The geological formations consist of highly-cleaved Silurian slates and intrusive bosses and dykes of quartz-felspar porphyry. The reefs occur in the slates. These rocks are decomposed to great depths, and this circumstance has enabled mining in the past to be carried on at a very low cost. No water has as yet been encountered in any of the shafts.

There are two distinct fields: one near the surveyed township and the other 4 miles east of it.

The working upon the former field are for the most part grouped along two lines of reef, which are approximately parallel and half a mile distant from one another. They are known respectively as Tarcombe line and Finn's line.

Tarcombe Reef.

This reef trends approximately north and south, and has a slight underlay to the west. It is from 2 to 18 inches thick, and closely follows the cleavage planes of the slate containing rock. At the present time there is but little payable stone available for exploitation, and in my opinion the chances are against the reef yielding any regular supply of ore in the future.

Upon the accompanying plan I have shown the various workings. I have also noted as closely as possible the positions occupied by the various parcels of stone which have been crushed and the yields which were obtained from the same.

Tarcombe Prospector's Claim.

Shaft 107 feet deep. At 50 feet, drive 120 feet north to boundary and 18 feet south. From the stopes north of the shaft and above this level parcels of ore which crushed as follows have been obtained:—

No. of tons crushed.	Yield of Gold per ton.
6	3 oz. 10 dwt.
11	2 „ 11 „
35	1 „ 15 „
30	0 „ 15 „
8	2 „ 10 „
30	1 „ 11 „

At 107 feet a drive has been carried north for a distance of 80 feet, and so far has encountered very low grade stone. It has yet to be driven 40 feet before reaching the boundary of the adjoining claim.

Great Tarcombe Claim.

This is situated upon the same reef and immediately north of the last mentioned claim. A shaft has been sunk to a depth of 160 feet. At 50 feet a level has been driven 40 feet south to boundary of the Prospector's Claim and 48 feet north. At 100 feet levels have been driven to the boundary upon the south and 90 feet north. The reef has been stoped for a height of 18 feet above the 50 feet level south, and 10 tons of this ore, together with 50 tons raised from the shaft, and 40 tons raised from the No. 2 shaft, yielded on being crushed at Mount Allen 6 dwt. of gold per ton. From the stopes situated between the 50 and 100 feet levels 50 tons of ore have been raised, which yielded on being crushed at Mount Allen 6 dwt. of gold per ton. No. 2 shaft is about 200 yards north of the main shaft, and apparently upon another line of reef. It has been sunk to a depth of 100 feet, and 40 tons of ore have been raised from stopes in the back of the 80 feet level.

No. 3, North Tarcombe.

This claim is situated to the north-east of the Great Tarcombe. A shaft has been sunk to a depth of 80 feet, and a crosscut driven from the bottom 80 feet in an easterly direction, with a view of cutting the Tarcombe Reef. Whether this reef runs through the claim or not could be definitely settled by means of a deep east and west costeaning trench. There is no more chance of its being struck at a depth of 80 feet than in the slate rock a few feet below the surface.

The Slanter.

This is situated about 30 chains south of the Prospector's claim. It is being worked by Messrs. Polonaise and Parry. A shaft has been sunk to a depth of 160 feet upon a well-defined reef, which has an average width of 9 inches. At 80 feet a level has been driven 60 feet north and 60 feet south. Gold has been found in some of the stone, but none of it has been considered rich enough to warrant a parcel being sent to the battery.

South Slanter.

This adjoins the claim last mentioned. Two shafts have been sunk upon the vein, which are 80 and 110 feet deep respectively. No crushings have been obtained, and the reef would seem to contain but little gold.

Finn's Line of Reef.

The ore deposits worked upon this line differ altogether from those occurring in the Tarcombe and adjoining claims. They consist of bunches and anastomosing veins of highly ferruginous quartz. The auriferous lodestuff, on the whole, trends N. 20° E. with the cleavage planes of the slate, but has no defined walls. A mass of quartz 2 or 3 feet wide, when followed a few feet either in a vertical or horizontal direction, will suddenly split up into a number of leaders; further on again these leaders may reunite, or they may cut out altogether. Very coarse gold is present in some of the stone. Should any stone be obtained from a depth—beneath the oxidised zone—it will probably be heavily charged with pyrites. Some patches of very rich ore have been obtained; but a consideration of the general character of the deposit, and the results of the exploratory work already carried out as detailed upon the accompanying plan, has made me of opinion that the payable ore-bodies are not of great extent.

Her Dream—(Finn and Party).

A shaft has been sunk upon the lode to a depth of 107 feet. At 55 feet a level has been driven 50 feet south and 38 feet north. At 107 feet two parallel levels 80 and 125 feet long respectively have been driven. A winze has been sunk between the upper and lower levels along the boundary of Mullen's Claim. I did not examine this winze. In the back of the 55 feet level the lode splits into two branches, and in the bottom of the shaft these branches are separated from one another by 12 feet of barren rock.

The following crushings have been obtained :—

No. of tons.	Where crushed.	Yield per ton. oz. dwt. gr.
6.....	Clyde Works	6 0 0
25.....	Clyde Works	3 10 0
35.....	Mort's Dock	4 10 0
12.....	Cobar	2 10 0

At the time of my inspection about 200 tons were being crushed, which, having regard to amalgam obtained, would yield 2 oz. per ton.

Mullen's Claim.

This adjoins that of Finn and Party upon the north, and exploits the same lode. Two shafts have been sunk which are 105 and 150 feet deep respectively. The lode is to be seen in the southern shaft to a depth of 60 feet. Here it appears to pass to the east; and at a depth of 80 feet a crosscut has been driven 60 feet in an easterly direction with a view of cutting it, but did not encounter any lode. The deeper shaft has cut a network of quartz leaders at a depth of 150 feet, some of which carry gold.

The following returns have been obtained from stone raised from the stopes which abut against Finn's Claim, and are above the 60 feet level :—

No. of tons.	Where crushed.	Yield per ton. oz. dwt. gr.
30.....	Clyde Works	2 0 0
35.....	Gilgunnia	0 17 0

Riley's Claim

Is situated about 350 yards from the last-mentioned claim in a north-easterly direction. The lode is from a few inches to 3 feet wide. The average width of the ore stoped is about 2 feet. A shaft has been sunk to a depth of 100 feet. From the bottom of the shaft a crosscut has been driven 20 feet in an easterly direction. Neither in the bottom of the shaft nor in the crosscut has any ore been found, and all the circumstances seem to indicate that the deposit is of a most uncertain character, and does not extend continuously to any great depth.

The Four-mile.

Upon this field a very large amount of work has been done with the most disappointing results. Altogether I went down about a dozen shafts upon various claims which have been sunk to depths of 100 feet. It would serve no useful purpose were I to describe in detail the work which has been done. The various reefs are identical in character, and the remarks which I am going to make are applicable to all of them. They vary in thickness from a few inches to 2 feet; have for the most part a very slight underlay, and follow the cleavage planes of the slate, swelling out in some places and pinching in others. Reefs of this character are very common in the Silurian rocks of the Colony. The gold which they contain almost invariably occurs in irregularly distributed patches and not defined shoots.

Parcels of stone have been crushed at the Gilgunnia battery with the following results :—

Name of claim.	No. of tons crushed.	Yield per ton. oz. dwt. gr.
No. 1 East	25	0 2 12
Cripples' Reward	12	under 1 0
Collin's Claim.....	20	0 9 0
Silver Ray	20	0 7 0
Keep it Dark	37	under 1 0

It seems extraordinary, having regard to the little gold contained in the stone as evidenced by the above returns, that the claims should have been so vigorously prospected. It is only recently, however, that a battery has been erected upon the field, and that the claim-owners have had an opportunity of testing their stone in bulk.

An idea appears to be generally prevalent upon the field to the effect that as a greater depth from the surface was reached the stone would increase in richness. Neither theoretical considerations, nor evidence derived from other gold-fields in the Colony where similar reefs occur, support this theory. There is nothing to indicate that the patches of golden stone are more often arranged vertically underneath one another, and one is as much likely to cut them in a drive as in a shaft. Again, a deep longitudinal trench carried along the outcrop of the reef is, for prospecting purposes, equally as valuable as a level driven at a depth of several hundred feet below the surface, and it is ten or more times less costly.

A 15-stamp battery has been erected near the Gilgunnia township. The field cannot produce enough payable stone to keep this battery working, and it will probably be idle before long.

I have, &c.,

JOHN B. JAQUET,

Geological Surveyor.

The Government Geologist.

APPENDIX 22.

Report on Gold Discovery 14 miles S.E. of Yass.

Geological Survey Branch, Department of Mines and Agriculture,

New South Wales, 23 October, 1896.

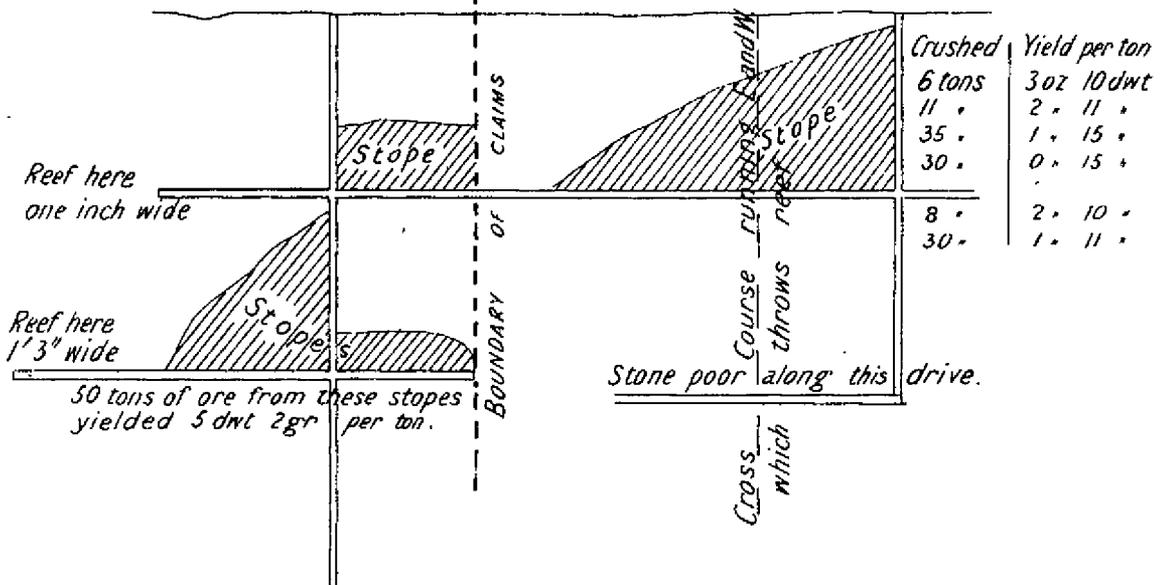

Sir,

I have the honor to inform you that, in accordance with your instructions, I have made a geological examination of the cupriferous gold deposits recently discovered upon Portion 180, Parish of Jeir, County Murray, about 14 miles S.E. of Yass, near the head of Gooda Creek. The

GILGUNNIA GOLD FIELD

Finn's Claim "Her Dream." *Mullen's Claim.*

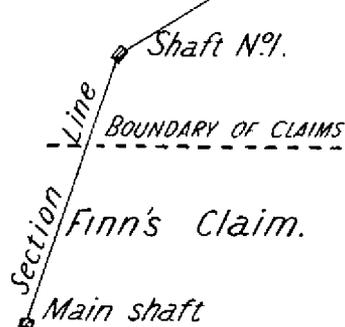

Plan of 107 Ft. Level.
Finn's Claim

Ground Plan

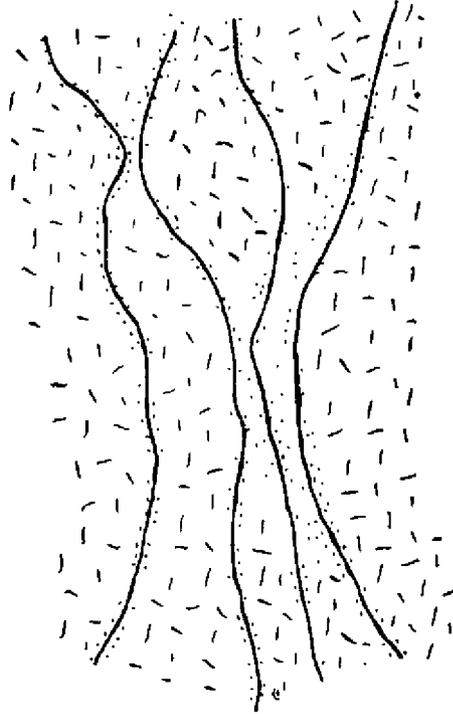

Mullen's Claim.

Scale 0 40 80 feet

The accompanying diagram explains the character of the ore deposits. The gold occurs in thin veins, from one-eighth to one-half inch thick, composed of quartz, iron oxide (limonite), and copper carbonates (malachite and azurite). For a distance of from 1 to 2 inches on either side of the veins the country rock is impregnated with gold, and in places where they approach one another bodies of ore up to two feet wide are to be seen. At a depth of 18 feet the oxidised ores give place to iron and copper pyrites. The deposit as a whole trends N.W. and S.E.

Diagram illustrating the occurrence of gold on portion 180:—

Quartz Felsite. (Country rock).

Thin veins ($\frac{1}{8}$ to $\frac{1}{2}$ inch) of auriferous limonite with copper carbonates passing below into iron and copper pyrites.

For a distance of from 1 to 2 inches on either side of the veins the country rock is more or less impregnated with gold. The dots represent this impregnation.

Messrs. Rook and Party, the prospectors of the field, have sunk an underlay shaft to a depth of 18 feet upon "the lode," and put down several excavations for a distance of about 4 chains along its course. In the shaft a cross-course (wall) exhibiting slicken sides, and coated with a clay dig, is to be seen. The ore seems to accompany this plane of faulting, and I would advise the prospectors to endeavour to trace it through their property, since it might be found an indicator of great value in guiding them from one ore body to another.

To the east of the northern extension of the lode a block of land has been taken up by a Syndicate, who have started a vertical shaft with a view of cutting the lode upon its underlay. Having regard to the general character of the ore deposit, I am of opinion that the chances are greatly against its being met with in this shaft.

From the discoveries already made, and referred to above, small parcels of very rich ore will probably be obtained, but the ore bodies are too small and irregular to permit of any large output being made. As a depth is reached some very hard rock will be encountered, and it is probable that the ore will yield less gold beneath the zone of oxidation. Gold in small quantities has been found in many places around the field, and it is possible that other discoveries of payable ore may shortly be made.

I have, &c.,

JOHN B. JAQUET,
Geological Surveyor.

The Government Geologist.

APPENDIX 23.

Report on Mount Blundell, Uriarra, Queanbeyan District.

Geological Survey Branch, Department of Mines and Agriculture,

Sydney, 31 October, 1896.

Sir,

I have the honor to inform you that, in accordance with your instructions, I have made a geological examination of the mineral deposits upon Mount Blundell, about 2½ miles N.E. of Mount Coree, and 30 miles from Queanbeyan in a westerly direction.

The deposits were discovered by Mr. J. Blundell, junior, as the result of a systematic prospecting of the district undertaken by him. Having found small and not payable quantities of alluvial gold in the creeks, he devoted considerable time to tracing the precious metal to its source, and was rewarded by finding it *in situ* upon the mountain since called Mount Blundell.

Upon the western slope of the mountain, about 250 feet below its summit, a wide lode has been discovered and traced for a distance of 60 chains. The exact width of the outcrop at any one place is very difficult to determine, since one is unable to distinguish between masses of the lode *in situ* and those which have

have fallen from their original position. The northern end of the outcrop is composed of a more or less spongy gossan, mainly composed of limonite, but also containing variable quantities of quartz, oxidised lead ores, and in places a little gold. As one travels southward the general character of the outcrop changes. The gossan and lead minerals disappear, and give place to a compact white quartz, with which is associated a little auriferous pyrites. I saw several samples of this quartz crushed, and all of them yielded small quantities of gold. About

About 40 yards west of the main lode another outcrop has been discovered (Wombat Lode) and exposed in a shallow trench. It consists of quartz, with a small quantity of galena and blende, and yields, I have been informed, a little gold.

About 25 chains south of the camp, at a point 60 feet below the outcrop, which consists here of quartz, a tunnel has been driven into the hill for a distance of 140 feet. At the period of my inspection this tunnel had just entered the footwall of the lode, some samples from the same which I saw crushed yielded a little gold. A short distance north of the camp a tunnel has been started at a point about 110 feet below an outcrop of spongy gossan. A large amount of trenching has been carried out in various places upon the outcrop.

I took away with me several samples for assay, but on account of the removal of the Laboratory to Clyde I have reason to believe that a considerable period must elapse before I get the returns. The following results have from time to time been obtained from samples of the lode which have been tested in the Laboratory of this Department:—

1. Neither gold nor silver.
2. Silver, 9 oz. 2 dwt. per ton. Gold, a trace.
3. Silver, 2 oz. 16 dwt. per ton. Gold, 4 dwt. per ton.
4. Neither gold nor silver.
5. Silver, 1 oz. 10 dwt. per ton. Gold, a trace.
6. Silver, 118 oz. 15 dwt. per ton. Gold, 10 dwt. per ton.
7. Silver, 1 oz. 8 dwt. per ton. Gold, 8 dwt. per ton.
8. Gold, a trace (under 2 dwt. per ton).
9. do do do
10. Gold, 8 dwt. per ton. Silver, 9 dwt. per ton.
11. Silver, 4 oz. 18 dwt. per ton. No gold.

The lode in my opinion represents a wide belt of country rock which has been replaced by ore. In many places the cleavage planes of the slate containing rock have not been altogether obliterated, and can be seen in the gossan.

Three great problems presents themselves in connection with the lode, and prospecting operations should be directed towards their solution. They are as follows:—

1. Does a considerable portion of the gossan contain sufficient gold to permit of its being profitably extracted by the cyanide process, and, if so, are there any minerals present which would be detrimental to this method of treatment?
2. Does the ore beneath the gossan contain enough lead, silver, gold, and copper to permit of its being profitably smelted?
3. Does the large body of quartz upon the southern end of the lode contain enough gold to permit of its being treated in an ordinary battery?

Under favourable circumstances a bulk yield of from 3 to 5 dwt. of gold per ton should enable the gossan to be cyanided at a profit. The ironstone has, however, a considerable quantity of oxidised lead ores associated with it, and is possible that this circumstance might militate against its treatment by this method. I have not been able to obtain any definite information upon this point. Mr. C. W. Merrill, in his paper concerning the present limitations of the cyanide process, states* "that trustworthy information is still lacking in regard to the behaviour towards cyanide solutions of ores containing galena, zinc blende, or oxidised lead compounds."

The amount of gold in the gossan, I need hardly add, can be determined by systematically sampling the outcrop and assaying the samples obtained.

Underneath the gossan large quantities of iron-pyrites will undoubtedly be found together with some galena. The ore below may contain a little copper; but, in so far as no carbonates of this metal can be seen in the oxidised ore, I think the chances are against such being the case. On the other hand, it should be pointed out that at Captain's Flat and elsewhere copper has been found in payable quantities beneath oxidised ores which are entirely free from the metal. The gold is not likely to increase in quantity as a greater depth is reached, and if the upper and oxidised ore does not contain it in payable quantities it will certainly not pay to work the pyrites below for this metal alone, though, even if present in small quantities, it would considerably enhance the value of the ore for smelting purposes.

I would recommend that the tunnel which has been started a little north of the camp be continued until it has passed through the lode, and that samples of the ore be sent to this Department with a view of determining whether they could be treated at a profit.

I would also recommend that a sample of, say, 10 tons of quartz, be obtained either from the southern tunnel or the outcrop above this tunnel, and that the same be treated in an ordinary battery.

The ore which I saw exposed in the outcrop of the "Wombat Lode," north of the camp, is of no value, since it contains too much zinc-blende and too little galena to permit of its being concentrated and smelted, while at the same time these minerals would prove an obstacle in obtaining the little gold which the ore may contain by means of a battery.

The prospectors have, in my opinion, acted wisely in devoting considerable attention to trenching upon the outcrop and testing by means of the mortar and dish the various ores they encountered.

Upon the west of Mount Blundell there is a large area of mountainous country, for the most part composed of palaeozoic slates, which is likely to contain mineral deposits, and which, as far as I could learn, has hitherto received but little attention from prospectors.

I have, &c.,

JOHN B. JAQUET,
Geological Surveyor.
Assay

A.

Assay of Three Samples from Mount Blundell, Queenbeyan, for G. F. Litchfield.

1. Coarsely crushed average sample, yielding :—

Silver	oz. dwt. gr.	17 0 19 per ton.
Gold		0 8 16 „
Metallic lead		2·21 per cent.

2. Same as No. 1, yielding :—

Silver.....	oz. dwt. gr.	0 13 0 per ton.
Gold		A trace (under 2 dwt.) per ton.
Metallic lead		2·63 per cent.

3. Same as No. 1, yielding :—

Silver.....	oz. dwt. gr.	1 17 13 per ton.
Gold		A trace (under 2 dwt.) per ton.
Metallic lead		13·39 per cent.

1. Near Camp, Gossan, yielding :—

Neither gold nor silver. Lead present, less than 50 per cent.

2. Bluff, No. 2 Tunnel, Gossan, yielding :—

Gold	dwt. gr.	4 8 per ton.
Silver		2 4 „

No lead present.

3. Silver ore.—No. 1 Ridge, south of Camp, Gossan—pyritous, yielding :—

Silver.....	oz. dwt. gr.	2 17 16 per ton.
Gold		0 3 6 „

4. No. 1 Tunnel, south of Camp—quartz and ironstone, yielding :—

Gold	dwt. gr.	2 4 per ton.
Silver		A trace (under 2 dwt.) per ton.

APPENDIX 24.

Report on Sunnyside Argentiferous Copper Lode, Wollomombi River.

Geological Survey Branch, Department of Mines and Agriculture,

24 December, 1896.

Sir,

I have the honor to inform you that, in accordance with your instructions, I have visited the recently discovered argentiferous copper lode, situated upon the bank of the Wollomombi River, about 12 miles below the falls, and about an equal distance in a direct easterly direction from Hillgrove.

Copper, I have been informed, was first discovered in this locality by a prospecting party sent out by the Government. The party, however, failed to trace the "shode stones" to their source, and nothing further was done in the matter until the Messrs. Keys, of Hillgrove, commenced a systematic search and were rewarded by finding the lode.

The dominant formations are slates and quartzites of Silurian age, which are intruded by dykes and bosses of quartz-felsite. The copper lode would seem to be situated in the sedimentary rock close to a line of contact with the intrusive.

Unfortunately heavy rains had fallen a short time prior to my visit, and a large mass of rock had slipped from position and carried away the short tunnel wherein the copper lode had been exposed. Under the circumstances I am unable to give any information concerning the character of the lode, the position of which was indicated by the copper charged waters issuing from the rock in its vicinity, and must confine my remarks to a description of a few tons of ore which had been stacked upon the surface.

This ore was of a very valuable description. It consisted of copper pyrites with a small and variable admixture of malachite and azurite.

The following returns, which were obtained by Mr. J. C. H. Mingaye, Analyst and Assayer to the Mines Department, upon testing five samples which I selected at random from the heap, speak for themselves as to the great richness of the ore :—

1. Copper	39·38 per cent.
Silver.....	10 oz. 4 dwt. 16 gr. per ton.
Gold	A trace (under 2 dwt. per ton).
2. Copper	39·93 per cent.
Silver	12 oz. 12 dwt. 14 gr. per ton.
3. Copper	47·51 per cent.
Silver.....	10 oz. 5 dwt. 18 gr. per ton.
4. Copper	43·94 per cent.
Silver.....	13 oz. 13 dwt. 6 gr. per ton.
5. Copper	43·22 per cent.
Silver.....	12 oz. 16 dwt. 22 gr. per ton.

One of the worst features in connection with the profitable working of the lode is the fact of its being situated at the bottom of a deep gorge about 1,500 feet below the New England Tableland. However, this is not altogether an unmixed evil, in so far as the lode could be exploited by means of tunnels driven into the hillside, and the cost of mining reduced in consequence to a minimum.

This discovery would seem to be an important one, and should direct the attention of prospectors to the large area of unexplored mineral country situated between Hillgrove and the coast.

I have, &c.,

JOHN B. JAQUET.

The Government Geologist.

Progress Report of the Curator and Mineralogist.

Sir,

Mining and Geological Museum, 13 January, 1897.

I have the honor to present the following report of work done during the past year. In accordance with your instructions, a detailed statement of the assays made will not be prepared, but the more important results will be noted herein. The numbers attached to analyses are in all cases the registration numbers for the year 1896, and the localities are those given by the senders of the samples. The whole of the analyses and assays were made in the chemical laboratory, under the direction of the Assayer and Analyst, Mr. J. C. H. Mingaye.

Owing to the very large number of samples received, the time of two of the assistants (Messrs. M. Morrison and J. E. Dobson) and myself have been principally devoted to their examination and the clerical work in connection therewith. This and other correspondence has necessitated the writing of 4,154 letters. Although primarily engaged in the preparation of collections of minerals and registration of specimens, the senior assistant, Mr. L. F. Harper, has frequently been required to assist in the sample work.

The total number of samples exhibited has been far in excess of any previous year. Of these it was necessary to send 6,013 to the chemical laboratory for analysis; this number being 1,000 in excess of last year, and nearly 15 per cent. higher than in the previous record year—1888. The number would have been greater still had it not been for the repeated removal of the office, and the consequent difficulty in finding it. Owing to the accumulation of work in the laboratory, a most regrettable delay occurred in dealing with the samples assayed. The work has now, however, been overtaken, and frequently not more than five or six days elapse between the receipt of a sample and the despatch of the assay return in the ordinary course. The removal of the chemical laboratory to Clyde has rendered it necessary to send the samples there by rail. The method adopted is to enclose each sample, after examination, in a sealed package. Every evening a box (also under seal) is sent to Clyde by passenger train.

This duty of examining minerals submitted by the public having to take precedence over everything else, there is but little progress to report in the Mining and Geological Museum and with other work. As the Museum will shortly attain its majority, having been opened in March, 1876, it had been hoped to mark the occasion by the preparation of a small popular guide-book; but this has now had to be postponed. The Museum space was increased during the year by the removal of the heavy material in the stores to the Naval Depôt at Circular Quay. The increased accommodation—some 600 square feet—has enabled the Assistant Palaeontologist, Mr. W. S. Dun, to continue his arrangement of New South Wales fossils, and rendered possible a more satisfactory display of rocks. The ravages of the silverfish grub upon labels made the question of the re-registration of the rock specimens collected by the field—officers and others one of great urgency. This work is now well in hand, the method considered most suitable to the conditions being to register each specimen consecutively as it is received by means of a painted number. The registers are fully indexed and the specimens kept in covered wooden trays for ready reference. When time permits a selection will be made for exhibition in the Museum, where a geographical classification will be adopted. In this way the igneous rocks characterising a well-defined district such as the New England Tableland or the area occupied by the Hawkesbury Formation will be placed together. This is supplemented by the display of a collection of type rocks from foreign localities. The re-labelling of the mineral and fossil collection, which is so very necessary, has had to be entirely suspended. The collections are being increasingly used by students whose special needs will be met by the reservation of carefully selected specimens that can be freely handled. To this class of visitors the opening of the building on Saturday afternoons, which is now being tried, should prove a boon. It is satisfactory to note that there is an increasing tendency to apply at the Museum for information about minerals. The interest aroused by the definite establishment of the occurrence of a glacial epoch in the Southern Hemisphere in Permo-Carboniferous times suggested the arrangement of a small series of erratic and scratched pebbles from Australian localities, with a few from the Swiss and North American moraines for comparison. This has now been done.

Through the instrumentality of the Agent-General some useful exhibits were presented by a number of English firms. By the aid of these it has been possible to show the raw material used in the manufacture of Portland and other cements, and many other substances in the crude condition or in the early stages of utilization. These exhibits will be found in detail in the list of donations to the Museum appended hereto. To the numerous donors of these our thanks are due; their assistance being of the greatest value. Specimens have also been procured from America to complete our series illustrating the occurrence of petroleum oil and other hydro-carbons there. Early in the year a number of samples of ochres from various localities in New South Wales, sent from the Museum, were valued by Sir W. Rose & Co., London. The prices quoted for the best of these showed them to be of excellent quality. Duplicates of the whole series are now on view. When once the work of bringing the labelling up to date and the preparation of a handbook is completed it should be possible to materially extend the educational usefulness of the Museum, if only by the giving of demonstrations in simple methods of distinguishing the commoner minerals. That even a modicum of such knowledge is lacking to many prospectors is very evident. Very noticeable during the year has been the case of a prospector who is persistently prospecting a granite area, notwithstanding that his "gold" always proves to be bronze-coloured mica. Other instances were those in which a boss of rotten granite was prospected—apparently because it differed from the surrounding country and was consequently novel—and a bed of carboniferous clay-shale that was for some time believed to be silver-ore.

Six collections of minerals have been prepared for local schools of arts and public schools. An exhibit was sent to the Ballarat Exhibition early in the year, and two show cases of minerals and ores to the Albury Industrial Exhibition in September.

The examination of the New South Wales meteorites in the Museum collection by Prof. A. Brezina, of Vienna, shows that we are in possession of some unusual types. This matter is referred to fully in the Geological Survey Records, Vol. v, Part ii.

Some very interesting mineral determinations were made during the year. Phosphatic substances, so largely required in the manufacture of superphosphate for agricultural purposes, have been discovered, both in an earthy form and as rock phosphate. The rock phosphate—apatite—is said to occur as a small vein in granite at Gordonbrook. Crystals can be readily detached from the mass. An analysis will be found in the Appendix.

An

An earthy phosphate of alumina and potash was found by Mr. Wiburd, guide at Jenolan, in beds of clay in a new cave there. The exact chemical nature and manurial value of this substance are now being worked out by Mr. Mingaye. American and Algerian phosphates are obtainable at so low a price that it is doubtful whether these discoveries will ever be of much economic importance.

Two more localities for telluride of bismuth have been noticed. Tetradyomite was detected in some specimens collected from Slippery Creek, near Tarana, by Mr. E. C. Whittell, field-assistant, and a telluride, probably tetradyomite, in a gold-bearing quartz from Kentucky. In both instances the mineral was associated with free gold, but tellurides of the latter have not yet been noticed. A partial analysis of the Tarana mineral will be found in the Report of the Assayer and Analyst.

In addition may be noted the following:—

Cupro-scheelite, collected by Mr. Whittell, from Yeoval. This mineral has hitherto been recorded only from Peelwood, near Yass.

Martite, the octahedral red oxide of iron in a soft yellowish matrix, from near Byng.

Rutile and Cyanite, from Tumberumba.

Tin pyrites (stannine), associated with zinc blende, in quartz, from near Torrington, New England.*

The existence of zircons at the Hanging Rock, in the Nundle district, had long been known. During the year, consequent on reports that diamonds had been found, numerous parcels of stones from there were examined. No diamond was found in any of these, they consisting almost entirely of zircons.

About 200 thin sections of rocks have been registered during the year. Of the examinations made by myself the following may be referred to:—

Basalt, from a depth of nearly 2,000 feet, from the Woolabra bore.

Basaltic rocks, associated with the diatomaceous earth at Barraba, and a chrome-bearing felsite from Crow Mountain, collected by yourself. The presence of chromite in the felsite was found to be due to the absorption of chrome-bearing serpentine by the intruding acid magma.

Felsites (nodular) and tufts from Eden, and rocks from Port Macquarie and the northern coast, collected by Mr. Geological Surveyor Carne.

A series of rocks from the Evening Star Mine, Coramba, to obtain evidence as to the nature of the country rock, this having a bearing on the method of working to be pursued.

Gold-bearing rocks from Wolumla; these were found to be in part crushed granite.

Hypersthene-diorite, from Kiandra; interesting from the alteration of hypersthene into hornblende as in the case of the norite from Wyalong.

A number of rocks from the East Maitland Council for report as to their suitability for macadamising.

The following remarks may be offered on some of the more interesting results obtained from the examination of the ore samples:—

Gold and Silver.—Numerous samples have been received from Hazlegrove, near Oberon. It would appear from these that the silver is contained principally in the pyritous stone, two such samples yielding 60 oz. of silver to the ton (166,2574). Several gossans yielded over 1 oz. of gold, while one sample of pyrites (312) gave 3 oz. One sample of ferruginous material (2,572), stated to come from a depth of 50 feet, contained 50 oz. of silver and 2½ oz. of gold.

Some extremely rich stone was received from Wolumla, the peculiarity being that little or nothing was visible to the unaided eye. A sample of ferruginous material (2,758) contained 27½ oz. of gold and 315 of silver; a ferruginous quartz (2,782), 211 oz. of silver and 74½ of gold; one of quartz (2,903), 267 oz. of silver and 24 of gold; while an iron-stained quartz from Momson's claim (4,474) gave 11½ oz. of gold. A brief microscopic study of the country rock showed it to be a crushed granite in part. A number of tests were made from deep levels at Wyalong; the results, being of interest, are tabulated below. A number of such yields were obtained from ferruginous or pyritous stone from various parts of the Wyalong district.

1078. Pyritous quartz	from the Welcome Stranger Mine, 150 feet level,	4½ oz. of gold.
1079. "	" Victory Mine,	154 " 16½ "
1080. Ferruginous quartz	" Mallee Bull Line,	100 " 22½ "
1082. Pyritous quartz	" Pine Ridge Line,	100 " 4½ "
1823. Pyrites	" Boltes Mine	200 " 34½ "
1824. "	" "	230 " 16½ "
1825. "	" White Reef	210 " 20½ "
1826. "	" Pine Ridge Line	100 " 2½ "

The Yass District supplied a number of good samples, most of these coming from Gooda Creek. A ferruginous pyromorphite (4,695) from near Yass contained 130 oz. of gold.

An assay was made of the concentrated pyrites from the Bell's Creek Mine, Braidwood (4,557), the concentrates were found to contain 7 oz. of gold to the ton (of concentrates). From the northern district were received a large number of rich silver ores. These consisted principally of arsenical pyrites, and were derived from the area included within a triangle formed by joining Glen Innes, Armidale, and Inverell. In some of these pyrrargyrite—antimonial sulphide of silver—could be readily detected. More than twenty of these ores gave silver varying from 50 to 700 oz. per ton; gold being either absent or present in traces only. An arsenical pyrites from a depth of 180 feet at Deep Creek, Nambucca, gave 15 oz. of gold (5,477). A specimen of galena and quartz from Jenolan (5,692) contained 65 oz. of silver and 43 per cent. of lead. Several samples of quartz from Waratta gave good results; 388, gold 20½ oz.; 389, gold 3 oz.; and 3485 (milky quartz), gold 64 oz.

Manganese and Limestone.

The possibility of the establishment of iron and steelworks in the Colony has given an impetus to the search for these substances. Numerous specimens of wad or pyrolusite have been received, but these have generally been evidently picked samples, and often came from distant or inaccessible localities. Some of the limestones were of very poor quality, being merely calcareous tufts, or even stalagmitic incrustations. Some assays and analyses are appended. The

* On assay (4,617) a sample of this ore yielded 4.81 per cent. of copper, 2.75 per cent. of tin, and 4½ oz. of silver to the ton.

Copper.

The improved outlook for copper has led to much activity in prospecting for ores of that metal. Owing to the common occurrence of copper ores in metalliferous lodes, and the frequent practice of collecting picked specimens, it is difficult to form an idea of the value of the finds made. From Molong district argentiferous fahlerz has been received, one assay (3,000) resulting in a return of 6.54 per cent. of copper and 14 oz. of silver. A massive copper glance from Burra Burra, Cobar (3,853) contained 48 per cent. of copper and 3 dwt. of gold. A ferruginous carbonate ore, 7 miles north-west of Deepwater (5,066), gave 10½ per cent. copper and 53 oz. silver. From Bingera (5,520-1) a massive copper pyrites gave 49 per cent. of copper, and a carbonate ore from Barraba (5,701) contained 34 per cent. of metal.

Nickel and Cobalt.

An ironstone, from 8 miles south of Adelong, was found to contain about 4 per cent. of nickel. The ore consisted of magnetite and hematite, and Mr. Mingaye showed the nickel to be associated with the latter. Manganese wads from Port Macquarie yielded from 3 to 4 per cent. of metallic cobalt, and one from the Maclean district contained 4½ per cent. of that metal.

Monazite.

The increasing use of the oxides of the rare earths for illuminating purposes has occasioned many inquiries after Monazite. A sand from the Tooloom River, near Rivertree (602), contained a good proportion of Monazite, but the percentage of Thorium oxide—the most valuable constituent—was only 0.45. Monazite sand has also been received from the Delegate River, but it probably came from the Victorian side of the border where deposits are already known.

Ochres, &c.

An amber from Barber's Creek (1,247) contained 43.93 per cent. of ferric oxide in the washed material. Some splendid yellow ochre from Dubbo has been presented to the Museum by Mr. Hibble, manager of the Longnose Point Paint Works, at which works it is being regularly used. The pricing in London of some New South Wales ochres, &c., has been already referred to.

Plumbago is still being searched for at Wilson's Downfall. Of the samples examined during the year the best contained only 43 per cent. of carbon. This, however, closely approximates to the lower grades of Bohemian graphite, which fall to 50 per cent. But little interest appears to have been taken in chromite, wolfram, and tin. The search for marketable chrome iron ore along the belt of serpentine stretching from Bingara to Tamworth is still unsuccessful. Requests from Germany for a periodical supply of wolfram were reported; but the ore was required of almost theoretical purity, and the quantity required was but small.

The Junior Assistant, Mr. J. E. Dobson, has spared no pains to qualify himself for the technical portion of the work. His studies at the Technical College were rewarded by an Honours pass in the second year's course in geology.

At the moment of writing it is my sad duty to report the death of our late Museum Caretaker, Mr. W. Wass. During his short two years of service, Mr. Wass gained the respect and liking of all his colleagues.

Several short contributions have been made to the Geological Survey Records.

Further details will be found in the form of appendices.

I have, &c.,

GEORGE W. CARD,

Curator and Mineralogist.

APPENDIX A.

DONATIONS to the Mining and Geological Museum.

Donor.	Donation
Adams, T., sen.	Iron ore, rhyolite.
Adams, G. F.	Apatite.
Anselm, Odling, and Sons	Collection of foreign marbles.
Ashworth, J. W.	A quantity of ilmenite.
Australian Museum	Cast of the Nocoliche Meteorite.
Barton, Faithful J.	Complete set of pigments, foreign marbles, ores, &c.
Bailey, W.	Auriferous pyrites.
Baker, R., Son, & Co.	Mica.
Beasley, W. S.	Auriferous conglomerate.
Bell, W. R.	Crocoisite, zaratite, and other minerals.
Bensusan, A. J.	Tin ore, native mercury, rhyolite, and other specimens.
Blackwell, Sons, & Co.	Bauxite.
Blakemore, ———	Copper ore, copper ore showing native bismuth, and other specimens.
Blakemore, G. H.	Prehnite.
Boswell, A.	Copper ores, &c.
Bowman, Thompson, & Co.	Crude rock salt and brine, and bye-products from salt manufacture.
Brice, W. S.	Zircon sand, auriferous wash-dirt, and alluvial gold.
Brandram Bros. & Co.	Sulphur (crude and prepared).
British Aluminium Coy.	Aluminium articles.
Brow, Westhead, Moor, & Co.	Materials used in the manufacture of Staffordshire Clinkware.
Burke & Co.	Marbles.
Campbell, J.	Rock specimens.
Cameron, J. Swan, & Co.	Witherite.
Cleaver, R.	Auriferous arsenical pyrites in quartz.
Clayton, L. F.	Auriferous stone.
Cock, Captain	Epidote.
Collins, H. F.	Iodide of mercury and other specimens.
Colchester, Wemyss, & Co.	Building stone.
Crosier, Stephens, & Co.	Aluminium articles.
Croncban and Tigroacy Mineral Co (Ireland).	Ochres, iron ore, and copper—sulphur ore.

Donor.	Donation.
Dobson, Rev. J. S.....	Sulphate of copper, lode tin, rock specimens, gold nugget.
East Darren Mining Co.	Galena (argentiferous and non-argentiferous).
Easdown, W. R.	Gold-bearing quartz.
Ellern, Jones, & Co.	Emery.
Elliott Metal Co.	Stourbridge fire-clay and brick, copper (metal, alloys, &c.).
Ennis, J.	Quartz showing gold and tetradymite.
Francis & Co.	Cements and plasters (raw material and manufactured article).
Gibson, R. M.	Gold-bearing quartz.
Glasgow Ironfounders Blacking Co.	Graphite.
Gordon, J.	Diamond in ferruginous cement.
Graham Bros.	Limonite possessing cone-in-cone structure.
Hales (Warden).....	Auriferous stone.
Hassall & Dowel, Messrs.....	Galena with jamesonite.
Hazelton, W. H. (Warden's Clerk)...	Alluvial gold.
Hanoverian Kieselguhr Co.	Diatomaceous earth.
Hedworth Barium Co.	Barium compounds.
Heather, W. D.	Quartz showing gold.
Higgins, T. E.	Argentiferous massive iron pyrites.
Hibble, W. G.	Collection of crude and manufactured pigments and kalsomines.
Kerr-McKell (Warden)	Argentiferous lead and copper ores.
Larnach, ———	Gold-bearing granite.
Lloyd-Price, R. J.	Rhivlas earth.
Lock, Lancaster, & W. W., and R. Johnson & Sons.	Aluminium.
Loveridge and Hudson.....	Granite and trachyte (syenite).
Long Meg Manufacturing Plaster Company, Cumberland, England	Ochres.
Maitland (Warden)	Auriferous stone.
Mareh, C.	Tourmaline rock.
Martin (Warden)	Copper ore, quartz crystal, rock crystal, &c.
Mackenzie, Dr.	Cobaltiferous stream tin.
McGlew, C. S.	Massive arsenical pyrites, fluor spur.
McDonald, ———	Ore and rock specimens.
Mining Registrar, Glen Innes	Rock crystal.
Mills, J., & Sons	Aluminium articles.
Mills, W.	"
Monteith, W.	Crystal of rutile.
Montgomery, A.	Tin ore containing rare cerium minerals.
Mt. Gabriel Barytes and Umber Co.	Barytes.
Munro, D. W.	Sludger cores.
Newman, H. W. (M.P.)	Octahedral crystals of martite.
Oldbury Aluminium Co.	Bauxite.
Orme, J. & McDonnell, S.	Concretionary nodules and volcanic glass.
Pascoe, Grenfell, & Co.	Copper ores and matte.
Pickford & Winkfield, Messrs.	Phosphates.
Powor, F. D.	Allanite, garnet, and other minerals; also photographs "surveyor's shield," &c.
Ramsay, S. F.	Kyanite and Andalusite.
Rae, W.	Auriferous pyrites.
Rienits, H. G.	Diorite and graphitic granite.
Salt Union (Limited).....	Salt (products, &c.).
Scheerer, J. M.	Quartz showing gold.
Shaw and party, Messrs.	Iron-stained quartz showing gold.
Smith, G.	Stolzite and native silver, cerussite, calamine, pyromorphite, and other minerals.
Stuart, T.	Specimens from Major's Creek.
Sissons Bros. & Co.	Ochres.
Tonkin, J. E.	Sulphur.
Tout, J.	Auriferous pyritous quartz.
United Asbestos Co.	Asbestos (crude and manufactured).
Warden, Wyalong	Auriferous stone.
Warden, Wagga	Auriferous ores.
Warden's Clerk (Grenfell)	Quartz, &c.
Wescott, J.	Ferruginous oxide of manganese.
Winslett, Purcell, and party	Quartz showing gold freely.
Wilson, H.	Native copper.
Williams, W.	Rock and ore specimens.
Williams, Foster, & Co.	Copper ores and matte.
Wilson, Pease, & Co.	Cleveland iron ore, &c.
Wright, C. C., & Co.	Graphite (crude and prepared).

APPENDIX B.

INSTITUTIONS and Individuals to whom Collections of Minerals have been sent during the year:—

- | | |
|--|---|
| * Alexandria (Sydney), Grills, ———. | Marrickville, Smith, L. |
| Bega, School of Arts. | * New Caledonia, Reichenbach, S. |
| * Berry, McLennan, Rev. D. | Newtown, Cluim, S. |
| * Broken Hill, Smith, G. | Newcastle-on-Tyne, School of Mines. |
| Eugowra, School of Arts. | Oberon, Public School. |
| * Germany, Vogelsang, Dr. | Parramatta, The King's School. |
| Globe Point, Wood, Harrie. | * Rochester, N.Y., Prof. H. Ward. |
| * Georgetown (British Guiana), Institute of Mines and Forests. | Sydney, Superior Public School, Cleveland-street. |

A water from Eulonga Run (3012), in the Hay district, proved to be strongly saline, and quite unfit for use. It had the following composition:—

Total solid matter (dried at 220° F.)	979.104 grains per gallon (13.987 grains per 1,000 parts).
Chlorine in combination	560.700 do do (8.010 do do do).
Sulphuric acid in combination	81.755 do do (1.168 do do do).

The solid matter consists mainly of soda and magnesia, with lesser amounts of potash and lime combined with chlorine and sulphuric and carbonic acids. A small amount of silica, alumina, and oxide of iron are also present.

95—A light coloured shale from the Orange District, which it was proposed to use in the manufacture of cement:—

Moisture at 100° C.	0.50
Combined water	3.34
Silica (SiO ₂)	68.79
Alumina (Al ₂ O ₃)	17.31
Ferric Oxide (Fe ₂ O ₃)	4.77
Lime (CaO)	absent.
Magnesia (MgO)	1.18
Potash (K ₂ O)	4.26
Soda (Na ₂ O)	absent.
Sulphuric anhydride	0.11
Phosphoric anhydride	minute trace.
Organic matter	trace.
	<hr/>
	100.26

7—Siliceous nodule, found half-a-mile from Puddledock, county Sandon:—

Moisture and combined water	9.90
Silica	84.82
Ferric oxide and alumina	4.40
Lime84
Magnesia54
	<hr/>
	100.50

468—Ferruginous calcite, somewhat resembling ankerite in appearance, from Onkey Creek, between Bingara and Warialda:—

Carbonate of lime	71.69
Carbonate of magnesia	1.32
Carbonate of strontia	strong trace.
Carbonate of manganese	1.12
Carbonate of iron	9.83
Alumina	3.30
Gangue	12.66
	<hr/>
	99.92

1065—Felsite, from a rich shoot in Faulkner's Mine, Pambula:—

Moisture and combined water	1.80
Silica (SiO ₂)	83.18
Alumina (Al ₂ O ₃)	6.77
Iron di-sulphide (FeS ₂)	5.70
Lime (CaO)	absent.
Magnesia (MgO)	0.26
Potash (K ₂ O)	1.86
Soda (Na ₂ O)	absent.
	<hr/>
	99.57

Gold, 7 oz.; silver, nearly 2 oz. to the ton.

9501—A compact, translucent, pearl-grey mineral from Adjinbilly, near Gundagai. This mineral occurs in large masses, and closely resembles a massive form of Grossularite (lime-alumina garnet).

Moisture at 100° C.	0.10
Combined water (H ₂ O)	5.22
Silica (SiO ₂)	32.75
Alumina (Al ₂ O ₃)	22.40
Ferric oxide (Fe ₂ O ₃)	0.85
Manganose oxide (MnO)	absent.
Lime (CaO)	38.25
Magnesia (MgO)	0.90
Potash and Soda (K ₂ O, Na ₂ O)	traces.
Phosphoric anhydride (P ₂ O ₅)	traces.
Specific Gravity 3.315

Sir, Geological Branch, Department of Mines and Agriculture, Sydney, 16 January, 1897.

I have the honor to submit the following Progress Report on the Caves for the year 1896:—

The following improvements have been authorised:—

Opening up of the new cave, Jenolan.

Building of a caretaker's cottage at Bungonia.

Preparation of a Bathing-place at the Thermal Spring, Yarrangobilly Caves.

Erection of ironwork to protect "The Altar" at the Wellington Caves.

Sundry improvements at the Wombeyan and Abercrombie Caves of a minor character.

Sketches of the surface features and improvements at the various caves are in course of preparation with a view to publication.

Jenolan Caves.

A road through the Grand Arch has been completed. The road improvements include a handsome stone bridge over the creek. Visitors are now able to drive right up to the Caves House.

In order to provide for the better accommodation of visitors, men are now employed excavating for the foundations of a new Caves House, for which designs have been prepared by the Government Architect.

The

The electric lighting of the Lucas and Imperial Caves has been improved under the able supervision of Mr. Fitzmaurice, of the Electric Telegraph Department.

Mr. Jeremiah Wilson was temporarily appointed as Explorer at the Jenolan Caves on the 1st August, 1896.

Number of visitors to the Abererombie Caves during the year 1896.....	962

I have, &c.,

The Government Geologist.

O. TRICKETT.

Report on the Wombeyan Caves, by T. W. E. David, Geological Surveyor.

Department of Mines, Sydney, 22 June, 1885.

THE Wombeyan Caves are situated in the parishes of Bouverie and Guineacor, county Westmoreland, 5 miles east of the water-parting of the Cordillera, and about 33 miles, in a direct line north north-east from Goulburn, on the Wombeyan and Mare's Forest Creeks, tributaries of the Wollondilly River. The caves may be reached by two routes, either from Goulburn, on the south south-west, or from Mittagong, on the east south-east. The former route is the one generally preferred by tourists. A coach drive of 30 miles along a good road brings the tourist to the town of Taralga. From Taralga there are three ways to the caves, two being buggy roads, and the third a bridle-path.

The best buggy road is that which passes through Richlands, making the distance from Taralga to the caves 19 miles. The second buggy road, which is rough and hilly, must shorten the distance by about 4 miles, while the bridle-path reduces it to about 12 miles.

The Wombeyan Caves were inspected by the late Mr. Lamont H. G. Young, F.G.S., in 1879; and I have little to add to the report then furnished by him to the Department, beyond a brief description of some parts of the caves, which he was unable to explore owing to their being flooded with water, or the discovery of which has been subsequent to the time of his visit.

At a distance of about 8 miles west of the caves the two buggy tracks converge on the summit of the Main Coast Range, at an elevation of about 3,200 feet above sea-level.

From this point the track descends easterly, passing over a coarse, much water-worn pebble gravel more than 20 feet thick in places. I am informed that colours of gold can be got all through this gravel, which has been derived chiefly from the waste of an adjoining bed of coarse pebble conglomerate, of paleozoic age. At a distance of about 2 miles from the caves, the track reaches the top of the steep hill called the "Queen's Gap." This was formerly the nearest point to which visitors could drive, the remainder of the distance to the caves having to be performed on foot or horseback. At the time of my visit, however, a buggy road had just been finished by the Government down this hill, which enables tourists to drive to within half a mile of the caves. In places, where the road has been terraced out of the rock, a rather rare variety of syenite granite may be observed, of a pink colour mottled with green. This stone, which is fairly durable, might be used for ornamental purposes; but it would be difficult to obtain large blocks free from cracks.

A sharp turn in the road brings into view a deep, rocky gorge on the left opening into a wide undulating valley, the low hills covered with red soil, and rich grass marking the commencement of the limestone country.

At the point where the syenitic granite and limestone join, the latter has been altered into a coarsely crystalline white marble. This formation continues, with the exception of a small intrusive patch of syenitic granite, to within one quarter of a mile of the Basin Cave. The entrance to this cave is situated on a steep slope above the bed of the Mare's Forest Creek. It is about 6 feet high by 12 feet wide; the cave slopes steeply downwards for about 20 feet into a chamber about 20 feet high, from the roof of which hang long ropy stalactites, nearly touching slender pillars of dripstone, rising to meet them from the floor. A second descent leads on to a small cupola in the marble, the roof ornamented as before by clusters of stalactites, and the floor with small rounded bosses of stalagmite. A further descent, past a mass of pendent calcite resembling a frozen waterfall, brings the visitor into a large chamber, the floor of which is traversed by ridges of stalagmite about 6 inches in height, ranged in wavy lines, like crumpled ribbons. From the remarkable evenness of their surfaces it is evident that they have once formed the margins of tiny ponds, now dry. Here the cave bifurcates. Following the left branch through a fissure 4 feet wide for about 40 yards, the visitor, after a slight ascent, enters a dome-shaped chamber about 40 feet wide, and as many high.

Following a gallery in the rock for about 100 yards past a stalactite known as the "Kangaroo's Tail," one of the most interesting objects in the caves is reached.

This is a large pocket of stalagmite, which has grown by chemical action on the steeply sloping side of the passage, so as to form a perfectly water-tight tank, 5 feet deep by 3½ feet square. The wall of stalagmite, which constitutes three sides of this tank, is firmly cemented to the rock, has a perfectly level rim, and varies in thickness from a thin crust one ¼-inch in diameter at the rim to a strong wall of 6 inches or more through, at its base. Passing on, and still ascending, the principal feature of the cave comes into view, a staircase, in which the place of steps is taken by a number of stalagmitic pockets, similar to the one just described, moulded out of the sloping rock. These vary in size from the smallest, about the size of a watch-pocket, to the largest, measuring 10 feet long by 4 feet wide, and 5 feet deep. Climbing to the top of the "Basins," a second small series of stalagmite tanks is seen, plastered against the rock like swallows' nests. The height at which the water last stood in these cisterns is marked by a sparkling white film of calcite, studded with small tufts and rosettes of crystals of the same mineral. The

The origin of the "Basins" was probably the following:—The sloping rock on which they stand once formed the bed of an underground stream, which had dissolved and worn a passage for itself through the marble, and descended at this point through a series of small cascades into its channel below. At the bottom of each cascade a small basin would be scooped out, by the mechanical action of the falling water, and a ridge of stalagmite would form at the outer rim, where the water being shallow and exposed to air currents, would be most ready to part with its lime. These ridges, once formed, would grow faster at their summits than at their sides, because the rim, over which the water trickled, would still be the point of greatest evaporation, and consequently of greatest precipitation of stalagmite; and in this way they would be gradually built up into the delicate walls now constituting the "Basins."

Returning from the "Basins" to the chamber with the wavy ridges crossing its floor, where the cave was described as bifurcating, the visitor on taking the right hand branch finds it leads into the "Ball-room," a large vaulted hollow in the rock with a tolerably even floor.

From the "Ball-room" a narrow gallery leads to the "Bullock's Caul," a small chamber about 12 ft. x 10 ft. x 10 ft., containing a variety of beautiful snow-white stalactites of every shape and size, from the straw-like shaft to the broad thin transparent curtain. There is a freshness and lustre about these stalactites which is rather wanting in other parts of the cave.

Leaving the new cave the tourist is conducted, by a somewhat rough track over the limestone hills, to the old cave, one half mile distant. A short distance above the entrance to this cave, the Wombeyan Creek opens into a small, well grassed alluvial flat. Just below this the valley is hemmed in by steep limestone walls, and ends abruptly at the mouth of the old cave. The entrance to this cave is through a wide tunnel in the hill communicating with a large "pot-hole" at its further end. The whole has the appearance of a massive marble arch spanning the creek, sloping with the hill slope from left to right, and supported by a strong pillar towards its lower end.

Its measurements are about 90 yards long by 40 yards wide, and the roof in places must be from 50 to 60 feet high.

The floor is strewn with large masses of marble, which had evidently fallen from the roof, and is covered in places with pebbles of metamorphic and igneous rocks, and fantastic pedestals of dripstone.

The best view of this part of the cave is to be obtained by ascending by means of a ladder, placed against the right side of the cavern, to a rocky platform about 25 feet above the floor.

The sunlight streaming through the arches brings out fine contrasts of colour, from the pale pink and white of the recesses of the roof, to the dark green and brown of the dripstone on the floor. Close to the edge of this platform stands a white canopy of stalagmite supported on dripstone pillars; and a little further back in a small branch cave on the same level, some curiously curved stalactites may be studied. Some groups show evident traces of having been naturally broken and re-cemented while still hanging to the roof, for the older stalactites are not parallel with the newer, and the course of the crack where the original break occurred can be plainly traced.

Descending the ladder to the floor of the main cave, a dark chasm is seen extending to the right, forming one of the underground courses of the creek. In winter time, when the creek is running strongly, entrance by this passage is impracticable, owing to the depth of the water. At the time of my visit, however, the creek was dry; and the only water in this subterranean channel was to be found lying in nearly circular basins hollowed by the creek out of the white marble.

This marble channel appeared to me to be one of the finest sights in the caves, with the clear water lying in the smooth white rock basins at one's feet, and the high terraced walls above winding in exquisite curves.

Near the lower end of this channel the tourist has to cross some water-holes on saplings laid across them.

In accordance with the recommendations made in Mr. Young's report, the lowest of these water-holes, which used to bar further progress, has now been drained sufficiently to allow visitors to pass by without getting wet.

The marble channel opens at its lower end into a large vaulted chamber, in which, as the guide informed me, the water stands 10 feet deep in flood time. The outlet for this water is through a tunnel about 80 yards long, from 5 to 10 feet wide, and 30 to 40 feet high at the far end of this chamber. The water is carried out by this means, at the side of the hill, into the head of a rocky gully. Excepting in flood time this part of the cave is practically dry, and the waters of Cave Creek find their way into the Wombeyan Creek, as the guide told me, by a deeper underground channel, commencing in the floor of the main cave, and having its point of discharge in the banks of the Wombeyan Creek, half a mile distant, just below the Basin Cave.

Returning from the outlet up the channel, and climbing a ladder, a second series of galleries and chambers is disclosed leading to the "Sounding-board." This is a fine transparent curtain stalactite, 9 feet long, 1 foot wide, and one-sixth of an inch thick, the top and one of the sides being attached firmly to the rock. The free side is deeply notched, and the whole fabric, where it hangs vertically, is barred with horizontal lines, resembling the woof of a coarsely woven material; but where it overhangs the lines have a downward curve. When tapped, it gives out musical notes. Some very beautiful stalactites are to be seen in an adjoining passage, and also some pretty little pedestals of dripstone, like branching coral 2 or 3 inches high, standing in shallow basins. Judging from their rough, spongy appearance, they have been formed, I think, partly in water. A detailed description of all the complicated ramifications of the Old Cave would be too tedious; the exploration of them alone occupying more than a whole day.

Two groups of stalactites, however, deserve special notice—the "Organ" and the "Trophy." The "Organ" is a huge compound stalactite which has become united with the dripstone on a ledge overlooking a large vaulted chamber. The column measures 10 feet by 5 feet, and is from 15 to 20 feet high. Fringes of stalactites encircle it at a short distance above the ledge, their points not quite reaching the floor. When struck, these ring like a chime of hand-bells.

There are many other musical stalactites in these caves, some so delicately hung that they were set ringing by the bats flying against them.

The "Trophy" was characterised by Mr. Young as "a group of the largest stalactites he had ever seen," and may be described as a beautiful cluster of ropy and curtain stalactites, about 15 feet high.

On the whole, there is far more to be seen at the Old Cave than at the new.

Mr.

Mr. Young mentions in his report that "the formations in these caves are as a rule of a snowy whiteness, and generally opaque, as compared with those of the Fish River Caves." I noticed that, as Mr. Young remarked, many parts of the caves, while preserving their beauties of shape, have lost much of their freshness through exposure to the atmosphere.

From their shapes and positions it is evident that these caves, like nearly all similar hollows in limestone rocks, are deserted subterranean watercourses. The chain of evidence connecting the past with the present is in this case perfect. In the present underground channel of the Cave Creek a water cave with all its elaborate system of passages and chambers is no doubt now being excavated. The old marble channel, which acts as a bywash for the flood-waters of the creek, is just the link that was needed to connect the old with the new; and standing here, the observer is led on by insensible gradations to speculate with tolerable certainty as to the origin of the flats and stories of passages and chambers, now high and dry, at various levels above the present creek. There can be little doubt that they are what might be termed fossil underground channels, just as many of our deep leads are fossil river beds.

Of all minerals forming large rock masses in the earth's crust, limestone, next to gypsum and rocksalt, is most soluble in the ordinary water which drains from a land surface. Rain-water, charged with carbonic acid absorbed from the atmosphere, as it passes over limestone beds dissolves for itself underground passages, chiefly along lines of natural joints in the rock. As these become widened the creek abandons its subaerial bed for one of the largest of these fissures; and the erosion of its underground channel is now assisted by the mechanical action of pebbles and sand swept down by the increased current.

In the course of ages, as the general deepening of the valley proceeds below the lower outlet of the underground stream, so the latter is constantly deepening its channel to adapt itself to the increased fall, leaving its old bed high and dry to form caves.

Such caves have from prehistoric, and probably early geological, time been used as sheltering places and habitations by various animals.

Hitherto few fossil bones have been discovered in these Wombeyan Caves, so there is little clue as to their age, excepting that to be obtained by a comparison of the level of the highest suite of passages and chambers with that of the general line of drainage of the present valley. If the thickness and height of some of the masses of dripstone are to be taken as a test of age, the commencement of the excavation of these caves must date far back into the past.

At the celebrated Ingleborough Cave in Yorkshire, England, careful measurements of a boss of stalagmite, called the "Jockey Cap," show that it is increasing at the rate of about 1 foot in forty years; and this amount of growth is exceptionally rapid. From this may be inferred the great age of such ponderous masses of dripstone as the "Organ" and the "Trophy."

The belt of limestone in which the caves occur is estimated by Mr. Young to be $2\frac{1}{2}$ miles long by 1 mile wide. The rock is composed of a coarsely crystalline white marble veined with yellow. The coarsely crystalline varieties are less suitable for lime-burning or building purposes than the more compact. Almost every kind, however, from the coarsely crystalline white marble to the blue limestone, can, I am informed, be obtained in the district. Mr. Young noticed fossils in one place only, namely, just below the New Cave. These fossils show that the limestone bed is an old coral reef of palæozoic age. Buried beneath massive accumulations of clay, sand, and quartz pebble conglomerates, and subjected for vast periods of time to intense heat and pressure, nearly all traces of the original organic structure of the corals and shells have been obliterated, and the old atoll has been converted into a bed of more or less crystalline limestone. The whole of these sedimentary strata with the underlying limestone bed have subsequently been slowly raised above the sea-level by those oscillations of the earth's crust which, as geology shows, have prevailed throughout all the past of which we have any record, and are even now in progress. Exposed to the denuding influences of air and water, the overlying rocks have been worn down until at last, at a point far inland, the fossil coral reef, now changed into limestone, is again laid bare.

Then commences the process of cave-making already described. The lime dissolved out by the acidulated water in the course of the formation of caves is partly deposited in the beautiful and fantastic forms of stalactites and dripstones, but chiefly carried away in solution down the Wombeyan Creek, into the Wollondilly River, on to the Nepean and Hawkesbury, and so out to sea at Broken Bay. Arrived in the waters of the Pacific, it is partly absorbed by fish, crustacea, shell-fish, and tiny organisms on our own coasts and partly carried southwards by the east Australian current, and later northwards into waters warm enough to support the life of the coral polyp, as at Lord Howe Island. Here it is taken up by the polyp and converted into beautiful coralline structures. Thus history repeats itself, and the coral polyps of to-day construct their stony skeletons out of the material which formed the bones of their Silurian ancestors.

The Wombeyan Caves are, therefore, interesting in many ways, as much from a scientific point of view as from the natural beauty of their scenery.

I have, &c.,

T. W. E. DAVID.

Sir,

Department of Mines and Agriculture, Sydney, 2 March, 1896.

I have the honor to report that, during my recent visit to the Wombeyan Caves, in connection with improvement works, I inspected a new discovery made by the keeper, Mr. M. Chalker. The cave, which is comparatively small, but very interesting, is situated about 1 mile south of the Accommodation House, on the right bank of Marc's Forest or Wombeyan Creek, 20 chains north-west of the Basin Cave, and about 40 chains west of the Fig-tree Cave.

The entrance, which is triangular in shape, being 7 feet wide at the base and 5 feet high, is about 100 feet above the level of the creek, on the face of hill topped with a rugged limestone bluff. After traversing a narrow sloping passage a distance of 30 feet, a conical-shaped chamber, about 30 feet wide by 25 feet high, is entered. The walls are bare of calcareous depositions, and the floor is strewn with large boulders. On the left-hand side of this chamber is another passage or outlet, leading to the surface, about 5 feet wide, the downward winding course of which is followed about 50 feet. Groups of pure white stalactites and columns of various sizes are met with at intervals, and the walls for the most part have a thick stalagmitic coating, which in places projects and assumes irregular buttress-like forms. On emerging from the passage into daylight one finds himself on a flat ledge of rock or natural balcony—a space scooped out of the southern face of the precipitous limestone—overlooking and about 40 feet directly above the
bed

bed of the creek. Immediately to the right of this, and separated by a massive column, which apparently supports the overhanging roof, is an immense cavity running at least 50 feet back into the limestone face, and down to the level of the creek, the waters of which, flowing in, form a small subterranean branch channel.

The walls of this opening or archway are richly ornamented with a dripstone coating of various colours and shades, some protruding portions of which, of a yellowish-green tint and foliage-like in appearance, bear a striking resemblance to "The Willows" in the Nettle Cave at Jenolan.

Doubtless, when it is found convenient to further explore this cavity, other passages will be met with which may probably lead to larger chambers in the heart of the limestone.

Although an inspection of this cave alone might not warrant a special journey from the Accommodation House, yet visitors to the Basin Cave in its immediate vicinity would be well repaid for the little extra trouble entailed in traversing its rather intricate passages to gain the ledge of rock referred to, overlooking the creek and archway, which also commands a good view of extensive picturesque scenery beyond.

Owing to the arch-like shape of the two cavities on the southern face of the limestone, it was suggested that the cave be named "The Arches."

I have, &c.,

W. S. LEIGH,

Superintendent of Caves.

Sir,

Department of Mines, Geological Branch, 20 July, 1896.

I have the honor to report, as requested, on the new caves discovered by Mr. R. J. Wilson, near Stuart Town. The caves are situated on portion 93 of 40 acres, parish of Cooper, county of Wellington, the property now being in the possession of Mr. M. Brady, and occur in an outcrop of limestone about 2 miles square in extent, one of a series in a belt running between Molong and Wellington, about 6 miles distant by road from Stuart Town. The limestone is of the same nature as the Wellington but not so flat, more bluffs and peaks being noticeable, which has a more promising aspect as regards the discovery of good caves.

Access to the main cave is effected through a vertical fissure about 5 feet long by 18 inches wide, the floor of the cave being reached after a descent of 15 feet. This cavity is about 40 feet square, the floor being strewn with large boulders and detached stalactites. Very pretty drapery-like stalactic formations are met with at intervals on the walls, under which the floor has a fine crystallised coating. Descending circuitously to the left from the main chamber, one or two small grottoes, profusely decorated with miniature stalactites and coral-like growths are passed through. About 40 feet below the surface it is found necessary to crawl through a very small opening, when a lofty but narrow fissure is entered. The floor of this cavity, which is known as the Bone Cave, is coated with a muddy composition and bears evidence of being frequently under water. Branching from this cavity is another fissure in the limestone averaging 3 feet wide, filled with a reddish clay, which is literally packed with the fossilised bones of both herbivorous and carnivorous marsupials, specimens of which have been submitted for examination. The cave has not been made accessible beyond this point, but other cavities have been noticed and will probably soon be entered as Mr. Brady has two men engaged in opening up same.

Both from a spectacular and scientific point of view I consider the caves quite equal to those at Wellington; but to make them easy of access to the public it will be necessary to expend, say, about £50 in improvement works.

I have, &c.,

W. S. LEIGH.

The Government Geologist.

Annual Report of the Assistant Palæontologist and Librarian for the Year 1896.

Sir, Geological Survey Branch, Department of Mines and Agriculture, 6 January, 1897.

I have the honor to submit to you the following summary of the Palæontological work and work connected with the Library performed by myself during the past year:—

Records and Memoirs.—Volume V, Part 1, of the *Records* has been published and distributed, and Part 2 will shortly be issued. No *Memoirs* have been published during the year.

Miscellaneous Determinations.—These determinations have been made principally for members of the staff. The more important are:—

1. Carboniferous Fossils from near "The Fort," County Courallic, collected by yourself, including *Zaphrentis*; *Spirifera*; *Orthis australis*, M'Coy; *Orthocheles crenistria*, Phill; *Enomphalus*; *Pleurotomaria*.
2. Siluro-Devonian Fossils from the Wellington Caves, collected by the Keeper, Mr. T. Sibbald:—*Stromatoporoidea*; *Favosites*; *Dania*, *Heliolites*; *Halysites catenularius*, Linn.; *Tryplasma wellingtonensis*, Eth. fil.; *Syringopora*; portion of the calyx of a crinoid; Trilobite (indeterminable); *Spirifera*; *Spirifera cf. sulcata*, Hisinger; *Cyrtina*; *Rhynchonella*; *Chonetes*; *Leptæna rhomboidalis*, Wilckens; *Atrypa reticularis*, Linn.; *Orthis cf. turgida*, M'Coy; *Hyolithes*; *Murchisonia*, two species; *Orthoceras*.
3. Carboniferous Fossils from the Rawden Vale, County of Northumberland, collected by Mr. Forester Rudder, comprising:—*Spirifera convoluta*, Phillips; *Productus cf. hemisphaericus*, Spy.; *Reticularia lineata*, Martin; *Orthis australis*, M'Coy; *Rhipidomella*; *Athyris*; *Chonetes*; *Fenestella*; *Platyceras* (?); *Aviculopecten*, two species; *Sanguinolites*.
4. Carboniferous and Lower Mesozoic Fossils collected by Mr. Geological Surveyor Carne, from the Port Macquarie District.—*See antea*, pp. 103—104.
5. Upper Silurian Corals, from Yass, presented by J. K. Hume, Esq., and interesting as showing the large size attained by *Cyathophyllum Mitchellii*, Eth. fil., and *Photidophyllum Lonsdalei*, Eth. fil.

6. A collection of Lower Silurian, Permo-Carboniferous, and Mesozoic Fossils from Tasmania, presented by Mr. Montgomery, M.A., late Government Geologist:—(a) Lower Silurian, from the Tasmania Mine, Beaconsfield—*Orthis*, sp. This is a small costate form of the type of *Orthis testudinaria*, Dalman, which is especially characteristic of the Llandeilo of Europe and the Hudson and Trenton Groups of North America. The structure is very poorly preserved, but this form appears to fall into Hall and Clarke's sub-genus *Dalmanella*, which, though it extends into the Upper Silurian, is more characteristic of the Lower. Worm-burrows, indeterminate. (b) Permo-Carboniferous:—Tasmanite Shale from near Latrobe. From Henty River—*Glossopteris ampla*, Dana; *Glossopteris browniana*, Brong. From Middle Arm Creek, Beaconsfield—*Stenopora ovata*, Lonsdale; *Stenopora tasmaniensis*, Lonsdale; *Protoretepora* (2 species); *Spirifera Strzeleckii*, De Koninck; *Martiniopsis subradiata*, G. Sby; *Aviculopecten*. From north face of Western Tiers, near Westbury—*Stenopora tasmaniensis*, Lonsdale; *Strophalosia*; *Martiniopsis subradiata*, G. Sby.; *Spirifera*, *Platyschisma oculum*, J. de C. Sby.; *Aviculopecten* (? *limiformis*, Morris). From North Cliff, Maria Island—*Stenopora ovata*, Lonsdale; *Strophalosia Clarkei*, Eth. fil.; *Spirifera tasmaniensis*, Morris; *Productus*. (c) Lower Mesozoic, from Mount Nicholas Coal-mine—*Alethopterus australis*, Morris; *Alethopterus serratifolia*, Johnston; *Zugophyllites elongatus*, Morris; *Baiera*, sp. (This form is abundant; I do not think that this is the form referred to by Feistmantel (*Uhlenosne Utvary v Tasmani*, t. 10, ff. 4 and 5) to *Trichopitys Johnstoni*, Feistmantel, and considered by him as synonymous with *B. tenuifolia*, Johnston); *Sagenopteris tasmanica*, Feistmantel; *Sagenopteris* sp.: a large form, different to *S. rhoifolia*, Presl.
7. Silurian Fossils from Stuart Town. In July, 1896, it was reported to the Department that limestone caves had been discovered at Stuart Town, on Portion 93, Parish of Cooper, County of Wellington. While on a visit of inspection, Mr. W. S. Leigh collected bones of *Thylacinus spelaeus*, Owen, *Dasyurus*, and *Macropus* and specimens of *Favosites gothlandica*, Lam., and *Dania*. Shortly after Mr. C. Cullen, Collector to the Survey, got together a larger number of forms from the limestone beds, among which are some interesting forms. The general facies of the collection points to the limestone being of Upper Silurian age, it includes *Favosites gothlandica*, Lam; *Favosites*, 2 species indet; *Tryplasma*—this is a more elongate form than *Tr. wellingtonensis*, Eth. fil. of the Wellington Caves limestone; *Pachypora*, a species similar to an undescribed form occurring commonly at Tarago; *Tryplasma Lonsdalei*, Eth. fil., a form very common in the Yass District, but this is the first specimen we have had from the Western District. *Amplexus*, *Heliolites*, *Cyathophyllum*, a new species of an astriform *Cyathophyllum* after the style of *Mitchelli*, Eth. fil. of the Yass and Murrumbidgee limestone, but differing from it in the much greater size of the corallities and the relative proportions of the tabulate area. *Cyathophyllum*, a large simple form with a strongly marked tabulate area. *Orthoceras*, two species, one of which is similar to an undescribed form very common in the Murrumbidgee limestones. *Cyrtoceras*, *Murchisonia*, *Strophomena*, *Spirifera multiplicatus*, De Koninck.
8. From the Woolahra Bore—*Teniopteris Daintreei*, M'Coy and a conifer.
9. From Waratta Bore, at a depth of 1,050 feet, a young specimen of *Pseudovicula* of Lower Cretaceous age.
10. Some indistinct fossils of Upper Silurian age, collected by Mr. J. B. Jaquet, at Wattle Flat, consisting of *Spirifera*, *Rhynchonella*, *Heliolites*, and crinoid stems.
11. Fossils from the Wellington Caves, limestone collected by Mr. W. S. Leigh:—Stromatoporoid, *Heliolites cf. porosa*, Goldfuss, *Favosites*, *Orthis*, *Rhynchonella*, *Atrypa reticularis*, *Cyrtia* (?), *Loxonema*, *Worthenia*, *Cyclonema*, *Macrochilina* (?), *Bellerophon*, *Orthoceras*.
12. A small collection of Permo-Carboniferous fossils from Gerringong, collected by Mr. J. E. Dobson, were named for him. It comprised *Stenopora crinita*, Lonsdale; *Stenopora tasmaniensis*, Lonsdale; *Fenestella*; *Protoretepora*; *Martiniopsis subradiata*, G. Sby.; *Spirifera Strzeleckii*, De Koninck; *Spirifera 12 costata*, M'Coy; *Dielasma hastata*, and vars; *Nuculana*; *Astartila polita*, Dana; small *Pachydomus*; *Pleurophorus*; *Aviculopecten*; *Ptycomphulina morrisiana*, M'Coy.
13. From the Genoa River, Parishes of Genoa and Nangatta, County of Auckland, Mr. J. E. Carne, collected plant remains comprising a *Pecopterid* fern and a *Sphenopteris* of Devonian age. These will be described in detail shortly.
14. From parish of Lawson, county of Wellesley, Mr. J. E. Carne has collected undoubted Lower Silurian graptolites. They occur in a black slate, and are mostly preserved as shiny films. The following forms are represented:—*Didymograptus (Cladograptus) furcatus*, Hall; *Dicranograptus cf. ramosus*, Hall, sp.; *Didymograptus*; *Diplograptus, cf. mucronatus*, Hall; *Diplograptus*, sp.; *Phyllograptus*; *Didymograptus extensus*, Hall.
15. Several small collections were named for the Curator of the Technological Museum.

Collections.—Small collections of fossils were prepared for the following:—The King's School, Parramatta; St. Stanislaus' College, Bathurst; Mr. Benjamin Dunstan; the Minister for Mines and Agriculture; Rev. D. M'Lennan, Berry.

Collector.—Mr. C. Cullen made collections of Permo-Carboniferous fossils from the Macleay River and Gerringong, and brought together a large series of Upper Silurian forms containing many new forms from various localities in the Yass and Murrumbidgee Districts.

Museum.—The cases at the disposal of the fossil collection are now all filled, and it has been found necessary to still keep stored a large proportion of the Post-Tertiary bones, and impossible to display any of the fossils from the Marine Tertiaries of Victoria, South Australia, Tasmania, and New Zealand, of which we have a fairly large series. During the year the Department has received from Mr. C. Holeroff, of Dudley, England, a very generous donation of a large series of Upper Silurian fossils from the Dudley district. These fossils are very well preserved, and will prove most valuable for purposes of comparison. A series of Pliocene Invertebrata from Wanganui was also received as an exchange from the Wanganui Museum, N.Z. The Jurassic Fish from the Talbragar River have been returned by Mr. A. Smith Woodward, who described them in a recent memoir of the survey (No. 6). The types and co-types are now on view.

Library.

During the past year 1,446 publications have been registered and placed in the Departmental Library, consisting of societies transactions, reports of state departments, and separate works and pamphlets. This total is made up of 1,207 volumes, parts of volumes, and pamphlets, and that have been presented or sent in exchange for the departmental publications, and 226 that have been purchased.

The Library is now in correspondence with 186 Institutions and State Departments, from which exchanges are regularly received, and there are also numerous personal exchanges.

The principal additions to the Exchange List are:—

Geological Commission, Capetown.
 Academie des Sciences, Cracow.
 Naturwissenschaftlicher Verein, Frankfort-a-Oder.
 Denison University, Granville, Ohio.
 Yorkshire Geological and Polytechnic Society.
 Societ  Imperiale des Naturalistes, Kasan.
 La Plata Museum.
 Society of Natural History, Portland, Maine.
 Societa Geologica Italiana.
 Illinois State Museum and Geological Survey.
 Gross. Badischen geologischen Landesanstalt.
 St. Petersburg—Section geologique, Cabinet du Maison de l'Empereur.

The following publications have been distributed to correspondents:—

- (1.) Records Geological Survey, Vol. V, Part 1.
- (2.) Index to Records, Vol. IV.
- (3.) Annual Report for 1895 to Institutions.
- (4.) Numerous miscellaneous lots.

The Library Catalogue has been kept to date.

I have, &c.,
 W. S. DUN,
 Assistant Palaeontologist and Librarian.

STH BALLINA

Report by Mr. D. W. Munro on Prospecting Work done on the Northern Beaches.

Sir,

I have the honor to forward herewith rough plan, section, and tracing explanatory of Prospecting work done on Northern beaches to end of 1896.

At McAuley's, between Esk River and Jerusalem Creek, 2,828 bores, with aggregate depth of 45,632 feet, were put down, and on and also towards Evans River, 187 bores of 2,782 feet, making a total in this locality of 3,015 bores, with a total depth of 48,414 feet 4 inches.

The five main lines at McAuley's, as will be seen by Sketch Map A, were carried from the beach due west across the Heath on to the first of the sandstone ridges, forming what is locally known as "the Mainland," being lateral spurs from the watershed between the Clarence and Richmond waters.

The centre line of bores "C" crosses McAuley's Prospecting Claim at about three-quarters of a mile from the beach. Along this line the section was taken for 5,146 feet to base line; and a check line of levels along base line half a mile south to next line D; and thence along that line to high-water mark. This line was practically the same as the one plotted.

These levels prove that the top or upper side of the auriferous wash, in centre of McAuley's Claim, is 12.28 feet above high-water mark.

The bores show the sands much disturbed and jumbled up for the first portion of the line; but the different layers of sand—white, brown, black, and reddish-brown—become more compact and regular as they recede from present coast line towards main land, and the black, indurated sand becomes very hard and gritty.

In many of the bores quantities of gas were met with, and in one place a cobra-eaten log was passed through at 12 feet from the surface. On the western side of McAuley's lead numerous pieces of sharp-edged quartzite were found at various depths, similar to the quartzite found near Byron Bay, and under Lennox Head (40 miles north of McAuley's), the only places I know of in this district where this particular quartzite is found *in situ*.

Below the wash in McAuley's Claim a bore was put down 14 feet to 3 feet below high-water mark. Coarser reddish-brown sand only was met with; and, even if longer tubes had been available, the influx of water at this depth would render sludging useless.

On the new lead found west of McAuley's, and proved to extend for a mile, some claims have been taken up and worked, but, at the time this was struck, many of the men were leaving the field attracted by the accounts from Bucca Creek. But, no doubt, this lead will eventually be worked, as it will at least pay wages, and richer patches may be found as it is opened up.

On Broadwater Heath (*see* sketch map B), 2,644 bores of an aggregate depth of 38,912 feet 6 inches have been sunk. A back lead was worked here formerly, and some rich patches obtained, and is still being worked by a few parties. The auriferous wash here, however, is not found, as at McAuley's, in or below the "black rock," but above it at comparatively shallow depths, and on the western side of the "Terrace." A lead nearly parallel with the inland track across the heath from Broadwater extends for about $4\frac{1}{2}$ miles, but is very patchy; still, as the stripping is only from 4 to 13 feet, and portions are very favourably situated for working, I think this place should provide "tucker" for a fair number of men, and no doubt it will be opened out when the cane season is over and regular work becomes scarce. The best portion of this has been marked out with flags. It is probable that another lead may exist to the eastward of this, but all efforts to bottom on the supposed line were futile owing to the great influx of water and quicksand after the heavy rains in the beginning of November.

Immediately behind Broadwater and south-west of Cook's Hill 3 to 5 feet of very good wash was found carrying fair prospects, and extending for (as far as traced) about 500 feet, but stripping would be heavy—13 to 17 feet.

The beach between Broadwater Gap and Baker's Gap has always been a favourite locality with beach-miners for "sniggers," and at the former place gold is stated to be found in small soakage streams running over the "black rock" from under the terraces. This place was well tried, a line of bores being put in on top of the terrace 20 feet deep in places, and also along the beach above high-water mark. At the Broadwater Gap 15 feet was sunk through the indurated sand at a spot where gold was seen trickling over the black rock from under the terrace, and an average of only two colours to the sludger was obtained: the bottom of this bore was 36 feet below the top of the terrace.

The number of bores put down from 4th May to 24th December totals 4,659, of an aggregate depth of 87,326 feet 10 inches.

The men have worked well, and to the great interest they have displayed must in a great measure be attributed the amount of work accomplished.

I have, &c.,

D. W. MUNRO.

The Under Secretary for Mines and Agriculture.

REPORT OF THE CHIEF MINING SURVEYOR FOR THE YEAR 1896.

Sir,

I have the honor to hand you the following report on the Mining Survey and Charting Branch for the year 1896.

On the 15th July last I was appointed to the position of Chief Mining Surveyor, in addition to that of Government Geologist previously held by me; I have, therefore, resumed the supervision of the mining survey work after an interval of over five years.

The year just ended has been characterised by greatly increased activity in mining matters, and as a consequence the work of this branch has been about doubled. The number of mining surveys made during the year 1896 was 2,225, and of these 1,313 were dealt with by surveyors who were paid partly by salary and partly by fees, while 912 were made by surveyors who were remunerated by fees alone. During the previous year (1895) the total number of surveys made was 1,163. Until the 20th October last only five salaried mining surveyors were employed, namely, Messrs. R. H. Cambage, J. Thomas, E. Thomas, J. T. Gray, and E. G. Sewell; but it then became apparent that these were not able to deal rapidly enough with the increasing work of the department, and accordingly a sixth surveyor, Mr. A. E. Hall, was appointed temporarily. It is probable that not more than five salaried surveyors will be required permanently, as the rush of work last year was exceptional. On the 31st December only 360 instructions for surveys remained unacted upon, and almost all these related to very recent applications for leases. The 2,225 surveys made during the year comprised 1,445 gold leases on Crown lands, 147 mineral leases, 218 mining tenements, 54 mining permits, and 361 leases on private land. One underground survey was also made with the object of determining to what extent the workings of the Greta Colliery encroached upon adjoining land.

On the 15th July Mr. G. A. McKay (previously of the Lands Department) was appointed to the position of Chief Draftsman. Under his immediate supervision the charting branch is showing excellent results, the record of work for 1896 being a most satisfactory one. The draftsmen have ably seconded Mr. McKay in his efforts to cope with the increased work of the branch, and they have also been aided by the improved methods which he has been able to introduce. There is no doubt whatever that the charting branch is now in a much more efficient state than it has ever been previously, and will, I think, compare favourably with any similar branch in the service. During the year 1896 no less than 2,999 gold and mineral applications of all descriptions were charted and dealt with, as against 1,234 in the previous year, and on the 31st December, 1896, there were only 304 applications undecanted in the branch.

The Chief Draftsman has adopted the heliographic process for making copies of mining plans, and this has resulted in a great saving of time as well as of expense. He is now introducing the same process for the preparation of maps for the information of the mining warden and of the public.

The accompanying report by the Chief Draftsman gives detailed information in regard to the work of the Charting Branch

I have, &c.,

EDWARD F. PITTMAN,
Chief Mining Surveyor.

The Under Secretary for Mines and Agriculture.

ANNUAL RETURN, 1896.

Mining Surveys.

THE number of mining surveys made during the year 1896 was 2,225. Of these 1,313 were made by surveyors on salary and 912 by surveyors remunerated by the fees paid by mining applicants. These numbers represent a very large increase on the returns for 1895, when only 1,163 surveys were made. Five mining surveyors on salary were employed on the work until 20th October, when a sixth surveyor was temporarily appointed to assist in the survey of leases scattered over wide areas of country. At the close of the year only 360 instructions remained to be dealt with, and almost all these related to very recent applications for leases. The 2,225 surveys made comprised 1,445 gold leases, 147 mineral leases, 218 mining tenements, 54 mining permits, and 361 leases on private land. One underground colliery survey was also made to determine the extent of encroachment of coal workings upon land adjoining the Greta Colliery.

Charting.

The total number of gold and mineral lease applications on Crown land dealt with in the Charting Branch during the year was 2,261, against 855 in the previous year; the number of 27th and 28th section applications 257, against 189 dealt with in 1895. In addition to the foregoing, 481 applications for leases on private land and 251 measurements under the Mining Board Regulations were dealt with.

At the close of the year there remained undecanted with 208 gold and mineral lease applications, 39 applications under 27th and 28th sections, and 57 applications for leases under the Mining on Private Lands Act.

Two hundred and sixty-eight applications for authorities under the Mining Act of 1889 were received and dealt with.

Descriptions of 40 reserves under Section 26, and 21 mining divisions, were prepared in the branch, gazetted, and charted.

Forty-eight maps were prepared in connection with alterations in Mining Wardens' districts.

Two thousand nine hundred and nine notations of transactions relating to leases, &c., were made on plans.

In addition to lease applications, surveyors' reports, and other unregistered documents, 5,100 papers were received and dealt with.

Plan-drawing.

Up till the end of July plans were drawn from surveyors' field notes by contract draftsmen paid by results. After reorganisation of the Department by the Public Service Board this practice ceased, and plans have since been drawn by a draftsman attached to the branch. 954 plans were produced since the alteration in practice was made. (Saving of £60).

Heliographic

Heliographic Printing.

As a more expeditious and economical means of securing copies of mining plans, the heliographic process was introduced on 18th August, 1896. Since that date 3,933 copies of plans have been printed for departmental use. The change in practice has already effected a saving of £200.

Maps for Information of Mining Wardens, &c.

During the year charted up copies of maps were forwarded as follows:—To Wardens, 301; to District Surveyors, 93; to Mining Surveyors, 47; and to other persons, 8; making a total of 449.

It will be seen from the particulars furnished that there has been an abnormal increase in almost every department of the work, but notwithstanding this the staff has by steady application succeeded in preventing the work from falling into arrear.

The Chief Mining Surveyor.

G. A. MCKAY,
Chief Draftsman, 15/1/97.

Compilations.

During the year 13 locality maps, embracing 18 parishes or parts of parishes, were completed, 11 were published and put into office use and 3 remained in hand in various stages; 63 proofs of parish and other maps, showing mining measurements, were received from the Department of Lands, 60 were revised and returned, 14 were adopted as mining maps and put into office use.

In addition to the above 4 sheets of the map of the Mining Districts of New South Wales, embracing an area of about 80,496 square miles, were completed; 3 sheets were published and 2 sheets remained on hand awaiting examination.

COMMISSION.

VICTORIA, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen,
Defender of the Faith, and so forth.

To Our Trusty and Well-beloved

CHARLES EDWARD ROBERTSON MURRAY, Esquire, one of the Judges of the District Court, appointed
in and for the Metropolitan, Suburban, and Hunter District, in Our Colony of New South Wales.

Greeting :—

KNOW YOU, That We, reposing great trust and confidence in your ability, zeal, industry, discretion, and integrity, do, by these presents, authorise and appoint you, the said CHARLES EDWARD ROBERTSON MURRAY, to make a diligent and full inquiry :—

- I. Into the cause or causes of accidents which have recently taken place in certain mines and quarries in the Albert Mining District.
- II. Whether the provisions of the Mining Act, 1874, and the Regulations relating to the inspection of mines other than coal or shale made thereunder, are sufficient to secure the safe working of the mines and quarries in the said district, especially in regard to the use of explosives and the system of timbering and of working large lodes adopted. And, if they are not sufficient, to suggest in what respect and to what extent they should be added to or amended.
- III. Into the truth of the statement that the number of accidents in such mines and quarries has largely increased, and the cause of such large increase.
- IV. Whether the open-cut system of work is specially dangerous; and, if so, whether this is due to such work being carried on at night; and whether such system should be prohibited; and, if necessary, to suggest regulations for the purpose of safeguarding the lives of the miners and other persons employed in that class of work.
- V. Whether the risk to the persons employed in the said mines and quarries is increased by reason of incompetency on the part of managers and subordinate officials.
- VI. Whether the services of additional inspectors are necessary.
- VII. As to the best means of making known, to all persons employed in and about the said mines and quarries, the statutory enactments and regulations relating to the inspection of such mines and quarries; and to make any recommendation which you may deem advisable in the premises.

And We do, by these presents, give and grant to you full power and authority, with all proper or necessary assistants, at all times, to enter into and upon any land, mine, quarry, or premises; to survey and examine the state and condition thereof; and, for the purposes aforesaid, to descend all pits and shafts, and to enter into and to use all adits, levels, galleries, drives, and excavations; and to use all roads, ways, engines, ropes, machinery, gear, appliances, materials, labour, and other things, in or on any such land, mine, or quarry, which shall be by you deemed necessary; so that in so doing no unnecessary interference is caused: and to call before you all such persons as you may judge necessary, by whom you may be better informed of the truth in the premises; and to require the production of all such books, papers, writings, plans, sections, and all other documents, as you may deem expedient; and to visit and inspect the same at the offices or places where the same or any of them may be deposited; and to inquire of the premises by all lawful ways or means: And Our further will and pleasure is that you, after due examination of the premises, do and shall, within the space of three months after the date of this Our Commission, or sooner if the same can reasonably be done, certify to Us, in the Office of Our Chief Secretary, under your hand and seal, what you shall find touching the premises: And We hereby command all Government Officers and other persons whomsoever within Our said Colony that they be assistant to you in the execution of these presents: And We do give you power at your discretion to procure such clerical and other assistance as you may deem necessary for enabling you duly to execute this Our Commission; which said Commission We declare to be a Commission for all purposes of the Act 44 Victoria No. 1, intituled "*An Act to regulate the taking of evidence by Commissioners under the Great Seal.*"

In testimony whereof, We have caused these Our Letters to be made Patent, and the Great Seal of Our said Colony of New South Wales to be hereunto affixed.

(L.S.) Witness Our Right Trusty and Well-beloved Cousin, HENRY ROBERT, VISCOUNT HAMPDEN, Our Governor and Commander-in-Chief of Our Colony of New South Wales and its Dependencies, at Government House, Sydney, in New South Wales aforesaid, this seventh day of July, in the sixty-first year of Our Reign and in the year of Our Lord one thousand eight hundred and ninety-seven.

By Deputation from His Excellency,
JOHN LACKEY,
Deputy Governor.

By His Excellency's Command,
JAMES N. BRUNKER.

Entered on record by me, in REGISTER OF PATENTS, No. 19, page 19, this seventh day of July one thousand eight hundred and ninety-seven.

For the Colonial Secretary and Registrar of Records,
CRITCHETT WALKER,
Principal Under Secretary.

ROYAL COMMISSION APPOINTED TO INQUIRE INTO THE WORKING OF
MINES AND QUARRIES IN THE ALBERT MINING DISTRICT.

REPORT.

To His Excellency the Right Honorable HENRY ROBERT, VISCOUNT
HAMPDEN, Governor and Commander-in-Chief of the Colony of New
South Wales and its Dependencies.

MAY IT PLEASE YOUR EXCELLENCY,—

Your Commissioner was directed by Your Excellency's Commission, dated the seventh day of July last, to make a diligent and full inquiry:—

1. Into the cause or causes of accidents which have recently taken place in certain Mines and Quarries in the Albert Mining District.
2. Whether the provisions of the Mining Act, 1874, and the Regulations relating to the inspection of mines other than coal or shale made thereunder, are sufficient to secure the safe working of the Mines and Quarries in the said district, especially in regard to the use of explosives and the system of timbering and of working large lodes adopted. And, if they are not sufficient, to suggest in what respect and to what extent they should be added to or amended.
3. Into the truth of the statement that the number of accidents in such Mines and Quarries has largely increased, and the cause of such large increase.
4. Whether the open-cut system of work is specially dangerous; and, if so, whether this is due to such work being carried on at night; and whether such system should be prohibited; and, if necessary, to suggest regulations for the purpose of safeguarding the lives of the miners and other persons employed in that class of work.
5. Whether the risk to the persons employed in the said Mines and Quarries is increased by reason of incompetency on the part of Managers and Subordinate Officials.
6. Whether the services of additional Inspectors are necessary.
7. As to the best means of making known to all persons employed in and about the said Mines and Quarries the statutory enactments and Regulations relating to the inspection of such Mines and Quarries; and to make any recommendation which Your Commissioner may deem advisable in the premises.

Your Commissioner having, for the purpose of prosecuting such inquiry, proceeded to Broken Hill—where the great bulk of the mining operations of the Albert Mining District is carried on—and having there examined thirty-one witnesses, the minutes of whose evidence are annexed to this Report, and having made certain personal examinations of the working of the mines and quarries at Broken Hill, and also at Tarrawingee, has now the honor to present his Report.

Seeing that the questions with which Your Commissioner had to deal affected the safety of all workmen and others employed in and about the mines in the Albert Mining District—of whom by far the greater number live at Broken Hill—Your Commissioner not only publicly requested all persons having any information to give in the matter to come forward as witnesses, but especially sought the assistance of the Amalgamated Miners' Association, to which body about half of the whole number of miners employed in the Albert District belong. The Association, through
their

their local President, Mr. Polkinghorne, expressed their willingness to be represented, thereby furthering the object of the inquiry to a most valuable extent. Your Commissioner, when communicating, through the secretary, Mr. Wright, before the taking of evidence, with the officers of the Amalgamated Miners' Association, acted under what afterwards proved to be a mistaken impression; namely, that the Association, which Your Commissioner then assumed to include a larger proportion than it actually does of the miners employed at Broken Hill, had taken an active—in fact, the principal—part in moving for this inquiry. Being under that belief, Your Commissioner spoke—as appears in the Minutes of Proceedings, page 2—of the Amalgamated Miners' Association as standing in the position of promovents, and requested Mr. Polkinghorne to begin the proceedings by calling his witnesses. It was only during the course of the third day's sitting that your Commissioner was made aware, by Mr. Polkinghorne, as a witness (Minutes of Evidence, page 47, Q. 1358), that the assumption was a mistake. Your Commissioner wishes to express his indebtedness to Mr. Polkinghorne for his valuable and courteously tendered aid in producing and eliciting evidence. The mine-owners also, appearing by Mr. Edwards, their Solicitor, gave very substantial assistance. Although Mr. Hebbard, the Inspector appointed, under the provisions of the Mining Act, 1874, for the Albert Mining District, was not deputed to appear on behalf of the Department of Mines, yet Your Commissioner invited him, and he elected, to be present at the inquiry, and to examine witnesses. In addition to Mr. Polkinghorne, whose experience of mining was confined to underground work, Your Commissioner, during the course of the inquiry, allowed Mr. Williams, an officer of the Association, who had a personal knowledge of the "open-cut" or quarrying operations, to appear on behalf of the Association. In response to Your Commissioner's invitation, publicly given, no other person or body of persons asked to be represented; though a few, whose attendance was not requested either by the Association or the mine-owners, came forward and gave their testimony. Having heard all the evidence procurable at Broken Hill, Your Commissioner deemed it neither necessary nor expedient in the public interest to search further, and returned to Sydney only in time to resume his duties as District Court Judge. The continued performance of these duties, of late rather unusually heavy, and the fact that the printing of the large body of evidence, taken with great expedition and accuracy on twelve days—all, with the exception of two, afternoon, as well as morning, sittings—by the shorthand-writer, Mr. Little, has only just been completed, have prevented Your Commissioner from presenting his report before this; at the very extreme limit of the time—three months from the 7th of July—fixed by Your Excellency's Commission.

Although Your Commissioner was careful, in accordance with his duty, to keep reasonably within the limits fixed by the terms of the Commission, he still, being anxious not to omit anything which might even indirectly bear upon the questions involved, allowed very full latitude in the selection and in the examination and cross-examination of witnesses. If, however, some of the issues that arose had been followed out to the extent to which it would be possible, before arriving at an absolutely certain conclusion—if that could ever be reached—to pursue them, the limit intended, in the opinion of Your Commissioner, to be imposed on the inquiry would have been very far exceeded, and the time necessarily taken up would have been unduly protracted. As it stands, the evidence is amply sufficient to enable Your Commissioner to determine with reasonable certainty the several questions to which an answer is sought.

The first of these questions requires the discovery of the cause or causes of accidents which have recently taken place in certain mines and quarries in the Albert Mining District. Your Commissioner takes the words "cause or causes" in this question to mean, not the immediate cause or set of circumstances which led to an accident, but the general conditions which preceded and conduced to it; such, for example, as a negligent or ignorant course of control, a faulty mechanical system, or recklessness or incompetency on the part of the workmen concerned.

A perusal of the depositions taken on inquests held in all cases of fatal accidents connected with mining which took place in the Albert District between September, 1894, and the end of 1895, and of the reports of all similar casualties, whether fatal or otherwise, of anything like a serious nature which occurred there during 1896 and the former half of 1897, has satisfied Your Commissioner that there is no such general similarity in the various accidents—the immediate causes of which

are

are remarkably diverse—as to make it possible to reduce them to a few heads of immediate causation; unless it be that there are three kinds of accident which are rather more frequent than others—namely, falls of ore in stopes, falls of workmen through floors of sets or into shoots, falls, or the flying from blasts, of stones in “open cuts.” Considering the accidents which do not fall under one of these classes, each by itself, and regarding them in the light of the evidence given, Your Commissioner has been unable to discover any general course of mismanagement or negligence on the part of the mines or their officers, or faulty construction or mechanism, conducing to these casualties.

Many of them seem to have been pure accidents, practically unavoidable: in some of them the injured man brought the trouble on himself by want of care or by error of judgment. In a few cases perhaps the judgment of a mine officer was at fault; but, certainly, the prevailing condition, without which the accident would not have happened, was want of care or skill on the part of the victim. As to the three classes of accident which appear rather more prevalent, those due to falls of ore or mullock are often quite unavoidable. No system of mining can absolutely prevent their occurring; no experience can certainly guard against them. The evidence points to remarkable care on the part of the mines, and ample provision in the supply of timber, in working the various forms and modifications of the “square-set” system in use at Broken Hill; and Your Commissioner is satisfied that no reasonable means are left unused for securing the safety of the working faces and roofs in stoping out the enormous masses of ore of varying nature and stability that form the lode at Broken Hill. But in some cases it is clear that the exercise of ordinary discretion by the injured man would have prevented the accident.

The witnesses were practically unanimous in their approval of the “square-set” system; though experience is gradually showing that improvements may be made upon it to suit new developments of the lode. Reflections were cast by some witnesses on what are called by the miners “open cuts underground,” but are more properly described as underground chambers, made in the hard sulphide ores. It was said that some of these were carried out to an undue extent in all three dimensions. Your Commissioner is, however, satisfied that every proper precaution is used in the making of these excavations—and before they are timbered or filled—both to ensure the stability of the roof by the erection of “pig-styes,” and to enable constant inspection of it, to prevent the risk of falls by flaking. It is possible that, in the excitement of winning large quantities of very rich and easily-smelted ores, there was at one time a neglect in following up stoping with filling as closely as would have been proper: the error of such a course is now, however, fully recognised: and seeing how deeply impressed Mr. Inspector Hebbard has become with the danger of allowing stopes to remain open longer than necessary, Your Commissioner feels that this risk has practically disappeared. The working of the surface open-cut system has been a most valuable adjunct to underground mining, by supplying abundant material for filling. At page 184 of the Minutes of Evidence, Mr. Hebbard gives a very interesting account of the development of the system of stoping at Broken Hill.

An apparently dangerous crushing of timbers, spoken of especially by the witness Kelly (Minutes of Evidence, page 106, Q. 2950), as being in existence at the 415-foot level of Kelly’s shaft, on Block 10 Mine, was satisfactorily explained by Mr. Thomas, Underground Manager (Minutes of Evidence, page 119, Q. 3327), and by Mr. Warren, General Manager (Minutes of Evidence, page 127, Q. 3596). The place was seen by Your Commissioner, Mr. Polkinghorne being present, and Your Commissioner has no doubt of the truth and reason of the explanation, and of the absence of any real danger. In the light of other evidence dealing with matters spoken to by the witnesses Shinnick and Kelly (Minutes of Evidence, pages 99 and 106, Q. 2704, 2955), Your Commissioner also feels assured that the extraordinary risks said to have been run by men riding in the cage at the same shaft, in consequence of the use of another compartment as a mullock shoot, were grossly exaggerated, if even the history of them had any foundation in fact. No accident happened from this cause. But, in the investigation of the general causes of accidents that did happen, all these matters became incidentally material.

So far as falls through the floors of sets and down shoots are concerned, there is no doubt that these accidents are generally caused by disobedience of orders on the part of miners. The evidence proves that it is a rule universally adopted by the mines that, in all places where work is going on, or where men have to pass,
 floor’s

floors of sets, consisting of "laths" of Oregon pine 10 inches wide and 2 inches thick, shall be left undisturbed, and that, when displaced by blasting, they shall be at once replaced by the miners whose shots have affected them; or that, where they have to be stripped for any necessary purpose, such as the making of a "shoot" or "pass" for sending down ore or mullock, the opening shall be kept securely railed off by pieces of scantling spiked to the Oregon pine uprights of 10 inches square section which form the legs of the sets. It is also a rule that if one or more laths have to be raised for any temporary purpose they shall be replaced as soon as that purpose is served, so that a trap shall never be left for the unwary. And it is proved that one of the commonest offences committed by miners, for which they are frequently dismissed, is a neglect of these rules, sometimes through carelessness or indifference to their own safety and that of others, sometimes in order to save themselves, when requiring laths to replace broken ones or in the erection of new sets, the trouble of procuring them from the proper place, generally at no great distance.

With regard to accidents caused by falls of stone in open cuts or quarries, it appears that every care is taken by the contractors to keep the "permanent batter" on which work is not being done—rising in some parts to a height of about 150 feet—in a safe condition by constant inspection, and by "barring down" any piece of rock that may appear likely to fall. The angle of safety is carefully considered: and the risk of falls is reduced almost to nothing. On the working faces the batter is necessarily in a continually changing state: but undermining is, for a very good reason, strictly prohibited by the Inspector; and Your Commissioner is satisfied by the evidence that all reasonable care is exercised by the Contractors, under whom the work is carried out, and is insisted upon by the Proprietary Company, with whom they contract, to avoid accidents. This question will be dealt with more particularly under the fourth head of inquiry. Your Commissioner finds that, generally, accidents of the nature now dealt with have been either practically unavoidable, or due to want of care or of judgment on the part of workmen.

And, therefore, on the whole, Your Commissioner is of opinion that, so far as it can be said that there has been any prevailing cause of these accidents, they have been largely due to the neglect of the workmen, generally the victims themselves, of the means of securing their own safety, and to their want of judgment in carrying out their work. At the same time it is true that very many of the casualties that have occurred have been purely accidental, and such that no care or foresight on the part of any person concerned could have prevented them.*

The second head of inquiry is as follows:—

Whether the provisions of the Mining Act, 1874, and the Regulations relating to the inspection of mines other than coal or shale made thereunder, are sufficient to secure the safe working of the Mines and Quarries in the said district, especially in regard to the use of explosives and the system of timbering and of working large lodes adopted. And, if they are not sufficient, to suggest in what respect and to what extent they should be added to or amended.

In the Mining Act, 1874, the only power to make regulations for the safe management of mines appears to be that contained in Subsection 3 of Section 64, which reads, or should be read, as follows†:—

For enforcing, under a penalty (in any case of default) of a sum not exceeding fifty pounds, the proper ventilation and safe construction and timbering or supporting of all mining shafts tunnels drives or other mining workings used in mining for gold or any other mineral or metal: for prescribing the mode of inspection for all such shafts tunnels drives or workings and the powers and duties to be exercised by the persons authorised to act as inspectors in that behalf: and for determining and enforcing the distance at which all such shafts and other mining workings are to be kept from public and private roads ways and passages and from private land dwellings and other buildings.

This section, in Your Commissioner's opinion, authorises only the making of regulations—quasi-penal—controlling the action of the management of mines, and fails to provide any power to deal with miners or others committing improper acts in relation to mining.

It

* The question of competency of miners is alluded to later, on pages 19, 20, under the third head of inquiry.

† There appear to be two mistakes in the copy issued (in book form) from the Government Printing Office—the omission of the word "of" after "default," in the first line, and the misplacing of the word "for" in the ninth.

It is, moreover, so limited in its extent to the matters of ventilation, and the construction, timbering, and supporting, of workings, as to fall far short of what is required; inasmuch as many other matters—of which several purport to be dealt with by the Regulations of July 12, 1889—should obviously come within the scope of the power conferred by statute on His Excellency the Governor for the time being, if that power is to be beneficially exercised.

The section, therefore, appears to Your Commissioner to be insufficient in two respects—first, because of its failing to give power to make Regulations dealing with all persons, as well those owning or managing, as those employed or being in, mines; second, by reason of the undue limitation of its scope in relation to the phases of the subject matter: and therefore Your Commissioner is of opinion that the provisions of the Mining Act, 1874, are *not* sufficient to secure the safe working of *any* mines or quarries. At the same time, seeing that doubts have been raised on the subject, Your Commissioner deems it proper to express his opinion that open cuts and quarries used in connection with mining are in fact included in the words of subsection 3 of section 64 of the Act, as well as underground workings.

The Regulations referred to, dated July 12, 1889, read as follows:—

Interpretation of Terms.

1. In the construction of these Regulations the following terms in inverted commas shall have the respective meanings hereby assigned to them, unless there is anything in the subject matter or context repugnant to such construction (that is to say):—

- (a) "Inspector." The person appointed by the Governor, with the advice of the Executive Council, or the person authorised by the Secretary for Mines, to inspect any mine or mines.
- (b) "Mine." Any land or claim demised or occupied and used for mining purposes other than coal or shale mining; and shall include any place, pit, shaft, tunnel, drive, level, or other excavation, drift, gutter, lead, vein, lode, or reef, wherein or whereby any operation for or in connection with mining is or shall be carried on.
- (c) "Machinery." Steam or other engines, boilers, furnaces, stampers, or other crushing apparatus, winding or pumping gear, chains, trucks, tramways, tackle, blocks, ropes, or tools; and shall include all appliances of whatsoever kind used in or about or in connection with the mine.
- (d) "Owner." In respect of claims occupied in virtue of miners' rights, the registered owner, or, where the title to such claim is not registered, the person in actual possession and working the claim; in respect of land demised for mining purposes, the lessee; in respect of any mine worked on tribute, the tributor for the time being of such land; in respect of machinery used in connection with mining, the person claiming or in charge of such machinery; in the case of incorporated companies or of companies registered under the Act to limit the liability of mining partnerships, the managers of such company; and, in every other case, the person having the management of the mining operations carried on in any mine.

The singular shall, unless inconsistent with the subject matter, include the plural; and "person" shall include any incorporated company.

Inspector of Mines.

2. The Secretary for Mines may, by writing under his hand, authorise any person to inspect any mine or mines or to act temporarily as an Inspector of Mines.

Powers of Inspector.

3. An inspector shall have power to do all or any of the following things, namely:—

- (1) To make such inspection, examination, and inquiry, as may be necessary to ascertain whether in the case of any mine the provisions of these Regulations relating to matters above or below ground are complied with.
- (2) To enter into at all times by day and night, and inspect, examine, and inquire, respecting the state and condition of any mine to which these Regulations apply, or any part thereof, and the ventilation of such mine, and the sufficiency of the special rules (if any) for the time being in force therein, and all matters and things connected with or relating to the safety of the persons employed in or about the mine or any mine contiguous thereto.
- (3) To exercise such other powers as may be necessary for carrying these Regulations into effect.

Penalty for obstructing Inspector.

Every person who wilfully obstructs any inspector in the execution of his duty under these Regulations, and every owner of a mine who refuses or neglects to furnish to the inspector the means necessary for making any entry, inspection, examination, or inquiry, under these Regulations, in relation to such mine, shall be liable to a penalty not exceeding fifty pounds.

Notice to be given of cause of danger.—Penalty for neglecting to comply with notice.

4. If any inspector find any mine or any part thereof, or any matter, thing, or practice, in or connected with such mine, to be dangerous or defective, so as in his opinion to threaten or tend to the bodily injury of any person, such inspector may give notice thereof verbally or in writing to the owner or Mining Manager of the mine, and shall state in such notice the particulars in which he considers such mine or any part thereof, or any matter, thing, or practice, to be dangerous or defective, and require the same to be remedied within a period of time named in such notice; and, unless the cause of danger be removed

removed or such defect be remedied within the time named, the owner or Mining Manager shall be liable to a penalty not exceeding ten pounds, and to a further penalty of one pound for every day thereafter during which the owner shall fail to comply with such notice.

5. A copy of every written notice as aforesaid shall forthwith be transmitted by the inspector to the Secretary for Mines.

Disqualification of Inspector.

6. No person shall be appointed or authorised or be qualified to act as an inspector who practises or acts, or is a partner of any person who practises or acts, as a mining agent, or who is employed by the owners of, or is interested in, any mine.

Penalty on Inspector divulging information.

7. Any inspector who shall, without the consent of the owner, divulge or make known to any person, otherwise than as a witness in a court of justice, or to the head of his department, any information obtained by him in the discharge of his duties, respecting any drift, gutter, lead, vein, lode, reef, or other metalliferous or mineral deposit, in any mine, shall be liable to a penalty not exceeding twenty pounds, and shall be disqualified for the office of inspector.

Duties of mine-owners, &c.

8. It shall be the duty of every owner to enforce the proper ventilation and safe construction and timbering or supporting of all shafts, tunnels, drives, or other excavations, in his mine, and to see that such mine and the machinery are in such a state as shall not injure or endanger the health or life of any person employed on such mine or any mine contiguous thereto, or employed in or about such machinery. And any accident occurring in any mine or in or about any machinery shall be *prima facie* evidence that such accident occurred through some neglect or default on the part of the owner thereof.

Liability of owner in case of accident.

9. If any person employed in or about any mine or machinery suffer any injury in person, or be killed, owing to the default or neglect of the owner thereof, his agents, or servants, the person so injured or his personal representatives, or the personal representatives of the person so killed, may recover from the owner compensation by way of damages as for a tort committed by such owner; and the amount of such compensation with the costs of recovering the same shall be a charge on the mine or machinery or both in or about which such person was employed. If there be more than one owner, and the person so injured or killed be* one of such owners, and the accident be not wholly due to the neglect or default of such person, the compensation and charges shall be borne and paid ratably by the owners.

General Rules.—Penalty for contravention of.

10. The general rules in the Schedule hereto shall apply to such mines or mining districts as the Secretary for Mines shall from time to time upon the report of an inspector direct; and any owner of any such mine who contravenes any such general rule shall be liable to a penalty not exceeding ten pounds; and any person (other than the owner) employed in any such mine who contravenes any such rule shall be liable to a penalty not exceeding two pounds.

Penalties, &c., how recovered.

11. Penalties, charges, and sums of money, under these Regulations shall be recovered in the manner prescribed by the "Mining Act, 1874."

SCHEDULE.

General Rules.

1. An adequate amount of ventilation shall be constantly produced in every mine to dilute and render harmless noxious gases to such an extent that the working places of the shafts, levels, stables, and workings, of such mine, and the travelling roads to and from such working places, shall be in a fit state for working and passing therein.

2. If at any time it is found by the person in charge of a mine, or any part thereof, that such mine or part is dangerous, every workman shall be withdrawn therefrom; and in every such case a true report of the condition of such mine or part thereof shall be forthwith made to the Secretary for Mines; and no workman shall (except in so far as is necessary for inquiry into the cause of danger, or for the removal thereof, or for exploration) be readmitted into the mine, or such part thereof as was so found dangerous, until the same is stated by the Manager, or by an inspector, to be safe. Every such report shall be recorded in a book which shall be kept at the mine for the purpose, and shall be signed by the person reporting.

3. Gunpowder or other explosive or inflammable substances shall only be used underground in the mine as follows:—

- (a) It shall not be stored in the mine in any quantity exceeding what would be required for use during six working days.
- (b) It shall not be taken into or kept in the mine except in a case or canister.
- (c) A workman shall not have in use at one time in any one place more than six pounds.
- (d) In charging holes for blasting, an iron or steel tamping bar shall not be used; and no person shall have in his possession in the mine underground any iron or steel tamping bar, rod, or stemmer, unless mounted with at least four inches of copper.
- (e) A charge of powder or other explosives which has missed fire shall not be unrammed or drawn.

4. Every mine shall be provided with proper and sufficient machinery and appliances for keeping such mine free from water, the accumulation or flowing of which might injuriously affect any other mine.

5. Every shaft which is out of use or used only as an air-shaft, and the top and all entrances between the top and bottom of every working or pumping shaft, shall be securely fenced or otherwise secured; but if proper precautions are used such fences may be removed for repairs or other operations.

6. Every working and pumping pit and shaft where the natural strata are not safe shall be securely cased or lined, or otherwise made secure.

7.

* This is evidently the correct reading: The printed copies contain the word "by" for "be," which is absurd.

7. Where one portion of the shaft is used for the ascent and descent of persons by ladders or by a man-engine and another portion of the same shaft is used for raising material, the first-mentioned portion shall be cased, or otherwise securely fenced off from the last-mentioned portion.

8. *Every working shaft shall be provided with means of communicating from the bottom of the shaft, and from every entrance for the time being in work between the surface and the bottom, to the surface, and from the surface to the bottom of the shaft, by such distinct and definite signals as shall be prescribed by the Minister or approved of by him; and all shafts used for raising or lowering persons shall be provided with guides.*

9. A proper footway or ladder, inclined at the most convenient angle which the space in which the ladder is fixed allows, shall be provided in every working shaft where no machinery is used for raising or lowering persons; and every such ladder shall have substantial platforms at intervals of not more than 30 feet; and no such ladder shall be fixed for permanent use in a vertical or over-hanging position unless in shafts used exclusively for pumping.

10. In every mine in which vertical or over-hanging ladders shall be in use in the shaft at the time when these rules shall be applied to it, they may be retained, provided securely fixed platforms be constructed at intervals of not more than 20 feet from each other, and such ladders have sufficient spaces for foot-holds of not less than 6 inches; but in no case shall new vertical or over-hanging ladders be constructed either in substitution for old ones or otherwise.

11. A sufficient cover overhead shall be used when lowering or raising persons in every working shaft, except where it is worked by a windlass, or where the person is employed about the pump or about some work or repair in the shaft.

12. *No single-linked chain (except the short coupling chain attached to the cage or load) shall be used for lowering or raising persons in any working shaft; and no material shall be lowered or raised in the same cage with or in the opposite cage against any person.*

13. *To the drum of every machine used for lowering or raising persons, such flanges or horns, or such other appliances, as shall be sufficient to prevent the rope from slipping, shall be attached.*

14. *A proper indicator, in addition to any mark on the rope, to show the position of the load in the pit or shaft, and also an adequate break, shall be attached to every machine worked by steam or water power used for lowering or raising persons.*

15. *If more than twelve persons are ordinarily employed in the mine below ground, sufficient accommodation shall be provided above ground, near the principal entrance of the mine, and not in the engine-house or boiler-house, for enabling the persons employed in the mine to conveniently change and dry their dresses.*

16. *Wherever any entrance to any mine, or any communication within any part of any mine to any other part thereof, shall be by means of a vertical shaft, or pit, or inclined plane, no person, other than a properly competent person, of the full age of eighteen years, shall have charge of any engine, windlass, or gin (whether driven or worked by manual labour or any other power), or of any part of the machinery, ropes, chains, or other tackle, by or by means of which persons are brought up or passed down any such vertical shaft, or pit, or inclined plane. And no person in charge of machinery in connection with the working of any mine shall, under any pretext whatever, unless relieved by a competent person, absent himself or cease to have continual supervision of such machinery during the time it is used in working the mine. No person in charge of steam machinery shall be employed more than eight hours in any one day.*

17. *Every steam boiler shall be provided with a proper steam-gauge, water-gauge, and safety-valve; and at least once in every six months every boiler shall be subjected to a hydraulic test.*

18. *The fly-wheel of every engine, and all exposed and dangerous parts of the machinery, used in or about the mine, shall be securely fenced.*

19. Sufficient boreholes shall be kept in advance and on both sides, at least 4 feet in length, to prevent inundations in every working approaching a place likely to contain a dangerous accumulation of water or noxious gases.

20. The roof and sides of every travelling road and working place shall be made secure; and no person, unless appointed for the purpose of exploring or repairing, shall travel or work in any such road or place until it is made secure.

21. On the occasion of any examination or inspection of a mine, the owner shall, if required so to do, produce to the inspector or any other person duly authorised by the Secretary for Mines an accurate plan of the workings thereof; and if the inspector or such other authorised person finds that any part of any plan is withheld or any part of the workings of the mine is concealed from his inspection, or that any plan produced is imperfect or inaccurate, he may require an accurate plan of the actual workings of such mine to be made within a reasonable time by and at the expense of the owner, on a scale of not less than two chains to the inch, or on such other scale as the plan then in use in the mine is constructed on. And every such plan as aforesaid shall show the workings of the mine up to within six months of the time of the inspection; and the owner shall, if required by such inspector or other authorised person, cause to be marked on such plan the progress of the workings of the mine up to the time of such inspection, and shall also permit the inspector to take a copy or tracing thereof. Every such copy or tracing shall be deposited in the principal office of the Department of Mines; and no copy or tracing thereof shall be furnished nor information given, nor shall such plans or tracings be open to inspection, without the sanction of the owner or of the Secretary for Mines.

22. *A printed copy of these Rules shall be posted in the office and on a building or board in some conspicuous part of the mine to which they shall apply.*

The parts printed in italics appear, in the light of the limitations of Section 64, to be clearly *ultra vires*, and so of no avail.

It follows that a substantial portion of the Regulations still remains effective, while, as a whole, so far as they derive their power from the Act—and so far as any Regulations are really of service—they are not sufficient to secure the safe working of mines and quarries.

In dealing with the last clause of the second head of inquiry, in relation to this effective remnant of the present Regulations, Your Commissioner will now consider what alterations in or additions to these Rules are advisable.

In Regulation 4 (which, of course, Your Commissioner thinks can only legally apply to questions of ventilation, construction, &c.) the elimination of the words "verbally or" after the words "notice thereof" would be advisable, inasmuch as it is essential that a record of such notices should always be kept; and it is not expedient that the Inspector should have the option of making them verbal. Your Commissioner would also recommend the addition of a direction that a special book be kept in the office of the mine, in which should be entered a record of all such notices and of all acts done in conformity therewith, signed by the manager; such book to be produced to the Inspector when required.

The first of the "General Rules," the Schedule to the Regulations, appears to be unduly vague in the use of the expression "adequate amount of ventilation." Although the conditions of mineral mines and coal mines differ essentially, in this, that the former are generally free in themselves from dangerous gases, such as the inflammable hydrocarbons and the poisonous oxides of carbon, given off or engendered in the latter, and therefore it may not be necessary to provide so high a minimum of ventilation for mineral as for coal mines, still the air of the former is constantly being vitiated by respiration and the use of explosives, and it would be safer, and would leave a less onerous and invidious responsibility on the Inspector, if some minimum amount of pure air—such, for instance, as 50 cubic feet per man per minute—were made compulsory, as in General Rule 1, section 47, of the Coal Mines Regulation Act, 1896. At the same time, a full discretion would have to be left with the Inspector, and, in case of sudden emergencies, in the unavoidable absence of the Inspector, with the officer in charge of the mine, to permit men to work for a limited time in a shorter supply of air. But it should be made a condition of such action on the part of the officer in charge that he should use reasonable diligence in communicating with the Inspector before adopting such course, and should as soon as practicable inform him of the fact, and should afterwards furnish a report in writing of his action, and of his reasons for taking such action. It would have involved undue delay to Your Commissioner to inquire exhaustively into the question of the theoretically proper minimum of air to provide. The amount of 50 cubic feet was merely put forward as a suggestion by Mr. Hebbard. By inquiry of acknowledged experts in England, America, or the continent of Europe, a satisfactory conclusion could probably be easily arrived at. The means to be adopted in each mine for the supply of air may well, as in the present Regulations, be left to the management, acting, no doubt, generally after consultation with the Inspector; but Your Commissioner is strongly of opinion that the providing for a substantial minimum supply of ventilation will be of great benefit to the mines and to the miners, as it appears that, though the mines at Broken Hill are generally very well ventilated, there has been an absence of any regular system of ventilation. Seeing also that much heat is given off in some parts of the lode by chemical action, Your Commissioner would suggest that a certain standard, which might be fixed at 85° Fahrenheit, should be made compulsory as the maximum temperature of the air in any working part of a mine. This would compel an improvement in conditions, by means of an increased supply of air above the minimum of 50 cubic feet, a deviation in currents, a sealing off of the hot place, or otherwise.

Still keeping within the powers given by the Mining Act, 1874, Your Commissioner would suggest the addition to the General Rules of one providing for the safety of miners in relation to floors of sets. This Rule should compel—in conformity with the practice in fact now generally adopted and sought to be enforced on miners by the mine managements—the leaving properly covered with laths all floors of square-sets or other analogous constructions used in stopping ore, downwards from the floor immediately over, to at least two floors under, any working floor, unless and until the sets of which they respectively form the roofs be completely filled; and the railing-off securely of all unfloored sets or other open places, whether used as passes, shoots, or otherwise, in the neighbourhood of working places, or by or near which workmen may have to pass in the performance of or in going to or from their work, or that may be in any way dangerous to any person lawfully being in the mine,

The

The Regulations—General Rule 9—deal with ladders in shafts, but omit all mention of ladder-ways in stopes. This omission might be cured by directing that proper footways or ladders should be provided, securely guarded, and inclined at an angle of not less than 30° from the perpendicular (with discretion in the Inspector to approve of any existing ladders already fixed more steeply) to connect floors of sets in stopes, and other places requiring such communication, in mines.

Another question to which attention was directed in the course of the evidence was the providing of conditions of safety for men engaged in sinking or deepening shafts. There was much difference of opinion among experts on this matter. Your Commissioner has concluded that it would be well to make a Rule to the following effect:—That, before the sinking of any shaft or winze, or the deepening of any shaft, a written notice shall be given to the Inspector of the intention of the mine management to carry out the work, setting out the mode in which it is to be performed: and that no such work shall be begun until the Inspector shall have signified his approval in writing.

Finally, Your Commissioner is of opinion that a Rule should be framed compelling the management of every mine to provide at least one ladder-way, in addition to the regular hauling shaft, connecting each level with the one above it, for every 40-acre block over which the workings extend; the sufficiency, for furnishing means of escape, of such ways, in regard to their position in the mine, to be determined in each case by the Inspector.

The next question that presents itself for consideration is this:—What amendments are required, in relation to providing for the safety of mines and the persons employed in working them, in the Mining Act itself? Your Commissioner, feeling it his duty to interpret Your Excellency's Commission in a wide and beneficial sense, has dealt with this matter, as well as with the narrower question of the sufficiency of the present Regulations. Finding, as Your Commissioner has found, that the Act is insufficient, he feels that he is required to suggest how it should be amended. It appears to Your Commissioner that the amendments required should extend:—1st, To give power to Your Excellency to make Regulations dealing, not only with the ventilation and construction of mines and mining works—as in section 64, subsection 3, of the present Act—but also with the questions of management and supervision, including the qualifications of engine-drivers; with drainage; with the storage and use of explosives; with the nature and maintenance of all machinery, including steam and other engines; with provisions for the safety, comfort, and health, of employees; and, generally, with all matters whatsoever involved in or connected with the control and working of mines; and of works immediately connected therewith, in which the ores, minerals, or metals, won in such mines are reduced, smelted, refined, or otherwise treated. It should also be expressly provided that these Regulations may be directed, not only to the enforcing of conditions to be imposed on owners and officers of mines, but also to the coercing of employees and all other persons whose actions might require to be controlled thereby: The power to impose a substantial fine, with a maximum of (say) £50, for breach of such Regulations, and, in default of payment or as an alternative, a term of imprisonment not exceeding three months, should, Your Commissioner thinks, be given to the Warden of the District, or to a Stipendiary or Police Magistrate, or two Justices of the Peace.

In addition to the power to make such general Regulations, Your Commissioner would also suggest that, by analogy to the provisions contained in sections 49 to 56 of the Coal Mines Regulation Act, 1896, an Amending Act should provide for Special Rules, to have effect in each mine, non-compliance with which should be punishable. In fact there seems no reason why these sections should not be transferred as they stand, with such verbal alterations as are necessary to make them appropriate, into an Act Amending the Mining Act, with the addition of a section providing a penalty for breach, the limit of which might be fixed at £10, or one month's imprisonment. Such a penalising of acts now only punishable by dismissal would be a very wholesome deterrent in checking indulgence in reckless conduct endangering the safety of the wrongdoers and of others.

The Rules and Regulations of the Broken Hill Proprietary Mine [*Appendices 1 and 2*] would—with some modifications—become the Special Rules of the mine, and would, as such, have the force of law. Some of the other mines have adopted these

printed

printed Rules : some depend upon oral instructions only. The suggested change in the law would probably result in a conference of the mines, with the object of settling a code, applicable, with variations to suit different conditions, to all the mines at Broken Hill.

Some of the matters referred to as proper to be dealt with by Regulation might possibly be more appropriately made the subject of direct legislation ; such, for instance, as the qualification of engine-drivers*. As to the latter, there was a general consensus of opinion among the witnesses that engine-drivers employed in working hauling engines, by which miners are raised and lowered, should be required to hold certificates of competency : the provisions of the Coal Mines Regulation Act, 1896, whether used as a basis of direct legislation, or as an assistance in framing Regulations, under a power to be conferred by an Amending Act, may fairly be suggested as a guide in this relation. But, in dealing with the question whether it is expedient to legislate directly or by means of a power to make Regulations, Your Commissioner would point out that there is so much of a tentative nature in ore-mining, that so many improvements and alterations are continually being made in the various systems adopted, and that the advance of chemical and mechanical science—notably, in the discovery of new explosives—is so rapid, that there is a substantial advantage in the elasticity of a power to make Regulations, as compared with the slowness and difficulty incidental to change by legislation.

Lastly, assuming the creation of a power to make Regulations to operate in the directions suggested by Your Commissioner as requisite for the purpose of securing the safe working of mines and quarries, and, therefore, regarding the present Regulations and General Rules which appear to be *ultra vires* as if they were valid, Your Commissioner will deal with the question of the manner in which the Regulations and Rules printed in italics on pages 6 and 7 of this Report seem to be in need of alteration, and with the further inquiry—what additional Regulations or Rules Your Commissioner would, on the same assumption, suggest : necessarily, the two questions will be considered together.

Passing over Regulations 8 and 9, which Your Commissioner deems to be outside of the intention of any statutory power to make Regulations, and to be partly enunciations of the general law, and partly ineffective attempts to modify it, Your Commissioner comes to the schedule of "General Rules." As to No. 2 of these General Rules, a modification, generally thought advisable by the witnesses on the inquiry, might be made. It is of this nature :—that, if men be withdrawn by the person in charge, he should be allowed the discretion of ordering them back ; but, if the Inspector has directed them to be withdrawn, or has intervened in any way, then this discretion should rest with him only ; though he may be allowed expressly to depute it—in writing—to an officer or officers of the mine ; for he may be unavoidably called away before the danger is removed : that no workman, appearing to have an honest belief in the continued existence of the danger, shall in any event be compelled, by threats or otherwise, to return, or be liable to be treated as in any way in default for refusing to do so : and that a substantial proportion—Your Commissioner would suggest one-fourth—of the men affected shall have the right to require the Inspector to be called in to decide on the question of safety ; the refusal of the person in charge to communicate this order to the manager, or of the latter to comply with it, to be an offence.

On the questions raised under the head of Rule 3 there was much diversity of opinion among the witnesses. The conclusions at which Your Commissioner has arrived are as follows :—

- (a) No question was raised as to this : there seems no need of modification.
- (b) To this might be added the words " of a pattern and make approved by the Inspector."

It has been proved that miners persist in using as watercans canisters made and supplied by their employers for the purpose of holding explosives. This may be checked by a vigorous enforcement of the penalty for keeping explosives improperly, when and if that penalty becomes legally enforceable. And an effort should be made to contrive a safe and easily moved receptacle for explosives which shall be unsuitable for holding water. (c)

* The qualification of managers, under-ground managers, &c., was hardly touched upon. Probably an unrestricted selection may safely be left with the Companies.

- (c) This rule is inapplicable to present conditions: the weight of explosive used in a set of machine holes generally largely exceeds 6 lb. The rule might stand thus:

“A workman shall not have in his possession at one time in any one place more explosive than is likely to be required for use on the shift on which he is employed: and, except when actually in use for purposes of charging, explosives shall be placed in a safe position at a distance of not less than thirty feet from the face to be blasted, and so that they cannot be struck by any material thrown out from the face in a direct line.”

- (d) Taking the evidence of all the experts who depose to the question of tamping, Your Commissioner has come to the conclusion that the safest form in which to re-model this rule is as follows:—

“In charging holes for blasting, no metal tamping bar shall be used; nor shall any person have any such bar in his possession in the mine.”

- (e) There was not much difference of opinion, except as to details, on the question arising in connection with this rule. Your Commissioner would suggest that it should read thus:—

“An accurate record of some kind shall be kept, by every man who is charging a hole for blasting, of the distance from the outer end of the charge to the collar of the hole.* A charge of powder or other explosive which has missed fire shall not be drawn; but the tamping shall be carefully removed to a depth distant not more than twelve, and not less than six, inches† from the outer end of the charge; and a fresh charge, or fresh charges, shall be inserted for the purpose of exploding the original charge, till the same be exploded; and no hole shall be bored in the neighbourhood of an unexploded charge for the purpose of exploding it by means of the explosion of a charge in the new hole.‡

“In the event of the bottom of a hole in which a blast has been exploded remaining in any working place, then, unless or until it can be clearly seen by two persons, one of whom, at least, is an official of the mine, that no explosive remains unexploded in such bottom, no work, whether of boring, barring down—except so far as may be absolutely necessary in order to make it safe to approach such bottom—picking, or otherwise, shall be done in such place, until such bottom has been broken away and completely exposed by a further charge or further charges inserted therein; but, for the purpose of inspection, such bottom may—and shall—be carefully cleaned out, water being freely used therein, before being finally proved to contain no explosive. This rule shall apply to all “old bottoms”, wherever found.

“In the event of a “miss-fire”, no person shall return to within a distance from the charge which would be unsafe in the event of its exploding until the expiration of one hour and a half from the time of the lighting of the fuse: provided that, if the person whose duty it was to light the fuse has good reason to believe, and does in fact believe, that he omitted to light it, then he—but he only—may return within thirty minutes. A “bulled” hole shall not be recharged within two hours of the time of explosion of the “bulled” charge, unless it be thoroughly washed or swabbed out with water, and unless, after the hole is cleaned out, a metal rod inserted and left therein for at least five minutes shall be at no point hot to the touch; in which case the hole may be recharged within thirty minutes.

“Explosives shall not be carried in the cage when workmen are descending or ascending at change of shifts.” In

* Mr. Horwood's suggestion is in point. (Minutes of Evidence, page 70, Q. 1953.)

† Mr. Hebbard's opinion, however (Minutes of Evidence, page 174, Q. 5602), would suggest a variation of the rule when gunpowder is used.

‡ The plan of exploding a charge by percussion through part of the tamping appears to apply as well to gunpowder as to the high explosives: Mr. Hebbard's statement (Minutes of Evidence, page 174, Q. 5600.)

In addition to the mention of the matter in the special rules of each mine, perhaps—seeing of how universal an application the subject is, and that the fear of consequences looked upon as remote and improbable, though involving possibly a charge of manslaughter, does not always deter men from running risks—it would be well to make a General Rule—with, of course, a sharp penalty attached—absolutely prohibiting the firing of blasts under such circumstances that any person may be endangered thereby. This would extend to meet the case mentioned by Mr. Polkinghorne in his evidence (Minutes of Evidence, page 40, Q. 1202 : page 49, Q. 1410). The discretion given to the Company's surface foreman in No. 8 of Surface Rules and Regulations (Appendix 2) must have been improperly exercised in the case spoken of by Mr. Polkinghorne—if the permission was given at all. Some one was clearly at fault. Your Commissioner inadvertently omitted to insist upon an explanation of this matter. No accident actually happened as a result of the firing when men were in the changing-house ; but the action was very reprehensible.

Rule 4 appears to admit of the insertion of a few words, making it read thus :—“ Every mine shall be provided with proper and sufficient machinery and appliances for keeping such mine free from water, the accumulation or flowing of which might imperil the health or safety of the workmen therein, or might injuriously affect any other mine.”

In Rule 12, before the word “ material,” the words “ tools or,” and, after the word “ material,” the words “ except explosives, accompanied by one man only,” appear to be required.

In Rule 14, it would be expedient to substitute the word “ other ” for the word “ water ” : this will save any question, in case engines worked by electricity, compressed air, or other vehicles of power, should be used.

Passing to Rule 16, the question of the advisability of requiring an engine-driver to be certificated comes to be considered. An opinion was expressed by most of the witnesses examined that engine-drivers in charge of winding engines, by which miners are lowered and raised, should be required to hold certificates, granted by some authority, to be constituted either directly by Statute or by Regulations under statutory powers. With this view Your Commissioner agrees : if it is thought proper to carry out the suggestion, then, instead of the words “ a properly competent person,” some such words as “ a properly qualified and competent person ” will have to be used. The management must still be under the obligation of employing only competent persons, as competency—involving real practical ability, sobriety, and steady nerve—will not necessarily be presumed from the possession of a certificate, which will at best be only *prima-facie* evidence of sufficient knowledge and intelligence to justify a man's employment as an engine-driver upon whom a serious responsibility rests. In fact, when the question of the value of certificates was mooted, it was proved by the evidence of some of the witnesses, undoubtedly correct in their statements, that certificates are of doubtful value, because of their being not infrequently transferred, the name of the original holder being assumed by the transferee. An easy and fairly effective means of checking such frauds would be to attach to every certificate a photograph of the holder, to be taken on behalf of the office granting the certificate, a duplicate being annexed to the record of registration, and the negative being kept for at least five years ; the photograph itself to be so officially stamped or punctured on its margin as to make it easy to detect the substitution of another on the same mounting ; on which mounting the certificate would be engraved. The holder should have a right to require, on payment of a small fee, covering cost of photographing, &c., to be re-photographed, and to have a fresh certificate issued to him, at any time ; the former certificate to be given up, or satisfactory proof of its loss or destruction to be produced : each renewal to bear its own date, as well as to show the original date of issue : the issuing office to have a right to refuse to issue a fresh certificate, unless satisfied of the identity of the holder, where, through lapse of time or otherwise, his appearance fails to establish his identity by comparison with the recorded likeness. Every certificate should on the face of it contain a conspicuously printed caution advising the holder not to allow more than three years to pass without the taking out of a fresh certificate.

The last sentence in Rule 16 incidentally introduced a question that was dwelt upon at some length in the course of the inquiry. It is this :—Whether at change of shift it is expedient that there should be a second engine-driver in the engine-house,

to meet the risk of sudden illness of the man working the engine. In the intense heat which frequently prevails at Broken Hill it would appear as if such a danger might well be more pronounced than in less extreme climates; and the suggestion seems to have a fair foundation. On the other hand, the opinion of several experts was that the presence of two men would rather, on the whole, increase the risk, because of their inclination to talk—especially if one were coming on fresh from the town, while the other had been for eight hours in the engine-house. And the frequent improvements in winding engines, together with the use of safety gear and hooks to prevent overwinding—to be dealt with later on in this Report—continually reduce more and more the risks arising from negligence in or failure of the engine-driver. On the whole, Your Commissioner thinks it is not necessary that such double attendance should be made compulsory. But, inasmuch as, on mines that work three shifts, it is a simple matter for the management, if it be thought advisable, to arrange that the attendance of the engine-drivers shall overlap for from fifteen to thirty minutes while the shifts are changing, it is not expedient that there should be any obstacle in the way of such a course. If, however, this be done, the engine-drivers must remain in the engine-house, and therefore practically be employed, more than eight hours in one day. Therefore to the last sentence of the Rule should be added the words “except—should it be deemed expedient—for the purpose of enabling the engine-drivers respectively leaving and coming on shift to be both present in the engine-room during the change of shift of the workmen underground.”

The next Rule—No. 17—is too vague, in Your Commissioner’s opinion, to be of much use as it stands. If a Land Boilers Act is passed—which may possibly happen before the enacting of any authority to make these Rules effective—the question will be settled, and presumably the Rule may be struck out. Otherwise a rule might be framed upon the basis of the conditions imposed by insurance companies. Evidently the existence of an unlocked safety-valve is no sufficient safeguard: and the provision for subjecting a boiler to an undefined hydraulic—or, rather, hydrostatic—test is equally useless. The practice deposed to by Mr. Hebbard (Minutes of Evidence—p. 177, Q. 5664, &c.) of testing up to one-third over working pressure appears reasonable; but something more definite by way of direction is required. Inspectors cannot be supposed to be necessarily experts in boiler-testing: one might require only a test so low as to be quite ineffective: another might insist on an unduly high one, destructive in the present, or dangerous in its results in the future. The question cropped up incidentally: and Your Commissioner did not think it expedient to go into it more fully than it appears in Mr. Hebbard’s evidence already alluded to.

Rule 18 calls for no comment.

The last Rule—No. 22—appears to require amplification. In order to give workmen a full opportunity of reading all printed directions, Your Commissioner would suggest that it be made compulsory that Government Regulations and Rules in force in mines, as well as Special Rules, be printed clearly in black ink on a white ground in large type, so as to be easily readable by a person with ordinary sight at a distance of 6 feet: that they be framed, or stretched on boards, and kept fixed up vertically in a clearly legible condition, outside the office of the mine, at every brace and plat, and in such other positions as the Inspector may from time to time direct: that, if kept in a plat which is lit, they shall be so placed as to be illuminated while being read by a man standing opposite them. Copies, of a convenient size, in book form, clearly printed and strongly bound in paper, of all such Regulations and Rules, should also be kept in the office of every mine. Every workman, when engaged, should be supplied with one copy; and, thereafter, he should have the right to purchase a copy, at a sum, to be from time to time fixed by the Minister, not exceeding 3d.

Wilful defacing of, or injury to, copies of Regulations or Rules posted up should be an offence.

The sheet and book forms, as approved by the Minister, should be issued by the Government Printing Office, and supplied on request to all mine managers, at a cost representing, in the opinion of the Government Printer (subject only to the revision of the Public Service Board), the actual cost of production.

In further addition to the Rules that have been considered, there are some which appear to Your Commissioner to be clearly required.

1st. It should be compulsory to provide all cages with safety appliances, to check their descent in case the rope breaks or anything else happens to let them go. These are in fact universally, or almost universally, in use at Broken Hill; but there should be no option in the matter.

2nd. Every cage also should have a safety hook to prevent accident in case of over-winding. These are not in general use at Broken Hill; but there are now so many contrivances used in other countries that their adoption should be enforced.

In each case it might be left to the Inspector to approve of the particular pattern of safety-grip or hook to be used.

Bearing upon the question of inspection of mines, a Regulation providing for the keeping, in the office of every mine, of a book has been proposed; and the suggestion appears to be a good one. A book should be kept, in the nature of a diary, in which should be entered all orders given or suggestions made by the Inspector, and a statement of what has been done in conformity with them. These entries should be signed by the manager. A special boiler record for each boiler or set of boilers should also be kept, with a history of every test and of every repair or alteration, whether ordered by the Inspector or not. These entries should be signed by the engineer in general charge of the engines on the mine; the boiler test being countersigned by the Inspector. All entries in these books should be dated. The Inspector should have access to them at any time when the mine is working.

Rules similar to General Rules 35 and 36 of the Coal Mines Regulation Act, 1896, might with advantage be embodied in rules for other mines. The hospital at Broken Hill is a considerable distance from any of the mines; and the need for a proper ambulance waggon has been felt on several occasions. One ought certainly to be available, stationed in a central position. Your Commissioner is informed that it is the intention of a local committee of citizens to procure the waggon: if that is done, then Your Commissioner would strongly urge upon your advisers the propriety of taking steps to provide a station, with a horse and driver, necessary for making the scheme effective.

Two simple matters, rather in the nature of details, but still put forward by one of the most intelligent of the witnesses as proper to be made universally compulsory—an opinion in which Your Commissioner concurs—were these: That no open hook, but only some form of grip- or shackle-hook, to be approved by the Inspector, shall be used with a bucket in hoisting; and that, where men are travelling up and down in a bucket, a proper safety-rope or loop shall be provided, to prevent accident in case of dizziness, and to leave a man's arms free to check spinning, &c.

A question which came up for consideration, and to which much attention was directed, with the view, apparently, of inducing Your Commissioner to recommend the making of a Regulation to enforce certain action on the part of both the employers and miners, was that of the place at which the shifts of miners engaged in stopping should change. A probable cause of accidents—certainly a likely source of danger—is the coming on of a shift in ignorance of how matters stand at the "face." Cases have even been known, resulting in the discharge of miners, of men going off shift and leaving a miss-fire—a charge of explosive the fuse of which had been lit shortly before change of shift, but which had not exploded, and which might, therefore, be hanging fire—without informing their mates coming on shift. This is an act which might cause a fatal accident. Again, the results of a shot fired just before the change may have been to loosen rock or ore and to leave it in a dangerous state, easily discernible by a man who has put in the charge and who has been working in the mine for hours, but likely not to be perceived in time to avoid an accident through a fall by one who has just come down from the glare of daylight. A conscientious miner will always take measures to inform the on-coming shift of any special danger, being careful that he or his mate shall meet one of their number; but not only may men miss one another altogether, one going up in one cage while the other is coming down in the other cage, but, through a change in the *personnel* of the shift, a miner may not know who the men on the next shift are. Thus, though a man is really careful, he may find it impracticable to give the necessary information. In the case of a careless miner the probability of his not going out of his way to do so increases the chance of his not giving it. Of course, it is only an utterly unscrupulous man who will allow any risk to the next shift of their coming on unaware of the danger in the case of a miss-fire; as he will wait, or see that some one waits, in the neighbourhood to give warning. The

The natural remedy for all this uncertainty is obviously to make a hard and fast rule that the shift shall change in the face, instead of at the brace as at present; or near to the face, in the event of a miss-fire. And this is the rule that was suggested. It would entail a loss of time to miners, variously estimated, according to the locality, at as little as a few minutes and as much as half an hour. And, unless the ventilation is very good, inasmuch as it is a common practice to fire blasts shortly before the change, so as to utilise for the clearing of the air the time taken in changing, there would appear to be some further loss of time, as shots would have to be fired earlier, so that the air might be clear for the next shift, and men would be compelled to remain off work during the whole interval of clearing. This, however, really means that the men towards the end of the shift would spend underground, waiting for the air to clear, the time otherwise used by the two shifts, the one in getting up to, and the other in coming down from, the brace. And the question resolves itself into this:—Is it worth while to keep the men underground a little longer in order more effectually to secure their safety? The natural answer is, most assuredly, that it is worth while. But, having heard all the evidence given in relation to this matter, and knowing the enormous force of ingrained prejudice, well expressed by Mr. Hebbard when he said, in answer to Q. 5988 (p. 187 of Minutes of Evidence), “There are certain prejudices you cannot prize out of a miner’s heart with a crowbar; and it is little things of this sort that go to inflame him, and create much irritation, though in reality there are no substantial grounds for it”; and noting also the next question and answer—“Do you know of any mines where it is the rule to change in the face? No; but I know of plenty where it has been tried, but has always had to be dropped on account of its not working properly”—Your Commissioner has come to the conclusion that the making of such a rule would be injudicious, and that the best way to meet the difficulty, and to induce miners to use their utmost endeavours to communicate with their mates at change of shift, would be to make a rule that, before leaving at relief of shift, and after the last firing, one member at least of a party of miners shall carefully inspect the face, except in case of a miss-fire; and that any danger found to exist, or a miss-fire, shall be communicated to the relieving shift before they come to the face; and that for failure to so inspect, or so communicate a danger, each member of the party going off shall be liable to a severe penalty, a substantial minimum fine of (say) £2 being payable by each in any event—on proof only of the failure to inspect, or of the actual existence of the danger and of the failure to communicate, and even though that failure be the wrongful act of one of the party only, to whom the other or others have entrusted the duty. There would be no real hardship in such a rule, because it is always within the power of a miner, if he chooses, to wait for the relieving shift at or near the face, and so, at the expense of a little loss of time, to ensure the communication; and it would only occasionally happen that such communication would be essential. No miner who takes any interest in his work will fail to run in—even before the air has cleared enough for working—and see the effect of his shot: the fear of the penalty suggested would, it is to be hoped, outweigh the selfish desire of the indifferent workman to get away from his work as soon as possible.

At the same time, seeing that miners are always liable to be placed at a disadvantage through ignorance of the composition of the on-coming shift, a rule should be made, disobedience of which should be also severely punishable, that, immediately on its being known at the office of the mine that any such change has been made, or how any uncertainty in that respect has been settled, the full particulars of such change or settlement shall be communicated, with all possible despatch, to the members of the party underground.

A suggested compromise between changing at the brace and at the face—namely, changing at the plat—did not seem to be satisfactory: it omits the most valuable element in the latter of the two alternatives—the opportunity for actual pointing out of dangers and peculiarities.

Although it does not appear on the rules, Your Commissioner was informed of an order actually recognised in the district, which gave rise to some discussion; an order to the effect that no hole for blasting should be put down to a greater depth than 15 feet. This would apply really only to open-cut work. On the evidence, Your Commissioner is satisfied of the inexpediency of any such order: it may often happen that a deeper hole is necessary; and to leave full discretion to the miner in
this

this respect is rather in the interests of safety than tending to danger. Mr. Horwood's evidence (page 72 of Minutes of Evidence, Q. 2005, and page 85, Q. 2294) puts the matter very clearly.

Each mine appears to have its own system of serving out explosives. It would appear to be better not to make any general rule on this subject, but to leave it to be dealt with, if necessary, by Special Rules.

The last suggested additional regulation that calls for comment is one to strengthen the hands of the Inspector in respect to the reporting of accidents, a subject which will be again alluded to in connection with the next head of inquiry. It is a regulation compelling the person in charge of a mine to immediately report to the Inspector every accident that happens, on a form to be supplied by the Department or in substantial conformity with it. The system is now carried out, in effect, at Mr. Hebbard's request; but it should be a matter of compulsion. The duties of the Inspector in relation to the Department need not be fixed, except by the Department itself.

Although no mention was made of the subject, Your Commissioner, on looking through the Coal Mines Regulation Act, 1896, observes that general rules 14 and 15 appear to be applicable to all mines, with a slight alteration in technical terms, &c. In framing regulations, Your Commissioner recommends a careful perusal of these rules. No doubt there are other matters in the Coal Mines Regulation Act which would be suggestive to the mind of an expert in drawing regulations for the control of mineral mines.

The third head of inquiry directs Your Commissioner to examine—

Into the truth of the statement that the number of accidents in such Mines and Quarries has largely increased, and the cause of such large increase.

A comparison of the number of accidents that took place during the first half of the year 1897 with the number which occurred in 1896* certainly fails to bear out the suggestion that the number of accidents had at the time of the issuing of the Commission largely increased: the number during the six months from January to June, 1897, was 30, involving more or less serious injury to 31 men; of these, 9 accidents proved fatal to 10 men. These numbers include surface and true mining accidents. During 1896 the total number of accidents was 59, causing injury to 62 men: 12 of these proved fatal.

During the year 1895, inquests were held in the district in 14 cases on the bodies of 21 men.†

Comparing the first half of the year 1897 with the whole of 1896, and considering the fact that—according to Mr. Hebbard's evidence (Minutes of Evidence, page 173, Q. 5575)—during eighteen months, say from about the beginning of 1896, the mines had shown an increase of 1,600 or 1,800 workmen—an addition of about 40 per cent., the present number being about 6,000—the total numbers for the first half of 1897 would be relatively considerably less than those for 1896: though the number of fatal accidents in 1896 was proportionally lower, in relation to the time only during which they occurred, than the numbers which happened in the first half of 1897, still it is to be observed that there had been only five up to the end of May, 1897; this would agree with the average for 1896: then came the four almost concurrent casualties which brought the number up to nine, and the number of men killed to ten.

Again, assuming the number of miners at work in 1895 to be 4,500, and to average during the first six months of 1897, 6,000 (see Mr. Hebbard's evidence—Minutes of Evidence, page 183, Q. 5883), then the ratio of 14 fatal accidents for 12 months among 4,500 men is a shade higher than that of 9 for 6 months among 6,000 men. And, if the total number killed in each case be taken, then 21 men among 4,500 for 12 months is a number higher by 40 per cent. than 10 men among 6,000 for 6 months.

If, however, as a more correct basis, the accidents which occurred at Broken Hill only are considered—for, practically, Broken Hill is the scene of this inquiry—
and

* From the records in the Mines Department.

† According to depositions supplied by Department of Justice.

and if, as the best approximation that can be made, the average number of men be taken as 4,500 for 1895, 5,500 for 1896, and 6,000 for 1897, then the figures stand thus :—

Fatal Accidents at Broken Hill Mines.

	Number of Accidents.	Rate per 1,000 Men per Annum.	Number of Men Killed.	Rate per 1,000 Men per Annum.
1895	11	2.4	17	3.7
1896	10	1.82	11	2.0
1897 (1st half) ...	7	2.3	7	2.3
1897 (1st five months)	4	1.6	4	1.6
		mean 2.13	mean 2.8	

Accidents of all kinds (including fatal) at Broken Hill Mines.

	Number of Accidents.	Rate per 1,000 Men per Annum.	Number of Men Affected.	Rate per 1,000 Men per Annum.
1896	57	10.36	60	10.9
1897 (1st half) ...	28	9.3	29	9.6

The truth is that, during 1897, up to the time when one of those apparently strange concurrences of misfortune arose—generally known as a chapter of accidents—beginning with the deaths of Ryan and Taylor, there had been an unusually small number of fatal, or, indeed, of serious, accidents connected with mining in the district. The spurt—as Mr. Hebbard puts it in his evidence (page 173, Q. 5571)—of fatal accidents that followed was remarkable, and, naturally, attracted attention, while, in fact, it proved nothing; nor did it suggest any connected course of conduct anywhere. Ryan and Taylor both met with their deaths on Friday, June 4, in the open cuts, by distinct causes—Ryan, in Smith's cut, from being struck by a falling stone that had probably been shaken loose from the slope above the working face by the vibration of blasting; and Taylor, on the evening of the same day, by a run of stone in Harry's open cut, after all apparently loose or suspicious ground had been barred down. In the former case, the Coroner's Jury attached no blame to anyone; in the latter, they censured the ganger, Humphries, for allowing Taylor to work in what appeared to them a dangerous place; though the evidence indicated that proper care had been taken, and that the run of ground was such as could not have been foreseen.

On the 5th of June, Kennedy and Sawyer were killed at Tarrawingee, over 40 miles away, in a totally different manner; the shift-boss in that case being certainly to blame for a, perhaps, not unnatural piece of carelessness in using an iron bar to force down a piece of bagging that had jammed in a "bulled" hole, partly recharged with powder. Whether the explosion that followed and killed the two men, by causing them to fall backwards into the quarry, was the result of a spark from friction, or heat from sudden compression of air, is uncertain. On the 8th of June, Andrewatha was killed at Block 10 by a most extraordinary—and, it seems, unprecedented—mishap, the sudden running out of a flat wire winding-rope that was being turned end for end, the bight of which was left hanging, in a loop, down the shaft, one fall being attached to the brace, and the other clamped between two pieces of 10 in. by 10 in. Oregon timber laid across the shaft, and bolted together through and through. After being suspended thus for some two hours, the rope suddenly slipped between the timbers. The rush and increase of weight in the bight caused the other end also to carry away; the part of the rope coiled at the surface caught Andrewatha as it ran down the shaft, and killed him. Whether it was that the nuts of the bolts had not been screwed up tightly enough, or that the tension on them, and the compression on the wood and rope and the hessian with which it was served, gradually acting, had loosened work at first properly secured, can only be conjectured: it seemed—from the fact that the rope hung immovable for two hours, and that the plan had been successfully, with a much longer bight, adopted before—that the mishap was a pure accident.

Looking at the disconnected nature of these accidents, especially in the light of the history that preceded them and the pause in similar occurrences that followed, Your Commissioner can see in them no significance—nothing to suggest any peculiar relaxation of human care or increase in human perversity, to account for their concurrence. They seem simply to deserve the name of coincidences. But they

evidently intensified an idea, curiously, though illogically, founded on the very care which has been taken to prevent accidents, by scrupulous investigation of every one that happens, that the Broken Hill mines are peculiarly liable to casualties. At page 173 of the Minutes of Evidence, beginning with Q. 5561, Mr. Hebbard has described the system which he has adopted of reporting all accidents of any consequence. Again, at page 183, Q. 5883, he alludes to the subject: and, in answer to Q. 5888, he explains how it comes about that miners in the Albert district, as compared with those in other parts of the Colony, unfairly appear to the public to be peculiarly liable to injury, when in point of fact they are probably, by comparison, remarkably safe in that respect. In answer to Q. 5883, Mr. Hebbard gives his conclusion, drawn from his own experience, that the annual average of fatal accidents in the district is about 2·4 per 1,000 men employed. On the Proprietary mine—by far the largest in the district—employing at Broken Hill alone about 2,500 men—Mr. Stewart says (page 93 of Minutes of Evidence, Q. 2522) that the number of fatal accidents on that mine has been under 2 per 1,000 per annum, while, considering the kind of work to be done, three would not be excessive. A table showing, approximately, the dealings of this mine at Broken Hill only (see Mr. Stewart's evidence, page 93 of Minutes of Evidence, Q. 2517 &c.), will give a practical idea of the work done by the company in connection with which so small a proportion of fatal accidents has occurred:—

Tonnage of Material Handled.

	In open cut.	Underground.
	Tons.	Tons.
Ore, per annum	100,000	300,000
Waste „	400,000
Filling „	150,000
Coke, per month	3,500
Coal „	3,000
Timber „	800
Flux „	7,500
Bullion „	2,200
Slag „	22,000

Quantity of Explosives Used.

	Tons.
Nitro-glycerine explosives, per month	5
Gunpowder and low explosives „	7

Payments Made.

	£
Wages, per month	30,000
General Stores, per month	4,500
Timber, per month	3,500
Coke „	11,000
Coal „	4,500

Men Employed.

	Men.
Underground	1,000
In open cut	350
On surface works	1,150
Total, employed by the Company	2,500

The evidence of other managers bears out fully the same conclusion—that very few deaths have occurred in proportion to the number of men employed.

Mr. Polkingborne, in his evidence (page 47 of Minutes of Evidence, Q. 1364) deposed that (according to a report which he accepted as correct), among 1,650 members of the Amalgamated Miners' Association working at Ballarat in 1896, there had been 5 fatal accidents: this is equivalent to 3·03 per 1,000.

Although some of the witnesses called, who had no data to go by, and whose minds were evidently impressed by the sensational concurrence of fatal accidents in June, expressed an opinion that casualties had increased of late—as they certainly had, to a remarkable extent, in those few unfortunate days; yet all those who exercised any reflection on the matter agreed that there had been no general noticeable increase, in proportion to the number of men employed.

The

The effect of so many fatal accidents taking place about the same time was no doubt heightened by the fact that during the months of May and June the total number of casualties, including those that resulted in death, was above the average; though the significance of this fact disappears when the whole of the accidents for the eighteen months beginning on January, 1896, are tabulated. They stand thus:—

Month.	1896.		1897.			
	Broken Hill only. (Probable average number of men—5,500.)		Whole District. (Number of men uncertain.)		Broken Hill only. (Probable average number of men—6,000.)	
	Number of accidents.	Number of men affected.	Number of accidents.	Number of men affected.	Number of accidents.	Number of men affected.
January	0	0	6	6	6	6
February	7	7	1	1	1	1

December	4	4
Total for 12 months ...	59	62
Total for 6 months	30	31	28	29
Monthly average ...	4.9	5.2	5.0	5.2	4.6	4.8

N.B.—The irregularities in this list show how accidents apparently come in spurts.

As to the cause of the accidents that had occurred, there was hardly any difference of opinion among the witnesses that the incompetency of men representing themselves as miners, and having no real knowledge of the work, had contributed very largely. There has of late years been an exodus of many of the best men to Western Australia; and their places have been taken by men, principally from South Australia, drawn from all classes of labourers. A return given by Mr. Stewart seems to indicate that it is due to the vigilance of the mine managements that the number of accidents has not increased considerably within the last twelve months. It gives the actual numbers of men discharged for misconduct or incompetency from the Proprietary mine from June, 1895, with the reasons; and the numbers of men passing through the books (page 93 of Minutes of Evidence, Q. 2517, &c.). The return is as follows:—

Causes of discharge of men.	For twelve months ending	
	June 30, 1896.	June 30, 1897.
Drunkenness on works	24	34
Smoking underground	39	27
Lighting fires underground	2	0
Leaving undischarged holes in "face"	0	8
Leaving shoots uncovered	0	4
Sleeping underground	2	9
Quarrelling underground	2	2
Total	69	84
Incompetency*	210	461
Total number discharged	279	545
Total movement of men (including men re-engaged)	2,104	3,138

* Mr. Thomas, underground manager on Block 10 Mine, says about 50 per cent. of miners now employed are incompetent (Minutes of Evidence, page 116, Q. 3249).

The

The first total shows an addition to the number of such acts as steady, competent, miners would not be likely to indulge in; the second shows more than a doubling of cases of want of ability in itself calling for dismissal; and the third indicates an increase, by nearly 50 per cent., in an unsettled or migratory tendency; all these changes suggesting a falling-off in the proportion of experienced men, of settled habits.

In accounting for accidents—assuming, incorrectly, that there had been a substantial increase of late—several of the witnesses insisted upon the idea that the contract system was responsible for them, in that it created a tendency among miners to rush their work, in order to get through as many sets as possible within the fortnight, whereas, on the day-labour system, they were naturally inclined to do everything to secure their own safety. On the other hand, it was urged by the witnesses who stood in a favourable relation to the management that the contract system, by placing men in a more independent position and making good work an element of personal success, improved the tone of the miners, and tended both to make them more competent and to attract better men to the mines. It was conclusively proved that the average wage earned under the contract system is in advance—and in some cases very much in advance—of the ruling wage upon which the prices offered by the management are based, at so much a set, in stopping on the square-set principle: this ruling wage is 9s. per man per shift; and it is clearly proved that, without running undue risks, or working unduly hard, men can make at least that amount. In fact the average paid by the Proprietary mine has been about 10s. 6d. or 11s. (Mr. Horwood's evidence, page 68 of Minutes of Evidence, Q. 1916). At page 66, Q. 1876, Mr. Horwood explains the system, and gives the reason for reducing the duration of contracts from a month to a fortnight. And, on the whole evidence, Your Commissioner is satisfied that it is absurd to attribute accidents to the contract system, which has so largely increased the efficiency of the work on the mines.

The general agreement, however, in the belief that the incompetency of the men was the prevailing cause of accidents led to the expression of an opinion, to which there was no exception, that a system of apprenticeship of boys, not under sixteen, would, if it could be instituted, be of great service to the mining industry. It is curious that absolutely nothing of the kind exists, though there are youths apprenticed to the mine management in surface work. This is a matter that cannot be touched by any regulation: perhaps it might be helped by legislation: it lies largely with the miners themselves; whose object it should be to have their sons, if intended to follow their fathers' calling, properly and systematically instructed: and it is also essentially a question that the Miners' Association can assist or hinder. Your Commissioner does not feel justified in going further into it here.

Finally, therefore, as to this head of inquiry, Your Commissioner finds that the statement that the number of accidents in the mines and quarries in the Albert Mining District has largely increased is not true: and it follows, therefore (though the question of the causes of accidents generally has been touched upon) that there is no large—nor is there any—increase requiring explanation.

The fourth head of inquiry runs thus:—

Whether the open-cut system of work is specially dangerous; and, if so, whether this is due to such work being carried on at night; and whether such system should be prohibited; and, if necessary, to suggest regulations for the purpose of safeguarding the lives of the miners and other persons employed in that class of work.

Although the open-cut system of mining seems to be a new one in Australia, it has been carried on in other parts of the world to very much greater depths than that to which it extends at Broken Hill. Mr. Stewart gives an account of large works in Spain in existence for at least thirty years (page 87 of Minutes of Evidence: and page 115, Q. 3198.) Although one witness, O'Brien, whose demeanour indicated very strong animus—possibly the result of his having been dismissed for refusing to obey orders, given to secure his own safety—and who was conclusively contradicted on many important points, gave evidence which, if it is to be believed, would show
the

the utmost recklessness on the part of the manager and gangers employed by Baxter and Saddler, the principal contractors under the Proprietary Company for their open-cut work; still, from the whole of the evidence taken together, Your Commissioner is satisfied that there is no foundation for the allegation that open-cut work is specially dangerous. Certainly two men, Ryan and Taylor, were both fatally injured on the same day, June 4 last, in two adjoining open cuts, or sections of the same cut: their cases have been already mentioned: but it is remarkable that, before these accidents, there appear to have been none of any kind in the open cuts during 1897, except one causing the death of a man named Gainey* in a peculiar manner, through an accident to the skip hoisted by means of the "flying fox," a truck running on a rope tramway, and only two—both from falling stones—neither of them fatal, in 1896. Mr. Shaw, who has been in charge of Baxter and Saddler's open-cut works since October 1, 1892, and who has had under him an average of 300 men, who have moved 2,000,000 tons of material and have used nearly 500 tons of explosives, explained the four fatal accidents which had occurred under him during the four years and three quarters. It is noticeable that only one of these accidents resulted from the peculiarity, upon which the special risk is supposed to depend, of the open cuts, as such; namely the danger of falls of stone, either loosened by "barring down," or coming away unexpectedly. (Minutes of Evidence, pages 144-145). William Harry, contractor on the open cut on Block 11, proved that Taylor's accident was the only fatal one that had occurred on his contract, and that he had never had one of any kind at night except that which befel Taylor, or any other serious accident by day or night. (Minutes of Evidence, page 154). William Smith, another contractor on the open cut in Block 11, described Gainey's and Ryan's accidents. (Minutes of Evidence, pages 157-158). Gainey was killed on January 28, 1897. Between the accidents to Gainey and Ryan no serious casualties had happened on Smith's contract. There is always an element of danger in the use of over-head hoisting gear of all kinds, such as has to be employed on open cuts, except where the spoil is passed directly down to the stopes below for filling; the open cuts being excavations made for the purpose of winning the upper part of the lode, taken out below by stoping; but the evidence proved that strict orders were given to the men to "stand from under," and that the main difficulty was to enforce this rule; and that every possible care was taken, both by the company and by the contractors, to secure the safety of all gear used in vertical hoisting, and in hauling trucks up inclined lines of rails to the surface, or to intermediate levels, to pass through tunnels to the tips, &c. Although both Harry and Smith had a most unfortunate experience, there was nothing to show that any relaxation of care or changed conditions had led to the fatal accidents in their cuts; taking Baxter and Saddler's experience together with theirs, the excessive risk of open-cut work seems to disappear entirely.

Among the incidents of open-cut work, in which it is almost entirely used, the system of "bulling"—consisting of the enlargement of the bottom of a hole by exploding a small charge in it, in order to enable it to hold a large charge concentrated at one point, giving to the explosion a more effective lifting power—was gone into at considerable length. By far the larger balance of testimony was in favour of its utility and safety, if only a fair amount of knowledge and care is applied to its use. It involves some peculiar risks, the main one being the possibility of there being left in the hole to be charged, which must frequently be surrounded by radiating cracks, some smouldering matter or rock dangerously heated by the concussion. Your Commissioner would not recommend that the practice of "bulling" be forbidden: its regulation has been touched upon in the suggested alterations of the rules concerning explosives.

A mode of excavation, connected with open-cut work, in use long before Broken Hill was named or even known,† has come in for much abuse—partly, it seems, by reason of a name. A heading, or tunnel, is driven into a face to be worked down, in any excavation deep enough to make the plan appropriate. The tunnel extends outside of the face, where it is, in fact, a built covered-way. It is logged or slabbed across on the top, being, of course, timbered on the sides in the usual manner. A truck runs on rails within. Wherever it is suitable to the state of the face

* This name appears as Gaynor in the Minutes of Evidence.

† Mr. Shaw, Engineer-in-charge for Baxter and Saddler, says the plan has been "in existence from time immemorial" (Minutes of Evidence, p. 146, Q. 4122).

face to do so, a sort of hatchway is opened in the roof; and the truck is run under the opening and filled by a man standing on the side of the kind of hopper formed by the material as it is barred or shovelled down from the face. He is not surrounded by a bank on all sides, one, at least, being open. Another man, down below, regulates the filling of the truck; another, or others, are working down the spoil from above. One of the logs in use on the edge of the hatch, to which various uncomplimentary names have been given by navvies, came to be called at Broken Hill the "Chinaman"—no doubt an unintentional compliment to a steadily useful and long-suffering race. (Mr. Horwood's evidence: Minutes of Evidence, page 76, Q. 2116.) After a time the whole contrivance was known by this, to the average European, opprobrious title. And—partly, perhaps, from this accident; partly, it may be, because the use of the "Chinaman" is an enormous saving in labour—this mode of working has acquired an evil name. The evidence, and the nature of the contrivance, convinced Your Commissioner that it is not only a serviceable, but a safe, mode of working; much safer, in fact, than the plan of filling from a bank under the face into a line of trucks. Before it came into use, according to Mr. Hebbard's evidence (Minutes of Evidence, page 182, Q. 5858), minor accidents were much more numerous.

In the past, although care was taken to light the open cuts effectively, electric arc lights being used for the purpose, it was found that the plan adopted was not quite satisfactory. Yet experience has from the first shown that in fact accidents were less common at night than in the day-time; partly, no doubt, because of the fact that fewer men were at work at night than by day. On the principal open cut, Baxter and Saddler's contract, it was proved by their engineer that there had actually been no accidents at night. (Minutes of Evidence, page 146, Q. 4432.) This contract, however, had not been working at night for about thirteen months. But now, and for some time back, incandescent burners are in use, so contrived as to be easily moved. Their light is very steady and diffused; more so, and easier to work by, than that of the arc lights. Altogether the change is a great improvement. The practice is to bar down all loose stuff before the night-shift comes on, unless it is then broad daylight: on Block 11 they come on at about 4:30 p.m. (Mr. Horwood's evidence: Minutes of Evidence, page 76, Q. 2100). Your Commissioner is satisfied that no extra risk is practically involved in night-work; of which, however, very little is being done at present. During the summer months the comparative ease and comfort of working in the open cuts by night must be very great, seeing the intense heat which prevails at Broken Hill—so far inland, in latitude 32° S., about 1,000 feet only above sea-level—from November to March: though the conditions under which miners have to attempt to sleep in the day-time largely discount the advantage of working by night. What are really required are well ventilated underground dormitories, in the silence and coolness of which miners would be able to secure the true sleep they need to fit them for their hard work.

As to the necessity for regulations to be applied to open cuts. In the first place, although, as appears in a former part of this Report, Your Commissioner is of opinion that the word "mine" in the interpretation section of the Mining Act, 1874, and the words "other Mining Workings" in subsection 3 of section 64 of the Act, include open cuts, and that such excavations are also covered by the definition of the word "mine" in subsection 5 of Regulation 1, still, seeing that in fact no such thing as an open cut of the nature of those in question was apparently contemplated by the framers of the Mining Act, 1874, and that there is a doubt on the question of construction, it would be expedient, both in legislating and in drawing regulations, to express clearly the intention to include, where it is proper that they should be included, open cuts and quarries.

As to any special rules to be made in relation to open cuts, it was pressed upon Your Commissioner to suggest the providing of a minimum batter, instead of leaving this question in the absolute discretion of the Inspector. Considering the infinite variations in conditions—in hardness of rock or solidity of soil—in their susceptibility to chemical or mechanical change—in cleavage and strike, in relation to line of excavation—and in numerous other ways, resulting in a limit of the difference in the angle of safety of, probably, not less than 60 degrees at least, Your Commissioner is of opinion that it would be worse than useless to provide for a

minimum

minimum angle from the perpendicular at which the side of an excavation should stand; inasmuch as such rule might tend to unsafely weaken the sense of responsibility of an Inspector, who, if he felt that his authority to determine the angle was absolute, would always be careful to keep well on the side of caution. The only rule that Your Commissioner can suggest is that no undermining of a face shall be allowed unless the ground from the bottom of the excavation to a depth of at least 100 feet be absolutely solid for a distance horizontally in every direction of at least 200 yards from the ground undermined.

There are so many varieties of mechanism used for raising material out of open cuts—such as inclined planes, with rails and trucks; cranes of various patterns; wire-rope travelling hoists, like the “flying fox”—that it is impracticable to suggest any general rules to control these. The “Special Rules” of each mine would cover various matters connected with this kind of work. Rules dealing with open-cut work, in the book form suggested in connection with underground mining, should be similarly supplied to men engaged in this kind of excavation. Regulations and rules affecting open cuts should be set up at the office, and in conspicuous places on the work. All the duties and powers of an Inspector should be made to apply, *mutatis mutandis*, to open cuts.

The fifth head of inquiry is this—Whether the risk to the persons employed in the said Mines and Quarries is increased by reason of incompetency on the part of Managers and Subordinate Officials.

As to managers and officials generally of mines at Broken Hill, there was an almost unanimous opinion expressed by the witnesses that they are thoroughly competent men. Mr. Polkinghorne’s evidence on this point was very emphatic. (Minutes of Evidence, p. 40, Q. 1193–4.) Shinnick (Minutes of Evidence, p. 100, Q. 2717) and Kelly (p. 107, Q. 2956) certainly spoke in a disparaging way of the subordinate officials—shift-bosses; but Your Commissioner does not attach much weight to the evidence of these witnesses, whose animus was too apparent. Finan, a shift-boss himself in the Central mine, who seemed an able and intelligent man, scrupulous not to conceal his honest convictions (Minutes of Evidence, p. 141, Q. 4276), said he had known of four, in his opinion, incompetent shift-bosses. Two, however, had been discharged for not being capable (Q. 4281); another, the witness believed, was no longer in the position of shift-boss. Naturally, and properly, Finan was very reluctant to name the officers in question; when compelled, he did so in writing, under a pledge of secrecy imposed by Your Commissioner (page 142, Q. 4300). The evident anxiety of the management, expressed through their solicitor, Mr. Edwards, to arrive at the truth, was only consistent with the clearly pervading strong desire shown by all the mines to purge their lists of officers of any whose ability they doubted, and to get rid of workmen whose want of intelligence or of care imperilled the safety of the men or of the mines. It is possible that, by mistake, or through favour leading to the absence of a sufficient test of competency, a man may now and then be injudiciously appointed; but, taking the matter broadly and fairly, it can be safely asserted that incompetency in mine officers is a non-existent factor in producing accidents.

O’Brien, a very prejudiced witness, whose positive statements—as to care of ropes, machinery, &c.—were as positively, and, Your Commissioner believes, truly, contradicted, spoke strongly of the carelessness, and more strongly of the severity, of the gangers employed by the contractors on the open cuts, whom he described as “those sweating, slave-driving, gangers” (Minutes of Evidence, p. 59, Q. 1631); W. J. Williams, of whose accuracy—as far as intention goes—Your Commissioner has no doubt, deposed to having seen a “powder-monkey”—the man employed by the contractors to charge and fire holes—drunk on the work (Minutes of Evidence, p. 10, Q. 300), and (p. 11, Q. 302) to general looseness in management by the gangers. Although Your Commissioner attaches little weight to O’Brien’s statements, still it appears, taking the evidence of the witness Williams, that there have been gangers employed whose conduct has been reprehensible; but it is two years since Williams worked on the open cuts; and at present Your Commissioner is satisfied that due care is taken, and successfully, by the contractors, over whom the very strict management of the Proprietary Company exercises a full control, to have competent and careful officers.

The

The limestone quarries at Tarrawingee, situate over 40 miles from Broken Hill, were visited by Your Commissioner; but, without the expenditure of time urgently required for the purpose of continuing the taking of evidence at Broken Hill, it was impracticable to examine witnesses at the former place. Everything there bore the appearance of care and good management. A serious accident, causing the death of two men, Kennedy and Sawyer, had recently happened (this has already been alluded to); the ganger, Lawson, who was to blame in that case for allowing an iron bar to be used in a partly charged hole, to cut away some bagging that had got jammed about 12 feet above the powder, acted against general orders, and deserved to be, as he was, severely reprimanded by the jury at the inquest; though certainly the occurrence was one that no one would have anticipated; but, beyond Lawson's improper act, there was nothing in this, or the former casualty, by which Williamson was killed, on the 7th of May last—evidently a pure accident, except, perhaps, for some want of care on Williamson's part—to suggest incompetency on the part of any official employed at the quarries. Work will soon be discontinued there altogether: and Your Commissioner did not think it expedient, either to bring a number of witnesses, who could hardly be spared, from their work, or to go there again himself for the purpose of taking evidence.

To the question put under this head, 5, Your Commissioner finds an answer in the negative.

As to the sixth head of inquiry—whether the services of additional Inspectors are necessary—Your Commissioner, having carefully considered this question, and being at first inclined to think that, over such an enormous area as that of the Albert district, the supervision of at least two Inspectors is essential, has, on reflection, come to the conclusion that the appointment of another Inspector is at present quite unnecessary. Mr. Hebbard's description of the nature of the outlying mining patches (Minutes of Evidence, p. 172)—one of which, Tarrawingee, so far as the work done there can be called mining, will very shortly cease to exist, as the smelting of ore, for which the limestone won at Tarrawingee is required, is shortly to be transferred from Broken Hill to Port Pirie—and of his duties in relation thereto, leaves it quite evident that he is practically resident Inspector at Broken Hill. And another Inspector would have nothing to do if Mr. Hebbard continued to attend to his work as he has in the past. Your Commissioner had a good opportunity of forming an opinion of Mr. Hebbard: and the opinion—which Your Commissioner thinks it material in this relation to express—is that he is a gentleman most thoroughly suitable for his office; conscientious, intelligent, energetic, and determined; with good sound practical experience; taking a steady interest in his work; continually aiming at improvement in all he has to do with; absolutely independent; with a manner that conciliates those whom he has to direct and control. Your Commissioner may be allowed to suggest that an office of such responsibility, involving much physical risk and labour, often entailing unpleasant and invidious action, and requiring special training and knowledge, should, in justice and in the public interest, be well remunerated: a salary of £500 per annum would, in Your Commissioner's opinion, be the very lowest fairly attachable to the appointment.

The seventh and last head of inquiry is as follows:—

As to the best means of making known to all persons employed in and about the said Mines and Quarries the statutory enactments and Regulations relating to the inspection of such Mines and Quarries; and to make any recommendation which Your Commissioner may deem advisable in the premises.

Your Commissioner has already dealt with and made suggestions in relation to the question of making known to miners and others all material rules and regulations: it is improbable that any actual statutory enactments would be so worded as to require publication, as all matters affecting workmen would probably be contained either in the General Regulations and Rules or in the Special Rules of each mine.

Your Commissioner would, however, again urge the adoption of the suggestion as to regulations, &c., in pamphlet form: it is probable that—especially if, as it should be, the type is clear, and not too small—many men, who are ashamed to acknowledge

acknowledge their slowness in reading by standing in the presence of others spelling out a copy posted up, will quietly, at their leisure, read their little books and learn therefrom the most useful parts.

Various subjects cropped up in the course of the inquiry; and various suggestions were made. Some of these may be dismissed in a few words. One was a plan of certificating—(1) shift-bosses—(2) miners. Neither of these ideas seems to Your Commissioner to be practicable. Then it was indirectly suggested that cognisance should be taken of the one-sided nature of the contracts (Appendices 3–4) made by the Proprietary Company with the men. This was a matter clearly beyond the scope of regulations or of this Commission: the form is, no doubt, the result of long experience and careful study; and any attempt to take unfair advantage of the conditions is very rare: the influence of the Association, and the self-interest of the mines, prevent this: and Your Commissioner believes that the mine managers have, as a rule, a real wish to further the interests of the miners, while protecting those of their own employers.

One matter, however, of much importance was mooted, namely the establishing—by statute, of course—of some tribunal to deal with accidents, connected with mines, not resulting in death. The analogy of section 23 of the Coal Mines Regulation Act, 1896, is in favour of this contention. And Mr. Polkinghorne's argument is a sound one, that it is an anomaly that it should only be when an accident causes death, and, therefore, only when the witness who could have given the most material and direct evidence of its circumstances is not in existence, that an inquiry, perhaps of a very useful nature, in helping to avoid further mishaps, can be held. Various suggestions were made as to the composition of this tribunal, spoken of as a "Board"; that it should consist partly of miners, partly of managers, partly of a Government officer. On the other hand, a strong opinion was expressed by some witnesses that such a tribunal would be useless, or worse, and that all that is required is the existing system whereby the Inspector finds out and reports to the Chief Inspector, who communicates to the Minister, all that can be discovered as to the cause and nature of an accident. But then it is clear that the Inspector's own action in the matter may be questioned: it may be that it has been the result of his own want of care or of discretion in controlling the action of a mine officer.

On the whole, Your Commissioner is of opinion that some such tribunal would be useful, and that its operation would tend to the general taking of a just view of the facts of serious, but not fatal, accidents. And Your Commissioner does not regard the risk arising from mine officers being taken away from their duties, to give evidence, (Minutes of Evidence, page 92, Q. 2498) as a substantial objection. Its operations might be, if it is constituted in such a simple manner as Your Commissioner is about to suggest—and they certainly ought to be—so arranged on each occasion as to minimise this possible evil. But a representative Board appears to Your Commissioner a clumsy and objectionable contrivance. The very fact that a tribunal is representative tends to prevent its being impartial. All that seems to be required is the possibility of holding, as soon as is practicable after the accident, an inquiry before the Warden or Police Magistrate. The Inspector should inquire and report, as he now does: but he should also, at once, on receipt of the report of the accident, forward it on to the Clerk of Petty Sessions; the Warden or Police Magistrate should then determine whether to hold an inquiry or not, either on his own motion, or at the request of the Inspector, or any one acting on behalf of the mine or of any person injured. The proceedings would be similar to those on a magisterial inquiry: and the finding should be reported to the Minister for Mines.

The position of Broken Hill makes it practically impossible for explosives to be supplied from any other colony than South Australia. In South Australia there is an Inspector of Explosives; and great care is exercised in examining all that are imported, and, if it is thought expedient, destroying any that appear of bad quality. The nitro-glycerine compounds, it is well known, are not always in a satisfactory condition; and nitro-glycerine, separated from the infusorial earth with which it is mixed to make dynamite, or from the other vehicles used, is very unstable, and may explode unaccountably—as in the well-known Bridge-street case, which, more than thirty years ago, first brought nitro-glycerine so forcibly to the notice of the people of Sydney. And not only in the possibility of their unforeseen explosion, but
in

in their becoming inert, and refusing, in whole or in part, to explode, under conditions which are supposed to insure that result, are nitro-glycerine compounds in a damaged state or of low grade dangerous. The evidence seems to prove conclusively that dynamite plugs have survived the concussion of a blast of which they actually formed a part of the charge; yet it appears that these plugs have exploded afterwards under slightly different conditions of friction or percussion. It is these peculiarities which make it necessary to investigate, or blow out with an explosive, a hole of the kind known as an "old bottom," provided for in the suggested alterations of the rules dealing with explosives. If Broken Hill were ever enabled to trade with New South Wales—as by the laying of a narrow-gauge line similar to that which, provided, at moderate cost, by a private company between Broken Hill and Tarrawingee, connects those two places with such remarkable success—then the question of introducing dangerous explosives that had not passed a careful examination would be a very serious one in relation to the safety of the large mining population of the Barrier. The expediency of introducing—by statute—a system of inspection, at least as effective as that in force in South Australia, is, to the mind of Your Commissioner, a very important one. In fact the handling of any explosive, even in small quantities, requires strict regulation. New explosives of enormous force and of erratic tendencies are continually being invented, and are occasionally carried about as samples: the exhibitions of their effectiveness which this is likely to lead to should be discouraged.

In connection with the question of explosives, Your Commissioner, though conscious that the terms of the Commission were being somewhat extended thereby, allowed Mr. Wilks, Stock Inspector, whose evidence will be found at page 9 of the Minutes of Evidence, to bring forward what he considered to be the dangerous position occupied—with the permission of the authorities—by the explosive magazines belonging to various companies and contractors at Broken Hill. These magazines, a series of sheds, built of galvanized iron, and said to be lined inside with "match board" lining only, stand on the edge of a plain on the north side of Broken Hill, about half a mile or more from a prolongation of the town along William-street, Willyama. Between the dwellings on this street and the magazines is the plain: close behind the sheds is a ridge of moderate height: a few hundred yards further on, over the ridge, and easily accessible by another route from the town, is a depression. The hills cut this position completely off from the town. The plain is a reserve on which sports are commonly held. The magazines are entirely above ground, and are only protected by a galvanized iron fence closely built round each of them. There are lightning conductors—more or less efficient—fixed on the sheds; which are so constructed that a stray bullet would probably go through them with ease. Whether this would explode the contents or not, if it hit a case of explosives, may be doubtful. The whole of them—with, when Your Commissioner looked at them, the exception of one, which appeared to be supposed to take care of itself—were under the charge of an old man who had been nearly killed by accident in a shaft not very long ago. He was relieved by another man, each doing 12-hour shifts.

To one who is not an expert in explosives, the position of these magazines, and the way they are constructed, certainly lead to the conclusion that they are unnecessarily risky. The ridge at the back would probably aggravate the effect of an explosion on the side of the town. The way they are built makes it certain that their contents are subjected to enormous and rapid changes of temperature. Presumably this is not a proper condition to which to subject delicate chemical compounds, due, for their effectiveness, to the instability of their chemical affinities. On the other hand there is apparent:—1st. A safe and convenient place to which the sheds can be moved. 2nd. A good opportunity of protecting them with cheaply-constructed low earth mounds surrounding them, and a thick layer of sawdust forming a ceiling over them and a filling round them; or some such inexpensive protections, which would together make them both bullet- and sun-proof, in their new position, without super-imposing weight enough to appreciably aggravate the effect of an explosion. Mr. Wilks, probably correctly, estimated the whole cost of moving the sheds as they are at £150 at the most. Yet he deposed—and rightly, it appears, expressed indignation at the waste of public money involved—that it is in contemplation to spend a large sum (over £2,000) in putting up a mound between the present site and
Broken

Broken Hill, in order to break the force of an explosion acting in the direction of the town. Nature has put up great mounds all over the surrounding country: neither Mr. Wilks nor Your Commissioner can see why any more should be built. Mr. Wilks may be quite in error in this matter: knowing and seeing only as much as that gentleman, however, Your Commissioner thoroughly agrees with him.

There is another matter calling for comment and suggestion. There have been various opinions expressed as to the causes of miss-fires, and of shots hanging fire. One witness deposed to an observed lapse of 35 minutes between the spitting of the fuse and the explosion in a fairly deep hole. On the one hand it is a common opinion among miners that, where the column of powder is broken in a fuse, the cotton or other material of which it is made will sometimes continue to smoulder till it again sets fire to the intercepted core. On the other hand this has been disputed; and the cause of hanging fire has been ascribed to the fuse failing, through intervention of sawdust from the packing, or otherwise, to ignite and explode the fulminate of mercury in the cap. Then the theory is that the dynamite is set fire to: it burns very slowly under the circumstances, till the temperature of a small mass of it rises to 430° Fahrenheit, at which degree it explodes. This, however, would not explain hanging-fire in a powder charge; and in Foster's text-book of ore and stone mining (1894), at page 217, will be found a statement that the coloured threads running down the centre of the core of powder, and serving as trade-marks, are, in some fuses, impregnated with potassium nitrate, with the view of carrying the fire along in case of interruption in the continuity of the core.* And Foster certainly assumes that hang-fires are due to the defective action of the fuse.† As defective fuse is nearly as dangerous as defective explodents, and as there is so much uncertainty about the action of fuses in this relation, Your Commissioner promised—in the course of the inquiry—to suggest, and now expresses his opinion that it would be expedient, that careful experiments should be made—which the representatives of the Broken Hill and other mines might be invited to attend—by order of the Department of Mines, on the action of various known makes of fuse, with broken cores and otherwise.

It was contended by one witness, Mr. Jabez Wright, that a co-efficient in producing accidents was the difficulty of proof on behalf of the plaintiff under the Employers' Liability Act. This, he urged, had the effect of making employers less careful than they would be if the onus of proof of defect or negligence were removed from the plaintiff, and the onus of disproof were laid on the defendant. Your Commissioner leaves this difficult question of legislation to be debated, as it probably will be, in the future; merely remarking that the negligence of another is so difficult of proof, unless it be inferred from the very fact of an accident's having taken place, that the contention appears to have very good reason in its support. Beyond this, however, seeing that the balance of evidence strongly points to the conclusion, at which Your Commissioner has arrived, that the want of care and of discretion among workmen themselves is the prevailing cause of accidents at Broken Hill, it follows that, rather than tending to reduce the number of casualties, an amendment of the law which would make the remedy of the employed against the employer easier would have the opposite tendency.

Lastly, a suggestion was made that the present state of the Jury law imposes upon the working of mines a risk that should not be incurred, by occasionally depriving the workers of the benefit of regular management and control. It was contended that general managers, underground managers, and the heads of departments generally, as also engine-drivers on mines, should be exempt from service on juries. It was doubted whether shift-bosses ought or ought not to be included in the exemption: as there are so many men employed on a mine capable of undertaking the duties of a shift-boss, this extension was not pressed. Your Commissioner agrees with the proposal to exempt general and underground managers, heads of departments (including engineers in general charge), and engine-drivers, having control of or working in any mine that employs not less than twenty men.

In

* *Quere*—caused sometimes by stretching, in straightening fuse: Day's opinion (Minutes of Evidence, page 150, Q. 4589).

† Mr. Thomas, underground manager on Block 10 Mine, mentions a case, twenty years ago, of a charge exploding after hanging fire for sixteen hours (Minutes of Evidence, page 122, Q. 3407). Mr. Smith, contractor, has known an interval of thirty-five minutes (Minutes of Evidence, page 160, Q. 5004).

In closing this Report, Your Commissioner wishes to call attention to the able and thorough manner in which Mr. Wright, who acted as Secretary, and Mr. Little, the shorthand-writer—upon whom a very heavy strain was imposed at Broken Hill and since, in consequence of the rapid rate at which it was necessary to take the evidence—have carried out their duties. Without making this Report, which in length has already exceeded Your Commissioner's intention, unduly long, Your Commissioner feels that, in the limited time at his disposal, he has failed to do justice to all the multifarious subjects to the introduction of which the general terms of the Commission naturally led. Your Commissioner can only hope that the information acquired and the conclusions at which he has arrived will be of service in settling the questions propounded by the Commission.

I have the honor to be,

Your Excellency's obedient Servant,

(Signed) C. E. R. MURRAY.

E. C. WRIGHT,
Secretary.

Thursday, 7th October, 1897.

ROYAL COMMISSION APPOINTED TO INQUIRE INTO THE WORKING OF
MINES AND QUARRIES IN THE ALBERT MINING DISTRICT.

MINUTES OF PROCEEDINGS.

MONDAY, 5 JULY, 1897.

His Honor the Commissioner, at 7:15 p.m., left Sydney for Broken Hill.

C. E. R. MURRAY,
Commissioner.

THURSDAY, 8 JULY, 1897.

His Honor the Commissioner arrived at Broken Hill at 8:30 a.m.

At 10:30 a.m. His Honor paid a visit to what are known as the open-cuts, situated on the mine owned by the Broken Hill Proprietary Company, Limited. Mr. James Hebbard, Government Inspector of Mines for the Albert Mining District, accompanied His Honor.

The first spot seen was the northern boundary of Block 13, where the outcrop of the lode had been removed, and the lode excavated to a depth of about 60 feet by an open-cast. The cutting was about 260 feet wide by 300 feet long at the top, and 160 feet wide by 200 feet long in the bottom. The section of the lode which had been left untouched immediately south of this so as to support Wilson's shaft and engine-room was seen. The gear and fittings around Wilson's shaft were examined, as also were the bins for holding the ore brought from underground. Attention was directed to Messrs. Baxter and Saddler's works, and the timbers of one of the underground stopes which were being removed by the open-cut came under notice. His Honor next proceeded to the vicinity of Wigg's shaft, and thence to the open-cuts at Block 11, and to Smith's and Harry's contracts.

His Honor, at 3 p.m., accompanied by Mr. Hebbard, visited the northern nest of furnaces at the Broken Hill Proprietary Mine, the blower-house and engines, and the tapping and feed floors; and also saw the electric light and air-compressing plants. The leaching works, the pumping-house, and the nest of boilers at the southern smelters of the mine, were also viewed.

C. E. R. MURRAY,
Commissioner.

FRIDAY, 9 JULY, 1897.

His Honor the Commissioner, at 10 a.m., in company with Mr. James Hebbard, Government Inspector of Mines, viewed the open-cuts at Block 11, and saw the machinery in the engine-room at the Weatherly shaft. Thence His Honor proceeded to the Central Concentrating Works, and observed the machinery and boilers. Having arrived at the Kintore shaft, Central Mine, His Honor went below as far as the 600-ft. level for the purpose of experiencing the operation of lowering and raising the cages. The engine and the steam-brakes at the Kintore shaft were afterwards examined. Subsequently His Honor visited Campbell's shaft at Block 10, and saw the engine-house and engine, and then went to the concentrating plant, Block 10 mine, which was shown by Captain Warren, general manager of the Broken Hill Block 10 Proprietary Company, Limited.

At 2:30 p.m. His Honor, who was attended by Mr. James Hebbard, Government Inspector of Mines, proceeded to the Block 12 Broken Hill Proprietary Mine, and, at Dickenson's shaft, went down to the 300-ft. and 400-ft. levels. Mr. Edward James Horwood, the mining manager, conducted His Honor to some of the working places, and showed some of the methods of timbering in the mine.

C. E. R. MURRAY,
Commissioner.

SATURDAY, 10 JULY, 1897.

His Honor the Commissioner sat at the Town Hall, Argent-street, Broken Hill, at 10:10 a.m.

His Honor announced that the proceedings were open to the public.

The Secretary read His Honor's Commission.

His Honor said that he proposed, in carrying out the work of taking evidence, to allow any person or persons who thought that they were affected in any way by the inquiry, or likely to be affected by it, or any person or persons who volunteered to assist the Commission, to appear there as if they were interested parties, either themselves or by their solicitor, or counsel, or agent. He asked what persons were present wishing to be represented or to represent others.

Mr. John R. Edwards, solicitor, said he was instructed to represent the following companies at the inquiry:—

The Broken Hill Proprietary Company, Limited;
The Broken Hill Proprietary Block 10 Company, Limited;
The Sulphide Corporation (Ashcroft's process) Limited, (owners of the Central mine);
The South Broken Hill Silver Mining Company, No Liability;
The Broken Hill Proprietary Block 14 Company, Limited;
The British Broken Hill Proprietary Company, Limited;
The Broken Hill Junction Silver Mining Company, Limited;

The

The Broken Hill Junction North Silver Mining Company, Limited ;
 The North Broken Hill Silver Mining Company, No Liability ;
 The Australian Broken Hill Consols Silver Mining Company, Limited ;
 The Broken Hill Junction Consolidated Silver Mining Company, No Liability ;
 The Tarrawingee Flux and Tramway Company, Limited.

His Honor said that, of course, he allowed all those companies to be represented, and it was very convenient that they should all be represented by Mr. Edwards. He was very glad that Mr. Edwards had been so instructed.

Mr. John Polkinghorne, President of the Amalgamated Miners' Association (Barrier Branch), intimated that he appeared for that Association. He added that that portion of the miners who belonged to the Association had been pleased to appoint him to represent them at the inquiry.

His Honor remarked that he thought they had, perhaps, the most thoroughly recognisable right to be represented that there could possibly be. He looked upon the Amalgamated Miners' Association as the promovents in the matter, because they had, he understood, practically initiated the Commission. He understood that the miners of the district practically all belonged to the Association.

Mr. Polkinghorne replied that he could not say that. A good proportion of them did belong to the Association ; and he represented the portion of the miners who belonged to the Association. He thought he might safely say that they did not exceed half the miners employed along the line of lode.

His Honor inquired whether anyone appeared to represent any other Association of miners, or miners in any other relation.

There was no response to the question.

His Honor stated that he took it that there was no other representation of miners than by Mr. Polkinghorne.

His Honor asked whether the Department of Mines wished to be represented on the inquiry.

Mr. James Hebbard, Government Inspector of Mines for the Albert Mining District, said that he had not had any specific instructions, but that in every case in the district he appeared as the representative of the Department of Mines.

His Honor inquired whether Mr. Hebbard asked for leave to appear.

Mr. Hebbard replied that he had not had any instructions in that direction. He had not thought of appearing in any capacity except as a witness, if called.

His Honor stated that if Mr. Hebbard wished to ask questions, in order to elucidate matters which came before the Commission, he would allow him to do so. His Honor further intimated that if, at a future stage, anyone else wished to be represented, he would allow representation. Mr. Polkinghorne could now call his first witness. He (His Honor) looked upon the Miners' Association as the promovents in the matter, and that was why Mr. Polkinghorne's witnesses would be called first.

Mr. Polkinghorne stated that the Amalgamated Miners' Association, being asked whether they, as a society, intended to be represented on the Commission, gladly accepted the opportunity. They could not, however, go out of their own Society's members in getting witnesses. There were witnesses outside their ranks whom they did not feel disposed to call, considering that they should be called in some other way. He would like to name them, so that they might be called by the Commission.

His Honor said that if Mr. Polkinghorne preferred to give the names on a slip of paper to the Secretary, he would, if assured that it was believed they could give material evidence, direct that they be called. He looked upon the giving of names by Mr. Polkinghorne as an assistance to the Commission.

Mr. Polkinghorne said he would ask that Mr. Williams be called.

His Honor intimated that if Mr. Polkinghorne wished to begin, before calling witnesses, by addressing the Commission, he would be happy to hear him.

Mr. Polkinghorne said : Thank you, your Honor ; I would like to say a few words. What has mainly prompted me to appear here to-day in the capacity of representative of the A.M.A. is to bring under the notice of the Commission the fact that many of the regulations in connection with our mining laws have been ruled in our Courts to be *ultra vires*. There are really some very good clauses in the Act—better we could not wish for if they were carried out, and if power were given under the Act to carry them into effect. It has been pointed out to us that, in many of those cases that have been brought before the public, certain things which have been ordered to be done by the officer in charge or the local Inspector of Mines have been over-ruled by the law, because the regulations under which the orders were made would not hold water. We want to see everything repealed—the Mining Act of 1874, the Amending Acts, and the Regulations—and a new Act brought forward, complete in itself, and styled the Mining Act of 1897. At the same time, a new code of regulations should be brought forward, which could be carried out and given effect to. There is another thing : I would like to suggest that a Board of Inquiry be appointed on all mining fields to inquire into all accidents. Of course, in fatal accidents we would expect a further inquiry—the Coroner's inquiry ; but, in all serious accidents, the Board of Inquiry should make an investigation. In my opinion, all accidents that disable a man for a week or more should be inquired into by this Board ; and in this way much information would be elicited : which would go to show the need of the regulations being such that the local inspector could put them in force when he saw the necessity to do so. When a fatal accident takes place the chief witness is lost to us ; but when a man meets with an injury—if he is not rendered insensible—there is some chance of getting some information from him which would be of benefit.

Mr. Edward James Horwood, mining manager for the Broken Hill Proprietary Company, Limited, received permission to attend the proceedings of the Commission, in order to be of assistance to Mr. Edwards, solicitor. Mr. Polkinghorne expressed his acquiescence.

William Williams was sworn and examined.

The Commission, at 1:10 p.m., adjourned for luncheon.

The sitting was resumed at 2:15 p.m.

William John Williams and William Noble were sworn and examined.

His Honor, at 4 p.m., adjourned the inquiry until 10 a.m. on Monday, the 12th July.

C. E. R. MURRAY,
 Commissioner.

MONDAY,

MONDAY, 12 JULY, 1897.

His Honor the Commissioner sat at the Town Hall, Argent-street, Broken Hill, at 10 a.m.
Mr. John Polkinghorne, representing the Barrier Branch of the Amalgamated Miners' Association; and Mr. J. R. Edwards, solicitor (Mr. E. J. Horwood, mining manager, assisting), representing mining companies—attended.

Mr. James Hebbard, Government Inspector of Mines, also was present.

John August Berndt and Francis Harrington were sworn and examined.

The Commission, at 12:50 p.m., adjourned for luncheon.

The sitting was resumed at 2 p.m.

Francis Harrington was re-called and further examined.

William James Pascoe was sworn and examined.

His Honor, at 3:40 p.m., adjourned the inquiry until 10 a.m. on the following day (Tuesday), the 13th July.

C. E. R. MURRAY,
Commissioner.

TUESDAY, 13 JULY, 1897.

His Honor the Commissioner sat at the Town Hall, Argent-street, Broken Hill, at 10 a.m.
Mr. John Polkinghorne, representing the Barrier Branch of the Amalgamated Miners' Association; and Mr. J. R. Edwards, solicitor (Mr. E. J. Horwood, mining manager, assisting), representing mining companies—attended.

Mr. James Hebbard, Government Inspector of Mines, also was present.

Joseph Bourne and John Polkinghorne were sworn and examined.

The Commission, at 1 p.m., adjourned for luncheon.

The sitting was resumed at 2 p.m.

John Polkinghorne was re-called and further examined.

His Honor, at 4:15 p.m., adjourned the inquiry until 10 a.m. on Thursday, the 15th July.

C. E. R. MURRAY,
Commissioner.

WEDNESDAY, 14 JULY, 1897.

His Honor the Commissioner, at 10:30 a.m., took train from Broken Hill to Tarrawingee, where were seen the quarries of the Tarrawingee Flux and Tramway Company, Limited.

Mr. M. Morrison, accountant to the company, conducted His Honor to the east and west quarries.

Subsequently, His Honor, who was then accompanied by Mr. James Hebbard, Government Inspector of Mines, viewed the crushing plant and trucking plant, which were shown by Mr. James Stirling, manager of the company. The Mount Jackson (No. 36) Quarry, and Lawson's (No. 19) Quarry, were next seen, and cognisance was also taken of the air-compressing plant.

His Honor, at 3 p.m., returned to Broken Hill, which was reached at 5:30 p.m.

C. E. R. MURRAY,
Commissioner.

THURSDAY, 15 JULY, 1897.

His Honor the Commissioner sat at the Town Hall, Argent-street, Broken Hill, at 10 a.m.
Mr. John Polkinghorne, representing the Barrier Branch of the Amalgamated Miners' Association; and Mr. J. R. Edwards, solicitor (Mr. E. J. Horwood, mining manager, assisting), representing mining companies—attended.

Mr. James Hebbard, Government Inspector of Mines, also was present.

Mr. William John Williams, ore-dresser, stated that at the half-yearly meeting of the Barrier Branch of the Amalgamated Miners' Association, held on Tuesday evening, the 13th July, he had been appointed to attend the inquiry and ask for His Honor's permission to represent the interests of the surface workers.

His Honor gave his permission, and said that the Commission would be very pleased to have the assistance of Mr. Williams. He understood that Mr. Polkinghorne was versed, principally, in underground-working, and that Mr. Williams had a special knowledge of surface-working.

Mr. Williams thanked His Honor, and took a seat at the table.

John Polkinghorne was re-called and further examined.

The Commission, at 1 p.m., adjourned for luncheon.

The sitting was resumed at 2:15 p.m.

John Polkinghorne was re-called and further examined.

His Honor, at 4 p.m., adjourned the inquiry until 10 a.m. on the following day (Friday), the 16th July.

C. E. R. MURRAY,
Commissioner.

FRIDAY, 16 JULY, 1897.

His Honor the Commissioner sat at the Town Hall, Argent-street, Broken Hill, at 10 a.m.
Mr. John Polkinghorne (on behalf of the Barrier Branch of the Amalgamated Miners' Association), representing the underground workers; Mr. W. J. Williams (on behalf of the same organisation), representing the surface workers; and Mr. J. R. Edwards, solicitor (Mr. E. J. Horwood, mining manager, assisting), representing mining companies—attended.

Mr. James Hebbard, Government Inspector of Mines, also was present.

Joseph Wilks and John O'Brien were sworn and examined.

The Commission, at 12:50 p.m., adjourned for luncheon.

The sitting was resumed at 2 p.m.

Edward James Horwood was sworn and examined.

His Honor, at 4:5 p.m., adjourned the inquiry until 10 a.m. on the following day (Saturday), the 17th July.

C. E. R. MURRAY,
Commissioner.

SATURDAY,

SATURDAY, 17 JULY, 1897.

His Honor the Commissioner sat at the Town Hall, Argent-street, Broken Hill, at 10 a.m. Mr. John Polkinghorne (on behalf of the Barrier Branch of the Amalgamated Miners' Association), representing the underground workers; Mr. W. J. Williams (on behalf of the same organisation), representing the surface workers; and Mr. J. R. Edwards, solicitor, representing mining companies—attended.

Mr. James Hebbard, Government Inspector of Mines, also was present.

Edward James Horwood was re-called and further examined.

His Honor, at 12:30 p.m., adjourned the inquiry until 10 a.m. on Monday, the 19th July.

At 1:45 p.m. Mr. James Hebbard, Government Inspector of Mines—who was seeking information as to an accident that had recently been reported as having happened at The Pinnacles—drove His Honor the Commissioner to the mine of The New Pinnacle Group Silver Mining Company, where His Honor saw the remains of the machinery at the surface.

C. E. R. MURRAY,
Commissioner.

MONDAY, 19 JULY, 1897.

His Honor the Commissioner sat at the Town Hall, Argent-street, Broken Hill, at 10 a.m. Mr. John Polkinghorne (on behalf of the Barrier Branch of the Amalgamated Miners' Association) representing the underground workers; Mr. W. J. Williams (on behalf of the same organisation), representing the surface workers; and Mr. J. R. Edwards, solicitor, representing mining companies—attended.

Mr. James Hebbard, Government Inspector of Mines, also was present.

Edward James Horwood was re-called and further examined.

Mr. Williams asked His Honor to call, as witnesses, the Chief Inspector of Mines and the local Inspector of Mines.

His Honor said he did not think that the Chief Inspector of Mines knew anything about the subject intimately, and that he did not intend to bring him from Sydney. The local Inspector was present, and would be examined as a witness.

Alexander Stewart was sworn and examined.

The Commission, at 1 p.m., adjourned for luncheon.

The sitting was resumed at 2:15 p.m.

Alexander Stewart was re-called and further examined.

His Honor, at 4:30 p.m., adjourned the inquiry until 10 a.m. on the following day (Tuesday), the 20th July.

C. E. R. MURRAY,
Commissioner.

TUESDAY, 20 JULY, 1897.

His Honor the Commissioner sat at the Town Hall, Argent-street, Broken Hill, at 10 a.m. Mr. John Polkinghorne (on behalf of the Barrier Branch of the Amalgamated Miners' Association), representing the underground workers; Mr. W. J. Williams (on behalf of the same organisation), representing the surface workers; and Mr. J. R. Edwards, solicitor (Mr. E. J. Horwood, mining manager, assisting), representing mining companies—attended.

Mr. James Hebbard, Government Inspector of Mines, also was present.

John George Shinnick and Christopher Kelly were sworn and examined.

The Commission, at 1 p.m., adjourned for luncheon.

The sitting was resumed at 2 p.m.

Christopher Kelly and Joseph Bourne were re-called and further examined.

Jabez Wright was sworn and examined.

Alexander Stewart was re-called and further examined.

Mr. Stewart handed in, for perusal by His Honor, an agreement, made the sixth day of March, 1895, between the Broken Hill Proprietary Company, Limited, and Messrs. Baxter and Saddler, contractors. The agreement dealt with the matter of excavations made and to be made by the contractors on the company's leases as from the first day of January, 1895.

His Honor, at 4:20 p.m., adjourned the inquiry until 10 a.m. on the following day (Wednesday), the 21st July.

C. E. R. MURRAY,
Commissioner.

WEDNESDAY, 21 JULY, 1897.

His Honor the Commissioner sat at the Town Hall, Argent-street, Broken Hill, at 10 a.m. Mr. John Polkinghorne (on behalf of the Barrier Branch of the Amalgamated Miners' Association), representing the underground workers; Mr. W. J. Williams (on behalf of the same organisation), representing the surface workers; and Mr. J. R. Edwards, solicitor (Mr. E. J. Horwood, mining manager, assisting), representing mining companies—attended.

Mr. James Hebbard, Government Inspector of Mines, also was present.

His Honor said that he had read through the agreement made between the Broken Hill Proprietary Company, Limited, and Messrs. Baxter and Saddler, and he had marked the clauses which bore directly or indirectly on the questions before the Commission. These he desired to have in evidence; and Mr. Stewart

Stewart could either be examined upon them, or extracts could be made. It would be unfair and unnecessary to put the whole document in evidence; and it would be unfair to Mr. Williams to pledge him to secrecy (as he had suggested) and then to allow him to see it.

Richard Thomas was sworn and examined.

The Commission, at 12:55 p.m., adjourned for luncheon.

The sitting was resumed at 2:15 p.m.

John Warren was sworn and examined.

Captain John Warren also exhibited a tin canister, of the kind provided in the Block 10 mine, for holding the explosives used by the men.

William Rowe was sworn and examined.

His Honor, at 4:30 p.m., adjourned the inquiry until 10 a.m. on the following day (Thursday), the 22nd July.

C. E. R. MURRAY,
Commissioner.

THURSDAY, 22 JULY, 1897.

His Honor the Commissioner sat at the Town Hall, Argent-street, Broken Hill, at 10 a.m.

Mr. John Polkinghorne (on behalf of the Barrier Branch of the Amalgamated Miners' Association), representing the underground workers; Mr. W. J. Williams (on behalf of the same organisation), representing the surface workers; and Mr. J. R. Edwards, solicitor (Mr. E. J. Horwood, mining manager, assisting), representing mining companies—attended.

Mr. James Hebbard, Government Inspector of Mines, also was present.

By His Honor's direction, the Secretary read certain clauses of the agreement—made the 6th day of March, 1895, between the Broken Hill Proprietary Company, Limited, and Messrs. Baxter and Saddler, contractors—dealing with excavations by the contractors on the company's leases as from the 1st day of January, 1895. A copy of the clauses was made, and was marked Exhibit E.

A plan of the open-cut work which was being carried out by Messrs. Baxter and Saddler was placed before the Commission for inspection.

Jeremiah Andrew and Richard Parkinson Finan were sworn and examined.

Under His Honor's instructions Mr. R. P. Finan wrote down the names of some shift-bosses whom he believed to be incompetent. His Honor handed the paper bearing the names to Mr. Edwards, for the information of the management of the mine in which those shift-bosses were employed, so that their capabilities might be tested. Mr. Edwards gave a pledge that the names should not be otherwise divulged.

The Commission, at 12:50 p.m., adjourned for luncheon.

The sitting was resumed at 2 p.m.

James Joseph Shaw, Henry Day, and Alfred Dean, were sworn and examined.

His Honor, at 4:10 p.m., adjourned the inquiry until 10 a.m. on the following day (Friday), the 23rd July.

C. E. R. MURRAY,
Commissioner.

FRIDAY, 23 JULY, 1897.

His Honor the Commissioner sat at the Town Hall, Argent-street, Broken Hill, at 10 a.m.

Mr. John Polkinghorne (on behalf of the Barrier Branch of the Amalgamated Miners' Association), representing the underground workers; Mr. W. J. Williams (on behalf of the same organisation), representing the surface workers; and Mr. J. R. Edwards, solicitor (Mr. E. J. Horwood, mining manager, assisting), representing mining companies—attended.

Mr. James Hebbard, Government Inspector of Mines, also was present.

William Harry, William Smith, and Samuel Mayne were sworn and examined.

The Commission, at 1 p.m., adjourned for luncheon.

The sitting was resumed at 2 p.m.

Joel Phillips, John Evans, and Thomas Phillips were sworn and examined.

Edward James Horwood and Christopher Kelly were re-called and further examined.

James Hebbard was sworn and examined.

His Honor, at 5:5 p.m., adjourned the inquiry until 9:30 a.m. on the following day (Saturday), the 24th July.

C. E. R. MURRAY,
Commissioner.

SATURDAY, 24 JULY, 1897.

His Honor the Commissioner sat at the Town Hall, Argent-street, Broken Hill, at 9:30 a.m.

Mr. John Polkinghorne (on behalf of the Barrier Branch of the Amalgamated Miners' Association), representing the underground workers; Mr. W. J. Williams (on behalf of the same organisation), representing the surface workers; and Mr. J. R. Edwards, solicitor (Mr. E. J. Horwood, mining manager, assisting), representing mining companies—attended.

Mr. James Hebbard, Government Inspector of Mines, also was present.

James Retailick was sworn and examined.

James Hebbard was re-called and further examined.

His Honor, at 1:20 p.m., said he did not consider it necessary to take further evidence, and adjourned the inquiry *sine die*.

His Honor, at 3 p.m., paid a visit to the Block 10 Mine. Accompanying His Honor were Mr. John Polkinghorne and Inspector Hebbard. Captain Warren, general manager, took His Honor and party down Campbell's shaft to the 415-ft. level. The flats at Kelly's shaft were also seen. His Honor went through the stopes, and examined all from the 415-ft. to the 615-ft. level. The methods of working and of filling up the depleted stopes were noticed, and an examination was made of the mullock-shoot formed by portion of Kelly's shaft. The "guarding" of the stopes which had been stripped of their laths, and that of the ladder-ways, were observed.

Afterwards, Mr. William Rowe, underground manager of the Central Mine, escorted His Honor and party to the 400-ft. level there. The open-cut stopes and the west stope were viewed.

His Honor, accompanied by Mr. John Polkinghorne and Inspector Hebbard, at 7.30 p.m., visited the British Broken Hill Proprietary Company's Mine, and, with Mr. William Francis, one of the shift-bosses, saw the stopes throughout the 300-ft. level. The system of breaking the ground, and timbering and filling, came under notice. After also visiting the 200-ft. level, His Honor saw the concentrating mill.

C. E. R. MURRAY,
Commissioner.

SUNDAY, 25 JULY, 1897.

His Honor the Commissioner, at 7.10 p.m., left Broken Hill on the return to Sydney.

C. E. R. MURRAY,
Commissioner.

WEDNESDAY, 28 JULY, 1897.

His Honor the Commissioner, at 11 a.m., reached Sydney on the return from Broken Hill.

C. E. R. MURRAY,
Commissioner.

ROYAL COMMISSION APPOINTED TO INQUIRE INTO THE WORKING OF
MINES AND QUARRIES IN THE ALBERT MINING DISTRICT.

MINUTES OF EVIDENCE

TAKEN before His Honor Judge Murray in the course of his inquiry :—

1. Into the cause or causes of accidents which have recently taken place in certain Mines and Quarries in the Albert Mining District.
2. Whether the provisions of the Mining Act, 1874, and the Regulations relating to the inspection of mines other than coal or shale made thereunder, are sufficient to secure the safe working of the Mines and Quarries in the said district, especially in regard to the use of explosives and the system of timbering and of working large lodes adopted. And, if they are not sufficient, to suggest in what respect and to what extent they should be added to or amended.
3. Into the truth of the statement that the number of accidents in such Mines and Quarries has largely increased, and the cause of such large increase.
4. Whether the open-cut system of work is specially dangerous, and, if so, whether this is due to such work being carried on at night; and whether such system should be prohibited; and, if necessary, to suggest regulations for the purpose of safeguarding the lives of the miners and other persons employed in that class of work.
5. Whether the risk to the persons employed in the said Mines and Quarries is increased by reason of incompetency on the part of Managers and Subordinate Officials.
6. Whether the services of additional Inspectors are necessary.
7. As to the best means of making known to all persons employed in and about the said Mines and Quarries the statutory enactments and regulations relating to the inspection of such Mines and Quarries; and to make any recommendation which His Honor (the Commissioner) might deem advisable in the premises.

SATURDAY, 10 JULY, 1897.

William Williams sworn and examined :—

1. *Mr. Polkinghorne.*] What is your name? William Williams.
2. You are a practical miner? Yes.
3. You have had varied experience? Yes; my experience extends over thirty-five years.
4. You have heard the Commission read this morning, and the questions about to be put to you will be relevant to that Commission. I mention this as it is probable I will put to you questions that you have not thought about, but which are relevant to the Commission; and you will, no doubt, have a knowledge of them. In the first place, do you consider that the ventilation in the mines on the Barrier in which you have worked is sufficient? No.
5. Are you prepared to suggest any means by which the ventilation may be improved? Yes.
6. Is it your opinion that the safety of the lives of those employed is best conserved by the system of mining at present in vogue along the line of lode? Yes, with one exception.
7. There is one exception? Yes.
8. What is the exception? In connection with the sinking of a winze with a horse-track alongside it. How we got off so well as we did is a surprise to me. The winze we were sinking was by the side of a horse-track, along which horses were drawing trucks of ore. The brace around that winze was something disgraceful, and there was no protection whatever to the men underneath. If it had been put up as it should have been, it would have been quite safe. 10 in. x 2 in. timber was used instead of 10 in. x 10 in., and the result was that every shot fired scattered this flimsy material. It would have taken three or four days, or perhaps a week, for us to have put that secure; but this time, of course, we could not lose, as we had our own work to do, and were working on contract. We, therefore, only patched it up.

W. Williams.

10 July, 1897.

- W. Williams. 9. And contracting was actually the cause of that? Yes.
- 10 July, 1897. 10. Contracting leads to work of a dangerous nature being undertaken? Yes.
11. If any working has been pointed out to the company under which you have worked as being dangerous, they have never refused to place it in a safe condition? I brought this matter under the notice of the man in charge of that portion of the mine, and he said, "Oh, you go and fix it up." Even one of the officers said it was a patched-up affair.
12. *His Honor.*] You were working, I understand, under the contractors? Yes.
13. Were you working as a sub-contractor or a labourer? As a contractor. There are six in a party, and we are all contractors.
14. You had not the contract for the sinking of the winzes from the surface? No; only from one level to another.
15. You had only the sinking? Yes; but only from fortnight to fortnight. That is the system on the Hill, and a rotten system it is. A man knows he has only got that contract for a fortnight, and it is quite possible he will strike better (softer) ground the last three or four days of the contract; and, knowing that he will be cut in prices at the end of the fortnight, he will rush through it and get as much as possible out of it in that time.
16. *Mr. Polkinghorne.*] Are you prepared to say that the system of contracting adopted at most places on the Barrier is a cause of rush and tear on the part of the workmen as well as on the part of the employer? Yes; the employer adopts this system in order to get as much as he can out of the workmen, and the employee, in order to get as much as he can, has to adopt the same principle.
17. You consider it a dangerous practice? Yes.
18. If at any time any part of the mine should be considered dangerous, whose duty should it be to withdraw the men? The man who is in charge of that portion of the mine considered dangerous.
19. If pronounced by the inspector to be dangerous, he should have the power to withdraw the men at any time? Yes.
20. In the event of men being withdrawn from a certain portion of the mine by an order from the foreman or man in charge, or by the inspector, by whose authority should the men go back to work again? By the inspector, or by the man who condemns the place.
21. I said if it was condemned by the man in charge or by the inspector, whose duty should it be to give the men permission to go back when the danger has been removed? The inspector, in my opinion.
22. In all cases? Yes.
23. You think that it is necessary that the inspector should have full power to withdraw men from any part of a mine which, in his opinion, is unsafe to the life and limb of those employed there? That is my opinion.
24. *His Honor.*] And that the men should not be allowed to return until the inspector gives his sanction? I do not say that he should give his sanction to the men, but to the officers in charge, and if they order the men back without his sanction they should be held responsible. As to ventilation, it is not for us as workmen to dictate; but my opinion is that better ventilation could be provided by sinking winzes. We all know that there are some places that it is almost impossible to get to. You find it very hot only 12 feet from where an air-pipe comes in from a blower. In my opinion, the best ventilation is to be obtained by opening up from one mine to another, and by sinking winzes from one level to another. By cutting up the ground you secure ventilation.
25. *Mr. Polkinghorne.*] What do you consider is a safe distance to sink a shaft? From 200 to 250 feet; that is, with a secure penthouse over your head.
26. Do you consider it safe for workmen to be working at the bottom of a shaft at any distance from the surface if a portion of that shaft be not covered so that they can get back for protection? 250 feet, in my opinion, is quite far enough to work without some protection over your head.
27. *His Honor.*] You do not think that it is safe for a man to have more than 250 feet of vertical shaft over him when working in the shaft? Yes, that is my opinion—either from the surface or from any plat in the shaft.
28. Wherever he may be, your opinion is there should not be more than 250 feet of vertical unprotected shaft over him, or more than 250 feet of vertical height of unprotected shaft—unprotected at the top? Yes.
29. *Mr. Polkinghorne.*] Then that answers the question that a cross-cut or plat should be driven at least every 250 feet? Yes. So far as that goes, I would suggest that no distance should be more than 100 feet. Of course, I can speak more about the district I came from. There they have got to put a penthouse in the shaft.
30. *His Honor.*] Of what district are you speaking? The Bendigo district.
31. *Mr. Polkinghorne.*] What distance should be between the communications—say, a winze or rise—in your opinion, to provide proper ventilation for the carrying out of the work? From 200 to 300 feet.
32. Do you think that in all cases, no matter what the mine might be, there should be a ladder-way in each block of 40 acres for the ascent and descent of the men? Yes.
33. Independent of the hauling-shafts with the cages? Yes.
34. In your opinion, should the man in charge of an engine for lowering men into a shaft be the holder of a certificate as being a proper person and competent to look after such machine? Yes.
35. At what age do you think a man should be capable of taking charge of machinery where men's lives are hanging by a thread under his control? Not younger than 25.
36. Do you think that the men in charge of shifts at any mine, or any part of a mine where the work would be naturally dangerous, should be men of experience, and pass an examination as to their capability of performing the duties of the office placed upon them? Practically; not theoretically.
37. Do you think there should be a Board of Inquiry in each mining district which should inquire into accidents of all kinds, whether fatal or otherwise—of course, in the event of an accident proving fatal a coroner's inquest would also be held;—do you think an inquiry is needed in every case? Not altogether.
38. *His Honor.*] What modification? Should there be any suspicious circumstances in connection with an accident, then an inquiry should be held; but anyone knows who has any practical knowledge of mining that accidents will occur, and no matter how many experts, or how many inquiries, you cannot prevent them. This is so to a great extent because of the inability of some men to see danger ahead. For instance, they will think a certain spot perfectly safe, but the next minute it comes off to what we term

term a "soapy head," or a "V" piece, and, of course, the men are killed. This is an accident that cannot be very well guarded against, and in such accidents, as there are no suspicious circumstances, and nothing to hint that the Act has not been properly carried out, an inquiry is not necessary. Where, however, there is an idea that the accident is caused by neglect, such an inquiry as you suggest should be held. A Board of Inquiry should of course be appointed, so that they may be called into requisition whenever a suspicious accident occurs.

W. Williams.
10 July, 1897.

39. *Mr. Polkinghorne.*] Should such a Board be elected by the people or appointed by the Government? I think the members of the Board should be elected by the miners and the investors. This would give representation to both sides. By investors I do not mean speculators—men who invest in shares—but men who invest in mines.

40. You mean registered shareholders? Yes.

41. Would you be in favour of the Board's decision being final, without the right of appeal to law? No; in fairness to both sides, I think there should be the right to appeal. And, if anyone appeal, the privilege should be allowed of doing so, without being taxed with legal costs. This would give everyone a chance, the poor as well as the rich.

42. What number would you suggest should constitute the Board? Seven.

43. The Act says that everyone employed in or about a mine is a miner, but I take it when you use that term you mean that he should be employed either underground or in surface work that it is necessary for miners to perform? It can pretty well be seen how the accidents take place on the surface without any inquiry, but underground it is different. There there are certain provisions made for the safety of the men, and when an accident occurs it is for the Board to see whether those provisions have been carried out.

44. Do you think that the regulations now in circulation, as we have them in the amended Acts, and as posted on the mines, if carried out, would afford as much protection as it were possible to obtain? I think they should be amended.

45. In what manner would you suggest an amendment? I could not answer that question without some consideration. I am not prepared just now to make any suggestions. I know that there are some very good clauses in the Act, but there are also some very bad ones.

46. You have said that, with one exception, wherever you have been asked to do work it has been carried out as safely as possible;—have you ever seen, in connection with the mines that you have been employed on in this district, anything left open that would be a man-trap to any person through the negligence of somebody? No.

47. In most cases who is to blame when accidents occur—the man in charge of the shift, or the men themselves? In some instances it is the men in charge of the shifts who are to blame, and in others the men themselves; not through wilfulness, but through inexperience.

48. You mean to imply that a man should have a thorough practical knowledge before he is employed in those places? Yes.

49. In your opinion, what has been the cause of so many accidents in Broken Hill during the last eight or nine months? Mostly inexperience.

50. *His Honor.*] On whose part? On the part of the miners themselves. They profess, many of them, to be miners, but they are not.

51. *Mr. Polkinghorne.*] Is it your opinion that one inspector is sufficient for the Albert Goldfield? Yes, quite sufficient.

52. You think that if the Act and regulations were such as to give an inspector proper power, one inspector would be sufficient? Yes.

53. Has your experience brought you in connection with the open-cuts? I have only passed by them.

54. You have never worked in them? No.

55. As a practical man, do you think the open-cuts along this line of lode are worked in the safest possible manner? I could not express any opinion. I would rather not have anything to say about them.

56. In an excavation, what depth do you think a hole for a charge should be bored? Not deeper than 15 feet; and I should like to say the men working below should be considered.

57. Do you think it is safe for men to be working night-shifts on these open-cuts? No.

58. *His Honor.*] Even assuming that the electric light is used? The electric light is not sufficient for the men to see the surroundings and dangers. Not being a practical man in this respect, I do not know whether my opinion is worth much.

59. *Mr. Polkinghorne.*] You do not care to express any practical opinion upon the open-cuts? No.

60. *His Honor.*] You have never worked in a quarry on other kind of work? No.

61. *Mr. Edwards.*] On the question of ventilation;—I think you know that under the present Act the inspector has power to insist upon ventilation for the mines? Yes.

62. You come from Bendigo? Yes.

63. As a matter of fact, is not the ventilation of these mines far beyond that of Bendigo? Yes; the ventilation is better generally than we have at Bendigo, but there they are agitating for a better system.

64. The "miners' complaint" is a very common disease there among miners? Yes.

65. And it is owing to bad ventilation? Yes; what miners call poor air and powder-smoke.

66. It affects the lungs in some way? Yes.

67. There is an absence of that on the Barrier? Yes; ventilation is a great factor in doing away with leading. In the sulphides, if plenty of ventilation—

Mr. Edwards: I would ask *His Honor* whether the question of lead comes within the scope of this inquiry?

His Honor: I think that it should.

68. Your mode of ventilation is by sinking winzes? Yes.

69. Where practicable? Yes. It is practicable almost anywhere. The only question is the expense.

70. What I understand you to mean is, where practicable with a reasonable expenditure? I do not think that the question of expenditure should be brought in, because we know that if the mine is to be opened up they have to do it in the long run.

71. You think that the underground workings are safe, so far as you know, with one exception? Yes.

72. And that was owing to the defective securing of a brace around a winze? Yes.

73. Did you report that—the defective nature of this brace—to anyone? Yes—to the person in charge.

74. Who was that? I do not see that I should be compelled to answer that question.

W. Williams. 75. I can assure you that your answering the truth will not interfere with your position. You know the rules are posted underground, and you have read them? Yes. There is one rule which says:—

10 July, 1897.

Workmen shall not remove or interfere with any precaution for the safety of the underground employees—such as coverings over, or guard-rails around, shafts on surface, winzes, ore-shoots, or other dangerous places; and shall keep all such places in the vicinity of their work, as it proceeds, properly covered or railed off.

And it goes on to the effect that any workman who shall observe, or come to the knowledge of, any damage, deficiency, or defect, in any part of the workings, whereby the safety of workmen or others may be impaired, shall be bound forthwith to communicate the same to the shift-boss or foreman. [*Vide* Rule 6 of Underground Rules and Regulations. *Marked Exhibit "A."*]

76. Did you communicate to the shift-boss or foreman? I did.

77. Before this accident happened? No accident occurred. I only pointed out that that was the only defect I saw.

78. No accident occurred? No.

79. It was a dangerous place in the workings? Yes.

80. You reported it to the shift-boss? Yes.

81. Although it was unnecessary;—the shift-boss came twice a shift, and the foreman once? Yes.

82. What was done in this case you refer to? It was patched up for the time being, and then it went on again.

83. You kept on working there? We got shifted from there.

84. Although it appeared to you dangerous, no accident occurred? No.

85. How long have you been working in the mines here? About a year and eight months.

86. In that year and eight months, with one exception, the underground workings, as far as you have seen them, are safe for the men? Yes; so far as I know.

87. *His Honor.*] Except that you found the air not so good as it ought to be? Yes; the air is not so good as it ought to be.

88. *Mr. Edwards.*] I think you have worked all over Block 13? I have worked in a good many places in that block.

89. There are 40 acres in the block? I worked in about six or seven different places.

90. So you are giving general evidence as to the condition underground in Block 13? Yes. I have been working in the British about six months.

91. You say the great cause of danger to the men is the contracting system? Yes; that is my opinion. It has a lot to do with it.

92. In a contract, men tender at a price? No; the price is fixed, and you have to go and sign it. You do not know the price until you go in to sign.

93. You say the price is fixed, and the men have to accept it whether they like it or not? Yes.

94. As a matter of fact, does not the foreman arrange the price first of all with two of the mates, who represent the whole party? The whole of the time that I was working in Block 13 the foreman did not speak half-a-dozen times as to the price we were to work for.

95. You are not compelled to accept it? No.

96. It is merely optional? Yes.

97. If the work did not pay you you would not undertake it? No. When we once start on the contract system there is one thing about it—I do not know whether this Commission will bear upon the point—if you once start a contract, and become dissatisfied with it, and you leave off, they keep 20 or 25 per cent. back for non-fulfilment of contract. They, at the same time, have the power to sack you at a moment's notice if you do not suit.

98. Is it not the practice in all contracts to keep back a certain amount of money until the contract is completed? Of course, as soon as you complete the contract, at the end of every fortnight, you get your money.

99. But if a man contracted to build a house a certain amount is kept back by the employer until the termination of the contract. This amount kept back is a retention during the term of contract, but should the work be not carried out, is applied as a penalty? But the working-man has no penalty against the company for not allowing him in to work. For frivolous reasons men have, it is known, been sacked at a moment's notice; but they had no penalty against the company for not allowing them to fulfil their contract. What I am complaining about is that the penalty is all on one side—it ought to reach all round.

100. I suppose you would allow managers the right to discharge men for misbehaviour or incompetency? I would allow them to have power to discharge men for incompetency, but as for misbehaviour, the question arises what constitutes misbehaviour.

101. Say a man came to work drunk? The manager then would be quite justified in keeping him from going down below.

102. What would you suggest in place of the contract system? I would suggest either longer terms or else a wage system—day-labour.

103. What suggestion have you to make as to lengthening the contracts? I think in winzes the distance should be at least 50 feet.

104. And in stoping? So many sets—a given number of sets.

105. I suppose it would be impossible to limit them? If there was a big stope to be taken out, then I should say they should have the contract for a given number of sets. I am not prepared to dictate.

106. You would have to leave that to the discretion of the company? No; I do not say that. There should be a certain understanding between the men and the management, that they should have a show as well as the company, so that it would be as equal for the one as the other.

107. You are not prepared to suggest any means as to how the length of the contract should be arrived at? That would be a matter depending on circumstances.

108. I suppose men very often take contracts at prices they think would pay them, and afterwards find they have made a mistake, and they naturally become disheartened? Yes; the men would have a better heart to go on with their contracts, providing they did turn against them, if they had 100 feet to go, because they would have hopes of the ground turning in their favour.

109. But supposing the ground continued bad right through? I have heard of cases where men have got into good ground, and they have been shifted out of it, and then put back in the same place after the fortnight was over, at a lower price.

W. Williams.

10 July, 1897.

110. Did you ever report that? It never occurred to me. I am only speaking from what I have heard.
111. You are contracting now? Yes.
112. You have been well treated? I can't complain.
113. You have made good wages? Yes.
114. What is your average wage, now, at contracting? I have never kept an account.
115. I suppose your average wage would be 10s. 6d. a shift of eight hours? I believe it would—or more.
116. So far as you are personally concerned, you have nothing to complain of in the contract system? No, nothing at all.
117. As an alternative to that—the question of day-labour—I suppose you will admit that all miners are not of the same efficiency? Yes.
118. There are a lot of men about here who tie a piece of string round their legs and call themselves miners? Yes.
119. Would you say that all miners are entitled, supposing they be put on day-labour, to be paid the same rate of wages? Yes.
120. Although of different standards? The officers who are visiting, sometimes twice or three times a shift, ought to be competent to know whether those men are miners or not.
121. If that was enforced at the present time—that only competent miners be allowed to work—how many would be left at the Proprietary? I could not say.
122. I think very few would be left? I could not say. I say that if the company employ a man they should pay him at the current rate that obtains in the district.
123. Whether he is a man of your experience or whether a man who has been on only a year or so? The company has the privilege of employing whomever it likes.
124. Supposing the company cannot get men such as you appear to be, what would they do then? If the company have a man who is incompetent they generally put him with a man who is competent; but they have the privilege whether they employ him or not.
125. The matter of first importance to the employer is not how the man gets his living, but how he does his work? There are plenty of employers who would rather pay two inferior men 6s. each than pay a good man who does just as much work more than 10s.
126. You still hold that every man employed as a miner should receive the same rate of wages, whether an experienced miner or not? Every miner should be paid enough to keep body and soul together.
127. What do you call enough to keep body and soul together? I reckon that to any man who works in those mines yonder 10s. is little enough for him to live on.
128. You belong to the A.M.A.? Yes.
129. Every man who belongs to that Union and works underground, whether competent or not, claims 10s. a day, does he not? I am not speaking on behalf of the Union. I am speaking on behalf of every man employed. I am an Oddfellow, and it no more follows that I should be here representing the A.M.A. than representing the Manchester Unity. I am not here in the interest of any organisation, but merely as a citizen.
130. But in your Society all men are of equal quality? Yes, as miners.
131. You say that when ground is noticed to be dangerous the officer-in-charge should have power to withdraw the whole of the shift? Yes.
132. Has he not that power now? I could not say what their powers are, having never been in such a position myself.
- Mr. Edwards read Rule 6 [vide exhibit marked "A"] of the Rules and Regulations, underground, Broken Hill Proprietary Company, Limited.*
133. That rule meets the case? But for all that, I understand the officer-in-charge has his instructions from the superior officer.
134. Those rules [*Exhibit "A"*] apply to what you refer to? Yes, if they are enforced.
135. You often see the inspector on his rounds? Yes.
136. I suppose you know that you have a perfect right—in fact it is your duty—to complain to him about any matter that may appear to endanger the safety of either yourself or any of your fellow-men? I know that I have that right; but I know another thing—that if I do it very often my right will soon be cut off.
137. What authority have you for saying that;—have you ever been threatened in that way? No.
138. Have you not been treated with the utmost fairness by the officers of the mine? Certainly; I am not making any complaint.
139. Is it not only imagination on your part that if you did what was your bounden duty to your fellow-men you would be interfered with in some way? I do not say that.
140. In reference to machinery, you say that no man under the age of 25 years should have charge of machinery? That is my opinion.
141. You were working for a very long time at Bendigo? Yes.
142. And Victoria has taken the lead in deep-mining? Yes.
143. What age is the limit there for persons in charge of machinery? That is a failure there, as well as at other places. I think 18 is the limit.
144. I suppose so long as a man—that is, if he had arrived at man's estate—if he had experience—that would be sufficient? I think a man should go through a training for this work.
145. You think a man should have a certificate? Yes.
146. I suppose a man of 22 or 23 is quite as good as a man of 25? I do not think so.
147. You think a man should be at least 25? Yes; you must draw a line somewhere.
148. As to this Board of Inquiry or investigation, you think that the Board should be elected partly by the shareholders and partly by the men? Yes.
149. Where would you have the election take place, say, for instance, as regards Broken Hill? Every district should have its own Board.
150. How would you allow the shareholders to vote—would you make their personal attendance necessary? The voting should be by ballot, and you should make them attend personally.
151. But do you not know that most of the shareholders of the Broken Hill Proprietary live in England? They could have their representatives.
152. Would you allow voting, then, by proxy? The way I am situated, if a ballot takes place, and I am unable to attend, I have to abide by those who do attend.

- W. Williams. 153. There are seven to be elected, half by the miners and half by the shareholders? I should say that the whole should be elected by the majority of the votes recorded.
- 10 July, 1897. 154. The whole seven? Yes.
155. You would allow each shareholder the same vote as a workman? Yes.
156. Do you not think that in a company like the Proprietary that would put the miners in the minority, especially the underground men? I do not see that. A shareholder should not have a vote for every share.
157. And if more miners than shareholders, the shareholders would be in the minority? Not unless they were distrusted.
158. As to the kind of accident you would have made the subject of an inquiry;—if a man had his finger hit while holding a drill, would you have that inquired into? No; only when there is any suspicion that there has been a breach of the Mining Regulations.
159. With regard to the surface hands—you think they could fix up their accidents themselves; they do not want a Board of Inquiry? Not so far as my opinion is concerned.
160. As to the regulations, you could not at present suggest any amendments? No.
161. You say that in some cases accidents occur through faults of shift-bosses, and sometimes through faults of the men themselves—can you tell me any particular case where an accident has been caused by the neglect of a shift-boss? Seeing that I have not been mixed up with any I do not see that I could. I only go by the evidence I have read.
162. You simply go by hearsay? No; by reading what is in the Press.
163. Can you tell me of any particular case where you have read of an accident having occurred through the neglect of a shift-boss? The last accident at Tarrawingee.
164. Do you know of any other case? I could not call any to memory just now.
165. And you have been here about a year and eight months? Yes.
166. You say in reference to explosives that no holes should be over 15 feet;—I suppose you have had a great deal of experience in the use of explosives? Yes.
167. Is it not a fact that shallow holes will scatter stones, and throw them further than deep holes? It is quite possible.
168. Is not that in itself a source of danger? I say that the shallow holes are safer in every way than the deep holes. You have more trouble with a deep hole to get the explosive down; and in a deep hole it is quite possible for something to get between the explosive, and in that case only the top part goes off, and the bottom part is left in the hole unexploded. Again, in a shallow hole you have not to put the quantity in that you have in a deep hole.
169. In a deep hole you first of all “bull” it? In some cases.
170. Do you ever in a deep hole put in a charge without “bulling” it? Yes, in what you may term a deep hole, about 9 or 10 feet.
171. I am speaking of 15-foot holes? I never charge any over 10 feet deep.
172. Then, underground, no holes are charged at a greater depth than 10 feet? No.
173. So that a hole from 15 to 18 feet deep does not come into the question as regards underground working? No so far as my experience takes me.
174. In open-cut work you have had no experience at all? No.
175. I suppose that in every blast put in there is an element of danger? Yes.
176. And the shallower the holes the greater the number that would be required to be put in to do the work? Yes; according to the position in which the hole is placed.
177. If you have to take out a certain piece of country, and it requires a certain amount of explosive to do it, if you put in shallow holes you have to put in more, and every hole is an element of danger in itself, and, therefore, by increasing the number of holes you would be increasing the danger in that direction? No.
178. You think not? Yes.
179. You do not follow the argument as far as that? My contention is, that the deeper the hole the more danger there is attached to it. You are trying to make me say that there is more danger in shallow holes.
180. I say that if you have a certain amount of work to do, and by having shallow holes you require a greater number, the danger is increased? No.
- His Honor: Mr. Williams is speaking of the danger relative to the charging.*
- Witness: And also of the possibility of the whole of the compound not exploding.*
181. What is the deepest hole you have put in since working underground? 10 ft. 6 in.
182. There is one rule, I think, in the Government regulations which says that no missed hole shall be unrammed or drawn;—do you think that is a safe practice underground? It depends generally on what compound you use. As far as the glycerine compound is concerned, there is no necessity at all, to use the miners' terms, to pick it out if you can only get a plug or two in—that is, if you have got a genuine article, you put a couple of plugs in, and put a lump of paper or some water in, and, as a rule, that will explode the whole lot.
183. As a rule? Yes. But if the compound is not the genuine article it is quite probable that even when a hole goes off there is some left in the bottom.
184. There is a hard-and-fast rule in the Government regulations that a missed-hole must not be drawn;—is it not safer to withdraw the tamping than to put in another hole close to it? Yes.
185. I would like to point out that General Rule 3, sub-section e, of the Mining Act Regulations, says that a charge of powder or other explosives which has missed fire shall not be unrammed or drawn:—this rule is condemned by practical men as being not the best system to adopt? I would suggest that there should be a proper inspector appointed to inspect all explosives that come in to a mining community. Mr. Hake is Chief Inspector of Explosives in Victoria. He inspects every shipment that comes in, and if any be inferior he has power to condemn it.
186. Do you know that all explosives that come to Broken Hill have to come through South Australia, and are there inspected by a Government officer? No.
187. If that is the case you would not want a double inspection—an inspection at Adelaide and one up here? No.
188. You say that the cause of the accidents lately has been owing to inexperienced men. I think it is
your

your experience, as a miner of so many years, that accidents, when they do come in a mine, very seldom come singly? There is an old adage to that effect. W. Williams.

189. Is it not your experience as well? I might state, your Honor, that it has been the experience of men of very large knowledge that accidents appear to come in a most unaccountable manner all of a heap, with a long period between each lot. I do not think that, because of two accidents, men would purposely rush into danger to make a third. 10 July, 1897.

190. You say that they are in a great measure due to the inexperience of the men? That is one of the causes.

191. At what age is it best for a man to learn mining? In my opinion every man ought to commence at the lowest age that he is allowed by the Act, either with his father or some experienced man, so that he will be brought up to it with a fair experience, which every man should have.

192. Of course, if you want to make miners you must train them when young? Yes.

193. And then you will agree with me that an apprenticeship for miners would be a good thing? But I do not think they should be bound apprentices.

194. Of course, you would not expect the mine employers to pay apprentices the same wages as they would pay efficient workmen? No; I should not.

195. That would not be reasonable, would it? That is up to a certain age. I do not say that if I were to go along and ask for a job, as an inexperienced man, they should be allowed to pay me as an apprentice, seeing that I am a married man.

196. You would not like to be paid the same wage as an apprentice working alongside you? I never grumble about what anyone else gets—so long as they make enough to live upon I am satisfied.

197. Then you think there ought to be some system for training men as miners? Yes.

198. Men work two in a face? Yes; sometimes three, and sometimes four.

199. But generally the party is divided—if six men, two in each shift? Yes.

200. And just before change of shift they frequently put in a hole and fire it? Yes; sometimes they do. If they do, the custom is to see their mates, and tell them generally how things were when they left.

201. They see their mates? Yes.

202. They do not point out the ground to their mates? They simply tell them about certain things there. If a missed-hole, they will go back and try and get that hole off before they leave the face in which they are working.

203. Do not they frequently go away and leave a missed-hole in the face? I have not seen that.

204. Two men coming off have no opportunity of showing their mates the ground they are leaving, have they? It is this way—say four of us work together. We see our mates. If there is a missed-hole we tell them its position. It is not necessary for a practical man to go and point out the very spot where the hole is. You just tell your mate that there is a missed-hole there. He knows where to go and find it. If a piece of ground is unsafe the same course is followed.

205. I suppose sometimes you miss seeing your mates? Not often.

206. Sometimes you do? If we do, we can send word through the man in charge of the shift.

207. Would it not be better to show them the face? If we stayed at the face then we should be too late to get out. We tell them where the hole is.

208. Then, assuming that there was some ground hanging in the roof or on the face, would it not be better or safer for you to have an opportunity of pointing that out to your mates coming on than to trust to conveying information to them in this way? In some places that is very nearly an impossibility, for if you stop to see your mates you have to get an order from the boss before you can get up the shaft.

209. That is owing to the change of shift taking place at the brace at present? In some places in the Proprietary you may be working a long way from the shaft up which you go to the surface, and if you wait for your mates to come down to that place for you to see them and point out anything, you have then to wait until the winch-drivers change shift, and by that time they are commencing to put ore, and you have to go and find the boss of the shift, and get an order before you can get up.

210. Would it not be better to have the shift changed actually at the work? It would not be practicable.

211. Supposing the mining authorities could make it practicable, would it not be safer for the men? I do not think that, if a man is a practical man, and his mates are practical men, and there are communicated to them any dangers that may be existent, there is any need to show them the actual dangers. Practical men can locate points even to within a distance of 6 inches, when they are down here in the streets. If I met a man, and told him how the ground was, and he went in and could not find the danger, he would not be a practical man.

212. But all men are not so efficient; and, another thing, as you are going up in the shaft, perhaps your mate is coming down in the other cage, and then you would miss him? If there is anything dangerous, men make it a rule to see one another.

213. But if a change of shift takes place at the face, could not the dangerous ground then be pointed out on the spot? Yes.

214. And you could point out the spots much better than you could describe them? Now, in your profession, you take cases very often, and you know just as much about them as the parties, and perhaps more, though you gather the information away from the actual spot.

215. I think you know that recently there has been a great exodus of miners to the west? Yes.

216. The best miners of the field, not all of them, have gone to the west? Yes.

217. And that other men have come on representing themselves to be miners? Yes. The mining companies have to take part of the blame for the importing of men here.

218. You cannot tell a miner by appearance? No.

219. You have got to see how he can use his hammer, his drill, or his pick? Yes.

220. Miners do not carry certificates of efficiency about with them from one mine to another? No.

221. Do you think that would be of any assistance to prevent the employment of inexperienced men—the issuing of certificates? I think it would have a tendency for the betterment of both the miner and the employer.

222. For certificates to be issued? Yes; that is, if I worked under a manager, and gave every satisfaction as a miner, he should supply me with a certificate.

223. *His Honor.*] If you were going to move from the district, you would be able to get a letter from your former manager? It has not been necessary; and, therefore, it has not been carried out.

- W. Williams. 224. But if you asked for one? I believe you could get one.
- 10 July, 1897. 225. That would go a considerable way, probably, with another manager who knew the manager who had given you the letter, in procuring you work, where otherwise you would not get it? Yes.
226. A man in charge of a mine can tell in, I suppose, three minutes whether a man is a miner or not? Yes.
227. *Mr. Edwards.*] Are not miners as a rule noted for their carelessness? I do not think so.
228. Have you ever seen practical miners closing a cap on the face with their teeth? Yes.
229. Do you consider that a safe practice? No; but if you have no other appliances to squeeze them, you can do it with a knife.
230. You think closing with your teeth is a safe practice? I think it is a dangerous practice; so also it is to squeeze it without proper nippers.
231. Have you ever applied to anybody for the proper tools to close them? No.
232. I suppose you close them with your teeth? No; I have not got any strong enough. I generally close them with a knife. In other places I have seen the proper tool used—it is a knife with nippers at one end.
233. *Mr. Polkinghorne.*] I understand you do not make reference to this place? No; I have never seen such a tool in this district.
234. *Mr. Edwards.*] You have never applied for one? No.
235. *His Honor.*] Are the managers supposed to supply them? They are supposed to supply all tools.
236. *Inspector Hebbard.*] I know quite well the winze Mr. Williams has referred to in his evidence;—do you really think that anything in the way of 10 in. by 10 in. framing could have been put there to stay there with all the heavy firing that was done? Yes; I think so.
- Inspector Hebbard:* I thought about the matter when I was there, but I could not see any way of fixing anything more secure than that already there.
237. *Mr. Polkinghorne.*] As Mr. Edwards has opened out on some new ground, I would like to ask the witness some further questions. As to the contract system;—do you wish to tell us that in your opinion contracting should be abolished altogether in favour of day-pay? No.
238. Your greatest opposition to the mode of contracting here is the fortnightly system? My opinion is that there should be longer contracts, so that if a man made a pound extra this week he would not be cut off, and therefore would not rush so much.
239. You think that changing from fortnight to fortnight, with power given to the foreman to stay proceedings at any time, makes it one-sided—that is your objection? Yes.
240. Your experience has taught you that a foreman sets you work, and it is actually piecework and not contract work at all? Piecework and contract are the same according to my opinion.
241. A contract, I take it, is an agreement entered into, but no agreement has been entered into in the so-called contracting along this line of lode? You have to sign an agreement, but I have not had time to read it.
242. But you did not sign an agreement. Your argument is that it is one-sided, and it is, consequently, no agreement. All power is given to the employer, and he keeps back 25 per cent. In a contract, each party should have the same chance. Fair play should be given on either side. In the contracting here it has been your experience that if at any time the man in charge sees fit through some reason of his own he can take you away from one part of the mine and put you to another, although they claim that you have a contract in that particular part of the mine; and if in the middle of the fortnight you leave off, if he says he is going to remove you and you refuse to go, he keeps back 25 per cent., which you say is very one-sided? Yes; that is very one-sided.
243. And that in order for men to keep pace with themselves in these contracts, they rush, and that causes accidents in some cases? Yes.
244. And the incompetency of some of the men employed is also a cause of accidents? Yes.
245. On the question of explosives, Mr. Edwards went very carefully into that. He tried to gather whether, in your opinion, it was not more dangerous to fire four holes to take out 6 feet of ground than to fire one. I think that as a practical man you have worked in every department of a mine, and from the way mining is carried out here, in your opinion, deep and heavy holes are more dangerous than shallower and weaker holes? Yes.
246. Four holes would be better for the men, and would work the ground better? I do not say that a shallow hole would take out the ground, but that a deeper hole, especially as they are bored now with those drilling machines, has more danger attached to it than a short hole. Of course I am only speaking of my own experience.
247. Is it not a fact that we see as many as twenty parties engaged in the one stope, and working on different sections, and if a heavy hole were fired on the top section would it not be a source of greater danger than if a lighter hole were bored? Yes.
248. Has not your experience taught you that in the stopes the men have to work too-close to one another? I could not give much information regarding the stopes, as I have only been in this district a year and eight months, and I have done very little timbering in stopes during that time.
249. As to explosives, is the regulation in force sufficient if carried into effect? The regulations have been neglected in some cases, and inferior stuff has been used. But the latter, I believe, was not the fault of the management altogether, as there was a scarcity of the real article in the market.
250. Several accidents have occurred, I believe, through miss-firing;—would you leave a face with a miss-fire there, without putting up the proper warning at all the approaches? If I failed to see my mates, I would inform the man in charge of the shift that such a danger was there.
251. That is not what I want to get at. There may be many approaches to the place you are working in, and there may be men passing that way, and if there were no warning notices up they would be unaware of the danger;—as a rule, men stay in the face to point out the place of danger? Yes.
252. You have not many times left a missed-hole until you saw your mates and told them? No.
253. Has it been your practice that when you find it is a missed-hole, and there is some danger about it, you wait about until your mates are in sight? If there is a miss my experience is that men will wait about, and if there is time will go in and fire it. They go in with another primer. The explosives now used underground require very little tamping. It is no trouble to go in and put in another primer and fire it.
254. Do you think it is more dangerous to go back within twenty minutes than to leave it two hours? Not a bit more dangerous.

255. *His Honor.*] I see it specifies one and a half hours (*vide* rule 7, rules and regulations, underground, the Broken Hill Proprietary Company, Limited, marked exhibit "A"). Is that regulation carried out in effect? Yes. W. Williams.
10 July, 1897.

256. *Mr. Polkinghorne.*] Is it not a fact, in many cases where there is little ventilation, that at the close of the shift you fire, which gives the place a chance to become clear of the fumes before the arrival of the on-coming shift? Yes.

257. Is that the general practice? Yes.

258. That will answer the question put by Mr. Edwards just now, that it was the practice of men to fire and leave it without pointing out to their mates the danger there might be in the face:—having known that your mates fired on leaving, your first duty would be to examine the workings? Yes; even if they did not fire. Most men have a look round before they commence work to see if there is any danger, or anything that is likely to cause injury. Generally, practical men have a look round, and if there is anything they consider dangerous, they attend to it.

259. *His Honor.*] You mean they find out for themselves, apart from anything they might have been told. They always consider it their duty to find out for themselves the condition of the face? Yes; I always consider it my duty to have a look for myself, independently of what anyone tells me. Of course there are exceptions. I do not maintain that every man is so cautious; but it is the usual practice for men to have a look round the place before they commence work.

260. Still it would be a very great help to you, and a very great safeguard, if someone told you before you went in of the presence of danger? Yes.

261. When you first go in, is your sight really as good for the purpose of mining as it is after you have been in fifteen or twenty minutes? It depends upon the weather on top to a great extent. On a bright day it takes some time before we can get our underground sight; but on a dull day we can see just as well when we first go down. Most of the shafts are sunk away from the lode, so that you have a cross-cut to go through before getting into the workings. By the time you get in you generally have got your eyesight pretty well, and are able to detect any dangers.

262. Even then you might easily miss something? Yes; I say it is the best safeguard for your mates to point the dangers out, and that is the practice generally adopted.

263. Do you not think that there ought to be an established system, to which there could not be any exception, that a man on going to his face should have an opportunity of having everything pointed out to him on the spot by the man who knows best how matters stand;—do you not think a system of that kind would be the safest? Yes; but there is nothing to prevent it now. In all mines I have been in I have never known them to prevent men from stopping down to point out dangerous places to their mates.

264. You say the management never prevent it? Yes.

265. Do you not think it would be a good thing to have a rule compelling the men to do it? No doubt it would do a great deal of good.

266. It would lose a little time to the men, but it would be a very great safeguard? Yes; but it is very seldom that accidents occur when the on-shift comes on.

267. *Mr. Polkinghorne.*] Mr. Edwards stated that accidents never come alone;—is it not quite possible that after a series of accidents, and when there is a lull, more precaution has been adopted, and when laxity comes again we may look out for more accidents? Experience has taught me that after an accident everyone concerned is more careful than before.

268. In respect to the age of a youth coming on to work in a mine, your opinion is that he should be at least 16 years of age? Yes, 16 at the least.

269. Is it your opinion that he should serve an apprenticeship, be examined, and declared competent to perform the several duties that he may be called upon to perform in that sphere, before being taken on as a competent miner? Yes; he should go through a certain examination.

270. The Board of Examiners should be empowered to give certificates of competency, which would be a passport to him in any part of the country to which he might go? Yes.

271. Has it not been your experience in knocking about the different mines you have worked in that the managers say they do not want paper, but men? Yes, generally speaking.

272. You get a testimonial from your employer, and you take that to another man, and he says, "I don't know that man, and I don't know whether you worked for him";—should not this Board of Examiners be able to issue certificates that would be passports? The Board would be of no service if they did not have that power.

273. Is it your opinion that this should be done in all cases? Yes.

274. It is actually necessary that the calling of a miner should be a trade, and an apprenticeship to it should be served? Yes.

275. Do you think, then, that the general system of apprenticeship which has been adopted on the Barrier, where they take three or four competent men and three or four incompetent men and put them all together and expect them to do the work in a workmanlike manner, is a good one;—you do not think it is right that the incompetent men should expect as much as the competent men? If a man does not suit, they soon get someone in his place.

276. Is it always within their knowledge that a man is incompetent? I could not say.

277. As to miss-fires, glycerine compounds carry with them several dangers? Yes.

278. One is that if by any means a portion of dirt gets between the primer and the main part of the charge, it may by chance leave the blast unexploded at the bottom of the hole? Yes; my experience in that way has only been in connection with one certain brand of explosive. It was a cheap article. There is not the same percentage of nitro-glycerine in it as in the superior brand. It takes more of it to do the same work of the better article. It is very difficult in some cases to know that the compound has not exploded; you find that it is only the top part that has gone off. This is where the danger comes in with this explosive. It is quite possible for any man to overlook the unexploded part in the bottom of the hole, and when he starts drilling again it is quite possible he might pierce it; and that is the cause, in my opinion, of some of the blasting accidents that have occurred on the Barrier since I have been here.

279. In your opinion, is it a wise procedure to fire more than two holes in the one face at the same time? It is not necessary to enforce that. So far as I have seen, it has never been dictated to a man how many shots he shall fire. It is generally left to the knowledge of the men working in the faces, who use their discretion.

W. Williams. 280. But seeing that there are a number of incompetent men at work, as has been stated, and as undoubtedly there are, would it not be a very good thing to have a regulation restricting the number of holes to be fired in a face. As you have already stated, there is a chance of deep holes being misfired. Do you not think that it is required that some regulation should be framed to restrict the number of holes to be fired in the one face at the same time? There is a regulation in the mine I am now working in, that all miners should be very careful and examine all the holes, to see that all the compound has exploded.

10 July, 1897.

281. In your opinion, it is not necessary that a regulation should be framed to say how many holes should be fired? No.

Mr. Edwards: I think it is provided in the regulations, so it is not necessary to frame another rule.

His Honor read Rule 7 of Exhibit "A."

Witness: I am talking of the British Mine. The rule read by your Honor refers to the Proprietary.

282. *His Honor:* I understand it is quite possible, if you have several holes, you may not be able to tell by the sound whether every hole has actually exploded; you cannot tell by the sound because two may go off together, and then you would be misled? Yes.

283. Then you may find, after all, even if you have heard the correct number of reports, that one charge has missed fire. It is impossible very often to be sure whether one has missed or not by the sound, and one of the next charges may have cut off the face, so that it would be very difficult to detect in that case that it was a miss-fire? The men are very particular. They are particular to see whether every shot has exploded. My contention is that the greatest danger is in only part of the charge exploding; that is the greatest source of danger. In a miss-fire, if you fire four holes and only hear three, you go in and search the face; but if you hear the proper number of reports you feel satisfied then that things are all right, and you go on with your charging. It is a very difficult matter sometimes when the top portion goes off and leaves the bottom to detect it, because of the charge being the same colour as the earth around it. The drillings from the hole when boring make the blasting material appear the same colour as the ground itself.

284. You say that the partial explosion of one of these explosives will not take place unless a very low-class explosive is used? It is only when the lowest class of glycerine compound is used that a part is left in the bottom unexploded.

285. And you suggest there ought to be a restriction of the use—in fact, of the sale—of low-class explosives? Yes.

William John Williams, sworn, and examined:—

W. J. Williams. 286. *His Honor.*] What is your name? William John Williams.

10 July, 1897.

287. *Mr. Polkinghorne.*] You have worked in the open-cut along the line of lode? Yes; in Block 11 open-cut.

288. In your opinion, is the system adopted in the open-cut work especially dangerous to the men employed there? Yes.

289. What makes it especially dangerous? I consider the present mode of working the "chinaman" especially dangerous; more so now than when I worked up there.

290. Perhaps you will let the Commission know what is termed in the open-cut work a "chinaman"? It is an opening left over a level; the trucks are put underneath, and the rock is brought down into a kind of facing and allowed to fall into the bottom, and so fills the truck, which is then taken away.

291. Is it, in your opinion, safe for this work to be carried out at night;—is it more dangerous to work in the open-cut at night than in the daytime? Yes; I consider it is so.

292. If night-work is especially dangerous, what would you suggest in place thereof? I would suggest that it be done in the daytime only; that there be only one shift in the winter, and perhaps two shifts as the days grow longer. In the short days there should be only one shift, as the flickering of the electric light injures the men's eyesight, and is more likely to lead to accidents.

293. In working in open-cuts by electric light, small objects cast very large shadows? Yes. Besides, the shadow is constantly shifting. The flickering of the lights causes shadows to be continually moving to and fro, which weakens the eyesight. You cannot, as it were, get a steady view.

294. Do you think that the batter that has been adopted in the open-cuts is what it should be? When I worked there they had a very fair and a very safe batter, and the contractor was most particular about that, but at the present time I would decline to work there, principally on that account. I consider the batter to be very dangerous.

295. What batter would you suggest, taking into consideration that the open-cuts are getting to a considerable depth—to below 100 feet? For a 100-foot open-cut you want 1 in, 1 and for a 50-foot, 1 in 3. When I was there we worked between a depth of 50 and 60 feet.

296. *His Honor.*] By 1 in 3 you mean 1 horizontal to 3 perpendicular? Yes.

297. *Mr. Polkinghorne.*] You consider there should be 1 in 50 after passing 50 feet? Yes.

298. *His Honor.*] Do you mean that after the depth has attained more than 50 feet the whole batter should be broken down to 1 in 1, or that there should be a shoulder, from which the new batter should start? I would prefer that.

299. *Mr. Polkinghorne.*] You think that the cause of a number of these accidents has been through want of sufficient batter? Had that batter been safer I do not think that last accident would have occurred. Had the batter been safer the man would have had a better show to get away. But at the present time the open-cut is more the shape of a basin. A man has not much chance of getting away. The danger is from anything high up tumbling down. He would not always have an opportunity of seeing it in time, especially with the electric light, to get out of the way.

300. Did you ever notice anything while working in the open-cut of extraordinary danger incurred through the man in charge of the explosives—the "powder-monkey"? I have noticed on some occasions that the "powder-monkey" has come down in an intoxicated condition, and we have found in some places that he has left packages of the dynamite and caps lying about. On one particular occasion when he was "bulling" a hole, a piece of 10 x 2 timber was thrown over on to a shelf of rock, and near to a number of packages of loose dynamite and caps. On other occasions we have unearthed them. I remember on one occasion we unearthed several packages. Some of us have complained about this. I complained, and said I did not care about my life being endangered in that manner.

301. You do not say that the regulations in connection with the blasting are insufficient, but that they are not being properly carried out? I say that men do not pay sufficient attention to the lives of their fellow men. The regulation now before us in the Mining Act, that no man shall have in his use at any one time in any one place more than 6 lb. of blasting material, I do not agree with, because in charging a hole I think it must be patent to your Honor that if it be a deep hole for a big blast considerably more than that quantity of explosive must be used in one hole alone, consequently that rule could not be carried out to the strict letter as put down here in the regulations.

Mr. Edwards: I would draw Mr. Polkinghorne's attention to the fact that this regulation applies to underground and not to the surface.

W. J.
Williams.
10 July, 1897.

302. You consider that accidents that have occurred have been occasioned, in your opinion, through the incompetence of some of the subordinate officials or their neglect of carrying out the regulations? Yes; I can give you some instances. At times when things were being carried on in a loose manner, when the manager was known to be coming around, a very noticeable improvement would take place. On one occasion I heard the men grumbling about the inspector not being seen around. A little before that the inspector had been around cautioning the officers; and I heard one say, "Hebbard was down here and caught me, and threatened that if he caught me again I would have to look out." That, I take it, shows that the neglect was wilful.

303. How could an improvement be made? I would suggest that these officers be made to pass an examination, the same as in the coal mines. In fact, this is a matter I put to Mr. Cann in the form of a question the first time he was elected. I think it is only fair to the men that they should have competent men over them. Care should also be taken to see that the men are competent. A case occurred in the Central where two men after drilling a hole could not charge it, and had to get the assistance of the men alongside.

304. Is it your opinion that the services of additional inspectors are necessary in this district? Yes.

305. Do you think it would be necessary to get additional inspectors if the regulations were such and the Act such that the inspector could put them in force and see that no breaches were made in them? I think there is a growing necessity for an inspector for the surface work and machinery alone, considering the present developments in mining.

306. You think a subordinate officer should have a fair hang of the regulations, and that he should pass an examination showing his competency to carry out the duties involved in his position? I think when a man has the lives of other men in his charge he should be able to satisfy an impartial Board or tribunal that he is fairly competent to take charge of those men. He should be acquainted with the regulations, and have a fair technical knowledge.

307. In your experience in the open-cut, have you noticed that one accident is followed very closely by others? In reply to that, I can say that only one fatal accident occurred in the open-cut while I was working there—a man, named Riley, was killed. Since I left, there have been a number of accidents. I cannot give any reason why it should be so, if such is the case. It may be on account of the men growing nervous when an accident happens. They might possibly become too careful.

308. You do not think a man to make a long list would run himself into danger;—do you think a man would put himself into danger knowingly? Yes; I have seen a man come down the face of a rock, scrape out a hole, put in some fracture, and put it down with his scraping-rod. We, of course, cleared off. I said to my mates that it was a very foolish thing for him to do. I said he should be more careful. We got away. We were afraid that an explosion would occur. I take it that if men were certificated this thing would not occur.

309. The present regulation provides that no iron bar is to be used as a rammer or tamper, unless mounted with 4 inches of copper;—do you think that the mounting of a piece of iron or steel is sufficient? I have had strong opinions on that point ever since I was a youth at home, in Cornwall. I have seen one of my school-mates killed and another injured, through using iron rods. I have strong opinions that nothing but wood or copper should be used.

310. Do you know what explosive they were using at the time? I know they were wrapped up in the ordinary white paper—packages of dynamite. I do not profess to be an authority on explosives.

311. *His Honor.*] They were not powder? No.

312. These rods they were using were copper-tipped? No; they were iron scrapers.

313. *Mr. Polkinghorne.*] Have you ever seen a mishap through a large number of holes being fired at the same time? I know that we have had difficulty sometimes in determining whether holes have gone off or not. I have seen cases where the men thought all the holes had gone off, and were starting to go down when one would go off. Sometimes the "powder-monkey" has said a hole has missed and has ordered us back. This difficulty often arises, and there is a controversy among the men as to whether all the shots went off.

314. *Mr. Edwards.*] You have only lately taken up mining? Three years ago.

315. You are by trade a painter? Yes.

316. Have you ever worked in quarries before you came here? No; not in that kind of quarry.

317. In railway cuttings and things of that sort? I worked in cuttings before.

318. You say that working in the open-cut is more dangerous at night than in the daytime? Yes.

319. You would be surprised to learn that fewer accidents have taken place in the open-cut at night than in the daytime? No; not to a great extent.

320. Would that not go to show that the greater danger at night cannot be appreciable? No, because in the day-shift, men were employed in working up the ironstone, and those men would not be working at night. And there was not so much firing at night.

321. Even now, in the winter time, they only work two shifts in the twenty-four hours? I do not know anything about it now.

322. You do not know that even now they only work sixteen hours? No.

323. How long is it since you worked in the open-cut? Over two years ago.

324. So you cannot say what the work is like now? Only from what I have seen in passing.

325. It is two years since you worked in it? Yes.

326. As to the matter of the electric light, I believe you had as much light there as you wished for? After a certain time we had more electric light—more poles were erected. But even then the light was defective.

- W. J. Williams.
10 July, 1897.
327. Can you point to any accident that occurred through defective light? We have had several accidents occur there.
328. You say it is dangerous on account of the electric light;—I want to know if you can particularise any accident caused by the electric light? I had occasion one time to knock a man down to save him from the skip which was coming down.
329. Was that owing to the light? If it had been day light he would have had a better chance of seeing it.
330. Of course, there is danger incidental to open-cut work? Yes.
331. With reference to this "powder-monkey" who you say came on intoxicated—what was his name? "Sam, the powder-monkey," was the name we knew him by.
332. Did you complain to the shift-boss about his being intoxicated? We complained afterwards.
333. At the time you saw him in charge of those explosives in an intoxicated condition, did you complain to the shift-boss? We mentioned it to the shift-boss.
334. At the time? Not at once.
335. The rules were posted up at the time—you know them? I have never read them.
336. Were they posted up? I never saw them in the open-cut.
337. No rules and regulations for surface working? No.
338. Nor on any part of the lease? Only near the changing-house.
339. You know the rules, of course? No; I cannot say that I do.
340. You know these rules (*reading Rules 1 and 5 of Exhibit "B," being the surface rules and regulations for the Broken Hill Proprietary Company's mine*)? No.
341. These rules, you say, were not posted up on the mine? I do not know. That man was discharged from there soon afterwards.
342. Were you never told to report anything that you discovered dangerous at once to the foreman or shift-boss? No.
343. No instructions to that effect were ever given you? No.
344. Did you report the fact as to that man leaving packages of dynamite about in the open-cut? I reported to the shift-boss about the packages found, but not about the piece of wood.
345. Who had charge of the shift you worked in? W. Beaglehole. Barnes was in charge of the other shift, and Fred. Page of the night shift.
346. As to the batter, do you know what it is now? No.
347. You cannot say whether it is at the present time 1 in 1 or 1 in 3? I could not think it was 1 in 3 in some places. It seems to be very nearly perpendicular.
348. As to the men you say were working in the Central, and could sink a hole but could not charge it. I suppose they were not allowed to remain there long? One of them was put with a competent man.
349. At once? I do not know whether at once.
350. Were you there when these men were there? Yes. I did not know of it until afterwards—not until I heard the men speak of it at crib time.
351. Do you think it possible to frame rules to meet these cases where men will not report irregularities? No.
352. I suppose the shift-boss in the Central did not know that these men could not charge a hole? No, or he would not have allowed them in together. I mentioned this to show that the men sometimes pass themselves off as miners when they are not.
353. As to an additional inspector—you think the inspector should be a man of the very highest character and of the highest qualifications? The inspector should be a man of high moral character, and he should be practically acquainted with his work.

William Noble sworn and examined:—

- W. Noble.
10 July, 1897.
354. *Mr. Polkinghorne.*] Your full name is William Noble? Yes.
355. You are a practical miner? Yes.
356. Have you, in your experience on the Barrier, seen at your work as a miner anything left undone that could have been done which would have made it more safe for you and others employed in that particular part? I have seen it in the first instance in the open-cut.
357. *His Honor.*] Have you been working underground? Yes.
358. Before you went into the open-cut? Yes.
359. *Mr. Polkinghorne.*] You had practical experience as a miner before you came on to the Barrier? Yes; I have been mining, off and on, since I was 12 years old.
360. I believe you have had some experience in mining in the old country? Yes; in England.
361. You have spent several years in Australia? Yes.
362. The last two years you have spent on the Barrier? Yes; two years and seven months.
363. Is there anything you could suggest that could be done to prevent accidents happening to workmen? Different things happen underground which I consider should be amended in two or three ways. Something should be done to meet those men who come here passing themselves off as miners when they have not done a day's mining in their lives. They say they are miners. The shift-boss comes round and gives them a test to a certain extent. He says, "I would like to see you take up that hammer." Perhaps they have a little idea of using a hammer, and can tap a drill, and the shift-boss, on that, thinks they will do, with a little improvement. But hammer and drill work is only one very minor part in mining. An incompetent man like this might think the ground a bit weak overhead. Perhaps it might be better left there than pulled down. He, however, pulls it down, and makes matters much worse. Another piece he tries with the hammer and thinks it firm, and it afterwards comes down on him. Such a thing as this, I might say, has never occurred alongside of me; but it has occurred. There is another thing, which I experienced last week. The men work too thick underground. They are working one on top of the other—in too close a compass. In the stopes they are in each other's way. Of course, some men are careful, but others are not; and in working too closely together there are likely to be accidents. I have had two or three narrow escapes myself.
364. There is nothing you can suggest, only that the men are working too closely together; what would you suggest to prevent these men working on top of one another? At present we are working right on top

top of each other's heads. It would be well if there could be about three floors (21 feet) between each working party. Often now, when the shot is fired, the ore breaks through the floor and makes it very dangerous for those working just underneath. We should be further apart.

