467. If the new entrance were opened, would not the high land about Trial Bay be a certain shelter to it? It would be for the outside work.

468. But you think the scour coming from that channel would shoal the water at Trial Bay? Yes. They have something like this in Gippsland. They have piles there which form each side of the channel. The modern idea of working these rivers is to concentrate the scour by making training walls.

Magnus Thompson, J.P., sworn, and examined:—

469. *Mr. Hassall.*] You are acquainted with the Macleay River? Yes, I have been acquainted with it since 1858.

M. Thompson,
J.P.
17 Feb., 1898.

470. Have you had charge of boats taking away produce? Yes.

471. What is your opinion of the proposed scheme? In 1864 I was trading to the Macleay. I brought my vessel to anchor on one occasion inside a fine high sand-bank, when down came a flood with easterly gale, and next morning I found myself lying inside of a channel leading straight out to sea. The fresh had swept the sand-bank out. That was a mile from Grassy Head, and it was the only opening from there to the South West Rocks. That same flood cut a channel out by South West Rocks where there were 12 or 14 feet of water. That is about three-quarters of a mile from the present new entrance. That channel remained open for a considerable time, but not for navigation.

472. How long after that channel was cut in 1864, was it before it silted up or became insufficient to take in the navigation of the river? The channel remained good for several years, but the old Grassy Head channel got closed completely, and a sand-bank formed across it, reaching nearly to the top of the inside part of Grassy Head. Now all the sand blocking Grassy Head channel is cleared out, and the present channel close to rock, as it was in 1858.

473. In your opinion it would be the better channel of the two to try to make permanent? I should certainly connect Rudder's Hill, where they are taking the stone from now, with South West Rocks, thus making South West Rocks a breakwater on the southern side of the channel. I have never known a sand-bank to be outside South West Rocks. I have always known 4 or 5 fathoms of water to be there. Where you are making the channel now, there is a scoop of sand outside for a distance of a mile. On account of the shifting nature of the sand, I have a poor opinion of Grassy Head entrance; but there would be great improvement to this place if the sunken rock off an inner head, named Razor Back, were removed, or connected with Razor Back.

474. Then you would bring the channel in a line from Rudder's Hill to South West Rocks, keeping as close to the rocky formation as possible? Yes; I think you could easily clear a channel along there without any great expense.

475. Having once got the channel clear, do you think the scour of the Macleay would keep it clear? Yes. When I was down there I made it my business to see which way the flood-water came in. The flood-water which came in at the new channel went to meet the old channel. More water came in at the new channel than at Grassy Head.

476. Does your experience bear me out in this conclusion: That the more direct the channel from the ocean into the river the more easily will it be kept open? I should think so.

477. Would it be a shorter route to Kempsey? Yes, about 12 miles.

478. Is the work which has been commenced having a beneficial effect on the channel? It has not done any harm; but I do not think it will do any good.

479. What is the river like as far as Kempsey? When I was trading we could beat a vessel up and down, except at one particular flat, drawing 7 feet of water. There has been a dredge working there for thirty years, and she has not made much improvement. When Captain Rorison had charge of the dredge there I asked him why he was cutting the river 10 or 12 feet deep, when there were only 8 feet on the bar, and his answer was that he received instructions from headquarters.

480. Is there plenty of stone at Rudder's Hill? I think so. With reference to the Trial Bay breakwater, I may mention that a wharf was built by the Government inside the bay some years ago. When I was there three years ago I could drive outside that wharf. Last August, when I was there, the sand had scooped away, and the piles were in water. They ought never to bring the breakwater into 12 or 14 fathoms of water. I think they are carrying it too far out. I am of opinion that it would have been better if it were run out for South West Rocks in 6 to 7 fathoms, and the force of the easterly sea would slide along it.

481. Is there a good deal of traffic at the Macleay? Yes.

482. How many boats a week? One boat regularly every five days; and during seven to eight months many of the N.C. Co.'s steamers call. Last year, the ocean steamers nearly all loaded in Trial Bay, the maize and other produce being brought out by the new entrance.

483. Do you think the Government are justified in spending a considerable amount of money in making a permanent entrance to the river? Yes.

484. *Mr. Lee.*] You propose that the channel should be somewhere at the intersection of Shark Island and the river, then trending down until it comes to the South West Creek above the quarry, and follow that creek down to the South West Rocks entrance? Yes.

485.

- M. Thompson, 485. The formation of the channel then would be almost a complete S? Yes. But had South West Creek been cut in a line from river to quarry, thence to South West Rocks, it would be a fairly straight run. 486. *Chairman.*] Is it much smoother at South West Rocks than at the proposed entrance? Yes. 487. Is there deeper water right into the beach there? Yes; I never knew it to be shallow or a sandbank to form outside South West Rocks.*

FRIDAY, 18 FEBRUARY, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Macleay River.

James Bolton, sworn, and examined:—

- J. Bolton. 488. *Chairman.*] What are you? I am a shipwright. 489. Where do you reside? In Sydney at the present time. 18 Feb., 1898. 490. *Mr. Fegan.*] Have you had any experience of the Macleay River;—have you ever lived there? I went to the Macleay River in the month of February, 1850, and I have lived there on and off ever since. 491. So that you have a fair knowledge of what is necessary to make the Macleay Harbour or breakwater of service to the navigation or shipping there? I have an opinion about it. 492. Have you seen the plan before the Committee at present? No; but I know the place perfectly well. 493. Would you kindly make a statement as to what you think would be the best method of affording the people of the Macleay facilities for navigation? The works under construction at present in my opinion will never stand, for the simple reason that I have seen the floods boiling out there 4 or 5 feet high, though somewhat closer to the South West Rocks than where it is broken out now; but some months afterwards I have seen it blocked up again. 494. How long since did you see it like that? Perhaps, twenty years ago. 495. But I think it was in 1893 that the flood swept that clear again? Yes, in 1893 or 1894. I was on the beach at the time, and I saw the water running out, but closer to the South West Rocks than where the little creek is. It has now broken through at the South West Creek, but formerly it used to break out closer to the rocks, and there is always a little draining of water close to the South West Rocks and across the beach. As regards the work that is now going on, I think that a big flood would undermine the soft sand and flatten the whole lot—sweep it right away. 496. But will it not be a better inlet than the old place? No, I do not think so, where it is. If it were alongside the South West Rocks I think it would have been a better place, but it is nearly a mile from the South West Rocks. 497. And you think that, being so far, it is left to a great extent unprotected there? I do not think it ever could be protected there. 498. You think that in the first serious storm that came, the retaining wall would give way? Yes; I have not the slightest doubt about that; it must give way. 499. Would you give us an idea of what you think would benefit the river more than the proposed works? If it were possible to change the position of the works, and to place them alongside the South West Rocks, I would not be against that, but otherwise I would advocate doing something at the old place on the south spit at the Grassy or North Head. I think it would be a great deal less expensive to do something at the old bar than at the new one. 500. Your chief work is the making and repairing of vessels? Yes. 501. You would not for a moment pit your opinion against that of a man who, as an engineer, thoroughly understands the work? I would not like to condemn anybody's opinion. I am simply advancing my own opinion. 502. Do you think that the engineer who proposes this scheme is not conversant with the floods that so often occur at that place, or he would not propose the present works? I do not think he would at the present place. I do not say that he would not advocate carrying them out at the South West Rocks. 503. Were you here yesterday? Yes. 504.

* NOTE (on revision):—It is nearly 6 miles from Grassy Head to the new entrance. The tongue of sand from South West Rocks, separating the sea from the river, has been gradually washing away on the sea side; and, since Sir John Coode visited the place, the proposed new entrance washed out with the flood of 1893 in one night. I went out a few days after, in the "Belmore" steamer (Captain Ferguson). There were 7 feet of water straight out, and smooth with a flat sandbank for a considerable distance outside the entrance. On this occasion, the "Belmore" crossed in by Grassy Head channel, and there was much more sea there. There is another gap in the tongue of sand, washed out just opposite Mangrove Point, with an open entrance to the sea of $\frac{1}{2}$ mile. This is near Sir John Coode's No. 2 Plan of the channel, but neither this nor the proposed channel was open when Sir John Coode visited the Macleay. Now, as regards the South West Rocks channel, every river on the coast of New South Wales, north of Sydney, that has a southern head to its entrance has its best entrance at that side; and my idea is that South West Rocks would make a splendid south side; and by having it connected with Rudder's you would have a good southern side, not exposed to the sea or likely to be washed away. Of course, the work that has been done in the new entrance would interfere with this plan, as the creek is blocked up with stone. The stone they were getting out was a quantity of rotten shale; and, should there come a big flood, I am very much afraid it might level the whole of the works down at the new entrance. The floods on the Macleay indulge in some queer freaks. I have seen the river running nearly full down to the old entrance. At this time there was no water in Clybucca Creek, and the water from the river ran up the creek and partly filled the Seven Oaks Swamp. To do this it had to run up nearly 20 miles. I should leave all the openings on the beach for the escape of flood-waters, for the floods here are of considerable magnitude—reaching nearly from Yarrahapinni to Port Macquarie—some 30 odd miles, by about an average 10 miles from the sea-coast inland—and the average depth of water for this distance over the sand would exceed 5 feet.

J. Bolton.

18 Feb., 1898

504. You heard Captain Thompson give his evidence? I did.
505. Do you agree with his evidence? Yes.
506. Have you anything to add to it? Nothing, unless you went down to the old place, to Double Corner—that is what I would rather advocate—at the North or Grassy Head.
507. If these proposed works are carried out, will they interfere in any way with the trade of the people at Stewart's Point? Yes.
508. In what way? In a measure it cuts them off.
509. They are cut off by tides now, are they not? Since they have been working the new channel they have been cut off; that is, the traffic has not been so good.
510. Previously to 1893 were they not cut off from time to time? They always worked the old channel in those years.
511. Is it not a fact that vessels could not get up there at one time? Yes, vessels could not get up the river for many years. There is a crossing inside now at the old bar; that is the only stoppage. It is not the old bar that stops them. There is as much water on the old bar as on the new, perhaps more.
512. What depth? Eight feet 6 inches or 9 feet. The crossing inside does not carry more than 7 feet or 8 feet 6 inches, at most. There is a bank—a clean sand-bank—about 2 chains long, which they term the crossing.
513. But the trade of Stewart's Point and that part of the district is not considerable? No; but the Nambucca people are beginning to trade there now, and therefore some trade will come from the Nambucca.
514. So that with what you have added you entirely agree with Captain Thompson's evidence? Yes.
515. You think that the evidence he gave us was in every sense from a practical point of view, and after many years' experience, from his observation of the various floods that have taken place there? Yes; quite correct.
516. And your evidence is similar? His views are exactly similar to my own.
517. If you can explain to the Committee any other scheme that would serve the people better than that proposed you can do so? Supposing that they were to construct a railway line on each side of the river, and do away with all the dredges and wharves, and let the vessels take their chance, the same as in former years. In former years I have been up and down the river dozens of times with vessels, and we had to get up and down as best we could, and we always managed to do it, at any rate at spring-tides.
518. Have you any idea how far a railway would have to be constructed if your proposal were carried out? From the Double Corner to Kempsey, which is about 30 miles.
519. And you would want a line on each side of the river? Yes.
520. That would be 60 miles of railway? Yes.
521. That would cost an enormous sum? That is a question I cannot answer.
522. The cheapest at the present time is £2,000 or £2,500 a mile? Yes; but that is all for new material. Why do not the Government use some of the old material, such as rails, instead of letting it lie about rotting. Then the railway would not cost half the amount of money it otherwise would. Furthermore, a railway would be reproductive, whereas the river droghing brings in nothing to the Government.
523. You say that instead of widening the North Head or the old opening, or going on with the new works, in your opinion, the Government ought to construct a railway on each side of the river—from Kempsey to where? To Trial Bay.
524. What is the distance? 30 miles.
525. *Mr. Roberts.*] Has it struck you that the frequent handling of the produce to get it on to the railway would in a marked degree increase the cost to the farmer of getting his produce to market? No.
526. Do you think that if a railway were constructed there the steamers and droghers would cease to ply to and on the Macleay River? Yes.
527. Do you not think they would be able to successfully compete with a railway down to Trial Bay? If a railway were constructed, the farmers could take their produce to the jetty, and then all their trouble would be over.
528. Is the navigation of the river impeded very frequently? Generally after every flood.
529. How often would that be? As a rule we get a flood every year. Sometimes we go two or even three years without having a bad flood, but I think that, as a rule, we can reckon on having a flood every year—two or three in a year sometimes.
530. Are the ocean steamers unable to get out of the river then? Yes.
531. What is the longest period you have known a steamer to be detained inside the bar? About a week.
532. How often would that occur? Once in twelve months, or in, perhaps, two or three years, just according to the floods.
533. Do you regard that as sufficient to warrant an increase in the cost of getting the produce to market by rail;—it must surely be more expensive than the carriage is now? I do not think so.
534. Do you know what it costs now;—have you given any consideration to the question? Yes; it costs 9d., 10d., and, when the price is up, it costs 1s. a bag; it varies according to the market. With a good price for maize they charge more, and, if the price goes down, they charge less. I have never known it under 9d., and 1s. is the general run.
535. Do not the droghers go to the different farms and collect the produce? Yes; up the creeks only, and take it to the steamboat.
536. Without extra charge? For every bag taken by the droghers 3d. more is charged; but when the produce is picked up by the steamer in the river no such charge is made.
537. Do you think that they will be able to cart it from the farms, and put it on the railway, and take it off at Trial Bay, and then take it by steamer to Sydney, and still be able to put it on the market at as low a rate as at present? Yes; there will be no more handling than at present. They carry it from the farms to the wharf, and then to the droghers, and then to the steamers, and then from the steamers on to the wharf at Sydney. If taken by rail to Trial Bay there will be only two handlings.
538. There will be the railway carriage to pay? Yes; but the Government would reap the benefit of that.
539. You think it would not be any more expensive than the present system? I do not think it would be. There would not only be the produce going down, but all the merchandise and passenger traffic coming back.
540. *Mr. Hoskins.*] I think you said that you had lived in the Macleay District for some years? Yes.

- J. Bolton. 541. Therefore, I suppose, you have been in the district when the river has been in flood? Yes.
- 18 Feb., 1898. 542. I suppose that a large body of water flows out of the Macleay and discharges into the ocean during flood? Yes, an immense quantity.
543. Which do you think would be the most easy of access during a flood in the Macleay River for vessels which seek to go up the Macleay River, the old entrance at the north rocks or the new cutting? There would be no difference.
544. Which would be the safest and easiest to enter? I think the Grassy Head one.
545. Will you tell me why you think so? Because it is mostly a deeper channel, and it is generally open to the sea, and there is no breakage of water except at the corner, whereas around the breakwater you get into the broken water of Trial Bay, and that continues right round the beach, and so, entering the new channel, you have to go through this broken water.
546. Would not that cause great difficulties, and probably danger, in vessels attempting to enter that channel when there was a heavy rush of water from the river? They could not possibly go in with any flood rushing out. They could not at either place.
547. Neither at the old entrance, nor at the proposed new entrance? No, they could not if there was any flood coming out.
548. How long, generally, have vessels to lie outside when there is a flood, and the water is much discoloured, before they can make an entrance to get up the Macleay River? About a week. It is about that time before the water clears sufficiently for them to see where the channel is.
549. In which channel would the water become clearer the sooner, and therefore the channel more accessible after flood, at the old entrance or this new one? One would be clear as soon as the other.
550. With the average swell that there is in the Pacific Ocean, do you think that the new entrance would be more safe and easy of access at all times except during floods? Not more so than the other.
551. Do you think it would be as easy of access? Just about the same as the other. It would depend on which way the wind was blowing. They could come into either of them with the same breeze, or with the same rough sea, or calm water as the case might be.
552. Have you ever taken up or brought down the Macleay River any vessels yourself? Yes, very often.
553. Do you really think that that long, comparatively speaking narrow channel—circuitous channel—would be as likely to be as open for navigation, as a rule,—that the silt and sand there affords less material to be silted up than does the channel at the old place? I should rather think that the new one would be silted up first.
554. Why? Because it is all soft mullock and black sand, and low country.
555. Do you think that the bend in the new channel would not very likely silt up very frequently in consequence of the silt and the sand that is carried down by the stream? The bend in the channel would have nothing to do with it. Water will run round bends, if they are not too sharp, as well as through a channel.
556. Would it not be likely to leave a deposit of silt and sand on the inner side? No, I think it would wash more away in the bights and leave it on the points.
557. Do you think that if access to the Macleay River were by means of that channel, a great deal of the land about there would be flooded during a flood? All of it would be flooded. The water would rise over all that low country there. It does do it.
558. Is it occupied by farms? Only on the banks of the creeks further up—not where the new channel is.
559. As an old resident, you have a preference for the old entrance rather than the new one? Yes.
560. Do you happen to know what is the general opinion of the residents of the Macleay, or of persons who are in the habit of taking vessels into the Macleay River, and bringing them out again, as to the merits of the two entrances? I have spoken to several captains of vessels, and they advocate the old channel.
561. On what ground? Because it is a better and deeper place than the new. The bar is too long at the new channel. When they think they are over the bar, it continues 8 feet, or 8 feet 6 inches, for $\frac{1}{2}$ mile.
562. At the proposed new entrance, will there be a great length of bar for vessels to go over on entering the river? Yes; that is why I am against the bar. It would silt up in a day, and keep the entrance so shallow.
563. What length would they have to go over? The last time I came out, Ferguson, the captain of the droghers, said there was $\frac{1}{2}$ mile of bar.
564. Is it a sandy bottom? Yes, all the way.
565. When the Macleay River is in flood, or when the ocean steamers cannot enter, and when the water subsides a little, droghers bring the loading out, and get alongside the ocean steamer and unload into her? Yes; at all other times as well as flood times. It is very seldom that a steamer goes up the river, and picks up her own cargo; it is generally droghered down to her.
566. It is a fact, then, that steamers now trading from the Macleay do not take their cargoes in the river if it is not favourable, but outside in the bay? Not in the bay; they tranship in the river.
567. In the river, before they cross the bar? Yes. At neap tides there is only 8 feet 6 inches on the bar. Of course, there is more water at spring tides.
568. *Mr. Clarke.*] You seem to approve of the old entrance at the South of Grassy Head? Yes.
569. You have said that you think it is best for the general interests of the people of the district? Yes; and also for the Government, as regards expenditure.
570. You have also stated that you think that the South West Rocks would be the best place? As the works are started there, I would not be against them being there, but I would not advocate it.
571. Is the water near the South West Rocks generally deep? It was always deep just outside the break, but as you went up into the bay it got shallower, more particularly after you passed the South West Rocks where it is shoaling up fast.
572. In the event of your proposal being carried out, can you indicate on the map where you would join the river from the South West Rocks? You would join the river at the same place—at Rudder's Hill, or somewhere in the vicinity. But instead of going where the South West Creek is, you would keep nearer to the South West Rocks themselves.
573. You favour the position shown as No. 4 on the map? Yes.
574. Are you aware whether it is practicable to get there without cutting through some rocks? Yes, I think so. You have only to follow round the edge of the ridge.
575. Is it all sand? No, there is a ridge that runs along from Rudder's Hill.
- 576.

576. Are you aware whether there are any rocks in the way that would necessitate extensive cutting? I do not think there are any rocks in the way. You will not encounter any rocks until you get to the South West rocks. J. Bolton.
18 Feb., 1898.
577. Is there any more shelter at Trial Bay than there is at the old Grassy Head or north entrance? Yes, certainly. There is a great deal more shelter at Trial Bay than at Grassy Head.
578. In that case would it not be more practicable to have the present plan carried out in consequence of there being more shelter there? Yes, provided that the bay did not shoal up and block the bar, and keep it shallow.
579. But does not the high land at Trial Bay make it better for vessels entering there, and going into this proposed entrance, than would be the case at North Head? I do not think so. There is no high land. Smoky Cape lies farther south clear. You have still the open ocean there, supposing you were running across to Double Corner, or turning the point of the bay to run to the new channel.
580. You think there is as much shelter then at the north entrance as at the proposed entrance? No, there is more shelter at Trial Bay. But the bay is shoaling up.
581. Can you say any reason why it is shoaling up? Because of the sand travelling all along the beach from the north, from the headlands all along.
582. I think I understood you to say that droghers generally bring down cargo both to the old channel and to the new? Yes.
583. To which place is it more convenient for the droghers to bring the produce? The new channel, because they do not have to go nearly so far down the river—by some 7 or 8 miles, I suppose.
584. Would that be some consideration for using the new channel in preference to the old? Certainly it would; but at the same time it cuts off the people at Stewart's Point.
585. You mean a good many people at North Head and from the neighbourhood of Nambucca and that direction? Yes.
586. Would those people be put to much inconvenience? Yes. The droghers would either have to continue running, to carry their produce, or they would have to have a fresh road to Shark Island near Jerseyville, where the steamer always lies.
587. On the whole, taking everything into consideration, do you approve of the old entrance in preference to the new proposal? Yes, I do.

Richard Taplin, master of the steamer "Burrawong," sworn, and examined:—

588. *Chairman.*] You are captain of the "Burrawong"? Yes. R. Taplin.
18 Feb., 1898.
589. And in the employ of the North Coast Company? Yes.
590. Do you know the old entrance and the present one? Yes.
591. Will you tell the Committee your opinion in regard to the two schemes? I am in favour of the old entrance.
592. The entrance as the Macleay originally went to sea? Yes, Grassy Head.
593. Why? Because I consider that that is the natural outlet for the river, and until such time as this break out of storm-water we always had plenty of water there.
594. Is the bad bar you have experienced recently because of the break-out at Spencer Creek? Because of two break-outs. There are three entrances at present.
595. And the water going to the south has caused a bad bar near North Head? Most decidedly.
596. Has the bar been worse since 1893, when the serious break-out occurred, than it was previously? Yes. It seems to take turns about—one will deepen and the other will shoal up.
597. Which entrance does the "Burrawong" use now? The south entrance, where they are putting the new cutting.
598. What is your opinion of that entrance? I think that if they can manage to keep training walls there it will make a very good entrance.
599. How much water is in it now? Four feet at low water.
600. That means 8 ft. 6 in. at high water? It depends on the rise of the tide. With a 4 ft. 6 in. tide yesterday I had 8 ft. 6 in. coming out on the bar at the shallowest place.
601. As you leave the river there is plenty of water? Yes.
602. What does the "Burrawong" draw? With a full load she will draw 8 ft. 10 in. aft and 7 ft. 6 in. forward.
603. Do you know where the walls have been placed on Spencer Creek channel on the northern side? Yes.
604. Is there good water from the river to that point? Yes; there is a little bit of shallow at the top of Shark Island as you enter that channel.
605. But nothing serious? Nothing serious.
606. There is good water right through until you pass the second place where they are putting a training bank? Yes; there is good water right down to the bar.
607. How far is the bar from the beach? About 300 yards—that is, from the end of the training wall.
608. What, in your opinion, is going to be the result on Trial Bay from discharging the Macleay River as proposed by the Department;—would it have a tendency to silt the bay up? I should rather think it would. In fact the bay has been silting up for a good while—ever since they have been taking out the outer breakwater at the gaol.
609. Do you think that has affected it? I think so. It seems to prevent the sand from getting out.
610. Is there any current in Trial Bay? Sometimes.
611. Where does it come from? From the north, and sets round the breakwater.
612. Would there be a set to the south from the new entrance? It generally sets the way the wind is. With a southerly wind it sets to the north, and with a northerly wind it sets to the south.
613. Does the river carry a considerable amount of sand down? In flood-time or at spring tides, the river carries a considerable amount of sand.
614. Have you any definite opinion as to what is becoming of the sand that goes out through the new cutting on the river? I think it must set on to the beach.
615. Would it go to form a bar? Certainly it will. It will form a bar right enough until the current will carry it away again.

- R. Taplin.
18 Feb., 1898.
616. There is no current to depend upon there? - No, there is not. That is one reason for my liking the old bar best, for when you get over that you go into deep water, and there is a strong current which keeps it clear.
617. Is this your view of the case: That if the river is brought out at the old entrance the water will be concentrated far enough to carry whatever stuff is brought down the river into deep water? Yes.
618. If it goes out by the new cutting you are apprehensive that, landing as it will in the calm water of Trial Bay, it will stop there and form a bar—is that your view? I am afraid it will.
619. You think it will be better to discharge into the open sea rather than into the bay, for that reason. Yes.
620. In entering the Macleay River in rough weather, presuming that you have a 700-foot entrance at the North Head and a 700-foot entrance at Spencer Creek, which would you rather take? Spencer Creek.
621. Why? Because, in the first place there are no rocks there to contend with. It would all depend on the water.
622. We give you the same water and the same width? Then I prefer Spencer Creek.
623. Therefore, if it be possible to keep open the entrance at Spencer Creek you think it will be better negotiated in rough weather than North Head? Yes, very much.
624. And therefore if we can keep it open it furnishes a better entrance for trade purposes? Yes, if we can do it.
625. It is just a question of doing it? Yes.
626. You would rather have Sir John Coode's scheme, because you believe it would be permanent? Yes.
627. But if they can make a permanent entrance at Spencer Creek, and if you can be satisfied that it would not shoal up, the entrance being in the quiet water of the bay, you regard that as being a better entrance for commercial purposes, because of the shelter afforded by the bay? Yes, I do.
628. That is, roughly speaking, your view? Yes.
629. What is your opinion of the shelter in Trial Bay? It is a very good shelter for southerly winds, or for south-east winds. As a matter of fact, last Saturday night I was afraid to proceed, because I knew there would be no entrance there with such a gale blowing, and I had to go to Port Stephens. But anything from south-east to south-west there is splendid shelter there.
630. With regard to negotiating the bars in flood-time, will you explain your difficulties? It is most difficult to take a bar at flood, for you generally meet big trees running out. It is in all the thick water, and you cannot see what you are doing, and if you happen to take the ground and make a sheer, you must go back to the surf again.
631. *Mr. Lee.*] If there were a lot of stuff, such as big trees, coming down the river, could you go up the proposed new channel? I would not attempt it.
632. Supposing that when you reached that entrance you found there was a flood, and a heavy gale blowing at the same time, you could neither go through the entrance nor shelter in Trial Bay? I would not attempt to go near Trial Bay. I would keep away to sea if I could.
633. Knowing the difficulties, you would not approach it? I would not approach it.
634. So even if the works were carried out, it would not be a safe entrance under those conditions? No. But if you were there at anchor, and an easterly gale came on, you would have a chance of running in there before the flood came down.
635. If you were sure that that you had water enough there, would you tackle that entrance with a heavy south-easter or easterly tide? There would be no occasion to tackle it with a south-easter.
636. Well, with an easterly one? I would tackle it if I were jammed there and could not get out.
637. Without taking an extreme—that is a heavy gale, and a heavy flood together,—but if you got there in a heavy gale, the question is would you go in; that is, if you were certain that you would have water enough under you? I would have to go; but sometimes it is more prudent to go out to sea for safety to the passengers and property. I would not attempt to go in there if I could get out again. After the gale is over, the general wind is from westward, and it is comparatively smooth there. I have lain there five days quite smooth, but we could not attempt to get over the bar.
638. As a rule, the gale is generally finished when the flood commences to come down? Yes; a flood does not come until after the gale is over. But, as soon as the wind is over, down comes the flood.
639. Do you know the Clarence entrance? Yes.
640. Have you been there since the new works have been carried out? Yes.
641. Have they not had the effect of carrying the sand and debris completely clear of the entrance? Yes; but the Clarence is altogether a different place. Since the new wall has been there, it has thrown the channel just outside the Black Boy, and over to the quarries to the southward. But when I ran there it was deep water east-south-east. There is sufficient current there to carry it off the point.
642. Which does not prevail in the Macleay? Yes. There is not the fiftieth part of the current in the Macleay.
643. There is not a strong current from Trial Bay to the North Head? No; there is not.
644. It is a gentle current, and, consequently, the sand precipitates? Yes; the current is influenced by the wind—a great deal of the strength of the current outside.

Henry Richard Carleton, Principal Assistant Engineer, Harbours and Rivers Branch, Department of Public Works, sworn, and further examined:—

- H. R. Carleton.
18 Feb., 1898.
645. *Chairman.*] Does your Spencer Creek scheme encroach on any private land? There was a slight encroachment, but we have resumed all that land.
646. *Mr. Lee.*] Regarding the alienated land on Shark Island, it will not be interfered with, nor will resumptions be rendered necessary in consequence of the carrying out of this proposal? No; on the southern side of Spencer Creek a portion has been resumed in connection with the harbour works.
647. Will your proposed works interfere with the boundaries of any of the alienated land on that side? No.
648. Is it likely that any claim will be set up by the owners of that property in consequence of your depriving them of a natural water frontage? We do not deprive them of a water frontage.
649. If you erect training walls to the properties, you cut them off from the water? They would come out to that. It is simply just protecting the property, if anything.

650. But you would debar them from using that creek, access to which they have at the present time? I do not think we would. They would have a frontage to it still.

651. Do you propose to resume any portion of land either at that particular spot, or out of it? We have resumed all we consider necessary for the work—that is, a site for the quarry, and a portion of Julius Rudder's 64 acres.

652. Are there any other private interests that would be interfered with in any way by these works? I think not.

653. Are there any rights existing now that the settlers have for getting access either to the ocean, or to Spencer Creek, of which they will be deprived by these works;—is it possible that any claims will be set up hereafter for damages? I think not. That matter has been looked into very fully, and we are unable to see that any claims are likely to arise.

654. You heard the evidence given by Captain Taplin just now? Yes.

655. Do you think that danger is likely to arise outside the proposed works, by the silting up of the bay, as predicted by him? I think not. We know, as a matter of fact, the bay is not silting up. Changes take place in it from time to time. We have had a series of soundings taken over the bay by the resident officer there, and they do not show that the bay is actually silting up at all.

656. I presume not since that channel has been opened? No.

657. That is to say, you have taken your soundings since the channel was opened? No. We have had soundings taken since the serious breaks-out occurred, and there is no evidence of silting. It occurs at times; but with a change of weather it goes away to sea again. There is no permanent siltin, as far as we know, and we take periodic soundings in the bay.

658. Have you tried it after a severe test—a flood in the river? I could not say whether we have actually made the soundings immediately after a flood.

659. It has been indicated that there would be a likelihood of the large trees touching the ground outside the entrance, and therefore piling up silt and other stuff, and interfering with navigation? Any timber that came out of that river in flood-time would be carried away to sea—10 miles out to sea.

660. Would flood-waters give sufficient impetus to carry it out to there? Yes.

661. Supposing the flood-water met the tide, would that not make it stationary for the time being? Yes, while the tide was running. The flood-current is stronger than the tide. The flood would run 8 to 10 miles an hour. The greatest velocity of tide that you would get would not be more than 4 knots.

662. But that flood-water would not extend very far from the mouth of the river? It does. The flood carries its effect a long way out into the sea. When 4 miles out at sea from the Richmond, I myself have put over a pannikin from a boat and obtained and drunk fresh water from the ocean.

663. But it is said that this particular bay differs materially from the Richmond and the Clarence—that there is not the same current here as will be found there, and hence the greater likelihood of its being silted up? I do not know of any difference in the currents.

664. Do you think that the coastal current is as strong there as it is at the Clarence? Yes, I think it is about the same, once you get clear of the headland. There would probably be an eddy from the north.

665. You are relying on the impetus given by the flood-water to drive the timber and other stuff beyond Lager's Point, where it would meet with a current sufficiently strong to carry it away? Yes. It does do so at present. There is no accumulation of flood debris here in the bay to speak of. We have taken soundings over the bay from time to time. Several floods have occurred during that time, and there is no indication of permanent silting in the bay.

666. Have you picked up any old timber deposited there—in your soundings have you come across any old trees that have sunk? Never. I may add to my evidence that the Chairman's argument that we lose scouring power by reducing the tidal compartment would be quite sound if the tidal compartment were small, and was filled up to the level of high water of the ocean during each tide. But the Macleay stands in this position: The tidal compartment even though reduced by the portion between Rudder's Hill and Grassy Head is still far greater than the tide is able to fill through a 700-foot opening, the width designed for the present new entrance. The maximum quantity which could reasonably be expected to pass through the entrance on a spring tide is 700 ft. x 2 ft. 3 in. x 2 ft. 8½ in. per second, x six and a half hours = 100,000,000 cubic feet. The area of the tidal compartment is about 7,600 acres, and of the reduced compartment over 5,000 acres. Its capacity is, therefore, 5,000 acres x 43,560 sup. ft. x 4½ ft. = 980,000,000 cubic feet, or nearly ten times the greatest quantity of water which could flow in on a spring tide.

THURSDAY, 3 MARCH, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Macleay River.

Richard Cooke, Secretary, North Coast Steam Navigation Co. (Limited), sworn, and examined:—

667. *Chairman.*] What is your freight from Sydney to the Macleay? Twelve shillings and sixpence a ton outward, and 10½d. per bag for maize inward, including all drogherage, wharfage, and storage.

668. Can we deduct from the 10½d. per bag 3d. for drogherage? Yes.

669. So that the railway would have to carry a bag of maize to Sydney from the Macleay for 7½d. to equal you? Yes; but I do not think that the railway would either load or discharge it at that rate, and we do both.

670. The freight from the Macleay is less than from the other rivers; that is accounted for, I presume, because there is more trade on the Macleay? That is one of the reasons.

H. R.
Carleton.

18 Feb., 1898.

R. Cooke.

3 Mar., 1898

- R. Cooke. 671. *Mr. Lee.*] But is there not another reason governing the maize trade—as a matter of fact, do not your company afford storage accommodation, and allow the corn sold to be removed from there? Yes; we give free accommodation so long as we are not overcrowded. I have seen maize on our wharf for a month.
- 3 Mar., 1898. 672. It enables them to take advantage of the market? Yes.
673. *Chairman.*] What is the quantity of timber brought from the Macleay? I know nothing about the timber.
674. What is the freight per 100 feet for any timber you may carry? In quoting a rate for timber, we should quote about 3s. a 100 feet.
675. What quantity of goods go outward to the Macleay? I suppose about 50 tons, a weekly trip.
676. Coming down, how much? It is governed by the seasons.
677. Give us two statements—one for a busy season, and the other for a slack season? It is very hard to say. For four months in the year, perhaps, we would have two steamers there, and during the other eight months we, perhaps, could not fill one. We never take much notice of the total quantity. It is the £ s. d. that generally concern me.
678. But it comes to the same thing? Yes. I suppose that since the first of the present year we have not averaged 50 tons a trip coming to Sydney; but from the 1st April, if we do not have any floods, I suppose that we shall get as much as we can safely carry over the bar.
679. What will that be? I suppose that for about four months we may get about 4,000 bags a week, if we can carry it. We have to do a lot of the loading in Trial Bay. We drogher it over the bar.
- 680-1. You are carrying maize at 10½d. a bag, including 3d. for drogherage? Yes. 7½d. a bag would be 6s. 3d. a ton.
682. Is the trade of the Macleay growing? The dairy trade is growing, but that is the only one that is. However, although that represents a lot in money, it represents very little in freight.
683. Supposing that the Macleay, the Nambucca, and the Bellinger be furnished with suitable entrances, are you prepared to state that the freights will be reduced? We may reduce them on the Nambucca and the Bellinger—those two small rivers—but as to the freights from rivers like the Clarence, the Macleay, or the Manning, we consider that we could not possibly carry at a lower rate than now. The volume of trade governs us in a great degree in charging freights.
684. If a suitable entrance be furnished to the Macleay, will you be able to carry more cheaply from the Macleay than you do now? No.
685. You do not think so? No.
686. There is not a sufficient volume of trade to justify it? No. We consider that we are down at bed-rock prices now, because maize is the principal product, and we always take it as low as we possibly can. The lowest rates we have are the Macleay River 10½d., and the Clarence River 11d., and we know that we cannot go lower than that.
687. *Mr. Wright.*] Supposing that you had active competition, do you not think that you would reduce prices? You might reduce prices, but it does not follow that it would pay. I was referring to maize freight just now, and, as I have said, two-thirds of the freight is maize freight.

FRIDAY, 4 MARCH, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
	FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Macleay River.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

- H. Deane. 688. *Chairman.*] Can you give us a statement of the cost of a line from Trial Bay to Kempsey in connection with the proposed harbour works at the Macleay? Yes.
- 4 Mar., 1898. 689. What is the estimated cost of a line from Trial Bay to Jerseyville, that being the nearest accessible point on the Macleay? There were two estimates made, for I went into the matter considering two different systems. One is for a tramway on the standard gauge. That would be 4 miles 60 chains in length, with 60-lb. rails. The total estimated cost is £18,350, equal to £3,863 per mile. Then, under instructions, I considered the question of a narrow-gauge tramway on (say) a 2-foot gauge, 5 miles in length, 24-lb. rails, and the total estimated cost is £9,602 15s. 9d.; average cost per mile, £1,920. Supposing it were decided to build one of these tramways, I think that much better worth would be got out of the dearer one than out of the cheap one. I do not think that narrow-gauge lines with light rails are to be recommended.
690. The other gauge line would cost twice as much money as the narrow-gauge line? Yes; apparently it would cost twice as much money.

MONDAY,

MONDAY, 21 MARCH, 1898.

Present:—

CHARLES ALFRED LEE, Esq. (TEMPORARY CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Macleay River.

Frederick William Neitenstein, Comptroller-General of Prisons, Department of Justice, sworn, and examined:—

691. *Mr. Hoskins.*] Are you acquainted with the locality of the Macleay River? I have been to Trial Bay. I have always gone overland from Trial Bay to Kempsey; and I may say that I am simply interested in the prison aspect of the question before you.

692. Do you think from what you have seen that the requirements of the people of the Macleay district would be better met by having a good wharf at Trial Bay, where vessels could load and unload with safety, seeing that the place is intended for a harbour of refuge, and by having the cargoes brought down the river by lighter, than that the new entrance or the old entrance to the river should be utilised? I could only answer that question from my own personal feeling in the matter. I should say decidedly that it would be better to load the ships at Kempsey, and bring the cargoes down to the new entrance, in preference to having a wharf at Trial Bay.

693. Have you been to the new entrance? No.

694. There is a wharf at Trial Bay, is there not? It is only a temporary affair. Very little has been done at Trial Bay. There is no proper landing-place for boats at the bay at the present moment.

695. Do any of the steamers calling at Trial Bay unload at the wharf which you describe as a temporary wharf? No; it is all done out in the open bay. The "Burrawong" often drops anchor in the shelter of the breakwater, and discharges her cargo into lighters—that is, the general cargo for Kempsey.

696. Does the steamer "Burrawong" frequently load her cargo into lighters, in preference to going through the entrance to the river? Yes; because it is often impossible, owing to the state of the entrance, to get over the bar. Vessels of a lighter draught come down the river and take the cargo from the "Burrawong."

697. Have ordinary coasting steamers great difficulty in making a safe entrance to the river through the new entrance? That I am not in a position to say.

698. Were there great difficulties in connection with the old entrance? Yes; it was continually silting up. I do not say so of my own experience, but from what I have been told by captains of various steamboats.

699. The Macleay River district is a fine agricultural district? It is a very fine district indeed.

700. It is well settled upon? Yes. I went overland from Kempsey to Armidale about a fortnight ago, and I was then very much struck with the character of the country. It is splendid agricultural country on the flats.

701. Do you think it would be advantageous to utilise Trial Bay for the loading and unloading of steamers instead of taking them through the proposed entrance to the river? Certainly not. But you must understand that I am giving you my own opinion, as a prison official. In my opinion there is no comparison between the two schemes.

702. Some difference of opinion has been expressed as to the difficulty of entering the river both at the new entrance and at the old? I believe the work at the new entrance to be a successful effort.

703. Have you been through the new entrance? No; I speak only from a general knowledge of the coast-line, and from what I have heard from the captains of various steamboats.

704. *Mr. Clarke.*] Trial Bay is intended for a harbour of refuge? It was intended for a harbour of refuge.

705. Still you say it is of no utility for the loading and unloading of steamers? I did not say it was of no utility. I said that in my opinion the other scheme was preferable.

706. Is there not a great number of prisoners employed at Trial Bay? Yes; there are 125 employed there at the present time.

707. Is the work done more cheaply by prison than by ordinary labour? There is a certain disadvantage about the employment of prison labour there. Directly a prisoner becomes an expert he is due for discharge, and then another prisoner has to be taken in hand and taught. On the other hand, prisoners do not cost as much as free men. The prisoners would not get more than 1s. 6d. a day of eight and a half hours' work.

708. Are they long or short sentenced men? All men serving a sentence of over three years are entitled to go to Trial Bay. They are permitted to go there within a certain period of the expiration of their sentences. Take the case of a man who has twelve years to serve, he would be entitled to go to Trial Bay, subject to good conduct, after he had served six and a half years.

709. It is regarded as a concession for good conduct? Good conduct is the means by which they get down to Trial Bay. We do not send badly-conducted prisoners there.

710. Was it not intended that Trial Bay should be made a harbour of refuge? That was the original intention; but the conditions have since changed. That proposal was made a very long time ago.

711. For what other purposes could Trial Bay be utilised? I think I must refrain from answering that question. I can merely look at the question from the point of view of a prison official.

712. The bay could be utilised either as a harbour of refuge or for the shelter of vessels trading to the Macleay? Yes.

713. *Mr. Trickett.*] Is the breakwater in a satisfactory condition? When it blows very hard from the south-east the breakwater is subjected to a very great trial, and occasionally large pieces of it are washed away. It has not been taken out very far yet.

714. Have you heard whether the effect of building the breakwater has been to shoal the water along the inside of it? I believe that has been one of the effects.

715. Preventing the continuous scour? Quite so. It would naturally tend to have that effect, as it will form a sort of half-circle across the bay.

F. W.
Neitenstein.
21 Mar., 1898.

F. W.
Neitenstein.
21 Mar., 1898.

716. *Mr. Hoskins.*] Would the breakwater interfere with the proposed entrance? If you continued the breakwater and carried it out (say) a mile, it would naturally have an effect upon the entrance of any place so close to it.

717. How far would the entrance be from the breakwater? I cannot tell you; but I know that it is intended to run out the breakwater a mile from the point.

718. *Mr. Trickett.*] Do coasting steamers use the inside of the breakwater at the present time? For the transhipment of cargo from one boat to another, but not as a place of refuge.

719. You have had information from local captains that they have used the breakwater for that purpose? Yes.

720. How do you get from Kempsey to Trial Bay prison? We go overland by road. I think the distance is about 30 miles, but I could not say accurately.

721. How are the prisoners conveyed there? They are conveyed by steamboats from Sydney. The boat comes inside the breakwater, and our whaleboat goes off for the steamers.

722. What would ordinary visitors do? They would get the captain of the steamer to signal to the prison authorities, and they would then send off our boat.

723. Could they always get in? Unless it were blowing hard from the south-east—then it would be almost impossible to get in. All communication between Trial Bay and Kempsey is by land. All the provisions are obtained from Kempsey.

724. Have you heard, on your visits to the Macleay, whether the formation of the breakwater, as far as the point marked red on the plan has had the effect of silting up the river entrance? I have had no conversation with Kempsey residents at all, excepting with one gentleman, who said he thought that it would be a great thing to have the breakwater completed. He thought that it would be a good thing for trade.

725. On the whole, you are more favourably disposed to the completion of the scheme marked No. 3? Yes; but understand I am merely expressing an opinion as a prison official.

726. Is the wharf you have mentioned from the beach or from the rocks? It is the commonest of wharfs, commencing from the beach, and it is not usable under certain conditions. The boats come in under the breakwater, and you have to scramble off on to the rocks as best you can. I was there the other day with the Public Service Board, and there was a great difficulty in landing. There was a heavy sea, and it was hardly safe to tranship to the whaleboat and land on the rocks.

727. But you think it is better to do that than to take the passengers into the Macleay River? They cannot always get there. A vessel may get into Trial Bay and have to wait there some time until there are favourable conditions. I have known the "Burrawong" to be detained there for two or three days. On one occasion she had about 200 pigs kept on board during that period. The live cargo gets knocked about a good deal.

728. As far as your experience goes, you think that the proposed works would be effective? Yes; but I believe in the breakwater, as a prison officer, because it affords much continuous and good work. It is an incentive to prisoners to behave properly. That is the only value I can see in the breakwater.

729. If the construction of the breakwater will have the effect of silting up the river entrance, surely that is a consideration which would receive some weight? I have given you my opinion on the point. I say what I do in regard to the breakwater merely as a prison officer.

730. Is there no other work there upon which prisoners could be employed? No.

731. The soil is not suitable for agriculture? No; it is a rocky peninsula.

732. *Mr. Hoskins.*] Have you heard any of the captains trading to the Macleay state that if the breakwater were extended a considerable distance out, it would have a tendency to shoal up the new cutting into the river? No; I have not heard them say that.

733. *Mr. Wright.*] Have you been to the Macleay more than once? Twice.

734. Have you heard an opinion expressed by any competent persons as to the probable effect of the proposed works? I had some casual conversation with the Engineer-in-Chief with reference to the matter.

735. But have you heard the opinion expressed from any outside source that the new channel will be better than the old entrance? No.

736. What do you think of the proposal to connect Kempsey with Arakoon by railway, making Trial Bay the shipping port, and constructing wharfs there instead of a breakwater? I should say that would be a matter for the Traffic Superintendent. The question is whether it would serve the district and whether it would pay; then, again, how much would it cost to complete the breakwater. Of course, water carriage is always cheapest, and both sides of the river would be served, whereas a railway would serve only one side.

737. On the whole, you think the permanent improvement of the river would be the better plan? Yes.

738. You spoke of the prisoners getting 1s. 6d. per diem—that would be for good-conduct men? No; the rate of pay commences at 6d. a day for the first six months, and it rises by increments of 3d. a week until they get 1s. 6d.

739. The prisoners have a great deal more latitude than they would enjoy within the four walls of a gaol? Yes; there is no comparison between the conditions.

740. And the occupation is a healthy one? Yes; the objection I have to Trial Bay prison as a prison officer is the association between the different classes of prisoners. It is not possible to adopt a classification. We take trouble in some gaols to keep first offenders from others, but towards the end of all their sentences they are all mixed up at Trial Bay. The prisoners there have a large amount of liberty. They have all Saturday afternoon and Sundays and holidays to wander about freely along the coast-line.

741. They are almost like ticket-of-leave men there? Yes; they also get better rations; they do not wear prison clothes, and they are allowed many privileges in the way of books and papers; they also earn a comparatively large sum of money.

742. Upon what authority do you say that the bay is silting up? I only say so from my general observation.

743. The set of the tide away from the coast-line is southward, but there is back wash along the coast-line to the north? I should say that the silting would depend upon the prevailing winds, as well as upon the tides and currents.

744. What is the nature of the water about the wharf;—is it shoaling-up. Yes; but the wharf is a temporary structure. It was put there to land a cargo of timber in the first place, and it has been allowed to remain. It is practically of no use at all at the present moment.

745. The bay is actually silting up? Very much depends upon the set of the sea. A south-easterly gale has a very different effect, for instance, from a north-easterly gale.

746. You say that the water at the wharf is getting shallow? Yes; the bay forms a sort of elbow to retain the sand, and as the breakwater gets out further, the present effect, I should say, would be intensified.

747. You think that if there is a deposit there now caused by the breakwater extended to its present point, it is likely to increase with a further extension? I should think so. Another question is, whether you really require both works. If you carry out one, do you require the other.

748. Is the breakwater extended to any length at the present time? We do not keep particulars of the work done. I do not know whether you are acquainted with a report which was made some years ago by Mr. Moriarty and Mr. Maclean upon the breakwater. You will see from that report that the breakwater was undertaken as forming a harbour of refuge for any vessel which might be caught in a severe storm in that part of the coast, and also as a means of working certain well-conditioned prisoners. It was thought that this work should be established at Trial Bay, because there was a possibility of its extending over a lengthy period, which would justify the cost of the establishment of the prison. The cost of the prison was estimated at £28,000, and it was thought that the harbour works would extend to at least fifteen years.

749. It was supposed that the prisoners would be profitably employed there, and that a work of some importance would, at the same time, be constructed? Yes; I believe the principal object, so far as the prisoners were concerned, was to afford an intermediary period between the closing of the sentence and the giving of absolute freedom. Mr. Maclean, I believe, was struck with the operation of the intermediary system at Lusk, in Ireland, and thought it would be a good thing to establish a similar system in this country. So far as the harbour of refuge is concerned, the conditions of trade at sea have altered very much since then. We do not find many full-rigged ships in distress on this coast.

750. *Temporary Chairman.*] If the breakwater were to be carried out to the length shown on the plan, would it not take a great many years to complete it? Undoubtedly.

751. About how many? I could not say. It would be merely a guess on my part.

752. About what length of breakwater has been made? There have been great difficulties so far. It was started at one point, and after some amount of labour had been performed a heavy sea came and washed the work away. They then had to commence at another part of the point. Even now, occasionally, a heavy sea comes up and washes away 50 or 60 feet. The engineers may say that that strengthens the base of the work; but if you are going to strengthen the work by washaways, you will find it will take a long time to complete the undertaking.

753. What sized stones do you usually use? We use blocks as heavy as 35 tons. It is rough granite. The sea has a resistless force at this point.

754. Is the stone similar to that found at Rudder's Hill? Yes.

755. It wears well enough? Yes; but it is pretty hard to get the best stone out of the quarry. A lot of soft streaks are met with.

756. The idea that Trial Bay could be made a port of shipment, instead of the entrance to the Macleay River, you think is somewhat in advance of its time? I think a long time would elapse before that could be done.

757. A great deal of breakwater would have to be constructed before the bay could be used as a harbour of refuge? I think so.

758. Would there be any objection to the employment of prisoners on public works, such as those proposed at the entrance of the river? A great deal of time would be lost in taking the men to and fro, and they are not skilled men at that sort of work. They are now engaged in rough quarrying. It is simply hard labour. They quarry the stone, put it on the truck, take the truck to the end of the breakwater, and tip the stone over. The scene of their labour is also next door to their residence. If you had to take them about all over the place in boats, you would also have to provide a very good guard to prevent escapes.

759. It would be too far from the prison to admit of the prisoners going to and from the proposed works at the Macleay in one day? They could get to and fro, but a large body of men would have to be taken over and brought back again.

760. I presume that so long as the prison remains at Trial Bay the breakwater will be proceeded with? The prison would be of no use to us all if it were not for the breakwater. The difficulty and expense of getting there are considerable. The place is right away from head-quarters. If it were not for the breakwater I should recommend the closing of the prison.

761. This may happen: The entrance to the Macleay River may be improved, and the breakwater at Trial Bay may be carried out to its extreme length—that would be making practically two harbours within a stone's throw of each other? Yes.

762. And it is possible that either might so alter the current as to destroy the utility of the other? Exactly so.

763. Without committing yourself to an opinion as to the necessities of the Macleay River, do you think there is any possibility of the Trial Bay breakwater being carried out? That I could not say. It is more a matter of policy for the Government.

764. *Mr. Hoskins.*] You have no hesitation in saying, from actual observation, that the effect of south-easterly gales has been to create a good deal of injury to the breakwater? Yes.

765. The south-east gales will continue to have that effect? Naturally, as the breakwater is extended.

766. It has been reported that the breakwater stands well? So much as is built stands well.

767. You were speaking just now of injury to the breakwater when it was first constructed? Yes; not to present injuries.

768. There has been no injury for some time? I do not think any washaways have occurred within the last eighteen months. The effect of the washaways has been to make the base of the breakwater stronger, by distributing the stone.

769. We have been told by an engineering authority that when the seas break against the breakwater the water goes through the stone without doing any injury to the work? I should hardly think that could be the case. The effect has been on half a dozen occasions to wash portions of the breakwater away.

770. *Mr. Wright.*] Would it be possible to employ prison labour at so great a distance from Trial Bay as the entrance to Spencer's Creek? Yes; but there would be a considerable difficulty in getting the prisoners backwards and forwards.

771.

- F. W. Neitenstein.
21 Mar., 1898.
771. Still would not the cost be less than that of ordinary labour? I hardly think so. There are great difficulties surrounding prison labour. There is the difficulty of security; and then, again, on wet days we could not do anything. If a storm came on we could not embark the prisoners.
772. Could you not have a series of huts close to the work? Even then you would require a large body of men to look after the security of the prisoners. I should like to mention that the first license-holders were sent down to Trial Bay on the 4th October, 1888.
773. *Temporary Chairman.*] Would that be the date of the commencement of the breakwater? I hardly think so, because we had to make a road between Arakoon and Trial Bay itself. We did not build the prison. It was built for us.
774. Then the breakwater has been over ten years in course of construction? Yes. Up to the 31st December last we have had 1,012 licensed holders down there. At the present moment there are 125 men there.
775. I suppose that would be the average? I should say that 120 would be the average. Some of the men are first convicted; others are second, third, fourth, and fifth convicted men, and so on.
776. The number must be limited according to the accommodation? Yes.
777. There is no proposal to increase the accommodation? Yes; I have just recommended to the Minister for Justice that he should do away with the associated huts, which are, I think, objectionable, and that another wing should be built to the prison.
778. That would be to accommodate the prisoners you have now—not to increase the number? Just so.
779. As far as you can see, therefore, the work of the breakwater is not likely to proceed more rapidly in the future than it has in the past? No; as we go into deep water the further we shall be from the scene of operations, and the work will necessarily be slower.

FRIDAY, 22 APRIL, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Macleay River.

Austral Rowe, farmer, Macleay River, sworn, and examined:—

- A. Rowe.
22 April, 1898.
780. *Chairman.*] You are a farmer, residing on the Macleay River? Yes.
781. Are you much inconvenienced by the present state of the Macleay bar? Our difficulty is that the river from Stewart's Point up to the new entrance is silting up, and we are afraid that we shall very shortly not be able to have our produce taken away.
782. Your property is below the new entrance? Yes.
783. You believe that if the Government carries out its proposed scheme the river below the new entrance will silt up, and you will not have the water approach to your holding which you now have? Yes.
784. You desire the Committee, in coming to a conclusion in regard to the works now being carried out at the entrance, to take into consideration the fact that there are a number of people lower down the river who may be prejudicially affected by them through the closing up of their waterway? Yes.

WEDNESDAY, 11 MAY, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.	HENRY CLARKE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	CHARLES ALFRED LEE, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
	FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Macleay River.

Henry Richard Carleton, Principal Assistant Engineer, Harbours and Rivers Branch, Department of Public Works, sworn, and further examined:—

- H. R. Carleton.
11 May, 1898.
785. *Vice-Chairman.*] Since you were last examined by the Committee, you have visited the Macleay? Yes.
786. *Mr. Hoskins.*] Has your recent visit confirmed you in the opinion that the new entrance which the Department is making, and which is being used, is better than the old one? It has confirmed me in the opinion that eventually it will be better than the old one.
787. Is the new one generally used now by vessels? It is invariably used now, I believe. I sounded it myself, and got 8 feet at low water.
788. You are aware that there is a difference of opinion amongst seafaring men as to the best entrance? I do not think there is any difference of opinion among seafaring men.
789. They have given conflicting evidence here? Some of the residents of the lower end of the river are opposed to the new scheme.
790. Do you think that a wharf made at Trial Bay, not far from the new entrance to the Macleay, would not provide better accommodation for ocean-going steamers than having to go through the new entrance? I think not. It would mean constructing a railway from the river out to Trial Bay to convey the produce to

H. R.
Carleton.

11 May, 1898.

to the steamer lying at the wharf. That would be too costly; it would mean double handling, and the conveyance by rail; and you would lose the benefit of a natural highway for 40 or 50 miles.

791. If the ocean-going steamers went up to the proposed new wharf at Trial Bay, could not droghers, carrying large cargoes, go through the new entrance and unload into the steamer; would not that save the probable difficulty of navigating the new entrance, or would it be as difficult to navigate an ocean-going vessel up to the proposed wharf at Trial Bay as to go through the new entrance? You will want some entrance to bring the droghers through if they have to go out to the steamer in Trial Bay to load.

792. The commanders of ocean-going vessels feel that they may have some difficulty in going through the entrance, and they think it will be better to take the cargo out in droghers? I do not think it would be as good. We have almost completed a wharf at Trial Bay.

793. The steamers do sometimes leave cargo and passengers at Trial Bay? They leave passengers, but no cargo. They anchor in the bay and a whaleboat takes off the passengers.

794. You have a staff of men and a dredge working on the Macleay? Two dredges at present.

795. Have they made great improvements on the river;—could ocean-going vessels more readily make the new entrance in the recent heavy gales than they could the old entrance? With a southerly gale like the one we had recently they could not enter any port. It is very much better than it was, since we blocked Spencer's Creek channel and made a new cut. The new entrance is decidedly an improvement, but it is not in such a state that a vessel could take it in a gale.

796. After the gale has abated, and there is a heavy sea on, will the new entrance be more easy of access and more safe than the old entrance? Certainly. It is more sheltered as it is in the bay.

797. What work is your staff engaged on now? In constructing the training-walls at the entrance.

798. Have you been up the river? I have been up the river and most of the tributaries.

799. It is a fine district? Yes.

800. It contains a large area of valuable land? Of very fine agricultural and grazing land.

801. It is well settled up the river? Yes.

802. Is it your opinion that the works will be productive of great benefit and improve the entrance to the river and its navigation? It is. There is a marked improvement since we made that new cut, and Spencer's channel has been blocked. All the tidal water runs down the new cut and maintains a depth of over 14 feet in the cut. Another curious thing I noticed was that the new entrance is taking control of the river. The tide, which formerly ran down towards the old entrance at ebb-tide, runs up the river channel and out at the new entrance now.

803. *Mr. Lee.*] Since you commenced these works a considerable time has elapsed? Yes.

804. The extension of these works has been in the direction of the entrance? Yes.

805. Have you seen any necessity to alter the original design? No; there were some slight variations in the position of the walls, but you could hardly call them alterations in the design.

806. Have you seen any reason to cause you to alter your original design? No; I think we have hit on the right width of entrance for it, which is the main thing really.

807. Are you satisfied that these works as they proceed are giving you the depth of water you anticipated? I was very much pleased with what I saw on my recent visit.

808. Has it been equal to your calculations? Quite so up to the present time.

809. You still have a considerable distance to go before you get down to where you pick up the new work? Yes.

810. The work already authorised has to go some distance before it terminates? Yes.

811. Will it interfere with the intention of your design—namely, to direct the water in a certain way and make it do certain things? No.

812. That, I suppose, we can absolutely rely on? I think you may.

813. Do you find, as you proceed into deeper sand, that the work is costing you more per cubic yard? No. If we find that it is scouring out too deep we coat the bottom with stone, and prevent a scour from taking place. We do not let it scour beyond a certain depth. If we find it is scouring too rapidly we put a thin layer of stone on the bottom, and then no further scour takes place. A current which will move sand is not able to move the smaller stone.

814. You put a coping of stone on a surface of sand? We drop the stone on the bottom in advance of the training-wall, and that prevents further erosion there. The bottom will not scour away then.

815. How does it compare in cost, when you get out into deeper water, with what it would cost if you allowed erosion to take place? If we allowed erosion to take place the wall would be so much more costly. On the Manning one of the walls was eroding too rapidly, and we coated the bottom and put a stop to it.

816. Will you be able to adopt the same principle when you get out into deeper water? Exactly the same.

817. As you get out into the stronger and more dangerous water, will you not have to use much larger stones than you are using? Not to prevent the erosion of the bottom. For the construction of the breakwater in the exposed sea we require heavier stone; but we can get stone as large as we like from the quarry.

818. Can you give an instance where you have carried out a work of this kind to completion? Yes; on the Clarence we coated the whole of the bottom. When a little of the wall fell down, we coated the bottom and prevented it from scouring any more. We have 53 feet of water at the side of the wall, and I do not suppose our stonework is 20 feet deep.

819. You have it on a good batter? Yes. We built timber stages and tipped the stuff from the timber. When the scour took place along the stone some of it fell down and coated the side of the bank, and prevented it from eroding any further.

820. That was seven years ago? It has been finished about two or three years.

821. Has it stood well? Excellently.

822. Have you not had to build up the breakwater? We did not put a stone in it last year.

823. So far as you can see it is a piece of work which is standing very well? Yes; no doubt, if we had a very heavy flood, we might have to patch it up in places, but everything requires mending.

824. Has it been there sufficiently long to establish the principle? Yes; we shall never have a bad channel on the Clarence again.

825. Do you think it is a precedent which we might follow in the case of other rivers? I do.

826. Are there any conditions of current, inside or outside, on any of the other rivers which differ from those

- H. R. Carleton.
11 May, 1898.
- on the Clarence? No; they are all the same, except that the Clarence is the largest. The Hastings, as shown on this map here, is a miniature Clarence.
827. On the Clarence the construction of breakwaters and training-walls had been going on for twenty years prior to the visit of Sir John Coode? Yes.
828. The principle he laid down to a very large extent differed from the works which had been carried on? I do not know that there was any definite scheme before that time. In the old days Mr. Moriarty only got small sums from time to time, and he was not able to lay down a big scheme.
829. He was only doing patchwork while the other man was working out according to a design? Yes.
830. In view of the experience you had during the last few years, are you of opinion that if the country takes up the work of improving any port it is desirable that they should have an appropriate design, and should adhere to that design in carrying out the work? I think you should lay down a complete design, and then take up the most important parts of it, and attack them first.
831. Do you approve of small votes per annum being expended in a haphazard way on these rivers? No; I never did.
832. Do they do any good at all? They may give some temporary relief, but that is all. It is very much better to have a complete scheme, even if you have not the money for it, and do the portions which appear to be most urgent so far as your money will go.
833. The Committee wish to know whether your Department lays that down as a cardinal principle in dealing with these works? It does.
834. Cannot we take the Tweed as an example of what adhering to a design means? Yes.
835. Would you have achieved the same good results as you have achieved there if you had altered your design, or carried out the work in patchwork fashion? I think we could not have done better than we have done on the Tweed.
836. Do you think that if the proposed work on the Macleay is carried out it will be a benefit to the district? I do. Those persons I spoke to seemed to be very pleased with the result so far. I noticed that the dairying industry is increasing very much on all the rivers.
837. Had there been a flood of any consequence between your last visit and the preceding one? No, no large floods; but I think there must be a pretty good fresh after the recent storm.
838. It was supposed by one witness some time ago that Spencer's Creek was very likely to burst and cut another channel for itself—that you would not be able to confine it within the proposed training-walls;—did you see any evidence of that during your late visit? It cannot get away from us now; we have it tied down.
839. But suppose you get a big flood? If we had not got that wall across Spencer's Creek it might have got away from us at any time; but it can never move now.
840. But will that wall stand? Certainly.
841. It must bear an enormous weight of water? It will stand there all right—it is quite thick enough. We are strengthening it at the back as it is; but it is sufficiently strong. I have no fear at all as to Spencer's Creek wall.
842. Can the Committee safely dismiss any fear they may have on that point? Certainly. It is only quite recently that we have had it under our control. If a large flood had come before we got that wall across Spencer's Creek, I have no doubt that it might have broken away from us; but it cannot do so now.
843. Is there any possibility of the water under strong pressure from above forcing its way through any portion of the country behind your works; can it force its way from above the southern training-wall down into the South-west Rocks Creek? No; it cannot do any harm out that way.
844. It cannot get round there? Some flood-water might get out there, but it cannot do any harm. The rocks are pretty close to the surface right down through there.
845. You maintain that once you get the works completed you will be able to keep the water within the walls? It cannot move now.
846. As the result of your recent visit, you assure the Committee that your Department sees no reason for departing from the design it prepared, and you think that if that design is carried out the object in view will be achieved? I think so. We shall get a very good entrance there. The scheme has been thoroughly threshed out.
847. You would not alter the design if you had power to do so? No.
848. *Mr. Roberts.*] Did not Sir John Coode favour the improvements being made at the old entrance at Grassy Head? He did. There was no opening at the present entrance at that time. I think another of his reasons for adopting the Grassy Head entrance was that he thought we should lose the assistance of the Clybucca Creek waters; but that difficulty can be got over also.
849. Was Sir John Coode's opinion obtained on the scheme which is before the Committee? He reported on four entrances to the Macleay, which you will see in his report, and which are referred to in the report handed in by Mr. Hickson.
850. I notice from perusing the evidence that the master of the "Burrawang" favours the old entrance? I believe he did. I do not know exactly what ground he gave for it, but I understood him to say that of the two he preferred to take the new entrance in bad weather.
851. Do you anticipate any danger of portion of Trial Bay silting up there and impeding the entrance to the river? I think not. The beach grows at times, and with changes in the weather it goes out again. There is no permanent silting in Trial Bay, as far as we know.
852. Will the stone required for the work be easily procurable? There is excellent stone within less than a mile of the work.
853. As compared with the old entrance, the new entrance will be much nearer to Sydney? Yes. The distance between the two entrances is from 5 to 6 miles, so that it means a saving of about 12 miles on the round trip. In addition to that, you get away from all the unstable and varying portions of the river. We drop into the deep-water portion of the river at once.
854. The new entrance will be well sheltered from southerly weather? It will be far better sheltered in that respect than the old entrance.
855. That is an important feature of the scheme? Yes; the only weather which would be a source of trouble would be easterly weather. I went over the bar the other day, at dead low-water, in a tiny little steamer. I am certain that we could not have gone over the bar at the Grassy Head entrance at the same time in the same boat.

TUESDAY, 17 MAY, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Macleay River:

Henry Richard Carleton, Principal Assistant Engineer, Harbours and Rivers Branch, Department of Public Works, sworn, and further examined:—

856. *Mr. Black.*] Have you anything to add to your previous evidence? I think not, except that I have recently visited the river, and am very much pleased with the progress of the works and the result up to date. We are getting on quite as rapidly as I expected with the improvement. There is good deep water down along the northern side of the channel where we blocked Spencer's Creek.

H. R.
Carleton.
17 May, 1898.

857. You still have no fear that the discharge from the new entrance is likely to silt up Trial Bay? No; I do not think there is the slightest probability of that occurring.

858. Do you think that two breakwaters will be found necessary? Not unless you want to get a much larger class of vessels into the Macleay.

859. One would think that with the breakwater in conjunction with the headland at Trial Bay, it would be almost as good as the proposed southern breakwater? It would take one hundred years to complete that breakwater in Trial Bay, at the rate it is going on. It is only out as far as it is marked black on the plan. I do not think you can look upon getting much assistance to the entrance from the breakwater at Trial Bay.

860. You do not expect any effects from that breakwater either for evil or for good? No; it was never intended for more than a harbour of refuge. There is not so much necessity for a harbour of refuge now-a-days. Everything is now done by steam, and that work was begun in the days of sailing vessels.

861. I suppose, in the event of these works being gone on with the river will still be used by droghers, and the vessels will load at Trial Bay as they do now? If this entrance is made navigable then I take it that we shall have to improve one or two of the bad flats in the river. There are only a few bad spots in the river to remove. It would enable any vessel drawing 12 or 14 feet to go up to Kempsey, which is 26 miles from the entrance. Of course, the first object is to get a much larger vessel inside, and then it is not nearly so difficult a matter to cut out the bad portions of the river afterwards, either by dredging or by contracting the channel, and putting in light training-walls.

862. Is there any likelihood of that portion of Spencer's Creek, across which you have built a wall, falling in when you have done the remainder of that retaining-wall there? On the lower side of the wall I think that will silt up. We should probably use that space for depositing dredged material.

863. That would make it very much more secure? It would strengthen the bank across the creek very much, and there would be less likelihood of its being carried away in time of flood. I think it is sufficiently strong to resist any flood that we shall get in the Macleay. It is completed, and it is fairly strong, but we are still going on strengthening it slightly. I think it is able to withstand any flood which may come down at the present moment.

864. Is there any opening at all to the North Head? Yes; it is rather a tortuous channel. It keeps rather close to the headland all the way in. It is not more than 150 feet wide in deep water.

865. We have had evidence from some of the captains that they prefer that entrance to the other? I was only present when Captain Taplin gave evidence, but I understood him to say that if we could make the new entrance he would prefer it, but he was rather doubtful about our being able to do so.

866. I presume it would be always more expensive to keep open and protect the channel at the North Head than the other one? I think so. We have got so much natural protection from Lager's Point at the new entrance, while the old entrance is open right out to a south-easter.

867. Is there not always a danger of that sand terrace being burst into? Yes; one of the great advantages of the new entrance is that we avoid all the unstable portion of the river, a length of 6 miles, which is constantly varying its position and its depth. We drop into deep water almost directly with the new scheme. When we come out at Spencer's Creek into the main river, we drop into the stable portion of the river, and in fairly deep water, in at least 2 fathoms.

868. You have given evidence about getting stone by means of a tramway? Yes; you get very good stone indeed. The quarry is improving too. Site No. 2 on the plan is the quarry we are working at present. I saw blocks of stone there weighing from 60 to 70 tons that we got out of it.

869. Did the recent gales have any effect on the entrance? We have had no report from the local officer to that effect, and as he has reported with regard to some of the others, I take it that the new entrance has not been affected. Some slight damage has been done at the Manning, and also at the Nambucca; but there has been no report as to damage done at the new entrance to the Macleay.

870. Has there been any damage done at the Tweed? There is some slight damage done to the sand terrace, but not to the training-wall.

871. A prior gale cut that away? Yes; there were two slight breaks from the sand terrace in the recent gale, but I do not think they are very serious matters.

872. *Mr. Trickett.*] If you refer to page 26 of the evidence, you will see that Captain Taplin gives his reasons for preferring the old entrance to the new one;—It would appear that he prefers the old entrance because there is a strong current there which would keep the bar scoured; but that he fears that the sand will stop in the bay and form a bar? I understood Captain Taplin to say that if we could provide deep water at the new entrance he would prefer that entrance, but that he had some doubt as to our being able to do so.

873. That is a practical question on which the opinion of a man like Captain Taplin must be regarded with some degree of consideration;—have the Department and yourself considered that position? Yes.

874.

H. R.
Carleton.
17 May, 1898.

874. He says that the strong current at the North Head will naturally scour the sand away, whereas in the bay, where you propose to make your new entrance, there will be no current at all, and the sand may lodge there;—what do you think of that position? If what he says is correct, we would expect to find a deposit of sand at the mouth of the new entrance after a flood breaking out there. There is no indication of that from our soundings. The bay is uniform in depth, and there is no variation or heaping up of the sand at the mouth of the new entrance, showing that any sand which has been washed out there has been carried out probably beyond Lager's Point, and into the ocean current.

875. You think that the force of the river is sufficient, even in that sheltered part of the bay, to carry the sand out so that it will get within the influence of the current and go away? I think so.

876. From looking at the plan, and from reading this evidence, it would appear to be a question worthy of very serious consideration? It has been carefully weighed. We have sounded the bay, and there is no indication of silting up. The sand which was washed out must have been deposited somewhere, but we cannot find it in the bay.

877. Another witness has stated that even that short length of breakwater which had been built by prison labour has had the effect of shallowing that part of Trial Bay;—is that the case? I think not. There are variations in the bay from time to time, but they are not due to the construction of the breakwater. I dare say at the present time it is somewhat deeper in there. The sand accumulates in the bay—from what cause I really cannot say—at some periods of the year, and at others it is cut out again.

878. At the southern end of Shark Island where you are going to bring the bulk of the river water down, I suppose your operations would have to be of a very substantial character? I think the end of that island ought to be well protected. The local officers have had instructions already to put stone on that point as soon as possible, to prevent it from eroding. A good coating of stone will keep it. There is no doubt that it has been washing away.

879. That would seem to be a point which will meet the full force of the river water in flood-time? Exactly, and split the current there. There will be no wave there; it will be smooth water, but it will require to be protected as we have shown there. That point has been eroding very rapidly. I recollect when the depth there was not a third of what is shown on the map now.

880. Do you think the total sum which is put down here will effectually carry out the work? I think we shall be able to do it for that estimate.

881. You think £95,000 will be ample? I think it will. We are getting the advance walls made at about that rate at present.

882. The work you will carry out in these training banks seems to be of a character which will not require much care once they are built? They are very substantial.

883. Nothing like the entrance to the Tweed where the seas may get over it at any time;—these will be river training-walls? Yes; the inner walls do not require much renewal. No doubt, out at sea they get knocked about at times, and require some maintenance, but it is not of a very costly character at any time.

