated that you were in possession of a large amount of detailed information which you thought it was not necessary to put before the Committee. Do you not think that it was not only unfair to yourself, but also unfair to the Committee, who had to consider the project, that this detailed information, which they were told off to obtain, should be kept back from them? I am sorry that the Committee took it in that way; I certainly did not mean it so. I must, however, repeat what I said there. For instance, not a stroke of the pen more has been put on the plan you have seen, nor has there been a stroke of the pen put on the plans of the tanks and engines and so on. We do not go into the details of the scheme until the Committee has reported on it. We simply give the general features.

1525. But Mr. Stayton, who is somewhat of an expert on sewage matter, when he was examined, said that he had made an estimate of the work required to be done to prepare the sewage farm, and that it would be necessary to raise it 5 feet above high-water mark; but, owing to these details being suppressed, he could not say whether the cost of that work had been taken into consideration by the Department? I gave the cost of the work in the report which was before the Committee when they made their recommendation. You will find the information on page 80 of the Committee's report. The Committee have all the information that I have got.

1526. As a matter of fact, some £16,000 has already been expended on sewerage works at Parramatta, in the construction of stormwater drains and approaches and the erection of fascine banks in connection with the sewage farm? I do not think the whole £16,000 have been spent. I think that £13,000 had been spent at that time.

1527. Let me draw your attention to question 68:—

68. Will you give us some information now with regard to the estimated cost of the work? The whole of the works herein described, exclusive of the future extensions, are estimated to cost £75,926. That sum includes £20,000 for reticulating sewers which are not shown on the plan, and £16,000 already spent on sewage farm and storm-water channel? We were not £16,000 out of pocket at that time, though we were pledged by the contracts which we had in hand to an expenditure of that amount. As a matter of fact, we were only £13,000 out of pocket. You will find that stated on page 2.

1528. But now the expenditure has reached £16,000? Yes; it has almost reached that amount, though I could not tell you what it is exactly.

1529. So that £16,000 has been laid out in Parramatta in connection with this work, but for that money the State is getting no interest, nor is the principal being returned? That is so.

1530. And the State cannot obtain interest for the expenditure until the whole scheme has been completed and rates have been levied? Yes.

1531. The Special Commission, consisting of Messrs. Wardell, Chamier, and Bell, which was appointed by the Minister to inquire into this matter, recommend what is known as the distinctly separate system;—do you approve of the suggested alteration from the partially separate system, which you endorsed when last before the Committee, to the distinctly separate system? No.

1532. You would still carry out the proposed scheme under the partially separate system? I would.

1533. Do you think that if the separate system were carried out there would be a saving, as estimated by these gentlemen, to the extent of 25 per cent. on the cost of the work? The actual saving, supposing we carry out the separate system, allowing the prices upon which we based the original scheme, would be £6,000. But the Committee must remember that there would also have to be an alteration of grades, because, with the separate system, the proposed sewers would not be self-cleansing. To alter the grades we should have to cut down very much deeper, and at the pumping-well, for instance, we should be discharging at 7 feet 6 inches or 8 feet lower down than proposed. If we did that we should come under the tidal influence, and the cost of making the sewer would be increased to very much more than the schedule rates placed beside the various items.

1534. Then you do not agree with Mr. Bell that the same grades would do for the separate system? I do not.

R. R. P.
Hickson, Esq.,
M.I.C.E.

28 Feb., 1894.

1535. If you had to go down 7 feet more to get the proper grades you would have 7 feet more to pump the sewage up to the delivery main? That would not make very much difference, because there would be a less volume of sewage to pump, and one would balance the other.

1536. But the difficulty and expense would be increased by the necessity of making steeper grades, which would be self-cleansing? Yes; we have reduced the quantity of water going into the Parramatta sewers to a very low amount indeed.

1537. A very much lower amount than is the case with the western suburbs sewerage? Yes; at Parramatta we have included the water falling on the yards and roofs, but it is possible that we may omit the roof water and take in only the yard water. Of course I need not point out that the less sewage we have to pump the better, not only for the pumps but for the sewage farm. It is just possible that we may be able to keep the roof water out of the sewers; but what we should save in that way is not worth mentioning.

1538. Will the sewage conveyed by the mains from Parramatta to the pumping station be delivered on to the farm without creating any nuisance to the neighbourhood;—will it be conveyed through hermetically sealed tubes or cylinders? It will be completely sealed up, and there will be no nuisance whatever.

1539. It would not come into contact with the atmosphere at all? It would not come into contact with the atmosphere.

1540. Have you any recent information as to the success or failure of the International system of dealing with sewage? I have no information dealing directly with that system. What information I have I laid before the Committee in a short report, showing that all chemical processes so far had been a failure.

1541. Is it the general opinion of those engaged in the construction of sewerage works that the best way of dealing with sewage is to take it out to sea? Yes; I think it is better to get rid of it entirely, if you can.

1542. But if you have a suitable area of ground within a reasonable distance which can be utilised as a sewage farm, the next best way of dealing with it is by the process of intermittent irrigation? Yes.

1543. Failing both of these processes, it must be treated with some chemical precipitate? There is nothing left but to do that.

1544. Would you call the International process a chemical or a mechanical process? A chemical process.

1545. How does it compare with other chemical processes? It is very hard to answer that question, because I can get very little information in regard to it, except from the company itself. The International process is not specially mentioned when chemical processes generally are dealt with, so that there is very little information to be obtained in regard to it, except what appears in the pamphlets issued by the company.

1546. Suppose the departmental scheme were carried out, and the sewage farm were found to be a nuisance, I suppose it would be possible to try the International or any other chemical process of precipitation at the pumping station? Certainly.

1547. Only whatever work has been done below the pumping station would be thrown away? Yes; though I am not sure that it would all be thrown away, because you would want some land on which to bury the sludge. Sludge is a very unmarketable product.

1548. It is always difficult to find a market for the residuum left after chemical treatment? So I ascertained from the reports which I have received from England.

1549. Is it true that the sludge obtained from the treatment of the London sewage is pumped out to sea and thrown into the English Channel? I know that a great deal of it is sent to sea; I cannot say whether all of it is.

1550. The London authorities find that the most expeditious way of getting rid of it? Yes.

1551. *Mr. Humphrey.* Are you of opinion that provision could be made for dealing with the sewage of a population exceeding 22,000 at the proposed sewage farm? Yes, I think so, on a sand filtration bed. At Botany we are dealing with the sewage of 1,000 people per acre.

1552. For how many do you think provision could be made at Parramatta? I do not think any of us know the limit of the powers of a sand filtration bed.

1553. Do you feel disposed to venture an opinion on this subject? I do not; and I will tell you why. The Agent-General only the other day sent me a paper describing a test which had been made with a filter bed. The bed was 3 feet 1½ inches deep, and was formed by a bottom layer of stones broken to an inch measurement, 6 inches deep, an intermediate layer of fine stones, broken to a ½-inch measurement, 3 inches deep, and a top layer of sand. That filter was used for several months by putting crude sewage upon it, varying in quantity from 178,290 gallons per acre per day to 484,000 gallons per acre per day; in other words, allowing 40 gallons of sewage for each head of the population, the sewage of a population of from 4,460 to 12,100 an acre was treated on it. The report says: "The quantity applied when the most satisfactory result was obtained was at the rate of 263,780 gallons per acre per day, which is equal to the sewage of a population of 6,600."

1554. What became of the effluent? After elaborate experiments had been made with the filter, the filtering material was carefully examined, and it was found that, except at the actual surface, it appeared to have undergone no change whatever. It emitted only the ordinary earthy smell, and was perfectly clean. None of the effluent, when kept in a room, underwent decomposition.

1555. Where was the experiment made? In London. It was made by Sydney Richard Lockett, M.I.C.E.

1556. Does the report say where the sewage came from? I take it that the sewage was London sewage.

1557. If that system is so successful, what necessity is there for establishing a costly sewage farm? I only quote that experiment to show how little we know of the capabilities of a sewage farm. The experiment was made at the end of last year.

1558. Then your information is quite recent? I only received the paper from London the other day.

1559. Does not what you have said go a long way to support Mr. Stayton's contention that the best way of dealing with sewage is the International process, which is a process of filtration through polarite? No; the results of the systems to which I refer were entirely due to the action of microbes grown on top of the filter bed. No chemicals were used.

1560. Does this recent information which has reached you in any way alter your previously expressed opinion that the best method of dealing with the sewage of Parramatta would be by treating it on a sewage farm? No; it enormously strengthens my opinion.

1561. In what way? Because it enables me to see what a sand filter can do if it is put to it, if I may use the term. I should be very sorry, however, to recommend the Committee to propose the establishment of

R. R. P. of a sewage farm on the lines suggested by Mr. Locoock, because I would like to see more experiments made first. I have merely referred to the matter to show that we really do not know what the capabilities of a sand filter are. We know that at Botany the soil has treated the sewage of a population of about 1,000 per acre, and I believe that with the climate we have here, it could do a great deal more if it were put to it.

Hickson, Esq.,
M.I.C.E.
28 Feb., 1894.

1562. Your opinion is that the proposed sewage farm would provide for the sewage of at least 20,000 people, and that provision could be made by means of this new method of filtration for dealing with the sewage of a largely increased number? It is hardly a new method—it is really an improvement on the present system; and instead of having the filter bed composed entirely of sand, there is a layer of sand on the top and stones on the bottom. This lets the water and air get through more quickly, and hence you can treat a much larger volume of sewage.

1563-4. You do not care to commit yourself to an opinion as to the population the proposed farm would serve? I have no hesitation in saying that it would serve as many people as the Botany farm has done—1,000 per acre.

1565. If it should be necessary to extend the area of the proposed sewage farm, would it be possible to do it? Yes; you could take the land fronting Duck River. The land is very much of the same character all along that river.

1566. How many additional acres could you reclaim? I could not say without going over the ground; but at all events you could easily double the area.

1567. Does the land there, which is subject to tidal influence, belong to the Government, or would it have to be resumed? I presume that it stands in the same category as the other land.

1568. Have you any information on the subject? No.

1569. Who could give us the information? You could get it through the Under Secretary of the Lands Department.

1570. If there should be any doubt about the area of the proposed farm not being sufficient for the future population of Parramatta, there would be no difficulty in doubling it? No difficulty.

1571. A question had been raised as to the difference in cost between the International system and the sewage farm system; I want you to give me the actual cost of the works above the pumping station, taking as your first item the £6,000 or £7,000 which, in your former evidence, you said had already been spent on storm-water sewers? I think that evidence has been given already.

1572. I want to get it from you definitely now? If you refer to Question 72 of the former evidence, I think you will find all the information there.

1573. Is it correctly stated there that the cost of the works above the pumping station will be £53,416, of which £6,000 or £7,000 has already been expended on storm-water sewers? Yes.

1574. Has the expenditure upon the storm-water sewers been increased since you were last before us? Yes; but only to a very slight extent. I think that £16,000 has very nearly been spent now.

1575. That includes what has been spent on the farm? Nothing has been done to the farm since. We have simply been making storm-water sewers, but I could not tell you how much we have spent on them, without looking at the office records.

1576. If £13,000 had been spent when you were last examined, of which £7,000 were spent on storm-water sewers, and you have now spent £16,000 altogether, though nothing further has been done to the sewage farm, the total expenditure on storm-water sewers up to date must be about £10,000? Yes, about £10,000; but I should not like to be bound down to any definite sum until I knew exactly how the account stood. For instance, we may not have spent the whole of the £16,000, though I think it is pretty nearly all spent.

1577. Have you taken it for granted that the sewerage of Parramatta is to be proceeded with under one system or another, and has this expenditure been made in anticipation of the authorisation of the scheme? Yes; that is the case.

1578. So that is really left for the Committee to say which system should be adopted? Yes.

1579. You assume that sewerage works will be carried out? Yes.

1580. Will you give us the rest of the proposed expenditure above the pumping-station; in your former evidence you gave it as main sewers, £26,416; reticulation, £20,000; and storm-water sewers, £7,000;—are you prepared to say that that would be the total expenditure? I am prepared to say that the work would not cost that.

1581. For how much less than the estimate do you think the work can be done? That depends a good deal upon when we commence. If it is put off for an indefinite period, prices may come up again.

1582. I want to know how much per cent. may be saved on the estimate under existing conditions? I know what has taken place in regard to other contracts, and I do not see why something similar should not take place here. I should say that there would be a saving of 15 per cent.

1583. *Chairman.*] If you went on with the work now? If we went on with the work now.

1584. *Mr. Humphery.*] What would be the cost of the pumping-station? £3,670—that is, including the acre of ground.

1585. What will be the cost of the works between the pumping-station and the farm? There will be delivery mains, costing £7,095.

1586. You also make provision for other works—£3,408? Yes.

1587. That money has already been expended? Yes, practically.

1588. Are you prepared to say that these figures will certainly not be exceeded? The estimate is a very liberal one, and if we were to start work now we could effect a saving upon it.

1589. *Chairman.*] The saving which could be effected if the work were proceeded with now, would apply to all works above the pumping-station? Entirely, you may say.

1590. *Mr. Humphery.*] With regard to the farm—you say that the sand will be given to you free of cost? Yes.

1591. But the fascine work must be charged to the scheme? Yes; we have already paid £1,098 for that.

1592. How much additional fascine work will be necessary? There is only a gap to fill up.

1593. You will not want a side boundary? That has been made as far as we want it.

1594. I understand that the Harbours and Rivers Department propose to deliver the sand free of cost;—what would it cost, presuming you had to pay for it? That would altogether depend upon where we got it from.

1595. What do you estimate would be a low cost? I could not give you an estimate, because if there were no dredges at work, I do not know where we could get the stuff from. The work would, in that case, be most costly and would more than likely involve a totally different scheme. Your assumption seems hardly necessary, because this material must be dredged and got rid of, and the Harbours and Rivers Department can send it to Parramatta as well as anywhere else.
1596. But the Harbours and Rivers Department will only deposit it alongside the sand pump? No; they will put it right on the land.
1597. Will that not cost more? I can only tell you what Mr. Darley told me.
1598. But it would require an additional expenditure to put it on the land;—at present the silt simply drops from the barges into the sea? Yes; but then there is the loss of time caused by the dredges lying idle in bad weather.
1599. So it would really cost the Harbours and Rivers Department nothing to give you the sand you required? That is what Mr. Darley says, and I think the Under Secretary sent a letter to you to that effect.
1600. Do you know if the use of the International system has been largely extended since 1891? No, I do not.
1601. Mr. Stayton says that over 100 places now adopt the system;—have you any information on the subject? No.
1602. Are you in a position to say he is incorrect? I should be very sorry to say that.
1603. In your estimate of the annual return, which will be available for paying the interest and the cost of maintaining this work—is a sum of £17,000 a year to be charged against the Government institutions at Parramatta;—do you believe that that is the fair annual ratable value of that property? It accords with the information which was given to me.
1604. Do you know the Government institutions at Parramatta? I have been over some of them.
1605. Do you think that a fair annual value is anything like that? I do not know. I think Mr. Vernon, and Mr. Barling, and, I presume, Dr. Manning, made out the estimate.
1606. But you refer to it as your estimate? It was based on what I had been told by those gentleman, who I presume are able to give the information. I had not the least idea what the value of the property is.
1607. Do you think that these institutions are worth anything like £17,000 a year? I should be very sorry, with the limited knowledge I have, to give a valuation. I can only give you the information which was supplied to me by officers who, I presume, are in a position to furnish it.
1608. It is on the assumption that the Government buildings will be rated at an annual value of £17,000 that you estimate that the sewerage rate will not be more than 11d. in the £? That is so.

John William Withers, Esq., Mayor of Parramatta, sworn, and examined:—

1609. *Chairman.*] How long have you been connected with the Municipal Council of Parramatta? On a former occasion I was an alderman for three years, and I have now been an alderman for two years—five years altogether.
1610. How long have you resided in Parramatta? About twenty-nine years altogether.
1611. You are familiar with the details of the proposed scheme for dealing with the sewerage of Parramatta? I am.
1612. Your predecessor gave evidence before the Committee when this scheme was last being considered by them? Yes.
1613. Are you aware that since this Committee reported on the subject, a commission of experts so-called have made a report upon it, and your Council has passed a resolution urging the carrying out of the scheme suggested by them? Yes.
1614. I suppose the details of the scheme are immaterial to the people of Parramatta so long as their sewage is dealt with? I do not think the details of the scheme trouble them very much.
1615. Has the necessity for dealing with the sewage of Parramatta increased or decreased since this matter was last before us? I think it has increased, more on account of the Government asylums.
1616. Have the greater number of complaints arisen during the last fifteen months in regard to the insanitary condition of the town? A great many complaints have been made with regard to the pollution of the river, and, if you were to see it, you would not think twice about it. I suppose there are 1,500 persons—I was going to say that half of them are loafers—in the poor houses, and including the gaol, lunatic asylum, and Girls' Home, I suppose the river receives the sewage of from 3,000 to 4,000 people.
1617. As a matter of fact, do not the officials contend that you are in error in making that statement? I do not care whether they do or not. In my opinion the nuisance is caused mostly by the Government institutions.
1618. Are you aware that, as a matter of fact, they have small sewage farms within their own borders on which they treat their sewage? Most of the pollution of the river is caused by Government institutions. Very little sewage goes into it from Parramatta itself.
1619. How do you know? I am quite sure of it.
1620. If we have had the sworn testimony of the managers of these institutions to the effect that they deal effectually with their sewage, and only pour innocuous effluent into the river, does that alter your opinion? No; I am of the same opinion still.
1621. So far as Parramatta is concerned, there is an urgent necessity for dealing with the sewage irrespective of whether the Government institutions contribute an undue quantity or not? There is no doubt about that. The matter has been before the Council for a long time, and no opposition has been shown to it.
1622. Has the population of Parramatta increased or decreased during the last eighteen months? I think that, if anything, it has increased.
1623. To an appreciable extent? I do not think it has increased to a very large extent; but there is a better class of houses being built there.
1624. Was there an increase or decrease in the municipal valuation last year? There was a slight increase last year.
1625. An increase for 1893-94 as against 1892-93? Yes.
1626. The valuation for this year has not yet been made? No.