W. Noble.
10 July, 1897.

365. Has there been anything put in your way whilst employed in your capacity as a miner to prevent your carrying out the regulations as set down under the Mining Act? I do not exactly understand what you mean.

366. Have you always been able to get what you thought was necessary to guard against accidents? Yes, everything, such as tools and timber, to do it with.

367. Have you taken the trouble to study the regulations? I have read them over.

368. Do you consider the regulations, as set out under the Mining Act, are sufficient, if carried into effect, for the mining on the Barrier? What I have to complain about most is the incompetent men put on. This should be more strictly guarded against. A strict trial should be made of every man put on. Broken Hill ground, as a rule, is very dangerous, and requires a good man to manage it. As I have already said, the men stopping in the faces are too close, and it is dangerous.

369. Does that occur very often? No; but I fancy it is going to occur oftener as everything gets worked up nearer.

370. You have not experienced it very much? I have seen a good deal of Broken Hill. I have worked in three or four mines at this place. This is the worst practice I have seen, and I think it should be checked.

371. In respect to the statement that there has been an increase in the number of accidents, what, in your opinion, has given rise to this increase? It is owing, for one thing, to a number of the men being incompetent, also to carelessness, and I suppose the companies are to blame somewhat, and in this way: You might be working in a dangerous place, and, if the head official came round, you would be all right; but, if he was not about, and you spoke to one of the shift-bosses, you would get a sharp answer, and be told that it was all right. If you do not know any better, you will go into the place, and the consequence is that something will probably happen.

372. Are you satisfied that it is due to the incompetent men—this increase in the number of accidents—and that it is the incompetent men who have been injured? I consider it is so. Of course, it does not matter much how careful a man is, or how practical he is, he is liable to receive an accident. There have been a lot of accidents at Broken Hill since I have been here, but I have never been near when one happened, and all the information I can give regarding them is from what I have heard in conversation and read in the paper. There is no doubt that accidents have occurred owing to the neglect of either the man himself or of one of the subordinate officials, and there were others which could not be prevented.

373. Are the regulations, in your opinion, as to explosives sufficient if carried into effect? Yes.

374. There is no complaint you can make that any regulation whatever has been broken which would tend to endanger the limb or life of the men in any way? No.

375. Do you think the regulations are sufficient so long as they are carried into effect? A few little amendments might be made to meet what I have complained of. I have nothing else to complain about.

376. Do you think it is necessary to appoint additional inspectors in this district? I think there should be an improvement in that matter. If it is required of the inspector to be continually underground or about a mine, one could not do it all. He could not inspect the outside districts as well as Broken Hill. At present he has to go to Day Dream and other outlying places.

377. What system of inspection do you consider is the best and safest? The inspector should take a cage down, just as a policeman goes unexpectedly to an hotel on a Sunday. That is the proper way. He would then see what was going on.

378. Under the Act he is permitted to do that; but what I want to know is whether you consider one inspector is sufficient for the district? Is it only here in Broken Hill you are referring to?

379. No, I refer to the Albert mining-field; that includes Tibooburra and White Cliffs? That is too much. He cannot be everywhere. There is a lot to look after in Broken Hill alone.

380. As to the ventilation: have you found inadequate ventilation in any place where you have been working? I cannot complain much about it. I have worked in one very bad place; but, on the whole, I consider the ventilation very fair.

381. You could not suggest an amendment in the regulations in any way to make them more effective? No; nothing more than what I have complained of.

382. If any part of a mine were considered dangerous, whether by the officer-in-charge or the inspector, and the men were withdrawn to admit of it being repaired, whose duty should it be, in your opinion, to pronounce it safe for the men to return? Of course, that is a hard thing to answer. If the Inspector of Mines were there I would ask him; or if any of the higher officials were there I would go by their opinion. At any rate, I would have a look at it for myself.

383. If the shift-boss says the place is too bad, and the inspector also pronounces it dangerous, after it is repaired, who should give the word to go back;—would it be the place of the shift-boss who called you out, or should it be left to the discretion of the inspector? I consider that should be left to the inspector.

384. I ask these questions because of General Rule 2, and I wish to know whether you think the onus should lie on him (the mine's official) or on the inspector of saying that everything was safe for the men to go back? I consider it should be the inspector's place to say whether the men should go back.

385. Do you think it is desirable that a Board of Inquiry should be appointed in each mining district to investigate all accidents that may take place; by accidents I mean those which necessitate a man's remaining off work for (say) a week or more? That is a question I have never given much thought to. I do not know whether it would be of any advantage to us.

386. You think that the magisterial inquiry which is held now in the case of fatal accidents is quite sufficient? No, I do not; because a man behind a draper's counter does not know much about mining.

387. But is it not the case that a man may have a very severe accident; it may be through his own neglect, and it may be through the neglect of the person in charge. He lives, and is perhaps in misery all his life. At the present time there is no inquiry into accidents of that kind. There is only an inquiry in the case of a fatal accident, and of course there the principal witness is dead. In the face of that you do not think that such a Board of Inquiry would be an advantage to all concerned. Again, almost every fatal accident is the cause of a stigma being cast on the man in charge. People say, "Oh, it was his fault." A Board of Inquiry would remove that where unjustified? That would be a good thing, and I think it would make a lot of them careful.

388.

- W. Noble. 388. You think it would have a tendency to make the men more careful? Yes.
389. And, of course, those in charge of the men? Yes.
- 10 July, 1897. 390. *Mr. Edwards.*] In what part of the mine do you complain about the men being worked too closely together? In Block 11, between the 200 and 300-foot level—in McGregor's stopes.
391. That is where you are working now? Yes.
392. Have you made any complaints to the shift-bosses about it? Yes; I have said that it is not a fit place for men to work in. He said, "Oh, you must stand on one side when anything is coming down." But a man might be barring down, and a stone drop right on top of me.
393. Has that continued for any length of time? It has been going on for some little time. It is a bit better now.
394. You have often seen Mr. Horwood through there;—have you never mentioned it to him? No.
395. You are not afraid to go and speak to Mr. Horwood about anything? Not in the least. I would rather speak to Mr. Horwood than those two or three classes below him.
396. The only way to relieve this difficulty would be to get rid of some of the other men? Yes; it would mean a little more unemployed, but it would remove the danger. Of course we have each got six or seven depending upon us, and we would rather run a risk than not be able to keep them going.
397. As to the incompetent men;—it is very hard to tell whether a man is a miner until you see him at work? Yes.
398. And sometimes a man can deceive a shift-boss by the way he taps a drill? Yes; if he can tap a drill fairly well the shift-boss very likely passes him.
399. It is only by seeing the men work that you can ascertain whether they are miners or not? As he goes on you can tell more about him. If he cannot do his work he is sent up.
400. I understand different kinds of ground require different kinds of labour;—for instance, a man may be a good workman in one portion of a mine, and be incompetent in others? Yes.
401. And a man in Broken Hill wants to be good all round;—it will not do if he can only use a hammer? No.
402. You say accidents are due in a great measure to the incompetence of the men and to carelessness? You see, a man may be working in a dangerous place or in a dangerous manner, and, having six or seven depending upon him, he will risk things. Of course, if a man is foolish enough to go into danger it is his own fault, although he is actually forced into it.
403. Will you tell us about a suggestion that has been made as to training miners in Broken Hill;—when should a man be taken in to learn mining;—when should he be taken underground? I consider, before a man can go through Broken Hill—that is, taking the hard and the soft and other things, such as timbering,—it would take him at least two years to do it.
404. What do you think of a system of apprenticeship to teach young men mining? Of course, as they grew up they would learn; but I know of men in Broken Hill who are among the best miners in the country, and they never knew anything of mining until they came here.
405. When a party of men (say six) are working in a contract, there are two men in the face at a time—that is, two men in each shift;—when they finish their shift, where do they meet their mates who are coming on? Sometimes they meet them, and sometimes they do not.
406. If there is any dangerous ground in the face, what means have they of informing their mates? If there is anything special we generally try to see our mates. If nothing more than ordinary we do not care whether we see them or not. Any man going into a face, whether he has notice or not, sees for himself. He taps the face, and sees that it is secure, &c.
407. But sounding the ground is not a certain test? There are men in Broken Hill and other places who can form an idea so well by tapping a stone that they would almost go to sleep under it. They would not be a bit afraid of it. Of course, sometimes you get deceived.
408. Where the ground ends in what is termed a "soapy" end it sounds safe? No; it would sound loose.
409. Supposing a large lump ends with a "soapy" end, it would then sound solid? You could tell, I think.
410. Do you not think it would be better if you had an opportunity of showing your mates on the on-coming shift any dangerous ground, either on the roof or in the face? Yes; and I have always, if I wanted to tell my mates anything specially, tried to see them.
411. And have taken them down and showed them it? No. I could meet my mates here in the street and tell them exactly where to find within 6 inches of any place in the face where we were working.
412. But would every miner be able to do that? I do not say everybody is like that.
413. Would it not be safer if you had the opportunity of showing your mates how the face was when you left it, pointing out any missed-holes, and showing the dangerous ground? You do not want to go and show a man where a missed-hole is. If he wants it pointed out to him he has no business there.
414. I suppose sometimes you would be coming up the shaft in one cage, and your mate going down in another? Yes; but I would guarantee to see him if there was anything.
415. But you are an extra cautious man;—every man would not be the same? Of course some men do not care, so long as their time is up; they clear off.
416. Then would it not be far better to have the change of shift take place in the face, instead of at the top as at present? It would be an advantage to some, but to others it would not. I do not see why an experienced man should suffer because of the useless men that are employed.
417. It is so very hard to tell useless men until they have been tried, and while they are being tried, these accidents take place;—do you think then experienced men should have certificates? It would do a lot of good.
418. From whom should they get the certificates? From some man who understands mining, and who would examine them.
419. I suppose a certificate from the Inspector of Mines would be sufficient? Yes; of course it is understood that the inspector should be competent.
420. If additional inspectors are appointed, it is necessary that they should be men of the very highest qualifications? Yes; you would want a man who thoroughly understood his work.
421. You have often seen Mr. Hebbard through the mines? Yes; plenty of times.
422. Did you ever complain to him about anything? No; I have never had any reason.
423. There has been nothing for you to complain about? Only what I have already referred to.
424. General rule 3, sub-section c, says that a workman shall not have in use at one time in any one place more than 6 lb. of explosive;—is that sufficient for a party of men? Yes.

425. Where you are working machines? I am not a machine man. I have never worked a machine. W. Noble.
426. You cannot say whether that is sufficient for a machine? In some cases, 10 lb. of dynamite are used.
427. Is that rule unreasonable—limiting workmen to 6 lb. each? I do not see how it could matter if a man had a case. 10 July, 1897.
428. I suppose if 6 lb. went off close to a man, it would do just as much damage as if a case went off? Yes.
429. Sub-section *c* of the same rule says that a charge of powder or other explosives which has missed fire shall not be unrammed or drawn. Now, would you put in another hole close to a missed-hole, or would you draw the charge? I would draw the charge.
430. With a proper tool? The best thing is to have a plug of fracture and blow it out.
431. You do not think that is a good regulation, that if a charge of dynamite has missed fire, it should not be unrammed or drawn;—you would not consider it safe to put down another hole just alongside a missed-hole? It would not be safe to put it down close to it.
432. And you could not guarantee if you put it down at a safe distance that it would explode the miss-fire? No.
433. You prefer to draw the tamping, and put in some dynamite? Yes.
434. In appointing this Board to investigate into these minor accidents, how would you propose to constitute it? I do not see how things could be benefited a great lot.
435. You are not prepared to make any suggestion on the subject? No.
436. With the one exception about the men working too closely, you have nothing to find fault with? No.
437. You have no fault to find with the regulations (*Exhibits "A" and "B"*)? No.
438. Are those underground regulations (*Exhibit "A"*) posted up everywhere, so that the men can see them? Yes; posted all over the mine.
439. You know them all? Yes.
440. Is it not a fact that more notices are posted than there are men who read them? Yes.
441. *His Honor.*] How many men out of every ten can read? I do not think you will find, now-a-days, 10 per cent. that cannot read or write.

MONDAY, 12 JULY, 1897.

John August Berndt sworn and examined:—

442. *Mr. Polkinghorne.*] Your name is John August Barndt? Yes.
443. You are a miner? Yes.
444. You are now working on the Barrier as a miner? Yes.
445. From your experience on the Barrier, is the ventilation in the mines sufficient? No.
446. What amount of air do you think it is necessary must be passed through the workings for each man and animal employed below? 300 to 400 cubic feet.
447. Have you any idea of the amount of air that is passing through the workings in the several mines that you have worked in? From about 100 to 150 cubic feet.
448. What means would you suggest by which the required amount of air might be carried into the workings? By air winzes.
449. What danger is caused by improper or insufficient ventilation? It tends to endanger the health of the men and to affect the workings.
450. Have you perceived any noticeable increase in the number of accidents at the mines you have been working in along the line of lode during the last nine months? Yes.
451. What has been the cause of this increase? The contract system.
452. Is it your opinion that the increase has in any way been brought about by the incompetency of the men or officers in charge? As regards the men—they know their work, and thoroughly understand what they have to do; and the bosses, as far as they are allowed to go, are not at fault.
453. The regulations, I take it, are not sufficient for carrying out the work in a proper workmanlike manner? Yes; that is it.
454. Do you think that the services of additional inspectors are necessary under the existing regulations? Yes; there ought to be no less than two for the Hill alone.
455. Do you think the regulations are sufficient, provided that additional inspectors were appointed? Not in the state in which they are at the present time.
456. You think the regulations are not sufficient to protect the life and limb of the employees? They are not.
457. Have you a sufficient grasp of these regulations (under the Mining Act) to suggest any amendment which would be of benefit in securing better conditions for the men to work under? No; I have not had sufficient time to go through them and do that.
458. I believe you have the regulations posted up in the mines? Yes.
459. Have you ever read those regulations? They have only been there a few days. I have not read them since they have been there.
460. You have not read them sufficiently well to have a grasp of them which would enable you to suggest any amendments? Every miner should have them in his hands, so that he could read them properly.
461. You think that each employee should be supplied with a copy of the regulations? Yes.
462. Should they be supplied by the employer, or by the Government, or how should they be obtained? I think you should receive them from the employer.
463. In the event of those regulations being supplied to the employees, would you suggest some means by which men should be punished for committing a breach of them? Yes.
464. Whether broken by the companies or by the men, punishment should be imposed? Yes.
465. Can you point out any accident that has occurred through a breach of those regulations? Two large shots are fired; and too much hanging ground is over men during the whole time they are working.
466. In your opinion, the ground that is being opened up in the mines is not being sufficiently secured? Yes; not being sufficiently secured and timbered.
467. Can you point out a case where an accident has occurred through an insufficiency of timber? Yes; in Harvey's case.

J. A. Berndt.
12 July, 1897.

- J. A. Berndt. 468. I would like you to give your reasons for saying that that accident was caused by an insufficiency of timber? Big shots were being fired, and slabs of country were hanging overhead. If the ground had been closely timbered there would have been no accident.
- 12 July, 1897. 469. In this particular place there was a larger excavation than, in your opinion, should be allowed to be left open? Yes.
470. Had there been sufficient timber used the accident would not have happened? No.
471. Is there any other case that you know of? There have been minor accidents through places not being sufficiently covered up.
472. The big timber of the square sets has been in, but not securely covered? Yes; not securely covered over head.
473. What caused this insufficient covering;—has it been through the men's neglect, or through the faulty provisions of the companies in not providing the required timber to do the covering? Shots have been fired, and the laths broken and not replaced.
474. Was it the men's duty to see to the covering? It was the men's duty to see that they were over their head, but it was the boss's duty to see that sufficient laths were there, which was very seldom the case.
475. It was the men's duty to see that these places were kept covered, but proper timber was not supplied so that they could do it? That is it.
476. General Rule 3, sub-section *d* says that, in charging holes for blasting, an iron or steel tamping bar shall not be used, unless mounted with at least 4 inches of copper;—in your opinion, should any iron or steel be used in tamping a hole that has been charged with glycerine compounds? No; nothing should be used but tamping sticks.
477. You do not think iron or steel should be used? No.
478. Not even if mounted with copper? I cannot say about that, as I have never seen copper tested.
479. If at any time any part of a mine should be found to be dangerous, and the workmen were withdrawn from that portion of the mine by the man in charge or by the inspector, whose duty should it be to say that the place was again fit for the workmen to return? I think it should be the inspector's place in all cases.
480. General Rule 3 of the Mining Act, sub-section *c* says that a workman shall not have in use at one time in any one place more than 6 lb. of explosive;—do you think that that clause is sufficiently elastic for the Barrier? I think that is quite sufficient.
481. I would like you to understand that this inquiry is being held for the purpose of suggesting any alterations thought necessary;—in the case of a party of men working with rock-drills, do you think that clause is elastic enough? I do not know anything about rock-drills. I am only alluding to the hammer and drill.
482. You think that at any one time 6 lb. is any amount for any party with hammer and drill to have in their possession? Yes.
483. But you are not acquainted with rock-drills? No.
484. You agree with sub-section *b* of General Rule 3, that the explosive shall not be taken into or kept in the mine except in a case or canister? Yes.
485. Has a case or canister always been provided in the mines you have been working in? At times canisters have been provided, but at times they have run out.
486. In the case of your not being supplied with a canister, has it been a regulation that only the amount required for a charge should be taken from the magazine? No. In many cases there have been boxes of it standing all over the stopes.*
487. In your opinion, should a charge of gunpowder or other explosive which has missed fire be unrammed or drawn? The top of it should be drawn, and the hole charged the second time. It should not be gone near within twenty minutes or half an hour.
488. But do you think it is safe in the case of a powder-hole that the tamping should be drawn from off the charge? No.
489. In the case of the glycerine compounds, do you think it safe to uncover the charge in the case of a miss-fire? No.
490. Do you think it is safe for another hole to be drilled close to that hole? Not within from 18 inches to 2 feet of it.
491. You think it is safe to bore a hole within 18 inches to 2 feet of a hole that has missed fire, and with the charge still remaining in it? Yes; provided it has stood long enough.
492. How long would you consider it safe to leave that hole before starting to bore again? Not less than twenty minutes or half an hour.
493. You think it is safe to go back to a missed hole within twenty minutes or half an hour? Yes.
494. As to the regulations in force in your mine;—do you know whether they provide that you shall go back within that time; or must a longer time expire? I have not seen a clause to that effect.
495. You would be satisfied if the regulation provided that it be not less than twenty minutes? Yes.
496. How long do you think a hole should be left after being "bulled" before being charged? That would depend upon the depth of the hole, and the quantity of stuff used in the "bullying."
497. Say a 6-foot hole drilled in a face? It should be left nothing less than an hour.
498. That is with how much explosive used for "bullying"? Six to eight plugs.
499. After using six or eight plugs for "bullying" is it safe to charge a hole after an hour elapses? Yes.
500. Without putting anything into the hole? After wetting it—pouring water into it. Deeper holes require a longer time.
501. I suppose, as far as underground work is concerned, a 6-foot hole would be oftener over the limit that is bored than under? Not in the way the open-cuts are being worked at present. Holes are bored as deep as 10 feet.
502. Have you got open-cuts underground? Yes.
503. I would like you to give us some idea of them. Kindly explain to the Commission what you call an open-cut underground;—I have never heard of them before? It is an opening underground without timber, about 30 feet by 18 feet.
504. Could you give the dimensions about right through? From 16 to 30 feet wide by 12 to 14 feet high, and from 40 feet to 60 feet long.

505.

* NOTE (on revision—question having been misunderstood):—Yes; but tins were being left about the stopes, instead of being taken back to the magazine.

505. That is what you call an open-cut underground? Yes.

506. In your opinion, is that being worked as safely as it should be worked? No; I think it should be timbered.

J. A. Berndt.
12 July, 1897.

507. *His Honor.*] Where can you locate one of those open places? In the Central Mine, on the 400 and 500 feet levels.

508. *Mr. Polkinghorne.*] Have there been any accidents in those places, fatal or otherwise? There has only been the one fatal accident during the last eight or nine months. There have been several minor accidents.

509. Has a fall of the roof been the cause? Yes; and the fall of slabs.

510. Then that must have some reference to what you said in Harvey's case—that there is insufficient timbering? Yes.

511. Do you think that if a Board of Inquiry were appointed to inquire into accidents, drawing the line of course at those which might be considered trivial, it would result in a benefit? Yes; it would tend to avoid further accidents.

512. What number would you suggest that the Board be composed of? Twelve miners.

513. How should they be elected? They should be subpoenaed.

514. I might state that this Board of Inquiry I refer to would be outside of a magisterial inquiry, or a coroner's jury, as it is better known. I mean a standing Board which could be called into requisition at any time it was required to inquire into any accident. Do you think it necessary that twelve men should compose that Board? I do not think there should be less than twelve men.

515. How should they be elected? They should be elected from the men working where the accident happened.

516. Do you think they should always be selected from the mine where the accident happened? Yes.

517. You do not think it should be a standing Board, to be elected for a certain period? No; I think it should be elected from the place where the accident happened.

518. Do you not think there would be a tendency to prejudice in some cases? Yes; I daresay there would. But I do not think that should have anything to do with it. I reckon it ought to be a straight-forward inquiry.*

519. But is it not possible, if twelve men were selected from the mine where an accident occurred, some of whom, perhaps, would be mates of the injured party, and inclined to lean towards him, that the result of the inquiry might be a false one? I cannot see how it could.

520. Do you know anything of the surface open-cuts? No.

521. *Mr. Edwards.*] Speaking about the ventilation—You say that 300 to 400 cubic feet of air is the least quantity necessary for each man? Yes.

522. At the present time, you say that 150 cubic feet of air is passing through? Yes.

His Honor: I suppose it might be admitted that whatever has been proved a fair thing in a coal-mine, as far as ventilation is concerned, for the purpose of supplying air to men, might be taken as a fair thing for any other mine; so I consider the question of ventilation one that has already been gone into.

Mr. Edwards: I would like, your Honor, to put two or three further questions to Mr. Berndt on this matter.

523. Would you be satisfied with the same ventilation that the Government say is sufficient for men working in coal-mines? I do not know what the ventilation is in coal-mines.

524. At any rate, you say that 150 cubic feet of air per man is passing through the mines in which you have worked? Yes.

525. Do you know that that is 50 cubic feet more than is required in a coal-mine? If that is so, there is not more than 30 cubic feet per man here.

526. Have you ever measured it? No.

527. You have no data by which you have arrived at your estimate? No; only according to what I have read.

528. What have you read? About the ventilation in different mines.

529. I suppose you are hardly competent to give any evidence as to what air is passing? [*His Honor:*—I understand the witness is speaking by his feelings.] (*Witness*):—I consider there is not sufficient air by a long way.

530. What mine do you refer to? The Central mine.

531. In its present condition? Yes.

532. I suppose you see the inspector through there? I have not seen him during the last six months.

533. Not through the mine? No.

534. What part have you been working in? The 500-foot level.

535. You have not seen him for six months? No.

536. What shifts have you been on;—on the day shifts as well as the night shift? I am on the three shifts as my turn comes.

537. I suppose you know there is an inspector here? Yes.

538. Have you ever made any complaint to him about an insufficiency of ventilation? No.

539. Have you complained to any of the shift-bosses? Yes.

540. Which one? To all of them on our shifts.

541. You know the names of them? Yes; William Dryer, John Simmons, and Ben Murrowood.

542. Anybody else? They are the only shift-bosses I have been working under.

543. Did you complain to them about insufficient ventilation? Yes.

544. When? At different times.

545. I suppose in opening up fresh ground there must necessarily be temporarily not so much air as there would be in other workings? In some places there is sufficient air, and in other places there is no ventilation coming through at all. Where I have been working the last three months it has been defective.

546. I suppose in putting through a drive the air would be bad? It is not a drive that I refer to. The end of the drive is a long way from where I am working. Near the end of the drive there is no air at all, and you could not work there more than five minutes on some occasions.

547.

*NOTE (on revision):—There should be half miners and half mine-owners, or bosses.

- J. A. Berndt. 547. Do I understand you to say that this want of ventilation is continued for any length of time? Yes.
 548. For how long? For the last three months in that particular place.
 12 July, 1897. 549. Is it hard ground you are working in? Yes.
 550. I suppose in hard ground three months is not a very long time in which to make a connection from one part of the mine to another? No; they won't do it in three months.
 551. Are they making a connection now? No; there won't be a connection for the next six months unless they put down winzes from the upper levels.
 552. *His Honor.*] What plan of ventilation is adopted in the Central? A few winzes, and what comes down the main shafts.
 553. Any compressed air? No.
 554. No pipes laid? They are starting to lay them now.
 555. *Mr. Edwards.*] They are now laying pipes? They have just started laying them.
 556. There has recently been a change in the management? Yes.
 557. A new manager has been appointed lately? Yes.
 558. I understood you to say that the contract system was a cause of the increase in the number of accidents;—in what way does it contribute to the increase of accidents? The depth of the holes being bored, and the open-cuts underground.
 559. Is it necessary to bore deeper holes working on contract than working on day-labour? It is all planned for them to bore deeper holes.
 560. *His Honor.*] Planned by whom? By the shift-bosses.
 561. *Mr. Edwards.*] What depth are the holes that you have been working on? They generally plan the holes from 3 feet 6 inches to 10 feet.
 562. Do you consider 10 feet an excessive depth underground? Yes.
 563. *His Honor.*] Can you explain why deeper holes are planned for them working under contract than would be planned working under the day system? They open up more ground.
 564. You mean that the contractors, when they think it is in their own interest, will run a greater risk than men will when working only in the interest of the mine owners? When working on day-labour they do not stand the same risk.*
 565. They won't stand the same risk? No.
 566. They run risks under the contract system because by running risks they make a greater profit for themselves? Things are cut too fine for them to make any profit.
 567. By competition? Yes.
 568. *Mr. Edwards.*] I suppose under the contract system they make good wages? No; only a shade over wages.
 569. Right through? I do not believe they average more than 10s. to 10s. 6d. a shift.
 570. *His Honor.*] You mean each man per shift? Yes.
 571. *Mr. Edwards.*] I think contractors lose some time occasionally? Yes.
 572. Through their own fault? No; through an insufficiency of steel.
 573. But after pay—the Monday after pay day—is not time frequently lost then? Not that I know of; there may be, perhaps, odd ones, but very few.
 574. They work, then, every shift? Pretty constant.
 575. You say their average pay is 10s. 6d.? Yes.
 576. You admit that generally the men are competent and the shift-bosses are competent? Yes.
 577. Then you state that the regulations are not sufficient for carrying out the work in the proper manner;—but I understand you have never read the regulations? They are forced in a good many ways to do things they should not do. If the regulations were more enforced that would never be done.
 578. I understand you have never read the regulations? I have read part of them.
 579. What regulations have you read? I have read several of the rules and regulations of the mines here, but I have not read them all through.
 580. Each mine has working rules in addition to the Government regulations? I have not seen them.
 581. *His Honor.*] Are the rules posted up? I have never seen them.
 582. *Mr. Edwards.*] I suppose most people congregate at the pay-office on certain occasions;—are there none there? Only those that have been put there recently.
 583. You say there are no regulations posted up on the mine? Only what I have seen at the pay-office.
 584. Could they be there without your seeing them? I have been at the Central for about eighteen months, and never saw them until within the last month or so.
 585. That is either for above ground or under? Yes.
 586. Even those that you did see posted up you did not read through? Not all of them.
 587. I suppose they had not sufficient interest for you? They had interest, I suppose, but I had not the time. I could not stay long enough to read them.
 588. You never had time to stop to read them? Not at the mines, but I have read them at the office.
 589. *His Honor.*] What I understand you to say is that you would like to have a copy to read at home? Yes.
 590. *Mr. Edwards.*] You have no suggestions as to what should form any new regulations? No; I have no proper code to draft by.
 591. Do I understand you to say that the ground is insufficiently timbered in the Central? Yes.
 592. And that there is a scarcity of timber in the Central? I do not know about there being altogether a scarcity. There is a scarcity more so than otherwise.
 593. As a matter of fact, are not men supplied with any quantity of timber required to secure the ground? There has not been enough timber for some time to timber up the ground properly.
 594. Have you ever asked for timber, and been refused? Yes; it was not there for them to send it.
 595. Whom did you ask? William Rowe for one, and other shift-bosses.
 596. Within what period are you speaking? Any time within the last eighteen months—at different times.
 597. That is in the hard ground you are working in? No; all through; in the stopes as well. I have been working in the stopes besides in the hard ground.
 598. I suppose you admit that in hard ground timber is not required right through? Not right through; but I do not see that men should work without timber in any case. 599.

*NOTE (on revision):—Because day men mostly plan their own holes; and, for the contractors, they are mostly deep holes that are planned.

J. A. Berndt.

12 July, 1897.

599. No matter how solid ground is, you think timber should be there? Yes, barring drives.
600. In Harvey's case, was that in the Central? Yes.
601. How did that accident occur;—were you working with him? I was not on that shift.
602. All you know about Harvey's case is what you have heard or read? Yes; I know the place where the accident happened.
603. Do you know that it was sworn at the inquest that there was plenty of timber handy for the men? No; I was not here at the inquest.
604. And you were not on the same shift? No.
605. So that all you know about Harvey's accident is what you have been told from outside? Yes.
606. Did you see the ground where Harvey was killed? Not precisely the ground.
607. Was it in a stope? No; in an open-cut underground.
608. What we call a chamber? Open-cut is the name I have heard it called by.
609. In speaking of the laths;—when they are blown away by blasting, I suppose it is not the duty of the mines to put the timber back again? No; that is the duty of the men.
610. And if they do not, and an accident occurs, it is their fault? Yes, if timber is there. But if timber is not there, I do not see that it is the men's fault.
611. As to the use of explosives;—you think that 6 lb. would be sufficient for a party of men to use at a shift? Yes.
612. You are only speaking of hammer and drill? Yes.
613. They would not use more than 6 lb. of dynamite in eight hours? No.
614. You say you have seen cases of dynamite standing about all over the stopes? Packets, and tins containing packets, is what I mean.
615. Who would leave that, the shift-bosses or the men? The men.
616. You would hardly blame the shift-bosses for that? No.
617. That is the fault of the men? Yes.
618. I suppose men are careless? I do not see that they are careless. Odd ones may be careless.
619. Men get careless through handling explosives? I don't think so.
620. Tins are provided for the men to carry their dynamite in? One time they were; but now a man goes around with a box of fractureur to deliver to each party as they require it.
621. The man goes round and serves? Yes; serves out the dynamite to the different parties.
622. That is a safe practice, so long as they put it in the holes and fire it, and do not leave it about? Yes.
623. You have no complaint to make on the part of the management as to the distribution of dynamite at the present time? No.
624. As to the missed-holes, do you consider it unsafe to draw the tamping from a missed-hole with a proper tool? Portion of it could be drawn, not all of it.
625. Portion of it, sufficient to explode the charge;—a sufficient quantity of tamping to enable a man to get within such a distance of the charge as to explode it with a plug or two of dynamite? Yes.
626. I suppose you are in the habit of using dynamite always? Yes, and gelatine.
627. Do you close the cap down on the fuse with your teeth? No.
628. You have seen it done? Yes.
629. Frequently? Yes.*
630. And yet you say men are not careless? They are not careful in that way.
631. You do not consider it a safe practice? No.
632. Those caps are charged with one of the highest explosives known? Yes.
633. And if there happened to be a little bit on the edge, and the teeth touched it, it would explode? Yes.
634. And if it exploded, what would happen? There would not be much of your head left.
635. Do you think it safer to draw tamping from a missed-hole and explode it, than to put down another hole alongside? It is safe to withdraw portion of the tamping and fire it; but I think it is just as safe to bore a hole alongside.
636. You say you would not put a hole down nearer than a foot or 18 inches to a missed-hole? Yes.
637. Do you think a hole a foot or 18 inches from a missed-hole would necessarily explode the missed-hole? I think it would.
638. Supposing it did not, and had the effect of tearing this stuff about without exploding it, the dynamite would be blown out and scattered with the dirt? I fancy it would explode with the other; but the cap would go off in any case, and there would be no danger in the explosive itself. The men would see it lying about if it did not go off, and would pick it up.
639. Supposing you struck it with a pick, what would result? It would explode.*
640. There is no doubt about that? I do not think so.
641. From your experience, you think twenty minutes to half an hour is sufficient time to leave a missed hole before you go back to it? Yes.
642. Would you go back in twenty minutes or half an hour? Yes.
643. To a missed 10-foot hole? No; I only reckon on a 6-foot hole.
644. You would go back within twenty minutes or half an hour to a missed-hole 6 feet deep? Yes.†
645. And you think you would be perfectly safe? Yes.
646. Do you know the rule of the mine is that men are not to go back to a missed-hole within an hour and a half—a rule to that effect is laid down in the mines' regulations, and yet you say men are not careless in the use of explosives? Not necessarily.
647. With reference to this Board of Inquiry, what would be the duties of the Board, supposing an accident happened? To thoroughly inquire how the accident happened.
648. Anything else? And to try to avoid such an accident in the future.
649. Anything in the way of compensation to the man injured? I reckon the man injured ought to be compensated by the mine.
650. Who would fix the compensation? The Board.
651. Do you think twelve miners would be an impartial Board to assess damages against mine-owners? Yes.

652.

* NOTE (on revision) :—Because there is no other appliance to hand to do it with.

† NOTE (on revision) :—I never heard other than half an hour. I did not know it to be two hours.

- J. A. Berndt. 652. The mine should not be represented at all? Oh, yes, certainly; they should be represented.
 653. I understood you to say that it should be chosen from twelve miners. [*His Honor*: I do not think that it has been suggested that this Board should be a Judicial Board, but merely a Board to report.] Then this Board would simply determine the cause of the accident? Yes.
 654. I suppose you admit that some miners are grossly careless in their work? I dare say there are some.
 655. They become reckless to danger—they become so accustomed to the danger that they apparently become reckless? I will not admit that.
 656. I suppose if a man brought about an accident by his own carelessness, you would hardly expect the mine to compensate him? No.
Mr. Polkinghorne: I did not suggest anything about compensation.
His Honor: I understood this Board was to be something analogous to the Marine Board—to inquire into the cause: not to assess compensation.
Mr. Edwards: Very well, your Honor.
 657. You say, when men are withdrawn from any part of a mine, they should not be allowed to go back without the sanction of the inspector? I would not go back until I had the inspector's opinion as to whether it was safe or not. I would not take my own opinion on the matter.
 658. You would have the men laid off until the inspector came? Yes.
 659. That might occur in the one stope six times in a day? I do not think so.
 660. It would not be impossible? It would not be very probable. Besides, there are plenty of other places to go to.
 661. Assuming there were not, these men would be taken out and would not be able to go back until the inspector came? To what do you refer?
 662. I am referring to hanging ground? There would be no need to send for the inspector in a small case.
 663. You only refer to where there might be a movement in the ground of some magnitude? Yes; where there is a large space of ground to move.
 664. And when the timbers are giving? Yes.
 665. [*His Honor*.] To whom would you give the discretion to determine the point, whether the inspector should or should not have to pass the work before the men go back? I do not understand.
 666. Would you leave it to the men to say whether the inspector's services should be called in? Yes.
 667. [*Mr. Edwards*.] Supposing there was a dispute about it—that some men wanted the inspector and others did not;—how would you get over that difficulty? I cannot say.
 668. [*His Honor*.] There might be no difficulty in getting an inspector at Broken Hill if there were two inspectors appointed; but, supposing the thing were to occur 50 miles out, but still in the same district, then it would be a very difficult thing to get the inspector? As I said, I think two inspectors should be on the Hill itself.
 669. [*Mr. Edwards*.] There is hanging ground every time a shot is fired, and do you not see the difficulty that would arise? In that case there would be no difficulty. I only refer to large creeps as requiring the consent of the inspector.
 670. What you mean is that, in case of any large movement or creep in the ground, and the men being taken out, the inspector should report before the men are allowed to go back? Yes.
 671. But in ordinary workings the shift-boss, or foreman, or underground manager is sufficient authority? Yes.
 672. I suppose Mr Rowe, whom you have been working under, and who is the underground manager of the Central, is about as experienced a man as there is on the field? Yes.
 673. I understand you to say that all you have told us about Harvey's case as to insufficiency of timber is founded simply on hearsay? Yes.
 674. [*Mr. Polkinghorne*.] In Mr. Edwards' examination, he asked if it was usual for a good deal of time to be lost by contractors after pay, and if the average pay was not 10s. 6d. a day;—should I understand from your answer that the average of 10s. 6d. is for twelve shifts composing the fortnight, or for the actual number of the shifts worked? 10s. 6d. is the average wage for the actual shifts worked.
 675. [*His Honor*.] Under what conditions are the underground chambers put in, and where are they put in? They are started from the foot-wall working towards the hanging-wall, going from one to the other.
 676. Are they only put in in cases where the ground is so solid as to make timbering unnecessary? There is very little timber in some, and in others no timber at all.*
 677. Timber is economised then, when it appears not necessary to use the full quantity of timber? Yes; they do not use the sets right through.
 678. Have there been many falls there—many accidents? There has been only one fatal accident during the last six or seven months. There have been five or six minor accidents, where they have only been disabled for about a fortnight.
 679. From falls? From falls and small "jombs," and through there being no laths.
 680. The accidents, through there being no laths, would not apply to the chambers? No.
 681. Have there been in the chambers themselves falls of much consequence? Not that have hurt anyone.
 682. Falls of mullock or ore? Both mullock and ore.
 683. [*Mr. Polkinghorne*.] Would it be wise to keep the timber closer to the face than is being done at the present time? Yes.
 684. Would it injure the timber if it were brought closer? If brought too close it would.
 685. What distance should the timber be from the face? Not more than 12 feet; that is two sets.
 686. How high should they (open chambers) be carried? Not more than two sets; that is clear of the timber.
 687. Two sets high without timber, and not to exceed 12 feet from the face? Yes, no further than two sets.
 688. If they are two sets high, that will be 16 feet? Yes.
 689. You think 16 feet would be a sufficient height to go? Yes, nothing beyond that.
 690. And to timber it within two sets of the face? Yes; I think the timber should be within 10 feet of the face.
 691. How far now is the timber being kept from the face? In some places over 20 feet.
 692. And the height? 12 feet to 15 feet.

693.

* NOTE (on revision):—They are put in both in solid ground, and also in friable ore or soft ground, and require timbering.

693. *Inspector Hebbard.*] What is the exact locality of the place in the Central Mine where you complain of the ventilation? No. 2 drive in the 500-foot level. J. A. Berndt.
12 July, 1897.
694. Does a winze not come down on to the back of the part you refer to, and is there not a cross-cut right through, and, besides, there is the communication between the shafts? There is very little air there.*
695. As to the accident to Harvey, do not you know, as a matter of actual fact, that in that case the timbers were within 18 inches of standing ground, and that the fall was brought about by the swinging tom being interfered with? It was in the open-cut the accident occurred.
696. But there are 1,400 or 1,500 sets of timber in what you call the open-cut? There was very little timber there at that time.
697. *Mr. Edwards.*] When men are working in a face there are two of them to a party in the face at the one time, and the change of shift takes place on the surface;—would it not be safer if on the change of shift the men going off work should have an opportunity of pointing out to their mates coming on anything that might appear dangerous in the face or on the roof? Yes, it would be safer.
698. It would be far safer for the change of shift to take place in the face than on the surface? No; I do not think that it makes any difference. The men might meet at the plat; that would answer the same purpose.
699. Would it not be better to point out anything dangerous at the face than away from it? I do not see how that would make any difference.
700. You think you could describe the condition of the face just as well as you could point it out to the men on the spot? Very nearly as well.
701. Not quite? Almost.
702. Supposing you are going up the shaft at the same time as your mate is coming down, you would then miss him altogether? No; there are two of us. My mate would then see him.
703. Sometimes you do miss the on-coming party altogether? No.
704. Does it not occur sometimes that men go away home and never see their mates? I do not think so.
705. Do you not think it would be safer to point out the exact position of the danger, supposing there was any hanging ground or a missed-hole? We would then wait for one another.
706. Where? In the plat.
707. Would you come back then and point out the place? Yes.
708. In all cases? Yes.
709. I suppose you know of instances where holes have been charged by men going off shift, and they have left them and omitted to tell their mates anything about them? I have never heard of anything like that in the Central.
710. You think it just as safe to describe the condition of the ground as to point it out to the man on the spot? Yes.
711. *Mr. Polkinghorne.*] Is it not a fact that in many instances a good deal of firing takes place at the change of shift? Yes; about a quarter of an hour before we knock off.
712. In a place where ventilation is not very good, it necessitates men being out of the face close on an hour before it is fit to be worked in again? Yes.
713. Then it would be impossible on change of shift under these circumstances for men coming off shift to go into the place and point out to men going on shift the condition of the face? Yes; no one could go near the face just after the shots had been fired.
714. Why does this firing take place in so many instances just before knock-off? So that the time between the shifts can be given for the face to cool down, and be again fit to work in.
715. *His Honor.*] A certain amount of time has to be wasted after firing; and it is less wasted than it would be at any other time, for the simple reason that it works in with the change of shift? Yes.
716. *Mr. Polkinghorne.*] I take it that you are working on day-work? Yes.
717. Are your instructions from your shift-boss that you are to fire before knock-off or before crib, so that the place may have a chance to cool down? Yes.
718. Are the shift-boss's instructions that you shall fire on or about these times? Yes.
719. And you do not think a change in that custom would be beneficial? No.
720. *His Honor.*] Is it the rule that you cannot fire without permission of the shift-boss, and does it rest on him when to tell you that you may fire? Yes.
721. Can you suggest any rule which would preclude the men going off shift missing their mates coming on? They should fire no later than a quarter of an hour before knock-off, and they should meet their mates at the plat.
722. Not at the brace? No.
723. What is the longest time that it would take men to get from the face to the plat, taking your experience of the mines here? The longest would be about five minutes.
724. It would not run over that? No.
725. How many mines have you been working in? Only one mine on the Barrier, namely, the Central.
726. You cannot say what it would be in other mines? No.

Francis Harrington sworn and examined:—

727. *Mr. Polkinghorne.*] What is your full name? Francis Harrington.
728. You are a miner? Yes.
729. Of varied experience? Yes.
730. As this Commission is to inquire into and take evidence as to whether the regulations now in force for the carrying out of mining on the Barrier are such as they should be, I will read No. 1 rule:—

An adequate amount of ventilation shall be constantly produced in every mine to dilute and render harmless noxious gases to such an extent that the working places of the shafts, levels, stables, and workings of such mine, and the travelling roads to and from such working places, shall be in a fit state for working and passing therein.

From your experience, is there sufficient ventilation in the mines on the Barrier to comply with that rule? In the various mines I have worked in on the Barrier I have found sufficient ventilation.

731. What would be the effect, in your opinion, of bad ventilation, in respect to the men and to the property? Of course, in those mines, leading to a certain extent, and other ailments through dust and smoke not being able to get away.

732.

* NOTE (on revision) :—It is used as a mullock pass, and no air comes through it.

F.
Harrington
12 July, 1897

F.
Harrington.
12 July, 1897.

732. Do you think that bad ventilation would cause an accumulation of gas that would prove dangerous to the property, as well as to the life and limb of those employed?

His Honor: I do not think you need really trouble yourself on this question, for every one knows that bad results come from bad ventilation.

Mr. Polkinghorne: It is generally understood here, your Honor, that a lot of bad gases come off from the ores on the Barrier, and, if there is not sufficient ventilation, it might lead to something serious.

His Honor: Gases other than those arising from respiration? I only wish to let you thoroughly understand that the Commission recognises that ventilation is a very important question in all mines.

733. If at any time a portion of a mine should be pronounced by the man in charge or by the inspector to be unsafe, and the men were withdrawn until it was repaired, who should be the person to say that it is again safe for the men to return? The inspector.

734. Rule 2 gives power to the man in charge to withdraw the men, as well as to the inspector;—do you think that, in the event of the men being withdrawn by the man in charge, and the matter not being considered to be of such importance as to warrant the inspector's being called in, the part should be pronounced safe by the inspector before the men resume work? Yes.

735. Then, in all cases where places are considered by the man in charge to be unsafe, before the men are put back the inspector should be called in to say whether there is any danger? Yes.

736. Have you noticed an increase in the number of accidents in this district during the last nine months? There has been an increase in the number of accidents during the last two years; I cannot particularise the last nine months.

737. In your opinion, accidents are on the increase? Yes.

738. What do you think is the principal cause of the increase? The chief cause is the employment of incompetent men.

739. What is another cause? The workings are more extensive now, and more men are employed.

740. Do you think accidents have increased more in proportion than the number of employees during the last two years? I have not given it much consideration in that regard.

741. You think the chief cause has been the employment of incompetent men? Yes.

742. Have you any reason to believe that the increase is brought about by incompetency on the part of any officer? There is no doubt there are men employed on some of the mines as shift-bosses who are equally deficient in practical knowledge as some of the men.

743. As a natural consequence, that must be one of the causes why some of the accidents take place? Yes.

744. Do you think that, under the existing regulations, the services of an additional inspector would be of any use? Yes.

745. Do you think, then, that the regulations as set down in connection with the Mining Act are sufficient for the carrying out of mining in this district? I think they are deficient by a long way.

746. Are you prepared to suggest any amendments to those regulations? Not off-hand. It requires a man to sit down with the regulations, and to go over them carefully one by one, before he can venture to make any amendments.

747. Do you know fairly well what the regulations are that are now in force? I am not able to repeat them, but I have read them often enough. I know sufficient of them for my guidance.

748. You would know, then, when a breach of them was made;—have you seen any noticeable breaches of the regulations in parts of the Barrier where you have been working? No doubt I have. I suppose I have committed some myself at various times. Very often the handiest way is adopted in many cases, without any consideration for the regulations at all.

749. You admit that you have made breaches of those regulations? Yes.

750. Have you seen any breach of the regulations made by those in charge of the mines? I cannot safely say by anyone in charge.

751. I mean shift-bosses? I do not think so. My general experience is that men are warned at various times against certain things by various officers. I have never seen a shift-boss working or doing anything that would need him to commit a breach of the regulations.

752. Do you think there is anything required by these regulations which is being left undone by any of the companies? I think the present regulations are very vague in some instances. They do not clearly define things.

753. As far as you can see, you have no cause to complain of any breaches of those regulations? Not so far as I am personally concerned.

754. The question of open-cuts underground has arisen;—do you know anything about them? Open stopes, I suppose you can call them. I believe, where I am working at the present time with machines, we have an open excavation following the lode. Of course, it is not safe to put in timber, as it would not stand any time alongside those machines. They would shatter it in no time.

755. What distance do you think it is safe to open those stopes before any timber is put in;—what height, width, and length? The width of the lode, whatever it may be, although I do not think it is safe to leave it open without some support. The height should not be over 10 feet. That would be sufficient height for a man to see when it began to flake, and it would be high enough for him to keep it in order. If any higher, it would be out of a man's reach, and flakes might scale off and be on top of a man before he could see them. Again, with a greater height than 10 feet, there would be no possible chance of sounding.

756. Ten feet would be high enough to put in sill timber? Yes.

757. What distance would it be necessary, in your opinion, to keep the timber off the face, so that it would not be injured by the shots? Where the machines are working, the timber does not want to be any closer than 30 or 40 feet to the face.

758. We understand these openings have been carried higher than 10 feet? I believe they go over 10 feet.

759. You consider an additional inspector is necessary? I think this Hill is too much for one man to do it justice.

760. What should the additional inspector be—a theoretical man or a practical man? A thoroughly practical man. Theory on this field is no good.

761. Sub-section c of rule 8 says that a workman shall not have in use at one time in any one place more than 6 lb. of explosive of any kind;—do you think that rule is elastic enough—have you ever broken that particular rule? Yes.

F.
Harrington.
12 July, 1897.

762. You have found it necessary to break that rule to carry out your duty? Yes.
763. You think a regulation a little more elastic should be framed? Of course, that is a part of the regulations I have never given any thought to. I have very often seen that amount used in the one hole, and six or seven others alongside requiring just as much.
764. You would actually want half a hundredweight for one round of blasting? Yes.
765. So that a regulation that cannot be carried into effect by either the companies or the men is no good? No.
766. Sub-section *d* of the same rule says, that, in charging holes for blasting, an iron or steel tamping bar shall not be used, unless mounted with at least 4 inches of copper. It is evident that this rule was made for powder, which has almost gone out of use now, especially on the Barrier;—with the explosive now in use, do you think that is a good clause? I think it is behind the age altogether. For the explosives now used, a wooden stick is all that is required.
767. You say that a wooden rammer is all that the men should be allowed to use? Yes.
768. In the event of a charge missing fire, do you think it safe to unram or draw the charge? I would not attempt it myself.
769. Would you use any device of your own to explode the charge? I would fire it until it did explode.
770. You would put another plug on top of the sand or whatever may be put in as tamping, until it got deep enough to explode the charge; and that, you think, would be the safest device? Yes.
771. You are well aware that the company making those glycerine compounds say they should never be rammed; that they should have no tamping—only water or sand;—in your opinion, is the regulation issued by that company sufficient? I never tamp any charge. I simply put in a little dirt to make it air-tight. In the case of a miss, I put in a fresh detonator, and fire it again.
772. The regulation issued by this company is quite sufficient;—they only ask that the charge be kept air-tight? Yes.
773. And if used only in that way, there would not be much danger from a missed-hole? No.
774. What time do you allow before you go back to a missed-hole? If a hole is tamped the same as I would tamp it myself, I consider twenty minutes sufficient.
775. It is well known to you that a good many charges are done differently from the way you do them? Yes; I have seen some men tamping the same as they would powder.
776. Do you think it is safe to go back in twenty minutes to a hole served in that way? No.
777. What time should elapse in a case like that? Two hours.
778. *His Honor.*] Would a fuse, then, burn very slowly, occasionally, in a tamped hole? Not more so in a tamped hole than any other; but some fuses have got flaws in them, and there might be places without powder. The spark would then travel slowly along the inside packing, and perhaps delay an hour or two before catching the powder again.
779. That would not be affected by the question whether the hole had been tamped? No.
780. Is the fuse likely to be injured in the tamping? Not unless a sharp-edged bar is used.
781. A copper-tipped bar, for instance? Yes. Of course, copper is not likely to jar—it is blunt. Iron has the opposite tendency.
782. *Mr. Polkinghorne.*] I understand you to mean that, in the making of the fuse, there are joints left where the powder does not meet? Yes.
783. The cotton might be set fire to, and after some time it would have travelled across the break, and would then ignite the powder again? Yes. You very often have a miss if you take a piece with a splice in it. Almost in every case you have a miss then.
784. Seeing that there are different devices used by different men in charging a blast, you think twenty minutes should be a standing regulation? No.
785. What, in your opinion, should be a standing regulation? Two hours. I have never seen a hole hang fire more than two hours.
786. *His Honor.*] You yourself would never use a fuse with a splice in it? No.
787. You would think that it ought to be an offence, really, to use a fuse with a splice in it? Yes.
788. And that a regulation should be made against it? It would be wise to guard against it in that way.
789. *Mr. Polkinghorne.*] Do you think that if any loose glycerine compounds were lying about in the dirt, and you threw a pick on to one, it would explode? It would all depend upon whether there was anything solid underneath. If there were only loose dirt, I do not think it would; with solid rock, no doubt it would.
790. *His Honor.*] Of course, it is not a good thing to have bits of loose explosives lying about? No, it is not.
791. *Mr. Polkinghorne.*] You have never been unable to get any timber you might require to secure the ground where you have been working? No, not in my workings. I have always had all I wanted, except blocking for the set timber. I have seen that scarce, and stones used instead.
792. All the set-timber and laths required have always been procured for you on the asking? Yes.
793. You are now working in one of those large chambers? Yes.
794. What is your mode of informing your mates as to the state of the face;—when you are leaving off, do you make a point of meeting them, or do you stay in the face and wait for them? We do not try to meet each other. Our pair go into the face and know what they have to do. Unless such a thing as a miss-hole be in the face, we do not trouble. In the case of a miss-hole we tell the shift-boss to let the on-coming shift know.
795. What is the custom generally in firing;—do you mostly fire just before the knock-off? We fire every afternoon shift. We make no special conditions with those machines.
796. In the general way of working, would it be advisable to fire on the knock-off of the shift? Yes.
797. Working those machines requires special conditions? Yes.
798. What would be your object in firing just before knock-off? I would not have much smoke; and by the time the in-coming shift came down, the smoke would be cleared away for them too.
799. It would save time;—the time taken in change of shift would be almost sufficient for the smoke to get away? Yes.
800. Instead of firing a quarter of an hour before knock-off, would you not have to fire half an hour before knock-off if you wanted to show the in-coming shift the condition of the face? Yes.
801. Is it necessary you should be in the face to point out to the in-coming shift its condition? No.

F.
Harrington.
12 July, 1897.

802. Do you think it would be a benefit to have appointed a permanent Board of Inquiry to inquire into all accidents that necessitate a man's stopping away from work for a week or over? I believe it would be a very good idea if such a thing were instituted. It would show what was the true cause of an accident. At the present time, in the Coroners' inquests on fatal accidents, the true cause of the accidents is hardly ever obtained.

803. What should be the composition of that Board? They should be practical men.

804. How many should compose the Board? It is a thing that I have not given any consideration to. This is the first time I have heard it mooted; but, in my opinion, I think there should be practical men to deal with it.

805. But how many should the Board be composed of? I do not believe in too many on a thing of that kind. I think three would be any amount.

806. Is it your opinion that they should be appointed by the Government, or how? Oh, yes, by the Government; they should be entirely independent of everything else.

807. A permanent Board appointed by the Government? Yes.

808. You do not think that the people of the district should be allowed to elect one by the same franchise as they elect their representative to Parliament? I do not say that such a mode of procedure should not be adopted; that would be almost equal to Government appointment.

809. Do you know anything of the open-cut work on the surface? No.

810. I do not think there is anything in the regulations providing what number of feet there shall be between the different levels;—how many feet, in your opinion, should there be between the levels? 100 feet, in my estimation, is close enough and fair enough.

811. In sinking a shaft, at what distance do you think chambers should be cut, and cross-cuts driven? Every hundred feet.

812. That a man might sink with safety, what distance do you think should be open over his head? Not more than 100 feet.

813. The dirt should not be drawn from a shaft more than 100 feet? If you have got one hauling shaft, and the compartments covered over, I do not say that it is not safe to haul to the surface with proper appliances. I say no shaft should be sunk more than 100 feet without a covering overhead, but leaving the hauling shaft open.

814. When you got down 100 feet, that part of the shaft would have to be covered over? Yes.

815. Before going down the next 100 feet you would put in a pent-house? Yes.

816. Would you still haul dirt from the bottom to the surface? You have no other way of getting rid of it. In opening out a mine, it might be necessary to go down 600 or 700 feet. Although you might have a plat at every 100 feet, still, you would have no place to store dirt except on the surface.

817. It would be possible to haul it from the bottom of the shaft to the lowest level, and then up the compartment in which the pent-house is placed? In the case of opening up a new mine, you would cause more danger by hauling to one plat, and shifting from there again, than you would by hauling straight to the surface.

818. In the case of "bulling" a hole, what time, in your opinion, should elapse before you charge it? I have never given that any consideration. I have never "bulled" a hole.

819. *His Honor.*] Is it an advantage to "bull" a hole? In "bulling" a hole, you burn the bottom of it, and you can then scrape out a bigger hole than the drill left. You can pack more fracture into the hole than you would otherwise, and you can concentrate the whole of the explosion in the bottom of the hole.

820. You have heard of that, but have not done it yourself? Just so.

821. *Mr. Polkinghorne.*] You have an idea of what a "bull" is, and I suppose you have some idea as to when it would be safe to again charge the hole? A good deal, of course, depends upon the ground itself. Again, where you can get plenty of water, you can get the hole damp and cool enough to charge it within a quarter of an hour after you have "bulled" it.

822. *Mr. Edwards.*] What mines have you been working in on the Barrier? Proprietary, Block 10, Block 14, and British.

823. In all those mines, the ventilation, so far as you have experienced it, has been all that you could wish for? Yes.

824. I suppose you have seen Mr. Hebbard, the Government Inspector, through the mines continually? I have seen him occasionally. Of course, in working the three shifts you are very likely to miss him, especially on night shift.

825. I think any requirement that the men have wanted, for the purpose of securing themselves, the mine has always supplied? Yes, as far as my experience goes.

826. One question was asked with reference to the ground appearing dangerous, and men being ordered out. You said that the men should not be allowed to go back until the inspector had considered the ground safe, and had authorised them to return? Yes.

827. I suppose that would only apply to large movements in the ground? Yes; not to any little frivolous occurrence. It is the large movements where you find it necessary to withdraw the men.

828. Such as a creep, or ground coming in in a large way? Yes.

829. For instance, if there was dangerous ground hanging in the face, or from the roof of a stope, the men could be taken out of that temporarily while other men broke it down;—you would not want an inspector to report on that? No.

830. The way this was put previously, it implied "in all cases"; that is why I have put these further questions;—you only refer to large movements? Yes.

831. You think the underground foreman is quite capable of judging whether ground is safe or not? Yes.

832. I suppose the practical miners working on the face are the best judges whether they are working in dangerous ground or not? Yes; if they are practical men.

833. You attribute the cause of accidents in a great measure to the employment of incompetent men? Yes.

834. You know that within the last two or three years there has been a great draft of some of the best miners to West Australia? Yes.

835. Other men came up here representing themselves as miners? Yes.

836. Is it possible to tell whether a man is a competent miner or not until you have seen him at work in the different branches? In some cases, the appearance of a man clearly indicates that he is not what he indicates himself to be.

837. But you would not like to judge a man by his appearance? In some cases, the first sight of a man clearly convinces you that he is not a practical man.

F.
Harrington.
12 July, 1897.

838. And these men are not only a danger to themselves, but to the men working round about them? Yes.

839. You told us that the increase in the number of accidents was fairly attributable to the workings having become far more extensive, and to the great increase in the number of hands employed? Yes.

840. I suppose the number of workers in the last three years on the mines has almost doubled? Hardly so.

841. What would you say then? There are about a quarter more employed now.

842. There are over 6,000 men employed now? Yes.

843. So that there would be an increase of from 1,500 to 2,000? Yes.

844. And to that is fairly attributable the increase in the number of accidents. It must necessarily be so, must it not? Yes.

845. You will also admit that the most experienced miners treat danger with contempt? Yes; they get so accustomed to it that they get careless at times.

846. Have you ever known any of the mines to refuse to supply as much timber and material as you wanted to secure the workings? Not as far as my experience goes. I have done but very little of that class of work on the Barrier.

847. Not in timbering only, but in taking out ground, have you ever been refused anything? No.

848. You stated that some of the shift-bosses were incompetent. Would you mind telling me the names of those who are incompetent? I would not care about going that far. Of course, when I said that, I spoke of a couple of years back. As to the mine that I am working in at present, I would not care to give any names.

849. Of course, I cannot force you to. I can only ask you to give the names in the interest of the mine and of the men? —

850. *His Honor.*] If you do not wish to speak the name, you might write it on a slip of paper; and then it would not be handed to anyone but Mr. Edwards and myself? It is not that. We have experienced a lot of difficulty in Broken Hill; and the system of boycott has been exercised to such an extent here that it makes a man very careful.

851. Exercised by whom? By the mines.

852. By the management? Yes.

853. But it is a fact that the persons who were most prominent in old disputes against the management are now employed by the management in the mines? Yes.

854. It has all come right in the end? Yes; after a lot of suffering.

855. *Mr. Edwards.*] I know what you refer to. But is it not a fact that no difference is made now so long as they do their work properly? No difference is made now, I know.

856. You do not feel disposed to give the names of these people? I would rather not.

857. Do not you think it an unfair thing to make a charge of that sort and then stop short? —

His Honor: You see, it leaves a reflection on the good men—the men who do not deserve it. No one knows of whom you are speaking, and they might imagine that men who, all along, have done their work in a proper manner, are those who have not carried out their work properly.

858. It is impossible for the general managers or the officers to follow their shift-bosses around to see that they do their work, or to see that they are competent. Still, it is a reflection upon them, too, to have incompetent men in those positions. I think you should either give the names of the shift-bosses, or else withdraw the statement? The statement is correct. This has been an open secret on the mines.

859. If it is an open secret, the sooner it becomes publicly known the better. Really, if you have this knowledge, and the officers have not, you are concealing from them a very serious danger? One of the men I refer to left Broken Hill some eighteen months ago. It would do him no good, or anyone else, to mention his name.

860. As to the present condition of the mine. Have you any charge of that sort to make against them now? No; where I am working now, the shift-bosses are thoroughly practical men.

861. Then, when you refer to shift-bosses as being incompetent, you refer to men employed some eighteen months ago? Yes.

862. And who have left the mines in the district? Yes.

863. They do not occupy positions now? No, not that I am aware of.

864. I suppose, if additional inspectors are considered necessary, the men you would appoint to that office would be men not only with a practical knowledge of the subject, but men of high character? Yes.

865. And men apart from political influence? Yes.

866. The mines that you have been working in have rules for working both on the surface and underground? Yes.

867. They are in addition to the ordinary Government regulations? Yes.

868. And I suppose, Mr. Harrington, from your experience you would say this,—that it is impossible to make rules to govern one half of the matters that are continually arising in mining? I think it is almost impossible.

869. And I think you know this,—that those rules that are posted up are seldom read or attempted to be understood by the men working under them; I suppose even you yourself have not read them very carefully? I generally read them; and I understand them as soon as I do read them.

870. And forget them as soon as you pass on? Oh, no. Of course, sometimes I take very little notice of them.

871. I suppose the warnings by the shift-bosses underground are the principal things? Yes.

872. And the instructions given from time to time verbally? Yes.

873. And is that not the best system of regulation? Yes.

874. Do you think that all the rules in the world, and all the additional inspectors, will prevent accidents happening in mines? No; I do not think that for a moment.

875. I suppose you do the same thing as other men;—you have seen men carrying dynamite inside their shirts, have you not;—is not that a common practice? I have never seen that.

876. You have seen them close the cap on the fuse with their teeth? Yes.

877. I suppose you have done that, too? Yes; very often they are the handiest nippers you have got.

- F. Harrington.
12 July, 1897.
878. I suppose no regulation will prevent men from doing that? No.
879. And no series of inspections? No; unless they had a boss standing over them continually.
880. You cannot assist us in any suggestion as to any new regulation? No, not without due consideration.
881. Coming to those big chambers underground;—in working the ground up to any considerable height, I suppose the men are all the time standing on the ore they are breaking down? No.
882. To what height do they work those chambers? They work on a sort of scaffolding, 6, 7, or 8 feet high.
883. And, when working on that scaffolding, they must always be within reach of the roof? Not exactly within reach of the roof, because the bar itself is 7 feet long.
884. But they are always within reach with the tool they are using? Yes.
885. And as soon as they have worked it to a sufficient height they begin to put in timber? They are not putting in any timber at the present time.
886. Are they left standing, then, in this condition? Yes.
887. Without any timber? Yes.
888. And no security for the roof? The roof is kept up in certain places.
889. So timbers are put in where required? Yes, to keep up the roof.
890. Do you know of any fatal or serious accidents that have occurred in one of these chambers? No.
891. How long have you been working on the mines here? Ten years last December.
892. I suppose the security of the roof is a matter that is left to the discretion of the foreman and underground manager? Yes.
893. If you were working in one of those places and saw something you did not consider safe, what would you do—would you report it to the shift-boss? I would not report anything like that. Where you have hard ground the roof may be sufficiently safe for anything, but its being exposed to the air for any length of time may cause it to shell off; and, while you may put your machine in one place, at the same time a flake might come down. You cannot see the whole of the roof, it being so high; you cannot see it well from the sill floor.
894. The security of that ground, then, is a matter that is left in a great measure to the Inspector of Mines? Yes, I suppose it would be.
895. As to that rule as to the quantity of explosives;—as a practical man of ten years' experience in this district, what would you say should be the maximum quantity of explosives that men should be allowed in any one particular place, allowing for the drills and also for the machines? I do not think a man should have any about him, only when charging the hole; and then only the quantity required.
896. Would you put a limit on that? That would be difficult. You may have to fire out a face which would require seven or eight packages, and another face might only require three.
897. That quantity of stuff would be required to be stored somewhere in the mine? Yes.
898. I suppose there is just as much danger with one packet of dynamite as there would be with a case if it exploded while in the possession of the man? Yes; I suppose it would be just as dangerous for the party possessing it. The quantity required for the charge should be obtained from the magazine, and, as soon as the charging is completed, if any be left, it should be taken back to the magazine.
899. As to the tamping bar;—you have never known of any tamping bars underground other than wooden ones? No.
900. You have never heard of a man's being asked to use an iron or steel one? No; I have seen a man use a scraper.
901. Why was that? Sometimes they cannot find a wooden one. They see a scraper lying by, and use that rather than look for a wooden rod.
902. Wooden tampers can always be obtained? Yes; they can get them for the asking.
903. And you will see an experienced man use a scraper in preference to going to a little extra trouble in getting a proper timber one? Yes.
904. In the case of a missed-hole, I understand you would not put another hole in alongside it? No.
905. You would prefer to remove some of the tamping over the charge, and put more dynamite in? Yes.
906. That is the safest plan? Yes.
907. I take it that in all cases, although twenty minutes might be long enough to leave a missed-hole where you have been tamping with water, on the average, two hours is a fair thing? Yes.
908. You have never known of a hole that has been left over two hours explode? No.
909. As to the spliced fuse, which might be a source of danger;—the men are given what fuse they require? Yes.
910. They can cut it into what lengths they require? Yes.
911. There is no necessity for a man to use a bit of fuse with a splice in it? No.
912. He could cut the splice out and throw it away? Yes.
913. With reference to warning men coming on shift as to any danger that may be in the face, is it not common sense that a man in the face with his mate can better explain and point out to his mate any danger there might be in it than by describing it to the shift-boss? If you adopt that plan—and I have worked under it—it is very seldom that the men go into an explanation of anything in the face.
914. Do you not think it would be far better that there be a hard and fast rule compelling men going off shift to point out to their mates anything that might be dangerous in the face, and, in default, to impose a penalty? Supposing that two men stayed in the face, waiting for the relieving shift to come in. They would get their clothes on previous to the other men coming down, and, as soon as their mates were in sight, would rush past them, saying, "You will find everything all right," and nothing further.
915. Would it not be well to stop that practice? Unless you placed a shift-boss there you could not compel them to point everything out to their mates.
916. I suppose, telling of the condition of the face to their mates in the plat would be the same thing as telling them at the surface? Yes.
917. After being down there eight hours they are only too anxious to get away? Yes.
918. And if they did talk to their mates it would be more about a football match than their work? Yes.
919. As to this Board which has been suggested;—what would be the duties of the Board? I take it that it is intended by Mr. Polkinghorne it should be something similar to the Coroners' inquests, only, instead of dealing with fatal accidents, it would deal with minor accidents.
920. With a Board composed of three men, how would you have them elected? By Government appointment, I said, or elected under the franchise. Either one would do.
- 921.

921. You would not have them appointed on the recommendation of Members of Parliament alone? No. I think there should be one representing each side, and one to act as a judge.
922. One appointed by the mines, one by the men, and an independent competent person to be appointed by the Government? Yes; I should think that would be the fairest way to all parties.
923. I suppose the person appointed by the Government should be free from political control too? Yes; and from all other influences.
924. And he should be a thoroughly practical man? Yes.
925. In reference to sinking 100 feet or more in an uncovered shaft—you would have a hard-and-fast rule as to that? I say men should not work more than 100 feet without some protection over their heads.
926. Supposing you had a prospecting shaft, and were sinking with only one compartment, what would you do there;—it is very often you go down 200 feet in a vertical shaft, is it not? Not in one compartment.
927. What is the depth? 100 feet is as far as you can go, and even then you are supposed to have a ladder compartment in it.
928. The ladder compartment is not closed; it is only for a means of escape? But you can have it closed.
929. You think 100 feet in a prospecting shaft is the deepest that should go uncovered? Yes.
930. I suppose, if a stone hit a man at 100 feet, it would be just as fatal as at 300 feet? Yes; but where the danger comes in is if you are working at the bottom below other workings, stones from those higher levels may come down on you. If a covering were put up, it would do away with such a danger. I only want the pent-house to go across two compartments; one compartment would be open right through, no matter what depth you went. As the bucket went up the uncovered (hauling) compartment, they could step into the adjoining covered compartments and be free from anything that might tumble out of the bucket.
931. It is quite safe to have one compartment open all the way down? Yes, to haul the stuff straight to the surface.
932. It would be ample security to the men if only two compartments were covered over, and the third compartment left open? Yes; and if you keep the timber to within 30 feet of the bottom of the shaft, the men then have always plenty of room to keep out of the way of the hauling shaft.

William James Pascoe sworn and examined:—

933. *Mr. Polkinghorne.*] What is your name in full? William James Pascoe.
934. You are a practical miner? Yes.
935. I believe you have had varied experience in mining throughout the colonies? Yes.
936. What experience have you had on the Barrier? Seven years'.
937. Has your experience taught you that sufficient ventilation is provided for the workmen? Where I have been employed there is sufficient ventilation if it were properly distributed through the places where the men are working.
938. Plenty of air is taken down the mine; but it should be better distributed? Yes.
939. Is there anything you could suggest that could be done which has not been done, to get the air into those working places you refer to? It might be arranged by preventing the air from going into the faces where it is not required. This could be done by means of air-tight doors.
940. If at any time any part of a mine should become dangerous, and it should be found necessary by the man in charge to withdraw the men, should it be his duty, or the duty of the inspector, to say, after the place has been made secure again, that it is safe for the men to go back? The inspector's.
941. Have you noticed any great increase in the number of accidents on the Barrier during the last twelve months? Not in the underground workings.
942. You have noticed an increase? Yes, on the surface. But in the mine I am employed in I do not think there is any increase.
943. Being an employee under ground, you are not prepared to give an opinion as to the increase on the surface? No.
944. Do you think that the services of additional inspectors would prevent any of these accidents from taking place? I do not think so.
945. Are you prepared to suggest any improvement in the present regulations that are in force in this district? No. I am not thoroughly acquainted with the regulations; but, since the regulations have been framed, mining has advanced on quite a different system from what it was some years ago.
946. Your opinion is that these regulations, which were framed when the Mining Act was brought into force, have not been improved upon as much as was needed, considering the growth of mining? Yes.
947. They are not advanced enough to meet the requirements of to-day? No.
948. Do you think that a man placed in charge of a shift should be the holder of a certificate, showing that he is a man with a practical knowledge and experience of the work he has to take charge of? Yes.
949. How would you suggest that they should obtain these certificates of competency? From a Mining Board, just as a sea captain obtains his certificate from the Marine Board.
950. You do not think it would be wise for these certificates to be given to the men by the managers of the mines in which they are employed? In case the manager refused to give a certificate, they should appeal to this Board.
951. Then you think that the manager of a mine where a man has been working should give that man, if he finds him competent, a certificate as to his competency? I think so.
952. If he were refused a certificate by the manager, he should then, you think, have power to make application to the Mining Board, who would be able to inquire into the matter, and, if it were found to be a deserving case, award a certificate? Yes.
953. As to the General Rules in connection with the Act, sub-section c of rule 3 says that a workman shall not have in use at one time, in any one place, more than 6 lb. of explosive;—do you think that quantity is excessive, or not enough, for a man to have in his possession at one time? I think it is sufficient.
954. Under all circumstances? It is, if more can be obtained by going to the magazine within a reasonable distance. I do not think it is safe to have more than 6 lb. in the face where a man is working.
955. In your varied experience, have you not found it necessary to use, perhaps, over the amount of 6 lb. in one blast? Yes.

F.
Harrington.
12 July, 1897.

W. J.
Pascoe.
12 July, 1897.

W. J.
Pascoe.
12 July, 1897.

956. Do not you think that it would be better to obtain a larger quantity, so that you could fill up your charge without going along to the magazine? If you knew that you required a greater amount before you started to work in any particular place, you would be justified, I think, in getting more than the 6 lb. But, for ordinary working, I think 6 lb. is quite enough to have in the face.

957. Do you think it should be fixed by law that 6 lb. be the maximum amount of explosive a man should be allowed to take into the face and to put in a charge? No; I mean that 6 lb. is quite enough to have lying about the face. Of course, if you want to charge a hole with so much as 60 lb., you should be allowed to do so.

958. You think, then, that no maximum should be fixed by law, and that the amount required by the workman should be supplied by the magazine when applied for? Yes.

959. Sub-section *d* of the same rule says that an iron or steel tamping-bar shall not be used unless mounted with at least 4 inches of copper;—do you think that section is sufficient for all purposes? I would not tamp a hole without I had a copper-headed tamping-rod—that is, speaking of gunpowder. Dynamite or gelatine requires no tamping at all, so long as it is air-tight.

960. As powder is still being used, do you think that this section should read, “for all purposes where gunpowder is being used, a tamping-bar should be composed of copper,” or, “be copper-tipped”? It would be safer if copper altogether.

961. In all cases where the glycerine compounds are used, it should be wood? Yes.

962. What is the custom in blasting that you have been in the habit of following;—is it generally done before knocking-off time, or at any other particular time in the shift? There is no particular time. Of course, in some places, where the air is light, we generally manage to bore as many holes as possible before a blast, so that the one cleaning will do.

963. Would it prevent accidents happening if the relieving of the different shifts took place at, or in, the face? I do not think it would make any difference. Of course, if there is anything particular, it is only right that you should stop and point out to your mates the particular danger.

964. What is the usual custom followed out by you? We meet our mates underground or on the surface, as the case may be, and explain to them how things are, and they, in their turn, explain things to the men who relieve them.

965. You have no fault to find as to insufficient timbering in the mines you have worked on? No.

966. You have always been able to get what you required in order to keep the place where you were working secure? Yes.

967. Do you think that, if you were to throw a pick into a plug of dynamite lying scattered about in the material broken down by a charge, it would explode? I have never tried it.

968. What is your opinion? I do not think dynamite will explode unless it is confined.

969. In your opinion, how many holes should be charged and fired at one time in the one face? That all depends upon the condition the face is in. If you are starting a face, of course you could not fire many holes; but, when it is worked to an end, you could, perhaps, fire five or six.

970. You are speaking, I suppose, principally of hammer and drill work? Yes.

971. You have never had much experience with the rock drills? No, none.

972. What distance, in your opinion, should be left open in a vertical shaft above the men's heads? That all depends upon what is on the top. Do you mean a hauling shaft?

973. Yes. Say you are sinking a shaft from the 200-foot level to 300 feet;—is it safe that that shaft should be left open from the surface? I think there should be a pent-house every 100 feet.

974. Not to exceed 100 feet? No.

975. Do you think that the hauling shaft should be left open from the surface to the bottom? No.

976. How should the break take place? At every 100 feet. Of course the hauling part of the shaft would be open down to the last plat. The advantage of this is that the stuff would be received on the last plat from the men working at the bottom of the shaft, and transferred from there to the other compartment, which would, of course, have a pent-house, and be sent on to the surface. This would minimise the danger of anything falling down to the bottom of the shaft.

977. Do you think there should be certificated men in charge of machinery used for hauling purposes and for lowering the men down the shafts? Yes.

978. Would you restrict the age? The age would have something to do with the experience of the man. A man might take charge of an engine at 30 years of age and know not nearly so much about it as a boy who has been connected with machinery from his childhood. But, for all that, I think no man should be allowed to take charge of an engine used for hauling purposes unless he is about 25 or 30 years of age.

979. You think he should not be considered capable of taking charge, even if possessing a certificate, until he is about 25 years of age? That is a matter for the Board to arrange.

980. You think that when he gets his certificate, no matter what his age may be, he should be capable of taking charge of an engine? I do not think the Board would grant a certificate to a youth.

981. Have you ever had any experience in the underground open-cuts? No.

982. You have never seen, where you have been working, any open breaches of the regulations? No.

983. *Mr. Edwards*] I understand that you have very little complaint to make about the way the men are cared for in the mines? I have no complaint to make.

984. You have been employed on the Barrier seven years? Yes.

985. What mines have you been in? In the Proprietary and Block 11.

986. So far as you have seen, is every reasonable care taken by the shift-bosses and officers to secure the safety of the men? Yes.

987. As to leaving the vertical shaft unprotected;—the last witness said that instead of the present system, adopted in the Proprietary, of hauling from the bottom of the shaft and transferring to the other compartment at the next level, it would be safer to haul from the bottom of the shaft direct to the surface, having, of course, pent-houses in the other two compartments? I do not think that would be so safe as having a pent-house in the hauling shaft and transferring the bucket to the other compartment at the next level.

988. Supposing, then, you had a pent-house right across the three compartments;—do not you think the limit of 100 feet between the levels might be increased? I think 100 feet is quite sufficient.

989. I suppose anything falling 100 feet would be just as serious as anything falling 300 feet? Yes.

990. Supposing the shaft was down 200 or 300 feet, with a pent-house right across, would there be more danger in sinking 200 feet under it than 100 feet? I do not think there would be any danger if the shaft were properly timbered.

991. That would be closely timbered, as the Proprietary shafts are? Yes.
992. In that case it would be just as safe to go 200 feet as 100 feet? It might be; but it would look safer at 100 feet.
993. As to the regulations—you cannot suggest any amendments? No.
994. I suppose you have not read them very carefully? No.
995. Men do not read the regulations, do they? I cannot speak about other men. I have never read them much myself.
996. As to the engine-drivers being certificated—who would they receive certificates from? From a Board.
997. And there is no Board, I understand, in this Colony? If there is not, there ought to be.
998. And a system of examination? Yes.
999. So far as you can see, the present system is sufficient for the mines here? I think so.
1000. I suppose you have never had to complain about anything, or asked for anything, but what you have been attended to at once? I do not say at once, but as early as convenient.
1001. With all reasonable despatch? Yes.
1002. I suppose you have never seen any other tamping rod used for dynamite or glycerine than a wooden one? No.
1003. And as to the time for blasting—you blast according to the condition of the work, irrespective of whether it is crib time or knock-off time? Yes.
1004. In reference to men coming on—do not you think it would be safest to have a rule that men going off should point out to their mates coming on anything that might be dangerous on the face? I think competent men always do that, without the necessity of a rule.
1005. But then, unfortunately, all the men are not of the same standard in the mines, and it would be of no use explaining to them the condition of the face when at the plat;—you might just as well tell them on the surface? Yes.
1006. I suppose it would take a very large plat to hold all the shift coming off or going on? Yes; but they would meet in the drives, and they would be pretty thick there.
1007. Would it not be far better, then, if the change of shift took place at the face? I do not think it would make any difference to competent men.
1008. Not competent men, but incompetent and careless men? They should not be there.
1009. With reference to those air-tight doors—I believe the Proprietary Mine have curtains for that purpose? Yes; I have seen them in some places.
1010. You have never had occasion to complain to any inspector about want of ventilation, and there has been no accident through it? No.
1011. *His Honor.*] Is there any man whose duty it is specially to look after ventilation in the mine? Not that I know of.
- Mr. Edwards:* Of course, your Honor, it is the foreman's duty to see to that, amongst other things.
1012. *Mr. Edwards.*] Apart from those air-tight doors, you have no suggestion to make for any improvement to the present workings? No.

W. J.
Pascoc.
12 July, 1897.

TUESDAY, 13 JULY, 1897.

Joseph Bourne sworn and examined:—

1013. *His Honor.*] What is your full name? Joseph Bourne.
1014. What is your occupation? I am a working miner.
1015. *Mr. Edwards.*] How long have you been working as a miner? Close upon fifty years.
1016. How long on the Barrier? Three years.
1017. In what mines have you been employed? I am employed at Block 14 at present.
1018. Who is the foreman in that mine? The underground manager is Captain John Evans.
1019. What is the state of the ventilation in that mine? As far as I can see, and as far as I know—I have worked in several mines on the Barrier—it is the best-ventilated mine on the Hill.
1020. There has been an increase in the number of hands employed on Block 14 during the last two years? There has been during the last six months.
1021. Not before that? No.
1022. What is the increase in the number of hands? I could not tell you exactly. I am always on the one shift, and cannot tell what men are employed on the other shifts. I can only give an idea of the shift I am employed on.
1023. You are employed underground only? Yes.
1024. Have you noticed, in connection with the underground workings in Block 14, any increase in the number of accidents? There have been a number of accidents lately. In some cases the men have been entirely to blame themselves.
1025. *Mr. Polkinghorne.*] It is your opinion that the principal cause of the increase in the number of accidents is the men's own carelessness? To a great extent.
1026. Is there any other cause? I do not think there is. I am only speaking from my own point of view. Whenever I have wanted timber—no matter when it was—I have had time allowed me to get it, and to put it in its proper position to make things secure. In my opinion, where accidents have arisen, it has been through the incompetency of the men. There was an accident seven or eight months ago. A party of men were working on a contract—six in the party, two on each shift. The afternoon shift fired a shot, and loosened a large boulder, so much so that it was swinging—neither loose nor fast,—and you could move it from one side of the set to the other. A practical man, instead of trying to pull it down, would have put a pop in it, and blown it to pieces, but these men kept on trying to bar it down, and could not make it come. They then left it to their mates, who came on at 12 o'clock at night. They, too, tried the same tactics; and the result was they could not get it down. By some chance, their hammers were lying in the face between them and the boulder; and, as one of them was going in to get his hammer, this lump came down, and cleaved his skull. What they should have done in this case was to put a pop in it, and scatter it at once. Of course, while barring it, they were loosening it all the time without bringing it down. In some parts of Block 14 it is very good working; but, in other parts, there are

J. Bourne.
13 July, 1897.

J. Bourne. are very rough boulders, which require very competent men. Some men come here to work, and call themselves miners, and no doubt they are miners accustomed to hard ground; but, as to these boulders, it is a hard matter to sound them thoroughly, and to do so a miner wants a varied experience to bring to his aid. You might sound one now, and it would to you sound solid, no matter what your experience. In the course of half-an-hour or so the air naturally expands the joint and brings it away. So we cannot have men too competent to fill these places.

13 July, 1897.

1027. You say we cannot get men too competent—how shall we get these competent men;—there is considered to be a dearth of competent men at the present time? This is a question that I have been trying to get at for a number of years. If we find that we have got a man competent and suitable, and he attends to his employment in a proper manner, he ought to receive extra remuneration to the general run. In many parts of different countries where I have been working it is the custom to give what they term “consideration” money. That is to say, when pay came, and you were working in ground which required to be closely timbered, in addition to your regular wages you got something extra. If two, four, or six of you, you might get £1 each more than the average wage. This is the idea ruling at the Thornley Colliery and in the County of Durham, and in the Cleveland Ironstone Mines, North Yorkshire, England.

1028. But how are we going to secure men to fill the places of the competent men as they drop out? In the ironstone mines in Yorkshire it was the custom to take men in with us as apprentices. They did all the hard, rough work, and we termed them “breakers-up.” They are something similar to floormen here. Of course, every chance we had we would initiate them into the work. The work there is something like that obtaining here, the seams being very rough, high, and wide. Accidents occurred there sometimes through inexperience. Perhaps a man would bar 6 or 7 tons down on himself. We used often to have a party of men on each shift to carry the injured away to the hospital.

1029. I should infer from what you say that there should be apprentices? Something should be done to bring on the incompetent men.

1030. Do you believe in taking youths underground as apprentices, or is it better that they should reach a mature age before they go underground. That is a question we want to settle on the Barrier. The question of boy labour has been a bone of contention here for many years, and as you have had so large and varied an experience I would like to know whether you think that the best mode of apprenticing would be by taking in the youth or the matured man? I think that the incompetent man would be a far better mate, but we must look at this: a trucker, if he has been in the mine six months, and if he wish to go in the face, should have the preference; a tool boy should also advance to a floor boy, and then to a trucker. If the youngsters are not trained, who are going to take our places when we pop off? If a man takes a youngster under him, and anything happens to him, it is nothing but right that an inquiry should be held; but for the responsibility of taking the youngster, the competent man should be remunerated.

1031. If a competent man and his apprentice get through as much work as two competent men—say the boy is strong and can get through as much rough work as a man—you think they should receive the pay of two men, but that the skilled man should draw the greater pay? Yes.

1032. As we are placed now, incompetent men must be secured, and, this being so, have you anything to suggest that would prevent any further increase in the accidents? Yes; there ought to be an Act here applying specially to the requirements of mines other than coal-mines, and there ought to be very stringent and carefully-drawn regulations extending beyond the actual provisions of the Act itself, in a similar manner to the Coal Mines Act now in force here. The persons employed in a mine should, from time to time, appoint two of their number to inspect the mine, and the persons so appointed should be allowed to go all over the mine in company with the manager or some other official, and be afforded every facility to carry out such inspection. They would then make a true report of such inspection; and such report would be recorded in a book kept at the office for the purpose, and signed by the persons making the inspection. There is a provision in the English Act to that effect; and it should be the same here. Such a provision gives the employees an opportunity to see how matters stand by a formal inspection.

1033. *His Honor.*] You think that places the employees in a proper position, and puts them on their mettle to think for themselves? Yes, it acts capitally. It gives the men an interest in the management of the mine. This always gave general satisfaction in the Cleveland District, Yorkshire.

1034. *Mr. Polkinghorne.*] Has any accident come under your notice on the Barrier that has occurred through the incompetency of the officer in charge of the particular place? The open-cuts are not, I consider, worked in a systematic manner. I have seen a lot of this kind of work in my travels; and I have never seen anything worked in a more reckless manner in my life than the open-cut here. I was in Sydney at the time of the building of the Cockatoo Dock. It was built in terrace fashion, and, if the open-cuts here had been worked on a similar principle, it would have relieved a lot of top weight from the timber and have been far safer for the men. In the event of rain or frosts, no matter how carefully you may sound the ground, they will operate upon it, and if either gets behind those slimy joints the result will be that the ground will gradually push away. Terraces would stop falls of this nature from doing any harm. There is another matter I would like to speak upon, and that is the outbreak of fire in Block 11. I do not know whether it has ever been found out what was the cause of that fire, or how it was caused. I do know how it was caused. It was caused by incompetence and ignorance. But, as I am going off the subject I am here for, I will not say anything further on it. Should anyone, however, be anxious to know, with your permission, your Honor, I would let him know.

His Honor: I do not know that it is directly within the scope of this inquiry. However, I thank Mr. Bourne for the suggestion he has made, and leave it to Mr. Edwards whether he shall avail himself of it.

Mr. Edwards: Of course, your Honor, we have had the highest expert experience at our disposal in the matter, and, from that, we have come to our own conclusions. For all that, it might be well if Mr. Bourne gave us the value of his experience.

1035. *His Honor.*] I would ask Mr. Bourne, then, to state what he thinks caused the fire? The cause was this: the top portion of the timber in the open-cut in Block 11 was very much exposed to the sun, and, in consequence, became very dry. There was a large fissure in the ground—what we call a crack; and the party that was in charge thought this would be a grand opportunity to fetch a lot of ground down by a sand blast. He started to charge this sand blast, and there were five or six casks or kegs of powder put in—25 lb. in each. But, before the sand blast was charged, five or six old bags were put in flush

flush with the bottom ore, or what we would call the deposit of the mine; and, to fill any vacancy there might be, an old pair of white moleskins were put in, and then five or six kegs of powder on top. Six holes were fired—result, bags and trousers started the timber going. The men worked quietly away, and thought no more about it until the fire was seen issuing from the timber. Had I had my way, to have saved a lot of trouble, I would have set the men drawing all the dry timber around where the fire was raging, and have played upon the fire. Instead of that, they ordered large holes to be placed all round. These were exploded on to the burning mass, and, instead of extinguishing the fire, made it worse, because it scattered the burning timber all over the place.

J. Bourne.
13 July, 1897.

1036. What I understand you to say as to the open-cuts is that, instead of putting in a single batter, it ought to be put in on terraces? Yes. I might draw your attention to the practice in the quarries in North Wales. They work there in the same manner (by terraces) in getting slates. I worked there for a long time from 1863, and, though 2,000 quarrymen were employed, I never heard of a man getting hurt.

1037. What was the total height of the face? About 60 feet in 1863. Of course it would be much deeper now.

1038. Was that worked in terraces? Yes.

1039. How many terraces on the one face? We had a terrace every 25 feet.

1040. Was the face on the line of cleavage of the rock? Yes.

1041. *Mr. Polkinghorne.*] What batter would you consider safe? I should say 10 or 12 feet in 25 feet. Of course, it depends a great deal upon the ground. If loose ground, you could do with less; but, if heavy clumsy ground, with more. If you want to get at the ore you can always step back.

1042. *His Honor.*] You mean 10 or 12 feet horizontal in 25 feet vertical? Yes.

1043. *Mr. Polkinghorne.*] You consider the regulations now in force are not sufficient to secure the safe working of mines? Yes.

1044. The regulations that you consider would be of benefit are those contained in the English Act which you have referred to? Yes.

1045. *His Honor.*] Would you say that open-cuts ought to be just as much within the province of an Act as underground work? I should think the inspector ought to have just as much power over the open-cuts as over the mines.

1046. They ought to be provided for in the regulations, and to be under the control of the inspector just as much as mines? Yes.

1047. *Mr. Polkinghorne.*] Are you pretty well versed in the regulations now in force in connection with the Mining Act of this Colony? No. I do not, in fact, think there is a Mining Act in force. I believe there is an Act being brought forward now. The only thing I can see is to insert that rule in the Mining Bill now before the House.

His Honor: In point of fact, *Mr. Polkinghorne*, the Mining Act does appear to deal very slightly with the safety of workmen.

Mr. Polkinghorne: But there is a Mining Act in force, your Honor, and regulations under it. I have asked the witness if he thought them sufficient, and he said "No." I have asked him if he knew them, and he said "No." I would like to read General Rule 2, under the Act, to *Mr. Bourne*, and ask for his opinion upon it.

1048. *Mr. Bourne*, General Rule 2 says:—

If at any time it is found by the person in charge of a mine, or any part thereof, that such mine or part is dangerous, every workman shall be withdrawn therefrom, and in every such case a true report of the condition of such mine or part thereof shall be forthwith made to the Secretary for Mines; and no workman shall (except in so far as is necessary for inquiry into the cause of danger, or for the removal thereof, or for exploration) be readmitted into the mine, or such part thereof as was so found dangerous, until the same is stated by the manager, or by an inspector, to be safe. Every such report shall be recorded in a book which shall be kept at the mine for the purpose, and shall be signed by the person reporting.

We will consider that a portion of a mine is considered to be unsafe by the man in charge, or by the men, or by both, and the man in charge has seen fit to call the men out; it is not, however, considered necessary to call the inspector in, as the ground can be secured without very much danger;—who do you think should say that the part has been made secure enough for the men to resume work—the inspector or the man in charge? I think the inspector should be called in.

1049. You think, then, the inspector should be a man of greater ability than the man in charge of the work? Yes.

1050. Sub-section *a* of general rule 3 says, that gunpowder or other explosive or inflammable substances shall not be stored in the mine in any quantity exceeding what would be required for use during six working days, and sub-section *b* of the same rule says, that it shall not be taken into or kept in the mine except in a case or canister;—do you think that clause is sufficient? Yes; I think every man should have a canister. In the mine where I am employed at present they are very strict on that point. There is a little matter I would here like to refer to: at some of the mines, boys only are in charge of the magazines. In my opinion, there ought to be a staid man, and not a boy, in charge of every magazine; and then things would be carried on a little better and a little safer than they are. Sometimes it will happen that several boys meet together in a magazine, and there is no telling what kind of tricks they might get up to. I think there ought to be a clause to meet this inserted in the Mining Bill now before the House.

1051. *His Honor.*] What age would you fix as the lowest for a man to be employed at a magazine? Not less than 18.

1052. What age do you find them there now? They are quite youngsters—impossible to tell their age. I suppose they get there this way: The father is, perhaps, a drunkard, or may be he is dead, and the mother must get in some money to make ends meet. She represents her son as being over 16, and gets him work on the mines.

1053. He may be only 14 or 15 years of age? Yes.

1054. And you think it is not the right thing that a boy of that age should be in charge of explosives? Yes; of course they are pretty smart in checking off the explosives taken out; they can do that part of the business all right.

1055. *Mr. Polkinghorne.*] You think it is often the case that the parents make a breach of the regulation which says that a boy below 16 shall not be employed?

Mr. Polkinghorne: Although this restriction, your Honor, as to age is in a regulation in connection with the Lead Poisoning Act, I take it that it applies to all cases. *His*

J. Bourne.

13 July, 1897.

His Honor: It is universally admitted, and especially insisted on by the A.M.A., that we should have a new Mining Act.

Mr. Polkinghorne: Yes. The old Act should be repealed, also the regulations; and a new Act and a new set of regulations should be framed. If the age cannot be dealt with in any regulation coming under the Mining Act, but only under the Lead Poisoning Act, I think it is time something more definite was done in the matter.

His Honor: As it very often takes a long time for a Bill to get through the House, what wants doing is to make the best of the old Act, and to make much more stringent regulations.

1056. Is it a breach more often committed by parents than by managers of mining companies, this taking on of boys under the age of 16? Yes.

1057. Sub-section c of General Rule 3 says that a man must not have in his possession at one time in any one place more than 6 lb. of explosive;—do you consider that that clause is elastic enough—will it, in your opinion, allow workmen to have sufficient? I think it is quite sufficient, unless a man is working a machine, when, if he has a heavy hole, he might require more than that. Some men, if they had a canister of powder, would lay it by carelessly, and they might bar dirt down on it and explode it. Before the compressed powder was introduced, miners would sometimes carry their powder in a man's worsted stocking slung over their shoulder. This, of course, very often resulted in accidents. If, however, you were working on contract, you were allowed to take a keg of powder in. But some of the miners were dishonest, and, accordingly, some of the contents of the kegs mysteriously disappeared. Powder tins are in force now, and that is the safest way. In the Cleveland district, in the old country, they do not fire the powder with a fuse, but with a needle, which is a much safer way than we have here. But I am afraid such a system would be too dangerous for the Barrier, because the miners require to be well trained before they can adopt it with safety.

1058. You do not think there are many old powder men on the Barrier, and the needle would not be of much use here? No.

1059. What, in your opinion, is a safe distance to sink a vertical shaft without a covering over your head? I have had great experience in sinking. I thoroughly understand sinking in any kind of ground. If I were going to sink a shaft to-morrow a mile deep, I would have no covering whatever; but I will tell you what I would have. I would have a capital, good, travelling trolley, and I would see it made myself. Another thing is to have a good braceman over your head. I have worked in some of the deepest and best shafts in the world. I worked in two shafts for Messrs. Bolehow, Vaughan, & Company, at Fogga, near Sketton, Cleveland, Yorkshire, that cost £190,000. They had the most perfect hauling and winding machinery—cages with patent clips and over-winding catches—the best that I have ever seen in my life. They were bricked from top to bottom. Give me a good braceman and a good travelling trolley. In the colonies, shafts are, as a rule, very primary affairs—for instance, the winding shaft which was in use at the Central when I worked there about two years ago. At that time, however, the best shaft on the mine was lying idle. In sinking a shaft I would just have what is termed a common kibble, a good rope, which should be overhauled every morning, and a good braceman—one that you could rely upon.

1060. In your opinion the mode adopted here for sinking a shaft is not what it should be? Exactly.

1061. Under the system adopted in this district, what is a safe distance to work under a drawing shaft—what distance should it be over your head;—say the shaft was in three compartments, how would you secure your head—how would you have the dirt drawn out in deepening the shaft? I would have no protection at all. The last time I was employed in sinking a shaft was on a claim called "The Home Rule," in Charters Towers. The shafts there are mostly very deep, and the sinking is carried out without anything overhead.

1062. Do you think that a man in charge of machinery for raising and lowering men should be certificated? Yes.

1063. How should those certificates be obtained? There should be a Board of Examiners under the Government.

1064. A Board of Engineers? Yes.

1065. And when an engine-driver has secured a certificate, he should be considered capable, no matter what his age, of taking charge of an engine where he has men's life to handle? Exactly.

1066. Do you believe that men in charge of shifts should be certificated men? They have to be in the old country. I am very sorry to say that, from my experience in that way, some of the certificated men are the greatest dunces or dummies I ever met. When the Mining Act of 1872, in Great Britain, came into force, every underground man was supposed to get a certificate. I, myself, was offered a certificate without examination at all; but I would not accept it, as I did not think it was right. An old manager whom I worked under in the Old Country had no certificate, and I do not think you could have got a more finished manager. That was Mr. Bartholomew Farrow, manager of Messrs. Morrison & Company's mine, Brotton, Cleveland, Yorkshire. He used to visit every working place every day. His son, who had been brought up to mining all his life, failed in his examination for a certificate; but a young fellow whom he coached gained his certificate, although he knew nothing whatever about practical mining as compared with his coach, who failed. I must admit, however, that there was some undue influence at work in this case.

1067. You do not think it necessary that the man in charge of a shift of men should be certificated? I do not think so. There is no more competent man than my boss. I do not think that he has got a certificate, and I do not think that he requires one.

1068. Do you think it would be of any benefit to the men and the companies, generally, if a Board of Inquiry was appointed in each mining district, to inquire into causes of all accidents other than fatal ones? I do not think that would do any good whatever. There are so many systems of working. If we picked 100 men who had been about Broken Hill only, and sent them to Gympie, not two of them would know how to start. At Gympie, they all work single-handed, and, if you took on 100 men who had never seen single-handed work, they would be hitting themselves and one another instead of the drill.

1069. Do you think it would be safe for men to work single-handed here? It would be impossible for men to work here single-handed, because some of the timber is so heavy that one man could not lift it.

1070. Then a Board of Inquiry, in your opinion, would be useless? Exactly, taking into consideration the variable nature of the country throughout the Colony.

1071. *His Honor.*] Mr. Polkinghorne means a local Board? Oh, I would quite agree with that. I quite think, myself, that that would be a great benefit to all. In the North of England we drew up such a thing, and it acted very satisfactorily.

1072.

1072. *Mr. Polkinghorne.*] If you think a local Board of Inquiry would be of benefit, how would you suggest it should be appointed? There should be six miners, two of whom should come from the place where the accident occurs, and an equal number of mine managers. They should select a chairman by ballot amongst themselves, and so arrange it that a mine manager should be chairman at one sitting, and a miner at the next. J. Bourne.
13 July, 1897.

1073. How would you suggest they be elected? The men should choose a man from their own number. The men on each mine should have a meeting among themselves, and elect their own man to sit for (say) six months.

1074. But, seeing that there are a dozen mines in this district, if it was left that vague, they would want to have a representative each—a line would have to be drawn somewhere; further, the Proprietary mine would say that, as they employ over two-thirds of the men working along the line of lode, to have all things equal, they should elect two-thirds of the managers and two-thirds of the men? To meet that, I would say, let each man represent a certain number. They who employ the greatest number of hands should have the biggest say in the matter.

1075. And a ballot to be taken on the several mines for the men who are nominated? Yes.

1076. Have you seen in connection with your work along the line any dangerous places left unprotected? There are one or two places where I am working, which at a very slight cost could be rectified. They have no doubt been overlooked by the management. Where the ladder-way goes up from floor to floor at the part where I am working, in some places the wall is crushing, and there are bits of loose ground that would fall rather heavy if a man happened to be underneath. With the exception of that, the mine is in a sound condition. A couple of men in a couple of hours could rectify the matter. I do not think there is a mine better worked on the Hill than Block 14. They send very little dirt to the surface—they always find a place for it down below.

1077. You have never pointed out a dangerous working that has not been put right? They are very good that way. I have never had the slightest ground to find fault with the management; in fact, they have always acted very courteously to me when I have suggested anything.

1078. Have you had any experience in the open-cuts? Not in those underground.

1079. Have you had practical experience in those along the line of lode? I worked for a short time in one.

1080. Do you think that the system carried out in the open-cuts could be made safer to work than at present? I think so.

1081. *His Honor.*] How long were you in the open-cut? Two or three months only. I worked there until I could get on at the mines. I had some difficulty when I came here in getting employment underground, because I was not known. When I applied at the Proprietary, they asked me all sorts of questions—so many that I walked away disgusted. I thought they would ask me next what was my religion.

1082. *Mr. Polkinghorne.*] How long ago would it be since you worked in the open-cut? About three years ago.

1083. A great deal of alteration has taken place since then? I have never been near the open-cut this last two years.

1084. Is it your opinion that a "powder-monkey" should be allowed to charge holes while the men are in the place working? Certainly not.

Mr. Edwards: I might point out to *Mr. Polkinghorne* that the surface rules framed by the mine forbid men to remain in a place where holes are being charged.

Mr. Polkinghorne: I am aware of that; but it is not provided for in the regulations under the Mining Act.

1085. When you were employed there (in the open-cut) was it customary for the "powder-monkey" to charge while men were working on the face? No, I never saw it done.

1086. *His Honor.*] One of the witnesses said that he thought the system called the "chinaman" was a very dangerous one, but he did not go on to tell us why. I do not know whether you have had any experience in that direction? I have not had much experience in "chinaman" work; but I know a man is in a very dangerous position when working on a "chinaman." The waggon goes underneath, and the dirt comes through the "chinaman," or movable hatch, into the truck. In my opinion, the stage should not be overloaded with lumps too large. Before the lumps come down to the "chinaman," they should be blown to pieces. I have known instances where men have been underneath the "chinaman," and a large stone has come down, smashed through, and killed them. All large lumps should be smashed before being brought down.

1087. Do you think that the men working on night shift in the open-cuts are exposed to more danger than if working on day shift? I do not approve of men working in the open-cuts except by a capital light. The electric lights at present in use on the Hill sometimes flicker, and a man's attention might be turned away by this flickering light, and in that brief space of time he might be caught.

1088. *Mr. Polkinghorne.*] Yours has been a varied experience in connection with explosives? Yes.

1089. How long should a hole be left after being "bulled" before being charged? I have never "bulled" a hole in my life, and I think I have broken as much ground as any man. I think "bullying" is a very bad process. I have seen so many accidents arise from it. I saw one in the open-cut. He was a smart chap at "bullying" holes in his way, but one day he got his thumb and part of his hand blown off. I have seen several cases where men have been blown away. In my opinion, the principal cause of accidents arising from "bullying" is this: A hole takes a long time to cool after being "bulled," and, when the fracture, some of which is very cheap and nasty, is put in, it explodes. As I have said, I do not believe in "bullying." I have seen holes after being "bulled" blow out through the bottom and leave the top standing. Other holes have then had to be put in to bring down the top part. I do not agree with "bullying," and it is a dangerous practice.

1090. But, in the event of a hole's being "bulled," how long do you think it should be left before being charged? That depends a great deal on the season and the depth of the hole. I should say an hour in winter, and two hours in summer. Of course, if it is a down-hole, and you have water handy, you could get it cool in a very much shorter time.

1091. Do you think that the services of additional inspectors are necessary on this field? By all means. I think an inspector should be stationed here all the time. There is another little thing I do not

J. Bourne. altogether agree with. I think we should have the best men that could possibly be procured. Another thing, the inspector's pay is not sufficient for this field. In England, the inspector's pay runs to about £500 a year. I think if we have the services of a good man he should be paid something similar, because great responsibility rests upon the inspector here. He has to please the employers and the employees too. I do not know our present inspector personally, and, for my part, I cannot see anything wrong in the way he carries out his duties; but he should be stationed here. We do not know the hour he may be called upon.

13 July, 1897.

1092. *His Honor.*] You would like to limit the district and increase the salary? Yes.

1093. *Mr. Polkinghorne.*] The inspector has just informed me that the extent of this district is from Thackaringa to Tibooburra. You say that an inspector should be in the immediate vicinity of the line of lode at all times? Yes.

1094. How many more do you think this district requires? For the outlying districts, where there is not such a large number of men employed, one, I think, would be sufficient.

1095. What is the best means to make known to all persons employed in or about a mine the regulations, statutory enactments, &c., in connection with the Mining Act? In the north of England the '72 Act, after it was passed, was posted outside the office, on the brace, and down below in the plat. I think that is all that would be necessary here.

1096. You do not think it would be a better plan to give every employee a copy of the regulations? When the '72 Act that I speak of was passed, the company under whom I was employed at the time handed each of us a copy.

1097. Seeing that regulations should be made not only for guidance as to how work should be performed, but to regulate men as to how they should carry out their work, do you not think that every man should have a copy? Yes.

1098. You think that, even if they are stuck up in conspicuous places, there is a way of getting out of it by saying "I do not know the rules—I never had them given to me?" In England they are set out in large print on large frames, and made very easy to read.

1099. *Mr. Edwards.*] I notice that under the Coal Mines Act of this Colony this rule applies:—

The owner, agent, or manager shall supply a printed copy of the abstract and the special rules, gratis, to each person, employed in or about the mine, who applies for a copy at the office at which the persons immediately employed by the owner, agent, or manager are paid.

I suppose that would meet the case? Yes.

1100. You would not ask the manager to go and hunt up the men and deliver copies to them? No.

1101. I suppose at your mine the rules are posted up? Yes, outside the candle office.

1102. And outside the pay office? I do not know.

1103. I suppose they are not very diligently studied by the men? No.

1104. In reference to the open-cuts, I understand your experience was about two years ago, and then only for two months? Yes.

1105. Given a sufficient quantity of electric light on the night shift, and the greater danger is hardly discernible? No; but the electric light is not so good as daylight.

1106. In reference to working on the "chinaman"—I suppose in their own interest the contractors would have all big stones popped in order to save the trucks under the "chinaman"? Yes.

1107. So in their own interest they would not let large stones down? Sometimes large stones get away from them; and that is owing to the neglect of both, sometimes the man in charge, and sometimes the men themselves.

1108. The man barring down stone will sometimes get in front, and then, should it run, it would come on top of him? Yes.

1109. Judging from the questions put to you when you applied for work at the Proprietary Mine, you cannot say that they are careless in endeavouring to get competent men? I thought they were careless at the time. I considered myself insulted. If a man came to me for employment I would put him to work, and soon see whether he was competent or not.

1110. As to the dangerous places that you say are unprotected in Block 14;—have they ever been pointed out to the shift-bosses as being dangerous? Not to my knowledge.

1111. Is there not a rule that any dangerous place observed by a workman shall be at once pointed out to a shift-boss? Yes; but you must bear this in mind, that a man, by asking these questions, might be making himself too inquisitive.

1112. But if you saw a dangerous place you would mention it? If in my neighbourhood, I would. If not, I would not.

1113. Whose duty would it be then? The shift-boss's I take it.

1114. But, if dangerous to the men, would you not point it out? The place I refer to might keep its position for twelve months, and it might come down in a couple of hours. No men are working under it; men only pass under it.

1115. Do you not think that it is your bounden duty to go and acquaint the shift-boss of that at once? No; not unless I am working under it.

1116. But would you like men to work under it? No one is working under it.

1117. But you pass under it? No; I would not report it. I should be told at once that I was making myself too busy.

1118. But I understand you to say that the shift-boss is a man that you have no fault to find with; and why do you not approach him? I would not consider it my place, being a subordinate. Suppose I had been on the "Victoria," and warned the Admiral of the approaching collision with the "Camperdown," what would he have said?

1119. Rule 6 of the Underground Rules and Regulations says:—

As a matter of common safety, any workman who shall observe, or come to the knowledge of, any damage to or deficiency in any part of the workings, any defect or flaw in the cages, chains, ropes, or chairs, or in any part of the engine, machinery, gearing, or plant used in or about the mine, whereby the safety of workmen or others may be impaired, shall be bound forthwith to communicate same to the shift-boss or foreman. * * * If, in the various mining operations underground, the workmen notice any undue pressure on the timbers, or any movement or disturbance in the ground which might be in any way considered dangerous, they shall immediately convey information of to their shift-boss, who shall at once advise the foreman.

Surely you could have acquainted the shift-boss—do you not think so? There was not any immediate danger; but still it was a place that should be attended to.

1120.

1120. Now, supposing that earth fell, and crushed some men passing underneath, whose fault would it be—who would be to blame? Perhaps you would want to say that I should be to blame. I am not paid to inspect and find fault. If I took upon myself to do that, I should be sent adrift at once. J. Bourne.
13 July, 1897.
1121. You say the shift-boss is the right man in the right place; and do you mean to say that if you pointed out a danger of that kind to him he would not praise you for it, and thank you? —
1122. In reference to men driving machinery, I suppose, so long as a man has experience, it does not matter what his age is, so long as he is not a boy? No.
1123. And as to certificates for shift-bosses, you think certificates go for very little—what you want is experienced men? Yes.
1124. You said something about the central shaft being defective two years ago; I suppose you know that a new shaft has been put down since then? I believe so.
1125. As to an uncovered vertical shaft, you think there is no need for a pent-house? Yes.
1126. It was stated yesterday by a witness that a vertical shaft should not be sunk more than 100 feet without pent-houses;—you do not agree with that? No.
1127. As to the quantity of powder allowed to be used by one man at one time,—do you work by machine or by hand? By hand.
1128. Of course, with a rock-drill you make a larger hole, and you require a large quantity of explosive? Yes.
1129. It would be very hard, then, to limit the quantity of explosive to be in use at any time? Yes.
1130. As to boys being employed in charge of magazines,—where is there a boy employed in a magazine here? In Block 14.
1131. What age is he? I could not tell you the exact age; I should take him to be 13 or 14.
1132. With the exception of that, you say in Block 14 they are most careful, and very strict in the use of explosives? I do not think they could improve anything, so far as my knowledge goes.
1133. Then you stated that when men are withdrawn by the inspector, or by the manager or shift-boss, from dangerous ground, they should not be allowed to return to that part of the mine without the consent of the inspector? I do not remember answering that.
1134. You wish to qualify the answer you gave Mr. Polkinghorne in this way: that in the event of there being dangerous ground in any part of the mine, such as ground hanging from the face or swinging from the roof, and it is necessary to take the men out of that portion until that ground is got down, as soon as the ground is down to the satisfaction of the shift-boss the men can go back again? Yes.
1135. You think it only necessary to call the inspector where the ground is coming in in a big way; and then, the inspector having been called in, he ought to be satisfied before allowing them to go back? Exactly.
1136. We will come back on to the open-cuts;—you think they should be worked on terraces or benches? Yes.
1137. I suppose you have to be guided in a great measure by the conditions of the ground as to the size of your bench, or whether you can put a bench in? Yes.
1138. Do you know that in the open-cuts here they are at present working them on a system of benches? I have not been up there for two years.
1139. You think the batter should not be less than 10 in 25? Not in loose ground.
1140. That is equal to $\frac{1}{2}$ in 1? Yes.
1141. Do you know that the batter in the open-cuts here is never less than $\frac{3}{4}$ to 1? I could not say; it is two years since I was up there.
1142. So you cannot say that the batter in the open-cuts does not come up to the measurement you think it should? No.
1143. You have no idea whether it is safe to work there or not? No.
1144. Of course, as to your suggestion regarding the fire in Block 11, it is a very valuable one; but the mine authorities have reason to attribute it to another cause altogether. In your first answer in reference to the open-cut, I understood you to say it was not worked in a systematic manner, and that you never saw anything worked so recklessly in your life:—that was nearly three years ago? Yes.
1145. In reference to apprentices: no doubt about it; the earlier a man begins, the better miner he makes? As a rule.
1146. Then you say that when a competent miner is working with an apprentice, they should receive the wages of two competent men? As a rule, in the North of England, the man who takes an apprentice, who is generally termed a breaker-up, has the paying of him himself. They are generally paid there by the weight—by the ton; and the competent man fixes up the wage for the total amount.
1147. But, if paid by the day, as here, you would not expect a mine to pay a man and a boy the same wages as two competent men? He would not be much of a boy at seventeen or eighteen.
1148. But he would be simply an apprentice, as far as mining was concerned? Yes.
1149. And you would not pay him so much as you would a competent miner? Certainly not.
1150. I suppose you have worked on contract right through? I have never worked by contract on the Hill; always day work.
1151. When you are going off shift, do you point out to your mates coming on the condition of the face? I always leave the face safe. I generally fire half-an-hour before change of shift; and I then go back to see if the face is secure and safe. I think all over the Hill men fire too late; they fire exactly at change of shift. The firing probably scatters the laths; and the incoming men, not being aware of the danger, fall through; and, if the floors underneath have been stripped, as is sometimes the case, they may have a very serious fall of some sets in extent. In the event of my firing at change of shift, I always go back to see that there are no loose laths, and, if I find any loose ground, I work it down. It has always been understood by the management that things should be that way. Sometimes, however, men are a little slow, and they fire and leave the face in a wild state, and everything topsy-turvy.
1152. And when they leave they do not know whether it is in a safe or dangerous condition? They do not. An accident occurred about a year ago in this way: A party fired a series of holes, and one did not take—it was not properly lighted. When the other shift came on, one of the men looked round and saw that this hole had not taken. What should he do but light it with his candle. Of course, away went his candle, and he was left in the dark; and, there being a lot of laths out at this place, down he went and injured his back.
1153. What I mean is this: men fire at knock-off time, and the moment they see the fuse spit, they go up? Yes; but I think they should go back. 1154.

- J. Bourne. 1154. They should go back, and either see the face secure before they leave, or else point out to their on-coming mates any danger? Yes.
- 13 July, 1897. 1155. And going up to the surface they very often miss their mates? Yes; you might be going up in one cage, and they coming down in the other.
1156. You say that, leaving the face without knowing whether it is secure or not, is a fruitful source of danger? Yes.
1157. That being so, would it not be far better to have a hard-and-fast rule that men should not be allowed to leave the face until they had pointed out to their mates coming on any danger in the face? Just so; I quite agree with that.
1158. And change of shift, instead of taking place at the brace, should take place at the face? It would not be always suitable to change at the face. You may have just fired a heavy hole, and have some loose ground hanging, in which case I would rather wait and get it down before my mates came in.
1159. But could you not get over the difficulty by firing earlier? Yes.
1160. You think that would be the safest course to adopt—to compel the mates coming off to show their mates any danger there might be? Yes.
1161. I suppose, since you have been in Block 14, you cannot say that anything has been left undone, within reason, for the safety of the men? No; there is one little matter I would like to mention. When I first came here, I went to work at the Central, and there they had some very bad fuse. I think it should be the duty of the mine-owners to get the best quality of fuse possible. While I worked at the Central, I had five holes miss in one day. Since I have worked at Block 14, I have only had one miss, and then it was my own fault.
1162. I suppose you know that sometimes the most careful buyer will get inferior stuff thrust on to him, not only in fuse but in other things? Yes.
1163. I suppose you complained to the shift-boss about its being bad? Yes. Going away from the Hill, I know of several places in the Colony where the fuse was very bad, and caused several fatal accidents.
1164. It is admitted that bad fuse is dangerous, but can you attribute this to the neglect of the mine officials? No. Fracteur, in my opinion, should be tamped as lightly as possible with a soft stick. I notice that in the Tarrawingee accident they had a hard-wood stick. I do not believe in a hard-wood stick—nothing but a soft-wood stick. I have seen several men crippled through using hard-wood sticks. A soft stick is less liable to friction. You want to push fracteur home very steadily. I have seen plenty of miners tamp it very violently.
1165. *His Honor.*] Do you find that you have to be very careful in selecting the length of fuse—should there be a splice in it, is not the powder at that particular spot likely to be disconnected for a space? That is very rare if you get the best quality. It is very easy to distinguish the best quality.
1166. So it comes to this;—that, if we have an inspectorship of explosives, fuse should be regarded as an explosive? Yes.

Mr. Edwards: I would like to draw attention, your Honor, to the last clause of Regulation 8 under the Mining Act:—

And any accident occurring in any mine in or about any machinery shall be *prima facie* evidence that such accident occurred through some neglect or default on the part of the owner thereof.

His Honor: I should say that was purely *ultra vires*. It goes outside the intention of the power to make regulations altogether.

Mr. Edwards: But supposing a short Bill was passed declaring these Regulations to be law, notwithstanding that they were *ultra vires*. However, I do not suppose there is any necessity for me to refer to that further: it is too evident.

His Honor: I do not think that you need refer to that matter further.

Mr. Edwards: I would like to say that I think "*prima facie*" put in there simply means that it places the owner as defendant.

His Honor: Yes; it is not in the nature of a Regulation at all.

John Polkinghorne sworn and examined:—

- J. Polkinghorne. 1167. *His Honor.*] What is your full name? John Polkinghorne.
- 13 July, 1897. 1168. What is your present occupation? A miner.
1169. I would ask you to inform the Commission of any matters that have come under your notice during your experience as a miner in this district? As to the matter of ventilation, which is the first subject I will touch upon, as far as my experience goes, the amount of air brought into the mine is quite sufficient, but it is not distributed as well as it might be through the different workings. I have spent most of my time in the Proprietary, where I went just after the fire. I was engaged in opening up a portion of the mine away from the fire; and, to get to that part, other means than those used before the fire had to be adopted, and, on account of the blocking of the old roads, the air was rather warm. The Proprietary, however, has as much air going through it as anyone could wish for, if it were only distributed a little better. I worked at the Central two years ago, and there was a place in it where a great deal of work was going on, but there was no air-way provided until the stope was put up something like six floors. Why I mention this is to try and corroborate some of the evidence that has been given, that the best means of ventilation would be to block out the ground so that the air can be circulated into the parts where the men are working. There is always plenty of air sent into the mines on the Barrier; it only wants distributing. Men have had to work for a good while in places rendered very hot by the heat of the ground, by the breath of the men, and by the blasting operations. The current of air was not sufficient to drive out the noxious gases that accumulated. Though there be plenty of air in a main drive, it is no proof that the workings are supplied with pure air. The distribution could be done with very little cost; and I do not think, from what I have seen of the Companies, that, if the necessity were pointed out, they would be other than ready to have the matter at once attended to.
1170. Is such a thing as bratticing ever used in these mines? I have seen a little of it here, but not much. In some places, the air has been almost completely thrown off from a place where it was not required by the use of canvas. These things only want to be mentioned, and I have no doubt they will be carried out. In the opening up of the different levels I think the greatest care should be to see that

a connection is made from one level to another before stoping is done. The connections should be made by winzes. It is better to sink than put up a rise when making these communications, because, in sinking, it is found that the men inhale less of the poisonous gases that are given off. I have never mentioned to anyone, nor have I thought, that there was ever anything that could be done which was not being done for the safety of the men employed. Plenty of timber has always been provided. It has been said at this inquiry that at times on some of the mines there has not been sufficient timber. I may say that, during my short term in the Central, for a while there was a run on timber, and orders could not be filled by the mill so soon as was desired. In that case, every endeavour was made by the Company to get the timber. I do not know anything about these dangerous portions of the mines referred to—the underground chambers. In my opinion, if they are carried out to the extent that has been pointed out, it is necessary that a Regulation should be framed restricting their dimensions. In my opinion, no open excavation underground should be carried out to a greater height than 10 feet, which would enable men to control the back. I think they could keep their face 20 feet in front of the timber even with machines. The timber would not be shattered at that distance. I do not consider it safe to work in an opening underground of a greater depth than 10 feet.

J.
Polkinghorne.
13 July, 1897.

1171. As to the number of accidents that have occurred, have you noticed that there has been any increase out of proportion to the increase in the number of miners? I think there has been an increase in the number of accidents out of proportion to the increase in the number of miners. I certainly think that the cause of so many accidents is through the employment of so large a number of incompetent men. I have heard such terms as this used by the bosses who have employed them: "I wish it would come on to rain in South Australia, so that these fellows would go back again." These men cause accidents by their bad work, and very often it is not themselves, but the men on the next shift, who suffer. Incompetent men are not in a position to tell their relieving mates of any danger; and their mates, even before they have time to look round, fall victims from a fall. It is then, perhaps, said that the man brought on the accident by his own fault; but, at the same time, it was very probably the fault of the outgoing man. I think that nearly every accident is brought about by incompetence on the part of the men employed. It is my opinion that, if men were allowed to select their own mates, better men would be employed. There are plenty of good miners, it is said, who are walking about and looking for work. At the present time, I believe, if a party wants a man to complete it, by applying to the officials, they will allow you to select your own man if you have a wish to do so; but, if you cannot get hold of the man you want at once, or within some little time, the boss puts on one, and you have to put up with him for the time being, no matter how incompetent he might be. I have been working in the Proprietary a year and nine months; and I must admit that I have seen during the last six months more men come down into the block in the shift I have been working on, and sent up and not allowed to come down again, than there are on any shift in that block. They have come down and shown their incompetency; and some of them in less than half an hour have been told to go. Some of these very same men may go to another mine; he may be a very good "bullock," or he may be a good shovelman, and as the boss goes round he happens to be doing something which passes him off as suitable; but, at the same time, he has got no idea whatever how to break down ore. How to prevent the employment of these men is a difficult question. When a man is working and wants somebody to fill up the party, he very often does not know what men are out of work. It is said that lots of good men are out of work, but very few of them find their way to fill vacancies on the blocks I have been working in. The best means to adopt to secure good miners is to put a lot of those young fellows into the face who are at present working as truckers, &c. They are very anxious to get into the face, and I am sure they would make very good miners if they were put under a good system. I think you would find plenty of good miners willing to take these boys on, because they are fine strapping fellows, and could get through just as much of the rough work as the miner proper. If these boys were taken on as apprentices, one of them with a competent miner would get through as much work as two competent men, since the boy would be able to do all the rough work which requires no experience, and the competent man would do the skilled work. The wage now is 9s. a day, and, as the competent miner and his apprentice would get through as much work as two competent men would, the two together should receive two men's pay, viz., 18s. a day, which should be divided in this way: the skilled man to receive, say, 10s. 6d., and the apprentice 7s. 6d. The apprentice, by working alongside a skilled man, would very soon begin to pick up things. As to the inspection of the mines, I certainly think that this district is too large for the one inspector. While a lot has been said against the way in which the local inspector has carried out his duties in this district, I have nothing to say against him at all. All I say is that we want a Mining Act and a set of Regulations which will give him more power to act. From what I have learned since I have been on the Barrier, it is proved that the Mining Act and Regulations are not what they ought to be; and, consequently, the inspector has not been able to do what is expected of him; but, apart from that altogether, seeing the amount of work that is being carried out on this line of lode—there are over 6,000 men employed within a line of lode 2 miles in length—this immediate district requires a man in itself, and the outside localities should be taken charge of by another inspector.

1172. You mean two men should be appointed, and that it should be so arranged that always one of them would be available at Broken Hill? I think one should be available at Broken Hill at all times. Of course, I would not suggest that one be appointed at Broken Hill and another at Milparinka. They could work the district (the Albert Mining District) between them, but so arrange it that there would be always one at Broken Hill. Just previous to the luncheon adjournment we were discussing the question of inspectors. I said that I thought one was not sufficient for the district, and that one should at all times be in Broken Hill. The question then arises—what class of men the inspectors should be. I think they should be practical men, and not only theoretical. I do not object to a little theory; but practice is far better than theory. There is one thing that I would like to suggest, that I do not think is in use on the Barrier—the adoption of safety hooks and thimbles on the skids to prevent overhauling. These would disconnect the rope from the cage in the event of overhauling.

Inspector Hebbard: Two or three different kinds are in use on the Barrier.

Witness: They should be adopted in all cases where men are being raised or lowered by cages. I think there should be a Regulation compelling their adoption. There is nothing in the Regulations at the present time providing that even the safety appliances which are now in use should be provided for every cage.

Inspector

J.
Polkinghorne.
13 July, 1897.

Inspector Hebbard: Safety appliances are in general use; but they are not compulsory.

Witness: I believe there are some cages in use on the Barrier without them.

Inspector Hebbard: There were two or three, but I do not think there is one now in use without the safety appliances.

Witness: I was given to understand that there were, some time back, but I do not know whether it is so now. I think that the most modern appliances that can be got should be provided for in the Regulations. I have seen in Victoria three or four different appliances in use. I do not know what appliances are in use on the Barrier.

Inspector Hebbard: Those at the "South" are Noble and Chessel's, and those at the Pinnacles are the same. Middleton's patent is in use at Block 14; and those at the Proprietary were introduced by Mr. Patton from America.

Witness: I think engine-drivers should be holders of certificates that they are competent to take charge of an engine. This is especially necessary where they have charge of the hauling of men to the surface. The Regulations at present provide, I believe, that no vertical ladders be allowed in shafts—only in pump shafts. I do not think a vertical ladder should be allowed in any shaft, whether pump or hauling shaft.

1173. Do you think a man is less likely to fall from a vertical ladder with ordinary rungs than from a steep ladder built in ordinary step-ladder form? I do not think so. I think the step-ladder would be the safer. I do not think that a vertical ladder is safe at any time. The ordinary rung ladder, inclined somewhat, is the safest ladder for shafts. I do not approve of them at too steep an angle. The ladder I like best is the rung ladder—10-inch rungs. If such a ladder were placed at an angle of (say) 4 feet in 20 feet, it would be very easy to climb. Step-ladders are the safest for stopes in this district. In looking over the Regulations as to the inspector's duties, I cannot see that it lays down anywhere that the inspector shall leave a record in the office of any defects or of any place he deems unsafe. In my opinion, when an inspector has made an inspection of a mine, and has seen any defects or unsafe places, he should put it in writing and sign it, and place it in the office of the company, so that, if anything happened, the inspector could have it on record that he notified the company that such defects had to be looked after. I think some provision should be made that such records be kept. In all cases a record should be left in the office of the company. It would be far better for the company as well as the inspector. One of the subordinate officers may be with the inspector at the time that he points out any defects; and the superior officers might never know anything about those defects. But, should a record be kept in the office, it would be placed before the head officials. In many cases the inspector may, perhaps, come across little matters that could be rectified in a short time with little cost, and at present he simply informs the officer-in-charge of that part of the mine that it would be better to get them repaired, and he gives an order that it be done. But there is at present nothing to show that he has given such an order. No doubt, a record should be kept.

1174. You would amplify General Rule 2 of the Mining Act to meet the case? Yes. As to the calling of men out from any part considered dangerous, as set down in that rule, my opinion is, that if a man in charge calls men out, and the defect is not considered, in the opinion of the men, to be of such a nature as to require an inspector to be called in, when the place is put into repair it should be the place of the man in charge to give the order for the men to return to work; but in all cases where it is deemed advisable to call the inspector, he should be the man to say when it is safe for the men to return. That rule (No. 2) is hardly sufficient. The inspector would not be required to be called in for everything. Often a small movement will take place, where, if they waited for the inspector to come before they secured it, the delay would, perhaps, lead to a serious creep; whereas, by the man in charge taking the men out and making it secure, a more serious danger is averted. In all cases, the men are the best judges as to whether the inspector should be called in. If there be an extensive movement, the inspector should be called in, and the ground should be secured under his supervision. While we may have most efficient men as managers and foremen, they have to depend upon other men to a great extent. Men are placed in charge of certain places, and they have only been workmen, and are not at all times to be entirely depended upon. Men who have been taken from the face and placed in charge will very often run into more danger—and take men with them—than the manager would allow. Of course, it would not be possible for the head officials to be at all times present in every working place in their mines. Another matter has occurred to me. It has not been mentioned here as yet, and it is a matter that I have had under consideration for some time. It is necessary, in my opinion, that two engine-drivers should be in the engine-house when men are being lowered or raised. At present, twelve men, six in each cage, are at the mercy of the one man. In my opinion, when men are being raised or lowered there should be two drivers. I have read of an engine-driver who, in the midst of his work, was seized with a fit, which resulted in much damage and loss of life. Two men would be a safeguard against such an occurrence. It may look a hardship to some companies that may be working only two shifts, as then they would have to employ an extra man to be on duty in the engine-house during the raising and lowering of the men at change of shifts. But I do not think the extra cost should stand in the way. Twelve lives should be considered of some value to the State. Not only that, the losing of twelve lives would probably mean the throwing of thirty or forty persons on to the State for maintenance. As to the Regulation regarding explosives, I think it is hardly elastic enough for the conditions under which you have to work in this district. On the other hand, in framing a Mining Act and Regulations, I quite recognise that it would not do to have a separate set of Mining Regulations for each mining district. But I believe in having a Regulation which you would not be bound to break. Under this existing Regulation, that the amount of explosive a workman may have in use at any one time in any one place shall not exceed 6 lb., I take it that it means the explosive in use after it has been taken from the magazine. I would rather see the Regulation provide that the quantity required be taken out, but that, as soon as the blasting to be done had ceased, the canisters should be returned again to the magazine. In order to minimise the waste of time that would occur in returning the canisters to the magazine, it would, perhaps, be necessary to have a magazine at each level.

1175. How would it be to give the Minister discretionary power, on the report of the local inspector, to grant an extension of the quantity to be used at the one time on any particular mine? I can hardly see how we are going to get out of the difficulty unless we do it in this form—that no man be allowed to take more than is required for the shift. In hammer and drill work you may have to fire four or five times in a shift. It all depends upon the nature of the ground you are taking out. It may be you are squaring up to get a set of timber in: perhaps the one blast will take out the best part, but five or six little shots would

J.
Polkinghorne.
18 July, 1897.

would further have to be fired. At the close of every shift, the canisters could be returned to the magazine. Explosives, while in the canisters, would be perfectly safe. As to the open-cuts, I have never worked in them, and I hope I never will. They may, of course, look more dangerous to the uninitiated taking a view from the top than they really are. I think, myself, from what I have seen of them, that a sufficient batter has not been kept; but I believe steps have now, and for some time, been taken to get a better batter. I believe that the open-cuts at the present time are in a better condition than I have known them to be in before. We all recognise that they are very dangerous things to work. In taking down those open-cuts, I see they have had a good deal of trouble in ascertaining what they would have to take away in order to get the ore out. They have endeavoured to get a batter, and, on going down a little way, find the ore widening out, and of course the batter then gets very bad.

1176. At the same time, you recognise the fact that it should be considered as a mine for all purposes of the Mining Act? Yes.

1177. And that would involve the question whether all quarries should not be similarly under some sort of control? Yes.

1178. Tarrawingee, for instance, is a place where ore is not being raised in the ordinary sense of the word, and therefore that comes strictly within the meaning of a quarry? I think all quarries, no matter for what purpose the material is being raised, should be treated under the Mining Act Regulations. But I think we must all admit that there should be a lot of discretionary power allowed to inspectors in all those cases. You cannot lay down a hard-and-fast set of regulations to be worked by. To-day, a quarry is in a good state, and to-morrow, because of its being necessary to blast away some overhanging rock, it would look bad. Two or three shots would be sufficient to make a quarry that has hitherto had a good face look in a bad state. Therefore, discretionary power should be allowed the inspector in such cases. In quarrying, in order to remove a danger, they have to remove the material, and in doing this they might for the time being destroy the face. You could not frame regulations sufficient to cover everything, and I do not think you could have sufficient inspection to prevent all accidents. I don't believe a man would run in front of a moving boulder, but there are men on the Barrier who would not know which way a rock would go that they are barring down. I have seen them underground as ignorant as that.

1179. You do not wish to express any opinion regarding Mr. Bourne's suggestion that an open-cut should be worked with benches? I do not think such a mode would be any improvement on a fair average batter.

1180. Where much work of that kind is going on, you would like to have it brought under the control of an inspector, and to leave the way it should be worked to the inspector? Yes. The man appointed as inspector should be a practical man. He should be a man who would be considered to be beyond any outside influence, and who would go about his work in a straightforward manner, without fear or favour to the men or the masters. I think most of these matters as to the open-cuts should be left to the discretion of the inspectors; but I would like to see in the regulations a minimum batter set out.

1181. The difficulty of that would be that there are some rocks that would not require any batter at all—for instance, solid sandstone; so that, if you provide a minimum batter, it would have to be vertical; and that would not be of much use? Of course, as I have said before, I have not had much experience in these matters, and it is the open-cuts here that I have in view. I think it should be left to the inspector—the advisability of increasing the batter in any part. As to the proposed Board of Inquiry. I think it is a very necessary thing that in all mining districts a Board of Inquiry should be appointed to inquire into all cases of accidents other than fatal. I know of accidents that have occurred under my personal view, when gross negligence on the part of the injured party has been the cause in some instances; and in others, the negligence of the man in charge. Frequently the wrong party is blamed. The man in charge is blamed when the accident has been brought about by the gross carelessness of the person injured. If a Board of Inquiry were appointed, and could be called into requisition when an accident took place, it would remove the probability of the blame being thrown on the wrong man. Of course, in all fatal accidents, the magisterial inquiry would be sufficient. I have often heard that such-and-such an accident occurred through the carelessness of the shift-boss; but, on making inquiries from the men who witnessed the accident, I have elicited that it was the man's own carelessness. Of course, there is the other side. If a man receives an injury it is only fair that the blame should be placed upon the proper person. If it be the fault of the shift-boss, then the blame should be placed upon his shoulders. In the case of a fatal accident, the way it occurred is never known. I think a Board of three would be sufficient. Two of the members should be elected by the people of the mining district in which the Board acts; and that should be done by means of the franchise, as in the case of Members of Parliament. The Government should appoint the third party, who would be chairman. Of course, the mine-owners might say that by manhood suffrage, the miners being in the majority, the two men selected would be of their selection, and the companies would have no representation whatever. I would like to be fair; and, after considering the matter, I have come to the conclusion that the companies should be allowed to elect one. Their being elected in this manner is the only guarantee that no man would be appointed by undue influence. I would say—let us have no Board rather than a Board appointed by the Government.

1182. You do not believe in a system, then, which would provide that the Chief Magistrate of the district should hold an inquiry in the nature of an inquest? No, your Honor, I don't. I have a reason for not believing in that system. I have attended a few of the inquests held here. You can never get a witness to go into Court and say what you could get him to say on the spot. I maintain that a Board of Inquiry should visit the spot and interview those who witnessed the accident.

1183. Well, assuming the Police Magistrate visited the spot? They are susceptible to political influence, in my opinion. I think if the whole matter were left in the Police Magistrate's hands we might just as well remain as we are. In the event of a fatal accident happening, in the magisterial inquiry the jury should be composed of practical men. I do not think the present mode of summoning juries on fatal accidents is a good one. What is the benefit to be derived from a verdict arrived at by ten or eleven men who know nothing whatever of mining only what they see from Argent-street? They cannot be capable to form an opinion, unless it is a case of plain facts only; but in technical evidence they are not the proper persons to be on a jury. Three quarters of the jury here, in most cases, are men who have had no practical knowledge of mining. I think it should be made a rule to summon a certain number of practical men on every jury called together; at least one-half should be practical men. As to the firing at
change

J.
Polkinghorne.
13 July, 1897.

change of shift; I do not think it would be an improvement, but rather otherwise, if men were compelled to relieve each other in the face. I think I can illustrate that. I worked in a claim in Victoria, and there was a decree issued that we had to relieve in the face. We were sinking with rock-drills. Our machine was just worked out on time; we had, however, to wait in the face until the men of the on-coming shift relieved us. When they came on, they had to return to the surface and get another machine. If we had been relieved at the top, we could have let them know about the machine, and much time and trouble would have been saved. Many such things as that are likely to occur when relieving in the face. To change in the face would be neither an advantage to the men nor to the company. It would mean the employment of the engine-drivers for longer hours, for one thing. I say a man has no right to be working underground unless he is capable of taking the necessary precaution to have a good look round before he attempts to begin work in his face. I know a lot of men who do not do this; but those men, I say, are not in their proper place. Some men will walk into their face without looking around at all. As to leaving a missed-hole, I can say that I have never at any time since I have been mining left a missed-hole. I have always seen my mates before leaving it, and it is the duty of every man to do the same. I do not think anything would be gained by meeting in the face. If there was a regulation laid down to that effect, it would be simply helter-skelter, and you would not give them so much information as you would if you met them in the plat. As to a missed-hole, there is only one man who has given evidence on this point that I would corroborate. If a hole misses, the safest thing to do is to prepare another primer and put it in. As to the time that should elapse, I think, myself, a couple of hours should elapse. Of course, it may turn out, as it has been proved in some cases, to be more dangerous after the two hours than after twenty minutes.

1184. *Inspector Hebbard.*] If you had a powder-hole miss fire, you would rather take the tamping out than bore another hole alongside it? Yes.

1185. The rule in the Act saying that it shall not be unrammed is always being broken? Yes.

1186. It must, in fact, be broken? Yes. I would much rather take out the tamping with a scraper even than bore another hole alongside.

1187. *His Honor.*] What metal would you use? When I got on to the powder, copper would be the safest to use. I have taken tamping off powder with only a common scraper. I think it is safer to go with the ordinary pricker or scraper and take tamping off blasting-powder than to bore alongside it.

1188. *Inspector Hebbard.*] What is the general practice with missed-holes;—is it not the practice now-a-days not to completely pick a hole, but to take out some of it and charge some dynamite on top of it, so as to produce concussion of the powder? That is the general practice; but, as far as I am concerned myself, I have not adopted that way more than twice. It did not seem to break the ground enough. I prefer, therefore, to take out the whole of the tamping. With regard to the glycerine compounds, miners think that so long as they are air-tight it is all that is required. I can hardly fall in with that part of their theory. I believe that a little sand or water on the charge is better than a bit of clay or something to stop the air. In my opinion, the instructions issued with Nobel's glycerine compounds are sufficient. They say that only sand or water tamping shall be used. They do not say you shall fill it to the collar. It is used to-day with a little loose material put on the collar of the hole and fired. Water tamping, in my opinion, is the safest tamping, and it prevents bad fuse from bursting—at least, prevents the bursting being the cause of an after explosion, as the water will get to it and put it out. I have always found the fuse made in Victoria very good, and that made in South Australia is also good.

1189. *His Honor.*] Have explosives in South Australia to be passed by an inspector? All explosives for South Australia have to be examined out at the Semaphore before being placed in the Government Magazine.

1190. Does that include fuse? I do not think so. Fuse is manufactured locally.

1191. There is no local manufacture of explosives there? I do not know of any.

1192. You cannot say that there is anything wrong in the general system of stopping and working of the mines on the Barrier, putting aside altogether the question of open-cuts? I do not think the system of square-set timbering which is in vogue here could be improved upon. I have been working the square-set timber now all the time I have been in the Proprietary, and I was also working it at the Central. This system is in use on all the mines here. Everything has always been provided, and if anything is at any time required, you have only to speak about it and it will be supplied. I do not see how we could better it.

1193. *Mr. Edwards.*] You have been specially appointed to represent the miners on this Inquiry? Yes.

1194. As their representative, do you make any charge as to incompetency on the part of any of the managers or subordinate officials in the mines on the Barrier? No; I do not. I was unable to get that from any witness that was called, and my experience has not given me room to say so.

1195. I suppose you have been directly under Mr. Horwood, and Messrs. Barrett and Bayley, foremen? Yes.

1196. You do not suggest anything in the way of incompetency on the part of any of the managers or the subordinate officials? No. So far as I know, the men I have had to deal with are men capable of doing a day's work in the face.

1197. No charge of incompetency is brought against Mr. Stewart, I suppose? I do not think so.

1198. You say this—that everything is provided for the men within reason in order to enable them to secure the workings? I have never seen one case where anything required could not be obtained.

1199. Is there any wilful disregard for the ordinary safety of the men displayed by any of the officers? I cannot point out anything like that at all. We see little things sometimes that we might think out of the way, but nothing to make any charge about.

1200. You know the working rules for the mine, surface and underground? Yes.

1201. You have read them? Yes.

1202. Do you not think they provide for nearly every matter? I must say this: that there is nothing contained in those rules but what a miner of ordinary ability should know was required of him. And I think what is laid down there, if carried out by the men, would make it better by far for all concerned. As to the surface regulations [*vide Exhibit B*]. The hours are set down between which blasting shall be allowed in the open-cuts. On one occasion, before 4:30 in the afternoon, sixteen shots were fired, and some of the stones came through the roof of the changing-house while we were changing. I complained of this at the time.

1203. Were they blasts, or merely pops? They were deep holes.

1204.

J.
Polkinghorne,
18 July, 1897.

1204. That might have been done by permission of the company's surface foreman;—the regulation contains a clause to the effect that, should it be necessary, owing to exceptional circumstances, to blast outside the regulation hours, permission to do so may be obtained from the company's surface foreman only? That might have been. I did not inquire.

1205. If that rule [No. 8, Exhibit B] were carried out, it would be safe enough? The surface foremen should not be allowed to give permission to blast outside the prescribed hours. We are in danger in the changing-room if that permission be given.

1206. I suppose no matter how stringently rules are fixed, you will find people breaking them? Not such a glaring breach as that. Besides, the surface rules are posted up right in front of those people's eyes.

1207. As to the rules underground;—you have read them? Yes; and there is nothing in them more than any ordinary miner ought to do.

1208. If they were carried out, would that not be all that was desired? Yes. If a man wants a copy of those rules to carry about with him, he must be very shallow.

1209. There is no complaint as to insufficiency of timber, or anything of that sort? No.

1210. And as to the underground open-cuts;—you have never worked in them? No; I know nothing about them.

1211. As to the increase in the number of accidents that have taken place;—you have never been present at any serious or fatal accidents? No.

1212. In addition to there being a large number of incompetent men in the mines, you say that even the best of miners become indifferent to danger? Yes; the best of them.

1213. I do not suppose you are in the habit of biting those caps with your teeth? Yes; I have bitten hundreds of them; but I think, for all that, nippers should be provided.

1214. You said something about the incompetent men that are in the mines;—have you any idea how many men have been discharged for drunkenness, and incompetency, and breaches of the regulations within the last twelve months in the Proprietary Mine alone;—you would not be surprised to hear that it exceeds over 3,000? No; I would not be surprised at all.

1215. When you are working alongside a man and you see him incompetent, you consider him a danger to the men he is working with? Yes.

1216. I suppose you would report it to the shift-boss? I never did that. I do not think that is part of my duty.

1217. Is he not just as much an element of danger as a hanging stone? I would report no man for incompetency. I do not think that is my duty. I might report to the shift-boss the portion of the stope rendered dangerous by an incompetent man.

1218. In parties of six, you select your own mates to start with? Generally speaking.

1219. Then, perhaps, one of your mates drops out; you are allowed an opportunity to select another in his place, and a reasonable time to get him in? I believe that is the rule now. Of course, there was a time when you were not allowed that privilege. I believe, at the present time, I would be right in saying that you are allowed to do so at all times. Of course, it might be this way—that you might not be able to come across a man that you know enough of to recommend him to a foreman. Then, probably, one would be sent from the office.

1220. Otherwise the work would be delayed? Yes. I would like to say, however, that very often through having an incompetent man sent to you, the work is rather delayed.

1221. But, if a man is sent on and he is incompetent, you have the right to go to the shift-boss and report him incompetent? Yes; it is my duty then to do so, because I have to earn my own living and his too. But if he is alongside me, and in another party, then it is not my duty to report him. But there is one thing;—if I report a man working with me who is incompetent, he will very likely be sent to the surface; but, for all that, at the end of the fortnight he will draw for that shift the same pay as myself, even though he has not done sixpence worth.

1222. But the danger of his being there is removed;—and judging from what you have said, where danger is to be averted, the expense should not be considered? The company—not the man—should incur the expense. The office do not know whether a man is a miner, and they send him over just on his word that he is a miner. They come over, and we find that they are not miners at all. That is how they get into the mine.

1223. They simply represent themselves as miners in order to get work and the wages being paid? Yes.

1224. The only way to remedy that is by training up young men; and I understand you to say that, if you put a competent man with a boy or youth, the two will get through as much work as two competent men? Yes.

1225. And that the company might just as well pay them the full wages? Yes.

1226. Then, in the next contract you take, why not take on an apprentice? That is right enough; but there are other things to be looked at. Perhaps he may leave a place to come with me, and at the end of a fortnight I am offered a price and refuse it, because I do not consider it sufficient. I could probably get work somewhere else, but the young fellow would not. I have known lots of smart young fellows on the Proprietary, who have told me that they would like to give up trucking and go in to the face.

1227. What is the objection to apprentices going into the mines, and occupying the same grade as they would in other professions;—blacksmiths' apprentices and others get paid so much, according to their value? But, in the trades, they have not got the heavy work to do that an apprentice in the mines would have. The apprentices should be put on day-labour. They should not be put in the face with competent men, and at a lower wage be supposed to do, with a competent man, the work of two competent men.

1228. What age should apprentices be fixed at, and at what rate of pay? The age should be what the Act allows—16 years.

1229. How many years should an apprentice be supposed to work before being entitled to rank as a miner? Until he is thoroughly capable of taking the position of a miner. Some of them would never become competent.

1230. But you must fix a limit of time? I do not think you could fix a limit of time. A boy might be apprenticed to a trade, but never learn it.

1231. What would be the time for an ordinary youth? If a youth of 16 were to go underground with a man prepared to look after him—of course, more care than teaching is required, because he can see for himself what is to be done—after three years, if there were anything in him, he would be A.1, and capable of holding his own with ordinary men.

1232. Then you think a youth should be apprenticed for three years? Yes.

1233.

J.
Polkinghorne.
13 July, 1897.

1233. What rate of pay should he start on? Supposing a workman is worth 9s. a day, what should an apprentice be worth? It is a matter that you want to look at in a good many ways. I believe in a system of rate of pay being fixed, if you could possibly do it; but we must not forget this, that if we take a youth underground at 16, in ninety-nine cases out of 100 it is far different from a trade of any other kind. In a face, it is very heavy rough work they are called upon to do.
1234. Would you pay them at one-half? No, I would not give as low as that. If a boy at 16 is not worth more than half as much as a man he is a very poor lad. I do not think, at the lowest, the pay should be less than 7s. 6d.; that is, 1s. 6d. below the standard rate ruling in this district now.
1235. Do you not think that could be embodied in the regulations to the benefit of the miners? I do not see any need for such a regulation.
1236. I understand there is some objection at present to boys being taken into the face? It is being done. I do not say the boys are as young as 16.
1237. Is there not some objection by your society to any person going into a face at anything under full pay? That only applies to workmen.
1238. In addition to the danger arising from incompetent men, there is a good deal of unsteadiness among them, is there not? I do not think so.
1239. Many of them get drunk; and, after a heavy drunken bout, are they fit to go to work? I have never seen a man drunk. Provision is made in the regulations of the Proprietary Mine that men shall not be allowed to go underground if intoxicated. They have to pass two or three bosses before getting to their face, and would be detected.
1240. But a man might be sober, and just, perhaps, recovered from a drunken bout, and be unfit for work? I do not understand that feeling.
1241. But no doubt men do go into the mine in that nervous state brought about by drink? I have not experienced it myself. I have heard men say that they have a "fat" head. Of course, that may be applied in several ways.
1242. How long have you been working on contract in the Proprietary? Close on two years altogether. Out of that time I have not been more than three months on day work.
1243. I suppose your average wage is considerably more than you would ever make at day-labour? My average wage has been above day-labour, or I would not have gone on contract work.
1244. Would it be about 12s. 6d. a day? I do not think it would come up to 12s. 6d.
1245. Have you any objection to the contract system yourself? No. But the contract system here is not contract at all. I do not agree with the system applied on the Proprietary.
1246. *His Honor.*] What is that system? Nothing more nor less than piece work. If you take a stope, the foreman will come down and set you for a fortnight, or is supposed to set you for a fortnight. I believe, now, the fortnight is generally allowed to be worked out if possible; but at one time, if you were making money thought to be too good, they would take you away. They set you out work at so much per set. No number of sets is stated, but you are supposed to have enough to last you out the fortnight. It may be you are working in one stope to-day and another to-morrow. For instance, you are on the change, on the end of the fortnight; the two men on the day-shift are supposed to represent the party, and to agree with the foreman for the price, and they have either to accept it or refuse it. Another part comes very heavy. The afternoon men and the night men have to go and sign that contract before they can get their candles to go below. They do not know what the ground is like, unless they have worked there before. That system has been introduced within the last few months—not letting the afternoon and night men see the ground. The bosses hold the right of coming and stopping you at any moment. They can come and take you out of the face, and put you in any other part of the mine. They will stop you from what they call a contract. Then, something may occur that you want to get away, and you leave before the end of the fortnight. They, in that case, keep 25 per cent. back. But, if they like, they can come and take you away from where you are earning 12s. a day under the contract system and put you on day-labour at the ordinary daily wage, 9s. a day. And, if you refuse, you are sent up.
1247. *Mr. Edwards.*] It is only in urgent cases that you are taken away from your stopes, and then it is to go and see to some repairs that are required to be attended to? Yes; it is only on odd occasions.
1248. *His Honor.*] You are asked what price you will accept? Yes.
1249. Your price can be either accepted or refused? Yes.
1250. The boss has got a reserve price? Yes.
1251. And that is the limit? Yes.
1252. And if you refused to take it? There are generally parties waiting to go on.
1253. There is no calling for tenders? No; unless it is for sinking.
1254. *Mr. Edwards.*] I suppose this work varies in value? Yes.
1255. Sometimes they make as much as £1 a shift on it? Yes; and some of them have made 1s. 8d. a shift.
1256. I suppose the good and practical workman can always make better money than incompetent men? Yes; but sometimes they cannot get a very big price.
1257. But your average has been about 12s.? Yes; but I am not complaining.
1258. They let the contract, and, if you make £1 a shift out of it, they do not interfere with you in the fortnight? There have been exceptions to that.
1259. *His Honor.*] I suppose the quicker the ore comes out the better? Sometimes it goes out rather too quickly, and then men are kept back and remain idle for a little time. It is the opinion of the men that the engines could work the three shifts, and they would then keep up with the supply.
1260. *Mr. Edwards.*] Is it possible to frame any regulations that men will observe? I am only one of them, and I take it that I am not above the average; and I cannot see for the life of me what good can be done by the printing of regulations to compel men to do what their own common sense ought to tell them to do.
1261. Take the majority of the men—if they had a jumper handy to them when charging a hole, and they had a wooden tamping-rod a few yards away, which would they take up first? The wooden rammer.
1262. You think they would go to the trouble to get it? Yes.
1263. A wooden rammer is always provided wherever you have been through the stopes? Yes; wherever I have been in the Proprietary. You can always get a charge-stick whenever you go to the magazine.
1264. And that charging-stick is made of soft-wood? Yes.
1265. And is sufficient for all purposes? Yes.

THURSDAY, 15 JULY, 1897.

John Polkinghorne re-called and further examined:—

1266. *Mr. Edwards.*] Your last answer, on Tuesday, was that soft-wood tamping rods sufficient for all purposes were provided by the mines? Yes. J.
Polkinghorne.
15 July, 1897.
1267. Do you consider the practice of "bulling" holes a dangerous one, or is it necessary in order to produce efficient work? That is a question that requires a lot of answers. Under certain circumstances, "bulling" holes is absolutely necessary. It is attended, no doubt, in some cases with great danger. "Bulling" is carried on extensively along this line of lode, which is such a big mass. It is considered necessary to put in large holes to bring about the result desired. It is found necessary, in the opinion of most men, that the explosive should be concentrated into as small a space as possible, or as near to the bottom of the hole as possible. Of course "bulling" brings about that result, and makes room for the charge to settle into the bottom of the hole. Where it is a great source of danger is in large holes. On the surface, for instance, I have seen holes "bulled" in the open-cuts that have sometimes shifted 100 tons. In my opinion a hole of that description, where the four or five plugs used for a "bull" would remove the whole burden, should not be "bulled." It may be that the man in charge of the work did not know the exact nature of the ground being bored. It may be that a slip was in the rock, which caused the whole burden to be removed by "bulling." This gives rise to great danger. Men are working in the bottom of the cut while "bulling" is going on above; and, if the "bulling" were to cause the burden to slip away, their lives would be in great danger. If men "bull" holes, there should be a limit. It is all very well to talk about wet ground or water; but unless there is a limit put to it—as to the time holes should be allowed to remain after being "bulled" before being charged—men will run great risks, and charge before they know whether the hole is fit or not. In a lot of the ground in the Proprietary where I have been accustomed to work, there are a number of joints, fissures, or crab-holes in the ground; and there is a great chance of fire being carried into those fissures when "bulling." I would not condemn the "bulling" practice in every instance; but I think a limit should be placed as to the time.
1268. The system of "bulling" is not objectionable;—it is the way it is carried out? It wants to be carried out with great care.
1269. As you say, the object of "bulling" is to concentrate the charge at the bottom of the hole and prevent the explosives rising up the drill-hole? Yes.
1270. Where you have a heavy burden in the open-cuts, it is absolutely necessary to get your explosive as low as possible? It is generally considered so. Men with greater experience than myself say they never "bull" a hole under any circumstances. It is my opinion that it is not absolutely necessary to "bull" all holes that are being "bulled"; but, in some cases, I think it is an improvement.
1271. You do more effective work with the same amount of labour and the same quantity of explosive? Yes.
1272. *His Honor.*] Do you think a certain limit of time ought to be fixed as to the time which should elapse after "bulling" and before re-charging? Yes; of course there may be some cases where water could be procured, and in a short time the hole could be re-charged with safety; but, if there is no restriction placed upon them, men will run the risk of charging in cases where they have not the necessary appliances to cool down.
1273. You would make no exception;—you think it better to have a fixed rule? Yes.
1274. What time would you fix? I do not think, in the case of a "bull," it would be safe to again charge the hole under an hour and a half. Of course, some holes can be re-charged in half-an-hour—that is, holes that are "bulled" with only a small amount of explosive. I have "bulled" hundreds of holes, and have found this to be the case; but, on the other hand, seeing that a large quantity of explosive is used in "bulling" most of the holes, which is necessary, owing to so many of the holes being put down a great depth, the limit should be fixed for those larger holes. This, as I have said, should not be less than an hour and a half.
1275. *Mr. Edwards.*] An hour and a half is already the time, I believe, that is fixed in the open-cuts? I do not know what time is fixed. That, in my opinion, should be the limit.
1276. With short holes underground, do you think one hour and a half should be the hard-and-fast limit, where plenty of water is provided? You see where it comes in—although there may be plenty of water to be got underground for cooling down holes, if you make no limit, abuse will follow.
1277. Men would not go to the trouble to get water? I do not think they would in some cases. If that restriction—the time limit—were placed upon men, they would run a risk of losing their places if caught infringing it. I might here say again that lots of holes are "bulled" underground that do not want "bulling."
1278. Do you think one rule should be made for both surface and underground, or do you suggest a different period for short holes underground from that for long holes above ground? There is not much "bulling" done underground unless for big holes, and I do not think there should be any difference. The same danger attends both. "Bulling" is only done underground when it is necessary to shift big burdens. A man "bulls" a hole underground, which dislodges a portion of the burden, as on the surface; and his mates, as they take very little notice of a "bull," do not get away to a safe distance, and part of the burden comes down on them. I think the "bulling" of a hole should be looked after as much as when a hole is properly charged.
1279. You think, then, one and a half hours should be the fixed limit? Yes.
1280. In reference to that Board of Inquiry referred to by you, I am not quite clear as to the basis of election that you suggested. I understood you to say that the election on the popular basis would not be fair to the mines. I think you will admit that from your experience in past elections? After looking at the matter from an impartial standpoint, I came to the conclusion that it was only fair that the owners should have a representative on that Board.
1281. One to be elected on the popular basis, one to be elected by the mine managers, and one to be appointed by the Government? Yes.
1282. And the duties of that Board would be simply to inquire into causes of accidents and to report to the Minister of Mines? Yes.
1283. That would be the whole of that Board's function? Yes.
1284. In reference to requiring two engine-drivers in the engine-house when lowering and raising men;—do you think that is necessary? I do.

- J. Polkinghorne.
15 July, 1897.
1285. The engine-driver generally has a cleaner with him in the engine-house? It must be understood that a cleaner, in the strict sense of the word, would not be a man who would be efficient to carry out the work.
1286. But, by analogy, if you require two engine-drivers to lower six men at a time, would it not be as necessary to have two engine-drivers on a train;—there you have only one engine-driver and a stoker, and sometimes you have 1,000 people in a train? Before a stoker is put on to a railway engine he has to serve a certain time in cleaning, and a certain time in the railway-yard on shunting work; and he has a knowledge of what is required of an engine-driver. In every case, I think, you will find that the man on the engine with the driver is as competent as the driver himself.
1287. Your reason for saying that you require two engine-drivers at the mines is that, in case one should fall down in a fit, the other would be there to avoid an accident? Yes.
1288. There has been no occurrence like that on the Barrier? I have not heard of one.
1289. That would be a very unlikely risk? It has occurred in parts of Australia.
1290. In the change of shift, men occupy from twenty minutes to half an hour—three times in twenty-four hours? Yes.
1291. And during the whole of the time the mine is working the men are going up and down? But at change of shift is the time when the driver has the two cages loaded with men under his charge.
1292. But during the whole of the day he is lowering someone or other down? Yes.
1293. And do not you think their lives are worth considering? Yes; but I say we should have two drivers at change of shift. If thought necessary, the owners could keep the two men on. At the change of shift, in the space of twenty minutes, often more than 200 men pass up and down. Perhaps through the day the same man might pass up and down twenty times; and sometimes the manager and sometimes a shareholder might go down. I take it that, if anything like I have stated happened when a shareholder was on board, it would be conducive to two men being put on. We, however, want to prevent anything of that sort happening, and would like to see an extra driver in every case put on at once.
1294. But do not you think, as all cages have to be supplied with safety appliances, that would be sufficient? If the chairs were in position, and the cage were to get away from the engine-driver, and run to the 300-foot level, it would cut through them and go to the bottom.
1295. I think you know that in the case of Bowden's, when the cage ran away with six men, it struck on the chairs at the 300-foot level;—the grip was then caught, and the cage was stopped within 3 or 5 inches? I was not on the Barrier at the time that accident occurred.
1296. You think, notwithstanding the cages being fitted with safety appliances, that two engine-drivers should be on duty at change of shift? Yes.
1297. Notwithstanding that the trains run throughout the world with only one driver;—you admit that it would be hard on small mines? Yes; it would be, to a certain extent.
1298. Do not you think that too many of these conditions would have the effect of checking mining operations, and therefore employment to a great extent;—I suppose you want to avoid that as much as possible? I want to see mining fostered as much as possible, and not too many hindrances placed upon it. I have seen my suggestion carried out on small mines. They had a blacksmith, and he was competent to take hold of the engine.
1299. But you said just now that no person should have charge of an engine unless he were a certificated engineer? There are scores of mine managers and scores of blacksmiths that hold engineers' certificates. Unless a man had a certificate—the engine-driver could refuse to allow him to put his hand on the engine. In Victoria, in many cases on the small mines, the manager himself is the engine-driver.
1300. But if you employed a blacksmith with an engineer's certificate he would necessarily expect to be looked upon as an engineer, and not as a blacksmith? Not necessarily.
1301. But then you could only employ a blacksmith who held an engineer's certificate? Only in the smaller places; and a blacksmith would have to be employed there.
1302. In reference to the dangerous places in the mines, I think you will agree with me that it is the duty of the workmen to report at once to the shift-bosses any dangerous places they might see? Yes.
1303. If they see any portion of the mine in a dangerous condition, it is their duty to report it? Yes.
1304. You heard the evidence of Mr. Bourne the other day;—that he noticed dangerous places in Block 14, and that it was not his duty to report it, it not being in his portion of the mine? I think it is everyone's duty to point out dangerous places.
1305. And, if workmen refuse to do this, they contribute in a great measure to accidents? Yes.
1306. You think negligence is strongly to be condemned? I think so; if a man looks only after himself he is a very selfish individual.
1307. You said that where a movement took place, and the inspector was called in, the men should not be allowed to return to that part until the sanction of the inspector had been obtained;—do you not think it would be a difficult matter to ascertain what was a serious movement, and what was a slight movement? I have seen in Block 11, since I have been working there, two or three small movements, such as stopes settling, where it would have been useless to send for the inspector to know what should be done. The man in charge took the men from the dangerous portion and had things made secure. In those cases, the man in charge and the men are the best judges as to whether the place is safe. If, however, the man in charge and the men find it necessary to call in the inspector, then the inspector should say whether it is safe to return to work.
1308. You say that the men working in the face, if they are competent men, are the best judges as to whether the ground is safe? Yes; they should be the best judges.
1309. After them would come the ganger or shift-boss? Yes.
1310. And after the shift-boss would come the foreman? Yes.
1311. Then comes the underground manager? Yes.
1312. Then the general manager? Yes.
1313. The men who are the best judges are the men who are actually engaged in mining operations in the face? Yes.
1314. *His Honor.*] But would not those men run very often a greater risk than a man who had no interest in the working of the mine one way or the other would think anybody ought to run? I think it should be to every man's interest to secure the welfare of the mine. I should be as much interested in the welfare of the mine I am working in as any shift-boss.
1315. It is the interest of everyone to keep the mine at work? Yes.
- 1316.

1316. That is where the inspector comes in as a valuable authority, because he has no interest one way or the other; all his interest is to see that lives are not lost? Mining on the Hill is different from what it is anywhere else in Australia. Subsidence has taken place in different parts of the mine, and the stopes have in some cases begun to drop, and if we were to wait until the inspector came it would mean the stopping of the whole of the block in a very short time; whereas, by repairing the damage at once, the men would incur no great danger, and the shrinkage would be stopped. I do not think the inspector should be discarded; but I say that in many cases along this line there are movements taking place which necessitate men being put on at once in order to save not only that portion, but other portions of the mine. I do not wish to take anything away from the inspector. He should have a free hand to go and inspect and condemn anything that he thinks is of a dangerous nature. The mines are being worked under a system which I do not think we could improve upon. The lode is so very large, and the inspector might go through this morning and pronounce everything secure, and, before he had gone four hours, a shrinkage might take place. It would be impossible for him or anyone else to know better than those working there how it had taken place. In those small cases it would be far better to have the work carried out at once by the man in charge. Not long ago, in Block 11, the underground manager was for sixteen hours supervising operations in connection with a small shrinkage. If, in that case, he had waited for the inspector, the shrinkage would have spread to a large extent. I do not think the inspector should be called upon at all hours to look after these small matters.

J.
Polkinghorne.
15 July, 1897.

1317. *Mr. Edwards.*] Then a great deal must be left to the discretion of the underground foreman? I would like it to be understood that I would not leave too much altogether in the hands of the foreman. I say that the men should not be asked to go into a place until they pronounced it was not necessary for an inspector to be called in. That protects the foreman; protects the men, and it puts the onus of whether it is safe for them to approach it on the inspector.

1318. *His Honor.*] Would you leave it this way: That if a certain number demanded that the inspector should pass the ground before they were allowed to return, then it should be necessary for him to do so? I would like the responsibility taken off the foreman. I would like to see a fair proportion of the men asked to give their opinion as to whether it was safe or not.

1319. Would you say a certain fixed number, as a proportion would be rather difficult to arrive at? There may be a shrinkage in a stope, and perhaps not more than six men in that stope. There would be in that case, taking the three shifts, eighteen altogether employed in that stope, but only six men on the one shift. It would, therefore, be difficult to fix a number. If you say four out of six, that would be a small number. But I think if it were left to the man in charge and the men employed in that portion, that would be all that was required.

1320. *Mr. Edwards.*] The only difficulty is, if the foreman said he thought it was safe, and five of the men agreed with him and one did not; if, then, an accident occurred, the foreman would be responsible? If one man said it was unsafe I do not think the foreman should compel him to go back. It would then be better to call in the inspector.

1321. Unless the men were unanimous, he would have to call in the inspector, no matter how small the creep might be? For his own protection he would do that. Looking at it from a practical point of view, that would be the safest thing for him to do.

1322. That would result, then, in the inspector's being sent for in every case where the men were not unanimous? Yes.

1323. Would not that hamper operations considerably, both to the detriment of the men and of the owners? I take it that the mine authorities do not want their men to rush into any unnecessary risk. They do not want their foreman to put men in any risk. Consequently, I think the managers would say that that suggestion would be the best. Their foreman would then be exonerated from any blame.

1324. Now you are working on contract;—there are three parties in the contract; perhaps two are willing to go on working, and the third is not; you would then be thrown out of employment in your contract until the inspector came? If I held it was safe, and my mate did not, he has just as much right to his opinion as I have to mine. It would be very selfish on my part—because I said it was safe—to expect others to say the same.

1325. Then the only way out of the difficulty is this: That where a manager or foreman orders men out of unsafe ground, he cannot put them back until the inspector has passed it? Only in the event of all the men not agreeing. If the shift-boss called them out, his first duty is to inform the foreman, and his other duty would be to ask the men whether they considered it a small creep or a big movement.

1326. *His Honor.*] It comes to the same old thing;—will it be by majority, a certain percentage, or what? The only thing, then, is to go outside my suggestion on that matter, and make it compulsory wherever men are called out that the inspector shall be called in.

1327. *Mr. Edwards.*] Supposing the foreman considered, in his judgment, that the ground was safe, would you allow those who agreed with him to go to work, and those who did not to go up aloft, only temporarily—not to be discharged from their contract—until the ground was made absolutely safe? I would not like to impute any wrong motives to any foreman that I know of now; but the foremen of to-day will not always be our foremen.

1328. You think in some cases the foreman might take a greater risk than would be justified? Yes; and I know from my own knowledge that there are hundreds of men who do not know whether they are running a risk or not.

1329. Supposing you were putting in a set, and there was a piece of hanging ground which looked dangerous, you would then send for an inspector;—it is an element of danger, and, if it falls upon a man, it would kill him just as much as a big lot? You would not want an inspector for that. If I were working in a part of a stope, and any piece of ground were left unsafe, I should consider it a very easy matter to secure it.

1330. Would it not be safe to do this: To leave the matter in the hands of the foreman, making him responsible for anything that might take place? I mean in ordinary movements, not in large cases;—in one case you have great responsibility left upon the foreman; in the other you have to send for the inspector before you can put the men back? In all cases like that the power is in the hands of the foreman, even now; and I do not think it should be taken away from him. The foreman is the man in those cases, and you should not want the inspector at all. My version is, that whenever it is required to call in the inspector—that is, when he has been called in by the men's orders—he should be the man to say when to go back.

1331.

J.
Polkinghorne.
15 July, 1897.

1331. Where the inspector prohibits men from going to work, they should not be allowed to return until he gives his consent? Yes. I take it this way: I am a worker, and, if I inform him that anything has taken place, it is his duty to proceed at once and inspect for himself; and, if he thinks my opinion correct, and that men should not work there until certain things are done, then he should say when the men are to go back.

1332. In other cases the matter might be left to the discretion of the foreman? Yes.

1333. In reference to men going off shift;—do you not think that it would lead to the greater safety of the men if, when going off shift, they pointed out to their mates anything that might be dangerous in the work? My experience has always taught me that the less smoke I eat the better. My plan has always been to leave blasting operations until about ten minutes before the time the men leave for the plat; and by so doing, do not inhale the smoke, and at the same time they can meet their mates at the plat; and in all cases where it has been advisable for them to see their mates, they do so. Whether they are competent or not, they take the cue from the older hands, and, as a rule, meet their mates and inform them what has been done. If there is any danger in the stope whatever, I do not think there is any man who would ascend the shaft unless he knew he could meet his mates and inform them of it. My general plan is to leave blasting until the last; so that during the time between my going off and my mates coming on there is a chance of the smoke's clearing away.

1334. You say, as a rule, men meet their mates; but exceptions happen, and it is on these exceptions that accidents happen;—you heard Mr. Bourne say that men leave the face in a wild condition, and that all men should remain in the face, and point out to their mates any dangers;—do you think that that is advisable;—you have heard him say that men, when they meet in the plat, are willing to talk about anything else except their work? That is not my experience.

1335. But that is the experience of other miners;—do you not think a rule should be passed compelling the men coming off to point out to their mates going on the condition of the face? It is not in my opinion advisable that the change should take place in the face. If that were brought about, there would be more slovenly work than now.

1336. Would it entail a greater expenditure of time than ten minutes, on an average, to point out anything dangerous in the face? If that were brought about, that men should change in the face, as soon as ever the shift going off knew that their mates were coming, instead of explaining to them as they would if they met them near the shaft, they would run off to catch the cage, and just call out, "You will find things all right."

1337. Supposing a regulation were framed with that object, and a penalty imposed for breach of it? But who shall know that a breach has taken place?

1338. The management say they will do everything in their power to prevent accidents; but they must have the co-operation of the men, and if they do not get that, it will be impossible to prevent these accidents? It is not at change of shift that accidents occur. They more often take place just about knock-off of shift.

1339. Is not that showing anxiety of men to get away from their work—scamping their work at the last moment? No; it is in the endeavour to get a set of timber in within the time.

1340. That is what I mean—hurrying through their work? But then you have to take this into consideration. That certain prices are given, and a certain amount of work must be got through in a certain time to earn a certain amount of money.

1341. But if I scamped work, and did it in a hurry, I would have to take the responsibility? Yes; if a man meets with an accident through his own carelessness, he alone should be to blame. I met with an accident myself. I do not say that it was exactly through carelessness. The price happened to be tight; and we had a chance to get away some dirt. I did this hurriedly, as I wanted to get away; and in doing so a lump came on to my foot. Of course, in that case no blame was attachable to anyone but myself. Do you think I would, in a case of that nature, turn round and say it was the fault of the company?

1342. You would not; but I have no hesitation in saying others would? If I saw an accident take place owing to a man's own neglect, and he blamed someone else, I would certainly stand up and say what I thought about it.

1343. To get back to the question;—on an average, could not all of this take place within ten minutes? No; in Block 11, where I have been employed, it will take more than ten minutes to come from some of the workings to where they have got to catch the cage.

1344. But, in other places, men are working handy to the plat; and it would not take them more than two or three minutes to get there? I do not know any portion of the mine where it would only take two or three minutes.

1345. Say, some took fifteen minutes, and others took five? It would take a quarter of an hour to get there, and a quarter of an hour to get back. I am now referring to Block 11. The men coming on would take the cage at the surface, and they would get out at the 400-foot level. They would then go on to McBride's shaft, get in there, and ride to the 500 or 600-foot level—whichever one they worked in. They would then have to go to where their mates were, and talk over things; and by the time the men they relieved had reached the surface, a half-hour would have elapsed.

1346. That would be an extreme case, and I admit that there would be a certain loss of time involved to the men; but do you not think the sacrifice of a little time should not weigh where the lives of men are concerned;—mind you, it would be a loss of time entailed on the part of the mine as well, and loss of time to them is money? If I am on a contract, and through some regulations I have to throw away during the twenty-four hours about two hours' work, that means a considerable loss; and, if the company is prepared to meet that, it would be all right; but so long as the rule stands that eight hours constitute a day's work, I do not think any regulation, no matter how binding you make it, will have any effect if it compels men to stay on beyond that time.

1347. No regulation will? I mean as regards the change of shifts.

1348. Do you not think it would tend to? No.

1349. In the face of Bourne's evidence that men go off and leave the face in a state of wild confusion, and will talk to their mates about anything except the condition of their face? I do not think that that man spoke the truth.

1350. Do you know that during the last couple of years there have been no less than eight cases where men have gone off shift and left unexploded holes without informing their mates—holes that have never had

had a match put to them? I do not know that that is a fact. If Mr. Horwood says so, of course I am prepared to accept it. I have never heard of it.

1351. In reference to the jurors on coroners' inquests, I think you know that the juries—at any rate, for some months past—are composed half of miners? It is not a fact.

1352. The police have instructions to that effect? I know it has not been so in all cases during the last six months. I do not think it is six months since Williamson was killed; and I am prepared to say that half of them in that case were not miners, and did not represent themselves as miners. I understand there is an instruction to that effect given to the police.

1353. *His Honor.*] I suppose there are men who get on a jury for the sake of being jurors, and misrepresent their qualifications? Yes; for the sake of the 5s.

1354. *Mr. Edwards.*] In reference to additional inspectors, I understand you to say that the very best men should be appointed as inspectors? Yes.

1355. You do not think that any Parliamentary experience would qualify a man as an inspector? No.

1356. Do you know that it is an open secret that one of the Members for this District has been trying to move Heaven and earth to be appointed to the Barrier? I do not know anything about it. I saw one time something in the *Barrier Miner* about (I think it was) Josiah Thomas being appointed; but I thought so little about it that I never took any notice of it. Because a Member of Parliament represents a mining district, it does not follow that he would make a competent inspector.

1357. It is an open secret that Mr. Thomas has, for months past, been trying to get appointed to this district? I have only seen that in the paper.

1358. And it is a funny thing that Mr. Thomas is prime mover in this inquiry;—as President of the A.M.A., did you ask for this Inquiry? No.

1359. Did the men? No; not through the Association. It was never asked for. You have asked me as President of the A.M.A. Although I am not President to-day, I have held that position for the last six months. I do not come here in the capacity of a plaintiff. I have come here to give evidence; and I am here to-day giving evidence on my own behalf.

1360. I understand thoroughly. You came here as an experienced miner to assist at the Inquiry. A short time ago, there was a searching inquiry made in Ballarat as to the effect of tamping, and not tamping, dynamite. It was shown that, in cases where dynamite or glycerine compounds were not tamped sufficiently to exclude the air, they gave forth gases highly injurious;—have you read that report? I do not think I have.

1361. Can you give any evidence on that matter as a practical miner? I think from my practical observation that if glycerine compounds are burned in any way they do throw forth gases which are highly injurious to health and to life. The instructions given by the manufacturers of these explosive compounds point out the great danger of putting the fuse into the cartridge. The cap should not be inserted more than two-thirds or three-quarters of the way, so that it would not allow the fire from the fuse to ignite the compound before it had time to explode. In my opinion, that is the cause of the burning in most cases; not that the air has not been kept away. There is a great difference of opinion as to whether 1 lb. of glycerine compound will do the same amount of work if not tamped as it would if tamped. My opinion is that the air should be kept from it in all cases if possible; and, by putting a certain amount of sand or water on the charge, you would obtain that result; and it would make the charge more solid.

1362. Have you ever compared the death-rate from accidents in the mines here with the death-rate from accidents in other mining centres? I have looked at it from my own point of view; and I have said many a time that, when we take all things into consideration, the fatal accident list here is not very much greater than that in other mining districts.

1363. You have never made a comparison? I think there are some places that will come up to the average of Broken Hill.

1364. Ballarat or Bendigo, for instance? I see in to-day's *Barrier Miner* that there were five fatal accidents at Ballarat during the past year to members of the local A.M.A., which has a membership of 1,650.

1365. Have you any idea as to the rate per thousand here during the past eight years;—do you keep any record in your Association? I have never heard of any record being kept by the Association.

1366. You have no idea of the rate per thousand of fatal accidents? The death-rate per thousand here would be, I think, just about the same as that at Ballarat. That is, taking the A.M.A. list.

1367. You worked at Bendigo? Yes; for several months.

1368. There they have most stringent regulations? Yes; in most cases.

1369. And an ample system of inspection? The inspection was just the same as we get here. Whether an alteration has taken place since I was there I do not know. It is over twelve years since I was at Bendigo.

1370. I suppose the miners there got all the inspection they thought necessary? Whether they got all they thought necessary, I am not prepared to say.

1371. *His Honor.*] Have you any idea how many miners were working on the whole field of Bendigo then? The rough estimate was between 8,000 and 9,000; that is, in the whole district.

1372. Do you know how many inspectors there were for that district? One, I think, at that time. There is another thing I would like to suggest that was in the regulations in Victoria when I was there eleven years ago. When men are riding on buckets, appliances should be used for their safety. Over in Victoria, a rope is brought into use, by which it is impossible for a man to fall out of a bucket. This was found necessary owing to two or three men having fallen from the bucket when ascending the shaft. The adoption of this rope would entail very little cost. Should even giddiness overtake a man, and he loses his senses, he would still be quite safe, as the rope, which is fastened under his arms, would keep him in position. I have, myself, experienced the value of this rope. It leaves your arms free. There was also another contrivance in use in Victoria when I was there. They had discarded the use of all common hooks, and the tumbler-hook was brought into use very extensively, which hook, I believe, is being used very extensively here. They ultimately, however, adopted a shackle-hook. This hook provides a very easy mode for changing the rope from one bucket to another. It is a very safe mode, in my opinion, and I would like to see it adopted where the rope has to be changed. It is one of the safest couplings that can be used over men's heads.

1373. That was not provided by the regulations, but used by the mine managers? I do not think it was embodied in the regulations.

1374.

J.
Polkinghorne.
15 July, 1897.

- J. Polkinghorne.
15 July, 1897.
1374. *Mr. Edwards.*] They are always making improvements in these safety-hooks? I have seen several attempts to improve upon them.
1375. I think the tumbler-hook, or else some improved safety-hook, is used here? I have never done any sinking here, and I do not know what is generally used. It is only a suggestion on my part. In my opinion, a common hook should not be used.
1376. By a common hook, you mean an ordinary open hook? Yes.
1377. A common grip-hook is safe? Safe for most purposes; but I do not care what hook is used, even if a tumbler-hook, unless used with care, there is a great deal of danger in connection with it. It needs care to properly adjust it. In this hook I speak of, you have to put in a pin before the load will go away, and once this pin is put in it is impossible for it to come out.
1378. Could you produce a sketch? I will produce one to-morrow.
1379. *Mr. Williams.*] You referred to the character of the Proprietary ground. You said something about crab-holes;—do you consider that ground, particularly, more dangerous than in other localities where you have worked—say, in South Australia? In what direction do you wish me to say more dangerous?
1380. You spoke about crab-holes, which, you said, might render "bulling" more dangerous? I was speaking of the Proprietary simply because I have gained most of my experience there. Of course, in answering your question, it can be looked at in two or three different ways. I said that it might be the fire getting into crab-holes when "bulling" that caused an explosion when a hole was too quickly re-charged. Any further than that, I do not see that that sort of ground is any more dangerous than any other sort of ground.
1381. If there were not those crab-holes there would not be so much liability of holes exploding out of their place? Other than those holes, I cannot see that the ground is more dangerous than any other.
1382. Have you had any experience in "bulling" other than on the Proprietary Mine? No.
1383. In giving evidence, you are speaking of the Proprietary Mine? I have "bulled" holes at other places besides on the Barrier.
1384. You are speaking, then, from your experience of the possibility of such a danger accruing from the nature of the ground. Your experience has taught you to more particularly take notice here? Crab-holes did not originate on the Barrier. I have found them in other places. From my observations, crab-holes are a source of danger, which would not be present in more compact ground.
1385. Your previous experience leads you to the knowledge that in compact ground there is not the danger of those faults; and, therefore, the danger of premature explosion is greatly lessened thereby? Yes.
1386. You having worked in ground of that nature, and being accustomed to the mode and operation of "bulling," would not that make you more competent to observe ground here? Yes.
1387. Would not such technical experience acquired at other places lead you to be more correct in your observation here than an inexperienced man? If experience gained at other places is not of any benefit to a man he cannot be much good.
1388. Have you observed any crab-holes on the Proprietary? Underground we are constantly coming across what we term crab-holes.
1389. And you have "bulled" holes underground in the Proprietary Mine? Yes.
1390. You are acquainted with Rules 8 and 9 of the Surface Rules [*Exhibit B*]? Yes.
1391. Do you know whether the hours specified therein are observed? I have seen blasting operations carried on outside those hours.
1392. What time besides the hours specified have you seen blasting carried on? From 4:15 to 4:45 p.m.
1393. Then this rule (No. 8) has not been carried out in its integrity. It says that:—
Blasting on the surface and in the open-cuts (except "bulling" of holes) is only permitted between the following hours, viz., 2 a.m. to 2:30 a.m.; 6:45 a.m. to 7:15 a.m.; 12 noon to 12:30 p.m.; 5 p.m. to 5:30 p.m.; and 9 p.m. to 9:30 p.m.
- You say you have seen blasting going on before 5 p.m.? I have seen blasting being carried on before 4:30 p.m.; I might say from 4:15 to 4:45 p.m. I do not say that I have seen it on a great many occasions at this time.
1394. Would those occasions be the exception or the general rule? They are more the exception than the general rule.
1395. The next sentence of that rule says:—
Should blasting be considered necessary in any exceptional case at times other than above, it may be done only with the permission of the company's surface foreman.
- I suppose you would not know much about that? No.
1396. It then goes on to say:—
When shots are about to be fired, contractors, or those in charge of blasting operations, must station men with red flags at all approaches to the work to warn off all persons by calling out, and repeating in a loud voice, the word "Fire!" and at the same time displaying the red flags, and notice must be specially given to all persons inside of buildings within a dangerous distance of where the blasting is going on.
- Could you say from your experience whether that has been carried out in its entirety? I could not say. I have seen them standing around with flags in different places. I have been told that firing was going on while I have been in the changing-room. I am not in a position to say whether that rule is carried out in its entirety.
1397. As a matter of fact, you have notice given to you in the changing-room that firing is going on? In some cases. There might, in some cases, be notice given to the changing-house, and I not being there at the particular time would not hear it.
1398. You have been in the changing-room and heard notice given? Yes.
1399. What time would that be? At the change of day shift.
1400. At what time would you be in the changing-room? The last cage is not later than 20 minutes to 5.
1401. What shaft do you come up generally? Weatherley's.
1402. How long does it take you to get from the top of the shaft to the changing-house? I have never timed myself, but I suppose you could do it in two or three minutes.
1403. Have you any idea what the distance is? About 10 chains.
1404. You think a man could get to the changing-house within five minutes? Yes.
1405. And the latest time the last cage arrives is about 20 minutes to 5? It would be an exception for the cage to be so late as that, 1406.

J.
Polkinghorne.
15 July, 1897.

1406. Which do you generally come up by? The first I can get. It depends upon what level you are working in.
1407. What level are you working in? The middle one.
1408. And you generally come up from there? Yes.
1409. What is about the time the first of the miners arrive at the surface? Some of them get there about 3 minutes past 4 o'clock—that is, those who catch the first cage.
1410. From 5 minutes past 4 to 20 minutes to 5, the whole of the men would be up? Yes.
1411. And you have received notice that firing was being carried on while you were changing? Yes.
1412. Have you seen any flags exhibited? Yes.
1413. The regulation that I have referred to further says that all persons so warned must retire to places of safety;—do you consider the changing-house a place of safety? No.
1414. Did you retire to places of safety? No.
1415. That regulation further says that no charge shall be fired until five minutes shall have elapsed after the giving of the first warning;—is it your experience that the men in the changing-room receive warning that they must retire to a safe distance? I do not think so.
1416. Have they been called upon to do so? I take it that no blasting shall, according to the regulation, be carried on within a certain time, unless special permission is obtained from the surface foreman; therefore, the surface foreman should, I think, satisfy himself that no one was in immediate danger.
1417. You think he should exercise his discretion? I would rather see him not have the discretion to allow firing to be carried on within the time fixed in the regulation for blasting not to be carried on. To fire within those hours on Block 11 is dangerous.
1418. The regulation says that notice must be specially given to all persons inside of buildings within a dangerous distance of where the blasting is going on;—what distance on Block 11 would the blasting be from the changing-house? I have seen where holes have been fired within 300 feet.
1419. Would you consider that a dangerous distance? Yes; the rocks come through the roof at that distance.
1420. You say rocks come through the roof;—do you mean the roof of the changing-house? Yes.
1421. And has this occurred while the men were changing? Yes.
1422. While the men are in that changing-house, is there any official present? There is generally a watchman there at change of shift.
1423. Is he the person who gives the special notice when required? He is the one that generally sounds the note of warning inside. I have generally heard the warning sounded by the watchman.
1424. It is very essential that the watchman should look after the men's interests? We do not want watchmen—we want a hard-and-fast rule that no blasting shall take place within a certain time.
1425. Who is the surface foreman? Mr. Hanson, I suppose.
1426. Have you seen Mr. Hanson about when these blasting operations have been going on? I could not say that I have specially noticed him about at those particular times.
1427. Do you think this watchman was doing his duty unless he saw you go to a safe distance, and that within the time provided, viz., five minutes? I do not think so.
1428. Can you say that that five-minutes' interval has always been given? I do not know; I always try to get away as soon as possible.
1429. You think that this watchman has not carried out the regulation drawn carefully up by the management for your safety; and you think that any man who stands there, and does not see you retire to a place of safety, is not carrying out the wish or intention of the manager? I cannot say that such was the case. I want to see no exception made to carrying on blasting outside the hours fixed for it in the regulation.
1430. But that would be rather hard on the company? But exception to that should not be allowed at change of shift.
1431. You have just made a suggestion as to an improved hook for the purpose of saving life;—do you not think it would be just as incumbent upon you to suggest that such an exception as provided for in Regulation S should not be allowed to take place at change of shift? I have suggested that.
1432. You suggest that Rule S of the Proprietary Company shall include a provision that such an exceptional permission shall not be given at change of shift? I would like to point out that shooting and firing, no matter how much of it, would not interfere with them at Block 12. I think the Proprietary Company, from what they have now heard, will stop firing within dangerous hours at places like Block 11, where the changing-house is so close. As to Block 12, the cutting over there might start again. If it did, it would be a terrible blast that would interfere with the men in the changing-house of that block. The changing-room there is in such a position that blasting operations in the open-cut could not interfere with it.
1433. Would you couple with that recommendation something stating the distance;—one you consider to be within a dangerous proximity, and the other you consider is not? The question I am on, and the one I am trying to answer, is as to the time specified in that regulation. What should be provided is that no exceptional permission be given at change of shift when the changing-room, with perhaps its 100 men inside, is within dangerous proximity to the firing.
1434. With regard to Rule No. 9 [*vide Surface Rules, Exhibit B*], have you ever observed men in the open-cuts while blasting or "bulling" operations were going on? Yes.
1435. How many would there be at a time—fifty or sixty or half a dozen? I do not know whether fifty or sixty. I have seen men at the bottom of the cut when charging operations have been going on on some of the ledges.
1436. As a matter of fact, there would be men engaged in operations as quarrymen, and the "powder-monkey" at the same time going on with the charging? Yes.
1437. Rule 9 says:—

No holes are to be charged (unless for "bulling" purposes) with any kind of explosive whatsoever, whilst workmen, other than those actually engaged in charging, are in the quarries or cuts; and, before placing the charge in any hole for the purpose of "bulling" it, the powder-man (know as the "powder-monkey") shall give due warning of his intention to charge same, when all workers are required to leave the part of the face or work which will be affected by the explosion (whether prematurely or otherwise) of the "bulling" charge.

Would it surprise you if anyone came here and gave evidence that they had been struck with anything coming from a "bull"? It would not surprise me. I cannot say that I have ever seen many men under
when

J. Polkinghorne.
5 July, 1897.

when "bulls" have been fired. I have, however, seen men in places that I would not stop in. Some clear out of the cut altogether; others get so used to it that they will not bother getting away. I do not know how these men have got in the positions I have seen them in.

1438. They have been in a position you would not care to be in yourself? Yes.

1439. You would expect the man in charge to ask them to retire to a place of safety? Yes.

1440. You would expect the shift-boss to be human as well as any other man? Yes.

1441. You said just now that you thought an hour and a half should elapse after "bulling"? Yes.

1442. And, in reply to a question put by Mr. Edwards as to the difference in the nature of the ground, you thought that both long and short holes should have the one fixed time limit? Yes.

1443. The Proprietary rules also say that:—

Before charging a "bulled" hole sufficient time shall be allowed to elapse for the hole to cool off, varying according to the nature of the material and the weight of the charge; and every care is to be taken to ascertain that the hole is cool before beginning to charge for the blast.

Is it not your idea that that clause is the outcome of practical experience in such work on the part of the framers? What I say is, that the whole set of regulations, both for underground and for surface, are only such regulations as every common-sense man should take as a standard to work upon. They are only common-sense rules—only rules that every miner should know.

1444. You take it that those rules are the outcome of common-sense, experience, and judgment on the part of those who drew them up? Yes; but I take exception to one or two clauses in them.

1445. You think there is a possibility of amending them in one or two instances? The time for firing, in my opinion, is the best; but there should be no exception allowed.

1446. With regard to this varying nature of the ground, they have given us what they consider to be the outcome of their experience when they say, "varying according to the nature of the material and the weight of the charge"? Yes.

1447. You think these rules are nothing but what every man who has common-sense to exercise would follow out for himself? Yes.

1448. "Before charging a 'bulled' hole, sufficient time shall be allowed to elapse for the hole to cool off," &c.; do you not think they should fix a certain time;—would you recommend that an hour and a half be inserted in that rule? Certainly.

1449. You would suggest that the company's rules be amended accordingly, and that in case of these rules being copied and brought under a new Mining Act such a time limit should be adopted? I think the general rules for the working of a mine should not be incorporated in a Mining Act. There is not another district in Australia that would require the same rules as the Barrier.

1450. Rule 12 says:—

A safe exit from open-cuts or quarries for the use of all men employed therein shall be made and maintained in good order by the contractors.

You would strongly favour such a rule as that? Yes; I certainly think that should be provided. I would like to say that I think every mining company should have a code of their own rules for the guidance of their workmen, and I think that, while we have inspectors of the highest ability, they should be able to say whether the regulations drawn up by any particular company are sufficient.

1451. *His Honor.*] You would like to see the rules of the different mining companies passed by some authority, say, the Minister for Mines, on the report of the local inspector, before they became operative? Yes; I would not like to see one hard-and-fast set of rules to apply everywhere.

1452. What you would prefer to see would be an authority controlling the rules which should be made operative for any particular mine? Yes; that would allow more elasticity.

Inspector Hebbard: Sub-section (ii) of clause 3 of the Government regulations says that an inspector shall have power to inquire respecting the sufficiency of the special rules (if any) for the time being in force in any mine.

1453. *Mr. Williams.*] Rule 18 reads:—

Where cranes or other overhead appliances are used, workmen shall not stand under the skip or load, or within reach of such overhead appliances.

You would strongly recommend that that be carried out above everything? Yes.

1454. It has been stated that the unexpected sometimes happens; therefore, to meet these unexpected, unforeseen, accidents, a certain amount of discretion should be allowed to those engaged in blasting operations? I do not believe in too much discretion being allowed anyone. It must be borne in mind that you could not get twenty men out of 100 that would adopt the same course in blasting, and I think there should be no discretion at all. It is no use saying that they have got to adopt a certain method. The word "discretion" is not the proper word to be used in this case. So long as the amount of explosive and the time limit were fixed, that is all we need regulate. Commonsense would do the rest.

1455. *His Honor.*] What I understand you to infer is that it is no use making laws which men may break if they like? I believe in making laws that it is possible for people to keep. Rather than make laws that people cannot keep, have no laws at all and depend upon commonsense.

1456. *Mr. Williams.*] As there is a great deal of danger attending blasting operations, the persons so engaged should have sufficient knowledge to know how to handle explosives safely? Certainly.

1457. Would you allow blasting operations to be carried on by men who have not sufficient knowledge to take care of their own lives, let alone others? No.

1458. How would you stop them? Not by Act of Parliament. If they are known to be not trustworthy, then the best thing is to have them dismissed.

1459. What method or system would you advocate for the shift-bosses to adopt in order to arrive at the conclusion whether men were capable? I think the majority of the shift-bosses that I have come across on the Barrier, with one or two exceptions, do not want to see a man lift a hammer or pick very long before arriving at his value.

1460. But a man may not be a good hammerman, and be a skilled man for all that; he may not be a flash hammerman, but yet be as effective in his way? I do not think the practical shift-boss really uses that as a test, but merely as an excuse to tell them to go. The majority of the shift-bosses are good practical men, so far as the Proprietary is concerned. They can tell, as a rule, when a man takes his candles at the candle-house, whether he is a miner.

1461. You admit that it is quite possible a man may not be a good hammerman and yet be a good man for timbering? He might be a good timberman and have no idea how to make room for the timber.

1462. Can you tell us any other method for gauging a man's competency besides using commonsense in asking a question or two, or handling candles;—would you make any suggestion to be adopted in this respect? I would leave it to the shift-bosses.

1463. And you say the shift-bosses are competent? Yes; they can go into the face and do a day's work.

1464. From your experience of the Miners' Association, you think they are always desirous of promoting that end, that competent men should occupy that position? Not only the Miners' Association, but every other organisation that is organised for the welfare of the community, has that end in view—the appointment of the best men where life and limb are brought under their charge.

1465. You have been President of the Miners' Association for the last six months? Yes.

1466. And from your intimate acquaintance with those things, cannot you say that the A.M.A. would be glad to see the company served by the best men they can get? The A.M.A.'s wish is that the very best men shall occupy those positions.

1467. And you would repudiate with scorn any opinion to the contrary as coming from the A.M.A.? Yes.

1468. What would be your idea as to the qualifications of the "powder-monkey";—would you suggest an examination of that man, or that he be selected from his previous knowledge in the mine—I am referring now to open-cuts? I believe in efficient men holding those positions. Before a man is placed in the position of "powder-monkey" he should be known as a most efficient man. He need not have received his training in the mine at which he is appointed; but it should be known that he is capable. In fact, all men should be certificated. As soon as they get to such a stage as to be considered competent, they should receive a certificate, which would be of use to them, and a guide to those employing them.

1469. You think "powder-monkeys" should be certificated men? Yes.

1470. How would you suggest they get their certificates? From a Board consisting of (say) the Government Inspector, a man nominated from the employers, and another from the employees? In some parts of the Colonies there are managers who do not know whether a man is a miner or not. They have been simply pitchforked into their positions. I would not like to see a man of that class on a Board. I have seen men come here from other places with certificates who have known nothing about mining whatever. I know of one case where a man had been minding sheep for fifty years, and then spent three months in digging a hole for a manager, and for that managed to get a certificate as a miner.

1471. *His Honor.*] I think you suggested that the managers should themselves be certificated, as they are in coal-mines? Yes.

1472. You think that whatever the authority is that is appointed to give the managers their certificates will be the proper authority to give all other certificates? Yes; but I am looking at it further away than that. A man goes, say, to West Australia; he gets a testimonial in the manner I have just stated; he comes to Broken Hill, and he is employed on it.

1473. But he has not a certificate at all;—a Government certificate would be a certificate under an authority of some kind? If a manager were a certificated man, he would be sufficient authority. I do not think there is a manager who would refuse a testimonial where one was deserved.

1474. But you would not rely upon them as real certificates of competency where you thought a certificate of competency was necessary? I think a certificated manager would be sufficient authority to give a certificate to a man. He would have to take care of his reputation, and would give certificates to none other but deserving parties.

His Honor: But you know how difficult it is for a manager to refuse a certificate at times. A man may have been working for a manager for years, and all the time the manager may be aware that he is almost a born fool, and yet not like to refuse him a certificate when he leaves. He would not, however, do it if he were in the position of a Board with a duty cast upon him of giving or refusing a certificate.

Mr. Edwards: The worst of it is that, if we have too many certificated men, the certificates would probably be passed from one to the other.

Mr. Williams: You consider the suggestion by *His Honor* the best: that men shall be examined for their certificates by men constituting a Board, and who are themselves certificated men?

His Honor: My idea is that, if it is essential that men should be certificated, either as "powder-monkeys," engine-drivers, or anything else, the Board appointed to grant these certificates should also be the authority to pass managers, under-managers, and so on.

Mr. Williams: Yes; that would maintain uniformity of competency, and would be a sufficiently conclusive authority.

1475. *Mr. Williams.*] You would have no objection, Mr. Polkinghorne, to a Board of that kind? No; I was going on easier lines in suggesting that a certificated manager be allowed to grant a certificate. I do not think abuse would follow if my suggestion were carried out, because no manager would endanger his reputation.

1476. Do you think a "powder-monkey" should be certificated? If that man has got his place through a certificate as a practical miner, I do not think it is necessary that he should be called upon for further qualifications to act as a "powder-monkey."

1477. Do you think, then, that a "powder-monkey" should have a certificate? I say they should all be certificated men. Under the existing circumstances, the manager or under-manager, or whoever has got to do with the employment of the "powder-monkey," should be held responsible for his efficiency.

1478. While no certificates are in force, an examination by the manager or under-manager should be sufficient;—you have expressed an opinion that every man should be certificated, and I will ask you now as to the constitution of the Board that will grant the certificates;—are you in favour of a Board being appointed, to consist of three members, in the way I have suggested? Do you mean that this Board is to examine on practical mining or on theory: it must be a practical examination, I take it. If so, and providing the mining inspector could always attend, the Board would not be a bad idea. It is my opinion that every man should have a certificate, and that, in order to get one, he must go through some examination.

1479. You think the constitution of such a Board would be a good idea? Yes.

1480. Would you not give the representative of the employees the right to challenge the qualification of
the

J.
Polkinghorne.
15 July, 1897.

J. Polkinghorne. the man representing the employers, and *vice versa*? No, I would not, seeing that the Board would be composed of one from each side, and the inspector would be of the highest standard we could possibly get, and would hold the balance of power.

15 July, 1897.

1481. You would recommend the appointment of such a Board as that? Yes.

1482. As to the change of shifts in the face, I would take it to be that the intention is rather to preserve lives than to cause men to work ten or fifteen minutes longer. Have you received the impression from the questions put to you by Mr. Edwards in seeking to elicit your opinion with regard to the change of shift in the face that it is to safeguard lives of miners rather than to make them work extra time? To be plain, I do not think that the safeguarding of the miners' lives is the only object in view in seeking to bring about the changing of shifts in the face.

1483. If the object in view be the safeguarding of lives, could you suggest the adoption of a report-book, in which any danger could be recorded, so that, if you missed your mates, the information would be in the book for their guidance? That would save changing in the face; and at the same time you would not be endangering your mates? When there is any danger to be reported to your mates there is no fear of your missing them. There are always two of you, and one can stop in the plat and the other get into the cage. That is the present mode, and I do not see how it could be improved upon.

1484. They do that? Yes.

1485. If they are doing that now, why alter a good thing;—you would be quite content for things to remain as they are in that respect? Yes.

1486. You think the pointing out of dangerous places in the face is provided for in every way by the miners? Yes.

1487. Is there any possibility of the shift-bosses being unacquainted with dangerous places in the face;—do you think that they, having the charge of the men's lives, should be acquainted in some way with all dangerous places? I am not a shift-boss, and am not likely to be. That is a question to be put to a shift-boss.

1488. Is there any method at present obtaining by which the shift-bosses get an acquaintance with dangerous places previous to their general inspection of the mine? Marks are put up showing dangerous places.

1489. As to the best authority to know whether ground is dangerous, you think the miner would be the one who would know best whether there was any danger in the ground where he was working? Yes; I think the men actually working in the ground know most about its dangers. Take, for instance, the underground manager. You could not expect him to know as well as the men actually employed there what was going on in a face. I do not want it to be taken from my answer that I infer that the shift-bosses are inferior to the men.

1490. You mean that the miner, on account of working there, would know more about the danger of that immediate vicinity than the shift-boss, who only periodically visits it;—the shift-boss would know less, generally speaking? Yes.

1491. Then, according to the law of comparison, the manager would have to rely upon subordinate officials; and, to a great extent, he would be benefited by the employment of competent miners? Certainly.

1492. As to withdrawing men from dangerous ground and reinstating them, you say that in the case of six men being ordered out, and after the danger has been attended to, one of them, not thinking it safe enough to return, he should not be forced to do so against his will; and you believe in providing him with a fair method for securing the safety of his own life? Yes.

1493. When the inspector calls men out, you think he is the proper person to send them back again? Yes.

1494. In cases where it is not thought necessary to call in the inspector, and the foreman calls them out, and five out of the six are in favour of going back, and one is not, how would you get over the difficulty, supposing the danger to be due to hanging ground? Looking at it from a practical point of view, I can only see one answer to your question. If a man thinks his life is in danger from such a cause, he need only stand out a few minutes, when the danger will be passed. Of course, in such a case as that, there would be no necessity to call in the foreman.

1495. But where it is considered necessary to call the foreman in? Where it is seen necessary by the foreman or the man-in-charge to call in the services of the inspector, the onus should lie on the inspector to say when the men should be readmitted.

1496. But when the foreman calls the men out on his own responsibility, and, say, five are in favour of going back, and one not, how would you get over the difficulty? If five went back and an accident happened, the responsibility would rest entirely upon the foreman. The fact of one refusing to go in would show that there were still defects. If I were a foreman, I would, in a case like that, have the weight taken off my shoulder by calling in the inspector.

1497. You admit the possibility that, in such a case, the five men who consent to go back might be inexperienced, and the one man who refuses might be the only experienced man of the lot, and, therefore, see danger where the others would not? Yes.

1498. *His Honor.*] The question is this: Would you allow that one man the right to have the inspector called in before the others could go back, or would you allow him the right to be treated as committing no breach of the regulations if he insisted on staying out until the place was passed by the inspector;—would you allow him, in fact, to control the others, or only his own action? Each man should bear the burden of his own folly if anything happened. The foreman would be only one out of six. The responsibility should not be thrown upon his shoulder altogether if five said it was safe, providing of course that those five were competent miners; and I take it that a foreman would see that he did not have incompetent men under him.

1499. What should be the rule? It would be unwise, in my opinion, to make a regulation in respect to that. I certainly think that, if the men were satisfied that the inspector was not required at the time they were called out, and that if the foreman considered it was fit for them to go back, and the men considered so at the same time, the onus should be taken off the foreman. If one man stood out, he should have the untrammelled right to appeal to the inspector for an inspection of the place. At the same time, if any accident happened in the meantime, the sole responsibility should not rest upon the foreman, seeing that five of the men themselves considered the ground safe.

J.
Polkinghorne.
15 July, 1897.

1500. *Mr. Williams.*] As to the other man, if he is not satisfied—and the possibility is that he might be the most experienced man of the lot—you would recommend that he have the right to appeal to the inspector, or even to another official;—you would not compel that man to go in at the risk of his life when he did not think the ground safe? No person would compel me to go in.

1501. *His Honor.*] He should have a right to exercise his own judgment until the inspector was sent for and inspected the place? I do not mean that the one man who stood out should control the action of the five others.

1502. *Mr. Edwards.*] You mean that no man should be forced to undergo a risk that he would not undergo voluntarily? Yes.

1503. *Mr. Williams.*] Do you think the appointment of sub-inspectors by the companies on their own properties would be of any use in seeing that the regulations were carried out? I think that all the precaution that the companies can be reasonably asked to take is already provided by means of the shift-bosses, who are really sub-inspectors. I do not think any system of sub-inspection, further than what they already have, would be of any benefit.

1504. As to the men changing shift, and the on-coming men not being aware of anything that has occurred in the previous shift;—what time would the shift-bosses come up? There is supposed to be always one shift-boss underground in the Proprietary—during lunch-time and the changing of shifts; in fact, throughout the twenty-four hours.

1505. Was that your experience in the Central? I do not think so; but it is two years since I left there. In the Proprietary, a shift-boss is in the mine at the change of the different shifts, and one has to remain below during lunch-time. That has been so for the last three months.

1506. What mines have you worked in on the Barrier? The Proprietary and the Central, and at the Pinnacles.

1507. You know they have watchmen on the surface? Yes.

1508. You would not care to see that system extended underground;—you do not see the necessity for it? No.

1509. Is it your experience that noxious fumes arise from the explosion of dynamite and other explosives, and injure the health of the miners? Yes.

1510. If they were compelled to remain in the face, and to fire at the end of the shift, they would have to swallow a considerable amount of this gas? If it were compulsory to always relieve in the face and to examine it after blasting, in many instances that result would follow.

1511. Is it your opinion that more accidents occur at the finish of the shifts than at the beginning? I do not know whether we take more notice of an accident occurring at the finish of a shift, but it appears very plain to me that more accidents occur at that particular time.

1512. As far as you know, accidents have taken place more often from men blasting their own holes than from men coming in and firing other men's holes? From my experience, I know of no accident resulting from blasting.

1513. You have heard of the British accident? Yes.

1514. What order is there in firing in the stopes? It depends upon the requirements of the different faces. When a party require to fire, they give the necessary warning to the others around, and the firing is then carried out. Should, however, another charge near by be almost ready for firing, they will then perhaps wait, and both will fire off together. There is no fixed rule as to whether it shall be the bottom party or the top party who shall fire first. If such a rule were fixed, there might be no firing at all, because all through the shift the top party might not want to fire.

1515. As a rule, when firing, you go one way to give notice, and your mate another? Yes; if there is a party below us, we ask them to keep watch in their direction; and we then both ascend in different directions. If there is no party below, we go one each way.

1516. That is a strict rule in the Proprietary—that every man shall take every precaution he can to prevent men approaching when an explosion is about to take place? Yes.

1517. One goes up and the other down, providing there is no one near you? Yes.

1518. With regard to the tests recently carried out in Ballarat;—do you think it would be beneficial if the mining authorities circulated such information for the benefit of the miners? The best test regarding those noxious fumes is for a man to have a smell of them. Practical knowledge is far better than any theory. With a theoretical knowledge you run risks; but, if you have just one dose of the glycerine compound, you will be very careful that you do not get the second. But a man should not be employed in connection with those things unless he knows how to handle them. Unfortunately, many have to handle them who are totally ignorant of the probable results. There are times when this burning of an explosive takes place, and you cannot get away from it. I have seen such a case in Block 11. Another party were firing—the case I speak of happened only two months ago—and we got in what we thought to be a safe position. We were five floors above; and there was no chance of the blast throwing any of its burden to us. We could just see the corner of the hole through the floor; and, instead of exploding, the charge burned, throwing a glare throughout that part of the mine, and spreading about gases which made it impossible to get near that particular part for hours afterwards. In order to get away, we had to pass through the thick of it.

1519. *His Honor.*] The compound, instead of exploding, merely burned itself away? We heard no report, but a hissing noise; and all at once the whole stope was lit up as if by limelight. We hurried out of the stope, as we did not know what would take place next. After five minutes, the light disappeared; but the gases thrown out by it were very evident. The gases went both up and down. These gases will go against the strongest draughts—they are very heavy.

1520. Did you find out how the tamping had been put in? The only explanation the men gave was that it was in broken ground; and, presumably, some of the fire ran from the fuse into a crack where some of the gelatine had got, and ignited it before the explosion could take place.

1521. *Mr. Williams.*] What is the general practice in setting fire to fuses underground? There is no general practice. Some cut open the fuse and insert a piece of gelatine in it, which, when lighted by a candle, burns until it reaches the powder. Others, again, use wax matches. The safest plan is to split the fuse, and to give yourself sufficient length to admit of your getting away after you see it spit. When a fuse is ignited, there is no question then as to whether it has taken, and, when you see it spit, you know it is ignited.

1522. What is the average pace at which a fuse burns? For the average fuse it would exceed thirty seconds to the foot.

Inspector Hubbard: About 18 inches to the minute is the average.

1523.

J. Polkinghorne. 1523. *His Honor.*] That being so, where you are lighting three or four holes, and you want to get them all properly under weigh before you leave, what you want would be some means of lighting the fuse—of getting it to spit certainly and quickly;—what do you think is the best way to get a fuse to spit quickly and certainly? There is no better way than by preparing the fuse so that when you touch it with the candle it will spit. You split it until you come on to the powder. Others will not do that. They say the safest way is to put in a piece of gelatine. But there is a chance of the piece of gelatine being knocked out by a falling piece of gravel.

1524. When you put the gelatine in, what do you do? You light the gelatine, and it burns, but it might take some time before it touches the powder. The gelatine is sure to light the powder; the only thing is that it might be knocked out before it lights the powder, as (say) when coming away from the holes—clambering away from them—you might knock something on to the fuse which would shake the gelatine off. In the other way, when you touch the powder with your light, it is a certainty that the fuse has taken.

1525. Do you think there should be any rule; or should it be left to the men's discretion how they should fire? I think that is a matter that might be left to the men. I do not believe in having a regulation framed which would probably be broken every day. Without doubt, if a regulation were made to that effect, it would be broken every day. The method set out in the rule might not be that believed in by some men; and they would not adhere to it.

1526. I suppose if a deep hole and a shallow hole were to be fired at the same time, no man in his senses would attempt to light the shallow one first? I should not think so.

1527. Although that does appear to have been done in one case recently where two men lost their lives? It came out in evidence that that did happen. If he did do it, I do not think he was a fit and proper person to be in charge of the work. I do not know whether the truth came out in that case.

1528. Would you look upon him as a lunatic? Yes.

1529. *Mr. Williams.*] You do not think that that man would have been able to obtain a certificate from a qualified Board? No.

1530. *His Honor.*] Underground, a man charges and fires his own shot; on the surface, the "powder-monkey" does that? Yes, according to what I hear. I think if a man got his certificate from a Board of Examiners, consisting of a mine manager, the inspector of mines, and a miner, that would be quite sufficient, and it would be a safeguard against accidents being caused by incompetence. I do not think any of the parties on such a Board would consent to the granting of a certificate to a man who was not efficient.

1531. *Mr. Williams.*] Do you not think that there would be a likelihood of the companies themselves getting rid of a lot of risk if they saw that the men they employ were competent? According to what we have been told to-day, we have not sufficient competent miners in the place to meet requirements. If only competent miners were imported, it would be of great benefit both to the employees and the employers. If, however, no steps are taken in the other colonies to employ competent men only, the managers in the other colonies will always be ready to give their incompetent men a piece of paper as being competent, and palm them off on to their neighbours. So long as you have that, so long will you have incompetent men. If this system of granting certificates by means of a Board were adopted throughout the colonies, there would be no risk run by the employers; and, instead of having the refuse from other mining districts thrust upon him, he would know what men he was employing, and would only employ those he knew he could rely upon.

1532. With regard to the inspector's qualifications, you have been asked whether you are in favour of the inspector's possessing the highest qualifications;—do you think he should be a man whose moral character should be the highest, and whose practical knowledge of the work in which he is engaged should be thorough? Yes.

1533. Has it come upon you as a surprise—the statement that a Member of this district has been doing all in his power; in fact, has been moving Heaven and earth, to get this appointment? I was rather surprised to hear it.

His Honor: This is a matter that is outside the question.

Mr. Williams: Very well, your Honor, but I would just like, if you will permit me, to speak a little further on this matter, since it has been brought under the notice of the Commission.

1534. Independently of his position as a Member of Parliament, Mr. Polkinghorne, I would ask you as a practical man, supposing the choice lay between two such men as Mr. Josiah Thomas and the Manager of Block 10 for the position of an inspector of this district, which would you recommend on account of his practical knowledge? I do not know anything of Mr. Thomas. I have no personal knowledge of him, to say whether he is a skilful man or not. So, if the choice lay between the two, I should say Captain Warren, owing to the long experience he has had, and which I know he has had.

1535. And I should say so too;—but whether or no, Mr. Thomas is not the only man in this district capable of filling the position? I should judge that, no matter how good Mr. Thomas may be, out of the 6,000 along the line there ought to be one as good.

1536. You know Mr. J. G. Taylor? Yes.

1537. Are you aware that he was an applicant when the present inspector obtained his appointment? No.

1538. Mr. Hebbard knows him, and he knows also that in beating him he beat a good man. Just now you said that no certificates are held by miners in this district. That they should hold certificates, you would embody in the new regulations? I certainly think it would be a benefit; but I fail to see that you could make a regulation for the employment of men only who hold certificates.

1539. I am asking that question on the possibility of the recommendation from this Commission causing a new Act to be framed? I would not like to see a regulation framed that only those men holding certificates be employed as miners. It would bear very heavily on the mining companies; they would not be able to cope with it. Besides, there are a number of fairly good men who can go into different portions of a mine, and do as well as most men would do, and earn a fair living, and, if it had not been for the employment of these men, these places would not be worked. The companies cannot get the competent men in sufficient numbers. If legislation should take place, saying that the companies shall only employ men holding certificates, half of them would have to shut down.

1540. My suggestion goes as far as the "powder-monkey," shift-bosses, or anyone in charge. I do not go as far as the men. Then have you not made some suggestion as to training men;—would not that reduce

reduce the unemployed? There are a lot of men working on the surface that I would not mind taking into the face with me. There is a class of men on the Barrier to-day who are not working in the face as minors, but who could be taken into the face and made very useful in a very short time. I could pick them out from among the truckers and the unemployed. I know among the truckers many that are anxious to go into the face, and who would make very good men with a little coaching. The men who are anxious and willing to work, are the men who should be encouraged.

J.
Polkinghorne.
16 July, 1897.

1541. Has it ever occurred that practical men have asked to have such men with them? I do not know of any case.

1542. *Mr. Edwards.*] You said just now that the A.M.A. endeavoured to provide good men for the mines? I do not think I said that.

1543. Is it not a fact, that when the mines found themselves short of good miners, and tried to introduce them from Ballarat, every possible obstruction was put in their way? I do not think that any obstacle was placed in the road of procuring good men for the Barrier. The men first introduced from Ballarat and Bendigo were simply the riff-raff which the managers in those mining centres were glad to get rid off. Of course, some of them turned out to be very good men. The argument we used was that there were plenty of unemployed in the place, and it was no use bringing over a lot of incompetent men to swell the number still more. There has never been any opposition to the importation of good men. We well know by the first batch that came over that they were not men suitable for the place. As a citizen, I considered it my place to prevent the influx of a number of people who would be dependent upon charity in a very short time.

1544. Is it not a fact that when the companies tried to get skilled men from Ballarat and Bendigo every intimidation was put in their way? I do not think so. The first batch arrived for the Central. There were Ballarat and Bendigo men already at work here, and they knew some among the batch who were not competent. They were coming here for 50s. a week. You know that would be one of the first things the Association would do—prevent the cutting of wages. I was not an officer at that time in the Association; but I remember the occurrence. A large number of men went to the train and met these men, and the first thing they did was to see that they did not go to work for less than the current rate, viz., 9s. a day. Moral suasion only was used.

1545. Moral suasion, as you know it on the Barrier? I do not think there was anything other than moral suasion. There was no fighting.

1546. You do not deny that there was any intimidation? I deny that there was any intimidation as far as the A.M.A. was concerned. No objection was raised to the company's securing good, practical men.

1547. *Mr. Williams.*] With regard to the importation of these men;—was it stated by anyone that they did not know anything about pick and shovel work, and that they could not be utilised for anything? I heard one manager say that they could not do anything heavier than tailoring.

1548. Would you be surprised to learn that, of the first batch, some of them did not know how to handle the tools? No; because I know that myself.

1549. *His Honor.*] You were speaking about blasting in the face. Accidents are caused in some instances, I believe, by the displacement of what you may call the floor of the set;—do you think that one floor is sufficient to depend upon? I think every floor, no matter what height the stope, should be kept covered until the filling-in is done. In the Proprietary, if a man opens a floor and leaves it unguarded, he will very likely see the surface before the shift is up. Every floor is supposed to be covered; and no laths are allowed to be removed. This should apply to all mines. In firing, some of the laths might be displaced; and, owing to the dirt brought down, you would have no chance of being made aware of it if there was no covered floor underneath from which to make an examination. Every set should be kept covered.

1550. Should it be compulsory to keep every floor intact until the sets are filled? Yes; especially around the travelling road. Of course, a good deal of discretion could be used. The eastern part may be beat up six or eight sets, and the western part beat up not more than three or four sets. I do not mean to say that they shall not uncover those floors. Were they railed off and guarded, it would be sufficient. Where men are working overhead, the floors should in all cases be kept covered. The rule in the Proprietary is that should any man require to knock down a guard rail or open a floor, he must replace the timber as soon as possible. Rule 6 of the Underground Regulations meets this. [*Vide Exhibit A.*]

1551. You think there should be a universal rule making it necessary to cover all workings? Yes; I have heard of cases on the Barrier where there are as many as six floors open, and men are working on the seventh. If anything went wrong with their floor, and they fell through, there would be nothing underneath to save them. I have never heard of any such case on the Proprietary.

1552. *Mr. Edwards.*] Would not a hard-and-fast rule of that nature interfere with operations? I do not think so.

1553. *His Honor.*] The rule might have a limitation;—it might extend to one or two floors under the working party? That would be safe, so far as the Proprietary is concerned. Where this system of stoping is being carried on without filling in, it must be recognised by everyone that to leave five or six floors open is dangerous.

1554. I suppose that would be where the ground is very solid, and there is no sign of a creep. The managers, therefore, are pretty certain that although the ground be left unfilled, it will stand? I do not think that is the case. I believe, in most cases on the Barrier where stoping operations are being carried out, they are filling a little or a great deal, whether it be hard or soft ground. I believe every place should be filled as solidly as possible.

1555. It is the safest method to fill the stoping as quickly as possible with mullock? Yes.

1556. Is there anything more that you would like to tell us? There is another matter, which the secretary of the hospital has reminded me of. We think that each company should be compelled to provide an ambulance litter on the mine for use in case of accident, and that the Government should provide and maintain in this district, and in every other mining district, an ambulance waggon in which to convey injured persons to the hospital. Taking into consideration the money that has been taken by the Government from this place, I think the least they might do for us would be to provide the town with an ambulance waggon, so that the litters might be conveyed from the mines to the hospital without injury to the patients.

1557. There has been a good deal of delay in some cases, I believe? Yes; it has been reported freely that delay has taken place. The Proprietary have one or two very good ambulance litters; but I do not think the other mines provide them.

1558.

J.
Polkinghorne.
15 July, 1897.

1558. *Mr. Edwards.*] Do they not borrow them from the Proprietary? Sometimes they do. At other times I have seen men taken to the hospital on a rough ambulance stretcher.

1559. *His Honor.*] You would make it compulsory for every mine to provide one litter? Yes; they should all be compelled to provide one at the least. The waggon should be provided by the Government, and maintained by the Government, and should be stationed in a central position, and in communication with the telephone, so that it could be called for without any delay from any part of the line of lode. A man should be in readiness at all times to take it out. It would be too far out if kept at the hospital; it should be kept in a more central position. As the police are rung up whenever an accident occurs, it would be a very good plan to keep the waggon at the police station. Had there been proper ambulance accommodation, probably some of those men who have died from accidents would be alive to-day. It hurts me to see men dragged off to the hospital on a heavy jolting trolley that could carry 3 tons. I do not think the council could purchase a waggon, as they would not be empowered, under the Municipalities Act, to expend money in that way.

1560. *Mr. Williams.*] Do you know that the miners have been endeavouring to obtain a grant, the same as the miners in Newcastle, for ambulance requisites? I know the miners of the Barrier have appealed to the Government for the same concession as that which was granted to Newcastle. The extent of the concession I do not know. The Minister has replied that he will do the same for the Barrier as has been promised for Newcastle.

1561. *Inspector Hebbard.*] In reference to floors being uncovered in stopes;—does it not often occur that a stope is uncovered because of the men stripping laths from it rather than going to the plat for them? That is the case at times. But I believe, from what I have been told, that it is the rule in some of the places, and not the exception, to leave the stopes open for the purpose of saving money. Men have spoken to me about it, and I have told them that they should report the matter to the inspector.

1562. *His Honor.*] If the men were to do it, you would be quite willing to see them fined for it under regulation, even if they were members of the A.M.A.? Yes; because they not only endanger their own lives, but the lives of other men.

1563. Of your own knowledge, you cannot say it is a fact that the stopes have been left uncovered by way of economy? I have heard it; and I have every reason to believe it is a fact. Railing off in some cases would not be sufficient. You would then fall through just the same.

1564. *Inspector Hebbard.*] It is no good railing off while the stope is being continued in height? If there were no persons working overhead, then the railing would be sufficient. While a stope is being extended in height, the floors underneath should be kept covered.

1565. If the sets were jogging back, there would be no need for the floors? No.

1566. *Mr. Edwards.*] In any case, two or three floors under the working-floor would be sufficient? When a stope is actually in work, all the floors should be covered.

1567. Would not the inspector be competent to deal with this matter? Yes; the inspector, no doubt, should be allowed to use his discretion in this matter. Many vexatious little things are likely to occur with a set regulation.

1568. If you have a rule similar to the one in the present Government Regulations, that the inspector can step in at any time, and order coverings to be put in wherever he may think necessary? Yes. One notice should be sufficient. There should be no running notices. If, after one notice, the inspector's directions are not carried out, a penalty should be imposed. Under the present Act, the inspector has not power to put things in motion.

His Honor: The question is, whether it would be a good plan to leave too much discretion to the inspector. If you are of opinion, and it is a fact, that, at any rate, one sound floor ought to be left under a working place, it would be very much better to provide that that should always be done than for the inspector to find out that it had not been done, perhaps by means of some one tumbling through. Do not put too much on the discretion of an inspector; for one thing, you would make him unpopular.

Mr. Edwards: On the other hand, your Honor, you would not have unnecessary regulations that would be irksome.

His Honor: I think there ought to be at least one sound working-floor, in addition to the floor on which the party are working. *Mr. Polkinghorne* said he would like to see the whole of the floors intact, and the necessity for that might be left to the inspector. There is always a chance of a blast shifting the laths on the floor itself; but is there any chance of its getting to the next floor?

Mr. Edwards: I do not think so. A blast might affect the floor above and the working-floor; but it would not affect the floor under the working-floor.

Witness: I think your Honor's suggestion would be well worth adopting, that it should be enforced by regulation that one or two floors at the very least be securely covered, and that it be left to the discretion of the inspector whether the whole of the floors should be covered or not. Of course, when stopes fall back, there would be no need for floors; but, for all that, floors not under a working floor should be railed off. If the general rules of the Proprietary were followed out, we could not go far wrong. Of course, the company's rules and the Government rules are two different things. As to the Government rules, the Legislature can say, "They shall be enforced."

1569. *His Honor.*] What you suggest is that the company's rules, after being passed by the Minister, should be made law, so that infringement of them might be punishable by fine? Yes.

1570. The miner ought to have the right to have the manager fined, and the manager the right to have the miner fined? Yes.

1571. *Mr. Williams.*] In the event of the preparation of a new set of rules, would you like to see the miners represented? I think, if we get a fairly good Mining Act the company will take good care that they do not make any rules but what they can carry out. I know, if the rules framed by the Proprietary had been adopted by some of the other mines, and they were by Act of Parliament made law, things would be much better than they are.

1572. You spoke just now about the inspector's not having power to carry out the Government regulations? There is a clause in the regulations saying the inspector "shall" require dangerous or defective places to be remedied; but, when trying to act upon it, the inspector finds himself blocked by all the judicial forces of the country. Under those circumstances, what can you do.

1573. What good is it to have an Act that can be ruled *ultra vires*? The old Act and regulations should be repealed, and an Act of 1897, and a new set of regulations, brought into force,

1574. Is it not a fact that we are working under regulations which cannot be enforced? Yes.
1575. There is a penalty of £50 provided in the regulations should anyone obstruct the inspector in the execution of his duty;—that, however, cannot be enforced; if it could, it would be pretty severe? Seeing that the department of the Minister for Mines is being ruled by such an Act, I think it high time that the Parliament came to his assistance and gave him power to administer the mining laws to the satisfaction of himself and the welfare of the country.
1576. These rules under the Act are of no practical benefit? They have been ruled *ultra vires*, and yet men have to expose their lives under them.

J.
Polkinghorne.
15 July, 1897.

FRIDAY, 16 JULY, 1897.

Joseph Wilks sworn and examined:—

1577. *His Honor.*] What is your name? Joseph Wilks.
1578. You are the Inspector of Stock for the Menindie Sheep District? Yes, and I reside in William-street, Broken Hill.
1579. I believe that your object in coming here is to say something as to the way in which explosives are stored in or near the town of Broken Hill? Yes.
1580. You reside in William-street? Yes.
1581. How far in a straight line from the magazines? About half a mile.
1582. You wish to bring the matter before the Commission because you think that the system under which explosives are stored here is a dangerous one in relation to the town? Yes.
1583. Is your principal objection to the position of the magazines, or to the mode in which the storage of the explosives is conducted? Principally the site.
1584. You think it is too near the town? Yes.
1585. Have you any special knowledge of the action of explosives when they go off in bulk? No.
1586. You speak, then, as your common-sense prompts you when you say that if they were to blow up—especially if they were to make a running fire—it would be dangerous to you? Yes, and to a great number of others.
1587. Do you think the effect would be serious half a mile off? I would not take £1,000 and remain in my house if I knew these magazines were to be exploded. That I swear on my oath.
1588. Of course, that would apply to a great many other persons? Yes; persons who are nearer than I am.
1589. Supposing the town were extended to its furthest limits, as laid out; would there be any part of it nearer to the magazines than that end of William-street where you are living? Yes.
1590. What is that open space on which the explosives are stored? The open space is a reserve from certain occupation, which was originally reserved for noxious trades, I think. I am not now referring to the powder-magazine reserves, but to a reserve between the powder-magazine reserves and my place. The powder magazines are on a small reserve within another reserve.
1591. The larger reserve is the reserve from certain occupation? Yes.
1592. It is not reserved as a temporary common? I think it is included in the temporary common.
1593. At any rate, whether the land is built on in the future or not, you consider that the end of William-street that is already built upon is too near to be safe in case of an explosion? Yes.
1594. What have you to say as to the mode of storage adopted? I think the system adopted, giving a common-sense view, is a farce.
1595. Is there any underground storage, or is it all above ground? All above, I believe.
1596. Is it correct that these stores are simply galvanised-iron sheds, resting on the ground, lined inside with match-boards, and hardly painted, if painted at all, with refrigerating paint? Yes; that is a correct description.
1597. If you were working out a scheme for the storage of explosives, do you think you could suggest a worse system? No.
1598. Do you know anything of the nitro-glycerine explodents and other chemical explodents? I believe the heat in those huts at summer time—which I take to be, at least, about 150 degrees—is sufficient to make them very dangerous.
1599. Do you know whether they are dangerously affected by sudden changes of temperature? I have every reason to believe so; but I cannot speak from practical experience.
1600. There is nothing to prevent a stray bullet or other projectile from going right through one of those huts? No; and you could have as many watchmen as you like, and they would not be able to prevent such a thing as that occurring.
1601. How many watchmen are there employed at present? One, I think.
- His Honor:* I must say that I could not conceive that a worse scheme could be thought out, unless it were to store them under a tarpaulin on a plain. I made it a point to go out to these magazines yesterday, and have a look at them for myself.
- Mr. Edwards:* They have been inspected by the inspector; and, besides, a reserve for a magazine was made after the magazines were built.
- Witness:* I admit that; but the Crown sold the land alongside in suburban allotments.
1602. Those magazines were not constructed by the Government? I believe they are private property.
1603. Is there anything more you wish to say on this matter, Mr. Wilks? Yes, your Honor; I would like you to call for the papers about it, and for this reason: Mr. Chief-Inspector Smith was here, and he made some report, which, I have every reason to believe, was in a manner favourable to the removal of the magazines. Mr. Ferguson, Member for the District, some time ago sent me a letter which he had received from the Under Secretary for Finance and Trade stating that it had, practically, been decided to remove these magazines to a safer position; but that, in the meantime, the Government intended to erect temporary mounds between the huts and the town.
1604. But nature has erected a very favourable mound? Yes; at the back.
1605. Could the magazines be shifted to the back of the hills? Yes; what I was going to say is this: There has been some recommendation made, and the Department has already called for tenders. I saw the specifications, and, from my knowledge of work in general—and I have had great experience in earth-work, dam-work, &c.—the work will cost between £2,000 and £3,000. To expend that much on the construction of mounds would be absurd. The buildings, fences, and everything as it stands in the way of buildings

J. Wilks. buildings, I am prepared myself, so as to show that it is not hearsay, to take a contract to remove the lot and put them anywhere within 5 miles for £150; then I would sub-let it and make something.

16 July, 1897.

1606. Have you formed any estimate as to what it would cost to make a proper excavation at the present site? No; I say the present site should not be made use of at all. Plant the magazines over among the hills, which would be cheaper and safer. I strongly object to the present site. There are far better sites where the danger would be at a minimum. That reserve, I might say, is used by hundreds as a recreation reserve—I mean the reserve between my place and the magazines.

1607. You do not know to whom the country belongs that lies to the back of the magazines on the other side of the ridge? It is nearly all Crown lands—the resumed area of a pastoral holding.

1608. With an intrinsic value, I suppose, of about 1s. an acre? About that.

Mr. Edwards: Of course, in connection with this matter, I act for the owners of the explosives. They are entitled to some consideration for the extra haulage that would be entailed. There would not only be the expense, but increased danger in hauling the explosives to the mines, should the magazines be shifted farther back. I think Mr. Wilks takes rather an extreme view of this matter. He is rather hysterical on the subject.

His Honor: Of course, these magazines being half-a-mile away, it is very doubtful, if they exploded, whether any damage would be done.

Mr. Edwards: I understand that those light buildings, as they would offer no resistance, are safer than if you even had the explosives stored underground.

His Honor: The usual practice, I believe, is to put explosives partly underground and partly above ground, surrounded with non-conducting material.

Mr. Edwards: The action of those glycerine compounds is downwards, not upwards; and the embankment, which it is said by Mr. Smith, an expert, would be perfectly safe, will form a cushion between the explodents and the town; and that, it is thought, will meet every requirement.

His Honor: It depends upon the cost.

Mr. Edwards: I know of nothing the Government has given to us excepting the cemetery and the post office, whose tower is an eye-sore to every one. Broken Hill consumes 45 per cent. of the whole quantity of explosives introduced into New South Wales.

His Honor: This is a matter hardly within the scope of this inquiry; but, still, I think Mr. Wilks is quite justified in taking this opportunity of ventilating the matter. I must say that the present sheds for the explosives are very funny things, to my mind. I think two or three different expedients could be adopted which would increase their safety: the use of saw-dust, for instance. I am informed that, at present, there is nothing used but iron and match-board.

Mr. Edwards: I understand that that is the safest way to construct magazines—to have as little resistance as possible.

His Honor: But something should be provided against the sun's heat.

1609. *Mr. Edwards:* The Explosives Department is of opinion that the little space between the magazines makes a sufficient cushion of air to prevent the explosion of one magazine setting off another? My objection is not so much to the structure as to the site. The distance of carting cannot for one moment be considered where there is the slightest colour of danger as regards the site. I do not think there should be any consideration as to what it would cost to cart another extra mile. Furthermore, those magazines are built in such a manner, and the site is so situated, as if it were intended that an explosion should have double force over the town. There is a range of hills at the back; and that would give an explosion fully double the force it would have in the middle of a plain. It would be far better if the explosives were stored in the middle of a plain than backed up by that range of hills. Mr. Edwards has said that I am hysterical on the point. Probably I am. But there are many scores in this town the same. The last thing that must be taken into consideration is the expense (to the mines) of carting. The Government have sold us the land; they have thrown land open alongside the magazines, which is open to me to take to-morrow if I like; and it cannot be said that, because the magazines are there, it should not be taken up. Then again, it is not only the buildings in the vicinity, but also the amount of traffic. The main road, which takes all the refuse from the town, runs very close to the place, and is used daily and nightly. And then there is the reserve close by, where I have seen as many as 300 at one time, either the pick of Broken Hill manhood, practising on their bicycles, or spectators. Their lives are worth some consideration. I do not see why such a big storage should be kept within the municipal boundary at all. I have pointed out to the present Mayor and to previous Mayors the danger; and I think it a disgrace that they have not taken action. Only for the cost, I would have fought the companies myself, to see whether it was legal for them to store their explosives there. If they put those mounds there that they talk of, there will be a very good chance of the cemetery's becoming filled. The temporary mounds, according to the way they have laid them out, will take at least nine months to build. To take the whole of the magazines to a safe distance would not exceed nine days. Then, again, why should there be such a gross waste of public money? Why should £2,000 or £3,000 be expended when £150 would cover the lot. I have seen the specifications, and therein there is one clause prohibiting the contractor from using explosives within a mile and a half in getting dirt for the embankment. If there is no danger of these explosives going off, why do the Government specify a mile and a half as the distance inside which blasting must not be carried out, and so go to the extra expense in getting the dirt? I do not think they can make the present site safe, no matter what they do to it. When you peruse the papers, your Honor, you will find that the Police Magistrate was one of the first to bring under the notice of the Government this danger. It may seem that I am pushing this thing, but people are careless here, as has been shown by this Commission; I am not.

1610. *Mr. Polkinghorne:* You say that the magazines, where at present erected, are backed up by a range of hills;—what distance do you consider the magazines would have to be shifted from their present position to put them at the back of that range of hills? About 1½ miles is the distance that a site can be got.

1611. You think a site could not be got nearer than 1½ miles? I would not say so; the distance might be less.

1612. You think if the explosives were stored at the back of one of those hills, in the event of an explosion, the danger to the town would be minimised? Yes.

1613. What do you think would be the cost to take out a place behind one of those hills for the explosives? That is, taking it out; but I maintain that the present buildings can be picked up and dumped down. They can all be put on a trolley, with the exception of one of them. They could all be taken away and dumped down for £150.

1614.

1614. Do you think the present buildings put between two hills would be as safe as an excavation between two hills with a temporary covering? I do not think there would be any difference. You would only want to take the buildings; you do not want to go to the expense of taking out the ground. J. Wilks.
16 July, 1897.

1615. Is there not a certain time fixed for the removal of explosives from these magazines? I believe there is; and I believe they are restricted to a certain tonnage, and to certain vehicles.

Mr. Edwards: They can only cart 100 lb. at a time in a properly-prepared conveyance. I understand that, after these complaints were made, a highly competent officer was sent here specially by the Government to inquire into the matter. It has been gone into most fully. I think the main object in proposing to put up an embankment was to soothe the nerves of the people, who were making so much fuss about the danger.

His Honor: Still, it does not appear to be a legitimate thing that a lot of explosives should be stored in such a position, especially when a stray bullet might blow the whole lot up.

Mr. Edwards: Broken Hill depends solely on the mining industry; and all these little things tend to hamper operations, and, in the end, to do the town no good.

Witness: I am not depending on the mining industry; and, of course, that gives me a freer hand than business people to complain about the matter.

Mr. Edwards: I find that a ton, not 100 lb., is the amount that can be conveyed in a vehicle.

John O'Brien sworn and examined:—

1616. *His Honor.*] Your name is John O'Brien? Yes.

1617. Are you a miner? No.

1618. What are you? I am an open-cut man.

1619. Working formerly as a navvy? Yes.

1620. You have been lately employed in the open-cuts? Yes.

1621. On the Proprietary? Yes.

1622. I understand you wish to give some evidence as to the safety of the mode in which the open-cut work is conducted? Yes.

1623. How long have you been working in the open-cut? Three years.

1624. Continuously? Yes.

1625. Are you still working there? Up till last Monday.

1626. Did you leave to take other work? We finished the portion we were at, and there was not enough room for all of us in the other parts.

1627. You are just out of work for a time now? Yes; because there was no room for the lot of us.

1628. Which contractors were you working under? For the first, and greater, portion of the time, I worked under Baxter and Saddler. The last job, working among the sulphides, was only a small one.

1629. What have you to say in regard to the way in which the work is conducted? I consider that we were treated very roughly.

1630. In what respect? We were hurried, and due precaution was not taken for life and limb.

1631. By whom were you hurried? By those sweating, slave-driving gangers.

1632. When you say hurried, you mean you were spoken to to get on quicker? Yes.

1633. Quicker than you expected, or were the men loafing? No; we were supposed to go quicker than we really could.

1634. In consequence of that rushing, were there any accidents? Yes, often.

1635. Will you tell me of any accidents occurring within the last year or two? At Baxter and Saddler's, when working under the crane, the skip is lowered to you; they are swung down to you one after the other. When the skips have been filled they are heaved up. The driver of the crane cannot see you at all times, and he is not a practical man. He heaves the skip up; she bangs against the other skips, and it is ten chances to one if your leg is not broken.

1636. Can you give an instance of any man being hurt in that way? I have been struck myself three times with a skip while being lowered.

1637. Was any notice given of the skip's being lowered? There is so much bellowing and singing out that it is impossible to hear the notices, and, if you looked up to see, they would swear at you.

1638. Did you find a greater risk from the raising and lowering of the skip in the night than in the day shift? They do not work the skip I am speaking of at night. It is worked in the day only. I believe it has sometimes been worked on the night-shift.

1639. When the skip comes down, or when it rises, would you be shovelling into the other skips at that time? Yes; we are supposed to take notice of nothing, but to fill the skips as fast as we can. You are not supposed to lift your head at all. Three skips are used. They are lifted up. If they were lifted straight, it would be all right, but they are not. The jib is not immediately over the skip; consequently, it drags. The jib goes in all directions; the weather has an effect upon it. You have perfect control over the travelling crane, and can bring the tackle immediately over the skip, but, with the jib-crane driven by a steam winch, it is altogether different.

1640. Have you found the work dangerous in any other respects? Yes; with regard to the ropes and hooks, which are used in the hauling of the trucks on the incline. There are two kinds of trucks, the small and the large. The large trucks are like those you see used on the railway, and are for mullock; the small ones are for ore. It seems to be nobody's business to look after the ropes and hooks.

1641. You mean to keep them in order—to see that they are not wearing? Yes.

1642. Have you known the ropes to break? Yes.

1643. And let the trucks down? Yes.

1644. With a run? Yes; the incline is 2 to 1.

1645. How often have you known that to happen? Not a week passes but a hook breaks or carries away. They have boys there to hook them on instead of men; boys under age.

1646. You mean that the hooks are not properly hooked on? It is either the fault of the rope or the hook. The rope is supposed to be steel; and it runs out on rollers; and it is on this rope that the men's lives depend. If the truck comes down with a run, there is no "get away" from it if you are working in the face. The rope, as I have said, is supposed to run on rollers; but the ground very often subsides; and when it does, the rope is thrown on one side; and the friction on the ground wears it, and strand
after

J. O'Brien.
16 July, 1897.

- J. O'Brien. after strand goes. If you pick it up, it is like picking up a bundle of needles; and no notice is taken of it for days and days; and at last the truck, when she gets about half-way up, comes back with a rush.
- 16 July, 1897. 1647. Have you known any instances, lately, of men being killed by the carrying away of the hooks or the breaking of the ropes? Not lately. I have seen the trucks break away; but the men have just managed to escape them.
1648. Are the trucks and ropes supplied by the company or by the contractors? I could not tell what system they are working under. It is a sweating system, so far as I am concerned.
1649. What wages did you earn? From Baxter and Saddler we received 7s. 4d., and from the company 7s. 6d. Baxter and Saddler kept 2d. for hospital purposes; but whether it ever reached the hospital we do not know. The shovels we use we can buy anywhere for 3s. 6d., and they charge us 6s. 6d. for them.
1650. The workmen find their own tools? All navvies are supposed to find their own shovels. I do say the company always finds you with a shovel.
1651. Is there any other respect in which you find the work dangerous? With regard to the "flying fox"—that is another way in which they work the open-cut—no man should be allowed to work under it.
1652. That is when the skip rises? Yes.
1653. Is there not a general order that you shall not stand under the skip when it is going up? If you are breaking down stuff from a face, and she is travelling that way, you must work under her; otherwise you would be continually running away from her, and they would not allow that.
1654. The "flying fox" has never been known to carry away itself? The hauling rope has.
1655. Is there any risk of stones falling out of the skip? Yes, by overloading.
1656. Has that ever happened? Yes; the rule is not to stack the skip beyond water-level. An ignorant man might do that.
1657. Have you known, lately, the skips to be loaded beyond what you term water-level? Yes, the mullock skips; not the ore skips—they are too heavy.
1658. Is that a late practice? They will make you put into her as much as she will hold.
1659. Have you known stones to fly often? Yes; whenever she touches something.
1660. Of course, the skip is not supposed to touch anything after she rises until she touches the block? That is not the case with a timber-crane or jib-crane worked by a steam-winch.
1661. But the skip of the "flying fox" rises clear from the ground? Yes.
1662. Would the jerk on reaching the block throw any stones out? It is very seldom that that happens.
1663. I suppose more care is taken with the skip of the "flying fox" than with the cranes? They do not put as much ore in the "flying fox" skip, because it is mostly hand-fed. They are very careful of it.
1664. Does the "flying fox" hoist ore only? It has been hoisting both, but ore generally.
1665. Is there any other respect in which you find this work dangerous to the men? When working the night-shift there should be more care in taking down the face. All the loose stones should be taken down before the night-shift go on.
1666. But is that not the regular practice—to bar down anything that appears to be loose before the night-men go on? Not always.
1667. Of course, it is a matter of guess-work what will come down? In working the night-shift, the ground naturally settles down after midnight, and, if there is any loose stone, it is bound to come.
1668. Do you find that commonly happens—the tendency of the ground to settle down after midnight? Yes; most experienced men have reckoned that the night air is the cause of it. They reckon that the night air is heavier.
1669. You think care enough is not taken in barring down before the night-shift comes on? Yes; and I do not consider there is batter enough.
1670. You think the slope is too steep? Yes; in some cases it is almost perfectly straight. On a Government railway the batter is one to one. On the Great Northern Line in New South Wales, on the road to Queensland, they tried it half to one, because the ground was very hard; but no batter will stand which is less than one to one.
1671. That, of course, depends upon the rock; you could have the batter perpendicular in some cases? No engineer would pass it.
1672. That is, if there is broken ground of any sort? Yes. It must not be overhanging.
1673. From your experience as a navvy, you say that the railway engineers would not pass the batter here as a standing batter? Certainly not. There are parts of it very good; but my side is not good enough for men to work under.
1674. It depends a good deal upon which way the layers of the rocks lie? The ground here varies very much. On the actual surface it is very hard; and, the deeper you go, the softer it gets.
1675. So that is where you find one source of danger—in the way the batter has been allowed to stand, too near the perpendicular? Yes. In parts the batter is very good; but in other parts it is not good enough.
1676. As it is at present, what do you say? I do not consider there is batter enough on the near side.
1677. It would be very difficult to lay down a hard-and-fast rule as to what particular batter should be left? The depth defines that. The deeper you go, the more batter you are supposed to have.
1678. Still it would be very hard to lay down a hard-and-fast rule; it is a thing you would have to leave to the inspector to say whether the batter is safe, or whether it is not? On a railway they know they have to take the batter down at a certain slope; but here, the contractors want to get over the work as soon as possible, and I do not know whether any batter is laid out.
1679. It would not do to make any particular rule, because it would differ with the particular class of rock and with the depth? The inspector could see to it.
1680. You think you ought to have a strict inspector, and that he should be very careful to see that a sufficient angle is kept? Yes; it would be very little extra expense to take down a batter.
1681. Is there any other peculiarity in these open-cuts that you find is a source of danger? I do not consider it is safe to work the "chinaman" at night.
1682. Why? Sometimes you have not got light enough. There might be heavy, rough, stone on one side; and, if it got a run on, it would swamp you and the "chinaman."
1683. I suppose it is very hard to get the electric light to show down on the ground where you are working? The light is bad and defective.
1684. The danger, principally, at night is the defective action of the light? The "chinaman" is not safe at night, because you have got to go as fast as you can.
- 1685.

1685. In the daytime, with a fair amount of light, you can see what you are about? Yes; if the ground comes down in the daytime, you can get back; but working on the "chinaman" is at all times very risky. J. O'Brien.
16 July, 1897.
1686. Is there any other means of filling the truck which would be safer and more effective? Of course, in a "chinaman" the dirt runs into the truck itself; there is no hand-work.
1687. It is a fair enough plan in daylight? Yes; if reasonable care be exercised.
1688. But not safe by electric light? No.
1689. Have any men been injured lately by working on the "chinaman" at night through that cause? I have only worked on Block 12.
1690. You have had no personal experience of night-work? Yes.
1691. How long ago? Last winter.
1692. *Mr. Edwards.*] Twelve months ago? Yes.
1693. *His Honor.*] At that time were there any accidents, or approaches to accidents, through the use of the "chinaman" at night? No accident occurred on the shift I was on.
1694. Did you hear of any on the other shifts? Slight accidents happened, but nothing serious.
1695. Whether there had been accidents, or whether there had not, what you say is that it is too great a risk for men to run to work the "chinaman" at night? Yes.
1696. Is there any other matter to which you would like to call attention? There is another item with regard to the skips. They are bound with two straps each, which are flat; and the ring easily wears them away. If the straps and rings were made of round iron, there would not be so much wearing away. Another thing is that the hook should be a swivel one.
1697. Then, if the rope spins, it will not affect the skip? Yes; when it is not a swivel-hook, if the rope gets twisted in the swinging, the twist does not come out, and the skip comes back to you in that state.
1698. If there were a swivel-hook working freely, it would turn round and come to its natural position itself? Yes; it should be made a special order that swivel-hooks should be used.
1699. But the swivel itself is a point of weakness, is it not, unless kept constantly oiled or greased? Yes; but proper oil would keep it from wearing away. I say honestly and fairly that it should be a special order that swivel-hooks should be used. They should not be allowed to work a straight hook.
1700. Is there anything else that strikes you? There is a new Act with regard to lead-poisoning. It was carried out for a while; but it soon became a dead letter.
1701. In what respect has the Act not been complied with? In summer time it is very warm here, and the navvies, having to work very hard, need a lot of water, and this water is supposed to be kept in a clean, covered, vessel to protect it from the dust. It has come to us in a bucket with a dirty old bag thrown over it; and, the hotter the day, the less water you get.
1702. Skilly would be better? Yes.
1703. You have found that it is better to drink skilly? Yes; with boiled skilly you can knock out the hardest and the best of them in the hottest day of the year.
1704. You say that ought always to be supplied to the men? It is not necessary in winter; but in the hot weather it is. In South Australia the men are supplied with it. But it is in regard to the shortage of the water that I am complaining. Another part of the Act says that water should be put on the face to keep the dust down. The dust comes over you, and you are half smothered. They keep hoses there, but they do not like playing the water on the face. They play it on some of the concentrates.
1705. Anything else? With regard to the regulations signed by Mr. Stewart. There is one clause that says no holes shall be fired until five minutes after the men have left the face. I have seen that rule broken repeatedly.
1706. You think the rule is a good one, but it has not been properly enforced? It is a dead letter.
1707. If two or three men were fined occasionally, it would straighten them up—if they could be fined, and were fined? If we had proper mining laws, they could be fined; but we have no mining laws in New South Wales.
1708. Is that all you can think of at present? Yes.
1709. You have had no experience underground? No.
1710. *Mr. Polkinghorne.*] Is it not one of the rules of the mine that every man is supposed to stand back whenever a skip is being raised or lowered? Yes. I have read that regulation, which is posted on the blacksmith's door. It says distinctly that a man is not supposed to work under a crane or skip; but that rule is repeatedly broken.
1711. It is compulsory that you work there while the skip is over you, or your services are not required? Yes. If you were to allow a man every time a skip was hauled up to stand and look at it, he would not be able to do any work.
1712. That is the general rule signed by John Howell, the former general manager, that when a skip is being raised over that portion of the cut where you are working, you are to stand back? Yes.
1713. You have not seen any of the regulations at present in force, and signed by Mr. Stewart? I have seen one copy at the office.
1714. I think that rule—the "stand from under" rule—is still in existence;—has it at all times been your experience that men are told to stand from under the skip when it is being hoisted? Not always. Your mate might just say "Look out!"
1715. If the general rule says that every man should stand back, is it right that you should wait for an order from any person to stand back? You do not know when the skip is about.
1716. Mr. Howell, when general manager, passed a remark, that the men in Broken Hill were that foolish that when they saw a chance of putting their head in danger they ran to meet it;—do you think what led him to make that remark was because, although he had signed a general rule that the men were to stand back from under the skip, they refused to do so? That depends upon the system you work under. If working for the company, you would be able to stand from under; but those sweaters up there will not give you time to have a drink of water.
1717. Do you stand under at your own risk, or are you compelled to do so? Men do do it; but then sometimes they do it through ignorance. They do not know the risk they run in doing it. As soon as the skip is lifted, you have to work. You must work as fast as ever you can; never mind danger.
1718. As to the ropes used in raising this material;—you say it is no person's place to look after those ropes and to see that the tackle is safe? Yes.

- J. O'Brien. 1719. Is there no one appointed to examine the ropes and hooks and all tackle used? I have never seen anyone. Some definite person should be appointed; and then we should know who was responsible. At present, they say "Oh! she will do to-day," and she is allowed to go on for two or three days until she breaks. If a man were responsible for looking after it, you would know whom to blame for it. The ganger says, "Why didn't you speak about it," but a navy has no time to go about looking for bad hooks and worn-out ropes; and, besides, he is not supposed to be a judge of those things.
1720. No one is appointed specially to look after those things? No.
1721. Are you compelled to procure your shovel from the contractors? No; but if he did not, a man would then be compelled to go hawking his shovel about the streets.
1722. It is not safe, in your opinion, to work the "chinaman" at night? No.
1723. Is it safe to work any part of the open-cut at night? I cannot say as to the present time. I have not worked lately at night-shift. When I was working on night-shift, the light would go fairly well until about midway through the shift; and then it would dwindle down to nothing.
1724. No matter how good the light, if there be a small object between the light and the "chinaman," it throws such a shadow as to make it very dangerous? Not unless there be a pillar between. The pole is pretty high; and the light is generally placed in the best position. If she only acted properly, you would have plenty of light.
1725. *His Honor.*] What you complain of is the running down of the light through the dynamo not working properly? Yes; for half the shift the light is all right; but it then begins to get weaker and weaker, and, after a while, it dies out altogether.
1726. That is an arc lamp you are speaking of? Yes; they have better ones now, I think.
- Mr. Edwards:* They use incandescent lights now, and there is no flickering.
1727. *Mr. Polkinghorne.*] You make another complaint, that there is not enough sprinkling done to keep the dust down;—can you say you have been denied sufficient water to keep down the dust? I have seen them working in concentrating stuff on one side, in chloridising stuff on another, and still another lot about you working in mullock; and the dust was smothering you, and the taste and smell from it were beautiful. I asked why we could not get water. There is a boy there who generally puts the water over the dust; and there is a man over him. I inquired why we could not get water on the face. I was told that it was too dear; that the manager would not allow it. Of course, that was not the company's manager, but the contractor's manager.
1728. You think it highly dangerous to work those ores unless water is put on to damp them? Yes.
1729. You think provision should be made for water to be used while handling those ores? If it be dry, fine, chloridising stuff, or concentrating stuff, it needs water on the face to keep down the dust.
1730. Have you ever been employed as what is termed a "powder-monkey"? No; I have assisted a "powder-monkey"; but I have never assumed that position.
1731. Do you think the Government Regulation, as worded now, is sufficient:—
- In charging holes for blasting, an iron or steel tamping-bar shall not be used, and no person shall have in his possession in the mine underground any iron or steel tamping-bar, rod, or stemmer, unless mounted with at least 4 inches of copper.
- From your knowledge of blasting, is it wise that an iron or steel rammer should be used? It has been totally condemned. Copper, steel, and iron are failures, and the scrapers are failures. Nothing but wood should be used. I have seen them all used; and, from my experience, I say that nothing but wood should be used. Any man who is a "powder-monkey," if caught using anything but a timber tamping bar, should be liable to a penalty. He endangers his own life and all those within reach of him.
1732. Do you think a "powder-monkey" should be allowed to charge holes while men are in the face working? That brings me on to a point that I would like to see settled. I find out from experience that the material here retains the heat. After you take off the surface, no matter how cold the night, the stuff underneath is quite warm to the touch. No matter what the material is—stiff clay or ore—it is always warm a few inches under the surface.
1733. But is it not highly dangerous that men should be working down in a face while the "powder-monkey" is charging the holes? It has acted in both ways. Accidents have occurred through it. It is an every-day occurrence in some of the cuttings.
1734. Your experience being that the ground is, naturally, heated;—would not that make it all the more necessary that the men should not be in the face while charging operations are going on? That would be a serious difficulty to get over in the working. In the morning, the men start to jump the hole, and will get it down very likely in a couple of hours. About 10 o'clock the hole is "bulled," and is then left one and a half or two hours before being charged. You want experienced men to do the charging. Great care should be taken that the hole is properly cool before charging. I have seen accidents occur through men starting to charge straight away after "bulling." This ground is ragged also, and smouldering parts of the fuse get away into the cracks. A bucket of water is thrown down the hole; but it does not reach all the cracks; and, when the powder is put down, it comes in contact with these smouldering pieces, and a premature explosion takes place.
1735. *His Honor.*] That is where you think the danger is—not so much in the ground retaining the heat? No.
1736. *Mr. Polkinghorne.*] After a hole has been "bulled," what time, in your opinion, should elapse before it is again charged? It should never be less than two hours.
1737. *Mr. Edwards.*] You have read the surface rules of the company? They are in a frame at the office. That was the first I saw of them.
1738. Are they not stuck up at the pay office? Not at Baxter and Saddler's office. They pay in a little humpy out on the bank.
1739. They are stuck up on the quarry? They might be now; but they were not in my time.
1740. When did you leave? I left their open-cut about three months ago.
1741. You say the rules were not stuck up on the top of the bank? Let me see. Yes; it does strike me very forcibly that they were stuck up on the top of the incline.
1742. The men read these rules for their safety? About one out of ten does.
1743. Have you read them? I read part of them one day as I passed.
1744. Why did not you read the whole lot: they are put up for your protection;—had not you time? Yes.

1745. You have read this part, I suppose—

The above rules have been framed to facilitate the work of the mine, and for the benefit and safety of the men employed. As it is impossible, in writing, to provide a rule for everything, workmen are required, under pain of dismissal, to strictly comply with any rules or instructions which may be made and given verbally by the management from time to time; and are further required, personally and individually, to exercise every care to prevent accidents happening to themselves or to their fellow-workmen.

—? I think I have.

Where cranes or other overhead appliances are used, workmen shall not stand under the skip or load or within reach of such overhead appliances.

1746. Did you read that rule? How, then, are you going to land a skip?

1747. I want to know whether you have read that rule; and, if so, whether you have obeyed it? I have read it.

1748. I understand you to say that this rule—that the men shall not stand under the skip—is impracticable, and that if men did not stand continually watching they would not know when the skip was coming down? That is it.

1749. But is not a warning given, such as "Look out"? Orders are given all over the place. You do not know whether they are intended for you or not.

1750. But if you heard the man on the bank, who is in charge of the skip, say "Look out," you would take notice of it? Yes.

1751. Do you say that the man in charge of the skip does not give warning? It all depends on the position you are in. Sometimes you are loading on the level, and sometimes you are loading over your head.

1752. When it is coming from the bank down, he gives warning? Sometimes he never gives warning.

1753. Is there anyone else who gives you warning? There is no particular person.

1754. I suppose the men at the ropes who are guiding the skip would give you warning? If the face is any distance away you do not want any warning. It is only when working directly under the machine; and then you do want warning.

1755. And it is only for a short time that you would be working under the crane? If it is a travelling-crane, you would be always under her; if a fixed crane, driven by a winch, you would not.

1756. Who is this slave-driver or sweating-ganger you have referred to; you have mentioned the word "sweating," and you have stated that water is not provided in proper vessels for drinking purposes; also, that you are treated pretty roughly by gangers and overseers, and rushed about your work;—I must ask you to give the name of the ganger? There is no particular one. It is a well-known rule that they are all so.

1757. You make a charge of this serious nature, and you will not give any name? I am not preferring a direct charge against any man, but against the system.

1758. Do you say that any particular ganger treated you roughly, and rushed you about your work;—is that your experience? Not any particular man more than another. They all want you to do as much as you possibly can.

1759. Did you ever complain to any person about the ropes or hooks being defective? Yes.

1760. To whom? The ganger.

1761. What ganger? Different men I have worked under.

1762. What gangers were you working under? Day and Thompson.

1763. Will you give the name of the ganger you complained to? I complained about the links.

1764. You started by saying that the ropes were defective, and that the strands were allowed to wear out day by day? And I say the strands do wear out.

1765. But I have asked you if you complained to any person about the rope wearing out and breaking? I said the rope wore away.

1766. Did you ever complain to any ganger about any rope being dangerous or wearing? Not particularly.

1767. Can you tell me of any serious accident that has occurred through a rope breaking while working under Day and Thompson? No.

1768. Can you tell me of any serious accident that occurred through the breaking of any hook? A horse was killed one time.

1769. I am not talking about horses, but about men? I know of no men being hurt in that way.

1770. You said that accidents were occasioned by the breaking of ropes and hooks, and you cannot give us the particulars of any accident that has occurred through this? No.

1771. As to the sweating system;—you said that the mines give you 7s. 6d. a day, and the contractors, 7s. 4d.? Yes.

1772. Do you know what becomes of the other 2d.;—do you not know that it goes to an accident and medical fund? I do not know of any man who has got anything out of it.

1773. If you meet with an accident, do you not go to Dr. Belgrave, without expense to yourself, and, besides, do you not get free hospital attendance? I have never been to the hospital.

1774. While you are working for Baxter and Saddler, for this 2d. a week, if you met with any accident, you would be privileged to go to the hospital and have free attendance. I understood you to say just now that you are not compelled to buy Baxter and Saddler's shovels at 6s. 6d. each? Yes.

1775. And it does not matter to them, I suppose, if you got one down town for 2s. 6d.? No.

1776. Why do you not, then, buy one down at an open store? So I did.

1777. And, then, they did not stop money out of your pay for a shovel? On a couple of occasions they have done so—when I had not time to run down town and get one. You either have to get your shovel the day before you start work, or else run down for one after you are put on; and then you have not the time, and must get one from the contractors.

1778. You said just now that one objection to buying your shovel down town was that it was not a very nice thing to be carrying about? I have carried a shovel about.

1779. So there is absolutely no necessity for you to pay 6s. 6d. for a shovel to the contractors when you can get one down town for 2s. 6d.? Still, the system is wrong.

1780. And that is your idea of sweating? Yes; and with regard to the hospital money. If I work for the company, they do not stop it unless I consent; but, with Baxter and Saddler, it is compulsory. They do not ask you whether you want it stopped.

1781. You know Mr. Shaw, the manager for Baxter and Saddler? Yes.

J. O'Brien.
16 July, 1897.

1782.

- J. O'Brien.
16 July, 1897.
1782. I am sure you are not afraid to go to him with any complaint you have to make? He is a gentleman that I have not very much love for, I can assure you. He seems to know my private affairs, and to know all about me. I keep clear of those people who pry into other people's business.
1783. Then you are not on good terms with him? I am not in love with him.
1784. Did you ever complain to Mr. Hebbard about any danger in the work? I never interfere with that gentleman. He knows his duty, and it is not a common navy's place to go and report to an inspector.
1785. Then you did not make any complaint to any person? No.
1786. Whom was it you asked for water, and it was refused? I could not swear which of them it was. I know Day had nothing to do with it; it was under Thompson.
1787. Are you sure you asked Thompson for it, and that he refused to give it to you? I am not sure whether I asked him or whether I asked the "ironstone" man.
1788. Does the "ironstone" man supply the water? That is what I was trying to find out. If I had known who supplied the water, I would have soon seen about it.
1789. Did you complain to the boss about the want of water? I asked for the water, and I was told I could not get it.
1790. From whom? From Thompson.
1791. You are certain of that? I would not be certain which of them I asked—whether Thompson or the "ironstone" man.
1792. You say that the men work in the face while holes are being charged? Yes.
1793. Have you ever read rule 9? No.
1794. You have never read that rule (*vide Rule 9 of the surface regulations*)? But you cannot well get out of it.
1795. Do you know that you are working under those rules, and that there is no necessity to work in defiance of them? How can you get out of it. If you can solve the question, I shall be satisfied. That is what we want to get at.
1796. Is it not a fact that day after day you will hear the ganger shouting out to the men to get away from the "flying fox," or from under the skip? Yes, occasionally.
1797. You say that, in working at night, the danger is from the loose stuff not being barred down? Yes.
1798. The night-shift goes on as a rule by daylight? You are supposed to start, in the summer time, at 5-30. The day-shift do all the firing. In the winter time, they made it half an hour earlier, so that it would not be too dark to fire the holes.
1799. What time do they fire now? In the morning, before they start; at dinner-time, and at knock-off time in the afternoon.
1800. Is there not sufficient light for the night-shift going on to see whether the stuff has been barred down from the last explosion? Not in winter time; it is impossible.
1801. Then, I suppose, if you could fire shots at night and bar down at night by electric light, you could also see whether there was any loose stone hanging in the face? They only pop large blocks at night.
1802. They do not fire any deep holes at night? The ganger on the day-shift is always supposed to leave enough stuff for the night ganger and his men to take off.
1803. Then it is the exception, and not the rule, to fire deep holes at night? Yes. If a deep hole were fired, it would be after a shift knocked off. They only pop large boulders at night time.
1804. You say the electric light is good half the shift, and bad the other half? Yes.
1805. If the electric light were maintained as good right through the shift, as you say it was part of the shift, it would be comparatively safe working there? My experience is this, that even working there in the daylight with the "chinaman," it takes you all your time to look out.
1806. Given a good light, I suppose the work on the "chinaman" would be as safe at night as during the day-time? No, I do not think so. You have not the same chance at night to see whether the stuff is coming.
1807. Do you know that at night there have been fewer accidents in the open-cuts than in the day-time? Because the men employed on the day-shift number more.
1808. With reference to the danger arising from plain hooks, are you aware that swivel-hooks were tried in those open-cuts and proved to be a failure? I never knew them to be a failure. I have proved them to be quite the opposite.
1809. Then you have had different experience from the men working in these cuts? I have never proved them a failure.
1810. As to the water in the bucket, with a dirty bag thrown over it, how often did that occur? It is occurring there at the present time.
1811. The water is not in a proper utensil, but in a bucket? Yes.
1812. When were you there last? I was there on Tuesday.
1813. You had a drink out of the bucket then? I was not dry then, but I have drank from it often enough.
1814. *Mr. Williams.*] Is it your experience that the brighter the light the darker would be the shadow cast by any intervening object? I have not taken that much notice. The lamps on the slag-heap are the best.
1815. Are they clear glass? Yes.
1816. Would that dazzle your eyes? If you continue working under the electric light for some time it affects your sight so much that you cannot read.
1817. Since you have been working under the electric light, do you find the letters, when reading, appear to have a blurred aspect? Yes, it affects your sight.
1818. For the electric light, there is a pole erected in the centre? Yes.
1819. In the skip passing to and fro, would there be any likelihood of the light throwing a shadow upon the work? No; the skip would have no effect upon the light. The light is, generally, put in the centre, and the skip would have no effect upon it.
1820. You know the inspector? Yes.
1821. You have seen him on the mine occasionally? Yes.
1822. In the open-cut? Yes.
1823. You have been asked and pressed to give the name of the person or persons to whom you have made any complaint as to water from time to time;—how long ago would it be since you made the complaint? With regard to the sprinkling of water to lay the dust?
- 1824.

J. O'Brien.
16 July, 1897.

1824. Yes; how long ago is it since you were required to make such a complaint? Last summer.
1825. I suppose last summer you went into an hotel now and then, or into a cook shop, to get a dinner? Yes.
1826. Do you think you could possibly give me the name of any person who served you on those occasions? Certainly not.
1827. With regard to buying the shovel, is there any possibility of some men going up there for a job without the price of a shovel in their pocket? Yes, very often.
1828. Are not they the men for whom the shovels are provided by the contractors? Yes.
1829. That is the system in vogue on the railways? Yes; they are following up the system carried out on the railways.
1830. You think it would be a very good thing for the contractors to advance a man a shovel and charge him the market price for it? It is the extortion I complain of. They should not make 2s. 6d. or 3s. profit on every shovel sold.
1831. Did you ever know them to give a common navvy 2s. or 3s. extra pay? No; I did not. They will take 6d. off him if they can.
1832. You think it would be just as fair for the men to claim 3s. more wages as for the manager to try and get 3s. out of them? I should say so.
1833. Navvies engaged in such operations as those at the open-cuts are noted for their qualification for hard work? Yes.
1834. Are they kept very long, if inclined to loaf? Not very many minutes.
1835. You know the disease "straight-back"? Yes.
1836. Have you ever known men to be shouted at for trying to straighten their back? Yes; they roar out, "What are you doing there; what are you looking at?"
1837. And it would not be in decent English language? It would be very plain English language, I can tell you. I have heard that Mr. Stewart has issued an order to stop swearing.
1838. You believe Mr. Stewart is a more humane man than those under him? Yes.
1839. Since his advent into Broken Hill, the men have not been treated worse than before? No; if anything a shade better.
1840. If you complained every time there was reason to do so in the week of 48 hours, how much work would you do? I would not be able to do anything. Navvies are supposed to know nothing, hear nothing, and see nothing. They are supposed to only work.
1841. How long would you have any work to do if you began complaining? If you began complaining, you would not be there longer than it would take to put away your shovel.
1842. You have been pressed to give the names of those gentlemen who adopt the rushing system. Do you complain of the system as it generally obtains in the open-cut, or do you complain of any particular ganger? I speak against the system.
1843. As being an inhuman system and an unfair system? It is supposed to come under the rules and regulations of mining, and no miner is supposed to "bullock" like we have to.
1844. Do you think that any business man or any professional man in Broken Hill could carry out those rules in their entirety, and satisfy the gangers at the same time? They would not be there ten minutes.
1845. I have been up there, and I have tried and failed, and I can feel for you. Mr. Edwards asked you a question about standing away from under the skip, and you replied that if you carried out the rule bearing on that point, you would not be able to land the skip. How many generally go out to receive the skips when on trucks;—say you are working on the face a little distance away, and there is a line laid down from there to where the skip is hoisted—how many men go up to get the skip when coming down? One man is specially appointed to hook on. It is only when the skip is landed directly under the crane that you have to hook on yourself.
1846. As to that rule about getting away from under, is it not a fact that a skip is very often suspended overhead longer than it takes it to fill? Yes; and you do not know the minute when a stone might drop from her on to somebody. She comes back mouth down, with only two chains fastened, and sometimes a stone is left in her.
1847. Is it not a fact that in lowering the skip it sometimes swings round and twists the rope, and does not the jib sometimes fly right across? If you are working under a timber crane you have very little control of her on a windy day.
1848. Would not that be dangerous at night? They have tried to work it only once at night, and it was not a success. I believe they do work it at night at Block 11.
1849. Have you ever had occasion to fall almost flat in order to escape the skip? That is on account of bad driving. The driver whips the skip up too quickly.
1850. Is not the skip out of the driver's sight sometimes, and he cannot see how it is rising? If the driver cannot see the skip, the man tipping the skips says either "lower," or "heave-up," as the case might be. This driver is merely a man picked up promiscuously.
1851. May there not, on some occasions, be this sort of thing—that the driver misunderstands the order shouted to him by the man who tips the skips? Yes; there is a possibility of that occurring.
1852. Have you not seen the most careful men give signs with their hands as well as shout? If the engine-driver was a careful man, you could give signals; but you could shake your arms off signalling to some of those fellows, and they would only think that you were fooling them.
1853. You have come here to prevent an objectionable system of work being carried on, and not to get any ganger dismissed? Yes.
1854. You have come here relying upon the assurance that by so doing your position would not be interfered with in any way? What induced me to come here was a leading article that appeared in the *Barrier Miner* on Tuesday, asking men to come and give evidence for the purpose of saving the lives of their fellow men.
1855. You have no complaint to make against the company; in fact, you would prefer to work for the company rather than for the contractors? My word, I would that.
1856. And you only wish that the contractors would treat their men the same as the company do? Yes; but it would be better for the company if they did this work themselves.
1857. *Inspector Hebbard.*] In reference to the condition the empty skips are sent back in;—I think you said that there is a possibility of a stone being retained in the skip after being emptied, and that there was danger of it being thrown out on the skip's return? Yes.

1858.

- J. O'Brien. 1858. How long is it since you have seen a skip returned to the working face with only two chains hooked? Last week. As a general rule, the skips are returned mouth down, with only two chains fastened.
16 July, 1897.
1859. Is that the "flying fox"? No.
1860. *His Honor.*] At any rate, you say that the skips ought to be lowered right side up, with all the chains fixed? That is the safest and proper way.
1861. Is that not the usual practice? It is only the ore-skips that come back with the four chains fastened. The mullock-skips always come back with two of the chains undone.
1862. *Inspector Hebbard.*] But the hauling in those cases is only a few feet? It averages from 25 to 50 feet. They might fasten all the chains in Block 11, and, of course, where it was very deep they would have to do so.