884. With a straight entrance of that character, in an easterly gale, will not the disturbed water run for a considerable way up the river? It would; but we are fairly well protected from an easterly gale there. That entrance is facing north-east. Trial Bay is a very deceptive place.

885. I suppose all that lower part of the river which has been used till recently will gradually silt up? It might up to low water, but not above that. There will still be a sort of tidal compartment; it will still take the same amount of tidal water in.

886. You said the Trial Bay breakwater will take a great many years to build;—I suppose works of this kind will go on much more rapidly than that? Yes; prison-labour stone is the most costly on the coast. It costs more per ton for the stone deposited in that breakwater than it does for the stone in any other breakwater on the coast.

887. How long would it take to carry out this modified scheme? Six or seven years.

888. Do you think you will carry it on by day labour as you did at the Tweed? I think so; as you watch the progress of harbour works you may find it necessary to slightly vary the position of a wall, or its height, and the contractor immediately steps in and wants an increased price per ton for raising or lowering the wall, whereas it adds nothing to the cost of the work, if we are carrying it out by day labour. If you can specify exactly what you want, and hold to it, it is very much better to let a work by contract. But where you have to watch the progress of the work, and vary it accordingly, I think it is better to carry it out by day labour. There is not a doubt that in the case of works we are carrying out on the coast, we have invariably done the work more cheaply than we could have done by contract.

889. I suppose you enter into contracts for the quarrying of material? That includes the quarrying, the conveying and the depositing of the stone. Our rate per ton on the Tweed where all the work has been done by day labour was considerably less than our rate per ton on any of these works which are being carried out by contract. So also is the rate per ton at the Macleay new entrance, although we are saddled there with the cost of plant and other matters, and we are hardly in full swing yet. The curious point of it all is that in the case of the Trial Bay breakwater which is being carried out by day labour the rate per ton is higher even than contract rate.

890. I suppose in all these rivers where improvements of this kind are going on we may always look forward to having to maintain a dredge service? I think there will always be a certain amount of dredging. The river deposit accumulates in places which you would never contemplate. I look upon the dredging of the river in the same light as the maintaining of an ordinary road in the country. Just as you must put metal on a road from time to time, so you must attend to a waterway.

891. It is a varying channel according to the weather? Yes.

892. I suppose if these entrances were carried out according to the plan, the same staff would be required at the Heads to attend to the lighthouse, the tug, the pilot service, and so on? The pilot establishment will probably require to be moved up. The lighthouse is on rather a high headland—Smoky Point. It is one of the principal lights on the coast.

893. The tug service will have to be kept up I suppose? There is no subsidised tug for the Macleay. Curiously enough they seem to get in and out there without the tug. I fancy that the subsidised tug-boat on the Nambucca includes in the charter attendance at the Macleay if necessary; but there is very little demand for a tug at the Macleay.

894. Do you adopt the same system there as you did at the Tweed, as regards filling-in behind the training-walls

H. R.
Carleton.
17 May, 1898.

training-walls with the stuff dredged out of the river? Yes, we are doing that. The cutting which you see on the plan has been made in that way with one of the sand-pumps working there. That is increasing in depth daily now. We only dredged to 14 feet, and there are nearly 18 feet of water there now.

895. Experience has shown that dredging in front of a training-wall, and filling-in behind the wall, does not have a tendency to let the wall drop into the river? I think it does to some slight extent. Some of the stone falls down into the channel and coats the side of the bank, and that prevents any further erosion.

896. It gives you a good base? Yes.

897. *Mr. Wright.*] I think you said that so far as your experience goes there is no silting in Trial Bay? No permanent silting.

898. If evidence has been given that as the breakwater extends, the bay in the immediate vicinity gradually shoals,—you maintain that that is not correct? I do.

899. I find that in their evidence both Captain Neitenstein, and also Mr. See, make that statement, and Mr. See bases his evidence on statements which have been made to him by the captains of steamers? He may be alluding to the immediate vicinity of the breakwater where the material itself has been washed down into the bay.

900. Will you listen to this evidence by Mr. See:—

Mr. Hoskins.] I understand you to say that as Trial Bay is being extended a bank of sand is shelving up against it? No; there is a bay inside at the back of the breakwater, and I am told that as the breakwater is extended the sand shoals up in the bay. In other words, there is less bay now than there was when they began the breakwater.

? He simply says that he is told that.

901. You say that that is not correct? I do say that there is no permanent silting in the bay.

902. By the extension of that breakwater creating as it will a cul-de-sac, is there not a danger of the silt discharged from the mouth of the new opening gradually silting up the entrance to the river or a portion of Trial Bay? I think not.

903. What tidal action will you have to sweep it away? The length of the breakwater at Trial Bay is so slight that I hardly think the effect can be noticed in any way. It is represented by that portion on the plan coloured black. It is so slight that I hardly see how it is possible to have any effect in the way of intercepting sand.

904. Is there any coastal current there to sweep away the debris which comes down the river? I am inclined to think that there is an eddy. The current would shoot from North Head to Lagger's Point in a direct line; but there would be a slight eddy in the bay, going round again and touching the southerly current.

905. You do not know that for certain? Yes; the current tests which were made by Captain Howard or Mr. Keele seem to indicate that.

906. As an engineer you think that there will be sufficient action in the ocean current to remove any accumulation of sand at the mouth of the new entrance? I do. The flood did break through at what we call the Macleay new entrance. It cut a channel there; we did not make it. We therefore ought to find a deposit of sand at the entrance if what you say is correct. The recent soundings did not show any indication of an accumulation there.

907. Your recent soundings are the same as those you made before this new opening took place? Practically.

908. Whatever was swept out through that entrance has been carried out into the ocean current? Yes.

909. You think that any future silt which comes out through that entrance will be dispersed by the action of the ocean current? It ought to be. The current through the new entrance will be improved by the construction of the walls.

910. One or two witnesses have expressed very grave doubts about the efficacy of the new entrance. They think that big floods will break away and will continue to go down the old channel to Grassy Head? That might have been the case before we blocked Spencer's Creek, but fortunately we were able to get a wall constructed across the creek before any big flood came down, and we are now in a position to stand an attack of flood of any magnitude we know of.

911. On the western side of Shark Island, in the event of an unprecedented flood coming down—a flood much larger than your channel would carry—would not that tend to sweep out that channel, and destroy your new entrance? There is no doubt that it would act as a relief valve in case of flood. A large portion of the flood waters will go down that old channel.

912. May it not act to such an extent as to make a much better channel on the western side of Shark Island, and pass by your proposed new channel, or silt up Trial Bay? The scour made the new channel in the first instance unassisted.

913. In the event of an unusual flood you propose to let the flood-waters escape by a comparatively narrow channel, but if you leave a wider and better channel open for its escape;—what is going to happen then? We look upon the old channel as a relief valve. We do not propose to draw the whole of the flood-waters through our new entrance.

914. You think that that relief valve will not eventually destroy your new channel? I think not. They will each take their share of the flood-waters as they have done hitherto.

915. Your contention is that even if a big flood should deepen the old channel and the old entrance, it will not sensibly affect your proposed new entrance? I think not. I think we will get sufficient flood-waters through the new entrance to improve that entrance.

916. Under any circumstances? Yes.

917. Is there any proposal to protect the narrow bank facing the ocean? No.

918. Is there any danger of the bank breaking away there? It does not matter whether it comes in over the whole of it. Three or four entrances have been formed by the action of the flood-waters at different times. I do not see any necessity for its protection at the present time, but if such a thing should arise there would be no difficulty in blocking the river, and turning the whole of the flood-waters through the new entrance.

919. Would not that interfere with the rights of people down below in the old channel? I think that most of that land is Government reserves. I do not know that there are any water frontages down there, except the saw-mill at Stewart's Point.

920. In their evidence, both Mr. See and Captain Taplin preferred the retention of the existing channel at

H. R.
Carleton.
17 May, 1898.

at Grassy Head on the ground that it is a certainty; that under any circumstances there is always water there, but that there is an element of risk about the new entrance? I listened very attentively to what Mr. See and Captain Taplin said. All I gathered from Captain Taplin's evidence was that he preferred the new entrance if we could give him sufficient water for his boat there, but he was doubtful whether it was possible to do so. At the present moment there is more water there than there is at the old entrance.

921. Mr. See said in his evidence:—

I firmly believe that if the same amount of money had been spent on the old channel, and no attention had been paid to the new one, you would have had a better result.

? Admitting that the same amount of money was spent at the entrance, there would still be some 6 miles of a very unstable portion of the river to improve, which expense we are saving. I mean the distance between the new entrance and the old entrance.

922. That you look upon as a very great commercial advantage? Certainly; every ton of stone used in the work is hauled 1 mile instead of 6 or 7 miles.

923. You have recently visited the work, and you are satisfied with the work which has been done and its future prospects? I am.

924. As an engineer, can you assure the Committee that it will be a success? My firm conviction is that it will be a success.

925. You saw nothing during your recent visit, and you know nothing in connection with the river to cause you to have any doubt on that subject? I was very much pleased with the result of the project so far. It is quite up to what I expected from the work we have done and the time we have been at it.

926. From your knowledge of this river, you think the new entrance is better for all commercial purposes than the old one at Grassy Head? Decidedly.

927. *Mr. Roberts.*] I wish to ascertain what depth of water there is at Kempsey at the present time;—I notice that in his report of December, 1890, Sir John Coode says that the river in its present state, and under the most favourable conditions, cannot be considered as navigable by craft drawing over 9 feet; in fact vessels of 8 feet draught have to wait for high water to get up to Kempsey, about 32 miles from the entrance;—does that state of things still exist, or has the river improved? It is not because of the depth of water at Kempsey; there is quite enough water when you get there. At that time there were several shallow spots on the river. One of the most serious of them was at the back of the western side of Shark Island, where a considerable sum of money had been spent in dredging to keep the river open. That was a serious block to navigation always; but that is evaded by coming in through the new entrance. Fisherman's Bend is another place in the river where the vessels had to wait to get high water to cross.

928. Do you get better water from the new entrance right up the river? Yes. There are one or two places up the river which are rather shallow, and which will require to be improved; but at Kempsey there is quite sufficient water for any ordinary vessel to lie in. Generally speaking there is quite enough water in the river; but there are two bad places in the river still which will require to be dredged.

929. They can easily be dealt with by constant dredging? I do not know that it would be advisable to keep constantly dredging. These shallow flats occur at very wide parts of the river, and it would be much better to put in a light training-wall, or two if necessary, and concentrate the river current between the walls, and scour it out; it would remain permanently deep then. It could be assisted, of course, in the first instance by dredging.

WEDNESDAY, 15 JUNE, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Macleay River.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and further examined:—

C. W. Darley. 930. *Mr. Lee.*] Do you happen to know the trend of the bar coming out of the Macleay to-day? No, not to-day.

15 June, 1898. 931. You are now widening what is called the new cut at a point about midway down the training-wall; the proposed width, I see, is about 600 feet, but you intend to dredge only 300 feet? The first two cuttings made 200 feet. We are now making a cutting which will give another 100 feet, and it is very likely that we shall afterwards come back and make another cutting.

932. I suppose the tidal influence is assisting you at the present time? Yes.

933. Take first of all the trend of the river in time of flood, I suppose the new cut is where the bulk of the flood-waters would be drawn? Yes.

934. Taking a sectional area calculated at 300 feet wide in your new cutting, do you think that will be wide enough to admit of the proper rapid passage of flood-waters? Not at present.

935. Would it not be wise to complete your dredging to the full width of 600 feet? We propose to go on until we get the 600 feet. Part of the scheme is the construction of the southern training-wall, and we cannot make that until we get the dredging done. We must first of all dredge up to it.

936. I suppose 300 feet would be more than enough for any navigable purposes in still water, where you are beyond the influence of the sea. But what I want to impress upon you is this, that inasmuch as that will be the chief outlet for the flood waters of the Macleay, there must be a channel of proportionate volume? Yes; but I would point out that 300 feet there would be more effective than 600 feet in the other channel. The gradient is five times as great in the new cut as in the old channel, therefore it will carry proportionately more water.

937. The water would have 6 miles further to travel along the old channel, and the channel is also shallow? Yes. In the new cut the water will reach the sea-level in one-fifth of the distance. You would find 300 feet there more effective than 600 feet in the channel of the main river.

938.

C. W. Darley.
15 June, 1898.

938. The existence of flood-water is a great consideration? Yes.
939. So far as area is concerned there will be a greater area for the passage of flood-water through that cut than in the river itself? Yes.
940. Is it your intention to do anything towards blocking up the entrance to Clybucca Creek? Not at present.
941. Nor is it intended to block up the old entrance to Grassy Head? No.
942. Therefore, the saw-mills at Stewart's Point could take advantage of the new entrance, or use the Grassy Head entrance? Yes.
943. Will any of your works interfere with the vested interests at Stewart's Point from the standpoint of navigation? Not in the slightest degree.
944. As to the suggested inundation of farms, is it not a fact that for the past twenty years the river has been in the habit of breaking through the sandbank at various places? Yes.
945. And I suppose that, while the openings remain, there would be a considerable influx of tidal waters? Yes.
946. The inference, therefore, is that the lands which it is to-day suggested will be flooded have been always more or less subject to tidal inundations? Yes, it must be so.
947. Do you think that the fact of the proposed new entrance, admitting the tide sooner than it would be admitted at Grassy Head, would make any appreciable difference to residents on the river bank? No doubt, in the portion of the river opposite the new cut, there will be more tidal range than there has been, but that is not by reason of anything the Government proposes doing. The tide will inevitably have a bigger range in the river than it had before the river broke out in two places.
948. If the objections of the residents at Grassy Head were considered now, would it not mean the absolute closing of the new cut at great expense, and also considerable expenditure at Grassy Head? It would mean this, that if the work already done had to be undone, you would leave the river as it has been, because there is nothing to warrant the expenditure which would be involved in opening the river at the old Grassy Head entrance. The estimate for that entrance was a very costly one indeed.
949. Supposing things were as they originally were at the new cut, and that you took up Sir John Coode's idea of the opening at Grassy Head, do you think that you would ever keep the flood-waters from breaking over the sand spit, unless you took a training-wall almost to the extreme end of the spit? No doubt it would be necessary to carry out more works in protecting the banks in that way than Sir John Coode calculated.
950. If a witness states that all that it would be necessary to do would be to carry out a slight breakwater from the North Head, as shown on the plan, and not to have any southern breakwater or training-wall, do you think he is putting forward a suggestion which is tenable? No; I think the river would break out again.
951. Does not the value of any scheme for Grassy Head depend more upon a southern breakwater than upon the northern one? Yes; it depends more upon the southern works generally.
952. If ever that entrance is to be made effective, there must be works on the southern side? Yes; and they would require to be extended well up the river.
953. Supposing you adhered to the northern breakwater only, it would not have the effect desired—that is to say, flood-waters would break out in the future as they have done in the past? Yes.
954. *Mr. Roberts.*] Would the diversion of the flood-waters of Clybucca Creek be a very expensive work? I have not prepared an estimate; but I do not think it would be a very expensive work. I do not see any object in carrying out that work at the present time. I have not, therefore, taken up the investigation.
955. If the work were found desirable afterwards it would not be found a very expensive one? No.
956. *Vice-Chairman.*] One of the witnesses expressed a doubt as to the permanence of the proposed work; have you yourself the slightest doubt as to its value and permanence? I am quite satisfied that when the work is finished it will be found to be a good, substantial, permanent work. Perhaps those who express the opinion you indicate may not know what it is proposed to do.
957. *Mr. See* expressed the opinion that if a flood forced its way down the river, and made an opening at No. 2 scheme, it would affect the value of the works now proposed;—what is your opinion on that point? I do not think the river is likely to open at No. 2, when it can get free egress through the new channel.
958. Assuming the possibility of such an opening, would the value of the proposed work be in any way affected by it? There is an opening there at present, but it is closing up from day to day, and no doubt it will eventually close up altogether. No doubt it lets out some of the water which would otherwise be passing through the new channel.
959. Then there is some force in the objection that if No. 2 opening is rendered permanent by flood-waters the value of the proposed works would be lessened? It would not matter much in a flood, because the new channel would carry the major portion of the flood-waters. If the place remained open afterwards, and if there were tidal action through it, it might injure the new channel to some extent.
960. Would it lessen the depth on the bar? No.
961. Would it leave the river navigable for all vessels passing over the bar? Yes.
962. Then in what way would the proposed works be prejudicially affected? They would not be very seriously affected. Of course, in a big flood a portion of the waters would escape through the new channel, and a portion through the old channel, but the new channel would not be permanently affected.
963. You are not apprehensive of any difficulty arising to the navigation of the Spencer's Creek channel from any possible opening which might be made in time of flood? I do not anticipate any serious damage at all.
964. Let me refer you to the evidence of Captain Taplin in reply to Questions 618 and 619:—
618. If it goes out by the new cutting you are apprehensive that, landing as it will in the calm water of Trial Bay, it will stop there and form a bar—is that your view? I am afraid it will.
619. You think it will be better to discharge into the open sea rather than into the bay, for that reason? Yes.
- What is your opinion upon that point? In the first place, the water does not really discharge into the bay proper. It discharges into the open sea. I do not think that there is anything in that objection. No doubt the sand will move out further; but there will be always a channel over the bar. There will be always a bar there, but there will be a channel through it.
965. You do not think the sand will be deposited in the bay in the way suggested by that evidence? No.
966. In other words, you do not think any difficulty will arise from the causes suggested by Captain Taplin? No; I do not think there would be any risk of serious inconvenience from that point of view.
967. *Mr. Lee.*] Your experience since you started the southern breakwater has been that the sand has followed you out behind it—that is, on the southern side of it? Yes.
- 968.

- C. W. Darley. 968. If that breakwater be carried out to the proposed terminal point, and if the sand follow you out to that point, and if any silting is to take place immediately outside that, there will be no more danger of such a thing occurring than there is at the present time, because the line of sea beach would be in a line with the low water at Trial Bay at this moment? Yes.
- 15 June, 1898.
969. If you extend the breakwater out a considerable distance, is not the lower portion of Trial Bay likely to be the place where the silting would take place—either there or in the reach on the northern side of the present breakwater? Yes.
970. You will bring the work out sufficiently far to ensure a distribution of the sand? Yes, the beach will grow behind the work. We know that from experience.

MONDAY, 27 JUNE, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Macleay River.

Henry Richard Carleton, Principal Assistant Engineer, Harbours and Rivers Branch, Department of Public Works, sworn, and further examined:—

H. R.
Carleton.
27 June, 1898.

971. *Chairman.*] It has come to the knowledge of the Committee that the Maria River, a tributary of the Hastings, extends some 30 miles in the direction of the Macleay; the Belmore River is a deep channel, and extends to within a reasonable distance of the deep water of the Maria River; therefore, it appeared that, whilst making good the entrance to the Hastings, and dealing with the Bellinger and Maria Rivers, and cutting a canal through the low-lying intervening country, it might be possible to dispense with the entrance to the Macleay; with that end in view, we should like to hear one or two things from you;—do you know the waterway of the Maria River? I have been at the head of it.
972. The Committee were informed that a tug drawing 8 feet of water could go 30 miles up the river;—do you know whether or not that is a fact? No; I doubt it.
973. You do not know the Maria River well enough to express an opinion with regard to it? No.
974. With regard to the Belmore River, can you give us any idea as to it? You could not take one of the Macleay boats up to the Loftus Bridge on the Belmore. I have been aground with one of our tugs, drawing 6 feet 6 inches, in the Belmore River going up to the Loftus Bridge. It is a very tortuous stream.
975. Are you prepared to say whether the cost would be prohibitive to make it navigable for such a boat as the "Macleay"? Not for such a boat as the "Macleay."
976. Take the "Tomki"? Nor for the "Tomki." She draws 8 or 9 feet of water. If you make a canal only for a vessel like that, you cannot increase the size of your vessels afterwards. But at the entrance we hope to get vessels in drawing 14 or 15 feet. A canal of 14 or 15 feet between the Hastings and the Macleay would cost far more than both the entrances put together.
977. Can you inform the Committee whether the cost of making the Belmore River up to the Loftus Bridge suitable for such a boat as the "Tomki" would be prohibitive? No, not to get as far as the Loftus Bridge; but it would have to go very slowly. The wash from steamers, if they go at any pace, would soon break the bank in. You would have a great deal of trouble in keeping it up.
978. Will you express any opinion with regard to the Maria River? No; I do not know it sufficiently well.
979. The Maria is a good river for a considerable distance? I have here a table of distances that might be of some use. From the proposed new entrance to the Macleay River to the junction of the Belmore River is $15\frac{1}{2}$ miles. That, of course, is all good water, or can be made good water. From the junction of the Belmore River to Loftus Bridge is 9 miles. It is rather a tortuous channel, some portions of it fairly deep, but not a channel that could be made available for vessels drawing 14 or 15 feet, except at a very great cost. The cutting from Loftus Bridge to the head of Connection Creek is 7 miles; from the head of Connection Creek to the junction of Wilson River is 12 miles. The whole of that would, I believe, require a great deal of dredging, and, possibly, rock may be found that will have to be removed in places.
980. But you do not know? I do not know, except that I have travelled through the country at the back, and I know that it is broken. From the junction with the Wilson River to the junction with the Hastings River is $11\frac{1}{2}$ miles. The Wilson River is fairly good. There is good water at Telegraph Point. From the junction of the Wilson River to the proposed new entrance to the Hastings, is $6\frac{1}{4}$ miles, giving a total length from the entrance of the Macleay River to the Hastings River of $61\frac{1}{4}$ miles. At the ordinary towing rate in such a canal as that, namely 3 or 4 miles an hour, the journey would take nearly as long as the traffic to Sydney.
981. Sixty-one miles of canals? Yes; 7 miles would be actual cutting.
982. What is the cost of the Macleay entrance? £100,000.
983. And that does not at all deal with the keeping open of the upper reaches of the river? Mr. Harrison estimated that to cut, certainly a very small canal, 15 feet at the bottom, at 3d. a ton, would cost between £15,000 and £16,000.
984. How deep? Seven feet. I think it is an underestimate. It might be pumped out at 3d. a ton. I do not think that a canal carrying what we shall have on the Macleay, could be constructed between the Hastings and the Macleay for the cost of either entrance?
985. You think that the cheaper way to give access to the Macleay district will be to carry out the work suggested to the Committee? I think so.

986.

H. R.
Carleton.
27 June, 1898.

986. Did the Department ever make surveys, or consider whether it is possible to save one of those entrances? We looked at it in a general way, and we saw that it would cost too much. Mr. Darley never even recommended that the survey should be made, because he could see from the plans alone that it would cost too much. Then it is only a makeshift.

987. Your evidence is this; you believe that a cursory investigation of the scheme of connecting the Macleay and the Hastings, and making one port do for both districts, was sufficient to justify the engineering department in regarding it as a scheme that would give an inferior outlet to the one proposed by the department? Yes, that is so.

988. *Mr. Lee.*] In connection with your Macleay scheme, is it not the fact that it will offer a much quicker outlet for flood waters—a very important factor? Yes, it is important in more than one way. We shall get rid of the flood waters sooner, and get more scouring power for deepening the entrance.

989. The Macleay River is subject to very severe floods? Yes.

990. And the erosion of the banks is very serious? Yes; that is the case with all the rivers.

991. That alluvial matter must be deposited somewhere? Yes.

992. Unless you can keep up a good scour, there is a danger of its settling at the back of the entrance? In big floods, as a rule, the greater portion is carried right out to sea and dispersed.

993. Suppose this canal were made, would it divert the flood waters? It would not be of any value as a flood carrier at all. It would be a mistake as far as floods are concerned, because I think that in dealing with the floods of these two rivers you should separate them altogether by a bank; otherwise, when you have a flood in the Hastings it would back up Connection Creek, and come into the Macleay water-shed. The same occurs on the Macleay. It backs up the Belmore River, and runs out on the Hastings water-shed. It ought to be dealt with by a bank running across to Crescent Head, letting each keep its own flood water. That could not be done if the two were connected by a canal.

994. As regards the flood water of the Macleay, that new entrance gives a much speedier exit than the old entrance at Grassy Head? Yes.

995. The upper entrance to your new channel is almost in a direct line with the main volume of water which passes down the Macleay River? Yes. We shall have the old entrance still as a relief valve.

996. But the body of water will pass through the new cut? Yes.

997. *Mr. Trickett.*] The gentleman who proposed this scheme suggested that the cost would be about £15,000;—what do you say? Probably he got that from Mr. Houison's report on the matter.

998. Was that for a 50-foot channel? Yes. He says he estimates that to cut a channel 50 feet wide and 12 feet deep, giving 7 feet at low water, would necessitate the removal of 800,000 yards, equal to 1,230,000 tons, and would cost at least £15,500 at 3d. per ton. It would be at least that.

999. That is the bare removal of the stuff? Yes.

1000. I suppose the bank would have to be protected? Yes.

1001. There would have to be fascine banks or timber or stone work to keep it up? Yes; it would require the expenditure of more money.

1002. I think you said that to make a canal that would work in with the other navigable parts of the river, would cost as much as either of the entrances? I think it would cost more than either of the entrances.

1003. Then, in a question of that kind, would not the fact have to be considered of its cutting open either river as regards its output of water? I do not think it would have much effect on it in one way or another. There is a small example of the same kind of thing on the Richmond River. We made a canal there, but the current is very slight.

1004. Of course you have not studied the case very carefully? No; we could not do it without a survey.

1005. Looking at it without a survey, you do not favour it? No.

1006. *Mr. Roberts.*] How far would Kempsey be from the Hastings entrance if the canal scheme were carried out? It would be a little under 60 miles.

1007. And the distance from the Kempsey to the new entrance of the Macleay is about 30 miles, is it not? Less than that.

1008. Does not the Burrawong at present, drawing 8 or 9 feet of water, go all the way to Kempsey when she once gets through the bar? Yes.

1009. *Chairman.*] You are prepared to make this statement with regard to the Macleay, that even if the Macleay River, spilling as it does into what is stated to the Committee to be still-water, if it does form a bar, the modern appliances for dredging which will presently be at the disposal of the Department, can cut a channel through the bar at any time? Yes; I make that statement.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

HARBOUR WORKS AT MACLEAY RIVER.

REPORT.

THE Sectional Committee, consisting of Messrs. C. A. Lee (Chairman), Henry Clarke, Frank Farnell, the Hon. C. J. Roberts, and the Hon. W. J. Trickett, appointed to "inspect, take evidence, and report with reference to the proposed Harbour Works at Macleay River," commenced their inquiry into this subject at Kempsey on Saturday, 4th June, 1895. The Sectional Committee on that day carefully inspected the localities at the entrance to the river where it is proposed the works recommended for the improvement of the river entrance shall be constructed, and the old entrance at Grassy Head. At the termination of this inspection they returned to Kempsey and commenced the examination of witnesses there on Monday, 6th June, completing their inquiry on the following day.

Before taking evidence the Committee, accompanied by the District Engineer, Mr. David Houison, made a thorough inspection of the river and the chief centres of population from Kempsey downwards, viewing the works already carried out and the locality of those to be effected, the stone quarries, the new entrance, and the bar. They then proceeded along Fisherman's Bend to the old entrance at Grassy Head, which they thoroughly examined with the assistance of the local pilot. The difficulties, tortuous course, narrow channel, and shallow portions inside the bar entrance there were pointed out, and the inconvenience of traversing this extra length of river below the new entrance was apparent.

Evidence was sought on all phases of the inquiry—the new entrance, the old entrance, the suggested railway from Jerseyville to Trial Bay, and the question of vested interests, all receiving attention. In addition, information was obtained both of a general and of a special character as to the present and future resources of the district.

The following witnesses were examined:—David Houison, District Engineer; Samuel Sheppard, farmer, Rainbow Reach; Frederick William Cox, farmer, Rainbow Reach; Timothy Rafferty, farmer, Central Kempsey; William Thomas Ryan Sinclair, river pilot, Kempsey; John Anderson Jamieson, pilot, Macleay Heads; Alexander Ferguson, agent, North Coast Steam Navigation Company, Kempsey; Brabazon Newcome Casement, medical practitioner, Kempsey; James Arthur Winney, journalist, Kempsey; Austral Rowe, farmer, Yarrahappini; Thomas Patrick John Taylor, storekeeper, Kempsey; Austral Verge, grazier and land-owner, Macleay River; Enoch Rudder, farmer and grazier, Kempsey; Herbert Phillips, Crown Lands Agent and Clerk of Petty Sessions, Kempsey; Otho Orde Dangar, auctioneer, Kempsey; Otto Albert Herborne, licensed surveyor, Macleay and Port Macquarie Districts; John Hibbard, storekeeper, Dalcoongli and Gladstone; William Thomas Dangar, saddler, Kempsey; Alfred James Trees, farmer, West Kempsey; Phillip Calfe Hill; Thomas Hennessy, sawmill proprietor, West Kempsey; and Henry Edmund Palmer, Inspector of Stock, Kempsey.

It will be noticed in the evidence that some witnesses from the Lower Macleay assert that since the new entrance has been opened and the present works effected, their lands have been occasionally partly submerged by the influx of tidal waters; but whether this is directly owing to the new entrance, to exceptionally high tides, or to gradual erosion of the banks, cannot be said to be a settled question. It may be pointed out that if the trouble is due to an enlarged entrance, it would have presented itself no matter where the improved entrance was constructed.

The

The Committee, in regard to the Macleay River (and the same remark will apply to the other rivers visited), were much impressed with the importance of this grand waterway; and its magnitude and navigable extent, they feel sure, are not fully realised by those who have not had the advantage of a personal inspection. The impression is at once forced upon one that the extensive and fertile districts fringing, or within reach of, this river are seriously handicapped by reason of its defective and dangerous entrance to the sea. With a "good bar" all goes well; but, as is often the case, when the negotiation of the bar by even the shallow-draught steamers and sailing vessels that run there is difficult or impracticable, trade suffers, goods deteriorate in value, the market is often lost, and a general disturbance of trade and domestic arrangements ensues. The Committee had, therefore, to consider: Is the present state of affairs to continue, or, is it not advisable to carry on a work which, according to the expert evidence, promises to make the entrance to the river navigable in almost any weather.

The question then resolves itself into a determination as to the best mode of improving the means of communication, and a justification or otherwise for the expenditure of a large sum of money upon the work. The Committee fully considered the question of a possible connection with Trial Bay by railway, and the various suggestions for improving the approach to the Macleay, and they came to the conclusion that the improvement of the river entrance is the mode of relief which upon all grounds commends itself to favourable consideration. With regard to the Departmental scheme, it seems to be preferable to the proposal to improve the Grassy Head entrance, for the seven reasons advanced in the Report of the Engineer-in-Chief for Public Works, and for reasons of economy. Although the work cannot be looked upon as directly reproductive, it is amply proved that the Macleay River district is one of the most favoured for agricultural purposes in the Colony. With better means of communication, it and its resources would become better known, and as a consequence there would be a large influx of population. The evidence as to the capabilities of the district is most encouraging, and although at infrequent intervals floods have caused temporary loss, the seasons generally are reliable, the rainfall copious, and the soil most fertile, the maize crop averaging from 50 to 60 bushels to the acre, and in some places yielding phenomenal returns. The dairying industry is rapidly increasing, cattle breeding is largely carried on, and the people as a whole are reputed to be in a prosperous condition. The one thing required to advance the interests of those already in the district and to attract many others is a more reliable means of communication.

The Committee have had, as in other cases, the opportunity of seeing the effect of works already in progress; and although for some reasons, perhaps, it might have been better had their investigation taken place before the project was commenced, on the other hand the works so far carried out have proved an object lesson of great value as to the effect of construction of training walls. So far, the scour thereby created has done good work, and although at the time of the Committee's visit the entrance to the river was more circuitous than prior to the recent "Maitland" gale, the evidence shows that since the opening of the entrance and its subsequent improvement it has been used almost exclusively by the vessels trading to the Macleay, and delays have not been frequent or prolonged.

A perusal of the evidence will show that there are varying opinions as to the power of the scour to entirely dispose of the sand at the end of the proposed training walls. Some witnesses urge that the sand will not get away, while the Departmental evidence is to the effect that the proposed scheme has been thoroughly thrashed out, that the sand will be distributed, and that a very good entrance will be obtained.

Having regard to the fact that the conditions are quite changed since Sir John Coode reported on the Macleay River entrance at Grassy Head, that the works so far carried out at the new entrance appear to have been beneficial, and that the general feeling of the residents of the district is in favour of the present proposal, and that the responsible Governmental officials are strongly of opinion that the scheme will be a success, your Committee are of opinion that the works already commenced should be completed at the further estimated cost of £93,000.

Kempsey, 7th June, 1898.

CHARLES A. LEE,
Chairman.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

HARBOUR WORKS AT MACLEAY RIVER.

[TAKEN BEFORE THE SECTIONAL COMMITTEE.]

MONDAY, 6 JUNE, 1898.

[The Sectional Committee met at the Court-house, Kempsey, at 10 a.m.]

Present:—

CHARLES ALFRED LEE, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

FRANK FARNELL, Esq.

The Sectional Committee proceeded to consider the proposed Harbour Works at Macleay River.

David Houison, District Engineer in Charge Macleay, Camden Haven, and Hastings districts, sworn, and examined:—

1. *Chairman.*] Your head-quarters are at Trial Bay? Yes.
2. Are you acquainted with the recommendations for the improvement of the Macleay made by Sir John Coode? I have seen the plans.
3. His report contained four proposals? Yes.
4. He favoured the Grassy Head proposal, known as the No. 1 scheme? Yes.
5. To that there was an alternative scheme? Yes.
6. If that scheme had been carried out where would the entrance have been? Between 3 and 4 miles south of Grassy Head, and slightly north of the present entrance.
7. His first scheme would have cost £382,192? Yes.
8. The cost of schemes 2, 3, and 4 was not worked out? No.
9. Would the No. 3 scheme have given an entrance about the position of the present entrance? No; we are less than $\frac{1}{2}$ a mile further north.
10. Why did Sir John Coode select that site for an entrance;—was there any creek or other opening there at the time? No.
11. Then what led him to make the suggestion? I think that he made that suggestion because, if carried out, it would have given the river a straight run from Rainbow Reach.
12. There was no indentation in the beach there? Not that I know of.
13. The No. 4 scheme would have given an entrance still further south of the present entrance? Yes; close to the south-west rocks.
14. How far is the present entrance from the old entrance at Grassy Head? About 6 miles.
15. How far is it from the top of Shark Island, where the diversion of the river commences, to the old entrance? About 7 miles.
16. And to the new entrance? About $1\frac{1}{2}$ miles to the ocean.
17. When did you begin the work of making the new entrance? I finished the survey in November, 1895, and I was about four months making it. I made a complete survey of the whole of the new entrance.
18. Sir John Coode's report was made in January, 1891? Yes.
19. Prior to your survey had any of the departmental officers been sent up to report on this scheme? Yes; Mr. Carleton had been up here.
20. Did not Mr. Price also come here? Yes; he was here during the big floods.
21. Did not they together inquire into the agitation going on for the improvement of the Grassy Head entrance? Yes.
22. Was it not after hearing the representations made by the residents, and the consideration of these proposals, that he reported in favour of the new entrance? I do not think the new entrance was reported upon until Mr. Carleton came up here, just before I made my survey. They at one time intended to close the entrance to Spencer's Creek. My survey was subsequent to Mr. Price's visit. Mr. Price had nothing to do with the recommendation of the new entrance.
23. Who recommended it? Mr. Carleton.
24. He was there twice? Yes.
25. Twice in one year? No; I do not think so. I only came here in May, 1895.
26. Mr. Carleton reported in December, 1892? Yes, and again in 1895. The river was then under different conditions from its present condition.
27. It was in consequence of the report made by Mr. Carleton that the Department decided to try if the new entrance could be made use of? Yes.
28. You thereupon made a survey? Yes.
29. In what year did you commence actual work? In April, 1896.

*22 (a)—A

D. Houison.
6 June, 1898.

- D. Houston.
6 June, 1898.
30. What was the state of the river then? The lower bar was very bad at that time, and there was only 3 ft. 9 in. at the new entrance. Steamers had been in there before, but it was not until we commenced work that they came in frequently. The "Burrawong" came in frequently while we were working there, before anything had been done outside at all. She used to go round the back of Spencer's Creek, and follow up the edge of Shark Island. She came through the channel we have now closed.
31. To get out at the new entrance? Yes.
32. Have Mr. Hickson and Mr. Darley seen this place? Yes.
33. Did Mr. Hickson see it before the decision of the Board of Reference was come to? I think not.
34. The river cut this opening of its own accord? Yes.
35. What was the amount of the first vote for improving the new entrance? £15,000.
36. What was the first work you commenced? Getting the stone across on to the neck of land that we have cut off. Of course, the first money was spent in making a tramway, to get as much stone as we could on to the other side before we cut through. At the same time the bank of sand blocking Spencer's Creek was being formed.
37. What was the cause of your anxiety to close that creek? To throw more water through the entrance. As the dredge made a cutting we followed up with stone.
38. And eventually you got the stone right across Spencer's Creek? Yes.
39. What was the immediate result of that work? A considerable improvement of the bar. There was a very heavy spit in the middle of the channel, and it was almost wholly removed. The main channel originally ran out east from the point of the commencement of the present work on the southern side. Now it runs out more to the north-east.
40. Were you carrying out any other work then? Then we started on with the wall on the south side.
41. Where does the wall on the south side commence, above the wharf or below it? Above the wharf.
42. I suppose you put the wharf there? Yes; after the wall was made.
43. For the convenience of the work, not for public use? For the convenience of the work, to enable us to land heavy goods there.
44. What was the effect of the work on the northern side? We started dredging from Spencer's Creek down towards the mouth, and as we cut in we lined the bank with stone to prevent erosion. We carried 14 or 15 feet of water with it all the way, and the channel is 2 feet deeper now.
45. Is there any sign of silting up? No; there was a slight sign of silting a little above the wharf, but that has gone away now.
46. Did you confine the whole of your attention to that side then? Yes.
47. Did you continue dredging at the same time? Yes.
48. You got as far north-east then as you could get with the dredge;—did that bring you into sufficiently deep water? Yes.
49. Is that why you ceased dredging there? No; we commenced dredging another 100 feet of width. We did not need to dredge any further down the channel.
50. Then you got a sufficiently wide channel for vessels to use? Yes.
51. Now for the southern wall;—when did you start it? I cannot tell you the exact date, but it was six or eight months after the work commenced.
52. What depth of water had you when you commenced? We had 16 feet of water at the end of the wall.
53. What have you to-day? From 21 to 23 feet.
54. You then had a sandbank to contend with;—what was the action of the water on that bank as you proceeded with the wall? It cut the bank away.
55. Did you carry 15 feet of water with you? We have 15 feet of water alongside the wall now.
56. Did you carry that depth with you as the wall proceeded? Yes.
57. Will you mark upon the map the point where the proposed southern breakwater will terminate? About 1,200 feet from the present working.
58. Are you satisfied that that will be sufficiently far for it to go? I think so. We have 35 feet of water out of 300 feet.
59. But you also have a sandbank to cross, and there is a wreck lying in the channel? The wreck is just inside the line of wall.
60. As you carried out the southern wall you carried out the sand on the southern side of it as well? The sand followed out the wall on the south side.
61. Do you expect that it will follow the wall right to its terminal point? No; because there will be a much larger area to fill up.
62. But it is only a matter of time when that space will be filled up? Yes.
63. When the wall reaches its terminal point will you be able to spill the sand out into a current that will carry it north? Yes.
64. Is not the current considerably influenced by Trial Bay? No. At times I have seen it set to the south, and at other times I have seen it set to the north. There is no continuous current there.
65. There is no fear of creating a sandbank out beyond the breakwater? I do not think so.
66. You will carry the northern breakwater out abreast of the southern breakwater? Yes.
67. And when you have a complete scour there is nothing that will prevent the sand from being taken well out into deep water? I think not.
68. Taking a line from the wharf, and running up the river on the eastern side, there is there at the present time a large area shown on the plan as solid land upon which trees are growing? That land has all been cleared.
69. How much of it has been dredged away? About 250 feet out of 750 feet. We are going to take off another 100 feet, so that then we shall have about one-half of it dredged away. The channel will then be 350 feet wide.
70. What depth of water do you expect to get in that channel? Fourteen feet.
71. That will be a sufficient depth for the ordinary steamers? Yes.
72. Will 350 feet be a sufficient width? Quite.
73. What is your reason for not making the channel 750 feet wide? I have not been instructed to make it wider than 350 feet.
74. What has been the effect of the current on the solid land on the eastern side of the channel? A great deal of erosion takes place after the dredge cuts through.

D. Houston:

6 June, 1893.

75. The tendency is for the channel to widen? Yes.
76. Will the current take all that soil away? If it does it will not matter, because we shall have stone laid further to the east, which will drop into place and form a bank as the river encroaches on that side.
77. By the present scheme the scour of the Clybucca water will be lost? Not quite.
78. Clybucca Creek will enter the main river considerably below the new entrance? Yes.
79. Consequently you will lose the influence of that water? To a certain extent.
80. Have you any scheme for the diversion of the Clybucca water? None has been put forward yet, but it has been talked of.
81. You are aware that Sir John Coode expressed himself strongly against No. 3 scheme, because it would lose the influence of the Clybucca water? Yes.
82. The Engineer-in-Chief is of opinion that it is not necessary to use the Clybucca water, and that if it should become necessary in future that water could be used? Yes; a channel could be dredged across the head of Shark Island.
83. Would not the water of Clybucca Creek still go out at the Grassy Head opening? No, because it will be shorter for it to come through that cutting. We draw that water now for nearly 3 miles.
84. Do you think that as the new opening is widened and deepened you will draw still more of that water? Yes.
85. Will you not always have serious trouble from an engineering point of view because of the two entrances to this river? That is a drawback.
86. I presume that it is unavoidable? Well, we have three openings now.
87. Where is the third opening? A little more than a quarter of a mile to the north of the new entrance. It was very nearly closed up last time I saw it.
88. It would be idle to think of closing up either the Grassy Head entrance or the new entrance? I think we can hold our own without closing the Grassy Head entrance.
89. You must always lose scour while the Grassy Head opening remains? Yes; though at present we have too much scour. We are in a transition state now, and with big tides the sand is always in motion, both in and out.
90. Is not this the position—that so much work has been done at the new entrance that it is absolutely necessary that the scheme should be completed, or that it should be abandoned? I do not see any necessity for abandoning it.
91. If it were decided to improve the Grassy Head opening all your work would be lost? Yes.
92. To make the Grassy Head opening a good one the new entrance would have to be filled up? Yes.
93. The new entrance has affected the Grassy Head entrance? No doubt.
94. Do you regard the stone that you are now using as suitable for the work? I think that it is the best stone on the coast without exception.
95. Are you of opinion that there is sufficient of it? The quarries will yield twice as much as we want.
96. At the present time you have not the complete appliances for carrying out these works? No.
97. Is the work being done by contract or by day-labour? By day-labour.
98. What is it costing you? Up to the end of the last year it cost 3s. 6d. a ton, paying for all the plant on the ground, and the assistance we give to the dredge in supplying manual labour and so on.
99. You do not know the cost of the stone per ton apart from the dredging? About 1s. 4d. apart from the cost of plant, buildings, and everything else.
100. That would be the stone for the southern wall? All the stone for both walls.
101. If the northern breakwater is carried out you will have to use very large stone there? Yes.
102. Will you be able to place stone in position in the northern wall as cheaply as in the southern wall? No, because it will have to be punted to the northern wall.
103. What will be the difference in cost? I think not more than 1s. a ton. The cost of the southern wall will be reduced considerably when we get new appliances for handling the stone.
104. Do you know upon what prices the estimate put before us has been based? 4s. 6d. a ton for the breakwater, and 3s. 6d. a ton for the other walls.
105. Is the estimate a sufficient one? It is a full estimate. The cost of the other walls will be less than 3s. 6d. a ton.
106. Will it not be necessary for you to dredge the whole of the channel between the proposed walls in order to give a speedy exit to flood waters? It is my intention to give a sufficient exit for flood water.
107. Do you not think that that is a very important feature of the work? The whole of that channel will be dredged eventually, but I do not know what the Engineer-in-Chief's present intention is in regard to it.
108. The erosion of the river banks here is very great? Yes.
109. And the river is subject to very heavy floods? Yes.
110. Do you not think that it will be necessary to make the entrance sufficiently wide to allow of the flood-waters passing out as quickly as they passed out through the old entrance? I should prefer to see it.
111. Do you not think that that is necessary? Well, the ground there is very low. My instructions are to make the channel 350 feet wide.
112. No one can form the same valuable opinion upon the river as yourself;—we should like to have your opinion on the point? I should like to see it done.
113. You think that it would be a protection? In more ways than one. If part of the channel is left undredged, the gradual erosion will give us so much more sand to deal with on the bar.
114. But do you not think that, having altered the course of the river, you are bound to give a sufficient opening for the proper discharge of the flood-water? Our present opening is much larger than the Grassy Head opening ever was.
115. May not the flood-water cut through at the bar, or round the head of Shark Island? I do not think so. There is very high ground at the point of Shark Island.
116. If another entrance was cut alongside the present entrance, would it not seriously injure your work? Yes.
117. Therefore, do you not think that, as a matter of safety, the channel at the new entrance should be dredged to its full width? That is what I should prefer.
118. What would it cost to dredge it out to a sufficient width to give a proper exit for flood-water? I could hardly tell you. The dredging is altogether a separate matter.

- D. Houston. 119. I presume that you do not anticipate underlying rock? No. We have been down outside 36 feet with the "Jupiter," we have been down 30 feet with piles, and in the channel we have been down 30 feet.
- 6 June, 1898. 120. You anticipate that once you are able to create a proper scour, the water will do everything for you? Yes.
121. There is not likely to be any additional expense required for the removal of rock? No; there will be no rocks to remove.
122. Do you see any difficulty in connection with this proposal? No.
123. Do you see any weak point in it that could be improved? I do not think there is any improvement that I could suggest at the present time.
124. Are you prepared to assure the Committee that if the works are carried out as designed they will give the desired effect? I think they will.
125. What depth of water will you then have? Fourteen feet at the bar.
126. And how much inside? Sixteen or 18 feet.
127. Will you have a crossing inside? I do not think so.
128. There will be only the bar to contend with? Yes. The only place where we could have a crossing would be where the river widens out at the top of Shark Island.
129. What depth will you have at high water? At ordinary spring tides, 19 feet. We have had higher tides, but the ordinary spring rise is 5 feet. The rise of tide varies with the season. We have had as small a rise as 2 feet.
130. You feel pretty certain that you will be able to get and to maintain a depth of 14 feet at low water? I do not see anything to prevent it.
131. And you do not anticipate that any new difficulties will be created? No.
132. If the work is successful, larger vessels will be able to trade here than come to the river now? Yes.
133. Can you give the Committee any information in regard to the flooding of certain lands in the vicinity of the new entrance, which it is stated occurs because of the entrance having been made? The tidal rise is now a foot higher than it was before the new opening broke out, and I have had to raise work in the vicinity of Clybucca to prevent the water from flowing over the Clybucca flood-gates. These flood-gates were designed to meet the original condition of the river, but since they were made I have had to put in an 8-inch plank to provide against the increased rise of tide. The Clybucca work was done just about the time that we commenced at the new entrance.
134. As soon as the river cut its way through at the new entrance higher tides set in? Yes.
135. Do you know if any farms have been inundated by this increased rise of the tide? I have heard complaints about some of the low-lying land being covered, and the corn destroyed with salt-water.
136. You repudiate the idea that this inundation has been caused by your works? Well, the opening of the new entrance was the act of Providence.
137. Was this land subject to tidal inundation before the new cut was made? No, I do not think so, but I have only been here three years.
138. Do you attach much importance to this damage? Not in comparison with the general benefit obtained by the whole community.
139. Are you of opinion that, whatever precautions may have to be taken to overcome this difficulty, you can make no alteration in your works? No alteration at all.
140. If it is necessary to insure the prosperity of the people on this river that the proposed works be carried out then, however unfortunate the position of those whose lands have been flooded may be, it must be recognised that that position is due to natural causes? Yes.
141. If larger vessels are attracted to the river, will a very great outlay be necessary for the dredging of the river to enable them to come as far as Kempsey? I do not think so. All the dredging that is done on the river at the present time is done to what we consider 10 feet at low-water, which really means 12 or 14 feet.
142. Is there any place near the entrance where large vessels could safely lie and take in cargo? Yes, Jerseyville.
143. The question of dredging the river to a greater depth is one to be dealt with in the future? Yes, it is quite a future consideration.
144. *Mr. Trickett.*] You have read the Departmental Report on the scheme? Yes.
145. In that Report, page 3, the following reasons are given for the construction of the new entrance:—
- (1) A much more sheltered entrance than the present one.
 - (2) At least 10 miles less steaming on the round trip Sydney to Kempsey.
 - (3) The saving in dredging in consequence of the unstable portion of the river not being required in the new scheme.
 - (4) The saving of about 10 miles of training-walls over the above length.
 - (5) Increased scour on the new bar due to tidal flow and flood discharge in consequence of the decrease in length of river channel.
 - (6) The saving in haulage of all stone used in the work. It is more than probable the stone will be obtained from Rudder's Hill, which is within a mile of the new entrance.
 - (7) A smaller and cheaper class of stone required in the breakwaters in consequence of the sheltered position, and a less length of breakwaters to that required at Grassy Head.
- Do you agree with those reasons? Yes.
146. Were you examined before the Board of Experts who inquired into this matter? No.
147. But your investigation and experience here lead you to adopt the reasons I have read? Yes.
148. Sir John Coode strongly advocated the improvement of the Grassy Head entrance;—have the circumstances altered since he made his report? Considerably, because of the break-out.
149. When he reported the only opening was at Grassy Head? Yes; but there was a blind channel at south-west Rocks.
150. Since the new entrance has been made have the vessels used the old entrance at all? Yes; but not for a long time.
151. How long is it since they ceased to use the old entrance? I think about six months.
152. Is the channel inside the old entrance of less depth than it was? It is just the same as when I examined it twelve months ago—that is the crossing; but inside the bend, after you pass Razorback, it is much shallower because of the encroachment of the sand spit.
153. Has not that entrance been affected by the new entrance? Yes. The new entrance takes water away from the old entrance. The crossing inside Razorback has been dredged repeatedly, but it fills up again almost immediately.

154. At Grassy Head there is not only a bar to cross, but there is a circuitous channel to follow afterwards? Yes. The water will persist in taking a curve right round the western side. A straight channel has been cut through, but it will not remain. D. Houston.
6 June, 1898.

155. No works of a permanent character have been undertaken at the Grassy Head entrance? Nothing beyond dredging. Most of the dredging on the river was done at Fisherman's Bend, which had to be dredged after every flood.

156. I suppose that if the new opening had not broken out the cost of improving the Grassy Head opening would have been a rather severe handicap for the district? Yes; it would have been almost prohibitive.

157. We have been told by Mr. Darley that the cost of improving the new entrance will amount to £108,000, including what has already been spent;—have you checked those figures? No. Those are entirely Departmental figures.

158. Do you think that the new opening will give a sufficient outlet for flood-water? I think so, especially while the Grassy Head entrance remains open.

159. Although at the present time the land near the new entrance is occasionally slightly flooded? Of course, it will take a certain amount of time to carry off the flood-water. The water must accumulate to a certain extent.

160. Will the ebb and flow of the tide be sufficient to keep the new entrance navigable, or will the aid of the flood-waters be required occasionally? The bar will be all the better for the scour of the flood-waters occasionally; but the tidal scour will be sufficient to keep the channel good.

161. Do you think that in the absence of floods the bar will silt up? I do not think so; but after a flood there will be more water on the bar.

162. What is the depth of water on the bar at the present time? Seven feet was the depth shown by the latest sounding. Originally there were only 3 feet 9 inches.

163. Captain Taplin said that the depth of water on the new bar was 4 feet at low tide? It is 7 feet now. Mr. Carleton and I went out and got 11 feet.

164. Why does the bar crossing, instead of going straight out, go to the north-east, almost at right angles to the entrance? That is because of a heavy south-east gale which we had about the 5th of last month. Now the crossing is showing a tendency to come back to its original position. We always had bad bars on the coast in June, because of the prevalence of south-east weather then. The bar crossing at the Macleay never went so far north before; but we had not had a south-east gale.

165. When were the last soundings taken? I could not tell you the exact date. I got 7 feet when Mr. Carleton was here, less than two months ago; 11 feet was the actual sounding, but there was a rise of the tide of slightly over 4 feet.

166. Have the steamers often been bar-bound since they have been using the new channel? Very seldom.

167. Mr. Carleton, in his evidence, said distinctly that there was no silting up in the bay, whereas Captain Taplin said that the bay was silting up? The following table shows the depth of water in Trial Bay, at various points opposite the breakwater, in the years 1893, 1896, and 1898:—

Distance from starting-point of breakwater.	700 ft.	800 ft.	900 ft.	1,000 ft.	1,100 ft.	1,200 ft.	1,300 ft.
1893 Depth	30 ft. 9 in.	32 ft.	32 ft. 6 in.	33 ft. 9 in.
1896 "	34 ft. 9 in.	36 ft. 3 in.	38 ft. 3 in.
1898 "	31 ft. 9 in.	31 ft. 3 in.	32 ft. 9 in.	34 ft. 6 in.	36 ft. 6 in.	38 ft. 6 in.	37 ft. 9 in.

Inside the breakwater itself there are about 18 inches more sand than there were five years ago, when the survey was made. At the wharf which adjoins the breakwater there is a depth of 16 feet at the present time.

168. Do you agree with Mr. Carleton that there has been no silting up? I cannot say whether there has been a silting up, because I have taken no soundings in the bay. These soundings are taken every three years, and I am just about to take new soundings.

169. You do not see any difference in the bay? No. The soundings I have read were taken for the purpose of seeing whether steamers could come to the wharf at the breakwater. So far as we sounded there had been no silting up.

170. Have you had anything to do with the harbour works on the Richmond or on the Clarence? No.

171. Can you point to any work similar to the proposed work which has been successful? The works at the Clarence are the only works that I can mention.

172. Have you considered what effect the closing of the Grassy Head entrance will have upon vested interests there? I could not offer any opinion upon the subject further than to say that the droghers will be able to go to that part of the river just as they go there at the present time.

173. Your observation would enable you to say whether the settlement on that part of the river compares in number and importance with the settlement higher up the river? There are very few people near the Grassy Head entrance. There is one saw-mill there, but the proprietor told me some time ago that the timber was getting very scarce.

174. Do you think that the proposed breakwaters are likely to suffer from heavy storms? No.

175. What makes you think that? My knowledge of the work that has been done, and the experience we have had at Trial Bay. The Trial Bay breakwater is broadside on to the waves, and withstands the whole force of the sea. Here the breakwaters will be end on to the sea, and we are using stone of the same specific gravity as the Trial Bay stone, and we can get it in any sized blocks.

176. Have you considered how the range of the sea would affect the new entrance? We have a slight range within the channel now; but it does no harm to the work, and we are gradually increasing the size of the stone we are using as we go out.

177. When your bar improves, and the crossing goes straight out, will there not be a danger of the waves coming up the channel with sufficient force to injure the works? No; it is only during exceptionally high tides that there will be any danger. We have not lost any stone at the new entrance yet, although the water has been over the railway line.

178. I suppose the completion of these works will take a considerable time? About five years from now. We have already been two and a half years at work.

179. Do you think that the whole of the proposed works are necessary? Yes.

180. And nothing less? No.

- D. Houston. 181. Up to the present time £15,000 has been expended? Yes.
- 6 June, 1893. 182. And it is proposed to expend £93,000 more;—do you think that the works can be carried out for that amount? For less than that. We are a little ahead of the estimated expenditure now.
183. *Mr. Roberts.*] Have you always held the opinion that the best course has been adopted in improving the new entrance instead of the Grassy Head entrance? Certainly.
184. You have never had any doubt upon the point? No.
185. Is the fact that the flood-waters empty themselves into the sea at the new entrance fair evidence that the proper site has been adopted? That is a good indication. The new entrance gives the shortest course to the sea.
186. Have not the flood-waters frequently broken out before at other places lower down? Yes; but at this place we have solid land behind us. Where the other break-outs occurred there is only sand, and the water may cut through there again at any time.
187. Would not an opening at the south-west rocks be more sheltered than the new entrance? We have borings which show that you could not get more than 11 feet there without coming to the rock. Before this proposal was decided upon, I was directed to take two sets of borings—one at a place a little nearer to the rocks, and the other in the position of the present entrance.
188. What was the result of your investigation? The present scheme was adopted.
189. Were you the first to suggest this opening? No; Mr. Carleton and myself went out and took soundings across the bar before he reported.
190. Would the deepening of the south-west channel be a very expensive matter? Yes; there are bars of rock running through it in every direction, and there are pinnacles of rocks sticking up. Then, too, that channel will be very circuitous.
191. Would that prevent you from getting as good a scour as you get now? No; but we should have rock all the way. There have been no borings taken close to the south-west rocks, but the headland there is very rocky and the opening never keeps open for any length of time.
192. Did not Sir John Coode mention in his report that if the No. 3 scheme were adopted it would cost as much as the No. 1 scheme? I do not remember. I do not think that any estimate was made of its cost.
193. In a statement laid before the Committee Mr. Hickson referred to a portion of Sir John Coode's report, in which the cost of Schemes 3 and 4 is spoken of as fully equal to the cost of Scheme 1? I cannot see how that would be, because 8 or 9 miles of training-wall would be saved.
194. Have you made any estimate of what it would cost to bring in the Clybucca water? No.
195. Does the Department expect to get all the scour required at the new entrance with the assistance of the Clybucca water? Yes; during big tides we draw water from there for a distance of 3 miles.
196. In Sir John Coode's report it is mentioned that the Clybucca water could not be diverted through the new fair-way unless at a great cost? The cost would not be very great. It is merely a matter of dredging.
197. Sir John Coode says distinctly that it would cost a great deal to bring the Clybucca water into the new fair-way? I do not think that it would. I do not place much reliance upon the Clybucca water myself. No great volume of water comes down that creek except during heavy floods. For the ordinary scour the Clybucca water is almost useless.
198. You regard it as unimportant? Yes.
199. The total estimated cost of Mr. Darley's complete scheme is £218,000 as against £382,000 for Sir John Coode's scheme? Yes.
200. Do you feel satisfied that Mr. Darley's scheme will give as satisfactory a result as Sir John Coode's scheme would have given? I think a more satisfactory result.
201. And there will be a great saving in cost? Yes.
202. Therefore, one of the great points in the recommendation of the Departmental scheme is its economy? Yes; the proximity of a large supply of stone is a great help to us.
203. Is there an almost inexhaustible supply of stone close to the new entrance? Yes.
204. Could not stone have been obtained close at hand if the No. 1 scheme had been carried out? The stone there is not as good as the stone we are using. It is slaty.
205. Was there not a proposal to construct a tramway from Jerseyville to Trial Bay? I have seen it in print, but I do not know anything about it.
206. Do you think that would be of any advantage to the people on the Macléay? It would be of no good to them at all that I can see.
207. Is the country through which the proposed tramway would go level? No; it is rather hilly.
208. I suppose the use of such a tramway would necessitate a double handling of goods? Yes; the goods would have to be taken down the river by droghers, then put on to the tramway, and then taken from the tramway to the steamer.
209. Sir John Coode seems to have been influenced in favour of the No. 1 scheme by what he terms the "sand travel" along the beach;—he pointed out that the sand passing northward along the beach would be likely to give considerable trouble at any of the other openings suggested for consideration? Yes; with the exception of proposed opening, No. 4, which, of course, would be under the headland at the south-west rocks.
210. Will your entrance be affected by the sand? I do not think the sand travels north, and I have known the flood-waters to have quite a southerly trend. It all depends upon the direction of the wind. By means of floats placed in the bay, we have ascertained that there is no distinct northerly trend.
211. Sir John Coode says in his report: "The experience of the Department in dealing with the various entrances along the coast leads to the belief that there is less cause for apprehension on this point than would at first appear. It is well known that the bars debouching at a south head are better than those of a north head"? That does not always hold. We have a bad bar at the Hastings now, although that opening has a south head.
212. Is it impossible to form a fixed opinion upon the subject? Yes; it all depends upon the direction of the wind.
213. In your experience of the old entrance has the bar been constantly changing? Yes; and there are two crossings. The crossings were the greater trouble there. One crossing was inside, between the two knobs that they call Grassy Head, while the other crossing still further inside has been a permanent source of trouble.

214. But once inside the river you have always got deep water? No; there is only 7 feet of water now at low tide. D. Houston.
215. Is not that because you do not dredge there now? We have not dredged there for a considerable time, but there is the same quantity of water upon the crossing now as there was a short time after we finished dredging there. 6 June, 1898.
216. The old entrance will shortly cease to be navigable, will it not? It is in the same position now as it was in twelve months ago.
217. Will not many settlers between Stuart's Point and Spencer's Creek be inconvenienced by the closing of the old entrance? There are no settlers between the points you mention. It is the settlers out back, at Unkya and out that way, who complain.
218. Will there still be sufficient water to enable the droghers to get down to Stuart's Point? Yes.
219. They will not be put to any extra expense? I do not think so.
220. How many settlers are there down there? I am not aware. There is one saw-mill and the houses of the pilot and his men on the river, and there is some settlement at the back.
221. Is there a road by which the settlers can get to the river? There is a road from Stuart's Point to Clybucca.
222. The Comptroller-General of Prisons informed the Committee that the effect of the Trial Bay breakwater had been to shoal up the bay inside it? His statement is incorrect so far as the result up to the present time is concerned.
223. If ever there was a shoaling up it has disappeared? Just close in underneath the breakwater there is sand, but that may be caused partly by the drainage from our works. 200 or 300 feet out from the breakwater the soundings give the same depth as we got five years ago.
224. Do you not fear the silting up of sand at the new entrance? No.
225. Is not the new entrance upon all fours with the Bellinger entrance? No; the one opens north-east and the other south-east. In other respects they are similar. There will be a sandbank on each side of both of them.
226. Up to the present time the works at the Bellinger have been a decided success? Yes; but we are not as far advanced here as at the Bellinger. We shall have better conditions here when we are as far out as we are there.
227. Has not the steamer "Burrawong" been detained at the Heads since Saturday, unable to get out? Yes.
228. Is not that because of the insufficient depth of water upon the bar? No; it is because of the heavy sea. The "Pelican" went out twice.
229. With what depth of water can the "Burrawong" go out? She has gone out in smooth weather when there has been only 8 feet of water.
230. Are there not only 7 feet of water now? At low tide. At high tide there are from 10 to 11 feet of water, but that is insufficient when there is a heavy sea on.
231. She would not be fully loaded? She was drawing 8 feet this morning. She was within about 6 inches of her Plimsoll mark then.
232. As a rule, does she not complete her loading in Trial Bay? She has not done that very often lately.

Samuel Sheppard, farmer, Rainbow Reach, sworn, and examined:—

233. *Chairman.*] How long have you been living at Rainbow Reach? Nearly forty years. S. Sheppard.
234. *Mr. Trickett.*] Whereabouts is Rainbow Reach? It is on the main river, about 2½ miles from the present entrance, and about 2 miles below Jerseyville. 6 June, 1898.
235. On which side of the river is your property situated? On the west bank.
236. You have a farm there? Yes.
237. What do you grow? Maize.
238. Do you grow anything else? I milk cows, but only for my own use.
239. Do you breed pigs? Yes; and I grow potatoes and other things. Maize is what I send to market chiefly.
240. You have a knowledge of the harbour works that are now being carried on? Yes; I am sorry that the Government ever went into such a big undertaking, making a storm-channel into a navigable channel. It has injured, I might say, hundreds of acres of cultivated land upon the Lower Macleay.
241. In what way? By allowing the salt water to flow over the land, and to destroy the vegetation.
242. When did the salt water first go over the crops? I think in 1890.
243. That was when the opening broke out? Yes; then, after that, when very heavy spring tides came, the salt water flowed over the cultivated land. A meeting was held at Jerseyville, and we asked the Government to put a wall across Spencer's Creek as high as the tide-level, to prevent the salt water from coming up and going over the farms.
244. The damage done by the salt water was caused through the breaking out of the new entrance? Yes; but the more the channel there is dug out, the more damage will be done, because more water will come into the river.
245. To what extent has your holding been damaged? I have 97 acres of land, and my wife has 84 acres. Out of that area 30 or 40 acres have been destroyed by the salt water.
246. Does it come over your corn land? Over part of it.
247. How much corn land has been injured? I suppose about 10 acres.
248. What is the other land—grazing land? It was grazing land.
249. Has the grass all been killed? Yes.
250. Do I understand that that land is now useless to you? There is nothing growing there that the cattle will eat.
251. Did any of this flooding occur before the new channel was made? No; the land was never flooded with salt water before. I can show you land upon which gum-trees 3 feet through have been killed by the salt water.
252. When did that happen? Since 1890.
253. When did you grow your last crop on the land that has been damaged? I put crops in, and they were destroyed. When we get a heavy spring tide and an easterly wind and sea, the weather is heavier than

- S. Sheppard.
6 June, 1898.
- than it is at other times, and many of us are afraid that if there is a good easterly gale now it may destroy all our farms.
254. Are you certain that none of this flooding occurred before the new channel was formed? Not for hundreds of years. The appearance of the timber will tell you that. We had swampy land, but there was fresh water in the swamp. Now all that water is salt.
255. Have the Government works benefited the district generally? I think that it will cost the Government £1,000,000 to make a good entrance, the bar runs such a distance out. Of course, since the works have been commenced we have never had an easterly gale. A southerly gale does not interfere with the place much, because of the shelter given by Smoky Cape.
256. If this is such a bad entrance, why do the steamers and sailing vessels use it instead of the old entrance? Because it has more water.
257. It is a good navigable channel? Yes; but a dangerous one. It is nothing like the old channel. The river is the river, and always will be. There is an opening just below the present channel, and in 1893 two more openings occurred, and before the dredge went to work there was another opening. The water was so much divided that none of the openings received the whole run of the tide.
258. Suppose your land were bought back from you at a fair value—I put this only as a supposition—would you favour the improvement of the new channel? No.
259. You still think that the old channel would be better? Yes. This entrance will destroy the lower part of the Macleay. What are the people down there to do. There are thousands of settlers back in the bush who have to bring their produce to Stuart's Point, and there are thousands of feet of timber cut there by the saw-mills. How is that timber to be sent away, if the lower part of the river is destroyed. There is a beautiful reach of water there from Shark Island. I suppose it is 5 miles long, and is capable of holding nearly all the British men-o'-war. The settlement from Unkya, the head of Warrell Creek, Yarrahappini, and other places all goes there.
260. How have those people got their produce away to hitherto? They bring their produce to Stuart's Point now.
261. Before the new entrance was made, how did their produce go away? It came to Stuart's Point. Stuart's Point is only about 2 miles from the Heads.
262. They will always have to get their stuff carried by droghers; but how can it matter to them whether it goes to the new entrance or to the old entrance? If the new entrance is improved, there will be no water going out of the old entrance, and there will be no navigation down to Stuart's Point.
263. The new entrance lets the water of the river escape out to sea more quickly than the old entrance? Yes; but it allows more water to come into the river, and that spoils our cultivation. No sooner does the tide rise, but the salt water comes on to my land, and on to the land of other people there. If you go down the river you will find nothing but sand and swamp and miserable places. I have been living upon my farm for forty years. I took it up as a selection, and I have reared a family of twelve children upon it; but if these tides continue I cannot go on.
264. The settlers who go to Stuart's Point live at Unkya and Allgomera? This diversion of the channel affects hundreds of people, right up to Clybucca Creek. I do not mean to say that all that land will be covered by the tide. I know one man down the river, one-third of whose land has been destroyed by the tidal water.
265. How long is it since the farmers down there raised this objection? They raised it about 1892. They had meetings there, and made a request to the Government upon the subject.
266. Are you sure that their complaint was about the flooding of their farms;—are you sure it was not because they thought that they would be cut off from communication with a market? No; we wanted a wall to keep the tide out.
267. Did they not put in some kind of claim against the Government for injury to certain vested rights? No; they simply asked that a wall should be put across the creek to prevent the salt water from coming up the river. If that wall had been made it would have prevented the tide from rising too high.
268. You wanted a sea-wall to prevent the salt water from rising on to your land? We wanted a wall put across the creek.
269. Do you still want that wall? Yes; but we cannot get it now.
270. If that wall were made would it remedy your grievance? Yes; but it would make it impossible to use the new entrance.
271. The construction of such a wall would have the effect of stopping the present work? Yes.
272. How many settlers do you say are affected—fifty? I suppose there must be.
273. Where were those fifty living? A great many of them reside on Long Reach, on the Clybucca, and from Jerseyville right down to the turn off. All these people are affected more or less.
274. Your proposal is, that to benefit these fifty settlers, the works should be abandoned? Yes; because I do not think the new entrance will ever be any good.

Frederick William Cox, farmer, Rainbow Reach, sworn, and examined:—

- F. W. Cox.
6 June, 1898.
275. *Mr. Roberts.*] How long have you resided at Rainbow Reach? I was born there thirty-three years ago.
276. How much land have you there? Seventy-three acres. My mother owns it. I have only an interest in it.
277. How much of it do you cultivate? About 25 acres.
278. What do you grow? I grow maize, oats, potatoes, and different things. I am growing about 1,200 bushels of maize.
279. How much of your land is devoted to maize? The whole of it. Other crops I grow upon other land.
280. How many acres are devoted to oats, potatoes, and so on? About 2 acres to oats, and probably half an acre to potatoes.
281. Do you grow potatoes only for home consumption? I sell them to anyone who may come along.
282. Do you send potatoes to Sydney? No.
283. Do you send oats to Sydney? No. I only grow them for my own use.
284. Do you send maize to Sydney? Yes.
285. How many bushels of maize do you get to the acre? About 50 bushels.