J. W.
Withers, Esq.
28 Feb., 1894.

- J. W. Withers, Esq.
28 Feb., 1894.
1627. Do you think there is likely to be an increase upon the valuation of last year? No; I do not.
1628. Do you think there will be a decrease? I think there will be a decrease on all property.
1629. To what extent? I should not think to a very large extent.
1630. Would it go back to what you received in 1892-93? Very likely.
1631. The increase last year will be counterbalanced by the decrease this year? Yes.
1632. So that the income of the borough for the coming year will be much the same as its income in the year 1892-93? Yes.
1633. Can you tell the Committee what the estimated revenue was last year, and how much was actually received? I did not bring that information with me, but I know that we received about £2,500 from water rates last year.
1634. Was that what was actually received, or was it the assessment? The actual assessment.
1635. What water rate do you pay? Nine pence in the £. We have our own scheme.
1636. Have you raised any loans during the last eighteen months? No.
1637. Then your indebtedness is the same as it was eighteen months ago? Yes.
1638. What was it then—£56,000? I think it was about that.
1639. Have you an overdraft? Yes.
1640. To what amount? About £1,600.
1641. Is it larger now than it was when your predecessor was examined? I do not think so.
1642. Then you have a standing overdraft to that amount? No; we will pay it off during the next six months.
1643. You have borrowed right up to your limit? We have borrowed up to our limit. I should like to know from you what the proposed scheme will cost?
1644. A scheme to meet the present requirements of the town will cost £75,926? What will be the annual maintenance? I thought it was to cost about £45,000.
1645. £4,268 is the annual charge? What will the Government institutions pay?
1646. It is for you to say what they are worth? —
1647. *Mr. Humphery.*] What do you assess them at for the water rate? They pay 10s. for each inmate per year.
1648. *Mr. Dawson.*] How many people are there in these institutions? I believe there are 1,000 in one and 450 in another.
1649. That is in what you call the asylums? Yes.
1650. Then there is the gaol? There are about 450 there, and about 1,500 in the lunatic asylum.
1651. Do you think it would be an advantage to the people of Parramatta to have the sewage farm, or would it be better to dispose of the sewage by treating it with chemicals, or in some other way? Of course I am not an expert, but what I have heard from other people the sewage farm would be a good thing.
1652. You do not think it would cause a nuisance? From inquiries I have made, I do not think it would cause a nuisance.
1653. Have you ever been to Webb's Grant? No, I have not; but people who have been there tell me that the place is not a nuisance to anyone.
1654. You think the people of Parramatta would pay for this work;—it would not be a drag upon the Government in after years? I do not know what the rate would be.
1655. It would be about 11d. in the £? I do not think that that would hurt anybody, and the scheme would be a good thing for the town.
1656. How much are they taxed now? 2s. in the £.
1657. *Chairman.*] You are including the pan charges? No; that is an extra tax. We pay 3d. for gas, 9d. for water, and 1s. as a general rate.
1658. Then from the 2s. 11d. you would have to deduct what you are now paying for the pan service?—
1659. *Mr. Dawson.*] You have not gone into the matter sufficiently to be able to say whether the borough could pay for this work, if not at the present time at least very shortly? I believe that the people of Parramatta would be able to pay for it, and I am sure that they would be willing to pay for it.
1660. Do you think that the majority of the ratepayers are in favour of it? I am sure of it. The matter has been alluded to during elections, and there has never been any dissent from the proposal.
1661. You do not think any nuisance would arise from the farm? I do not think so, because it will be quite away from the town. I suppose the farm will take the sewage of Granville, though I do not know whether that would make any reduction as far as Parramatta is concerned. There is no doubt something must be done in regard to the river, because it is in a terrible state.
1662. How do you account for the statements of the superintendents of the asylums that the sewage from these institutions is carefully and properly treated and creates no nuisance, never getting into the river? The sewage from these places used to cause a nuisance where the bridge is now, but they spent a little money and had it brought nearer to the town. The black slimy mud there is so objectionable that you cannot go near the place.
1663. Is not the nuisance caused by the drainage from the town? No; it mostly comes from the lunatic asylum, the gaol, and Biloela. It has always been caused by these places.
1664. *Mr. Ewing.*] Do you regard Parramatta as a healthy place? I am sure that it is.
1665. What is the usual reason why people carry out sewage works;—is it to insure the health of the people? Yes.
1666. If Parramatta is a very healthy place, under the pan system, why do you want to spend £70,000 to make it what it already is? The principal reason for carrying out sewerage works would be to get rid of the nuisance caused by the Government establishments. It is because they empty their muck into the river that the danger has arisen.
1667. But you, as Mayor of Parramatta, say that the health of the people is not suffering? I do not say that we are not suffering.
1668. But the cleansing of the river is necessary? The pollution of the river is the worst nuisance with which we have to contend.
1669. Is it the only nuisance? Of course, there are some parts of Parramatta which would be the better for a sewerage scheme.
1670. Notwithstanding the fact that the town is a healthy one, you are going to put a debt of £75,000 upon the ratepayers because the river does not smell very savoury sometimes? Yes.
1671. The people of Parramatta will have to pay something like £3,000 a year for the sewerage system? Of course, the Government will have to pay a large part of that.
- 1672.

J. W.
Withers, Esq.
28 Feb., 1894.

1672. Do you think a sewerage system would be worth £2,000 a year more to Parramatta? I am sure that if we could get the work done for £2,000 a year no one would grumble about it.
1673. You are now paying £1,300 a year, and the total cost of this scheme will be £4,600 a year. Subtracting £1,300 from that, it leaves £3,300, of which, if the Government pay £1,000—which will be a very large amount—£2,300 must be paid by Parramatta, in addition to what it pays at present? You say that there will be a rate of about 11d. in the £.
1674. But you realise that you have already borrowed up to your limit? Yes.
1675. Still you believe that it is a wise thing to increase your debt to between £130,000 and £140,000? It would take a number of years to complete the sewerage of Parramatta, and I believe it is proposed to expend only £76,000 at the present time.
1676. But you already owe £56,000. Adding £76,000 to that would make your liability £132,000 at the lowest estimate. All that expenditure is to be incurred to make a town healthy which is healthy already? I have no doubt about the healthiness of Parramatta.
1677. Then why are you anxious to incur this liability? There are some parts of Parramatta which would be the better for a sewerage system.
1678. *Mr. Collins.*] Does not the Council attend to the pans of the asylums? No; I think they empty their own now.
1679. *Mr. Byrnes* said that the Council serve all the Government institutions except the lunatic asylum? We serve the poor-houses, but not the lunatic asylum or the gaol.
1680. What do you receive from the Government for that? I could not tell you off hand.
1681. Do you charge them what you charge the ratepayers, or so much per head? I believe we charge so much per head.
1682. Are you aware that £16,000 has already been expended in connection with the sewerage of Parramatta? Yes; on the storm-water drains.
1683. Have the Council paid any part of that amount? No.
1684. Why not? We have never been asked to pay.
1685. You make use of the drains, and do not pay anything towards their cost? We have not paid anything yet.
1686. Do you not think that you should pay for them? I know that we shall have to pay for them—I have always expected that.
1687. *Mr. Humphery.*] Looking at the plan before the Committee, what proportion of the annual rateable value of the property will be served by the proposed scheme? It would serve the principal part of Parramatta.
1688. About what percentage of rateable property will not be served by this system? The population that will not be served is very scattered, but I should think that fully 10 per cent. of the rateable property will not be served.
1689. *Mr. O'Sullivan.*] You have no doubt as to the financial capacity of Parramatta to bear the burden of this work? I have no doubt that we could bear it.
1690. It would be some years before the work was finished, and in that time the population would increase, and it would go on increasing? Yes.
1691. Although you may be temporarily hampered just now, having borrowed up to your limit, you will not always be in that position? I hope not. We are going to try to pull down our liabilities.
1692. Parramatta has made great strides during the last ten years? Yes.
1693. Is it becoming a favourite residential suburb? Yes; during the last few years a great number of people have come to live there.
1694. Do you think there is any possibility of Parramatta ever repudiating its obligations, or failing to meet them? I do not think there is the slightest possibility of that.
1695. It is not within the ken of man to discern the likelihood of it? No.
1696. If the public institutions were taken away from Parramatta would you be able to bear this impost? I think so. I do not see why not. No doubt if we had a sewerage system people would be more inclined to live in the town.
1697. In the ordinary course of events, Parramatta will become the industrial centre, and its population will be increased in that way? Yes.
1698. *Mr. Davies.*] *Mr. Byrnes*, in a statement which he sent in correcting and amplifying his evidence, says that £4,324 are received from other sources of revenue in addition to the general and special rates; are those figures correct? I have no doubt they are correct.
1699. *Mr. Byrnes* stated that £56,000 had been borrowed by the Council, in which case you have exceeded your limit, because you are only allowed to borrow a sum equal to five years' rates? Yes; that is so.
1700. Do you know to what extent the revenue has increased during the last eighteen months? I could not tell you that.
1701. Is there likely to be an increase of revenue during the present year? I do not expect it. I think it will be the other way round.
1702. Does the Government pay rates on its buildings? No.
1703. If the proposed scheme were adopted, would it be necessary to assess and rate the Government property? There is no doubt about that. I should like to know what the Government are likely to pay.
1704. If Parliament gave you power to levy sewerage rates on the Government property as well as on other property, would you be in a position to pay the working expenses and the interest on the proposed scheme? We have always considered that we should be able to do so. I reckoned this morning, before coming away, that the sewerage rate would be about 9d. in the £.
1705. It would be only reasonable to expect the Government to contribute towards the cost of the sewerage scheme? Yes.
1706. Notwithstanding the great debt which you at present owe, you believe that if a rate of 10d. or 11d. in the £ were imposed upon all properties within the borough you could pay the £4,000 odd, which would be necessary to meet the cost of management, together with the interest on capital? That would be after deducting what should be paid by the Government.
1707. But striking a general rate? Yes; we think so.
1708. You have been asked whether, if the Government institutions were abolished or removed elsewhere, your income would be very largely crippled? No doubt it would make a great difference in the returns.

- J. W. Withers, Esq.
28 Feb., 1894.
1709. Would your borough, with such a shrinkage of income, be able to strike a higher rate, and thus equalise the cost amongst the residents of the municipality, or would the impost be found oppressive? I should not like to impose a rate of more than 9d. or 11d. in the £. I should not care to have to pay a higher rate than that.
1710. You have been informed that it has been estimated that, taking in the Government buildings, a rate of 11d. in the £ would have to be levied;—do you think that the ratepayers could pay such a rate in addition to the 2s. in the £ which they already pay? I believe there would be no difficulty about that.
1711. It would be equal to about 15 per cent. increase on the assessed value of the property there? Whenever the question has been brought up there has never been any objection to the scheme. Everyone knows that they will have to pay something like 9d. in the £.
1712. Have they not been looking to a paternal Government to do everything for them? No; it would be stupid for anybody to think that the Government would undertake such a work without being paid for it.
1713. When does any portion of your loan fall due? Speaking from memory, I think in about five years' time.
1714. How do you hope to be able to meet your debentures then? We must do as a good many others do—renew them, and try to get a reduction.
1715. Seeing that you have exceeded the limit imposed by the Act, do you think that the Government will allow you to re-borrow? I think there will be no help for it. We have a water service there which is a good asset.
1716. What did it cost? We got it from the Government. The Government made the dam about forty years ago, but it was lying idle until Mr. Byrnes had the water brought into the town. We have reticulated a large part of Parramatta out of the rates paid for water.
1717. The municipality has only paid for the reticulation? Yes; the dam was made when I was a boy, and was lying idle for a long time, until handed over to the Parramatta Council.
1718. You supply the public institutions with water? Yes; at so much per head.
1719. Is it a pumping scheme or a gravitation scheme? A pumping scheme—the water is pumped into reservoirs.
1720. That asset is in no way pledged to the debenture holders? Yes; we have borrowed money on it to reticulate the town, to construct filter-beds and reservoirs, and to build the engine-house.
1721. What amount has been borrowed in that way? I should think half of our loan.
1722. Fully £26,000? Yes.
1723. What other assets have you? The town-hall, a square of land, baths, and market buildings, and two reserves in the town are, I think, the principal assets.
1724. *Mr. Hoskins.*] What interest do you pay annually? I think 6 per cent.
1725. What!—6 per cent. on £56,000 would be £3,360 a year. What interest do you pay on your overdraft? Seven per cent.
1726. That is practically £3,500 a year for interest? Yes.
1727. What do you raise by taxation? I think about £7,000.
1728. What are the working expenses of the Council? I cannot tell you. We spend all our money upon improvements and working expenses.
1729. It takes all the money the corporation can raise by taxation to pay the interest on their debt and overdraft, together with their working expenses? There is a certain amount of money spent in each ward every year upon permanent improvements, such as kerbing and guttering. We spend all the money we raise.
1730. You think the corporation of Parramatta could raise £4,600 yearly in addition to what they get now? The Parramatta people would not have to pay the whole of that amount, because the Government institutions would have to pay a good deal. We reckon to get £1,800 or £2,000 from the Government.
1731. The Government would only pay a few hundreds, say £1,000 a year;—at present they only pay £674;—do you think that the Council could pay £4,600 a year in addition to what they have to pay now? I was rather surprised to hear what the scheme would cost. I thought it would only cost £50,000.
1732. Then you speak with some hesitation with regard to the ability of the corporation to repay the cost of carrying out this scheme, together with the annual working expenses? I do speak with hesitation, considering what it will cost.
1733. If the Government could dispose of their sewage without creating a nuisance, would the people of Parramatta be content to do without this scheme? I maintain that the principal cause for carrying out the work is the nuisance created by the Government institutions draining into the river.
1734. If the Government got rid of that nuisance, would the people do without a sewerage scheme? Speaking for myself, personally, I think they would if it is to cost so much.
1735. Do you say that the principal expenditure in connection with your water scheme is incurred by the Government? No; I say that the Government built the dam.
1736. Is it not a fact that at several meetings of the Council several of the aldermen have complained of the rates which are charged as excessive, and have suggested that the present scheme be got rid of so that the town may be served by the Prospect scheme? I think only one alderman has suggested that.
1737. *Mr. Wall.*] Have the Council discussed the sewerage scheme during your term of office? No; we have not. I was only elected a week ago.
1738. At present the Government pay £674 for having their pans attended to, and the annual cost of the scheme will be £4,268;—assuming that the charges to the Government were not increased, that would make the municipality liable for £3,594, or four times as much as they are paying now, because at present they pay £856 for the pan system;—under those circumstances, do you think the ratepayers would be prepared to adopt the system? I do not think they would; I think they would growl.
1739. Do you know the actual number of Government institutions that pay for having their pans removed? I think that George-street asylum, Macquarie-street asylum, the poor-houses, and the old men's homes are all attended to by the Council, while the Government attends to the gaol, the lunatic asylum, and the girls' reformatory.
1740. *Mr. Barling*, in submitting this work to the Committee, says: "For many years past the unsatisfactory sanitary condition of Parramatta has been the source of much trouble, both to the municipal authorities

- authorities and to the Government." You stated just now, however, that the town is particularly healthy? I say so again.
1741. Then what you say does not accord with Mr. Barling's statement? No.
1742. Do you know how they dispose of their sewage under the pan system? I think it is mostly taken out to the orchards.
1743. Is it only the Government institutions which have not adopted the pan system that are discharging their sewage into the river? It is not the contents of the night-pans that go into the river, but the slops and grease, and washing-up water.
1744. You could not tell us the number of ratepayers in Parramatta? Not from memory.
1745. *Mr. Neild.*] According to the statement of your predecessor, Mr. Byrnes, it would appear that the people of Parramatta pay £856 for the removal of their night-soil, which, with a population of 12,000, would be at the rate of 1s. 5d. per head. The proposed scheme is expected to cost £4,650 per annum. Taking off £1,000, say, for the Government institutions, it leaves £3,650 to be raised by the Council? Yes.
1746. Which, with a population of 12,000, would mean a cost of 6s. per head;—do you think the ratepayers would approve of the increase of cost from 1s. 5d. to 6s. per head? I know that they would not.
1747. Do you think that they could afford to pay such a rate? It seems a large sum of money, and I do not think so.
1748. Putting the calculation in another way—the number of houses in Parramatta is stated roundly at 1,950, so that the proposed charge would be £2 per house per annum;—do you think that the taxpayers would agree to pay such an impost? You could not tax them in that way.
1749. I am putting the calculation before you in two forms—per head of population and per house;—£2 would be a small charge for some houses, but it would be deemed altogether too heavy for smaller places? There can be no doubt about that.
1750. Would you have any difficulty in meeting your charges for interest or in renewing your loans? No.
1751. Have any loans fallen due lately? Not lately.
1752. Do you know of any large municipalities in the Colony which have had a difficulty lately in renewing loans, or providing money to meet existing liabilities? I do not remember any.
1753. Is the next loan falling due a large one? I do not think the amount is a large one.
1754. I gather from what you said to Mr. Wall, that if the sewage from the Government institutions could be prevented from going into the river, the people of Parramatta would not be so anxious for this scheme? It would do away with the greatest nuisance we have.
1755. And if that nuisance were removed, would you advocate a four-fold increase of the present cost of removing the night-soil? I should not.
1756. Then, after all, the question seems to resolve itself into this, that you desire a sewerage system in order to obtain relief from the nuisance created by certain Government establishments? Yes; principally.
1757. That nuisance removed, you would not trouble about the sewerage scheme at present? I should not.
- 1757½. Do you think the people would? I do not think they would.

J. W.
Withers, Esq.
28 Feb., 1894.

THURSDAY, 1 MARCH, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTON.	WILLIAM CHANDOS WALL, Esq.
The Hon. JAMES HOSKINS.	WILLIAM McCOURT, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	JOHN CASH NEILD, Esq.
The Hon. JOHN DAVIES, C.M.G.	EDWARD WILLIAM O'SULLIVAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	CHARLES COLLINS, Esq.
THOMAS THOMSON EWING, Esq.	HENRY DAWSON, Esq.

The Committee further considered the proposed Sewerage Works for Parramatta.

Charles James Saunders, Esq., Chief Draftsman, Department of Lands, sworn, and examined:—

1758. *Chairman.*] You have been requested to furnish information as to whether the land to the south of the proposed sewage farm at Duck River is Crown land? So far as our records show, that land forms part of John M'Arthur's Grant of 850 acres, issued in 1816.
1759. Is there any reservation of any kind? No; there is no reservation of water frontage in the old grant. I satisfied myself about that.
1760. The land to which you refer is bounded by Duck Creek? By Duck Creek and the Parramatta River on the southern and northern sides.
1761. The land already resumed for the purpose of a sewage farm, was resumed either from M'Arthur's executors, or some subsequent purchaser of part of the estate? Yes.
1762. Can you tell the Committee how the Lands Department define the term "high-water mark"? High-water mark is the mean high-water mark between spring high tides and neap high tides.
1763. The mean between the highest water at neap tides, and the highest water at spring tides? Yes.
1764. If the land is very flat there may be a considerable area at times covered by the tide, but not belonging to the Government? Yes.
1765. As a matter of fact, the Crown has no right to any portion of the land in question? I should not like to say that. I believe that the Crown has a right to all lands under the sea, and I think that if there was a gradual encroachment of the sea, the Crown would gradually acquire the title to so much of the land as was encroached upon. That, I think, is the common law of England.
1766. But your Department recognise mean high-water mark as the boundary? Yes.
1767. As far as the Lands Department are concerned, you are not aware of the existence of any Crown land to the south of the piece that has already been resumed? No.
1768. *Mr. Davies.*] All the land referred to is under water at times, is it not? I am not aware.