Edward James Horwood sworn and examined:—

- E. J. Horwood. 1863. *Mr. Edwards.*] What is your full name? Edward James Horwood.
16 July, 1897.
1864. You are the mining manager of the Proprietary Mine? Yes; that includes the supervision of the underground workings, and the open-cuts as well.
1865. You have been at Broken Hill how long? About ten years.
1866. And for how long have you been connected with the Broken Hill Proprietary Company? For about nine and a half years.
1867. As mining surveyor and as mining manager? Yes; and I have been in charge of the open-cuts since their inception.
1868. I think, Mr. Horwood, you were born on the cap of a reef at Bendigo? A gold reef was found beneath the house in which I was living.
1869. You have been intimately connected with mining operations all your lifetime? Yes, more or less all my lifetime; with mining machinery and mining itself.
1870. *His Honor* wants you to give a description of the administration of the Proprietary Company up here, beginning with the general manager, and then describing the different branches, with their different heads;—can you do it from memory? There is the general manager at the head; and then comes the chief metallurgist, who is termed the assistant general manager. He takes rank above all other officers; he comes immediately under the general manager. In the departments that I have control of, I have, first of all, an assistant.
1871. *His Honor.*] Do you call him sub-manager? Not sub-manager altogether; he is the general assistant. In the underground department there are three day foremen—one in each block. Each has an assistant foreman; and in two blocks out of the three there is a timber foreman on the day shift. Under the foremen are two shift-bosses in each portion and on each shift—eighteen shift-bosses in all.
1872. The shift-bosses keep time with the shift? Yes; they follow with the shift; and, unless the men change, they have the same party on their shifts.
1873. The shift-bosses are selected from the miners? Yes.
1874. Do they do any work themselves, or do they only give orders? It is only in cases of emergency that they do any work. Their duty is to see that the work is done properly and safely, and to carry out any orders they receive from their foremen or from anyone over them. In the open-cuts, we have two day foremen and a night foreman. There is very little night work being done in the open-cuts. We, however, have a night foreman, whose duty it is to look after the open-cut work at night. The chief metallurgist, or assistant general manager, has several assistant metallurgists, and under them there are foremen and shift-bosses in the various departments, somewhat on the same lines that are in force underground. Perhaps there are not quite the number of foremen and assistant foremen in the metallurgical department as there are underground. Under the chief engineer are an assistant engineer and the foreman of the general surface work, the foreman of the fitting shop, and the foreman of the foundry. They work day shift, and, of course, there are not so many foremen and shift-bosses required in those branches. Under the chief engineer, all mechanical work and tradesmen are brought, including carpenters, riggers, engineers; in fact, all men engaged in construction of every kind or repairs.
1875. *Mr. Edwards.*] What other departments are there besides the mining? The open-cuts, smelting (or metallurgical), and engineering. And then there is the clerical staff.
1876. *His Honor* would like you to explain as to the work being done underground? Almost the whole of the work is done by piece or contract—whatever you would like to call it; not by the hour, but so much per set or per foot. The great bulk of the contracts are of fortnightly duration. In the case of shaft-sinking, if we get a good party together, we generally let 100 feet at a time. At one time the duration of the contracts let for stoping was a month; but it was found not to work satisfactorily, and the time was brought down to a fortnight. The chief objection to the long contracts is, that the men are not in the same position as a capitalist might be, who could put up with a loss for a short time in the hope of making it up afterwards. If the men fail to make wages for several weeks at a time they are deprived of actual subsistence. We have, therefore, made the contracts of fortnightly duration, so that the amount of risk taken by the men will never be very great. In the event of the ground's turning out unfavourable, they would not be compelled to work an up-hill contract for too long a time.
1877. *His Honor.*] On what basis do these contracts rest with relation to payment? The miners are paid by the set. The sets, as a rule, are all one size. In the event of any extra height, unless arranged before, payment in proportion is made.
1878. If a fortnight runs out in the middle of putting in a set, what arrangement is made then? In all cases it is left to the discretion of the foreman; and, as a rule, he discusses the matter with the men as to whether half, three-quarters, or what, should be allowed for the work done, and that is accepted and booked.
1879. If they are near completion of the set, I suppose they are allowed to finish it? The time of the contract is taken up to a certain hour—4 o'clock on Wednesday afternoon on every alternate week, and the amount of work done up to that hour is estimated. If there is the value of a quarter of a set left undone, that goes in to the next fortnight's work.
1880. Then, the same price is supposed to rule from fortnight to fortnight, and, generally, the same men are kept on;—is that so? It is more often the case that men remain in the face than that they are changed.

E. J.
Horwood:
16 July, 1897

changed. It is a benefit to the company not to remove them unnecessarily; but, in some places, it may be, perhaps, cooler to work than others, and the men are then changed about in order that, if there be anything detrimental, each should have no more than his fair share of it. Of course, it becomes very necessary very often to remove parties from one place to another, owing to those parties being unable to cope with the kind of ground to be worked. The parties on a contract change very often indeed, and the foreman is not able to form an estimate of what a particular party can do until he has had some little experience with them. Again, the foreman is not always able to place a party in exactly the same kind of ground that suits them, and that is one reason why moving about to a small extent is necessary. But, as a rule, men continue to work in the same faces unless there is some good reason connected with the work for the contrary.

1881. Who fixes the price? The foreman.

1882. Does it come to this—that the men are offered the work at a certain fixed price, and they either take it or refuse it? There is no obligation on the part of the miners to take it; and, in the event of their refusing a contract, if there is any other place vacant, it is offered to them.

1883. It is not anything like the tendering system, but a system of offering at a fixed price work to be done? Yes; of offering work, or of coming to terms with the particular parties.

1884. If no satisfactory party of miners would take the work, I suppose the mine would then go into the question whether the price ought not to be raised? It might be done on day-wages in that case. Very often men think a certain piece of work is very much more difficult to do than the foreman does, and he elects to do it by wages, viz., 9s. a shift; and, in this way, he very often gets work done under the price that he offered to the party who refused it.

1885. The foreman goes into the question of fixing prices and making contracts? In all ordinary cases.

1886. Unless there is something to refer to his superior officer? Yes; for instance, in the case of sinking a shaft where a large expenditure would be involved. He then refers to me. It is in some of these cases that we do call for tenders from parties who choose to offer to do the work.

1887. And, in that case, the price forms part of the tender? Yes.

1888. *Mr. Edwards.*] On the question of ventilation; I suppose it is as much to the interest of the mine-owner as it is to that of the men to have good ventilation in the works? If possible, it is more so. It has always been recognised that men are able to do very much more when the air is good than when it is deficient. It is certainly very much to the interest of the management to provide the best air practicable.

1889. In what manner is the mine ventilated? In open places the natural ventilation is sufficient. The air is diverted by curtains where the stopes are off the shortest route that the air might take. A good deal of that sort of thing has been done from time to time. In the great majority of cases, very little in the way of special provision has been necessary. The mine is opened up so extensively now that there are not many places that require special ventilation. In those places where air cannot circulate, fans driven by compressed air are used, also jets.

1890. *His Honor.*] I suppose the short distance the shafts are apart, and the large number of openings in relation to the horizontal area of the mine, enable mines of this kind to be more easily ventilated without artificial means than coal-mines? Yes.

1891. A coal-mine cannot be ventilated without either a furnace or a very powerful fan of some kind;—you find those not necessary in these mines? The various connections with stopes leading underground, in addition to the shafts, make those unnecessary. There are many disused shafts and winzes that have been uncovered by open-cut work; and, in some cases, stopes themselves have been uncovered; and they admit a large quantity of air into the workings.

1892. And, practically, you find it unnecessary to resort to artificial means, with few exceptions? Yes.

1893. And it is to your interest to supply fresh air to the men? Yes.

1894. Have you got on the mine any officer whose special duty it is to look after ventilation? It is the duty of the foreman in each block; and those who supervise work generally, look after that too. There is no special officer for this work, as the conditions are not so varying as to warrant that. If a place seems to be warm, and requires some additional means of circulation, it is brought about either by my own orders or the orders of the foremen.

1895. Does the ground increase in temperature appreciably here as you go down? I think there is the same increase here as there would be in any other place. I have no reason to think that it would be more—that is apart from the decomposition of the sulphides. A degree to 68 or 70 feet is what is quoted by some authorities as being the natural increase in temperature as you go down.

1896. Do the sulphides give out heat as they decompose? They do in places; but it is not the rule. In the Proprietary, there is only one place that is noticeably hot owing to the decomposition of sulphides, and that is a length embracing only 200 or 300 feet.

1897. There it is noticeable? Yes.

1898. That helps the ventilation, does it not? It would help it on the whole; but it would be disagreeable in the immediate vicinity. On the whole, it promotes ventilation if it is in communication with an up-cast shaft.

1899. By having an up-cast shaft in the close neighbourhood, and where the temperature is continually rising like that, you would get a natural means of ventilation? Yes.

1900. But I understand that, as far as you can, you try to secure a good ventilation right through? Yes.

1901. And you say you succeed in doing so generally? Yes; of course, these things are not remedied until it becomes apparent that the remedy is needed. We recognise that it is decidedly against our interests to not give good ventilation, as it not only interferes with the comfort of the men, but it takes longer for the smoke to clear, and the men have thus to waste more time.

1902. *Mr. Edwards.*] It would save loss of time? Yes; if the air is stagnated it will mean that the smoke will hang for hours, and the men would be unable to get back to their workings within a reasonable time.

1903. *His Honor.*] Except for the [air-compressing engine, you have no other means at present for stimulating ventilation? We have a number of fans used in places—for instance, where we are putting up rises or putting in drives; where there is just the dead end, and no circulation is possible. We use fans for all these. They are worked by an engine, which is itself driven by compressed air.

1904. You use the compressed air as the motive power? Yes.

1905. And you do use fans? Certainly.

1906. But you do not carry compressed air-pipes right through the stopes? No; its main purpose is for power for working pumps underground, underground hoists, winches, fans, and jets. These are the main purposes for which compressed air is used; also for working rock-drills, mainly in drives and shafts.

E. J.
Horwood.
16 July, 1897.

1907. You do not use the rock-drills in the stopes? It is exceptional at present that we use them in the stopes, although we have at the present time one stope being worked by means of rock-drills. The air is only carried into that stope for the purpose of working the drill, and not for ventilation.

1908. In that case you would work the stopes by day-labour? No; we provide contractors with machines and compressed air, and they break the ground at so much per set.

1909. Of course, it makes a difference in the price per set? Yes; it is provided for in that way.

1910. It saves them drilling? Yes; and in hard ground, results in more economical work.

1911. *Mr. Edwards.*] In reference to the alleged increase in the number of accidents in the Broken Hill District lately;—speaking of your mine, have you noticed any increase; and, if so, how do you account for it? I cannot say that the total has or has not been greater; but, assuming that it might have been greater, it is well known that there has been a very large exodus of miners to West Australia during the last two years; and, naturally, the miners who leave are those who conclude that they will get work anywhere, and are, of course, generally the pick of the men. We found, as a rule, that it was the best men, or portion of the best men, who left to go away; and, of course, their places were filled with the best men available outside. Owing to the extension of work in Broken Hill, there was not the supply of miners as efficient as those that left to keep pace with the increased work in mines outside the Proprietary. Then, the other mines have largely increased their work during the last two years. Consequently, a large number of men, of second-rate quality as to a knowledge of mining, have got into the ranks. That would largely account for any increase there has been in the number of accidents—that is, if there has been an increase. I cannot say, taking into account the largely-increased number of men employed, that there has been any noticeable increase in the number of accidents.

1912. Are you, in your mine, in this present year, employing more men than you were before? We are employing about the same number underground; but fewer men have been employed in the open-cuts during the last twelve or eighteen months.

1913. I believe it is a fact that men are employed simply on their merits as workmen, and with a total disregard as to whether they belong to any union, or are free labourers? Yes.

1914. The object being to secure the best workmen possible? Yes.

1915. Some one said that the cause of increase in accidents was attributable to the contract system;—what do you think of that suggestion? I think that if the contract system had not been introduced, there would have been a great many more accidents. The experience of the Proprietary Company was that it took two men to do the work that is now being done by one man. On wages, it required two men to do the work that one man does now. Having that large number of men engaged in the work of taking out the ore, and doing the work that had to be done, there actually would have been a greater number of accidents. On the other hand, the contract system, attracting as it does the best and the most efficient men, tends to the improvement of the miners and the discouragement of inefficient workmen, who know that, if they are not up to the standard, they are liable to make under the standard wage. The contract system, therefore, should contribute to the safe working of the mine for that reason.

1916. Some one has suggested that, owing to the contract system, men have to rush their work in order to make wages;—what is the average wage on those contracts? It is somewhere in the neighbourhood of 10s. 6d. and 11s., and has been for some years.

1917. That is the average earnings of the whole of the miners engaged per shift of eight hours? Yes. The contracts are based on what the foreman would estimate a miner could do, working at wages at a fair rate of speed. If they take extra risks to earn more, that cannot be prevented. The prices are fixed so that the men can, without unduly exerting themselves, make at least the ruling wage—9s. per shift. Of course, the ground changes very often after a contract has been let, and the men are unable to earn as much as the ruling wage. On the other hand, it changes in their favour just as often; and I have seen nearly 30s. a shift earned for nearly a fortnight.

1918. *His Honor.*] I understand that, under the contract system, as it is known here, no middle man comes in—that is to say, the worker contracts to do the work himself? Yes.

1919. Except in the case of the open-cuts? Yes.

1920. The workers deal directly with the company? Yes.

1921. It is practically piece-work? Yes; through the foreman direct. There is nothing in the nature of a middle man at all.

1922. But that "middle man" element does come in in the open-cuts, does it not?—

Mr. Edwards: They are separate contracts.

1923. They are sub-contracts? There is very little of that. The contractors employ all day-labour. There is very little sub-letting. A "chinaman" tunnel may be sub-let. All the men engaged under the contractor are working at so much per hour, or so much per day.

1924. Still, the contractor makes a living by calculating on such a difference as will give him a fair wage for his superintendence? Yes; that is about the principle. The contractor is always a man of experience and resource, and it is to his interest to exercise his ingenuity to the greatest extent in improving methods, and, by doing so, he gets a profit for himself.

1925. *Mr. Edwards.*] Is there any truth in the statement that, when men take a contract, and the ground turns in their favour—I am now speaking of underground—and they are making a good thing out of it, they are taken away from that and put on to inferior ground? It has always been a very strict order—and it is the wish of the General Manager, and the foremen all know it—that, if circumstances should arise, in a case where a party have a good contract, such that men are urgently required in some other part of the mine, rather than have the appearance of taking away from them a good contract, some inconvenience should be gone to on the part of the management to avoid it. There may be exceptional cases where contracts are stopped, when the men are earning exceptionally good wages; but they are very rare.

1926. Would they be stopped simply to prevent the men earning a good wage? No; it is when something that has to be attended to occurs in the mine. But taking men away from good contracts is avoided as much as possible.

1927. As to the shift-bosses, can you say they are competent, steady, men? I can; the foremen and shift-bosses are all men who have worked themselves up from the lower grades, and have shown themselves as possessing capabilities fitting them for the positions they have been appointed to. We aim at getting the very best men it is possible to get, and we take all means to assure ourselves that we do.

E. J.
Horwood.
16 July, 1897.

1928. As to supplying the men with necessary timber or material of any description, in order to secure the ground which they work in;—is there any limit to that? There is no restriction whatever in any part of the mine. There might be a slight delay, for some reason or other, in getting timber to an out-of-the-way place; but there is nothing to prevent a man ceasing work in an unsafe place, if in want of timber, temporarily. The timber, as far as is possible, is cut to the sizes and in the quantities which we find, by experience, are necessary to meet all requirements.

1929. Are the workmen supposed to run any unnecessary risks, or asked to perform work in dangerous ground? They are certainly not asked to run any unnecessary risk at all; and, where there is considered to be any danger, and it is necessary, in order to secure the ground, to continue working in it, the foremen or shift-boss or some of the others whose work it is to supervise, spend a lot of their time in that place assisting and getting the place into a safer condition. Risks must be run in mining; and, of course, no one disputes that; but no unnecessary risks are run by the miners, as far as we are able to prevent it.

1930. These are the underground working rules of the mine. (*Exhibit "A."*)? Yes.

1931. These are the rules under which the work is carried out underground? Yes.

1932. Are the shift-bosses and foremen instructed to see that these rules are strictly observed? They are.

1933. These rules, I think, were prepared under your supervision? I assisted in their preparation.

1934. If dangerous ground is observed by a workman, is he encouraged, or is he snubbed or checked if he makes any complaint to his shift-boss or foreman? I have no reason to think that he is snubbed in any way. I think it is only right—and our rules show it is our wish—that if any danger be undetected by the shift-boss or foreman—and it is quite possible that a danger may arise, and be a real source of danger without being noticed by any of the bosses—the men should report it, and they are encouraged to do so.

1935. With reference to accidents taking place owing to the incompetency of the men, are the men incompetent, as compared with any other period when the standard was different? When we find the men incompetent they are discharged, and other men put on in their places. A very large number of men have been discharged for incompetency.

1936. Can you give any idea of the number that have been discharged during the last twelve months for incompetency, and drunkenness, and misbehaviour? It runs into many hundreds.

1937. Has any effort been made to get competent miners from other parts? Yes; we appointed a mining man in Ballarat, a man who had been connected with mining for many years over there, and who has occupied the position of mine manager and other positions, to act as agent to secure competent miners, and he sent 300 or 400 up. Of course, some amongst them were not first-class miners; but, on the whole, they proved satisfactory. The greater portion of them were acceptable miners. Of course, they were not accustomed to the square-set system, but many of them are working by means of the square-set now, and are looked upon as very good miners.

1938. Before sending for those men, did you exhaust the local labour market for skilled miners? Yes, we did. Almost every man sent on had to be discharged, and this was occurring for a long time before we took the extreme step of sending elsewhere for men.

1939. There were a number of unemployed here at the time, but they were not competent miners? They were certainly not competent miners.

1940. And you exhausted the competent miners before you sent elsewhere for men? Yes; some considerable time before.

1941. Were these men who were introduced from outside paid the same rate of wage as was ruling locally? Yes, the same rate. The work was getting behind, and there was no labour here to do it, and we were forced to get men from elsewhere.

1942. And, in getting those men, you were met with certain opposition? Yes.

1943. Have you done your best to get competent men to work those lodes? Yes.

1944. They are different from any others in the colonies, and you require the best miners you can get to work them? Yes; the better the miners we can get, the safer and more efficient will be the work done.

1945. In reference to the regulations in force on your mine, do you think they are sufficient—supposing they could be enforced by penalty both as against the mine manager and as against the workmen, with a slight modification, perhaps—to secure the safe working of the mine and the protection of the men? I cannot suggest anything that can be added. These rules, as is the case with all rules, are an improvement on the previous rules, which themselves were an improvement on the rules in existence before them. The present state of the rules has been brought about by long experience, and I cannot suggest anything at the present time that would lead to a safer arrangement if included in them.

1946. Do you know any safer system of timbering or of working these lodes than is adopted by the Proprietary? I do not think any safer system of timbering could be introduced. Of course, timber is looked upon as scaffolding in stopes; and it is generally conceded that filling is unnecessary.

1947. Is that being adopted? The stopes are filled as closely as it is possible to fill them consistently with the convenience of the working. It not only results in much safer working, and in enabling the stope to be kept open, but it also saves timber. Nothing will hold the ground up so well as a section filled with mullock.

1948. And that is being used in large quantities now in the works? We are putting all in that we have room for. We are leaving nothing but gangways necessary for working, for circulation of air, and for working room. It is more necessary in our case to fill closely than in some mines, where lower levels are being opened up, and the ground will stand for a considerable time. Here, on the Proprietary, the oxidised ores that are being worked are being cut up in different directions, and filling becomes a necessity. If large spaces are allowed to be formed, there is the liability of a collapse.

1949. Has any accident ever occurred in the Proprietary Mine since it has been under your supervision owing to a deficiency of timber to enable the workmen to secure themselves from danger? I do not know of any.

1950. You have known, I suppose, of men meeting with accidents from not using timber that was there for them to have? Yes; a few, where men have thought timber not necessary—where the ground has been deceptive.

1951. That was simply an error of judgment as to the soundness of the ground? Yes.

1952. In reference to explosives—a clause in Regulation No. 7 of your Underground Rules says:—

A charge of explosive of any kind which has missed fire shall not be unrammed, and a fresh hole shall not be drilled within an unsafe distance of the missed-hole.

You

E. J.
Horwood.
16 July, 1897.

You do not consider that a good regulation? No, I do not. I think unramming should be allowed. Of course, our rules are based on the Mining Regulations under the Act, and we must insist on the same provisions that are insisted on in those regulations. We would be very glad to be relieved of the necessity of having it the rule that holes are not to be unrammed, because it is universally admitted that it would be safer to take out a portion of the tamping, and then explode by putting in more dynamite.

1953. Not touching the charge itself, but simply taking off some of the tamping? Yes. If there is any possibility of getting tamping of two different colours, it would be a good thing to make a habit of putting on a few inches of tamping of a whitish material, and the balance of a darker material, so that in drawing a charge it could be seen when the dangerous part was being reached.

1954. You could do that by means of measuring with the tamping-stick? Yes, if they would take the trouble to measure it. They would know by the length of the drill they had been working about the length of the hole.

1955. As a rule, do you find miners careful men about explosives? There are cases of carelessness that come under one's notice. I think in that, as in most other things, the constant acquaintance with the danger lessens the appreciation of it.

1956. *His Honor.*] As to untamping to within a short distance of the charge. Supposing it is one of the detonating explosives, not powder—within what distance of the charge do you think you would have to get before you could be quite sure that a smaller amount of explosive would set off the unexploded charge? I think anywhere within 6 inches of the charge would explode it. Putting a plug within 3 inches to 6 inches would explode it.

1957. And yet there are those cases where an explodent supposed to have been put in continuously has exploded in part only? Cases like that are occurring, but I think such a thing is very rare with good explosives. I think it is more likely an inferior brand that gives that result.

1958. You agree with other witnesses who have expressed an opinion that it is only an inferior explosive that will act in that way? Yes.

1959. *Mr. Edwards.*] All the nitro-glycerine explosives are sold through agencies out here? Yes.

1960. And on the introduction of those explosives to South Australia, do you know what steps are taken there to test them to see that they are of good quality? There is a Government Inspector.

1961. Professor Renne, of the University? Yes; I think he is the inspector.

1962. *His Honor.*] Is there any such inspection of explosives in New South Wales? We have had no dealings with any Sydney firms in the matter of explosives that I have heard of. All explosives pass through the South Australian Government, and that Government only, so far as my experience is concerned. I have heard of a number of cases where dynamite has had to be taken out to sea and destroyed by the South Australian authorities.

1963. *Mr. Edwards.*] That loss does not fall upon the people in the colonies, but upon the exporters at home? Yes.

1964. Because they merely sell through agents? Yes.

1965. So there is no inducement to people to buy bad explosives? No.

1966. When you let a contract for explosives you insist upon being supplied with the best quality? We get the best. We would rather pay a good deal more and get the best than pay a low price and get an inferior explosive.

1967. I believe there are some cheap German explosives that are dangerous? Yes; there is more danger with some explosives than with others. The South Australian Government, however, are very strict in this respect.

1968. Something has been said about scrapers in connection with a charge. I think that practice is condemned? Yes; a scraper should not be used as a tamper.

1969. It is absolutely prohibited underground? Yes.

1970. Soft-wood tamping rods are provided? Yes; by the company.

1971. So that if the workmen use an iron instrument it is not the fault of the company? No, not at all.

1972. *His Honor.*] According to the Government regulation, you may use an iron tamping-rod so long as you have it copper-tipped;—what do you say as to that? I do not think 4 inches is sufficient. If an iron rod is to be used for tamping, I think there should be at least 1 foot of copper, or else the rod should be copper throughout.

1973. *Mr. Edwards.*] But I think the wooden one is admitted to be the safest? Yes; it is quite sufficient for the work here.

1974. *His Honor.*] Does the heavy compression of those explodents make any difference in their effect when they explode? The smaller the space they can be got into, the better the work they will do. Beyond a certain point, however, nothing can be gained. With a very ordinary amount of tamping, you may do away with, probably, 25 per cent. of the interstices there may be at the top of the charge, and it would take a very large amount of tamping to get at the remaining 5 per cent. An iron rod, therefore, is not necessary to get an efficient result. You get all the tamping that is required by the use of the wooden rod.

1975. In point of fact, you practically get rid of, you may say, all the air, with very little tamping? Yes; a wooden tamping-rod can do all the packing that is required. I am quite sure that tamping does improve the result in the case of dynamite, as it does with powder. It is not right to assume that, because dynamite does a lot of work with little or no tamping, as against powder, it does not want tamping. Tamping immediately over the charge is much better than simply closing the hole, because in the latter case you leave a certain amount of air between the tamping and the charge to take away the efficiency of the blast. It certainly adds to the efficiency of a blast if the charge be tamped, even in the case of dynamite.

1976. *Mr. Edwards.*] I believe the absence of tamping causes some chemical change, and the explosive throws out some injurious gases? It does occur in some cases with the nitro-glycerine compounds that a sort of secondary explosion takes place, and the chemical action that takes place in that case is not what is intended by the inventor of the explosive, and gases of a noxious nature are thrown off.

1977. *His Honor.*] When it is fired properly there is a very imperfect combustion, in the true sense of the word, and when fired improperly a more perfect combustion? Yes.

1978. *Mr. Edwards.*] So that tamping should be insisted on with dynamite to a degree? Yes.

1979. And I suppose the extent of that would be impossible to limit in any regulations? Yes; it would vary. It would be hard to regulate.

E. J.
Horwood.

16 July, 1897.

1980. It all comes to this—that drawing the tamping out to within some few inches of the charge ought to be safe? Yes; and safer than any other means of exploding the charge that can be suggested.

1981. Is it safer than putting in another hole not less than 6 inches away? I think it is much safer. There is in that case a liability of boring into the charge, and also the liability, when this second hole is fired, of its breaking the ground and scattering the charge of the first hole amongst the broken ground without exploding it. In working with machine drills in a drive, it has been found that holes explode very close to one another without exploding the adjoining charge.

1982. *His Honor.*] But in the other case, if you remove the tamping to within 6 inches of a charge and put in a plug of dynamite, you think it is sure to explode the charge? Yes.

1983. But the tamping, being softer than the rock, would not carry the vibrations so well? It will; a plug of dynamite exploded over a charge compresses the tamping to a certain stage, and then drives it with great force into the larger charge. I am inclined to think that 6 inches would in all cases be a sufficient distance.

1984. You think there ought to be a fixed distance within which the tamping should not be withdrawn? I do not think the distance should be fixed, because circumstances might be different in different cases.

1985. If a hole went off, it would be very hard to say whether a man had been pricking within 6 inches or not? Yes; it would be impossible to prove that. I think the distance a thing that might be left to the discretion of the miner.

1986. But you would not allow him to go right down on to the charge? If a man was inclined to go down on to a charge, I hardly think that a regulation would stop him. I do not think any miner would be so foolish as to actually uncover the charge.

1987. It is being continually done in the case of powder? It has been done.

1988. Of course it is recognised not to be a safe practice?—

Mr. Edwards: It is not like drawing a charge out of a smooth-barrelled gun;—there is a difference in drawing powder out of rough rock? It might be put in as a warning for the guidance of men deficient in knowledge.

1989. That is the object of regulations—not so much that you can enforce them; they should be more in the nature of directions than anything else—instructions as it were? Certainly, your Honor.

1990. Because the men who did it, if there were an accident, would not be punishable in this case? It would be safe, then, to have a regulation that no charge be uncovered.

1991. Do you think 3 inches would be a safe limit to prescribe, or should it be more than that? I would not say 3 inches would be sufficient in all cases.

1992. *Mr. Edwards.*] There is a regulation at present under those Government rules that not more than 6 lb. of powder shall be in a workman's possession for use at one time in any one place. With machine drills, that is not sufficient, I understand? Not nearly sufficient. Many times that quantity is required for the one operation, for the one series of holes.

1993. *His Honor.*] Of other explosives besides powder? Yes; of nitro-glycerine compounds. Five or six times that quantity of this explosive used in the one series of holes is not an uncommon occurrence.

1994. That is when going in with a big drive? Yes; there may be twenty holes in the drive. They are all bored out first, and then fired in succession. The centre portion is taken out first, and the other holes are gradually fired as it is most advantageous to fire them; that is according to the burden they carry. If the men firing out that face had to go tramping backwards and forwards for 6 lb. of explosive at a time, it would introduce a new element of danger. It is much safer to take in in one lot what is required, and keep it stored in a safe corner. At the conclusion of the operation, they should not, I think, be allowed to have more than 5 or 6 lb. remaining in the face in their possession.

1995. It is necessary, I suppose, to allow a man to have some remaining in his possession after the charge has been fired, because he may want to put in some small shots? Yes; it would lead to a great deal of inconvenience if a man were prohibited from having any explosives in his possession; and I do not know of any accident that has happened through miners having that privilege.

1996. Then you would qualify the rule somewhat in this way: A workman shall not have in use at one time in any one place more than 6 lb. of explosive, except when engaged in charging holes? Yes.

1997. *Mr. Edwards.*] I suppose, when not stored in the magazine, the explosives should be kept in a secure case or canister? Certainly; it is the rule in the Proprietary Mine that they should be so kept.

1998. In the case of a missed-hole, what time do you think should elapse before anyone is allowed to go near it? It is impossible to say whether a hole has missed in all cases.

1999. I suppose two hours would cover everything? I have never heard of anything happening outside two hours. That would be ample; but in a case where a miner has reason to believe that a missed-hole is due to a certain action of his own, I do not know that it would be right to prohibit him from going back within that time. He might be quite satisfied that the fuse had not taken when he left the place. In cases of that kind a certain amount of discretion should be left to the miners.

2000. *His Honor.*] Does the appearance of the fuse indicate whether it has burned into the hole or not—whether the spitting has taken place inside the collar? If he sees it spit he can be satisfied that it is not a missed-hole as regards the fuse.

2001. Then a fuse that a miner is not positive about spitting would not be taken as a missed-hole? I should not call it a missed-hole. In a case like that, the rule should not be made so hard-and-fast as to preclude a miner from going back.

2002. It should be considered a missed-hole only where the fuse has spat without effect? Yes.

2003. *Mr. Polkinghorne.*] I quite believe that there are many things that will cause a miner to be doubtful whether he has properly lit the fuse; but he will clear out just for the time being to be on the safe side; he is often afraid that, through some particular action of his, the charge will not fire; and in such cases I think he should not be precluded from going back to it within a reasonable time; that would be unnecessary delay to keep him away from it for two hours? Yes; unnecessary delay, not only to himself, but to the men near by. I would make the rule read that, where a hole is known to have missed by the man engaged in charging, one and a half or two hours should elapse before anyone returns to it.

2004. *Mr. Edwards.*] As to the system of "bulling" holes, is that necessary in order to give the explosive full effect? Yes; absolutely necessary.

2005. And as to the depth of the holes in the open-cuts, do you consider that an 18-foot hole is necessarily more dangerous than a 15-foot hole? I think that, on the whole, the work can be done more safely the deeper

E. J.
Horwood.
16 July, 1897.

deeper the holes are, for various reasons. The only extra danger in connection with a deep hole, as against a shallow hole, is the extra difficulty there may be, in some cases, of getting the charge to the bottom of the hole. It may be a little difficult to do that in some cases; and that is the only thing that can be said against deep holes. On the other hand, with a large number of shallow holes you have to repeat, according to the number of holes taking the place of a deep hole, the various operations of "bulling," charging, and firing—all, in themselves, dangerous operations. Then again, in working with long holes, the deeper the bench you form with that hole the fewer holes you will require, and the fewer benches you will have to work to get the stuff down; and it is found that at the bottom of a bench the rock that has been in the neighbourhood of a hole is very much shattered and cracked, and that, in itself, is a source of danger in every succeeding bench. In getting down the ground, these irregularities have to be contended against when charging; and there is an element of danger introduced into every succeeding hole. So the fewer benches the better, as you have then less irregular or cracked ground, and less holes to fire.

2006. There is a danger in creating crevices? Yes; the danger is, that the explosive itself, or part of the charge, might get into them, and result in a premature explosion. It is only in exceptional cases where long holes may be considered a source of danger, and that is in passing the explosive down the hole. But in the long run you have to go down a greater depth, and have a greater length to pass the explosive down in shallow holes than if working long holes. Besides, the long hole would bring down about three times the quantity that the short holes would, which means a decreased use of explosives, and it is explosives that are the greatest source of danger in quarrying operations. The long holes minimise the use of explosives, and, I think, you would really be introducing a source of danger if you limited the holes.

2007. *His Honor.*] You think no limit should be fixed? The limit should be nothing like so small as 15 feet.

2008. What limit would you name? I do not think it should be under 20 feet. It is rarely that any hole is sunk as deep as 20 feet; but for all that I do not think the limit should be under 20 feet. Eighteen or 20 feet would be the maximum that would be attempted, as, beyond that, the tool would become unmanageable.

2009. You think, on the whole, it would be better to do away with that limitation, and leave it to the discretion of the men? Yes.

2010. Of course, this is not intended to apply to boring in the stopes, because there the holes are limited by the size of the set, and, I suppose, the orders of the shift-boss, who, I take it, has control over the depth of the holes? If there was any tendency to exceed the proper dimensions, he would, of course, interfere; but, as a rule, the men never attempt to bore holes too deep.

2011. It is too risky for themselves? Yes, and inconvenient.

2012. *Mr. Edwards.*] In reference to additional inspection; that is a matter, I suppose, entirely for the Government;—the managers do not mind how many inspectors there are, so long as they are competent men, and not Members of Parliament? There is no objection, provided they are suitable men.

2013. *His Honor.*] Taking the Albert Mining District, have you got an opinion as to the expediency, in the public interest, of appointing an additional inspector? I think it is hardly fair to expect the inspector of this district to have charge of all the outlying country. The managers are not asking for an additional inspector; but they are not opposed to another one being appointed, by any means.

2014. You think that there ought to be an inspector whose duty shall never necessarily, except perhaps to a very trifling extent, take him away from the immediate neighbourhood of Broken Hill? I think it would result in much inconvenience and other drawbacks if the inspector were to be allowed to be away for a week at a time, because it frequently happens that he has to be referred to on different matters. At the same time, I do not admit that the appointment of any number of inspectors would reduce the number of accidents.

2015. You are aware that there is a singular difference in the manner of a cabman when he sees a transit inspector looming anywhere within range, and when he does not;—the knowledge of the presence of an officer always has a wholesome effect? I admit that. Human nature is human nature in every branch of life. I think, however, it must be admitted that a great many more things are done in the way of preventing accidents that the inspector would not ask for or insist on. It is apt to reflect on the management if accidents are too numerous. A great many precautions are taken in the mines here that it is not compulsory on the part of the management to take, and I am satisfied that they are the means of preventing accidents.

2016. It would very much strengthen the hands of the mine-managers if some of those precautions they insist upon could be made compulsory? I am not referring to anything that could be stated definitely, but to matters in general. We do the work in what we consider the safest way, and you could hardly frame regulations to cover all circumstances that might arise. A great many things are done by the companies here which could never be stated in the regulations.

2017. *Mr. Edwards.*] You say the managers do that for their reputation, apart from any humane feeling? Yes; for the sake of their reputation they would do that.

2018. They do not try to pay dividends out of the corpses of their men? No.

2019. As to the system of apprenticing youths;—what have you to say to that? I think that is the best way to train miners.

2020. Would not that system, if recognised by the law, tend to build up a sturdy race of competent miners? Yes.

2021. Of course, you would have to limit your number of apprentices to the number of competent miners working? Yes. I do not think apprentices should, as seems to have been assumed here, be allowed to go straight into the face. I think they should be sent down first to do the same work that truckers have to do, and so on, so that they may gradually become familiarised with underground conditions. If sent straight to the face, they would not become so efficient as they would if given the opportunity of going through the different grades and different kinds of work.

2022. I suppose the truckers are on the lowest rung of the ladder? Yes. The apprentices should first be engaged in trucking and filling, and doing work other than that actually required of a miner.

2023. Of course, the remuneration of an apprentice would be a matter that would have to be left entirely in the hands of the management? I think so. I do not think it is a matter that could be legislated upon.

2024. In reference to what has been suggested about a Board of Inquiry to take evidence as to minor accidents

accidents;—what do you think of that proposal; would it have any benefit; would it tend to reduce the number of accidents; or could it be made a lever as against the management? It is only in rare cases that the cause of an accident is not self-evident, and I take it that, if the thing is not quite clear, there is nothing to prevent the mining inspector from getting to the bottom of it; in fact, he makes it his duty to do so now. The management themselves aim at getting to the bottom of every accident; and, if one occurs from unforeseen circumstances, and any information be derived from it which could be made useful in preventing a similar accident in the future, the management take steps to profit by it. I think these Boards would occupy a lot of time, and the time wasted might lead to further accidents. I do not see that there is anything to be gained that is not obtainable at the present time.

2025. Then the inspector would be able to get at the causes of accidents as well as this Board? Yes.

2026. *His Honor*] But he would have no power to compel the attendance of witnesses? —

2027. *Mr. Edwards*.] That might be given to him by an Act? Yes.

2028. With this Board, in the event of any unfriendly disposition on the part of the men, the management might be put to great expense and inconveniences to no good purpose? Yes. If the inspector had ample power it should be sufficient.

2029. *His Honor*.] You do think, I understand, that it would be well if there were some means of bringing before some competent person—put it in that way generally—the circumstance of an accident, which, if death had ensued, would have formed the subject of a magisterial inquiry, so that it might be fairly gone into, in the event of the person injured not being able to afford, or not caring, to bring an action; the only way he can do that at present is by suing someone; no one should be compelled to bring an action, and he would often be a great fool if he did;—the question is, whether you do not think it would be well, when rather serious accidents happen, and yet life is not lost, that they be inquired into, without leaving it to the person injured to take the initiative? I think something might be done in that way. If the inspector were satisfied that he could not get to the bottom of a thing without a formal investigation, it would be a fair thing to empower him to hold one.

2030. Then there would be this difficulty in the way: it sometimes might look as if the inspector himself had been negligent in enforcing his own powers, and therefore, in those cases, no matter however much he might be in the right, a good many people would still imagine him in the wrong, and there would be a good deal of dissatisfaction; everything, however, would be cleared up if an open inquiry were held by some competent officer outside the inspector:—the inspector does, at present, report all accidents to the Minister, but the distance away very much defeats the whole of the proceedings? —

2031. *Mr. Edwards*.] In the absence of the inspector, would not (say) the warden or the coroner be sufficient;—at any rate, it should be some person outside political influence? The difficulty is, to draw a line where an inquiry is necessary.

2032. *His Honor*.] As suggested by Mr. Polkinghorne, someone would have to have discretion to determine whether an accident should be inquired into; perhaps the tribunal itself would have that discretion;—assuming that the matter was an important one—take the case of two or three men being nearly killed, not quite killed—do you not think there ought to be a means of bringing that matter before a fair and competent tribunal, without throwing upon anyone injured the duty of seeking his rights? I do not think that would be objected to. The only thing is, that it might be made to act in a vindictive manner: all cases might be gone into. It would be assumed, probably, that there was something wrong, when it could be made perfectly clear to anyone conversant with the thing that it was a pure accident. It would lead to a good deal of vindictiveness and loss of time without a corresponding gain. If it could be limited in such a way as to avoid that, I do not think anyone would oppose it.

2033. The existence of such a tribunal would have a tendency to make all persons careful? In cases where neglect can be proved now the ordinary process could be adopted.

2034. But perhaps overmen might know themselves to be so much to blame that they would have no chance of recovering in an action;—still, the matter ought to be ventilated? If proper limits were placed upon the Board, I do not think the management would object to it.

2035. *Mr. Edwards*.] From your experience on the Barrier, would a Board have power to work in a vindictive manner towards the mines, and should it be left in the hands of some competent officer to be appointed by the Government, and clothed with sufficient power—either the Police Magistrate, Coroner, or some other person? I think that some single officer could carry out the duties quite well enough if it were thought that the inspector was an interested party. Of course, if it was thought the inspector was an interested party, it would be better to have someone else, and I should think a single officer, appointed by the Government, would be ample.

SATURDAY, 17 JULY, 1897.

Edward James Horwood re-called and further examined:—

2036. *Mr. Edwards*.] In opening Mr. Horwood's examination yesterday, I omitted to ask him as to his qualifications and experience as a mining engineer. Would you tell us, Mr. Horwood, what training you have had as a mining and civil engineer? I received my training as a mining and civil engineer, first, at the Bendigo School of Mines, and, afterwards, I went through a three years' course at the Melbourne University, gaining the certificate of "Master of Civil Engineering" (M.C.E.)

2037. *His Honor*.] That involves all the theoretical portion? Yes.

2038. *Mr. Edwards*.] After that, you served twelve months in the Bendigo Iron Works? Yes; my course was interrupted for a year, and I spent that year in the draftsman's office in the Bendigo Iron Works, where mining machinery is the principal work.

2039. After that, you had two years on large railway contracts? Yes, partly in Victoria and partly on the South Australia-Broken Hill line; as assistant engineer in the first case, and engineer to the contractors in the second. That led me up to the Broken Hill experience which I mentioned yesterday. I became connected with the Broken Hill Proprietary Mine about nine and a half years ago as underground surveyor, and my connection with the mine has continued ever since.

2040. *His Honor*.] In connection with the mining engineering work, had you to go through a course of chemistry and experimental physics? Yes; the course included experimental physics, chemistry, mineralogy, and practical chemistry.

- E. J. Horwood.
17 July, 1897.
2041. *Mr. Edwards.*] I think, when we left off yesterday, we were on this proposed system of inquiry into minor accidents;—do you think that such a Board as is proposed could be made a matter of great annoyance to the mining management without resulting in any special benefit either to the mines or the men? Yes; I certainly do think so. In fact, I think it would be almost certain to put them to a lot of unnecessary expense.
2042. *His Honor.*] You think it ought to be so constituted, if constituted at all, as to eliminate all possibility of its representing political or social distinctions in any way? Yes.
2043. It ought to be absolutely independent? Yes.
2044. De-localised, as it were? Yes.
2045. *Mr. Edwards.*] It should be a strictly judicial inquiry? Yes, apart altogether from outside influences.
2046. As to these proposed regulations: Is it possible, from your experience, or will it be possible, to frame a set of hard-and-fast regulations that can be applicable to all the different mines on the Barrier alike, or would it be better for each mine to make working regulations for itself, to be subject, if necessary, to the approval of the Minister? I do think that too hard-and-fast regulations would become impracticable in many cases; and, in endeavouring to work by them, accidents might be brought about. If the mine rules could be altered, and approved by the Government Inspector as circumstances required, I think that would meet the case in the way of providing for a contingency, where it is possible, by a rule or regulation.
2047. Of course there are certain things, such as the use of explosives and things of that sort, for which hard-and-fast rules could not be laid down? Yes.
2048. As far as your experience goes since working on the Proprietary, you find it necessary to alter the working rules as the work develops in the mine? Yes.
2049. *His Honor.*] Even as to explosives, you must allow a large amount of elasticity, because it is a fact that new explosives are almost daily being brought into use? Yes.
2050. An explosive in use to-day would be the cause of a danger which would probably not exist at all in an explosive that might be in use six months hence? Yes.
2051. And which might involve entirely new elements of danger, and new conditions of treatment? Yes; more attention is being paid by experimental chemists to the manufacture of new explosives than to almost any other branch.
2052. A good example of that is shown in the case of dynamite and powder. A spark to powder is as dangerous as a shock to dynamite. Conversely, a very severe shock is not dangerous to powder, and a spark is not dangerous to dynamite? That is a very good example.
2053. *Mr. Edwards.*] In reference to making known to the men any regulations that may be framed. I think you had the Proprietary Mine simply plastered with rules and regulations? Yes; we have had the rules and regulations stuck up in large numbers. If it is the desire of any man to acquaint himself with the rules, he has every opportunity to do so. In fact, it is hard for them to avoid seeing the rules in any part of the work.
2054. Would anything be gained by having copies of them delivered to each man? It is quite possible; but I would not like to undertake that they would be read very extensively. Still it might be a good plan to provide a copy of the rules and regulations to any man who made application for them.
2055. And have them at the mine's office so that any person might get them who chooses to apply for them? Yes.
2056. *His Honor.*] A good plan would be to supply every man who comes fresh on the field with a copy of the rules and regulations, and then let him know that if he lost his copy or wanted another one he might get one by making application? Yes; that might be a good idea.
2057. And it would be a good idea, perhaps, to charge a penny for every copy after the first one supplied? Yes.
2058. *Mr. Edwards.*] It was said (I think, by O'Brien) that the open-cuts are worked in a dangerous and reckless manner;—is that so? I am of opinion that every reasonable care is taken.
2059. Is the open-cut in itself necessarily a dangerous occupation—more dangerous than railway cuttings, or more dangerous, say, than underground workings? Taking into account the amount of work that is done, I think it is not as dangerous as the underground workings.
2060. *His Honor.*] Not as dangerous? No; not as dangerous.
2061. *Mr. Edwards.*] Take the open-cut in block 12 and 13—Baxter and Saddler's. I believe Baxter and Saddler are one of the largest contracting firms in the colonies? Yes, they are. They have been engaged on that kind of work considerably over a quarter of a century.
2062. Under the Millars, originally? Yes; first under C. and E. Millar.
2063. Do you know their engineer, Mr. Shaw? Yes.
2064. Is he a skilled and competent officer of works in that direction? Yes; I am quite sure of that. He has had very large experience in very heavy works—in very extensive cuttings and tunnel work, "chinaman" work, and all kindred operations.
2065. I think Baxter and Saddler have been working in these open-cuts for about five years? Yes; approaching five years.
2066. They are the contractors who introduced free labour here after the strike? Yes; they introduced the first men from outside after the strike in 1892. They brought in several hundred men.
2067. As the open-cuts are worked now, and have been for some time past, in what condition is the lighting at night? No restriction is placed on the amount of light. The contractors are not charged for the light. The Company provides for all that is requisite. Anything that the contractors or the Company may consider necessary is provided.
2068. Is the electric power on the mines sufficient to supply light in any quantity throughout the surface workings and the underground workings, if required? I think it is ample for the requirements. Much more light can be provided by the present plant than is required.
2069. *His Honor.*] Can you explain the statement made by O'Brien in his evidence, that the light had a way of running down after some time? He referred to the arc light.
2070. Would it be the burning away of the carbons? No; it would be the mechanism that acts on the carbon getting out of adjustment.
2071. It is an automatic adjustment? Yes. The arc lights always give a certain amount of trouble; and

and, unless a man is engaged at all times going round and attending to them, the light would, no doubt, at times be insufficient. We depend almost entirely now on incandescent lights. We have a larger number of these lights; and they are actually on the spot required, and not a considerable distance away. The arc lights, of course, had to be placed a considerable distance away, to be out of reach of the shots. With the incandescent lights, you have appliances to draw them out of reach of the shots when firing is about to take place. The incandescent lights altogether work much more satisfactorily than the arc lights.

E. J.
Horwood.
17 July, 1897.

2072. Having more of them, do they give a more diffused light than the arc lights? Yes; and as they can be brought immediately over the work, there is not the same chance of shadows forming as the work progresses.

2073. Those shadows were referred to by some of the witnesses as being very noticeable and very objectionable. As far as your observation goes, does that apply in any appreciable extent to the incandescent lights as now distributed? That is a matter now that hardly gives any trouble at all, because these incandescent lights are portable. They are fixed on an overhead wire, and can be drawn either up or down. If a shadow is thrown, the light only wants moving to avoid the object. These lights are also placed on a portable post sometimes, which can be stuck in the bank.

2074. Under whose authority is the adjustment of the lights now carried on? In the first place, the Chief Engineer has control of the electrical works; and he is the officer whose duty it is to fix these lights. He fixes them in such a way that the contractors themselves can move them up and down, or move the posts on which they are sometimes placed. This enables them to put the lights in the best positions.

2075. The contractors have the right to do that? Yes, and to pull the lights up when a shot is about to be fired.

2076. *Mr. Edwards.*] Then there is no limit or stinting of the electric light? None whatever.

2077. The men in the open-cuts can have whatever they require? I have never heard of any complaint as to want of light that has not been met by more light being provided.

2078. Can you say it is true, as stated by Mr. O'Brien, that the light might be good for half the shift, and then, for the latter part, be faulty, and, consequently, dangerous? —

His Honor: Mr. Horwood has, practically, explained that, and O'Brien gave evidence that the arc light was in use at the time.

Mr. Edwards: I think, your Honor, O'Brien went further, and said in all cases.

His Honor: I do not think he said recently.

Mr. Edwards: I think he referred to last winter—12 months back.

Witness: When the arc lights were in use, it was the exception for them to give any trouble.

2079. *His Honor.*] It was not a thing that happened every night? Certainly not. It might have happened occasionally. It would not have paid to allow work to be interrupted for the want of electric light.

2080. In regard to the incandescent lights: does the dynamo vary in its action, or does it work at the same power continuously? I think it works at the same power continuously. Resistance coils are put in if lights are cut off. If one light out of a series is shut off there would be no saving in the fuel, as the dynamos have to be kept up. Of course I cannot speak as an expert on this matter.

2081. *Mr. Edwards.*] It was said that Baxter and Saddler's plant or gear was defective and worn out, and that it was breaking continually;—have you, as mine manager, ever had any complaints to that effect? Those statements I consider very gross exaggerations. Of course all plant wears out and has to be renewed; but there has been constant supervision of all the ropes, both on the part of a man specially appointed by the contractors themselves, and also by a man in the company's employ, whose sole duty it is to look after ropes and the attachments thereto.

2082. *His Honor.*] What is his office called? I do not know that any particular name is given to the office. He is an old sailor, and has had large experience in ropes and in mining. He is a man drawn from the sailor gang.

2083. A sort of boss rigger? He is one of the most experienced of the rigger gang. He is not a boss.

2084. *Mr. Edwards.*] You have a sailor gang on the mine? Yes.

2085. And one of those men is selected to go about and supervise all ropes, running gear, attachments to ropes, &c.? Yes, inclusive of all ropes used by contractors.

2086. That is in addition to the supervision by the contractors themselves? Yes.

2087. I think you know that Baxter and Saddler have a man especially for that purpose too? Yes, they have.

2088. So there is no justification, as far as you can see, for this man's saying that it appeared to be nobody's business to look after the repairing of ropes? None whatever. I do not think he was in a position to know.

2089. He says not a week passes without a hook or rope breaking and allowing the trucks to run down the incline;—would you call that true or false? It is false.

2090. He says the rope was supposed to be steel;—as a matter of fact, they are all steel ropes, are they not? I have not come across any case of a rope other than steel being used. I have never heard of any but steel ropes. The company buy nothing but steel ropes themselves, and the contractors almost invariably get all their rope from the company.

2091. He speaks about Baxter and Saddler's twopence a day deduction as sweating twopence from the men? —

His Honor: I do not think there is any need to go into that.

Mr. Edwards: I only wish to refer to it, your Honor, because Mr. Horwood has been connected with Mr. Baxter in railway contracting work.

Mr. Williams: I look upon this deduction of twopence a day for an accident fund as a very good idea. I think it is a very good scheme—a very praiseworthy one.

Mr. Edwards: But I believe O'Brien said yesterday that the twopences deducted were really not applied to such a purpose.

His Honor: I have no doubt he was under the impression yesterday, that his twopence was not put to the right purpose. He is somewhat prejudiced, I think.

Mr. Edwards: Yes; and that is only one feature in the whole of his evidence.

2092. It was stated, Mr. Horwood, that, although the rule said men were not to stand under the skip, they were forced to do so, as they were not allowed to leave their work;—you are in the habit of going through these open-cuts regularly as manager? Yes.

E. J.
Horwood.
17 July, 1897.

2093. Do you know whether that rule is enforced, about men not being allowed to stand under skips? It is my experience that they have been compelled to stand from under. The men themselves, on their own responsibility, sometimes elect to remain under the skips.

2094. Do you not hear the gangers every time you go into the cuts shouting to the men to get away from underneath? Yes; frequently I have seen that done. It is a well-understood rule that work is to be suspended on those occasions.

2095. That the moment the word "Heave" is shouted, all men affected have to stand away? Yes.

2096. *His Honor.*] Do you think it would be a good idea to use a whistle when the skip is going up? Whistles, on some occasions, have been used; but, as a rule, in those cases, the man who does the shouting is chosen partly because he has a good voice.

2097. *Mr. Edwards.*] An objection to the whistle, I think, is the fact that there are so many whistles on the mine? Yes; and it might possibly lead to confusion.

2098. *His Honor.*] But you could not very well mix a steam whistle up with a boatswain's whistle? The workmen are provided, sometimes, with those metal whistles—whistles with a pea in them—and they have, occasionally, been used for giving the signals. I don't think it is a matter of very great importance, because the total length of time that the men are compelled to work in these places is short. The crane or overhead appliance is only overhead while the men are working in its immediate vicinity. As soon as the face is opened up the men get away from it. Then rails are laid, and the skips are placed on trucks; and there is only one man who must get underneath to a certain extent, and that is the man who hitches on. He, however, has every opportunity of standing clear.

2099. *Mr. Edwards.*] Then there is no necessity for men to place themselves in danger? No; not at all.

2100. O'Brien also said that more care should be taken to bar down the loose stuff before the night men went to work;—is it not a fact that all loose stuff in a face is barred down before the night shift come on? Yes, that is the practice.

2101. That is when the night shift comes on after dark? Yes; but, as a rule, the night shift comes on in daylight, and they have an opportunity to make the place in a condition to satisfy themselves.

2102. What time do they come on? They are only working night shift in Block 11, and there they come on about 4:30 p.m.

2103. Of course during eight or nine months of the year that gives them plenty of time to secure the ground before the night comes on? It gives them sufficient time all the year round.

2104. Mr. O'Brien went further on to say that at midnight the ground naturally settled down, letting go all loose stuff;—I do not know whether there is any truth in that idea of his that at midnight a change takes place in the open-cut? If any settling does take place, I think it would probably be due to the effect of the work that has been done (*i.e.*, material shifted) in the earlier portion of the shift. I do not think that the atmosphere could have any appreciable effect on the ground.

2005. *His Honor.*] Could contraction by cooling do it? I think, on account of the non-conductivity of the material, that the effect of cooling is inappreciable.

2106. *Mr. Edwards.*] You think, then, that midnight has no effect upon the open-cut? I am of that opinion.

2107. He further says that, in his opinion, the walls are quite perpendicular and the batter is too steep? I consider that the general condition of the batters gives room for no complaint. I think he must have referred to the condition of the working face.

2108. The working face; not the permanent batter? Yes.

2109. As to the permanent batter, is that too steep to be safe? I think it is more than ample. It is our aim to give all the batter required.

2110. I suppose the slope depends in different places upon the nature of the ground? Yes, in some places $\frac{1}{2}$ to 1 gives a safer batter than 1 to 1 in other places. In some places we have to go more than 1 to 1; and, in other places, $\frac{1}{2}$ to 1 seems unnecessarily flat.

2111. Of course in working the face it is impossible to keep any regular batter, because every shot alters the condition of it? Yes; as soon as the bottom material is removed, it is time to put in another shot to bring down the upper part.

2112. He said the "chinaman" was always a source of danger;—as a matter of fact is not the "chinaman" about the safest system under which you can work an open-cut? I think, in carrying out a large work in that way, fewer deaths would result by using the "chinaman" than would result in any other way. If, instead of using a "chinaman," the material were loaded off a bench on which trucks were run, I think there would be infinitely more danger to the men engaged in (say) shovelling, for the reason that they would be working in places between the bottom of the slope and the trucks, and, in the case of a run of ground, would have very little chance to escape. In the case of the "chinaman," there would be much more room to get about. There the men are over the truck, and have an opportunity of getting away in any direction. It is a little bit steep in places, but not so steep that a man could not run up.

2113. He could get away to the other face? Yes.

2114. In the other case he would be hemmed in between the bank and the line of trucks? Yes, and there would be very little "get away" for him.

2115. I think the "chinaman" is the system that is in use in all big open-cut work? Yes, in all big excavations. It is a mode of work that has been in use a number of years.

2116. *His Honor.*] Can you account for the name of "chinaman" being given to it here;—is it purely local, or is it a name that has been introduced from some other part? The "chinaman" particularly is applied to one of the logs that form the temporary covering of the tunnel; and the only reason I can suggest is that, as in these colonies the Chinaman is looked upon in certain quarters with such contempt, and this log, which has to stand the wear and tear of everything passing over it—boulders dropping on it, and so on—simulates to such a degree the qualities ascribed to the Chinaman, it has occurred to some one to name it after that individual. I have never heard the origin of it; and that is the only explanation I can give.

2117. *Mr. Edwards.*] Mr. O'Brien has complaints to make about the skip-straps and rings being made of flat iron, and states that their being flat causes them to wear more easily;—I believe the straps are thickened towards the eye? Yes; it is necessary that the straps should be of flat iron to admit of bolts being passed through them and the timber forming the skip. The practice is to "jump up" the ends of the straps so as to thicken them, and this gives a greater wearing surface. There may have been a skip or two where this was not exactly done.

2118.

E. J.
Horwood.

17 July, 1897.

2118. *His Honor.*] The end is turned and welded? Yes, turned and welded, and "jumped up" while it is hot.
2119. *Mr. Edwards.*] With all due respect to Mr. O'Brien, you think the round straps would not do;—he said they should be made of round iron? I do not think that would be practicable.
2120. He says swivel-hooks ought to be used;—I believe they were tried there, were they not? The swivel-hooks he referred to, I took it, were the hooks at the end of the crane rope. We did try them, with a view to enabling the skip to twist without twisting the rope; but it was found that the friction of the swivel was greater than the tendency to resist twisting on the part of the rope or ropes, and that they really did not operate.
2121. Were they kept greased? Yes.
2122. And then they would not act? Not automatically.
2123. As soon as the strain came on, the friction was too great? Yes.
2124. It is a matter of self-interest to avoid the twisting of ropes? Yes; if allowed to get twisted they wear very quickly. It is a strict rule that the skip be sent up with the ropes—say three are forming the lifting part—made parallel.
2125. It is always lifted with two single sheaves? It is, in the case of the wooden jib cranes; but in the case of the steam cranes, a single rope is used.
2126. O'Brien said that the Lead Poisoning Act was carried out for a while, but, subsequently, became a dead letter;—are the provisions of that Act carried out on the mine? I think everything is done to meet the provisions of that Act. Of course, at times a water-pipe might get broken and lead to a temporary difficulty in providing water; but all contractors working in those places have bound themselves under their contracts to put on the necessary water for laying the dust in the lead ores; and they are made to keep their faces reasonably free from ore dust.
2127. He says in reference to the drinking water, that in summer-time it should be kept in a proper covering; but that it is kept in a bucket with a bag thrown over it? The Lead Regulations require that in the case of drinking water a covered bag is to be provided. These bags are made on the mines; and the contractors are supplied with them. In cases where oatmeal is mixed with the water it is impossible to use these bags, because they would become sour after a day or two's use. When using oatmeal it is very necessary to have some open receptacle that can be cleaned. A clean bucket with a clean bag over it is a reasonable vessel in which to hold such material. It is readily cleaned to prevent it from becoming sour. In the case of pure water the rule is that a bag be placed in a shady place.
2128. And proper bags are furnished for that purpose? Yes, and made by the company. A canvas bag might get worn out occasionally, and some other receptacle be used temporarily. That, however, would be a rare occurrence.
2129. Has any complaint ever been made to you as to the want of drinking water in the open-cuts? No complaints that have not been rectified at once.
2130. *His Honor.*] Do the contractors or the company ever supply the men with skilly, instead of water? The company have so few men working for them in the open-cuts. The contractors, however, find it is to their interest to supply skilly, because it enables the men to do more work. It is recognised that skilly gives the men much greater strength.
2131. *Mr. Edwards.*] Oatmeal water is supplied to them? Yes; large quantities of oatmeal are consumed in the open-cuts. The oatmeal is provided by the contractors.
2132. Is there any truth in this statement, that the "sweaters" working them would not give them time to get a drink of water, or anything like that, as far as your experience as manager of the open-cuts goes? I do not think there is any foundation for that at all. Some men take every chance they can get of loafing, and, naturally, they have to be reprimanded—pretty strongly too, sometimes. The men who attend to their work have no cause to complain.
2133. He asked his Honor to believe that if a man straightened his back he was sworn at by the ganger? I think that is a gross exaggeration.
2134. Is there any foundation or justification for this man saying that they are worked so fast as to have hardly time to look round, or, if they looked round, they would be spoken to by the ganger? I know of no foundation for such a statement.
2135. I believe in the open-cuts there is no necessity for the men to use iron tampers or even copper-tipped tampers, and that wooden tampers are provided? Wooden tampers are always obtainable from the company.
2136. He says it is the practice of the "powder-monkeys" to charge holes while men are in the face? I say it is not the practice; and it is directly forbidden under the rules—that is, men other than those actually engaged in charging.
2137. *His Honor.*] Would that apply to "bulling" as well? The "powder-monkey" should keep the men away temporarily while charging for a "bull."
- Mr. Edwards:* Rule 9 of the Surface Regulations makes a provision which practically means that the men shall leave the face when a hole is to be charged for a "bull."
- His Honor:* Yes; it says:—
- Before placing the charge in any hole for the purpose of "bulling" it, the powder man (known as the "powder-monkey") shall give due warning of his intention to charge the same, when all workers are required to leave the part of the face or work which will be affected by the explosion (whether prematurely or otherwise) of the "bulling" charge.
2138. *Mr. Edwards.*] If that "chinaman" were not used, you would either have to take the stuff overhead, which would be a matter involving greater risk; or else by railway trucks running through a tunnel? You would have a method of shovelling into trucks or skips, and they would prevent a man's getting away from the face in the event of a fall.
2139. *His Honor.*] The "chinaman" is the safest method of enabling men to load into trucks? Yes; I think it is safer than shovelling into trucks.
2140. And it saves the waste of labour involved in dropping your material to the level of the road and hoisting it into the truck; in this case you drop the material only to the level from which it falls into the truck;—by doing that you save a large amount of labour? Yes; there are a number of cases where the lode would not be worked at all but for there being an economical way to remove the over-burdens—where the ore is of too low a grade.
2141. *Mr. Edwards.*] I understand the waste from the open-cut is used for filling? We take underground all the waste that we can find room for.

E. J.
Horwood.
17 July, 1897.

2142. *His Honor.*] All the rest, I understand, goes on to the S.E. side of the hill? The greater portion goes there; and some on the western, and some on the southern end. We estimate that all that material will be required, sooner or later, for filling stopes that will be worked in the future. If that open-cut work were not done now, the same amount of excavation on the surface would have to be done at some future date; that is, judging by the quantity of ore it is estimated will be extracted.
2143. *Mr. Edwards.*] I think Mr. Polkinghorne in his evidence referred to stripping laths off the floors of the stopes, and spoke about railing off those portions that were stripped? I think in all those places where traffic is necessary or likely to be necessary the floor should be left in; and I do not think it is safe unless two or three floors under the working face are closely covered.
2144. *His Honor.*] You agree with Mr. Polkinghorne there? Yes.
2145. You say you ought to have two or three floors closely covered under a working face? Yes.
2146. *Mr. Edwards.*] Do you know if the men when they want a piece of timber are in the habit of taking the nearest they can get, and that is the floors of the stopes? It has frequently been done; and, in many cases, they are found out and punished—discharged in many cases.
2147. I believe the punishment is to simply send them up? That is the rule. There are cases where men are suspended, say for small offences, such as smoking. In that case for the first offence they would be suspended for about a week, but if caught the second time they would probably be dismissed.
2148. It was stated by one of the witnesses that after firing the laths become shattered;—in that case, whose duty would it be to see that they were replaced? Undoubtedly, it is the first duty of those who fired the shot to see that all laths are properly replaced.
2149. *His Honor.*] And very often you can see better whether any laths want replacing by going on to the next floor and looking up? Yes, in many cases.
2150. You can be more sure of it than by noticing from the working floor? Yes, and for that reason the floors, or at least two or three, under the working floor should be left covered.
2151. *Mr. Edwards.*] In the event of flooring not being covered;—if it is discovered by a party other than those who fired, it would be their duty to report the matter to the shift-boss? Yes; in all cases.
2152. And if they won't do it I suppose it is impossible to prevent accidents? Although I cannot particularise, I think it is not at all unlikely that many accidents could have been prevented by a danger being pointed out—a danger that it might have been impossible for the boss to have seen.
2153. Accidents have happened through passes or shoots being left open? Yes, that is a frequent cause of accident. The company are very strict about that—seeing that the shoots are protected.
2154. *His Honor.*] What is the difference between a shoot and a pass? I do not know that there is any special difference; they are synonymous terms.
2155. *Mr. Edwards.*] A witness said something the other day about a brace around a winze being covered over with timber that was too light;—do you know anything about that? I have examined that brace frequently.
2156. You know the winze;—I think it was spoken of by William Williams? Yes; I have been up and down there frequently. I have frequently examined the timbers forming the brace, and considered that they were perfectly safe.
2157. Would any additional security have been gained by putting heavier timbers there? I think there is some misapprehension about the size of the timber; 10 x 10 was the principal timber used. The 10 x 4 were the covering pieces. I cannot see how a safer brace could be constructed than the one in use. The ground in the winze was extremely hard, and in the earlier portions of the work rocks would fly through the brace, and in one or two places they displaced portion of the covering. In these cases the men were paid wages to effect repairs.
2158. Then any injury caused to this brace by shooting was repaired at once? Yes, with all reasonable despatch.
2159. In reference to the change of shift;—do you think that men going off shift should be compelled to show the face, or point out any dangerous places in the face they are leaving, to the men coming on?—Do you think it would be a means of greater security to prevent accidents? From our experience here, I certainly do think that it would greatly lead to safer working if it were made a rule that the men change in the face, and that they point out to their mates anything of a dangerous nature.
2160. Do you know instances where unexploded holes have been left in the face? We have had our records looked up, and find that eight men have been discharged during the last two years for leaving unexploded holes in the face without acquainting anyone of the matter.
2161. Without acquainting either their mates or the shift-bosses? Yes. It is almost inconceivable that men will do that, but that has been the case. Only two months ago a case occurred.
2162. What case was that? The men charged a hole and left it unfired. They had the explosive in the hole, and (I think) the fuse, but did not fire it. It is very easy not to notice that a hole is charged ready for firing, and an accident might very easily happen.
2163. Then there is a great deal of truth in what Mr. Bourne stated the other day, that men, at change of shift, run off and leave their face in a state of wild confusion? It is done in many cases. I think the miners who take an interest in their work, if they fire at the end of the shift, are anxious to see how the work they have planned has panned out. They like to see the result of their shot, to see whether they over-charged, or under-charged, and what has been the effect.
2164. But, although careful men will do that, I am afraid there are a great many careless men who would do nothing of the kind? Undoubtedly. It frequently happens that the condition of the face is such that it should be pointed out to the men succeeding.
2165. Meeting their mates in the plat would have no more effect than meeting them at the brace? Unless they have an opportunity to, and are compelled to meet and point out these things in the face, I do not see that there could be any improvement on the present system.
2166. Of course, you are not anxious to keep men working more than eight hours? Certainly not.
2167. Would it necessarily entail any serious loss of time on men going out? I think, taking into consideration the number of shafts up which men are hoisted, the maximum time taken to change runs up to twenty or twenty-five minutes. Those parties who are near the shafts would only take a minute or two. I think ten or twelve minutes would be the general average. They would be that much later in getting up.
2168. Mr. Polkinghorne said that to ensure the safety of the men when being raised or lowered at change of shift, there should be two engine-drivers in the engine-house during that particular time; do you think that

E. J.
Horwood.
17 July, 1897.

that is absolutely necessary;—it would not affect your mine, because you have two engine-drivers there as a rule, and they would only have to go into the engine-house; do you think a rule to that effect would be desirable? I do not remember any occasion where it would have been better had there been another engine-driver on duty. I remember no occasion where a driver became unfit to do his duty.

2169. It would be an extraordinary risk? Yes, especially if the cage is provided with safety appliances and with safety hooks. The cages are also in many cases provided with safety appliances, enabling the men themselves to bring the grippers into operation; but it is questionable whether it is safe to give them that power, because they may use it unnecessarily, and the jerk resulting from the sudden stoppage of the cage, should a false alarm be raised, might bring about an accident. With ordinary appliances to prevent over-winding or the cage dropping, the risk of there being an accident through only one driver at change of shifts is unappreciable. There are much greater risks run every day in every other department of life.

2170. In reference to calling men out of dangerous ground; do you think that the inspector alone should be allowed to say whether ground is sufficiently safe for men to return to work, or do you think the underground manager should be sufficiently capable of taking the risk if he choose to take it? Where the man in charge and the men are satisfied, there should be no need to call in the inspector. The men are never prevented from calling in the inspector, and, no doubt, the inspector is here for that purpose. If there is any room for doubt, it has always been the custom to have the inspector brought in.

2171. No man working in the mine is compelled to take a risk if he does not voluntarily accept it? If a man thinks his place is dangerous he is not discharged, and if there is any possibility of giving him other work there and then, it is given him. No man is compelled to work where he feels he is not safe, because if men are timid, that mere feeling would contribute to danger. If men express a fear of working in a certain place, although some one may have to work in it to repair it, and prevent a serious creep or movement occurring, others are asked to take their places.

2172. And those men that are naturally more nervous than others are not discharged? No; where possible, they are found other work; and it is, certainly, nearly always possible to give them other work. In reference to the inspector, I think that, where he is brought in and declares a certain place is not fit to work in, it is only right he should be given an opportunity of saying that it is fit, before work other than repairing work is resumed.

2173. I suppose the inspector frequently makes requisition upon you for different things? Yes.

2174. Are his orders complied with with all reasonable despatch? Yes; they are always attended to within a reasonable time.

2175. Is there any instance of an accident having occurred in consequence of the inspector's orders being disregarded? I know of none.

2176. Something was said with reference to pent-houses and unprotected shafts;—what is your idea about that;—that is, in continuing the sinking of a shaft, where would you put your pent-house in order to provide sufficient security for the men? Where possible, pent-houses should be put in at reasonable distances.

2177. Do you think every 100 feet is necessary for the safety of the men? No; I think within 300 feet would be sufficient. If you have the shaft that you are winding up lined off closely from the other compartments, and, perhaps, provided with skids or close-lined, so that the bucket, if it strikes the sides, is not likely to detach anything, there would be no more appreciable risk in sinking to 300 feet than to 100 feet. The greatest danger in sinking is in discharging the load at the top; and, of course, that remains the same no matter how deep the shaft is. The extra hauling up a shaft, in view of the speed at which hauling is done, is a very small increase of risk. The increased time in hauling the extra 200 feet bears a very small proportion to the total time occupied by the bucket in the operation of getting a load from the bottom to the top and down again.

2178. If you have a pent-house at the plat, would it be safe to have one compartment open all the way down, the pent-house covering the other two compartments? Of course there should be a substantial pent-house beneath the winding compartment that is used for hauling to the surface. There should be a strong pent-house under that; and there is nothing to prevent it. In the case of a close-lined shaft, or a shaft where the rock is thoroughly reliable, in view of the fact that you can always cover the shaft 30 or 40 feet above you with temporary covering for two-thirds of the width of the shaft, I do not think that any restriction should be placed upon the depth you sink. At any rate, the depth should be considerable. In some cases, in sinking a shaft, there may be only one shaft in the mine; and it would be rather hard to compel the company to double its winding appliances when there is an efficient plant on the surface that would, probably, do the work safer than any underground winch would do it. If there is any increased risk in going to a depth of 300 feet, it is simply the slightly-increased time in the hauling of the load. As to the falling of a stone, it might just as well be 300 or 400 feet as 100 feet. A stone would have just as much effect on a man in a 100-foot fall as it would in a 300-foot fall. At 100 feet it may have already gained its maximum velocity, owing to resistance due to friction of the air.

2179. In reference to those underground open-cuts that were mentioned, what are your ideas as to when the timber should be put in them? I do not think it would be possible to make a hard-and-fast rule as to the distance the timber should be from the face. It varies according to the nature of the ground. If a particular piece of ground is considered to be dangerous, the inspector can require the timber to be closer; but, in these stopes, if the timber be put in too close, it is simply shattered to pieces.

2180. To what height should the roof be carried before you start timbering on the sill floor? You should have something to stand on, some reasonably safe scaffolding, or the ore that you have broken. The latter is a frequent way of working these open chambers. The ore is broken down, and enough is left under foot to work on; the excess being sent down the shoot. I know of cases where this has been done, and no doubt the ore makes a very convenient standing platform, and brings the men within a reasonable distance of the roof, which, I think, should not be more than 9 or 10 feet. If it is intended to timber the excavation after reaching a certain height, the ore is taken out, and timber placed in what is considered a safe distance from the working face.

2181. Something was said of the danger of the roof's scaling? Yes; that is a frequent occurrence. Ground may look safe to-day; but it is not to be assumed that it will be safe to-morrow. It wants frequent examination, if men are going to work under it.

2182. So you could not frame any hard-and-fast rule to say when timber should be put in? No.

2183. That must be left to the discretion of the men, the shift-bosses and the inspector? Quite so; and the management generally.

E. J.
Horwood.
17 July, 1897.

2184. *His Honor.*] There was a somewhat similar case referred to by Noble. He said it was very dangerous, in his opinion, to have two, three, or more floors stoping at once, one above the other. He thought stoping ought not to take place within (say) three floors' distance; what have you got to say to that? It all depends on the width of the stope. It would be safer to work a party on every floor in a wide stope than on every third floor in a narrow stope. The thing is to avoid having the men underneath one another at too close a distance.

2185. You say they should not be immediately over one another at a close distance? They should not be so close as to be in one another's way.

2186. How far apart vertically would you keep them from one another? It is a thing that it would be hard to make a hard-and-fast rule about. Of course the party in the floor below are generally working in advance of the party above. They are forward a step, and have the opportunity of working not immediately underneath the party above. It should be left to the man-in-charge of the particular place to say whether the men are too close. It is against the interest of the management, in view of economical work, to have the men in each other's way; and that sort of thing is not done if it can be possibly avoided. There are times, and have been times lately, where a particular kind of ore has been demanded by the smelters. The character of the ore is such that it may require a considerable increase in the amount of flux used, and it may be almost impossible to get the necessary quantity without sometimes double-banking the men. But those things are foreseen as much as possible, so that the stock of ore can be kept up, and the working of the men too close to one another avoided. It is necessary to foresee these things, both for the safe, and the economical, working of the mine.

2187. *Mr. Edwards.*] That is a matter, then, that could safely be left to a competent inspector? Yes.

2188. I believe, in Noble's case, his party were a bit too quick for the party in front? Miners sometimes become dissatisfied. They think, perhaps, that other men are taking their ground from them. There might be other reasons for thinking a party too close, besides the question of safety. Men, as a rule, like as much room as possible; but it is not always practicable to give them all the room they think they ought to have. It is to the company's interest to give each party as much room as possible, in order that the work may be carried on as advantageously as possible.

2189. To what cause do you attribute the great majority of accidents at Broken Hill? I think it has been admitted by the men themselves that two-thirds of the accidents are due to causes directly attributable to the men's own actions.

2190. Their own negligence? Not negligence altogether, but to actions that are within their control.

2191. *His Honor.*] Not negligence only;—you mean that sometimes it may be negligence and sometimes want of judgment—want of knowledge? Just so.

2192. And sometimes it may be pure accident? Yes, that the most experienced miner could not foresee. Two of the fatal accidents that occurred in the Proprietary underground last year occurred to men who were highly experienced miners. In spite of their high experience they met with fatal accidents.

2193. *Mr. Edwards.*] Do you know of any precautions that could be taken by the management that are not taken, whereby accidents to men could be avoided? No. We frequently see, as work progresses, where something can be done to bring about greater safety, and it is always attended to. I do not see that we could do more than has been done to prevent accidents, either at the surface or underground.

2194. As to that fire underground in Block 11, Mr. Bourne gave his reason as to the cause of it. I think the management attributed it to a totally different cause? Yes.

2195. As to getting certificates. I suppose, as to the idea of getting certificates for miners, it is utterly impracticable? To get any benefit from it, it would have to be done throughout the Colonies simultaneously, because there is no class that shifts about so much as the mining class. Until it were brought about universally nothing would be gained.

2196. In reference to the shift-bosses. Is there anything to be gained by a hard-and-fast rule there; or should not the mine management be competent to say whether a man is fit for a position as boss or not;—is there any virtue in a certificate at all? A certificate may not belong to a man whose possession it is in.

2197. Do not you meet the greatest muffs with certificates? Yes.

2198. Who are utterly useless when put to any work? Yes. In selecting shift-bosses the only thing is to select men that you have a personal knowledge of. It is to the interest of the management, in appointing shift-bosses, to appoint the most efficient men available, and, it being to their interest to do so, I cannot see where it requires a law; and, as I have said, the possession of a certificate does not necessarily imply that the holder is suitable.

2199. In view of the Employers' Liability Act, and the fact that an employer is liable for the work of any incompetent person; that is in itself a safeguard? Yes; the manager, in his own interest, is not going to appoint an incompetent man, because he may bring blame upon himself in so doing.

2200. As to granting certificates to engine-drivers,—I presume there is no objection to that, seeing that engine-driving is a skilled occupation? I think engine-drivers should be certificated.

2201. *His Honor.*] As to granting certificates to managers and sub-managers,—what do you say as to that, Mr. Horwood?

Mr. Edwards: If no man were allowed, your Honor, to take charge of men unless he were certificated, would it not hamper, to a tremendous extent, prospecting and mining operations?

His Honor: In the Coal Mines Act, the manager and sub-manager must, in certain cases, hold a certificate, and the only way to get at them is to suspend or cancel their certificates.

Mr. Edwards: Yes, your Honor; but a coal mine is a thing that is carried out on a very large scale, and is well established; it is far different from a small prospecting operation.

His Honor: But I fancy there is some limitation under the Coal Mines Act which would meet such a case. I do not think there is found to be any practical difficulty in the working of that Act now.

Witness: I do not think any competent manager would raise any objection to the granting of certificates; but care should be taken not to bear harshly upon the smaller concerns.

Mr. Edwards: There are men on this field who have been reared in mines, who still would not be able to pass a theoretical examination.

Witness: I do not think the examination should be altogether a theoretical one; it should, in the main, be a practical one.

His

His Honor: The examinations held under the Coal Mines Act are such that any first-class, practical miner could pass. The limitation clause that I referred to reads:

In the case of a mine in which not more than twenty persons are employed it shall be sufficient for the manager to hold a permit from an inspector; such permit shall remain in force for twelve months, but may be renewed at the option of the inspector.

That would admit of some little elasticity which would not interfere with prospecting.

Mr. Edwards: Yes, your Honor; that is what I wanted to get at.

2202. *Mr. Edwards*.] Mr. Polkinghorne said something yesterday about thimbles to prevent cages from overhauling;—you perfectly agree with him that the most approved appliances should be used? Yes; I think that ought to be the rule.

2203. *His Honor*.] A hook has been used in England for many years, which will prevent overwinding, and yet not cut the ropes? Yes; and it is in use throughout Victoria.

2204. Compulsory by legislation, or by choice? I am inclined to think it is compulsory. We have had some of them in use on the Proprietary.

2205. You have no substantial objection to them on the ground that their adoption might make the engine-drivers careless? I have heard that objection, but I do not think there is anything in it.

2206. *Mr. Polkinghorne*.] At the commencement of your examination yesterday you said, in reply to a question from his Honor, regarding the contract system, that at 4 o'clock, Wednesday, every alternate week, the fortnight terminates? Yes.

2207. Work done up to that time should be paid for in that fortnight? That is the aim. Of course, the amount of work has to be estimated, sometimes, before 12 o'clock, in order that there should be no delay in re-letting contracts for the succeeding fortnight.

2208. But in all cases where a party of men are removed from one stope to another, you think it is the aim of the company that the men shall be paid for the labour they have laid out in the particular stope from which they are removed? Yes.

2209. If the foreman finds it desirable to take away certain work from a party, and add it to the adjoining party's work, in that case, the first party should be paid for the work they have done? Yes; the actual work they do should be paid for.

2210. Do you think there is the same number of men working underground now as there was eighteen months back? I do not think that there is any marked difference one way or the other, as far as the Proprietary is concerned. There may be a slight increase, that is, of miners. The truckers number less than they did eighteen months ago.

2211. In your opinion, the accidents have been less under the contract system than they would have been under wages? I think the total number of accidents would have been considerably greater under the wages system than has been the case under the contract system.

2212. You gave as your reason that one man does as much under the contract system as two men under the day system? Not as the only reason, but as partly the reason.

2213. Would not the wages system tend to lessen the number of accidents somewhat, seeing that the men would then have ample time to put their workings in, and keep them in, a safe condition;—under the contract system a man in order to make a fair thing will probably only devote two shifts to putting in a set of timber to secure his working place, whereas under the day system he would be able to devote three shifts to it;—under the present system a man says, "I have to run a deal of risk, but I will risk it rather than put in another shift to make it safe;"—under the day system, the bosses would compel that work to be done? In the contract system, the price is fixed at such a rate as will allow the miner to take all precautions for his safety, and, in addition to that, excavate a sufficient number of sets to give more than the average rate, or, at least, the average rate, of pay. Further, I claim that the extra time that was taken under the wages system was not spent by the men in securing their ground, but in a variety of ways other than that.

2214. You said, further, Mr. Horwood, that the average earnings were 10s. 6d. a shift for the last two years? Yes, 10s. 6d., or over.

2215. You say the taking away of men from a contract in the middle of a fortnight is avoided where possible? Yes.

2216. Men have been taken away on occasions in the middle of their fortnight? Yes, but from considerations quite apart from the earnings the men happened to be making.

2217. But the imputation has been made that it was because only of the earnings that were being made? I have heard that, but you cannot prevent people from imputing all sorts of things. Men are a bit suspicious when they are stopped in work that is bringing them in good pay, and make up their minds, no matter what reason the company's officers have for making such a change, that it was done merely to prevent them from earning too much. I maintain that our books show that men earn from 15s. to 20s. per shift for a full fortnight; and that being shown in the books points to the fact that men are allowed to work out their contracts.

2218. It is said that where men are taken away from a good piece of ground they are brought back after a lapse of two or three weeks to the very same stope and paid a less rate? They may not be put back at the same price, certainly. The condition of the stope at the time the stoppage took place may have altered, as compared to that when the contract was let, thus requiring a change of price when work is again resumed.

2219. But I am referring to the same ground—where the stope has remained idle during the time that has elapsed? I do not say that it may not have remained idle, but that does not, necessarily, go to show that the reason they were shifted was that the price they were getting was too much. It is totally against rule and against practice that such a thing should be done.

2220. Is not that quite sufficient to induce men to say, "We were only shifted out to prevent our getting too much"? I admit you cannot prevent the men imputing anything.

2221. But is it not a reasonable imputation? I think these imputations will always be made.

2222. Causes of accidents, you have said, are due to many things;—to the men's incompetency, neglect, and everything that can be named; and you said, yesterday, that it was not until the companies found it absolutely necessary that they imported men here from Victoria? Yes; I adhere to that.

2223. Are you prepared to say that the larger number of the men imported during the last fifteen months are still remaining on the Barrier? I have every reason to believe that they are, although I have no means of telling. After their term was up with the Proprietary Company, they had the right of exercising the privilege, which every other man has, of changing about from one mine to another. They were introduced to the district; and we, as part of the district, benefited from their introduction.

2224.

E. J.
Horwood.
17 July, 1897.

2224. Still the fact remains that a large number of those imported were not the class of men required for the work they were imported for? There were some incompetent men amongst them; but, on the whole, we had reason to be satisfied with them.

2225. You are speaking for the Proprietary Mine in particular? We did four-fifths of the importing, as far as I can remember. We expected to get a number of incompetent men, although we took all precautions to ensure their being men who would make themselves efficient in the work to be done here.

2226. In the case of powder, as distinct from dynamite, do you think it is safer to withdraw the tamping to within a few inches of the charge than to bore a hole in close proximity; I am speaking, of course, of a charge that has missed? Yes; I think it is as safe to withdraw the tamping, and probably safer.

2227. With regard to the nitro-glycerine compounds, in all cases it is sufficient, in your opinion, to get within 3 inches or 6 inches of the missed charge to explode it with another primer? I do not think it is necessary to go nearer than 3 inches in any case. If a plug does not take effect within 3 inches of a charge, another plug could be inserted, which would be, of course, nearer to the charge than the first one was; therefore 3 inches could safely be left as the distance to which tamping should be withdrawn.

2228. You yourself have not had much practical use with explosives? I am not a practical miner. I have not served my time as a miner; but, for all that, I have seen these things used considerably.

2229. Do you not think that, in the majority of cases, if you withdrew the tamping to within 6 inches of the charge, it would be sufficient to enable you to explode it? I do. I think in the great majority of cases 6 inches would fire the charge. I believe in the majority of cases a foot, even, would fire a charge; when using the same hole; but, in some cases, it may not. It would be safe to make it a rule that the tamping be not withdrawn within 3 to 6 inches of the charge.

2230. You quite agree that in many cases a plug inserted on a foot of tamping would explode a charge? Yes, in most cases.

2231. It would be much safer to do that than to bore a fresh hole alongside? Yes.

2232. You know the instructions issued by Nobel with all his glycerine compounds? Yes.

2233. Are they sufficient for the safe handling of the explosives? Those instructions are framed to conform to the existing mining regulations in the countries in which the explosives are used. That is why they say no tamping shall be withdrawn; of course, you must admit, at the same time, that it is to the manufacturer's interest too to have as much explosive used as possible. In the same way, we are, in our rules, compelled to embody matters we do not agree with, in order to conform to the Government regulations. Nobel, no doubt, is in the same position as we are ourselves.

2234. I believe Nobel says that no other tamping but sand or water is required for the glycerine compounds? Yes, and they insist on tamping.

2235. You believe that tamping of some sort is absolutely necessary? Yes, for efficient work; and, in some cases, for safe work. A secondary explosion takes place sometimes as a result of insufficient tamping, which gives out noxious gases.

2236. In the case of "bulging" a hole for a charge, do you think two hours is too long a time to wait before charging in all cases; would it be advisable to have a hard-and-fast rule stating two hours as the time? It depends upon the nature of the rock very largely whether anything like two hours is necessary. Again, if water can be used, there is no need to wait so long as that. I would place the limit from 1½ to 1¾ hours.

2237. Would you bring "bottoms" under the same category as "bulled" holes? In what way?

2238. Say a charge in a hole throws off the upper burden only, and leaves the bottom part of the hole and the bottom burden intact; what time should elapse before again charging that hole to bring the remainder of the burden? It should, decidedly, be treated the same as a "bull." There may be some burping piece of fuse left in it which would make it just as dangerous as an ordinary "bulled" hole.

2239. As to Sampson's case. The question has been asked me why nothing was placed under the plat-sheet in his case. I would like you to explain how that accident occurred? Sampson and his father were running a cross-cut from the side of a stope, and a portion of their material had to be disposed of through a shoot leading to a stope worked on a lower level. The top of this shoot was securely covered by means of a large steel or iron plat-sheet; and the father and son, knowing the position of this shoot, went to uncover it; and, while uncovering it, the son slipped down the hole. This was my information, as reported by the foreman.*

2240. The plat-sheet, then, was placed in that position to securely cover the shoot? It was used partly as a means of turning trucks of ore taken from the stope adjoining. There were two lines meeting at right angles on this sheet; and as well as serving as a turning point it served as part of a covering for the shoot. This shoot had been previously used for receiving mullock for below; and each time the sheet was removed in order to form an opening.

2241. Were they removing it under instructions, or were they removing it to place it in position? They were moving it with the view of enabling them to tip their mullock down the shoot.

2242. As to the Inquiry Board: you think a Board of Inquiry is not necessarily required; what objection would there be raised to a Board of Inquiry consisting of (say) a man appointed by the mining companies, a man elected by the miners, and someone appointed by the Government;—what objection is there to a Board so constituted inquiring into any accident that takes place? I think the Board is unnecessarily large. All sides can be represented by the evidence forthcoming. I think the evidence would be sufficient representation for all parties, so long as you had an impartial Judge. I do not think it would be necessary to have an unwieldy Board.

2243. While we may have some men whose verdict we may be prepared to accept, there may be others where the case would be otherwise? The Government could dispense with their services if they proved unworthy.

His Honor: But you have to abide by their decision in other cases, such as law cases.

Mr. Polkinghorne: But don't you think, your Honor, that the very sight of a Judge or Police Magistrate—more especially a Judge—would be sufficient to damp witnesses and cause them to withhold evidence they might be in a position to give.

His Honor: I do not see that.

MONDAY,

* NOTE (on revision):—I have since ascertained that the foreman was mistaken as to the men knowing that the shoot was covered by the plat-sheet. They were (I now understand) unaware of this, and were removing the sheet to use it elsewhere, on their own responsibility.

MONDAY, 19 JULY, 1897.

Edward James Horwood re-called and further examined :—

2244. *Mr. Polkinghorne.*] It was said, Mr. Horwood, that the dropping of a spark into a charge of powder would have a disastrous result;—would not a spark dropped on to unconfined dynamite produce a result just as bad? The burning of dynamite would not result so disastrously as would the ignition of gunpowder.

E. J.
Horwood.
19 July, 1897.

2245. A spark falling on to a charge of dynamite would have a tendency to burn it? In the case of powder, an explosion would ensue; and, in the case of dynamite, burning would generally follow.

2246. Several classes of powder are used for explosive purposes? I take it that you are referring to blasting powder, as distinguished from Hercules powder.

2247. There was a powder made in Victoria, commonly called "Donald Dinnie" by the miners; it was put up by miners in kerosene tins, and was considered to be a very good explosive; well, that powder would burn? Undoubtedly, there are classes of powders that will burn, and that require detonation to explode them; but I have been referring only to ordinary blasting powder.

2248. *His Honor.*] I understand that you are now referring to powders in the shape of explosives—not necessarily to gunpowder? Yes, as distinguished from nitro-glycerine compounds.

2249. There are some explosives in the form of powder, and that yet are not of the qualities of gunpowder? Yes.

2250. *Mr. Polkinghorne.*] What would be the result of fire getting to dynamite;—would it burn in all cases, or would there be a likelihood of its exploding? I think it would be very exceptional for an explosion to take place. Burning would be the general effect.

2251. And the gases thrown off would be very injurious? Certainly.

2252. Is it your opinion that detonators are required to explode any other class of explosive outside the glycerine compounds? Yes, certainly.

2253. Are there any kinds that you can mention that are in use? Hercules powder is one; and roburite.

2254. *His Honor.*] What is roburite;—what is its composition? We had trials with roburite extending over some considerable time. We were comparing it with dynamite; I forget the exact composition of it.

2255. Is it a nitro-glycerine compound? No.

Inspector Hebbard: I think there is ammonia in it, in some form.

Mr. Edwards: It requires a far more powerful detonator than the nitro-glycerine compounds.

Mr. Williams: Would His Honor have any objection to asking Mr. Horwood to submit the formula for roburite.

Witness: I think I have the formula for the approximate composition of it. We used it for two or three months, and no men were hurt by it, although I believe it is a fact that its sale has been objected to. It is not now sold in Broken Hill.

His Honor: As this explosive has gone out of the market, evidence upon it would not be of much use to the Commission.

Mr. Williams: I would like to have the formula, your Honor.

Mr. Edwards: I think Mr. Williams would have no difficulty in obtaining one from the local agent.

It had the name of being a very safe explosive; but the fumes it gave off were very objectionable.

2256. *Mr. Polkinghorne.*] In reference to the open-cuts: you say that so far as the working face is concerned, each shot alters its condition, and you cannot keep a regular batter;—do you mean to say that, in order to take down a regular face, it is wise to first undermine the place; or should it be taken from the top at all times? It should not be undermined to an unsafe extent. It depends upon the nature of the ground how steep a face should be allowed to become before the next shot is fired. Some material will almost stand vertically without any danger whatever, to a moderate height—say 25 feet. Some of the material forming the lode here can be worked in that manner, while other material close by requires a comparatively flat slope to be safe.

2257. In all cases you only want the most practical men you have to look after them, and give instructions as to how the face is to be kept? That is all that should be necessary.

2258. I think you answered a little while back a question on the Lead Poisoning Act;—in your opinion, is everything done that can reasonably be done to carry out the provisions of that Act? In so far as my connection with it is concerned—and I can only speak of the work of my own department—that is my opinion. I am not in a position to speak as to what is required in other departments; and also I am unable to say what is done; but, as far as that is concerned, I have no reason to think that the provisions are not carried out in any of the departments.

2259. You speak more particularly of the mining department? Yes; the extraction and handling of ore.

2260. You think that the regulation that is now supposed to be in force on the Proprietary, as to charging holes while men are in the face, should be strictly carried out? Yes; it is one of the rules, and I certainly think it should. We always endeavour to enforce the rules.

2261. You have never been brought face to face with any breach of that regulation? I may have been brought face to face with it on an exceptional occasion, and had it corrected. The rules are broken, of course, sometimes; but I can remember no particular occasion at present when the rule you refer to was broken.

2262. You recognise that it is highly dangerous in all cases of "bulling" or charging for men to be in the face while they are being carried on? There is a distinction between "bulling" and charging. In "bulling" it is simply necessary to stand at a moderate distance away from the face, according to the nature of the "bull" and the nature of the face that is being operated upon. In firing charges, however, no man should be in the vicinity. That is the intention of the rule.

2263. One of your rules says that no man shall be in the face when a hole is being charged? Yes, that is so, other than those engaged in charging other holes. Of course, that is implied.

2264. If a regulation were framed enforcing men to change in the face, and at all times to point out the condition of the face to the incoming shift, would it not very often be a matter almost of impossibility for the men to do so? I cannot see how it would. It is not the rule that all firing takes place at the end of the shift, and that the faces are unapproachable at that time; it is rather the exception. And when firing does take place at the end of a shift, it is not right at the end, because the men themselves like to see the result of their firing. I cannot see anything to prevent the relief shift from seeing the face.

2265. While a man might wish to see the result of his labours before he knocks off, which I admit is quite

E. J.
Horwood.
19 July, 1897.

quite probable, he would not require to stay in the face to do so, because he would only require to slip in and out; whereas the relieving shift would have to stay in there and work, and they would find it very unpleasant? In these cases I admit that it may necessitate the men waiting a little longer, should there be anything in the face to be pointed out, but to get over that they would in future fire earlier.

2266. Do you know that men will drill right up to the last minute but what they will get a hole off? Yes; but it is an exceptional occurrence to fire at the end of a shift; and it would be an exceptional occurrence if they left the hole to the last moment. A case of that kind would be one in many hundred.

2267. Taking the whole of the parties working on blasting ground, it is your opinion that a great majority of them do not fire on the close of the shift? There would be nothing, in my opinion, to prevent their firing as much earlier as this relief business would necessitate. It is only a matter of arranging their work a certain number of minutes earlier; and I see no reason why it should not be done.

2268. But I think you will admit with me that, in the great majority of cases where blasting operations are carried on in the different faces, it is not the exception but the rule that they fire about the end of shift? Many parties certainly do fire towards the close of the shift; but, knowing that they are not required to go into the face to point out things to their mates, they leave it until the end of the shift. If it were the rule that they had to point out the condition of the face to their mates, they would arrange to complete the firing so much earlier.

2269. And, in cases where it could not be, it would be the exception? Yes; quite the exception.

2270. You think there should be no restriction on the depth of the holes bored in the open-cuts? I think the operation would limit itself at a depth less than what could be considered a dangerous depth. It would be inconvenient to bore an unduly deep hole; and it, therefore, would not be attempted.

2271. What would be the danger in connection with a long hole other than there would be in a short hole? As I pointed out before, the only danger I can see, that might be considered an increase, is this: That the charge has to pass through a greater lineal depth to reach its destination; and, should there be irregularities in the ground, this charge would have to pass through a greater number of irregularities before reaching its destination; but in view of the fact that one long hole may do as much as three small holes, and not nearly reach the total depth of three small holes, that is one reason why deep holes should not be prohibited.

2272. But if there be irregularities, is there not a great danger in getting the explosives to the bottom in a deep hole? According to the number of irregularities you pass through, so you meet so many dangers; but you pass through more irregularities in three shallow holes than you would in one deep hole to do the same work.

2273. I do not want to infer that, instead of one 15-foot hole, you should have three 5-foot holes? The comparison is the same; it is just a matter of degree.

2274. Say you are taking up a "lift":—there is a great deal of danger in connection with taking up these "lifts" if you bore deep holes. Holes are bored to a greater depth sometimes than take; and don't you think it would be very dangerous in those cases? I do not see that any danger can arise from non-explosion to a greater degree in a deep hole than in a shallow one.

2275. What I mean to say is, that the shorter holes are so arranged that the holes will be uncovered by the explosion; whereas in deeper holes a lot of the hole remains covered after the explosion? Covered with loose material only, if a successful shot; and as a rule all shots are successful.

2276. Your attention has never been drawn to shafts fired in the open-cut—where a hole has been bored 15 ft., and the explosion has only uncovered 10 ft., and, on blasting later on, it turned out that part of the charge had been left in the "bottom" unexploded? I have never heard of that. That might just as likely happen in smaller holes. I have never had any direct evidence, where a good explosive, properly tamped, has been used, that any part of the charge has remained unexploded.

2277. You said on Saturday that, in your opinion, in those open excavations underground, carried on principally in the sulphide portions of the workings of the mines, a man should never be placed to work in any position but what he could command the "back"; that would mean that 9 ft. to 10 ft. over the staging should be the maximum distance? Yes, as far as that over the staging.

2278. Would not the safest way be to take out 10 ft. and put in your permanent timber, so that you would always have a staging of permanent timber to work from? I think it would be perfectly safe to carry a stage up a moderate distance. It might be either a stage or the ore you are breaking, which you could let remain underfoot to stand on. In accordance with the nature of the ground you are operating upon so you would vary the height before putting in permanent timber.

2279. I believe all ground is susceptible to atmospherical changes? Yes, in time; but it does not take long to put in timber.

2280. No; but there would be great danger;—say a stope was taken to a height of 30 ft., and that all the ore on the floor had to be taken out;—would there not be a great danger while taking out the ore owing to the unsafety of the roof? The character of the ground would alter cases. If the ground would not stand and sufficiently long you would limit the height.

2281. *His Honor.*] Mr. Polkinghorne is coming to this—whether there ought not to be some definite limit beyond which stoping should not be allowed to go in this way? I do not think that placing a definite limit would meet the majority of cases where accidents might happen, because, in the great majority of cases, the stopes are carried to within the limit that would be considered perfectly safe.

2282. If a limit were made it would encourage men to go up to that limit in cases where otherwise they would not; therefore it would be better to leave the height of the stope to the man in charge? Yes; working under the instruction of the inspector of the district.

2283. The proper limit would be so very variable, that were you to leave a permitted maximum it would be rather apt to tempt men to adopt it as the height which they should reach in all cases? Yes; it would have that tendency.

2284. *Mr. Polkinghorne.*] You will agree with me that 10 ft. is a sufficient height to enable sill-timbers to be placed in position? Yes; but there is certain ground which will not admit of the timbers being brought as close as 10 ft. to the face; so it would mean a minimum close on 20 ft. overhead before you could put in any permanent timber, because, when you put in the sill, that occupies (say) 9 ft., and leaving a height of 10 ft. over that would bring you close on 20 ft. before you could, with safety, put in any permanent timber.

2285. Nine feet will take up the usual sill-timber—9 feet is the height required to go before you can get your

E. J.
Horwood.
19 July, 1897.

your timber in? In cases where it is safe to put your timber close to the ground (roof); but there are cases where it is not safe to put permanent timber within 10 feet of the roof ("back").

2286. *His Honor.*] How is it there are cases where it is not safe to put the timber within a certain distance of the roof? If you put the timber comparatively close to the ground (roof or "back"), you have no means of protecting it from the large lumps—sometimes running up to 20 tons—that are brought down in those excavations. You want something to distribute the concussion. You want to have room to cover your permanent timber with a layer of old useless timber, and upon that, again, a quantity of "dirt."

2287. *Mr. Polkinghorne.*] But you would not require 10 feet above your sill timber in order to get sufficient room? You may not; but, if you are only going to put in one set at a time, the men are exposed to danger longer than if allowed to work up the excavation to three or four floors.

2288. If the excavation was only worked to within 2 feet of the sills would not the men be working closer to the "back," and would that not give them an opportunity of seeing whether there was any dangerous portion in the "back"? Ten feet is the height of the face when finished. They are working, when putting in their holes, within a few feet of it, as they are standing on the ore broken down. Of course, when the work in the face has been finished, an efficient stage should be in position within 10 feet of the ground.

2289. Always keeping the stage within 10 feet of the "back"? Yes, if the men are going to work under the "back."

2290. You said you did not think it was beneficial to the company that men should be working in stopes in too close proximity to one another? It is detrimental to the company's interest in most cases.

2291. Wherever possible the men have been distributed to the best advantage? Yes, taking into consideration the nature of the ore demanded by the treatment works.

2292. You will admit that two parties working directly over one another—one, say, on the sixth floor, and the other on the seventh floor—are too close? It depends on the width of the floor.

2293. But I mean directly under? As a rule, it would be a mistake to work so close as that.

2294. You are quite agreed that engine-drivers in charge of winding engines where men are hoisted should be certificated men? Yes. I may be allowed to make mention regarding deep holes in quarry work. I was going to point out a little while back that an additional safety in the use of deep holes, as compared with shallow holes, is that, in the event of a premature explosion, there is less danger with a deep hole. Further, when the shot is fired at the proper time, the material scatters less with a deep hole. A deep hole will shift as much as two shallow holes; and two shallow holes would scatter material much more, and be a source of much more danger than one deep hole. It is much easier to overload a light hole than a deep hole, and thus scatter rocks, because the larger the quantity you are dealing with, the less effect a few extra pounds have.

2295. *Mr. Williams.*] In your evidence, you referred to some statements tendered by John O'Brien as being grossly exaggerated? I did.

2296. You said that it was a false charge? I said words to that effect in reference to one of his statements.

2297. Did you understand the question as put to you by Mr. Edwards as portending any future proceedings? I simply answered the questions put to me.

2298. You did not consider any question was put to you with an idea of involving intimidation? I simply answered all questions put to me without thought of intimidation or anything else apart from the matter.

2299. You are aware of the difference in the education of yourself and that man? Yes.

2300. And in your relative positions? Yes.

2301. And you will admit this—that the less a man is educated, the more inclined is he to exaggerate? I don't see how that should be made an excuse for exaggeration.

2302. Do you not think that education enables a man to view things around him with more impartiality? Not in the case of everyday facts. It would, no doubt, operate in cases where there were complicated circumstances; but there only.

2303. Have you ever seen O'Brien up there while working under the contractors? I saw him while engaged in removing sulphide ores.

2304. In the company's employ, or the contractors'? He was in Lewis and Duxbury's employ at the time I speak of.

2305. Have you ever seen him in the employ of the company, apart from the contractors? Not to my knowledge.

2306. You admit the possibility of men viewing things from their standpoint, in a manner different from what you would;—you would not expect O'Brien to view things as you would? For plain matters of fact, I should.

2307. It has been stated that the men have a better knowledge of the workings of the mine than the shift-bosses, and the shift-bosses than the foremen, and so on. Therefore, in deciding a plain matter of fact, you would consider that O'Brien had an advantage over the shift-boss, who only occasionally visited the face, (say) in a case of danger? No. In minor matters of danger I would, such as an unreliable roof.

2308. You will admit that a man working in a face continuously would, necessarily, know more of what was occurring there than would the man who only pays the face a visit once or twice in a shift? That is the general rule.

2309. The man who continuously works in any place would know more about the general method of operation than you? No; I do not say that.

2310. I put that question for analogy only;—do you think an efficient manager would know more than the man who is working there the whole time? The manager acts on his own judgment, aided by the judgment of all those who are assisting him.

2311. Is it not possible—from your knowledge of the workings up there—that O'Brien might have spoken as he did from a natural tendency to exaggerate things, rather than a wilful intention to come here to do you harm? I have no opinion on the man's character. I never heard of him before.

His Honor. Mr. Horwood did not express any opinion as to whether O'Brien was wilfully misrepresenting facts, but simply said that O'Brien, as far as his knowledge went, had made a mistake.

Mr. Williams. Very good, your Honor; I am glad to hear you say that.

2312.

E. J.
Horwood.
19 July, 1897.

2312. You do not intend to charge that man with a wilful perversion of the truth, but simply to place your opinion in juxtaposition with his? It is not always a case of opinion; it may be a case of perversion of fact.

2313. It may be prejudice? But prejudice has nothing to do with truth.

His Honor: It is for me to determine whether O'Brien was accurate or mistaken, from the other evidence I have heard.

Mr. Williams: I did not want any impression to arise that there was any intimidation on the part of the Company to prevent men coming here. Another thing, your Honor: Is not this Commission appointed to inquire into the correctness of the report submitted to the Minister for Mines by the Chief Inspector of Mines, and the report submitted to the latter by the Inspector of Mines?

His Honor: The Commission has nothing to do with what anyone may have said.

Mr. Williams: What limit is there on the word "recently," as appearing in the instrument appointing the Commission?

His Honor: I cannot answer that question.

Mr. Williams: Have we had any evidence from inspectors that accidents have occurred, and have they occurred recently?

His Honor: The Commission takes cognizance of the fatal accidents that have happened during the last three years, and of the non-fatal accidents that have occurred during the last two years.

Mr. Williams: May I presume to ask your Honor to summon the Chief Inspector of Mines and the Inspector of Mines, so that we may be the better enabled to arrive at a correct solution of the difficulties with which we are surrounded?

His Honor: I do not think that Mr. Slee knows anything about the subject intimately; and I certainly do not intend to bring him up from Sydney. The Local Inspector is here, and will be examined as a witness.

2314. *Mr. Edwards.*] I think you would have no objection to a hard-and-fast rule prohibiting men from continuing a hole from a "bottom"? Apparently, you cannot expect some men to take sufficient care to ascertain that "bottoms" are not dangerous, and I do not think such a rule as you suggest would be objected to.

2315. *His Honor.*] How would you define a "bottom" for that purpose? The part of a drill hole left in a face. In some cases, of course, the hole may be 2 or 3 feet long. There is a certain amount of danger in all "bottoms."

2316. A "bottom" is that part of a hole not acted upon by the explodent? Yes; the explodent may not operate right down to the bottom of the bore.

2317. Would you, Mr. Horwood, make it a hard-and-fast rule that you must never re-bore from an old bore, or would you allow miners the discretion to utilise an old bore if they thought fit;—of course, after testing to see that there is nothing left in it? I think if men would bear in mind that these "bottoms" should be considered dangerous, and that they required careful treatment, the case would be met just as well as if a regulation were framed; because many of these holes could be used again, and the regulation would be broken, and there would be no chance of detecting the men. It is one of those cases where, if a regulation were made, it would be frequently broken.

2318. Do I understand that it is never permitted to a miner to put in a bore anywhere without permission of the shift-boss? It is exceptional, your Honor, that a shift-boss is referred to as to where a hole should be put in. It is only in cases where the men show themselves deficient in judgment that the boss interferes.

2319. The shift-boss has the right to say to a contractor that he shall not put a bore in without consulting him? Where he sees that the interest of the miner or of the company is being affected detrimentally by the position in which a hole is being bored, he has the right to stop the hole and have it put in in his own way.

2320. Don't you think this—a modification of Mr. Edwards' suggestion—would be a good rule: that no man be allowed to bore from an old "bottom" without first obtaining permission from the shift-boss or the man in charge of the work? That might lead to a lot of delay.

2321. But is not the shift-boss always to be found within a few minutes? He might be within a few minutes' walk of the face where the "bottom" is, but the miner might not find him within an hour. It might so happen that the miner would be following in his wake some considerable distance before finding him.

2322. You think it should be left to the discretion of the miner himself? I think it is one of those matters that could be left to the miner himself.

2323. *Mr. Edwards.*] Or a clause drawing attention to the danger might be embodied in the working rules? Yes; the attention of the men could be drawn to the danger.

2324. *His Honor.*] Would it be possible to test all unexploded holes by putting in another charge? A test should be made in all holes the bottom of which cannot be seen.

2325. That would be with a detonator and small portion of a plug of explosive? Yes.

2326. That rule, then, would be a safe one to adopt? I think it would be better to have such a rule. If these "bottoms" were not to be utilised the miner would not take the same care to see whether any unexploded material was in them. He would bore holes near them, and, when fired, loose pieces of explosive would probably be scattered with the burden; and this would give rise to a danger just as great as if he bored into an unexploded part, because, in breaking up afterwards with his hammer, an explosion would inevitably follow.

2327. You think it would be a good rule for every old "bottom" to be tested with a small charge? Yes; every old hole, where there is a doubt, should be re-exploded.

2328. Into which you cannot see to be sure that it contains no unexploded explodent? Yes; in all those cases it would be a good rule to insist upon their being re-exploded.

2329. That being done, you would not make any rule as to re-boring in an old hole? I do not think I would.

2330. That would pretty well ensure the risk being done away with? I think it would.

2331. *Mr. Polkinghorne.*] I believe, as a rule, miners do not bore any deeper than they can possibly help;—it would necessarily follow that, if only portion of a burden were brought down, they would re-charge in order to bring down that portion left behind? It might be considered, in some cases, more economical

to

to deepen the hole and then charge it than to fire the hole without boring; and I dare say it is more often done in that way. There are plenty of cases where it would be more advantageous if the hole were deepened.

E. J.
Horwood.

19 July, 1897.

2332. I think the method generally adopted is to re-charge the hole and explode it? Where you are not limited as to the distance you are going in the direction of a bore-hole, I think, in many cases, it would be better to deepen the hole.

2333. *His Honor.*] The rule proposed would not interfere with the action of the miner in either case? Mr. Polkinghorne means, I think, that you should not only put in enough explosive in the second charge to explode the unexploded material, but to bring down the burden.

2334. *Mr. Polkinghorne.*] You would not object to one of the working rules providing that, in all cases, all "bottoms" in any place where a strange party of men might be put to work should be examined by the man in charge or the shift-boss? I think I would make each man responsible for his own "bottoms."

2335. But the "bottom" may have been left twelve months ago, and the man responsible be in West Australia? That would be an exceptional case, of course; and you could say equally as well that the shift-boss might also have left.

2336. But when a party are being put on after another party, should not the shift-boss take precautions? I do not think it would be fair to make him responsible.

2337. *His Honor.*] No harm would be done in that case by putting in a detonating charge? I think in all cases it should be the rule that "bottoms" be re-exploded before being deepened.

2338. *Mr. Edwards.*] You could not put that responsibility on to a shift-boss? No; he would only know in exceptional cases.

Mr. Edwards: I understand, your Honor, that the practice of men going to old "bottoms" and continuing them has been productive of several accidents in different parts of the colony—accidents that have been brought about purely by ignorance, and there should be a rule for the purpose of preventing repetition of such accidents: making it compulsory to re-explode all old "bottoms" would meet the case. As an instance, I could quote the accident in the "British."

Mr. Polkinghorne: The men, in that case, were boring a new hole, which came in contact with an old one. That shows the necessity of re-exploding a hole that has not brought its burden.

Mr. Edwards: That is the suggestion His Honor has made.

His Honor: You think it would be better to neither re-bore a "bottom" nor bore another hole near it, without first putting in it a detonating charge?

Mr. Polkinghorne: I believe miners of ability are very careful about old "bottoms," but some men are not as careful as they should be; and, seeing that carelessness as to "bottoms" would prove a source of danger, not only to themselves, but to others, your suggestion could, with advantage, be adopted.

Alexander Stewart sworn and examined:—

2339. *Mr. Edwards.*] Your name is Alexander Stewart? Yes.

2340. You are General Manager of the Broken Hill Proprietary Company, Limited? Yes.

2341. You have occupied that position for how long? About three years.

2342. Would you tell the Commissioner, Mr. Stewart, what experience you have had, and your different qualifications as a mine manager? I have been regularly trained to mining. During the last twenty-five years I have been engaged in mining only, and have had charge of some very large works. I do not think I would detail my further experience, but would be glad to answer any questions as to it.

2343. *His Honor.*] I understand you were brought from Spain direct to hold this office? Yes.

2344. *Mr. Edwards.*] I think, as manager of the Tharsis Mine, you had very large experience in open-cut work? Yes.

2345. Can you give the Commissioner some idea as to the quantity of material that was removed from the open-cuts there, and under your superintendence? I think we moved about 2,000,000 tons per annum, making about 20,000,000 tons for the time I was there.

2346. *His Honor.*] To what depth did the open-cuts extend? Between 500 and 600 feet from the surface.

2347. That is the vertical depth? Yes.

2348. What was the nature of the rock? Very much similar to the country rock here; but the ore was very much harder.

2349. The climate is not very much unlike the Broken Hill climate, but the rainfall is heavier? Yes; the average rainfall there is about 24 inches per annum.

2350. What is the average here? From 9 to 10 inches.

2351. For the purpose of working the mine here, you have several departments under you, viz., the underground workings, the surface workings, the metallurgical, and the engineering divisions? Yes; besides others. We have an establishment at Port Pirie, too, which is also under my charge; and it contains several departments.

Mr. Edwards: But they would be outside the scope of this Commission, your Honor?

His Honor: Yes.

2352. *Mr. Edwards.*] I suppose, in selecting the officers who are in charge of these different departments, and also those lower in grade to them, you have chosen men who are substantially qualified for the different duties? Yes; men who are specially qualified, and the very best men that can be obtained.

2353. That is, ranging from the assistant manager to the "powder-monkey" in the open-cut? Yes.

2354. *His Honor.*] Do you make all the appointments yourself? They are all referred to me.

2355. And you exercise final discretion? I do.

2356. *Mr. Edwards.*] The first subject for inquiry by His Honor, Mr. Stewart, is as to the cause, or the causes, of accidents which have recently taken place in certain mines and quarries in this district; and it has been suggested that ventilation is a matter to be inquired into;—what can you say in reference to ventilation as regards the Proprietary Mine's different workings underground? I have not the slightest doubt but that it is as good as it can be. I have had no advice of any accident that has occurred through deficient ventilation.

2357. It is in the interest of the mine to see that ventilation of the best is secured? Yes.

2358. Both for the safety of the men and the timber? Yes.

2359.

A. Stewart.

19 July, 1897.

- A. Stewart.
19 July, 1897.
2359. It has been suggested that the contract system has given rise to an increase in the accidents:—can you say that there is any ground or any justification for such a suggestion? From the experience I have had with contract work—not only here, but elsewhere—I can say that it tends altogether in an opposite direction.
2360. Are there reasons for that? In contract work you naturally breed a very much better class of worker—more expert men, with more interest in their work; and these men are less liable to meet with accidents than the slow men on day-labour who take no interest in what they are doing.
2361. In connection with this, it was said that accidents were introduced by reason of the contractors having to rush their work in order to make the average pay or average remuneration obtaining in day-labour? That is a mistaken idea altogether, because contracts in this district—in the Proprietary Mine at any rate—are fixed and based on the average work that can be got from an average man to make the ruling rate of wage.
2362. As a matter of fact, what is the average rate earned by men working on contract? I think a fair average would be 10s. 9d.
2363. How many men have you employed at present in the Proprietary Mine? 2,500.
2364. Could you say how they are distributed? About 900 are underground, and the rest are on the surface.
2365. *His Honor.*] And of those, can you give the number in the open-cut doing navy work? About 350 are engaged in open-cut work alone.
2366. *Mr. Edwards.*] The open-cut work is done by day-labour, which is employed by the contractors under the company? Yes.
2367. Those contractors being under your supervision? Yes.
2368. The largest contract, I understand, is let to Baxter and Saddler? Yes.
2369. And I think they are recognised as competent a firm of contractors as there is in the colonies? Yes, I think so. They have got a very good name all over the colonies, and have done a large amount of work.
2370. As to the plant that is used in the open-cut contracts. It was stated here by a witness the other day that the plant was in a very defective condition, and that no attention was paid to the ropes or to the hooks used either for hauling trucks or lifting skips;—from your own personal inspection, can you see any justification for a statement of that sort? Not the slightest. Such a statement is untrue.
2371. It was stated that no person was appointed by the contractor to see to the condition of the working gear? That is equally untrue.
2372. As to the number of accidents that have occurred on the Barrier—have they increased of late? I am really not in a position to give the information for the whole of the Barrier.
2373. Well, then, for your own mine? I do not think so. I do not think they have increased in proportion to the increased work done.
2374. Can you account for the principal causes of accidents that have taken place in the mine? Analysing the total number of accidents that we have had, I think 60 per cent. are caused by the men or their mates, 30 per cent. are due to causes over which the men have more control than any one else, and the remaining 10 per cent. are difficult to specify. Of course there are, and always will be, accidents, not only in mines, but wherever operations are carried on on a large scale.
2375. Wherever a large body of men are employed, accidents will arise? Yes.
2376. And I suppose no amount of human forethought or care can prevent the 10 per cent. you refer to? I think not.
2377. As to the 60 per cent. that are due to the men themselves;—can you tell us how they arise, and what suggestions you would make to prevent them? This 60 per cent. is composed mostly of accidents brought about by men hurting themselves with tools, or by ore falling on them, or by falling off ladders or down shoots. Those accidents, I consider, are due to the men themselves.
2378. That is, either carelessness or incompetence? Yes; I think it is fair to state generally that these are all due to carelessness.
2379. As to the incompetent men;—are there many incompetent men employed underground by you? Not one knowingly.
2380. Any man proving to be incompetent is turned off at once? Yes.
2381. Have you done everything in your power to introduce competent and skilled men into the mine? Yes, we have done a good deal, and, in endeavouring to get good men, have spent a large sum of money.
2382. That is, in importing men from other parts? Yes.
2383. Before doing that, did you exhaust the market here? Yes.
2384. And then you engaged men from the gold-fields in Victoria? Yes; and all those men were engaged for us by competent men.
2385. And engaged at the same rate of wages as were ruling here? Yes.
2386. Did you receive any assistance from the local labour body to get men here competent to work in the mines? No; on the contrary, we received a great deal of opposition. The different bodies of men, when they arrived here, could not find places to live in; and none of the boarding-houses would admit them.
2387. Were the boarding-houses influenced by the labour parties? I am not in a position to know.
2388. You have done your utmost to put into the mines the most competent men? Quite so; and I will always endeavour to obtain competent men.
2389. I believe men are put in the mine, so long as they are competent, irrespective of whether they belong to any union or not? Yes.
2390. No distinction whatever is drawn? No.
2391. None is recognised in any way? No.
2392. Since the contract system has been introduced can you say what effect it has had on the mine and the work that has been done, in relation to the number of men employed;—I take it that the greater the number of men employed underground the greater the number of accidents that will happen. In that respect, what effect have you found to result from the operation of the contract system? The Proprietary Company's experience of day-labour underground is this:—Under day-labour, it was found necessary to employ about double the number to get through the same amount of work. If day-work had continued, there would have now been no accidents, as the mine would have been shut down. However, the contract system has been introduced; and, as it has considerably reduced the number of men, so (I take it) it has also reduced the number of accidents.
- 2393.

2393. I suppose the fact that men can earn such high wages under contract induces the best men to come forward? Yes, there is not the slightest doubt as to that.

2394. Mr. Horwood has told us that he has known men to make from 20s. to 40s. a shift for a fortnight at a time? Yes, I have no doubt as to that. I consider that thoroughly competent miners are making at least 12s. per shift.

2395. And, so long as the work is done, you are only too glad that they should earn these profits? Yes.

2396. Are any of the men engaged underground asked in any way or forced to take any unreasonable risk that is not incidental to their work? I am quite sure no one is. Of course, in cases of accidents, men are required to take risks; but, for those occasions, we always find men willing to volunteer their services.

2397. These underground rules [*Exhibit "A"*] were prepared by you? Yes.

2398. Do you think it possible, without hampering operations greatly, to add in any way to those rules? I do not think so. I do not see where they can be altered very well.

2399. Taking them generally, those rules embrace everything required for the safety of the men, if they would only adhere to them? I think so. Further, if you enlarged those rules and made them apply to details, the probabilities are that it would lead to accidents. You cannot bind a man up to do an operation in any one particular way. I find it is better to leave details of operations to the men employed in them.

2400. And I suppose the longer the rules, or the greater in number, the less likelihood is there of men reading them or paying them any attention? Yes.

2401. I suppose the shift-boss is the man who is best able to tell men what they should do under certain circumstances; and this would give greater satisfaction than a number of hard-and-fast detailed rules? Yes.

2402. In fact, there are innumerable cases where it is impossible to make any rule, and where the men must be left to the direction of the shift-boss or foreman? Yes.

2403. Is it your opinion that the men read, or attempt to work by, those printed rules? The rules are stuck up about the place, but I really do not know whether the men read them or not.

2404. At any rate, they are put there for all to read if they think fit? Yes; and the officers, as far as they possibly can, insist upon the rules being observed by the men.

2405. Have your officers instructions to supply underground men with all material they may require in order to make their workings safe? Yes, anything necessary.

2406. There is no limit? No, none whatever.

2407. Are they provided with the very best tools that can be procured? Yes; the very best tools and material that can be procured.

2408. Are the workmen underground encouraged to report any dangerous ground, or place, at once to the shift-boss or foreman? Yes; and it is their duty to do so.

2409. If they do not do it, can accidents be avoided? No.

2410. Can you tell how many men you have had to discharge during the last twelve months for incompetence, drunkenness, or disobedience of orders? I think we have had to discharge men to the average of about seventy-five each year, for the last two years, for offences which might directly have caused accidents. Of that number, perhaps one-half would have been discharged for drunkenness on the works; eight were discharged last year for leaving shots undischarged in the faces without giving any advice. Some were discharged for smoking, some for sleeping, and some for lighting fires, and an average of about 300 per annum for incompetence.

2411. How many actually left the mine during the last two years? Somewhere about 2,500 or 3,000 per annum. Of course some have gone away, come back, and been re-engaged, and these would appear twice in the numbers I have quoted.

2412. Some have left of their own accord; and some have been discharged? Yes; a good many have left of their own accord.

2413. I suppose the present system of timbering underground is the best one, in your opinion, that can be adopted for working an ore body of this description? I think it is a thoroughly safe system.

2414. As safe for the men as any that could be adopted? Yes.

2415. In addition to the timber, you fill in the places that have been exploited? Yes.

2416. In reference to the question of explosives. There is one rule in your working regulations which says that no missed-hole shall be unrammed? Yes.

2417. Do you think that is a good hard-and-fast rule to have? No. This rule was adopted by us because it appeared in the Government regulations. It is quite impossible for us to frame rules contrary to the Government regulations.

2418. What alteration would you make in that rule? This rule and others—especially those referring to explosives—in the Government regulations, were framed in 1872. They appeared first of all in the Imperial Coal Mines Act of 1872, and were evidently copied by this Colony when the Act of 1874 was being framed. All those rules are framed on blasting-powder—as that is the explosive that was in use in 1872—and they have no proper application to higher explosives.

2419. *His Honor.*] The regulations in force, under our 1874 Act, were borrowed from the rules under the Imperial Coal Mines Act? Yes.

2420. Powder is still used in coal mines? To a great extent it is.

2421. And hardly used in your mines? No, not in the ore. It is almost unknown underground, in the ore.

2422. *Mr. Edwards.*] What form should the alteration take? I would suggest that it would be safer, as a general rule, not to unram the charge, but to remove the stemming, or part of the stemming—to remove it to such a distance that a new charge can be placed over it, which, when fired, would explode the original charge.

2423. What depth of stemming do you think should be left on the original charge? I think there is not the slightest fear in removing it down to within 6 inches of the original charge. This rule brings out another danger that we are specially subject to, should its provisions be carried out; *i.e.*, the boring of a new hole at a safe distance from the original hole. It is very likely that the new hole will blow out the original charge unexploded, and lead to an accident in that way. I think the balance of safety is very much in favour of withdrawing portion of the stemming.

2424. I suppose, in the case of carbonate ores, some of the dynamite might find its way into the smelter furnaces? Yes; we have already found unexploded cartridges on the smelter floors, which had evidently been sent up from underground.

- A. Stewart.
19 July, 1897.
2425. And, in addition to that, there would be the danger likely to befall men working amongst those ore s with their hammers? Yes.
2426. Do you think a charge could be exploded by leaving 6 inches of stemming between it and the explosive? I think there is no fear of its missing at a distance of 6 inches.
2427. I believe some recent experiments have been made by highly-skilled experts in that direction? Yes. In their experiments they went up to a depth of 14 inches of solid stemming; and they could always count on exploding a charge with that depth of solid stemming over it.
2428. Do you think it is necessary that glycerine compounds should be tamped? Certainly. That brings me on to another clause calling for comment in the Government Regulations. It is laid down that no iron or steel tamping-bar shall be used unless mounted with at least 4 inches of copper. That is altogether out of date; and if we followed it now, we would be taking considerable risk. This rule was also made at a time when blasting-powder only was used, and, for that, the miners wanted a heavy stemmer—a stemmer with some weight in it, so that they could pound the charge home. But, with high explosives, it is altogether different. They should be squeezed home with pressure only, and so should their stemming.
2429. The dynamite should then be first pressed with a firm pressure? Yes. There should be no concussion.
2430. And then the stemming should be pressed home firmly on the explosive; and with that there is no danger? No danger at all.
2431. I suppose the use of any metal tamping-bar is to be condemned altogether—either copper, steel, or iron? Yes.
2432. And softwood tamping-bars are provided throughout the whole of your workings? Yes; and they are quite sufficient for all purposes.
2433. *His Honor.*] As powder is still sometimes used in the open-cuts, I suppose you would, in point of fact, split the rule—make a distinct rule for powder, and one for the higher explosives, so as to allow men, if they were using gunpowder, to tamp heavily with a metal tamper, copper-tipped? I would prefer, your Honor, that the metal stemmer should not be used in any case.
2434. What would you use with powder? A wooden rammer is quite sufficient. You can ram it home quite sufficiently with a wooden stemmer. I consider a competent man is quite able to stem his shot properly with a wooden stemmer.
2435. So you would make one rule which would exclude a stemmer of any metal? Yes.
2436. *Mr. Edwards.*] Even in copper there is an element of danger? No, I do not think so; but there is no need for it, and I do not think any company would supply a stemmer of copper; the expense would be too great.
2437. Of course, you could have a wooden stemmer shod with copper? Yes.
2438. But, in your opinion, a wooden rammer would be better? Yes.
2439. *His Honor.*] To meet the probable ignorance of some men, would it not be better to distinguish between gunpowder and high explosives, in face of the fact that we have powders, which really are not forms of gunpowder, that are fired by detonation? I would certainly prohibit the use of iron and steel.
2440. You would think it risky to attempt to distinguish between gunpowder and other explosives, because of the other inventions that are continually coming out? Yes.
2441. *Mr. Edwards.*] There is a regulation that a workman shall not have in use at one time in any one place more than 6 lb. of explosive; that would hamper operations very much if adhered to? Yes; and I think observing that rule would tend to increase accidents. There is greater risk in taking the explosives from the magazine to the face than in actually handling them in the working face. If, instead of making one trip for explosive, they made two, the danger would be increased.
2442. Then you think that no limit should be placed on the quantity? I do not think that any advantage can be got by stating a fixed quantity.
2443. For instance, a round of machine holes would take a considerable quantity of dynamite? Yes, a very large quantity sometimes.
2444. Ranging up to a half-hundredweight or so for seven or eight holes? Yes.
2445. So if that rule were adhered to, or even approached in any way, mining operations would be at a standstill;—you would not be able to use your machines? That depends, I think, upon the meaning of this rule.
2446. *His Honor.*] Yes, it is very hard to see what the rule really does mean. It wants abolishing, and the question arises what rule should be inserted in place of it—of course, in a new Act? I consider the less carrying about of explosives we have in the workings underground the better.
2447. There is much greater risk in carrying explosives some little distance than leaving them in a quiet corner in a box specially provided for the purpose? I do not think there is any danger in having them in a box, and I do not see where the danger, if any, would be minimised by restricting the quantity to 6 lb., since that would be quite sufficient to do all the harm possible to the men in the face.
2448. *Mr. Edwards.*] Then you think the powder should be kept in proper canisters? Yes.
2449. I believe you have provided canisters? Yes.
- His Honor:* It might be well to leave the inspector the right to determine what is a proper case or canister, and the quantity of explosive to be used?
- Mr. Edwards:* It has occurred in the mines, here, that the men leave their candles in the box.
2450. In the case of missed-holes, what time do you think should elapse before they are returned to? I think at least one hour.
2451. Do you think an hour would be sufficient time? It is hard to say. I have heard of cases occurring at longer intervals; but, for ordinary cases, one hour, I think, would be sufficient.
2452. *His Honor.*] The risk, I understand, is defective fuse—the ability of the smouldering fuse to carry the fire on, even though the powder does not? Yes.*
2453. Has any fuse been invented that cannot act in that way in itself—that must either depend upon the powder or nothing? I am not aware of any fuse possessing that quality.
2454. Has not that object been sought for? It has been sought for in this way; to use electric fuses instead of powder fuse.

2455.

* NOTE (on revision, question having been misunderstood):—It is my opinion that no properly-made fuse will carry on the fire if the powder column is wanting.

A. Stewart.
19 July, 1897.

2455. But, apart from that. I mean, has the object never been sought after to make a fuse that would depend upon the powder, and the powder only, and not anything else? But the fuses in use depend on the powder only.
2456. But is not the cause of late explosions due to the powder in the fuse being intercepted somewhere;—it is not a break, really, where the powder is intercepted, because the smouldering fire continues slowly along the material of which the fuse is made, and, by and by, reaches the powder? That is not altogether the case. The cause (I think) is the bad manipulation by the miner who is charging the shot. For instance, with dynamite, if the detonator is not properly cleaned out, it may not explode, and the fuse, in passing down the cap, may light the upper portion of the charge, which, after burning for a certain time, would probably explode the lower portion of the charge.
2457. Heat will sometimes explode dynamite, in spite of the fact that it does not appear to do so on the surface? Yes; I think the heat that will explode dynamite is about 430° F. When you arrive at that heat, with any charge, you have an explosion, even without a detonator.
2458. So, in point of fact, the lighting of the nitro-glycerine without detonating it is likely to lead to an explosion? Yes; it may.
2459. And it is impossible to say how long the burning will go on before the heat has been raised sufficiently to cause an explosion? Yes; it depends upon the quality of the glycerine, the shape of the hole, and all sorts of other things.
2460. *Mr. Edwards.*] The detonators are packed in saw-dust, I believe, as a rule? Yes.
2461. And some of the saw-dust getting over the fulminate of mercury would interfere with the operation of the cap? Yes. Unless the cap is properly cleaned it may prevent the explosion of the charge. The cap also may not be properly nipped on to the fuse, which may come out again.
2462. In reference to deep holes, as distinguished from shallow ones. Do you think any limit should be placed on the depth of the holes in open-cut work? No; I do not think so.
2463. Do you think any greater degree of safety is arrived at by limiting a hole to (say) 15 feet? No; I think the balance of safety is the other way.
2464. And your reasons? If you divide a deep hole into two shallow ones, there is not the slightest doubt that you run a greater risk of accident than you would from the one hole. And, besides that, two shallow holes would do less useful work in the majority of cases.
2465. The object of the deep hole is to get your explosive as low down as possible under the burden it is to take? Yes; and if there should be a premature explosion of a deep hole, the men have a better chance to escape than would be the case with a shallow hole.
2466. In one case, it lifts the ground and spreads its force; and, in the other, it scatters it around? Yes.
2467. It has been sworn here that "bulling" a hole is very dangerous. Is that your experience? It is done everywhere where blasting has to be done.
2468. It is absolutely necessary to make a chamber to receive the charge in heavy blasting? Not necessary; it can be done without, of course; but it would be a very bad practice on the part of any miner to do without "bulling."
2469. And if ordinary precaution is taken in the "bulling," there is no appreciable danger in the operation? No.
2470. What time should elapse between the "bulling" of a hole and the beginning of putting in the charge? I think if you can get water into the hole it could be charged at once.
2471. *His Honor.*] But, in a case where you cannot get water into a hole—when it is not bored downwards? In those cases, they ought to powder the bottom of the hole well with fine stuff.*
2472. Which would fill up the crevices? Yes. I do not see any necessity for a rule fixing the time for charging after "bulling."
2473. *Mr. Edwards.*] Then you think it would be useless to have a rule limiting any particular time between the operation of "bulling" and the operation of charging? I think it would be useless. I think you should credit the miner with having some common sense. If he has no common sense, he should not be there.
2474. Given water, you can start charging at once: without water, you think that a man, by powdering the bottom of the hole with (say) sand or some other light stuff, could make the hole thoroughly secure within a short time to charge? Yes.
2475. It has been suggested that some of the fuse originally attached to the "bulling" charge might get away into the crevices in a burning state. I suppose, by powdering with sand or some other light stuff, you would prevent that? I do not say it is impossible; but it is so improbable as to be on the bounds of impossibility.
2476. You have never known of such a case in your experience? No.
2477. *His Honor.*] You have heard of a "bulled" hole having something in it which has fired the powder upon its being put in? No. I have heard of cases of accidents in the operation of "bulling" itself, through premature explosion of the "bull"; but, in all my experience, I have never heard of an accident arising from the charging of a hole after a "bull." I do not remember one single instance.
2478. That is the risk, of course, that is sought to be guarded against in making a time rule, supposing a rule is made? I think it would be better to leave such things in the hands of the persons themselves who are engaged in those operations.
2479. *Mr. Edwards.*] It has been suggested that additional inspectors should be appointed to see that every precaution is taken for the safety of the miners in the Broken Hill district. Have you any remarks to make on that? No; except that, provided the inspector we have now finds he has too much to do, he should be supplied with assistance; and he is the best judge of that.
2480. I suppose, in the appointment of any new inspector, care should be taken that a competent man is appointed? Yes; and I consider that, unless you have thoroughly competent men appointed to a district like this, where the operations are on such a large scale, you introduce an element of danger.
2481. I suppose, not only a man of great practical experience, but a man of unimpeachable character? Quite so.

2482.

* *NOTE (on revision):*—I must have understood the concluding words of this question to be "when no water is available." Water, if available, can always be got into a hole, no matter at what angle the hole is bored. If it cannot be poured in, it can be introduced by soaking a cloth in water, and, by this, sponging out the hole.

- A. Stewart.
19 July, 1897.
2482. A man free from class-feeling or prejudice? Yes; I consider that every inspector of any sort should be free from class-feeling or prejudice.
2483. And utterly free from political influence? Of course.
2484. With a view to getting over the question of incompetence of miners, are you in favour of a system of apprenticing youths to underground mining? Yes; this is the only field that I have seen where there are no young men training for miners. There is not a single instance where one has come forward from Broken Hill for training in the mining department.
2485. There is a rule that all men working in the face shall receive the same rate of pay. That must operate against apprentices? Yes.
2486. That is most unreasonable? Yes.
2487. It puts every man in the face on the same level, no matter whether competent or incompetent? Yes.
2488. Would you be prepared to accept apprentices in your mine as miners? I have never considered the proposal at all, because I have not had a single application yet. I should be very pleased to do what I could to train youths who are fit and willing.
2489. I suppose they would be required to work their term of apprenticeship the same as other youths in other occupations? It would be to the advantage of the youths themselves to be bound for a certain period.
2490. What minimum limit would you put on the term of apprenticeship? The Proprietary's term, now, for apprentices on the surface, is five years, and I have such a high opinion of the miner's trade that I think five years is little enough.
2491. Because striking a drill is not the only qualification? No; that is the least part of the trade.
2492. Do you think the training of men to do the work would tend, in the future, to decrease the number of accidents? I think it would. It would tend to raise the average competency of the miners in the district.
2493. I suppose the remuneration of apprentices is a matter that would have to be left entirely in the hands of the employers? I think so.
2494. A suggestion has been made that a Board of Inquiry should be appointed to investigate all cases of minor accidents, that is accidents other than fatal; and that the Board should consist of three members—one to be elected by the men, one by the managers, and one to be appointed by the Government. Do you think that any such Board is necessary; or, if appointed, will it conduce to the amicable working of the mine between the men and the managers? I do not think it would be of any benefit at all as relating to accidents. I think it is part of the Inspector of Mines' duty to inquire into all such accidents; and, as a matter of fact, he does. If such a Board were to take this matter out of the hands of the inspector, no advantage, but great disadvantage, would follow.
2495. A Board of that sort would require to be kept constantly sitting, and could be made the vehicle of great annoyance to the employers? It might.
2496. It has been suggested by His Honor that in some cases the inspector might be required as a witness? I think he would always be required as a witness. He would always be giving evidence. I do not see any reason for such a Board. Every accident is reported; and the inspector looks into it; and the mine officials look into it. Every accident is carefully looked into on the part of the inspector for his own purpose, and on the part of the officials for the benefit of the mine. This is done whether the accident leads to injury or not—an inquiry by the mine officials.
2497. *His Honor.*] What do you think of the suggestion to extend the powers of the Police Magistrate to hold what you might call a Magisterial inquiry even in cases where death does not ensue? For what purpose, your Honor?
2498. For the purpose of enabling him to get at the truth just in the same way as truth is supposed to be "get-at-able" by holding a Magisterial inquiry in the case of death—taking from the inspector the responsibility of deciding the question, and only allowing him to come in as a witness? I consider, your Honor, that the Police Magistrate would be a more suitable person to do it than a Board, no matter how it was constituted. But I consider the Police Magistrate, in an inquiry into a matter of that kind, having presumably no technical training, would have to decide on evidence, and not by means of his own technical knowledge, and, to procure that evidence, he would be required to call from their work the officers who knew something about the matter; and the taking away of these men would, probably, lead to further accidents. Such a system would, I think, tend to increase accidents.
2499. Supposing the inquiry took place at the spot where the accident happened? In the case of an accident underground, to hold it on the spot would make it very dangerous. I do not believe in men being underground for any purpose at all except to do their work.
2500. But I mean that an inquiry would not be held at Broken Hill for an accident that happened at Tarrawingee or the Pinnacles? Still, in the case of the Proprietary Mine, if you had an accident, and had a Police Magistrate sitting in the room, he would have to summon underground officers from the mine to submit their evidence; and, in that period, their special work would be looked after by some new hand, which might increase our accidents.
2501. You think it would be better for the inspector to go and see the men, and find out all details, without taking the men from the spot, and to form his own conclusions, and report to the Minister? Yes.
2502. *Mr. Edwards.*] You think the result is gained equally as well now as it would be by a Board? Yes.
2503. *His Honor.*] Do you think it might be a good provision that the inspector should have the right, if he wishes to exercise it, of putting a man on his oath and making it possible that that man be prosecuted if he gives false evidence? I must confess that I have not much belief in the benefits of putting a man on his oath.
2504. *Mr. Edwards.*] So you do not think that any good end would be gained by giving power to the inspector to administer the oath and to take evidence? I do not think so.
2505. In reference to the underground working regulations. I suppose you find it necessary from time to time, as work proceeds and varies, to alter them? Yes; from time to time.
2506. So it would be almost impossible to frame hard-and-fast regulations that would be applicable to all mines? I think it would be a great mistake to attempt to do it. As a result of an attempt in that direction, we have regulations before us that have no application to the present work.
2507. What subjects should hard-and-fast regulations deal with? General principles only, leaving out any detail of any operation.
- 2508.

2508. *His Honor.*] I suppose you do not think that your own regulations go too much into detail, although, in so far as they are framed in accordance with some of the Government regulations, they have to be put in a wrong form—one or two of them, at any rate. If the law could stand in this way:—that the regulations in force at any particular time, properly adapted to the mine or district for which they were in force, could be made enforceable by fine, then, I suppose, the mine would stand in the best possible position? Yes; but regulations such as those (*Exhibit "A"*) cannot be embodied in any Act.

A. Stewart.
19 July, 1897.

2509. I mean, if the law stood in this way:—that a mine might have regulations, approved by the Minister for the particular time, and changeable, with the approval of the Minister, from time to time; then, if those regulations had the force of law, so that an infringement of them would be an offence, the difficulty would, I suppose, be pretty well met? Yes; I think that would tend to improve the force of our own private regulations.

2510. They would then become, in fact, public regulations, although, in their original framing, they might have been the work of the mine managers. After approval by the Minister, or some competent authority, they would become law? I think the inspector could approve of regulations for each mine.

2511. The Minister, of course, would act on the advice of the inspector? That would be sufficient, then.

2512. *Mr. Edwards.*] I suppose the best rules are those issued from time to time to the men by the shift-bosses, by word of mouth? Yes; for the actual detail of the work.

2513. For instance, it would be impossible to make any regulation as to explosives, since new explosives are continually coming into the market? Yes; and the explosives we have now in use may be out of date in another year. It is of no use making regulations to deal with explosives of to-day. Further, I do not think they would do the men much good if they were made. They would not be read.

2514. No doubt some new regulations will be framed, and become law. As to the best method of making them become known to the men, can you make any suggestion? No; except by pasting them up, and publishing them in every way possible. You cannot possibly force a man to read them.

2515. I suppose the mines might supply them to all men on application? Yes, I do not think there would be any objection to that at all.

2516. *His Honor.*] Can you say how much it actually costs the mine to have printed a set of regulations like these (*Exhibit "B"*)?

Mr. Edwards: The Government regulations (printed on calico) cost 6d. apiece here, and are obtained through the Government Printing Office. At one time, they cost 1s. each.

His Honor: Of course, it would not be necessary to supply the regulations to miners in that form; but it might be a fair thing to supply every miner with a copy printed on paper as soon as he goes on to the mine. After twelve months, he might have another copy, but, in the meantime, be allowed to have an extra copy at a fixed price.

Witness: We supply every man with a copy, printed on paper, of the lead-poisoning regulations.

2517. *Mr. Edwards.*] It was stated by one of the witnesses the other day that the open-cuts are carried on in a reckless and dangerous manner, referring particularly to Baxter and Saddler's contract;—is there any foundation for that, in your experience? Before proceeding further, I would like to produce the exact figures in connection with my statement of this morning as to the number of men discharged. These are the actual figures:—For the 12 months ended 30th June, 1896, 24 men were discharged for drunkenness on the works: for the succeeding 12 months, ended 30th June, 1897, 34 were discharged for the same cause: for smoking underground, in the first-named year, 29 were discharged, and, for the second year, 27: for lighting fires underground, in the first year, 2; and, in the second, 0: for leaving undischarged holes in the face, in the first year, 0; and, in the second year, 8: for leaving shoots uncovered, in the first year, 0; in the second, 4: for sleeping underground, in the first year, 2; in the second, 9: for quarrelling underground, 2 in both periods. This makes a total of 69 in the first, and 84 in the second, year. For incompetency, 210 were discharged in the first year and 461 in the second. The total movement in the first year was 2,104; and, in the second, 3,138. Of course, in these last figures, as I said before, there may be cases where a man has been counted more than once. I would also like to submit figures as to the tonnage handled. In the open-cut, we are handling about 100,000 tons of ore per annum; underground, about 300,000 tons of ore per annum; in the open-cut, about 400,000 tons of waste per annum, and about 150,000 tons of filling for the same period; coke, 3,500 tons per month; coal, 3,000 tons per month; timber, 800 tons per month; flux, 7,500 tons per month; bullion, 2,200 tons per month; slag, 22,000 tons per month. It is my opinion, taking these figures into account, that we have nothing to be ashamed of, if compared with any other industry.

2518. *Mr. Williams.*] Those figures would compare favourably with any other district in the world? Yes.

2519. And with any other industry? Yes.

2520. *Mr. Edwards.*] Have you any other details? At the present time we are paying, in wages, about £30,000 (Proprietary only—not including outside works) per month; for general stores, about £4,500 per month; for timber, we are spending about £3,500 per month; coke, £11,000 per month; coal, £4,500 per month. These figures refer to Broken Hill only. I think the quantity of explosive we are using here is a matter that cannot be let pass unnoticed. Of nitro-glycerine explosives, or what you would term high explosives, we are using 5 tons per month; and, of powder and low explosives, nearly 7 tons a month. Our actual consumption of explosives is from 10 to 12 tons per month; and, I think, taking the amount of explosives used into consideration, that the number of accidents in Broken Hill due directly to explosives is remarkably low. I am quite sure that in no mining district in the world is so large a quantity used with so few accidents. I must give the Broken Hill workmen credit for being able to handle such quantities with so little disaster. In round numbers, about 1,000 underground men are employed, also 350 open-cut men, and 1,150 on the surface works: total, 2,500 men.

2521. *Mr. Polkinghorne.*] That is, actually employed on the Hill? Yes; by the Proprietary Company; not including Tarrawingee or any other place outside the Hill.

2522. *Mr. Edwards.*] Can you give the rate per thousand of fatal accidents? Under two per thousand. I consider that a very good rate. Considering the work we are carrying on, three per thousand would be a very good rate; and we are under two.

2523. It was stated the other day that the work in the open-cut under Baxter and Saddler is carried on in a reckless manner;—is there any ground for that statement? Not so far as I know.

2524. Do you know of any precautions that could be taken by your officers that are not taken to prevent accidents? No; but I think considerable advantage would be obtained by having the men change in the face. I know that view has been expressed here, and I think it would be a reasonable course to take.

2525.

- A. Stewart. 2525. I suppose, if the change takes place in the face, it would entail additional work and delay on the mine owners? Yes; it will increase the cost of changing very considerably; but I think it is the duty of all men going off shift to point out the condition of the face to the men coming on.
- 19 July, 1897. 2526. And on the part of the men, what loss of time would they suffer? Very little. I do not think it would amount to ten minutes. Besides, I find that, at the present time, all careful miners do wait.
2527. And the careless ones ought to be compelled to do it? Yes.
2528. Objection has been raised to that, because the shift going off fire their holes just about the time of the relief. There is no necessity for their leaving the firing until so late a time? In my experience no good practical miner will leave his work after firing without seeing the effect of his shot. If a man does do such a thing, he shows a great want of interest in his work. A miner should no more leave his face without seeing the effect of his firing than a marksman should close his eyes without seeing the effect of his shot.
2529. Objection has been taken by one of the witnesses to the batter in the open-cut; and he says that it is dangerously steep;—can you give any information upon that, Mr. Stewart? I suppose by that is meant the permanent batter; and that, I consider, has little or nothing to do with any accident that ever takes place in any open-cut, because, once the permanent batter is arrived at, the men are removed from that point. In the working face of any open-cut work, it is impossible to keep to any fixed batter. In an open-cut, when worked on proper lines, the bottom ought to be put in first, and then the heads brought down, and then the bottom put in again. That is the theory of working an open-cut. To speak about the batter on a working face is to speak of an absurdity.
2530. Objection has been taken to the use of the "chinaman" as being highly dangerous? I think the answer to such a point is that, without the "chinaman," you would have to employ so much larger a number of men to do the same work as would increase the total number of accidents. From my experience of open-cut work, under any other system of working you would require to consume double the amount of explosive, and to employ nearly three times the number of men, to do the same work; and, under such a condition, you would have a greatly-increased total number of accidents.
2531. In addition to that, if you had to shift what was brought down from the faces in trucks, that in it itself would be an element of danger, would it not, to the men? Yes, my experience in the past is that a great number of accidents are caused by truck traffic. In Spain the locomotives were required to go down the deepest cuts; and the greatest number of accidents were brought about by people getting in front of the locomotive or trucks.
2532. And if a line of trucks were in front of a face, the men loading them would naturally be between the trucks and the face, and in the event of a run of the ground they would have a poorer chance of escape? Yes. In addition to that, the only method of loading would be by shovelling, and that in itself is dangerous. They either hit themselves or someone else.
2533. It is said that the open-cut work at night time is far more dangerous than at day time, and is productive of a number of accidents. What have you to say as to that? That statement is not borne out by the records of accidents that have taken place in the past. As a matter of fact we have had fewer accidents in the open-cuts at night, and I consider the open-cut work is equally as well lighted as the underground workings, where candles are used.
2534. There is no stinting in the matter of light? None whatever. Although the open-cut work is done by contract, the company supplies the light; and the men can get whatever they ask for.
2535. Is there not a rule that, if the light becomes defective, the men are to knock off? Yes; there is such a rule.
2536. The open-cut system is absolutely necessary, I understand, for the working of the mine? It is absolutely necessary to do the amount of work that we are doing. Of course, there is no impossibility in doing the work by an underground system.
2537. Assuming that, instead of the open-cut system, you adopted the underground system; would it entail the employment of a much larger number of men, and would it be more dangerous than the open-cut system? You would require three times the number of men, and twice the amount of explosives; and that would cause a very great increase in the number of accidents.
2538. The machinery that is in use on the Proprietary Mine is all of the best description? We are continually improving the machinery, of course.
2539. Is it kept up to date? Everything is kept up to date.
2540. And there would be no saving in having defective machinery? No.
2541. Is care taken to get the best quality of explosives? Yes; we always get the very best in the market.
2542. It was stated the other day that an accident might occur through a splice in the fuse. I suppose if there should be a splice in a fuse there is no necessity for the men to use it? No.
2543. All explosives are supplied free to the men? No. Of course, in fixing a contract the amount of explosive to be used is taken into account; and it therefore comes to the same thing. Charging the men for explosives induces them to take more care, and not waste any.
2544. The company does not make any profit on it? No.
2545. As to the men in charge of the machinery. I suppose you engage competent and careful men to take charge of machinery where men are lowered and hoisted? Yes; where engaged in any machinery in connection with moving men about they are specially-selected men.
2546. It has been suggested that, at change of shift, two engine-drivers should be in the engine-shed. Do you see any necessity for that? I do not. There is an old saying that two heads are better than one; but there is a practical limit to that. Put two men into an engine-shed, and there is a danger of their beginning to talk or do something that one man would not do. I see no necessity for having two.
2547. I think the reason put forward was that one man might fall in a fit or something? There is a possibility, of course, of that happening; but if you endeavour to guard against possibilities of that kind you will have to double the staff all over.
2548. Have you ever known it, in your experience, to be the practice to double the men on the engines? No; not even where they have far more men than here.
2549. As to sinking unprotected shafts. Something was said about pent-houses being required at every 100 feet? In sinking a shaft, my practice has always been in the past to select sinkers—men who have had special experience in sinking shafts; and those men (as is done here) are put on contract; and they,

- they, practically, have control of the whole operation. If they ask for any special safety to be put into the shaft, there is no objection to it—none whatever. I think the greatest preventative against accident in sinking a shaft is to get men with experience to work it. I may state that I have never seen in sinking shafts any safety appliances of that sort employed, except in one instance, where the shaft, owing to special urgency, was sunk and lined at the same time. In that case, a platform was erected; and the sinking was carried through without any accident.
2550. As to engine-drivers having certificates. I suppose there is no objection to their being certificated men if you can get them? No.
2551. Would you make it a hard-and-fast rule that no man be allowed to run an engine unless he had a certificate? I would never allow a man to be employed on his certificate alone. We have found here on the Proprietary that certificates are passed from man to man, and you do not know whether the certificates apply to the persons in whose possession they are.
2552. After all, it comes to the same thing—you have to inquire personally into the man as to who he is, what he is, &c.? Yes.
2553. I suppose the same thing would apply in reference to shift-bosses, only in a larger degree? Yes.
2554. In the event of a movement underground taking place, and the men being called out until the country has been secured;—do you think it would be necessary to call in the mining inspector before the men were again put back into that part of the mine; or would you leave that responsibility upon the foreman or the underground manager? I would certainly leave it to the men who took action in the first place, provided that the inspector had not intervened in the matter.
2555. When the inspector intervenes, he should give his authority before the men go back? Yes.
2556. That is the practice at the present time? Yes, as far as I know.
2557. In charging holes at the face, especially in the open-cuts, the rule is, I think, very stringent, that the men shall be withdrawn while the charging is going on, except those actually engaged in charging? Yes. I think we make an exception in "bulling" only, when they have to be withdrawn to a safe distance only, and not out of the cut, as in the case of charging.
2558. That rule is insisted on? Yes.
2559. What is the punishment for men breaking that rule? The only punishment we have is discharging them.
2560. And that follows immediately on any breach coming to your ears? Yes.
2561. It has been stated that notwithstanding that rule men are compelled to remain in the face while holes are being charged in the open-cuts? It is not so within my knowledge.
2562. I suppose you are frequently through the cuts? Yes, often.
2563. Have you ever known such a thing to occur as men to be kept in the face while a hole is being charged? No; I have had occasion to object to a man charging a hole before the men were out of the cut.
2564. Were the men prevented from going out of the cut? No; it was brought about by the "powder-monkey" being too anxious to get on with his work, and not waiting till the cut was properly clear of workmen.
2565. So there was no compulsion for the men to remain in that case? None whatever.
2566. It was said that, if men are making good money on a fortnight's contract, they are taken away and put into ground where they cannot make so much;—is there any truth in that? It is utterly untrue.
2567. *His Honor.*] I notice that, among the accidents that have occurred aboveground, one was brought about by a boy being caught in one of the belts;—is provision made for protecting all the belts that can reasonably be expected to be a cause of danger to workmen when passing? I think we had an accident within the last two months at the chloridising works, and that accident was caused by a boy having been sent up to oil some wheels by a man whose duty it was to do it. It was the man's duty to do the oiling; but, because otherwise occupied, or from laziness or some other cause, he sent the boy up to do it. The boy had an overcoat on; and it got caught in the wheels.
2568. How was the man dealt with on that occasion? I really could not say at the present time what was done with him.
2569. Is there a rule in the works, where accidents of that kind might happen, as to the kind of clothes the workmen should wear? No.
2570. I suppose you find they protect themselves? Yes.
2571. Is there any rule made in factories where an accident of that kind might happen to the effect that workmen shall not wear any kind of loose clothing, or anything that is not close fitting? I do not remember any case, except in explosive factories. There they are bound to wear clothing suitable for the purpose; to wear proper shoes, &c. I do not remember any other case.
2572. You have not found, by experience, that it is necessary to make such a rule in your works aboveground? No; I think that such cases are so few that a rule is not required for the matter at all.
2573. You do not think it is necessary, as one of the working rules of the works themselves, to provide that a workman engaged in that kind of business shall not wear any loose form of clothing? I do not think a rule to that effect would be out of place; but, I consider, that the cases are so few as to make a rule almost unnecessary. It would be simple enough to draw up a rule that no man should wear anything but a close-fitting jacket.
2574. *Mr Williams.*] Similar to an engineer's jacket? Yes.
2575. *His Honor.*] Very often they use knitted jumpers? Yes.
2576. *Mr Polkinghorne.*] As regards apprentices, there is one question that might as well be put to you, and that is:—What age, in your opinion, is the best at which to commence learning the art of mining? I think that depends upon the boy's body. Some are quite as fit to start at 15 as others at 16. I think, as a general rule, 16 is quite young enough.
2577. That would be the best age—from that to 18? I think 18 is too late. Any boy who is going to start business in life should start before he is 18.
2578. You think you would make a better man out of an apprentice who starts at 16 than at 25? Yes; 16 was my own age when I went underground.
2579. You say that the prices offered to the contractors are so arranged that they may earn at least the ruling rate, viz., 9s. a day? Yes.
2580. Do you think that the working rules of the Proprietary, with one or two exceptions, are any more than a miner of ordinary experience should know himself? I do not consider that any of those rules are very much beyond what any ordinary miner ought to know. Of course, the rules are not framed for the good

- A. Stewart. good miners, who can be depended upon, but for the inferior men who cannot be depended upon. Rules must be framed for the protection of the inferior men.
- 19 July, 1897. 2581. While speaking upon the importation of miners for the Proprietary, there was some suggestion that opposition had been raised to the bringing in of good men to the district;—do you think that this really was the case? Yes; to my knowledge, I know there was opposition raised.
2582. I would like to know what opposition was raised? I would not like to say that any opposition was raised by any trades union; but opposition was raised by some of the residents of Broken Hill; and I know that a number of men—I do not say that they belonged to any trades union—met them at the station and called them all sorts of foul names, and frightened them out of their wits. They were actually in such fear that they would not walk about the streets of Broken Hill alone.
- Mr. Polkinghorne:* I would like to say that it was never through any action of the organisation with which I am connected that this took place; but, at the same time, I would not like to say that no members of the labour organisation were mixed with those who assembled at the railway station. The direct opposition was never to the importation of good men. Opposition was raised by the labour organisation to men being brought here who were no better than men walking about the streets.
- His Honor:* Really, it is not worth while going into this, because Mr. Stewart does not charge any particular organisation with having raised opposition.
- Mr. Edwards:* The only reason, your Honor, that I introduced this matter was to explain away the cause why incompetent men might be found in the mine.
2583. I think Mr. Stewart has already stated that a goodly number were competent, and that they would be very fortunate if they got all competent men among those who were imported. Mr. Stewart goes further on to say that 60 per cent. of the accidents occur through incompetency? I would not say that because a man brings an accident on to himself or his mates he is incompetent; it may be a fault of his judgment at the time.
2584. As to this Board of Inquiry;—in your opinion, would it be taking away anything the company has to-day, or would it interfere in any way to have a Board to inquire into all serious accidents where the party concerned asks for an inquiry; seeing that the company are blamed when they have no right to be blamed, and also the man in charge, and sometimes the inspector, and sometimes even the injured party himself. An inquiry by a Board would clear the whole matter up? I think, no matter what Board you appoint, you will still have imputations made against the men occupying prominent positions.
2585. *Mr. Williams:* I would like to ask this witness whether he has any objection to submitting a report of the company for the last half-year? It is being printed, and will be issued in about a fortnight's time.
2586. Will you supply the report for the previous half-year? Yes, with pleasure.
2587. I have also to request that you will supply the Commission with a copy of the form of contract used underground? I will supply one.
2588. Also the contract between the open-cuts contractors and the company? —
- Mr. Edwards:* I do not think Mr. Stewart could meet your wish there, as the contract is a document of a strictly private nature.
- His Honor:* Does it not contain some general provisions which refer to the safety of the works?
- Mr. Edwards:* The open-cut contractors are bound in all cases to stand by the rules of the mine and the Government regulations.
- His Honor:* How is non-compliance dealt with?
- Witness:* In all those contracts it is provided that the general manager can stop work at a moment's notice if anything is not complied with.
- Mr. Williams:* I ask specifically, for the purpose of arriving at the truth, that the authority of those contractors to carry out the work in the way they do be submitted. Death has occurred to certain men in their employ, and it is only fair that the contract entered into with those people, giving them power to carry out operations in which loss of life has occurred, should be produced here.
- His Honor:* I will ask Mr. Stewart, then, to produce a copy of the contract entered into with Messrs. Baxter and Saddler. If I satisfy myself that Mr. Stewart's statement is correct, I will go no further.
- Mr. Edwards:* On behalf of the company, I would ask that the documents asked for be not made public property.
- His Honor:* I will ask Mr. Stewart, simply for the purpose of my inspecting it, to produce the contract asked for.
- Mr. Williams:* I am prepared to submit myself to an oath that anything that comes to my knowledge while perusing the plan or contract will remain private property. Further, may I ask Mr. Stewart whether he is prepared to supply proof of his appointment as general manager of the Broken Hill Proprietary Company?
- His Honor:* That is going too far, and it would be quite unnecessary.
2589. You have stated that you are manager of the Proprietary Company? Yes.
2590. You here assert, on oath, that you are the general manager appointed by the Proprietary Company for the purpose of supervising their workings? Yes.
2591. You have endeavoured to faithfully discharge the duties of that position? Yes.
2592. You have been here about three years? Yes.
2593. Since your arrival have you altered the system in any way as to the mode of appointing officers and employing men? That information I cannot give, because I do not know what was done before I came here. As far as the appointment of officers is concerned, I have always done that myself.
2594. You say you have had experience of open-cuts extending to a vertical depth of between 500 and 600 feet? Yes.
2595. What was the permanent batter in those cases? On an average, $\frac{1}{4}$ to 1.
2596. *His Honor:* $\frac{1}{4}$ horizontal to 1 vertical? Yes, for the final batter.
2597. *Mr. Williams:* You found that safe? Yes.
2598. What grade was there on the temporary or working batters? That varied almost every hour in the day as the benches worked forward. Sometimes they must pass beyond even the perpendicular to get the stuff down. They must undermine it.
2599. That is the theory of working in an open-cut? Yes.
2600. What depth do you take your lifts at a time? I have seen them taken considerably over 100 feet at a time.

A. Stewart,
19 July, 1897.

2601. That is the maximum. What would be the minimum? About 50 feet.
2602. What would you strike the average at? No average can be struck in those matters, because things have to vary according to circumstances.
2603. In the maximum lift of 100 feet, did you then undermine, as a general thing? Yes.
2604. Was that an every-day occurrence? Yes; it was quite usual.
2605. Were the strata similar to those here? Yes.
2606. Where were those open-cuts located? In Spain.
2607. And you held a position there immediately before coming here? Yes.
2608. I believe your experience as a practical miner has not been confined to Spain? No.
2609. Have you had anything to do in Wales? I have been there, but have done nothing there in connection with mining.
2610. What do you consider to be a safe batter for an open-cut at Broken Hill of a depth of 500 feet—you work according to plans? No; I do not. You cannot work the open-cut by a plan. So far as final batters are concerned, I have seen batters come away that were so flat that afterwards they had been used as carriage roads—perhaps 1 in 10. You must suit your working to the special circumstances.
2611. Was there anything extraordinary to lead to that 1-in-10 batter slipping away;—earthquakes are liable to occur in that country;—some time ago an earthquake occurred in the adjoining Colony? Yes.
2612. And you will admit that one is likely to interfere with the open-cuts here? It is possible.
2613. You say you endeavour to secure the appointment of competent subordinate officers by using your own judgment? Yes.
2614. Is that the only effectual course you can adopt to secure efficient officers? I think it is the best course.
2615. You have endeavoured to have all appointments made simply on merit? Yes.
2616. Without any political or social influence? No influence whatever. I never consider such matters.
2617. Have you changed your officers since you have been here? I have changed a good number.
2618. And the men appointed in their places have been appointed because of their merit only? Certainly.
2619. You have given us the number of men you discharged, but you have not given us the number of officers you have changed for incompetency. Could you supply that information? I have not got the information before me—but it can be looked up.
2620. Would you supply it to-morrow? Yes.
2621. You infer that, because those men were incompetent and had to be discharged, incompetent men must have been working here before you took the appointment you now hold? No; I do not make any such inference.
2622. Of those incompetent workmen you had to discharge, were any of them working here before you became general manager? I do not think there is that information in the office. The keeping of a record of the movements of the men has only been in vogue within the last two years.
2623. Up till two years ago, you had no records kept for that purpose? I do not think such was the case: at any rate, they are not available now.
2624. Can you give us any idea whether any of those officers you discharged for incompetency were here previous to your appointment? I have not stated that they were discharged for incompetency. A number have been changed; and, as to those that were discharged, I do not say that it was because of their incompetency.
2625. It has always been your aim to invest the mine with good men? Yes.
2626. You say the contract system breeds good men? I said that under a proper contract system you would have naturally more competent workmen than under the day-labour system, and that the contract system in that respect does produce and work out a competent body of miners.
2627. I suppose you have frequently used pumps constructed by Tangye, of Birmingham? Yes.
2628. Have you any acquaintance with the way that firm turn out good men? No.
2629. Are you aware that they are prepared to develop the intelligence of their men, and when developed to avail themselves of it? That is the case in all large concerns.
2630. And are you aware that they have given their men an interest in their work by patenting inventions for them? No: I am not acquainted with Tangye's methods.
2631. In any department under your control are you prepared to encourage the men? In all departments, except underground, we have apprentices.
2632. Was that inaugurated by you; or did you find it here in operation? There was a system already in operation when I came; but I think I modified it to some extent.
2633. As a matter of fact you have been endeavouring to encourage men to become good workmen in every department except underground? Yes.
2634. And you desire to introduce that into the underground workings for the benefit of all concerned? Yes.
2635. You should be the most competent authority to offer the suggestions that have been wisely asked for by the Secretary for Mines. No other person in this district occupies a position that should qualify him to offer suggestions more so than yourself as to the prevention of future accidents; and, with that experience, do you believe that an extension of the principles you have on the mine now to mining generally would lessen the possibility of loss of life? Everything in my power I do to minimise the risk to life.
2636. Do you find the system of training youths in the surface departments a good idea? Yes.
2637. And you wish to introduce it into other parts? Yes; I am quite willing provided there are any young men willing to come forward.
2638. You said the age should be 16. Supposing you found men up to the age of 30 years who wished to become competent miners, would you let age debar them? They would be pretty old apprentices; and, in my time, I have never had any such experience.
2639. The contractors were here—some of them—and had contracts before you arrived? I do not think that any of the existing contracts were in existence before I came here. Those contracts that we have now have all been put in operation since I came here.
2640. As a matter of fact, you have changed the conditions of the contracts since you have been here? Yes.
2641. You said this morning about a man being appointed to look after the ropes;—do you know his name? I cannot give it at this moment.

- A. Stewart. 2642. Do you know what he is like;—is he a tall man, a short man, or what? [*Mr. Edwards*: The man will be called, later on, as a witness.] How long has he been appointed? I could not say.
- 19 July, 1897. 2643. You can assure us that he has been appointed more than a month? I cannot say.
2644. Say, a week ago? I think I could say he was appointed more than a week ago. A man has been appointed ever since I have been here, whose duty it is to look after all ropes.
2645. All ropes, or those in the open-cuts in particular? All ropes; giving, of course, special attention to winding ropes.
2646. You do not refer to the sailor gang? Apart altogether from that.
2647. You say 60 per cent. of the accidents are due to the men themselves? Yes; due to causes arising within the men themselves or their mates.
2648. Due to causes that they could control? I consider that 90 per cent. of the total number of accidents anywhere can be best controlled by the men themselves.
2649. You say that 90 per cent. of the number of accidents that have occurred could have been prevented by the judgment of the men? No; I do not make any such statement.
2650. You say 60 per cent. could have been prevented by the judgment of the men? No; I never made any such statement.
2651. Can you tell us what percentage could have been prevented by the judgment of the men? No.
2652. You say that the company have spent a large sum of money in endeavouring to obtain competent men, after a fair attempt had been made to secure them from the local market? Yes.
2653. Can you tell us the amount? Somewhere about £400 or £500.
2654. You said that you endeavoured to secure these men from the local market? I am quite sure there were no men on the local market, otherwise we would not have spent that money in bringing in men from outside.
2655. You allow no favouritism whatever? No.
2656. And if a person gets work on the mine by favour it must be by yours? Yes.
2657. And you are responsible to your directors for what favour you deal out? Yes.
2658. Do you place any value on certificates? No.
2659. Because you think there is a possibility of passing them on from one to the other? I know for a fact that that is done.
2660. You believe in a practical demonstration as to whether a man can fill the office he applies for? Yes.
2661. Would not the fact of a man's possessing a certificate assist him in any way? Not unless you know more about him than his certificate shows.
2662. Would it not give you some data to examine him upon? No data are required to examine a man.
2663. Your objection is that the certificate might not belong to him? Yes, and he may not be as good a man as he was when he got the certificate.
2664. And there is also the possibility that the man who gave the certificate was himself not qualified? Yes.
2665. But if you gave a certificate to a man—a man who was, say, going to the West;—would it not be of value? As a matter of fact, certificates are supplied to many of the men going to the West.
2666. Are you aware that in parts men are working as miners who hold certificates qualifying them to act as managers? I am aware of that.
2667. Would you be surprised to be informed that a firm in England has a number of men employed as common miners, or colliers, who at any moment can step out and take the position of manager? I may state that I hold a certificate of competency myself under the Coal Mines Act, but I have never made use of my certificate in a coal mine. Men may have certificates to take control of a mine, but nothing would induce me to believe that they were competent to go in and hold such a position until they had been proved.
2668. You said that for specially dangerous occupations you would call for volunteers, so that a man would not be forced to endanger his life unless he were willing? I never force a man to take any risk whatever.
2669. One of the witnesses referred to the possibility of six men being desirous to return to a face and one objecting;—you would not, for the same reason, inflict any punishment upon him for that? No, certainly not; I would think he was doing quite right.
2670. As to rules about explosives: you suggested that arrangements should be made as circumstances occurred? Yes.
2671. You referred also to the danger of an unexploded portion of a charge being scattered about the place: you referred to something in the way of unexploded portions that you had found in connection with the smelters? Recently we found a considerable quantity of unexploded explosives on the smelter floor.
2672. Would that not imply that there should be competent men handling these explosives underneath, if only to secure the lives of your smelter men? They are competent men underground.
2673. And yet with these competent men you find such a terrible thing as that? Yes; and that is the danger I said would arise in boring a new hole.
- His Honor*: *Mr. Edwards* put that as a question, that a case like that might arise in drilling a new hole alongside a missed-hole and blowing it out.
2674. Did you notice in the evidence a statement to the effect that dynamite had been unearthed in some of the operations in the open-cut after having been left lying about loosely? I never heard of a statement to that effect.
2675. If left lying about, an explosion would probably be brought about by the men driving their picks into it? Yes.
2676. If it were said that such an accident in Block 11 had occurred, you would not dispute it? No; it is within the bound of probability that such an accident might occur.
2677. Can you suggest any recommendation to be embodied in a new Act to bring it up to date? I would not care to do that off-hand.
2678. You have no objection to offering your best services, if required, in the preparation of an up-to-date code of rules? No; I would be very pleased to do so.
2679. You would, under all circumstances, emphatically prohibit steel and iron tamping-bars being used? Yes.
2680. Then there was the question as to fuses? ————— 2681.

2681. *His Honor.*] The question was—whether the enclosing material of a fuse could not be made of something non-combustible, so that, in the event of a break in the powder, the fire would not be carried on. It struck me that the ability of the enclosing material to carry on the fire over a break was the cause of a great many accidents? I do not know whether any such fuse is made. A. Stewart.
19 July, 1897.

2682. Do you know whether any of the salts used to make vegetable matter non-combustible have been tried? I do not think so.

Inspector Hebbard: The object of the cotton in the fuse is to carry the fire in the event of the powder failing.

His Honor: I should have thought that the opposite object would have been sought for—something that would not have carried the fire.

2683. You think that really the cause of hanging fire is not the creeping of the fire along a part of the tube where the powder is intercepted, but the action which takes place in detonating the cap? I think that miss-fires are due to a number of causes, and that that is one. I have never heard before of an accident occurring through the lingering of the fire in a fuse that was faulty owing to the powder being wanting.

Mr. Williams: Sometimes, in the manufacture of fuse, faults occur. It may be obstructed, perhaps, one-thirtieth of an inch only; and the fire goes down to that obstruction; and, if it had not been for that little thread passing through, the fuse would have failed in its work. That is what caused the late fire and a number of accidents.

2684. Then it all comes back to this: that to name a time within which a fuse will not act is impracticable? Yes.

2685. If it once stops running at its ordinary rate you cannot say what time it will take? No.

2686. You say the only unobstructable method is electricity? Yes.

2687. *Mr. Edwards.*] But electricity has its drawbacks? Yes; it has very serious drawbacks.

2688. *His Honor.*] Expense is one? Not so much expense as the great number of instruments that have to be looked after and kept in order. Electricity is used mostly in large open-cut works. It could not be used in our underground workings to advantage. Further, there would be more danger from electricity, because of the greater ignorance concerning it on the part of the men.

TUESDAY, 20 JULY, 1897.

John George Shinnick sworn and examined:—

2689. *His Honor.*] What is your full name? John George Shinnick.

2690. What are you? At present I am in business; but I have been a miner, also a surface-worker, on the Barrier between ten and eleven years. J. G.
Shinnick.

2691. Were you a miner by occupation originally, before you came here? Yes; before I came to the Barrier. 20 July, 1897.

2692. And you came here in what year? In 1888.

2693. After coming here did you work at mining aboveground and underground for some years? Yes.

2694. Till what year? I have been working as a miner up to three months ago.

2695. You have given it up now for other business? Yes.

2696. You were working continuously from 1888 till three months ago? No.

2697. How much of that time? The biggest part of my time after coming here I spent on the surface, principally among the smelters.

2698. Any time on the open-cut? Yes, about three months.

2699. When was that? In 1893.

2700. And not since then? No.

2701. You have worked underground part of your time here? On the mines here, just in Broken Hill, for about twelve months at different times. I have worked at three different mines.

2702. When did you work last underground? In the Central Mine, between seven and nine weeks ago. I was then stopping ore.

2703. What information have you got to give the Commission on these different matters? I have evidence to give, your Honor, based upon a good deal of experience on the surface and underground, at the smelters and in the open-cuts. I have seen things occurring from time to time that I considered were dangerous, and which could be remedied. With that object in view, I come here to give evidence.

2704. Will you take the things one by one that have struck you, and explain them, and suggest any remedy you may think advisable? The principal thing I have to complain about is the work I was at last as a miner in Block 10. It is with reference to the putting down of mullock in Kelly's shaft. I have seen great lumps of rock as big as my head break through the lining and fly out on to the plats while we were waiting to go in cages. I have seen truck-loads of mullock shot into that shoot while we have been going up in the cage.

2705. Is the shoot partitioned off from the hauling-shaft? Yes, but the shaft is, of course, perpendicular; and slides are put across to break the fall. The mullock strikes these slides very hard, and, as a consequence, has broken away the lining between the hauling-shaft and the shoot, and I have seen stones fly out on to the plat. I have seen stones even go into the shaft.

2706. How often have you seen that happen? Twice, while I was working there.

2707. Was it a common practice to use the shoot while the cage was being used? Yes; while I was there.

2708. In how many places did you notice the lining broken? My work took me to the 400-foot level; and, of course, I used to go direct from the surface to that level. At that level the angle on the plat was broken. I saw it repaired and broken again. It must also have been broken higher up, because I have seen stones coming down from above.

2709. Has anyone ever been hurt through that? No one has been hurt; but there have been some very close shaves.

2710. Is that practice still continued? I could not say.

2711. That was within the last few weeks? Within the last nine or ten weeks.

2712. What was the material used for lining? 10 x 4 Oregon.

2713. That mullock was shot down for filling? Yes. I have also to complain of the contract system, which,

J. G.
Shinnick.
20 July, 1897.

which, in my opinion, is very much to blame for a great many accidents that have occurred on the mines. My reason for saying that is that men get a contract for stoping ore at a certain price; and they have got to fetch all the timber. I am speaking about the Central and Block 10 mines, as they are the only two I have worked in. The men get so much; and they have to go and fetch their timber from the plat. Very often the level they have to bring it along is crushed from 7 feet down to 4 feet 6 inches, which makes them have to go along in a crouched position to bring their timber. You have to timber for your own safety; and you put in as little as possible, because it is so awkward to get it, and you would lose so much time.

2714. Had the timber to be carried? Very often—you could not get the timber carried. This led to very little timber being put up, and sets being left improperly covered. I have seen five or six sets not properly covered, and men fall through from the top to the bottom.

2715. The contractor finds it easier to strip the covering below? Yes.

2716. No doubt they could get timber if they looked for it? Yes; but a contract has that tendency. A man is losing time while running after timber; and he has to go in such awkward places for it. Therefore, the less timber he brings the better; and, as far as I could see, no one was there to watch whether you put timber in or not.

2717. How about the shift-bosses? All they cared about was to see that the ore was got out and the shoots properly filled. If men were working day-work, they would not care how much time they spent in securing the place properly with timber. I have also to complain of the dangerous practice that is now in existence—at least, it was within the last eight or nine weeks—of carrying out what is called the open-cut system of stoping ore underground in the Central mine. I have seen great cuts there without any timber in them, and eight or ten sets of men working in a small space and no timber at all.

2718. What dimensions? Twelve by fourteen sets long, seven or eight wide, and four or five high.

2719. In that case, it would be very difficult to keep an eye on the roof? Yes.

2720. Do you know of any accidents in consequence of that? I was not working there long enough to see much. I worked there one shift, and considered it too dangerous. It was so dangerous that one party I knew had an accident the first shift he worked there. His toes were cut off through the fall of a piece of ore from the "back." I worked there one shift; and my mates and myself thought we might make it safe enough to work on; but, after spending all one shift, we had to give it up as a forlorn hope, and did not try any more, and left the place. There were thirty or forty sets of timber not properly blocked up. They had, apparently, been knocked down and put up, and knocked down and put up until the joggles were all worn off them. They were knocked about that much that they could not be safe.

2721. Was there not fresh timber to be got if the men applied for it? Certainly. But these timbers were standing, and not properly blocked. That is why I considered it was dangerous.

2722. Was it especially dangerous? The ground was of such a nature that, when you shot it, it would come down in big lumps, perhaps 2 or 3 tons in weight, and crush the timber. That was why there was not so much timber put in. I have seen as much as five sets knocked down by the one shot.

2723. Was the ground hard? Yes; hard sulphide ore.

2724. Did it continue hard, or did the air affect it? The ground would flake a lot after exposure to the air, and you had to be very careful with it and test it well.

2725. Other than the man getting his toes cut off, you did not hear of any accident there? No.

2726. If there had been any serious accidents there you would have heard of them? I might have heard, and I might have not. It is a dangerous practice, and not at all safe, to have so much ground taken out without putting in timber. I think the "back" to be four or five sets high is too much; it should not exceed 10 feet. Then it would be safe for the men to work under it.

2727. Was there a heap of ore on the floor, or anything to enable a man to bring himself within a short distance of the roof? They build a "pig-stye," and stage themselves up to their work.

2728. So really those "pig-styes" take the place, as far as the working stage is concerned, of built sets? Exactly. They give the men a chance to get up to their work; but there is actually no support to the "back."

2729. But they (the "pig-styes") are less likely to be injured by anything falling on them than sets built up? Yes.

2730. They were moved as suited the work? There were only there, of course, while the men would be working.

2731. That appeared to you to be a very much more dangerous practice than building sets within a safe distance from the face? Yes. I also think there should be more mullock put in the sets.

2732. Was not the filling-in at that time going on at a good rate? It was, in some of the other levels.

2733. You think the work had got too far ahead of the filling-in? Yes.

2734. Had the ground begun to move to any extent? In some places.

2735. Not enough to cause a dangerous crush? Of course, that is a matter of opinion.

2736. But, as far as you could see, I mean? Of course, a man does not see danger much, if accustomed to working underground; but still, there is always a possibility of its coming down.

2737. I suppose miners never care about seeing a crush coming down if it can be avoided? No.

2738. Will you now tell us what you know of the open-cut work? I think, as far as my experience in the open-cut work is concerned, the men have been kept too close at their work. Caution enough is not taken; and I do not think the batter of the bank is sufficient to make the work safe. I think there are places there that are extremely dangerous. I also think the system of the "chinaman" is a very dangerous form of work.

2739. Why so? Because, in the event of a slip, there is not sufficient chance for a man to get away. In a "chinaman" the dirt is always loose, and, being loose, a man has to be down there to stop it when the truck is full. In fact, he is in a regular hopper, and has not got a possible chance of getting away. It is bad enough in day-time, but must necessarily be much worse at night.

2740. The plan of the "chinaman" is substituted for that of filling trucks from a level? Yes.

2741. Would it not be more difficult to get away from something you saw above if you were between the truck and the bank? Not if on a level space; and when around a truck, filling into it, you have a way to run back. If down in a hopper, however, with walls around you, you have not got much chance to run away.

2742. On the whole, do you not think the "chinaman" affords a better means of getting away? No; if you are down in a hole and surrounded, you have not got much chance to run away. 2743.

J. G.
Shinnick.

20 July, 1897.

2713. What height is the ground raised in the hopper? About 16 feet in some places; others not so much; others more.
2714. That would not be all round? No; when I worked in the open-cut, it was some time ago, and the banks were not so deep as now.
2745. You mean the banks of the cutting itself? Yes; I can only see that they are more dangerous now. They are narrower in the bottom, and deeper.
2746. When you were working there did any accidents take place from stuff coming away from the sides? I never saw any accidents, but have seen men have to clear off in a hurry.
2747. Did they generally succeed in getting away easily? Sometimes they did not; they would have a hard struggle.
2748. As to the batter;—was it a common thing for stuff to get away from the slopes on the permanent batter, or on the working batter? Generally on the working batter. The permanent batter, too, in my opinion, is in default; it is almost perpendicular; it may get weather-beaten, and, after two or three months, a stone may come away.
2749. But is it not the practice of the officer in charge to keep his eye on the permanent batter, and to send a man to bar down anything that may come down? It may be so, but men get careless, seeing a rock from time to time, and, at the same time, that rock might be a great danger to them. It may get weather-beaten, and become loose and slip away. If the batter was more there would be less chance of stones coming away in that manner.
2750. But still, the batter, if run even to an angle of 45 degrees, would require constant watching to see that stones did not become gradually loosened? Yes.
2751. How high did the working face run in your time? Fifteen to 16 feet.
2752. That would be almost perpendicular, I suppose? Yes. The men are crowded together in the face, and are exposed to great danger, owing to men above them being engaged in barring down. They have to keep on going, and have no chance of turning to look round. Often a run of ground comes unawares on them; and there is a cry of "Look-out"; and they, perhaps, jump in one another's way.
2753. Was it the practice for the men running the stuff into the trucks to be right under the face where a man would be barring the stuff down? Yes; a man would be up there barring down rocks and loose dirt.
2754. Did you work there at night? Yes.
2755. How did you find the light? I found it sometimes very bad; I have seen it go out.
2756. In your time, was it the arc-light or the incandescent light? It was the small ones, not the big ones. I have seen them go out. I have seen it happen, sometimes, once every shift. In some shifts it did not happen; but, in the majority of shifts, it did.
2757. How was that accounted for? Something was wrong with the wires, I suppose.
2758. That would be while the electric lights in the other places were burning well? Yes; I believe the arc lights would be burning very well.
2759. So it would look as if nothing were wrong with the engine, but something wrong with the conductors? Possibly; I am not prepared to say that.
2760. When the light was fairly good, did you find it as well to work there as in the daytime? No.
2761. It would be cooler? Yes.
2762. In daytime, what was it like to work there? Very hot.
2763. As far as the temperature was concerned, it would be much better to work at night? Yes.
2764. But, as far as the light was concerned, you would not prefer to work there at night? No.
2765. When the light was burning fairly well, did you consider it dangerous? I do not know what has been the result in the cuts since the new light has been introduced. I know they have better lights there now than in my time. It was in 1893 when I was there. The lights look better now. Anyhow, they always throw glares; and you may, perhaps, be working in a dark shadow thrown by the bank or a truck.
2766. Still, the lights are moved to suit the work? That I could not say.
2767. Is there any other matter in the open-cuts that you wish to call attention to? The only other thing I have to refer to is in connection with the smelting branch.
2768. What have you to say as to that part of the work? I have seen what I consider unnecessary work performed in that branch. I have seen men ordered down into the furnace to pick off the ore that was stuck to it sides. They would have to go down within four or five hours after the running down of the furnace, or the turning off of the blast.
2769. What would they be standing on? They would throw down a board on top of the hot ore.
2770. The ore would be cool enough not to burn the board? I have seen it blazo at times.
2771. Has that led to any accident? No; but you suffer in health from it. I myself have suffered from it.
2772. You have been down? Yes. The air is very bad, and very hot. There is always a certain amount of fumes arising. I think the picking off of the ore could be done better from the top. It is quite unnecessary that men should have to go down into the thick of it. There is nothing to prevent its being done from the surface with long steel-bars. They did do a lot of it in that way; but, after getting a certain distance, the men would prefer, in many cases, to go down. Sometimes the boss would order you down. He would say, "The others have gone down: you go down too."
2773. Some would prefer to go down? Yes; they would rush into it. The trouble is to try and get men to guard their own actions.
2774. They did not then complain to the management of this? No.
2775. Was a man compelled to go down if he did not care about it? I have seen it tantamount to that. I saw a man in one case refuse to go down: the boss went down and picked a bit, and came up and said, "It is good enough; go down." I take it that in a case like that it is either one of going down, or else of packing up your clothes and going home. It is all very well for a boss to go down for a few seconds; but it comes a bit different when you have to work down there for some time.
2776. The men would only stay down for a few minutes each? Yes, as long as they could stand it; and they would then come up, and others go down.
2777. Did you find yourself suffer from this? Yes; I suffered from lead colic. The furnace was run down in the night-shift, and in the morning three or four of us were put on at barring it down. That morning, after going home, I took ill, and was not able to return with the next shift.
2778. That brought on the colic? Yes; all the men complain about that work hurting them. 2779.

J. G.
Shinnick.
20 July, 1897.

2779. What mine was that in? The Central. Of course, they do not use smelters there now. The Proprietary is the only mine where smelting operations are carried out.

2780. Have you any other matter you wish to speak about? No.

2781. *Mr. Polkinghorne.*] You say that, in your opinion, the shooting of mullock down portion of Kelly's shaft, on Block 10, is very dangerous? Yes.

2782. Can you suggest any mode of getting mullock down into the workings that would be safer? I would suggest that that shaft be specially set apart for that purpose, and that men be not allowed to travel up and down it. The thing I complain about is that they shoot down the mullock at the same time as the men are going up and down the shaft; and, as I have said, the thing is continually getting out of repair, and at any time a man might meet with a fatal accident. I consider the men are going up and down in too close proximity with danger.

2783. As to the timbering, do you think it at all times follows that, because the timber is inconvenient to get, it keeps men from getting a sufficiency of timber for their working;—what I want to get at is, is the inconvenience of getting timber the greatest reason why timber is not used to the extent it should be by some men? It was not, so far as I was concerned. Of course, I don't know what might be the rule in other places; but I have seen us have to go to the boss for timber, and he would not be able to give it to us.

2784. If a face were considered dangerous by the men, and they asked for timber and could not get it, what did the boss generally do? Where we were working, it was a fairly safe face; and there was not much danger about it. We got £5 a set; so it was pretty hard ground. There was not much danger of its coming away.

2785. As a rule, was there sufficient timber kept in the mine for all practical purposes? As far as I know there was.

2786. As to the open-cuts underground;—what distance, in your opinion, would be safe to keep the timber from the face? From 9 to 10 feet, I said.

2787. Not from the back, but from the face? I should say one set. Of course, in loose ground you would want to keep closer. You could work where we were three or four sets without putting in timber. The ore body was only about two sets wide, and was encased in very hard country.

2788. You say you think the back should not go more than 10 feet high before permanent timbers are put in? Exactly; that is particularly where you are working in sulphide ore. I have seen stuff to-day look fairly well, and sound all right; and, to-morrow, it has become quite baulked, and the firing in other parts causes a vibration, which helps to bring it down.

2789. Where timber has been knocked out by heavy firing, would it have been safer to have kept it closer to the face? Yes; if properly blocked and fastened, and if sollar of 10 x 10 timber were laid down to shoot on to. From what I could see, it was catch-as-catch-can. I asked the boss if there was anything to put down. He said, "Oh, look about; you will find something." I put in a whole shift, and did not satisfy myself, so I left the place. I think, if the sets were kept closer to the back, and plenty of big timber were handy to put down as sollar, it would prevent a good deal of the timber being knocked about—as it was where I was—and being knocked down altogether. It was at the close of the shift that I saw the timber knocked down, and, according to our contract, we had to put up timbers knocked down. We came to the conclusion that it would take us all our time to keep the timbers up.

2790. How close was that timber you saw knocked down kept to the face? We were working on wing sets. I suppose it was as close as it was possible to have it under the circumstances. But what I mean is that the timbers underneath us were not properly blocked or plumbed; and there was not enough sollar timber to put down to shoot on to.

2791. Was the timber there if the men wanted it? As far as my experience went, I could not get it. I went to the boss and could not get it. We could not get tools even. My mate went to the surface twice to hunt for tools, and while he was there I was endeavouring to get timber for sollar.

2792. *Mr. Williams.*] I think you were referring to the work you did on Block 10 when I came in? Yes.

2793. Which shaft is it you complain of? Kelly's shaft.

2794. The mullock you referred to is taken from where? From one of the dumps of the Proprietary open-cuts.

2795. And utilised for filling? Yes.

2796. Have you ever done any work on the surface in Block 10? No.

2797. You have worked on the surface in the Central? Yes.

2798. Where about? In the smelters.

2799. How long ago would that be? Two years ago.

2800. Who was your boss then? I forget his name. He is an American, I know.

2801. Was that a general practice, to go down into the furnace and bar it down when it got clogged up? Yes, when I was there.

2802. Men prefer going down to working with a bar from the top? Yes; sometimes they do.

2803. Do you know anything about the material used as flux; would there be a less clogging of the furnace in some cases than others; and would this be brought about by the nature of the flux used? I do not know anything about flux. As far as I know, they were using too much of the sulphide ores; and they seemed to clog quicker than other ores.

2804. You think there were noxious gases rising from the ore in the furnace? Yes.

2805. And where would the chimney be to convey off those gases—above you or beneath you? Above me.

2806. As a matter of fact, you would really be in the passage of those gases? Yes; they would have to go past you to get to the flues at the top of the furnace.

2807. Other men did it besides yourself? Yes.

2808. As a matter of fact, they are not using their furnaces there now? No.

2809. So there is no cause of complaint at present? No.

2810. How long is it since you worked in the open-cut? Not since 1893.

2811. Which cut did you work in? In the one now known as Harry's cut, also the one now filling at the back of the Proprietary Mine, which used to be Miller's.

2812. You worked for Mr. Harry? No, I did not work for him. I worked for a man named Davis.

2813. Who was your boss? Barrow; and, I think, a man named Woods.

2814. Are you working in the mines now? No.

J. G.
Shinnick.

20 July, 1897.

2815. You consider the "chinaman" a dangerous system? Yes.
2816. The most dangerous system at work here? Yes.
2817. Have you come across, in your experience, twenty men who are of opinion that the "chinaman" is the safest system to adopt? I do not think you could find twenty men to say that.
2818. Would you be astonished if it were put forward that the "chinaman" was the safest mode of working the open-cuts? Yes.
2819. From the experience you have had? Yes.
2820. I take it if you were not working the "chinaman" you would be working from a level? Yes.
2821. Which do you consider the most dangerous spot in the "chinaman" work;—say you and I were working together, would you prefer to be down on the flat, or up above barring down? I take it that the most dangerous place would be down on the "chinaman."
2822. Suppose both of us were at the top? The lower you are down, the more dangerous your position.
2823. Have you always sufficient foothold when barring stuff down? They have always to make their own foothold, and the stuff is shifting all the time.
2824. As a matter of fact, men have to work there like goats, picking their footing? Yes.
2825. They have to move ground that has previously been shaken by an explosion? Yes.
2826. And those explosions are notorious for their strength? The holes are generally full-charged.
2827. And that constitutes one of the dangers incidental to the "chinaman"? Yes.
2828. You are not working on the mines now? No.
2829. Have you complained about any of these things you have drawn attention to, to the bosses that were over you? No.
2830. Did you complain to the underground manager in the Central or Block 10? No.
2831. Did you complain to the general managers? No.
2832. Are you afraid of them? I considered that it would not suit me to make any complaints. I was a man that had already been marked in Broken Hill, and had suffered a great deal from it.
2833. What do you mean by saying you were marked? I had been boycotted. I was refused the right to work on a mine for a long time.
2834. What mine? On all the mines.
2835. Can you specify any particular mine? Yes; the Proprietary, Block 14, and British.
2836. Where were you working on the Proprietary when boycotted? I worked in the open-cuts, also in the sailor gang, and other places.
2837. And how came you to be boycotted? I would not be working at any place long when I would be discovered and discharged.
2838. I would like you to understand the gravity of what you are saying? I would be discharged. In the first place, when working in Davis's cut, I was at first very "soft," and would not have been surprised if they had sent me about my business then; but, just about when I was getting hard, and used to the work, and it was no trouble for me to work, they discharged me. Just after crib time it was. I saw one of the foremen go down and speak to the boss, and, as I was coming down to work after crib time, the boss—Woods—told me that I should have to go straight away and "get my time." I said, "What is that for?" He said, "It has nothing to do with me." I said, "It has a lot to do with me: have I not given you satisfaction?" He replied, "It is nothing to do with me." The shots that were fired at this time—while we were at crib—blocked the tunnel the trucks had to go through, and, of course, some of the men had to remain idle. And this is the reason why I know that I was marked. The timekeeper said, "I would not take time if I were you, because the tunnel will be cleared in a couple of hours"; I said, "I have been discharged." He said, "I suppose that is what Hanson was talking about to your boss. I said, "Would he block a man from getting work here?" He then recalled his words, and said, "I do not suppose that was it." I said, "What am I to do with this shovel?" and he said, "Oh! you can dig the garden with it." I said, "I will take it home, and write 'blackballed' on it." A few days after that I started with another contractor—a man by the name of Miller. I worked there for seven or eight days, and with the same result. The ganger told me straight out on that occasion that Hanson gave him orders to sack me. I asked him if it was Hanson's work; and he said, "Yes." He said, further, "I am sorry for you, old man; that is what's the matter."
2839. Did he tell you what was the matter? Yes; he told me that I had been objected to by the company.
2840. Did he give you reason for the objection? No; he only said that I was objected to in the office.
2841. Is that the only other occasion? I was also discharged from Sullivan's sailor gang in the same way within the same year. All these things happened within the same year. I worked with the sailor gang for something like six weeks. Sullivan had several notices from the under officers to have me discharged. He said "No," and that he was not going to do it, and that they could do it themselves if they liked. In the long run, notice came from the office; and I had to go. One morning, just before I went to work, he said, "Well, Jack, old man, I am sorry for you; you have to go; but, if you will take my advice, go and see the manager."
2842. Who was the manager? Mr. Howell.
2843. Did you see him? He told me that it was useless seeking employment there, as he would be putting me on as against his officers, and that he was never going to do that sort of thing. I pleaded with him. I told him that I had no recollection of doing anything to hurt either his officers or himself, and that any action I had taken during the strike was simply on principle. I was not aware that I had done anything that I need be sorry for. If I had, it had been done unknown to myself. All this I told him, and asked him to let me know if there was anything I had done, and I would apologise; and, further, that if there was any accusation against me, to bring me face to face with my accuser and give me a chance to clear myself. He said, "I have got it very hot against you here"—putting his hand on a pile of paper—"and that it would be no use bringing me face to face with any accuser." Mr. Schlapp told me that it was no use applying for work in Broken Hill, and that the best thing I could do was to sell out and get away to another district.
2844. Would that form part of the reason why you did not complain of those things you have drawn the Commission's attention to? Yes.
2845. You had grown a little bit wiser? Yes.
2846. *Mr. Edwards.*] This, what you speak of, occurred a long time ago? At the time I stated.
2847. Four years ago? Yes.

- J. G. Shinnick.
20 July, 1897.
2848. Mr. Howell has gone over three years, and Mr. Schlapp has also gone? Yes.
2849. And I suppose you do not deny the right of managers to employ or discharge whom they think fit? Certainly not.
2850. They must keep that right? Certainly, by all means.
2851. I suppose in employing a large number of men such as the Proprietary have, the manager is not called upon to account for his action in discharging a workman? No; but my case was different.
2852. You have only worked as a surface hand and a miner for about twelve months up here? I worked on the surface under Lane for four years without losing a shift.
2853. Mr. Lane has gone about four years? Yes. He had the reputation of being a very hard master; and he did not keep a bad man long. I worked for him for four years; and it was very hard work.
2854. At any rate, what you have been speaking about is ancient history practically? It is not very ancient to me; it is, rather, very fresh.
2855. Possibly, they thought they were justified in what they did; and, possibly, you thought it very hard? I did think it very hard.
2856. You admit that the manager has the right to discharge what men he thinks fit? Yes; but you will admit, with me, that if a man has a complaint, and is labouring under something that he is supposed to have done, it is only right that he should be given a show to clear himself.
2857. How long have you worked underground up here? I have worked here about twelve months altogether, underground.
2858. At different periods? Yes.
2859. How long were you working in Block 10? I was there as a miner for about six or eight weeks.
2860. That is quite recently? Yes.
2861. Dick Thomas is the underground manager? Yes.
2862. And I think he has the reputation of being one of the best underground managers here? I am not prepared to say what his reputation is.
2863. I suppose you saw the inspector about occasionally? He never came into our face while I was there.
2864. Now, as to this shoot you spoke of in Kelly's shaft;—was not the mullock compartment closely boarded off from the hauling compartment by 10 x 4? It might have been 10 x 2; I took it to be 10 x 4.
2865. If any boards were broken, they would be repaired at once? I have seen broken boards there for a week without being repaired. I have seen a trucker work a whole shift removing mullock that had fallen out on to the plat.
2866. The danger would be to men working in the plat? No; the men, if any, working down the shaft. A man might have been coming up or going down in a cage.
2867. As a matter of fact, no man was hurt? I have seen men escape just by Providence, as it were.
2868. You made no complaint to the shift-boss? No.
2869. Nor to any other person? No.
2870. Why did you not go to the shift-boss? I just gave Mr. Williams my reason for not doing so. I did not want to be the first to begin to complain. They would have said, "This fellow is always stirring up mischief; he is going on with the same old game."
2871. You know Captain Warren? Yes.
2872. Would you be afraid to go and speak to him? Yes.
2873. As to the Central Mine, how long did you work there underground? I worked there on two or three occasions.
2874. On each occasion how long did you work? I suppose about two or three months altogether. I only worked there one shift last time.
2875. Did you make any complaint to the shift-boss or to Mr. Rowe, the underground manager, about not having sufficient timber? I told the boss I could not get it.
2876. What was his name? I could not tell you; I never heard it. He came to us in the face once, and I said, "I want some timber." He said, "Oh, look round; you will get some."
2877. Did you leave that place because you could not get timber, or because the work was dangerous? If I could have seen my way to get things to secure myself it is possible I might have stopped on.
2878. You were only on one shift? Yes.
2879. Did you complain to Mr. Rowe? I told him, and he said, "Oh, I will see that it is got." The more I saw of the thing the more I went about looking at it. The timber was out of plumb, and jumbled up together, as it were. I thought it not good enough to take the risk, and I left it.
2880. You have never worked long in any one of those places since you left Block 14? No.
2881. I suppose these "pig-styes" they put up would be stronger than even the square sets? Yes; but they were simply used as stages.
2882. That is from your experience of one day;—would you say they were not specially put up to protect the ground that was dangerous in the face? Yes; I am satisfied they were simply put up for stages.
2883. I suppose you know that these chambers are filled up with timber as soon as they are excavated, from the floor to the roof? Yes, with square sets; and, in many cases, the sets are not properly lathed.
2884. Is that owing to the carelessness of the men or of the shift-bosses? I would take it that it was the carelessness of those who had the supervising of the work.
2885. You admit that the men strip the floors for their own work? It is often the case that men do that. That is the fault of the man supervising; and the men who do it ought to be discharged.
2886. When an excavation is finished, it is filled up with square-set timber? Yes; but it is very dangerous before that timber is put in.
2887. You cannot put timber in before you take out an excavation? But you can take too much out before you put in timber.
2888. You never knew an accident to occur through this, except the one you have mentioned? No. He was boring in the face, and the timber men were trying to square up sets of timber; and while they were doing this some of the ore on top of the sets above him came away.
2889. Was he not breaking down a bit of stuff, when it came down on to his toe? No.
2890. What is the man's name? Kelly. It came from over the top of the set just behind him. I knocked some of it down the next day.
2891. You have not worked in the open-cut since 1893? No.
2892. I think you are keeping a boarding-house now? No; I am not.
2893. You were keeping a boarding-house? Yes.

2894. You can give no opinion as to the effectiveness of the electric light at present? No. From what I saw of the other lights, they throw shadows; and that misleads a man. I believe under any circumstances artificial light is not as good as daylight to work in.

2895. As to breaking down the lead that sticks to the side of the furnace. That was in the Central and Block 14? I am not sure about Block 14, but I am quite sure as regards the Central.

2896. How long have the Central smelters been absolutely closed? I think somewhere about two or three years.

2897. No smelting is going on there now? No.

2898. So that is all ancient history? Yes; it only goes to show what dangerous practices men have been put to, and what they have been asked to do. I can assure his Honor that men are asked to go and do things that are absolutely dangerous to their health.

2899. Before the shift-boss ordered the men down, he went down to see that it was safe himself? He went in one morning. One man said, "It is not good enough," and the boss went down, and picked a bit, and said, "It is good enough; go down and pick that stuff out."

2900. On those occasions the furnaces were shut down? The fire would not be taken out. All they did was to cut off the blast and throw in more ore. Underneath, there was nothing but molten material.

2901. But there would be a great depth of ore? Not greater than 4 ft. 6 in., and then you would come to the molten stuff.

2902. The boss went down first of all to see whether it was safe? Yes; but he did not stop there long.

2903. He thought what he could do other men could do? Yes; but he took very good care not to do it very often.

2904. You think men would be safer loading a line of trucks at the bottom of a face in a cut than they would be working on a "chinaman"? Yes.

2905. *Mr. Williams.*] You were asked if you had been keeping a boarding-house. Carrying on that occupation would have led you into contact with a number of men? Yes.

2906. You have not worked in the Proprietary since Mr. Stewart has been manager? No.

2907. Have you heard men express any opinion as to whether Mr. Stewart has removed that system of boycott? I heard that Mr. Stewart had done so; and I was advised to apply to him for work. I said: "Mr. Stewart may be all right; but there are officers under him who have a dislike to me; and they would be sure to make up an excuse to get rid of me."

Christopher Kelly sworn and examined:—

2908. *His Honor.*] What is your full name? Christopher Kelly.

2909. What is your occupation? A mechanic, as well as a miner.

2910. Have you been mining at Broken Hill for some time? Yes.

2911. Up till how recently? Up till within seven weeks.

2912. Until you met with an accident? Yes.

2913. For how long altogether were you mining? For eight years.*

2914. Below ground all the time? Three years above ground, and after that below ground.

2915. In what mines have you been working? Proprietary, Block 10, Central, and Silver Hill Junction.

2916. In which mine were you working last? Block 10, and the Central.

2917. At stoping? Yes.

2918. And before that? All stoping work.

2919. I thought you said you worked part of your time on the surface? That was tool-sharpening on the Proprietary.

2920. You wish to inform the Commission of some matters in which you think dangerous practices are being carried on by the management? Yes.

2921. I want you to tell me, in order, what these different practices are that you take exception to? In the contract system—the way it is carried on here—a man has no liberty whatsoever. When you go to take a contract, you have a price offered you, which is a fixed one; and you must take it.

2922. They name a price; and you may either take it or refuse it? Yes, that is the only option you have. They have a fixed price; and no matter whether it pays or not, you have to take it or go without. As regards timber, on many occasions I have had to go to the plat for it, and, not being able to get it, I have sent word for it, and then could not get it.

2923. Was that when you were really in want of timber? Yes, to save pulling up timber from the floors.

2924. How often did that occur? I was six weeks in Block 10; and I spoke, I think, three or four times about it.

2925. Did you not finally get the timber? Not that day. We had to leave it to our mates to get it.

2926. What did you do for the want of timber? Of course, under the contract system, if you cannot get it you risk many a thing you ought not to, in order to make a livelihood. You do without timber, and incur many a risk.

2927. Can you mention any accidents that took place from want of timber? I can only state that where I met with my accident timber was wanted. At the Central, on the 400-foot level, there is an open-cut; and you have to travel along on the caps and struts, there being no flooring-boards at all.

2928. What was your accident that you speak of? We started a contract in this open-cut. I asked Mr. Rowe previously to going down, if the place was ready and fit for us to start in. He said that it was. When I went down, I asked the shift-boss where I was to start; and he seemed to be in a bit of a fog as to where I was to make a beginning. He put me on to a place for the time being; and above the strut was a large piece of loose stuff. I complained to the shift-boss, and said, "This is a nice place in which to start a man working." He took me overhead and had a look. There were 8 or 9 tons of ore lying on the floor that should have been cleared away before we were put to work. The shift-boss could not give us any definite instructions, and I thought that, by being careful, we might possibly "dilly dally" the shift out until our mates came in with definite instructions. I tommed this big lump up, and started to bore a hole. The timber men came round, and started to straighten the timber; and I saw the lump move. I said,

* *Note (on revision):*—I understood the question to refer to Broken Hill only, or I should have said, "It is twenty years since I started mining."

J. G.
Shinnick.

said, "Get away, Bill." My mate hit it; and it fell down through the floor. If it had gone through the next floor it would have killed the trucker. I saw another lump which was evidently keeping the stuff behind from running; and I put a chock under it. Afterwards, the timber men went a set further back; hit the leg, and disturbed this lump, without giving me warning; and down it dropped on my foot. That is how I met with my accident. It is a shame and a disgrace the way the stuff is left about there. You have to be very careful there, or else you would meet with an accident. I have heard numerous men complain; and I am sorry to see they are not coming forward to give information.

2929. Complaining about the want of timber to keep pace with their work? Yes. In the old days, when I worked under Mr. Harper, the system was that, whenever a man wanted timber and there was none at the plat, immediately after sending word to the platman the cage came down with some. Now, it is different altogether. In Mr. Harper's time, timber was the first thing considered.

2930. There appears to be plenty of timber on the surface? Yes.

2931. And your observation would lead you to think that the management are stinting the amount of timber supplied to the workmen? Yes; economy is practised. Very often, if you had timber at hand, you could prevent danger from increasing; and, instead of running about for timber, you could save many hours' labour.

2932. A good deal of that you put down to the contract system? Most decidedly.

2933. You mean that men are tempted to run risks they would not run if working under the day-labour system? Most decidedly.

2934. So as to make a little more out of their contracts? This system they have here—the fortnightly system—is an old system that I saw worked under twenty years ago in New Zealand in connection with the coal-mines.

2935. Did it not work well there? No; you cannot compare the working of a coal-mine with the work here. They are worked on a totally different scale. Here, if a man fortunately struck a good piece of ground during his fortnight, they would have no hesitation in dropping him down £1 or 30s. a set for it.

2936. Is there any other matter down below that you specially wish to call attention to? There is this filling-in business. I believe there could be a little more done with it. I have seen them build rough stone up and put a lath across from leg to leg. If those laths were kept away, and the stones built properly up in the levels, things would be much safer. After a certain time, you can put your "spider" in these laths, and they go to sawdust; and, if a stone were to roll through, it would be sure to bring others with it.

2937. It is a safe plan to use the laths in addition to the stones; but the stones should be built up instead of being tumbled in? Yes; above the levels.

2938. You would not do away with the laths, to act as a temporary support for the wall? I think I would prefer to see them away, in the levels, because what good are they when they rot?

2939. But, do they not help the wall to keep its solidity while it is settling? But the walls would never be built properly then.

2940. You think the using of laths prevents men from building the walls properly? Yes; they just chuck the stones in roughly.

2941. Is there any other matter you would like to speak about? Yes; as to the boring of missed-holes. I have heard a lot said about the fuses, and that men are neglectful with the detonators. From what I have seen, the miners are generally very careful with the detonator. It is the fuse that has been the cause of trouble—bad-quality fuse.

2942. How do you account for the late firing of a charge? Sometimes the cotton in the fuse may be smouldering away for hours. In New Zealand, a man, after a hole has missed, is not allowed to go near it for the rest of the day; and you have to knock off in that particular part.*

2943. Twenty-four hours would be the limit in that case? Yes.

2944. Does that apply to all mining in New Zealand? I think so.

2945. You are speaking of a coal-mine now? Yes.

2946. In that case, powder was used? Yes; fracture was also used.

2947. Then you think that a regulation ought to be made that a longer time should elapse than is at present provided before going back again after a miss-fire? Yes.

2948. Of course that is a very difficult question? It is difficult, but we must use a safeguard if possible. Though I have often risked the thing myself, of course, on account of the contract system, I think there should be a rule to keep men under.

2949. Was it considered in New Zealand that the fuse did carry fire along in that way—through the material? I could not say. I have examined a fuse myself after a shot has gone off; and I have seen the thread smoulder for an hour afterwards. Sometimes we find a knot in the fuse; and where that knot is there is very often no powder. Sometimes, however, that knot is so fine you have to look very minutely to detect it; and in some cases it may escape your attention, and it is then that a miss takes place; that is, the charge does not explode until the fire has smouldered its way along the thread and again reached the powder.

2950. Is there any other matter underground that you wish to speak about? I wish to call attention to the condition of the plat at the 415-feet level in Block 10. It is in a most disgraceful state. The timber above the men's heads is shattered to pieces, and all splintered.

2951. How has the splintering been caused? By the weight of the ground above crushing it.

2952. Which plat is it you refer to? At Kelly's shaft, on the 415-feet level.

2953. When did you last see it? Somewhere about nine or ten weeks ago.

2954. Was it then in the same state? Yes.

2955. Have you heard of its being repaired since? No. They have there, too, a mullock pass; and, when men have been passing up and down in cages, I have seen them running the mullock down; and, at the 415-feet level I have seen lumps of mullock come out and nearly cause accidents. The stones even rebound off the plat, sometimes, and lodge within an inch of going down the shaft. I passed a remark once or twice to the shift-bosses about the thing, but they never took any notice of it. As to the shift-bosses, what I have seen of them goes to tell me that they are there just to watch the shoots. So long as they are kept filled, things are all right.

2956.

* NOTE (on revision) :—I understood this question to refer to miss-firing.

2956. You think the shooting of mullock down this pass is a serious risk for the men who are travelling up and down the shaft? Yes. Another thing, while I was working there, the shift-boss would come and give you one order; and, presently, the underground manager would come down and lecture you for carrying out the work in such a manner. You were in a fog as to whom you should please; and, if you attempted to obtain redress, you got nothing but a snub; and, if you did not like it, of course you could go home.

C. Kelly.
20 July, 1897.

2957. Whom would you go to for redress? The only one I look to is the underground manager.

2958. And would he give no satisfaction? We spoke to him, and he would not listen to us, but walked away. Of course we could not do any more, and we let him go at that.

2959. You have never worked in the open-cuts? No; and I would sooner starve than risk my life in one of them. Why do they not adopt the railway system as to the batter; none other could be safer.

2960. What is the difference between the railway system and the open-cut system? In a railway cutting the ground slopes backwards; here they have gone underneath, and the mullock is hanging over the men's heads, and you can see cracks running in all directions. It is the greatest piece of Providence that there have not been ten times the number of accidents in Broken Hill. They have practical surveyors here who know the width of the lode; and surely they would know what grade to take down an open-cut to prevent overhanging; and if that were done it would be a great protection to the lives of the men working there. What brings about this overhanging is, that after they get down a bit they find the ore widens out, and to get it out they have to undermine for it, as it were.

2961. Still it is a good deal a matter of experiment as you go down to see how the ground would stand;—you could not start on the surface with an assumption that you would have to put on a certain fixed batter by the time you got to the bottom? We all know very well that in these mines the ground on the surface is worse than it is deeper. The deeper you go, the sounder and more solid it is.

2962. That would make it all the more difficult to decide on the surface what batter you would want? The shafts that have already been put down would give you a very good idea.

2963. But the rock varies? But in Broken Hill they have had all through a very good idea of the country.

2964. Therefore, they ought to have started the batter from the top of the open-cut? It is my opinion that in doing this open-cut work they ought to have started from what they call the viaduct, and to have gone straight ahead; and not from the top of the hill. That is the ordinary practice with railway cuttings. It is my firm opinion that a lot of the ore that is wasted now in the shifting of the mullock would have been saved had such a system been adopted.

2965. You would always know then how you were with your batter? Yes.

2966. But the question is how the matter stands at present with regard to safety—you have not been down in the cuts: you have only looked down? Yes. Even now, any man who looks down Block 11 open-cut will see something which would not encourage him to risk himself in it. The stuff is overhanging, and great large cracks are running in all directions.

2967. As to the use of the "chinaman," have you any opinion to express upon it? I have seen where the men have been working underneath filling, and I have noticed that they have not time to lift their heads to look round. They are always in a hurry and a bustle to get the stuff away. Another thing, I have heard in the open-cuts with my own ears the gangers using some of the most disgusting language that could ever come out of a man's mouth. They are what I call "bullying gangers." You never hear such language from a good, practical man; he always speaks to his men with civility. I have never in all my experience seen anything but the greatest civility come from the really practical man; but, where men are not practical, and not up to their work, then you know what to expect. This "bullying" business flurries a man, and no doubt gives rise to accidents.

2968. Have you done any work in the open-cuts during any part of the time you have been working on the Hill? I could never get any work there.

2969. There is nothing else you can speak of? No.

2970. *Mr. Polkinghorne*] You say that timber was not at all times procurable when required? Yes.

2971. Have you at any time applied for timber and been told that you could not have it? They would not say straight out that you could not have it, but it would never come down. I believe the platmen have done their work, and sent up the orders for it.

2972. You have never in your experience witnessed an accident brought about through lack of timber? No; I have not been where any accidents have occurred through that cause.

2973. You say that, in your opinion, the way of getting mullock down Kelly's shaft in Block 10 is dangerous? Yes, decidedly.

2974. Are you prepared to suggest any means to make it more secure against accident? There should be a separate shaft altogether to send mullock down.

2975. In your opinion the practice of putting mullock down should be discontinued, or else the hauling and lowering of men? Yes.

2976. *His Honor*.] The practice of putting the shaft to both uses should be discontinued? Yes.

2977. If men are going up or down, mullock should not be shot down? No. I have noticed very often that the runners of the cage have been put out of place on account of this mullock. That is very dangerous.

2978. *Mr. Polkinghorne*.] You also spoke of the plat being very insecure. Was no attempt made while you were there to secure the timber? No; not while I was there.

2979. Is the ground very dangerous around that shaft? Of course, it was not my business to make an examination as regards that; and I had quite enough to do where I was working. Of course, I did not examine it carefully, but just took notice of what I saw wherever I was travelling. We only travelled the one road; and I always watched where I was going for my own safety, but never took the trouble to enter into a careful examination. Besides, it was not my business to do that.

2980. You know enough about it to say absolutely that fresh timber should have been put in? Yes; the plat should have been re-timbered and secured.

2981. It was stated that a number of sets are very often left uncovered. Would they be under where men are working? Yes.

2982. Did you ever point it out to the shift-boss, that there were not sufficient laths to cover these sets? It was in the Central where I noticed that; and I had only just started.

- C. Kelly. 2983. You did not notice it in Block 10? No; what drew my attention to it in the Central was that when we went down to examine the place where we were to start work, we had to walk along struts; and it must have been five or six sets high. Some of the floors were covered, but the majority were not.
2984. Was it in what they call the open-cut? It was at the 400-foot level; I believe they call it the open-cut.
2985. To what extent was it being worked without timber? As soon as you entered you saw in front of you a chamber fully 30 feet long and from four to five sets high, and no timber.
2986. How far would the face be ahead of the timber? The drive was about 30 feet long; and the distance across the lode must have been fully 60 feet. It was 30 feet wide, 30 feet long, and about five sets high.
2987. Were machines being used in that excavation? No, not then.
2988. How close would it have been safe to have brought the timber to the face, so that it would not be exposed too much to the shots? I would say it should be within two sets, anyhow.
2989. And what height do you consider it a fair distance to go without securing it with permanent timber? I would prefer myself to keep more than a set above me. I would keep the timber to within one set.
2990. I believe the ground is naturally hard in those open places? It looked very hard where we were; but I believe in places there are large pockets of soft ore as well.
2991. Would it not cause delay to the company if permanent timber were placed too close to the back—would not the shots interfere with it? The floor can be built up with old timber, which will protect it from being broken about with the shots.
2992. Was the cause of your injury due to the fact that the timber was not put close enough to the face? No.
2993. Could you have taken any precaution that would have prevented your accident? If I had been under wages the first thing I would have done would have been to go up above and clear the stuff away. But it was not my place to go and shift the stuff hanging up on the next set; and I should have got nothing for it.
2994. Did you point out to the shift-boss that the stuff should be cleared away? Yes; I told him that the place was not fit to work in.
2995. He did not suggest to you to clear it away, and that you would be allowed for it? No; I remarked about this lump that was overhanging; and he said that it had been standing for weeks and weeks. I replied that that was more the reason why it was dangerous.
2996. Was that the place where the sets under the working-place were not covered? Yes; I had to cover the sets myself before I could start work.
2997. How many floors do you think should be kept covered under a working-place to ensure safety? I approve of Mr. Harper's system. There was not a floor left uncovered, and filling in was done wherever possible, while he was here.
2998. Was that in the Proprietary? In McGreggor's.
2999. You think every floor should be kept covered? Yes, or else the sets be filled in.
3000. Is it your opinion that the number of accidents during the last two years has been on the increase? Yes, so far as I have seen by reports in the press.
3001. What, in your opinion, is the principal cause of these accidents? A good deal of it is due to the contract system, because men cannot afford to take the care they would under day-labour.
3002. Are the instructions of the bosses such as to cause men to run risks? They will not give a man a fair price to work comfortably.
3003. Leaving the prices paid out of the question, are the orders given by the men in charge such as to make the men run greater risks than they were asked to do under the day-labour system? Yes; when I worked under Mr. Harper on day-labour the instruction was always to secure the ground, no matter what time you spent.
3004. Is not that the order now under the contract system? That is the order; but supposing you have got a wife and family, and there is only just a bare subsistence to be got from your contract. In that case, rather than have a delay, you would work on under a great risk. Under day-work there would be no necessity to run such a risk.
3005. What would you suggest in order to bring about a better system? I am a strong upholder of day-labour; and I think you will find that the profits derived under day-labour were just as big as they are now.
3006. Would you be surprised to hear that there is as much work done now with 1,000 men as was done on day wages by 2,000? There may be some instances where that has been the case, but these things are exaggerated a great deal sometimes. Of course, we know this open-cut work has to a large extent increased the out-put of ore; but, excepting that, I do not think the day system was any costlier than the contract system.
3007. You think it did not cost more to get out ore under day work than it does now under contract, taking the underground portion of the work? No; in the early days one shot among the rich carbonate ores would do as much execution as half a dozen shots in the sulphides to-day. I have seen one shot in a drive take out 40 trucks of dirt.
3008. I suppose you are aware that, at the time you speak of, silver was almost double the price it is to-day? I think it was on the drop at the time.
3009. What was about the price of silver at that time? I could not say. My opinion is that one man does not do as much now as two did under the day-work system; at any rate, not where the men did their work legitimately.
3010. Can the men, under the existing system, take all necessary precaution for the safeguarding of their lives? Most decidedly no. If it were freedom of contract, and not this fortnightly system, they might. The present system is freedom for one side only. When a man is given a contract, let him have a certain amount of sets or feet to do; and let him put in his price for it. Under the present system, if you make good wages during the fortnight, at its termination you are cut down; and sometimes you are even cut down while the fortnight is in progress, and if you attempt to say anything about it you are told to go about your business. Let them have a proper contract system; and not, as at present, where your price may be one thing offered, and their's another; but they will not budge

an inch to you. They say, "Our price is so and so; you will have to take it or else leave it." At the same time they know that the price is one that you could not make wages at.

3011. Do you know of any accidents that have taken place because of the incompetency of any of the managers or their subordinate officers? I cannot say; I have never been near when any accident has taken place.

3012. Do you think the regulations under the Mining Act, and which are supposed to be now in force, are sufficient? I have never read them enough to know them properly.

3013. Do you think that one inspector is sufficient for the Albert Mining District? No; I do not.

3014. How many do you think there should be? I think there should be two at least.

3015. And one to be always on the Hill? Yes.

3016. What do you think of this Board of Inquiry that has been suggested;—do you think it would be a benefit to the district, to the owners, workers, and inspectors, to have a Board to inquire into all accidents other than fatal ones? Most decidedly there should be a Board to inquire into those things.

3017. How would you suggest the Board be appointed? There should be three to represent the mine owners, three to represent the miners, and a chairman, who should be the Coroner or the Warden. I firmly believe that if such a Board were established, many of the difficulties we are labouring under to-day would be seen to. I will give an instance of how the Board would come in: Lately we tried to suggest one or two things to Mr. Thomas, now the underground manager of Block 10, that would probably be of benefit to him; but our ideas were scorned. It looked as if we were not men at all, and that we knew nothing at all. He would not listen to us in any way. Suggestions from the Board would have to be listened to.

3018. You think such a Board would result in the best interests of all concerned? Most decidedly. I notice that over in New Zealand recently a man was blown up; and his wife sued the company for £1,000, and got £750. If we had laws like those, and one or two cases like that were brought against them, the mine managers would show a great deal more interest and care in the well-being of their men.

3019. Do you think the Government should provide this district with an ambulance waggon? Yes; but I think we want more than one ambulance waggon for Broken Hill. The Proprietary would very often require more than one for its own use.

3020. You are evidently referring to litters? Yes.

3021. Do you think it should be made compulsory that each mine keep an ambulance litter? Yes.

3022. And that the Government provide an ambulance waggon for taking these litters to the hospital? Yes.

3023. In your opinion should there be a regulation made enforcing the adoption of safety appliances on all cages used for lowering and raising men? Yes.

3024. I think you said, in opening your evidence, that you are also a mechanic? Yes.

3025. Is it your opinion that engine-drivers should be certificated before taking charge of a winding-engine where men are lowered and raised? Yes, certainly; but the certificates only should not be relied upon. I have known in many cases men to possess certificates, and not be practical.

3026. *His Honor.*] You think a Board should not grant a man a certificate without testing him on the different engines? Yes. In New Zealand, I have seen men who only had book-learning obtain certificates as engineers.

3027. *Mr. Polkinghorne*] The Board granting these certificates should be composed of practical men? Yes; under the supervision of the Government.

3028. And the man should give a proof of his practical ability before being granted a certificate? Yes. Another thing: the system adopted ten years ago by the Government School of Mines in New Zealand, as regard mine managers, is a very good one. There, after a man has learned all the theory and so forth, he has to serve two years underground and gain practical knowledge before he can send in any application for a position as a mine manager. Mr. Horwood could not hold the position of a mine manager; he is a surveyor. Your Honor, that is the system in New Zealand.

3029. *Mr. Williams.*] In giving your evidence upon the open-cuts, you expressed an opinion that it would have been better to have cuts in from the slopes of the hill instead of down from the top? Yes.

3030. But they have been put in from the top; and the question is, now, how to further conduct operations in them with a minimum loss of life: you have given your recommendations with that object in view, and, as a man, you have come here to endeavour to give the benefit of your thought, and experience, for the prevention of unnecessary sacrifice of life? Most decidedly.

3031. Without the desire to hinder or hamper the operations of any party whatever? Yes.

3032. Would you be surprised if the "chinaman" was advocated as the most humane system of working the open-cut? I would certainly say it is a dangerous system, especially to the men engaged in filling.

3033. You would prefer to work with skips and trucks? I would prefer to get at the lowest part of the hill first, and carry on from there.

3034. But, taking the work as it is being done now, would you not prefer the Block 10 system, where they are sending the overburden straight away through a tunnel into the mine for filling? I would prefer Block 10 system to the others at present in practice.

3035. You think that would be the most practical and economical way to get rid of the mullock? Yes.

3036. You have complained of the bad language used by the gangers; do you think that would have any influence upon the men? It might hurry some up, but others it might flurry, and so lead to accident.

3037. You know the contractors by repute in the various open-cuts along the line of lode? Yes.

3038. Have you known any of them to have a straightforward character and a good name? I could not say.

3039. It has been said that the proprietors have a perfect right to work their leases in their own way? I have known the managers at other places to have a little social chat with their men, and be only too glad to adopt any suggestions of value they might make. If you made a suggestion, they gave you credit for it; but here, if you attempt to offer a suggestion, they snub you like a mad dog travelling down the street.

3040. *Mr. Edwards.*] You met with your accident through the fall of some stuff from above where you were working? Yes.

3041. How long would it have taken you to have shifted that stuff? It might take me a whole shift to do it.

C. Kelly.
20 July, 1897.

- C. Kelly.
20 July, 1897.
3042. How long would it have taken you to have popped that big stone that led to your meeting with your accident? If you had attempted to put a pop in it you would have popped yourself. The way it was hanging, no sane man would ever have attempted to pop it.
3043. Could you not have barred it down? Yes; but it was not the big lump that fell on me; it was the small lump.
3044. But could not the small lump have been barred down? It might have caused a run, and in that case the trucker below would have probably got injured.
3045. You could have warned the trucker? I said to my mate "We will be as careful as possible; we will 'dilly dally' until the morning, until our mates come."
3046. You were waiting for proper instructions from your mates? Our mates were to get proper instructions from the manager.
3047. In the meantime you left that stone above you hanging;—surely to goodness you could have taken it down? I had not got authority from the shift-boss to do it, and I was not going to do it myself.
3048. How long have you been working underground? Twenty years ago I started in mines.
3049. Do you mean to say that after twenty years' underground experience you could not take down a piece of ground like that without consulting the shift-boss? It is not my place to see to such things.
3050. Were you not competent to do it? Yes.
3051. Well, why did you not do it? By doing so, I would not have been acting in accordance with discipline. If you made a start at taking the work out of the hands of the manager or shift-boss, you would very soon be sent about your business.
3052. Would the manager or shift-boss reprimand you for taking down a piece of dangerous ground? No; but they very often do not pay you for it.
3053. How long would it have taken you to knock down this lump of dirt that was hanging on the strut;—the big piece weighed about 7 cwt., and the small piece less? It all depends. Sometimes it looks as if you could do it in an hour, and it might take the whole shift. By looking at it, you could not define the time.
3054. As to that big piece of ore that was there? The timbermen came and were straightening a leg, and I noticed it move. I told my mate to get out of the road. He turned round and hit it with the hammer, and a lump fell off it; he hit it again, and it went through on to the next floor, leaving a piece behind resting on the strut. A chock was put under, with a side wedge to jamb it; and, if the timbermen had not interfered with the leg, a set further back, it would never have come down.
3055. If you had put a bore in that piece, it must have come down? Yes.
3056. What weight was it? About 40 lb.
3057. You could have lifted it off with your hands? Your head would then perhaps have got it, as the other stuff above it would have come down with a run very likely.
3058. But you could have got above it? No; you would have had a good bit of shovelling to do to get to it.
3059. But you could have made it secure? Yes; but if you are engaged by a man to do a certain work you are not going out of your way to do other work.
3060. You prefer then to work under a little danger, rather than make the ground secure yourself? But if the timberman had said, "Look out," when he hit the leg, I should have been all right.
3061. You preferred to work under danger? It was not imminent risk.
3062. *His Honor.*] I understand you were deceived by the 40-lb. lump;—you did not think it was necessary to bring it down; you thought it was safe? Yes; I put a chock under and wedged it, and, if it had not been disturbed, I could have worked there three shifts, and not have met with an accident.
3063. *Mr. Edwards.*] But it would have been far safer to have brought it down? The shift-boss never said anything about bringing it down, and when you are working on a price which is a bare subsistence, you could not make a living if you spent time upon those things.
3064. But if you are set to work in a place, surely it is your place to make it safe before you start? Decidedly not. The manager is supposed to leave the ground safe for you to start in. It is not till after I start work that I am responsible for any dangers.
3065. If you were put to work in an insecure place, you would go on with your operations and take no precautions? But this place was not in such a critical condition as you try to make out.
3066. Just before lunch, you admitted that you did take a certain amount of risk in going to work under that stone? I wish to correct one word—I said "dilly dally."
- His Honor: The Commission, Mr. Kelly, understand the sense in which you used that word, and do not take it that you implied you were idling away your time.*
3067. You admitted you did accept a certain amount of risk in going to work with this stone above you on the strut? I will explain a little clearer. Later in the morning I gained information from my mates, who went on after us, that that stone, that I had chocked, prevented a lot of stuff behind from running. Where that stone came away from, they touched the stuff with a drill, and it started running from the top floor, which should have been cleared before we started to work.
3068. However, if you had knocked that stone down, as you might have done, even if it had caused you some time and trouble, the accident to you would not have happened? I feel confident that any practical miner would have done the same as I did. No miner will shift dirt that he is not going to be paid for.
3069. And that is the reason why you did not interfere? Yes.
3070. You have been working on contract a long time? I have not done a great deal here. I am one of the unfortunates that have been out of employment for a long time.
3071. You have been working on contract? Yes.
3072. In the Proprietary? In the early days.
3073. And in Block 10? Yes.
3074. And you had just started in the Central? Yes.
3075. What have been your average earnings? At Block 10 my average was 7s. 6d. for one term, and just on 9s. for another.
3076. How long did you work there? Five weeks.
3077. Then you have only done five weeks' work in Block 10? Yes.
3078. And how long did you work in the Central? One shift, worse luck.
3079. So your experience of Block 10 extends only over five weeks? Yes.
3080. During what period? It is nine weeks ago since I was up at Block 10.
- 3081.

3081. Whom did you complain to about not having timber;—what is the name of the shift-boss? Of course; I did not make a great complaint to the shift-boss in Block 10. C. Kelly.
20 July, 1897.
3082. The evidence is that you spoke to the shift-boss in Block 10, and asked him for timber, and could not get it? I went to the plat, but there was not any there. I gave an order to the platman, but it did not come down.
3083. What is the platman's name? I do not know.
3084. What is his Christian name? I did not take any particular notice of the man.
3085. Could you describe him? He was something similar to myself, only shaved.
3086. An Englishman, Irishman, or Scotchman? I might tell a German from an Englishman; but I could not distinguish an Englishman, Irishman, or a Scotchman.
3087. You do not remember the name? No.
3088. I understand you spoke of it on three or four occasions? I spoke on three or four occasions about the stones coming out of the pass; not about the timber. I went up to the plat, and found there was no timber there, and then ordered it, thinking that it was the usual thing for the timber to come down immediately after giving an order for it.*
3089. Who is in charge—the platman or the shift-boss? The shift-boss is supposed to be in charge. I did say to him that there was no timber in the plat.
3090. Which shift-boss was it? "Sie," I think you call him. We just said that there was no timber.
3091. That is the only way you can describe him? Yes.
3092. How many times did you speak to him? I do not take a book in with me to take notes.
3093. How many times did you speak about the stones coming down? I did not speak particularly to anyone, but just passed a remark three or four times on the plat that it was a shame such things were allowed to go on. The shift-boss was there, within hearing distance. I did not complain; only passed a remark.
3094. You see, Kelly, it is just as much to the interest of the management to prevent accidents, as it is to that of the men. The management are doing everything they possibly can to minimise the least possible chance of an accident's occurring, but if they have not the assistance of the men you can see the position they are placed in. Do you not see the error you committed in letting such a thing pass unnoticed, or without drawing the attention of the management to it;—do you know of any accident that occurred through the breaking away of these stones? No; but I have seen men very nearly hit on several occasions.
3095. No person was injured? No.
3096. You were only in the Central one shift? Yes.
3097. So the condition of that chamber you speak of could not have affected you much? No; but a man is not blind when he looks at those things.
3098. Do you know if it is timbered up now? I do not know.
3099. Do you know that that chamber is as full of square-set timber as it can stick? At the time I speak of it was not, and you had a job to get a plank of any description.
3100. Shinnick was your mate in the Central? No; in Block 10. He was one of the six in the Central, but was on a different shift from me.
3101. Did you ever complain to the shift-boss about the dangerous condition of the plat at the 415-feet level in Block 10? No; I did not.
3102. You say that is dangerous? Well, any man who sees timber splintered over his head in all shapes and forms naturally comes to the conclusion that it is dangerous.
3103. When you see dangerous places, do you not think it your duty to complain to the shift-boss? It may be; but the shift-bosses should know these things themselves.
3104. You did not point it out to any person? My business is in the face; not to point out to the shift-boss what I see in every place. I have got enough to do to complain about what is in my own face.
3105. You said you complained once to the underground manager about the stones breaking through? No; it was in the stope where we were. He charged one of our mates with insufficient work.
3106. And that is the time he would not stop and speak to you? Yes.
3107. Where was this? Underground in Block 10; and the underground manager was Mr. Thomas.
3108. I suppose you have worked on railway cuttings? I have done a little, now and then, in my time.
3109. Do you not know that the system called the "chinaman" is adopted in almost all railway cuttings? When I was giving my evidence on that matter I did not exactly know what was referred to as a "chinaman."
3110. You did not know what a "chinaman" was until it was explained to you afterwards? I never heard tell of a "chinaman" before—only on the Barrier—but I have seen the same class of work done under a different name.
3111. Do you know what a "chinaman" is now? Yes; I have a very good idea.
3112. And is that not the system invariably adopted in all large railway cuttings? Yes, I think so.
3113. And it is considered safe in big railway work, and not here? There is no restriction to save ore in a railway work, while there is here. Again, there is a great difference between day and night.
3114. You admit that it is a system that is used in all large railway works where the contractors know their business; as to its being dangerous or not to work in this open-cut, all that you can say is from an observation made from the top bench;—you have never been down? No; but there is no need to go down to see it.
3115. I suppose hundreds of men have been working in the cuts? Yes.
3116. As to sets being uncovered by the taking away of the laths, I suppose you do not know whether the laths were removed under orders from the management, or taken by men too lazy to go to the plat for timber? I could not say.
3117. It is not the platman's duty to carry timber to a contractor? No.
3118. It is the duty of the contractor to bring his own timber from the plat? Yes.
3119. That is one of the terms of the contract? But if the timber is not there you cannot fetch it.
3120. You cannot say who shifted those laths? No; I only worked one shift.
3121. Excepting one shift, you have never worked in any of those underground chambers, and you know

* NOTE (on revision):—This question I must have mistaken, to have given the answer as far as the word timbered the end of the first sentence. My answer would be "Yes."

- C. Kelly.
20 July, 1897.
- as much about them, I suppose, as you do about the open-cuts, which you have never been down? A miner is not an idiot; when he looks at the place he has an idea what it is.
3122. When the officer took you down to look at this work you were put on, you objected? Yes.
3123. What did he say? He said it was hanging for weeks and weeks.
3124. What was his name? Andrews, I think. I am not positive.
3125. And the only reason you think the contract-system is dangerous is because they will not give you a fair price for the work? That is the main reason.
3126. Would you be surprised to learn that, at the present time, under contract, they are shifting twice the tonnage they ever did under day-labour? That may be so; but I doubt it.
3127. You would be surprised to learn that, notwithstanding the greater depth they have to lift the mullock, they are shifting twice the tonnage? The depth does not matter if they have machinery to haul the mullock, so you need not bring that in.
3128. *Mr. Williams.*] When you say you "complained," do you mean that it was a general grumble among your mates, or a specific complaint to the underground manager, or anybody else? When we complained, the manager was there, in our presence.
3129. You think you spoke loud enough for him to hear? Yes.
3130. You did not address yourself particularly to him? Yes, we did; and he answered back with a snub. There is another thing I would like to speak about. I have seen fracture knocking about in the mines. In Block 10, they have no canisters to hold it, and the men leave it about loose.
3131. *His Honor.*] You have never seen cases or boxes there to carry it in? No; they send it down after you.
3132. How do they send it down? In the ordinary packages.
3133. *Mr. Polkinghorne.*] Is there no magazine underground in Block 10? Not at the 415-foot level; and that is the only place I can speak of. We always had to go to the magazine just below Mr. Thomas's office for our explosives.
3134. Had you to take them down in the cage with you? No; they were sent down in the cage; and we would take delivery at the plat.
3135. How much did they allow you to take down at the one time? They never restricted you in any way. I have taken down two packages at a time.
3136. Do you think there should be a limit to the quantity men should be allowed to have in use at the one time? In Block 10, you can only get it on the day-shift; and you must, therefore, make provision for the on-coming shifts.
3137. The regulation at present in force is that a man shall not have more than 6 lb. of explosives in use at one time in any one place. Do you consider that that regulation is all that is required? No; 6 lb. would be sufficient if you could get it at each shift; but it is not when you have to get enough in the one shift to last out twenty-four hours.
3138. The rule also states that explosives shall not be taken into, or kept in, a mine except in a case or canister. Do you think that is a good regulation? Yes; in New Zealand they will not allow you to take any down unless you have a canister.
3139. You think that, in all cases, canisters should be provided by the mines for the use of the men? Yes.
3140. And, in Block 10, you never saw any? No.

Joseph Bourne re-called and further examined:—

- J. Bourne.
20 July, 1897.
3141. *His Honor.*] You wish to make some further statement, I understand? With your permission, your Honor. My reason for sending you a note asking to be re-called is that I was led to believe I should not be required here any further, and that I should be going away, as I have been informed that there is no more work for me on Broken Hill; and, of course, in that case, it is a very sad job for me. I fully expected that things would go on all right.
3142. What is it you wish to inform me of? I went to work on the Tuesday night at 12 o'clock, and I could see at once that there was something wrong somewhere or other. Everybody was quiet in regard to me. Everybody appeared to be watching me very closely. Of course, I then kept my ears open; and I heard several observations passed, to the effect that all the boys in the mine were going to be discharged through me. I heard several nasty expressions made; and one or two parties spoke very loudly and threatened to kick me out of the mine altogether.
3143. Who were they? Workmen. I went to work the following night; and everything was very quiet; nothing whatever was said to me. One of the shift-bosses came round and spoke to me in the usual manner, directing what I was to do; and, as he turned to go away, he said, "Joe; there is a letter for you in the office." I said, "Yes." He then said, "Will you call for it in the morning?" I said, "Yes." Well, I worked on; and nothing more was said about it one way or the other. When the shift was up, I heard several parties giving me a very strange character, and stigmatising me. They were saying that I was bought over by the mine managers, and that they were sold like lost sheep. I ascended; and, when I got to the surface, I went straight to the office, and, arriving there, found the underground manager, the head shift-boss on our shift, and the head shift-boss on the on-coming shift. The manager wanted to know what it was I had to say about the boys. I told him something similar to what I said at the Commission; but it did not appear to be at all satisfactory to him. At any rate, he called several of the boys in. One or two of them brought in notes from their parents while I was there; but that was nothing to do with me. He said that certain statements had appeared in the *Barrier Miner*, and he would like me to go to that office and make some explanation. I considered that he wanted me to go to the *Barrier Miner* office, and make some apology for what I had stated here. He also drew my attention to what I stated here in reference to a certain place in the ladder-way. He wanted to know where it was. I pointed it out to him. Of course the danger that was there is to a certain extent over, because the place has fallen down. I did not see it fall; but my attention was called to it afterwards. A man was working there at the time. A shot was fired, and it had a great effect on the hanging-wall, on account of the vibration; and the result was that this loose ground came down; but, fortunately, a little loose gravel preceded it, and gave the man under it a chance to jump aside. If he had not jumped aside, 2 or 3 cwt. of stuff would have been on top of him. Upon my attention being called to this fall, I had a look at it, and, unless something

something has been done to it since I worked there, it is not in the safest condition now. I would like the reporter from the *Barrier Miner* to give me a fair and honest report. By his doing otherwise, I have suffered injury. As far as I am concerned, personally, I wish to goodness I had not come here, and I wish the Royal Commission to Jericho. But that is not it. I have come here, and have given all the evidence I possibly could to save my fellow-creatures' lives; and I wish now to try and point out to you and all sensible men here things that will not only tend to save human life, but enable work to be carried out on better lines. For my part, I wish all the mine managers in Broken Hill were here now, and all the mine officers, and every other man who has anything to do with the mines.

J. Bourne.
20 July, 1897

3144. But what is it you wish to point out, Mr. Bourne? I will point it out presently, your Honor. You will excuse me. There are gentlemen sitting at this table who have had a University education; but I have never had anything of the kind. I was 25 years of age before I could scratch my own name, and I do not call myself much of a writer even now. The greatest instrument I use is a pick or a hammer.

3145. But we want facts, Mr. Bourne? I was sitting in this room yesterday when Mr. Stewart, the general manager of the Proprietary Mine, was giving evidence. I am very proud to say that everything he said is what I fully agree with; but, as I am an older man than Mr. Stewart or Mr. Horwood, as far as underground goes, I might be permitted to make a few remarks. I will come to explosives first. There was an inquiry about twenty-seven years ago in regard to compressed powder, because of the number of accidents that were taking place owing to the use of loose powder. The inquiry was held in London, and it resulted in the adoption of compressed powder for mining purposes.

Mr. Edwards: I understand from Mr. Bourne that he is leaving Broken Hill, and I hope he will tell the Commission, your Honor, that it is not on account of any action on the part of mine officers.

3146. Do I understand that you were in any way threatened, expostulated with, or spoken to in any way by the manager for evidence given by you? I could not but notice the way the men regarded me.

3147. It was the men, you say? I got several side-winks from parties connected with the mine, and I will explain to you how.

3148. If you have got any specific complaint to make against any person or persons who have interfered with you because of your giving evidence before the Commission, then I will hear you, and see whether any remedy can be found, and whether those persons can be dealt with? It was distinctly stated to different parties that, as soon as the Commission was over, I would have to leave Broken Hill, and that I would not be allowed to work in Block 14 or anywhere else.

3149. *Mr. Edwards:] Who were the men that threatened you? The men themselves.*

3150. No shift-boss said anything to you? No.

3151. *His Honor:] Do I understand it is this: that you think your evidence has appeared to the men to be too favourable to the management? Exactly so.*

His Honor: Then I think it must be only an odd man here and there who has been foolish enough or mischievous enough to start these stories, because I do not think that any decent miners would think of interfering with you for any evidence you have given. If you belong to the A.M.A., I think that association will do their best to protect you.

Witness: I am a member of the A.M.A., but I never had any instructions from them. I came here on my own responsibility to give evidence.

His Honor: I am perfectly certain the A.M.A. would not countenance, for one moment, any ill-treatment of you for evidence you have given. The best thing you can do is to pay not the slightest attention to anything you hear from these one or two mischievous persons. I am quite sure the managers would not countenance any interference with you, nor would the A.M.A., for the evidence you have given.

Mr. Polkinghorne: From what I heard outside, your Honor, I came to the same conclusion you have yourself; and that is, that Mr. Bourne has been the victim of the talking of some mischievous persons, of whom Broken Hill has not a few. As far as the Association is concerned, they would not for one moment think of interfering with Mr. Bourne in the least for the evidence he has given; nor would they countenance any interference; and I know that, so far as the mine managers are concerned, they will protect their workmen, and allow no man to be interfered with, so long as he does his work to their satisfaction.

Witness: But what am I really to do?

His Honor: Take my advice, and treat everything of this kind with utter contempt.

Mr. Williams: I am pleased to say that I also am an A.M.A. man, and I would be ready at all times to defend Mr. Bourne against any interference for what he may have said at this Commission.

Witness: But am I to return to work?

Mr. Edwards: You go back on to your shift: that is my advice.

His Honor: Yes, Bourne, you go straight back to work.

Witness: If I report myself to the mine it will be all right?

Mr. Edwards: Yes.

His Honor: And if there is any young fellow up there mean enough to interfere with you, I should think all the other decent miners would immediately make it very hot for him rather than for you.

Jabez Wright sworn and examined:—

3152. *His Honor:] Your name is Jabez Wright? Yes.*

3153. What are you? I am an undertaker at Broken Hill.

3154. Have you had anything to do with mining? I have been here just on ten years, and I have had a very large intercourse with the men who work at mining and surface work.

3155. You have not done any mining yourself? No.

3156. You have some information that you wish to give to the Commission? Yes.

3157. If you will say what it is I shall be obliged? The information I have to give is this:—From my personal knowledge I know of many men, and have met them, who could give valuable information to this Commission, but they are absolutely afraid to do so.

3158. What are they afraid of? They are men with families, and have not the means sufficient to shift from here; and they do not know where to shift to. They are afraid of being refused work, not only in one mine, but along the whole line of lode. I pointed out to them that they ought to do their duty, and

J. Wright.
20 July, 1897.

- J. Wright. said, "If one mine sacks you, get a job on another." They replied, "You see: the one solicitor represents the whole lot, and the whole lot would turn us off."
 20 July, 1897. 3159. That is where they are mistaken. I am sure the mine managers would not interfere with persons in any way for giving any evidence they might wish. I can only request you to induce these men to come forward. (*Witness*): I have induced two—the two who came this morning.
 3160. Are there any others? I have tried to induce others to come, but without effect.
 3161. If you give names to the secretary I will have summonses issued? I would not care about giving names; but I will endeavour to induce them to come forward.
 3162. Have you anything else you wish to say? Yes. The only way by which to minimise accidents on this field is to introduce an Employers' Liability Act on fair lines, which will throw the whole of the onus of any accident on the employer unless culpable negligence can be shown on the part of the injured person.
 3163. That is, of course, a matter for general legislation;—you think it would be better if the present Act were amended in some respects, so as to make it easier for the injured person to take advantage of it? Yes. There was a case here where six men went away in a cage. One of the men sued the Proprietary Company, and a jury were empanelled; but they disagreed. The case came on again; but it was not allowed to go to a jury.
 3164. This man (Bowden), through no fault of his own, is injured for life; and I hope the company will do something for him. (*Witness*): Under the existing law, he could not do anything for himself; and, so far as I know, he has never received any help from the company. I say that the present Employers' Liability Act is not effective, and that the only way to make an employer more careful of those he employs, is to have an Act affording means of throwing the onus upon him in all cases of accidents not arising through his negligence.
 3165. That is a question for general legislation; and if the Act wants amending it is for some Member of the House to take it up in the way of introducing an amending Act. I have not had occasion to read the Act lately; but I daresay it does contain some provisions which throw technical difficulties in the way of men taking advantage of it. However, that is a very general matter, dealing with all employers and employees, and is outside the scope of the Commission. (*Witness*): I did not feel satisfied to let this Commission leave Broken Hill without telling it what I know of the feelings of the men.
 3166. Have you studied the Act yourself to see where it wants amending? I know it wants amending, because, at present, it is extremely difficult, if not impossible, to prove negligence on the part of the employer, which you have to do before you can recover. Further, it is not limited in extent, and the working-man is done if he has to make a prolonged fight. It should be restricted to the lower court.
 3167. *Mr. Edwards.*] It comes in the end, your Honor, to a question of insurance, and as to who is to pay the insurance. (*Witness*): If the Government want to get any evidence here, they will have to send up two or three detectives.
 3168. *Mr. Williams.*] You believe that a workable Employers' Liability Act would tend to lessen the number of accidents? Yes; I have belonged for twenty-one years to one of the largest unions in the world—the Amalgamated Carpenters' and Joiners' Association. After the introduction of a workable Employers' Liability Act, we found that we paid less for accident benefits than formerly.
 3169. *His Honor.*] It had the effect of making the employers more careful? Yes; any legislation in that direction would have more effect than any amount of regulations.
 3170. *Mr. Williams.*] Can you tell whether it has actually reduced the number of accidents? The fact that after the introduction of the Act the Union had not so much to pay for accidents points to that inference.
 3171. Is that a safe conclusion to draw? I think so.

Alexander Stewart re-called and further examined:—

- A. Stewart. 3172. *Mr. Williams.*] I understood you to say that 400 degrees of heat would explode a detonator;—did you refer to 400 degrees F.? I said nothing of the sort. 400 degrees F. is the heat that will explode dynamite; not the detonator.
 3173. You referred to dynamite? Yes.
 3174. You pointed out that if a Police Magistrate were deputed to inquire into cases of accidents he might have occasion to take officers away from their work? What I intended to convey was that, should a Police Magistrate be appointed to do that duty instead of the Inspector of Mines, he would be under a great disadvantage, because he would require to rely upon expert evidence, which an inspector, from his own knowledge of the subject, would be able to do without.
 3175. You employ 2,500 on the Proprietary Mine alone? Yes.
 3176. I understood you to say that that did not include the number of outside men employed? Outside men are not included in that number.
 3177. Nor is that agent included in it whom the company appointed to obtain for them competent men? No.
 3178. He secured you competent men from Bendigo and Ballarat? Yes; and other places.
 3179. You secured a competent person to pick out these men? Yes.
 3180. Were you acquainted with him? No.
 3181. He is not a permanent official in your employ for that purpose? No.
 3182. Nor is anyone else for that purpose? No.
 3183. You were satisfied with the outcome of your endeavours to obtain competent men for your mine? Yes.
 3184. If you could not get competent men you would assist those here—I am speaking of the young men—in becoming competent miners? I am willing to assist in every way young men starting as apprentices.
 3185. What will you do with the men now in your service when they get leaded or worn out;—do you intend to cast them on the State? I am not authorised to distribute charity amongst the residents of Broken Hill in any way whatever.
 3186. You said something about a rule referring to the cessation of operations in the open-cuts when the light becomes insufficient? Yes.
 3187.

3187. Where is that rule? I do not think it appears in the printed rules; it is one of the unwritten rules given to the men in charge of the work. A. Stewart.
20 July, 1897.
3188. You have said in your evidence that, unless you used the "chinaman" in the open-cut work, you would have to employ a larger number of men, and, therefore, more explosives would be used, which would increase the number of accidents? What I said in reference to the "chinaman" was, that if we did not use that system, the number of men employed in loading trucks would be increased.
3189. And that, by increasing the number of men, you would increase the quantity of explosives used? But we do not load trucks by means of explosives.
3190. But the more men you have to use explosives, the more explosives you must necessarily use? Yes.
3191. And, unless you adopted the system of the "chinaman," you would have to employ more men? Yes.
3192. And, even should there not be more explosives used, there being a greater number of men in the cut, would, you think, tend to increase accidents? I would not like to amplify accidents by having too many men.
3193. You think the presence of two engine-drivers in an engine-house at the one time would lead to a division of interest in their work, and an accident be caused thereby? Yes. I suggested that the presence of two drivers, when only one man was wanted, was bad; and, in general principle, it is bad.
3194. It would be just as absurd to get two general managers for the Proprietary Company? Yes.
3195. As to the rule that men shall be withdrawn from a face while holes are being charged;—you have insisted on that being strictly enforced? Yes.
3196. When you first came here, I believe you were in the habit of going round to see whether the men were doing their duty; and, on one occasion, you happened to hear one of the bosses make use of blasphemous language, for which you thereupon rated him? I do not remember that; but it is quite possible. I do not like to hear bad language used to the men.
3197. *His Honor.*] You got your open-cut experience from those works in Spain? I did.
3198. Can you give any idea how long the open-cut system has been in force on those mines or other mines in Spain? At least thirty years. I think that in those Spanish mines the open-cut system has reached greater development than in any other portion of the world.
3199. There was an older system? Yes; an underground system.
3200. The open-cut system, being considered more satisfactory, was adopted? Yes; it is more satisfactory from every point of view.
3201. Was the open-cut system substituted for the underground system altogether, or in the upper levels only? In some cases it is not economical to carry out the open-cut system, because there might be too large a quantity of waste to remove before getting to the ores.
3202. These ores got at by the open-cut system were ores that had not been thought rich enough originally to be worth winning? They were left, first of all, by the Romans and Phœnicians, and then by the French. It was when British capital came in that the open-cuts were started.
3203. During the working of the open-cuts in Spain, has the number of accidents been greater than in the old underground workings? I have no definite figures, but I think, in proportion to the number of people employed, the open-cuts did give, while I was there, more accidents than the underground work. The underground work there, however, was very safe—only solid iron pyrites being mined underground. In proportion, however, to the amount of waste and ore removed, the open-cut system gave a less proportion.
3204. I suppose, in the course of that thirty years, a good deal of experience as to how to work the open-cut system most safely has been gained by the management? Yes.
3205. Was the modern working under English or Spanish management originally? I think it was under French management first of all; I do not think they have had a Spanish manager.
3206. Had you Spanish workmen, or did you import workmen? Spaniards, Portuguese, and a few Italians and Frenchmen supplied the labour. We took out no British labour, except men to take charge of the departments.
3207. Was the open-cut over depleted stopes? In some cases it was; in others it was started on new ground.
3208. *Mr. Williams.*] Did you have more than one open-cut? Yes; we had six different open-cuts.
3209. *His Honor.*] Were those open-cuts opened on the same system as these here have been, beginning from the surface and working downwards, or were they put in horizontally in the same way as a railway cutting is generally opened? They were opened on very much the same system as we have here. Of course, in some instances, the circumstances there varied very considerably from those obtaining here; and systems to meet those cases had to be adopted.
3210. Can you remember what was the average of fatal accidents in those open-cuts? I think I have the figures somewhere.
3211. Roughly can you say what it was? It varied very much from year to year. In some, periods we would be very free of accidents; and in others they would come on with a rush, which appears to be a general rule in all large operations. The death rate (I think) was not over three per 1,000.
3212. Did you find the Spanish and Portuguese workmen careless? Mining there is so settled, that the people are brought up to it, and it only, from childhood. They are, therefore, very good miners.
3213. I suppose the Spanish Government is not very particular in making provisions for the safety of the miners? Yes; it is extremely particular. The laws are most binding.
3214. In the way of compelling employers to take great care of their workmen? Yes.
3215. More so than in England? Yes.
3216. *Mr. Williams.*] More so than in Australia? Yes.
3217. *His Honor.*] Are the laws stringently carried out? As a matter of fact the men are not looked so well after as they are here; the laws are very stringent, but are not strictly carried out.
3218. Is there anything more you would like to say? I think it is the duty of the Government to encourage the immigration of competent miners. Upon the development of the mining industry depends, to a very great extent, the future of this Colony; and, to admit of that development being brought about, the Government should encourage the immigration of competent miners.

WEDNESDAY, 21 JULY, 1897.

Richard Thomas sworn and examined:—

- R. Thomas. 3219. *Mr. Edwards.*] What is your name? Richard Thomas.
 21 July, 1897. 3220. As there are many Thomas's on the Hill, you distinguish yourself by being known as Richard N. Thomas? Yes.
 3221. You are underground manager of Block 10? Yes.
 3222. How long have you been in that position? About six years. I was in the Proprietary at its inception.
 3223. How many years were you on the Proprietary? Nearly five years.
 3224. What position did you occupy there? Head timberman.
 3225. And for six years you have been underground manager of Block 10? Yes.
 3226. What experience have you had in connection with mining? I have been connected with mines for forty years.
 3227. Besides mining, have you engaged in any other works? I have been engaged by the Government in open-cut work, and in almost all lines of excavations of any kind you can mention.
 3228. This Commission, as you know, is to inquire into causes of accidents that have recently taken place on the mines in the Broken Hill District;—can you say that there has been any increase in the number of accidents in your mine lately? No; there has been no increase.
 3229. How many fatal accidents have you had? About three.
 3230. In the six years you have been there? Yes; and they occurred at the first opening of the mine.
 3231. Can you particularise those accidents? Yes; the first fatal accident was at the dump.
 3232. Was that the sulphide dump, on the surface? Yes.
 3233. Do you remember the man's name? Broadstock.
 3234. Was that man employed by the company, or by a contractor? By a contractor.
 3235. He was accidentally smothered? Yes. Previously to this accident I went to the man who had the contract and cautioned him. Mr. Slec, the Chief Inspector, was about at the same time, also Mr. Hebbard; and we cautioned the party about not giving the dump sufficient batter, thus rendering it liable to come down and cause a mishap. Men were then put on to take down the batter; and Broadstock was engaged to watch the batter, and warn the men in case it showed danger. He was stationed in what they thought a safe position; but the dirt came down, and he was caught, the others escaping.
 3236. *His Honor.*] From the papers it appeared in that case (I think) that he was not actually watching at the time? It was his duty to watch.
 3237. He neglected his duty, I believe? Yes.
 3238. *Mr. Edwards.*] The second man, I believe, fell out of a cage? When he was coming up in the cage, he dropped something, and stooped to pick it up; in doing so he overbalanced himself and got jammed.
 3239. His name was Hall? Yes.
 3240. What was the third man's name? W. Thompson. He was killed by a winding-rope on the surface.*
 3241. Is every precaution taken in your mine to prevent accidents? Yes; every precaution possible.
 3242. Are the men supplied with all the timber they require? Timber is supplied in all parts of the mine for men to use to prevent accidents occurring.
 3243. Does delay ever occur in supplying the men with timber? Not the slightest.
 3244. Have they ever been refused timber? Never.
 3245. How many foremen and shift-bosses have you under you in Block 10? Six shift-bosses and one foreman.
 3246. How many men do you employ underground? About 220 miners.
 3247. And on the surface? The labourers amount to about 250.
 3248. The average employment would be between 400 and 500 men? Yes.
 3249. Do you find the miners you employ competent men? About 50 per cent are not competent men.
 3250. I suppose it is impossible to tell whether a man is competent or not until you have had an opportunity of trying him? You cannot judge a miner by his appearance; you want to see him at work. As soon as I clap my eye on a man at work I know whether he is a miner or not.
 3251. Have you had occasion to discharge men for incompetency? That is an every-day occurrence.
 3252. There was some evidence given here by a man named Shinnick and by Christopher Kelly, who were working in your mine for about five or six weeks;—do you remember them? Yes; I remember them well.
 3253. What sort of miners are they? They are no miners at all, and that is the reason why I discharged them.
 3254. They were not discharged on account of belonging to any particular association, or for any reason other than because they were incompetent? No; not at all. I did not know they belonged to any party whatever. I went down; and I complained because I thought there had not been enough work done; and I discharged the whole party that same day.
 3255. When you went down, what did you find them doing? They were just in the midst of whistling and singing, and no man can do those things and his work at the same time. I know when a man is engaged in work it takes him all his wind to do it without whistling and singing. No man can strike a drill into hard rock, and whistle and sing at the same time. It takes a man all his wind to fulfil his duty.
 3256. Apart from the whistling and singing, did they understand their work as miners? Not in the slightest.
 3257. Was the place a difficult one, or easy? It was an easy place. I was doubtful about the party when I put them on. I said, "Are you new men? I think the sun has been shining on your heads all your life." However, I let them go on for about five or six weeks, and found they were as I thought, and then discharged them.
 3258. Was the place a safe or dangerous place? It was as safe as this room.
 3259. Was it an easy place? Yes, and there was plenty of fresh air. That has always been my study.

If

NOTE (on revision):—W. Thompson was killed by a fall of rock underground. A fourth man—Andrewatha—was killed by a winding-rope on the surface. [Vide 3274, and following questions.]

- If I am doubtful of a man's ability, I do not put him in a place that requires skill, but in an easy place first.
3260. Was the amount of work they did up to the average at all? Not in the slightest.
3261. It was simply on account of their being incompetent that you got rid of the whole party? Yes.
3262. Is the ventilation of your mine good? Yes, it is very good! We keep up a splendid ventilation to carry the fumes away; then the men can get to work quicker and do one-third more work. If the fumes remain long hanging about, it delays men from going back to work. We keep the stopes so ventilated that, directly a party blasts, the fumes go away.
3263. What pay per day do the miners make on an average? Nine shillings and 6d. a day. A good man always makes from 10s. to 12s. a day; but some men are not worth the room they are standing in.
3264. Can men earn 9s. 6d. on an average without rushing their work, or taking unnecessary risk by insufficiently securing the ground they are in? If a man is a practical miner I would not wish to see him earn under 10s., 11s., or 12s. a day. I have got men under me now, whom I have put into a place at £5 a set, and have had to take them out because they could not make a living, and to give them an easier place. The next party who went into that very same place made £4 a week.
3265. Are any men in your mine asked to take any risk? Not the slightest whatever. It is always my care every time I go through the mine to caution every man whom I see doing anything whatever that is likely to lead to an accident. Of course, where you have a large number of men you have a few who want watching very closely. They will go behind where they are working and strip laths and use them up in their own places, and afterwards swear that they don't know who stripped them. We can always tell when laths have been taken up from floors, because they are then covered with sulphides and are not new-looking; but it is difficult to get at the real culprit.
3266. So to save themselves the trouble of going to the plat or level to get timber for their floor, they will strip another man's floor? Yes, and never put up a guard-rail. I offer up more prayers for this reason than any other. If the bosses themselves did not look after the men better than the men look after themselves, the number of accidents would be far greater than it is.
3267. The greatest difficulty is to protect men from their own acts? Yes. Yesterday I was down twice. Whenever I can I go down, sometimes three times a day. I was down yesterday morning, and went through a place where one particular party were taking out a set. A shoot was right at the back of them, and I gave them strict orders to cover it up. I said, "When you want to throw ore down the shoot, take up a board, and put a guard-rail around." When I descended again, the first thing after lunch, I went into this same place, and there were those men with the open shoot at the back of them, and no guard-rail whatever. I said, "You did not do that"; they said, "We were going to do it, but had our lunch, and have not had time since." I made them go straight away and do it, or else leave the mine. You cannot be answerable for men like that.
3268. When men are guilty of actions such as that, what do you do? In that case, as they said they had been too busy, and as I had come pretty quickly on to them, I let it pass; but nineteen times out of twenty we discharge them. There is no man more likely to fall into those places than the men working there themselves. If a stranger goes round he always sees that everything underneath him is properly safe before he steps. I told them that no man was more likely to fall into those places than the persons themselves working near them: that they take up boards, forget the position they are in, and step back.
3269. As to the shift-bosses you have under you, and the foreman;—are they competent men? With regard to the shift-bosses, they are all practical men, and were brought up to mining from their youth.
3270. You have chosen the skilled and steady, sober men? Yes; the foreman that I have got under me is as good a man as you could have.
3271. What is his name? J. H. Thomas. He has been working along with me ever since he was 15 years of age.
3272. Is he a relation of yours? He is a son of mine.
3273. And the shift-bosses are men you have chosen yourself? Yes; and they are men that I can rely upon. They are thoroughly practical men.
3274. You have never had a fatal accident underground since the mine opened? Yes, there was one lately, when W. Thompson was killed.
3275. Was Thompson the man killed underground? Yes.
3276. Who was the man, then, who was killed on the surface by the winding-rope? Andrewatha.
3277. So you have had four fatal accidents altogether? Yes.
3278. How did Thompson's death occur? It was in a stope of very large rocky ground. Thompson's mates of three shifts previously had blasted a hole, and at the time of the accident he and his shift-mates were engaged in crow-barring down some of the overhanging rock. There was a big flaw; and, having tried the rock with a bar, they did not think there was any immediate fear of its coming away; and, without putting in a "tom" to protect it, they started to drill a hole into it. They thought everything would be perfectly safe, and went on without putting any timber up; though, had they wanted it, there was a full supply of timber lying about; and before they had gone very far the rock came down.
3279. They sounded this overhanging stuff? Yes; previously to drilling the hole underneath it.
3280. And they did not secure it? No.
3281. There was material there with which to secure it if they wanted it? Yes; there was timber there in abundance.
3282. With this one exception you have had no fatal accidents underground? No; except the man falling out of the cage.
3283. In reference to explosives;—it was said in evidence yesterday that in Block 10 there were no canisters or boxes for the purpose of keeping explosives in? Canisters made to carry 5 lb. of explosives have always been provided, but the men keep in them water for watering their holes, and never use them for their explosives.
3284. How do they carry their explosives down? In packets.
3285. But how do they carry the packets down? The explosives are made up in 5-lb. packages, and it is in that form they are carried down.
3286. Then you say canisters are provided by the mine? Canisters are provided, and they are made to hold a 5-lb. package.

R. Thomas.
21 July, 1897.

- R. Thomas. 3287. Do you know of any case in your mine where the man has used his box to keep candles in? No; I have known them to use them for carrying water to water their holes.
- 21 July, 1897. 3288. Was there not some case in which a man dropped his lighted candle into a box containing explosives? We did sometime back supply a box, 3 ft. x 20 in. x 20 in, to each party in which to keep their explosives; and we always gave strict orders that it was to be kept not closer than 30 feet to the face where they were working. This man, whom you speak of, put a 5-lb. package of gelatine into the same box where he had his detonator, fuse, and candle. After a time he went back to get the candle, and the candle he had had burned down in his spider so far that it dropped through into the box while he was in the act of getting out the fresh candle. The result was that the box was blown to pieces, and he was found about 60 feet away, but not injured seriously.
3289. That is an instance of what men will do? Yes; you need to have ropes around some of them.
3290. In reference to missed-holes;—in your opinion, is the better plan to put in another primer, or to bore another hole alongside within a certain distance? I think a man who draws a charge from a missed-hole, particularly gelatine, or any explosive of that class, is a man incompetent, and has no idea of mining. My experience is that a man should not fill his hole up with tamping, but should leave sufficient of the hole clear on top; so that in the case of a miss-fire he could put a primer in, which would throw a concussion through on to the charge and explode it.
3291. I suppose you have no objection to withdrawing part of the tamping? There is no need to put more tamping in than will make the charge air-tight, and, if it does not explode, all you have to do is to put a primer on top of it, and throw in a handful of loose dirt.
3292. Then you do not believe in the practice of putting in another hole alongside a missed-hole? Not at all. I put in only enough tamping to make the charge air-tight; and if it does not explode, I put in another primer.
3293. How long do you think a missed-hole should be left before a man goes back to it? That would depend on the depth. We never let a party go back on the same shift in which a miss-fire occurs.
3294. If you have water? Where we have water it has always been our practice to fill the missed-hole with water, and to cover it over to keep the air from it. We have made it a practice to always do that; and I might say that more than one-half the miners on the Barrier do not know anything about that system.
3295. It has been said that the contract system is the cause of accidents in the mines;—is there any ground for that? Not the slightest. There is no ground whatever for the contract system being blamed for accidents. When I go down once a fortnight to let contracts to the parties, I always say, "You have got to work this safely, and carry it out according to instructions."
3296. Who gives instructions? I give instructions when I let the contract; and then the foreman gives instructions every day when making his rounds; and the shift-bosses also give instructions. Very rarely I have had a man refuse; they have always admitted that the prices were sufficient to enable them to make over wages.
3297. You have no printed rules for working underground? No.
3298. The instructions are given by the shift-bosses, and foreman, and yourself? Yes; daily and hourly, which is better than having printed rules.
3299. I suppose the contract system attracts the best men? I have got men who will not work unless on contract. I have lost as good men as ever worked because I have had to put them on places for a while on day-labour; but they have come back after a time and asked for contract work. A competent miner or a practical man never refuses to go down below and work on contract. Every man who is competent and practical prefers contract work. It is only "fencers" and "sundowners" that prefer day-labour.
3300. It has been said that "bulling" holes is a dangerous practice;—is there anything in that? It is, to a man who knows nothing about it.
3301. Is it dangerous to a man who does know something about it? Not at all.
3302. I think you have worked in every department? In every line that can be mentioned in excavation work.
3303. What time should you allow between "bulling" and charging a hole? That depends upon whether a man is competent to judge a hole. After you "bull" a hole, the first thing is to put in as much water as possible; then take a long scraper and feel about the hole. By doing that, any man who has had experience can tell whether a hole is safe or not. If the end of the scraper be warm, then the hole is not safe to charge; if cool, it is. Where mishaps occur, the men do not know anything about "bulling."
3304. Is plenty of water always supplied for this purpose? Yes; and, if they do not use it, it is their own neglect, so far as my experience goes.
3305. It has been said that in some of the mines the shots fired are too large; that there is too much explosive for the burden? Perhaps that is an error of judgment.
3306. That is left entirely to the discretion of the men? Yes; every man is liable to err in that. Further, when a man drills a long hole, there might be a secret face he cannot see. The charge then does not do its duty as anticipated. It brings only portion of the burden, which is scattered in immense fury all over the place. A man cannot see those things at all times.
3307. Something was said about the inconvenience of contractors having to carry their timber from the plat? All contractors are supposed to carry their own timber.
- His Honor: It was said that a man has, for some distance, to stoop very much in carrying his timber, and that this tempts him to do without it.*
3308. Yes; it was said that the timber is crushed in places, through which it is difficult to carry timber? I do not know one place where a man has to stoop; and carriages on which to carry timber are on every level. The old kaolin stopes where men are not working might be a little crushed; but in any place where men are working they have not to stoop. A very tall man might have to stoop, the height of a set being 6 feet 2 in.
3309. If you are beginning to fill in a worked-out stope, when should you take off the floors? Not until the stope is filled up to the floor.
3310. Supposing a man is working on the top floor, how many would you leave sound under him? I would leave them all standing until the place was filled with mullock. As they fill up, so they take the boards off, unless some of these wretches below them have not taken them away and used them over again.
3311. Is that of frequent occurrence? Yes; we cannot avoid it. Then we have to send parties down with new laths.