286. What is the average number of bushels obtained per acre—is 50 bushels a fair average? I suppose it is, but some people get 80 and even 100 bushels to the acre. 100 bushels to the acre is a very heavy crop. F. W. Cox.
6 June, 1898.
287. Is not the present year a very good one? Not a remarkably good one down the river. The early maize is very good, but the late maize has been no good at all.
288. How far is your farm from the new entrance? About a mile, more or less.
289. Has it a frontage to the river? Yes.
290. Would your property be between Blind Creek and Spencer's Creek? Yes.
291. Does the drogher call at your place for maize? Yes.
292. Where is it shipped on board the ocean steamer? At different places. Sometimes they take it to Jerseyville, and at other times they tranship it from Trial Bay.
293. Is Jerseyville the last place of call for the ocean steamer? Very often the ocean steamer calls at my place, because the company have a coaling station there.
294. Have you suffered inconvenience or loss since the harbour works at the new entrance were started? Yes.
295. Will you tell the Committee the nature of that loss? In 1890 the present entrance broke out, and in 1893 two more storm channels broke out to the north of it. After that I found that the tide rose higher upon my land. Before the entrance was improved by the dredge I lost about 5 acres of land, but since the dredge has cut through I have lost 15 or 18 acres of land. This season I had 6 acres of maize damaged by the salt water. The tide first came on to that land in November, then again in February, and again last month, during the storm in which the "Maitland" was wrecked.
296. Have you represented your grievance to the Government? No. In 1891 we held a meeting at Jerseyville, asking the Government to protect our property by making a wall from Rudder's Hill to the point of Shark Island, and we got an answer from Mr. Hickson that the land he was cutting through was a salt water flat. Still, our properties were not salt water flats. Salt water flats will not grow maize.
297. Since then has any correspondence taken place between you and your neighbours and the Government? No.
298. Have you made any representations to Mr. Darley since he took control of the Department? No.
299. Has the loss and damage that you speak of been going on since the new works were started? In 1890 I found that I lost 5 acres of land, but since the new entrance has been cut through by the dredge I have lost 18 acres. Six acres of that was maize land, and the remainder paddock land.
300. When did your second loss take place? In November last.
301. What was the cause of it? They cut a more direct opening from the ocean into the river.
302. How often does the salt water come upon your land—every tide? No. Every tide flows over 5 or 6 acres of it, but with a very heavy storm the tide flows over 15 or 18 acres.
303. Has the salt water flowed over 15 or 18 acres of your land on more than one occasion? Yes; upon the three occasions that I have mentioned. As a rule the tides are very high for three or four days in succession.
304. Do you look upon the land as permanently destroyed? Most decidedly, if the salt water cannot be prevented from going over it.
305. Have you ceased to cultivate these 18 acres? Only about 5 or 6 acres were cultivated, and the rest of it was valuable for grazing, but there is not a vestige of feed on it now.
306. What would be the length of wall that you would require? I have never measured.
307. Would not that wall go across the new entrance? Yes; but the Grassy Head entrance would be left.
308. *Mr. Farnell.*] If the wall you speak of were made, the work already done at the new entrance would be rendered useless? Yes. The meeting we held in 1891 was before the harbour improvements were thought of. I have nothing to say against the proposed works, or against those in charge of them, but at the same time they are ruining my land.
309. Have you any proposal to lay before the Committee now for the alleviation of your loss? The only thing that can be done is to put a wall across Spencer's Creek, and to use the Grassy Head entrance.
310. You wish to protest against the proposed works because of the loss and inconvenience which you and your fellow farmers are suffering? Yes. I am supporting my mother and sisters upon this property, and it is very hard for me to be forced to leave it because of its destruction by the salt water.
311. You think that the scheme of Sir John Coode for the improvement of the Grassy Head entrance should have been carried out? Yes; most decidedly. That entrance served as for many years, and I do not see why it should not have been improved.
312. How many settlers will be affected by the carrying out of the proposed works? I would not like to say, but I know fully twenty people who are affected.
313. On twenty different farms? Yes.
314. Where are those farms situated? Between Rainbow Reach and Long Reach. There are only two farms below me on the eastern side of the river.
315. *Mr. Trickett.*] How many farms are there below you on the western side of the river? Three, independent of Mr. Rudder's property. Henshaw, Taylor, and Mrs. Ball all own good properties there.
316. *Mr. Roberts.*] How far up the river are the farms affected by the salt water? I cannot say from my own observation. I can only tell you what I have heard.
317. How many properties do you know as a matter of fact will be affected? The whole of the island upon which I am living is affected.
318. How many people live there? It contains about 900 acres of land. There are fourteen or fifteen farms there.
319. And about five more in other places? Five that I know of, and there may be more. I am told that it interferes greatly with the Clybucca Creek people, but I cannot answer for that.
320. How many acres of land are affected in other parts of the river? I do not know.
321. Would 1,100 acres take in the whole area that is affected by the salt water? I think that about 1,600 acres are affected.
322. Nine hundred acres of which are upon the island upon which you reside, and the rest in other parts of the river? Yes.

Timothy Rafferty, farmer, Central Kempsey, sworn, and examined:—

- T. Rafferty. 323. *Chairman.*] How long have you been living here? I lived on the Lower Macleay for twelve or fourteen years.
- 6 June, 1898. 324. How long ago? Twelve or fourteen years. I own property down there, and I go down once and again to see it.
325. *Mr. Clarke.*] On what part of the river is your land situated? At Rainbow Reach.
326. You are the owner of the land tenanted by Mr. Henshaw, who wrote to the main Committee asking to be examined? Yes.
327. What is the size of the farm? About 100 acres.
328. Is it all good land? No; there are 40 or 50 acres of very low land; but it was good grazing land before the new channel opened. Now, however, about 40 acres are quite useless. Not a blade of grass is growing there.
329. You think that the opening at the new entrance has been detrimental to the land? Yes.
330. Before the new entrance was opened, was any of that land flooded by the tide? Yes, by a high tide now and again, but only very seldom, perhaps once a year at the most. That did not injure it; but since the new channel has been opened it is continually covered with salt water, and not a blade of grass is growing on the land.
331. Are you sure that none of the land was destroyed before the new entrance was opened? Yes.
332. Did you make any representations to the Works Department, or to the Government upon the subject? No. I left it to the authorities to do what was right.
333. Did your tenant or any of the other people who have been subject to loss through the flooding of their land, make any representations to the Government? I do not know; but I believe they did.
334. You do not know what reply they got? No.
335. Do you approve of the proposed works being carried out? I approve of the work being carried out if people are compensated for the damage done to their property.
336. You think that the new entrance is preferable to the old entrance near Grassy Head? I believe that it will be more beneficial to the river. In times of flood the water will get away more quickly.
337. Could you give the Committee any information as to the value of the land which you say has been spoiled? In my opinion, the land which has been spoiled would be worth £6 or £7 an acre.
338. It is not very valuable land? No. The lower land is not very valuable, but still it was good grazing land.
339. Can you give us information as to other farms which have been destroyed by the overflow of the tide? Unless it is Mr. Sheppard's farm, I cannot, because I have not gone through any of the farms there. I have heard a great many complaints, but I do not know of anything of my own knowledge. I know that the low-lying land there has suffered.
340. Can you say to what extent? I cannot say to what extent, except in regard to my own property. I believe that there are between thirty and forty farms, the lower portion of which has been destroyed by salt water.
341. What area of land would they comprise? From 40 or 50 acres up to 100 acres or more.
342. Have 1,500 or 1,600 acres been destroyed altogether? I do not think so.
343. It would be only a small part of the farms that would suffer? That is all.
344. You cannot say what area has been destroyed? I cannot. I believe that the making of the new entrance will be beneficial to the Macleay, but the lower farmers suffer severely by it.
345. What would you be agreeable to take for your farm in the event of the Government offering to resume the land? I know that land is down in value now, but at one time I could get —
346. Never mind that;—what is the present value of the land? Well, if I were selling it to-morrow I believe I would take £1,500 for it.
347. For how many acres? 100 acres.
348. What is the value of the improvements upon it? I cannot tell you. I have felled the timber, cleared it, and fenced it. I have carried out all the improvements required by law.
349. *Chairman.*] You have already sworn that you value the land which has been destroyed at from £6 to £7 an acre? That is the lower land; the land that is cultivated has a higher value.
350. What do you value the higher land at per acre? I should value it at about £20 per acre.
351. Has any land been sold in that locality lately? I believe that a farm there was sold lately.
352. What did it fetch? I cannot tell you.
353. *Mr. Clarke.*] I understand that your tenant cultivates only 25 acres? He cultivates more than that; but the salt water soaks into a good portion of the high land, and kills the crop. Forty acres have been destroyed by salt water—that is, more or less. I have not measured it.
354. Have you anything more to say? Only this, that since the new entrance was made the rapid run of the tide up the river is interfering with the banks very much. It is cutting them away, and they are washing into the river very fast.
355. Has there not been a washing away of the banks right up and down the river? Yes; but it has taken place to a much larger extent since the new entrance was made.
356. Do your remarks apply only to the lowlands? Yes. Underneath part of the low-lying land is a bed of sand. The rush of water washes the sand away, and the banks fall in unless some protection is given to them.
357. You do not approve of the new entrance altogether? I approve of the cutting if the people are compensated for the loss they have sustained, and if something is done to protect the banks of the lower river.
358. *Mr. Trickett.*] As an old resident, do you consider that the new entrance will be better than the old one? I believe so, if the channel can be carried out true; but I leave that to better head-pieces than mine.
359. *Chairman.*] You have owned your land for twenty-eight years, and you have lived on it for fourteen years? Yes.
360. During that time have you seen more than one opening to the sea made by the floodwaters of the river? Yes.
361. When these openings were made, did not the tide come in at them? Yes; but not half as much as it does now.
362. Is it not a fact that part of the 40 acres which you say have been inundated by reason of the new entrance being made, were inundated during the time you first held the land, twenty-eight years ago? By a high tide.

363. Then this land has not been inundated because of the new cut? If one tide came in in a year the water went away again directly.
364. Every year there are specially high tides, so that, if your land was flooded by one high tide, it would be flooded several times? Well, that may be.
365. You admit that part of the 40 acres was inundated twenty-eight years ago? Yes; but, nevertheless, there used to be good feed for cattle upon it.
366. Your contention is that more of this land has been inundated since the new cut was made? Yes.
367. If it came to a question of compensation, you could reasonably claim damage for the destruction of 40 acres? What water came on to the land before the works were constructed did not kill the grass there.
368. Is there anything that can be done by the engineers which will prevent your land from being flooded? I think so. A dam might be put across the river to prevent it from letting such high tides come in.
369. At what point? This side of the new cut.
370. Blocking up that arm of the river altogether? I would leave a way for the steamers to come up.

T. Rafferty.
6 June, 1898.

William Thomas Ryan Sinclair, river pilot, Kempsey, sworn, and examined:—

371. *Chairman.*] How long have you been in the district? Thirty-two years.
372. *Mr. Farnell.*] What avocation do you follow here? I have been trading up and down the river in charge of a drogher part of the time, and at other times I have had charge of the tug-boat at the entrance.
373. You have not been in the Government service? No.
374. During the time you have been here you have had a good opportunity to observe the varying conditions of the river? Yes.
375. You know what has already been done at the entrance? Yes. At the present time I am engaged in piloting the opposition boats up and down the river.
376. You know the proposal before the Committee? Yes.
377. During the time you have been here you have had good opportunities of judging of the facilities of navigation afforded at the old entrance? Yes.
378. Would you mind describing the state of affairs at the Grassy Head entrance before the new channel was made? It was a very difficult channel to navigate.
379. I suppose if weather conditions were against you it was almost impossible to use that entrance? Yes.
380. Have you noticed a great accumulation of sand lately at Grassy Head? Not down towards Grassy Head.
381. What draught of steamers were able to use the Grassy Head entrance? The "Burrawong" was about the largest. Before 1893 it was quite blocked up.
382. What is the greatest depth of water that you have had on the Grassy Head bar? I have seen as much as 9 feet there.
383. What is the least depth? About 6 feet.
384. Would that be at high tide? At low tide.
385. Do you remember the flood of 1890? Yes.
386. Was that flood responsible for the new entrance? I think the present outlet was opened in 1893.
387. Since the new channel has been forced through what has been your opinion as to its suitability for a permanent highway? It is not to be beaten.
388. You have watched the progress of the works? Yes.
389. Have you watched the effect of the work already completed? Yes.
390. What conclusion have you arrived at in regard to the efficacy of the work already done? It has done a lot of good.
391. Do you think it has increased the depth of water both in the channel and on the bar? Yes.
392. So that steamers can trade now more freely and with less risk than previously? Its condition is a little bit critical at the present time, but until the last gale it was all right.
393. I understand that the conditions which are preventing the steamer from leaving to-day very seldom occur, and that she would probably be weatherbound no matter what depth of water you had on the bar? Yes.
394. From what quarter does the worst weather come for accumulating sand on the bar? Northerly and north-east weather is the worst.
395. What effect has south-east weather on the bar? It would have no effect whatever.
396. Since the construction of the southern training-wall has the sand been accumulated behind it? I think the sand may make up a little there as the wall goes out.
397. I suppose after heavy weather you have two currents? Yes, a little bit further out. I do not know if the current would come in as far as the new entrance.
398. Do you think that it will be necessary to carry out the proposed works in order to make a good entrance? Yes.
399. If the proposed works are carried out, will they be permanently beneficial? I am confident that they will be beneficial to the district at large.
400. Do you think it is necessary in order to remove all chance of a bad bar that the southern or northern breakwaters, or any part of them, should be constructed, or would you be satisfied with the works proposed? I think that if the proposed works are carried out it will give a good entrance for all time.
401. Do you think it will be necessary to dredge the main river at all? I do not think it will be necessary to dredge it below Jerseyville.
402. Do you think that the ordinary flow of the tide will act as a sufficient scour? Yes.
403. Of course, the channel will be all the better if the tidal scour is assisted by the flood-waters? I think that the flood-waters are more likely to do harm. In my opinion, the present scour is quite sufficient.
404. Do you think it is necessary to carry the training-walls out any further than is proposed? I think that if the southern training-wall were carried out 1,000 feet further that would be quite sufficient.
405. It is proposed to continue the southern training-wall to a point a little past the wreck of the "Phillip Palfrey"? Yes; that would be about 1,000 feet from where it stops at present.
406. Do you think that that will create a sufficient scour to improve the bar, and perhaps to remove it altogether? Yes.

W. T. R.
Sinclair.
6 June, 1898.

- W. T. R. Sinclair.
6 June, 1898.
407. Have you ever heard complaints from producers in the district as to the inconvenience they have suffered through not being able to get their produce regularly to market? Yes.
408. I suppose at times great losses of perishable products occur because of their irregular communication? Yes.
409. What will be the effect of these harbour improvements? We shall have a better entrance; vessels of a better class will come here, and they will be able to trade regularly.
410. Will there be any reduction in the rates of freight? There is not the slightest doubt of that.
411. You think that the steamship companies would reduce their rates if they could carry on a permanently regular service? Yes.
412. Do you think that a reduction of rates would induce the farmers of the district to put larger areas under crop? I daresay that it would. There is a lot of waste land now that could be occupied. The bad bar has been an obstruction to the district ever since I have been here.
413. It would be a great incentive to production if better communication were given? Yes.
414. Are areas available for the settlement of a large population in the district? Yes. There is plenty of land available for both dairying and farming.
415. I suppose the products carried away by the steamers are mostly agricultural products—maize in particular? Yes; maize, pigs, and so forth.
416. Has any move been made in the dairying industry here? Yes, it is increasing.
417. It is quite likely that that industry will be catered for by the ocean-going steamers? Yes; and if the bar were improved the producers could send their produce to market regularly.
418. It has been suggested as an alternative that Trial Bay should be improved, and that a railway or a tramway should be made from the Macleay to Trial Bay;—what do you think of that proposal? I do not think that that would meet the requirements of the district so well as the improvement of the river entrance. It might do for maize, but it would be of no use for perishable goods.
419. Do you hold the opinion that the less handling products get the less expensive they become, and the less likely they are to deteriorate? Yes.
420. You would not approve of an arrangement which would mean droghing, then transhipment to the railway, railway carriage, and a second transhipment on to the steamer? No.
421. *Mr. Trickett.*] One or two witnesses have stated that since the improvements at the new entrance were commenced the erosion of the banks on the lower river has been greater than before? I do not see that this erosion has increased. Of course, the banks are always falling in. The last south-east weather caused a soakage, and the strong wash has made the land fall in more than usual. This happens once every two or three years.
422. Do you look upon the erosion of the banks as a matter which should engage the early attention of the Government? It is a matter which might perhaps be looked to. In some parts of the river some protection will, I think, be necessary.
423. Since the new works were commenced have you noticed an improvement at the entrance? Yes; and I think we have had the best bar that we have ever had, with the exception of one time about 1874 or 1875, when Razorback was closed altogether. We had a straight out channel then, and a good depth.
424. That was only for a short period? For a couple of years, I think.
425. Is it within your knowledge that since these works have been commenced fewer vessels have been bar-bound? I think so.
426. How do you account for the fact that at the present time the bar-crossing takes a turn to the northward? I think the wreck lying near the channel is to a great extent the cause of that.
427. Do you think that it will be necessary for the Government to get rid of that wreck? Yes; the bar will then, I think, take a straight course again.
428. *Chairman.*] What is the cost of droghing produce to Jerseyville? The opposition company do not employ droghers. The steamers do all their own droghing.
429. Is the charge to the shipper the same whether his produce is put on board the steamer direct, or is droghed down the river? Yes.
430. What is the charge? 10d. or 10½d. a bag for maize. I think that is the universal charge along the river.
431. What is the charge for pigs? It varies according to their size from about 1s. to as much as 3s. 6d. each.
432. Is 5s. ever charged? That would be an exceptional charge.
433. Do your steamers go for maize to the higher parts of the river? Last week the Wyoming went up to Green Hills.
434. What draught is she? Seven feet six inches.
435. What is the height of her masts? I cannot tell you.
436. Will it be an inconvenience if vessels of that description are prevented from going above Kempsey? I do not think so, because the droghers can bring everything down to them there.
437. When the bridge at Kempsey is finished all the produce from the higher parts of the river will have to be brought down by droghers? Yes.

John Anderson Jamieson, pilot, Macleay Heads, sworn, and examined:—

- J. A. Jamieson.
6 June, 1898.
438. *Mr. Trickett.*] How long have you been in your present position? Nineteen years.
439. You reside at Grassy Head? Yes.
440. You are thoroughly acquainted with the entrance there? Yes; I have known it for thirty-nine years.
441. Which do you favour, the old entrance or the new? Well, I have always found the old entrance better than the new entrance. I favour it as the main entrance to the river.
442. Will you give us your reasons for that view? In the first place there is a good depth of water a cable's length from the headland, whereas at the new entrance the water is very shallow. My next reason is that a rocky headland always takes the scour.
443. You think that there need be no fear of sand accumulating at Grassy Head? No; it will go past the head. I am of opinion that a permanently good entrance could have been made at Grassy Head if Sir John Coode's scheme had been carried out, for less money than it will cost to improve the new entrance.
- 444.

J. A.
Jamieson.

6 June, 1898.

444. I suppose you are aware that Sir John Coode's scheme was estimated to cost £382,000? Yes; but the entrance at Grassy Head could have been improved by doing very little to it.
445. What portion of Sir John Coode's scheme would you like to see carried out? That portion which takes the whole scour of the river and concentrates it upon the entrance by making a wall from Rudder's Hill to Shark Island.
446. Sir John Coode's modified scheme involves an expenditure of £268,000; he advocated the construction of a southern breakwater 4,000 feet long;—do you think that that will be necessary? No; I think that the scour would always keep the sand away from the headland.
447. He also advocated the construction of a northern breakwater, to cost £48,700? Yes; it is the northern breakwater that I approve of.
448. Then he wanted a training bank along Fisherman's Reach, to cost £62,800;—what do you think of that? I do not see that it is required. There is a good channel through that reach now.
449. Is not that a sandy reach which would always require dredging without a training-bank of some kind? Well, it has remained good for some years.
450. He also proposed a training-bank at Shark Island? That is the training-bank I mean. It would bring down the Clybucca water.
451. Sir John Coode proposed the construction of a training-bank along Shark Island for a distance of 5,600 feet;—do you think that that training-bank would be necessary? Yes; that is for the Spencer Creek water.
452. Do you think that what was known as the western training-bank will be required to make a continuous scour? Yes.
453. That was estimated to cost £48,400; so that the three items you mention as necessary would run into an expenditure of £160,000? But there has never been any money at all laid out at the Grassy Head entrance.
454. You said just now that a very small expenditure would make the entrance a good one; but the works I have mentioned would be very expensive? They would be necessary to make a good entrance.
455. Has it not been recognised all along that the old entrance is an awkward one, and that after you have got inside the river the navigation is very difficult? It is inside that it is intricate. That is where all the trouble is. The trouble is caused by the sand crossing.
456. That would have to be taken away by the construction of training-walls? You could use the dredge there.
457. Is there not rock at some of these points? Yes; but there is good water where the rock is.
458. What depth of water? 12 or 14 feet.
459. What do you get at low tide at the present time? The latest soundings showed 5 ft. 10 in. on the crossing, about half a mile from the head.
460. Is that a sandy bottom? It is all sand.
461. You say that a small amount of money would make an improvement to the old entrance;—do I understand that you would put your opinion on the subject against that of a man like Sir John Coode? No.
462. Well, Sir John Coode's scheme would be a very expensive one to carry out? I only say that without any expenditure at all we have had a very good channel there. We have always from 12 to 14 feet of water.
463. But then, on the other hand, has not the entrance been closed altogether at times? Not before the break-outs, which took the water through other openings.
464. The break outs were due to natural causes? They were caused by the floods.
465. The question we have to consider is partly one of expense; if you can get an entrance at a cost of £100,000, will it not be better to take it instead of an entrance costing £268,000? Yes; if you could get a permanently good channel.
466. What are your objections to the present entrance? I am not opposed to it. All I say is that a better entrance could have been made at Grassy Head for less money.
467. I suppose you have not gone into the question of how many feet of training-wall would be required there, and so on? No; but I could very easily measure the distance.
468. Seeing that you have no fixed calculation to go upon, would you advise the Committee to take your bald statement before the opinions of skilled engineers? It is not for me to dictate to you what opinion you should take.
469. You give the opinion that the old entrance is the better one? Yes; but I only give that as my opinion.
470. Will you have any objections to the new entrance if it can be made a good one? None whatever.
471. Do you think that they will be able to make a good entrance there? Well, the sand will follow the walls out, and it is very shallow there.
472. You think that when the walls are carried out there will not be sufficient current to take the sand away, and that it will accumulate, and the entrance will become as bad as ever? Yes; the bay is shoaling up now.
473. Which part of the bay? Off the entrance, and in the middle of the bay. I find that there is less water in the bay now than there was twenty years ago.
474. Have you sounded it yourself? Yes.
475. When? About nine months ago.
476. What depth did you find it as compared with previous soundings? Where I have previously got 8 fathoms I found about 6 fathoms. I found that the bay was shoaling up in several places.
477. Did you find that it had deepened in other places? No.
478. Is not the bottom of a shifting nature? No; it has remained about the same for years. Of course, near where the breakwaters are it has shifted a good deal of late. Sometimes it has shoaled up a fathom and more, and at other times the sand has been taken away.
479. Have you taken any soundings near the breakwater lately? I have taken soundings where the steamer has been lying.
480. Is the depth there greater than it was? It has remained about the same for some considerable time.
481. Do you not think that your fondness for the Grassy Head entrance rises from sentiment more than from anything else? I do not favour either the new or the old entrance.
482. You merely give us your opinion upon it? Yes.

J. A.
Jamieson.
6 June, 1898.

483. Is there any other reason you wish to advance against the continuation of the present work? No.
484. How long is it since a vessel came in through the old entrance? About six months. The tugs have been in and out, and Captain Ferguson, about a fortnight ago, came in there with the "Pelican." So far as the bar is concerned, any vessel can get in and out, but inside the channel is intricate.
485. Still, most of the trade goes through the new entrance? Yes; though at times it has all gone through the old entrance, because they could not trade through the new entrance. There has always been from 6 inches to a foot more upon the old bar than upon the new bar.
486. Is that according to soundings taken by yourself? Yes. For the last twelve months the soundings at the new entrance have varied from 4 feet to 6 feet at low water.
487. They have not been dredging at the old entrance for a long while? No.
488. Since when? For I think over twelve months.
489. Have you noticed any difference since they stopped dredging? No. The bucket dredge that came there did not do any good. The sand was too fine to lift.
490. What is the state of the new entrance to-day? The channel is very intricate. It goes along the north beach.
491. Steamers going out have to take a turn to the northward, and go parallel with the beach for some distance? Yes.
492. That brings them broadside on to the sea? Yes. If a vessel cannot get out she cannot get back, so that she has to go on to the beach.
493. Why does the channel take this turn? I think it is because of the continuance of easterly weather.
494. You do not think it is due to the harbour works at all? No; I think it is the weather that affects these places. The sand is always shifting.
495. Until the wall gets out another 800 or 1,000 feet I suppose no one can say what the effect of the works will be? That is, supposing the walls will stand on a sunken bottom.
496. Do you not think that there is every probability of a strong current being formed which will keep the channel clear? I am inclined to think that the sand will follow out the walls.
497. What depth of water is there when you get past the bar? I have been the length of a warp—120 fathoms—beyond the bar, and then I have only got from $3\frac{1}{2}$ to 4 fathoms.
498. *Mr. Farnell.*] If the walls were taken out 1,000 feet further what would you get? I do not think I should get much more.
499. *Mr. Trickett.*] When the proposed training-walls are carried out, will not they shoot the sand into deep water? If the silt of the river follows the wall the entrance may shoal up all the time.
500. What depth is there there now? I took soundings the other day when the "Macleay" was there.
501. What depth did you get? From 3 to 4 fathoms.
502. That is at about 1,000 feet beyond where the wall is at the present time? At a distance of 120 fathoms beyond the bar.
503. Do you think you would get a much greater depth if you went out another 300 feet? You get more water as you go further out.
504. We understand that there is a difference of opinion as to the set of the current along the coast;—what is your experience? My experience is that the current always sets south; but in all bights the eddy current works north.
505. Do you not think that when the sand is shot out beyond the training-walls it will come within the influence of the current, and be taken away from the bar? I do not think so. There is no current there. You get out into still water.
506. And you think that the sand will lodge there? That is my opinion.
507. That appears to be your main objection to the present scheme? Yes.
508. Have you been to the Clarence? Yes.
509. You do not look upon the proposed works here as similar to the works which have been successfully carried out at the Clarence? No.
510. Although the engineers have given it as their opinion that they are? The entrance to the Clarence now is different from the first entrance that they tried to make.
511. *Mr. Clarke.*] Have you been to the Bellinger since the training-walls there were built? It is eighteen months or two years since I was there. They were just beginning the wall then.
512. Is not what is being done there similar to what it is proposed to do here;—the river cuts through an open beach there? Yes; but the entrance there has always been through an open beach.
513. If those works have improved the entrance to the Bellinger why should not similar works improve this entrance? I do not think the walls at the Bellinger are sufficiently far out for you to be sure of their effect.
514. I suppose that if they go further out they will still further improve the entrance? Well, they should do so.
515. *Chairman.*] You have expressed fear that the sand will follow out these walls, and eventually set up a bar in front of them? That is my opinion.
516. The object lesson that we have in view at the present time is the Clarence entrance;—would not you, as a sea-faring man of great experience, rely upon that object lesson? At Yamba there is a rocky headland to which the current adheres.
517. Would there not be a danger of the sand following out any walls that were made at Grassy Head? I maintain that where there is a headland there is not the same danger of the sand silting up. The water always scours the sand from the rocks. There is never any sand alongside a rocky head.
518. If Sir John Coode's proposal were carried out the headland would not be depended upon for the scour because a breakwater would be made to take the water out? That breakwater would go very little beyond the head.
519. But would not the conditions for the accumulation of sand be the same there as at any other place? I do not think so.
520. You have been guided a good deal in your opinion by what you have seen of the action of the sand in following out the southern wall at the new entrance? No.
521. Are you aware that the engineers rely upon the sand piling up on the outside of the walls to strengthen them? In some cases. It was a great trouble to get the sand to pile up at Newcastle. Sand bags were placed in position there.

522. If the training-walls are carried out beyond high-water mark, and about 700 feet apart, is it not reasonable to suppose that the scour will be sufficiently strong to spill the sand out into a current which would carry it north or south? As soon as the scour gets clear of the walls it spreads.

523. And passes into a general current north or south? It forms a circle.

524. Would it not form a circle at Grassy Head? I believe it would.

525. You favour the construction of the northern breakwater at Grassy Head, but not of the southern breakwater? Yes.

526. On the south side of the entrance there, you have a very large area of low sandy beach over which the flood waters break;—are you not aware that it is held by the highest engineering authorities that it is always difficult to keep a good entrance where you have a southern sandspit? Not if there is a sufficient scour.

527. How are you going to maintain your scour here without a southern wall? The water will always adhere to the northern wall.

528. You may get deep water right under the northern wall, but will you get a sufficient width of deep water? Well, the river has kept the channel open for many years.

529. But has it not been a narrow and tortuous one? At times, but at other times it has been very good.

530. At Razorback the channel is very narrow? Yes; but there is a good depth of water.

531. How are you going to improve that channel without a southern training-wall to straighten it;—the present scour does not keep the sand from filling up? The sand keeps moving about.

532. How are you going to get rid of this difficulty unless you put in a southern wall, and keep up a proper scour? If there was a straight training-wall right along, the water would adhere to it.

533. You practically have a training-wall on the northern side now;—Sir John Coode recommended the construction of a southern training-wall, but you say that that is not required;—we should like to know how you are going to improve the entrance with a southern training-wall? The entrance at Grassy Head many years ago when all the waters used to go out there was always good, the sand being kept away by the scour; but since the river has gone out at two or three different channels the scour has not been sufficient to take the sand away.

534. But the entrance has always been intricate and difficult? It has not been nearly so bad as many of the bar harbours. I have traded to all of them, from Eden to the Tweed, and I have always found the Macleay entrance to be one of the best, next to the Clarence.

535. Do you remember the various breaches which have been made through the beach at various times by the flood-waters? Yes; there have been eight or nine.

536. During your time? Yes.

537. That is, in about forty years? Yes.

538. When these cuttings were made the tide used to come in at them? Yes.

539. In your opinion, has this contributed to the flooding of the land in the neighbourhood of Rainbow Reach? Yes; because the break-outs have affected the tide.

540. Do you know if the land there has been flooded by the tide? I do not think that much land has been flooded. Complaints have been made about the high tides, but I do not think much water has gone over the land.

541. If this land was not flooded when these break-outs occurred, how is it that it is flooded now since the new entrance has been made? The tide rises higher because there are more openings to let in the water. There are three entrances now.

542. What do you think ought to be done to give the best entrance to the Macleay? I consider that Sir John Coode's scheme should be carried out.

543. Taking things as they are, do you think it would be wise for the Government to proceed with the present work, or to stop up the new entrance and to go on with Sir John Coode's proposal? I would not give an opinion upon that matter.

Alexander Ferguson, agent for North Coast Steam Navigation Company, Kempsey, sworn, and examined:—

544. *Mr. Roberts.*] How long have you held your present position? Over thirty-four years. Until eight years ago the company trading here used to be called the Clarence and Richmond Steamship Company.

545. You are familiar with the entrances to all the rivers on the North Coast? No; but I know Port Macquarie, the Macleay, the Nambucca, the Bellinger, and the Tweed.

546. Are you familiar with the scheme now under the consideration of the Committee? Yes.

547. Can you make a comparison between the present entrance and what is known as the old entrance at Grassy Head? Since the new entrance has been made it has to a great extent destroyed the Grassy Head entrance, although the outer bar at Grassy Head is nearly as good as the outer bar at the new entrance. The trouble at Grassy Head is in connection with the channel inside.

548. You use the new entrance now altogether? We have done so for the last five months.

549. Has your steamer been frequently delayed during the last five months? No; only occasionally for a day or two. The weather has everything to do with the delays. It is the easterly and north-easterly weather that bothers us.

550. Is it easterly weather that is preventing the steamer from going out now? It is the sea coming in from the east, not the wind.

551. An easterly sea affects all the entrances on the North Coast? Yes; and it would affect the old entrance as well as the new.

552. Has the steamer been less frequently detained at the new entrance than at the old entrance? I do not think there is much difference. Some time ago we were running from one entrance to the other trying to get out.

553. Did the old entrance get worse as the new entrance improved? Yes; there has not been sufficient scour to take the sand away from the old entrance.

554. Do you think it desirable to stop the works at the new entrance, and to commence to improve the old entrance? I do not think so, seeing that the Government have gone to such great expense at the old entrance. This scheme may be partly an experiment, but it should be carried out now that they have gone so far.

J. A.
Jamieson.
6 June, 1898.

A. Ferguson.
6 June, 1898.

- A. Ferguson.
6 June, 1898.
555. They had spent £15,000 at the new entrance up to the end of last year;—do you think it would be a wise policy to look upon that as money lost, and to devote attention to the improvement of the Grassy Head entrance? No.
556. You have every reason to anticipate that the new entrance will ultimately be a success? I believe so, though it will be years before it will be finished, because if the walls go out they will be knocked into all sorts of shapes by the sea.
557. Is it very difficult at the present time to negotiate the bar at the new entrance? Yes; because the channel runs along the beach broadside on to the sea, and if anything goes wrong the vessel must go on to the beach. That happened about a fortnight ago.
558. Is it part of your duty to take soundings at the new entrance? Yes.
559. Do you advise when it is safe to go out? The changes have been so great lately that we have been in the habit of going out in front of the steamer every time.
560. Have you any record showing the depth of water on the bar at various times since you have been using the new entrance? I have a record, but I have not brought it with me.
561. Does the depth vary much? Yes; I have known it to be as little as 3 feet at low water, and lately again it was nearly 7 feet at low water.
562. What is it now? We had 7 ft. 9 in. yesterday, with 2 feet of a rise. We went out twice, but because we could not find water enough the steamer had to leave it alone.
563. Is not a tidal rise of 2 feet very little? Not at this time of the year during the day.
564. What rise would you get at night? There was a rise of 5 feet last night.
565. Is there a third opening to the river? There is a place half a mile or three-quarters of a mile to the north of the new entrance where the river broke out in 1893. The river also broke out a little to the north of that again; but this opening has closed up, and the other opening has more than half filled up.
566. When the training-walls are finished, do you think there will be any accumulation of sand outside to make a bar? The sand will follow out the wall for a certain distance, but after that I think it will stop. I think there should be a sufficient run round the bay to the northward to keep the channel clear. At the south-west rocks there is always deep water. At one time a vessel laden with coal was wrecked half way round the beach, and part of the coal rolled along the beach to the north head.
567. Does the current depend upon the direction of the wind? I think so.
568. Captain Taplin told us that the current in the bay generally sets the way the wind blows? Yes; that is all along the beach. With north-east winds the drift of sand along the beach to the south is something enormous.
569. He was asked if the sand would form a bar, and he said, "Certainly, until the current takes it away"? Of course, if the walls are carried out sufficiently far it will prevent the formation of a bar.
570. Do you think that when the works are carried out as far as they are shown on the plan the scour will prevent the formation of any bar? I think that that would be far enough to take them out.
571. Do you think that it will be necessary to construct both of the breakwaters? Yes, decidedly. One will be of no use without the other.
572. If the training-walls are carried out as far as the wreck, do you think the scour will be sufficient? No; because beyond the wreck there is a large field of sand, which has accumulated there within the last ten days.
573. But would not the scour clear away that sand? I think the walls would have to go further out.
574. How much beyond the wreck? Nearly 1,000 feet.
575. It is proposed to take them 200 feet beyond the wreck? Well, yesterday, I saw some fellows walking there, and the water was not beyond their knees. Perhaps if the walls are carried out 700 feet beyond the wreck they may do some good; but I do not think that any smaller extension will do good.
576. What would be the object in taking them out so far? To prevent the accumulation of sand outside.
577. What depth of water would you then get? You ought to get about $2\frac{1}{2}$ fathoms. The depth there varies very much.
578. You know Clybucca Creek? Yes.
579. Do you think it will be necessary to divert the water of that creek into the main channel in order to increase the scour? It will be a very difficult thing to do, and a very extravagant one, because a strong wall would be necessary to divert that water. There is not much water coming down the Clybucca, except during flood time, and during flood time there is always plenty of water coming down the main river.
580. Is the traffic on the Macleay improving? It has improved considerably. At one time the only production was maize, but now dairying has made a considerable alteration in the trade.
581. Have you any record of the quantity of maize shipped, say during the last twelve months? Last year, from the beginning of July to the end of the year, something like 100,000 bags of maize were shipped away.
582. I think you supplied some figures to Mr. F. Clarke, M.P., showing the export in 1897? No; but the maize export of that year must have been something like 150,000 or 170,000 bags.
583. He stated it at 152,000 bags? That is pretty near it, and this year the export will be about the same.
584. So far as your memory serves you, his statement contained a correct estimate of the traffic? I think so, but there are some things which might be reduced a little.
585. Do you carry any sawn timber on your steamers? No.
586. Is all the timber taken by the sailing vessels? Nearly all of it. Sometimes we take away small orders.
587. Do you regard the statement I have read as approximately correct, or as an under-estimate? It may be an under-estimate in regard to some things, but on the whole, it is fairly correct.
588. How many tons of merchandise are imported annually? I do not know.
589. Fifty tons a week? I think that would be over the mark.
590. What is the freight upon maize now? $10\frac{1}{2}$ d. a bag.
591. Including droghing? Including everything; there are no other charges.
592. If a man does not require the services of the drogher, is he charged any less? No.
593. From what distance above Kempsey do you draw produce? We go 8 or 9 miles up the river, and we can go another 8 miles up Darkwater.
594. From how many miles beyond the head of navigation does maize come to your steamers for shipment? Twenty-five or 30 miles. 595.

595. Can you tell us from memory the value of the export trade from the Macleay? No.
596. Nor the value of the import trade? No.
597. Which of the items of produce sent from the Macleay shows an increase;—does the butter production? Yes; but it is only likely to increase until the winter is over.
598. Is the export of maize increasing? It depends entirely upon the season. I do not think there will be any increase in stock as compared with the last year. The production of maize depends upon the weather, and is affected by floods.
599. Is the area under maize increasing, or has all the available land been taken up? I believe that up the river the area under cultivation is increasing; but it is not so down the river.
600. Has the potato export increased? The export of potatoes depends upon the season.
601. Maize-growing and dairying are the principal items of export from this river? Yes.
602. How does the trade on the Macleay compare with that on the other North Coast rivers;—is the production of the Macleay greater than that of the Manning? Yes, in maize and butter; but more general cargo goes from the Manning.
603. Is there as much sent from the Macleay as from the Clarence? No.
604. As from the Richmond? No; from the Richmond so many things besides maize are sent. Maize is the principal thing sent from here. Our shipment of maize will almost compare with that sent from the Clarence; but then, on the Clarence, they grow a number of other things that we do not grow.
605. Which river on the North Coast gives most freight? I think the Clarence.
606. And then the Richmond? Yes.
607. Would you put the Macleay third? Yes.
608. Do you think that the importance of the Macleay warrants the proposed expenditure at the entrance? If they can carry out the works for less than £100,000 I believe that the expense will be warranted. When Sir John Coode proposed to expend over £250,000 I thought that the expenditure was more than the place was worth. All the land below Kempsey, part of which is swampy now, will be brought into use by and by with a proper system of drainage and dyking.
609. Is there a large passenger traffic from the Macleay? The passenger traffic is not very large. Sometimes there are half a dozen passengers, and sometimes a dozen. It all depends upon what is going on.
610. What are the fares to Sydney, first and second-class? Thirty shillings single and £2 5s. return first, and 15s. each way second.
611. The first-class fare from the Macleay seems to be the same as the first-class fare from the Clarence;—is that because of the possible delays here? Yes, wholly.
612. What do you charge for the carriage of pigs to Sydney? It depends upon their size and value.
613. How do the rates vary? Well, they charge 1s. for a pig that will bring 10s., 1s. 6d. for a pig that will bring 20s., and so on, as the value of the pig increases.
614. What is the maximum charge? About 3s. 6d. for a pig that will bring £3 10s.
615. Does the value of the pig depend upon its size? Not always. Sometimes pigs bring more in Sydney than at other times.
616. Who decides what a pig will bring? The agents have to pay the freight.
617. If the new entrance is made what distance will be saved in the round trip from Kempsey to Sydney and back? Between 10 and 11 miles.
618. That would mean a considerable saving in fuel to you in twelve months, and a saving in time to passengers? Yes.
619. And produce would be delivered in Sydney more quickly? Yes.
620. Do you regard this as one of the great advantages of the scheme? Yes.
621. *Chairman.*] Is there anything you would like to add? The tide is nearly an hour earlier at the new entrance than at the old entrance, and it rises from 12 to 18 inches higher than it used to rise. That is what is doing the damage at these low-lying places. At the same time things were nearly as bad before the new entrance was made as they are now. Formerly the tide took longer to come up the river, because there was only one entrance.
622. *Mr. Roberts.*] Does this increased rise of the tide account for the flooding of land along Rainbow Reach? Yes.
623. Do the people there suffer a great deal from the floods? A great deal of the land there is practically worthless. They might find a way of making dykes and keeping the tide out, but I think there is too much sand there for that.
624. Do you know anything which could be done by the Government to alleviate the losses of these people? The only thing to do would be to dyke the land, and to maintain the dykes, or the Government might resume the land.
625. Have you known any of the crops there to be destroyed by salt water? Yes; I have seen the tide come on to the crops. When the tide comes on to them the crops die, and the land becomes completely worthless.
626. How many acres have been affected by the salt water? A good many hundred acres.
627. Do you think 1,600 acres have been affected? I think less than that area.
628. From 1,000 to 1,600 acres? Yes.
629. How often are these low-lying lands flooded—every tide? No; only at spring tides. Four or five times during spring tides.
630. How often do these tides come? Every fortnight.
631. Do insanitary effects follow extremely low tides? No.
632. Is there much erosion of the banks? There has been, particularly after the last storm.
633. The "Maitland" gale? Yes.
634. Is it only when a heavy gale is raging that the river banks are affected? When there are high tides and strong winds. The north-east winds in summer affect some places, while the westerly winds in the winter time affect other places.
635. Do you regard the erosion of the banks as so serious as to warrant the attention of the Government? Their attention ought to be drawn to it, but it is difficult to stop it.
636. Efforts have been made to prevent this erosion from taking place? Yes, lower down the river; but the cobra will get into the timber that has been used, and then a flood will take it all away.

A. Ferguson.

6 June, 1898.

TUESDAY, 7 JUNE, 1898.

[The Sectional Committee met at the Court-house, Kempsey, at 10 a.m.]

Present:—

CHARLES ALFRED LEE, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.	HENRY CLARKE, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	FRANK FARNELL, Esq.

The Sectional Committee further considered the proposed Harbour Works at Macleay River.

Brabazon Newcome Casement, medical practitioner, Kempsey, sworn, and examined:—

B. N.
Casement.
7 June, 1898.

637. *Chairman.*] How long have you resided here? Sixteen years, except for a year that I resided at Trial Bay.

638. Is that your total experience of the district? Yes.

639. I understand that you desire to give evidence upon the question before the Committee;—what point do you wish to bring before us? I think it would be impossible to carry out Sir John Coode's scheme, except at ruinous expense, as the spit which extends from Arakoon towards Grassy Head is breaking away worse than any other part of the coast that I know of, and I know the coast for about 70 miles. I think that the new entrance is doing harm to the swampy land lower down the river, because of the higher rise of the tide which it has brought about, but when a proper system of gates is provided, it will be beneficial. Some of the swamps, when drained, will be suitable for grazing, and may in the future be used for farming. I think that the improvement of the new entrance is much more feasible than the maintenance of the old entrance.

640. What is your opinion in regard to the future prospects of this district? I think it would be a great fattening district, but, owing to the variable seasons, and to the floods, it will never be more than a moderate dairying district.

641. You have a pretty extensive knowledge of the people here, and of their position? I know almost all the farmers on the river, and all their holdings.

642. Are they generally in a state of prosperity? They are just getting square at the present time after the floods, and they are nearly all solvent now. About one-third of them would be called prosperous.

643. Are you of opinion that if a more reliable entrance is given, and a better class of steamers can trade regularly to the river, it will tend to the greater prosperity of the district? Yes, very much. A number of small places will be taken up, and eggs and other perishable articles will be sent away in greater quantities than hitherto.

644. The steamer running here—the "Burrawong"—is, I believe, rather a fine type of vessel for the river? Yes; it is quite as good as we can expect at the present time.

645. Do you think that the trade of the district requires any further accommodation? In one way it does not; but if a rival steamer came here the company would be more obliging. I have heard of several cases of hardship caused by neglect, which, perhaps, would not have occurred if there had been a rival company.

646. Competition would probably lead to a better and a cheaper service? Yes.

647. Is there anything you would like to add? I heard the evidence of Mr. Rafferty and others yesterday, and I think that where the banks are low and have been flooded by the tidal water, the Government should give the farmers compensation, or perhaps assist them to make small flood-gates to keep the water off their land.

James Arthur Winney, editor, *Macleay Chronicle*, Kempsey, sworn, and examined:—

J. A. Winney.
7 June, 1898.

648. *Chairman.*] Have you been long in this district? I have been on the Macleay since 1890, and previous to that I was on the Clarence, and on the Hunter.649. *Mr. Clarke.*] During your residence in the district, you have had an opportunity of watching its development;—can you give the Committee a statement showing its production? Maize-growing has largely increased here of late years, and within the last twelve months dairying has made very rapid strides, and has made still more rapid strides within the last four months. In 1891, when I first came to the river, the export of maize was 109,487 bags. That increased in 1892 to 110,382 bags. In 1893, the year of the floods, and in 1894, there was a decrease. In 1896 the export was 142,022 bags; and in 1897 the steamers took away 152,530 bags, while a sailing-ship took away 200 bags. These figures were supplied to me from the head office of the North Coast S.S. Company. In addition to the export by sea in 1896 and 1897, many of the farmers on the upper river sent maize to Hillgrove by road. I have no accurate information with regard to the quantity sent, but I estimate that at least 2,000 bags were sent in each year.

650. Did not these statistics appear in your newspaper some time ago, and were they not afterwards given in evidence by Mr. F. Clarke, M.P.? I believe the figures are the same.

651. *Mr. Farnell.*] Have you any idea of the local consumption of maize? No.652. *Mr. Clarke.*] Have you any further statement to make? The export of maize during the present year shows a decrease for the first four months, but this will be more than made up by the returns for May. During the season shipments are often irregular, because of the bad state of the bar, and during May we had a very heavy gale. The following table gives the exports of the district from 1891 to 1897:—

MACLEAY EXPORTS.

	1891.	1892.	*1893.	1894.	1895.	1896.	1897.
Maize—bags	109,487	110,382	68,375	77,580	107,135	142,022	152,530; also 200 by sailing-ship, and 400,000 feet of timber.
Pigs	9,742	11,030	9,820	9,649	10,054	9,260	785
Butter—kegs	556	1,320	536	560	481	874	138 kegs, 3,021 boxes.
					4 boxes.		
Cream—cans	69	38	Nil.	11		3,680	4,040
Hides	3,729	3,537	3,330	3,258	4,083	3,541	3,483
Poultry—crates	556	851	486	637	913	972	946

Horns—bags	54	22	17	70	18	15	15

* Record flood, 12th June.

I have also a statement showing the exports for 1898, which is as follows:—Maize, 30,669 bags; butter, 5,154 boxes, 13 kegs; pigs, 1,297; hides, 1,599; poultry, 277 coops; eggs, 525 cases; tallow, 28 casks; bones, 153 bags; horns, 1 bag; potatoes, 167 bags; pumpkins, 37 bags; fish, 27 cases; turtle, 1 basket; calves, 45; fruit, 4 cases; pie melons, 75; wool, 5 bales; horses, 7; cedar, 87 pieces; skins, 1 bundle; peas, 20 bags; sugar, 33 bags; bacon, 19 cases = 285 sides (?); lard, 35 packages; honey, 35 packages; sundries, 835 packages.

On a rough computation I estimate the value of the exports last year at £115,000, in round figures. That is excluding sailing cargoes. The value of the cargoes taken away by sailing vessels I am unable to give. I value the exports of the first four months of this year at £34,000.

653. When does the busy season commence here? About November.

654. And it extends up to the end of June? Up to the end of July. August, September, and October are slack months.

655. *Chairman.*] Are you in a position to give us the value of the imports of the district? No; because no account of them is taken. The following table shows the population of the district, as returned by the census of 1891, and as computed in the police returns for 1898:—

<i>Kempsey and above.</i>			<i>Lower Macleay.</i>		
	Census, 1891.	Police returns, 1898.		Census, 1891.	Police returns, 1898.
Kempsey municipality.....	2,143	3,609	Frederickton.....	845	927
Greenhills	1,134	Smithtown	1,068	434*
Bellbrook	449	847	Arakoon.....	815	1,019
Parrabell.....	406	Austral Eden	522
Kalateene	497	Gladstone	501	816
			Total	7,880	7,652

*Portion now included in the Raleigh electorate, Arakoon Division.

656. *Mr. Clarke.*] Does that include the whole district? No; it only takes in the various townships on the river which would be benefited by the proposed improvements. The apparent decrease in the population is owing to a flood and to a fire which occurred in 1893, and to other causes. People have gone from here to Western Australia, to Wyalong, and to Canada. I could count up nearly a hundred who went away after the flood of 1893.

657. Do the figures for Arakoon include the prisoners and officials at the Trial Bay gaol? I do not think so; they may include the officials, but I do not think they include the prisoners. To give you some idea of the importance of Kempsey, I may say that at a recent meeting of the Public Schools Athletic Association here 5,000 persons were assembled on the Show Ground, and the other day over 3,000 people attended a race meeting here. The Municipal Council controls 52 miles of roads, and the municipality contains eight churches of various denominations, seven hotels, a School of Arts, a Free Library, two theatres, four public halls, two post and telegraph offices, one receiving office, and a court-house, gaol, Lands Office, and Police Officers' quarters. The Agricultural Association has a large hall and cottage standing upon its ground, and last year paid away £350 in prizes. There is also a hospital here which has a balance to its credit, a Government dock, a Government slip, and five wharfs in the town. There are also two sawmills.

658. Are there any creameries? There is a butter factory, a bacon factory, and a slaughtering establishment in connection with it, and up and down the river there are about twenty-five creameries. There is also a butter factory at Frederickton, and another at Smithtown.

659. What is the difference between creameries and butter factories? The farmers send their milk to a creamery, and when the cream is separated, it is sent on to a butter factory to be churned. The creameries do not make butter, they only separate the cream from the milk. There are also a large number of hand separators in the district. A matter which has not been mentioned, and which I should like to refer to, is the Hillgrove trade. At the present time the Government are constructing two bridges on the New England road. Since that road has been improved, teamsters have been in the habit of coming down to Green Hills, and taking goods from there to Hillgrove. Sometimes there are as many as fourteen teams on the road, and they have taken as much as 40 tons a month from Green Hills to Hillgrove. This trade appears to be increasing. They find it cheaper to get their heavy goods round that way than by way of Armidale. Then, too, the passenger traffic along the road is increasing. The mail contractor is only bound to keep a sulky, but for a considerable time he has been running a buggy. The Hillgrove man is only bound to provide a horse, but he also finds it necessary to run a buggy.

660. Which do you consider will suit the public best, the new or the old entrance? The new entrance most decidedly.

661. What are your reasons for that opinion? In the first place the new entrance provides a shorter way out to sea. I have come in at Grassy Heads when the channel has been extremely intricate. One time when I came in you could touch the rocks from the ship's deck. I have seen the "Burrawong" unable to get further than Razorback without being warped round, and on one occasion the warp snapped, and injured a man. She has been unable to get further than Razorback, because of the silting up of the river between Stuart's Point and Shark Island. The dredge was constantly at work there, but it never seemed to do much good.

662. Do you think that the proposed harbour improvements, when completed, will be of great assistance in making the river navigable, and in increasing the depth of water upon the bar? I believe that they will. I was down in the "Pelican" last year, and whilst I was there a heavy gale came on, so that the "Burrawong" could not get in, and I had a chance of seeing the works at a time when, if they were likely to be damaged, they would have been damaged. During the same gale 75 feet were knocked off the Trial Bay breakwater, and the "Mikado," the Government steamer attached to the "Jupiter," was wrecked behind the breakwater, while the "Jupiter" had to put to sea. When the "Burrawong" came in two days afterwards she was knocked about terribly, but I do not think a stone shifted at the works. I believe, too, that the new entrance will provide the best outlet for the water in flood time. Upon the occasion to which I refer there was a fresh in the river, and I was told that none of the water went out at the old entrance—that is, none of the flood water.

663. I suppose that if the harbour works are beneficial they will bring about competition, and a consequent lowering of rates? I believe that, if another 2 or 4 feet of water could be obtained, the North Coast Company would put larger boats into the trade.

664.

- J. A. Winney. 664. Do you think that the present rates of freight are excessive? Not for the work done.
- 7 June, 1898. 665. Do you think that competition would bring about a reduction in rates? It might bring about a slight reduction.
666. I suppose that on the whole the public do not complain of the charges made by the North Coast Company? Not of the present charges. What they have complained about has been the way in which the rates have been raised and lowered. I think it would be well to explain that originally we used to pay 1s. 6d. a bag for maize taken to the steamer by drogher, and 1s. a bag for maize put upon the steamer without the assistance of the drogher. Then the rates were reduced to 1s. 9d., but the people who were compelled to use the drogher did not like that, and the result was that the Company struck a uniform rate of 10½d. a bag.
667. *Chairman.*] The system here is the same as on the other rivers? Yes.
668. *Mr. Clarke.*] Do you think that the North Coast railway would be beneficial to this district? Most decidedly.
669. Do you expect to get the North Coast railway and at the same time have a large amount of money expended in improving the entrance to the river? Yes; we expect to get both.
670. Would the trade go by railway;—would not a large part of it still go by the steamers? Certain products would be sent by the steamers; others would not. There is room here for a large development in dairying and in other small industries, and the productions of those industries would go away by train.
671. Would it pay the railway people to carry small articles, while heavy goods were sent by sea? The country about here is very undeveloped, and, if a railway were made, it would be largely settled upon. I have seen very small places in England connected with the railway, and the lines have paid.
672. Is it not unreasonable to suppose that the Government would expend a large amount of money in giving you a railway, when you already have every convenience for getting goods to Sydney? Well, at the present time, if an easterly gale sets in, vessels cannot enter or leave the river for three or four days, and that would happen if we had the best bar possible.
673. Does not the same thing occur all along the coast? Yes; but at a place like Newcastle they can use the railway at such times. In two or three days some kinds of produce will deteriorate greatly.
674. Is there anything you would like to add? There is one thing I should like to refer to, and that is the fertility of the land here. There is a farm on the river here, just opposite the town, which, although it has been closely cropped, has given two crops of maize in one year, one crop yielding as much as 110 bushels to the acre.
675. Is it usual to get two crops in the year? On some of the farms they can get two crops.
676. Is the land here on the whole well cultivated? Not so well as it might be.
677. With better cultivation there would be a larger yield? Undoubtedly.
678. Is there much unalienated land in the district? I believe that there is a fair quantity of second-class land unalienated.
679. Is it land fit for grazing purposes? Yes; and there is a larger area of swampy land—I believe something like 162,000 acres.
680. Would it be possible to drain that land? Yes; already efforts are being made to drain it. The Darkwater Drainage Union embraces about 11,000 acres, and there is other land under the Drainage Union Act.
681. Is the land to which you refer Government land, or is it private land? Some of it is Government land, and some of it has been in the hands of private people for many years. There are some selections containing swampy land, which have reverted to the Government.
682. *Chairman.*] You attach some importance to the Hillgrove trade? Yes.
683. What is the distance from here to Hillgrove? A little over 80 miles.
684. What is the cost of carriage between the two places? I believe that the latest rate is about £2 10s. a ton.
685. The Hillgrove people are in the habit of getting certain classes of goods by sea from Sydney to Kempsey, and then on from Kempsey by dray? Yes; that trade is developing, and a certain amount of produce from the upper river also goes that way.
686. Hillgrove is a mining town about 20 miles from Armidale? A little more than that. It has about twice the population of Kempsey.
687. There is a railway at Armidale? Yes.
688. The distance from Sydney to Armidale by rail is about 357 miles? Yes.
689. You have expressed the opinion that a North Coast railway would pay? I believe it would.
690. How can you reconcile that opinion with the existing state of affairs at Hillgrove;—those people are near a railway, and yet it pays them to bring their stuff from Sydney by sea to Kempsey, and on from Kempsey by team? The main traffic of the North Coast railway would be in cattle, I think.
691. Do you not think that one train a month would carry every beast in the district;—by your own showing places which have railways do not use them fully, but make use of the sea as much as they can. I should like to know how a railway would serve you better than the river does? It would only be under certain circumstances. At the present time we cannot ship cattle from this place by sea. It has been attempted, but with considerable loss. Other produce is not sent away, because it could not be sent away by sea.
692. Are there not large shipments of cream sent from here to Sydney? No cream is being sent now.
693. Cream was sent in 1897? Yes.
694. If it were necessary to send it now it could be sent? Yes.
695. Why is not cream sent now? Because it is turned into butter.
696. The butter is sent away by sea? Yes; but it would be sent by train if there were a railway, because it would then realise a better price. In the summer it deteriorates when sent by sea.
697. Have the steamers cool chambers? The steamer has what they call a cool chamber, but it is cool rather by name than in reality.
698. If it were possible to send 4,000 cans of cream in 1897, surely it would be possible to send butter, because butter stands carriage so much better? Yes; but I think that if people had a choice between the train and the steamer they would use the train.
699. Suppose the steamer rate was 20 per cent. below the railway rate, which would they use? I think a good deal would depend upon where it was going.

700. Are you of opinion that the district requires both a railway and an improved port? Not at the present time. J. A. Winney.
701. What does it demand at the present time? A good port. 7 June, 1898.
702. Suppose that a choice had to be made between a port and a railway, which, in your opinion, would be of most advantage to the district? A railway.
703. Do you happen to know much about the flooding of land which has taken place on the lower river? No; I cannot say much about it.
704. You have seen a flood since you have been here? I have seen the record flood, and other minor floods.
705. The new entrance affords an outlet for flood-waters 6 miles nearer than the old entrance? Yes.
706. Is not that of advantage to those living at Kempsey and further up the river? Yes; but the water requires some other outlet. The flood-cutting that was made in 1892 resulted in some of the water of the Belmore River not reaching to within 3 feet of the height to which it reached during a smaller flood than the 1893 flood.
707. Would it not be of advantage to the people on the river generally to have an outlet to the sea 6 miles nearer than the present outlet? Certainly.
708. Is not the loss from floods in this district very serious sometimes? Yes.
709. A matter requiring as much attention as the improvement of the port? Yes; quite as much.
710. If the two things can be worked together it will be a double advantage? Yes.
711. Do you think that the new entrance will facilitate the escape of flood-waters? Yes.
712. Will it give greater relief than the Grassy Head entrance? Yes.

Austral Rowe, farmer, Yarrahapinni, sworn, and examined:—

713. *Mr. Farnell.*] How far from Kempsey do you live? About 25 miles—about 2 miles back from Stewart's Point, where the sawmill is. A. Rowe.
714. What is the area of your holding? 100 acres. 7 June, 1898.
715. How much of it is under cultivation? Eight or 10 acres at the present time.
716. Is the rest of the land cleared or improved in any way? Yes.
717. Why have you not put more of it under cultivation? Because I have been occupied with other land which I hold on the Belmore River, and near Gladstone.
718. The irregularity of the steamer service has had nothing to do with the small area of your cultivation? No.
719. You have had your hands too full elsewhere to attend to this land? Yes.
720. You have seen the work which has been done at the new entrance and you know the Grassy Head entrance? Yes.
721. Comparing the two, which, in your opinion, is the better? I do not know that I am called upon to give an opinion upon the point. My trouble is this: I live 2 miles out from Stewart's Point, and, so far as I can learn, the proposed harbour works will intercept the Clybucca water just above Shark Island, and draw it into the new channel, causing the navigable part of the river near us to silt up. Now, we took up our land in the belief that we should be able to ship our produce away by river.
722. It is not proposed to intercept Clybucca Creek, as you fear;—I understand that you have sent your produce away through the Grassy Head entrance? Yes, until very lately, when it has gone through the new entrance.
723. That entails 8 or 9 miles extra haulage, I suppose;—are there other people similarly situated? I am only 2 miles from the Stewart's Point wharf. There are about forty settlers on the Unkya and Allgommera who draw their produce to the Stewart's Point wharf.
724. And they feel inconvenienced by having to send their produce away through the new channel? No; it is not that. They must continue to draw to Stewart's Point wharf; but we are afraid of the silting up of that part of the river.
725. If the new entrance is improved it will still be possible for a drogher to call at Stewart's Point wharf? Well, I did not quite understand the project, so I made it my business to come before the Committee.
726. The Grassy Point entrance has been abandoned by the ocean-going steamers? Yes.
727. Those steamers now use the new entrance, a fact which proves it to be the better entrance? Yes.
728. Your fear has been that the portion of the river leading down to the Grassy Head entrance would be closed through the diversion of the Clybucca Creek; since that is not intended, will you be satisfied if a good entrance is made at the new opening, which will allow of a regular steamer service for the export of produce? Yes.

Thomas Patrick John Taylor, storekeeper, Kempsey, sworn, and examined:—

729. *Chairman.*] Have you been long in the Macleay district? I am a native of the district. T. P. J. Taylor.
730. On what particular point do you wish to give evidence? Chiefly in regard to the damage done upon some property at Rainbow Reach belonging to my father. 7 June, 1898.
731. How long has he owned the property to which you refer? I think somewhere about twenty years.
732. To what purpose has he put it? He has used it as a farm.
733. Have you a personal knowledge of the facts about which you wish to speak? Yes; and I am pretty well acquainted with the place. Before the new entrance broke out there was a tenant upon my father's farm who was paying £64 a year. When the entrance broke out he had his crop in, and he wanted to get back half of what he had paid and to leave the place. He said that the tides came over the land to such an extent that he could not afford to continue to pay so large a rent. Since then we have not been offered anything like £64 a year for the farm.
734. How many acres was the tenant leasing? Sixty-four acres. He paid £1 an acre.
735. Was it all suitable for agriculture? No; there were a few acres in gullies.
736. Was that the total area of your father's holding? Yes.
737. Was the whole of it cultivated? No.
738. How much of it was cultivated? Forty or 45 acres.
739. How does the tide flow on to the land;—does it rise over the foreshores, or does it run up the creeks and indentations? At one end the tide comes over the foreshores completely, and it flows through a few gullies.

- T. P. J. Taylor.
7 June, 1898.
- gullies. There is a creek running round the place, which is nearly an island, and this creek overflows on to the land.
740. The tide flows into the depressions and over the lower land? Yes; the whole of the land is not flooded.
741. Did the tenant you have spoken of leave? Yes.
742. Has the farm been let since? Yes; but we have never got rent for it.
743. At what rental has it been let? One tenant was supposed to pay £64 a year, but we never got the money.
744. Notwithstanding the fact that the first tenant left ostensibly because some of the land was flooded by the tide, and its value impaired, you were able to relet the farm at the same rental? Yes; but to a person who really did not know what had occurred. When he saw how the land was affected he refused to pay the rent.
745. Do you consider that that land has been permanently damaged? I think that it has.
746. At what do you value it in fee-simple? I could not say.
747. What would it bring per acre if it were put upon the market to-morrow? I could not say. Before this happened an offer of £1,600 was made for it.
748. Do you wish us to infer that your land has been flooded entirely because of the new cut? No; a few of the gullies were affected before.
749. Part of the land was always subject to the influence of the tide? Yes.
750. Possibly half of it? Only a small portion was affected before the new opening was made.
751. All you can claim is, that in consequence of the new channel the area of land flooded by the tide has been increased? Yes.
752. Is your father opposed to the improvement of the present entrance;—is he of opinion that the works now going on should be stopped, and that the old entrance at Grassy Head should be resorted to again? He is of opinion that the old entrance at Grassy Head should be used, but he is not of that opinion entirely because of the damage he has sustained.
753. Is there any other point upon which you would like to speak? No.

Austral Verge, grazier and land-owner, Macleay River, sworn, and examined:—

- A. Verge.
7 June, 1898.
754. *Mr. Trickett.*] How long have you resided in this district? Fifty-two years. I was born here, and with one or two breaks I have been here all my life.
755. You have a thorough knowledge of the district, and more particularly, I believe, of the Lower Macleay, and of the entrances to the river, and the varying conditions prevailing there? Yes; I have constantly been boating in that neighbourhood, and I have paid particular attention to the effect of the floods on the lower river, at the entrances, and along the shore from Trial Bay to Grassy Head.
756. And you are acquainted with the scheme before the Committee? Yes.
757. Would you like to see the new entrance improved, or would you rather see the Grassy Head entrance improved? I think that the new entrance is the better of the two for more than one reason.
758. I think you were in Court yesterday when the Departmental reasons for the scheme were read out;—do you accept them? Yes.
759. I think you know something of the breakout, north of the new entrance, which occurred some time ago? Yes. Many people suppose that because of these breakouts the bay is silting up. I rather think that it is not.
760. How far is the breakout you are speaking of north of the new entrance? I think about three-quarters of a mile. I noticed it first on the 14th December, 1892, when I was on a fishing expedition.
761. Did that breakout continue open? I have not been there since 1896; but I believe that it is still open, although the Harbours and Rivers Department have put a dam across Spencer's Creek, which may have had the effect of closing it.
762. What has been the effect of that breakout? Well, it seems to me to have had an influence in flooding the low-lying land. I saw the sea running in there quite strongly, and breaking on the sand inside, and on the mangroves on the eastern side of what I call Lower Shark Island, some little distance north-west of the lowest farm on Spencer's Creek. Higher up, in the surf, I saw an old mangrove-bed upon which the stumps were standing; but the trees appeared to have been cut off 18 inches above the mud; and I concluded that the sea had at one time broken in there and covered up the trees with sand. This mangrove-bed must have been an old salt-water lagoon, and this lagoon must have been in existence some time to have allowed the trees to grow, because they must have been from 12 and 18 inches down to 6 inches in diameter. The conclusion I drew from my observations was that the sea-shore must originally have been to the east of this mangrove-bed; and when people declare that the bay is silting up I think that they make a mistake, and that what they really notice is the encroachment of the sea upon the land.
763. Is that mangrove-bed visible now? I think not.
764. Did the breakout flood the land down there? It must have flooded all the low-lying land within a considerable distance. I was at the new entrance again in April, 1895, and I then saw the surf breaking very heavily through. In January, 1895, I was pulling up Spencer's Creek, and the surf was rolling in so that I had to watch the waves to avoid the curl. The waves were then breaking very heavily upon the eastern side of Shark Island, and were carrying roots and other things in amongst the mangroves. I suspect that all the low-lying land in the neighbourhood must have been flooded at that time.
765. Your observations go to show that the flooding of the land is the act of nature, and is not due to the harbour works? Between 1892 and 1895 the land which is liable to be flooded now must have been flooded.
766. If the Grassy Head entrance had been improved so as to make it more easy for the sea to come in, would the low-lying land that is flooded now not have been quite as likely to be flooded? I think the result would have been about the same. Of course, with a greater number of openings the water can get out of the river more quickly, and the tide drops more, so that anyone who wishes to improve swamp land by making embankments and flood-gates has a better opportunity to do so. I have noticed at Kempsey that whenever the bar is in good condition the tides are unusually low. I own some swamp land about 5 miles from the new works, and I cannot see that it has deteriorated in any way. I am on the eastern bank of the main river.

767. You know the lands about which we have had evidence;—can you tell us why those lands have been flooded? I suspect that the water comes up the creeks. There may be places where the banks are unusually low, and where the tide would rise over the foreshore. A. Verge.
7 June, 1898.
768. There are varying opinions as to whether, when the harbour works are finished, the sand will accumulate at the end of the breakwaters, and thus merely remove the bar a little further out;—what do you think? I hold the opinion that the works will prove a very great success indeed. In volume 25 of the *Journal of the American Society of Civil Engineers*, I came upon an article dealing with improvements effected at the mouth of the Brazos River, upon the coast of Florida. Where previously there had only been 5 feet of water, a depth of 16½ feet was obtained. The river is about 200 miles in length, and enters the sea through a sandbank.
769. What was the cost of that work? The average cost of 1 cubic yard of jetty in place was 2 dollars 60 cents on the outer 2,000 feet, where it was exposed to the heavy sea action. It was composed of brush mattresses loaded with stone, and sunk into position. The cost of 1 cubic yard of mattress, with superintendence, was 38 cents.
770. Did the river enter the sea through an exposed ocean beach? Yes. The party sent down to explore it had to wait for two weeks before venturing out in a boat. Similar work has been successfully undertaken upon the coast of Oregon.
771. The success of those works establishes you in the opinion that this work will be successful? Yes.
772. Has the new entrance been largely used by the sailing vessels and steamers which have come to the river? I think that it is preferred to the old entrance.
773. The channel inside Grassy Head is very tortuous and narrow? Yes; and it was always a troublesome channel, constantly needing dredging.
774. Have you carefully watched the progress of the harbour works? No; but when I have been at the entrance I have paid considerable attention to them.
775. You must have been struck with the increase of depth that has been obtained there? Yes. Possibly, however, that opening would be too narrow, if an attempt were made to turn the whole of the river water into it.
776. Do you think that the entrance, when finished, will drain the district sufficiently quickly? I should think that the new entrance would be somewhat narrow if the old entrance were blocked up entirely. The scour would then be too great, and the water might rise above the stonework.
777. It is not proposed to close the old entrance; that will still act as an outlet for part of the flood-water? I think it would be unwise to close up any entrance. The people on the upper part of the river have been agitating for flood-water exits, and it seems to me that the greater number of openings the better from their point of view. I should not think that the existence of two or three small openings would in any way seriously diminish the scour at the new entrance.
778. You have noticed the erosion which takes place in the banks;—do you think that the banks will suffer still more when the new entrance is completed? I do not think that the new entrance will increase the erosion, but I think that some conservation of the banks should certainly be attempted. Lower down the river the alluvial land overlies sandbanks, and when it is washed away the sand is carried down and deposited in the channel, creating an obstruction to navigation.
779. Can you tell us what is the trade of the river? I have a very high opinion of the capabilities of this river, and I think that the district is in an undeveloped state yet, though, perhaps, the steamers running here can cope with our present output. With an improved entrance, however, we will get better steamers, and that will induce a large number of people to settle here. In the past we have had very inferior steamers, because for many years it was always difficult to get over the bar. People desiring to settle upon the land always try to go to districts where these difficulties do not exist, or where they are not very great.
780. Is it within your knowledge that the farmers have been considerably injured by the delays which have occurred in steamer communication? For years, and even until quite lately, serious loss occurred, because only one steamer was coming here. Corn had to be kept back because it could not be got to market.
781. How long have you had an opposition service? The present boat has only been running for a month or six weeks.
782. Do you look upon this competition as the result of an improved entrance? Yes; people see that they can run their boats here with more safety than was the case formerly.
783. With a better entrance you would have competition, and possibly better boats, with more regular transit for passengers and goods? I think so.
784. I suppose you regard the agricultural districts on the North Coast as a great stand-by for the Colony? I have a great opinion of the North Coast country, because of the fertility of its soil and the adequacy of its rainfall. I am of opinion that these districts could absorb a large population, and that a large population would come here if we had better means of communication.
785. We have heard that the district is now recovering from the effects of a very severe flood which occurred some years ago? In 1893 we had a very destructive flood, and people were very close to the wall then. That was the last flood of any consequence that we had.
786. Do you look upon floods as of regular recurrence, or are they exceptional? Floods occur most irregularly, and in any month of the year.
787. You get a regular and sufficient rainfall here? Sometimes we get too much rain. Up to November of last year we had four months of dry weather, but since that time we have had hardly a week without rain.
788. You look upon the district as climatically favourable for agricultural pursuits? Yes; and there is room for a great range of production here.
789. Why should a flood that happened four or five years ago still be affecting the settlers? Well, I suppose it is because they were heavily involved before that. The years 1896 and 1897 were very favourable for corn-growing.
790. What do you consider the average value of land here per acre? Well, that is like trying to determine the unimproved value of land. I do not think anyone knows the value of the land here. I have seen £40 an acre given for agricultural land; but I do not think that anyone could safely give more than £20 an acre for good farming land. If we had a deep-water entrance, and regular communication, we might be able to go in for lucerne growing as they do on the Hunter, and in that case our profits would be very much larger.
- 791.