C. J.
Saunders,
Esq.
1 Mar., 1894.

Alexander

Alexander Brown Portus, Esq., Assoc. M. Inst., C.E., Superintending Engineer of Dredges, Department of Harbours and Rivers, sworn, and examined:—

- A. B. Portus, Esq.
1 Mar., 1894.
1769. *Chairman.*] You have been connected with the Harbours and Rivers Department for many years? For nearly thirty years.
1770. How long have you been superintendent of dredges? For thirteen, nearly fourteen years.
1771. Can you tell the Committee what it costs per ton to dredge material in any part of Port Jackson by means of your ordinary ladder dredges and deposit it in the punts alongside? From 2½d. to 3d. per ton.
1772. That estimate of cost is based upon a consideration of the loss of time in removing dredges, wear and tear, renewals and all other expenses? Yes.
1773. What does it cost per mile for the towage of punts? It costs about 3d. per ton to tow the punts 24 miles, that is, 12 miles each way.
1774. That would be to tow them to sea and simply to drop the silt down there? Yes.
1775. Would it be any saving if you took it to Long Cove or Neutral Bay? Yes, the cost would be somewhat less, because you could work with a tug of less power than would be required to tow to sea.
1776. Would the distance from Sydney Harbour to the junction of the Parramatta and Duck Rivers be equivalent to the distance of towing to sea? It would be about the same.
1777. And it would cost 3d. a ton? About that.
1778. But would you require so powerful a tug to tow the punts to Parramatta as would be required to tow them to sea, where the weather is sometimes heavy. You said there would be a saving if you were only taking the stuff to Neutral Bay? Yes; but the distance to Neutral Bay is less, and therefore a tug of less power would do than would be required to tow a punt as far as Parramatta.
1779. It is not because you go out to sea that you require heavier tugs, but because of the longer distance? Yes.
1780. What does it cost per ton to lift and deposit material upon a reclamation area by means of a sand-pump? About 2d. a ton, though the cost varies. We have paid 2d., 2½d., and have gone almost as low as 1½d. per ton; but the latter price was only paid under very favourable circumstances on the northern rivers where there is a great deal of sand, and the distance to be pumped is not very great.
1781. The cost depends very greatly upon the distance at which you have to deliver the sand? Yes; and the nature of the material operated upon.
1782. Do you know the land at Parramatta of which it is proposed to make a sewage farm? Yes.
1783. Can you give us any idea as to what it would cost to lift and deliver material on to that land? I think if the "Groper," the Von Schmidt dredge, was sent up there, and material favourable for the purpose were put ashore, the work could be done for 1½d. per ton.
1784. What does it cost you to pump and land material at Long Cove? About 2d. a ton with the "Neptune," but with the Von Schmidt dredge we can work more cheaply. We have no actual return for the working of the Von Schmidt dredge yet, because she has only been in use a few months.
1785. But there is no doubt that she is working more economically than the other dredges? Yes; we have had to combat several difficulties but they have been overcome now, and I think we can put the work of that dredge down at 1½d. per ton.
1786. Is it a fact that the "Neptune" was a hopper-berge and was converted into a sand pump? Yes.
1787. But the "Groper" is a sand-pump constructed upon more modern principles? She is specially adapted for dealing with clay. The "Neptune," under certain conditions will deal with sand just as well as the Von Schmidt dredge, but the Von Schmidt dredge is more powerful and will force the material to a greater distance.
1788. Is any hand labour employed in spreading the stuff after it has been put on the land by the sand-pump? No; the water levels it off.
1789. Did you employ any men to spread the stuff at Long Cove? We had men making fascine banks there.
1790. But was the material put on by the sand-pump spread by hand? No; if the spreading is properly done there should be no hand work.
1791. What is the area of the Long Cove reclamation? I think we have reclaimed about 40 acres.
1792. That is 20 acres on each side of the channel? No; the greater area is on the southern side. I speak approximately when I say 40 acres.
1793. There are about 40 acres enclosed in the fascine bank? About that approximately.
1794. *Mr. Trickett.*] Do you think that the sand-pump which would have been moored in Duck River or in Parramatta River could spread the sand all over the proposed farm? Yes; I think the work could be done admirably by the Von Schmidt dredge. The material discharged by the pump would be sand, but silt would also be lifted with it, and this would flow away over the adjacent land. The sand would deposit itself at the mouth of the pipe.
1795. But that would only apply to land up to high-water mark? No; the work could be done at a height of 10 or 15 feet—as high as you desired to lift the sand.
1796. *Chairman.*] Can you tell the Committee the longest distance you have delivered sand by means of a pipe from a sand-pump? Two thousand feet; but in Melbourne material has been delivered ¾ of a mile in this way.
1797. But speaking of your own dredges? About 2,000 feet. You require more power to deal with sand than with silt, because of the friction caused by the sand going through the pipe.
1798. You estimate that it would cost 1½d. a ton to land silt or sand upon the proposed farm. That would include the cost of removing the dredge to the place, ordinary stoppages of work, and so on, and interest on capital? Not interest on capital; just the actual cost.
1799. Including renewals? Yes; including renewals.
1800. Everything that could be fairly charged would be charged, with the exception of interest on capital? Yes.
1801. You think that 1½d. per ton would cover the cost of the filling in? Yes; that is, dealing with the material I know there is up there, and which would be suitable for the farm. We have dredged there before, and have found the material to be sand intermixed with silt. If the Von Schmidt dredge were used the sand would be left on the land, and the silt would flow in whatever direction you liked to direct it.
1802. From your knowledge of the various kinds of silt and sand in Port Jackson and its branches, can you tell the Committee if there is any silt or sand near the site of the proposed farm equal in quality to that

that which the Committee saw at Neutral Bay? About 2 miles below the site of the farm there is sand which is quite as good as any to be got in the harbour. Some of it was brought down to White Bay, and pumped ashore there.

A. B. Portus,
Esq.
1 Mar., 1894.

1803. What part of the river do you refer to? Just above Ryde Bridge.

1804. Is that stuff in the way now; in other words, will it have to be removed in order to make a channel? At present we have to dredge the channel to a depth of 8 feet for the Parramatta boats, but it will be necessary to make it 11 feet deep in order that we may take our heavy barges up there. The "Castor," for instance, draws 11 feet, and we require a channel of that depth for the Homebush reclamation.

1805. Certain of your plant which draws 11 feet will have to be used for the purpose of completing your own reclamation? Large punts may not necessarily have to be used, but it will be more economical to use them than to use barges of lighter draught.

1806. To that end you must dredge the channel where the good sand is? Yes.

1807. That channel would have to be dredged to properly complete the Homebush work, irrespective of the sewage farm altogether? Yes; in order to enable us to carry out our own reclamation to advantage.

1808. And where are you going to get the silt for the Homebush reclamation? We get the softer material—clay and material of that kind—from Sydney Harbour. We do not consider it desirable to put sand there, because we wish to conserve the sand as much as possible for health purposes, and use it at North Shore and other places at small reclamations.

1809. Has not some dredging been done off Darling Point of late? Yes.

1810. Where are you taking the material so dredged? It has been taken to Careening Cove, Neutral Bay, Long Cove, and, I think, a little was taken to the Homebush reclamation, where the "Neptune" was dredging.

1811. So that you have been punting some of the material dredged from Port Jackson up the Parramatta River? Not very much. A little was taken up there when the "Neptune" was working there to mix with the softer material.

1812. What would it cost to dredge the stuff at this point, 2 miles below the farm, and deliver it alongside the sand-punt at the junction of the creek and the river? The cost of the dredging would be just the same as it costs in Sydney Harbour—from 2½d. to 3d. a ton, say, 3d., and the towage would be about 1½d. per ton.

1813. So that it would cost 7½d. per ton to dredge material from the channel above the Ryde Bridge, and deposit it upon the proposed farm? Yes; because you would have to deal with it by means of two dredges. It is that that runs into expense.

1814. If the stuff was not deposited on the proposed farm, would it be deposited on the reclamation area at Homebush Bay? Yes; that is probably what we would do with it.

1815. Is there sufficient stuff there to complete your work at Homebush Bay? No. There are about 500 acres enclosed at Homebush Bay, an area sufficient to keep us at work for a long time.

1816. If you put the stuff on the site of the proposed farm, you will be robbing the Homebush reclamation? Yes; but we would not put sand there by choice, because our supply of sand is limited.

1817. You would bring the ordinary silt from Sydney Harbour, and put it there? Yes. We are not punting to Homebush Bay now, because there is no dredge available for the pumping work. We are sending all the stuff to Long Cove.

1818. *Mr. Davies.*] How many sand-pumps are there in connection with your Department? Eight.

1819. Whereabouts in the harbour are they working? There is only one in Sydney Harbour at the present time. The other is at present deepening the bar at the Clyde.

1820. Where is the one that is working in Sydney Harbour delivering the sand? At Long Cove. It was recently working at Callan Park.

1821. You have no difficulty in finding reclamation works where you can deposit silt and sand taken up by the dredges? No; we have no difficulty.

1822. You have any number of places where you can dump down the sand or silt without going outside the Heads? Yes; we have Long Cove and Homebush Bay.

1823. At Long Cove there is room for millions of tons of stuff, is there not? Yes, there is room for a large quantity.

1824. The Department is not inconvenienced for want of a place where it can deposit the sand? No.

1825. So that you have no occasion to take stuff outside the Heads? No occasion.

1826. And you will not have for many years to come? No.

1827. You have told us that it would cost 7½d. to deliver sand on to the proposed sewage farm. Does your Department usually debit another Department with the cost of services rendered by it in reclaiming land for public purposes? The Government by arrangement with the Municipal Council of North Shore receives half the cost of pumping the material on to the land at Careening Cove and Neutral Bay. They (the Municipality) pay for the delivery of the sand only, not for dredging it.

1828. That would be about 1½d.? About that.

1829. Where you render similar service to another Government Department do you debit the department with the cost of delivering the sand or silt? There has been no instance where that has been done.

1830. Would it be a fair thing to charge the Sewerage Department whatever may be the cost per ton of reclaiming this land so that it may be used for the purpose of a sewage farm? If it is a Government affair, it would not be a fair thing to do, because we have hitherto taken all the sewage delivered at Sydney out to sea without charging it to any person.

1831. I think you misunderstand my question; do you think it a fair thing, where one Department renders a service to another Department, to charge against it the cost of that service? Our Department should receive credit for the work done by it; but it is a question for the Minister to decide. I have never been asked to give an opinion upon it.

1832. You cannot say whether it is likely that your Department will get credit for this reclamation? Our Department would get no credit for it, because any money that was received would be paid direct into the Treasury.

1833. You say that this work will cost about 7½d. a ton? Yes; but if the material were dredged just at the spot the work would cost only 1½d. a ton.

1834. That is independently of the capital cost of the machinery used? Yes.

- A. B. Portus, Esq. 1835. You simply take into account the wages and wear and tear? The wages and wear and tear.
- 1 Mar., 1894. 1836. *Mr. O'Sullivan.*] We have it in evidence that it will take 600,000 tons of silt to carry out this work; that, at 7½d. a ton, would come to over £18,000? That is, supposing the whole of the material were taken from Ryde, but a great deal of it could be obtained on the spot—probably 150,000 tons—and that would only cost 1½d. per ton.
1837. Seven pence three farthings per ton is the cost of taking it from the harbour? That would be about the cost if two dredges were employed; but if the "Von Schmidt" could pump the stuff direct on to the reclamation, it would only cost 1½d. a ton.
1838. Whatever it may cost, I understand that this work would be done by your Department in the ordinary way, just as you would deposit material at Long Cove or Homebush Bay? Yes.
1839. If you did not take it to the proposed sewage farm, you would have to take it to some other place? Yes.
1840. Under those circumstances, do you think the work would be a fair charge against the sewage farm? The question of public health comes in here. The Dredging Department has always looked upon the public health as being a chief concern with it. If the requirements of the public health necessitates sending a dredge to any particular place it is at once sent there, and I suppose that on that score the people of Parramatta would be entitled to some consideration.
1841. Your Department would be justified, on consideration of the public health, in depositing silt on this particular spot? I think that is a very serious consideration. The preference should be given to a place where the reclamation will benefit the public health.
1842. Would your Department suffer any loss by the work at Long Cove or Homebush Bay, or any other place, being retarded while you were depositing silt at Parramatta? If the "Groper" were sent to Parramatta another dredge would be required at Long Cove. I daresay it would be possible to deposit the material dredged in Sydney Harbour upon the land at Parramatta; but it would be better to have another dredge at Long Cove and deposit it there.
1843. Supposing you did not send another dredge to Long Cove, and the work there was stopped, would your Department suffer any loss? Yes; it would inconvenience the Department.
1844. *Chairman.*] How would the Department suffer loss—through having to tow their material to Parramatta, or else take it out to sea? Yes; besides the material dredged from Sydney Harbour would not be very suitable for a sewage farm, because it is mostly clay and you require sand there.
1845. *Mr. Humphery.*] The sand-pump at Long Cove at present disposes of all the silt raised in Port Jackson? Yes.
1846. You are not put to any inconvenience in finding a place for depositing the silt that is raised? No.
1847. Do I understand that provision has been made for many years to come for depositing any silt that may be raised inside the Heads? Yes, for a long time to come.
1848. So that you do not want the Parramatta site as a dumping ground? It is not absolutely necessary to us.
1849. Is it necessary at all, if you have made provision for many years to come? No, it is not.
1850. *Mr. Trickett.*] You say that the area you have been filling in at Long Cove is about 40 acres? That is speaking at a guess; I think we have done that. I believe there are 60 or 70 acres there altogether.
1851. Which have to be filled in? Yes.
1852. How long have you been working there? We have been working there intermittently for a little over two years.
1853. Can you tell the Committee how many tons of silt have been put in there? Not without referring to the records.
1854. Do you know what the work has cost the Department? I could not tell you without referring to the records.
1855. What depth had you to fill in there? At the lower portion, 8 or 10 feet. The bottom is very soft, and the material sank down.
1856. Has the work been nearly completed? No; there is a good deal to do yet.
1857. What time would it take to complete it, using one dredge only? Eighteen months, I think.
1858. That is working continuously? Yes.
1859. In taking stuff up the Parramatta River, would you not have to go very slowly above the Ryde Bridge? No; we could go full speed.
1860. Would it not take time to moor the punts? No; the tug would go alongside the punt before reaching the sand pump, and you could then open the doors, and steam away again. The whole operation of discharging does not take longer than five minutes.
1861. How much stuff do these punts hold? From 250 to 500 and 600 tons, but the very large punts could not get right up there. I have explained that it would be necessary to make the channel 11 feet deep in order to get the larger punts up there.
1862. How many punts a day do you think you could send there? Each of the larger dredges would turn out about 2,000 tons a day.
1863. Could you send up five punts a day? Yes; five 400-ton barges.
1864. That would be using all the dredging plant in the harbour? We have two dredges working in the harbour, each capable of lifting 2,000 tons a day of eight hours.
1865. Will you furnish a return showing what amount of stuff you have already put upon the land at Long Cove, and what the work has cost? Yes.

Robert R. P. Hickson, Esq., M.I.C.E., Commissioner and Engineer-in-Chief for Roads and Bridges and Sewerage, sworn, and further examined:—

- R. R. P. Hickson, Esq., M.I.C.E. 1866. *Mr. O'Sullivan.*] I want to know from you if the tramway from Parramatta to the river, which runs past the sewage farm, would be in any way injured by the works which you intend to carry out? I do not think so.
- 1 Mar., 1894. 1867. Will not the tram-line be lower than the sewage farm, and will not the water from the farm therefore drain on it? It is rather lower than the sewage farm will be, but the side drain will catch all the soakage.
1868. Will you have concrete drains on the outside to carry off the soakage? No; pipe drains.

1869. Do you anticipate the probability of damage occurring to the tramway, and a claim being consequently made for compensation? No; there is no possibility of that, I think.

1870. Do you think that any claim for compensation will arise because of the sewage farm proving disagreeable to travellers by the tram? If the farm is properly managed, I do not think that it can be disagreeable.

1871. The Rosehill racecourse, which is very much frequented by the public on holidays, is near the proposed farm;—do you think that the odours from the farm will prove disagreeable to the people attending the races, and thus depreciate the value of the racecourse and give the owners of it a claim for compensation? I do not.

1872. Do you think that if the farm is properly managed, no claim for compensation can be made? If the farm is properly managed it cannot be a nuisance either to the tramway passengers or to the racecourse people.

1873. Do you think it is likely to be better managed than the Botany farm? Yes; because it will be managed under very much better circumstances.

1874. You are aware that at times there is a disagreeable odour about the Botany farm? To a very slight extent, and it is due entirely to the way in which we have to work the farm on account of the syphon under Cook's River. Instead of sending the sewage on to the farm diluted with water, the sludge has to be collected by the strainers, and when it has been collecting for some days, it is no doubt very disagreeable. I have never been able to detect any smell from the conduit that carries the sewage water.

1875. I understand that you anticipate that there will be still less smell at Parramatta? Most decidedly.

1876. Is your Department satisfied as to the financial ability of Parramatta to pay for the work? That is hardly a matter upon which I should like to give an opinion. I can only give an engineering opinion. The Parramatta people, however, seem very anxious to have the work carried out, and I understand that they are prepared to take the burden upon themselves.

1877. How long do you anticipate that the farm can continue working without anything like a disagreeable result;—how many years do you think it can be used before any radical alteration will be required? Sewage farms improve, they do not deteriorate.

1878. We have it in evidence from Mr. Stayton that he anticipates that within the next twenty years the farm will be, as it were, played out, and an enlargement of the area, or something else will be required? He is entirely wrong there. I have here the report of a Royal Commission which sat last September to inquire into the water supply of the metropolis of London. The Commission also dealt with the sewerage question, and amongst its members were Sir George Barclay Bruce; Sir Archibald Geikie, Doctor of Laws, and Professor of Geology and Mineralogy in the University of Edinburgh; James Dowar; George Henry Hill, Civil Engineer; James Mansergh, Civil Engineer—it was he who designed the Melbourne sewerage scheme—and William Ogle, Doctor of Medicine. Some of the members of the Commission were Cambridge men, and others were from Edinburgh University. This is their opinion upon the subject of filter beds:—

The action of a filter-bed appears to be partly mechanical, partly vital; but the mechanical action, which is confined, or almost confined, to the holding back of the comparatively gross substances suspended in the water, and which was supposed until recently to be the only operation in the filter, is now held to be of far less importance than the vital action, which depends on the activities of the gelatinous layer of living matter gradually deposited on its surface. A new filter, composed of perfectly purified sand, has little or no effect in producing either chemical or bacteriological purification; but, in course of use, a layer charged with living microbes is deposited upon the surface, and it is by these organisms which constantly increase in number, and also penetrate the sand to a slight distance, that both the nitrification of organic matter and the arrest of other microbes is affected. Thus, the longer a filter has been in use the more efficient it becomes, provided, of course, that the surface layer has not acquired such density as to interfere with the passage of the water; and consequently the recommendation, which was commonly given in former times, that a filter-bed should be cleansed as often as possible, appears to have been a mistake; cleansing, by which the efficient superficial membrane is removed, should only be carried out when the filter has become unduly blocked.

I have several other similar extracts which I could read to the Committee if they wished to hear them? The extract I have just read is, I might say, the cream of the sanitary engineering of the present day.

1879. That extract supports the theory that the longer a sewage farm is used the better it becomes? Provided that it is used properly; otherwise you could clog it in a very short time.

1880. But there seems to be no danger of the soil becoming choked, and proving a nuisance if properly managed? Not in the least.

1881. We have it in evidence that it will cost 1½d. to deposit silt raised from the river near the farm, and 7½d. to bring silt from the upper portions of the harbour, and put it on to the farm, so that the work would cost altogether about £17,000. Mr. Portus has informed us that the deposit of sand and silt there will necessitate the Department of Harbours and Rivers incurring a certain amount of expense, because they would have to neglect other work. His answer seems to convey the impression that there should be some charge upon the sewage farm for the work of reclamation, and I should like to have your opinion upon the point? The only statement I can make in reply is to read to you the minute which Mr. Darley has written on the subject:—

When we are dredging up the river, it will be a most convenient site to send the silt, and for landing. We have to get rid of the material, and it would actually be cheaper to land any silt raised in the upper portion of the Parramatta River at the farm rather than to send it to sea. The flats in the river above the railway bridge are nearly all good sand, very suitable for the farm.

1882. I gather from that minute that Mr. Darley takes over this work as part of the work of his Department? It seems to me a very simple thing. The material has to be dredged from the harbour, and has to be deposited somewhere. If it can be deposited at this place as cheaply, or, as Mr. Darley says, more cheaply than it can be sent to sea, why should it not be deposited there, and why should we be charged anything for it? Besides that, they are actually depositing material now at different parts of the harbour without the work bringing in any return, whereas, if the stuff were deposited at Parramatta, it would bring in a return.

1883. *Mr. Hoskins.*] Are you not aware that there are towns in England where they have had sewage farms for years, but because these farms have become foul in consequence of the quantity of sewage deposited upon them, they have been compelled to supplement them with the precipitation system? No; I am not.

R. R. P.
Hickson, Esq.,
M.I.C.E.
1 Mar., 1894.

R. R. P. 1884. It has been given in evidence before the Committee that the International process has been
 Hickson, Esq., adopted in over 100 places, in some of which there had been sewage farms? No doubt there are places
 M.I.C.E. in England where they cannot have sewage farms. I get all the latest papers on the subject by almost
 every mail, but I have never come across an instance where a properly designed and managed sewage
 1 Mar., 1894. farm has had to be given up, and a chemical process has been adopted in its stead.

1885. *Chairman.*] Or where a sewage farm is being helped by a chemical process? No.

1886. *Mr. Hoskins.*] Are you aware that at Glasgow, the most populous town in Great Britain next to London, they are about to adopt the precipitation system? I am not.