3312. When laths are broken in shooting, whose duty is it to replace them? The party's. But we always get them to lay 10 x 10 on the 10 x 2; and, when the blasts go off, these 10 x 10s take the burden. Even this is not done sometimes unless we are there to make them do it: they will blast on to the light 10 x 2 stuff, which is only put there to stand on. R. Thomas.
21 July, 1897.
3313. I suppose you can protect the 10 x 2 with mullock or ore as well as with 10 x 10? It is safer to lay 10 x 10 on the 10 x 2.
3314. *His Honor.*] Do I understand you to say that it is not safe to blast on to 10 x 2, even if you have a covering of mullock? I do not think it is. There should be 10 x 10 on the 10 x 2 to take the force of the ore as it comes down. With 10 x 2 only, the weight of the mullock and the force of the ore striking would break through it.
3315. *Mr. Edwards.*] What tamping-bars are allowed in your mine? Only soft Oregon wood.
3316. Are they provided to any man? Whenever a man requires one he has only to go to the carpenter's shop.
3317. You have the Government regulations posted on the mine? Yes.
3318. One of those rules says that no greater quantity than 6 lb. of explosive shall be allowed to be in use at any one time. Do you work with machines in your mine? Yes.
3319. Would 6 lb. be sufficient to charge a series of holes? No.
3320. You think that should be amended? Yes. I have got a party down in Kelly's shaft now, and in drilling four or five holes they will take perhaps four boxes of gelatine—20 lb.
3321. Would you fire more than one series during a shift? They would fire eight holes altogether.
3322. That would be in one shift? Yes.
3323. So no rule should provide a limit? No, not where rock-drills are used.
3324. Are men allowed to leave explosives lying about? No.
3325. What do they do with any balance they might have? They are supposed to put it back in a secure place no closer than 30 feet to the face where they are working.
3326. Something has been said about the plat at the 415-foot level at Kelly's shaft, as to the timber there being all crushed and splintered and dangerous to the men working in there? Yes; I remember seeing something about that in the paper.
3327. What is your explanation of that? I know the timber has splintered. In those places the kaolin ore was worked out four years ago; and they have been closely packed with mullock. My experience has taught me that, when you fill a place with mullock, you should let your timber crack as much as it likes so long as you know it is safe to the men passing to and fro—let it go until the mullock takes the pressure. You know it cannot go far; and as soon as the mullock takes the pressure you can turn to and take out all the old timber, and replace it with new; and the timber then stands for ever. If you take out the timber as soon as it starts to crack, and put in fresh timber before the mullock has taken the pressure, you only lose time and waste timber.
3328. Is the timber there now safe? Yes, perfectly.
3329. To an inexperienced man it might seem unsafe? Yes; a "fencer" or "sundowner" might think the place was coming down on top of him every minute.
3330. As soon as the mullock has settled and taken the pressure from above, you will take out the old timber and put in new? Yes; and make everything secure.
3331. It is said you have been passing mullock down the ladderway of Kelly's shaft while the cage with men in it has been coming up the hauling compartment; and that stones as big as a man's head have fallen through to the plat on the 415-foot level; and that the plat there has at times been nearly filled with mullock that escaped from the shoot? (*Witness*): No accident occurred?
3332. No. (*Witness*): There are two divisions between the mullock-pass and the winding compartment; and it is impossible for stones to break through into the latter. We are all aware that materials do wear out; and the planks of this shoot did wear out. As soon as I noticed the stuff coming through on to the plat, I went straight away and stopped them from putting in further stuff until the pass was repaired. No matter who the man might be, if he reports to me that the mullock is escaping, work is stopped and repairs effected at once. As to stones going into the winding-shaft, I do not see that that is possible.
3333. It is not a source of continual danger? Not in the slightest.
3334. Is it the duty of the men to report any dangerous places? It is the duty of every man, directly he finds anything dangerous, to make a report to the first official he drops across, who sends a man at once to rectify it. Most men, if they see anything dangerous to their fellow-men, do not report it unless the office-in-charge happens to go round and see it. We have to be always on the watch. The foreman and myself are continually watching. If men do not try to protect themselves, unless you have a boss to watch over them, accidents must happen. It would not make any difference if we had forty more inspectors; we are doing everything possible for the safety of the men, and could not do more. We are doing our very best to protect the lives of our men. We cannot more than try to make the men take care of themselves; and, if men will not try and help themselves, the devil help the lot.
3335. If an additional inspector were appointed, you would like him to be a thoroughly competent man? If an additional inspector be appointed, I would like to see him a man that has been brought up to mining and that would know more about mining than myself. I am always prepared to receive instructions from any person.
3336. I suppose an incompetent inspector would be a source of great danger? Yes; it would be much better to be without him.
3337. In sinking a shaft, do you think it would be safe for a man to sink without any covering overhead;—what distances overhead are pent-houses required? It has always been my practice to leave a crown pent-house in overhead—over the two winding-shafts.
3338. Leaving one compartment open for the purpose of hauling dirt, and the other two compartments covered? Yes.
3339. I suppose you can go any depth with that? Yes; it is perfectly safe. I have worked in places on that principle for sixteen years.
3340. When men go off shift and other men come on, do the men going off point out to their on-coming mates the condition of the face? Sometimes they do; and sometimes they do not. If there be anything dangerous, they try to see their mates. They have been cautioned frequently that, if there be anything dangerous in the face, one should remain and point it out to the on-coming shift.

- R. Thomas.
21 July, 1897.
3341. But I suppose you have men who do not carry out rules? We meet with them frequently. I have a case on hand now to be investigated. A party of men left a missed-hole and never reported it; the men who came on noticed it after having fired another hole alongside.
3342. They drilled alongside the unfired hole? Yes, after blasting their hole they found this other hole.
3343. Were the explosives found? The second shot had not exposed it.
3344. Supposing it had thrown the explosives out, there would be a danger not only to the men working among them, but of their finding their way to the treating machinery on the surface? Yes; that has occurred; and I have tried to ascertain where it came from; but, where you are sending in about 600 trucks every twenty-four hours from all over the mine, it is hard to find out anything like that.
3345. Would it not be better, then, in order to provide against careless men, to compel the change of shift to take place in the face in future? I do not think so; they do not know the danger. The only way is to draft them out and not let them come on at all.
3346. I suppose all men, even the most ignorant, would know the danger of leaving a missed-hole about? I am not quite sure that they do. They have got no thought upon the matter at all.
3347. They must have a very low order of intelligence? You find men like that: they do not give such things a thought.
3348. It has been stated by one of the men that men go off shift and leave the face in a wild state of confusion; that they fire just before shift, and do not wait to see the result of their shot. Would it not be far safer to compel those men to wait in the face, and to point out to their mates coming on anything dangerous;—I am dealing, not with competent men, but with these incompetent, reckless, and careless men? Perhaps in those cases it might tend to prevent accidents to a certain extent.
3349. For instance, in the case of ground hanging in the face, do you not think it would be better for them to have an opportunity of pointing it out to their mates? Some of them would not know whether a hanging rock was dangerous or not.
3350. Supposing in a party there are one or two competent men and one or two incompetent or careless men, and a competent man going off shift knows that there is something dangerous in the face; if he was compelled to wait there, and point it out to the other man, who might not be so skilled, would not that be a matter of security? In that case it would; but many men do not know their own danger.
3351. Yes; but it is for those workmen you have to make these binding rules? Of course I believe in that to a certain extent.
3352. If the change of shift takes place at the face instead of at the brace or in the plat, would it entail much loss of time upon the men? It might entail twenty minutes or so, or perhaps half an hour.
3353. On the whole shift? Yes.
3354. I suppose there is no necessity to blast just before leaving shift? That depends upon the time they start to drill a hole. A man finishes his hole just on time and blasts it, and instead of going back he tells his mates in the plat that he has just blasted, and to look around.
3355. But supposing he missed his mates? He might; but they should not both go up in the one cage; one should remain.
3356. But they do not do that? No, they try to get up as quickly as they can.
3357. I suppose you find a great deal of truth in what one of the witnesses said, that men are prepared to talk about anything else other than their work when they meet their mates? Yes; work can go to Hong Kong so soon as they are finished.
3358. It has been said that two engine-drivers are required to be in the engine-house while men are being lowered or raised, in case one man falls down in a fit. What have you to say to that? Perhaps if he passed a doctor every day before going to work that would meet the case.
3359. The fact of two men being in the engine-house might be a cause of producing an accident? Yes, I believe with two men we should have accidents. Some men have got a tongue like a woman's; you cannot break their yarn; and you cannot cut it. A man stands there with his hand on the handles of the engine, and riveted in a yarn; the engine overwinds; the men go to Hong Kong or somewhere else; and the whole thing goes to pieces.
3360. What do you think of apprenticing youths to the mining as a means of getting over the difficulty of incompetent men? I think that is a very good idea.
3361. What time did you start? At 12.
3362. That is rather young for the colonies? Yes; 16 is young enough.
3363. How long do you think apprentices should work before they know something of mining;—I suppose a miner never is accomplished; there is always something to learn? That depends on the training the boy gets, and whom he gets with. Some men will teach a boy more in twelve months than others would in a life-time.
3364. But you must have a fixed time, I suppose, before you can say that a man has been so long underground, and is worth so much now? But some men have been underground all their life and know nothing.
3365. Do you think five years would be too long? I say if a boy goes underground at 16 years of age he ought to be accomplished at 20.
3366. There is no apprentice system in vogue in your mine? I had a young boy up there that I put down with his father. His father asked for him; I said, "He looks small; but I will try him." I went down and saw him work; I never saw a man who could use a hammer with more freedom; the way he could slip hands was an object lesson to the oldest hands. I took him out from that place, and put him where I had a large number of men, just to show him off and show them up.
3367. How old was he? Seventeen.
3368. Is he working there now? He left me about six months back. If you could get boys like that they would show up two-thirds of the men you have.
3369. In the case of a movement in the ground underground where the men are ordered out, who do you think should have the ordering of them back? I think the foreman should. No man ought to know better than the man in charge.
3370. Of course, when the inspector orders men out, he should be the man to order them back? With all due deference to inspectors, no man knows better than the man who has been there continually, from whom very often the inspector takes his advice.
3371. You think the man in charge should be the man? Yes.

3372. If the men are ordered out, and the ground is reported safe by the man in charge, and some men refuse to go back, you would not force them? Not at all. Any man who refuses to work in a place I take away directly, and put him to a place where he feels he is satisfied. I go then to other parties, and point out to them all the disadvantages connected with that place, and ask them if they will secure it. R. Thomas.
21 July, 1897.
3373. Some men are naturally nervous, but you would not punish them for being so? Some of them have nerves like a woman's, and want to be put into easy little places. I do not discharge a man for being nervous, and always shift him at once from a place he considers dangerous.
3374. Is the machinery that you have on the mine in good order? All the machinery that we have there is in splendid order to-day.
3375. Sufficient for all reasonable requirements of the men, and their safety? Yes.
3376. And the system of timbering underground—is that safe? I never saw any better system, and never saw men looked after anything like they are on the Hill to-day. If they were put into boxes they could not be looked after better. All my lifetime, in other places, we have had to protect ourselves; and if we found anything dangerous, we had to go and attend to it ourselves; there was no foreman to run to.
3377. Have you had any experience in the open-cut work? Yes.
3378. You know the system of the "chinaman"? Yes; it is a very safe system.
3379. How long has it been in use? Ever since I can remember; but I never heard it called the "chinaman" until I came here.
3380. Do you know why it is called the "chinaman"? No; unless it is because of the over-burden it carries.
3381. It is a system not dangerous if carried out properly? Work is more safe with it than without it.
3382. More safe than loading into trucks? Yes.
3383. How long have you known this system? Ever since I have been connected with mining—forty years or over.
3384. It is no new system? No; the name only is new.
3385. You have never had anything to do with the over-casts here? No.
3386. You have had experience with long holes? Yes.
3387. Is there any increase in the danger in a long hole as compared with a shallow hole? Not the slightest. I would sooner charge a deep hole than a shallow one. Of course, it depends upon a man's knowledge of those things. If he never had any experience in those things, it is dangerous for him to meddle with them at all. If a man has had experience, he would just as soon charge a hole 20 feet deep as one 2 feet deep. Instead of putting the plugs in in their uniform size, you should break them up and drop them down bit by bit, and press them down as tightly as you like. Everything is then as safe as can be.
3388. There is no danger in breaking them up? No; you can crumble them up as fine as you like.
3389. What time would you allow to elapse between "bulling" and putting in a long charge? That depends on the nature of the rock. If it is a close hard rock, the "bull" does not crack it up so much; and you can put in a bucket of water and cool it down directly. In half an hour, or a little over, you could charge that hole with perfect safety. In a soft rock, which the "bull" is liable to crack, you could not form much of an idea, and in that case I should say let it stand two or three hours.
3390. Of course, the object of this inquiry is to find out what regulations should be framed, and how they should be made known to the men;—what is your idea about printed regulations for the men? When I was in the Proprietary Mine we had printed rules; and to every man who came on we gave a copy; but it did not avail a finger-snap. I have looked through the window and seen a group of five or six of them go away and tear them up without attempting to read them. You cannot force men to read those things.
3391. Do you think anything is to be gained, towards procuring the safety of the men, by having lengthy regulations? The best way is to have the rules and regulations printed, and placed at the different shafts. As for giving every man a copy as he comes on, that would not, so far as I can see, benefit things in any way.
3392. I suppose most of the men employed on the mines can read? Yes; nineteen out of every twenty.
3393. It has been suggested that a Board of Inquiry should be formed to inquire into minor accidents:—do you think that is required, or would the inspector be sufficient? I think the inspector would be sufficient for that. At present, directly an accident occurs, we drop him a line and report to him, so that he can examine the place and examine the people. We always write to him or ring him up as soon as an accident occurs.
3394. It has been suggested that a Board be appointed consisting of—some say three persons, some say seven, and some say twelve—at any rate, an equal number be appointed by the men, an equal number by the mine managers, and a chairman by the Government;—could such a Board be made the means of great annoyance to mine managers? Very likely.
3395. Do you think it would tend in any way to prevent accidents? No.
3396. I suppose there would be an equal number of advocates on both sides; and the Government man would have to decide after all? Yes; I do not think any benefit would be derived from such a Board. If an accident be reported to the inspector, and he furnishes a full report to the Minister for Mines, that is quite sufficient.
3397. What mines have you worked in besides these? I worked in the Wallaroo Mine, York Peninsula, for twenty-four years.
3398. Where did you first learn mining? In Cornwall.
3399. In your honest opinion, is anything omitted by the management here that could be done in order to secure greater safety to the men? Not one iota, that I know of. If men would only act with a little more care and caution themselves, a great number of the accidents might be prevented. It is through carelessness and neglect on the part of the men that accidents are brought about.
3400. And I suppose error in judgment sometimes? Yes.
3401. In your experience, do you know of any place where men are better cared for, better paid, and have their safety better looked after, than in Broken Hill? I never saw anywhere men looked after like they are here. I have been surprised myself sometimes, when I have gone through, to see the safety provided for men; and, since an inferior class of men have come here representing themselves as miners, it has made me exercise more care than ever in providing for their safety.

- R. Thomas.
21 July, 1897.
3402. You do not concern yourself whether men belong to a union or not? I believe in a union; but I do not believe in the A.M.A. taking in every man, whether a "sundowner" or "fencer" who never saw a mine before, and enrolling him as a miner, and protecting him as a miner. The other day I gave a party of men an order to go to the store and take what tools they required for hard rock. They went to the storeman and said, "We don't know what to get." They actually did not know what to get out of the store to prepare for hard rock. They came back to me again; and I said, "Go to the diggings; I do not want you."
3403. In reference to the chambers that are cut underground, what height should the back be from the men working? That depends on the nature of the rock.
3404. I am referring to the open stopes? The system that we adopt in hard faces, where the rock is hard and massive and we use machine drills, is this: We put timber close up within 5 or 6 feet of the ground, then cover the timber with 10 x 10, on to which we blast. We carry the stope forward two sets high, perhaps 14 or 15 feet high, allowing the ore to remain underfoot. When sufficient work has been done, I take the men out, clear all ore away, and put up the timber.
3405. Fourteen or 15 feet is the greatest distance the back is ever away from the men? Yes; but scarcely that, because the men are standing on the ore.
3406. After the ore is taken out you put in your 10 x 10 timber? Yes.
3407. In connection with explosives, have you ever known any accident to occur through faulty fuse—fuse with a knot in it? I have known an accident to occur where the fuse had been lit sixteen hours previously. Just as the third shift came on the hole went off. Fortunately the men were not close to it; and the only damage done was a slight injury to one of the party. That was brought about by the fuse hanging fire. Of course that occurred twenty years ago.
3408. But I mean of recent days? I know of no recent cases.
3409. As to the quality of the fuse and explosives you use, are they of the best quality you can get? Yes. We had a complaint some time back about an explosive, and we wrote to the parties about it; and they came here and tried it themselves. Any time a complaint is made we always make inquiries about it, and see that we get the best explosives forwarded.
3410. *Mr. Polkinghorne.*] You say, Mr. Thomas, that a charge of glycerine compounds only requires to be kept air-tight? That is all.
3411. Any further weight than sufficient to keep the charge air-tight, in your opinion, is unnecessary? Quite so.
3412. In all places where men are asked to go in your mine, there is no crushed drive? No.
3413. In all those places there are 7-ft. 2-in. legs? Yes. Of course they might be compressed half an inch or an inch in places; but that is neither here or there.
3414. How often is the magazine opened? Twice a day.
3415. For what two shifts? The afternoon and the morning shifts.
3416. One of the regulations under the Mining Act says that no explosive shall be taken into a mine except in a case or canister? In our mine it is taken down in card-board boxes.
3417. You do not think it is absolutely necessary that it should be kept in some safer contrivance than that? We have got them there; they are there in the store ready for use, and fitted with locks and keys, if the men would only use them.
3418. There has been some evidence here that they are not procurable in Block 10, or are not in use. Of course, I do not doubt your word for one moment; but if you have no objection, I would like you to produce one of the canisters to the Commission for examination? I will try and get one down this afternoon.
3419. You have already stated that 6 lb. of explosive is insufficient in many cases for men to have in use at one time? Yes.
3420. But still there is a regulation to that effect; of course I take it that this inquiry is to inquire into whether regulations at present in force are sufficient or not;—you think that regulation should be amended? Of course it should.
3421. In what way would you amend it? I would recommend that it be left to the discretion of the manager as to what quantity should be left in the men's possession.
3422. No man would know better than the manager? No.
3423. And the regulation providing that an iron or steel tamping bar shall not be used in charging holes for blasting, unless mounted with at least 4 inches of copper, should, in your opinion, be also erased? I believe in wood.
3424. That regulation is really out of date? Yes.
3425. In your opinion, is a wooden rammer sufficient for tamping a powder-hole? For black diamond-grain powder it is not. That is a thing that very few miners nowadays know how to use.
3426. *His Honor.*] What would you use for tamping that? A copper bar, or an iron rod with 4 or 5 inches of copper at the end of it.
3427. You do not think it necessary to have them supplied now, because there is no use for them? No; we do not use that powder now.
3428. *Mr. Polkinghorne.*] We know that powder is still being used in places? It is used sometimes where they want to quarry stones.
3429. I believe a good deal of it is in use in the Proprietary Mine? I have never seen any in use for a long while.
3430. *His Honor.*] When you speak of black diamond-grain powder, you mean gunpowder? Yes.
3431. *Mr. Polkinghorne.*] You think it necessary that provision should be made for some other rammer as well as a wooden one? I should say a copper rammer for black powder.
3432. That would be very expensive, would it not, for a long hole? You need only have about 4 inches of copper. I do not mean that the whole of the rod should be of copper.
3433. *His Honor.*] In making a regulation would you distinguish between the two;—as you have to deal with powder, you would allow a copper-tipped tamping-bar for powder, and for powder only; but no metal bar should be used for any of the glycerine compounds? That would be it.
3434. *Mr. Polkinghorne.*] Do you not think that a copper bar could be procured almost as cheaply as an iron bar copper-tipped? No; there is a great difference between the price of copper and iron, and the cost of splicing a bit of copper on would be nothing.

R. Thomas.
21 July, 1897.

3435. Would the increased cost of a copper bar compensate for the increased safety it would give? No; an iron rod with a copper tip would be just as safe; on account of the shoulder the iron could not strike the sides of the hole.
3436. *His Honor.*] What length of tipping would you make compulsory at least? Four inches would be quite sufficient, with a shoulder.
3437. If a bar were constructed in that way, there would be no risk? None whatever.
3438. Are tamping-bars always constructed in that way? Yes, the copper is always much larger than the iron to which it is fastened.
3439. *Mr. Polkinghorne.*] You say that the shoot in Kelly's shaft is kept as safe as it possibly can be kept? Yes; I send men through it every week, and if we find any leakage we at once stop stuff from being sent down and have repairs effected.
3440. Do you think there is any danger in mullock being tipped into that shoot while men are being lowered or raised in the hauling compartment? I question whether mullock has been tipped in while men have been descending or ascending.
3441. But you will admit that it would be dangerous, were it done? I do not see how it would, because there is a footway between the winding-shaft and the mullock-pass. If mullock did happen to get into the footway it could not get into the winding-shaft.
3442. What is the centering between the winding-shaft and the footway? Ten by four; and to that is nailed 10 x 2 planking. The mullock shoot is closely timbered all the way up with 10 x 4.
3443. As to the sinking of shafts. What is a usually safe distance to sink under a pent-house? About 150 feet.
3444. Do you think that is a fair distance to be sunk? I think you could sink to 1,000 feet, if you have the two winding-shafts secured by a ground pent-house, and only one shaft open—a permanent footway running all the way down.
3445. In your opinion you might just as well go 1,000 feet under the rope as 150 feet? Every bit of it; all you want is a good rope and a careful man on top to land the trucks you send up.
3446. I suppose you would like to see the two compartments closely centered off? Yes.
3447. And the danger from the rope breaking would not be greater at 1,000 feet than 100 feet? No.
3448. You are agreed that a course of training for boys should be adopted? Yes.
3449. Would that in your opinion have a tendency to remove the disability of the mines in procuring competent men? I think so.
3450. I suppose young fellows of the town who serve their apprenticeship here would be better adapted for work required of them here than good men imported for the purpose? Yes; a lot of these boys working now on top would, if you took them underground, be better than two-thirds of the men. They will do what they are told; the others are so thick-headed that they cannot do anything. One does his work with a free will: the other takes everything as a burden.
3451. It would be no drawback to the companies? The companies would profit by it.
3452. *Mr. Williams.*] And the men? Yes, and the men as well.
3453. *Mr. Polkinghorne.*] On what standard would you put an apprentice? I think a boy should do four years before he could be recognised as a full-blown man entitled to a man's pay. I took my boy with me when he was about 15; and I worked him up until he was 20 before I got full pay for him; and you know better than I can tell you what sort of a man he is.
3454. A lot has been said about this question of apprenticing boys; that the companies would take advantage of it, and would force a lot of boys into places that they should not be forced into, and therefore interfere with the employment of a number of men; they would simply give the apprentices a small wage, and expect to have the same work performed by them as by a man at the current rate? I do not think that any mine would expect a man to take a boy in of (say) 16 years of age, and do with his assistance the work of two practical men; but, if a competent man has had a boy with him for three or four months, the boy will then do more work than two-thirds of the men who are here to-day representing themselves as miners.
3455. Under the contract system, no difference should be made? Not the slightest.
3456. If a set is worth £5 to six men, it is worth £5 to three men and three boys? Yes.
3457. Do you think there would be anything gained in restricting the number of apprentices to the number of men employed? No, I do not fancy that at all. I think it should be left entirely to the management. I think it should also be left to their discretion to decide with whom the boys should be put.
3458. On the Barrier you will admit there are not the same advantages for men to take boys as in mines you have been accustomed to in other parts? The same advantages are held out in my mine that I have been accustomed to elsewhere. Any man could take in his boy; and I would give them a price for the work done.
3459. But I refer to the different phases of mining. A man might take a boy into a stope and keep him there for five years, and all he would learn in that case would be but a puff of a candle so far as mining was concerned? I always change the men about from hard ground to soft ground, and *vice versa*.
3460. Boys should have the opportunity of working in all kinds of ground? Yes, they should be put into every variety of place, always of course avoiding risky places.
3461. In charging long holes, do you think it would be absolutely safe to break up the pellets before putting them in? I have proved that it is by practical experience.
3462. But that would not answer in a ragged hole? If you break the plugs into fine pieces, there is not the same chance of their getting stuck. Plugs, when put in whole, are liable to hang across the hole.
3463. I suppose you know pretty well the regulations under the Mining Act? Yes; there may be a thing or two I am not exactly acquainted with.
3464. You say you have no printed general rules on your mine? No; we give all instructions verbally, which answers just as well as any printed rules.
3465. You state that when you were in the Proprietary they had printed rules? Yes.
3466. In your opinion was there anything in those rules more than a man with ordinary experience would know himself? No; a practical man would know the whole thing without looking at it.
3467. You say if there were forty inspectors you would do just the same as you are doing now? Yes; I am doing my level best to protect the life and limb of the men.
3468. But, seeing the extent of the Albert Mining District, is it your opinion that one inspector is sufficient

R. Thomas.
21 July, 1897.

sufficient to carry out the inspection of all the mines in the district? Yes; I have never seen officers on any mining field attend to their duties better than they do on the Barrier, and, because of that, the inspector has less work to do. He knows that the officers could not do better even if he were constantly with them. If an inspector were appointed to every two men, we would still have accidents.

3469. I admit that; but we cannot forget that this district is pretty well 300 miles long, and it is necessary for the inspector to be at the very end of it sometimes; and, seeing that there are about 6,000 men within a radius of 2 miles along this line of lode, do you not think there should be one within easy distance of the Hill at all times? I do not see that at all. If the inspector were to go through the mine I am connected with every time I went through myself, it would make no difference at all, because we do everything that possibly can be done to protect the life and limb of the men. If the inspector be 500 miles away from here it would not make any difference to us, and if anything occurs in his absence we make a full report to him on his return.

3470. As to this proposed Board of Inquiry to investigate all minor accidents;—do not you think such a Board would be an advantage, seeing that sometimes the officials of the mines are wrongly accused of carelessness or neglect in the case of accidents? Look at the time that man was killed on the dump. Mr. Slee, Mr. Hebbard, and myself, cautioned the party where this man was killed; but directly we turned our backs they took no notice of our caution, with the result that this man was smothered. Well, we were censured for that, although the men admitted that we had warned them.

3471. But would not an inquiry prevent the blame from being put on the wrong shoulders? In the first place the inspector could go the man who meets with an injury, and obtain from him a statement; and then go to the officer in charge at the time of the accident and obtain a statement from him, and after making observations for himself he could draw his own conclusions, and make a report to the Chief Inspector of Mines. That is being done now; and I think every accident is thrashed out just as much as if we had a Board of Inquiry.

3472. But an accident might be brought about owing to the neglect of the inspector. Of course, I am speaking generally, and not making any particular reference to our present inspector; and, human nature being human nature, he would naturally make his own case as good as he could. He may tell the truth, but not the whole truth? I would like to see the man that ever did.

3473. Further, it might be stated among people outside that the inspector, even if he were not, was to blame, and was not therefore a proper party to make the inquiry? My experience of the inspector here is that he is no favourite of our party; he is generally on the side of the men. He is always down on me whenever he can get a slant. However, I do not believe in this Board of Inquiry. I think the inspector can always get sufficient evidence to thrash the matter out. If the inspector misrepresents the cause of an accident, the parties concerned can appeal against it.

3474. You will admit, then, that it is necessary the inspector should at all times be within an easy distance of the Hill; a man might live for twenty-four hours after meeting with a serious accident; and, should the inspector see him before he died, he would be able to collect the principal evidence surrounding the matter? I differ from you there. I have never seen a man in my life who, after meeting with a serious injury, could tell you how it occurred.

3475. That would be in the case of an unforeseen accident;—I can speak of one or two accidents where the injured persons, although they died ultimately, were able to give a correct statement as to how they met with their accidents? You might have more experience in that than I have. I have never seen a man, under those circumstances, give evidence that could be relied upon.

3476. As to those underground chambers. How do you go about opening out the stope? We carry it up two sets high, and go forward two sets, and then come back and put in one set.

3477. You would not open it to any great width? No, not if the ground is any way treacherous.

3478. It has been said that explosives are not kept as safely in Block 10 as they should be; that they are allowed to lie about in the stopes? Every man has been informed from time to time that he has not to keep his explosives closer than 30 or 40 feet to the face, and that he must keep them in a secure place. If directly a party blasts you must have a man over them to compel the putting away of the balance to a safe corner, no mine would pay; you would want more officers than workmen.

3479. You think what is required is to penalise them in the event of their committing a breach of that rule? Yes, if you could place a fine upon them it would do good.

3480. *His Honor.*] You think they ought to be compelled to use the proper canisters or boxes supplied? Yes, and there must be some sort of a fine imposed to make them do so.

3481. I understand you do try to make them do so? Yes; but instead of using them for their explosives, they make water-cans of them.

3482. Have you got them in stock? I believe we still have some.

3483. I understand you found it so hard to make the men use them for their explosives that you have given up the idea of ever bringing them into use? Yes.

3484. And now it is the habit not to use them? Yes; but the dynamite is in cardboard boxes; it is not carried down loosely.

3485. Are those cardboard boxes fastened round with a cord? Yes.

3486. Are they made of strong cardboard? Yes.

3487. Is it cardboard or mill-board? I could not say what is the difference between the two.

3488. Mill-board is stronger than wood really? I do not mean to say that the substance of which these packages are made is stronger than wood; but it is as good as wood, and is of some thickness.

3489. *Mr. Polkinghorne.*] Do you think the use of the canister should be enforced? I do not see that the canister is in any way safer than the packages. If the men take proper precautions, when they take a charge of gelatine out of a package, to bind the package up again, it would be equally as safe as a canister.

3490. But we must admit that it is easier to put down the lid of a canister than to tie up a package? I admit that; but I have seen them not even cover the canister.

3491. *His Honor.*] But a man who would do that would be quite certain to leave open a package too? Yes.

3492. And with a lazy, careless man there would be more temptation to leave a package open than to leave a canister open? Some of them would not close the package; and some would not close the canister.

3493. Of course some would smoke on a powder keg? Yes; we have them up there now. You have almost to knock them down with a stick to keep them from the magazine with a pipe stuck in their jaw.

3494. *Mr. Polkinghorne.*] You are not prepared just now to suggest any amendments in the regulations under the Mining Act? No. R. Thomas.
21 July, 1897.
3495. *His Honor.*] Do you not think that written regulations would be useful for one class of men;—you do come across men who know very little of mining, but who try to find out as much as they can as they go along? Yes, there are instances.
3496. Sailors, for instance? Yes. Printed rules should be posted about the mine. If we find intelligent men trying to pick up information, we try all we can to help them. We put them in easy places, and show them things as they go along. But there are others who think they know the whole business; and you cannot teach them anything whatever, nor can you do anything with them.
3497. *Mr. Williams.*] You understand that the two principal objects desired by this Commission are—firstly, to find out the causes of accidents; secondly, to devise means to prevent the occurrence of accidents? Yes.
3498. And also to ascertain whether the regulations under the Mining Act are sufficient, if carried out properly, to prevent accidents occurring; and also, as far as possible, to find out what has been the cause of the recent increase in the number of accidents. You admit that accidents have occurred? Yes.
3499. And several recently? Yes. They come and go in spurts, as it were.
3500. You think there has been an increase in the number of accidents lately? Yes; not only in the mines, but in the district. They seem to come in a crop.
3501. You said that if men understood the law, and obeyed it, there would be less accidents? I said something to that effect.
3502. And you cannot expect a man to obey a law unless he knows it? No.
3503. You have no printed laws; you prefer the men to learn them by word of mouth? Yes.
3504. Do accidents occur through incompetency of the men employed? Yes, a lot of those small accidents occur through the men not knowing their business.
3505. You believe it is possible for men not knowing danger to fall into danger? Yes.
3506. And therefore you have been endeavouring to instil into the men the things required of them in order to satisfactorily perform their work? Yes.
3507. You said just now that you would want one inspector to every two men? I said things would be no better if we had an inspector to every two men.
3508. If you placed a boy in a mine under his father, there would in that case be an inspector, as it were, to the two? At first that would work all right; but after a little while the boy would get stubborn; and it would then be better to place him with a stranger. I do not believe altogether in putting a boy to work with his father; he should be put with a stranger.
3509. You do not mind a man's complaining to you about anything? No; I would thank a man for doing that.
3510. One of the causes of accident is, it is stated, that men break the laws. Have you ever brought any of those men down here before the Police Magistrate for breaking the laws? No.
3511. Would you give the inspector the power of administering the oath when making inquiries concerning the men and the employers? No, I would not. If he cannot rely upon a man's statement, then it is for the higher authorities to step in.
3512. Do you believe in men having certificates? Yes.
3513. If a man came to you with a certificate, you would give him a job to see whether he was as able as the certificate represented him to be? Yes; of course I would first look at the signature at the bottom of the certificate.
3514. As to the probability of an engine-driver's falling down in a fit. Was it the practice in the Cornwall mines for the engine-driver to have a fireman? No; the engine-driver had to do his own stoking.
3515. There was no man nearer to him than the brace-man? No; the pumping-engines have a driver and a fireman.
3516. As to finding explosives on the furnace floor. You said it would be difficult to ascertain which truck they came from? Yes.
3517. You have known explosives to be found on the feeding-floor? Yes; they have been found there occasionally.
3518. Have they ever found their way into the rock-crushers? We have had breakages in the rollers; but I do not think it has been due to explosives.
3519. *Inspector Hebbard.*] Do you think there is any more risk in carrying dynamite in its own package than carrying it in a tin? Not the slightest.
3520. You think there is no more danger in leaving it in the package underground than in the tin? No, there is no more danger.
3521. *His Honor.*] On the whole, you would consider it more satisfactory if it were kept in a secure metal canister? Yes; the Government should be asked to pass a law compelling the men to use canisters for their explosives, and to keep them closed; failing which they should be liable to six months' imprisonment. That is the only way to bring the thing about.

John Warren sworn and examined:—

3522. *Mr. Edwards.*] Your name is John Warren? Yes. J. Warren.
21 July, 1897.
3523. You are general manager of the Broken Hill Proprietary Block 10 Company, Limited? Yes.
3524. How many years' experience have you had in mining? From when I was 14 years of age to the present time I have been engaged in mining.
3525. How many years altogether? Considerably over forty years.
3526. In what mines have you had experience? In all kinds of mineral but coal.
3527. Both in Cornwall and Devonshire? And in New Caledonia and various parts of Australia.
3528. This inquiry is being held to inquire into the causes of accidents that have recently taken place in mines of this district. Do you think accidents have increased in any measure in this district recently? I do not know about the district; they have increased with me in some degree.
3529. To what extent;—how many fatal accidents have you had? Four.
3530. During what period? Since the commencement of 1890.
3531. What number of men do you employ? In 1890 there were thirty-seven men employed.
3532. Since then? During the past two months we have been employing over 600.

- J. Warren. 3533. What do you think would be the average during the six and a half years the mine has been working? Close on 300, speaking from memory.
- 21 July, 1897. 3534. To what do you attribute the cause of the accidents that have taken place? Firstly, to the increased number of men employed.
3535. Secondly? Through carelessness and the want of interest of the men employed.
3536. Are the men competent that are employed below? Numbers of them are not.
3537. Have you done your utmost to procure competent men? We have.
3538. You did not import any men? No; not since the strike.
3539. Can you suggest anything other than is done at present with the view of preventing the recurrence of accidents? I do not see that any further precaution can be taken. It rests, to my mind, simply with the men themselves.
3540. Are your subordinate officials competent? They are; they are competent, practical miners, every one of them.
3541. Is the system of timbering a good one? Yes, it could not be improved upon.
3542. Your mine is thoroughly secured? Yes, no mine is more so, so far as I can see.
3543. And thoroughly ventilated? Yes.
3544. Have you any working rules on the mine; or do you depend upon the instructions given to the men by the shift-bosses? We have no printed rules. We have a copy of the Proprietary rules in the office. They were adopted at the time of the strike, and are supposed to apply to all associated mines.
3545. And, besides, you have Government regulations? Yes.
3546. Of the four fatal accidents that occurred on your mine, only one, I think, was underground? There was only one in the face.
3547. That was a man named Thompson? Yes.
3548. Could that accident have been prevented by any forethought or care on his part? It seemed to me an error of judgment on the part of the man himself.
3549. It arose through his not securing the overhanging ground? Yes; the comrade who was with him said they barred down all ground they considered unsafe, and resumed work.
3550. Is there any stint of timber required for securing the ground? There is an unlimited supply in Block 10 for the men to use.
3551. Are the men encouraged to report any dangerous places? I should expect them to do so.
3552. If they do not report dangerous places, can you prevent accidents? No; it is impossible for the underground manager to see every point of the mine every day.
3553. Are the men closely supervised in their work? Yes.
3554. And every precaution taken to protect the men against themselves? A greater precaution than on any other field on which I was ever located.
3555. During the forty years' experience that you have had, do you know of any other place in the world where men are better paid and better precautions are taken for their safety than at Broken Hill? No.
3556. In reference to explosives; you buy these yourself? Yes.
3557. Are they of the best quality? The best class that can be obtained.
3558. One of the Government regulations says that not more than 6 lb. of explosive shall be taken down into a mine by a workman at one time. Is that a workable rule where you are using rock-drills? I do not think that rule is understood properly. 6 lb. is not much to give to a party for twenty-four hours.
3559. Would it be sufficient for one shift? No, not for machine drills.
3560. Another rule says that it shall not be kept in a mine except in a case or canister. Are canisters provided at the mine's store for men who want them? Yes.
3561. Do they use them? No; not for the purpose for which they were made.
3562. Who made them for you? They were made specially through Messrs. Harris, Scarfe, and Company, of Adelaide.
3563. Have you got some of them in stock still? Yes.
3564. What do men use them for? For water-cans.
3565. Another rule says that an iron tamping-bar shall not be used, unless tipped with copper;—they are not used now, are they? No; no iron rods are used in our mine.
3566. What rods are used? Soft-wood ones.
3567. Do you believe in a copper tamping-rod? The whole made of copper might do very well; but a soft-wood rod is as good as copper, in my estimation.
3568. Would a copper-tipped rod be serviceable, supposing the copper were of greater thickness than the rod? I think it better to dispense with the iron rod altogether.
3569. Even if that part of the rod made of copper were thicker than the iron? Yes; the iron might strike near the collar of the hole and make fire there.
3570. Then you think it would be safer to abolish the metal rod altogether? Yes.
3571. Wood would be sufficient for all purposes? Yes.
3572. Would it be sufficient for powder? Yes, I think so.
3573. Under the present regulation, a missed-hole is not to be unrammed or drawn. What course would you adopt with regard to it? I think it would be preferable to withdraw the charge.
3574. The charge or the tamping? A portion of the tamping, to within a couple of inches of the explosive.
3575. Of course you would not withdraw the charge of glycerine compound; nor would you touch it? No. I would withdraw the tamping.
3576. Would it be a safe practice for men to put in another hole close to the missed-hole? I should prefer certainly to withdraw the tamping and try to explode the hole.
3577. Have you ever known of explosives being scattered about and being found in other parts of the workings amongst the ore? No; not in Block 10.
3578. I suppose that could occur? I have seen a plug of dynamite intact in the bottom of a hole.
3579. But what I mean is this: Supposing you put in a hole near a missed-hole; would it not be possible for the second charge to throw out the first charge unexploded, and scatter it amongst the ore? Yes; it depends upon the distance between the two charges.
3580. Mr. Thomas told us of some dynamite plugs having been picked up near the stone-breaker on the surface. That did not come to your knowledge? No, it did not.

J. Warren.

21 July, 1897

3581. Is the machinery on your mine suitable for its purposes and safe, so far as the lowering and raising of men is concerned? I think so.

3582. It has been suggested that the contract system is productive of accidents to the men, in consequence of their having to hurry through their work in order to make wages at it;—is there any foundation for that? Not in my opinion. With me, during the past six months, the men have lost on an average 15 per cent. of the hours they should work, and my impression is that, if they can afford to lose nearly a day a week, there should be no occasion for them to rush through their work.

3583. Do they on an average lose a day a week? It works out a shade over 15 per cent; and that is nearly a day a week.

3584. How is that lost? Through neglect of labour.

3585. I suppose, sometimes by sickness? I think it is oftener through other causes than sickness. Anyhow, they do not turn up to their work.

3586. Do you notice that that frequently occurs on the Monday after pay-day? Yes; frequently.

3587. That might be from sickness the source of which could have been prevented? Yes.

3588. Does the contract system induce the competent men as well as the inferior men to come forward? There are some competent men among them, but of course there are numbers who do not know a pick from a shovel, so to speak.

3589. Have you had occasion to discharge many men for incompetence? That is a daily occurrence.

3590. It has been stated that "bulling" is a dangerous practice? We have no need for "bulling" in the mine under the present circumstances; but, so far as "bulling" is concerned, I see no danger in it.

3591. It only requires care? That is all.

3592. Is there necessarily an increase of danger in a deep hole, as compared with a shallow hole? No; I should say not.

3593. I suppose a deep hole would do more work than a good many shallow holes? It stands to reason that the deeper you can get your charge of explosive the better chance it has of doing the execution required of it.

3594. You have had no movements underground of any magnitude? No; only just a slight shrinkage, which occurs in all mines where large bodies of ore are removed.

3595. You know Kelly's shaft at the 415 feet level? Yes.

3596. It has been stated that the timber in the plat there is all crushed and splintered? Yes; the timber is crushed there very badly; but the danger is only in the timber itself. The roofing of the plat is a hard capping of ironstone that covers the whole width of the ore-body there. If at any time we took the timber out, there would not be an ounce of mullock fall.

3597. Behind the timber it is all mullocked up? Where the timber is crushed there is no mullock at all. What has caused it to crush is this immense body of rock sinking in a mass. Where the ore has been removed, filling has been put in, and that too has caused a slight shrinkage. The whole body of this ironstone has subsided, possibly, a foot or more; and, if the timbers were removed, not an ounce of rock would come away.

3598. Is it safe? There is no danger there so far as I can see, with the exception perhaps of the timber.

3599. It has been said that a source of danger to the men is the practice of passing mullock down a shoot in the same shaft, only a different compartment, as that used for raising and lowering men; and that it is continued while the men are passing up and down? No mullock could possibly get into the cage shaft.

3600. And the moment the lining is broken through, it is repaired? Yes.

3601. In the event of any movement taking place in the ground below, and the men being ordered out, who should have the authority to say when they should go back? The man who orders them out.

3602. If the inspector were called in, you would leave the responsibility to him? Yes.

3603. On the question of increasing the number of inspectors: it has been said, and very truly, that this is a very large mining district, embracing districts as far away as Mount Brown and Tibooburra;—but do you think an increase in the number of inspectors would tend to lessen the number of accidents? I think not. If you had an inspector for every party of men in the mine I do not think it would make much difference in the number of accidents.

3604. Could you do more than you are doing at present to prevent accidents? No.

3605. You do not wait until the inspector comes round to tell you of danger, but look to it yourself? Yes.

3606. Supposing new regulations were framed, what course would you adopt, or would you suggest, for the purpose of making them known to the men;—the present instructions are verbal, I believe? Yes.

3607. Do you think the object would be attained by providing every man who came on to the mine with a printed copy? Yes.

3608. In addition to those on the mine? Yes.

3609. And would you have penalties imposed upon the men if they committed breaches of them? Yes.

3610. I suppose you yourself are not brought much in contact with the men? No.

3611. You simply lay out the work? Yes.

3612. And then you have your foreman to see that it is attended to? Yes.

3613. Who is the best judge as to whether a face is in a safe or unsafe condition? The men themselves, I should say.

3614. And, after them, the shift-boss? Yes.

3615. And then the foreman? Yes.

3616. And then the manager? Yes.

3617. At present, the change of shift takes place either in the plat or at the brace? Yes.

3618. Do you think any further safety would be provided if the men, before leaving the face on change of shift, were compelled to point out to their mates coming on the condition of the face? I do. If any danger was known to the off-going shift, they would then, before they left, point it out to the on-coming shift; in fact, in many cases in the old country the men are bound to relieve in the face; and it was attempted here after the strike.

3619. I suppose, owing to the width of the ore-bodies here, this is not easy ground to work? I do not think it is easy.

3620. I suppose dangerous places are continually appearing in the mine? There is always danger in this hard, flawy ground. The explosion shakes more rock than it brings down; and the danger is that the men might not pull all the loose ground down.

- J. Warren.
21 July, 1897.
3621. Firing takes place just about the relief? I think the men on contract fire when it suits them.
3622. There is no hard-and-fast rule in this respect? No.
3623. A man is allowed to fire at any time? Yes; unless it interferes with others working on the same face.
3624. Has it ever been brought under your notice that missed-holes have been left? No.
3625. In order to prevent men from leaving missed-holes without notifying their mates—and this has been done;—would that be met by compelling the men to change in the face? They could not well meet their comrades without telling them of a miss, if there was one. At present they miss them altogether.
3626. Would that entail much loss of time on the men, taking an average right through? It would not make a difference of ten minutes a day.
3627. It would entail the same difference to the mine? No; only to the men.
3628. You think it would be safer? Yes.
3629. It has been suggested that, while men are being raised and lowered at change of shift, two engine-drivers should be in the engine-house, in case one should fall down in a fit, or something;—do you think there is any occasion for that? I do not think the community is so liable to fits as all that.
3630. Do you think the presence of two men in the engine-shed would give rise to conversation, upon which would follow neglect of work, and very likely an accident? I know that in well-arranged mines no man is allowed in the engine-room except the engine-driver.
3631. And his whole attention is supposed to be on the engine, the rope, and the signals? Yes.
3632. In sinking from the bottom of a shaft that is unprotected, with three compartments, do you think, in order to protect the men working below, pent-houses are necessary for more than two compartments? I do not see any need for a third pent-house.
3633. At what distances should the pent-houses be put? It all depends upon the depth of the shaft. 100 feet is the usual lift from level to level, and that is what we adopt.
3634. As to the engine-drivers having certificates;—I suppose it would be an advantage if they all had certificates? If they obtained them through a proper channel; but, whether or not, I would prefer to give a man a trial first.
3635. No matter what certificate he possessed? Yes.
3636. The mere fact of a man's having a certificate would induce you to give him a trial, to see what he was made of? Yes.
3637. With a view to getting over the difficulty of incompetent men, do you think the system of apprenticing lads would be beneficial;—do you think that would get over the difficulty of inexperienced men? Yes; to a very great extent.
3638. At what age do you think a youth should go underground? Sixteen years, according to the present Act.
3639. I suppose you went under younger? Yes—before I was 14.
3640. How long should an apprentice be compelled to work before he could be entitled to call himself a miner? That would depend upon the lad himself.
3641. But you would have to make some limit, I think, as to time? Many would be as good after two years as they would be all their life. When I was 18 I was a better man than I have been since, so far as labour is concerned.
3642. A man, after five years' experience, would be a better man than after two years' experience? Certainly, he would have more experience in the different classes of ground.
3643. Do you think a youth who went in at 16 would, in all cases, when he arrived at 18, be entitled to demand a miner's wage? I would make no hard-and-fast rule.
3644. It would depend upon the individual? Yes.
3645. As to the shift-bosses and foremen having certificates. Of course, there is no Board in existence now that could give them; but, if there were, do you think it would be an advantage that these officials should possess them? I do not see it.
3646. I suppose you would have to get all the mines in the different colonies in line before you could work it well? Yes; I feel that if I had fifty certificates I would not be any better than I am now. That is my own feeling in the matter.
3647. In reference to the minor accidents, it has been suggested that a Board of Inquiry should be appointed, to consist of representatives of the managers and the men; some have suggested twelve, others seven, and others three;—do you think it would be of any advantage to have such a Board to inquire into all minor accidents; or do you think an inquiry by the inspector would be sufficient? I would leave it to the inspector.
3648. *Mr. Pollinghorne.*] You say the men in your employ lose 15 per cent. of their time? Yes; of the underground men.
3649. Have you taken any notice whether this time is lost by the better class of men? I think it is about equally divided between the competent and the incompetent men.
3650. That, in your opinion, will not bear out the justification of men saying that they have to rush their work, in order to earn what is considered a livelihood, under the contract system? Yes; that is my idea.
3651. I believe the system of sinking a shaft, as adopted in Block 10, is a little bit different from that adopted in some of the other mines; I believe you use the windlass? Yes.
3652. You do not use the air-winch? We have used it, but are not using it now.
3653. Do you think the same precaution should be taken with sinking with an air-winch as when sinking with a windlass? I think 100 feet is quite far enough to sink in all cases.
3654. You believe that explosives should be kept in canisters, and provision made for a penalty where a breach of that is committed? Yes.
3655. You quite agree that the regulations should be such that the men should be get-at-able as well as the companies? Yes.
3656. I dare say you have read the Regulations under the Mining Act of this Colony? Yes.
3657. Do you think they are sufficient? There is room for improvement.
3658. One or two of the regulations have been questioned, especially the rule restricting the quantity of explosives to 6 lb., that a workman should have in his possession at one time in any one place;—you do not consider that quantity sufficient? I do not.
3659. And you consider a regulation a very poor one which must, of necessity, be broken? Yes; and I consider

- consider the first clause (sub-section *a* of Rule 3), as to carrying a week's supply into the mine, is a big mistake. J. Warren.
21 July, 1897.
3660. You have your explosives stored above ground in magazines—not stored down in the mine? Yes; the men take down at 8 o'clock in the morning, and 4 o'clock in the afternoon, what they require.
3661. Tho 6 lb. provided for in the Regulations is not sufficient? No; not for machine-drilled holes.
3662. Then that sub-section should be amended? Yes.
3663. And sub-section *d* should also, you think, be amended? Yes.
3664. And sub-section *e*? Yes; I think the tamping should be unrammed to within a couple of inches of the explosive.
3665. If 1 foot of fine tamping, say sand, were put into a hole, and the charge missed fire, would it be necessary to withdraw any of that tamping? Yes.
3666. Do you not think that the insertion of another cartridge on top of that fine tamping would be sufficient to explode the previous charge? I do not think it is to be relied upon. I would certainly recommend that portion of the tamping be withdrawn. In taking out the excavation for the buildings on the mine, the contractor exploded a hole some 10 or 12 feet deep, and shifted an immense body of rock. After the explosion a plug of dynamite intact was found in the bottom of the hole. Now, if the explosion of all the balance of that heavy charge was not sufficient to put off that plug, how much more chance is there of a miss with a light charge which has to force through 9 inches of material.
3667. How did you account for that plug being left intact? My impression is that the plug above it got across the hole, and this left a space between the two plugs, which acted as a cushion, and prevented the explosion of the first plug put in.
3668. You cannot say it was because of a defect in that plug? No.
3669. *His Honor.*] You cannot say whether that plug was used afterwards? No; I took it out; and it seemed sound enough.
3670. *Mr. Williams.*] You have studied the rules under the Mining Act, and endeavoured to carry them out? Yes.
3671. I suppose you would be surprised if I told you that you are the first witness who has said that? I would not be surprised at anything now-a-days.
3672. You believe in apprenticing boys? Yes.
3673. Underground? Yes.
3674. And on top? Yes; I am training boys now to look after the machinery.
3675. You are not in favour of certificates being issued to miners unless they are issued by some practical Board? No.
3676. You say that a certain number of the men under you are incompetent? Yes.
3677. In case any movement should be inaugurated to educate men to be better workmen, would you do anything to advance such a movement? Yes; I would be happy to do anything in that way.

William Rowe sworn and examined:—

3678. *Mr. Edwards.*] What is your name? William Rowe. W. Rowe.
21 July, 1897.
3679. You are underground manager of the Central Mine, the property of the Sulphide Corporation (Ashcroft's Process), Limited? Yes.
3680. What experience in mining have you had? I have had thirty-three years' experience.
3681. From what mines did you get your experience? From mines in England and Australia; it is hard to name them, there being so many.
3682. Have you been mining all through the thirty-three years? Yes.
3683. How long have you had charge of the Central? About four years.
3684. Have you noticed any increase in accidents in your mine lately? No; I cannot say that I have.
3685. How many fatal accidents have you had in that mine since you have had charge of it? Three.
3686. What were they caused by? One (Brokenridge's case) was by falling down a shaft.
3687. How was that occasioned? He got out of one cage, and fell down the other compartment. He came down on to the plat by the eastern compartment of the winding-shaft, and stepped across from the plat into the western shaft.
3688. *His Honor.*] He seemed to be under a mistake as to which compartment the cage was in;—absence of mind, apparently? Yes.
3689. *Mr. Edwards.*] What was the second accident? The man's name was Pendergast. He got into a disused drive. We had been firing some distance away, which shifted the ground in this old drive; and a sulphide rock fell upon him.
3690. Did his work take him into that place? No.
3691. I suppose the men firing did not know he was there? No.
3692. The third accident? The man's name was Harvey. He was engaged in drilling a hole in the open-stope on the 400 level; and a "tom" close by interfered with his position somewhat; and to have more convenience he knocked it out, with the result that stone came away and struck him down.
3693. It was said the other day that that accident was caused by want of sufficient timber to protect the ground;—is there any truth in that statement? Not in the least.
3694. The man who said that—Berndt—admitted that he was only speaking from hearsay;—is timber supplied in sufficient quantities to protect the ground where the men are working? Yes.
3695. Where are men supposed to get their timber? At different places. Some from the plat; and others have it taken to them.
3696. Is there any ground whatever for the statement that men incur risks through want of timber, through not being able to get it? Not that I am aware of.
3697. Do they lose time in looking for timber? It is provided in the contract that they have to take their timber from the plat.
3698. Is timber supplied there on all occasions for them? Yes.
3699. How many men have been employed—the average number—since you have been there? I could not say exactly what the average has been.
3700. How many have you now? 366 underground.
3701. How many on the surface? I do not know. 3702.

- W. Rowe. 3702. It has been stated that the ventilation in that mine is not sufficient; that places in the mine are unfit to work in;—is that true? It is false.
- 21 July, 1897. 3703. Are there any places in the mine where the air is light? Yes, one—the western main drive at the 500-foot level.
3704. Where is the air light there? Just in the drive itself.
3705. Are any means being taken to improve the air there? Yes; we have laid pipes.
3706. And you are pumping air down? We will be shortly; we have not started to do so yet.
3707. Are men working in the drive? Only a few.
3708. Do those men who are working there complain about the air? They have never complained to me.
3709. Where was Berndt working? In section No. 3, 500-foot level.
3710. Was that in the same drive? No.
3711. He had no reason to complain of section 3 in that level, so far as the air was concerned? No reason whatever.
3712. How was that supplied with air? By a cross-cut.
3713. Then, if he says that the ventilation is not sufficient there for the men to work comfortably, he is not saying what is correct? No.
3714. Have any other men complained? No; I have not heard anyone complain about that place.
3715. Are you there frequently? Yes; two or three times every shift.
3716. That is during the daytime? Yes.
3717. It has been said that the contract system is a cause of the increase in accidents;—is that your experience? No.
3718. What is your experience? I think if we had more contract we should have fewer accidents.
3719. Why;—does it bring about a better class of men? Yes.
3720. What is the average rate of wages in the Central under the contract system? From 10s. 6d. to 11s.
3721. It is said that in order to earn a daily wage of 9s. they have to hurry through their work, and are compelled to run risks they would not take if working on day-labour? I cannot see it.
3722. Who plots out the ground for them, and fixes the prices? I do.
3723. Can men working in the ordinary way, without bustling themselves, earn that money? Yes.
3724. From 10s. 6d. to 11s.? Yes.
3725. That is the average rate through the mine? Yes.
3726. Are the shift-bosses under you competent for their position? Yes.
3727. They have been chosen because of their being practical and experienced men? Yes.
3728. It has been said that you have some underground open-cuts in your mine, which are worked in a dangerous manner? I do not know how they bring it in.
3729. What height are they opened out to? Various heights. Generally from 10 to 12 feet above where the men are working.
3730. What is the width of that big open-cut on the 500-foot level? Fifty feet.
3731. What height? Twelve or 14 feet in one place; there are different stopes.
3732. When the men are working in that, how high above them is the back? About 12 to 14 feet from the ground-sill. Of course, it is worked up by timber to a considerable height.
3733. But the men are never more than 12 or 14 feet from the roof? No.
3734. Before putting the timber in, how do you make it safe? By building "pig-styes."
3735. When the stope is completed, and all worked out, what timber do you put in then? We then put in the permanent standing timber.
3736. Is that open chamber worked in a careless or reckless manner, or in such a manner as would lead to accident? No.
3737. Has any accident occurred there? No, excepting Harvey's accident.
3738. Did that take place there in that particular place? At the 400-foot level. The timber was standing round him at the time.
3739. It was in one of those chambers? Yes.
3740. And it was timbered up? Yes.
3741. The permanent timber was standing? Yes.
3742. You say that he brought the accident upon himself by removing the "tom"? Yes.
3743. Who put in the "tom"? The timberman.
3744. With the exception of Harvey's case, have you had any accident underground at all? Yes; the cases I have already cited—the accident in the disused drive and the fall down the shaft.
3745. Has any accident been occasioned through want of timber? No.
3746. Is everything done there by yourself and your subordinates to protect the men from injury? Yes, everything possible.
3747. Do you find you always get competent men? A number of them are very inferior—very incompetent men.
3748. What are some of the minor accidents that have happened to men? In one case a man missed a drill, and knocked the tip off one of the fingers of his mate. In another case a man's ear was partly knocked off from the same cause.
3749. Those are accidents which it is impossible to guard against? Yes.
3750. What do you do with men of that sort? Send them off.
3751. Have you had occasion to discharge many men for incompetency? Yes, a good few.
3752. Have you done anything to get good men? Yes.
3753. I believe the Central Mine imported men from Ballarat? Yes.
3754. Was the local labour market exhausted before that was done? Yes.
3755. Do you know Shinnick? Yes.
3756. Is he a competent miner? I do not think he is fit to hand tools to.
3757. Did he do any work while down on the one shift he was there? Very little.
3758. He is not a safe man to be entrusted with tools? No.
3759. As to this man Berndt;—have you anything to say with regard to him? Only that he has not been mining more than twelve months. Previous to that he was mullocking.
3760. How long should a man be underground before he could be considered as a miner? Not less than five or six years. Of course, some learn faster than others.

W. Rowe.
21 July, 1897.

3761. Berndt told us that it was the practice to fire shots too large underground, and that the ground was insufficiently secured and timbered;—if that does take place, is it the fault of the management or the fault of the men? 7 feet 4 inches is the deepest hole ever fired in the Central.
3762. Berndt said that there was not only an insufficiency of timber, but that the laths shot away were not replaced? It is the men's duty to replace the laths they shoot away.
3763. And whose duty is it to report where laths have been shot away and not replaced? The men's. They should report to the shift-bosses.
3764. And if that is done are repairs effected at once? Yes.
3765. Is it the practice of the men to strip the floors? Yes.
3766. And that is to save themselves the trouble of going to the plat for fresh timber? Yes.
3767. When you catch a man doing that, what do you do? Discharge him.
3768. At once? Yes.
3769. Is the stripping of the floors a matter of frequent complaint? Yes. It is a very hard matter to find out who are the men who strip the floors.
3770. *His Honor.*] What is the rule in the stopes as to stripping floors or leaving floors open? If we find the men who do it we discharged them.
3771. Is it the rule to leave every floor covered until all under is filled? Yes; that is the rule of the mine.
3772. Unless used as a shoot; and then they are railed off? Yes.
3773. *Mr. Edwards.*] I suppose sometimes those handrails are knocked down? Yes.
3774. Is it the duty of the men to report that to the shift-bosses? Yes.
3775. Do they do it? Very seldom.
3776. Shinnick said that when he was taken down there they had to walk on the caps and struts for a long distance to get to their work? Of course they would be covered over with laths.
3777. I understood him to say that they walked simply on the naked struts and naked caps;—could that happen without your noticing it? No.
3778. Is there any place in the mine, where men are at work, to reach which they have to walk on the tops of the caps and struts? Not that I am aware of.
3779. He said that as far as he could see there was no one to care for or watch whether the floors were covered or not? A man is employed in those stopes purposely to keep those floors covered and to see to the guard-rails.
3780. *His Honor.*] What do you call him? The timberman.
3781. That is part of his duty? That is his duty.
3782. *Mr. Edwards.*] Kelly blames the timberman for throwing a lump of sulphide on to his toe;—was the timberman to blame in that case? The man himself was to blame.
3783. It was Kelly's own fault? Yes.
3784. How did the accident come about? A stone was standing on the timber, which the men on the previous shift had tried to bar down. When Kelly and his mate came on they broke it with a hammer, and neglected to take down some loose stone, leaving it standing on the timber.
3785. If they had taken down that loose stone, the accident would not have happened? No.
3786. Was it his duty to have made the place secure before commencing work? Yes; every man is supposed to secure his own place.
3787. How far back from the face should the timber be when you are using big shoots? In some cases 12 to 20 feet.
3788. The timber is put as close to the face as the shooting will permit? Yes.
3789. And that is a matter left to the discretion of the men? Yes.
3790. You say the deepest hole you have put in is 7 feet 4 inches? Yes.
3791. Is the practice of "bulling" a dangerous one? Very seldom we "bull" any holes in the Central.
3792. Is it a dangerous practice? I cannot see it.
3793. In case you do "bull" a hole, what time do you think should elapse until you put the charge in? That would depend upon the position of the hole. If you could water it, the charge might be put in within half an hour. Where you have to let the hole cool naturally, I should say leave it two and a half hours.
3794. In the case of missed-holes, what plan do you adopt? We take out the tamping.
3795. You would not go down to the charge itself? No.
3796. And you then fire another primer? Yes.
3797. *His Honor.*] How near to the charge do you think it is safe to go, and proper to go, so as to ensure the charge going off? It would certainly depend upon the depth of the hole.
3798. What thickness of tamping would you leave between the primer and the charge? About 8 or 10 inches.
3799. You think the primer would be sure to explode the charge with that thickness of tamping between? Yes; I do not remember seeing any miss at that distance. Of course it would depend a lot upon how you rammed. With a very loose hole it would be safe to leave a foot.
3800. Then the distance would depend on the solidity or looseness of the tamping? Yes.
3801. Would you consider it too risky to take the tamping out to within 3 or 4 inches of the original charge? I would not care about doing it myself.
3802. You would not go so close? No.
3803. *Mr. Edwards.*] In reference to Kelly, do you know that he complained about the place he worked in? He was only there an hour and a half.
3804. When he first went to work, did he complain about the place—did he make any report to the shift-boss? It was not reported to me.
3805. Have you ever known of missed-holes to be brought about owing to bad fuse? One has been reported to me.
3806. Was the fuse proved to be bad in that case? Yes.
3807. It did not go off at all, I suppose? No.
3808. Some fuse has knots or joints in it, I believe;—are the men compelled to use that? They generally cut the joint off.
3809. What is the character of the explosives you get—good or bad? Very good.
3810. The men are in the habit, I believe, of clearing out of the face as soon as the whistle goes;—would it

- W. Rowe. it be safer if the change of shift were to take place at the face instead of at the plat or brace as at present?
 In my opinion it would.
- 21 July, 1897. 3811. Have you ever known dangerous ground to be left in the face? Yes.
 3812. And the mates coming on have not been aware of it? Just so.
 3813. I suppose some of them are really reckless and careless, and indifferent as to how their faces are left? Yes.
 3814. Would it inconvenience the men if the change took place at the face? It would make them a few minutes later in getting up.
 3815. What average would it be throughout the Central? It might be ten minutes.
 3816. And you think accidents could be avoided in that way? I do.
 3817. Could that accident of Harvey's have been avoided in that way? No.
 3818. That was not on the change? No.
 3819. You think it might prevent accidents, through dangerous places being left, and the out-going shift not acquainting their mates of them? Yes.
 3820. Have you ever known missed-holes to be left in the face? Yes, but very few.
 3821. Have the mates been informed? Yes, always.
 3822. Do you think there would be fewer accidents under the day-labour system than under contract? I think there would be less accidents under contract than on day-labour.
 3823. Why? Because then we should get a better class of men.
 3824. There would be fewer accidents under the contract system than on day-labour? Yes.
 3825. You are working on contract now? Only about one-half.
 3826. You think if the contract system were adopted right through the mine there would be fewer accidents? Yes.
 3827. You would get a better class of men? Yes.
 3828. I suppose it is impossible to tell whether a man is a miner or not until you have seen him at work? It is very hard to say whether a man is a miner or not until you have seen him at work.
 3829. You cannot tell well unless you see a man at work? No.
 3830. Do you think a system of apprenticing youths to mining would be a good thing to provide for? Yes; that would enable us to get a better class of men than we have at present.
 3831. At what age should boys be apprenticed? From 16 to 18.
 3832. What time should they serve? Five years.
 3833. It would take that time to make them miners? Yes.
 3834. In reference to the machinery you have there, is it in good order? Yes; so far as I am aware.
 3835. I think most of your plats and principal workings are lighted by electricity? Yes.
 3836. Does that go through the mine? Yes, to different parts.
 3837. In taking the explosives into the mine, how are they carried—what are they carried in? Canisters.
 3838. Specially provided by the mine? Yes.
 3839. Do you think that 6 lb. of explosive is sufficient to be in use at one time? Yes.
 3840. Could you work the mine with that? Yes.
 3841. Supposing you were working with machine drills? Then very likely it would take 6 lb. for one hole.
 3842. It would not be sufficient then? They would have to travel to the magazine oftener.
 3843. If you had eight holes, they would have to make eight trips to the magazine? Yes.
 3844. That would be waste of time? Yes.
 3845. Is 6 lb. an unreasonable amount for one hole? No.
 3846. Where are the explosives kept? Underground. We have magazines on the different levels underground, away from the drives.
 3847. You have no underground rules? No.
 3848. You work under the Government regulations? As near as possible.
 3849. How do you instruct the men as to what they are not to do? Verbally. I either do it myself or the shift-bosses do it.
 3850. Do you frequently instruct them? Yes, very often, when there is cause for it.
 3851. All your orders and working rules are given to the men verbally by the shift-bosses and yourself? Yes.
 3852. To what depth would you sink an uncovered shaft without protection in the shape of pent-houses to the men? 200 or 300 feet.
 3853. Would you work with the whole three compartments open? I would close one and a piece.
 3854. That would be half of the shaft with a pent-house over it, and the other half open? Yes.
 3855. Is that the practice you have adopted lately? That is the practice I have seen adopted at different places.
 3856. I think you put down the new (Kintore's) shaft? Yes.
 3857. What depth is that? 670 feet.
 3858. How was that sunk? It was sunk in different sections.
 3859. At the same time? Yes; sunk from the surface to the 500-foot level in sections.
 3860. How many different sections? Four.
 3861. Were they all worked at the same time? Yes.
 3862. All worked in the same way? No; some up and some down.
 3863. That was carried through without any accident? Yes.
 3864. And I believe it came out within an inch? Yes.
 3865. What was the distance between the lifts there? 100 feet.
 3866. Do you think the appointment of additional inspectors will prevent accidents? I do not think so, myself.
 3867. I suppose you are not afraid of an inspection at any time? I would not care if an inspector were kept in the mine.
 3868. Provided, of course, he was a competent man? Yes, of course.
 3869. Your mine is open at any time for inspection? Yes.
 3870. Additional inspection would not make any difference to the way in which you are working your mine, so far as safety is concerned? No.
 3871. You are doing everything to prevent accidents happening to men? Yes.

W. Rowe.

21 July, 1897.

3872. You have heard said something about a "butcher's bill" from Broken Hill? Yes.
3873. You say that everything is done to take care of the men? Yes.
3874. A suggestion has been made that a Board of Inquiry should be appointed to inquire into minor accidents;—do you think the inspectors should be sufficient in themselves to make those inquiries; or do you think a Board of Inquiry would be of any assistance to the men? I think the inspector is quite sufficient to make all inquiries.
3875. Are all your accidents reported at once? Yes; as soon as we can send word.
3876. Did you report that accident where the man received an injury to his ear, and that other one where the man lost the tip of his finger? The "injured ear" accident occurred a long while back; but the "finger-tip" accident, which occurred more recently, was reported.
3877. So the smallest accidents are reported at once? Yes.
3878. To the inspector? Yes.
3879. In reference to the engineers at the surface whose duty it is to lower and raise the men: should they be certificated men? Yes.
3880. How many engine-drivers should there be in the engine-house at the one time? I should think one would be quite sufficient.
3881. It has been suggested that the driver might fall down in a fit: do you think that two being in there would tend to prevent accident? That depends upon the class of engine. Some engines are so constructed that, directly the driver takes his hand off the handle, action is stopped.
3882. I suppose two men would be likely to produce accidents? Yes; they might engage in conversation, and allow it to interfere with their strict attention to their work.
3883. I suppose the drums on all your engines are fitted with strong brakes? Yes.
3884. And all your cages are supplied with safety appliances? Yes.
3885. And you tell us that an ordinary, competent man can, under the contract system, earn a fair day's wage without any hurry or bustle at all? Yes.
3886. Do you notice any unnecessary loss of time on the part of the contractors? Yes.
3887. About how much? Twenty to twenty-five are absent after every pay.
3888. I suppose that is owing to their drinking habits? I could not say, because I have never seen them there drunk.
3889. If they are drunk you do not allow them on the mine? No.
3890. *Mr. Polkinghorne.*] You say that safety appliances are attached to your cages now in use? Yes.
3891. Do you think it should be made compulsory that they be attached to every cage used for lowering and raising men? Yes.
3892. And that the latest appliances to prevent overhauling of the cage should be used? Yes.
3893. *Mr. Edwards.*] The latest appliances are not always the best? No.
3894. *Mr. Polkinghorne.*] We will say the latest approved appliances? Yes.
3895. As to the question of having an extra engine-driver on duty at change of shifts. You will admit that there is a probability of a man's falling down in a fit while engaged in drawing a load of men to the surface? It would be a very rare occurrence.
3896. But it is possible? Yes; nothing is impossible.
3897. You have seen men down your mine fall to the ground with fits? I cannot say that I have, although I have heard of it.
3898. I have seen them. They have appeared as well as you could wish to see a man, and, without any warning, have fallen down in a fit. If that occurs underground, it is quite possible it may occur on the surface, and the engine-driver may be the man; and it is quite possible that, at the time, he might have twelve men or more at his mercy. Generally, on a railway train, if they have a distinguished party on board, such as the Governor or the Commissioners, you find two of the most careful men obtainable in charge; and, on the same principle, I think that while the men are being hauled up a shaft, two men should be on duty. Of course, the extra man need not be on duty longer than it takes the shifts to change. Do you think then, taking all things into consideration, that the extra cost that would be involved, would be sufficient to put against the possibility of a dozen men being dashed into eternity? I have never known yet of two drivers being stationed in the engine-house; and I do not think it is necessary.
3899. It has been commonly said in Broken Hill that the open-cut system underground is being carried on to a dangerous extent;—what is the usual height in opening out on to the sills? 10 to 12 feet.
3900. Then you clean out and put your sill-timber in? Yes.
3901. That is sufficient room to enable you to put your sill-timber in so that you can build from it? Yes.
3902. A man is then in a position to watch the ground above his head? Yes.
3903. In the case of Pendrieth. It has been stated by you that you thought he was in an unused drive, which he had no right to be in? Yes.
3904. Was that drive unnecessarily dangerous? Just around the entrance from the stope there was some ground hanging loosely.
3905. Was there a possibility of guarding that old drive so that men could not use it? You would have to put the guards very thick to keep them out. When a man wants to smoke, he gets into some very curious places.
3906. You said, in respect to apprenticing, that by putting boys underground the tendency would be to breed a better class of men to take the place of the incompetent men now at work on the Barrier? Yes.
3907. You think the only way to breed a good class of miners is to train men up from their boyhood? Yes.
3908. Do you think you could do anything towards making proficient miners out of the incompetent men now on the Barrier? No.
3909. You said it would be necessary for apprentices to serve five or six years? Yes.
3910. You do not mean to say that it would take your son six years before he could do as much work as you? I do not know.
3911. Well, take the average boy? That is a question very hard to answer.
3912. You do not think six years should be the fixed limit? Very likely my son would learn more from a stranger. I think it is a very bad habit to put the son to work with his father.
3913. Should it be a fixed limit, or be left to the discretion of the manager? I certainly think it should be left to the manager.

3914.

- W. Rowe:
21 July, 1897.
3914. If you had a fixed time, it would bear very hard on some of the young fellows who could learn in a shorter time? Yes.
3915. You think the general rule that explosives should be kept in a case or canister should be adhered to? Yes.
3916. What, in your opinion, would be the best course to take to compel men to comply with the regulations;—would you impose penalties? Yes.
3917. Both for the company and for the men? Yes.
3918. Do you think that in all cases it is necessary to change in the face? Yes, I do.
3919. You say that you have magazines at different levels underground? Yes.
3920. Are these magazines close to the men? Yes. Men are employed whose duty it is to charge holes, and they take the explosives from the magazines, and distribute them wherever required. In the case of contractors, they have their dynamite delivered to them by the shift-bosses in such quantities as they require.
3921. You have your own regulation in that respect, which you consider quite good enough for all requirements? Yes.
3922. You think the 6 lb. provided for in the Act is not sufficient? Not for machine-drills.
3923. It is necessary that that regulation should be altered? Yes.
3924. *Mr. Williams.*] You would not confine your teaching to boys? I would have no objection to training an intelligent man; but I would not give him 9s. a day during his apprenticeship.
3925. Is that plat where the man fell down the shaft in the same condition now as regards light as it was when I worked there? Exactly the same.
3926. What light do you get there other than that thrown by your own candle? None whatever.
3927. Do you think the placing of a lamp there would prevent the recurrence of a similar accident? No, I do not. Very often men seem to go about with their eyes closed. If a candle is sufficient to work by, why is it not sufficient to light you to the cage?
3928. Is there any light at the 200-foot level in the south shaft? It has not been in use for two years.
3929. What about the middle shaft—that is, where the accident occurred? No; it was in the north shaft.
3930. You have got electric light on the plat in the new shaft? Yes.
3931. Do you bring men up shafts other than that? Yes; we bring them up the other shafts as well.
3932. Do you not think it would be better to have lights provided in the plats of those other shafts? I do not see any necessity for it. I do not see that it would be any advantage to have a light on the plat, and I have never heard of that being done, only on the Hill.
3933. Have you been down any collieries? Yes; I have seen a light there on the plat. They generally have a lamp.
3934. *Mr. Polkinghorne.*] I believe it is the custom to have guard-rails put up to the shafts? Yes.
3935. Were there guard-rails at this particular plat from which the man fell? Yes; he admitted himself that he stooped under the guard-rail.
3936. *His Honor.*] What is the height of the guard-rail? About 3 ft. 6 in.
3937. *Mr. Edwards.*] All places like that have hand-rails to them? Yes.
3938. *His Honor.*] It is not usual to light the plat? It depends upon the amount of traffic. If there is a great amount of traffic we might provide light, but not otherwise.
3939. *Mr. Edwards.*] Do you know of any mine in the world where men are better cared for and better paid than they are here? No.

THURSDAY, 22 JULY, 1897.

Jeremiah Andrew sworn and examined:—

- J. Andrew.
22 July, 1897.
3940. *Mr. Edwards.*] What is your name? Jeremiah Andrew.
3941. You are shift-boss on the Central Mine? Yes.
3942. I think you were the shift-boss when Christopher Kelly was employed there? Yes.
3943. When he met with the accident to his foot? Yes.
3944. If Kelly had taken the precaution that an ordinarily careful man would take, could he have prevented that accident? Yes.
3945. Was the ground safe enough for a man to work in? Yes.
3946. Is it true that sufficient timber was not supplied to the men to enable them to secure themselves? There has always been plenty of timber in the mine since I have been there.
3947. Has any person ever asked for timber, and been refused it? Not to my knowledge.
3948. How long have you been in the mine? Nearly four years altogether.
3949. Where is the timber placed in the mine? In the plat, chiefly.
3950. And where have the contractors to get it? On my shift, they had it trucked into them.
3951. Do you know if any delay has ever occurred in supplying contractors who have asked for timber, on your shift? No.
3952. It is said that the air in the Central is very bad,—is there any truth in that? It is not very bad there now.
3953. How is the air at the 400 and 500-foot levels? The 400-foot level is pretty good.
3954. And the 500? I do not work there.
3955. Where was Kelly working? On the 400 level.
3956. These big open stopes are on both levels? Yes.
3957. On the 500 and on the 400? Yes.
3958. He says the one on the 400 level is worked in a dangerous manner? It is quite safe enough if a man attends to his work properly; it is well secured with timber.
3959. How far above the men's heads is the back kept as a rule? Only one set; that is the usual height, of course.
3960. In the open-cut, I mean? About two sets.
3961. That would be about 14 feet? Yes.
3962. As they get higher, do you bring timber after them? Yes, as fast as we can get it in.
3963. And should there be any dangerous ground, pending the placing of this timber in position, how do you support it? We put in bulkheads, or "pig-styes."

3964. Have you ever known any accidents, except that one to Kelly, to occur in those underground open-cuts? Not since I have been there. J. Andrew.
3965. Are they worked in a way safe to the men? Yes. The hanging stone (if any) is always barred down before the men go in to work. 22 July, 1897.
3966. Wages men are employed to bar down before the contractors are allowed to go to work in these places? Yes.
3967. Can you see anything further that could be done by the boss to protect the men from accident further than what is being done at present? Everything possible has been done; and, if men meet with accidents, it is their own fault.
3968. What is the deepest hole you have fired on your shift? About 6 feet.
3969. It has been said that too large charges are put in, and that the holes are too deep to be safe for the men;—is that an exaggeration, or is it the fault of the men if it is done? That I cannot say. I have been charging there for six months, and have not met with any such case.
3970. As "powder-monkey"? Yes.
3971. Was it your experience that charges were too heavy? No; I have never charged a hole too heavily that I know of.
3972. Do you "bull" the holes? No; we have "bulled" no holes since I have been there.
3973. What do you work with? Hammer and drill.
3974. Are machine drills used in those big open stopes? Not at present.
3975. Were they used? Not since the open-cuts were started.
3976. Was it on your shift that Kelly met with his accident? Yes.
3977. How was it occasioned? It occurred through his doing work that he need not have done—through doing work I told him not to do.
3978. You told him to let that stone alone? Yes; it had been there a good while.
3979. Was it safe? Yes; we had tried it on several occasions. He went up with a hammer, and broke it down, but did not take the trouble to notice that other stuff came from behind, a piece of which, later on, came down on to his foot.
3980. Was there anything to prevent his taking down that stone that fell on his foot? No; it was lying there, and he had only to take his pick and send it along to where the other stone went. If he had left the first stone alone the accident would not have happened.
3981. Did you tell him to leave it alone? Yes; and the men working alongside told him to leave it alone.
3982. Is it the practice of the men going off shift to point out to their mates coming on the condition of the face; or do they clear out of the stope as fast as they can, and get up to the surface? They generally meet their mates; sometimes, however, they miss them.
3983. Would it not be better if they had an opportunity of pointing out to their mates the condition of the face? It might be; but I have worked in a place, and never knew who my mates were. I never saw them.
3984. I suppose it would have been safer for them if you could have pointed out to them the condition of the face? It might be a little safer to adopt that plan; but, as I have said, very often you do not know who is following you.
3985. But, by changing in the face, you would know then who were your mates? Yes.
3986. If the change of shift took place in the face, would it delay the men much? It would make a considerable difference to the men getting up.
3987. What time? Half an hour.
3988. Not to every man? No; but it would take some men longer than that.
3989. But, even though it would incur a delay, would it not tend to minimise accidents? It might.
3990. Do men leave missed-holes in the face? Sometimes.
3991. Would it not be better to lose half an hour than have it in your mind ever afterwards that you caused another man's death? But you can see your mate, and tell him of any danger.
3992. But supposing you missed him? The other one would stay down for the next cage, and would be sure to meet him.
3993. But, apart altogether from the delay it might incur, do you not really think it would be safer if men were compelled to meet their mates in the face, and point out to them anything dangerous? It would be better, I suppose, as far as that goes.
3994. Is every care taken in lowering and raising men in the mine? Yes.
3995. In reference to the men employed there: are they all competent men, or otherwise? No; some of them are sent up very soon after they come down.
3996. They are not fit to go into a mine? No.
3997. How long did Kelly work in that mine? About an hour and a half.
3998. Then you cannot say whether he is a miner or not? No.
3999. *His Honor.*] Could you not tell by the way he shaped? I never stopped to see him shape. I had a lot of other work to attend to after I pointed out to him his place.
4000. There is nothing for you to go by then? No. When I got back, he was hurt.
4001. *Mr. Edwards.*] There are no written or printed rules for the underground working in that mine? No.
4002. Do you give your men instructions when you put them on? Yes, sometimes; but I do not put them on—the manager does that.
4003. But when you put them into a stope to work, I mean? I give them instructions then.
4004. Supposing new men come in, do you give them any advice or instructions what to do? Yes; I always tell them what to do.
4005. Do you know Shinnick? I am not acquainted with him, but I know him by seeing him around the town.
4006. You have never seen him working in a mine, and do not know whether he is a miner or not? No.
4007. Do you think the contract system has anything to do with the increase in accidents? Not the way they work there, because all they have to do is to bore holes.
4008. Have they time to do their work well and carefully, having regard to their own safety, and earn a full day's wage each shift? Yes.
4009. Is there any necessity for them to bustle over their work, or to take unnecessary risks, in order to earn at the rate of 9s. a day? I do not think so.

- J. Andrew.
22 July, 1897.
4010. Do you think that, if there were additional inspectors, any further precautions could be taken in the mine than are taken at present? I do not think it would make much difference. We always do all we can for the safety of the men.
4011. You say the timber is lying handy to the men to secure the ground if they like to use it? Yes.
4012. You do not know the particulars of Harvey's case from your own observation? No; I know nothing about his case.
4013. I suppose the use of metal tamping bars is prohibited altogether in underground work? Yes.
4014. Only softwood tamping-bars are used? Yes.
4015. *His Honor.*] What is your opinion as to tamping down a charge of gunpowder? We never use it.
4016. Supposing you were to use it, would you then require some sort of metal bar, or would the wooden tamping-bar be heavy enough? I think a wooden tamping-bar would be as good as any other.
4017. You think you could get enough pressure on the powder with a wooden rod? Yes; I have charged several holes that way, and found the wooden rod to act all right.
4018. In any case, of course, you have got to get your tamping on to the charge, and your charge down into the hole, whether it is dynamite or anything else; and a wooden bar, you think, is sufficient at all times? Yes.
4019. *Mr. Edwards.*] What do you do if you have a missed-hole? I put in two or three more plugs, and fire.
4020. And, if they do not explode the charge, what do you do then? I would put in plugs and primers until she did go off.
4021. You would not put in a hole alongside it? No.
4022. It has been proposed that a Board of Inquiry be appointed to inquire into all accidents other than fatal ones;—do you think that would be of any benefit to the men, or do you think a report by the inspector would be sufficient? I think a report by the inspector would be quite sufficient.
4023. You think it would be quite sufficient if the inspector made an inquiry immediately after an accident occurred? Yes.
4024. In reference to the engines used for lowering and raising men;—how many drivers in the engine-house have you always seen? Only one at a time.
4025. Do you think that is sufficient? Yes.
4026. You do not think two are necessary? No.
4027. I suppose the probability of a driver's falling down in a fit is very remote? If a man fell off our engine, it would stop of its own accord.
4028. It works automatically? Upon a man's releasing his hold of the handle, steam is shut off, and the engine stops.
4029. Has there been an increase in accidents in the Central lately? No; there has been nothing very serious at all.
4030. With the exception of Harvey's accident? That is the only one.
4031. I believe men take the tips of their mates' fingers off sometimes, instead of hitting the drill? I have had that done several times to myself; at least, I have been knocked.
4032. A man has hit you on the hand instead of hitting the drill? Yes; and very often has hit me on the legs too.
4033. I suppose bad language is prohibited in the stopes? Yes; but of course it is enough to make a man use a little bad language when he gets a knock like that.
4034. I suppose you have had a good many years' experience underground in different mines? Yes.
4035. Where did you first start work? In Cornwall.
4036. In any of the mines that you have worked, was any precaution taken for the safety of the men that you have not noticed here? I think the Central is as good a mine as I have ever seen as regards taking care of the men. In other mines, I have seen the men left to themselves, in pairs; and any provision for their safety they had to make themselves.
4037. Here the men have shift-bosses always round amongst them? Yes.
4038. I suppose you went underground when you were young? When I was about 15.
4039. Do you think a system of apprenticeship here would raise the standard of the men as miners? I do not know; it might. A lot of boys do not care to go underground.
4040. I am speaking of boys 16 or 17 years of age? It would be a good thing, if they were allowed to go in with good men who would train them up.
4041. How long should a boy work before becoming fit to be called a miner? Some would get on in two or three years.
4042. It depends on the boy? Yes.
4043. In your mine, as in others, there is no distinction drawn, whether a man belongs to a union or anything else? No.
4044. *Mr. Polkinghorne.*] You say your name is Jeremiah Andrew? Yes.
4045. Can you tell His Honor what experience you have had underground—how many years' experience, approximately? It is four years since I did steady work underground. I have worked sometimes underground, and sometimes at other things.
4046. The principal part of your mining experience, I believe, has been picked up on the Barrier? The greatest part of it at the one stretch.
4047. Are you strictly a shift-boss in the Central Mine? Yes.
4048. Then it is not true that you are a "powder-monkey" in charge of a certain stope? Not now. I was a "powder-monkey."
4049. Is there not some place in the No. 4 level where the air is bad? No; there is one stope that is a little warm; but the air is not bad.
4050. Is there any possibility of getting sufficient air there to cool it? We have got appliances up at each end of the 400 to regulate the air.
4051. Oh, yes; that is, in the main drive? Yes.
4052. I believe everyone will admit that there is plenty of air going through the drive; but is it a fact that in some of the western workings there is not sufficient air? No; they are all pretty good.
4053. *His Honor.*] Do you adopt any means to throw the current into any place you find short of air; or do you let it find its own way? We let it find its own way.
4054. Do you know what bratticing is? Yes.

J. Andrew,
22 July, 1897.

4055. Have you ever adopted that plan? It has never been done there in my time.
4056. Do you not think you would get those places that are rather warm into better condition by trying that? It is not more than about 20 or 30 yards away from the main shaft.
4057. What causes the heat—does it seem to come out of the ground; or is it for want of air? It is coming out from the old stope.
4058. It seems to be something coming from the mine itself? Yes.
4059. Has it anything to do with any fire that is burning anywhere? No fire has been in the Central since I have been there.
4060. *Mr. Polkinghorne.*] Is it a fact that men, in order to secure themselves in the set where they are working, have to take away laths from other sets because of there not being sufficient laths sent underground to meet requirements? They do that of their own free will, because they will not go and get them.
4061. What do you do? If they take them away, we go and replace them.
4062. Is it not true that some of the stopes are quite void of laths, to the danger of the men working there? They are all covered over, to the best of my knowledge.
4063. And are always so kept? As far as they can be so kept. Sometimes firing breaks them down, and they have to be re-covered.
4064. With reference to Kelly's accident: you say he took down a piece of stone he had no right to take down;—was it necessary to take down that piece of stone before a set of timber could be put in? It was not in the road of any timber going in.
4065. Not in the road of laths that were being put over a set that had been put in? No.
4066. Then what was his object in taking it down? I could not say; I never asked him.
4067. He must have stated some reason when you told him it was all right, and to leave it there? He never said any more about it. Instead of working where I told him to, he went in the opposite direction altogether.
4068. And what was his reason for doing that? I am sure I could not tell you.
4069. What is the system adopted by the shift-bosses at change of shift;—is one of them supposed to remain in the plat? Not that I am aware of.
4070. Where are the shift-bosses at change of shift? In the changing-house.
4071. Until all the men are down? Yes.
4072. To adopt the system of changing in the face, what would be the result;—how long would the men going off have to wait in the face for the men coming on? I do not know; I have never yet seen it tried.
4073. *His Honor.*] Have you never been on a mine where that system was adopted? No.
4074. *Mr. Polkinghorne.*] Then you do not think it would be of great benefit to change in the face? I do not see where the benefit would come in.
4075. In regard to these open-cut stopes underground;—is it not a fact that some of them have been carried as high as 30 feet before any timber was put in? Not that I am aware of.
4076. What, in your opinion, is a safe height to go before the sills are put in? The ground is hard enough in our stopes to go as high as you like, if you could get up to shoot it down. It is all solid ground.
4077. Is it not very flawy ground, and likely to flake? It may be a bit flawy; but it is not bad.
4078. You think it is safe? I would sooner work in that cut than under the timber.
4079. It is not carried above two sets high? That is the most it has been carried since I have been there.
4080. You are speaking of the open-cut on your level? Yes.
4081. The present Mining Regulations do not provide that safety appliances shall be attached to the cages where men are being lowered or raised;—is it your opinion that there should be a regulation enforcing the adoption of safety appliances? I suppose it would be a good thing to have safety appliances.
4082. They are now in use, I believe, in the Central? I think so.
4083. *His Honor.*] Do you mean safety-brakes—safety catches? Yes.
4084. Is the safety-hook (a detachable hook to release the cage in case of overwinding) in use? I could not say.
- Mr. Polkinghorne:* I do not think they are, your Honor, from what the manager informed me. I think they have one of those disengaging hooks at the Proprietary.
4085. In how many mines did you work in the old country? Only one.
4086. Did they use the disengaging hook? Every man had to climb there: it was a ladder shaft.
4087. Shallow sinking? It was down about 80 fathoms.
4088. *Mr. Polkinghorne.*] Do you think an additional mining inspector is required for this mining field? I do not know. Perhaps it might not be out of place if there were another one, but I think one is sufficient.
4089. But you must bear in mind this district is of vast extent, and do you think the Hill should be without an inspector at any time? It would not be amiss to have an inspector here at all times in case there is anything requiring his attention.
4090. In order to have one here all the time, there must of necessity be two at least? Yes.
4091. You do not know much about the Mining Regulations under the Act? I have never read them; I have seen them posted up.
4092. What, in your opinion has been the principal cause of most of the accidents in this district during (say) the last two years? Through men not looking after themselves enough; they are in too much of a hurry to get over their work.
4093. What causes them to hurry over their work in such a manner? I suppose it is because they want to make as much money as they can.
4094. Are not the prices given for the work sufficient to enable them to get a fair average pay unless they hurry over it? Not in some places.
4095. Then men will rush through their work to make only a fair living? Yes; but I have seen men who were making 11s. and 12s. a day rushing through their work with the hope of making still more.
4096. I suppose you have seen some with very low pays? Yes; I have had very low pay myself, especially when working in Block 11.
4097. You did not work in Block 11 very long? I worked there long enough; I should be better off if I had never seen it.
4098. Did you work there long enough to recognise what was the cause of your having such a small pay? The price was not too bad if we had only had the dirt kept away from us.
4099. *His Honor.*] When was that? Twelve months ago.

4100.

- J. Andrew. 4100. *Mr. Edwards.*] I understand the cause was the delay in getting away the dirt that you broke down? Yes; the ore was coming too quickly; the shoots were full, and we could not get rid of it.
- 22 July, 1897. 4101. *Mr. Polkinghorne.*] What was your experience as far as that block went;—was it worked as safely as it was possible to work it? I believe so; I never saw anything dangerous.
4102. You never heard of an accident while there? Nothing serious.
4103. *Mr. Edwards.*] Are the canisters in which to take ammunition into the mine used by the men? We used to have tins to carry the fractureur in.
4104. *His Honor.*] Are the tin canisters supplied now? We have now got wooden boxes in our mine.
4105. *Mr. Edwards.*] Made specially for ammunition? Yes.
4106. Are they considered to be better than metal boxes? They are just as good, I believe.
4107. Made with hinged lids? Yes.
4108. Good, strong hinges? Yes.
4109. And a clasp on the lid? There is no clasp.
4110. How are the lids kept down, then? They can only open a certain height; and, as soon as the fractureur has been put in, down they go.
4111. What size are those boxes? Handy for a man to carry about—not too heavy. They hold about two and a-half packages of fractureur.
4112. Have these been adopted because they are found, on the whole, to be better than metal boxes? I could not say.
4113. You do not know why they have been adopted? No. I think they were adopted because the tin boxes did not hold enough.
4114. What did the tin boxes hold? Only a packet.
4115. Are these wooden boxes carried backwards and forwards between the working-places and the magazine; or are they left in one place? They are taken to the magazine at the end of the shift, and locked up.
4116. The explosives are not carried in their own packets? No, in boxes.
4117. Are these boxes in use all over the mine? I believe so.
4118. They are, in your part? Yes; in the 400.
4119. Is it not a fact that those boxes were introduced because the men used the tin boxes as water-cans? I could not say. I have never seen any person since I have been there carrying water in the tin boxes.
4120. I believe the system in the Central is different from that in the other mines;—you have a man there to deliver the explosives when required? Any man who requires fractureur on my shift has to come to me for it. I keep the key in my pocket; and no contractor, or any man in the face, can get fractureur unless he comes to me.
4121. What brought about that? I think it was because of the magazine's having been set alight once or twice.
4122. *His Honor.*] It is the key of the magazine you keep? Yes.
4123. *Mr. Edwards.*] And you go yourself to the magazine? Yes; or if I am too busy, and the man who wants a charge is one I can trust, I give him the key, and let him go himself. Generally, I go myself.
4124. You or he takes the box to the magazine; and the explosives are placed in it? Yes.
4125. The boxes themselves are not locked? No; they are placed in the magazine, which itself is locked.
4126. But when in use at the stopes? They are not locked then.
4127. What do you use them for? To carry fractureur about while charging holes.
4128. Then you use the fractureur at once? Yes.
4129. And if there be any left over? I take it straight back to the magazine and lock it up.
4130. It is never allowed to be stored away in the stope for future use? No.
4131. That is a different system from that in force in any other mine? Yes.
4132. It is the best system, I suppose, in the opinion of the management? Yes.
4133. *His Honor.*] You do not know anything about the open-cut on the surface? No; I have never worked there, except for a little while some time back.
4134. *Mr. Williams.*] You have said something about the engine up at the Central stopping if the driver fell off his seat? So far as I am informed, it will.
4135. Have you ever seen it done? No.
4136. Who informed you that it would? The underground manager.
4137. When did he tell you? Before ever she was put in.
4138. You do not know of your own knowledge that it is so? I have never seen it proved.
4139. You say you worked in Cornwall? Yes.
4140. What mine? The Great Western Tin-mine.
4141. Where is that mine situated? In the western part of Cornwall.
4142. How long did you work in Cornwall? I was there several years.
4143. How long did you work underground as a miner? I was underground with my brother for several years.
4144. How many years have you worked in this country at mining? About five or six years altogether.
4145. Have you been working continuously at mining since you have been on the Barrier? No.
4146. What have you been at other than mining since you came to the Barrier? On the open-cut.
4147. Whom did you work for? Bennett.
4148. You found things conducted pretty well while he was there? Yes.
4149. There were very few accidents under Bennett? There were none very serious.
4150. Some occurred after he left? I think so.
4151. From what you know of Bennett, you think he was a fairly competent man to be in charge of a quarry? Yes.

Richard Parkinson Finan sworn and examined:—

- R. P. Finan. 4152. *Mr. Edwards.*] What is your name? Richard Parkinson Finan.
- 22 July, 1897. 4153. What are you in the Central Mine? A shift-boss.
4154. How long have you been mining? As near as I can recollect, fifteen or sixteen years.
4155. Where did you get your experience? In pretty well all the colonies, excepting New Zealand.
4156. In quartz? In quartz and alluvial. 4157.

R. P. Finan.
22 July, 1897.

4157. What level are you shift-boss on? The 400-foot level.
4158. Do you know a man named Shinnick? Yes; I believe such a man worked on my shift.
4159. How long did he work? As near as I can recollect, one shift.
4160. Did he work through that shift? Yes.
4161. He said he was not provided with tools, or timber, or anything else to go on with? There was an abundance of timber, and plenty of tools, if he had looked for them.
4162. Did he ask for the tools? Yes.
4163. Did you give them to him? I went round myself and got him the tools.
4164. Was there any difficulty placed in his way by the shift-boss? No.
4165. Was the ground ready for him? Yes.
4166. Did he shape well? From what little I saw of him, I would not say he was a miner.
4167. He tells us he had to walk over the naked struts and caps to get to his work;—is that so? No.
4168. Are the floors and the stopes leading up to his place covered? Yes.
4169. Are all the floors intact; or do you sometimes take them up? They are never taken up, to my knowledge.
4170. Are any of them stripped of the laths? It is decidedly against the rules to strip the floors of their laths.
4171. If laths are stripped, who does it? We generally try to find out who strips them, and, if we get hold of the parties, they do not come there any more to work. I have not heard of anyone stripping the laths on my shift.
4172. What do you do if you catch them? They are sent up.
4173. To get their time? Yes.
4174. In the open stopes, how far do you keep the back from where the men are working;—what is the greatest distance? The average distance would be 10 or 11 feet.
4175. Would two sets be the limit? That is the limit.
4176. About 14 feet? Yes.
4177. It is said they are worked in a dangerous manner? They are worked as safely as it is possible to work them.
4178. Is there any precaution not attended to which could be adopted with a view to prevent accidents, as far as you can see, in the Central? Not so far as I can see.
4179. How long have you been working in the Central? Four months.
4180. Where were you working before then? I had just come from Victoria; but previous to that I had about six years' experience on the Hill.
4181. In what mines? Block 11 chiefly, the Proprietary, the British, and Block 10.
4182. Have you noticed any increase in the number of accidents during the last six months? I have never taken any particular notice.
4183. I mean in your mine;—have there been any accidents on your shifts? No.
4184. Not necessarily a fatal accident, but any serious accident? No serious accident has happened on my shift.
4185. How do you find the men down there;—are they experienced men? You do see good men, but they are very scarce.
4186. You see a good man sometimes? Yes.
4187. What are all the rest? Duffers.
4188. How are explosives used in your mine? They are taken to the magazine; and from the magazine the men take them as they want them.
4189. What do they carry them in? A wooden box.
4190. You were not on the shift when Kelly dropped a piece of mullock on his toe? No; I was not.
4191. Do you know anything at all about Harvey's case? That was before my time.
4192. How is the air in that level? The general run of the air is very good. It is a little hot in some places.
4193. Is that owing to the want of ventilation, or to the heat of the ground? It is the natural heat from the ground, I think.
4194. That is in the sulphide stopes, I suppose? Yes.
4195. It is brought about by the decomposition of the sulphide ore? Yes.
4196. The decomposition of the ore throws out this heat? Yes.
4197. Apart from the heat, is the air good? Of course you cannot expect the quality of the air to be too good in those hot places.
4198. At change of shift the men do not report to their mates coming on the condition of the face? Sometimes they do not.
4199. I suppose sometimes they do not know who is going to follow them? No, sometimes they do not.
4200. I suppose they leave dangerous places in the face sometimes? If there are any dangerous places, they generally tell the shift-boss; and he tells his mate.
4201. They sometimes forget to tell the shift-boss? I do not know; I cannot say that.
4202. Of course you would hear nothing at all about it if they did? No.
4203. Supposing the change of shift took place in the face, they would be able to acquaint their mates then of the exact condition of the face; and that might prevent accident? To a certain extent it would.
4204. It might occasion men a little loss of time on each shift? Yes.
4205. Are the men on contract rushed about in their work, or have they plenty of time to protect the ground, and still knock out a fair day's pay for a fair day's work? It all depends on the kind of men contracting.
4206. A competent miner could knock out a fair average wage? According to the prices now, they ought to. The prices are better now than what I have seen them.
4207. In working in other mines in Victoria, either quartz or alluvial, have you ever found any places where the men are better looked after than on the Barrier. Of course, in some of the small mines, you can look after the men better; but, in big mines—for instance, the Star of the East, in Ballarat—the men there are looked after no better than, if as well as, the miners on the Barrier.
4208. What depth is that mine working? Something considerably over 1,000 feet.
4209. Do you find the air in the Central as good as the air in that mine? It is far better.

- R. P. Finan. 4210. You never find miners there troubled with "miners' complaint"? No; I have never heard of such a thing on the Barrier.
- 22 July, 1897. 4211. That is a common complaint over there, is it not? Yes.
4212. *His Honor.*] It is a form of lung disease? Yes; it is a lung disease.
4213. A form of consumption peculiar to miners? Yes.
4214. *Mr. Edwards.*] I think it is attributed solely to bad air? Yes.
4215. Are those underground open chambers in the Central worked in a careful manner, or are they worked in a reckless or dangerous manner? I have never seen them worked in a reckless or dangerous manner.
4216. Is the back always within sufficient reach of the men working at it? Not from the sill; but there is always timber there for them to build a "pig-stye," to see what the back is like.
4217. Is there any scarcity of timber at all for the men there? No; I cannot say that I ever saw what you may call a scarcity of timber. You would never see a piece of bad ground underground, but what you would find timber to hold it up, without stripping the laths from the floors.
4218. I believe some men would rather strip the floors off the stopes than go to the plat for timber? Yes; some would do it.
4219. Did this man Shinnick give any reason for leaving his shift? Not to me, personally. I believe he said the price was insufficient.
4220. It was the price, and not the bare struts, that frightened him? I do not think it could have been the latter.
4221. That statement that he had to walk over naked struts and naked caps, and over high, floorless stopes, is untrue? To my knowledge it is untrue.
4222. It was on your portion of the mine, and you ought to know whether it is true or not? It is untrue.
4223. *Mr. Polkinghorne.*] Have you noticed any increase in the number of accidents during the last six months on the Barrier? I have not been here six months.
4224. Did you not say you were engaged on the Barrier for a period of six years some time previously? Yes.
4225. How long were you away from the Barrier? About eighteen months.
4226. Then it is within two years since you worked on the Barrier before? Yes.
4227. During the time you have been back have you noticed any increase in the number of accidents, compared with what there were before you went away? Certainly accidents have been of more frequent occurrence since I came back than when I was here previously.
4228. What, in your opinion, has been the chief cause of the increase? The neglect of the men.
4229. Their neglect to do what? To have a look round in their face when they go in. I have seen men start to work in a place that you would not put a dog in; and upon your telling them that the ground was not good, they would say, "It is all right," and in ten cases out of twelve they would afterwards abuse you behind your back for your want of knowledge.
4230. How many accidents have occurred directly under your eye through the men not being careful when going on shift;—do they meet with accidents frequently when going on shift? No; but I have seen men working in places where they had no business to work; and, no doubt, had they worked there very much longer, the ground would have come down on them.
4231. Would it not be your duty, when you see men working in direct danger, to send them away? Yes.
4232. Is there any other reason that you can assign for the accidents? No, not that I could say.
4233. Has the increase been caused through a number of incompetent men being employed? I should say that would tend to increase accidents.
4234. You do not think that the employment of competent men would cause an increase in the number of accidents? No; I believe if there were more competent men on the Barrier there would be less accidents.
4235. Have you looked carefully through the regulations under the Mining Act of this Colony? I have looked through them, but have not made a thorough examination of them, and cannot say that I know them.
4236. I believe all your instructions are given by word of mouth? Yes.
4237. And that is the practice throughout the Central? Yes.
4238. You, as a shift-boss, endeavour to get the regulations under the Act carried out; and yet you do not know what they are? I do not see what you mean.
4239. There are certain regulations under the Mining Act that have to be carried out in connection with mining; and you say you are a shift-boss, and men have to work under your instructions, but you do not know what instructions to give them? Will you give me an instance, please?
4240. *His Honor.*] You do not remember them by heart? No.
4241. *Mr. Polkinghorne.*] Can you, from memory, give us one clause under General Rule 3?
- His Honor:* I think it hardly fair, *Mr. Polkinghorne*, to ask questions on numbers only.
4242. Clause *a* of General Rule 3 says:—
Gunpowder or other explosive or inflammable substances shall not be stored in the mine in any quantity exceeding what would be required for use during six working days.
- Do you consider that that clause is as it should be? Yes.
4243. Do you remember whether that is in the rules or not? I believe I have seen that.
4244. Would you be surprised if I told you that there is a clause in the rules saying that a workman shall not have in his possession more than 5 or 6 lb. of explosive? I would not be surprised at anything in these times.
4245. Of your knowledge, you could not say that there is such a rule? No; I could not say.
4246. Clause *b* says that:
Explosives shall not be taken into or kept in the mine except in a case or canister.
- Do you consider that clause sufficient to meet all requirements? Yes.
4247. The next clause says that:
A workman shall not have in his possession at one time in any one place more than 6 lb. of explosive.
- Do you think that that clause should be inserted in any new set of rules that might be framed;—take glycerine compounds, for instance—would 6 lb. be sufficient for a man, or too much? Well, I reckon 6 lb. is ample.

4248. In all cases? Certainly not in all cases; but, in the general run, 6 lb. is quite sufficient.
4249. *His Honor.*] Do you supply fractureur to the men as they require it, or are they allowed to keep a supply at hand in the stope? I supply it only for immediate use, except in cases where men are working a great distance away from the magazine, when I supply them with sufficient to do them the shift.
4250. In that case, some part of the explosive would be kept for a time in a box or something;—it would not be in the magazine; and it would not be in immediate use, but would be kept by until wanted? Yes.
4251. At the end of the shift, what is done with any that might be left over? The mates coming on take charge of it. It is an understood thing among the competent miners, upon coming on, to see whether they have enough fractureur; if they have not, they go back for some.
4252. If you are shift-boss in that part of the mine, they would ask you? Yes; if I am in charge of the magazine.
4253. What about the key of the magazine? I have a key to the magazine; and, if a man comes to me in a hurry for explosives, and I am busy, I lend him the key, and he brings it back to me.
4254. Will you give the key to any man? Only to men that I know I can trust. I would not, for instance, give the key to contractors; but I would not hesitate in giving it to a wages-man.
4255. What if a contractor comes for powder when you are busy? You have to leave your work and supply him yourself. If I am too busy, I send a wages-man with him to supply the explosives.
4256. *Mr. Polkinghorne.*] Why would you not give the contractor the key;—is he more dishonest than a wages-man? A contractor will make as much as he can; and if I were contracting, and not making good wages, and a man gave me the key, I would endeavour to make it pay.
4257. *His Honor.*] In what way? In more ways than one.
4258. You do not mean to say that you would steal the explosive? I would not steal the explosive; but I would not say that I would not take it.
4259. You mean to say that you would use perhaps more than the legitimate quantity? Yes. For instance, supposing I am contracting, and I am firing a hole, and it is "heavy going." It is considered three plugs will do the business; I go to the shift-boss; he gives me the key; on my way to the magazine I begin to think that, perhaps, three or four plugs would make things more sure; and, when I leave the magazine, I have five plugs, which all go into the hole.
4260. And three would probably be enough? But putting in an extra plug or two saves you a lot of labour.
4261. *Mr. Polkinghorne.*] Then it does not follow that because a man is a contractor he is a bigger rogue than a man who is on wages? Certainly not.
4262. The same man you would trust to-day because he was a wages-man you would mistrust to-morrow were he a contractor? Yes; as far as taking explosives from the magazine is concerned.
4263. *His Honor.*] You do not wish to tempt a man to make a violent explosion? It is for the purpose really of preventing waste of explosives that I adopt that course.
4264. *Mr. Polkinghorne.*] Is a contractor in the Central charged for the explosives he uses? Yes.
4265. And that is the reason why you have to take that precaution? Yes.
4266. *His Honor.*] How are they charged? So much a packet.
4267. And you think they would attempt to take more than they would be charged for? A man is but human.
4268. *Mr. Polkinghorne.*] Have you had any experience in open-cut work on the surface? No.
4269. You have already stated that the open-cuts underground are only carried to a height of 14 feet? Two sets high.
4270. You said 14 feet? Yes.
4271. In starting a stope with a sill-set, how many feet of ground do you want to take down before getting up the second set? There is a 7-foot leg and a 6-foot leg—that is 13 feet. Your sill-set would be 7 feet high, and your next set 6 feet; making, in all, 13 feet.
4272. I think it would take 16 feet. However, do you think, in carrying a stope 14 feet high, a man is in command of the back sufficiently to see whether it is shaling off? Not in all cases; but, by rigging "pig-styes," they bring themselves into full view of the back.
4273. You have to clean the ore out and remove the "pig-styes" to put in your permanent timber? Not always.
4274. What chance have you to get the ore out and put the sills in if the "pig-styes" are left in; and if they are not left in, how are you going to escape if the back should be shaling? The open-cuts are carried two sets high. The ground is very hard. Before taking away the "pig-styes" we look to make sure that the back is good; and in this hard ground the back is good generally; and in that case we are quite justified in taking out the ore to put in the sills.
4275. You have never seen any accidents brought about by the back shaling? No; I have not.
4276. One portion of the duty of this Commission is to inquire whether accidents are brought about by the incompetency of the managers or subordinate officials;—what is your opinion as to the competency of the managers and the subordinate officials along this line of lode, so far as your knowledge goes? I will admit, as regards the shift-bosses, that I have seen incompetency in places; but I cannot say the same as to the managers.
4277. You have seen incompetent shift-bosses, but you cannot say the same of the managers? No.
4278. Has any greater risk been run by reason of incompetency on the part of those shift-bosses; or have any accidents occurred? I cannot say that accidents have occurred through incompetency of shift-bosses, though I have seen risks run.
4279. *His Honor.*] How many instances can you give of incompetent shift-bosses? In my experience on the Barrier?
4280. Yes? I can call to my mind four.
4281. Were they long following the occupation of shift-bosses; or were they discharged, and other men put into their places, on account of their incompetency? Two were discharged for not being capable.
4282. What became of the other two? I could not say. I know that one of them is a miner now.
4283. Not a shift-boss? No.
4284. And the other—is he still a shift-boss? I do not think so.
4285. How long were those two, who were discharged, acting as shift-bosses? As near as I can recollect, four or five months.

- R. P. Finan. 4286. How long did you know of the others, whose discharge you did not actually hear of at the time, being in the position of shift-bosses? That I could not say, exactly.
- 22 July, 1897. 4287. About how long? About six months.
4288. Have you any idea how they came to be appointed shift-bosses when they were incompetent? That is a thing we very seldom hear. It was common talk that two of them became shift-bosses through social influence.
4289. As to the other two? They were what we say "pitchforked" into their positions.
4290. Through influence? Yes.
4291. Relationship to somebody, or friendship to somebody? Relationship.
4292. That was the talk amongst the miners? Yes.
4293. With those exceptions, as far as your experience goes, is the choice of shift-bosses generally founded on real merit, or real belief in their merit? Yes; real merit—real grit in the men.
4294. Do you know at present of any shift-bosses who are incompetent? I do not think that is a fair question.
4295. I am not asking for the names? I do know shift-bosses whom I believe to be incompetent.
4296. Is that a strong opinion of yours, or merely a suspicion as to their competency? I should say it is a fact.
4297. Do you think it is a fact known to others, or only to yourself? It is known to others.
4298. Known to the management of the mine in which they are? That I could not say.
4299. How long have those men whom you have in your mind been in the position of shift-bosses? —
4300. Do you wish not to answer that question for fear of identifying the men? Yes.
- Mr. Edwards: Do you not think the men's names ought to be mentioned, your Honor?*
- His Honor: I will allow anyone to press for the names; and then I will decide.*
- Mr. Polkinghorne: I think, in justice to the witness, that if he submits those names to your Honor or to Mr. Edwards, it will be sufficient. I do not think any witness should be compelled to give names publicly.*
- His Honor: I think you are right, Mr. Polkinghorne: that question should not be answered except in writing.*
- Mr. Edwards: Your Honor will understand that, in representing the mines, I am here to find out any abuses, just as much as your Honor is for the purposes of the Government. It is the desire of the management, just as much as it is the desire of the Government, to have the workings of the mines carried out under the best possible conditions; and, should there be any defects that have hitherto remained undetected, they will be only too glad to see them revealed, so that steps may at once be taken to remedy them.*
- His Honor: You will write down the names, and hand them to me, Mr. Finan.*
- Witness: But, before I write down any names, I would ask if you really think it is fair for me to do so? Would it not be fairer to subject them to an examination?*
- His Honor: I cannot subject them to an examination.*
- Witness: I consider it a very unfair thing for me to put them down while Mr. Edwards is here.*
- His Honor: I understand, Mr. Edwards, that you will give me your word that you will not in any sense publish the names Mr. Finan will write down, except to inform the management of them under a similar pledge of secrecy. Of course, they will exercise their own discretion in determining whether they will make further or special examination as to the competency of the men; but they shall not, directly or indirectly, inform the men of the fact that Finan has mentioned their names; nor shall they inform any other person of the fact. You give your word, Mr. Edwards, that that course will be adopted.*
- Mr. Edwards: I will adopt your Honor's suggestion. Of course, it is only right that the management should have these men thoroughly tested to ascertain whether they are competent or not; and, if they are found to be incompetent, I feel certain one course will follow very quickly.*
- His Honor: You pledge yourself to adopt the course I have suggested?*
- Mr. Edwards: Yes, your Honor.*
- His Honor: Then I will ask you to write down the names, Mr. Finan.*
- Witness: My opinion is that it will injure all parties concerned.*
- Mr. Edwards: If it turns out that they are not incompetent, it will not affect them; and it will not affect you in any case.*
- His Honor: I decide, Finan, that it will not injure you in any way; and I direct you to write the names down. [Witness wrote something upon a piece of paper and handed it to his Honor.] I will hand this paper to you, Mr. Edwards, under that pledge which you have given.*
- Mr. Edwards: Certainly, your Honor.*
4301. You spoke about the mine being naturally heated in some places;—is there any system on the mine of keeping a regular course of ventilation, as, for instance, by using one shaft as a down-cast and another as an up-cast, or is the ventilation reversed in accordance with the direction of the wind? There is no system in connection with down-cast or up-cast shafts. If there is more than sufficient air in any place, an endeavour is always made to carry the surplus to those hot places.
4302. How is that done? By a pipe.
4303. Not by diverting the air by bratticing? No; that has been done, I believe, on the big mine.
4304. Successfully? Partly.
4305. Do you use fans in the Central? No.
4306. You say the heated part in the Central is near one of the shafts? Yes.
4307. And whether the air from the heated part happens to pass up the shaft nearest to it, or goes round and passes up another shaft, is, I understand, a matter of accident? Sometimes it depends on the current of air on the surface. In one shift you will find the wind in a drive going one way; and in the next shift it is going in an opposite direction.
4308. And wind in one direction will give better ventilation than when in another direction? Yes.
4309. You have never studied the subject of ventilation carefully? Only from practical experience.
4310. Have you not thought of any way by which those heated stopes could be better ventilated than they are at present? There is only one place in the Central that could be better ventilated.
4311. How could that be done? By carrying air from the shaft into the hot place by means of pipes.
4312. Without using a fan? Yes; immediately north of the shaft there is a winze, up which, when they

they are hauling ore, or when the cage is coming down, the air is forced from the shaft. Had they a bell-mouthed pipe over this winze, connecting it with the heated drive, matters would be improved.

4313. Is anything of that kind going to be adopted? I believe so.

4314. At any rate some care is being taken to try and improve the ventilation of the heated part of the mine? Yes.

4315. Taking advantage, I suppose, of the lightness of the heated air to encourage an up-draft from it? Yes.

4316. *Mr. Polkinghorne.*] Are there some portions of the Central mine that have plenty of air in them? Yes; there are portions where you have to shelter your candle.

4317. That would be coming from the north shaft to the south shaft? Yes.

4318. There is an abundance of air in that drive, I believe? Yes.

4319. Has there been any attempt to divert portion of that air into some of the other workings? The air itself naturally disperses in different ways.

4320. Is there not a very strong direct current from the north end to the south end of the drive? Yes.

4321. Where are the principal workings? North of the central cross-cut there are workings, about 50 or 70 feet north from this current.

4322. Fifty or 70 feet from the Central cross-cut? Yes; it might be 100 feet.

4323. Has there been any attempt to get part of that strong current diverted to that western stope? No; there is going to be. The manager was speaking of it only last week.

4324. You think plenty of air is taken down into the mine for all purposes? Yes, plenty.

4325. It only wants to be divided up, and sent into places where required? There are not many places where it would be necessary to do that; only two places to my knowledge, and very slightly then.

4326. How is this western stope connected with any other level? There is a drive.

4327. Is there any connection made with the upper level? No.

4328. How is the air taken up into the stope? It is only in a distance of eight or nine sets; and the air is good. Certainly it is a little hot; but that is only the heat from the ground.

4329. How high is the timber taken up? Only one set high and two sets wide.

4330. Do they intend to put a rise through there for air; or are they only opening up the stope? They are opening up the stope.

4331. There was a creep on that level some three or four years ago, was there not? I could not say. I was not there three or four years ago.

4332. Is this stope being opened up round about where there is some crushed ground? Not to my knowledge.

4333. Then, it is true that one portion of the Central is hot? Yes.

4334. How long is it since you commenced to open up this western stope? It might be, as near as I can recollect, six weeks ago. It might be more; I could not say positively.

4335. Do you think it necessary that copies of the regulations and the working rules should be given to the men, so that they may have a chance of reading them? No, certainly not. They are stuck up there in the most conspicuous places of the mine; and everyone has plenty of opportunities to read them. They are stuck up both underground and on the surface.

4336. But, if they had them to put in their pockets, there would be no excuse for their not reading them? Certainly there would be no excuse then.

4337. They would not be able to say then that they had no chance to know what the regulations were? No.

4338. Something has been said about bad air in some of the mines in Victoria bringing about "miners' complaint." You do not know of any such thing here? I have never heard of such a thing here.

4339. I believe you said you had six years' experience here previous to two years ago? Yes.

4340. Have you seen anything on the Barrier resulting from bad air or from bad workings, equally as bad as the "miners' complaint"? It is a matter of opinion between "miners' complaint" and lead.

4341. Which, in your opinion, is the worse? For my part I prefer the lead, and severely too, because you are soon done with it. With the "miners' complaint" you linger for years; while with the lead, if you take it in time, you have a chance of getting over it; and in some cases it only attacks you slightly. The "miners' complaint" is a very slow death. I think, given plenty of air—which, in the majority of cases I have seen, has been so—the men on the Barrier should live longer than the men in those mines I have work in in Victoria.

4342. But, if sufficient ventilation were provided for the men in the mines in Victoria, there would be no greater risk from illness than here? Of course, over there, you can get tons of air into the mines; but the workings in some cases are so far in that it would not pay the men to take in air with them. The men there work on tribute.

4343. Then it is the men who simply take upon themselves their own "butchering"? Necessity compels them. If you had children and they wanted bread, you would be a very poor specimen of a man if you did not try to get them some. Besides, the majority of men on tribute get faith in the workings, and would hang on until they died.

4344. In the event of a portion of a mine becoming dangerous to the men, and if they were called out, who should say when they were to return to work, provided the inspector had not been called in? I should say that the man who took the men out would be the man to say when they should go back. If he was competent enough to judge that the place was not safe, he ought to be competent enough to judge when it was safe.

4345. If the inspector ordered them out? The inspector should then say when the place was safe for them to go back.

4346. In sinking a vertical shaft, what distance do you think it is safe to work with a rope hauling directly over your head. Say a shaft is down 600 feet, it is a three-compartment shaft, and you want to continue it. In that case would it be safe for you to have the dirt from the bottom hauled direct to the surface, with the hauling compartment open all the way up; or to what distance do you think they should go with the rope over your head? I should say 100 feet would be a fair limit. Should you be sinking from the bottom of a 600-foot shaft, I do not think the dirt should in any case travel higher than 100 feet above the men's heads.

4347. Do you think engine-drivers should be certificated? Yes; I think it should be like in Victoria, where the engine-drivers have to have a first-class certificate before they can drive in a shaft like the Kintore.

- R. P. Finan. 4348. Or in any shaft where men are being hauled, or are working under a bucket? Yes.
4349. As to the change of shift. How much longer would it take to change a shift of men in the Central, if they had to change in the face, instead of at the brace or plat, as at present? I think it would take a considerably longer time—in fact, you could not say exactly, because men, when they get together, would, after talking about the ground, very likely start confabulating about politics or something else; and, all the time, the platman would be waiting for them to come out.
4350. *His Honor.*] But politics will not keep a man down when he wants to get out? There are men who are so taken up with their work that they will explain everything in minute detail, no matter what time it takes them.
4351. *Mr. Polkinghorne.*] You think they would waste time, and go too far? I believe they would.
4352. Then the chances are that there are more odds against changing in the face than changing in the plat or at the brace? I believe if men knew who their mates were it would be a lot better, and they would then be able to explain to them individually. When your mates of to-day are working somewhere else to-morrow it makes it very difficult, because you do not know who has been put on in their place. A pair might be working in a face to-day; and perhaps some work is required to be done in another part of the mine, and they are cut out for it. Another pair is put on in their place; and they, of course, do not know who are their on-coming mates; and the on-coming men in their turn are looking about for their old mates, being unaware that a change has been made.
4353. *His Honor.*] Can you suggest any improvement on the present system which would ensure, without waste of time, a communication between the men relieving and the men coming off? I have no suggestion to make as to that.
4354. I understand you to say that you do not think a rule providing for the compulsory changing at the face would be an improvement? Of course, that is only my opinion.
4355. On the whole, what do you think is the best system yourself? The best system, I should think, is to have some means of knowing who follows you.
4356. But could you make any rule that would ensure the men being able to communicate with each other as to the state of the face, other than one which would compel them to meet at the face? I do not see that you could lay down any hard-and-fast rule.
4357. There is always a chance of men going on and finding themselves wanting in what would be to them very valuable information for the purpose of securing their safety? Yes; if those men knew their mates it would not be necessary for them to change in the face, because they could then see their mates on the surface or at the plat.
4358. But could you devise any rule which would make it certain that they should know who was coming on, that they should not miss, in fact, the chance of communicating with one another? The only way would be to not change the men about so much, but to keep them in the one place.
4359. But the changing of men about cannot always be avoided? No; not always.
4360. *Mr. Edwards.*] One cage is going up loaded with men, and the other coming down also loaded with men, all the time the change of shift is going on, so some people cannot possibly meet? When I was contracting we always managed to see one another without meeting in the face.
4361. *His Honor.*] That is it. You must devise laws for the careless men, and, if possible, prevent them from doing mischief to others? The only way I can see out of the difficulty is for the men to always use every endeavour in their power to find out who their mates are.
4362. *Mr. Edwards.*] You tell us that, very often, men do not know who have to follow them? They do not.
4363. And sometimes even amongst a party one man is laid up at home, and another comes in his place; and you do not know who he is, and perhaps do not see him through the fortnight? Yes; that is possible.
4364. Then how are you going to acquaint him of danger if you do not see him? That would be dangerous.
4365. Would it not be safer if you had an opportunity of pointing out to him anything dangerous in the face? In that case it would be.
4366. The only objection is that they lose a certain amount of time;—in other respects it would be a good thing? Not necessarily.
4367. *His Honor.*] Would it be practicable for the shift-boss to act in all cases as a medium—I suppose he would have too many messages to remember? Not only that; by the time he had explained to the first man, the last man would be in his place working.
4368. *Mr. Polkinghorne.*] Then the only thing is to keep the duffers out; which would do away with the necessity of framing a rule to that end? Yes.
4369. *Mr. Edwards.*] I suppose, if you took all the duffers out, work would stop? You would find very few men left.
4370. *Mr. Williams.*] Can you tell us that it was really because of your ability that you were appointed as a shift-boss? I am labouring under that delusion, at any rate.

James Joseph Shaw sworn and examined:—

- J. J. Shaw. 4371. *Mr. Edwards.*] Your name is James Joseph Shaw? Yes.
4372. You are the engineer in charge of Baxter and Saddler's open-cut on the Proprietary Mine? Yes.
4373. And you have entire charge of that? Yes.
4374. Since when? 1st October, 1892.
4375. That was when the open-cut was first introduced? Yes.
4376. In reference to the gear that you have up there;—who has the superintendence of all the gear and the machinery—ropes, chains, blocks, and tackle of every description? The foreman carpenter.
4377. What is his name? Alfred Dean.
4378. He has charge of all ropes, chains, &c.? Yes; but he has nothing to do with the machinery.
4379. In what condition are the cranes and lifting machinery, used in the cut? I consider them first-class.
4380. They are safe, and fitted for the purpose for which they are used? Yes.
4381. What number of men have been employed on that cut since you have had charge of it? Taking an every-day average for the past five years, I should say 300.

J. J. Shaw.
22 July, 1897.

4382. These men are employed on day-labour? Yes.
4383. Over them you have how many gangers? The number varies. Just now there are four. We have had as many as a dozen when a lot of men have been there.
4384. What is the greatest number of men you have had employed there? Five hundred.
4385. What quantity of material have you taken out of those cuts? One and a half million yards, or 2,000,000 tons.
4386. And what quantity of explosives have you used? Close on 500 tons.
4387. Consisting mainly of gunpowder? Yes.
4388. Since 1892, how many fatal accidents have you had in the cut? Four.
4389. Will you just tell us shortly the particulars of those accidents? The first accident occurred to James Cable, a horse-driver. He was taking a load out of the tip, but turned round as he was going out, and tripped over the rail, and one of the wheels took off his leg. He died from shock. On 29th December, 1894, a navy named John Olds was killed by stuff from off the batter.
4390. Do you know how that was occasioned? He was working in the tunnel after working-hours, cleaning it up, and the ganger was "bulling" a hole above him. When the "bull" was ready to go off, the ganger sent word down to the men to get away. This man went into a place of safety, but before the "bull" went off he came out, and thought he would have time to pass where the stone would fall. He did not have the time, however, and the stone caught him. He acknowledged the warning in the first instance, and said "All right"; and, after retiring to a place of safety, he should not have stirred from it until he received the signal "All right" from the ganger. The third case was the accident to James Dwyer, or Maguire—I am not certain as to the name—which took place in January, 1895.
4391. How was he killed? It is the usual custom for men to go out early in the morning, before the gang start work, to bar down loose stones, and make the place safe for the day's operations. He was barring down a stone, and somehow tripped; and the stone caught him. The third accident occurred on one of the inclines on the last day of February, 1895. The man's name was Richard Dyas, a navy. He was working down at the foot of the incline; and the man on top of the incline omitted to chock an empty truck; and it ran over the top of the incline to the bottom.
4392. *His Honor.*] The man who omitted to place a chock under the truck wheel was committed for manslaughter;—what was the result?
- Mr. Edwards:* I defended the man; and the Judge withdrew the case from the jury under section 13 of the Criminal Law Amendment Act.
- Mr. Williams:* Who was the Judge?
- Mr. Edwards:* I cannot remember; I think it was one of the Supreme Court Judges. In that case the truck was drawn up the incline, and on to the level; and, on its reaching the level, it was this man's duty to put a block down to stop it from working back. He, however, omitted to put the chock across the rails; and the wind caught the truck, and started it going.
- His Honor:* The real question seemed to be whether it was a single act of forgetfulness, or whether it was one of a series of acts of carelessness. I presume that the Judge concluded it was a single act.
- Mr. Edwards:* Yes; evidence was called to show that he was a man who had been very careful up to that time, and that he was a man of good steady character.
4393. *Mr. Edwards.*] You know the Government regulations relating to surface work? Yes.
4394. You know the surface rules of the Proprietary Mine? Yes.
4395. Are those regulations strictly observed by your men, so far as you know? Yes.
4396. Do you instruct your gangers to strictly observe them? Yes; and I see that they do.
4397. Are you on the open-cut every day? Yes.
4398. During all working hours? From 8 o'clock till 5 o'clock.
4399. How many parties of men have you working in the cuts? Four.
4400. Your time is occupied in going from one party to another? Yes.
4401. And in inspecting the machinery, and looking after the mechanics that you have employed? Yes.
4402. Are the men asked to take any unreasonable risk in that cut? No; certainly not.
4403. I believe you leave the employment of men to your gangers? Yes; they put on the men and discharge them.
4404. You never interfere at all? No; if I notice anything wrong with a man, I go to the ganger.
4405. You never give any instructions to the men yourself, except through the gangers? No.
4406. So they have absolute control over the men in the cut for the time being? Yes.
4407. Any interference by you is through the ganger? Yes.
4408. Have you ever had any complaint from the gangers or from any of the men as to any of the plant being defective or worn out? No.
4409. Have you ever had any complaint from the men, or any other persons, that the men working in the cut are rushed about by the gangers? No.
4410. Or slave-driven in any way? No.
4411. Do you know as a matter of fact that they are? I know that they are not. I have had over twenty years' experience in railway work; and I can say that the work here is less arduous.
4412. Will you tell us, Mr. Shaw, what qualifications you have. I think you are an Associated Member of the Institute of Civil Engineers, London? Yes.
4413. And how many years' experience have you had in the colonies on railway works and in these open-cuts? Twenty years'.
4414. In all the colonies? Yes; Queensland, New South Wales, Victoria, and South Australia.
4415. In connection with the permanent batter in the open-cut; is that left in a safe condition? Yes.
4416. The work is done under contract with the Proprietary Company according to plans and specifications? Yes.
4417. And those plans and specifications have been observed by you, as representing the contractors? Yes, to the best of my ability.
4418. As to the working-face; that is continually altering? Yes.
4419. It alters with every shot fired? Yes.
4420. Is the working-face kept in as safe a condition as the nature of the work will allow? Yes; men are sent up to bar down any loose stuff that there might be; and, should they get the batter too steep, the work is stopped until it is brought down again. Whenever there is any loose stone, work is stopped until men go up and bar it down. We always keep a safe working-face for the men. 4421.

- J. J. Shaw
22 July, 1897.
4421. You use the "chinaman" in this work? Yes.
4422. That is not the real name for it? No. It is the old movable shoot that has been in existence from time immemorial.
4423. How long have you known this system of the "chinaman" to be in use? Over twenty years. [*A plan showing the working of the "chinaman" was placed before the Commission for inspection.*]
4424. *His Honor.*] Was it formerly known by any particular name? Of course, the "chinaman" is only part of the tunnel.
4425. *Mr. Edwards.*] You do not know why it is called the "chinaman"? No.
4426. Do you know of any safer method for working a cut than by the "chinaman"? No, I do not; it is much the safest. Wherever the cutting is deep enough to put a drive in, it is done. Of course it is just a question whether the height of the cutting warrants the driving of this tunnel.
4427. It is safer, I suppose, than having a line of trucks along the face, and men shovelling between the trucks and the slope? Yes; and with the "chinaman," two men would do as much as fifteen or twenty men under the other system.
4428. And if a run of ground took place with the "chinaman" they would have a better chance of getting away? Yes. Two men are actually engaged in pulling stuff down; and they would be able to get away if they saw a run of ground coming down. If a lot were filling into trucks they would not be able to get away.
4429. As to the trimmers in the tunnel with the trucks; are they protected? They are under cover.
4430. There is no danger to them? None whatever.
4431. Is there any extra danger in working those cuts at night, providing you have an efficient electric light? I do not think so; it is just a matter of light.
4432. Have any serious accidents occurred in the cuts at night? We have never had an accident at all at night.
4433. Are the gangers that you have under you experienced men? Yes; old experienced gangers from different railways. They are paid big wages, and are the best men procurable. That is why we employ them.
4434. They are men who have been in the service of Baxter and Saddler on railway works for some years? Yes; they have proved themselves to have ability; and for that reason the firm have retained their services.
4435. Under your contract the Proprietary Company have, I believe, to supply you with sufficient light? Yes.
4436. When the light has been at any time defective, have you stopped work, or have you gone on? In cases where the light has not been sufficient, we have just given notice to the electric light staff of the company, and it has been remedied at once. In cases where it has gone out through some cause, we have knocked off work.
4437. You are in the habit of using long holes for explosives in the cut? Yes, at times.
4438. Is that absolutely necessary for the work? We consider it much better than putting in a lot of shallow holes. There is the same danger in charging a shallow hole as in charging a deep hole; and it is therefore much better to have one deep hole instead of half a dozen shallow ones. And, the deeper you get your explosive down, the less danger there is in the case of a premature explosion. In a shallow hole a premature explosion is very dangerous, since the stuff is scattered all over the place; with a deep hole the ground is only lifted.
4439. In deep holes the explosive merely lifts and shakes the whole burden; in the other it scatters the stones, and is much more dangerous? Yes.
4440. Is there any greater danger in the operation of charging a hole 18 feet deep than in charging one 15 feet deep? I do not think there is. The 18-foot hole would require a little more tamping; but that is of minor importance. There is no danger with tamping.
4441. In order to get the full force of the explosive in the bottom of the hole, you resort to "bulling"? Yes.
4442. Is there anything dangerous in the operation of "bulling" a hole? Not to an experienced man.
4443. In tamping a hole for "bulling," what sort of a bar do you use? We do not tamp a hole when "bulling"; we just make it air-tight.
4444. I mean when charging? A wooden rod.
4445. Is the use of an iron or steel rod absolutely condemned or prohibited on the works? Yes.
4446. Are wooden rods provided in sufficient numbers, and handy to the men to use in all cases? Yes; and there are always plenty of spare ones about.
4447. So there is no necessity to use anything but wooden rods? No.
4448. You find that, even for heavy explosions, you can get your powder home quite well enough with wooden rods? Yes.
4449. When holes are being charged, where are the men? The charging of deep holes is done after working hours.
4450. After the men have left the face? Yes.
4451. All the big holes are charged after they have left the face and gone home? Yes.
4452. When big rocks are brought down, you put blisters on them? Yes; you make a depression in the stone and put dynamite in it, and cover it over to keep the air from it. Another way is to put a plug in about 6 inches, and pop it. A pop is a very shallow blast on a small scale.
4453. *His Honor.*] And a blister is put on without any boring at all? Yes; you avail yourself of a little depression in the stone.
4454. *Mr. Edwards.*] Are men put at a safe distance from pops and blisters? Yes.
4455. Have you signals for the purpose of warning men when a charge is about to be fired? Yes.
4456. What are they? Men are sent round with red flags in all directions; and the word "Fire" is shouted out.
4457. Is ample warning given? Yes.
4458. You say that is strictly observed? I do not say it is for every shot that is fired. I have watched them, and the foreman has watched them, and we always take notice that warning is given.
4459. Have you ever had any accident from that? No.
4460. During all the time you have been in charge of these cuts you have never had an accident from an explosion? No fatal accident.
4461. Have you had any accident of a serious nature? There was an accident in the ironstone, which resulted in a man getting his face knocked about, but he was at work again after a while. That is the only accident I know of.
- 4462.

4462. *His Honor.*] Was that caused by stuff flying from a shot? I do not know exactly how it was. I believe he was charging a shallow hole in ironstone, and it went off prematurely. I J. J. Shaw.
4463. *Mr. Edwards.*] Was he the "powder-monkey"? Yes. 22 July, 1897.
4464. He did it himself? Yes.
4465. He was back at work after a short time? Yes; he had to be taken to the hospital, but was back again to work after a little while, and is still there.
4466. Is water supplied by the contractors for the purpose of keeping down the dust, particularly in the ground containing lead? Yes; water is laid on by us.
4467. Is there any stint in the water supplied;—can men have as much as is necessary for the purpose of keeping dust down at all times? The foreman has a boy to put the water on. We have to keep the dust down. I do not know whether the men are consulted.
4468. A boy is there for that purpose? Yes; he puts the water on with a hose.
4469. Have you ever heard any complaints about there not being sufficient water, making it injurious for the men working there? No.
4470. I believe sometimes you blast away some of the water-pipes? Of course in an accident like that there would be no water, but the matter would be rectified and put right as soon as possible. That would be the only time water would not be on the face; but it would be only for a little while, as it does not take very long to re-lay a pipe.
4471. With regard to the drinking water for the men,—is that kept in proper receptacles? We had canvas bags; but the men themselves prefer buckets made out of powder-kegs, which are looked after and kept filled by a boy.
4472. I suppose these powder-kegs are washed out and kept clean? Yes; a boy is told off to do that. In the summer time, when oatmeal is used, they have to be cleaned out two or three times a day.
4473. You cannot very well give them oatmeal in bags? No; they would turn sour.
4474. Is it true that water is kept in a dirty bucket and covered with a dirty bag? No; that is not true.
4475. Do you drink water out of the same vessel as the workmen? Yes.
4476. Have you ever had occasion to complain of it? I have gone along the cuts, and found the water getting low. In those cases I have disrated the boy for being neglectful. In every gang there is a boy to look after these buckets, and it is his duty to keep them full; in summer time he keeps oatmeal in them.
4477. If a man says that the water is kept in a dirty bucket, and is covered with a dirty bag, it is not true? Not so far as my knowledge goes. It is always kept in clean kegs under a clean cover.
4478. In winter time too? Yes.
4479. Have you ever had any complaints about it at all? No.
4480. You work with skips on planes, and also with the "flying fox"? Yes.
4481. Are men compelled to stand under those skips or "flying fox" when they are being raised? No.
4482. In lifting the skip into the truck, or other receptacle for dirt, the jib of the crane swings round? Yes.
4483. Before the skip is lifted, is warning given to the men to stand aside? Directly the rope takes the strain, the cry is given, "Stand from under." The men then have to stand back until the crane swings round. Of course, this operation is only necessary when you first put the crane down. As it gets away from the face, trucks are brought into use; and then the men are clear of the jib altogether.
4484. There is no necessity for any man to stand in his place when the crane is swinging over his head? He is not allowed to stand there.
4485. Have you any difficulty in shifting men away? Some men are very careless; and the gangers find it their hardest duty to keep men from getting hurt. I have known a man to be dismissed because the foreman would not have him there. When "Stand back" was cried, he would not stand back.
4486. Do you know that as a matter of fact this man O'Brien, who has given evidence in respect to the cuts, was dismissed for the very same thing? The ganger reports to me that he was. The ganger was so afraid that this man would get hurt that he had to get rid of him. He said to me one day, "If I do not get rid of that man, I will be up for manslaughter before very long."
4487. When the crane is on the bank, and you have to lift a good height, is the same warning given to the men? Yes.
4488. Is there any necessity for them to stand in danger from the skip attached to the crane, or from the "flying fox"? No, not at all. If a man stands under, and does not take notice of what he is told, he is dismissed.
4489. Have you ever had an accident from the "flying fox" or crane? No.
4490. Something was said about the ropes breaking, and its being the duty of no person apparently to look after them, and that the straps around the skips were made of flat iron instead of round iron, which caused the eyes in the straps to cut the hooks away. I suppose these things wear away the same as everything else? Yes; it is the foreman carpenter's duty to go round every morning and examine all ropes, chains, hooks, and rings; and, if he sees a rope wearing, and it is too bad for use, he puts a new one on. If the ganger during working hours sees a rope bad, he sends at once for the foreman carpenter, who puts a new one on; and in the meantime work is stopped.
4491. Have you ever had an accident from a rope breaking? Not the slightest accident has occurred from the breaking of a rope.
4492. Or from a hook breaking? No.
4493. Mr. O'Brien said that he approved of swivel-hooks in preference to plain hooks;—have you tried swivel-hooks with the crane? On the incline, you cannot use them; but, with the lifting crane, we use them.
4494. O'Brien said the chief objection to working there was the manner in which the skip was hauled, and that he had been struck with it on several occasions;—did you ever have any complaint in that respect? No.
4495. He said that with your firm the men are slave-driven and hurried, and that no precaution is taken for the safety of life and limb? It is not true.
4496. He said that the men are worked more quickly than they should be, and, in consequence, they have no time to look about; which results in frequent accidents;—is that true? No, it is not.
4497. He says, further, that sometimes notice is given that a skip is being hoisted, and sometimes not? Notice is always given. All accidents have come to my knowledge; and they have to be reported to the general manager of the Proprietary mine; O'Brien's name, however, has never been on the accident list.
- 4498.

- J. J. Shaw.
22 July, 1897.
4498. He claims that you charge 6s. for a shovel. I suppose they can buy their shovels wherever they like? They can buy them where they like; I do not want them to buy from me; they know that.
4499. How long has O'Brien been with you? I could not say. They tell me he has been there two years. I did not know him until lately.
4500. It has been said that if they looked up every time warning was given, their services would be dispensed with? There is no truth in that. I might here say that any man is at liberty to tell the ganger if he sees anything wrong; and the ganger will get it rectified.
4501. O'Brien also says that it is particularly dangerous to work in the cuts at or after midnight, because at that time the ground settles down. Did you ever notice anything like that? No.
4502. He says that he has repeatedly seen the regulation broken that no shots shall be fired until five minutes after the warning has been given the men to leave the face; he considers that rule, in fact, a dead letter. Is there any truth in that? I cannot say how long after the warning is given the shots are fired; but I know the men are out of danger; and that is proved by the fact that none of them have been hurt.
4503. When did you last work at night-time under the electric light? Thirteen months ago.
4504. Do you propose to work again under the electric light? Not that I know of. I cannot say whether it will be again necessary.
4505. Can you get whatever light you require from the Proprietary? Yes.
4506. Up to any candle power? Up to all that is necessary.
4507. He said there was a disease called "straight back," and that if a man was found straightening his back too often he would be dismissed? Every time he has to look out, or get away, he has to straighten his back.
4508. But, if a man did get a pain in his back, and had to straighten himself, would he be sacked? No; that is a gross exaggeration.
4509. He said the skips, when returning from the truck after the ore had been deposited, hung by four chains; but that when they were coming back after delivering mullock, only two chains were fastened? I think he must be alluding to the "flying fox." In the case of the crane, the two outside chains of the skip are let go; and, by doing this, the skip, upon being raised, empties itself.
4510. And when it comes to the ground the chains are hooked on again? Yes.
4511. And it is fitted with rings, so that men can draw it in? Yes.
4512. It is absolutely necessary to let go two chains in order to empty it into the truck? Yes.
4513. And I suppose the other two chains are quite strong enough to hold it? Yes.
4514. Have the men ample opportunity of getting out of the road of the skip as it comes back? Yes; they are warned. As I explained before, when these little trucks are in use the men are not near the crane. When the empty skip comes round, it rests on the truck; the men are not there. It is then run into the face.
4515. He complained about some medical fund. I think it is your practice to keep back a small amount from the men's wages for use as an accident fund in cases of accidents, by which a man is provided with medical attendance and sent to the hospital; and I think in no case of a fatal accident have the relatives not been compensated in some way? In the four cases of fatal accidents that have occurred, money has been given by the firm, and subscriptions raised. Of course, in all cases of accidents the injured persons are provided with medical and hospital attendance free of charge, the charges being met by this accident fund.
4516. *Mr. Polkinghorne.*] You say there have been four fatal accidents in the open-cuts? Yes.
4517. Have there not been some serious accidents as well? One man had his leg broken; and ultimately it had to be amputated at the ankle. His name was Rolfe.
4518. Are there not some very peculiar circumstances about that case, I mean as to the way in which he got his leg fractured? I can explain how it occurred. He is an old ganger; and, as there was no room for him in that position, he was put in a gang as an ordinary worker. A big boulder happened to be on the face, and he was told by the ganger to put a pop in it. The stone was not near where they were working, but on an old face. He was getting ready to put the hole in for the pop—picking off the flakey stuff, it is said; and a larger piece than usual sliced off, and cut him on the leg, breaking it right across. He was by himself at the time.
4519. Is he still in Broken Hill? No; I think he is now in Newcastle.
4520. He was never employed by the firm afterwards? We raised a lot of money for him; and the firm gave him a big subscription. I fancy he went to Cockle Creek, where Mr. Saddler is one of the directors. I know he went over there, and I gave him a letter to the firm.
4521. No doubt you have heard that there were some peculiar surroundings? I know that he applied to the general manager for assistance, because he had lost his leg while doing work under his charge. He was taken to the hospital, and was kept there for a long time; we did all we could for him. He told me himself that it was a pure accident. He said that as he was being carried out of the cut.
4522. *Mr. Williams.*] You say Mr. Rolfe has been a ganger for you? Yes.
4523. His name is Fred? Yes.
4524. Do you reckon him a capable man? Yes.
4525. To have such a man under you would be a feather in your cap? I found him to be a thoroughly experienced man.
4526. You said he applied to the general manager. Who was the general manager;—was it in Mr. Stewart's time? Yes.
4527. Did he make a complaint to Mr. Stewart about you? Not that I know of.
4528. How much money was given to Rolfe by the firm, independently of any outside subscriptions? We gave him £50. I believe he is now in light employment over at Cockle Creek.

Henry Day sworn and examined:—

- H. Day.
22 July, 1897.
4529. *Mr. Edwards.*] What is your name? Henry Day.
4530. You are a ganger in the employment of Baxter and Saddler? Yes.
4531. How long have you been working for them? Three years.
4532. In the open-cuts up here? Yes.
4533. Do you know a man named O'Brien? Yes.

4534.

H. Day.

22 July, 1897.

4534. John O'Brien? Yes.
4535. You, as ganger, have the hiring and dismissing of men? Yes.
4536. How many men do you generally have in your gang? Thirty or forty—sometimes less, sometimes more, and sometimes as many as fifty.
4537. Mr. Shaw is engineer of works? Yes.
4538. But the men are entirely under your supervision? Yes.
4539. You hire them, oversee them, and dismiss them? Yes.
4540. Do you remember when O'Brien was working in your gang last? I could not tell to a month or two.
4541. Do you know why he left? I discharged him.
4542. Why? Because he would not obey orders.
4543. What orders were they he would not attend to? In the last instance, he was on the incline splitting a boulder alongside a skip; and, when they gave him the signal to stand back, he stood there, and would not leave. If the driver had started when signalled, the skip would have swung round and caught O'Brien, probably breaking his leg. I then distinctly told him that he would have to obey orders or clear out of the cut. He opened his mouth and said "Do you mean it?" I said, "Yes; I will be up for manslaughter through you." That is the reason why I discharged him.
4544. Was he a good man? He was an ordinary man.
4545. He said the men were hurried, and no precautions were taken for their safety? He told a falsehood. I am very careful in anything of that kind.
4546. He said they were worked so quickly that they could not look round for their safety? I do not know about working quickly; it would take two or three gangers to make him work quickly.
4547. He said frequently accidents occurred on account of the men being rushed? I have never had an accident during the three years I have been there.
4548. You have never had an accident under you? No.
4549. He said he had been struck three times with a skip? Not under me.
4550. I believe he came on afterwards with Mr. Thompson? Yes.
4551. You are the ganger he referred to in his evidence? Yes.
4552. He said that the ropes and hooks were frequently in a bad state of repair, and that it was, apparently, no one's duty to look after them? I have never known a rope to break since I have been with Baxter and Saddler; nor have I known a hook to give way.
4553. Has any accident ever happened in consequence of the breaking of a rope or hook? No; not while I have been there.
4554. Before a skip is raised, what warning is given? To clear away.
4555. Who gives it? The ganger; or, should he be not at hand, the "hooker-on," who would signal before he hooked on to the crane.
4556. Is sufficient time given to the men to clear away? Most decidedly.
4557. Is there proper supervision of the ropes and hooks? Yes; they are all well looked after.
4558. How often are they inspected? Every morning.
4559. If you see the strand of a rope giving? If I think it is unsafe to work it, I stop work, and send one of the "nippers" over to the rope overseer, who comes and has a look at it. If he thinks it is not safe, work is stopped until it is replaced.
4560. Are men asked to work in unnecessarily dangerous places? Not at all.
4561. You say there has been no serious accident with you? No accident at all.
4562. None whatever? No; none whatever.
4563. During the three years? None whatever.
4564. As to the "chinaman";—have you known that system long? I think it is about the first thing I met with about thirty years ago; but they did not call it the "chinaman" then.
4565. What did they call it then? In the old country, they called it an underlay heading. "Chinaman" is a new name, which I never heard until I came to these colonies.
4566. Is there any danger in working it? Not at all, with precaution.
4567. How many men do you have on the "chinaman"? Two.
4568. Is it safer than filling into trucks in front of a face? Yes, most decidedly. The face is right away from you altogether; and all the stuff is in front of you—nothing on the wings whatever; and it is guided into the trucks in the tunnel.
4569. With reference to explosives;—I suppose you have had a good deal of work with them? Yes.
4570. Do you charge your own holes? Yes.
4571. Is there any more danger in charging an 18-foot hole than a 15-foot hole? No.
4572. When charging holes, where do you put the men? They are away.
4573. The charging and firing of holes takes place after the men leave work? Yes.
4574. Only a blister or a pop is fired while they are there? Yes; if a rock is too large to move by hand, you simply make a blister or a pop, and shatter it in that way. For a pop, you put in a hole to a depth of 4 or 5 inches, and insert a couple of plugs and a primer; and in firing blisters a somewhat similar course is followed.
4575. And the men are warned away? Yes.
4576. And you have red flags? Yes.
4577. No accident has taken place with explosives while you have been there? No; there was one accident since I have been there, but not under my charge. The man, whose name, I think, was Ryan, met with the accident while firing a hole. He was under Mr. Smith's charge.
4578. What was he? A "powder-monkey."
4579. How was that accident brought about? From what I have heard, he was charging the hole himself in the morning before the men came on, so as to prepare for the day's operations—it was summer time. He must have been running a steel bar down the tamping-hole to clear it; and it exploded.
4580. A man named Smith was ganger? Yes; he is now contracting for himself in Block 11.
4581. That was through using a steel tamper? I only go by hearsay.
4582. What do you use? Oregon.
4583. Have you had any occasion to use anything else? No; Oregon is safer than anything else. If you are in ragged ironstone, and the Oregon picks up a bit of stone, it will not hold it, but drop it.
4584. You "bull" these holes first of all before you put any powder in? Yes.

4585.

- H. Day. 4585. Is there any danger in that system? No.
- 22 July, 1897. 4586. In the case of deep missed-holes, what do you do? If I had a deep missed-hole, I should not work. Say I had a deep-missed hole at dinner-time; I would not work that afternoon; I would let that hole go for two hours. I would know the distance from the powder to the top of the hole. The rule is, when charging a hole, to tie a string on the tamping-bar, which gives you the exact distance. You tamp with fine mullock, which you can safely withdraw to within a foot of the charge.
4587. You take the tamping out to within 1 foot of the charge; put in some dynamite with a primer; and fire it again? Yes.
4588. In those long holes, do you depend on a single fuse? For anything over 6 feet we use a double fuse.
4589. Do you think two hours long enough to leave a missed-hole? Yes; in my experience the gun-cotton in the double tape fuse sometimes sets fire to the material of the fuse, and should there be a break in the powder the material will go on smouldering for some considerable time before it reaches the gun-cotton again. You put a reel of fuse round a post to pull the wrinkles out, and in doing this you probably burst it. That is how the breaks in the gun-cotton are brought about; and, in consequence, miss-fires.
4590. Have you ever had fuse with knots or splices in it? The gun-cotton is lapped 8 or 9 inches, and this part you cut out when firing a deep hole.
4591. Is there any necessity for the men to stand in the road of danger as regards the skips or the "flying fox"? No.
4592. O'Brien was sometimes working three skips at a time—one alongside the other—and had to keep filling them in as fast as he could go, there being no time to get out of the way. He has stated that: is there any truth in it? No; I am very careful upon that point, and it is surprising to me more accidents have not occurred. If you speak to some of the men there they are that ignorant they would not get out of the way.
4593. He says you gangers use terrible language? I do not see that at all.
4594. If you see a man in a dangerous place, and you ask him to get out of the way, and he does not, you would then? No, I would not; I would discharge him.
4595. Is there any more danger at night, if you have good light? No; the day gang takes every precaution to make things safe before the night gang comes on.
4596. He says that at midnight the ground settles down in some peculiar manner? I have never known the ground to creep at night.
4597. Is the working-face kept as safe as possible? Yes.
4598. Are there any precautions you could take that are not taken for the safety of the men;—is there anything that can be adopted in order to make the work safer for the men? I could not adopt anything: everything that could be done has already been attended to. I have had thirty years' experience on public works, and I cannot see where anything can be done in those cuts to make them more safe than they are to-day.
4599. I suppose you have worked as a navy right through? Yes; since I wore trousers.
4600. Have you ever had to complain of the light? I complained one night, and on that night we knocked off at 12:30, and the light went out at 1 o'clock. I sent a boy down for the electric-light man, and after he came up, I said, "No good starting, chaps; knock off."
4601. You would not allow them to work in the dark? No.
4602. Did you ever find the light defective, so as to make work dangerous? I have seen the light sometimes flicker for a few minutes; and that has been caused, I think, through the increased pressure put on when the lights were being lit throughout the mine.
4603. He said sufficient water was not laid down to sprinkle the chloridising ore? O'Brien only worked for me for about three days in that ore, and during that time there was plenty of water there.
4604. Have you ever had any scarcity there? No.
4605. I suppose pipes will break sometimes? Taking it right through, there has been a continual supply.
4606. He says the drinking water is kept in a dirty bucket with a dirty bag thrown over it? I drink the same water; and I feel certain that if there was a dirty bag over the bucket I would chuck it away myself, and I believe every man in the gang would do the same.
4607. Have you boys there, to get water? Yes.
4608. How many times through the day are the buckets washed out? I think every morning and dinner time.
4609. And fresh water put in? Yes; I make a wooden house for the water, and cover it round with clean sacks. We had water-bags there at one time; but it was found that they kept the water so cold as to give the men chills, and, for that reason, they had to be discarded. The kegs keep the water at a nice temperature for the men, and do not waste the water.
4610. What sort of a bag do you cover them with? A clean four-bushel sack. The place where the water is kept is covered over with timber, which keeps it cool; and bags are hung down the front to keep out the dust.
4611. O'Brien distinctly stated that men had to stand under the skips; that it was not a case of doing so of their own free will;—you say that is not true? It is not true.
4612. Did you receive instructions from Mr. Shaw to observe strictly the surface rules of the company? Yes.
4613. And have you always done so? Yes.
4614. Mr. Polkinghorne.] You will admit that your instructions to the men are not at all times carried out? They are not.
4615. When the men are sinking with the jib-crane, is it necessary that they should stand back? Three sets of men are working—one set (four men) to a skip: that is twelve altogether. These men are engaged in filling; but, of the twelve, one set—four men—are never in danger, because the skips are dragged from them; and, of the others, four are in danger one time, and eight the next; and it keeps at that—four and eight—all the time.
4616. You always sink under the crane? No; you sink at the end of the jib.
4617. You do not sink with the "flying fox"? Yes, I do.
4618. You go down deeper with the "flying fox" sometimes? Yes.
4619. In that case, the skips would lift perpendicularly, and not drag as they would in the case you just quoted of the three sets of men? Yes.

4620. It would be necessary at all times for all the men to stand back when the skip is lifted to the "flying fox"? Yes.
4621. Is there always a man kept on the bank to give warning to the men when the skip is going down and coming up? Yes; and a man is also stationed below. There is one on the top, and one at the bottom.
4622. And while that skip is travelling from the bottom to where it strikes the cable, the men are supposed to stand clear? Yes.
4623. That is always followed out? Yes.
4624. *Mr. Williams.*] From whom do you get your instructions? From Mr. Shaw.
4625. In sinking, you go down in 25-foot lifts? Yes.
4626. You say plenty of water is provided for the men to drink? Yes.
4627. How is it provided? It is Stephens' Creek water, and is stored in a 400-gallon tank in the cut, into which is run a pipe.
4628. You dip the water from that tank? No; it is not dipped; it is drawn.
4629. And how do you use it for laying the dust? Pipes are laid.
4630. Who sees to the sprinkling—the boy? Yes; or, if he is not there, the "ironstone" man.
4631. How many boys have you for that purpose? One to each gang.
4632. The "ironstone" men and these boys are supplied by the company? Yes.
4633. What is the name of the boy you have there now to attend to the ropes? I cannot think of his name.
4634. You know there is a boy there? Yes, undoubtedly.
4635. Who is in your place while you are here? The other ganger.
4636. Does that boy do anything else besides lay on the water? You are not required to lay the water on; you have only to turn on the tap.
4637. If there is anything wrong with a rope, you send a boy to see about it? Yes; he is my boy.
4638. Whom do you send him to? To Mr. Dean, the foreman of the ropes.
4639. How long has Mr. Dean been carrying out that work? He was here three years ago when I came to the Hill.
4640. He has not been appointed to anything extra lately? He was overseer of the whole lot three years ago.
4641. You cannot say whether he has been promoted? No.
4642. You are instructed by Mr. Shaw to carry out the work according to the regulations of the company? Yes.
4643. Do you know the company's rules? I know the dangerous parts of the rules, and stick to them.
4644. You said that the lights occasionally flickered for a few minutes? Yes; just for a few minutes after extra pressure was put on for the mine lights.
4645. They are a little better now? I do not know; I have not done any work at night for twelve months.
4646. How many days did O'Brien work for you? He worked for me three separate times.
4647. He has worked there for two years? I do not know how long he has worked there.
4648. What are the names of the gangers he has worked under? Mr. Thompson is one; but he might have worked for the lot for all I know.
4649. Did any of them ever "sack" him? I believe Mr. Thompson "sacked" him.
4650. Did you "sack" him? Yes.
4651. Did Mr. Thompson tell you he had "sacked" him, and did he give you his reason for doing so? If any ganger said anything to me about a man I had under me, I would keep that man on in spite of him.
4652. What did you "sack" O'Brien for? The last time I discharged him was because of his refusing to take notice of warnings.
4653. Would you be surprised if a Member of Parliament was to state that he stood on top of those open-cuts, and watched the skips going up and the men working away underneath, and that no warning was given? I defy any Member of Parliament to say that ever any man was underneath and did not get warning.
4654. So far as you are concerned? Yes, of course.
4655. You cannot speak for any of the other gangers? No.
4656. I am speaking of Block 11? Oh, I know nothing about them.
4657. Where did the horse and cart go over;—was it in your cutting? No.

Alfred Dean sworn and examined:—

4658. *Mr. Edwards.*] What is your name? Alfred Dean.
4659. You are the foreman carpenter in the employ of Baxter and Saddler, and are under Mr. Shaw? Yes.
4660. What are your duties? To look after the whole of the plant.
4661. Does that include the inspecting of ropes, chains, and hooks? Yes.
4662. When do you inspect the ropes, chains, and hooks? Every day.
4663. Do you ever miss? No, never. Every day I make an inspection.
4664. As a general rule, what time do you make an inspection? The first thing in the morning.
4665. Are the ropes ever allowed to wear out and to become dangerous? Sometimes they get worn.
4666. What do you do then? They are removed; and new ones put on.
4667. Have you ever known worn ropes to cause an accident? No.
4668. As to hooks;—are they expected to break? Yes.
4669. And are they repaired as required? Undoubtedly.
4670. A man named O'Brien gave evidence the other day that it seemed to be no one's business to look after hooks and ropes, and that the trucks came down with a run, at times? I know of one rope letting the truck go down the incline. The truck came into contact with the bridge, which caused the rope to give way.
4671. It was a winding engine? Yes.
4672. And it was a case of the rope giving or the bridge giving? Yes.
4673. Something had to go? Yes.
4674. Was that owing to the rope's wearing out? No.
4675. He says the strands wear out one by one, and, if you pick up the rope, it is like picking up a bundle of needles? That is not the case. Of course a rope will wear; but because a rope is worn a little it does not

A. Dean.
22 July, 1897.

- A. Dean. not follow that you should take it off. Should, however, a strand be broken, the rope is then taken off, and a new one put on.
- 22 July, 1897. 4676. What do you do immediately on discovering a rope to be in an unsafe condition? Work is stopped until a new one is put on.
4677. I suppose your business takes you round into the cuts frequently? Yes.
4678. And you see the way in which the skips are worked? Yes.
4679. Do you know if men are allowed to stop under the skips? They are always cautioned to keep from under the skips.
4680. You have a gang under you? Yes.
4681. They are always roping and repairing, doing nothing else? Yes.
4682. What tradesmen have you? Carpenters and blacksmiths.
4683. Who does the roping? I have another man with me; but I, principally, do that part myself.
4684. What experience have you had in that sort of work? I have been with Baxter and Saddler four and a half years; previous to that I have had experience for—well, I will not say all my life-time.
4685. At any rate you have been four years and a half on this work with Baxter and Saddler? Yes.
4686. When shots are fired, is warning given; or is it omitted? I cannot speak about that; it is out of my line.
4687. All you can speak of is as to the condition of the running gear; and you say that that is kept in good order? Yes; if there is anything dangerous at all I always report to the gangers, and request them to keep the men out of the way until I make things secure.
4688. Has any man ever been injured by a broken hook or by a broken rope, since you have been on the job? No, never. A safety hook was straightened out one time because of the man's having hooked the first part instead of the second part.
4689. How many feet of rope are in use at the present time in this quarry? Very nearly 4,000 feet; we have used as high as 6,000 feet.
4690. What rope is it? Steel wire, from $\frac{1}{2}$ -inch up to $1\frac{1}{2}$ -inch.
4691. And during your time not one accident has occurred through the breaking of a rope? Never an accident; although sometimes a rope has carried away.
4692. Are all means taken to prevent injury to the men by providing the best gear? Yes.
4693. And if you want any further ropes you have only to apply to the manager? Yes.
4694. I suppose you drink out of the same buckets as the men? Yes, when going through the cuts.
4695. In what condition have you found the drinking water? We get the best obtainable, either condensed, or from Stephens' Creek.
4696. Is the water kept in a clean receptacle? It is kept in a bucket or a bag; but the men prefer a bucket.
4697. The water is kept in a clean condition? Yes; it is kept in a cool place, and is covered over.
4698. Is there anything for a reasonable man to complain of in reference to the drinking water? I do not think there is.
4699. Do you think anything further could be done in respect to the ropes you have under your control, with a view to preventing any accident? I cannot recommend anything.
4700. You think every necessary precaution is taken? Yes.
4701. I suppose, if you want further assistance you can have it, and as much as you like? Yes.
4702. There was a complaint that the straps around the skips are made of flat iron, instead of round iron? Flat iron is the proper thing; round iron would not do. In fact, I do not think anyone ever saw round iron around a skip.
4703. He said the flat iron cut the hook away;—is there any truth in that? No; flat iron is the proper thing.
4704. I think all the hooks you use on the cranes are of the tumbler class? The hooks used have a single turn; in the tumbler hooks there is a double turn, and they are used on the incline road.
4705. Plain hooks are used on the skips, and tumbler hooks on the inclined plane? Yes.
4706. Can you suggest any improvement in the hooks that are used? No, I cannot. We have never had any hooks break; but we have found them straightened out because of the men not hooking them on properly.
4707. When O'Brien said that no one was in charge of the hooks or ropes, he must have been speaking wildly? I have been appointed to look after those things; and I have attended to my work.
4708. *Mr. Polkinghorne.*] Has anyone else got the looking-after of those ropes? No.
4709. You have sole control of the running-gear in all its departments? Yes.
4710. Is it not true then that the company also keeps a man to look after the running-gear in Baxter and Saddler's cuts? I do not know of anybody else.
4711. You say you inspect the ropes and gear every day? Yes.
4712. Was it possible for you to inspect the gear every day without O'Brien's having a chance of seeing you? No; he could see me in the parts he was working in.
4713. Were any of those ropes ever tested? No, we have not tested them.
4714. I suppose the load put on them is never up to the strain given to them by the maker? No; the lightest rope we use is the half-inch, and the breaking strain of that is 6 tons, single part. We never use less than two parts, and sometimes use three; and the heaviest load we have lifted is $2\frac{1}{2}$ tons.
4715. *Mr. Williams.*] How long have you been appointed specially to look after these ropes? Four and a half years.
4716. Who appointed you? Mr. Shaw.
4717. Are you engaged as a practical roper? I am engaged as a foreman carpenter.
4718. And as a carpenter you have practical experience? Yes.
4719. Have you ever been a sailor? I have been to sea as a ship's carpenter.
4720. Had you anything to do with ropes there? Yes.
4721. You obtained pretty good experience there? Not so much as I have on the Hill.
4722. You have had experience of different kinds of ropes here? Yes.
4723. They are mostly steel ropes? Yes.
4724. Do they keep a stock of ropes? Yes.
4725. How many at a time, say of half-inch? I think we have about 4,000 or 5,000 feet on hand.
4726. And you cut from that as required? Yes. 4727.

4727. What is about the average length of the rope in use? On the "flying fox," the half-inch rope is between 500 and 600 feet in length.
4728. You have got about 4,000 or 5,000 feet in stock? Yes; I think we have more.
4729. What is reckoned about the shortest rope used on the "flying fox"? I believe that is about the shortest in connection with the running gear. Of course we have stays much shorter—about 150 feet.
4730. The running-gear always wears out much quicker? Yes.
4731. How long would it take to wear out a good rope? It might last three months.
4732. It wears out gradually? Yes.
4733. How often do you examine the ropes? Every day.
4734. What are the men doing? Working.
4735. They stop hauling for you to examine the ropes? No.
4736. How do you manage? It is not at all necessary to stop work to examine the ropes.
4737. Supposing one or two wires were broken, you would not condemn a rope for that? No.
4738. By and by you might see a strand coming loose; you would condemn it then? Yes, straight away.
4739. You would not splice it? No, it would be too far gone.
4740. You would not repair it in any way? No.
4741. You would not be surprised if that was not so along the line? I would be surprised to hear of a rope's being repaired. As soon as I see a strand broken I have the rope taken off.
4742. When a rope is running along, how can you tell whether a strand is broken? If a strand is broken, the part will open out, making it very easy to discern.
4743. How long would you allow it to hang before you would condemn it? It must come off at once; it could not run through the blocks.
4744. What space have you got in the blocks? Three-quarters of an inch.
4745. If a rope was broken, upon coming to one of those blocks it would tear out? The strand that was broken would be stripped back.
4746. How many cranes have they got in use? We have no cranes working at present; they are all idle.
4747. Are the "flying foxes" all idle? No.
4748. How many? Only one.
4749. Only one "flying fox" is working at present? Yes.
4750. And no cranes? No.
4751. How are they hauling stuff up? On the inclined road.
4752. How many men have you got attending to the ropes? Only another man and myself.
4753. And you look after the ropes every day? Yes.
4754. If anyone was working in the cut, and saw a rope unstranded, what would be done? The ganger's attention would be drawn to it, and he would report the matter to me.
4755. How long does it take to replace a rope (say) 500 feet long? It could be done in two hours, and spliced too.
4756. The men or the gangers are not allowed to look after the ropes? No; if anything is wrong they report to me, and I attend to it.
4757. *Mr. Edwards.*] I think a man from the sailor gang of the Proprietary goes through the open-cut ropes occasionally? A man used to go round and inspect the ropes.
4758. Have you seen any other man in the cuts inspecting the ropes? I have seen the Mining Inspector.
4759. How often? About two or three times in the week sometimes; at other times I might not see him for a month.
4760. He might be there and you not see him? Of course.
4761. *Mr. Williams.*] Have you ever seen him test them? No.
4762. *His Honor.*] I suppose these ropes are all supplied by good makers, whose test can be relied upon? Yes.

A. Dean.
23 July, 1897.

FRIDAY, 23 JULY, 1897.

William Harry sworn and examined:—

4763. *Mr. Edwards.*] Your name is William Harry? Yes.
4764. You are one of the contractors on the open-cut in Block 11? Yes.
4765. How many years' experience have you had in work of that nature? I have had forty years' experience in such work and railway cuttings, &c.
4766. How long have you had the contract there? Between three and four years.
4767. What is the average number of men in your employment? Between forty and fifty at present, sometimes more and sometimes less. The actual number at present is, I think, forty-five.
4768. I believe you have had one fatal accident in the quarry? Yes.
4769. During the years that you have been working in these cuts, have you ever had any other fatal accident? No, that is the only one.
4770. That man's name was James Taylor? Yes.
4771. Is every precaution taken by you to protect your men from injury? Every precaution that I can possibly think of.
4772. I believe you make no distinction as to the men you employ, as to whether they belong to any union or not, so long as they are competent men? No, and I never have done so.
4773. You are a contractor under the Proprietary Company? Yes.
4774. And the surface rules of the company are observed by you? Yes; I work under those rules.
4775. Are those rules strictly observed? So far as it is possible. Men disobey them sometimes in spite of what we do.
4776. How many gangers have you under you? Two—one to each shift.
4777. At the time of Taylor's death, had you Humphreys as ganger? Yes.
4778. Was he a capable and competent man? Yes, as competent a man as ever I met. I have known him six or seven years.
4779. Is he working as a ganger for you now? No, he has left.
4780. You say he is as careful a man as ever you met? Yes.
4781. Is the working-face kept as safe as the nature of the work will permit? Nothing has ever been left that would be likely to fall down. The batters are perfectly safe.

W. Harry.
23 July, 1897.

- W. Harry. 4782. Is there any increase of danger in working the open-cuts at night? Not in the least.
- 23 July, 1897. 4783. How are you provided in the matter of light? There are plenty of lights, and no shade or darkness is thrown from them. They are swinging incandescent lights; and it is impossible for them to throw shades.
4784. Have you movable lights? Yes, they are all movable lights. I have three lights in the face; and only three men are working there; so they are well provided.
4785. Have you ever had any serious accident at night? Never; with the exception of Taylor's accident, there has never been the least sign of one, not even a jammed finger or foot.
4786. I suppose you have worked the "chinaman" for years? Yes; it is an old idea, but not under that name. "Chinaman" is a Broken Hill name.
4787. It is called all sorts of names? Yes; "Cousin Jack," "Irishman," and such like, just according to what the navy takes it into his head to call it. He generally names it after the man on whom he has the greatest set; and I suppose that is the reason why it has been named here the "chinaman."
4788. Is it a safe system? To my mind it is far safer than filling waggons; because, if the waggons were drawn along the foot of the batter for immediate filling, the men would be shovelling between the foot of the batter and the wheels; and, if anything fell down, they would be caught between the two. In the "chinaman" there is a "get-away."
4789. There are generally only two men on the "chinaman"? Yes; sometimes there is a man pulling stuff down to them, but not always. The stuff generally runs down of its own accord, for the whole shift perhaps.
4790. The men working on the "chinaman" are exposed to no danger? Not in the least. The men working on the "chinaman" work there from choice. Taylor worked there of his own choice. They get more wages; and they work there from choice.
4791. I suppose the use of the "chinaman" reduces the number of men? Yes, considerably.
4792. Has it any other effect? It cheapens the work to the benefit of everyone.
4793. With the exception of Taylor's accident, you have had no serious accident there? No, none at all; there might be now and then a bruised finger or a bruised foot; but that happens everywhere. A stone might roll down even if the cut was not carried higher than the table, and it would gather enough weight to make a bruise.
4794. Is care taken to bar down everything on the face? Yes; work is always stopped until all loose stuff has been barred down.
4795. In reference to explosives and the use of explosives;—is care taken to have the men in a place of safety when holes are being charged? There is a tunnel close by, under the "chinaman," which is away from all danger.
4796. You have had no accidents from the use of explosives? Never in my life.
4797. Do you use much in the quarry? Yes; I believe I use too much. My explosive bill last month was £100.
4798. What quantity? I could not say from memory; I know I have got the bills for the amount I stated.
4799. £100 a month? Yes.
4800. You chiefly use powder? Yes; and dynamite.
4801. Is there any greater danger in using a deep hole, than a shallow one? Not so much, if a proper man is in charge.
4802. What depth do you put in holes up there? We are not allowed to go more than 15 feet; but I would prefer to go 25 feet in some places where necessary.
4803. Would you explain why a deep hole is safer than a shallow one? In the first place, it is put in ground that will carry the explosive better in a deep hole than in a shallow one. If you put a deep hole down you put it in the ground that will be certain to do the work required; and, if the ground is even and solid and good to bore in, there is no danger if you go 40 feet. I would prefer always to put a 30-foot hole down in solid ground. Everything depends on the ground. If you make a hard-and-fast rule limiting a hole to 15 feet, the batter at that depth might be weak, and the charge would blow out there; whereas if it had been put down 25 feet the burden would have been brought. Again, a deep hole simply lifts the burden, and does not scatter it all over the place, as does a shallow hole.
4804. Someone has said the practice of "bulling" holes is dangerous;—is that your experience? I do not believe in "bulling"; it is a modern idea; I have knocked it off for some time; it is expensive.
4805. Have you knocked it off on the ground of danger or of expense? On the ground of expense. It is a new idea that was never used until recently; not until dynamite came into use. Before that we did not "bull."
4806. There is no particular danger in the process? No; I have had "bulls" do what the shot was supposed to do. I have seen that two or three times. My opinion is that it is cheaper to go down 2 or 3 feet further, and do without "bulling." You get what you "bull" for by going down another 2 or 3 feet.
4807. If you did not "bull" you would have to go down deeper? Yes.
4808. Then this is an experiment on your part, to see whether you can do without "bulling"? Yes.
4809. I suppose you have not proved it yet, whether you can concentrate a charge in a narrow hole? I have not proved it yet.
4810. When you are putting a blister on a rock, or putting in a pop, where are the men placed? Pops and blisters are all the same; of course a blister is put on to save the trouble of boring a hole.
4811. Are the men put in a safe place? Yes, the same as when firing a charge. Pops are equally as dangerous when among ironstone as an ordinary charge.
4812. You use that rule, that men be withdrawn from the face when charging or firing? Yes; I do all I can to enforce it; but sometimes it is impossible to make the men observe it.
4813. Do you lift by skips? No.
4814. Have you any difficulty with the men through their being incompetent and not attending to the rules, or through their being careless? I have never had more than seven or eight competent men at the one time since I have been in Broken Hill. There are very few competent men in Broken Hill to-day.
4815. How do you account for such a scarcity of competent men in Broken Hill? The labour trouble has been the cause of it.
4816. Can you give me any idea of what quantity of stuff you have lifted since you have been in the open-cut? I could not say. I am now on the second contract. I lifted about 80,000 tons in the last contract.
- 4817.

W. Harry.
23 July, 1897.

4817. As to the trucks and machinery you use for shifting it—are they in perfect order? Yes; as good as can be. If anything wants doing, I have only to apply to the mine; and they do it.
4818. Of course, you keep carpenters and blacksmiths to look after these things? Yes.
4819. When the men are barring down from the face, have you life-lines where necessary? Yes, in every place; no man is allowed to go up the face without a rope.
4820. Is there anything you can suggest in the way of regulations for the future that will prevent accident, or compel careless men to be a little more careful? The men, so far, do not even take care of themselves. Men come to work with a "don't care" sort of feeling; they do not care what they do; they do not seem to care about their own safety. I have to go round the cutting three or four times every day, and also at night, to see that the loose stones are knocked down. Men never take the least pains to see whether there is anything over their heads. A man will sit down and eat his "crib" under a stone that is likely to come down on him every minute, and should anyone be coming along and draw his attention to it he says "All right; it will stop there."
4821. Do you know a man named Shinnick? Yes.
4822. Did you offer to engage him? Yes.
4823. You offered him work in the open-cut? Yes. He told me in the street here, in the presence of two or three people, that he could not get work on the Hill because he was black-balled. I said, "You come up and I will give you work;" he said, "You will sack me;" I said, "If you can do work the same as any other man, I will have you; you come up." He never came.
4824. What bars do you use for tamping? Wooden bars; I have never seen anything else used anywhere I have been for the last forty years.
4825. *His Honor.*] For tamping powder as well as for tamping dynamite? Yes.
4826. You use a good deal of powder? Yes; we use mostly powder. Dynamite only wants pressing.
4827. You find a wooden rod sufficient to tamp powder? We use nothing but wood.
4828. You do not require iron or metal? No.
4829. *Mr. Edwards.*] You put large charges in? Yes; sometimes three kegs of powder.
4830. You find wooden bars sufficient for powder? It does not want tamping at all; that is a mistaken idea altogether. I have charged thousands of holes with nothing but dry sand.
4831. *His Honor.*] That is with powder? Yes.
4832. *Mr. Edwards.*] If boring into solid rock, can you do that? Yes; for three years in Victoria I did not use even a tamping-rod or scraper.
4833. Is the use of an iron bar restricted in Victoria? When I took charge of the works there I gathered up the tamping-bars and had them sold for old iron, and adopted sand instead. I have never seen a tamping-bar used here where I am.
4834. Can you prevent your men from doing reckless things? No. I remember, when I was a boy, 7 or 8 years of age, gathering up bits of brick and pottery, to make stuff for tamping, which the old men used to put in with a tamper to make it solid. I was under the impression for years afterwards that those old men were trying to make the tamping as solid as stone. As I grew up, I began to look round, and found it was impossible to make it as solid as stone, and that, if the charge were kept air-tight it would be the same thing. I tried sand, and succeeded. No tamping is required at all.
4835. *His Honor.*] You find that the work is quite as effective without tamping? Yes.
4836. *Mr. Edwards.*] Is it possible to prevent men doing reckless things? No.
4837. Would any system of rules or inspection prevent that? No; scarcely a day passes that a man does not do something for which I have to check him—things that risk his own life.
4838. *His Honor.*] Do you think that if rules were framed, and the men could be fined for committing a breach of them, that would have any effect? I do not think so. Men here are being fined every day for being drunk, and they keep on getting drunk; and it would be the same way with the men in the cuts. I have seen a man who has used powder for years, sit on a full keg, with a keg half-full alongside with no covering on it, with his pipe alight in his mouth, smoking away as unconcerned as if he were squatting on a log in front of his tent.
4839. *Mr. Edwards.*] You do not think rules would stop a man of that sort? No; I do not see what good these rules are. I have seen men light fires at the foot of trees in the bush on which were stuck "Fire" notices, and go away and leave them burning. Rules never trouble some men.
4840. Are loose packages of dynamite ever left about by the men? Not to my knowledge. I have seen it done, but not in Broken Hill.
4841. I suppose you have a "powder-monkey"? Yes.
4842. Is he a careful man? Yes; he is a very good man.
4843. He does not allow loose explosives to knock about the quarry? No; I have never seen any.
4844. It has been said by one of the witnesses that the batter in that cut is very dangerous—is that true? No; it is not true. It is perfectly safe. It may look dangerous to any person who goes there perhaps once a year; but it is perfectly safe; there is not a crack of any kind.
4845. It may appear dangerous to people who know nothing at all about it? There is no danger whatever, and never has been. Of course it requires a good deal of care should there be any cracks on top; but as soon as you work back beyond the cracks things are perfectly safe. There has not been the least move there since the fire.
4846. *Mr. Polkinghorne.*] You say that, in your opinion, tamping is not required for any charge? Yes.
4847. Why is it then that you use sand? I take the word "tamping" to mean "ramming," and when I said no tamping was required I meant no ramming was required. I do not want to insinuate that nothing is required over the charge, but that it does not want ramming.
4848. In your opinion the cause of not being able to get competent men has been the labour troubles? Yes.
4849. How do you make that out? Good men that I knew over in Victoria refused to come over here and work for me, for the reason that they would have to join the union here if they did. That was one reason; but since the strike they refuse to come over because of the reception they get in the way of abuse and foul names. They are abused in the streets, and cannot get into a boarding-house for lodgings; nor will any hotel serve them with a drink. Everywhere they go they are insulted. That is the reason now why men will not come here, or why they will not remain here if they do come.
4850. Is that the rule now, or the exception? It is the rule. I have men now who have to fight for their

W. Harry. lives every week. One man has to fight for his life every Sunday. It is a disgraceful thing that such a thing should be; but it is a fact. The name of free labourer is enough to get any man a thrashing at any time from a dozen or fourteen roughs.

23 July, 1897.

4851. Is there no law in Broken Hill? There is law; but the police are not always there. I am looked upon as a champion of the free labour party; and a man has only to work for me to get his name up. My men are looked upon as free labourers, but they are not.

4852. I suppose you would not like me to say that I was a free labourer? You are a free man.

4853. I am a free labourer. *Witness*: I am very glad to hear it.

4854. But I am a member of the Union;—the men you have got under you are a pretty fair class of men? About half a dozen of them are; the rest are inferior. I want some to-day, and cannot get them. Twenty came for work, but I could not put one of them on. I learned years ago to know a man by sight.

4855. I suppose you have been mistaken sometimes? Not often.

4856. You are a pretty good phrenologist then? Yes.

4857. What is the average batter on the east side of the cut you are in? That is a moving batter—the working batter.

4858. Do you move away your material from the top, or do you undercut it? I take it from the top. I know better than to work at the bottom before I take the top out.

4859. It has been stated that the best system is to undermine first, and then shoot down the top? I have never seen a practical man do that.

4860. You say then that the top must be taken away first? Yes, decidedly; otherwise there would be a smash up every time you took the top down.

4861. You say you make no difference as to whether a man belongs to a labour union or not? I have never made any difference. I only want a man to do what is asked of him; and if he does not do that he can go.

4862. I believe you have only had one accident in your open-cut? That is all.

4863. You said just now that you have had no serious accident? Yes.

4864. What about the man that was crushed with a truck a few weeks ago? He was at work yesterday.

4865. That was a serious accident? No; it was an accident that would have happened anywhere.

4866. There could not have been greater precaution taken to prevent that accident? No, not at all. He simply had to keep away between the waggon and the side of the tunnel. It was a pure accident; he never blamed any one. The horse, I believe, was partly the cause of it. The horses I have got up there, I am very proud to say, teach the drivers. This was an instance. The horse this man had been driving was killed two days before the accident, and the fresh horse, not being accustomed to the work, wanted some handling. The horse was accustomed to the work, but had not been down for two months.

4867. You recognise that there should be regulations under which the work should be carried out? I have worked on bigger works than these without any regulations at all; and have had no accident. The employers of labour that I have ever been engaged with have always made it a point to have no accidents, if possible, because they do not pay; they take away from the profit. I have never yet met employers who have been careless of the life and limb of their employees.

4868. You will admit that there are laws required in the country to govern the people? Yes; we would be in a bad state without them.

4869. Laws must be made for the protection of life and limb? I do not object to regulations at all, but I say that the men will not read them, and you cannot force them to it.

4870. Could not a regulation be enforced to make them carry out the regulations? Whether that would be interfering with the liberty of the subject, I do not know; but I wish there could be. I would relieve me. I would be able to sleep better at night if men would take more care of themselves.

4871. Should men be made responsible for their carelessness or insufficient thought? I do not think it would be fair to punish all men for not thinking; thousands of men cannot, and never do, think. I would not like to see a man imprisoned for a neglect of something which he did not really understand. I would like to see something done to make things better, but really I cannot see how it could be brought about.

4872. *His Honor.*] Do you not think a man would take the trouble to think, if he knew that by not doing so he would get into trouble? I would like to see something brought about to make them think. I have told men repeatedly to cease work so soon as ever they see anything dangerous; and I have got a standing order to that effect posted on the work; but it is no good.

4873. *Mr. Polkinghorne.*] You have to work in your quarry under the rules and regulations adopted by the mine for the surface workings? Yes.

4874. Is there anything more in those rules than an ordinary man ought to know? The men reckon they do know them. I put one down in the cut, and drew their attention to the rule as to the hours of firing, which I thought it might be difficult for them to remember; they said, "Oh, we know all about that"; but at the same time I am certain they had never read them before. I do not know what idea you could adopt to make the men read the rules; I have one set posted up where they sit down to eat their crib; and I do not believe one of them has ever attempted to read them. You cannot bring old me to do anything fresh; they are very conservative as a rule; they will do just what they have been accustomed to do; and all the regulations in the country will not affect them.

4875. What, in your opinion, is the principal cause of the accidents that have lately taken place in the mines and quarries? Men being incompetent, and perhaps not sober.

4876. Do you provide against men that are not of sober habits? Yes; so soon as I see them the worse for liquor, I send them off; but it is possible men may come on to work apparently perfectly sober, and have only just got over a heavy drinking bout; and whether they are fit to take care of themselves I cannot say, but I should think they are not. I have known men to drink £6 17s. in six days; and work every one of those days. I do not know what really could have been their state; they did not appear to be the worse for liquor; but still the effect must have been on them. I cannot speak from experience on these things, as I have never taken drink myself. I see men passing my place at nearly every shift more or less drunk. Whether they work or not I do not know; but I know that they pass my place on their way to work.

4877. You say the principal causes are incompetency and drunkenness? Yes.

4878. How shall we remove the incompetency? I could not say; I give that up.

4879. Is one inspector, in your opinion, sufficient for this district? So far as I am concerned, I do not want any inspector at all; I do my own inspecting.

4880.

4880. Have you ever seen the Mining Inspector there? Yes, often; not too often. He has never had any occasion to find fault. He cannot come too often for me. W. Harry
23 July, 1897
4881. It would be better for you to have him coming round? I would not depend upon any inspector; I can look after my men myself: I do not think if there was an inspector to every man they would prevent accidents; the possibility is that the inspectors would get killed with the rest of them.
4882. Do you think an increase in the number of accidents has been caused through incompetency of the managers, shift-bosses, or men in charge? I do not know anything about mining; but, so far as I have seen, every care appears to have been taken on the Proprietary during the four and a half years I have been up there. Of course, I have never been underground. If inspections are carried out as much below as above I rather pity those working underground.
4883. *Mr. Williams.*] You have no brother or friend in Broken Hill, I believe? I take care to have no friends in Broken Hill.
4884. You buy a man's labour, and you endeavour to give him a proper wage for it? Yes.
4885. And there your contract with him finishes? Yes.
4886. You show no fear or favour to any man? No.
4887. You say you know a man named Shinnick? Yes.
4888. You offered him a job in your quarry, and he did not turn up? No, he did not.
4889. Do you remember my asking you for a job? No.
4890. I asked you for a job, did I not? I could not tell you. I know Shinnick, and remember his asking me, because he is an agitator.
4891. You do not remember a man's asking you for a job, because he would like to work in your cutting on account of its being carried out in a scientific manner? No.
4892. You said just now you wanted men? Yes.
4893. How many would you require to-morrow morning? Ten.
4894. You want competent men, and you do not care what nationality or association they belong to? No; I would not care if they were Chinamen; but I bar "Cousin Jacks" sometimes.
4895. Very good; but would you ask them if they were "Cousin Jacks"? No; I know them by sight.
4896. Supposing they went up to you and said, "Give us a trial, boss, and, if we are not worth anything, pay us nothing"—would you try them? Not many would make that offer.
4897. If you had them to-morrow, would you give them a show? No; because you would send some duffers up there.
4898. I would go up myself if I had a chance. You said you do not believe in a man's being imprisoned for neglect? Yes.
4899. What steps would you suggest to enable men to be taught the law? I would let every man think for himself; and not try and think for him, as you do.
4900. Supposing you saw men going wrong for the want of thought, would it not be your duty to think for them? Unfortunately, I have to do so; but in the early days—forty years ago—in Victoria and South Australia, there was a class of men totally different from that of to-day. Men in those days did not want the care and watching that men want nowadays, and there never was any accidents to speak of.
4901. Did not that arise from the fact that they had been trained to their calling from their early youth? Yes; but at present men go to work with a sort of indifference, because they are told to do as little as possible, and to say all they can against their employers. The unions all over the colonies have been the cause of these incompetent men.
4902. You believe in free labour? Yes, for the simple reason that every incompetent man is protected by the unions.
4903. *Inspector Hubbard.*] You spoke about a horse being killed;—would you mind explaining how that accident occurred? It was on the incline, and was brought about by the carelessness on the part of the lad below who hooked on. It was a safety hook; but he did not hook it properly; and it came undone, and killed the horse. Of course, those safety hooks are as safe as can be if any care be used. When this accident happened I asked both the driver and the lad how it was brought about; and they both said that the thing was right when it left the incline. Of course, I could not believe that. If it had been a man killed, instead of a horse, it would have been exactly the same thing; they would have both sworn that the hook was right when the truck left the bottom.
4904. *His Honor.*] I suppose it would be impossible to devise a hook which could be worked safely even if a good deal of carelessness were shown? I have adopted another hook now—a straight hook, with a ring in it; it is better than the tumbler, because it must be fixed properly before it will work.
4905. *Mr. Williams.*] You have never had a man injured on the "chinaman"? No.
4906. Did the inspector on any occasion ever order you to withdraw men from your cutting? I think he said once that if a thing was not altered I would have to take the men out.
4907. You altered that certain thing? Yes.
4908. And did not stop the work? No.
4909. *His Honor.*] There was use, then, for the inspector in that case? But he thought the work more dangerous than it really was. It looked dangerous from where he stood. However, I acted on his suggestion; and I do not think he has ever had any complaint to make as regards me.

William Smith sworn and examined:—

4910. *Mr. Edwards.*] Your name is William Smith? Yes.
4911. You are a contractor on the open-cut in Block 11 under the Proprietary Company? Yes.
4912. How long have you been working there? Twelve months come August next.
4913. Before that you were ganger for Baxtor and Saddler? Yes.
4914. For how long? Three years.
4915. I think you have had two fatal accidents in your quarry? Yes.
4916. One was to a man named Gaynor, who was hit with a skip? Yes; that was the first one.
4917. Was he standing under the skip when it was lifted? No; he was some 20 feet away.
4918. Was he warned of the danger he was in? The ganger warned him to shift to one side. I was not there personally; but, according to the ganger's statement and those all around him, he stood looking, and never offered to shift.
- 4919.

W. Smith.
23 July, 1897.

- W. Smith.
23 July, 1897.
4919. The second man's name was Ryan? Yes; he was caught by a stone that fell out of the face.
4920. Was he warned of any danger at the time? The ganger called out to him to look out.
4921. That stone did not fall out of the face where men were working? No; and when it struck the ground it took a different direction. It fell on to a ledge and bounced off.
4922. Had care been taken to bar down all dangerous stone before that? Yes; the ganger goes round at the commencement of every shift. According to my orders, he sees that everything is correct previous to starting the men.
4923. Besides these two fatal accidents, have you had any serious accidents? No.
4924. Is every care taken of your men? Yes; every precaution is taken for the benefit of the men.
4925. How many have you working under you? At the present time about ninety.
4926. What is your average, about? We have had over 200 at the one time. Ninety is the smallest number we have yet had.
4927. Do you find that you have competent men? A greater portion of them can only use a shovel; if you put a jumper in their hands they would not know what to do with it; and if you gave them a drill, they would not be able to strike it.
4928. Do you change your men repeatedly? It is of daily occurrence.
4929. You know the surface regulations of the Proprietary? Yes.
4930. Are they strictly observed by you and your gangers? Yes.
4931. How many gangers have you? Four.
4932. You use the "flying fox" for lifting your dirt? For the lode alone.
4933. You have trucks on the incline for your mullock? Yes.
4934. Are the men warned when the skip from the "flying fox" is being lifted? If they are working in close proximity, they are always warned before the "flying fox" is started; they are warned when it is being lifted up, and when it is coming down. The man who hooks on and hooks off gives the warning.
4935. Are men rushed about in their work? They are allowed ample time to take care of themselves; in fact, they are authorised to do so.
4936. Are men asked to take any unreasonable risk not incidental to their work? Not to my knowledge.
4937. Is it against your orders for them to do it? Yes; I always tell the gangers if they have any doubt at all to cease work.
4938. Are your ropes and tackle examined? A man daily comes round there; we call him the "roper." Anything he condemns I have to abide by.
4939. And renew it at once? Yes.
4940. Have you had any accidents from broken ropes or gear? None at all.
4941. I believe a truck ran away once;—how did that happen? Through the rope's coming over the flange of the wheel, which allowed it 15 feet before it became taut; and this caused the coupling to give way. Two men were slightly injured, one being away one day and the other two days. They are both up there now.
4942. In the case of a break-away on the incline, have you any protection? Yes; what we call "man-holes."
4943. I think that since that accident you have had an alteration made in the drum? Yes; a 9-inch flange has been put on, and it is impossible for the rope to come off now.
4944. In addition to that, you have "man-holes"? Yes, in every fourth set of timber in the heading there is protection offered the men.
4945. What explosives do you use—powder or dynamite? Both.
4946. What depth of hole do you put down for powder? As far as 15 feet.
4947. Is there any danger in putting a hole down deeper than 15 feet? There is less. There is less danger in deep holes than in shallow ones.
4948. What tamping-bars do you use? Soft wood.
4949. Do you prohibit the use of iron and steel bars? I do not allow their use, if I know it.
4950. Is it possible at times to prevent men doing reckless and foolish things? You would want more men to look after them than you really had as work to do that.
4951. What do you do when you find men guilty of carelessness? Discharge them.
4952. Is that the cause of your having so many discharges? Yes.
4953. Do you "bull" holes for those deep holes? Yes.
4954. Anything dangerous in that? Not in the least.
4955. Do you believe in "bulling"? Yes, I do. I have had great experience in "bulling."
4956. You concentrate the whole of the charge at the bottom of the hole? Yes.
4957. That is the main object? Yes; to get the explosive as low down as possible, and as concentrated as possible; it then lifts the burden all the better.
4958. Is there any danger in "bulling"? If men do not carry it out in a practical manner there might be danger; but there is no danger in it if the man understands his work. I have never used anything else for some years.
4959. For how many years? Ever since dynamite came into use.
4960. Who charges the holes? The "powder-monkey."
4961. Is he an experienced man? Yes.
4962. What is your rule with regard to men being in the face when big holes are charged? The big holes are charged after the men leave off.
4963. And in case of blistering or popping the stones that come down, where do you put the men then? There are three or four different cross-drives in the bottom of the cut where they can get.
4964. Is warning given before either of these operations takes place? Yes; the men are sent away before the fuse is lit.
4965. Are you there when blasting goes on? Yes.
4966. I think while you were with Baxter and Saddler you had one slight accident to one of your "powder-monkeys"? Yes.
4967. That is the only accident you had? Yes, barring a hurt I got myself.
4968. How did Ryan's accident happen;—he was the "powder-monkey"? Yes. I was not there at the time; but I believe it was through charging his hole with a scraper. It was broken country; and the hole choked on him; and he took to ramming it with the scraper, which is against all rules. He told me himself

himself afterwards that he was trying to clear the hole with the end of his scraper. I was not there until about four minutes after the accident, and so cannot say myself how the accident occurred.

W. Smith.

23 July, 1897.

4969. It was early in the morning, before the men were at work? Yes.

4970. He injured one of his eyes? He has lost one of his eyes in consequence of that accident.

4971. That was purely his own foolish action? Yes; it was really his own stupidity.

4972. Can you suggest any alteration in the way of carrying out the work which would tend to prevent accidents in the future? I really cannot see anything to better the present system of working. There is one thing—I have seen several remarks made about miss-fires. I consider in a miss-fire that it is less risky to prick it out than to bore a hole alongside. In a deep hole you know exactly where the powder is; and if it misses you can jump the hole out to within 15 inches of the powder, put in two or three plugs of dynamite and a primer, re-tamp it, and then set the lot going. If you bore another hole, you do not know what side of the powder you are getting to. I am positive that there is less risk in recharging than in boring another hole alongside. I have drawn many a one myself.

4973. What instrument would you use for jumping the stuff out? I would use a jumper with water.

4974. There is no danger if you have water? No.

4975. How long have you been practising that system? I have been thirty years at it.

4976. You must have water to keep your tamping wet? Yes. You want to let the water down lightly as you work, and when you get too much of it swab it out, and then let more down until you have again to swab it out. By doing that there is no danger in pricking to within 15 inches of the charge.

4977. You locate the position of the powder by your tamping-bar when putting the charge in? Yes; any practical man will always do that; he will mark on his tamping-bar the depth of the powder before he puts his fuse in, and then measure the fuse and make a mark on it, so that he will know when it is down.

4978. It has been said that the "chinaman" is a dangerous system? I cannot see where it comes in. I consider it safer than men being down in the cut with either skips or waggons.

4979. How many years have you worked with the "chinaman"? Over 40; but it was not called the "chinaman" then.

4980. It is a very useful thing? Yes, it is.

4981. Is the light at night defective; or is it good? I consider the light ample for all purposes. I myself cannot see how you could in any way better the light. If I require any extra light I make a report; and it is at once put on.

4982. Can you get as much light as you want? Yes.

4983. There is no stinting on the part of the company? No; if I want an extra light it is fixed without charge.

4984. To what cause do you attribute the accidents in the cuts? Gaynor's accident was brought about by his own stupidity in not getting away when asked to get away.

4985. Of course, the last accident that happened, that to Ryan, was an unforeseen accident? It could not have been avoided, because if he had been as quick as lightning the stone would have caught him. He made a run to get out of its way; but it struck a ledge and bounced across on to him. If he had not moved he would have been safe, but no one was to know that the stone was going to take such an erratic course.

4986. In shooting in the face, what precaution is taken? The ganger with his men bar down the loose material before the morning shift start; and this is again done at dinner-time.

4987. In what condition is the working face kept? I am always looking around there myself; and if I see anything that I am doubtful about I say to the ganger, "Take it down at once; better to do that than be sorry afterwards." I always impress that upon the gangers—to be sure and take down anything they are in doubt about; and tell them that it is far better to do that than to be sorry afterwards. I really think that the men in my employ carry out their instructions to the letter.

4988. I suppose you see the inspector round there occasionally? Yes.

4989. Do you carry out the instructions he from time to time gives you? Yes; if ever he makes a remark about anything I endeavour to take action at once.

4990. And your work is also inspected by officers of the Proprietary Company? Yes; two or three of them come round; and if there is anything that does not suit them they inform me; and, of course, I have the matter attended to.

4991. What limit of time would you fix for the re-charging of a hole after being "bulled";—would you fix any hard-and-fast limit of time, or leave it to the discretion of the men? I have "bulled" a hole myself on the Hill, and charged it within five minutes afterwards. Of course, in that case I put a keg of water down the hole.

4992. You are speaking of holes you can get water into? Yes.

4993. In that case you think there should be no fixed limit of time? No, there should not.

4994. If you do not use water, what time would you fix? Ironstone keeps the heat longer than the burden, and I would give it an hour.

4995. What do you think is the cause of danger in charging a hole that has been "bulled"? I have never known an accident to occur in charging a hole that had been "bulled."

4996. You always assume that there is a risk in charging immediately after a "bull"? When you are in doubt, put in a tamping-bar, and leave it there for five minutes; if it comes out cold you can charge with immunity.

4997. Do you think there is a risk of small portions of the fused used in the "bull" remaining smouldering about the hole? No; the "bull" would blow it all out.

4998. You cannot say that there is any fixed rule that could be made which would meet all cases? I cannot see where you could improve upon the present practice.

4999. The present practice is what? To use a short fuse, and, where possible, water.

5000. The time is left at present to the discretion of the men? A man will always put in his tamping-bar if he has a doubt about it, and try whether the hole is still hot.

5001. You do not think that any hard-and-fast rule could be made that would meet all cases fairly? I do not see how it could come in.

5002. In cases of missed-holes, do you think there ought to be a hard-and-fast rule as to the time? I should certainly say that an hour should elapse before withdrawing the charge.

5003. *His Honor.*] Do you think an hour would be sufficient? Yes.

5004.

- W. Smith. 5004. You have heard of cases where missed-holes have gone off considerably beyond that time? I have read of it, but never witnessed it. I have seen, in Tasmania, a 20-foot hole not go off until after thirty-five minutes.
- 23 July, 1897. 5005. So you would name an hour as a safe limit? Yes.
5006. *Mr. Polkinghorne.*] Have you got a man in your cut to look after the gear? No; the Proprietary Company have a man to attend to that.
5007. How often does he inspect the gear? He is there every day. If he condemns anything I have to abide by it, and at once.
5008. That is in the agreement? Yes.
5009. And anything he points out has to be at once made good? Yes.
5010. You know the surface rules of the Proprietary Company? Yes; I have got them at the cut.
5011. Do you think they are sufficient, if adhered to? I do.
5012. So far as you know, are they always adhered to in your cut? So far as I know, they are. I would not like to go and swear that they are, because there are some men who are that stupid that it is almost an impossibility to get them to carry out rules, unless you are standing over them all the time.
5013. Is it your instructions that they should be carried out? Yes; and the gangers' instructions, too.
5014. Do you think there is anything more in those rules than any ordinary practical man ought to know? No.
5015. Do you think there should be a regulation in connection with the working of those open-cuts as to the quantity of powder that should be in use at one time? I cannot see that a regulation to that effect is necessary. The magazines are close at hand; and powder can be taken out at any time.
5016. One of the surface rules says that, in the event of a charge missing fire, no workman shall return to work within an unsafe distance of the missed-hole until it has been exploded, and that those particular persons who are engaged in effecting the explosion of the missed charge may only return to their duty when there can be no further doubt that the charge has missed;—have you anything to say as to that rule? We have knocked off altogether on several occasions when we have had missed holes; and we have also knocked off when there has been a missed-hole in the adjoining contract.
5017. You think an hour is sufficient time to leave a hole? I think it is ample.
5018. You do not think it is unsafe to jump the tamping out of a missed-hole? I contend that there is not the same risk, if properly carried out, in taking the tamping out as there is in boring a hole alongside.
5019. Do you think it necessary that tamping should be settled in a hole so as to make it necessary to use a jumper to jump it out? If you did not tamp a deep powder-hole you would lose a lot of power. Say I have a 14-foot hole. I tamp it solid for a distance of 6 feet above the powder, and then fill the balance with loose stuff.
5020. *His Honor.*] So long as it does not shoot the tamping out, the powder must do its work? Yes; but if you did not tamp it at all it would not do its work.
5021. Have you seen it do that? Yes; the more it is confined the better the effect.
5022. And you would use a wooden tamping-bar? Yes.
5023. *Mr. Polkinghorne.*] Then pouring in fine sand is not so effective as settling the tamping on the charge? Dry sand is a thing I have never used.
5024. From your varied experience, you could form an opinion? I do not think it would require tamping at all if you had sand; the weight of the sand would in itself be sufficient.
5025. Have you ever used the jumper here in taking the tamping off a charge? I have used it myself personally; but I would not like another man to do it. When I was ganger for Baxter and Saddler I did my own "powder-monkeying" for a long time.
5026. Then you think that that general rule as to not unramming a charge is more often broken than adhered to? Yes; and it is less risky not to adhere to it.
5027. In your opinion, that rule is not required? I do not think it is required; in fact, I think it would be better if it were cut out as regards open-cut work, where deep holes are put down. I have never seen an accident occur in the whole of my experience through jumping a hole out; and I have jumped scores out myself. If you use water, and take proper precaution, there is not one-tenth the risk there is in boring a hole alongside.
5028. What, in your opinion, has been the principal cause of the accidents that have taken place in the district? I cannot see where there has been any accident through carelessness on the part of the management. So far as I can see, it has generally been the carelessness of the individual himself. In the case of Ryan it was not his fault. The ganger himself had been on the face and barred down everything he thought was loose; still this piece came out. There was no carelessness about it.
5029. Have you noticed any increase lately in accidents? No.
5030. In the district, I mean? There was the Tarrawingee accident; and there were two here on the Hill within a few days of one another; and that was an unusual thing. It was just like a chapter of accidents. I think, however, that the percentage of accidents for the quantity of men at work is very low.
5031. Do you think that there has been an increase in fatal accidents lately? No; excepting the one week when those several fatal accidents occurred.
5032. Do you think that working in the open-cuts at night has a tendency to increase the number of accidents? I cannot see where it comes in. I think if you refer to the reports of accidents you will find that very few have occurred on the night-shift.
5033. You think it is quite safe to work them at night? In the past twelve months I have only had, I think, one accident; and that was when the truck went down the incline, and slightly injured two men.
5034. Do you think the services of an additional inspector are required on this field? I cannot see where there is use for him; we could not take any more precaution than we are already taking at the present time.
5035. But when we remember that this district is 300 miles long, and that 6,000 men are working within a radius of 2 miles, do you not think an inspector is required for that radius alone? I am speaking of the Hill; of course, I know nothing of the outside district.
5036. You think there should be an inspector on the Hill at all times to report to whenever accidents occur? I was under the impression that we had one here.
5037. But if he happened to be up at Tiboburra you would probably have to delay your work for some time if an accident occurred. You would have to wait a week or ten days, perhaps longer, before the inspector returned? Yes; but I have never seen anything like that occur.
5038. *Mr. Williams.*] You say that if Dean condemns a rope, you have to attend to it? Dean does not concern me at all.

5039. But if he inspects a rope and condemns it, you have to attend to it immediately? Dean is the inspector employed by Baxter and Saddler; the man who comes round to me is employed by the Proprietary. He comes round every day.
5040. What is his name? Really I could not tell you. The last man's name was Sullivan; but there is a new man on now.
5041. Can you tell what sort of a man he is;—is he an iron man or a wooden man? He is a sailor, I believe.
5042. You take every precaution to prevent accidents to your men? Yes.
5043. As a matter of fact, when they die you take such interest in them as to see that they are put underground? If men die under my employ, I pay them respect, and follow them to the grave.
5044. You are then doing your duty as a man and as a brother. When you see men in danger you order them to cease work? Yes.
5045. You believe in withdrawing a charge when it misses fire? Yes; not the charge, but the tamping.
5046. And you would recommend that advice as a brother? Yes.
5047. You would not ask your brother to go and bore a hole alongside a missed-hole, if you did not care about doing it yourself? I would not.
5048. If your brother was here, and he charged a hole for the purpose of firing it and you found that there was no necessity for it, you would ask him to withdraw the charge? I would not ask him to withdraw the charge; I would then let him fire it.
5049. You would let him fire it at his own risk? I understand you to say that if he put it in and it was not required he should withdraw it. I would let him fire it.
5050. If you were withdrawing a hole, you would put enough water in to stop an explosion? Yes; let the water be constantly running—that is, in a deep hole.
5051. In putting water in you would prevent friction or heat arising from friction? Yes.
5052. And you not only put the water in, but you would take it out with a scraper? I would use the scraper as a swab.
5053. You prefer using a wooden rod to a metal one? Yes.
5054. You do not believe in using a metal rod on any occasion? No.
5055. You get as much light as you require up there? Yes.
5056. And if you wanted a little more you could have it? Yes.
5057. They give you what is considered a fair light? Yes.
5058. The Proprietary gives it? Yes.
5059. If you want any more you ask for it? Yes.
5060. And if you want any more and you do not ask for it, then it is your own fault if the light is bad? Yes.
5061. You know what it is to suffer from any accident; and that makes you more careful of your fellow men? I have been very careful all through my life.
5062. I think I asked you for a job on one occasion, but you were full-handed. You get the light supplied to you free of charge? Yes.
5063. When you want light, you say, in fact, "Let there be light," and there is light? Yes, I send in an application; and a man comes over from the electric department and puts the light up wherever I want it.

W. Smith.
23 July, 1897.

Samuel Mayne sworn and examined:—

5064. *Mr. Edwards.*] Your name is Samuel Mayne? Yes.
5065. You are underground manager, I think, of the South Mine? Yes.
5066. Before being appointed underground manager you were an underground foreman? Yes.
5067. For how long? Two years.
5068. About two years ago you had a very serious accident in the South Mine? Yes.
5069. That was caused through the ground giving in one corner of a stope? Yes.
5070. *His Honor.*] The men were killed by the force of air? Yes, the whole stope came in; and these men were in the drive, and were blown down.
5071. *Mr. Edwards.*] I think you went down to the stope, and ordered the men to the surface? Yes.
5072. And you came up and changed your clothes; and these men delayed in the drive? Yes, they thought they were quite safe.
5073. You had ordered them away from work; and there was no necessity for them to be there? That is so.
5074. Unfortunately, they did not come to the surface; and the rush of air through the drive killed them? Yes.
5075. With the exception of that, what other accidents have you had in the South? Three within the last seven years. One fell down a shoot; another fell down a set; and a third was killed by stuff coming from off the back.
5076. How were those accidents caused—take the first one, the fall from the shoot? We could not find where he got into the shoot. Where he was working it was covered over and guarded. He must have fallen through away from where he was working.
5077. You could never find out how he got there? No.
5078. Was that shoot generally covered over? It was at all times except when being used; but there were guard-rails round it.
5079. Were the guard-rails up when you found him? Yes; where it was supposed he went through it was close sollarred over.
5080. Then you could never tell how he got down there? No.
5081. If he had fallen down there someone must have replaced the plank; perhaps some person passing, and not knowing that anyone had fallen through, had covered it over again? Yes.
5082. As to the other man? The second accident was brought about by the man's falling down one set. His mate had taken a lath up; and he stepped back through the opening made.
5083. Ought that lath to have been taken up? No; a fresh one should have been got.
5084. *His Honor.*] His mate, in taking up that lath, acted contrary to the rules of the mine? They often take up one or two for air.

S. Mayne.
23 July, 1897.

- S. Mayne. 23 July, 1897.
5085. *Mr. Edwards.*] The third accident? Some of the back came away.
5086. Who was the man? Ellis.
5087. How long ago did that happen? Two and a half years ago.
5088. Was that brought about by the carelessness of any person? There was one piece to put up to form the full set; and they were lifting that up when the ground came off from the back, and crushed Ellis down.
5089. Were any laths in? The back laths were in; and it came through them, breaking off two of them.
5090. Was every reasonable precaution taken? Yes; when the back laths are in we always consider it safe.
5091. Your mine is well ventilated? Yes; there is no complaint to make in that respect.
5092. Those three accidents extend over seven years? Yes.
5093. How many men have you employed? 420 altogether; 250 underground.
5094. Have you noticed any increase in accidents in your mine lately? Nothing more than usual. Accidents must occur in a big mine where there are lots of men working.
5095. Have you any underground rules for the men? No; they are told the rules by the officials every day.
5096. Are your shift-bosses competent men? Yes, they are thoroughly practical men.
5097. Is timber supplied to the men for the purpose of securing the ground they are in? As much as they want; and should the ground at any time be thought dangerous they are shifted until the timber is put in.
5098. They are not allowed to work in places where timber is required if timber is not handy to secure it? No.
5099. Is it against your orders that men strip the floors off the sets? Yes, we discharge them for doing that; but it is difficult to find out who are the culprits.
5100. Have they to go to any trouble in getting timber? No; it is brought up close to them.
5101. And before going for it they will take up the floors? Yes.
5102. Do you find men careful? Competent men are; it is the incompetent men who cause accidents.
5103. Are there more competent men than incompetent men in your mine? Yes.
5104. As a rule you find the men competent in your mine; and they obey orders? They have to be competent, or they are discharged.
5105. You have discharged some for not obeying orders? Yes.
5106. Have you kept a record? No.
5107. How do you take your explosives down? We take a case into the magazine down below; and it is taken from there in tins as required.
5108. Do you believe in withdrawing part of the tamping in the case of a missed-hole? I believe in re-charging. We do not tamp holes full; so long as you make them air-tight it is sufficient. There is no need to meddle with a hole at all, so long as you put a fresh charge on top of it.
5109. You object to putting in a hole alongside a missed-hole? Yes, that would be dangerous; because the concussion in putting down the new hole would probably explode the missed-hole.
5110. Do you think additional inspectors would prevent accidents in the future? No; unless they could find a thoroughly practical man who could see through 20 feet of solid wall. The inspector we have is quite sufficient.
5111. What tamping-bars do you use in the mine? Wooden ones.
5112. Soft-wood? Yes; and hard-wood.
5113. Are metal bars prohibited altogether? Yes; we will not have one on the mine on any account.
5114. Do you "bull" their holes? Not often.
5115. I suppose there is no danger in doing that if it is properly carried out? No; not if the hole is allowed to cool.
5116. In the case of a missed-hole, how long would you leave it before touching it? It all depends; sometimes an hour, sometimes more, sometimes less. I often leave it to the discretion of the men.
5117. Have you had any serious accidents with reference to explosives? No.
5118. You have good "powder-monkeys"? The men charge their own holes. If a man cannot charge his own hole he is no good.
5119. I suppose men on going off shift often leave their face in a dangerous condition? Not often.
5120. Do they sometimes? Not that I remember. If they do they always acquaint the shift-bosses.
5121. And in case of a missed-hole? That is always reported.
5122. You have never heard of a missed-hole being left, and no report being made? No.
5123. I suppose it would be safer if the men coming off shift had an opportunity to point out to their mates anything dangerous in the face? Yes; sometimes men stop, if there is anything dangerous, and point it out.
5124. If they do not stop, it is possible for them to miss their mates? Yes.
5125. Do you not think it would be a benefit if change of shift took place in the face? I do not think it would.
5126. Why? It would be loss of time to the men.
5127. But apart from that? I think the present system is quite good enough.
5128. You see we want rules for careless men? I do not think there would be any advantage in changing in the face.
5129. I suppose the great objection would be the loss of time to the men? There would be a good deal of loss of time to the men.
5130. But it would be a matter of additional security? Well, I might say it would as far as incompetent men are concerned.
5131. That is what I mean;—supposing you get men entirely reckless? I think they ought to be made to change in the face.
5132. That is if you did not get rid of them at once? Yes.
5133. For breaches of instructions what do you do? Discharge them.
5134. What quantity of explosive do you allow men to use in the face? They do not carry explosives into the face unless they are going to charge.
5135. A rule here says that not more than 6 lb. shall be used at one time in the one place. If you had a series of machine-holes you would require more? Yes.

S. Mayne.
23 July, 1897.

5136. That rule might be eliminated altogether? We rarely use more than 5 lb.
5137. But suppose you have about six or seven machine-holes? They do not fire more than three or four together.
5138. How much do they take each? 5 lb.
5139. For the whole lot or for each? For the whole lot.
5140. That is with machine-holes? Yes.
5141. What depth do you put them in? Three to 5 feet.
5142. I suppose you sometimes use more in certain work in the mine? Yes; sometimes we use more.
5143. Then it would depend upon the nature of the work the men are at as to the quantity of explosive they would require? Yes.
5144. A hard-and-fast rule limiting the amount to 6 lb. would not be a workable rule? You require to take in more than 6 lb. sometimes.
5145. Is there any reason why the quantity should be limited? No.
5146. The result to a man if 6 lb. went off would be the same as if 12 lb. went off? Yes, just the same.
5147. Do you think there is any necessity to have a Board of Inquiry to inquire into minor accidents; or do you think the inspector would be sufficient? I think the inspector would be quite sufficient to make inquiries into things of that kind.
5148. Do you report all accidents to him? Yes.
5149. And the place is left until he has an opportunity of seeing it? Yes.
5150. It is never interfered with? No.
5151. He has the opportunity of investigating the thing immediately, on the spot? Yes.
5152. Can that be improved upon in any way? I do not think so.
5153. Do you think he is a better judge as to the cause of accidents than a man who has no experience? Yes.
5154. I suppose, when men are ordered out of the ground by one of the underground officers, that officer should have the right to say when the ground is sufficiently safe for them to return? Yes.
5155. And when the inspector is called in he should be the man to put the men back? Yes.
5156. In continuing a shaft, what depth of uncovered shaft would you allow above the men? I never allow more than 100 feet, and always keep a penthouse in.
5157. Is that necessary? Yes, where working overhead; but if a shaft is used for nothing but sinking it does not matter whether you have a pent-house or not.
5158. I suppose you have the most suitable machinery for the working of the mine? Yes.
5159. It has been suggested that at change of shift, when men are being lowered or raised, two engine-drivers should be in the engine-house, in case one man should fall down in a fit? I have never known of such a thing to occur, and I think it safer to have one than two.
5160. I think you agree with the suggestion that they should have certificates? There are lots of good men who have not got certificates. I have employed miners with certificates, and they have turned out to be no good.
5161. Then you do not think a certificate is any guide at all? No.
5162. You would put a man through his facings when you took him on, whether he had a bushel of certificates or none at all? Yes.
5163. And I suppose certificates for miners would be utterly absurd? Yes.
5164. Or for shift-bosses? Yes; if you want certificates you can get bushels of them at a shilling each.
5165. Do you think that a system of apprenticing lads to mining would tend to produce a better class of miners? I am sure it would. If we discharged a lot of the men now on the mines, and put on these boys, they would be better workmen right from the very start.
5166. What age? Eighteen.
5167. How long should they serve before they would be entitled to call themselves miners? Some would make good miners in twelve months; others, again, would take years. As far as working is concerned, I was as good at 18 as I am now.
5168. They would not get all their experience in twelve months? No.
5169. They would be able to use a hammer and drill; but they would not be experienced in the various phases of mining? No.
5170. Would you fix a term? I think it should be left to the discretion of the manager as to when they should go into the face as men.
5171. *Mr. Polkinghorne.*] Have you noticed any increase in the number of accidents on the Barrier during the last twelve months? No, not particularly, especially when you take into consideration the class of men employed at present.
5172. But have you noticed an increase? I have not.
5173. What is the chief cause, in your opinion, of the accidents that have recently taken place in the district? In most cases, through incompetent men and their neglect.
5174. Is there a dearth of competent men on the Barrier? Yes; there is.
5175. What has brought about the great number of incompetent men on the Barrier? I could not say.
5176. There are more men on the Barrier now than are employed, I believe? There always are, go where you will. Some will not work so long as they can get a few shillings to go and have some beer.
5177. Do you think the risk is increased by the employment of incompetent managers and shift-bosses? I do not know of any who are incompetent. All the managers and bosses I know along the line are competent men. I am not personally acquainted with all of them; but of those I do know I think they are well qualified for the positions they fill.
5178. In your opinion are the Regulations under the Mining Act sufficient for the safe working of the mines and quarries in this district? Yes; if carried out.
5179. Do you endeavour to carry them out in your mine? Yes.
5180. What is the penalty for breach of any regulation by your employees? We often discharge them; and sometimes we only caution them.
5181. But for any flagrant breach they are discharged? Yes.
5182. Is there any truth in the assertion that in many places in the South Mine not sufficient laths are provided to keep the stopes covered? I wish they would have a look at our timber bill; quite sufficient laths are always on hand.

- S. Mayne. 5183. What are your instructions in regard to stopes before they are filled? To keep them all covered. I have one now ten floors high; and it is covered from top to bottom with laths—thousands of laths; but it is not necessary at all times to keep the stopes covered.
- 23 July, 1897. 5184. But is it necessary to keep them covered under the working-faces? Yes; of course it is.
5185. You believe every set should be kept covered in that case? Yes.
5186. *His Honor.*] Is that one of the principal troubles you have got to contend with—the men stripping laths where they have no business to do so, instead of taking the trouble to get fresh timber? Yes, that is one of the most difficult things we have to contend with.
5187. You would be in a better position if, instead of sacking a man for doing that, you could get him fined? Then some of them would never have any pay.
5188. *Mr. Polkinghorne.*] With reference to the fatality that occurred in the South two years ago, would that accident have occurred if there had been an air-way through that stope on to the level above? There was an air-way; but it was not quite sufficient for the rush of compressed air that took place.
5189. The men met their deaths in the drive? Yes.
5190. You had ordered them out on the stope? Yes.
5191. There was no specific order from you that they were to go to the surface? No; they could have gone, but they thought they were safe where they were.
5192. I suppose if nothing had happened, you would have said that they did quite right in staying there until the cages came on at 4 o'clock. You would have thought they were perfectly safe there. You had no idea that if a fall did take place it would be followed by such a dire result? It was quite unforeseen.
5193. No blame was attached to anyone? No.
5194. Do you think, from your knowledge, that it is safe that a stope should be worked to the height that stope was without having greater communication through than there was in that case? It was quite safe at the time.
5195. It has been stated that it was hot in that stope? The sulphide was warm; but the air was good.
5196. It is not true that men could not work on the top part of that stope more than five minutes at a time? They have worked there more than five hours at a stretch; if they could not work longer than five minutes at a time it would not pay to work the stope.
5197. As to Vivian's getting down the shoot? He was working—like—on this floor; and the shoot was over on the other set.
5198. The floor under the one on which he was working was open? No; it was covered.
5199. The one he was on and the one under him were covered? Yes.
5200. He could not walk in from anywhere unless a lath had been lifted? No.
5201. What was the name of the man who fell down the one set? I could not tell you his name now; he had not been working there long; very rarely I ask a man his name.
5202. *Mr. Williams.*] Were those men at liberty to come to the surface; or were they forced to stay down until 4 o'clock? I am referring to the big accident. They were at liberty to come up.
5203. *Mr. Polkinghorne.*] There is no regulation at present in force under the Mining Act making it compulsory that the mining companies attach safety appliances to their cages;—do you think there should be a provision in the Act to that effect? I think it would be very advisable.
5204. And appliances to prevent over-winding, such as a disconnecting hook, or something to sever the rope? I do not think they are of any use; we tried them and lost a cage through them.
5205. Were there no safety appliances on the cage as well? There was not at that time; it was seven or eight years ago.
5206. *His Honor.*] But it is a fact that there are several thoroughly accepted hooks to prevent overhauling at present in use in England and America? I have heard of them.
5207. They are not commonly used here? No.
5208. There have been no accidents here from overhauling? No.
5209. But there have been in different parts of the world? Yes.
5210. So on the whole you would approve of a safety-hook being made compulsory? Yes.
5211. Not only the safety-brake, but the safety-hook also? Yes.
5212. *Mr. Williams.*] As to the man falling down the shoot;—the place was covered over and railed in? Yes.
5213. You do not think it possible he could have got there unless one of the laths had been moved? I do not.
5214. When you went to the place you found the laths over it? Yes.
5215. You made inquiries, and could not find out whether anyone had removed a lath and then put it back? Yes.
5216. His mate knew nothing about it, only that he had gone? Yes, that was all.
5217. One of the truckers found him in the shoot; and the shoot was covered over with laths; but, for all that, he must have fallen through? Yes. An inquest was held; and four or five of the men who had been working there gave evidence.
- His Honor: The end of it was that no one could find out how he got there.*
5218. When a place is warm, men sometimes take up a lath to get air? Yes.
5219. It is quite possible, then, that this man may have taken up a lath and slipped down, and afterwards someone came along and replaced it? I do not know.
5220. Did you see the inspector down the mine any time previous to that big accident? I often saw him down.
5221. He was down a week before the accident occurred? Yes.
5222. Did he make any complaint to you just before the accident that the stope should be better ventilated? I could not tell you now.
5223. Is it possible that he advised you to improve the ventilation of that place before the accident occurred? We had sufficient ventilation up there, without increasing it. We had improved the ventilation before the accident occurred.
5224. You said you would like to get rid of incompetent men, and put boys on? I said it would be a good idea if apprentices were put on in place of some of the incompetent men.
5225. You have worked your way up from a miner on the Hill? Yes.
5226. From a miner to a shift-boss, then to foreman, and then to manager? Yes.

Joel Phillips sworn and examined:—

5227. *Mr. Edwards.*] Your name is Joel Phillips? Yes.
5228. You are general manager of the Broken Hill Junction Silver Mining Company, Limited, and of the Broken Hill Junction North Silver Mining Company, Limited? Yes.
5229. Who is the underground manager of your mine? Charles Bennetts.
5230. How many years' experience have you had in mining? Forty-five years. I first started on the surface, doing work such as boys generally do—dressing ore, &c.; and afterwards went underground, working first with my father, and then with other parties.
5231. How long have you had charge of the Junction? Five years.
5232. How many do you employ there on an average? About 300 or 320.
5233. This Commission is to inquire into causes of accidents that have taken place in the Broken Hill district lately, and to get at the reasons of them, to prevent a recurrence in future. Have you noticed an increase in accidents lately in your mine? I do not think so. We have not had many accidents altogether—nine, I think, altogether, in five years.
5234. How many fatal accidents have you had? Not one.
5235. And of the nine accidents? Most of them were slight accidents.
5236. Have you had any fatal accidents on the Junction North? No, not one.
5237. What has been the nature of these other accidents? The most serious accident was the breaking of a small bone of a man's arm. A small stone came down the shaft, and struck him on the arm.
5238. Are the men under you competent and skilled men—the underground manager and the foreman? Yes; and they are all good practical miners.
5239. I believe most of the men you have are men that you have brought up from Moonta? They are strangers. We have got some very good men; but some are inferior. We have a lot of very good men in the mine.
5240. Can you suggest how accidents are caused in the mine;—can you suggest any means by which they can be prevented, further than the precautions taken at present? I do not see how there could be any further precaution taken. We take every precaution we can to prevent accidents.
5241. You had a creep the other day in the Junction? Yes.
5242. No accident was occasioned through it? No.
5243. You knew the ground was going? Yes; I knew for some time that the ground was very heavy.
5244. The men had means of getting away without endangering themselves in any way? Yes; there were several ways to get away from it.
5245. I suppose that ground must have come? Timber would not have kept it.
5246. The wole of that is, I think, if not completely repaired, very nearly fixed up? We have not meddled with it very much where the crush took place. We are putting in new drives round the sides to get at the solid ground. No one is working in the crush.
5247. Is the timbering carried out under a good system? Yes.
5248. And you have had as much filling done as possible? Yes.
5249. You use dynamite, of course, underground in your mine? Yes.
5250. Do you "bull" your holes? They may sometimes, but very seldom.
5251. It has been said that the practice of "bulling" is a dangerous one? I do not see that there is any danger in it. "Bulling" comes in as a rule where deep holes are bored.
5252. What time would you leave a "bulled" hole before putting in the charge? That would depend upon the quantity of explosive that had been put in for "bulling." If only a small quantity of explosive were put in, a few minutes would suffice; that is, where you have water to put in. You can generally tell by the tamping-stick whether the hole is cool or not.
5253. In the case of a missed charge, would you withdraw the tamping or put in another hole alongside;—which is the safer? The rule is to draw portion of the tamping, and re-charge; and then the concussion will send off the original charge.
5254. Within what distance of the charge can you withdraw the tamping? I would not be afraid to go within 1 foot.
5255. And, at that distance, by putting in more dynamite you can explode the missed charge? Yes; often with 2 feet on top you can explode it.
5256. You have had no accidents from falls of ground underneath? I do not remember anyone being hurt from a fall of ground.
5257. Is plenty of timber supplied to the men underground to secure the places in which they are working? A good supply of timber is always on hand.
5258. Where do they get it? There is always a stack of timber at the mouth of the shaft on the surface, and whenever there is a chance it is sent down to the drives, where they can get it easily and without trouble.
5259. I suppose only wooden bars are used for tamping below? Yes; that is all I have seen.
5260. Do you use machine drills down there? Yes, just now.
5261. There is a rule that no man shall have more than 6 lb. of explosive in use at the one time;—would that quantity be sufficient for machine drills? No. He would want more, or else have to make three or four journeys to the magazine when charging.
5262. Where is the magazine? Aboveground.
5263. How are the explosives taken into the mine? They are generally taken down in their packets. We had canisters; but the men would not take the trouble to use them; they used them for water-cans instead.
5264. The explosives are in cardboard boxes? Yes.
5265. Do you think cardboard boxes are sufficiently safe to carry explosives in? Yes; I think so.
5266. When men are ordered out by one of the mine officers on account of the ground's being apparently unsafe, on whom should the responsibility rest of telling them to go back? The underground bosses always consult me before men are put back; and I have a look to see whether the place is safe.
5267. And where the inspector orders men out you always refer to him before the men go back? We have never had any serious trouble with the ground, only this last big creep.
5268. Do you think that additional inspectors on the field would prevent accidents? I do not think so.
5269. If you had a dozen different inspectors could you do more than you are doing at present to prevent any

J. Phillips.
23 July, 1897.

- J. Phillips, any accident in your mine? I do not see how I could. We have taken every precaution to keep all places secure.
- 23 July, 1897. 5270. You have worked on gold-reefs as well as in copper-mines? Yes.
5271. Have you ever known men to be looked after better, or better cared for, than at Broken Hill? I have never seen any place where men have been better provided with timber than at Broken Hill.
5272. And every care taken for their safety? Yes.
5273. What time would you leave a missed-hole before allowing the men to go back to it? I think the rule is not to allow the men to go back in the same shift; they are supposed to leave it for the rest of the shift; it might be eight hours; and it might be only four.
5274. What do you think should be the limit? I think one and a half hours, or perhaps one hour, would be long enough.
5275. Supposing you are putting down a three-compartment shaft, how many compartments would you close? The whole, except the one that the stuff is being hauled up. The rule is to go 100 feet; but I would not be afraid to go 150 feet.
5276. There would be no danger in going 200 feet? No.
5277. I suppose that depends upon the men that are sinking? Yes.
5278. Do you think a system of apprenticing youths would be of any advantage to the mines of Broken Hill? I think it would be a very good idea.
5279. What time should they serve? I should say three years.
5280. I suppose your machinery is suitable in every way for the lowering and raising of men? Yes; we have good winding-engines for hoisting the men; they are also used for hoisting the ore.
5281. It has been said that as a matter of further safety two engine-drivers should be in the shed when men are being hoisted or lowered, in case one man might fall down in a fit? I do not think it is necessary to have two drivers; I have never seen it.
5282. Might not two men being in the shed be more likely to lead to accident? Yes; their attention might be taken away from their work by talking.
5283. Would you have those men hold certificates? I think they should.
5284. I suppose you would not appoint a man on a certificate alone; you would give him a test? I would like him to have a reference from some other place showing him to be a competent man.
5285. Do you think it would be an advantage if men were to change in the face instead of at the plat or brace? I do not think there should be a hard-and-fast rule to change at the face, because at present they blast as the last thing.
5286. They could alter their hours of blasting? They fix the time for blasting so as to allow for ventilation.
5287. To change in the face might cause loss of time; but would it not be a matter of greater safety and security to the men if the in-coming shift were to have the face pointed out to them? Where men are working with the pick they should, I think, change in the face, as there is nothing to prevent their doing so; but where they are blasting they could not very well do so, because it is an advantage sometimes to blast at the change of shift.
5288. I suppose the loss of time to the men is the only objection to their being compelled to show their mates the face? Yes, that is all; there is no objection otherwise.
5289. I suppose you have never had missed-holes left in the face and not reported? I do not remember that ever occurring.
5290. Is there any truth in the statement that accidents are occasioned here by incompetent managers or incompetent shift-bosses? Not so far as I know.
5291. Your brother, Thomas Phillips, is underground manager of the North Junction Mine? Yes.
5292. He has shift-bosses under him? Yes; they are appointed through me.
5293. The evidence you have given in relation to the Junction will apply equally well to the Junction North? Yes.
5294. I believe the creep in the Junction North has been secured? Yes; all that is required; but there is part of the ground that has collapsed that will not be required again.
5295. All portions now being worked are safe and secure? Yes.
5296. No accident has happened in that mine? There was a slight one yesterday. A wheel came off a truck, and struck a miner who was standing in the plat.
5297. Was that owing to any carelessness? I do not think so. I do not see how it could be called carelessness on the part of anyone. The wheel dropped off as the braceman was turning the truck round.
5298. Was the man at the plat severely hurt? I do not think it was anything serious; he got a nasty blow on the chest.
5299. With the exception of that, you have had no serious accident? No.
5300. *Mr. Polkinghorne.*] What are your instructions to the men in respect to the covering of sets with laths? Every thoroughfare is supposed to be covered or railed off.
5301. Under where men are working? Yes.
5302. If they are working up six or seven floors, are all the floors underneath the working-face covered? Not all the way from top to bottom. The faces above and below where the men are working are covered.
5303. But under a working-face how many floors do you consider it is safe to leave? We generally keep two or three floors in under where men are working—sometimes two, sometimes three.
5304. All the other places are guard-railed off? They are often left open; but any place where men are liable to step in is guarded by rails.
5305. You consider that two or three floors under the working-floor should be left covered, and that that would be sufficient? Yes.
5306. Do you think it safe to uncover all sets excepting the one you are working on? If you are working in a soft place with a pick, one should (I think) be sufficient.
5307. But supposing a lump came down, and a man went through the floor? It would be as well to have a second floor.
5308. No accident has occurred in the Junction through a man falling through in that way? I do not remember any. We had an accident the other day brought about by a man jumping under the batten nailed up to keep him away; but if men will jump into places like that we cannot help it. We cannot cover the passes over; we must keep them open.

5309. You say your magazine is on the surface? Yes.
5310. Do men take explosives into the cage with them? I think they do generally.
5311. Do you not think that should be prohibited? We have never had an accident with explosives yet.
5312. Should an explosion take place in the cage it would be a serious one? Yes; there is no question about that.
5313. Not only for the men in the cage, but for the mine? Yes.
5314. Do you think then that taking explosives down with them in the cage should be prohibited? It might be prevented by getting a man to take the explosives down after them.
5315. What, in your opinion, has been the chief cause of the accidents that have occurred in this district during the last twelve months? I could not tell you; I do not go outside of my own mine much.
5316. I suppose you have got an opinion? I could not tell what the principal cause is.
5317. Do you think that the regulations and provisions under the Mining Act of 1874 are sufficient for mining as it is carried on to-day? I think so. We cannot do more than we are doing; and it would make no difference to us if you made any number of Acts.
5318. It has been pointed out that there is no power to impose a penalty on the men should they commit a breach of the regulations. Do you think if provision was made for a penalty in connection with some of the rules it would tend to prevent accidents? Make what penalty you like, if a manager is taking all the care possible he can do no more.
5319. But do the men at all times follow out the instructions of the manager? If men would follow out the instructions of the manager some accidents would not occur. I have known accidents to occur through men not doing what they were told; but we have had no serious accidents.
5320. Do you know if it is true what the paper says about Jones, who was hurt at the Junction North;—is the accident likely to prove fatal? I saw him yesterday at his house; and he looked very well; and I heard this morning that he had a very good night, and is improving.
5321. Do you think that sufficient provision is made for the men to know what the regulations under the Mining Act are? The regulations are posted up in the most conspicuous places, where the men have to go every day; they cannot help seeing them.
5322. Have you got any rules other than the Government regulations? We have not got any printed code of rules.
5323. All verbal? Yes.
5324. I think you said it is safer to take off some of the tamping from a charge than to bore a hole alongside? Yes; there is just as much danger, perhaps more, in boring a hole alongside as in taking out portion of the charge.
5325. One of the rules says that a charge of powder shall not be unrammed? That rule is broken very often.
5326. *Mr. Williams.*] You should put another primer in? Yes; take out the tamping to within 6 inches or a foot of the charge, and put another plug in.
5327. Could you suggest any improvement on that method? No.
5328. You have tried electricity? Yes; but have gone back to the old system.
5329. You prefer the old method to electricity? Yes.

J. Phillips.
23 July, 1897.

John Evans sworn and examined:—

5330. *Mr. Edwards.*] What is your full name? John Evans.
5331. You are underground manager of Block 14 mine? Yes.
5332. How many years' experience in mining have you had? Twenty-seven altogether in mining, and twenty-five underground.
5333. How long have you been underground manager of Block 14? Two years and four months.
5334. I believe there have been no fatal accidents in that mine since 1892? Yes; it is five years ago.
5335. When Mr. Lane was general manager? Yes.
5336. And Mr. Simpson underground manager? Yes.
5337. Have you had any serious accidents underground within the last two or three years? No.
5338. Any accidents laying men up for a time? About a fortnight is the extreme.
5339. A man has been laid up for a fortnight? Yes.
5340. That would be from what cause? A stone fell on him, and cut his head.
5341. Is the ventilation in your mine good? Yes, it is perfect.
5342. I think we had a witness named Bourne from Block 14 the other day. He is working on the mine now? Yes.
5343. Is he a good steady workman? He never lost a shift until last Wednesday night.
5344. He said there was some dangerous ground in a pass or ladderway that men were in the habit of going past; he said he had not pointed it out to the shift-boss or underground manager? I asked the man about that; and he told me that Bourne refers to some considerable time back, and the ground has long since been secured.
5345. So far as you know, are there any dangerous places in your mine not secured? None at all.
5346. Is it the duty of the men to report dangerous places at once to the shift-bosses, or to you? It should be.
5347. Are they instructed to do so? Yes.
5348. Are they encouraged to do so? Yes.
5349. Are the men provided with plenty of timber to secure the ground? Plenty of timber is always at hand.
5350. What sort of shift-bosses have you got under you;—are they competent men? Yes, they are all competent.
5351. How many have you got? Three.
5352. How many men do you employ underground? For the last eight and a half years the average is 400.
5353. Do you find the men competent? They are of all classes and sorts. You have to find men for places, and places for men.
5354. Have you more incompetent than competent men? I do not think so; I think I have more competent than incompetent men.

J. Evans.
23 July, 1897.

- J. Evans.
23 July, 1897.
5355. Could many of the smaller kinds of accidents that now occur be avoided if you had more competent men at work? As a rule we do not have much in the way of accidents in our mine; but I think if the men had been competent some of the accidents that have occurred would not have been brought about.
5356. Can you suggest anything that could be done, and that is not now being done, by which accidents could be avoided? Nothing at all.
5357. Do you think if you had additional inspectors knocking round the mine, accidents would be prevented? Not unless they could look through the ground. As far as the ground goes now, one inspector is enough. If one could look through ground a little way he might tell you something fresh.
5358. Have you printed rules to work by? Yes; we have rules posted up.
5359. They are on the same lines as the Proprietary rules? Yes, I think so.
5360. In addition to them you have the Government regulations? Yes.
5361. Do you know if men make themselves acquainted with these rules and regulations? I could not say.
5362. They are stuck up so that they can read them if they like? Yes.
5363. In addition to that, the shift-bosses tell them all their duties, and warn them of what they should not do? Yes.
5364. Could you give any idea as to the movement of the men during the last twelve months, principally those taken on and those got rid of? I could not; I have no idea.
5365. As to explosives—I suppose you only use wooden tamping-rods? Yes.
5366. Metal ones are prohibited? Yes.
5367. Do you “bull” holes? No.
5368. You use just the plain hole? Yes.
5369. In the case of a missed-hole do you draw the tamping, or put in another hole alongside? We generally put in another plug and detonator, and fire it again.
5370. You find that in all cases effectual? I think that is the safest plan.
5371. Do you think a system of apprenticing youths might be adopted in Broken Hill with advantage? I think it would be better.
5372. At what age did you go underground? Twelve.
5373. That is a little young? Yes.
5374. What age would you suggest for boys up here? I do not think they should go underground before 15 or 16.
5375. And how long do you think they should serve before becoming miners? I do not think they should serve any time; some may be only two years, while others may be four or five years, before they become efficient.
5376. Do you think that changing at the face would prevent accidents through over-hanging ground being left? I do not think it would in our mine.
5377. You haul from one shaft alone? Yes.
5378. And it would take a considerable time to get the men up? Yes.
5379. Apart from the loss of time, it would be a protection? No, I do not think it would; the shift-bosses are made acquainted with any dangerous places.
5380. It would be a means to preserve the in-coming shift from danger? If one man were to stop, it would be sufficient.
5381. Is your hauling machinery good? Yes; it is in good repair.
5382. How many engine-drivers do you think you ought to have in the shed when raising and lowering men? We have only one; and if you had more they would talk and neglect their duty.
5383. In the case of men being ordered out of dangerous ground by you; would you be prepared to take the responsibility of ordering them back again; or would you call in the inspector? I would take them back when I thought it fit.
5384. If the inspector were called in, you would leave the responsibility on his shoulders? Yes.
5385. As to the floors in the stopes: do you keep the laths on, and, if so, up to what time? They are pretty well covered until mullocking is put in.
5386. Do you notice the men take the laths off? Sometimes.
5387. Is that against the rules? Yes.
5388. What do you do? Discharge them, if I can find them.
5389. How are those stopes secured where the floors have been taken off? The laths are re-laid, or else battens are put round in the shape of railings.
5390. When working out a stope, how many floors do you keep secured under the floor on which the men are working? We generally keep two sets secured underneath.
5391. You think that is sufficient? Yes.
5392. I hope Bourne did not get into trouble with the men or the management for giving evidence the other day? He did not get into trouble with the management; I do not know how he will shape with the men. Really, I do not think there is anything in it.
5393. *Mr. Polkinghorne.*] Have you got safety appliances attached to your cages? Yes.
5394. Do you think it should be compulsory for all mining companies to have safety appliances attached to their cages used for lowering and raising men? Yes, I think it would be safer.
5395. Do you think it would be a further degree of safety to have disconnecting hooks or thimbles to prevent the overhauling of cages? That might be safer.
5396. Is there any truth in the assertion that some of the boys employed on Block 14 are below the age prescribed by the Act? There was one.
5397. It has been said that there were two—one by the name of Graham, and one by the name of Doon? Doon's parents misrepresented his age; and, on making inquiries, we find that he is two months short of 16. The other boy is over 17.
5398. As to having two engine-drivers in the shed at change of shift, is there not a probability of a man's falling down in a fit? I have never heard of such a case; but I think there is a greater probability of talking being indulged in if you have two drivers in the shed; and that would be a greater danger than the probability of a man falling down in a fit.
5399. You think engine-drivers in all cases should be certificated? A certificate is very good provided the man merits it. I remember on one occasion on Broken Hill where there were two non-certificated men

- men driving the engine; and the other, who was a certificated man, was discharged for neglecting his duty. J. Evans.
23 July, 1897.
5400. That may be so; but still the certificate did not make him neglectful? And the certificate does not make a man competent in many cases.
5401. He was in that case discharged for being neglectful; not for being incompetent? He was discharged for nearly knocking a man's head off.
5402. What, in your opinion, has been the chief cause of accidents in this district? I could not tell you about the district; I have been pretty well at the one place ever since I have been on the Hill.
5403. Have you noticed any increase in the number of accidents during the last twelve months? There has been a decrease in our place.
5404. You have not watched what has been going on outside your mine? No, not at all.
5405. There is a rule under the Act saying that a man shall not have in his possession at one time in the one place more than 6 lb. of explosive. Do you think that rule is sufficient? No; it is often broken.
5406. What course do you adopt in your mine? In the machine-drilled holes the men can have just what they require; but in the hand-drilled holes not many of them take more than 6 lb. In our place, they go to the magazine and get what they require in a canister, and, immediately after using, return the canister again with any balance.
5407. Is work carried out in your mine under contract, or by day-work? Pretty well all on day-work, at present.
5408. And that is the rule of the mine—that the men take what they require, and return what they do not use? Yes.
5409. *His Honor.*] When? Immediately after they have charged their holes.
5410. What if they want to charge any more holes during the shift? They have to go and get some more.
5411. You do not find that inconvenient? No.
5412. Where is the magazine? We have a magazine on each level.
5413. They have not to go very far? No.
5414. Who is in attendance at each magazine? Boys.
5415. A boy at each of them? Yes.
5416. Do you not think that is rather a dangerous occupation for boys? I do not think so; they seem to do it very well; they have never had any mishaps.
5417. You say the ventilation in your mine is good? It is perfect all through.
5418. And you think the matter of changing in the face would not conduce to the lessening of accidents or to the benefit of the mine or the men? I do not think it would.
5419. *Mr. Williams.*] You say you believe in having floors covered to within two sets of the level where the men are working? Yes.
5420. You say you have boys in charge of the magazines? Yes.
5421. And they are doing pretty well? Yes.
5422. No accidents have occurred through their being employed? No.
5423. Do you think it would be safer to have experienced men in charge of the explosives? I do not think so.
5424. *Mr. Edwards.*] What became of Doon? He was knocked off; he did not come back after it was discovered that his age was under 16.
5425. And he is now out of employment? Yes.
5426. Who made that rule that boys must be 16? The Lead Commission, I believe.

Thomas Phillips sworn and examined:—

5427. *Mr. Edwards.*] Your name is Thomas Phillips? Yes. T. Phillips.
23 July, 1897.
5428. You are the underground manager of the Broken Hill Junction North Silver-mining Company, Limited? Yes.
5429. How many years' experience have you had in mining? A little over thirty years'.
5430. And how long have you been in charge of the Junction North? Twelve months.
5431. Your brother, Joel Phillips, is general manager? Yes.
5432. Have you got good shift-bosses under you? Yes.
5433. Competent men? Yes.
5434. And how many men have you employed there? 130, I think.
5435. How is the mine as regards safety, so far as the timbering is concerned? Since I have been there it has been very good.
5436. You had a creep there the other day? Yes.
5437. Is that all secure now? Yes, all the ground that we are working in.
5438. Have you had any fatal accidents in that mine? No.
5439. Have you had any serious accident? No, not since I have been there.
5440. What about that man who was struck with a wheel off a trolley? That occurred the day before yesterday, and is not very serious.
5441. Have you had any men disabled for any length of time? No, I am not aware of any being disabled for more than a day or two.
5442. You have no printed rules for the underground working? No, only the Government regulations.
5443. You and your shift-bosses give instructions verbally? Yes, daily, to the men.
5444. How do you stand with regard to your men; are they competent? I have got a very fair number of men.
5445. Where did you get them? Principally from here.
5446. Is your machinery suitable for its purposes? Yes.
5447. How many engine-drivers do you keep on at change of shift? Usually two, for a time.
5448. Do you think that two are absolutely necessary? I think it is as well to have two.
5449. What have you seen in other places? I have usually seen two kept on during change of shift.
5450. And that is your practice? We have not carried it right out.

- T. Phillips. 5451. Do you not find them liable to have a yarn to each other and neglect their work? Not for that time; they are only together half an hour.
- .23 July, 1897. 5452. *His Honor.*] Do the engine-drivers' shifts overlap at that time? Yes.
5453. Before one goes off the other has come on? Yes.
5454. So that, generally, when a cage is coming up loaded with men at the change of shift, two drivers are in the shed? Yes, very often.
5455. Is that in consequence of any rule, or wish that you have expressed; or is it only that it happens generally so? It has not been made a strict rule.
5456. Do the men prefer it themselves; or how is it that it does happen? I have never heard them express a wish to have more than one.
5457. It is the rule generally for men not to go on before they can help it? The driver generally comes on a little before his time.
5458. You find they do work it that way, as if they preferred it? Yes.
5459. *Mr. Edwards.*] Is plenty of timber supplied for the men to secure the ground? Yes.
5460. Where is it kept? At the surface; and it is sent down as required.
5461. Is anything left undone that you could do to prevent accidents? I do not think so.
5462. Do you think additional inspectors would prevent accidents? No.
5463. What is your practice as regards blasting;—I suppose you "bull" the holes there sometimes? It has not been necessary to do that.
5464. Do you use rock-drills? No.
5465. The mine is only being opened out? Yes.
5466. In fact you are prospecting in the mine in places? Yes.
5467. You have not used rock-drills in it yet? Not yet.
5468. I suppose you have used rock-drills before you came to this mine? Yes.
5469. There is a rule about not more than 6 lb. of explosive to be in use at one time. That would not be sufficient for a rock-drill? No.
5470. How is your explosive taken into the mine? It is taken down in the cages.
5471. Have you got canisters or boxes for it? It is generally tied up in a packet.
5472. Is that taken for storage, or for immediate use? For immediate use.
5473. Have you got any storage below for powder? Yes.
5474. Away from the workings? Yes, we keep a little stored.
5475. Is it a magazine? It is a drive that is not used; it is away from the workings.
5476. *His Honor.*] Not a regular magazine, but a drive that acts as one? Yes.
5477. *Mr. Edwards.*] I suppose only wooden tamping-bars are used down below? Yes.
5478. Metal bars are prohibited altogether? Yes.
5479. *His Honor.*] What practice do you follow in giving out powder? The shift-bosses get the powder for the men.
5480. Is it under lock and key? Yes.
5481. Who keeps the key? The shift-bosses.
5482. The shift-bosses always serve the powder out? Yes.
5483. *Mr. Edwards.*] So that it is really a magazine, although not a properly constructed one? Yes; we are always obliged to put a little on one side; we could not take it up and down as required.
5484. Do you think it would be an additional security to the men if they changed at the face;—would not men then have an opportunity of pointing out to their mates coming on the condition of the face? A man goes round and sees that everything is all right at each shift.
5485. That is where you are employing a small number of men; where you employ a large number of men, that would not be possible? No.
5486. What do you think about apprentices; do you think they would be an advantage;—do you think it would be an advantage if you were allowed to apprentice youths to mining underground? I think there is no better time for them to learn than when young.
5487. I suppose you learnt pretty young? I was underground when 15 years of age.
5488. And you have been under ever since? Pretty well all the time.
5489. How old should a boy be before he is allowed to go in? Sixteen, according to the Act.
5490. *His Honor.*] What age would you suggest? I think 16 is quite young enough.
5491. *Mr. Edwards.*] How long would you make them serve before they could call themselves miners? I think twelve or eighteen months, if the youth be smart.
5492. It would be according to the man? Yes.
5493. In your stopes, when do you take your floors off;—do you ever shift them? We have to shift them when throwing stuff down.
5494. When filling? Yes.
5495. When a man is working on the top floor, how many floors would you leave under him? The greater part is being filled; and there are not many floors under where we are working.
5496. As you take the laths up you put in mullock? Yes.
5497. Do you find the men ever rob the floors of laths to save themselves the trouble of going to the plat for timber? They would if allowed.
5498. When they take the laths up, do they put any protection round them? We have them battened off, ready for filling.
5499. However, the floors are looked after; and you have never had an accident from that cause? No.
5500. *His Honor.*] In your opinion—apart from your experience in that mine—how many floors under a working-floor would you make it compulsory to have securely covered with laths? I think within two floors of the working-floor should be covered.
5501. There should be two sound floors underneath the working-floor? Yes.
5502. And below that you see no necessity to keep the floors closed? No; not so far as the working-floor is concerned.
5503. *Mr. Polkinghorne.*] You have two engine-drivers on at change of shift;—are we to understand that it is your wish that two should be there at change of shift? I think it would be safer, and would be the best course to adopt.
5504. How long have you been on the Barrier—residing permanently? Twelve months.

5505. *His Honor.*] Do you think you could arrange with engine-drivers to agree that their shifts should overlap to such an extent as would cover the time it takes the men to come up? Yes; and that would be the best thing to do. T. Phillips.
23 July, 1897.

5506. With a small increase of pay? Yes; they would be agreeable to that.

5507. And that would not be any great extra expense to the mine? No; it means merely half an hour.

5508. Just to make an overlap? Yes.

5509. *Mr. Edwards.*] You would not have a hard-and-fast rule though, because some mines only work one shift? No; I would not have any hard-and-fast rule on the matter.

Edward James Horwood re-called and further examined:—

5510. *His Honor.*] You spoke of the system of apprenticing that was in force aboveground at the Proprietary Mine? The general manager referred to such a system. E. J.
Horwood.

5511. I want to find out whether the youths are apprenticed to the management, I believe; because men in charge of different portions of the works where apprentices are taken are changed very often. I have not seen any of the documents relating to apprenticeships, and cannot, therefore, speak for certain on this matter. 23 July, 1897.

5512. The system is somewhat on the same principle as that obtaining at Mort's Dock, I suppose? Yes, your Honor; they are apprenticed to the establishment.

5513. You have not actually got any copies of the forms used? These matters are attended to by the chief engineer and his department; and, consequently, I am not thoroughly acquainted with the details. I think they have forms for each apprentice.

5514. There is a regular form, of course—a printed form? Yes; I believe so.

5515. I should like to have one of those forms? I will endeavour to get you one, if obtainable.*

Christopher Kelly re-called and further examined:—

5516. *His Honor.*] I understand you wish to give some evidence as to your experience and competency as a miner? Yes. I notice that Mr. Thomas stated in his evidence that Mr. Shinnick and myself had both been discharged because we were no kind of miners and had no idea of the work. To disprove that, I will now, in the first instance, hand your Honor a credential from the manager of the Mount Euriovie Tin-mining Company, New South Wales, and lately of New Zealand. It is dated 10th September, 1888. C. Kelly.
23 July, 1897.

5517. What is your trade? General blacksmith and horse-shoer.

5518. You were working at this tin-mine, partly as a miner, and partly as a mining blacksmith? Yes.

5519. What other experience have you had? I was for three years in a coal-mine in New Zealand; first in helping the men up the boards with their trucks, from that to horse-driving, and then to mining, at which I served six months.

5520. Beyond that, what experience have you had in mining? I was then apprenticed as a blacksmith; but after I had served six months we had a row, and the indentures were cancelled. I then went as an improver, and afterwards started mining by roughing it on reefing-fields. I was for five years underground, as a tributor and on wages.

5521. Not blacksmithing? No; but I occasionally sharpened tools for the men.

5522. And then you came over here? Yes; under that manager whose name is attached to the credential I handed you.

5523. Then you say you are, although a blacksmith, also a miner by occupation? I am not afraid to take up work in any capacity as regards mining. As to Mr. Thomas's statements. I will tell you that, when Mr. Shinnick and I first made a start in Block 10, Mr. Thomas's son, the foreman, came round and had a look at us when we had two sets of timber in; and he passed the remark that, if every set of timber was put in as those two sets were, Block 10 would have the best sets of timber along the line of lode. The monthly dividends, and the decrease in the number of accidents, on that mine show that the men are not incompetent. It is splendid, indeed, for Mr. Thomas to call his employees "fencers" and "sundowners." Mr. Thomas has a great habit, when men get through half a set, to stop them, and not pay them; and—another thing—if you are in good ground, they won't take the ore away; and you have to stay off two shifts before it is cleared. Mr. Thomas further stated that the time on the plat at the 415-foot level, at Kelly's shaft, was not unsafe to an experienced miner; but I do not agree with him. When timber is bent and splintered in all shapes, it shows that it wants retimbering. Again, often we have been nearly smothered with dust from the stuff being shot down the shoot at change of shift. The sulphides do contain lead; and I say this, that the gas in those gold-mines in Victoria is easily got rid of, and is not as severe on the men as lead. Put the Victorian miner and the Broken Hill miner out in the streets, and you could pick the Broken Hill miner out very easily. I wish also to refer to Mr. Rowe's statement. He said that I met with my accident through breaking up a rock. I say I did not. I did not interfere with any rock. The shift-boss then comes in with another statement, which even contradicts the underground manager's, saying that I had no business to touch that stone. If we had not touched that stone, and had allowed it to fall on us, then "Dead men would tell no tales." Mr. Andrew goes on to say that I did not start where I was put. Our mates who came on in the next shift can prove that he is wrong; and I question whether the shift-boss or underground manager knows the date on which I met with my accident. Nearly every week you hear of accidents occurring in the Central. I thought my first object in coming here was to show things that wanted attending to, in order to prevent accidents in the future; but I can plainly see that the old sore of 1892 is still to the fore. I know that in the early days of the Barrier Mr. Thomas was discharged from the Proprietary Mine by Mr. Harper for his brutality to the men. Plenty of men can give evidence here as well as Mr. Shinnick and myself; but they won't come; they know too well what would be the result. Mr. Andrew said I was only one and a half hour working in the Central. That is not true; I was two and a half hours there, spending nearly an hour looking for tools and water before we could make a start. There is another thing I would like to call attention to; and that is, in going southward on the 415-foot level towards Campbell's shaft of Block 10, about half way the drive is only about 4 feet high; and if there was any creep men could not pass on. I believe they

*NOTE.—His Honor was afterwards informed that the apprenticeships were arranged verbally only.

- C. Kelly. they have since started on the east side to make a drive; but for what purpose I do not know. While I was there we had to sometimes carry timber on our shoulders, and crouch down, and get along like goats. While I was in the Central I picked up half a dozen plugs of fracture lying on the sill-floors.
- 23 July, 1897. 5524. *Mr. Polkinghorne.*] Were you compelled to go through that crushed drive you speak of in order to get your timber? There was no other way; that was the only road.
5525. You had to go through this crushed drive in order to get to Kelly's shaft? Yes; we were working on the Central boundary. If they have a set on one man, it is a shame (I think) that the whole party should be made to suffer. When Mr. Harper was here, I was only working one month underground at McGregor's shaft, Block 11. I had the offer of being an underground boss; but I preferred to go up and work on the surface at my trade. Mr. Harper is the best and most practical manager we have ever had here. We shall have to have stronger social and political influence to bear on those mines before justice is administered to the worker.

James Hebbard sworn and examined:—

- J. Hebbard. 5526. *His Honor.*] Your name is James Hebbard? Yes.
- 23 July, 1897. 5527. You are Inspector for the Albert Mining District? Yes.
5528. When were you appointed? I was appointed as inspector in December, 1891.
5529. Was there another inspector before you; or are you the first inspector? There had been an inspector here, but he died.
5530. What was his name? William Rue.
5531. What is the extent of the Albert Mining District? I think Tiboburra is considered the limit to the north, and that is a distance of about 200 miles.
5532. What are the boundaries of the district itself;—what distance might you have to go if any fresh discoveries were made further north? My district has never been defined; the other inspectors do not come this way further than Cobar, and I conclude that my district extends to the Queensland and South Australian borders, and to the Darling.
5533. Has it never been marked off on any map, or described in any proclamation? The inspector for the Albert Mining District simply has his headquarters at Broken Hill; the other inspectors have theirs in Sydney.
5534. Is there any inspector stationed between here and Sydney? Not resident.
5535. Mining is going on at various other places outside of Broken Hill within what you consider to be your district? There may be ten or a dozen men engaged in actual mining at Mount Browne and Tiboburra, the balance being puddlers. The mining at White Cliffs is intermittent, depending mostly on the amount of work available on the stations. Their work there consists almost entirely of paddocking.
5536. How far is White Cliffs from here? About 160 miles. There is no actual mining there, except in turning over ground in the manner of deep trenching.
5537. Is that north from here? About 60 miles north-west from Wilcannia.
5538. That is E., N.E. from here? Yes. Then there are about 110 men engaged at Tarrawingee, and perhaps sixteen or seventeen at Thackaringa.
5539. How far is Thackaringa? From 25 to 30 miles from here by buggy; it is 6 miles this side of Cockburn, which you reach by train.
5540. What are they doing there? Mostly fossicking. The lodes do not go down very deep there; they are of an undulating formation. Nearly every man there is a "hatter."
5541. Simply open-trenching? Not that exactly; every thing can be done with a windlass. Nearly every man there is on his own hook, and sends his ore either to Port Pirie or Dry Creek.
5542. Do these other mines outside Broken Hill require you to leave headquarters on any occasions? A day, or a day and night, or two days, will suffice for a visit to any of them, excepting Mount Browne and Tiboburra, which take about twelve days. I have not been up there for over two years; and the Chief Inspector does not consider it necessary for me to visit those places frequently.
5543. Practically, then, is there any work for you outside Broken Hill, except at Tarrawingee? There is Tarrawingee, The Pinnacles, and Thackaringa; also Yuba, where there are a few men working.
5544. The Pinnacles you can almost call Broken Hill, I suppose? Yes; you can reach them in an hour. There is also a small party of men working at Balaclava, engaged in opening up a copper lode. This lode is being opened up by men from the Moonta copper-mines; and it is situated towards Menindie.
5545. Then it is possible you may be taken away for a day or two from here? Yes, when I visit Thackaringa I generally take a run over to Yuba at the same time; and to do this double visit it requires me to leave here by the express at night, and to be absent from the Hill until the second evening.
5546. You would come back the second day after leaving? Yes.
5547. You would be away two nights and two days? Yes.
5548. There is nothing doing at Silverton? No, nothing at all.
5549. What do you say in your opinion—quite apart from all question of salary—as to the necessity or expediency of there being another inspector for the whole Albert District, in addition to yourself? I do not think there is any necessity for it, your Honor; and I have already reported in that way to the Department.
5550. Assuming, of course, that your salary would remain as it is now, and looking at it as a New South Welshman having to pay for the inspector, is that what you say? I do not think there is work for another inspector. Of course, I should be very pleased to have one for company.
5551. He would have to put in all his time loafing? Yes; unless we travelled together.
5552. That is your opinion then? Yes, that is my candid opinion.
5553. You think you can do the whole of the work with perfect ease? Yes.
5554. It does sometimes happen that you are sent for very suddenly? Yes, sometimes.
5555. Well, then, supposing you are away at one of these outside place? If a fatality occurred they would have to wait until I could come back. That has been done. A fatal accident occurred during one of my trips to Mount Browne; and they waited.
5556. Of course it is not absolutely essential that you should see the man who is killed? No; there is no rule to that effect. It has been the custom, at my request, for every place where an accident of a serious nature or resulting in death occurs to be left untouched until I view it. There is nothing in the regulations to compel that.
- 5557.

5557. How many days on an average in the month are you away from Broken Hill? My visits outside are so very irregular that I could hardly strike an average. Half a day will do for the Pinnacles; and since I have been in the district I have not visited Thackaringa once in three months, because there is no fear of danger arising there from any infringement of the regulations. J. Hebbard.
23 July, 1897.

5558. No sufficiently deep mining? No; the deepest they are working there, or have worked there for the last eight or nine years, is not more than 50 feet vertical. The lodes are small, and the enclosing rocks hard.

5559. So that, practically, you can spend the whole of your time in Broken Hill? Yes.

5560. And you do not think another man is wanted here? I do not.

5561. When was the system first instituted of reporting to the Minister all accidents that happen? I do not know; but I believe it was commenced some few months after my appointment. When I came here I found absolutely no records of any sort; and anything I wanted to know regarding accidents I had simply to fish out the best way I could. I then recommended to the Chief Inspector that he should request the managers to report all accidents; and a circular conveying such a request was ultimately sent out from the head office to all managers. There is nothing in the regulations providing that they should report accidents.

5562. Do you remember the date of that circular? I could not say. I think it was sent out on two or three occasions, when it was thought that accidents were not always being reported.

5563. You find that all accidents are now reported? Yes.

5564. And you make a report to the Chief Inspector? Yes.

5565. And the Chief Inspector reports to the Minister, or do you report direct to the Minister? All my correspondence is sent direct to the Chief Inspector.

5566. To Mr. Slee? Yes.

5567. And he sends it on to the Minister, if he thinks it necessary? Yes.

5568. Is every accident reported? I use my discretion as to whether I send a full report on. When I make my annual report I state the number of fatalities, and serious and minor accidents, and also the number of accidents which I had considered so slight as to be not of sufficient consequence to report to the Department.

5569. You do report anything of sufficient consequence? Yes.

5570. How long has that been done for certain? For certain, about four years.

5571. That being so, what do you say as to the increase of accidents within the last year or two—say within the last two years? I do not think there has been a noticeable increase. We get accidents in spurts; the same as this last spurt, where we had four fatalities, and an accident resulting fatally, in forty-eight or fifty hours.

5572. Which cases were those? They were the cases which brought the discussion on in Parliament. Timothy Ryan and James Taylor were killed on the same day; and a few hours afterwards James Kennedy and Henry Sawyer met their deaths at Tarrawingee; and a couple of days after, William Andrewatha met his death.

5573. It was these five fatalities that attracted public attention? Yes.

5574. Up that time you had not noticed any increase? No; it did not strike me that any increase was noticeable.

5575. On recollection, has it struck you that there was an increase? I do not think so, not in proportion to the increased number of men employed. Within the last eighteen months the mines show an increase of 1,600 or 1,800 workmen.

5576. As to the cause or causes of accidents, in a general way. Have you formed any opinion as to any prevailing cause or causes, as to any special want of care, or anything of that kind, on the part of any person or persons, resulting in accidents? In visiting places where accidents have occurred, particularly underground, I frequently have to make a mental note of the fact that the accidents might have been prevented had some little precaution been taken.

5577. On whose part? On the part of the men. Every individual face in a stope is absolutely in charge of the men who are working it; if they cannot safeguard themselves, no instructions from anyone else will do so; unless they are at the same time absolutely forced to do certain things that are often left undone.

5578. Have you had occasion sometimes to remark upon carelessness in the management? No.

5579. You remember no occasion on which you have had cause to notice carelessness in the management? I cannot call to mind any particular instance. So many accidents came under my notice that you must excuse me if I cannot remember the exact circumstances in every one of them.

5580. The general impression left upon your mind is that the cause has been rather carelessness upon the part of the men? I would not say carelessness for a moment, your Honor; I should be inclined to think that it was not carelessness altogether that caused accidents, but, perhaps, error of judgment.

5581. Some act which was unavoidable so far as the management was concerned? Where men are working in a stope together, the management cannot have anything, or can only have very little, to do with their safety. If they provide the men with all the tools and material they require for working the stope, that is practically all they can do for the individual safety of the men.

5582. Except to make rules which, if the men carried them out, would help them to secure their safety? Speaking apart from my position as inspector, I would not give a finger-snap for rules. If the men have not got such knowledge as to know what is essential to their safety in carrying out their work underground, I do not think it is any good tying rules round their necks.

5583. There are some few general rules which are useful for information to men who are not quite up to the mark in knowledge? Yes; but I do not think mining operations can be carried on by rules.

5584. Not by hard-and-fast rules going too much into details? The safety or danger of workmen in a mine is largely a matter of common sense.

5585. It would be well to have general rules in some cases; for instance, if a man could be sharply fined for stripping floors? If the fine could be recovered I think it would act as a deterrent against carelessness.

5586. A fine, with imprisonment for non-payment? Perhaps a rule in that direction might have some good effect.

5587. Has it struck you in the course of your going through the causes of the different accidents that that has, or has not, been virtually the source of many smaller accidents and some bigger ones? It is only occasionally that things of that sort have happened in later times; there used to be a good deal of it one time

- J. Hebbard. time; but accidents of that description very seldom occur now. I remember two or three cases where men have fallen through; and this is brought about sometimes by a man treading on a broken lath after shooting.
23 July, 1897. 5588. I suppose you hardly know of a case where a man has been seriously injured through falling through one floor? It would largely depend on the manner of his falling; if he fell in such a manner as to strike his head on something hard, he might receive serious injury. Take Harvey's case, for instance; it was not the stone falling on him that killed him, but his falling back and fracturing the base of his skull.
5589. Serious risk is generally involved by a man's going down several floors? Yes; but from my experience it must be very rare that that can happen. I have had to serve one or two notices on companies for not having laths on the floors; but my action was very prompt; and at the time the notices were served there was, I believe, a scarcity of 10 x 2 timber through the failure of their ship to come in to Port Pirie; and the companies were struggling on, meanwhile, the best way they could.
5590. How long ago was that? I think the case where that occurred was quite recently, either at the end of last May or the beginning of June.
5591. Did any accident happen in consequence of the shortage of timber? I did not hear of any. The juries in Broken Hill have declared that verbal notices from the inspector to the managers are not sufficient; and I therefore serve with written notices wherever I think the matter is of any importance at all: and I must say that they have always been obeyed.
5592. As to the question whether the rules and regulations under the Act are sufficient to ensure the safe working of a mine, especially in regard to explosives and the system of timbering. There is a set of regulations of course? Yes.
5593. No doubt you have noticed a peculiarity in the regulations, when compared with the Act, which has been the subject of certain legal decisions. I will not ask you what conclusion you have formed: at the same time, you have, no doubt, formed a very definite opinion on that matter. But, supposing the rules are within the powers of the Act, you might (I think) express an opinion as to whether they want amending? As applied to this particular district, I think if the rules that are in daily practice in this district were embodied in our regulations that would be as much as could be done.
5594. You think the rules of the mines are good ones generally? Yes.
5595. There is only one set of rules in force here? Yes; the Proprietary have a set for the surface, and a set for underground; and they are practically the outcome of my conversations with the managers at different times. I had a hand in their framing; in fact they were sent to me for revision.
5596. As to that rule *re* boring a hole alongside a hole that has been missed fire? I think that is a very dangerous practice. Even if there were a greater amount of risk in attempting to refire a hole by withdrawing portion of the tamping, that risk is soon over; whereas in the other case you are exposed to risk all the time you are boring the fresh hole.
5597. How long should a missed-hole be left? I do not think a missed-hole should be seen to, at any rate, within an hour.
5598. You think an hour would be sufficient to provide as a minimum? I think so.
5599. As to removing the tamping;—how near to the surface of the explosive do you think it safe or expedient to remove tamping? I think it could safely be removed to within 2 or 3 inches; but I do not think there is any necessity, from my experience, to go so close to the charge.
5600. On one side, you want to be sure that you get near enough to the charge to be reasonably certain that you put it off by the shot you merely put in for the purpose of exploding it; and, on the other hand, you do not want to go closer than you can help. Looking at both sides of the question, how far do you think it is reasonable to go? Not within 6 inches of the explosive. I do not think there would be any added danger in going 3 inches, provided the depth of the hole were correctly ascertained; but really I do not think there is any necessity to go within a foot. I have myself exploded a missed powder-hole with 18 inches of tamping left in it.
5601. And that is more difficult to explode by detonation than nitro-glycerine? That will be the question. When you have got dynamite inert, I think it is much more difficult to explode than grain powder by concussion.
5602. Supposing you were framing a rule, would you think it expedient to frame one providing some minimum distance within which you should not be allowed to go in drawing the tamping? If I were framing a rule, I would say, in the case of a powder-hole miss-fire, to go within 1 foot of the powder. In the case of dynamite, I would not like them to press the tamping upon it at all; it should be something soft that there would be no occasion to remove in case of a miss-fire. I would not allow a nitro-glycerine or dynamite hole to be tamped in any way.
5603. Then you say you would not allow anything to be removed because there would really be nothing to be removed? Tamping is both the material used and the operation of putting it there. When I say I would not allow it to be tamped, I mean I would not allow it to be rammed.
5604. But, in dealing with a missed-shot in nitro-glycerine compounds, what limit would you provide? In charging a hole I would begin by limiting the tamping to so many inches; and then there would be no need to remove anything.
5605. Where would you place the limit? Not more than 6 inches of material should be placed over the charge.
5606. You would let a man close the collar? Yes.
5607. That is very effective? According to my reading and experience, if you have absolutely excluded the air from the charge, you have provided all the conditions for a perfect explosion.
5608. You do not think it matters whether you close the collar or not? No, not if the tamping is down on the charge itself.
5609. If you could imagine the tamping being shot out as the first step in the explosion, before any disruption took place, then the fact that the collar was closed would make a great difference on the final effect of the shot? Yes, I believe it would; the same as putting a cork in the muzzle of a gun.
5610. You would provide that there should be no tamping or cover of more than 6 inches on the nitro-glycerine compounds; and in that case you would simply provide that in all cases of missed-holes with these compounds the tamping should not be removed, but a fresh charge of one or two plugs should be put on the top to blow the original charge up? Yes.
5611. And that would apply to all explosives except powder? Yes; to roburite, rackarock, and all others.
5612. Gunpowder is the only slow explosive now? Yes.
5613. And so very little of it is used that it practically does not apply to mining operations? Yes.