- A. Verge.
7 June, 1898.
791. They have commenced to grow lucerne here? We can grow lucerne, and we can make good hay, but the freights are very heavy.
792. Is it very difficult to clear the land here? Yes, it was very costly. There was first the expense of felling, which would amount to 30s. or 35s. an acre, and then the time had to be taken in burning off the timber. The total cost of improving the land might be put down at from £6 to £8 an acre.
793. What is the average yield of corn per acre? Well, I think that throughout a period of years, 50 bushels to the acre is a very fair yield. I have heard of 100 and 110 bushels being obtained, and upon some land you might average 60 bushels, but taking the district throughout, I think 50 bushels would be a fair average.
794. Is not a large quantity of corn consumed locally to feed pigs and other stock? I do not think a large quantity is consumed locally; I think that it is nearly all sent to Sydney. Some of the corn grown on the upper parts of the river may be used in that way, but it would be damaged corn chiefly.
795. Do you look upon this district as a progressive one? Undoubtedly. The butter industry has taken a hold here, and is moving ahead very fast. The output is increasing almost daily.
796. Do you think that the output of corn for this year will be equal to or more than the output of previous years? I think it will be equal to the yield of last year, which was an exceedingly good year.
797. Are the farmers here generally the owners of their farms or do they rent them? In past years I think the land was mostly rented, but of late there has been a great deal of selection upon the upper part of the river, and that would alter matters.
798. About what rents are obtained? I think from 20s to 30s. and 35s. an acre.
799. What do you think a fair value for land here;—we have heard of low-lying flooded flats being valued at £25 an acre? I think that would be an excessive price for such land. A fortnight ago I sold a farm on the bank of Kinchela Creek, only 2 miles from a butter-factory,—land with two water frontages, thoroughly cleared, the higher ground capable of growing as good maize as any land in the district, and the lower ground all laid down under buffalo grass, the droghers calling to take produce from the banks—I sold 59 acres of such land for £550, or less than £10 an acre, and that land was offered for a very long time. I should think the price that might be expected for the best river-bank maize-growing land would be about £20 an acre. Low land could not be valued so highly, because of its liability to inundation by flood water, and perhaps also by tidal water.
800. What is wanted for the advancement of the district is the improvement of the river entrance? Undoubtedly. That is what we have been wanting ever since the district was settled.
801. Which would be of most benefit to you—the improvement of the entrance, or the making of a railway? I think if I had a choice between a railway and an improved entrance, I should prefer a railway. We could use the present entrance, even though it might become bad at times, and by this means we could send our heavy produce away cheaply, while we could use the railway for other produce. With a railway I think there would be a large accession of population. It seems to be generally thought that railways cannot be made except at a certain cost per mile. I think we might have cheaper railways, but as the authorities show no inclination to make them, I suppose all we can expect at the present time is the improvement of the harbour.
802. People will naturally send produce to market in the cheapest way, and it has been proved that steamer carriage is invariably cheaper than railway carriage? I understand that all over the world steamer carriage is cheaper than railway carriage.
803. It has been suggested that a railway should be made from Jerseyville to Trial Bay? I do not think that would do. Such a railway would be very expensive to use.
804. Looking at the matter from every point of view, you have come to the conclusion that the harbour works should be gone on with? Undoubtedly. I think that they will give us a fine deep-water entrance. Sir John Coode expressed the opinion that if a scheme were adopted such as that at Trial Bay it might have the effect of bringing silt into the bay; but if the banks were conserved, less sand would go into the river. The greater part of the sand in the river is produced by the erosion of the banks. The alluvial matter brought down from the mountains is deposited in the swamps, but the sand comes from the sea.
805. But this sand will be got rid of if a proper scour is created by the construction of training-walls? Yes; I think there will be a fine scour then.
806. Although this cannot be looked upon as a reproductive work, do you think that it can be justified by its indirect advantages? I think so. These harbour works will induce people to settle in the district, and those who are here now will work more hopefully. I think that the rates that we pay now are higher than we may expect to pay when the entrance is improved, because I think there will be more competition for the trade when better boats can come here.

Enoch Rudder, farmer and grazier, Kempsey, sworn, and examined:—

- E. Rudder.
7 June, 1898.
807. *Mr. Roberts.* How long have you resided on the Macleay? Since the district was first opened up.
808. For how many years? It must be fifty-three years since I came here.
809. Upon what part of the river do you live? At the first falls—about 9 miles above Kempsey.
810. Have you resided there during the whole of this year? No; for the larger part of my life I have resided in Kempsey, and just about a mile above Kempsey.
811. I understand that you are appearing before us as a delegate from the Farmers' Union? Yes.
812. Do you wish to make any statement to the Committee putting forward to the views of the members of the Union upon any particular point? Certainly not. I simply desire to give evidence as an individual upon the wealth of the district.
813. Have you made yourself familiar with the proposed scheme for improving the entrance to the Macleay? I think I thoroughly understand it.
814. You know the difficulties with which the people here have had to contend because of the bad state of the entrance in the past? Yes.
815. Would you like to make a statement upon the subject? I should like to say that I have some knowledge of works such as these, and I have not the slightest hesitation in stating that the proposed works have been most ably designed, and, if carried out as proposed, will confer the greatest benefit upon the district that it is possible to give it. When Sir John Coode designed his scheme the conditions were different from those prevailing at the present time. In former times the sand-spit through which the break-outs

- break-outs have been made was a scrub in places 10 to 12 chains wide, and almost impenetrable. To look at it one would have thought that it would remain firm for ever. The vegetation upon it, however, has now been totally destroyed, and the sea has at various times broken through it in many places.
816. Do you recollect the break-out occurring in 1893, which produced the present entrance? Yes.
817. Do you recollect a break-out occurring in the vicinity of Sir John Coode's scheme? Yes.
818. Is that open still? I cannot tell you. There has been an opening at the South-west Rocks as long as I can remember. That opening has contracted and enlarged according to the operations of various floods. It would be utterly useless to attempt to improve the Grassy Head entrance without constructing a southern breakwater.
819. Do you recognise that that would be an expensive work? Yes, most expensive; and I do not think there is anything to warrant the expenditure. In my opinion, if the departmental proposal is carried out, we shall have a permanently deep channel at the new entrance. In regard to the alleged silting up of the bay, I think that the evidence that the river does not carry down sufficient silt to have an appreciable effect on the bay is irrefragable. What the river fetches down is the finest description of mud, and a close examination of the bottom of the bay will show that it is all clear sand. The only difficulty that could occur at the entrance might be in the formation of a bar of ocean sand in the lower part of the river. I would, therefore, impress upon the Committee the absolute necessity for removing that sand from the river, and depositing it behind a training-bank by the simple process of dredging. You will find that after you get under the alluvial in the lower river there is sea sand. This sand sometimes works away and allows the alluvial to fall into the river; but you do not find that the alluvial is carried into the sea. I have heard statements made about the formation of a bar outside the projected breakwaters; but I cannot see why there should be such a bar. At Grassy Head there is no get-away for the sand; but at the new entrance there is a get-away both to the north and to the south, and the scour will inevitably carry the sand to a point from which it will be removed.
820. Do you think that the proposed training-walls are designed to go out sufficiently far? I think so.
821. Have you been there lately? No. I believe that the scheme designed by the Department will give us a good entrance. Another point which I should like to impress upon the Committee is with respect to levels. The Committee must remember that the land along these rivers is the highest at the water's edge, but in a great many places, and especially at Rainbow Reach, a great part of the banks have been worn away. This has in some cases made an alteration of level to the extent of 2 feet, and perhaps more, which might mislead people not acquainted with the original state of affairs in regard to the rise and fall of the tide. Then, too, wherever the land has been of a spongy nature, and stock have been put on to it, it has solidified, and where water was not formerly seen it is now everywhere evident.
822. Can you tell the Committee anything of the losses which have been sustained by the farmers on Rainbow Reach? No, I am ignorant on that subject; but you will see that there is some explanation of that in what I have said about the alteration of levels.
823. You hail with feelings of great satisfaction the proposal referred to the Committee for consideration? I believe it to be the most important work for the development of the district that has ever been undertaken, and I have no hesitation in saying that it will be a most emphatic and marked success.
824. Is the Macleay district increasing in prosperity? Undoubtedly.
825. If the proposed works are carried out will the district greatly develop? They will prove a most material factor in promoting the welfare, prosperity, and progress of the district.
826. Is the dairying industry making rapid progress there? Yes; it is a new industry, and bids fair to make a great expansion.
827. That is an industry which would be developed by carrying out the works in question? Yes, unquestionably.
828. Do you corroborate what Mr. Verge said in regard to the value of land here? To a large extent. If you divided the district into three divisions, the good agricultural land in the central division—that is, the land a few miles above and below Kempsey—would be worth £40 an acre. Outside that division I think Mr. Verge's estimate would be a fair one.
829. Have you known land here to be sold for £40 an acre? I have known it to be sold for more than that; but you would not get so much now.
830. What would you get now? I do not think you would get above £35 an acre; but I know farmers who would sell for that.
831. Do you feel sure that it would bring more than £20 per acre? I feel confident of it.
832. What is good land on the Macleay leased at per acre? From £1 per acre up to 30s. per acre is about the average rent.
833. It would be only the very best land that would realise 30s. an acre? Yes; and its situation must be very good. Exemption from floods is a great advantage.
834. Do you endorse the reasons given by the Department for the proposed harbour works? Yes. However complete you may make the works at Grassy Head, you will not have the advantage there which you have at the new entrance. At Grassy Head you are always subject to the full effect of the north-east winds, and in olden times I have known vessels to be detained there for two months. On one occasion, when a lot of pigs were sent away by the steamer, she was detained there so long that the people eat them all.
835. How many years ago is that? Twenty years ago. It was when steam communication was first introduced into this district.
836. Do you regard 50 bushels of maize to the acre a fair average crop? A very fair average. I have known 20 acres to yield 2,200 bushels.
837. Where was that? Just opposite my own farm.
838. What is the largest yield that you ever obtained? 110 bushels to the acre. The value of land here depends to some extent upon the number of years for which the farmers have had it under cultivation. The land upon many of the farms is to a certain extent worn out.
839. What other industry, beyond maize-growing and dairying, is likely to be developed here? We may develop the wine-making industry.
840. Is this soil well adapted to the growth of the vine? For only one class of vine; but we can grow it in any quantity, and make a first-class wine from it.
841. Is much fruit grown in the district? Very little. The climate is not suitable for fruit-growing. Maize, butter, and pigs are the staple commodities of the district.

- E. Budder. 842. What about timber? The timber supply is to a large extent exhausted.
- 7 June, 1898. 843. What is your opinion of the proposal to construct a tramway from Jerseyville to Trial Bay? I think that no substantial benefit would be gained by the construction of such a tramway. The extensive handling of goods would be almost as large as the expense of getting them to Sydney. I am totally opposed to such a work. Furthermore, if you were to ask me which I should prefer, good water communication or a railway, I should emphatically declare myself in favour of a railway, because of its cheapness, and on account of many other considerations. It would be as much trouble to bring heavy products to a railway as to take them all the way to Sydney by steamer.
844. A railway would only serve those above the head of navigation? Yes; and for carriage of light and perishable articles.
845. The people on the banks of the rivers would always use the steamers? Yes. I heard some remarks made by Mr. Verge in regard to the necessity for improving the banks of the river, and I look upon that work as a most important element in the final success of the scheme. I think we shall have to introduce municipal action in regard to the matter. The chief reason why the banks of the river are destroyed is, that settlers allow their stock to graze at the water's edge. Nature protected the banks by placing the reeds all along them, but the cattle get down and eat them off. If the banks of the river were fenced off, the reeds would grow again, and nothing would disturb the soil. Then, too, if you could level the banks down to a certain angle, and plant them with willows, cutting the willows off when they had arrived at a certain age, so as to make them fall over, and send out millions of roots, you would have a protection to the banks that could never be disturbed. In this way, in the course of a few years, the river would be restored to its original condition, the channel would deepen, and you would have no further trouble.
846. Has your suggestion ever been adopted in any part of the river? No; but in some places they have been compelled to fence the roads off, and wherever that has been done the banks have returned to their original state.
847. *Mr. Farnell.*] Will willows grow where there is salt water? No; but there are other trees which would serve the purpose equally well where there is salt water. The oak is even more effective than the willow. When the banks are protected you will be able to conduct your dredging operations with every prospect of permanent improvement.
848. Efforts have been made to prevent the erosion of the banks lower down the river? I regard what has been done there as utterly worthless, and a waste of public money. The erosion takes place under the wood-work.
849. Is there anything you would like to add? In regard to the tides, I should like to say that within the last eighteen months, we have had phenomenally high tides—tides at least a foot above the average height of high tides. I do not remember having seen such tides in the early days; in my opinion this is not due to the harbour works, but is caused by the break-out which Nature herself has made.

Herbert Phillips, Crown Lands Agent and Clerk of Petty Sessions, Kempsey, sworn, and examined:—

- H. Phillips. 850. *Chairman.*] How long have you been in charge of this district? About nine months. I have been on the North Coast for the last seven years—that is, at Grafton and here.
- 7 June, 1898. 851. *Mr. Clarke.*] Can you supply us with information in regard to the Crown lands in this district? There are at the present time about 415,000 acres available for settlement in this district under the Crown Lands Act.
852. Where is this land situated? Of course, the land upon the river bank was taken up first, and I think that most of the area available lies north from Kempsey.
853. *Chairman.*] Are there any large reserves here? There are several large forest reserves. For instance, there is the Maria River forest reserve (F.R. 100), parish of Lincoln; the Allgommera forest reserve (F.R. 14,537), which takes up nearly the whole parish of that name; the Collombatti forest reserve 12,301; and forest reserves numbered 158, 112, and 3,753. These are all large reserves.
854. Have you any knowledge of the quality of the soil in these particular reserves? No; I have never been on the land.
855. As a rule, the land in timber reserves is not good agricultural country? That is so. The country in the parish of Colombatti is mountainous, but I think there should be fairly good country where the other reserves are situated.
856. Have you any other information to give in regard to the settlement here? Yes; 1,391 conditional purchases were being paid for during the year 1897.
857. That would include new conditional purchases, and instalments upon old conditional purchases? Instalments, interest, and balances were being paid upon that number of conditional purchases in 1897, the amount paid being £7,103 15s. 1d. The total revenue received from land in 1897, was £9,568 2s. 11d., and in 1896, £8,081 10s. 1d.
858. Have not all the balances under the 1861 Act been paid up? Every now and then people come in and pay up their balances to make a freehold. The totals I have given you include all balances. The revenue for 1895 was £7,611 6s. 11d., so that there has been a gradual increase from year to year. The number of timber licenses issued during 1897 was 261.
859. What is the license fee? Five shillings a month for an ordinary hardwood timber license, 2s. 6d. for a deadwood timber license, and 10s. for a cedar license. For licenses coming under Class A the charge is £1 a month. The Allgommera is a Class C reserve, and they can only get permission from the Department to take timber from that land.
860. They also pay royalties upon some classes of timber? Yes; but the royalties do not come through my hands.
861. I suppose that settlement has considerably increased in the district since you came here? There has been an increase nearly every month.
862. That shows that the conditions of the settlement are satisfactory? Well, I am receiving more money than I received last year.
863. Although an Act is in force providing for the postponement of payments? The provisions of that Act have not largely been availed of.
864. Is there much swamp-land in this district? Yes, a good deal.
865. Is it owned by private individuals, or by the Crown? Most of it has been taken up; but some of it is still available for selection.

866. That land is almost valueless, even for grazing? Yes; though in a dry time it is very valuable indeed. There is grass on the swamp lands when there is grass nowhere else in the district.
867. Would it be possible to drain these swamps? I could not say.
868. Have you any other returns? I have a return showing the number of conditional purchases applied for during the last three years. In 1895 six conditional purchases were applied for, in 1896 four, in 1897 two, and this year up to date, eight.
869. How does your district extend? From Taylor's Arm, on the Nambucca, to the Port Macquarie district.
870. Does it go right to Port Macquarie? No, not quite to Port Macquarie itself.
871. Is there any other information you can give us? The revenue received from Petty Sessions work in 1897 was £442 8s. 1d. The sum of £125 8s. 9d. was received by the mining registrar.
872. Has any application been made to have the timber reserves thrown open for selection? A little while ago a gentleman told me that application had been made to the Minister for the setting apart of one of the reserves for a refuge in times of flood; but that is a matter with which I have nothing to do.
873. You have not heard the result of that application? No. The only thing I should hear would be that the land had been withdrawn from reserve, or had been set aside for a specific purpose.
874. Do you not think it is advisable that some of these reserves should be thrown open to the public? Well, it might promote settlement.
875. Is the land likely to be occupied if thrown open to selection? I could not say. There is land available for selection pretty well all over the district, to a greater or less extent.
876. Still the selections have been very few? Yes; but this year they have been more than during several previous years.
877. Do you know if there are any estates in the district under the old grant system? I could not say. The parish of Lincoln used to be part of the Port Macquarie district, and there are several large grants there.
878. Were similar grants made within the vicinity of the town of Kempsey? I do not think so.
879. How is the land in this district held—chiefly under conditional purchase? Yes, mostly about here, with a little freehold here and there. Of course, taking the whole district, I should think the larger area would be under leasehold.
880. Leasehold from the Crown? Yes.
881. Has any land been set apart under the settlement lease section? Not in this district.
882. Have any homestead selections been made? Yes.
883. Many? No, not many.
884. Has there been much inquiry from outside people for land? No; though I have had a letter from Victoria, and another from New Zealand, since I came here.
885. If this district is to increase its output, in which direction must new settlement take place? Settlement can take place only where land is available.
886. Do you know whether the Crown lands shown on our map of the county of Dudley is suitable for settlement? No; I can give you no opinion about that.
887. So far as you know, unless some of the reserves are revoked, there is no place where settlement can take place? There are bits of land here and there in most of the parishes, but the areas are small.
888. What would be the area of an average conditional purchase in this district? I suppose an average holding would be from 100 to 120 acres.
889. Would not that indicate that the land is held purely for agricultural purposes? The map shows that the land which has been alienated is land suitable for cultivation.
890. So far as you know, is the land held by *bonâ fide* settlers, or is any large extent of it held for speculative purposes? I do not think so. So far as I am aware, most of the holdings are *bonâ fide*.
891. Has there been dummying to any extent? I have not heard of it.

H. Phillips.
7 June, 1898.

Otho Orde Dangar, auctioneer, Kempsey, sworn, and examined:—

892. *Mr. Farnell.*] You are an old resident of this district? Yes; I have resided here since 1859.
893. And you at one time represented the Macleay electorate in the Legislative Assembly? Yes; from 1889 to 1893.
894. During your residence here you have had an opportunity of gaining a good knowledge of the resources of the district? Yes.
895. Are you conversant with the proposal now before the Committee? Yes; this is a matter to which I have given attention since 1868. In that year I formed one of a deputation who waited on the Minister for Public Works on the improvement of the entrance, and I then gave an opinion in favour of the construction of training-walls and of the projection of breakwaters into the sea.
896. I suppose you then had in mind the improvement of the old entrance? Yes.
897. Can you make a general statement to the Committee in reference to the question which has been referred to us? Yes. I have lost vessels at both entrances, and I have had actual experience of the terrible difficulties in the way of navigation on the lower part of the river, when taking cedar rafts down. In my opinion the proposed works are preferable to Sir John Coode's scheme.
898. You knew the old entrance before the new entrance broke out? Yes.
899. What was its condition then? Sometimes, under favourable circumstances, there would be a depth of 16 or 18 feet of water there, and then at other times vessels would be bar-bound for weeks together. The steamer trade was stopped altogether for a time, and the steamboat company had to employ sailing vessels. The entire blocking-up of the old entrance, which took place during a heavy easterly gale, by the accumulation of an enormous amount of flood-drift, could not occur at the new entrance. The timber was packed up into a solid mass, so that the river was literally blocked, and the water broke out through the sand, and formed a new channel 2 miles further south. That could not occur at the present entrance, because of its comparatively sheltered position. The breakout to which I refer gradually worked north, until about seven years ago the channel reached Grassy Head again. One vessel that I had was wrecked just opposite Stewart Point, and the "Agnes Irving" was wrecked about 2 miles south of the present Grassy Head entrance.

O. O. Dangar.
7 June, 1898.

- O. O. Dangar. 900. You have noticed the effect which the construction of training-walls at the new entrance has had on the river? Yes; their immediate effect was to produce a scour which gave a great depth of water. Another effect has been to let the tide in more rapidly, so that it now rises in the river somewhat higher than formerly.
- 7 June, 1898. 901. On the whole, do you consider that the work has been effective and beneficial? I have no hesitation in saying that that is my opinion.
902. Have you come to a conclusion in regard to the proposed extension of the training-walls? I am not an engineer, but I should say that the extension of the training-walls will permanently benefit the river, not only by improving the navigation, but by giving a speedier outlet for flood-waters, which will be an immense advantage.
903. Have you seen the harbour works at the Bellinger Heads and at the Clarence Heads? The works at the Bellinger Heads had only just been commenced when I was there in 1893, and I have not been there since. At that time, however, they had done an immense amount of good.
904. You have no doubt as to the permanency of the benefit which will be obtained from the carrying out of the Macleay works? The only question which arises in my mind is as to the possibility of the formation of a sandbank somewhat near the outlet of the channel, and as to whether the ocean current will be strong enough to sweep away the sand deposited there. Upon that point I am not able to form an opinion.
905. But you are in favour of the carrying out of this scheme? Yes, emphatically. I consider that it will be a great boon to the Macleay district.
906. It is of vital importance to the development of the district? Undoubtedly.
907. What do you think of the construction of a tramway from the Macleay to Trial Bay to allow of ocean steamers being loaded there? In my opinion there is no doubt that the time will come when a railway will be essential. There is a future for this district in connection with the export trade, and more particularly the export trade of live stock and frozen meat, which will necessitate, probably, not within my lifetime, the construction of a jetty at Trial Bay. That, however, is a matter wholly for the future, and I consider that our present necessities require the completion of the scheme for improving the river entrance.
908. Do you think that the construction of the North Coast railway can wait until these works are completed? I look upon the North Coast railway from a different point of view. I look upon that as a national work which, apart from local requirements, should be carried out, first, for the purposes of defence, and secondly, as a means of getting to Brisbane with a great saving of haulage. I look upon its construction for defence purposes as imperative. But even if such a railway is constructed, there will be a trade amounting to between 100,000 and 200,000 tons a year carried away in ships' bottoms, that being the cheaper mode of conveyance.
909. Have you studied the question of railway construction from a commercial aspect? Yes; if it were proposed to make the Macleay the terminus of such a railway, I should say that its construction would be a great piece of folly, because I look upon its extension through to Brisbane as imperative.
910. If it were decided to carry out this great national work, would it still be necessary to push forward with harbour improvements at Nambucca, the Bellinger, the Macleay, and other places? Well, I consider that the resources of the Macleay are sufficient to justify the proposed improvements of the river entrance. As to the other rivers, their output is smaller than ours, and it is probable that it will not increase.
911. If the proposed improvements are carried out, it is hardly likely that the Government will expend money on another public work which would take from the trade of the river? I submit that the case of the Macleay is very different from the case of the other rivers on the North Coast. While we may be perfectly confident of the development of the Macleay district, I will not speak with equal confidence with regard to the condition and prospects of the other rivers.
912. You said something, a little while ago, about certain lands being subject to inundation by floods;— is the improvement of the new entrance responsible for this inundation, or is it due to natural causes? The flood of 1893 did a great deal of the mischief, and I do not apprehend that its consequences have been made worse by the work which has been done since. Three or four openings were made by that flood, and, in my opinion, the work that has been done at the new entrance has not increased the injury.
913. I suppose that the area inundated by tidal water would be very small? I should imagine that it might amount to 1,000 acres.
914. At what would you value the land there per acre? That would entirely depend upon its condition before the flood took place.
915. The land which has been flooded by the tide has been rendered valueless? No; but lands which I have sold since have depreciated from £6 or £7 per acre to £2 per acre. A great deal of the injury could be prevented by making banks and ditches.
916. I suppose it would be quite possible to grow vegetables and other products upon this land then? Yes; it is merely a matter of taking proper precautions to prevent the tide from flowing on to the land. Where salt water goes over land grass will not grow.
917. If the proposed scheme is carried out, do you think it will be necessary to take steps to prevent the erosion of the banks, and the formation of sandbanks in the main channel? Those are matters which would have to be attended under any circumstances, and have been before the Government for the last thirty or forty years. The erosion of the banks has been going on ever since the scrub timber was felled. The silting up of the river is another matter.
918. Do you think that united action should be taken by the Government and by the land-owners to deal with this question? That would be decidedly a wise thing. The Government have done something in places, because they have owned roads alongside the river. Only last week I wrote an application for a person at Long Reach, who asked the Government to have another 20 chains of bad places made good. Work of this kind will have to be done whether the new entrance is made or whether Sir John Coode's scheme is adopted.
919. Will you tell the Committee what you think of the general prospects of the district, and of the effect of the proposed works upon its development? In the first place, I think that one of the results will be a reduction of rates. I believe that we may reasonably look forward to a reduction of 20 per cent. That will be a great boon to the people. With every improvement of the river there has been a reduction of rates.

When

When the North Coast Company first took up this trade we paid 3s. a bag freight for maize, and now we are paying only 10½d. per bag. O. O. Dangar.
7, June, 1898.

920. What is your opinion as to the probable extent of the dairying industry here? That industry has developed very materially within the last twelve or eighteen months, and we have now reached an output of 10 tons of butter per week. In my opinion the capacity of the district for development is such that one may readily suppose that the output of butter next year will be 20 tons a week, and in two years' time 30 tons a week. It would be very difficult to say what the maximum output will be. There is an enormous area of land in this district which can be made productive—a much larger area than one would imagine.

921. Is all the land that can be put to profitable use for dairying and mixed farming within the influence of these works? It is all within 5 miles of the river, and would use the new entrance. One of the greatest benefits to the district would result from the draining of the swamp lands. These lands, when drained, would carry three or four cows to the acre.

922. Can you tell us of any place where that is being done? I can cite the case of a property at Seven-oaks, where, by giving ordinary facilities for the getting away of the water, land that twenty years ago was almost a morass, is now capable of feeding two or three head of cattle to the acre. A plain just near here that was uncrossable has, by the cutting of a drain, been made leaseable at 20s. an acre.

923. Then the draining of these swamps is practicable? Yes.

924. Has the "Drainage Union Act" been used to any extent here? No, not at all.

925. Do you think that the improvement of the entrance, and the giving of regular communication, will act as an incentive to the development of the district? I have not the least doubt that the output of the district will be doubled. In a letter which I sent to the Premier some time ago I pointed out that the area of the swamp land in this district was 50,000 acres.

926. If the Government drained the swamp land belonging to the Crown could it be let at profitable rentals? There are only three swamps of which the Government hold any considerable area. Most of the swamp land is held by private individuals.

927. Would it be easier to improve this land than to pay £20 or £30 per acre for clearing other land? Naturally so. The land could be drained for £1 an acre, but it is held by a number of settlers, and each man says, "Let the other fellow drain it."

928. You are aware that the Government in some places is clearing land for the development of settlement;—do you think it advisable for them to also direct their attention to the draining of swamps? Yes; but the difficulty is, that the Government do not own a sufficient area of swamp lands. This land is held by people on the waiting principle. It would be a grand thing if it could be resumed at its present value. I have 1,750 acres of swamp land which I can sell for £500. It is in the hands of the banks, and they will not improve it. This land is capable of making 300 per cent.

929. Do you think that two steamers trading here regularly would be able to do the trade of the district for some years to come? We have three or four steamers coming here at the present time. The North Coast Company loaded the "Wyrallah" and the "Burrawong" this week, while the "Wyoming" has also come in. They sometimes take away 8,000 bags of maize a week.

930. You have very great faith in the district, and you think that the Committee would be justified in recommending that something be done to further develop its resources? Yes. I have not the slightest doubt that the proposed harbour works will be an immense service to the district. The following information in regard to the district may be of interest to you:—We have 3 dairy factories, 21 steam creameries, 18 blacksmiths, 10 saddlers, 15 wheelwrights and implement makers, 28 general stores, 30 shops, 2 chemists, 5 hairdressers, 9 auctioneers, 2 newspapers, 16 hotels, 1 spirit licensee, 3 banks, 3 solicitors, 3 doctors, and 750 farmers and dairymen.

Otto Albert Herborn, licensed surveyor, Macleay and Port Macquarie districts, sworn, and examined:—

931. *Chairman.*] How long have you been here? I am a native of this district; but for some years I had charge of the Mudgee district. O. A.
Herborn.
7, June, 1898.

932. You have a personal knowledge of the whole of this district? Yes.

933. What opportunity is there for an extension of settlement here? In the first place, if the harbour works are successful—and here appears to be every indication that they will be—a great deal of land on the tributaries of the Macleay will be made use of for farming.

934. Is there room for any more settlers? Yes, certainly.

935. Where would the land be found? Upon many of the creeks which are tributary to the Macleay.

936. Is it within reserves? A good deal of it is within reserves.

937. I understand that there are a great many reserves in this district? Yes.

938. Chiefly timber reserves? Yes.

939. Many of them were proclaimed some years ago? Yes.

940. Are you in a position to say whether many or any of them have served their purpose, and might now be revoked to allow of settlement taking place? I think it would be generally beneficial if most of the reserves, and especially the timber reserves, were revoked. The reserves in among the mountains might be retained, and in places, might be added to, where the country is mountainous and inaccessible. For present purposes sufficient timber could be obtained from a few reserves.

941. Have not all the reserves been denuded of their commercial timber, and are they not therefore valueless as timber reserves? That is so to a certain extent.

942. In that case they could be turned to better account if they were settled? Yes.

943. How many acres are there in the reserves which you think could be brought under settlement? I could hardly say.

944. You believe that the area would be large, but you are not in a position to say how large? Yes.

945. What is the character of the Crown lands outside the reserves? It varies a good deal. Some of it may be considered worthless, while other land consists of rich alluvial soil. This rich alluvial soil, however, is only in very small patches. There might be 100 or more small patches from 5 to 10 acres each in bends of the creeks and similar places. This good ground would be backed up in many cases by good forest country, with perhaps inferior forest country behind.

946. We have been told by the Crown Lands Agent that there is a considerable area of Crown land in the district;—do you know whether any portion of that land is suitable for settlement under the settlement lease

- O. A. Herborn.
7 June, 1898.
- lease or homestead selection provisions of the Crown Lands Acts? I should not recommend anyone to take it up under those sections. I think that the only way this land can be settled is by giving people the right to eventually acquire it in fee simple.
947. Do you think that if the country you have spoken of were thrown open under the settlement lease provisions, it would be taken up? I do not think so.
948. How is it held at the present time? Some of it is held under annual lease, but a great deal of it is not occupied.
949. I suppose the annual lease system is the worst form of occupation we can have, because it involves no improvements and no residence? The country most suitable for permanent occupation and settlement is not, as a rule, held by annual lease. The annually leased land is used for grazing purposes, and does not require much improvement, apart from ringbarking.
950. Do you think there is enough unalienated land in the district to support twice the present population? I think so.
951. I presume that the first settlers went for the best land, and what is left is inferior land? Yes; though occasionally good pieces of land are discovered.
952. Do you think that this district is capable of supporting a large population? I think so. The land is the richest I have seen anywhere.
953. Is the rainfall good? The rainfall is very good, though it occasionally produces floods.
954. Is it sufficient to give certainty to the operations of agriculture? I think so.
955. Can you tell us anything regarding the swamp land, of which there appears to be large areas in this district? There is a great area of swamp land.
956. Most of this land is in the hands of private owners? It must be in the hands of hundreds of separate owners.
957. Do you think it is capable of being improved by drainage? I am certain that it is. I consider that in most cases the land is worth less than £1 an acre at the present time.
958. Would it be practicable to drain it? All the swamps could be easily drained, because they are all above high-water level—that is, with a few exceptions. I consider that the swamp land is as rich as the land on the banks of the river, though of a slightly different formation. It will fatten about two beasts to the acre.
959. Is that as it stands? No; when it is drained and improved. Some of these swamps have been drained. One, of which I have some personal knowledge, is the Austral Eden Swamp. That swamp has been drained.
960. Is the draining of these swamps within the power of the present owners? Under the Water Rights Act.
961. Have you in view the possibility of the Government being requested to undertake this work? Yes. There have been several moves in that direction.
962. But could the land be drained by the private holders? Well, a great many of the private holders have not sufficient means to improve their land. Many of them are in the hands of the Banks.
963. Before this land can be made use of, capital will have to be expended in draining it? Yes.
964. Do you know anything of the land in the vicinity of Rainbow Reach? Yes, I know a great deal of it.
965. Do you know anything of the land held by Messrs. Cox, Sheppard, and Sinclair? I am not sure if I know those exact properties, but I know the situation of the land about there.
966. It has been asserted that this land is subject to inundation by tidal water, because of the new ebb entrance being made;—will you tell us if that is really a fact? The land in that locality is usually higher on the river or creek bank than further back, and generally slopes inland. The tidal water in many cases flows up the gullies and creeks, and overflows the back land. These creeks and gullies are generally small, and could be easily blocked, and I think by using flood-gates, and by taking advantage of the exceptionally low tides which follow the exceptionally high tides, much of the low-lying land could be made much more valuable than it was originally.
967. Do you know of your own knowledge if there has been a higher rise of tide in that locality since the new channel was cut through? Yes.
968. As a matter of fact, have not the lands now alleged to be inundated been partially inundated for many years? To a certain extent, that is so.
969. The low-lying land will always be subject to inundation while the by-creeks are allowed to remain open? Certainly.
970. Are you of opinion that the mischief could be stopped by putting in flood-gates? Yes, in most cases, and the land could be made better than it was before these exceptionally low tides.
971. Do you hold the opinion that it would be wise to abandon the new entrance in order to preserve these lands from further inundation? Certainly not.
972. Do you think it would be advisable to carry out works which the Department is satisfied will be effective, and to take other steps to relieve the farmer whose lands may be inundated? Yes.
973. Are you prepared to say that this inundation was consequent upon the cutting through of the new channel? No; it would have occurred in any case.
974. In flood-time does the river break out at different places, or does all the water go through Grassy Head opening? In flood-time the river has a tendency to break over the banks at places called Sevenoaks, and to go across the swamp and plain country there until it finds its way into Clybucca Creek.
975. Do you think the construction of a channel which will give an outlet for the flood-waters 7 miles nearer than the old Grassy Head entrance will relieve the river? I think so.

John Hibbard, storekeeper and grazier, Dulcoonghi and Gladstone, sworn, and examined:—

- J. Hibbard.
7 June, 1898.
976. *Chairman.*] You have been living upon the river for about thirty years? For upwards of forty years.
977. You desire to bring under the notice of the Committee certain facts in regard to the course of flood water;—have you undertaken to do this because you are of opinion that the proposed works will be detrimental to a certain portion of the river? Speaking honestly, I believe that they will be detrimental, but at the same time there are some benefits that will be derived from them. It stands to reason that the closer you bring the ocean to the river the higher the tides will rise, though, at the same time, you get a speedier outlet for flood waters.

978. The new entrance was cut through by flood waters, and the Department have since expended a large sum of money in making the opening permanent;—are you prepared to recommend the closing of the new entrance, so that the Grassy Head entrance may be resorted to again? Certainly not. J. Hibbard.
7 June, 1898.
979. You are of opinion that the new entrance causes the tides to rise higher in the river;—will you show us how this is to be prevented? I think it is almost impossible to say how it can be prevented.
980. Have you yourself suffered damage by reason of the higher tides? No.
981. Have you any objection to urge against the proposed completion of the works at the new entrance, or have you any suggestion to make for the mitigation of the evil which you are afraid will occur? I think that the works will be of more benefit to the district at large than they will do injury to a few landholders on the lower Macleay. Even if the Government had to pay a few thousand pounds to recoup those farmers for their losses, I should consider that the new entrance would be of more benefit to the district than the Grassy Head entrance as Sir John Coode proposed to improve it. I think that Sir John Coode's scheme was too costly to be considered.
982. If you were an engineer, and found this entrance made by nature, would you have adopted it, and improved it? I believe that I should. I might perhaps have taken it a little further south in order to touch the South West rocks.
983. Do you think that the Department has made a mistake in choosing the new entrance instead of the Grassy Head entrance? I think that they have made a mistake; but it is too late to remedy it now.
984. A mistake in what respect? I believe that if the Grassy Head entrance had been improved as Sir John Coode proposed to improve it, it would have been preferable; but looking at the vast expenditure which it would have entailed, I consider that it will be more advantageous to the Department, and perhaps eventually to the district also, though not to the farmers whose lands may be injured, to improve the new entrance. From that point of view I do not consider that the engineers have acted unwisely. I have watched the action of the floods for a number of years, and I know their tendency.
985. The object of these works is to maintain a good channel for navigation;—do you not think that they will also have the effect of giving a quicker outlet to flood waters? Certainly.
986. The channel at the entrance will be about 700 feet wide, and its sectional area will be greater than that of the river, though its width will be 100 feet less;—at the same time it will shorten the distance to the ocean? I admit that the closer you can bring us to the sea the better.
987. Floods in this district are very serious? Yes.
988. Anything that can be done to assist the escape of flood-waters will benefit the interests of the people? Yes.
989. Do you remember the flood that cut this opening? Yes.
990. Was it a large one? Yes; it was a record flood for Kempsey, but not for the lower Macleay.
991. Did the break there occur suddenly, or did it occur gradually? I really cannot say.
992. Have you heard the farmers say that when that opening was made they got immediate relief? The farmers on the upper part of the river said that it gave them immediate relief, but the farmers on the lower part of the river said that it injured them, because it brought about higher tides.
993. Do you think those farmers were greatly injured? No; they have always suffered from the erosion of the banks. The banks there are very low, and they are worn away, even by the wash of the steamers.
994. The various openings, which have been cut through the sand-spit from time to time, have always affected the unfortunate holders of land on the lower parts of the river by admitting the tidal water more quickly? Yes.
995. Admitting that these men have suffered to some extent, do you think it would be wise to proceed with the proposed works, and to recoup them in some other way? Yes.
996. Is there anything you would like to add? Well, in regard to the Unkya settlers, how does the Government propose to recoup them in the event of the closing up of the lower part of the river. They asked me to bring this matter before you. They have had to undergo great hardships in settling there, and they want to know if the Government will grant them relief, in the event of the closing up of the channel which leads to Grassy Head. I suggested that if the Government were to construct a training-wall which would lead the flood-waters of Clybuca Creek into the present channel, there would be a greater scour, though I am of opinion that if you cut off the Clybuca water, the sediment will lodge in Trial Bay, and eventually silt it up. I suggested that an opening could be left in this wall for barges to go through. I also suggested that if the channel were closed up, a road could be made to the mouth of the Clybuca Creek.
997. The proposition that you have put before us can hardly be considered until after the completion of the proposed works. If it is then found necessary to give relief to these people, your scheme may be considered at some future time?—

William Thomas Dangar, saddler, Kempsey, sworn, and examined:—

998. *Chairman.*] How long have you been in this district? Forty years next October. W.T. Dangar.
7 June, 1898.
999. *Mr. Trickett.*] You were formerly Mayor of Kempsey? Yes.
1000. As an old resident of the district, do you recognise the vital importance of regular and easy communication? Yes.
1001. Do you think that the district has suffered by reason of the bad river entrance? Yes. The steamer is barbound at the present time.
1002. That used to be a frequent occurrence, but it has not happened so often lately? No.
1003. Do you think that it has happened more often since the new entrance was made? We have had quicker despatch through the new channel than we had previously, but a shoal has now formed outside, which causes some inconvenience.
1004. When the training-walls are carried out as far as it is proposed to take them, do you think that the entrance will be a good one? I think so.
1005. Do you think that you will then get a scour which will move the sand away? I think so. If the water can be conveyed out of the river without spreading too much I think that the scour will make the channel a deep one.
1006. Do you look upon the rates of freight prevailing in the district at the present time as rather high? We are paying a higher rate than is generally paid on the other rivers. I believe that we pay a trifle more than is paid on the Clarence and on the Richmond. 1007.

- W. T. Dangar. 1007. Of course, that is owing to the bad river entrance? So I learn from the North Coast Steamship Company, of which I happen to be a shareholder. Steamers of a light draught have to be used here, and smaller cargoes have to be carried than would be carried if the river were deeper.
- 7 June, 1898. 1008. As an old resident, do you favour the continuation of the present works? Yes; seeing that so much has already been spent on the entrance, I think it only right that the works should be completed. I consider the experiment a very valuable one.
1009. Do you confirm the opinion of the last witness that the cutting through of this entrance has had the effect of relieving the higher parts of the river during flood times? I believe that it has had that effect, because it has let the water out much more quickly.
1010. Mr. Verge was examined generally as to the prosperity and capabilities of this district. He spoke highly of its qualities. Do you agree with what he said? Certainly; and no one could be in a better position than Mr. Verge is in to give an opinion upon the subject, seeing that he is so much interested in properties here.
1011. Do you regard it as a splendid agricultural district, and as a district suitable for dairying and for cattle-breeding? Yes; I have invested all I could spare in the place, and I think the investment is one of the best I could make. That the district is a prosperous one is beyond doubt, but for years it has been shut in by the mountains on the west, and by the bad entrance. Now, however, we have a tolerably fair road to the New England district. Going south to the Manning and on to Maitland the roads have also been very bad, so that the district has been almost isolated.
1012. Do you regard the river as the natural outlet for the trade of the district? I believe that it is the best outlet we can get. If we had a railway we could hardly hope to expect it to carry our maize as cheaply as the steamers carry it.
1013. And at the present time you regard the improvement of the entrance as the best way of advancing the district? Certainly; a railway would, no doubt, be patronised by passengers; but I do not think it could compete successfully with the steamers for the carriage of produce.
1014. Has the district greatly improved since you came here? Of course, we have had the usual draw-backs, floods, and the bank stoppage. I do not think, however, that the floods have done as much harm as people were at first inclined to think, because, while they have caused great inconvenience, they have also enriched the low-lying lands very considerably.
1015. Floods do not occur very often? My observation is that very large floods come about every ten or twelve years.
1016. Otherwise the seasons are fairly regular? Yes. Sometimes we have had a succession of wet seasons, and not so long ago we had four very dry seasons. We had a very large flood in 1864, and then we had not another very inconvenient flood until 1875. The biggest flood within the memory of a white person occurred in 1893, when the water covered the whole of Central Kempsey and a great many places down the river.
1017. Do you know anything of the low-lying land at Rainbow Reach? I am not so well acquainted with Rainbow Reach; but I have had property on Darkwater and Kinchela Creeks.
1018. Has the land there been affected by the new entrance? I think it has been much improved, because the water gets away more quickly now.
1019. What do you consider about the fair value of agricultural land in this district? I should think the arable land was, on an average, worth from £20 to £25 an acre.
1020. And the swamp land? Land that can be grazed upon is worth from £3 to £5 an acre. I think in all earnestness that the improvement of the new channel should be prosecuted so as to give us a good entrance. In my opinion, the carrying out of a training-wall will bring about a successful result, though I would not think of blocking up the old entrance. In years gone by there used to be a tremendous sand beach at Grassy Head, and the entrance was further to the south. The "Agnes Irving" was wrecked at that entrance; but there is a sand beach there new. If the experiment of the Department is unsuccessful we can, of course, return to the old entrance; but the Departmental scheme is worth trying. A great deal more work is required at the present entrance to give a satisfactory result.
1021. You consider that the development of this district depends upon the improvement of the entrance? Yes, because we must have a convenient outlet to market. I might mention that for fifteen or sixteen years I have been connected with a saw-mill, and I have shipped a considerable quantity of timber to Sydney. Upon one occasion I shipped about 50,000 feet by the "Platypus," a vessel that used to trade here; so that I am interested in the improvement of the entrance. I have been over the bar as often as four times a day, so that I have some knowledge of the place, and know the effect of the floods there. On one occasion I saw between 5 and 6 feet of water over the highest banks at Kinchela Creek.

Alfred James Trees, farmer, West Kempsey, sworn, and examined:—

- A. J. Trees. 1022. *Chairman.*] You have heard the evidence that has been given;—is there anything you desire to add? Well, I was down to see the new entrance some few months ago. I went there on purpose to form ideas about it, and I thought the scheme was great. I think in times of flood it will relieve the farmers both up and down the river. I have been a resident here for forty-three years, and I noticed that after the 1893 flood the water got away much more quickly than ever before. It was said this was because of the openings which had been cut through the beach, and I believe that it was so.
- 7 June, 1898. 1023. You have seen this district progress? Yes. When I came here there was only one building in Central Kempsey.
1024. Do you think that the country is justified in spending a large sum of money in improving the entrance to the river? Yes.
1025. Do you think that the trade of the district warrants the expenditure? Yes. There is a great deal of land not now cultivated which is very rich, and would grow almost anything.
1026. In general terms, you are satisfied with the site selected by the Department, and with the scheme designed, and you think that the improvements is necessary and justifiable? Yes.

Philip Calfe Hill, sworn, and examined :—

1027. *Mr. Roberts.*] You resided for a long time on the Macleay? About twenty-four years.
1028. Are you residing here at the present time? No.
1029. You are now residing in Sydney? Yes.
1030. You can speak as to the inconvenience to which the business people here have been put by the bad state of the entrance? Yes. We have often found it very difficult to send produce away and to get goods from Sydney.
1031. What do you think will be the result of the proposed works? In my opinion, there never will be a good bar.
1032. Why? I have been through the new entrance ever since it was opened, and it seems to me that the further the walls go out the further the sand goes out with it. Captain Taplin tells me that even the bay is being silted up.
1033. Do you think the works are sufficiently advanced to enable you to give a decision on the point? No; I do not.
1034. If the training-walls are carried out as proposed, do you not think the scour will carry away any sand that might otherwise accumulate at the entrance? The beach seems to me to be running right along to join the wreck that is lying in the channel now, and, in my opinion, the entrance will not hold, because there is nothing but sand to build upon. At the present time the bar trends away to the north.
1035. Up to within a month ago has not the new entrance been exceptionally good;—is not this the first time that any difficulty has been experienced in getting in or out? The bar has never been absolutely good.
1036. Not as good as the old entrance? No; I am in favour of the old entrance. In my opinion it would have been better to have improved the old Grassy Head entrance, but as so much money has been spent at the new entrance we should go a little further, so that we may see if the scheme will be a success.
1037. In view of the fact that only about £15,000 has been expended at the new entrance, do you not think it will be better to treat that as a loss, and devote attention to improving the old entrance? When Mr. Carleton came to view the place I was chairman of the Progress Committee, and I told him that this entrance would be of no use, but he said that they knew better than we did. If the place were my own, I would expend a little more upon the scheme, and see if it would be any more good, though I hold the opinion that it will never be any good.
1038. Do you favour the carrying of the training-walls further out? I think if you do not get a good bar when the walls are carried out as far as it is proposed to carry them out you will never get a good bar.
1039. Is the trade of the district generally increasing? Yes; very much.
1040. What are the principal features of improvement? There has been a marked increase in dairying. Before we were growing so much maize that the price went so low that it did not pay us. Since then, however, people have gone into mixed farming, and have studied their interests better. I have heard of farmers at Unkya and Yarrahapinni growing as much as 1,500 and 2,000 bags of maize in a season. I think that they should be considered, and an opportunity given them to get their maize away. Mr. Hennessey has a saw-mill there, and so have I.
1041. Do you refer to the people who ship at Stuart's Point? Yes; if the new entrance is made, and the lower part of the river is not kept open, they will have no way of getting their produce to market.
1042. But it is not proposed to shut up that part of the river; the droghers will call there as usual, and will take produce down to the new entrance? Still, it makes a difference to them. They will have to pay for the droghing. I have to pay £1 extra to have vessels towed to Stuart's Point.
1043. Is it not a fact that the rate of 10½d. a bag includes droghing from any part of the river? I do know what the arrangement is.
1044. That has been stated in evidence? Well, before the new entrance was made no droghing was required at Stuart's Point, because the steamers used to call there.
1045. Is much timber sent from the Macleay now? Yes; for blocks and market timber.
1046. Any cedar? Yes; but that comes from up the river.
1047. Is the trade generally improving? I think so.
1048. You are the owner of property in the district? Yes. I have several farms and other property here.
1049. Have rents been advancing, or have they been going down of late years? Well, town property is not so good as it was, but farm property is very much sought after. Of course, when we get a better entrance property will increase in value all round.
1050. Have you anything further to say? Well, I do not think that your scheme will do any good, but I hope that it may.

P. C. Hill.
7 June, 1898.

Thomas Hennessey, saw-mill proprietor, West Kempsey and Stewart Point, sworn, and examined :—

1051. *Chairman.*] Do you ship your timber from Stewart Point? Yes.
1052. Do you come here because you are afraid that the lower river will silt up, and that you will be cut off from the new entrance? That is what we were informed will happen.
1053. It is not intended that that shall happen;—will that remove any fears you have? That will remove a very serious objection I had to the scheme.
1054. Inasmuch as it is not intended to put a training-wall across your part of the river, but to allow it to remain open, do you think that you will suffer by the carrying out of the Departmental proposal? No, I do not think so. The question for us is, will the Government keep the lower part of the river dredged?
1055. If things remain as they are there, will it suit your case? Yes; I have no objection to the scheme so long as I am given an outlet for my vessels. As Mr. Hill has pointed out, it will cost me £1 more for towage now that vessels come in at the new entrance.
1056. How much do your vessels draw? About 8 ft. 6 in. or 8 ft. 9 in. when loaded.
1057. Then they could get along the lower part of the river at high tide? Yes. From Stewart's Point to Shark Island has been dredged, but I suppose that it will silt up again in time.
1058. If the channel is dredged again and you can get out at the new entrance, I suppose you will not object to the carrying out of the Departmental scheme? No.

T.
Hennessey.
7 June, 1898.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Henry Edmund Palmer, Inspector of Stock, Kempsey, sworn, and examined :—

H. E. Palmer. 1059. *Chairman.*] You have certain returns to produce? I have a copy of the stock returns for the last two years. They are as follows :—

PROGRESS Return, 1897.

Returned and estimated.	Horses.	Cattle.	Sheep.
Number returned	9,768	45,807	205
Number estimated not returned	100	1,000	50
	9,868	46,807	255

PROGRESS Return, 1898.

Returned and estimated.	Horses.	Cattle.	Sheep.
Number returned	10,028	47,200	252
Number estimated	200	1,000	25
	10,228	48,200	277

1060. How far does your district extend? The returns take in the district from Port Macquarie to the Bellinger.

1061. And how far back inland do you go? To the Dividing Range—60 or 70 miles. More than three-fourths of the stock returned is Kempsey stock. The Bellinger stock is hardly worth consideration.

1062. Where does the fat and store stock go to from here? We fatten about 5,000 head on the Macleay. Last year about 2,800 head were sent to Sydney overland. We have made attempts to ship stock away, but we have had very severe losses.

1063. The rest of the stock is, I suppose, sold to the local butchers? Yes.

1064. Is there any considerable trade in store cattle? I suppose about 6,000 would be sold in Maitland.

1065. I suppose the stock leave here for the fattening districts farther west? Yes; I do not think they would be affected by the scheme under consideration.

1066. They would scarcely be affected either by the construction of a railway or by the improvement of the river entrance? No.

1067. Is this a healthy district for stock? Remarkably healthy district.

1068. You have no tick here yet? No.

1069. Is there anything you desire to add? Only that there has been a marked increase in the number of dairying cattle in the district during the last two years.

1070. Do you think that this is a good dairying district? There can be no question about that.

[Two plans.]

PLAN.

Manning River Entrance.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

HARBOUR WORKS AT MANNING RIVER.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing Harbour Works at Manning River," have, after due inquiry, resolved that it is expedient the proposed works, as referred to the Committee, be carried out with such modifications as are suggested in their Report; and, in accordance with the provisions of sub-section (IV) of clause 13 of the Public Works Act, report their resolution to the Legislative Assembly :—

SIR JOHN COODE'S SCHEME.

Ever since 1882, the Committee are officially informed, the Government has found it necessary, in order to maintain the navigation of the Manning, to expend large sums of money on dredging, the total sum so expended up to the end of 1897 amounting to £54,774. Of this sum about £14,470 has been spent at or near the entrance. But while this work has given a measure of relief, it has always been felt that nothing short of the construction of walls and breakwaters for the training and concentration of the river currents could give satisfactory and permanent results. The Government therefore obtained from Sir John Coode a report as to the nature of the works which, in his opinion, would best secure the end in view, and in 1889 he recommended the construction of training-walls and breakwaters as follows :—

South Breakwater.—A rubble mound, commencing at the eastern termination of the south sandspit, and extending therefrom for a length of 4,000 feet, the inner portion being curved, and the outer length carried on a straight line, running in an east-south-east direction.

North Training-bank.—A low rubble bank, commencing from the rocky ledge under Flagstaff Hill, and extending thence on a curved line 2,300 feet.

Barrier Bank.—A rubble bank, about 4 feet above high water, extending from the root of the south breakwater in a southerly direction about 5,200 feet, to prevent the erosion of the south spit and the outflanking of the new works by the discharge of flood-waters.

Rubble Facing.—Rubble facing, a length of about 1,500 feet of the river-bank at the root of the South Spit.

North Breakwater.—A rubble mound 2,200 feet long, to seaward and curved, and finishing with a straight length almost parallel to the south breakwater, the opening between the two works being 800 feet. This width, Sir John Coode "believed would be sufficient for the discharge of flood-waters without creating a gorge, especially bearing in mind that it is not proposed, at all events in the first instance, to close Farquhar Inlet." The

The effect of the proposed works when completed would be to form an entrance to the Manning, having a depth of not less than 12 feet at low water, or 16 feet at high water of spring tides.

The estimated cost of the works was as follows :—

South Breakwater... ..length, 4,000 feet£118,200
North Training-bank ... „ 2,300 „ 7,400
Barrier Bank to South Spit „ 6,700 „ 8,630
North Breakwater... .. „ 2,200 „ 57,700
Leading lights, buoying and lighting channel 2,000
	<hr/>
	£193,230
Say	... £194,000

THE DEPARTMENTAL SCHEME.

2. The scheme referred to the Committee for inquiry is, to some extent, similar to that of Sir John Coode, the difference being the addition of a river wall extending up-stream from the inner side of the north training-wall, and the omission of a wave basin at the northern side of the entrance. It consists of two breakwaters, 800 feet apart, at the north and south sides of the river entrance respectively, and the continuation of training-walls, at a lower level, up-stream to confine and train the river waters, and also the construction of some stone facing at a portion of the south bank of the river to prevent erosion. The total length of the breakwaters, training-walls, &c., in this scheme, is about 25,000 feet, and the estimated cost £222,500; but it is thought that, for the present, the scheme may be modified by reducing the total length of the breakwaters, and walls to a little over 19,000 feet, at an estimated cost of about £100,000. This is in addition to work already done in the construction of a portion of the north training-wall and breakwater at a cost of £23,020.

On the completion of the modified scheme, the depth of water at the entrance, the officers of the Department consider, should be ample for all vessels likely to use the port for many years to come.

LOCAL REPRESENTATIONS.

3. After the receipt of Sir John Coode's report the residents of the towns on the river petitioned the Government to take some steps towards improving the entrance. They represented that for many years past, owing to the treacherous state of the bar, the people of the district had suffered great loss and inconvenience; connection with the metropolis had been uncertain, and the casualties to shipping had been so numerous that in order to make trade profitable, steamship-owners had been forced to charge almost prohibitive rates of freight. It was estimated that £60,000 would not cover the losses at the bar during the past twenty years, and in 1893 alone they had reached £10,000. In May, 1894, the Minister requested the Engineer-in-Chief "to report, as soon as possible, whether any work, at a comparatively small cost, could be carried out which would be of material benefit to this entrance, say, perhaps, the northern training-wall; if so, it might be desirable to do this work at once." Mr. Darley thereupon had an estimate prepared of the probable cost of opening up a quarry at Crowdy Head, constructing a tramway thereto, providing plant, tools, &c., and constructing the north training-bank, and found that the work could not be carried out for less than £20,000. He suggested, however, testing the market by preparing a specification which could be drawn up to provide for the contractor finding the stone, either by bringing it down the river or from Crowdy Head or from any other source he might find available; the contractor to provide all plant, &c., and complete the work at a price per ton. Tenders were thereupon invited, the estimated cost being put down at £16,000. The lowest tender was at a rate of 3s. 8d. per ton, and a vote having been taken on the Loan Estimates, this tender was accepted for the construction of the north training-wall on 29th December, 1894, and the work is still in progress.

The

THE MANNING RIVER AND DISTRICT.

4. The Manning flows through a thickly-settled agricultural and pastoral district, embracing the southern portion of the county of Macquarie and the north-eastern portion of the county of Gloucester. The river flats and low lands generally through which it runs are exceedingly fertile, and said to be particularly adapted to the growth of maize and tobacco. The good land, however, does not extend far back, and all of it may be said to have been taken up. The farmers do not cultivate their holdings to the extent possible, and in that respect the land in occupation may be made to support a larger population than it has upon it at present. On the upper part of the river, or of some of its tributaries, opportunity exists for settlement. Most of the tributaries have upon them what is called second-class agricultural land; but, generally speaking, the land available in the district at the present time is only suitable for grazing purposes, and much of it is of poor quality. Maize has been, so far, the principal product of the district. Dairying has commenced, and the industry is assuming considerable dimensions. Large quantities of timber are exported.

The towns upon the main river though, with the exception of Taree, not large, show signs of prosperity and progress.

THE RIVER BAR AND ENTRANCE.

5. The difficulties in connection with the bar and the channel at the entrance of the Manning arise from the shifting and uncertain nature of the former and the shallowness of the latter, caused mainly by the want of works to shelter the entrance from the effects of heavy weather, and to concentrate and guide the river currents so as to deepen the channel permanently. The river has no headlands—it discharges into a bight; and its mouth being exposed to the full force of the worst gales experienced on the coast, the entrance is intricate and dangerous. Inside the entrance the sand-spit, which forms in that locality the southern bank of the river, and is partly covered with ti-tree scrub, has been encroached upon by the sea to such an extent that there is danger of either it or the river breaking through and a new channel being formed; and the protection of the bank at this spot, by the construction of a rubble wall on the river side, is part of the proposed works. In the same locality, but nearer the entrance and on the Harrington side of the stream, is a place known locally as the "Narrows," which frequently proves a serious obstruction to vessels passing in and out of the river.

EFFECT OF THE WORK ALREADY CARRIED OUT.

6. From the inspection of the river made by the Committee, as well as from the evidence given in the inquiry, it is apparent that, in connection with the improvement of the river and the construction of the proposed works, the three principal ends to be attained are, the removal of the bar by providing a permanently deep channel at the entrance, the scouring away of the sand which forms the "Narrows", and the protection of that part of the southern bank of the river where there is danger of the river or sea breaking through.

In order to do something towards lessening the difficulties with which vessels trading to the Manning are beset, the Department of Public Works commenced in 1895, to construct a north training-wall, and this work has been continued until the wall is now 3,287 feet in length. The effect of it, the departmental officers say, has been beneficial by closing a channel that passed out to sea in a north-easterly direction near the village of Harrington, and behind the site of the training-wall, and by, in this manner, confining the river outlet to the channel now used. While the two channels were open it seemed, the Engineer-in-Chief states, that neither would ever be satisfactory, and he considers that nothing will tend to maintain deep water in the river more than a properly-constructed north training-wall.

The Committee, however, are of opinion that the effect of first constructing the northern wall has been to make it necessary to greatly increase its strength. Exposed as it is to the seas breaking at the river entrance, it has become necessary, in order to prevent its destruction and make it in any way effective, to build it of a height and size only required in a breakwater.

THE COMMITTEE'S RECOMMENDATION.

7. The Committee very carefully examined the wall in progress, and the sites of the other works proposed, and also visited the quarry at Crowdy Head, where the stone for the work is being obtained. From their inspection, and the examination of witnesses at Harrington, they are of opinion :—

- (1) That the southern works should be commenced without delay, especially under the circumstances created by the construction of the northern training-wall.
- (2) That the northern wall above Harrington, as it is continued, may with advantage be reduced below the height proposed by the Department, and that its length may perhaps be curtailed.
- (3) That the space on the river side of the south sand-spit, between the site of the proposed rubble stone wall and the commencement of the south training-bank, should be protected so that, instead of a gap existing between the two walls, they should be continuous.

With regard to reducing the length of the northern training-wall, it will probably be found, as the wall is continued westward from opposite Harrington, that the sand in the shallow portions of the river at this spot will be scoured away before the wall is extended to Chinaman's Point, which, according to the departmental design, is its western limit. The reduction in the length and height of this wall should considerably lessen the expenditure upon it, and a portion of the money so saved may advantageously be spent on the additional extent of rubble facing which the Committee consider should be placed on the river side of the south sand-spit.

RESOLUTION PASSED BY THE COMMITTEE.

8. The Committee have passed the following resolution :—

“That, in the opinion of the Committee, it is expedient the proposed Harbour Works at Manning River, as referred to the Committee by the Legislative Assembly, be carried out, with such modifications as are suggested in their Report.”

THOS. EWING,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 30th June, 1898.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

HARBOUR WORKS AT MANNING RIVER.

TUESDAY, 22 MARCH, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee proceeded to consider the expediency of constructing Harbour Works at Manning River.

Robert R. P. Hickson, Under Secretary and Commissioner for Roads, Department of Public Works, sworn, and examined:—

1. *Vice-Chairman.*] Have you prepared a statement for the Committee in regard to the proposed work? Yes. I will first explain the two plans which have been furnished. The lower one is the plan submitted by Sir John Coode, which will be referred to in my statement. The upper one is the plan designed by the Department. The work done is shown in black, and the incomplete and complete schemes are shown in solid red and dotted lines respectively. The scheme recommended by the Department is that shown in solid red lines. The pink shading represents land which will be made by the sand thrown up by the sea.
2. *Mr. Trickett.*] The difference between your plan and that of Sir John Coode is chiefly that you have a training-bank on the northern side? Yes; and the wave-trap is omitted. Mr. Darley will explain why that has been done. My statement in regard to the work is as follows:—

R. R. P.
Hickson.
22 Mar., 1898.

MANNING RIVER.

Ever since the year 1882 the Government has found it necessary, in order to maintain the navigation of the Manning, to expend large sums of money on dredging, the total sum so expended up to 31st December, 1897, amounting to £54,774. Of this sum about £14,470 has been spent at or near the entrance. While this work has given a measure of relief, it has always been felt that nothing short of the construction of walls and breakwaters for the training and concentration of the river currents could give satisfactory and permanent results. The Government, therefore, availed itself of the visit of the late Sir John Coode to the Colony in 1885 to obtain from him a report as to the nature of the works which, in his opinion, would best secure this end. For the purpose of enabling him to study the whole question, a careful survey of the river was made, and the necessary information as to rainfall, floods, prevailing winds, &c., obtained by Mr. Carleton in 1888, and the following particulars of the river are taken from his report:—

“The Manning River is connected with the South Pacific Ocean on the east coast of New South Wales by two mouths or entrances, called respectively the Harrington (north) and Farquhar (south) Inlets, distance about 8 miles apart, in latitudes 31° 51' and 31° 56' south, and longitudes 152° 42' 45" and 152° 37' 10" east. It flows through a thickly settled agricultural and pastoral district, embracing the southern portion of the county of Macquarie, and the north-eastern portion of the county of Gloucester. The low-lands through which the Manning runs are exceedingly fertile, particularly adapted for the growth of maize, sugar, and tobacco. A large quantity of timber, both cedar and hardwood, is exported from here, for the supply of which several steam saw-mills are working.

“The area of the Manning basin is about 3,170 square miles, and the principal tributaries which join the main river are the Barrington and Barnard, having a basin of 1,595 square miles; the Gloucester and Avon having a basin of 680 square miles; the Dawson and Lansdowne, with a few lesser streams, draining the remaining portion of 895 square miles.

“The rainfall of some portions of the Manning district was obtained, the average of which for the last five years is about 45 inches per annum.

R. R. P.
Hickson.

22 Mar., 1898.

"The following table gives particulars of the depths, widths, and sectional areas of river and height of floods"

Point of Observation	Distance by river from Harrington entrance	Soundings in channel along line of deepest water	Mean width of river under ordinary conditions	Highest flood level above low water	Sectional area of river below low water	Remarks
	miles.	feet	feet	feet	feet	
Bungay Bungay Falls	33½	2 to 25	100 to 150	62	390	Highest point that can be reached by boat.
Blomfield's Bend	31½	6 to 14	240	56	1,370	Eighteen inches of water at ford
Sullivan's Ford	31	6 to 16				
Wingham	29	5 to 22	560	52	4,290	A short length near Wingham punt has 2 feet only. Rise of tide here 2 ft. 6 in
Devil's Elbow	27½	2 to 6½	250	42	3,650	Lower half of this reach dredged to 6½ feet
Woolla Woolla Bend	26	9 to 29	620	39		
Tinonee	21	8 to 29	510	29	6,760	Head of navigation for coasting steamers
Taree	18	9 to 30	1170	20	10,600	
Cundle	14	10 to 34	330	16½	5,280	
Ghinni Ghinni Creeek	10	20 to 36	220 2,000	9½	18,900	
Croki	8	10 to 35	960	9	14,350	
Mangrove Island	5	20 to 40	820	8½	15,400	
Chinamen's Point	3½					
Harrington Heads	¼	Variable	620 (varies)		5,400	

With reference to the bar at the time of the survey, Mr. Cauleton says —

Owing to the heavy rains of last winter, and consequent freshes, the Harrington bar and inner crossing have about 9 feet upon them at present, but this is not always the case. Previous to the floods of last winter the bar was extremely shallow, and the coasting steamer drawing 7 feet was bar bound fifty nine days in one year. Changes, however, when they do come, are rapid, and the bar has been known to increase from 5 feet to 11 feet in one night. The position of the bar also ranges over a space of about half a mile, the headland being the northern limit; at present it is well to the north, and still working in that direction. The Harrington bar is considered one of, if not the most, dangerous one on our coast, as is shown from the number of wrecks and loss of life upon it. It has no protection from the east and south east from which quarter the heaviest seas come. The headland, in the case of the Harrington bar, is situated on the north side, and affords no shelter even from north easterly weather, as it is about half a mile inside the bar. The bar itself is constantly changing its position, and although the present channel is straight and comparatively deep, at other times it is exceedingly tortuous. Only last year (1884) the channel had two bends in it of over 90 degrees, and a considerable portion of it ran parallel to and directly in the outer break. Sailing vessels rarely attempt to cross the bar without the assistance of a tug, for which purpose a boat is subsidised by the Government. The coast chart shows the entrance is situated at the northern extremity of a large bight, consequently the heaviest seas on the Manning bar are those produced by the south and south west winds, which winds are the most frequent. It will be seen from the large plan that the further the entrance works northward, the more difficult it becomes for vessels to cross the bar when the wind is from the south and south west, and at present a vessel coming in on the port tack can barely reach inside the break before she is obliged to go about or run the risk of being driven on the north beach, and masters of vessels arriving at the entrance in south-westerly weather, prefer to drive their vessels over the south spit at high water rather than enter by the present channel, which brings them too close to the north beach.

On 15th July, 1889, Sir John Coode forwarded his report, in which he recommended the construction of training walls and breakwaters, as follows —

South Breakwater — A rubble mound, commencing at the eastern termination of the south sandspit, and extending therefrom for a length of 4,000 feet, the inner portion being curved, and the outer length carried on a straight line, running in an east south east direction.

North Training bank — A low rubble bank, commencing from the rocky ledge under Flagstaff Hill, and extending thence on a curved line 2,300 feet.

Barrier Bank — A rubble bank, about 4 feet above high water, extending from the root of the south breakwater in a southerly direction about 5,200 feet, to prevent the erosion of the south spit and the outflanking of the new works by the discharge of flood-waters.

Rubble Facing — Rubble facing, a length of about 1,500 feet of the river bank at the root of the South Spit.

North Breakwater — A rubble mound 2,200 feet long, seaward and curved, and finishing with a straight length almost parallel to the south breakwater, the opening between the two works being 800 feet. This width Sir John Coode believed "would be sufficient for the discharge of flood waters without creating a gorge, especially bearing in mind that it is not proposed, at all events in the first instance, to close Fairquhar Lilet."

The effect of the proposed works when completed would be to form an entrance to the Manning, having a depth of not less than 12 feet at low water, or 16 feet at high water of spring tides.

The estimated cost of the works was as follows —

South Breakwater	length, 4,000 feet	£118,200
North Training Bank	" 2,300 "	7,400
Barrier Bank to South Spit	" 6,700 "	8,630
North Breakwater	" 2,200 "	57,700
Leading lights, buoying and lighting channel		2,000
		£193,230
	Say	£194,000

On several occasions, subsequent to the receipt of Sir John Coode's report, the residents of the towns of Taree, Wingham, Cundletown, Cooperook, Tinonee and Croki, petitioned the Government to take some steps towards improving the entrance. It was represented that for many years past, owing to the treacherous state of the bar, the people of the district had suffered great loss and inconvenience, connection with the metropolis had been uncertain, and the casualties to shipping had been so numerous that in order to make trade profitable, steamship owners had been forced to charge almost prohibitive rates of freight. It was estimated that £60,000 would not cover the losses at the bar during the past twenty years, and in 1893 alone, they had reached £10,000. In May, 1894, the Minister requested the Engineer-in-Chief "to report, as soon as possible, whether any work, at a comparatively small cost, could be carried out which would be of material benefit to this entrance, say, perhaps the North Training wall, if so, it might be desirable to do this work at once." Mr. Darley thereupon had an estimate prepared of the probable cost of opening up a quarry at Crowdy Head, constructing a tramway thereto, providing plant, tools, &c., and constructing the North Training bank, and found that the work could not be carried out for less than £20,000. He suggested, however, testing the market by preparing a specification which could be drawn up to provide for the contractor finding the stone, either by bringing it down the river or from Crowdy Head or any other

other source he might find available; the contractor to provide all plant, &c., and complete the work at a price per ton. Tenders were thereupon invited, the estimated cost being put down at £16,000. The lowest tender was at a rate of 3s. 8d. per ton, and a vote of £17,000 having been taken on the Loan Estimates, this tender was accepted for the construction of the north training wall on 29th December, 1894, and the work is still in progress.

R. R. P.
Hickson.

22 Mar., 1898.

On 31st January, 1896, after visiting the works, I reported as follows:—"When visiting the Manning River a few days ago my attention was called to the large amount of scour that had taken place at the end of the outside training wall, the result of which was that instead of having to tip the stone into about 6 feet of water, as shown on plan, we are now tipping into something like 14 feet, with every prospect of this depth increasing."

It is manifest that this must at once be put a stop to, otherwise our money will be spent long before we get to the end of the proposed work. To meet this I have had a conference with the contractor, with a view of having stones placed from a punt in front of the work, so as to secure the bottom from scour. After going carefully into the cost of the work, the contractor writes, offering to deposit the stuff from a punt supplied by the Department at a rate of 5s. per ton (the contract rate for tipping it in the ordinary way at the end of wall being 3s. 8d.). This price I considered too high, and have arranged with him, subject to the Minister's approval, to allow him 4s. 6d. per ton, on condition that he takes the responsibility and care of the punt.

I think this is the most economical arrangement that can be made, and would request the Minister's approval thereto.

A contract at the rate of 4s. 6d. was thereupon entered into, and a total of 10,302 tons had been deposited at a cost of £2,318.

During 1895, serious erosions of the foreshore of Harrington having taken place, and some works being necessary to confine the waters to one channel, it was deemed advisable to construct a training-wall, extending up stream from the "Painted Rocks," and nearly parallel with the Southern Barrier Bank. At present the waters divide on a sandspit, the upper end of which is about three quarters of a mile above Harrington, portion flowing along the north-western shore, and the remainder along the outer side of the spit; a very large amount of dredging has always been found necessary at the crossing between the two channels, the results of which have only been temporary. The wall, when completed, will have the effect of directing the whole of the river waters into the outer channel, where the increased scour may be expected to maintain a navigable depth without the aid of dredging. The material being used in this wall is the smaller stone from the Crowdy Head Quarry, and which, owing to the more exposed position, would be unsuitable for the north training-wall, and would otherwise have had to be run to spoil. The length of this wall constructed to 31st December, 1897, was 1,287 feet, at a rate of 2s. 5d. per ton, the total cost being £6,059.

The votes taken for the harbour works have been as follows:—

1894 Loans	£17,000
1896 "	10,000
1897 "	15,000
Total	£42,000
Total expenditure to 31st December, 1897	23,020
Balance at 31st December, 1897	£18,980

As soon as Mr. Young ascertained that the expenditure was exceeding the £20,000 limit, he instructed Mr. Darley to submit to him a scheme for the improvement of the entrance with a view of placing the same before the Public Works Committee.

Mr. Darley's scheme, which is now presented for the consideration of the Committee, consists of two breakwaters, 800 feet apart, at the north and south sides of the entrance respectively, and the continuation of the walls at a lower level up stream to confine and train the river waters, also facing of stone to portions of the river bank to prevent erosion.

The scheme is to some extent similar to that proposed by Sir John Coode, the difference being the addition of the river wall extending up stream from the inner side of the North Training-wall, and the omission of the wave basin at the northern side of the entrance.

The total length of breakwaters, training walls, etc., in this scheme is about 25,000 feet, and the estimated cost £222,500. Mr. Darley, however, thinks for the present this scheme might be modified by reducing the total length of breakwaters and training walls to a little over 19,000 feet, at an estimated cost of about £100,000. This is in addition to the work already done, which, as before mentioned, cost £23,000.

On the completion of this modified scheme, the depth of water at the entrance should be ample for all vessels likely to use the port for many years to come.