1887. Can you tell me how many storm-water drains have been constructed in the suburbs of Sydney as far as Parramatta which do not connect with any sewerage system? There are a good many; I could not tell exactly how many.

1888. The residents in the vicinity of these drains are not called upon to pay rates for the benefits which they derive from them? We have no power to compel them to pay rates; but the Minister has a Bill dealing with the matter in print, which, I understand, he intends to bring before Parliament this Session.

1889. Therefore, the construction of storm-water drains at Parramatta is not to be taken as a special reason why the proposed scheme should be carried out, seeing that in other localities similar drains have been made for the benefits of which the residents are not paying rates? This sewerage scheme was designed not to fit in with the storm-water sewers, but to ensure the health of the town. I do not, however, quite follow your question.

1890. The fact that these drains have been constructed is not to be regarded as any justification for the carrying out of a sewerage scheme there? Unquestionably not, if a sewerage scheme is not required.

1891. *Mr. Trickett.*] When you were examined before the Committee in September, 1892, you stated that it would take 400,000 tons of stuff to make this reclamation, but yesterday you said that it would take 600,000 tons? Four hundred thousand tons was Mr. Stayton's estimate. Dr. Garran mentioned it in his question, and I assumed that the estimate was correct.

1892. But in answer to Question 1413, you say: "I think it is about right"? I took what Mr. Stayton said in regard to the quantity, which, as a matter of fact, had not been taken out at that time. It has been taken out correctly now, however, and is 600,000 tons.

1893. Do you not think that this is a very important feature? From my point of view, I do not think it is of any importance whatever.

1894. You think that 600,000 tons is correct? Yes; as near as possible.

1895. The Department estimate that the sewerage scheme will cost, in round figures, £76,000; but if 600,000 tons of sand has to be put on to the land—and that, at the lowest estimate, will cost £15,000—the whole work will cost £91,000? No. I have already shown that it will not cost anything extra to put the silt on the farm.

1896. The towing of the punts and dredges will have to be paid for by someone? Yes; but I should like to explain that the dredging has to be done in any case, and the head of the Department says that he could deposit the material dredged more cheaply at this place than he could send it to sea.

1897. We have had it in evidence from Mr. Portus that there are several places in Sydney harbour which are quite as convenient and less than one-third of the distance away? There is no place, with the exception of the Homebush reclamation, nearer to the spot from which Mr. Darley proposes to get the material—that is, just above the Ryde bridge.

1898. I understand that about £16,000 has already been spent at Parramatta:—supposing this scheme is not carried out, to what account will that expenditure be charged? If a Bill is passed compelling the people who live in the immediate vicinity of a storm-water sewer to pay for the convenience, I presume that it will apply to Parramatta.

1899. But if the scheme were not carried out, could the land which it is proposed to reclaim be put to any other purpose than a sewage farm, or would the money spent on it have been wasted? I do not know what use it could be put to. I do not think it could be used for anything else.

1900. Is not this very much the position of affairs—£16,000 has been expended, and we must borrow £76,000 to put on top of it to carry out the whole work? The way I look upon it is this: Parramatta is a very unhealthy place, and a sewerage scheme should be carried out there.

1901. *Mr. Hoskins.*] The Mayor says that it is a very healthy place? Then I stand corrected; but I know that letters from doctors have appeared in the newspapers saying that it is very unhealthy.

1902. *Mr. Trickett.*] Upon whose authority was the £16,000 spent? It was put on the Loan Estimates by the Minister.

1903. We also had it in evidence from the Mayor yesterday that if the refuse from the Government institutions were satisfactorily disposed of, Parramatta would not agitate for a sewerage scheme such as this;—is there any way by which the sewage of the Government institutions could be easily disposed of except by a scheme such as this? I am not sufficiently conversant with the system adopted there to be able to answer the question. There is a very considerable number of people living in Parramatta, and I think they require some sewerage system.

1904. I think that in most rural districts they bury their refuse? Yes; as a rule.

1905. Is there any place around Parramatta where that system could be effectively carried out as far as the Government institutions are concerned? Not that I know of just at present. It would be difficult to do that without creating a nuisance. In your report of the 12th November, 1892, you say:—

The objections raised to all chemical precipitants yet known are based on very substantial scientific ground. Their action is at the best partial. They act as clarifiers rather than purifiers of the sewage.

Are those your own words, or are they an extract? They are my own words, and convey the opinion I have formed from the papers which I have read.

1906. Mr. Stayton was very positive that the statement was not correct? Professor Warren of the Sydney University says that—

Chemical precipitation processes have been applied to render the effluent sufficiently pure to discharge into a river, but these are only partial, as they leave the precipitated impurities, known as sludge, to be dealt with in some other way. The purification of the effluent is more apparent than real, and it rapidly decomposes if allowed to remain standing.

Mr. Sidney Lowcock, in a paper published in the *Building and Engineering Journal*, says—

It has been proved by the Rivers Pollution Commissioners and other investigators, that the chemical treatment of sewage can only remove suspended matters, and does not remove the highly putrescible soluble constituents from the liquid which passes off, containing about six-sevenths of the total manurial value of the sewage.

That paper was sent to me by the Agent-General, and arrived here on 10th February.

1907.

1907. Does that refer to precipitation or filtration brought about by means of a material called polarite? This is speaking generally of the whole question after various experiments had been made with chemical processes.

R. R. P.
Hickson, Esq.,
M.I.C.E.

1908. We have had it in evidence that the use of certain clarifying matters does not effect purification, but that where polarite is used the effluent is rendered absolutely harmless? Mr. Price, who has just come back from a trip to the old country, and part of whose instructions were to inquire into the methods of dealing with sewage in vogue there, told me that the consensus of opinion amongst scientists at home was that the polarite and ferrozone loses its effect in six months. Mr. Price is making a report on the subject which I ought to have received this morning, but unfortunately it has not yet come to hand. When it does come I will send it on.

1 Mar., 1894.

1909. In answer to Mr. Hoskins you said that you did not know that the sewage of Glasgow was being treated by precipitation. I suppose, however, that the *Scientific American* is a fairly creditable authority? Yes.

1910. Well, in an article appearing in that newspaper on the 16th December, 1893, the statement occurs, stating that the precipitation system is about to be tried at Glasgow? I have no doubt that the statement is correct.

1911. The concluding portion of the article is as follows:—

When in full operation, 10,000,000 gallons of sewage will be treated every twenty-four hours, while provision is made for extensions capable of dealing with double that quantity. The total estimate, inclusive of land, is £100,000.

That will be a much cheaper process than ours? You cannot compare the two, unless you have the details before you. I think that the £100,000 must be the cost of treating the sewage.

1912. Would not the adoption of that system in the old world, where they are in the midst of all this scientific information, seem rather an argument in favour of the precipitation system? Certainly not. If you cannot send your sewage to sea, or get land upon which to treat it, you must adopt a chemical process. I think that is admitted by everyone; at least, it is as far as my reading goes. The best way of dealing with sewage is to send it to sea, and the next best way is to treat it upon a sewage farm;—sand is the best material you can get for that. Both these methods failing, you must adopt a chemical process.

1913. *Mr. Neild.*] I find in looking over the evidence that the Committee have never learnt what was paid for the land which it is intended to use as a sewage farm? I think you will find the information on page 80 of the Committee's first report—"Farm (land), £5,592."

1914. Do you know when the purchase was made? I think about two and a half years before that evidence was given.

1915. That would be in 1890? I think so; but it was done through the Land Valuation Branch.

1916. Do you know from whom the land was purchased? I do not.

1917. At Botany, where you have to deal with a large quantity of storm-water, it is customary to allow it to flow into the river, together with any sewage matter that may come down with it? That is only when the sewers are surcharged.

1918. Is it proposed that the storm-water at Parramatta should be run direct into the river? When the sewers are surcharged you can do nothing else; but we shall not have the same quantity per head of population coming down there.

1919. Is there not some element of danger in discharging storm-water directly into a river, seeing that at any moment a large quantity of sewage may come down with it? We have been letting storm-water run into Cook's River whenever it was necessary to do so, but I have not heard any complaints.

1920. But there is no population there? There is no population below the farm.

1921. The nature of the channel there would give the tide a greater sweep than it would have in the tortuous arms and bays of the Parramatta River? The rate of tide is about the same in both places. The tide in the Parramatta River is very strong.

1922. You said that this farm, if properly managed, would cause no nuisance, but is it not a fact that numerous complaints have been made in regard to the English sewage farms? Not that I am aware of.

1923. Then I ask your opinion about this statement, made by Mr. Arthur Angell at a meeting of the Society of Arts, and reported in the journal of that Society:—

The one at Cheltenham, he found from the *Birmingham Daily Gazette* for the present month, there were complaints about, and memorials were being presented against it as creating a nuisance. Croydon, he admitted, was one of the best managed, for he had never seen any other to come near it, but there the sewage was very dilute and the land well drained, but he was informed on authority, in which he had perfect faith, that a loss of £12,000 was made upon it in one year. Next, he would take Harrogate, and he found, from the *Leeds Mercury*, that the Corporation of the town were making complaints about the pollution of a tributary of the Nidd, consequent on the irrigation farm not dealing effectually with its sewage.

There is a statement, made apparently on authority, that sewage farms are a cause of trouble? Decidedly they can be a great cause of trouble.

1924. In the *Macclesfield Courier and Herald* of 2nd December, 1893, there is a long account of the Swinton and Royton sewerage works. I wish to draw your attention to this particular paragraph:—

We have given a full and particular description of Swinton works, because we visited them first, and because they are the outcome of the sewage farm on which irrigation was originally tried, and was an utter failure and a great nuisance.

Did that fact ever come under your knowledge? No; but I think the statement is utterly useless unless one knew the character of the farm and the whole of the circumstances.

1925. You said that the proposed farm at Parramatta would be less likely to be a nuisance than the one at Shea's Creek. Have you any other reason for making that statement, except the way in which the sludge is treated at Shea's Creek? The material forming the farm will be a little better, because we shall be able to get a purer sand. At Botany the sand is not pure. You will see from the samples before you that there is a good deal of silt in it. The way in which the sludge will be dealt with, however, is the main reason.

1926. But has not the evidence you have already given gone to show that the success of a sewage farm is not due to the purity of the sand of which it is composed;—is it not a fact that the presence of soil or the residuum of sewage is requisite in order to bring about the propagation of the friendly microbes? It is the sewage itself that is necessary for this purpose.

1927. The presence of a certain amount of sewage in the sand is necessary? Yes.

1928. Then why do you say that the proposed farm will be better than the Webb's Grant farm, because the sand will be purer;—is not that a contradiction of your former evidence? No; the material of a

E. R. P.
Hickson, Esq.,
M.I.C.E.
1 Mar., 1894.

sewage farm, or a sand filter (and that is really the better designation) should be as coarse as possible, and quite free from anything that will prevent the air from going through it. You put the sewage on to the land in a thin layer. If you let it go on in such quantities as to form a cake the whole effect of the farm is stopped.

1929. You consider that the 42 acres which you are going to reclaim will make an excellent sewage farm. I ask your attention to the following statement made by Mr. James Lemon, a member of the Society of Arts, and reported in the journal of that society. He said that—

He was not opposed to putting sewage on land, but though he had found that when it was put on high land you got purification, and it succeeded, when he could not get proper land, and had been forced by the exigencies of the case, or economical reasons to put it on low land, there was not the purification there ought to be. Low-lying land had water enough already, and sometimes more than it could do with. The effect of putting a large quantity of sewage on the low-lying land or the bank of the Thames would be that in some parts of the year it would be filtered, but at other times it would all go into the river.

Does not that reference to low-lying land on the banks of the Thames apply equally to the situation of the land at Parramatta? I really could not say, because I do not know what the low-lying land there is composed of. It may be a swamp, for all I know.

1930. Is it not a fact that in wet weather the sewage farm will be charged with a large quantity of rain-water, together with soakage from the higher lands? No; not in the least.

1931. Why not? Because it will be so thoroughly drained. We know that water never lies nearer the surface at Botany than 3 feet or 3 feet 6 inches. It never gets lower, and never gets higher than that. We have wells all over the sewage farm by which we can tell.

1932. You think you will always have 3 or 4 feet of dry land and soil on the farm? I am quite certain of it.

1933. I would now ask your attention to a statement made by Sir Robert Rawlinson, whom I think you will admit is a recognised authority on sewerage? Yes; I think I have quoted from him pretty freely myself.

The only purification of sewage with which I am acquainted is when it is used in broad irrigation on a light porous soil, in summer weather, when the entire volume of water disappears in absorption and evaporation, the soil and the sun having effectually purified it. This, and this alone, so far as I know, is sewage purification.

1934. That is not your opinion? Yes; that is my opinion.

1935. Were you not placing all your stress upon the work of micro-organisms? Yes; but they are the result of those conditions.

1936. The result of the absence of water? The result of the presence of heat and air.

1937. But reference is also made to the soil? Of course, as I have said, the more porous the soil, the more air will get through it, and, therefore, the microbes will grow more quickly.

1938. Do you think that that is a proper interpretation to put upon Sir Robert Rawlinson's words; he says nothing about the friendly microbe? The soil itself will not purify sewage, it is the microbes that do the work. I think that is hardly a matter of opinion now after the four years experimenting which has taken place at Massachusetts.

1939. You say that you know no place where a sewage farm has been given up and the International process adopted? I cannot call to mind such a place, but I do not say that there is no such place.

1940. What do you say to this statement by Mr. Egan, the engineer to the Epping rural sanitary authority, in explaining the sewerage of the town of Loughton—

The land is under-drained, and the sewage from the settling tanks passes through it. This answered fairly well for some time, but ultimately the effluent from the land became most unsatisfactory, and other steps had to be taken to prevent pollution. In 1888 it was resolved to improve the state of affairs, and also to extend the sewerage system for the northern part of Loughton, and after many schemes of sewage purification had been considered, it was decided to adopt the use of ferrozone for precipitation, followed by filtration through polarite beds, instead of buying more land, especially as the land treatment had altogether failed.

It is quite possible that the land treatment was a failure, but I should like to know what the soil was.

1941. You say you receive information from England at frequent intervals, with reference to the progress of sanitation in the old world. Have you received any information with reference to the failure of the Huddersfield sewage farm? Not that I can call to mind just now.

1942. Have you seen any statement showing the great success that has attended the use of polarite filters in connection with the Huddersfield sewerage scheme? No; on the contrary, all that I have read goes to show that chemical processes—not distinguishing any one process from another—had been a failure.

1943. Mr. Hoskins asked you whether you are acquainted with the large number of cases in which the International system had been adopted. Are you aware that it has been adopted at Acton? I could not say from memory. I have got the International Company's pamphlet, and no doubt the information is given there.

1944. In that pamphlet there is a long list of towns in which this system has been adopted, amongst others Reading, Leicester, Hastings, Huddersfield, and Worcester? I believe so.

1945. Still the information you have received is in favour of the sewage-farm system as compared with any chemical system, or with any other system except that of discharging into the ocean, or so large an arm of the sea that no nuisance is likely to follow? That is so.

1946. *Mr. Wall.*] Have you taken into consideration what it would cost to deal with the sewage of the Government institutions separately? No; I think Mr. Barling, in his first examination, told the Committee what it cost them to dispose of their sewage at the present time. I have not gone into the matter myself.

1947. You say there have been a number of complaints regarding the insanitary condition of Parramatta. Have they referred principally to the nuisance caused by the sewage from the Government institutions? To the general nuisance.

1948. In your reply to the report of this Committee you say—

I desire to say that before submitting the scheme to the Committee the Department have carefully studied the applicability of all the known arrangements for sewage disposal and utilisation, and had worked out the details of the farm as fully as was necessary to arrive at a just conclusion.

From that I infer that before submitting this matter to the Committee your Department made a thorough investigation into it, and that the evidence you are bringing before us now is evidence which you were in a position to give on a former occasion, but which you did not think it necessary to put before a Committee of laymen? I do not think that that is quite the way to put it. The evidence I am putting forward

forward now is not exactly in addition to what I gave before, it rather bears on the same point and illustrates it. I think I explained yesterday that I should be sorry if the Committee thought I had some information which I had purposely kept back. That is not the case. I gave the Committee all the information in regard to the proposal that we had at our disposal.

1949. In a Minute which you submitted to the Chairman, you said that the study of the subject has shown that the purification of sewage is due to the work of a bacillus commonly known as the friendly microbe or nature's scavenger. But this was your evidence when before the Committee in 1892—

Have you studied the chemical action of soils upon sewage? No.

You admit of course that sand can have no possible action on sewage? No.

I gather from your evidence to-day that you regard the Parramatta farm as likely to be superior to the Botany farm in consequence of there being more sand on it? The sand, of course, would have no effect upon the sewage.

1950. But the sand, giving facilities for quick drainage, is the best material for a sewage farm? Yes; the coarser the material the better.

1951. Have you gained the information in regard to the action of the friendly microbe, which you have recently submitted to the Committee, since you were examined in 1892? Yes; to a very great extent.

1952. When you were examined before, you said in answer to the question—

I suppose you depend very largely on your crops for the absorption of the sewage? Yes; a good deal.

Professor Anderson Stuart, however, stated the other day that sand alone would not contain friendly microbes, and that instances were known where it had to be covered with a certain quantity of loam in order to generate the micro-organisms that dispose of the sewage? That has not been the result of my research.

1953. You do not anticipate that, in consequence of the greater purity of the sand at Parramatta, it will have to be covered with loam in order to generate the friendly microbes? On the contrary, the coarser and purer the sand, the better it will be, because it will allow more air and heat to penetrate into the sewage deposited upon it. The microbes grow out of the sewage; they do not grow out of the land.

1954. You disagree with Dr. Anderson Stuart, when he says that if the micro-organisms are destroyed by chloroform or heat, sand itself will not generate them? If that is his opinion, I certainly disagree with him.

1955. The Professor said that it was possible, by the use of chloroform, or the application of great heat, to destroy these organisms, and thus render the sewage farm entirely useless? That has not been the result of experiments made in other parts of the world.

1956. The tenor of his evidence was that pure sand, in which there were none of these organisms would not act as a purifier at all, and that the sewage does not in any sense contribute the organisms, but that they are in the soil and act upon it? I do not agree with him there.

1957. You could not form an approximate estimate as to what it would cost to dispose of the sewage of the Government institutions at Parramatta, taking into consideration what the sewerage of similar buildings usually costs? I could not, because I have nothing to do with the sewerage of Government buildings.

1958. Mr. Price, in his evidence the other day, referred to an automatic system of disposing of sewage which he had seen in some part of Ireland; could you give us any idea of the cost of that system? I could not, but I think I will be able to lay the whole of the particulars before you when I receive Mr. Price's report.

1959. I find, from a return furnished by the late Mayor of Parramatta, that the Government contribute something over £600 a year to the council there in connection with the pan system. Do you think that if the sewerage scheme were carried out, the council would be justified in making a greater demand upon the Government for the removal of the fœcal matter from these institutions? I think that is hardly a matter for an engineer to give his opinion on. I do not know what amount the council should ask from the Government.

1960. The whole thing depends on the subsidy which the council will receive from the Government, and the ability of the ratepayers to pay for the scheme. I suppose you recognise that? Not entirely, the question of health should be the first consideration.

1961. Have you formed any opinion as to whether the present cost of removing the fœcal matter from these institutions is expensive or otherwise? I do not know how the work is done.

1962. You are not in a position to say that £600 a year would pay the interest on sewerage works for the Government institutions? It would be very hard to answer that question, because it would be difficult to divide the cost of the scheme into two, and ascertain what portion was chargeable to the town, and what portion was chargeable to the Government institutions. It would either have to be done as a whole or not at all.

1963. You recognise that the construction of the work hinges to a very great extent on the ability of the ratepayers to pay the interest on the cost of construction. That being so, the Department might have been in a position to give us information as to what the Government are prepared to pay? I understood that the Under Secretary gave that evidence. It is an aspect of the question that I have gone into very little.