5614. In what other respects do you think the regulations would be better for amending? There are a lot of things that might be done to bring them up to the ordinary requirements of this district. Rule 1 reads: "Adequate amount of ventilation"; and that leaves something very discretionary in the power of the inspector. J. Hebbard.
23 July, 1897.
5615. You think there ought to be a provision, as in coal-mines, for a certain fixed quantity of air? Yes, or else that the temperature in any part should not be allowed to rise above a certain point. The air in all metal-mines is good enough in quality, provided it is sufficient in quantity. There is nothing deleterious, except what is given off from the breath. At present the only test we have is the common-sense one of seeing how a candle will burn. There is nothing in the regulations to guide you as to what shall be stipulated as an adequate amount.
5616. Do you think 100 cubic feet per minute for each man and animal should be supplied, as in coal-mines;—do you think that would be practicable or expedient? I do not know that that amount could be given, or that it would be necessary; because there is very little, if any, noxious gas to pollute the air.
5617. Of course in many coal-mines there is no sign of noxious gas, except that given off from the breath? I think it would be much better in metal-mines if the question of an adequate amount of ventilation was based upon the temperature.
5618. What would you provide as the limit of temperature? I could not say definitely without some thought on the matter. I think we should find most of our mines pretty comfortable if the temperature did not rise above 80. The atmosphere underground is different from that on the surface.
5619. Eighty would not be too low a limit? I believe the limit fixed in Victoria is a good deal higher—95, I think. Broken Hill is Heaven to a lot of the mines in Bendigo. [*Mr. Polkinghorne: The south drive in the Central was 75 last summer.*] I think the limit should be obtained by some series of experiments extending over a given time. That would be the best way to arrive at what should be an adequate amount of ventilation.
5620. But still that would not be sufficient by itself, would it;—you might have a cool part, where the temperature never rises above 80; and yet the ventilation might be very bad? It seems to me that you can govern the amount of air in any of these mines by temperature.
5621. Would you leave it this way: That the ventilation should be such as the inspector approved, and that the temperature should never be allowed to exceed a certain fixed limit? I would not leave it to the discretion of the inspector.
5622. Not as to the amount of ventilation? No.
5623. Then you would have to provide for a specific quantity of air passing a given point within a certain limit of time, as they have in coal-mines. Yes; something of that sort. I think the better way to arrange it in these mines would be by the temperature, instead of by the quantity of air passing per minute.
5624. But, then, do you not see the difficulty;—you might have one very cool part very badly ventilated; temperature does not always rise with bad air? The hot places are almost invariably the places where little air gets to.
5625. If you were to drop a thermometer and candle together down a great many holes, you would find the candle going out from carbonic acid, while there would be very little change in the thermometer? The acknowledged test here is from the burning of a candle; and that, with the temperature, would (I think) be quite sufficient.
5626. You might make the minimum quantity less than 100 feet? Yes, that would be a good way; but I think the other would be the handier.
5627. Could you provide for both—that a certain quantity of air shall pass a certain point in a given time; and that the temperature in no working-place shall be allowed to exceed a certain fixed limit? The only difficulty in that is that in lots of places in these mines you could not have a certain amount of current passing a given point. Supposing you were driving a long drive to make some connection for the ventilation.
5628. In coal-mines it is managed by bratticing, as well as by furnace or fan? That makes me think that the temperature test would be the most convenient—the very remote possibility of the presence of carbon dioxide in metal-mines.
5629. As to the limit of time after "bulling," do you think any fixed limit of time should be provided; or should it be left to the discretion of the men carrying out the work? The man who is carrying out the work can always tell very readily whether a hole is ready to charge, by putting his tamping-bar down. There certainly would not be any explosion where he could bear his hand to the stick upon drawing it out of the hole.
5630. You do not believe in the possibility of any piece of smouldering fuse being left in it? The force of the explosion would blow everything of that kind clean out of the hole. I think water might be thrown in as an additional precaution.
5631. Do you think that is a matter that requires any additional regulation; or should it be left to the discretion of the men? I do not think it would do any harm to limit the time to one hour before charging.
5632. Meanwhile, other work could be going on? Yes.
5633. You believe, with most of the witnesses, that there is no necessity to use a metal tamping-rod at all, even with powder? If I were going to charge a powder-hole to-morrow I should not like to tamp it with a wooden rod; and it has been my experience that I can procure a copper bar cheaper than a copper-tipped one.
5634. Do you think it safer to have a copper tamping-bar only; and would you exclude all other metal tamping-bars? I do not think there is any harm in allowing the use of metal tamping-bars, provided they are copper-tipped, or wholly copper.
5635. You would allow a bar tipped with copper? Yes.
5636. How much tipping? Six or seven inches. I do not think that the length provided for in the regulations is sufficient. Where nitro-glycerine compounds are used there is no necessity for a metal bar at all. There may be occasion to use powder in a mine; and then a heavier bar than a wooden one is necessary.
5637. But with a wooden bar a few feet long you can put on a very considerable amount of squeezing pressure? You can put a little pressure on, but powder wants to be rammed in the same way as you drive your ramrod into the barrel of a gun. You produce a better explosion by doing that with the gun; and I am sure it is the same in the other case.

- J. Hebbard. 5638. So you would not modify the rule to exclude metal tamping-bars altogether? No, certainly not.
5639. Would you make it a regulation that nothing but a wooden tamping-bar should be used in the case of any explosive except powder? No, I would not do that either. I do not see a bit of harm in using a metal bar of any description in putting a plug of dynamite into a hole. As far as the danger of doing it is concerned I would just as soon put dynamite into a hole with an iron bar as with a wooden stick—I mean so far as the danger of friction is concerned.
5640. You think there would be no danger from a spark? No.
5641. Would it not be possible that one spark might set it sizzling? No; you must have a flame to set it on fire. I do not think there is any danger in pressing home a charge of dynamite with an iron bar, or with any bar that you might like to use.
5642. You would not encourage it? I think the operation can be done just as well with wood; but there is no danger with metal.
5643. You would make it compulsory to use wood in all cases; but you do not think that an iron bar copper-tipped for 6 inches would be dangerous? I have no objection to a copper-tipped bar.
5644. Do you not think there is a risk, in using an iron bar tipped with copper, in a rough hole, of its causing sparks by friction of the iron on the sides of the hole somewhere near the collar; and of the spark's dropping down on to some powder that may be hanging on the side? That might occur.
5645. The Tarrawingee accident, for instance. That must have been caused in some way like that, unless they were ramming through the bag with the bar? Of course, you can only theorise upon these accidents.
5646. It may have been the compression of the air that caused the explosion. You could put terrific force on a plug with a 1½-inch steel bar 21 or 22 feet long, if you rammed it down 5 or 6 feet with one push? Yes.
5647. I think you said that a bar of copper throughout was less expensive than an iron bar copper-tipped? That is my experience as a manager. Wherever I have been managing I have always had bars all copper, and found them a good deal cheaper than joining a piece of copper on to an iron bar, even if copper were 15d. a pound.
5648. How many pounds would an 8-foot bar probably weigh? I never had a bar that long. In mining operations, if you have a bar 3 ft. 6 in. or 4 feet long it would be a very long one. It does not run to much.
5649. Do you not think it would be better to provide that it be made of copper entirely, if a metal tamping-rod were required? Yes, it would be cheaper.
5650. As to the quantity of explosive to be entrusted to any one man? I think from my knowledge of the regulations that what that regulation means is this: At the time it was framed it was the custom for each pair of men to take their powder in a can underground, and store it close by where they were working. That is what the regulation means, in saying that a man shall not have in his working-face more than 6 lb.—one can-full.
5651. What regulation would you substitute for that? I would make the regulation read that a man shall not be allowed to take into his working-face more explosive than is actually required for the firing about to take place.
5652. Then you would pass over the possibility of his wanting to put in other shots shortly afterwards; you think it would be better to give him the little trouble of going for a fresh supply than to let him run the risk of storing any surplus in the face? He should not keep any explosive in his working-face at all; he should keep it back some short distance, and then bring in the quantity he requires.
5653. You would let him keep a quantity stored back in a quiet spot? Yes.
5654. How would you limit that? I do not know how to limit that except by common sense.
5655. Generally speaking, fetching the powder would mean going up in the cage? No; it is the general practice in all mines to take underground as much as you think you would require for your shift; and, unless it was a hard face working with machines, I suppose 5 or 6 lb. would always be a long way outside the limit of any requirements for two men.
5656. And where machines are used the chances are there would be magazines underground? Not in all cases.
5657. They might bring down a larger quantity in excess than—larger in proportion to the larger quantity they would want; and how then would you frame a regulation to meet all cases? That no workman take into the face more explosive than absolutely required for the firing about to be done. There should be nothing kept in the working-face except that required for immediate use. He should only bring it into the working-face just as he was about to fire or ready to fire.
5658. Then you would not make any regulation as to the quantity he might keep at a distance from the face? I do not see how you could; because the quantity would be so variable.
5659. You would allow each mine to adopt its own regulation as to the way in which it distributed explosives? Yes.
5660. You observe that in the evidence there have been three distinct systems of distribution spoken of? That is according as it is most convenient. In some of the mines, where they are working under contract, the men practically go to a shop underground, and buy what they want for immediate use. The only restriction placed upon them is that they shall not leave any in their face. In the Proprietary Mine, when a man comes to a magazine he buys what he wants to use. In places where they work on wages mostly there is not that restriction; a man simply goes and asks for what he wants, and gets it.
5661. You think it would be enough to provide that a man be not allowed to keep at his face any quantity of explosive in excess of what he was using at the time? Yes; I think that would cover the general run of cases.
5662. That would apply to drives as well as to stopes? Yes.
5663. The best term to use would be "working-places"? Yes.
5664. In what other way do you think the regulations might be amended? I do not see how I could make a direct statement. Perhaps I should be able to answer questions if they were put to me. I might here refer to clause 17 of the regulations, which I consider very indefinite. It says:—
- Every steam-boiler shall be provided with a proper steam-gauge, water-gauge, and safety-valve; and at least once in every six months every boiler shall be subjected to a hydraulic test.
- I do not know of anything more indefinite than that clause. Of course, the six-months' test is complied with; and it has been an arrangement between the managers and myself that it shall exceed the ordinary working

working pressure of the boiler by at least one-third, and that a record of the test shall be kept in a book at the mine, and signed by the engineer and at least one of the assistants who observed the test; and in that book shall also be noted every detail of repair subsequent to the last test.

J. Hebbard.
23 July, 1897.

5665. One-third over the ordinary working pressure of the boiler? Yes; that, I thought, was the best way to interpret the clause.

5666. That is the load indicated by the safety-valve? Yes.

5667. Is there any provision for keeping the safety-valves on these land boilers locked? Every word about boilers is contained in that clause that I have read. There is nothing at all under the regulation to prevent a mine manager doing anything; except for clause 3, which gives the inspector authority to step in wherever he sees danger. There is no regulation whatever applying to the safety-valve.

5668. You think it would be wise to have a regulation in that direction? Yes.

5669. That regulation as it stands is of no earthly use? None whatever.

5670. What regulations should be provided for steam-boilers would be a very big question? Yes.

5671. I suppose you would hardly like to go into it? As far as the safety of boilers is concerned, I think the actual practice that is now followed out, and has been followed out since my intervention, is about the only thing that can be done. I know that in boiler insurance the test is very strict; the valves are kept locked, and all that kind of thing. For practical purposes I require them to merely set the valves to blow off at certain pressures indicated; and that is done every six months.

SATURDAY, 24 JULY, 1897.

James Retallick sworn and examined:—

5672. *Mr. Edwards.*] Your name is James Retallick? Yes.

J. Retallick.

5673. You are general manager of the British Broken Hill Proprietary Mine? Yes.

24 July, 1897.

5674. How many years experience have you had in mining? Thirty-five to forty.

5675. First in Cornwall? Yes.

5676. And afterwards on the Lake Superior mines in America? I was in Cumberland for two years, and from there I went to the Lake Superior mines, where I put in two years; thence to California for six months; and the balance of my time was put in on the Comstock line of lode, Nevada.

5677. You were twenty-two years there? Yes; I was for twenty years in the one mine.

5678. How long have you been here? About six years.

5679. What is the average number of men that you have had under you? Since the strike, about 210. We have had as many as 500, and as few as 50.

5680. Have you noticed any increase in accidents in your mine lately? The only accident we have had took place last year, excepting one of five years back.

5681. You have had three accidents? Yes.

5682. What were they? White, Barnes, and another.

5683. What was the first accident? The one to Barnes and White.

5684. What was the nature of that? It was brought about by an explosion.

5685. Was it an explosion of a hole they had put in themselves? The hole that killed them was an old one, and they had started to drill into it again.

5686. *His Honor.*] They were drilling into an old "bottom" Yes.

5687. Which was supposed to have been fired, but had been partly left unexploded? Yes.

5688. *Mr. Edwards.*] You never satisfied yourself as to whether it was an unexploded hole or an exploded hole with part of the charge left? No.

5689. There were three holes; and this one was in the centre? Yes.

5690. They were about 2 feet 6 inches apart? Yes.

5691. And it is quite possible that the two outside holes may have shot away the fuse, and left the fractureur in the hole? Yes.

5692. *His Honor.*] It may never have exploded at all? Yes, the two outside ones may have exploded before the middle hole had time to explode, and knocked away the fuse.

5693. *Mr. Edwards.*] Who were the men who put in the three holes, and tried to fire them;—the same men who were killed? I could not tell you; there were six men in that drive.

5694. But did Barnes and White sink these particular holes? I could not say; it might have been the men on the former shift.

5695. What was the nature of that accident where the man was crushed in the stop? A rock from the back came down on top of him.

5696. Was he working on contract? Yes.

5697. With the exception of those two accidents, have you had any other fatal accidents? Not since I have been there. Up till nine months ago there had been only one accident on the British.

5698. Have you had any serious accidents? One only, I think.

5699. How did that happen? Men were passing down timbers one to another; and the mate above called out to the one below to look out; and he answered back, "All right"; but he slipped back for his candlestick, and, in doing so, a strut caught him and broke the cap of his knee. There was another accident, where a man was injured by a truck because of his foot getting caught in the track.

5700. They were all the accidents you had there? Yes.

5701. In the majority of cases do you find the men you have up there experienced or inexperienced? We have some very good men up there; but a lot are inexperienced.

5702. Have you any printed working rules underground? They are stuck up about the shaft.

5703. Those are the Government regulations? Yes.

5704. You have no printed working-rules? No; but written rules at all flats.

5705. What shift-bosses have you? We have three shift-bosses for the miners, and three for the truckers.

5706. Are they competent, steady, men? Yes; they have all been in mines since boyhood.

5707. Is the mine sufficiently secured as far as timber goes? Yes.

5708. There is a sufficient supply of timber? Yes.

5709. Where is the timber kept? On the plat.

5710. And the contractors get it from there? The drilling is done by contract; and the timber is put in by the company.

5711.

- J. Retallick.
24 July, 1897.
5711. *His Honor.*] The company exercises its own discretion, through its officers, as to how the timbering should be carried on through the stopes? Yes.
5712. *Mr. Edwards.*] You have magazines on each level? Yes.
5713. And how are the explosives taken from the magazines to the workings? In boxes.
5714. Provided by the mine for that purpose? Yes.
5715. There is one rule in the Government regulations, that not more than 6 lb. of powder or fractour shall be used at one time;—that is insufficient? Yes; we want 15 or 20 lb.
5716. Would a rule be reasonable allowing a man to have in his possession 6 lb. after he has fired? He should not have any; he should know how much he wants.
5717. Then no man should have more than is actually required? No.
5718. Is the ventilation in the British good throughout? Yes, very good throughout. At the 400 it is not too good; but we are starting a winze there now.
5719. Will that give you all the air that is required? Yes; in fact we are blowing in there now. Of course when the winze is through we shall be able to do away with our fan.
5720. You "bull" holes there occasionally? We do not "bull."
5721. How long should a missed-hole be left before being touched? One and a half hour.
5722. Is that long enough for a missed-hole? Yes.
5723. I suppose you have had a lot of experience in explosives? Yes; where I came from there were only a few missed-holes.
5724. What is your experience about drawing the tamping of a missed-hole, or putting in another hole alongside it;—which is the safer practice? Drawing the tamping. I would never think of putting in another hole alongside; that would be very unsafe; in fact, I never heard of it before.
5725. If, in faulty fuse, the column of powder was broken or separated, do you know if the cotton would smoulder on and ultimately reach the powder below the fault? Yes, it will sometimes.
5726. *His Honor.*] You think it is possible that the cotton may carry the fire on over the fault? Yes.
5727. *Mr. Edwards.*] I suppose that is merely theory; because it is impossible in the case of a late explosion to tell how it was delayed or what took place;—it is merely guess-work? The way to test the matter would be to take a fuse, light it, and see the result.
5728. But then the conditions surrounding a fuse in the open-air would be altogether different from those underground? I think it would be a very good idea if the Department made experiments in this direction.
- His Honor:* I shall certainly suggest that that be done.
- Mr. Edwards:* Would your Honor let us know the result?
- His Honor:* Yes; I will see that it is furnished you.
5729. You supply the best fuse possible? Yes.
5730. And, if there is a splice in a fuse, the men need not use it? No; they can cut it out and throw it away.
- Mr. Edwards:* With regard to the experiments it is proposed the Department shall carry out, I think it would be well if, at the same time, experiments could be made on all fuses, as to their quality, &c.
- His Honor:* Yes; that might be done.
5731. To what cause do you attribute the great majority of accidents on the mines here;—is it to want of care on the part of the managers, or want of proper precaution on the part of the men? I think it is due to the men's own neglect. It was through their own neglect that Barnes and White were killed. The third man also showed neglect, because all the timber he wanted to secure the place was on the floor ready for him.
5732. Did it come out in evidence whether he had sounded the back before he took the risk? You could see the back easily enough; and it would have been all right had he put in a tom. You cannot get any boss or foreman in the world that can go round and make men do these things.
5733. So these two accidents were attributable solely to the men's own neglect? Yes.
5734. It is recognised as an unsafe thing to sink in a "bottom" without testing it? No experienced man would do it.
5735. It must be, then, owing to inexperience or neglect that these two accidents occurred? Yes.
5736. Or, in the case where the man was crushed, it might have been due to want of judgment? Yes; men will run chances; I have done things a thousand times over that I would not let other people do.
5737. Of course in your case it would be wilful neglect, and not want of judgment? Yes.
5738. In reference to the floors on the stopes, are the laths kept on, or are they taken off? They are always kept on.
5739. You do not take them off until you begin to fill with mullock? No.
5740. In all cases where men are working on the top floor you leave covered floors beneath them? Yes.
5741. How many floors should be left underneath where a man is working? They should be all left, I think, until you start to fill.
5742. *His Honor.*] But supposing there should be a very great demand for timber, and you wanted to strip laths, then now many floors below where a man is working would you make it compulsory that the laths should be left? I think two would be enough; but it is the ladder-way that you want look to.
5743. *Mr. Edwards.*] Can you suggest any additional precaution that can be taken in addition to what is observed now, with a view of preventing accidents in the future to men? No; we have all along been doing our best. Everything possible is done to prevent accident.
5744. Do you think additional inspectors will prevent accidents? No; I think if we had ten inspectors on every shift accidents would happen all the same.
5745. Do you think an elaborate system of rules and regulations will prevent accidents? No.
5746. Do you think it is possible that too many rules and regulations are likely to bring about accidents? I think if men are cautioned too much they do not then look about enough themselves.
5747. Do you know any part of the world where men are better cared for, or better looked after, than in Broken Hill? They are looked after better in Broken Hill than anywhere else. There is too much here altogether about the men. I have heard more here in a month than during all the rest of my life. It is possible to wet-nurse men too much, and then they do not look after themselves.
5748. *His Honor.*] In other places, if you wanted experienced men, had you any difficulty in getting them? No.
5749. And if you want experienced men here, what is your chance of getting them? When we want men here

here we have to take them as they come; and we do not know whether they are experienced or not until we try them. When we proved them we find some experienced, and some not; and the latter we send up to the surface. J. Retallick.
24 July, 1897.

5750. Have you more difficulty here than in other places you have been in in getting experienced men? Yes.

5751. That being so, I suppose it is more necessary to have rather stricter rules than those obtaining in other mines you have been on, to prevent men from doing risky and stupid things on account of want of experience? That may be so; but I never saw mining laws stuck up before in my life. If a man got killed, it was an accident; the company did its best to protect the workmen.

5752. If a man got killed it was his own look out; and that put them on their mettle? Yes.

5753. Of course, that is very well for a man who knows his business; but, if a man comes here (say) from a coal-mine, and works in a stope, although he might be a good man, you would not expect him to know the ins and outs of ore-mining; he would want some instruction? Men, when they come on, get instructions straight away.

5754. You think that if he were a good man he would find out very soon from other men what to avoid? Yes; very soon after he had started his work.

5755. *Mr. Edwards.*] Do you think the system of apprenticing youths would help to increase the standard of the underground miner in Broken Hill? Yes.

5756. You went underground when young? Before I was 10, and have been working underground ever since.

5757. At what age do you think a youth should be allowed to go into the face to be apprenticed? 16 or 17.

5758. And how many years should he work before being entitled to call himself a miner? That all depends.

5759. What is the shortest limit of time you would allow? Three years.

5760. I suppose a man at 19 or 20 is just as good as he ever will be? Yes.

5761. That is, if he is smart? Yes.

5762. And you could never knock mining into some men? No.

5763. Do you think it is necessary for the safety of the men that they should have a Board of Inquiry, consisting of a member appointed by the men, one by the management, and another by the Government, to inquire into all mining accidents; or do you think the inspector should be sufficiently competent to inquire into all accidents that take place? I think the inspector would be the most competent to make inquiries.

5764. I suppose it is not the most difficult thing in the world to get at the cause of an accident, if a man is on the ground immediately after? No.

5765. And there would be a greater probability of one man getting at the cause than two men prejudiced either way, and a third man who knows nothing about the business? Yes.

5766. Your hauling machinery is all in good order? Yes.

5767. It has been suggested that for fear an engine-driver should fall down in a fit there should be two in the engine-shed at the change of shifts, when men are being lowered and raised;—have you ever known of that practice in your experience? No.

5768. Do you think it would be safer to have two? They might engage in conversation and neglect their duty; and for that reason I think one would be better than two.

5769. In the case of dangerous ground, or any movement, and the underground manager or shift-bosses ordering men out, who should be the proper person to say it is safe for the men to return to work? The shift-boss; or whoever calls the men out.

5770. And if the inspector were called in, you would put the responsibility upon him? Yes.

5771. I understand that with the exception of the accidents you have mentioned, there have been no accidents in your mine at all? Yes, that is so.

5772. And up till nine months ago there had only been one accident in your mine since it was opened? Yes.

5773. *Mr. Polkinghorne.*] You say it was neglect on the part of Barnes and White that they met with their death? It must have been.

5774. You are able to come to that opinion; yet you have not arrived at the actual cause of the accident? It is a well-known fact that there was an explosion.

5775. But is it not rather far-reaching to say it was neglect on the part of the men, when you have no idea what gave rise to the explosion? I think every man who sinks in an old "bottom" without testing it first shows recklessness.

5776. Has it been proved that they were drilling in an old "bottom"? Yes; you could see the mark of the drill.

5777. The evidence stated that they bored into an old "bottom"? I claim that no man should put up a machine to drill in a face until he has first proved all the holes. He should clean them all out, and make sure; and then there is no danger. I have always seen that done.

5778. Barnes and White were engaged by you for the British Mine;—were they known by you to be experienced men? They were not engaged by us at all. Two men took a contract; and they got four others to come in with them, among whom were Barnes and White.

5779. In your opinion, they started to bore in the old "bottom"? In the old "bottom"; or near it. It would not be exactly in the old "bottom," from what we could see after the explosion.

5780. I suppose you have started many a hole within 3 or 4 inches of an old "bottom"? Yes; but I have always tested the old "bottom" first.

5781. You say you have run many a risk that you would not permit any man to run. That was not recklessness on your part, or want of judgment; still it would be on the part of the men? Say a man goes on who has not had much experience. He may be working a piece of ground, and be afraid of it. I would say, "Come back here; I will do that myself." That is done hundreds of times when old miners see young hands in difficulty.

5782. If in such a case you had met with an accident, would it have been through carelessness or an error in judgment? It would not have been carelessness.

5783. Would it have been error of judgment? No; it might have been recklessness.

- J. Retallick. 5784. It would be an error of judgment if you thought it safe enough? If you look at it in that light, it might be.
- 24 July, 1897. 5785. Have you ever met with an accident? I have never been in a shift where an accident has occurred. The men I have been with generally knew what they were going to do, and always looked around. I never worked in a dangerous place in my life but what I had a place in my eye to jump to quickly.
5786. Regarding miss-fires;—it would not be a miss-fire if the cap went off? No; there would be an explosion; but the charge would still be there.
5787. Have you ever taken any notice what has caused the miss in such a case? No.
5788. Sometimes a miss is brought about by a stoppage in the fuse? Yes.
5789. Do you think it is possible for the material or outside covering of a fuse to carry on the fire in the event of there being a break in the powder? Yes; the outside covering will smoulder.
5790. I believe that you work some of your sulphide stopes in the open-cut style? No; we work the stopes to 10 or 12 feet high, and then fill them.
5791. They are generally called in this inquiry underground open-cuts. You carry them 10 or 12 feet high before putting in sill-timber? Yes.
5792. That is the limit? We have not put any limit on yet; some only go to 8 feet in height, while one is 15 feet.
5793. What is a sufficient height to go to get your sill-timber in? It takes 9 feet for us to put in a sill set of timber. You want to carry the stope high enough, so that there can be put 3 feet of filling on top on which to blast, so as not to injure the timber.
5794. It is not true that you carry some of those stopes between 30 and 40 feet high without putting timber in? No.
5795. Do you think the drivers employed on winding engines in lowering and raising men should be certificated men? I do not think that it is necessary. Some of the best drivers I have ever seen in my life have been miners picked out of the mine. Of course, I would not put them on to some of the big engines, and I would not take this man or that man, or any man that I did not know.
5796. You must have some knowledge of the men you put there, in the interest of yourself and the company? Yes.
5797. As we have to have engine-drivers, would it not be better that only the holders of certificates from a responsible Board should have those positions? It might be as well.

James Hebbard re-called and further examined:—

- J. Hebbard. 5798. *His Honor.* Yesterday afternoon we were dealing with the regulation regarding the testing of boilers in relation to engines, and its absurdity was pointed out? *Witness:* Yes; I would like now, your Honor, to refer to the matter of ventilation again. In giving my evidence yesterday I overlooked the fact that in these mines here there are patches of sulphide that are very hot, owing to decomposition; and I do not think the temperature test would apply to them. As a general thing, therefore, I think it would be better to apply the quantity test.
- 24 July, 1897. 5799. The heat coming from the sulphides would be coming from the ores when actually stoped? Yes.
5800. And the difficulty is that you could cut off hot air coming from unworked sulphides, but could not do that with sulphides being worked? No.
5801. Discretion as to the heat would have, in that case, to be left to the inspector? Yes.
5802. There was a point that touched me in Mr. Retallick's examination as to explosives—as to the proper rule in dealing with old "bottoms." What are known as old "bottoms"? An old "bottom" is a piece of a hole that has been left, owing to the burden not having been torn to the bottom.
5803. I suppose re-boring in an old "bottom" may save a good deal of work? Yes; and sometimes it is absolutely necessary to bore in an old "bottom" so as to get the hole in proper position.
5804. There ought to be some regulation to prevent miners re-boring an old "bottom" without investigation of some kind;—what rule do you think there ought to be as to that;—what would be the simplest provision to make? Some rule making it compulsory to examine a "bottom" before boring in it. I do not think any work ought to be done in a face while there is any explosive in a hole anywhere.
5805. Or while there is a hole that may have explosive in it? Yes.
5806. Even when you have three holes charged, and distinctly hear three shots, there is a possibility of some unexploded explosive being left in the bottom of one of those holes? It has occurred that you get a very effective explosion, and all the burden is removed, still you find one or two plugs of dynamite in the bottom.
5807. That being so, do you think it would be expedient to leave it to a man to examine the hole by looking into it? By either looking into it or trying it with a scraper.
5808. Would it be safe to try it with a scraper? Perfectly safe. I have no hesitation in saying that, with nitro-glycerine, you can use any metal tool you like with perfect safety.
5809. But, suppose the explosive was of the nature of fulminate of mercury;—you could not then use metal? No; but we have no explosive of that nature.
5810. But such an explosive might come into use? Yes; but, of course, explosives will always be altering; and, in like manner, with the rules; or, at any rate, it will be necessary that they should.
5811. With powder, you could not? No; but powder is obsolete, except in open-cut work.
5812. Do you not think it would be better to have a pop put in? Then some of that may be left unexploded.
5813. You think, then, the hole should be carefully cleaned out in all cases? An examination should be made as to whether there is any explosive in the bottom; and, if so, it should be fired.
5814. Then you would put another charge in—one plug, I suppose? Yes; or whatever was necessary. I would not for a moment bore in an old bottom of any description unless perfectly satisfied that there was no explosive in it.
5815. The rule should be that the hole be carefully explored; and if any explosive were found in it an explodent should be put in to clean it out? Yes.
5816. That would make sure that nothing would remain? Yes.
5817. It would be again examined before re-boring? Yes. You cannot do away with the practice of boring in old bottoms or near them, because they are sometimes in the very identical place where you want to put in your hole.
- 5818.

5818. And you would be in nearly as much danger by boring alongside a "bottom" (say) to within 8 or 9 inches or a foot? Yes, almost as much danger; because the immediate vicinity of the bottom of a hole is always to an extent shattered. In this particular case referred to in the British, I saw the place before anything was removed from it. There had been three conduit holes: and it was necessary, in that particular instance, that they should begin to bore their hole right at, or very close to, the end of an old hole; by the position the machine was in, I judged they had been boring exactly at that point; it looked as if the drill had been pointing right to that spot. In that particular instance there was any amount of opportunity of examining the bottom of the hole without any trouble, because the face of the drive was clear of dirt. These men had cleaned out the dirt themselves; there was no more dirt there than a handful or two, which this last explosion had broken. I do not think there was any excuse at all for those men, except that, from the appearance of the face, it looked as if all the holes had been exploded.

5819. You think they were misled by assuming that all the three holes must have gone off? Yes; they were misled by the appearance of the face; the holes had done their work; and the face looked absolutely clear.

5820. That shows the necessity of enforcing the rule that men shall not bore in or near an old "bottom" without taking proper precautions? Yes.

5821. I suppose a good many people are still of opinion that it is impossible for part of a charge to remain in an exploded hole? I do not think any practical man holds that view. Of course these regulations are not meant for the best men, and for the safety of men who have had experience; and I think a clause of that sort would have a good effect.

5822. Is there anything more with regard to explosives that it strikes you to suggest? I do not know that there is. I might say that from what I see it is the general practice in the mines to take every sort of care in handling explosives. Personally I do not attach much importance to the question of great care in handling dynamite. I have often carried it in my shirt myself.

5823. Looking at the regulations again, is there anything else that it strikes you to suggest as a modification or alteration or addition? I think with reference to safety-hooks and safety-grippers that it should be made compulsory to adopt both of them. Safety-hooks to prevent overhauling, and safety-grippers to prevent the cage dropping. Safety-hooks are not in use except in one or two cases; but the safety-grippers are in use throughout.

5824. There are several forms of safety-hooks to which no possible objection can be made? Yes.

5825. Do you think that providing safety-gear will make everyone so careless that the result will be worse? I certainly do not. With regard to the open-cuts, I would point out that there is absolutely no provision in our regulations for any such work.

5826. They are quarries, in fact? Yes. There is only the merest reference to any such work; and that is in the definition of terms, where it says "or other excavations."

5827. "Other excavations" seems to cover them? But there is nothing in the way of regulations that in any way points as to how these cuts should be worked.

5828. Do you think provision should be made as to the batter or anything of that kind? I think there should be a fixed minimum batter; and something should be left to the discretion of the inspector as regards safety after that.

5829. If quarries were brought under the Mining Act, in some cases they might consist of granite or sandstone, which it would be quite safe to allow to overhang? I would certainly not allow rock of any description to overhang or to be even perpendicular; because pieces may become detached by the action of the air, and constant examination may not be deemed necessary. If the face is left anything like perpendicular there is a chance of injury resulting; whereas, with a fair batter, the stone, if going to fall, takes a long while to fall, and gives warning as it is coming down.

5830. You are aware that plenty of railway cuttings are absolutely vertical? But it does not matter about killing a few of the general public, so long as they are not miners.

5831. What would you provide as to a minimum batter? I do not think in any case that it ought to be steeper than 1 in 5—1 horizontal to 5 perpendicular.

5832. That, of course, would be a great deal too steep for some kinds of rock? Yes.

5833. Therefore, after all, do you not see you would have to leave it to the discretion of the inspector? After the minimum had been fixed.

5834. But an angle of 30 degrees would be only safe in one instance, whereas in another it might be 90 degrees, which would leave an angle of 60 degrees to be dealt with? Of course it would leave a lot to the discretion of the inspector; but, if there was something stated in the regulations, then you would have something to work on.

5835. Would it not be likely to lead to this result: there may be careless inspectors, or inspectors who do not like to take too much on themselves; and an inspector might be induced to accept the minimum angle—from the vertical—laid down when a very much smaller angle from the horizontal would be necessary, and so be led into taking a greater risk than if he had no starting-point? One contention against the regulations is that they leave too much to the discretion of the inspector. I do not think that there should be more than is absolutely necessary left to the discretion of the inspector.

5836. If you fixed it at one horizontal to five perpendicular, would not an inspector be inclined to accept that as having something more in it than it really could have; whereas, if the matter were entirely open, he would conclude that a much smaller angle—from the horizontal—would be appropriate? As for myself, it would not affect me in that way.

5837. Do you not think it might affect many men in that way? It might.

5838. Could you not suggest some other means for determining the proper angle? The inspector now can get on what batter he wants.

5839. Should there be a dispute over the batter between the inspector and the manager, who would settle it? If I did not get my way I would serve him with a notice, and the moral influence of that notice would have effect, because he would not like to have a fatal accident, and that notice brought in against him. The inspector generally manages to get his own way.

5840. The question is whether you could improve upon that by giving any hard-and-fast angle? Why I brought this matter forward is because there is no reference made to those open-cuts in the regulations; and up to now it has been doubtful whether the inspector had any right to interfere in any open-cut or quarry.

- J. Hebbard. 5841. That ought to be clearly expressed? Yes; at the present those words "or other excavation" are the only ones in the regulations which can be made to apply to the open-cuts.
- 24 July, 1897. 5842. Is there any other matter, in addition to the question of determining the batter, that you think ought to be specifically provided for in regulations dealing with the open-cuts? I do not see anything in the general practice of the work that would lead me to make any other suggestions. I noticed particularly that Mr. Stewart, in talking of the method in which they should be worked, spoke about putting in the "bottom;" which meant undercutting the top. That has never been the practice, and I have never seen any attempt at undermining the face since the very first days of the open-cuts. Abraham Baxter started to undermine; but I would not have it; we fought it out; and he had to come to my way.
5843. Do you think it would be as well to have a rule prohibiting undermining? I do not think it is necessary, because it is not the practice.
5844. It is a very dangerous practice? My reason for prohibiting it here was that they were railway men, and knew nothing of the condition of the lode under the surface. The ground was all undermined; and, if they had left their working-face in that condition, any slight lurch of timber underground at that particular point might have affected the face and brought the whole lot down on to the men; whereas with a certain amount of slope the danger would be very much decreased.
5845. Do you think it better again to leave the matter to the discretion of the inspector; or to provide that undermining should not be allowed, unless by special permit or something of that kind? I think it would be as well to disallow undermining.
5846. You can always get at it from the opposite system—breaking down from the top? Yes.
5847. And it is much safer? Yes.
5848. And you have then a batter? Yes.
5849. Does any other point strike you in relation to the open-cuts? No.
5850. Lighting, and all that sort of thing, has to be left to the approval of the inspector? Yes.
5851. And I suppose work of this nature, for a large part of the year, could be done very much better at night than in the day-time? Yes; the only trouble is that a man has to sleep at day, which is impossible in the hot weather. If I had my way I would abolish the night-shift altogether.
5852. Still, the miners would object to the abolishing of the night-shift altogether? In many places, only two shifts work; and, in some places, only one.
5853. And that is found to work better? Yes; in a place worked by two men instead of six you can produce 25 per cent. more work for the same money. The two men working at the one place continuously are following their own idea; whereas, in working three shifts, you have three separate ideas. Breaking ground is so much a matter of judgment that different sets of men must affect progress considerably.
5854. You think also that a man who has the opportunity of sleeping at night is a much better man to do work? Yes; if a man has to do hard manual labour he must of necessity get his proper rest. If a man goes a whole week through with an average of only three hours sleep a day, he is not much good at the end of the week. They cannot sleep in the day-time in this hot climate.
5855. *Mr. Edwards.*] You would not abolish the night-shift by regulation? Oh, certainly not. That is only a matter of opinion.
5856. *His Honor.*] It has been to a very great extent, I understand, stopped in the open-cuts? Yes; it is only on Block 11 where any night-shift is being worked; and then the work is for only sixteen hours in the twenty-four.
5857. As to the heading system, which goes here by the peculiar name of "chinaman";—what is your opinion as to that? I thoroughly agree with the evidence tendered by the men running the open-cuts as to the difference in danger.
5858. How is there a difference? When the open-cuts were worked on the level, and there was not much opportunity for a "chinaman," the minor accidents that occurred in the way of men letting stones fall on their feet, stones breaking in men's hands, bruised shins, legs, &c., more than outnumber the accidents that have occurred since the "chinaman" has been in use.
5859. You think the "chinaman" is not only a great saver of labour, but also of risk? Yes.
5860. Is the open-cut work specially dangerous as contrasted with underground work? I think not. If the quantity of material removed per accident were contrasted, I think you would find that there has been three or four times as much material removed from the open-cuts per accident as underground.
5861. If you take the quantity of ore won there would be a different proportion? Yes; but that would not be a fair way to put it. The quantity of material moved should be taken.
5862. The mullock has to be got to fill the mine; and the more mullock put in the safer the mine? Yes; the mines would not have been working to-day only for the mullock put in.
5863. As to working at night in the open-cuts, whether the system is dangerous. That would resolve itself on your evidence into this question: Whether there is a substantial element of risk resulting from work being done at night? I do not think so. The practice is that blasting and barring-down shall be done by day-light; and there is nothing for the night-shift to do except to remove material.
5864. Is the "flying fox" worked at night? Not now.
5865. There would be, perhaps, a little more risk in the use of the "flying fox," or a skip let down by a crane at night than in the day-time? Yes; because of the moving shadows.
5866. Therefore it is not necessary to go into regulations for the purpose of safe-guarding the lives of persons employed in that kind of work, unless it were in relation to lifting skips and the use of the "flying fox" at night. Supposing the crane or "flying fox" were used at night, do you think there is any regulation which ought to be adopted to minimise the risk in that respect? I do not think so. The practice at night is exactly the same as in day-light.
5867. It is always a case of "Stand from under"? Yes.
5868. What do you say as to competency on the part of the managers and subordinate officials;—what is your experience as to whether or not the risk to the miners has been increased by reason of incompetency on the part of the managers and subordinate officials; going down to the shift-bosses? I have not seen any incompetency. Of course, as far as the actual work of many of the shift-bosses is concerned, I do not see very much of it; but I personally know a good number of them, and am of opinion that they are men capable of doing their work.
5869. Have you any duffers in your eye at present? No.
5870. You do not know of any man who is incompetent? No.

5871. As to the best means of making known to all persons statutory enactments and regulations. Assuming that certain regulations are made and to be enforced, what is your opinion as to the best way to give the men a good opportunity of knowing what they are, and to try, if possible, to get them to find out for themselves what they are? I do not think it would entail a great deal of expense or trouble if the regulations were put up in book form. I think they could easily be supplied at a penny each; and a copy could be given to every man when engaged. J. Hebbard.
24 July, 1897.

5872. You think that would be better than to give him a sheet to stick up in his house; or would you give him both? I think if he were supplied with a copy of them it would be his own look-out if he did not know the provisions in them; and I do not think the cost of supplying the books would be greater than that of supplying calico posters, which would cost about 6d. each, and last only two or three months. I think it would be cheaper for the companies to adopt that plan.

5873. As a matter of fact, I do not think the expense of printing should be thrust on the companies at all; the books should be sent out by the Department. However, that is a matter of detail. You think a man should be supplied with one when first employed, and then afterwards be supplied with one at (say) a penny? Yes.

5874. You think the rules being printed in book-form would lead to their being read more? Yes.

5875. *Mr. Polkinghorne.*] As to that explosion in the British;—in your opinion, is it not possible that the middle hole of the three had not exploded at all? That might have been possible.

5876. If, as in this case, you had to blast three bottom holes in a drive, which one would you attempt to put off first? The middle one.

5877. And it is quite possible, if the middle hole missed, that the other two would do their duty so well as to make it appear that the whole had gone off? Yes; and in this case the clearness of the face may possibly have led them to believe that every hole had done its duty.

5878. I believe you said you have not noticed any increase in the number of accidents in this district in excess of the increased number of workmen? I do not think there has been any increase; it has not been noticeable; it is not impressed upon my mind that there has been an increase, except that we had four or five men killed within a couple of days a little while back.

5879. You have records for some time back of all accidents that have occurred? Yes; for the last four years.

5880. Can you say from memory what was the number of accidents during the first of the four years? I could not say from memory; the annual reports by the Department would give the information.

5881. Of course, that would be a means at your disposal to know whether there had actually been an increase? Yes.

5882. What do you assume the percentage of non-fatal accidents has been to the number of men employed? Accidents are divided into two or three classes.

5883. Take all accidents that are reported to you other than fatal accidents? There are lots of things reported to me that should not be called accidents at all. For instance, I can show you a report where a man upset a billy of tea on to his foot; which was sent to me as a minor accident, because it occurred on a mineral lease. If you come to my office any day I shall be most happy to show you any information of that kind that I can. Speaking generally, I think, if you include every sort of occurrence that has been reported to me, there would not be more than fifteen or sixteen casualties per thousand men employed. With regard to fatal accidents, I remember the figures for last year. In December last the total number of men employed was 6,013; and the fatalities for the year numbered twelve. For the previous year I think the numbers would be something like 4,500, and twenty fatalities, including those who were killed in the accident at the South. I think, taking it all round, that the percentage of fatal accidents is about 2.4 per 1,000.

5884. You think sixteen per 1,000 would cover everything? The number may be more than fifteen or sixteen; I am only speaking from memory. There are any amount of little things that are reported to me that I think should not be reported at all, and that are not worth mentioning in any sort of way.

5885. If a bone were broken you would consider that of sufficient importance? Oh yes anything in the way of broken limbs, bad bruises, and any injury to the head.

5886. *His Honor.*] They are all recorded in the Department? The reports of the companies to me are kept at my office; and I report from them to the Department. My reports are filed at the Head Office.

5887. You have to cull out a lot of little things that are trifling? Yes; I would like to mention here that there is no provision in the regulations compelling mine managers to report accidents to anybody. At present it is a mere matter of courtesy between the managers and myself.

5888. You think there should be a short clause providing for that? Yes; with all due respect to everyone concerned, I do not think this district has had fair play. I am absolutely certain that accidents in other portions of the Colony are not reported with anything approaching the care they are here. In other parts, the inspector is in the mine to-day, and may not be there again for another six months; and any small casualties that occur are not reported at all. The Barrier district, owing to my care in having every little casualty reported, shows a very much larger number of accidents than other districts; and unfairly so. I will give an instance. When managing at Orange, I never knew of an accident being reported to anyone concerned; and that was only five years ago. I have known of broken legs, broken arms, and other serious accidents, to occur, and no steps whatever to be taken to report them. That is why the Barrier to-day stands out so conspicuously above the rest of the Colony; but, in reality, it is no worse than any other mining district.

5889. *Mr. Polkinghorne.*] You think the regulations are not sufficient? I do not think they are; although as an officer administering the Act, I do not think I have any right to express an opinion.

5890. Is it your opinion that the number of accidents in mines and quarries has been largely increased through the provisions of the Mining Act being insufficient? No; I do not think so. If you built regulations to cover everything here, you could only embody in them such things and rules as are already in practice here.

5891. You said that the open-cut is not specially dangerous? I think that is quite manifest to anyone who looks at it.

5892. You have stated the best means you know of to make known to all persons employed what the regulations are? Yes.

5893. In regard to those open-cuts underground, have you, as inspector, ever seen them carried to what you considered a dangerous height? No.

- J. Hebbard. 5894. You have never had to caution the management for that? No.
- 24 July, 1897. 5895. It has been stated that they have been carried to a height of over 30 feet? I have never seen it. The greatest height I have seen would be perhaps a little more than sufficient to take the first two sets in. The difference between this hard sulphide ground and the other parts of the mines has been such that almost a new system of working has had to be evolved. We have had four mines working on that particular class of ground, viz, The British, Block 14, Block 10, and the Central; and now there is the Central South. They have all got a little different style; but, by-and-by, we shall have, I think, one system which will be just as universal as the present square-set system. As far as my experience of them is concerned, I think that absolutely the safest method so far adopted has been in the British, and there no permanent timber is used except that forming the level of the gangways to and from the stope. That system, I think, will be the one that will be adopted by-and-by throughout the mines where these large bodies of hard sulphide are being worked. To put in ordinary square-set timber in this class of ground, where there must of necessity be heavy blasting, is, I think, a great mistake. Timber there is of no use except as staging; and if you can make the mullock serve as staging you have something very much better than built-up timbers.
5896. *His Honor.*] Is the British in very hard ground? Yes; as hard as any of them.
5897. The lode itself is very solid? It is one solid mass of sulphide. Their method of working has been to strip the whole of the lode contained between the two walls to the height of 9 or 10 feet, or whatever is necessary for putting in the sill-timbers. Wherever the width or the flatness of the ground made it apparent that there was the possibility of something falling, "pig-styes" have been built. As the work proceeds, the mullock is brought in after the men, and sections at a time are filled in; and after that has been done the next run of stoping is proceeded with. The tailings from the concentrating mill are put in as filling. In Block 10, so far, their method has been to work with the ordinary timbers; advancing three sets, and then coming back and putting in one. The timber is always kept a given distance from the working-face; and the men are always within a reasonable distance of the back. In the Central, the lodes are very wide; and they thought it not expedient to stope the ore in the direction of its strike, but to cross-cut it. The cross-cuts were driven through the ground first: and then they were widened out and heightened. When five sets wide had been obtained, they proceeded to take out the broken ore; and, as it was taken out, they erected timber five sets wide and three sets high. All means were taken to steady the timber, but notwithstanding that, in heavy blasting big lumps of rock would come down and knock the timber about like skittles. I was there myself one day when over thirty sets were completely knocked out by one blast, although they were wedged and blocked to the ground at every point possible. They collapsed like a pack of cards.
5898. It is not the practice to bring ore out, as a rule, except in very large masses? That is the nature of it. It is better to attempt to bring it out in big masses than in small pieces, because the flying of rock from a small shot is much more violent than in big explosions. I think, on an average, the highest point at which the back has been above the bottom would not be more than 20 feet. The only time the back is not left within reach of the men is between the time of clearing the broken dirt and the erection of the timbers under it. It is absolutely impossible in that sort of ground to keep the timbers so close to the working-face as is possible in ordinary ground. The blasting is so violent that no timber can be made to stand near it.
5899. And that very hardness makes it safe to leave these large arched chambers? Yes, they are always of necessity arched; it would be utterly impossible to carry them level. If any weakness is observable, a prop, "pig-stye," or stack of some kind, is always built under.
5900. Can a weakness be detected in the case of a back 20 feet overhead? The weakness would be observed before they cleared the dirt; and, if there was any weakness while the dirt was there, they would break it down on to the dirt.
5901. Is that ore of a nature that the air acts on quickly? No; any shattering done is usually the result of firing.
5902. It is of too hard a crystalline nature for air to act quickly on it? Yes.
5903. *Mr. Polkinghorne.*] Then you do not think the air would act on it to any great extent? No.
5904. *His Honor.*] Which is the form of sulphide that gives off heat? Generally, the more friable sort.
5905. I suppose the fact that ore does not give off heat to a certain extent indicates that the air is not acting on it, and *vice versa*? What is technically termed "winding" or flaking is not in the nature of decomposition. The hot sulphides are either connected with some large natural cavity in the mine, or with a series of small ones.
5906. *Mr. Polkinghorne.*] You have never had to stop operations in any of this places because you thought it dangerous for workmen to be in them? Sometime ago a notice that I served on the Central Company was to the effect that a certain stope had better not be proceeded with until filling had been done. The stoping had got ahead of the filling operations. In this particular stope, there was so much of this sett timber standing, without any possibility of its being loaded or steadied with mullock, that I considered it a trap. A shot might, at any time, have knocked a lot of it down. In this case, the manager agreed with me, and he stopped further stoping until mullock was brought in.
5907. Are they now being worked as safely as could be? Yes, I think so, under the circumstances. You can only form your conclusions as to the safety or otherwise of any place by something occurring to prove it dangerous.
5908. *His Honor.*] You are all learning every day? Yes; and the alteration in the method of working these sulphide stopes is a case in point. It is utterly impossible for them to be worked on the ordinary square-set system.
5909. *Mr. Edwards.*] On the question of ventilation: I do not know whether you have arrived at any decision on that point;—how are you going to fix it;—will you limit the temperature, or limit the quantity of air to each man? I told His Honor this morning that, after reconsidering the matter, I did not think the temperature test would answer.
5910. But you did not say as to the limit of quantity of air you would allow to each man; in a coal mine it is limited to 100 cubic feet for each man; but you would not want so much in these mines, I suppose? I think the limit might be placed here at 50 cubic feet.
5911. Suppose you were running a drive, would it be possible to give 50 cubic feet to each workman? When talking of 50 many feet of air to the minute, you are talking of air supplied by artificial means of ventilation

ventilation. If you have to drive 200 or 300 feet away from the ordinary current, it is absolutely impossible to expect that you are to a certainty going to have any certain number of feet in that end. J. Hebbard.

5912. *His Honor.*] Could you not have ordinary galvanised iron pipes, rolled and soldered, and a fan used at the outer end to drive the air in? Even that will lead to trouble. I have seen, in plenty of places in hard ground, where the vibration of air in blasting would flatten the pipes. 24 July, 1897.

5913. The vibration of the air alone? Yes.

5914. Could they not be covered with mullock? That would necessitate sinking the drive a foot lower.

5915. If they were laid in the corner of the drive? I do not think it is practicable to lay pipes on the bottom.

5916. You can only simply direct the air into the mouth? Yes.

5917. *Mr. Edwards.*] Of course, it is to the interest of the mine to have plenty of air? Yes.

5918. At the same time, a hard-and-fast regulation insisting upon a certain quantity of air might hamper operations considerably;—I take it that the 100 feet provided in coal-mines is to allow for prevention of choke-damp and other gases peculiar to coal-mines. Some coal-mines are perfectly free; but you can never tell when choke-damp or these other gases might appear. We, however, are perfectly free of that here. So do you not think 50 feet is rather a liberal allowance where those things have not to be accounted for. You see, if you had two men in a face, that would mean 100 feet passing every minute? I do not think, except in very exceptional cases, that the ventilation is less than that now. I think the great majority of the working places in the Broken Hill Mines have ventilation equal to that required in coal-mines.

5919. How would it do to put 50 feet as a standard limit, and leave a little elasticity to the inspector?

5920. *His Honor.*] Yes; put it in that way—that the management shall supply 50 cubic feet per minute for each man, unless they get a special permit from the inspector? Yes; that would do.

5921. *Mr. Edwards.*] That would meet cases where it is necessary to contend against bad air, while putting in a drive to make a connection to better the ventilation? Yes; I think in making connections it should be left to the discretion of the inspector; also when prospecting or developing work is being carried on. In those cases it would be well to allow the inspector the discretion to let work be carried on with a less quantity of air than 50 feet for each man.

5922. Do you know the quantity of air a man takes into his lungs and vitiates every minute? According to one of the latest authorities, one-fifth of a cubic foot per minute; and, on that assumption, 50 cubic feet per minute would give a man any amount of air.

5923. Supposing we had a man of less experience than yourself, and who was possibly a harder man than he should be; do you see the difficulties he could throw in the way of the management? I do not think we should cut that too fine. Our mines will be getting deeper all the time, and, possibly, hotter, owing to the decomposition of the sulphides. I think, if you are going to fix any limit on the ventilation, you should make a very ample one.

5924. As they get deeper, it might be impossible for them to supply the quantity of air that you insist upon in your rules, although a less quantity might be ample for all purposes? I do not think it would be impossible to provide it, and I am pretty well certain that the shafts in operation along the line of lode are sufficient to provide an ample supply of air.

5925. That is all right enough at the present depth. (*Witness*): The depth will not make any difference.

5926. I suppose you will have to sink your levels as you sink your shaft; and the deeper you go, do you not find it more difficult to keep up the supply of air? Not if you have a connection between the two shafts. A shaft will draw just as well at 3,000 feet as it will at 300 feet.

5927. How has this difficulty with the ventilation occurred in Bendigo? Because there is no connection.

5928. What is the ventilation there? I could not say.

5929. My object is this: I do not wish to have any rule passed that might in any way operate harshly upon the men who are working; at the same time, I do not want any rule passed that will hamper operations; and the question is, whether, in passing a rule that 50 cubic feet per minute shall be supplied for each man, you are not giving more than is absolutely necessary? I am not saying absolutely that 50 feet should be fixed as the limit; and I think that such a question as that should be gone into thoroughly before determining upon anything finally.

5930. *His Honor.*] It is a matter you would like to see referred to some of the best experts? Yes; and I would like to go very thoroughly into the matter myself before suggesting any fixed standard.

5931. *Mr. Edwards.*] You think a most careful investigation should be made; in fact, a fresh inquiry instituted to go into that particular subject, before a regulation is framed fixing any limit? Yes.

5932. The difficulty is this: that most of the scientific men you get on ventilation are men without practical knowledge so far as mining is concerned;—whom would you suggest as being the best experts to give evidence, apart from book-men or theorists? I really do not know. Even with practical men the difficulty might arise that they would probably know that there was an insufficient amount of ventilation, and not know the reason of it, or how to increase it. All I wanted to say on the matter is this: that the rule under the regulations is not sufficiently definite, and that, in carrying out my duty as regards ventilation, there is absolutely nothing to go on except my own feelings in the matter. In metal mines, when a candle will burn well you are generally supposed to assume that the air is right enough.

5933. That being so, could it not be left to the discretion of the inspector? The manner of the burning of a candle is the only guide an inspector has; but even when a candle burns all right there may not be enough air to admit of the mine's being worked comfortably.

5934. It would be absurd to make comparison between these mines and coal-mines as to ventilation? Yes, of course.

5935. *His Honor.*] It comes to this in the coal-mines now, that they are about the healthiest places to work in as a rule—healthier, in fact, than in the open. (*Witness*): There is not very much to complain of as regards the ventilation in these mines; and, as far as my experience goes, I say absolutely, without fear of contradiction, that the ventilation here is a long way better in every sort of way than in any of the mines I have been in in other parts.

5936. *Mr. Edwards.*] Then you have to provide for greater depth, more men, and the consequent increased difficulty of ventilation; you want to protect men, and at the same time not hamper operations? I know work has to be done sometimes in mines where the air is heavy, and where it is light. It may be necessary

- J. Hebbard. 24 July, 1897. to make new means of ventilation through a stope that has not been worked for a long time, for instance in Block 11 after the fire, where, to ventilate some of the stopes, the men had to work under difficulties; still, the work had to be done. All such matters as that would have to be left to the discretion of the inspector; and it would be nonsense to talk about bad ventilation in such cases, inasmuch as the very object of the work was to improve the ventilation.
5937. It is a most important subject with reference to works? Yes.
5938. And you do not know, from your experience, whether a man requires 45 cubic feet, or 5 cubic feet, of air a minute? It has never been in my experience a necessity to measure the air; and that has never been the method adopted here of arriving at the adequacy or inadequacy of the ventilation.
5939. You do not know from practical experience the quantity of air required for a man to work with? No.
5940. You think it is such an important subject that making a regulation in a hasty way for it might be productive of great evil either one way or the other? Yes. I want to say that my reason for mentioning this matter of ventilation is that it is absurd to have a clause merely stating that an adequate amount of ventilation shall be supplied.
5941. You would leave it this way, that the mine shall provide such ventilation as shall be deemed necessary by the inspector for the time being? Of course, you might have an unreasonable inspector. I think it always advisable that not too much be left to any man; it would be much better if he had something to work upon, which should always be the case.
5942. With regard to the open-cuts; I suppose you will admit that both Mr. Stewart and Mr. Baxter have had greater experience in open-cut work than you have? Most decidedly.
5943. You have heard Mr. Stewart say that he had 20,000,000 tons of stuff moved in one mine at Tharsis? Yes.
5944. And you know Mr. Baxter has moved a lot? Yes.
5945. In reference to undercutting a face; I suppose, when Mr. Stewart said that, he did not mean to make the overhanging dangerous; there are degrees of undercutting? Mr. Stewart in mentioning the operation of undercutting gave, I think, a wrong impression. The toe is at the base, and is the solid portion still left, which is blasted out by a series of small holes. It was that, I think, that Mr. Stewart referred to.
5946. You blast away the toe; and that straightens the face to a great extent? Yes; but it would not be undercutting. I do not think it is intended, or ever has been intended, that any of the operations in the open-cut would be facilitated by undercutting; and I think that Mr. Stewart conveyed a wrong impression when he spoke upon this matter. He meant to cut the solid toe right into the face.
5947. *His Honor.*] Not under the face, but up to the face? Yes.
5948. *Mr. Edwards.*] I suppose you know that the universal custom in railway cuttings is to undercut, and to have an overhanging burden? I have never had any experience in railway cuttings. I know when Mr. Baxter came here he wanted to undercut the face, and I managed to prevent him.
5949. You had good reason then because of the cut being over old workings? Yes.
5950. But a great deal now is on solid ground? Yes.
5951. However, no accident has ever happened here from undercutting? There has never been any undercutting done; I promptly stopped it.
5952. Something was said by a witness, I think his name was W. Williams, about some winze that was not protected at No. 3 level? I have seen the winze any amount of times, and I have been down in it three or four times.
5953. I think he stated it to be a very dangerous place? I think what Mr. Williams said in regard to that winze was absurd. So long as he nailed the boards up after he blasted them off it would have been right enough; and I do not think even an iron framing round that brace would have stood the heavy firing.
5954. He said there was no protection round the brace. (*Witness*): That is all nonsense; a framing was formed of 10 x 10; and on the outer side of that was 10 x 4.
5955. What is your idea about having two engine-drivers in the engine-house during the raising of men? I think if it were made the rule it would have to be broken in the greater number of instances. If there was only one shift employed, they would have to engage another engine-driver; and the same would apply to where there are only two shifts. Where there are three shifts, of course they could work it.
5956. About changing in the face; do you think it would have the effect of preventing accidents? I do not think that any good would be done by making that the rule, because it is quite as easy for men to meet and exchange their ideas about their work at any place other than the face; and, in fact, in nine cases out of ten it is more convenient.
5957. But the thing is this: can you describe anything as accurately and as well as you can point it out on the spot? Yes, you can.
5958. You could describe the condition of a face, or the position of a missed-hole, as accurately as if you had a man in the face and showed it to him? Yes; I could tell within 6 inches of any spot.
5959. Supposing you did not know who was following you? I would make it my business to find out. That is where they make the great mistake, not meeting.
5960. But in order to get over that difficulty? I do not believe in having anything to do with incompetent men; and I am certain of this—that, if a competent man is relieving me, I can indicate to him just as plainly in two minutes by word of mouth the position of any missed-hole, or dangerous or treacherous ground, as I could by pointing it out.
5961. That is when the men are competent; but, even then, supposing you did not meet your mate, and the shift-boss, who has forty different messages, omits to tell him, how would you get over that? I think it would be quite safe to make a rule that the men being relieved should be met somewhere by the men relieving them.
5962. But would you not fix a place;—they could not meet at the plat, because there would not be enough room for them; and they could not meet at the brace very well? As a matter of fact they could meet in the plat easily enough, or in the level leading to the plat.
5963. If they can meet in the plat, why not meet in the face? Because as a rule the blasting is done at relief of shifts; which enables the air to clear during the time occupied in changing.
5964. Why cannot they fire a bit earlier, so as to let the face clear before the relief comes on? The work is cut out to be done in a certain time; and if they were to fire half an hour sooner they would either have to work under pressure or do less work.

5965. It may be wrong, but I understood from some of the witnesses that they had no fixed time for firing; that they put in a shot and fired whenever the condition of the ground demanded it? The general rule is that all firing shall be done at relief of shift.

J. Hebbard.
24 July, 1897.

5966. On some parts of the mines, men work for a fortnight without firing a shot; still, they are in dangerous ground? Yes.

5967. There would be no explosion there to interfere with them? I do not think, so long as the men meet their mates, that there is any good to be obtained by making them meet in the face; and I am absolutely certain that by so doing you will cause a lot of irritation and do no good by it.

5968. But how are you going to meet the men coming on, in the case, say, when a man is sent on from the office. You know that on Mondays half the men are not at work, and their places are taken up by strangers altogether. How is a man to know a stranger, unless he meets him in the face? I will admit that there are difficulties there.

5969. I think men not meeting in the face is a fruitful cause of accident; men leave missed-holes for instance.

5970. *His Honor.*] You can tell a missed-hole by there being no report; and the next shift should not work in that face; but, if they received no warning, they would start work, and, in all probability, be immediately killed? Of course, there are difficulties about it, but I really think that, if a rule were made that men should change in the face, the inconvenience and difficulties in carrying it out might possibly lead to more trouble than there would be advantage gained. Men can always find the shift-bosses on relief.

5971. And then you would have to provide that men should not go down until they had communicated with the shift-boss? I think it would be well to make a provision that the men going off should meet the men coming on.

5972. But the question is where? —

5973. *Mr. Edwards.*] The witness from Block 14 said that men run off and leave their faces in wild confusion, and that at 4 o'clock they are only too anxious to rush up to the cage? Yes.

5974. If it were possible to arrange it, do you not think it would prevent accidents? I believe accidents have occurred which would have been prevented had the men relieved in the face. I do not think it would in any way be a loss to the men should relieving be done in the face; they go down at 8 o'clock, and come up soon after 4, and they can only work three eight hours in the twenty-four; therefore, if a little is taken off of one shift it is put on to another; it works round, as it were; it is all equalised, whether changing is done underground or in the changing-house.

5975. *His Honor.*] The two risks, I understand, are loose ground, which does not necessarily occur only where blasting operations are carried on, and missed-holes? With a missed-hole you cannot relieve in the face.

5976. Not literally in the face, but as near to the face as would be advisable. What happens when missed-hole is reported to the men going on shift. Those two men cannot go to the face at all for some little time? A man who has any opinion of himself will not leave a missed-hole to his mate, but would rather stay two hours, and work it off himself.

5977. But still the two men are there? They would be put on to something else; they would not be compelled to be idle because of a missed-hole.

5978. *Mr. Edwards.*] The cases I had in my mind were where holes had been charged but not lit? That would be failure of duty; and if a man failed to do that he would fail to do anything.

5979. *His Honor.*] How would you provide that men should be able to meet one another, and advise of things in the face? It seems with Mr. Edwards that the difficulty is who is the mate; but I do not think that difficulty occurs very often now.

5980. They might miss their mates by crossing? It is the custom, according to the evidence, for only one man to go up at a time.

5981. I did not understand that to be the rule? It is the general practice.

5982. What is the object? So that they can meet their mates.

5983. But they might miss even then? There is little probability of that.

5984. Unless they meet in the face, you cannot suggest any rule by which it could be absolutely assured that they would not miss one another? No, I cannot. It comes to this, that if you want to make absolutely certain of the men meeting each other they must meet in the face.

5985. If a rule of that sort were made, do you think it would lead to very great dissatisfaction? Yes; it would be worse than taking a shilling off their pay.

5986. It would not keep them away long; it would take them just so much longer as it takes a man to get from the brace to the face? Yes.

5987. That may run into ten minutes or a quarter of an hour? I do not think it would average that.

5988. Therefore you think it would not really be a hardship, although it would be looked upon as a hardship? There are certain prejudices you cannot prize out of a miner's heart with a crow-bar; and it is little things of this sort that go to inflame them, and create much irritation, although in reality there are no substantial grounds for it.

5989. Do you know of any mines where it is the rule to change in the face? No; but I know of plenty where it has been tried, but has always had to be dropped on account of its not working properly.

5990. You cannot see a way of getting out of the dilemma? No; only by changing in the face; and there the remedy would be worse than the cure. I am absolutely certain that if any attempt be made to bring it about, that men shall change in the face, there will be a hole blasted at fifteen minutes to 4, so that the relief cannot be effected in the face.

5991. *Mr. Edwards.*] I suppose it would be quite possible for the mines to say you cannot blast beyond a certain time? And then the men would say we must blast when we find it necessary.

5992. *His Honor.*] How about making a regulation providing that word shall be left in the plat;—could that be managed? I have seen that plan adopted; a slate has been hung up, and anything to be communicated was written down.

5993. And you can safely assume that miners can write, or, if not, get some one else to do it for them? Yes.

5994. Do you think that could be managed? I think it would be very cumbersome here, and would not work out.

5995. Supposing it only applied to matters considered dangerous, such as miss-fires or dangerous ground, could it then be enforced? I think it could.

5996.

J. Hebbard. 5996. In that case, a man would be bound to make an entry, and would also probably see his mate; if he should, however, miss his mate, the entry would be there? Yes; I do not think there is much fear now of men not meeting their mates, or not being able to recognise them. Things that way are better now than they used to be.

24 July, 1897.

5997. Why? The contract system has made men take more interest in their work; it is to a man's interest to make his mates understand the work he has been doing.

5998. Is it, in your opinion, expedient that managers, or under-managers, or shift-bosses, or any men employed in looking after men on mines, should not be liable to be summoned on juries? I do not see that that should make any difference. It should not matter what the *personnel* of the jury is.

5999. *Mr. Edwards.*] That is not the question; it is as to officers having to leave their men? There is usually somebody to take their place, and I do not see that that makes a great deal of difference.

6000. This is in reference to an application made by mine-managers to be relieved from service on juries. In Victoria, any man who has charge of twenty men or more is exempt from serving on a jury; and an application has been made here to have all mine-managers, shift-bosses, and men who have more than twelve men serving under them, exempt from jury service? I think it is advisable that a man in that position should not be dragged away from his position more than possible.

Mr. Edwards: *The Circuit Court and the District Court were held at the same time on the last occasion; and I think eight officers from the Proprietary were in attendance. Considering the nature of their work, they ought to be as exempt as I am.*

6001. *His Honor.*] A mine-manager may get on a case lasting three or four days; and, during that time, the mine would be without his services? I think, considering the duties of a mine-manager, he should be exempt.

6002. Would you apply that to shift-bosses? I do not think there is any necessity to go so far as that, because, in that case, there are so many doing practically the same class of work.

6003. *Mr. Edwards.*] I suppose you would say that the foremen and heads of different departments and engine-drivers should be exempt? Yes. As to engine-drivers, every engine has its own personality; and no man is master of any engine until he has had some practice with her; and, if the other two men worked for him, they would break the law, because of their working more than eight hours a day. It would also give rise to a very great danger to allow a man to work an engine more than eight hours at a time.

6004. *His Honor.*] As to certificates for engine-drivers? If a certificated engine-driver came to me I would give him a test.

6005. Still, if you advertised for an engine-driver, you would rather choose from a number of certificated men than from men without certificates? Yes; because I would be certain, then, that they knew something about the principles on which an engine is constructed.

6006. Although practice is most important in the matter of engine-driving, theory is very useful? Yes; I think a man is a little better if he knows something of theory. He ought to know an engine's workings; and (I think) he should be certificated.

6007. You do not believe in miners being certificated? No. If a man can handle a hammer in the various positions, it is pretty safe to assume that he knows the rest. I think it is quite true that there are a number of incompetent miners on this field; in fact, there is no doubt about it. They may be handy men in other capacities, but they are certainly not miners. In viewing the scenes of accidents, this much has been very patent to me; that if the men concerned in them had done what any reasonable men would have done, the accidents would not have occurred; and it is this that leads me to think that incompetency is the cause of a large number of accidents.

6008. *Mr. Polkinghorne.*] Is there any regulation in the Act providing for the number of shafts? No.

6009. Do you not think there should be,—should not the Act insist that there be two shafts carried to the level of the deepest workings on every mine?—

6010. *His Honor.*] Or one shaft divided into compartments—an up-cast and a down-cast? All shafts are like that; but *Mr. Polkinghorne* means two distinct shafts. I do not think that, in a mining district, there is any necessity for that provision, because one mine never stands by itself; and there is always some way of communicating to some other mine.

Mr. Polkinghorne: *There is one mine in Bendigo whose workings are a good many feet below any of the other workings on the field, and it is impossible, in that case, to make a connection.*

Witness: *Would you compel the company to carry down another shaft?*

Mr. Polkinghorne: *I think you should compel them to make a communication from the lowest level to other workings, so as to encourage a draught.*

Witness: *I think it is very desirable that two shafts should be connected at the lowest level possible; and here there is no difficulty in doing that because of the number of shafts.*

His Honor: *You would leave that to the inspector; because, if provision be made that a certain amount of air be supplied to working-places, it will have to be done somehow.*

Mr. Polkinghorne: *If a mine had two shafts, there would also be a means of escape; and, as an instance pointing to the necessity of such a provision being made as regards metal-mines, when I was in Bendigo the men were delayed underground for sixteen hours, and were underground altogether twenty-four hours, before they could get out. That was brought about by the breaking of a rope, which resulted in the shaft being so knocked about that the cages could not travel either up or down.*

6011. The risk is generally done away with by large mines always requiring two shafts, and by mines working near one another making connections? Yes; the only mines here that are not in the position of being able to connect with the others are the North and the Consols. They are the only two not connected at present; of course, I do not say that they should be connected.

6012. You do not think it would be practicable or fair to enforce in metal-mining the rule that is in force in coal-mining—that each mine shall have two shafts? I do not think it would be possible, because, when a metal-mine is opening, there is no telling what is in it.

MINES AND QUARRIES IN THE ALBERT MINING DISTRICT.**

APPENDICES.

Appendix No. 1.

EXHIBIT "A."

THE BROKEN HILL PROPRIETARY COMPANY, LIMITED.

RULES AND REGULATIONS to be observed (in conjunction with the Government Mining Regulations of New South Wales) by all underground workmen, including braccemen, brace-truckers, winding-engine drivers, and all other men employed in or about the shafts, on the surface, who are connected with the underground department.

1. All workmen connected with the underground department shall work shifts of 8 hours, less 20 minutes for "crib."
2. Any workman arriving late will lose one shift.
3. No workman shall be permitted to enter or remain on the mine while in a state of intoxication, or to bring intoxicating liquor on the mine.
4. Lowering and hoisting men, &c.—No workman shall enter a cage under any circumstances till the signals, specified on the signal code, have been given and received. When a cage, resting on chairs, requires to be lowered below that level, the engine-driver after receiving the signal to lower shall, before lowering, raise the cage about 3 inches to allow the chairs to be withdrawn. Brace and platmen, and any who may be authorised from time to time to attend to this matter, are strictly forbidden to withdraw the chairs till the cage has been raised as above stated. When both cages are in gear, the engine-driver shall not move either cage before receiving signals for both of them. Shift-bosses on duty when shifts are changing shall remain at the plats underground and at surface brace until this operation is completed. No signal shall be given to the engine-driver affecting any cage unless such cage is at the level from which the signal is to be given.
5. All workmen are prohibited from entering any place throughout the mine where not absolutely required by duty to be at the time.
6. Workmen shall not remove or interfere with any precaution for the safety of the underground employees, such as coverings over, or guard-rails around shafts on surface, winzes, ore-shoots, or other dangerous places, and shall keep all such places in the vicinity of their work as it proceeds, properly covered or railed-off. As a matter of common safety, any workman who shall observe, or come to the knowledge of any damage to, or deficiency in, any part of the workings, any defect or flaw in the cages, chains, ropes, or chairs, or in any part of the engine, machinery, gearing, or plant used in or about the mine whereby the safety of workmen or others may be impaired, shall be bound forthwith to communicate same to the shift-boss or foreman. Workmen are prohibited from tampering with any marks which may be made in any part of the workings for the guidance of the workmen or the management; or interfering without authority with any part of the machinery, gearing, or plant, in any way whatever. If in the various mining operations underground the workmen notice any undue pressure on the timbers, or any movement or disturbance in the ground which might be in any way considered dangerous, they shall immediately convey information of such to their shift-boss who shall at once advise the foreman. It will be the duty of the shift-boss whose attention has been directed to such matters, to fully explain (before he leaves the mine) to the shift-boss who relieves him, the nature of the movement in the ground, or anything else which may require special attention, and the relieving shift-boss having been so informed shall notify the workmen under his charge of any danger or indication of same. If at any time a movement in the underground workings should occur which would be at all likely to cause a subsidence on the surface, it will be the duty of the shift-boss in charge of that particular section of the mine to immediately notify his foreman about it, and the foreman shall, without delay, inform the contractor, the contractor's foreman, or anyone in charge of the surface work immediately over where the movement underground is taking place, so that the men may be withdrawn from the open-outs or other surface work. If the shift-boss cannot quickly find his foreman, he must himself convey the information to those in charge of the surface work.
7. Blasting Underground.—Before the fuse in a charged hole is lighted, due notice must be given by the man or men in charge of the blasting by calling out in a loud voice not less than three times the word "Fire!" the number of holes charged, and the number of the floor on and the direction in which the holes are, as for example: Two holes, seventh floor, north end; or three holes, fifth floor, south end; or four holes, ninth floor, east side; or five holes, tenth floor, west side. After the fuses are lighted, the men in charge of the blasting must guard the passages leading to where the blasting is being carried on, and they must prevent anyone from going dangerously near to the holes. If a hole has missed fire, the place where the missed-hole is must not be approached in less than ONE HOUR AND A HALF from the time that the fuse in such missed-hole was lighted; danger notices must be put in conspicuous places warning persons to keep away, and a man must be left to guard the place. A charge of explosive of any kind which has missed fire shall not be unrammed, and a fresh hole shall not be drilled within an unsafe distance of the missed-hole. When blasting in the square-set timbering, where the material to be blown out by the blast will fall upon the plank flooring of the square-sets, such flooring must be protected by laying loose planks or timbers across the regular floors, and the flooring must be further protected by a sufficient mass of loose ore or mullock laid upon the floors which are likely to be affected by the material blown out by the blast.
8. Smoking is strictly prohibited underground and during working hours on the surface.
9. Shift-bosses are fully empowered to discharge or suspend workmen under their charge for neglect of work, idleness, or insubordination.
10. All tools (hammers, gads, picks, &c.) shall be left at the face on quitting work, and the "planting" or secreting of tools of any kind is strictly forbidden. All blunt tools shall be delivered at the plats by the workmen using them.
11. Any employee or any other person, or persons, found removing from the mine specimens of ore, tools, candles, or any other property belonging to the Company will be liable to criminal prosecution.
12. Pay-day is on alternate Saturdays, the Company retaining three days' pay.

The above Rules are framed for the purpose of facilitating the work in the mine, and for the safety and benefit of all workmen on contract or otherwise. As it is impossible in print to provide a rule for everything, employees are required, under pain of dismissal, to strictly comply with any rules or instructions which may be made and given verbally by the management from time to time, and are further required personally and individually to exercise every care to prevent accidents to themselves or to their fellow-workmen.

Broken Hill, August, 1896.

A. STEWART,
General Manager.

Appendix No. 2.

EXHIBIT "B."

THE BROKEN HILL PROPRIETARY COMPANY, LIMITED.

RULES AND REGULATIONS to be observed (in conjunction with the Government Mining Regulations of New South Wales) by all surface workmen, contractors, and others in all departments of the Company's operations.

1. All surface workmen shall work eight hours daily on shifts, as required.
2. No workmen shall be permitted to enter or to remain on the Company's property while in a state of intoxication, or to bring intoxicating liquor on the mine.
3. Any employee coming to work late will lose one shift.
4. Shift-bosses are fully empowered to suspend or discharge any employee for neglect of work, idleness, or insubordination.
5. The workmen shall keep all dangerous places, in the vicinity of their work as it proceeds, properly covered or railed off, and shall not remove any precaution for the safety of workmen in the open-cuts, metallurgical plants, or elsewhere, such as the coverings of air passages, ore shoots, winzes, guard-rails, fences, or danger notices. As a matter of common safety, any workmen who shall observe, or come to the knowledge of, any damage to, or deficiency in, any part of the mine, whereby the safety of workmen or others may be impaired, shall be bound forthwith to communicate same to the shift-boss or foreman. Workmen are prohibited from tampering, or interfering without authority, with any part of the machinery, gearing, or plant in any way whatever.
6. Any person or persons found removing specimens of ore, candles, tools, timber, or any other property from the mine or the Company's works will be liable to criminal prosecution.
7. Smoking is strictly prohibited during working hours.
8. Blasting on the surface and in the open-cuts (excepting "bulling" of holes) is only permitted between the following hours, viz.:—2 a.m. to 2.30 a.m., 6.45 a.m. to 7.15 a.m., 12 noon to 12.30 p.m., 5 p.m. to 5.30 p.m., 9 p.m. to 9.30 p.m. Should blasting be considered necessary in any exceptional case at times other than above, it may be done only with the permission of the Company's surface foreman. When shots are about to be fired, contractors, or those in charge of blasting operations, must station men with red flags at all approaches to the work to warn off all persons by calling out, and repeating in a loud voice, the word "Fire," and at the same time displaying the red flags; and notice must be specially given to all persons inside of buildings within a dangerous distance of where the blasting is going on. All persons so warned must retire to places of safety, and in order to give such persons an opportunity to so retire, no charge shall be fired until five minutes shall have elapsed after the giving of the first warning, and such warning shall be continued until the whole of the charges shall have been exploded.
9. No holes are to be charged (unless for "bulling" purposes) with any kind of explosive whatsoever whilst workmen, other than those actually engaged in charging, are in the quarries or cuts, and before placing the charge in any hole for the purpose of "bulling" it, the powder man (known as the "powder-monkey") shall give due warning of his intention to charge same, when all workers are required to leave the part of the face or work which will be affected by the explosion (whether prematurely or otherwise) of the "bulling" charge. The powder man must repeat the warning immediately before exploding the charge. Before charging a "bulled" hole, sufficient time shall be allowed to elapse for the hole to cool off, varying according to the nature of the material and the weight of the charge, and every care is to be taken to ascertain that the hole is cool before beginning to charge for the blast. In the event of a charge of any kind of explosive missing fire, no workman whatever shall return to work in the quarry or open-cuts within an unsafe distance of the missed-hole until the blast therein has been successfully exploded, and those particular persons who are engaged in effecting the explosion of the missed-charge may only return to carry out their duty where there can be no further doubt that the charge has missed.
10. A charge of powder or other explosive which has missed fire shall not be unrammed, and a new hole must not be drilled within an unsafe distance of the missed-hole.
11. After a blast, and before men return to work at the foot of a face or batter, all loosened material shall be barred down in order to prevent accidents happening through unexpected slips of earth and rock, and while men are working at the foot of a face or batter, contractors shall at all times keep the faces or side batters in a safe condition, both as regards inclination of slope and absence of overhanging material.
12. A safe exit from open-cuts or quarries for the use of all men employed therein shall be made and maintained in good order by the contractors.
13. Where cranes or other overhead appliances are used, workmen shall not stand under the skip or load or within reach of such overhead appliances.
14. Pay-day is on alternate Saturdays, the Company retaining three (3) days' pay.

The above Rules have been framed to facilitate the work of the mine, and for the benefit and safety of the men employed. As it is impossible, in writing, to provide a rule for everything, workmen are required under pain of dismissal to strictly comply with any rules or instructions which may be made and given verbally by the management from time to time, and are further required personally and individually to exercise every care to prevent accidents happening to themselves or to their fellow-workmen.

A. STEWART,
General Manager.

Broken Hill, August, 1896.

Appendix No. 3.

EXHIBIT "C."

THE BROKEN HILL PROPRIETARY COMPANY, LIMITED.

No. _____

Underground Contract.—Stoping.

THIS AGREEMENT made the _____ day of _____, 189____, to terminate at _____ p.m. the _____ day of _____, 189____, between _____

(hereinafter styled the Contractors) of the one part and the Broken Hill Proprietary Company, limited (hereinafter styled the Company) of the other part: Whereby the Contractors agree to carry out the work enumerated below, subject to all the conditions and agreements hereinafter set out, and to take all personal risks and responsibilities underground.

1st. To stope the ore situated _____

from such positions as may from time to time be defined during the progress of the work, and in such quantities as may be required by the General Manager or whom he may appoint.

2nd. It is hereby agreed that the work of stoping will consist of mining the ore, breaking it into a suitable size, handling and dumping it into the shoots, sorting the ore from the waste material or mullock which may occur in the lode, removing and handing the framed timbers from the shoots nearest the point of work, and placing and blocking each square-set securely into position. The waste or mullock must be deposited in the open sets to form bulkheads as directed by the General Manager or whom he may appoint.

3rd. Sufficient men must be employed when necessary to obtain an increased quantity of any special grade of ore as may be required by the General Manager or whom he may appoint.

4th. The General Manager reserves the right to change the locality of the work providing circumstances, in his opinion, demand such a course; also to substitute one or more Contractors for any number of shifts for those signing this contract if, in his opinion, such a course is rendered advisable from any cause whatever.

5th. _____ men are to be employed in this Contract who shall be competent miners, and whose names must be submitted for approval to the General Manager, or to whom he may appoint, before work is commenced.

6th.

- 6th. The Contractors agree to do any timbering which may, in the opinion of the General Manager, or whom he may appoint, be necessary to secure the ground for safe working, and the price as stated below shall include all such timbering.
- 7th. This Contract is to be carried out subject to the rules of the Company, which are now, or may at any time hereafter be posted about the mine, and the Mining Regulations of New South Wales, so far as same require anything to be done or omitted to be done by the Contractors or any other persons employed in connection with this Contract, which said Rules and Regulations the Contractors hereby agree to fully recognise and observe.
- 8th. The Company agrees to pay at the rate of £ _____ for each square-set completed in accordance with the foregoing conditions, and to the satisfaction of the General Manager, or whom he may appoint.
- 9th. In the event of one or more of the Contractors not working full time, he or they will only be entitled, as his or their share, to the portion of the proceeds based on the actual number of shifts worked by him or them.
- 10th. The amount of work mentioned above is approximate only, and the General Manager, or who he may appoint, may determine this Contract at his option, providing circumstances in his opinion demand such a course.
- 11th. The Company shall incur no liability to any person whomsoever employed in connection with this Contract by reason of any injury or loss arising out of this Contract, or the work to be performed thereunder.
- 12th. Payments will be made fortnightly to each person employed in connection with this Contract upon the Company's timekeeper's certificate, and the Contractors hereby authorise and direct such payments accordingly, and the Company may retain 25 per centum of the amounts due; and if the Contractors or any of them, or any person employed in connection with this Contract, at any time make default in the performance or observance of anything on their or his part to be performed and observed, in pursuance of this Contract, the balance so retained as aforesaid shall thereupon be absolutely forfeited, and all the rights of the Contractors thereunder immediately cease.
- 13th. The Company will provide all candles and tools required for this Contract.

The expression "The General Manager," where used herein, shall be deemed to mean and signify the General Manager, or Assistant or Acting General Manager for the time being, of the Company, or any person he or any of them may from time to time appoint to represent him or any of them hereunder.

Given under our hands at Broken Hill, in the Colony of New South Wales, the day and year first above written.

Signed by the Contractors, in the presence of—

Part VII.—Minutes and Reports on Removal of Stopping in Road in Stockton Colliery; also, Minute and Report on Abandoned Districts in Coal-mines.

1. Minute by the Hon. Minister for Mines, asking for explanation <i>re</i> removal of stopping. 11 March, 1897	86
2. Under Secretary for Mines and Agriculture to Mr. Inspector Dixon, asking for report on removal of stopping. 11 March, 1897	86
3. Mr. Inspector Dixon, acknowledging above and forwarding report (with minutes). 15 March, 1897	86
4. Mr. Inspector Humble to Under Secretary for Mines and Agriculture, reporting on removal of stopping (with minutes). 20 March, 1897	87
5. Mr. Inspector Humble to Under Secretary for Mines and Agriculture, reporting further on removal of stopping (with minutes). 13 April, 1897	87
6. Minute by the Hon. Minister for Mines, on abandoned districts in Coal-mines. 25 March, 1897	89
7. Mr. Inspector Dixon to the Under Secretary for Mines and Agriculture, reporting on abandoned districts in Coal-mines. 31 March, 1897	89

* Omitted by the Printing Committee.

STOCKTON COLLIERY DISASTER.

PART III.

Correspondence and Decision to hold Investigation under Section 23, Coal Mines Regulation Act, 1896, into Stockton Colliery Accidents.

No. 1.

Minute by The Hon. the Minister of Justice.

Subject :—Stockton Inquest.

I HAVE had a consultation with the Minister for Mines in reference to this matter, and learn that he determined, when the accident was repeated, to have an inquiry under the provisions of the Coal Mines Regulation Act (sec. 23) as soon as the inquest was concluded.

It does not appear that another inquest is called for, provided the inquiry under the Act is proceeded with, as, under this course, a competent person, with assessors having special knowledge, will hold an investigation in open Court for ascertaining the causes and circumstances of the accident, after which the persons so appointed will report to the Minister, stating the causes of the accident and its circumstances, adding any observations which they may think right to make. This will ensure a finding. To hold another inquest would, as pointed out by Mr. Wilshire in his report, necessitate not only the exhumation of at least one of the bodies, but a long inquiry, with perhaps the same unsatisfactory result, while I understand no further evidence can be obtained other than of the character already submitted. The Coroner may be informed and requested to forward papers at once.

A.J.G., 14/1/97.

Wire sent to Coroner, 14/1/97.

Telegram from The Under Secretary of Justice to The Coroner, Newcastle.

Sydney, 14 January, 1897.

PLEASE forward all papers in connection with Stockton inquest, as Minister for Mines intends having investigation under section 23 of Coal Mines Regulation Act. Minister of Justice, for this and other reasons, does not think another inquest necessary.

No. 2.

Telegram from The Secretary for Mines and Agriculture to The Premier.

Department of Mines and Agriculture, Sydney, 15 January, 1897.

STOCKTON Colliery Accident: After prolonged inquiry, jury disagreed and were dismissed. It is necessary to come to some determination as to cause of accident, and Ministers in town, Messrs. Brunner, Gould, Cook, and myself, decided that it was desirable to carry out my original intention of holding investigation under new Act which gives this power. It is thought Judge Murray and two competent assessors, as required by the Act, should be appointed to hold the inquiry. Matter urgent. Kindly let me know whether you concur as to appointment of Judge Murray.

SYDNEY SMITH.

No. 3.

Telegram from The Premier to The Secretary for Mines and Agriculture.

Lorne, Victoria, 15 January, 1897.

QUITE concur as to Murray and inquiry.

G. H. REID,
Lorne.

No. 4.

Memorandum by The Secretary for Mines and Agriculture.

Department of Mines, 14 January, 1897.

SECTION 23 of the Coal Mines Regulation Act, 1896, provides that:—

Where it appears to the Minister that a formal investigation of any explosion or accident, and its causes or circumstances, is expedient, the Minister may direct such investigation to be held, &c.

When I received the telegram on December 4th, apprising me of the accident at the Stockton Mine, I was of opinion that the case was one in which the provisions of section 23 of the Coal Mines Regulation Act should be brought into operation, and a special investigation held as to the causes and circumstances surrounding the occurrence. In view, however, of the Coroner's inquest, I decided to defer action until the jury had deliberated, as it would be inadvisable to have two inquiries proceeding at the same time.

As the inquest is now concluded, and the jury failed to arrive at a verdict, I have, after consultation with the Minister of Justice, decided that the investigation shall now be proceeded with, so that some determination may be arrived at as to the cause of the accident.

S. SMITH.

No. 5.

No. 5.

W. T. Dick, Esq., M.P., to The Under Secretary for Mines and Agriculture.

Sir,

Newcastle, 13 January, 1897.

I have the honor to draw your attention to the result of the Coroner's inquest on the Stockton fatality, and to request that you will be kind enough to suggest to the Minister the importance of having the matter further investigated with a view of arriving at the cause of the deaths.

I have, &c.,

W. T. DICK.

It was decided yesterday that an investigation is to be held under the 23rd section of the Act. Resubmit on Monday next as to the persons to be appointed to make the inquiry.—D.McL., 15/1/97.

No. 6.

W. T. Dick, Esq., M.P., to The Under Secretary of Justice.

Sir,

Newcastle, 13 January, 1897.

I have the honor to direct your attention to the result of the inquest on the Stockton fatality, which is not only unsatisfactory to the relatives of the deceased and the general public, but also to the mine officials. I desire to point out the necessity for further searching investigation. The matter is far too grave to allow it to remain in its present condition. Will you kindly suggest to the Minister the necessity for instituting some other form of inquiry? I do not know whether a second Coroner's inquest is possible.

I have, &c.,

W. T. DICK.

Submitted. The Minister may, perhaps, approve of the effect of his minute, dated 14th instant, being conveyed to Mr. Dick, though it appears in this morning's paper.—G.M., 15/1/97. Approved.—A.J.G., 15/1/97.

No. 7.

The Under Secretary of Justice to W. T. Dick, Esq., M.P.

Sir,

Department of Justice, Sydney, 16 January, 1897.

Referring to your letter of the 13th instant, calling attention to the unsatisfactory result of the inquest held respecting the Stockton fatality, I have the honor, by direction of the Minister of Justice, to inform you that it does not appear that another inquest is called for, in view of the fact that the Secretary for Mines and Agriculture, whom he consulted in the matter, had previously decided, on the termination of the Coroner's inquest, to have a separate inquiry held, under the provisions of section 23 of the Coal Mines Regulation Act.

I have, &c.,

GEORGE MILLER,

Under Secretary.

No. 8.

Telegram from The Under Secretary for Mines and Agriculture to His Honor Judge Murray.

15 January, 1897.

The Government have decided to hold an inquiry as to the cause and circumstances connected with the Stockton Colliery accident, as provided for in the 23rd section of the Coal Mines Regulation Act. I am desirous to ask whether you will accept position on Board, with the assistance of two assessors; and, if so, the earliest date when you would be prepared to commence the investigation.

D. C. McLACHLAN,

Under Secretary.

No. 9.

His Honor Judge Murray to The Secretary for Mines and Agriculture.

Sir,

Drummecvin, Mittagong, 15 January, 1897.

In reply to your telegram received by me this afternoon, asking if I would accept a position on a Board to be appointed to inquire into the Stockton Colliery accident—I presume as Chairman or President of such Board—I have the honor to inform you that I am prepared to undertake the duties of the office offered to me as soon as arrangements can be made for the constitution of the Board.

I have to request that you will give instructions that a copy of the last Coal Mines Regulation Act, which I have not the means of procuring here, be posted to this address to-morrow, to be received by me in the ordinary course of post on Sunday morning, with all particulars of the matter which it may appear that I should be informed of. If it then seems to me that the work of the inquiry can be expedited by my presence in Sydney on Monday, I will go to town by the early train.

I have, &c.,

C. E. R. MURRAY.

P.S.—I have, of course, assumed that there is no probable chance of this inquiry lasting so long as to clash with the performance of my duties as a "Court of Review," under the Land and Income Tax Act.—C.E.R.M.

No. 10.

Telegram from The Under Secretary for Mines and Agriculture to
John Thwaites, Esq.

Department of Mines and Agriculture, 21 January, 1897.

PLEASE say if nominated whether you would accept appointment as an assessor in holding an investigation of the accident at the Stockton Mine, and of its causes and circumstances, under section 23 of the Coal Mines Regulation Act. Kindly favour me with an immediate reply.

D. C. McLACHLAN,
Under Secretary.

Telegram from John Thwaites, Esq., to the Under Secretary for Mines and Agriculture.

Adamstown, 21 January, 1897.

YES; if nominated will accept appointment.

JOHN THWAITES.

No. 11.

Alfred Edden, Esq., M.P., to The Secretary for Mines and Agriculture.

Hon. Sir,

Adamstown, 10 February, 1897.

As the House is not in Session, I am forced to trouble you on the following matter, viz., the appointment of Mr. John Thwaites as assessor to the Stockton Inquiry. It is looked upon as ignoring all the miners' representative men; not that anyone can put a finger on Mr. Thwaites' character. It is being discussed as wrong all over the district, and I am charged as the man that has recommended him to you, and so caused his appointment. I suppose he was recommended by some one; and I don't think you do things in a corner, and I ask you to kindly state who did recommend him, and so clear me from a charge that is doing me great injury. I have offered to resign my seat, so you will see how it stands with me. Awaiting an early reply,

I have, &c.,
ALFRED EDDEN.

Mr. Edden replied to.—D. McL., 10/2/97.

The Under Secretary for Mines and Agriculture to Mr. A. Edden, Esq., M.P.

Sir,

Department of Mines, Sydney, 11 February, 1897.

I am desired by Mr. Secretary Sydney Smith to acknowledge the receipt of your letter of yesterday's date regarding the appointment of Mr. John Thwaites as one of the assessors in connection with the Stockton Inquiry, and to say, in reply, that you did not make any recommendation on Mr. Thwaites' behalf, as you state you have been charged with doing. To the statement that you did, the Minister can give an emphatic denial, if it be necessary.

Mr. Smith wishes me to explain that Mr. Thwaites was first known to the Department when his name was prominently brought before it as a suitable appointment to make as one of the Board to select the examiners under the new Coal Mines Regulation Act; and although he was not appointed to that Board, yet the inquiries made at the time as to his qualifications and general character were such as to cause his name to be brought up when the appointment of an assessor on the Board of Inquiry had to be considered. The Department, before selecting him, gave the greatest consideration to his claims, and it comes as a surprise to the Minister if Mr. Thwaites has not the confidence of the general body of miners, as, from the exhaustive inquiries which were made before his appointment, it was considered he was in every sense a good and practical miner, with a knowledge of the work, gained not only here but in England; and was, moreover, held in general esteem and repute throughout the mining community. Your letter itself confirms this, as you state that Mr. Thwaites is a man no one can put their finger on as to his character.

I have, &c.,
D. C. McLACHLAN,
Under Secretary.

Mr. Dixon.—Can you say whether there is any general dissatisfaction as to Mr. Thwaites' appointment; and, if so, whether there are any grounds for it?—D. McL., 11/2/97.

I am not aware that there is any general dissatisfaction as to the appointment of Mr. Thwaites. If such were the case I should have certainly heard it. Mr. Thwaites is a thoroughly practical miner, with both Home and Colonial experience. He is well known in this district as an honorable, just man, with a character beyond reproach.—J. DIXON, 17/2/97.

Submitted.—H.B.S., 18/2/97. For the Minister's information.—D. McL., 19/2/97. Seen.—S. SMITH, 20/2/97.

No. 12.

W. T. Dick, Esq., M.P., to The Under Secretary for Mines and Agriculture.

Sir,

Newcastle, 17 February, 1897

I have the honor to suggest that the whole of the evidence taken at the Coroner's inquest, and at the subsequent examination before Judge Murray, together with the addresses made by the various representatives present, be combined and published. Such a publication would be of the utmost value as an instruction to mine managers, under-managers, and miners. It would tend to lessen the risk of danger from such causes, and would draw the attention of all concerned to various vital points in the new Act, to which sufficient attention has not been directed.

I have, &c.,
W. T. DICK.

The

The expense of printing the large amount of evidence taken would, I think, be considerable. The publication of the report of the Court of Investigation would serve all practical purposes.—H.W., 18/2/97. The Under Secretary.

Submitted.—H.B.S., 19/2/97. D. McL., 19/2/97. To await receipt of report.—S. SMITH, 19/2/97. Inform Mr. Dick that we are awaiting the publication of the report of the Court of Investigation.—H.B.S., 23/2/97. Mr. Dick informed, 23/2/97. Resubmit in a fortnight. Resubmitted, 10/3/97. In a week.—H.B.S., 10/3/97. Resubmitted, 17/3/97. Chief Clerk,—I do not think that it is intended to publish the report and evidence, unless called for by Parliament; perhaps this paper might be submitted to the Under Secretary.—H.W., 18/3/97. Put by.—H.B.S., 18/3/97.

The Under Secretary for Mines and Agriculture to W. T. Dick, Esq., M.P.

Department of Mines and Agriculture, Sydney, 23 February, 1897.

Date of letter under reply:—17 February.

Subject:—Stockton Colliery Disaster. Suggesting that the whole of the evidence taken at the Coroner's inquest, and at the subsequent examination before Judge Murray, together with the addresses made by the various representatives present, be combined and published.

Reply:—The Department is awaiting the publication of the report of the Court of Investigation.

I have, &c.,

D. C. McLACHLAN,

Under Secretary.

His Honor Judge Murray to The Secretary for Mines and Agriculture.

Court of Investigation, Stockton Colliery Accidents.

Sir, Department of Mines and Agriculture, Sydney, 4 March, 1897.

I have the honor to forward herewith, in duplicate, the report of the Court appointed on the 22nd day of January last, to hold an investigation into the causes and circumstances attending the fatal accidents which took place in the Stockton Colliery on the 2nd, 3rd, and 4th days of December, 1896. Attached to the report is a tracing of a plan showing some of the important workings of the colliery.

I also beg to submit a copy of the evidence and addresses taken and delivered in open Court at Newcastle, as well as minutes of the proceedings and sittings of the Court.

I have, &c.,
C. E. R. MURRAY,
President.

The report and evidence with plan were sent to the Attorney-General; copies are also with the Crown Solicitor.—D McL., 11/3/97.

No. 22.

Report of Court of Investigation.

Sir, Sydney, 4 March, 1897.

We, the persons appointed by virtue of the provisions of section 23, of the Coal-mines Regulation Act, 1896, to be a Court to inquire into and report upon the causes of and circumstances attending the fatal accidents which took place at the Stockton Colliery on the 2nd, 3rd, and 4th days of December, 1896, having completed our investigation, have now the honor to report as follows:—

Before taking the oral testimony which is attached to this report, we decided that it was expedient to adopt as evidence in this investigation the depositions taken by the Coroner at Stockton, in the course of the inquests held on the bodies of Curran and Smith, whose deaths are the subject matter of the accident which

which occurred on the 2nd of December, and on the bodies of Cockburn, Bailey, T. L. McAlpin, S. S. McAlpin, Charlesworth, Sweeney, Gascoigne, and Fitzpatrick, whose deaths constituted the second accident. But, before finally taking this course, we, by notice in sundry newspapers, invited all persons who wished to be represented at the investigation, held in open Court at Newcastle, to attend the hearing, and Mr. Dixon and Mr. Wilshire alternately appearing for the Department of Mines and Agriculture, Mr. Curley, on behalf of the Colliery Employes' Federation, the Stockton miners and the relatives of some of the deceased, and Mr. O'Sullivan for the Stockton Colliery Company and its officers, and no other persons suggesting that they had a *locus standi*, we informed all present of our intention to thus use the evidence taken at the inquests, adding that we should allow any of the witnesses to be further examined by any party, for which purpose we would, if requested, compel the attendance of the witnesses required. We invited objections to this course; all freely assented. We then proceeded to call Mr. Dixon, whose evidence had not been taken on either inquest, and afterwards called Gould, Burt, Jury, and Ellis. Messrs. Humble, McAuliffe, and McDonald were afterwards called, partly at our suggestion and partly by desire of Mr. Curley and Mr. O'Sullivan. We invited the production of any other witness whom any person present might wish to examine, or who might come forward to volunteer evidence, but the parties preferred to leave matters as they appeared on the depositions and the evidence taken, and no person tendered his testimony. Seeing no need to go further, we closed the Court, after hearing Mr. Curley and Mr. O'Sullivan, who elected to address us on the facts proved. In addition to the oral evidence taken, the tracing map herewith was also before us, and we had occasion to refer to the general map of the mine, which is, however, required for use at the colliery, and which we allowed, after its production in Court to be taken back. The tracing will sufficiently explain the evidence, and is the only plan we consider necessary to attach to our report.

Before hearing evidence, we made such a personal inspection of the mine as we judged expedient, for the purpose of informing ourselves of the locality.

To render the plan, which is generally very clear, and practically speaks for itself, fully intelligible, it is necessary to explain that the seam of coal worked at Stockton is double, consisting of a lower seam, serviceable to a thickness of about 7 feet, and a top seam, good for about 9 feet, separated by a band of blue shale, known as the morgan, 6 feet and upwards in thickness, and by some commercially useless coal. The lower seam only, as shown on the plan, has been generally worked, though in places the workings are in the top coal. The main return air-way shown rises from the lower to the upper level as it approaches the furnace drift, which is in the top seam; the same level is shown continuing thence through No. 3 door round the down-cast shaft, and contains No. 2 and No. 1 doors. This drive opens on the shaft at a stage some 14 feet above the bottom, the skips of coal for the furnace being raised to this stage taken in through No. 1 door, and then run round, on tram rails, through No. 2 and No. 3 doors, to the furnace, and returned empty in the same way. On the same level is shown the prolongation in a straight line, in a southerly direction, of the main return air-way, till it meets the narrower drive running to the eastward, crossed by two stoppings with trap doors; the ladder, further on, marks the descent to the bottom coal, whereby access is gained from the top level to the trap door "Z," formerly one entrance to No. 3 district, but now built up solid, or to the main engine plane. The drive again, on which the skips start from the down-cast shaft is continued across the prolongation of the main return air-way, to the westward, and is marked on the plan "to top seam by rope road." The tail rope, which hauls the trucks, empty so far as coal is concerned, outwards on the engine plane (along which it is led overhead on sheaves) runs from the down-cast shaft—having descended therein from the surface to the upper stage—along this "rope road" as far as the drive which turns off at an obtuse angle, by which it is led to the bottom level. But the "rope road"—which is thenceforth only a rope road in name—continues, on a down grade till it meets the main road or going bord (or "ganning bord") of the No. 3 district, passing over the "travelling road bottom seam." About the point marked "d" is now a solid stopping. Here was originally a large door; that was taken away some years ago, and a stopping, with a trap-door in it, was substituted; this again was removed some time about the middle of 1896, and was not rebuilt until after the two fatal accidents, the subject of this inquiry. This explanation will, it is hoped, clear up some difficulties presented by the tracing, by reason partly of its attempting to set out two levels on one ground plan.

The tracing does not show the workings on the north-east side of the haulage road. These, bounded on the east by the main return air-way for some distance, are also abandoned. They are affected with falls to a great extent. Unfortunately there is known to be a communication in the upper seam between these old workings and the No. 3 district, at the point marked on the plan with a red cross, where a bord has been broken through over the main road. No attempt has been made to get at and stop this communication, to attempt to gain access to which would probably be very difficult, if not impossible, and would certainly involve great risk. The consequence of the existence of this communication is that these old workings have become more or less charged with the noxious gases generated in No. 3 district, and that—failing the means of closing the connection—it has become necessary to seal off a large extent of these workings, a task involving the erection of many stoppings of great size, several of which have to be built under very difficult conditions. These not having yet been completed, it has been deemed proper to protect the men working at the furnace from the risk of poisonous gases exuding into the main return air-way by erecting across it a galvanised-iron partition, extending into and dividing the furnace drift, so as to direct all the return air to the furnace, and prevent its affecting the men, whose position of safety is now the seat on which Smith and Curran met their deaths; to which pure air, direct from the down-cast, is now supplied by means of regulators placed for the purpose in Nos. 1, 2, and 3 doors—No. 3 district being, of course, completely locked off by the stopping in the "rope road." At a point in the main return air-way, not far from the furnace drift, where the head of a partly fallen bord provides an outlet from the old workings, we were made aware very decidedly—on our visit to the mine—of the presence of "fire-stink," as described by the witnesses, drifting out of the opening, accompanied by an extingutive gas; but whether this latter was carbonic acid or nitrogen in excess we had no means of deciding.

In order to follow the course of events that led up to the accidents on the 2nd, 3rd, and 4th of December, it is necessary to go back about three years, when (*vide* Mr. McAuliffe's evidence), in consequence of a crush on the pillars bounding the main haulage road, the brick stoppings at the entrance to the abandoned bords broken off that road were so affected as to permit a serious waste or leakage of air through these stoppings by way of the No. 3 district direct to the furnace. It was to effectually cope with

with this leakage that Mr. McAuliffe, the manager, says the stopping at "d," with a manhole or slide-door for easy access to No. 3 district, was built, and not for the purpose of preventing poisonous gases, known to be generated in the abandoned workings, from being drawn—or, rather, forced—along the rope road to the furnace, or, on the other hand, in case of a careless use of Nos. 1 and 2 doors, driven by impulsion from the down-cast into the main engine plane. This object would appear equally legitimate, if not more important; but, unquestionably, a stopping placed in this position would correct or control wasting of air through the crushed stoppings referred to. Owing to the litigation arising from an alleged subsidence of strata under certain properties over this No. 3 district, to permit an inspection by experts, the slide-door in the stopping "d" was opened in 1893, and on occasions up to 1896, but appears to have been closed after each inspection, thus sealing off the district. In August, 1896, another inspection was made by several experts; but on this occasion, if not earlier, the stopping, with slide-door, was entirely removed, as stated by Mr. McDonald, for the purpose of more promptly clearing out the gases which had accumulated. Unfortunately, this stopping was never replaced, until after the accidents.

On Monday night, the 30th of November last, Gould, a bricklayer, temporarily employed unloading coal at the furnace, working under direction of the furnace-man, Smith, left the No. 3 door open (to save trouble) for some considerable time longer than was necessary to pass the skips of coal through to the furnace. Feeling sick and giddy, and suspecting that the cause was bad air, and having an appointment with Henry Burt, the night officer, at another part of the mine, he, as soon as he was able to meet Burt, reported the circumstance to him. That officer—although Gould's evidence is somewhat unsatisfactory on the point—rightly concluded from what Gould told him that the matter was sufficiently serious to justify an immediate inspection. Proceeding to the furnace, Burt examined its vicinity, and also between No. 3 and No. 2 doors, and found no indication of a smell or of gases likely to produce the effects described by Gould, and by Smith, the furnace-man, who, on being questioned, said he also felt ill when No. 3 door was open. Burt, although certainly aware that the men felt ill only when the No. 3 door was left open, that the stopping at "d" had never been replaced, and that poisonous gases, if present at the furnace, could only come from the No. 3 district by way of the "rope road," and with No. 3 door open—contented himself with an examination of the locality in its ordinary working condition, under which danger could not well be expected to exist. In fact, the experience of all the witnesses who inspected the entrance into No. 3 district when the No. 3 door was shut, and the ease and rapidity with which the current was reversed on the morning of the 4th of December, indicate a tendency of the air to flow down the rope road and to escape by some outlet, possibly the disused overcast, and only to take the opposite course under the strong inducement held out by the leaving open of No. 3 door for some time. The levels, and the direction of the established currents, would appear to favour this theory.

Burt, it would appear, reported Gould's and Smith's complaint to the under-manager, Mr. McDonald; and it was also brought under cognizance of the manager, Mr. McAuliffe. Mr. McDonald, on the morning of Tuesday, the 1st of December, and also on the same night, made an inspection of the furnace and for some 200 yards along the going bord from the door "Z," and found nothing to indicate danger from any cause. Mr. McDonald, however, like Burt, although fully aware of all the surrounding conditions, and from whence and by what means Gould and Smith must have been affected, did not think, or take the trouble, to make his inspection under the conditions prevailing when Smith and Gould were attacked, namely, with the No. 3 door open, thus providing direct communication with the No. 3 district, from which he and Burt admit dangerous gases could only be expected. Burt, on his inspection, and previously, had warned the furnace-man as to the danger of leaving doors open; and Smith gave his promise that the doors should be shut in future. On Tuesday, the 1st of December, about 9:30 p.m., Smith, the night furnace-man, on that occasion assisted by Curran, proceeded to his work as usual.

On the morning of Wednesday, the 2nd of December, about 4 a.m., Jury and Coulson, deputies employed to make the statutory inspection of the mine before the miners began work, proceeded in their usual course to the furnace. On opening the No. 1 door, from the fact of the air rushing through in the direction of the furnace, they became aware of some defect in the ventilating arrangements. This they verified by finding No. 2 and No. 3 doors open, the latter permitting a current of air to pass from No. 3 district to the furnace. On the furnace side of No. 3 door the bodies of Smith and Curran were discovered; and, with commendable energy, under great difficulties, owing to the existence of foul air, extinguishing their lights, the bodies were removed by Jury and Coulson to a place of safety outside of No. 1 door. Coulson then reported the sad event to the under-manager, Mr. McDonald, who was soon on the scene. Jury, Coulson, and McDonald, emphatically asserted on that morning that the gas was black damp, owing to its extinctive properties, and to its having a smell. Mr. McDonald thought the smell was somewhat different from that he had usually found accompanying black damp. Mr. McDonald then inspected the "rope road" for some distance, and found everything as on his former inspection, except for the presence of the black damp which he detected. Mr. Humble, inspector, having been duly apprised of the deaths of the two men, visited the furnace and surroundings about 8 p.m., with the manager and Mr. McDonald. Mr. Humble at once detected the odour of "fire-stink," and informed the manager and under-manager of the fact. Shortly after this, Mr. Dixon, the Chief Inspector, joined the party; and that gentleman was the first to suggest the very proper course then adopted—an inspection of the part under the only conditions in which danger from the gases generated in No. 3 district was likely to arise, namely, by the opening of No. 3 door. This having been done, in about ten or twelve minutes it became apparent, from the odour of "fire-stink," and from the fact that a light continued to burn, that carbon monoxide was being produced by a gob-fire in some part of the district. Mr. Dixon and Mr. Humble then notified the manager of the fact, and that, being a defect and a menace to the safety of the men employed in the colliery, the defect would require to be remedied. Mr. McAuliffe, it is clear, on this occasion was fully impressed with the opinions of the inspectors; but Mr. McDonald, notwithstanding their emphatic warning, and the presence of this peculiar benzine-like odour—or "fire-stink"—seemed to treat the opinions of the inspectors with something akin of contempt, holding that the gas which caused the death of Curran and Smith, and which was at this time being discussed, was black damp.

During the course of the day—Wednesday—it was decided by the management to remedy the defect complained of by the inspectors; and, accordingly, by means of knocking out a stopping at No. 20 bord, on the main intake or haulage road, and bratticing across the road, a current of air was directed into the No. 3 district, finding its way by sealing through the workings as approximately shown by the blue arrows on plan, through the "rope road," and through the No. 3 door (propped open) to the furnace.

It

It was the intention of the management to send a party to explore the workings on the afternoon of Thursday the 3rd of December; but, in order to give more time for the air to clear out any gases which might have accumulated, the departure of this party was deferred till 9:30 the same evening.

The explorers—a party of twelve, all told—Mr. McDonald, the under-manager, leading—first having left two of their number, Alexander McDonald and Benjamin McAuliffe, at the furnace, went by way of the dismantled stopping at “d” on the “rope road” into the old workings, as shown by the green line on plan, as far as No. 16 bord. In proceeding thus, from the foregoing remarks it will be noted that the party was advancing *against* the air, and meeting any noxious gases that might be produced in the workings. No inconvenience or ill effects seem to have been experienced by the party until No. 16 bord was reached by Mr. McDonald, who then called a halt, and gave an order to retreat. In the vicinity of No. 11 bord, Bailey very suddenly gave signs of distress; and, in assisting Bailey, others soon gave way to the effects of the poisonous atmosphere they had been unconsciously inhaling. The explorers appear to have stuck to one another nobly up to the point when, from physical and mental exhaustion, further assistance would have been suicidal, and useless. Struggling and staggering on, Jury, Ellis, Wm. McAuliffe, and Burt finally reached the trap door “Z” in a state of exhaustion; but, without delay, proceeded to the shaft and gave the alarm to the manager and others. The manager, having secured some assistance, promptly entered through the trap door, and succeeded in rescuing alive Mr. McDonald and his son, James McDonald; but, in doing so, was himself affected by the gas, and rendered unfit to take further part in the proceedings. Rescuers continued to arrive; but, unfortunately, in the haste and confusion, and with the principal officials of the colliery either totally or partially prostrated from the effects of the noxious gas they had inhaled, with no controlling authority, zeal outran discretion, and several paid the penalty with their lives of their noble but misdirected efforts. Of the exploring party, Cockburn, Bailey, and the two McAlpin’s—of the rescuers, Charlesworth, Sweney, Gascoigne, and Fitzpatrick—were found dead or dying in the mine; another of the attempting rescuers, Thomas Sneddon, died in the hospital a few days afterwards from the effects of the poison he had breathed.

Between midnight on Thursday and 1 o’clock on Friday morning, Messrs. Dixon and Humble arrived on the scene; and, under their direction, prompt steps were taken to reverse the current, thus permitting the rescuers to be either in or within touch of fresh air. Firm measures were taken to restrain the ardour of the rescuers; thus accomplishing the object in view, without further loss of life. At 11 a.m., on Friday, the 4th of December, the last body, that of Fitzpatrick, was recovered at No. 11 bord, as shown on the plan. Finally, at a meeting of experts, on Saturday, the 5th of December, with the concurrence of the inspectors—but in the absence, and without the approval, of the manager—it was decided to seal off the No. 3 district, and the other districts connected therewith, by means of brick stoppings at all openings into intake or return air-ways.

Dealing with the events recorded in the depositions taken at the inquests, and the evidence adduced before the Court, in the order of time given in the foregoing *resumé*, it will be apparent that the primary cause of the accidents was the removal of the stopping at “d.” Mr. McAuliffe maintains that this stopping was originally intended to control the leakage of air from the stoppings along the main haulage road, which had suffered from a crush; and that, the crush having ceased, it was not considered necessary to replace the stopping at “d” after the inspection by the colliery managers in August, 1896. It is somewhat singular that, the crush having ceased long before 1896, and the No. 3 district having been inspected on several occasions from 1893 to 1895, the slide, or trap, door in this stopping being closed after each inspection, on none of these former occasions did the propriety of leaving this slide-door open occur to the management. It would also seem strange, and inconsistent with the good relations existing between the manager and under-manager, that the question of replacing or leaving open this stopping had never formed the subject of conversation between these gentlemen. From the evidence of some of the under officials, it appears clear that no instructions had been given to them to rebuild it. It would almost appear, therefore, that the matter had been entirely overlooked; although the officials, having made several inspections of the district, in doing so passing through this dismantled stopping, must have been well aware that this formerly effectual safeguard against the emission of gases from the district was not in existence. With this stopping removed, persons having occasion to pass through the No. 1 and No. 2 doors practically entered the No. 3 district, and would be brought in contact with any noxious gases generated there and finding their way by any means towards the furnace. When the No. 3 door was opened, the way was clear to the up-cast; and there was nothing to prevent foul air or gases from pouring forth out of these old workings so long as the No. 3 door remained open. Having known that these workings did generate carbonic acid gas, that no attempt was made, as a matter of good mining practice, to ventilate this abandoned district, giving it an outlet into a return air-way with sufficient volume of ventilation from other districts to neutralise or dilute to a reasonable extent any dangerous gases produced, it does seem a most regrettable circumstance that no colliery official ever suggested, or appears to have ever thought of, the advisability, as a matter of safety, of either erecting an additional door or replacing the dismantled stopping on the “rope road,” to hold under control any gases collected in No. 3 district when No. 3 door was opened. The necessity of this course was made all the more obvious, apart from the danger arising from the unavoidable opening, necessitating a prompt closing of the door, to pass through the skips of furnace coal, by the knowledge the manager appears to have possessed of doors having been carelessly left open on former occasions. But—altogether apart from such knowledge—the experience which every employer must possess of the carelessness of men, especially when the conditions of their employment tempt them to commit certain acts of negligence to save labour to themselves, should have led the management to the conclusion that it was most unwise to allow the security from death or illness of the furnace-men, as well as possibly, of other workmen, to depend upon the proper closing and keeping closed of this single door, which there was so much temptation to leave open dangerously long. And they should also have known that any sudden fall in general atmospheric pressure might seriously aggravate the risk incident to the leaving of a working, in connection with an abandoned part of a mine, in the position of the uncorked neck of a bottle containing poisonous gases. Burt, the night deputy, was also aware of the No. 3 door having been left open on the night Gould complained. Burt reported the fact to the under-manager. He was also cognizant of the No. 3 door having been left open on a former occasion, although he states he did not report the circumstance to his superior. From the fact that he remonstrated with, or warned, the furnace-men to be specially careful to close the doors, it would almost appear that he, at least, had some doubts as to the security afforded by this single door. Every official seems to have been fully aware of the
necessity

necessity for enforcing Special Rule No. 28, and of the serious consequence that might result from leaving a door open; but, apparently, beyond cautioning offenders, no serious step, such as fining or prosecuting workmen for a breach of the rule, seems to have been taken by the management. Clearly, Smith's and Curran's deaths were due to inhaling some poisonous gas; but the proximate cause was, undoubtedly, in spite of the warning of Burt on the previous night, and in contravention of Special Rule No. 28, the leaving open of a door which they were bound to close promptly after passing through it. Had the discipline of the mine been strict, and had persons leaving doors open been promptly and severely dealt with, it is much less likely that these two men would have dared to risk the consequences following upon their neglect or wilful breach of the rule; and it is highly probable that lax discipline is at least indirectly responsible for their deaths. The inspection of this locality by Burt and McDonald after the complaint made by Gould and Smith can only be regarded as perfunctory and incomplete. If they had taken the course promptly suggested by Mr. Dixon on the Wednesday morning—that is, the opening of the No. 3 door—they could not have failed to discover noxious gases; and Curran and Smith would now, in all probability, be alive.

Considerable diversity of opinion has been expressed as to the nature of the gas which caused the deaths of Curran and Smith. The manager and Mr. McDonald, and the deputies, have emphatically designated it as black damp. Dr. Hester, at the first inquest, seemed also to favour this theory; while, on the other hand, the inspectors (Messrs. Dixon and Humble) hold by carbon monoxide. Jury and Coulson, who found the bodies, assert that the gas extinguished their lights; that it had the "smell of black damp"; and Jury says he detected an acid taste. When the inspectors reached the scene of the accident the gas did not then extinguish the light, but the smell was quite pronounced, and they had no hesitation in ascribing the cause of death to carbon monoxide accompanying the volatile hydro-carbon, which has the benzine-like smell peculiar to "fire-stink." Those who favour the black damp theory are evidently labouring under some misapprehension with regard to the smell. Neither carbonic acid nor carbon monoxide has a smell; and the odour detected was, undoubtedly, "fire-stink," or the characteristic smell known to be given off during the partial destructive distillation and partial imperfect combustion of carbonaceous matter, in which process both of these gases are generated in proportions varying with the supply of oxygen. There can be no reason to doubt that the composition of the gas inhaled by Curran and Smith was essentially different from that afterwards found by the inspectors on the Wednesday, and the explorers and rescuers on the Thursday night. Whether the poisonous element predominating was black damp—a mixture of carbonic acid and nitrogen—as the management claim, or carbon monoxide, as the inspectors maintain; and whether the extinction of the light was due to carbonic acid, or, as the inspectors assert, to an excess of nitrogen; or, whether carbon monoxide was then present to a dangerous extent, is, in the absence of an analysis, pure conjecture. One fact, however, seems beyond dispute, that, at the time Jury and Coulson discovered the bodies, the gas did extinguish lights, and, therefore, did not support combustion. The point is only important in so far as it might justify the subsequent action of the management in the assumption that the difficulty to be dealt with was black damp; but, in face of the warning of the inspectors, to be hereafter referred to, such a contention is perfectly untenable.

The inspectors having, on the Wednesday morning, arrived at the scene of the accident, and, after inspection, satisfied themselves that the pungent odour then so pronounced was "fire-stink," indicative of combustion of carbonaceous material in some part of the No. 3 workings, and that certain deadly gases, including carbon monoxide, were being generated, at once notified the manager, then present with the under-manager, of a grave defect, which was a menace to the safety of the colliery, and required him to remedy the same. It has been contended that this notice should have been in writing; and there seems to exist in some minds the impression that, in a way that it is hard to understand, the failure to give notice in writing had some connection with the calamity of the following night. It is difficult to discover any substantial ground for such a contention. Section 20 of the Act very properly gives a discretionary power to the inspector; and if an inspector were to serve written notice to managers in respect of every matter requiring attention, this would lead to interminable correspondence, and would cause needless friction and distrust where nothing but good feeling and a spirit of loyal co-operation should exist. An inspector must, in the course of years, be in a good position to gauge the professional knowledge and general disposition of the managers in his district, and to determine to whom and under what circumstances it would be expedient to give a written notice. Moreover, in this instance, two inspectors were present when the notice was given to the manager in the presence of the under-manager. Again, it is quite clear that Mr. McAuliffe was open to reason and conviction, and would not treat the inspectors' opinion lightly; and the fact that he immediately (whatever opinion may be formed as to his method) took steps to remedy the defect is the best proof that the inspectors' confidence in the manager was not misplaced, and that under some circumstances and with certain people a verbal notice would receive, probably, more attention than a formal written notice, the giving of which might cause irritation and annoyance. If the inspectors had had to deal with an unbelieving, opinionative man, with little knowledge of the dangerous properties of the gases, such as Mr. McDonald appears to be, it is very probable that a written notice would have at once suggested itself. But even if a written notice had been given to Mr. McAuliffe, he could not have done more to give effect to it than to proceed, as he did forthwith, to remedy the defect. It has been suggested also that the inspectors should, at this time, have required the manager to replace the stopping at "d." It is no part of an inspector's duty, and is clearly inadvisable, for him to suggest how a defect is to be remedied. The course to be pursued under such circumstances is to notify the manager of a defect, and to see that the defect is cured, leaving the management to adopt such methods as their experience may suggest or their circumstances permit; though an inspector should always be ready to consult with a manager who seeks his advice; and, if he is aware that what he considers a dangerous or foolish step is contemplated, he should at once express and give reasons for his disapproval.

It is perfectly clear that Mr. McAuliffe and Mr. McDonald were warned in the most emphatic terms by the inspectors, that "fire-stink" was being then given off; and that they understood that this odour was, in the opinion of the inspectors, produced by a fire in the No. 3 district. Mr. McDonald, it is true, ascribed it then—and in his evidence before the Court maintained—that it was due to the fermentation of old wood in water; but that conviction, however sincere, would not exonerate Mr. McAuliffe or himself from the consequence of any action taken subsequently in defiance of the inspectors' warning. This, unfortunately, seems to have been what actually happened; the steps taken to discover in order to remedy the defect, being based on the assumption that (incredible as it may appear in the face of the inspectors'

inspectors' warning) black damp, as on former occasions, had only to be dealt with, and that a vigorous coursing of the ventilation through the old workings would clear out the poisonous gases accumulated therein, when, in point of fact, had they reflected a moment upon the subject of their conversation with the inspectors, and given due weight to their opinion—that of experts approved by the State—both the manager and under-manager must have perceived that the probable effect of increased ventilation would be to fan the flame and increase the production of deadly gases.

Here it may be well to deal with the point raised by Mr. Curley, namely, that the management were under an obligation to make an inspection of the workings before taking an exploring party, and that the inspection by Mr. McDonald did not comply with General Rule No. 7. It was contended that, before an exploring party may be sent into a mine with the object of discovering or locating a mischief, an inspection must be made and duly recorded; but a careful reading of the section in the light of common sense appears to lead to the conclusion that the word "exploration" used therein is really almost synonymous with "inspection": the "competent person" having a right to conduct his examination with the help of others, whose services he utilises for the purposes of "inquiring into the cause of danger, or for the removal thereof, or for exploration." To contend that the unfortunate "competent person" must go alone, practically as far as the exploring party is intended afterwards to follow, and may on his return—if he should ever come back—take a mate with him, is utterly to stultify the rule and its framers. The management did not claim that the inspection by Mr. McDonald was more than a superficial examination for his own satisfaction; moreover, while there is nothing in General Rule 7 to limit the inspection to one man, the consensus of opinion seems to be that it would have been most unwise to send one man, and that, in point of fact, safety would lie in numbers. Clearly, the number of men forming an exploring party must be a matter for the discretion of the management; and, when penetrating old workings likely to contain noxious gases, more danger is likely to result from an undue limitation than an unnecessary extension of the numbers of a party. These men were not taken into the workings to follow their usual avocation, but for the purpose of helping to inspect and remedy a defect complained of. If, as Mr. Curley contended, an inspection should have been made as far as the explorers intended to go, it is difficult to see what good purpose the explorers could serve by virtually repeating the operation. In point of fact, the explorers might quite reasonably be designated an inspecting party.

During the course of Thursday the 3rd of December, Mr. McAuliffe, Mr. McDonald, and Mr. Cockburn, seem to have had a conversation with reference to the inspection or exploring of the old workings in No. 3 district. But it is material to remark that this conference, if it may be so termed, did not take place until *after* a large part of the work of sweeping out the district from No. 20 bord towards the "rope road" had been completed. This would indicate that—inasmuch as it appears to have been known from the first that an approach could not be made from bord No. 20—the decision to enter in face of the air had been arrived at before the conference took place; a contrary decision would have amounted to a reversal of a scheme evidently adopted on the Wednesday. The subject of noxious mine gases seems to have been discussed at this meeting. This would imply that it was thought that gases other than black damp, usually met with in this colliery, might have to be dealt with in the course of the inspection or exploration. The manager appears to have been aware of the route to be taken by the party; but, beyond advising Mr. McDonald to take fresh men, he issued no further instructions to his subordinate officer. He states that he intended to join the explorers, but arrived late, and did not make haste to come up with them. A party of subordinate officials and workmen, under ordinary circumstances, would await the arrival of the manager; but, apparently, it was understood that he was not to be present, and his absence caused no comment. The manager, on his arrival, finding the party gone, went to the furnace. It is a matter of great regret that he did not personally supervise this exploring or inspecting party, as the circumstances were of such a grave and unusual nature as to demand the best knowledge and experience available to direct operations. He explains that he was considerably upset by the deaths of Curran and Smith; that he had been attending to the funeral arrangements; and that he was not in a fit condition for superintending such work as exploration. Mr. McAuliffe, apparently, is a man of a keenly sensitive nature; and there is no reason to doubt that the circumstances were such as to cause mental distress in a man occupying a responsible office; but his position was not analogous to that of a manager having to deal with a mine swept by an explosion, causing death and destruction in every direction; and there seems hardly sufficient reason for his delegating his duties on this occasion to Mr. McDonald. It was all the more incumbent upon him to assume control, inasmuch as his under-manager had somewhat contemptuously treated the views of the inspectors, and was an opinionative man, ignorant of the nature and properties of such deadly gases, and likely to permit prejudice to warp his judgment. Mr. McAuliffe was entitled by section No. 3, subsection (i), of the Act, to delegate his duties to the under-manager; but, as provided by subsection (ii), this delegation of authority does not relieve the manager from his personal responsibility; and, being aware of the route to be taken by the exploring party, he must be held personally responsible, equally with the under-manager, for the course of action adopted.

Under the leadership of Mr. McDonald, the exploring party entered the No. 3 workings by way of the dismantled stopping at "d," and followed the course shown by the green line on plan, thus facing the return air and the possible products of combustion from the fire believed by the inspectors—but not by the leader of the party—to exist in the workings. This, as events proved, was a fatal mistake, which should never have been made by colliery officials of considerable experience, presumably accustomed to act with deliberation and judgment. Mr. McDonald explains that he thought he had to deal with black damp, as on former occasions; and, being a firm believer in the fermentation of old wood, he did not recognise, or did not heed the warning given by the pungent odour present throughout the workings; and he considered—as the manager also thought—that the vigorous current of air which had coursed the district for some thirty-six hours had removed all danger. This explanation, if offered by men ignorant of the fact that a gob-fire would produce deadly gases, might, to a certain extent condone their blunder; but neither the manager nor the under-manager can plead ignorance after the emphatic and unmistakable warning of the inspectors. A danger signal was given by these gentlemen which was deliberately ignored by the management—an act of indiscretion that led to the deaths of nine men. It is perfectly true that no one seemed to anticipate danger. The very fact of Mr. McDonald's being accompanied by his own son, and Mr. McAuliffe's brother and nephew being members of the party, would imply, on the part of the management, a sense of security not warranted under the circumstances. None of the party seemed to apprehend danger in the slightest degree, a fact inexplicable in the case of Jury and Cockburn, men evidently of a superior type, and

having

having a considerable knowledge of the gases met with in coal-mines. The explanation appears to be that the manager allowed his better judgment to be overruled by his reliance on Mr. McDonald, and the explorers, with equally mistaken but commendable confidence and respect for the position and experience of their immediate superior, the under-manager, did not exercise the caution and judgment which a full sense of responsibility might otherwise have brought forth. There was also one consideration, very far from legitimate, which acted possibly on the mind of Mr. McAuliffe—certainly on that of Mr. McDonald. It was this: the inspectors had expressed an opinion which involved the conclusion that Smith and Curran had been poisoned by carbon monoxide; the management contended that carbonic acid was the cause of their deaths. This difference of opinion was involved in the further question whether there was or was not a gob-fire burning. Dr. Hester's evidence, given on the Wednesday, tended to the conclusion that the men died of carbonic acid poisoning. On Thursday the inquest was adjourned till the following Tuesday. Before it could be concluded, Mr. McDonald at any rate was anxious to prove by actual inspection that he was right and the inspectors were wrong. Not believing in the existence of a gob-fire, he could not suppose that expedition was essential to locate or extinguish it; his strong opinion and decided inclination practically overruled Mr. McAuliffe's wavering faith in the judgment of the inspectors.

Apart from the one vital blunder of advancing in face of the air, there appears to be no reason for taking exception to the measures adopted by the explorers. Placing chalk marks on the roof was a very proper course, usually followed when traversing old workings, and not in apprehension of any special danger to be encountered. The *personnel* of the party was unexceptionable, being made up of colliery officials mainly, with other colliery employees, able-bodied and accustomed to mining work.

All the way to No. 16 bord, where a retreat was ordered, no inconvenience or ill effects were apparently experienced; but the insidious nature of carbon monoxide being considered, this is not to be wondered at, and, unquestionably, the unfortunate men must have been unconsciously inhaling the gas from the start. At this point a fall is said to have been heard by some members of the party, and there is no reason to question the fact. Falls may always be expected in old workings, and when the roof is alternately affected by the action of heat from a gob-fire and by a fresh current of air, a condition of matters arises when falls would almost certainly occur. It is probable that this weighed with Mr. McDonald, and, in fear of their retreat being cut off, he ordered the party to return. At this time signs of distress were shown by several of the explorers, and it is reasonable to suppose that the consequence of inhaling the gas in the advance were aggravated by the gas belched forth from the old bords by means of the rush of air caused by the fall. But the sound was, in fact, not heard by most of the party, and the effect on the flames of their lamps appears to have been very trifling; the size of the bords, with an average section, when intact, of over 100 square feet, and the extent of the workings, covering nearly 30 acres of ground, and giving at least 15 acres of actual excavation, would provide ample scope for absorption of concussions. The effects of this fall must have been quite local, and had the route traversed in the advance been as free from poisonous gases as it is described to have been by the survivors, the party, when retreating, would soon have reached a region of comparative safety. The fact that six men were prostrated at a considerable distance from No. 16 bord, and that four only reached the trap-door, "Z," after great difficulty, evidently inhaling this deadly mixture all the way, is convincing proof of the insidiousness of the gas and the misplaced confidence of the explorers when advancing.

Mr. McDonald having been rendered unconscious in the retreat, his responsibility would cease there; and other under-officials—Jury, Ellis, and Burt—having got out only after a struggle, and suffering from the gas they had inhaled, were not (although they afterwards rendered noble assistance in the rescue work), in a fit condition to take charge, and could not be reasonably held responsible for anything that followed.

Mr. McAuliffe having been alarmed, and having obtained assistance, headed the first rescue party, and, following a natural impulse, entered the poisonous atmosphere without hesitation, and succeeded in rescuing the two McDonalds. If he had hesitated, in order to alter the ventilating arrangements, or to secure the safety of the rescuers, it seems probable that the two McDonalds would not have been brought out alive. Had he also, as he asserts, been able to command sufficient assistance to send in from time to time fresh parties of rescuers, it is probable that the bodies of the explorers might have been recovered without the sacrifice of a single rescuer. Unfortunately such assistance was not immediately available, and when he returned with the two McDonalds, Mr. McAuliffe was himself so overcome by the effects of the gas he had inhaled as to be unfit for further duties. Rescuers arrived, but Mr. McAuliffe and his principal officials being laid low (with the exception of the mechanical engineer, Mr. Sampy, placed in charge of the trap-door), there was no controlling authority, and the rescuers were, until the arrival of the inspectors, at liberty to follow their noble impulse to save life without the guidance and restraint of the officials. It is not a matter for surprise, therefore, that so many of these men, some of them probably ignorant of the dangerous character of the atmosphere they had entered, and unacquainted with the locality, were sacrificed to their misdirected zeal.

With the arrival of the inspectors, effective measures were taken, needless to detail, to enable the rescue work to proceed with reasonable safety; order was restored, a wholesome restraint was placed upon the rescuers, and further loss of life was averted. If the inspectors had not appeared at this time—lamentable as the loss of life actually was—there is good reason to believe the sacrifice would have been much greater.

Mr. Sampy, the engineer in charge of the trap-door, from the nature of his duties, would not come in contact with the general body of the men, and his authority would not, perhaps, be recognised, by miners eager to rescue their fellow-workmen. Nevertheless, he appears to have done his utmost to exercise some control, and to prevent men from re-entering the trap-door when unfit for further exertion.

The mode adopted by the management for clearing and entering the old workings was claimed as the only practicable method, but this contention will not bear investigation; and, in point of fact, Mr. McDonald, in cross-examination, could see no insuperable difficulty in the manner suggested by the Court, namely, to replace the brick stopping at "D," place a brattice stopping on the main intake at the old stables at No. 1 bord, and remove the trap-door at "Z," thus causing a current of air to be diverted into No. 3 district along the going bord, finally returning by way of No. 20 bord to the main intake or engine plane, thence by way of the door at the disused air-crossing to the main return air-way, and so direct to the furnace. In other words, the current of air which entered at the No. 20 bord, and thereafter traversed No. 3 district, could, with slight modification of the arrangements, have been very easily reversed, thus giving every facility for the thorough inspection of the district, the explorers taking fresh air with them right up to the gob-fire or seat of trouble. It has been contended on behalf of the

management that the course adopted on this occasion was identical with that followed formerly, when experts had occasion to enter these old workings; but the circumstances were of an entirely different character then. At that time, only the accumulated carbonic acid had to be dealt with; and a vigorous ventilation would undoubtedly sweep out entirely, or break up and isolate to a harmless extent, all black damp or noxious gases. On this fatal evening, however, different conditions altogether existed, which the management, although warned, failed to realise. They should have recognised that the retorting of coal was in active operation in this working, producing certain gases of an extremely dangerous nature; and that the effect of increased ventilation would be to generate still greater quantities of gas, and, in fact, intensify the evil. To enter and inspect this district with ten men, in such a manner as to expose and bring every one in contact with the products of combustion of a gob-fire, for a distance of some 500 yards from fresh air, displayed either gross ignorance or an indifference to danger not usually found in men occupying responsible positions. When the party actually started, the previously pent up gases having been removed by the sweeping of air through the district, the smell had been appreciably reduced, but still manifested itself perceptibly. The inspectors had warned the management that this smell denoted the presence of a deadly gas, known to be terribly insidious and deceptive in its action; and there was every reason to believe that a certain substantial portion of the air met at the eastern end of the going bord was sealing down the "double heading"; and that, therefore, as the explorers passed that point, they would not only lose some of the air that was meeting them, but would also encounter a more and more vitiated current, as they approached the point, about bord 19 or 20, where the fire, if it existed, was supposed to be. On cross-examination by Mr. O'Sullivan, Mr. Humble, in the course of his evidence, given before the Court of Investigation, said that on the Thursday evening, the 3rd of December, he was incidentally informed by Mr. Cockburn of the intention to explore on that night, and of the mode of entry to be adopted; and he does not appear to have, as might be expected, raised any serious objection or given an emphatic caution. This conversation took place at the Technical College, a considerable distance from Stockton; Mr. Humble's attention would be taken up with his duties at the College; Mr. Cockburn was in a hurry to leave; and there really does not appear to have been time or opportunity for such reflection as might have led Mr. Humble to attempt to exercise the indirect authority which, we think, his position as inspector would have justified in opposition to the project. Mr. Cockburn's action in putting his affairs into Mr. Humble's hands (*vide* Mr. Humble's evidence) would indicate that he had some strong doubts of the safety of the expedition. This gives colour to the suggestion that he had deferred to Mr. McDonald's strongly expressed opinion rather than that he was following out his own ideas. Mr. Humble freely admitted this conversation; and we do not feel justified in imputing blame to him under the circumstances. It appears that the fact that he had thus become aware of the proposed exploration was not communicated to the manager or under-manager. In the course of his evidence, Mr. Humble afterwards said that he had, in a rather hurried conversation with Mr. McDonald on the Wednesday, specially warned him to take the air with him if an exploration should be attempted; and he gathered from Mr. McDonald's conversation that he was anxious that an examination should be made.

After all that has occurred, and the unmistakable evidences at the present moment of a gob-fire being in active operation in these old workings, the obstinacy of Mr. McDonald in scouting the idea of there being such a thing in existence, and in accounting for the odour of "fire-stink" by the fermentation of old wood, is almost inexplicable.

The immediate object of the exploring party was to inspect the old workings, and to locate the position of the gob-fire, with a view to its extinction, if possible, or, failing that, to its being confined to a small area. This was a very obvious and very proper course to pursue—to conserve the interests of the proprietors and the safety of the employees. From the evidence of the inspectors and Mr. McAuliffe and his under-manager, it appears that there would have been no difficulty whatever in reaching the locality of the fire with perfect safety, except for the ever-present risk of a fall. The inspectors, however, seem to have anticipated some difficulty, owing to broken ground, in sealing off the fire—an opinion not shared by the management. Be that as it may, however, no effort was made either to extinguish the fire or to confine it within a limited area, although such action could have been taken promptly and with reasonable safety. It is to be feared that the shadow cast by these lamentable accidents warped the judgment of the gentlemen responsible for the decision to leave these old workings to their fate.

Having in view the only alternative left—if this fire was not to be conquered or controlled at its inception—namely, to seal off an immense area of abandoned workings charged with dangerous gases, and bounded on two sides by a main intake air-course and travelling road leading direct to the working faces, and that from this main road, bords had been broken off in a most reckless fashion in former years; that each of these old bords was closed by frail brick stoppings, up to 14 or 16 feet in length by 9 or 10 feet in height, and in thickness only 9 inches; that the conditions were as unsuitable as it is possible to conceive for the sealing off of a gob-fire; that, in point of fact, there appears to be no other instance known of a district being sealed off under such unfavourable conditions, fraught as they are with danger to the colliery, and greatly depreciating the value of the shareholders' interests;—it is a matter for extreme regret that the original intention of the management (bad as the methods proved to be), to confine the fire, was not vigorously carried out, and that the course recommended by the experts, in the absence of the manager and under manager, and without the benefit of their local knowledge, was not adopted only as a last alternative after all other measures had failed. The final stoppings had not been completed at the date of the Court's inspection; but sufficient noxious gases were present to indicate a gob-fire still, probably, in operation. To relieve the pressure of gas on the stoppings along the engine plane, an outlet might be provided at a point near the furnace on the main return, as, in Mr. Humble's opinion—accepted by the Court as evidently correct,—it is inexpedient to leave a large area of old workings absolutely sealed, with the almost certain result of the forcing out of noxious gases at various points, especially in the case of a fall of the barometer, and the possible forcible destruction of stoppings by sudden increases of internal pressure caused by falls or otherwise.

From the report of the inspectors to the Honorable the Secretary for Mines and Agriculture, and, in the course of this investigation, the Court has been made aware of certain misfortunes or difficulties the Stockton Colliery Company has experienced in the course of its comparatively short life. Water, and the intrusion, in former ages, of igneous rock "cinderling" the coal, have been a source of great expense; and the latter cause of trouble has considerably hampered the management in developing the colliery under ground. It has, however, been apparent that, apart from these difficulties imposed by nature, the colliery operations have been subject to serious interruptions, and the shareholders' interests

have

have been sacrificed, by reason of a reckless and improvident system of mining, calculated to invite disaster. As early as 1889 (*vide* Mr. Humble), when the colliery was practically in its infancy, a crush took place, stopping work for some weeks; and similar trouble has been met with in later years. From an inspection of the plan, it is obvious that this trouble was due, not to unforeseen causes, but to the absence of adequate provision in the way of pillars to protect the workings from the pressure of the superincumbent strata, known to consist largely of water-charged sandy alluvium, the security of the main shaft even being from the same cause not above suspicion. This absence of provision for the protection of ordinary workings is regrettable enough; but, when main roads have suffered from the same cause, and as operations have extended matters have not improved materially, one is astonished that the management of a large colliery, warned by costly experience, should not adopt a system of mining fairly certain to ensure safety, and ultimately to prove the more profitable. The absence of sufficient barriers, or pillars of coal, to support main roads and isolate different districts, seriously increases the difficulty of sealing off this fire, and has certainly intensified the danger. Although the extent of an inspector's power and duties under section 20 of the present Act and section 25 of the Act of 1876 are debatable, we are of opinion that this section—practically identical in each statute—enables an inspector to question the mode in which a mine is being worked in relation to the size of the pillars, and, generally, the support left for the stability of the workings, and the disposition of the main roads as affecting ventilation; and we think it is a matter for regret—though we have no doubt that they were pursuing, in their own opinion, a proper course in refraining from interference—that the inspectors in the Northern District have not, seeing the very peculiar mode in which excavation of coal has been conducted, taken advantage of the powers conferred upon them by these sections, and so brought the question to an issue, whatever the immediate result might have been. We are also strongly of opinion that it is the duty of an inspector, where he has a doubt as to the extent of his powers, and believes that their exercise would be beneficial, to put them in force at all hazards, though he should always be careful to avoid unnecessary or irritating action.

The system of breaking off headings from a main haulage road, forming an intake for a large section of the mine, cannot be too strongly condemned. All such roads should have a return air-way on each side, to carry off the air from old workings direct to the up-cast shaft. In this particular instance the old workings are bounded by a main intake air-way for many hundreds of yards; and the effect of a large fall there would probably be the expulsion of a dangerous quantity of gas, which would be carried into the working places. The outlet to the return air-way suggested would, by putting a slight pressure from without on the stoppings, or inducing an indraught in the case of a blown-out or damaged stopping on this road, tend to check the emission of dangerous gases, or to confine them to the old workings. The objection to this course would be the tendency to feed the fire with fresh air, but it would be the less of two evils; and it is, under the circumstances, apparently necessary.

There has been, in the past, a general tendency to consider the working places and travelling roads as being the all-important parts of the mine; and it is to be hoped the lesson taught by these accidents will not be lost upon mining men, and that greater attention will be paid in future to the supervision and ventilation of old workings and parts of a mine other than the actual working sections. There can be no question as to the safety afforded by the continuous ventilation and inspection of abandoned districts—where pillars are not extracted, and where vast spaces are left for the accumulation of gases, fraught with peril to those employed in the mine. The ventilation at all collieries should be ample to provide for the constant renewal of the air in old workings, in addition to the places in actual operation; and, where this cannot be accomplished, sealing off the district altogether, or arranging an outlet properly regulated into a main return air-way, supplied with an overwhelming volume of air, should be imperative. Either of such courses could have been adopted at the Stockton Colliery, if good management had existed from the first; and it is evident that had proper forethought been exercised in such matters by the management, the lamentable loss of life on the 2nd, 3rd, and 4th of December last would have been averted.

We, therefore, taking into careful consideration all the circumstances attending these accidents, have arrived at the following conclusions:—

1. The immediate cause of the accident of the 2nd December was the extraordinary recklessness and obstinate disobedience of orders on the part of the men Smith and Curran; and, probably, of the former especially, inasmuch as Curran was, to a certain extent, under his control, and had not personally received, and may have been unaware of, the warning given to Smith.
2. The proximate causes of the accident were:—
 - (1) The permitting of a system whereby the only protection of the furnace-men from poisonous gases, known to be generated in No. 3 district, was a single stopping on hinges—as it has been appropriately called—placed in such a position as to tempt them to leave it open. In this relation, we think there was a serious want of consideration on the part of all concerned in the management of the mine. It is very unfortunate that the removal of the stopping in the rope road was not discovered by the inspectors before the accident happened; as they would, presumably, have called attention to its absence as a defect to be remedied; but we do not find that their failure to discover this danger implies any want of care on their part.
 - (2) A certain laxity in the discipline of the mine, which probably conduced to the negligence of the men.
3. In attempting to find out, at once, by exploration, the seat of the mischief which the inspectors had required to be remedied, the management acted properly; though the motive which partly operated on Mr. McDonald's mind—namely, the wish to prove himself in the right, and the inspectors in the wrong, before the close of the first inquest—was not a legitimate one; but—
4. The action of the management of the colliery in sending the exploring party into No. 3 district on the 3rd December was ill-considered; and the primary cause of the deaths of all the men who were killed on that occasion—as we find, by the inhalation of carbon monoxide—was, directly or indirectly, the adopting of a plan of entering against the air,—an act, under the circumstances, most injudicious, and one that no man of experience in coal-mining could reasonably approve.
5. It would have been better if Mr. McAuliffe had himself undertaken the leadership of the party of explorers. We assume that he really thought there should be no delay in the carrying out of the inspection; and we believe that he felt justified in delegating this very important duty to the under-manager, suffering, as he was, from mental distress and from fatigue; but we think he should, nevertheless, have made a real effort to do the work himself. G.

6. The course pursued by Mr. McAuliffe and all other officers of the mine after the second accident was proper and reasonable under the circumstances; and their conduct was that of brave men honestly doing the best that was practicable to save life, under conditions of great danger to themselves.
7. The inspectors, on their arrival, adopted a proper method to prevent further loss of life, and acted with discretion, vigour, and courage, in directing and personally assisting in the work of recovering the bodies of the rescuers who had lost their lives. Their conduct also on the occasion of the first accident was highly to be approved, and they displayed energy and quick perception. Mr. Dixon, especially, deserves to be commended for his action in placing No. 3 district in the same condition in which it was when Smith and Curran met their deaths, as a preliminary step towards discovering the cause.
8. The general course of working of the mine has been such as to tend unnecessarily to the happening of such accidents as these with which we have had to deal, by leaving abandoned districts in a dangerous condition; and, in this relation, the powers and duties of inspectors should, we think, be made the subject of special consideration.
9. As a conclusion naturally drawn from our former findings, we further are of opinion that both the manager, Mr. McAuliffe, and the under-manager, Mr. McDonald, are, by reason of incompetency and gross negligence, unfit to discharge their duties as manager and under-manager, respectively—their incompetence being shown by their inability to distinguish “fire-stink” from other and totally different gases met with in coal-mines, and their gross negligence consisting in their adopting, under circumstances of evidently considerable risk, and in the face of the warning given by the inspectors, a dangerous, instead of a safe and practicable, mode of entry into the old workings.

We have, &c.,

C. E. R. MURRAY,
President.
D. A. W. ROBERTSON,
Assessor.
JOHN THWAITES,
Assessor.

The Hon. Sydney Smith, Secretary for Mines and Agriculture.

[Here follows plan, with Depositions and Exhibits at Inquest on second fatality, Part II.]

No. 23.

Evidence.

EVIDENCE taken and addresses delivered at Newcastle on the 10th, 11th, 12th, and 13th February, 1897.

WEDNESDAY, 10 FEBRUARY, 1897.

The Court appointed to hold an investigation into the fatal accidents which took place on the 2nd, 3rd, and 4th days of December, 1896, at the Stockton Colliery, met in the old Court-house, Newcastle, at 10 a.m.

Present :

HIS HONOR JUDGE MURRAY (President),
DANIEL ALEXANDER WILBERFORCE ROBERTSON, Esq. (Assessor),
JOHN THWAITES, Esq. (Assessor).

By His Honor's instructions, the Secretary read the following notification, showing the authority of the Court:—

COAL MINES REGULATION ACT, 1896—SECTION 23.

I, Sydney Smith, Secretary for Mines and Agriculture for the Colony of New South Wales, being of opinion that a formal investigation into the fatal accidents which took place on the second, third, and fourth days of December, 1896, respectively, at the Stockton Colliery, in the Colony of New South Wales, is expedient, do hereby, in virtue of the powers conferred on me by section 23 of the “Coal Mines Regulation Act, 1896,” direct such investigation to be held. And I hereby appoint Charles Edward Robertson Murray, Esquire, one of the District Court Judges for the Metropolitan, Suburban, and Hunter District of the Colony of New South Wales, being a competent person, to hold such investigation. And I hereby appoint Daniel Alexander Wilberforce Robertson, Esquire, and John Thwaites, Esquire, being persons possessing special knowledge, to act as Assessors to the said Charles Edward Robertson Murray in holding the investigation.

Dated this 22nd day of February, 1897.

SYDNEY SMITH,
Secretary for Mines and Agriculture.

Mr. T. D. O'Sullivan intimated that he appeared on behalf of the Stockton Colliery Company.

Mr. James Curley said he was present on behalf of the Colliery Employees Federation, the Stockton miners, and the relatives of some of the deceased.

Mr. John Dixon, Senior Inspector of Collieries, announced that he represented the Department of Mines, in the unavoidable absence of Mr. E. H. Wilshire, of the Crown Solicitor's Office.

His Honor asked whether there was anyone else who wished to be represented, or to have a *locus standi* in Court. There was no response to His Honor's question.

Mr. William Humble, Inspector of Collieries, who was present in the Court, withdrew upon His Honor intimating that he would be called later on as a witness.

His Honor : I think that the fairest plan to adopt would be to call, first of all, Mr. John Dixon, Senior Inspector of Mines. Mr. Dixon is one of the most important witnesses, and did not give evidence at the inquest. I think he should give his evidence first.

This proposition was agreed to.

His

His Honor : As to the evidence given before the Coroner's Court, we propose to accept it as primary evidence, but not as conclusive evidence. The Court will, however, allow any witness to be further examined or re-examined by anyone concerned. Is there any objection to that course being adopted?

Mr. Dixon : I have no objection, Your Honor.

Mr. O'Sullivan : No, your Honor.

Mr. Curley : No, your Honor.

Mr. Curley : Will the evidence taken at the inquest be open to comment?

His Honor : Yes.

Mr. Curley : Has it already been carefully perused by the Court, your Honor?

His Honor : Yes.

* Mr. John Dixon, Senior Inspector of Collieries, was called and sworn :—

His Honor : Will you, Mr. Dixon, give your own clear account from beginning to the end of the circumstances within your knowledge attending the whole of this matter?

Mr. Dixon : I will, your Honor.

Mr. Curley : Before beginning with Mr. Dixon, I would like to ascertain, your Honor, whether the inquiry covers the whole of these accidents, or simply the later accident.

His Honor : The inquiry covers both accidents.

Mr. Dixon said : I have been inspector of collieries for fourteen years and eight months. I was appointed under the old Act, and continued under the present Act. Before that, I was employed at everything in connection with coal-mining and shale-mining. I have had forty-four years' experience as a miner in the old country and in this Colony. I have worked at everything in the pit, from the trap-door up. I have been through the whole curriculum. I managed a small mine at Mittagong for some time.

His Honor : Have you studied coal-mining from a theoretical point of view?

Mr. Dixon : I have studied the matter for a number of years from a geological point of view, and am a Fellow of the Geological Society. I am besides a practical man.

His Honor : Have you studied chemistry and mineralogy?

Mr. Dixon : Yes.

Mr. Curley : I would draw your Honor's attention to the presence in the Court of Mr. Thomas, manager of the Minmi Colliery.

His Honor : Do you wish, Mr. O'Sullivan, to call Mr. Thomas as a witness?

Mr. O'Sullivan : I have no intention, your Honor, of calling Mr. Thomas as a witness, but simply wish to receive instructions from him on matters of expert knowledge.

His Honor : Under these circumstances, I do not think there can be any objection to Mr. Thomas's presence. I understand that you, Mr. McAuliffe, are present as representing the colliery?

Mr. McAuliffe : I am, your Honor.

His Honor : Will you please continue your statement, Mr. Dixon?

Mr. Dixon : Yes, your Honor. On the morning of the 2nd December last a messenger sent by Mr. Humble informed me that two men had been found dead at the furnace at Stockton, and that Mr. Humble had already gone over. I at once proceeded to the pit, at which I arrived a little after 9 o'clock. I descended the shaft, and on landing at the bottom met Mr. Humble and Messrs. McAuliffe and McDonald. They had explored the vicinity of the furnace, and were about to take the cage to the surface. At my request, as I wished to see the scene of the accident for myself, they came back with me to the furnace where the two men had been found. We then went down the rope-road in the direction of the abandoned workings of No. 3 district. On reaching the point where a door had been taken down at some time or other, I thought that I should like to obtain the same conditions as we supposed the men were under when they met their death. To this end we opened the No. 3 door, which is the door leading to the furnace, and through which door would pass the air from the No. 3 district. Near this door, and where the heading turns off to go to the furnace, we placed a lamp on the floor of the rope-road to see what action the gas coming from the No. 3 district would have on it. We could at once see that it was something more than black damp, as it would not extinguish the lamp. The door had been opened about twelve minutes, as near as I can remember, before we noticed a peculiar smell, which I at once recognised as fire-stink. We shortly afterwards closed the door. I was satisfied, the moment the noxious gas came up the rope road, that it was fire-stink, or what we commonly call in a mine "gob-stink." I said, "That is fire-stink." I was positive of it, and made the remark in a rather surprised tone, having never heard of fire-stink in the mine before. After shutting the door the gas retreated down the slope and the surroundings became comparatively clear. We then came up the shaft, and Mr. Humble and I went home. In the afternoon we attended the inquest on the two bodies; also next day.

His Honor : The four of us were together when the conversation took place as to the fire-stink. At the moment I noticed the smell Mr. Humble said, "Yes, that is it." We all then had a general conversation on the matter. Mr. Humble and I remarked that the smell was no doubt accompanied by a dangerous gas, and that it was a menace to the men at the furnace, and might prove also a menace to the whole of the men in the pit. We had some considerable conversation over the matter, and I thought at the time, and think now, that we thoroughly impressed the position of affairs on the mind of Mr. McAuliffe; at all events he seemed to drink in with avidity what we said. We asked him, in accordance with our positions as inspectors, to have the difficulty remedied. Seeing the condition the mine was then in, any one at the furnace might at any time be overcome by the same noxious gas and lose his life, should the No. 3 door be left open. We impressed on Mr. McAuliffe that the matter should be remedied as speedily as possible, and I am positive that he was satisfied, and agreed with what we said. We did not suggest in what way the difficulty should be remedied. We thought the death of the two men had resulted from carbon monoxide coming from a gob-fire. Both Mr. McDonald and Mr. McAuliffe appeared to understand what we meant by carbon monoxide; but Mr. McDonald seemed rather sceptical on the point. He thought the difficulty was black damp.

His

* NOTE.—The evidence of this witness was put in at the Court of Inquiry as Exhibit No. 11 by Mr. Wilshire, and read 23rd March, 1897.

His Honor : Can you mention any remark that led you to believe that Mr. McDonald thought the cause of the men's death was something else than carbon monoxide?

Mr. Dixon : I asked Mr. McDonald if he noticed the smell. He said he did not notice anything peculiar, and he did not seem to recognise it as fire-stink in the way I did. The smell was very strong to me.

His Honor : Was it stronger than the smell we noticed on our inspection of the mine yesterday which came out from the opening off the left side of No. 6 heading, near the furnace.

Mr. Dixon : It was just about the same strength, perhaps a little more pungent. I likened the smell to benzine.

Mr. Dixon (continuing) : After this conversation we came to the pit-top, and we renewed it when we reached the office. I left the colliery, and my colleague did the same, under the impression that the matter would be remedied as speedily as possible. From what we could learn from Mr. McAuliffe, he seemed to be anxious to remedy the matter, and appeared very sorry that the accident had occurred. I came away under the impression that the matter would be remedied as speedily as possible; but I heard nothing as to the way it was intended to remedy it. On the Thursday night following a messenger called on me at about five minutes to 12 at my house and told me that a certain number of men had gone into Stockton pit about 9:30 that night, and that some had lost their lives, while others could not be found. As the messenger had a cab, I sent him round to pick up Mr. Humble, and shortly afterwards, about 1 o'clock on Friday morning, I arrived at the pit and descended. I then met Mr. Humble along the road. We went to the first trapdoor (marked Z on plan). We saw a person in charge of the door, and some people sitting around. We asked how many men they thought were inside; but they did not appear to know. We then went up to No. 20 bord to see what was going on there. We found the stopping had been broken and a current of air was being taken in. We at once decided to close up that stopping and knock out the trapdoor in the stopping marked Z on the plan, so as to reverse the current of air, which would enable us to penetrate the workings safely with the air instead of against it, as had been done by the explorers. By this time some rolls of canvas, with hammers, nails, &c., had arrived. We at once started to erect brattice from the stopping marked Z. By taking this step we were able to search for the bodies without further loss of life. I measured the air at the orifice in the stopping that we had knocked out, and I consider that in from five to ten minutes we had a flow of 10,000 cubic feet of air coming in that way. We kept working at the canvas until we had it hung for, say, 66 yards, when we found the flow of air not returning up the rope road. It was continuing on, we did not know exactly where. We got some men to go ahead of the brattice, and by temporarily bratticing off the bord openings on both sides of the going bord—not, however, before ascertaining whether there were any bodies in those bords—we managed to keep a current of air sufficient for all purposes with us, in spite of the scaling coming through the brattice to the furnace, as we could not make the brattice air-tight. The bratticing was a very difficult work to carry out, and, with much trouble, we could only make it partially air-tight. We kept men bratticing up until we got to the top end of the going bord, and then, having found all the bodies except Fitzpatrick's, thinking he might be in one of the headings we had temporarily bratticed off, we took down the stoppings, and sent men to explore each heading, and then finally closed them up. After five hours' search we ultimately found Fitzpatrick's body at No. 10 bord. [*The witness here referred to the plan of the colliery workings, and described the headings and bords through which the air was forced, &c.*]

Mr. Dixon (continuing) : I am satisfied that the air was getting away and going over the overcast. It could not escape over 20 bord anywhere else. I measured the air at the top of the going bord, and reckoned there were 3,000 cubic feet coming in per minute. We were satisfied that 3,000 feet was good enough for us, especially as we were in a great hurry to get to the bodies.

To His Honor : For thirty men that would be 100 feet each. I forget how many men we had with us.

To Mr. Robertson : If we had had time to make better arrangements we could have obtained enough air to have reached the seat of the trouble. We would have bratticed up every opening we were suspicious of.

To His Honor : There was a certain amount of scaling along the rope road, as we could not successfully tighten the brattice. We started with between 10,000 and 11,000 cubic feet of air. We put the leakage down to the flow back along the rope road. If we had closed the rope road I think we would have very nearly doubled the current.

To Mr. Robertson : If we had had time to make proper preparations, we would not have had any difficulty in reaching any part of the district that was not inaccessible before; and, if the air could have been brought in with proper preparation, we might have got 10,000, 15,000, or 20,000 cubic feet. If it had been a matter of investigating the district only, and not an urgent one of recovering bodies, we would have had no difficulty in bringing in this quantity of air. [*The witness here further explained the plan to the Court.*]

Mr. Dixon (continuing) : I had to close the double heading so that the fresh air would not scale away instead of going up to the top of the going bord.

Mr. Robertson : Having found a scale of air coming through the double heading in the direction of No. 20 bord, that would imply that there was a contrary scale when the air was entering 20 bord?

Mr. Dixon : Yes.

His Honor : The block shown on the plan is known as the 10-acre Block?

Mr. Dixon : Yes.

His Honor : And was the subject of a dispute?

Mr. Dixon : Yes.

His Honor : It is represented as clear on the plan—as not having been touched; but, in point of fact, how would you show on that where the actual workings had gone round the upper (north) corner of the block?

Mr. Dixon : The top corner of this block has been entered by a number of bords and cut-throughs, and in consequence there is a connection.

Mr. Robertson : According to the plan there was no connection between No. 3 district and the other district (Gardner's Heading)?

Mr. Dixon : No.

Mr.

Mr. Robertson : The district to the east and north of the engine plane appears to be connected with No. 3 district by a sort of overcast at No. 17 bord?

Mr. Dixon : That is so.

His Honor : No. 17 bord connects the east side and the west side?

Mr. Dixon : Yes.

His Honor : Supposing foul air is being generated in No. 3 district, that would be the only way you could account for fire stink passing out on to C heading?

Mr. Dixon : Yes.

His Honor : C heading does not connect directly with No. 3 district.

Mr. Dixon : No; No. 3 is a distinct district.

His Honor : There is a connection which takes this stink over the main road into the east side?

Mr. Dixon : Yes.

His Honor : You have not been on the overhead connection at No. 17 bord?

Mr. Dixon : No, I cannot remember it; I may have seen it. I have not inspected Stockton Colliery regularly for many years. The other side of the main road appears to be very foul now from the fire stink oozing out of the bord end.

Mr. Robertson : The district has been shut off to the east of the engine plane; do you not think if the same time and money had been expended in blocking No. 17 it would have been spent to better advantage?

Mr. Dixon : There is a lot of fallen ground there, and it may be a difficult matter to get at it and remedy it properly. It would be rather a risky thing to get there now.

Mr. Robertson : There is fresh air there now?

Mr. Dixon : Yes; but when you are going through fallen ground you hardly know where to steer at times.

Mr. Robertson : Practically it would have been a very much more effectual way of sealing off the district?

Mr. Dixon : Yes.

To His Honor : We were ten hours recovering the bodies. We were five hours looking for one (Fitzpatrick's) body. During that time the whole of the rescuing party did not appear to suffer from poisonous gases until towards the latter end of the shift when Jury seemed to be a little affected; but I could not wonder at it, as he had been in the gaseous part so long, having been at the pit from the night before, when he went in with the first party. In our operations we sent two men at a time down a bord and made them come into the fresh air every few minutes.

His Honor : You were present when a sample of the air was taken?

Mr. Dixon : Yes; I filled one jar myself in Professor Threlfall's presence.

His Honor : Comparing the smell of the air from where the sample was taken by Professor Threlfall with what you observed when you first smelt the air coming out of No. 3 district, what do you say as to the relation between the two?

Mr. Dixon : Professor Threlfall mentions the word benzine in his report, and that is the name I gave to that smell myself. The place from where we took the air for analysis smelt the same as we smelt all the night long—just about the same strength. It was quite strong enough for anyone to be certain that it was a benzine smell which is one of the first products of distillation.

His Honor : How do you explain the formation of carbon monoxide accompanied by this benzine smell?

Mr. Dixon : Carbon monoxide is simply where there is one atom of oxygen taken up. Carbonic acid is two of oxygen and one of carbon. In carbon monoxide there is an atom of oxygen gone, and this CO is one of the first things that come off in distillation of coal in an old bord. There must be a red heat to bring it off, and as a rule it is accompanied by a benzine smell. Proper distillation can only be got with a liquid. This is a destructive distillation or sublimation, when a solid body is undergoing destruction by a red heat. There is of course incomplete combustion, which is brought about by a short supply of air.

His Honor : What experience had you before this in similar cases?

Mr. Dixon : This is the eighth colliery in this colony that I have had experience in in underground fires, and I must say that there was no mistaking the smell when it came from a gob-fire.

His Honor : What were the collieries?

Mr. Dixon : One was in Greta, Brown's Colliery at Minmi, Thoruley Colliery, A. A. Company's Old Pit, Hillside (Merewether), and No. 2 Ferndale; also that at Lithgow, where eight men lost their lives in 1886. In each instance I have noticed the peculiar smell of benzine, which cannot be mistaken. Brown's Colliery was fired by soot accumulating in the return air-way, and so was Lithgow Colliery; Greta was fired by the furnace. The gob-fires I have experienced were in Thoruley, Hillside, A. A. Company's Pit, and Stockton. In each case it was a gob-fire pure and simple. I watched its action in A. A. Company's Pit, having been a workman there. I can state pretty well now from past experience when gob is heating—that is, spontaneous combustion. I was the first person to discover the heating of coal in the A. A. Company's mine. My experience is, your Honor, that a gob-fire is more likely to take place where there is a great percentage of iron pyrites. Other people differ from me; but what I have stated I believe to be the case. I never knew these fires to break out until the clay-shale came away, and as soon as that falls it forms a sort of wet blanket upon the heated small coal. The heated substance must be covered over with something before this spontaneous combustion can take place.

To Mr. Robertson : The first place in the A. A. Company's mine where I ever found coal heating was a place where there was a current of air playing on the small coal at the bord end. I used to plant my tamping stick into it, and on one occasion, when I pulled it out in the morning, I could hardly bear it in my hand, it was so hot. I drew the attention of the foreman to it. I believe that the gob-fire was owing to the extra amount of iron pyrites present at the time.

Mr. Robertson : Would the circulation of a good current of air have a cooling effect and tend to stop a gob-fire?

Mr. Dixon : As a matter of fact, if you keep the place cool you would not get a gob-fire.

Mr. Robertson : But could you, in any large area, spare sufficient air to put it through every bord?

Mr.

Mr. Dixon : Well, if you could supply sufficient cool air, especially in old workings, and confined it to a given course down each bord, you might obviate a gob-fire. (*Continuing*.) I do not believe in furnaces. I do not believe in underground furnaces—the day has gone by for them; and I do not believe in having a reservoir of gas. The area of old workings is on the increase. There ought to be some system in a mine to cause sufficient ventilation. As regards the course I would recommend to be adopted in the absence of a sufficient volume of air to ventilate the old workings, I see no harm in having an open end to a return air-way, but not to a furnace; I do not believe in having any place of that kind sealed up. Of course you cannot help it in the case of a gob-fire.

To His Honor : I have known carbolic acid to put out gob-fires.

To Mr. Robertson : The conditions must be very favourable to get an effectual seal of a gob-fire. If I can hear certain sounds which my experience has taught me, I can tell whether there is any air going in. Here you have something like a mile of main road, and there would be getting on for fifty or sixty stoppings. As to whether I think it possible to seal up this gob-fire—supposing that there is one (and Mr. Humble and I say we believe there is)—until the other stoppings are sealed up and we get the normal pressure of the No. 3 district, I cannot say positively. My own opinion is that it would go through a plastered stopping. In the No. 3 district nearly all the stoppings are sealed up, but where the poisonous gases are now the stoppings are not built. The by-products coming from that gob-fire—we suppose there is one there—are bound to be coming out there, while being engendered, until the other stoppings are built. After I hear the sounds, after the other stoppings are built, I will be able to give a definite opinion as to whether there is a gob-fire there; I am awaiting the issue of events to see if the other stoppings will render it safe. I have never heard of a gob-fire, or seen anything of one, in a mine where there is such a large area with so many as fifty or sixty stoppings. It is unfortunate that it should be so, but it is so. As to the Lithgow accident, that was owing to a big fall in the roof. The small coal stoppings were forced out by a fall of the roof. I cannot say whether the pillars had been taken out between there (Lithgow) and Eskbank. I did not see the pillars. Several acres of ground came away in one big body.

Mr. Robertson : Can you state what were the recommendations of the Royal Commission on the Lithgow accident?

Mr. Dixon : That they have complete stoppings.

Mr. Robertson : Did not the Commission point out the danger of an old working being sealed off in proximity to working places?

Mr. Dixon : I really forget now; it is such a long time ago. I do not know that they recommended brick stoppings. The effect of a fall forcing out a stopping would be that some of the old noxious gas would come out. As regards the Lithgow accident, the question is about a fall of such magnitude coming away.

His Honor : Is there any risk of a gob-fire spreading in a mine;—if it is well sealed off, is there any risk of the fire, if there is one there, becoming serious to the surrounding country?

Mr. Dixon : Providing the fire were to come through, I think it would go through the whole district. If it is well sealed off, I expect it to be put out—that is, if it is hermetically sealed off.

His Honor : If the highest temperature in the mine is 78, what would that indicate?

Mr. Dixon : It would be a question of how much heat was coming from the seat of the fire.

His Honor : If “fire-stink” was coming from it, would it indicate that there is a large or small fire?

Mr. Dixon : I believe that the fire was not a month old when the accident happened. I believe it was only an incipient fire. I believe it will go out when that district is sealed off. I think I look for the extinctive gas being able to put that fire out. It must go out when it cannot get anything to live upon. I look upon a lot of small coal in a gob as a heap of porous matter. A certain percentage of oxygen enters the pores, and incomplete combustion takes place owing to the want of more oxygen. That tends to destructive distillation or sublimation. One of the first products given off by incomplete combustion is naphtha, which carries with it benzine, and is invariably accompanied by carbon monoxide gas. This distillation is caused by red heat, and, as a supply of oxygen cannot again be readily supplied to those pores, the gob-fire naturally dies out for want of oxygen. Take away the oxygen and it naturally dies out. Chemical action is done after the first oxidation. Away comes the naphtha and benzine, and then comes this carbon monoxide and free nitrogen. Hydrogen, to some extent, is also given off in the process of destructive distillation. Carbonic acid is a virulent poison, and, when inhaled to the extent of 10 or 15 per cent., it lays violent hands upon you, and you are dead directly. Carbon monoxide infiltrates into the blood. A person can live in it until the blood has about 2 pints in it. A person may travel a considerable distance in this gas without feeling its ill effects until the infiltration is complete. Then the person desires to lie down and death ensues. It is a direct poison through the blood to the brain. The whole system afterwards becomes affected, causing weakness in the limbs, dimness of sight, loss of memory, and then unconsciousness. I have seen men stricken down with it. Sulphuretted hydrogen is composed of about 95 per cent. of sulphur and 5 per cent. of hydrogen, and also acts on the blood and brain. It smells like rotten eggs, and as soon as a person smells it he ought to get out of it, as 1 per cent. is dangerous to life. That is quite distinguishable from carbon monoxide. When poisoning takes place from carbon monoxide, the blood is turned scarlet. When poisoning ensues from sulphuretted hydrogen, the blood is a dark brown. I knew Curran well. I have known him for twenty years. I have read Dr. Haldane's report on his examination of persons about the face and ear who have been poisoned by carbon monoxide. I noted Curran's appearance around the ears and jugular, and saw signs of pink in the skin. I came to the conclusion that Curran and Smith both died from carbon monoxide. Dr. Hester made a *post mortem* examination of Curran and believed it was a case of carbonic acid poisoning. I think he was well seized of the facts before he made that *post mortem* examination. I think Dr. Hester's attention was drawn to the question whether it was carbon monoxide or carbonic acid poisoning before he made the *post mortem*. Of course, the jury came to the conclusion that the death of the two men was due to carbonic acid and other gases, and that is a very wide range. After-damp is the product of an explosion of fire-damp, and the result of that explosion is free nitrogen, steam, and a percentage of carbonic acid and carbon monoxide; but it is only of late years that they have come to discover carbon monoxide in after-damp. Nitrogen is not a poison; it is a dilutant.

To Mr. Robertson : Carbon monoxide has only been suspected in after-damp in quite recent times. Inspector Atkinson and Dr. Haldane have been bringing these things to light. Everything used to be attributed to carbonic acid.

Mr.

Mr. Robertson : Is it not conceivable that at the time of Smith and Curran's death, carbonic acid may have been present in large quantities, and that it may have been followed up at a later stage by carbon monoxide ?

Mr. Dixon : I would rather think it was through an extra supply of free nitrogen.

Mr. Robertson : Mr. Jury mentions an acid taste about the carbonic acid ?

Mr. Dixon : I have never tasted that acid taste in carbonic acid. I have been amongst it many a time. I have travelled with 3 feet of it on the floor. I have a habit when amongst gases of keeping my mouth shut and breathing through my nose. That has, perhaps, saved my life. There is nothing improbable about carbonic acid killing these men.

Mr. Robertson : Is it not possible that Smith and Curran may have been suffocated by carbonic acid gas, and that after that, that gas was diffused ?

Mr. Dixon : I want to know where the settlement of the carbonic acid gas would be to environ the carbon monoxide. There was a man mortally sick at the furnace the night before the accident to Smith and Curran. I noticed the pink hue in the skin of Curran about the lobe of the ear and about the neck. I am prepared to abide by what Dr. Heister has said after making his *post mortem* examination, because he is a scientific man in his own profession. I don't bow to him in coal-mining matters. I presume that it was at the meeting of colliery managers that it was decided to seal off the No. 3 district. We have had in evidence that the meeting was held. There was a meeting of managers, and at that meeting it was decided to recommend Mr. McAuliffe to shut the place off. I did not say that there was no difficulty in reaching the seat of the fire. I said the seat of the fire might be reached if proper precautions were taken. We might have reached further on than we did.

Mr. Robertson : Would it not have been better to have endeavoured to have extinguished the fire ?

Mr. Dixon : That's a mighty question. If the fire was in the top drive, it would have been a heavy undertaking to extinguish it. It is best to try and circumscribe an underground fire. It was not a panic decision to do as was done, but we knew we had eleven men dead already. I knew most of these men who were killed, and it affects me more than anything else. Men, at a time like that, might not think at the time just the same as they do afterwards. I have said that, providing a current of air was forced into the No. 3 district, it might be possible to manipulate all the air current to get further round. It was thought by the managers that the best way would be to seal up the district. To carry fresh air on to 18, 19, and 20 bords would, if there was a gob-fire, probably blow the whole thing into a blaze. If you put fresh air on to a smouldering fire you will probably blow the whole thing into a blaze. It is a serious matter to seal off such a large area of the mine.

To His Honor : I have a knowledge that No. 3 district was cleared of noxious gases on two or three occasions in order to let certain gentlemen in who had to give evidence in a court case. And there was more than one case. I was present—I think it was on December 5th, 1895—when a visit was made in connection with a court case. The air travelled through 20 bord, and came through a slide door. The slide was pulled back to let the return air through. The party went through the slide door marked "Z" on plan. That was when I was in that district last. The procedure adopted was done to clear away the noxious gas in that district. There was a good current of air on that occasion ; but it is so long ago that I can scarcely remember all about it now. There had been a falling bord, as far as I could make out. Sometimes the covering over a bord might be softer than that over another bord. Where the roof was soft it would fall ; where there was a big stone it would stand. On the occasion of the inspection for the court case, the air was comparatively pure. It was pure enough to live in, and for us to be able to do what we did. There was not the slightest suspicion of benzine there ; and there was no sign of fire or heat. I did not feel distressed in any way. Since this accident, the return air-way from No. 3 has gone by the name of the rope-road. After December, 1895, I did not go again to inspect the colliery. I do not, of my own knowledge, know that the stopping on the rope-road had been knocked out. I heard after this accident that this stopping had been knocked out. I had been under the impression that that stopping with the trapdoor had been left there and was there still. As an expert I say that it was not expedient to knock that stopping out.

Mr. Thwaites : When the No. 3 door was opened, had the foul air from No. 3 district a direct course to the furnace ?

Mr. Dixon : Yes, a direct course to the furnace.

Mr. Thwaites : If the stopping and man-hole door had been rebuilt, would the air have had the same effect on Curran and Smith at the furnace ?

Mr. Dixon : No.

Mr. Thwaites : If the No. 2 door had been opened, and the No. 3 door had been shut, would the poisonous gas then have had a connection with the furnace ?

Mr. Dixon : No.

Mr. Robertson : When that stopping was down, on every occasion that a man had to pass through at No. 2 door, he was virtually getting into No. 3 district,—it was the neck or approach to the No. 3 district ?

Mr. Dixon : It is a very crooked neck.

Mr. Robertson : If the gas was coming out, it was very unwise to leave that stopping out ?

Mr. Dixon : If they knew the gas was coming out from that district towards the furnace—and they knew that gas was coming out—I think it was very unwise. The effect of that No. 3 door being opened every time skips had to pass in and out would be to allow the noxious gas from the No. 3 door to go direct to the furnace, and this would happen every time the skips would have to be taken to and fro.

His Honor : In some instances it is a fact that if you leave any patch of country underground alone, after it has been worked and abandoned, carbonic acid gas would be present. If I suspected any gas in pits in the old workings in this district, it would be carbonic acid gas that I would suspect. If I had a reservoir of gas, and a ventilating fan, I would not hesitate for a minute to clear the gas out, unless there was gob-fire. That is the way I look at No. 3 district.

His Honor : You would not expect a short or slight draught to blow out such a heavy gas as carbonic acid ?

Mr. Dixon : No. I could understand it accumulating, but would not expect it to come up that hill so readily as the other mixture. Carbon monoxide has a lower specific gravity than carbonic acid gas.

Mr. Curley: I saw Mr. Curran's body, and from his appearance judged that his death was in consequence of inhaling carbon monoxide. I saw the whole of the bodies taken out later on, with the exception of one of the McAlpins. I saw Thomas McAlpin's body, but did not notice any frothy mucus about the nostrils or mouth. I did not notice him particularly about the face, and could not say for certain what appearance he really had. I paid more attention to his body. As a rule people poisoned with carbon monoxide are limp; but he was not—his was the stiffest body we got. I examined the bodies of Gascoigne and Sneddon closely; it was by lamp-light in the pit. I did not see Sneddon afterwards at the hospital. If there had been a frothy mucus at the mouths of these two men I would say it was an indication of any sort of gas. They might have died in some sort of throes—trying to vomit perhaps. I would not consider the mucus at the mouth anything to go by. It would not indicate to me sulphuretted hydrogen. That gas does not breed from a gob-fire. You get sulphurous acid but not sulphuretted hydrogen. Sulphuretted hydrogen is generated from water and decayed matter, and there is no water near the fire at Stockton. There is no considerable moisture given up in No. 3 district; it is a very dry district. There is no drainage from any other district into it. The Stockton Colliery is classed in the Northern district, which is one district.

Mr. Curley: The case of a man who was affected by gas in the mine prior to the death of the two men having been reported to the manager, do you, in your opinion, think he ought to have looked into the matter and seen for himself as to the cause of the complaint?

Mr. Dixon: The manager has got officers under him to do his work should he be absent. If he could have got to the place himself I would say yes, he should have made an investigation; but I do not say that it was imperative for the manager to do it. He has capable officers under him, and at this particular time the under-manager had the mine in hand, and made an inspection.

Mr. Curley: When a serious matter of this kind crops up, do not you think that the manager himself should attempt to make a personal inspection?

Mr. Dixon: If the manager is not urgently engaged on something else, I say yes; as a responsible person he should make an inspection, and try and get rid of the cause of complaint.

Mr. Curley: When you made inspection on the 2nd December, after the two deaths had occurred—when you made the experiment with the light, did you then know that the door in the stopping was out?

Mr. Dixon: Yes; I knew there was then direct communication with No. 3 district.

Mr. Curley: Did you ask why that door was removed?

Mr. Dixon: I do not remember; I do not think I did so right on the spot. I had heard that it had been removed. It had been knocked down to let the return air in when certain people inspected those workings in August last.

Mr. Curley: Did not the stopping being out surprise you into making some remark to the manager, seeing that there was only the furnace door to keep back the foul air from No. 3 district?

Mr. Dixon: It surprised me, but I do not think I made any specific remark to the manager about the stopping being out. Mr. Humble had been down the mine before me and made an inspection, and I therefore did not make any specific remark about it.

Mr. Curley: If that door had been put up at once would not that have allowed the management to look around?

Mr. Dixon: Yes.

Mr. Curley: How long would it have taken to put the stopping in—one similar to what was there before?

Mr. Dixon: Not many hours; the one there now was placed in position in about twenty-four hours after the second fatality.

Mr. Curley: How long did it take you to force the air into No. 3 district?

Mr. Dixon: We got up to the top of the going bord, as near as I can remember, about 3-30 in the morning. We would have been up quicker only we had the heading ends to shut off as we went up, to make sure of the current going upwards.

Mr. Curley: Can you tell us how long it took to get up to the cinder dyke, shown on the plan?

Mr. Dixon: It was about 3-30 in the morning when we got to the top of the going bord, which is beyond the dyke.

Mr. Curley: When you mentioned to the manager that the "fire-stink" indications were a menace to the colliery, did you not think it necessary to hand some communication to him?

Mr. Dixon: No, as it would be met by Rule 1, section 47 of the Act.

Rule 1, section 47: An adequate amount of ventilation shall be constantly produced in every mine to dilute and render harmless noxious gases to such an extent that the working-places of the shafts, levels, stables, and workings of the mine, and the travelling roads to and from those working-places, shall be in a fit state for working and passing therein. The ventilation so produced shall be the supply of pure air, in quantity not less than 100 cubic feet per minute for each man, boy, and horse employed in the mine, which air (in that proportion, but with as much more as the inspector shall direct) shall sweep along the air-ways and be forced as far as the face of and into each and every working-place where man, boy, or horse is engaged or passing, main return air-ways only excepted.

Every mine, except such as are worked on the longwall system, shall be divided into districts or splits of not more than 70 men in each; and each district shall be supplied with a separate current of fresh air. The in-take air shall travel free from all stagnant water, stables, and old workings. In the case of mines required by this Act to be under the control of a certificated manager, the quantity of air in the respective splits or currents shall at least once in every month be measured and entered in a book to be kept for the purpose at the mine.

We considered, Mr. Humble and myself, that that warning was as good as any we could give. We talked the matter over with the manager and his over-man, and we took it that our verbal instructions to the manager were definite. We assumed that a gob-fire was in the abandoned workings, which, if allowed to burn, would be a very serious matter. At that time I thought a gob-fire to be in existence in an incipient state.

Mr. Curley: Does not section 33 of the Act stipulate that notice should be given in writing?

Section 33: All notices under this Act shall (unless expressly required to be in print) be in either writing or print (including lithograph), or partly in writing and partly in print (including lithograph), and all notices and documents required by this Act to be served or sent by, or to an inspector may be either delivered personally, or served and sent by post by a registered letter; and if served and sent by post, shall be deemed to have been served and received respectively at the time when the letter containing the same would be delivered in the ordinary course of post; and in proving such service or sending, it shall be sufficient to prove that the letter containing the notice was properly addressed and put into the post.

Mr. Dixon: I contend that notices can be either in writing or verbal and base my contention on section 20, and on Rule I of section 47.

Section 20: (1.) If in any respect (which is not provided against by any express provision of this Act or by any special rule) any inspector finds any mine or any part thereof, or any matter, thing, or practice in or connected with any such mine, or with the control, management, or direction thereof by the manager to be dangerous or defective, so as in his opinion to threaten or tend to the bodily injury of any person, he may give notice in writing thereof to the owner, agent, or manager of the mine, and shall state in the notice the particulars in which he considers the mine or any part thereof, or any matter, thing, or practice to be dangerous or defective, and require the same to be remedied, and unless the same be forthwith remedied shall also report the same to the Minister.

Mr. Dixon: I contend that section 20 provides that the inspector *may* give notice, not that he *must* give notice.

Mr. Curley: Does not section 33 apply to all notices?

His Honor: I think it is hardly a question of great importance whether Mr. Dixon wrote or gave verbal instructions to the manager.

Mr. Curley: I want to lead up to Part 3, Supplementary, of the Act, section 59, subsection (ii), which has a very important bearing on the point.

Part 3, Supplementary, section 59, subsection (ii): Every person who is guilty of an offence against this Act for which a penalty is not expressly prescribed shall be liable to a fine not exceeding, if he is an owner, agent, or manager, or under-manager, twenty pounds, and if he is any other person, two pounds for each offence; and if an inspector has given written notice of any such offence, to a further fine not exceeding five pounds for every day after such notice that such offence continues to be committed.

His Honor: That does not touch the question before this tribunal to any appreciable extent.

Mr. Curley: Should the inspector give a written notice about a defect, it imposes upon him the duty of being there the following day to see that the defect is being remedied; and I want to ask Mr. Dixon if he was there the following day.

His Honor: Whether Mr. Dixon gives a written notice or not it is his duty to be there.

Mr. Curley: I admit that; but it would be imperative if the written notice had been given. Did you attend, Mr. Dixon, the day after to make inquiries?

Mr. Dixon: No.

Mr. Curley: Did Mr. Humble?

Mr. Dixon: I cannot speak for Humble.

Mr. Curley: I thought you acted conjointly in this matter.

Mr. Dixon: Yes, we did; but I do not know whether Mr. Humble was at the pit the next day. We were at the inquest most of the time.

Mr. Curley: General Rule 7 says:—

“If at any time it is found by the person for the time being in charge of the mine, or any part thereof, that by reason of inflammable gases prevailing in the mine, or that part thereof, or of any cause whatever, the mine or that part is dangerous, every workman shall be withdrawn from the mine or part so found dangerous, and a competent person appointed for the purpose shall inspect the mine or part so found dangerous, and if the danger arises from inflammable gas, shall inspect the mine or part with a locked safety lamp; and in every case shall make a true report of the condition of the mine or part; and a workman shall not, except in so far as is necessary for inquiring into the cause of danger or for the removal thereof, or for exploration, be re-admitted into the mine, or part so found dangerous, until the same is stated by the person appointed as aforesaid not to be dangerous. Every such report shall be recorded in a book which shall be kept at the mine for the purpose, and shall be signed by the person who made the inspection.”

At the time that you made your inspection, Mr. Dixon, you considered that certain circumstances in connection with No. 3 district made it somewhat dangerous?

Mr. Dixon: Yes.

Mr. Curley: You informed the manager of that?

Mr. Dixon: Yes.

Mr. Curley: Is it your opinion that this district should have been thoroughly inspected before taking men into it?

Mr. Dixon: You could not make an inspection without taking someone in.

Mr. Curley: Do you think that an inspection should have been made?

Mr. Dixon: We have it in evidence that an inspection was made. Mr. McDonald says he got up 300 or 400 yards.

Mr. Curley: I think you are wrong; I think he said 150 or 160 yards. [Upon looking up the evidence, it was found that an inspection was made for a distance of 160 yards from point marked Z.]

Mr. Dixon: Mr. McDonald examined that district as a competent person, and satisfied himself that the place was safe.

Mr. Curley: Do you think that the point he intended to take men to should have been inspected?

Mr. Dixon: I cannot say, as there is no telling where he wanted to take the men to.

Mr. Curley: From the evidence, Mr. McDonald only inspected 160 yards, leaving 500 yards not inspected prior to the men entering;—would you regard that as a mistake?

Mr.

Mr. Dixon: I would regard it in this way: that it wanted inspection.

Mr. Curley: Do you regard the want of inspection of 500 yards a serious blunder?

Mr. Dixon: I do not understand the way you are putting that question.

Mr. Curley: General Rule 7 provides for an exploration party, and the question is, how many men you would have go in with the manager to make up the party?

Mr. Dixon: The manager could not go in by himself and make an inspection; he must be accompanied by some one.

Mr. Curley: You say the underground manager, when you made your inspection, was sceptical about the views that you enunciated regarding what transpired in the locality inspected;—do you think, in the face of that, he was the right man to send to lead the party, being so sceptical on the question.

Mr. Dixon: I could not answer that. I said he appeared to be sceptical; not so sceptical.

Mr. Curley: You knew the dangerous gases that would have to be contended with, I presume, and you no doubt impressed that upon the manager?

Mr. Dixon: I may say again I never thought they intended to penetrate No. 3 district, and the message coming to my place informing me of the accident was the first intimation I received on the matter.

Mr. Curley: You knew the under-manager's opinion?

Mr. Dixon: Yes.

Mr. Curley: That he thought it was black damp?

Mr. Dixon: Yes.

Mr. Curley: Did you not think there was a danger in sending this man on an expedition, with his peculiar view?

Mr. Dixon: I never knew he was going to be sent on such an expedition.

Mr. Curley: Do you think the manager should have gone there himself?

Mr. Dixon: Yes; I think the manager should be on the spot as well as the under-manager if they are exploring, provided he is not engaged on other urgent duty. I believe the manager was fully seized of everything in detail as to what we said about gases being there.

Mr. Curley: Do men usually look for their lights to go out when penetrating a district containing black damp?

Mr. Dixon: We know men do it, but it is not a wise thing to do.

Mr. Curley: Do you think it a mistake to imagine they can travel with impunity until their lights go out?

Mr. Dixon: Yes; wherever gas is met with, fresh air should be carried along with the party.

Mr. Curley: How would you look upon this exploration?

Mr. Dixon: Simply in this way: that it was a grave error of judgment to go in from the rope-road in the face of the return current. It should not have been done. I never thought that anyone would have gone down the rope-road in the face of a current of air.

Mr. Curley: After you had made the inspection, and closed No. 3 door, did you discover at that time that the current of air was going in some other direction when the door was closed?

Mr. Dixon: I discovered that the gas seemed to retreat down the rope-road.

Mr. Curley: Do you think it went over the overcast?

Mr. Dixon: I do. I think it retreated down the rope-road until it found its equilibrium in the No. 3 district.

Mr. Curley: That being so, was there not a return over the overcast, and would not these circumstances be fully apparent to the management of the colliery?

Mr. Dixon: Yes; that there was an overcast there, and a return.

[The Court, at 1 p.m., adjourned till 2 p.m.]

Upon the Court resuming at 2 p.m. (Wednesday), Mr. John Dixon was re-called.

To Mr. Curley: I did not, when this inspection took place, ask the manager what experience he had had in gases; and I did not ask the under-ground manager, because I do not talk to managers and under-managers as I would to a school-boy. I have been in the vicinity where gob-fires have been shut off in times gone by. Mr. Humble and I could see that everything hinged on that No. 3 door being open or shut. On making the inspection, we said that it was carbon monoxide which was present in the mine, and Professor Threlfall says the same. Professor Threlfall came to that conclusion upon examining the air which he took in the mine. There was one bottle which he said he did not expect to get any good result from because it had not been properly sealed. He told me so when we came to the surface the day the samples were taken. He was not properly satisfied with it at the time. The products from the kerosene pump never came down into the No. 3 district, but passed into the "C" heading-way. They never went into the No. 3 district. I cannot tell you how long that pump was in operation, but I think it has ceased to operate for eight or nine months or more; it was put into the mine, I think, about three years ago; I have seen it at work; I do not know the quantity of oil used per day, but I saw it at work one time. I was present at the consultation of managers. I did not make any communications to the manager of the mine to the effect that it might be desirable to have a consultation with some of the other managers. I did not know that we were going to meet till the Saturday. I think the whole trend of the arguments was to shut the whole place up—to seal it up—so far as I remember. I do not think the matter of confining the fire into a smaller area was discussed. The only place where gas is now escaping is in the "C" headings, which have not yet been sealed off. That has not been done yet. I think there will be forty or fifty stoppings now alongside the engine-plane. They are 9 inches thick. There is a patrol stationed on the main road. There has not been any inspection of the top drive or bords in the top drive since the accidents. The top and bottom drives in the No. 3 district are now totally abandoned. Round the "C" heading the work of stopping is still going on.

Mr. Curley: Are you fully satisfied that the whole of these deaths were from carbon monoxide?

Mr. Dixon: As I said this morning, I would not like to go in the face of Dr. Heester's evidence in regard to the first two deaths. In the case of Curran, I thought at the time that he had died from carbon monoxide; but I do not say so much of the other man. As a matter of fact, after I have known a person I cannot bear to see him dead. I knew them alive, and did not want to see them after. I saw two

two when I came over—Cockburn and Bailey—and after that Sneddon, Charlesworth, McAlpine, Sweeney—about eight altogether. I think Dr. Haldane is the greatest authority on the high colouring of the blood in this sort of poisoning. I have not read “Taylor’s Manual of Medical Jurisprudence.” I have not read “Foster’s Text-book on Physiology.” It has been a moot question for many years in regard to colliery explosions, and, just now, they seem to be arriving at some settled conviction on the matter. In regard to the first two cases of death, Mr. Humble thought, as I did, that it was “fire-stink” that was in the mine. I think it was the duty of the manager to regard our opinions. Such a fall as McDonald described, if he could hear it, would have the effect of disturbing any noxious gas that might be there, and forcing it out. I have heard that it in no way affected the light. I know that most of the witnesses did not hear it; they only felt something slightly. On the following Monday, Mr. Humble and I heard a fall in No. 20 bord. No doubt that was caused by the fresh air which had been passed in. I am of opinion that it is highly probable that a fall had taken place. Well, it might have been only the morgan falling, and been just enough to displace the gas. The bords have stood there for years. There would be a certain heat in the old workings, and the fresh air passing in would tend to cool the strata, and that, I believe, is why there are more falls at night-time than in the daytime—owing to the cooling of the pit after the heating during the daytime. If it had been a big fall in No. 3 district, where the exploring party were, it would have affected the light; it would have deflected the light or put it out. I would not say the fall was one of any very great extent. When I made the inspection, I did not make any inquiries whether the managers had made inspection of the locality prior to that accident. I heard that McDonald had been down there a fortnight before. I do not think there would be any reports of inspections entered in the colliery books between the time of the accidents and now. I have not had time to go to the pit, owing to the work which I have had in the office. I know that inspections are to be made when anything dangerous takes place, and that the inspectors have to record them in a book. Yes; that is the law. In one or two places in the back return, the “C” heading way, I found this benzine smell. It has, at times, affected my light; it has put it out. I believe that it is nitrogen set free, as a product of a gob-fire, which has put my light out. I cannot remember whether the subject of free nitrogen was discussed at the time we had conversations with the manager and under-manager; so much was said. In my opinion, there was, at the time of the investigation of the accident to Smith and Curran, no effect upon the light, except that it was deflected a little. I think that Mr. McAuliffe could, at the time of the inspection, see the effect upon the light. I think he said in his evidence that the gas affected the light. From that, I judge that Mr. McAuliffe was well seized with what we said, and that he would know that it was a gas of a very dangerous character—a gas that would have to be approached with every caution. I did not feel anxious to be at the colliery on the following day. I was in Stockton. I was at the inquest, and that went on till about 5 o’clock. The colliery was idle. We knew that the colliery would not start work until the defects had been remedied—namely, until the pit had been cleared of the bad air which the inspectors had described as a menace. The manager had told me that. I had it from the manager’s own lips. It was on the Wednesday—the day after the first two men were found. At the time the inspectors cautioned the manager about the nature of the mixture in the mine, we did not call attention to the fact that the stopping and trap-door ought to have been replaced between the No. 3 furnace-door and the old workings. The policy of the inspectors had been, not to dictate how a manager should manage his colliery, which would mean taking complete control of the colliery. I, as an inspector, have no right to go and suggest to the manager how he is going to do his work. I have been inspector now nearly fifteen years, and that is how I have always acted, and I will stand or fall by it. I would step in and stop a manager if I thought he was going to endanger men’s lives. Men’s lives were lost by what the manager did. If I had been down the pit the following day, or in the colliery office, I should have asked what they were doing. We—Mr. Humble and I—never dreamed that they were going to try to penetrate into No. 3 district as far as they went. I did not suggest any remedy at all. The place was stopped off on the Saturday evening after the accident. I did not suggest the rebuilding of the stopping and slide door; if I did, I cannot remember it. [At this stage, Mr. O’Sullivan put in a copy of the *Special Rules of the colliery* (marked Exhibit “A”).]

Mr. Dixon (to Mr. O’Sullivan): In regard to the samples of air taken in the mine by Professor Threlfall, the first sample was useless, the second contained carbonic oxide, and the third carbonic acid. The district in question would be an extremely difficult one to seal off effectually. In view of the decision arrived at at the first inquest, and of the evidence given by Dr. Hester, that the men, Curran and Smith, had died from inhaling carbonic acid gas, it was quite within the bounds of reason for a party of explorers to have entered the district with the idea of trying to locate the cause of the trouble. The smaller the space it (the gob-fire) could be confined to the better. The desire to locate it was, I understand, in order to confine it to a small area. I do not say it was imperative for them to get near the locality of the trouble. I do not say there was any great cause for them to go in and do it. My contention is that the fire was the cause of the trouble in this case. This gob-fire—supposing there is a gob-fire—would be generating noxious gases all the time.

Mr. O’Sullivan: When you went into No. 3 district in December, 1895, did you not go in facing the air current?

Mr. Dixon: Yes, I did; but the conditions were not the same in this case as they were then, as it was then black damp, and it can be swept out and would not generate again while we were travelling. I knew that all the gas that had been there was swept out. I was told that black damp had been found in that district. I have never crawled on my stomach in that district, and I have never seen others do so. I climbed up a fall once, but did not crawl up. I cannot remember being on my stomach. It was grave error of judgment for anyone to go in on the rope-road if the conditions were the same as Mr. Humble and I found them. I say if the same sort of odour was present as we found on the morning of the accident to Smith and Curran, it was an error of judgment. I am prepared to say that. I say if the conditions were the same, and if that benzine smell were coming out. At the time of seeking the bodies on Friday morning, we had 3,000 cubic feet of air with us in the innermost heading at the top of the going bord, and this returned to the overcast and into the “C” heading back to the pump at the bottom of the furnace shaft. I never said that the 3,000 feet reached the No. 16 bord; I said to bord No. 10. Probably we could have got enough air to have served our purpose as far as the exploring party went. We lost 7,000 feet of air going behind the brattice to the furnace. We were going in to get dead men—and, perhaps, a living man if we could; and, as long as we found enough air for our purpose, we were satisfied. I believe we could have got in in that fresh current, and could have got in as far as McDonald and his party

party went. Falls have been likely to take place in that district, and, as a matter of fact, have taken place there. The fall in No. 3 district was not of the magnitude of the fall at Lithgow, where the small coal stoppings were blown out. There is no analogy between the fall at Lithgow and the one at Stockton. I do not believe in anyone travelling in the face of a return air current. If you are going into gas, the plan is to take fresh air with you.

Mr. O'Sullivan : If it were wrong to go into these workings in this instance, why was it not wrong in the previous instance, when you went in with them ?

Mr. Dixon : The party did wrong in going in against the current. With the air going with us we got to 16 bord, under Brackenridge's property.

Mr. O'Sullivan : At the inquest we were told by McDonald that the danger they expected to meet, if any, was black damp, and that he subjected the workings to a thorough clearing out of thirty hours, putting in 20,000 cubic feet of air a minute. On the previous occasion when you went in, the workings were subjected to a similar clearing out, and it was then found they were properly cleaned out ; on this latter occasion I presume they were also properly cleaned out. In face of that, do you think there was an error of judgment in going in to the workings ?

Mr. Dixon : Yes.

Mr. O'Sullivan : Was it not one on the previous occasion ?

Mr. Dixon : As I have already said, the conditions were entirely different on the two occasions.

Mr. O'Sullivan : But Mr. McDonald disbelieved the gob-fire theory ?

Mr. Dixon : That is his fault ; he was too sceptical.

Mr. O'Sullivan : But we have no proof that there is a gob-fire there, or was one ; moreover, the accidents that have occurred from carbon monoxide in this and other districts have not been serious ones, with the exception of Lithgow ;—is that not so ?

Mr. Dixon : Lithgow is the only serious one that I know of besides Stockton. No one has been killed by them in this district, except at Stockton.

Mr. O'Sullivan : Had there been sufficient men to take out the explorers that night, do you think they would have been got out safely, though overcome ?

Mr. Dixon : According to the evidence—yes.

Mr. O'Sullivan : Do you think that Mr. McAuliffe's action, when he heard of the accident and the men being in there, in rushing through the trap door, was the best one, and that if a delay had occurred until more elaborate preparations had been made, lives would have been sacrificed ?

Mr. Dixon : I quite agree that Mr. McAuliffe did what I would have done myself had I been in his position.

Mr. O'Sullivan : In point of fact, his prompt action saved two men's lives ?

Mr. Dixon : Yes ; and I believe if Mr. McAuliffe had had relays of men as resolute as himself and as strong, they would have recovered the party.

Mr. O'Sullivan : It would have been a mistake at that moment to have adopted your proceedings ?

Mr. Dixon : Yes. When we got there we considered that there was no life inside, and that enough men had been knocked down, five men having been lost in endeavouring to recover one man. We, therefore, stopped the men from going in until the conditions were made more favourable.

Mr. O'Sullivan : Do you not think it probable that the return air you sent in in a contrary direction, might, perhaps, have found its way over 17 bord ?

Mr. Dixon : No ; I think it found its way over the overcast. It may have gone both ways, but I hardly think it went over No. 17 bord.

Mr. O'Sullivan : Dr. Hester had not given his opinion when you formed your idea that the cause of death was carbon monoxide ?

Mr. Dixon : No.

His Honor : How does the ventilation come from No. 3 shaft ?

Mr. Dixon : It comes along a main road to two districts, which it ventilates, and then passes on to the furnace.

His Honor : Does the direct draught from No. 3 join the return draught and come down C heading ?

Mr. Dixon : Yes.

His Honor : The other air that goes up the main road for a considerable distance and returns along C heading is greatly diluted ?

Mr. Dixon : Yes. The gas noticed at the inspection yesterday gets mixed with 5,000 cubic feet of air coming out of the inner workings.

His Honor : As far as the percolation of carbon monoxide out of No. 3 district across No. 17 bord is concerned, for every volume of oxygen that somehow or other gets to the gob-fire after the combustion, there are about two volumes of gas given off ; therefore a very small percolation of air would cause a greater return than the quantity that percolated ; consequently there would be a continual increase in pressure ;—that would account for it forcing out at any point ?

Mr. Dixon : Yes ; the heat would cause expansion and turn solid carbon into a gaseous state. The benzine smell we noticed yesterday might simply be the product left. It may not be associated with the burning fire at present, nor with the carbon monoxide, but the probabilities are that it is.

Mr. Robertson : As to the fire-stink now being given off on the C return, do not you think it is from an act of combustion ?

Mr. Dixon : No ; I would not say so.

Mr. Robertson : You think the fire may now have been extinguished ?

Mr. Dixon : I would not say that ; I do not think it has had time. I would not say the fire could be extinguished under seven weeks. There is a lot of broken ground at C heading which may have been pretty well permeated with this foul air from No. 17 bord ; but they are going on with the stoppings, thus confining it, and it is now taking the line of least resistance. We will never know where it is coming from until these stoppings have been built. The effect of your getting atmospheric air on to a fire is, that the porous body (small coal, &c.) swallows up the oxygen, and the nitrogen is set free and permeates the whole of the district.

Mr. Robertson : Is not the gas that extinguished the light yesterday, when we inspected the mine, likely to be black damp ?

Mr.

Mr. Dixon : We could settle that point by having it analysed.

Mr. Robertson : When a manager is made aware that a door has been left open by some employee, do not you think it is the duty of the manager to deal with the offender?

Mr. Dixon : Yes.

Mr. Robertson : Especially when knowingly and wilfully done?

Mr. Dixon : Yes. I hold that if a man or a boy in a pit go through a door they should see that it is shut, the same way as they found it; and the duty of the manager is to be stringent on this point.

Mr. Robertson : Would you consider it a prudent course for Mr. McAuliffe to have inspected the No. 3 district single handed?

Mr. Dixon : No.

Mr. Robertson : Then, for safety, two or more persons should make the inspection?

Mr. Dixon : Yes. It is not right for any man to go single-handed and inspect an old working; you should take a good relay of men with you. We, when searching for the bodies, took the precaution of leaving men a few yards behind us, so that if any of us dropped they could rush up and bring us out.

Mr. Robertson : Is there any special rule being proposed in which the minimum number of men to enter old workings is two?

Mr. Dixon : Not that I know of.

Mr. Robertson : It is so. Under certain conditions it would be a prudent and safe course for the manager to send nine or ten, or more, men into old workings?

Mr. Dixon : Yes.

His Honor : You think the safest plan is to have the men so many yards apart, going in two and two?

Mr. Dixon : Yes; you should never go in singly, nor have your men in a body. In the rescue work at Stockton the men were placed a certain distance apart—never out of calling distance nor out of sight; and the men were not allowed to remain any time in the foul air.

His Honor : You have given us all the evidence you can, Mr. Dixon, have you not?

Mr. Dixon : Yes, your Honor.

His Honor : Have you any witnesses you wish to recall, Mr. Dixon?

Mr. Dixon : No, your Honor.

His Honor : Mr. O'Sullivan, have you any further questions you would like to put to Mr. Dixon?

Mr. O'Sullivan : No, your Honor.

His Honor : Have you, Mr. Curley?

Mr. Curley : Yes, your Honor.

His Honor : Will you kindly put them?

Mr. Curley : You have said, Mr. Dixon, that if more men had been there at the time that Mr. McAuliffe went through the trap-door, probably more men might have been got out?

Mr. Dixon : Yes.

Mr. Curley : Would not that have aggravated the danger—would they not have been incurring more risk?

Mr. Dixon : No, I do not think so; because Mr. McAuliffe was carrying out two men at a time, carrying one on and dropping him, and then going back for the other.

Mr. Robertson : Was it not said in evidence that sixteen men were in?

Mr. Dixon : Yes.

Mr. Robertson : You would not consider that a small number?

Mr. Dixon : No.

His Honor : You would not have allowed a man to go in the second time?

Mr. Dixon : No; and that is where a number of men available would have come in. They would not all have gone in at once, but in parties.

His Honor : You stopped men from going in?

Mr. Dixon : Yes; when we first got to the place we did not think there was a living man in the workings, and would not let the rescuers go in. We took up the work, and were successful by reversing the current of air. The circumstances under which Mr. McAuliffe and I went in were very dissimilar.

His Honor : A man may be on the point of falling from carbon monoxide without suffering at all?

Mr. Dixon : Yes; he might go on for twenty minutes and feel all right, but at the end of that time he wants to sit down, and does not feel inclined to get up again. The gas has then saturated the blood, and he dies.

The Court, at 3-20 p.m., adjourned till 10 a.m. the following day (Thursday).

No. 24.

THURSDAY, 11 FEBRUARY, 1897.

The Court sat at 10 a.m., pursuant to adjournment.

Mr. E. H. Wilshire, of the Crown Solicitor's Office, was present.

His Honor : Unless you, Mr. Wilshire, wish to close your case, the case is now open for you to proceed with it. We have four witnesses here—John Gould, Henry Burt, Robert James Jury, and John Ellis; but it may be that you wish to recall some of the other witnesses. It is open for you to do so if you so desire. However, those four witnesses are here now.

Mr. Wilshire : It may be that I may have some questions to ask Mr. Dixon at a later stage, but at present, having seen only what appears in the Press, I have nothing to ask him. We have nothing further at present, so far as the Department (Department of Mines) is concerned.

His Honor : You do not wish to call any evidence on the part of the Department?

Mr. Wilshire : No, your Honor.

His Honor : Is there anyone else who wishes to ask Mr. Dixon any questions?

Mr. Curley : There is one question, your Honor, I would like to ask Mr. Dixon.

His Honor : Very well.

Mr. Dixon was recalled.

Mr.

Mr. Curley: In regard to the pillars in the Stockton Colliery, is it not a fact that several pillars have been crushed there in the history of this mine;—falls have taken place, have they not?

Mr. Dixon: Yes; at different periods falls have taken place over some of the pillars. These falls may have occurred through the pillars being left too thin. An unusual quantity of timber has been required in the mine in consequence of the necessity for keeping the surface intact. The pillars are required to keep the surface intact; they do not want the surface to come away. It is possible that in some of the old workings the forest of timber keeping up the surface would be on the road to decay. The whole of the peninsula is water-logged. It is not desirable to have a fall of roof which would let this quicksand and water into the workings. The colliery is heavily timbered. It is the best timbered colliery in the country. There is a gang of men kept to renew the timber in the old bords. I suppose the timber is decaying in the old workings where the men cannot get to it to renew it.

Mr. Curley: Do you think there is any danger of the roof pressing on the pillars and affecting these stoppings in the No. 3 district?

Mr. Dixon: Well; it's a peculiar question. When I cannot see the place I cannot say that the falls which have taken place would indicate danger, as the fallen *debris* that comes down always acts as a buttress to the pillars. It is a question which wants careful consideration. I inspected that colliery for a number of years in years gone by.

Mr. Curley: Is it really not a question of doubt what will transpire in the colliery—that is, if there is a doubt about the pillars?

Mr. Dixon: Well; it's a question of doubt what will transpire in any colliery. I am not going to prophesy what is going to happen in the Stockton Colliery, or in any other colliery. I cannot speak as to futurity. I think that that is a question which should not be put to any mortal man.

Mr. Curley: I do not think you are the judge in this matter. What good will stoppings be if the pillars fine away?

To Mr. Robertson: I would sooner trust to the coal pillars than trust to timber, because timber must decay.

To His Honor: The whole district is water-logged. In some parts there are 80 feet of quicksand and clay.

To Mr. Robertson: Adequate pillars should be left in every colliery to ensure the safety of the main road. It is an exceptionally thick coal at Stockton, and very clean. The pillars in a 20-foot coal would have to be very much larger than in a 6-foot coal. The back main roadway travelling alongside the intake road has been crushed for a considerable distance. Bords have been driven away from the main road. This very much increased the difficulty of sealing off the old workings.

His Honor: This tracing of the colliery workings before the Court, as far as you know, is approximately correct?

Mr. Dixon: Yes.

His Honor: I understand it is not the proper practice to open the bords into the main travelling road?

Mr. Dixon: In laying out a pit on scientific principles there should be at least three roads, one main road and two branch roads. In the Stockton mine a great many of the bords were driven from the main road which was then termed a heading. In the early days of the mine the road was opened out more like a prospecting heading than anything else.

His Honor: The idea has not been originally to utilise it on the large scale on which it is now utilised?

Mr. Dixon: No. In laying out a mine my idea is that Nature should be followed as much as possible, but on scientific principles. I believe in always having a good retreat—that is, a wall of coal on either side of the main road.

Mr. Robertson: As a matter of economy in the working of the coal it is advisable to use large pillars?

Mr. Dixon: Yes?

Mr. Robertson: Have not the proprietors been put to great expense in this case owing to the mine not having been laid out properly at first?

Mr. Dixon: Yes. Of course they had a lot of cinder to contend with that other people did not. They had to prospect about many times to again strike the coal. The road is bottomed on a leader from a volcano, a big dyke, and this dyke threw everything out of reckoning. No one knew what was on the west side.

Mr. Robertson: But still the operations ought to have been conducted on good mining principles?

Mr. Dixon: Yes; I believe a place should be plotted down on paper first and followed if possible, if Nature will allow it. If Nature will not allow it then bring in art.

Mr. Robertson: From lack of good mining principles this property is very much depreciated.

Mr. Dixon: Yes; the Company has had difficulties to contend with ever since the pit was sunk. Nature's difficulties have been aggravated through the neglect of good mining principles at the inception of the pit.

John Gould, being duly sworn, said, in reply to His Honor: The evidence of mine, taken at the inquest, is correct. I was employed in the mine as a bricklayer. I cannot remember how long it was before my conversation with Smith that I was last employed only at the furnace. I think it was about a couple of weeks. I had not, on previous occasions to the one when I spoke to Smith, noticed any peculiar smell in the mine. I had not, on any former occasions, noticed any peculiar smell—nothing that affected me or anyone else. On the particular occasion when I noticed the smell I was helping the furnace men to unload skips. It was on December 1st—a Tuesday night. No; it was on the Monday night, I think. That was when I first noticed the smell. I noticed the smell as soon as I went in. I described the smell as something like benzine. I was working for about a quarter of an hour or twenty minutes before I began to feel any effects from it. I then felt a kind of shakiness. It affected my head. It was a sort of dizziness. When I felt too bad I went away. I think I was about there for about three quarters of an hour. When I felt bad I went and changed my things. They were lying on a table. I rushed out from where the smell was, and closed the door behind me. It was the No. 3 door. As soon as I got outside the door my lamp went out, and I fell there. I picked myself up eventually. I scrambled down to the bottom, where

where I sat for about twenty minutes—down to the travelling road. I came round in a bit. I went up to No. 48, where Burt, the night overman, was, and told him that there was a bad smell there, and that it affected my legs. He went directly up there to have a look. He left me. After that I was sent by the wheeler to unload props. For about an hour and a half I was working there. It was very hard for me to work. I was shivering. I was weak on the legs; but had no headache. There was a sort of general weakness about me. It went off eventually. I suffered altogether for a couple of hours, I think. The next day I got over the effects altogether. When I spoke to Smith he did not appear to express any opinion as to the cause of the smell. I only just told him about a smell being there. I did not tell him about the benzine smell. I did not describe the smell to him. No word was used by him or me to describe the smell. The word "fire-stink" was not used. I have not before, when working in the mine, felt the same sensations as I did on the night in question. The thing was quite new to me. I do not know anything about the knocking of the stoppings out of the rope-road connecting with No. 3 district. Brickwork was my work; but after that in the mine. I worked at the stoppings. I could not say who put in the stopping originally in the rope-road just where the rope turns off. That was done before my time. I know it was knocked down. In putting in the stoppings, the bricks were set in mortar. The work was done well—as well as we could do it. Parts were well cleared away to bring the work up to solid ground. It was 9-inch work, and it was made so as to get a good grip of the sides and top.

To Mr. Robertson: I did not mention to Burt that I had fallen down. My light was extinguished while I was in the mine. It was extinguished by the draught.

His Honor: As you went through the No. 3 door?

Mr. Gould: Yes.

Mr. Robertson: Who left the door open?

Mr. Gould: Smith. (*Continuing.*) I think it was quite unusual to leave the door open. I think that Smith, owing to his being an old hand in the colliery, would know all about the effect of leaving the door open. I could not say whether the men were in the habit of leaving the door open.

To His Honor: The doors were opened while the skips were being taken through. The door was not closed immediately skips were taken through. One skip was taken through at a time. We ran the skip in and then the door was closed. It was not left open longer than was necessary to take the skip in. We then unloaded the skip.

Mr. Robertson: How long might the door have been left open;—was it half-an-hour or three-quarters of an hour?

Mr. Wilshire: If Your Honor looks at the evidence of this witness you will see my note.

His Honor: Yes, I see it.

Mr. Robertson: How long might the door be left open?

Mr. Gould: It was left open on one occasion for a good while. Four or five skips were run in, and I think we took in the first two skips and closed the door, and then the other two were taken in, and the door was not closed. We did not close the door on every occasion.

To His Honor: We fixed the door open. It keeps open of itself. It falls to, if we leave it open almost too wide.

His Honor: Smith did make some statement to you about this smell, did he not?

Mr. Gould: Smith said, "It's rather strong to-night." There was no more conversation about the smell; none at all. There was no conversation about the orders to keep the door shut. There was no conversation about the source of the smell, and about where it probably came from.

To Mr. Robertson: I have been at the Stockton Colliery thirteen months. I got a copy of the special rules. There is something in the special rules about leaving a door open. If we left a door open it was a breach of the rules.

To His Honor: I do not look upon myself as a collier.

Mr. Wilshire: As to that night when you made the complaint to Burt, is it not a fact that you had the door propped open for three-quarters of an hour;—is it not so?

Mr. Gould: I cannot say so; I don't recollect.

His Honor at this stage decided to allow Mr. O'Sullivan, if he thought fit, to examine the witness first.

Mr. O'Sullivan: I would like to draw attention to Rule No. 28. It says:—

"No workman or other person shall injure any air-courses, brattice, or stopping, or leave open wholly or partly any door, or do any other act whereby the ventilation of the mine may be affected, or the lives of the men or the property of the owners may be endangered."

To witness: Do you know of that rule?

Mr. Gould: I know there was a rule saying we had to close doors. I did not, when I spoke to Burt, tell him that I felt ill. From what I said, Burt might treat it as a trifling affair.

Mr. Wilshire: On that night had not the door been open for over three-quarters of an hour?

Witness hesitated.

Mr. Wilshire: Just think. Didn't you prop it open?

Mr. Gould: We didn't prop it open.

Mr. Wilshire: About how long was it before you were affected?

Mr. Gould: I can't exactly say. It must have been three-quarters of an hour, I suppose. (*Continuing.*) I know that when the door was shut I felt all right. Smith also said to me, that when the door was shut it was all right, but that was afterwards—after I left him. When Burt got there the door was shut. By that time the furnace would have cleared the air, and Burt would not have noticed anything. I never mentioned to Burt that the door was kept open. I knew it was wrong to keep it open.

Mr. Curley: Didn't you tell Burt that night when you met him that there was a very strong smell coming from No. 3 district?

Mr. Gould: I never mentioned that. I never mentioned No. 3 district. When the door was open I said, "There's a very strong smell to-night." I think that's what I said, but I don't remember exactly

Mr. Curley: Did not you state that you had been affected that night, and that you had fallen down, or something like it?

Mr. Gould: No.

Mr. Curley: Did you mention it some time during the next day to the manager or anybody?

Mr. Gould: No.

Mr. Curley: Then how can you explain it being reported to the underground manager?

Mr. Gould: I believe it was reported to the underground manager. If it was reported to the underground manager, there must have been a complaint made.

Mr. Curley: Are you sure you did not say anything to Burt about the strong effect it had upon you; how you were completely overcome by it; how it affected your knees and you could not walk; and how you had a difficulty in breathing; and that you had never felt like that before in the colliery?

Mr. Gould: I do not remember.

To His Honor: I did not tell Burt that I had been knocked over.

His Honor: Do you ask us to believe that?

Mr. Gould: Yes; that is the truth. I did not tell him.

His Honor: Do you say you did not tell Burt about being weak in the knees and falling down?

Mr. Gould: I did not tell him. That is the truth.

His Honor: Then why did not you tell him?

Mr. Gould: I was beginning to get all right then.

His Honor: Because you were beginning to get all right then, you did not tell him how you had been affected?

Mr. Gould: No.

To Mr. Curley: I thought Smith would have told Burt about the occurrence. I had no particular conversation with Smith about it.

Mr. Curley: From the time you left that door open you appear to give a somewhat conflicting statement. I think you told us at first that there were only four skips taken through. When you were examined on a previous occasion, did not you say there were only four skips?

Mr. Gould: Yes; it was either four or five.

Mr. Curley: You said this morning you took two in and then closed the door, and afterwards took the others in?

Mr. Gould: Yes.

Mr. Curley: Did not you tell us on the first occasion that you only took four altogether;—is not that a fact?

Mr. Gould: I do not exactly remember. My mind is partly erratic to-day. I was working hard yesterday and had not much sleep last night. My mind is wandering a little.

His Honor: Will you try and put it together again, please, if you can?

Mr. Curley: Try and answer. All these statements cannot be correct. Would you rather rely on this statement as against any statement you made before?

Mr. Gould: The statement I made before was accurate.

Mr. Curley: Would you rather rely on the statement you made previous to this as against any statement you are now making for accuracy; you say your mind is wandering;—now, would you rather rely on that previous statement?

Mr. Gould: Yes, certainly.

Mr. Curley (to His Honor): If the witness is incapable of giving evidence to-day, as he seems to be, I do not think he is a proper witness.

Mr. Gould (to Mr. Curley): When I met Burt that night it was quite accidentally. I knew he would be where I saw him. I went to him to get instructions about my work. I casually mentioned to him about the smell in the mine. My memory was clearer on the previous occasion than it is now. When I saw Burt I said to him, "The air is very bad up there to-night."

His Honor: Is this correct: "I met Burt in the pit and said to him, 'There is a very strong smell up by the furnace to-night'?"

Mr. Gould: Yes.

His Honor: You swore that you said this to Burt?

Mr. Gould: Yes.

His Honor: Burt said, "I will go up and see." You then appear to have said, "I was completely overcome by it." You state now that you did not say to Burt that you were completely overcome by it. Is this your signature attached to the evidence which you gave at the inquest?

Mr. Gould: Yes.

His Honor: And was the evidence read over to you before you signed it?

Mr. Gould: Yes.

His Honor: In the face of that, you say now that you did not tell Burt you were completely overcome by the smell. Remember, you gave this evidence three weeks after the accident; a much longer time has elapsed now. Did you or did you not tell Burt that you were completely overcome by the smell?

Mr. Gould: I cannot remember.

His Honor: If you cannot remember now, and if you did swear to that effect on the 23rd December, was it or was it not correct?

Mr. Gould: It was correct.

His Honor: If it was correct, then you must have told him you were completely overcome?

Mr. Gould: Yes.

His Honor: You say that in point of fact you were completely overcome. Whether you told Burt that or not, you were in fact completely overcome?

Mr. Gould: Yes.

His Honor: Did Smith tell you that he had himself not only noticed the smell, but felt the effects of it?

Mr. Gould: No.

His Honor: Are you quite sure of that?

Mr. Gould: Yes.

Mr. O'Sullivan: Are you not of a very nervous temperament?

Mr. Gould: Yes.

Mr. O'Sullivan: After you fell you say you sat down, and afterwards met Mr. Burt. You tell us now that you did not tell him about the effect of this gas upon you. Could you explain why you did not tell him? If you did not, would it be a kind of shame that you should have fallen over from the effects of the gas?

His

His Honor: That is hardly the style of question, Mr. O'Sullivan, to put to a witness who is in your favour.

Mr. O'Sullivan: Until this morning I was under the impression that this witness was hostile to my clients; he certainly was hostile at the inquest.

His Honor: Under the circumstances it is not judicious to suggest answers to the witnesses.

Mr. O'Sullivan: Do you remember being cross-examined at the last inquest, Mr. Gould?

Mr. Gould: Yes.

Mr. O'Sullivan: Were you in a fit condition at the last inquest to give your evidence?

Mr. Gould: Yes.

Mr. O'Sullivan: I would like, your Honor, to put the question to Mr. Gould why he did not explain to Mr. Burt.

His Honor: Without suggesting a reply to the witness, the question might be put.

Mr. O'Sullivan: Supposing, Mr. Gould, you did not tell Burt that you were affected in this manner, can you now explain why you did not tell him;—you are of a very nervous temperament?

Mr. Curley: I would like to know, your Honor, how Mr. O'Sullivan obtained knowledge of the witness' nervous temperament.

Mr. O'Sullivan: The witness' demeanour in the box signifies it. Your memory, Mr. Gould, about this occurrence is as good now as it was when you gave evidence at the inquest?

Mr. Gould: No; my memory is wandering at present.

[The witness withdrew.]

Henry Burt, being duly sworn, in reply to His Honor, said: I have already on several occasions given evidence upon this matter, and that evidence is correct. I am night deputy overman at the Stockton Colliery. On the Monday night, 1st December, I was down near the No. 48 district, when Gould came to me and said he felt sick and a little giddy, and that Smith felt the same. I asked him if he had left the No. 3 door open. He said, "Yes, while running the skips through."

His Honor: Whatever he said, you concluded it was some bad air coming through No. 3 door?

Mr. Burt: I could not imagine at the time that it was so, having never heard of bad air there before.

To His Honor: I made it my business to go and see what was the cause of the mischief. I found the door shut and everything all right. Smith, too, said he felt a little queer, but that after shutting the door he felt all right. When I made this visit there was no draught coming up the rope-road to the furnace. I did not try what the effect was in opening the door. I noticed a strong draught of pure air from the intake shaft when I opened the door to pass through. After that I went to Mr. McDonald and reported to him what Gould had told me. It was about 1 o'clock when Gould made the report to me. I did not go straight to Mr. McDonald then, but straight to the furnace, and made an examination. It was about 6 o'clock, some hours afterwards, when I saw Mr. McDonald. I see him every morning, when I report all matters to him that I think it my duty to report. I informed him of what Gould had said to me, that he felt giddy and sick; also that I went straight to the furnace, and found nothing detrimental; that the doors were closed and the air was pure; that Gould had told me that he had kept the door open while the skips were going in, and that Smith, too, had felt a bit sick and giddy. I could not form any conclusion as to the cause of the sickness and giddiness of the men, as there was nothing to go by. At the time I thought it might perhaps be black damp coming out of the No. 3 district; that was the only way I could account for it. I mentioned that to Mr. McDonald. I did not go with Mr. McDonald when he made the examination. As to the stopping that had been in the continuation of the rope-road leading to No. 3 district, there had been a regulating board there, but it had been knocked out. The door, which was a small, sliding one, was in a frame. The sliding door was the last there; it was knocked out about twelve months ago. Before that there had been a large door further up in the rope-road; I could not say when it was taken out. It was where the stopping is at the present time. The sliding door was substituted in place of the large door. The large door had not been specially put up to close off the No. 3 district when it was put out of work; it was there when the district was working. Subsequently nothing was put up there until since the accident. It did not strike me that if No. 3 door was left open, in the absence of the stopping there might be a draught to the furnace. I have never found anything there to complain of. No. 20 board had been opened on different occasions to let the air in from the engine plane; it was closed on each occasion after it was done with, and kept closed. There were other means for the air to get in; it could come over the overcast. But the overcast never worked properly; it never drew the quantity of air required. I cannot say why it was originated. I do not think the air-way between the No. 3 district and the overcast was completely stopped. I know that the air, when it was reversed at the time of the accident, passed away over the overcast. The communication was not a good one; I do not think it was completely closed at any time. I was aware that if the No. 3 door was left open it would draw from the No. 3 district, and I concluded that black damp was coming from that district when Smith and Gould complained. I merely reported these men's complaints to Mr. McDonald; no conversation took place. I accompanied the party who went into the mine to try and find out the cause of the mischief that resulted in Smith and Curran's death. We went a few yards up the double heading, as far as the fall. As we went along the going bord the air was fresh all the way in to the fall. The smell was about the same in the going bord as in the heading. The air was meeting us, but very slightly; you could not feel it. There was very little air coming down the heading; the main body of air was coming along the going bord.

To Mr. Robertson: When Gould reported that he was sick, and Smith likewise, I could not form an opinion at the time as to the cause of the sickness. When I went back, everything seemed to be correct. When it was reported to me that both Gould and Smith were sick, I thought there must be something wrong, and immediately went to the furnace to see what it was. I thought it must be black damp. The only way black damp could come to the furnace was by No. 3 door. It did not occur to me at the time to open the No. 3 door, to test whether foul air was coming in there. I went down the rope-road to see if I could find anything. The door was shut, and there was nothing to suggest anything wrong. When I reported this matter to Mr. McDonald, I suggested that it might be black damp. I did not have any conversation with Mr. McDonald as to opening the door to see where the black damp was.

The

The bottom was full of men at the time who had to be attended to, and we could not converse further. I am aware that it is a serious matter for two men at the same time to report being giddy; if it had been one man only I might have thought it was due to something he had been eating. When I reported the matter to Mr. McDonald I thought that was sufficient. I was the responsible officer, and virtually in charge at the time. I felt it was my duty, on receiving a complaint of this nature, to investigate it thoroughly. I thought I did sufficient at the time; now I can see that I should have opened the door. There was no smell whatever when I went back to the furnace; the air was as pure as possible, and all doors were shut.

His Honor: Did it strike you, considering the enormous quantity of air coming to the furnace from all sources, that when the No. 3 door was open there must be something pretty bad to affect two men, since it would be mixed up and diluted with a large quantity of air before reaching the men?

Mr. Burt: It would not be mixed with the "C" heading air until it got within a few feet of the furnace. The air coming from No. 3 district would mix with the air coming up from the travelling road, and leaking from the shaft.

To Mr. Robertson: On this occasion I reported the circumstances of the doors being left open to Mr. McDonald. On one other occasion I found the No. 3 door open, and did not report it. I recognise that leaving a door open is a very serious matter—the most serious matter that can happen in a mine. The men have been cautioned a great number of times about the No. 3 door; but I have no reason to suppose they were in the habit of leaving it open.

His Honor: Was the caution because you suspected the doors had been left open, or because of the very great temptation there would be to the men to leave the doors open, on account of their having to bring the skips through three doors, one after the other?

Mr. Burt: Yes, because of the temptation.

His Honor: There was a very great temptation to leave No. 2 or No. 3 door open?

Mr. Burt: Yes.

His Honor: Did it never strike you that, in the face of that strong temptation, it was a very dangerous thing to leave the stopping out of the rope-road?

Mr. Burt: I did not think there was a great deal of danger in leaving that stopping down. I can see now that there was some danger in it, but did not see it before.

To His Honor: I had been in No. 1 bord some months previously, and found no bad air. There was no idea of ventilating the old workings by leaving the stopping down, because if a draught did go through it, it would only bring out the bad air, if any, in the district. If we wanted to ventilate the old district we would take the draught direct to the furnace without passing over any workings, or else dilute it with an enormous quantity of air should we have to pass it over any workings.

To Mr. Robertson: I know that on two occasions, when the No. 3 district was ventilated, black damp was met with.

Mr. Robertson: Knowing that No. 3 door, when opened, established a connection with No. 3 district, did not you think it a risky thing to leave the stopping down?

Mr. Burt: I did not think so if No. 20 bord was stopped off.

To Mr. Robertson: No. 3 door established a connection between the furnace and the old workings. These workings had generated black damp on former occasions. I cannot say why the stopping was not rebuilt. I have never had any conversation with the manager concerning it. I have had thirty years' experience in mining. As a practical man, considering the small quantity of black damp found in the old workings on former occasions, I did not think there was any danger should No. 3 door be left open.

Mr. Robertson: You consider, as a practical man, that the No. 3 district is now completely sealed off with stoppings?

Mr. Burt: Some more stoppings are to go in yet.

Mr. Robertson: Can it ever be properly sealed off?

Mr. Burt: I could not say. To a certain extent the stoppings will, I think, always leak, but not sufficient to do any damage.

Mr. Robertson: Do you know that there is a connection between the old workings on the east side of the main road and No. 3 district by way of No. 11 bord?

Mr. Burt: I have heard of a connection between the east and west side, but in what bord I could not say. I worked as a miner in No. 3 district; but, as a miner, I only travelled into my own workings and out again. I did not have any general knowledge of that district.

To Mr. O'Sullivan: I was in No. 3 district last three weeks before the accident. I found nothing but pure air; there was no effect on the light, nor any smell. I have never made any definite time for my visits to the furnace. I made it a regular practice to go once or twice every night, barring this Tuesday night. My approach could be known to the two men at the furnace, as the current of air leading to them would cause them to hear me some distance off, and in sufficient time to enable them to close the doors, if they were open, before my approach. I warned the men on several occasions about leaving the No. 3 door open, and Smith promised me that it would not occur again.

To Mr. Wilshire: I visited the furnace once or twice every night. I always found the air all right when the doors were shut. The doors were always shut when I visited the furnace, except on the one occasion that I mentioned to His Honor. I had been visiting the furnace about three months prior to the accident. It was in 48 district I met Mr. Gould. He appeared to be all right then, and had been working before I saw him. I at once went up to the furnace and found everything pure. The doors were shut, and everything was all right. I then went down the rope-road, but could trace no smell. The only words Gould said to me were "I felt a little giddy and sick when running the skips in." I asked him if he had the doors open, he said "Yes, all the time we were running in the skips." I remonstrated with him then. I said he knew it was wrong. They had done it for convenience more than anything else. Gould did not say he had fallen down; he only said he felt sick. He did not make out that he was very seriously effected, only slightly sick and giddy. Smith was at the furnace when I went there. I did not have any conversation with him about Gould. He said Gould felt giddy and sick. He said he felt the same, but not as bad as Gould. He admitted that as soon as he shut the door he felt all right again. It was then that he told me he would see that it never occurred again.

To Mr. Curley: When I was in No. 3 district, three weeks before the accident, I went in as far as the first right-hand heading. After leaving the furnace I generally used to walk down the rope-road a trifle,

trifle, but on this occasion I went further, and down into No. 3 district, to see whether there were any falls, or anything else that might want attending to. I usually ceased work at 6 o'clock in the morning. My visits to the furnace were at all times. I could not make any definite time for my visits. My first inspection, as a rule, could not be made at any particular time. I went after I had directed the men in their work—sometimes one time and sometimes another time. It was never two nights alike. I went there at whatever time I had a chance to get away. On the night that Gould complained to me I went direct to the furnace; it was then about 1 o'clock. Sometimes it was before and sometimes after midnight before I made my inspection. I know, by report, about the time Curran and Smith were found the following morning.

Mr. Curley: Seeing that these two men (Smith and Gould) made that report to you on that particular night, were you not anxious to visit the furnace again the following night?

Mr. Burt: Mr. McDonald reported to me that he had just left the furnace, after having inspected it all through. I thought that was quite sufficient, seeing that he is a more competent man than myself.

To Mr. Curley: That was at 9:30 when we went down. I did not make inspection again on that occasion until 4 o'clock in the morning.

Mr. Curley: Did it not occur to you that something might come up again with regard to the foul air there, and that it would be necessary for you to make an inspection?

Mr. Burt: I did not think it necessary to make an inspection. I did not expect any foul air so long as the doors were kept shut.

Mr. Curley: As Gould had told you that the doors were left open, as an official, did you not think it necessary to again visit the furnace and see whether the foul air was still present, or the doors left open against the rules of the colliery?

Mr. Burt: I took the man's word that he would see the door was kept shut in future.

Mr. Curley: But when men had reported to you that they felt sick and giddy, and had been affected by foul air, did not that make you desirous to see that those duties were carried out faithfully?

Mr. Burt: On that occasion I did see that they were carried out.

To Mr. Curley: It has been necessary all through for me to go to the furnace. Sometimes once and sometimes twice a night. I did not consider it more necessary for me to be there the following night any more than usual.

To Mr. O'Sullivan: When I inspected at 4 o'clock on the morning of the two deaths, it was within the time of my duty to inspect. I had before inspected at that hour, and sometimes later.

*Robert James Jury, on being called, said: Will I be allowed expenses, your Honor?

His Honor: Oh! that will be all right.

The witness was then sworn.

To His Honor: I have already been examined on two occasions; that evidence is correct. I have altogether been employed as fireman at this mine for nearly two years—that is, at the Stockton Colliery. I have also been employed at other mines. I also attend to the brattice at the Stockton Colliery. When I say that, I mean to say that it is part of my duty to see that the ventilation is in proper condition. On going into the mine we used to go to the furnace every morning to see that the furnace-men were there and at their positions. That was the first thing we did. The same system which was adopted on the occasion of the visit by the exploring party had been adopted on two other occasions—that is, in regard to knocking out the stopping at No. 20 bord and allowing the air to come up round the rope-road. I cannot say when it was knocked out on the second occasion that it was knocked out. The idea of knocking out the stopping in the rope-road was to allow the air to go direct that way to the furnace. I should say the stopping would be about 6 feet wide by about 8 feet high. I have never measured it; that is approximate. It is good solid ground there. I do not know, as far as I am aware of, that there would be any great difficulty in building it up again. I could not say whether some of the bricks would be taken for other purposes. I do not know very much about that stopping. I know the door must have been opened to admit of the air going in that direction. If not, the air could not have gone in that direction; I know it did go in that direction. I have no knowledge of the reason why the stopping was left out. I suppose it would take a bricklayer about a day to put the stopping up again. I took the thermometer in when the exploring party went in. I had the thermometer at the furnace on the night previous. On the night of 3rd December I asked McDonald whether I could take it down; it was on my own property. I took it from the furnace on the night of the 2nd December. I did it to compare the air coming from the No. 3 district as compared with that of other workings. I took it down after the death of Curran and Smith. I knew that the idea of a gob-fire was entertained; I could not say by whom. I could not say that it had been suggested by Mr. Dixon and Mr. Humble to Mr. McDonald that a gob-fire was there. I smelt a smell something like kerosene. There was not a high temperature. I did not suspect it was "fire-stink"; I do not know what it was. I thought this peculiar smell might arise from the decomposition of wood, or from the chemical action of water on the wood in the mine. There was a lot of water in the mine, and I thought the effect of that on the wood might cause it. I had some experience of a gob-fire on the A.A. Company's mine about ten years ago, but the smell from it was altogether different from the smell I experienced in the Stockton mine at the time of the disaster. The smell in the Stockton mine was a kind of kerosene smell, but in the case of the A.A. Company's mine the smell was just like the smell from heaps of burning refuse on the surface at a colliery; also the effect on the breathing at the two mines was entirely different. In the A.A. Company's mine the temperature was also very high. I had the idea that some process was going on causing this very disagreeable odour. Through the ventilation—as I suppose—on the Wednesday night it was very much better. I did not notice that peculiar smell at the furnace. When the No. 2 and No. 3 doors were open there was foul air coming on to the furnace. I thought there was a slight smell of sulphur. I did not take much time to notice, because we wanted to get out the men. I was not present with Mr. Humble when the experiment was made. On the Wednesday night I smelt an odour like "fire-stink." There was no smell to be detected, however, when the doors were closed. I had always found them closed up to the morning when we

NOTE.—The evidence of this witness was put in at the Court of Inquiry by Mr. Wileshire as Exhibit No. 7, and read, 23/3/37.

we found the two men. I noticed an acid taste in my mouth. I am not aware that sulphurous acid gas produces an acid taste in the mouth. I know, from reading the authorities on ventilation of mines, that black-damp has a slightly acid taste. That can be found in Williamson's work on Coal-mining; you can find it in Robert Peel's work on Coal-mining; you can find it in J. H. Merivale's work; and I believe also in Mr. Pamely's work. I would not say that I noticed a perceptible current near the double heading. We went in about 15 or 20 yards. There might have been a little air coming down. There might have been a little finding its way there.

Mr. Robertson: You took a thermometer with you, and had some conversation about a fire in the workings?

Mr. Jury: I had an idea that someone had said there was a fire. I got poking among the small coal. I did not suspect a fire; but I wanted to convince myself. I would not think it probable that there was a fire, because I should then have expected more heat coming along. In old workings, one wants to get all the information one can. I thought that there might be some chemical action going on on the old wood there—the action of water on old wood (I think I have read, somewhere) gives off some peculiar odour. I cannot say what I would have done if I had expected a fire. I cannot say that I ever heard, among the party of explorers, anything said about a fire. The way the exploring party went in was not conducive to conversation. We went in two or three feet apart. We did not stop anywhere for conversation, I think. I found an acid taste in my mouth at the furnace. Our lights were extinguished when we were going in for Curran and Smith. Our lamps died out from black damp. I am positively certain that the gas that killed Curran and Smith was not the same as that which killed the other men. I have been in both, and have been affected by both, and I am certain that they are different. In the case of Curran and Smith, found dead at the furnace, our lights were extinguished by the foul air; but, in the second case our lights burned brightly, and the effect on me, bodily, was entirely different. I do not know why this stopping on the rope-road was built. As regards whether I, as a practical man, think that only one door was sufficient to keep the bad air back, I don't know. We had no previous trouble. There was no smell. When these doors were as they should be, this smell never came out. Through the doors being left open, the black damp came out. My belief is, that hundreds of thousands of cubic feet of black damp came off from these old workings previous to anything else coming off. Carbon monoxide might have come off after. The object of putting up double doors is to prevent waste of air.

Mr. Robertson: Is it not an additional precaution?

Mr. Jury: I know it is a practice to put up double doors. I think it is an additional security. (*Continuing.*) I am certain it prevents waste of air. It is also easier to pass through doors when they are double, especially when there is heavy pressure, as there is in that mine. There had been nothing to suggest the need of double doors.

[The witness then showed on the tracing before the Court the position in which bratticing was put up on the occasion of the visit of the exploring party, and showed also the course which the air travelled.]
Witness added: When we found Fitzpatrick, the air was very foul in that particular locality.

To His Honor: I am quite certain that the air was very foul where we got Fitzpatrick's body.

To Mr. Robertson: If Mr. McAuliffe and others had not rushed in right off, I don't think the two men—the two McDonalds—could have been saved. If they had stopped to make greater precautions they would have brought out corpses, that's all. I believe they ran a risk in going in to fetch out the bodies, and I believe that if there had been plenty of help at that particular time all might possibly have been got out alive.

To Mr. Thwaites: I said in my evidence that No. 2 and No. 3 doors were left open on the morning of the 2nd. If No. 3 door had been shut, and No. 2 open, I do not think the furnace would have drawn from No. 3 district. If No. 3 door had been shut, the deaths of Curran and Smith would not have occurred.

To His Honor: On going into the No. 3 district Mr. McDonald told us to keep 8 or 10 yards apart. We only went a short distance along the double heading; I could not say how far. We did not go in further than about 15 or 20 yards. We did not get as far as No. 16 bord in the double heading; we came out by way of No. 1 bord, and got as far as 16 bord. At that point (16 bord) the temperature was 78. I would not call that a risk sufficient to call for alarm in travelling through old workings. There was a smell all the way in. I do not remember hearing any fall; I was very busy doing other things, and a fall may have occurred and escaped my notice. I cannot say that I heard one. I felt no distress until we turned to come back. Then I felt myself going over. It is impossible for me to say whether it was Williams or the Government Inspectors who first suggested knocking out the stopping and carrying the air in with them. Williams was the first man I heard suggest it. No. 2 door is simply one of two doors to make an air-lock.

[The Court, at 1 p.m., adjourned till 2 p.m.]

Upon the Court resuming at 2 p.m. (Thursday) Robert James Jury was recalled.

To Mr. O'Sullivan: I was at the furnace on Wednesday night. The air was tested there with a lamp on several occasions during the night, and on each occasion it put out the lamp. The air was tried about every half hour. The light was placed close to the ground, and in other positions. On every occasion the air extinguished the light. Towards Thursday morning it did not extinguish the light so quickly as it did during the middle of Wednesday night. The air seemed to be clearing towards morning. I would gather from the light going out that there was a lot of black-damp coming out of the No. 3 district; so much so that it extinguished the light. The last test with the light was made towards 6 o'clock in the morning. The result then showed that the air was clear, as it did not extinguish the light nearly so soon as it had done a few hours previously. I have been reading up a lot about theoretical mining. I have been engaged on the study of mining a number of years. I intended to sit for the last examination, but was unable to do so owing to my illness, arising from this accident. I was not reading up solely at the time of the accident because of my intention to sit for an examination, but because I am always anxious to gain all the knowledge I can on mining. I could not say that that would account for my having carried a thermometer with me on the night we went into the No. 3 district. I generally like to make observations, and on this occasion took the thermometer with me for that purpose. I know the overcast marked on the top point of the plan. I have been given to understand from those who frequented that part of the pit that very little air can get over it on account of the fall. The overcast
has

has been bricked up since the accident. I have no idea of the quantity of air that was passing through 11 bord on the night of the accident. I cannot say whether there was a good, free current. I never measured the air on any occasion that night. Before the retreat of the party there was sufficient air, otherwise I would not have gone past that point (11 bord).

To His Honor: There was sufficient air, provided it was good.

To Mr. O'Sullivan: I was a member of the exploring party and one or two rescuing parties. The distance from the trap-door that the party entered and No. 16 bord is about 400 yards. I think that about an hour elapsed from the time that I went in with the exploring party through the trap-door until I got back to that point; but I am not borne out by other witnesses in this opinion. I cannot say, when I went in with the rescuing party, how long it was before the bratticing was put up. Some of the men who were overcome were in for about twenty minutes only, and I can instance one case where a man was carried out within that time.

To Mr. Wilshire: I was in this district for an hour—at least, so I think—and came out all right, although I was pretty well done up. Another man went in afterwards, and was carried out within twenty minutes overcome. The only conclusion I can draw from that is that either the power of the gas had increased or there was a very great difference between the powers of endurance of the two men; but my opinion is that the power of the gas had increased. I know that this district was cleared out on a former occasion. On the former occasion the air was not playing on the district so long by several hours as it was on this occasion. I would say that the air was playing on the district a longer time on this occasion than on any previous occasion that I know of.

Mr. O'Sullivan: We are told by Mr. Dixon and Mr. Humble that the amount of air at the top of the going bord after the brattice was erected was 3,000 feet;—what is your opinion?

Mr. Jury: I never saw the inspectors measure the air.

Mr. O'Sullivan: I do not think they measured it other than by their lights.

Mr. Jury: That is a very rough and ready way. I do not think there were 3,000 feet.

To Mr. O'Sullivan: The doors in the air-pit were slung so as to open against the current and close with the current.

Mr. Robertson: What was the area where the air was measured?

Mr. Jury: I should say about 48 feet.

Mr. Robertson: Might not 3,000 feet be passing almost imperceptibly?

Mr. Jury: I do not think there was 3,000 feet; there may have been, but I do not think there was.

To Mr. Wilshire: Prior to the accident, as fireman, I visited the furnace every morning. I went on at four o'clock in the morning, and always went direct to the furnace. I never found the air bad at the furnace, nor the doors open. I did not know it was the practice of the men to leave them open. If I had known that such was the case, I would have corrected them. I never heard anything about the complaint made by Gould to Burt until it came out in evidence. I never heard anything from Smith about the air being bad at the furnace. I saw Smith every morning at the furnace. He never made any complaint. He was always on the night shift, and consequently I always saw him at four o'clock in the morning. I always spoke to him, and he always had an opportunity to make a complaint if there was anything to complain about. I do not say that I am of opinion that this is not a gob-fire in the mine. I was under the impression that the chemical action of stagnant water on decayed wood would give rise to the smell said to be fire-stink. I have seen this view expressed in one of the standard works on coal-mining, that a peculiar smell is given off in this way. I am not thinking of sulphuretted hydrogen. I do not think that white damp is given off by decomposition of wood in old workings. I believe that foul smells do arise from that cause. I cannot quote the authority I refer to just now; I will very gladly look it up and send it along, if it is thought desirable. Smith had been at the furnace before his death about twelve months. I always found him a careful man. All the time he was there, I never thought he would carelessly leave open the door.

[At the request of the parties in the Court, Mr. Robertson scaled off the distances between several of the points marked on the plan: From trap-door marked Z to No. 11 bord is about a quarter of a mile; from the furnace to No. 16 bord, about 700 yards; from the double heading to No. 16 bord, about 420 yards.]

To Mr. Curley: It was very close to the furnace in the No. 3 return, where we tested the air with our lights. The No. 3 door was open at the time. There was a pretty good current coming from No. 3 door after the air had been introduced at No. 20 bord. The district was being cleared at that time. The last time we tested the air with a lamp was about six o'clock. We were coming off then; we had been there from seven o'clock or half-past nine on Wednesday night—half-past seven, I think. I had been in No. 3 district before I went in exploring. I have travelled through the old workings in No. 3. I would not say that I have a close knowledge of the places in that district. I went with those who knew the district well. We took plans, and with their aid I could find my way over such parts of it as could be travelled.

Mr. Curley: You speak about decayed wood and the action of water;—was there any water in that district?

Mr. Jury: Yes; water was lying in portions of it.

To Mr. Curley: So well as I can remember, there was very little water dripping from the roof. There was water lying in pools on the floor. I was not at any consultation that took place before the exploration party went into this district. I only heard a warning from the manager to the under-manager. I offered no opinion myself.

His Honor: What warning did you hear?

Mr. Jury: Mr. McAuliffe said to Mr. McDonald, "Be sure and take fresh men out for the exploration work"—that is, men who had not done a shift just before; men who had had a rest.

Mr. Robertson: Did you anticipate then that they would meet with difficulty?

Mr. Jury: No; I only thought that it was advisable to take precautions.

Mr. Curley: When you noticed this peculiar smell, can you account for you not being so distinct about it as Mr. Burt. Mr. Burt's evidence was very clear and distinct on the matter. He states that it was the same smell he had noticed when he went there after the two bodies were found?

Mr. Jury: I have nothing to do with Mr. Burt.

Mr. Curley: Can you account for that conflict in your opinions?

Mr. Jury: I cannot attempt to account for it. I am here only to give my own opinion.

Mr.

Mr. Curley : In those books you say you have looked into, do they not warn men against going into districts until thoroughly ventilated, where gases are given off in that way, such as sulphuretted hydrogen ?

Mr. Jury : That is very vague.

Mr. Curley : Yet you say you noticed a sulphurous smell ?

Mr. Jury : Yes, I did.

Mr. Curley : If a warning is given in that direction in a book, do not you think it is worth while taking notice of ?

Mr. Jury : Yes.

Mr. Curley : I suppose it is understood that all exploration work is attended with more or less danger ?

Mr. Jury : There is always some danger, otherwise it would not be termed exploration work, and experienced men would not be chosen to carry out the work.

Mr. Curley : Were you not aware that the return air was loaded with poisonous gases ?

Mr. Jury : If I had been sure that the return current was loaded with poisonous gases I would not have gone in against it.

Mr. Curley : Had you not some intimation that there was something peculiar in the district ?

Mr. Jury : There might have been something peculiar yet not very dangerous.

Mr. Curley : You knew two men had been found dead previous to this ?

Mr. Jury : Yes ; but I do not believe that that particular kind of gas killed those two men at the furnace. That was my belief, and I am still of that opinion.

Mr. Curley : You say that very large quantities of black-damp came out of the No. 3 district ;—how do you reconcile that with the fact that the inspectors, in company with the manager and Mr. McDonald, when making an inspection on the Wednesday, put a light down on the floor, left it there, opened the door, brought out those deleterious gases, and the light still burned ?

Mr. Jury : I think, previous to Messrs. Dixon and Humble and the manager going to the district that morning, there had been large quantities of black-damp drawn out, and I am quite certain that a large quantity was drawn off afterwards.

Mr. Curley : If drawn off before and afterwards, and this was an intermediate examination, how could the circumstances be different at this examination ?

Mr. Jury : I do not know, except that they did not keep the doors open to bring the black-damp out. I feel sure that it was black-damp that killed Smith and Curran. I am quite certain that up to 6 o'clock on Thursday morning black-damp was coming from those old workings.

Mr. Curley : Did you make any protest against going into these old workings ?

Mr. Jury : No ; if I had thought there was any danger I would not have gone in.

To Mr. O'Sullivan : In giving evidence before the Coroner's Court, I stated that I had noticed a gob-fire ten years ago in the A. A. Company's pit. The smell it gave off was nothing like the smell met with at Stockton at the time of the accident. At the A. A. Company's mine at that time we could push our hands into small coal and experience considerable heat—this small coal had been thrown back only a few days previously.

To Mr. Robertson : I am of opinion that the gas that extinguished my light was black damp. I know that it has been suggested that the extinguishing of the light might be due to free nitrogen, and that might probably be the cause ; but whether free nitrogen or black damp I am quite satisfied it was not a gas that supported combustion. I am quite sure that it was the gas that extinguished the lights on each occasion and not the draught.

To Mr. O'Sullivan : When we were testing the current, the following pit officials were present, Messrs. McDonald, John Ellis, Henry Jones, and others, I think. I know Mr. McDonald was there nearly the whole of the night. Sometimes he would go back and hold a light in the current and sometimes I would ; alternately we would test it. The general conclusion arrived at was that the light was extinguished by the foulness of the air, and that it was black damp. If there had been any considerable portion of carbon monoxide in that gas, I cannot say whether the lamp would have burnt. There seems to be a great difference of opinion about carbon monoxide.

Mr. O'Sullivan : The latest books seem to indicate that it is rather the presence of free nitrogen that acts as an extinguisher ?

Mr. Jury : Yes ; but these new ideas must be borne out first by practice before they can be believed. The gas that killed Smith and Curran was a gas that would not support combustion, and therefore I think the causes of the two accidents are entirely different.

To Mr. Robertson : I think that the fact of some men being knocked over in twenty minutes, and others not until an hour has elapsed, might be due to difference of constitution. I can quite understand the fact that one man might last out for an hour, while another would go under within twenty minutes. The fact of a man getting out from these workings might be due to his persistent struggling and strong will.

His Honor : As to the length of time you were in the pit with the exploring party : When you are walking, say in a street, do you know your usual pace ;—could you not reckon the time from the distance you cover ?

Mr. Jury : I could not estimate the time in that way.

To His Honor : When I turned back I kept on walking at a steady pace. Now and then I made a very short stop only. I think I walked a little faster than 2 miles an hour. It occurred to my mind that we were an hour in the workings ; but my mind was a little affected that night. The distance from the foot of the shaft to where I turned back is about 600 or 700 yards. It would have taken about twenty-five minutes to travel each way, if going at only 2 miles an hour. I cannot remember how long I stopped before turning back. I have always been of opinion we were an hour in the workings. I cannot say at what rate we came back as I was unconscious at times. I must have struggled out mechanically. The return I think took very much longer than going in. The other men who went in were all accustomed to the pit. There was only one who was not a miner, and he was a surveyor's assistant, and knew the pit workings thoroughly. I could not gauge their capabilities to stand the gas. I should think from their build that they could have stood it better than I, but yet some of them went down more quickly than I did.

John Ellis, being duly sworn, said, in reply to His Honor: I am trolly weighman at the Stockton Colliery. I gave evidence at the inquest, and that evidence is correct. I was one of the exploring party. I was asked to go in, but did not know exactly what was on. I made no question about it; I went in as a matter of duty. I noticed a smell at the furnace on the Wednesday night, when I was there; and I again noticed the smell when I was standing near the second door. My work would generally keep me on the main road looking out for horses and ropes. There was some talk about the timber on the part of McDonald and Cockburn. McDonald said he thought it was metals and water and the fermenting of timber. It was not thought to be the same gas as caused the death of the two men at the furnace. Black-damp was supposed to be the cause of the death of the two men, Smith and Curran, through their sitting down and falling asleep. Black-damp was known to have been present on former occasions in No. 3 district. It was—the No. 3 district—to my knowledge, sealed off, all but the rope-road, from the intake to the main air course. The object of clearing out the district was to find the origin of the smell which had been noticed. Curran and Smith were affected before the clearing out took place. I don't know whether it was the black-damp which killed them. There was a slight smell at the very time the men were killed. It was the smell that continued all along. On the Thursday night when we went in, the smell was much lighter, as if it had been reduced by the clearing out. It was something similar to the smell of an extinguished lamp—something like kerosene. I have had no experience of benzine; I don't know the smell of benzine. The smell becoming so peculiar, it was proper to find out what was happening in No. 3 district to occasion that smell. I am not aware that in the course of conversation which took place there was any allusion made to "fire-stink." I never heard what "fire-stink" was. I never heard the expression before. There was not in my knowledge any mention of a gob-fire burning. I was away from home from 6 in the morning till 9.30 in the evening. Mr. McDonald asked me to come to work at half-past 1 o'clock in the day. It was a little before 6 o'clock in the morning of the Thursday that Mr. McDonald asked me this. When I went at half-past 1, I saw Mr. McAuliffe and Mr. McDonald and others at the colliery office. Mr. McDonald told me to come back at 6 in the evening, but a message was sent to me afterwards at my home, telling me not to come till half-past 9 o'clock in the evening. We went down into the mine, and McDonald said, "It's a great deal clearer"; and I think it was generally spoken of as much clearer—much lighter. I did not notice any difference in the smell until we got to about No. 11, and then it seemed to be a little stronger if anything. The smell seemed to increase suddenly. I did not hear a fall. I observed a slight concussion. It seemed to come over me as a slight shock. I felt a sudden change come over me. Mr. McDonald was then just about giving the order to return. He was about 50 yards in front of me.

To Mr. O'Sullivan: When down the mine that night, it was at the furnace side of No. 3 door that the black-damp put the lights out. As time went on, the air got purer. We made the last test before I left at 6 o'clock in the morning. The air was a great deal clearer then. The conclusions drawn from the tests made were that the smell and the black-damp were decreasing rapidly. I did first receive instructions to come back at 1.30 p.m. I don't know if a test was made then. I did not make any inquiries about the test having been postponed. The smell was not as great, or as strong, on the Thursday night as it was on the Wednesday.

To Mr. Curley: I do not know that the test made at about 5 or 6 o'clock was the final test. The air, between 5 and 6 o'clock, was much clearer. The light did not go out then. On previous occasions it had gone out. The distance between No. 2 and No. 3 doors I could not exactly say; Mr. Robertson measured the distance and said it was about 23 yards.

To Mr. Thwaites: The No. 3 door was opened on the Tuesday night. On the next night the air was much clearer.

His Honor (to Mr. Wilshire): Are there any witnesses you wish to call, Mr. Wilshire?

Mr. Wilshire: Well, I sat all through the inquest, your Honor, and heard what the witnesses said. I don't know of any others who will throw any light upon the matter. I do not know of any to suggest.

His Honor (to Mr. Curley): Are there any witnesses you wish to call, Mr. Curley?

Mr. Curley: I would like to call Mr. Humble.

Inquiries were made as to whether the attendance of Mr. Humble could be secured that afternoon; but it was found that Mr. Humble was away attending to some of his duties. It was thereupon decided to call Mr. Humble on the following day.

Mr. Curley intimated that he would like to call the Minister for Mines as a witness. Under the Act, Inspectors were to be allotted separate districts, and he would like to know why that had not been done. He explained that he would like to examine the Minister as to the way he administers the Act in regard to the appointment of inspectors to different districts.

His Honor: How can that in any way appertain to the inquiry before this tribunal?

Mr. Wilshire: I must object, on behalf of the Mines Department, your Honor, as the Minister can throw no light upon the matters before the Court.

Mr. Curley: If it was the intention of the Act that these districts should be mapped out, why was it not done at the inception of the Act? They should be mapped out by the Minister, I presume, as he is at the head of the Department. Had that been done, each particular inspector would have been looked to as responsible for his particular district, apart from any other inspector.

His Honor: A line must be drawn somewhere.

Mr. Wilshire: All the Court has to do is to make an investigation as to the causes and circumstances of the accidents. How the Minister can come in as to the appointment of inspectors, and the way he should appoint them to any particular district, I cannot see.

His Honor: Inquiries have to be limited to immediate causes, and I think, Mr. Curley, that these circumstances which you wish cleared up by Mr. Sydney Smith cannot come within the province of the Court. I do not at present see that there is any need for sending for the Minister. I do not think that the question of his action can come within the province of this Court of Inquiry. Mr. Curley does not know of any other witness at the present time that he would care to call?

Mr. Curley: Only the Minister, your Honor.

His Honor: The presence of the Minister is not material to the case. That question can be gone into on the cross-examination of Mr. Dixon or Mr. Humble.

Mr. Curley: I could not get anything more definite from Mr. Dixon, because he has already said that the Northern district is one.

His

His Honor: Would Mr. Dixon kindly give the boundaries of the Northern district?

Mr. Dixon: The Northern Coal-fields district is approximately bounded by a line running from Lake Macquarie to Gunnedah in the north-west; thence to the Macleay River, following its course to the ocean; and then along the coast to the other side of Lake Macquarie.

To His Honor: The bulk of the work lies on the Hunter. There is some work going on at Gunnedah, also at Greta. Our work is geographically concentrated in one district, with some very much dispersed out-branches. When we had an Examiner of Coal-fields, and the three of us were inspecting, we each kept a certain run of collieries, and, as a rule, when an accident happened, the inspector who visited that district received direct notification of the accident without it going through the Examiner. That practice still obtains. The reason I went with Mr. Humble to Stockton was to assist him. If I were free of the Examiner's duties I would have my own collieries to visit. I have been taken to other districts. The last few years I have been going up as far as Capertee and down south in Mr. Rowan's district. I think it is impossible to parcel the Northern district into three or four divisions. The work could not then be properly carried out. It is better to leave it as it is. It is a very important thing for one inspector to have the assistance of another. I, as a rule, as senior inspector, have always travelled with an inspector if he wanted my advice. Our inspections cover coal and shale mines only. No mining is at present going on along the Macleay, but that part has been inspected. There is only a small area of carboniferous country in that locality. Our furthest workings are at Gunnedah.

His Honor: Have you any witnesses, Mr. O'Sullivan, you desire to call?

Mr. O'Sullivan: No, your Honor. Every question I would like to ask has already been asked at the previous inquiry. Possibly, however, Mr. McAuliffe and Mr. McDonald would like to be called.

His Honor: It is the intention of the Court to call those gentlemen.

[The Court, at 4:5 p.m., adjourned till 10 a.m. the following day (Friday).]

No. 25.

Evidence.

FRIDAY, 12 FEBRUARY, 1897.

The Court sat at 10 a.m., pursuant to adjournment.

**William Humble*, being duly sworn, said:—

To His Honor: I have given evidence before on this matter, and that evidence is correct.

His Honor: I would suggest that Mr. Wilshire ask Mr. Humble any questions he might wish.

To Mr. Wilshire: The stopping at the road leading into No. 3 was, I understand, knocked out in August last. The benefit of the stopping was that it separated No. 3 workings from the furnace. It sealed off No. 3 workings to a certain extent from the furnace. The No. 3 workings were connected with other parts of the mine at another point. The stopping prevented a free flow of air through the old workings up to the furnace. As long as this stopping was intact the air in the old workings would be stagnant; no current whatever would be passing through. In my opinion, it was advisable to have that stopping there. Seeing that it was put in in the first case, it was advisable to leave it in. Apart from the question of carbon monoxide generating in these old workings, it was advisable to have it there. If there were no fire-stink it would be as well to have those old workings separated from the other part of the mine, although, if there were no carbon monoxide, there would have been no danger to men at the furnace or anywhere else. There was always a possibility of carbon monoxide occurring in these old workings. It was not until after the accident that I became aware of the stopping having been knocked out. The reason given for knocking it out was that it cleared out the No. 3 workings in August last much sooner than if they had simply opened the door in the stopping itself. By taking out the stopping they made a bigger aperture. The knocking out of the stopping really converted No. 3 door into a stopping on hinges. This made it all the more necessary that the door should be kept closed.

Mr. Wilshire: If that stopping had remained intact, would this gas, in your opinion, have generated, there being no current of air?

Mr. Humble: There is still a possibility that gas would have been generated; but it certainly would not have harmed the furnace-men.

To Mr. Curley: A little air might have got into that locality from some other quarter, but the exit would have been in the "C" heading return, along which a large quantity of air was flowing. I was quite satisfied that there was an outlet to the "C" heading from No. 3.

Mr. Curley: Seeing that there was an outlet there, was not that all the more reason that the stopping should have been left intact?

Mr. Humble: I think the stopping ought to have been left intact.

To Mr. Curley: When I was examined before the Coroner's Court I did not recollect the last time I had been at the furnace. I said it was some considerable time before the accidents occurred. I have thought the matter over since. I have no clear recollection of the time; but I think it was some time during the strike last year. I really could not say positively. It was somewhere in the winter months. I made a note as to the dates that I visited the mine. I visited it in May and April, it must have been on one of those visits. I have not made any inspection of the furnace during the night time. I have made a night inspection of Stockton Colliery, but it did not include the furnace. I do not ask the furnace-men any questions in regard to the air during my visits of inspection. I claim when I go to a furnace, or when I go to any place, I can see the state of the ventilation myself. If I find it all right then, I conclude that, seeing it under ordinary circumstances, it is all right at other times.

Mr. Curley: You knew last time you were in No. 3 district that other people thought that there were some foul gases in that mine.

Mr. Humble: I knew that black-damp had been cleared out of No. 3 district.

Mr. Curley: After it had been cleared out, would you not expect it to generate again?

Mr. Humble: Yes, I would.

Mr. Curley: Having this knowledge, did you not think it worth while to put a question or two to the furnace-men.

Mr.

*NOTE.—The evidence of this witness was put in at the Court of Inquiry by Mr. Wilshire as Exhibit No. 9, and read 23rd March, 1897.

Mr. Humble : I did not think it necessary to put any questions to the furnace-men.

Mr. Curley : You have been the principal inspector of this colliery for some years ?

Mr. Humble : Yes ; about six, I believe.

Mr. Curley : When you made this inspection after the accident, you say you had no knowledge previously of the stopping being out ;—did you get that knowledge that day ?

Mr. Humble : I cannot say whether it was on the second or the third ; it was certainly during the time we were investigating one of the two fatalities ; I think it was on the second.

To Mr. Curley : I was present when Mr. Dixon, the manager, and under-manager were there on the Wednesday after the first accident, and when the manager's lamp was put down on the floor. The No. 3 floor was open, and we were testing what was coming out of the No. 3 district. A large volume of noxious gas was coming out. The principal ingredients were carbon monoxide and perhaps free nitrogen, they come together usually ; but carbon monoxide was the predominant compound. So far as I could see, the light was not affected. The door was open perhaps fifteen or twenty minutes altogether. I believe I opened the door myself. About ten minutes passed before we got the strong disagreeable smell. The door might have remained open a few minutes after that, but not for very long. I know we closed it soon after noticing the disagreeable smell.

Mr. Curley : That would indicate to you pretty clearly that the other stopping had been taken away ?

Mr. Humble : Yes, that indicated to me that the other stopping had been taken away ; but I knew it had been taken away an hour before that.

Mr. Curley : Knowing that it had been erected there before—and you have said already that its removal came as a surprise to you—did you not at that particular juncture, at the time you made the inspection after the first accident, think it necessary to point out to the manager that it ought to be re-erected.

Mr. Humble : I do not think we did point it out to the manager at that time, because he was fully seized with the idea that it would have been better if the stopping had not been taken out.

Mr. Curley : Did you think the stopping should not have been taken out ?

Mr. Humble : Yes.

His Honor : Are we to understand, Mr. Humble, that you knew the stopping had been originally knocked out for the purpose of clearing the district, and you thought it had then been restored, and that you were surprised to find that it had not been restored ; or did you not know even of the knocking out of the stopping originally for the purpose of clearing the district ?

Mr. Humble : I did not know that the stopping had been knocked out until after the deaths of Curran and Smith. I assumed the same mode of procedure would have been adopted in August last as was adopted when I was in those workings in December, 1895—that is, opening the man-hole door in the stopping.

His Honor : Your surprise was that it had been knocked out at all, not that it had not been rebuilt ?

Mr. Humble : My surprise was not so much at it being knocked out, but that it had not been replaced.

Mr. Curley : Having had six years' experience in that district, and knowing of these foul gases being generated, did it not occur to you when this inspection was made that a remark might have been made to the manager then that that stopping should be put up again ?

Mr. Humble : I was not aware that the stopping had been taken out.

Mr. Curley : You admit that you were aware just before this inspection ?

Mr. Humble : An hour or two before the accident to Curran and Smith, I was made aware that the stopping had been taken out.

Mr. Curley : When this inspection was made to investigate the accident to Curran and Smith, and you saw the foul air coming up then, and you had a knowledge of that stopping and the door being taken out, did it not occur to you then to point out the necessity of rebuilding the stopping ?

Mr. Humble : No ; I pointed out to Mr. McAuliffe that this mixture coming from No. 3 district was a danger to the men in the mine, and would have to be remedied. We left the matter of remedying it to himself.

Mr. Curley : But you know very well if that stopping had been there the No. 3 district would not have been a menace to the furnace-men ?

Mr. Humble : Yes.

Mr. Curley : And knowing that the stopping had been there, surely the idea would have occurred to you as a practical man that it was necessary for that stopping to be put there again ?

Mr. Humble : Perhaps it was necessary ; but there was virtually a second stopping in No. 3 door if it had been kept closed.

Mr. Curley : But, according to the principles of scientific mining, you must know that No. 3 door is not a stopping in the true sense of the word ?

Mr. Humble : I know it is not a stopping, because you do not usually move a stopping on hinges ; but that door when closed was practically a stopping.

Mr. Curley : But had not the door to be opened several times to admit of skips coming into the furnace ?

Mr. Humble : Yes.

Mr. Curley : It could not have been so good then as a stopping ?

Mr. Humble : No.

Mr. Curley : And, even if it were desirable to penetrate into that district, there was a slide-door on that stopping which would make the workings accessible ?

Mr. Humble : Yes.

Mr. Curley : With the knowledge of those facts, did it not appear to you desirable that the defect should be remedied ?

Mr. Humble : We told the manager it should be remedied. We are not called upon to tell him what to do. We assume the manager knows his work, and will do it accordingly.

Mr. Curley : If you knew something had been done that made the mine defective, which you say yourself came as a surprise to you, would it not surprise you into making some remark ?

Mr. Humble : I expressed myself that I was surprised that the door was taken away.

Mr. Curley : Did you tell the manager to replace the door and stopping ?

Mr.

Mr. Humble: No.

His Honor: It did not occur to you to tell the manager to replace the stopping?

Mr. Humble: No.

His Honor: In regard to the opinion you offered at that time as to the gases coming out of that district, are you still of that opinion?

Mr. Humble: Yes.

Mr. Curley: Had you read Dr. Haldane's report before this accident?

Mr. Humble: Yes.

Mr. Curley: And you know what he states with regard to the appearance of the bodies?

Mr. Humble: Yes.

Mr. Curley: Were you anxious to see the bodies to ascertain yourself whether those conclusions were fully borne out?

Mr. Humble: No, I am not anxious to see a dead body at any time; I, however, noted one body particularly—the body of my friend, Cockburn. I thought at the time, when I saw him lying at the office, that he was not dead but asleep, his colour being so high and his features so calm.

Mr. Curley: Do you think that all the bodies presented the same appearance?

Mr. Humble: I understand that Dr. Hester swore they did so. I did not see any of the others except Curran and Smith. I did not notice anything particular about them, as they were covered with soot.

His Honor: I ask you again, do you think that the manager fully realised the statement that you made to him?

Mr. Humble: Yes, I think so. I think the manager was fully aware of the dangerous character of this gas from what we said.