3. Upon the completion of the scheme recommended by the Department the depth of the water should be enough for all vessels likely to use the port for many years to come? Yes.

4. What will the depth be? About 12 feet.

5. And what would be the draught of vessels generally trading to the port? About 7 feet.

6. Would they be good large steamers? Not very large steamers. They are fairly comfortable boats.

7. A vessel drawing 12 feet would run up to fully 600 or 700 tons? Yes.

8. That I suppose would be as large a vessel as would be likely to trade at the port? It would be quite large enough I should say for the trade of the place.

9. *Mr. Wright.*] The "Electra," I suppose, would be about the type of vessel? Yes.

10. *Mr. Trickett.*] How is it that money has been so freely voted for this work. It would appear that £16,900 has been voted in excess of what has been expended. Apparently, in 1897, £15,000 were voted, when you clearly had some money in hand? We had some money in hand, but it was considered advisable to make arrangements then for a further grant, so that the work could be continued without any block. Of course, works like these cannot be stopped; they must go on.

11. It must have been known all along that this was a work, the total cost of which would exceed £20,000;—why then was it not submitted to the Committee before? The first approval for the northern piece of work was expected to involve an outlay of about £17,000. But when Mr. Young found that the £20,000 was being exceeded, he desired that a scheme should be submitted to the Committee, and this scheme is the result.

12. But the scheme does not appear to have been submitted until £27,000 had been voted? As you are probably aware, money is often voted before a work has been approved. It does not follow from the mere voting of the money that it must be spent.

13. You say that the £17,000 was the first estimate? Yes.

14. I cannot understand why £17,000 was voted in 1894, and apparently another sum of £10,000 in 1896. When that £10,000 was put upon the Estimates it must have been clearly seen that the expenditure upon the work was in excess of £20,000. Why was not the work referred to the Committee, in 1896, when the £10,000 was voted? The Minister sent the work to the Committee as soon as he could, having regard to the other work we had in hand at the time.

15. I do not ask you to explain the action of the Minister, but £17,000 was voted in 1894, and in 1896 £10,000 more was required, making a total of £27,000. The Committee do not hear anything of the work until the end of 1897? That is as soon as it could be sent on.

16. I suppose you cannot explain the matter? Not beyond what I have already said.

R. R. P.
Hickson.
22 Mar., 1898.

17. You say in your statement that the materials used in one of the walls was the small stone from the Crowdy Head Quarry which would be unsuitable for the northern training-wall. Why is that? It was too small. That quarry, like all quarries, gives a certain amount of large stone and a certain amount of small. The small stone would have to be thrown to spoil or waste if it were not put into that wall.
18. What character of stone would you require for the northern breakwater? The large stone we are now getting from the Crowdy Head Quarry.
19. What size would the stones be? They would run to about 4 or 5 tons—something like that.
20. The northern training-wall would be in a very exposed position? The northern breakwater will be, but the northern training-wall will not be.
21. Then why do you want such very big stuff for the northern training-wall? We are putting small stuff into the northern training-wall, and the larger stuff into the northern breakwater. The stone is brought down to a jetty near the Painted Rocks, and it is there divided. The small stuff goes up the river and the large stuff goes down.
22. How is it done? By tip-waggons or a tramway.
23. The marked difference between the Departmental scheme and Sir John Coode's scheme appears to be that the Department extends the northern training-wall so as to narrow the stream very much, and to prevent the water from getting behind the sand-banks and islands that are shown on the plan? Yes.
24. Thereby intensifying the scour, and making the stream more rapid? Yes.
25. I suppose that is a principle that has been proved to be the most efficacious in dealing with works of this kind—that is to make the stream as narrow as possible, and thus get a rapid scour? Yes.
26. Does Sir John Coode in his report give any reason for leaving the northern part so wide, and having such a tortuous course, as is shown on his plan? I think he does; but I really should not like to say unless I had his report to refer to.
27. Looking at the two schemes, the Departmental scheme seems to convince one as being far the better? I think so.
28. One can hardly understand a man like Sir John Coode leaving the northern portion of the stream to twist about among sand-banks unless there were some good reason for it? I think he was considering more the entrance across the bar than the navigation after vessels got in; but there can be no doubt that the weak feature in his scheme is allowing the channel to divide into the two branches.
29. Your experience at the Tweed works shows that the narrower the limits within which the water is confined the greater the scour and the greater the depth obtained? Yes; but there is always a limit. You must leave room enough for the flood waters to get out.
30. What has been the result of the works carried out so far at the entrance of the Manning? There have been very good results so far as the work itself is concerned, but of course, as yet, it has had no effect on the bar.
31. Will you point out where the bar is? It is just about half a mile to seaward of the Painted Rocks.
32. What is the depth of the water indicated on the bar there? The last information we had a few days ago, I think, was that there were 7 feet of water.
33. That, of course, is an insufficient depth for either steamships or sailing vessels entering the river? Yes.
34. I suppose very great inconvenience is caused by that low depth of water? Yes; I cannot tell you the number of times vessels have been stopped.
35. In your report you say that during 1895 there were serious erosions of the foreshore of the Harrington Inlet;—will you explain that matter a little more fully? That would be right up in the bend.
36. The erosion to which you referred in your report occurred on the northern side of the present channel and to the north of where it is proposed by the Departmental scheme to construct the northern training-wall? Yes.
37. Has that erosion affected the water by shallowing it there? It has affected it by shallowing it, but the worst effect has been that it has made the channel more tortuous than it was before. It has made the bend more difficult to get round.
38. I suppose that where the erosion occurred there was merely soft beach sand? Yes.
39. With regard to the construction of the training-wall, do you think that the stones you are about to put there will find an easy bottom, or that they will keep sinking down through the sand? I think they will find an easy bottom.
40. Is any work being carried on at the Manning at the present time? The work of the northern training-wall and the northern breakwater is going on now.
41. Under contract? Yes.
42. What is the amount of the contract? It is so much per ton deposited—2s. 5d. for the upper portion and 3s. 8d. a ton for the other portion.
43. So far as the work has been carried out, does it give any appearance of being permanent? Quite.
44. Looking at the map, it would seem as if the bend in the northern training-wall would have to meet a considerable force of water in the river? No doubt it will. There will be a deep channel along there.
45. The work so far constructed is standing well? Yes.
46. Have there been any heavy floods in the river since the works were undertaken? Not a very heavy flood, nothing more than ordinary freshes.
47. Where was the point that you found you were tipping stone into 14 or 15 feet of water? I could only describe it as being just opposite the letter "K" in the word "Bank."
48. How did you obviate that? By coating the bottom with stones ahead of the tip. With reference to the statement in my report as to the tipping of stone into 6 feet of water instead of 14 feet of water, I might explain that when tipping is done on to a sandy bottom there is at the tip end a current, the effect of which is to excavate the sand immediately in front of the tip. In this case instead of tipping the stone into the water that we expected to find—namely, about 6 feet—we found that we were really tipping it into 14 feet. To prevent this the Minister approved of the bottom in front of the tip-head being coated with stone, in that way putting an end to the scour, and the tipping going on as usual on the top of the stone.
49. I understand that Mr. Darley has now reduced the probable cost of what he thinks will be the necessary work at the Manning to about £100,000? Yes.
50. In addition to the £23,000 already expended? Yes.
51. Have you a pretty good reason to suppose that the work could be carried out for that amount? I think so; but Mr. Darley will be able to give you particulars showing how he made out his estimate.

R. R. P.
Hickson.

22 Mar., 1898.

52. Will you point out on the map where the North Head really is? The North Head is really to the east of the Painted Rocks, the land between there and the entrance being a large sandbank.
53. The sand bank at the entrance or bar is frequently changing? Yes.
54. Does it change with regard to locality or depth? In regard to both locality and depth.
55. How does the Department manage in regard to giving the necessary information?—is there a harbour? There is a pilot at Harrington, and he signals to vessels which direction they are to take.
56. I suppose this is really one of the most dangerous entrances on the coast? I think it is about the most dangerous.
57. On account of exposure to the south and south-west winds, and also on account of the changing character of the bar? Yes.
58. I suppose you are not prepared to give us any opinion with regard to the two schemes—that is, the railway extension from Maitland to Taree and the construction of the harbour works;—will you express an opinion as to whether both or either should be carried out? I am not prepared to give an opinion upon that point; it is a matter of policy.
59. Looking at the work as the head of the Department, and as a professional man, do you recommend it as necessary to make the entrance suitable for the purposes of the district? I do. I cannot imagine anything competing with water carriage. No matter what other accommodation is given, I am quite sure that the river will have to be kept navigable.
60. It is a great waterway when once you get inside? Yes.
61. And some work of this kind is absolutely necessary for the purpose of rendering it suitable for modern navigation? Yes.
62. As far as you know the district, whatever other means of communication are provided there will always be an agitation or necessity for this port to be kept clear? Yes.
63. Is it not the general experience of the world that waterways and rivers are maintained as against all other means of communication? Yes.
64. And as between the two schemes—the one submitted by Sir John Coode and the more modern one now submitted by the Public Works Department—have you any difficulty in saying of which you would approve? I have no hesitation in saying that the scheme now submitted by the Department is far the better of the two.
65. You think the omission in the scheme of Sir John Coode in not providing for a training-wall to the eastward of the sand bank is one which should now be remedied if the work is carried out? Yes.
66. *Mr. Clarke.*] An amount of £17,000 was expended upon this work in 1894? It was voted in 1894.
67. Was a contract taken for that work? Yes; it is all contract work.
68. Is it not a fact that day-labour has recently been employed upon the work? Not upon the Manning River. There has been only one contract there, and it is still going on.
69. Is the original vote of £17,000 not yet expended? The contract was not for a lump sum, it was at so much a ton.
70. *Mr. Lee.*] Have you any suggestion to make by which port dues could be imposed upon this or any of the other northern rivers, with a view to obtaining a revenue? I have not. I think you would want special legislation to deal with the matter.
71. I am asking the question in a general way, because there are so many proposals before the Committee for the improvement of our northern rivers, and it would appear to be a fitting time to inquire whether it would be possible to impose port dues to provide a revenue to cover the interest on the cost of construction or the cost of maintenance? I think there would be great difficulty in doing that.
72. There is no scheme in the office at the present time? No.
73. So far as our ordinary navigation laws are concerned, without further legislation the dues could not be imposed? No.
74. The class of vessels trading to the port are colonial vessels from the port of Sydney, and the fact of their being registered there would give them the right of entry into the whole of these rivers? Yes.
75. You have made a statement as to the losses upon the bar of this river;—they appear to have been very heavy. I suppose the figures have been obtained from accurate source? They are only quotations from deputations which have waited upon the Minister. I do not hold myself responsible for their accuracy.
76. Will the carrying out of these works at the entrance to the Manning involve any large expenditure higher up the river? No.
77. That is to say, if you afford an entrance for vessels of a certain size would it not necessitate heavy expenditure in deepening the river higher up? No.
78. You think the initial cost would be about the only cost? Yes; of course the Manning, like all other rivers, will have to be dredged from time to time, but no exceptional dredging will have to be carried out.
79. If the scheme is carried out in its entirety it will give from 12 to 14 feet of water? About 12 feet I should say.
80. And the scour would be so maintained that there would be a permanent entrance for vessels drawing 9 feet of water? Yes.
81. The question arises whether these vessels will not require to get higher up the river to distribute their cargo. Do you not think that the effect of deepening the entrance will be to necessitate the deepening of the river higher up? I think not.
82. *Mr. Black.*] Sir John Coode in one part of his report states that one of the effects of closing the Farquhar Inlet might possibly be to create a gorge at the Harrington entrance. Does that mean that instead of keeping the whole width between the two breakwaters, the force of water would carry away the sand in the centre and create a very deep passage there while perhaps silting up the sides? I think that what Sir John Coode intended was, that it would probably create such a deep gorge at the Harrington entrance as would eventually pull the breakwater down on each side.
83. You mean that the walls would be undermined? I fancy that is what he meant.
84. Mr. Carleton says that the changes in the bar are rapid, and that it has been known to increase from 5 feet to 11 feet in one night. Does he mean that where there were 5 feet of water over it at one time, a little later there would be 11 feet of water over it, or *vice versa*? Yes.
85. His statement would appear to be based upon the fact that the headland on the northern side affords no shelter even from north-easterly weather; would the proposed breakwater afford such a shelter from north-easterly weather as is not afforded by the headland? Yes.
- 86.

- R. R. P. Hickson.
22 Mar., 1898.
86. Is it perfectly certain that the position of the breakwater would be such that the bar would not form outside of it as it now does outside of the headland? Not if the breakwaters are put out sufficiently far.
87. What is the reason then for the statement that the position of the headland is such that it leads to the formation of a bar outside of its protective limits? Because the headland is not near the entrance, it is about half a mile in from the entrance.
88. You propose to close the northern channel with a training-wall? Yes.
89. Will that interfere with the township of Harrington at all? It is not a very big place. I do not think there will be much trouble on that score.
90. You spoke about the tipping of stone at the end of the training-wall involving a scour, and that you were at one time tipping the stone into about 14 feet of water;—how do you account for that scour? It is what takes place at nearly every tip-end on a sandy bottom, if there is a strong stream running alongside.
91. It means that instead of gradually building up the breakwater to the height of the specification, you lay a bed for it first? Yes.
92. *Mr. Wright.*] Upon page 7 of your report you speak of the stone you put into the water to prevent the erosion of the banks. I see the training-wall itself cost 3s. 8d. per ton, and the other stone put in cost 4s. 6d. a ton; how do you account for such a big difference? The stone in the one case is loaded at the quarry into the tip-trucks, and is tipped direct into its place. In the other case it is loaded at the quarry into a tip-truck, and the truck is tipped into a barge, which is towed out to the front of the tip-end; hence the enhanced cost.
93. *Vice-Chairman.*] Where did the first expenditure take place when it was proposed to proceed with the training banks? From the Painted Rocks.
94. What work did you expect to accomplish by that expenditure? A deepwater channel—to divert the channel from the northern side to the southern side, and to get a better crossing. There is a very bad crossing as soon as you get inside the entrance, and the idea was to divert the current and make it a good one, allowing vessels to make use of the southern channel.
95. Was that part of the original scheme of Sir John Coode? The part from the Painted Rocks seaward formed part of it, but Sir John Coode did not propose anything from the Painted Rocks up the river.
96. Where do you propose to start the breakwater from? It is a continuation of the work we are now on.
97. The training-bank merges into the breakwater? Yes; we call it the breakwater from the Painted Rocks seaward, and the training-wall from the Painted Rocks up the river.
98. What was the reason for attempting to carry out a work of such magnitude for such a small sum as £17,000? *Mr. Darley* will explain that matter to you. He thought he would get a fair result for the expenditure.
99. He thought an expenditure of £17,000 would be enough to give a permanent channel? Not over the bar; but he thought it would improve that part of the river which was perhaps the most difficult for vessels after they got inside the bar.
100. Have you formed any opinion as to what the effect of the northern portion of the work will be? I believe it will give a very good channel alongside; but it would be absolutely necessary to make the southern wall for the protection of vessels using the channel. I do not think the northern wall of itself would be sufficient.
101. Will the northern training-wall or breakwater stand without the protection of the southern wall? Yes.
102. What protection is there now? There is none just at present. That is the difficulty of getting in and out.
103. Is the object of the southern training-bank and breakwater to afford protection to steamers entering and leaving the channel? Yes; and to assist in making the scour by throttling the entrance.
104. How do you explain the difference in the length of the training-wall and breakwater described in Sir John Coode's scheme, and that proposed in the scheme now under consideration? By the addition of the northern training-wall.

WEDNESDAY, 23 MARCH, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Manning River.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and examined:—

- C. W. Darley.
23 Mar., 1898.
105. *Mr. Clarke.*] Have you anything to add to the statement laid before us yesterday by the Under Secretary for Public Works? I might give an explanation in regard to the works. As set forth in the statement laid before the Committee, Sir John Coode was asked to report upon the improvement of the river, and his scheme embraced a short length of the northern training-wall now proposed, with a wave-trap, and the northern breakwater; on the southern side the training-wall and south breakwater, together with a certain amount of rubble work for the protection of the river-banks at the weak point. The navigation of the river being bad, the Minister asked me whether a portion of the scheme might not be carried out for its improvement, and whether we might not commence by making provision of the northern training-bank. I reported that to open this quarry and construct a tram-line for heavy stone would cost a sum exceeding £20,000; but suggested that tenders might be invited for a schedule contract, leaving it to the contractors to either open the quarry at Crowdy Head and lay a tram-line, or open a quarry up the river and bring stone down in punts. The Minister decided to call for tenders for a schedule contract, which might terminate at any time; and the north training-wall, as shown upon Sir John Coode's scheme, has practically been completed; but I saw the necessity for dealing with the harbour so as to direct the current along the training-wall. The current strikes the south bank and reacts, dividing on a sand spit, the strongest portion

portion of the current striking towards the north, and making along the coast in front of the township of Harrington, and so out over the bar. A great deal of money has been expended at different times dredging that portion of the river. The northern half of the channel always tends to maintain its depth best, but a certain amount of dredging from time to time has had to be carried out in order to keep the channel open opposite the sand-spit. Sir John Coode recommended that we should discontinue dredging and allow that channel to close, thus keeping open the straighter and more direct channel. Nature, however, would not altogether allow us to close it. It seemed always inclined to keep open, and while the two channels were open it seemed that we should never have a satisfactory channel. The more I studied the question, the more I saw the necessity for taking the river out of the northern bight altogether; and I am now more than ever convinced that nothing will tend to maintain deep water in the river more than a properly-constructed north training-wall. I believe it will do more immediate good than even the breakwater will do. The river will cling to it, and will sweep round the training-wall, as shown on my revised scheme—the scheme now put before the Committee. You will see that it is proposed by that scheme to carry the training-wall from the Painted Rocks, which formed the starting point of Sir John Coode's wall, and to go westward from the same point, following round to the point on the north side of the main river, indicated upon the plan. The river strikes on the south bank, and reacts towards the northern training-wall, and it follows that wall out over the bar. Until the wall I have described is constructed, I think it is hopeless to get one leading channel over the bar. We have employed a sand-pump dredge to improve the main channel, and to pump silt between the opening in the sand-spits, which the current is always inclined to follow. The last flood, acting as it has always done, carried it away. We had a barrier bank there, and while that existed the main river tended to improve. When the flood came down, however, it burst through it again, and until we get that barrier bank constructed it will be hopeless to try to maintain a good crossing inside. The Manning, even when the bar has been fairly passable, has had the disadvantage of this inner crossing. In the scheme which I placed before the Minister I proposed to do away with the wave-trap. In the case of this particular river there is no necessity whatever for it. It means an extra length of breakwater, and a more costly work to construct. This is not a case where we want shipping to lie close inside the entrance. The object of a wave-trap in the Newcastle harbour was to enable shipping to lie both north and south close inside the entrance. You, therefore, wanted still water. In this case, if a wave struck on the breakwater it would run along it, and do no harm. There was, therefore, no object in going to the expense of constructing a wave-trap, which would complicate construction and serve no good purpose. I proposed to do away with the wave-trap, therefore, and to continue on towards the breakwater with the training-wall. By this means we shall get a direct current on to the bar. An important feature in the scheme is a further training-wall on the south side. I have left it just as Sir John Coode has shown it in his scheme; but I think that if the work is carried out it is very likely that what is shown as rough rubble facing on that side will have to be joined on to the barrier bank. It is a weak point. We must take care that the river does not break through that narrow neck. It might break through to the east or west of it, and it is very possible that we may have to protect the whole frontage up as far as the Mangrove Creek on the one side, and down to the barrier bank on the other. However, that is not an expensive item. I daresay for £2,000 or £3,000 we could do the whole thing.

106. What work has already been done in connection with the northern training-wall? The total length is 3,287 feet. Nothing has been done beyond the portion marked black on the plan. We propose to carry out the portion marked in solid red lines, but not at present. The work I propose not to have carried out is shown by the dotted red lines, north and south.

107. You propose to go westward with the training-wall a certain distance? Yes; I propose to extend the northern training-wall a considerable distance westward.

108. What would be the total length of the training-wall? The total length would be about 10,300 feet; the quantity of work still remaining to be done is 8,993 feet.

109. £100,000 is to be expended in addition to the amount already expended? Yes. The western extension of the northern training-wall, 8,993 feet, will cost £24,307 10s. To run the wall to the point where Sir John Coode proposed to run it—a further 50 feet—will cost £483 15s. The carrying out of the breakwater to the point to which I propose to take it—900 feet—will cost £18,652 10s. The proposed expenditure upon the north side is £43,443 15s. On the south side there is rubble facing, 1,500 feet, costing £1,530; a barrier bank, 5,200 feet, costing £13,950; and the south breakwater, as far as it is shown in the solid red lines, that is 2,600 feet, costing £36,162 10s. The total expenditure upon the south side will be £51,642 10s. The two sides together will involve an expenditure of £95,086 5s.; for supervision, I have allowed £4,713 15s., making a total expenditure of £99,800.

110. That is the total expenditure proposed at present? Yes; independently of the amount already expended.

111. Do you think that amount would be quite sufficient to carry out the work both on the north and south side, according to your plan? I should consider it quite sufficient to carry out the improvements at present required at the entrance of the river.

112. I notice that there are no headlands—that there is merely sand on both sides of the opening? The Manning River has no headlands. It really discharges in a bight. The nearest headland is 4 miles to the north at Crowdy Head.

113. If there were headlands, I suppose the proposed works would be cheaper? The sand-banks make the approach to the river more difficult. It is at present a shifting entrance.

114. It has always been a difficult river to enter? Yes; it is very changeable.

115. It is only in recent years that it has been navigated by small vessels drawing 6 or 7 feet of water? I believe it has been navigated occasionally by vessels drawing 8 or 10 feet.

116. What depth of water have you at the entrance at the present time? There are 10 feet on the bar at the present. It shoaled up to 9 feet in January last, but during the last two months it has been 10 feet. It has been as deep as 12 feet, but only for a short time. In June of last year it was 7 feet, and in April of last year there were only 5 ft. 8 in. of water on the bar. It is constantly changing. Lately it has been pretty fair.

117. Are the measurements you have given high or low water measurements? On the day on which 10 feet of water were reported, that would be the 10th March, there was a range of 3 ft. 3 in. of tide. At low water there would be only about 7 feet on the bar.

- C. W. Darley. 118. As a rule, there is not anything like 10 feet on the bar at the present time? Only at high water. In April last the navigation of the river was practically closed—nothing but a rowing boat could get in and out. On the 24th May the entrance was practically dry, there being only 1 foot 6 inches across the entrance.
119. How do you account for there being so much water there now as compared with ordinary times? At this time last year there were about 9 feet. We are approaching winter, and in the winter time the bar has a tendency to shoal up. We have had a fresh lately, and it scoured the bar out a little. It has helped to improve it slightly.
120. Do I understand you to say that with westerly winds the bar has a tendency to shoal? It seems to shoal up during the winter months.
121. Is that usual in our coastal harbours? Last winter happened to be a dry winter. We had not so much rain as we usually have. I think the shoaling is due to that more than to anything else. But the changes are very rapid indeed.
122. If the proposed improvements were carried out what depth of water would you expect to get at the entrance at high water? There would be no difficulty in obtaining 15 feet of water on the bar.
123. Giving you from 9 to 10 feet at low water? Yes, but I think the channel would be deeper than that when it was properly confined.
124. You think there is sufficient justification for expending the amount proposed, namely, £100,000? The district is a good one, and there is a good deal of land there which could be occupied, and which probably would be occupied if people had proper means of getting their produce to market. I think the district is worth a large expenditure.
125. The proposed expenditure would enable vessels of a larger class to enter the river? Yes; and to carry produce at a cheaper rate.
126. That must be a considerable benefit to residents of the district? Yes.
127. *Mr. Lee.*] Sir John Coode's proposal appears to have provided for a north training-wall, starting from the shore and running straight across the sand-spit on the north side to the breakwater? Yes.
128. He proposed apparently to have a training-wall for a certain distance, merging into the breakwater? Yes; the training-wall was to carry a tramway.
129. At the present time, in heavy weather, I suppose the surf breaks over the sand-spit? Yes.
130. Sir John Coode did not propose to erect a barrier to the moving of the sand at that point? No; the object was to get access to the breakwater. It would not matter how much the sand moved in that position.
131. Would it not appear that the object of Sir John Coode was to prevent the sand from coming in? No; the object was to get to the breakwater.
132. Do you attach any importance to that sand-spit being covered at high water and in heavy weather? No.
133. Would your training-wall at that stage be above high-water mark? It would be 4 feet above it. We are commencing to rise higher there.
134. That would be an effectual barrier to any sand which might otherwise come in from the northern side? Yes.
135. Did Sir John Coode's breakwater go further out than you propose to take your breakwater? My breakwater agrees with Sir John Coode's breakwater exactly, but I do not propose to carry out the whole work at present. The extreme points of the breakwaters in both schemes correspond exactly. I do not propose to carry out more than half the breakwater at present. I should like to construct a portion and see what the effect will be. I adhere strictly to Sir John Coode's breakwaters as regards their position, but I have done away with the wave-trap saving some 1,000 feet of stone wall.
136. Do you not propose a curve in your northern training-wall admitting of a proper discharge on that side which could not, apparently, happen under Sir John Coode's proposal? Yes; I attach the utmost importance to the northern training-bank. Even if it were constructed without the southern training-bank, I think it would tend greatly to fix and maintain the entrance. At the same time, the bank on the other side should be constructed.
137. You are convinced from your experience that it would be of little use to put down one training-wall; you think there must be two to set up the scour? You really want two.
138. You think the breakwater if carried out to the distance you propose will give sufficient relief? Yes; and we shall then be able to see whether the increased traffic would warrant a further expenditure.
139. If it is afterwards found necessary to extend the breakwater further it will not involve a greater proportionate cost? No.
140. The remainder of the scheme can at any time be carried out without in any way jeopardising the efficiency of the work? Quite so.
141. As to the inner training-walls, I suppose they are all above high water, and also above flood waters? Yes. The flood waters at the entrance do not really rise higher than high water.
- 141½. According to the map, the worst water appears to be from the bar up to the western end of the proposed southern training-wall? Yes.
142. Consequently that is the difficult portion you have to deal with? Yes.
143. It is where you want to keep up your scour? Yes.
144. Above that the sand increases until you get off the mouth of Mangrove Creek? Yes.
145. Scott's Creek opens into the Farquhar Inlet? Yes.
146. How far is Scott's Creek from the entrance? Nine miles. The creek runs on each side of Oxley Island. The distance up the western entrance to Harrington is 14 miles.
147. Up to the junction of Scott's Creek there is good water? Yes.
148. If you confine the flood waters to the narrow space you propose to do, will they not have a tendency to make their way through Scott's Creek and discharge at the Farquhar Inlet? A large portion of the flood waters escape by Scott's Creek as matters stand.
149. At the present moment there is a large surface over which shallow flood waters spread;—if you confine them within the narrow channel you propose, will you not create a tendency for them to break through somewhere else? No; if the channel is open it will give a better discharge than you have had hitherto.
150. You view the narrow strip where the rubble stone facing is shown as a dangerous place? Yes; if the river goes through there it might be difficult to get it back again. I think it might be necessary, as I have

have already explained, to extend the rubble facing from the southern breakwater or southern training-wall practically to Mangrove Creek. It would not be a very costly matter.

C. W. Darley.
23 Mar., 1898.

151. You adhere, I presume, strongly to the principle that the completion of these works will increase the volume of the discharge? It will give a more direct and better discharge; it will be deeper and wider than it is at present.

152. If it were not so there would be a tendency for the flood waters to break through or to back up and inundate the land above? Yes; I have fully considered all those points. If the channel I point out is cleared it will be a much better discharging channel than it is at the present time.

153. Admitting that the carrying out of the work will give a depth sufficient for any steamer to carry away the produce of the district, will the work involve the country in any considerable cost on account of dredging the river in order to meet the circumstances of the increased traffic by larger boats? There are certain places where the river needs improvement, but I regard the improvement of a river of this kind very much in the light of the improvement of a public road. I regard the dredging of a river as being in the same category as the maintenance of a road. In any case it will only be a question of dredging a few shallow spots, in order to enable the larger steamers to go up.

154. That will not involve the country in any very large expense? Not in any serious expense. It depends, of course, upon how far you want to take the steamers up. If you are going to take the large steamers up as far as Taree, there will not be much to dredge. Taree is a distance of 18½ miles. If you want to take the steamers up to Wingham the dredging will involve a heavy cost. I think we should be satisfied at present to get the steamers up as far as Taree, and allow the work of the upper portion of the river to be done by droghers. It would not cost very much to make from 12 to 15 feet of water up as far as Taree.

155. Have you appliances on the spot for the carrying out of these works? The work at present being done is under contract. If the whole work were authorised we should take the work off the contractor's hands, and probably carry it out by day-labour, or let a fresh contract. The present contract is not drawn in a way to admit of our getting large stone, suitable for a breakwater. It is intended only for getting stone suitable for training-walls. We can stop the contract, however, by a month's notice.

156. The plant in such works is, as a rule, a costly item? Yes.

157. Could the plant used upon the Manning be made available for any other places where similar works are being carried out? We move our plant to a great extent from port to port. When we have finished one work we generally move the plant on to another, and credit the work with the then value of the plant.

158. You are satisfied that you have in the neighbourhood abundance of stone for the proposed work? Yes; there is abundance at Crowdy Head. It would be conveyed to the works by tramway.

159. You have found that you had to take some precautions in putting in the northern training-wall, owing to the scour at the end;—did it increase the cost very much, and do you anticipate an increase of that cost? I think it is economy to line the bottom of the tip-head with stone.

160. What is the greatest depth of sand you have met with in that vicinity? It has scoured out to 28 or 29 feet.

161. That would prove that a great depth of water could be obtained? Almost any depth—it is all sand.

162. Do you not think you might find reefs or boulders which would upset your calculations? I do not think it is likely.

163. At the extreme end of your breakwater, about how many feet of water will there be, under normal conditions? Opposite the point of the breakwater, if it were completed, I should expect to see something like 20 feet. Between the breakwater and the crossing inside there should be from 15 to 18 feet. There would be about 25 feet between the actual points of the breakwaters. On the crossing inside there would be about 15 feet.

164. Would that be deep enough to spill the scour into? Yes.

165. Would the wind which now creates a bar when the works are completed, offer so much resistance as to cause a precipitation of sediment near the mouth of your entrance? No; the wind acting against the current might cause a choppy sea, but it will not stop the scour from taking place.

166. You do not anticipate from wind, current, or any other cause, that the sand will set up a bar outside of your breakwater? I do not think so.

167. What is the set of the current at that point? From north to south, wide of the bight; the current in the bight is not very strong, but what there is of it is southerly.

168. The tendency would be for the sand to drift to the south? Yes.

169. *Mr. Wright.*] The proposed breakwaters are situated in a bight? Yes.

170. What is the set of the ocean current there? The main current is wide of the shore. Inside, it still has the same set—southerly.

171. Your northern breakwater would be free of any accumulation of sand? Yes.

172. And the silt from the river would work down the coast? Yes.

173. Do you think it will become necessary to close the Farquhar Inlet? I do not see any immediate necessity for it. If we found we could not get enough scour we might entertain the proposal at a future date. It can never let out any great quantity of water, because Scott's Creek and the other openings there are comparatively narrow. It is an outlet for big floods.

174. You think it would serve a useful purpose? Yes. At the same time I should like to see it closed, but I would not go to the expense of closing it at the present time.

175. Do you think your breakwaters are taken out far enough to prevent an accumulation of sand on the bar? They are sufficient to confine the channel in one position. They will give a channel of sufficient depth over the bar.

176. You feel satisfied that you have extended the breakwaters far enough to admit of the carrying away of the sand-banks shown upon the plan? Yes.

177. You said you regarded rivers as occupying much the same position as do roads in the matter of maintenance;—I suppose it is necessary to dredge the whole of our rivers to a greater or less extent? Yes. We have dredges on all the rivers now.

178. If they are to be kept in a navigable state, dredging is an absolute necessity? Yes.

179. So that the dredging upon the Manning River would be only in keeping with the dredging upon other rivers? There would be no more dredging than we have been doing in the past.

- C. W. Darley. 180. It has not been decided whether the proposed work is to be carried out by contract or day-labour? It has not yet been decided.
- 23 Mar., 1898. 181. Who settles the matter? I generally make a recommendation for the consideration of the Minister.
182. Have you heard that a number of men are assembling in the neighbourhood now with a view of entering upon these works? No; there is a contract already in existence.
183. What has been your experience upon works of this kind;—have you found it cheaper or more expensive to carry them out by contract or day-labour? In many cases it is cheaper to carry them out by day-labour, and it is far more satisfactory. Where there is a settled piece of work, where you have no doubt as to any change being required, it is, perhaps, better to carry out the work by contract.
184. Where no unforeseen contingencies are likely to crop up you prefer contracts? Yes; but in many cases there are unforeseen difficulties. It is especially in the case in harbour works, and immediately you ask the contractor to do anything which is not in his contract he wants an excess price. In works of this kind you must be prepared to meet difficulties day by day. You must have your hands free to meet unforeseen contingencies. There are works in which we find it a great advantage to proceed by contract.
185. Do you find that the men do as much work for the Government as they do for contractors? I think so. We pay the men well, and we also pick them.
186. You get a good class of workmen? Yes; and if they do not do the work they can go. If we were hampered, if we had to take certain men, and if we had not a free hand in sending them away if they were not doing their work, we should have to abandon the system, and do all the works by contract. But where the engineer has a free hand, where he can send a man away when he is not earning his money, I think the work can be done as cheaply and well by day-labour as by contract. We employ absolutely competent and experienced foremen who know what a man's work is worth, and if they report that a certain man is not earning his wages we let him go.
187. There is no political influence at work—it is a question of doing the work or clearing out? Yes.
188. You are getting all the stone for these works at Crowdy Head? Yes; there is no other suitable stone available.
189. All the stone used in the southern breakwater will require to be taken over in punts? Yes.
190. Would that add much to the cost? Yes; I have added one shilling to the price of the stone employed in the northern breakwater to meet the increased expense in the case of the southern breakwater.
191. How far is it your intention to line the bottom with stone ahead of the tip? Until we get up to the point where the river divides. When that point has been passed there ought to be no tendency for the current to run round our work.
192. I suppose you have made allowance for the extra cost of the material employed to prevent the scour to which you have referred? Yes.
193. You have made ample provision to meet all contingencies of that kind? Yes.
194. *Mr. Lee.*] How much will it cost to complete the breakwaters as far as the dotted red lines? The northern breakwater up to the end of the dotted portion will cost £23,602 10s., and will have a length of 1,100 feet; the southern breakwater will have a length of 1,400 feet, and will cost £54,257 10s., giving a total of £77,860. I have added to that £3,940 for supervision and plant, making a total expenditure of £81,800.
195. That is a contingency which the country may yet have to face? I think it is doubtful whether the work will be necessary.
196. If it should be necessary, the total cost of making the Manning River a good navigable river will have been a little over £200,000? Yes.
197. In your opinion, is the district of sufficient importance to justify the expenditure of nearly £250,000 of money upon the proposed harbour? I do not think that at the present time we are justified in expending more than £100,000; but on the other hand, if the entrance is improved, there will be a considerable increase of population in the district, and a larger expenditure may be justifiable hereafter.
198. There is a large area of valuable land about the Manning? There is a large area which has not yet been much cultivated.
199. *Mr. Hoskins.*] But if the works are carried out as you propose, do you consider that after they have been completed there will be exceptional difficulties in the way of steam vessels entering or leaving the Manning as compared with other rivers? No doubt there will be times in bad weather when it would not be safe to take it; but it would not last long, and it would only happen occasionally.
200. Do you consider the entrance to the Manning River more dangerous than that of any other river on the coast? At present, yes; but I do not think it would be more dangerous than the entrances to the Richmond and the Clarence, when improved.
201. *Mr. Black.*] Is it particularly dangerous to come out of the Manning? No; it would be safer to come out than to go in.
202. But is there any phase of weather in which it would be dangerous to come in? In certain classes of weather it would be dangerous to go in or to come out.
203. *Vice-Chairman.*] Has the western end of the constructed portion of the northern bank been injuriously affected up to the present time by the ebb tide getting behind it? Yes; both the ebb tide and current get behind it now.
204. Is that affecting the work injuriously at the present time? Only by making the work more costly by deepening the water.
205. Has it caused the training bank to sink? No; because the full depth is secured before we go ahead.
206. What is the depth of water at the present time along the constructed portion of the northern training bank? There is about 28 feet of water in front of it at present.
207. From your experience of the Clarence River, do you think it would be necessary to carry out the dotted portions of the breakwaters shown upon your plan in the Manning River? Not for some time to come; I see no necessity for it at the present time.
208. In considering the matter, therefore, do you think the Committee need have regard to the possible expenditure on that portion of the proposed works? No; I do not see any necessity for it. In no way will the work now proposed commit the country to the larger expenditure.
209. It was more with the view of the possibility of our having to extend the northern breakwater that I put the question? I do not think that it would be necessary.

C. W. Darley.
23 Mar., 1898.

210. Therefore we may confine our attention to the expenditure necessary to construct the western portion of the northern training-bank, and to complete the breakwater where the firm lines occur on the plan? Yes.
211. Will that work remove the whole of the sand-spit shown on the plan near the entrance? We may possibly have to help it a little by dredging.
212. What will be the cost of the necessary dredging to remove it? A great deal of it will scour away, but we may have to help it. It is difficult to say what may be required, but so far as the expense for dredging is concerned, it would come out of our annual vote for dredging on the river. We cut off a small bank in the Richmond River without any dredging. As the breakwater went out so the bank disappeared.
213. Do you think the other sand-bank shown upon the plan will scour away? Yes; the water there will have a tendency to deepen.
214. Then do you think the construction of the northern portion of the work will give a good permanent channel? Yes.
215. Of a greater depth than the depth likely to be obtained on the bar? There will be a channel of from 12 to 15 feet.
216. Are you of opinion that the construction of the works proposed on the southern side of the river may be postponed until the effect is seen of the proposed works on the northern side? I cannot see that any harm would result from doing so. The southern breakwater might be postponed until we got the northern works finished. At the same time, I consider the construction of a southern breakwater and works necessary to maintain and fix the channel.
217. You do not think it probable that you may be able to dispense with the expenditure on the southern side? No; I think it will be necessary.
218. To improve the bar entrance? Yes. As long as the south spit is allowed to move about it must be a source of danger.
219. May we assume, also, that it will be necessary to construct the barrier bank as shown upon the plan? Yes; if only as a means of getting to the southern breakwater.
220. You mean that you would be unable to construct the breakwater without first constructing the barrier bank? Yes.
221. I suppose there would be a tramway along there? Yes.
222. Therefore, you see no means of lessening the proposed expenditure of £100,000? I have cut the amount as fine as I safely could.
223. *Mr. Lee.*] What provision is made for maintaining works of this character? No actual provision is made. Of course, if any harm is done, we may have to get another vote to make good the works, but we do not find that any expenditure is necessary. If any expenditure is necessary a vote is taken.
224. What is your general experience with regard to these harbour works;—does it cost much money to maintain them? Practically nothing. Take the Newcastle breakwater. It was taken as far as it was necessary to go at that time some ten or eleven years ago. Nothing has been expended there until the expenditure under the recently adopted scheme.
225. The question of maintenance, therefore, is an inconsiderable matter? Yes.
226. Will you express an opinion as to how or by what means revenue could be provided from these ports, which are improved so that the State may be, to a certain extent recouped for its expenditure? That is a matter to which I have given some consideration, especially after my visits to a great many New Zealand and Queensland ports. I may say that I think there ought to be a local tax towards paying for a portion of the works. In New Zealand, and in every case, a certain district around the river or harbour, as the case may be, is taxed. In Queensland there are several harbour trusts formed now. The Government have given practically no endowments to the works. They say, "You can carry out these works when they have been approved by us, and you can raise the necessary money by taxing yourselves for them." That is the system in Queensland on the northern rivers. The system is not adopted in Brisbane. I presume it is considered that Brisbane is the main entrance to the Colony, and that it is the duty of the Government to carry out the necessary works there. But on the important rivers to the north they have either to tax the district or to tax the goods passing in and out of the ports. In New Zealand a circle is struck round a port, or sometimes there will be a series of circles. In some cases every property within a certain radius pays so much in the £.
227. Are they permitted to impose port dues? Yes; in some cases they have done themselves harm by overcharging. In Dunedin the charges are so excessive that they are driving trade away from the port. They have to make the charges, however, because they have gone to so great an expense.
228. Is there any limit of time fixed, or is the charge permanent? It is a permanent charge.
229. The system is not one under which a certain amount is obtained within a certain number of years? No. I think rivers, like roads, should be regarded as a sort of highway. At the same time, there ought to be a tax upon the district to pay interest on the cost of the work, or a portion of it. If the Government pay a portion I think the residents of a given district ought to be made to pay the other portion. It must be remembered that property is greatly benefited by the opening of these rivers.
230. Although the district is benefited the whole Colony would also be benefited to a certain extent? Yes, from the increased population and settlement upon the soil.
231. Would a tonnage imposition be possible or politic in connection with rivers of the kind we are considering? It would be quite possible.
232. Would it be politic, seeing that the trade is done by vessels which are registered in the chief port of the Colony? I see no reason why they should not be made to pay tonnage dues.
233. There is very little foreign shipping coming to these rivers? Very little. In Queensland, a charge of 2s. a ton is made in some cases upon every ton of goods entering or leaving a port. That is the practice at Rockhampton, Maryborough, Mackay, and Townsville. The dues are collected for the trustees by the Government Collector of Customs. He pays the amount to the credit of a fund at the disposal of the trustees.
234. At the present moment we have before us no less than five proposals for the improvement of entrances of rivers on the North Coast. If these works are carried out they will involve a very large expenditure;—do you not think that if the necessities of the respective districts demand the improvement of these ports a charge of some kind should be made? It has always been my opinion that there should be local taxation towards payment for works of this kind.

C. W. Darley. 235. Are you of opinion that it is a wise step in the interests of the Colony to preserve these waterways on the North Coast? I think it is a wise principle for the Government to act upon, to improve the waterways and to develop the districts affected. The works will have the effect of opening up large districts which are capable of settling a great many more persons than are now resident there. Of course, the more you settle people in these districts the better it is for the country. These districts are capable of maintaining a very much larger population than they now have. People are frightened to go there owing to the want of proper means of communication. Again, if you improve the rivers you must cheapen the means of bringing goods to and fro, and a portion of the cost, therefore, should, I think, be made chargeable in the form of a tax. The residents there pay a certain price at the present time on account of the risk and danger of getting into the rivers. Freights would be reduced, in many cases, if there were a perfectly safe access.

3 Mar., 1898.

236. In view of the fact that all the rivers on our northern coast are within a few hundred miles of the chief port of the Colony, and that behind all these rivers the richest land in the Colony is to be found, does it not appear extremely improbable that even if a railway could be constructed for less money, the produce from these districts would be conveyed by that railway at a less cost than by water? We must anticipate that produce will always go by water. It is so much cheaper than railway carriage. Even if there were a railway in these districts now, and if the present bad bars were allowed to remain, the produce would still go by water.

237. *Mr. Wright.*] If it be sound policy for the people on our coastal rivers to pay for the improvement of those rivers, would it not be equally sound policy for the people of the interior to pay for the construction of roads and bridges? I certainly think there should be taxation under Local Government for the maintenance of roads. But, as regards the northern rivers, you must remember that the Government are making roads in those districts as well as improving the rivers.

238. Do you not regard the improvement of the rivers as affording an additional road, enabling these people to get their produce to market? I do not think that argument would apply. If the Government were expending nothing in these districts in making roads it would be a different thing, but the Government are still making roads there.

239. If you make a charge upon these rivers at all should it not be a tonnage rate instead of a local tax? A tonnage rate would do, of course.

240. In that case, only those who use the rivers would be charged? The amount would come out of the residents' pockets after all.

241. *Mr. Clarke.*] In dredging the Manning River, would the sand be taken out to sea, or would it be put behind the walls? It is put behind the walls.

242. *Mr. Wright.*] You were asked to supply the Committee with certain information with regard to the watersheds of the northern rivers. I particularly desired to obtain it for our information in the consideration of these works? I have a statement showing the watersheds of all the northern rivers, the total length of the rivers, their navigable length, the width of the proposed entrances, and the mean annual rainfall. It is as follows:—

River.	Area of watershed.	Total length of river.	Navigable length of river.	Width of entrance proposed.	Mean annual rainfall.
	sq. miles.	miles.	miles.	feet.	inches.
Tweed	420	46	24	500	69·17
Richmond	2,680	149	68	1,000	51·47
Clarence	8,500	247	67	1,400	51·15
Bellinger	480	76	15	500	70·00
Nambucca	550	58	9	500	70·00
Macleay	4,580	219	39	700	46·33
Hastings	1,390	110	19	650	62·10
Camden Haven	240	18	13	400	62·10
Manning	3,160	141	29	800	47·46
Cape Hawke	510	46	400	47·46 (?)
Hunter	8,270	288	49	1,200	32·16

In handing the return in, I should like to explain that it will be difficult without grave consideration to draw any conclusion from it. It must be taken with the greatest possible care if the Committee desire to draw conclusions, for instance, that because a river has a certain area, a certain rainfall, and a certain width, that ought to be accepted as a basis for designing other river improvements. The Committee must be extremely careful as to what inference they draw from any portion of it, or they may find themselves very much misled. For instance, the Tweed River has 420 square miles of watershed; the normal width of the proposed entrance is 700 feet, but I have quoted in all cases the choke width, which in this case would be 500 feet; the mean annual rainfall is 69 inches. Now, take the Clarence: It has a watershed of 8,500 square miles; it has a total length of 247 miles; the width between the entrance as proposed is 1,400 feet, and the mean annual rainfall is 51 inches. Now we will assume for a moment that these proportions in the Clarence River are exactly correct, what I want to impress upon the Committee is that they must not infer that if those particulars are correct as regards the Clarence the same ratio will apply to any other river, because nothing could be more fallacious. Suppose the proportions of the Clarence are correct, and that therefore you might find a constant, and that you applied it to the other rivers—the Tweed, for instance, what width do you think the Tweed should be? The entrance would only require to be 69 feet instead of 500 feet. In the same way, if 420 miles of watershed requires an entrance of 500 feet in width, the Clarence upon the same proportions would require to be 10,000 feet in width.

243. Is not that matter governed by the rainfall? To some extent; but the rainfall does not vary in proportion. On the Tweed it is 69 inches, and on the Bellinger and Nambucca it is 70 inches; upon the Clarence it is 51½ inches. The real point is this: the entrance is regulated more by the length of the river and the shape of the basin. The Tweed is a short river. The whole length from the sea to the source is only 46 miles. The Clarence is 247 miles in length, and 67 miles are navigable. When a flood comes down the waters are stored and are slowly given off, so that the smaller entrance does. An engineer in determining what width an entrance should be has to study a number of questions. He has to ascertain what is the width of the river at certain salient points, and that must regulate him in fixing the width of the entrance.

George Charles Yeo, Draftsman, Stock Branch, Department of Mines, sworn, and examined:—

244. *Mr. Lee.*] Can you give us any particulars as to the stock in the Manning River District? Yes; the following return has been prepared:— G. C. Yeo.
23 Mar., 1898.

DESCRIPTION of area in which the following Stock are returned.

Commencing on the shore of the South Pacific Ocean at the mouth of the Manning River, and bounded thence by that shore north-easterly about 20 miles; thence north-westerly about 45 miles; thence south-westerly about 50 miles; thence south-easterly about 45 miles to the shore aforesaid; thence by that shore north-easterly about 30 miles to the point of commencement.

Horses.	Cattle.	Sheep.	Pigs.
7,052	46,341	991	—
7,402	48,317	1,166	—
7,064	45,285	1,473	8,615

245. You told us the other day, in connection with another inquiry, how the stock drifted to market. Are you prepared to say now how the horses and the horned stock from the Manning River reach the market? They all go overland.

246. They are not conveyed by steamer? No.

247. The pigs would be sent by steamer? Yes; and also the sheep if there were any to send.

248. I suppose the bulk of the horned cattle find their way across to the Muswellbrook and Maitland markets? I should think so, but I could not say definitely.

249. How do the A. A. Company dispose of their cattle? They may go across to Warrah.

250. Could you say whether the stock is increasing or decreasing in the district, outside the period you have named? No; in making out the return I went back only to 1895.

THURSDAY, 24 MARCH, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Manning River.

Samuel Boulden, master of the Steamer "Coraki," sworn, and examined:—

251. *Mr. Wright.*] You are master of the steamer "Coraki," trading to the North Coast? Yes.

252. How long have you been trading to the Manning? I have been going there in the "Coraki" two years and one month, but I have been going to the Manning on and off, but not continuously, since 1890.

253. What has been the condition of the entrance to the river since you have been trading there? It has varied a great deal. The channel shifts considerably. It has shifted a great deal during the last two years, sometimes to the north and sometimes to south. It shifts on the bar as much as a mile at different times. In March, April, and May of last year the water on the bar ranged from 6 ft. 6 in. and 5 ft. 9 in. to 7 ft. 6 in. at high water.

254. What is the lowest depth of water you have known on the bar during the last two years? Five feet nine inches.

255. What is the tidal range there? In spring tides 4 ft. and neap tides about 1 ft. 6 in. The north-easterly and south-easterly weather have also an influence on the tide. The south-westerly weather accelerates it, and the north-easterly weather cuts it down.

256. Has the work which has been already done there had any effect in deepening the river? I could not say whether the work has deepened it, but the bar is better now than it was last year.

257. There has been some freshes in the river during the last few months? Yes.

258. Would they not deepen the bar a bit? It was just as deep previous to the freshes of the last three or four months. The freshes, however, have made a lot of alteration inside.

259. Do you think the work marked on the plan with a black line has had the effect of deepening the river inside? I think it has deepened it as far as the wall has gone.

260. What effect do you think the proposal before us will have? I think it will keep the channel from going north as it used to do about two years ago. The channel at present runs right over the wreck of the "Murray."

261. Does not the river divide near the island shown towards the end of the northern training-wall, and is there not a channel from that point round by Harrington? Yes.

262. Does not the existence of that channel prevent the scour to a certain extent? Yes.

263. You think the confining of the waters by the construction of the training-wall across the entrance of that channel will greatly assist the scour? Yes.

264. Do you think the point to which it is at present intended to extend the breakwaters will have the effect of promoting a good scour? It may have that effect, but it would be necessary to construct the southern training-wall. The complete work would have to be carried out.

265. What is the set of the current outside the breakwater? In flood-tides usually northerly. With the ebb-tide it is inclined to run to the south. About 2 miles out to sea the current is to the southward.

266.

S. Boulden.

24 Mar., 1898

- S. Boulden, 266. Is it strong? It depends upon whether the winds have been blowing from the north-east for any time.
- 24 Mar., 1898. 267. I ask the question because the Departmental officers say that the set of the current is always southerly both inshore and out? We have proved that that is not so again and again. Going north, we have followed round the beach to get the set of the flood-tide. We have often found the current running north in the bight right up to Crowdy Head. It might run at times from 2 to 3 miles, but that would not be right inshore.
268. That is your general experience in connection with the whole of these North Coast harbours—there is a northerly set inshore, a kind of eddy? Yes.
269. Do you think the prevalence of the southerly current seaward would have the effect of keeping the mouth of the river open if a good scour is promoted by the confining of the channel by training-walls? I could not say. The breakwaters do not appear to me to be carried out a sufficient distance to meet the southerly current. There is not much strength in the current within a $\frac{1}{2}$ mile of the shore, especially to the southward.
270. The proposed works would probably have the effect of bringing a large quantity of sand down the river, and the engineering staff say that once you get that near the bar it will be swept away by the southerly current? It may be so. In my own opinion, there will not be enough current to sweep it away unless the breakwaters are carried out a considerable distance. What I have noticed is that as the present works have been carried out the bar has also gone further out to sea.
271. When the works are completed, they will have the effect of driving the bar out far enough into the ocean to bring it within the influence of the southerly current? I should think it is likely to have that effect.
272. You see the portion of the plan marked "rubble-facing"? Yes.
273. Do you think there is much danger of the river breaking through at that point? Yes.
274. Do you think the proposal to carry the rubble-facing up to the southern training-wall would make that neck of land secure? Yes, I think that should answer the purpose.
275. Do you think that the construction of a training-wall from Chinaman's Point, on the other side of the river, forcing the water into one channel, will have a certain effect in deepening the channel? I have always thought the work should have been started from Chinaman's Point, instead of from the Painted Rocks. The ebb-tide would act at once there.
276. The report of the Department shows that at the end of the wall the water is deepening fast? It may be so; but it is not so deep at the end of the wall as it was six or eight weeks ago. That is what I have heard from local residents.
277. You think then that the works proposed will have a beneficial effect? My experience in these matters is, that if the water is confined it will have a tendency to keep the channel clear. Every fresh which comes down cuts a certain amount away from the spit at the south of the entrance, and makes the bar wider than it was before. Since this plan was drawn nearly the whole of the sand-spit on the southern side has been washed away. Not more than two months ago the sand there was 2 feet above high-water, now, at spring-tide, it is 2 feet under high-water. The water has broken through the inner side of the spit near the proposed training-wall, and the last fresh we had, with a south-easterly gale, scoured it out, and left 5 feet of water. Since then the whole spit is under water at high-tide.
278. Showing that the effect of confining the water by the northern training-wall has already produced a considerable scour in the river? Yes; there is at times a strong current running down; it is as much as we can do to steam against it.
279. You think the proposed works will not only have the effect of deepening the river, but also the bar? When the southern breakwater is made; but at present the bar is at right angles to the existing wall. There is a sand-spit on that side which is nearly level with the wall, and it has not been scoured. In fact, there is more sand there since the wall was made than before. The spit runs out from the Painted Rocks down to the end of the wall.
280. The sand has accumulated behind the wall, while the southern side has been scoured out? Yes.
281. You think that when the southern training-wall is built the river will be entirely scoured out by the action of the water? Yes; the southern training-wall will certainly have a beneficial effect.
282. How far do you go up the river? Up as far as Wingham.
283. What sort of water have you there? It varies from 7 feet to 16 or 18 feet in holes. The lowest depth is 7 feet.
284. What is your draught? Eight feet loaded.
285. So that you cannot go either up or down the river fully loaded? I have not loaded deeper than 7 feet 8 inches since I have been on the river. When I start from the upper and shallower portion of the river I am only partially loaded. I am picking up cargo all the way down.
286. In going up I suppose you are discharging cargo? Yes.
287. As a rule, when you come down you draw more water than when you go up? Yes, as a rule.
288. What water do you generally draw? From 7 feet 3 inches to 7 feet 6 inches.
289. You can safely navigate the bar with that draught? At present, yes.
290. What is the longest detention you have had in going in or out of the river? I have always managed to get in; but I have often been detained. For the past two years the longest detention I have had has been four or five days. I do not take more cargo than I know I can get in and out with.
291. You regulate your freight according to the water on the bar, so that you can always get in? Yes.
292. Coming out of the river what has been the longest detention you have had? The longest detention I have had during the last two or three years has been four or five days. In May last there was only 5 feet 9 inches or 5 feet 6 inches, and with any sea on you could not get out with that depth of water.
293. That has been your longest detention in getting out? Yes.
294. Have you ever known the water to be so high as to give only 1 foot 6 inches at low tide? At high-water, with a 2-foot rise, there has been 5 feet 9 inches.
295. *Mr. Hoskins.*] If the proposed works are completed as they have been described to you, do you think the entrance to the river will be exceptionally dangerous and bad—that it will be worse than that of any other river on the coast? I do not think so.
296. Do you consider that at the present time the entrance is an exceptionally difficult one? Just at present it is a little better than it was. Last year it was very dangerous, especially as the channel was going over the wreck of the "Murray" for a considerable time. I go in now close to the wreck.

297. The works already constructed have greatly improved the entrance? I could not say that. S. Boulden.
298. Do you not find that you can get in and out with greater facility than before the works were constructed? I have got in and out with facility before any works were constructed. The bar shifts a great deal. If the channel had followed the breakwater, I should be inclined to say that it has had the effect of deepening it, but the channel is at right-angles to the breakwater. I believe the works already constructed have prevented the channel going north, and that alone would have a good effect. 24 Mar., 1898.
299. Do you think there is any danger, if these improvements were carried out, of the deposit of sand being shifted further out, and therefore causing an additional impediment to the entrance? That is a thing upon which I should not like to offer an opinion. I should say it would be a matter of carrying out the breakwaters until you meet the stronger current.
300. *Mr. Lee.*] I suppose you have been up to the Manning in all weathers? Yes.
301. Can you, at the present time, enter the port if there should happen to be sufficient water on the bar when there is a heavy gale blowing? When there is a very heavy gale blowing none of us can enter. It is left to the judgment of the pilot. If he thinks it dangerous to enter he runs up the signal, and it then rests with shipping-masters whether they will go in or stay out.
302. There might be water enough on the bar, but the wind blowing from a certain quarter might render it unsafe to take the bar? The wind would not affect me, and it would have to be a very heavy sea to keep me out. Coming out, of course, it would be different.
303. What is the worst wind you would have in getting in? From the south-east or south-west. We always know that if the wind shifts round from the south-east to north-west we should be able to get out in a day or so. Crowdy Head runs to the north-east, and it seems to make the sea smoother.
304. Supposing you were lying inside, loaded for sea, what conditions of weather would stop you from getting out? A heavy sea. There is now 7 feet of water at neap-tide and 9 feet at spring-tide. If we were drawing 7 feet, and we were to come down heavily on the bar, it would take the way off the ship and we would then turn round.
305. A heavy sea with wind from what quarter? South-east or south-west.
306. Have those winds the effect of piling up sand on the bar? As a rule, we find that it is the north-east winds which block up the bar more than any other.
307. That, as a rule, is not a strong wind? It is the prevalence of it which is the cause. It is a bad wind for shoaling, but it is not a bad wind for getting out.
308. If the proposed works were carried out you would have an entrance 800 feet wide;—would that, in your opinion, be wide enough? Yes, for steamers.
309. How would it affect sailing vessels? Sailing vessels would never be able to get in unless they had a fair wind. They would not be able to get in any more than they can at the present time. Supposing, for instance, the wind were coming from the westward, they could not get in. A tug comes out to them.
310. Is there a tug stationed at the Manning River? Yes.
311. Would a sailing vessel be able to take the entrance when there was a heavy flood running out of the river? It would be dangerous for even a steamer to tackle the bar when there was a heavy flood.
312. You are aware that it is proposed to narrow the entrance; the flood-waters now coming down can pass over the sand on either side; if you narrow the entrance, of necessity, there will be a stronger current of flood-water;—how will that affect you—will you be able steam against it? A great deal would depend upon the power of the boat. We never attempt any of the bars except on a flood-tide, with the exception of the Clarence River bar.
313. Under those conditions it is assumed that you always have an abundance of water under you;—would a strong current such as I have mentioned affect your coming in? Not with a powerful boat.
314. Take the boat you are commanding now? There would be a pilot there, and he would signal me if he considered the entrance dangerous. If he put up the stand-off signal it would rest with me whether I took the risk or not.
315. You have an entrance 800 feet wide, and gradually widening as you get into safer water; you will have double the depth that you now have, but you will have a stronger current against you;—would you, under those conditions, be able to take the entrance? I would not care to do so if there were a heavy sea.
316. Then, even if the proposed works are carried out, you will only be able to trade to and from the port at times when the weather is partially favourable? The flood-waters do not last long in coming out. We might be kept a day. If we were certain of the water of course we would go in. The question is, whether we are certain the depth of water is there. At Port Macquarie we used to go in at all times, as long as we knew that the water was there.
317. The assumption is that if the proposed works are carried out the water will be there? If that is so we can go in and out. At Newcastle there is plenty of water, but very often large steamers will not go in. It often happens that in a heavy south-easterly gale the stand-off signal will be run up, and often ships in ballast, with plenty of water under them, will not go in. Shipping-masters must use their own judgment.
318. But if the port is to be a good port you should be able to get in at night as well as in day time? If the entrance is made as good as the entrance to Port Macquarie was two years ago, we could do that. At least a dozen times last year I came out of the Manning River at night-time. I waited for the top of high water, and of course in winter-time the tides are highest at night.
319. Are there any sailing lights there? No; I did it at my own risk.
320. Would it not be necessary, in a port of the kind we are considering, to establish entrance and sailing lights? That is for the Marine Board to decide.
321. But you, as a master mariner, would not like to take the entrance on a dark night without sailing lights? No.
322. Therefore, if you could not do so the port would be valueless at night-time? At present we keep the river cleared, entering it by day-time only.
323. You time your sailing so as to hit the river at daylight, and on the flood-tide? Yes.
324. You can enter the Clarence under any conditions of weather at the present time? I think so. The Sugar Company's boat, a month ago, was bar-bound for six or seven days. Our boat came out; but the "Fiona" did not.
325. I suppose the steamer was weather-bound, but not bar-bound? She is a larger boat than ours, and she was probably drawing more water. I do not know what the reason was, but I know that she was bar-bound.

- S. Boulden. 326. Do you think that if a comparatively safe entrance were made at the Manning your company would be induced to send a larger description of boat there? It would rest with them.
- 24 Mar., 1898. 327. Would it be necessary to have the river deepened to enable the boats to proceed up as far as Taree? With the present draught we have, I can keep the river clear. My boat is as large as any which has ever traded there, and she is 160 feet long. I go up to Wingham, calling at each wharf as I go along, and I make on the average six trips a month.
328. Do you go right up every trip? Yes, under circumstances.
329. The produce is not brought down by droghers to deep water? There are droghers there which collect and bring the produce to the different wharfs.
330. If that be the case, the settlers are not put to any great amount of inconvenience at the present time? I cannot see that they are put to any inconvenience as regards the water-way. We take the produce when they are ready.
331. Does it happen that you take live stock—pigs and calves—and that when you get down the bar you have to land the live stock? I have never done that. In every case we get out when we can. I have brought pigs to Croki, and have watered and fed them, and have gone down again the next day. On one occasion I was lying inside the little wharf, and the tide fell so that I could not get up again as usual. I had about 100 pigs on that trip, and some poultry. They were about three days on board there. We had any quantity of water down there, and we fed and watered them just as we should do at any other time, and no harm resulted.
332. Had the pigs deteriorated in quality when they reached their destination? No; I think they were enhanced in value, because we fed them on maize. Of course, the farmers would have to pay for that.
333. It appears from what you say that you are just as likely to be weather-bound if the proposed works are carried out as you would be without them? If there were a heavy gale blowing I should be better off inside.
334. About how often would you be bar or weather bound in the course of a year? From June until February last we were only two days weather-bound.
335. Are you stuck up more than six times in a year;—how many times were you bar-bound last year—about nine days? Sometimes more than that in the course of a year.
336. I suppose there is a loss to the company from your being bar-bound? Of course, there is the men's wages, and the coal.
337. You are not burning coal all the time? If we were bar-bound three days we should go up and down the river three times.
338. Do you consider it a loss to the company for you to be bar-bound? There is a certain loss to them.
339. Are there any other steamers trading there now? No, there have been others at different times.
340. I suppose that in the busy season of the year, when freight is pretty plentiful, there might be an odd boat occasionally? There was only one boat last year to help us. The bar was bad then. But if the bar keeps as it is at present the "Coraki" will be ample to take away everything grown on the Manning. Of course, if the crossing got as bad as last year, we should have to go out with half loads.
341. Are there many sailing vessels going to the Manning? There are several; they go to saw-mills at Coopernook, Lansdowne, and Scott's Creek.
342. They carry timber chiefly? Yes.
343. Of which steamers do not carry much? We carry cedar usually; but we do not usually do the hardwood trade.
344. Sailing vessels bring down a lot of timber—a class of cargo you do not care about? Quite so.
345. I suppose they bring it more cheaply than you can do? Yes.
346. You say that you make about six trips a month? I averaged that from June last until January.
347. What inward goods did you average? The average would be 50 tons a trip.
348. What would be your tonnage from the Manning on the average? During the year I brought down about 80,000 bags of maize, 11,000 pigs, 9,000 cases of eggs, 2,000 bags of oysters, 4,000 kegs of butter, 2,000 cans of cream, also some poultry, hides, fruit, timber, and sundries. The busiest time is from April to November, and I should say that the tonnage would come to about 10,000 a year.
349. You think your tonnage coming down would average about 150 tons a trip? Yes; the boat will carry 240 tons. A great deal depends upon the crops. During the last three years they had good crops. If a flood were to come down we should not bring down more than from 30,000 to 40,000 bags of the maize.
350. Practically, that is all the traffic of the river? Yes, one way.
351. Are there many sailing vessels going to the Manning? For the last six or seven years there has been only one mill going; but at the present time there are two going, and there is another ready to start.
352. What would the sailing vessels carry usually? They would average from 20,000 to 30,000 feet of hardwood. Now and then they would carry down a little general produce; but they carry timber chiefly.
353. What is the freight? We charge 1s. a bag for maize, but what the other freight is, I could not say.
354. What are your passenger charges? £2 return saloon, or 25s. a single ticket; 25s. return steerage, and 15s. a single ticket.
355. *Mr. Black.*] What is the reason you prefer to remain inside on certain occasions when the weather is rough;—do you think your boat lacks power, or do you consider your deck cargo? The bar is like all other bars on the coast. If it is shallow, and there is a heavy sea, it is impossible to get out.
356. But you said that, even if the bar were removed, there would be some weather in which you would not be able to get out? That often applies to Sydney Heads.
357. But would it be because you have deck cargo? We do not study the deck cargo. If we can get out we do so. We seldom lose any deck cargo.
358. I suppose you carry a number of pigs on deck? Yes.
359. If you had a number of pigs on deck, and the weather were rough, you would stay inside? We seldom consider the pigs in the matter. If we can get to Sydney we get there, whether we have pigs or not.
360. It is for general reasons that you remain inside, and not because you carry deck cargo? Yes.

FRIDAY, 25 MARCH, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.
 The Hon. WILLIAM JOSEPH TRICKETT.
 The Hon. DANIEL O'CONNOR.
 HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
 GEORGE BLACK, Esq.
 FRANCIS AUGUSTUS WRIGHT, Esq.
 FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Manning River.

Thomas Robert Allt, Managing Director, North Coast Steam Navigation Company, sworn, and examined:—

361. *Mr. Hoskins.*] For how long have you had any connection with the North Coast Steam Navigation Company or with vessels trading to the north coast? Over thirty years. T. R. Allt.
362. This is a proposal to improve the navigation of the entrance to the Manning River;—do you think that the works hitherto carried out by the Department of Harbours and Rivers have improved the navigation of the river? I think the money expended has improved the entrance. 25 Mar., 1898.
363. Can you ship larger cargoes and can you ship them with greater regularity to the Manning River than you could do some years ago? Undoubtedly. I ought to qualify that reply by saying that the Manning is a river which alters very much. During the last year or two the entrance has been somewhat better than it was heretofore. Occasionally it goes back to its former condition. I have been absent in New Zealand for six or seven weeks, and I believe that while I was away the entrance shoaled up to about 5 ft. 6 in. That, however, is a very unusual thing.
364. What is the depth of the water there now? There is a fair depth of water there now.
365. Does your company use steamers of a larger carrying capacity than they used to do on the Manning River? Yes.
366. The presumption is that the navigation of the river has been greatly improved? That is not absolutely so. We are using a more adaptable class of steamers; they carry a larger cargo with a much lighter draught of water.
367. Are you acquainted with the improvements which it is proposed to make upon the river? No, I am not. I have been there half a dozen times, but Mr. John See is better acquainted with the river than I am.
368. Do the masters of vessels represent that the works which it is proposed to carry out are likely to result in an improvement to the navigation of the river? Personally, I have not questioned them upon that point; but, generally speaking, they express the idea that the improvements going on are undoubtedly of some benefit.
369. Is the trade of the river increasing? I do not think it is. I do not think the volume of trade at the present time is greater than it was four years ago.
370. Has the population upon the river increased? It has increased, but not materially. I do not know the absolute statistics, but from what I have seen, and looking at the quantity of cargo which comes out of the river, I do not think there has been any great increase.
371. The cargo brought by your steamers from the Manning has not increased of late years? No.
372. Then the improvements made on the river have not had the effect of increasing the volume of trade? I do not think they have.
373. Is it your opinion that the entrance to the Manning River is more dangerous than are the entrances to the other rivers on the north coast? Undoubtedly.
374. Why? I am not comparing the Manning with rivers like the Nambucca and the Bellinger, but with rivers like the Richmond and the Clarence. The entrance to the Macleay is better than that to the Manning. I would much rather go to the Macleay than to the Manning.
375. The reason that I ask the question is that there is a proposal before the Committee to construct a railway from Maitland to the Manning River, costing about £1,000,000, and the principal reason alleged for the line is that the entrance to the Manning is very dangerous and difficult;—the question is whether that should be considered? I cannot see how that question can come in, because the settlers on the river suffer little or no inconvenience. I think that if our secretary were to give you the statistics of the year's trade, it would be found that there were a few occasions upon which vessels have been bar-bound. At no time have they been bar-bound for any considerable period. I do not know any settler on the river who has suffered any loss from the detention of the vessels.
376. It may be inferred that the delays at the bar have been greatly diminished since the improvement works have been going on? Not greatly, but they have been diminished.
377. Communication by steam between Sydney and the Manning may be regarded as more regular than it was some years ago? Undoubtedly.
378. The argument, therefore, that the entrance to the river was so very dangerous would not apply, seeing that the navigation has been improved, and that vessels can enter and leave the port with greater facility than they used to do? That is undoubtedly the case. Of course a railway might be a convenience to myself and to gentlemen like yourselves if you wanted to get hurriedly to Sydney. You would get down in less time by rail than you would by steamer, because the steamer would have to wait for the tide; she cannot go out with the ebb tide. There is generally only one tide a day.
379. I presume that the passenger traffic between the Manning and Sydney is very small? Very small.
380. Do you think the Railway Commissioners would ever be able to take the produce of the district to Sydney as cheaply as it could be conveyed by the steamer? I do not think they could profitably do so. Of course they might take it. We only charge a matter of 10s. a ton for bringing the maize to Sydney, and we pay droghing out of that. We have a large droghing plant to keep up as well. You might safely take off 2s. a ton, and then the company's droghing plant would be a loss taking it all the year round.
381. Do the droghers you speak of take produce from the different wharfs? They have to collect it here, there, and everywhere—up the creeks and arms of the river which the steamer cannot reach.
382. The farmers have not to carry their stuff far to the droghers? No.