1964. *Mr. McCourt.*] Have you any personal knowledge of the working of the International system? No.

1965. That system is being run by a company? Yes.

1966. Do you know if the company has any representative in New South Wales? I believe that Mr. Stayton is their representative here, at all events I have been written to to that effect. In a letter received from a Parramatta man, he says, "I have received from Mr. Candy, director of the Company, the information that he is their accredited representative in this colony."

1967. You believe that that is so? I have no reason for disbelieving the statement.

1968. Interest is to be charged on a sixty years' basis, is it not? Yes.

1969. Has there been any movement on the part of the Government to extend the time? Not that I know of.

1970. *Mr. Davies.*] On the 12th November, 1892, you sent to the Secretary for Works a reply to the report of this Committee, in which you urged that no action should be taken upon the report of the Committee until a "competent and unprejudiced engineering opinion" had been obtained on the matter? Yes.

1971. On the strength of that report three gentlemen were appointed to inquire into the matter? Yes; I might perhaps take this opportunity of explaining that those three gentlemen were not the three whom I proposed in the first instance. I advised that Dr. Ashburton Thompson, being the medical officer of the

Crown,

R. R. P.
Hickson, Esq.,
M.I.C.E.
1 Mar., 1894.

R. R. P. Crown, was really the proper person to be on the Commission, and that Mr. Chamier, whom I knew had
 Hickson, Esq., had something to do on sewage farms, should act with him. I am sorry to say that Dr. Ashburton
 M.I.C.E. Thompson had to go to Broken Hill, and could not take the matter up. Then I personally asked Dr.
 1 Mar., 1894. Manning if he would take it up, and he said that he had too much to do, so that it was no use suggesting
 his name to the Minister. Therefore, I requested the Minister to ascertain if the now President of the
 Board of Health, Professor Anderson Stuart, would take up the matter, because I was very anxious that
 a man of his standing should inquire into it. I believe that he was pressed to do so, but that he could
 not find the time. The Minister then applied to another doctor to accept the position, and at this time,
 when we were almost stranded, Mr. Napier Bell happened to come to Sydney from New Zealand. I have
 known Mr. Bell a great many years, and he therefore called upon me, and I suggested his name to the
 Minister. We then had two engineers upon the Board who had been connected with sewerage works, and
 I had not at the time the remotest idea what their opinions were, so I suggested the appointment of a
 third engineer as umpire. That is how the Board came to be constituted.

1972. Your chief grounds for urging the Minister to take no action upon the recommendation of the
 Public Works Committee were that you desired an unprejudiced engineering opinion upon the matter. Is
 Dr. Ashburton Thompson, or Dr. Anderson Stuart, or any of the gentlemen whom you first named an
 engineer? Yes.

1973. Who? Mr. Chamier.

1974. He subsequently became a member of the Board? Yes.

1975. Do you think that the gentlemen you named in the first instance were qualified to express an
 "unprejudiced engineering opinion" upon the matter? I would have been quite prepared to abide by
 the decision of the first two men, whatever it might have been.

1976. What do you know of Mr. Chamier as an engineer who has had to do with sewerage matters? I
 know that he was a member of a Royal Commission appointed to report upon the Adelaide sewage farm,
 so that I suppose he knew something about the matter.

1977. To report in regard to the site? I think the Commission reported upon the farm after it was in
 operation, but I make this statement subject to correction. I know that Mr. Chamier was a member of a
 Royal Commission appointed in connection with the Adelaide sewage farm, and I understood at the time
 that he reported upon the working of the farm.

1978. Have you seen the evidence which he gave before this Committee? No; I do not think I have.

1979. That Board was appointed, and reported to the Minister, and in the concluding paragraph of a letter
 which you wrote dealing with their report, you say:--

The question now to decide is—What is the next step to be taken?, and though this is a matter which rests entirely
 with the Minister, I might be permitted to say it would appear of little use to resubmit a purely sanitary engineering question
 such as this, which has been fully dealt with by a scientific board, to a committee of laymen.

So you regard the three gentlemen whom you have named as a scientific board? Yes.

1980. What particular portion of their report do you regard as of any value in connection with the
 proposed scheme? The whole of it from beginning to end is full of value.

1981. Will you tell me what portion of it bears out the departmental scheme? It bears out the depart-
 mental scheme as to the advantage of a sewage farm, and as to the proposed area being sufficient. I
 think those are the two points upon which we joined issue.

1982. Do not they recommend an entirely different treatment from what you recommend;—do they not
 recommend the separate system? That is not a treatment. The treatment takes place at the sewage
 farm, and in regard to that they entirely agree with me. They disagree, however, as to the system of
 sewerage to be adopted, and recommend the totally separate system.

1983. In that they were unanimous? Apparently so.

1984. Can you tell the Committee the names of any distinguished sanitary engineer of the present day
 who recommends the adoption of that system? Not from memory; but as I have pointed out in my
 report, that is a point upon which a great many engineers would report in one way, and a great many in
 another way.

1985. Can you mention one engineer who is in favour of the system? Not now, but if I look through
 the pamphlet which has been sent to me, I could find plenty of them, though I admit that the majority
 recommend the partially combined system.

1986. That is the system you favour yourself? Yes.

1987. Then I want to know where this scientific board comes in;—they recommend the separate system,
 and you are not in favour of it? No.

1988. Do you think they are correct in estimating the reduction in the cost of reticulation, supposing the
 separate system were adopted? Their estimate runs out very close to mine. I understand that they
 make it £7,000, while I make it £6,000, which is practically the same.

1989. Are you not aware that they state in their report that the cost will be from 17 to 25 per cent. less?
 That is not on the whole work, because some of the money had already been spent, and the adoption of
 the separate system would not affect the sewage farm, nor the pumps, nor the rising main.

1990. Would it not affect the pumps if there were less pumping to do? There would be a less quantity
 to pump; but the sewage would have to be raised to a greater height. It comes to practically the
 same thing.

1991. But would there be anything like the saving they estimate, that is, 17 to 25 per cent. on the cost
 of the reticulation and the main sewers? It comes out to about that on the works above the pumping-
 station.

1992. What great sewerage works have you had to do with prior to joining the Water and Sewerage
 Board? None.

1993. What experience have you had with regard to sanitary sewerage works? None.

1994. It is all a matter of theory with you? Not entirely. I was engaged for a number of years by the
 London North-Western Company in designing station yards, and I had to provide sewerage for them.

1995. But you have never had to do with the sewerage of a city? No.

1996. You have only had to do with sewerage works since you became connected with the Water and
 Sewerage Board? Yes.

1997. In your letter to the Minister, dated the 12th November, 1892, you stated that the farm at Webb's
 Grant was serving a population of 1,400 to the acre;—do you still adhere to that statement? I got that
 information from the engineer in charge of the farm; but I understand now that it should be 1,000 to
 the acre.

1998. You stated yesterday that you had received from the Agent-General an account of an experimental sewage farm conducted on new principles;—will you give a brief description of that farm? The filter-bed was 3 feet 1½ inches deep, and was composed of a 6-inch layer of stone broken to a 1-inch mesh, a 3-inch layer of metal broken to a 5-8th inch mesh, 10½ inches of screenings from the broken metal, and a top layer of sand. R. R. P.
Hickson, Esq.,
M.I.C.E.
1 Mar., 1894.
1999. Practically, that would be the old principal of subsoil drainage? Yes; with sand on the top.
2000. I think you said that your authority did not say where the experiment had taken place? Yes, in London.
2001. In what part of London? The name of the place is not given. London sewage was treated however.
2002. Suppose it was not necessary to build up the whole area of Parramatta in the way proposed, what would be the cost of the system to which you have just referred? In the first place, it will be necessary to make the reclamation, and in the second place, I have not the data by me to form an estimate of the cost.
2003. Is it not usual for one Department to charge another for any service rendered;—if your Department did a service to the Railway Department, would you charge the expenditure against them? Yes, if we incurred any extra cost.
2004. Would it not be a fair thing for the Harbours and Rivers to charge you with the service rendered in filling in this land? I do not think so, because it will not cost anything extra to them. We paid them for the fascine work, because they had to employ men specially to do it, but it will not cost them extra to deposit the silt there.
2005. But supposing we have the statement of those who control the work of that Department that it would cost from 1½d. to 7½d. per ton to deliver sand by means of a sand-pump? I do not know that it was stated that that would be the extra cost.
2006. Yes, the extra cost? Then I cannot reconcile that statement with what has been said by the head of the Department.
2007. You would not doubt Mr. Portus? It is not a question of doubting any person's word. Mr. Portus told me that it would not cost them anything more to land the stuff dredged up above the railway bridge on the sewage farm than to send it to sea. Of course, if you brought it from the far end of the harbour it might cost more.
2008. Why should it go to sea when there are twenty different places to put it? I answer that by saying, Why should it not go to the sewage farm, from which there will be a return, while there will be no return from the other places?
2009. All land reclaimed by the Government has some value? So will this land.
2010. Has not the land reclaimed at Shea's Creek a commercial value? I do not know where the return comes in.
2011. But surely it has a commercial value? Yes; and so will the Parramatta farm. But there has been no charge made yet.
2012. But should there not be a charge for this service in connection with the Parramatta scheme? I do not agree with you there, but, of course, it is a matter of opinion.
2013. If you had to do this work, what do you think it would cost the Department? Probably if we had to get the stuff ourselves, we should have to carry out a totally different scheme.
2014. You are aware that there is no difficulty in finding places on which to deposit dredging material? There was no inconvenience last year, because they were not working the dredges then, but Mr. Darley tells me that he is going to put all the dredges back directly, and he wants a place to dump the silt.
2015. Are you not aware that at Homebush Bay and at Long Cove, there is room for millions of tons of silt? Yes; and there is room for 600,000 tons at Parramatta.
2016. The Water and Sewerage Board have under their control the Botany farm;—do you think that it is satisfactorily managed? Yes.
2017. Do you look upon it as perfect? I do not. I think it is imperfect as far as the way in which we have to deal with the sludge, but I am preparing designs for a pipe sewer across the river, which will enable the sludge to be taken straight on to the farm.
2018. *Chairman.*] Will not that interfere with the navigation of Shea's Creek? It will be a swing pipe.
2019. *Mr. Davies.*] How do you propose to treat the sludge at Parramatta? In the first place, we would not have the same sort of sewage to deal with, because it would all have to pass through the pumps, and would be completely broken up in the process. It could go straight on to the farm and be spread upon the beds, while the effluent would drain away into the river.
2020. You do not think that strainers, or any apparatus similar to that at Webb's Grant, would be necessary? There would have to be a strainer to catch dead animals, stones, and other things which could not go through the pump, but the fæcal matter would not be collected.
2021. What provision have you made for the drainage of this farm? There would have to be drains underneath. I think the most likely way we shall work the farm is this: The red line on the map shows the delivery-main. On the north-west corner of the farm there will be a small tank, which will be necessary to collect the sewerage brought down at night. The main carrier will come along the western fence, right down through the centre of the farm, and on either side of it will be the beds, just as we have them at Botany. Round the boundary there will be catch-drains, and eventually the effluent will find its way into Duck River.
2022. Will there be one point of discharge or two? That is a matter of detail. It will depend a great deal upon the quantity of water, but most likely there will be two points of discharge.
2023. You have no plans showing the section of the batter? No; they have not been prepared yet.
2024. From your general knowledge, you believe that there will be no nuisance from this farm? I can come to no other conclusion in view of the enormous weight of evidence I have here, testifying to the good results of sewage farming when you have sand-beds to deal with.
2025. *Mr. Humphery.*] What do you estimate will be the maximum annual cost of the sewage farm, and the maintenance of the whole system. You gave some figures in your last estimate;—have you revised them? I have not revised them, though I think I might fairly do so, and reduce the cost.
2026. Will you do so, and give us a statement of the matter? Yes.

TUESDAY, 13 MARCH, 1894.

Present:—

JACOB GARRARD, Esq. (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTON.

The Hon. JAMES HOSKINS.

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JOHN DAVIES, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

THOMAS THOMSON EWING, Esq.

WILLIAM CHANDOS WALL, Esq.

WILLIAM MCCOURT, Esq.

JOHN CASH NEILD, Esq.

EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES COLLINS, Esq.

The Committee further considered the proposed Sewerage Works for Parramatta.

Herbert James Beaumont, Esq., Assessor, Metropolitan Board of Water Supply and Sewerage, sworn, and examined:—

- H. J. Beaumont, Esq.
13 Mar., 1894.
2027. *Chairman.*] You are assessor for the Metropolitan Water Supply and Sewerage Board? I am.
2028. How long have you been connected with the Board? Since July, 1888.
2029. In the capacity in which you now officiate? Yes.
2030. Prior to that were you engaged in the valuation of properties in the various municipalities? I was.
2031. For how many years? Five years.
2032. Were you engaged in the city as well as the suburbs? No; I was engaged in Balmain, St. Leonards, East St. Leonards, Strathfield, Randwick, Waverley, Leichhardt, and Willoughby—seven or eight boroughs altogether.
2033. You have had considerable experience in the valuation of properties for rating purposes? I have.
2034. Will you inform the Committee as to the mode of assessing Government institutions within the jurisdiction of the Metropolitan Water Supply and Sewerage Board? We take them upon what we consider to be a fair average annual rental—the same as in connection with any other premises.
2035. Is there only one mode of valuation provided under the Act, namely, on the annual rental? There is nothing provided under the Water and Sewerage Act. We are bound by the Municipal Councils' assessment, if there is any. In cases where the Councils have not valued the premises, we rate them.
2036. Do you take the valuation made by the City Corporation for properties within their boundaries? We do.
2037. Do you take the valuations made by the various suburban municipalities within their boundaries? Yes; but, of course, the suburban municipalities do not rate the Government buildings.
2038. Is there any power under the Act to assess large Government institutions on a different basis from that of mere valuation? None at all. The Act simply says that we are bound to take the assessment of the Municipal Councils if there is any. If not we make our own.
2039. Then you are not operating on anything at present but what is within the municipal boundary? Yes, we are. If we make our own valuation, we give the people the right of appeal on the same line as the municipalities do. That is provided for in the Amending Act of 1889.
2040. Will you inform the Committee how you arrive at the valuation for sewage and water rates (say) for a Government institution like Darlinghurst Gaol? That is assessed by the City Council, but there are three or four Government institutions outside the city altogether which I have valued. They are the Prince Alfred Hospital, the Callan Park Asylum, and the Gladesville Asylum.
2041. They were in municipalities before? Yes; they are in municipalities now, but they were not rated by the Municipal Councils, because they cannot rate Government buildings or charitable institutions.
2042. Therefore you had to rate these various institutions? Quite so.
2043. Can you tell us the principle upon which the City Corporation acted so far as the gaol is concerned? Upon what they considered a fair average rental.
2044. Is that what you did with reference to the institutions to which you have just referred outside the city boundary? Yes. In addition to those institutions there are the Victoria Barracks, the Evelcigh workshops, and the University. The Victoria Barracks comes within the borough of Paddington. There are also the Maitland Gaol and the Newcastle Benevolent Asylum.
2045. How did you arrive at a fair annual rental or value of these Government institutions—take the Maitland Gaol for instance? I went round the premises and saw each building, and put down what I thought would be a fair value for them supposing they were occupied by a private individual.
2046. Are there any institutions supplied with water by your Board upon a different basis than on the ordinary rental basis? Only one, and that is Darlinghurst Gaol. That is assessed at £10,000 a year. In that case the authorities have entered into an agreement with the Board not to pay according to the assessed value but to pay a lump sum of £660 a year. That was done in order to do away with the meter, so that they could have a better pressure.
2047. You know the number of persons, who, as a rule, are within the Darlinghurst Gaol. Can you tell us how much per head that runs to? On an average I believe from 1,000 to 1,200 persons in the gaol, and I should think between 9s. and 10s. per head.
2048. Roughly speaking you charge them about 10s. per head? Yes.
2049. That would be very much higher than if you were rating ordinary dwellings? Certainly. They entered into a special agreement to that effect.
2050. And because the number of inhabitants to a given area is larger in the case of a Government institution like that than in ordinary dwellings, a larger amount is charged? Yes; we took the average meter consumption. They wanted to do away with the 4-inch meter, and they asked us to fix a lump sum, so that they might use an unlimited supply.
2051. You have power, under the Act, to do that? Yes—to make special arrangements or agreements. At the Colonial Secretary's office, for instance, they wanted a better pressure in case of fire, and asked us to do away with the meter, and we fixed the sum they had to pay at £310 per annum.
2052. You referred to the Maitland Gaol just now;—has your Board any control over the Hunter River Water and Sewerage Board? No; but I was sent up there to assess the collieries and Government buildings at the time the Board was formed.
2053. You were lent to them for a time? Yes.
2054. Do you know whether they have any special contracts for water supply similar to the one at Darlinghurst? I could not say. I have not been there since I made the assessment.
- 2055.

2055. You state that the special contract for the supply of water to Darlinghurst Gaol, is at the rate of about 10s. per head;—is there any agreement as to a sewerage rate? None whatever. We have not any agreement with any place in reference to sewerage.
2056. But if you charge more per head for water for the persons within Darlinghurst Gaol, because of the density of population on a given area, why should you not do it in connection with sewerage? It does not cost us any more whether there are twenty people or 1,000. So long as the pipes are there the sewage will go away all the same.
2057. But 1,000 people will give more excreta to a sewage farm than 500? But in this instance it does not go on to a sewage farm, but to Bondi. Of course the Board have power at any time to insist upon a meter being fixed, and in these big institutions meters are fixed. They pay the assessment, and then pay the excess over and above the assessment. In the case of Darlinghurst Gaol, they wanted to do away with the meter altogether, in order that they might have a better pressure, and a special arrangement was made.
2058. What is the sewerage rate in the city? Sevenpence.
2059. Is that the rate all through, including the suburbs? Yes.
2060. I understand that you have recently visited Parramatta, and have seen the various Government institutions there? Yes, I went up on Friday.
2061. And you have arrived at what you consider to be a fair ratable value for them? Yes.
2062. Have you the list showing the various institutions? I have a list showing the total of the Government buildings.
2063. Mention the names and the amount? The assessed value of the gaol is £3,500—that is the total; the Industrial School, £1,000; the post office, North Parramatta, £36; the post office, South Parramatta, £350; school and residence in Macquarie-street, £300; school and residence, North Parramatta, £300; court-house, Parramatta, £600; the police barracks, £500; the Lunatic Asylum, £7,000; the George-street Asylum, £2,000; the asylum, Macquarie-street, £800; the asylum, Harris-street, £250, and the Cottage Homes, £200. Then, there are two large blocks of land belonging to the Government in Parramatta, which I have assessed. There is the land which has been resumed for the court-house, which I have assessed at £425 per annum. That is, 5 per cent. on the capital value. Then, there is the land at the corner of Windsor-street and George-street—that is also resumed land—which I have assessed at £250 per annum.
2064. Under your system of rating, would these be subject to a sewerage rate? Yes. The total assessed value of the Government buildings is £17,511.
2065. Under the rate which you are now imposing for your metropolitan sewerage, what would that realise per annum? £802 11s. 9d.
2066. That is on a 7d. rate? No; on a 11d. rate.
2067. Presuming sewerage works were carried out at Parramatta, and were vested in the Board for management, and you struck an 11d. rate that, in your opinion, would be the amount which would be received from the various Government institutions? Yes.
2068. Is there anything else you desire to say? Yes. Through the kindness of the Mayor I yesterday ascertained the amount paid to the Council for emptying night-pans. The amount in regard to all the buildings I have mentioned last year was £702 17s. That is the amount paid by the Government institutions last year to the Corporation.
2069. And there are some of these Government institutions which do not have night-pans? Yes; the Lunatic Asylum.
2070. Is that the only instance? Yes; with the exception, of course, of the vacant land.
2071. Last year, then, the Government institutions, excluding the asylums, paid the Corporation £702 17s. for a night-pan service? Yes. I may mention also that there are premises which are not rated by the Council at all, and they would not be liable unless they were connected with the sewer, namely, the two railway stations. They would be liable, of course, if they were connected with the sewer, but they would not be liable unless they were connected.
2072. Does that apply to any of the institutions you have enumerated? No; only to the two railway stations.
2073. But does that apply to any of the other institutions you have mentioned, or would they all come under a compulsory rate? The institutions I have previously mentioned would be liable whether they were connected or not, but the railway stations would only be liable if connected.
2074. Why should they not connect;—are they beyond the area in which the sewers would be formed? No. According to the Railway Act of 1888 all railway properties are exempt from the payment of certain rates and taxes. In the city we do not charge the railways a sewerage rate unless they actually connect, and we do not charge a water rate unless they actually connect.
2075. You spoke just now of the Eveleigh Works;—are they connected? Yes.
2076. But unless they are connected there is no power on your part to assess them? No. The amount which would be received from the two railway stations—the Parramatta and Harris Park—at 11d. in the £ would come to £18 6s. 8d. a year. Last year they paid the Council for emptying the pans £32, so that under a sewerage system they would pay less. Again, there are properties which are not rated by the Council, and which the Council have not the power of rating, but which would be liable, under the Act, to pay rates whether they were connected or not. For instance, there is the Town Hall, the baths, the hospital, and the fire station, and all churches.
2077. A church is not liable to a rate for sewerage? Yes; for both water and sewerage rates.
2078. And do you impose the rates? We do; but we do not exact them. We let them run on until we get power under an Act of Parliament to charge them less than ordinary premises or exempt them altogether. Some pay, and some do not.
2079. Have you any other information to offer? With reference to the institutions in Parramatta, I may mention that the gaol last year was charged £193 for water. Presuming that the Council assessed the gaol, and did not charge as they do now at 10s. 6d. per head, the valuation of the gaol calculated at 9d. in the £, would be £5,146. Presuming that they assessed it on the ordinary assessed value, and did not enter into an agreement with the Council at a fixed sum per year of £193, the assessment of the gaol would be £5,146. The same with the Industrial School—that valuation would be £1,467, and so on all the way down, until you come to the Lunatic Asylum, which would be £14,266. That is presuming the Council made an assessment of the premises instead of having a special contract.
2080. *Mr. Humphery.*] What method did you pursue in arriving at the annual value of the various Government buildings you have mentioned? I used my own judgment in the matter. I took what I considered to be a fair average annual rental. 2081.