His Honor: It is a very important question, what was said on the occasion of the conversation when the manager and under-manager were present, just after you went into the mine after the death of Curran and Smith?

Mr. Humble: I do not pretend to be able to remember the exact words. The first part of the inspection was made by myself, accompanied by the manager and the under-manager. I travelled down the road leading into No. 3 district, and then detected what I thought was a smell of fire-stink, and said so to the manager. I said, "That smell is very like fire-stink," but it was very slight. We travelled further down; and the under-manager, I think, said, "Well, our lights are likely to go out." Our lights did not go out; and I think I then said, "That satisfies me it is fire-stink." We returned to the shaft bottom and met Mr. Dixon; Mr. Dixon accompanied us, and we went to the furnace a second time. In travelling down the rope-road we came to a point where Mr. Dixon proposed that we should place the mine under the same conditions as when those men were found. We did so by opening No. 3 door. Five or ten minutes after the door was opened we were assailed by a strong, disagreeable smell. The smell then came up much stronger than when we met it before. When the door was closed the air was stagnant. About 2,000 or 3,000 feet came up the second time, sufficient to give off a very strong smell. Mr. Dixon said it was fire-stink. We told the manager it was highly dangerous. Both the under-manager and manager were present when we stated this. We said it was a menace to those men working at the furnace, and that it would have to be remedied.

His Honor: Did you use any words to describe what it was?

Mr. Humble: Only the word "fire-stink."

To His Honor: Mr. McAuliffe—I do not remember what he said—practically agreed that it was not black-damp. At first Mr. McAuliffe and Mr. McDonald were inclined to believe that it was black-damp. After hearing our statement, Mr. McAuliffe was inclined to believe that it was fire-stink. His utterances led us to conclude that. He said the smell was quite different to what he usually experienced with black-damp; and, therefore, it was quite likely what we said was correct. Mr. McDonald held to the opinion that it was black-damp. He said, "There may be some other gas with it, but the large proportion is black-damp." After meeting Mr. Dixon we went down about half-way between the furnace and the road end leading into No. 3—some distance past the branch-off of the rope-road. We came down to that stopping which your Honor saw on Tuesday morning (to that point—the stopping was not there then). Mr. McDonald said that there might be some other gases mixed with it, but it was really and virtually a black-damp mixture. Although we reiterated our opinion, yet he seemed to be firmly convinced that it was black-damp. Mr. McAuliffe said that the smell was quite different from what he usually experienced with black-damp; and, therefore, he was prepared to believe what we said had some truth in it.

His Honor: Mr. McDonald then stood up against you while Mr. McAuliffe came to your opinion?

Mr. Humble: Mr. McAuliffe appeared to agree with us.

His Honor: Was it a quiet, ordinary conversation?

Mr. Humble: Yes; the conversation was quiet, ordinary, and calm. It was not a heated one in the slightest degree. Of course, we took very great pains to explain that this gas was the gas we had experienced with such deadly effects in other places.

His Honor: Did the conversation amount to as much as a discussion;—was it less or more excited than the little discussion that took place at point Z the day the Court inspected the mine?

Mr. Humble: I think it was even calmer than that conversation.

His Honor: As you came back, did the discussion continue?

Mr. Humble: I think not; the discussion ceased as we came back towards the cage and ascended to the surface.

His Honor: Did Mr. McAuliffe and Mr. McDonald, during the remainder of the time, appear to change their opinions?

Mr. Humble: No, I do not think either of them did.

His Honor: You did not change your opinion?

Mr. Humble: No, I still held to it. Mr. Dixon, I think, took the greater part in the conversation, because I recognised him as having greater experience than myself.

To His Honor: I think I said that that was the same gas that had rendered me unconscious in the Thornley Colliery. I would not say for certain that I said this; but I know when I was speaking, during our conversation with the manager and under-manager, I had that experience in my mind. All through we had the benzine smell. I believe whenever we get that smell it is always accompanied by carbon monoxide.

His

His Honor : If there be a dangerous proportion you can detect it whether anyone is in front of you with a lamp or not?

Mr. Humble : Yes ; the smell is so strong.

His Honor : The sense of smell to a man who is accustomed to mining is fairly well cultivated?

Mr. Humble : Yes ; he has to make much use of that sense. I have detected fire-damp where it could not be detected by a lamp.

His Honor : As far as actual smell is concerned, neither nitrogen nor carbonic acid has any smell of its own.

Mr. Humble : No ; but they are always accompanied in a mine with other ingredients that have a smell. We are told that fire-damp has no smell, but we can usually ascertain its presence by the sense of smell.

His Honor : There may be a feeling which is not exactly a smell?

Mr. Humble : There may be. I can detect any of those gases by my nose before the lamp shows it.

To Mr. Robertson : I say that fire-damp pure has no smell, but it is usually accompanied in a mine with other gases that give off a smell.

Mr. Robertson : Would it not be more correct to say "accompanied by other ingredients?"

Mr. Humble : I have never found fire-damp but what it was accompanied by other gases which give the odour.

His Honor : Is there any taste in the mouth due to the presence of carbonic acid in the air in large bodies ; if you noticed an acid taste in the mouth, what would you put that down to, without noticing what any smell indicated?

Mr. Humble : I should put it down to the presence of either sulphurous acid or sulphuretted hydrogen.

His Honor : Would sulphuretted hydrogen give an acid taste?

Mr. Humble : I have not had much experience with this gas. I understand it has an acid taste ; but it has a very strong smell. If it had a taste and no smell, then it would not be sulphuretted hydrogen.

His Honor : As to that question of leaving a disused part of a mine in what may be called a possible barometrical connection with a working part (say) with a furnace, as a matter of practice, what do you say of that ; is it a fairly proper course to pursue or otherwise?

Mr. Humble : In my opinion, the proper course to pursue is to have at least one outlet ; but usually best if the outlet is into the main return, where the air is flowing away to the shaft. I do not think it would be the proper thing to seal off old workings completely. If a district is abandoned, I do not think it is advisable in all cases to seal it off completely.

His Honor : Would you then provide for a continual small draught through the district?

Mr. Humble : No ; I should provide that there be an outlet, so that the pressure of gas inside would never exceed the ordinary atmospherical pressure in the mine.

His Honor : Then you consider that leaving out that stopping, supposing there were means provided for preventing the setting up of a draught through the old workings, was the proper course to pursue?

Mr. Humble : I do not mean that leaving out that stopping was right, because it was not connecting that district by way of a return. Anything coming out of that stopping practically came straight to the furnace undiluted. If it had been connected with a large return of air it would have been different.

To His Honor : I believe there is a communication through the overcast. I have never travelled there. I was told there was one, and feel satisfied there is one. The plan shows it, and the officials who have been on the mine for many years say there is one. I do not think there was any need to take down the stopping, since there were two other outlets which were sufficient to allow of the gas exuding from the old workings so as to give a barometrical connection to the outside. If there was no barometrical connection the pent-up gases would probably blow out the stoppings.

To Mr. O'Sullivan : I remember inspecting the mine before the stopping was ever erected. I presume it was erected to remove the possibility of any black-damp or noxious gas coming from No. 3 district to the furnace. It is not conceivable that it was erected to save the scalings from the brick stoppings along the main heading.

Mr. O'Sullivan : If the brick stoppings were fractured along the main road, would not the air then come straight back to the furnace if some provision had not been made such as this?

Mr. Humble : If that provision had been made the sealing would still have come back. It would prevent scalings coming back to the furnace by the rope-road, but they would come back by another road.

Mr. O'Sullivan : You remember that this district was left not sealed up for a couple of years after it was abandoned?

Mr. Humble : No ; I do not remember that. I remember that when I passed through the district in 1894 with the overman the stopping and man-hole door were in then.

Mr. O'Sullivan : You cannot recall visiting that district seven years ago?

Mr. Humble : The district was at work at that time.

Mr. O'Sullivan : Five years ago?

Mr. Humble : Yes ; a few men were still working in it five years ago.

To Mr. O'Sullivan : I have no recollection of ever visiting the pit and this stopping not being in, after the workings were abandoned. I had no knowledge on the Thursday night of the state of the ventilation at 9:30 when the explorers went in.

Mr. O'Sullivan : Any opinion you have expressed on their action in going in has been founded on what you heard, I take it?

Mr. Humble : No, on what I have seen ; because, if the conditions were the same, the circumstances were the same.

Mr. O'Sullivan : You have said they were foolish to enter, but you did not qualify your statement?

Mr. Humble : I say so again. They were foolish to go in against the current of air, and there was no necessity to explore.

Mr. O'Sullivan : You had some slight knowledge that the exploring party were going to examine this district?

Mr. Humble : I had no knowledge until a very short time before the exploring party went in, and then I was far away from the colliery.

Mr.

Mr. O'Sullivan : Did you, then, know the way the current was turned on, and the way they were to enter ?

Mr. Humble : I was then informed.

To His Honor : I obtained that information from Mr. Cockburn, one of the men who was lost. Mr. Cockburn was a very great friend of mine. I met him at the Technical College. He had run away to get himself ready for the mine, and he told me then that it had been proposed to go into the district that night to explore. He had not been asked to tell me that. It cropped up in an ordinary way. He felt it his duty to tell me of his private affairs, as he thought there would be danger attached to the undertaking, and that is how he came to tell me that an exploring party were going in.

His Honor : As far as the action of the management was concerned in not communicating to the inspectors their intention of making this investigation, can you say, as a matter of practice, whether that was a usual or an unusual course to adopt ?

Mr. Humble : I think it was a usual course to adopt. They do not, as a rule, tell us what they are going to do. It is quite usual to take such steps. They were under the impression that the exploration of these old workings was not a serious step.

His Honor : You had indirectly suggested to them that it would be a serious step ?

Mr. Humble : Yes.

His Honor : The way you look at it is this : that they held a different opinion from yours ?

Mr. Humble : Mr. McAuliffe was quite satisfied that what we said was worthy of attention, but he still thought that by putting in the air current in a particular direction they would be safe, even should our theory be correct.

His Honor : But neither the putting in of a current for the purpose of sweeping out the district, nor the sending in of a party, had been suggested to you in any way ?

Mr. Humble : No ; it was mentioned to me indirectly by Mr. Cockburn as a secondary matter. He had previously told me about his private affairs, and thought he should tell me this.

To Mr. O'Sullivan : Mr. Cockburn had a fairly good knowledge of ventilation. He was a very studious man. He had a theoretical knowledge of all the gases, and had practical experience with two of them. His knowledge would be equal to the manager's knowledge as far as carbonic oxide was concerned. I remember meeting Mr. McDonald on the Wednesday before the big accident, at lunch time, and had a discussion with him then. I met him between the colliery and the hotel in which the inquest was being held. The mode of entry was then not mooted at all. I said to him that this mixture was highly dangerous, and that it was not safe to approach it unless he had a current of air with him. I was coming down from the colliery office to the hotel to attend the inquest. Mr. McDonald walked down with me. He talked in such a strain as to let me know they were desirous of knowing the cause of this fire-stink. I told him that it was highly dangerous to approach it without taking a current of air with them. I then had to go and attend the inquest.

His Honor : Did he agree with you, then, that it was a fire-stink, or did he stick to his old opinion ?

Mr. Humble : He said then that he was not so strong in his opinion as he had been on the day before. His words were : " I am not so strong in my opinion as I was yesterday, although I still believe it is black-damp to a large extent." Of course my opinion that it was carbon monoxide did not vary. This conversation took place on Thursday morning.

Mr. O'Sullivan : Did you then suggest that he should take some brandy, or some such remedy as that, when exploring ?

Mr. Humble : No ; I do not remember that.

Mr. O'Sullivan : Your suggestion that he should take the air with him was on account of yourself having been overcome on one occasion when neglecting to do so ?

Mr. Humble : No ; I did not neglect to take the air with me at Thornley. I was overcome there because of my anxiety to detect explosive gas, of which we had some trace. We had the current of air close to us then—within 3 or 4 yards of where I got my dose.

To Mr. Robertson : When I discover a serious defect in the mine, it is my duty to notify the manager. It is not part of my duty to suggest a remedy. That would be taking the responsibility of the mine upon our shoulders, and that is not desirable, as we cannot always be at the mine.

Mr. Robertson : To remedy this defect, might it not have been necessary to leave the stopping open ; it has been suggested that it should have been built up ;—might it not have been necessary that it should have been left open ?

Mr. Humble : They would have to close the road to remedy the defect.

Mr. Robertson : It was your duty, after giving warning, to inspect the mine, and see that your warning had been attended to ?

Mr. Humble : Yes.

Mr. Robertson : You say that there was no necessity to explore ?

Mr. Humble : Knowing as I do the physical conditions of No. 3, that it is practically broken ground, the pillars narrow, and the bords heavily fallen ; knowing that, I considered there was no necessity to explore with the view of getting close to the fire and sealing it off. It could not be sealed off. The only thing that remained to be done was to seal it off in the way that has since been done.

Mr. Robertson : Do you not think it the duty of the management to endeavour to reach the seat of a fire and discover its extent ; at all events, to ascertain whether it could be sealed off ?

Mr. Humble : Had the district been an ordinary one, and not broken, perhaps it would then have been advisable to try and locate the seat of the fire ; but in this case, if they had found the seat of the fire, they could not have sealed it off, except at the places where it has since been sealed off.

Mr. Robertson : The sealing off that has been done is of a very extensive character, and not so perfect as would have been the case if only one-quarter the area ?

Mr. Humble : No.

Mr. Robertson : But do you not think they should have endeavoured to reach the seat of the fire, to ascertain its compass ?

Mr. Humble : No.

Mr. Robertson : If you had had time to make more elaborate preparations, would you have had any difficulty in reaching the supposed seat of the fire ?

Mr. Humble : I think it might have been reached safely if proper precautions had been taken.

Mr.

Mr. Robertson : Do you not think it was premature to abandon that district without making any effort to subdue the fire or locate it ?

Mr. Humble : Not under the circumstances. From what I know of this district it is broken ground ; and even if they had got close to the fire they could not have sealed it off there.

Mr. Robertson : Do you not think the manager was justified in entering this district and exploring it ?

Mr. Humble : Perhaps he was. I do not think it was his bounden duty to do so in the interests of his employers.

Mr. Robertson : You have said there would be no difficulty in reaching the seat of the fire ?

Mr. Humble : Yes.

Mr. Robertson : Do you think a manager would be justified in abandoning a district without having made an effort to reach the fire ?

Mr. Humble : Yes ; considering the physical conditions I have told you of. If he had got to the seat of the fire he could not have made any practical attempt to seal it off there ; he would simply have had to come back and seal it off at the place where it has since been sealed.

To Mr. Robertson : The district has been sealed off at the only place where it could be sealed. I admit that the work is not quite perfect. The sealing is about $1\frac{1}{2}$ mile in length. I do not know whether the fire will ever be put out. Short of flooding the mine, the method adopted is the only practicable way they could do it. In Stockton there is plenty of water, and the facilities for extinguishing a fire are very good.

Mr. Robertson : You said no danger would have been encountered in exploring if proper precautions had been taken ?

Mr. Humble : Yes.

Mr. Robertson : You have spoken of bords being crushed ;—do you approve of bords being broken off the main intake ?

Mr. Humble : It is a very bad practice.

Mr. Robertson : The falls that have occurred in this mine did not indicate very good mining practices ?

Mr. Humble : No ; I think the main road should be flanked on each side by a large pillar of coal.

Mr. Robertson : The only danger to be apprehended from No. 3 district you said was from carbon monoxide ?

Mr. Humble : I think that was the danger they had to meet the night the exploring party went in.

Mr. Robertson : You said the only gas to fear was carbon monoxide ?

Mr. Humble : I mean that the only gas that would have endangered the lives of the furnace-men was carbon monoxide.

Mr. Robertson : The old workings were known to contain black-damp ?

Mr. Humble : Yes ; but there is this difference between carbon monoxide and black-damp ; black-damp will put the light out before it endangers any lives.

Mr. Robertson : You are pretty positive that the deaths of Curran and Smith were due to carbon monoxide ?

Mr. Humble : Yes ; in my opinion all the deaths were due to that. I believe that the predominant compound in the mixture that killed those two men was carbon monoxide.

Mr. Robertson : Can you account for the fact that your lights were not extinguished, and yet you were in the same gas that killed Curran and Smith ?

Mr. Humble : The mixture supported combustion, and that is why I consider Curran and Smith were not killed by black-damp. There may have been other ingredients, but still be a dangerous amount of carbon monoxide.

Mr. Robertson : It is quite possible then that Curran and Smith might have met their deaths by carbonic acid ?

Mr. Humble : Yes ; but it is my opinion that it was carbon monoxide. The carbonic-acid gas may have helped to kill them, but it is my opinion that if there had been nothing but carbonic acid they would not have been killed. I do not mean to say that they could not have been killed by carbonic acid ; but if there was nothing but black-damp present, they would have been warned of danger by the extinguishing of their lights. They would then have recognised their danger and got away.

To Mr. Robertson : I do not believe those men would have sat down on that seat and died if their lights had been extinguished. Although the lights were fixed on the caps, I think these men would have known if they were out. Perfect safety would be secured, so far as ventilation is concerned, in old workings, by circulation of fresh air. If the volume of air circulating in a mine is sufficient to permit of the old workings being ventilated, that is the best means to ensure their safety.

Mr. Robertson : Could that have been done in this case ?

Mr. Humble : No ; because the supply of air was insufficient.

To Mr. Robertson : The aggregate amount of air circulating in the Stockton Mine varies from 45,000 to 50,000 cubic feet, according to the atmospheric conditions, and is just sufficient to ventilate the present workings. I am aware that the Annual Report states about 25,000 cubic feet ; but that is the actual quantity of air used to ventilate the working-places only. The difference between 25,000 and 50,000 cubic feet is simply going to waste or passing through the old workings without reaching the men. In our report it is deemed necessary to give the number of men working in the mine, the number of splits, and the aggregate quantity of air being utilised for the men—not the aggregate quantity of air in the mine. I do not think they could have spared sufficient air to have aired that old district and other old districts in Stockton. I was not aware that 100,000 feet were circulated in 1881. That could be accounted for by the extreme point of the working-places being much closer to the shaft in 1889.

Mr. Robertson : It is hardly a proper course to pursue to reduce the air to 40,000 feet, and extend the workings at the same time ?

Mr. Humble : The furnace was probably driven at its maximum when it produced 100,000 feet. At the same time the air circulated through a very small area. Now the workings are more than a mile away from the shaft, and the length of air-ways has been increased. The friction, therefore, has been increased ; and now, with ordinary work at the furnace, you get about 50,000 cubic feet. If you have ample room in the air-ways you get better results than if you have them small and contracted.

His Honor : The angles of turning are very important ?

Mr.

Mr. Humble : Yes.

His Honor : If you can only get a small quantity of air through some means must be adopted to prevent friction?

Mr. Humble : Yes; they have reduced friction by the connection of No. 3 shaft with the workings.

Mr. Robertson : With No. 3 shaft facilities for ventilation are better now than in 1880?

Mr. Humble : No; if you made another shaft the furnace would not give any more air.

Mr. Robertson : As the area of operations increases, is it not the mining practice to maintain the ventilation, or, perhaps, increase it?

Mr. Humble : Yes; as the area opens out more ventilation is required, and I think it is well to have power sufficient to double the ventilation required for ordinary working conditions, so as to be prepared for any unforeseen circumstances that may occur.

Mr. Robertson : Did you observe in Mr. Threlfall's report that he shows no free nitrogen?

Mr. Humble : Yes; I am aware that he shows black-damp.

Mr. Robertson : Does that in any way qualify your opinion as to the probable cause of the deaths of Smith and Curran?

Mr. Humble : No; I still think that the predominant compound in that mixture was carbon monoxide. I think that wherever carbon monoxide is given off there is always free nitrogen with it.

His Honor : Does not Professor Threlfall say in his report that there was an insufficient supply of oxygen in the air which he took from the pit?

Mr. Humble : Yes.

His Honor : And, that being so, that would account for the excess of nitrogen which you were assuming to be in the atmosphere?

Mr. Humble : Yes.

His Honor : If a portion of oxygen was taken from the air to form carbonic acid and carbon monoxide, there would be a relative excess of nitrogen left?

Mr. Humble : Yes.

His Honor : You do not assume that nitrogen is given off—because there is nothing to give off nitrogen—there is nothing in the pit to give it off?

Mr. Humble : I do not assume it, your Honor. (*Continuing.*) As far as the exploration went, I was of opinion that if an exploration were necessary the explorers should have the air with them. If it was expedient to make a search for the fire, and try to put it out, it should have been done in the way your Honor suggests, namely, to carry the air with them. That method would only be to ensure the safety of the men. After the accident, it was not expedient to search for the fire. In point of fact, it was bad to feed the fire at all. The fire would be fed by the air passing over it. The difference consists in the men having to breathe the air coming from the fire, and, in the other case, breathing the fresh air going to the fire. All the conditions show that it must be an incipient fire if there is a fire at all there. In regard to the chance of being able to extinguish the fire in the No. 3 district, my experience is this—that it is scarcely possible in a mine where the stoppings are so numerous to completely seal it off. If there is a fire there, and it is not put out, the result will be the destruction of the mine. If the fire cannot be put out by stoppings, I think the next best thing would be to stop the mine working, and to flood it with water. To flood the mine would mean the stopping of work for an indefinite period, and would be throwing the mine entirely out of gear. I believe it is in some of those bords which have fallen. It will be almost impossible to get there to put it out with the hose. If they had a hose, they might play upon the fallen rock for a time, without, however, reaching the fire. The only justification which the managers had for making the exploration in the way they did was to ascertain the extent of the fire. It might have been of great satisfaction to the managers to know exactly what was going on. The percolation of a very small quantity of air would be enough to keep the fire going. The fire would keep itself alight if only fed to the extent of next to starvation. I am going by the experience which I have gained at the Seaham Colliery. In the case of the trouble there, there were only two stoppings—one in each shaft—and yet there was enough air to keep the fire alight for five months. The fire was confined to one bord when they first saw it. Probably one of the causes of this fire being alive for five months was that the mine was practically full of fresh air when the shafts were sealed off, and the fire would draw upon this fresh air by diffusion.

His Honor : I suppose, on the question of whether the working of the mine has been on a proper basis—I take it, it would have been better if those wide bords had not been turned off from the main road?

Mr. Humble : Yes. On the north-east side, there are bords turned out of this back heading; but that does not, in my opinion, provide sufficient coal to support a main road.

To Mr. Robertson : The fire at Seaham was sealed off about August, 1895; and, six months afterwards, it was reopened. When opened, it was found that the fire was more extensive than before. I believe that the reason of the shafts being sealed off was that a large fall took place at the front of the fire, and almost covered some of the men working at the fire. The falls brought out a large amount of extinctive gas, and they thought it was dangerous. The fire was, at the time, confined to a small area. There were exceptionally favourable conditions there for the sealing off which was afterwards done. It is quite permissible to try and seal off any part in a mine provided proper precautions are taken. I know rule No. 7. I certainly do not think that, to comply with it, it would have been prudent to send in one man to explore the district. The safety might lie in numbers. I see that rule 7 reads:—

If at any time it is found by the person for the time being in charge of the mine, or any part thereof, that by reason of inflammable gases prevailing in the mine, or that part thereof, or of any cause whatever, the mine or that part is dangerous, every workman shall be withdrawn from the mine or part so found dangerous, and a competent person appointed for the purpose shall inspect the mine or part so found dangerous, and if the danger arises from inflammable gas, shall inspect the mine, or part, with a locked safety lamp; and in every case shall make a true report of the condition of the mine or part; and a workman shall not, except in so far as is necessary for inquiring into the cause of danger, or for the removal thereof, or for exploration, be readmitted into the mine or part so found dangerous, until the same is stated by the person appointed as aforesaid not to be dangerous. Every such report shall be recorded in a book, which shall be kept at the mine for the purpose, and shall be signed by the person who made the inspection.

There were no men working in the affected district. The exploring party were admitted to comply with the provisions of rule 7. To send a number was more prudent than to send one man in. *To*

To His Honor : I think it would have been better to send less men in, but I think it was better to send ten men than it would have been to send one in. It is always assumed that the leader of the party is competent to lead, and that he will keep the men in comparative safety.

To Mr. Robertson : Cockburn was a very cautious man, and I think his caution was a little bit more noticeable than usual that night. He was a new official there. I think he had been at the Stockton Colliery three months only. He spoke to me about private affairs, and I was much surprised he should do so. He had been sufficiently long, and knew Mr. McAuliffe well enough to have offered suggestions if he thought them necessary, but he had not been there sufficiently long to know the geography of No. 3 district. I think that if he had been aware of any danger he would not have gone in as he did. I think it has been said that there was some conversation in the office as to what they were likely to meet. It is just possible that, Cockburn being young in official life, he thought he was justified in going by what the older men than himself thought.

To His Honor : Cockburn was a man of about 32 years of age. He had been out eight years in July. As a young man he was a miner; but he studied, and got a second-class certificate in Great Britain. I think he had been at the Colliery about three months. By studying text-books, a student would get a fair theoretical knowledge of the gases met with in mines. Cockburn would not have been likely to have had much experience of carbon monoxide, because, in the mines of South Durham, where he worked, gob-fires are few and far between.

His Honor : In your opinion, is the management of mines more careful in Great Britain than—we will not say in New South Wales—we will say in Australia?

Mr. Humble : Well, the managers in Britain have a great many more dangers to contend with. I think that if our managers here had as much to contend with, they would be just as careful. In Britain they go down a great depth; 1,000 feet is nothing. Cockburn, from his nature, was not likely to set up his opinion against that of an older man with more experience. He was not the kind of man to set up his opinion against Mr. McAuliffe's or Mr. McDonald's.

To Mr. Robertson : I think Mr. McAuliffe did right in going in as he did to rescue the two McDonalds. I think I should have done the same thing under the same circumstances. His prompt action saved these two men's lives.

To His Honor : It would have undoubtedly been the best way if the exploring party had carried the air in with them. I think that, considering the circumstances, I should have done the same as Mr. McAuliffe did when going in to rescue the McDonalds. I think that fifteen or twenty minutes after the change was made in regard to the ventilation there was a current of air flowing up the going-board. I believe that a certain amount of this air would have gone up directly the stopping marked "Z" was knocked out. Knowing Mr. McAuliffe as I know him, I do not wonder at him doing as he did in attempting the rescue of the McDonalds. I think that his anxiety to get the men out induced him to go in without considering the reversal of the current of air.

To Mr. Robertson : I think that if Mr. McAuliffe had stayed to reflect he would have done as I was suggesting just now. I am assuming that Mr. McAuliffe was at the trap-door, and had to do something by himself. If he had stayed to reflect the only thing he could have done would have been to knock out the stopping with the trap-door in it. By doing so the two McDonalds would have been supplied with fresh air in a very short time; and, therefore, their lives would not have been in danger, for we know that William Sneddon was taken out alive after he had been in the noxious atmosphere five or six hours. He was lying in one of the side bords, and would, therefore, not get the benefit of the air-current so much as if he had been in the going-board, where the McDonalds were found. It was a natural thing for the manager to do as he did. The great point was to recover the bodies safely, and without further loss of life.

To Mr. Thwaites : Two sections of the one seam have been worked in some part of the No. 3 district. The ground there is very much broken. That is why I do not think they could have sealed off at the point near to where the fire was supposed to be. This being so, the only sealing off that could be done was at the point where they have since done it.

Mr. Thwaites : Do not you think it would have been better for the party to have taken steps to satisfy themselves of the existence of a fire, seeing that they were so near to where it was supposed to be?

Mr. Humble : On general lines it might have been better; but owing to the physical conditions existing in the No. 3 district it was almost impossible to do the sealing off near to where the fire was supposed to be. It is possible that the fire could be put out, and thus far they were justified in going to search for it. If they had found a fire, and it had been a very small one, they might have put it out by other means than scaling off. There was not, when the managers were there, a strong smell of gas.

Mr. Thwaites : This leads me to think it would have been better for the management to have found out whether there was a fire, considering the possibility of their being able to get enough water to put it out.

Mr. Humble : It is quite possible that they could have got enough water to put out the fire if it had been a small one.

Mr. Thwaites : Was the No. 3 door open when they cleared out the district?

Mr. Humble : Yes.

Mr. Thwaites : When the gas was being cleared out the furnace-men would be working in it?

Mr. Humble : When they were feeding the furnace fire, yes; but there was one good place where they could remain in the intervals in comparatively fresh air.

Mr. Thwaites : Had the furnace-men to remain at the furnace?

Mr. Humble : The furnace-men had to be on, attending at the furnace; but, as you know, it only takes a man two or three minutes to poke up a fire, and after that he can come back and sit down in a mixture of comparatively pure air. If Curran and Smith, instead of sitting where they did sit, had rested a short distance from this point, they would have been in a roadway along which was passing 28,000 cubic feet of air, which was comparatively fresh.

His Honor : Where they did sit was at the seat near the No. 3 door?

Mr. Humble : Yes.

To Mr. Wilshire : One of the reasons for the men sitting where they did was that there was no draught there.

To Mr. Robertson : There would be a draught when No. 3 door was open. They were sitting in the draught, then, of course. I know nearly all the managers who, by invitation, went to the colliery—went down

down the mine. I am pretty positive that one or two of the number did not go down the mine. I remember one saying that he did not intend to go down; but, if you ask me his name, I cannot now say. Those who did go down did not get very far, I think. The managers went down soon after the Minister for Mines, Professor Threlfall, and others came up. I do not know how far they got into the going bord. I was at the meeting of mine managers, but left before the finish. Mr. Jonathan Dixon was there as the manager's representative. I am not sure about Mr. McDonald being there.

To Mr. Curley: As regards whether the air went in more than 160 yards, I heard at the inquest one of the officials say he had been through the top end of the going-bord, and that it was clearing out nicely. There would be two bords between 16 bord and where the fire was supposed to be—a distance of 28 or 30 yards.

Mr. Curley: Taking into consideration that the inspection was only made for 160 yards, would you call that a sufficient inspection, knowing that foul air was coming out?

Mr. Humble: No; I would not call it a sufficient inspection—certainly not. (*Continuing.*) I know that clause 7 says that when the person in charge of the mine finds danger he must withdraw the men, make an inspection, and afterwards record the result of the inspection in a book. I felt pretty certain that the manager did not intend to start working the mine until the defect was remedied. It is highly probable that the manager told Mr. Dixon so. The exploring party were simply an inspecting party. They were simply going in to make an inspection—what they termed an exploration. I consider an exploration as simply an inspection. If you go to explore, you are also going to inspect. I say I do not consider that ten men were necessary; but it was better to take ten men than to take one or send one. I consider that all of the ten were not necessary. A smaller number would have done. The number of men would depend on the number of points they had settled on in their minds to go to. If they settled on many, it would take eight or ten men. If they decided to go as they did, I think less than ten men would have done. All these things must be judged by the circumstances surrounding them. There was an inspection in the first instance. We have had it in evidence that an inspection was made by at least two of the officials to the top end of the going-board. I know that an inspection has been made in accordance with Rule 7, but that no report has been made as to the result of that inspection. I know that when an inspection is made it should be recorded in a book. The managers present by invitation to advise were:—Messrs. William Turnbull, Croudace and his son, Frank; Thomas (Minmi), Thomas (East Greta), Croft, Fletcher, Mathieson, Neilson; but several more as well that I forget the names of just now.

Mr. Curley: In regard to the samples of air taken by Professor Threlfall, I suppose they can only be taken as approximate of the state of what the air was?

Mr. Humble: Yes; I think Professor Threlfall only regards them as approximate. The .3 per cent. of carbon monoxide which he gave was the mean of several percentages.

Mr. Curley: So that there might be several constituent elements there not shown in the report of the analysis?

Mr. Humble: Well, if they are searching for one element or compound they may reject anything else not material for the purpose in view. Professor Threlfall says nothing about free nitrogen, except inferentially, as His Honor has pointed out—that the analysis showed there was an insufficient supply of oxygen; therefore, there must have been free nitrogen. The whole trend of Mr. Dixon's and my own experience is that this gas was the same as that which overcame me at Thornley Colliery. As regards the difference of opinion between Mr. McDonald and Mr. McAuliffe, I think the under-manager ought always to submit to the orders of the manager—not to the opinions of the manager.

Mr. Robertson (after drawing attention to Rule 7) asked: Were these men admitted for the purpose of working in the district?

Mr. Humble: No; not for working, as we look on it. They were going in with the under-manager to try and find out where this fire was. (*Continuing.*) Rule No. 7 evidently takes in exploration as well as any other kind of inspection. Those men were admitted for the purpose of exploration. Exploration is, practically, inspection. I think Rule No. 7 covers a contingency of an exploring party of ten men.

To Mr. O'Sullivan: The management have complied with Rule 7 with regard to the exploration. The rule allowed them to send in an exploring party. As regards the help which was given to the explorers when they were overcome I think it had to be given immediately. I think it took upwards of an hour to fix the brattice up. Directly the first few yards of brattice were put on there was air passing along the going-bord. Mr. McAuliffe did, I think, under the circumstances, what I would have done if I had been in his place.

**Daniel McAuliffe*, manager of the Stockton Colliery (being duly sworn), said, in reply to Mr. O'Sullivan:—That the stoppings indicated on plan was knocked out about the middle of last year. It was knocked out so as to allow a bigger current of air to travel the engine plane and enter the old workings at No. 20 bord for the purpose of clearing them out. It was originally put in to save scaling through the brick stoppings in the main heading, and so to prevent the fresh air returning to the furnace. [*At this stage the witness showed on the plan and tracing before the Court the methods adopted for ventilating various parts of the mine.*]

Mr. O'Sullivan to witness: With regard to the methods used for clearing out the No. 3 district, on occasions prior to the accident—what methods were adopted on previous occasions?

Mr. McAuliffe: The methods were exactly the same on those occasions. On previous occasions, however, the district was cleared out in about six or seven hours. On this occasion the process was carried on for about thirty hours.

Mr. O'Sullivan: About what volume of air passed through every minute?

Mr. McAuliffe: About 20,000 to 25,000 feet.

Mr. O'Sullivan: Did you brattice across the main heading?

Mr. McAuliffe: Yes.

Mr. O'Sullivan: While the party went in, Mr. McAuliffe, was your furnace specially watched?

Mr.

[*NOTE.—The evidence of this witness was put in at the Court of Inquiry by Mr. Wilshire as Exhibit No. 13, and read 24th March, 1897.]

Mr. McAuliffe: I think there were three men at a time attending the furnace. To keep the furnace bright we ran three men at a time.

His Honor: As far as you are personally concerned, you had nothing to do with the way the mine was worked in the early days.

Mr. McAuliffe: Well, I have been ten years at the colliery. I have been manager for seven years on the 19th June.

The Court, at 12:50 p.m., adjourned till 2 p.m.

Upon the Court resuming at 2 p.m. (Friday), Mr. Daniel McAuliffe was recalled.

His Honor: Have you any questions, Mr. Wilshire, you wish to put to Mr. McAuliffe?

Mr. Wilshire: No, your Honor.

His Honor: Have you, Mr. Curley?

Mr. Curley: Yes, your Honor.

To Mr. Curley: The reason why the stopping was put in in the first place was to prevent scaling from the main intake to the furnace. Owing to a movement in the ground along that roadway, we found the stoppings becoming broken, and consequently we had to put in this stopping to prevent the air returning to the furnace through No. 3 district. It was put in about three years ago. A door was put up first, and afterwards a stopping with a slide door in it. The stopping was removed when we entered that district to examine it at the time the lawsuit was on. No. 3 district was supposed to be cleared out with the slide door open, according to the evidence; but I am not positive about that. The overman and Mr. McDonald cleared the district out. I was manager at the colliery during the time that was going on. When we got word to examine that district I told the under-manager what was wanted, and the next day the district was cleared out ready for examination. The first examination took place in December, 1895. Three or four examinations have been made since then. I cannot say exactly at which examination the stopping was removed. I presume it was removed at the first examination. I cannot give any definite time when it was removed. I know the district was cleared out, and reported to me as ready to be entered, which I did on the different examinations. The stopping was removed to clear out the district.

Mr. Curley: If you could have cleared it out sufficiently when the slide door was there, what was the reason for taking it out?

Mr. McAuliffe: I think that is proof, and the greatest reason why it was knocked down, that the district was not cleared out sufficiently.

To Mr. Curley: Previous to the exploration party going in, I received no word from Mr. Cockburn that he had seen Mr. Humble. I have only learnt that lately. Cockburn did not make me acquainted with any conversation that had taken place that night between him and Mr. Humble. I think it was the under-manager who suggested that the chalk-marks should be put up.

Mr. Curley: Had you no apprehension with regard to the men being overcome when they went in?

Mr. McAuliffe: Our intention was to play the air on until we were satisfied the district was in a state to allow of their entering without danger.

Mr. Curley: But that is not a direct answer;—on that particular night had you no apprehension that there was a possibility of the men being overcome in going into that district?

Mr. McAuliffe: No; I had no apprehension, because it had been reported to me early in the day that everything was cleared out nicely, and that they could have then entered easily.

Mr. Curley: Had you been down there yourself?

Mr. McAuliffe: No.

Mr. Curley: Did you never think about making a personal inspection yourself?

Mr. McAuliffe: I was so engaged with looking after the bodies of Curran and Smith, and arranging for the burials, that my time was pretty well taken up, and the overman was, therefore, reporting to me from time to time.

Mr. Curley: At the time the consultation took place, did the question of distance away from the main current of fresh air that you would have to travel, to the point you intended to reach, never engage the attention of the parties to the consultation?

Mr. McAuliffe: We had the plan before us, examining it, and discussing which would be the best way to approach the fire, and where it would likely be.

Mr. Curley: Did you not discuss the probability of something unforeseen happening, and the necessity of fresh air being required?

Mr. McAuliffe: We considered we were providing for that by a good strong gang of men. If anything happened, the men in advance would have a sufficient gang behind them, who would go forward and bring them out quickly. That was our object in having a good strong body.

To Mr. Curley: We thought that possibly some danger would arise if the party reached 18 or 19 bord. The question was fully considered as to the distance that would have to be travelled to reach that point. I knew the men were going in against the current of air; but we decided there should be no approach against the current of air until we were sufficiently satisfied that we could go into the district with safety.

Mr. Curley: It amounts to this, that you never thought about any other contingency arising?

Mr. McAuliffe: I am satisfied if the contingency (the fall) did not occur, the whole of the men would have got out without any difficulty. The fall waisted the bad air on to the men.

Mr. Curley: My question relates to the time before the party went in?

Mr. McAuliffe: All I can say is, that the overman had made several visits of examination along the road previous to the party going in. Once or twice in the morning, and then in the middle of the day, when he went to the further cut-through, and came back and reported to me that everything was favourable and nice and clear.

Mr. Curley: Still, that does not answer my question.

Mr. McAuliffe: It would answer the question in this way: if men, at 12 o'clock in the day, could get up so far, allowing the air to still play on another nine and a half hours, would put that district in a still better position.

Mr. Curley: Would it not occur to you that no matter what was cleared out, unless the origin of this gas was dealt with, it would still exist there?

Mr.

Mr. McAuliffe: That is why we wanted to get in there, to deal with it as promptly as possible.

Mr. Curley: Would the idea not forcibly strike you that, independently of this clearing out that you speak so emphatically about, there would still be existent the cause that was promoting this very deleterious stuff?

Mr. McAuliffe: But we were trying to locate the gas, so as to deal with it.

Mr. Curley: But the question I want you to answer, if you will, is this;—did any other contingency about the introduction of fresh air, &c., arise at the consultation?

Mr. McAuliffe: At the consultation we unanimously agreed to adopt this principle, not to enter the workings unless they appeared to have cleared sufficiently to allow us to do so with perfect safety.

Mr. Curley: Did anything occur to your mind that something would happen while the men were in the workings?

Mr. McAuliffe: We considered that an emergency might arise, and that is why we provided for a strong gang of men, so that any emergency that might occur could be coped with.

Mr. Curley: Well, you do not appear to have thought about anything else?

Mr. McAuliffe: We considered we were dealing with all the things we were likely to meet with, and that we were using every precaution we could to deal with the matter.

Mr. Curley: When you went in with the rescuing party, did you not think of placing the mine at that particular time in the hands of some efficient man prior to your entering?

Mr. McAuliffe: You are, of course, aware that a mine is handled by the different officials according to their grade?

Mr. Curley: But did you personally, as manager of the colliery, appoint anyone in that capacity?

Mr. McAuliffe: The duties of the officials placed them in that position.

Mr. Curley: You knew McDonald was down, and you went in with the purpose of trying to rescue him and others, and you knew how some of the other officials had been affected; who then was there to fall back upon?

Mr. McAuliffe: Ellis, Jury, and Sampy. It is their duty to take charge of the mine when officers above them are knocked down.

His Honor: Did it strike you from the first that there was no risk other than meeting black-damp?

Mr. McAuliffe: I recognised in our discussion that there was something else, but that black-damp was predominant. The smell was to be accounted for, and that was the reason why the overman, Mr. Cockburn, and myself went into consultation. We could not understand this smell.

His Honor: Did that conversation, coupled with what the inspectors had said to you before, lead you to suspect that there might be a gob-fire burning?

Mr. McAuliffe: I thought if there was one that it was simply generating.

His Honor: Do you not think that the fact of letting air on to a gob-fire would excite it?

Mr. McAuliffe: Probably; but we considered we had sufficient air to dilute it.

To His Honor: We could detect a slight odour, but it was nothing like it was previously. That was the odour that the inspectors contended was caused by a gob-fire. When I put my lamp down I recognised that the biggest percentage of the mixture was black-damp. At the same time I recognised that the smell was to be accounted for. The peculiar smell might indicate the existence of a fire.

To His Honor: From the first, is it a fact that McDonald set his face against that theory? He did not think it was a gob-fire that gave rise to the smell. The smell, he contended, arose from the water in the vicinity of bord 20 decomposing the wood. Cockburn referred to his book, and considered that the predominant element was black-damp without a doubt. He admitted that the smell was to be accounted for. I think he was inclined to believe that there might be a fire generating, but in a very early stage.

His Honor: As to the conversation between Cockburn, McDonald, and yourself, what question was raised as to the smell of fire-stink accompanying carbon monoxide;—you, McDonald, and Cockburn understood that even if, in infinitesimal quantities only it was a very dangerous gas?

Mr. McAuliffe: Yes; but we thought we could dilute it sufficiently to render it so harmless as to allow of our exploring, and thus locating it.

His Honor: Did you not recognise that a man might be in it for some time drinking it in slightly and then suddenly go down;—was that not known to you?

Mr. McAuliffe: I think that point was considered by us.

His Honor: When you came to the double heading, if any air was coming down there it would be clear of the gob-fire, if the position of the fire, supposing there was one, was, as you think, in bord 18 or 19, and the further you went along the going-bord the larger would be the proportion of air coming from over or near the fire?

Mr. McAuliffe: We considered that the fire was generating and in a very early stage. We did not think it was in a very active stage.

His Honor: But still, your air would have got worse and worse the further you went on?

Mr. McAuliffe: We considered that the fire, if there was one, was in a very early stage, and that the current of air we had was capable of dealing with it.

His Honor: But the further you went on to the west, the worse the air would get, whatever stage the fire was in?

Mr. McAuliffe: That would not be necessarily so.

His Honor: If you are correct as to the position of the fire, the further you went on the greater the chance would be of meeting with air vitiated with gases coming from the fire. Very little, you say, would be flowing down the double heading. The main body of air current would be going along 19 bord into furthest heading, and thence along the going-bord. Once you got past the point where the cindered ground intercepts the cross-cuts, you would get none of that air; then you would begin to get the air that came right round, and that would pass the point where you assume the fire would be, if there was one;—did not that strike you?

Mr. McAuliffe: But we thought that the fire, if there was one, was in a very early stage. We considered that we should have sufficient fresh air to dilute the foul air and render it harmless.

His Honor: Did Mr. McDonald, by expressing his opinion very strongly, cause you to give up your opinion?

Mr. McAuliffe: My opinion was not given up. We discussed the matter, and decided not to approach the seat of the fire until we were satisfied that everything was clear.

His

His Honor: It never struck you all through that you might approach the fire to windward instead of to leeward?

Mr. McAuliffe: We would like to have got into 20 bord if possible, and went down that way; but that place was too dangerous. We considered that we would let the air travel down bord 20 to play on to the place until we could get in safely the other way—down the going-bord.

His Honor: As it struck you that it would be very much better to get into the windward instead of to leeward, did it not occur to you that it would be very much better to reverse the air?

Mr. McAuliffe: It could not be done. To go into 20 bord was our best plan, but if a fall occurred there, we should be locked in.

His Honor: The men at the furnace were those you considered, on the question of reversing the draught?

Mr. McAuliffe: Yes.

His Honor: Was not the difficulty you suggested first of all that the horses would have to be taken out?

Mr. McAuliffe: No; the horses were not in the road; they could have been shifted away in half an hour.

His Honor: The current put round that way would have shifted the bad air in the "C" heading?

Mr. McAuliffe: Yes.

His Honor: But that could have been provided for by preventing the men from going to that side of the furnace, and bringing them round to the other side where Curran and Smith had been killed. That would have been safe?

Mr. McAuliffe: If we had put up a partition as we have since done it might have been safe.

His Honor: Did it not look to you like a risky proceeding in face of the fact that you were obliged for safety to take in such a very large number of men;—did you not consider it such a very important question that you should try experiments with the air itself first?

Mr. McAuliffe: The greatest danger I anticipated was after we got in the district, in trying to locate the seat of the mischief in the various bords.

His Honor: The progress of the men up to the vicinity of the cause of the mischief you really considered not risky?

Mr. McAuliffe: No; I did not think there would be any danger up to that point.

To His Honor: I had no knowledge of chemistry before I became a mine manager. I have read up a little since. I had been for thirty-five years connected with mines, inclusive of the time I have been manager. I was deputy for three months, and overman for four years, at the Stockton Mine previous to becoming manager of it. Before that I was engaged on all classes of mining, but principally coal-mining. I was appointed to the managership of Stockton Mine about seven years ago. I have been eleven years altogether on the colliery. The colliery was opened about fourteen and a half years ago. It had been opened about three and a half years when I went to it first. Deputy was my first position in the Stockton Mine. I held that position for three months.

Mr. Robertson: When you had to clear out the No. 3 district before, you had only to deal with black-damp?

Mr. McAuliffe: Yes.

Mr. Robertson: After the conversation with the inspectors did you not think it probable that a gob-fire was there?

Mr. McAuliffe: Of course there was the smell that had to be accounted for.

Mr. Robertson: The smell would be produced by combustion?

Mr. McAuliffe: Yes; that is what the inspectors said.

Mr. Robertson: Did you not perceive, with regard to the two different opinions on this matter, that in the one case the more air you swept through the safer it would be, while in the other case, having a fire to deal with, the more air you swept through the more gas would be generated?

Mr. McAuliffe: But if it was generated would not the more air we swept through produce a different kind of gas?

Mr. Robertson: The more air you coursed in the more dangerous would it become by reason of generating more poisonous gases.

Mr. McAuliffe: But the greater the quantity of air coursed through the more the quantity of poisonous gases would be lessened.

Mr. Robertson: It does not follow that increased air will reduce the quantity of poisonous gases. 5,000 cubic feet of air might produce 1 per cent. of black-damp, and 10,000 cubic feet might produce 10 per cent.;—did it not occur to you that in taking the men against the air you were walking into danger?

Mr. McAuliffe: We considered that by going into the place carefully, and paying all attention possible to it, the way would be clear.

Mr. Robertson: With such a serious matter as this to deal with, do you think you were justified in delegating your duties to the under-manager?

Mr. McAuliffe: The curious position that I was in, attending to the bodies of Curran and Smith and the funeral arrangements, which kept me up all night, obliged me to take to my bed at the time. I was completely knocked up. I was satisfied that McDonald and Cockburn and the other men attending that party were good and careful men, and that they would not run any risks. We discussed fully the best things to do, and how to approach it; and if any difficulty was thought probable to be met with they were not to venture.

Mr. Robertson: You mentioned to His Honor that in reversing the current there would have been the difficulty of the men at the furnace;—had you not the same difficulty with the system you adopted; were the men not at the furnace?

Mr. McAuliffe: Yes, they were.

Mr. Robertson: No matter which way the current went it would pass over the men at the furnace?

Mr. McAuliffe: Yes.

To Mr. Robertson: After the stopping was removed on the rope-road, I did not have any conversation with Mr. McDonald or my other officials about replacing it. We did not think it necessary to replace it, as we had bricked right along the main heading and secured the place again. I cannot remember having had any conversation to that effect. The replacing of the stopping was not overlooked, and the

the necessity of it did not arise. We are in the habit of periodically examining the whole of the old workings of our mine. I did not see that there was any necessity for this stopping. It had been closed prior to the inspection by the colliery managers. It was then knocked out and never replaced. The stopping was first of all put in when the necessity arose to sustain the ventilation along the main intake. After the main intake was bricked all along we did not bother about the stopping until we opened it when we went into the district. I do not know whether any particular question ever arose between Mr. McDonald and myself that the stopping was not needed. The stoppings on the main road were bricked up some considerable time before the inspection by the colliery managers.

To His Honor: The door was first put in when the district was working. It was found not to be a sufficient stopping. We then put in a brick stopping, as being more effective.

His Honor: When the stopping was knocked out was it not really supposed that there might be further investigation required, and to save trouble it was not put up again?

Mr. McAuliffe: That was never discussed, because we had the stoppings in our main road attended to, and the necessity for building this one up again did not therefore arise.

To His Honor: I was confident all this time that no air could get in over the overcast into the No. 3 district. The overcast is blocked up as tight pretty well as a bottle, for about 60 or 70 yards. I have examined that corner of the district dozens of times. A line of cut-through goes through the top corner of the rectangular block (shown on plan). A small amount of air would perhaps go through that cut-through, but it would be very small. There is another in-let at 11 bord, but it is of small account.

His Honor: That being so, there would be a risk of a draught being established from No. 3 district to the furnace, if No. 3 door was opened?

Mr. McAuliffe: Only scalings coming back to the furnace.

To His Honor: It is always essential that all doors should be kept closed, irrespective of the presence of noxious gas, otherwise the air would not be diverted into the inner workings.

His Honor: Did it not strike you, as men had to go with skips through No. 3 door, that either that door should have been a double one, or else that the stopping should have been replaced for safety?

Mr. McAuliffe: No, I never anticipated any danger from that quarter. Only a little while previous to the accident both the deputy and overman inspected that district.

To His Honor: It never struck me that black-damp would be generated there, and suddenly rush up. I do not think it would come up in sufficient quantities to do any injury.

To Mr. Thwaites: I cannot tell you the exact date when this stopping was knocked out. Our present foreman says it was knocked down in December. The managers were in the mine in December as well as in August.

Mr. Thwaites: After the accident, and the inspectors said it was "fire-stink," they said to you that you ought to be very cautious—that you were to use every care?

Mr. McAuliffe: There were words used to that purport. I do not know that the words which you have used were the exact words. Everything was done to the best of our power. The inspectors told us this verbally, and I claim that I took more notice of it than if it had been in writing, because it had been under discussion.

Mr. Thwaites: I understand you to say that in the neighbourhood of 17, 18, and 19 bords it is pretty well solid ground?

Mr. McAuliffe: Yes.

Mr. Thwaites: Well; that being so, do you not think that there was no hurry to penetrate the old workings;—do you not think it would have been better to have taken the air with you, and taken more time to get to that part?

Mr. McAuliffe: Well; we thought we were getting to it, and we were making a reasonable attempt to get there as quickly as possible.

Mr. Thwaites: And that you were more likely to have got to it?

Mr. McAuliffe: Well; we discussed the matter, and we considered that we could clear it out and watch events, and that if we found that we could clear it out we would then go in. We had cleared it out before on other occasions.

Mr. Thwaites: You went in right against the current, and you were informed that the experts thought it to be a menace. I think it would have been better if you had gone with the current, and I think you would have been more likely to have got to the seat of the trouble. You say that adjacent to 17, 18, and 19 it is pretty solid ground?

Mr. McAuliffe: Yes; but it was to prevent the wide spread of the air that we were trying to get in the way we did.

Mr. Robertson: Was it ever reported to you that any of these three doors were left open by the workmen?

Mr. McAuliffe: You often hear the overman say he has been told of a door being found open. As to whether any action is taken when it is found that a door has been left open, it depends whether the person who does it does it wilfully. It is a very serious breach of the rules of the colliery. I think it would be my duty to prosecute a man if I found he did such a thing wilfully; but it is hard to prove when anyone does it wilfully.

Mr. Robertson: When you were warned by the inspectors of a serious defect which required a remedy, did you set about remedying it?

Mr. McAuliffe: Yes; and I think that the exploring party going in was giving effect to the inspector's instructions. (*Continuing*): I conceived it to be my duty to try and locate the fire and to confine it to as small a space as possible. I would, in any case, like to keep it to as small an area as possible. As regards the meeting of managers, I cannot say whether some of those managers had never seen the mine. The conditions for sealing off this No. 3 district are very difficult. When the trouble arose it was certainly my intention to get to the seat of the trouble if possible; but I left it in the hands of the managers to decide.

Mr. O'Sullivan: The night these men went in was the Thursday night, between the adjournments of the inquest, was it not?

Mr. McAuliffe: I think so.

Mr. O'Sullivan: At the inquest, you have already told us, there was a difference of opinion as to the cause of this trouble; did that cause you people to go in a little earlier than you might have so as to bring fresh evidence on Tuesday? *Mr.*

Mr. McAuliffe: We were wanting to try and locate the fire as soon as possible.

Mr. O'Sullivan: How often would No. 3 door require to be opened to feed the furnace and bring in the skips?

Mr. McAuliffe: About a dozen times daily. (*Continuing*): It would not require to remain open very long. On each occasion when it had to be opened it would have to be open for a minute or a minute and a half; otherwise, that door was supposed to remain closed. The mining managers did not express any surprise at going in against the current of air. I heard no remark from any of them.

His Honor: As experts, outside of their own position as inspectors, did it strike you at any time that it would be a very good idea to see what they (the inspectors) thought about this exploring party?

Mr. McAuliffe: Well, when they were available I have been glad to ask them. I did not ask them on this occasion.

His Honor: Practically, your action left them in the dark as to what you were going to have done?

Mr. McAuliffe: I thought that we would deal with the subject successfully.

His Honor: Did it or did it not strike you that your action was, to a certain extent, in opposition to the views of the inspectors?

Mr. McAuliffe: It might have been in opposition to the inspectors. They pointed out that a certain smell was a sign of a fire generating in an early stage. They did not suggest what should be done. I thought that the seriousness of the position would depend on the hold which the fire had got.

His Honor: That is a very dangerous gas—carbon monoxide;—that has been recognised of late years, but might not have been recognised some years ago; it caused the death of these two men, and was still coming off?

Mr. McAuliffe: One of the inspectors said so at the inquest, but Dr. Hester did not.

His Honor: Did it strike you at that time that there was a certain amount of antagonism between Dr. Hester and the inspectors?

Mr. McAuliffe: Well; I think there was a difference of opinion. We all thought that if black-damp was being given off from a fire it was in such an early stage that we could deal with it effectually. We held the opinion that it was black-damp which was in the mine. All the time I knew that black-damp could be detected by the light and that carbonic oxide could not. Some authorities tell us differently; but that is only when the proportions are rather large.

* *William McDonald*, Under-ground Manager of the Stockton Colliery, being duly sworn:—

Mr. O'Sullivan: Tell us the time you knocked that stopping out on the rope-road?

Mr. McDonald: I think, as far as I can remember, it is close on two years ago.

Mr. O'Sullivan: Perhaps you do not understand the stopping I mean. In your evidence, you state that it was knocked out two or three months ago:—was it three or four months ago?

Mr. McDonald: It would be fully that. I recollect the Wednesday and the Thursday nights at the beginning of December. I was at the furnace on the Thursday night and tested the gas with the lamp for about ten minutes. It put out the light. I continued on till 6 o'clock in the morning. Then the two men who were left in charge after that tested it regularly. [*The witness showed on plan the way the exploring party went.*] (*Continuing*), he said: My reason for changing the time for some of the men to come was because we did not think the air was clear enough to stay in any longer. The question of the desirability of moving the horses had no weight in deciding what should be done. When it was decided to knock out the stopping, there was something said about the different gases to be found. Cockburn brought a book, and I did too. He had a higher theoretical knowledge than I had, but I would not give way to him on a practical point. I was carrying a big lamp in my hand. I did not observe much deflection of the light at the time. There might have been a small deflection of the lamp, and I may not have observed it at the time. As to the mode of going in, when we started away from the furnace we left two men there with instructions to keep a good fire there while we were away. The men who went in kept 10 yards apart. Each pair kept 10 yards apart. We put chalk-marks so that any one coming after us could find their way out. I cannot say that we anticipated anyone coming in after us. I was present at the mine when the mine managers entered against the air-current. There was no surprise expressed at that. If a fall had taken place inside the workings, it is hard to say where we should have been. Some of us had to creep on our hands and knees. The air was comparatively fresh.

Mr. Wilshire: You say to-day that the horses were not considered at all?

Mr. McDonald: There was not very much consideration taken about the horses. I said on the last occasion that we should have had to take all the horses out if we were to reverse the current of air. We could not have taken in a good current of air by bratticing. The inspectors only got 3,000 cubic feet to reach 66 feet up the going-board, and they had to carry the brattice all the way with them. There is a great leakage through brattice. We could have stopped up all the cut-throughs. The way we ventilated the mine was the best to get it cleared out quickly—that is, by taking it into 20 bord. I am still of the opinion, notwithstanding what has been said to the contrary, that black-damp was the greatest thing we had to fear at the furnace. That is the only gas we expected any harm from. I was of that opinion all through, and am still of that opinion. It is safer to travel with the air; but, if a place is thoroughly cleared out, it is very little odds where you enter it.

To Mr. Curley: I think the temperature was 70 when we came down the pit, and the highest temperature observed was 78. It occurred to us to put the chalk-marks when we were going in. We always do it when we are going into these old workings. We always do that for the same purpose—so that if anyone got lost he could find his way out. It was in case anyone did not know the road, and he would have these chalk-marks to help to get him out. Always when I am going through old workings I look for some danger.

Mr. Curley: From the books in your possession, was it not indicated to you that other gases than black-damp would come from a gob-fire if there was one there?

Mr. McDonald: It had first to be established that there was a gob-fire. (*Continuing*): I know that a gob-fire had been mentioned, and that the inspectors had referred to "fire-stink." I took that phase of

* NOTE.—The evidence of this witness was put in at the Court of Inquiry by Mr. Wilshire as Exhibit No. 4, and read 23/3/97.

of the matter into consideration. It did, to a certain extent, impress me with the idea that there might be other gases. The smell was very slight when we went in. I know that a very limited percentage of carbonic oxide would affect the system. It took us from about three-quarters of an hour to an hour to go in. I am quite sure of that. That was from the time we started from the rope-road till we got to 16 bord. It is not more like twenty minutes. When the exploring party went in I cautioned the men about the trap-door, and said that would be the way out to the fresh air. In doing as we did, we recognised that time was an object. The sooner you can locate a thing of that kind the better, I think. The longer you let a thing of that kind remain the stronger it will be getting—that is, if it is a fire. In going in when I did, I was not thinking of getting anything fresh for the inquiry which was being held. As regards the opinion of the inspectors in thinking they could have reached 16 bord quicker their way, considering that they got only 3,000 feet over whole ground I do not see how they could have continued with it over broken ground.

Mr. Curley : Having the experience you have, and knowing something about carbon monoxide, and having read those authorities you speak about, do you now regard it as a very dangerous business to travel against the air-current ?

Mr. McDonald : Yes.

To Mr. Curley : But I still say my method was the best, as everything was cleared out. Any man being there at the time we penetrated those workings at half-past 9 that night would have had no hesitation in going into them. The air was very fresh, and the smell very slight all the way in. I know that a gob-fire when fed with air will produce noxious gases. A gob-fire always gives off steam and smoke. That has not been so in this case. I have never yet experienced a gob-fire but what there was either steam or smoke given off. I have never got nearer to them than in this case. I knew the inspector's opinion, and I paid a good deal of attention to it.

Mr. Curley : Did you not feel anxious before the exploration began to have the manager with you ?

Mr. McDonald : We consulted about that, but the manager was not altogether in a very fit state to go down at the time.

To Mr. Curley : Mr. Cockburn did not express to me any apprehension of danger prior to going in. He did not say that he had seen one of the Inspectors of Collieries. The manager never expressed a desire to me not to proceed until he was there. I looked upon myself as being in charge of the whole affair, and as responsible for everything.

To Mr. Robertson : When Mr. Burt reported the matter of Gould's complaint to me I at once inspected the neighbourhood of the furnace. I went up to the double heading in the morning and found that all right. I went from the trap-door of No. 3 and then came back. I went down the pit the following night about the same time the gas had been detected the night before, and found everything right. From that I anticipated danger could only come from the old workings, and that noxious gases reached the furnace through the No. 3 door, which had been left open. It did not occur to me to try the effect by leaving that door open. It had not been reported to me that the door had been left open occasionally.

Mr. Robertson : Knowing that danger could only come from No. 3 workings, I should have thought that you would have tried the effect of the door being left open, since it was the only connection between the two ?

Mr. McDonald : After going in so far, and finding nothing there, I thought the door would have to be left open for a long while before anything came out. (*Continuing*) : On reflection now, I think it would have been better to have opened the door. Under similar circumstances again I would certainly do it. The stopping on the rope-road was built to prevent the leakage from going through there and getting to the furnace. It was knocked out when the colliery managers examined the district. There was no need to replace it afterwards. The matter of replacing it was not overlooked.

Mr. Robertson : Knowing the old workings generated at least black-damp, and that there was only this one door between, do you not think it was unwise to leave that stopping as it was ?

Mr. McDonald : But we like to keep these old places clear.

Mr. Robertson : You have said that there were difficulties in the way of taking the air in with you ?

Mr. McDonald : Yes.

Mr. Robertson : Could you not have replaced that stopping on the rope-road, put a good brattice-stopping beyond No. 1, and made the stopping at 20 bord the return ?

Mr. McDonald : The air would then have had a good deal further to travel. (*Continuing*) : It is a good road. The air would have about 600 yards further to travel in going that way. There was no difficulty in the way of adopting that method, excepting that the distance was greater. We would not, however, have got the same quantity of air ; but still, I admit, we could have done it that way. It would have been much better if the area sealed off could have been reduced. I could see no difficulty at the time in reaching the seat of the fire. I do not approve of the district being shut off in the way it has been done. I do not think it will ever be perfectly sealed. If the area had been much smaller it would have been much better. Many of the stoppings are very large. It is not a question of two or three, but of fifty or sixty stoppings. They are all very large and of unusual size. I have had experience of gob-fires in Scotland, some of which cost several thousand pounds to get out.

Mr. Robertson : If you were told by a competent person that a gob-fire was in existence at Stockton, you would be very anxious ?

Mr. McDonald : We were very anxious. (*Continuing*) : I still hold to my opinion that the cause of the trouble is black-damp.

To Mr. Thwaites : When Mr. Burt reported to me of Gould being affected with the bad air, I paid a special visit to the furnace. It is not a fact that the furnace did not act right, through the day—the day I paid the special visit. The furnace always acted well. I reported to the manager what Burt told me. The stopping in the rope-road was taken down about four months ago. The manager knew that it was knocked out.

Mr. Thwaites : Was there no other outlet for any noxious gases that might gather in No. 3 district but by the rope-road ;—you said in your evidence that there was no other outlet ?

Mr. McDonald : All the others are intakes.

Mr. Thwaites : That being so, any foul air that might gather in the No. 3 district would, in the event of the No. 3 door being left open, go to the furnace ?

Mr.

Mr. McDonald: Yes. (*Continuing*) We had a conference among ourselves about going in to explore this district. The manager did instruct us to be cautious, seeing that the inspectors had already said how dangerous was carbon monoxide gas. We had a definite understanding among ourselves as to what we were going to do. I have not noticed the same smell, said to be fire stink, in any other part of the pit. The reason I think that by reversing the air it would have taken five times the time to clear the district, is because of the distance it would have to travel. The overcast would not have been an outlet for the air if it had been reversed. It did strike us as being dangerous to go in in face of the return air.

Mr. Thwaites: But seeing that there was nothing much to be gained—only getting to know where the fire was, if any—do you not think it would have been better to have gone with the current?

Mr. McDonald: If it had been possible to get in with the current we should certainly have done so. (*Continuing*): We could not have gone through 20 bord with the current. We might have changed the current.

Mr. Thwaites: Would not that have been much better, seeing that you wanted to find out where the trouble was;—would it not have been much better to have taken time, and taken the air with you? Perhaps, then, there might have been a possibility of sealing off a less area of the old workings.

Mr. McDonald: Yes, that would have been much better. (*Continuing*.) The manager did not go with us; I had full control of the party.

His Honor: Supposing you had been able to get at the fire, would you have expected to be able to extinguish it with water or seal it off in a small compass?

Mr. McDonald: We would have expected to be able to either seal it off in a small compass or remove it altogether. (*Continuing*.) There was a very fair chance of putting it out if we could have got to it. There was plenty of water and a very heavy pressure. I do not believe there is a fire in these workings in a burning state—that is, giving off a flame. I do not believe the gas that we smelt was caused by a gob-fire. I think it arose from decaying timber standing in stagnant water. I gave the inspectors all due credit for their opinion, but did not agree with them. Mr. McAuliffe was inclined to agree with them at first. I could not say whether he changed his opinion afterwards. The three of us had a talk in the office afterwards about it. After we had finished the talk we came to the conclusion that it was best to go into these old workings and examine, and make sure. It was thought then that the smell was from stagnant water and decayed timber. The idea of a fire was put on one side. We thought there was just an off-chance of one. We went in to prove whether the inspectors had made a mistake—whether they were right or wrong. If there was a fire, and if we had kept the district sealed up as closely as we could, not opening up No. 20 bord or doing anything to let any more air in, the chances are, if there was a fire that it would have spread quickly. If we had shut off the rope-road again, that would not have left the workings in such a state that very little air could have got in, as there was broken ground all along there. Not much air can get through the overcast. No. 17 bord is the only other place I know of where air can get through. A little air could get over there. There was nothing to show us then that air actually got over there. There was no smell to show us that air was getting into the "C" return. I believed a heat was being given off, but did not think there was a fire. We thought the heat did not come from a gob-fire, because there was neither steam nor smoke. When the inspectors came to the conclusion that it was a gob-fire, I came to the conclusion that it was not. In my mind, and in Mr. McAuliffe's and Mr. Cockburn's, there was no fire there at all.

His Honor: Believing the chance of a gob-fire being there to be so small, how came it that it became so urgent to locate the fire which you did not believe in?

Mr. McDonald: We thought it possible there might be one.

His Honor: Is it a fact that the great anxiety to get at it was not to put the fire out so much as to prove, before the inquest on the two men was over, that the inspectors were wrong and you were right;—was not that the principal reason for your action?

Mr. McDonald: No; it was to get there so as to prove whether there was a fire or not, and, if so, to have it attended to as soon as possible.

His Honor: You expected there would be no fire there?

Mr. McDonald: We did not know exactly whether we would find a fire or not. (*Continuing*.) We found it hotter inside than outside. We found that out when we went in on Thursday. When we made up our minds to adopt the course we did adopt, we did not know it was hot there.

His Honor: So it comes back to the same thing, that when you made up your minds to clear the district out, and sent in an exploring party, you were of opinion that the cause of the smell was not fire, but rotten wood and water?

Mr. McDonald: Yes.

His Honor: And yet you thought it very necessary to do the thing as quickly as possible, on the off-chance of it being a fire?

Mr. McDonald: Yes.

His Honor: And then you swear your action was not rather for the purpose of getting some correct explanation of the death of Curran and Smith for the inquest?

Mr. McDonald: It was for both reasons. To locate the fire (if any), and to ascertain the cause of the death of Curran and Smith.

His Honor: Did it not strike you to mention to the inspectors that you were going in to see whether there was a fire?

Mr. McDonald: No.

His Honor: Were you aware that they did not know anything about the intention to send a party in?

Mr. McDonald: I know Mr. Dixon did not know anything about it.

His Honor: Did you think that Mr. Humble knew anything about it?

Mr. McDonald: He should have known about it, because we disputed in the office as to there being a fire. (*Continuing*.) I told Mr. Humble then that I was going in to see it. He told me to be very careful. He understood that I was personally going in to have a look. I said that I would see the district was properly cleared out before I went in. He understood that I meant the air would be turned in. I thought he understood that there would be some sort of inspection made. At that time he still had one opinion and I had another.

Mr. McDonald having withdrawn,—

His Honor inquired: Are there any more witnesses to be called;—do you wish to call any more witnesses, Mr. Wilshire?

Mr. Wilshire: No, your Honor; we have no more witnesses.

His Honor: Have you any more witnesses, Mr. Curley?

Mr. Curley: I have no more, your Honor.

Mr. O'Sullivan: I have no more, your Honor.

His Honor: Then there is no other witness at the present time. Now, the question is, whether any of you gentlemen who represent different interests wish to address the Court?

Mr. Wilshire: I do not wish to say anything, your Honor. I am here representing the Department to assist the Court in this investigation, but would not think of addressing the Court.

Mr. Curley: I certainly wish to address the Court on one or two points.

Mr. O'Sullivan: At present I have no desire to address the Court, your Honor.

His Honor: Possibly, after you have heard what Mr. Curley has to say, you may have something to say yourself.

Mr. O'Sullivan: Possibly, your Honor.

[The Court, at 4:45 p.m., adjourned till 10 a.m. the following day, Saturday.]

No. 26.

Addresses.

SATURDAY 13 FEBRUARY.

The Court sat at 10 a.m., pursuant to adjournment.

Upon the opening of the Court His Honor intimated to Mr. Curley that the Court were prepared to hear his address.

Mr. Curley: Before addressing the Court I would like to draw Mr. Robertson's attention to page 22 of the Royal Commission's Report on the Lithgow Colliery, where special reference is made to the pillars. (*Continuing.*) Are the points where the bodies were found shown on the plan before the Court?

His Honor: Yes.

Mr. Curley: I would like to obtain definite information as to the actual number of rescuers?

His Honor: That question could perhaps be settled by asking Mr. McAuliffe.

Mr. Curley (addressing Mr. McAuliffe) asked:—Can you inform me of the total number of rescuers who went to the colliery on that particular morning when the rescues were undertaken?

Mr. McAuliffe: No; I cannot tell you.

His Honor (addressing Mr. McDonald) asked:—Do you know, Mr. McDonald, the actual number of rescuers?

Mr. McDonald: No; I cannot say.

Mr. Robertson (addressing Mr. McAuliffe) asked:—Were these men paid for their services?

Mr. O'Sullivan: I can supply a return from the books showing what men were paid for the rescue work; and I will undertake to supply this information.

Mr. Curley: I want the total number of men called upon to go down the pit that night, also the names.

Mr. O'Sullivan: I will have this information supplied from the books.

Mr. Curley thereupon proceeded with his address. He said:—Your Honor and Gentlemen, in reviewing the circumstances that led up to the cause of the catastrophes at the Stockton Colliery on the Tuesday night or Wednesday morning, and on the Thursday night following, probably I had better begin from the time that Gould was assisting the furnace-men at the colliery on the 30th November—the Monday night prior to the first fatality. In looking over Gould's evidence we find a discovery was made on that Monday night that highly deleterious gas was coming from the No. 3 district when the No. 3 door was open. It was of such a character that it affected Gould seriously—so seriously that he tells us in his evidence he fell down. Subsequently he reported to the night-officer, Mr. Burt, that he was completely overcome, adding that the door was open at the time. Thereupon Mr. Burt promised to make an inspection of the place. He did make an inspection, and found the doors closed and everything satisfactory, so far as he was concerned; but he also found that Smith, too, had a similar complaint to make, although in not quite so aggravated a form. Now, this was reported on to the under-manager, Mr. McDonald; and I wish the Court to bear in mind that Mr. Burt, having been told that this occurred when the door was open, would very likely in his report to the under-manager inform him accordingly. If we take that circumstance into account it would very naturally follow that the underground manager, in making an inspection of that locality, would endeavour to see whether this was borne out. He would experiment. He would open the No. 3 door. He would endeavour to see whether it was an actual fact that these deleterious gases were coming in that particular way. Whether he did that has not transpired in the evidence taken, so far as I am aware. Mr. Humble, in his evidence, said that he could account in two ways for Mr. McDonald's not having discovered the gas that Gould and Smith complained of. First, when he made this examination probably the door was shut. Secondly, he went there simply to look for black-damp. If that is so, we must come to the conclusion that he did not attempt to experiment in any shape or form; and that, in making this inspection, he thought these men who had reported were erratic; that they had no good grounds for complaint. It is to be presumed that the night-officer, when he went down with his workmen on the Tuesday night, received a report from the under-manager that everything was satisfactory and all right. It has not transpired whether he told Burt that he was to go at any stage during that night-shift to make an inspection, or to ascertain if the doors had been kept open. Now, it must be apparent to your Honor, that this question of open doors, especially in the vicinity of a furnace, is certainly a very serious matter in connection with the operations of a mine. Gould told us in his evidence that the door had been open for three-quarters of an hour. Now, there were other men in the mine on that particular night; and, whenever a volume of air in a colliery is deranged by circumstances of this character, it must necessarily seriously affect the air in connection with the workings of the mine. It, therefore, does appear certainly surprising

surprising that the night-officer did not make his appearance up to the time that we know the bodies of these men were found. At 4 o'clock in the morning, following upon this, taking the inspection of the underground manager, taking the absence of the night-officer's visit to that place up till 4 o'clock in the morning, what do we find? A discovery is made; two men are found dead at the furnace. They are found about 4 o'clock in the morning by the two men, Jury and Coulson, who made any early inspection of the colliery. These men stated the position the bodies were in. Smith was lying on the ground with his face to the floor of the mine. Curran was sitting on the seat—the usual place where they sat. They also stated they found No. 2 and No. 3 doors open. When the overman (or under-manager), Mr. McDonald, followed these gentlemen into the mine, this is the position that he stated he found the doors in: No. 2 door was shut, and No. 3 door slightly ajar—there was a small piece of coal preventing it from getting to. The position of the doors was not left as Jury and Coulson found them; nor were they so left until the Inspector of Collieries subsequently made an inspection of the locality in accordance with the Act. I am ready to admit that these doors not being left in the position in which these two men found them may probably be accounted for; and I know that there is some reason for it, by the fact that it was necessary to close them as speedily as possible, and so rectify the derangement. Of course, that would not apply very much if the furnace was actually out. It would not then be of any serious consequence, as in that case the furnace would not act as a drawing power from the No. 3 district in the same way as it would while in full blast. I only mention these circumstances incidentally, in order to point out that by leaving the doors open any longer the danger would, probably, under the circumstances, not have been increased. Now, let us take the evidence of Dr. Hester with regard to what was the cause of the death of these two men. It is not nearly so conclusive as it appears to be, when we come to examine it. Let it be strictly looked into. With regard to Curran we find the doctor states: "In my opinion, the cause of the death of George Curran was from asphyxia; I cannot say from what cause—probably, from his appearance, it was caused by carbonic acid poisoning." The doctor says he cannot tell from what cause; and then when he does say carbonic acid, he only says "probably." That is the extent of the weight of the doctor's evidence with regard to Curran's death. What does he say about Smith? He says, "In my opinion, the cause of the death of Charles Smith was syncope, due to poisoning of some kind, and not to asphyxia. In all probability Smith died a short time before Curran, on account of his heart not being thoroughly sound." If this evidence influenced the method of exploration in any way, I am afraid the decision arrived at was built on a foundation somewhat weak. To go on, we find that Inspector Humble appeared on the scene of the accident early on the Wednesday morning, and that after making an inspection of the colliery, in company with the manager, Mr. McAuliffe, and the under-manager, Mr. McDonald, he was of opinion that the fatal gas was fire-stink. At that particular time that opinion does not appear to have been of too bold a character. However, on the way out, Mr. Dixon was met, a return journey was made, and the workings were again inspected. Mr. Dixon having suggested that the mine should be placed under similar conditions to what obtained when the two bodies were found, an experiment was tried, at which were present both Mr. McAuliffe and Mr. McDonald. The No. 3 door was opened. Of course it was immaterial at that particular time whether No. 2 door was opened or not, as it was only a check door to No. 1 door. What was the result? After the mine had been put under these conditions, and a lamp had been placed upon the floor, at the expiration of about thirteen minutes according to Mr. Dixon, and from about fifteen to twenty minutes according to Mr. Humble, a strong pungent odour was noticed coming out of the No. 3 district. It did not put out the light; and the expression used by Mr. Dixon was, "By heavens, that is fire-stink." Well, after this test was over, and the door was closed, Mr. Humble walked a certain distance down the rope-road—he tells us in the direction of No. 3 district—and he discovered that, when the door was closed, he could go down the rope-road for a considerable distance without noticing any appreciable smell, as the tendency of the air-current was then in an opposite direction. At about this time, the opinion that there was "fire-stink" in the mine was emphasised; and the manager was informed of that definitely, clearly, and unmistakably, and verbally—that it was a menace to the men in the colliery; that it was a defect in the colliery; and that they (the inspectors) would expect it to be remedied. The only thing I regret is that Mr. Humble did not deem it prudent, under the circumstances, as inspector of the Stockton Colliery, to hand in a written notice to the manager. Perhaps he could not have done it on the moment, but he could have done it later. However, Mr. McAuliffe, in his evidence, goes this far: he says he took more notice of this verbal communication than if it had been a written document. Well, I cannot understand that. I think that, on such an important question as this—and a matter of such importance—a verbal statement is not of the importance of a written communication. It appears that some consultation had taken place between Mr. McAuliffe and Mr. McDonald early on the Wednesday morning, and that on that day a stopping at No. 20 bord had been broken through. It had been decided to introduce the air that way, and to make No. 3 district a return. Knowing at the time that that was the district that they would have to explore, they must have known that, unless it was cleared out thoroughly, they would have to inhale the gas coming from the No. 3 district.

Referring to the text-books on mining, Mr. Curley then drew attention to the Colliery Manager's Catechism, by W. Fairley, and said he thought that this was a book which Cockburn, and also Messrs. McAuliffe and McDonald and Jury were acquainted with. He quoted from the book the following question and answer:—

What is the composition of carbon monoxide; by what other name is it known; what is its symbol and specific gravity; and what are its properties?

It is composed of one volume of carbon and one of oxygen; its symbol is CO, and specific gravity 0.968; it is known as carbonic oxide; air containing only $\frac{1}{2}$ per cent. of this gas, by prolonged breathing, would prove fatal. It is inflammable, has no taste, but a peculiar odour. Carbonic acid formed at the bottom of a coal, coke, or charcoal fire, is sometimes converted into carbonic oxide by being deprived of a part of its oxygen as it passes upwards through the red-hot embers. It is found in mines after an explosion of gunpowder or dynamite, and is engendered by gob-fires.

(Continuing.) Mr. Curley said: So that your Honor will see that men being familiar with text-books of this character in connection with gases and mining work must have been familiar, at least in a theoretical way, with them. The probability of the presence of "fire-stink" must have been present to their minds when those inspectors were there. They admit, in their evidence, that they would expect something of that kind to be given off if a gob-fire existed in the workings. Now, what evidence have we that there

was

was a gob-fire? Well, some will say none. At least, that has got to be qualified by Mr. Macdonald's own statement. During the time he was in No. 3 district some months ago, he states that he noticed about No. 18 bord that it was very warm. I suppose that if he noticed that it was warm, this in itself should have indicated something to him at that time; and that appears to have been the time for close inspection. I point this out to show that Mr. McDonald himself states that it was very warm there. Therefore, there was a very high temperature. That is an indication of something. Coming back to the exploration business, I do not know that I can say very much on this point; but it appears worth noticing in some way that even Mr. Cockburn did not appear to be over confident, judging from the fact that he put all his affairs in order that day. Being acquainted with Mr. Humble as a friend, he arranged his affairs in the interest of his children, and put his things in his friend's possession. There must have been something in Cockburn's mind about something being likely to happen. We know that Mr. McDonald stated to the jury that, "if anything happens while we are in here, that's the shortest way out to the fresh air," pointing to the trap-door—the slide door. Then there were the chalk-marks, which were put as they went along the road. Even the manager, Mr. McAuliffe, does not appear to have been free from anxiety. In reply to Mr. Wilshire, he stated it was not his intention to go with the exploring party, but on the evening of the Thursday he had fixed in his mind to go, but when he went to the mine he was too late, as the party had gone down. He went down the mine, and lingered about the furnace until he was apprised by Burt of what had taken place regarding the explorers; and, while I have to express my regret that the manager was not with the party, leading it, it is some satisfaction to know he was in the mine at the time of the occurrence, and rendered some service later on in the rescue of the McDonalds. The under-manager was entrusted, it appears, with leading the exploring party, although he was sceptical from the beginning on the quality of gas from No. 3 district; and no matter what Cockburn's views might have been theoretically on these gases, he said yesterday, when giving evidence, that while he would give place to Cockburn in regard to theory, he would not do so in practice. In practice he regarded himself Cockburn's superior, but not in theory. It is surprising that, when the exploring party went in, they did not take the air current with them. I know it may be remarked "that we are all good Generals after the battle"; but Mr. McDonald has admitted that there was an outlet for air as a return in the No. 3 district over the old overcast away into "C" heading. He states in his evidence, in answer to Mr. Humble, "There is an overcast in connection with the return and No. 3 workings which would have provided an outlet for a current of air driven into No. 3 workings in the reverse way to what the air was put in." Then, again, he gives a peculiar answer further down: "I was not warned by anyone of the danger of meeting these gases. No one spoke to me of the necessity of taking fresh air in with me." Surely Mr. Dixon and Mr. Humble's idea about this matter would have been of some weight. Mr. McDonald's own knowledge of what he had read in the several standard works on the subject should have given sufficient warning itself. These works told him that carbon monoxide was one of the most poisonous gases in connection with coal-mines. How, then, in the face of that, can Mr. McDonald make this statement? Mr. Cockburn, it appears, was warned in a way. He met Mr. Humble, whom he informed that he was going into No. 3 district. If what I gather from Mr. Humble's evidence is correct, he warned Mr. Cockburn that he should not go. I do not know whether the fact of Mr. Humble not being more active in warning these men, or stopping them from doing an absurd act, would have any weight with your Honor in drawing up the report. As it is, I bring it under the notice of the Court. I am not aware that Mr. Dixon was cognizant of the intention to explore this old district. If I was, I would ask the Court to also give that fact their notice. But your Honor must not forget that Mr. Humble is the inspector for the Stockton Colliery. Coming back to the situation at the entry, the limited precautions adopted for getting out to fresh air if anything happened, and the chalk marks, if they became separated—admitting the arrangements to be bad—does it not appear to your Honor that getting on towards midnight was a most peculiar time to enter upon an exploration, especially taking into account that there was no need for hurry. At that hour everybody would be retiring to rest. You would imagine that an exploration of that character, surrounded with peculiar danger, as they must have known from the way it was carried out, would have been entered upon through the day, when everybody was about. I think this is a very pertinent question to the whole business. Again, there was a slight current, so it has been stated, coming out of the double heading. How is it men were not located in that fresh air in the double heading, a considerable distance away from the trap-door, and partly intermediate between the trap-door and where the men were found? Or, if that was not thought about, why not have had some more men about the mine in case of any unforeseen circumstances occurring, especially when it was known that ten men were going in? It appears to me that the daytime should have been chosen for the work. A staff of men could then have been handy, and at the trap-door, in the event of unforeseen occurrences taking place. The exploration takes place; ten men are in it; some are very young, and without much experience; some are experienced. Mr. Burt, of course, is an experienced man, so far as mining is concerned; but he had no knowledge of gases. Mr. Jury is a student in gases; but, notwithstanding that he has been schooled a good deal in these matters, we have the melancholy fact that he never raised any protest whatever against the party's going in. We have had no mention of any protest from Cockburn. Mr. Humble explained that from his temperament he was hardly likely to make one. Besides, he was a newly-appointed official, and would not care to question the management. It does seem surprising to me that these men, with their education, when confronted with this danger, did not raise a manly protest, and object to the men being taken in on false lines. With regard to the other men, probably some had a fair practical knowledge. One thing about Mr. McDonald that cannot pass unnoticed is that, while he went in with his own life, his son's life was with him at the same time. I admit there is that much to be said in his favour; but I do not say that it militates against the foolishness of travelling in against the intake air. It only proves that Mr. McDonald had formed a strong opinion, and was determined at all hazards to hold to it. The unfortunate part of the business is that, even after the casualties, Mr. McDonald will not come down and admit that carbon monoxide is there, notwithstanding Professor Threlfall's report and the opinion expressed by Dr. Hester. Mr. Jury, too, appears to be somewhat sceptical about the matter. We are told that some of these men were volunteers. The principal officials (Burt, Jury, and Ellis) were simply told to come to work in the ordinary way. Ellis tells us that he was at the furnace on Wednesday night, and that he was affected and felt very bad. It does not appear that he mentioned this to anyone; but he made such a statement in his evidence. How long were these men in there? What evidence have we on that point? The evidence is not very clear, and the only thing we can do is to get a fair approximation. That can only be worked out from the circumstantial evidence that has been given. For instance,

Dr.,

Dr. Hester states that he got word in Newcastle that he was wanted at the Stockton Colliery, some time before 11 o'clock. He went over to the mine in the 11 o'clock boat, and arrived on the pit-top at 11:10 p.m. Ellis tells us that when he came out of the mine he knows it was not 11 o'clock. James Goodwin, one of the rescuers, then tells us that he went down in the first cage between 10 and 11 o'clock. Roberts, another of the rescuers, says that he heard the whistle blow or give forth the warning between 10 and 11 o'clock. I think we may say that half-past 9 had just turned when the explorers entered the mine. Mr. McDonald, Jury, and one or two more went down to the furnace after they arrived at the pit bottom. Ellis, with others, stayed near the No. 2 door until they came back. Ellis also states that while at that No. 2 door he noticed even there this same smell before entering. Afterwards Mr. McDonald came back; he had not been to the furnace many minutes when he returned. They then entered the rope-road, and walked quietly on until they came to the double-heading, which they entered, and stayed there for a few minutes. Although they would be inhaling that peculiar atmosphere down to the double-heading, once in there, there would be some partial relief. They, therefore, stayed there a few minutes. I do not think it would be an unfair computation to say that when they left the double-heading it would be probably a quarter to 10. After they moved on from there (I assume that it was then a quarter to 10) they went quietly on, marking the road (the different turns) as they went with chalk; and they went on till they came to No. 16 bord; and, as soon as they got there, they had just about halted when an order was given to each of them to go back, Mr. McDonald remarking at the time, "Bailey will take the lead." And the next thing we hear of is Bailey falling into the arms of James McDonald, and exclaiming, "I'm done." In regard to the time the men were in the mine, I am inclined to think that they were not in more than twenty minutes when they became affected. Bailey was the first to be overcome. Jury, at the same time, says he felt shaky, and a dizziness came over him. Shortly after this Burt says he fell down, and that appears to be the time when the race for life unfortunately began. Bailey's condition would be a warning to all parties that the danger signal had been exhibited unmistakably. Mr. McDonald, in his evidence, says that they got to No. 16 bord, and that during the time that he stopped there he said to Cockburn, "Did you hear that?" He says, Cockburn answered, "Yes, Mac; that's a fall." Well, Cockburn is, unfortunately, not here to speak as to what did take place. Jury says he heard no fall, and felt no concussion. Burt says he heard no fall, and felt no concussion. Ellis says he felt a slight concussion, and James McDonald says he felt a slight concussion; but they both state that they heard no fall. It did not affect their lights. McDonald says he noticed a draught come on to them. The witnesses say that they did not feel anything up to this time, and from the time the order was given to return to Bailey's being overcome was simply a matter of a few minutes. I think a fair conclusion to draw—and the only one—is that these men having been in that atmosphere for something like twenty minutes from the time they left the double heading, I think they had inhaled that much poison that it began to take effect. That they were all affected at that time is not quite borne out by some of the evidence. It is stated that some struggled out, and we know that Ellis himself states that he felt nothing peculiar at the time—not till he was partly on the way out. Well, now, these are the circumstances in connection with this business. The men start to return, and eventually we find that there are only four who make their escape—Ellis, Burt, Jury, and William McAuliffe. I take it they must all have been somewhat affected. As regards the rescue work we find that the manager, as soon as he gets the information, makes all haste to give an alarm and get a rescue party formed. I suppose it was the best he could do at that particular time. The rescue party went in, and following this, a good deal of unfortunate business takes place. The manager remaining at the pit-top, after having been doing rescue work in connection with the McDonalds and Mr. Sampy, the engineer of the colliery—who, by the way, had never been taken into the consultation, although a man possessing good mining knowledge in a general way—takes charge of the trap-door. Parties of rescuers are admitted, and there is no time specified as to how long they should stay, as far as I have been able to discover. There was no standard set up that a man should not remain in more than a certain time. And it does not appear that any standard was fixed with regard to the interval which should elapse before a man was admitted a second time. It was left as a matter of endurance. It was left to them to go in and to get bodies out, dead or alive, or to become exhausted and then attempt to get out the best way they could. I will admit, your Honor, that these men acted no doubt nobly in responding to the call to go and rescue the men in the mine in the hope of saving life; but the clear, intelligent, control of the mine, under any circumstances, must never be overlooked; we have no right to give it up at any time. If not retained by the manager, surely it should be by somebody to whom he is able to delegate his authority. Anyhow, we find that men were going in more than once, and, I believe, in some cases more than twice. The men, when they got in, were permitted to wander away out of the main road—to the by-ways, so to speak—and there lose their lives; and I believe that in pursuit of Thomas McAlpin no less than five lives were sacrificed. And we have it from the evidence of Mr. Roberts—one of the rescuers—that there were no less than sixteen men in there at one time. Dr. Hester states in his evidence that he warned Sweeney and Charlesworth against going in, and that he believed Mr. Sampey heard this warning given; yet these men were allowed to run into what proved to them a death trap. And these are some of the unfortunate circumstances in connection with this business. I will again draw the Court's attention to these clauses of the Act in regard to the issue of notices by the inspectors that I have already referred to. What does the thirty-third section of the 1896 Act say? That all notices under this Act, by or to an inspector, shall be in writing, or partly in writing and partly in lithograph. I think all notices dealing with danger in a mine should be given in writing, as it is well to have a record that instructions have been given. Besides, a written notice has a much more potent force than any verbal instructions. Notwithstanding your Honor's opinion on General Rule 7, I would again bring it under the notice of the Court. The reason I am emphasising this matter is this: In the old Act of 1876 there was a clause giving the inspectors power, where men had been brought out of a mine in consequence of danger, to say that they should not go back until that mine was declared safe. It was, however, deemed expedient by the legislators to eliminate that clause when the Bill was under consideration. With regard to General Rule 7 of the present Act, it says:—

If at any time it is found by the person for the time being in charge of the mine, or any part thereof, that by reason of inflammable gases prevailing in the mine, or that part thereof, or of any cause whatever, the mine or that part is dangerous, every workman shall be withdrawn from the mine or part so found dangerous; and a competent person appointed for the purpose shall inspect the mine or part so found dangerous, and, if the danger arises from inflammable gas, shall inspect

inspect the mine or part with a locked safety lamp, and in every case shall make a true report of the condition of the mine or part; and a workman shall not, except in so far as is necessary for inquiring into the cause of danger, or for the removal thereof, or for exploration, be readmitted into the mine or part so found dangerous, until the same is stated by the person appointed as aforesaid not to be dangerous. Every such report shall be recorded in a book, which shall be kept at the mine for the purpose, and shall be signed by the person who made the inspection.

I still contend that the first part of this Rule intends that an inspection should be made. I admit that the exploration comes in later on; but I take it that the intention of the Rule is that at least there shall be an inspection, and that such inspection shall be recorded in a book, which shall be kept at the colliery office for the purpose. I wish your Honor to give this Rule a little further consideration.

His Honor: You contend that before an exploration is undertaken some sort of an inspection should be made as a preliminary to allowing workmen to go in and explore?

Mr. Curley: Yes, your Honor.

Mr. Robertson: Your contention is, that the person inspecting should go as far as the exploring party intend to go?

Mr. Curley: My idea of an inspection is this: the man in charge of the mine has a right to see that an inspection is carried out of that part to where it is intended to proceed with the exploring party; and, as manager, he should be one of the men to make the inspection, if it is a case of peculiar danger.

Mr. Robertson: In this instance, you contend that an inspection should have been made as far as the explorers went.

Mr. Curley: Yes; as far as it was intended to go. That is my idea of an inspection. I contend that a manager has no right to send men where he cannot go himself. I admit that an inspection might not be made by one man only; but it is an extraordinary thing to call that an inspection where a party of ten men is engaged.

His Honor: I take it you mean that the person inspecting should first of all make a general examination?

Mr. Curley: These are my views: if it is desirable to enter any portion of a mine to explore it, an inspection in the first place should be made of the locality in the proximity. I do not say every detail should be carefully gone into, as that would be a matter for the explorers; but the particular locality somewhere near the vicinity should be inspected before an exploration party is taken in, more especially in such a case as that under notice, where there was no hurry, as the manager states.

Mr. Robertson: What would be the necessity of an exploring party if the district had already been inspected? If it had been inspected in the immediate locality, then I would say it was not necessary for explorers to go in.

Mr. Curley: But my contention is, that there should be an inspection prior to the explorers going in.

Mr. Robertson: But is not an exploration an inspection?

Mr. Curley: Not altogether. If explorers went into a locality and noticed anything wrong, they would set to work and remedy it. I consider that the question of inspection supersedes everything, and that it should be held as a vital principle.

Mr. Robertson: You cannot define the number of people for an inspection?

Mr. Curley: I should say two or three people, or four at the outside, would be quite ample for an inspection.

Mr. Robertson: But that may be a matter of opinion?

Mr. Curley: Yes; I am only giving my opinion.

Mr. Robertson: When you admit three or four, another man might think seven or eight?

Mr. Curley: Yes; but you can go on to the absurdity, and say that one man might think a thousand necessary. (*Continuing.*) I also wish to emphasise the fact that we have no record of any written notice having been tendered to the inspector for the district with regard to the deaths of Curran and Smith. A verbal message only was sent to Mr. Humble. Coming back to the fact of the Inspector for the Stockton Colliery, and I think also Mr. Dixon, not appearing at the colliery the day after their inspection to make some inquiry; both Mr. Humble and Mr. Dixon were at Stockton at the inquest on Thursday, which adjourned about 1 o'clock; and it does not appear that they thought it worth while to go to the colliery office and inquire what was going on. I want that matter considered as well. Why they did not appears to me difficult to comprehend, especially as they knew what was transpiring when they made the inspection; and moreover, Mr. Humble admits in his evidence that that door's being out in No. 3 district came as a matter of surprise to him. I think it must appear as a surprise to your Honor that that stopping was taken out. The idea of calling the door at the furnace a stopping on hinges: why the whole thing is absurd. It seems to me singular that an inspector of this colliery did not think it worth his while to get down to the furnace, seeing that it is the most vital part of the colliery, a little oftener, and pay some attention to it. It is a surprise to me that Mr. Humble, on the last occasion he visited the colliery, did not deem it worth while to inspect the furnace. Again, it is rare that an inspection is made at night time. Surely there could be a casual inspection made now and then other than during the day time. There is another matter. The inspections made by the colliery officials should be embodied in their report books. Good administration is certainly what I would like to see exercised in connection with the practical branch of the Mines Department of this Colony. I would like to see the Act administered in a little firmer manner than appears to be the case at the present time. I hope I have not wearied your Honor. I have to express my thanks for the courtesy the Court has extended to me, and for the patient hearing it has given me.

Mr. O'Sullivan, said:—I should not have thought of addressing the Court if Mr. Curley had confined himself to the facts. I ask—Have the provisions of the Regulations of the Coal Mines Regulation Act been complied with? What evidence have we that they were infringed? What evidence of the kind is there, except that the manager neglected to enter in his book the accident which happened to Smith and Curran? It is known that the manager, at this time, was ordered to his home by the doctor. I ask—Was this accident due to an unforeseen occurrence, or to an error of judgment which any man might make, or was it due to neglect? There could have been no neglect, for, when the Government inspectors and the colliery managers visited this particular district some time back, they also went in against the return air. Now, as to the stopping, the manager explains that the No. 3 district some years ago was worked out. It remained unscalded for more than three years. It was then found that the stoppings on the main intake of No. 2 district

district were leaking, and it was on account of this that the stopping which was knocked out afterwards was erected. During the three years this district was open, the only stopping was No. 3 door, which proved in every way effectual. On each occasion of the managers visiting the mine, they entered against the current of air; and no surprise was expressed either by the inspectors or managers. It was in order to clear out the district more effectually on one of these visits of examination that this stopping was knocked out. As regards the leaving of the doors open, that was contrary to Rule 28 of the Special Rules of the colliery, a copy of which is served upon all the colliery employees, and was certainly served upon Curran and Smith. This Rule reads:—

“No workman or other person shall injure any air-courses, brattice, or stopping, or leave open, wholly or partly, any door, or do any other act whereby the ventilation of the mine may be affected, or the lives of the men or the property of the owners may be endangered.”

On the Thursday night there is evidence that the door was left open.

[Mr. O'Sullivan then proceeded to refer to the verdict of the jury at the first inquest upon Curran and Smith, and Mr. Curley took exception to the construction which Mr. O'Sullivan put upon it. His Honor thereupon quoted the verdict, and said that it was “That Curran and Smith died in the Stockton Colliery, and that their deaths were caused by inhaling noxious gases, commonly called black damp, the said gases being accumulated and caused by the doors Nos. 2 and 3 being left open; but there is no evidence before us to show how those doors came to be left open.”]

Mr. O'Sullivan: Well, the doors were left open. I submit that the exploring party was necessary in any case. First of all, it was necessary for the purpose of locating the seat of the fire, if one existed; and the reason for making the exploration as early as possible was to avoid the fire, if there was one, spreading, and to get it sealed off at an early stage. As Mr. Humble told us yesterday, it is a very difficult thing to seal off a fire in a mine where the stoppings are so numerous as they are in the Stockton Colliery. In regard to Mr. Curley's contention that Dr. Hester was not positive as to what caused the death of the men, there is what the jury thought. All the men who went into the mine were of opinion that black damp was present, though they were certainly on the look out for other gases as well. As regards the action of the manager, it is in evidence that he was at his home nervously prostrated on his bed; but when he hears of the exploring party going in, he repairs rapidly to the mine and finds that he is just too late to join; so he attends to the furnace. The air was evidently pretty good when the exploring party went in, for one of them, now dead, remarked “I could live in this for a week”; and we have it in evidence that McAlpin said, “I could live in here for a week.” The evidence of all the survivors is that the air was very good. Concerning the cause of what took place, what more likely than that it was what was thought by Macdonald—namely, a fall? Mr. Humble and Mr. Dixon themselves heard a fall after the accident; and is it not likely that that was a continuation of what was going on in the mine? Ellis speaks of sickness on the Wednesday night. He was employed at the furnace to clear out the black damp. He knew of the danger. As to Gould's evidence, I do not think anyone would call Gould a reliable witness. His evidence has been given in such a way that very little weight can be placed upon it. If he was completely overcome, it was very strange that he could walk a mile to report what had happened very shortly afterwards. These are two very conflicting statements. There is this smell noticed on the Wednesday night. I do not pretend to be able to account for it. All the authorities I have looked up tell me that carbonic acid is odourless, tasteless, and colourless. Professor Threlfall took samples in the mine. The first was no good; in the second, carbonic oxide predominated; and, in the third, carbonic acid—black damp. That supports McDonald and his opinion of black damp. I will just quote Dr. Hester. He says, “Judging from what happened to the rescue party, I should say that the poisonous gas must have increased very considerably while the exploring party were in the workings.” And again, “Restraint had to be placed on men to prevent their going in to try and rescue; and in many cases men went in who had been in before, in order to lead and show other men the way.” That is how several were lost. They escaped from those who were in charge, and that is how they were lost. Dr. Hester also said that one of the effects of carbonic oxide was to occasion dimness of sight. In conclusion, I say that whatever happened was purely accidental, and that it happened from some unforeseen occurrence that the management could not have contended against.

Mr. Robertson (addressing *Mr. McAuliffe*) asked: Can you tell me the names of your under officials who were unaffected by the gas, and were at liberty to take charge when you, Mr. McDonald, Jury, and others, were affected by the gas?

Mr. McAuliffe: I sent Jury and Ellis out into the fresh air to recover themselves. There were no other deputies except Jones, who, however, was not one of the exploring party. (*Continuing.*) Jones was fresh, and could have taken charge. He was assisting in the rescue work. All the officials except Baitey, senior, were there that night. Jones was not one of the explorers; he was one of the rescuers. He was physically quite able to take charge. Baitey was not on the scene at all that night. He was not aware of the accident. He was deputy at that time.

Mr. Dixon (in the absence of *Mr. Wilshire*, whose attendance had not been deemed necessary), addressed the Court. He said:—Your Honor and Gentlemen forming the Court,—I wish to draw attention to the fact that, as far as the inspectors are concerned, everything we have done in connection with the Stockton disaster has been made transparent to the public. We have not kept anything back; and I venture to assert that, in getting out the evidence, the questions put by the inspectors at the inquest were intelligible and lucid to everyone. We tried to make the inquiry as simple as possible, and to get all the facts we could with regard to the disaster. Mr. Humble has been referred to as the inspector of the Stockton Colliery; but in relation to the written notice which was not served, and the verbal notice which was given, I wish the Court to bear in mind that I consider myself as one with Mr. Humble in this respect; and if any blame is due to Mr. Humble it is also due to me, as senior officer. We understood, both of us, that the verbal instructions were as good as written instructions, so far as the management was concerned. All through the Stockton case I went with Mr. Humble, and I stood by him. Of course, there has been no reference made to what we did other than merely going to the pit. I think it is only right that the Court should take notice of what we did in the ten hours of rescue work. I do say that there are not two inspectors in the British Empire who could have done better than Mr. Humble and myself. I can only emphasise what I said before—that if there is any blame attributable to Mr. Humble for not having written the notice, I am here to stand by his side, and share that blame. In conclusion, I have to thank your Honor and the Court for the way the inquiry has been conducted.

At this stage the Court adjourned *sine die*.

APPENDIX TO REPORT OF PROCEEDINGS.

MR. CURLEY having undertaken to supply the Court with a copy of certain recommendations made by a Royal Commission appointed in England to inquire into the cause of mining accidents, and the means to be used for their prevention, forwarded, under date of 15th February, 1897, a document in the following terms:—

[Copy.]

“The Colliery Managers’ Hand-book”: by Caleb Pameley, 1886, page 320, Appendix.

Measures for dealing with Casualties.

WE consider that measures should be adopted to deal more systematically, and, if possible, more expeditiously with casualties resulting from the various sources of accidents dealt with in this report.

Collieries or mines should be required to provide an ambulance and stretchers for the purpose of conveying to their homes sufferers from injuries received while in the discharge of their duties.

Arrangements should be made for the establishment of centres in mining districts where additional appliances for accour and relief, and also special appliances for exploring purposes, should be maintained in an efficient condition, so as to be ready for use at the shortest notice.

It is most desirable that facilities should be afforded for the instruction of men in the use of special auxiliary appliances for exploring purposes, and in simple measures connected with the provisional treatment of injuries.

SPECIAL RULES for the conduct and guidance of the persons acting in the management of the Stockton Colliery, in the District of Newcastle, and all persons engaged in or about the Colliery.

N.B.—One or more copies of these Rules shall be fixed up in the principal office at the colliery; and all persons accepting employment in the colliery shall be engaged subject to the Regulations contained in them.

A printed copy of the Rules shall be supplied to every person before he is employed in or about such colliery.

Special Rules.

1. The colliery manager shall have the daily supervision and control of every shaft in the course of sinking, and every level and inclined plane in the course of being driven for commencing or opening any mine, or for searching for or proving minerals, and all shafts, levels, planes, works, machinery, tramways, and sidings, both below ground and above ground, in and adjacent to the mine, and any such shaft, level, and inclined plane belonging to the mine.

2. He shall comply with the requirements of the Coal Mines Regulation Act, 1876, and shall, to the best of his power, enforce the observations of the said Act, and of the General and Special Rules.

3. He shall appoint such competent persons as may be necessary for carrying out the provisions of the said Act, and to provide for the safety and proper discipline of the persons employed in the mine or mines under his control.

4. The overseer shall have the daily supervision and responsible charge of the mine, under the direction of the manager, and shall give all necessary instructions to the men and boys in the pit respecting their work; and shall see that they pay due respect to the Rules and Regulations of the colliery; and shall visit every working-place in the pit daily, or as often as may be practicable, and see that the air-courses and stoppings are in a good state of repair, and that an adequate quantity of fresh air is constantly supplied to the men.

5. In the event of any sudden discharge or accumulation of inflammable gas in any part of the workings, the fact shall be immediately reported by or through him to the manager, and he shall also adopt such measures as may seem to him most advisable for the immediate removal of the gas, and work shall not be resumed in such place or places until the gas has been removed.

6. In any place where there is a dangerous appearance of fire-damp, locked safety-lamps shall be used, and no workman shall be permitted to remain where fire-damp shall be accumulated in such quantity as to burn in the inside of, or to heat the lamps dangerously.

7. The overseer, or some other person specially appointed in his place, shall personally see that the air furnaces are kept in good repair and carefully attended to, and shall examine daily, or as often as practicable, the state of the roof in the main roads and the working-places, also the state of the shaft and the guides therein; and in the event of any of the above-mentioned places being found insecure, he shall cause them to be repaired at once.

8. It shall also be the duty of the overseer to see that an adequate supply of timber is sent into all the working-places, and to see that such places are properly and securely timbered.

9. If on examination by the overseer or any other person specially appointed, any working-place shall be found insecure from a defect in the ventilation, or from insufficiency of timbering, he shall cause a danger-signal to be placed in the middle of the road, at the entrance of it, such danger-signal to consist of a board with the word “danger” printed thereon.

On-setter or Hooker-on.

10. The on-setter or hooker-on shall, subject to the directions of the manager or overseer, have the sole control of the pit-bottom, and the command of the signals up the pit, and on no account shall he allow any person to interfere with the rapping of the signal-hammer. He shall at all times when sending up waggons of coal, see that none of the coal projects beyond the side of the waggon, and shall pay the greatest attention to the signal-hammer when men are going to ride, in order that accidents may be avoided. The rapping shall be as follows:—

11. Number of raps—
 - 1 for “go on.”
 - 2 for “lower down.”
 - 3 for “men coming up.”
 - 4 for “empty cage.”
 - 5 for “go slow—door open.”
 - 6 for “small coal for engine.”

12. The on-setter shall on no account allow any person to ride in a cage with a waggon, and on no account shall any person be allowed to go across the pit-bottom while work is going on in the pit, and any violation of this Rule shall be reported to the manager immediately.

Banksman.

13. The banksman shall, subject to the direction of the manager or overseer, have the control of the pit-top, and the command of the signals down the pit, and have power to prevent strangers from descending without special instructions from the manager.

14. The banksman shall be responsible for the state of the pit-top, and shall see that the frames and the surface near the pit-mouth are kept free from coal, stones, or rubbish, and that they are cleaned at least three times a day. He shall also see that the ropes and slides are well greased, and on no account shall he allow any person to descend the shaft in a state of intoxication.

15. He shall not allow any miner or workman during work hours to descend the pit in the same cage along with his tools, but he shall send them down for him.

16. He shall examine the pit ropes and the cage-chains frequently through the course of the day, and shall report to the manager or overseer if they are found faulty, adopting at the earliest opportunity such means as will, to the best of his judgment, remedy the defects.

17. Wire-ropes shall be run through the banksman’s hands slowly, once every week, to detect broken wires.

Engine-driver.

18. The engine-driver shall have the sole control of the engine entrusted to his care.

19. He shall inspect daily the engine, boilers, drums, chains, cages, and all other machinery used for the purpose of raising men and coals from the mine; shall see that all winding-ropes be carefully attached to the drum by clamps; that boilers be blown off every twelve hours; that the pumps are working well, and that the water is regularly pumped.

20. The engine-driver shall attend constantly to his engine during the shift, and upon no account shall he permit any person to touch any of the machinery or enter the engine-house, except such persons as may be appointed so to do by those in authority over him. He shall run the ropes once up and down before men descending in the morning, in order to see that the ropes, &c., are all right.

21. The engine-driver shall at all times pay strict attention to the rapping of the signal-hammer, as specified above, and to the oiling of the engine and the pulley-wheels, and should he discover any derangements of the machinery he shall stop the engine at once and report the matter to the manager, overseer, or engineer.

22. When men are in the pit-workings the engine-driver shall not leave the handle of the engine on any account, and when men are going to ride from the bottom he shall not lift the cage until he is sure of the signal given, and when men are going down he shall see that they are all right before the cage is started, and he shall see that the men are let down or drawn up with the greatest possible care.

Colliers and Workmen.

23. No collier or other person shall descend contrary to the direction of the banksman, nor ascend contrary to the direction of the hooker-on, nor shall any person or persons ascend or descend upon a loaded skip, or attempt to get out of the cage when in motion.

24. Every collier shall in all matters relating to the workings of the mines, or to the safety of the men, obey strictly the orders of the manager or the overseer, and no man or boy shall go into any part of the pit other than where he works without special authority from the manager or overseer.

25. Every collier shall, upon leaving his place of work, take care that no lighted candles or lamps or other fires (except such as is used for the purpose of ventilation) be left burning in any of the workings he may pass through or by, unless it be under the care of some person, nor shall he leave any gunpowder dangerously exposed.

26. Every collier shall securely sprag or uphold the coal whilst boling, and shall securely prop up the roof of the board or heading where he may be working, so that accidents may be avoided; and if he shall not be provided with a sufficient quantity of timber he shall cease working, and report the same to the manager or overseer.

27. Every workman employed in any pit shall inform the person in charge of the workings of the existence of any choke or fire damp; of any insecurity of the roof, shaft, or any other part of the workings; or of any air-door being damaged or left open, immediately on its being observed by him.

28. No workman or other person shall injure any air-courses, brattice, or stopping, or leave open wholly or partly any door, or do any other act whereby the ventilation of the mine may be affected, or the lives of the men or the property of the owners may be endangered.

29. The seam of coal must be wrought strictly in accordance with the instructions of the manager or overseer. No collier shall on any account be allowed to take the tools of another.

30. Every person employed shall obey the orders of the manager or overseer, or other person specially appointed to give orders in all matters connected with the safety of the miners or the working of the colliery, and shall refrain from quarrelling, fighting, or using obscene language, or from doing anything that may cause a stoppage of the works.

31. There shall be no restriction as to the amount of any individual's daily or weekly earnings.

32. Any miner or other person employed in or about the colliery shall be liable to instant dismissal if he shall wilfully violate the foregoing Rules, or if it shall appear to the manager that the men or machinery are in any way endangered by his neglect or incapacity.

Firemen.

33. The firemen shall be in the pit four (4) hours before the workmen commence to draw coals, and shall examine carefully with the safety-lamp all places and sections where gas has previously been seen.

34. He shall suspend "danger crosses" in all places where gas is found to be dangerous and stopped, and on no account allow them to be removed until the place is considered safe, and started again.

35. All safety-lamps to be examined by the fireman before they are given out to the miners or anyone connected with the colliery requiring the use of a safety-lamp.

36. All safety-lamps shall be locked by the fireman before they leave the lamp-room, which will be in charge of the fireman.

37. Any lamp receiving any injury shall be at once delivered up to the fireman or overman, and the fact reported to the manager.

38. No smoking shall be permitted in any place where safety-lamps are used.

Furnace-men and Horse-drivers.

39. The furnace-men and horse-drivers shall be subject to the same Rules and Regulations as the other workmen, and when the pit is not at work shall obtain special instructions from the manager or overseer.

40. When day and night furnace-men are required, the one shall not leave the furnace until the other arrives, except to give information of the non-attendance of the other, in which case he shall return again with all speed to the furnace, and remain there until relieved by someone appointed by the manager or overseer for that purpose. When a day furnace-man only is employed the furnace shall be got into vigorous operation before the time for starting work in the pit, and he shall see that a clear brisk fire is kept up all day.

41. Gunpowder or other explosive or inflammable substance shall not be stored in the mine.

42. It shall not be taken into the mine except in a covered or closed case or canister, containing not more than four pounds.

43. A workman shall not have in use at one time, in any one place, more than one of such cases or canisters.

44. No steel or iron rammer shall be used, and a charge of powder which has missed fire shall not be unrammed.

N.B.—It is the particular desire of the owner of the colliery that the various officers shall at all times report to the proper authorities every individual case of neglect or wilful disobedience of the Rules and cautions abovementioned, in order that the safe and proper working of the colliery may be duly maintained.

By the 34th clause of the 39th Victoria No. 31, it is enacted every person who shall be guilty of any offence against this Act, or who shall wilfully violate or neglect to observe any provisions of this Act, or any general or special rule established hereby or hereunder for the violation or neglect of which no penalty is hereby expressly imposed, shall for every such offence be liable to a penalty not exceeding £10, recoverable summarily before two or more Justices of the Peace.

By the 33rd clause of the same Act it is enacted every person who pulls down, injures, or defaces any notice hung up or affixed as required by this Act, shall be liable to a penalty not exceeding 40s.

Exhibit "A"—Court of Investigation. Exhibit No. 10—Court of Inquiry.

No. 28.

W. T. Dick, Esq., M.P., to The Under Secretary for Mines and Agriculture.

Dear Sir,

Newcastle, 19 March, 1897.

Could you kindly supply me with half-a-dozen copies of the finding of the Court of the Stockton inquiry, if published.

Yours, &c.,

W. T. DICK.

Inform, Department regrets its inability to comply with his request; but the report has not been published, except so much of it as appeared in the daily papers.—H.B.S. (for U.S.), 19/3/97.

The

The Under Secretary for Mines and Agriculture to W. T. Dick, Esq., M.P.

Department of Mines and Agriculture, Sydney, 19 March, 1897.

Date of letter under reply:—19th March, 1897.

Subject:—Asking to be supplied with six copies of the finding of the Court on the Stockton inquiry.

Reply:—The Department regrets its inability to comply with your request. The report has not been published yet, except so much of it as appeared in the daily papers.

D. C. McLACHLAN,
Under Secretary
(Per A.F.)

PART V.

Decision to hold Court of Inquiry under section 10, Coal Mines Regulation Act, 1896. Proceedings of Court of Inquiry into conduct of Messrs. McAuliffe and McDonald, and Finding of Court; also Order of Minister for Mines cancelling Certificates.

No. 1.

The Secretary to The Attorney-General to The Under Secretary for Mines and Agriculture.

Re Stockton Inquiry.

Sir,

Attorney-General's Department, Sydney, 9 March, 1897.

I have the honor, by direction of the Attorney-General, to inform you that, after perusal and consideration of the papers in the above matter, he has decided that no criminal proceedings shall be taken.

I have, &c.,
H. POLLOCK,
Secretary.

Submitted.—D. McL., 9/3/97. Seen.—S. SMITH.

No. 2.

Minute by The Secretary for Mines and Agriculture *re* Stockton Colliery Accidents.

Subject:—Stockton Colliery Accidents.

Department of Mines, Sydney, 11 March, 1897.

I HAVE very carefully perused the full and very comprehensive report submitted by the Court of Investigation appointed to inquire into the causes and circumstances attending the fatal accidents which occurred in the Stockton Colliery in December last.

The finding of the Court is that both the manager and the under-manager are unfit, by reason of incompetence, to discharge the duties of their respective positions; and I, therefore, direct that an inquiry under clause 10 of the Coal Mines Regulation Act be held at Newcastle—the inquiry to be conducted by His Honor Judge Backhouse. The Crown Solicitor should be moved to have all documents prepared, so that the inquiry may be commenced without any avoidable delay.

S. SMITH.

No. 3.

The Under Secretary for Mines and Agriculture to The Crown Solicitor.

Sir,

Department of Mines and Agriculture, 11 March, 1897.

With reference to the inquiry recently held at Newcastle in connection with the Stockton Colliery accident, and to the report of the Court as to its causes and circumstances, I am directed to state that, as it appears that the manager and under-manager are unfit to discharge their duties by reason of incompetency and negligence, the Minister desires that an inquiry shall be held under section 10 of the Coal Mines Regulation Act.

Under subsection (ii), section 10, the Minister is directed to furnish to the manager and under-manager a statement of the case on which the inquiry is instituted, and I should, therefore, be glad if you will have the proper statement of the case prepared.

The report of the Court of investigation is forwarded, together with a copy of the evidence. As it is intended to hold the inquiry at an early date, I should be glad if the matter can receive immediate attention.

It will also be necessary that some person be appointed by the Minister to undertake the management of the case, and I would ask that Mr. Wilshire, of your Department, be instructed to do so.

I have, &c.,
D. C. McLACHLAN,
Under Secretary.

No. 4.

The Crown Solicitor to The Under Secretary for Mines and Agriculture.

Sir, Crown Solicitor's Office, Sydney, 11 March, 1897.

With reference to your letter of to-day's date, respecting the inquiry to be held as to the competency of the manager and under-manager of the Stockton Colliery, I have the honor to forward herewith statements of the cases on which the inquiry is instituted, and to state that, as the Act requires the Minister before the commencement of the inquiry, to furnish the statement of the case to the party affected, it would, perhaps, be advisable for the Minister to authenticate the same by his signature.

As requested by the Minister, Mr. Wilshire of this Department will undertake the management of the case, and should, according to the Act, be appointed by the Minister,

Kindly inform me as early as convenient where, and on which date, the inquiry is to be held.

I have, &c.,

GEO. COLQUHOUN,

Crown Solicitor.

Mr. Humble and I saw Mr. Wilshire on Saturday, and again this morning, when he approved of the statement as now amended being sent.—H.D.W., 15/3/97.

No. 5.

Memorandum by The Under Secretary for Mines and Agriculture to Inspector Lynch.

Department of Mines and Agriculture, Sydney, 16 March, 1897.

Will Inspector Lynch please cause the enclosed letters and statements to be served on Mr. Daniel McAuliffe, manager of the Stockton Colliery, and Mr. William McDonald, under-manager of the Stockton Colliery, at the earliest moment to-morrow?

Attached hereto are duplicates of the statements, having on their back a certificate of service, which should be filled in by the officer effecting service.

The duplicates should then be returned to this office.

D. C. McLACHLAN,

Under Secretary.

Notices served, certificates on originals filled in, and papers returned herewith.—W. C. LYNCH, Inspector of Police, Newcastle, 17/3/97.

[Enclosure.]

* Statements signed for McAuliffe and McDonald, and sent with duplicate copy to Inspector Lynch, Newcastle, for service. 16 March, 1897.

COPIES of Certificates of Service.

I, CONSTABLE ALBERT F. KNIGHT, of Stockton, do hereby certify that I have served, this 17th day of March, 1897, upon the within-named William McDonald, the statement herein, by delivering to him personally, at Stockton, a true copy thereof.

ALBERT F. KNIGHT,

1st-Class Constable.

I, CONSTABLE ALBERT F. KNIGHT, of Stockton, do hereby certify that I have served, this 17th day of March, 1897, upon the within-named Daniel McAuliffe, the statement herein, by delivering to him personally, at Stockton, a true copy thereof.

ALBERT F. KNIGHT,

1st-Class Constable.

No. 6.

The Under Secretary for Mines and Agriculture to His Honor Judge Backhouse.

Sir, Department of Mines, Sydney, 17 March, 1897.

I am directed by the Secretary for Mines to inform you that he has, in the exercise of the power conferred on him by section 10 of the Coal Mines Regulation Act, 1896, directed you to hold an inquiry into the conduct of Daniel McAuliffe, as manager of the Stockton Colliery, in consequence of representation having been made to him by the "Court of Inquiry into the Stockton Colliery Accidents," that Mr. McAuliffe is unfit, by reason of incompetency and gross negligence, to discharge duties as such manager.

A copy of the statement of the case upon which the inquiry is instituted is enclosed herewith for your information.

The inquiry will be held at the Court-house at Newcastle, and will be begun at 2 p.m. on Monday, the 22nd inst. Mr. E. H. Wilshire, of the Crown Solicitor's Office, has been appointed to undertake the management of the case.

Annexed hereto will be found your formal appointment under the hand of Mr. Secretary Sydney Smith. †

Steps, I may add, are being taken to obtain the services of two shorthand writers, one of whom may act as Secretary to the Court.

I have, &c.,

D. C. McLACHLAN,

Under Secretary.

Report of Court of Inquiry into Stockton Colliery accidents (and tracing). Copy of evidence taken and addresses made before the above Court. Copy of report of Inspectors Dixon and Humble. Copy of evidence taken at second inquest (in three parcels). Copy of exhibits (except plan). Copy of evidence taken at first inquest. Copy of statement served on D. McAuliffe, with certificate of service on back. Copy of statement served on Wm. McDonald, with copy of certificate of service on back.

No. 13.

The Crown Solicitor to The Under Secretary for Mines and Agriculture.

Sir,

Crown Solicitor's Office, Sydney, 18 March, 1897.

With reference to the inquiry to be held into the conduct of the manager and under-manager of the Stockton Colliery, the following witnesses will be required to be in attendance, viz.:—Messrs. Martin, Coroner; William Dixon, Chief Inspector; William Humble, Inspector; Jonathan Dixon, Burt, Gould, and the two gentlemen who took the shorthand notes at the Court of Investigation.

The whole of the papers, including the plan of No. 3 district, should also be at the Court for the purpose of reference.

I have, &c.,

GEO. COLQUHOUN,

Crown Solicitor.

Mr. Wilshire asked for a summons for R. J. Jury.—H.W., 19/3/97.

No. 14.

The Under Secretary for Mines and Agriculture to Mr. E. H. Wilshire.

Sir,

Department of Mines and Agriculture, Sydney, 19 March, 1897.

Adverting to my letter of yesterday's date, addressed to the Crown Solicitor, respecting the inquiries to be held into the conduct of the manager and under-manager of the Stockton Colliery, I am directed to enclose herewith additional papers in connection therewith, viz.:—A copy of the special rules of the Stockton Colliery; the appointment of the late Court of Investigation under section 23; a copy of the report of Dr. Haldane on the causes of death in colliery explosions; a report of Pameley's Colliery Manager's handbook (see pages 323-331), and also of Roscoe's Elementary Chemistry (see page 76).

The original depositions taken at the first and second inquests will be forwarded to Newcastle, as well as the original plan put in by Mr. Jonathan Dixon.

Summonses have been forwarded to the Inspector of Police for Service on G. C. Martin, John Dixon, William Humble, Jonathan Dixon, Burt, Gould, R. J. Jury.

Five forms signed by His Honor are enclosed for your use, and a further supply will be forwarded to-morrow.

The police authorities have been asked to provide facilities to enable you to effect the service of summonses.

I have, &c.,

D. C. McLACHLAN,

Under Secretary.

No. 15.

The Under Secretary for Mines and Agriculture to The Inspector-General of Police.

Sir,

Department of Mines and Agriculture, Sydney, 19 March, 1897.

I am directed to inform you that an inquiry will be held at the Court-house (occasional court-room), Newcastle, on the 22nd instant, commencing at 2 p.m., by His Honor Judge Backhouse, into the conduct of Daniel McAuliffe and William McDonald, manger and under-manager respectively of the Stockton Colliery. I am therefore to request that one of your local officers may be instructed to act as erier to the Court, and that assistance may be accorded to Mr. E. H. Wilshire, who has undertaken the management of the cases, in effecting service of summonses.

I have, &c.,

D. C. McLACHLAN,

Under Secretary.

No. 16.

Memorandum by The Under Secretary for Mines to The Police Constable at Greta.

Department of Mines and Agriculture, 19 March, 1897.

Will you please cause the enclosed summonses to be served on Mr. Jonathan Dixon, manager of the Greta Colliery, as early as possible to-morrow, and notify Mr. E. H. Wilshire, "Great Northern Hotel," Newcastle, when you have done so.

D. C. McLACHLAN,

Under Secretary

(Per H. Dalrymple Wood).

No. 17

No. 17.

Memorandum by The Under Secretary for Mines and Agriculture to Inspector Lynch, Newcastle.

Department of Mines and Agriculture, 19 March, 1897.

Will you please cause the four enclosed summonses to be served on the persons to whom they are directed as early as possible to-morrow.

D. C. McLACHLAN,
Under Secretary
(Per H. Dalrymple Wood).

No. 18.

The Secretary, Court of Inquiry, to The Under Secretary for Mines and Agriculture.

Court of Inquiry into the conduct of the manager and under-manager of the Stockton Colliery.

Sir,

Newcastle, 22 March, 1897.

I beg to inform you that the Court of Inquiry into the conduct of Mr. McAuliffe, the manager, and Mr. McDonald, the under-manager, of the Stockton Colliery, was opened in the Court-house, Newcastle, at 2 p.m. to-day. His Honor Judge Backhouse presided. Mr. E. H. Wilshire, prosecuting officer, Crown Solicitor's Office, was present, and notified that he had been appointed to undertake the management of the cases. Mr. F. E. Rogers, Q.C., instructed by Mr. T. D. O'Sullivan, appeared for Messrs. McAuliffe and McDonald.

It was agreed by the parties:—

- (1.) That the two cases should be taken together.
- (2.) That Mr. Wilshire may, if he think proper, put in evidence already given by Mr. McAuliffe, as evidence against Mr. McDonald, and the evidence already given by Mr. McDonald as evidence against Mr. McAuliffe.

Mr. Wilshire then opened his cases, after which witnesses were called. At 5 p.m. the Court adjourned till 10 a.m. to-morrow (Tuesday). Mr. Rogers has undertaken to then hand in the certificates of the manager and under-manager.

I have, &c.,

E. C. WRIGHT,
Secretary.

For Minister's information.—D.McL., 23/3/97. Seen.—S. SMITH, 23/3/97.

No. 19.

The Secretary, Court of Inquiry, to The Under Secretary for Mines and Agriculture.

Court of Inquiry into the conduct of the manager and under-manager of the Stockton Colliery.

Sir,

Newcastle, 23 March, 1897.

I have the honor to inform you that, upon the Court resuming its sittings to-day, the certificates of Mr. McAuliffe, the manager, and Mr. McDonald, the under-manager, of the Stockton Colliery, were handed in.

Afterwards a considerable amount of documentary evidence was put in, and witnesses were called. At 5 p.m. the Court adjourned till to-morrow (Wednesday) morning.

I have, &c.,

E. C. WRIGHT,
Secretary.

No. 20.

The Secretary, Court of Inquiry, to The Under Secretary for Mines and Agriculture.

Court of Inquiry into the conduct of the manager and under-manager of the Stockton Colliery.

Sir,

Newcastle, 24 March, 1897.

I beg to inform you that the Court resumed its sittings to-day.

Mr. Wilshire called additional witnesses, and shortly before the mid-day adjournment closed his cases. Mr. Rogers, Q.C., thereupon opened the cases for the manager and under-manager of the Stockton Colliery.

At 4:50 p.m. the Court further adjourned till 10 a.m. to-morrow (Thursday).

I have, &c.,

E. C. WRIGHT,
Secretary.

No. 21.

Telegram from Mr. E. H. Wilshire to The Under Secretary for Mines.

Newcastle, 25 March, 1897.

Court of Inquiry concluded. Certificates of manager and under-manager cancelled.

For Minister's information.—D.McL., 25/3/97. Seen.—S. SMITH.

No. 22.

The Secretary, Court of Inquiry, to The Under Secretary for Mines and Agriculture.

Court of Inquiry into the conduct of the manager and under-manager of the Stockton Colliery,
 Sir, Newcastle, 25 March, 1897.

I beg to inform you that the sittings of this Court were resumed at 10 a.m. to-day. The taking of evidence was concluded at 11 a.m., at which hour Mr. Rogers, Q.C., proceeded to address the Court. Mr. E. H. Wilshire followed, after which His Honor Judge Backhouse summed up.

The Court, on the grounds of incompetency and gross negligence, cancelled the certificates of the manager and under-manager.

Upon rising, the Court adjourned till 2 p.m. on Saturday, the 3rd proximo. There is at present, however, no intention of the Court sitting on that day; but it may be found necessary to do so.

I have, &c.,
 E. C. WRIGHT,
 Secretary.

Seen.—D.C.McL., 26/3/97.

No. 23.

His Honor Judge Backhouse to The Secretary for Mines and Agriculture.

Court of Inquiry into the conduct of the manager and under-manager of the Stockton Colliery.
 Sir, Court-house, Newcastle, 25 March, 1897.

I have the honor to inform you that the Court of Inquiry concluded sittings to-day, and that I made an order cancelling the certificates of Daniel McAuliffe, the manager, and William McDonald, the under-manager, on the grounds of incompetency and gross negligence.

My report, in accordance with the provisions of the Act, will be forwarded to you in due course.

I have, &c.,
 ALF. P. BACKHOUSE,
 D.C.J.

Submitted for the information of the Minister.—H.B.S. (for U.S.), 29/3/97. See me *re* this.—
 S. SMITH, 31/3/97. Done, 1/4/97. Resubmit with the report when it comes to hand.—D.C.McL.,

No. 24.

The Crown Solicitor to The Under Secretary for Mines and Agriculture.

Sir, Crown Solicitor's Office, Sydney, 27 March, 1897.

I have the honor to return herewith the papers relating to the Stockton Colliery accidents, except those put in as evidence at the Court of Inquiry, and to state that the inquiry commenced at 2 p.m. on Monday, the 22nd instant, and continued from day to day until Thursday, at 2:30 p.m., when His Honor Mr. District Court Judge Backhouse found the two principal charges fully proved, and ordered the certificates of Mr. Daniel McAuliffe (manager) and Mr. William McDonald (under-manager of the said colliery) to be cancelled, the Court was then adjourned until Saturday, the 3rd April next, at 2 p.m., in case any formal matter which might have escaped attention could be done.

By consent, the cases being practically identical, were heard together, which considerably shortened the proceedings.

Mr. Wilshire, who was appointed by the Minister to manage the case, conducted it on behalf of the Department, Mr. Rogers, Q.C., appearing for Messrs. McAuliffe and McDonald.

I have, &c.,
 GEO. COLQUHOUN,
 Crown Solicitor.

For the information of the Minister.—H.B.S. (for U.S.), 30/3/97. Seen.—S. SMITH, 31/3/97.

No. 25.

His Honor Judge Backhouse to The Secretary for Mines and Agriculture.

Sir, Judges' Chambers, District Court, Sydney, 5 April, 1897.

I have the honor to forward, in accordance with the provisions of the Coal Mines Regulation Act of 1896, section 10, subsection 5, reports (in duplicate) on the inquiries which I have held into certain charges alleged against the manager and under-manager of the Stockton Colliery. The evidence which I had before me accompanies the report. In addition to these documents I forward the certificates issued, under the above-mentioned Act, to the manager and under-manager, together with the formal orders by which they are cancelled.

I have, &c.,
 ALF. P. BACKHOUSE,
 D.C.J.

For approval to record the cancellation of these certificates in accordance with section 12 of the Act.—D.McL., 6/4/97. Approved.—S. SMITH, 8/4/97. Cancellation duly recorded.—H.W., 9/4/97.

No. 26.

Report of Court of Inquiry into the conduct of Daniel McAuliffe.

Sydney, 5 April, 1897.

In the matter of the inquiry under the Coal Mines Regulation Act, 1896, into the conduct of Daniel McAuliffe, manager of the Stockton Colliery.

REPORT sent to the Honorable the Secretary for Mines, in accordance with the provisions of section 10, subsection 5 of the said Act.

The inquiry was commenced, in the Court-house, Newcastle, at 2 p.m. on Monday, the 22nd March, and was continued till Thursday, the 25th March, 1897. There was afterwards, one additional sitting, which was held in the District Court-house, King-street, Sydney, on Saturday, the 3rd April, 1897. This

This case was, by consent, heard with that of William McDonald.

The management of the case, on behalf of the Honorable the Secretary for Mines, was conducted by Mr. E. H. Wilshire, of the Crown Solicitor's Office.

Mr. McAuliffe was represented by Mr. F. B. Rogers, Q.C.

It was not necessary for me to view the mine, as nothing that I could have seen there would have helped me in the slightest in coming to conclusions, the condition of things being altered since the time of the accidents, and the representatives of both parties agreeing that such a visit would be useless. It would, also, have unnecessarily protracted the inquiry.

Taking the charges in the statement of case in the order in which they were set out, the following were my decisions on each point, and the reasons for giving them:—

Charge No. 1.—That you, as manager of the Stockton Colliery, allowed the stopping marked D on the plan put in as evidence at the Court of Investigation lately held at Newcastle, respecting the late Stockton Colliery accidents, to be removed and did not replace the same or make any provision to prevent the noxious gases in No. 3 district from escaping into the workings of the mine.

The facts were not in dispute. Some years ago, when No. 3 district was worked out, the board ends along the main road (*see tracing, Exhibit No. 1*) were closed, but the rope-road was left open, and there was no stopping at D for some time. A movement then occurred in the roof of No. 3 district, causing the stoppings along the main road to be twisted about and broken. This allowed leakage, or scaling of air into No. 3 district from the main road wherever there was an unobstructed way from the rope-road to the furnace, which happened every time that No. 3 door was opened. To prevent the leakage so caused the stopping at D was put in, and it remained till June, 1896, when it was taken out, evidently to save time in clearing out No. 3 district, to enable persons who were to give evidence in certain cases which had been brought against the Stockton Colliery Company to inspect the falls from the roof. That it was not absolutely necessary that the stopping in which there was a manhole should be removed is shown by the fact that in the previous December the district had been cleared for a similar purpose without the permanent stopping being interfered with in any way. That this stopping, for the safe working of the mine, was indispensable, is practically proved by the course adopted in the management of the mine; and not replacing it seemed unquestionably to be a matter showing gross negligence, as its absence was a constant menace to some men in the mine. There was, right up to the time of the accidents, scaling of air from the main road into No. 3 district every time No. 3 door was opened, as it had to be a dozen times a day for the purpose of replenishing the furnace. The foul air from No. 3 district was drawn to where the furnace-men were. If the stopping at D had been replaced, it would have been impossible for Curran and Smith to have brought about their deaths, which unquestionably they did by leaving open No. 3 door.

Charge No. 2.—That you did not enforce, or cause to be enforced, the special rules of the colliery, and were lax in the discipline of the mine.

This charge did not appear to be made out. The evidence simply pointed to the man Gould having made complaint on one occasion to the under-manager, which was conveyed to the manager, about No. 3 door being left open. The under-manager made an inspection, and, finding everything correct, had some doubt of Gould's statements, and took no further steps. This, certainly, does not support the general charge.

Although there is no charge with reference to No. 3 door, I think there should have been two doors instead of one.

Charge No. 3.—That you did not cause to be constantly produced an adequate amount of ventilation in the mine to dilute and render harmless noxious gases to such an extent that the working places of the shafts, levels, stables, and workings of the mine and the travelling roads to and from those working-places were in a fit state for working and passing therein.

This charge was not proved. In fact there was no contention before me that any part of the mine was improperly ventilated, except No. 3 district, when the exploring and rescue parties went in.

No. 3 district is sufficiently dealt with in my remarks relating to Charge No. 5.

Charge No. 4.—That you did not supervise and accompany the exploration party on the 3rd December last under the unusual circumstances then existing.

It certainly appeared to me that, ordinarily, Mr. McAuliffe should have led the exploring party; but, having heard his explanation as to the state of prostration in which he was—caused by the deaths of the furnace-men shortly before—and having judged him by his subsequent conduct in going down to join the party—although he was too late—and the heroic manner in which he acted afterwards when rescuing and attempting to rescue some of the men, I had no doubt that he had no intention of shirking his duty, and that the reason which he gave for his absence was perfectly *bonâ fide*.

If this charge had stood alone I should not have considered it my duty to have dealt in any way with Mr. McAuliffe's certificate.

Charge No. 5.—That, after being notified by the Government Inspectors that "fire-stink" was in the No. 3 district and gas generating therein, you allowed the exploration party to go into the said district against the air-current, thereby permitting a dangerous instead of a safe and practicable mode of entry into same to be adopted.

No doubt, as it was contended to me, it is "very easy to be wise after the event"; but, in judging of Mr. McAuliffe in allowing the under-manager to take in the exploring party against the current of air, I had to consider what were the conditions under which he acted on the 3rd December, and whether his conduct was such as would have been reasonably expected from a competent manager; although, in the light of subsequent events, the course of action taken might have proved to have been wrong.

It was and fairly might be urged in Mr. McAuliffe's favour that on previous occasions men had gone in the same way without any disastrous results, and if the conditions on the 3rd December last had been the same as existed in December, 1895, and June, 1896, it might be that something could be said to justify the course adopted. On that I express no opinion; but the conditions were not the same. First of all, Gould had made a complaint of what happened to him on the night of Monday, the 30th November. [He, by mistake, speaks of the 1st December in his evidence.] I had little doubt, from the symptoms which

he

he described, that he was then suffering from the effects of carbon monoxide ("fire-stink.") This complaint alone should have aroused the management to recognise that there was a possible danger, till then unheard of, to the men at the furnace. The complaint was followed by the terrible deaths of Curran and Smith on the night of the 1st December. Dr. Hester gave the cause of death in their cases as poisoning by carbonic acid gas (black-damp); but it was quite possible, and extremely probable, bearing in mind what was discovered afterwards, that carbon monoxide ("fire-stink") played a part in contributing to their deaths. But, assuming in favour of Mr. McAuliffe that their deaths were entirely due to carbonic acid gas (black-damp), the consultation with Mr. Dixon and Mr. Humble, Inspectors of Collieries, and the presence of the benzine smell in the atmosphere (which was coming from the rope-road out of No. 3 district) should have shown any competent manager that, at all events, a party entering by the rope-road would probably meet the insidious and dangerous gas carbon monoxide ("fire-stink"), and should have made him determined not to enter by that way. Entering against the air current might, possibly, have been justified if it had been necessary to act at a moment's notice, and where the loss of every instant was a matter of importance, such as in the case of a rescue party. But there was no such necessity. The exploring party did not enter till between 9 p.m. and 10 p.m. on the 3rd December—at least thirty-six hours after the decision as to the course to be adopted had been come to. It was admitted, on the last sitting day of the Court, that the air could have been sent round the reverse way, namely, in at the trap door marked Z on the tracing, and out at 20 bord, to the main road, without any serious difficulty. Some objection was raised at the hearing, at first, that this might have shut off the pumping gear from inspection; but, as was at once pointed out by Mr. Humble, if the course suggested had been adopted, the pumps could have been approached from No. 3 shaft. The possibility of using No. 3 shaft should have occurred—it appeared to me—to any competent manager. But, if the air could not have been sent round the reverse way, some such system of bratticing as was adopted by the inspectors to enable the rescue parties to work should have been made use of. In any event, the men ought never to have been taken in by the road they were until it was made absolutely clear that there was no carbon monoxide ("fire-stink") coming from No. 3 district; and, if there had been the slightest doubt about this, the inspectors—it seemed to me—should have been consulted before any move was made.

I recognise that, in all probability, the danger to the men was increased by a sudden fall while the exploring party was in. But a fall might reasonably have been expected. I assume there was a fall, and, by reason of it, a considerable increase of danger to the men. But, if it had not taken place, I doubt whether all the exploring party would have come out. In favour of the affirmative view of this question, the opinion of Dr. Hester as to the condition of the air when the men went in was urged. But this depends on the time they were in; and, as to that, there is little more than guess—a guess, when consideration is given to what followed, worth nothing.

Charge No. 6.—That you were ignorant of the nature and quality of the gases met with in coal-mines, particularly the gas known as carbon monoxide or "fire-stink," and that you were unable to distinguish this gas from other and different gases.

I did not find this charge proved. Mr. McAuliffe seemed to have recognised on the 2nd December that the inspectors were right in the conclusions to which they had come. He is placed on the horns of this dilemma:—If he recognised carbon monoxide ("fire-stink"), he should not have allowed the men to go in: if he did not recognise it, he showed an ignorance which unfitted him to be a manager.

There was no attempt to show ignorance of other gases.

Charge No. 7.—That you were ignorant of the fact that a current of air passing over a gob-fire would cause a larger quantity of carbon monoxide gas and other noxious gases to generate.

This charge did not appear to me to be correctly stated. Up to a certain point, the current of air would have the effect described; but when the conditions of ordinary combustion by fire would be reached, less carbon monoxide ("fire-stink") would be given off.

I found, on the two matters, namely:—

Charge 1.—as to the stopping at D being removed and not being replaced, and

Charge 5.—as to allowing the exploring party to go in against the current of air,

that Mr. McAuliffe had been guilty of incompetency and gross negligence, and was unfit to discharge his duties as manager; and, as the consequence of such incompetency and gross negligence were so terrible, it appeared to be my duty to order his manager's certificate under the Coal Mines Regulation Act, 1896, to be cancelled, and I ordered accordingly. A formal order is attached to the papers.

It has not been necessary for me to set out any of the evidence verbatim, as, on most points, there was no conflict; and where there was a conflict as to facts, I took the view put forward by Mr. McAuliffe and his witnesses.

Before concluding—in fairness to Mr. McAuliffe—I wish to add that, with the exception of the two matters particularly referred to, he had, according to the evidence, shown himself competent, and, in some respects, more than competent. One piece of work in connection with shaft-sinking in difficult ground was spoken of by the Inspectors of Collieries as a great achievement. To his bravery I have already alluded.

Mr. Wright I have to thank for great and able assistance; and Mr. Roberts discharged his duty as deposition clerk in a highly satisfactory manner, bearing out my previous experience of him.

The Hon. Sydney Smith,
Secretary for Mines and Agriculture.

I have, &c.,
ALF. P. BACKHOUSE,
D.C.J.

No. 27.

Report of the Court of Inquiry into the Conduct of William McDonald.

Sydney, 5 April, 1897.

In the matter of the inquiry under the Coal Mines Regulation Act, 1896, into the conduct of William McDonald, under-manager of the Stockton Colliery.

Report sent to the Honorable the Secretary for Mines, in accordance with the provisions of section 10, subsection 5, of the said Act.

The inquiry was commenced, in the Court-house, Newcastle, at 2 p.m. on Monday, the 22nd March, and was continued till Thursday, the 25th March, 1897. There was, afterwards, one additional sitting, which was held in the District Court House, King-street, Sydney, on Saturday the 3rd April, 1897.

This case was, by consent, heard with that of Daniel McAuliffe.

The management of the case on behalf of the Honorable the Secretary for Mines was conducted by Mr. E. H. Wilshire, of the Crown Solicitor's Office.

Mr. McDonald was represented by Mr. F. E. Rogers, Q.C.

In this report I would repeat and incorporate all that I have said in my report in the case of Daniel McAuliffe, excepting only what I have stated in regard to charge No. 4 set out in the case against Mr. McAuliffe.

Dealing with the charges seriatim, I report as follows :—

Charge No. 1.—That you, as under-manager of the Stockton Colliery, allowed the stopping marked D on the plan, put in as evidence at the Court of Investigation lately held at Newcastle respecting the late Stockton Colliery accidents, to be removed, and did not replace the same, or make any provision to prevent the noxious gases in No. 3 district from escaping into the workings of the mine.

I found this charge proved.

Charge No. 2.—That you did not cause to be constantly produced an adequate amount of ventilation in the mine to dilute and render harmless noxious gases to such an extent that the working places of the shafts, levels, stables, and workings of the mine, and travelling roads to and from those working places, were in a fit state for working and passing therein.

I found this charge not proved.

Charge No. 3.—That you did not enforce, or cause to be enforced, the special rules of the colliery, and were lax in the discipline of the mine.

I found this charge not proved.

Charge No. 4.—That, after being notified by the Government Inspectors that "fire-stink" was in the No. 3 district, and gas generating therein, you led the exploration party into the said district against the air-current, thereby adopting a dangerous instead of a safe and practicable mode of entry into same.

I found this charge proved.

Charge No. 5.—That you were ignorant of the nature and quality of the gases met with in coal-mines, particularly the gas known as carbon monoxide, or "fire-stink," and that you were unable to distinguish this gas from other and different gases.

Although Mr. McDonald differed from the inspectors, and seemed to hold his own opinion as against theirs, still he had had experience of carbon monoxide, or "fire-stink," in Scotland; and I saw no reason to come to the conclusion that I might deal with his certificate on the ground of ignorance in the matter herein charged.

Charge No. 6.—That you were ignorant of the fact that a current of air passing over a gob-fire would cause larger quantities of carbon monoxide gas and other noxious gases to generate.

This charge I found not proved.

I found, on the two matters, namely :—

Charge 1.—As to the stopping at D being removed, and not being replaced; and

Charge 4.—As to leading the exploring party in against the current of air,

that Mr. McDonald had been guilty of incompetency and gross negligence, and was unfit to discharge his duties as under-manager; and, as the consequences of such incompetency and gross negligence were so terrible, it appeared to be my duty to order his under-manager's certificate under the Coal-mines Regulation Act, 1896, to be cancelled, and I ordered accordingly. A formal order is attached to the papers.

As in the case of Mr. McAuliffe, with the exception of the two matters referred to, Mr. McDonald was spoken of in the evidence as competent. His personal bravery was not questioned.

The Hon. Sydney Smith,
Secretary for Mines and Agriculture.

I have, &c.,
ALF. P. BACKHOUSE, D.C.J.

No. 28.

Order of Court cancelling Certificate of Daniel McAuliffe.

In the Court of Inquiry, Newcastle, New South Wales.

In the matter of the Inquiry under the Coal-mines Regulation Act, 1896, into the conduct of Daniel McAuliffe, manager of the Stockton Colliery.

WHEREAS representation having been made within the meaning of the 10th section of the Coal-mines Regulation Act, 1896, to the Secretary for Mines, that Daniel McAuliffe, manager of the Stockton Colliery, situate at Newcastle, in the said Colliery, holding a manager's certificate of service under the said Act, was, by reason of incompetency and gross negligence, unfit to discharge his duties as such manager as aforesaid, the Secretary for Mines directed an inquiry to be made into the conduct of the said Daniel McAuliffe as such manager, and did duly appoint me, Alfred Paxton Backhouse, one of the District Court Judges, to hold the said inquiry, and did direct the said inquiry to be held at the Court-house, at Newcastle on the 22nd day of March, and the said Secretary for Mines did before the commencement of the said inquiry furnish to the said Daniel McAuliffe, the said manager, a statement of the case on which the inquiry was instituted, and did appoint Ernest Henry Wilshire, a solicitor of the Supreme Court, to undertake the management of the case; and whereas the said inquiry was duly held by me as such Court as aforesaid, on the said 22nd, on the 23rd, 24th, and 25th days of March last past, and on the 3rd day of April

April instant at the place appointed ; and whereas the said Daniel McAuliffe attended the said inquiry and was represented by counsel thereat, and the said Daniel McAuliffe tendered himself as a witness, and was sworn and examined as an ordinary witness in the case : Now I, the said Alfred Paxton Backhouse, after hearing the evidence in support of the case and the evidence on behalf of the said manager, and under and by virtue of the powers conferred on me under the said Act, do hereby order that the manager's certificate of service, held by the said Daniel McAuliffe under the said Act, be and the same is hereby cancelled on the ground that the said Daniel McAuliffe is unfit to discharge his duty by reason of incompetency and gross negligence.

Dated, at Newcastle, this 3rd day of April, A.D. 1897.

ALF. P. BACKHOUSE, D.C.J.

No. 29.

Order of Court cancelling Certificate of William McDonald.

In the Court of Inquiry, Newcastle, New South Wales.

In the matter of the Inquiry under the Coal-mines Regulation Act, 1896, into the conduct of William McDonald, under-manager of the Stockton Colliery.

WHEREAS representation having been made within the meaning of the 10th section of the Coal-mines Regulation Act, 1896, to the Secretary for Mines, that William McDonald, under-manager of the Stockton Colliery, situate at Newcastle, in the said Colony, holding an under-manager's certificate of service under the said Act, was, by reason of incompetency and gross negligence, unfit to discharge his duties as such under-manager as aforesaid, the Secretary for Mines directed an inquiry to be made into the conduct of the said William McDonald as such under-manager, and did duly appoint me, Alfred Paxton Backhouse, one of the District Court Judges, to hold the said inquiry, and did direct that the said inquiry be held at the Court-house at Newcastle, on the 22nd day of March, and the said Secretary for Mines did, before the commencement of the said inquiry furnish to the said William McDonald, the said under-manager, a statement of the case on which the inquiry was instituted, and did appoint Ernest Henry Wilshire, a solicitor of the Supreme Court, to undertake the management of the case ; and whereas the said inquiry was duly held by me as such Court as aforesaid, on the said 22nd, on the 23rd, 24th, and 25th days of March last past, and on the 3rd day of April instant, at the place appointed, and whereas the said William McDonald attended the said inquiry and was represented by counsel thereat, and the said William McDonald tendered himself as a witness and was sworn and examined as an ordinary witness in the case : Now I, the said Alfred Paxton Backhouse, after hearing the evidence in support of the case and the evidence on behalf of the said under-manager, and under and by virtue of the powers conferred on me under the said Act, do hereby order that the under-manager's certificate of service held by the said William McDonald under the said Act be and the same is hereby cancelled, on the ground that the said William McDonald is unfit to discharge his duties by reason of incompetency and gross negligence.

Dated at Newcastle, this 3rd day of April, A.D. 1897.

ALF. P. BACKHOUSE, D.C.J.

No. 30.

Proceedings of Court of Inquiry and Evidence taken.

Proceedings of the Court, and Evidence taken at Newcastle, on the 22nd, 23rd, 24th, and 25th March, and at Sydney on the 3rd April, 1897.

His Honor Judge Backhouse constituted the Court.

MONDAY, 22nd MARCH, 1897.

[The Court sat in the Court-house, Church-street, Newcastle, at 2 p.m.]

Under His Honor's instructions, the Secretary to the Court, Mr. E. C. Wright, read the following warrants :—

Department of Mines, New South Wales.

Coal-mines Regulation Act, 1896, section 10.

I, SYDNEY SMITH, Secretary for Mines for the Colony of New South Wales, being of opinion that it is expedient that inquiry shall be made into the conduct of Daniel McAuliffe, the manager of the Stockton Colliery, who has been represented to me as being unfit to discharge his duties by reason of incompetency and gross negligence, do hereby, in virtue of the powers conferred on me by section 10 of the Coal-mines Regulation Act, 1896, direct such inquiry to be made, and I hereby direct Alfred Paxton Backhouse, Esquire, one of the District Judges, of the Metropolitan Suburban and Hunter District Court, to hold such inquiry, and I hereby appoint that the said inquiry shall be held at the Court-house at Newcastle, on Monday, the 22nd day of March instant, at 2 of the clock in the afternoon.

Dated this 16th day of March, 1897.

SYDNEY SMITH,
Secretary of Mines.

Department of Mines, New South Wales.

Coal-mines Regulation Act, 1896, section 10.

I, SYDNEY SMITH, Secretary for Mines for the Colony of New South Wales, being of opinion that it is expedient that inquiry shall be made into the conduct of William McDonald, the under-manager of the Stockton Colliery, who has been represented to me as being unfit to discharge his duties by reason of incompetency and gross negligence, do hereby, in virtue of the powers conferred on me by section 10 of the Coal-mines Regulation Act, 1896, direct such inquiry to be made, and I hereby direct Alfred Paxton Backhouse, Esquire, one of the District Judges of the Metropolitan Suburban and Hunter District Court, to hold such inquiry, and I hereby appoint that the said inquiry shall be held at the Court-house at Newcastle, on Monday, the 22nd day of March instant, at 2 of the clock in the afternoon.

Dated this 16th day of March, 1897.

SYDNEY SMITH,
Secretary for Mines.
The

The two cases were before the Court in the following terms :—

Inquiry under the Coal-mines Regulation Act, 1896, into the conduct of Daniel McAuliffe, manager of the Stockton Colliery.

Statement of the case on which the inquiry is instituted.

To Daniel McAuliffe, manager, Stockton Colliery.

TAKE notice that, representation having been made to the Minister for Mines that you, as manager of the above colliery, holding a certificate under the Coal-mines Regulation Act, 1896, are, by reason of incompetency and gross negligence, unfit to discharge your duties, the said Minister has directed an inquiry to be made into the conduct of you as such manager, and on the said inquiry the following acts, omissions, matters, and things will be relied upon to prove the charges against you :—

1. That you, as manager of the Stockton Colliery, allowed the stopping marked D on the plan, put in as evidence at the Court of Investigation lately held at Newcastle respecting the late Stockton Colliery accidents, to be removed, and did not replace the same, or make any provision to prevent the noxious gases in No. 3 district from escaping into the workings of the mine.
2. That you did not enforce, or cause to be enforced, the special rules of the colliery, and were lax in the discipline of the mine.
3. That you did not cause to be constantly produced an adequate amount of ventilation in the mine, to dilute and render harmless noxious gases, to such an extent that the working places of the shafts, levels, stables, and workings of the mine, and the travelling roads to and from those working places, were in a fit state for working and passing therein.
4. That you did not supervise and accompany the exploration party on the 3rd December last, under the unusual circumstances then existing.
5. That, after being notified by the Government Inspectors that "fire-stink" was in the No. 3 district, and gas generating therein, you allowed the exploration party to go into the said district against the air-current, thereby permitting a dangerous instead of a safe and practicable mode of entry into same to be adopted.
6. That you were ignorant of the nature and quality of the gases met with in coal-mines, particularly the gas known as carbon monoxide, or "fire-stink," and that you were unable to distinguish this gas from other and different gases.
7. That you were ignorant of the fact that a current of air passing over a gob-fire would cause a larger quantity of carbon monoxide gas and other noxious gases to generate.

16th March, 1897.

SYDNEY SMITH.

Inquiry under the Coal-mines Regulation Act, 1896, into the conduct of William McDonald, under-manager of the Stockton Colliery.

Statement of the case on which the inquiry is instituted.

To William McDonald, under-manager, Stockton Colliery.

TAKE notice that, representation having been made to the Minister for Mines that you, as under-manager of the above colliery, holding a certificate under the Coal-mines Regulation Act, 1896, are, by reason of incompetency and gross negligence, unfit to discharge your duties, the said Minister has directed an inquiry to be made into the conduct of you as such under-manager, and on the said inquiry the following acts, omissions, matters, and things will be relied upon to prove the charges against you :—

1. That you, as under-manager of the Stockton Colliery, allowed the stopping marked D on the plan, put in as evidence at the Court of Investigation lately held at Newcastle respecting the late Stockton Colliery accidents, to be removed, and did not replace the same, or make any provision to prevent the noxious gases in No. 3 district from escaping into the workings of the mine.
2. That you did not cause to be constantly produced an adequate amount of ventilation in the mine, to dilute and render harmless noxious gases, to such an extent that the working places of the shafts, levels, stables, and workings of the mine, and the travelling roads to and from those working places, were in a fit state for working and passing therein.
3. That you did not enforce, or cause to be enforced, the special rules of the colliery, and were lax in the discipline of the mine.
4. That, after being notified by the Government Inspectors that "fire-stink" was in the No. 3 district, and gas generating therein, you led the exploration party into the said district against the air-current, thereby adopting a dangerous instead of a safe and practicable mode of entry into same.
5. That you were ignorant of the nature and quality of the gases met with in coal mines, particularly the gas known as carbon monoxide, or "fire-stink," and that you were unable to distinguish this gas from other and different gases.
6. That you were ignorant of the fact that a current of air passing over a gob-fire would cause larger quantities of carbon monoxide gas and other noxious gases to generate.

16 March, 1897.

SYDNEY SMITH.

Constable A. F. Knight declared the Court open.

Mr. E. H. Wilshire, Prosecuting Officer, Crown Solicitor's Office, handed in the appended notices of appointment :—

Department of Mines, New South Wales.

Inquiry under the Coal-mines Regulation Act, 1896, into the conduct of Daniel McAuliffe, manager of the Stockton Colliery.

To Ernest Henry Wilshire, Esq.

I, SYDNEY SMITH, Secretary for Mines for the Colony of New South Wales, in pursuance of the powers vested in me under section 10 (sub-section 111) of the Coal-mines Regulation Act, 1896, do hereby appoint you to undertake the management of the case on which a certain inquiry is to be instituted into the conduct of Daniel McAuliffe, manager of the Stockton Colliery, in connection with certain fatal accidents which recently occurred in the said colliery.

Dated this 17th day of March, 1897.

SYDNEY SMITH, Secretary for Mines.

INQUIRY

INQUIRY under the Coal Mines Regulation Act, 1896, into the conduct of William McDonald, under-manager of the Stockton Colliery.

Department of Mines, Sydney.

To Ernest Henry Wilshire, Esq.

I, SYDNEY SMITH, Secretary for Mines for the Colony of New South Wales, in pursuance of the powers vested in me under section 10 (subsection III) of the Coal-mines Regulation Act, 1896, do hereby appoint you to undertake the management of the case on which a certain inquiry is to be instituted into the conduct of William McDonald, under-manager of the Stockton Colliery, in connection with certain fatal accidents which recently occurred in the said colliery.

Dated this 17th day of March, 1897.

SYDNEY SMITH,
Secretary for Mines.

Mr. F. E. Rogers, Q.C.—who was instructed by Mr. T. D. O'Sullivan, solicitor—appeared on behalf of Daniel McAuliffe and William McDonald, both of whom were present in Court.

His Honor said that, to comply with the Act, the certificates held by McAuliffe and McDonald should be handed in.

Mr. Rogers undertook that they should be handed in on the following (Tuesday) morning.

The order as to witnesses leaving the Court was made.

It was agreed by the parties—

- (1.) That the two cases should be taken together.
- (2.) That Mr. Wilshire may (if he think proper) put in the evidence already given by Mr. McAuliffe as evidence against Mr. McDonald; and the evidence already given by Mr. McDonald as evidence against Mr. McAuliffe.

Mr. Wilshire opened his cases by putting in a tracing showing some of the workings of the Stockton Colliery. The tracing was marked "Exhibit No. 1." With the assistance of the tracing, Mr. Wilshire explained various matters and proceedings at the mine having relation to the accidents which occurred there in the early part of December, 1896.

Having concluded the explanation, Mr. Wilshire proceeded to call witnesses, the first of whom was John Gould.

This deponent, *John Gould*, on his oath, states:—I am a bricklayer, working in the Stockton pit; I remember the 1st December last; I was in the pit about 9:45 p.m. on that date; I went there to help the furnace-men to unload the skips; I noticed a very bad smell there; it was like benzine; I noticed that near the furnace; the No. 3 furnace-door was open at the time; it was kept open; I was there about three-quarters of an hour; the smell was coming through the No. 3 door; it came from the No. 3 old workings; I could tell that from the current of air; a man named Smith was with me at the time; he was the furnace-man; I said something to him when I noticed the smell; I know Mr. Burt, who was night overman then; I spoke to him about the smell that night; I was affected by the smell; I was overcome by it; I first felt weak in the legs, and my head quite giddy; I could not walk well, and fell outside No. 3 door; I had never been affected like that before in any colliery; I was there running the skips in very frequently prior to that occasion; the skips were left between doors No. 2 and No. 3; I cannot exactly remember whether No. 3 door was open or not on my previous visits; on the previous occasion I was there it was left open while we got the skips through; it was not closed after the skips were put through; I cannot say whether it was or not; I cannot remember at all whether before the 1st December the No. 3 door was left open or not; the door had been left open on several occasions prior to that after the skips had gone through; it would be left open for forty-five minutes or an hour on those occasions; I had my lights with me on the occasion on the 1st December last; my lights went out; we carried naked lights and could not keep them alight; there was not a very strong draught there; it was not the movement of the air that put them out, but some other cause, in my opinion.

By Mr. Rogers: I have never been in any other colliery besides the Stockton in New South Wales; I have been in one other in Queensland for about six months; I attribute the extinction of the lights to the gas; I know that carbon monoxide will burn, and does burn with a blue flame round the lamp; I did not shut No. 3 door; I know it was absolutely against the regulations of the mine to leave the door open; I left it open because I was under the supervision of Mr. Smith, since deceased; he knew it was open; he was alongside me all the time; there was no other cause for my feeling groggy about the knees on that occasion on the 3rd December last; I was affected in the manner described for three or four hours, but was very bad for about twenty minutes; I was taking the skips to feed the furnace; I met Burt that day and complained to him; he said to me, "Never leave that door open"; before that he had constantly warned me not to leave that door open while I was filling the skips.

By His Honor: I was not intoxicated on the night I noticed the smell, and was affected by it; on the night Smith died, McDonald charged me with being drunk; Burt, Smith, Curran were present at the time; that was on the night I had given the warning; McDonald was standing at the skips with Burt, and said to Smith "You've been drinking last night," Smith looked astonished; as I had been with Smith the previous night I took it that McDonald included me in his remark; Smith said nothing in reply to him, nor did I; on the same night McDonald said to Stratton the watchman, referring to Smith, "send that man home if he comes here again intoxicated."

By Mr. Wilshire: I was never prosecuted for leaving these doors open.

By Mr. Rogers: I know the smell of benzine; it smells like kerosene; that is the sort of smell I smelt that night.

Taken and sworn at Newcastle, this 22nd }
day of March, 1897, before,— }

JOHN J. GOULD.

ALF. P. BACKHOUSE, D.C.J.

This deponent, *Henry Burt*, on his oath, states:—I am the night deputy overman at the Stockton Colliery; in the absence of the manager at night time I have full control of the colliery and the men working there; I visit the furnace, and go through the mine generally at night; I remember the witness Gould making a complaint to me on the night of the 1st December last; it was about 1 o'clock in the morning; I told McDonald about it the next morning about 6 o'clock; I told him Gould had complained to

to me about feeling a bit sick and giddy while at the furnace; Gould told me that he left the door open while running in the coal, and after shutting the door he had felt all right; McDonald gave me no instructions when I told him this; I cannot remember whether he said anything at all then; when Gould made the complaint to me I went straight to the furnace; the air was pure and the door shut; I went a short distance down the rope-road; I did not go as far as the point "D" on the plan; I smelt no peculiar smell at that time there; only on one occasion have I found No. 3 door left open; it was about two months before the accident; I know the leaving of the doors open is an offence against the Act; nobody was prosecuted for it; I did not report the matter as there was only one skip in at the time; there was a greater current of fresh air coming out when the door was open; it came up the main shaft; I did not notice any current of air coming up the rope-road; No. 3 door naturally swings to itself; the current of air shuts it; it takes a heavy pull to open it; I knew where the stopping was at the point "D" in the plan; it was removed about twelve months ago, I think; I cannot say who knocked out the stopping; I knew it was knocked out for the purpose of ventilating No. 3 district; the removal of that stopping would allow any gas that might be in the workings to come up to No. 3 door on the rope-road; that being removed, there was nothing to prevent the gas coming out; I first received notice of the deaths of Curran and Smith about 5:30 a.m. on the 2nd December last; Robert Jury told me about it; I went to the pit bottom and saw Mr. McDonald; we went straight to the furnace, and lit the fire; doors No. 2 and No. 3 were shut when we went in; I did not observe any smell then; after lighting the fire I went to the top; McDonald came with me; the bodies had been taken out of the mine then; no steps were taken to punish anyone for leaving the door open on the occasion that Gould complained to me, as far as I know; I have been working in Stockton mine about ten years; I know No. 3 district; it is about four years since any work has been done there, I think; that district was cleaned out on two occasions; I never knew any bad gas to be found in those workings on those occasions; so far as I know they were cleaned out on those occasions on account of the actions brought against the Company by Mr. Breckenridge; on the night of the 2nd instant I was in the mine; I was for two hours at the furnace that night, but did not go through the mine; I understood there was to be an exploring party that night, but received no intimation that I was to go with them; at half-past 9 I went down with McDonald, Jury, and others; I went to the furnace; McDonald said, "We are going in to explore No. 3 workings, to see what is to be found"; we were to go in in twos, about 10 yards apart; McDonald went to the furnace, came back, joined us, and we all went down the rope-road; the green line on the plan produced (*marked "Exhibit No. 1"*) shows the way we went; the air was coming against us as we went down; I know how the district was then being ventilated; the air was coming in at No. 20 bord; McDonald was leading, and had got as far as No. 16 bord; we had not discovered anything up to that to show where the gas was coming from; it took us about forty-five minutes to get to that point; when we got to that point McDonald called on us to go back, and told Benjamin Bailoy to take the lead, as he had chalked the route we had come; young Bailey then said, "Boys, I'm about done"; this was about No. 11 bord; he had hold of a prop; he felt faint, and asked for a bottle to have a drink; I then felt faint myself, and weak in the knees; I fell down, and rolled down a fall into the heading; I could not prevent myself rolling; up to that point I had felt all right, and had not noticed anything wrong with the air; I felt no effect in my head up to that; I got up and saw Jury ahead of me; he asked me could I see the chalk-line, and I said, "Yes," and that I would show him the way out; we went along, and when we were about half-way out, another of the party—John Ellis—passed us; William McAuliffe also got out; two of the men went to the surface, and I went to the furnace, where I found Mr. McAuliffe; I cannot recollect anything that happened till I got on top; our lights burnt brightly all the way in; they were bare lamps; when McDonald gave us the order to turn back I did not hear any fall, nor did I feel any concussion of air.

By Mr. Rogers: I did not see the bodies of Curran and Smith till they were in the office; I heard that Jury saw them first; No. 3 district was open for a good while before the stopping was put in after they had ceased to work that district; there was no stopping at the point "D" for twelve months after they had ceased to work that district; Gould told me he had left the door open while they were running the skips through; the door must be opened to run the skips through; it will close itself afterwards; Gould told me he had closed the door after the skips had gone through; I have been coal-mining over thirty years; I would caution a man for leaving the door open as Gould did, and then shutting it after the skips had gone through; I reprimanded Gould for doing what he did; I cannot remember whether I told McDonald I had reprimanded Gould or not; McDonald seemed to study a lot over what I had told him; the No. 3 district was inspected from time to time to see if any falls had taken place in it; I was in there myself about three or four weeks before the accident; I went in to where the green line on the plan joins the branch green line, and about as far as the branch green line goes; I believe we were taken in by McDonald on the occasion I have spoken of to see whether there were any "gob-fires"; I got as far as No. 14 bord; McDonald and Mr. Cockburn went first; they were more than 10 paces ahead of us when McDonald told us to turn back; he did not tell us why we were to turn back; Cockburn was with McDonald at the time he told us to turn back; we turned back at once; McAuliffe has been managing the mine for three or four years; McDonald had been under-manager for about three months before the accident; McAuliffe had been under-manager for a long time before he became manager; they were not working as miners in Stockton before they became under-managers; I worked with them in the Borehole mine before they went to Stockton; I consider Mr. McAuliffe understands his business; from my knowledge of McAuliffe, I consider him a good manager; I consider McDonald a good under-manager; on former occasions when inspections have been made of this mine, the inspectors themselves have gone down against the current; twice they went into these old workings; on one occasion I went with them, and they then went in the same way as we did on the night of the 2nd December last, and against the current; we were in the old No. 3 district about forty-five minutes on the night of the 3rd December; there was a very slight smell all the way in that night, but nothing to affect us; I did not take much notice of the smell going in; it was not such as to cause me any anxiety.

By Mr. Wilshire: It was a smell I had never noticed there before.

By Mr. Rogers: There was a good current of air as we went in—plenty air for us to breathe.

Taken and sworn at Newcastle, this 22nd }
day of March, 1897, before,—

HENRY BURT.

ALF. P. BACKHOUSE, D.C.J.

By consent, the depositions of William McDonald, taken at the first and second inquests, and his evidence before the Court of Investigation, were put in by Mr. Wilshire. The depositions taken at the first inquest were marked "Exhibit No. 2," and were read.

Inquiry adjourned till 10 a.m. to-morrow.

Newcastle, 22nd March, 1897.

ALF. P. BACKHOUSE, D.C.J.

TUESDAY, 23 MARCH, 1897.

Daniel McAuliffe's manager's certificate, and William McDonald's under-manager's certificate, were handed into the Court.

Evidence of William McDonald at second inquest read in Court. (Marked "Exhibit No. 3.")

Evidence of William McDonald at Court of Investigation, also read. (Marked "Exhibit No. 4.")

It is admitted by Mr. Rogers that the representation contemplated by section 10 has been made to the Secretary for Mines.

Evidence given by Robert James Jury at first inquest read, put in evidence, and marked "Exhibit No. 5."

Evidence given by Robert James Jury at second inquest read, put in evidence, and marked "Exhibit No. 6."

Evidence given by Robert James Jury at the Court of Investigation read, put in evidence, and marked "Exhibit No. 7."

All these depositions are put in evidence with the consent of Mr. Rogers.

This deponent, *Robert James Jury*, on his oath, states:—*To Mr. Rogers*: With George Coulson, I was the first to find the bodies of Curran and Smith; one body was sitting up with his head leaning against the prop; there was an ordinary bare lamp with him; it was Curran's body that was leaning against the prop; there was nothing but gas to have put out his lamp; the lamps of both men were out; I have worked under McAuliffe for about two years and nine months; he has always appeared to me to be a careful capable man; I have been coal-mining for twenty-six years, and have passed an examination as under-manager; from my experience of coal-mining and managers of mines, I am of opinion that McAuliffe is a careful capable manager; McDonald was under-manager for about eight months; I have the same opinion of him in his capacity of under-manager; he has always seemed a careful capable man; it was the proper thing to do to try and find out what was the cause of this gas coming out of the workings, and where it was coming from; the air had been kept going for thirty-six hours to purify that No. 3 district; under those circumstances I would not consider it improper to go in against the air current; I considered what we had to fear was black-damp; I consider that was what caused the deaths of Curran and Smith; I remember tests being applied at the furnace on the Wednesday night; we frequently tested the air to see if the district was being cleared. It extinguished our lights till towards the morning when it began to get clearer; when the exploration party went in as far as the action of the air on the lamps could guide us the air was perfectly clear; we got as far as No. 16 bord with the exploring party; I do not know for what reason McDonald gave the order to return; I was looking for heating in the coal; there is no flame with a gob-fire; it is a process of fermentation; it is combustion at a low temperature; at the time McDonald gave the order to turn back no fire had been located nor anything else ascertained to show the cause of the foul gas we were looking for; I was 8 or 10 yards from McDonald when he gave the order to turn back; Cockburn was with him at the time; I do not know of my own knowledge why the order to return was given; up to the time that order was given all the members of the party seemed satisfied with the ventilation and with the quality of air; I was satisfied myself, and I heard none of the party express any dissatisfaction with the air; there was a slight smell, but nothing to take notice of; I remember the inspectors going into the mine; they went in to assist in the rescue, and also to try and ascertain the cause of the accident; I believe the inspectors did not go further than No. 10 bord, which would be about 100 yards short of the distance I had gone; the bratticing was carried to about the point marked "X" on the plan; the air current was very poor through the brattice; I cannot say there were 3,000 feet of air coming in; I have heard that when they reached the point marked "X" they were only getting 3,000 feet of air; that would be a very weak current indeed; I cannot say how many men there were in the party, not having properly recovered myself, but I should say there were from twenty to thirty men in the party; I consider that quantity of air was very small for the number in the party; the further they went the more leakage of air there would be; there is always a great waste of air in the use of brattices.

By Mr. Wilshire: I did not examine the current lamp; it was out; I cannot say whether it had gone out through the exhaustion of the tallow in it; these lamps will burn from an hour and a half to two hours; Curran would have gone into the mine about 9:30 the previous evening; the miner carries a supply of tallow with him; I think McAuliffe has a good practical knowledge of the gases met with in coal-mines; I mean by that that he could devise a good system of ventilation of a mine, and could deal with the ordinary gases to be dealt with in a mine; at the time of the accident I did not believe the gas carbon monoxide was the cause of it; since then I have altered my opinion, and am ready to admit now that it was the cause; assuming that there was a gob-fire in the workings, it would depend upon the state in which the fire was as to whether the passage of air over the fire would increase the combustion; if the fire were in an incipient stage the air would dilute the gas; that would be the immediate effect of the air upon the fire; eventually it might increase the combustion; the divisional bratticing was only carried about 60 or 70 yards; I have heard there were 10,000 feet of air at that point and 3,000 feet at the point "X" on the plan; stopping up the bords would have increased the current; the current was returning at the back of the brattice, and getting out by the rope-road.

By Mr. Rogers: I do not mean that the 3,000 feet of air would return at the back of the brattice, but that it was too small a quantity for the number of men in the party.

By His Honor: I meant that 3,000 feet would go on and find its way out somewhere, but not that it would go back behind the bratticing.

ROBT. JAS. JURY.

Taken and sworn at Newcastle, this 23rd }
day of March, 1897, before,— }

ALF. P. BACKHOUSE, D.C.J.

Evidence of William Humble at second inquest read, put in evidence by consent of Mr. Rogers, and marked "Exhibit No. 8."

Evidence of William Humble at Court of Investigation read, put in evidence by consent of Mr. Rogers, and marked "Exhibit, No. 9."

Special rules of the colliery put in evidence and admitted by Mr. Rogers. Marked "Exhibit, No. 10."

This deponent, *William Humble*, on his oath, states:—McDonald became under-manager at the beginning of September or August, 1896; if it were considered advisable to replace the stopping it would be part of his duty to see that it was replaced; that would also apply to the manager; if the stopping were left there, and the door closed, the atmosphere in the old workings would be a stagnant one; I have said it was necessary to have that stopping made; had that stopping been made just after the inspection had been made, in my opinion no accident could have taken place; I believe the necessity of opening and shutting the door several times every day was likely to produce the gob-fire by causing an intermittent current of fresh air; assuming that the management did not consider the replacement of the stopping was necessary, they ought to have properly ventilated the old district.

By Mr. Rogers: I think that if that door had not been left open for an hour or an hour and a half at a stretch it would have answered all the purposes of the stopping; I have known McAuliffe seven years; putting aside this affair I consider he has given the mine fair attention; he has put down shafts that have been of great benefit to the mine; but putting down the last shaft I consider he has done something that no man in Australia has ever done; he has shown great skill in the putting down of shafts; I consider that in this matter he has done nothing more than commit a very grievous error of judgment; I consider he ought never to have allowed the exploring party to have gone into the mine, or ought to have led it himself; I do not consider the exploring party was necessary; I do not believe that he for a moment thought of evading any responsibility by not going in himself with the party; I do not consider he shirked his duty in not going under the circumstances; he has done a great deal of timbering in connection with the mine, and it has been very well done; both the timbering in the shafts and where the roof is coming down has been very well done; the boring in the mine that is necessary under their lease has been fairly well done; I know that McAuliffe did not lay out the first workings of the mine; apart from this lamentable accident I think that everything he has done has been well done.

By His Honor: I have been in this district seven years; I was here when the old district in the Stockton was being worked; I was here when the stopping was put in; I do not remember when the stopping was put in; they ceased working there in 1891; I think the stopping was put in soon after the work ceased there.

By Mr. Wilshire: It was not necessary for me to go down the old rope-road every time I inspected the mine.

By His Honor: I did not shortly after they ceased the work in the old district inspect the mine to see if the stopping had been put in; shortly after the stopping ought to have been put there I saw it had been put there.

By Mr. Rogers: I have entered the mine on two occasions against the current; I did not know when I did so, that the mine had been cleared by ventilation; I knew that the mine was fairly clear when I went in; there was no fire-stink there then; there were stoppings put on the bord ends; I know that the roof was coming down and broke these stoppings; that would not allow the escape of noxious gases, the tendency of the air being to pass into the workings, and not the gas to come out; one could not assume that the air that would pass through those broken stoppings would be efficient ventilation for the workings; I know the stopping at point "D"; the scalings of the air over the broken bord ends would reach the furnace by another route than the rope-road; I know that quite recently they have made good the stoppings at the bord ends, or rather, if they have been made good it has been quite recently; some of them were not good in December last.

WILLIAM HUMBLE.

ALF. P. BACKHOUSE, D.C.J.

Evidence of Mr. Dixon, Senior Inspector of Collieries, taken before the Court of Investigation, read, admitted in evidence by Mr. Rogers, and marked "Exhibit No. 11."

Court adjourned till 10 a.m. to-morrow.

Court-house, Newcastle, 23rd March, 1897.

ALF. P. BACKHOUSE, D.C.J.

WEDNESDAY, 24 MARCH, 1897.

This deponent, *John Dixon*, on his oath, states:—I am Chief Inspector of Collieries; where carbon monoxide is the product of gob-fire it is accompanied by this benzine-smell; that smell is caused by the benzine which comes out of the naphtha; that smell is not produced by an explosion of fire-damp; carbon monoxide is a very variable gas; it mainly depends upon what factors have taken part in causing the explosion; I have read Dr. Haldane's report of the causes of death in colliery explosions.

By Mr. Rogers: Carbon monoxide is a gas that is not frequently met with in this district; there would not be much opportunity of a manager who had gained his experience in this district obtaining much experience of this gas; I have gained my experience of this gas in eight collieries, seven of them in this district; I have been inspector in this district fifteen years; I was here when the Stockton Mine was first started; I know that neither the present nor the previous manager had anything to do with the opening of the mine; I have known McAuliffe thirty-five years; I have known him as a coal-miner, and in the various positions he has occupied in connection with mines; I have never had occasion to regard him as other than a careful man; the shaft he has lately sunk I look upon as the best bit of mining engineering that has been done in the colonies, if not anywhere in the world; it was a feat in shaft-sinking; I remember the occasion when the water broke into the pit; I can speak very highly of what he did on that occasion; I do not know a mining engineer that could have made a better job on that occasion than McAuliffe did; he has had to contend with great difficulties in this mine; a large quantity of timbering has had to be done in the mine; the timbering has been very skilfully done; it

is

it is the best timbered coal-mine in the Colony, and I have seen them all; the pure carbon monoxide has no smell, but when it is the product of a gob-fire it has this peculiar benzine-smell; I say it was a decided error of judgment for them to go in against the air-current on the occasion of the accident; I did not hear a fall in the mine on the 4th December last, but I heard one there on the 7th December last; I heard it in 20 bord, not far from the main road; Mr. Humble was with me, and heard it also; a fall of sufficient size in the mine would have the effect of sending forward a quantity of deleterious gas, if such gas were present in the mine; I have heard McDonald say that he heard a fall in the mine on the occasion of the exploration; I think it was quite probable that a fall occurred as he said; I do not know McDonald very well, and have had nothing to do with his work in the mine; I know of him by repute as under-manager in the night-shift; I have no personal knowledge of him; I have heard nothing against him; if he were an incompetent man, I should most likely have heard of it; I believe he has done his work in a competent manner; I have seen the work he has done in the night-shift.

By Mr. Wilshire: I have heard pretty well all the evidence given in the different inquiries in connection with this accident; I have heard the witnesses say that when they went into the mine on the exploring visit they smelt a gas; I should say that that indicated the presence of carbon monoxide in the mine at that time.

By His Honor: Carbon monoxide is produced wherever there is incomplete combustion, either above or below ground, and is produced in an ordinary coal fire.

By Mr. Rogers: My theory at first was that there was a fire in the mine; McDonald seemed to doubt my opinion in the matter; I say they committed an error of judgment in going in against that air-current; they always regarded the gas as black-damp.

By His Honor: There is no benzine-smell in carbonic acid.

Taken and sworn at Newcastle, this 24th }
day of March, 1897, before,— }

JOHN DIXON.

ALF. P. BACKHOUSE, D.C.J.

This deponent, *Jefferson William Hester*, on his oath, states:—I am a legally qualified medical practitioner, residing at Stockton; on the 3rd December last I received certain information, in consequence of which I went to the Stockton pit, arriving there a few minutes past 11 o'clock; when I arrived at the trap-door I found the two McDonalds being brought out; I saw some others who were unconscious and others who were dead; I attended to those who required my attention, and on the following day examined the bodies of eight men; I made a *post-mortem* examination of the body of one of them—Fitzpatrick. The cause of death in his case was undoubtedly poisoning by carbon monoxide; I thought at the time, and still think, that there was 3 per cent. of the gas in the mine at the time; I think that in such an atmosphere a man would become helpless, and shortly after unconscious, in from fifteen to twenty minutes; from 40 to 50 per cent. of this gas must be absorbed into the blood to produce helplessness; the earliest effects would be giddiness, palpitation, mental confusion, weakness in the legs—general weakness, but chiefly in the legs; a man would probably feel the earlier symptoms in such an atmosphere in about five minutes; I also made a *post-mortem* examination of the bodies of Curran and Smith, who were killed the day previous to this; it was on the afternoon of the 2nd December last that I examined the body of Curran; in my opinion his death was caused by carbonic acid.

By His Honor: There are very marked differences in the symptoms of death caused by carbonic acid and death caused by carbonic monoxide; if death resulted from a mixture of both the gas predominant in the cause of death would bring about the symptoms showing the cause of death.

By Mr. Wilshire: A death from a very large dose of carbonic acid would be a quiet one; carbon monoxide of 3 per cent. strength would cause a perfectly calm death in about thirty-five minutes—a painless death.

By His Honor: In poisoning by carbonic acid the most marked symptom would be the engorgement of the whole blood system with very dark, venous blood; in poisoning by carbon monoxide the blood is of a bright, scarlet colour; that bright, scarlet colour is not met with in any other form of death, but is typical of death by carbonic monoxide.

By Mr. Rogers: Judging from my *post-mortem* I have no doubt that Curran died from carbonic-acid poisoning, and Fitzpatrick from poisoning by carbon monoxide; I know the Stockton Mine, and have been down it several times; given a gob-fire, with a large current of air passing over it, the increase of the current of air would not necessarily produce a large product of carbon monoxide, but would increase the production of carbon dioxide, or black-damp; I am of opinion that the amount of carbon monoxide that was in the mine when the exploration party went in could not possibly have been the same as was present when the rescuing party went in; I should say from the results that the gas must have come down on the party suddenly; from the fact of the exploration party having been in the mine for forty-five minutes, without feeling any ill-effects, and then to feel suddenly ill, I should say that there had been a sudden liberation of gas, and of a greater strength than 3 per cent.; I think, from the fact of their being in the mine for forty-five minutes, and feeling no ill-effects; then, hearing a fall, they suddenly felt the ill-effects, there would have been no danger but for the fall; there would have been no danger but for some unexpected occurrence such as a fall; the gas given off by a gob-fire with a fairly strong current of air passing over would be carbonic acid; this gas would indicate its presence by putting out the lights long before it would be injurious to the men; I saw the effects of the carbon monoxide on the men as they were brought out of the mine through the trap-door; that is, I saw them before they were taken into pure air; I saw the rescue party go in and saw them come out; from what I saw then I should say the condition of the atmosphere of the mine must have been absolutely different from the time when the men stayed in it for forty-five minutes without feeling any ill-effects.

By Mr. Wilshire: Carbon monoxide is a product of a gob-fire; it is not one of the ordinary gases of the mine; it must have been produced from some outside cause; I cannot say that there was carbon monoxide in the mine when the men first went into it, but I think it improbable that there was more than 1 per cent. there when the exploring party went in, as the effect of the gas is a gradual one; before they felt the effects of it the blood must have been absorbing it; the exact effect of a very small quantity of carbon monoxide is a matter of discussion by the authorities; there is a great difference of opinion between them; Dr. Haldane says that death would ensue in an hour and seven and a half minutes in an atmosphere of 2 per cent. of carbon monoxide.

By Mr. Rogers: I know the benzine-smell; I do not think it can accompany carbonic acid; wherever you get that smell there must be some carbon monoxide, even though it be an infinitesimal quantity; from the manner in which the bodies of Curran and Smith were found lying, and the fact of their lights being out, there was no doubt in my mind that the miners would conclude their deaths were caused by black-damp; I had given my evidence as to the cause of their deaths on the morning of the 3rd December last, and the exploring party did not go in till the night of the 3rd December; if there is combustion of carbon with oxygen the product that is always formed is carbon dioxide under ordinary circumstances; carbon dioxide is the staple product, and will always be formed if it gets the oxygen.

By Mr. Wilshire: The cause of death in the cases of the seven men besides Fitzpatrick was carbon monoxide.

J. W. HESTER.

Taken and sworn at Newcastle, this 24th }
day of March, 1897, before,—

ALF. P. BACKHOUSE, D.C.J.

The evidence given by Daniel McAuliffe at the second inquest and at the Court of Investigation read, admitted in evidence by Mr. Rogers, and marked "Exhibit No. 12" and "Exhibit No. 13" respectively.

Mr. Wilshire here closes his cases.

Newcastle, 24th March, 1897.

ALF. P. BACKHOUSE, D.C.J.

Mr. Rogers opened his cases by calling Mr. Richard Thomas as a witness.

This deponent, *Richard Thomas*, on his oath states:—I am manager of Messrs. Brown's colliery at Minmi; I have been manager of a mine for twenty-two years, and assistant manager for five years; I have been manager of a coal-mine in South Wales, and for ten or eleven years in this district. I was formerly manager of the Stockton Mine for three years; when I took charge of the mine the mine had been opened out; I have visited the mine on several occasions since my retirement from the management of it; I know that when the crush came on the No. 2 headings, the stoppings were crushed, and there was a leakage of air there; this was caused by the crushing of the roof on to the stoppings, which were crushed out; when a falling roof settles itself, it goes no further; it is impossible to say at what time a roof would settle itself; the roof had not completely settled in my time; I do not know that the stoppings have all been mended up; I know the "D" stopping in the mine; I do not know why it was put there; if the stoppings were crushed and imperfect, the intake air would take the shortest course to get out: the best way to get a full current would be to prevent all leakages along the road; while the crush was settling we would be patching from time to time. Any air that leaked through the bords would get into the road and through the place where the "D" stopping is if that stopping were not there; it was a wise thing to put in that stopping to prevent the leakage; I know the No. 3 district of the Stockton; it was worked out while I was there pretty well; it had been started when I went there, but work had not gone far; I know where No. 3 door is in the mine; if that were kept shut it would practically cause a stopping; during the time I was at the Stockton Mine I never met with carbon monoxide there; it is a very rare gas in any mine; a manager would have practically no experience of it; all he would know of it would be from his reading; I have no knowledge of any fatality from this gas; I went through No. 3 district in December, 1895, and in July, 1896; Mr. Humble was with me and a colliery official the first time, but no manager, I think; in July we had a number of managers with us; on each of these occasions we entered the mine by the trap-door (marked "Z" on the plan); we went against the current on each occasion; our object in going in on each occasion was to notice the state of the mine with regard to a claim for damages against it through a subsidence; falls were very frequent in No. 3 district; there was a very large fall at No. 11 bord extending about 50 yards; the country about No. 11 has been very subject to falls; on each occasion that I went in we had to crawl along on our hands and knees—almost to drag ourselves on our faces; from what I know of the country there, I should say it was quite likely that the exploration party on the 3rd December last heard a fall; the fact that up to that time the party had not felt any ill effects and then felt such effects would tend to show that some bad gas had been liberated by the fall; I have known McAuliffe between ten and eleven years, during which time he has been under my observation; he was the overman under me when I had charge of Stockton; I considered him a good, capable, careful, practical man; I have had good proofs of his courage also; if any danger was to be encountered he was the first to meet it; he has sunk the most difficult shaft that I know of anywhere; the timbering in the mine is also excellent.

By Mr. Wilshire: I have had some experience of gob-stink; I have detected the strange benzine-smell accompanying it on one occasion; on that occasion it affected the men; I have looked into the thing closely, and cannot find a genuine gob-fire in the Colony; in the Stockton Mine the gob-stink must have arisen from a fire caused by spontaneous combustion; I should look for other symptoms of the gas besides the peculiar smell before I made up my mind that it was carbon monoxide in the mine; smelling the peculiar smell, and seeing that it did not extinguish the lights, I should say it was carbon monoxide; as a practical miner I would not have put in the stopping at "D" as I am a great believer in not imprisoning gas in a mine; I should say the mine was safer with that stopping knocked out, and other means taken to take the gas out, and the mine kept safe by ventilation; I believe if that stopping had been in, the deaths of Curran and Smith would not have taken place; when I went into the mine there was no carbon monoxide in the mine; if there had been, I would not have gone in against the air-current.

By Mr. Rogers: If No. 3 door had been kept shut, Curran and Smith would not have met their deaths; There were other abandoned workings in the mine besides No. 3, and they were periodically visited in my time.

By Mr. Wilshire: In my opinion the stopping at "D" was put in to prevent leakages; the No. 3 door would have prevented the leakages, but not so effectually.

Taken and sworn at Newcastle, this 24th }
day of March, 1897, before,—

ALF. P. BACKHOUSE, D.C.J.

RICHD. THOMAS.

This deponent, *John Ellis*, on his oath states:—I was trolly-weighman at the Stockton Mine; I remember the fact of the deaths of Smith and Curran; I was down the pit on the morning of their death; I was at the furnace; I picked up Smith's lamp; it was an oil lamp; there was plenty of oil in it; I was one of the exploring party; before they went down I was aware that it had been reported that the mine had been well cleared; I believe they had been clearing it for about thirty hours; I was about 50 yards behind McDonald and Cockburn going in, and I was third or fourth from the last; I did not hear any order to retreat given by McDonald or anyone else, but saw the men ahead of me turn to leave the mine; just before that I had felt a concussion of the air; I felt a rush of air towards us; up to that time no one had complained, and there had been plenty of air, good air; I did not hear anything when I felt the concussion; after we began to retreat I began to feel bad; I saw Cockburn was ill and assisted him; he had one arm round me, and he dragged himself as well as he could, and I dragged him that way for about 30 yards; I was fatigued from assisting him; up to the time the retreat began, I had no fear of anything; I have known McAuliffe about ten years; I always thought him a competent, cautious man, and very clever as a manager; I always thought McDonald a competent and good man; we were in the mine nearly an hour on the exploration trip.

By Mr. Wilshire: I did not know what fire-stink was; there was a slight benzine-smell on going in; it was new in that portion of the mine; I cannot remember the stopping at "D" being put up nor knocked down; for two years after the district had been worked out there was no stopping there at all; about a minute elapsed from the time I felt the concussion till young Bailey became bad; I do not remember any remark being made about the peculiar smell when we first went into it.

By Mr. Rogers: I was down when they began to ventilate; there was a smell then; when we went down after the thirty hours' ventilation there was a smell of the same kind, but not nearly so strong.

Taken and sworn at Newcastle, this 24th }
day of March, 1897, before,— }

JOHN ELLIS.

ALF. P. BACKHOUSE, D.C.J.

This deponent, *Daniel McAuliffe*, on his oath, states:—I am the manager of the Stockton Mine; I had nothing to do with the laying out of the mine; I took it over from Mr. Jonathan Dixon, the former manager; No. 3 district was abandoned shortly after I took over the management—a few months after; no stopping was put at "D" for two years after; it was put up there because we found it impossible to maintain our air-current to the back of the mine, in consequence of the breakages of the stoppings on the main route by crushing; the stopping at "D" was put up while we repaired the breakages; the "D" stopping remained in about three years, and was taken out in December, 1895; when it was taken out, the other stoppings at the ends of the bords had been repaired and made right; we had to examine the No. 3 district on account of an action against the company, and we found black-damp in that country on our examination; the stopping at No. 20 bord was knocked out for the purpose of clearing the district of the black-damp; after we had finished the examination, we still left the stopping out; that was because the necessity for it ceased, the district being in the same state as before we had put it in; No. 3 door was put in to check the scaling going up the rope-road; No. 3 door if kept shut would have the effect of preventing any noxious gases from coming up from No. 3 district; I never prosecuted anyone for leaving No. 3 door open; I never knew it had been left open by anyone; all the officers of the mine as well as the Government inspectors make periodical inspections of all abandoned workings in the mine. McDonald and Burt had been in No. 3 three weeks or a month prior to the date of the accident; I had been in either in August or September last; on that occasion I noticed no bad gases; neither Burt nor McDonald reported the presence of any gases to me on their last visit; I remember the accident by which Smith and Curran lost their lives; as soon as I heard of it, I sent messengers direct to Mr. Humble, before 5 o'clock in the morning; the bodies had been found about half-past 4 in the morning; Mr. Humble came first, and we went down the mine; before the exploring party went in McDonald, Cockburn, Bailey, and I, discussed the best way of going in; we thought that we would arrive at the probable seat of trouble in two or three hours; I mean we would be able to go in in two or three hours, and find the seat of the trouble; we came to the conclusion that it would be dangerous to go in by 20 bord, on account of the broken ground as it might fall and crush us or block us in; we abandoned the idea of going in by No. 20 bord, and some one suggested going in by the trap-door; someone also suggested the opening of No. 2 door and No. 1 door, and thus allow the air to flow down that way; Cockburn mentioned the possibility of flowing the air down over the overcast, but we concluded that was impossible because the overcast had been blocked up by falls; we also found that No. 17 bord was not available on the same ground; we discussed three or four methods of going in and eventually decided to go in in the way McDonald did go; at the time the men went into the mine I knew Dr. Hester had given his evidence on the bodies of Smith and Curran, and I also knew that he had given the cause of their deaths as black-damp; I also knew that when the bodies were found, all their lamps were out; I was satisfied there had been a big percentage of black-damp in the air, but with a smell; then, before the exploring party went in, I satisfied myself from the reports made to me that the district was clear; I also went to the furnace and made further inquiry, and found it was still all clear; I know the point to which the exploring party reached; I did not refuse to turn the current of air on account of the difficulty there would have been in getting the horses out; knowing the distance I had to go, I could not have carried sufficient air with me to have turned the current; it would have been possible to have sent the air the other way, but it would have stopped our pumps, and also sent the air over the furnace-men if we had done so; that would have been fatal to the men at furnace, in the same way as it had been to Smith and Curran; I did what I believed to be the very best thing under the circumstances; the matter was discussed by us all, and discussed anxiously; there were from 30,000 to 40,000 feet of air at the trap-door when the inspectors went in; according to them, they lost about 27,000 feet in going about half the distance I did; I have had about thirty-five years' experience of mining; I had never experienced the same smell before that night as I noticed then; I have not been in any coal-mine in which there has been a gob-fire.

By Mr. Wilshire: The stopping at "D" relieved No. 3 door altogether; I cannot say who ordered the stopping to be knocked down; I believe McDonald knocked it down; I think he was wrong in stating he knocked it down in August, 1896. The district could have been cleared by opening the door of the stopping, but that would have taken a much longer time; I knew black-damp was in the district before the stopping was knocked down; it was quite possible for it to be there after the stopping had

had been knocked down ; it could not have got to No. 3 door unless it were left open ; I did not make any provision for ventilating the district after the stopping had been taken down ; I did not know that noxious gas was being generated to any dangerous extent ; the idea of going in by No. 20 bord was discussed by us seriously ; I cannot remember McDonald reporting to me that No. 3 door had been left open ; I heard that Gould had been sick ; I deemed the opinion of the inspectors worth consideration, but I had never come across fire-stink ; even after their expression of opinion I thought the cause of the trouble was black-damp ; in our discussions about the best way to go in, we gave full weight to the opinion of the inspectors ; I know that during the day Cockburn and McDonald travelled about 470 yards into the district and the same distance back without any inconvenience ; the inspectors had none of the air coming down No. 3 shaft ; I am quite satisfied that the inspectors had from 30,000 or 40,000 feet at the trap-door ; the shortening of the air-course would increase the current about 100 per cent. at that particular place ; I did not give the go-by to the fire-stink after hearing Dr. Hester's opinion as to the cause of the death of Curran and Smith ; I reckoned with the fire-stink in all my discussions and in everything I did ; I could not have forced the air up without its crossing the pump-line.

Taken and sworn at Newcastle, this 24th }
day of March, 1897, before,—

D. McAULIFFE.

ALF. P. BACKHOUSE, D.C.J.

This deponent, *William McDonald*, on his oath, states :—I have heard the explanation given by McAuliffe as to the stopping at "D" ; that is correct ; before the death of Smith and Curran I had been in No. 3 district ; that was about three weeks before their death ; I went in by myself ; I noticed nothing wrong in the district then ; I first saw Smith and Curran about a quarter-past 4 in the morning ; they were dead then ; they were at No. 1 door then, having been brought out ; their deaths were reported to the inspector at once ; I knew of the evidence given by Dr. Hester ; I believed they died from black-damp ; after their death I believed there was black-damp in No. 3 district ; up to the time I heard the noise of what I took to be a fall there had been nothing to show the presence of a noxious gas in the workings ; I had been into the district with Cockburn about noon on the 3rd instant ; I went in about 500 yards, and felt no ill-effects then ; we were in for about half an hour.

By Mr. Wilshire : I went to about the point "C" on the plan on the 3rd December at noon with Cockburn ; I have not given that evidence before ; I knocked down the stopping at "D" ; I cannot fix the date when that was done ; I am almost certain it was out the first time the No. 3 district was cleared out ; Mr. Jonathan Dixon knocked part of it down ; there was not a big enough area by opening the door in the stopping ; Smith and Curran would have been all right if the door had been kept shut ; the fact of the door having been left open was reported to me on the morning of the 1st December ; notwithstanding the expression of opinion by Messrs. Dixon and Humble that there was fire-stink in the mine, I thought Smith and Curran had been killed by black-damp ; I still think so ; I have smelt gob-fire in Scotland ; it had a more sulphury smell ; I know that gob-fire gave off a very dangerous gas know as fire-stink ; I did not know that it was always accompanied by this peculiar benzine-smell ; I have to admit that the exploring party were killed by fire-stink ; heat will give off this gas without a fire ; to my mind, a fire, to be a fire, must have red coals in it ; there was a very faint benzine-smell when the exploring party went in ; the warning of the inspectors troubled me a good deal ; I gave it plenty weight ; I considered there was a necessity to get into the district quickly ; I was chiefly testing for black-damp on the night of the 3rd December last.

Taken and sworn at Newcastle, this 24th }
day of March, 1897, before,—

WILLIAM McDONALD.

ALF. P. BACKHOUSE, D.C.J.

Inquiry adjourned till 10 a.m., to-morrow.

Newcastle, 24th March, 1897.

ALF. P. BACKHOUSE, D.C.J.

THURSDAY, 25 MARCH, 1897.

This deponent, *Daniel McAuliffe*, recalled on his former oath, states :—In discussing the point of reversing the air-current and sending it along 20 bord, we thought it might interfere with the men attending the suction-pumps ; that could have been avoided by sending the men down No. 3 shaft ; I did not think of that at the time, but have since seen it could be done ; I did what I considered best to try and discover the seat of the trouble ; I was influenced by what I knew of the fire in the Seaham Colliery, which had burnt for months ; I wanted to get at the fire and confine it to as small a space as possible ; it never struck me that we could send the men down the No. 3 shaft ; whatever had to be done had to be done quickly.

Taken and sworn at Newcastle, this 25th }
day of March, 1897, before,—

D. McAULIFFE.

ALF. P. BACKHOUSE, D.C.J.

This deponent, *Jefferson William Hester*, recalled on his former oath, states :—I consider there must have been considerably under '1 per cent. of carbon monoxide in the mine when the exploring party went in ; in my opinion, with an atmosphere of '1 per cent. of carbon monoxide helplessness would result in half an hour ; I have formed this opinion after consulting authorities yesterday ; I know the point the exploring party reached and the time they were in the mine, I should say it was quite impossible for '1 per cent. of the monoxide to have been in the atmosphere ; the party went about 1,200 yards altogether in the atmosphere, that is, going and coming ; four of the men were in that atmosphere while they travelled that distance, about three-quarters of an hour ; I know myself that some of the rescue party were overcome in from ten to twenty minutes ; from the facts of the case there must have been a new state of things after the exploring party had gone into the mine ; I am as certain as I can be that some sudden change must have taken place in the atmosphere ; if there was 1 per cent. carbon monoxide in the atmosphere the men would have been knocked over in two or three minutes ; a sudden liberation of such a gas would affect them quickly.

By

By Mr. Wilshire: I should say it was extremely probable that there was 1 per cent of the monoxide where young Bailey was taken bad, as days after 3 per cent. was found at a very distant part of the mine from there; I think it is extremely probable that the fall, if any took place, released a large quantity of the gas suddenly; I am perfectly certain that a body of gas which was not in action was suddenly set in action by a fall, or some other cause; I considered that fifteen minutes was quite long enough for any of the rescue party to be in; I doubt if any of them were in longer at a time.

By His Honor: I cannot say that it was impossible for carbon monoxide to have taken part in the death of Curran, but I saw no signs of its presence; the two gases—the monoxide and the di-oxide—do act together; in giving my opinion yesterday as to the carbon monoxide, I misread Haldane's report which was given to me in the witness-box.

W. McAULIFFE.

Mr. Rogers here closes his cases.

It is admitted that the stopping at "D" was removed in June, 1896, by Mr. Dixon, the late manager. Newcastle, 25th March, 1897.

ALF. P. BACKHOUSE, D.C.J.

EVIDENCE in Reply.

This deponent, *William Humble*, recalled, on his former oath, states:—I heard it stated yesterday that we were getting from 30,000 to 40,000 feet of air at the trap-door; I say, as I said before the Coroner's Court, that we had from 10,000 to 12,000 feet; the 3,000 feet we were getting at the end of the brattice was quite sufficient for us; I have been overcome three times by carbon monoxide, and have met it six times; on all those occasions the peculiar benzine-smell was present; I was in the gas for twenty minutes at Thornleigh before it affected me; my legs went from under me suddenly; we took our samples of the gas in a stagnant atmosphere—a place where we could never get the current to reach.

By Mr. Rogers: I got a good dose of the gas in England: still, I went into the same gas at Thornleigh; it was my duty to do so; we had to find out the cause of explosive gas; on each occasion my head was first affected, then my legs became weak; upwards of 1 per cent. of the monoxide would knock a man over suddenly.

day of March, 1897, before,—

ALF. P. BACKHOUSE, D.C.J.

WILLIAM HUMBLE.

Mr. Rogers then addressed the Court, and was followed by Mr. Wilshire.

His Honor summed up, and concluded by saying that he considered it to be his duty to cancel the certificates on the grounds that Mr. McAuliffe and Mr. McDonald were unfit to discharge their duties, by reason of incompetency and gross negligence.

Formal orders were drawn up, and received his Honor's signature.

The Court was then formally adjourned till 2 p.m. on Saturday, the 3rd April.

His Honor had no intention of sitting again; but had some doubt as to the sufficiency of the formal orders which had been drawn up. Consequently—having no authorities at Newcastle to consult—His Honor decided to adjourn the Court till the day already named.

ALF. P. BACKHOUSE, D.C.J.

SATURDAY, 3 APRIL, 1897.

By consent, the Court sat in the District Court-house, King-street, Sydney, at noon.

Mr. Wilshire submitted amplified Orders of Court, showing the cancellation of Daniel McAuliffe's manager's certificate, and William McDonald's under-manager's certificate. These orders were presented to be substituted for those issued on Thursday, the 25th March.

The amplified orders were duly signed by His Honor Judge Backhouse.

The Court, at 12:10 p.m., adjourned *sine die*.

ALF. P. BACKHOUSE, D.C.J.

PART VII.

Minute by the Honorable Minister for Mines on Removal of Stopping in Rope-road, Stockton Colliery, and Reports by Colliery Inspectors; also, Minute by the Honorable Minister for Mines on Abandoned Districts in Coal-mines, and Report by Mr. Inspector Dixon.

No. 1.

Minute by The Minister for Mines and Agriculture.

Subject:—Stockton Colliery Accidents.

Department of Mines, Sydney, 11 March, 1897.

THE Court of Investigation, in their conclusions, state that it is unfortunate the removal of the stopping in the rope-road was not discovered by the inspectors before the accident happened; and although the Court absolves the inspectors from blame, stating that the failure to discover this danger does not imply any want of care on their part, I consider it is a matter which deserves some further inquiry at the hands of the Department, and the inspectors should be called upon for an explanation why they did not discover this stopping had been removed.

S. SMITH.

No. 2.

The Under Secretary for Mines and Agriculture to Mr. Inspector Dixon.

Sir,

Department of Mines, Sydney, 11 March, 1897.

I am directed by the Minister to inform you that the Court of Investigation appointed to inquire into the accidents at the Stockton Colliery, state, among other conclusions arrived at by them, as to the cause and circumstances surrounding the accidents which happened on the 2nd, 3rd, and 4th December last, that it is very unfortunate that the removal of the stopping in the rope-road was not discovered by the inspectors before the accident happened, as they would presumably have called attention to its absence as a defect to be remedied. I am, therefore, to ask that you will furnish him with a report as to why the removal of this stopping was not discovered when making the ordinary inspections of the mine prior to the date of the accident.

I have, &c.,

D. C. McLACHLAN,

Under Secretary.

No. 3.

Mr. Inspector Dixon to The Under Secretary for Mines and Agriculture.

REPORT on Stopping in Rope-road between No. 3 abandoned district, and furnace in the Stockton Colliery.

Sir,

Coal-fields Office, Newcastle, 15 March, 1897.

I have the honor to acknowledge receipt of your communication marked "M," under date 11th instant, in which my attention is drawn to a portion of the report furnished to the Minister by the Court of Investigation appointed to inquire into the accidents at the Stockton Colliery, said Court being of opinion "that it is very unfortunate that the removal of the stopping in the rope-road was not discovered by the inspectors before the accident happened, as they would presumably have called attention to its absence as a defect to be remedied."

2. In reporting on this matter, I may be allowed to state that my last visit to the Stockton Mine prior to the time of the accident, was on 5th December, 1895. It has been stated in evidence that the stopping alluded to on the rope-road was taken out during the latter part of August last, and from that time to the time of the accident two inspections of the Stockton Colliery were made by Mr. Inspector Humble—one in October and the other in November last.

3. On the 1st October, 1896, the new Coal Mines Regulation Act came into force, and by certain provisions therein contained, considerable changes were required in the matter of ventilating the face of each working place, making additional refuge holes on the travelling roads, and in sundry other details; therefore the two inspections referred to were wholly directed to these matters, in order that the workmen might, above all other things, get the benefit of having the current of air conveyed to the working face as soon as possible.

4. Under ordinary circumstances, the road-ways and air-ways near to and in the vicinity of an underground furnace undergo no material change from year's end to year's end, differing in this respect from the face workings which are continually changing as the workings advance; and as the inspector was totally unaware that the rope-road stopping had been taken out, and not replaced, he would naturally conclude that the furnace and its surroundings would be in the same state as when he last saw them, and as a consequence would devote his attention to the inner workings, where the most important work in the shape of alterations was being carried on.

5. The site of this displaced stopping is at the entrance to a totally abandoned district, and entirely separate from any ordinary road along which persons usually travel; and therefore the removal of the stopping could not have been discovered unless the inspector had gone into or come out of this abandoned district along this road to the furnace.

6. In conclusion, I beg to point out, that owing to the peculiar situation of the Stockton Colliery furnace, in what is known as the upper portion of the seam, and the fact that it can be approached in three different directions without travelling on the rope-road, an inspector might at any time, when in the mine, visit the furnace and its surroundings without passing down the rope-road in the direction of the No. 3 abandoned workings; and in my opinion, the thought might never occur to him to pass along said road, when he believed the said district to be totally isolated from furnace influence by a brick stopping.

I have, &c.,

JOHN DIXON,

Inspector of Collieries.

The Minister wishes also to have Mr. Humble's report on this matter.—D. McL., 17/3/97. Report herewith.—W.H., 20/3/97. The Under Secretary for Mines and Agriculture.

I submit that I fail to see why I should be brought into this matter. My last inspection of the Stockton Colliery, prior to the accident, was on the 7th and 8th January, 1895, and on the 23rd September, 1895, I inspected the third shaft and openings only. On 5th December, 1895, was in the No. 3 district to see some fallen ground, as I had to give evidence before a Court on the matter. The stopping on the rope-road was at the time intact, and I was not again at the Stockton Colliery until the accident happened to Curran and Smith, in December, 1896.—J. Dixon, 13/4/97. The Under Secretary for Mines and Agriculture.

No. 4.

Mr. Inspector Humble to The Under Secretary for Mines and Agriculture.

Report on Stopping in Rope-road between No. 3, abandoned district, and furnace in the Stockton Colliery.

Sir,

Coal-fields Office, Newcastle, 20 March, 1897.

In accordance with your minute on Mr. Dixon's report, under date 15th March, instant (No. 5,845), I have the honor to report as follows:—

As stated in that report, there were two inspections made of this colliery by me between August last, when this stopping is alleged to have been removed, and the time of the accidents, viz., in October and November. As the new Act had just come into operation, and as the working places and roadways leading thereto are extensive and widely scattered, many of them being under the Pacific Ocean, I devoted the whole of the time to seeing that the men got the benefit of having the current of air at the face, and that the refuge holes were made on both engine-planes and horse-roads to meet the requirements of the Act.

These duties required that each roadway should be travelled and the face of each working place visited, in order to ascertain if the Act had been complied with in the matter of ventilation. Many things peculiar to the working of a delta colliery, such as an abundance of timber in all bords, whether working or abandoned, in the respective working districts; the matter of bore-holes in the roof, and advance headings to ascertain the nature and thickness of the strata forming the roof; and the character of the coal,—were matters which required my undivided attention during these two inspections; and therefore I did not visit the furnace and its surroundings, situated as they are in the upper seam, quite distinct and separate from any working place or travelling road.

I was totally unaware, until after the accident to Curran and Smith, that this stopping had been remove.

I have, &c.,

WILLIAM HUMBLE,

Inspector of Collieries.

Submitted.—H.B.S., 22/3/97. The Under Secretary. Submitted.—D. McL., 24/3/97.

Since these reports were submitted the Court, presided over by Judge Backhouse, has sent in its report, in which it is stated the stopping in the rope-road was removed in June last, and not in August, as previously assumed. It would seem, therefore, that the introduction of the new Coal Mines Act could not have been engaging the inspectors' attention at that time, and a further report from them upon this matter seems desirable.—D. C. McLACHLAN, 9/4/97.

Approved.—S. SMITH, 9/4/97. Mr. Inspector Dixon, who will please inform Mr. Inspector Humble.—H.B.S., 10/4/97. B.C. For the information of Mr. Inspector Humble.—J. Dixon, 12/4/97. Seen; further report forwarded.—W.H., 13/4/97. Please see minute on my original report herewith.—J. Dixon, 13/4/97. The Under Secretary for Mines and Agriculture.

No. 5.

Mr. Inspector Humble to The Under Secretary for Mines and Agriculture.

Further Report on the removal of the Stopping in the Rope-road, Stockton Colliery.

Sir,

Coal-fields Office, Newcastle, 13 April, 1897.

In obedience to your minute of the 9th instant, stating the Court presided over by Judge Backhouse had "sent in its report, in which it is stated that the stopping in the rope-road was removed in June last, and not in August, as previously assumed," I have the honor to report further on the matter.

I was in Judge Backhouse's Court, sitting beside Mr. Wilshire at the table, when a statement to this effect was made by Mr. McDonald, late under-manager of the Stockton Colliery, and I submit that it is, to say the least, vastly different to that made by the same person before the Coroner's Court on the 10th December last.

In the witness-box, before His Honor Judge Backhouse, he first said he thought it (the stopping) was removed in December, 1895. When asked if he was sure, he shifted his ground, and said, "Either June or July," and when further pressed he said "he was not sure—it was one of the two."

His Honor then interposed by saying to counsel for the defence, "Let it be June, as the further back it is the better for you," or words to that effect. Before the Coroner's Court, on the 10th December last (and when the consequences of his action in the disaster appeared to be much more distant than they were when he appeared before His Honor Judge Backhouse), McDonald, without hesitation and on oath, said, "There was a stopping in the rope-road; but it was removed three or four months ago. The cause of its removal was to clear out No. 3 workings."

In

In believing this statement to be more reliable than his latter utterances (which were very vacillating), I rely upon the fact that certain colliery managers asked to support the Stockton Coal Company against a claim for damages by three property-owners in Stockton, were hurriedly taken into this No. 3 district in the last week of August last, so as to be ready to give evidence in the case heard before Mr. Justice Simpson on the 1st, 2nd, 3rd, and 4th of September last.

Unfortunately I cannot state positively when this stopping was removed; but of this I am sure, as stated in my report of the 20th ultimo, I did not know until after the accident to Curran and Smith that it had been removed.

As on several occasions previous to the removal of the stopping, the district had been temporarily ventilated and cleared of black-damp by opening the manhole door in the said stopping, and closing the same after the workings had been inspected, I never for one moment thought that this method which had acted so satisfactorily in the past would be rejected and abandoned in favour of the entire removal of the stopping.

I have, &c.,

WILLIAM HUMBLE,

Inspector of Collieries.

For the information of the Minister.—H.B.S., 14/4/97.

This reply of Inspector Humble's raises a further question as to why, when he made visits in June and August, he did not inspect the stopping, the removal of which is said to have largely contributed to the accident. With regard to the date of the removal of the stopping, Mr. Jonathan Dixon stated in his evidence before the Court that it was in June last. I should like this matter of the date cleared up if possible.—S. SMITH, 21/4/97.

Mr. Dixon.—D.McL., 23/4/97. For the information of Mr. Inspector Humble.—J. DIXON, 24/4/97.

The only reasons I can give for not inspecting this stopping in June and August are as follows:—

1. Its site is in a roadway far from the working places and ordinary travelling roads of the mine. No person worked or passed anywhere near it; and therefore it was not likely to be interfered with or damaged by irresponsible persons as they passed in or out of the mine.

2. It was well built of 9-inch brick-work; was of small area, and therefore strong; and, like hundreds of similar stoppings in this and other mines, really required no inspection, simply because under ordinary circumstances a brick stopping is in as good a condition at the end of fifteen or twenty years—aye, even more—as on the day it was built. I saw this stopping some time after it was built, and being of opinion that, if left alone, it would remain for years in the same state and condition, I was not anxious to travel into an isolated and abandoned part of the mine to see it every time I made an inspection. So much prominence and importance has been given to this stopping that it appears to overshadow another matter equally as important, but which seems to have fallen into the background, namely, that even with this stopping removed the accidents, or at least the accident to Curran and Smith, would not have happened if the No. 3 furnace door had not been carelessly and culpably left open.

With reference to the second part of the Minister's minute as to the date of removal of the stopping, "and that Mr. Jonathan Dixon stated in his evidence before the Court, that it was in June last," I beg to state that Mr. Jonathan Dixon did *not* give evidence before either of the Courts presided over by Judges Backhouse and Murray. The only evidence he has given on those accidents was before the Coroner's Court on the 10th December last, when putting in a plan of the colliery. It was purely formal, as the following full and complete copy will show:—Jonathan Dixon, being sworn, stated: "I am a colliery manager, and live at Greta; I know that this inquest is being held on the bodies of eight men found in Stockton Colliery; I produce a plan of the colliery. It is a correct plan of the No. 3 workings. I also produce an enlarged plan of the No. 3 district, showing where the exploring party went in, and the route taken by them, and the trap-door through which the rescuers passed; also the points where some of the bodies were found, and the coursing of the air temporarily along the No. 20 bord. I am at present in charge of the pit, acting manager; I do not know who was in charge of the pit last Thursday. The last sketch (enlarged plan) I put in as evidence is marked 'Exhibit A.'—JONATHAN DIXON."

Mr. Inspector Dixon.

WILLIAM HUMBLE,

Inspector of Collieries, 24/4/97.

I fully agree with the above minute written by Mr. Inspector Humble; and I know brick stoppings in some of the mines in this district which are as good to-day as they were when first built over twenty years ago.—J. DIXON, 26/4/97. The Under Secretary for Mines and Agriculture.

I regret that this matter has not been so satisfactorily cleared up as I could wish; and granting that there may be the uncertainty as to the date when the stopping in the rope-road was removed (although Judge Backhouse fixes it in his report in June), I cannot, I am sorry to say, quite bring myself to believe that the inspector made the diligent inspection of the workings which the duties of the position demanded. The fact that some of the employees had at times to pass in to this rope-road in connection with their duties, made it, it seems to me, a part of the working place, and therefore everything in and about that part of the mine should have been examined. If this had been done, it would have been discovered that this stopping was down, and the manager's attention would have been directed to it "as a defect to be remedied." The Court of Investigation having stated that the failure of the inspectors to discover this danger—*i.e.*, the removal of the stopping—did not imply any want of care on their part, I will not further prosecute the matter; but I wish it to be impressed upon all inspectors that they are to make careful examination of every part of any mine they are inspecting which is in, or is in any way connected with the working places where the men are employed, or any matter or thing which may in any way be a menace or a danger to the lives of the persons working in any mine.—S. SMITH, 3/5/97.

Inspector Dixon.—D.McL., B.C., 31/5/97. Seen.—J. DIXON, 5/6/97. W.H., 5/6/97. T.L.B., 5/6/97.

No. 6.
Minute by The Minister for Mines and Agriculture.

Abandoned Districts in Coal-mines.

25 March, 1897.

THERE is one of the conclusions arrived at by the Court of Inquiry into the Stockton Colliery accidents which requires the early and earnest attention of the Department, and I wish the matter thoroughly taken in hand and dealt with at the earliest possible moment. It is to the effect that the general course of working of this mine has been such as to tend unnecessarily to the happening of such disasters, by leaving abandoned districts in a dangerous condition; and, further, that the powers and duties of inspectors should be made the subject of special consideration. By section 19, subsection (iii) of the Coal-mines Regulation Act, 1896, an inspector is empowered to examine and make inquiry respecting the ventilation of the mine, and this no doubt gives him full authority to inspect any place which is likely to be the cause of danger to the men working in any part of the mine. It was held in *Brough (appellant) v. Homfray* (L.R., 3 Q.B., 771), in England, that it was not sufficient compliance with the rule to cause ventilation to pass along the working-place and travelling roads, but that so much of the mine must be kept so ventilated as to render the working-places and travelling roads safe. This was a case under the Mines Act of 1860, section 10, G.R. 1, which corresponded to G.R. 1 (Ventilation), section 49, of the English Act of 1887. If the General Rule were not complied with as to any part of the mine, such as is referred to in the above case, then, under section 48 of the Coal Mines Regulation Act of 1896, the owners, &c., would each be guilty of an offence. [For penalties see 50 (ii) and 60]. If in any respect, which is not provided against by any express provisions of the Act, or by any Special Rule, an inspector finds any mine or any part thereof—this, presumably, includes old workings—or any matter, thing, or practice in or connected with such mine or within the control, management, or direction thereof to be dangerous or defective, so as to threaten or tend to the bodily injury of any person, he has power under section 20 (i) to require it to be remedied. Mr. Attorney-General Barton, advising on the same section contained in the old Act, said that the danger must be imminent, and, as was said in an English case by Lord Esher, M.R., “he (the inspector) is not told to say what he thinks to be the remedy, nor to require that remedy to be carried out. It is for the mine-owner to remedy the matter, and if he does not he must take the consequences.”

The inspector, under section 19 (iii), has power to examine into and make inquiry respecting the sufficiency of the Special Rules for the time being in force in the mine. Section 49 (i) provides that there shall be established in every mine such (Special) Rules for the conduct and guidance of the persons acting in the management of such mines or employed in or about the mine as under the particular state and circumstances of such mine may appear best calculated to prevent dangerous accidents and to provide for the safety, convenience, &c., of the persons employed. By section 52 (ii) the Minister is empowered to propose any new special rules or any amendments of the special rules already established.

In the Metropolitan Colliery Special Rules, the following provisions have been inserted with regard to old workings:—

The under-manager.—“He shall cause competent persons to inspect once a week all old workings, wherever accessible without undue risk; and such competent persons shall report as to their condition regarding the presence of noxious or inflammable gas, condition of ventilation, and security of roof and sides, and such report shall be entered in a book to be kept at the mine for that purpose. Such inspection shall be made by not less than two (2) such competent persons (deputies).

“He shall before the commencement of each shift, make the inspection and report required by General Rule 4 (i), and shall also inspect all old working-places temporarily or permanently abandoned on the intake side of the last working-place in his district; such inspection shall be made within three (3) hours before the commencement of each shift. Including this inspection he shall make at least two (2) such inspections during the course of each working shift.”

It seems to me these are excellent rules, and provide reasonable safeguards against dangers arising from the insidious issue of gases, or noxious air, from abandoned workings, and every possible step should be taken with a view to guard as much as possible against danger to persons employed in the mine arising from these causes. Unless good reasons can be shown to the contrary, I see no reason why somewhat similar provision should not be inserted in the Special Rules of every colliery where any part of the mine is unworked and abandoned.

Although the inspectors now clearly understand that where any danger is likely to arise from the old workings, it is their duty to bring it under the notice of the management, I desire the attention of the Chief Inspector to be drawn to the extract from the Court's report, and wish him to report at once as to what other steps should, in his opinion, be taken in the existing state of the law to guard against danger arising from abandoned workings, and what proposal he has to make for the inspection of old workings by the inspecting staff.

This is a matter of vital importance to all concerned in the working of our collieries, and I trust the Chief Inspector will be alive to the duty which devolves upon him in providing such means as shall ensure (as far as human agency can) to those working in our mines, immunity from death or accident from old workings.

SYDNEY SMITH.

Mr. Dixon.—H.B.S., B.C., 26/3/97. Urgent. Report herewith.—J. DIXON, 31/3/97. The Under Secretary for Mines and Agriculture.

No. 7.

Mr. Inspector Dixon to The Under Secretary for Mines and Agriculture.

Sir,

Coal-fields Office, Newcastle, 31 March, 1897.

Referring to paper No. 6,795, under date 25th March instant, *re* abandoned workings in coal-mines, I have the honor to submit the following report for the information of the Hon. Minister for Mines and Agriculture.

1. I have carefully read the extract from the Court's report, and also noted the extract from Section 19, subsection (iii) of the Coal Mines Regulation Act, 1896, as to the powers of inspectors. I am fully aware that an inspector has power to inspect any place which is likely to be the cause of danger

to the men working in any part of the mine; and I submit that this has been done in past inspections. For whenever it has become known to me that any part of a mine has been likely to cause danger, I have made it my business to visit and inspect that particular mine, both by day and by night, until satisfied that the danger had been removed.

2. In opening out a colliery, and after the shaft pillars are formed, it is the custom to commence one or more narrow bords, which are termed the winning places of the mine. From such bords, headings are turned away, and from the headings wide bords are driven. In course of time, the whole area of that particular district is worked out, and consequently abandoned. The winning places in the meantime, are being advanced, and other districts formed. When the first districts from the shafts are abandoned, it is found necessary to build stoppings in all the openings which have been formed from the main roads, in order to comply with the provisions of the Coal Mines Regulation Act, as, for instance, General Rule 1, section 47 of the present Act provides that "the intake air shall travel free from all stagnant water, stables, and old workings"; hence the necessity for building stoppings. Such old workings are not necessarily hermetically sealed, but left with an open end or "breathing hole" into the main return air-way. As a rule, the return air is not coursed into, and through the abandoned heading and bords. This being so, in some cases an extinctive gas is generated in the old workings; but after having attained a certain volume, it gradually exudes through the "breathing hole" into the return air-way, where it is diluted and rendered harmless by coming into contact with the return air, before reaching the bottom of the upcast shaft. This method of old workings obtains when the pillar-coal is not extracted; and thus, it may be, that scores of acres of old abandoned workings are left standing on the pillar-coal. When, however, the pillar-coal is extracted, such coal is attacked at a convenient distance behind the bords working in the solid coal; and after the pillars have been taken out the immediate roof subsides and fills up all open spaces. This is called a "goaf" or "waste."

3. In the matter of the Metropolitan Colliery, for which the manager has formulated certain Special Rules in order to deal with old workings, I may be allowed to say that while I agree with the spirit of said rules, I feel it my duty to draw attention to the fact that there is but little analogy between this colliery and scores of other collieries now being worked in this Colony. The Metropolitan Colliery is a comparatively young mine, and, owing to the fact of pillar extraction, there cannot be said to be any very extensive area of old workings standing on the pillar-coal. But for the most part, the so-called old workings will be "goaf" or "waste" where the roof has fallen. The inspection of the "goaf" edge can be readily accomplished, and in a mine giving off fire-damp (such as the Metropolitan Colliery is alleged to do) the inspection of the "goaf" edge is considered to be imperative, the world over. On the other hand, there are mines in the Colony, much older than the Metropolitan, where pillar-coal cannot be extracted—for instance, Wallsend and Bullock Island, and Hetton and Stockton Collieries. Owing to this fact, no "goaf" or "waste" can be made, and as the old districts are abandoned, stoppings are built as above described.

4. I have endeavoured to make plain the two systems of old workings, viz., bords and headings sealed off from main roads, and "goaf" or "waste" formed by pillar-coal extraction. As I have already stated, a "goaf" edge can be examined without much trouble; but it becomes a serious question as to how old workings (bords and pillars) can be entered and inspected with safety. In old workings where the pillar-coal is intact, the timber which may be left in decays, and as a consequence a certain portion of the rock or shale roof falls away; and it often happens that some of the roof in old bords, which does not come with the first fall, is left in such a fractured condition as to render it liable to fall at any moment. Besides, if there is an accumulation of extinctive gas in any such old workings, they would not be in a fit state for anyone to work or pass therein until such gas were cleared away. In order to do this, a stopping would have to be taken out, and fresh air coursed through the old headings and bords. This could only be done on a day when the mine would be idle, as to divert the main current of air to clear old workings would be lessening the volume of air in the face workings. The action of the fresh cool air on the already fractured roof, would, in all probability, cause some of the roof to fall, and this alone would be a source of danger to any person or persons making the inspection. But a still greater danger than this might be brought about by introducing a large quantity of oxygen into old workings which would be to some extent heated by long standing, and being shut off from a cool atmosphere. This sudden flushing with fresh air might have the effect of inducing a "gob-fire" by a supply of oxygen, which the "gob" was not able to get while the extinctive gas abounded.

5. In conclusion, I may be allowed to state that I have entered rather fully into a description of old abandoned workings with one sole object in view, viz., to show what, in my opinion, might be a source of danger, if it were insisted on that certain classes of abandoned workings have to be inspected. I may further state that I have no objection to the new Special Rules being submitted to the colliery managers in the Colony. Neither have I any objection to do my share of inspecting the old workings, whatever the risk might be to myself. I dare go where any other man dare to go; and in scores of instances I have risked both life and limb in the execution of my duty as a Colliery Inspector, with a view to the safety of the persons employed in the mine. I have ever been fully alive to the duties devolving upon me as an Inspector, and I would not hesitate for one moment to enter a mine at any hour, day or night, if by so doing, I could prevent an accident; for, without fear of contradiction, I can honestly say that I have the interests of the coal-miners of the Colony at heart as much as any person can have; for if I were to try, I could not forget the fact that I have been one of them. I have, &c.,

JOHN DIXON,
Inspector of Collieries.

1897.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

WALLSEND COLLIERY.

(REPORTS RESPECTING.)

Printed under No. 12 Report from Printing Committee, 22 July, 1897.

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 1st July, 1897, That there be laid upon the Table of this House,—

“ All reports made by the Government Inspectors on the Wallsend Colliery
“ during the present year.”

(*Mr. Watkins.*)

Report on Wallsend Colliery.

WALLSEND NO. 2 COLLIERY INSPECTION.—WALLSEND.

Sir,

Coal-fields Office, Newcastle, 9 January, 1897.

I have the honor to report inspection of the above colliery on Monday the 4th instant.

There are 64 minors employed in this No. 2 Colliery, 32 in bords and 32 in pillars. Forty-eight of the total number may be considered to be on one split, and the quantity of air passing in to them was 9,500 cubic feet per minute, which gives an average of 164 cubic feet each for them, and the 5 boys and 5 horses employed in wheeling their coal.

In other parts of the mine there are two groups of 8 men each engaged in the extraction of pillars, one group working at night-time, when special provision is made for their ventilation by opening a door on the engine-plane, which admits a fair current of air to pass these working places on its way to the No. 1 Colliery furnace.

The other group of 8 men were, at the time of my visit, not very well ventilated, but the under-manager (Robert Lundy) assured me that it (the ventilation) was worse than he had seen it, and he would at once take steps to increase the quantity of air flowing to them.

The ventilation in other parts of the mine was good, the brattice used in the sixteen bords at work conveying a fair proportion of the current into the face of each place.

Since my last inspection additional refuge holes have been made on the plane, and the travelling road extended and improved. Previously it was a return air-course, now it is an intake, and a great protection to the men using it on their way in and out, because it keeps them clear of the fast-running trains on the engine-plane.

The provisions of the new Act have been fairly well complied with.

I have, &c.,

WILLIAM HUMBLE,

Inspector of Collieries.

John Dixon, Esq., F.G.S., Inspector of Collieries, Newcastle.

Report on Wallsend Colliery.

WALLSEND COLLIERY INSPECTION.—MAIN TUNNEL WORKINGS.

Sir,

Newcastle, 13 March, 1897.

I have the honor to report having inspected the above colliery on March 8th, 9th, and 10th.

Olinaman District.

No. 1 Split.—There are 18 men, 2 boys, and 2 horses employed, total 22; and supplied with 17,100 cubic feet of air per minute, giving each an average of 777 cubic feet.

No. 2 Split.—There are 4 men, 1 boy, and 1 horse employed, total 6; and supplied with 2,000 cubic feet of air per minute, giving each an average of 333 cubic feet.

No. 3 Split.—There are 62 men, 5 boys, and 5 horses employed, total 72; and supplied with 13,200 cubic feet of air per minute, giving each an average of 183 cubic feet.

Jubilee

212—

[580 copies—Approximate Cost of Printing (labour and material), £2 14s. 6d.]

Jubilee District.

No. 1 Split.—There are 24 men, 2 boys, and 2 horses employed, total 28; and supplied with 11,850 cubic feet of air per minute, giving each an average of 423 cubic feet.

No. 2 Split.—There are 56 men, 4 boys, and 4 horses employed, total 64; and supplied with 15,360 cubic feet of air per minute, giving each an average of 240 cubic feet.

No. 3 Split.—There are 30 men, 4 boys, and 2 horses employed, total 36; and supplied with 5,281 cubic feet of air per minute, giving each an average of 146 cubic feet.

No. 4 Split.—There are 28 men, 3 boys, and 3 horses employed, total 34; and supplied with 14,000 cubic feet of air per minute, giving each an average of 411 cubic feet.

Lambton Headings District.

No. 1 Split.—There are 43 men, 5 boys, and 5 horses employed, total 53; and supplied with 11,000 cubic feet of air per minute, giving each an average of 207 cubic feet.

No. 2 Split.—There are 26 men, 2 boys, and 2 horses employed, total 30; and supplied with 6,090 cubic feet of air per minute, giving each an average of 203 cubic feet.

No. 3 Split.—There are 63 men, 6 boys, and 6 horses employed, total 75; and supplied with 13,600 cubic feet of air per minute, giving each an average of 181 cubic feet.

No. 4 Split.—There are 20 men, 2 boys, and 2 horses employed, total 24; and supplied with 7,200 cubic feet of air per minute, giving each an average of 300 cubic feet.

The working places are adequately ventilated, the wheeling and travelling roads in good condition, and there was a plentiful supply of timber on the various flats.

I have, &c.,

THOS. L. BATES,

Inspector of Collieries.

John Dixon, Esq.

Report on Wallsend No. 2 Colliery.

WALLSEND NO. 2 COLLIERY INSPECTION.—WALLSEND.

Sir,

Coal-fields Office, Newcastle, 3 April, 1897.

I have the honor to report inspection of the above Colliery yesterday.

There are 58 miners employed, 34 in bords and headings and 24 in pillars, 8 of whom work at night-time.

I measured the following quantities of air:—

No. 1 Split.—Thirty-four men, 5 boys, and 5 horses employed, and supplied with 6,300 cubic feet per minute, being an average of 143 cubic feet each.

No. 2 Split.—Sixteen men, 2 boys, and 2 horses employed, and supplied with 2,400 cubic feet per minute, being an average of 120 cubic feet each.

The 8 miners working at night-time are ventilated by a current of air, specially turned into their places by the opening of a door alongside the engine-plane.

A deputy is in constant attendance on these men, and looks after this door, opening it before they start and closing it after they finish, and before the day-shift miners are admitted.

From what I could see when I opened the door to pass through, these 8 men will receive seven or eight thousand cubic feet of air per minute while they are at work.

I afterwards visited four shift-men in the No. 3 District who were engaged in ridding through some fallen ground to recover some rails, &c. It is hazardous work, but every care is being taken for their safety.

The provisions of the Act are being fairly well complied with, particularly as regards ventilation; the men have a satisfactory amount of air carried to their working-place.

I have, &c.,

WILLIAM HUMBLE,

Inspector of Collieries.

John Dixon, Esq., F.G.S., Inspector of Collieries, Newcastle.

Report on Wallsend No. 2 Colliery.

WALLSEND NO. 2 COLLIERY INSPECTION.—WALLSEND.

Sir,

Hamilton, Newcastle, 21 May, 1897.

I have the honor to report inspection of the above Colliery to-day.

Fifty-two miners are employed in this Colliery, 40 during the day in bords and headings, and 12 at night-time extracting pillars.

The current of air on the main road just beyond the engine-flat measured 16,120 cubic feet per minute, and I found that 6,720 cubic feet of this was being supplied to the 40 men, 5 boys, and 5 horses employed during the day. This gives an average of 134 cubic feet each. A fair proportion of this current of air was being conveyed to the face of each place.

The 12 men employed at night-time work in two groups of 8 and 4, the former commencing at 4 p.m., when special provision is made for their ventilation.

The latter start at 12 p.m. and finish between 7 and 8 a.m. They, too, have a current of air specially supplied to them by the opening of a door alongside the main road.

I visited the working places of these men, and have no doubt that while they are at work an adequate amount of ventilation will be supplied to them. I found one of these working-places slightly troubled with black damp, which is constantly generated in the goaves of this colliery, and which at times exudes into the workings and roadways, where it is taken up by the air-current and carried into the return airways. Judging from appearances it will be cleared away in a few minutes before the men are admitted to-night.

While

While examining the deputies' report books I had reason to believe that copies of such were not kept at the colliery office, as I had previously requested they should be. Have, therefore, written a letter to manager. Copy annexed.

I have, &c.,

WILLIAM HUMBLE,

Inspector of Collieries.

John Dixon, Esq., F.G.S., Inspector of Collieries, Newcastle.

Sir,

Hamilton, Newcastle, 21 May, 1897.

On the 2nd of April last, while inspecting No. 2 Colliery, I requested your son and the Under Manager (Robert Lundy) to bring before your notice the requirements of general rule 38 of the Coal Mines Regulations Act, 1896, which provides that the books or a correct copy thereof "shall be kept at the office of the mine," &c., &c.

I do not know whether they spoke to you about the matter, but I naturally expected they would; and, after inspecting the mine to-day, I went to the colliery office for the purpose of seeing that such copies were duly kept. I found nothing of the kind there, and can only conclude that such has not been done, and that this part of the Act is not being observed. I have, therefore, to request compliance with the said rule without delay, and shall be glad to hear, as soon as possible, that such has been done.

I have, &c.,

WILLIAM HUMBLE,

Inspector of Collieries.

Alex. Ross, Esq., Manager, Wallsend No. 2 Colliery, Wallsend.

Report on Wallsend Colliery.

WALLSEND COLLIERY INSPECTION.—MAIN TUNNEL WORKINGS.

Sir,

Newcastle, 5 June, 1897.

I have the honor to report having inspected the above colliery on May 31st, June 2nd and 3rd.

Lambton Headings District.

No. 1 Split.—There are 44 men, 5 boys, and 5 horses employed, total 54; and supplied with 9,720 cubic feet of air per minute, giving each an average of 180 cubic feet.

No. 2 Split.—There are 34 men, 3 boys, and 3 horses employed, total 40; and supplied with 7,500 cubic feet of air per minute, giving each an average of 187 cubic feet.

No. 3 Split.—There are 68 men, 6 boys, and 6 horses employed, total 80; and supplied with 13,500 cubic feet of air per minute, giving each an average of 168 cubic feet.

No. 4 Split.—There are 8 men, 1 boy, and 1 horse employed, total 10; and supplied with 2,000 cubic feet of air per minute, giving each an average of 200 cubic feet.

Chinaman District.

On the day of my inspection no miners were at work in consequence of an interruption in the railway traffic, and the ventilating-fan was only going at half-speed. Two shiftmen were employed, and there was a fair current of air in circulation.

Jubilee District.

Work was also suspended on the day of my inspection of this district, but 19 men, 9 boys, and 9 horses were employed in sending small coal up the Jubilee shaft for use at the ventilating-fan. Seven other men were repairing the main roads, &c. There was a fair current of air in circulation—quite sufficient for the number of men at work.

The wheeling and travelling roads were in good condition, and there was a plentiful supply of timber on the various flats.

I have, &c.,

THOS. L. BATES,

Inspector of Collieries.

John Dixon, Esq., Inspector of Collieries, Newcastle.

Report on Wallsend No. 2 Colliery.

WALLSEND NO. 2. COLLIERY INSPECTION.—WALLSEND.

Sir,

Hamilton, Newcastle, 18 June, 1897.

I have the honor to report inspection of the above colliery to-day.

At the present time 37 men, 5 boys, and 5 horses are employed during the day. They were being supplied with 8,320 cubic feet of air per minute, which gives an average of 177 cubic feet each. An excellent proportion of this current was conveyed to the face of each working-place.

In addition to the above number of men there are two groups of 4 and 8 who work at night-time extracting pillars in other and separate parts of the mine.

These men are ventilated by currents of air specially provided by the opening of doors which during the day must be kept closed, hence the reason for working at night-time.

A deputy is in attendance on each group to see to their safety, and Mr. Robert Lundy, the under-manager, informed me to-day that he also visits those men occasionally to see that all is right and safe in and around their working-places.

I have, &c.,

WILLIAM HUMBLE,

Inspector of Collieries.

John Dixon, Esq., F.G.S., Inspector of Collieries, Newcastle.

1897.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

VENTILATION OF COAL-MINES, NEWCASTLE DISTRICT.
(RETURN RESPECTING.)

Printed under No. 7 Report from Printing Committee, 10 June, 1897.

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 12th May, 1897, That there be laid upon the Table of this House,—

“All reports regarding the ventilation of coal-mines, under the new Coal-mines Act, from the Inspectors of Coal-mines in the Newcastle District, “from the commencement of the year 1897.”

(*Mr. Edden.*)

Name of Mine.	Inspector.	Date of Inspection.	Average amount of air supplied per minute to each man, boy, and horse.	Remarks.
A. A. Co.'s No. 2	Bates	1897. 7th and 8th January.	There was a good current of air circulating through all the working-places which produced adequate ventilation.
“	“	22nd and 25th March.	I found all the working-places adequately ventilated.
“	Dixon	17th and 21st May.	{ 500 in No. 1 district 722 in No. 5 “ 583 in No. 3 “	{ Each working-place was well ventilated. Galley workings were well ventilated. Place of Griffiths' narrow bord near south-east main road the ventilation was splendid.
A. A. Co.'s New Winning.	Bates	18th and 19th February.	{ 196 in No. 1 split 254 in No. 2 “ 326 in No. 3 “ 461 in No. 4 “ 191 in No. 5 “ 163 in No. 6 “ 775 in Reid's heading, N.E. side of shaft.	Adequately ventilated.
“	Dixon	3rd and 4th May.	{ 250 in Emery's “ 318 in Emery's left, “ 334 in main narrow bord (left side), S.E. side of shaft. 241 in main narrow bord (right side), S.E. side of shaft. 466 in Matthew's heading, S.E. side of shaft.	Each working-place was adequately ventilated.
Bloomfield	Humble	8th March	A splendid volume of air, entering by four shafts and an adit, was flowing through each working-place, and the ventilation was therefore, in my opinion, full, ample, and adequate.
“	“	7th May	An excellent current of air was flowing round and into the face of each and every working-place.
Brown's No. 2	“	24th February	{ 262 in No. 1 split (middle heading) 112 in No. 2 “ (shaft “	{ A fair proportion of the current of air entering each district is conveyed by canvas brattice to the face of each working-place, and the men are now working under fairly good conditions as regards ventilation.

Name of Mine.	Inspector.	Date of Inspection.	Average amount of air supplied per minute to each man, boy, and horse.	Remarks.
Brown's No. 2	Humble	1897. 3rd May	{ 240 in No. 1 split (middle heading dist.). 156 in No. 2 ,, (14 heading dist.) }	An excellent proportion of the current of air entering each district was conveyed into each working-place.
Burwood	Dixon	17th and 26th March.	{ 168 in Nos. 1 and 2 headings 217 in Nos. 3 and 4 " 214 in cross-cut 161 in south side	The ventilation in the south side district was found adequate, and in the other districts of this colliery the ventilation was also found to be adequate, and every bord and heading was bratticed.
"	"	26th and 27th May.	{ 142 in Nos. 1 and 2 headings (left) 180 in Nos. 3 and 4 " " " 441 in cross-cut 132 in south side	With the exception of a few places on the north side, which required a few lengths of brattice on, the ventilation was satisfactory. I drew the manager's attention to this matter by letter on the 28th May.
Brown's No. 4	Humble	26th March	{ 400 in No. 1 split (south heading dist.) 324 in No. 2 " 476 in No. 8 heading split 217 in No. 9 " " 430 in No. 5 " "	A good proportion of the current of air in each district is conveyed, by canvas brattice, to the face of each working-place.
" " 4	"	13th May	{ 181 in No. 1 split (south heading district). 218 in No. 2 " " " 361 in No. 3 " (No. 8 heading district). 500 in No. 4 " (No. 10 " " " 175 in No. 5 " (No. 9 " " " 468 in No. 6 " (No. 5 " " "	A fair proportion of the current of air entering each district was conveyed to the face of the majority of the working-places. In some few places in each district the ventilation was not so good. I drew the attention of both manager and under-manager to this matter, and they promised to attend to and improve the same. They said that it was chiefly owing to the non-arrival of a quantity of brattice-cloth they were expecting. I have no doubt the matter will be remedied in a few days.
Bayley's Reward	Dixon	Ventilation excellent.
Cardiff	Bates	15th January	The working-places are all adequately ventilated.
"	"	27th April	" "
Centenary	"	27th January	216	" "
Co-operative	Humble	22nd January and 26th Feb.	{ 182 in No. 1 split 215 in No. 2 " 190 in No. 3 " 190 in No. 4 " 194 in No. 5 " 157 in No. 6 "	A fair proportion of the current of air entering each district is conveyed into each working-place near to the men at work at the face. It was not, however, so satisfactorily done as on my previous inspection in November last. Yesterday I expressed myself to this effect, and the under-manager (Mr. John Wilson) promised me he would at once take steps to force more air from the heading into the face of each working-place. This can, and, I believe, will be done in a few days.
"	"	9th and 12th April.	{ 128 in No. 1 split 240 in No. 2 " 183 in No. 3 " 210 in No. 4 " 292 in No. 5 " 157 in No. 6 "	A good proportion of the current of air entering each district was conveyed to the face of each working-place.
"	"	31st May and 1st June.	{ 186 in No. 2 236 in No. 3 240 in No. 4 211 in No. 5 190 in No. 6 140 in No. 7	A fair proportion of the current of air entering each district was being conveyed to the face of each working-place.
Durham	Dixon	6th April	The headings were bratticed almost close to the face, and a good current of fresh air was sweeping the faces.
Duckenfield	Bates	1896. 29th and 30th Dec.	{ 224 in No. 3 split 213 in No. 4 " 202 in No. 5 " 132 in No. 6 " 175 in fault heading 150 in No. 4 heading split 195 in No. 5 " 160 in No. 6 " 500 in No. 8 " 142 in No. 3 "	The working-places are adequately ventilated.
"	Humble	1897. 7th and 8th April.	{ 169 in fault heading split 270 in No. 3 split 174 in No. 4 " 164 in No. 5 " 116 in No. 6 " 900 in No. 8 " 151 in fault heading split	An excellent proportion of the current of air in each district is carried to the face of each working-place.
"	"	27th and 28th May.	A fair proportion of the current of air entering each district was conveyed to the face of each working-place.
Dudley	"	6th April	{ 309 in No. 1 split 178 in No. 2 " 312 in No. 3 "	A fair proportion of the current of air in each district is conveyed to the face of each working-place.
"	"	4th June	{ 426 in No. 1 split 270 in No. 2 " 173 in No. 3 " 192 in No. 4 "	An excellent proportion of the current of air entering each district was being conveyed to the face of each working-place.
Dulwich	Bates	29th January	There was a good current of air in circulation and quite adequate for the number of men employed.
"	"	5th May	483	The working-places are adequately ventilated.

Name of Mine.	Inspector.	Date of Inspection.	Average amount of air supplied per minute to each man, boy, and horse.	Remarks.
		1897.

New Park	Bates	28th Jany	335	Adequately ventilated; the refuse of the seam is now packed in such a way in the bords as to leave an air-way 4 feet wide and 6 feet high next the rib-side; this acts as a brattice, and conducts the air current to the face of each working-place.
"	"	4th May		All the working-places were adequately ventilated.
New Lambton	"	17th March		" "
New Anvil Creek	"	27th May		" "
"	"	18th "		Not working for some months. I travelled down the tunnel to the pump and found a good current of air circulating.
Northumberland	"	5th Feby.		I found a good current of air circulating through the working-places.
"	"	13th May		A good current of air was circulating through all the working-places.
Northern Extended.	"	1896. 22nd Dec.		Some men were repairing the top of the furnace shaft and the fire was nearly out. The working-places are bratticed, and it is probable that if the ventilation had been in the usual state when the mine is working, that the working-places would be adequately ventilated.
"	"	19th March		The working-places were well ventilated.
Oakvale	"	21st May	206	Ventilation adequate.
"	"	5th "		I found a good current of air in circulation, and the working-places in good condition.
Pacific	"	15th March	{ 416 in West side 323 in East side 228 in dip workings	The working-places were well ventilated.
Quarry	Dixon	30th April		The working-place was adequately ventilated.
Rosedale	Bates	29th January		Not working at date of inspection. I found the working-places either bratticed with cloth or the refuse from the seam, built in such a way as to form an air-way next the rib-side, thus conducting the air current to the face of the working-places.
Rosehill	Dixon	5th May		All the working-places are adequately ventilated. One man occasionally employed. Ventilation is as good as on surface.
Seaham	Humble	2nd March	{ 243 in No. 1 split 166 in No. 2 split 172 in No. 3 split	The mine is in a good condition, and the ventilation excellent; an excellent proportion of the current of air entering each district is forced to the face of each working-place.
"	"	29th April	{ 192 in No. 1 split 200 in No. 2 split 200 in No. 3 split	The mine was idle at date of inspection, but the ventilating-fan was running at working speed, an excellent proportion of the current of air entering each district.
Side	Dixon	30th "		There was only one working place (a narrow bord), and it was well timbered almost close to the face. The ventilation was good throughout the whole of the mine.
South Wallsend.	Bates	18th March		Not working.
South Hetton	Humble	22nd April		The ventilation was particularly good, owing chiefly to the south-east gale then blowing, which was in the right direction for entering the mouth of the adit.
South Greta	Bates	23rd December		There was no fire on at the furnace, but a fair current of air was in circulation, and if the ventilation had been up to the usual mark when the mine is at work, it is probable that the working-places would be adequately ventilated.
"	"	2nd April	264	Adequately ventilated.
South Waratah.	"	17th and 21st December.	{ 219 in No. 1 split 138 in No. 2 " 142 in No. 3 " 153 in No. 1 split 203 in No. 2 "	The working-places were all adequately ventilated.
"	"	1897. 29th and 30th March.	{ 240 in No. 3 " 735 in South-east drives, but more air is circulated when the men are at work.	All the working-places were adequately ventilated.

Name of Mine.	Inspector.	Date of Inspection.	Average amount of air supplied per minute to each man, boy, and horse.	Remarks.
		1897.		
Stockton.....	Humble...	30th, 31st March, and 1st April.	{ 140 in No. 1 split (43 district ocean winning.) 214 in No. 2 " " " 136 in No. 3 " " " 160 in No. 4 " " (48 district ocean winning.)	An excellent proportion of the current of air entering each district was conveyed to the face of each working-place.
"	"	18th, 19th, and 20th May.	{ 149 in No. 1 split (43 district ocean winnings.) 221 in No. 2 " " " 137 in No. 3 " " " 231 in No. 4 " " (48 district ocean winnings.)	A fair proportion of the current of air entering each district was being carried to the face of each working-place. In a few I thought the ventilation ought to be increased and said so to the manager who accompanied me, he at once ordered the same to be done, starting another brattice man for the purpose, this increased help would remedy the matter on the following day. Ventilation adequate.
Sunside	Dixon	Ventilation good.
Sunnside	"	Ventilation good.
Teralba	Bates.....	20th April	No coal is being mined at present.
Thornley	Humble..	8th March	The ventilation of the whole of the mine was, in my opinion, full ample and adequate, a good proportion of the air supplied owing to the frequency with which cut-throughs are driven, sweeping the working-face of each place.
"	"	7th May	The volume of air flowing was about 4,000 cubic feet per minute. A fair proportion of which was sweeping the face of each working-place.
Wallsend Main Tunnel Workings	Bates ...	8th, 9th, and 10th March.	{ 777 in Chinaman's district No. 1 split 333 " " " 2 " 183 " " " 3 " 423 Jubilee district No. 1 split. 240 " " " 2 " 146 " " " 3 " 411 " " " 4 " 207 Lambton headings district No. 1 split. 203 Lambton headings district No. 2 split. 181 Lambton headings district No. 3 split. 300 Lambton headings district No. 4 split.	The working-places are adequately ventilated.
"	"	31st May and 2nd and 3rd June.	{ 180 in No. 1 split	Adequately ventilated. Chinaman District.—On the day of my inspection no miners were at work in consequence of an interruption in the railway traffic, and the ventilating-fan was only going at half speed. Two shiftmen were employed and there was a fair amount of air in circulation.
Wallsend, No. 2 District.	Humble	4th January.	{ 168 in No. 3	Jubilee District.—There was a fair current of air in circulation—quite sufficient for the number of men at work.
"	"	2nd April	{ 143 in No. 1 split.....	Forty-eight of the miners employed may be considered to be on one split, and the average quantity of air supplied to each man, boy, and horse in the split was 164 cubic feet. In other parts of the mine there are two groups of eight men each engaged on the extraction of pillars, one group working at night time, when special provision is made for their ventilation by opening a door on the engine plane, which admits a fair current of air to pass these working-places on its way to the No. 1 colliery furnace. The other group of eight men were, at the time of my visit, not very well ventilated, but the under-manager (Mr. Robert Lundy) assured me that it (the ventilation) was worse than he had seen it, and would at once take steps to increase the quantity of air flowing to them. The ventilation in other parts of the mine was good, the brattice used in the sixteen bords at work conveying a fair proportion of the current into the face of each place.
"	"	21st May	{ 120 in No. 2 "	The provisions of the Act are being fairly well complied with, particularly as regards ventilation, the men having a satisfactory amount of air carried to their working-place.
"	"	{ 134.....	A fair proportion of this current of air was being conveyed to the face of each place. The twelve men employed at night time work in two groups of eight and four, the former commencing at 4 p.m., when special provision is made for their ventilation. The latter start at 12 p.m., and finish between 7 and 8 a.m. They, too, have a current of air specially supplied to them by the opening of a door alongside the main road. I visited the working-places of these men, and have no doubt that while they are at work an adequate amount of ventilation will be supplied to them.

Name of Mine.	Inspector.	Date of Inspection.	Average amount of air supplied per minute to each man, boy, and horse.	Remarks.
		1897.		
Wallarah	Humble...	16th February	{ 251, No. 1 split (B adit) 138, No. 2 ,, 359, No. 1 ,, (C adit)	On my last inspection I was far from satisfied with the arrangements made to convey a current of air to the face of each working-place. I laid the matter before Mr. Thomas Parton, the general manager, who promised to comply at once with my wishes. Yesterday I found great improvement; each place is now getting a fair proportion of the current of air entering each district. B adit.—The furnaces were kept at a little under working capacity, and a very satisfactory current of air was therefore flowing through each working district.
"	"	21st April	Left hand split, 19,386 cubic feet per minute. Right hand split, 10,080 cubic feet per minute. C adit, 9,680 cubic feet per minute. New shaft sunk.—A wind-sail, with brattice below it, dividing the shaft into two parts, provides ample ventilation.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

MINING.

(RETURN RESPECTING LEAD-POISONING IN CONNECTION WITH THE BROKEN HILL MINES.)

Printed under No. 7 Report from Printing Committee, 10 June, 1897.

The Chief Inspector of Mines to The Under Secretary for Mines and Agriculture.

26 May, 1897.

I HEREWITH enclose returns for the months of January, February, and March, under the Lead Poisoning Act, which gives a total for the last three months of five persons having been lead-poisoned in the Broken Hill district. By comparison, it will be seen that there were twenty-four cases during the first quarter of 1896, and only five cases ending the first quarter of 1897, which is very satisfactory, as proving without doubt the gradual decrease of lead-poisoning in connection with the Broken Hill Mines.

W. H. J. SLEE.

LEAD-POISONING—Return in connection with the Broken Hill Mines for quarter ending 31st March, 1897, as compared with the corresponding quarter for the year 1896.

REGULATIONS RELATING TO LEAD-POISONING.

NEW SOUTH WALES, } Proclamation by His Excellency the Right Honourable SIR ROBERT WILLIAM
to wit. } DUFF, a Member of Her Majesty's Most Honourable Privy Council, a Knight
(L.S.) } Grand Cross of the Most Distinguished Order of Saint Michael and Saint George,
R. W. DUFF, } Governor and Commander-in-Chief of the Colony of New South Wales and its
Governor. } Dependencies.

WHEREAS, by the Act 57 Vic. No. 18, the Governor is empowered to make Regulations for the prevention of lead-poisoning or poisoning by lead or any other fumes in conducting mining operations: Now, therefore, His Excellency the Governor doth, in exercise of the powers conferred by the said Act, make the following Regulations, to be in force in all the Mining Districts of the Colony, that is to say:—

Employment of Females.

1. It shall be illegal to employ females in any capacity at works where lead, lead-ores, or lead-compounds are mined, dressed, smelted, or manufactured.

Employment of Boys.

2. It shall be illegal to employ any boy below the age of 16 years in mining or sorting ores underground at any mine where lead containing minerals are got, or to employ any such boy on the surface in any place where lead-ores, lead, or lead-compounds are handled, or to employ any boy below the age of 14 years.

Record of Cases of Leading.

3. The Manager of every mine shall record the name, age, branch of occupation, and length of time employed of every workman laid off on a medical certificate by leading, and also of every workman laid off on account of alleged leading—that is to say, where no medical certificate is produced—and shall transmit a copy of each month's record (distinguishing certified from uncertified cases) to the Minister not later than the seventh day of the next following month.

Supply of Drinking-water.

4. The owner shall provide an ample supply of sweet and wholesome drinking water, which shall be freely and easily available to all hands at all times at the mine; (b) It shall be stored with special care to prevent contamination with dust; (c) Whenever canvas bags are provided, they shall be made according to a pattern approved by the said Minister, and shall be so constructed as to be closed at the top by a solid (not a canvas) cover, and the water should be drawn from them through a metal or wooden tap (not a canvas pipe) suitably fixed to the bottom, or a suitable wooden barrel shall be used for sending drinking water to the men, and shall be stored in a cool place, and such barrel should be supplied with a metal tap for drawing off the water; (d) The dipper for drinking out of should hang in an enclosed place so as to be thoroughly protected from dust, or pure drinking water should be supplied by pipes to every plat in the following way, the source being either the public water-mains or well-protected reservoirs of condensed water at the surface:—The supply pipe should descend to the lowest plat, and should there enter a closed metal reservoir of about 100 gallons capacity or larger; the delivery pipe should return from the reservoir to the surface, and should be fitted with a tap at every plat for supply of water thus cooled to underground workmen; or miners may take into the mine, tea or water in cans covered by tight-fitting lids, which should not be removed in the mine except for the purpose of drinking therefrom.

Sprinkling Water and Water for Washing.

5. On feed-floors and tapping-floors, and at every other place where dust is raised, stand-pipes and hose or other suitable contrivances shall be so provided that dust may be conveniently laid by sprinkling the ore, &c.; sprinkling-water shall also be furnished in the main drive on all the different levels, so that it can be led to every working, and so that it may be easily distributed to allay dust. Proper provisions shall be made in all the levels to enable men to wash their hands before crib.

Bath-water, Bathing, and Changing-rooms.

6. At every mine, bath-houses and changing-rooms shall be provided as follows:—(a) The baths shall include both showers and plunge-tanks; (b) The changing-rooms shall be attached to, and in communication with, although separate from, the bath-house, and shall have boarded floors; (c) Both bath-houses and changing-rooms shall be available to the workmen, free of cost, at all reasonable hours, and so that they can be used by every shift; (d) Both shall be reasonably comfortable, sufficiently lighted after dark, and sufficiently warmed in cold weather; (e) Both plunge and shower baths shall be supplied with water, warm to such a degree as may be found desirable in cold weather—say, 75 degrees or 80 degrees F.; (f) A caretaker shall always be in charge of bath and changing-rooms, and it should be part of his duty to keep a day-book and to record therein the names of all persons who use the baths.

Change of Clothes.

7. Every underground workman shall change his ordinary clothes for working-clothes, in the changing-rooms to be provided for this purpose, before descending to his work, and change his working-clothes for his home-clothes again on finishing his work, and before leaving the mine. Surface workmen shall have liberty to make the same change of clothes, and should be encouraged to do it.

Flue-dust.

8. Emission of flue-dust from smelter stacks should be prevented as much as possible. If the Inspector considers any alterations or any additional appliances are necessary for that purpose, he may by written notice require the owner to make or supply the same; and in such notice a time shall be named within which the necessary alterations are to be made, and such time should not exceed twelve months. If any owner object, he may within the time named in the notice show cause in writing to the Minister, who may confirm, vary, or veto the notice of the Inspector.

Flue-dust—how dealt with.

9. (a) The ports by which flue-dust is removed from champion flues must not open into tapping-floors, but on the other side of the flues and into a space otherwise unoccupied; (b) The floors to which the dust falls when first hoed out when tipped on the feed-floor, &c., must be smooth and impermeable, and

and provided with a curb raised above the surrounding surface, so that the deposited dust or mud may not be stepped on and carried about, and must be perfectly clean, except when in actual use; (c) Workmen employed to cleanse flues and to gather and transport flue-dust shall be under the same obligation to change before going on shift as underground hands; (d) It shall be illegal for an owner to allow any man to be thus employed on the mine unless carrying a suitable respirator to cover nose and mouth, or to engage in his work and to stand about where it is being carried on by others, unless he put on his respirator; (e) The flue-dust shall be carefully wetted as soon as drawn from the flue; no accumulation of wet flue-dust shall be permitted on any mine unless within a securely closed receptacle, nor shall any accumulation of dry flue-dust be permitted outside the flues, but shall forthwith be charged back regularly.

Ventilation of Tapping-floors.

10. Tapping-floors shall be ventilated at the angle between the top of the champion flue and the feed-floor, to reduce draught on the tapping-floor and to afford fumes a way of escape; flues of large diameter may be carried up through the feed-floor without interfering with operations there, and they may expand below into oblong funnel-shaped openings.

Use Respirator.

11. It shall be illegal for any workman to engage in repairing a furnace in blast (as in replacing a faulty water-jacket panel), unless he wear a respirator as mentioned above in connection with removal of flue-dust.

Fumes from Molten Metal and Slag.

12. Furnaces should be surrounded with a hood which expands below so as to catch fumes from molten metal and slag, and which should terminate on one side in a chimney leading to the air on the open side of the tapping-floor.

Qualification of Inspectors.

13. Inspectors should be proficient in some simple process of estimating the proportion of carbon dioxide present in atmospheric air.

Ventilation of Mines.

14. It shall be the duty of an Inspector to see that the state of the air in the various workings is at all times satisfactory, to see that sufficient pure air circulates through the galleries, and to see that the air in all workings off through ventilated passages is sufficiently pure.

Purity of Air.

15. The criterion of "purity" should be the presence in the air of less than one part of carbon dioxide in every one thousand parts of air, as ascertained by an apparatus approved by the Minister.

Copy of Regulations to be supplied to Workmen.

16. A printed copy of these Regulations shall be presented by the manager to each workman on engaging him, and it shall be the duty of the Inspector to ascertain from time to time that this is duly done.

Enforcement of Regulation Penalties.

17. Any Inspector shall have power to enforce the foregoing Regulations; and if any person shall, after written notice served upon him by an Inspector, refuse or neglect to comply with any such Regulation, he shall be liable to a penalty not exceeding £20, and to a further penalty not exceeding £5 for every day during which the offence is continued after receipt of the notice aforesaid (and any Inspector or other person may recover such penalties in any Court of summary jurisdiction).

Interpretation of Terms.

18. The following terms shall be the meanings hereunder assigned to them:—
 "Minister," The Minister for Mines.
 "Inspector," The Chief Inspector or an Inspector of Metalliferous Mines.
 "Leading," Lead-poisoning.

Given under my Hand and Seal, at Government House, Sydney, this twenty-fifth day of September, in the year of our Lord one thousand eight hundred and ninety-four, and in the fifty-eighth year of Her Majesty's Reign.

By His Excellency's command,
 SYDNEY SMITH.

GOD SAVE THE QUEEN!

Department of Mines and Agriculture, Sydney, 6th September, 1895.

AMENDMENT OF REGULATION No. 2 OF THE REGULATIONS RELATING TO
 LEAD-POISONING.

HIS Excellency the Lieutenant-Governor, with the advice of the Executive Council, has approved of Regulation No. 2 of the Regulations relating to Lead-poisoning, made under the provisions of the Act 57 Victoria No. 18 ("An Act to amend the Mining Act of 1874"), and published in the *Government Gazette* of the 28th September last, being amended by the transposition of the words "lead containing minerals," and of such Regulation No. 2 now reading as follows:—

Employment of Boys.

2. It shall be illegal to employ any boy below the age of 16 years in mining or sorting ores underground at any mine where minerals containing lead are got, or to employ any such boy on the surface in any place where lead-ores, lead, or lead-compounds are handled, or to employ any boy below the age of 14 years.

SYDNEY SMITH.

NEW SOUTH WALES.

MINING.

(CORRESPONDENCE RESPECTING JUNCTION MINE AT BROKEN HILL.)

Printed under No. 2 Report from Printing Committee, 6 May, 1897.

[Laid upon the Table of the House in answer to Question 3 of Tuesday, 4 May, 1897.]

Question.

- (3.) JUNCTION MINE AT BROKEN HILL.—Mr. FERGUSON asked the Secretary for Mines,—Has his attention been called to the collapse of the stopes in the Junction Mine at Broken Hill; and will he lay upon the Table of this House the Inspector of Mines' report as to the cause of such collapse?

Answer.

Mr. SYDNEY SMITH answered,—Yes; and I will presently lay copies of correspondence upon the Table of this House.

Telegram from The Chief Inspector of Mines, Sydney, to Inspector of Mines, Broken Hill.

17 April, 1897.

EXTENSIVE creep affecting Junction and Junction North Mines occurred yesterday. All the men were got out in safety. Two shafts are affected, but not seriously. Creep extends from above 670-ft. level to about 450-ft. level; as far as possible I will go through workings to-day and report.

Junction men were removed from stopes on Thursday, but owing to big pillars between mines it was not thought necessary to move Junction North men. They were driven out by the dust, and the shaft being affected, made their way through Junction Mine in safety.

JAMES HEBBARD,
Inspector of Mines,
Broken Hill.

Seen.—W. H. J. SLEE, 22/4/97.

The Inspector of Mines, Broken Hill, to The Chief Inspector of Mines, Sydney.

Sir,

Broken Hill, 17 April, 1897.

I have the honor to inform you that I have visited the Junction Mine regarding the creep, the subject matter of my wire of this date.

Apparently the settlement has commenced at the intermediate level, about 30 feet above the 670-ft. level, from there the course of the subsidence is about 100 feet south to a filled portion, and north to the Junction North boundary, where a pillar of ore has been left standing. In height the break extends to the 400-ft. plat where the shaft has been thrown out of position preventing the passing of the cages.

The pumps, however, appear to be in order and are now being started.

Apparently the greatest movement has been along the depleted ore body at the 470-ft. level and this has seriously affected the Junction North shaft, which, for about 50 feet, is badly affected. The men were withdrawn from the stopes of the Junction Mine at midnight on Thursday night, but it was not thought necessary to withdraw the Junction North men.

Examination this morning shows the Junction North stopes intact, though the men were driven out by the dust raised by the fall.

I am glad to say that beyond two or three men being knocked down by the rush of air, no injury has been received; and I was in conversation with some of the men this morning who were in the Junction North Mine stopes at the time of the fall.

No injury has resulted from the occurrence, except to the workings of the mines.
I will procure sketch plans of the mines and write further when I have had better opportunities
for an examination. I have, &c.,

JAMES HEBBARD,
Inspector of Mines.

May be acknowledged and put away for further reference if required.—W. H. J. SLEE, 27/4/97.
For the information of the Minister. Acknowledged.—J.M., 28/4/97.

Minute Paper.

Chief Inspector of Mines and Diamond Drills, Department of Mines and Agriculture.

Subject:—Requesting Mr. Inspector Hebbard to furnish full report *re* collapse of stopes in Junction and North Junction Mine, Broken Hill.

Sydney, 20 April, 1897.

REQUEST Mr. Inspector Hebbard by wire to furnish me as early as possible with a detailed report *re* the falling in of stopes in the upper levels of the Junction and North Junction Mines, Broken Hill.

W. H. J. SLEE,

Chief Inspector of Mines.

Requested.—J.M., 20/4/97.

Telegram from The Chief Inspector of Mines, Sydney, to The Inspector of Mines, Broken Hill.

20 April, 1897.

FURNISH me as early as possible with a detailed report *re* the "falling in" of the stopes in the upper levels of the North Junction Mine, Broken Hill.

W. H. J. SLEE,

Chief Inspector of Mines.

Telegram from The Inspector of Mines, Broken Hill, to The Chief Inspector of Mines, Sydney.

Broken Hill, 21 April, 1897.

I FORWARDED report on Junction creep on 17th instant. Will make further examination shortly. Creep in Junction North is continuation of that in Junction. It is advisable to allow the ground to thoroughly settle before interfering with it, and I have advised that the movement be watched but no work done.

I anticipate that you will receive my Saturday's report to-day. Accordingly I did not reply to your wire until now. I will make thorough inspection in few days when I am satisfied that the settlement is finished.

JAMES HEBBARD,

Inspector of Mines, Broken Hill.

Seen.—W. H. J. SLEE, 21/4/97.

Memorandum.

Chief Inspector of Mines' Office, 29 April, 1897.

INFORM Mr. Inspector Hebbard by wire that I am anxiously waiting for his further report as to the cause of the collapse in the Junction Mine.

W. H. J. SLEE,

29/4/97.

Informed.—J.M., 24/4/97.

Telegram from The Inspector of Mines, Broken Hill, to The Chief Inspector of Mines, Sydney.

Broken Hill, 29 April, 1897.

POSTED report and sketches referring to Junction creep to-day. Delay was owing to having to wait for sketches.

JAMES HEBBARD,

Inspector of Mines, Broken Hill.

Seen.—W. H. J. SLEE, 30/4/97.

The Inspector of Mines, Broken Hill, to The Chief Inspector of Mines, Sydney.

Sir,

Broken Hill, 29 April, 1897.

I have the honor to inform you that on 23rd instant I visited the Junction and Junction North Mines and inspected as far as possible the workings affected by the creep which occurred on the 16th instant. As stated in my report of 17th instant, the movement had evidently commenced at the intermediate level of the Junction Mine, about 640 feet from surface, and has extended in height to the 400-ft. level, and in length as shown in the sketches enclosed, which have been furnished at my request by Mr. Phillips, the General Manager of Junction and Junction North Mines.

I proceeded in MacIntyre's shaft by the cage as far as the 400-ft. level, and then took the ladders to 675 feet. The shaft for a little distance (say 40 feet) below 400-ft. level has been dragged out of plumb, but beyond this no damage has been done, and work is now in progress for refitting the shaft. Bearers are being put in position in solid ground above the break, and the timbers will be hung securely throughout the break until the firm ground of the foot-wall of the lode is reached. Owing to the comparatively large pillar of ore left standing around the shaft the movement has only been slight, and is indicated by cracks in the back and bottom of the 400-ft. plat.

At

At the 550-ft. level the creep is more apparent, as there is considerable crushing around the plat, and the stope immediately to the north has collapsed.