- T. R. Allt. 383. It would be more difficult for them to convey their produce to the proposed railway? Yes; unless there were a railway-station to the door of every farmer.
- 25 Mar., 1898. 384. From your experience of the more regular journeys made by steamers, you are of opinion that the Government would be justified in expending more money in improving the navigation of the river? Undoubtedly.
385. *Mr. Trickett.*] I understood you to say that the trade of the Manning had fallen off lately? It ebbs and flows. The volume of trade at the present time is rather low.
386. What is the reason for that? The seasons have a great deal to do with it. In one year we may run our vessels to the river at a heavy loss on account of the small cargoes. 1890 or 1892, was, I think, the flood year, when the farmers lost nearly all their crops.
387. Have you ever lost any vessel at the Manning River? No.
388. Seeing that the entrance is spoken of as about the worst on the coast that is rather to be wondered at? It is one of the worst places to navigate. It is a shallow bar, but you very seldom lose a vessel there; you may get ashore, and have to wait to get off. It is rather costly sometimes. We have had that happen to us. We have had one boat ashore there twice within the space of a year.
389. Do you look upon the district as one which is bound to progress and advance in the future? I think it will improve, but not to the extent people would like to make out. It ought to improve as the country gets opened up.
390. Do you regard the district as being as good a district as The Tweed? No.
391. I suppose you will have observed that it is always desirable to keep open these waterways and improve them rather than allow them to go back? I think so, undoubtedly.
392. Have you visited the Manning River lately? I was there six or seven months ago. I usually go up there once a year.
393. *Mr. Clarke.*] What is the freight now to and from the Manning? I think we are charging 12s. 6d. to the Manning, and 10s. from the Manning to Sydney.
394. The average freight either way would be about 10s.? Yes; we carry all dead weight.
395. Do you think that when the proposed improvements have been effected freight will be lower than it now is? It is very hard to say. I do not think it will be much lower than it is at the present time, unless the volume of trade is much increased. If you could ensure good cargoes up and down, you could do the trade for less; but you cannot ensure that. We often keep up communication with the district at a loss to ourselves.
396. I suppose the floods have been against any increase of traffic? The floods are a great barrier to people settling on the soil; they are frightened of them.
397. Would the proposed railway from Maitland to Taree interfere in any way with your trade? I do not think it would interfere with us at all. We could compete with the railway ourselves.
398. By that you imply that water carriage is always cheaper than is railway carriage? That is incontestably proved by facts all over the world.
399. I suppose the heaviest produce you would carry from the Manning would be maize? A great proportion of our cargoes is maize.
400. The live stock would probably go by rail if possible? I dare say it would; but I think there is not a deal of live stock there at any time.
401. I suppose the only live stock would be pigs? Yes; but as the factories are increasing the traffic is diminishing. They kill the pigs, and cure the bacon there. The pig traffic is decreasing.
402. You would have the traffic either as live stock or as bacon? Yes; but it makes a great deal of difference in the earnings.
403. I suppose other live stock would go overland? Yes.
404. Have the works already constructed improved the river much? To some extent. I can recollect the Manning River when you could not get a ship in there once in three weeks. That was in 1875 or in 1876.
405. Do you think a further expenditure of £100,000 upon improvements in the river would be justified? The improvements of course would make a great difference to the entrance, but the question is a very difficult one to answer. I am not an expert, and I cannot say whether the expenditure would be justifiable or not. A good entrance would, of course, very much benefit the river.
406. You say that there has been no improvement in population or traffic within the last few years? It is not appreciable.
407. Do you see any probability of an improvement in those respects? If you could keep the river free of floods, it would undoubtedly improve. Floods are a great drawback to the river; they not only destroy the crops, but kill the live stock. One heavy flood will throw the district back eighteen months.
408. *Mr. Lee.*] You have only one boat trading to the Manning? Yes.
409. Do the steamers of any other company trade there? No.
410. One boat practically carries the whole trade of the river? It is, taking the year all round, too much for the trade.
411. Making six trips a month? Yes.
412. The steamer has been proved for some time to be sufficient for the requirements of the river? Yes.
413. If the port were improved, and the river were so dredged as to enable you to get in at all times, and to discharge your cargo at all points, it would be a great convenience to your boats and a saving of expense to the company? It would be a saving to us.
414. It is proposed to expend £50,000 more upon the works;—if these works are carried out, do you think your company would be prepared to entertain the payment of port dues or a charge of some kind from which the Government could derive revenue to pay portion of the interest on the outlay? I think we should be perfectly willing to do that, provided the dues were not put on too strongly.
415. Presuming the contemplated works would give additional facilities for shipping, and would enable boats to carry larger cargoes at a reduced freight, the payment of dues might reasonably be expected? Yes.
416. If the settlers obtained a reduction of freight in consequence of the proposed works, do you not think it would be a fair thing to ask them to return a portion of the benefit in the shape of dues? No doubt it would be a fair thing, but the difficulty is to get the money out of the people.
417. Suppose you continued to charge the present rates of freight, which, of course, would be earned, you would be inclined to favourably consider the proposal that you should pay port dues? The chances are

T. B. Allt.
25 Mar., 1898.

are that if you give the river a first-class entrance, enabling us to get in and out at any state of the tide, we could run at reduced freights. We should have to do so, but the public would get the chief advantage.

418. If the port were made a good and accessible one, do you not think it possible that we might have some opposition on the river? That is very likely.

419. If that were the case, then, all the vessels competing for the trade should be called upon to pay port dues? Yes.

420. How would that affect you in this way: your vessels are registered in the chief port of the Colony, and are free to enter all the ports of New South Wales;—would your company consider it a hardship if port dues were imposed at the Manning and at other places where similar improvements had been carried out; would that appear to you to be too heavy a tax? It might take some years to carry all these works out. As far as my company are concerned, we have specially-built vessels, which you will not find in any other of the Australian colonies. They were designed to meet the particular requirements of these shallow-draught rivers. To a certain extent, when these rivers are deepened, those steamers will become obsolete, because they will not be required. That would mean an additional expense to us—not that I should hesitate to incur it—because the improvements to the river would be a benefit to my company. At the present time we have boats adaptable to all these rivers, such as no other company has.

421. *Mr. Black.*] Would not the boats be available for shallow-draught rivers which had not been improved? If you could find them, but I thought it was contemplated to improve all the rivers.

422. *Mr. Lee.*] Your company practically does all the shipping to the north coast? The larger proportion of it.

423. The entrances to the Clarence and Richmond Rivers have been improved, and it is proposed to improve the entrances to the Tweed, the Bellinger, the Nambucca, the Macleay, and the Manning;—the contention is, that in these rich portions of the Colony the settlers must have a better means of outlet than they have at the present time;—the question is, shall this means be afforded by improved ports or by the construction of a railway, and, if you improve the ports, are you justified in imposing dues? I certainly think some revenue should be derived from the improved ports.

424. Does it appear to you that if a railway were made along the north coast, and the ports were not improved, that the railway would entirely carry the produce of the district in competition with the water-carriage? I am quite sure it would not.

425. When you admit that, do you not admit that a great necessity exists for devoting attention to the improvement of the ports? Undoubtedly. I think the ports should be improved.

426. You would offer no objection to the payment of dues, provided that they did not amount to a serious impost, interfering with the progress of the district? No.

427. *Mr. Wright.*] I understand you to say that the trade of the Manning is not increasing? Just so.

428. Is it decreasing? I do not think it is; it remains about the same. The year 1897 was better than 1896; the year 1895 was a bad year.

429. That was owing to the floods? It was due to various causes—chiefly to bad weather.

430. You said your chief item of transport from the Manning was maize? Yes.

431. Is there a disposition on the Manning to abandon maize-culture, and to go in for dairy-farming? They can go in for the two things simultaneously. There is a lot of land adapted for pasture, and there is a lot of agricultural land.

432. If it pays people there better to go in for dairy-farming than for the growth of maize, that will have a considerable influence on your freight? Yes; an omnibus would bring it all down in that case.

433. Is there not a tendency on all the northern rivers to go in for butter rather than for maize-growing? I do not think so. I do not think people will abandon the growth of maize. It grows easily, and they get two crops a year.

434. You think the maize-culture will continue irrespective of the dairying industry? Yes; the farmers during the last twelve months have been exceedingly fortunate. They have had a better market than has been known for years.

435. Is the population increasing or decreasing on the Manning and its tributaries? I can only judge by the passenger traffic, and taking a superficial view of Taree, Wingham, Tinonee, and other places I have visited. I was there eight months ago, and I can see no difference in those places, as compared with what they were five years previously.

436. The population is not increasing? I cannot see that it is.

437. There is not much chance, you think, of increased production? No.

438. *Vice-Chairman.*] Have you kept separate accounts of your trade with these northern rivers? Yes.

439. Do you know the earnings of your boats running to the Manning and the Macleay? Yes.

440. Do you happen to remember the figures? I could not do that; and even if I could I do not think they would help you very much.

441. Could you furnish the Committee with a statement for (say) three years, showing the tonnage you have carried from Sydney to the Manning and from the Manning to Sydney? I could not give you the exact tonnage. All I know is what the earnings have been.

442. How could the Committee arrive at information upon that point? I could not give you information as to earnings. I regard that as being of a private character.

443. How many trips does your steamer make to the Manning a month? Six.

444. And to the Macleay? They are very erratic. During the maize season we sometimes run two steamers there. We run the steamers as quickly as we can to get the maize away. They grow more maize on the Macleay compared with the Manning. The Manning maize is a mere bagatelle compared with the Macleay maize.

445. How many trips do you make to the Macleay in the course of a year? I suppose about 100 trips.

446. What is the tonnage of the steamer? About 200 tons.

447. What is the tonnage of the steamer running to the Manning? About the same tonnage.

448. Upon the average, would your steamers be half loaded? Not more than that. I have the "Burrawong" running to the Macleay, and I received a telegram this afternoon with reference to her. She will carry 2,200 bags of maize, and the captain sent me a telegram to the effect that he had 1,300 bags. The reason he cannot bring the larger quantity is that there is not water enough to bring the vessel out, and they have good tides.

- T. R. Allt.
25 Mar., 1898.
449. Would half-cargoes be a fair average? Yes; I think half-cargoes each way would be a fair estimate, but we have only one boat running to the Manning, and she would make about sixty-six trips a year.
450. Mr. Lee asked you as to port dues—as your boats call in at most of the northern ports, you would have the dues to pay at more than one port—what I want to know is, whether you have a direct service to each port? Yes.
451. Have you any intermediate service? Yes; to Nambucca, to Bellinger, and Port Macquarie.
452. Is not that a branch in connection with the Macleay River? No.
453. You have a steamer running direct? Yes; when the water allows us.
454. Take the Manning, the Hastings, and the Macleay;—there are three different entrances, and you have a direct service to each port? We have a broken service at Port Macquarie.
455. But the others are direct services? Yes.
456. If port dues are imposed, therefore, you would only have to pay one set of dues on account of each service? Yes. But you must bear in mind that we have a steamer which always makes a duplicate voyage, it brackets either Port Macquarie with the Nambucca, or Port Macquarie with the Bellinger. She sometimes brackets the three.
457. If dues were charged at Port Macquarie, and none at Nambucca or Bellinger that would be all right? Yes.

Captain Francis Hixson, R.N., President of the Marine Board, sworn, and examined:—

- Capt.
F. Hixson,
R.N.
25 Mar., 1898.
458. *Mr. Trickett.*] You know the Manning River? I know the entrance.
459. Has it occupied the intention of the Marine Board from time to time? The entrance has been a troublesome one, inasmuch as there have been frequent delays in getting vessels in and out in consequence of the obstruction to the bar.
460. What supervision has your Board over the Heads? We have a pilot station there, and there is a lighthouse; but we have no supervision over the works in the locality.
461. What are the duties of the pilots? To sound the bar, and to move the buoys into proper positions as changes take place. Also to bring in or take out such vessels as require a pilot's assistance, and perform the general work in connection with the station.
462. I suppose they have also to hoist a signal when it is unsafe to enter? Yes, and also to show the state of the tide always.
463. Have there been many casualties at the entrance to the Manning? Not many—there have been several.
464. When was the last? I could not say from memory. There has been none recently.
465. The bar at the entrance to the Manning shifts very much? Yes.
466. The depth of water is constantly changing? Yes.
467. Could you tell us what expense is incurred by the Marine Board in connection with the Pilot service? The establishment costs about £600 or £800 a year; that includes the light at Crowdy Head. The light is not exactly at the entrance of the Manning, but is at Crowdy Head, about 3 miles to the north.
468. Has the Marine Board at any time brought under the notice of the Government the insecure entrance to this port? Not specially in the case of the Manning. In fact, we have been accustomed to the Manning so long that we look upon its insecurity as a matter of course. The bar has been so troublesome that we quite accept the fact of vessels sometimes not being able to navigate it. We have a tug there to assist vessels in and out—a subsidised tug.
469. You recognise this as being one of the worst of our bar harbours? Yes.
470. Is the tug service an additional expenditure? Yes.
471. What does it cost a year? Between £400 and £500.
472. What is the name of the tug, and what is her tonnage? The "John Gollan," a tug of between 50 and 100 tons. We have so many of these tugs in various ports that I cannot remember this particular case at the moment.
473. Is she used only for towing-in sailing vessels, or does she render assistance to steamers? She helps steamers as well. It is optional with both sailing vessels and steamers whether they employ her services or not. She frequently helps both classes of vessels.
474. Is the chief difficulty at the port experienced in coming in or going out? It is more in going out. As a rule, vessels coming in are light; the difficulty is, in getting vessels to sea after they have taken their cargo on board.
475. It is chiefly owing to the sandy bar which forms and shifts at the entrance? Yes.
476. Do vessels sometimes get stuck on the bar? They frequently stick; not so much on the bar as on the spits jutting out from the shore.
477. Do they remain there as a rule until the next tide? They are often got off at the same tide. We have a good plant of salvage gear there, and immediately a vessel is in distress the tug and pilot render all the assistance possible. Sometimes, however, a vessel will remain there for two or three days.
478. You see that Sir John Coode's plan shows a wave-trap on the northern side, with a breakwater at the entrance, and a training-wall of limited extent; there is also a training-wall on the southern side running along towards Mangrove Swamp; the Departmental scheme, as shown on the upper plan, is similar. The portion of the present wall marked in black has been already constructed. There is a proposed continuation of the training-wall on the southern side of the sandspits right up to the bend in the river; but the scheme omits the wave-trap on the northern side. That is practically the only difference between the Departmental scheme and that of Sir John Coode, with the exception of the continuation of the training-wall. Do you think the Departmental plan with the continuous training-wall, designed for the purpose of creating a scour, would be more effectual than that in which the training-bank stops short, allowing the water to work in among the sandbanks? I am much in favour of the Departmental plan.
479. Have you been consulted about it? No.
480. You never saw it until to-day? No.
481. From your experience, you think that a continuously close channel, such as indicated by the Department, would more greatly conduce to a perfect scour, than would the channel indicated by the plan below? Yes; a glance gives the Departmental plan the preference, to my mind, instantly.
482. Are you able to say whether the work which the Department has already carried out at the Manning has been of some advantage in improving navigation? I am not prepared to say that it has been of much advantage

Capt.
F. Hixson,
R.N.

25 Mar., 1898.

advantage up to the present time, except that it has prevented the channel from opening to the northward, as it used to do. The breakwater has overlapped that, and has saved a great deal of trouble to which we were subjected in times gone by. I have known vessels go along the beach and make a right-angled turn to enter the river. The training-wall has had a beneficial effect in that respect.

483. The peculiarity of this port is, that the Painted Rocks are considerably inside;—the real entrance to the port is outside the Painted Rocks; and a large mass of sand, until the portion marked in black was constructed, enables the current to cut in and form a new channel at varying periods? Yes.

484. The construction of the training-bank has helped to do away with that, and to keep one channel? It has made the channel more regular, and it has done away with the objectionable channel that used to open out parallel with the beach.

485. When were the Marine Board last at the Manning River? We have not been there within the last eighteen months.

486. Do not the Marine Board inspect the lighthouses periodically? They have not done so latterly. There is a proposal to upset the Board's practice of going to these ports annually. The Public Service Board have recommended that an inspector be sent; since then the Board have not gone.

487. Therefore, you have not an opportunity to see these works? Not as I should have done a year or two ago.

488. Were you consulted with reference to these works when Sir John Coode was here? He had some casual conversation with me on the subject, but I do not know that he consulted me with reference to his design. It was more with a view to obtaining information than as to the actual design of the work.

489. As far as your experience goes, do you think that it is desirable that a work of this kind should be carried out? I think so. I am always an advocate for trying, as it were, to assist nature in any of these works. I never like opposing nature. But when the work is designed with a view of following up what nature has done, I am in favour of it. The carrying out of the breakwater beyond the Painted Rocks is, to my mind, a very good scheme.

490. Mr. Darley explained yesterday that the wave-trap designed by Sir John Coode had the object of preventing the waves from running right up the channel, but he seemed to think that the trap was not so very necessary at the Manning River, seeing that there was no settlement at the entrance, and that ships were not required to lie alongside wharfs or piers there? Quite so; there is no settlement there. As to the sea, it would run along the training-wall, and after a vessel negotiates the entrance I should not think anything of that. I do not believe very much in Sir John Coode's wave-trap. I do not think the waves in the scheme prepared by the Department would be of any moment directly vessels got inside the bar. The weight of the sea is spent upon the bar.

491. Do you think if the entrance were improved as suggested there would be likely to be a considerable deposit of sand outside the breakwaters;—would the sand accumulate there to the detriment of navigation? I think not. I think the sand would be likely to back up into the bight, but I do not think it would extend beyond the breakwaters. I think that if the stream is narrowed in the way indicated by the plan it will scour the entrance. The sand might back up behind the breakwaters, but that would have rather a good than a harmful effect.

492. Have you had enough experience to say whether you think training-walls constructed of loose rubble stone will be likely to stand? The Clarence River has been much improved by the training-walls. They have stood there very well.

493. Have you seen the walls there recently? I have not been there for the last eighteen months.

494. About what size are the stones? They are not very large.

495. They have stood well? As a rule.

496. And there is a considerable rush of water down the Clarence and Richmond occasionally? A great rush.

497. *Mr. Wright.* Are you acquainted with the ocean currents in the neighbourhood of the Manning? To the extent to which I gained experience of them when surveying the coast.

498. If it is stated by the Department that there is a southerly set in the current both inshore and off, would that be correct—we are informed by captains of vessels that there is a southerly set off shore with a northerly set inshore? I do not think there is any positive rule as regards the current. I believe the captains are correct. As a rule, there is a southerly current in the offing, but if you get close inshore there is a little eddy in the opposite direction.

499. The Department say that there is a southerly set right in to the proposed breakwaters? For my part, I am inclined to agree with the captains of vessels who have expressed the opinion you have indicated.

500. You think that in this particular bight, as in most other bights on the Australian coast, there is a northerly eddy? Yes. We found the currents most fickle. Instead of taking a straight line, we often had to zigzag, sometimes for a northerly and sometimes for a southerly current.

501. What effect would that have upon the entrance, if by narrowing the course of the river you succeed in deepening it;—would the sand be carried away or would it be likely to accumulate? I think it likely that the sand will back up behind the breakwaters. In some instances it would be carried away. The sand in many of these places makes most extraordinary changes. At the Macleay River the entrance at one time is wholly different from what it is at another. For some reason we cannot understand, the sand shifts very rapidly at times.

502. It has been stated to the Committee that the Manning River bar will shift suddenly,—that is, within a few hours;—would you infer from that that there is no definite current—that the shifting of the bar is accounted for by the changes in the current? There are constant changes; you never know what some of these bars are going to do; they will be one thing to-day, and quite a different thing this day week.

503. Do you not think the shifting of the bars is accounted for by the changes in the currents? I think it is likely that that and the rush of water at a time of fresh, together with gales and heavy seas, produce the changes.

504. We have it in evidence that the Manning River shifted half a mile in a few hours? I would not be prepared to go to that extent; but I know that it shifts a great deal.

505. What effect do you think the construction of the proposed works will have upon the bar? I think the changes we have been discussing will probably be mitigated by the works proposed. The sand will probably be carried out into deeper water, and will have a less detrimental effect than it has at the present time.

- Capt. F. Hixson, R.N.
25 Mar., 1898.
506. We are told that the construction of the northern training-wall has deepened the water very much—in some cases to 25 and 26 feet; the deepening of the water has removed the sand further out to sea. Supposing the whole of the channel from the mouth to Chinaman's Point is deepened by 6 or 7 feet by the construction of the proposed works, what is to become of the sand taken away;—do you think it is likely that it will lodge at the mouth of the proposed works? I think it will go further out into the ocean than it otherwise would do, and will have a less objectionable effect.
507. You do not think the tendency will be to pile up a still bigger bar of sand than now exists? I do not think so.
508. You think the ocean currents, whichever way they go, will disperse the increased accumulation of sand? Yes.

Captain John Jackson, Manager of Public Wharfs, made an affirmation, and was examined:—

- Capt. J. Jackson.
25 Mar., 1898.
509. *Mr. Clarke.*] What is the practice on our coastal harbours as regards the imposition of port dues? There are no port dues charged excepting at Sydney and Newcastle.
510. Upon none of the rivers? No.
511. Are there not wharfage rates charged on some of the rivers? Only at Coff's Harbour and at Woolgoolga.
512. Are there no charges at Byron Bay? The wharf there is leased. I think they charge a trifle there now; but it is optional with the lessees.
513. Does it not seem rather strange that harbour or wharfage dues should be charged at these three places, and at no other part of the coast? The expenditure at Coff's Harbour and Woolgoolga has been pretty heavy; there is a great deal of wear and tear. The revenue obtained will only pay the caretaker.
514. Is that the reason why charges are made at those particular places and not elsewhere? I presume so.
515. Are there not charges at some places to the south—at Wollongong, for instance? There are no wharf dues charged at Wollongong now; only tonnage dues and pilotage.
516. What is the rate charged? Ten shillings per diem upon a vessel under 240 tons, or a halfpenny per ton per diem on vessels over 240 tons; that is, on vessels coming in for the purpose of loading.
517. Are there no charges at Eden? No.
518. Or on the Clarence or Richmond? No.
519. Considering the amount already expended upon the improvement of the Manning River, and the additional amount which it is proposed to expend to render the river navigable, do you think it fair that tonnage or wharfage dues should be imposed there? I think it would be very fair, having regard to the benefits derived by the public from the improvement of the ports. The residents will be greatly advantaged. I think it is only fair that tonnage dues should be charged upon vessels taking away produce.
520. You would not charge the residents of the district? The residents will pay the dues; the steamship companies will not pay them.
521. You could get at the residents better than by charging the vessels? No; the company will charge 6d. more for freight, and that will cover the lot.
522. *Mr. Lee.*] The wharfs on the Richmond and Clarence are Government wharfs? Yes.
523. Are any charges made? No; unless they are proclaimed public wharfs under the Act. The Government can impose wharfage, but they do not do so. It would not pay to impose it. On the Richmond there are thirty-six small Government wharfs, all constructed by the Government. The Government has to keep them in repair. It has been my policy since I have been in the Department to lease these wharfs to private individuals at a nominal rental, upon condition that they keep them in repair. I try to get rid of them as opportunity offers, to save the Government the annual expenditure, which is very heavy.
524. How many wharfs are there on the Clarence? A great many. I could not say how many, speaking from memory.
525. You have some wharfs on other rivers, and also some on the South Coast;—what is the total number? I tried to arrive to-day at an estimate of what they have cost, and I think they have cost somewhere about £150,000. That does not include Kiama and Wollongong.
526. Then there has been the cost of maintenance? Yes.
527. Does it amount to 5 per cent.? After a few years it would do so.
528. I suppose these wharfs were built to facilitate the shipment of the produce of the districts? Yes.
529. Has there ever been a charge by the Government upon any of them? Not on most of them. In 1881 or 1882 a charge was made at Kiama, Eden, Wollongong, Morpeth, and Newcastle; but it was cancelled after the first year. I do not think it was seriously intended.
530. Can you give us any idea why the charges were abandoned? No.
531. It is not within your recollection that any wharfage charge has been made upon any of our rivers to recoup the Government for the outlay? I am sure of that.
532. The Government build the wharfs and have to maintain them for the public convenience? Yes.
533. Would the letting of the wharfs carry with it the right to make a charge? Yes; but, as a matter of fact, they would not do so. These wharfs are very small places, only about four piles, costing from £150 to £500 each. There is a cluster of farmers around them, and the farmers bring their produce there. There is a shed, and the farmers use it for the storing of their produce.
534. The majority may be small wharfs of that description, but still there are large piers; for instance, take Ballina and Lismore? The Ballina pier is let, and the one at Lismore is handed over to the municipal council. The Coraki wharf is also let.
535. I presume the lessees do make a charge? They do in some cases; but at Coraki they do not. It is added to the freight. The wharf is in the hands of a steamship company.
536. The Government hand over the wharfs to get rid of the maintenance? Yes.
537. But if the respective local bodies make a charge, how is it that the Government do not do the same thing? It is only at Lismore that a charge is made, I think, by the municipal authorities.
538. I suppose it has become the custom upon these rivers so long that it is a difficult matter to alter it? Yes; you could not very well alter it.
539. Are you still building wharfs on these rivers upon the same principle? Yes.

Capt.
J. Jackson.
25 Mar., 1898.

540. The wharfs are under your charge? Not unless they are proclaimed under the Act.
541. And the moment they are proclaimed, a charge is made? The charge can be made.
542. It is proposed now to improve five or six rivers on the northern coast. Would you with your experience of shipping business, think it in the interests of the State, having regard to the necessity for maintaining the works, that a charge of some character should be made (say) in the shape of port dues? I have a strong opinion upon that point. I do not think the State should construct such costly engineering works without being recouped to some extent. Of course, we cannot get the interest on the total expenditure, but I think that those who benefit by the expenditure should contribute towards the interest.
543. And you think port dues would be more easily collected? Yes.
544. It would in reality be the payment for services rendered? Yes.
545. There is no doubt that the boats which now trade to these harbours would have an easy time if these works were carried out? Yes.
546. They will carry a third more cargo than they do at the present time, and they will be under no greater expense? Yes, and there will be no detention.
547. You think, therefore, that the traders could well afford to pay the extra money? Yes.
548. *Mr. Hoskins.*] Is it your experience that in other parts of the world where wharfs are erected for the public accommodation a charge is invariably made to the persons using them? I never knew a port anywhere, excepting in this Colony, where wharfage charges were not made.
549. *Mr. Wright.*] What dues are charged in Sydney at the present time, exclusive of the wharfs? Harbour and light dues, tonnage dues, and pilot dues. The harbour and light dues are included in the tonnage dues.
550. Your experience of other countries is that there are charges in every harbour? I know of only one place where no such charge is made, and that is Hongkong.
551. Are there any harbour dues in the port of Newcastle? I think that what is charged in Sydney holds good for six months in Newcastle. But there are pilot dues in Newcastle, and vessels loading there pay a halfpenny a ton while loading. A great many vessels do not pay pilotage dues at all at Newcastle—they are exempt.
552. But if a vessel does not fly the exempted flag she must pay pilotage dues? Yes.
553. Upon the northern rivers the Government subsidise a tugboat and there are pilot-stations? Yes.
554. Is it compulsory upon vessels trading there to take a pilot and tug? Most of the captains trading there have exemptions.
555. They do not take a pilot or tug? Sometimes they may be compelled to take a tug.
556. The Committee are to understand that the Government keep special tugboats and pilots on the northern rivers, and that there is no compulsion on vessels to pay pilot or port dues? Quite so.
557. Do you know why the wharfage dues were discontinued at Newcastle? I think Mr. Watson was Treasurer at the time. There was then very little importation at Newcastle. The port was used chiefly for its export of coal. Since then things have altered considerably, and the import and export trade of Newcastle other than coal is now very large.
558. Is it not contended at the present time that wharfage dues at Newcastle are contained in the freight paid to the Railway Commissioners for the use of the railways and of the steam-cranes? Yes.
559. There is a charge of 10d. upon every ton of coal shipped at Newcastle for the use of the railway and cranes, irrespective of the distance from the wharf from which the coal is brought? That is so, I believe.
560. The statement of the coal-owners is that this heavy charge of the Commissioners includes not only the railway charges, but also the wharfage dues? Yes; but I do not consider that they pay wharfage at all.
561. You regard the payment as being solely for railway rates and the use of the steam-cranes? Yes.
562. You said you believe in wharfage dues upon all our coastal harbours, and that owing to the smallness of the trade it would be impossible to collect them, the salary of the collector amounting in some cases to more than the amount collected;—might not the difficulty be met if you charge tonnage dues? Yes.
563. They would be very simply collected? Yes.
564. Do you think it would be fair to the country and to the trading community upon these rivers that such a charge should be made? I do.
565. What would you consider a fair tonnage charge for the northern rivers—take the Clarence River, for instance? I am not prepared to say what should be charged; I have not thought much about that point.
566. Do you think you could collect enough to pay interest on the outlay? No; but we could collect a good deal towards it.
567. Do you think you would collect enough to pay the salaries of pilots, the tugboats, and light-houses? Yes.
568. By that means a considerable saving would be effected in the annual expenditure of the State? Yes.
569. *Mr. Hoskins.*] What charges are imposed in British ports, as a rule; take Glasgow and Liverpool, for instance—I am not referring to the dock charges, I mean the port charges? I could not say from memory, but I know that they are heavy.
570. You think that a moderate charge might, with justice, be made upon these northern rivers? Quite so. I would not advocate anything oppressive. I would propose only a fair charge for services rendered.

Henry Spondly, Compiler, Government Statistician's Office, Chief Secretary's Department, sworn, and examined:—

571. *Mr. Wright.*] Have you prepared a statement with regard to the proposal under consideration? I have made out a statement in two different forms. In the first instance, the statement applies to the district from which we consider the trade goes to the Manning; the second statement relates to the whole of the Manning electorate, which goes rather farther to the north. The statements disclose the population,

H. Spondly.
25 Mar., 1898.

H. Spondly. population, the area occupied, the different forms of occupation, the area under various crops, the quantity of the chief crops, live stock, and the production of butter. They are as follows:—
25 Mar., 1898.

Manning River District and Manning Electorate.

	River District. acres.	Electorate. acres.
Estimated population on 31st December, 1897.....	8,100	9,130
Total area.....	1,477,500	1,641,000
Occupied area—		
Crown lands	88,500	95,000
Alienated lands—		
Freehold	219,000	241,900
Private leasehold	121,200	130,600
	340,200	372,500
	428,700	467,500
Area under crop—		
Wheat	460	500
Maize.....	17,540	20,030
Other grain crops	1,150	1,280
Lucerne and sown grasses.....	120	140
Sorghum	210	240
Root crops.....	310	350
Tobacco.....	30	35
Sugar-cane	6	7
Vineyards and orchards.....	270	300
Market gardens	60	70
Minor crops	170	195
	20,326	23,147
Under permanent artificially-sown grasses	3,000	3,450
Production—	bushels.	bushels.
Wheat	7,020	7,700
Maize.....	624,930	713,880
	tons.	tons.
Hay	770	860
Potatoes	1,160	1,320
Live stock—	No.	No.
Horses	6,270	7,050
Cattle—		
Dairy.....	6,920	7,670
Ordinary	26,570	29,320
	33,490	36,990
Sheep.....	980	1,110
Swine	4,340	4,690
	lb.	lb.
Production of butter	199,500	221,050

TUESDAY, 29 MARCH, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Harbour Works at Manning River.

Henry Richard Carleton, Principal Assistant Engineer, Harbours and Rivers Branch, Department of Public Works, sworn, and examined:—

- H. R. Carleton.
29 Mar., 1898.
572. *Mr. Hoskins.*] How long is it since you were last at the Manning River? A year or eighteen months.
573. Works have been going on there since you visited the place—works undertaken by the Harbours and Rivers Branch for the improvement of the entrance to and of the general navigation of the river? Yes; the contract that was then let has been running ever since.
574. Is there an officer of your Department down there looking after the work? Yes; we have a resident inspector there.
575. Is there a tug kept to tow in vessels? There is a subsidised tug; but it is under the control of the Marine Board.
576. Sir John Coode reported upon the question of improving the entrance to and the navigation of the Manning River? Yes.
577. But the department is not following out his recommendations? Except that we are extending the northern training wall, and omitting the wave trap, the scheme is practically Sir John Coode's.
578. What is the primary object that the Department have in view—the improvement of the entrance or the improvement of the navigation of the river? The improvement of the unstable portion of the river.
579. Has the carrying out of the northern training-wall improved the navigation of the river by giving more water at the entrance, or stiller water? I doubt if there is any permanent improvement yet. The wall

H. R.
Carleton.
29 Mar., 1898.

- wall has hardly been carried far enough. Still, the inner crossing has been improved slightly.
580. Can steamers ordinarily trading to the river enter more easily now than they could before the works carried out by your Department were commenced;—is there less detention? I think so. The periods of detention are shorter.
581. Evidence has been given to the effect that the entrance to the Manning River is about the worst upon the coast;—is that your opinion? It is as bad as any of them.
582. But in your report you say, "The Manning entrance, in comparison with most of our east coast rivers, is, therefore, remarkably free from reefs and other obstructions of a rocky nature"? I made borings at the entrance in 1888, and I ascertained that there would be no difficulty in obtaining a scour. I proved that there was practically no rock down to a depth of 30 feet below low water.
583. The difficulty at the entrance is caused by the collection of sand there? Yes.
584. And you anticipate that you will be able to get rid of that sand by causing a greater scour? Yes; by concentrating the tidal and flood-waters upon the bar.
585. The Committee have before them a proposal to construct a railway from Maitland to Taree, one of the most urgent reasons in favour of which is the argument that the Manning entrance is exceedingly dangerous, and that steamers are frequently delayed there, and many of them have been lost;—do you think that the proposed work will improve the entrance? I think so. I think that if the scheme is carried out it will give a fairly safe port.
586. The navigation of the Manning would not then be exceptionally dangerous? I think not. There will always be times when it will be advisable for steamers to stand off; but that happens all along our coast during easterly gales.
587. And it happens in England too? Yes. However, if the proposed scheme is carried out, those times will be fewer, and the detention will be less.
588. Will the depth of water obtained be sufficient for the class of vessels trading there? I think we shall be able to get a boat drawing 12 feet or 15 feet up to Taree. Once inside the entrance there would not be much dredging required to get a boat of that draft up there now. There are only one or two shallow places in the river, and they are of no great length.
589. The difficulties lie at the entrance? Yes.
590. By causing a great scour at the bar and by dredging you will be able to get rid of them? Yes.
591. Have you a dredge there now? Yes.
592. Is it a sand-pump dredge? No; it is a bucket dredge. The sand-pump dredge has been removed.
593. Would not a sand-pump dredge be better for dealing with sand? Yes, if the water was sufficiently smooth; but for a sand dredge you want a wall behind which to pump the sand; otherwise the sand gets washed back into the channel.
594. The first work the Department would take in hand would be the training walls? Yes.
595. The southern training-wall would not be so long as the northern training-wall? It would be only about half as long.
596. *Mr. O'Connor.*] What is the distance from the entrance to Taree? Eighteen and a half miles.
597. *Mr. Fegan.*] What is the draft of the vessels going up the river now? About 7 feet.
598. *Mr. O'Connor.*] About 500 tons burden? No; about 350 tons.
599. *Mr. Fegan.*] There is a greater depth of sand above the rock than was first surmised? Yes; by keeping away from the rocky point we shall be able to get nearly any depth we like.
600. It is not intended to charge any toll for the use of the river? I believe not.
601. What amount has already been expended at the Manning? £23,000. We have a balance of about £19,000 left.
602. Is that upon the votes for several of the rivers? No; that is the amount of the unexpended votes for the Manning. £17,000 was voted in 1894, £10,000 in 1896, and £15,000 in 1897, or £42,000 altogether. Of this amount £23,000 has been expended.
603. *Vice-Chairman.*] Upon the completion of the proposed work will the annual expenditure in connection with the river be lessened? Yes.
604. What is the present annual expenditure? Upon dredging?
605. Upon dredging, tug service, and so on? I do not know what the tug subsidy is; you would have to obtain that information from the Marine Board—but probably £500 or £600 a year is paid.
606. What is spent upon dredging operations? The expenditure varies very much.
607. What has been the average expenditure for the past four or five years? £3,500 a year.
608. Apart from the cost of the work now being carried on? Yes.
609. Upon the completion of the proposed work what would be a fair provision to make for the keeping open of the river? It would be necessary to keep one dredge always upon the river. That would cost from £1,500 to £2,000 a year.
610. The saving effected would be approximately £1,500 a year? Yes; there would be that saving. We should also save the whole of the dredging done at the entrance. Some £15,000 has already been spent there in dredging.
611. Are you of opinion that it would be possible to dispense with any part of the proposed scheme and still obtain a sufficiently good channel? I hardly think so. Mr. Darley has cut the estimate as fine as he could. There were other walls included in the first scheme which he has cut out.
612. You are of opinion that it will be necessary to carry out the whole of the work shown upon the plan in firm red lines? Yes.
613. I suppose you share Mr. Darley's opinions that the breakwaters will not be necessary for some years? It will be many years before they are required.
614. When the work is completed, without the breakwaters, what will be the average depth of the river? From 12 to 15 feet.
615. There will be from 12 to 15 feet where the bar is now? Yes; there are only one or two bad places between the entrance and Taree.
616. *Mr. Hoskins.*] Are you of opinion that when the proposed works are completed there will be no necessity for any large expenditure to further improve the navigation of the river? Yes; there will be always a certain amount of maintenance to be paid for; but that will be comparatively small.
617. *Mr. Fegan.*] Will the amount you have in hand complete the scheme in view? No.
618. How much more will be required? £81,000. We shall require £100,000 altogether.

WEDNESDAY, 30 MARCH, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).
 The Hon. JAMES HOSKINS. | JOHN LIONEL FEGAN, Esq.
 The Hon. DANIEL O'CONNOR. | FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Harbour Works at Manning River.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and examined:—

C. E. Rennie. 619. *Mr. Wright.*] You have brought a plan with you? Yes. I place before the Committee a map, which I have had prepared, showing the tenure of land within a portion of the Manning River watershed.
 30 Mar., 1898.

620. Will you describe the area to which you refer? It comprises the eastern portion of the watershed of the Manning from a point about 2 miles east of the village of Nowendoc to the sea-coast.

621. How far does it extend from Taree? Roughly speaking, about 50 miles.

622. And how far north and south of the river? We have taken the borders of the watershed on the north and south sides, but we have not gone further back than Nowendoc, because the country west of that place is served by the New England railway.

623. The borders of the watershed of the Manning north and south would embrace country lying within 15 miles of the river on each side? Within 15 or 20 miles of the river on each side.

624. The area you have described embraces all the land on the Manning River and its tributaries which is suitable for agriculture? Yes, east of the village of Nowendoc.

625. What is the explanation of the various colours shown on the map? The area tinted blue represents alienated land, which comprises 364,200 acres. The area hatched blue is part of the Church and School lands under lease, and amounts to 25,200 acres.

626. Is this good arable land? There are some agricultural and some pastoral leases upon the Church and School Estate; but I could not tell you the character of the land. Reserved land is tinted green, and comprises 135,200 acres. Crown land is tinted brown, and comprises 637,400 acres.

627. Am I right in assuming that most of the Crown land shown on the map is only fit for pastoral purposes? A good part of it is not fit for pastoral purposes. It is thickly timbered, rough country, and very slightly grassed. About 259,000 acres are held under occupation license.

628. Is the rest of the land unoccupied? Yes.

629. Then it is practically worthless? Yes, for settlement purposes, though there is some good timber I believe.

630. It is what is known under the Crown Lands Acts as inferior land? Yes.

631. It might be leased if a very low rental were charged? Probably. I do not know the country myself; but I believe that it is poor. There is a very large reserve near Tinonee.

632. Do you know anything about the quality of that land? No.

633. Is the reserve far from Tinonee? It runs up to within a quarter of a mile of the town.

634. And almost down to the coast? It goes down to the coast, and as far as the southern limit of the area shown on the plan. There is another large forest reserve, containing about 15,000 acres, just south of the village of Giro. It is quite possible that we have gone a little far back there. The country west of that point goes to the New England line.

635. How much Crown lands, as shown on this plan, would be west of a north and south line 20 miles west of Taree? I suppose, roughly, about 350,000 acres.

636. About one-third of the Crown land of the district? About one-half of the Crown land. We did not know in the office what the trend of the traffic was; but I think I include all the country from which traffic goes to the Manning.

637. Is there any likelihood of much of this land being thrown open for settlement shortly? Pretty nearly all the land coloured brown is open for conditional purchase now.

638. There is very little occupation there? Very little.

639. Will the Committee, therefore, be right in assuming that the land is comparatively poor? Yes.

640. Have you been on the northern rivers at all? I have been on the Manning once or twice; but I have not travelled there to any large extent.

641. I suppose you are aware that the agricultural land upon the Manning, as upon many other coastal rivers, is in narrow strips? Yes, along the banks of the river.

642. Therefore, the Committee will be right in assuming that there is not much possibility of a large increase in population? Not so far as the agricultural and pastoral industries are concerned. There may be an increase of population in connection with the timber traffic.

FRIDAY, 1 APRIL, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).
 The Hon. JAMES HOSKINS. | JOHN LIONEL FEGAN, Esq.
 The Hon. DANIEL O'CONNOR. | FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Harbour Works at Manning River.

George Walters, General Manager, Australasian Timber Company, sworn, and examined:—

G. Walters. 643. *Mr. Fegan.*] Have you any mills on the Manning? One.

644. How many men do you employ? Between sixty and seventy.

1 April, 1898. 645. What is your weekly output? About 60,000 feet. We have the machinery for a large mill ready in Sydney. We intend to erect that mill on the Manning. I have had a mill on the Manning for seventeen years.

646. Have you ever found the river there unnavigable? Yes; and I have been put to great inconvenience by it. G. Walters.
647. Recently? No. 1 April, 1898
648. How long is it since there has been an improvement? Since the breakwater was made.
649. Were not the works there stopped for a considerable time? I think they were stopped for a short time.
650. You do not know why they were stopped? No.
651. Did not the training-walls give way? I do not think so.
652. You desire to give evidence to-day chiefly as to the value of the timber trade of the Manning? Yes. We have a company, floated in London, with a capital of £50,000, and the Manning is the chief place where we have mills. We have also two mills at Camden Haven. On the Manning there are forests second to none in the colonies.
653. What timber do you get? Blackbutt and tallow-wood are our chief timbers. We have ironbark, but we do not cut much of it. We have nearly 500,000 feet of timber on the Central wharf now ready for export.
654. You have gone largely into the export trade? Yes, very largely. We export both for Scotland and for England.
655. Do you find the home market a good one? We have had a hard fight, and have spent a lot of money in getting our timber into the market. At the present time we are only making a very small interest upon our outlay; but we have great hopes of improvement during the next year or two.
656. What has made it so hard to get into that market—is it because the timbers are unknown? That is the whole secret. When we sent our Mr. Scott from Sydney, they told him, "We do not dispute the goodness of your timbers; but lay them down and prove them. We are not going to the expense of proving them." We had to give many thousand feet of timber away in order to prove its value.
657. *Mr. Hoskins.*] Has not the Jarra Company of Western Australia been more pushing than you, and thus supplanted you in the English market? They got the start of us with their jarra; but we have a timber here called red mahogany which can hardly be distinguished from jarra. If we had it in large quantities we could pass it off as jarra; but we have not much of it. We have sent our blackbutt to England and we had to prove that it was equal to the jarra. Now, however, we are getting very large orders from the Caledonia Railway Company. I was the first man to introduce timber tramways on the north coast. The trams are drawn by horses; but we intend shortly to go in for locomotives such as they use in Western Australia. Along the north coast the forests have only been tapped for a few miles inland, whereas the best timber lies 10 miles or more back. The timber that has been taken out up to the present has come from the outskirts of the forest, and is the stunted growth. Further back you get an altogether superior timber.
658. Have you much tallow-wood? We have just put down 26 chains of tramway, and our foreman tells us that along this line of tramway we shall get 500,000 feet of tallow-wood.
659. Tallow-wood is a superior timber? Very superior.
660. Do you find any market for it? We have not tried it in England; we have only tried to push the blackbutt there. We can get a very fair price for tallow-wood out here.
661. Do you find the Home market better than the local market? If we threw up the export business, and supplied only the local market, we should glut it in a month.
662. You are finding a footing in the Home market which you believe you will be able to hold against all-comers? Yes.
663. I suppose the improvements to the river really mean the saving of your trade? They will save it wonderfully.
664. What is the longest time for which vessels have been bar-bound in the river? The mills which we have on the Manning we let for the last eighteen months. Previous to that, I ran a mill for fifteen years there single-handed.
665. You are going in now chiefly for the export trade? Yes. We have refused city orders altogether. We are cutting expressly for the Home market.
666. I suppose this gives a large amount of employment? At the present time we are employing 150 men in the three mills that we are running, and we have machinery for another mill ready in Sydney which will employ about 120 men more.
667. Is there much ironbark? There is a good deal of ironbark on the Manning.
668. I suppose you supply the Sydney market with ironbark? We have done a little with ironbark; but we are not sending it out of the Colony.
669. When these works are completed, larger steamers will be able to go up the river? I do not know that we want larger vessels. We were the first to go in for scows. They carry all their cargo on deck, and only draw about 5 ft. 6 in. If the entrance were better, the vessels could often get in and out when that is impossible at present.
670. The present difficulty would be overcome? Yes, to a great extent. Of course, there will always be heavy seas at times; but our position would be greatly improved. In the opinion of most people the breakwaters should be carried out on both sides.
671. Do you send planed timber Home? No.
672. Only rough timber? Yes. We are also dressing chairs and keys for the railway company. If both breakwaters are carried out it will give a better scour. There is a narrow spit upon the south side, and if it were to break through, the work that is now being done would be useless.

FRIDAY, 13 MAY, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Manning River.

Charles Macleay Boyce, solicitor, sworn, and examined:—

- C. M. Boyce, 13 May, 1898. 673. *Vice-Chairman.*] You are a solicitor now practising in Sydney? Yes.
674. You are familiar with the nature of the proposed scheme to improve the entrance to the Manning? Yes.
675. *Mr. Lee.*] How long did you reside in the Manning district? About fifteen years off and on. I practised there for six years, and two years ago I bought in in Sydney and came down here.
676. During your residence there did you give much attention to the question of improving the harbour? It was much considered, and, of course, I went into the matter with the others. I had the advancement of the district largely at heart, and I went into the matter rather fully.
677. Was there a committee, progress or otherwise, to advocate the improvement of the harbour? There have been local committees at different towns on the river, but there was not one general committee. Taree and Wingham are incorporated towns.
678. What do you think would be the effect of the proposed works, not including the two breakwaters, if carried out? I certainly think the effect of concentrating the stream in so narrow a place would cause the flats both inside the river and at the entrance to scour away. There is a large flow of water, and if it were concentrated in that space—1,000 feet I see it is—it certainly would have that effect.
679. Under what conditions have you seen the bar? Under very many conditions. I have crossed it, I suppose fifty times, and on various occasions I have been at the head on each side of the bar.
680. What is the chief difficulty in connection with the bar from the navigation point of view? The difficulty is that the channel is hardly the same from one week's end to another. On one trip you cross in probably on the north side, but a month afterwards you go in by the wreck of the "Murray" to the south of the proposed breakwater. It is a shifting channel, and it varies in depth from one week to another.
681. That I presume was largely in consequence of there being no headland on either side, and a large deposit of sand outside the Painted Rocks? That is the chief reason of it. The sand shifts backwards and forwards.
682. Were you in the district when the piece of training-wall tinted black on the plan was built? I was there when a great deal of it was built. I was solicitor for the contractor, and I went over the work with him.
683. Had it the effect of causing the sand to pile up behind it? Certainly it did.
684. Did it have any marked effect on the depth of water in the immediate vicinity and further out on the bar? It had right up against the wall, but as to its effect further out I could not say.
685. Seeing the short distance it is intended to carry out the north training bank, do you think it will be sufficiently far to set up a scour to give the depth of water required to accommodate the steamers which are going there? I should think so, in conjunction with the south training-wall.
686. At the present time there is a sand bar on the south side reaching almost across to the northern portion? Yes.
687. In time of bad weather I presume the sand is piled up at this particular point, and makes the entrance so difficult? After any spell of bad weather the channel alters.
688. The constructed work terminates inside the sand bank, and the question is does that go out sufficiently far to set up a scour to remove the whole of that matter? I should hardly like to say that it would absolutely. I think it would take off the northern end effectually.
689. Did anything occur during your residence to lead you to suppose that the constructed work does not go out sufficiently far? I cannot say that I did.
690. When you spoke of the deepening of the water by the construction of the training-wall, I suppose you meant that the water had deepened immediately underneath the wall? The deep water extended to a distance of 20 or 30 feet from the wall. It may have extended out a little further.
691. You are prepared to accept the Departmental proposal? Certainly.
692. And if the works which the professional officers of the Department have designed will have the effect of giving a secure and permanent entrance, you think it will be quite sufficient? Yes.
693. What, in your opinion, is the position of the farmers or other producers in that district? The position of the farmers at present is an improving one. They have had various fairly good seasons, but if that work were carried out it would wonderfully enhance the value of property in the district as well as the position of the farmers. At present the farmers are under a great disability as to anything which is perishable. For instance, their eggs always command 1d. a dozen less than eggs from the south coast, and 2d. a dozen less than eggs which come down by rail. Their eggs are delayed occasionally at the bar, and therefore they have got a bad name in the market. It is also the case with their pigs. I think it is the best pig-producing district in the Colony. On an average, I suppose, £250 or £270 worth of pigs come down every week.
694. In what way would property be largely improved? Simply because you have a readier transit to market for the produce, and your yearly income from your produce is greater from the fact that you can take advantage of better prices in the market.
695. But the chief product is maize? The chief product has been maize; but sometimes they put the maize into pigs.
696. Is not that likely to continue to be the case? Not so largely as heretofore. They have gone in for dairying a great deal more during the last year or two.
697. Are they likely to convert their cultivation lands into grazing lands? They are doing it in a great number of instances. One reason is that, with maize, if they have a drought or a flood they lose the whole of

of their year's work. They have only one crop of maize a year, and if they lose that crop they lose everything, whereas if they get cows and have a dairy-farm, one flood does not affect them very much. C. M. Boyce.

698. Do your remarks apply to river-bank land or to land lying back from the river? The land lying back at any distance from the river is not suitable for crops of maize. The land which is out of reach of flood is not usually good agricultural land. 13 May, 1898.

699. Is it rich land on the river banks which is going out of cultivation and going into grass? To a large extent, yes.

700. If dairying should supplant maize, there may be a more valuable product to carry, but there would be very much less freight? I do not think so.

701. You could not expect to get the same tonnage of butter as of maize? I do not suppose there would be, that is, if the whole of the land were put in grass.

702. Have any of the settlers been seriously inconvenienced by being unable to get their produce to market? Undoubtedly they have.

703. How did it arise? Suppose there were a good market for maize or pigs or any other product, and they wished to catch the market, they would bring their produce down, it would be delayed at the bar a week or ten days, or three days, and thus they would miss a good market which others could take advantage of. It has often happened that the farmers on the Richmond and further north have taken advantage of a market, and that the farmers on the Manning could not get their produce to that market.

704. They have had to get their produce to market when they could, irrespective of market value? Yes.

705. You think that if they could take advantage of a rising market, like the people on rivers with better entrances can do, it would be a means of improving their position? Undoubtedly.

706. I presume all the land suitable for cultivation in the district is pretty well secured? The best of the land has been taken up. I do not think there is much cultivation land to be taken up.

707. Where could extra settlement take place? In the upper part of the river, and at the top of some of the tributaries, but not along the main river.

708. Although some of these rivers are not so navigable as the main river, yet on the banks there is very rich land? Yes.

709. But the land is not so extensive? The good land does not run so far back.

710. But still it is equally good in quality? Most of the tributaries have what they call second-class agricultural land, but still it averages in value from £8 to £10 an acre when cleared and prepared fit for the plough.

711. During your long residence, did you notice any considerable progress in the district? Undoubtedly. The settlement has become thicker, the farmers are buying their own farms, instead of being under landlords to a certain extent, and some of the old holdings are being broken up. The Taree Estate is being broken up; the Cundle Estate is broken up, and the Mundrook Estate is being broken up. Taree, the chief town, is double the size it was, and the buildings are of a far better nature. For instance, instead of having the ordinary four-room weatherboard cottage, or plank cottage, they are going in for something artistic.

712. If the chief town has progressed, it is an indication that the district generally has done so? Yes.

713. You look upon it, I presume, as a live district? Yes.

714. As a district which has not seen its maximum settlement, but which is capable of very large expansion? Yes.

715. If the place has progressed during the last few years, in spite of the existing disabilities, how is an impetus to be given to its further progress by the construction of the proposed works;—you have shown that it has progressed, notwithstanding the bad entrance to the bar? It must progress more if you give the settlers greater facilities to get the whole life and substance of the district (the produce) to market.

716. I suppose the people would like to have an entrance which would admit a decent sized steamer, offering reasonable accommodation for passengers? Yes; I know lots of them who will not take a sea trip, simply because they are afraid of the entrance. They either remain there, or go overland, which is a long trip. The distance overland to Hexham is from 120 to 130 miles. It is a very long tedious journey, and the fare by land is twice the fare by steamer.

717. The greater portion of the stuff is droghered down to near the entrance to the river? It is droghered to the different wharfs and picked up by the ocean-going steamer.

718. You have heard of an agitation, which has existed for many years, for the construction of a North Coast railway? Yes.

719. If it became a question of improving the port and having no railway, or neglecting the port and having a railway,—which do you think, in the interests of that district and of the Colony generally, should be carried out? I have no doubt about the improvements of the port being the better scheme.

720. That will always be of more importance than a railway? It will be of more local importance; I do not know about the national importance.

721. Will not the settlers be able to make use of the water carriage at a much less cost than they could use a railway? Undoubtedly.

722. Does not that fact alone determine the question of a railway *versus* a port? That is how I take it.

723. Have the shipping community complained of the excessive rates of freight they have to pay? They have been complaining for a very long time, and they have got up an opposition on various occasions, but it has been too weak for the present company.

724. They naturally suppose that the improvement to the entrance would give them cheaper freights? Yes, and the state of the bar is the reason which the present company gives for maintaining its freights. It charges just the same from the Manning as it does from the Richmond, which is about twice the distance.

725. How does the Manning River rank among the rivers on the North Coast? I think next to the Clarence and the Richmond it is regarded as the most solvent and the best river with which to do business, and the best for settlement too.

726. In your profession you would have a very fair opportunity to know the position of the people? Yes.

727. Do you think the financial position of the district is solid? Generally, yes.

728. It has not suffered more than other districts in proportion during the late crisis? No; I think it is the best district up north, excepting the Clarence and the Richmond. I happen to know the Port Macquarie and Macleay districts well, and it is certainly before those districts financially.

729. It is possible that some slight improvement in the river might meet the requirements of the present population, but in view of largely increased settlement taking place there as a consequence of a large scheme

C. M. Boyce, scheme of harbour works, do you think it presents a case which would justify the State in spending a large sum in carrying out such works? Knowing the value of the district as I do—the fertility of the soil and the resources of the district generally—I certainly do.

13 May, 1898.

730. Possibly, in the future, when the improvements to all these rivers have been completed, it may be considered by the Government advisable to impose some rate of tonnage on the northern rivers for the purpose of obtaining some revenue to meet the interest on the outlay;—suppose it were a general scheme, which applied to all the northern rivers, do you think that there would be any serious objection to it? I would not like to answer for that, because there is always an objection to taxation.

731. The improvement of a harbour of that character differs very much from the construction of a railway, because from a railway you get a revenue, be it much or be it little, while from an improved port you get nothing;—under these circumstances, if very largely increased accommodation is given to the people, and they thereby obtain a large reduction in freights, do you not think it would be a fair thing to impose some rate of tonnage? I certainly think it would be a fair thing.

732. If the case were presented in that way to the public generally, do you think that they would accept the proposal? I do not think the better class of the community would raise any objection.

733. Is there room in that district for the present population to quadruple itself? I would hardly like to say that. I think there is room for the population at least to double itself.

734. Are the river-bank lands held in large areas—that is, large areas for the Eastern Division? Yes.

735. In areas of 640 acres? No; in smaller areas as a rule.

736. Are they nearly all conditional purchases? They have been conditional purchases, but a lot of them have been paid up.

737. Was it alienated in that way in the first instance? A good many of them away from the towns were, but the towns are mostly situated on old grants. They have been subdivided into farms and sold.

738. But the land generally in the district is held under conditional purchase tenure? Yes.

739. What would be about the average area? I suppose it would be from 50 to 150 acres. Of course, when you go up higher into the grazing parts, up to the high lands of the river, some of them have miles of land.

740. If there is no room for a large population it becomes apparent at once that there cannot be any very large export? There is no doubt that the export could be doubled in time.

741. I suppose that might fairly be expected from the land which is already held? Yes; and you would get a better class of farmers up there too.

742. The utmost is not taken out of the land by the farmers as a rule? No; they are the old style of farmers as a rule. Just now there are a few good farmers coming up from the South Coast—a better class of farmers, with more experience.

743. But the settlement which will take place will be above Taree? Some of it above Taree, and some on the tributaries below—up the Landsdowne, and in different parts.

744. On the north, how far is the nearest river to the Manning? The Camden Haven, which, I suppose, is distant about 20 miles. There is no steam communication to the Camden Haven; it is only supplied by sailing craft.

745. How do the settlers on the Camden Haven get their produce to market? Some of them bring it into the Manning, and others send it down by sailing-vessels as they come down with timber—ketches and schooners of from 60 to 80 tons.

746. How do they get their stuff to the Manning? They cart it over the main road to Cooperook.

747. Do you think that an improved Manning River would attract much of the stuff from the Camden Haven District? It would open up the lands between the two places considerably more than they are opened up. There is a great deal of land available for settlement between the two rivers.

748. Naturally, the Manning would be the port for that country? Yes.

749. The settlers immediately within the influence of the Camden Haven would possibly avail themselves of the small sailing craft trading there;—is there any land in that direction the trade from which would be influenced by this port if it were made available? Yes. The land, for instance, on the Upper Camden Haven is exceptionally fine dairying land, but it has not been utilised at all, simply because there is no carriage from Camden Haven, and they cannot rely on the steamer from the Manning. They cannot bring in butter and milk, and store it on the wharf.

750. It has been suggested that the Manning would become to a certain extent a shipping dépôt for all the trade from a considerable distance around it? Yes.

751. It has not been shown yet where it would come from, and I wish you to show me where the settlement is or can take place? The Johns River, an arm of the Camden Haven River, which runs towards the Manning, is open to a great deal of settlement. The land there is very good; but the few settlers who are there complain of the distance they are from any port of shipment. They also complain that the shipment to Sydney is precarious, and a few of them are thinking of throwing up their holdings.

752. Simply because they cannot get an outlet? It is simply because they cannot rely on getting their produce to Sydney when they want to send it away. They are away from intelligence as to the steamer; they do not know how to catch her; they cannot rely on her trips being regular; they do not know when to bring their produce in to send it to market; whereas if the bar were alright the steamer could make regular trips on regular days, and they could always rely on catching her. It would give a great deal more satisfaction, and lead to a great deal more settlement.

753. It would be a serious thing if these people brought in live stock, fowls, or cows, and missed the steamer; but that objection would not apply very strongly to maize? No.

754. Inasmuch as the settlers depend very largely on their pigs and fowls, they must have a certainty of getting them away when they bring them in from a long distance? Undoubtedly, or else they lose a great deal by it.

755. In some cases it means a total loss? A man who drove in 200 or 300 pigs would find that the steamer had either just left, or that she was bar-bound, or that she had not completed the trip, and he would have either to leave his pigs there, and pay for their being fed, or to take them all the way back. On the south the Wollomba is the next river. It is about 18 miles to the south.

756. You are aware that pig-raising is not an indication of a high state of farming, that it is generally resorted to by districts which are unable to go in for a higher class of farming, in consequence of being unable to get to market? Yes.

C. M. Boyce.
13 May, 1898.

757. By giving the settlers an opportunity to get to the outside world when they like, and with a degree of regularity and celerity, do you think that this state of affairs is likely to pass away, and that there will be a better class of settlement in the district? I certainly think so.

758. *Mr. Roberts.*] Have there not been numerous wrecks of steamers and sailing vessels in their efforts to enter the Manning River? Yes; the "Brunswick," the "Murray," and the "Fire King" steamers and the "Amy," and the "Trusty," small sailing vessels, were wrecked. Other vessels have got on the bar and got off again. I think the "Murray" was the latest steamer to be wrecked there.

759. Owing to the shallow water on the bar and the really perilous voyage which the people of the Manning feel that they have to undertake, it prevents them from journeying to Sydney to transact their business? Undoubtedly.

760. For that reason an agitation was got up to construct a North Coast railway? Chiefly.

761. Was the piece of training-wall, tinted black on the map, regarded as a success by the people with whom you conversed during your visit two years ago? Different opinions were held as to the effect it would have. Some persons thought that it would be a success, and others did not.

762. Did they give any reason for thinking that it would not answer the expectations of the designers? No, except that they did not perceive any great benefit accruing just at the time. The work had not been sufficiently advanced to enable anyone to form an opinion.

763. Is it not a fact that the pilot has to signal to masters of vessels which entrance they had better take? Yes; it certainly is a shifting bar. At the present time the steamer cannot get out till the bar is sounded and the channel defined. The captain does not know where the channel is at present and he is waiting till the bar is defined.

764. Is it not regarded as one of the most dangerous entrances on the coast? Certainly. Next to the Brunswick I think it is the most dangerous.

765. There is no shelter on either side from any of the prevailing winds? No.

766. It has sandbanks on the north and sandbanks on the south? Yes. The rocks on the north side lie too far back to afford any shelter to the bar.

767. When you are approaching the entrance the steamer appears to be going straight on to a beach? Yes; you always have to take a turn.

768. The entrance is scarcely discernable except to an expert? The only way you can tell is by watching the leading marks on the shore, otherwise I could not tell which was the entrance and which was not.

769. Is it not a common occurrence for steamers to be hard and fast on the bar when going in? You very often strike the sand on the bar. I have been on the steamer dozens of times when she has struck the sand and staggered.

770. The steamers have to wait on the sand-bar till the tide rises to enable them to get in? There have been instances of that.

771. Is it not really a frequent occurrence on the bar? Not so frequent now as it used to be, but sometimes they do stick there. The steamer usually waits for the tug; she will not go in by herself now.

772. After they get over the bar which is the next difficulty they encounter? After they pass the Painted Rocks they encounter the Narrows, about a quarter of a mile further up the river. These sandbanks carry a small depth of water.

773. Do the steamers often get blocked there? Very often. Sometimes they have to come down half loaded, to get over the Narrows, and they complete their loading on the outer side of the Narrows; they bring a drogher down all the way with the rest of the cargo.

774. That causes great delay? They lose a tide. It means twelve hours delay, and if there is only one tide in the day it means a day's delay.

775. They cannot always tell when they leave Taree whether they will be blocked at the Narrows, and the passengers and the produce are frequently delayed there for twelve hours? Yes; often. I have been delayed there a day and a half, and at other times I have gone back to Taree in the steamer.

776. You anticipate that by the erection of the training-wall that difficulty will be removed? Yes.

777. Where is the timber shipped at the Manning? The sawn timber is shipped from Cooperook and Tinonee. The railway sleepers and girders are shipped from various parts of the river.

778. How far is Cooperook from the Manning Heads by water? It is from 8 to 10 miles. It is about a mile and a half up the Landsdowne.

779. Is the Landsdowne River navigable? For sailing vessels beyond Cooperook. They can go up to Saville's wharf, which is some distance up the river.

780. Is not a good deal of maize grown on the Landsdowne? Yes.

781. Is not the land on the banks of the Manning amongst the finest land to be found in the Colony? Undoubtedly the land on the banks is.

782. It is remarkable for its fertility, and it is capable of growing anything? Yes.

783. Is the land on the Landsdowne of similar character? Yes.

784. On what part of the river is dairying going on? It is carried on right along the whole length of the river now. They have separators up Callaghan's Creek, above Wingham. They are carrying on dairying right along the whole length of the river to the Heads.

785. Are many of the farmers giving up growing maize? No; they are keeping on maize-growing, and dairy-farming to a large extent.

786. Which pays them better? They consider that dairying is paying them better than maize just now. They get their returns every month, and always have some ready money, whereas with maize they get their returns only once a year.

787. Is all the good land on the Landsdowne taken up? No, there is land available there yet.

788. I suppose the land on the banks of the river is taken up? Yes; right up to the top of the Landsdowne—as you go back towards the mountains.

789. Do you think settlement will follow the construction of these harbour works? I think that with increased prosperity to the district other persons will be induced to go there and take up the land which is available there, even with a little more carriage to pay than those who are there now have.

790. What sort of timber do they send from Cooperook and from Tinonee? Hardwood, such as blackbutt and tallow-wood.

791. The Manning River enjoys a reputation for the quality of its timber? The Manning and Camden Haven, and the ridges in between.

792. Is there a sawmill at Cooperook? Yes; and one is being erected at Hanging Rock, 4 or 5 miles above Cooperook.

- C. M. Boyce. 793. Is there not a saw-mill at Tinonee and at Scott's Creek? Yes.
- 13 May, 1898. 794. A large quantity of timber is sent from the Camden Haven? Yes; there are five mills on the Camden Haven.
795. What towns are there on that river? Laurieton and Kendall; Kew is on the main road, about half a mile from the river.
796. With the exception of the timber, all other produce is sent by way of the Manning? Either by way of the Manning, or in the trading cutters or small vessels.
797. These harbour works, if carried out, would be a great convenience and advantage to the residents of Camden Haven? Undoubtedly. All the passengers and all the perishable produce come over to the Manning from Camden Haven.
798. There is a large amount of good agricultural land in Camden Haven? Yes; the famous Comboyne Scrub is at the top of the Camden Haven, where they say hundreds of families could settle if it were thrown open.
799. Is there not a good quantity of wine produced in the Manning River district? A fair quantity.
800. The land is well adapted for the growth of the vine? Excellently.
801. Coopernook would be the shipping-place for the Camden Haven produce? Yes.
802. Going up the Manning from Coopernook, which is the next town? Croki.
803. There are a good many towns on the Manning with a fairly large population in each of them? Yes, five or six.
804. Is not Croki the centre of a very large farming district? Yes; there is an exceptionally large area of farming-land around Croki, and very high-class land too.
805. Is Jones' Island somewhere near Croki? Croki is on Jones' Island.
806. There you find some of the finest land in the Northern district? Undoubtedly.
807. What is the highest price you have known that land to be sold at? I have known farms of about 20 odd acres to be sold for £600—that is, nearly £30 an acre.
808. What would be its value to-day? I think it is fully worth that, if not more.
809. Going still further up the river, which is the next important town you come to? Ghinni Ghinni, at the other end of Jones' Island.
810. That is also a very important farming centre? There are good farms around it? The Motto and Cundle Plains are around it.
811. The next town is Cundle, where there is a fairly large population? Yes.
812. And numerous farms? Farms all around it.
813. Is that where the well-known Cundle Plains are situated? Cundle Plains are part of the estate on which Cundletown is built; they run to the back of it, and down along the river.
814. Do you know the area of Cundle Plains estate? It was originally one of the very largest grants in the Northern district? It measured 10,000 or 15,000 acres originally, but it has been subdivided and sold to a large extent. I do not know the area of the estate at the present time.
815. Was it not used for pastoral purposes many years ago? A great deal of it is so used now, and a good deal of it is under cultivation.
816. Is the land well adapted for agriculture? It is splendid land; it only wants a little draining.
817. There are very fine farms on what is known as the Upper Landsdowne? Yes there are good farms out there. They draw to Cundle or to Savill's wharf. They send all their produce by way of the Manning.
818. From Cundletown you come to Taree? Yes.
819. Which town is regarded as the capital of the Manning? Taree.
820. Do you know the population of Taree? I think it is from 800 to 1,000.
821. How many banks has it? Two—the Commercial Bank and the Bank of New South Wales.
822. For many years Taree was the head of navigation? For a great number of years.
823. How far do the ocean steamers go now? Up to Wingham, which is about 32 miles by water from the Manning Heads.
824. These harbour improvements, if carried out, will be an advantage to people along the banks of the river, and further up for a distance of 30 miles by water? Yes; but Wingham is the shipping port for people at least 25 or 30 miles above that. They come down all the way from Tiri.
825. All along this river the land is capable of growing anything a farmer may wish to grow? Certainly.
826. And all along the river is a settled population? Yes.
827. And every few miles you come to a township? Yes.
828. After leaving Wingham, there is very fine land on the Upper Manning? Some of the best land is up Woodside way. Perhaps the most productive soil on the river is comprised in the Woodside and Maryville Estates.
829. Are there any very old estates up there which have been devoted to farming for very many years? The Woodside Estate, Maryville Estate, and Mount George.
830. When entering the Heads, which are the most dreaded winds that have to be encountered? The south, south-east, east, and south-west winds.
831. There is no shelter of any kind? There is no shelter of any kind from those winds. You do not want shelter from the west winds, because they are usually calm winds.
832. When a steamer from Sydney is unable to enter, where does she take shelter? It all depends on the wind. With a south wind she would take shelter at Cape Hawke, or if she had got past there, not knowing that she could not get in, she would take shelter at Crowdy Head, which is 5 miles away.
833. She could only get shelter there in a southerly wind? If it came on to blow from the east she would have to go. It is a straight headland which shelters a vessel from the south wind only.
834. The steamer could not get in at Cape Hawke? No; the bar is too shallow.
835. Do the people expect both the railway and the harbour works to be carried out, or would their interests be served by carrying out the harbour works? I think their interests would be served if this scheme were carried out, and it were effectual.
836. If given a good entrance, it is fair to assume that all the produce, at any rate, the produce grown on the banks of the river, would go by steamer? Yes; except when there is a gale such as we had during the last few days. As a rule it would go by steamer.
837. Do you know the other rivers on the North Coast? I know the Hastings, the Macleay, the Wollomba, and the Camden Haven.

838. Do you not think the time has arrived when something ought to be done for the settlers in these districts? Certainly I do. C. M. Boyce.
839. What other rivers run into the Manning? Ghinni Creek, the Dawson, Scott's Creek, the Cedar Party, and Dingo Creek. 13 May, 1898.
840. Is the Dawson navigable? No; vessels do not go up the Dawson.
841. To which shipping place do they bring their produce? On the Cundle side, to Cundle; and on the Taree side, to Taree.
842. All along the banks of these creeks there are very fine farms? Yes; for a good distance up.
843. And all round Tinonee, between Taree and Wingham? Yes.
844. Do the ocean-going steamers call there? Yes.
845. Going from Hexham, and crossing the river at Tinonee, about how many miles is it from the other side to Taree? Tinonee is 3 miles from Taree.
846. Does not a very large traffic cross there? Yes; it is the main North Coast road.
847. Is there a bridge over the river? No; a punt.
848. They have been asking for a bridge for many years to accommodate the large traffic along the road? Yes.
849. When you get across to Tinonee, is not the land from the Manning River up to the town of Taree of a very high-class character from an agricultural point of view? Yes; that is the Taree estate. It has been subdivided and sold lately.
850. Used it not to be leased to farmers? Yes; they used to get a rent of from £1 to 30s. an acre for it.
851. Was it sold by auction recently? Some of the estate was sold by auction during last month. I do not know the price it fetched then, but I know it fetched £25 an acre some time ago.
852. *Mr. Black.*] How large is Jones' Island? Driving across the island, it is from $3\frac{1}{2}$ to 4 miles across one way, and I suppose it is from 2 to 3 miles the other way.
853. It is all fit for farming? I think it is the best bit of grazing land on the North Coast. It is exceptionally fertile. It is one fine alluvial flat surrounded by water—the Lansdowne, Ghinni Creek, and the Manning.
854. The estimated cost of the complete scheme is £223,500, but Mr. Darley thinks that by reducing the length of the breakwaters and the training-walls, the cost might be reduced to £100,000, in addition to the £20,000, which has been spent on the northern training-wall;—do you think there is any justification for expending that large sum to improve the entrance to this river? I do. There are a considerable number of settlers up there. I have travelled over a great deal of the Colony, and I really think the land up there is about as fertile as any land in the whole of the Colony.
855. Do you think that these works, if carried out, would merely afford an entrance and an anchorage for the steamers, or would it permit them to go up the river and collect their freights? They go up the river as it is. It would not make any difference, so far as that matter is concerned, except that they would be able at all time to cross the Narrows.
856. I understood that there are several shallow flats on the river? There are; but the steamer manages to get past them. The worst sand flat is between Pelican Bay and the entrance; it is one mass of shifting sand, and occasionally a steamer cannot go over it until she is lightened.
857. How do you account for the presence of the Narrows there;—where does the loose sand come from? It is owing to the sandy formation of the country.
858. Do you think it is caused by the scouring action of the tide over the sandspits? They have been there for years. I think it is owing to the nature of the country.
859. Where did it come from? I think the sand was there before the river broke out. I do not think that this is the old entrance to the river; it has two entrances.
860. You have had a flood many times, which would have cleared it out;—it must have been renewed surely? The flood would carry it out to a certain extent, and the sand on the bar too, but a heavy easterly wind draws that sand in and increases the Narrows.
861. You think these shallows inside are caused by the easterly gales? They are kept up by them. I could not say they are all caused by them. It must be from a quarter to half a mile across there. It is one vast deposit of sand. The river flows over the top of it to a depth of only 2 or 3 feet in places. In some places it is dry at low tide.
862. The Department are of opinion that by the erection of these training-walls which would narrow the channel, the tide would not only scour out the channel, deepening it, and removing the shifting sand banks in the Narrows, but would also effectually remove the bar? It would narrow the rush of water to at least a quarter of the space it occupies. If the tide is confined to a small space it should have the effect of scouring the entrance and the Narrows.
863. Does the water break over the part where you see it is proposed to put a rubble stone facing? I do not think so. As far as I can see the object of the engineer in proposing to put a rubble stone facing there is to break the rush of water coming down the river in flood time. Certainly the water does not break over there.
864. Have you formed an opinion as to what kind of works are necessary for the improvement of the river? I think that is the best class of work which is shown on the plan.
865. Do you think these training-walls will be effectual without the breakwaters? That is a matter entirely for an engineer to say. I should not like to hazard an opinion on that matter.
866. You could not say whether, without breakwaters, there would not be a danger in times of heavy weather of sand which accumulates at the entrance, and which is covered at high-water being scoured away by the tide and deposited in the channel? No; I think it would be scoured and carried too far off to be any danger there. The great rush of water would scour the sand out for some distance.
867. That which is caused by the gale may be immediately removed by the floods, but they may not occur coterminously? They may not come together.