H. J.
Beaumont,
Esq.
13 Mar., 1894.

2081. Having regard to the number of inmates or the rental value? The rental value.
2082. How did you arrive at the annual value of £7,000 in the case of the lunatic asylum? I went round and valued every building in the place.
2083. At a capital value? No, at an annual value.
2084. Everything included, what do you estimate will be the contribution from the Government for all buildings that would be subject to a sewerage rate of 11d. in the £? £802 11s. 9d.
- 2084½. Would that comprise all ratable property belonging to the Government? Yes, except railway stations.
2085. What would it be including the railway stations? £820 18s. 5d.
2086. *Mr. Davies.*] Do you regard a sewerage rate of 11d. in the £ as a fair and equitable rate for a town like Parramatta;—do you know of any rate struck by your Board as high as 11d. in the £? No; 7d. is the highest rate.
2087. What is the present rate? Sevenpence in the £.
2088. And that is the highest rate you have ever had for sewerage? Yes.
2089. *Mr. Neild.*] Are you contemplating a higher rate? I do not know. I have not heard anything about it.
2090. Has it not been discussed by the Board? I am not a member of the Board.
2091. *Mr. Davies.*] Are you aware that the Parramatta people have an independent water supply? Yes.
2092. And this inquiry is simply confined to the question of sewerage and drainage? Quite so.
2093. Your estimate of the income to be derived from the Government buildings is £802? £820, including the railway stations.
2094. That is including everything belonging to the Government? Yes.
2095. And that would be brought in by a rate of 11d. in the £ on the assessed value of all Government properties? Yes.
2096. *Mr. Hoskins.*] If the control of the sewerage of Parramatta were turned over to the Water and Sewerage Board, as it might be under the law, do you think that the Board would charge a rate of 11d. in the £ to the residents, seeing that they hitherto have only charged 7d. in the £ to those who have used the sewers under the control of the Board? I could not answer that question, for the reason that I do not know what rates would be derivable from the private properties in the town of Parramatta. Unless I went through the books of the Council, I could not tell you what revenue would be derived from a rate of 11d. in the £, exclusive of Government buildings.
2097. But I suppose you consider a rate of 11d. in the £ exceptionally high? Yes.
2098. And you do not know of any place in which a sewerage rate of 11d. in the £ is paid? No.
2099. *Mr. Trickett.*] Did you, in dealing with this question, consider the capital value of any of these properties? No; I took them at a fair annual average rental, with the exception of the two blocks of vacant land that I have mentioned which I took at 5 per cent. on the capital value.
2100. Is it not a very difficult thing to say what would be the annual average value of a gaol? Yes.
2101. Did you assess every little sentry-box? No; I did not include the sentry-boxes.
2102. You took into consideration the whole range of buildings used for the accommodation of inmates;—how could you arrive at the annual value of property of that kind? I thought the matter over as to what it would be, presuming it were occupied by a private individual. I presumed on the cells being done away with altogether, and the place made into a private house. One can only use their own judgment in a matter of this kind. There is nothing laid down to guide you. If I were dealing with the capital value it would be a different thing altogether.
2103. Are these places suitable for private occupation? Some of them are.
2104. The Lunatic Asylum for instance—you value that at £7,000 a year? Yes.
2105. How would you arrive at that;—do you know of any place within the Colony which is fetching £7,000 a year? I compared that with the Darlinghurst Gaol, and also with the Maitland Gaol which I assessed. In neither instance was any appeal received against the amount of the assessment. I also assessed the Callan Park Asylum and the Gladesville Asylum, and the authorities had the right of appeal, but they evidently thought the assessment a fair one.
2106. How many acres are there connected with the Lunatic Asylum at Parramatta? I could not gather; they did not know at the institution.
2107. Could you not form an idea? They have a lot of land outside, which is not enclosed at all. I could not form any idea. I tried to obtain the information.
2108. I suppose the valuation you have made is a very high one? No; generally speaking I put it down very low, subject to its being increased at any time.
2109. Do you think the Lunatic Asylum premises are worth £70,000 at ten years' purchase? Yes; that would be £150,000 at twenty years' purchase. It is a very difficult thing to get the total cost of the asylum premises, and also of the gaol premises, because the greater portion of the work was carried out by prison labour.
2110. I should have thought you would have more equitably arrived at a decision by using the capital value as a basis rather than the average annual value of premises which are never let? If you take it according to the capital value—that is the cost of the work—the buildings in the Lunatic Asylum are very poor in comparison with those in the gaol.
2111. Which would come the highest in the assessment? As far as buildings are concerned, I suppose the buildings in the gaol go as high as those in the Lunatic Asylum, because a large portion of the Lunatic Asylum is weatherboard.
2112. But would the assessment come higher if you acted in regard to the capital value? I should think they would be pretty nearly on a par. The Lunatic Asylum might be slightly more. A large portion of the Lunatic Asylum is weatherboard.
2113. *Mr. Wall.*] I suppose you know nothing about the present rates of Parramatta? No, I only know that the water rate is 9d. in the £.
2114. Do you know what it brings in at that amount? No.
2115. We were told by the Mayor of Parramatta that a 2s. rate realises £3,790;—that means £1,800 for a shilling rate? I think it must be more than that. What is the assessed value of the properties?
2116. We are told by Mr. Byrnes "the 2s. rate realises annually £3,792"? I think the assessed value of the town is £76,000, and that at one shilling in the £ would come to £3,800.
2117. Then based on your calculation you think that the rates accruing from a sewage farm at 11d. in the £ would reach over £4,000—that is, taking £800 for the Government buildings, and assuming that the rates of Parramatta at 11d. in the £ would realise £3,500? Yes.

H. J.
Beaumont,
Esq.
13 Mar., 1894.

2118. And it would give a total revenue of £4,000 odd? Yes. Of course it is a difficult thing to know what the revenue from the town will be, for the simple reason that the Act provides a minimum of 10s. a year.
2119. Why did the Department take 11d. in the £ as the basis of your calculation, seeing that the amount was not required to pay the interest on this work? I did not have any instructions that way at all. I simply had instructions to assess the premises. Reading through previous reports, I saw that 11d. in the £ was thought would be required to cover interest, &c., and I worked it out accordingly.
2120. You have taken that as the basis, although the highest rate charged by the Department is 7d. in the £? Yes.
2121. *Mr. Collins.*] To make up the £4,000 a year, you would have to charge 11d. in the £? Yes.
2122. If this scheme were handed over to the Board, that would be the lowest amount you could charge in order to make the people pay the capital and the interest? I presume so, but I have not gone into that question at all.
2123. At any rate if it is necessary to have £4,000 a year, a rate of 11d. in the £ will be required? Yes.
2124. *Chairman.*] Do you know what is the population in the Government buildings to which you have referred? Yes.
2125. Can you give us the numbers separately? Yes; in the gaol the average is 360; in the Industrial School, 100; in the Asylum, 1,070; in the asylum in George-street, 900; in the asylum in Harris-street, 160; in the cottage homes, between 50 and 60. The latter are old married couples who occupy 21 houses, and the matron occupies the other one.
2126. How about the asylum in Macquarie-street? The average there is from 340 to 350.
2127. What about the schools—can you give the average number of those who attend them? No; I have not the average number of scholars.
2128. Only of the continuous residents? Yes; they would not come to more than 12.
2129. Seeing that the sewage will have to be dealt with either by means of a farm or by some method other than discharging into the sea—which means of course expense—ought you not to take into consideration the volume of sewage coming from the schools;—presuming there were 100 children on the roll of a school, what would be the average which you would put down, bearing in mind that the children are only attending the school one-third of the day? I can only give you what is the charge made by the Council for emptying the night-pans, which would be a guide as to what would be the amount of faecal matter coming away from the school. The school in Parramatta is charged £33 15s. per annum. The public school north is charged £19. That might be some guide as to what faecal matter is taken away from the schools.
2130. What is the total population of these Government institutions? About 2,980.

J. W. Withers, Esq., Mayor of Parramatta, sworn, and further examined:—

2131. *Chairman.*] Is it true that since you were last examined by the Committee a meeting of the Parramatta Council has been held to again consider the question of the sewerage of the Borough? Yes.
2132. Is this the resolution which was carried by the Council:—
- That whilst this meeting is desirous of the sewerage works being carried out, it is necessary that this Council should know its exact position with reference to the amount the Government intend to pay for connecting the Government institutions with the sewerage; also the probable cost that this work is not likely to exceed; and in order to obtain this information, it is hereby resolved that this meeting now stands adjourned for one month?
- Yes, that is the resolution.
2133. Then what the Council is asking for is, first of all, information as to what the Government would pay towards the scheme, and secondly, what the total capital cost would be? Yes.
2134. But has not the capital cost been put before the Council over and over again? We have always run away with the idea that it will cost about £50,000 or £60,000.
2135. Has the Council had the last report of the Committee upon this matter before them? No; we have not had any report about it.
2136. Are you now aware that the estimated cost of the proposed scheme is £76,000—that is the probable cost? I now understand it is from £90,000 to £125,000.
2137. When this matter was considered by the Council, during your predecessor's term of office, were not all the facts as to the area to be drained, size of sewers, and, generally speaking, the cost of the whole scheme put before the Council? I was not aware of it. I believe a map was shown, but I do not think anybody took much notice of it.
2138. But, as a matter of fact, on two or three occasions the Council has approved of, and urged the carrying out of the work? Yes; but we always understood it would not cost more than £50,000 or £60,000.
2139. How did they get that impression? I always understood from our Member, Mr. Hugh Taylor, that it would not cost more than that.
2140. But had you no information from the Department as to what it would cost? No, we knew nothing about it.
2141. Do you think that the Council, if they knew that £76,000 was to be the capital cost, would approve of the undertaking? There were only three who voted for it, and five against it. We had not a full Council then. Mr. Byrnes was not in the Council, and one Alderman's seat was disputed, and he has come back to the Council since; and one was away.
2142. You have heard the evidence of the assessor for the Metropolitan Water and Sewerage Board who estimates, upon their ordinary principle of valuation, that the Government would contribute about £820 per annum towards this scheme under a rate of 11d. in the £? Yes; and it would cost £4,000.
2143. Do you think your Council is prepared to take the responsibility? I am quite sure we are not. If we cannot get more than £820 from the Government, we cannot find the remaining £3,000.
2144. *Mr. Hoskins.*] Besides working expenses? Mr. Taylor told me last night that the least the Government would pay would be about £2,000. We had an ordinary meeting last night, and I asked him about the matter, and he said, "The Government will pay from £1,800 to £2,000."
2145. *Chairman.*] If the Government are only going to contribute £820, you think the Borough Council would not be prepared to go on with the scheme? I am quite sure of it. You would frighten all the people out of the place. People of property laugh at the very idea of it. I am quite sure the Parramatta people would not be inclined to pay £3,000 odd for sewerage.

J. W.
Withers, Esq.
13 Mar., 1894.

- J. W. Wither's, Esq.
13 Mar., 1894.
2146. *Mr. O'Sullivan.*] Your predecessor was Mr. C. J. Byrnes? Yes.
2147. I find that when he was examined, Mr. Humphery asked the following question:—
675. Assuming that this scheme is carried out at a cost of £75,000, and the annual charge for interest is about £3,000, would you expect the Government to contribute in the proportion in which they are now contributing—that is, about £2,200? I should not expect them to pay a bigger proportion than they would be legally entitled to pay.
- There he was made aware of the fact that it would cost £75,000;—did he never convey that information to the Borough Council? I have never heard of it.
2148. Was no one else connected with the Council aware that it would cost more than from £50,000 to £60,000? We have always thought it would cost from £45,000 to £50,000. I might call your attention to the report in a Parramatta newspaper of the last meeting at which some aldermen mentioned the matter.
2149. It is evident from the question and answer I have read to you that Mr. Byrnes knew better? He might have known better; but if we have to pay £3,000 for sewerage I am quite sure the people will "buck" at it.
2150. *Mr. Davies.*] You are rated at the present time with a general rate and a lighting rate? Yes; 2s. in the £, and we have the earth-closet system as well, which is extra.
2151. Do you think the ratepayers and the property-holders could afford to pay another 11d. in the £? I am sure they could not. It is ridiculous to think of such a thing. We have to pay 3d. for lighting, 9d. for water, and 1s. for the ordinary rate.
2152. In addition to that you have the night-pan system which costs about 9d. a week? Yes; it costs me 9d.
2153. Do you think it would be possible to relieve the borough of Parramatta of the drainage and sewage matter coming from these institutions if it were treated at the several institutions themselves;—would that relieve the borough of the necessity of any great expenditure on a sewerage system such as is proposed? As I said on a previous occasion, if the sewage of the institutions were taken out of the river at Parramatta, it would do away with the largest amount of nuisance we have.
2154. That is to say, if the sewage matter were treated at the institutions, under the control of some Government or municipal officer, it would relieve your municipality of the necessity of such an expenditure as is proposed—by the uniform adoption, for instance, of the pan system? I do not think any solid matter goes into the river, but imagine there being some 3,000 or 4,000 old men and women at the lunatic and other asylums—all the washings and urine go into the river. That is what causes the nuisance.
2155. Would it be possible to abate that nuisance if the sewage matter and drainage were intercepted and dealt with at the institution? Yes.
2156. Is there an abundance of labour available for the purpose of dealing with a matter of that kind? Yes.
2157. So that the cost would not be anything very great? No; it would cost nothing to the Government, I should think. They have hundreds of men there able to work.
2158. Then the whole of the sewerage matter might be intercepted and treated at the institutions? It ought to be.
2159. Do you think it could be treated so as not to be offensive to the town of Parramatta? Yes. There are the gaol and lunatic asylum that you might say are out of Parramatta. They are on the borders. There is a poor house in Macquarie-street, and one in George-street. In the one in George-street there are generally from 1,100 to 1,200 men, and in the one in Macquarie-street I have seen as many as 500.
2160. Where do you empty your pans? In the orchards.
2161. There is no special place allotted by the municipality? No; several people who keep orchards are very glad to get it. They apply to the Council for it.
2162. And you have no difficulty in finding a place to deposit the contents of the pans? No.
2163. Have you had any complaints from any people living in the localities in which the pans have been emptied as to the existence of a nuisance? No; it is thinly populated where they are emptied.
2164. And you have had no complaints? No.
2165. If that system were uniformly adopted throughout the municipality, you think there would be no occasion for any large expenditure on a sewerage scheme such as that which is proposed—that is, if the institutions provided for intercepting the sewage and treated the matter on the land adjacent to the public buildings? I do not see why they cannot do it, and I am quite sure if it were done it would do away with the greater part of the nuisance at Parramatta.
2166. And there would be no expense so far as labour is concerned? No; they have hundreds of men there able to do something. We are getting all the paupers from all over the country.
2167. *Mr. McCourt.*] Were you present when the Council passed a resolution approving of this work on the 6th July, 1892? Yes.
2168. Was that resolution carried unanimously? I could not tell you.
2169. Did you vote for it? That I could not tell you. Very likely, if the amount were £50,000 I would vote for it.
2170. The resolution is:—
- That the Parramatta Sewerage Works, as proposed by the Government to be carried out in Parramatta, now submitted, be adopted by this Council.
- So that you must have had the plans and everything before you. That resolution was adopted I presume? Yes; I know a plan was submitted.
2171. *Mr. Wall.*] Do you know whether that resolution was carried unanimously or not? I could not say. I know it was carried.
2172. You have not rescinded the resolution yet? No.
2173. Do you intend to rescind it? If the scheme is to cost Parramatta so much as is stated, I am quite sure it will be rescinded.
2174. That is, if it is to cost £75,000? That is, if it is to cost £3,000 odd a year.
2175. Do you know whether it is the intention of the Council to take any action with regard to rescinding the resolution, or to make any representations to the Committee on the subject? There is not the slightest doubt that the Council will take action in the matter, if we are supposed to find all this money.
2176. Now that you know you will have to find £3,000 a year, do you think the Council will take action to rescind the resolution? I am sure they will.
- 2177.

2177. *Mr. Humphery.*] What is your total rate at 1s. in the £? About £3,500.

2178. I think you said 10 per cent. of the ratable property would not be served by the sewerage scheme? A good deal of ratable property would not be served.

2179. I think you said about 10 per cent.? Yes; about 10 per cent.

2180. So that 1s. in the pound for sewerage purposes would produce a little over £3,000;—is that it? That would be about it.

2181. *Chairman.*] Will this matter come before the Council again in due course? Yes.

2182. Are you taking any steps to better inform the Council as to the cost and the amount the Government will contribute? We only go by what the assessor states.

2183. He says that under the method of assessment adopted in Sydney, the Government will contribute about £820? We shall have to have our own assessors I suppose. We would have no power to assess the Government property.

2184. Not unless special power were given to you under the Act? I know, from the opinions expressed in the Council last night, that they expect the Government will pay at least £2,000. We could not carry more than about £2,000 for sewerage?

2185. That is the most you could afford to give for sewerage? Yes; I asked every alderman about it last night.

2186. I want to know what steps you and the Council are taking for the purpose of answering the two points contained in the resolution moved by Mr. Moxham, namely, as to the definite amount the Government would contribute and the total of cost? I shall tell them what the assessor states—that the amount will be £802 11s. 9d.

2187. Are you, as Mayor, instructing the Council Clerk to apply to the Works Department for the information the Council requires? I shall take as a basis what Mr. Beaumont states.

J. W.
Withers, Esq.
18 Mar., 1894.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Sewerage Works for Parramatta.

APPENDIX.

A.

[To Evidence of J. Barling, Esq.]

PARRAMATTA SEWERAGE SCHEME.