Proceeding to the 550-ft. level I found all about the shaft perfectly sound, but the workings beyond the main cross-cut were broken down, and no entry could be effected.

At the 675-ft. level the timbers are only slightly affected by the crush, and operations can be resumed as soon as the shaft is in good condition. I did not attempt to go up through the stopes, as no good object could be attained by so doing, and perhaps considerable risk would be run.

I then went into the Junction North Mine, and found that the north end of the stope was not affected.

The Junction North shaft has collapsed, however, between about 420-ft. and 580-ft. levels, and the line of the break extends some little distance north of the hanging wall.

The line of the break is apparently up to where the friable ore meets the hard, the top of it extending from about 400-ft. level. Junction Mine down to 470-ft. level. Junction North Mine and back to the small lode indicated in cross-cut driven from stope in Junction Mine, as shown in transverse section. Throughout the mine the garnet sandstone has continuously followed the friable ore and caused a lot of trouble. Evidently the true wall of the lode is behind the sandstone, and it is up to that point that the ground has broken away.

I am of opinion that most of the ore will be recovered, and if the true hanging wall is of a solid character I think the mines will be worked to much greater advantage than formerly. I am enclosing the sketches, so that you may judge of the creep. The pencil-lines are, of course, only approximate, but, from the examination I made, I judge them to be nearly correct as showing the extension of the creep. I am further of opinion that the creep in Junction caused the collapse of the Junction North shaft.

Everything possible is being done to equip the shaft speedily, and when these are in working order mining operations will be resumed, in my opinion owing to the creep, under safer conditions than obtained before the creep occurred.

I have, &c.,

JAMES HEBBARD,

Inspector of Mines,

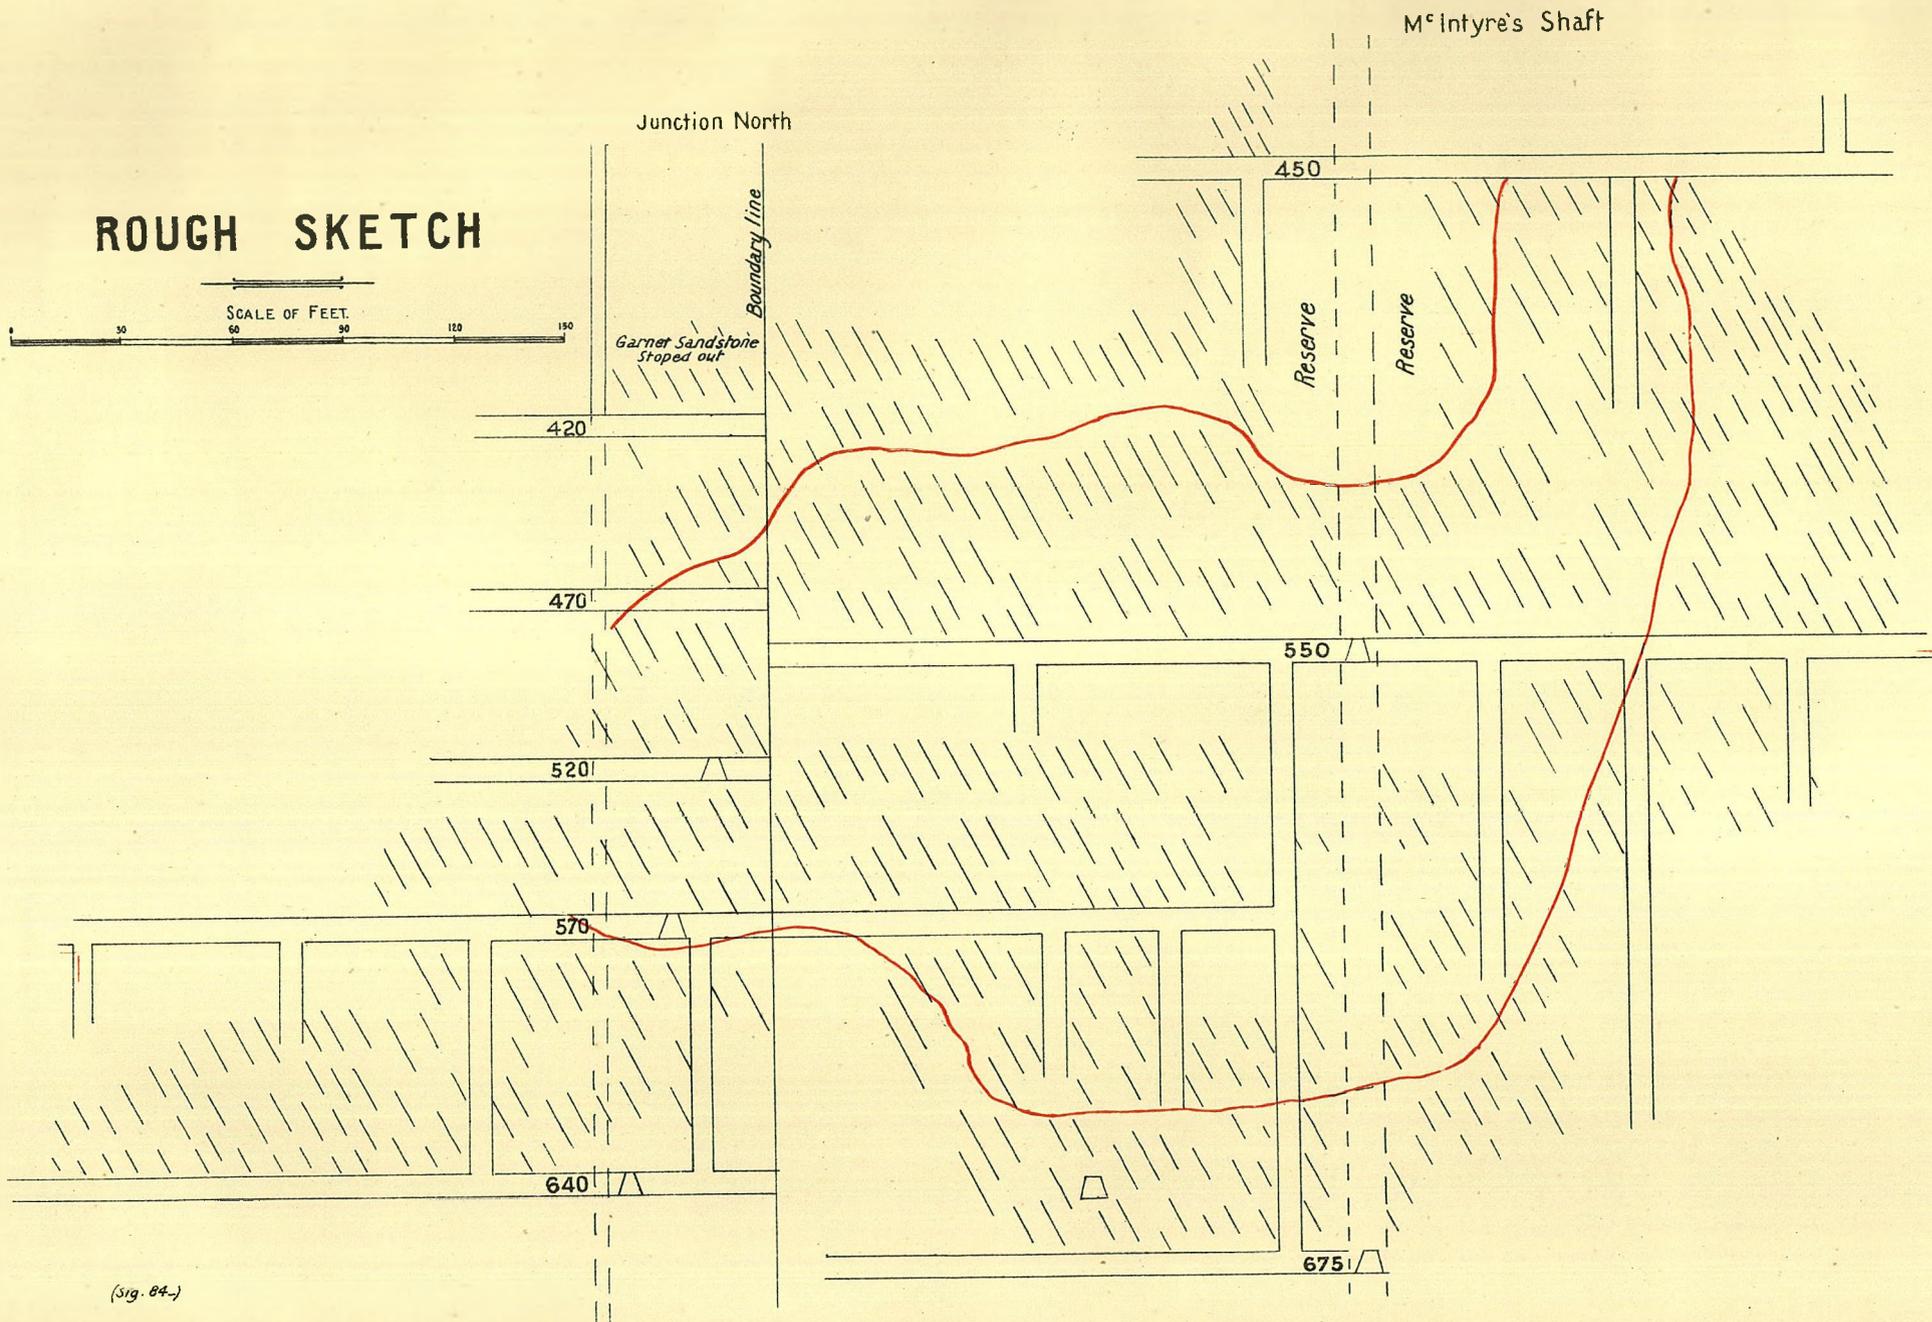

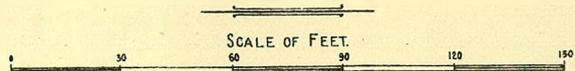

Broken Hill.

I endorse Mr. Inspector Hobbard's opinion that owing to the creep the mines can be worked on a safer principle than hitherto. Mr. Phillips, the General Manager of the Junction and Junction North Mine is without doubt one of the best Mining Managers in Australia, and is highly esteemed by the men working under him.—W. H. J. SLEE, 3/5/97. The Under Secretary. For the information of the Minister.

[Two plans.]

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

APPLICATION FOR SUSPENSION OF LABOUR CONDITIONS BY WENTWORTH
PROPRIETARY GOLD-MINING COMPANY, LUCKNOW.

(RETURN RESPECTING.)

Printed under No. 22 Report from Printing Committee, 18 November, 1897.

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated the 27th October, 1897, That there be laid upon the Table of this House,—

“Copies of all proceedings in the Warden’s Court, Orange, on Friday, 22nd October, in the matter of the application for suspension of labour conditions by the Wentworth Proprietary Gold-mining Company, together with copies of all letters and applications to the Minister on this subject, and copies of all minutes, correspondence, and other documents bearing on the matter of the above application.”

(Mr. Lyne.)

Messrs. Watterson, Collins, Eades, and others to The Secretary for Mines and Agriculture.

Dear Sir,

Orange, 13 October, 1897.

We, the undersigned, desire to call your attention to the fact that the labour conditions, as required by the “Mining on Private Property Act,” are not being carried out by any of the following companies, viz., the “Wentworth Proprietary,” the “Aladdin’s Lamp,” the “Amana,” and the “D’Arcy Wentworth” Gold-mining Companies, and respectfully request that you will at once see that the law be complied with, as is the case with all other companies similarly situated; and, if not complied with, that the leases be cancelled in the usual way, and in keeping with the Act.

We are, &c.,

P. WATTERSON, miner, Orange.
C. COLLINS, miner, Orange.
FRANK EADES, miner, Orange.
FRED. HARRISON, miner, Guyong.
A. UNWIN, miner, Lucknow.
J. CONVOY, miner, Bloomfield.

[Here follow 269 other signatures.]

Seen by Minister. Acknowledge receipt, and attach copy of reply given to question in House this afternoon.—D.McL., 14/10/97. Ackd., 15/10/97.

R. Sleath, Esq., M.P., to The Secretary for Mines and Agriculture.

Sir,

11 October, 1897.

I beg to lodge a complaint against the Wentworth Gold-mining Company for non-compliance with the labour conditions on their property situated at Lucknow, and to ask that their leases be immediately cancelled for their failure to comply with the conditions as laid down in the Act.

I am, &c.,

RICHD. SLEATH.

Memo. by Registrar.

These leases were only executed on the 8th instant, and stamped and forwarded to the Company’s solicitor yesterday. It is not the practice of the Department to entertain a complaint of non-work when lodged prior to fourteen days after issue and delivery of the lease.—E.R., 13/10/97.

HAS application for suspension of labour conditions been made to you by the Wentworth Companies? If so, date of application, and state what action has been taken by you in regard to it. Reply fully.

D. C. McLACHLAN.

Telegram from Warden King, Orange, to The Under Secretary for Mines and Agriculture, Sydney.

APPLICATIONS, dated 8th instant, received by me for suspension on Wentworth Proprietary Mines at Lucknow. Have appointed 22nd instant for hearing same, and have granted suspension of labour conditions pending such hearing.

JOHN L. KING,
Warden.

Conditional Suspension.

I, JOHN LETHBRIDGE KING, Warden for the Bathurst Mining District at Orange, hereby grant conditional suspension on the undermentioned Special Gold Leases, under the "Mining on Private Lands Act of 1894," pending further consideration of applications for six months' suspension, to be heard at Orange, at 10.30 a.m. on the 22nd October, 1897:—

P.G.L. 38, 954 acres, parish Huntley.

P.G.L. 37, 30 acres, parish Huntley.

P.G.L. 36, 36 acres 2 roods 6 perches, parish Huntley.

Orange.

9 October, 1897.

Memo. by the Under Secretary.

The following wire sent to Warden King (Orange):—

20 October, 1897.

WIRE me to-day full reasons (if any) given by Wentworth Company for suspension labour conditions. Important.

D. C. McLACHLAN,
Under Secretary, Mines.

Reply received, and handed to Minister.—D.C.McL., 20/10/97.

Telegram from Warden King, Orange, to The Under Secretary for Mines and Agriculture.

Cargo, 20 October, 1897.
BEING here on duty, have not got applications before me, but reasons given are generally as follows:— Mines unworkable owing to strike and intimidation used by pickets towards free labourers, and objection by those willing to work to be designated "scabs."

JOHN L. KING,
Warden, Orange.

Crown Solicitor's Opinion.

20 October, 1897.

THE rate of wages to be paid to miners or the conditions under which they are to work are not causes that make a mine unworkable, and therefore the application, if based upon that ground alone, should not be heard by or adjudicated upon by the Warden. Such causes do not appear to me to come within the term "unworkable from any cause." Wages and conditions must be relegated to the Minister to decide.

Application for Suspension of Labour by the Wentworth Proprietary Gold-mining Company.

SINCE receiving the intimation from the Warden that the Wentworth Proprietary Company have applied for suspension of labour conditions, I am in receipt of advice from him that the reasons given generally for the suspension are that the mines are unworkable owing to strike and intimidation used by the pickets towards free labourers, and objection by those willing to work to be designated "scabs." This opens up the question as to whether the case is one that can be properly heard by the Warden, seeing that the reasons which will be presented to him by the company will in the main be that the miners refuse to work at the rate of wages offered, and decline to accede to the conditions the management wish to impose.

The 34th section of the Mining on Private Lands Act, which deals with the question of suspension of labour, provides that if the mines shall become unworkable from any cause which would necessitate a suspension of mining operations, the Warden may grant such suspension. The question, therefore, arises as to whether the reasons named are such as can be construed as making the mine unworkable. If the application were based on the ground that the mine is flooded, that the shafts had fallen in, or that there is a failure of water, any of these would be a reason which would bring the hearing of the case within the jurisdiction of the Warden; but I doubt whether it can be held that the mine is unworkable when the reasons given are that the men regularly employed will not work unless paid a certain rate of wage, or that they demur to the conditions of employment imposed upon them. This, then, leads to the question as to whether the application is one which can, under the circumstances stated, be properly dealt with

with by the Warden. Upon this point I sent for the Crown Solicitor, and had a long consultation with him upon the whole of the facts surrounding the case; and after a most careful consideration of the Act and the regulations governing the matter, he arrived at the opinion that the rate of wages to be paid to the miners, or the conditions under which they are to work, are not causes that make a mine unworkable within the meaning of the Mining on Private Lands Act; and, therefore, the application, if based on those grounds alone, should not be heard or adjudicated upon by the Warden. Such causes, he states, do not appear to him to come within the terms "unworkable from any cause."

In view of this advising, I am of opinion that the application made by the Company should not be determined by the Warden without he has clearly placed before him the law bearing upon the case as interpreted by the Crown Solicitor. It is the first case of the kind brought under the Mining on Private Lands Act, and it is important that this aspect of the matter should be before the Court when the case is being dealt with. I therefore approve of a solicitor being engaged to place before the Warden the contention that the want of agreement between the management and the employees is not sufficient ground for the Warden to hold that the mine is unworkable within the meaning of the Mining on Private Lands Act.

The Crown Solicitor should be asked to arrange for this view of the case being placed before the Warden in open Court.

S. SMITH, 20/10/97.

Telegram directed by the Minister for Mines to be sent to Mr. Allman, Officer of Mines at Orange.

PLEASE instruct solicitor appearing to place and argue before the Warden the contention submitted in the Minister's minute with reference to application for suspension of labour conditions in connection with Wentworth Mine. Reply wire.

PLEASE forward to Department at once, without fail, all papers relating to the Lucknow leases, including evidence re suspension.

H. B. SULLIVAN.

Warden

Warden King to The Under Secretary for Mines and Agriculture, Sydney.

Sir,

Orange, 29 October, 1897.

In reply to your wire, which I received at Molong on 27th instant, and replied to same day, also your wire of even date, I have the honor to forward three applications for suspension of labour on the Wentworth Proprietary leases at Lucknow; also affidavit in support of same; copy of interim suspension and fixing date of hearing; copy of telegrams and replies; the depositions taken at the inquiry, and order made thereon.

I have, &c.,

JOHN L. KING,
Warden.

ORDER for Registration for Suspension of Work.

In the Warden's Court holden at Orange, this 22nd day of October, 1897.

WHEREAS application having been made to me for the suspension of work on the undermentioned leased lands, and evidence on oath having been given in open Court in support of such application, I hereby order the registration of the said undermentioned leased lands for partial suspension of work for a period of one month from this date, *i.e.*, on condition that not less than sixty men be employed on the three leases, *viz.* :—

On P.G.L. 37. None.
On P.G.L. 38. Fifty men.
On P.G.L. 36. Ten men.

Given under my hand at Orange, this 22nd day of October, 1897,—

JOHN L. KING,
Warden.

No. of Application.	No. of Portion.	Situation.	Lessees.
9	P.G.L. 37	} Lucknow	} Amana (Wentworth) G.-M. Co. (Ltd.) Wentworth G.F.P. Co. (Ltd.) Aladdin's Lamp G.-M. Co. (Ltd.)
10	P.G.L. 38		
11	P.G.L. 36		

JOHN KING,
Warden.

This order is irregular. The leases are not amalgamated; it should therefore be stated how many men are to be employed on each lease. There is at present no power to concentrate the labour.—E.H.R., 27/10/97.

The Warden for report.—D.McL., B.C., 27/10/97.

Warden King to The Under Secretary for Mines and Agriculture, Sydney.

Orange, 29 October, 1897.

I BEG to report that Mr. Lock, in his evidence at the inquiry, stated the leases were amalgamated. This must have been an error, but it was agreed that in regard to the suspension applications and objections thereto they should be considered together.

I have now amended my order as follows :—

On P.G.L. 37. Total suspension.

On P.G.L. 38. Fifty men on P.G.L. 36. Ten men are to be employed during partial suspension, ending 21st November, 1897.

JOHN L. KING,
Warden.

The Attorney of the Aladdin Lamp Gold-mining Company (Limited) to The Warden, Court-house, Orange.

Sir,

Sydney, 8 October, 1897.

As the duly constituted Attorney of the Aladdin's Lamp Gold-mining Company (Limited) I hereby apply, on behalf of the said company for a suspension of six months of the conditions to employ labour on P.G.L. 36 of 36 acres 2 roods 6 perches, parish Huntley, county Bathurst. This lease to the said company is dated the 4th September, 1897, and was duly executed by the lessee company on the 8th October, 1897. The labour conditions are for the employment of eight men.

This application for suspension is made under Section 34 of the Mining on Private Lands Act of 1894 and Regulation 33 thereunder.

The ground of such application is as follows :—That the lessee company, which has been continuously and efficiently mining the said property for a number of years, is prevented from putting on a number of men sufficient to comply with the conditions of the above lease owing to the action of the miners formerly in the employ of the said company going out on strike, and owing to the intimidation by the men on strike to miners able and willing to accept employment, and owing to the fear of molestation by the miners on strike in the minds of such miners able and willing to accept employment, and owing to the insufficiency of police protection in order to enable the requisite number of men being safely conducted to the mine.

In support of this application I forward herewith an affidavit of facts which is the same as that forwarded with respect to my application on behalf of the Wentworth Gold Fields Proprietary Company (Limited).

Yours, &c.,
W. TARLETON.

Declaration.

In the Warden's Court, }
holden at Orange,— }

ON this eighth day of October, one thousand eight hundred and ninety-seven, I, WILLIAM TARLETON, of Sydney, in the Colony of New South Wales, being duly sworn, maketh oath and saith as follows:—

1. I am the duly constituted attorney of the Wentworth Gold-fields Proprietary Company (Limited), The Amana (Wentworth) Gold-mining Company (Limited), and The Aladdin's Lamp Gold-mining Company (Limited).

2. On the 4th day of September last a gold-mining lease, under the Mining on Private Lands Act of 1894, was duly granted by the Crown to The Wentworth Gold-fields Proprietary Company (Limited), over P.G.L. 38 of 954 acres, parish Huntley, county Bathurst. Such lease was accepted and signed by the said company on the 8th day of October instant, and contains a condition for the employment of 191 men.

3. On the 4th day of September last a gold-mining lease, under the Mining on Private Lands Act of 1894, was duly granted by the Crown to The Amana (Wentworth) Gold-mining Company (Limited), over P.G.L. 37 of 30 acres, parish Huntley, county Bathurst. Such lease was accepted and signed by the said company on the 8th day of October instant, and contains a condition for the employment of six men.

4. On the 4th day of September last a gold-mining lease, under the Mining on Private Lands Act of 1894, was duly granted by the Crown to The Aladdin's Lamp Gold-mining Company (Limited), over P.G.L. 36 of 36 acres 2 roods 6 perches, parish Huntley, county Bathurst. Such lease was accepted and signed by the said company on the 8th day of October instant, and contains a condition for the employment of eight men.

5. The said companies have been carrying on mining operations on their respective properties for a number of years, and have efficiently and continuously worked the same.

6. The miners in the employ of the said companies went out on strike some two or three months ago, and the majority are still on strike.

7. The said companies have endeavoured, pending the issue of the abovementioned leases, to employ a sufficient number of men to comply with the labour conditions contained in the said leases, but have been prevented from doing so, owing to the action of the miners on strike intimidating the miners able and willing to accept employment, and owing to the fear of molestation existing in the minds of such miners able and willing to accept employment, and owing to the insufficiency of police protection, in order to enable the requisite number of men being safely conducted to the said mines.

8. The said companies are anxious and willing to employ the requisite number of men for the purpose of fulfilling the labour conditions contained in the said leases, but are prevented from so doing for the above reasons.

Sworn by the deponent, the day and year first above }
mentioned, at Sydney, before me,— }

W. TARLETON.

W. A. WINDEYER,
Commissioner for Affidavits.

The Attorney of the Amana (Wentworth) Gold-mining Company (Limited) to The
Warden, Court-house, Orange.

Sir,

Sydney, 8 October, 1897.

As the duly constituted attorney of the Amana (Wentworth) Gold-mining Company (Limited) I hereby apply on behalf of the said company for a suspension for six months of the conditions to employ labour on P.G.L. 37 of 30 acres, parish Huntley, county Bathurst.

This lease to the said company is dated the 4th September, 1897, and was duly executed by the lessee company on the 8th October, 1897. The labour conditions are for the employment of six men.

This application for suspension is made under section 34 of the Mining on Private Lands Act of 1894, and Regulation 33 thereunder.

The ground for such application is as follows:—

That the lessee company, which has been continuously and efficiently mining the said property for a number of years, is prevented from putting on a number of men sufficient to comply with the conditions of the above lease, owing to the action of the miners formerly in the employ of the said company going out on strike, and owing to the intimidation by the men on strike to miners able and willing to accept employment, and owing to the fear of molestation by the miners on strike in the minds of such miners able and willing to accept employment, and owing to the insufficiency of police protection in order to enable the requisite number of men being safely conducted to the mine.

In support of this application, I forward herewith an affidavit of facts which is the same as that forwarded with respect to my application on behalf of the Wentworth Gold-fields Proprietary Company (Limited).

Yours truly,
W. TARLETON.

The Attorney of the Wentworth Gold-fields Proprietary Company (Limited) to the
Warden, Court-house, Orange.

Sir,

Sydney, 8 October, 1897.

As the duly constituted attorney of the Wentworth Gold-fields Proprietary Company (Limited) I hereby apply, on behalf of the said company, for a suspension for six months of the conditions to employ labour on P.G.L. 38 of 954 acres, parish Huntley, county Bathurst.

This lease to the said company is dated the 4th September, 1897, and was duly executed by the lessee company on the 8th October, 1897. The labour conditions are for the employment of 191 men.

This application for suspension is made under section 34 of the Mining on Private Lands Act of 1894 and regulation 33 thereunder.

The

The ground of such application is as follows:—

That the lessee company, which has been continuously and efficiently mining the said property for a number of years, is prevented from putting on a number of men sufficient to comply with the conditions of the above lease owing to the action of the miners formerly in the employ of the said company going out on strike, and owing to the intimidation by the men on strike to miners able and willing to accept employment, and owing to the fear of molestation by the miners on strike in the minds of such miners able and willing to accept employment, and owing to the insufficiency of police protection in order to enable the requisite number of men being safely conducted to the mine. In support of this application I forward herewith an affidavit of facts.

I have, &c.,

W. TARLETON,

The Attorney of the Wentworth Gold-fields Proprietary Company (Limited).

Messrs. E. Hancock, R. Hancock, and D. Morton to Warden King, Orange.

Sir,

Lucknow, 18 October, 1897.

We hereby notify you that we object to suspension of labour conditions being granted to the Wentworth Proprietary Gold-mining Company, in connection with their Private Gold Leases, Nos. 36, 37 and 38.

Your obedient Servants,

EDWARD HANCOCK.

RICHARD HANCOCK.

D. MORTON.

These names were called but no answer.—JOHN L. KING, Warden, 22/10/97.

Inquiry held on applications for suspension by William Tarleton, Attorney for the Amana (Wentworth) Gold-mining Company (Limited), P.G.L., 37. The Wentworth Gold-fields Proprietary Company (Limited), P.G.L., 38. The Aladdin's Lamp Gold-mining Company (Limited), P.G.L., 36. Before Warden King, at Orange, 22nd October, 1897.

Re Suspension on }
Lucknow Leases. }

Mr. BASSETT appears for the Companies, and consents to the three applications being heard together. Mr. Kearney asks to appear for the Minister for Mines, to lay before the Warden the interpretation of the law as per his Minute—as published in the *Sydney Morning Herald*—and submit same for my consideration. He desired to inspect documents which were produced to prove Mr. Lock as authorized to appear for the Company. I ruled that unless he appeared as an objector that he had no right to inspect these documents or to cross-examine the witnesses. Mr. Sleath, M.L.A., asked to appear as an objector. Leave granted.

JOHN L. KING,

Warden.

This deponent, *Charles George Warnford Lock*, on his oath, saith as follows:—I produce an authority from Mr. Tarleton to act in these matters; I produce the leases in question; and various powers of attorney to Mr. Tarleton; I also produce power of attorney to act in this matter, and miner's rights. Previous to July last events happened which caused me to close the mines, they re-opened subsequently; nearly the whole of the old employees being re-engaged, at fresh rates of wages, and under modified rules; some 340 of those employees accepted service under the new conditions, proceeded to work, remained at work for some 2½ weeks, having signed the Company's rule book, and then, in my absence, and without notice to me, of their own accord, left my employment; when I say "they left my employment" I don't wish to imply that the whole of the men left my employment in this manner; some 80 or thereabouts remained at work until threats and insults were received by them—proceeding from some of those who had quitted work of their own accord; the result of these threats was that these additional men finally left their employment also; previous to the 80 men going out a strike had been declared and a committee appointed, and information given to me of the fact; at the present time I am ready to start work at the mines at the established scale of prices; the strike is still in existence, as far as I am aware, pickets are placed near the mines; I know some of them are men from the strikers; work has been continuously carried on at the mines, and it has never ceased notwithstanding the strike; the pickets interfere with persons coming to and from the mines; acts of intimidation have taken place; threats to deal with men when they came out; the use of abusive language and calling of filthy names; I have heard men told that the time would come when they would not have police protection and blue metal might be handy; I have had threats uttered against myself; I have not witnessed any assault; at the present time if workmen want to go to the mines they have to be escorted under police protection; statements have been made to me by men concerning intimidation; on account of this intimidation I have difficulty in obtaining a sufficient number of men; failing police protection—I have made efforts to obtain men to comply with the labour conditions but under the present conditions of affairs I have found it impossible to put on more men than are on; miners have told me they are able and willing to work provided they can freely do so; I have also received a large number of letters from miners; previous to the strike, in the month of July there were 500 men employed on the land in question; there are no men working on the Amana lease; the leases are amalgamated; in the month of June previous there were 590 men employed; for the year ending September, 1896, there were 505 men employed; for the year ending September, 1895, 400 men; 207 men is the number of men required to carry out the labor conditions; at the present time between 70 and 80 men are working; the yearly outlay in wages in 1897 was £37,000, in 1896, £43,000, in 1895, £27,000, and a great many other items charged to various heads really cover wages; the total workings at the combined mines exceeds six miles; and during the two full years of my management over one mile per annum has been added to them; the machinery and plant at the two companies is worth at least £42,500; our weekly pay-roll for some time past has been close on £1,000; the present state of the mine is bad; a very large portion of the workings, essentially that portion where work has chiefly to be done, is full of water; further, large portions of some of the drives have had considerable falls of roof, and in other places the ventilation has become so defective that it would not be safe to allow men to enter them; several of the boilers also are
needing

needing repair and cleaning, and neither pumping nor ventilation can be proceeded with until those boilers have first received attention; pending what I have just mentioned, the mine is not workable by the number of hands required by the leases; I therefore apply for a suspension of the labor conditions on each of the leases in question; three months would rectify everything; when the rectification shall be completed, I shall have occasion to employ far more than the compulsory number of men specified by the conditions to the leases; the disrepair in the mines has been occasioned by the cessation of operations; the portion of the mine now flooded is where we expect to obtain ore for crushing purposes.

By Mr. Sleath: The mines were partially closed down in July; several of the boilers were then about due for periodical cleaning; I did not clean them then; I could not obtain men to do the work; it is special work; I did not anticipate anything irregular occurring; I can't give the names of the men who gave the threats and insults to the men; I don't know their names; generally the threats were made in company; I have never stated that I would not employ any of the late employees; I have re-employed some of them; I had not the boilers cleaned as the man whose duty it was had gone on strike; the leases in question were not granted to me; I don't know when they were granted; since the 17th August last, the full complement of workmen has not been employed on the mine; I can't say if any suspension previous to this application was granted; I believe there was a previous application; I don't know that the boilers require cleaning, the Mining Regulations require that they must be cleaned at certain times; some of the boilers want repair; the machinery for pumping and ventilating the mines are in connection with the boilers that now require cleaning and repair.

Taken and sworn before me, at Orange, }
this 22nd October, 1897,— }

JOHN L. KING, Warden.

C. G. WARNFORD LOCK.

This deponent, *Frederick Harrison*, on his oath, saith as follows:—I am a miner and reside at Lucknow; I have been employed on the Wentworth Gold-mining Co's. property for about six years; I ceased work there about three months ago; I had been receiving 7s. 6d. per shift of eight hours; I left as Mr. Lock reduced the wages to 7s. and 6s. 6d., and wanted to impose other conditions; one was that he could search my home at any time; I am ready and willing to resume work at the Wentworth Mine on the old conditions; I believe the whole of the miners are prepared to do the same; I know the Wentworth mining property well; it was in good workable condition last time I saw it; I knew nothing about the boilers; the air supplied to the mine is supplied through the shafts; in a few places it is compressed air; I never saw forced ventilation in a mine connected by drives and shafts like Lucknow; I never found the ventilation bad while there; forced air is used for ventilation in two places; I suppose twelve or eighteen men would work there; I have seen no intimidation at Lucknow; I have been there all the time.

Mr. Bassett: The compressed air that drives the drills mingles with the other air. I have not been down the mines since the strike; I signed the new regulations agreeing to them; the regulations produced are not the same as I signed; I stayed at work about a week and then went out on strike.

Mr. Sleath: Previous to my leaving work I was sacked as Mr. Lock closed down the mine.

F. HARRISON.

Taken and sworn before me, at Orange, }
this 22nd October, 1897,— }

JOHN L. KING, Warden.

This deponent, *Henry Wilson*, on his oath, saith as follows:—I am an ironfounder and reside at Lucknow; I know the boilers at Lucknow; about every month it was the custom to clean every boiler out; I have cleaned them on some occasions; nothing would happen if they were left for three months without cleaning; a boiler would go for five or six months without cleaning if clean water were used and proper care taken; I believe one boiler was cleaned out about the Sunday before the strike commenced; I am capable of cleaning out the boilers; generally three or four men are employed to clean a boiler, and it would take them a shift or a shift and a half to clean one out properly; I would not go back to work for the Wentworth Company again; the boilers could be cleaned out one at a time and the work go on at the mine just the same; under the ordinary circumstances a boiler was generally cleaned out while the full number of men were employed.

By Mr. Bassett: It has made no difference so far where the boiler is situated; in some places there is only one boiler; the boilers were generally cleaned on a Saturday night when work was done. (Mr. Bassett asks witness if he was a witness in Green's case and Sommerville's case, and witness declines to answer.)

Taken and sworn before me, at Orange, }
this 22nd October, 1897,— }

H. WILSON.

This deponent, *Philip Watson*, on his oath, saith as follows:—I am a miner, and reside at Bathurst-road; I was employed on the Wentworth Gold-mining Company's property as a miner; I acted as shift boss for two or three weeks; I had an opportunity of seeing the workings known as the new shaft; there are five shafts on the property—working shafts; there are other shafts that would act as ventilating shafts; the shafts are connected by drives as far as the 600-foot level; the New shaft and the Reform shaft are connected at the 600-foot level; all the others are connected at the 500-foot; I have been connected with the mine for the last twenty-five years; I have heard complaints about the ventilation at the 800-foot level, but down to the 700-foot the air is as good as in any mine I ever worked in; I never complained of the ventilation to my knowledge; in some of the ends there are machine drills at work, and compressed air is used for driving them, and it answers for ventilation at the same time; when the mine was in full swing nine men in each shift would work in the three dead ends; two ends only would be affected by the compressed air; if the machinery went out of repair there would be only four men in each shift affected; twelve men altogether; when last I saw the mine it was in splendid condition; the bulk of the men were employed between the 500 and 600-foot level; it would take two years for the water to rise to the 600-foot level; I was discharged from the Company's employ in the first instance; I had no reason given; I would go back to the mine at the old rate of wages if I was desirous of taking a job; I was never intimidated; I would not be afraid to go to work; I have been about Lucknow the last few

few months; I have never seen anyone intimidated; we have reasoned with the men against going in at the reduced rate of wages; I can't say I know much about boilers; the work has not been interfered with by the cleaning of the boilers.

By Mr. Bassett: I have worked all over the mine, but during the last two years in the new shaft, and the last fortnight in the "Aladdin"; I don't think the Shamrock shaft is filled up; I don't know that any have been filled up with mullock; I am one of the Strike Committee; I did not see Thackaray or any man pulled off a coach; I have not seen any stone-throwing; I believe gold has been stolen, but I don't remember telling Dr. Goode so.

By Mr. Sleath: As a practical miner, I should say the mine could be put in order in twenty-four hours so as to keep 207 men employed.

By Mr. Bassett: I have seen the mine after being out of work for over three months, but not under the present scale of working; the mine from the 600-foot or 700-foot would be in as good condition for working as regards ventilation and the ground after three years as it would be after three months.

Taken and sworn before me, at Orange, }
this 22nd October, 1897,—

P. WATSON.

JOHN L. KING, Warden.

This deponent, *Henry Stain*, on his oath, saith as follows:—I am a miner and reside at Lucknow; I was employed by the Lucknow Proprietary Co. for about three years; I was discharged; no reason was given; there are four working shafts on the property; there are other old abandoned shafts used for air-shafts—three or four; they are not filled up; the working shafts are connected by drives; the ventilation is very good to the 500-ft. level; I know nothing of lower down; I know nothing about boilers; if the old wages and conditions were reverted to I would be prepared to go back to work; most of the miners in Lucknow would; I have not known of anyone being intimidated or threatened, or pulled off coaches; a number of men are on the property now; I have seen them off the property; I never saw anyone interfere with them, and they went back again; I have had five years' experience as a practical miner.

By Mr. Bassett: I am a member of the Strike Committee; I went back to work a few days after I was discharged under the new conditions; I signed my consent to work under them.

By Mr. Sleath: I had no special reason for going back.

Taken and sworn before me, at Orange, }
this 22nd October, 1897,—

HENRY STAIN.

JOHN L. KING, Warden.

This deponent, *Henry Gardiner*, on his oath, saith as follows:—I am a miner and reside at Lucknow; I have been employed on the Wentworth Gold Mining Co.'s property as a miner for about five years; I was discharged in the first place; I went to work again as I considered it was a proof that Mr. Lock had nothing against my character; I did not intend to remain at work under the new conditions; I am prepared to go back to work if the old conditions and wages are reverted to; I know several who are prepared to do the same; there are three or four working shafts and two or three abandoned shafts on the property; from the 600-foot level up I believe the working shafts are connected by drives; the ventilation is good; there are air compressors to drive rock-drills and the exhaust supplies the ventilation; one end on the 700-foot and the 800-foot level are affected by the compressed air; about twelve to eighteen persons would be employed in those portions of the mine; the bulk of the working-faces are above the 600-foot level; if the pumps went wrong I should say it would take eighteen months or two years for the water to reach the 600-foot level in the new shaft; the ground is all rock in the levels and requires no timbering; I know nothing about boilers; I have never known the miners to be stopped while the boilers were being cleaned; I have not known anyone being intimidated or frightened to go to work; I would not be afraid to do so if I got the conditions asked for.

By Mr. Bassett: I am one of the strikers; I do picket work; I am on every twenty-four hours; I have never accosted anyone going to work; pickets are posted round the mine gate, and anyone coming is sometimes spoken to; pickets, at night, are all round the fence of the property; I have never heard of anyone being pulled off a coach; I have heard that the Inspector of Police was challenged one night and jumped out of his trap and drew a revolver; I heard that a man was followed one night, and that his horse was struck and afterwards died; I heard that Mr. Lock's groom was badly wounded coming from Spring Hill to Lucknow; I do not know any strikers who were there; I saw Mr. Lock's groom some time afterwards—some weeks; the pickets are still round the mine.

By Mr. Sleath: The first I heard of Mr. Ford was in the papers.

Taken and sworn before me, at Orange, }
this 22nd October, 1897,—

HENRY GARDINER.

JOHN L. KING, Warden.

This deponent, *Charles George Warnford Lock*, recalled on his former oath, saith as follows:—Ventilation mainly depends upon the shafts, and in this connection I would like to point out that the number of working shafts is four; that there is in addition one disused shaft which does ventilate a certain portion of the workings, and that the remaining shafts—some five or six in number—have been completely filled with mullock to prevent persons getting improper access to the mine, and whilst it is quite true that certain of these shafts are connected by levels, there are many other working-faces at the ends of drives which run away from any shaft, and in such ends ventilation is always a difficult matter, and the air must become stagnant and bad if work is suspended for any length of time; for this reason, even when the mine is in full working order, pipes carrying air from compressors into such faces have occasionally to be used for ventilating purposes alone; I am aware that only a few months ago a complaint was made with regard to the ventilation; the Mining Inspector came up to inspect the mine for that special purpose, about six months ago.

By Mr. Sleath: The Inspector of Mines gave me the information that a report had been made about the ventilation; he did not make any order that I should improve the ventilation; it is absolutely untrue that no timbering is necessary in the drives—some timbering is necessary; regulation 17 provides for the cleaning out of the boilers if a boiler was subjected to a hydraulic test without being cleaned

cleaned it might burst; the conditions as to ventilation, water in the mine, and the boilers wanting cleaning have been gradually increasing; I do not know precisely what height the water is; five winzes and the workings connected therewith are now under water, and that water has increased since the strike; the air in the parts affected is not fit for men to work in; I have made no test personally; I have not been through the affected parts for three or four weeks; it was not as bad then as it is now reported to be, but it was getting bad.

Taken and sworn before me, at Orange, }
 this 22nd October, 1897,— }
 JOHN L. KING, Warden. C. G. WARNFORD LOCK.

This deponent *Mark Edward Dyett Ford*, on his oath, saith as follows:—I am Inspector of Police, stationed at Orange; I have been out at Lucknow since the strike; strikers are picketed out there; I have at times observed disorder there; at one time I saw one of the officers of the mine rushed by a crowd of men, boo-hoed and assaulted; a number of complaints have been made to me about pickets sticking up people on the road; I was myself once stuck up by five pickets; Senior-constable Kenny is in charge of the police at Lucknow.

By Mr. Sleath: Mr. M'Cutcheon was the officer stuck up; I summoned the offender for riotous behaviour, and I believe he was fined; I knew the men were pickets who stuck me up; it was at where the roads meet, about a mile from Orange; I jumped out of my buggy and drew my revolver; they cleared; they said, "Pull up, what's your name, what are you going to do?" they endeavoured to stop the horse; I could not see who the men were; they were at the pickets' camp fire; I heard no threats made at Lucknow against anyone; I saw disturbances when two lots of free labourers came in; some came in a coach from Bathurst and drove into the mine property; no one assaulted them; I saw a great rush made towards them, they were boo-hoing; others drove from Orange into the mining property; I saw no one assault them; on both occasions seven or eight police were about; I think at the time the Bathurst lot came there were twelve police; if the strikers had broken the law it would have been my duty to protect the men.

Taken and sworn before me, at Orange, }
 this 22nd October, 1897,— }
 JOHN L. KING, Warden. MARK E. DYETT FORD.

This deponent, *Charles George Warnford Lock*, again recalled on his former oath, saith as follows:—I am able to employ the men now on the mine profitably.

Taken and sworn before me at Orange, }
 this 22nd October, 1897,— }
 JOHN L. KING, Warden. C. G. WARNFORD LOCK.

Partial suspension granted for one month from this date, *i.e.*, that not less than sixty men be employed on the three leases.
 JOHN L. KING, Warden.

Wentworth Proprietary Gold-mining Company, Aladdin's Lamp Gold-mining Company, and Wentworth Amana Gold-mining Company.—Application for Suspension of Labour Conditions.

IN accordance with instructions received I proceeded to Orange on the 21st instant for the purpose of instructing a solicitor to represent the Department of Mines at the hearing before the Warden's Court of the above applications. Before leaving I consulted the Crown Solicitor, and received instructions from him (which I took down in writing) to the effect that I was to engage a solicitor who was to ask permission to be present and represent the Minister for Mines, but was not to oppose or object to anything, and who was to watch the proceedings on behalf of the Minister. On arrival at Orange I found that the only available solicitor whom I considered it advisable to instruct was Mr. Kearney. Before seeing him I received a telegram from head office as under:—

"Please instruct solicitor appearing to place and argue before the Warden the contention submitted in the Minister's minute with reference to application for suspension of labour conditions in connection with Wentworth Mines.—Reply by wire."

I accordingly went into the matter very fully with Mr. Kearney, with the contention in view that the mine was not unworkable for the reasons given by the applicants within the meaning of the 34th section or any other section relating to suspensions. I further made clear to Mr. Kearney the position he was to take up, as representing the Mines Department only, not the Crown. I also agreed with him that his fee would be £3 3s. if the case lasted half a day, and £5 5s. for the whole day.

On the case being called on, Mr. Kearney stated his position to the Bench, and that he was prepared to argue the points submitted in the Minister's minute. Mr. Bassett appeared for applicants, and Mr. Sleath as an objector. The Warden decided to call evidence, and said he would hear Mr. Kearney afterward.

Mr. Lock was called by applicant's solicitor, and he gave evidence that the mine was unworkable, not only for the reasons set out in his notice, but for various other reasons, such as defective ventilation, water in the mine, &c. This evidence was objected to by Mr. Sleath, but the Warden decided to accept it. Mr. Sleath called five witnesses in support of his objections.

Mr. Kearney's position was accordingly somewhat altered, as he could not now argue that the mine was not unworkable for the reasons given in the Minister's minute. He contended, however, that the applications by the company did not show that the mine was unworkable for any reason contemplated by the Act. The Warden eventually decided to grant suspension for one month, sixty men to be employed in the meantime. The case commenced at 11 o'clock on the 22nd instant, and terminated at 5 o'clock same day.

To the Under Secretary for Mines. R. G. ALLMAN,
 23/10/97.

For Minister's information. Mr. Allman informs me that Mr. Kearney argued the case as put in the Minister's minute in an able manner, and placed all possible points before the Warden for his consideration.—D. C. McLACHLAN, 25/10/97. Seen.—S. SMITH.

Messrs. Kearney and Lane to The Under Secretary for Mines.

Dear Sir,

Lord's Place, Orange, 23 October, 1897.

Re Wentworth G.P. Company's (Limited) application for suspension of labour. Instructed by Mr. Allman from your Department, we attended the Warden's Court here yesterday to argue the question of law as submitted in the Minister's minute. In addition to the ground given by the company in the application they submitted another ground, that the mine was unfit for working by reason of water and foul air, and gave evidence on this ground. After argument, the Warden held that in the evidence he had jurisdiction; and granted a conditional suspension—the suspension to go for one month upon the Company employing sixty men. The Warden held, too, that section 36 of 57 Vic. No. 32 gave effect to section 32 and subsections 1, 2, 3, of 37 Vic. No. 13. Great interest was taken in the case, the Court being crowded. Messrs. Lee, Colquhoun, and Bassett appeared for the Company, and Mr. Sleath, M.L.A., in his own behalf.

Yours, &c.,

KEARNEY AND LANE.

For the Ministers information.—D.McL., 28/10/97.

1897.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

COAL MINES REGULATION ACT, 1896.

(MINUTES RESPECTING THE VENTILATION AND JOINT INSPECTION OF COLLIERIES IN THE NORTHERN DISTRICT.)

Printed under No. 7 Report from Printing Committee, 10 June, 1897.

Office Memorandum.

VENTILATION OF COLLIERIES.

DURING the debate in Parliament on Wednesday evening representations were made to the Minister that in but a few collieries in the North were the provisions of the Coal Mines Regulation Act, 1896, as to ventilation complied with, and that in some cases large quantities of air were flowing through the mine, but the air was impure.

The Minister wishes Mr. Inspector Dixon to say whether there is any ground for making such statement.—H.B.S., for U.S. Mr. Inspector Dixon, B.C., 21/5/97.

I am not aware of any colliery in the North where the provisions of the Coal Mines Regulation Act, 1896, as to ventilation, are not complied with. And I most emphatically deny that there is any ground for making the statement, that in some cases there are large quantities of impure air flowing through the mines. What I mean is, that all the intake air is pure from the surface in each mine, and is only rendered impure after having been used by men, boys, and horses in the several "splits" or districts. This impure air is then passed into the return air-ways to the bottom of the upcast, thence to the surface.—J. DIXON, 22/5/97. The Under Secretary for Mines and Agriculture.

For the information of the Minister.—H.B.S., for U.S., 25/5/97.

I should like Mr. Inspector Dixon to say whether the terms of General Rule No. 1 are thoroughly carried out as regards the supply of pure air to every man, boy, and horse working in the mine. I presume that where necessary the inspectors insist upon the supply being more than 100 cubic feet per minute, as provided for in Act.—S. SMITH, 26/5.

Inspector Dixon asked by wire No. 286, 26/5/97.

Telegram from Mr. Inspector Dixon to The Under Secretary for Mines and Agriculture.

Merowether, 26 May, 1897.

So far as I am aware the terms of General Rule 1 are thoroughly carried out as regards the supply of pure air to every man, boy, and horse working in the mines, and where necessary the Inspectors insist upon the supply being more than 100 cubic feet per minute, as provided for in the Act.

With regard to the second part of this General Rule, which provides that districts or splits, of not more than seventy men in each, shall be formed, and each district be supplied with a separate current of fresh air, Mr. Inspector Dixon informed me that this had been done, and that each district is served with a separate and distinct current of fresh air, which air, after having been coursed through a district, passes into the return air-way to the upcast shaft, thence to the surface. He adds that it is a very rare thing to find the current of air at the bare minimum of 100 feet, generally the least being from 140 to 150 feet up to 400 feet per minute for every man, boy, and horse in the district.

Mr. Dixon, as well as Inspectors Bates and Humble, states that large sums of money have been expended by the proprietors of some of the collieries in carrying into effect the provisions of the new Act, regarding ventilation, refuge holes, &c.

H.W., 7/6/97.

Mr. Colliery Inspector Dixon to The Under Secretary for Mines and Agriculture.

22 May, 1897.

No application has been made by the miners for a joint inspection, and when application has been made in the past such application has never been refused. I can truly certify that during the past fifteen years (my term of office) every complaint made by the miners has been investigated at once. In the matter of a joint inspection at any of the collieries, I am of opinion that we should wait until the demand is made. And I am further of opinion that it would be better if the miners, through their lodge secretary, were to make complaint of any defect to the Inspectors direct (as they used to do) instead of to Members of Parliament. Then the matter complained of could be looked to at once, without unnecessary bickerings and heart-burnings.

J. DIXON.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

COAL-MINES REGULATION ACT FURTHER AMENDMENT BILL,
(PETITION FROM CERTAIN PERSONS EMPLOYED AT THE NEWCASTLE COAL-MINING COMPANY'S COLLIERIES
IN FAVOUR OF.)

Received by the Legislative Assembly, 20 July, 1897.

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales, in
Parliament assembled.

The humble Petition of the undersigned Residents of New South Wales, over the age of twenty-one,
and employed at the Newcastle Coal-mining Company's Collieries, Newcastle District,—

SHOWETH:—

That a Bill has been introduced in your Honorable House having for its object the limiting
of the working-hours in mines of coal and shale.

That in the opinion of your Petitioners this measure should be passed into law as speedily as
possible.

That eight hours' work in mines is quite long enough for the physical powers of men to be engaged.

That to so regulate the working-time would permit of a reasonable portion of each day being
available for purposes of recreation.

That such a regulation of eight hours would prevent undue competition and establish uniformity
of working-time conditions in all mines.

That the work of a coal and shale miner is surrounded with those conditions of unnatural light,
unwholesome air, dangers by faulty roof, &c., and so generally hazardous that these are all weighty
reasons why eight hours should be legalised.

That the production and output of coal would not be lessened by such a regulation, as such would
be productive of better discipline and lead to more regular and concerted action equally by the employees
and management alike.

Your Petitioners therefore humbly pray that the Bill before your Honorable House for the above
object may be passed into law.

And your Petitioners, as in duty bound, will ever pray.

[Here follow 207 signatures.]

Similar Petitions were received,—

- On 20th July, 1897, from certain persons employed at the Caledonian Company's Colliery,
Waratah; 112 signatures.
- „ „ from certain persons employed at the Hetton Coal Company's Colliery,
Newcastle District; 155 signatures.
- „ „ from certain persons employed at the Seaham Colliery, West Wallsend;
132 signatures.

NEW SOUTH WALES.

COAL-MINES REGULATION ACT FURTHER AMENDMENT BILL.
 (PETITION FROM CERTAIN PERSONS EMPLOYED AT GRETA COLLIERY, GRETA, IN FAVOUR OF.)

Received by the Legislative Assembly, 27 July, 1897.

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales in
 Parliament assembled.

The humble Petition of the undersigned Residents of New South Wales, over the age of twenty-one,
 and employed at Greta Colliery, Greta,—

SHOWETH THAT:—

A Bill has been introduced into your Honorable House having for its object the limiting
 of the working-hours in mines of coal and shale.

That in the opinion of your Petitioners this measure should be passed into law as speedily as
 possible.

That eight hours' work in mines is quite long enough for the physical powers of men to be engaged.

That to so regulate the working-time would permit of a reasonable portion of each day being
 available for purposes of recreation.

That such a regulation of said eight hours would prevent undue competition and establish uniformity
 of working-time conditions in all mines.

That the work of a coal and shale miner is surrounded with those conditions of unnatural light,
 unwholesome air, dangers by faulty roof, &c., and so generally hazardous that these are all weighty
 reasons why eight hours should be legalised.

That the production and output of coal would not be lessened by such a regulation, as such would
 be productive of better discipline and lead to more regular and concerted action equally by the employees
 and management alike.

Your Petitioners therefore humbly pray that the Bill before your Honorable House may be passed
 into law.

And your Petitioners, as in duty bound, will ever pray.

COAL-MINES REGULATION ACT FURTHER AMENDMENT
BILL.

(PETITION FROM CERTAIN PERSONS EMPLOYED AT THE SCOTTISH AUSTRALIAN COMPANY'S
COLLIERY, BURWOOD, IN FAVOUR OF.)

Received by the Legislative Assembly, 4 August, 1897.

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales,
in Parliament assembled.

The humble Petition of the undersigned Residents of New South Wales, over the age of twenty-one,
and employed at the Scottish Australian Company's Colliery, Burwood,—

SHOWETH:—

That a Bill has been introduced in your Honorable House having for its object the limiting of the working-hours in mines of coal and shale.

That in the opinion of your Petitioners this measure should be passed into law as speedily as possible.

That eight hours' work in mines is quite long enough for the physical powers of men to be engaged.

That to so regulate the working-time would permit of a reasonable portion of each day being available for purposes of recreation.

That such a regulation of said eight hours would prevent undue competition and establish uniformity of working-time conditions in all mines.

That the work of a coal and shale miner is surrounded with those conditions of unnatural light, unwholesome air, dangers by faulty roof, &c., and so generally hazardous that these are all weighty reasons why eight hours should be legalised.

That the production and output of coal would not be lessened by such a regulation, as such would be productive of better discipline and lead to more regular and concerted action equally by the employees and management alike.

Your Petitioners therefore humbly pray that the Bill before your Honorable House for the above object may be passed into law.

And your Petitioners, as in duty bound, will ever pray.

[Here follow 125 signatures.]

A similar Petition was received

On 4 August, 1897—From certain Coal-miners of the Illawarra District; 844 signatures.

1897.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

COAL-MINES REGULATION ACT FURTHER AMENDMENT BILL.

(PETITION FROM CERTAIN COAL-OWNERS, REPRESENTATIVES OF COAL-OWNERS, AND OTHER PERSONS CONCERNED IN THE MANAGEMENT OF COAL-MINES, AGAINST.)

Received by the Legislative Assembly, 4 August, 1897.

To the Honorable the Legislative Assembly of New South Wales in Parliament assembled.

The humble Petition of the undersigned Coal-owners, Representatives of Coal-owners, and other persons concerned in the management of Coal-mines,—

HUMBLY SHOWETH:—

1. That a Bill is now before your Honorable House, the object of which is to restrict the daily hours of labour of all persons engaged in coal-mines to eight hours.

2. That if this Bill becomes law its effect will be to diminish the output of collieries, and to increase the cost of producing coal.

3. That the present condition of the coal trade is not favourable to the imposition of any additional burdens or restrictions, some collieries being now worked at less than an adequate profit, and in some instances the investment of capital is wholly unremunerative.

4. That in the progress of recent legislation for the regulation of coal-mines the whole subject was fully inquired into, not only by Parliament, but by a Royal Commission, with the result that the present Coal-mines Regulation Act is undoubtedly a most liberal measure. Coal-owners have been at considerable expense to meet the requirements of the Act, believing it to be a final settlement of all questions requiring legislative interference for years to come.

5. That the British Royal Commission on labour, which reported to Her Majesty the Queen in 1894, in the course of their proceedings inquired exhaustively into the proposal to establish an eight-hours day, and came to the conclusion that in reference to the coal-mining industry the proposal could not be recommended.

6. That, as your Petitioners believe to be the case, the hours of labour in coal-mines in New South Wales are already fewer than those worked in the same industry in any part of the world, and your Petitioners are well assured that the legislation proposed in the Bill is not called for by hardships to those employed, or by any other sufficient reason.

Your Petitioners, therefore, pray that your Honorable House will not give effect to the proposed legislation.

And your Petitioners, as in duty bound, will ever pray.

[Here follow 30 signatures.]

VOTES No. 51. TUESDAY, 24 AUGUST, 1897.

9. CASE OF SYDNEY COOPER, AS TO MINING UNDER A ROAD, PARISH OF CLYDE,* COUNTY OF GOUGH:—
Mr. Cruickshank moved, pursuant to Notice,—
(1.) That a Select Committee be appointed to inquire into and report upon all the circumstances attending the case of Sydney Cooper, who was the holder of an authority to mine under a road separating portions Nos. 330 and 413, in the parish of Clyde,* county of Gough, such authority being obtained by him as the holder of a document purporting to be a mineral license, but which was held by the Appeal Court, holden at Inverell, not to be a mineral license, as the “butt” was not attached thereto.
(2.) That such Committee consist of Mr. Sydney Smith, Mr. Chapman, Mr. Cann, Mr. Gormly, Mr. Lonsdale, Mr. Macdonald, Mr. Moore, and the Mover.
Debate ensued.
Question put and passed.
-

VOTES No. 80. WEDNESDAY, 8 DECEMBER, 1897.

8. CASE OF SYDNEY COOPER, AS TO MINING UNDER A ROAD, PARISH OF CLIVE, COUNTY OF GOUGH:—
Mr. Cruickshank, as Chairman, brought up the report from, and laid upon the Table the Minutes of Proceedings of, and evidence taken before, the Select Committee for whose consideration and report this subject was referred on 24th August, 1897; together with Appendix.
Referred by Sessional Order to the Printing Committee.

1897.

**CASE OF SYDNEY COOPER AS TO MINING UNDER A ROAD, PARISH OF
CLIVE, COUNTY OF GOUGH.**

REPORT.

THE SELECT COMMITTEE of the Legislative Assembly appointed on the 24th August, 1897,—“to inquire into and report upon all the circumstances attending the case of Sydney Cooper, who was the holder of an authority to mine under a road separating portions Nos. 330 and 413, in the parish of Clyde,* county of Gough, such authority being obtained by him as the holder of a document purporting to be a mineral license, but which was held by the Appeal Court, holden at Inverell, not to be a mineral license, as the ‘butt’ was not attached thereto;”—have agreed to the following report:—

Your Committee having examined the witnesses named in the list† (whose evidence will be found appended hereto) find as follows:—

†See list,
page 6.

1. That Sydney Cooper, being the holder of a mineral license, was granted an authority, dated 28th August, 1893, to mine for tin upon and under a road portion No. 1, parish of Clive, county of Gough, between portions 413 and 330.

2. That Cooper worked continuously on the ground from August, 1893, to March, 1896, and that no work had been done on the land in question at the time Cooper applied for the authority.

3. That subsequently it became evident that portion of the ground was mined under, as a serious subsidence took place, and Cooper ultimately took proceedings in the Warden’s Court against the holders of the adjoining land in respect of same. Pending the hearing of the case an injunction was issued restraining the defendants from dealing with the wash-dirt (estimated to contain from 4 to 5 tons tin ore) then in their possession, and supposed to have been taken from the ground in question.

4. That, at the hearing of the case at the Warden’s Court, a verdict was given against Cooper by Acting Warden Saunders on the ground that no encroachment had been proved. Cooper immediately appealed against this decision to the Mining Appeal Court.

5. That, prior to the hearing of the case in the Warden’s Court, Cooper had applied to the Acting Warden for the necessary order for an opening to be made, from the ground which had fallen in, to the defendant’s workings, in order to establish the connection and prove the encroachment; but the order given by the Acting Warden only permitted of a survey being made of the workings then open, which was obviously insufficient for the purpose in view.

* NOTE.—Should be CLIVE.

6. That, on a similar application by Cooper, after the case had been dealt with in the Warden's Court, and prior to the appeal being heard, an order was issued to Surveyor Folkard to fully survey the underground workings; and Cooper was prepared to place the facts disclosed by such survey before the Appeal Court.

7. That a technical point was taken in the Appeal Court that Cooper was not the holder of a mineral license at the time he obtained the authority, as the "butt" was not attached to such license. The Judge held that the point was fatal, and Cooper was compelled to withdraw his case.

8. That the Judge thereupon dissolved the injunction, and that Cooper immediately applied for a further injunction, which was refused.

9. That a clause was inserted in the Mining Act Amendment Bill (then before Parliament, and which was subsequently passed) to remedy the defect in the law which resulted in the disallowing of Cooper's appeal.

10. That Cooper went to considerable expense in his appeal, his legal costs and loss of tin ore being estimated at £300.

11. Your Committee have not deemed it necessary to call further evidence in order to thoroughly investigate the subject matter of the legal proceedings, but they are satisfied from the evidence taken that Cooper had good cause of action, that he adopted every possible means within his power to prove his case, and that he was prevented from proceeding because the mineral license issued to him by the Mines Department was held by the Judge of the Appeal Court not to be a mineral license within the meaning of the Mining Act, in consequence of which he suffered considerable loss.

Your Committee therefore recommend Cooper's case to the favourable consideration of the Government.

GEO. A. CRUICKSHANK,
Chairman.

*No. 3 Committee Room,
Legislative Assembly,
8th December, 1897.*

PROCEEDINGS OF THE COMMITTEE.

THURSDAY 21 OCTOBER, 1897.

MEMBERS PRESENT:—

Mr. Cruickshank,		Mr. Moore,
Mr. Macdonald.		

Mr. Cruickshank called to the Chair.

Entry from Votes and Proceedings appointing the Committee, read by the Clerk.

Ordered,—That the Under-Secretary for Mines be summoned to give evidence next meeting.

[Adjourned till Wednesday next at 2 o'clock.]

WEDNESDAY, 27 OCTOBER, 1897.

MEMBERS PRESENT:—

Mr. Cruickshank in the Chair.

Mr. Cann,		Mr. Gormly,
Mr. Moore,		Mr. Lonsdale.

Duncan McLachlan (Under-Secretary for Mines), called in, sworn, and examined.

Witness withdrew.

Committee deliberated.

Reassembling of the Committee to be arranged by the Chairman.

Adjourned.

WEDNESDAY, 24 NOVEMBER, 1897.

MEMBERS PRESENT:—

Mr. Cruickshank in the Chair.

Mr. Gormly,		Mr. Lonsdale,
Mr. Moore.		

William Richard Collis (Clerk in the Mines Department), called in, sworn, and examined.

Witness withdrew.

[Adjourned till To-morrow at 2 o'clock.]

THURSDAY, 25 NOVEMBER, 1897.

MEMBERS PRESENT:—

Mr. Cruickshank in the Chair.

Mr. Gormly,		Mr. Moore,
Mr. Lonsdale,		Mr. Macdonald.

Sydney Cooper called in, sworn, and examined.

Witness handed in plan illustrating the dispute between Cooper and Costello. [*Appendix A.*]

Witness withdrew.

[Adjourned till Tuesday next at 12 o'clock noon.]

TUESDAY, 30 NOVEMBER, 1897.

MEMBERS PRESENT:—

Mr. Cruickshank in the Chair.

Mr. Moore,		Mr. Lonsdale,
Mr. Gormly,		Mr. Macdonald

Francis Augustus Wright (*a Member of the Legislative Assembly*) called in, sworn, and examined.

Witness withdrew.

Sydney Cooper recalled, and further examined.

Witness withdrew.

[Adjourned till Tuesday next at 2 o'clock.]

TUESDAY,

TUESDAY, 7 DECEMBER, 1897.

MEMBERS PRESENT :—

Mr. Cruickshank in the Chair.
Mr. Gormly, | Mr. Moore.
[Adjourned till 3:30 o'clock This Day.]

The Committee reassembled at the hour named.

MEMBERS PRESENT :—

Mr. Cruickshank in the Chair.
Mr. Cann, | Mr. Moore.
Committee deliberated.
[Adjourned till To-morrow at 3 o'clock.]

WEDNESDAY, 8 DECEMBER, 1897.

MEMBERS PRESENT :—

Mr. Cruickshank in the Chair.
Mr. Gormly, | Mr. Macdonald,
Mr. Cann, | Mr. Moore.
Chairman submitted Draft Report.
Same read, amended, and agreed to.
Chairman to report to the House.

LIST OF WITNESSES.

	PAGE.
Collis, W. R.	9
Cooper, S.	10
McLachlan, D.	7
Wright, M.P., F. A.	12

1897.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON THE

CASE OF SYDNEY COOPER, AS TO MINING UNDER A
ROAD, PARISH OF CLIVE, COUNTY OF GOUGH.

WEDNESDAY, 27 OCTOBER, 1897.

Present:—

MR. CANN,
MR. GORMLY,

MR. LONSDALE,
MR. MOORE.

GEORGE ALEXR. CRUICKSHANK, ESQ., IN THE CHAIR.

Duncan McLachlan, Under Secretary for Mines, sworn and examined:—

1. *Chairman.*] You are the Under Secretary for Mines? I am.
2. Do you know the case of Sydney Cooper? From the papers I have a knowledge of the case.
3. Will you make a short statement of the case to the Committee? Briefly, Mr. Cooper held an authority to mine on a roadway, that is, what they call a 28-section authority, and there was a man named Costello who held the adjoining land, and who was mining on that land. Cooper said he discovered that Costello had gone from his land and worked out on to the roadway, for which he had an authority, and removed about 500 loads of washdirt which, of course, properly belonged to Cooper if the allegation had been proved. Cooper brought an action against Costello in the Warden's Court for trespass on this authority of his, but the Warden dismissed the case with costs against Cooper. Then Cooper appealed to the Mining Appeal Court, and Costello, through his solicitor, took the point that Cooper was not the holder of a mineral license. The point was that Cooper held a mineral license, but that he did not hold the butt of it, and it was decided by the Court to be an invalid document. As soon as that verdict was given in June, 1896, Cooper threw up the case, and subsequently he made an application to the Department for compensation for giving him what he considered was practically an imperfect title. The Department objected to pay any compensation, for the reason that Cooper had not proved that he had lost anything, that he had not proved that Costello had removed washdirt to which he was entitled, and that, therefore, he had not shown that he had suffered any loss. Briefly, those are the only facts I know of in the case. I may mention that the Minister afterwards brought in a Bill to validate all mineral licenses issued with or without the butt.
4. *Mr. Moore.*] And miners' rights? Yes.
5. But still the Department did not admit that it was necessary to do that? It was done so that people would have some guarantee of security if there was any suspicion lurking in their minds as regards the validity of their titles, but the point was a very small one indeed. Judge Coffey, when he decided that the mineral license was an invalid document in the condition in which it was presented to him, offered to adjourn the case for a few days. I presume the offer was made in order to allow this party to get the other part of the document from the Warden's Clerk, but I do not think that he ever made any effort to do that; he threw the case up altogether, and I infer that he said to himself, "It is better for me to go for the Department than to go for the man." The point with the Department is that he has never proved that he has lost anything.
6. *Mr. Cann.*] Is the license which was issued to Cooper the same as the license which is usually issued in all cases in the Mines Department? It is exactly the same document as has been issued from the beginning.
7. *Mr. Gormly.*] And when the Department issued that license, they supposed that it was a good license? It was always held to be a good one, and it had never been challenged until this case.

D. McLachlan.

27 Oct., 1897.

- D. McLachlan. 8. Until the Court in this case decided otherwise? Quite so. Immediately afterwards we validated all licenses that had been issued.
- 27 Oct., 1897. 9. *Chairman.*] On that decision by Judge Coffey the Minister brought in a Bill to validate all these licenses? Yes; it really arose out of that case.
10. *Mr. Moore.*] What the Minister really did was to insert a validating clause in a Mining Bill? Yes, in 60 Vic. No. 7.
11. Who was the Warden? Mr. Acting-Warden Saunders.
12. Of Inverell? Yes.
13. Was he an experienced Warden;—had he had any experience in mining matters? He had not had a very large experience, but in all cases he adjudicated upon for us he gave us every satisfaction.
14. *Chairman.*] Did he ever sit in the Warden's Court in any other district besides the Inverell district? That I could not say, as it occurred before my connection with the Department. I do not think he had; I believe his experience as a Warden was confined to the Inverell district, although he had experience as a Warden's Clerk elsewhere.
15. Is it not a fact that this is the only Warden's case of any importance that he has adjudicated upon? I could not answer that question right off. I would have to get the records of his Court before I could answer the question.
16. *Mr. Moore.*] Was he a Warden's Clerk and Mining Registrar? I think he was a Warden's Clerk, and this would carry Mining Registrar's duties as well.
17. You cannot say of how many years' standing? No, but I could furnish that information to the Committee. I do not think he has had great experience as a Warden, but he has given us the utmost satisfaction in the cases he has dealt with.
18. Have you the evidence which was taken in the case? No; it is in the Court-house at Inverell.
19. *Mr. Cann.*] Did the Department survey this road out before they gave him the permit to mine under it? Yes.
20. And also the land on both sides of the road? Yes.
21. It was all surveyed? Yes.
22. Did you ever call for any reports as to whether any encroachment had been made on their lands by either side? No.
23. The Department had no reason to suppose that any encroachment was being made? Quite so. We considered that it was quite a matter between Costello and Cooper. We did not interfere at all. We considered that it was for them to take the matter to the Court and prove who was right.
24. *Mr. Gormly.*] The Department does not take any responsibility for these encroachments? None whatever.
25. The Department give a license to mine on certain defined ground, and when they do that their responsibility in regard to encroachments ceases? Quite so.
26. *Mr. Cann.*] Do you keep in the Department any plans of the underground workings of the different mines which are worked? No; we have not a plan of all.
27. You do in the case of coal-mines? Yes.
28. But you do not in the case of minerals other than coal and shale? No; but the holders of that land are supposed to keep a plan showing their workings, which we can call for at any moment.
29. Did you call for the plans in this instance? No; because we took no part whatever in the proceedings. It was regarded simply as a question between the two litigants.
30. Could you call for the plans if the Committee asked you to do so? We could.
31. *Mr. Gormly.*] Would you be likely to get them? I very much doubt whether we would get them.
32. They might not be procurable? They would, if in existence, probably be sketch plans. They would be drawn to no scale, and therefore they would be worthless.
33. *Chairman.*] Was Mr. Surveyor Folkard your officer? No.
34. At whose instance did he survey this ground? That I could not say. It was not at the instance of the Department.
35. *Mr. Moore.*] He does work for the Department? He may be employed occasionally, and get a fee for doing work in the ordinary way, as a licensed surveyor.
36. *Chairman.*] Were these surveys made at the instance of the Department;—was he an officer of the Department at the time they were made? I could not say.
37. *Mr. Gormly.*] Did he survey under an instruction from the Department? He did not survey the land under an instruction from the Department. The surveyor who did is named Sewell.
38. Then it was surveyed by the Department? Yes.
39. *Mr. Moore.*] There was no survey made of the underground workings? No; it was a survey for the authority.
40. *Chairman.*] It appears to me that there was an application made for an injunction after the dismissal or withdrawal of the appeal to the Department, which was refused in consequence of the Judge dissolving the injunction granted in the first instance by the Warden; can you tell me if that is the case? No; I have not a knowledge of that, because that application for the injunction would be made to the Warden; and, of course, the records of that are in the Court-house in Inverell.
41. You are not aware that the application was made for an injunction after the dismissal or withdrawal of this appeal, and refused by the Department? No.
42. *Mr. Gormly.*] The papers before you do not disclose that? They do not, although it may be possible that he applied to the Warden for an injunction to restrain the other man.
43. *Chairman.*] You are aware that the not granting or dissolving the injunction would allow the removal of any washdirt which might be on the ground which Cooper claimed? Quite so, if on the ground the authority covered.
44. Do you know where the butt of the mineral license was at the time the case was tried? It was in the Warden's Clerk's office.
45. At Inverell or at Tingha? I believe it was at Tingha he took out his license, and it would be there.
46. Have you had cases under the decision given by the Chief Justice in Equity in the Homeward Bound Gold-mining case on this point? No; this is the only case we have had.
47. The Government had not dealt with this particular point before under the decision given in the Homeward Bound Gold-mining case? No.

WEDNESDAY, 24 NOVEMBER, 1897.

Present:—

MR. GORMLY, | MR. LONSDALE,
MR. MOORE.

GEORGE ALEXR. CRUICKSHANK, ESQ., IN THE CHAIR.

William Richard Collis sworn and examined:—

48. *Chairman.*] What is your occupation? Clerk-in-charge, Lease Branch, Mines Department.
 49. Have you the evidence taken at the Warden's Court in the case Cooper against Costello? Yes, I produce it.
 50. Can you give me any information as to whether the judge made any award on the ground that Cooper's title was illegal? The evidence I produce is the evidence taken in the Warden's Court. Judge Coffey's decision is not on record, as far as I can ascertain, and he has his notes with him.
 51. Have you not the evidence taken at the Appeal Court? No.
 52. *Mr. Moore.*] Have you any papers with reference to the case at the Appeal Court? Yes; I have a report. We asked the Registrar of the District Court to forward the depositions taken in the Mining Appeal Court, and this is his reply:—

W. R. Collis,
24 Nov., 1897.

In reply to your letter of 16th inst., I have the honor to inform you that no depositions appear to have been taken in the appeal case Cooper v. Costello, with the exception of the Judge's notes, which he has in his possession.

53. Have you any other evidence bearing upon the case? No other evidence.
 54. *Mr. Gormly.*] Have you any other documents bearing on the case that you can place before the Committee? Not so far as I know, except a letter by Mr. Boyd, the solicitor for Cooper, and a Press report of the proceedings in the Mining Appeal Court. I have all the Departmental papers in the case, right from the application for the authority up to the present time.
 55. What other facts have you in connection with the case, outside the depositions, that may be of use to the Committee? I do not know of anything.
 56. Would you state as briefly as possible the facts of this case, and what your knowledge of it is, as disclosed by the papers? Sydney Cooper applied for a permission in July, 1892, to mine under the road separating portions 330 and 413, parish of Clive, county of Gough. The application was granted, and the authority was issued to Sydney Cooper on the 28th August, 1893, giving him permission to mine for tin upon and under that road, area 1 acre.
 57. *Mr. Moore.*] Was it a condition of that that he should be the holder of a mineral license? Yes, that he should be the holder of a mineral license in force, to be held annually, and to be produced on the 25th August in each year.
 58. *Mr. Lonsdale.*] You would not acknowledge that permit unless he had that mineral license? Certainly not.
 59. *Mr. Moore.*] Before the Department issued the permit to Cooper it satisfied itself that he was the holder of a mineral license? Certainly.
 60. Otherwise you would not have issued the permit? Certainly not, he would not have been qualified.
 61. In fact you have, either on his application, or on the permit itself, the date of his mineral license and the number? The Warden's clerk has instructions to fill in in the authority the date of the mineral license produced, and a renewal of the mineral license must be taken out on the expiry of that license.
 62. Have you that day there? The 25th August.
 63. What year? I presume the date this was issued, that is 1893.
 64. In his application for the authority, what date does he give for his mineral license? 6th August, 1892. Of course that mineral license held good till the 5th August, 1893. An applicant for authority must be qualified at the date of the application, and when the authority issues eventually he must show then that he is the holder of a mineral license.
 65. *Mr. Lonsdale.*] His mineral license was dated the 6th, and he gets it on the 25th;—he must show that the mineral license of the 6th August qualifies him? The mineral license on the 6th August qualified him to make that application. When the authority was granted he took out a license on the 25th August, but the authority was not granted till the 28th.
 66. *Mr. Moore.*] The only material part is that he was qualified to apply in the first place? Yes.
 67. By virtue of his mineral license? By virtue of his mineral license.
 68. And then the Department granted him the authority because he had that mineral license? Yes.
 69. That mineral license, I suppose, was issued in the form in which all mineral licenses have been issued by the Mines Department right from the beginning? Since 1874.
 70. Since mineral licenses were brought into existence? Yes.
 71. It was in that form? Yes.
 72. That is without the butt? Without the butt.
 73. I presume the Department has issued some thousands of mineral licenses? Yes, annually.
 74. And also miners' rights? And miners' rights.
 75. *Chairman.*] In other words, it has been the practice to consider a mineral license without the butt a complete mineral license? Yes, up to the date of Judge's Coffey's decision. The butt was retained by the Mining Registrar as his record.
 76. Are you aware that on Judge Coffey's decision in this case a Bill was introduced by the Minister for Mines amending the Act so as to validate the mineral licenses without the butt? Yes, that is so.
 77. Have you any information in the papers to show us the date upon which Cooper applied for an injunction against Costello for removing the tin;—the authority was granted in 1893, was it not? Yes.
 78. What was the next phase of the matter that came before the Department? The next, I think, was a complaint that the traffic on the road was interfered with. The proceedings in the Warden's Court were really between Cooper and Costello, apparently for encroachment.
 79. *Mr. Moore.*] So far as the Department is concerned, these papers will disclose what was the next phase of the question that came up? As to the dispute between Cooper and Costello we have nothing. That is apparently between themselves.

- W. R. Collie. 80. I inferred from what Mr. Cruickshank said that there was some application made to the Department for an injunction? I think Mr. Cruickshank means an application for suspension of labour between the time of the hearing of the case in the Warden's Court and the appeal. Cooper applied for permission from the Minister to suspend the labour conditions under his authority, pending the issue of the appeal.
- 24 Nov., 1897. 81. Was any application made by the Mines Department in Sydney for an injunction in connection with the case? I can find no record of any written application for such a thing. No application was made to the Mines Department for an injunction, so far as I know.
82. Is that authority which was granted to Cooper still in existence? Yes.
83. You still consider it good? We still consider it good.

THURSDAY, 25 NOVEMBER, 1897.

Present:—

MR. GORMLY, | MR. MOORE,
MR. LONSDALE, | MR. MACDONALD.

GEORGE ALEXR. CRUICKSHANK, Esq., IN THE CHAIR.

Sydney Cooper sworn and examined:—

8. Cooper. 84. *Chairman.*] You are a miner at Stannifer? Yes.
- 25 Nov., 1897. 85. You are plaintiff in the case of Cooper *versus* Costello? Yes.
86. This case came before the Warden's Court some time in March? Yes.
87. Can you give us the date? On the 12th March, 1896.
88. You make your living by mining? I do.
89. Do you know portion 1 of the land in question? I do.
90. Do you know the adjoining block, 413-330? Yes.
91. Were you holder of a mineral license for previous years at the time you applied for the right to mine under the roadway? Yes.
92. You received that license from the Government Officer as a true mining license? I did.
93. Did you produce the mineral license at the time you applied to be allowed to mine under this roadway? I did.
94. There was no exception taken to it at any time by the Department? No.
95. The authority to mine under the road was granted upon the license which you exhibited? Yes.
96. Do you recollect the number of your authority? No. 859.
97. Did you work continuously on this land afterwards? I did.
98. Can you tell me the dates that you were working there after you got this authority? I worked continuously up to 1896.
99. How long did you hold this ground? I have been on the ground since 1892.
100. Had any work been done under the roadway at the time you applied for the authority? None whatever.
101. You believe that work was done by other parties which affected your interest in this mine? I do.
102. Your trouble is, that it was owing to the defect of title given you by the Department that you were unable to prove your case? Yes.
103. Could you give us any idea of the amount of washdirt that was taken out of the ground encroached upon? From 300 to 400 loads.
104. What would you estimate the damage to the ground at? At £100.
105. Had you a proper survey of the workings at the time when you appeared at the Warden's Court at Tingha? No; I had not a complete survey underground.
106. Was the hearing of that case adjourned from Tingha? Yes; to Inverell.
107. What was the intermission between the time that it was heard at Tingha and the time it was heard at Inverell? One week.
108. Did you at any time take such steps as would have enabled you to have a proper underground survey made? I did.
109. Was this before or during the inquiry? It was before and during the inquiry. I tried before the inquiry, and during the inquiry, before we closed our case at the Warden's Court, and then again before the appeal.
110. You tried to get authority to enable you to test the connection between the adjoining land and your own, as to where there was an encroachment? Yes.
111. Were you prevented from ascertaining whether there was any encroachment? I was refused the order by the Warden.
112. When did you first apply for an order to make such survey as would have been necessary to prove the encroachment? When I first commenced proceedings, about the 5th March.
113. To whom did you apply? To Acting-Warden Sanders.
114. And he refused to give you such authority as would enable you to get this information? He did.
115. When the case came on at the Warden's Court, was this one of the reasons given why you were unable to prove your case? It was.
116. Was this the reason why the verdict was given against you? It was. I had shown no underground communication. I had not proved that there was a trespass, because I could not show the underground communication.
117. You maintain that you were prevented from showing this trespass by the fact that the Acting-Warden refused to grant you authority to test the ground to see if there was an encroachment? I do.
118. Then, when the case came on, a verdict was given against you in the Warden's Court, because you had not proved the encroachment? It was.
119. Did you then make application for an adjournment to test the ground to see where the encroachment came from? I did.
120. Was it granted? No; it was refused on the ground that Acting-Warden Sanders considered that it was late for us to ask for an adjournment.

S. Cooper.

26 Nov., 1897.

121. He refused it before, then refused it at the Court, because it was rather late? Yes.
122. That is after having refused it previously? Yes.
123. Whilst you were working there, I suppose you always kept within the four corners of your land? I did.
124. When the underground measurements were made, was it shown that more tin was taken out of the ground than had been brought to the surface by you? Yes; tin had been taken out independent of mine.
125. Could the surveyor give an estimate of how much? He could give an estimate of the quantity of dirt that was taken out.
126. And it was on that estimate that you estimate your loss at £100? The damage was caused by letting the ground down. My action was for trespass and damages, £100—damage that accrued through their letting the ground down.
127. That was the subsidence? Yes.
128. Did you include that in the estimate of damage done? No.
129. Did you consider the subsidence was a serious loss to you in the working of this ground? Yes; it was a serious obstacle to me in working it.
130. Would it have been costly to you to have repaired the damage done before going to work? It would have cost £100 to timber it up, quite independent of the tin that was taken out of the ground.
131. After the hearing of this case in the Warden's Court, you applied to have a proper survey of the underground working? I did.
132. Did you get authority then to work on the adjoining land? I got authority from the Warden instructing Surveyor Folkard to do the work.
133. Were those instructions given from the Government? They were given to me in writing from Acting-Warden Sanders.
134. Did you take the same course in the latter case as in the first, before the hearing in the Warden's Court? Application was made in the same way, and what had been at first refused was subsequently granted.
135. Do you produce a map here which is a plan of the underground working of the mine? Yes. [*See Appendix.*]
136. Could you tell me which of the shafts were put down by you, and which of the shafts were put down by the tributors of the adjoining holder, and which shaft was worked by someone who took the tin away? Yes.
137. Do you know shaft C? Yes.
138. Was that sunk by you? Yes.
139. I see a shaft on the ground marked J? Yes; that was sunk and worked by me. I bottomed wash-dirt in J shaft.
140. I see shaft "G" marked here? Yes; I worked shaft G too.
141. Was that connected with J? G and J were worked together; J was an air shaft.
142. What shaft was the one marked H? That was a working whip shaft.
143. What is shaft B? That was a tributor's shaft; it was sunk by trespassers.
144. The road was not measured at that time? No.
145. Can you tell me anything about shaft E? That was sunk by my tributors.
146. Are No. 1 and No. 2 shafts on Costello's ground? They are.
147. Where did the encroachment commence? From No. 1 and No. 2 ground; the encroachment commenced which worked into my line and took my tin.
148. You produced a map at the Mining Warden's Court, did you not? I did.
149. Was that a complete map? No.
150. Is this a complete map before us? It is a complete map, made by Surveyor Folkard.
151. I understood you to say that you applied for this order to test the encroachment before the hearing of the case in the Warden's Court? I did.
152. That was refused to you by the Warden? It was.
153. And the verdict was given against you because you had not tested the encroachment? Because I had shown no trespass.
154. After the hearing at the Warden's Court, and before the case came on at the Appeal Court, the same Warden gave an order to Surveyor Folkard to make a survey? Yes.
155. Then, after this was done you appealed against the decision of the Warden's Court? I did.
156. When your case came on at the Appeal Court, had you an opportunity of giving this evidence? No.
157. I understand that the verdict was given against you? It was given against me on a technical point.
158. On what ground was this verdict given against you? On the ground that my mineral license or title was insufficient.
159. *Mr. Moore.*] The point was taken that your mineral license was not a mineral license? Yes; because the butt was not attached. The Judge held that it was not a mineral license within the meaning of the Act.
160. *Chairman.*] Judge Coffee suggested that you should withdraw the appeal? No; I do not think he did.
161. *Mr. Moore.*] You could not proceed any further with the case? No.
162. Then you had to withdraw the case? Yes.
163. And the Judge then and there dissolved the injunction? Yes.
164. The injunction protected the tin that was in dispute? Yes; pending the result of the inquiry. The tin was not on my land.
165. *Chairman.*] After the injunction was dissolved by the Court, did you seek further advice with the view of continuing your case? I did.
166. What were you advised? I made application to the Warden for another injunction.
167. On advice you made application to the Warden for another injunction? Yes.
168. With a view of continuing your case? Yes.
169. *Mr. Gormly.*] What was the result? He refused it.
170. *Chairman.*] Then the tin was removed after the dissolving of the injunction? Yes.
171. When the Warden refused to grant the injunction, did you take other steps to get an injunction? Yes; I wired Mr. Wright to make application to the Mines Department for an injunction.
172. Were you advised through Mr. Wright that you should apply to the Warden for this injunction? No;

- S. Cooper. No; I was advised through my solicitor to make application to the Warden, which was refused. Then I made application through Mr. Wright to the Minister for Mines for an injunction.
- 25 Nov., 1897. 173. Did the Department wire to the Warden, asking why he had refused? They did.
174. The result was that you were not allowed to get this injunction? I did not get an injunction.
175. The consequence was that the tin was removed and you were unable to proceed with your case? Yes.
176. You thought that you had a good title? I did.
177. You applied in the ordinary course of things for an order to prove the encroachment? I did.
178. You produced all the plans that you could get at the Warden's Court? I did.
179. And you applied for an adjournment of the Warden's Court to enable you to make a further survey? I did.
180. So you did everything that it was in the power of a miner to do to prove your case? I did.
181. You felt that all your efforts to prove your case were frustrated through the decision of the Judge that you had no title? Yes.
182. Mr. Moore.] This £100 does not include the value of the dirt, does it? No; I valued the dirt at from £130 to £150.
183. Is £100 a fair thing to claim for the damage done by letting down the ground? Yes. I was working in an open cutting, the depth of which was 25 feet. Theirs was less than 18 feet, and when I brought my cutting opposite the broken ground I had to log the whole thing round.
184. You lost that washdirt? Yes, altogether.
185. And you consider that it contained between 4 and 5 tons of tin? Yes; it was valued at about £150.
186. What would the cost of washing be? About £30.
187. So that there was over £100 net? Yes.
188. Chairman.] Could you give the Committee any idea of what your loss was altogether? I lost about £300.
189. How do you make it up? It includes the value of the tin, my legal expenses, and all the expense attached to opening up the ground and other incidental expenses.
190. Will you tell me what the plan is that you produce? It is a map of the underground workings in the mine concerned in the case of Cooper v. Costello.
191. Mr. Moore.] Did you accompany Surveyor Folkard when he surveyed your workings? I did.
192. You inspected the workings where the trespass took place? Yes.
193. Was the ground timbered? It was.
194. What state was the timber in? It was in a perfectly good state—as green as when it was put there.
195. How long had it been in? It could not have been more than six months; it was as green as on the day it was cut down.
196. So you are quite positive, from the state of preservation in which the timber was, that the ground had been worked at a very recent date? Yes.
197. You found that this ground had been worked from Costello's shaft? Yes.
198. Was it connected with any other workings? Not at all.
199. Was it connected with your workings? No.
200. It must have been worked from Costello's land? Yes; and it was impossible to get the dirt up any other shaft than No 2.
201. You swear that you never worked it? I swear that I never did.
202. And it was never worked by anybody with your authority? No.
203. Your legal expenses in this case came to about £131? Yes.
204. You produce the account? Yes.
205. Is it correct? It is quite correct.
206. Roughly speaking, what were your costs in connection with your appeal? £80 or £90.
207. Mr. Lonsdale.] These are the costs in the Warden's Court and the Appeal Court? Yes.
208. Which were the larger? The costs in the Appeal Court? The costs in the Warden's Court might have been about £40.
209. Chairman.] The expense of your working and the loss of the tin you estimate at £169? Yes; making in all £300 Gs. 6d.

THURSDAY, 30 NOVEMBER, 1897.

Present:—

Mr. GORMLY,
Mr. LONSDALE,

Mr. MACDONALD,
Mr. MOORE.

GEORGE ALEXR. CRUICKSHANK, Esq., IN THE CHAIR.

Francis Augustus Wright, Esq., M.P., sworn and examined:—

F. A. Wright, Esq., M.P. 210. Chairman.] It appears that Mr. Cooper has been refused by the Warden an injunction to protect the tin on certain land, and that an application was made through you to the Department of Lands;—will you kindly give us the benefit of your knowledge in connection with the case? Yes. Some considerable time ago—I cannot fix the date—I received a communication from Mr. John Boyd, solicitor, of Inverell, pointing out that in the case of Cooper versus Costello the Judge had ruled that the mineral license held by Mr. Cooper was not a mineral license within the meaning of the Act—that he should have had in his possession the butt of that license (which he had not), instead of only the counterpart. Mr. Boyd's letter went on to ask me to interview the Department and see if the Minister would grant an injunction for the time being, until the case could be reheard. My memory is not quite clear as to whether I did or did not see the Minister; but at all events I saw the Under Secretary, and he promised me that he would communicate with the Warden. I saw the Under Secretary on one or two occasions, and I communicated to Mr. Boyd the result of my interviews. In the first place, if my memory serves me rightly, the Under Secretary told me that he could see no objection to the granting of the injunction to restrain Costello from removing a quantity of washdirt which he had taken from ground which Cooper alleged belonged to him; but subsequently the Minister declined to grant this injunction, and I again saw the Under Secretary. I received an intimation from the Under Secretary that the Minister declined to grant the injunction, and said that the matter was entirely in the hands of the Warden, and he did not feel justified in interfering in

30 Nov., 1897.

in the matter. Two or three letters, I think, passed between Mr. Boyd and myself on the subject. I thought at the time that Cooper was subjected to considerable injustice, and I did my best to get what I thought he was entitled to—justice at the hands of the Department; but I failed to get any satisfaction from the Department.

I F. A. Wright,
Esq., M.P.
30 Nov., 1897.

211. Can you give the Committee any idea as to the date of this application of yours? It was some time towards the end of June, 1896, when I first made an application; and, as I have told the Committee, having pretty full information from Mr. Boyd, I laid it before the Under Secretary, and he at once took the view that the Minister might very well restrain Costello from doing anything with the washdirt until the matter could be reheard; but subsequently the Under Secretary told me that the Minister declined to do that.

212. Were you informed by the Department that the proper course for Cooper to take was to apply for an injunction? Yes; and I also informed the Department, I think, that Cooper had applied for an injunction, and that it had been refused by the Warden. I think it was in reply to one of my letters to Mr. Boyd that I got information that Cooper had applied for and had been refused an injunction by the Warden. The ground that the Department took up was that they could not interfere—that the matter must be dealt with through the Warden.

213. That Cooper's proper course was to apply for an injunction? Yes. I applied in the first place, of course, for the Minister to overrule what had been done previously, and to grant an interim injunction, which he declined to do.

Sydney Cooper recalled and further examined:—

214. *Chairman.*] I understand that there is a further statement you would like to make? There is a slight alteration I wish to make in my evidence.

S. Cooper.

215. Will you state to the Committee what it is? It is in reference to the order I first applied to the Warden for—to have this ground opened up and an underground survey made. I wish the Committee to clearly understand that the first part of this order was refused and the latter part was granted—that is, the Warden simply granted us permission to make an underground survey of what workings we could see, without tracing any connection with or making any communication from Costello's ground to mine. From the way the evidence now reads it might be taken to mean that the Warden refused to grant the lot, whereas he simply refused to grant the first part of the order—that is, to have the ground opened up; but he granted us an order to make an underground survey. The reason why we were able to put in at the Warden's Court only an incomplete map was because we could make only a survey of what workings we saw exposed.

30 Nov., 1897.

216. *Mr. Lonsdale.*] But did not that order give you a right to go down into their workings? Yes; but not to remove anything—simply to make a survey of the workings as they stood.

217. *Mr. Moore.*] I think you stated in your previous evidence that after this washdirt had been removed the ground had fallen in? Yes.

218. Therefore, in order to establish a connection between this ground that was encroached upon and Costello's workings, it was necessary for you to open up the ground? Yes.

219. And the Warden declined to give you an order to open up the ground? Yes.

220. So that his order authorising you to make an underground survey was not complete? It was not complete.

221. That is, it did not enable you to establish a connection between Costello's workings and this ground that had been encroached upon? Yes, that is it.

222. *Mr. Lonsdale.*] But was not that ground which had fallen in your own—that is, did you not have a right to deal with that ground which had fallen in? Certainly; but I had to cross Costello's land from that to show the connections with his shafts.

223. *Mr. Moore.*] Did the Warden assign any reason for declining to grant you that order? He simply said that he did not think he had the power to grant such an order.

224. *Mr. Lonsdale.*] Did he give any reason why he granted it on the second occasion? No; he gave no reason. He refused it on the second occasion, in the first instance, and we told him that we must have it—that if he did not grant it we would apply to the Minister, because it was a very material matter to us—and then he granted it.

[One Plan.]

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

DEPARTMENT OF MINES AND AGRICULTURE.

(ANNUAL REPORT OF THE STOCK AND BRANDS BRANCH FOR THE YEAR 1896.)

Printed under No. 12 Report from Printing Committee, 22 July, 1897.

The Under Secretary for Mines and Agriculture to The Minister for Mines and Agriculture.

Sir,

I have the honor to submit the report of the Chief Inspector of Stock for the year 1896, and it is satisfactory to know that the returns show an increase in both horses, cattle, and sheep.

Inspectors' Work.

The inspections made by the staff number over 45,000, exclusive of the inspections of Queensland cattle on the Border—rather more than usual—which include horses, cattle, sheep, dogs, pigs, and inspections of pounds, commons, &c., and in this work Inspectors travelled an average of some 4,000 miles each. Nearly 400 prosecutions took place under the different Acts, and 341 convictions were obtained.

Horses.

The number of horses in the Colony at 31st December last, was 484,028, being an increase of 1,569 on the previous year.

No serious outbreaks of disease have taken place. Blindness in horses, which was troublesome in previous years, has disappeared, probably owing to the dry season, which is unfavourable to the development of parasites.

String-halt appeared in a few districts in a rather lingering form.

Cattle.

The cattle increased during the year to the extent of 19,939, and now stand at 2,043,707. The increase is largely due to introduction from other Colonies, especially Queensland, large numbers being sent from that colony through the fear that the Border would be closed on account of the tick plague.

Several districts report pleuro-pneumonia, and cases of tuberculosis have been met with in almost every district, and the cattle have been destroyed.

Tick Plague.

The steps taken by this Colony, and which it is believed will prove effective for guarding against the introduction of the pest, will be found in the Report. A statement is also given of the measures adopted by Queensland, which it is believed have effectually prevented the spread of the disease, and protected a large portion of their own as well as this Colony.

Sheep.

Notwithstanding the number of sheep exported and boiled down, the returns show an increase of 701,103 over the previous year. About 1,000,000, however, were introduced from other Colonies.

A careful classification made of the different breeds shows the total number of merino to be 44,260,503, comprising 33,083,096 combing, and 11,177,407 clothing; long-woolled sheep number 1,279,178; while the total of English sheep and cross-breeds is put down at 1,279,178.

Of all descriptions, the grand total at 31st December last, was 48,318,790.

During the year 65 stud rams and ewes were imported from England, America, France, and Germany, and passed the prescribed quarantine.

It will be seen that nearly the whole of the sheep are now paddocked, and that their condition is generally reported as improving.

The Lambing.

The lambing for the whole Colony is estimated at 59½ per cent. The spring lambing gave 65½ per cent., and the autumn and winter 59½ and 54½ respectively.

The Clip.

5,857,382 lambs were shorn in the grease, and 535,101 washed; while 37,409,296 sheep were shorn in the grease, 2,793 creek-washed, and 2,193,011 second.

The average weights of the clip are estimated as follows:—

							Lambs.	Sheep.
							lb. oz.	lb. oz.
Grease	2 4	6 4
Washed	1 5½	3 0
Second	3 4½

The total clip for the Colony is estimated at 254,876,182 lb.; being an increase of 16,906,489 lb. on the year 1895.

Of the total mentioned, 205,032,653 lb. are estimated to have been sent to Sydney, 38,581,846 lb. to Melbourne, 11,122,028 lb. to Adelaide, and 139,655 lb. to Brisbane.

The sheep were comparatively very free from disease during the year. Outbreaks of anthrax still occur in several districts, but owners are inoculating with decided success, and the deaths from this deadly disease are decreasing.

It is very satisfactory to report that the whole of the Colonies, including Tasmania and New Zealand, are now free from scab in sheep, Western Australia being the last to be free from that pest.

Dr. Cobb is prosecuting his investigation in regard to parasitic diseases, more especially fluke worms, and it is expected that the result of his labours will shortly be given to the public.

Pigs.

The number of pigs in the Colony is 214,581, a number very far short of what there ought to be in the Colony.

Dogs.

Seventy dogs were quarantined during the year, but of these fifty-eight were "ships' dogs," and only remained in quarantine until the ships to which they belonged left the port.

Travelling Stock Reserves.

Owing to the dry season many of these reserves were quite bare of grass, and as the drought assumed serious proportions, travelling in many cases became impossible, and the sheep have perished.

The advisability of withdrawing the principal travelling stock reserves from lease is every day more apparent, and is a subject demanding early and serious consideration.

The proposal, brought under notice in Appendix J, for getting the store stock in certain portions of the Colony on to the railway, is well worthy of consideration.

Registration of Horse and Cattle Brands.

About the average number of brands were registered during the year, and the total number registered since the Act came into force up to 31st December last, was 76,683, and the number of sheep brands were as follows:—Fire-brands, 5,370; tar-brands, 20,048; and ear-marks, 12,480.

Public Pounds.

There are 260 pounds now open, and these are periodically inspected.

Noxious

Noxious Animals.

The receipts under the Pastures and Stock Protection Acts during 1896 reached £38,252 2s. 8d., while the amounts expended by the different Boards in the Colony for scalps of animals destroyed, and other expenses, amounted to £35,933 18s. 8d.

In only six districts were the full rates of assessment levied.

The number of the different animals destroyed, and paid for, is shown in Appendix L to this Report.

The Boards are still urging amendments in the Sheep, the Pastures and Stock Protection, and other Acts.

There has been no revival of the Live Stock Export Trade, but there has been a very large increase in the Frozen-meat Trade, the different phases of which are fully discussed in the body of the Report and Appendices.

Among the Appendices will also be found papers on Cross-breeding; on the Preparation of Edible Fat and Extract from Mutton; a communication from the Chairman of the Wool Brokers and Buyers on the subject "Tar and Paint Brands"; and a paper on the Carriage of Store Stock by Rail.

Papers are also submitted dealing at length with the Frozen-meat Trade as now conducted, and offering valuable suggestions for its improvement.

A large, elegant handwritten signature in cursive script, reading "W. C. Lachlan". The signature is written in black ink and features a long, sweeping underline that extends across the width of the signature.

Under Secretary, Department of Mines and Agriculture.

The Chief Inspector of Stock to The Under Secretary for Mines and Agriculture.

Sir, Department of Mines and Agriculture, Stock and Brands, Sydney, 1st June, 1897.

On the 2nd February last I submitted a Progress Report for the year ending 31st December, 1896, giving the approximate number of the horses, cattle, and sheep then in the Colony; and I have now the honor to submit for your consideration my complete Report for that year on the working of this Branch, which is, as usual, based very much upon Inspectors' estimates, owners still showing very little inclination to furnish data. It will be seen that the actual number of horses, cattle, and sheep in this Report exceed those in the Progress Report.

I have, &c.,

ALEX. BRUCE,

Chief Inspector of Stock.

INSPECTION OF OFFICES.

During the year the Offices of the Inspector of Stock at Hay and Narrandera were visited, and the books, &c., inspected.

Four inspections along the Queensland Border were also made from the head office.

INSPECTORS' WORK.

The Colony is now divided into sixty-five Sheep Districts, and there are fifty-two Staff Inspectors employed, who have made the following inspections during the year 1896:—

Stock, including horses, cattle, and sheep	27,686	inspections.
Reserves	5,620	"
Public Pounds	590	"
Commons	724	"
Dogs	1,784	"
Pigs	2,231	"
Under Pastures and Stock Protection Act	4,750	"
Under Public Watering-places Act	1,696	"
Under Diseased Animals and Meat Act	811	"
Total	45,892	

being an average of 882 inspections by each Inspector.

The total number of stock inspected was,—124,958 horses, 1,009,524 cattle, and 24,136,837 sheep. This shows an increase of 216,979 cattle, and a decrease of 20,474 horses and 1,226,100 sheep inspected during 1896, as compared with the previous year. This is exclusive of the inspections made by the Inspectors stationed along the Queensland Border.

Homebush Sale-yards.

As usual, the whole of the stock arriving at these yards were carefully inspected on each sale-day by an Inspector of Stock and the Government Veterinarian, and a considerable number were condemned as unfit for human consumption. The numbers of stock submitted to auction were as follows:—

Cattle, 111,147 head.

Sheep, 2,688,336 head,—

a weekly average of 2,137 cattle and 51,699 sheep. Compared with 1895, this is a decrease of 301 cattle and of 5,092 sheep per week. These inspections occasionally lead to the detection of stolen stock, as the Inspector's duty requires him to compare the brands and marks on the stock with those in the permits and travelling-statements accompanying them, which are filed in this office for reference by persons inquiring about stock supposed to have been stolen, and the identification of the owners of animals condemned at the abattoirs. Some of the permits and more of the travelling statements collected by the Inspector at Flemington are imperfect, especially as regards the brands and marks, and are useless in tracing stock or for production in a court of law. If, therefore, this continues, the Inspector will have to be instructed not to accept these imperfect documents, and to prosecute for non-compliance with the Act and Regulations.

Inspectors' Mileage.

During the past year the staff travelled over a distance of 212,593 miles while on duty, an average of 4,088 each per annum.

Prosecutions and Convictions obtained.

Under what Act.	No. of Prosecutions.	No. of Convictions.
Diseases in Sheep Acts	109	96
Imported Stock Acts...	7	6
Registration of Brands Acts	9	7
Pastures and Stock Protection Acts	199	175
Public Watering-places Act...	42	38
Impounding Acts	10	9
Diseased Animals and Meat Act	11	10
Total	387	341

The cases under the Pastures and Stock Protection Acts were principally against owners who had failed to make returns of their stock at the proper time, and there has not, during the past year, nor in any year since the Pastures and Stock Protection Act was passed in 1880, been a single prosecution for failure on the part of an owner to destroy the noxious animals other than rabbits on his land, although thousands of owners have every year since 1880 rendered themselves liable for neglect in this respect. The compulsory provisions of the law under which a Board can either prosecute a defaulter or put men on his land to destroy the noxious animals of which he takes no notice, although they are swarming on to his neighbour's holding and eating his grass and crops, have been a complete dead letter. The result has, in many cases, been, that while one man was doing his best to clear his land, his immediate neighbour was doing nothing, and not only was this injustice perpetrated, but noxious animals have, in numerous instances, increased and tens of thousands of pounds every year been wasted; for, without simultaneous action, no progress to speak of can be made in reducing the number of noxious animals, and it is absurd to suppose that simultaneous action can be obtained without compulsion. No doubt the number of kangaroos has been very much reduced; but that has been brought about, not by the enforcement of the law, but by the value of the skin, and it is altogether different in the case of animals whose skins are of little or no value.

Attention is called to this matter, because it is believed that if compulsion after caution was brought to bear on defaulters to a moderate extent by the Boards—and moderate compulsion can hurt no one seriously—simultaneous action would be brought about, and something like value for the money now expended would then be obtained, while the pest would, year by year, be reduced.

HORSES.

The number of horses in the Colony during the thirty-six years previous to and including 1896 was as follows:—

Year.	No.	Year.	No.	Year.	No.
1861	251,497	1873	328,408	1885	344,697
1862	233,220	1874	334,462	1886	361,663
1863	273,389	1875	357,697	1887	390,609
1864	262,554	1876	366,703	1888	411,368
1865	284,567	1877	328,150	1889	430,777
1866	282,587	1878	336,468	1890	444,163
1867	278,437	1879	360,038	1891	459,755
1868	280,201	1880	395,984	1892	481,416
1869	280,818	1881	398,577	1893	481,399
1870	280,304	1882	328,026	1894	500,068
1871	337,597	1883	326,964	1895	482,459
1872	304,100	1884	337,172	1896	484,028

being an increase of 1,569 horses on the number returned for the previous year, which is accounted for by increased settlement, more breeding, and fewer sales owing to low prices.

The number of horses as returned in each Sheep District of the Colony will be found in Appendix A hereto, as also the number of cattle, sheep, and pigs.

Breed of Horses.

Under this head the Inspectors' returns give the different breeds of horses as follows:—

	Ordinary.	Thoroughbred.	Total.
Draught	130,555	19,543	150,098
Light harness	112,696	14,240	126,936
Saddle	177,800	29,194	206,994
Grand Total			484,028

Australian and Foreign Horses Introduced and Imported.

Australian Horses—From other Australian Colonies.—By sea: 332 horses and mares. Overland: 16 stud horses and 6,550 ordinary horses and mares; total, 6,566.

Foreign Horses—From Foreign Countries (including Great Britain and Ireland).—During the year 20 horses were imported into the Colony from England and other countries, and were subjected to the prescribed quarantine of fourteen days in Sydney (except in the case of two lots which arrived without the necessary certificates, when an additional term of fourteen days was imposed, in accordance with Sub-Clause 3 of Regulation No. 33 under Imported Stock Acts) before being allowed to go inland. Particulars as to number and breed of these horses are as follows:—

Name of Importer.	Address.	Where Imported from.	Breeds.				Total.
			Thoroughbred.		Arabs.		
			Horses.	Mares.	Horses.	Mares.	
J. Brown	Bowenfels	England	1	1
S. Hordern	Haymarket, Sydney	"	3	2	5
H. C. White	Havilah, Mudgee	"	1	1
James Tulloch	Botany	India	2	...	2
G. W. Cotgrave	St. Mary's near Penrith	"	2	...	2
V. Dowling	Laue, Mudgee	"	2	...	2
E. Johns	Wollongough	"	...	1	2	...	3
F. Flynn	Surry Hills, Sydney	Noumea	1	1
T. Payten	Randwick	San Francisco	1	1
L. Broyman	Sydney	Germany	2	2
		Total	9	2	7	2	20

Horses fit for Sale, and number Exported, Improvement, &c.

In the several districts of the Colony, Inspectors' reports show that there are 22,254 draught, 23,934 light harness, and 38,769 saddle horses fit for market, while of this number 20,091 are considered suitable for requirements of India and China.

During the year 8,212 horses were exported, principally to India, Western Australia, New Zealand, Fiji, Victoria, and the Straits Settlements. Reports from thirty-eight districts say that the horses are improving in quality.

In twenty districts there is no improvement in the quality of the horses, while in seven districts they are reported as deteriorating.

Tax on Stallions.

A tax on stallions is still asked for by owners, and in the interest of horse-breeding generally I think this is highly desirable. Owners also recommend establishment of stud farms by the Government, and leasing stallions to small farmers. Stallions should be registered and owners compelled to report deaths from unknown causes to Inspectors.

Blindness in Horses.

No outbreak of this disease has occurred during the year, even in those districts in which it was at one time very prevalent. This is accounted for by the dryness of the season.

Mr. Veterinary-Surgeon Robinson, after investigating this ailment, came to the conclusion that it was caused by parasites, and prescribed accordingly. His prescriptions, when properly administered, proved successful, and as there may be a recurrence of the disease with wet seasons his prescriptions are here given.

Vermifuge.

Arsenic—5 grains, carefully mixed in (say) 3lb. bran, and give three doses to each horse at intervals of one week between each dose—each horse to receive 5 grains in each dose; or

Turps and Linsced Oil { 3 draughts for each horse at intervals of one week between } 1 pint linseed oil.
 each draught. } 2 oz. turps.

Tonic.

To follow the vermifuge if the disease has been allowed to make considerable progress:—

Black antimony	2 drams	} 1 dose.
Tart emetic	1 dram	
Sulphate of iron	3 drams	
Common salt	½ oz.	
Powdered sulphur	½ "	

Dose to each horse at intervals of three days for three weeks, to be given in chaff or bran damped.

In the localities in which the horses are attacked, licks of salt and sulphur should be provided for them in troughs in the paddocks, and the horses could be enticed to the licks by a little bran and chaff.

Australian String-halt in Horses.

The horses in nine districts are reported as having been affected with this ailment during the year, more particularly those in the districts of Braidwood and Goulburn.

Mr. Inspector Mater of Braidwood, states that about 5 per cent. of the horses in his district were affected in the early part of the year, and that various remedies were tried but with very little good effect. The majority of the horses, however, recovered when the spring set in.

Mr. Chief Veterinary-Inspector Stanley considers this a parasitical disease and is of opinion that the curative treatment is to expel the parasites by the administration of anthelmintics, and dose after dose may be required for this purpose. It is necessary to remember that brood after brood have to be poisoned; and that when they are ensconced in a living being, whose tissues are also liable to suffer from the introduction of drastic drugs, it is impossible to effect our object without perseverance; and to prevent re-infection it is advisable to move the patients to a sound paddock or, better still, into a yard or stable, to feed liberally, and also constantly supply salt with their food.

Prevention.

Preventive measures, I consider, are very important. With this object, avoid putting an affected animal into a paddock at all favourable for the development of worms. Infected paddocks should not be used by horses, even temporarily; half an hour's grazing may effect them, especially during the spring and autumn. The first grass after summer will scour animals, and has been known to cure them, because at that season the parasites are prepared for exit. Microscopical examination shows one affected animal introduced, though he may be eventually cured, means later on (all circumstances being favourable) a hot-bed of infection for future tenants of the paddock.

Mr. Veterinary-Surgeon Robinson is of the same opinion as to the nature of the disease, and prescribes as an anthelmintic and tonic the following mixture viz:—

Common salt	2 lb.
Powdered sulphur	2 "
Black antimony	1 "
Tartar emetic	½ "
Sulphate of iron	1 "

Doses, divided into ounce-doses and given in the feed, which may be varied by the administration of a draught every alternate day, composed of linseed oil (raw) 1 pint and spirits of turpentine 2 oz.

The skin disease (*prurigo*) is reported from four districts, anthrax or poison from one district, and influenza from one district. With the exception of the above ailments the horses throughout the Colony have been exceptionally free from disease during the year. Owners are cautioned, where their stock are not removed from the paddocks, that they should see that the pollard pellets poisoned for rabbits are small, as both horses and sheep are liable to pick up these pellets when laid large or in lumps. For treatment for influenza, see Appendix B.

The estimated losses in horses during the year from various causes, principally drought, amount to 15,591.

CATTLE.

CATTLE.

The returns of cattle in the Colony during the thirty-six years ending 31st December, 1896, stand as follows:—

Year.	No.	Year.	No.	Year.	No.
1861	2,271,923	1873	3,794,327	1885	1,317,315
1862	2,620,383	1874	2,856,699	1886	1,367,844
1863	2,032,522	1875	3,134,086	1887	1,575,487
1864	1,924,119	1876	3,131,013	1888	1,622,907
1865	1,961,905	1877	2,746,385	1889	1,741,592
1866	1,771,809	1878	2,771,583	1890	1,909,009
1867	1,728,427	1879	2,914,210	1891	2,046,347
1868	1,761,411	1880	2,580,040	1892	2,147,074
1869	1,795,904	1881	2,597,348	1893	2,155,500
1870	2,195,096	1882	1,859,985	1894	2,290,112
1871	2,014,888	1883	1,640,753	1895	2,023,768
1872	2,287,660	1884	1,425,130	1896	2,043,707

From the above it will be seen there was an increase of 19,939 cattle during the year 1896, and an increase of 675,863, as against the decennial year 1886.

The number of cattle in each of the Sheep Districts of the Colony will be found in Appendix A.

268,423 cattle were introduced from other Colonies during the year, and 45,720 exported, being an increase in the number introduced over the number exported of 222,703.

The cause of the large influx of cattle is attributed to the scare owing to the stock quarantine on the Queensland Border.

Breeds of Cattle.

	Pure and Stud.	Ordinary.	Total.
Shorthorns	60,596	653,966	714,562
Hereford	28,633	213,049	241,682
Devon	11,783	64,922	76,705
Black-poll'd	954	3,898	4,852
Red-poll'd	53	1	54
Ayrshire	4,878	26,207	31,085
Alderneys	1,449	4,744	6,193
Holstein	100	200	300
Jersey	1,875	6,643	8,518
Crosses (first crosses)	959,756	959,756
Grand Total	2,043,707

The crosses are estimated as follows:—

Shorthorn and Hereford	304,759
Shorthorn and Devon	133,788
Hereford and Devon	59,598
Shorthorn and Black-poll'd	14,716
Ayrshire and Shorthorn	54,946
Alderney and Shorthorn	116
Jersey and Shorthorn	83
Shorthorn and Holstein	300
Unrecognisable	391,450
Total	959,756

Australian and Foreign Cattle Introduced and Imported.

AUSTRALIAN CATTLE.—Overland—21 stud bulls, 6 stud cows, 268,350 ordinary cattle; total, 268,377.

By Sea—51 stud bulls and cows

FOREIGN CATTLE.—During the year, nine cattle were imported from England, and passed through the prescribed quarantine of sixty days in Sydney, before being removed inland. Particulars as to number and breed, &c., are as follows:—

Names and Addresses of Importers.	Where Imported From.	Breeds.								Total.	
		Hereford.		Shorthorn.		Jersey.		Ayrshire.		Males.	Females.

Total	2	...	2	...	1	2	...	2	5	4

Increase and Decrease of Cattle in the several Districts.

On reference to the number of cattle returned for each district as given in Appendix A hereto, it will be seen that there is an increase in thirty-two districts, which is attributed to the continued increase in dairying, additional settlement, breeding, number of owners stocking with cattle, large numbers introduced from Queensland, and effects of the Victorian Border duties.

In the remaining thirty-three districts they have decreased, some to a very slight extent and others very considerably, owing to owners selling out on account of the dry season, replacing with sheep, fewer cattle from Queensland, and less breeding.

The "Cast" of Fat and Store Cattle.

The estimated "cast" of fat cattle to be sent to market during the coming year is 297,579, and store cattle, 299,116. From fourteen districts the fat cattle are principally sent to Victoria; from three districts they are principally sent to South Australia and Tasmania; and the remaining districts supply the markets of Sydney, Maitland, Mudgee, Bathurst, Orange, Goulburn, Tamworth, Albury, Western Australia, and New Caledonia. The principal markets for store cattle are Muswellbrook, Maitland, Goulburn, and Wagga Wagga.

How kept.

The number of cattle kept wholly in paddocks is returned as 1,682,497; on open runs, 227,861; and the balance, 133,319, are depastured both ways.

Improvement and Deterioration.

In thirty-nine districts the cattle are said to be improving; in twenty-two districts they are stationary; and in four districts deteriorating. The principal reasons given for the improvement are—introduction of good stud stock; more attention and care in selection and breeding of stock, more particularly those for dairying purposes; also in culling and keeping in paddocks. The reason given for deterioration is inattention to breeding, some owners breeding from all sorts without respect to breed or quality, and using the same blood for years.

Their Diseases and Ailments.

Pleuro-pneumonia—Inspectors' reports show that this disease existed in twenty-eight districts and that the cattle on 162 runs were affected; while the other districts are reported to be free from the disease.

This disease, which was believed to be stamped out in the United Kingdom, has been detected in a London dairy, and the outbreak is attributed to a case of very long standing, where a cow had been affected and recovered, but with an encysted lung, which led to her being a medium of infection and spreading the disease. The whole herd, both affected and sound, has been destroyed.

Cumberland Disease.—From seven districts the number of cattle reported to have died from this form of anthrax is 591.

Symptomatic Anthrax or Blackleg is reported to have carried off 255 head in six districts.

Cancer and Actinomycosis.—1,247 cattle are reported to have died in thirty-six districts from these diseases.

Tuberculosis.—Cattle to the number of 5,180, suffering from this disease, are reported from thirty-nine districts as having died or were killed and boiled down.

Red Water.—From one district fifteen deaths are recorded. The disease is prevalent in certain localities in the coast country at particular seasons, more so in spring.

Ophthalmia occasionally assumes an epidemic form, and the number of cattle attacked is in some cases considerable, causing much temporary inconvenience to stock from blindness. Outbreaks have been reported from ten districts, and the deaths numbered 283.

Poisonous Plants.—From five districts deaths to the number of 432 are reported through eating supposed poisonous plants, but they were, it is believed, due in most cases to hoven, arising from starving cattle gorging themselves with indigestible vegetation.

Foot and Mouth Disease.—From latest accounts received, Great Britain and Ireland have been free from this scourge for the past year, and probably will remain so, as importation is prohibited from all countries in which foot and mouth disease exists. It has never obtained a footing in this Colony.

Tick-fever.—A statement will be found hereto as Appendix E, showing the measures adopted by this Colony to prevent the introduction of this plague, as also the measures taken by the Queensland Government to prevent its spread in that Colony.

Diseased Animals and Meat Act.

The number of cattle condemned under this Act, and the diseases for which they were so, are given in Appendix F.

SHEEP.

SHEEP

The number of sheep in the Colony during the thirty-six years ending 31st December, 1896, stands as follows:—

Year.	No.	Year.	No.	Year.	No.
1861	6,119,169	1873	18,990,595	1885	37,820,906
1862	6,558,896	1874	22,797,416	1886	39,169,804
1863	7,169,126	1875	25,353,924	1887	46,965,152
1864	9,082,463	1876	25,269,755	1888	46,503,469
1865	9,650,106	1877	21,521,662	1889	50,106,768
1866	11,644,593	1878	25,479,484	1890	55,986,431
1867	15,066,377	1879	30,062,910	1891	61,831,416
1868	16,000,090	1880	35,398,121	1892	58,080,114
1869	16,848,217	1881	36,591,946	1893	56,980,688
1870	16,218,825	1882	36,114,814	1894	56,977,270
1871	16,766,012	1883	37,915,510	1895	47,617,687
1872	17,873,696	1884	31,660,321	1896	48,318,790

For number of sheep in the several Sheep Districts, *see* Appendix A.

Increase and Decrease.

This shows an increase for the whole Colony of 701,103.

The number of sheep imported during the year was 1,010,176, and the number exported 744,578, an increase in the imports over the exports of 265,598 sheep.

In Appendix C there is a statement kindly furnished by the Government Statistician, which accounts for this increase.

Australian and Foreign Sheep Introduced and Imported.

Australian Sheep Overland from other Colonies.—Stud sheep, 5,478; ordinary, 1,000,452; total, 1,005,930.

By Sea from other Colonies.—4,246 stud sheep were introduced from the other Australian Colonies by sea; particulars of those sold at the annual stud sales are given in Appendix D.

The prohibition against the introduction of stock from Western Australia is now in force only so far as relates to sheep, and it is so on account of the existence of scab, as that Colony has not yet officially been declared clean.

Foreign Sheep.

During the year, sixty-five stud rams and ewes were imported from England, America, France, and Germany, and passed through the prescribed quarantine of sixty days in Sydney, before being allowed to be removed inland.

Particulars

Particulars as to number and breed, &c., are as follows:—

* Went to Melbourne after doing quarantine here.

The "Cast" of Fat and Store Sheep.

The annual "cast" of fat sheep for the ensuing season is estimated at 5,490,261, and store sheep, 5,517,480.

How Sheep are kept.

Paddocked ...	47,607,441
Shepherded ...	258,382
Both ways ...	452,967
	48,318,790

Condition of the Flocks.

In forty-seven districts the sheep are said to be improving, the principal reasons given being more attention to breeding, paddocking, introduction of high-class rams and ewes, more careful classing and culling.

In fourteen districts they are said to be stationary, and in four districts they are deteriorating.

Lambing.

From a return of the autumn, winter, and spring lambings obtained from the Inspector for each Sheep District, the average percentage of lambing for the whole Colony is estimated at 59½ per cent., *i.e.*, calculating the number of lambs marked on the number of ewes put to the rams. The spring lambing was the highest, averaging 65½ per cent., while the autumn and winter lambings averaged 59½ and 54½ per cent. respectively. The estimated number of ewes put to the ram during the year was 16,658,958, and the number of lambs returned as marked during the autumn, winter, and spring lambings was 9,879,677. The total number of lambs returned on 31st December was 8,742,968, giving an actual percentage of 52½, or a decrease of about 6½ per cent. on the number returned for the different lambings, which is accounted for by continued losses from the drought after the marking was completed.

The Clip.

Average per Sheep.

Lambs.—The number of lambs shorn in the grease was 5,857,382; the number washed, 535,101; total lambs shorn, 6,392,483.

Sheep.—The number of sheep shorn in the grease was 37,409,296; creek-washed, 2,793; and scoured, 2,193,011; total sheep shorn, 39,605,100.

The average weights of the clip are estimated as follows:—

	<i>Lambs.</i>	<i>Sheep.</i>
	lb. oz.	lb. oz.
Grease ...	2 4	6 4
Creek-washed ...	1 5½	3 0
Scoured	3 4½

Total Clip.

Total clip in the Colony for the year 1896, according to the number of sheep, would be:—

37,409,296 sheep shorn in the grease; average clip, 6 lb. 4 oz. per sheep =	233,808,100 lb.
2,793 „ creek-washed „ 3 „ 0 „ „ =	8,879 „
2,193,011 „ scoured „ 3 „ 4½ „ „ =	7,161,552 „
5,857,382 lambs shorn in the grease „ 2 „ 4 „ per lamb =	13,179,109 „
535,101 „ washed „ 1 „ 5½ „ „ =	719,042 „
	254,876,182 lb.

The estimated total weight of the clip as shown above is above that of the previous year by 16,906,439 lb., owing principally to the large decrease in the number of sheep and lambs shorn. The average clip per fleece in grease for sheep and lambs is higher, owing to the season all over the Colony being fairly good.

Condition of Clip.

In eight districts the clip is reported as entirely sound; in eighteen districts, from 90 to 98 per cent. is sound; in twenty-three districts, from 75 to 90 per cent. is sound; and in remaining districts weak. In a few districts only is the yolk reported to be well up. On the whole the clip was very clean. The value of the wool in a few districts was affected by grass-seed and burrs.

Exportation

Exportation of Clip.

The clip grown in the Colony of New South Wales is shipped principally to England, America, France, and Germany, and considerable portions of it is so from the ports of the three neighbouring Colonies, as well as from Sydney and Newcastle. The portions of our clip thus shipped from the other Colonies is often mistaken as the produce of those Colonies, more particularly for that of Victoria and South Australia.

The following is an estimate of the clip sent to Sydney, and also the proportion sent across the Borders and to Melbourne, Adelaide, and Brisbane for the years 1895 and 1896 :—

Port of Shipment.	1895.			1896.		
	Greasy.	Washed.	Total.	Greasy.	Washed.	Total.
	lb.	lb.	lb.	lb.	lb.	lb.
Sydney	182,052,232	2,541,427	184,593,659	199,346,896	5,685,757	205,032,653
Melbourne	40,860,575	624,215	41,484,790	38,280,139	301,707	38,581,846
Adelaide	8,451,158	3,252,328	11,703,486	9,220,519	1,901,509	11,122,028
Brisbane	187,705	103	187,808	139,655	139,655
	231,551,670	6,418,073	237,969,743	246,987,209	7,888,973	254,876,182

This shows an increase in the quantity of wool shipped during the year from the Ports of Sydney and Newcastle of 16,906,439 lb., as compared with that shipped in 1895.

Classing of Clip.

In thirty-eight districts the clip is reported as having been well classed. In the other districts it is not considered to have been so generally, the reasons given being, owners consider it does not pay, that prices obtained are no better, also want of convenience, sheds not large enough to warrant expense, and the difficulty of obtaining competent wool-sorters.

Wool-presses.

A great number of different kinds of presses are used; those most in favour are Ferrier's Patent and Williams' and Robinson's; rack screw and pinion presses are used. There is still room for improvement in the mode of pressing, especially by the owners of small clips.

Woolpacks.

The woolpacks used are mostly Calcutta and Dundee, of various sizes, from 4 ft. 6 in. x 2 ft. 2 in. to 5 ft. 3 in., and the weight from 10 to 12 lb.

On forty-two holdings the wool is dumped before leaving.

Sheep-brands and Marks.

During the year 1896 the number of Sheep Brands and Ear-marks recorded, transferred, and cancelled were as follows :—

Recorded.		Transferred.		Cancelled.		Total Registered.
Fire Brands ...	251	Fire Brands ...	66	Fire Brands ...	84	5,370
Tar do ...	1,152	Tar do ...	189	Tar do ...	247	20,048
Ear-marks ...	918	Ear-marks ...	161	Ear-marks ...	197	12,430
Total ...	2,321	Total ...	416	Total ...	528	Total 37,848

Ear-marking and Tattoo-marking.

In all districts the system of ear-marking sheep is now generally carried out, and the system of tattoo-marking is mostly used by owners of stud-sheep, not as yet to any great extent in the case of ordinary flock sheep, but where tried it has been found to be a good preventive of sheep-stealing.

Destruction of Wool by Tar and Paint Brands.

Buyers still complain of the destruction to wool by the use of the above materials for branding purposes; but it will be seen from the Report of the Chairman of the Wool-selling Brokers' Association, which will be found as Appendix G to this Report, that both they and the representatives of the wool-buyers in Sydney are still of the same opinion with respect to the impossibility of finding any pigment or other material for branding sheep which will be sufficiently legible and lasting and will not damage the wool. The result of this second inquiry only bears out the conclusions arrived at by reports received on this subject from the wool-brokers and manufacturers in 1894.

DISEASES IN SHEEP.

Scab.—The flocks in this Colony and in the Colonies of Queensland, Victoria, South Australia, New Zealand, and Tasmania are free from scab; and Western Australia may now also be considered clean, as no case of scab has been met with in that Colony since May, 1895. It may therefore be said with confidence that there is not a single scabby sheep in either Australia, Tasmania, or New Zealand, in which, according to the last published returns, there were. The importation of sheep from Western Australia into this Colony is still prohibited, and will be so until the Government of that Colony declare it free from scab.

Anthrax.—This disease appeared in several districts during the year, and owners are now availing themselves of the facilities offered for vaccinating their sheep, which has been the means of lessening the great mortality previously suffered by them. A statement (Appendix II) is attached showing the vaccinations made.

Foot-rot.—

Foot-rot.—Nineteen districts report foot-rot among the sheep, but only to a slight extent, the past season not being favourable to its spread. Remedies for foot-rot will be found as Appendix I.

Fluke.—Owing to the dry season this disease also was not so troublesome as in previous years, and is only reported from twenty-two districts, without any serious losses.

To prevent its spread, owners are again urged to free their land from surface water by running plough furrows where practicable and helping them with the spade. The preventives used by owners were salt, tar, and turps, sulphate of iron and Liverpool salt, and salt and sulphur.

Parasitic Worms.—Sixteen districts report the sheep as having been infested with worms last year to the extent of about 5½ per cent.; in seven districts the sheep were infested with stomach, lung, and tape worms; five districts with stomach and tape worms; and in three districts with stomach-worms.

The following results have been gathered regarding the efficacy of the various drenches and licks used for sheep for worms:—

Drenches.

Arsenic.—For the stomach and tape worms the arsenic and soda drench is still reported as the most effective, and has been by far the most generally used. It has, however, been recommended that potash, as being less severe on the lining of the stomach, should be substituted for soda in its preparation. The arsenic and soda drench is reported by several of the Inspectors as having been also efficacious for lung-worms. No authenticated information has been received of this drench affecting the health of the sheep or injuring the wool.

Turpentine.—Turpentine, with various mediums, has been very generally given for stomach, tape, and lung worms, with good results, when repeated.

Hayward's Specific is reported as having given satisfactory results where used.

Pottic's, Weaver's, and Walsh Bros.' Drenches are reported to have been used in a few districts with fairly satisfactory results.

H. C. Suttor's Drench is said to be, by persons using it, very good.

While it can be said that a decided improvement follows the administration of most of the drenches generally used, it is a fact that even in the case of the most effective the *post-mortem* examinations disclose that generally where the sheep are at all badly infested some worms are still alive; and this again, it is believed, arises from the owners delaying too long in drenching, and allowing the worms to have too great a hold on the sheep before they are drenched. The consequence is that some worms are left, which keep the sheep from thriving, and, with the introduction of fresh eggs from the water and pasture—if the weather is at all favourable for the development of the worms—in the course of a few months make the sheep as bad as they were before they were drenched. To make the cure effective, therefore, sheep which have been badly infested should, on receiving one drench, be kept as near the drenching yards as possible, and receive a second drench in the course of twelve or fourteen days after the first.

But, while licks and drenches should be provided and given at as early a date and as often as required, owners should give their earnest attention to the removal of what may be termed the contributing causes of the pest by avoiding overstocking, attending to the proper nourishment of the lambs and weaners, burning off old pasture, and getting rid by draining of surface and stagnant water, as suggested in Vol. II, part 2, of the *Agricultural Gazette*.

Licks.

It is reported that the following licks have been used with good results:—

Salt and sulphur.	Salt, sulphate of iron, and Hayward's Specific.
Salt and sulphate of iron.	Salt, tar, and turpentine.
Salt and turpentine.	Pottic's Preventive Lick.
Salt, sulphate of iron, and turpentine.	Salt and lime.
Salt, sulphur, and sulphate of iron.	

It is scarcely necessary to point out that a lick, if it is efficacious in warding off an attack of worms, is far preferable to a drench; and as owners in all but the true saltbush country are now aware that it pays them well to give their sheep a liberal supply of salt, it would add very little to the trouble or expense to give once a month with the salt some of the other ingredients here mentioned which they found from experience was to any extent effective in protecting their sheep from the worm-pest.

The following further progress report of his investigations in regard to fluke and worms in sheep has been received from Dr. Cobb:—

Department of Mines and Agriculture, Sydney, 27 May, 1897.

In accordance with the plan of previous years, work on the parasites of stock has been continued at Bong Bong, Sydney, Wagga, and Bathurst. My duties in connection with the Department of Agriculture have been such that it has not been possible to give to the subject of parasitic diseases of stock as much attention as I would have liked. Nevertheless, I am glad to say that very substantial progress has been made in several directions, notably in the preparation of the report of the work done during previous years. The additional illustrations prepared during the last few months number several score. These have been prepared with the same scrupulous care as in the cases already placed under your notice. The preparation of these illustrations entails a good deal of work—both artistic work and research work.

A recent improvement in the laboratory arrangements will soon enable me to prosecute this branch of my work more actively. I refer to the junction of the Bong Bong and Bathurst laboratories. The dismantling of Bong Bong is now practically complete, and the transfer to Bathurst will enable me to effect a very substantial saving of time.

The work already undertaken at Bathurst has yielded results that would not have been easily obtained before.

The collection of parasites now in the possession of the Department is a very extensive one. I beg to invite your attention to this matter in view of the possibility of placing it in a condition for public exhibition. Displayed in proper specimen bottles, this collection would make an imposing exhibition.

I should further mention that a considerable portion of the comparatively small amount of time I have been able to give to stock during the last twelve months has been taken up in replying to correspondents, attending conferences, and making examinations with the object of giving immediate advice in special cases of disease. In some of these latter cases stock-owners have expressed great satisfaction.

In conclusion, I beg to state that all the work under my direction has been conducted at a comparatively trifling expense.

I have, &c.,

N. A. COBB.

Sheath

Sheath Disease in Wethers.

No fresh outbreaks of this disease have been reported during the year.

Full particulars as to the nature of the disease, its treatment, and prevention, as furnished by Mr. Veterinary-Surgeon W. Scott, will be found in my Annual Report for 1895, as Appendix H.

PIGS.

On 31st December, 1896, the number of pigs in the Colony stood at 214,581, being a decrease of 7,016 on the returns for the previous year.

Seven thousand two hundred and ninety-one pigs were introduced by sea and land from the other Australian Colonies.

The prohibition which has been in force against the introduction of pigs from New Zealand in consequence of an outbreak of swine fever in that Colony has been withdrawn.

Nineteen hundred and ninety-seven pigs were exported from Sydney during the year.

Sixty-one ships' pigs were killed on board, as the owners would not quarantine them.

The latest reports with respect to swine fever shows that there has been a marked decrease in the number of outbreaks in Great Britain and Ireland during the year 1896 as compared with previous years.

DOGS.

Twelve dogs which arrived from England and other places outside the Australian Colonies passed through quarantine during the year.

Fifty-eight "ships' dogs" were quarantined during the stay of vessels in port, and three "ships' dogs" were destroyed.

All "ships' dogs" and other stock on board foreign vessels for the use of the passengers and crew are now quarantined during the stay of the vessel to which they belong in port, whether in Sydney or at Newcastle.

Four hundred and four Colonial dogs were introduced at the Port of Sydney from the other Colonies, and 335 dogs were inspected prior to exportation.

Diseases in Dogs.

Although rabies is reported as having decreased in the United Kingdom during the past year, yet the returns for that period are considered as anything but satisfactory.

TRAVELLING STOCK (*Reserves, Roads, Tanks, Wells, &c.*)*Trespass on Reserves.*

In thirty-five districts the travelling stock and camping reserves are reported as having been trespassed upon, generally only to a slight extent, and in thirty districts they are reported as being free from trespass.

From fifteen districts it is reported that 1,152,325 sheep have travelled through during the year in search of grass and water. From six districts the number of loading sheep is given at 152,502.

In the report for 1895 it was stated that constant complaints were being received of the want of grass on the travelling stock reserves, more especially in the Central and Eastern Divisions of the Colony. There they are in most cases under lease, and are fenced off from the adjoining alienated land, or are enclosed in paddocks containing very little else but the reserved land; and the tenant as a rule either "skins" the reserves or sublets them to others who do so. The result is that legitimate travelling stock suffer severely by the way for want of grass, and if they are prime fat when they start, and travelling on foot to market for even a moderate distance, by the time they reach their destination they are second, or it may be, if the weather is at all unfavourable, only third rate mutton.

If, again, they are stores, which they more frequently are, they would, although in first-class store condition when they started, be little else than "bags of bones" by the time they reach the run for which they were purchased, and, besides losing a considerable percentage by the way, will take quite twice the time to fatten they would have done if they had had a fair share of feed by the way. The wool also suffers, and frequently in such cases shows a decided break in the fibre, caused by the starvation.

This, so far as stock-owners are concerned, is a very serious state of things; but since the close of last year they have become very much worse, and with the continued drought a great many of the roads are now, through want of grass, completely impassable, for stock and sheep which would otherwise have travelled to where they could obtain feed have had to stop and perish. The extent to which reserves have been leased and sold has to account to a considerable extent for the losses of stock which have taken and are taking place in the drought from which the Colony is suffering, and that, too, while the greater portion of the stock which have been lost belong to tenants of the Crown. It cannot be otherwise, for as the feed on the reserves to which travelling stock have access is not sufficient in ordinary times, it can easily be conceived what the result will be when drought prevails, and two or three times as many stock as usual are sent on the road as the only chance of saving their lives.

The remedy would be to withdraw sufficient land from the reserves in the Central and Eastern Divisions from lease to meet the requirements of travelling stock in all seasons; but the mere withdrawal of reserves from lease, without providing the means for protecting them from trespass, would not bring about all the improvement that is desired. If, however, they were withdrawn, and no rent required to be paid to the Lands Department, a small charge, such as the owners would not feel, could be levied on travelling stock, which would not only enable the Department to employ a sufficient staff to protect the reserves, but would also provide the necessary funds for clearing the reserves of burrs and other noxious weeds—a matter which is urgently required.

There

There is still another direction in which I think we are entitled to look for help in this matter. I allude to the carriage of store stock by rail in the level portions of the Colony, where the cost of haulage is light, and the establishment of a system of differential railway rates in that class of country—say from Junce to Hay and Jerilderie, from Dubbo to Bourke, and Willow-tree to Moree. See Appendix J.

Marking of Travelling Stock and Camping Reserves.

Fair progress has been made with regard to the marking of travelling-stock and camping reserves, the system of which is shown as Appendix K, there being at present about 1,300 miles surveyed and about 180 miles in course of survey. The routes marked are:—

1. From Boggabilla, *via* Yetman, Warialda, and Cobbadah, to Broeza.
2. From Moree, *via* Millie, Narrabri, Boggabri, Breeza, and the Liverpool Range, to the Bulga Mountains.
3. From Walgett, *via* Coonamble and Mendooran, to Uarbry.
4. From Coolah, *via* Uarbry, to Rylstone.
5. That portion passing through Terry-hie-hie Holding.
6. From Boggabri, *via* Turrabeile or Cox's Creek, to Coolah.
7. Mungundi to Moree.
8. Along the Mara Creek from the Barwon River upwards.
9. Along the Bogan to travelling stock reserve on the Murda Creek.
10. From Breelong to Dubbo.

In course of marking:—

That from Jennings to Tamworth.

With a view of making these surveys of practical benefit to drovers, stock-owners, and others, lithographs are being prepared showing sections of the roads in lengths of between 20 and 30 miles.

Lithographs of the roads, Boggabilla to Cobbadah, in six (6) sections; Moree to Cobbadah, *via* Gurley Holding, in one (1) section; Walgett to the Uarbry, in five (5) sections; and Liverpool Range to Putty, in five (5) sections, are now on sale at the Head Office, and also at the local Stock Offices, at 2s. per section.

New Stock Roads required.

In nine districts new roads are required for travelling stock, and to obtain these action has been already taken in five districts.

New Stock Reserves required.

In eleven districts new reserves and alterations of existing ones for travelling stock are required. In fifty-four districts there are sufficient reserves; but in a great many cases the reserves are leased under annual lease, and are, therefore, kept very bare of feed.

New Wells, Tanks, or Dams.

In twenty-two districts the inspectors report that new wells, tanks, or dams should be constructed by the Government at places which they indicate.

REGISTRATION OF HORSE AND CATTLE BRANDS.

Brands registered.

The number of horse and cattle brands registered up to 31st December, 1896, was 76,683. The number of brands registered during the year 1896 was—Horse brands (alone), 255; cattle brands (alone), 358; and horse and cattle brands, 973; making a total of 1,586.

This shows an increase of 83 in the total number of brands registered during the year as compared with 1895. There is also an increase in the number of brands transferred and cancelled.

Brands transferred.

The brands recorded during the year 1896 as transferred were—Horse brands, 16; cattle brands, 23; horse and cattle brands, 104; total, 143—being an increase of 3 on previous year.

Brands cancelled.

The brands cancelled (horse and cattle) in 1896 were 178.

Addresses changed.

The number of addresses of owners changed in 1896 was 61.

Compliance with the Act.

In all the districts the provisions relating to registration and the other requirements of the Act are reported as being fairly carried out.

Benefits of the Act.

The inspectors, in alluding to the benefits of the Act, report that it prevents duffing, stock-stealing, facilitates identification, assists in recovering lost stock, and otherwise is a great convenience and protection to stock-owners.

There

There is a great necessity for an amendment of the existing Registration of Brands Act, and there is a prospect of this being obtained. It was decided at the Intercolonial Stock Conference in August last that a Brands Bill should be framed in this Colony, which, while it provided for a different form of brands in each of the Colonies to prevent the clashing of systems, would contain provisions of a similar nature for preventing the theft of stock; and the materials for the measure are now in the hands of the Parliamentary Draftsman.

POUNDS.

Number and Inspection.

At the end of the year there were 260 pounds in operation in the Colony, 37 have been closed for want of poundkeepers, and there are sites set aside for the establishment of 173 more as occasion requires. The whole of the pounds are inspected periodically by the various Stock Inspectors.

State of Yards.

Forty-three of the pound-yards are reported to be old; some require renewing, being unfit for the safe custody of stock; while others need repairs. The remainder are said to be in a fair and good condition.

Keeping and Depasturing Pound Stock.

The provision made for the proper sustenance of impounded stock, according to the reports received, is satisfactory. As a rule, poundkeepers have now paddocks for the stock.

Management of Pounds.

The poundkeepers are reported to be performing their duties, upon the whole, in a satisfactory manner, and the appointment of inspectors of stock as inspectors of pounds has had a very beneficial effect.

NOXIOUS ANIMALS.

The Districts in which the Pastures and Stock Protection Act is in force.

The Act has been brought into operation in all the districts, and during the year work has been done to the extent shown in Appendices L and M.

Receipts and Expenditure under the Act.

The amount of assessment paid by stock-owners in 1896 was £38,252 2s. 8d.; and the amount expended £35,933 18s. 8d. Five districts are reported to be in debt to the amount of £369 0s. 11d.

In six districts full rates were levied, in fifty-four districts less than full rates, while in five districts no rates whatever were levied.

During the year the bonuses paid by the Boards for scalps ranged as follows:—For kangaroos, from 1½d. to 6d.; kangaroo rats, 1d. to 3d.; wallaroo, 2d.; wallaby, from 1d. to 4d.; paddymelon, from ½d. to 3d.; bandicoot, ½d. to 3d.; hares, from 1d. to 4d.; native dogs, from 10s. to 40s.; pups, 2s. 6d. to 7s. 6d.; opossums, ¼d. and ½d.; wild pigs, 3d.; eagle-hawks, 3d. to 2s. 6d.; emus, 6d.; crows, 2d. to 1s.; foxes, 10s. and 20s.; and flying-foxes, 1d. and 1½d.

Increase and Decrease.

Kangaroos are reported to be increasing in fourteen districts, wallabies in nineteen districts, native dogs in seventeen districts, hares in seventeen districts, and wild pigs in five districts. In twenty-six districts kangaroos are reported to be decreasing, wallabies in eighteen districts, native dogs in eighteen districts, hares in thirteen districts, and wild pigs in three districts.

Number destroyed.

The number of kangaroos destroyed during the past year was 80,639; of kangaroo rats, 160,808; of wallabies, 655,309; of wombats, 112; of bandicoots, 1,879; of paddymelons, 21,791; of wild pigs, 23,300; of hares, 551,548; of foxes, 66; of native dogs, 13,138; of opossums, 7,142; of eagle-hawks, 8,810; of crows, 48,308; of emus, 4,050; and of flying foxes, 3,591.

Steps taken for their destruction.

In the majority of the districts, hunting with dogs, drives, shooting, trapping, and poison have been adopted with satisfactory results. In forty-seven districts poison has been used, mostly for dogs, with fair to best results, and from four districts it is reported that the results have not been satisfactory, the dogs being too cunning to take baits.

AMENDMENTS SUGGESTED IN THE ACT BY THE BOARDS.

The agitation for the passing of the Stock and Pastures Bill still continues, and among other amendments in the law asked for it is suggested that uniform rates of assessment and bonuses should be fixed; that bonus be paid for rabbit scalps; that assessments should be paid at the time of making returns; assessments in certain Divisions; that farmers and fruitgrowers should contribute to the funds raised under the Act; that all assessment be paid into a general fund; that the Government should contribute a higher rate of subsidy to the funds of the Boards; that Section 6 of the Pastures and Stock Protection Act Amendment Act of 1881 be amended; that Superintendents should have equal voting power with owners; that the suspension of the provisions of the Act in any district should be allowed on petition; that rabbits be declared noxious animals; that the Boards should have the administration of the Rabbit Act; and that a measure should be passed dealing with noxious weeds and plants.

LOSSES

LOSSES FROM NATIVE AND TAME DOGS.

The losses through native dogs for the year are estimated at 195,455 sheep, valued at £35,670 ; and from tame dogs 62,135 sheep, valued at £12,916 ; making a total loss of £48,586. A stricter enforcement of the law with respect to stray dogs, and the registration of dogs, is urgently required.

COMMONS.

There are now 344 Commons in the Colony, the average acreage of which is about 4,000 each.

Number of Commoners, Stock, &c.

The average number of Commoners to each Common is estimated at ninety, and the average number of stock kept on each Common at 150.

Many of the Commons are unfenced, consequently are trespassed upon by travelling stock.

MISCELLANEOUS.

Cultivated Grasses.

In thirty-one districts cultivated grasses have been sown for pasture during the year, the most successful being lucerne, prairie, and rye.

Number and Division of Runs.

The number of open or unenclosed runs in the Colony is 4,216 ; the number enclosed is 40,076 ; the number partially sub-divided is 13,992 ; and the number properly sub-divided is 22,694.

Improvements, Fencing, Dams, Tanks, and Wells.

The number of miles of fencing throughout the Colony is estimated as follows :—770,536 miles without wire netting, at an average cost of (say) £38 10s. per mile, amounting to £29,657,540, and 43,095 miles with wire netting, average cost at (say) £67 5s. per mile, amounting to (say) £2,898,997.

The number of dams used for stock purposes is estimated at 62,065, at an average cost of (say) £55 4s. ; number of tanks, 51,968, at an average cost of £140 each ; and the number of wells used is estimated at 8,405, at an average cost of £106 each.

Cost of fencing, £32,556,537 ; cost of dams, £3,426,399 ; cost of tanks, £7,274,702 ; cost of wells, £891,361 ; making a total of £44,148,999, as representing the amount expended by way of improvements, &c.

Plants and Weeds.

Prevalence.

In seventeen districts *trefoil burr* grows to a very large extent ; in five districts, to a considerable extent ; in twenty districts, to a slight extent ; and in nineteen districts there is none reported.

In thirty-two districts *variegated thistle* is reported to a slight extent ; in nine, to a considerable extent ; in eight, to a very large extent ; and sixteen districts are reported as free from it.

In twenty-nine districts *black thistle* is reported to a slight extent ; in seven, to a considerable extent ; in fourteen districts, to a very large extent ; and fifteen districts are reported to be free from it.

In eight districts the land is reported as being infested to a very large extent with *Bathurst burr* ; in sixteen districts, to a considerable extent ; in thirty-two districts, to a slight extent ; and in nine districts the land is not infested.

In twenty-five districts other noxious weeds grow to a slight extent ; in seven districts to a considerable extent ; in twenty-one districts, to a very large extent ; and in twelve districts there is none reported.

Legislation for Noxious Weeds.

Legislation is urgently required for dealing with noxious weeds and plants, more especially the *Bathurst burr*, the prevalence of which is inflicting very serious loss on travelling stock.

Cost of clearing Commons, Reserves, &c., of Weeds.

The cost of clearing the Commons of noxious weeds throughout the Colony is estimated by inspectors at £37,743 ; the police paddocks, £2,042 ; the travelling stock reserves and droving roads at £145,505 ; amounting in all to (say) £185,290.

PREVENTION OF SCAB IN SHEEP ACCOUNT.

A detailed statement of receipts and expenditure by the Department in connection with the above Fund for year 1896 will be found in Appendix N hereto, and will be published annually in the same form.

THE following is a Statement of the Boiling-down, Chilling, Freezing, and Preserving Works in the Colony and of their Capacity, and the Work done during 1896.

Name of Establishment	Boiling.		Chilling.		Freezing.		Preserving.		Sundries.	Remarks								
	Capacity per diem.	Number treated.																
	Cattle or Sheep.	Cattle or Sheep.																
Aberdeen—Australian Chilling and Freezing Co. (Limited)	200	3,000	290	18,230	200	2,500	4,465	2,851	100	1,000	1,164	203,542	100	1,500	1,887	93,391		
Albury—Meat Works (Dundas & Co.)	50	1,500	66	67,219									50	100		26,731		
Barham—Boiling-down	50	1,000		20,000														
Bathurst—Hereford Estate Boiling-down (Cobb & Co.)	50	500																50 pigs cured
Do Alloway Bank do (J. J. Sullivan)	25	300																
Bourke—Meat Preserving Co. (Limited)	150	2,500	2,537	28,258	150	1,500	1,500	21,279					150	2,500	280			
Carrathool—Stock Owners Company of N.S. Wales (Limited)		2,500		6,485		1,350		59,937										
Cooma—Bunyan Boiling-down Works		2,000																
Do Middle Flat do do		600																
Corowa Boiling-down Works (Limited)		1,000		25,322														Not in operation this year.
Darling Harbour—Geddes, Birt, & Company									160	2,000		214,000						Has storage capacity for 40,000 sheep; now being considerably enlarged.
Deniliquin—Riverina Frozen Meat Company	125	2,500		45,500							145	107,752						
Do Oddy & Sons' Boiling-down Works				125,786														
Do H. Ricketson's do do				13,423														
Do J. M. Carew's do do				22,000														
Dubbo—Refrigerating and Boiling-down Co. (Limited)	100	1,500		9,331	80	900	107	11,543										
Easton Station Boiling-down Works		300																Private establishment. None treated, as they were not prime enough.
Forbes—Stock Owners Company of N.S. Wales (Limited)		2,500				1,350												In course of erection.
Gunnedah—Pastoral Finance Company, Sydney	100	1,500	11	5,694	30	1,200	161	46,375										32 turkeys
Hay—Boiling-down Works		2,600		70,000														
Menangle Boiling-down Freezing and Meat Preserving Company (Limited), 6-Mile Point	300	3,500		8,703	60	600							100	2,000	30	10,327		Work only nominal during 1896, owing to scarcity of fat stock.
Meanna—G. G. Cloughton's Boiling-down Works				11,744														
Do John Stokes do do				22,945														
Molong—Beri Boiling-down Works	40	600																
Do Burrawang Boiling-down Works	20	300																
Do Buckenham do do	13	200																
Narrandera—Riverina Chilled Meat Works	30	2,000		1,667	30	800		15,120										Not working during year.
Narrabri—Namoi Refrigerating, Preserving, and Boiling-down Company's Works	89	2,000	195	32,085	50	500	253	3,782	40	400	19	11,725						12,000 doz. sheep tongues.
North Sydney—Pastoral Finance Co.									160	3,000	258,690							
Nyngan—Stock Owners Company of N.S. Wales (Limited)	150	2,000	247	10,323	75	900	97	4,351										
Rainworth—Australian Meat Works	100		175										150		10,066			*Also parts of 18,391 cattle
Sydney—Meat Preserving Company													875	7,500	7,603	511,311

The Live Stock Export Trade.

There appears no prospect of a revival of the live stock trade at the present prices at Home, the heavy expense of freight and forage, and the risk of loss on the voyage.

Export of Chilled Meat to London.

Some further attempts have been made during the year to send meat in a chilled state to England, but I regret to say that none of them have been attended with success.

Defrosting of Meat.

The following information under the above head is the latest procurable on this subject. It has been kindly supplied by Mr. M. Thompson, one of the directors and the Australian representative of the Colonial Consignment and Distributing Company, London.

The defrosting of meat is now an established addition to the handling of frozen meat in London. The patent, invented by Mr. E. M. Nelson, is to be seen in operation at the stores of the Colonial Consignment and Distributing Company, Lambeth, where there are eighteen defrosting chambers capable of treating 5,000 sheep, or their equivalent in cattle, and it is kept fully employed.

The process of defrosting is simply undoing the process of freezing. The operation takes as long, or nearly so, as freezing, and the cost is $\frac{3}{4}$ d. per lb. The producer can well afford to pay this upon really good stock, as the value is increased from $\frac{1}{2}$ d. to $\frac{3}{4}$ d. per lb.

It is obvious that to defrost all the meat under the process sent from Australia it would be necessary to have defrosting chambers equal in capacity to all the freezing establishments in New Zealand and Australia put together, and would entail the employment of an enormous amount of capital far in excess of any one firm's operations.

The expansion, however, of this part of the meat trade is the next and last thing necessary to its complete success.

Here again the necessity for exporting of only prime meat comes out in strong relief. Mr. M. Thompson repeats the statement which has often previously been made, that only real good meat will pay to defrost; and common sense tells us that this assertion will apply with double force to the appearance of second-rate and inferior mutton, thawed in the ordinary way by the atmosphere. Unless it is prime it looks anything but inviting when thawed in that way, especially if the sheep are merino.

THE EXPORT TRADE IN AUSTRALIAN FROZEN MUTTON.

Our export trade in frozen meat for 1896 (which may be said to consist almost entirely of frozen mutton) has been anything but a profitable one, and it will be well to notice the circumstances which it is believed brought about this disappointing result, and entailed the heavy losses which have been sustained by both sheepowners and shippers through the low prices realised for our mutton.

Among other causes for this unfortunate state of things, the following may be mentioned:—

1. THE LARGE INCREASE IN THE SUPPLY OF MUTTON RECEIVED INTO THE UNITED KINGDOM.

(1.) *The Supply of Mutton (including Sheep and Lambs) and Increase.*

The following frozen mutton was imported into the United Kingdom for 1896:—

		At London.					
From Australia	(carcases)	1,613,523
„ New Zealand	„	2,211,895
„ River Plate	„	245,573
„ Falkland Islands	„	24,074
							4,095,065
		At Liverpool, Manchester, and other ports.					
From Australia	(carcases)	77,883
„ New Zealand	„
„ River Plate	„	1,544,989
							1,622,872
Aggregate of carcasses in 1896		5,717,937
„ „ 1895		5,053,067
							664,870

This abnormal increase had, of course, a depressing effect on the trade all the year through; but this was especially the case in the beginning of the year, when the shipments from Australia and the River Plate were very heavy.

By the end of June the increase of frozen mutton from these two sources (which may be held to be of the same description) was equal to 100 per cent. on the previous year's supply, and at the end of the year the number of Australian carcasses in 1896 was 1,691,523 against 1,005,503 in 1895, showing an increase in Australian mutton of 685,000 carcasses, or 65 per cent. more than in 1895—the average weekly supply of Australian mutton springing up in one year from 18,000 to 30,000 carcasses.

This

This enormous increase was sufficient of itself to depress the market and bring about a heavy reduction of price; but when in addition to that there was a large increase in the supply of River Plate mutton to the extent of 174,000 carcasses, and what was worse—so far as our mutton was concerned—a great deal of it was only second-rate and some even third, the effect of all these circumstances can be readily conceived and the low prices realised easily accounted for—indeed, the wonder is that prices were not lower than they were; and these facts, disappointing though they be, give us good grounds for believing that if we can, as we hope to do, improve the quality of our mutton, regulate supplies, and arrange for a better mode of distribution, a much larger supply of our mutton than was sent last year can be absorbed in the United Kingdom at improved prices, the River Plate competition notwithstanding.

2. *The Mutton was of an Inferior Description.*

This might be said of it on either of two grounds:—

- (a) On the ground that it was merino and not crossbred.
- (b) The objection might be that the mutton, whether crossbred or merino, was of an inferior description.

The first of these sub-causes had a considerable share in bringing about the poor price our mutton brought, as the sheep imported were nearly wholly merinos; and in a full market merinos, unless they are prime, bring very poor prices, and are far from meeting a ready sale, except at ruinous prices. No doubt they are often in demand, as there are all classes of customers in the United Kingdom, but at figures that leave the breeder considerably less than boiling prices.

As regards the second sub-cause, there is no question but that, through the unfavourable seasons which we have lately had, a great deal of the mutton was anything but prime—much of it, in fact, barely second-rate; and mutton of any breed of that description brings a poor price even where the supply is normal; and as the merino sheep are, even when in prime condition, comparatively thin in the flank, sharp in the shoulder, narrow across the loins, and long in the legs, inferior mutton of that description suffers more in appearance than any other, and as a consequence suffers most in price.

3. *The Neglect of Grading the Mutton.*

The necessity for grading the produce for export is now so generally recognised that nothing need be said by way of advocating its adoption in the export of our frozen meat; but while that is the case there is considerable difference of opinion how grading should be carried out. There are three systems with which it can be so.

- (a) The shipper of the mutton could grade it.

This system is very ineffective, as it allows produce which may not be good enough for second-class to be put on the London market as first-class. Our produce in this way gets a bad name, confidence in our grading is lost, and even those who grade carefully and honestly suffer, and we can never under such a system expect to obtain top prices for our produce.

- (b) The Government could appoint a Board of Examiners consisting of (say) five gentlemen, having among them men with a thorough knowledge of the meat export trade in all its branches, who would examine applicants for the position of graders of meat, and grant those whom the Board considered qualified the necessary certificate; and the shippers of meat could employ any grader who held the certificate of the Board.

This is the same system as has been followed in the United States for twenty years, and in Canada for more than ten years, except that there the Boards of Trade in the States and Canada appoint the examiners; and although the system is optional in principle it becomes compulsory in practice, as the shipper who has a good article to export takes care to have it graded and is careful to send the certificate of inspection and grading with the produce; because in the case of dairy produce from the States or Canada, the want of the certificate now makes a difference of from 1d. to 2d. per lb. in the price in the United States and British markets.

This system may take a little time to come generally into operation; but it is both workable and effective—so much so that the purchasers of graded produce in the United States and Canada, if not in England, do not inspect the article they want but buy by the number of the grade.

- (c) The Government may appoint the grader.

This is the system followed in New Zealand and Victoria with respect to dairy produce. Under this system the effect of the grading would be soonest felt, and the work would no doubt be efficiently carried out; but it is questionable if those connected with the trade, either in meat or dairy produce, would not prefer the second system, as they seem to think such a system would leave the management of the trade more in the hands of those engaged in it.

4. *The want of co-operation among the Meat Companies and Shippers.*

The necessity for co-operation among our meat companies and shippers was strongly emphasised in the report which I submitted in the end of 1894 on the Meat Trade in the Colonies and Great Britain; and I there described at length the different classes of meat companies and the likelihood of their successfully combining for the general good, and especially for that of our stockowners. In doing so I divided them into three classes:—1. Graziers or stockowners' companies—companies whose shareholders are stockowners or those connected with them, and formed in their interest; 2. Agency companies, also largely formed by stockowners for the purpose of killing and freezing stock, and also in some cases shipping and selling the meat for stockowners and others in London on commission; and, 3. Trading companies which purchase stock in the colonies, which they prepare themselves or get some of the agency companies to prepare and freeze for shipment, but which also purchase frozen meat largely in the London market and dispose of it in the United Kingdom, having for that purpose a large staff of travellers and agents, and extensive cold storage accommodation.

The

The suggestions I then offered with regard to co-operation among the meat companies met with general approval, and several attempts have since been made to carry them into effect, but so far without success; because, instead of confining their efforts, in the first instance, to inducing the graziers and the agency companies which were working principally for stockowners to combine, it was attempted to obtain the co-operation of the whole of the meat companies, without regard as to whether they were graziers, agency, or trading companies. The attempt failed, and no other result was to be expected, for the interests of these different classes of companies, if they do not actually conflict, are far from identical. This will, I think, be seen from the description which I have given here of these companies, and at greater length in report referred to; and there is no doubt but even if these companies had agreed to co-operate, the agreement would not have lasted any more than the partial agreement which was made by the representatives of the meat companies in London, and which was broken through in less than two months.

As I saw, this was only what was to be expected; for while it is the interest of the graziers' companies that good prices should be obtained for the meat in the United Kingdom, it is clearly the interest of these trading companies when they purchase, as they frequently do, in the London market, that they should do so at as low a price as possible; and that if they got it cheap, which unfortunately for our stockowners they have been doing, they can make a much better profit on what they purchase in London than on the meat they import from the colonies. It is plain, therefore, that the lower the wholesale price of frozen meat is in the London market, the better it may suit the trading meat companies, and that the interests of the graziers' companies and the trading meat companies are anything but identical.

It may perhaps be said that the graziers' companies are not numerous nor strong enough to have sufficient say as to how the meat trade should be conducted at Home; but if these companies would stick together as they ought, and combine not only in each colony but in all the colonies, they would be able, with the meat going from their own works and that shipped by their fellow-owners from the agency companies, to have a very large output; and then, when such an arrangement as that is brought about, and the parties to it worked harmoniously together and faithfully supported each other, there would be a good prospect of some arrangement being made with the trading companies for regulating supplies and prices; for if the combined graziers' companies were not powerful enough to dictate terms to the trading companies, they would at least be able to secure a reasonable working arrangement and to enforce its maintenance if they stick together. It is, therefore, as I have always urged, for the graziers' companies in each colony to combine and to form a small intercolonial council, to be chosen by the directors of the combined companies, who should have the general control and conduct of the trade of these companies both in the colonies and in the United Kingdom. If such a combination as that were formed and conducted with ordinary prudence and ability, it ought not to be long before there was a considerable decrease in the number of trading companies and an increase in graziers' companies.

5. The want of direct shipments and centres of distribution.

The distribution of Australian meat in the United Kingdom, as now carried out, is defective in two respects—(1) There are too few ports to which direct shipments are made; and (2), there are too few towns at which proper cold storage is provided.

(1) Direct shipments to new ports in the United Kingdom.

Although a few direct shipments have been made to Cardiff and Manchester, it may be said that actually there are only two ports—London and Liverpool—to which direct shipments are sent, the shipments to London last year amounting to 4,095,065 carcasses; to Liverpool, 1,544,989; and to Manchester, the only other port to which a direct shipment was made, only 77,883 carcasses.

There is now ample storage at both Cardiff and Manchester for frozen meat, and no doubt considerable direct shipments will before long find their way there. Provision is also in the course of being provided at Glasgow, and when it is, at certain seasons of the year direct shipments will also be made there. Hull, again, on the east coast, which is a city with over 200,000 inhabitants, and in close communication with a good many of the large inland manufacturing towns, would, if cold storage were provided, be another excellent centre of distribution. Newcastle also, especially as it is at a considerable distance from London and also from Liverpool, would likewise, when the necessary cold storage is provided, be another port to which direct shipments might be sent. It might also, perhaps, by-and-by, be found practicable, if the necessary storage were provided, to ship direct to Leith, as both Edinburgh and Dundee could be supplied from that port.

(2) The provision for cold storage in the United Kingdom is insufficient.

There is cold storage accommodation at several of the inland cities in the United Kingdom, and some is in the course of being constructed, but a good deal more will have to be provided if the requirements of our trade in perishable produce are to be fully met.

Before such a trade can be established in any of the great centres of population there, it will be necessary to assure those who are inclined to take up the sale and distribution of our produce that they can thoroughly depend upon obtaining a steady supply of really good produce; and this guarantee cannot possibly be given without ample cold storage as well as regular supplies from the colonies of first-class meat, butter, fruit, &c.

In addition to the towns to which direct shipments are suggested, I believe that it would pay to erect cold stores at the following towns, each of which have more than 200,000 inhabitants:—Birmingham, Bradford, Leeds, Nottingham, Salford, and Sheffield.

Wherever provision such as I have described is made for the trade, and a full supply of really good Australian meat is always on hand at a reasonable price, there is no question but an extensive wholesale paying trade would be established, for there are plenty of people ready to go into the retail trade so soon as they are satisfied that they can obtain a constant supply of good meat; and this, the erection of cold stores in the large centres of population, would go a very long way to guarantee, if the graziers' companies would work together as here suggested, nor would there then be any occasion for our entering on the very risky, and what it is feared very unprofitable, undertaking of opening, as some propose, shops, and retailing our meat in England and Scotland.

These

These suggestions in regard to direct shipments and additional cool storage are made on the understanding that the shipments would not be confined to frozen meat, but that butter, cheese, fruit, game, and other perishable produce would also reap the benefits of these improvements.

6. *Advance Contracts for Freight.*

These contracts, which had in several instances been made for long periods in advance, where space was comparatively scarce, had an injurious effect on the Home market; for where cargo became scarce through those in the trade ceasing to ship on account of the low prices at Home, and the difficulty of obtaining prime sheep through the unfavourable season, the companies which had made these contracts had to go into the market and purchase, and as the drought continued they were frequently unable to obtain good sheep, and had to take second-rate sheep to fill the space they had engaged, thereby adding to the glut of second-class mutton, and intensifying the depression.

Freights are now much lower (they can be got at $\frac{1}{2}$ d. per lb.), and it is expected that they will be even lower at times, as considerable additions are being made to the vessels in the frozen meat trade, which will prove a most important boon to our stockowners.

THE EDIBLE FAT AND MEAT EXTRACT COMPANY (LIMITED).

Since last report a company, styling itself the Edible Fat and Meat Extract Company (Limited), has erected works at Belmore, about 10 miles out of Sydney, for the manufacture of meat extract by a new process. It commenced operations in November last, and has purchased to date, at Homebush, upwards of 130,000 sheep, and at present operates upon about 7,000 weekly. In addition to the whole of the fat contained in the carcasses (as much, if not more, fat is got by this process than by boiling), about 10½ oz. of extract per head has been obtained from the sheep treated, and these results being considered satisfactory it is proposed to extend the works.

The process is simple, speedy, and effective, and is briefly as follows:—The carcasses are boned and the meat is reduced to a mince, which is subjected to just sufficient heat to liberate the meat essence. The mince is then put into canvass wrappers, which are placed in powerful hydraulic presses, and the liquid expressed is allowed to settle. The meat essence is then drawn off, and the excess of water evaporated from it. The fatty liquid passes into refiners to be further clarified. The products are said to be of superior quality to those manufactured in any other way, and the cost of treatment is very little more than for boiling down.

The Meat Extract Patents Proprietary Company (Limited), O'Connell-street, Sydney, have secured the patent rights throughout the world, and have already arranged with several Queensland companies to erect works.

CROSSBREDS ON THE BATHURST EXPERIMENTAL FARM.

I have in previous Reports strongly urged those owners in the more temperate and cooler portions of the Colony, whose holdings are adapted for crossbreds, to put British rams to a portion of their merino ewes, and grow cultivated food, especially lucerne, to make the sheep prime at an early age; and those owners are now referred to Appendix O to this Report, in which they will find an interesting object lesson in the shape of a statement, giving the result of the experiments in cross-breeding, so far as they have gone, on the Bathurst Experimental Farm, at the instance of the Honorable the Minister, Mr. Sydney Smith.

The result is thus referred to by the *Stock and Station Journal* of 21st May last:—

In our issue of the 27th ult. we gave an account of the crossbred fat sheep from the Bathurst Experimental Farm, exhibited as non-competitive at the recent Metropolitan Show, which had been bred in the course of the experiments which are being carried out at the instance of the Minister for Mines and Agriculture, the Hon. Sydney Smith, for the purpose of settling which of the English breeds of sheep should be mated for crossing purposes with our merino ewes. We gave a full description of the sheep and the weights of the different crosses. Since then their skins have been felled and prepared by Messrs. Wright and Abbott, of the Lakeside Wool Scouring Works, Botany, and a joint report—in which the scourers were complimented for the manner in which the samples were treated—was kindly furnished by Mr. H. G. Holt, of Messrs. Hinchcliffe, Holt, & Co., and Mr. S. Nettleton, of Messrs. Laycock, Nettleton and Co., wool experts of this city, on the relative value in this market of the wool of the different crosses. Taking the particulars contained in their report, and those contained in our previous account of these sheep, we now present our readers with the following tabulated statement, based, of course, on estimates which it is considered are rather under than over stated, which show that these sheep, which were not more than seventeen months old, weighed very nearly 60 lb. each prime mutton, and would likely give a clear net average return, after deducting cost of slaughtering, shipping, freight, and all charges here and in London, of 13s. 11½d. each, and the lambs only a trifle less—prices which speak for themselves, and which, if realised, should lead our owners to freeze and ship only crossbreds, and crossbreds that are really prime.

APPENDIX A.

APPENDIX B.

INFLUENZA IN HORSES.

(By E. Stanley, F.L.C.F.S., Government Veterinarian.)

Character.

It is a contagious equine fever, due to germinal matter invading the system, producing disastrous changes in the blood, which interfere with nutrition, excite congestion, and occasionally inflammation of important organs or tissues.

The germs of this disease are always lurking about, and epidemics are due to exceptional climatic changes that have a lowering effect on the health of horses, and at the same time favour the vitality of the disease germs.

The worst cases are amongst hard-working horses in overcrowded sheds, with bad sanitary surroundings; next come fat horses; and the least susceptible are horses that are in good working condition, cleanly kept, and well-cared for. If such have the disease at all, it is in a mild form, and they speedily recover.

Symptoms:

Symptoms.

In the onset, loss of appetite, drowsy headache, pain in the limbs, general weakness; in many cases the eyelids are swollen, tears trickle down the face; there may be discharge from the nostrils, and occasionally coughing; the eye will be found scarlet and orange colour, the tongue furred, breath offensive, the heart beats feebly but quick, the pulse is small and weak, the dung is soft, and the urine high-coloured; there is a general rise of the bodily temperature.

As the disease progresses the symptoms will depend on its course, which is very variable, as the numerous names given to the disease indicate. The vital forces in many cases overcome the toxic effects and excrete the poison from the system. It is to assist this process that we have recourse to treatment.

The Treatment.

This should consist of rest, pure air, shelter from sun, rain, or wind, bran mashes, and cut green food with drachm doses of chlorate of potash, carbonate of ammonia, or nitrate of potash given in the drinking water. If the case has been taken early enough, and the surroundings are good, the fever will abate, and recovery be complete in a very few days.

Unfortunately many horses are worked at the commencement of the illness; then they are completely knocked up, and they present a variety of bad symptoms, owing to the mischief being located in individual organs, such as those of respiration, or the bowels, liver, spleen, lymphatic glands, or cerebro-spinal system. The location can only be diagnosed by the educated veterinarian, and every case should be treated to suit the nature and stage of the illness. Dropsical swellings are a favourable indication, but time and patience must be allowed for recovery. No case is cured until the horse is playful at exercise.

APPENDIX C.

(By the Government Statistician.)

INCREASE and Decrease of Sheep, year ended 31st December, 1896.

Number of sheep, on 31st December, 1895	47,617,687
Lambs marked during 1896	10,609,209
Number of sheep imported during 1896	1,010,176
					59,237,072
Slaughtered for food for local consumption (including sheep killed on stations)	2,987,944
Do for meat preserving	940,676
Do for freezing for export	1,372,373
Do for boiling-down in boiling-down works	523,279
Do do do on stations	133,819
Lambs slaughtered for food for local consumption	119,329
Total slaughtered	6,077,420
Exported during 1896	774,578
Killed by dogs	257,590
Loss by drought, ordinary mortality, and missing sheep	3,838,694
Total deduction	10,918,282
Number of sheep on 31st December, 1896	48,318,790
Increase on previous year	701,103

Total	3,400	273

APPENDIX E.

TICK PLAGUE.

Proclamations and Crossings.

On the 25th August, 1896, a proclamation was issued under the Imported Stock Acts, prohibiting the introduction of horses and cattle from that part of Queensland north of a line following the 24th parallel as far as the 144th meridian, and thence in a north-westerly direction to the South Australian border, at a point about midway between the 20th and 21st parallels, and only allowing the introduction of them from south of that line on inspection at the crossing-places at Tullabudgera, Mount Lindsay, White's Swamp, Acacia Creek, Wallangarra, Texas, Bogabilla, Mungindi, Hebel, Brenda, Barrington, Paragundy, Hungerford, Adelaide Gate, Wompah.

Inspectors and Inspections.

Each of these crossing-places are under the charge of an acting-inspector, who again is under the supervision of the staff inspectors for the districts in which the crossings are situated, except in the case of Wanaaring and Milpariuka, when the inspectors do both district and crossing work.

Thus there are eighteen inspectors now employed on the border in seeing that the Regulations are enforced, and in addition the Customs officers and the police give every assistance on the Queensland border in maintaining the quarantine.

The crossing-places are also inspected periodically by officers from the head office. They were first inspected by Mr. Inspectors Vyner and Mater, two officials specially selected for the purpose, and later by Mr. Metropolitan Inspector Jones and myself.

At the suggestion of a deputation which recently waited on the Minister, three inspectors, two of whom are stationed on the border between Wallangarra and Tweed Heads, and Mr. Inspector Vyner, M.R.C.V.S., Armidale, have been sent to the tick-infested country in Queensland that they may get a practical knowledge of the pest.

Before any cattle or horses are allowed to cross, they must give seven days' notice to the inspector at the crossing-place, and produce a declaration by the owner and a certificate by an inspector in Queensland that such cattle are not infected.

Erection of Yards.

Yards and forcing-yards and crushes, with the exception of one or two crossings (where they are now being put up), are in use at all crossing-places, and every beast has to be put through the crush and carefully examined on both sides. If any doubt exists the hand is passed over the suspected part; and if there be still a doubt, a small-tooth comb and magnifying glass is used before the stock are admitted!

Regulations, &c.—Hides.

Regulations are in force prohibiting the introduction of hides or skins unless they have been thoroughly salted, and are accompanied by a declaration by the owner, and a certificate from an inspector in Queensland to that effect.

Present state of Disease in Queensland, and steps taken to stay its spread.

Although the deaths of cattle from tick fever in Queensland are now comparatively few, and some are of opinion that the pest will die out, the Government of that Colony are not acting on that idea, but are taking well-considered and energetic steps at all the points at which the disease has shown itself to stay its spread into the clean country in that Colony, and especially that no cattle on the northern side of the quarantine line settled at the late Stock Conference cross to the south.

Of all the points of which there is any danger of the disease breaking through this line, the neighbourhood of Rockhampton is by far the greatest, not only on account of the strong footing the disease has evidently been allowed to get among the stock, and its virulent character there, but because it is coast country, which everyone knows is best adapted for the tick, and where experience goes to show that it is very much more likely to spread than in the dry interior.

The other point of danger is the doubtful country to the north of Longreach and Barcardine, and around Winton, but where, from the latest reports from the inspectors, it would seem there are now no ticks to be seen, nor have there been for two or three months.

At both these and other points active measures have been adopted which entail heavy expense to prevent the infection spreading or coming further south.

There are three inspectors in the neighbourhood of Rockhampton engaged inspecting and dipping cattle, three in the Winton, Longreach, and Barcardine districts, and twenty-five other inspectors in different parts of the Colony.

In addition to this, the Government have constructed fourteen public dips (there are besides fifty-two private dips), and have distributed large quantities of oil.

Several requests have been made for a relaxation of the quarantine regulations in regard to districts which have for some time been and are said to be free from ticks, but it has not been considered safe, in the interests of all the Colonies, to make any concessions at present, and this view has been confirmed by the resolution of the recent Conference.

A suggestion made by the Honorable the Minister for Mines and Agriculture to the other Colonies, that Dr. Koch should be invited to visit Queensland with a view of suggesting some means of prevention or effective treatment was also considered by the Conference, and it was decided to ascertain on what terms he would visit Queensland.

APPENDIX F.

TABLE 1.

SHOWING the number and proportion of Cattle condemned out of all those slaughtered at the Abattoir, Sydney, 1896.

Description of animals.	Number slaughtered.	Condemned diseased.		Condemned or bruised or unfit for food.	
		Number.	Percentage.	Number.	Percentage.
Bulls	24	5	20.83	Nil.	...
Bullocks	60,624	569	.93	7	.011
Calves	9,528	2	.0209	1,668	17.506

Fungoid growth	1	.007	Want of condition	6,406	47.3
Pneumonia	63	.4	Not specified	6,163	45.6
Immature	59	.4			
			Total	13,555

"Cattle" means all kinds of animals killed for food.

APPENDIX G.

TAR AND PAINT BRANDS ON WOOL.

Sydney Wool Selling Brokers' Association Offices, Wool Exchange, Macquarie Place.

Sir,

"Tar Brands on Wool."

Referring to the interview between yourself and the representative of the wool selling brokers and buyers of this city, I have the honor to report that the subject matter of that interview has since it was held received considerable attention, and a large amount of information has been collected on the subject from leading pastoralists. It is at once conceded that the contention of those who have represented the matter of the loss resulting from the "tar" branding of wool is correct. Although tar is rarely used in this Colony for the purpose of sheep-branding, it is found that any pigment which will remain visible on the sheep's back for twelve months is equally injurious, and a non-injurious substitute for tar cannot therefore be suggested. The practice of so-called tar-branding is not carried on to the same extent as it has been in the past, and will probably be further gradually discontinued; but as the whole question depends so largely upon the necessities and convenience of flock-owners, there appears little more to be done than to take such steps as will give publicity to the damage caused by tar-branding, and leave owners to decide whether this is likely to be greater or less than that incurred by discontinuing the practice. It appears that as the Travelling Stock Act requires that a T (tar-brand) shall be placed on all travelling stock, a regulation specifying that this or some other distinguishing and recognised travelling brand should be placed on the head instead of the back as heretofore would to a certain extent reduce the damage to the fleece.

I have, &c.,

HERBERT CUNNINGHAM,

Chairman.

The Chief Inspector of Stock, Sydney.

APPENDIX H.

APPENDIX H.

STATEMENT showing the result of Vaccinations for Anthrax as performed by Messrs. McGarvie Smith and Gunn with their own Vaccine, and by Mr. A. A. Devlin with Pasteur's Vaccine.

APPENDIX I.

FOOT-ROT.

DRESSINGS recommended by Mr. E. Stanley, Government Veterinarian. (For further details see *Agricultural Gazette*, July, 1891):—

Arsenic Dressing.

Arsenic, from 1 to 2 oz.

Potash, „ 2 to 4 „

Water, 1 gallon.

To be used in troughs for the sheep to walk through. The mixture to be boiled slowly for half-an-hour at least, till the arsenic is thoroughly dissolved.

Sulphate of Copper (Bluestone) Dressing.

Sulphate of copper, from $\frac{1}{2}$ lb. to 1 lb., dissolved in a gallon of water, may be used instead of arsenic. The following healing dressings may be used by hand after the above caustic applications:—

Tar Dressings.

Stockholm tar, 20 parts; carbolic acid, 1 part; or,

Stockholm tar, 8 parts; bluestone in powder, 1 part; or,

Oil of tar, 10 parts; carbolic acid, 1 part; olive oil, 1 part.

Lime Dressing.

Quick-lime, sprinkled on a dry surface, and the sheep walked through it frequently, will be found very beneficial. Before any dressings are used, the whole of the loose horn should be pared carefully from the diseased feet. It is of the greatest importance that the sheep's feet should, on the dressing being applied, be kept thoroughly clean and dry for at least three hours afterwards. They should, therefore, on leaving the troughs, or being dressed, be passed directly on to a battened or wooden floor, if it can be got; and where neither of these is obtainable, they should be passed into a dry yard, in which there is a good coating of straw, cut grass, or dry bark taken from trees which have been rung, or, in fact, any other thing which will keep their feet clean and dry.

The following are the remedies reported by the Inspectors to have been used and the results:—

Application.	Result.	Application.	Result.
Arsenic in troughs	Good.	Carbolic sublimate and bluestone	Good.
„ bluestone and carbolic acid	Not given.	Carbolic acid	Good.
„ and bluestone.....	Good.	„ and oil and butyr of antimony	Good.
„ and lime	Fair.	„ acid, bluestone, and arsenic ...	Not given.
„ and saltpetre	Not given.	Kerosene.....	Good.
Bluestone and corrosive sublimate	Satisfactory.	„ and bluestone.....	Good.
„ and arsenic	Good.	Lime and tar	Not given.
„ and kerosene	Good.	„ and arsenic	Not given.
„ and lime	Good.	Sulphur and bluestone	Good.
„ and sulphur	Good.	Saltpetre and arsenic.....	Not given.
„ arsenic and carbolic acid	Good.	Tar and turpentine	Not given.
Butyr of antimony	Good.	„ and quick-lime	Good.
„ „ carbolic acid and oil... ..	Satisfactory.	„ and bluestone.....	Good.
Corrosive sublimate	Not given.		

Specifics.

Cooper's Dip	Satisfactory.	Pottie's Specific	Not stated.
Hayward's Dip.....	In some cases.	Quibell's Foot-rot Cure	Good.
Little's Dip	Satisfactory.	Graham's Foot-rot Powder	Not very satisfactory.

APPENDIX J.

REDUCED RAILWAY RATES ON STORE AND BREEDING STOCK WHILE BEING CARRIED IN THE LEVEL OUTLYING DRY PORTIONS OF THE COLONY.

IT would be an incalculable boon to our stockowners in the western, north-western, and northern portions of the Colony, who have so frequently to struggle with dry seasons, and at times severe droughts, if the Railway Commissioners could see their way to lower the charge for the carriage of store and breeding stock in the level portions of the Colony (say from Dubbo to Bourke, Junee to Hay and Jerilderie, and from Willow Tree to Moree), proportionately to the cost of haulage on those portions of the line mentioned, but not, of course, below a rate which would pay to carry on these portions.

I make these suggestions because I understand that on the level country an engine can take at least twice the load that it can from Junee, Dubbo, or Willow Tree to Sydney, and because I believe such a course would tend before long to greatly increase the railway traffic, by leading owners in those portions of the Colony to send their store and breeding stock by rail where they were able to reach the train, as it would then be greatly to their advantage to adopt that course, except in unusually favourable seasons.

In order the better to show what my suggestion is, I will suppose that 5,000 store sheep, purchased in the country to the west or north of Hay, have to be taken to the Young district to be fattened, and that they are trucked from Hay to Junee, from which, unless they are to go by rail at ordinary rates, the sheep would proceed to their destination by foot. In that case, if the rate charged by the Railway Commissioners were such as would induce the owner of the sheep to truck instead of travel, the following advantages would accrue to him :—

- (1) There would be a great saving of time in getting the sheep to their destination ; for, while the journey on foot, extending to 167 miles, would, travelling at the regulation rate of 6 miles a day, take twenty-eight days, that by train, including time for trucking and unloading, would not occupy more than one and a half days, and this is a very important advantage.
- (2) The risk of actual loss of sheep on the journey would be much less by train than by the road. This would especially be the case in times of drought; for with low rates of freight owners would not put off sending their sheep to the mountains, as they now frequently do, till they are actually starving, when they can get them carried at starving rates, but when a good many frequently die by the way.
- (3) But the principal benefit, so far as the owner is concerned, in trucking instead of travelling the sheep on foot would arise from the saving of condition and preventing deterioration of the fleece.

Now that the travelling stock reserves are almost all under lease (*i.e.*, out of a total of some 8,000,000 acres contained in these reserves, there are only about 500,000 acres reserved from lease, and 7,500,000 acres under lease), the waste and deterioration going on when stock are travelled is exceedingly heavy ; indeed, so serious is it that I believe it would often, even in ordinary seasons, pay owners better (if they could only see it) to truck their stock where they can do so without going far out of their way than to travel by road ; for sheep travelled for twenty-eight or thirty days by a road on which there is little or no feed, would, if they were in no more than fair store condition when they started be "dog" poor when they reached their destination, and would take perhaps three months after they did so to get into as good condition as they were in when they started, thereby losing all that time, and perhaps missing the best time of the year for fattening. It is one thing to get the sheep home in poor condition and quite another for them to arrive in good condition ; and when, in addition to this, the deterioration of the fleece through starvation and dust, and by burrs and other noxious weeds picked up by the way, is taken into account, it will be seen that it would, as I have said frequently, pay the owner better to truck, I had almost said at even ordinary rates, than to travel his sheep by road. [*See statement appended, contrasting traffic by road and rail.*]

While this is the case, as there was at one time sufficient pasture by the way, travelling stock did not suffer as they now do ; and as their owners have been accustomed to take their store and breeding stock by road, they would not at first be inclined to send them by rail, and pay cash for what they do not see an immediate return. They would, therefore, look upon the freight as an extra expense ; and it is necessary that some inducement, such as I have suggested, should be held out to lead them to truck instead of travelling their sheep on foot to their destination.

I need scarcely point out that if this suggestion, or any modification of it, were considered practicable and acted on, it would bring a very large addition to the railway traffic, and would greatly assist in extending the railway as well as promoting closer settlement in the outlying portions of the Colony, as the stock traffic is both an important and constant one, and the extension of the railways into the dry country would be the means of saving a large portion of the stock which now perish in times of severe drought like the present. How much the additional traffic under such a system would be is hard to say ; but to give some criterion of the increase which the trucking of store and breeding stock would make to this branch of the traffic, I submit the following statement of the stock traffic in 1895, as reported by the Inspectors of Stock, and make an attempt at an estimate (which no doubt is a very uncertain one) of the additional stock which would, under such a system, be likely to be trucked instead of travelled.

Tentative Estimate of Increase to Railway Sheep Traffic if suggestion were acted on.

Stock traffic for the whole Colony, as reported by the inspectors of stock,	
for 1895	24,000,000
<i>Less—</i>	
Say one-half for same lot of sheep having been reported by more than one inspector	12,000,000
Sheep which cannot reach the train	3,000,000
Sheep which leave Colony on foot	1,000,000
Sheep which are now carried by rail	4,000,000
	20,000,000
	4,000,000

According, therefore, to this tentative estimate, there are 4,000,000 sheep in the Colony not now put on the train to be moved from one place to another, which might, if owners chose, be conveyed in that way to their destination; and if this estimate is at all near the mark the portion of that number which would be in the country to which it is suggested the reduction of freight should apply (that to the western, north-western, and northern portions of the Colony) might, it is thought, be put at one-half—say, 2,000,000, plus the Queensland traffic, 1,000,000.

The inspectors' reports show that during 1895 the large stock (cattle) traffic amounted to (say) 1,300,000; and estimating one head of large stock as equal to ten sheep, that would make the large stock equal to 13,000,000 sheep; and that, again taken in the same proportion as estimated above, would make 1,275,000 sheep to be added to the 3,000,000 there shown, making the total traffic equal to 4,275,000 sheep in the dry part of the Colony which might use the railway in addition to those now carried by train.

STOCK TRAFFIC BY ROAD AND RAIL CONTRASTED.

By Road.

	£	s.	d.	£	s.	d.
Driving 5,000 sheep from Hay to Junec, 167 miles, at 6 miles per day = 28 days at £3 per week per 1,000	60	0	0			
Losses and deaths by the way, say, $\frac{1}{2}$ per cent. = 25 at 5s. ...	6	5	0			
Waste of condition at the rate of, say, 2 oz. each per day, $3\frac{1}{2}$ lb. per sheep on 5,000 = 17,500 lb., at $\frac{3}{4}$ d. per lb.	54	13	9			
Deterioration of the fleece by dust and noxious weeds, and starvation of sheep—taking the fleece at 2 $\frac{1}{2}$ lb. for six months on 5,000 sheep = 13,750 lb., at $\frac{3}{4}$ d. per lb....	42	19	4			
	<hr/>			163	18	1

By Rail.

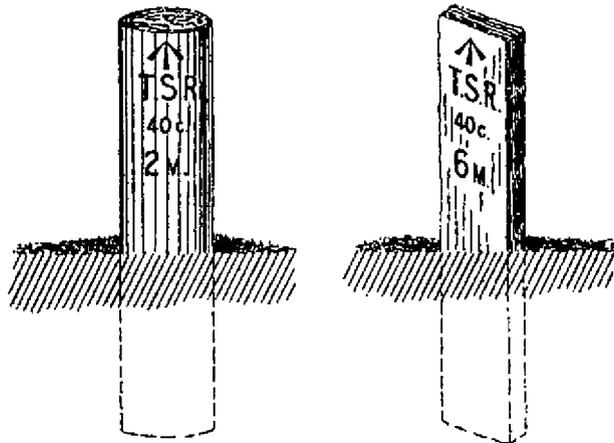

Yarding and loading 5,000 sheep at Hay on railway at 2s. per truck—say, 50 trucks =	5	0	0			
Railway freight on 5,000 sheep from Hay to Junec, 167 miles at ordinary rate, £4 7s 9d. per truck—50 trucks	219	7	6			
Unloading above 50 trucks at 1s.	2	10	0			
	<hr/>			226	17	6
<i>Deduct—</i>						
Reduction, as suggested, one-third on railway freight	73	2	6			
	<hr/>			153	15	0
Balance in favour of rail of	£10	3	1

RINDERPEST.

IN the early part of this year rinderpest, the most deadly of all the bovine scourges, raged in a most severe form in South Africa, decimating the cattle and carrying off 80 and even 90 per cent. of them. Quarantine lines were proclaimed, a large number of patrols were specially appointed, and a great many sound cattle were destroyed to prevent the spread of the disease which prevailed over a wide extent of country, and spreading as much as 30 miles per day.

The Cape Government authorised the destruction of all cattle infected, and also all those within a radius likely to become so, compensating the owners of those not already actually affected, in sums of from £3 to £5 per head.

They also assisted owners who had become embarrassed by reason of this dreadful scourge, and authorised the expenditure of fifty or more thousands of pounds with that object.

The number of cattle dying from the disease, and slaughtered to prevent its spread, is very large indeed.

As there is no known cure for the disease, the alternative is to stamp it out, and as much as possible prevent its spread.

It was reported that Dr. Koch, the eminent scientist, who had been brought from Germany to devise some means of checking the disease, had discovered a specific for the disease, but intimation has since been received by cable that his treatment had proved unsuccessful.

On receiving intimation of the prevalence of rinderpest in South Africa, steps were at once taken to protect this Colony from any risk of introducing the disease. Not only was the introduction of all stock, fodder, and fittings from South Africa prohibited, but the introduction of stock from Great Britain or any other country or colony by vessels calling at a port in South Africa was also prohibited, and a strict watch is maintained at Sydney and Newcastle that the prohibition is duly maintained.

The other colonies have since issued similar proclamations.

1897.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

POLICE DEPARTMENT.

(REPORT FOR 1896.)

Printed under No. 2 Report from Printing Committee, 6 May, 1897.

The Inspector-General of Police to The Principal Under Secretary.

Sir,

Police Department, Inspector-General's Office, Sydney, 7 January, 1897.

In compliance with instructions, and as required by the Police Regulations, I have the honor to submit, for the Chief Secretary's information, the following Report of the operations of the Department under my control for the past year, together with the particulars usually laid before Parliament of the strength and distribution of the Establishment.

During the year new stations have been established at the under-mentioned places:—

Bimbi	Western District.
Coramba	Northern District.
Daviesville	Western District.
Dural	Eastern District.
Geurie	Western District.
Girilambone	Bourke District.
Marshall M'Mahon's Reef	Southern District.
Naremburn	Metropolitan District.
Nowendoc	Northern District.
Rugby	Southern District.
Tooma	Murray District.
Wiseman's Ferry	Eastern District.
Yalgogrin	Southern District.

Police camps have been formed on the Parkes-Condobolin Railway Works, and at Locksley, Dargan's Creek, and Lawson during the progress of deviation works in connection with the Western Railway Line in those localities; a constable has also been forwarded to Finlay, in the South-western District, for duty during harvesting.

The strength of the Force in the Metropolitan District has been slightly increased, and additional police have been forwarded to Bullina in the Northern District, Marsden and Bega in the Southern District, Parramatta and Liverpool in the Eastern District, and Garah and Bingara in the North-western District, Nyngan in the Bourke District, and Jerilderie and Berrigan in the South-western District.

The stations at Garangula in the Southern District and Welaregang in the Murray District have been broken up, that formed at Tooma being in lieu of the last named, the two places being 8 miles distant.

122 appointments were made during the year to provide for the increases shown, and to fill up vacancies occasioned as under:—

Resignations	52
Discharges	13
Dismissals	5
Superannuations	24
Deaths	8

The

*15—A

[550 copies.— Approximate Cost of Printing (labour and material), £13 17s. 6d.]

The area of country under the control of the Superintendent of Police in charge of the Southern District has been slightly increased by transferring thereto the Police Stations at Wollongough, Marsden, and Yalgogrin, previously within the boundaries of the Western District. The station at Mungindi has also been transferred from the Bourke to the North-western District. Otherwise there has been no alteration in the ten Departmental Police Districts into which the Colony is divided.

Thirteen Police pensioners died in 1896 who had been in receipt of pensions amounting in the aggregate to £1,625 10s. per annum. One widow of a member of the Force died who had been in receipt of a pension of £36 10s. per annum.

Twenty-four members of the Force were superannuated during the year, 18 receiving pensions at rates varying from £63 17s. 6d. to £470 per annum, amounting in all to £3,129 per annum, and 6 being granted gratuities upon their discharge, which entailed a further charge of £815 5s. upon the Fund.

Eight widows of members of the Force were awarded gratuities from the Police Reward Fund, amounting in all to £1,474 10s.

The pension of £245 per annum awarded Sub-inspector Cornett in 1895, with the understanding that the case would be reconsidered at the end of twelve months, ceased on the 5th April last, when it was decided that the Sub-inspector should resume duty.

With regard to the Police Reward and Superannuation Funds, I regret to state that it has been found necessary to dispose of all the invested stock, which was a considerable source of income, to provide funds for the payment of police pensions and gratuities to date. The condition of these funds being the subject of special reports to the Chief Secretary, under whose consideration the matter now is, it is unnecessary to refer to it further in this communication.

The following figures taken from the station watch-house records in the Metropolitan District show an increase of 229 in the total number of apprehensions within that district during 1896 as compared with the previous year:—

Total number of arrests during 1895	22,337
Do do 1896	22,566

There were 317 more apprehensions for drunkenness, simple or accompanied by disorderly conduct, than during the previous year.

As regards crime in the Colony generally, the numbers of cases of attempted murder and of manslaughter were considerably below the average, there having been only 8 of the first-named offence as compared with 29 the previous year, and 10 of manslaughter as against 24. Other serious offences reported all maintain the usual average.

Burglaries and house robberies were less by 48 than during 1895. Many of these thefts resulted from householders leaving their premises and property unprotected. The value of goods stolen is almost invariably very considerably over-estimated, which is proved in many instances when the whole of the stolen goods are recovered.

The District Licensing Inspector for the Metropolitan District, in his report regarding licensing business transacted within that district during the year, states as follows:—

“In 1882, when the present Licensing Act first came into operation, the population of the Metropolitan District was 243,231, and there were then in that area 843 public-houses, or one to every 293 inhabitants.

“The ratio of population to each public-house in the district steadily increased year by year until in 1894, when the total population was 421,030, and the number of hotels 797, or one to every 528 inhabitants. Since then a slight decrease has taken place, and on the 31st December last, when the estimated total population of the district was 410,000, the number of hotels was 789, or one to every 519 inhabitants.”

There were 1,163 inquests held during the year on the bodies of deceased persons, or 13 more than during 1895. In 80 cases death was attributable either directly or indirectly to intemperance.

134 inquests were held on fires, or 27 less than during the previous year. 54 were returned as “wilful,” 38 as “accidental,” and 42 not specified.

512 missing friends inquiries have been instituted during the year, 242 successfully. These inquiries, which include 80 cases reported from Great Britain and elsewhere beyond Australasia, involved considerable correspondence and research.

Proceedings have been taken by the Police on behalf of the Public Instruction Department, under the compulsory clauses of the Education Act, for neglect to send children to school, and recovery of fees, &c., in 1,598 cases, and cautions issued by them in 209 cases.

Inquiries have also been conducted in 1,034 cases for the Master-in-Lunacy, 712 for the State Children's Relief Department and Government Asylums, and 167 cases on behalf of the Superintendent of the N.S.S. “Sobraon” 816 notices were also served on behalf of the Land Board.

Complaints constantly reach me, not only from the Superintendents of Police, but from Magistrates and other country residents, of the interference with the performance of ordinary police duties occasioned by members of the Force holding so many offices outside their proper functions. I have already, in a former report—that for the year 1894—enumerated some of these offices, which have been increased of late by the retrenchment of Clerks of Petty Sessions at important places, such as Murrumburrah, Crookwell, Nundlo, Nymagee, Richmond, Berrima, Moama, Camden, &c. The duty devolving on the Police, the most efficient men are thereby confined to their offices for a great part of their time instead of working about their districts and thief-taking. I venture to think that these arrangements will not prove economical in the end, and the results may be serious. However, this matter is to form the subject of special inquiry and report.

The

The under-mentioned works in connection with buildings have been completed during the year on behalf of the Department:—

Cooloon	Erection of police station.
Daviesville	" "
Drake	Erection of court-house and lockup.
Fernmount	Erection of court-house and police quarters.
Gloucester	Erection of police station.
Guy Fawkes	" "
Jindera...	Erection of police station.
Junee	Erection of lock-up.
Maclean	" "
Marsden	Erection of court-house and lock-up.
Nowendoc	Erection of police station.
Singleton	Erection of lock-up.
Sydney...	Watch-house, Bourke-street.
"	Police Officers' quarters, Darlinghurst.
Tareutta	Erection of police station.

It is very desirable that more commodious and suitable premises should be provided on the site purchased for the purpose for Head Offices and the Detective Branch. When the buildings already designed have been erected, for which provision has been voted, I shall be in a position to introduce a more useful and comprehensive system of criminal record, also to provide suitable accommodation for the plain-clothes Police, for photographic purposes, and the safe custody of exhibits and valuable property; and further, to have sufficient office accommodation, which is now sadly deficient. When such premises are built I propose to make them a Police Central Head Office, where work can be carried on by day and night.

During the year a trial has been made of providing some of the Police and stations with bicycles. In some respects they have been found extremely useful in enabling the Police to cover a long route in the suburbs and country towns, for rapidity in the pursuit of offenders, and for non-commissioned officers inspecting beats. I am not able at present to pronounce a very decided opinion. Under no circumstances, however, can bicycles replace horses to any considerable extent in the performance of police duties in the country.

During the year I have found it impracticable to inspect other than the following districts:—

Western (Bathurst and Dubbo),
 Bourke,
 North-Western (Tamworth, Murrurundi, and Narrabri),
 North-Eastern (Maitland),

and then only to make flying visits, but I found the books, records, buildings, and equipments in a thoroughly satisfactory condition.

The horses of the Mounted Force especially were of an excellent class, notwithstanding the great reduction in the price paid of late for remounts.

The conduct of the Police generally has been good, only five men having been dismissed from the Service during the year.

I have, &c.,

EDMUND FOSBERY,

Inspector-General of Police.

RETURN of the Strength and Distribution of the Police Force on the 31st December, 1896.

1897.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

PRISONS.
(REPORT ON, FOR THE YEAR 1896.)

Printed under No. 6 Report from Printing Committee, 3 June, 1897.

The Comptroller-General of Prisons to The Minister of Justice.

Sir, Comptroller-General's Office, Sydney, 27 April, 1897.

I have the honor to submit, for your consideration, my Annual Report upon the Prisons Department of New South Wales for 1896.

2. As a consequence of the reorganisation of the Government Departments by the Public Service Board, my predecessor, Mr. Miller, was appointed Under Secretary of Justice in June last, when I succeeded him as Comptroller-General of Prisons. Mr. Miller occupied the latter position for six and a half years, and during that period introduced many reforms which ameliorated the condition of the prisoners, and contributed towards the improvement of the penal administration. I trust that I may be enabled, in some measure, to continue the work of progress carried on for so long a time by my predecessor.

3. The statistical tables have been arranged differently to those of former years, and have been largely added to. They have been to a great extent modelled upon the returns contained in the Annual Reports issued by the Directors of the English prisons, and it is hoped that the varied and comprehensive information afforded by them will enable some understanding to be arrived at as to the nature and magnitude of the work performed by the Department. The Appendices are four in number. Appendix I contains reports from the various officers in charge of gaols, and their matured observations should be of value. Appendix II deals with medical and lunacy matters. Appendix III is divided into two Parts—A containing various statistics respecting prisoners, and Part B dealing with the distribution of officers and with matters of expenditure. Appendix IV refers to various points of prison management and subjects akin thereto, and also offers suggestions for the future. This Appendix is included in the Report with your sanction.

4. The number of prisoners of all kinds in confinement on the 31st December last was 2,357, as compared with 2,460 on the corresponding date of the preceding year. This showed a decrease of 103, while the estimated population of the Colony increased from 1,277,870 in 1895 to 1,297,640 in 1896. Of the prisoners, 217 were women, a decrease of 22 on the preceding year. The ages of those confined at the close of the year showed that 326 were under 25; 616 were between that age and 30; 746 were between 30 and 40; 374 were between 40 and 50; and the remaining 295 were over 50. From this it would appear that the fifteen years' period between 25 and 40

129—A

furnishes

furnishes the greatest number of prisoners. Leaving out those prisoners sentenced to imprisonment only (237), those on remand (42), and those awaiting trial (98), the remainder were serving sentences as follows:—Over 2 years, 813; and not exceeding that period, 1,167. Of the 813 serving over 2 years, the average sentence amounted to 5·8 years, counting life sentences as 20 years; those serving 12 months and not exceeding 2 years numbered 380, the average sentence being slightly over 1·5 years; of the 356 persons with sentences of 6 months and under 12, the average was 6·6 months; the average sentence for the 317 serving over 1 month and under 6 was nearly 3 months; while the 114 serving 4 weeks and under had an average of just over 3 weeks each. In the higher Courts sentences have shown a marked tendency to decrease in length during the past seven years. In 1890, out of 626 prisoners sentenced to penal servitude or hard labour, 38 per cent. received sentences of 3 years and upwards. During 1896, out of 714 convictions of this class, only 25 per cent. received such terms. This may in some measure account for the gaol population not increasing in numbers. As a matter of fact, there were 66 prisoners more on the 31st December, 1890, than on the corresponding date of 1896. But while shorter sentences have some effect in keeping down the prison numbers, there are undoubtedly other influences, such as education, improved social conditions, the increased interest of the individual in public affairs, and so forth, which all have a share in decreasing crime. It is a matter for congratulation that while the general population showed an increase of 15·6 per cent. during the past septennium, the gaol population dropped during that period nearly 3 per cent.

5. During the year 1896 the entries and discharges to the different prisons were 18,838 (3,538 females) and 18,941 (3,560 females) respectively, as compared with 18,552 and 18,696 in 1895. Included amongst these are many of the vagrant and habitual misdemeanant class who have been more than once committed during the twelve months, and who are consequently counted more than once in the above figures. It is difficult in a widely-scattered country such as this, with a large travelling population, to accurately ascertain the number of distinct individuals sent to the different prisons. No return on that head is therefore given on the present occasion.

6. Reconvictions at the Circuit Courts and Courts of Quarter Sessions were:—Of prisoners serving sentences of 5 years and upwards, 4 were undergoing a second conviction, 14 a third, and 49 a fourth or over that number. During the previous year the figures were 10, 5, and 35 respectively. Of prisoners serving sentences of less than five years, there were 101 under second, 50 under third, and 163 under fourth or more convictions, as compared with 91, 54, and 157. Of prisoners under sentences of imprisonment only, without hard labour, 3 were serving a second conviction, none a third, and 2 a fourth or more, as against 3, 1, and 2 in the preceding year. The total reconvictions at the higher Courts were 286, as compared with 358 for the preceding year—an increase of 28. The reconvictions of drunkards and petty offenders sentenced at the Police Courts cannot be accurately defined; but, so far as the methods of identification will permit, the numbers reconvicted twice or more during 1896 only were 1,016 a second time, 329 a third time, and 402 a fourth time or more. The figures for the preceding year were 1,040, 298, and 328 respectively. The total reconvictions of this class were 1,747, as against 1,666 for 1895, showing an increase of 81 for 1896.

7. The punishment returns show that 96 per cent. of the prisoners were not punished. Only 2 cases of corporal punishment took place. The great bulk of the prisoners conformed to the rules, and punishment was confined to the incorrigibly idle or vicious. There were 12 cases of violence to officers, and the escapes or attempted escapes numbered 13 (all recaptured), a large proportion of which took place from the Trial Bay Intermediate Prison.

8. The health of the prisoners has been good, and the deaths amounted to 29, exclusive of 1 suicide and 1 execution. The daily average number of prisoners was 2,442, and the percentage of deaths only 1·2; and it must be borne in mind that very many persons were admitted to gaol in a neglected condition of disease, and that some of those who died came to prison hopelessly ill, and died within a few days after arrival. In addition, 11 males and 1 female were discharged on medical grounds—9 of them on account of diseases contracted before admission. In Table E of the medical statistics will be found particulars of each case of insanity occurring in the prisons. They number

177 persons, of whom 121 showed symptoms of insanity on reception, and 33 within one month after admission. In addition to these there were sent to gaol 368 persons charged with being of unsound mind, or for protection, besides others in a more or less demented state through alcoholism.

9. The number of prisons remains unaltered, viz., 23 established and 36 police gaols. They contain 2,086 cells of all kinds—a number still insufficient to carry out the very desirable plan of allotting one cell to each prisoner. More accommodation is, however, being provided at Parramatta and Young.

10. The reports of the Governors of the various gaols, and the two summaries attached, show the nature of the work at which the prisoners have been employed. The returns have been arranged so as to show the actual labour performed by the prisoners; the value of the work, computed on a fair basis; and the number of prisoners who, for various reasons, have not been employed. Nearly £50,000 represent the value of labour only, of which about a fifth has been earned in manufacturing for other Government Departments. To this should be added the value of the work done at the Intermediate Prison, Trial Bay, in constructing the breakwater. Every effort is being made to obtain work from the various Public Departments, and of late a considerable increase has taken place in the orders for manufactured goods for the use of the various State establishments, the officers in charge of which are assisting us in every possible way. This, of course, is perfectly legitimate work for the prisoners, and no possible exception can be taken to it on the grounds of its competing with free workers. The labour schedules have been revised, and the industrial branches of the principal prisons have been reorganised, so that, as far as is possible, the trades and labour department will be carried on on business principles. There would seem to be plenty of work for us to do in the directions pointed out without materially coming in contact with outside labour.

11. A new departure was made during the latter part of the year in putting under cultivation such of the spare grounds as were attached to the gaol establishments. So far this has met with much success. The work is not only healthy and active for the prisoners, but is likely to effect some saving in the cost of provisions, as many gaols can now grow all their own vegetables. The Agricultural Department very kindly assists us with the necessary advice as to planting, manuring, &c., and it selects seeds, and supplies every gaol with a copy of the monthly *Agricultural Gazette*. The officers in charge of the prisons report most favourably on the nature of the work and the effect on the men. This work, being performed outside the walls, offers opportunities for escapes, but up to the date of writing none has occurred on this account.

12. Considerable alterations have been made in connection with the employment of prisoners. Oft-convicted men, especially of the petty-offender class, are no longer allowed to occupy "billets" on their return to gaol. The weekly tasks have been increased for all men in the workshops. A graduated scale of gratuity for labour has been established, distinguishing between first, second, and third-convicted men, while fourth-convicted persons receive no gratuity. All classes, however, are allowed, after completing their task, to work overtime, for which a fair scale of remuneration is allowed. This proves sufficient incentive to industry, keeps the men employed, causes them by their earnings to defray a portion of the expense they cost the country, and tends to discourage a return to prison life. Sweepers, cleaners, and others employed in the various domestic offices, are sent away to the works after completing their sweeping, &c., so as to prevent idling as much as possible. These alterations put a stop to much loafing, and perhaps naturally caused some dissatisfaction; but matters soon went along smoothly, and the increase of work is beneficial all round. Some abuses, too, were found to prevail in connection with the issue of "indulgences." Prisoners received them who were not entitled thereto, and this improper issue nullified to some extent the effect that the awarding of indulgences was intended to have. An alteration has been made in regard to this matter.

13. Just prior to my predecessor leaving office he introduced some concessions to the prisoners in regard to enjoying the modified servitude at Trial Bay, and of more frequently writing and receiving letters—privileges which were much appreciated. In addition,

addition, other improvements have been carried out with respect to the supply and cooking of food, the bathing and sanitary arrangements, and in other minor matters which have tended to the health and impartial treatment of all classes of prisoners alike. It has sometimes been stated that prisoners have no opportunities to represent their cases to the authorities. I would point out that during the six months ended 31st December last, 255 prisoners were personally interviewed in response to their requests, in addition to 595 written applications upon all sorts of matters connected with their cases.

14. Towards the close of the year, with your approval, a system of physical drill was introduced at Darlinghurst Gaol for the treatment of the young men forming the 7th class. Most of these were in prison for "larrikinism," and it was considered that by improving their bodies, a corresponding moral improvement might also take place. Besides this, it was possible for the new drill to be made an efficient substitute for that hard work which the nature of the 7th-class treatment prevented those subjected to it from obtaining. Up to the present the experiment has proved satisfactory, and it is highly spoken of by the medical and gaol authorities. The matter of extending the system in Darlinghurst and other places is under your consideration.

15. In connection with the internal discipline of the gaols, some alterations of considerable importance were carried into effect. A new plan of night-watch was brought into operation, and vigilance was insured by the introduction of mechanical detector clocks. Drill was enforced amongst the warders, who are all supposed to be used to arms, and a hand-book of drill was compiled so as to bring about uniformity of practice; and in other directions a general straightening-up took place. On the other hand, working hours were rearranged so as to avoid long periods of continuous duty; refreshments were allowed to the men on night-watch; warders on tower duty were relieved at noon; annual leave was made general throughout the service; Sunday leave was allowed in turn to third-class warders; a number of warders who had been in the country districts for a long time were given transfers nearer Sydney or other centres of population; and 42 promotions were shared out amongst the most deserving. These included a fair proportion of country as well as metropolitan officers. The changes amongst the staff during the year amounted to 67 retirements, 21 resignations, and 11 dismissals. In addition, for various other reasons, there were 102 transfers, 5 exchanges, and 42 promotions, while 25 officers were fined, 49 reprimanded, and 1 reduced in rank. Thirty-two officers' situations, on becoming vacant, were not filled, it being found on investigation that the posts were not required. This represents a future saving of £4,034 per annum.

16. The retrenchment effected by the Public Service Board, as well as by the operations of departmental reorganisation in the established gaols, has led to a decreased expenditure in 1896, as compared with that of the preceding year, of £2 9s. 5d. per head, calculated on the daily average number of prisoners confined, viz., 2,294, notwithstanding that the average number was less than in 1895. The total expenditure for the year amounted to £108,890 18s. 4d., from which might fairly be deducted the earnings of prisoners in manufactures, and work for other Government Departments, to the value of £9,881 7s. 11d. In the expenditure was included an unforeseen expense in consequence of the Police Department declining to take over four gaols which had been reduced by the Public Service Board, and for whose establishment no provision had been made on the Estimates. This formed a serious addition to the cost of the Prisons' administration.

17. Although a saving was effected in the year under review, it must be recollected that the general retrenchment and reorganisation were not commenced until the middle of the year, and that the operations were not completed at the close of 1896.* Before the staffs of the different prisons could be reduced, it was necessary for me to personally visit each place, and ascertain if any officers could be spared. This was a work entailing serious responsibility, and it needed very careful handling, and up to the present the work has not been finished. The larger prisons have now been carefully
inquired

* The Estimates for the financial year, which ends on the 30th June next, provided for a reduced expenditure of over £17,000 on the preceding year. It is expected that a saving of at least £2,000 on the reduced estimate will be effected by the various measures of reorganisation which have been brought into operation.

inquired into, and a rearrangement of the staffs and their duties has taken place. This is bringing about a saving in salaries to a substantial amount, as may be gathered from the pay-sheets for the months of March, 1896 and 1897 respectively. For the former, £7,091 7s. 11d. was the sum paid in salaries as compared with £5,775 1s. for the latter, showing a saving upon the same month of the previous year of £1,316 6s. 11d.

18. Generally speaking, the various staffs have done good work. The changes in routine, such as the new night-watch system, and other disciplinary duties were strange to the officers and led to some friction. Some of the officers were found to be wanting in vigilance and in fitness for their positions, while others had got somewhat careless and lax in the performance of their duties. These faults were not, I regret to say, confined to the lower grades. All these matters are, however, in fair process of adjustment. The office staff has done excellent work, and deserves commendation all round. The new position of Inspector of Prisons was filled by the appointment of Mr. McCauley, many years Accountant and Examiner to the Department. Mr. McCauley's intimate knowledge of prison routine and discipline, together with a strong liking for the work, enabled him to discharge his duties in a manner which commanded my highest appreciation. The statistics now presented were compiled by him or under his supervision.

19. The papers on prison matters contained in Appendix IV were written by me after great consideration ; and were included in this Report by your permission. There are certain drawbacks in connection with prison administration which offer obstacles to success. It has been thought well to look these things straight in the face, and, as it is of no use pointing out defects without proposing remedies, suggestions have been made with a view of effecting improvements in the future. In making these proposals, there is no intention, as there is no occasion, to in any way disparage past work. Great progress has been made in the face of many difficulties, but there is still plenty of room for improvements. The suggestions now respectfully laid before you may perhaps contribute to a further stage of progress being attained.

I have, &c.,

FREDK. W. NEITENSTEIN,
Comptroller-General.

APPENDIX I.

REPORTS from Governors and Labour Returns, with Summaries I and II.

1. Darlinghurst Gaol.	13. Forbes Gaol.
2. Parramatta Gaol.	14. Grafton Gaol.
3. Bathurst Gaol.	15. Hay Gaol.
4. Goulburn Gaol.	16. Mudgee Gaol.
5. Berrima Gaol.	17. Tamworth Gaol.
6. Biloela Gaol.	18. Wagga Wagga Gaol.
7. Maitland Gaol.	19. Wilcannia Gaol.
8. Albury Gaol.	20. Wollongong Gaol.
9. Armidale Gaol.	21. Yass Gaol.
10. Broken Hill Gaol.	22. Young Gaol.
11. Deniliquin Gaol.	23. Trial Bay Prison.
12. Dubbo Gaol.	

The small Police Gaols (36 in number) have been omitted.

1.—DARLINGHURST GAOL.

Extract from the Governor's Report.

DURING 1896 the staff was reduced from 97, on the 31st December, 1895, to 87 on the 31st December, 1896; total reduction, 10.

The general discipline and economical management of the prison has been most materially assisted by the introduction of a revised system of night duty, which came into force on the 24th August, and consists of eight-hour watches. In connection with this improved system of duty, a watchman tell-tale clock is used. This ensures that the Senior Warder in charge of the watch keeps moving, and on the alert. The Comptroller-General, recognizing the increased vigilance required under this improved system of duty, recommended, and the Minister of Justice approved, of light refreshments being granted for use during the first watch. In addition to this concession, since the 27th December, the 2nd and 3rd class warders, not forming a part of the night-watch, are granted leave each third Sunday.

The interest in the good management and discipline of the prison evinced by the Comptroller-General, leading to frequent visits of inspection, has been of very great benefit in more ways than one.

Prisoners.—5,428 males, 1,655 females, total 7,083,—have been received; and 5,416 males, 1,636 females discharged during the past year.

The conduct of the prisoners has been very good.

Only one attempt to escape took place.

The general health of the prisoners has been remarkably good.

Forty-six (46) is the daily average number of prisoners during the past year under the 7th-class treatment, and for some time prior to the close of the year, twenty-four of the prisoners in this class have been instructed in physical drill, twice daily, with excellent results. Much attention has also recently been given to providing suitable employment for the 7th-class prisoners. They also attend school four times each week, and are frequently visited by the prison officers. I should be pleased to be able to add that they are also frequently visited by the chaplains of the denominations to which they belong.

The prisoners in general have been employed on the following kinds of work:—Matmaking, shoemaking, tailoring, mattress-making, tinsmithing, blacksmithing, bookbinding, carpentry, masonry, bricklaying, painting, glazing, and also several less important descriptions of labour. The female prisoners have been employed at needlework, cleaning and sweeping, and other light labour.

Generally the buildings are in good condition, but the mess-sheds almost all require re-roofing, &c.

The following alterations have been carried out:—New office for the Superintendent of the female division, court-room fitted to serve as an office for the transaction of general gaol business.

The electric light plant is in good order and working well, and steps are being taken to supply a second relief boiler.

With the exception of the supply of meat, the various contracts for the supply of goods have been carried out in a satisfactory manner.

To the best of my belief the Rules and Regulations provided for the management of the prison have been faithfully carried out.

2.—PARRAMATTA GAOL.

Extract from the Governor's Report.

The conduct of the officers has been generally good

The conduct of the prisoners has been good.

The labour for the active employment of the prisoners has been sufficient, and includes—Stone-cutting and setting, blacksmithing, and carpentry, shoemaking, tailoring, bookbinding, cabbage-trec plaiting and hatmaking, cooking, washing, sweeping and cleaning, and other usual work in the ordinary service of the prison.

Many alterations and improvements have been made, and are still being proceeded with to the buildings of the gaol. The new wing, No. 6, in course of progress is approaching completion, the last range of cells on top landing now being in course of construction. Sixteen double cells in No. 1 wing have been divided and completed. Three new stone closets have been erected. No. 8 tower, being an obstruction for proper supervision, was removed. The new stone-cutters' shed and carpenters' shop were completed. A balcony has been added to the Governor's quarters and a door-way cut through the stonework to it. The carpenters' shed in front of the workshops has been pulled down. A new blacksmiths' store erected and fitted. A new school-room is being fitted up, and when completed the present one will be occupied by the tailors and hat-makers.

The quantity of bedding and clothing in store is sufficient for all requirements.

The rations and supplies have been good, with a few exceptions, and punctually delivered.

During the late portion of the year new duty has been introduced for the officers by which a saving of six warders in the staff has been effected. The new duty, and introduction of the peg clock, has caused a marked improvement in the discipline and efficiency of the staff, irrespective of the saving to the Department.

The Regulations and General Orders have been strictly complied with.

3.—BATHURST GAOL.

Extract from the Governor's Report.

THE conduct of the subordinate officers has been good, with a few exceptions.

The conduct of prisoners fairly good.

The prisoners have been engaged at the following trades and works:—Carpentry, painting, blacksmithing and tinsmithing work, bricklaying, stonecutting, hatmaking, shoemaking, tailoring, bookbinding, clerical work, sweeping and cleaning, cooking, general labouring, trenching ground, gardening, assisting schoolmaster, attending on sick and lunatic, servants, needlework, barbering, washing, marble work (sawing, cutting, and polishing), laying patent asphalt and tar paving.

The condition of the buildings is good, except the gutters that were injured by the snowstorm of June, 1896.

The only repair of any magnitude was to the apparatus for pumping water up to the elevated tank. This had to be done by free labour, as the work needed much skill and care, and a man had to work at a depth of 100 feet below ground.

About 1½ acres of land are under cultivation, which is estimated to yield between 5 and 6 tons of potatoes and other vegetables. The area of land to be cultivated is about 16 acres.

The quantity of clothing and bedding in store has always been sufficient to meet requirements.

The contractors' supplies have been good and punctually delivered.

The Regulations and Orders have been complied with.

4.—GOULBURN GAOL.

Extract from the Governor's Report.

THE conduct of the subordinate officers, with a few exceptions, has been satisfactory.

The conduct of the prisoners generally has been good.

There were two attempts to escape during the year.

Prisoners have been employed at the following work :—Tailoring, bookbinding, shoemaking, tinsmithing, carpentry, painting, bricklaying, plumbing, printing, blacksmithing, in addition to other work required in connection with the prison.

The buildings are now in a very good condition. Necessary repairs in different parts of the buildings have been effected, additions have been made to the workshops, new cooking stove placed in Governor's quarters, and verandah at the rear of house. New shelving has been placed in the hospital. Alterations to the gas-fittings in D wing have been made, and the yards and footpaths have been put in good order.

The clothing and bedding in store is sufficient to meet all requirements.

The contractors for supplies have given every satisfaction.

On the 13th October a commencement was made with the agricultural work. About 1½ acres of land have been trenched, and 1½ acres planted with potatoes. I think this kind of work very suitable for prisoners. They acquire a knowledge of gardening, which will, I have no doubt, be of great assistance to them in obtaining employment on their release. They take great interest in the work, probably from the fact that the produce is for their own consumption.

All Rules laid down by Regulation and General Orders for the government of the Prison have been, to the best of my knowledge and belief, complied with.

5.—BERRIMA GAOL.

Extract from the Governor's Report.

THE conduct of the subordinate officers of the establishment has, on the whole, been good. They have performed their duties efficiently, and, as a body, are suited for the work they are called upon to perform.

The conduct of the prisoners in separate treatment, on the whole, has been good. They have been steadily employed knitting, tailoring, and shoemaking.

A working party of four prisoners has been employed since October last trenching the ground to an uniform depth of 2 feet. With a little perseverance, any obstacles or difficulties which at first appeared will pass away, and the initiation of agricultural training, though on a small scale, may be said to have already commenced, and which, under proper supervision, may become a beneficial and productive industry in the near future.

A new store-room (weatherboard) 60 ft. x 14 ft. has been erected by prison labour in a most satisfactory manner. The Governor's quarters have been painted and renovated; decayed door and window sashes have been replaced by new ones. A doorway has been made to communicate between the cooking-room and electric light plant.

The whole of the exterior wood and ironwork of the prison has been painted, and necessary minor repairs inside the prison have been attended to.

The Regulations and General Orders have been complied with to the best of my ability.

6.—BILOELA GAOL.

Extract from the Governor's Report.

THE conduct of the subordinate officers has been good. There has been a reduction in the staff by two officers. Notwithstanding this, the duties have been effectively performed. This is due to a considerable extent to the alteration in the hours of duty, which has been found to work most satisfactorily.

The prisoners' conduct has been good.

The principal employment for the prisoners during the year was:—Quarrying stone for the erection of additional buildings, shrinking cloth, and needlework for the Government Stores Department.

Several repairs and additions have been made to the buildings. A new sulphur-house has been erected for fumigating the clothing of prisoners.

The old kitchen has been replaced by the erection of a new one.

Consulting-rooms for the Visiting Surgeon and isolated cells for the female wing are in course of erection.

There is no land available for agricultural work at this prison, although I consider it most suitable employment for prisoners.

The clothing and bedding have been found sufficient.

The contractor's supplies good, and punctually delivered.

The Regulations and General Orders have been complied with.

7.—MAYTLAND GAOL.

Extract from the Governor's Report.

THE conduct of the subordinate officers has been good, and they have discharged their duties efficiently.

The conduct of the prisoners has been good.

Employment has been found for the prisoners at the following trades :—Bootmaking, tailoring, tinsmithing, bookbinding, lithography, blacksmithing, painting, stonecutting, carpentry, asphaltum, washing, in addition to the usual work in the ordinary service of the gaol.

The condition of the buildings is good.

The gaol kitchen has been enlarged. A new shelter shed in No. 1 yard is much needed, and repairs are required to one of the towers.

The quantity of clothing and bedding has been found sufficient to meet all requirements.

The contractors supplies have been good and punctually delivered, and not a single complaint been made.

Fair progress has been made in trenching land for cultivation purposes. I am of opinion that when there is suitable land the employment of prisoners at this kind of work would be both useful to them and remunerative to the Government.

The Regulations and General Orders have been complied with.

The only change made in duty was the appointment of a foreman under new conditions, and it is a good improvement on the old system.

8.—ALBURY GAOL.

Extract from the Gaoler's Report.

THE conduct of the officers has been good.

The warders on tower duty are relieved daily at 12.30 p.m.

Conduct of prisoners good.

The labour at which the prisoners were engaged upon during the year was as follows:—Book-binding, carpentry, cutting firewood for police and gaol, and keeping the prison clean.

The condition of the buildings is good. Alterations have been made in the cook-house and in the hospital.

The quantity of clothing and bedding in the gaol has been sufficient to meet all requirements.

The contractor's supplies have been good, and regularly delivered.

Prisoners have been employed trenching and preparing the land for vegetables. The area to be cultivated is 2 roods 3 perches. Without doubt it is an excellent method of employing prison labour.

The Rules and General Orders as laid down have been strictly carried out.

9.—ARMIDALE GAOL.

Extract from the Gaoler's Report.

THE officers have performed their duties efficiently.

With two exceptions (females) the prisoners were generally well conducted.

There was one death in the gaol. The prisoner on admission required medical treatment, and he continued under such treatment until his death.

The labour of the prisoners has been:—Bootmaking, bookbinding, tailoring, cutting firewood for the police, asphaltting the yard, and sundry matters about the gaol.

The buildings are in a fair state of repair.

The quantity of bedding and clothing in stock is quite sufficient for all requirements.

The contractor for supplies to the gaol is very punctual in delivery, and has given general satisfaction.

About 1 acre of land has been prepared for growing vegetables, and seed is now being planted. This kind of work is not merely economic, but is most moral and reformatory in its tendency. I am of opinion that many prisoners on their discharge will feel disposed to follow up this kind of work. Not once has an officer had to complain of the conduct of a prisoner employed at this labour.

The Rules laid down by Regulations and General Orders for the government of the prisons have been complied with.

10.—BROKEN HILL GAOL.

Extract from Report of Officer-in-charge.

THE conduct of the officers has been generally good.

The conduct of the prisoners has, with two exceptions, been good.

There have been no escapes, nor attempts to escape.

The prisoners have been confined to work necessary for maintaining the gaol and premises in good order.

The buildings are in good condition.

The supplies of clothing, bedding, and other stores are sufficient, and in good order.

The contracts have been fairly carried out.

The General Rules of the Prison Service have been complied with.

11.—DENILQUIN GAOL.

Extract from the Gaoler's Report.

THE conduct of the subordinate officers has been good, with the exception of one warder, whose services were dispensed with.

The general conduct of the prisoners has been good.

The labour at which the prisoners were employed consisted of carpentry, painting, wood-cutting, and trenching ground, in addition to attending to the land attached to the court-house, hospital, and police barracks.

The buildings are in a fair state of repair.

The repairs and alterations carried out are:—Entrance to gateway (roofed in), gaol office (extended), tower platform (roofed in), lavatories erected in male and female yards; an iron fence, 10 feet high, erected between labour and female yards; two new cells added to female wing.

There is sufficient bedding in store to meet requirements.

The contractor's supplies have been good and sufficient.

As far as I can ascertain, the rules laid down by Regulations and General Orders, with a few minor exceptions, have been complied with.

12.—DUBBO GAOL.

Extract from the Gaoler's Report.

CONDUCT of officers good.

Conduct of prisoners, quiet and fairly industrious as a whole. The exceptions were old offenders of previous bad prison character.

The buildings are in good repair.

The large labour yard has been divided into three yards. A new trial yard has been erected within the old Court-house premises. The whole of the gaol premises has been overhauled and repainted.

The clothing and bedding have been sufficient to meet all requirements.

The contractor's supplies have been good, and punctually delivered.

The rules laid down by Regulation and General Orders have been complied with to the best of my knowledge.

14.—GRAFTON GAOL.

Extract from the Gaoler's Report.

THE subordinate officers are a steady lot of men, and have performed their duties satisfactorily.

The conduct of the prisoners has been generally good, with the exception of a few transferred from Darlinghurst, and who had to be punished.

No industries were carried on until November, and the prisoners were employed mainly in cutting firewood for the gaol and police, and improving the gaol grounds. Since November they have been employed cutting firewood, making cabbage-tree hats and Scotch twill shirts, and the cultivation of 4 acres of vacant gaol lands.

The buildings are in a good state of preservation. The repairs and alterations have been numerous, but unimportant.

The clothing and bedding was found sufficient.

In reference to the employment of prisoners at agricultural work, I may say that in my opinion there can be no more direct way of benefiting or reclaiming prisoners than by training them to a knowledge of the right methods of tilling the soil. I unhesitatingly say that the work is health-giving, and to an eminent degree suitable for prisoners. My own experience of the feelings with which they themselves regard this class of employment, though short, has shown me that they readily, and with the utmost diligence, enter on the tasks set them to do.

All rules laid down by Regulation and General Orders for the government of the prison have been, to the best of my knowledge and belief, complied with.

15.—HAY GAOL.

Extract from the Gaoler's Report.

THE conduct of the officers has been good.

The conduct of the prisoners has been good.

The prisoners have been employed at the following work:—Painting, carpentering, tailoring, repairing tinware, boots and shoes, sweeping and cleaning, &c., &c.

No new buildings have been erected during the past year.

The condition of the buildings is in good order.

All repairs have been carried out by prison labour.

The quantity of clothing and bedding in store has been sufficient to meet all requirements.

The articles supplied by the contractor have been good and punctually delivered.

The rules laid down by Regulations and General Orders have been strictly carried out

16.—MUDGE GAOL.

Extract from the Gaoler's Report.

THE conduct of the subordinate officers has been good.

The conduct of the prisoners has been good, with three exceptions.

The labour at which the prisoners were engaged upon during the year was:—Jobbing at carpentering, tailoring, painting, shoemaking for the prison, and making a dam for the Police Department; wood-cutting for the gaol, Court-house, Telegraph Department, and police barracks.

The buildings are in good condition.

The alterations and repairs carried out are as follows:—New-entrance with iron gates; old offices, surgery, and warders' room taken down and new ones erected. The outer wall of the gaol has been raised 2½ feet. Other necessary improvements have also been effected.

The quantity of clothing and bedding in store is sufficient to meet requirements.

The contractor's supplies have been good and punctually delivered.

I have made a commencement with the trenching of land at the gaol, and expect having a quarter of an acre under cultivation. I am of opinion that it would be a very good industry for prisoners to learn, as well as being beneficial to the Department. With anything like a favourable season sufficient vegetables can be grown to supply the prisoners all the year round.

The rules laid down in Regulations and General Orders for the government of the gaol have been complied with.

17.—TAMWORTH GAOL.

Extract from the Gaoler's Report.

THE discipline of the gaol has been good, and the prisoners well conducted.

No escapes or attempts to escape.

Prisoners have been employed drawing firewood from outside the prison and cutting it up, painting the buildings, repairing shoes, and other miscellaneous work in connection with the prison.

The quantity of clothing, bedding, &c. in the store has been found sufficient to meet all requirements.

The prison library is much appreciated by the prisoners.

All contracts for supplies have been satisfactorily carried out.

The grounds attached to the gaol are now being trenched for agricultural purposes.

The Regulations and General Orders have been duly observed.

19.—WILCANNIA GAOL.

Extract from the Gaoler's Report.

THE conduct of the subordinate officers has been very good.

The prisoners have behaved well, the punishments for the year being very light.

The prisoners have been employed at the following work :—Wood-cutting, painting quarters, sheds, wings, &c., carpentering, repairing boots and shoes, and the usual routine work of the prison.

The repairs to the gaol consist of putting the walls in good order, repairing floors, cleaning and colouring wings, quarters, sheds, and various parts of the gaol. When the present additions are completed the gaol will be in a fair condition.

The clothing and bedding has been sufficient.

The contractor has delivered supplies punctually.

All Regulations and General Orders have been complied with.

21.—YASS GAOL.

Extract from the Gaoler's Report.

The conduct of the officers has been good.

The conduct of the prisoners has also been good. There have been only three punishments during the year.

The prisoners have been employed effecting small repairs and keeping the gaol clean.

The buildings are in good repair.

The quantity of clothing and bedding in store is sufficient to meet all requirements.

The contractor's supplies have been satisfactory.

I think very highly of the introduction of agricultural work for prisoners. I feel certain that when the system is adopted that it will prove beneficial to the prisoners, both from a moral and educational point of view, and to the Department, by being reproductive. I will be able to grow sufficient vegetables to supply this gaol for half the year.

The Rules and Regulations have been carried out, to the best of my belief.

Return of the Value of Prisoners' Labour, 1896.

22.—YOUNG GAOL.

Extract from the Gaoler's Report.

The conduct of the officers has been good.

The conduct of the prisoners has been good, with the exception of five, who had to be punished.

The prisoners were principally employed building twenty additional cells. Special precautions were necessary to secure the safe custody of the men by day and night. The saving effected in the work already done amounts to £522 12s. 9d. I anticipate the completion of the cells in five months time; then each prisoner will be placed in a single cell, and if necessary, they can receive their food in their cells, except when at exercise or at work. No doubt substantial changes in the duty can then be made.

The general state of the buildings is satisfactory, but the interior ground space of the gaol is too limited, and the workshops are hardly large enough.

The stock of clothing and bedding is sufficient.

The provisions have been good, and regularly supplied.

The regulations and general orders have been complied with to the best of my ability.

23.—TRIAL BAY PRISON.

Extract from Report of Superintendent.

The conduct of the officers, with one exception, has been very good. Four officers of the Harbours and Rivers Department have been transferred to the strength of this prison.

The conduct of the prisoners generally has been very good, and no severe accidents have occurred.

There were five escapes during the year, all of whom were recaptured.

In addition to the work performed by the prisoners on the breakwater, two magazines have been completed, and gunpowder and dynamite stored therein. Miscellaneous repairs have been effected in connection with the prison. The lighting of the prison is defective, caused by the inferior quality of the gasoline supplied.

The Engineer-in-Chief visited the prison in September last, and inspected the floor in the hall and wings; also the roofs of the buildings. These necessary repairs, I understand, will shortly be taken in hand.

Return

Return of Receipts, Discharges, Work Performed, and Cost of Prison.

Number of modified servitude prisoners at Trial Bay, on 1st January, 1896 ...	88
Number received during the year	106
Number discharged.....	89
In Gaol on 31st December, 1896	105
Daily average number confined during the year	103
Quantity of stone put in breakwater from 1st January to 31st December, 1896	13,299 tons 9 cwt. 9,912 tons 2 cwt. to spoil tip.
Daily average number of prisoners employed at the above-mentioned work.	66.12 5.76 other works in connection.
Daily average number of prisoners employed in Prison service (exclusive of above named)	27.45
Amount paid to prisoners on discharge as gratuities earned while at other gaols	£220 16s.
Amount paid as rewards to prisoners released from prison during the past year	£1,037 13s. 5½d.
Number of officers on the strength (excluding those not in receipt of salaries)..	30
Amount of salaries paid to officers during 1896	£4,415 15s. 1d.
Amount paid as contingencies (embracing all other expenses during the year 1896)	£2,740 13s. 6d.
Cost per head per prisoner per annum	£77 12s. 1d.
Number of prisoners to officers	3.4

Total, 177. Of this number, 121 showed symptoms of insanity on reception, and 33 within one month after admission.
 Exclusive of this number, 368 persons were remanded into the various Gaols charged with being of unsound mind or for protection, and 41 others were received suffering from the effects of drink.

APPENDIX III.

PART A.

Returns Concerning Prisoners.

1. Return of prisoners received into the prisons of New South Wales, and of those disposed of, during the year ended 31st December, 1896.
2. Return of the daily average, the greatest and the least number of prisoners in custody in each of the prisons of New South Wales, during the year ended 31st December, 1896.
3. Return showing the number and sentences of prisoners under each period of sentence of penal servitude, hard labour, or imprisonment in all prisons on the 31st December, 1896.
4. Return showing the population of New South Wales, with the number of prisoners sentenced to death, to penal servitude for life, to imprisonment on indictment, and on summary conviction or want of sureties in each year from 1890.
5. Statement of the restraints, punishments, and offences during the year ended 31st December, 1896, in each of the prisons of New South Wales.
6. Statement of accommodation for prisoners in the prisons of New South Wales during the year ended 31st December, 1896, and of the daily average and the greatest number of prisoners.
7. Return of prisoners within each of the following period of age remaining in each of the prisons of New South Wales on the 31st December, 1896.

No. 1.

RETURN of Prisoners received into the Prisons of New South Wales, and of those disposed of, during the year ended 31st December, 1896.

	Received—			Disposed of—	Remaining in custody at the end of the year.....		
	Male.	Female.	Total.		Male.	Female.	Total.
Number of prisoners in gaol on 1 January, 1896	2,221	239	2,460	Discharged on expiration of sentence or commitment	12,062	3,242	15,304

* In addition ten prisoners escaped from other gaols and were recaptured—nine of this number were committed to the higher courts, and received various terms of imprisonment. The other, a boy, was not proceeded against.

Notes.—The number of offences committed and the number of punishments awarded do not, of course, agree, it being the practice in most cases to award one form of punishment for several offences, while in others the offence is met by admonition without punishment. In consequence of transfers the same prisoner may be punished in more than one prison during the year, so that the totals do not exactly agree with the total prison population of Form No. 1.

STATEMENT of Accommodation for Prisoners in the Prisons of New South Wales during the year ended 31st December, 1896, and of the Daily Average and the Greatest Number of Prisoners.

* Four overseers from Harbours and Rivers Department transferred to staff, and one warder added. Position of clerk and storekeeper amalgamated at Trial Bay Prison.

NOTE.—In the column "Number of Regular and Visiting Officers," Visiting Justices at all Gaols, Visiting Surgeons at Darlinghurst and Parramatta, and Honorary Chaplains at Bathurst, Albury, Armidale, Deniliquin, Forbes, Hay, Mudgee, Tamworth, Wagga Wagga, Wollongong, Yass, and Young are omitted. For the year 1895 the Visiting Justice at Darlinghurst Gaol was included, he being a salaried officer.

APPENDIX IV.

Crime and its Treatment in New South Wales: Some suggestions as to future procedure.

1. Sentences as affecting the diminution of crime.
2. The classification of prisoners.
3. Separation and separate treatment.
4. The identification of criminals.
5. The employment of prisoners.
6. Education and moral instruction.
7. Habitual drunkards.
8. Separate prison for females.
9. Habitual misdemeanants.
10. Lunatics in prisons.
11. Prison officers.
12. Aid to discharged prisoners.
13. Reformatories and the prevention of crime.
14. The causes and prevention of Parrikinism.
15. Conclusion.

1. *Sentences as affecting the Diminution of Crime.*

The administration of prisons has always been a fruitful subject for criticism, not always of a wise or just nature. Sweeping condemnations have occasionally been made of a character evincing little discretion, or knowledge of the subject, and, as a consequence, an unreasonable prejudice has improperly attached to gaol methods generally. Difficulties have been under-estimated, and crude impossibilities lightly suggested of a character more likely to hinder than to assist the efficiency of prison management. Still it must be recognised that, upon the whole, the penal administration has benefited by the constant and warm criticism which has attended it; and which has in no small degree contributed to the improved methods pursued to-day, as compared with those of a few years ago.

The efficiency of gaol management is largely hampered by causes outside its own control. Improper work is thrust upon it, much to the detriment of its more legitimate occupation, and it is compelled to deal with a number of persons who ought to be in lunatic or other asylums.

It is a common thing for persons suspected of mental derangement to be sent to prison for observation. Feeble old vagrants, diseased and friendless incapables, and dipsomaniacs are also committed. All such people are clearly out of place in a penal institution. Boys and girls under 16 occasionally find their way to gaol, an experience which cannot possibly do them any good whatever.

Power to sentence any of the foregoing classes to prison should be disallowed, excepting in abnormal circumstances, when the sentencing authority should be required to declare in open Court the special specific surroundings inducing him to take an extraordinary course.

Then again, reformation of the offender is expected to be accomplished under altogether impossible conditions, as regards the time allowed for such work. Offenders are brought up for the fourth, fifth, or twentieth time; and are sent off to prison for periods of detention which have proved too short to do any good on previous occasions. At the present time there is a prisoner in Darlinghurst serving a sentence of three months for stealing, who has fifty-four previous convictions recorded against him. Another one serving three months has seventy-three former appearances to answer for. Another person serving six months has ninety-six previous convictions. And many similar instances could be quoted. Indeed, some individuals have over 100 convictions recorded against them. One poor woman, now in gaol, has more than 100 convictions, all for periods not exceeding six months.

It has been sometimes the custom to look upon a prison as a hospital for the treatment of moral diseases; but the particulars just given would seem to show that it has not been a successful one. But then what other kind of hospital is so hampered in its work. Criminal therapeutics have special difficulties to encounter. Insane patients are not discharged from mental hospitals until they are cured; and where this is not effected, they are not discharged at all. And in hospitals for physical diseases no fixed period is assigned for cure. The moral hospital, however, receives each patient duly labelled with the exact time for which he or she is to remain under treatment, and there is no alternative but to turn the patient out at the end of the period, cured or uncured.

On the other hand—to pursue the analogy—many patients have to remain in the moral hospital for long after the period of their cure, because of the necessity for deterring others, who may be in danger of acquiring the criminal taint. Thus is brought about a prolonged treatment of such patients, useless so far as their individual requirements are concerned, and ever dangerous, as their confinement exposes them to the risk of further contagion.

The indeterminate punishment has been recommended by very many penologists, and such a system has been put into operation in various parts of the world. In America it is the basis of the Elmira methods. A maximum sentence is passed, but when reform has been accomplished, the patient is restored to freedom after passing through successive stages calculated to prepare him for resuming contact with the outer world. The hospital analogy here prevails. The individual is principally considered, but large discretionary powers have to be entrusted to the administration. Care is taken that only trusty men are put at the head of the department; but, very properly, they are trusted.

A somewhat similar system has operated for many years with success in connection with the "Sobraon" training ship, where the Superintendent possesses large discretionary powers. It might not, however, be thought desirable to entrust the same authority to the administrator of prisons; and yet he, aided by his officers' advice, is naturally the only person in a position to judge of the condition of reform achieved. Added to this, is the very serious objection to the Elmira system that prisoners, convicted of the most heinous of crimes, are liberated after a brief detention and the mildest of treatment. However good this plan may be for them individually, it can have no deterrent influence upon the more numerous class not in prison, who are contemplating a move in a criminal direction. The indeterminate or indefinite sentence could not therefore be introduced into this country in its entirety, although some modification of it is possible.

The system now followed is, however, greatly open to improvement. That many prisoners come out of prison unreformed is indisputable; but that the Prison Department should bear all the blame is most unfair. The sentencing authorities must accept their share of the responsibilities, and it may be confidently asserted that their share is a very large one. An element of vagueness now surrounds the general system of sentencing which leaves too much doubt in the minds of the criminal population as to the punishment following on wrong-doing.

The offence is more regarded than the offender, and while it may be possible to adequately weigh out the exact measure of punishment proper to the crime, such punishment may be altogether inadequate to the character of the offender. The treatment partakes too much of the *lex talionis*. Diminution of crime is not likely to be brought about to any extent by purely retaliatory measures; and, in these days, such principles have been practically discarded. Punishment, as simply revenge for an offence, is of no use to anybody; but punishment in its deterrent effects may be regarded as the principal object to be attained in dealing with wrong-doers. Next to this comes reform of the individual, but this is not of such far-reaching importance as the deterrence of possible offenders.

Sentences should therefore be of such a nature as to be deterrent and reformatory, rather than merely punitive. As all prisoners are not criminals, any more than all criminals are not prisoners, sharp distinction should be drawn between the accidental or impulsive offender, and the deliberate wrong-doer. Exceptional cases would have to be dealt with in exceptional ways, both as regards misdemeanours and felonies; but, as a general principle, first offenders should be dealt with leniently; second offenders more strictly, and so on; the measurement of punishment being determined by the degree of criminality attained.

Every effort should be made to keep first offenders out of prison. Wherever other remedies offered—as possible efficient substitutes for imprisonment—they should be tried. Fines; reparation, monetary or in kind, by labour even; suspended sentences; and any other mild repressive means of dealing with beginners in misconduct should precede penal confinement. The prison should be held *in terrorem*, for the more sparingly it is used the greater will be its influence for good.

Outside special cases, for all first offenders of the misdemeanant class, and perhaps for some of the more promising of those committed for graver offences, it might be possible to largely substitute fines for some of the imprisonments now inflicted; and, where money was not immediately recoverable, to allow payment by instalments, collected as is now done in maintenance cases. The suspension of sentences during good conduct might be extended to first offenders more liberally. Adequate compensation by the offender to the person offended against might, in certain cases, supersede gaol detentions; and the public reprimands, accompanied by fixed terms of police surveillance, with possibly confinement to home between sunset and sunrise, might be tried.

Where imprisonment was imposed, it should be sharp and short in its treatment and duration. A few days' incarceration, with perfect seclusion from other prisoners, would be quite sufficient to prevent the majority of first-time misdemeanants from offending again. But, for all succeeding offences, a system of gradually cumulative punishments should be instituted, based on simple but certain principles, which would be intelligible to any ex-prisoner who might be contemplating a further crime.

At present, the amount of punishment likely to be awarded is too much in the air to have deterrent influence. It is more or less a lottery arrangement by which the prisoner hopes, if not to get off altogether, at all events to get a very small sentence only; and he is encouraged in this idea by his personal observation of the treatment of many cases similar to his own. But let it be made clear to him that a second appearance would undoubtedly receive a punishment progressive on the first, and that further advancement would follow on a third, with a still more severe punishment on a fourth, and it is likely that he would seriously consider whether he ought longer to follow a course attended with such obvious disabilities.

This certainty of cumulating punishment would provide an effectual deterrent for that weak class of infirm honesty or conduct who now hover on the verge of gaol, while a more reasonable time would be allowed for the application of reformatory methods to those imprisoned. The ratio should be fixed by law, and the successive stages should be very moderately graduated, so as not to be unduly severe or oppressive.

I believe such a system would be productive of good results, both as regards the reformation of the individual in gaol, and the deterrence of those outside prison who might be contemplating mischief. It is possible, too, that these results would be accomplished with less suffering to the culprit, and with less expense to the country, by reason of the aggregate periods of imprisonment being lessened under the new system. There are twelve persons in Darlinghurst Gaol whose united previous convictions amount to 588. In Biloba Gaol there are twelve persons with 551. These twenty-four persons have therefore between them received 1,139 sentences without being reformed. And it is most certain that in the aggregate these 1,139 sentences have caused a very considerable amount of imprisonment, entailing much cost to the taxpayer and certainly doing no good to the individuals treated, while the deterrent effects on others of passing several hundred short periods of imprisonment cannot have been of much value. Probably, if a gradually progressive punishment had been applied to the earlier appearances before the Courts entailing a longer sentence for every successive offence, a fair percentage of the persons referred to would have dropped out of the petty offender ranks years ago, and thus a large amount of punishment, with its attendant misery and expense, would have been saved.

The same principle of scientific sentencing might also be applied to those who come before the higher Courts. There would naturally be exceptions to the rule, and they could be dealt with exceptionally. But possibly the system could be applied to nine out of every ten cases. A first offence should be dealt with as mercifully as possible, and, where the sentence of penal servitude had to be actually served, it should not exceed three years. Then would follow five, seven, nine years, and so on, always an advance of two years on the preceding sentence. The increase, being comparatively small but certain, would be a great deterrent to the criminal who might not also be a prisoner. The sentences would carry power to earn remission on a more liberal scale for the earlier than for the later periods; but liberation on remission should entail police supervision for the remitted terms in the cases of third offenders. A third penal-servitude man, immediately prior to the completion of his sentence, might be taken before a Judge privately and solemnly warned that on a fourth conviction he would be deemed an habitual criminal, and that when out of gaol he would always be under police supervision.

I know that much has been said against placing supervisory powers in the hands of the police. Possibly some abuse has taken place; but it has been very little indeed, and gross exaggerations have taken place in connection therewith. The criminal does not like to be under any supervision at all, and his voice is loudly raised against such surveillance. But a man, after two penal servitude sentences, ought not to be trusted too much, and he has no cause for complaint if his being at large causes society to take some precaution for prudential reasons. There is a great deal of spurious sympathy manifested for discharged prisoners of the habitual criminal type—a class above all most specious and cunning in its representations.

A system such as this would be very paternal and mild to the man *temporarily* slipping into crime. It could not be called harsh or unmerciful to the criminal by profession. He would have the certainty of long imprisonment before him if he persisted in his evil courses; and, if he deliberately persevered in his war against society, he would find his opportunities for doing wrong more and more restricted. After three sentences of penal servitude there does not seem much hope for reform, and the criminal condition may then be considered chronic. Prolonged incarceration, followed by police supervision when again at liberty, is the only alternative, in the interests of the public, to perpetual imprisonment.

The eminent criminologist, Professor Lombroso, writing to me last November, said:—"But when a previous offender comes again and again into prison, and is above 30 years of age, and has the criminal type, there is nothing else to do but to prevent his ever leaving again." This is the effectual remedy. There are men now in our prisons whose liberation will assuredly bring injury and distress to the community. Next to their death, their continual confinement can alone protect unoffending people from being harmed by them. But such an extreme step is not likely to be taken, and a middle course has therefore been proposed. The crux of the new proposal is the absolute certainty of cumulative punishment for relapses into crime. There should be no alternative. If injury were likely to be done in individual cases the Government could set the matter right, after consultation with the Judges, prison authorities, and others concerned. But it should be absolutely fixed in the would-be criminal's mind that every sentence would surpass its predecessor in severity. As before pointed out, the increase need not be large—in fact, it should not be—but it should be certain.

And in this connection it would be well to intercolonialise the criminal. If a prisoner were brought up in New South Wales for the first time, who had previously served a sentence in Victoria, his conviction in this Colony should count as the second, and so on. Such a system, aided by a more effectual plan for identification, coupled with a well-graded series of juvenile reformatories to intercept the budding criminal at the earliest possible period, would go far to crush out Recidivism.

2. *The Classification of Prisoners.*

In connection with prison matters no subject has been talked about so much as classification. It stands foremost amongst all the schemes propounded for the proper treatment of prisoners. The late Herbert Gladstone Committee, on the English Prisons, strongly insisted on the necessity for a sound system of classification. But no one yet has been able to define what a sound system of classification really is. Like some other branches of gaol management the idea is theoretically perfect but practically impossible. Considered in the light of workable possibilities, it is to be feared that a perfect plan of classification is unattainable at the present day and can only be numbered amongst the millennial expectations. A great authority on prison matters, the Rev. J. Clay, said "I believe it to be beyond human power safely to classify prisoners." And Livingstone, one of the soundest of writers upon Criminal Jurisprudence, observes upon classification "that moral guilt cannot always be discovered, and that it would be found that no two would be contaminated in the same degree. Even if these difficulties could be surmounted, and a class could be found of individuals who had advanced exactly to the same point, not only of offence but of moral depravity, still their association would produce a further progress in both."

Yet a few general applications of the principle should be the basis of all prison management. The difficulty is to hit upon the right things to apply. Conceded that our present system needs alteration it is not so easy to suggest an effectual remedy. Alterations are not necessarily improvements, and change may not lead to the right kind of reform. As Sir Edmund Du Cane, late Chief Director of English Prisons, very rightly says, "nothing is more common than to find persons whose attention has been attracted only to some disadvantage in the system finally decided on, discuss it without being aware that any alternative would introduce still greater evils." And the late Departmental Prison Committee say "it is easy to find fault, to form ideal views, and to enunciate lofty speculations as if they were principles arrived at by experience. It is extremely difficult to organise and carry out a perfect system with a reasonable regard to economy, which should provide equal advantages and similar methods of treatment not in one great centre, which would be comparatively easy, but in greater or lesser degree in all the considerable centres of a great population distributed throughout the country, and which should apply uniformly to all the ever-varying classes of offenders undergoing sentences from a day's imprisonment to penal servitude for life."

If this is true of a settled country like England how much more it applies to a vast territory such as this, thinly populated, and having small clusters of people widely separated and difficult of access. If such an expression is allowable, the criminal wants of these isolated communities have to be catered for on the spot. Especially is this so in the cases of short-sentenced prisoners, who, were it not for the local gaol, would have to be conveyed under escort long journeys involving in many instances prolonged and expensive coach travelling in order to reach a prison situated in the more settled centres of the Colony. This would mean considerable outlay, the employment of a large force of escorts, and the continual floating about all over the country of gangs of prisoners in transit, for, of course, they would have to be returned to the places from which they were convicted after the termination of their sentences. These difficulties of transit will, for many years to come, render a perfect system of *classification by prisons* impossible of realisation. It will not, therefore, be practicable to thoroughly carry out a very fascinating theory, *viz.*, the setting apart of particular prisons for particular classes of prisoners—even if we could fix the number of classes or the qualifying standard for each. For a very long time to come the small country gaols, especially in the more isolated districts, will have to deal with diverse kinds of prisoners, in a more or less imperfect way, occasional relief being afforded by the transfer of those of their inmates whose sentences are long enough to warrant the costly and inconvenient journey to one of the larger labour establishments.

Another mode of classification, which is generally in part operation, is the classification of prisoners in prisons. Not much can be done in this way in the small or country gaols. Position, want of space, structural defects, cost, and other difficulties offer obstacles to success. Such places have unavoidable drawbacks, and they must always be regarded as something apart from the ordinary prison methods of the country. In the larger gaols better opportunities are afforded, and, so far as is possible under existing conditions, the divisions of prisoners as graded are kept more or less apart. Excepting special bodies, such as seventh-class men, those under separate treatment, and others, the great bulk of the prison population are graded principally according to length and number of sentences. But sentences do not afford very firm grounds for classification, because while the length of a sentence may fit the particular offence it would not fix the character of the offender, who may have been the subject of several previous convictions for worse offences. Again, a first convicted man may not by any means be a first offender, although his power of contaminating others may be fully equal to those who have been convicted before. And there are many other obstacles in the way of proper grading.

The whole subject increases in difficulty the more it is looked into. If alteration is decided upon in the present system, it would be well not to aim at the unattainable, and above all to proceed cautiously. Our gaol methods are certainly not perfect. Yet they represent a great advance upon the methods in force not so many years ago. In classification, much progress has been made, and it is possible to progress further still; but classification, as a remedy for contamination by association, cannot proceed beyond certain limits; and, of itself, it cannot provide what the English Commissioners termed a thorough sound system, inasmuch as all prisoners, certainly in a country such as this, could not be uniformly brought within the scope of its operations.

But

But some general application of its principles could be used to improve management:—

Firstly.—Habitual criminals, comprising those with over three sentences of penal servitude, should be weeded out of the various gaols and placed apart from others in a separate prison, from which they should only, under most exceptional circumstances, be transferred. An isolated place such as Trial Bay would offer considerable advantages. Plenty of good sound occupation should be available, such as constructing breakwaters, artificial harbours, docks, and other public works, under firm and complete supervision, with confinement in a properly constructed prison out of working hours. All future offenders of the dangerous class referred to should be sent to this establishment, with sufficiently long sentences calculated to keep such desperate people from opportunities to injure society. Such men are no more fit to be at large than mad dogs or other noxious animals. Reform is not for them, and they make no secret of their future intentions when their time of discharge approaches. Some day the law will not permit the release of such hopeless dangers to life and property any more than it will now sanction the release of hopeless lunatics. There is not so much difference between the two classes, excepting that the first-mentioned are the more to be dreaded on account of their superior cunning. The ridding of the gaols generally of this class would remove a great source of contamination. Such men, after doing their nine months' period of separation, serve the rest of their sentences in association. The presence of determined ruffians of their nature, in a yard containing fifty or sixty less advanced in crime, makes for evil. Their removal would considerably purify the moral atmosphere. At the International Prison Congress, held at Paris, it was resolved that, in the interest of general discipline and of amendment, it is better to make a selection of the worst than of the best prisoners for classification. Here, then, is an admitted starting-point for separating the almost hopelessly bad from the various orders of possible reclaimables.

Secondly.—The sexually insane, such as offenders against nature, assaillers of little children, and other lust-degenerates, should be incarcerated in a separate prison. It is not quite certain if many such persons could not be more hopefully treated in what might be termed a Mental Asylum under the Lunacy Department, although monstrous acts have been committed by persons of normally high intelligence. At all events, it is a safe precaution to keep all such offenders apart from other classes of detenus. They are prolific sources of moral contagion, and instead of being scattered about the various prisons, it would be desirable to concentrate them in one special establishment where their abnormalities could be treated in a more effective way than where associated with other prisoners requiring somewhat different management.

Thirdly.—A prison might be built specially for vagrants.

Fourthly.—Drunkards should not be sent to an ordinary prison, but to institutions properly fitted to deal with them.

Fifthly.—Females should be treated in separate establishments.

Sixthly.—Imbeciles and prisoners suspected of insanity should be removed from ordinary prison treatment. If the Lunacy authorities would not accept their care, then a special establishment should be built for them.

Seventhly.—Magistrates should not be allowed to commit lunatics, persons dangerously ill, or otherwise needing protection, to prison. This is done now to relieve themselves of a difficulty, and it increases the drawbacks to efficient prison administration.

Eighthly.—Boys and girls under 16 should not under any circumstances be sent to prison. It is now done, and must be productive of harm. Actual familiarity with the interior of a gaol robs imprisonment of much of its imagined terrors, to say nothing of the dangers arising from contact more or less with ordinary prisoners. A scientific system of dealing with wayward, neglected, and vicious youths is badly needed, especially in a country like this, where, for some reason or other, fathers and mothers take their parental responsibilities so easy. I have dealt with this subject in a separate paper.

The foregoing being carried into effect would clear the gaols of a very embarrassing charge, and at the same time lessen the source of demoralisation. The remaining prisoners could be classified in prisons according to their records as known, rather than with regard to the particular offences leading to present incarceration, although these in certain cases would have weight. First offenders and special cases could be treated in certain gaols reserved for their use, and could be further classified therein according to conduct, disposition, and observation of their characters. With respect to the definition of the First Offender class, the regulations governing the classification should not be made too rigid, and much should be left to the discretion of the Comptroller-General, who would be helped in selection by the advice of the governors, clergymen, surgeons, and other officers.

The weak point in this scheme would be its inapplicability to all cases. In some of the remoter districts, amongst the difficulties, those of transit would be almost insuperable in the case of short sentences. But because all prisoners could not be so dealt with would be no reason why the vast majority should not be. The proposed partial classification could not hope to be perfect, and there would always be a certain proportion of prisoners evading their proper grade; but it would greatly assist prison work in the deterrent and reformative direction, and in the absence of any other definite proposal, it might be given a fair trial.

3.—Separation and Separate Treatment.

Separation is classification reduced to its logical conclusion. The accomplished American jurist, Edward Livingstone, says: "Every association of convicts that can be formed will, in a greater or less degree, pervert, but it will never reform, those of which it is composed, and we are brought to the irresistible conclusion that classification, once admitted to be useful, is so in an inverse proportion to the numbers of which each class is composed, and is not perfect until we come to the point at which it loses its name and nature in the complete separation of individuals." Prisoners may be graded into classes according to age, or crime, or length of sentences, or number of sentences, or in whatever way classification may be considered desirable; but amongst any such bodies of prisoners further classification would still be necessary to separate the various degrees. Two prisoners together might lead to one contaminating the other. It would appear, then, that separation should be held to be the true basis of effective prison management.

Prisoners under such treatment are more amenable to the softening influences of religion and friendly admonition. They are not subjected to the formation of bad habits by imitation. Individual needs, from a reformative point of view, can be better provided for. Isolation from others removes a great reason for misconduct and destroys the danger of corruption. The Howard Association say: "To reform prisoners while in association is comparable to the attempt to wash dirty linen in a sewer." As prisoners are so liable to contaminate each other, the only remedy is to keep them apart. M. Suringar, one of the most eminent of prison reformers, wrote: "I have spent half a century in discharge of duties connected with the repression of crime. I have become firmly convinced that whatever experiment may be made in the classification of prisoners, the separate system, although decidedly not perfect, is the best. . . . I have arrived at the most decided conclusion that the principle of the continued separation of offenders from each other is the only one effectual for its object." There are very few latter-day penological authorities who do not put separation in the front rank of prison requirements.

It

It would seem, therefore, that the whole matter is solved by confining each prisoner to a separate cell, so that he will have no chance whatever of coming into contact with any other prisoner. Opportunities would thus be afforded for reflection to pave the way to repentance, while frequent visitations from clergymen, teachers, governors, and various gaol officials would keep the confinement from being solitary. Provision would be made for work and exercise, and books would be available for spare hours.

But this system, although so sound theoretically, depends for success on so many things and on so many people. The Honorable Sir Frederick Darley, the Chief Justice, says: "In my opinion, the separate treatment of prisoners, if properly carried out, is at the same time the most merciful and the most beneficial system of imprisonment yet devised." His Honor is careful to say "if properly carried out." Separate treatment, improperly carried out, may dangerously trench on solitary confinement. One of the essentials of a proper system of separate treatment is a frequent and judicious visitation, but frequent visitations to every one of a large body of separately confined prisoners is not practicable under existing conditions. Unfortunately, the number of chaplains' visits and their duration are, for various reasons, by no means so numerous as is generally supposed. The same may be said of other classes of visitors. It therefore follows that separate treatment may leave a prisoner too much to himself if continued for too long a time. If association possesses great dangers, solitude has its own attendant evils. It is easy to understand the moral and physical degeneration arising from prolonged isolation. Characteristics of the erotic kind become developed, and mental alienation ensues. It is an undoubted fact that derangement of mind has followed upon separate treatment being applied to certain subjects who have not been able to endure a long seclusion, although modified by the visitation and other alleviations before mentioned which distinguish the separate from the solitary and silent systems. In addition to the dangers from self-contamination, there are other drawbacks. Cellular confinement restricts the selection of useful employments. Difficult as it is at all times to find beneficial occupation for convicts, which shall also be remunerative, the difficulty becomes accentuated when choice is restricted to the few employments which can be engaged in within the limited space afforded by a small cell. In a hot climate, such as this, with the thermometer occasionally registering 90 degrees of heat, occupations causing dust or fluff are unadvisable as impairing ventilation, a matter now attended by much disability through structural disadvantages.

Probably the most practical advance upon existing conditions would be to take the *via media*, for the present at all events, and to recognize the principle of separation for meals and rest, with limited association under all possible supervision for work and exercise. This would by no means be a perfect plan. It is quite easy to conjure up all sorts of difficulties. But no progress will be attained if this is to deter us from moving in a new direction. Against every plan there must be some objections; the thing is to choose that which apparently has the fewest.

Here it may be as well to briefly describe the methods pursued in our prisons. The great bulk of the inmates comprise a chaotic gathering of vagrants, drunkards, petty offenders, and others who are continually in and out of gaol. The sentences they receive are not progressive, and they neither deter nor offer sufficient time to effect reform. Many persons so treated are not fit subjects for criminal treatment at all, and their presence in prison is about as congruous as it would be in a palace. Then there are various classes of prisoners serving longer sentences of various durations under three years. Excepting special cases, and young prisoners whose term of imprisonment do not exceed twelve months, no separate treatment is applied to any of the foregoing. In the larger gaols, classification by yards does something towards keeping various grades of such prisoners in separate congregations; but, with the exceptions referred to, individual separation is not practised. It is when the sentences are for three years and upwards that separate treatment is experienced. Each convict, unless for medical or special reasons, passes the first six months in cellular confinement, relieved by one hour's exercise daily, and the visitations already alluded to. The next three months he is allowed two hours' exercise daily. Then he passes to association at labour, meals, and exercise until discharged. All prisoners are kept in single cells at night so far as is possible: but, despite the unwearying efforts of my predecessor to add to the number of cells, sufficient accommodation is not yet provided to allow of this most desirable practice being thoroughly carried out. Unfortunately, therefore, there are always more or less groups of three prisoners sleeping in one compartment. The removal of drunkards and others mentioned in the foregoing to establishments more proper for their cure would largely extend the means for separating the more legitimate prisoners at night.

In order to effect reform, it will be necessary for the Government to legislate for the proper housing elsewhere of those foreign bodies of unfortunates who now take up so much room in gaols. The prison administration is helpless in its endeavours to separate prisoners at night unless the country will provide the accommodation. When this is done, it will be possible to carry out the principle of association for work and exercise only, which in itself will be a great step forward. In the meantime, some alteration can be carried out in dealing with long-sentenced prisoners. Whatever good is effected by the nine months' period of seclusion must be largely nullified by the subsequent association in yards containing criminal communities comparatively strong in numbers. In such gatherings there generally are some predominant spirits capable of influencing the others, and here is a power for badness which cannot be ignored. The most earnest attempts have been made to classify each yard so that only prisoners of similar grades should be together; but classification of this kind, even if it could be made perfect, which it most certainly cannot, fails to prevent contamination. As in many other prison matters, the evils of association have been possibly exaggerated. A firm well-minded man can keep aloof from dangerous companionship. Many do; but the greater number are weak vessels, and these have to be protected. It is almost certain that an attempt to do away with the congregation in yards would be met by some temporary disorder. But the greater number of the prisoners, and certainly all the most promising, would prefer separation out of working hours. The hardened criminal would, no doubt, object and cause trouble, as was the case in Pentridge some years ago, when a similar system was introduced there; but little troubles of this kind might well be borne for the sake of the advantage accruing to morality and reform. A man then would only be associated with other inmates at work and at exercise under supervision, which would limit his liability to contagion. At all other times he would be in his cell where, as much as possible, visits from the various classes of officials would be supplemented by visits from approved lay readers or other accredited persons. A liberal supply of books, educational and entertaining, would be allowed, with lights up to 8 p.m. nightly, and certain progress in the upward stage might be marked by increased facilities for writing and receiving letters, more frequent visits from relatives, permission to hang photographs of wife, children, or parents, on his cell walls (a practice attended by good results in Norwegian prisons), the privilege of sending a portion of his earnings to his family if they were deserving; possibly, after a certain time, permission to care for a bird if sent from home, and what other inducements to clean living, not inconsistent with prison principles, might from time to time offer themselves. I do not think that these things would in any way shake the deterrent effects of imprisonment, but they might elevate the individual to a higher conception of life and its responsibilities.

But it seems a well-established rule in the prison administration of most countries (America is a notable exception) that a period of stricter seclusion than the foregoing should attend the criminal on his entrance to gaol. Nine months' separation is the period observed here and in the United Kingdom. On the European Continent the practice varies. In Belgium, there is almost constant separation. In France, prisoners serving a year are kept apart from others. In Norway, the inmates labour in association, but sleep in separate compartments. At the commencement and close of their terms of sentence the prisoners pass a short time in solitary confinement. A somewhat similar plan is followed in Victoria, where the isolation term depends on length of sentence, and ten days' seclusion is reserved for the concluding portion of the imprisonment. In Queensland, the period of separation is varied by length of sentence and by number of convictions.

The

The principle seems sound. The first entrance to gaol is to be followed by a period of separation from all but wholesome influences. No doubt the prisoner is in his degree of reflection more amenable to feelings of remorse and repentance than at any other period. The punitive part of prison life is here uppermost, and it is quite right that it should be. Objection may be made to calling this seclusion punishment, but it certainly is so regarded by the prisoners generally. Afterwards, a series of progressive stages ameliorating confinement and preparing for a resumption of personal liberty. But I do not think the period of seclusion should be so long as at present, and I do not think the same period should be indiscriminately applied to first-convicted men as to more hardened graduates in crime. And Mr. Michael Davitt's suggestions appear to have much in them that is commendable. He thinks a few months at the beginning of the sentences, with a month or two at the end, would be beneficial, so that "at the end of the sentence the prisoner would be amenable to the attentions and services of the chaplain and the schoolmaster, and every such reformatory influence as could be brought to bear upon him just before he comes out into the world again." This is the method followed in Norway and in the neighbouring Colony of Victoria, where much success has attended its operations.

It is therefore suggested that some similar plan might be followed here experimentally. For prisoners serving under three years imprisonment of any kind, the Comptroller-General might be entrusted with discretionary powers to provide such periods of seclusion at the two ends of the sentence as might be considered fitting, the maximum duration being defined. Prisoners with sentences of three years and upwards might be the subjects of separate treatment for periods at both ends of the sentences, calculated on a sliding scale according to length of sentence and previous records, second offenders being dealt with more stringently than first, and third offenders more stringently than second. I attach great importance to a period of seclusion from ordinary gaol routine being passed immediately anterior to discharge. Visits from clergymen and others of the staff would probably exercise a beneficial influence for good at a critical time, while visits from relatives, excepting where such persons were known to be unsuitable people, should be liberally allowed. Home ties, relaxed unavoidable by the requirements of punishment, might thus be renewed and strengthened. And it must be strongly insisted upon that if it were possible to hit upon the most perfect system of gaol treatment, that system would be completely nullified if the care of the patient is relinquished on the gates opening to freedom. At present society is strangely indifferent upon the subject. If a quarter of the attention and sympathy given to the man in gaol were afforded to him when he goes out again, a very great gain to the community would ensue. Unfortunately, as a free man, there are few found to help him along in the right path, while inducements to revert to wrong are numerous. That he goes to gaol again is not so much owing to his former gaol experiences, but rather for the want of a helping hand in his interval of freedom.