TUESDAY, 17 MAY, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Manning River.

Henry Richard Carleton, Principal Assistant Engineer, Harbours and Rivers Branch, Department of Public Works, sworn, and further examined:—

H. R.
Carleton.
17 May, 1898.

868. *Mr. Hoskins.*] Have you visited the Manning River recently? Yes.
869. Did you find that the works which have been undertaken by the Department were answering well? Yes, fairly well. The inner portion of them was rather successful. There was rather a large sandspit accumulating on the southern side of the northern training-wall.
870. Is that large sandbank between the training-wall and the entrance increasing? No; it is much about the same. I reported the matter to Mr. Darley, and asked him to put on a dredge to dredge along the wall, and endeavour to induce the current to follow the line of the wall.
871. Do you think that when the works at the entrance are completed, you will be able to remove absolutely that obstruction to navigation—the sand-bank—between the proposed breakwaters? I think we will get it out long before the work is completed.
872. Had it diminished a little before the last gale? I do not know that it had. It extended in a southerly direction from the present north training-wall across to what I may term the channel, to about half-way over to the wreck of the "Murray."
873. Do you think that the sand-bank must be dredged away; that the scour caused by the training-walls will be sufficient remove the sand? I think it will be desirable to assist the scour by dredging, at any rate, along the wall, and induce the current to run that way, and having once put a cut through there, I think the current will remove the rest of the spit.
874. When the sand has been disturbed by dredging the probability is that the flow of the water of the river will carry away more? Yes; once a channel is dredged along the wall parallel to it, and a cut is made through there, I think the tidal action will remove the rest of the stuff on the southern side.
875. The opinion has been expressed by Mr. See and others that the entrance to the Manning is about the worst on the north coast;—can you say, as the result of your recent visit, that the work which has been undertaken has made the entrance more easy of access and more safe; that it has given a greater depth of water? It is not sufficiently far extended to improve the bar yet. It has improved the inner crossing decidedly.
876. Where did the recent gales cause damage to the works? The waves went right over the wall, and washed some of the top off.
877. Do you intend to prevent that from happening again by increasing the height of the wall? I think that will be the best thing to do.
878. If you do increase the height you will back it up by filling in with the sand dredged from the river? Yes; anything we dredge there will be pumped over the wall, and will help to support it.
879. Did your recent visit confirm you in the opinion that by the expenditure of this money the entrance to the river and the navigation of the river would be improved? Yes; I think we are working on the right lines to create a fairly safe and navigable entrance.
880. And to give a fair depth of water in the channel up the river? Yes.
881. Have you received any report from the local officer as to damage caused by the recent gales? We had a telegram in regard to the Manning, in which we are informed that the sea came right up to the entrance, and cut some of the top off the training-wall. About 1 foot of the wall is already replaced.
882. Have you heard whether, during the recent storms, vessels were afraid to enter in consequence of the roughness of the sea at the entrance, that the work which has been carried out did not offer them a sufficient guarantee of a safe entrance? I do not think any vessel would have attempted to enter the Manning during that gale, especially when they are so close to Port Stephens.
883. *Mr. Roberts.*] Will you explain the difference between the work suggested by Sir John Coode, and the work which is now proposed by the Department? We do away with the wave-trap which he proposed. Instead of continuing the north training-wall as shown on the plan, and forming a northern breakwater in that way, he proposed to go off the northern beach with his breakwater, and form a wave-trap over that portion of ground marked by the wreck of the ketch "Amy." Our present proposal does not extend either of the walls nearly so far as Sir John Coode proposed to do in his scheme; but the completed scheme is very much on the lines of his scheme. The greatest variation is the omission of the wave-trap. Another very important difference is the extension of the inner training-wall up stream. That is not included in his scheme. It is a very important part, I think, in connection with the harbour works, because it prevents the current running along the northern bank, it contracts the river channel.
884. What is the Department's estimate for the completed scheme? £99,800.
885. How much money has been spent there by the Department? About £23,000.
886. How much is it now proposed to spend? Practically £100,000, in addition to what has been spent.
887. Does that include the cost of the two breakwaters? No; to construct the two breakwaters we would require £81,800.
888. The entire scheme would cost about £180,000? Yes.
889. Will these two breakwaters be found absolutely necessary in the near future? I think not. I think we will get a sufficiently good entrance by the construction of the walls shown by full red lines on the plan.
890. What depth of water is there on the bar, and what increased depth do you expect to get? There is very good water, so far as the walls have been constructed, right along them all the way and for some distance

distance beyond the ends of them, but the bar is no deeper now than it was when we commenced the work.

891. How deep was it when you were there last? I went out at high-water. I daresay there were 8 or 9 feet at high-water. H. R. Carleton.
17 May, 1898.

892. What depth do you think it would be fair to expect that you would get for the works? Twelve or 14 feet. Probably we would get that depth at low-water.

893. That would give ample water for a larger class of vessel? Yes, for a better class of vessel than is running there.

894. Is not the Manning one of the most difficult entrances for shipmasters to negotiate? It is a nasty one. The headland is on the northern side, and there is no protection from the southward. It is at the northern end of a bay also, and it receives the full sweep of the sea across that bay.

895. Is it not just like approaching a beach? Yes; it is somewhat similar to the Richmond in that respect. Each of them has a headland on the northern side, and both are equally bad bars.

896. Is it true that the pilot has to signal to masters of vessels telling them which entrance to take if there is more than one entrance;—does it not shift about in a mysterious way? Yes. The pilot finds out where the best water is, and he erects leading marks on the shore for the guidance of vessels entering, but a great many of them use the tug now.

897. An entrance does not remain stationary for any lengthy period? That is quite correct. It fluctuates, but not so much since the northern wall has been constructed. I recollect when the entrance was to the north of where the wall is at present. It can never come there again; we have driven it further south.

898. Do the Government subsidise a tug for the Manning? Yes.

899. There is a large traffic in timber by sailing crafts? Yes, to all the rivers. I think thirteen sailing vessels came out of the Camden Haven only the other day.

900. *Mr. Lee.*] How long had they been there? They were detained there by the late bad weather.

901. They must have been there for a fortnight? Fully that.

902. *Mr. Roberts.*] In anything like an easterly gale, it is a common thing for vessels to be detained for two or three weeks in the northern rivers? Only in case of a gale like the one we had last week.

903. That was an exceptionally heavy gale? Yes. They do not have any very long periods of detention now.

904. Having got over the bar at the entrance to the Manning, is there not some difficulty in getting past what is called the Narrows? I explained I think just now, that our work inside the bar has decidedly improved the inner crossing, but is not sufficiently far advanced to improve the depth on the bar. The Narrows are decidedly better than they were.

905. Having got over the Narrows is there a fairly good depth of water in the river? You can go straight to Taree then, a distance of 19 miles.

906. From Taree can you go to Tinonee and Wingham? You can go to Wingham. It is not quite so good above Tinonee; it is rather bad at the back of the island off Taree. There are one or two bad spots up the river. The coastal boat goes to Wingham.

907. Constantly? I think she goes invariably now, and if she does not, it is not from lack of depth of water; it is simply to make the round trip in a given time that it stops at Taree. The river has been well dredged between Tinonee and Wingham.

908. *Mr. Lee.*] A question has arisen as to the probable cost of the stone for these works. You have estimated what the cost of the stone is likely to be per ton; but so far we have not been able to find out that the stone can be obtained for that money. Will you explain where you propose to get the stone to carry out these works, and under what circumstances you put it down at not exceeding 4s. 6d. per ton? The stone for the Manning River works is obtained from Crowdy Head, a headland about $4\frac{1}{2}$ miles north of the entrance to the river. It is excellent stone, and there is any quantity of it.

909. To which head will you have to make a tramway? There is a tramway in existence; it is the property of the contractor. Our contract rate for depositing stone there at present is 3s. 9d. a ton.

910. Is that the price for landing it, or for placing it on the works? That covers everything. We pay 3s. 9d. a ton when the stone is deposited in the wall, and not till then. It has to be up to a certain standard. Every ton of stone is passed over a weighbridge, and weighed in a truck.

911. Of course it is supplied in sizes, according to your instructions? That is regulated by the inspecting officer. If it is not up to our standard he rejects it, or puts it into a lower class.

912. Your arrangement is to pay so much a ton for suitable blocks placed in position, not so much a ton for what is taken out of the quarry? No; we pay for the material deposited in the wall.

913. That price will include the use of the tramway? It is a contract at the Manning, and the contractor has to find the plant himself.

914. Suppose you could not get on with the contractor, and you had to make other arrangements, where would you be then? We would start in and do it ourselves a little bit cheaper than he is doing.

915. There would still be a tramway to construct? It is probable that we would have to take over the present tramway from the contractor at a valuation, or let him take it out, and we would put in our own.

916. Suppose that by subsequent events you were compelled to take it over, would it necessitate any large addition to your estimate? No; it would be covered by our rate per ton. That rate per ton covers the cost of all plant, the construction of lines, the quarries, or the construction of punts and steamers if we find it necessary to bring the stone by water.

917. For some portions of the work you will have to take the stone by water? Yes, and you will find in the estimate that the rate per ton is increased for the double handling. The rate for the material in the southern walls is somewhat higher than the rate for the material in the other work.

918. As a matter of fact, one rate is only 2s. 5d. per ton for a length of 1,287 feet? That is our actual rate with the present contract for similar stuff used in the wall. If he can do it we can do it at the same price.

919. You are estimating that these works will take so much stone at so much a ton; but suppose you are out in your calculations, and you find that owing to the depth of the sand, or to your getting into deep water, it will take 50 per cent. more stone? I do not think the depth of the sand has anything to do with it, because as soon as we find that it scours down to a certain depth, we take care to prevent it going any further.

920. You cannot prevent a certain quantity of stone being swallowed up? Our estimate is a very liberal one. We allow for scouring down to 12, 14, and 16 feet; in some places, 22 feet, perhaps.

921.

H. R.
Carleton.
17 May, 1898.

921. Your object is to get a certain depth, 12 feet, and possibly 16 feet? Yes; but in preparing the estimates there are many places where we allow for the wall scouring very much deeper than that.
922. At times there is a very great displacement of sand;—what percentage of stone have you allowed over and above what would be sufficient if there was no displacement? We had a line of soundings along the line of the wall, and then we estimate that perhaps, 2, 3, 5, 10, or 15 feet of sand along the line of this wall may scour out, and we allow for filling up from that up to our level of 2 feet above high-water, or whatever the wall is fixed at.
923. That is as deep as you think the scour is likely to be? Yes; they are always very liberally made. We allow for scouring out deeper than it generally goes.
924. Do you think it is possible for a work of this character to involve an expenditure similar to that which happened at the Hawkesbury when, instead of, as they thought, a few thousand tons of stone filling it, it took nearly 1,000,000 tons, owing to the displacement of the mud? I do not think a similar thing is likely to happen in carrying out harbour works. I do not think such a formation could exist in any of the rivers. If we had such soft material as that, instead of having a deposit of silt it would all scour out; you would have a big hole there. In the case of the Hawkesbury River there was no tidal action, and therefore there was no scour to remove the mud. There is not the slightest probability of our meeting with such a thing in carrying out these harbour improvements. If there was such material in the rivers, we would have deep water instead of the bars we have.
925. You are prepared to give the Committee your assurance that a very liberal estimate has been made over and above actual requirements, to provide for a contingency of that sort? Yes; we estimate to scour down to at least the depth we hope to get in the channel.
926. What do you allow in your estimate to cover contingencies—10 per cent.? No; it is the estimate of quantity which is taken out very liberally. There is no percentage added in that way. After having estimated that it will scour down to, say, 15 or 20 feet below low-water, we take out the solid contents of a wall constructed over that line, and then we deduct a fifth from that for voids. That gives us the quantity of material in that wall. As a rule, we find the scour is not as great as we anticipated, consequently we save a deal of material.
927. I presume there would be conditions in some places where the scour would be very great? Yes; and when that occurs it is never of any great length, because we immediately check it by putting the small stone from the quarry over the bottom, coating it and preventing any further erosion.
928. Can you draw a comparison between the works which have been completed on the Tweed River, and the proposed works on the Manning River;—are they in any way similar? In the case of the Tweed and the Manning they are very similar.
929. You are aware that training-walls of great length have been constructed on the Tweed with very small stones, and those walls appear to have stood remarkably well? Yes.
930. Are you in a position to say whether there will be as much or more scour here than there is in the Tweed River? There will be more scour. I do not think we will be able to put the stone in the work as cheaply as we did there. We had a remarkably good quarry at the Tweed.
931. Do the conditions on the Manning differ so much as to lead us to suppose that works which have been successful on the Tweed will not be successful there? No; we will get exactly the same results on the Manning if we construct the walls.
932. Is it a fair assumption that if the work on the Tweed has stood well and answers its purpose, a similar work will also do so on the Manning? Yes; I think, if anything, we can allow for a somewhat better result on the Manning, because the watershed is bigger and the river is larger, and we have more flood-waters to assist us.
933. I presume you will use medium stone for the inner portion of the training-wall and larger stone for the rest? Exactly; we will never be able to put in the stone and maintain the works as cheaply as we did on the Tweed. On the Tweed, the quarry was simply a heap of road metal, and we only had to take it out. I think it ranged from 1s. 11d. to 2s. 1d. a ton for the work in the walls at the Tweed.
934. Can we safely take that as an evidence of what can be done by using small stone for inner training-walls? You can rely on that.
935. Would the peculiarities of the configuration of the stone in any way account for the success of the work on the Tweed? It would be a great mistake to use the water-worn material in any of the walls. It would be a mistake to use any boulder-shaped stone at all.
936. The stone which would come out of your quarry would be blasted out, and, consequently, it would have irregular faces? Yes; it is a solid mass of rock at Crowdy Head.
937. The stone will not be dressed in any way? No random stone.
938. You find that the best for the purpose? Yes; it interlocks itself.
939. Is it basalt at the Tweed;—what is it at Crowdy Head? Vitrified sandstone.
940. Will it fracture in the same way? We shoot it up. We take the large blocks to the large works; and the small stuff which is made by the shooting goes to the inner wall.
941. Do you think the Committee will be on solid ground if they take the works at the Tweed River as an object lesson as regards the design, the class of the effectiveness of the works? Yes. We will get deeper water in some cases than we got at the Tweed. We will get a better scouring power. They have a fine rainfall at the Tweed, but the watershed is not the same there as it is in the case of other rivers.
942. You are obtaining excellent results inside the bar of the Tweed? Yes.
943. By carrying the training-walls down to a certain distance, but not to the rock? We could not get out on the bar with that material; we would have to go to another quarry to do so.
944. Is it not a fact that in heavy weather a tremendous sea beats over the walls in the lower portion of the Tweed? Yes.
945. Yet they have stood it? Yes; but it would not do to go much further out on that assumption.
946. Do you propose to go closer to rough-water than you did at the Tweed? We do not allow any stone under 4 tons in the north wall at the Manning. At the present moment that is our contract.
947. You ought to obtain similar results here by using larger stone? Yes.
948. Do you think that the design could be improved upon? I could not improve upon it. Mr. Darley thrashed it out as fully as it could be done. I do not know whether anybody else could make any other suggestions.
949. Are you satisfied that it is a design which, if carried out according to the proposal, will give permanent

permanent results? I think we shall get a fairly stable entrance to the Manning, if the work is carried out on the plans before the Committee.

950. *Mr. Black.*] The position of the Manning somewhat resembles the position at the Tweed? It is very similar. The headland is on the northern side in each case. H. R. Carleton.
17 May, 1898.

951. It is not such a bold northern headland at the Manning as at the Tweed? No; it is nothing like the magnitude of the Tweed headland. At the Manning there are only two small headlands on the northern side, and these are some distance in from the bar.

952. Is it because the bay which you intend to enclose with training-walls is so near the entrance that you have not left an opening as you did in the works at the Tweed? No; it is because we do not expect the shipping to stop down there, it will go up the river. At the Tweed there is a township on the northern bank, and we had to make provision for vessels to get in there. A vessel which goes into the Manning goes straight up the river.

953. How is it that you did not think it necessary to have wave-traps at the Manning, as you have at the Tweed? Because I do not think that the shipping will lie down there. The object of a wave-trap is to intercept the waves and to enable a ship to lie easily at the wharf without any great range.

954. Do you not think that there will be any waves to trap there? There may be waves, but there will be no vessels there for them to hurt.

955. I thought the object of the wave-trap was to protect the training-walls? No; it is to protect a vessel lying at the wharf in front of the training-wall.

956. But when the vessel lies behind the training-wall, what then? There is no necessity for a wave-trap in that case. The object of the wave-trap at Newcastle is to make it very much easier for vessels lying at the Queen's wharf.

957. Do you think the northern training-wall at the Manning is absolutely necessary? I think it is one of the best portions of the scheme.

958. You think it is necessary for narrowing the channel and increasing the scour? Yes; to prevent the river running along the rough northern foreshore.

THURSDAY, 2 JUNE, 1898.

[The Committee met at the Court-house, Taree, at 11 a.m.]

Present:—

FRANCIS AUGUSTUS WRIGHT, Esq. (TEMPORARY CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

The Committee further considered the proposed Harbour Works at Manning River.

John Thomson, storekeeper, and Mayor of Taree, sworn, and examined:—

959. *Temporary Chairman.*] You are aware that there is a scheme before the Committee to construct certain works at the entrance to the Manning River;—have you ever examined a plan of the works as proposed by the Engineer-in-Chief, partly Sir J. Coode's scheme, but with a modification of it? I have visited the place, and I have a personal knowledge of the work now being carried on. J. Thomson.
2 June, 1898.

960. I suppose that during your long residence in Taree you have had occasion to go occasionally to Sydney by steamer? I have.

961. Have you ever experienced any difficulty in going out of the river and coming in? There is considerable delay at times, and the crossing of the bar is always carried out with a large amount of difficulty and considerable danger, and there is always an amount of uncertainty.

962. What class of steamers visit this place? The "Coraki" is the regular trader. She is one of the fleet belonging to the N.C. Co., and she is exchanged at times for other boats as occasion arises.

963. Do you know what water she draws loaded? About 7 ft. 6 in. loaded, I think.

964. Could a vessel of larger tonnage come into the port with safety? Not now.

965. What are her freights from here to Sydney? Maize is carried at the rate of 10s. a ton

966. Including drogherage? Yes.

967. And the return freights from Sydney? Dead-weights, 12s. 6d.; other weights are calculated on the basis of 15s. per ton measurement. The measurement rates are most unsatisfactory. They are very erratic, and consequently a great deal of friction arises about the charges. They never book any parcel at less than 1s.

968. What do they charge for crates of poultry and things of that kind? For poultry they charge 4d. per pair, the consignees providing their own coops. You can put as many in a coop as you like.

969. Eggs, and things of that kind? Eggs, 1s. and 1s. 3d. per case, according to size. A 1s. 3d. case would hold about thirty-six dozens.

970. Do you consider those freights high? As compared with the freights from other rivers they are high; but I have every reason to believe that in the event of better facilities being introduced they would be reduced.

971. Do you think that if the bar were deepened and a better class of vessels could visit the river, you could obtain a reduction of the freights? Yes; I have it on the authority of the company.

972. Is a reason for the comparatively high freights the difficulty of navigation? Yes; and the rate of insurance.

973. Can you tell the Committee the average depth of the water on the bar? We have two difficulties at the entrance to the river. There is what is known as the bar which is the direct crossing from the ocean into the river, but half a mile further up there are the narrows or sand flat inside, and when the bar is deep the narrows inside, as it is now, are very shallow. Last week there were 11 feet on the bar, and only 6 ft. 9 in. on the narrows.

974. Is that occasionally reversed? It is always reversed. When the narrows are deep the bar is shallow.

975. Can you mention any assignable cause of that? Only the effect of the wind; and there is a considerable quantity of drift-sand on the place occasioned by the tugs and tides.

976.

J. Thomson. 976. It arises from various causes of which you do not know all the details? Yes.

2 June, 1898. 977. The portion of these works which it is now proposed to carry out is to cost, practically, £100,000, which is a large sum of money to spend on the improvement of the river;—supposing that the people of the Manning had their choice of having £100,000 spent on the entrance to the river or having the proposed railway constructed, which do you think they would select? The question is hardly a fair one, because £100,000 spent on the bar, I presume, would mean the completion of the works at the bar.

978. Yes, to make an entrance with 12 feet of water? That being so, £100,000 would go no way in the construction of a railway.

979. It is not a question of respective cost, but supposing that the alternative were put to the people of the district, "Would you prefer a railway constructed to Taree or your river made navigable with a depth of 12 feet of water on the bar," which would they select? Taking the district as a whole, and the intermediate districts which a railway to Taree would serve, I think that the greatest good for the greatest number would be given by the railway.

980. There can be no doubt that, whatever may happen to the Manning and this district, the Government of New South Wales are morally bound to give a proper outlet by the river for its traffic; I think that is inevitable;—do you take the same view as I do, that no matter what else may be done, that work should be carried out? Yes. I said this morning, when giving evidence with reference to the proposed railway, that there are a number of people on the river who can be served only by water, and our present situation is that we are entirely cut off from any centre when the bar impedes navigation.

981. In fact, all the lower part of the river—Cooperook and around there—can be served only, as things now exist, by water? Yes.

982. And considering that aspect of the question alone, you think that the Government are justified in spending the money at the entrance to the river, and the people are perfectly justified in asking for a fair means of access, so that there may be no obstacle in the way of communication between them and the metropolis of the Colony? Yes.

983. I suppose you know nothing technically about the works—you do not profess to be an expert in any way? I know nothing further than what I have noticed as a layman and what I have heard from other people.

984. What are the general comments on the proposed scheme? The general comments from persons whose opinions I think are worth considering are to the effect that the works being carried out at the Heads at the present time, being on the northern side, are not likely to be efficient, and that no complete entrance will be made, and the improvements will not be anything like effective until the southern breakwater has been constructed.

985. That is the contention of those people whose business it is to watch the place? Yes, pilots and other men continually on the spot.

986. They contend that without the construction of the southern breakwater a perfect entrance cannot be made? Yes.

987. Why do they assert that? Because all our bad weather comes from the south and south-east, and when the wind comes from the south or south-east it backs in sand and closes up the entrance. The south beach is more exposed than the north. We have a natural breakwater on the north in the "Painted Rocks." I may say, though, that the beach extends very much further east than the "Painted Rocks," and the works on the northern side have done this amount of good—the channel does not work northward at certain seasons of the year, when the winds vary, as it used to do. The wall, so far as it has been extended, has had the effect of stopping it, and now the same service is required on the southern side. The easterly gale two or three weeks ago had the effect of carrying away a large amount of the south beach, and some of the timber that had grown on it was swept away, and there is every probability of another channel breaking out, which will mean that instead of being as it is now even, a wide entrance and shallow, it will be still wider and consequently more shallow.

988. The present idea is to confine the river within certain training-walls, and thereby affect a scour by having a narrower body of water with more velocity and greater force of current, so as to permanently keep the bar scoured out? That idea is accepted by all gentlemen watching the matter here too.

989. But local residents think that will not effect the entire object unless the southern breakwater be carried out? Yes. The water cannot be confined without the southern breakwater.

990. Do you know that the complete scheme is estimated to cost £220,000 if all the works be carried out as shown on that plan, but the officers of the Harbours and Rivers Department assure the Committee that by the expenditure of £100,000 a good permanent entrance with about 12 feet of water will be obtained;—you say that the local people who know something about it are doubtful about that? I say that it depends on where the money is to be spent.

991. It is not going to be spent on the breakwater on the southern side? Then I am of opinion that though it will help materially it will not give a perfect entrance.

992. As far as your knowledge goes, by the inside works you will not obtain the satisfactory result which the Departmental officers anticipate? Just so. The work as it is being proceeded with shows that the scour is forced on the southern side, which is always considered the most dangerous part of the navigation.

993. Your contention is that the breakwaters, especially the southern breakwater, must be extended to make the entrance a perfect one? That is my contention.

994. You tell the Committee, from information you have received from people resident on the spot and also from captains and others, that unless the southern breakwater especially be carried out they do not think that the object of making a good entrance will be secured? Quite so.

995. *Mr. Black.*] Do steamers of any size ever come up to the town of Taree? The boat that trades to Sydney always comes to Taree.

996. The "Electra," is it? No, she does not come to Taree now; she had to go away on account of the shallowness of the water. The "Coraki" is coming here now.

997. What does the "Electra" draw? I think 8 feet or 8 ft. 6 in.

998. And the "Coraki" draws about 6 feet, does she not? About 6 ft. 6 in. She can carry 1,000 bags of maize, I think, and draw 6 ft. 6 in.

999. Do you know that we have it on the sworn evidence of an engineer that with a little dredging you could have 12 feet or 14 feet of water all up the river as far as Taree? I have not heard that, but I

submit

submit that that evidence does not bear on the case, because the proposed work will not affect the navigation of the river farther than a mile from the entrance. J. Thomson.
 1000. If, with a little dredging, a steamer drawing from 12 feet to 14 feet could come up the river, and if with the construction of harbour works, the bar be so removed and the channel deepened that a vessel drawing 12 feet or 14 feet could enter almost at any state of the tide, then, obviously, if your trade warrants it—the bar being removed and a dredge being, as I understand it will be, permanently kept in the river—you will have vessels drawing from 12 feet to 14 feet coming up to your town if those improvements be made;—do you not think that, under such circumstances, the passage by sea would lose many of its terrors for passengers, and that your goods would be more speedily and more certainly taken to market than they are now? Certainly they would. As part of my evidence, I should like to submit a copy of a return of the exports of the district, as compiled from a reliable source, showing the importance of the trade and the exports from the river. These have been carried away by steamers, and are a fair example of what the exports are each year. This return is for 1897:—

EXPORTS.

Place.	Year.	Passengers.	Cattle and Horses.	Pigs.	Tallow.	Butter.	Cream.	Eggs.	Hides.	Poultry.	Chaff and Grain (maize excepted).	Fruit.	Oysters.	Maize.

George Ricketts, master mariner, Taree, sworn, and examined:—

1001. *Temporary Chairman.*] You are the local manager for the N.C.S.S. Co. ? Yes. G. Ricketts.
 1002. *Mr. O'Connor.*] How long have you been on the river? I have been stationed on this river as manager for the steamship company twenty-five years last April. I had been trading here previously. I came here first in the year 1862, whilst I was trading on the coast. My first trip to this port was in command of a sailing coastal vessel. 2 June, 1898.
 1003. Have you been connected with the port ever since? I first traded here for ten months in 1862, and I traded here off and on afterwards.
 1004. Are you the local manager for the company of which Mr. John See is one of the directors? Yes.
 1005. Would you kindly, with your experience, give the Committee the benefit of your opinion with regard to the proposal now before us? I think that the training-wall has gone out sufficiently far at the present time on the north side, but I think it will be totally useless unless the southern breakwater be constructed.
 1006. Will you say why? The water coming down from Pelican Point at the present time is cutting away the dry sand-spit on the extreme end of Mitchell's Island on the south side, and I believe that when a flood comes down it will cut away a great deal more. I have seen all that sandy point disappear before. Then there is a possibility that both the northern breakwater and the inner training-wall there now will be sanded up.
 1007. What is the effect of the work already completed? The effect of the outer breakwater has been to bring the channel a long way south; it has brought it into its original position years ago, and I believe it has deepened the water on the outer bar.
 1008. If the proposed training-wall on the south side be carried out to the extent of the firm red line, will not that be most efficacious for the present? Yes; the sand-flat on the north end of Mitchell's Island, on the south side of the channel, is a dry sandbank, and at the present time it has gone into a flat, and the high water flows right over the point into the river. Where it used to be a high sand-flat previously it is cutting away. In almost all bad weather we have had it has been cut away before, but it makes up again into a dry flat.
 1009. The gist of your evidence is that that northern extension would be altogether useless unless the southern work be completed? I think it would be useless without the southern portion.
 1010. But if the southern training-wall be erected to the firm red point, that would produce something like the results anticipated by the Department? I believe it would.
 1011. And it would be safe for the navigation of steamers up to 300 or 400 tons? Yes; I think it would command at least 12 feet of water.
 1012. *Mr. Fegan.*] What is the average depth there? At the present time there is about 9 feet on the bar; sometimes it is only 6 ft. 6 in. on the bar. We have had for a long time 6 ft. 6 in. and 6 ft. 9 in., and have had to go out only partly loaded.
 1013. Is any dredge working there at present? No.
 1014. Therefore it is allowed to silt up? It shifts every day; in fact, the inner flat shifts at the present time almost every hour. A vessel can now get to the flat point opposite Mitchell's Island, but then drops into 6 ft. 6 in. or 7 feet of water at high water.
 1015. How do you manage to get up at low tide? The ocean steamers cannot cross anywhere there at all at low tide; it is only the river boats that can cross then. There is about 6 ft. 9 in. this morning at high water at that particular spot.

- G. Ricketts. 1016. But the ocean steamers can come up to the flat opposite Mitchell's Island at low tide? Yes, just inside—up to the training-wall.
- 2 June, 1898. 1017. After crossing that, how far from there can you come up towards Taree at low tide? If you cross it you can come right up to Taree with plenty of water.
1018. What is the width of that? It is an immense sand-flat, with little channels. There is one little channel running down to the Heads on the east side of that flat. It is all in little crooked channels. There are no defined channels at present.
1019. There is half a mile of sand-bed there? Yes.
1020. In reply to Mr. O'Connor, you said that the work that has been carried out by the Department up to the present time has made the channel much deeper? Yes, on the bar itself.
1021. Or, in other words, it has given a better scour than there was previously? Yes, on the bar.
1022. But the work will not make a good approach until the southern training-wall be completed? Yes; and the northern training-wall requires to go a long way farther to the westward—the inner one. It ought to go up three-quarters of a mile further to the southward and westward.
1023. What place would that be nearer to? Nearer to the land on the west side of the channel above Harrington—what they call Fresh Water Creek; the creek that drains the swamps.
1024. Do you think that if that were done first it would be sufficient to made the stream much better than it is at present? Yes.
1025. What are your reasons for saying so? I think we would have a straight run of tide. By confining the water between those two walls it would confine the tide, and consequently would scour out the sand, and would secure a uniform depth of water. Inside the river it most certainly would do so; but possibly it might carry the outer bar farther out.
1026. Without constructing the southern wall? By constructing the northern training-wall farther out you may carry the sand-flat out with it.
1027. Do you think, as a man of large experience, that there is a probability of doing that? No; I do not think it would. In my opinion, to set to the southward would carry the sand away.
1028. Do you think that that result might be obtained by extending this northern wall? The inner wall, with the south wall too.
1029. You wish the southern wall to be done in any case? Yes. It will never arrive at anything without the southern wall, in my opinion.
1030. What is the distance across Mitchell's Island? About 400 yards.
1031. How far do you feel the stress of weather up the river? The last gale we had came right across the point of Mitchell's Island, where there is a dry sand-spit. It came right across the top of it, and there was a big sea inside the harbour; it caused a vessel to go ashore.
1032. Which vessel? The "John Gollan," tug-boat.
1033. What was her tonnage? About 50 tons.
1034. *Temporary Chairman.*] As to the bar shifting farther out, what depth of water have you outside the present entrance? It drops off gradually from the bar at the present time. It is 9 feet, and in a few casts you get 18 feet, until you get to 3 or 4 fathoms.
1035. It drops very sharply? Not very sharply; but from 9 feet it will drop down 6 feet for about 200, and it drops very rapidly after that.
1036. Is there a southerly set in there? Yes; sometimes a very strong one.
1037. So any sand driven out of the river will be carried to the south beach? Yes; down the Manning Bight.
1038. Out of the way of the river? Yes.
1039. But there is a danger, with a strong south-easterly gale, of that being driven back again? Yes.
1040. And hence your contention that the southern breakwater is a necessity? Yes.
1041. That is, to prevent south-easterly gales from driving the sand across the mouth of the river? Yes, and to prevent the sea from washing it in over this bank.
1042. You think that, with the construction of the southern breakwater, that is a danger always likely to happen? Always will occur.
1043. That a strong south-easterly gale will force the sand back, and so form a bar? Yes.
1044. *Mr. Black.*] The Harrington bar is considered one of the most dangerous bars on the coast? Yes, I think it is about the most dangerous. It and the Richmond bar are about equal—being open to the ocean.
1045. Sailing vessels cannot very well come in without the assistance of the Government tugs? They cannot now, but they used to do it before there were Government tugs.
1046. You mean to say that if there were no tugs they would be able to come in? They would be compelled to come in. So long as there is wind enough to let them in they are bound to come in.
1047. But it is not very safe for them? With the assistance of the tug it is, of course, safer for them.
1048. Does that northern headland give any protection from north-easterly gales? Not a bit. Crowdy Head shelters the bar somewhat from the east with true north-easterly weather. Crowdy Head standing out to the eastward of the Harrington Bar shelters it somewhat, and there is not quite so much sea there as there would be with the same amount of wind round to the south.
1049. But the south and south-east winds are the most dangerous to the entrance, are they not? No. Easterly gales bring a bigger sea in as a rule, but a heavy south-westerly gale is the worst for this bar, because it brings down with it a cross sea and a heavy ground swell. I have had worse seas there with a south-westerly gale than I have ever had with any other wind—more difficult to come in with, because you have to let go your anchors inside and track them up.
1050. It is, then, very dangerous to make the entrance in south-westerly weather? Yes; with a sailing vessel, with the assistance of a tug, it is dangerous.
1051. You have to keep well off the north point, I suppose? You have to take the vessel as far south as you can, and if you have not a tug-boat, and your vessel will not stay, she goes ashore. I have assisted a great number off that beach under the same conditions.
1052. The entrance to the river is fairly free from rocks, I believe? No rocks at all at the entrance to the river.
1053. Then, if you have a good scour, you may get any depth of water? Yes; you may get 34 feet or 36 feet of water. I think you go down pretty well to the bed-rock then—on the bar itself.
1054. Do the easterly gales ever cut through the sand-terraces opposite the oyster-beds? To my knowledge the sea may have spread over, but never cut through. 1055.

1055. Then I presume that the portion of the southern training-wall which stands by itself is intended to receive the current as it comes down the river, and throw it into the centre of the channel? Yes. G. Ricketts.
1056. In order to prevent the scouring or cutting away of the sand terraces on the southern side? That portion marked there is the oyster-bed rocks, and that is where it would have to be commenced. It has a solid bottom, and that is the place I would start from. 2 June, 1898.
1057. Can you add anything to what you have already said? The only thing to be done now is to go on with the present work—the inner training-wall—and to start the southern one as soon as they possibly can.
1058. *Temporary Chairman.*] In the event of these works being the success predicted by the officers of the Harbours and Rivers Department, and a permanent depth of from 12 feet to 15 feet of water being obtained on the bar, and in the river also, do you think that the North Coast Steamship Company will be likely to reduce their freights? Seeing that it will possibly be twenty-five years before you get the southern training-wall completed, I hardly know what to say. Another generation will have sprung up by that time. I cannot form an opinion.
1059. The southern breakwater cannot be constructed until the southern training-wall has been constructed to give them a means of access to it? Certainly. You would have to commence with a training-wall, and the breakwater to follow.

Thomas West Dugdale, storekeeper, Taree, sworn, and examined:—

1060. *Mr. Black.*] What evidence have you to offer? I have been a resident here for a long time, and I know that there has been a great loss to the district through the detention and destruction of property, especially perishable produce, on account of the shallowness of the bar; and on account of the difficulty and danger in passing in and out, we have suffered great inconvenience and loss for many years. I have been a resident in this district for about forty years, and I have seen it, you may say, from its infancy, and have seen how things have gone on since I came to the river, and the amount of loss sustained has been enormous—the loss of property and perishable produce. The want of a proper entrance has been felt to my knowledge for a great many years. Sometimes the bar is passable, but on other occasions it is very dangerous. I think it is one of the most dangerous bars on the North Coast. An attempt has been made to some extent, and some work has been done at the northern training-wall, but my individual opinion is that they commenced on the wrong side altogether. They should have commenced on the southern side. My knowledge of the bar is pretty considerable. I have watched it for many years, and my impression is that the southern training-wall ought to have been commenced first, because the south winds, which are the worst winds we have on the coast, and the south-east winds carry the sand which crosses the bar and fills up the entrance. There will be scarcely any good effected unless the southern training-wall be constructed. I believe the money will be wasted that has been already expended unless the southern training-wall be carried out, and I think that the inner training-wall if continued up the river along the south side along by Mitchell's Island is very necessary. These works are necessary for the river improvement, and if it be possible that we shall not get the railway, I am sure that a still greater necessity exists for the harbour works. T. W.
Dugdale.
2 June, 1898.
1061. Have you considered the relative advantages of the railway, and the improvement of the entrance to the river? For the general advantage of the whole district and of the Northern districts, I believe the railway would be the better, because there is a very large extent of country to be tapped by the railway. Of course the Manning River taps only the lands adjoining the river, but the railway would be of great advantage for the sake of the whole of this district, and the districts to the north of us.
1062. Is there not as much good land, and perhaps more good land, adjacent to the river throughout its course, as there would be to the railway, taking mile for mile? Yes; of good land, but it is localised.
1063. Do you think that £1,000,000 could be more advantageously spent on the proposed railway to Taree or £100,000 on the improvement of the river? At the present time I think the expenditure of £100,000 on the harbour works would be more advantageously spent.
1064. You bring your goods by steamer from Sydney now, do you not? Yes.
1065. How much per ton do you pay? I think 40s. per ton measurement and 12s. 6d. per ton dead-weight.
1066. You trade with Sydney then? Yes.
1067. If a railway were constructed to Taree, would you continue to use the river or would you use the railway? I think that for perishable produce the railway would be preferable.
1068. What perishable produce do you import from Sydney? My shipments are very small just now, and cannot be taken as a criterion.
1069. What perishable produce do you get from Sydney? In store-goods we get a very good supply.
1070. But they are not perishable are they? Not from Sydney, but I mean the exports.
1071. In the event of the railway being constructed, would you continue to trade with Sydney by steamer, or would you use the railway? I think the railway would be preferable.
1072. You would use the railway yourself? I think so.
1073. Do you think there is any likelihood that the railway would carry your goods at 12s. 6d. per ton dead-weight and 40s. for goods that are measured? I do not know. I do not know their tariff. I have had no experience with the railways.
1074. Suppose that you were charged double or perhaps treble by the railway, what would you do then? I do not think the goods would be conveyed by the railway then. I think the water-carriage would be the cheaper.
1075. In that event the railway, so far as you are concerned, would be used only under exceptional circumstances? I think it would depend greatly on the charge for freight.
1076. If the cost of carriage by railway were two or three times the cost of water-carriage, you would use the railway only in exceptional cases? Yes, I think so. I think the water-carriage would be preferable under those circumstances; but that refers principally to the Manning River and Manning River Districts.
1077. Do you think that the perishable products you were speaking about just now—and I suppose that when you speak of perishable products you mean dairy produce and eggs, and articles of that kind—would bear the cost of railway transit to Sydney or Newcastle? I cannot answer that question.
1078. You do not know? No.

T. W.
Dugdale.
2 June, 1898.

1079. But if they would, that would be the preferable route because of the quickness of transit? Yes; you have to compete with other districts in regard to that kind of produce, and there is great loss in that direction.

1080. How often do the steamers arrive here? Sometimes twice a week. On the average, I believe, once a week. I cannot say exactly; I have not taken particular notice.

1081. Do you not think that, for your trade and township, that is a sufficiently regular service? No, I do not, because the detention at the bar is very great sometimes.

1082. But when the steamer is arriving twice a week there can be no great detention at the bar? Yes; but sometimes there is a great detention and a great loss in consequence.

1083. Supposing that, through the improvements to the river you had a tri-weekly service and no detentions, excepting such as were caused by great gales, when it was impossible for vessels to venture either in or out, do you not think that you would have a fairly good service? Yes, I believe there would be a good service.

1084. Now, supposing that, through the construction of these training-walls and the scouring caused thereby which removed the bar, you had from 12 feet to 14 feet of water there, and that the dredging of two or three flats which lie between here and Harrington, gave you a depth of 12 feet or 14 feet of water throughout at high tide, and that in consequence of that a larger type of vessel could trade with the river, and supposing that, as a result of this you had a more frequent service, and in consequence of the increased size of the vessel and the increased safety of the bar lower freights, do you not think that land competition would be well nigh impossible? Yes, I think it would, unless there were a corresponding reduction in the freight by rail compared with the water-carriage. We are all living in hopes that that will be the case.

1085. I suppose you are aware that on the northern rivers, in consequence of the dangers of the entrances, insurances are very high? Yes.

1086. If the entrances were made safe, entailing a reduction of insurance charges, that would mean a corresponding or almost a corresponding reduction in freight? Yes, it would.

1087. Supposing that you got such a reduction, say of 5 per cent., do you think it would be asking too much if the State were to impose as an annual charge a tonnage due of about 1 per cent on the expenditure incurred in improving the river? I do not understand your question.

1088. Supposing that through this improvement of the river at public expenditure you had a 5 per cent. reduction in freights, would it be too much for the State to ask that 1 per cent. of that should go into its coffers as tonnage dues to recoup the State Treasury for the expenditure which would have caused the reduction in freights? I think that the risks would be very nearly the same.

1089. Would you not give 1 per cent. in order to get 5 per cent back? Yes, I would.

1090. Do you not think you would have a long way the best of the bargain? Yes, I believe so.

1091. Do you not think it would be a good investment? Yes.

1092. You do not think that the people of the district are so economical as to grumble at being asked to donate 6d. where they get 2s. 6d. as a consequence of the donation? I do not think the people would be very well pleased. I think that the district is entitled to the expenditure without any refund to the Government for the works done. We have been, to my knowledge, for forty years asking, and until lately we never had £1 spent on the entrance to the harbour.

1093. Do you not know that they make such charges in other parts of the world? There may be such charge; but I do not think that a charge for tonnage dues should be imposed on the Manning River district.

1094. Then, you would rather go without the improvements to the river? No; I think we are entitled to the improvements without any charge being made by the Government, and I think it is nearly time we got them.

1095. Do you know that all the vessels that go into Sydney Harbour pay heavy wharfage and tonnage dues to the Government for the money expended there? Yes; I know that.

1096. Why should any exception be made in the case of the Manning River? I do not think it would be very pleasing to the population. I think there would be a general outcry against tonnage dues. I think we are entitled to have the harbour improvements if we do not get the railway, and to have the improvements free of any expense to the people, seeing that we have had nothing done for so many years, and there is a large population settled here.

1097. Supposing it were made a condition that you should not have the improvements to the harbour unless you consented to the payment of tonnage dues—what then? Of course, we would have to submit.

1098. *Temporary Chairman.*] Are you aware that if the railway were constructed—the distance being 220 and odd miles from Sydney—and if you were to pay the ordinary railway freights, you would be charged about 50s. per ton for the goods you now get for 12s. 6d.? I do not know that.

1099. That would be the ordinary rate for goods, such as wine and spirits, drapery, packed ironmongery, and goods of that sort—between 50s. and 60s. a ton—that is if the same rates were charged as in other parts of the Colony; sugar, salt, and iron you would, perhaps, get at half those rates. The lowest rate on our railways is for grain, and the freight from here to Sydney would be 13s. per ton. Therefore, the freights generally would be from 13s. to 70s. per ton? We are paying 13s. per ton by water.

1100. You pay 10s. for maize? About that.

1101. The railway freight would be 13s., and according to the class of goods the freight would go as high up as 70s.;—do you think, in view of those circumstances, that if a railway were constructed to Taree, you would be likely to patronise it? I think so. Perhaps those people living adjacent to the river banks would prefer the steamer under all risks; but the larger population would avail themselves of the railway.

1102. *Mr. Hassall.*] Supposing if it were to cost you £2 10s. to get goods to Sydney by rail from Taree, and you could get them by boat for 12s. 6d., which mode of transit would you patronise? The boat, of course.

1103. If you could get your goods cheaper by a bullock-team from Newcastle than by a boat, you would patronise the bullock-team, would you not? Yes.

1104. You have lived in the district a long time? Yes.

1105. Does much of the produce of the district go through your hands as a general storekeeper? Not much of it now.

1106. With regard to your own business, are you pretty well satisfied with the mode of transit of your goods at the present time? No; I am not.

1107. Then, to remedy that, you say that certain improvements might be effected in the river? Yes.
1108. And you think that the country would be justified in expending a certain amount of money on the improvement of the river, and thereby to remove whatever impediments there are now to the navigation of it? Yes.
1109. If the railway were constructed, do you think that it would compete successfully with the water-carriage? I cannot express an opinion upon that. I think that a large quantity of perishable produce would go by train.
1110. Where are the general public who are going to be benefited by this railway if it be constructed? If you were to reside in this district you would soon find that out.
1111. The population is distributed along the various water-courses and the little valleys running from them, the people utilising the land, I presume, for agricultural and grazing purposes? Yes.
1112. And doing their best to make a living in that way? Yes.
1113. The population being scattered and able to cross the water-courses only at certain points, it must of necessity be that a considerable amount of road-carriage would have to be done even to reach the railway? Yes.
1114. Therefore, if the residents could reach the water, perhaps having to travel a few miles farther, and then have the benefit of the water-carriage, would they not patronise the water in preference to the railway? I think so.
1115. I suppose there is a considerable amount of business done in and about Taree? A fair business.
1116. How many times does the steamer run in here a week? Once, and sometimes twice, according to the state of the weather.
1117. Pretty well loaded every trip? Yes.
1118. Does only one steamer come here? Yes.
1119. Does that steamer meet the requirements of the trade? Sometimes.
1120. And sometimes you have to wait for an order to be executed? Yes.
1121. But if there were no hindrance at the mouth of the river, either coming in or going out, you think that one steamer could meet the requirements of the district so far as the carrying traffic is concerned? Not the present steamer, but a larger boat might do it.

T. W. Dugdale.
June, 1898

FRIDAY, 3 JUNE, 1898.

[The Committee met at the School of Arts, Cundletown, at 10:30 a.m.]

Present:—

FRANCIS AUGUSTUS WRIGHT, Esq. (TEMPORARY CHAIRMAN).

The Hon. DANIEL O'CONNOR.
JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.

The Committee further considered the proposed Harbour Works at Manning River.

William Mills, boatman, Cundletown, sworn, and examined:—

1122. *Temporary Chairman.*] Already the sum of £23,000 has been spent, and it is proposed by the Harbours and Rivers Department to spend an additional £100,000, so as to take the southern breakwater out 900 feet, to run the training-wall shown by the firm red line, and to continue the other training-wall as shown on the map;—what is your idea of the effect of these works? I think it would be very good if the southern wall were there.
1123. If the departmental officers say that the construction of these works, at a cost of £100,000, will give you at all times 12 feet of water on the bar, and they propose to dredge the river so as to allow a boat drawing 10 feet to come up at any time, do you think that will be of some advantage to the Manning River? Yes; and the result will be cheaper freight.
1124. And if that work were carried out, you think the river would get all it wants in the shape of transport? Yes, for the present.
1125. Vessels could come in and go out at any time? Yes.
1126. With that work constructed, and with boats of the "Electra" type able to trade here, you think the wants of the district would be fairly met? Yes, I do.
1127. Can you tell the Committee what effect the piece of work already done has had on the river? It is not yet up to the mark; there is not enough done yet to show what the effect will be.
1128. But we are told that along the wall already constructed the river is rapidly deepening? At this end it is, but not at the mouth. There is nothing to protect the entrance to the river.
1129. The south-easterly gales drive the sand up into the mouth of the river? Yes.
1130. And until the southern breakwater be partly constructed you think that that will always happen? Yes.
1131. But if the southern training-wall be built—and that is the first work to be carried out, you think that that will protect the entrance of the river from south-east winds? Yes.
1132. How long have you been employed as a boatman on the river? About ten years.
1133. And your occupation as a boatman has made you fairly familiar with the river, and you have known times when vessels have been bar-bound and could not get out, and other times when they could not get in? Yes; I have seen the steamer stuck on the flat two or three days.
1134. It is proposed to carry out those works I have spoken of, and when they are completed the contention is that, with the assistance of a little dredging in the channel, a natural channel would be scoured out and kept scoured out by the construction of those works; and you believe that would be the case? Yes; I believe that will be the best thing for the district, for the present, at any rate.
1135. *Mr. Hassall.*] Is there not a place on Mitchell's Island where the sea-water and the river-water are very close together? There are 200 or 300 yards between them.
1136. Is that the narrowest portion? About the narrowest, I think. I do not think the river will break out, but the sea might break over.
1137. The river is never high enough to carry its water over? No; I have not seen it go over there.

W. Mills.
June, 1898

- W. Mills.
3 June, 1898.
1138. There is so much vent for the water at the back that there is no danger of its going there and breaking out and assisting to make a new channel? No.
1139. The breakwater, to make a good harbour entrance, should be carried out at the entrance as proposed? Yes; that is the proper place.
1140. You think that some protection might be required where it is proposed that a rubble-stone facing shall be erected? I do not know that it wants anything there; but it wants a southern wall, as I have said, to prevent the sand from silting up.

FRIDAY, 3 JUNE, 1898.

[The Committee met at Croki, at 2.45 p.m.]

Present:—

FRANCIS AUGUSTUS WRIGHT Esq. (TEMPORARY CHAIRMAN).	
The Hon. DANIEL O'CONNOR.	THOMAS HENRY HASSALL, Esq.
JOHN LIONEL FEGAN, Esq.	GEORGE BLACK, Esq.

The Committee further considered the proposed Harbour Works at Manning River.

George Allan, farmer, Oxley Island, sworn, and examined:—

- G. Allan.
3 June, 1898.
1141. *Temporary Chairman.*] How long have you been residing in the district? Fifty years on the 16th January next.
1142. You are one of the oldest residents? I believe I am the oldest now.
1143. Do you know anything about the scheme before the Committee for deepening the bar and improving the navigation of the river generally? I have had a good deal of experience of the bar.
1144. Do you know anything about the scheme before the Committee? I do not know much about that.
1145. It is proposed to run a training-wall along the southern bank of the river down to the sand-spit, and to carry out a breakwater 900 feet long at the end of it, and it is also proposed to run another training-wall along the northern side of the river down to the work already done, and it is said that by the construction of these works the flow of the river will be narrowed and the scour will be increased, and that with the assistance of a little dredging the channel will be deepened, and the bar will be permanently removed;—what is your idea of that scheme? I believe it will greatly improve it. Many times I have assisted vessels that have got on the southern spit. We had to unload them, and remove the cargo to the northern side and reship it there after the vessel had floated in off the southern spit.
1146. It is supposed by the engineers that carrying that southern training-wall down, and carrying the breakwater out 900 feet beyond the sand-spit, will prevent the south-east winds from driving the sand into the mouth of the river? You will be past all danger beyond the southern spit. I was wrecked there twenty-five years ago in the "Fire King." We were disabled on the outer bar, and the vessel drifted on to the northern spit and became a wreck.
1147. Was she totally lost? Yes.
1148. It is proposed by the Government to spend £100,000 on this work; the completion of the northern breakwater is not included in that, and only a portion of the southern breakwater; but the engineering staff say that the expenditure of £100,000, in addition to what has already been spent, will make a fairly good harbour, giving 12 feet of water on the bar at all times, and that with the assistance of a little dredging there will be the same depth of water in the river; if that is accomplished, will it meet the wants of the river? Yes, I believe it would.
1149. If you have a bar and river capable at all times of admitting boats of the size of the "Electra," will that be sufficient for the trade of the place? It will be sufficient for such trade as has been done during all my lifetime here.
1150. Do you think that the proposed works are likely to be useful? Certainly they will be useful. I believe that the northern training-wall will not be of much use unless there be something done on the southern side. There has always been more danger on the southern than on the northern side.
1151. By reason of the south-east winds heaping the sand up on the bar? Yes.
1152. If the southern breakwater and the southern training-wall be constructed, you believe that will be stopped? Yes.
1153. The original proposal was to spend £220,000 on the harbour works; £23,000 have already been spent, and the engineers say that if an additional £100,000 be spent, they think that the works will answer all the purposes required of them—that they will give you 12 feet of water on the bar, and that with a little dredging and the natural scour of the river, you will have a river navigable all the way to Wingham, with a fairly good depth, and always a good bar;—if that were done, I do not suppose you would want a railway? No; not for the lower part of the river anyway.
1154. The river banks are the richest part of the district? Yes, they are by far the richest.
1155. And the bulk of the settlement is on the banks of the river? Yes.
1156. And therefore the people there would be served better by a river with a good entrance than they would by the railway? I believe, honestly speaking, that 1 acre on the banks of the river below Taree is worth 10 acres above Wingham.
1157. The railway would serve only that portion of the river—it would not serve the lower portion? It would not serve the lower.
1158. And as the railway is estimated to cost £1,000,000, and to entail an annual loss of £31,000, do you think the Government had better spend money on the lower part of the river in making you a good harbour? Yes; it would certainly improve the lower part of the river.
1159. And it would do more good, I suppose, to the majority of the people than the railway would? It would, in my opinion. It would give facilities for freight of all kinds.
1160. It would be cheaper to the State and better for the people? Yes. A railway would be only for passengers and live stock.
1161. For carrying heavy goods the railway would be too expensive? Yes.
1162. Therefore, even if the railway were constructed, and if you were to have a good harbour, the bulk of the trade would go by sea? Yes; it is the cheapest freight to send all produce by.

1163.

1163. Do you know anything of the mountains at the head of the river, towards Gloucester? Yes; I have been there often.
1164. A great deal of that country is very rough, is it not? Yes.
1165. Unsuitable for settlement? There may be some of it about the Barrington and other places suitable for settlement, but the greater part of it is not fit for settlement.
1166. On the Barrington and about Gloucester there is some good land? Yes.
1167. But that all belongs to the A.A. Co.? Yes.
1168. And the proposed railway would pass through their land for 52 miles? Well, they should give whatever of their land is required for the construction of the railway.
1169. Do you think the taxpayers of this country would be justified in spending £1,000,000 to bring a railway to Taree, and then suffer an annual loss of £31,000 besides? I cannot see it.
1170. You think that they had better devote their attention and money to making your natural port better than it is now? Yes. If they can improve it as much as they have improved Newcastle Harbour the last fifty years it would be of great benefit to everyone.
1171. The engineers tell us that they could get from 12 feet to 15 feet of water on the bar and all the way up the river under this scheme, and you think that if they do that it will be a good permanent work, and beneficial to the district? It would.

G. Allan:
3 June, 1898.

Izra Perrett, farmer, Croki, sworn, and examined:—

1172. *Mr. Black.*] You heard the evidence given by the previous witness? Yes.
1173. Do you confirm it? I can confirm it.
1174. Is there anything that you would particularly like to add? I hardly agree with him so far as the railway is concerned. I think the railway would be a great blessing to the people on the river. The expenditure would be enormous, and consequently that would be a detriment; but, at the same time, I think that the railway would open up a large area of country that would be fit for the production of fruits, vegetables, and such things. There is one thing to be borne in mind. This North Coast is not subject to heavy droughts as many parts of the Colony are, and consequently I believe that in times of drought this North Coast will be a great blessing to the metropolis and people in general. It is well known that in times of drought Sydney suffers very much from want of vegetables, and many other things, which have to be brought from Melbourne and Hobart and other places, and I believe that we could supply these things quite as well in times of drought. I think that many thousands of acres could be brought under fruit cultivation. I believe we have some of the finest land between here and Port Macquarie that there is in the world for growing fruit, especially oranges. It has been said that the country lying between Taree and Port Macquarie is the home of the orange, and it is a well-known fact that Manning River oranges are now inquired for in Sydney, and have been for a good many years, and I think the railway would be very serviceable in this respect. Not only so, but I think you would derive a large revenue between the various townships and the rivers, such as the Macleay and Port Macquarie, and other places, leaving out altogether the revenue to be derived by the railway to Sydney and Maitland. There is a large traffic along the North Coast; in fact, you can scarcely look out without seeing some one travelling one way or the other, and I think that many people would dispense with the use of their horses and would use the railway.
1175. Do you know that the freight to Maitland by train would be at least twice as much as the freight to Sydney by water, and that the freight to Sydney by train would be about four times as much as the freight to Sydney by boat? I suppose it would—a great deal more, at all events.
1176. Under those circumstances, do you think the people would be likely to use the railway when they have water carriage so much cheaper? I think they would for perishable goods.
1177. Why for perishable goods? Because very frequently they deteriorate in value in going from the rivers to Sydney, and very often they are altogether spoilt.
1178. How—through delay? Yes; for instance, fish.
1179. There is a scheme proposed for the removal of the bar and the improvement of the river which will take away the cause of the delay;—if you were to have an improved entrance, and steamers of a more powerful character going up and down the river, they would be able to run to Sydney from the mouth of the river in about eight hours; you could not get round by the railway as quickly as that? I suppose it would be quicker, would it not? It is not the length of the passage by steamer, but the delays at the bar of which we complain.
1180. But this scheme is for the removal of the bar;—supposing that the bar be removed, and you get 12 feet or 14 feet of water at the entrance, and steamers are able to come in and go out in all weathers, excepting gales, and you have a larger class of boat than is now trading here, and supposing that this larger class of boat, through the dredging of two or three shallows on the river, is able to go as far up as Taree, do you think that, with such a convenience, you would have any need for the railway or be likely to patronise it at all? That would do away with the necessity for a railway to a very great extent, I believe. So far as I am concerned, I may say that the steamer would suit us best on the lower part of the river; but I cannot speak for the people of the district generally.
1181. *Mr. Fegan.*] How far do you live from here? Just across the paddock.
1182. I believe you were one of the men who started the dairy industry here? My son did.
1183. Is he making that business a success? Yes, quite a success.
1184. So much a success that he has given it up? No.
1185. I mean personally, and is devoting his energies to something else? He is keeping that on.
1186. Not by his own labour? Not altogether his own labour. He is here sometimes.
1187. It has been such a success that it has enabled him to employ men instead of doing the work himself? Yes.
1188. How many cattle has he? I cannot say how many.
1189. I suppose you are interested in it? Not in his dairy; he rents land from me.
1190. What is your area? I own about 200 acres altogether.
1191. How many cattle are there on that 200 acres? Some 200.
1192. That is a beast to the acre? It will carry more than that.
1193. Without having to drive them elsewhere during portions of the year? Perhaps in time of flood you have to remove them.

I. Perrett.
3 June, 1898.

- I. Perrett.
3 June, 1898.
1194. But in ordinary weather? In ordinary weather you can keep that number of cattle there.
1195. What did you grow on that land previously? Principally corn.
1196. Which pays you the better? The dairying—a great deal.
1197. So you found out that easy work is not always the best-paying; maize-growing is easy work, is it not? Oh, no. You have to work early and late to earn anything at all.
1198. But since your land has been cleared, it is comparatively easy work? Not at all.
1199. There is no necessity to get up at 3 or 4 o'clock in the morning? Perhaps not.
1200. But you have to do that with dairying? We get up about 4 o'clock.
1201. And must be at it late again at night? Sometimes.
1202. But it pays much better than maize-growing? Yes; I think that of the two, the dairying is the easier. We have longer hours, but we have a long spell in the middle of the day.
1203. Well, if it pays better, and is easier work, so much the better for those who carry it on? Yes.
1204. Whatever produce you have, you ship from here? Yes; at the wharf.
1205. How many butter factories have you here? Only one, and several creameries.
1206. How many creameries have you? Four belonging to this company.
1207. Does the butter factory take all the cream of the various farms round about here? The factory here does generally, but the other company comes here sometimes.
1208. So you do not send a great deal of the cream out of the district? We do not send much cream out of the district, but we send butter.
1209. The farmers individually do not send their cream out of the district, but to the butter factory? Yes, generally; but I think there is an exception or two.
1210. The owners of the butter factory take the cream from the farmers and ship the butter to places where they have a market? Yes; to Sydney generally.
1211. What is the price of butter here at present? I think 1s. 1d.
1212. That is a fair price for butter, is it not? Yes; but the supply of milk is very small now.
1213. Owing to the cold weather? Not only that, but we have had a heavy gale and very high tides which destroyed the grass.
1214. But you have no doubt that the dairying is preferable to any other industry which you have been carrying on on these rivers? Yes.
1215. Is the 12s. 6d. freight by boat the average freight which has been paid on these rivers? I cannot say. We have not sent anything for many years. Before we took to dairying we fattened cattle, and found that that was better than growing maize.
1216. To where did you send your cattle? We sold them on the rivers. Sometimes they were bought and sent to Sydney.
1217. And sometimes they were sent to Maitland? Yes.
1218. But not very often? Not very often.

Edward Albert Sheather, fisherman, Jones' Island, Manning River, sworn, and examined:—

- E. A. Sheather.
3 June, 1898.
1219. *Mr. Hassall.*] You see the plan of the river showing from Pelican Point down to the entrance at Harrington;—it is proposed to carry out certain works in connection with the entrance to this river, by running a training-wall along the eastern side of the river and out to the southern entrance, and then carrying a breakwater out 900 feet to protect the entrance from the south-easterly winds and the drifting sands; it is also proposed to run a training-wall along the western bank of the river, following right round past the township of Harrington to the pilot station, and continuing it out to the northern breakwater; the black line shows what work has been done, and it is proposed to extend that work out on the north and form a breakwater, and then to continue the training-wall along the sand-flats right up to nearly opposite Pelican Point; you have seen where the work has already been done? Yes.
1220. Has the erection of that wall had the effect of deepening the channel in any way? It has had the effect of improving the bar greatly.
1221. The work already completed has had the effect of materially improving the bar? I believe it has benefited me personally to the extent of £50 by the steamer getting more direct communication.
1222. By being able to come in better than she did before? Yes. After Christmas, and from that to midwinter, the bar generally shoaled up and split into three small channels, but since the training-wall was put there it has not done so.
1223. It has kept the one channel open the whole of the time? Yes.
1224. That is of great advantage to the steamer coming in or going out? Yes. That channel shifts to and fro, but a very small distance compared with what it used to do.
1225. But it still retains the one channel only? Yes.
1226. If this other proposed work were carried out, what do you think the effect of it would be—say, commencing at the southern sand-spit? At the present moment the water strikes the present training-wall just below the pilot station, and that has the effect of diverting it across to the southern point of the entrance.
1227. When the current is diverted in that direction, what effect does it have on the low sand-spit at the southern entrance? According to my recollection, it has never been as deep along the spit there as it is at the present moment. It was always shallow previous to the construction of the training-wall.
1228. But since the training-wall has been completed below the pilot station it has had the effect of putting the channel over what was formerly a shallow sand-flat? Just so.
1229. Does the steamer come in and go out over that channel? Yes.
1230. Comes in where it is proposed to construct the breakwater? No; I think according to the plans the channel would come inside of the breakwater.
1231. Do you think it is necessary to construct the training-wall along the western side of the river and down to the east of the line previously mentioned, and to extend the breakwater the distance proposed into the ocean? Well, the prevailing seas here are southerly, and that makes the bad bars and prevents communication.
1232. So that breakwater would be a protection against it? Most certainly.
1233. And would be the means of creating a strong scour in the river, which would have the effect of keeping the channel open practically at all times and in all seasons? I believe it would have that effect.

E. A. Sheather.

3 June, 1898.

- 1234. Do you think that that work will be beneficial to that river? I have no doubt it will, judging from the effects at the present wall.
- 1235. You feel confident that an extension of the work would result in very largely increased facilities for getting in and out of the river? Certainly. That has been proved already by what has been done.
- 1236. Is it very difficult to get in and out there at the present time? It is. I believe it is one of the most dangerous bars on the North Coast, but it has not been nearly so dangerous since the wall has been put there as it was previously.
- 1237. That shows the money spent has not been wasted? It has not.
- 1238. You depend entirely on the steamer as your means of communication between here and the market? Entirely.
- 1239. Do you think that if the bar entrances were improved, there perhaps would be more traffic in and out of the river? I have not the least doubt of it.
- 1240. Does the present steamer traffic meet all requirements? At times, but not always.
- 1241. Do you mean, then, that with a better means of getting in and out of the river an additional steamer would have to be put on? I have not the least doubt of it.
- 1242. To convey the produce from the farms lying along the banks of the river? There are farms lying idle in some places. The farmers are handicapped. During some portions of the year they can get their produce away; but, when the price rises, they are sometimes handicapped because they cannot get their produce away, and take advantage of a rising market.
- 1243. I suppose the bulk of the farms are situated along the course of the river, and the creeks going into it? Just so.
- 1244. And nearly all are served by water-carriage? Yes.
- 1245. They have only a short distance to go to get their produce to the water? Yes, with a very few exceptions.
- 1246. So, practically, the opening up the river entrance, and making it available in all seasons, would be of distinct benefit to the people of the district generally? It would.
- 1247. Have you also heard of the proposal to construct a railway to Taree? I have.
- 1248. Do you think that the railway would serve the district as well as the river? I think the rates on the railway would be too high.
- 1249. And the cost of construction being so high, the annual loss would be too great? I think so.
- 1250. But you think money might be advantageously spent in improving the entrance to the river? Yes.
- 1251. Now look at the red line on the map marked "rubble-stone facing"; it is proposed to carry out a piece of work there by putting rubble-stone along at that particular point—do you know that place? We call it the "blow-over"; it is a portion of sand with no timber on it.
- 1252. It is a bare patch of sand lying between the ocean and the river? Yes.
- 1253. Do you think there is any danger of the river ever breaking through there, and forming a fresh channel? Yes, I do.
- 1254. What width of sand is there between the river and the ocean? By a rough calculation, I think, at high water, there would be only about 6 or 8 chains.
- 1255. Then, if a heavy sea broke over that particular spot, and the river got a start running through there, it would form a fresh entrance altogether? I have no doubt there is a danger of it.
- 1256. Unless something be done to protect it? Yes.
- 1257. Is that the only spot that will need protecting along there? Yes; I think so. It has hardly altered in my time at all, only the sand is working over it. The ocean and not the river seems to be encroaching on it.
- 1258. It seems to be carrying the sand away a little, and narrowing the neck of land between the river and the sea? Yes.
- 1259. Do you think that the erection of a training-wall along the northern bank of the river would have the effect of throwing the water over there, and perhaps carrying away a portion of the bank? In flowing out the tides strike in the bend, but do not seem to break over the spit. They strike at about the place proposed to be protected by the rubble stone facing, and then turn and strike out towards a point of the wall already completed—just about the end of the wall.
- 1260. Do you think the erection of this wall along the northern bank will have the effect of keeping the channel clear at all times, and secure the proper inflow of the tide and outflow of the river? I have no doubt it will, judging from my recollection. When I was a boy we had the narrows at the end of the proposed training-wall on the western bank; that is, some twenty odd years ago. I was away at the time, but I believe that the dredge opened it, and when that was opened it scoured away. There is very deep water now where the narrows were formerly.
- 1261. So the channel has changed, and has been scoured out principally by the action of the tide or flood in the river? Yes.
- 1262. *Temporary Chairman.*] It is proposed by the Government to spend £100,000 on these works in addition to the money already spent, but it is not proposed to carry out any portion of the northern breakwater, and only a portion of the southern breakwater—do you think that that portion, if carried out, will be sufficient to protect the mouth of the river from south-east winds and the accumulation of sand—I mean the 900 feet that is to be carried out, will that be carried out far enough to protect the mouth of the river from south-east gales? I think not.
- 1263. You think that the whole of the southern breakwater should be carried out? Yes; I think it is of more consequence than the northern.
- 1264. That is admitted, but you think that the whole of the southern breakwater requires constructing to make a good job of it? Yes; I think so.
- 1265. You think that, under any circumstances, the whole of the southern breakwater should be built to protect the mouth? Yes. I think the southern is of more consequence than the northern.

William Henry Shoesmith, farmer and oyster-getter, Mitchell's Island, sworn, and examined:—

- 1266. *Temporary Chairman.*] Have the proposed works at the mouth of the river been explained to you? I have read a little in the newspapers about them, and I have seen the work already constructed.
- 1267. What has been the effect of that work? It has been a very good work I consider.
- 1268. Has it done any good? Yes, I believe it has done a lot of good.

W. H. Shoesmith.

1269. 3 June, 1898.

- W. H. Shoesmith.
3 June, 1898.
1269. Has it deepened the portion of the river where it is? Certainly, it has.
1270. And has done something to scour the entrance? Yes.
1271. Do you think that a prolongation of that work up the river on the northern side, and the construction of the work marked red on the plan, on the northern and the southern side of the river, will have a still further beneficial effect on the entrance? Yes; the northern training-wall should be continued up to the oyster swamp, as shown on the plan.
1272. Now, coming to the southern side, it is proposed to commence a training-wall at the point shown on the plan marked red, and continue that down to the point of the island which forms the southern entrance? We call it the south beach. That would be of more importance with regard to the navigation of the river than the continuation of the northern training-wall.
1273. As far as your knowledge goes, you think that these works will be beneficial? Most certainly.
1274. I presume you have had no experience of harbour works? I have had that much experience of water-running that I know that if you confine the water there in a narrow space it will be kept navigable, whereas if you allow it to spread over the Manning it will not be navigable.
1275. One of the objects of these works is to confine the river to a narrow channel, and by dredging assist the scour? Yes.
1276. If the channel be removed to the mouth of the river, do you think that the ocean current will carry the sand away from there? I think it would do so.
1277. It would be carried by the scour of the river into comparatively deep water, and then moved along by the sea current? Yes.
1278. It is proposed by the Department to spend £100,000 on these works, and not to complete the northern breakwater, as shown by the dotted red lines, and only 900 feet of the southern breakwater;—you think that the effect of the work will be good? Yes; I think that is of more consequence than any other part of the work.
1279. If the Government make, as they say they can, a harbour at the entrance to the Manning, with 12 feet to 15 feet of water, do you think that the means of communication will be all that is wanted for the river—that will permit boats carrying 500 or 600 tons of cargo to come here in any weather? Yes; I believe it will be of great benefit to the river.
1280. If you, as a resident of the district, were to have the question put to you, would you sooner have the harbour work complete or the railway built, which would you vote for? Harbour works.
1281. You think the harbour works would be the more beneficial to the district generally than the railway would be? That is a hard question to answer.
1282. Supposing that the railway were completed, and these harbour works were completed, if you wanted to send freight to Sydney, you would have to pay three or four times as much to send it by rail as by steamer;—do you think people would be patriotic enough to support the railway if they could get their produce taken to Sydney by boat at one-third of the cost? I think they would not.
1283. It is not possible to carry maize or heavy products by rail to Sydney;—they will always go by sea? Yes.
1284. All the railway would be useful for would be to carry passengers' live stock, and small packages? Yes.
1285. That being the case, do you think the country would be justified in building the railway at the cost of £1,000,000, and losing £30,000 a year afterwards? I do not think so. But the railway would open up new country.
1286. A lot of country that belongs to the A.A. Co.? Yes; but there is a lot of country also that does not belong to that company.
1287. The railway would run for 50 miles through the A.A. Co.'s land, and they would greatly benefit from its construction? Yes.
1288. Supposing that the question were put to the people of the district, "Will you have the railway, and let the harbour works go by the board, or will you have the harbour works and not the railway." Which do you think they would vote for? They would vote for the harbour works.