Reply to Report of Parliamentary Standing Committee on Public Works.

THE grounds on which the Parliamentary Standing Committee on Public Works resolved that it is not expedient that the proposed sewerage works at Parramatta should be constructed are as follows:—"That in the opinion of the Committee the sewage farm included in the proposed works is too small for the purpose, and the sewage should be dealt with at the proposed pumping station at Clay Cliff Creek by a system of precipitation and filtration, or other effective modern process." The Committee in their report state that the carrying out of an effectual system of sewage is necessary, but apparently guided entirely by the report and evidence tendered by Mr. G. H. Stayton (the other professional evidence being all in favour of the Sewage Farm) they express the opinion that precipitating works should form part of the present scheme.

Before entering upon a consideration of the main question, I may be permitted to draw attention to the *inuen*do contained in the report of the Committee in clause 11, where it is said that "the report from the Commissioner and his later examination, indicate that the Department had at that time a much fuller conception of the portion of the scheme relating to the sewage farm than appeared when the proposed works were first put before the Committee." I desire to say that before submitting the scheme to the Committee the Department had carefully studied the applicability of all the known arrangements for sewage disposal and utilisation, and had worked out the details of the farm as fully as was necessary to arrive at a just conclusion. In presenting a report to a non-professional committee, it was deemed unnecessary to enter upon such details, and these were omitted not only in the description of the sewage farm but of the main works. It would now, however, seem advisable to go somewhat into details in order that the misunderstanding into which the Committee have been led may be removed, and that the Minister for Works may have all the facts before him when determining on future action.

With reference to the question of the relative advantages of chemical precipitation and land filtration, I can without hesitation say that at the present time no sanitary engineer of eminence in Europe or America will be found who will give unqualified preference to the former. It is true that precipitation has been adopted in and around London, and in several provincial towns in Britain, and also on the Continent, but in such cases it has always been on account of local circumstances precluding the use of farms, except at large cost, owing to the unsuitability of the soil, or the impossibility of procuring land near enough to the area to be drained, precipitation is then accepted as the only known substitute for land filtration. One of the sanitarians who has been quoted as a strong advocate for the precipitation of sewage, Dr. Dupré, recently said in speaking of the precipitation works near London: "I am afraid that the London scheme is not well understood by many persons. It was based upon some very elaborate experiments by Mr. Dibdin and myself, which had led us to the conclusion, since verified by others, that no chemical scheme that could be adopted would do more than clarify the sewage, and remove a small proportion of the soluble matters. . . . It had often been said that the effluent produced by precipitation was not to be compared with that obtained from a sewage farm—that is true. I know no one familiar with the subject who denies that the most effective treatment of sewage is by passing it through land, provided the land is suitable." His contention for precipitation, was that the value of land near London, required for land filtration, was so great as to be prohibitive, that the volume of water in the Thames was sufficient to neutralize the impurities left in the clarified precipitant, and that the effluent was good enough to pass the health authorities.

Mr. Baldwin Latham, who is stated in the evidence to favour the adoption of the International process for a large district in Staffordshire, publicly expressed his views in April of this year as follows: "I will not say that sewage farming is the only mode of dealing with sewage, but there can be no doubt that it is the best mode when land can be got at anything like a reasonable rate, and within a reasonable distance of a town."

On the same occasion (a discussion on the Berlin sewage farms, which took place at the April meeting of the Institution of Civil Engineers), Dr. Drysdale, speaking of the Paris farms, said: "Those farms had convinced them all of the enormous superiority of the effluent, to any chemical purification attempted in England."

Mr. Dibbin, who has been associated with Dr. Dupré in his experiments on London sewage, said:—"Where sandy soil could be found for sewage irrigation, that method was no doubt the best. Ordinary precipitation processes would not remove more than a certain amount of the organic matter in solution." . . . "The results there obtained (by the Massachusetts State Board of Health) had entirely confirmed the view he had taken, that only a certain portion of the matters in solution could be removed by chemical precipitation, and for that purpose the best substances to be employed were found to be the very foolish and ridiculous substances, known as lime and sulphate of iron."

Lieutenant-Colonel A. S. Jones said, "It had long been known that land and vegetation, assisted by nitrifying organisms, could purify sewage, and that properly-managed sewage farms were, as Mr. Baldwin Latham, and Sir Douglas Galton, had stated, the healthiest localities for animal life."

Sir Robert Rawlinson said: "They could irrigate sea-sand, and they could irrigate the heaviest clay, and every class of land betwixt the two, but it should be remembered that the effect they got from the sewage, would be from the surface. He had special experiments made with regard to the celebrated Craigentiny meadows near Edinburgh. Some of those meadows which were common sea-sand, had received sewage more than a century, and at 6 inches in depth below the surface, they showed no stain or taint. . . . There was no evidence that one acre of that land at Edinburgh had either been sickened, or in any respect made dangerous to health by the gross manner in which the most corrupt sewage had been floated over it." "The chemical process, the precipitating process, the filtering process, and the combination of chemicals with filtering, had all been tried. The result of his experience . . . was that the crude sewage, in its simple form, without tampering with it by chemicals was the best form for the land, and would produce the best results, if applied judiciously in proper dilution, in proper quantities, and at proper times. . . . Many towns were so situated that they were not in a position to be able to carry out broad irrigation. Then they had to resort to chemical treatment to clarify, as far as they could, the effluent water before it passed into the river. But in no case was the clarified sewage pure; it had seven-eighths of the salts of sewage in it . . . and if passed into a shallow brook or a small river, it would in summer ferment and become putrid and offensive."

Mr. Paterson said: "The complete experiments of the Board of Health of the State of Massachusetts proved that pure sand or gravel, or both combined without aid of soil or vegetation, have an unequalled power of destroying the organic matters and the bacteria of sewage, without leaving a trace behind it, the sand and gravel being left perfectly clean."

Mr. Santo Crimp, in his recent work on Sewage disposal, gives extracts from the reports of the Rivers Pollution Commissioners and others, and stamps them with his approval. They are valuable in showing that from the earliest to the latest, they are all in favour of the adoption of sewage farms, unless in the face of insurmountable difficulties. The following are a few extracts:—

The Royal Sewage Commissioners' Report, 1865, says:—"The right way to dispose of town sewage is to apply it continuously to land, and it is only by such application that the pollution of rivers can be avoided."

The Local Government Board Committee, 1875, report that—"Town sewage can best and most cheaply be disposed of and purified by the process of land irrigation for agricultural purposes, where local conditions are favourable to its application." . . . "That land irrigation is not practicable in all cases, and *therefore*, other modes of dealing with sewage must be allowed."

Conclusions of Commissioners appointed to propose measures for remedying the pollution of the Seine, 1874:—"The experiments made in the plain of Gennevilliers are entirely conclusive in showing, not only the luxuriant vegetation which may be produced by irrigation, but their harmlessness, in respect of health, as well as the perfect purification of the waters which return to the river." . . . "As to purification by chemical processes . . . the Commissioners are of opinion that it will not constitute a complete and practical solution of the question."

The Committee appointed by the Corporation of Glasgow in 1830 to inquire into various methods of sewage disposal report that:—"Whatever be the process of chemical purification, the effluent is still impure and will putrify and give off noxious gases if kept for some time, and we know of no way but oxidation in which the purification can be completed. Filtration through cultivated land, *i.e.*, irrigation, is probably the best means."

The Lower Thames Valley Main Sewerage Board proposed a joint scheme of sewage precipitation. It was rejected by the Committee of the House of Commons, who in their report said:—"Your Committee believe that in these cases the process of filtering the chemically purified effluent through earth ought, if possible, to be adopted, which was not provided for in the scheme under their consideration."

The Commissioners appointed by the Municipal authorities of the city of Turin report "*that the chemical or precipitation methods for the treatment of sewage do not succeed in separating the manurial ingredients, are costly, clarify, but do not purify the water, which moreover remains liable to undergo putrefaction afresh if the process is not followed by some method of oxidation. The only method recognised up to the present time as really efficacious for the purification of sewage is irrigation, carried out in a proper way upon suitable soil.*"

The Royal Commissioners on Metropolitan Sewage discharge, appointed in 1884, after detailing the condition of the River Thames and urging the necessity of taking immediate steps to improve it at the two great outlets at Barking Creek and Crossness say:—"The liquid portion of the sewage remaining after the precipitation of the solids may as a *preliminary and temporary measure* be suffered to escape into the river. . . . But we believe that the liquid so separated would not be sufficiently free from noxious matters to allow of its being discharged at the present cutfalls as a *permanent measure*. It would require further purification, and this, according to the present state of knowledge, can only be done effectually by its application to land. In the case of the Metropolis the best method of applying the liquid to land with a view to its purification would be by *intermittent filtration.*"

Mr. Santo Crimp, writing in 1890, says:—"In summarising the foregoing conclusions and recommendations of the various Commissioners and Committees who have investigated the subject of sewage disposal on different occasions in this and in other countries during the past thirty years, it will be observed that *perfect unanimity obtains in regard to the purification of sewage by means of land. Notwithstanding the fact that during that period the chemical treatment of sewage has received the concentrated attention of the most eminent chemists, it is still recognised that in order to produce a sewage effluent of any substantial degree of purity land must be employed in some form or other.*"

The Massachusetts Board of Health have for several years been making experiments on sewage precipitation and filtration, which are acknowledged to be the most complete and exhaustive hitherto undertaken. The general results will be referred to further on, but it may be said here that after testing all the precipitants now in use Mr. H. F. Mills, their engineer, states that he found it "*totally impossible to obtain as good a result by their use as by simple intermittent filtration through sand.*"

Were further evidence required of the preference of sanitarians for land filtration over chemical precipitation, and the absolute superiority of the former process to the latter, it might be found in the fact that Sanitary Commission, appointed by the Paris authorities, for the investigation of the question *after having visited England and Germany, and having examined every known process of sewage purification, have determined on the adoption for the whole of Paris of the farm system, previously in use for part of it, at Gennevilliers and more recently at Achères.*

The pollution of the Thames water into which so-called purified effluent is being discharged is notorious. So much so, that many schemes have been proposed by the most eminent English sanitarians for the diversion of the sewage and its utilisation on farms. They, as well as the Royal Commission previously quoted, urge the necessity of action in this direction.

Of chemical precipitation processes, the International, which seems to be favoured by the Committee, is, I believe, the best, the Ferezone and Polarite acting to a certain extent as oxidizing agents. It is undoubtedly "modern," having been first introduced towards the end of 1887, only five years ago. Whether this is an advantage is doubtful, when it is considered that during the present century over 400 patents have been taken out for various precipitating mediums, while the "survivals" could be counted on the fingers. *Almost the only literature obtainable on its advantages is to be found in the pamphlets published by the Company interested in its sale. It does not seem to be in all cases successful, as at Wolverhampton, where it has been tried, it is stated by Mr. Berrington not to have offered any particular advantage, nor exercised any marked influence on the effluent. Mr. Cooper recently stated in reference to the process that "though the International Company's filters were certainly very practical, he did not for his own part believe in the great superiority of Polarite."*

The objections raised to all chemical precipitants yet known are based on very substantial scientific grounds. Their action is at the best partial, they act as clarifiers rather than purifiers of the sewage. Although the effluent may be discharged perfectly clear it still retains nearly the whole of the salts originally found in the sewage, and therefore putrefaction must rapidly follow unless the body of water into which it is discharged is sufficiently large to complete the process of oxidation.

In the purification of sewage by land filtration, perhaps the most important process is that of nitrification, that is, the conversion of the original organic nitrogenous compounds into harmless nitrates. *This is the work of an organism present in all soils, which breaks up and destroys the organic matters and renders the effluent entirely innocuous. This microbial action exists in clay soils to a depth of 15 in. to 18 in., and in more porous soils, sand, &c., to a depth of about 4 ft.; indeed as far as the friability of the soil will allow the air necessary to its propagation to penetrate.*

This property of land was investigated first by M. M. Schlessing and Muntz in 1877. It was proved that it was the result of organisms, active only in the presence of atmospheric air, that antiseptics were fatal to it, that nitrification was almost absent at freezing point, that it was most active at 100° Fahr., that though it entirely ceases at 131° Fahr., it has been shown that in sterilised sewage, nitrification can be again started by the addition of a few particles of fresh surface soil. Dr. Declaux, in his treatise on Fermentation, 1884, states that as a result of M. Pasteur's investigations, it has been ascertained that in six hours one globule can increase to 16 millions, and that "whenever and wherever there is a decomposition of organic matter, whether it be in the case of a herb or an oak, of a worm or a whale, the work is exclusively done by infinitely small organisms. They are the important, almost the only agents of universal hygiene: they clear away more quickly than the dogs of Constantinople, or the wild beast of the desert, the remains of all that has had life." Sewerage is favourable to the development of this organism, which in its presence increases to a wonderful extent, and hence it is that a sewage farm properly laid out and efficiently managed will improve rather than deteriorate the longer it is used.

Very exhaustive experiments have been made on this matter by the Massachusetts Board of Health, the result of which may be seen in their reports. In reviewing the results, *Engineering* (February 19th, 1892) states: "*The experiments prove conclusively that sand or gravel filtration is not a mere straining, but the organic matter of the sewage is actually burnt up and destroyed by the action of an organism which the experimenters have succeeded in isolating for the first time in America, though such an organism had previously been observed in Europe. . . . This organism requires a supply of oxygen to operate on the sewage, and hence the necessity of intermittent filtration, which will allow the upper part of the filter to become dry, and admit air.*" . . . "The fact that the purification depends on an organism also explains why some time is necessary for the filter to adapt itself to its work. In certain cases nitrification did not commence till some weeks after the sewage had been applied to the tank, but when in full working order it will go on for an indefinite period, provided that the amount of sewage applied is not too large. . . . This rate (36,000 gallons per acre per day) was maintained for six months, and was then increased to 100,000 gallons per day (equal to a population of 900 and 2,500 per acre respectively), with but little change in the result. At the end of the experiment the stones of the filter were found perfectly clean."

These facts are further proved by the experience gained on the Botany farm, where the effluent is now purer while nitrifying 56,600 gallons (equal to a population of 1,415 per acre) per day than when sewage was first placed on it.

Mr.

Mr. Baldwin Latham, in the discussion previously referred to, said in April last: "In England they almost seemed to have stood still with regard to the question of the purification of sewage. The French came to England to learn what had been done here. He had had numerous interviews with Mr. Durand Clay and other French engineers on the subject, and he had gone with them to the different sewage farms established in this country. They had then returned to Paris and had shown that the best method for the purification of sewage was its application to the land. They discovered on the Paris sewage farm the nitrifying organism, or, as it had been called, the friendly microbe, a microbe which had the power of converting nitrogenous matter into nitric acid, and, given the proper condition for its cultivation, it would go on purifying sewage to any extent and destroying all the noxious matter which was so baneful to life and health."

It need hardly be pointed out that nitrification is entirely absent when sewage is chemically treated. The precipitants arrest and carry down the organic matters found in the sewage, but do not destroy them. It may further be stated that it is found that in cases where the sludge and effluent are further treated on land nitrification is seriously retarded by the presence of chemicals.

Having indicated the general grounds on which it was determined to adopt a sewage farm for Parramatta in preference to chemical precipitation it now only remains to show that the site selected is suitable, and that the area resumed is sufficient for requirements.

On the first point it will be only necessary to recapitulate the reasons for the selection given by me in evidence before the Committee. They were shortly as follows:—

1. That though distant from populated areas the site is convenient to Parramatta.
2. That it is central to, and might hereafter be utilised for, the drainage of Granville and other Municipalities.
3. That it is adjoined by a considerable area of low-lying land which, though useless for residential purposes, could be made available by reclamation for an extension of the farm in the event of other areas being hereafter drained to it.
4. That the material intended to be used in the formation of this farm is proved by experience in America and Europe, as well as at the Botany farm, to be of the best possible description, excelling every other known filtering medium, whether natural or artificial.
5. That no one has so far been able to point out a site near Parramatta having the same advantages.

In considering the size of a sewage farm two points must be considered—first the nature of the sewage to be treated, and second the method of treatment. Sewage farms may be treated in three ways, viz. . . . By broad irrigation, by downward intermittent filtration, or by a combination of the two. It is on the last method that the Parramatta farm is proposed to be cultivated, and for which it is best suited. This fact seems to have, to some extent, escaped the attention of the Committee when considering their report, as in it they deal not with the scheme as laid before them, but as if broad irrigation alone was to be employed.

It is quite correct, as stated in their report, that on farms established in England for broad irrigation a basis of from 100 to 200 persons per acre is accepted. It is also true, however, that where downward intermittent filtration is employed even in part, the sewage from 500 to 800 persons per acre is treated. One of the most eminent writers on the subject, Mr. Bailey Denton, fixes the limit at 1,100. The Rivers Pollution Commissioners, in 1870, as a result of their investigation, fixed the limit at 2,000 persons per acre, but this has since been reduced by them to 1,000 per acre.

It is further important to observe that in England and Germany, where sewage-farming has been carried out to the greatest extent, long and severe frosts have to be contended with during winter, when vegetation is almost entirely checked, nitrification is greatly retarded; and, were it not that the temperature of the sewage is higher than that of the ground, its distribution and absorption by the soil would practically be at a standstill. Although the somewhat reduced sewage discharge during winter, to some extent, compensates for this, it is evident that provision has to be made for winter farming by the increase of area in proportion to population. In this Colony, where the average temperature is higher, where frost is absent, vegetation grows more rapidly and continuously, and evaporation is greater; the ratio of discharge to area can, I believe, with perfect safety, be increased by at least one-fourth, bringing the limit up to about 1,400 persons per acre.

On this basis, if downward intermittent filtration alone were adopted, the area required for Parramatta would be as follows:—

	Population drained.	Area required at 1,400 persons.	Discharge per day per acre.
		per acre.	gallons.
For present population	12,000	8.6	56,000
For prospective population in 20 to 25 years	32,500	23.2	56,000
For ultimate population	48,500	34.6	56,000

By a table given by Mr. Bailey Denton, which, though published some years ago, has been recognised as fairly correct by recent authorities, the filtration area required at Parramatta Farm for the present, prospective, and ultimate populations would be 9.9 acres, 26.8 acres, and 40.2 acres respectively, with the sub-drains at an average of 5 ft. below the surface, and a discharge of 48,400 gallons per acre per day. The table is based on the supposition that each cubic yard of sand will nitrify 7½ gallons of sewage. Mr. Santo Crimp states that experiments with the Beddington and Dowsley soils show that they will effectually purify 7.6 gallons and 9.9 gallons per cubic yard respectively, the latter being equivalent to nearly 100,000 gallons of sewage per acre per day. Under the more favourable climatic conditions prevailing here, these areas would be somewhat reduced, and would correspond very nearly with those given above.

These calculations are based on the assumption that each area is allowed two periods of rest for one of work, or, in other words, that on the average only one-third of the area is receiving the sewage at one time, while the other two-thirds are being recuperated.

It may, of course, be said that the conditions—the nature of the soil, &c.—of the various places I have referred to are not fully known, and consequently cannot be taken as examples of what might be expected at Parramatta. Let us, therefore, see what is actually being done at the Botany Farm. The daily dry weather sewage discharge at Botany Farm is 1,600,000 gallons. The total area prepared for the reception of sewerage is 38½ acres. Of this area 12½ acres are under crop, 13½ acres are used as filter-beds, and the balance as a storm-water overflow.