4. *The Identification of Criminals.*

A sure means of recognising criminals would go a long way towards the diminution of crime. If the criminal were only certain that identification would follow upon apprehension he would probably be inclined to more practically consider the advantages of reforming. The growth of recidivism in France led to much attention being given to this matter, the consequence being the invention of the anthropometric method of measurement by M. Alphonse Bertillon. Briefly described, this system rests upon two facts: firstly, that the osseous portions of the human structure do not alter in size between adolescence and old age; and secondly, that these parts do not measure the same in their totality in the cases of any two persons. A plan of taking and systematically recording these measurements has been devised that enables a criminal to be recognised with as great accuracy and with as little trouble as picking out a word in a dictionary. In France the results attendant upon the introduction of this method of identification have been wonderfully successful. In 1883 the recidivists recognised were 49; in 1892 they numbered 680. In ten years the identifications amounted to 4,564, and that number of dangerous criminals, persons of the most crafty and vicious kind, was deprived of opportunity for injuring society. It must be understood that these persons had all given wrong names, and had denied having had previous prison experience, and that the ordinary methods had failed to identify them. Year by year the system has been perfected, until it may fairly be classed as an exact science. The benefits it has conferred have been generally recognised, and the older countries of the world have largely adopted it as part of their prison and police systems. In time it will no doubt be made more generally applicable so as to prevent wrongful impersonation, and check fraud in connection with life assurance companies, benevolent organisations, &c., while its possible advantages to large business firms and banks may easily be guessed. It is, however, in its present application to the identification of criminals that I desire to invite attention.

On several occasions the advisableness of introducing the system into New South Wales has been under consideration.

The Inspector-General of Police (Mr. Fosbery), on returning from Paris in 1888, specially advocated its introduction. He wrote to the Colonial Secretary (then the late Sir Henry Parkes), under date of the 26th December, 1888, as follows:—

"In submitting the enclosed pamphlet and appendix for the information of the Colonial Secretary, I have the honour to report that, having in view the extreme difficulty which is invariably experienced in the Australian Colonies in identifying offenders by their photographs and ordinary personal descriptions, I inquired, in the course of my investigation in Paris, into the means employed by the authorities there of determining the identity of their offenders, whose recorded number now amounts to about 70,000.

"Their system, as shown in the pamphlet and appendix, was fully explained to me by its author, and tested practically on an offender received into gaol at that moment, who asseverated that he had never been previously in the custody of the police. His measurements and descriptions were taken on the spot, and in a few moments I was enabled to select without difficulty the corresponding description (with photograph) from a large range of tabulated pigeon-holes.

"The system is so simple that I suggest it should be adopted by the prison authorities here, to whom I request that this report may be submitted through the ordinary official channel."

Since the date of that communication the question has occasionally been discussed in a more or less spasmodic way; but very little favour so far seems to have been accorded the proposal to introduce Bertillonage.

The objections have been that there were no experts at hand cognizant of the details; that it was impracticable to entrust delicate measurements to ordinary prison officers; and that the increase of work and the increase of expense would be very great. It was also considered that no system of anthropometry would be of use unless uniformly adopted by the whole of the Australasian colonies. To meet this last difficulty, a circular letter was sent, at the instance of the Minister of Justice, to the Prime Ministers of the various colonies, advocating concerted action being taken with a view to the adoption of an improved and uniform system for the registration and identification of habitual criminals. Attached to this letter was a most able minute from the Under Secretary (the late Mr. Fraser), strongly urging the carrying into operation of the Bertillon system. The replies were not encouraging. Queensland was prepared to join with the mother Colony, and New Zealand was favourable to the adoption of an improved method of identifying criminals; but Tasmania, South Australia, and Victoria declined to have anything to do with the new plan, although the last-named colony expressed

expressed willingness to join in a conference of the Chiefs of the various Prison and Police Departments to consider the whole matter. The minute issued by the Chief Secretary's Office, Melbourne, so forcibly puts the various objections that it is here reproduced:—"Chief Secretary's Office, Melbourne, 19th July, 1895.—The question of adopting the Bertillon system of identifying prisoners was brought under the consideration of the Inspector-General of Penal Establishments and of the Chief Commissioner of Police last year, and they considered that the system at present practised in Victoria of taking the photographs (full and side face), and measures of height, &c., with descriptions of appearance and particular marks, was sufficient to meet present requirements, and that there was not justification for incurring the expenditure necessary to carry out the Bertillon and Galton methods with efficiency. The question has again been referred to these gentlemen for consideration, and they are still of the same opinion; their views, indeed, seem to be similar to those held by the Comptroller-General of Prisons, New South Wales, as stated in the minute of the Under Secretary of Justice."

The Chief Commissioner points out that so far as the search for and arrest of criminals is concerned, the Bertillon system is of no advantage, as, of course, the tests for identification cannot be applied until after an offender is in custody. He also observes that "the introduction of and carrying out of this system would cause much trouble and some expense, and that if the measurements, &c., were not taken by experts, and most accurately, they would often be used to prove that the prisoner was not the man wanted." This seems a very important consideration.

Mr. Chomley admits that there are, however, occasions when the photos and descriptions leave the identification doubtful, and then, no doubt, the system would be found useful, and he concludes his minute: "Shortly, my opinion is that if the system was perfectly carried out it would occasionally be useful, but if imperfectly carried out it would not only be useless but dangerous."

The Inspector-General of Penal Establishments reports:—"Whilst I have little doubt as to the greater facilities and reliability afforded under the Bertillon and Galton systems, still, I think the methods now in vogue here of relying on photographs, personal descriptions, marks on body, &c., are for all practical purposes sufficient."

He also calls attention to the following passages in the report of the Commission appointed by the Secretary of State:—"It is essential to the complete success of the registry to secure the services of an expert practised in the methods of scientific anthropometry"; again "Unless perfect accuracy be observed, the system would be only a snare, and lack of care or intelligence is an ever-present danger—if the task be committed, as it sometimes must be, to warders and police of perhaps doubtful zeal, or who have no experience. Then a prolonged search, and with dubious results, would be rendered necessary when measurements were on or near the margin or primary divisions."

Captain Evans proceeds: "To carry out the system would involve additional expense—certainly the pay of one officer. Again, to work it effectively, persons specially instructed, and records would have to be available at the several prisons throughout the Colony. I do not think the time has yet come for justifying such expenditure, nor has the necessity for it manifested itself."

He further states that experiments are now being made with mirrors to obtain photographs of the face of various definite angles.

In view of the opinions expressed by the officers having the largest experience in connection with this subject, and most deeply interested in adopting all necessary means for securing the identification of offenders, the Government does not consider it necessary at present to adopt the system of measurement of criminals introduced by M. Bertillon."

The matter thereupon dropped for the time, but the Minister of Justice (the Hon. A. J. Gould) directed that as details of the working of the system in other countries became available, they should be communicated to him with a view to possible future action. A very great improvement upon existing methods was about this time introduced into the New South Wales system by my predecessor, Mr. Miller, which can best be described in his own words. Under date of 12th June, 1894, that gentleman wrote:—"The new method which has recently been introduced for facilitating the identification of criminals consists of a classification and subdivision of photos., with descriptions attached, as shown hereunder.

The photos. are classified in four series, viz. :—

- 1st. English speaking races.
- 2nd. Known foreigners.
- 3rd. Females.
- 4th. Coloured races.

"The first series, which comprises by far the largest number of criminals convicted in the Colony, is also subdivided into four sets according to height of prisoners, as under :—

- 1st. 5 ft. 5 in. and under.
- 2nd. 5 ft. 5 in. to 5 ft. 7 in.
- 3rd. 5 ft. 7 in. to 5 ft. 9 in.
- 4th. All over 5 ft. 9 in.

"Under the old method there was no classification of photos. with descriptions, and the full face only was taken. Under the new method, both the full face and profile are taken. I attach sample copies of two photos. This improved system will, of course, greatly increase the work of the photographer, who had but one assistant (a warder), and in order that the duties of printing, classifying, registering, and indexing the photographs may be properly and effectively performed in future, I have appointed another man, who is an experienced photographer, to Darlinghurst Gaol, with the status of a warder and subject as such to the Regulations, but his duties will be confined to assisting the acting-photographer (Mr. Howden), who ranks as a senior warder."

Up to the present time, therefore, the plan for identifying criminals in the Australasian Colonies depends largely upon photography aided by personal description.

I have thought it desirable to briefly recount the foregoing history of what has been done in the past, as the opinions of so many experienced gentlemen must possess considerable value. The difficulties of initiating such a system are very great, especially when it is considered that we have no one practically conversant with it, and that all the knowledge possessed of an intricate subject with its many details have been gained from books and reports. Yet the latter are so numerous, so up to date, and so full and clear in their description as to cause the difficulties to appear not unsurmountable. This opinion is shared by the Hon. A. J. Gould, who has on several occasions expressed to me his strong desire that a system of Bertillonage, modified to suit the requirements of the country, should be brought into operation. By Mr. Gould's direction a complete set of measuring instruments has been obtained through the Agent-General and are now in this office.

It would no doubt be most desirable that a similar system should be brought into operation in all the colonies at the same time. Much mutual benefit would be derived if the growing class of "intercolonial criminals" could be identified. Facilities for travelling about are now so numerous that it is easy for them to wander from one province to another, exploiting each in turn, until they get locally recognised. Then proximity to New Caledonia offers opportunity for escapees from the French settlement to settle unrecognised in Australia. The matter should be properly regarded as an intercolonial or even an international one. It is beyond dispute that the professional wrong-doer is alive to the disadvantages he is under in countries where his identification is assured, and that he is migrating elsewhere. It would be well that the deterrent method of anthropometric measurement be introduced into the whole of the colonies.

I consider that the system might be started in New South Wales. It is as much a matter of police as of prison concern, and should therefore, as in England, be a joint matter controlled by both Departments. There should be a chief director, who should control the central office, where all measurements would be sent for recording and identification. Much would depend upon this officer, who would have to generally organise, instruct a staff, and be responsible for efficiency. It might be considered well to obtain the services of an expert to nurse the matter at its inception, or better still, to despatch a prison officer—a medical man for preference—to observe the procedure elsewhere. In Bengal and in Ceylon a combination of the Bertillon and Galton methods has been, for some time, operating with pronounced success. A visit for instruction to both of these places would not occupy much time or cost much money. But it would be possible to commence without further assistance than is obtainable from the very complete and explicit directions contained in the various books to which reference has already been made. Mistakes would of course occur, and there would be much discouragement for a time, but experience would soon bring about success.

1 Millimetre = 0.03937 Inches.
10 Millimetres = 1 Centimeter.

10 Centimetres = 1 Decimetre.
10 Decimetres (100 Cts.) = 1 Metre.

It would be well to begin cautiously, and to not attempt too much. The Bertillon system in its entirety, as now observed, might be too complex, and I think a modification of the Bengal plan would be the most suitable to undertake. The measurements to be taken should be six, viz.:-

1. Length of head.
2. Width of head.
3. Length of left middle finger.
4. Length of left forearm.
5. Length of left foot.
6. Height.

And, in addition an imprint of the ball of the left thumb, obtained by brushing the thumb with Indian ink and impressing it on a card. All these particulars would supplement the information now given by photographs, personal description, marks, history and age.

As

As prisoners become nearly due for discharge, the measurements of such of them as might be deemed fit subjects for registration would be taken and recorded on cards which would be stored away classified for future identification purposes at the Central Office, Sydney. Each of the six measurements would be subdivided into three, viz. :—"long," "medium," and "short," according to a certain anthropological standard, which I think should be fixed by medical experts. These standards being fixed, three cabinets would be constructed, designated A for "long" heads (according to standard measurement aforesaid); B for "medium" heads; and C for "short" heads. Each of these cabinets would be divided into three parts vertically for "long," "medium," and "short" middle fingers, and horizontally into three for "long," "medium," and "short" widths of head. Subdivisions into further threes would follow vertically for left foot, and again horizontally for left forearm, and a last subdivision for height. It will be seen, therefore, that there would be three cabinets, each containing 243 subdivisions or drawers.

On the arrest of a person in any part of the country locally unknown, the particulars already enumerated would be set forth on a properly prepared card and sent to Sydney. The operator there in endeavouring to place the card in its proper place amongst the 729 drawers contained in the three cabinets, would at once be able to discard two-thirds of the number by the suspect's head being of long, medium, or short length. Further examination as to width of head would reduce this number to 81. Length of left middle finger would bring the division to 27, still further reduced to 9 by measurements of left forearm. This would be brought to 3 by length of left foot, and the drawer which should place the card would be then arrived at by height measurement. There would, of course, be several cards in this last drawer, the right one of which would be fixed by the thumb impression. A telegram would be sent notifying the inquiring officer as to identification having taken place or not, and a letter would follow in due course, giving full particulars, including former convictions. It will be seen that the Bertillon system is followed more as an easy and rapid way of classification of old measurements so as to enable a record to be found readily and with certainty. But the best stage of arriving at convincing evidence of identification is afforded by the thumb impression, for no two persons' thumbs present the same appearance as regards skin markings when viewed under a microscope.

I consider the foregoing modification of existing plans would meet all our requirements for some considerable time, until the register cards became numerous enough to warrant a further subdivision, when the measurement of the bi-zygomatic diameter might be added. Indeed the latter even now might perhaps be substituted for the height measurement which is more liable to error on the part of the operator than any other part of the anatomy. I have only suggested the retention of the height because of its forming a part of the existing systems in other countries, and its consequent international value. Perhaps too it would be desirable to have a special series of cabinets for persons over 50 so as to prevent too great an accumulation of obsolete cards referring to persons who from age, death, or other causes might unrecognised drop out of the ranks of those forming the recidivist class. A still further reduction of cards would be arrived at by those referring to criminals under sentence being withdrawn until liberation, when they would again revert to the cabinets.

I do not think lads under 21 should be measured. In France such persons are so dealt with and a special cabinet allotted to their cards, but on account of their bones not having obtained full growth, their measurements at an immature age can have little practical value, while complicating the general classification. They might be treated as at present by photography and by record of distinctive marks, together with the thumb imprint which latter would not alter through life.

Measurements should be recorded on the metrical system, so far as the first five are concerned, and height should be in feet and inches. It would be advisable to adopt the instruments used in India by the controller of the Bengal system. They are distinct improvements on the articles used in England, and much better adapted for the measurements by non-experts. Difficulty would be experienced at first in training prison or police officers in various centres to make accurate measurements. But examination and time would produce a body of fairly-skilled measurers who could be relied upon, with the aid of the improved instruments now obtainable, to give particulars with but a slight margin of error. Four or six measurements might in each case be taken and the mean adopted. Inspectors would occasionally visit each district, examine the capabilities of the various officers, and test the measurements, and such a plan would bring about successful working. Too much would not be imposed upon the outlying officers. All that would be required would be to take the measurements and the thumb impression of any suspect, together with a description of any marks or peculiarities, and forward such particulars to Sydney where the central authorities would be able to pronounce the suspect an ex-convict or not in a very short time.

I strongly commend the matter for favourable attention as going some way towards solving the "habitual criminal" difficulty, which might be further advanced by legislation on the lines of the Victorian Influx of Criminals Act. Discharged prisoners from other countries should not be allowed to enter New South Wales within three years from the termination of their sentences under pain of imprisonment followed by deportation.

5. *The Employment of Prisoners.*

This is a matter surrounded by difficulties. Theoretically every prisoner, not mentally or physically disabled, should be made to work. Practically it is very hard to find work for them to do. It is a common thing to hear opinions expressed that those in gaol should be kept to hard work and made to earn enough to keep them. But people offering such opinions rarely suggest what hard labour should be done, or, if they do, it is something wholly impracticable. In this as in many other matters connected with prisons, it is quite easy to criticise but very difficult to prescribe a remedy.

Purely penal employment such as the crank, the tread-mill, shot drill, and other unproductive occupations formed an easy way of keeping the prisoners at work, and at work of a heavy kind. But public opinion rightly does not favour this system which finds no place in the New South Wales prisons. It is therefore difficult to provide occupation which shall be at once laborious, useful, and educational.

The number of skilled tradesmen coming into gaol is few, and the vast majority of prisoners are unskilled in trades, dull of learning, and averse to exertion. Then, as physical disability generally accompanies moral infirmity, many of them are of stunted growth or of broken down constitution, with a liberal sprinkling of feeble minded, or diseased, or crippled persons. This without reckoning the large majority who comprise drunkards and vagrants sentenced to prison to get rid of them for the time for such short periods as to render it perfectly hopeless to teach anything useful to such an everchanging population. It is obvious therefore that such material cannot do the work of skilled artisans.

Then there are drawbacks to gaols, as regards industries, which are not present in the outer world. The necessity for constant supervision, the ordinary disciplinary routine, and the structural disadvantages of buildings all offer serious opposition to steady and profitable occupation, which is further hampered by the complaints of free labour.

It will be perceived from this that obstacles to the constant and profitable employment of those in our gaols are by no means few or easy to overcome. It would be most desirable from every point of view to see all the prisoners perform day by day a good day's work, but at present this is impracticable for the reasons before stated; and I fear we must for the time accept the fact that there will be a certain proportion for whom little useful employment can be found. In the larger gaols where there are workshops and trades instructors, this fault is capable of being minimised, but the minor establishments situated in the outlying districts can be regarded as places of detention only. There is no

local

local work beyond wood-chopping or performing the necessary prison duties, while the cost of transit prevents material being sent from elsewhere to be made up, even if it were practicable to provide competent instructors.

With a full comprehension of all these hindrances to success, a more vigorous policy has recently been entered upon in order to import more liveliness into the industrial side of prison management. It has seemed to me that, with all the disabilities we labour under, there is not much occasion to seek custom in the open market. The various Government Departments are proper customers for our products, and it should be recognised that where anything for the Public Service can be produced by gaol labour, then outside sellers should not be dealt with. In the past this idea has not been so completely entertained as could be wished, and such trade gradually became reduced to small proportions. Various causes, too, also alienated the departmental trade. Our unskilled labourers occasionally turned out bad work. Goods were not produced to time. Heads of Departments were inclined to be hypercritical when comparing prison manufactured goods with articles offered in the open market. And, not least of all, there existed much apathy and lack of interest on the part of those charged with the execution of orders. The business was not taken seriously.

Measures have now been taken to brighten things up generally. The Governor of each gaol has been distinctly informed that he will be personally held responsible that as little idleness as possible takes place; that the various orders placed with him are carefully and promptly carried out; and that no article made in his prison passes out in an improper condition. The trades overseers have been warned that inattention on their part will be productive of serious consequences to themselves, and that they will be held responsible that every prisoner entrusted to their care is kept at work. Some changes in the trades' staff have already been made. Then, a new office has been created called Director of Labour. His duties involve a general supervision of the whole of the industries. He has to solicit orders from the various Departments, and to distribute them to the gaols most capable of executing them. He has to keep in touch with the trades instructors in all the prisons, so as to be well posted with the capacities of the inmates and the amount of work available for them, and he has generally to see that matters are conducted in a business-like style. I anticipate much good will result from the creation of this office. Already a number of orders have been placed with us for clothing, boots, bedding, tinware, matting, &c. It would be a good thing if the Railway Commissioners would obtain their mats from us. Such work would afford useful occupation for many of the unskilled men now in prison, and the mats could be made quite equal to those now imported.

Besides this, there is building, quarrying, &c., going on at Trial Bay and elsewhere, and also the work of many kinds incidental to gaol requirements, such as tailoring and shoemaking for the inmates; laundry work, cooking, cleaning, and so forth. And recently an attempt has been made to introduce farming and gardening. So far a fair amount of success has been attained in these latter directions, but there was not much forethought displayed in selecting the sites for prisons, most of which are of such small extent as not to offer opportunities for much outdoor work. Where there is any available ground, however, it is being used, and already vegetables and forage have been grown in some localities more than sufficient for the local gaol requirements. The Governors, as a body, report most favourably of the plan, and there can be no doubt it is a wholesome and healthy occupation for the prisoners who appear to be all the better behaved for the new departure which has only been established a few months. For the future, in addition to the existing occupations, I look forward with much hopefulness to the establishment of a new prison for females, a reformatory for drunkards, a large industrial prison on modern lines, and possibly a penitentiary for vagrants. Much of the cost could be defrayed by the sale of Darlinghurst Gaol, which is out of date and unsuitably placed. There is no reason why these places should not be built by the prisoners themselves. It is already in contemplation to add a new wing to Parramatta Gaol for the reception of those suspected of insanity, and the work could be done by prison labour after the erection of the walls on the outside grounds. Here would be good work provided of a hard, healthy, and useful kind. And I sincerely hope that the experiment may be tried.

I have only so far considered the subject from an economic and business, and, perhaps, a social point of view; but there is a moral aspect also, for most undoubtedly wholesome labour is a great reformatory agent. The industrious and willing worker in prison is well advanced on the road to reform. For many, work is distasteful, unfamiliar, and troublesome. Some consideration at first is needed for these; but with a proper system of rewards for industry, the necessary stimulus is provided for even the most unpromising cases. Some revision of the labour schedules has taken place, and a new scale came into operation on the first of the present year. This provides for every trade a task, defined by a certain amount of work.

In the case of a tailor, the weekly task is the making of so many pairs of trousers according to experience. For this, first-convicted men are credited with a small sum payable on discharge. Second and third men receive less, and fourth-convicted men nothing; but after completion of the task all classes are paid for every pair of trousers made over and above the task, and so with other occupations. A prisoner is, therefore, encouraged to be industrious, and at the same time he is made to feel that he is contributing something towards the cost of his maintenance. I would propose that prisoners should be allowed to contribute half their earnings towards the support of their families. This would be an incentive to industry, and would have an elevating effect, especially on new offenders, and by preventing absolute severance of home ties might pave the way to family efforts being made to provide employment on release, and so cause the discharge to be a final one.

6. *Education and Moral Instruction.*

Education is not expected to wholly eradicate crime, and, as a matter of fact, it does not do so. In particular cases it may even have assisted the professional criminal in his war with society; but as a general rule it may be taken that the spread of education has marched hand in hand with the cause of reform.

The public school system of this country has done much to assist the repression of wrongdoing, and, as in England, the prison population is largely recruited from a class who in some way or other have managed to evade the provisions of the Education Act. I have always thought that a drastic campaign directed against truancy would go a long way towards diminishing crime, and in another paper this matter has been more fully dealt with. In every prison, owing to the general spread of education, there are not so many totally uneducated persons to be found as was the case a few years back, but still there is a percentage received quite unable to read or write. There are considerable drawbacks in the way of repairing these deficiencies, as the primary objects for which gaol life is prescribed hardly make towards opportunities for any considerable educational advancement. Still it has been recognised as an obligation that a degree of tuition should be attainable, and, to some extent, school-teaching forms part of the prison routine.

At present, the female prisoners receive no educational attention. The male prisoners in six gaols have fair opportunities for schooling. Not much is practicable in this direction, nor is much done. The teachers combine scholastic duties with those of storeroom, clerk, or some other office, and possibly attach most importance to the latter work, of which the results are more readily shown. Then again they are not trained men, and consequently labour under serious disadvantages. The standard of gaol education needs better defining, and the absence of any definite rule as to age and length of sentence of those eligible for instruction is hampering to usefulness. I believe, however, good work has been done, and that prisoners have benefited by the efforts of the schoolmasters, who, for the most part, have been painstaking and earnest. Precisely the practical value of their work cannot

be arrived at in the absence of any record of results. An educational return certainly appears in the annual prison report purporting to show the progress made, but this is compiled from examinations made by the teachers into their own work and has little real value. An independent examination by a professional Inspector of the Public Instruction Department would afford a truer criterion of the success met with. The remarks made only apply to the male prisoners, for, as before stated, girls and women get no instruction at all.*

The improvements suggested would be to appoint trained teachers to the positions of schoolmasters, so that the opportunities for instruction, limited as they must be in gaol, may be made the most of. The changes should be gradually carried out and without hardship to the existing staff. In the larger establishments it might be advisable to separate the duties where another office is combined with that of schoolmaster, and so enable more time to be given to the latter functions. An earnest educated man in that position could be a great power for good in moving about sympathetically amongst the prisoners, teaching the less advanced, distributing and collecting library books, supervising the despatch and receipt of letters, and in helping illiterate prisoners to prepare their letters and petitions which latter assistance is now generally rendered by other prisoners.

Then, not too much should be attempted. Reading, writing, and the simple rules of arithmetic should alone form the curriculum. Prisoners of advanced attainments should, however, be afforded facilities for improvement by their own efforts with the aid of suitable books. But the gaol standard should be of an elementary character, and nothing beyond the ability to read a book, write a letter, and work a few simple sums should be attempted. The number of those to be instructed should not be too great, and success should not be endangered by the inclusion of those, who from age or extreme dullness, would require too much time to be spent on them to the disadvantage of other more likely material. Those over 35 should be excluded, as should all with sentences of three months and under. It would only be waste of time attempting anything with such cases. For convenience, it is the practice now to hold classes in association, but I question very much if better results could not be obtained from separate tuition in the cells. Each individual would have a shorter period of instruction, but it would impress him more, and his attention would not be distracted by company. Inducements might be held out to backward prisoners by requiring them to write their own letters after a certain period spent under the schoolmaster. At half-yearly intervals the measure of success attained should be gauged by examinations conducted by the inspectors of the Education Office in an independent way, whereby the necessary spur would be given to energetic and efficient methods being pursued. For women prisoners female teachers should be provided, but under present conditions this would entail much expense, as the women are comparatively few in number, and are so scattered as to render it difficult to get hold of them for teaching purposes. I have dealt with their case in a separate article.

The great majority of prisoners are, however, able to read, and for them gaol libraries offer great opportunities for moral advancement. Mr. Michael Davitt says: "No more efficacious reforming medium—apart, of course, from industrial occupation and habits—could be employed for the reclamation of all that is reclaimable in criminal lives than a judiciously-stocked prison library, in which the moral teaching and wrong punishing description of novel should be largely represented. It is only what prisoners read, between labour hours in prison, that can come between their thoughts of crimes past and reveries of criminal deeds to come." These are sound truths. A good book is a great teacher. Prisoners necessarily spend much time by themselves. Something must occupy their thoughts, and the more wholesome that something is the better for all concerned. The Chief Justice, speaking to me about the restrictions as to issues from prison libraries, said: "Why debar such men from reading? Books are amongst men's best friends." There can be no doubt but that much more can be made of this aid to reform than has been made.

The rules now governing the gaol libraries provide that no ordinary prisoner is allowed a book unless he has over three months to serve. It will thus be seen that a great portion of the gaol population is debarred from reading. Several reasons for this restriction have been advanced. Amongst them is the damage likely to be done by the hopeless class of short sentenced drunkards and vagrants. Much force attaches to this. Another reason is that the punitive effect of imprisonment may be destroyed, if prisoners are able to get books too readily, and so pass the time away in reading. I do not quite see the force of this. There are many people serving sentences of under three months whose minds could better be employed in absorbing the healthful teachings of a standard work than in pondering over and conjuring up evils and libidinous ideas. To refine such minds would not tend to lessen the punitive effect of imprisonment, but would probably increase it by raising the moral perception to a higher level.

I have consulted many of our most experienced officials on this subject of restricting books to prisoners serving over three months, and their unanimous opinion is that all prisoners, excepting the short-term vagrant class, should be allowed library privileges. In South Australia, the Comptroller has discretionary power to allow any prisoner a book. In Victoria all ordinary prisoners serving over seven days may have one. It would appear desirable that some relaxation of our present rule should take place.

Another way in which reading is restricted is the rule that prohibits artificial lights in the cells. Exceptions are made as regards the cells occupied by certain classes, such as separate-treatment men, seventh-class prisoners, and a few others, which are lighted until 8 p.m. by gas, but these form only a very small proportion. The vast majority of the prisoners, including those who have passed the "separate" stage, have no lights at night, and this in winter means twelve or more hours spent in darkness without occupation.

In several of the remote minor gaols gas or electricity is not available, and this has formed one of the principal reasons against lighting Darlinghurst, Parramatta, and the other large prisons. Because a few men incarcerated at, say, Wilcannia cannot have lights, therefore the many hundreds elsewhere should not have them. In this, as in other prison matters, it is to be feared that the desire to enforce uniformity of treatment has stood in the way of desirable reforms. I have recently submitted a recommendation to the Minister of Justice on this subject, and Mr. Gould has approved of the principle that all cells, where practicable, should be lighted, and the matter has now been placed in the hands of the Government Architect. I anticipate good results from the introduction of this great reform. When all the cells are lighted their inhabitants will be able to pass the hours prior to sleeping in reading. No doubt some will take up various studies by the aid of the educational works provided, while others will occupy themselves with fiction or travels. But good must in any case result from the new departure, which will enable that dangerous period of solitude—between the close of labour and the beginning of the night's sleep—to be safely employed in morally clean and instructive occupation.

Another advantage to be gained by the introduction of the lighting of cells will be the addition of a mild prison punishment to the present corrective code. For certain offences a prisoner would forfeit, for one or two nights, a light in his cell, and it is anticipated that this penalty would supersede some of the heavier punishments now inflicted, and would be more deterrent although less severe.

Libraries are maintained in all gaols ranging from some dozen works in small establishments to some two thousand at Darlinghurst, the schoolmaster of which prison acts as general librarian, and arranges for the selection (subject to the approval of the head of the Department) and exchange of works for the service throughout. That officer recently reported: "Works of fiction of the ordinary

* At Darlinghurst all seventh-class prisoners, excepting those serving sentences of fourteen days and under, are taught in a class in Evening on Mondays, Tuesdays, Wednesdays, and Thursdays from 2 to 3 p.m., each prisoner attending every alternate week. They do not attend when on low diet. Prisoners of other classes are admitted to the school (in the library) on their application being approved by the Governor, and are taught from 10 to 12 on the days mentioned. Twelve is the usual number that attend.

ordinary novel class (standard novels, even those of Sir Walter Scott, being classed in the same category) have been for a long time forbidden, so that under the heading of 'Fables' the only works permissible are stories of travel and adventure, or homely tales of a colourless and, in many instances, childish description. The choice of magazines has also been greatly curtailed. . . . There is no doubt that the libraries contain a great many books absolutely useless for the purpose for which they were intended, and I hope that in time they may be replaced by more interesting and instructive works." I quite concur with the principal librarian. A very large proportion of the books is neither instructive nor interesting. On my entrance into this office I was much surprised to learn that authors such as Thackeray, Sir Walter Scott, Dickens, and others were rigorously excluded from the shelves, and that modern novels generally were tabooed, no matter what their degree of excellence. It seemed, however, to be overlooked that these forbidden articles gained admission when running serial-shaped in the pages of a magazine. There were many admirable works of travel, biography, and so forth, and many valuable science books, but there was also, as the librarian implies, a great collection of ancient literature of an uninteresting and uninteresting kind. When these latter are weeded out, and worn-out dilapidated volumes withdrawn, the various libraries will need some extra money spent upon them to fill up the vacant places. The Minister of Justice, Mr. Gould, expressed to me his opinion that standard authors, such as Dickens, might be represented on the shelves, and accordingly the next selection of books will contain a carefully assorted collection of the better works of fiction and monthly magazines, while more solid matter will be provided by scientific and technical handbooks, travels, biographies, and so forth. The annual grant for books is £100, but this is insufficient. In English prisons 1s. 3d. per head is allowed, and this is supplemented at periodical intervals of extra stocktaking by additional grants. It needs about £300 to put our libraries in good condition, and a yearly grant of 1s. 6d. or 2s. per head, calculated on the daily average, to keep them in order. It would be money well spent in the interests of reform and morality.

In connection with the subject dealt with here must not be omitted the duties of the chaplains. Their opportunities for assisting and hastening reform are many. I do not so much refer to the softening and elevating influences of religion, as exerted by the various services of the different Churches, although their value is fully recognised, but to the private communication between clergymen and prisoners. Great good undoubtedly results from cellular visitation, and many an erring person has been brought to repentance by the friendly and sincere admonitions, not untinged by sympathy, of the chaplains. In the mother country there is in each prison a resident chaplain who, having no other duties, is enabled to devote the whole of his time to prison work, which includes the superintendence of the school, the library, daily religious services, besides useful help in connection with the Discharged Prisoners' Aid Societies. In this country the chaplains are non-resident, and have parish duties occupying their attention outside the gaol. It is obvious, therefore, that they have not the time at their disposal to accomplish all that could be desired. As it is, a large measure of usefulness is effected by these gentlemen.

I should like to see out here a plan which is working well elsewhere—that is, the introduction by the chaplains or clergymen from outside to occasionally conduct service and to give short addresses. More might be done, too, with the assistance of lay readers duly accredited, especially by women visitors to the women inmates. It might be found practicable to utilise some of the corridors for the purpose of "straight talks" or lectures on such subjects as Thrift, Temperance, &c., under the chaplain's auspices. Select bodies of well-behaved prisoners could attend there in turn, in parties small enough to be easily supervised and kept from communication by a few of the disciplined staff.

And in other directions changes might be cautiously and judiciously introduced which would help along the training in education and moral instruction, by awakening or quickening the receptive faculties in a healthily attractive way.

7. *Habitual Drunkards.*

The manner in which drunkards are dealt with is generally admitted to be unsatisfactory. Men and women afflicted with the disease of habitual drunkenness are ignorantly dealt with as criminals, and the abortive treatment to which they are in consequence subjected is neither deterrent nor reformative. Scores of these poor creatures spend years of their unhappy lives in moving backwards and forwards between the public-house and the prison.

It is no uncommon thing to find over fifty convictions recorded against one of these unfortunates. Could anything show more plainly the utter uselessness of the present system? Indeed, that is generally admitted; but, although reform is much talked about, it has been found impossible to get beyond the talking stage.

There is another aspect of this question which deserves attention. The constant stream of drunkards flowing into the gaols is at once most inconvenient and expensive. Their presence is embarrassing, and interferes considerably with the arrangements for properly accommodating the more legitimate prisoners. In Darlinghurst alone, a huge army of drunkards and vagrants, owing to drink, march into the prison, many of them in a filthy, diseased, and verminous condition, forming at once a danger to the cleanliness, order, and usefulness of the gaol. No possible good is done by their incarceration. Their sentence of two, or seven, or fourteen days, or whatever it may be, simply patches them up in preparation for another bout of drink, and so the miserable game proceeds, costing much money and doing no good.

From a prison point of view, the removal of this class would offer great advantages. The accommodation now occupied by these persons could be applied to the separate housing by night of prisoners who now, from want of room, have to be associated, while the sanitary condition of the gaol, together with its reformatory and industrial opportunities, would indubitably benefit.

It is not easy to hit upon remedial measures which are free from objections of some kind. It is no doubt due to this difficulty that the present system owes its continuance. To deal effectually with this matter, new ground will have to be broken, and some purely experimental steps undertaken. Objections will no doubt be raised, but they should not be allowed to obstruct reform. The first thing should be to take habitual drunkenness out of the category of crime, and class it as a disease requiring medical rather than prison treatment. This being recognised, a course of treatment might be instituted, involving detention, more or less prolonged, in an inebriate reformatory situated some distance from any large centre of population.

The establishment should not present a prison appearance, nor should it cost much money to build. Properly-classified dormitories, subdivided into cubicles so that each inmate would have a room to himself; a large refectory, which would also serve as a lecture and recreation hall; a well-stocked library, together with work-rooms, hospital, officers' quarters, and the necessary offices, would comprise the internal arrangements. Outside should be a large area of ground, suitable for floral, fruit, and vegetable gardening, dairy work, agriculture, poultry and pig farming, and any practicable outdoor work. A playing-field and swimming-bath would be attached. Opportunity would be offered for good wholesome work, as much in the open air as possible, and there would be ample time given for recreation, education, and moral and religious instruction. A special staff of officers would have to be selected, fitted by education and temperament for the work, and the general superintendence should, I think, be placed in the hands of a resident medical officer. An independent Board of Visitors would visit at uncertain times and report to the Minister having administrative control. The inmates, or more properly speaking, patients, would be habitual drunkards. Here would crop up a difficulty in definition. It would perhaps be well not to proceed too diastically at the beginning. Probably after a certain number of appearances before the Courts, a person might be deemed an habitual drunkard

drunkard liable to detention in the Reformatory. Such detention should not be for less than one year. No possible good could be effected in less time with such cases. After twelve months any patient would be eligible for discharge, either on probation or absolutely, and in no case should the time of curative detention exceed three years.

These conditions are no doubt of a stringent character; but the disease requires heroic treatment. Probably well-meaning people would cry out that the liberty of the subject is being unduly interfered with. Precisely the same objection would apply to the incarceration of the insane, who are detained in special establishments away from their relatives until cured. Again, it will probably be urged that much misery would be caused to families by the removal of their bread-winner. But, seriously considered, an habitual drunkard possesses little value as the support of a home, and his temporary absence would not diminish the family earnings or the family comfort. Besides, the patient could freely communicate by letter with his near relations, enjoy visits from them, and even in special cases be allowed occasional holidays under their care and responsibility, while from the proceeds of his labour he would be able to contribute towards their support.

The remarks made are equally applicable to female prisoners. It seems to me that such a system is capable of effecting great moral reformation and of conferring the necessary stimulus to enable this terrible mental disease to be overcome. I trust that whatever else may be effected in connection with prison reform this subject may be speedily dealt with. To continue the present useless and costly system would be indefensible.

8. *Separate Prison for Females.*

A portion of every gaol, more or less secluded, is set apart for the reception of female prisoners, who are controlled by women officers, under the general superintendence of the male head of the establishment. At the close of 1896 there were 217 female prisoners, with 78 officers of their own sex to manage them. The majority of the women were confined in Darlinghurst, Biloela, Maitland, and Bathurst, and numbered 181, with 23 officers—a proportion of 7·8 prisoners per officer; while scattered about all over the country were 36 more, with 55 officers—a proportion of 1·5 officers to 1 prisoner. Little useful employment can be found for these women, especially in the country prisons, where their services are principally utilised in washing and general domestic work for the gaoler and his household. This latter purpose is the principal reason for the appearance of women prisoners at some of the gaols, they having been specially transferred from the metropolis to perform general servants' duties. I cannot approve of the system which obtains of allowing gaolers to use prisoners as servants. It cannot assist discipline, it is liable to abuse, and it is objectionable for several easily understood reasons; and it would be far better to give the officers an allowance to provide free servants.

There is not much in the existing method to commend it. Better results should be obtained by the concentration of the female prisoners in one or two institutions specially adapted for their treatment. From an economic point of view the gain would be considerable. Probably half of the present number of officers would not be required; and the prisoners would benefit by the bringing into operation of more improved methods of dealing with them. Amongst these would be a better classification, which is much needed. Brothel-keepers and prostitutes should be kept wholly apart in a separate wing of the prison.

In Victoria they have concentrated the women, serving sentences of three months and upwards, in the central Female Prison, Coburg. When a woman is committed to one of the up-country gaols for a short sentence a special female attendant is engaged on the responsible recommendation of the gaoler to attend her, unless on inquiry it is found cheaper to transfer her to Coburg—a matter which is left entirely to the discretion of the Inspector-General. I inspected this prison, and was much interested in the arrangements for supervising and classing the inmates, and for keeping them usefully employed. Some similar plan should be carried out here. But no old building should be used. One of the greatest drawbacks to efficient prison management in this Colony is the bad construction of many of the gaols, and the necessity for making shift with ancient, ill-adapted structures. A new establishment should be built, specially fitted for the required purpose, so that health, reform, labour, and supervision could all be successfully and economically provided for. The removal of females from the present gaols would set free a large number of cells for the use of the males, many of whom have now to be associated together at night because of insufficient accommodation.

Women do not enter prison in such large numbers as do men. In New South Wales at the close of 1896 the general population showed the proportion of the sexes as 100 males to 86·6 females, while the proportion in prison was 100 to 10·1. But although the numbers are so low they require much greater supervision and are less amenable to disciplinary methods than the male prisoners.

They are subject to emotional instability and to periods of great nervous depression, rendering them liable to break out in fits of ungovernable hysteria for no apparent cause, and they necessarily require much consideration and even medical attention.

There can be no doubt about the treatment of women in prison requiring special attention. They need different regulations to those for men as regards food, discipline, and work. For prison offences another code of penalties would be desirable, and the remissions of sentences, the privileges and other incentives to good conduct should be on a more liberal scale. Visits from relatives might be permitted to a greater extent than is now the case, and every encouragement should be afforded to approved lady visitors, who might be able to exercise a beneficial moral influence over the prisoners, with whom they should be allowed to confer with as little restriction as might be found possible, having of course due regard to the necessary prison discipline. An influence thus gained within the walls would in many cases continue to exist outside, to the great benefit of the individual and also of the community generally. No doubt it would be found that ladies of influence performing this visitation would be able to provide the most deserving women with situations on discharge, and so help the work of reformation on to complete success. Perhaps even it might be possible, in exceptional cases, to discharge prisoners on probation where lady visitors accepted the responsibility of guardianship to keep them in the right path. Subsequent misconduct would lead to reversion to prison.

I attach great importance to this matter of visits from outside in the cases of female prisoners, and am quite in accord with Mr. Ruggles-Brise (Chairman of the Prisons Board, England), who, at the Paris Prisons' Congress, said: "I should like to see an aid society, consisting of ladies, in connection with every prison exclusively occupied by women. We have already, in many of our prisons, such lady visitors, whose zeal and kindness cannot be too highly praised."

Great care should be exercised in selecting the staff. Education, tact, and sympathy should be looked upon as essentially requisite in the cases of the higher officers whatever other qualifications they might be expected to possess; and the general control should be vested in a resident medical officer with a lady superintendent as his principal executive.

9. *Penitentiary for Habitual Misdemeanors.*

Another cause of inconvenience and obstruction to prison management is the habitual vagrant and misdemeanant. This person, like the habitual drunkard, is continually entering and leaving the gaol. As a rule, his sentences do not exceed three months, and little can be done to improve him, or to get any useful work out of him in such short periods. His case is, under present conditions, well nigh hopeless, and his presence in an ordinary gaol amongst long-sentenced men is detrimental to discipline in many ways,

At Darlinghurst and Biloela this class of prisoner is usually present in large numbers. The room taken up in the former prison is badly wanted for the longer sentenced men, and it would be beneficial in every way—sanitary, deterrent, punitive, and reformatory—if some sort of penitentiary could be established for the reception of these troublesome vagrants and petty offenders. So long back as 1886 one of my predecessors, the late Mr. Harold McLean, strongly advocated such a course being taken, and its necessity has only become more apparent as time has gone on.

The island prison at Biloela has, for some considerable time past, formed a sort of penitentiary, and has materially relieved Darlinghurst of a great burthen. Under the superintendence of its present able and energetic governor, almost everything that can be done is done; but Biloela at the best can only be regarded as a makeshift, and the Prisons Department has nothing to be proud of in the retention of such a place. Vagrants, drunkards, and petty offenders with all numbers of previous convictions are grouped *en masse* in large dormitories at night. Separation is unpracticable, and is not attempted. But had as Biloela undoubtedly is, it cannot be relieved of its present functions until other accommodation is provided.

The penitentiary proposed by Mr. McLean is what is wanted. It would not need to be a specially strong place, as prisoners of the class to be dealt with would not require it, consequently it should not be unduly costly. A large number of cells, back to back, built in parallel rows north and south, with open spaces between so that they might get the sun's light every day, would serve for sleeping and for meal purposes. The place should be surrounded by walls, and outside provision would be made for digging, gardening, and farm work. In the open spaces inside plenty of drill and any practicable hard labour available. Prisoners loafing and disinclined to work would suffer in diet and in loss of privileges, while a vigorous attempt would be made to render prison life distasteful to a troublesome class of offenders for whom the present system offers no terrors. Legislation in the direction of progressive sentences for habitual misdemeanants would greatly assist the proper dealing with such people. A first sentence of seven days might be followed by a second sentence of fourteen days, and so on. A gradual but certain progressive system of sentences, added to a busy life of hard work (or drill, if work were not available), would go a long way to lessen the number of these pests to society.

Amongst the vagrant class in gaol are often found very aged destitute persons. Asylum life would appear to be more adapted to these cases. In some instances they have already been inmates of institutions, and for various reasons have declined to remain in them. Being destitute they are locked up for vagrancy and sent to prison. It would be desirable that legislation should provide for such persons being committed to asylums, and for them being legally detained there. Another awkward section of the vagrant class is found in those unfortunates who, being discovered in a bad condition of health, are sent to prison by reason apparently of the committing magistrate not knowing what else to do with them. These cases occur in isolated country districts, and the absence of local benevolent institutions renders it very difficult to properly deal with them. They cannot be left to die in the open, and are consequently sent to gaol for the purpose of receiving medical attention. It is obvious, however, that a prison should not be regarded as an asylum or hospital. The experiment might well be tried of establishing branches of the Charitable Institutions Department in a couple of the country districts, to which unfortunates, such as have been here described, could be sent. This would be a more suitable and humane treatment, and would also relieve the penal establishments of much work which they are not adapted to perform, and which entails considerable unnecessary expense and inconvenience.

10. Lunatics in Prisons.

The Prisons Department is saddled with much work which it cannot properly perform, and which it should not be asked to do. Duties entirely foreign to a penal establishment have to be discharged more or less inefficiently, and the attempts at carrying out these extra prison functions seriously hinder the administration in its more legitimate tasks.

The least satisfactory of these foreign occupations is exhibited in dealing with persons of unsound mind. Prison officials ought not to be expected to treat cases of insanity or suspected insanity. It is unfair both to the officials and to the unfortunate persons so dealt with. There are reception-houses and hospitals for the mentally afflicted (with staffs of trained assistants) specially fitted for the purpose, and yet the gaols are used for housing and observing lunatics. During 1896 upwards of 350 persons were apprehended on the charge of being of unsound mind and committed to gaol. In addition to these, a further number—over 150 strong—arrested on other charges, were found to be mentally afflicted on entering prison or shortly afterwards. It is obvious that ordinary penal methods could not be applied to such people with advantage. The Department did what it could under the guidance of the medical officers, but prison surroundings are not calculated to improve the insane. No doubt many of the cases were due to alcoholism bringing on aberration of intellect, and forced abstinence from the predisposing cause for periods of greater or shorter duration led to temporary recovery. But even such cases are out of place in a prison, whatever may be said against committing them to lunatic asylums. They are not offenders excepting as against themselves, and they are for the time irresponsible for their actions. The proper location of this class has not yet been clearly defined; but, if it is possibly out of place in a lunatic asylum, it is certainly out of place in a prison.

Making due allowance for the dipsomaniacs, it is an undoubted fact that many persons of unsound mind are improperly sent to gaol in place of to an asylum. This is not only embarrassing to this Department and unfair to those so treated, but it is an expensive arrangement, largely adding to the cost of prison management. I can quite understand that in remote parts of the interior magistrates are confronted with a dilemma when insane or doubtfully sane persons are brought before them. In the absence of a near asylum, commitment to prison is the easiest way out of the difficulty. But there is little excuse in large centres of population, with railway access to the metropolis, for such action. Why those apprehended in Sydney or its vicinity should be sent to Darlinghurst Gaol instead of to the Reception-house is difficult to understand, yet sixty-three were so dealt with last year, notwithstanding that one place is especially adapted for their reception and the other is not.

But it is not only the undesirable commitment which is complained of, but the detention which takes place after prison is reached. For purposes of State economy and convenience temporary confinement might be permissible, it being understood that transfer to the lunacy authorities should be as speedy as possible. For various reasons, however, this is not so, and the consequence is that much inconvenience and unnecessary work are inflicted on this branch of the Public Service. The observation wards at Darlinghurst and Parramatta Gaols are simply portions of the ordinary prison establishment as regards construction, and the cellular accommodation and other adjuncts originally intended for convicts are now used for lunatics or suspected lunatics. The inmates are under the supervision of the visiting surgeons, and are examined at intervals by the Inspector-General of the Insane; but their principal care is entrusted to gaol warders, who, however kind and humane they may be, are not taken into the prison service in consequence of any qualifications they may possess as lunatic attendants. At night-time the unfortunates under observation cannot be left alone, and each one is confined in a cell in the custody of two keepers, who are prisoners. It is not implied that bad treatment or misconduct takes place under these conditions; but, naturally enough, disturbances are occasioned by these demented beings, and occasionally the noise is so great and so continuous as to cause unnecessary annoyance to other prisoners in other parts of the prisons, whose irritation is not to be wondered at. At Darlinghurst, not only the inmates are disturbed, but persons living outside the gaol have complained to the authorities of these nocturnal outbreaks.

I cannot think that the present system will be continued, but if observation wards have to form necessary parts of a prison establishment, then they should be built and fitted for the purpose. Again, their use should be restricted as much as possible to ascertaining whether a prisoner is sane or not. If the former, he or she ought to be shifted to the prison proper, or otherwise dealt with. If the latter, then immediate transfer to an asylum should follow. But it would be well to fix, as far as practicable, a maximum period for observational detention, and this should be as short as possible. At present some of the inmates of the existing places have been there for a very long time—in one case over six years.

It is understood that the Lunacy Department is somewhat hampered for want of room. Also, that some objection exists as to taking over the complete charge of prison lunatics. It is argued that a wide distinction should be drawn between those who commit crime by reason of their insanity and those who are criminals first and who become insane afterwards. From a non-professional point of view, I should imagine it exceedingly difficult to accurately and justly draw a line in all such cases. Persons of latent insanity may only have their condition recognised after incarceration. Instances have occurred where probably prison conditions have hastened the development of insanity, but it is exceedingly questionable if they have produced it. Possibly moral deterioration is always accompanied by impairment of brain, and insanity is related to certain phases of crime. Viewing the matter in a practical light, it is hard to know how to draw that sharp line of demarcation between the two classes which is desired by the lunacy authorities. With great diffidence, I would suggest that a criminal, when proved to be a lunatic, should cease to be considered a criminal. The prison atmosphere cannot conduce towards his recovery, and the loss of his mental faculties renders punishment by prison confinement out of place, as he is not in a condition to understand it. It has been stated that as prisoners suffering from bodily ailments are treated in hospitals within the prison, there would appear no valid reasons why arrangements should not be made for treating those suffering from mental diseases also. To this, I can only reply that the cases are not of a similar character. Physical ailments are not incompatible with a keen sense of right and wrong, and with an intelligent capacity for committing crime. But a lunatic is without moral responsibility, and is mentally non-existent.

Coming to practicalities, it will no doubt be generally admitted that a change in existing methods is needed. The lunatics are with us, and have to be provided for. A recommendation has been made by me to the Minister that a properly adapted observation ward be specially constructed at Parramatta Gaol, so that all persons requiring watching might be concentrated there instead of being divided amongst several places. The Inspector-General of the Insane is favourable to this scheme, but wishes to add to it provision for the accommodation of the criminal insane, who would thus remain permanently under the care of the Prisons Department. I do not like this idea at all, and do not consider so grave a responsibility should be placed upon us. Certainly the English Prison Directors had such a system in operation at the Woking establishment, where a wing was set apart for the treatment of lunatics of the convict class, and it has been stated that the results were satisfactory. Whether more satisfactory results could not have been obtained under the Lunacy Commission is to be considered. At all events, the system was abandoned some years ago, and the English prison management has no longer the permanent custody of pronounced lunatics.

The new observation wing at Parramatta need not be a large place, neither need it be costly. Its name aptly describes its functions, and they should not be stretched so as to include the charge of established lunatics. So soon as possible after observation has determined the mental condition to be unsound, the patients should at once be transferred to the Lunacy Department, which might establish a special institution for their use or not, as seemed fit; but it should not be within the walls of Parramatta Gaol, nor should it in any way have connection with this Department.

It is to be hoped that prompt steps will be taken to bring about an alteration in the present system, which is objectionable from every point of view.

11. *Prison Officers.*

The rules and regulations governing gaols may be the best in the world, but if they are ignored or unintelligently administered they might just as well be the worst in the world.

Only competent men should be employed to carry them out, and the greatest care should be taken in selecting such persons. This would appear to be so self-evident as to need no argument.

The matter is not, however, so simple as it looks, and possibly the greatest difficulty of all in connection with prison management is to properly fill the various positions on the staff. For one thing—especially in the lower ranks—the Service is not particularly attractive, and the right sort of men have not always been forthcoming. For another—on the assumption that anybody would do for some of the more subordinate positions—it has happened that other considerations than personal fitness have prevailed in gaining employment. There has been no qualifying examination as to education, and persons have gained an entrance in the Service possessing the most rudimentary idea of the three R's, and qualified neither by temperament nor training for their situations. It is easy to allow such people to join the ranks, but it is exceedingly difficult to get rid of them. They perform as little duty as possible in the most perfunctory of ways, and, keeping just within the limits which might subject them to dismissal, they remain a dead-weight of incompetency and discontent.

This, of course, does not refer to the great majority, which contains many smart intelligent men, who are a credit to the Service, but applies to the minority, few in number perhaps, but capable of influencing the general body in a wrong direction, and so impeding the proper treatment and supervision of prisoners.

Unfitness is also discovered in the upper ranks. Superior officers have been found who were quite unable to write an ordinary report without much misspelling. This is a very serious drawback, and causes much waste of time and labour. Frequently returns of an important character are sent to the head office improperly made out, through the inability of officers to understand plain directions when conveyed in writing. Accounts often come in wrongly computed. All this necessitates much extra correspondence passing to and fro of papers and constant friction.

The operations of seniority have pushed these persons into situations for which they were manifestly incapable. Seniority may be a good thing in its place, but should not be allowed to injure the public interests. It is obvious that officers in charge of gaols, labouring under educational deficiencies, cannot bring to bear the necessary moral and refining influence on either their subordinates or the prisoners. The position of governor is one carrying great responsibilities. There are few situations which offer such opportunities for practical reform work. An earnest man, seized with all the possibilities of his station, could take up his task in such an earnest spirit as to effect incalculable good. His subordinates would be inspired by his example, and society as well as the prisoners would undoubtedly benefit in consequence. To obtain the right kind of men for the leading positions we should not hesitate to look for them outside as well as inside the Public Service. It is impossible to deal in an ordinary way with situations of this nature, requiring such special qualifications, and it is an undoubted fact that there is a scarcity of suitable persons available already in the Government employ.

In time it may be found practicable to establish certain prisons as training schools for officers, and much is possible in that direction. The curriculum would comprise both the practical and theoretical management of a prison, and those under instruction should be scientifically and systematically trained in discipline, sanitation, temperance, anthropology, thrift, and general criminological affairs. The governor of such a penological prison-college would have to be a man of exceptional attainments, and his staff would necessarily possess special qualifications each in his degree. At present it is not practicable to initiate such an establishment, whatever may be done in the future; but it should not be.

be impossible even now for the governors, chaplains, surgeons, schoolmasters, and other officers competent to do so, to occasionally meet the other members of their staff in conference, and to address them on various subjects incidental to their occupation. Officers of all grades might be encouraged to prepare papers on various questions concerning gaol management, and rewards and prizes of various kinds given for the best productions; and, as a necessary part of the foregoing, a system of qualifying examinations should be established, which might indeed be at once carried into operation.

Some months ago proposals were made by me that applicants for warder's posts should be required to pass a qualifying examination of a simple character before obtaining employment. This, of course, in addition to producing testimonials as to character, physical fitness, and so forth. Then, it was further provided that each step of promotion should be preceded by periods of service free from misconduct, and by the gaining of certificates showing progressive knowledge in theoretical as well as practical prison treatment. The various stages were not made too difficult in the earlier steps upwards, but it was demanded that no person should fill the higher stations unless they were qualified by ability, study, and fitness. Concurrent with this scheme for raising the moral of the prison officers, a proposal was made that libraries should be established in all the large gaols for the use of the officials, containing standard penological works, latest reports relating to prison matters, and other books of cognate nature, so that every opportunity might be offered to gaol officials to improve their knowledge of the theory of prison work and of what is being done elsewhere, and to qualify themselves for advancement. I do not think that we shall get assistants of the calibre required until some such system as has been here foreshadowed is brought into operation. Quite recently several improvements have been carried into effect with regard to the various prison staffs, and further changes are in contemplation; many superfluous employees have been dispensed with; some shady and badly conducted men weeded out; some aged and infirm officials have received pensions or gratuities, and eight governors have for various reasons retired; a more effective system of night-watch has been instituted, and drill, discipline, and responsibility have been more rigorously insisted upon; transfers have taken place between town warders and others who have had a long share of duty in the back blocks; promotions have been frequent, and have been conferred on the most deserving and capable men, irrespective of seniority; annual leave on full pay has been allowed to all classes of warders, whether stationed in town or country; hours of duty have been made more reasonable, and a system abolished whereby officers had to perform twenty-four hours continuous duty; and Sunday leave has been introduced into the large gaols, where each warder now enjoys sixty-five days annually off duty, notwithstanding he is paid for all Sundays and holidays. With improvement in class and attainments it may be found practicable, when the staff is reduced to the limits of necessary requirements, to rearrange the emoluments, and to introduce special pay for long and faithful service in the cases of well-conducted subordinates not fitted for promotion.

12. Aid to Discharged Prisoners.

The reformatory side of prison treatment, to be successful, must be supplemented and assisted by a judicious moral control after discharge from gaol. There are great difficulties in the way, no doubt, but they are not insurmountable in all cases. My connection with reformatory work for boys convinced me that institutional training was of very little use if care and attention were not given to the boys when running alone after the institution was quitted. Something of the same sort of thing is wanted in dealing with adult offenders.

The Salvation Army and the Rescue Society accomplish a certain amount of good now, but there is room for a greater and more systematic extension of this work. The majority of prisoners have little hope of encouragement and assistance when they leave gaol, and what wonder is there if they revert to old evil habits. Men who have been for a long time subjected to rigid control, to the plainest of diet, and to the strictest supervision, all at once are restored to unrestricted liberty, with possibly a few pounds in their pockets, earned by prison labour. They occupy pretty well an analagous position to what was once described as "Jack ashore," and, after a short bout of dissipation, find little alternative but to start on a fresh voyage of crime as a qualification for further imprisonment. It is much to be feared that incarceration in gaol is looked upon by many of our criminals as simply the normal condition of their existence, relieved from time to time by brief outbreaks of licentiousness and crime when at large.

Many of those persons could be saved, and much expense to the country avoided, by the adoption of a suitable and comprehensive scheme for aiding discharged prisoners. Such a scheme is the indispensable complement of any reformatory system. Many years ago Lord Derby laid it down as an axiom that it was the duty of the State to afford to every man the chance of obtaining honest employment on leaving the prison. Personally, I should not be in favour of handing this matter over to Government control until I was shown that voluntary efforts had altogether failed. Up to the present not much encouragement has been given to voluntary workers in this large field of usefulness, which is comparatively, in this Colony, new ground; but there are not many avenues for philanthropic labours where the opportunities for doing good to the individual and to society generally are so pronounced.

I believe that a very large percentage of our prisoners sincerely mean to lead a new and better life on emerging from gaol. A helping hand extended to them in a broad and liberal spirit is what is wanted to give them strength to resist temptation. As a rule they are a weak, unstable lot, ashamed of showing themselves amenable to the finer emotions, and intensely suspicious. They need a moral support continuously applied, of a quiet, sympathetic kind.

I would propose that the Government and the public work hand and hand in this matter, as is now done in the case of some of the hospitals and benevolent institutions. Voluntary subscriptions should be supplemented by equal amounts from the State. There should be one large central committee, who would assume the general control and responsibility, and subordinate sub-committees should be established in every town where there is a gaol of any importance. A town committee should be elected from among the local or neighbouring residents, and should also include, *ex officio*, some of the gaol officials, such as the governor, chaplain, visiting magistrate, and medical officer. In other parts of the country, where there are no gaols, local committees or agents might be appointed for the purpose of finding work and assistance for deserving cases. But all these should be bound up in one system of uniform organisation mutually assisting each other. A prisoner discharged at A might, for various reasons, find it difficult to get on there. The committee at A might ascertain from some other committee the very place for such a man to settle in. A certain amount of publicity is inseparable from any system aiming at assisting discharged prisoners. It is the case wherever tried, and cannot be altogether avoided. But no doubt experience would bring quietness and privacy in its train, and would conduce to the general machinery working smoothly.

Existing organisations might be affiliated to the proposed General Society, and so come within its authority, so as to avoid any unseemly competing or touting for prisoners as now, unfortunately, obtains in some parts of the world, or they might be left free to receive such persons as might prefer their aid. But I would feel averse to the multiplication of societies, each working separately. A general controlling body is absolutely necessary, if for no other reason than to prevent people preying upon a number of societies in turn.

Amongst matters of detail would be the question of appointing paid agents to assist in finding situations, obtaining subscriptions, and in visiting where such was directed. I think it would be well not to seek the aid of the police in these things. The official members of the committee would be able to advise the members generally as to the conduct of the prisoners as the result of their personal

personal observation, and to particularise the more or less deserving and reliable. Opportunities might be afforded for occasional visits to prisoners, beginning at a period not later than a month prior to discharge, for preliminary visitation is essential to success. Wholesome communication might thus be opened up, under the auspices of the various committees, between the prisoners and their families, or their former employers, or any friends likely to assist them. Intermediation might very likely remove difficulties and prepare the return to former employment. Gratuities earned in gaol should not be paid as now by the authorities direct to the discharged prisoners, but should be payable through the society. An inducement to receive this money in instalments, rather than in a lump sum, would be afforded by the society undertaking to supplement such sums from their funds. The accumulated sum would then only be applied for the best interests of the individual, and would not be squandered or lost, as is now only too usually the case. It might also be possible for the committees, on the recommendation of the official members, to arrange for prisoners, prior to their discharge, to apply some portion of their earnings towards the support of their families, where the committees found such latter were deserving. This is allowed in the Swedish prisons, and is found to greatly influence reformation and moral progress afterwards. I can readily understand the refining and elevating tendency of such a system.

A debatable point in connection with obtaining employment is whether the employer should be informed or not that the applicant for work has been in prison. The attempt at secrecy now observed opens the door to much blackmailing, and many would-be converts must experience constant mental anxiety as to their secret becoming known. Probably no hard and fast rule should be laid down, and a well-organised Discharged Prisoners' Association might be left to deal with each case as seemed best. I am inclined to think that many employers would have their sympathies enlisted by being taken into confidence in such a matter, and that they would feel interested in helping to pull an unfortunate out of the mire. From a moral point of view, such a course seems preferable to employing deceit in obtaining employment for a man released from prison who would always be in dread that his situation would be lost directly his past became known. It is a very vexed problem. An association such as is here contemplated should, of course, amongst its functions, have the power to guarantee the fidelity of any of its *protégés*, and this would certainly be an aid to their permanent reformation.

The possibilities from a reformatory point of view opened up by the establishment of a comprehensive organisation, such as is suggested, are manifold. It would increase the wholesome visitation of gaols, and add to the usefulness of the officers, who would be encouraged to take more interest in their work. Certainly no harm, and probably very much good, would follow from a systematic development of the principle of affording aid to prisoners, not only *after* but for some little time *prior* to discharge.

13. Reformatories and the Prevention of Crime.

The Reformatory and Industrial Schools are in no way under the control of the penal administration, and it is generally considered proper that they should not be; but the nature of their work has a direct tendency to lessen the criminal population, and the diminution of crime is likely to receive more aid from their operations than from those of the Prisons Department.

It has been asked, where are the head springs of recidivism? It is probable that they will be largely found in our defective social conditions, which allow many children to grow up without proper care. Neglected youngsters, living amongst undesirable surroundings, at an imitative age acquire with fatal facility the vagrant habit which, by a natural evolution, ultimately becomes the criminal condition. Heredity may be a predisposing cause to some small extent, but it is not worth taking into consideration beside the evil producing effects of a vicious environment.

To do real good you cannot catch your criminal too young. The difficulties of reforming him become almost insurmountable if you wait until he is safely landed in prison. To check and stant the growth of the criminal population need much earlier treatment both remedial and preventive. In connection with the repression of crime, a more vigorous application of the principle that prevention is better than cure would bring about beneficial results.

For such reasons, it has been thought justifiable in these papers on prison matters to include some reference to reformatory organisations for the prevention and cure of incipient criminality. It is a matter fraught with the most tremendous interests to society, and it far outshadows in importance anything that can be considered in connection with purely penal matters. The business of the prison is to deter by punitive methods. To reform is only incidental; but the business of a reformatory is primarily to reform, and, to do this, it concerns itself principally with the individual, some amount of deterrence being also accomplished. That this is not at all an easy task is plainly shown by the constant state of unrest which everywhere besets child-saving organisations. Changes and experiments are continuous. No sooner has any particular plan reached maturity than demands, based on alleged defects more or less well founded, are advanced to alter or abolish it. And this uncertainty is the normal condition of all institutions. One of the best reputed and oldest established institutions is the Mettray Agricultural Colony founded by the late M. de Metz. Yet, a few years ago, when I visited it, it was in anything but good odour locally, in consequence of its then experiencing one of those periodical public attacks which assail all institutions in turn. The English Red Hill Reformatory, founded on somewhat similar lines to Mettray, I found slowly recovering from a like savage onslaught which undoubtedly caused the death of one of the principal officers, through sheer mental distress at cruelly unfounded accusations levelled against the establishment. The charges were proved to be utterly untrue. That the difficulty of hitting upon some scheme acceptable to all is not yet overcome, is plainly evidenced by the Report just issued of the Departmental Committee on Reformatory and Industrial Schools (England). The Committee were hopelessly divided on the main points referred to them, and their deliberations culminated in the issue of a number of separate reports differing from each other. I do not think the experiences of the Home Committees or of the Home schools, valuable as they may be in the direction of pointing out the avoidable and undesirable, are calculated to help us in establishing a system in New South Wales, where conditions of life are not altogether the same as in the mother country.

In England the local conditions favour independent institutions, each working distinct from the other. Out here the conditions are favourable to exactly the opposite plan. With great advantage to all concerned the various institutions could be built up in homogeneous association affording mutual help, one being able to do work which the other was not capable of performing, and so on. To construct such a system would necessarily lead to a greater outlay than is now permitted, but the saving in the long run would more than recoup the present expenditure. A few pounds spent in preventing the creation of a criminal is much cheaper than the cost of maintaining him after he has attained maturity.

The various corrective and benevolent institutions for juvenile offenders and neglected children in this Colony have unquestionably done good work; and the making of many a criminal has been prevented by their agency; but they do not accomplish enough, simply because their opportunities are so restricted, and also because it is not yet realised what immensely valuable work to the community they are capable of performing. For the last twenty years I have almost unceasingly been pointing out, as the result of practical experience, the necessity for making some alteration in existing procedure, and for extending the field of work. We have now several establishments under different Acts not connected with each other, although all doing the same kind of work.

This want of method entails loss of power, imperfect classification, and really hinders discipline and reform. Instead of working together as parts of a whole system, each one is independent of the other, and all sorts of inmates, as regards age, conviction, and character, are contained in each of the several establishments.

Under

Under a comprehensive scheme, scientifically adjusted, each institution would have its particular place in the general organisation, and thus would be brought about a more effective grading—in itself a very important factor in the work of reformation. My greatest difficulty on the "Sobraon" was the impossibility of dealing properly with returned apprentices and other incorrigibles. They only formed a small class, very few in number, but their presence constituted a disturbing element and set up a centre of badness to which all troubles were generally traced. Boys leaving the vessel apprenticed were perhaps returned, after two or three years' absence, with bad characters. While at situations they encountered contaminating influences which developed any latent badness they possessed, and going from bad to worse they had ultimately to be sent back to the ship, sturdy, defiant youths of 17 or so, who could not legally be discharged until the age of 18, and for whom there could be no hope of finding other situations, chiefly in view of the short unexpired term of detention. These overgrown vicious fellows should never have come back to the institution. Their presence was unfair to the other boys, and they set a bad example in more ways than one. What was wanted was another institution of a more penal nature in which such lads, and other inmates of pronounced evil instincts, could be segregated—in other words, to make a selection of the worst behaved, and to treat the habitual juvenile offender as a class apart.

It is quite true that theoretically the reformatory is presumed to be the place for the criminal juvenile, and the industrial school for the neglected and vagrant; but no effectual line of demarcation is carried out here or elsewhere, and there is little difference between the character of the inmates. Age largely guides the committal to an industrial school or to a reformatory in the mother country, the elder being marked out for the latter place; but in New South Wales children of tender years are sent to both places, and this is very undesirable. In connection with the "Sobraon" a rule exists that boys under 11 are, as soon as possible after arrival, transferred to the Boarding Out Department unless there are special reasons against that course. At the Carpenterian Reformatory, intended for the criminal class of boys, I could not help observing the other day several small fellows, apparently under 10 years of age, who might very well have been similarly dealt with.

What is wanted is a third establishment for the reception of the worst conducted, and for the three institutions to be worked under one control. To do this the present Acts need repealing in favour of a fresh enactment dealing with the various classes of juvenile offenders and vagrants in a comprehensive way. The present Reformatory Act is a most defective measure. It contains no provision for licensing or apprenticing; the procedure laid down for exacting contributions from neglectful parents is clumsy, and in other directions it is more or less inefficient. The Industrial Schools Act is also wanting in various ways, but its elasticity has enabled it to be successfully administered by regulation, so that its work of late years has been of a progressive nature, and of an extent never contemplated by its author.

The new Act, which would of course apply to girls as well as to boys, should not go too much into detail, but should only define broad workable provisions. Powers of discharge should be vested in the Minister, who should be enabled to transfer inmates from one establishment to another. This would enable a readjustment of the present institutional population to take place with great advantage to its discipline and well being. To guard against young children being detained in any of the gaols, power should be given to transfer any such to the schools. Provision should also be made for discharging to the Boarding Out Department (immediately after reception in the schools or at any future time), any inmates who might be deemed, after observation, fit subjects for the mild treatment of the boarding-out system. Certain cases might be advantageously dealt with by fining the neglectful or misconducting parent, and by suspending the sentence on the child. It is conceivable that such a course might awaken a proper feeling, and that the necessity for enforcing the suspended sentence might never arise. It is quite just too to institute a system of fining parents, as in most cases they are more to blame than are their children. Contributions at fair monthly rates towards the cost of maintenance should be fixed at time of commitment. This would be the best safeguard against abuse of the Act, and would generally awaken the parental responsibility. No fixed term should be prescribed but detention should be up to a certain age. Any youth under 17 should be liable to be dealt with, and legal control might be exercised if necessary up to 20. It would always be competent for the Minister to discharge on probation or absolutely, so that no possible hardship or injustice could arise.

Then, committals should simply be to the schools, leaving the Minister to determine which one. This would ensure a better system of classification than is possible by the present rough and ready methods. Committing magistrates are certainly not now in a position to perform the difficult and delicate task of defining the exact classification of the juvenile offenders who pass so hurriedly before them. The time allowed is not sufficient to admit of a correct estimate being arrived at, and the position is further complicated by the insufficient means at hand for identifying the youthful offender. It has happened that several prior appearances at various Courts have not been known when a particular case has been tried, and this has contributed to a wrong diagnosis. In any case, classification before committal must be often liable to error. It can only be properly arrived at after observation, assisted by whatever particulars can be gleaned of home life, antecedents, and companions.

To enable full enquiry to be made, there should be a general receiving depot in or near Sydney, to which place all young offenders—vagrants, beggars, and other kinds of neglected children—should be taken on apprehension. The first hearing should invariably be followed by a remand, for the purpose of ensuring the attendance of the parents or guardians, and of collecting full information. Upon committal, a preliminary period would be passed in the depot, until observation enabled the Minister, on the advice of his officer, to determine the ultimate destination, or to discharge on probation.

It would be desirable, also, that a special Court and a special magistrate should be appointed to deal with all juvenile delinquents or unfortunates in a somewhat more private way than now obtains. At present, the boys and girls are not edified or improved by contact with the persons with whom they unavoidably associate to a greater or lesser extent while awaiting trial in the Police Courts. The special magisterial system works well in South Australia, and also in some of the United States.

Then, after a certain period of reform had been obtained, provision should be made for licensing and apprenticing to various trades or useful occupations. In cases, the employers might even be the parents. Under the vast and admirable machinery of the Education Department, inspection of the apprentices and licenses could be carried out by the scholastic staff. One or two probation officers should certainly be appointed in the larger centres of population to specially clear the streets and lanes of children found wandering about under suspicious circumstances; to rescue children from brothels and other undesirable surroundings; to inquire into the home life of children charged; to collect contributions from parents, and so forth. It might also be found practicable to establish a Curfew hour, as is the case in some cities on the American Continent, a practice which greatly deters youngsters from being on the streets late at night unless under proper guardianship. And, certainly some power should be given to control the numerous body of juvenile hawkers who now infest the streets. Some of these, under pretence of selling newspapers or flowers, carry on a systematic career of wrong doing.

An Act such as is here suggested would accomplish much good, but it would need supplementing by a further measure aimed at the repression of truancy. Truants form a pretty numerous class, and very many of them ultimately join the ranks of juvenile offenders, thieves, and vagrants. My experience in connection with the "Vernon" and "Sobraon" was that most of the boys coming to those vessels had commenced a wayward career by first truancy; and, it must be remembered, that not a tithe of the whole number so offending were sent to the ships. In my last Annual Report it was stated: "After nearly a quarter of a century's experience, and after dealing with some thousands of boys, I am impressed with the fact that truancy is the most prolific cause of juvenile crime. Stamp this out and you will ultimately largely reduce crime and empty the gaols and reformatories."

Further

Further experience has only confirmed me in this opinion. The Chairman of the Industrial Schools Committee of the London School Board remarks in this connection: "After nearly thirty years of close acquaintance with the juvenile population of this great metropolis, I have no hesitation in saying that *truancy is to be credited with nearly the whole of our juvenile criminality*. The problem of the day, therefore, is to get all idle children out of the streets!" Lord Jersey, who has great knowledge of reformatory, truant, and industrial schools, in a recent letter to me, says: "I thoroughly agree with your view that truancy is the most prolific cause of juvenile crime. The truant is the idle boy; and never was there a truer saying than that about 'idle hands.' This truancy difficulty meets us constantly and it is very hard to meet it!"

Milder measures than the ordinary industrial school are needed for such cases, and the absence of something between the ordinary school and the semi-penal training ship is one of the faults of our present system. In England there is an excellent class of institution called the Day Industrial School, which deals in a kindly but unmistakably firm way, with boys (girls do not truant to any extent) who for any reason stop away from school. Under the Education Act of 1876, on proof being given that any child was an irregular attendant at school an order was issued compelling his parents to cause him to attend a day industrial school for a term of three years, which, however, was not to run after the age of 14. These schools are open from a very early hour for reception in order to enable parents going to their work to leave their children if convenient to do so; but obligatory attendance is not insisted on until 8 a.m. Then all must be present. The day is spent in school work, some domestic or industrial occupation, drill, and play. Meals of a simple nature are provided, and there is plenty of hot water and soap for those who need it. The plan is non-punitory, and every effort is made to brighten the surroundings. At 6 p.m. the children are free to go home. In describing the system for the information of the Minister of Public Instruction, I wrote: "By this means the boy is taught orderly, cleanly, and regular habits which he should carry into his home life, and he has experienced a large measure of wholesome restraint without having lost the freedom and advantages natural to companionship with his relations."

The parents, whose fault it generally is where children irregularly attend the ordinary school, are bound by law to ensure the attendance at the Day Industrial School under penalty, and they also have to contribute towards the cost of the maintenance. After a time the child is discharged on license, provided an undertaking is entered into by the parents that he attends a named ordinary school. Failure to do this leads to a resumption of the former compulsory conditions.

Some children, either through their own faults, but more generally through those of their parents, remain incorrigible. For them a severer form of treatment is called into requisition—the Truant School. Here, on a first appearance, they must undergo at least one month's treatment (it is usually two months). They remain wholly in the institution for that time, wear a distinctive dress, and are subjected to pretty rigorous discipline. Release on license to attend the ordinary school follows, but any neglect to do so leads to a second and more prolonged detention in the Truant School, a third appearance involving still longer confinement, and so on.

This system has produced good results, and nothing impressed me more when inspecting the Home establishments than these two species of schools dealing with truants. Some similar plan might with great advantage be adopted here. It would provide a middle course between letting a truant—very often a petty offender in other directions also—go unpunished, and taking him away from his parents for a long term of years. It is in not providing this medium that the existing Acts are so defective. There are, unfortunately, too many cases where it is the most merciful and the wisest thing for all concerned to remove children completely from their parents for a long time; but there are also many cases where absolute severance from home at what is the most interesting period of the children's lives is harsh and unnecessary. It is undoubtedly wrong to weaken the family tie excepting as a very last resource.

It might also be considered whether some other designation could not be found for the institutions. The reasons for change are perhaps more sentimental than practical, but people have come to look upon "Reformatory," and "Industrial School" as terms smacking strongly of the prison flavour. A change of name would do no harm. A selection might be made from "Training Schools," "Correctional Asylums," "Homes for Reform," "Training Homes," "Schools of Discipline," or other suitable appellations.

I would strongly urge legislation in the direction of establishing a scientific and comprehensive system such as is here suggested. There are no practical difficulties in the way of initiating or administering such a plan but what could readily be overcome by the sympathetic, skilled, and experienced ladies and gentlemen composing the Public Instruction Department, and the extra expense would be more than compensated by the ultimate saving to the penal establishments. The best way to empty the gaols and to diminish crime is to see that the children grow up trained to religious, moral, and industrious habits. It is because I am so much impressed with this that I have ventured to deal with matters which, strictly speaking, lay outside the bounds of the prison administration.

14. *The Causes and Prevention of Larrikinism.*

There would seem to be a periodicity in certain phases of crime which is amongst the most remarkable of criminal phenomena. Every now and again certain kinds of wrongdoing leap into prominence, and, after running a certain course, gradually die out or remain dormant for a time; but they invariably spring into prominence again just as everybody has ceased to trouble about them. Crimes of violence would seem to be particularly subject to this regular alternation; and nowhere does this appear more apparent than in the recurrence, at intervals, of that form of disorder which we have come to know by the name of "larrikinism."

Gangs of "hobbledehays" and young men form themselves into "pushes" under the leadership of such of their numbers as possess the stronger personality. Beginning with mild horse-play, they get emboldened by the toleration extended to their proceedings, and so at last receive an exaggerated impression of their power and immunity from punishment, which leads them to more objectionable actions. Then they proceed to "deal it out" to such persons who may have offended them, or, in their absence, to "likely marks" who may be found unprotectedly travelling within the bounds of their jurisdiction; for each "push" has its own territory, and it rarely interferes—excepting on state occasions—with another's province.

But this sort of annoyance is not by any means confined to Sydney. Many other large centres of population are troubled in the same way, although the nuisance is not called by the same name. The midland cities of England, Glasgow, and London all have their roughs, although of late years the operations of County Councils, and of an enlightened and progressive system of municipal government, have done much to ameliorate the evil by preventing overcrowding in dwellings, by providing wholesome forms of recreation, by the better lighting of streets, by furnishing increased police supervision, and by moving in other admirable and sensible directions.

Even now, however, it is safer to be in Sydney streets at night than in some parts of Glasgow and other big cities of the United Kingdom. In London it was quite a common thing for bands of roughs to periodically terrorise the poorer and most densely crowded parts of the metropolis. On such occasions shopkeepers put up their shutters and stopped business until the trouble was over. In the East End, Rosemary-lane, the Highway, and the scething courts and alleys (generally called "Rents") adjoining, were scenes of continual disorder and fighting during Saturdays and Sundays. On the latter day, bands of these East End larrikins, armed with sticks, would visit the central slums situated

situated about Drury Lane and Seven Dials, where pitched battles would take place with the "pushes" of that unsavoury neighbourhood. In the north, Hackney Marshes were unapproachable by respectable citizens on Sundays and holidays; and, if anything, the south part of the city had the most dangerous class of all, in the denizens of the slums bounding on the New Cut and the purlieus of Southwark.

A very great improvement has set in of late years, however, and the demolition of rookeries, and the recognition of the rights of the lower classes to be considered and treated more as human beings capable of moral and social advancement, have done much in the way of reform. The police arrangements, too, are of such a nature, and of such dimensions, as to be able to put a stop to the formation of bodies of ruffianly disposed persons. The metropolitan and city police alone, within a radius of 16 miles of St. Paul's Cathedral, number over 16,000 men. When it is considered that the whole of this vast country of New South Wales is dependant for law and order upon the exertions of less than 2,000 men, appreciation of the excellence of the Colony's police cannot be withheld.

One reason why larrikinism appears more rampant here than elsewhere is, probably, because it is given more publicity by the Press in this Colony. This has both a good effect and a bad effect. On the one hand, it causes vigorous action to be taken in attempting to bring about the suppression of a very great nuisance; while on the other, the circumstantial accounts of the doings of various "pushes," set forth in a readable way, rouses an emulative spirit amongst other bodies of the same nature.

No doubt, too, some exaggeration occurs when the assailed tell of their woes. Quarrels occur, and the defeated parties magnify the number of their assailants, while every street disturbance is put down to larrikinism.

Be this as it may, it is an undoubted fact that there is a great deal of undisciplined animalism on the part of certain of our young men. Between three and four years ago a wave of outrage of the kind before described broke over the city, and stern measures were brought into operation in the goal to make the punishment, of those committed for larrikin offences, of such a nature as to become reformatory to themselves and deterrent to others. The treatment was called seventh class, and it was applied to all young offenders under 25. Exercise and diet were both restricted, and gaol life was made very uncomfortable. Undoubtedly this treatment proved punitive and, to some extent, deterrent. Disturbances ceased to be so frequent, or, at all events, were not reported. But, notwithstanding that the prison treatment remains the same, of late there has been a recrudescence of larrikinism which plainly shows that the proper remedial measures have not yet been arrived at.

Recently, with the approval of the Minister for Justice, an experiment has been brought into operation at Darlinghurst Gaol, to try the effect of improving the physique of these youths, on the principle of "the sound body the sound mind" theory. The trial is only being carried out on a small scale, and it would be premature to express any decided opinion as to its effectiveness at the present and experimental stage. Those subjected to the new departure have two intervals of physical drill daily, one hour in the morning, and one hour in the afternoon. The exercises are the same as those which have been applied with so much success, from a reformatory point of view, to the lads and youths on the training ship "Sobraon." The movements are of a vigorous character, and they are at once work of a hard nature, when required, and exercise; in the latter respect superseding the old circumambulatory walk. This physical drill is followed by baths, and the bread and water diet is suspended. In addition, school, visitations from various officials, including the clergymen, the use of library books, and work of a useful nature are provided.

There is much reason for hoping that the new departure will be a success. Dr. Paton, the medical officer of the gaol, who supervises the whole thing, is a firm believer in its efficacy. He recently reported:—"The seventh-class prisoners who have been drilled have increased in height, in muscular development, and in chest measurement, with a corresponding decrease in their abdominal measurement. From a medical point of view, the men have undoubtedly improved. Whilst formerly they were listless and apathetic, with cold extremities and extremely irregular action of their bowels—they are now bright and alert. Their general health is improved; they contrast very favourably with the undrilled men, and can readily be picked out from them. Men discharged from prison in such condition have a good chance of obtaining employment, and of escaping from their former environments." (Signed) R. T. Paton, Government Medical Officer. Governor Herbert reports, too, favourably of the conduct of these prisoners. He says: "The physical effects of the drill are most markedly beneficial. With the physical improvement which is taking place it is hoped that an almost corresponding advance will take place morally." When the system has been a little longer on trial, the Minister will be in a position to decide as to the extent to which the new departure shall be applied.

Under the old existing plan of seventh-class treatment at Darlinghurst Gaol, the year 1896 saw 338 prisoners under 25 dealt with; of which number over 45 per cent. had been previously convicted. On one day in Darlinghurst there were found twenty of these young men, averaging 22 years of age, who had 180 convictions between them. The new system may, of course, not even accomplish as good results as these. It must surely be better, however, to turn these youngsters out to freedom, vigorous in health physically and, probably as a consequence, also morally well set up, than to discharge them in a more or less debilitated condition as the result of restricted food and insufficient exercise. As a rule, they have grown up amidst unwholesome surroundings, and are bodily, as well as morally, deficient. As the Rev. Dr. Morrison, a man of a life time's experience in prison work, says: "I am confirmed in the opinion that among the many causes which produce a criminal life the physical inferiority of the offender is one of the most important." There is undoubtedly much connection between the conditions of the mind and of the body, and the recognition of this was the reason for the experiment now being carried out at Darlinghurst.

But it is unfair to blame prison treatment if this class of discharged prisoner reverts to his old evil ways. The larrikin is very much the creature of environment. It is not of much use shutting him up in prison and applying curative treatment of a moral and physical nature, if he is exposed, on leaving gaol, to precisely the same conditions which led to his original fault. In such a case prison management cannot fairly be the subject of animadversion. The Penal Department can assist in repressing larrikinism by various deterrent and reformatory methods, but it cannot altogether prevent a recurrence, and it most certainly cannot stamp the thing out absolutely. Other things besides prisons are needed to work a cure.

Larrikinism is the product of defective social conditions. It is chiefly brought about by the neglect of parents to rear their children properly. Home life, in its proper sense, is not favourable to its growth; but when parental obligations are neglected, and boys are allowed to ripen into manhood, with no idea of self restraint, what wonder is there if the promptings of their undisciplined natures cause them to give way to excesses? The State has a right to demand from fathers and mothers that they should bring their children up properly and train them for the duties of citizenship. If they neglect this duty, then, in the interest of everybody, the State should use its best endeavours to act in *loco parentis* for its own protection.

In a previous paper an extension of the Reformatory and Industrial Schools Act has been urged in the interest of neglected children. Such an extension, carried out in a thorough comprehensive way, would most certainly dwarf and cripple the growth of larrikinism.

Amongst our other social obligations to the youth of the Colony, is the necessity for providing him with wholesome and manly recreation. In the daytime work, and occasionally cricket, football, and other athletic games occupy his attention, but during the long evening hours there is little for him

to do. Climatic conditions too are not favourable to his staying at home of nights, and the surroundings of his home life may not be attractive. He, therefore, has to go to the streets for such enjoyment as they may afford him; and, as no one—outside his own rank—takes any interest in him until he becomes a nuisance, he is cast upon his own resources. He loafs about in an aimless way with others similarly circumstanced, and it is in this way that "pushes" are formed.

The conversation indulged in by these uncared for youths is precisely of that nature which might be expected. They are at that dangerous age when character is being fixed, and when the primal passions are very strong. In such congregations there are always one or two leading spirits who can only maintain their following by an excess of daring. This generally takes the shape of brutality and obscenity of sometimes an incredible kind. A bad ideal is thus established, and the imitativeness of the younger members leads them to acquire depraved habits, which exert an influence—more or less pronounced—all their lives. These vicious attributes are further fostered and strengthened by a pernicious kind of literature, whose object would seem to be the glorification of the baser passions. It is a great pity that there is no way of checking the influx of these wretched books and papers, which, it is satisfactory to say, are not printed in this country. They are a great power for evil. Dancing halls, and the facilities for gaming, are also serious blots on our social system; and all such things make for badness in our young people.

It will readily be understood that a few months prison life is not likely to effect a cure for moral diseases of such a nature; especially when release from gaol means a resumption of the old conditions of life. And the punishment of one of their number is not likely to deter other members of the various gangs from misconduct to any extent, or for any length of time, for they never think that they personally will be caught. It is evident that the solution of this social problem is only to a very small degree a prison question.

To effect a cure—besides the remedial measures already proposed—bands of youths and young men should be prohibited gathering together in public places after nightfall. But wholesome alternatives should be provided in the shape of recreation halls, such as the Peoples' Palace in the Mile End Road, London, where are provided instruction and enjoyment in the shape of music, popular lectures, choral singing, gymnastics, debating classes, and so forth. Then, the parks might be utilised, after the style so prevalent on the European Continent, by brilliantly illuminating them at night (light is a great foe to wrong-doing), and providing music by competent bands. Small tables and refreshment kiosks might be allowed on the side walks, so that family parties might be able to enjoy tea, coffee, and other light refreshments at a very moderate charge. In German cities it is particularly gratifying to see family parties of the middle and artisan classes spending their evenings together amidst pleasant surroundings in the public gardens. Everybody feels it a duty to be cleanly and respectably attired; music of a high class is provided and appreciated; and the moral effect is decidedly good for the general community. Home ties are strengthened, the bread winner is kept out of the public-house, and larrikinism is unknown. There is no reason why, in our splendid night climate, more rational outdoor amusement should not be tried.

Then, a great effort should be made to establish volunteer corps after the English model. Each corps should possess its own drill hall, in which every opportunity would present itself for manly and healthful exercises, in the shape of assaults of arms, boxing, fencing, wrestling, and the more scientific "Kriegspiel," and other war and mental studies. There is certainly nothing like drill to inculcate habits of order, discipline, and self-respect; and it would not be a bad thing, either for the country or for our youth, if military service were made compulsory on all young men between certain ages. For self-restraint, self-discipline, and decent respect for authority are all very good things for growing lads to acquire.

In a recent lecture delivered at the Philosophical Institution, Edinburgh, Lord Wolseley said:—"I should very much like to see some compulsory system of universal physical training established by law for all the young men and women of the kingdom. We insist now upon a system of compulsory education for the mind. Why should it be more difficult or more despotic to insist upon a training of the body? The sound mind and the sound body go together." With these opinions I heartily concur. Such a system out here would greatly benefit our young people.

I believe a scheme such as is here suggested would go a long way towards stamping out larrikinism. But should such outbreaks occur, then the offenders might for first offences be fined. If the money were not immediately available, it might be paid by instalments deducted from future earnings, and the fines should go to the injured parties. Then, in addition, it should be obligatory for them to present themselves during a fixed period at some suitable place for evening drill. This would occupy a couple or more hours nightly, and would not only keep them out of mischief, but would benefit them physically and morally. After all these various stages of treatment there should only be a small residuum, and it might very well be left to be dealt with by penal methods.

In the suppression of larrikinism, too much has been left to the police and to the prisons; but other measures should be taken before the disease is allowed to attain full development. It is just precisely one of those things where prevention is better than cure. In most cases there is no real vice or harm about the majority of these lads. They have the spirits and virility natural to their age. Society should consider that it has some obligation to them, and should not neglect its duty. The only alternative to the prison that has yet been suggested is the lash. Neither one nor the other commends itself much to me, excepting as forming really last resorts. A sound thrashing—by which I do not mean the use of the cat-o'-nine-tails—judiciously applied might, for certain vicious acts, be beneficial. Certainly in such extreme cases it would not be harmful; but a general application of flogging would do more harm than good.

In the absence of any proposals to cope with larrikinism other than by penal remedies of a severe nature, I have ventured to make the foregoing suggestions with the desire to aid in the suppression of a very great social evil.

15. Conclusion.

There are several other matters in connection with prison subjects, which can only be briefly touched upon; and foremost amongst these is the "Mark System".

The New South Wales Mark System continues in operation unchanged from former years. It is not applied to females, and only to males having sentences exceeding twelve months. It consists in awarding "Orderly" or "Disorderly" marks; and "Industrious" or "Idle" marks. But the good marks do not convey much to the understanding of the prisoners, as the absence of a good mark would not lead to any consequences unless accompanied by a bad mark. It is the "Disorderly" or "Idle" mark that leads to results.

Possibly a change to the English convict system might be considered an improvement. That plan causes each convict's sentence to be represented by a certain number of marks calculated for each day of sentence. Industry is recorded by marks, and when by industry with good conduct, the number of marks which represent the sentence has been gained the convict is discharged on license. For steady hard labour and the full performance of the allotted task eight marks per day are awarded; seven for a lesser degree of industry, and six for a fair but moderate days work. A convict who by industry has earned eight marks every day, and has not forfeited any for misconduct, has obtained in every three days as many marks as represent four days of his sentence, and has gained the maximum remission of one-fourth thereof.

Some

Some such system might be introduced here, with modifications, so as to deal with old offenders who should experience more disabilities than first-convicted prisoners. Besides earning remission, a certain number of marks might confer various privileges such as letter writing or visits from friends, promotion to a higher class, and such other inducements to reformation and good conduct as might not be found incompatible with prison discipline and the deterrence of crime. This plan could be applied to females as well as to males; and perhaps might include all prisoners with sentences exceeding six months, so as to afford hope and encouragement to a class of comparatively short-sentenced prisoners who now have no chance, by industry or otherwise, of earning any remission.

Amongst other matters which need consideration when opportunity offers are:—the definition of the terms of confinement for life sentences; the treatment of debtors and unconvicted prisoners; and the more frequent inspection of prisons. The latter subject is a very important one. Under present conditions it is not possible to carry it out so effectually as is desirable. My visit to Wilcannia Gaol last year was the first ever paid by the Comptroller-General, and it involved altogether over 3,000 miles of travel. Other prisons require many hundreds of miles to be gone over in order to visit them.

With the ever increasing office work to attend to, it is not practicable to inspect all of these establishments excepting at long intervals. It is none the less undesirable to leave these places so much to themselves, and it would be well if arrangements could be made to admit of the Comptroller-General being less tied to his Sydney office than is the case at present.

In conclusion, I would beg leave to say that these papers were only written with a desire to present to the Minister of Justice the views of the present occupant of the Comptroller-Generalship. It is not anticipated that they will solve the large questions attached to successful penal administration. They are simply expressions of opinion, submitted with very great diffidence, in the earnest hope that perhaps in some slight way some of the suggestions offered may prove of public service.

FREDK. W. NEITENSTEIN,
Comptroller-General of Prisons.

MINUTES OF THE LATE UNDER SECRETARY OF JUSTICE, AND PRESENT UNDER SECRETARY OF JUSTICE, RESPECTING THE PRISON'S DEPARTMENT.)

Printed under No. 1 Report from Printing Committee, 4 May, 1897.

SCHEDULE.

No.	PAGE
1. The late Under Secretary of Justice (Mr. Arch. C. Fraser, J.P.) to the Honorable the Minister of Justice, respecting the administration of the Prisons Department of New South Wales, and the report of the Departmental Committee appointed to inquire into the administration of English Prisons (with minutes thereon). 5 June, 1896	1
2. The Under Secretary of Justice to the Honorable the Minister of Justice, in reply to the foregoing, 31 August, 1896, with minute thereon of the Minister of Justice, dated 22 September, 1896	20

No. 1.

The late Under Secretary of Justice to The Minister of Justice.

I AM not aware whether the Minister has read the report, dated 10th April, 1895, of a Departmental Committee appointed by the late Home Secretary to inquire into the administration of English prisons and the treatment of prisoners, a copy of which was recently received in this Department. I have carefully perused it, also the observations of the Prison Commissioners (forming the Board in charge of English prisons), upon the recommendation of the Committee, and a statement of the steps taken, up to the 27th February last, to carry out those recommendations, and I venture to bring them under the Minister's notice as being most interesting and instructive documents.

The names of the Committee speak for themselves. The inquiry occupied no less than eighty-five sittings, extending over a period of nearly nine months, during which time fifty-seven witnesses were examined, including Sir E. P. Du Cane, and his colleagues on the Prisons Board, also their Secretary, and many gaol officials and medical experts, and representatives of Government Departments, Prisoners' Aid Societies, Visiting Committees, Reformatory Schools, Trades Unions, and ex-prisoners. Amongst the witnesses examined many can be noticed whose positions naturally invest their evidence with great weight. In addition, a number of the principal Prisons, Refuges, and Homes were specially visited by members of the Committee; the Dutch and Belgian Prisons were personally inspected by Sir Algernon West, a member of the Committee; and numerous reports were obtained upon the working of the prison system in foreign countries (New York State, France, Prussia, Austria, Hungary, Belgium, Sweden, Norway, Switzerland, and Italy).

As a result of their investigations the Committee have made many suggestions, which, if carried out, would tend to meet complaints made against the prison system of England, through the public Press of that country, apparently similar to some of those which have, during the past two or three years been ventilated in the Press of this Colony.

The general tendency of the suggestions made by the Committee—of which many have been adopted and others are under consideration—is in the direction of ameliorating the conditions surrounding the treatment of prisoners; and whilst the Committee fully recognise the necessity of strict discipline being maintained, they forcibly indicate that such discipline should only be considered as a means to an end—the deterrence of crime and the reformation of the criminals—and I venture to submit that it is well worthy of consideration whether the somewhat mechanical system of administration which obtains in this Colony should not be improved by devoting more attention to the carrying out of the ultimate objects of imprisonment than the mere maintenance of discipline. It cannot be denied that such system naturally has a tendency to gather into its own hands control of every kind, and to shut out from the cognizance of the public and the Minister responsible to the country for proper prison administration much light which would otherwise be thrown upon the working of prisons by persons whose interest in prisoners is not mainly that involved in their disciplinary control. It may be appropriate here to mention that the General Orders, numbering about 300 (many of which directly refer to the treatment of prisoners, and are nearly as important as the Regulations), are issued solely on the authority of the Comptroller-General of Prisons, and they are not laid on the Table of the House, or in any way made public.

It must be realised that the Committee have enjoyed exceptional opportunities of making a thorough investigation into the whole question of prison administration, and that their conclusions have been arrived at only after a most exhaustive inquiry, and have received the most earnest consideration in England, and deserve the same in this Colony as far as they are applicable.

Before proceeding to specify in detail those recommendations of the Committee which appear to merit such consideration, it may not be out of place to point out that the Act under which the gaols of this Colony are administered was passed in 1840 (fifty-six years ago), just at the time when the transportation of convicts ceased, and no material alteration of the law has since been made, except that under the Criminal Law Amendment Act of 1883 provision was made for releasing prisoners on conditional licenses, or tickets-of-leave, and for the remission of sentences as an incentive to or reward for good conduct. It may also be brought to mind, as showing the trend of public thought upon the subject of the treatment of prisoners, that in the year 1894 the "First Offenders' Probation Act" was passed, under the provisions of which the Court may, on certain conditions, suspend the execution of a sentence, and the convicted person, if he complies with those conditions, can escape from the degrading and demoralising effects of prison treatment, and is afforded what is fairly considered to be a better chance of reforming than if he were confined in gaol. The Acts 11 Vic. No. 34, 16 Vic. No. 26, 16 Vic. No. 31, 17 Vic. No. 1, 37 Vic. No. 14, 48 Vic. No. 4, and 50 Vic. No. 9, which specifically refer to prison matters, only deal with details of a more or less important kind. It will be within the memory of the Minister that in 1878 a Royal Commission reported upon the general management and discipline of Berrima Gaol, but the investigations then made were mainly in reference to cases of alleged ill-treatment of prisoners by gaol officials.

If a retrospective glance is taken at the history of prison administration in England it will be noticed that during the past forty years there have been many inquiries into the system by Royal Commissions and Select and Departmental Committees, and several important changes have been made in regard to the treatment of prisoners.

The enactments passed during that time include the Prisons Act of 1865 and 1877, the Penal Servitude Acts of 1853, 1857, and 1864, the Prevention of Crimes Act of 1871, and the First Offenders' Probation Act of 1887.

Referring now to the Committee's report, it will be observed that when alluding to the change effected in England by the Prisons Act of 1877, under which the administration of the local prisons was transferred from the local authorities (the Justices assembled in Quarter Sessions) to a Board of Commissioners, the Committee express their views upon the results of such centralisation of authority in the following terms:—"The centralisation of authority has been a complete success in the direction of uniformity, discipline, and economy. On the other hand, it carried with it some inevitable disadvantages. The great, and, as we consider, the proved danger of this highly centralised system has been and is that while much attention has been given to organisation, finance, order, health of prisoners, and prison statistics, the prisoners have been treated too much as a hopeless or worthless element of the community, and the moral as well as the legal responsibility of the prison authorities has been held to cease when they pass outside the prison gates. The satisfactory sanitary conditions, the unbroken orderliness of prison life, economy, and high organisation, are held, and justly held, to prove good administration; but the moral condition in which a large number of prisoners leave the prison, and the serious number of recommissions have led us to think that there is ample cause for a searching inquiry into the main features of prison life."

The Committee also state that the absolute system of uniformity, carrying with it rigid discipline and perfect orderliness which was established by the Prison Commissioners, has with other causes led to the duties of the Visiting Justice being performed, as a general rule, in a perfunctory manner, although in some instances, owing to individual energy and capacity, the Visiting Committees have exercised a considerable and beneficial influence; and further, that *the best prisons under the former regime, while comparing satisfactorily in point of order and discipline with the prisons of to-day, were managed on lines in all probability more likely to produce a healthy moral effect of a permanent kind on the prisoners, but that in other cases the management was unsatisfactory.*

It appears to me that these views of the Commissioners might apply strongly to the somewhat analogous state of affairs existing in the prisons of this Colony, and that while under the prevailing system no effort is spared to secure strict compliance in every little detail with the prison regulations, sufficient consideration is not given to the more important question of reformation; further, that the enforcement of an iron-handed system of disciplinary control upon those who are not irreclaimable criminals must have a deteriorating effect unless softening influences are available.

The following remarks of the Committee upon the administration of English prisons, indicating certain changes that appear to be desirable, are worthy of special attention:—"We think that the system should be made more elastic—more capable of being adapted to the special cases of individual prisoners; that prison discipline and treatment should be more effectually designed to maintain, stimulate, or awaken the higher susceptibilities of prisoners, to develop their moral instincts, to train them in orderly and industrial habits, and whenever possible to turn them out of prison better men and women, both physically and morally, than when they came in"; and after referring to the fact that crime, its causes and treatment, has been the subject of much profound and scientific inquiry, and that many of the problems it presents are practically at the present time insoluble, the Committee add that "it would be a loss of time to search for a perfect system in learned but conflicting theories, when so much can be done by the recognition of the plain fact that the great majority of prisoners are ordinary men and women, amenable, more or less, to all those influences which affect persons outside."

To bring about such a change as is described in the foregoing remarks the Committee rely upon the administrative authority and the individual efforts of prison officials and others who might be called in to assist them, and they also consider it essential that there should be a proper classification of prisoners.

Referring to the administrative authority the Committee point out that while, for purposes of prison discipline, it is comparatively easy to mass prisoners together, to call each of them by a number, and by a cast-iron system to make them all go through the same tasks, observe the same hours, and lead the same lives, yet under this apparently orderly equality there exists the most striking inequalities, inasmuch as the hardened criminal bears the discipline without much trouble, whilst some are brutalised by it and others

others suffer acutely, and perhaps are permanently weakened by it in mind and body; and although it is impossible to administer to each prisoner a relatively exact amount of punishment, yet it is these very inequalities which often must produce that bitterness and recklessness which lead on to habitual crime.

The Committee, while recognising that inequalities must exist even under the best available system, consider that "the responsible authorities of a prison should have time at their command to observe prisoners individually, and sufficient discretionary power to give or obtain for an individual prisoner that guidance, advice, or help, which at such a crisis in his life may make a priceless change in his intentions or disposition, and that it should be the duty of the central executive to co-operate with the local officials in carrying out satisfactorily this most important part of their functions."

Upon the subject of individual effort by prison officials and others, the Committee make the following remarks:—"Without an excessive and impossible increase in the number of higher prison officials, adequate individual attention to prisoners could not be given; but the warders could be trained to do some of this work"

The assistance that would be afforded to the work of reformation, by a proper system of classifying prisoners, is described by the Committee in the following terms:—"The probabilities of success would be largely increased by a careful classification of prisoners. At present a large prison contains almost every type of offender. They are mixed up in hopeless confusion. . . . Old and young, good and bad, men convicted of atrocious crimes and those convicted of non-criminal civil offences, are all to be found in the same prison. The chaplain and the governor have to attune their minds as best they can to each individual case as they pass from cell to cell. Under these circumstances their best efforts can only reach a portion of the prisoners. A sound and wise system of classification would make it more possible to deal with prisoners collectively by reason of their circumstances being at any rate to some extent of a like nature. Efforts could then be concentrated on the individuals who were contumacious, and with better chances of ultimate success."

The attention of the Minister is specially invited to the investigations of the Committee into the question of Recidivism and the treatment of juvenile criminals, as showing how essential it is, if a decrease in the number of our criminals is aimed at, that in all gaols the question of reforming the prisoners should be paramount.

It will be noticed that the Committee obtained statistics showing the commitments of prisoners, and taking the years 1892-1893 they found that out of 100 who go to prison a first time thirty return again; of those convicted a second time, 48 per cent. return again; of those convicted a third time, 64 per cent.; of those convicted a fourth time, 71 per cent.; of those convicted a fifth time, 79 per cent.; and the old offender is constantly returning again. From the information placed before them the Committee found it difficult to avoid the belief that the proportion of reconversions during the last twenty years has increased.

In referring to the sources from which habitual criminals come, an allusion is made by the Committee to the conditions prevailing amongst the most wretched and criminal classes of society, where so many human waifs are born and educated in crime without a chance of their ever receiving any moral training; and it is stated that while numbers of lads and girls reared under those conditions have been permanently rescued by the Industrial and Reformatory Schools, still a large number of them find their way to prison, and are no doubt in most cases ultimately drawn into the class of habitual criminals. The Committee express their views upon this subject, in the following terms:—"It is certain that the age when the majority of habitual criminals are made lies between 16 and 21; and from the interesting figures supplied by Mr. Merrick, the Chaplain of Holloway Prison, the most fatal years are 17, 18, and 19. The proportion of juvenile criminals relatively to the population of the same age is shown by the return on page 29, of which the significance is apparent. This is corroborated by other experienced witnesses. It appears to us that the most determined effort should be made to lay hold of these incipient criminals, and to prevent them, by strong restraint and rational treatment, from recruiting the habitual class. It is remarkable that previous inquiries have almost altogether overlooked this all-important matter. The habitual criminals can only be effectually put down in one way, and that is by cutting off the supply. The improvement of general social conditions is the work of the community. But that some of its worst and most dangerous products, and that many of those who would lead honest lives under different surroundings, can be reclaimed by special and skilful prison treatment, is emphatically maintained by many of the most capable and experienced witnesses."

Some further remarks of the Committee may also be quoted here upon the general question of reforming prisoners, namely:—"There are few prisoners other than those who are in a hopeless state through physical or mental deficiencies who are irreclaimable. . . . Governors, chaplains, matrons, male and female warders, by personal influence have reclaimed individual prisoners. Given more time and opportunity for the work of reclamation, it is certain that in proportion there would be an increased measure of success. Beyond question, some prison officials with higher aptitude for the work succeed when others fail. It should be the object of the prison authorities through the prison staff and any suitable auxiliary effort that can be employed to humanise the prisoners, to prevent them from feeling that the State merely chains them for a certain period, and cares nothing about them beyond keeping them in safe custody and under iron discipline. The evidence in connection with reformatories bears directly on this matter. It is no doubt true that lads and girls are more amenable to influence to grown men and women. But it is only a question of degree. Mr. Trevarthen's evidence in connection with the Redhill Reformatory is to the effect that 91.7 per cent. of the inmates live satisfactory lives after leaving the reformatory. Observation of the individual cases is maintained for four years; and even allowing a considerable percentage for erroneous reports and for subsequent failure, the result is most satisfactory. The Salvation Army has organised Discharged Prisoners' Homes for men and women, and although it is too soon to express a decided opinion upon their working, yet it is quite certain that through these agencies a considerable number of apparently hopeless cases have been satisfactorily dealt with. The same can be said with regard to the Homes known as the Elizabeth Fry, the East Finchley Roman Catholic, and other institutions for discharged women prisoners. All those most praiseworthy efforts are attended by a certain measure of success. Experience at any rate shows, whether we look at the work done after prisoners have served their time, or at the individual efforts of prison officials while the prisoners are serving their time, that the present system, while admirable for coercion and repression, is excessively deficient on the reformatory side."

The

The foregoing remarks of the Committee might be considered advantageously in relation to the conditions surrounding our own prison administration. It seems only necessary to glance at the result achieved by the Elmira Reformatory, New York State, to be satisfied that much *might* be done to reclaim our criminals if a radical change were made in the manner of their treatment.

From the report of that Institution for the year 1893 these facts are gleaned. The Reformatory was established in 1876 for the reception of youthful male felons, to be committed there for the statutory term for their particular offence for the purpose of undergoing a process of training and reformation in place of the ordinary imprisonment. During the period 1876-1893, 6,551 inmates were received whose ages varied from 16 to 30 years, the average age being 21 years. The average number in confinement during 1893 was 1,470, and at the end of the year there were 1,378 inmates with an average period of detention of seventeen months.

The prisoners committed to the Reformatory are felons; 45 per cent. of them had previously been in contact with the restraining agencies of the law, 68 per cent. were illiterate, 75 per cent. were without regular occupation, and 92 per cent. were without the benefits of good home surroundings.

The moral inducement to reformation under the Elmira Reformatory system consist of (1) division into grades, with differing degrees of comfort and social standing; (2) a wage-earning mark system; (3) the personal influence of the Reformatory staff. Between 70 and 80 per cent. respond to the efforts made for their good, while for the remainder compulsion is found necessary, either by means of forfeiture of marks, degradation of rank, or personal chastisement.

During 1893 thirty-four different trades were taught, and it is claimed that 78 per cent. of the inmates discharged went straight to the trade learned in the Reformatory.

Prisoners can, at the discretion of the managers, be released on parole, to be brought back again if found to be drifting into crime, but the release is made absolute after six months satisfactory trial. The total number "paroled" during the period 1876-1893 was 3,723, of whom 259 were brought back, 110 were "paroled" a second time, and ten a third time. It is claimed that about probably 80 per cent. of the prisoners are reformed.

Although the prisoners seem to be treated generally in this Reformatory in a very humane manner, and are allowed many indulgences never experienced in prison life, it is specially worthy of note that the management appears to be conducted with sufficient rigour to produce a deterring effect upon the inmates. The report for 1893 shows that during that year, as there were about 400 prisoners associated in their rooms, in pairs, in order to avoid further overcrowding, it was found necessary to transfer 150 of the least promising to the State prisons, but that course was found to act as an incentive to troublesome conduct on the part of the inmates, in order to secure their transfer to the prison where they could earn an abatement of their sentence with less exertion on their part.

As to the expediency of introducing reformatory measures into gaols, the weight of evidence given before the Committee (excluding that of prison officials) is in favour of such being done, although notably Sir Godfrey Lushington, late Under Secretary of State, Home Department, considers it impracticable to do so, and it is to be borne in mind that the harm which results from pursuing an opposite course and using prisons for punitive and deterrent purposes only is incalculable, for such a system tends to embitter the minds of prisoners, and to harden them in crime.

In considering now the question of reforms, and the manner in which they might be introduced, it is necessary in the first instance to point out that the success of any improved system which might be adopted would depend to an almost vital extent upon the administrative authority and the prison staff.

The necessity for having a specially qualified staff to deal with prisoners is indicated by Sir Godfrey Lushington in his evidence, which was to the following effect:—"In working the prison machinery, too great importance, I think, cannot be attached to the personnel. It is not enough that a thing requiring to be done in the prison should be done. It must be done in a proper spirit. The duties of prison officers are often painful; often have to be performed under provocation; always on a helpless subject, and more or less without immediate control from a superior officer. Everything depends on the spirit, judgment, and behaviour of the officer. Any want in this respect must inevitably aggravate the lot of prisoners, and also lead to a multiplication of prison offences. Now, I believe this spirit must come primarily from above and spread downwards; I mean that everything should be done to secure the utmost influence of the Commissioners on the governors and the superior officers of the prison, and of the governors on the officers of the prison and all the warders As to the warders, I think that, before being definitely appointed, they should pass through a period of probation, during which they should be regularly trained at certain prisons set apart for this purpose. During this period they not only could obtain methodical instruction as to their duties, but would be tested to see whether they possessed the manner and temper requisite for the proper discharge of their duties."

The Committee were strongly impressed with the necessity of obtaining high-class warders, and of improving the general conditions governing their employment, and they recommended that certain prisons should be selected as training-schools for all ranks of the prison staff, and should be placed under the charge of the most experienced officers in the service.

The Prison Commissioners, in their observations on the Committee's report, fully concur in this recommendation, and the Secretary of State is in communication with the Treasury on the subject. The Committee, in dealing with the matter, make special reference to the systems of other countries in the following terms:—"The practice in other countries of training prison officials should be followed. For example, in France, nominations for the superior staff are given after examination. For the inferior staff there is a school in Paris and elementary schools in various establishments. In Germany warders have to pass through a probationary service of six months. In Austria the higher officials, after three months' service, have to appear before the Procurator-General for the oral examination, presenting at the same time a full report of their probationary work from the governor or manager of the prison in which they served. Warders have to undergo at least one year's probation, at the end of which they have to undergo an oral examination. In Belgium, prison governors, as a general rule, are selected from the administrative staff after a minimum service of ten years. They are examined in the theory of prison treatment, and in all subjects the knowledge of which is necessary to prison management. They have then to undergo at least a year's probation, either as assistant director in a central prison or as director in a prison of less importance, before their nomination is finally confirmed. The discipline officers serve six months as probationers. If they show the necessary qualifications they are subsequently appointed as third-class warders, but the appointment

appointment is not confirmed until after a further period of six months. In Sweden the warders are selected with great care, and preference is given to those who have learned a trade or show skill likely to be of use in directing the prison industries. The maximum age is 30 years. It has not been deemed necessary, or even advisable, to establish any special training school for warders. Experience has proved that efficiency in the management of prisoners is best acquired in the prisons themselves; but in order to raise the moral and intellectual standard of the men who are already in the Service, lectures and classes have been instituted in the central prisons. These are held by the Chaplain and schoolmasters, and the subjects taught or treated in lectures are such as may be of an educational or practical value to the warders in the discharge of their important duties. The central penal establishments have special libraries for the warders, and every year a great number of suitable and valuable books on religious subjects, temperance, history, biography, &c., are sent out to those libraries, as well as those intended for the use of prisoners."

It seems, therefore, essential, if a successful result is desired, to follow the introduction of reformatory measures, that the principal gaol authorities should display the combined qualities of humanity and firmness, and be in touch with, and exercise influence upon, the subordinate officers. None but specially-qualified warders should be employed, and arrangements might be made for their training, included in which should be a long probationary service in a specially-selected gaol.

This appears to have been the view of Parliament in passing section 39 of the Public Service Act of 1895, which provides that "no person shall be permanently appointed to any office in any penal establishment or gaol or reformatory school, probationary school, or receiving depôt, whether he be already an officer in the Public Service or not, unless and until he has served for twelve months on probation as an officer of some penal establishment or gaol or reformatory school, probationary school, or receiving depôt."

In regard to classifying prisoners the Committee have made the following recommendations:—

- (1.) That habitual criminals should be kept as a class apart from other prisoners, and the prison authorities should have discretionary power to distinguish between first offenders and habitual criminals caught for the first time.
- (2.) That juveniles, 17 years and under, should be specially treated in prisons, and should not be subjected to ordinary prison discipline and regulations.
- (3.) That the age of admission to reformatories should be raised from 16 to 18, and of detention to 21, and that by way of experiment a penal reformatory should be established to which offenders above 16 and under 23 could be committed by the Court or transferred from prisons by the Secretary of State, if satisfied that the treatment there would be more suitable.
- (4.) That prisoners sentenced primarily for drunkenness should be specially treated in prisons or parts of prisons set apart for them.
- (5.) That weak-minded prisoners should be concentrated, so far as is possible, in special prisons, and should be under special medical supervision.

With regard to "habitual criminals," the Committee have expressed their views in the following terms:—

"We recommend that this class of prisoners should be kept as a class apart from others. We think that they are a most undesirable element in a mixed prison population, and that they require and deserve special treatment. It is clear from the evidence that while the habitual prisoner is orderly and easily managed, the prison regime has little or no deterrent effect upon him unless he is subjected to long periods of imprisonment and penal servitude, which, however, frequently make him desperate and determined, when again at large, not to be taken alive. But there is evidently a large class of habitual criminals not of the desperate order, who live by robbery and thieving and petty larceny, who run the risk of comparatively short sentences with comparative indifference. . . . Upon the evidence given to us, we are strongly of the opinion that further corrective measures are desirable for these persons. When under sentence they complicate prison management; when at large they are responsible for the commission of the greater part of undetected crime; they are a nuisance to the community.

"To punish them for the particular offence in which they are detected is almost useless. Witnesses were almost unanimous in approving of some kind of cumulative sentence. The real offence is the wilful persistence in the deliberately acquired habit of crime. We venture to offer the opinion formed during this inquiry that a new form of sentence should be placed at the disposal of the Judges, by which these offenders might be segregated for long periods of detention, during which they would not be treated with the severity of first-class hard labour or penal servitude, but would be forced to work under less onerous conditions.

"We have not attempted a definition of 'habitual criminal.' This is a question which necessarily must be taken in conjunction with our suggestion that a new form of sentence should be set up. To lay it down that a prisoner should be regarded as an habitual criminal does not meet the case. Coiners, receivers, and other criminals by profession, frequently escape detection for long periods, and it would be necessary to bring this class into the category of habitual criminals. For this purpose it probably would be necessary to give a certain amount of discretion to the Court."

The Prison Commissioners concur with the recommendation of the Committee that habitual criminals should as a class be kept apart from other prisoners, and that the prison authorities should have discretionary power to distinguish between first offenders and habitual criminals who are caught for the first time, and they could see no difficulty in extending the Star Class system, which obtains in the convict prisons, to the local prisons, if applied only to prisoners serving a sentence of not less than three months.

If reference be made to the evidence of Dr. Brayn, Governor and Medical Officer of Woking Female Convict Prison, it will be found that the Star Class are kept separate from other prisoners. They are all first offenders; but before putting a prisoner into that class, exhaustive inquiries are made by the prison authorities through the police and private persons into his antecedents, and the result is sent up to the Director who decides, having regard to the general character of the prisoner, whether he is to be put into the Star Class or not. This system, which has hitherto been limited to penal servitude prisoners, has now been extended by the Commissioners, experimentally, under careful regulations, to local prisoners in the metropolis, and will, if successful, be adopted generally.

A definition of the Star Class is outlined in the memorandum of instructions issued by the Prison Commissioners respecting the separation of penal servitude prisoners not previously convicted. (*See Appendix "A"*).

Respecting "juveniles," the Committee report as follows:—"Several witnesses were in favour of the total discontinuance of committing this class of offenders to prison. We do not think this is practicable or desirable; for inquiry, or on arrest, children have to be detained. We strongly hold that it is most undesirable to commit them either to police cells or to workhouses. In many cases prisons are the only available places of detention. Further, we think that in the case of grave offences, for which reformatories are not available, that imprisonment is necessary. At the same time, children should be subjected to special treatment, and in every way be kept absolutely apart from other prisoners. . . . We think that the ordinary prison discipline and regulations should not be applied to juveniles, but that Governors and the Visiting Committees should be made responsible for their treatment, subject to general instructions which should be issued by the Secretary of State. The principle of these instructions should be that each child should be treated according to its own peculiarities of temperament; that the fact of imprisonment should be the main deterrent; and that treatment should be altogether of a reformatory character."

The Prison Commissioners, in their remarks respecting the treatment of juvenile prisoners, after referring to the practice hitherto prevailing in English prisons, give expression to the following opinion:—"We think, however, by way of emphasising still further what is now the rule and practice, it would be well that the special treatment of juvenile offenders should be made the subject of a rule of the Secretary of State. If still further segregation were considered desirable we see no difficulty in setting apart a portion of a prison in each district for the special use and treatment of juveniles, care being taken that they are not separated by too long a distance from their families and friends."

As a result of the recommendation made by the Committee on this subject, draft rules have been made and are under the consideration of the Secretary of State, to provide that "juveniles" shall be specially treated in prisons, and shall not be subjected to ordinary prison discipline and regulations.

Concerning "young prisoners," who as a class are most suitable for reformatory treatment, the Committee make the following statement:—"After 30 a very distinct decrease in the number of prisoners proportionately to the population of the same age sets in. Doubtless this decrease is due to various causes; but the fact that it occurs suggests that this tendency towards the abandonment of criminal practices may be strengthened by developing the reformatory side of prison life."

"Mr. Merrick and others hold that the younger prisoners are quite as difficult to deal with as the older; but assuming that this is so, the importance of saving them from a life of crime is not diminished, and it is all the more necessary to make the most strenuous efforts to reclaim them. As we have already said, the years 17, 18, and 19, appears to be the most fatal in the formation of lasting criminal habits. This fact itself denotes a degree of plasticity which might be made use of in the right direction. Even a moderate percentage of success would justify much effort and expense devoted to an improvement of the system."

After recommending the establishment of a penal reformatory, the Committee continue thus:—"We look upon this plan, in conjunction with the raising of the age of admission to reformatories, as the best proposal that is open to us for the rescue of young offenders. Under the present system, numbers of them come out of prison in a condition as bad, or worse, than that in which they came. They go out with a prison taint on them. The available prison staff and the rigid system of prison discipline, without any fault on the part of the officials, preclude the possibility of bringing to bear on the prison population the moral suasion and the healthy practical advice which we think could be exercised by a trained and selected staff in the penal reformatory. The inmates upon discharge would be provided for and looked after as much as in the case of the lads and girls who leave reformatories; and if they relapse into crime it would be of their own deliberate choice, in spite of every effort to save them, and they would subsequently be exposed to the far sterner penalties of prison life."

In regard to this matter the Prison Commissioners make the following remarks:—"We should be in hearty accordance with any feasible plan, the object of which was, by a distinctive method of treatment, to make an impression on that army of offenders—very numerous, as the report shows—who, by reason of their age, are excluded from reformatory treatment, and, therefore, in the absence of any intermediate classification, fall of necessity in the ranks of adult criminality. The proposal to extend the age of admission to a reformatory school to 18, and of discharge to 21, as well as the proposal to establish a penal reformatory up to the age of 23, are questions which will naturally engage the attention of the Committee recently appointed to investigate the reformatory system of this country. It would be premature to anticipate any conclusion at which they may arrive. . . . The attempt to apply reformatory treatment to adult criminals is being tried to a very large extent in the American State Reformatories, and with success, if we may judge by the enthusiasm with which its results were described at the recent Paris Congress; but it is applied to first offenders only (?), and it does not appear from the report under consideration whether it is intended that first offenders only shall go to the penal reformatory, or whether it is meant that all criminals under a certain age shall, in virtue of the 'plasticity' of their nature, be made the subject of experiment. We infer that the latter is meant, as the possibility of closing one or two prisons is mentioned."

With reference to the recommendation of the Committee respecting the separate treatment of "prisoners sentenced primarily for drunkenness," the Prison Commissioners state that until the policy of the Government is known on the general question of the treatment of habitual drunkards it would be premature to make definite arrangements for the segregation of this class of offenders.

With regard to the recommendation respecting the treatment of "weak-minded prisoners," the Prison Commissioners obtained a report from Dr. Gover, Medical Inspector of Prisons, in which he points out the difficulty of defining what is meant by the term "weak-minded," and expresses the opinion that the mentally defective are generally well cared for, and are the subjects of special attention on the part of the medical officers, who have unlimited powers of issuing orders as to the treatment of any prisoner who appears by reason of any defect, whether mental or physical, to be unfit for ordinary labour or discipline. Dr. Gover does not apparently consider the change suggested by the Committee either necessary or desirable, and he states that what appears to him of much greater importance than either concentration or distribution is that medical officers should deal with such cases individually, and make such

such recommendations or give such orders as may be indicated by the necessities of each case before them. He suggests that every good and useful purpose would be served by issuing a circular to medical officers, desiring them to pay special attention to any prisoners who may appear to be in any degree mentally defective, with the object of preventing them from undergoing any unnecessary or avoidable hardships, and, if possible, of effecting some improvement in their mental condition. With Dr. Gover's report the Commissioners agree.

In the prisons of this Colony, convicted prisoners are classified as follows :—

- (1.) Prisoners under sentence to penal servitude or to imprisonment with hard labour for five years and upwards.
- (2.) Prisoners convicted of felony or misdemeanour and sentenced for lesser periods than five years, either to penal servitude or to imprisonment with hard labour.
- (3.) Prisoners under sentence of imprisonment only, and persons detained during Her Majesty's pleasure.
- (4.) Prisoners under 25 years of age, undergoing sentences not exceeding twelve months' imprisonment, with or without hard labour.

A glance at the foregoing will show that the method of classifying prisoners, more especially in relation to the question of reformatory influences, is crude and imperfect.

It is admittedly difficult, if not impossible, to classify prisoners by any rule of thumb which would be perfectly satisfactory, as it seems essential, if the reforming influences are to be worked with the most beneficial effect, that in classifying them great attention should be given to (1) the nature of the offence, (2) the character, training, and history of the prisoner, and the practical probability of his reforming.

It seems to me that, viewing the recommendations of the Committee, and the evidence given before them, the following classification might broadly indicate the lines upon which a better system than the present could be fairly based :—

- (1.) Habitual criminals convicted of the more serious offences.
- (2.) Habitual criminals convicted of less serious offences.
- (3.) Prisoners (other than habitual criminals) convicted of the more serious offences.
- (4.) Prisoners (other than habitual criminals) convicted of less serious offences.
- (5.) Prisoners (16 years and up to 25 years of age) serving sentences of three years and under.
- (6.) Prisoners under 16 years of age.
- (7.) Prisoners convicted of drunkenness or offences under the Vagrancy Act, &c.
- (8.) Prisoners of weak intellect, and prisoners under sentence of imprisonment only, or detained during Her Majesty's pleasure.

It would be necessary, in carrying out a system of classification on the lines suggested, that a large discretionary power should be given to the prison authorities, and perhaps to the sentencing Judge (although experience as to the want of uniformity in Judges' views respecting sentences might suggest an objection to such a course being adopted), in determining a class in which a prisoner should serve, so as to ensure, as far as possible, that no hard and fast line should be drawn. The case of each prisoner ought to be dealt with on its merits, and classifications should follow accordingly, always keeping in view the future well-being of the prisoner and the class of treatment most likely to produce a beneficial effect upon him.

The opinion of the Committee would appear, on the face of it, to be entitled to great weight, that "habitual criminals" should be kept as a class entirely apart from all other prisoners, and it might be practicable in this Colony to confine such prisoners in a gaol specially set apart for them. So also, as far as consistent with the opportunities available, should "young offenders" (16 to 25) be confined in a separate gaol, where they could be specially treated upon reformatory principles.

As for "juveniles" (under 16), they ought to be kept apart from all prisoners, and their punishment should consist only of detention and enforced learning and obedience.

I propose now to point out where other important changes might be made in what is technically called by the Committee the "treatment of prisoners."

- (1.) *Separate treatment.*—All prisoners of the first-class and those prisoners of the second class who are serving sentences of not less than three years, are placed in "separate treatment" during the first nine months of their sentences.

It is interesting at this stage to note the origin of the system of placing convicts in separate treatment. According to the Committee, the object of that treatment has been long lost sight of; but this is not admitted by the Prison Commissioners. The Committee report so fully upon this matter that I cannot do better than quote the following extracts :—"It was originated in 1842 by Sir James Graham, then Home Secretary, and we have printed in *Appendix IX* a letter written to the Commissioners of Pentonville Prison, in which he fully explains the purpose of the experiment he was initiating. We shall show how complete a change in the apparent object of the practice has since occurred. Pentonville Prison was designed on new and approved ideas for the reception of convicts sentenced to transportation, and was to be restricted generally to those who were convicted of their first offence, and whose age was between 18 and 35. What Parkhurst was for juvenile offenders, Pentonville was to be for adults—a prison of instruction and probation rather than a gaol of oppressive punishment. It was the portal to the penal Colony. The convict was to undergo eighteen months solitary imprisonment, but he was to be freely visited by chaplain and prison officials; he was to be trained in a productive industry; he was to be subjected to a progressive system of education on the class system; lectures were to be given to him in the prison chapel; he was to be kept in a state of cheerfulness; hope, energy, resolution, and virtue were to be imparted to him; and he was to be trained to be fully competent to earn his own way and become a respectable member in the penal settlements. If, during the eighteen months, he behaved well, he would at once receive a ticket-of-leave on arriving in Van Dieman's Land. The whole letter is well worth reading, and it shows that, whatever may be said of the faults of the prison system from time to time, the then Home Secretary was as keenly anxious to devise the best methods of treatment in the interests of prisoners themselves as the most ardent prison reformer of the present day. Sir James Graham's plan was worked apparently

apparently with great success, so far as home treatment was concerned. We cannot follow out its permanent effect on the convicts in the penal settlements. In the report of the Commissioners for Pentonville, in 1844, the arrangements are thus described:—"The size, arrangements, and ventilation of the cell in which the prisoner is placed are favourable to the instruction of useful branches of labour, and such as greatly contribute to the maintenance of the prisoners health and cheerfulness. He is at all times supplied with the means of employment, and when not required to be at work he has sources of improvement in the books, slate, and materials for writing with which the cell is furnished. He is allowed daily exercise in the open air; he attends chapel daily and the school classes in chapel on alternate days; and he can, at any hour of the day or night, by means of a bell, obtain in a few minutes the attendance of an officer. The effects produced on the minds and conduct of the prisoners by this system of separate confinement has been highly satisfactory. The prisoner, on entering his cell, has been strongly impressed with a due sense of his penal condition, especially during the first few months of his imprisonment; but the deterring effects are controlled and alleviated by the other parts of the system which we have already described, and more especially by constant labour, the frequent visits of the prison officers and trade instructors, the consciousness that he can at any time insure the attendance of an officer, daily exercise in the open air, attendance at chapel and school, and the means of instruction and relaxation placed within his reach."

"Three classes were organised, according to good, indifferent, or bad behaviour:—"A strong desire is evinced by the prisoners to be placed in the first class, and it has been deemed desirable that the best-conducted of them should, at stated periods, receive some assurance that they are likely to attain this class. For this purpose, at the end of six months of good conduct, a red stripe is placed on the sleeve of the prisoner's jacket, and a second stripe is added at the end of twelve months if his conduct has continued to be satisfactory. It is a gratifying proof of their improvement that of 425 prisoners who have been six months or upwards in confinement there are but seven who have not received this creditable distinction."

"The general results were thus described:—"Most satisfactory proofs of these beneficial impressions have been manifested in the great improvement which has taken place in the moral condition and conduct of the prisoners within a short period of their reception. In the course of our visits to the cells we have had the gratification of witnessing, to a great extent, their just appreciation of, and the deep interest which they take in, the moral and religious instruction which is imparted to them; the removal of the debasing effects produced on their minds by their former criminal pursuits; their progress in self-improvement; their cheerful obedience to the prison rules; their acquirements in the trades which have been allotted to them; and their gratitude for the treatment they have received, under a discipline which combines instruction and reform."

"In 1848 it was determined that, eighteen months being too long a period for isolated confinement, a system should be introduced based on a period of separate confinement, followed by a term of associated labour, with a maximum of twelve months. This was reduced by Lord Palmerston in 1853 to nine months. The original intention of Sir J. Graham, which was that this period should be primarily of a reformatory character, appears, fifteen years later, to have been lost sight of. . . . It would appear from Sir J. Jebbs' evidence (before the Penal Servitude Acts Commission of 1863) that the main object of separate confinement had come to be deterrence. 'An educated prisoner,' he said, 'would much prefer separate confinement instead of being driven to associate with people of bad character and difference in social position. With burglars and reckless bad characters, I think that separate confinement is dreaded more than any other kind of discipline.'"

"It was given in evidence that owing to the demand for labour on public works, the nine months had fallen to an average of little more than seven. The Commissioners insisted on the necessity for enforcing the full nine months, and they proceed to say:—"We think, too, that though separate confinement, even under the present system, is, as has been said, extremely distasteful to convicts, this wholesome effect on their minds might be increased. It has been already mentioned that in Ireland the diet is lower during the first four months, and that no work is given to the prisoners for the first three months, except such as is of a simple and monotonous character, in which they require little or no instruction. This practice has been adopted because it has been found that by far the greater number of convicts have no knowledge of any trade, and when first taught one must necessarily be constantly visited by their instructor, whose visits tend to mitigate the irksomeness of separate confinement. There appears to us to be much force in the reasons which induced the directors of the Irish convict prisons to adopt these means for rendering separate imprisonment more formidable, and we therefore recommend that attempts should be made, with due caution, to give a more deterrent character to separate imprisonment in the English prisons."

"This passage from their report shows that Sir J. Graham's intention and scheme has perished, and that the period of imprisonment originally designed to train and improve prisoners for a good and useful life was now looked upon and intended to be the most formidable and coercive part of the punishment of penal servitude. In effect this is the purpose which it must be regarded as now designed to serve. . . . We think that it cannot be denied that cases occur in which a nervous condition, agitated by remorse and by a long continuance of the separate system, may be injuriously affected by it."

"From the evidence before us we have no reason to believe that such cases are of other than exceptional occurrence. We think it is worth considering whether the severity of the system might not be mitigated by a substantial reduction in the period of separation and by the wise and carefully-guarded introduction of such reformatory influences as were brought to bear on convicts at Pentonville, when first established, and of such philanthropic agencies as appear to be engaged in behalf of separate convicts in the Belgian prisons."

Under "separate treatment" as carried out in this Colony each prisoner is confined in a separate cell; he is not allowed to hold any communication, except with prison officers, and conversation with them (except in so far as may be absolutely necessary) is not permitted. Until recently he was not allowed to receive or send letters, but is now permitted to write and receive a letter at periods of two months and six months after conviction. He is bound to observe strict silence, and must not read aloud, sing, whistle, dance, or make any noise in his cell or in the exercise yard, corridor, or chapel. He is given such suitable work as may be found for him, and is allowed during the first six months, one hour each day for exercise, and thereafter two hours daily. If coming within the regulations as to eligibility for school he is allowed one hour daily for performing tasks set by the schoolmaster, and one hour for reading

reading such instructive and reforming books as may be selected for him by the Chaplain, and he is at all times provided with a Bible. It is the opinion of many (and the conclusion is one that may be arrived at with reason) that such treatment, which is so different to that outlined by Sir. J. Graham, does in some instances have an injurious effect upon the prisoner's mind. If the reformation of a prisoner is desired it would appear advisable (especially in the case of one predisposed to crime) that strong efforts should be made to divert his mind from his former life and associations, and to open up for him fresh channels of thought.

Harsh treatment and long-continued punishments will generally be found to produce in a prisoner a sense of injustice and a feeling of bitter resentment, which seriously impair the chances of his reformation.

It will be seen that the Prison Commissioners do not agree to any reduction of the time to be served in separate confinement (nine months), except in the case of recommitted license holders whose period of such treatment is now limited to three months.

The question is one, however, which appears to demand some further inquiry and consideration, and in the goals of this Colony it might, perhaps, be found desirable either to make a considerable reduction in the term of such treatment, or to improve in a rational manner the conditions surrounding it, so as to produce a more healthy moral effect upon the prisoners.

(2.) *Labour.*

With regard to the work upon which prisoners are employed, the Committee recommended that productive prison industries should be increased as much as possible, especially as regards gardening, farming, and land reclamation, and that unproductive labour should be abolished wherever possible; also that association for productive work and technical instruction should be extended gradually and with due caution throughout the prisons. They fully realise the importance of industrial labour as a reforming agency, and were duly impressed with the undesirableness of giving prisoners unproductive labour.

The Committee thus express their views upon oakum-picking:—"Because we attach so much value to training we think that oakum-picking should be discontinued as much as possible, except for penal purposes. It is disliked by most prisoners, and is of a mechanical nature which involves no thought or mental activity, and it cannot be said to discipline prisoners into orderly and systematic habits of labour. An old offender will get through his oakum task rapidly, and then do nothing. A new hand finds it difficult, and probably looks upon it as degrading and irritating as well," and in suggesting the employment of prisoners on associated labour of a productive kind they make the following remarks:—"We do not agree with the view that separate confinement is desirable on the ground that it enables the prisoner to meditate on his misdeeds. We are, however, disposed to agree that the separate system, as a general principle, is the right policy. The separate system rests on two considerations only: It is a deterrent, and it is a necessary safeguard against contamination. But we are not of the opinion that association for industrial labour under proper conditions is productive of harm. On the contrary, we believe that the advantages largely outweigh the disadvantages. We agree, however, that careful supervision is essential to all forms of prison association. Subject to this condition, and to a proper system of classification, Colonel Garsia, a prison official of great experience, stated in his evidence that there was no danger whatever in associated work. Dangerous, disorderly, and depraved prisoners should be kept at all times, so far as is possible, apart from others. The fears expressed by some witnesses that freer association might lead to combinations and risings, would, under such precautions, be groundless."

"The association we suggest is all in the direction of making it the prisoners' interest to maintain order; and we have before us the fact that association for work on a large scale has always been the practice at the convict prisons. Without being productive of dangerous outbreaks by prisoners, as a class, more desperate than those in local prisons, we do not consider the suggested danger to be of practical importance. We think that this limited form of association is desirable for several reasons:—(1.) It is a welcome relief to most prisoners from the dull and weary monotony of the constant isolation which forces men back on themselves, and in many cases leads to moral and physical deterioration. (2.) It can be made in the nature of a privilege liable to suspension, and would be therefore a satisfactory addition to the best kind of available punishment. (3.) It materially lessens the difficulty of providing and organising industrial labour in prisons. Prisoners can be taught trades in classes, and they can then work in association under proper and economical supervision in regular workshops or halls provided for the purpose. (4.) It is more healthy. It is desirable that cells should be untenanted for some hours in the day, and in any case it is better that work which produces dust should not be carried on in the cells. In recommending a wider adoption of associated work, we must admit that several competent witnesses expressed disapproval of the principle. Sir E. F. Du Cane laid great stress on the argument that the experience of every country has led to the cellular treatment as the best form of punishment and imprisonment. But upon cross-examination it did not appear that they could sustain their objection to associated labour properly supervised, and they seemed to us to have formed their opinions rather because separation has been the accepted rule of the prison system than on any experience of failure of the associated system. For these reasons we have no hesitation in recommending that the practice of association for industrial work should, with due caution, be extended gradually throughout the prisons. Satisfactory results must largely depend on the discretion of the prison authorities in making selections of prisoners for associated work; and in any case they would be materially assisted by a careful classification."

The Committee, in considering the different kinds of labour upon which the prisoners might be suitably employed, make special reference to the mat-making industry (which is of particular significance in view of the agitation some short time ago against the competition of prison labour) in the following terms:—"According to the evidence, difficulty of a greater or less extent, is experienced almost in every prison in getting a sufficiency of suitable work for the male prisoners. . . . This difficulty has been largely added to by outside agitation against competition of prisoners with free labour. In consequence of the agitation, and of proceedings in the House of Commons, some suitable industries, and in particular, mat-making, have been to a large extent given up. From the prison point of view, every witness, without exception, who was questioned on the subject, agreed that this is a great misfortune. We communicated with Mr. S. Woods, the General Secretary of the Parliamentary Committee of the Trades Union

Union Congress, and by his suggestion we examined Mr. J. J. Rudge and Mr. J. H. Walker as representing the views of the majority of trades unions. Those gentlemen gave very fair and impartial evidence. They admitted that industrial labour was morally and physically beneficial to the prisoners, and agreed that it ought to be found. They urged that direct competition with outside labour should not be allowed at cutting prices. Taking their evidence as a whole, we gather that they approve of industrial training of prisoners: and bearing in mind that the products of prison labour go to reduce the cost of prisons, they have no objection to the sale of prison goods, provided that—(a) they are not sold below the market price for the district, or the standard price elsewhere; (b) every consideration is shown to the special circumstances of particular industries outside to avoid all undue interference with the wages and employment of free labour. With these general views we agree. . . . We recognise that appreciable competition may arise with respect to certain industries, as, for instance, mat-making, which appears usually to have produced the agitation against prison labour. The extent of competition in a particular trade depends obviously upon its relative proportion within the prisons and outside. Mat-making cannot be called one of the large industries of the country; but at the same time up to 1890 it was one of the chief employments in the prisons. In 1877-78 the number of prison mat-makers actually exceeded those outside by 23·87 per cent. In a case like this we think that the industry, on account of its special value as a prison occupation, ought not to be given up, but at the same time great care should be taken to avoid as far as possible any direct or material interference with the local markets of the home manufacture. Every witness bore emphatic testimony to the advantages of mat-making labour in prisons, and expressed the strongest regret at its withdrawal. It can be learnt in a few days, even by unskilled men. It is specially adapted for cellular work, and for the weak-minded and epileptic class of prisoners."

In regard to the extension and further development of prison industries, the Committee expressed themselves in the following terms:—"We regret very much that there is not more opportunity for work in gardens or on the land. It is agreed by all medical experts and prison officials that no kind of employment is more useful. It is healthy, productive, varied, and of a more or less interesting character. Plain hard digging may under suitable conditions be found a valuable and wholesome substitute for hard labour, while the lighter forms of field and garden work would be adapted for other cases. . . ."

With regard to the Committee's recommendation that productive prison industries should be increased as much as possible, especially gardening, farming, and land reclamation, it will be seen from the observation of the Prison Commissioners that in the local prisons of England, of the 70 acres which could possibly be used for cultivation, 59 acres are actually cultivated; and in the convict prisons, of the 1,018 acres capable of cultivation, 973 are cultivated, nearly the whole of the remaining 45 acres being at Parkhurst prison, where it is stated the great majority of prisoners are physically incapable of doing labourers' work. At Dartmoor, 959 acres are under reclamation, and are to be brought into cultivation in due course.

The Prison Commissioners have, however, since instructed the Governors of the gaols to take all available land into cultivation, which is being done, and Major Griffiths, a Prison Inspector, who has made a special study of the subject, has visited all the prisons with the special object of ascertaining whether what is known as the Cottonian system could not be advantageously introduced, *i.e.*, the digging and redigging of land at considerable depth with a view to the higher productivity of the soil.

The Committee continue thus:—"If prison labour is to be developed it will be necessary to make better provision for the supply of skilled warders as teachers, and for the direct superintendence of industries in each prison. There are but a handful of artizan warders now in the service who draw pay as such, and warders who supervise or teach a trade have to pick it up themselves as best they can, and no extra pay is allowed them. To secure skilled teachers we think that a higher inducement should be offered than the ordinary pay of a warder, and we also think that warders who acquire sufficient knowledge to supervise anything in the nature of skilled work should receive an extra allowance. We think that the better training of prisoners in industrial work would go far to recoup the increased charge."

The Prison Commissioners appear to fully realise the importance of extending productive prison industries, but state that they are not yet in a position to submit a detailed report on the steps which they propose to take to carry out the recommendations of the Committee. They express the belief, however, that there is a large field for useful reform in the organisation of prison industry.

The recommendation of the Committee that oakum-picking should as far as possible be given up is one which could apparently be carried out to some extent in the gaols of this Colony, and greater ingenuity might be shown in discovering the means of giving suitable employment to prisoners. In England a new form of machine for grinding corn by hand is now being devised.

It is to be regretted that many of the gaols will hardly permit of the prisoners being employed to an appreciable extent on outside labour such as farming or gardening, but the matter is one which might be kept in view, and where practicable, prisoners should be given this kind of work to do. As opportunity offers, vacant land adjoining gaol premises might be acquired, in the improvement and cultivation of which most suitable employment could be found for prisoners.

Upon the subject of paying gratuities to prisoners, the Committee express the opinion that a prisoner should be able to earn something continuously during his imprisonment, and the Prison Commissioners are also in favour of allowing all prisoners, both local and convict, to earn gratuities throughout their sentences. A scheme for carrying out the recommendation of the Committee, and allowing prisoners to earn a sum of money as a reward for special industry, in addition to the gratuity provided for under the progressive stage system, is now under the consideration of the Prison Commissioners.

The gaol regulations of this Colony do not clearly describe the method under which gratuities to prisoners are distributed, although I am aware that gratuities are paid. It seems to me that the time and manner of payment of any money so paid should be a matter in the discretion of the prison authorities. If deemed expedient, a proportion of the amount might be paid during the term of imprisonment (with proper safeguards) to those dependent on the prisoner for support, and the payment of the balance to the prisoner himself, could be made in such a manner, and at such time or times as appeared most suitable in each individual case. Under an improved system of classifying prisoners the arrangement of prison labour would, no doubt, be considerably facilitated. The whole question of the management and direction of work in the gaols of this Colony is one that might with advantage be thoroughly inquired into.

3. *Diet.*

In considering the question of diet, it seems a reasonable and sound conclusion to arrive at that anything which tends to seriously lower the system of prisoners, and to take from them their strength of mind or body, must directly tend to unfit them for any effort to raise themselves above their previous surroundings, or to struggle against those influences which work against their reformation, and in favour of old association of an evil nature.

In the gaols of this Colony the dietary treatment of 7th-class prisoners, amongst whom are included all persons under 25 years of age undergoing a sentence of imprisonment, with or without hard labour, for a period not exceeding twelve months, is as follows:—

Prisoners under a sentence not exceeding fourteen days, receive during the whole term of their imprisonment a daily ration of 16 oz. of bread; if under a sentence exceeding fourteen days, but not exceeding six months, or if under a sentence exceeding six months—then for the first six months of that sentence they receive a daily ration of 16 oz. of bread for the first week and thereafter every alternate week; and in cases where the sentence exceeds six months they also receive that ration during the last fourteen days of their imprisonment.

The only class dietary in the English prisons which is adversely commented on by the Committee is a diet (the lowest one given) known as No. 1, consisting of a daily ration of 16 oz. of bread and a pint-and-a-half of stir-about, containing 3 oz. of Indian meal and 3 oz. of oatmeal, which is given to prisoners sentenced to seven days and under, and also, during the first week of their imprisonment, to prisoners under a sentence exceeding seven days, but not exceeding one month.

The remarks of the Committee upon this matter are as follows:—“A short period of low diet, followed after a few days by a long continuance of one that was more substantial, would not be likely to be prejudicial; but as a considerable number of prisoners are sentenced for a week or less, and after discharge are readmitted repeatedly at short intervals, this very low and distasteful dietary becomes in their case practically continuous. And as it is among such prisoners that cases of mental instability and unsoundness are most commonly found, we feel inclined to endorse the view expressed by the Medical Officer of Holloway Prison that this part of the dietary should be reconsidered.”

It may here be stated that the Prison Commissioners have not given way in this matter of diet, and so far no steps have been taken to introduce any alteration.

It will be seen at a glance how much more severe is the treatment of the 7th-class prisoners in the gaols of this Colony than that of the prisoners placed on No. 1 diet in the English prisons, and the greater the reason therefore why that particular class of dietary should be reconsidered.

The matter has to some extent been anticipated in this Colony, inasmuch as an investigation is now being made into the effects of this low dietary upon the weight, health, &c., of the prisoners, and the information thus obtained has been submitted to the Government Medical Adviser for his views upon the subject.

The whole question of the treatment of 7th-class prisoners is one which seems to urgently call for reconsideration. With many the treatment does not have a deterring effect (which was specially the object of its introduction), as is evidenced by the fact that a large proportion of the 7th-class prisoners return to gaol. If, again, it be considered that all prisoners under the age of 25 years, whether sentenced to hard labour or to imprisonment only, receive this special treatment, it must be realised that some are included in this class who are less criminal than many others, but receive more severe treatment because they have not reached a certain age. They are, in fact, punished for being young, when on the other hand their youth might reasonably be urged in many instances in palliation of the offences they have committed.

4. *Punishment.*

In regard to the punishing of prisoners, the Committee are favourable to the idea that the best form of punishment, except for the more serious offences, would be, as a general rule, to deprive the offenders of certain privileges, and that severe punishment should not be commonly resorted to. Their reference to this matter is in the following terms:—

“During recent years there has been a distinct move forward in the direction of mitigating the severity of prison punishments. The use of the entirely dark cell has been discontinued since the publication of the report of the Royal Commission on Irish Prisons in 1884; and the following figures show that corporal punishment has decreased in a striking degree in local prisons. In convict prisons the total number of instances also shows a marked decrease, but the percentage remains about stationary. It must, however, be noted that the convict population has been much reduced, but that there remains much the same number of hardened criminals of a low type.

“From time to time changes were made towards leniency by standing orders, which, according to Standing Order No. 94, produced no disadvantage. The same order stated that, as the result of experience, ‘discipline is not better maintained by resorting commonly to severe punishment, which should be reserved for use when milder means have been tried unsuccessfully, and when it is necessary to apply them on particular occasions.’

“This opinion of the Commissioners carries great weight, and it strengthens our belief that the main fault of our prison system is, that it treats prisoners too much as irreclaimable criminals, instead of as reclaimable men and women. . . . We think that No. 1 diet punishment should be inflicted with great care, especially in the case of women.

In this Colony women are not subjected to the bread and water diet which forms part of the treatment of 7th-class prisoners. The quotation continues as follows:—“Undoubtedly it tends to lower the system, and this in itself is most undesirable. Mr. Walker, the Governor of the Liverpool Prison, objected to dietary punishment altogether for women. We should be glad, at any rate, to recommend its partial abolition if we could see our way clearly to any definite substitute for it. We are disposed to think, and more particularly if our recommendations are accepted, that the best solution would be a more frequent infliction of loss of privileges. . . . Under the present rules, whilst a Governor cannot inflict more than three days’ bread and water diet in succession, after which must come an interval of twenty-four hours, the Visiting Committee can for a single offence sentence a prisoner to fourteen days in a punishment cell with No. 1 bread and water diet, alternating every three days with Nos. 2 or 3 diets. We think that, according to the intention of the Act of 1877, a prisoner should only be committed to a punishment

punishment cell on penal diet for fourteen days; and an interval of at least three days should elapse before any additional period is imposed in respect of a fresh offence, or an offence distinct from that for which the punishment was inflicted, and this second period should only be inflicted with the sanction of the medical officer. We further think, that in the case of a prisoner committed by the Visiting Committee to a punishment cell who expresses contrition, and whose contumacy the Governor considers to be ended, means should be adopted, in concert with the Visiting Committee, to cancel or suspend the remainder of the sentence without unnecessary delay."

Orders have been given by the Prison Commissioners that all such cases should be brought before the Visiting Committee, who alone have power to revise their own sentences.

In the prisons of this Colony the gaoler is empowered, in the case of any breach of the regulations, or disorderly conduct, to keep the offender in close confinement and upon half rations for any time not exceeding seven days, or until the arrival of the Visiting Justice. He can also place a refractory prisoner in irons, but must not continue the use of irons for more than forty-eight hours without the permission of the Comptroller-General of Prisons or of the Visiting Justice, and he must report the circumstances of each case to the Comptroller-General of Prisons and to the Visiting Justice.

The Visiting Justice is empowered by statute "to hear and determine all complaints touching any of the following offences—that is to say, disobedience of the rules of the prison; assaults by one person confined in such gaol upon another where no dangerous wound or bruise is given; profane cursing and swearing; any indecent behaviour and any irreverent behaviour at or during Divine service or prayer. . . ." and also "to hear and determine all complaints of idleness or negligence in work, or wilful mismanagement of work," and to sentence the offender "to be confined in a solitary cell on bread and water for any term not exceeding seven days."

In the case of a prisoner under sentence for a crime being guilty of repeated offences against the rules of the prison or of any greater offence than those already mentioned, any two Justices can order the offender to be punished by close confinement for any term not exceeding one calendar month, or by personal correction in the case of a prisoner convicted of felony or sentenced to hard labour.

While recognising the necessity that exists to have power to inflict severe punishment in gross cases which clearly require it, the conclusion cannot be avoided that in punishing prisoners for the many less serious offences it would be better, if reforming influences are to be established, to err on the side of leniency than on the side of harshness, and the suggestion of the Committee that deprivation of privileges should be substituted as a punishment in many cases, commends itself as being worthy of adoption.

It may be mentioned that although the use of dark cells was abolished in England more than ten years ago, this form of punishment is still used in some of the gaols of this Colony.

5. Privileges.

The evidence given before the Committee went to show that the privileges of writing and receiving letters and of receiving visits are greatly appreciated by prisoners, and it seems to follow, therefore, that the allowance of these privileges could be used with much beneficial effect. The Committee, in recommending the Visiting Committee should be entrusted with more latitude and a larger discretion in applying the regulations relating thereto, make reference to the subject in the following terms:—"Mr. Manning, a governor of the widest experience, thinks that it would not be wise to give the governors a discretionary power to relax the regulations in favour of the prisoner, on the ground that it would lead to favouritism; but he thought more indulgence might be granted to prisoners in respect to visits after three months. We think that while there should be uniformity in practice, and the greatest care taken against any weakening of the penal machinery, it is not advisable in the matter to lay down rigid rules from which there can be no departure. Many witnesses were in favour of extending existing privileges. Those who were most strongly in favour of the existing practice all admitted that, subject to the proper maintenance of regulations for the purpose of order and deterrence, they would approve of any regulation clearly calculated to produce a good moral effect on the prisoners. In other words, if, without endangering discipline and impairing necessary severity in prison regulations, it appeared that extra visits to prisoners, or privileges to send or receive communications from friends and relations, would be beneficial to a prisoner and likely to assist in making him a better man, such relaxations would be desirable. We consider that it would not be wise to place so much extra responsibility upon the governors with regard to all prisoners; but the Visiting Committee should have power to consider each individual case on its merits, either at the direct request of the prisoner or upon the representations of the governor or chaplain, and within certain limits (*infra*) to relax or maintain the regulations at their discretion. It should, however, be distinctly understood that any relaxation should not be in the nature of mitigation of punishment, but should only be when, after careful consideration, it appeared clear that the ends of justice would be served by bringing good and healthy influence to bear on the particular prisoners. Sir E. Du Cane, who thought it might be advisable to allow more frequent visits and letters after three months, put in the condition that the increase of privileges should be in accordance with the mark or stage system. With this we concur. To allow indiscriminate visits either by undesirable persons or even by persons not likely to influence a prisoner in the right direction would be most harmful; but no hard and fast rules at any period should be allowed to keep from a prisoner any good influence which might help to reclaim him or save him from becoming a permanent member of the criminal classes. These recommendations equally apply to female prisoners."

The Prison Commissioners are not averse to the Visiting Committee having larger discretionary power in this matter, so that, in cases of special importance or urgency, they might be in a position, without reference to the Commissioners, to accord the privilege; but when those two conditions are wanting, the Commissioners think the power of relaxing the rules should vest, as now, with them.

The Commissioners, on the 8th February, 1895, extended the powers of governors in regard to communications by authorising them—(1) to allow certain prisoners entitled to a visit to write a letter and receive a reply in lieu of such visit, should their friends be unable to visit them; (2) to allow (if in their judgment it is desirable) any prisoner to write a special letter and to receive a reply under any of the following circumstances—(a) the death of a near relative; (b) to give instructions as to his business or family affairs of an urgent nature; (c) to make arrangements for obtaining employment or assistance from friends on release.

So far as the goals of this Colony are concerned, it does not appear that, with the exception of first and second class prisoners, any material alteration is called for in respect of the concessions allowed them in the matter of visits and communications, unless a change were made to provide for the enjoyment of the privilege being regulated under a well arranged mark system. With regard to first and second class prisoners, however, the regulations might well be modified so as to make the privilege more accessible in deserving cases.

Recently a change has been made in regard to these prisoners, under which they receive slightly better treatment.

Another privilege, namely, reading, might be used advantageously as an incentive to good conduct, and could be more liberally allowed.

The Minister will remember that the question of allowing books to prisoners serving sentences of less than three months was recently brought under his notice by the Honorable the Chief Justice, who suggested that a discretionary power might be given to gaolers in such cases.

I might also point out that in winter months especially, owing to the darkness of the cells, prisoners (exclusive of first and second class prisoners, under separate treatment, who have lights in their cells for a limited time) have very little opportunity of reading, except on Sundays and holidays. The question of placing lights (where practicable) in the cells of all prisoners is one that might be inquired into and considered, particularly in the case of unconvicted prisoners, concerning whom the Committee recommended that if they desired to read or write, they should be allowed lights until the final locking up of the prison.

Upon the subject of allowing prisoners books, the Committee expressed their views in these terms:—"We think that there should be a larger supply of books, and that reading should not be restricted to one book a week if the prisoner cares to read more. All the witnesses agreed that it is desirable, so far as is practicable, to allow the prisoners to improve their minds by reading, and the only difficulty raised was one of distribution. This, however, is comparatively a trifling one, and can be readily overcome. The principle which we laid down as governing visits and communications also applies to the general occupation of prisoners other than that devoted to labour, meals, chapel, and other necessary prison duties. Everything should be encouraged which tends to elevate the mind, so far as it is consistent with regulations necessary for the general order and discipline. So much depends upon the kind of population in a prison and the individuals who compose the prison staff that it is not possible to go into the matter in detail. These are really questions which should always be before the responsible authority in every prison, and no rules or regulations should be of that hard, unbending character which prevents the changes being made according to special circumstances, which careful consideration shows to be beneficial to the prisoners."

The Committee also suggested that selected preachers should be brought in from outside, as the monotony of chaplains' work in prison is apt to produce a mechanical performance of duty.

The Prison Commissioners state that there is no rule limiting the supply of books to one per week, as chaplains have every discretion in the matter, and prisoners are allowed at some prisons to have their books exchanged whenever they ask; but if every prisoner is to have the right to have his book exchanged *as often as he likes*, the libraries would have to be increased, and also the school-warder staff. They recognise, however, the reasonableness of the recommendation that there should be a more frequent exchange of books, and propose to devise a scheme to give effect to it, if possible, without any material increase of staff.

The Prison Commissioners also agree with the Committee that the monotony of chaplains' work in prisons is apt to produce a mechanical performance of duty, and are of opinion that this can be largely obviated by a very considerable extension of the system prevailing at some of the smaller prisons, where the parish clergyman, who is assisted by one or more curates, acts as chaplain, and in this way the prison services are often taken by different clergymen—notably at Portsmouth, where the chaplain, Canon Jacob, is assisted by no less than eight curates, and his interest in prisoners is so great that he has been instrumental in establishing homes for male and female prisoners on discharge.

The Prison Commissioners state that the practice of bringing in from the outside selected preachers is now carried out to some extent, and will be encouraged as much as possible in the future.

In the meantime, the Secretary of State, in order to obtain full information to enable him to deal with the Committee's recommendations, has appointed a Committee, which is now sitting, to inquire and report on the whole question of the secular and moral instruction of prisoners.

The question of adopting the foregoing suggestions of the Committee, with respect to the goals of this Colony, appears worthy of consideration.

In regard to the question of allowing prisoners to converse with each other under certain restrictions, the Committee make the following remarks:—"We inquired carefully into the rules which regulate talking in convict prisons. Except for the purposes of labour, male prisoners are not allowed to speak to each other throughout the whole term they have to serve. Female convicts are allowed to talk for at least an hour a day, under proper supervision, and so far as we can learn no harm has resulted from it. We think that the privilege of talking might be given after a certain period as a reward for good conduct on certain days for a limited time, and under reasonable supervision, to all long-sentence prisoners, local as well as convict, who have conducted themselves well, and who are not deemed unsuitable for the privilege. The present practice of imposing silence, except for the purpose of labour, and during the visits of officials and authorised persons, for a period, it may be of fifteen or twenty years, seems to us unnatural. We recognise that careful supervision would be necessary if this privilege is allowed, but we do not think that the disadvantages which might, perhaps, from time to time occur, would be at all equal to the good likely to result from a partial and judicious removal of this very unnatural restriction."

The Prison Commissioners see grave objection to giving facilities for unchecked conversation on the ground of good conduct, as the worst criminals are very often the best conducted in gaol. They have, however, gone so far as to instruct the governors of convict prisons not to "push" the so-called silent system to an extravagant degree, with the result that the reports and punishments for talking have sensibly decreased.

Another most important phase of prison treatment to which I have not before referred, is the manner and conditions under which prisoners are discharged from gaol. If upon their release prisoners were afforded the opportunity of escaping from their former evil associations, and instead of being turned out and left to their own resources, were assisted in some slight degree, there is reason to believe that

many

many who are not hardened criminals would be saved from again falling into criminal's ways. In this respect it is a matter for regret that the labours of the Discharged Prisoners' Aid Society (which was established in 1874) have, after being carried on for a period of nearly twenty years, ceased some few years ago for the reason mainly, I understand, that the contributions were not sufficient to justify the work of the Society being continued. Some few copies of the Annual Reports of the Society have been obtained by me from the late hon. secretary, and, from a perusal of them, an estimate can be obtained of the good work done by the Society during the many years of its existence. The suggestion made in the Fourth Annual Report of the Society that the Government should take steps to provide that the money earned by prisoners in gaol, should, in the case of those applying for the assistance of the Society before they are discharged, be entrusted to the Society for the payment to and on behalf of the prisoner, is worthy of consideration in any scheme of reorganising our present system of prison administration. The English Committee, in considering the question of gratuities to prisoners, expressed the opinion that a prisoner should be enabled to earn something continuously during the sentence, provided that the money were not all given to him on discharge, but subsequently through a Prisoners' Aid Society, or in such way as the Prisoners' Aid Society or the Visiting Justices might determine. The Committee were satisfied that much admirable work was done by such societies, and in referring to the evidence given by Colonel Buchanan, secretary of the Royal Society for the assistance of discharged prisoners, Mr. Wheatley, superintendent of St. Giles' Christian Mission, Colonel Barker, of the Salvation Army, and Miss Elizabeth Fry, hon. secretary of the Elizabeth Fry Refuge, express the opinion that fuller scope should be given to their able efforts and philanthropic enterprise, and that other societies should be encouraged to work in the same spirit. They also consider that the Government grant (at present £1,500 per annum) might, with advantage, be increased, and should be made applicable in the case of societies which conduct establishments for the reception and training of discharged prisoners on principles approved by the Government, and which can show that their efforts are practically successful.

The Prison Commissioners attach "enormous importance" to an effective system of aiding prisoners on discharge, and are of the opinion that the system now in use in England is capable of much improvement and extension in convict and local prisons. They endorse the recommendation of the Committee that the Government grant to the Aid Societies should be increased.

Practical steps have been taken in the direction of improving the present system by specially appointing the Rev. G. P. Merrick, Chaplain of Holloway Prison, who is said to be a recognised authority on this question, to make a searching inquiry into the matter (which is now being done), and upon the receipt of his report and recommendations further action will be taken by the Prison Commissioners.

It is reasonable to believe that a sufficient number of philanthropic persons would be found in this Colony willing to undertake the re-formation of a Prisoners' Aid Society if it were understood that some slight assistance would be granted by the Government, and the whole question is one which might well be considered in conjunction with the matter of prisoners' gratuities and the mode and time of their payment.

I would now refer to the mark system which is in force in English prisons, and which is fully described in the evidence of Captain W. J. Stopford, one of the Prisons' Commissioners. (*See Appendix "B."*)

I may be permitted to express the opinion that the principle of that system is capable of elaborate extension in the prisons of this Colony. From the evidence of Captain Stopford it is clear that prisoners under that system have constantly before them some incentive to industry and good conduct, and as they pass from stage to stage (and such promotion can only be acquired by earning the requisite number of marks) they obtain better treatment and an extension of their privileges, and ultimately they can secure for themselves a remission of their sentence proportionate to the time occupied by them in obtaining the number of marks allotted to the period of the sentence.

It seems to me that with an improved classification of prisoners in the gaols of this Colony a more comprehensive and effective mark system than that now in use here could, with advantage, be adopted. Two or three divisions might perhaps be made in each class, and those divisions could be fixed according to a scale of marks. Every prisoner would then understand that before he could be promoted to a higher division he would have to earn the number of marks specified for that division. If, then, those divisions were made progressive, the prisoners receiving better diet, a higher class of work, more visits, and other indulgences, there would always be, in addition to the question of remission of sentence, a strong incentive towards industry and good conduct. The loss or forfeiture of marks or degradation to a lower division would probably, under such a system, be found a sufficient punishment for offences against prison regulations, except in serious cases.

The evidence of Colonel Plummer, Governor of Borstall Prison, who has charge of 275 convicts, nearly all of whom are engaged in making fortifications at Chatham, is very significant. He expressed himself as being very much satisfied with the mark system, and stated that whereas in the old days if a man was stopped a mark or many marks by the Governor he took not the slightest notice of it, but now a man counts every mark he gets, and if an officer stops a mark the prisoner is down to see the Governor the next day. His evidence continues:—"There is not a single mark stopped that is not brought before me. There is quite a change brought about in their spirits in that way. Every man is trying to see how soon he can get out of prison, and that he earns everything that he possibly can." And in reply to the question, "What proportion of them lose marks?" he replied, "We had 220 last year without a single punishment during the year."

Coming now to the consideration of the general question of prison administration in its relations to the Ministerial head of the Department and to the public, I have already indicated what appears to me to be a defect in our system, as administered, namely—a tendency to secure itself from outside criticism. It may be fairly admitted that the prison service should of all be open to public observation, affecting as it does the lives and liberty of so many persons.

Many of the remarks and suggestions of the English Committee bear directly upon this point and can be applied to the conditions existing in this Colony. For instance, the Committee express the opinion that standing orders issued by the Prisons' Board, and circular letters embodying general regulations, should be printed in the Annual Report of the Commissioners, and laid before Parliament. Similarly, it would be advisable that the General Orders (which have practically the force of regulations), or at any rate those orders which affect or refer to the treatment of prisoners should be publicly known, and a copy of all orders should, it seems to me, be forwarded at the time of their issue to the Ministerial Department.

I might also urge the importance to the Ministerial Department of being thoroughly conversant with the system of prison administration, and of obtaining information in regard thereto through channels other than those which are guarded by the disciplinary staff, and I would suggest that the Visiting Justices, the Visiting Surgeons, and the Chaplains, should not be discouraged from bringing directly under the notice of the Minister any matters connected with the prison system which appear to call for attention, or offering any suggestions that may occur to them respecting the general treatment of prisoners.

Under the Prisons Acts and Regulations, Visiting Justices are required to furnish a report to the Minister every month, specifying the general state of the gaol, and the manner in which the regulations have been attended to and the business of the gaol conducted, with a return of all punishments inflicted in the gaol, and unusual instances of coercion resorted to by the gaoler. They are also required to report to the Minister any occurrence of an extraordinary nature at the time of its happening, or anything it would seem proper to bring under the immediate notice of the Government, and must visit the gaols at least once in every week, unless prevented by illness or other sufficient cause, and also whenever applied to by the gaoler, to hear and determine cases awaiting adjudication, and under section 8, of 4 Vic. No. 29, any Justice of the Peace can, as often as he may think fit, enter and examine any gaol.

From my observation of the reports furnished by Visiting Justices, I can say that those reports have been practically of very little assistance to the Department in considering the question of improving our present prison system.

It will be noticed that much importance is attached by the English Committee to the work of the Visiting Justices, and a very large extension of and addition to their powers and functions is recommended.

Although many of their suggestions in this respect would not be adaptable to the gaols of this Colony, they are worthy of careful perusal, as showing the general tendency of opinion on the part of the Committee, that it is desirable to associate more closely Visiting Committees with the control, management, and discipline of prisons than has hitherto been the case.

The Committee considered it "most important that local interest in prisons should be revived, and that through this fuller interest the central authority should obtain the co-operation of a large number of persons not only qualified to take a practical part in the supervision of prisons, but who might be willing, as they certainly would be able, to give valuable advice and assistance to discharged prisoners, acting through, or with the various aid societies."

It is also stated by the Committee that "experience shows that in almost every society or organisation, the most effective changes come from outside influences. Those who have to administer a system year after year are inclined to stereotype practices which they know have produced good results, and to assume for that reason that they must permanently form the basis of management."

It might be instructive to quote here some of the additional duties and responsibilities which the Prison Commissioners propose should be imposed on the Visiting Committees:—

- (a) In cases of special importance or urgency, to allow prisoners additional visits or letters, or prolong the period of visits.
- (b) To assist the Commissioners with advice and suggestions as to the industrial employment and occupation of prisoners.
- (c) To organise, subject to the approval of the Commissioners, lectures and addresses in the prison, provided that this shall not interfere with the necessary deterrence of prison discipline, and shall be directed to the physical and mental improvement of the prisoners.
- (d) To exercise supervision in carrying out the rules for the treatment of juveniles and unconvicted prisoners.
- (e) To co-operate with the Governor as to the classifying of first offenders.
- (f) To inquire, from time to time, into the operation of the Discharged Prisoners' Aid Societies connected with the prison, or any other agencies having for their object the welfare of prisoners.
- (g) To inquire into the state of prison buildings whether any repairs or additions are necessary.
- (h) To inquire into the condition of prison labour, whether the industrial employments provided are sufficient, and of the kind most suitable for preparing prisoners for earning their livelihood on release in their own localities.
- (i) To report, through the Commissioners, for the information of the Secretary of State, once in every six months on the following points:—
 - (1.) The state of the prison buildings, and whether any necessary repairs have not been carried out.
 - (2.) Or any modification of prison arrangements which they may consider desirable.
 - (3.) Whether the industrial employments are sufficient, and of the kind most suitable for preparing prisoners for earning their own livelihood on release in their own localities.
 - (4.) Any observations they may wish to offer on the prison staff.
 - (5.) Whether the rules for the separation of first offenders from habitual criminals, and juveniles from adults, have been properly carried out.
 - (6.) On the general discipline of the prison.
 - (7.) On the operation of the Discharged Prisoners' Aid Societies connected with the prison.

Draft rules are now under the consideration of the Secretary of State, entrusting to Visiting Committees a larger discretion in applying the regulations dealing with visits to, and communications with prisoners, and confirming and extending their duties and responsibilities.

By seeking the views of medical officers connected with the gaols of this Colony, it may be anticipated that from time to time many valuable suggestions and much useful information will be brought before the Minister, which it is desirable he should have, directly referring to the conditions of prison life, and their effect mentally and physically upon the prisoners.

In the same way it is not unreasonable to conclude that viewing their position, and the nature of their duties, Chaplains will be eminently fitted to advise upon measures likely to assist in bringing prisoners to a realisation of their position, and to produce those softening influences which are essential to the work of reformation.

The supervision of Chaplains appears to be so far a matter of very great moment to the Prison Commissioners, that they have recommended to the Secretary of State the appointment of a Chaplain Inspector to assist them—(a) in the selection of suitable candidates for the office of chaplain; (b) in the selection

selection of local clergymen for the office of acting chaplain at small prisons; (e) to visit the prisons and see that the religious services are conducted with zeal, and that the duties of chaplains, Scripture readers, and schoolmasters are properly carried out, also that the moral instruction of the prisoners is well attended to; (d) to see that the prison libraries are suitably kept; (e) to see to the working of the Aid Societies; (f) to preach occasionally in prison chapels, and to arrange with the prison chaplain for securing suitable outside clergy to preach and lecture occasionally to the prisoners; and the Secretary of State is in communication with the Treasury respecting the matter.

In conclusion, I may perhaps be permitted to express the opinion that a change in the system of prison administration in this Colony cannot be much longer delayed, and I have indicated generally the most prominent faults of that system in the hope that the Minister may perhaps see his way to bring about or initiate a large measure of reform.

In preparing this paper, I have received valuable assistance from Mr. Whitfeld of this Department.

ARTHUR C. FRASER,
Under Secretary of Justice.

5 June, 1896.

Comptroller-General, for favour of his views.—A.J.G., 8/6/96. B.C., T.E.McN., for U.S. I have dealt with this paper in a separate memo. of even date herewith.—G.M., 31/8/96. The Honorable the Minister of Justice.

APPENDIX "A."

SEPARATION OF PENAL SERVITUDE PRISONERS NOT PREVIOUSLY CONVICTED.—"STAR CLASS."

1. With a view to the absolute separation, while in prison, of prisoners who have never been previously convicted, and are not habitually criminal, from those who are versed in crime, full inquiries will be made into the character and antecedents of prisoners sentenced to penal servitude on first conviction, for the purposes of obtaining such information as will furnish the grounds for deciding whether they shall be thus kept apart.

2. The necessity for these inquiries arises from the consideration that the object of the separation of these prisoners would be defeated if prisoners of corrupt habits were placed among them, solely because by succeeding in evading detection they had never before been convicted.

3. The forms of inquiry will be sent out whenever a prisoner, who has not previously been convicted, receives a sentence of penal servitude, with the following exception, viz.:—Any prisoner who has been convicted as a receiver of stolen goods, or of an unnatural offence, or of rape where more than one person was concerned in the crime, or of rape attended with special brutality.

4. They will be sent out from the prison in which the prisoner is confined at the time of his conviction, and will be addressed to the Chief of Police of the place (1) of committal; or (2) of conviction, or both; or (3) in the case of a prisoner who is unknown, or has been known only for a short period, at the place of his committal or conviction, to the Chief of Police of the place of his previous residence, if it can be ascertained. If the information obtained be not full and conclusive, similar inquiries will be sent to persons whose names and addresses are given in reply to question 11, or to other respectable persons whom the prisoner may name as being able to testify to his past history.

5. The forms will be addressed on page 1 to the persons to whom they are sent, and the replies should invariably be signed by the persons making them.

6. Inquiries may also be made in the case of a prisoner under sentence of penal servitude, against whom there may be a previous conviction for a trivial offence, or a conviction of a date several years before, but such a case should be submitted for instructions before the inquiries are made.

7. The replies to the inquiries in each case, together with the prisoner's penal record, will be forwarded to the Commissioners for their decision, as soon as the inquiry is completed.

8. Convicts ordered by the Commissioners to be kept apart from those previously convicted will be designated the "Star Class." They will be located in cells where they cannot come in contact with other prisoners. They will also sit in chapel and exercise apart from all other prisoners.

9. Convicts in the "Star Class" will wear a star of scarlet cloth on the front of the cap, and on both sleeves of the jacket, above the badge on the right sleeve, and in a corresponding position on the left sleeve.

10. A scarlet adhesive star will be placed at the left hand top corner of the first page of the penal record.

11. The inquiry forms above referred to, and the Commissioners' decision thereon will, in every case, accompany the convict on his removal to a convict prison.

APPENDIX "B."

Extracts from evidence of Captain Stopford.

STANDING ORDER 203 (LOCAL PRISONS), 13TH JULY, 1892.—SYSTEM OF PROGRESSIVE STAGES.

1. The following instructions will be observed with a view to give effect to rule 24, for the general government of prisons, made by the Secretary of State, 19th February, 1878, as to the employment of male prisoners above 16 years of age, sentenced to hard labour.

2. A prisoner shall be able to earn each week-day eight, seven, or six marks, according to the degree of his industry. On Sundays he shall be awarded marks according to the degree of his industry during the previous week.

3. A prisoner who is not at work, whether by reason of his being under punishment or in the infirmary, is not entitled to receive marks; but every prisoner actually at work may receive marks. A prisoner who has earned no marks during the week is not to receive marks on Sunday.

4. A prisoner who is idle will be reported, and be liable to punishment.

5. There shall be four stages, and every prisoner shall pass through them, or through so much of them as the term of his imprisonment admits.

6. He shall commence in the first stage, and shall remain in that stage until he has earned 28 x 8, or 224 marks; in the second stage until he has earned 224 more marks, or 448 in the whole; in the third stage until he has earned 224 more marks, or 672 in the whole; in the fourth stage during the remainder of his sentence.

7. A prisoner whose term of imprisonment is twenty-eight days or less shall serve the whole of it in the first stage.

8. A prisoner who is idle or who misconducts himself, or is inattentive to instruction, shall, in addition to, or in place of any punishment which may be inflicted on him in accordance with the rules, be liable—

(a) To forfeit gratuity earned or to be earned.

(b) To forfeit any other stage privileges until he has earned a specified number of marks.

(c) To detention in the stage in which he is until he shall have earned in that stage an additional number of marks.

(d) To degradation to any lower stage (whether such stage is next below the one in which he is, or otherwise) until he has earned in such lower stage a stated number of marks.

As soon as the prisoner has earned the stated number of marks he shall, unless he has in the meantime incurred further similar degradation, be restored to the grade from which he was degraded, and be credited with the number of marks he had previously earned therein.

9. A prisoner in the first stage will—

(a) Be employed ten hours daily in strict separation. If sentenced to hard labour, of which six to eight hours will be on crank, treadwheel, or work of a similar nature.

(b) Sleep on a plank bed without a mattress.

(c) Earn no gratuity.

(d) Have approved books of instruction in his cell.

10. A prisoner in the second stage will—

- (a) Be employed as in the first stage until he has completed one month of imprisonment, and afterwards, if sentenced to hard labour, be employed on hard labour of the second class.
- (b) Sleep on a plank bed without a mattress two nights weekly, and have a mattress on other nights.
- (c) Be able to earn a gratuity not exceeding 1s.
- (d) Have approved books of instruction in his cell.
- (e) Receive school instruction, if eligible under the rules made from time to time for the education of prisoners.

11. The gratuity to a prisoner in this stage whose term is not long enough for him to earn 224 marks in it, may be calculated at 1d. for every twenty marks earned.

12. A prisoner in the third stage will—

- (a) If sentenced to hard labour, be employed on hard labour of the second-class.
- (b) Sleep on a plank bed without a mattress one night weekly, and have a mattress on the other nights.
- (c) Be able to earn a gratuity not exceeding 1s. 6d.
- (d) Have library books as well as books of instruction in his cell.
- (e) Receive school instruction, if eligible, under the rules made from time to time for the education of prisoners.

13. The gratuity to a prisoner in this stage, whose sentence is not long enough for him to earn 224 marks in it, may be calculated at 1d. for every twelve marks earned.

14. A prisoner in the fourth stage will—

- (a) If sentenced to hard labour, be employed on hard labour of the second-class.
- (b) Sleep on a mattress every night.
- (c) Be able to earn a gratuity not exceeding 2s. in twenty-eight days.
- (d) Have library books as well as books of instruction in his cell.
- (e) Receive school instruction, if eligible under the rules made from time to time for the education of prisoners.
- (f) Be eligible for any special employment for which his services may be required.
- (g) Be allowed to receive and write a letter, and receive a visit of twenty minutes, and for each 672 marks earned in this class afterwards to receive and write a letter, and to receive a visit of half-an-hour.

15. The gratuity to a prisoner in this stage whose sentence is not long enough for him to earn 224 marks may be calculated at 1d. for every ten marks earned.

16. A prisoner shall be allowed to earn a gratuity at same rate so long as he is in this stage, provided that his gratuity on the whole shall not in any case exceed 10s.

17. The foregoing instructions will apply to female prisoners and males under the age of 16 who are sentenced to hard labour, except that such prisoners will not be employed on first-class hard labour.

18. They will apply to convicted prisoners, in order that such prisoners may have the advantage of the incentives to industry and good conduct which these regulations afford.

19. The provisions as to the use of a plank bed, with or without a mattress, will not be applied to women, children under 13 years of age, and men over 60 years of age.

20. A copy of the "System of Progressive Stages for convicted Criminal Prisoners" (L.P.-D. 76, revised 4th July, 1872), also a copy of the "Abstract of Regulations relating to the Treatment and Conduct of Convicted Criminal Prisoners (L.P.-D. 20), and of the "Dictary for Convicted Prisoners" (L.P.-D. 27), are to be posted in the cell of every such prisoner.

MARKS, REMISSION, AND CLASSIFICATION OF MALE CONVICTS.

1. The following system of marks, remission, and classification for male convicts will in future be observed :—

Marks and Remission.

2. The term of penal servitude to which each convict is sentenced will be represented by a certain number of marks, calculated at the rate of six marks for each day of his sentence.

3. His industry will be recorded by marks, and when by his industry, with good conduct, he has gained the number of marks which represents his sentence he may be discharged on license.

4. Marks may be assigned to him at the rate of eight marks per day for steady hard labour, and the full performance of his allotted task; seven marks per day for a less degree of industry; six marks per day for a fair but moderate day's work.

5. A convict whose conduct is either indifferent or bad, may be fined a certain number of marks, according to the nature and degree of the offence, and will thus forfeit by misconduct some of the remission he may have earned by industry.

6. A convict who by his industry earns eight marks every day, and forfeits none for misconduct, obtains therefore, in every three days, as many marks as represent four days of his sentence, and has gained the maximum remission of one-fourth thereof.

7. If a convict while on license is again sentenced to penal servitude, the term for which he was licensed will be added to the new sentence, and marks will be calculated as for a term equal to the combined periods.

8. If a convict has to serve a term of penal servitude by reason of forfeiture or revocation of license, whether accompanied or not by a sentence of imprisonment, such term will be represented by marks in like manner to a new sentence.

9. A convict sentenced to penal servitude for life must not, unless special instructions are given to the contrary, entertain any expectation of release until he has completed twenty years. No specific number of marks can be stated as giving a claim to release in accordance with paragraph 3, but the number assigned daily to each convict for his industry will be recorded, as well as his forfeiture for misconduct. Each case will be considered in due course by the Secretary of State on its own merits.

10. On Sunday a convict will be awarded marks according to the degree of his industry during the previous week.

11. A convict who by his misconduct forfeits the whole of his remission will be liable to be kept in separate confinement during the last six months of his sentence.

12. A convict in the light-labour class will be credited only with six or seven marks per day, according to his industry.

13. A list of all convicts who would be due for license in the ensuing month if they had not lost marks through being on light labour, is to be submitted monthly to the Director, who will decide whether the convicts are to be credited with any additional marks.

"The Director's special attention is to be drawn to the case of any convict who, in the opinion of the Governor and of the Medical Officer, formed from personal observation, has lost marks from absolute inability, and not from unwillingness to perform hard labour."

14. Any convict who is unable to perform hard labour on account of his having lost a limb, or who is suffering under some other grave bodily infirmity which, in the opinion of the Medical Officer, permanently unfits him for heavy labour, may be considered eligible for full marks without reference to the Director.

15. If the Medical Officer should give a special direction that any convict is not, for a specified period, to be employed on any but light labour, such convict will be eligible for full marks if his conduct and industry justify it.

16. A convict in hospital will be credited only with six marks per day on week-days, and seven on Sundays.

"No such convict is to be credited with more than seven marks per day unless laid up from an accident on the works, when, under the authority of the Director, he is eligible for eight marks per day."

17. The case of any convict who suffers a long-continued loss of marks by reason of his being in hospital, should be brought before the Director from time to time, with a report of the circumstances and of the total loss of marks involved.

Classification.

Classification.

A convict during the term of his sentence will be required to pass through the following classes, or so much of them as his sentence will allow, viz. :—

Probation class, one year, or until he has earned 2,920 marks.

Third class, one year, or until he has earned 2,920 marks.

Second class, one year, or until he has earned 2,920 marks; after which he will be eligible for promotion to the first-class

19. A convict who commits any offence will be liable to reduction from a higher class to a lower class, or to detention in the class he is in, or to forfeiture of the privileges of any class, until he has earned a stated number of marks, which number of marks is not to be added to the number of marks he has to earn for remission, unless directions are given to the contrary. As soon as he has earned the stated number of marks, he shall, unless he has in the meantime incurred further similar punishment, be restored to the class from which he was disgraced.

20. A convict in the probation class will—

(a) Be kept in separate confinement until he has earned 2,100 marks.

(b) Until he has earned 224 marks, be employed ten hours daily in strict separation on first-class labour, and sleep on a plank bed without a mattress.

(c) After he has earned 224 marks and until he has 448 marks, be employed on hard labour of second class, sleep on a plank without a mattress two nights weekly, and have a mattress on the other nights.

(d) After he has earned 448 marks, and until he has earned 672 marks, sleep on a plank bed without a mattress one night a week, and have a mattress on the other nights.

(e) After he has earned 672 marks, sleep on a mattress every night.

(f) Be allowed to write one letter during the first week of his sentence and receive a reply, and also to receive one visit during that period, and after he has earned 1,440 marks may receive and write a letter and receive a visit of twenty minutes' duration.

(g) After he has earned 2,100 marks be eligible for employment on public works.

(h) On reception at a public works prison, be allowed to write and receive one letter, but no other while in this class.

21. A convict, after completing a period of second probation in separate confinement, will pass through the classes in the same way as on completing his first probation in separate confinement.

22. A convict, whilst wearing cross-irons, or the parti-coloured or distinctive dress, will be in the probation class, after which he will return to his original class, unless directions are given to the contrary.

23. A convict in the third class will be allowed—

(a) To receive one visit of twenty minutes' duration, and both to receive and write a letter, and after earning 1,440 marks, to receive another visit of twenty minutes' duration, and to receive and write another letter.

(b) To receive a gratuity at the rate of 1s. for each 240 marks earned in this class, but not to exceed in the whole 12s. in this class.

24. A convict in the second-class will be allowed—

(a) To receive a visit of twenty minutes' duration, and both to receive and write a letter, and afterwards at the expiration of intervals, during each of which he must have earned 960 marks, he may again be accorded the same privileges.

(b) The choice of tea, and 2 oz. of additional bread instead of gruel.

(c) To receive a gratuity at the rate of 1s. 6d. for each 240 marks earned in this class, but not to exceed in the whole 18s. in this class.

25. No convict will be promoted to the first-class until he can read and write, except in special cases, which must be approved by a Director.

26. Convict in the first-class will be allowed—

(a) To receive a visit of half an hour, and both to receive and write a letter, and afterwards, at the expiration of intervals, during each of which he must have earned 720 marks, he may again obtain the same privileges;

(b) The choice of tea, and 2 oz. of additional bread instead of gruel, and baked instead of boiled meat;

(c) To receive a gratuity, at the rate of 2s. 6d. for each 240 marks earned in this class, but not to exceed in the whole 30s. in this class, nor £3 altogether.

27. A convict who has earned 2,920 marks in the first-class, and passed through that class with exemplary conduct, may be admitted into the special class when he is within twelve months of his release.

28. A convict in the special class will be eligible—

(a) To receive a visit of half an hour, and to receive and write a letter, and afterwards, at the expiration of interval during each of which he must have earned 480 marks, he may again obtain the same privileges;

(b) For any special employment for which his services may be required;

(c) To receive an extra gratuity of £3 on discharge, provided he goes to a Prisoners' Aid Society;

(d) To be recommended for an extra remission, not exceeding one week.

29. A convict in the special class may be accorded the extra remission and gratuity whether he passes the full twelve months in that class or not.

30. A convict whose sentence does not admit of his attaining the special class may be recommended for an extra gratuity, provided he has not forfeited more than 720 marks for remission, and has passed nine months preceding his release with exemplary conduct, and avails himself of a Prisoners' Aid Society on discharge. This extra gratuity will not exceed 10s. for a convict under a sentence of three years, £1 for a convict under sentence of four years, and £2 for one under sentence of five years.

31. A convict whose license is forfeited or revoked will not be admitted into the special class, nor be eligible for an extra gratuity, as provided in paragraph 30.

32. A convict whose license is forfeited or revoked without receiving a fresh sentence of penal servitude will not again be permitted to receive the gratuities referred to in the foregoing paragraphs; but he may, after he has earned 224 marks, be credited with a gratuity not exceeding 1s., or at the rate of 1d. for every twenty marks earned; after he has earned 448 marks he may be credited with a gratuity not exceeding 1s. 6d. or 1d. for every twelve marks earned; and after he has earned 672 marks he may be credited with a gratuity at the rate of 1d. for every ten marks earned, provided that the whole of his gratuity, including what he may have earned under a preceding sentence of imprisonment, shall not in any case exceed 10s.

STANDING ORDER No. 495 (CONVICT PRISONS), 15TH NOVEMBER, 1892.—MARKS, REMISSION, AND CLASSIFICATION OF FEMALE CONVICTS.

1. The following system of marks, remission, and classification for female convicts will in future be observed :—

Marks and Remission.

2. The term of penal servitude to which each convict is sentenced will be represented by a certain number of marks, calculated at the rate of four marks for each day of her sentence.

3. Her industry will be recorded by marks, and when by industry with good conduct she has gained the number of marks which represents her sentence, she may be discharged on license.

4. Marks may be assigned to her at the rate of—Six marks per day for steady hard labour and the full performance of her allotted task; five marks per day for a less degree of industry; four marks per day for a fair but moderate day's work.

5. A convict whose conduct is either indifferent or bad may be fined a certain number of marks, according to the nature and degree of the offence, and will thus forfeit by misconduct some of the remission she may have earned by industry.

6. A convict who by her industry earns six marks every day and forfeits none for misconduct obtains, therefore, in every two days as many marks as represent three days of her sentence, and has gained the maximum remission of one-third thereof.

7. If a convict while on license is again sentenced to penal servitude, the term for which she was licensed will be added to the new sentence, and marks will be calculated as for a term equal to the combined periods.

8. If a convict has to serve a term of penal servitude by reason of forfeiture or revocation of license, whether accompanied or not by a sentence of imprisonment, such term will be represented by marks in like manner to a new sentence.

9. A convict sentenced to penal servitude for life must not, unless special instructions are given to the contrary, entertain any expectation of release until she has completed twenty years. No specific number of marks can be stated as giving a claim to release in accordance with paragraph 3, but the number assigned daily to a convict for her industry will be recorded as well as her forfeitures for misconduct. Each case will be considered in due course by the Secretary of State on its own merits.

10. On Sunday a convict will be awarded marks according to the degree of her industry during the previous week.

11. A convict who by her misconduct forfeits the whole of her remission will be liable to be kept in separate confinement during the last six months of her sentence.

12. A convict in the light-labour class will be credited only with four or five marks per day, according to her industry.

13. A list of all convicts who would be due for license in the ensuing month if they had not lost marks through being on light labour, is to be submitted monthly to the Director, who will decide whether they are to be credited with any additional marks. The Director's special attention is to be drawn to the case of any convict who, in the opinion of the Governor and the Medical Officer, formed from personal observation, has lost marks from absolute inability and not from unwillingness to perform hard labour.

14. Any convict who is unable to perform hard labour on account of her having lost a limb, or who is suffering under some other grave bodily infirmity, which, in the opinion of the Medical Officer, permanently unfits her for heavy labour, may be considered eligible for full marks without reference to the Director.

15. If the Medical Officer should give a special direction that any convict is not, for a specified period, to be employed on any but light labour, such convict will be eligible for full marks if her conduct and industry justify it.

16. A convict in hospital will be credited only with four marks per day on week days and five on Sundays. No such convict is to be credited with more than five marks per day either on week days or Sundays, unless laid up from an accident, when, under the authority of the Director, she is eligible for six marks per day.

17. The case of any convict who suffers a long continual loss of marks by reason of her being in hospital, should be brought before the Director from time to time with a report of the circumstances, and of the total loss of marks involved.

Classification.

18. A convict, during the term of her sentence, will be required to pass through the following classes, or so much of them as her sentence will allow, viz. :—

Probation class, nine months, or until she has earned 1,620 marks.

Third class, nine months, or until she has earned 1,620 marks.

Second class, nine months, or until she has earned 1,620 marks.

After which she will be eligible for promotion to the first class.

19. A convict who commits any offence will be liable to reduction from a higher class to a lower class, or to detention to the class she is in, or to forfeiture of the privilege of any class, until she has earned a stated number of marks, which number of marks is not to be added to the number of marks she has to earn for remission, unless directions are given to the contrary. As soon as she has earned the stated number of marks she shall, unless she has in the meantime incurred further similar punishment, be restored to the class from which she was degraded.

20. A convict in probation class will be kept in separate confinement until she has earned 1,620 marks. She will be allowed to write one letter during the first week of her sentence and receive a reply, and also to receive one visit during that period, and after she has earned 1,080 marks, she may receive and write a letter, and receive a visit of twenty minutes' duration. If transferred to a convict prison while in this class she will be allowed to write and receive one letter, in addition to those above, but no other, while in this class.

21. A convict, after completing a period of second probation in separate confinement will pass through the classes in the same way as on completing her first probation in separate confinement.

22. A convict, whilst wearing a distinctive dress will be in the probation class, after which she will return to her original class, unless directions are given to the contrary.

23. A convict in the third class will be allowed—

(a) To receive one visit of twenty minutes' duration, and both to receive and write a letter, and after earning 1,080 marks to receive another visit of twenty minutes' duration, and to receive and write another letter.

(b) To receive a gratuity at the rate of 2s. for each 180 marks earned in this class, but not to exceed in the whole 18s. in this class.

24. A convict in the second class will be allowed—

(a) To receive a visit of twenty minutes' duration, and both to receive and write a letter, and afterwards, at the expiration of intervals, during each of which she must have earned 720 marks, she may again be accorded the same privileges.

(b) The choice of tea and 2½ oz. of additional bread instead of gruel.

(c) To receive a gratuity at the rate of 2s. for each 180 marks earned in this class, but not to exceed in the whole 18s. in this class.

25. No convict will be promoted to the first class until she can read and write, except in special cases, which must be approved by a Director.

26. A convict in the first class will be allowed—

(a) To receive a visit of half an hour, and both to receive and write a letter, and afterwards, at the expiration of intervals, during each of which she must have earned 540 marks, she may again obtain the same privileges.

(b) The choice of tea and 2½ oz. of additional bread instead of gruel, and baked instead of boiled meat.

(c) To receive a gratuity at the rate of 4s. for each 180 marks earned in this class, but not to exceed in the whole £2 4s. in the first class, nor £4 altogether.

27. A convict who has earned 1,620 marks in the first class, and passed through that class with exemplary conduct, may be admitted into the special class when she is within nine months of her release, if from any cause, without fault of her own, she is unable to go to a refuge, as referred to in paragraph 33.

28. A convict in the special class will be eligible—

(a) To receive a visit of half an hour, and to receive and write a letter, and afterwards, at the expiration of intervals, during each of which she must have earned 360 marks, she may again obtain the same privileges.

(b) For any special employment for which her services may be required.

(c) To receive an extra gratuity of £2 on discharge, provided she goes to a Prisoners' Aid Society.

(d) To be recommended for an extra remission not exceeding one week.

29. A convict in the special class may be accorded the extra remission and gratuity whether she passes the full nine months in that class or not.

30. A convict whose sentence does not permit of her attaining the special class may be recommended for an extra gratuity, provided she has not forfeited more than 540 marks for remission, and has passed six months preceding her release with exemplary conduct, and avails herself of a Prisoners' Aid Society on discharge. This extra gratuity will not exceed 7s. 6d. for a convict under sentence of three years, 15s. for a convict under sentence of four years, and £1 10s. for one under sentence of five years.

31. A convict whose license is forfeited or revoked will not be admitted into the special class, nor be eligible for an extra gratuity, as provided in paragraph 30.

32. A convict whose license is forfeited or revoked without receiving a fresh sentence of penal servitude, will not again earn the gratuities referred to in the foregoing paragraphs; but she may, after she has earned 168 marks, be credited with a gratuity not exceeding 9d., or at the rate of 1d. for every twenty marks earned; after she has earned 336 marks she may be credited with a gratuity not exceeding 1s. 2d., or 1d. for every twelve marks earned; and after she has earned 504 marks she may be credited with a gratuity at the rate of 1d. for every ten marks earned; provided that the whole of her gratuity, including what she may have earned under a preceding sentence of imprisonment, shall not in any case exceed 7s. 6d.

The Under Secretary of Justice to The Minister of Justice.

As requested by you, I now beg to submit my views regarding the very lengthy paper, dated 5th June, 1896, prepared by the late Under Secretary (Mr. Fraser), with the assistance of Mr. Whitfeld, embodying many of the suggestions and recommendations of an English Committee on Prisons (1895), whose report, with minutes of evidence, was obtained through the Agent-General in London in response to my request, made in my letter to the Department of Justice, dated 27th September, 1895. My object in asking for that report, and also for other reports from England, which I had obtained at different times on previous applications, was to make myself acquainted with the improvements which were being effected in other countries in prison management, in order to adopt them in the prison system of this Colony, *as far as practicable under the existing laws, and with the gaol accommodation at my disposal.*

In general terms, and chiefly by implication, Mr. Fraser's paper contains a formidable indictment against, not only the prison system of this Colony, but also the manner in which it has been administered; and, although he has not named me personally, yet it is impossible for me to treat his remarks, reflecting on the "administration" as applying to anyone but me, as the officer responsible by statute for the "care, direction, and control" of the prisons of New South Wales, which position I held at the time he sought the assistance of another gentleman in preparing his lengthy paper, and just when the Public Service Board were engaged in inquiring into the working of the various departments under your ministerial control.

The English Prison Committee has based its report and recommendations upon the evidence, &c., obtained by them after a very exhaustive and careful inquiry into the management of the prisons of England; but the Committee did not pass any unfavourable remarks, or make any recommendations and suggestions until they had fully and carefully examined experts and others as to the merits and demerits of the system of prison management in their own country, and the means which existed for carrying it out.

Mr. Fraser, on the other hand, without any reliable evidence before him taken on the spot (unless it be that of many years ago, when a different state of things existed in our gaols), and without any practical experience himself of the many very great difficulties surrounding the direct management of prisons and prisoners, has thought fit to condemn in general terms both our present prison system, and the manner in which it is administered. But he has carefully abstained from making any specific and definite statements upon which I could answer him; nor has he concluded his representations with definite recommendations for remedying the alleged defects which he has indicated only in such a very general way. He has, in effect, passed a very severe judgment condemning a system and its administration without showing the evidence upon which such judgment is based. This is both unfair and unjust to those upon whom such judgment reflects.

It is easy to collect from the products of the brains of other men ideal suggestions for the treatment and reformation of criminals of all classes, but it is a very different matter to invent the means of giving practical effect thereto, and Mr. Fraser has not committed himself to any specific and practical suggestions for your guidance, although he has couched the concluding portion of his paper in very strong language as to the necessity for some changes.

The question of dealing with criminals of the different classes which are to be found in all communities is perhaps the most perplexing and formidable of social problems which can be discussed in any civilised country. It is well known to everyone who has studied such matters that in every country possessing a prison system fault is constantly being found by certain sections of people with that system. No ideal system has yet been invented to please everybody, nor is it likely that one ever will be.

I therefore do not feel called upon to follow him through the whole of his paper, which, as I have before stated, is mostly made up of extracts from the English report. With the views expressed in some of those extracts I heartily agree, and much regret that they could not be successfully carried out under the existing exceptionally difficult circumstances of this Colony, arising out of its vast area, the scattered position of its Criminal Courts, and the incomplete means of communication over its service compared with such a country as England.

From Mr. Fraser's very unfavourable references to our prison system, it is clear to me that he has failed to grasp what it really is. The existing regulations and the standing orders under which it is administered are sufficient to prove that his general indictment against it on the ground of its severity is not justified by the facts. The existing Acts, regulations, standing orders, and bonus and gratuity schedules must be studied together before the system which they govern can be properly understood. And it must be borne in mind that they provide for a strictly disciplinary, deterrent, and reformatory system—not one established for the management of benevolent institutions or mere moral hospitals.

In order that what I have here said may be comprehended, I will now give an outline of what the present prison system of this Colony really is, and also indicate therein the defective means which exist for carrying it out. (To give an elaborate enumeration of its details would take up too much space and make this memorandum too lengthy.)

Prison System of New South Wales.

Our prison system is based chiefly upon what is known as Sir Walter Crofton's Irish System, which is one of progressive stages of amelioration of treatment, according to length of sentence and conduct.

The official prison staffs consist of regular and visiting officers. The latter comprise visiting Justices, surgeons, and chaplains; and the former contain governors, matrons, clerks, chief and senior warders, first and second class warders, and ordinary or third-class warders. In the large prisons, overseers and foremen are also employed for the supervision and instruction of the prisoners in the workshops, and while engaged on other skilled labour.

All the prisons and the regular prison staffs are under the direct control of the Comptroller-General.

There are fifty-nine gaols in operation, of varied dimensions, ranging from the metropolitan gaol, Darlinghurst (Sydney), to the small police gaols which are situated among the sparsely-inhabited country districts. The number of established gaols is twenty-three, and of police gaols thirty-six. The demand for the maintenance of the latter arises from the wide extension of Criminal Courts for the convenience of the local residents, and the consequent necessity for having a place of detention for prisoners committed

for

for trial. Prisoners locally sentenced for short periods are also detained in them. The buildings for these small gaols should therefore be constructed with due consideration for security and the health of the inmates, but most of them are of very defective construction and old-fashioned design, with wholly inadequate accommodation for prisoners according to modern ideas. They are occupied by the Prisons Department in conjunction with the police, in order to secure economy as far as practicable.

The seven principal establishments are Darlinghurst, Parramatta, Bathurst, Goulburn, Maitland, Berrima, and Biloela. Of these gaols, the two most modern in design, and which afford the best accommodation for prisoners, are Bathurst and Goulburn. The Biloela Gaol, which is situated upon Cockatoo Island, is used only for the detention of worn-out habitual petty offenders and other short-sentenced prisoners, both male and female, for town offences. No penitentiary for the treatment of such offenders has yet been established, but one is much required, sufficiently commodious to relieve Darlinghurst Gaol, which should be used only for prisoners awaiting trial or under remand, debtors, and the longer-sentenced prisoners who are capable of performing useful and remunerative work. The remaining established gaols are situated at the following places:—Albury, Armidale, Deniliquin, Dubbo, Forbes, Grafton, Hay, Mudgee, Tamworth, Wagga Wagga, Wilcannia, Wollongong, Yass, Young, and Broken Hill. The design of most of these gaols, especially those at Deniliquin, Forbes, Wagga Wagga, Wilcannia, and Yass, is very defective, and the accommodation very inferior, classification of any kind being impossible.

In addition to these established gaols, there is the Public Works Intermediate Prison at Trial Bay, where a large breakwater is being constructed by prison labour, for the purpose of forming a harbour of refuge. Only prisoners sentenced for three years and upwards to penal servitude, or hard labour, are eligible for the modified conditions of servitude which exist at this prison. They are eligible for such modified servitude at certain periods, varying according to length of sentence, before they become due for discharge to freedom under the ordinary remission regulations. The scale is as under:—

Sentence of 3 to 5 years,	to Trial Bay for 12 months.
Do 5 to 10 years,	do 2 years.
Do 10 years and upwards,	do 2½ years.

To be eligible, a prisoner must be passed by the surgeon as physically fit for quarrying or other similar kind of labour, and his conduct in prison must have been such as to warrant the belief that he will not abuse the privilege. If a prisoner is not physically fit he gets an extra remission in lieu of going to Trial Bay, varying according to sentence. The prisoners are liable to the usual prison punishment for any offence or disorder in like manner as if they were serving their sentences in an ordinary gaol; and any man who, through misconduct, is sent back to an ordinary gaol gets no alternative remission. The object of this system is to offer inducements to good conduct among prisoners undergoing long sentences in the ordinary prisons, and to afford them better opportunities of preparing themselves for work as free men on their discharge, and of earning a sum of money. The rations are on a very liberal scale, and include tea, coffee, and tobacco. While at Trial Bay they are in a condition of semi-freedom, and do not wear the usual prison clothing. They are allowed a daily payment, according to a scale, for work performed, on the recommendation of the officers directing their work. The scale of reward is as under, viz. :—

First six months,	6d. per diem.
Second six months,	9d. per diem.
Third six months,	1s. per diem.
Fourth six months,	1s. 3d. per diem.
Fifth six months,	1s. 6d. per diem.

The sums thus earned are credited to them until their discharge, and the funds are provided by the Harbours and Rivers Department; but the Prisons Department clothes and feeds the men, and bears the cost of supervision and of escorts, and is responsible for the order, discipline, and security of the establishment.

The total amount of cells provided by all the gaols, including the police gaols, is 1,992. It is to be regretted that the number of cells is not sufficient to enable the Department to carry out the plan of placing each man in a separate cell at night, which is contemplated by the regulations. As far as practicable, however, this important principle of separation is carried out in the larger gaols, such as Goulburn, Bathurst, and Parramatta.

The system is administered under regulations prescribing uniformity according to classification in the treatment of prisoners, so far as the dimensions of the gaols in which they are confined will admit. All prisoners under sentences of penal servitude, or hard labour, of three years and upwards serve a probationary term of nine months in separate treatment, before being worked in association according to classification.

Separate treatment is also resorted to for coercion in cases of persistent misconduct or disregard of prison rules. It is found to be the most effective means of maintaining order and discipline in the gaols. As this treatment is often confounded with "solitary confinement," the following explanation (which I gave in a recent report to you) of the difference between what is known as "solitary confinement" and "separate treatment" may here be repeated, as follows:—

"Solitary confinement," as termed in our gaols, means cell punishment for a prison offence, on bread and water, under section 12 or 13 of 4 Vic. No. 29, or half rations under regulation 69, and carries with it loss of remission, according to the time passed in such seclusion, which, of course, is for varying short periods, according to the nature of the offences. Such punishment is never imposed by the Comptroller-General, as the Minister is aware. (See powers of Visiting Justice, sections 12 and 13 of 4 Vic. No. 29, and regulation 13).

Cellular separation, or "separate treatment," is a part of the prison system, and is the means whereby good discipline is maintained throughout the gaols of the Colony. It is the only effectual means whereby dangerous or refractory prisoners can be repressed and brought to a sense of their wrong-doing, when "solitary confinement" has failed to check or deter them from a persistent disregard of the disciplinary rules of the department, attempts to lead mutinies, continued quarrelling with their fellow prisoners, and such like offences. It is not recognised as punishment in the gaols. It carries no loss of remission, and, while undergoing it, the prisoners have a wholesome and sustaining diet, which was fixed by a Board of medical experts, including Dr. Manning, Dr. MacLaurin, and Dr. Maurice O'Connor. They

They work in their cells. When not working they have books to read, and are allowed exercise from an hour to two hours daily in the open air, and even for a longer time, if the surgeon thinks it advisable. They are visited daily either by prison officers, chaplains, or the surgeon, who is required by the regulations to carefully watch them, and, in the event of his perceiving any injurious effects, either physical or mental, he is empowered to at once place them in association, which is duly reported to the Comptroller-General. Their treatment is surrounded by ample safeguards, full power, as I have said, being given to the surgeons as to exemption, extra diet, and exercise. The surgeons are now very careful in the exercise of these functions.

By the regulations in force, prisoners are classified as under:—

1. Prisoners under sentences of penal servitude, or of imprisonment with hard labour, of five years and upwards.
2. Prisoners convicted of felony or misdemeanour, and sentenced for lesser periods, either to penal servitude, or to imprisonment with hard labour.
3. Prisoners under sentence of imprisonment only, and persons detained during Her Majesty's pleasure.
4. Prisoners awaiting trial, or under examination.
5. Lunatics, comprising persons supposed to be of unsound mind.
6. Debtors, comprising persons confined for contempt upon civil process.
7. Prisoners who are youths not exceeding 25 years of age serving sentences not exceeding twelve months, with or without hard labour.

It is, however, competent for the prison authorities, under the regulations, to associate any convicted prisoner with a class other than his own. The prescribed classification is therefore not adhered to in cases where it is deemed desirable or necessary to alter it. So far as the accommodation in the different gaols will permit, the prisoners are classified according to these regulations, and also with due regard to nature of offence, age, and previous history, as far as they are known to the gaol officials. Nothing is more difficult than to effectively and judiciously classify prisoners, and a wide discretion is therefore given to the officer in charge of each gaol. Unfortunately, as before stated, the necessary accommodation is absent from most of the gaols, and it is therefore impossible to fully carry out a proper system of classification. These defects are, however, being gradually remedied by additions and improvements to the country gaols. All prisoners of the 7th class (boys and youths) are dealt with under strict conditions of separate treatment, in order to prevent contamination.

The discipline is both deterrent and reformatory in character. Deterrence is aimed at by strict conditions, especially in the earlier periods of sentences; and reformation by the employment of chaplains to teach the principles of morality and religion, by libraries, and by strict rules of regular hours, cleanliness, sobriety, and industry. Prisoners who have previous to conviction been idlers and loafers are taught useful work of some kind, to assist them to make a living on their discharge, and they are also, under certain rules, enabled to earn money, gratuities, and bonuses up to the end of their sentences, to aid them in making a fresh start in life.

They are also allowed certain indulgences, including allowances of tea, sugar, and tobacco, in all gaols, according to length of sentence and servitude, and also subject to good conduct. By means such as these, and by a liberal remission scale, which ranges from one-sixth to one-fourth of sentence, according to its length, hope is encouraged and kept alive among the prisoners. Schooling is provided in the larger prisons for prisoners who come under the rules in force. The education imparted is elementary only in character. No rule of silence, such as is in force in England, exists in the gaols of New South Wales.

The punishments usually resorted to are the solitary cell, the dark cell, loss of remission, or deprivation of indulgences for certain periods. Corporal punishment is inflicted in extreme cases, such as offences accompanied by violence, and efforts to raise a mutiny.

The prison system of the Colony does not include afflictive labour, such as the tread-wheel, shot-drill, and crank, as is the case under the English system; nor is contract labour in any form allowed as in America, where it has led to such abuses and destruction of all proper discipline. All the work performed by the prisoners in New South Wales is useful or industrial in kind. A diversity of industries is preferred to confining the labour to a few trades, but prisoners are employed in keeping land reserves in order and in the digging, trenching, &c., of gaol grounds, where such work is procurable, and *the necessary guards can be provided*. The labour is managed solely by the administration, and includes stone-cutting, stone-breaking, tinsmithing, blacksmithing, carpentering, painting, mat-making, brush-making, book-binding, bootmaking, tailoring, cabbage-tree hat making, &c. Most of the work connected with additions and improvements to the prison premises is performed by prisoners. The articles produced in the workshops are used principally for the Public Service, and in supplying the requirements of the different gaols and their inmates, and also of the Lunatic and other Asylums. The officers' uniforms, boots, &c., are all made in the gaols, the material being supplied by the Government Stores Department. Much difficulty is, however, experienced here as elsewhere in obtaining suitable work for prisoners confined in the lesser country gaols. There is great jealousy of any sort of competition with free labour, and it is of course impossible to find any description of productive work for prisoners, which will not, more or less, compete with that performed by free labourers. The labour returns from the different gaols, however, give in the aggregate, very good results. The net value of all kinds of work done by prisoners, including labour performed for the internal requirements of the gaols, during 1894 and 1895, was respectively £51,827 and £51,797, exclusive of work done in the construction of the breakwater at Trial Bay.

In consequence of the vast extent of the Colony, and the necessity for the convenience of the public, as before explained, of maintaining small prison establishments in townships scattered over its surface at considerable distances apart, the administration has to contend with very great difficulties, and the cost of the Prisons Department is very much greater than would be the case if prison staffs and prisoners were concentrated in a few large fully organised prisons to hold, say, 400 prisoners each. Such a system presents many advantages over the present one as regards economy, classification, discipline, and labour. I am not in favour of prisons with more than 400 single cells, as no Governor could, in my opinion, properly and effectively supervise a greater number of prisoners than 400 with the staff of officers necessary for complete control, who should also be carefully overlooked and instructed, in order to see that they are not too harsh or exacting in their management of the prisoners committed to their care. Upon the officers of a gaol everything depends in the carrying out of a good system. With careless, indifferent,

indifferent, or indiscreet officers, no system, however near to perfection, can succeed. No Comptroller-General or Inspector-General (whatever his designation might be) can hope to succeed unless he receives from his subordinates of all grades a loyal, intelligent, and vigilant support in the carrying out and observance of the Regulations and General Orders of his Department. This is where his greatest difficulties lie. The head of the Prisons Department has frequently to bear the blame for the neglect, indiscretion, or careless actions of some officer or officers of a gaol at a distance from his head office, and almost every trouble that occurs in a gaol, and which is made public, is by some people (who are prompted, no doubt, in many cases by relations of prisoners or by ex-prisoners), made the ground of an attack upon the whole prison system and its administration, as if it were an easy and simple matter to secure the faultless administration by the whole of the officers of a perfect system of prison discipline and management, under which no trouble would ever arise. This is my experience, at any rate.

In my Annual Report to you for 1894 I made the following remarks regarding country gaols:—

“The accommodation of some of the distant country gaols was for a time severely taxed owing to the increase of prisoners whose committals to gaol arose out of the shearing troubles, notably, the gaols at Broken Hill, Forbes, Wilcannia, and Walgett, where the staffs were hardly sufficient to properly guard and supervise the number of prisoners in confinement. To Walgett it was found necessary to despatch from Sydney three experienced warders to assist in the management of the gaol, pending the trial of the prisoners at the Quarter Sessions Court. The necessity for gaols in the outlying districts of the Colony (which has sometimes been questioned) has been strongly proved during the last two or three years. They add considerably to the expenses of the Department; but if law and order are to be properly enforced throughout the country districts, it is absolutely necessary that secure and efficiently-staffed places of detention for prisoners awaiting trial on the spot, or under short sentences, should be maintained at the public expense.

“Since most of the gaols were constructed, the population of the Colony has greatly increased, and with it there has also taken place a considerable advance in the number of prisoners for whom proper accommodation is required, thus leading to much over-crowding, which is remedied, as far as practicable, by transfers from one gaol to another, at, of course, considerable expense and inconvenience. This Colony has no protective law against the admission of criminals from other countries and colonies, as is the case in Victoria, where there is in force an ‘Influx of Criminals Prevention Act’; consequently, numbers of habitual criminals come to New South Wales from Victoria, while discharged prisoners from this Colony are debarred from entering Victoria, unless they choose to run the risk of being arrested and committed to gaol, if identified, simply for being within that Colony.”

Having given this explanation of what our prison system is, and having briefly indicated some of the great difficulties surrounding its administration, I will now proceed to deal with a few of Mr. Fraser's remarks.

I will pass over his reflections upon what he terms the “somewhat mechanical system of administration” which (he alleges) “has a tendency to gather into its own hands control of every kind,” “and to shut out from the cognizance of the public and the Minister responsible to the country for proper prison administration, much light which would otherwise be thrown upon the working of prisons,” &c., &c., as being absurdly incorrect, and unworthy of further notice. But as regards his suggestion that all the general orders issued by the Comptroller-General should be laid before Parliament, or in some other way made public, I may say that I cannot conceive what benefit would arise by inflicting upon Parliament or the public (who would be ignorant of the reasons which necessitated such orders), all the petty details of the management of the gaols that are contained in the general orders issued from the head office, under regulation No. 3, and which are liable at any time to be withdrawn, or altered, by the Comptroller-General, as the circumstances of the day may require. If such details of the management of the Prisons' Department should be laid before Parliament, so ought the general orders of the Military, the Police, and the Lunacy Departments, all of which are, like the Prisons' Department, disciplinary services under the control of officers with certain statutory powers and responsibilities. But Parliament is not the place for recording such general orders, which are at all times open for the information of the Ministerial Chief, if he wishes to see them.

As a matter of fact, in July, 1892, the whole of the general orders of the Prisons Department, which had been issued at different times between August, 1867, and July, 1892, were carefully revised by me, and so amended or struck out altogether as the altered circumstances of the day required. They were then arranged under proper headings, printed at the Government Printing Office in cloth bound volumes, fully indexed, and distributed to all the gaols in the Colony for the information of the officers, and several of the volumes were, at the same time, sent to the Ministerial office for the information of the Minister of Justice. What more could reasonably be required? The new general orders and the alterations to the existing ones, which, in the course of my administration I found it necessary, for various reasons, to issue after the publication of the volume referred to, are always ready for the Minister's perusal at any time he may wish to see them. Under the necessities of authority and discipline, and in view of the statutory responsibilities imposed upon him by the Prisons Act of 1874 (37 Vic. No. 14, sec. 4), the Comptroller-General cannot be expected to submit every general order to the Under Secretary before he issues it. The case might be one of urgency. Moreover, the Comptroller-General's position is above that of a head of a branch in the Ministerial office of the Justice Department under the Under Secretary.

Mr. Fraser thinks that the Visiting Justices, and all the paid surgeons and the gaol chaplains of the various denominations should be allowed to communicate direct to the Minister of Justice their views on gaol matters, and any suggestions that may occur to them as to the treatment of prisoners, without sending their reports through the Comptroller-General, who is the officer responsible by statute to the Minister for the care, control, and direction of the gaols. So far as the Visiting Justices are concerned, this right is secured to them as *unpaid officials* charged with duties of a ministerial, as well as a judicial character under regulation 13 (see paragraph 9 of that regulation). To give such a right to the paid chaplains and surgeons who are, under the regulations, bound to observe the disciplinary rules of the gaols, and to be subject to the Comptroller-General for the regular performance of their duties, would be a most unwise and unheard of proceeding, and one which would not only be productive of much confusion and misunderstanding between the Minister and the prison authorities, but would also be destructive of proper discipline. It would also discredit the authority, and weaken the position of the Comptroller-General. In their report, the English Prison Inquiry Committee suggested that the Prison Inspectors should

should report direct to the Secretary of State, and, in replying to this suggestion, the permanent Prison Commissioners say that "to appoint an intermediate authority between the Secretary of State and the Commissioners who aid him under the Act, would be to introduce a startling and novel principle, would degrade the Commissioners, and seriously impair their dignity and prestige, and weaken their administration." It is always open to the surgeons and chaplains of our gaols to make any recommendations or suggestions to the Minister that they may desire him to consider; but they are very properly required by the regulations to send their communications through the Comptroller-General, who forwards them to the Under Secretary for the information of the Minister. I could cite cases in which much trouble and friction have arisen through a disregard of that regulation.

On page 3 of his paper, he speaks of the age of the present Principal Prisons Act, but quite overlooks the fact that, under the regulations and general orders which have been issued from time to time, great improvements in the system of management of the gaols have been introduced. Compare our gaols now with what they were, according to the evidence then obtained, when the Commission of which Mr. (afterwards Sir Henry) Parkes was Chairman made its inquiries in 1861, and also the Berrima Gaol Commission, with Sir George Innes as Chairman, in 1878. Could anyone truthfully deny that great improvements have not been carried out since those Commissions held their inquiries? The Prisons Acts may not have been materially altered since the present Principal Act was passed, but most certainly the system of management of the prisons and prisoners has undergone very great improvements and modifications.

By implication, Mr. Fraser makes it appear as if "the remission of sentences" as an "incentive to reward for good conduct" was first provided for under the Criminal Law Amendment Act of 1883. Surely he must have entirely forgotten that under the regulations which became law in February, 1867, full provision was made for remission of sentences exceeding twelve months, such remission (as already herein pointed out by me) ranging from one-sixth to one-fourth of the sentence, according to its length. Provision was also then (1867) made for the granting of special remission in exceptional cases, or when a prisoner's conduct in gaol has been strikingly meritorious. As regards the general treatment of prisoners, could anything more liberal than our present intermediate prison at Trial Bay be wisely adopted?

Treatment of Prisoners.—Reformation.

At the foot of page 5, he says: "It appears to me that these views of the Commissioners might apply strongly to the somewhat analogous state of affairs existing in the prisons of this Colony, and that, while under the prevailing system no effort is spared to secure strict compliance in every little detail with the prison regulations, sufficient consideration is not given to the more important question of reformation, *further than the enforcement of an iron-handed system of disciplinary control,*" &c. This must mean that, according to Mr. Fraser's notions, our prisons are governed by a system of "iron-handed discipline," a phrase which, I think, he must have borrowed from the representations of some ex-prisoner, who doubtless did not relish the strict and exact discipline to which he was properly and necessarily subjected during his incarceration. Anyhow, it is a gross misrepresentation of the treatment to which prisoners in our gaols are really subjected. Every prisoner has a right to complain of his treatment by the subordinate officers to the gaoler, and from the gaoler he can complain to the Visiting Justice, the Comptroller-General of Prisons, or the Minister of Justice, if he so desire. You, Sir, know well that the term "iron-handed disciplinary control" cannot truthfully be applied to the system under which our gaols are managed. You have visited with me at different times the following gaols, viz.:—Darlinghurst (twice), Bathurst (twice), Parramatta, Goulburn, Maitland, Biloela, and Dubbo, and satisfied yourself by personal inquiry on the spot that the prisoners of the different classes were properly treated according to the regulations. By persons ignorant of the principles of prison management according to modern ideas, no doubt the "separate treatment" of prisoners is looked upon as a severe system; but as I have fully dealt with this subject in my report of 11th June last, I will not here say any more about it than that the principal civilised countries in the world have either adopted it, or are advocating its adoption, as the only means of preventing the ruinous and contaminating effects of the association of prisoners either in yards or cells.

It must be borne in mind that reformation of the offender is not the principal object of his incarceration. It can never be expected that the punishment of incarceration, however near to perfection the system may be, will transform a criminal into a law-abiding, honest man, *because it can only touch him after he has become criminal and anti-social in character as a free man from causes entirely beyond the control of any prison system.* In order to prevent crime, it is necessary to punish the offenders. In all sentences preventive justice comes first in consideration and reformatory justice second. The protection of society and the repression of crime demand first consideration. The views of hyper-Christian philanthropists must not be allowed to displace common-sense measures of precaution and repression in the treatment of criminals. In my Annual Report for 1891, I dealt with this subject in the following terms:—

"It has also been stated that our gaols hopelessly fail in reforming criminals, and it has therefore been assumed that the system is a bad one. Our prison system under the regulations in force is based upon what is acknowledged to be the best model that is known, viz., Sir Walter Crofton's Irish system; but owing to the want of adequate accommodation and other difficulties to which I have referred, it has been hitherto found impossible to fully carry it out. So far as the means at disposal will admit, every stimulus to reformation is offered to prisoners, without dispensing with the necessary deterrent portion of their treatment. It is obvious that nothing should be done to destroy the deterrent effect of imprisonment by making the gaol attractive to its inmates. A strict and close discipline of a humane kind must always be maintained over them. In a great number of cases, the benefits that a prisoner may have derived from his disciplinary and industrial training in a well organised gaol are soon destroyed by the many evil influences and temptations which beset him on his discharge. These are too well known to require enumeration here. The difficulty of finding employment is also a great cause of relapse into crime."

"In connection with the subject of the reformation of prisoners in gaols, I may here give an extract from a report of the 'State Board of Prison Directors,' of California. After summing up the many causes of crime, the Directors write as follows:—

"'Nevertheless, in the face of this, not a few persons stand up to denounce the State prisons of California as 'nurseries of crime,' for which the prison officers are solely responsible, because they have not accomplished what all the moral and christianising forces of civilised society and the denunciations and penalties of the criminal law have failed to accomplish, viz., the prevention of crime and the complete reformation of criminals.'"

"When

"When any State prison can be found, or any system of prison discipline devised, by which to effect a general reformation, or regeneration of the convict—when all the moral forces of society and the terrors of the penal law cannot prevent crime—we may reasonably expect the millennium to be near at hand."

"These remarks apply also to what has been said of the prisons of this Colony.

"A large number of cases, either of forgery, embezzlement, or conspiracy to defraud, in connection with various monetary institutions, have been dealt with by the Courts of this Colony during the last two years, and, in the great majority of these cases, the persons who were found guilty had not been previously convicted. They were not 'gaol-manufactured criminals.' It is almost unnecessary to repeat that there is also a large class of persons upon whom no system of disciplinary and reformatory treatment can produce permanently good results, owing to their naturally weak and dishonest natures."

The Rev. W. D. Morrison, a well-known English prison chaplain, thus speaks of reformation as an object of punishment:—

"Punishment is only a means, say some; its real end is the reformation of the offender. The practical application of such a principle would lead to very astonishing results. It is perfectly well known that there is no more incorrigible set of offenders than habitual vagrants and drunkards. And, on the other hand, the most easily reformed of all offenders is often some person who has committed a serious crime under circumstances which could not possibly recur.

"According to the theory that reformation is the only end of punishment, petty offenders would be shut up all their lives, while the perpetrator of a grave crime would soon be set free. An absurd result of this kind is fatal to the pretension that punishment is merely a means, and not also an end."

Individualisation of Prisoners.

On page 6, Mr. Fraser quotes from the English Committee's report in favour of the reformatory influence of the "individualisation of prisoners" and "classification,"—the system should be made more elastic, more capable "of being adapted to the special cases of individual prisoners." In order to secure this, it is suggested that warders and outside helpers could be trained to it. This suggestion has been dealt with by Sir Edmund du Cane, K.C.B. (late Director-General of Convict Prisons and Chief Commissioner of Local Prisons in England) in the following terms, which I will here quote in full, as they appear to me to be an excellent answer, and one which discloses the insurmountable difficulties of successfully carrying out such a suggestion:—

"If the prison treatment of each prisoner is to vary according to the opinion of each of the higher officials, and of the warders and outside helpers in each case, it certainly would be free from the reproach of uniformity which it has always been considered desirable to aim at, but would fall into the opposite extreme of anarchy. The principal object of the Prison Act, 1865 and 1877, would be defeated, and no Court of Justice could know the effect of the sentences it might pass. The most plausible prisoners would be the best treated. The man with outside influence and money at his command would find means to soften the heart of some warder or outside helper, and rules would be useless, because they could be set aside at the judgment of the various minor authorities. No more potent source of discontent and insubordination could be devised than these proposals. The Committee have adopted from some writer the prejudicial phrase 'cast-iron uniformity.' Sufficient inquiry would have shown them that there is no such thing, though it is certainly made difficult to get a rule set aside, and it is very proper that it should be."

"Nothing sounds wiser than to propose a 'sound, wise system of classification' similar to that by which hospital patients are classified and kept separate according to their ailments and requirements; but moral ailments and the causes of crime have not yet been definitely agreed upon and classified, as in the case of physical maladies, and it certainly would need almost superhuman insight in order to diagnose each prisoner's moral ailments (with no assistance from him, and probably every disposition to deceive), especially in the time available, and to classify him accordingly, and to bring the cure to operate when he has been classified. The most sanguine person would hardly hope to do this in six months, so that this proposed system would only apply to under 2 per cent. of the persons sentenced."

Elmira Adult Reformatory System.

Mr. Fraser seems much in favour of introducing the Elmira Adult Reformatory (New York) system into the treatment of our criminals—a system which I have seen described as combining "the material comforts of a Temperance Hotel with the intellectual luxuries of a Mechanics Institute." Under such a system as this of "Elmira," the term of the sentence to be served is determined, not by the judge who tries the prisoner in Court, but by the Board of Prison Managers under whom the prisoner is placed; in other words, the functions of a judge are transferred to a Prison Board of Managers or philanthropical authorities, who decide among themselves when the murderer, burglar, or garrotter who has given them an assurance that he is reformed is to be set free. However good it may seem in theory, this system does not appear to have been productive of satisfactory results in America, and it may not be out of place for me to here give some extracts from the reports of the Howard Association (England), which is a powerful association, having for its objects the promotion of the best methods for the treatment and prevention of crime.

Extract from Annual Report of Howard Commission for October, 1892.

"In the United States, unhappily, nearly all the prisons of every class are conducted on the association plan, and, consequently, there is a great development of crime in that country. Ex-President R. B. Hayes, speaking at a Prison Congress at Pittsburg last year, said: 'The gaols in our country are in most cases compulsory schools of crime.' 'Prisons, if so constructed and managed as to keep their inmates separate, would afford an adequate remedy for the evil.' But this extreme of mischievous association in gaols, and even in the so-called adult 'reformatories' in America, is not the only evil prevalent in that country. There is too generally a most mischievous pampering of criminals, both in common gaols and also in the 'collegiate and hotel prisons' or 'reformatories'; indulgences in the way of food, amusements, recreation, and general comfort are granted, such as millions of poor honest workers can never hope to obtain for themselves. Thus crime is made attractive. The Howard Association has endeavoured, especially through the American newspaper press, and by other means, to direct much attention to this evil; and many influential persons have expressed their appreciation of these efforts."

"Dr. Dana, of Lowell, writing the same month (May, 1892) on the labours of the Howard Association, observes:—'If we inquire for some of the causes of our increasing crime, we find that it is owing to the mutual corruption of prisoners by association, and the unwarranted leniency with which criminals and vagrants are treated.'

"Captain Joseph Nicholson, the veteran Governor of the self-supporting prison of Detroit, United States, reports, in 1892, of the collegiate class of prisons:—'The so-called reformatory 'isms' that are now so popular as being high philanthropic measures, only teach criminals that crime is not infamous, and can easily be atoned for by an exhibition of contriteness, or scientific acquirements.'

"Mr. Richard Vaux, the President, for many years, of the Board of Inspectors of the Pennsylvania Eastern State Prison, writes to the Howard Association, 9th June, 1892:—'Let me thank you for your paper on the collegiate and hotel prisons of the United States. It will do great service. I have read it, as I do all your reports, with great interest. The criticisms you make on the theories of sentimentalists in prison management are wise and just. It is almost impossible in many of the United States to punish for crime. The first impressions, in what is called 'the public mind' are against punitive laws courageously administered. The prisons are bad, and those who deserve to be prisoners are allowed to escape their deserts.'

"Perhaps no one in America can speak with more authority on these matters than Mr. Vaux. The prison of which he is chief director has long maintained an exceptionally good record.'

"A single native testimony speaks volumes. On 15th August, 1892, the Honorable Andrew D. White, United States Ambassador to Belgium, delivered a lecture at Chautauqua, New York, on murder in the United States. The *Times* reports that 'he said that the number of deaths by murder in the United States of America is more than double the average of the most criminal country in Europe. Year after year that number increases. Even Italy and Corsica, where crimes of violence are frequent, are below the United States in the proportion of murders to the population. Four thousand murders occurred in the United States during 1890, and in 1891 the number increased to nearly six thousand. The greater number of men who committed these crimes are still at large.'

"Perhaps many Americans will admit the weight of this authoritative testimony. Yet, for their murderers and violators of women, they continue to provide first-class hotel fare in so-called 'reformatory prisons,' with bands of music, military drill and titles, the teaching of fancy trades; in a word, pampering by all manner of ways, and finally, under the plea of 'indeterminate' sentences, reducing the maximum imprisonment nominally to five years, but practically, and in most cases, to half that term. For opposing this mischievous system, the Howard Association has been angrily abused by so-called 'philanthropists' in America. Far different was the genuine philanthropy of the hard-headed, but warm-hearted, John Howard.

"As to the luxurious dietary in many American gaols, the excuse is made that 'our people are accustomed to better food than Europeans.' Well, this may be very proper for those of their people who are honest and self-supporting; but to give atrocious criminals better food and more comforts than the toiling honest man is a mischievous unwisdom.

"Whenever the hand of justice becomes slack, or the 'power ordained of God' ceases to inflict adequate punishment on evil-doers, private revenge and lawless retribution take its place. Hence, the murders and lynchings so frequent in America, which is only beginning to reap the first recompense of morbid sympathy with law-breakers, and indifference to the sufferings of their victims.

"When the Americans retort that many of their murderers come from Europe, they may be reminded that, even if so, these criminals were far more effectively restrained, until they left the Old World for the New.

"The sheet-anchor of the advocates of the 'collegiate and hotel system' in their statement—'We reform 80 per cent. of our men.' It may be that by an immense expenditure in money and organisation, situations are found for nearly all the discharged men from Elmira; and for a year or two many may retain them. The statistics prove little more. But even if 80 per cent. are thus provided with situations, any system under which either religious influences are admittedly regarded as of minor efficacy, or where the elements of fear and contrition are largely or wholly ignored, can hardly be said to be even 'reformatory' in any true sense. Prosperous liberated rogues are not really 'reformed' by any system which produces no repentance, or no fear of evil-doing. For every ten prisoners thus 'reformed,' one hundred of the morally weak will probably be encouraged to commit crime.

"An American jurist, Mr. William P. Andrews, of Massachusetts, is hence fully warranted in writing to the Howard Association (4th December, 1891), 'Keep your people out of our abyss of folly.'"

Extract from the Annual Report of the Howard Association for October, 1893.

"There are very few prisons in the United States where separation is enforced. Consequently, the numerous revolts, escapes, and fatalities. Consequently, also, and much worse for the community, there is a terrible prevalence and increase of crime in general. The murders in the United States of late years have been as follows:—1,808 in 1885, 1,499 in 1886, 2,335 in 1887, 2,184 in 1888, 3,567 in 1889, 4,290 in 1890, 5,906 in 1891, and 6,791 in 1892. This indicates a terrible state of social disorganisation over wide areas; one far too serious to be checked by the new American style of 'collegiate and hotel prisons,' which is nevertheless so unwisely praised by too many persons on both sides of the Atlantic, who appear ignorant of the ultimate tendency of thus indulging criminals."

Mr. Brush, warden, of Sing Sing Prison, read a paper at the Prison Congress, at Cincinnati, in 1890, as to the wisdom of the indeterminate sentence, and, *inter alia*, said:—"Prison discipline, to be of any use, should not only make the prisoner subordinate, but should improve him physically and mentally, and also be of such a nature as to give him a character to control himself when released from prison; for it is a curious fact that many, if not most, of our worst criminals are our best-behaved prisoners. This shows conclusively that it is nearly, if not quite, impossible for prison officers to judge from the conduct of a man in prison what his conduct will be when he is released from prison. This is the strongest argument, to my mind, against the indeterminate sentence, for if a man is to be released upon his good behaviour in the prison, and his apparent reformation while there, we may, and very likely will, release many of our worst criminals, while men of lesser tact, who transgress the rules from want of firmness and decision, would remain in prison for a long time, if not for life."

These extracts appear to me to furnish strong grounds for the belief that such an indulgent and very expensive system as the Elmira Adult Reformatory is not a desirable one to introduce into this Colony.

Seventh-class Regulations.

I now come to the treatment of seventh-class prisoners (boys and youths) in our gaols, which is so adversely criticised by Mr. Fraser, who must be well aware of the circumstances that led the then Minister of Justice (Mr. R. E. O'Connor) to cause the regulations governing that class of prisoners to be framed and gazetted in April, 1893. During 1892 and part of 1893, in consequence of the outrages and impudent thefts which were being perpetrated by boys and youths of the larrikin class, the whole of the Press repeatedly and earnestly advocated the introduction of sharp and stern measures for checking the prevalence of those crimes. Mr. O'Connor introduced into, and carried through, the Legislative Council his "Disorderly Conduct Suppression Bill," in 1892; but it did not get further than this. He then conferred with me as to whether the then seventh-class regulations, which had been introduced by my predecessor (the late Mr. Harold Maclean), in 1888, could not be made more deterrent. Although they provided for strictly separate treatment, they were in other respects so mild as not to have proved effectual in checking the influx of youthful criminals to our gaols. The result was that, after very careful consideration and several consultations with the Visiting Surgeon of Darlinghurst Gaol and myself, Mr. O'Connor caused the then seventh-class regulations to be so amended as to make them more stringent, and submitted such amended regulations to the Executive Council, by which they were passed, and they subsequently became law on the 17th April, 1893. These are the regulations which Mr. Fraser has now attacked.

On the 10th July, 1893, a large public meeting was held at the Town Hall (Sydney), when the necessity for urging the Government to take proper steps to cope with, and put a stop to, the pest of juvenile crime and larrikinism, which had become an intolerable nuisance both in this city and elsewhere, was discussed, and a deputation, consisting of the Mayor (Sir W. P. Manning), the Hon. A. J. Riley, M.L.C., Mr. J. H. Carruthers, M.P., Rev. G. Bennett Anderson, Alderman Playfair, Mr. W. Rigg (Mayor of Newtown), and Mr. Charles Bull, was appointed to wait upon Sir George Dibbs (then Premier), which they accordingly did on Saturday morning, the 15th July following. They met with very full sympathy and support from Sir George Dibbs, who spoke strongly against the past leniency and sympathy which had been shown to criminals, and, *inter alia*, was reported to have said that "with regard to the treatment of prisoners in gaols, there was no doubt that the foolish sympathies of some led the gaol authorities in the past to make the internal discipline far too easy and pleasant for offenders, and the inmates had left the doors invigorated and refreshed by their sojourn inside the walls, rather than sorrowful and downcast. But the regulations had now been altered in such a manner that anyone who went inside a gaol would find it anything but a nice 'boarding-house,' as the larrikin class delighted to term it." He also said that "until the people strengthened the hands of the Government through Parliament to make gaols places of punishment, so long would crime exist."

Some discussion has since taken place on the subject of those regulations, but no proof has yet been furnished that they have had any other than very good effects in the repression and disciplinary training of the youthful criminals who have been subjected to the treatment which they prescribe. All the officers in charge of gaols have spoken very highly of the effects of that treatment. In speaking of those regulations in my report for 1893, after describing them, I concluded as follows:—"It is hoped that by the stringent nature of this treatment, juvenile crime and 'larrikinism' in their first stages will be effectively checked. Short sentences carrying such treatment should be much more effectual than long ones under the old conditions of servitude. To be deterrent, the punishment must be made a really genuine one.

"In its application to youths under 16, this treatment is intended more for the incidental offenders than for the vicious and incorrigible youths. It is recognised that a chance offender, whose crime was committed through recklessness, passion, or the force of bad example, requires penitential discipline only; while the youth who has shown by his depraved and vicious habits that he is incorrigible, should be subjected to lengthened detention and treatment of a disciplinary and instructive character in a reformatory, with plenty of hard work, chiefly in the open air. To place youthful first offenders in a reformatory for a long period would, as a general rule, be an unwise and an expensive proceeding, entailing heavy expense on the State, and relieving the parents of responsibilities which they should be made to bear. The discretion in such cases must, of course, be left with the Courts which deal with the young law-breakers."

I am not in any way influenced by Mr. Fraser's remarks to recommend that those regulations be either repealed or altered. Some day, perhaps, when the necessary funds are available, and under new legislation, a complete system of truant schools, industrial schools, and reformatories will be established in this Colony for the treatment of youthful offenders in various stages of criminal development. Until such a comprehensive system of treatment is introduced, it is probable that stern and sharp measures will constantly be necessary to keep larrikinism in check. So long as the Courts continue to sentence boys to gaol, the treatment must be made so uncomfortable for them as to act as a deterrent upon them, and thus prevent a repetition of their offences. Of course there are many cases of incorrigibles upon whom no system yet invented would have any good effect of a lasting character.

It will be remembered that an attempt was made early in 1895 to bring Mr. O'Connor's "Disorderly Conduct Suppression Bill" into force, but was unsuccessful; and, if Mr. Fraser's views were adopted, the active measures which Mr. O'Connor took in 1893 to suppress larrikinism and juvenile crime in the form of the present seventh-class regulations (for which on all sides he met with commendation) would be defeated; and gaol life would again be made comfortable and attractive, instead of disagreeable and deterrent. A prisoner is disgraced by the crime which he has committed, not by the punishment which he suffers for it. Until a penal reformatory has been established in this Colony, there is no other place than a gaol to which boys and youths under short sentences could be sent.

Books for Prisoners.

Mr. Fraser, on page 50, says that reading might be more "liberally allowed" in our gaols, and alludes to the fact that the Chief Justice had recently brought under the Minister's notice the question of allowing books to prisoners serving sentences of less than three months. As regards this matter, I may mention that, among the general orders issued by me some years ago, was one which reads as follows, and which is still in force:—

"(G.O. 136).—Limitation of Books to be kept in yards.

"In order to limit the number of books to be kept in the yards by prisoners, and thus prevent accumulation and facilitate the searching after musters, the Comptroller-General directs that the number of

of books shall be limited to four, as under:—One private book (prisoner's property), one library book, one prayer-book, one Bible."

"This rule is, however, not to interfere with the issue of such religious and instructive books as may be used by the respective chaplains in connection with their work."

"When a prisoner wishes to exchange a private book, the one he no longer requires shall be returned to the storekeeper, in whose charge it shall be kept."

It would never do to allow prisoners to keep all their private books in their yards. They must be kept with their other property in the gaol store. Two reading-books is surely enough to allow a prisoner at one time.

As regards the question of allowing books to prisoners serving sentences of *only three months and under*, I think, in justice to myself, I may here be allowed to insert my report to you, dated 7th May, 1896, in reply to the suggestion of His Honor the Chief Justice, that such short-sentenced prisoners should be allowed to enjoy the privileges of the gaol libraries. This is what I then wrote:—

"In consequence of reports made to him, my predecessor (the late Mr. Maclean) circulated a general order on 19th August, 1868, directing that books from the gaol libraries should not be issued to prisoners awaiting trial, and to those serving sentences not exceeding three months.

"When revising the whole of the general orders in June, 1892, I omitted the words 'prisoners awaiting trial' from the general order above mentioned, as I do not see any particular reason why committed prisoners, some of whom may be innocent, should not be allowed library books.

"The total number of prisoners serving the sentences of three months and under is always great (on 31st March last it was 732). It comprises a large proportion of incorrigible drunkards, vagrants, petty thieves, and such like offenders, to whom gaol life should be made as unattractive and monotonous as possible. The concessions should be very limited. These offenders are received into gaol generally under repeated short sentences, which appear to be quite useless, either as to deterrent or reformatory effects. Many of them enter the gaol in a broken-down or diseased condition from drink or other form of dissipation. The gaol is, in fact, a sort of clean and wholesome retreat for them to recover from the effects of their irregular lives when at liberty. (I venture to suggest that, in such cases, the sentences should be gradually accumulative, according to previous convictions; but, of course, this touches the judicial side of the question.)

"For prisoners under short sentences, penitential discipline chiefly should, I think, be resorted to. I do not think the issue of books from the library would have much effect, if any at all, in the way of reformation. The disciplinary effects of enforced regular hours and meals, enforced cleanliness, sobriety, orderly conduct, subordination, and employment on such work as can be found for them and for which they are fit, are all that we can trust to for reformation, outside the work of the chaplains.

To grant the use of the library books to such short-sentenced prisoners would greatly increase the wear and tear of the books, and would necessitate an augmentation of the annual vote. Many of them would probably ask for books, not from any desire to improve themselves, but simply because other prisoners were allowed to have them.

"For these reasons, I feel myself unable to recommend any alteration in the existing general order.

"Of course, all boys and youths under 25 (7th class) are allowed books by the special regulations governing their treatment, no matter what the term of sentence may be."

Special Gaol for Habitual Criminals.

Mr. Fraser thinks "it might be practicable" in this Colony to confine "all habitual criminals" in a gaol specially set apart for them. I have no hesitation in saying that it would certainly not be practicable to do this while such prisoners are dealt with in the Courts as they now are. Had it been practicable, I should long ago have taken steps to bring about such a very desirable change. A system of graded prisons, in which prisoners of the different classes could be distributed, is very easy to write about, but it would be impossible to bring it into actual existence in this Colony. The removal and transfer of the particular classes of prisoners from the Courts in all parts of the Colony to the special prison set apart for each class could not be carried out. Only those with long sentences could be removed, and it must be remembered that the greater proportion of sentences are short. Therefore, a great number of prisoners would have still to be detained in the nearest gaol to the Court at which they were tried. As I have said before, our Criminal Courts are scattered considerable distances apart all over the surface of this Colony.

In reference to the question of removing trial prisoners from one gaol to another, I reported on this matter on the 8th June last, in the following terms:—"When superior Courts are established, in practice it is found to be necessary that prisoners under remand or awaiting trial at such Courts should be kept on the spot, and, in practice, so must short-sentenced local prisoners. To remove trial prisoners to another district gaol (where they could not see their relatives and friends interested in their defence) pending their trial, and then to again transfer them back to the place of trial when the Court was about to sit, would, I consider, be an unwise proceeding, causing inconvenience and necessitating a great amount of travelling under escort. Further, to transfer all *short-sentenced* prisoners from the gaol at the place where they were convicted to another district would also be unwise. Many of them are boys and youths; some are females. Short-sentenced prisoners form a large proportion of the prison population."

Incorrigibles.

As regards the treatment of incorrigibles and "habitual criminals," who are either criminal by instinct or who have acquired their criminality by the evil surroundings of their homes and associations when very young, I think that the repeated short sentences which are so frequently given to this class of prisoners are a great deal worse than useless. It sounds very humane and kind to say, "Poor things, they are not responsible for their actions"; but if that be so, it must be remembered that their irresponsibility is just what makes them dangerous to society, and is the reason why they should be kept for long periods under restraint. The supreme duty of society is self-preservation, and this is what must be considered in dealing with habitual and incorrigible criminals who, when at large, have been properly described as the captains, the leaders, and the organisers of crime. They are the bane of all communities, and

and exercise a corrupting influence over others wherever they may be in free life. They earn their living by crime, and, in the interests of society, such criminals should be deprived of freedom and placed under restraint for long periods just as much as if they were lunatics, but, of course, under a different system of treatment.

In the second Annual Report of the Commissioner of Labour (Washington, U.S.), 1896, which deals with convict labour, the following recommendation appears on the subject of dealing with incorrigibles:—

“Incorrigibles should be sentenced to the State Prison for life. Community has no use for such. The chronic burglar, thief, embezzler, robber, or murderer should be given to understand that a limit has been set upon the privilege of pursuing his occupation. What is an incorrigible? The Commission favours drawing the line at a third conviction for felony. Less than that might possibly be unjust. More than that positively is not required to demonstrate a desperate and dangerous character. No more efficacious restraint could by any possibility be put upon the pursuit of grave crimes. Upon this point the Commission has spent earnest and exhaustive inquiry to ascertain the judgment of experienced prison managers, and with not one single exception have we found the man of experience to doubt the justness or desirableness of giving to incorrigibles a life sentence. Fortunately for all interested in this most important feature of prison reform, not only is precedent found, but the judgment of able writers is at hand in testimony of the propriety and benefits to be derived from such a law and practice.”

Mark Systems.

I am not in favour of an elaborate or complex system of marks for good conduct. I think that any mark system introduced into a gaol should be simple and easily recorded. An elaborate mark system is liable to be so administered as to become in the highest degree oppressive and exasperating to prisoners. It places too much power in the hands of subordinate officers who must be left to supervise the prisoners. Severe and exacting supervisors might use it as a powerful means of oppression and injustice, without regard to the constitutional differences or acquired capacities of the prisoners. Through ignorance, inadvertence, or incapacity on the part of the supervising officers, the grossest injustice and unfairness might be perpetrated, and a spirit of discontent and disaffection thus aroused in the minds of the prisoners to whom such an elaborate system was applied. Therefore, in my opinion, the simpler the system of marks under which prisoners' conduct-sheets are regulated, the better for successful management.

Prison Dietary Scale.

For information as to the dietary scales that are in force in our gaols, I would refer to the return which was laid before Parliament on 3rd July, 1895, and ordered to be printed, and is now attached to this memorandum as *Appendix A*. From that return, it will be seen that very careful consideration has been given to the subject by a Board of thoroughly competent gentlemen, of whom three were medical men.

Prisoners' Aid Societies.

As regards Prisoners' Aid Societies, they would be of very great benefit, if they could be successfully established and maintained in this Colony; but I fear that, for some time to come, there is no likelihood of their being brought into permanent existence. *To be of use they must be local* and largely aided by voluntary efforts; but in this Colony we have not yet got the men of wealth and leisure, such as are to be found in the counties of England, who would give their influence and pecuniary assistance in the formation and maintenance of such societies. Nearly the whole cost of maintaining those societies would therefore be thrown upon the Government in this Colony. In view of the numbers of unemployed men who have not been criminals, the question of the establishment of societies for aiding discharged prisoners is one surrounded by great difficulties.

Other suggestions which Mr. Fraser has adopted from the English Prison Committee's Report are equally difficult or impracticable, but I will not stop to deal with them in this paper.

One of the witnesses examined by the English Prison Committee of Inquiry was Mr. Michael Davitt who, as his evidence shows, had a personal experience of nearly nine years of penal servitude in England. During that period, he was at different times in the following gaols:—Clerkenwell, Newgate, Millbank, Dartmoor, Portsca, and Portland. When he was in New South Wales last year, he visited some of our gaols, and inquired into the existing system of prison management. When leaving the Colony, he expressed himself in writing to me, through Mr. F. B. Freehill, as being “very much pleased with what he saw of the prisons of this Colony.” Mr. Freehill also wrote to the late Under Secretary (Mr. Fraser), on the 14th October, 1895, stating that Mr. Davitt was desirous of obtaining a copy of the gaol regulations of this Colony “of the management of which he entertained a very high opinion from what he saw in the gaols visited by him.” When at Bathurst Gaol in September, 1895, Mr. Davitt questioned the Governor, Mr. Stace, very fully as to our system, and said that the English gaol system “had proved a failure owing to its severity,” and he observed, on going through the hospital at Bathurst Gaol, “There is something like humanity here; no luxuries, but comfortable.” He said that “in England, in a workshop like the tailors and shoemakers, there would be three or four warders constantly stationed with staves, and that all the warders were similarly armed on duty.” Finally, he remarked that our system “was far ahead of the English.” I mention this because Mr. Davitt was a man who understood what he was talking about from personal experience; and if our system had been one governed by “iron-handed discipline,” he would certainly not have spoken of it as he did to Mr. Stace.

Conclusion.

I do not claim that our prison system is a perfect one; but, after constantly administering the affairs of the Prisons' Department for six and a half years, during which period I have at different times visited and inspected the gaols, and interviewed many prisoners on various subjects, I can positively assert that it does not deserve the unfavourable comments which Mr. Fraser has passed upon it. There certainly is no need for alterations in the direction of pampering the prisoners, and making the gaols comfortable and attractive places for criminals, who include burglars, garroters, forgers, embezzlers, conspirators to defraud, swindlers, and other kinds of thieves for whom, I regret to say, too much sympathy is shown by many people. Their victims, whom they have robbed, or ruined altogether, get little or no sympathy.

There

There is great necessity for improving the means of properly carrying out the prescribed system, and this I repeatedly endeavoured to do during the period of my administration, as my many reports to the Ministers under whom I have served will show, and I have the satisfaction of knowing that, in many very important instances, my efforts to have the necessary improvements effected were successful. Other suggested improvements have been delayed owing to the inadequacy of the funds at disposal. There is still a great deal to be done in the direction of adding to the accommodation of our gaols, so as to admit of the single-cell system being carried out, and of increasing the number of yards for the proper separation of the different classes of prisoners. *The best system, in my opinion, would, however, be one under which prisoners would never be associated, excepting while at labour in the open air, or in the workshops, under proper supervision. They should take their three meals in their cells, and, on Sundays be allowed to take exercise for two or three hours under very strict supervision. When in their cells, they should, of course, be allowed books to read, as is the case with prisoners undergoing "separate treatment."* It would not be possible, however, to successfully carry out such a system as this in the absence of the necessary single-cell accommodation in the different gaols. A large expenditure would have to be incurred in additions and alterations to existing gaol premises before that system could be brought into operation. The following are the principal improvements which, as opportunity permits, should be effected. For some of them, we must look for assistance to the judicial side of the subject as well as the executive:—

- 1st. The association of prisoners in cells at night must be done away with as quickly as possible by increasing the cell accommodation in the different gaols wherever practicable.
- 2nd. Trial and remand prisoners should never be associated at any time with convicted prisoners. A trial yard should be provided at every small gaol where there is room for one.
- 3rd. Every opportunity should be afforded for disposing of the goods manufactured in the gaols, at prices to be regulated by the market rates of the day. The restrictions now placed upon the sale of the products of prison labour to the public should be removed, especially in the country districts, where it is impossible, under present conditions, to find suitable and useful work for the prisoners under sentence in the lesser country gaols. Nothing is more reformatory in its effects upon prisoners than regular and skilled labour.
- 4th. The Government Departments should give as much suitable work as possible to prisoners.
- 5th. Sentences of imprisonment only should be abolished, and all convicted prisoners should be compelled to work to a reasonable extent. Debtors should be included in this rule. This is one of the recommendations of the English Prison Inquiry Committee, and it meets the views of the Permanent Prison Commissioners. No man should be allowed to pass his time in gaol in idleness, excepting men who are awaiting their trial. Idleness breeds mischief and trouble, especially in large gaols.
- 6th. In the case of first-convicted men, the sentences should be shorter, and should be served in strict separation from other prisoners. A sentence of nine or twelve months passed in separate treatment would be far better than one of three years, the greater part of which would be passed in association with other criminals. In these cases, of course, due regard would have to be paid to the character of the offence, for, after all, the punishment of an offender must be measured to a great extent by the gravity of his offence.
- 7th. The present system of giving repeated short sentences to incorrigible and habitual offenders should be abolished, and the law should be so administered as to give sentences gradually cumulative upon previous convictions. This is especially necessary in the case of petty offenders, such as incorrigible drunkards and petty thieves. The trouble and expense of frequent prosecutions, as well as the damage to, or loss of, property of the victims, ought to be taken into consideration. The repeated short sentences are perfectly useless for either deterrent or reformatory treatment. It is hopeless to try to effect any good unless these unfortunate people are subjected to long periods of restraint. When the accommodation will permit, *men convicted of drunkenness only should be carefully separated from criminal prisoners.*
- 8th. The present conditions under which licenses to be at large are issued under the 409th section of the Criminal Law Amendment Act are unsatisfactory, inasmuch as there are no gazetted regulations governing the issue of such licenses. The consequence is, that there is no uniformity of treatment of prisoners in the granting of such concessions. I drafted and submitted, through the Under Secretary, regulations which appeared to me to be suitable, on the 18th January, 1892; but whether or not they were considered by the then Minister of Justice I cannot say. In dealing with this subject, it is necessary to bear in mind the effect that such licenses would have upon the intermediate prison system at Trial Bay, if the release of prisoners under license were to form a regular part of the prison system.

These are some of the most important alterations which I consider to be necessary in the improvement of our prison system in the direction of increasing its efficacy for the prevention of crime and social disorder. Legislation would, of course, be necessary before effect could be given to some of these suggestions.

In concluding this memorandum, I desire to explain that the delay in dealing with the paper of the late Under Secretary has been caused by my inability to give earlier attention to it, in consequence of the very heavy pressure of other and more urgent work which has devolved upon me since I received it from you.

GEORGE MILLER,
Under Secretary of Justice.

The Honorable the Minister of Justice.
31st August, 1896.

In view of the important character of the subject referred to in these papers, copies may be prepared to lay on the Table of the House for the information of Members and the public, and the papers resubmitted for the purpose of fully considering the several suggestions—many of which I fully concur with—made therein.—A. J. G., 22/9/96.

APPENDIX A.

1894-5.

Legislative Assembly.
New South Wales.

PRISON DIET.

(Return respecting.)

Ordered by the Legislative Assembly to be printed, 3 July, 1895.

RETURN to an Order of the Honorable the Legislative Assembly of New South Wales, dated 13th June, 1895, That there be laid upon the Table of this House,—

“Copies of all diet sheets and lists at present in use in the gaols of the Colony which regulate the dieting of the various classes and grades of prisoners, together with a statement from the Prison authorities showing on what dietetic principles the scale of dieting is based, and in what cases the ordinary diet is departed from.”

(Dr. Graham.)

MINUTE PAPER.

Subject:—Scale of dietary in Prisons—Order of Legislative Assembly, upon Dr. Graham's motion as to, dated 13th June, 1895.

Department of Prisons, Comptroller-General's Office, Sydney.

ATTACHED hereto are the following documents which contain the information sought for by Dr. Graham's motion:—

1. Copy of the scale of dietary now in force in the prisons of this Colony, regulating the ration allowance of the various classes and grades of prisoners.
2. Copy of the report of the Board, dated 28th November, 1888, which was appointed in May, 1888, to inquire into and consider the dietary scale then in operation.
3. Copy of letter of the Under Secretary of Justice, dated 7th December, 1888, approving of the adoption of the Board's report and recommendations, and conveying the thanks of the Government to the Members of the Board.
4. Copy of General Order 234 in further explanation of the ration scale.
5. Copies of General Orders 77, 78, 79, 80, 81, and 82, regulating the scale of indulgencies allowed to prisoners in excess of the ordinary rations.

It may be explained that the ration scale of Trial Bay Prison is an exceptionally liberal one, inasmuch as the prisoners are under modified conditions of servitude, and the work in the quarries and on the Breakwater is of a kind requiring a liberal diet.

GEORGE MILLER,
Comptroller-General.

The Under Secretary of Justice, B.C., 2/7/95.

[Enclosures.]

No. 1.

SCALE OF DIETARY IN PRISONS.

Schedule A.

Ration No. 1.—For prisoners serving sentences not exceeding six months:—

Bread (females, 8 oz.)	12 oz.	Salt	½ oz.
Maize meal	8 „	Soap	½ „
Meat	4 „	Rice (five times a week)	¼ „

*Vegetables (by substitution, chiefly in soup) . . . 8 „
* This applies to all rations.

† The Surgeon may order substitution apart from soap use.

Ration No. 2.—For prisoners after service of six months of sentence, and all prisoners in separate treatment:—

Bread (females, 10 oz.)	12 oz.	Salt	½ oz.
Maize meal	8 „	Soap	½ „
Meat	8 „	Rice	¼ „
Vegetables (females, 8 oz.)	12 „		

Ration No. 3.—Ordinary Labour.—Alternative ration on labour scale, as by Schedule B attached. For prisoners serving sentences not exceeding twelve months, exclusive of light labour:—

Bread (females, 12 oz.)	20 oz.	Salt	1 oz.
Maize meal	8 „	Sugar (ration)	1 „
Meat	8 „	Soap	½ „
Vegetables (females, 10 oz.)	12 „	Rice or barley	¼ „

Ration No. 4.—Harder Labour.—For prisoners employed on harder labour, as by Schedule B attached, and for prisoners on ordinary labour serving sentences exceeding twelve months:—

Bread (females, 16 oz.)	24 oz.	Salt	½ oz.
Maize meal	6 „	Sugar (ration)	1 „
Meat (females, 12 oz.)	16 „	Soap	½ „
Vegetables (females, 12 oz.)	16 „	Rice or barley	¼ „

Ration No. 5.—Solitary confinement:—

Bread	16 oz.
Soap	½ „

Ration No. 6.—For debtors, prisoners under civil process, awaiting trial, under remand, and detained as witnesses for want of bail:—

Bread	16 oz.	Salt	½ oz.
Maize meal	8 „	Soap	½ „
Meat	16 „	Rice	¼ „
Vegetables	12 „	Sugar	1 „

Ration No. 7.—For children of female prisoners above two and under eight years of age:—

Bread	8 oz.	Sugar (ration)	1 oz.
Meat	4 „	Soap	½ „
Milk	1 pt.		

Ration No. 8.—For children of female prisoners under two years of age:—

Bread	4 oz.	Sugar	1 oz.
Milk	1½ pt.	Soap	½ „

Ration No. 9.—Authorised to be issued to seventh-class prisoners according to regulations:—

Wheat bread	16 oz.	Sugar	1 oz.
Maize meal	8 „	Soap	½ „
Meat	8 „	Salt	½ „
Potatoes	8 „		

Daily scale of Rations for prisoners employed at the Public Works Prison, Trial Bay:—

1¼ lb. bread of fine wheaten and maize flour, in the proportion of ¼ of the latter; or			
1½ lb. bread of wheaten flour.			
Fresh meat	1½ lb.	Salt	½ oz.
Vegetables	1 „	Rice	1 „
Maize meal	6 oz.	Sugar	1½ „
Tobacco (weekly)	2 „	Soap	¼ „
Coffee	½ „	Tea	¼ „

Schedule B.—Labour Scale.

Male Prisoners.

(On completion of tasks or recommendation of overseer.)

Light Labour.—Oakum picking, hair picking, coir balling, and other like light work.

Ordinary Labour.—Boot-making, bookbinding, tailoring, brush-making, painting, sweepers and cleaners, cooks, yardsmen, servants, clerks.

Harder Labour.—Stone-cutting, blacksmithing, carpentering, mat-making, excavating, road-work, iron and tin work.

Female prisoners.

Light Labour.—Hair picking, oakum picking, and other like light work.

Ordinary Labour.—Needlework, knitting, sweeping and cleaning, servants.

Harder Labour.—Washing

NOTE.—The Officer in charge may, in relation to any particular work not above specified, place any prisoner on the ordinary or harder labour diet, and will report any such case to the Comptroller-General.

No. 2.

No. 2.
REPORT OF BOARD.

Sir,

Sydney, 28 November, 1888.

In accordance with the memorandum of instructions enclosed in your letter of the 14th May last (88/338), we have the honor to report the results of the inquiry with which we have been intrusted into the question of the prison dietary of the Colony.

The points to which we were desired specially to direct our attention were :—

1. The effects of the existing dietaries "upon the health of the prisoners, as well as their relation to discipline, to capacity for work, and to crime."
2. Whether "prisoners sentenced to short periods of imprisonment should be placed on a different diet from that of persons sentenced to longer periods."
3. Whether "in the event of the adoption of the principle of variation of diet with length of sentences, prisoners under long sentences should be placed at once upon the dietary belonging to such sentences, or should pass through these successive dietaries belonging to the shorter sentences."
4. Whether the diet now in force is sufficient, and not more than sufficient, to maintain health and strength; and to consider whether any rules can be laid down for establishing adequate checks upon the practice of ordering extra diets or for the guidance of Medical Officers on this point."
5. Whether, and how far, a reduction in diet can be made to secure the punishment for prison offences and under what system."

In pursuit of our inquiries, we have obtained reports from the officers in charge and surgeons of the principal gaols, and answers to communications addressed to the heads of the Penal Departments in the neighbouring colonies, with their dietary scales.

The whole correspondence forms an enclosure to this report. We attach hereto a revised scale which, in our judgment, would meet the penal requirements of the Colony in respect of preservation of health, effects in discipline, and capacity for work.

By the existing scale the dietary is entirely regulated on the principle of duration of sentence, and quite irrespectively of labour. This was found to be a great improvement on the formerly prevailing system of "no labour" and "hard labour."

After mature consideration, we have arrived at the conclusion that each system having its distinct advantages and fitness, it is desirable to weld them into the new scale in some modification of each, recognising both conditions.

There can be no question but that the conditions of treatment during limited periods can, with objects both deterrent and disciplinary, be made much more stringent, and that amelioration in some mode of necessity must form an element in dealing with sentences of longer duration.

We also think that, in a modified form, the allowance should advance with time—so the ration No. 1 gives the normal allowance, which is increased with servitude and the alternative labour scale.

From the information gathered, we are of opinion that the lowest time ration of the present scale, No. 1, is insufficient for sustaining constitutional strength, and for the performance of labour; and it would not appear that the very low ration (which provided $\frac{1}{2}$ lb. of meat weekly) has had, judging from the continual reconviotions of the class of petty offenders to whom it was allotted, the deterrent effect that was contemplated.

In the proposed scale, rations Nos. 1 and 2 recast the allowance on the lines to which we have referred, governed only by the principle of time and irrespectively of labour.

The labour question is dealt with in Nos. 3 and 4, and the schedule attached, which define "ordinary" and "harder labour," and the scale proposed seems to us to be only what is commensurate with the additional constitutional demand on the prisoner.

In comparing the scale of provisions in these Australian Colonies with those in the United Kingdom and foreign countries, it has to be borne in mind that here we are dealing with a community of liberal dietary customs, especially in respect of meat, and that some relevancy should be maintained in prison to the consumption outside. Further, in regard to meat—the most important item—a difficulty in comparison, and also in estimating the ration, arises from the difference existing in computing the allowance, by reason of meat being, under various systems, allotted with or without bone, and cooked or uncooked—thus, 1 lb. of meat as issued in this Colony, when cooked and bone deducted, means 8 oz.

In preparing our plan, due consideration has been given to the dietaries of the neighbouring colonies, and it will be found that our recommendations are in substantial accord with the system of Victoria, the colony whose conditions approach most nearly to those of New South Wales.

The adoption of the proposed scale will obviate the occasion for extra diet being authorised by the Surgeons, excepting in very exceptional conditions.

We think that the practice of allowing prisoners awaiting trial, and prisoners sentenced to imprisonment only, to provide their own food, as permitted by the present regulations, should be discontinued, and all rations for such persons be supplied by the establishment according to our proposed scale.

If this suggestion be adopted an alteration in the regulations will become necessary.

We have, &c.,

HAROLD MACLEAN,
H. N. MacLAURIN,
F. NORTON MANNING,
MAURICE J. O'CONNOR.

The Honorable the Minister of Justice.

No. 3.

Department of Justice, Sydney, 7 December, 1888.

Gentlemen,
I have the honor, by direction of the Minister of Justice, to acknowledge the receipt of your letter of the 28th ultimo, reporting the results of your inquiries into the question of the prison dietary of this Colony, and submitting therewith a revised scale of such dietary.

I am at the same time to inform you that the Minister has approved of the adoption of your report, together with the recommendations contained therein.

The Minister desires me also to convey to you the thanks of the Government for the great service you have rendered them in your painstaking labour in connection with this subject, and for the valuable information and suggestions contained in the report you have been so good as to favour him with.

I have, &c.,

ARCH. C. FRASER,

Under Secretary.

Harold Maclean, Esq.; H. N. MacLaurin, Esq., M.D.; F. Norton Manning, Esq., M.D.; Maurice J. O'Connor, Esq., L.R.C.S. Incl., Sydney.

No. 4.

GENERAL ORDER 254.

Rations: Explanation of.

THE following explanation regarding the application of the dietary scale is forwarded for gaolers' guidance :—

- No. 1 ration is for "light or non-labour" prisoners serving sentences not exceeding six months, and for first six months of sentence if serving longer periods.
- No. 2 ration is for "light or non-labour" prisoners after service of six months of sentence to end of same, and all prisoners in separate treatment not otherwise provided for.
- No. 3 ration is for "ordinary labour" prisoners serving sentences not exceeding twelve months, who will be placed on this ration as soon as classified.
- No. 4 ration is for "ordinary labour" prisoners serving sentences exceeding twelve months, and for "hard labour" prisoners, irrespectively of length of sentence. Both classes of prisoners will be placed on this ration as soon as classified.
- Nos. 5, 6, 7, 8, 9, and 10 require no explanation.

NOTE.—Prisoners awaiting classification for labour will be regarded as "non-labour" prisoners *pro tem*, and placed on ration No. 1. No. 5.

No. 5.

GENERAL ORDERS 77, 78, 79, 80, 81, AND 82.

Indulgences.

G.O. 77.)

Labour Indulgences.

WELL-CONDUCTED male prisoners, after a service of twelve months, are authorised, on completion of their allotted task, to receive weekly the following:—

- Scale No. 1.—4 oz. tea, 1 lb. sugar, 2 oz. tobacco.
- Scale No. 2.—4 oz. tea, 1 lb. sugar, 1½ oz. tobacco.

The prisoners eligible for full indulgences of tobacco are those in occupations mentioned in Labour Schedule A. Others, such as sweepers, cleaners, &c., fully employed in the work assigned to them, will be eligible for the lesser scale.

In cases where the work cannot be measured by task, the maximum, or as the circumstances may seem to justify, lesser portions of the indulgence laid down as above, may be allowed upon the recommendations for industry and good conduct of the overseer or other officer under whom the work is performed.

In cases of prisoners not completing their tasks, but who are specially reported by the overseer or other officer directing the labour as working hard and doing their best, they may be allowed the indulgence on the lesser scale, or a portion thereof, by the Gaoler. A list of all such cases must be kept.

A careful consideration is looked for from the officers making recommendations for indulgences.

In cases where by delay in supply of material, or other cause, prisoners are thrown out of work and there is no other work available, or are put to other work at which they do not earn the indulgence, the indulgence will be continued on the basis of the allowance they obtained the previous week.

If the Gaoler think it desirable in a particular case, a special-treatment man who is behaving well may have indulgence, if earned, or if he has been taken from work at which he was earning it. This will not, however, apply to prisoners placed in separate or special treatment for coercion, in which case they will not be allowed any indulgence during the time of their punishment for coercion.

Smoking in working hours is strictly prohibited. Tobacco will not be allowed to any prisoner, of whatever class, under the age of 21 (twenty-one) years.

(G.O. 78.)

Indulgences on Holidays.

WELL-CONDUCTED prisoners who are earning indulgences will be permitted to receive from friends at Christmas, Easter, and Queen's Birthday—3 lb. cooked meat, poultry, or fish; 2 lb. bread; 2 lb. vegetables; 2 lb. pudding or cake; ¼ lb. tea; 1 lb. sugar; ¼ oz. cheese; 4 oz. butter; 1 oz. mustard; 1 oz. pepper; 1 oz. tobacco; 1 doz. fruit; ½ pint milk.

Where a prisoner does not receive anything from friends, he may purchase food from money in hand, within the foregoing description, to the value of 5s., but must not transfer money to another prisoner for the purpose of purchasing.

In case of prisoners who do not receive anything from friends, or who have no money, or who do not wish to spend their money in this way, the ordinary indulgences may on the above days be doubled. Prisoners who are within six months of their probable discharge will not be allowed to spend money in the purchase of indulgences, as they will need such money to help them on their liberation.

The indulgences being allowed for the respective holidays must not be saved up beyond the day following, and cannot be taken on transfer to another gaol.

(G.O. 79)

Allowance to Prisoners of 4th Class.

PRISONERS of the 4th class may be allowed to purchase or receive from their friends weekly, in addition to their ration—3 loaves bread, 2 lb. sugar, ¼ lb. tea, 2 oz. tobacco, pipe, and matches.

(G.O. 80.)

Allowance to Prisoners who support themselves.

PRISONERS of the 3rd and 4th classes who support themselves will be allowed to purchase or receive from their friends weekly:—7 loaves bread, 7 lb. meat, 7 lb. vegetables, ½ lb. tea, 1 lb. coffee (or portion of each), 3 lb. sugar, 1 lb. butter, 1 lb. cheese, 2 oz. tobacco, pipe, and matches, &c. This includes for prisoners of 4th class the allowances before mentioned.

(G.O. 81.)

Indulgences to Jewish Prisoners.

JEWISH prisoners will be allowed the special indulgences at their Passover and New Year instead of Christmas and Easter. At the Passover the indulgence may be provided by their friends. The indulgence on Queen's Birthday will apply to them as to other prisoners.

(G.O. 82.)

Indulgences for certain Occupations, irrespective of Sentence.

THE maximum indulgence will be allowed, irrespective of sentence or servitude, to male prisoners who are employed, as shown hereunder, but the number employed must not exceed those appearing on the following Schedule:—

Gaols.	Head Cook or Sole Cook.	Baker.	Hospital Cook.	Honorary Maker.	Hospital Attendant.	Epileptic Attendant.	Lunatics keeper.	Lamp-lighters.	Hospital Washermen.	Close-cleaners.	Night Attendants O. B. Ward.