The filter-beds are frequently called upon to take the whole discharge equal to 109,100 gallons per acre, for lengthened periods, and do so successfully. Taking, however, the irrigation and filter-beds together, the discharge per acre is still large, viz., 56,600 gallons per day, equal at 40 gallons per head, to a population of 1,415 per acre. This is done without under-draining. Applying this as before to Parramatta, the area required for the present, prospective, and ultimate population would be as follows:—

	Population of area drained.	Discharge per day.	Area required of farm.	Discharge per acre, per day.
		gallons.	acres	gallons.
Present population	12,000	480,000	8.5	56,600
Prospective population in 20 to 25 years	32,500	1,300,000	23.0	56,600
Ultimate population	48,500	1,940,000	34.3	56,600

Mr. Bailey Denton's calculation, given above, allows a discharge per acre, per day, of 48,400 gallons. If one-fourth is added to this for colonial practice, owing to climatic advantages, it would be equal to 60,500 gallons, a quantity somewhat above that discharged on to the Botany farm, which is, as stated, 56,600 gallons.

That the purification of the sewage by land filtration is almost perfect is shown by the experiments being carried out by the Massachusetts Board of Health previously referred to, where various filtering materials have been under continuous scientific observation for some years. These experiments prove conclusively that enormous quantities of sewage can be passed through

through sand and gravel without reducing the filtering properties of the material; and that the process is not merely a mechanical one, by which the impurities are retained in the filter, but that these impurities are, by the process of nitrification completely oxidised and burned out, leaving the filter after long continued use, as pure and clean as when it was first prepared.

Where coarse sand 5 feet deep was used as a filter, 50,000 gallons of sewage per acre per day were supplied, and it was found that 99 per cent. of the organic matter was destroyed. With 70,000 gallons per acre per day, the percentage of organic matter destroyed was 98.2 per cent.; with 102,000 gallons it was 98.7 per cent. At the end of the third year, the quantity of sewage being treated was more than double of that passed through at the end of the second year, and notwithstanding this the effluent was purer. During the whole time, from 98.6 per cent. to 99.98 per cent. of the bacteria in the sewage was being destroyed. With similar material in another filter 100,000 gallons per acre per day, have been treated, and gave an effluent in which 99 per cent. of the organic matter was destroyed. This filter has now been tested with a supply of 180,000 gallons per acre per day, and gave a precipitant in which 97 per cent. of the impurities were destroyed. Where very fine sand was tested the results have been equally satisfactory, so far as they have gone. One filter had at date of last report been under observation for twelve months; during eight months, sewage at the rate of 42,000 gallons per acre per day was being passed, and the quantity was then increased to 60,000 gallons. The last analysis shows that 99.7 per cent. of the organic matter was destroyed, and that practically none of the bacteria remained. A 100,000-gallon supply has since been tested, but the results are not yet to hand.

A mixture of coarse and fine sand and fine gravel in a bed only 4 feet deep, after eighteen months' continuous use, with a supply of 42,000 gallons for fifteen months, afterwards increased to 60,000 gallons, gave an effluent in which 99.3% of the organic matter was destroyed together with practically all the bacteria.

I may here be allowed to remark that the activity of the nitrifying organism as shown in the experiments given above, is an ample answer to the question recently raised in Parliament and elsewhere, as to the effect of sewage farms in propagating epidemic diseases. As shown by the analysis of effluent waters taken at the Massachusetts Experimental Station and on continental farms, all bacterial life, on application to land, is at once destroyed by nitrification.

It may be further stated that in the immediate prospect of the recent cholera epidemic making its appearance in France, the Municipal authorities of Paris took action to ascertain the best means of improving the sanitary condition of that city, and averting the calamity. A commission was appointed with M. Poubelle, the Prefect of the Seine, as its President. It obtained the assistance and advice of the most eminent scientists of the day, and has had access to most carefully prepared records collected by sanitary authorities of the course of zymotic disease in severed towns, and of all known precipitating systems in use. The determination arrived at was, that the sewage farm system is the best, and work at Achères is being urgently carried out in consequence.

There is an average population residing on the Berlin farms of about 1,600 persons. Since 1885 the death-rate from zymotic diseases has fallen from 4.32 to 1.13 per 1,000, and generally speaking, when these diseases have been prevalent in Berlin the farm servants have escaped them.

The conclusions to be drawn from the foregoing facts are: First—That the filtration limit in artificial sand filters has not yet been ascertained, but that the most recent records show that 180,000 gallons per acre per day, equal with a 40-gallon supply per head to a population of 4,500 per acre can be absorbed, and still give an effluent almost perfectly pure. (Engineering, 19th February, 1892). Second—That the limit accepted by the Rivers Pollution Commissioners, for English practice, is a discharge of 40,000 gallons per acre per day, equal to a population of 1,000 per acre. Third—That with the more favourable climatic conditions prevailing in this Colony, that limit can here be safely raised, as proved by the fact that at Botany 56,600 gallons per acre per day, equal at 40 gallons per head to a population of 1,415 per acre, are being treated, and that, without subdrainage.

The sewage farm at Parramatta is 64½ acres extent; 42 acres will consist of sand filling and 22½ acres of friable clay, which though not capable of taking so much sewage as the sand is considered by some authorities to be even a better filtering medium.

The present population of Parramatta is 12,000, with an estimated sewage discharge of 480,000 gallons.

The prospective population in twenty to twenty-five years will be 32,500, with a sewage discharge of 1,300,000 gallons; and the ultimate population 48,500, with a sewage discharge of 1,940,000 gallons.

Reduced to population and discharge per acre of farm these figures are as follows:—

	Population of Area drained.	Population served per Acre of Farm.	Sewerage Discharge per Acre of Farm.
Present population.....	12,000	186	7,442
Prospective population in 20 to 25 years	32,500	504	20,155
Ultimate population.....	48,500	752	30,077

It will thus be seen that even with the ultimate population (which will certainly not be reached within the next half-century) the Parramatta farm will have to do little more than half the work that the Botany farm is now doing successfully with similar filtering materials. To take the sewage of the present population it is proposed to prepare about 40 acres (though a smaller area would probably suffice) to be used partly as a filter and partly for irrigation, so that the land will not be overstrained till its nitrifying properties are fully developed by cultivation and working. As the population increases this area will be more fully utilised, and extended as found necessary. It will be at least twenty years before the minimum limit allowed in cold countries for intermittent downward filtration, viz., 500 persons per acre is reached, and it is, therefore, in my opinion, quite unnecessary to introduce any artificial means of precipitation, even if combined with land filtration. If at the end of, say, twenty years it is deemed desirable on commercial grounds not to further increase the quantity of sewage per acre, two courses will then be open, viz., either to purchase more land or to dispose of a portion of the sewage by precipitation. By that time the now "modern" processes will have been thoroughly tested and probably others discovered, and the authorities will have the advantage of selecting the best system then known, without being hampered with antiquated and perhaps useless plant.

The study of Bacteriology, though having advanced rapidly during the last few years, is still in its infancy. Chemists and scientists are now concentrating their attention upon it, and new light is being thrown on the subject almost daily. When it is more fully understood there will be a prospect, as instanced by the experiments of Messrs. Adency and Parry, of Dublin, recently explained by them to the British Institute of Public Health, of discovering some artificial process of nitrification and oxidation approaching in efficiency to the natural one through land. Until the science is further advanced the inadvisability of accepting, unless under the most urgent necessity, any artificial process now known will be apparent.

On page 9 of their report, the Public Works Committee seem to contemplate a combination of land filtration with the precipitating process. Quoting from Mr. Stayton's evidence, they say: "The Polarite filters would not necessarily always be in use. Irrigation from the tanks can be conducted in two ways: the supernatant water may be drawn off direct from the large tanks after precipitation, or the effluent may be used after passage through the filters. During the growing season, when the ryegrass will greedily devour nearly any quantity of sewage, the water may be taken direct from the precipitation tanks; but when the land and crops have but little purifying power, the filtering tanks would be constantly employed, the effluent being afterwards run over the surface of the land for aeration." Passing over the fact that this evidence bears out the contention that even if precipitation is used the sewage farm cannot be dispensed with, I would point out: First—that at Clay Cliff Creek, where the Committee propose to locate the precipitating works, only a few acres of land are available; second—that they would have to be resumed at a very large cost, owing to their suitability for building sites and their contiguity to the town; third—that even if a sufficient area could be obtained it is not so suitable as that on the farm already purchased, as it consists wholly of clay, and having an irregular surface would require more preparation; and fourth—that its adoption would entail the abandonment of the area already resumed at a cost of about £6,000.

The Committee make no reference to the relative cost of the two schemes, or of the working expenses. In my previous report I showed that under both these heads the departmental scheme has a decided advantage. I now submit that I have succeeded in showing: First—that it is only under exceptional circumstances, such as the impossibility of procuring suitable land for filtration, that precipitation should be allowed; second—that no such difficulty exists in the case of Parramatta; third—that the site selected and purchased at Duck River is suitable for a farm, while that at Clay Cliff Creek is not, and that the material of which it is proposed to construct the farm is proved to have qualities superior to any other

other for destroying all noxious matter hurtful to life and health; fourth—that land irrigation and filtration is the only known means of procuring a pure effluent; fifth—that all sanitarians agree and statistics show that sewage farms, properly managed, are not injurious to health, nor do they create a nuisance; sixth—that the area resumed will be amply sufficient for requirements not only of the present but for the prospective population in twenty-five years, and with modification of arrangements, for the ultimate population of 48,500 also.

I regret that under these circumstances I cannot concur in the recommendation of the Parliamentary Standing Committee on Public Works that "the sewage should be dealt with at the pumping station at Clay Cliff Creek by a system of precipitation and filtration." I would further strongly urge that no action should be taken in carrying out their recommendation till a competent and unprejudiced engineering opinion has been obtained on the matter.

ROBE. HICKSON, M. Inst. C.E.,

12th November, 1892.

Commissioner and Engineer-in-Chief, Roads, Bridges, and Sewerage.

A1.

Messrs. W. W. Wardell, C. N. Bell, and G. Chanier to The Under Secretary for Public Works.
Parramatta Sewerage.

Sir,

Sydney, 28 July, 1893.

Referring to your letter of the 15th July instant, conveying to the undersigned their appointments by the Hon. the Minister for Public Works as a Board to inquire into proposals made for sewage works for the Town of Parramatta, and to your instructions that we should review the evidence given in the Report of the Parliamentary Standing Committee on Public Works relative thereto, inspect the site of the proposed works, calling further evidence if necessary, and advise on the question raised as to whether the scheme proposed by the Department for treating the sewage entirely by sewage-farming, as at Botany, should be carried out, or whether it is more desirable to treat it by a process of precipitation and filtration, we have the honour to report as follows:—

In compliance with these instructions we have carefully considered all the evidence adduced, the separate professional reports on the subject, and the finding of the Parliamentary Committee. We also visited the town of Parramatta, and examined the localities where it was proposed to lay the main sewers, also the condition of drainage of the township, the adjacent river, and the site for the proposed pumping-station. We visited the reclamation works at Neutral Bay and Long Cove to ascertain the nature of the material which is to be obtained, and its suitability for sewage-farming uses, and we examined with every care the site chosen for the proposed farm at Parramatta, where a block of land has already been secured by the Government for the purpose.

We made, also, a careful inspection of the Sewage Farm at Botany, and found it in excellent working order, giving satisfactory results, and without any nuisance whatever.

The evidence already before us is so abundant that we did not consider it necessary to invite any further, and we proceeded to weigh it in respect to the two schemes on which our opinion is desired.

There can be no doubt that the evidence given in favour of precipitation and filtration shows how useful it would be in cases of necessity, or where sewage-farming would be impracticable; but as all the conditions necessary to make sewage-farming successful are present in the case of Parramatta, we found no difficulty in arriving at a unanimous decision in its favour, as we consider it the simplest, cheapest, and best method of meeting the requirements.

In this opinion we are supported, not only by the preponderance of the evidence before us, but by the overwhelming concurrence of the leading authorities of the present day on sanitary engineering, many of whom have been quoted in the Commissioner's reply, dated 12th November, 1892, to the Report of the Parliamentary Committee. Those engineers, also, who have recently advised the Australian Governments on the drainage of their principal cities have been of one accord in recommending sewage irrigation, and where their designs have been carried out a perfect success has been realised. The examples at Adelaide, S.A., Christchurch, N.Z., and Botany, are instances in point, and similar works are now in course of construction for the sewage of Melbourne. At Christchurch, N.Z., the area prepared and used is 42 acres, the population draining to it is 30,000, and the sewage discharge 1,200,000 gallons per day. It has been in use ten years without complaint of any kind, although surrounded by houses and farms.

We think, indeed, there can be no reasonable doubt, in view of the varied experience of the past twenty years, that where suitable land is available the practice of distributing the sewage on its surface is the best means for its disposal.

The very important question raised by the Committee as to the area of the ground available being sufficient for the purpose intended, has been so completely answered by the Commissioner's reply, 12/11/92, that we need only refer to it, and we think that the sandy material with which it is proposed to reclaim the low lying portion of the farm is well adapted for sewage irrigation, and the area, 40 acres, so reclaimed will be amply large enough to meet the requirement of the sewage of Parramatta for many years to come. The more elevated portion of the ground, comprising 22 acres, can by means of subsoil drainage be rendered equally serviceable when required, and the whole area of 62 acres then available would, in our opinion, be sufficient for three times the present population of the town. On this account we consider that the initial outlay provided for the preparation of this portion may be postponed for many years, or very largely reduced.

We would also advise the diversion of the rainfall. In the case of Parramatta there is no reason why any rain at all should be admitted to the sewers. The town of Parramatta is situated on sloping ground, where all rain-water will flow with ease to the nearest storm-water channels or drains. If the rainfall is diverted the quantity of sewage would be reduced by more than one-half, and, therefore, the capacity of the land to deal with is at least doubled, while the sewage itself, being so much less diluted, would be better suited for farming requirements. It would also require less pumping and smaller conduits, and would probably reduce the cost of construction by 25 per cent.

We also find that, under the proposal to exclude the rain-water in both cases in comparing the two systems of sewage-farming and the "International," both the initial and annual cost of the former would be about 25 per cent. less than the latter.

Subject, therefore, to what we have suggested, our own judgment and experiences confirm the recommendation of the Department, and, supported as we are by the opinion of those who are accepted as the best authorities in Europe on this branch of science, we have no hesitation in advising that—with the modifications mentioned—they should be adopted.

We have, &c.,

W. W. WARDELL, M. Inst. C.E., Chairman.

C. NAPIER BELL, M. Inst. C.E.

GEORGE CHANIER, M. Inst. C.E.

A2.

The Commissioner and Engineer-in-Chief to The Under Secretary for Public Works.

Department of Public Works, Roads and Bridges and Sewerage Branch,

Sydney, 12 August, 1893.

Parramatta Sewerage Scheme.

It cannot but be a matter of considerable satisfaction to the Minister to be assured that the scheme for the sewerage of Parramatta, to which he, on the advice of his responsible officers, was committed, has been shown, after a very searching inquiry by three professional and independent engineering experts, to be the "simplest, cheapest, and best method of meeting the requirements," and so far from the farm being too small, they are of opinion "that 40 acres (out of the total of 62) will be amply large enough to meet the requirements for many years to come."

While on this point I might be permitted to remark that engineers have a great deal to learn yet as to the actual capabilities of a sewage-farm composed of sand and in a climate such as ours.

The Botany Sewage Farm has certainly surprised me, and makes one feel how very little one really knew on the subject. It was originally designed to serve a population of 800 persons per acre, which, at the time, was considered a large number. As a matter of fact, however, it is now (after being at work some five years) dealing, without creating any nuisance whatsoever, with the sewage from a population of over 1,400 per acre; and I am of opinion, if no more land could be obtained and the population increased, the same area could be made to serve for a larger number of people, which leads one to think the Rivers Pollution Commissioners were not so far wrong when, in 1870, they fixed the limit at 2,000 persons per acre.

It

It should also be remembered that the size of sewage farms is generally decided more from a commercial point of view than from that of a sanitary one. The larger the farm, of course within reason, the better it will pay, the revenue increasing in direct proportion to the size of the farm, while the expenses of management will not increase at anything like the same rate; and this, no doubt, to some extent accounts for the large farms, in proportion to the population, which are generally in use.

The exclusion of the storm-water from the sewers suggested by Messrs. Wardell, Bell, and Chamier, will receive careful consideration when the details of the scheme come to be worked out. I would, however, point out that this is a matter on which the leading sanitary engineers of the present day hold very different views.

Leaving out all artificial schemes, there are three means of dealing with the sewage of towns, as follows:—

1st. "Combined System," by which all storm-water is carried off with the sewage.

2nd. "Separate System," by which sewage only is dealt with, storm-water being carried by other means.

3rd. "Partially Separate System," by which a certain portion of the storm-water is allowed into the sewers.

Each of these systems has its own advocates, and I am inclined to think the "Partially Separate System" is, as a rule, the best. It is this system which has been adopted in the sewerage of Sydney and suburbs, the quantity of water allowed into the Sydney sewers ranging from 4 cubic feet per minute per acre to 1.19 cubic feet per minute per acre, while for Parramatta that quantity was reduced to .92 cubic feet per minute per acre. But, as I said before, it may be quite possible to exclude all storm-water from the Parramatta sewers, in which case a saving in the cost of the scheme might be effected.

The question now to decide is, what is the next step to be taken? and though this is a matter which rests entirely with the Minister, I might be permitted to say, it would appear of little use to resubmit a purely sanitary engineering question such as this, which has been fully dealt with by a Scientific Board, to a committee of laymen.

ROBT. HICKSON.

A3.

MR. G. GORDON, M.I.C.E., ON THE DISPOSAL OF SEWAGE.

Dear Sir,

Sydney, 13 February, 1894.

In compliance with your request at our interview yesterday, I have much pleasure in placing at your disposal the following notes on the disposal of sewage. I have given the subject much careful study for a good many years. About 1880, I sent in a report on the sewerage of Melbourne, which gained the premium offered by the then Mayor. A few years ago, at the request of the Royal Sanitary Commission, I submitted a new scheme for the sewerage of Melbourne, which embraced a much larger area than my report of 1880 had been intended to deal with. I also advised the City Council of Dunedin on the disposal of the sewage there. During my recent visit to England, I visited a good many sewerage works there, both of precipitation and filtration, that being one object of my visit. I found in England that the prevailing opinion among sanitary engineers of eminence is that the best means of disposal of the sewage of inland towns, or wherever a discharge into a strong tidal current is impracticable, and wherever land can be obtained, is by means of irrigation, both as regards efficiency and economy. The examples of Berlin, Adelaide, and many other cities where this system has been adopted with great success from a sanitary point of view, are no doubt one reason why purification by filtration is, so far as my inquiries inform me, looked on with less and less favour. In my opinion, in wet climates a portion of the farm should be set apart for "intermittent downward filtration," as a means of rapid purification at times when the sewage and rainfall are in excess of what can be profitably applied to the farm proper. The same consideration seems to point to the desirability of as much as possible of the rainfall being disposed of separately from the sewage. I have not had any opportunity of carrying out any sewerage works, as distinguished from flood-drainage of cities, but many of noting the advantages and defects of different systems; and although I have not personally examined the special case in question, from what I have read of it, I have no doubt whatever that a sewage-farm is the only proper plan to be adopted, and that the available area is amply sufficient.

Yours faithfully,

G. GORDON, M.I.C.E.

J. Barling, Esq.

In recommending the separate system, I do not recommend the exclusion of the drainage from back yards, &c., but only the clean water from roofs, storm-water running off large clean areas—parks, gardens, &c.—which can be disposed of by open channels without nuisance; but it is chiefly a question of expense.—G.G.

Forward for information of the Public Works Committee.—W.J.L., 14/2/94. The Secretary to the Committee.—J.B., 14/2/94.

A4.

OBSERVATIONS ON THE TREATMENT OF SEWAGE IN THE UNITED KINGDOM.

The Under Secretary for Public Works,—

Sir,

Harbours and Rivers Department, Sydney, 20/2/94.

During my visit to England last August, instructions were forwarded to me from the Minister, directing me to make some inquiries on behalf of the Commissioner and Engineer-in-Chief for Roads and Bridges, into the efficacy of some of the systems adopted for the treatment of sewage in the United Kingdom, and especially to obtain particulars of a process lately introduced by Messrs. Adeney and Parry, of Dublin.