William John Henry, manager of the Lower Manning Co-operative Dairy Co. (Limited), Croki, sworn, and examined:—

- W. J. Henry.
3 June, 1898.
1289. *Mr. Fegan.*] You are the manager of the butter factory? Yes; the Manager of the Lower Manning Co-operative Dairy Co., (Limited).
1290. When did you commence business here? The Company commenced in 1893.
1291. Therefore they have had five years of it? Yes.
1292. How long have you been manager here? Between nine and ten months.
1293. Have you any statistics with you? Yes; I have the turnover of the Company for the last twelve months. They shipped to Sydney 297,805 lb. of butter for the year ended 30th April, 1898. That is, a little over 146 tons. The value of that in Sydney was £13,678 8s. 10d. The freight paid the North Coast Steamship Company for the same period was £292, and other freights inwards, machinery, &c., amounted to £60, making a total of £350. Our Company's output is increasing every day.
1294. Have you any other figures for the Committee? Yes; I hand in a statement showing the returns of the factory for the last twelve months, both in output and value. It is as follows:—

					Butter.	Value in Sydney.		
					lb.	£	s.	d.
May,	1897	16,296	941	10 0
June,	"	16,893	1,154	9 10
July,	"	13,720	799	4 8
August,	"	12,514	622	11 8
September,	"	14,957	690	14 3
October,	"	28,392	1,064	14 0
November,	"	27,133	975	8 5
December,	"	30,128	1,032	5 4
January,	1898	14,403	1,431	7 8
February,	"	40,820	1,333	19 4
March,	"	43,064	1,586	13 4
April,	"	39,480	2,045	10 4
					297,805	£13,678	8 10

1295.

1295. I see that in April this year you had 39,480 lb. of butter, which was valued at £2,045 10s. 4d.;— W. J. Henry. would you compare April, 1897, with April, 1898? I have not got that information to hand. The output has nearly trebled itself this year, compared with that for the previous one. For the last six months the turnover of the company has been more than in the previous twelve months. 3 June, 1898.
1296. Do you know the number of farmers who supply you with their cream or milk, as the case may be? There are about 150 odd milk suppliers, and forty odd cream suppliers.
1297. How many cows does that represent? That would be hard to make out. The herds would range from 120 head for the largest man, down to four or five for the smallest. I think you can safely say twenty-five head apiece, on the average, in milk.
1298. In reference to your factory, what machinery have you there? In the factory we have a 16-horse power boiler, a 12-horse power engine, three separators, and two large churns.
1299. What is the capacity of the churns? 600 lb. each. We have also cool chambers and a compressor and one butter-worker, and, of course, weighing machines, testing machines, &c.
1300. According to that, you have a plant that would do double the work you are doing at present? Yes; and outside we have three creameries.
1301. But I mean your plant is sufficient to cope with double the amount you have at the present time? Yes, fully that; or, with the addition of another separator or so, we could make it equal to doing double the amount.
1302. That means an increase that will not take place for a few years to come? We expect to be put to our best next year. We expect to do double then.
1303. Are so many using their farms, then, for dairy purposes? A lot growing maize have spare ground on which they can run cattle, too.
1304. So, from your intimate knowledge of the dairy industry, you think that this country has a great future before it? I do, especially up the river.
1305. I suppose that you use the water for carriage? Yes; there is no other means.
1306. Has that been satisfactory to you so far? Yes; the only thing is the delay of the steamer. Sometimes we lose on our butter, through the steamer not being able to get out. That makes it bad for us, especially in the summer.
1307. What are you paying for the carriage of your butter per ton now? About £2 per ton. The carriage is cheap enough; but there is delay and loss through not being able to get it to market sometimes. If the delay were taken away we would be all right.
1308. What is the cause of the delay? The bar.
1309. If that is remedied, so that the bar will not be an obstacle to navigation, will not that serve the people of this district as well as the railway would? If they can remove the obstacle at the bar, I think it ought to suit the district.
1310. Do you think that you could get your butter conveyed as cheaply by railway to Sydney as by water carriage? No; I feel sure we would have to pay twice as much.
1311. That would take away a lot of the profits of your factory? Yes; it would.
1312. It would mean either taking some of the profits from your factory or reducing the payment you make now to the farmers who supply you with milk and cream? Yes; that is what it would mean. If the bar could be made navigable in all weathers, I do not think the people would have anything to complain of.
1313. *Temporary Chairman.*] If there were 12 feet or 15 feet of permanent water on the bar, and the river were deepened to that extent all the way up to Taree, would you consider that a good harbour for the requirements of this district? I would.
1314. That would admit boats carrying from 500 to 700 tons of cargo? Yes.
1315. And if that result were obtained by these works, would you consider the district thoroughly well served so far as transit is concerned? I would.
1316. You have creameries? Yes.
1317. Can you inform me if good cattle are used by the dairymen in the district? They are what I consider fair cattle.
1318. What is the average quantity of butter-fat? This month it would probably average 4'1.
1319. What would it average in ordinary seasons? About 3'5.

SATURDAY, 4 JUNE, 1898.

[The Committee met at Harrington, at 2 p.m.]

Present:—

FRANCIS AUGUSTUS WRIGHT, Esq. (TEMPORARY CHAIRMAN).

The Hon. DANIEL O'CONNOR.
JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.

The Committee further considered the proposed Harbour Works at Manning River.

Henry Deane Walsh, District Engineer, Newcastle, sworn, and examined:—

1320. *Temporary Chairman.*] These works are under your charge are they not? Yes.
1321. Will you kindly take this plan and explain fully to the Committee what has been done already and what you propose to do? No. 1 wall—that is, the north training wall, coloured black, starting from near the "Painted Rocks," and going easterly—was commenced in June, 1895; and in January, 1896, it was thought necessary, on account of the very crooked channels inside, in the basin, to run a training-wall in a westerly direction—a river training-wall—and that was started in January, 1896. H. D. Walsh.
4 June, 1898.
1322. What is the length of the portion already constructed? The amount of the north training-wall constructed up to date was 2,000 feet or 2,300 feet at the time the calculations were made, and there are also 1,287 feet of the river training-wall constructed.
1323. How much further east is it proposed to construct that north training wall? The north training-wall turns into a breakwater from now—it begins to rise to a greater height, and will have to be made of

- H. D. Walsh. a heavier class of stone; and it is proposed for the present to extend it in an easterly direction 900 feet farther from the point when this plan was designed, or about 800 feet from where you saw it to-day.
- 4 June, 1898. 1324. Taking the southern side, what are the proposed works there? It is proposed to create a barrier bank, 5,200 feet long, of small stone such as we are putting in the top end of the river training-wall, and to construct a southern breakwater 2,600 feet long.
1325. Is the whole of that breakwater proposed to be constructed at present? 2,600 feet of it is proposed to be constructed at present.
1326. Will you kindly say at what point it terminates? Almost opposite where it is proposed to terminate the northern breakwater, but slightly further to the east. Some distance up the coast where the scrub has been broken away, and where there is a chance of the sea breaking through, on account of the narrowness of the belt of land between the ocean and the river, it is proposed to construct 1,500 feet of rubble stone facing to protect that.
1327. To prevent the possibility of the river breaking through there? Yes; it may eventually be necessary perhaps to continue that rubble stone facing until it meets the barrier bank.
1328. Now, as regards works on the western side of the river? On the western side of the river it is proposed to carry the training-wall in an easterly direction some 8,900 feet further than it is at present—up to Chinaman's Point.
1329. Can you tell us the cost of the proposed works? The cost of the northern river training-wall will be £24,307 10s.
1330. And the northern breakwater? The northern breakwater, so far as we propose to go, is estimated to cost £18,652 10s.
1331. The total proposed expenditure on the northern side is £13,443 15s.? Yes.
1332. Now, on the southern side? On the southern side the barrier bank, £13,950, and the southern breakwater, so far as we propose to go, £36,162 10s.
1333. You have omitted the cost of the rubble stone facing? That is £1,530. Then there is supervising, &c., £4,713 15s.
1334. Making altogether how much? £99,800—practically £100,000.
1335. Will you now kindly explain what has been the effect on the entrance to the river of the works already constructed? Of course, we could not expect the works, so far as they have gone at present, to have any very material benefit up to this. It is only from this out that we may expect a great improvement.
1336. But has it effected any improvement? It has effected an improvement. It has prevented the channel from going north parallel along the beach as it used to do in the old days—and it was a very dangerous entrance to the port—and it has had the effect of making the water deeper.
1337. The water is deeper? It is decidedly deeper now than it was then.
1338. Do you expect any permanent improvement from the construction of the northern works before the southern works are well under weigh? I do not think that the southern works will have such a beneficial effect, in creating a permanent channel as the northern works will; but the southern works will have the great advantage of protecting vessels coming in from sea or going out.
1339. Will the southern works be at all effective in preventing the washing of the sand in by south-east gales? Yes; it will permanently fix the southern side of the channel inside, which will be a very beneficial effect, I think.
1340. So that if the channel is once scoured out by the natural action of the river, with the assistance of dredges, it is not likely to be silted up again by the action of south-easterly weather? I do not think it will ever silt up after these works have been constructed.
1341. What effect will the construction of these works have on the river a little higher up—for instance, on the flats where we stuck to-day? We have always had the disadvantage of having two channels inside—one channel running in-shore on the Harrington shore, and carrying the greater portion of the ebb-tide with it, and the other running about the centre of the old inlet.
1342. What effect do you think the construction of the works will have on the scour generally? It will force the whole of the tide up and down in the one channel, and that will tend to keep a permanently deep channel. The effect of the two tides parting at the old crossing was that we had not sufficient scour in the channels to keep either of them deep enough, and it necessitated constant dredging, with most unsatisfactory results.
1343. When these works are completed, instead of having a channel on either side, you will have one permanent channel? Yes—down the river training wall.
1344. What width is the channel which is now created by the work already done? I am not quite sure of the width, but think it would be about 150 feet. It is only a gutter at present.
1345. You designed a portion of these works yourself, did you not? It was on my suggestion that this river training-wall was carried out.
1346. And you were guided, I suppose, in that recommendation by your previous experience? By watching the river, and my previous experience in watching the results of similar walls in other rivers.
1347. And, as an expert in works of this kind, you have every reason to believe that the carrying out of these works will produce good results? I have.
1348. It has been stated in evidence that when these works are completed there will be permanently on the bar not less than 12 feet of water;—do you think that is likely to be obtained? Yes; from 12 feet to 15 feet.
1349. To obtain that depth of water, a great body of sand will have to be scoured out of the river;—is there any danger of that sand accumulating at the new entrance, or will the ocean currents distribute it and carry it away? I think they will carry it away. I had some experience with regard to the Newcastle Harbour works some years ago, with the construction of the northern breakwater there, and from soundings on the bar made at various times during the extension of that northern breakwater, the experience I gained was that the current had an actual effect for between 800 feet and 1,000 feet beyond the end of the wall, scouring out that number of feet on the sand. At Newcastle it shifted the bar out 800 feet or 1,000 feet beyond the end of the breakwater as we went out into deeper water. That breakwater was carried out so many feet at a time, and about a year after its construction stopped we found that the bar had shifted out to that extent. Exactly similar results might not be obtained here, but the tendency would be to some similar result.

1350. Supposing that your works succeeded in scouring out the river, and forcing the sand into 4 or 5 fathoms of water, do you think that will be sufficient? I think so. H. D. Walsh.
1351. At that point it would not accumulate so as to form a new bar? I do not think it would. The tendency is to throw the sand up behind the breakwaters. 4 June, 1898.
1352. The tendency, then, is for the sand to accumulate behind the northern and southern breakwaters, and thus strengthen them? Yes.
1353. And the sand carried out by the river scour will be carried further away by the ocean current? Yes. Once it gets into a little current it goes down the coast.
1354. Is anything contemplated for the improvement of the river above? There is nothing contemplated farther than the ordinary dredging.
1355. I suppose that in a river like this, after the harbour works have been constructed, a dredge will be permanently retained here? Yes; there has been a dredge in the river for years. The river being subject to floods it is necessary to keep a dredge here to keep the river open.
1356. Every flood brings down and deposits in the river a certain amount of debris? Yes; and from Wingham to Taree we have heavy gravel, and below that there is sand.
1357. Therefore, it will be necessary under any circumstances to keep a dredge on the river? Yes.
1358. Can you inform the Committee what is the cost of the dredge and the attendant boats on this river per annum? About £3,300 or £3,400 a year.
1359. Tow-boat, punts, wages, and repairs? Yes.
1360. And that will be a permanent charge, I suppose? There has been a dredge on the river for some years. The "Ulysses" came here in 1882.
1361. And a dredge will necessarily remain here? Yes.
1362. Even if these works be the success that you anticipate, it will still be necessary to keep a dredge further up for dredging the river? As far as Taree the channel is in very good order at present. Between Taree and Cundletown we have had a little trouble with the channel, but at present it is in good order.
1363. For all time it will be necessary to keep a dredge here as in other rivers? I think so. Of course, that is not charged to the votes of these works but to the river.
1364. You have no hesitation in affirming that, in your opinion, the works as proposed, if carried out, will result in a permanent entrance to this river with about 12 feet of water on the bar? I think so.
1365. *Mr. Fegan.*] Have you any other information to give? I have information with regard to the quantities of stone required. The quantity of stone required for the river training-wall is 194,460 tons; the northern breakwater, 82,900 tons; rubble facing, 10,200 tons; the barrier bank, 9,300 tons; the southern breakwater, 131,500 tons.
1366. I suppose there is no doubt that all the material you will require can be obtained from your quarry at Crowdy Head? Yes; there is an unlimited quantity of stone there suitable for the work.
1367. Good stone? First-class—as good as any stone we have on the coast.
1368. How is the work carried on? At present it is being carried on by a contractor.
1369. Under a contract for the whole of the work or only part of it? Only the north training-wall and the river training-wall at present.
1370. None of this work is being carried out by day-labour, I suppose? None.
1371. Have you tried at any time to carry out any part of it by day-labour? We have not done any of the Manning works by day-labour.
1372. Do you know the total cost of the work so far? The total cost up to December, 1897, was £23,020.
1373. That is the total cost for this river? Yes. Up to the 14th May the expenditure on the north training-wall was £15,422 16s.
1374. I suppose the Department are not looking in any way to recoup themselves for the expenditure of the money? The Works Department do not generally go into that matter very particularly unless they are asked specially to do so.
1375. It has not been done? So far as I know, it has not.
1376. So this money is to be expended to give greater facilities to the people of this district, and, so far as you know, they are not to be asked to pay anything towards the expense? So far as I know, they are not.
1377. *Mr. Black.*] As a rule, the bar is about half a mile to seaward of the "Painted Rocks," is it not? Yes, about that. It is constantly shifting, and it is very hard to say where it will be after any tide.
1378. How far is the breakwater at present carried past the "Painted Rocks"? The breakwater at present is past the "Painted Rocks" about 2,400 feet. It does not start quite at the "Painted Rocks," but 200 feet to the west of the "Painted Rocks."
1379. The breakwater does not start quite at the "Painted Rocks," you say? No; there is a viaduct which you walked over to-day.
1380. The present termination of the breakwater—that is, where you are working now—is about 800 yards from the "Painted Rocks"? About 2,600 feet from the "Painted Rocks."
1381. Then it is correct to say that the bar is only half a mile seaward of the "Painted Rocks"? It is not in the same direction as the breakwater, but very much to the southward of the breakwater.
1382. Can you give me an approximate idea? It is very hard to guess the distance from the breakwater across, but I think it is somewhere about half a mile.
1383. It may be 1,000 yards at one time and less at another? Yes; it depends on whether there is a fresh in the river.
1384. We may say half a mile to 1,000 yards, then? Yes.
1385. And the present point of the northern breakwater is now about 800 yards past the "Painted Rocks"? Yes.
1386. How much farther do you intend to carry out the breakwater? About 800 to 900 feet from where it is now.
1387. How will that compare with the breakwater on the southern side;—will the breakwater on the southern side project further out to sea than the northern breakwater? So far as we propose to go at the present, the proposed end of the southern breakwater would be slightly to the eastward of the northern breakwater—it would be further out to sea—when it is completed.
1388. I suppose that, as a matter of fact, it should be considerably further out if you desire to give protection to a vessel entering broadside on to heavy seas in south-easterly weather? The southern breakwater will be a very great protection to vessels coming into port. 1389.

- H. D. Walsh. 1389. The further it is run out the greater protection it will be for vessels in certain weather? Yes.
- 4 June, 1898. 1390. How much further would that portion of the breakwater which is shown by the hatched lines, and which it is not now proposed to construct, extend on the northern side than that which you propose to construct? 1,100 feet further. The hatched part of the southern breakwater would be 1,400 feet further.
1391. You are paying for the stone tipped from trucks 3s. 8d., and tipped from barges, 4s. 6d. a ton? Yes; but we are not doing anything from barges at present. That was a special work arranged for on account of the scour from the northern breakwater.
1392. To prevent erosion? Yes.
1393. That is not being done now? No; it has not been done for a very long time.
1394. But if you commenced tipping again at the breakwater end, and if you propose to prevent a cutting away and the formation of a hole at the end of the breakwater, will you not be compelled to resort to that again? It all depends on whether it scours in the same way as it did before.
1395. It is not scouring now, because you are on a sandspit? The reason why it scoured as it did before was that the old channel going out to sea went almost at right angles from the top end, and continued rushing past the breakwater in a way we do not expect again. The channel where the steamers came in and went out was practically at right angles to our present breakwater, and there was always a strong current round by the beach, and that kept scouring it out.
1396. What has occurred to divert that current? We have carried the breakwater over all the old channel. We are outside where the old channel was. We have not done any blanketing since October, 1896.
1397. Speaking broadly, I suppose that one of the objects of the work is a diversion of the channel from the north to the south side? It is from the south to the north side at present. The new channel will be practically midway between where it used to work north and where it used to work south.
1398. Does not the river run out on the north side now? It runs out to the southward of the northern breakwater now.
1399. Exactly; but is not the current just alongside the wall chiefly? Yes, it is alongside the wall.
1400. I suppose that both these walls are necessary to the formation of a good channel? I consider them absolutely necessary.
1401. Do you think that you followed the wisest course in constructing the northern wall first? I should be glad to see the southern wall going on with the other, from this out.
1402. Do you intend, when the northern training-wall has been constructed, to fill in at the back of it with a sand-pump, or are you going to leave it open? It will fill itself in by degrees.
1403. A slow process? There is no great object in filling it in unless we require to do any dredging in front of the wall; and we will always have that space available for pumping behind; but we hope the scour will do all that is necessary there without any further dredging up there.
1404. If that be entirely closed in, where are you going to find an anchoring ground for the tugs? We propose to leave a small viaduct above Harrington wharf for boats belonging to the residents of Harrington and the use of the pilot service, but nothing that will take the "John Gollan" in.
1405. The "John Gollan" is the subsidised tug? Yes.
1406. It has not been thought necessary to have a wave-trap here? No. Sir John Coode in his report recommended a wave-trap, but the Department have thought it unnecessary.
1407. There is a large saving in doing without it? Yes. The only object of the wave-trap was to reduce the range immediately inside the entrance. In the case of Newcastle, where the harbour is immediately inside the breakwaters, it is an advantage; but in this case it does not matter whether the range goes half a mile or a mile up the river.
1408. Unless it might cause an erosion of the banks? I do not think there could be anything that would hurt. We can put large enough stones to prevent that.
1409. Is there any danger of the river breaking through some of those lower portions of the sand-terrace we saw coming down? The only danger would be where we propose to protect it with a barrier bank, and that, I think, should be carried out at once.
1410. Have you ever heard of it breaking through there? I have not known it to break through, but the spray breaks over there.
1411. That is from the outside;—I am speaking of the river? It has never gone through there so far as I know.
1412. In the case of there being a big river running down, and a heavy easterly gale, and the river being banked up inside, would there be any danger in the river cutting through the sand-terrace? I do not think there is very much danger of its going through there, if there be a rubble-stone facing to it.
1413. I suppose that under such circumstances it is likely to overrun the low-lying land on the northern side of the river? Yes.
1414. You say that the spray breaks over the sand-terrace? I should imagine it does. I have never been here in a gale.
1415. But if it should be found that there were a cutting through of the sand-terrace, either from without or from within, then an extension of the southern training wall would be necessary, would it not? If we were to see anything of that kind, it might be necessary eventually to connect what we call the barrier bank with what is shown on the plan as rubble-stone facing.
1416. There is no indurated sand in the river? None that I know of.
1417. Then all your dredging can be done with an ordinary sand-pump? An ordinary sand-pump would not be as convenient up the river as the dredge we have, in some places, owing to the cultivated paddocks on each side.
1418. You mean that you would have a difficulty in disposing of the stuff? Yes, where there is agricultural land on the banks; and above Taree the sand-pump would not be so convenient, because what we have chiefly to deal with there is coarse gravel, which gets coarser and coarser as we go up to Wingham, the head of navigation.
1419. I believe that as yet you have not found any inconvenience in the river from rocks—there are no reefs? There are no reefs. I think there are some large boulders on this side of Wingham. We have removed two or three.
1420. So far up as that? Yes. There was a small reef of rock running out at Cundletown that we removed on account of the stern of the steamers sometimes getting on to it, but I know of no rock that would hinder the navigation of the river.
- 1421.

1421. I understand that, with the exception of one or two flats, it would be an easy matter to get 12 feet or 14 feet of water all the way up the river to Taree? That is so. H. D. Walsh.
1422. What depth of water could you easily get as far as Wingham? We could get the same up to Wingham. Of course a great deal depends on the floods. If we were to have a long spell of dry weather, and the lower portion of the river were in good order, it would not be difficult to get 12 feet of water up to Wingham if we could spare the dredge in the one place for so long a time. 4 June, 1898.
1423. What dredging is there to be done between here and Taree in order to give from 12 feet to 14 feet of water to that point? I think that there are very few spots, except the lower flats here, which carry less water than that. Probably the pilot will be able to give you better information, because it is constantly changing.
1424. I suppose that he would know about the river between Taree and Wingham also? Yes; he would know the present depths all the way up to Wingham. At present the river is in fairly good order—from dredging, of course.
1425. *Mr. Hassall.*] If these works are to be carried out, do you not think it would be advisable to commence the work on the southern side at once? I should like to see it commenced at once, and gone on with concurrently with the other.
1426. Is it not a fact that the heavy weather from the south has the effect of driving the sand from the most northerly point on Mitchell's Island into the channel, and that this causes the channel to shift? Of course, a good deal of the sand drifts over in heavy gales.
1427. And practically it would be no good carrying out the work on the northern side unless you were to carry out similar work on the southern side? I think both are necessary.
1428. And you think the works should be carried out simultaneously? Yes. I think it could be done more cheaply simultaneously, because you could work the different classes of stone better.
1429. And if work were commenced on the southern side at the same time as you were carrying out portions on the northern side it would give a more defined channel, and consequently the scouring would go on during the time the work was in operation? Yes; I think that the scour will be chiefly affected by the northern works. The scour will always hug the northern side from where it comes down the river.
1430. It seems a singular feature of these northern rivers that all of them, with one or two exceptions, seem to run parallel with the coast in a northerly direction for some distance before they break out to sea? They nearly always work as far as they can to hard ground, and then they have to come out.
1431. Does not that seem to show that the drift of the sand is northerly? My experience is that the drift of the sand is southerly.
1432. This river runs along parallel with the sea for some distance before it gets out, and strikes this head on which the pilot station is situated practically before it gets out into the ocean? But the Hastings River does exactly the opposite. The Hastings at one time went straight out to sea from where it comes down the river at the northerly headland, and then worked through the sand-flat until it struck the hard ground at Port Macquarie.
1433. Then, the Macleay is different altogether again? The Macleay used to be north of where the river came out. During a heavy flood a couple of years ago it broke right out opposite Trial Bay, and before it could get away again we fixed it there as far as we could with training-walls.
1434. *Mr. Black.*] But the Hastings has a southern headland that protects it? Yes. The tendency so far as I can see is for the sand to pile up more behind northern breakwaters than behind southern ones. Take the case of Lake Macquarie. There it is behind the northern breakwater that the sand piles up chiefly. If you have two headlands and an inlet you nearly always have a slight eddy inside.
1435. *Mr. Hassall.*] Does not that prove the necessity of a southern breakwater to make these rivers navigable in all weathers? I think so.
1436. They must be protected on the southern side to prevent the sand from drifting in and closing up your bar entrances? More particularly, I think, to protect the shipping coming in.
1437. And also to keep a channel open;—if nothing were done on the southern side of this river the expenditure on the northern side would be to a certain extent valueless? It would not be as effective as with the other.
1438. You would have a shifting channel and practically the same difficulties on the bar as you have at the present time? I think I have already said that I think the scour will always hold the deep water under the northern breakwater and the northern training-wall; but the southern breakwater will help to protect to a very great extent.

William Scott Murray, pilot, Manning River Heads, sworn, and examined:—

1439. *Mr. Black.*] How long have you been stationed here? Six years on the 1st of next August. W. S. Murray.
1440. I suppose that you have sometimes seen some heavy weather here? Yes. 4 June, 1898.
1441. Is the entrance a bad one in heavy weather? Yes, very bad.
1442. It is difficult, I suppose, to locate the bar after some of the gales? Yes; it wants a lot of sounding before you can put the marks in position.
1443. How much does it vary at times? This northern training-wall has put a stop on its going. The entrance to the river has been as far as $1\frac{1}{2}$ miles along the beach, running parallel along, going right alongside the sand-hills; but that has been done away with now. The northern breakwater being there, the channel is confined more to a position off the hill. It cannot get north now.
1444. If you were to draw a line straight out to sea, east from the "Painted Rocks," how far, as a rule, would the bar be situated from the "Painted Rocks"? It varies. I should say not more than half a mile.
1445. Never more? Never more, unless there has been heavy floods in the river, and then the sand goes out in a body, and the bar goes out in a semi-circle; but eventually, after the floods have ceased, the surplus sand on the mouth goes away with the current.
1446. Then, as a rule, the bar is not more than half a mile distant? I do not think it has been more than half a mile off the "Painted Rocks."
1447. What depth of water have you on the bar now? Eight feet six inches or 8 feet, at the morning tide.
1448. What is the lowest depth you have known on the bar since you have been here? Four feet at high water.
1449. What is the tidal range? Taking an average, about 2 feet. 1450.

- W.S. Murray. 1450. What is your opinion of the work that has so far been done;—do you think it has been of service to this river? The only benefit is that it has stopped the bar so far, but we are only commencing to get the results now.
- 4 June, 1898. 1451. From what part of the proposed work do you anticipate the most beneficial result? The crossing has been the great drawback to vessels getting in, and I think that the inner training-wall on the northern side of the river is going to show the best results. The sand leaves that as the work goes along.
1452. But do you think that there will be any permanent benefit without the construction of a southern training-wall and breakwater? No.
1453. When is it most dangerous for vessels to enter the channel? On an ebb tide.
1454. With what wind? Southerly and south-easterly winds are fair winds, but after the wind gets past south it is dangerous.
1455. When a vessel turns to come in, and is broadside on to the sea and the wind, there is a danger of her being driven aground on the northern shore, is there not? Yes, a great danger, if she has not good ground tackle, and keeps on the weather side.
1456. Then under such circumstances a southern breakwater is necessary for the safety of vessels making the port? Absolutely necessary.
1457. What depth of water do you think there is in the river, as a rule, between here and Taree? It varies from 8 feet to 14 feet and up to 20 feet.
1458. How many shallows have you between here and Taree? There is nothing to impede navigation at present—not even at low water. Any patches there were, the dredge has cleared out.
1459. But when they did impede navigation, how many were there? There have been only two—one at each end of Dumaresq Island.
1460. Those have been removed by the dredge? Yes.
1461. What depth of water have you there now? Eight feet or 9 feet at low water.
1462. Do you know the river between Taree and Wingham? Yes.
1463. What depth of water have you throughout there? I think about 7 feet was the lowest water we found in the last soundings I took—that is, at dead low water.
1464. At the shallowest places? Yes.
1465. It is nearly as good as between Harrington and Taree? Yes; they are making the Wingham channel good now.
1466. But there are one or two shallow places there, are there not? Yes.
1467. How many do you know? There is Clinch's Flat, Mundook, and Bird's Flat.
1468. What depth of water have you on those at high water? There would be 9 feet to 10 feet with a good tide; it would all depend on the rise of the tide. The tides rise from 15 inches up to 4 ft. 6 in.
1469. I thought you said you had only a 7-foot river between Taree and Wingham? That is, soundings at dead low water.
1470. What have you at high water? I said the tides average from 15 inches to 4 ft. 6 in. Taking an average, there would be 9 feet at high water in the river between Wingham and Taree.
1471. And what on the three shallows you have spoken of—Clinch's Flat, Mundook, and Bird's Flat—what depth have you there? I have given you the lowest, and the average of the tides. There is from 15 inches to 4 ft. 6 in. rise, and the average on these flats I should say would be between 8 ft. 6 in. and 9 feet at high water.
1472. Then these flats are not very great obstructions to navigation? But there are such things as north-east winds, and during the time they last they drain the water completely out of these rivers. These rivers run very dry then, and there is salt water to be found at the head of navigation in dry weather.
1473. Well, then, the whole of the river is shallower at that time? Yes, it affects it all.
1474. As far as I can understand from your evidence, there is a difference of only about 6 inches between the shallows and the deep portions throughout? Oh, no; I said from 8 feet to 20 feet, in the river. There is no comparison between the flat and those holes into which they have been emptying the dredges for years. There are places that they cannot fill up.
1475. Well, would it be necessary, in order to provide a good channel between Wingham and Taree, to do any dredging? There is very good water now for the class of vessel we have visiting the river.
1476. Can the "Coraki" go up to Wingham now? I understand that she can go up at dead low water.
1477. Could the "Electra" go up? Yes.
1478. Could the "Electra" get over the bar now? Yes; she could not get over the crossing.
1479. What do you call the "crossing"? The flats opposite Harrington.
1480. Then what you call the "crossing" is an obstacle to the river navigation now? That is a great obstacle now; and I am sorry to say that during these winter months all the tug-work will have to be done by night, with great risk, as the day-tides are not good. From May to October the good tides are entirely night tides, and everything will have to be done between 12 o'clock in the day and 12 o'clock at night, so as to catch the big tides. Nearly all the vessels will have to be towed over these flats during the p.m. tides.
1481. If that crossing were removed, would that state of things be altered? Yes; by the removal of the crossing I should fancy that the body of water would travel in a more correct course, and give better results. Now that these flats distribute the water all over, there is no confined channel at all.
1482. Then your opinion is that unless the channel be narrowed, and the water of the river be given a greater scouring power, this crossing cannot be permanently removed? No, it cannot.
1483. I suppose it is rare for a sailing vessel to come in without assistance? No—quite common.
1484. In favourable weather? Yes.
1485. Which is the most favourable wind for entering the river? Between a point south and east.
1486. Which is the most unfavourable? Westerly.
1487. Due west? Due west, straight ahead.
1488. Is that because of the existence of a bar? Yes—confined, no room to tack.
1489. *Mr. Hassall.*] In the one case you have a fair wind and in the other you have a head wind? Yes.
1490. *Mr. Black.*] Is this not a dangerous entrance with a southerly gale? Oh, yes. A southerly wind sweeps along the beach and a ship comes with her head to the westward, and the force brings her broadside on to the southerly gale; and with wind and sea against her, it is dangerous.
1491. She is apt to be driven on to the north head? Yes.
1492. That makes it necessary to have a southern breakwater? Yes. 1493.

1493. How far do you get the ocean current? The ocean current sweeps across the head of the breakwater. W. S. Murray.
1494. Then, if the channel were cleaned out by the river, and the ocean current got hold of the sand, there would be no danger of its being deposited anywhere about the port? No. 4 June, 1898.
1495. It would be taken right away? Yes.
1496. You heard Mr. Walsh's evidence? Yes.
1497. Do you think that, if the northern and the southern breakwaters were carried out, as he indicated, you would have a sufficient sweep to carry the sand within the influence of the ocean current? Yes; I think it would become permanent.
1498. But I suppose that, no matter what improvements may be made, there will always be some weather in which it will be dangerous for vessels either to leave or to enter the river? Yes.
1499. Like the last gales? No ships ever built would stand such weather as we had here.
1500. Have you seen any improvement in the trade of the river during the four years you have been here? Things are looking up now. Things have been very dull of late, but instead of one saw-mill there are three saw-mills now, and the shipping is commencing to increase on account of the timber trade.
1501. *Mr. Hassall.*] Do you know if any attempt has ever been made to remove what you call the "crossing"? Yes, several attempts; but it gradually fills up again. A body of water may flow through a deep-cut channel for a considerable time. There is no accounting for the changes made by the tide and the wind, and the sand is continually on the move.
1502. And it is impossible to deal with it unless you have it confined in a definite channel? There is no stopping it until it is confined.
1503. What class of sailing vessels trade here? There are schooners from 18 to 100 tons.
1504. Drawing what depth of water? On an average, 6 ft. 6 in. There is one now in the river which draws 8 feet, and she has to be very carefully handled. The last time she was here she lay for a week to get a favourable opportunity to get out.
1505. And does she have to lay long outside waiting to get in? The vessels generally come back light. That is an advantage to vessels coming in. They are easily headed in and managed over the bar afterwards. It would never be safe for deep-laden vessels to try to come in over these bars.
1506. What effect will the improvements of the river have on the navigation? I think that if once the water is confined the channel will be all right; but now one quantity of water goes along the north beach and the middle quantity up the centre and the south branch of it goes round along the south spit and comes back on to the bar again.
1507. And that is what brings the sand into the mouth of the river? Yes.
1508. The effect of the improvements would be that by confining the water to a definite channel it would have the effect of killing the eddies which deposit the sand in the channel, and would, of necessity, sweep the sand out to deep-sea water? Yes.
1509. The training-wall on each side of the river would, with the assistance of the dredging operations, give you as good a channel inside the bar as you could expect to have? Yes.
1510. And if the breakwaters had the effect of giving you 15 feet of water on the bar, there would practically be no hindrance to navigation for vessels of a decent size? Quite so.
1511. What size sailing vessel could come in then, do you think? A vessel of 14 feet draught and 400 or 500 tons register.
1512. They would practically come in light? Yes; and go out loaded.
1513. Then the effect of these improvements would be to make the navigation of the river practically safe, and would in all probability increase the trade and the traffic up and down the river to a considerable extent? Certainly.
1514. Do you know the country pretty well around here? I know it fairly well.
1515. You, as pilot here, would have a pretty good idea of the trade on the river—is there much? Last year seventy-three steamers visited the river, and I think sixty-seven sailing vessels; but it was a very dull year for sailing vessels—the timber trade was very quiet. This year I think there will be much better results.
1516. That is in the present state of affairs, when there are so many obstacles to navigation and risk of loss of passengers in consequence of the difficulty in getting in or out? Yes.
1517. But you think that the proposed improvements, if effected, would materially increase the traffic on the river? There is no doubt about that.
1518. Do you think that if the river navigation were improved as proposed it would serve the requirements of this district fairly well? I think so.
1519. The river being navigable for ocean-going steamers up to Wingham, they would practically, you think, be able to successfully compete for the whole of the trade of the district? I do.
1520. *Temporary Chairman.*] Before the construction of the northern training-wall the entrance must have been very bad with southerly or easterly winds? Scarcely a month passed but we had a ship ashore, tug-boat ashore, or steamer ashore. I have £80 worth of salvage gear. The Association of Underwriters in Sydney thought it was the best step to take. They had got tired of coming here to take vessels off.
1521. That is proof positive that the present works have made things better? There is such a thing as a mishap now and again, but nothing serious. No bones have been left on the beach, but every vessel that has gone on has got off.
1522. The evidence of the captain of the "Coraki" is that the bar shifts as much as a mile from place to place—have you known that to be done? Not lately.

William Charles Reading, civil engineer, Harrington, sworn, and examined:—

1523. *Mr. Hassall.*] What position do you occupy? Manager for the contractor for these works—G. C. Willcocks.
1524. He is at present carrying out the harbour improvements on the Manning River? The northern training bank and the inner training-wall.
1525. How long has the work been carried on? About three years.
1526. Where do you get the material from? Crowdy Head.
1527. Distant how far from the river? About 4½ miles.
1528. Conveyed by what? We have a regular tram-line laid down. There are two locomotives and fifty trucks employed on the work.

W. C.
Reading.
4 June, 1898.

W. C.
Reading.
4 June, 1898.

1529. Do you make fairly good progress with the work? We average about 5,500 tons of stone a month.
1530. And that would give you a length of how much, so far as the training-wall is concerned? Of course, it varies according to the depth of water.
1531. But on an average? When travelling over the spot we have gone as much as 250 feet a month, but at other times we go only about 20 feet a month.
1532. So it would be difficult to strike an average, as the distance done per month depends so much on the depth of water? You could not do it.
1533. Is the stone of good quality? Yes; I think it is about as good stone as you could get for the works. It is a grey sandstone—a very hard stone.
1534. Not likely to be affected either by wind or by water? No; I do not think there is any chance of its being affected.
1535. What are the largest size blocks you could handle or have handled from that quarry? I have handled stones up to 12 tons, but you could obtain them up to any size.
1536. What is the largest size stone you could obtain there? I have had a stone in the quarry 250 tons; but of course we could not handle it.
1537. Then, if the proposed breakwaters are to be constructed, the material is at hand—material of excellent quality—which could be obtained in blocks up to almost any size? Yes; there is a percentage of about 60 per cent. of stone below 1 ton.
1538. But suitable for training-walls? Yes; suitable for training-wall purposes. It would be a very expensive work to carry on the southern training-wall unless you were also carrying on the smaller training-walls concurrently, so as to get rid of your smaller stone.
1539. You think, then, that if the work be carried out, it will be advisable to have the breakwater in course of construction at the same time as the training-walls are being constructed, in order that the material got from the quarry can be utilised to the best advantage? It is absolutely necessary to do that in order to get the work done at an economical rate.
1540. Otherwise you would have to shift the material two or three times over? Yes. All the small stone has to be handled, and we would have to throw it away from the quarry in any case.
1541. If you were getting out large stone to construct the breakwater you would have to throw the smallest stuff on one side and handle it two or three times? Yes; we had the same difficulty here when the northern training-bank was started. There was an accumulation of about 2,000 tons of small stone, below our contract size, and we got rid of that when they started the inner training-wall—the up-river wall.
1542. You find the lighter stone acts almost as well as the large stone inside the river, where it is not affected by rough weather? Certainly.
1543. The sand, I presume, drifts into the interstices between the stone and gradually forms a solid bank? I do not think the sand makes any difference at all with it. On the northern training-wall a great volume of stone has accumulated which would suit very well as packing, but the sand that would percolate into the interstices in the wall would, in my opinion, have no effect.
1544. With regard to that bank near the northern training-wall below Harrington, do you think that would be scoured out, provided that a training-wall were put on the other side of the river and a breakwater carried out—I mean the sand-spit on the south side of the wall? Since the westerly or south-westerly winds have prevailed during the last few weeks—that is, since the last gale—I consider that about 5 acres of that spit has already gone away—that is, since 6th May.
1545. That has gone out? It has disappeared. A lot of it has come in and formed further up the wall. The channel has gone over at least 200 feet to the wall, and the south spit is going over a corresponding distance.
1546. You heard the evidence given by previous witnesses with regard to the construction of the southern training-wall as well as the northern one, and also the construction of the breakwater;—can you corroborate that evidence—from your own experience, do you think it is an advisable work to carry out? I think the southern breakwater should have been built first, because we have a good bar now—a depth of from 8 feet from 12 feet, it varying with the scour at different times of the tide, and the entrance now is broadside on, or almost broadside on, to an easterly sea.
1547. Practically, the channel runs down alongside the training-wall until it gets past the “Painted Rocks,” and then turns off at right angles and goes southwards? It is about south-east now.
1548. Goes in a south-easterly direction? Yes.
1549. Almost at right angles with the trend of the northern training-wall and breakwater? Yes.
1550. And you think it is absolutely necessary to construct the southern breakwater in order to confine the water in a direct channel, and so obtain the best possible results? That is my opinion.

James Martin Kerkin, master of the steam-tug “John Gollan,” Harrington, sworn, and examined:—

J. M. Kerkin.
4 June, 1898.

1551. *Mr. Fegan.*] How long have you been residing here? About fourteen and a half years.
1552. How long have you had charge of the tug here? During all that time.
1553. You have heard the evidence given by Mr. Murray and Mr. Walsh? Yes.
1554. Do you agree with that evidence? Yes. I corroborate the statement made in regard to the southern training-wall, which I think should be started as soon as possible. Pilot Murray referred to the heavy tides along the south beach. I do not term them heavy tides, but a tide pure and simple, and as you get a strong breeze from the south there is generally a little gutter or outlet along the end of the south beach. This eventually, with a strong rush of tide, brings the sand round that point, which causes the whole difficulty inside—the “crossing” we term it—and I say that if the southern training-wall had been carried out simultaneously with the northern wall it would have been much better, and now it is certainly necessary for the betterment of the river.
1555. With that exception you agree with Mr. Murray? Yes.
1556. What tonnage is your boat? Fifty-seven tons.
1557. So you can come in at all hours? No; I cannot approach it at low water.
1558. What do you draw? Six feet 6 inches. I manage to scrape over at half-tide, but at low water I cannot. I have heard the evidence given about the upper part of the river, and the changes there; but there is not the depth in the upper part of the river which has been stated.

1559. What depth do you say there is between the crossing and Ghinni Ghinni? There is no obstruction until you get opposite Ghinni Ghinni wharf. Then a vessel drawing 8 ft. 6 in. could not get across at low tide. Therefore, I differ from the evidence given by Mr. Murray on that point, and that point only. J. M. Kerkin.
4 June, 1898.

1560. From Ghinni Ghinni wharf to Wingham you have good water? Yes; fairly good, with the exception of Bird's Flat, where the dredge is working now.

1561. You agree with Mr. Murray in regard to that? Yes.

1562. *Mr. Hassall.*] How long have you been stationed here? Fourteen and a half years.

1563. You have been taking vessels in and out during that time at all hours of the day and night? Yes.

1564. Do you look upon the entrance as being dangerous? Certainly.

1565. Very dangerous? Yes; I have seen it in all forms.

1566. In some weather neither safe for a ship nor for the lives of the people on it? You could not possibly in some weather either pass out or come in. For instance, in the weather we had the other day, you could not have passed out with a 1,000-ton ship, even supposing that you had had sufficient water under her.

1567. Do you think the proposed improvements would materially lessen the danger? Decidedly so. With the improvements that are proposed you could come in, if the bar were carrying 12 feet or 15 feet of water, with a very heavy sea, provided you had a fair wind; but with the wind blowing out you could not do it, or at least there would be danger.

Reuben Richards, farmer and grazier, Harrington, sworn, and examined:—

1568. *Temporary Chairman.*] Do you know the proposal before the Committee? Yes. R. Richards.

1569. Have you anything to say in connection with it? I wish to draw the attention of the Committee to the encroachments which have taken place during the last thirty or thirty-five years, during which time I have been a resident here, and which have rendered it absolutely necessary that some step should be taken at once. 4 June, 1898.

1570. Encroachments where? On the sea-coast. I produce the parish map of the parish of Oxley, county of Macquarie, showing the encroachments that, within my knowledge, have taken place during the last thirty years on the sea-shore of Mitchell's Island, and also the encroachments upon the western side of Mitchell's Island by the erosion from the action of the river and flood-waters. At the present time, where you see a red mark on the western side of Mitchell's Island and on the narrow strip of land, there is a continual erosion going on from the action of the flood-waters and the sea, which makes it absolutely necessary that steps should be taken to prevent either the river from breaking out or the sea from breaking in at that particular point.

1571. Would the rubble-stone facing, in your opinion, meet the case? I think it would; but it requires to be done at once.

1572. An engineer says that eventually that piece of rubble-work would probably be extended to the training-wall? I am afraid that unless the proposed rubble-wall is continued to meet the southern training-wall, serious consequences might be felt.

1573. That suggestion meets with your approval;—if the rubble-wall be continued northwards to meet the training-wall, the danger you apprehend will be obviated? Yes; it is useless to expect any permanent improvement or benefit to be derived from the northern wall unless the southern wall be gone on with. The sand is continually shifting, and whilst the northern wall might prevent the tide from shifting northward, it would find its way to the south.

Alexander Newton, master mariner, Pelican Island, Manning River, sworn, and examined:—

1574. *Mr. Black.*] You heard the evidence given by Captain Murray and the last witness? Yes. A. Newton.

1575. Do you agree with that evidence? Yes. 4 June, 1898.

1576. Have you anything to add to it? The only thing I thought I might say in addition was that the land is being cut away at the narrow point shown on the plan.

1577. The sand-terrace between the river and the ocean is being gradually cut away on both sides, at the proposed site of the rubble-stone facing? Yes. The chart which Mr. Richards has shows that that strip of land was 22 chains across when that chart was made.

1578. At one time the narrowest portion of that sand-terrace was 22 chains across? When this chart was made.

1579. How many chains do you think it is across now? About $2\frac{1}{2}$ chains—that is, at high water, when we had the high tides the other day.

1580. At ordinary water, what width is it? About 6 chains.

1581. Do you think that, in order to prevent that from being cut away, on the river side some protection will be necessary? Yes.

1582. *Temporary Chairman.*] You are an old resident on the river? Yes.

1583. Do you think that, if the works proposed to be constructed here secure a depth for all time of 12 feet of water on the bar, that will afford ample facilities for the trade of the Manning River? I do not know what the trade may be in future, but it will for the present.

1584. As far as you know it now? Yes.

1585. That will give admission to vessels of sufficiently large tonnage to do all the trade of the district? Twelve feet of water would admit vessels that would carry at a much lower rate than is now charged.

1586. And could carry all the produce likely to be grown on the Manning for a long time to come? Yes.

MONDAY, 27 JUNE, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Manning River.

Henry Richard Carleton, Principal Assistant Engineer, Harbours and Rivers Branch, Department of Public Works, sworn, and further examined:—

H. R.
Carleton.
27 June, 1898.

1587. *Chairman.*] The Sectional Committee, when at the Manning River, thought well to suggest some alterations in detail, taking the scheme as a whole as being satisfactory. You will notice the break in the southern training-bank towards the western end. It appeared well to the Committee to fill that up since it would cost only a couple of thousand pounds to do it? Yes, that is a very good thing to do. It ought to be closed.

1588. With regard to the Manning River, the Committee, when visiting the place, thought it would be well to make the southern training-bank continuous. Would that be a wise thing to do? Yes.

1589. With regard to the western training-bank, the Committee were of opinion that after it had passed some distance up the river, the height of the bank might be lessened, and it might be possible by tying on to the bank further up to prevent some expenditure towards its western side. Thus, the training-wall would be less in height and less in length than that proposed. Is there any serious objection to that proposal? It would be worth while trying.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Harbour Works at Manning River.

APPENDIX.

A.

[To Evidence of C. W. Darley, Engineer-in-Chief for Public Works.]

ABSTRACT OF ESTIMATE FOR MANNING RIVER IMPROVEMENTS.

B.

SWORN STATEMENT BY THOMAS DYKES, COOPERNOOK.

WITH respect to the harbour improvements, I unhesitatingly assert that I consider it of first importance to the Manning district. The main river above the narrows is navigable for steamers of 1,000 tons burden as far as Taree (about 20 miles), and with blasting and removing a few patches of rock, and dredging the shoal flats between Taree and Wingham, the ocean-going steamers could trade to Wingham, which is about 10 miles further (by water). I look upon the bar at the entrance to the river in its present state as the greatest possible impediment to the advancement and commercial progress of the district, for if we had a safe entrance with a good reliable depth of water it would induce competition and give us a better class of steamers, of greater speed, better accommodation, and more reasonable freights. And seeing that it is the water-carriage that has made the district what it is to day, and as it is by water that the residents of the Manning expect the bulk of their produce to find its way to the markets of the world, then I contend that if the proposed scheme, at anything like the anticipated cost, will ensure a safe entrance, carrying from 12 to 15 feet of water, it will be £100,000 most judiciously expended.

Sworn before me at Coopernook, 15 June, 1898,—F. A. WRIGHT, J.P.

THOS. DYKES,
Coopernook, 9/6/98.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

HARBOUR WORKS AT BELLINGER RIVER.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing Harbour Works at Bellinger River," have, after due inquiry, resolved that it is expedient that the proposed harbour works, to cost £36,000, in addition to the amount already expended, should be constructed; and, in accordance with the provision of sub-section iv, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

DESCRIPTION OF THE RIVER.

1. In a report by Captain Howard to the Department of Public Works, dated 18th November, 1890, the Bellinger River, which is about 228 miles north of Sydney, and has a watershed of 480 square miles area, is described as entering the sea through an opening in the beach, about 5 miles northward of a remarkable peaked thickly-wooded hill, called Bellinger Peak, which stands about 2 miles back from the coast. Unlike most of the rivers on this coast, the Bellinger has no rocky headland on either side of the entrance. The nearest rocks are off a small headland over a mile to the southward, and although the entrance shifts north and south, according to the frequency of freshes and gales, it does not vary more than $\frac{1}{2}$ mile in either direction.

It has two arms, which meet within $\frac{1}{2}$ a mile of the entrance—the Northern or Main Arm, a wide, shallow stream coming from a N.N.E. direction, whilst the South Arm, a smaller but deeper stream, comes from the north-westward. Both these streams, however, soon turn to the westward and flow in that direction parallel to each other, and with an average distance of 3 miles between them. The narrow strip of country between the arms is high, broken, and thickly timbered, and both arms have their sources amongst the broken hilly country eastward of the New England tableland, and about 35 miles from the coast. Neither has tributaries of any size or importance, except the Never Never or North Creek, which comes from the northward into the North Arm.

The meeting of the waters of the two arms has caused extensive sand-banks to form at the mouth of each, aided, no doubt by sand washed in by the heavy sea. During long continued freshes, the South Arm water, having a more direct course to the sea, scours out a deep channel for itself; but in dry weather it has not so much power, and the water of the Main Arm seems to leave a deposit of silt across the South Arm Channel, forming a shoal, known as the Crossing, inside the bar.

The bed of the Main Arm is very shallow for above 2 miles from the entrance, and in that space extensive sand-banks, dry at low-water, have formed. To avoid these shoals, small vessels proceed up the South Arm for $\frac{1}{2}$ a mile above the wharf, and

and then enter a channel called Back Creek, which, after a course of $1\frac{1}{2}$ mile, leads into the Main Arm above the shoals. The limit of navigation by punts and lighters on the Main Arm is at Cahill's Wharf, about 14 miles from the entrance. The ruling depth is from 8 feet to 14 feet, with occasional patches from 4 feet to 6 feet.

Above the township of Bellinghen the river is a succession of rapids running over a shingle bed, with still and apparently deep reaches between them.

The South Arm is much narrower than the North Arm, but for purposes of navigation it is far superior. There is nothing to stop any vessel which can come in over the outer crossing from proceeding above Picket Hill Creek, a distance of nearly 10 miles. Handley's Crossing, about 15 miles from the entrance, is the head of tidal influence. As in the North Arm, the stream above appears a succession of rapids with deep pools between them.

This extract from Captain Howard's report is a fair description of the river at the present time.

THE PROPOSED WORKS.

2. Representations have been made from time to time to the Government by the residents on the river, as to the necessity for works which would improve the entrance, and up to 31st December, 1897, works had been carried out at an expenditure of £25,985. These consist of 6,305 feet of a southern training-wall, and the partial construction of 1,600 feet of a northern wall.

A complete scheme for the improvement of the river entrance has been designed, consisting of breakwaters, training-walls, facing, &c., to cost £171,300; but, in addition to what has already been done, the works now recommended, and referred for inquiry to the Committee, are the extension of the south breakwater 60 feet; facing the right bank of South Arm, 2,300 feet; constructing 1,500 feet of temporary bank, 3,000 feet of training-wall, and 1,070 feet of breakwater on the northern side of the entrance, and also 5,750 feet of the inner training-wall at the junction of the two arms of the river, the estimated cost of these works being £36,000. With these improvements, it is regarded by the Engineer-in-Chief as probable that no further expenditure will be found necessary at the entrance of the river for very many years to come, if at all.

SECTIONAL COMMITTEE'S VISIT.

3. A Sectional Committee, appointed to inspect, take evidence, and report with reference to the proposed works, visited the district, made a thorough examination of the works in progress, and of the sites of the proposed additional works, and took evidence at Bellinghen, Fernmount, and Bellinger Heads. They also examined the harbour works which have been carried out at the entrance of the Clarence River, in order to see the results that have followed their construction, and visited Coff's Harbour to ascertain whether and in what manner the residents of the Bellinger district might be served if that harbour were made the principal outlet for the trade of the Bellinger district.

PRODUCE AND TRADE.

4. The Bellinger Valley, the Sectional Committee say in their report, "is exceedingly fertile, and capable of supporting a large population. Large crops of maize are grown upon the rich alluvial flats which form its banks; the higher ground, while slightly inferior in quality, is, when cleared, admirably suited for the pasturage of dairy cattle, and excellent hardwood is everywhere exceedingly plentiful. At the present time the staple products of the district are maize and timber. The export of maize during 1897 amounted to 51,518 bags, while, in the same period, 587,314 feet of hardwood and 87,774 feet of cedar were shipped to Sydney. The dairying industry is yet in its infancy, and its improvement is retarded by the delays and inconvenience which attend the shipment of cream and butter to the metropolis; but large tracts of country are being cleared and made ready

ready for dairying by the selectors on the land, and inquiries for suitable ground are constantly made by persons desiring to settle in the district and embark in this enterprise. Poultry, eggs, and pigs are sent from the river as opportunity offers, and a tabulated statement of the yearly exports for the years 1892 to 1897, inclusive, shows an increase in every department of production."

SUGGESTED RAILWAY TO COFF'S HARBOUR.

5. One portion of the inquiry by the Sectional Committee was devoted to a suggestion that a light line of railway might be constructed which would connect the Bellinger district with the deep waters of Coff's Harbour. They found that the suggestion was not entertained by the residents of the Bellinger, and that such a railway would render little or no assistance to the district's development. Further, in the opinion of the Sectional Committee the cost of even the cheapest kind of line would greatly exceed the estimated cost of the proposed harbour improvements.

EFFECT OF THE WORKS ALREADY CONSTRUCTED.

6. The effect of the harbour works already carried out at the Bellinger appears to have been beneficial. The Engineer-in-Chief states that there can be no doubt the river has improved since the southern training-wall has been constructed; the channel which used to shift about a good deal will now remain stationary, and as the works progress will be permanently deepened. With the assistance of a dredge, the annual cost of which is £2,000, it is expected that the channel will be suitable for vessels drawing 7 or 8 feet of water. The Sectional Committee were of opinion that complete success will attend the carrying out of the scheme.

THE COMMITTEE'S RECOMMENDATION.

7. In the case of the Bellinger, as in those of the other similar proposals referred to the Committee, the works have already been carried out to such an extent that the Committee are practically compelled to recommend their completion. The scheme as a whole is a good one; the question chiefly to be considered is whether the river and district are such as to justify the proposed expenditure. Efforts were made by the Committee to reduce the expense by curtailing some of the works, but, from the inquiry made, it appeared that if this were done the saving would be inconsiderable, as the works have been carried out to an extent beyond that which will allow of any considerable modification.

Under the circumstances, therefore, the Committee recommend the construction of the proposed additional works, and have passed the resolution shown in the following extract from their Minutes of Proceedings:—

Mr. Farnell moved,—“That, in the opinion of the Committee, it is expedient the proposed Harbour Works at Bellinger River, to cost £36,000 in addition to the amount already expended, as referred to the Committee by the Legislative Assembly, be carried out.”

Mr. Clarke seconded the motion.

Mr. Wright moved,—“That the motion be amended by the insertion after the word ‘River’ of the words ‘with the exception of the training-bank on the north side of the South Arm.’”

The amendment was seconded by Mr. Hassall, and negatived on the following division:—

<p>Ayes, 4.</p> <p>Mr. Ewing, Mr. Humphery, Mr. Hassall, Mr. Wright.</p>	<p>Noes, 8.</p> <p>Mr. Hoskins, Mr. Roberts, Mr. O'Connor, Mr. Clarke, Mr. Lee, Mr. Fegan, Mr. Black, Mr. Farnell.</p>
--	--

The motion was passed on the following division:—

Ayes, 10.
Mr. Ewing,
Mr. Hoskins,
Mr. Roberts,
Mr. O'Connor,
Mr. Clarke,
Mr. Lee,
Mr. Fegan,
Mr. Black,
Mr. Wright,
Mr. Farnell.

Noes, 2.
Mr. Humphery,
Mr. Hassall.

THOS. EWING,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 5 July, 1898.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

HARBOUR WORKS AT BELLINGER RIVER.

WEDNESDAY, 30 MARCH, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).	
THE HON. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
THE HON. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee proceeded to consider the expediency of constructing Harbour Works at Bellinger River.

Robert R. P. Hickson, Under Secretary and Commissioner for Roads, Department of Public Works, sworn, and examined:—

1. *Vice-Chairman.*] Have you a statement to read to the Committee? Yes. It is as follows:—

BELLINGER RIVER.

THE entrance to the Bellinger River is about 228 miles north of Sydney. The watershed of the river has an area of about 480 square miles. R. R. P. Hickson.
30 Mar., 1898.

The following particulars are taken from Captain Howard's description of the Bellinger River, 18th November, 1890:—

"The Bellinger River enters the sea through an opening in the beach, about 5 miles northward of a remarkable peaked thickly-wooded hill, called Bellinger Peak, which stands about 2 miles back from the coast. Unlike most of the rivers on this coast, the Bellinger has no rocky headland on either side of the entrance. The nearest rocks are off a small headland over a mile to the southward, and although the entrance shifts north and south, according to the frequency of freshes and gales, it does not vary more than $\frac{1}{2}$ mile in either direction.

"The Bellinger River has two arms, which meet within $\frac{1}{2}$ a mile of the entrance—the Northern or Main Arm, a wide, shallow stream coming from a N.N.E. direction, whilst the South Arm, a smaller but deeper stream, comes from the north-westward. Both these streams, however, soon turn to the westward and flow in that direction parallel to each other, and with an average distance of 3 miles between them. The narrow strip of country between the arms is high, broken, and thickly timbered, and both arms have their sources amongst the broken hilly country eastward of the New England tableland, and about 35 miles from the coast. Neither arm has tributaries of any size or importance, except the Never Never or North Creek, which comes from the northward into the North Arm.

"The land at present cultivated is almost entirely confined to a narrow strip of alluvial soil on either side of the river bank, and the staple and almost only crop grown is maize. Where the hills have a considerable distance between their bases and the river bank, there are always swamps. There are several townships on the Main Arm but none on the South Arm, which is not so far advanced in settlement.

"The meeting of the waters of the two arms has caused extensive sand banks to form at the mouth of each, aided, no doubt, by sand washed in by the heavy sea. During long continued freshes, the South Arm water, having a more direct course to the sea, scours out a deep channel for itself; but in dry weather it has not so much power, and the water of the Main Arm seems to leave a deposit of silt across the South Arm Channel, forming a shoal, known as the Crossing, inside the bar.

"The bed of the Main Arm is very shallow for above 2 miles from the entrance, and in that space extensive sand banks, dry at low-water, have formed. To avoid these shoals, small vessels proceed up the South Arm for $\frac{1}{2}$ a mile above the wharf, and then enter a channel called Back Creek, which, after a course of $1\frac{1}{2}$ mile leads into the Main Arm above the shoals. The limit of navigation by punts and lighters on the Main Arm is at Cahill's Wharf, about 14 miles from the entrance. The ruling depth is from 8 feet to 14 feet, with occasional patches from 4 feet to 6 feet.

"Above Boat Harbour the river is a succession of rapids running over a shingle bed with still and apparently deep reaches between them. All the land on either side is cultivated with maize for a distance of 20 miles, following the course of the river. The Never Never or North Creek comes from the northward $6\frac{1}{2}$ miles above Boat Harbour, and its banks are also cultivated for some distance upward.

"The South Arm is much narrower than the North Arm, but for purposes of navigation it is far superior. There is nothing to stop any vessel which can come in over the outer crossing from proceeding right up above Picket Hill Creek, a distance of nearly 10 miles. Unfortunately the soil does not become good until the obstructions to navigation begin, and little produce is grown below, comparatively.

"Handley's Crossing, about 15 miles from the entrance, is the head of tidal influence. As in the North Arm, the stream above appeared a succession of rapids with deep pools between them. The banks are not high, but the wooded hills come close down to the water in places; the soil along the banks seemed very prolific.

"It is high-water full and change at the Government wharf near the entrance at Sh. 50m., and ordinary springs rise $4\frac{1}{2}$ feet.

"Within the entrance numerous heaps of ballast are to be seen at low-water, deposited by small vessels coming here for cedar in past times; they are to be seen in all directions, and are nearly all Sydney sandstone.

A perusal of the official papers shows that from 1879 to 1890 numerous representations were made by the residents, the Progress Association, shipping companies, &c., as to the shoal condition of the river entrance, and the necessity for improvement works; but, with the exception of dredging within the entrance and up the river, no works were carried out, as it was considered that the expenditure of any small sum of money could not be productive of any great permanent benefit to the entrance.

In March, 1890, Captain Howard reported that the navigable channel from the Government wharf to the Pilot Station was nearly straight out over the bar, and had a well-defined sand-bank on the southern side for nearly the whole distance, leaving a shallow opening about 200 feet wide near the South Spit. The channel had an average width of about 250 feet, the northern side not being so well defined. He suggested that, if considered desirable to fix the entrance in this position,

R. R. P.
Hickson.
30 Mar., 1898.

position, a training-wall from the Government wharf to the outer South Head, slightly concave to the northward, would have the effect, and that the stone in the numerous ballast-heaps to be seen in all directions in the harbour might be collected and used for this purpose. This would probably be the most inexpensive method of constructing the wall, as there appeared to be sufficient stone within a mile of the work to build 1,000 feet of wall.

During 1890, the bar appears to have been in a very unsatisfactory condition—vessels went ashore and others were bar-bound for lengthened periods. Further representations were thereupon made by those concerned as to the danger and loss consequent on the bad state of the entrance, and on 27th November, 1890, Mr. Darley reported as follows:—

“I have not yet received Captain Howard’s complete survey of this entrance; but, from the advance tracing he has forwarded on with his reports, I am of the opinion that some useful work can be done towards guiding the channel and fixing the bar, by the construction of a training-wall from near the wharf under the Pilot Station, in a south-easterly direction towards the South Spit.

“The bottom here is all shifting sand, and being very much exposed to wash from seas that pass over the bar, stone will be the only material suitable for its construction.

“To extend this dyke for the distance required, viz., about 1,000 yards, would take about 50,000 cubic yards of stone, allowing it to be 12 feet wide on top and 3 feet over high-water mark, and the probable cost would be about £15,000.

“From Captain Howard’s report, I have grave doubts as to the possibility of procuring stone for this work within a reasonable distance—the specimens he has collected are, with one exception, worthless, being of soft slaty formation, and likely to decompose in water. The one exception was stone broken from a boulder, but he has doubts whether any quantity of similar stone can be procured.

“Something may, however, be done towards starting the work by collecting the ballast now scattered about the harbour and probably causing harm in places and depositing this along the proposed line of dyke up to about mean-tide level. This will divert the current and, in an inexpensive manner, test the probable effect of the dyke were it completed.

“While this work is in hand, a more thorough examination of the district could be made to ascertain whether any suitable stone can be obtained within a reasonable distance.

“I suggest that the sum of £5,000 be placed on the Loan Estimates to provide a grab-dredge and some small punts, and make a start with collecting and depositing the ballast in the manner suggested.

“Doing this work, which will be useful and complete in itself, will not in any way commit the country to any large expenditure, should any great difficulty arise in procuring material.”

On the 29th November, 1890, Captain Howard, who had made a very careful and complete survey of the Bellinger, forwarded his plans and report. A comprehensive scheme was thereupon laid down for the improvements.

In June, 1891, the residents again petitioned the Government to proceed with the works; the channel was said to be very intricate, and a training-wall would obviate this, and cause a straighter and deeper channel. It was thereupon decided to send a grab-dredge to the river, to lift the stone in the ballast-heaps and deposit it in a line extending seawards from the Government wharf,—the wall to be raised to low-water level only, so as to get as great a length of wall as possible with the material available. The dredge “Chi” arrived on 4th August, 1891, and during the next six or nine months collected and deposited in the line of wall a large portion of this stone; but in March, 1892, this source of supply was almost exhausted. A thorough search was therefore made by Mr. Carleton, in the surrounding country, for material with which to continue the wall. No really good stone, however, could be obtained; but a soft clay-slate was found, which in the absence of better material he thought might be used. The best site for opening a quarry was at W. R. 90, on the south arm of the river, and about 6 miles by water from the entrance; this stone has a weight of 140 lb. per cubic foot.

On 14th June, 1892, Mr. Darley reported as follows:—“The construction of a training-wall on the south side of the entrance of this river, leading from the wharf near the Pilot Station, having been approved of some time ago, a dredge was procured to collect all the scattered stone-ballast lying in heaps about the harbour, and deposit it on the line of the proposed training-wall, about 400 feet of which has been more or less formed up to half-tide level by this means.

“The result of this work has been satisfactory, and sufficient to warrant me in recommending its continuation,—as a channel some 15 feet deep has scoured along the face of the wall, which is likely to remain permanent.

“There is no more ballast now available, nor is there any stone in the vicinity of the works,—the material about the Heads being only a soft clay-slate—useless for this work.

“I find there is fairly good stone up the river on a water reserve about $7\frac{1}{2}$ miles from the Heads, which might be punted down. I propose, therefore, with the Minister’s sanction, to invite tenders for the quarrying, punting, and discharging of the stone in the training-wall at per ton, measured in the punts. We can then see what the cost is likely to be. There is a sum of £2,800 available for the work.”

Ministerial approval having been given, tenders were invited, and that of W. R. Cowdery accepted on 22nd September, 1892.

In April, 1893, as the vote for the improvements was almost exhausted, Mr. O. O. Dangar, on behalf of the residents, wrote stating that the wall had more than fulfilled what was anticipated, and asked that provision might be made for extending the work; on which Mr. Darley reported that the effect of the wall in improving the channel so far had exceeded his expectations. He would, however, be glad to see the wall extended further seaward, and he had no doubt when this was done the navigation would be greatly improved, and the channel fixed in a permanent position.

On the vote becoming exhausted, the works were stopped; but on strong representations of the residents, shipping company, &c., being made as to the desirability of continuing the wall, work was again commenced, and has been continued up to the present time.

The votes taken for the work have been as follows:—

1890—Loan	£5,000
1894	3,000
1894	4,000
1895	5,000
1896	10,000
1897	6,000
Total	£33,000

The scheme now designed by Mr. Darley, and submitted for the consideration of the Committee, consists of northern and southern breakwaters 500 feet apart, training-walls extending up both sides of the North and South Arms for distances of about 3,500 feet and 9,000 feet respectively from the junction, and coating the river bank with stone where necessary to prevent erosion. The total length of breakwaters, training-walls, facing, &c., in the complete scheme is about 35,800 feet, the estimated cost being £171,300. The work carried out up to 31st December, 1897, consists in the construction of 6,305 feet of the southern wall—3,115 feet being above the Government wharf and 3,190 feet below—and the partial construction of 1,600 feet of the northern wall, the total expenditure on which has been £25,985. Of the remainder of the scheme, the portions now recommended are the extension of the south breakwater 60 feet; facing the right bank of South Arm 2,300 feet; constructing 1,500 feet of temporary bank, 3,000 feet of training-wall, and 1,070 feet of breakwater on the northern side of entrance, and also 5,750 feet of the inner training-wall at the junction of the two arms of the river; the estimated cost of these works being £36,000. With these improvements, it is probable that no further expenditure will be found necessary at the entrance for very many years to come, if at all.

2. What will be the cost of the complete scheme, including the money already expended? £171,000.

3. What will the scheme cost, excluding the work shown on the map by the dotted red lines? £36,000.

4. What will be the effect of this expenditure? Personally I know very little of the river. I have only been there once, and then for a very short time. Mr. Darley will be able to give you what information you want.

5. *Mr. Fegan.*] What trade are these improvements intended to serve? The settlers all along the river want some outlet for their produce.

6. Will the expenditure of £171,000 include wharfage accommodation? No; there will be no wharfage accommodation required.

7. A Government wharf is shown on the plan? That is built.

8.

E. E. F.
Hickson.

30 Mar., 1898.

8. Does it not strike you as strange that the people residing upon these rivers should never be called upon to pay anything towards the cost of improving them? That is a question of policy which I am not in a position to give an opinion upon.
9. But the fact remains that no revenue is obtained from these improvements? No direct revenue; but an indirect revenue is obtained from the increased sale of land. If the people have no means of getting their produce to market, you will not be able to dispose of your land.
10. The same thing might be said in regard to railway construction? No doubt.
11. But the contention is not admitted with regard to railways;—what draught of boats will be able to go up the river when these works are completed? I should like you to ask Mr. Darley that question.
12. How much have you already spent upon the river? £25,000.
13. That expenditure will be of little value if the scheme now proposed is not carried out? What we have done already has proved useful; but no doubt something further is required.
14. If the work were not continued what has already been done would be of very little use? It would be useful, so far as it goes.
15. But the possibility is that the channel would soon fill up again? I do not think it would fill up again. I think there will always be deep water where we have made the wall; but to improve the entrance, further expenditure is necessary.
16. Have you let this work by contract? Yes.
17. For how much per ton have you let it? Mr. Darley will tell you that.
18. How long has the work been going on? Practically it commenced in 1890 with the dredging.
19. *Mr. Hoskins.*] Do you know how many people there are living in the district? I could not say, because I know very little about it.
20. No steamers trade there? I do not think steamers trade there. I think the trade is done mostly by ketches.
21. I suppose half a dozen good-sized vessels could take away the produce of a whole year, taking one load each? I am not in a position to say.
22. The alluvial flats are very narrow? Yes.
23. This river is not like the Macleay, where there is a large quantity of alluvial land? When you get up the river you get into alluvial land; but there is not anything like the same extent of it as there is on the Macleay or the Manning.
24. Do you think the whole district is worth £171,000? It is only proposed to expend £36,000 now.
25. Will not the expenditure of that money be the expenditure of more than the district is worth, considering the small population and the fact that a great deal of the land is rough stony land? I would not say that. It is not proposed to expend £171,000, nor do I think that expenditure necessary. I think that the expenditure of £36,000 will give all that is necessary, and all that can reasonably be asked for.
26. *Mr. Wright.*] I suppose you can give us no idea as to the population of this district? No.
27. How far is it from the Bellinger to the Macleay? About 30 miles.
28. How far is it to the Clarence? About 80 miles.
29. And how far to the Nambucca? About 15 miles.
30. Do you know any other country in the world where large sums of money have been spent upon three harbours within 30 miles of each other? I cannot call to mind any parallel case, nor do I know any country where the conditions are the same as exist here. These rivers are completely isolated. It is not as if you could make one port and allow the produce from all the rivers to go to it. The rivers are as completely isolated as if they were hundreds of miles apart.
31. The Government propose the expenditure of large sums of money upon the improvement of each of these rivers? Yes.
32. What is the depth of water in the Bellinger at the present time? Mr. Darley will give you that information.
33. Were you not formerly in charge of work of this kind? Very little was being done on this river then.
34. The work that has been done is of comparatively recent date? Yes.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and examined:—

35. *Vice-Chairman.*] Do you wish to make a statement to the Committee? The statement, which, I C. W. Darley understand, has been read by Mr. Hickson, contains the history of the proposal up to date.
36. *Mr. Hoskins.*] Have you visited the Bellinger River? Yes.
37. Recently? It is a year or eighteen months since I was there.
38. Is it a district with wide, extensive, rich alluvial flats, thickly settled, and capable of large production, or are the alluvial flats narrow, and only sparsely populated? The district is not so rich as some of the other northern river districts, because the river flats are somewhat narrow. Still, I have not been through the district. I have mostly spent my time about the entrance to the river. I cannot say much of the country inland.
39. A good deal of the land fronting the river is not alluvial land? Near the entrance the land is very poor. As a rule the land at the entrance of all these rivers is poor. Higher up, however, there is a reasonable quantity of good land.
40. But nothing like the extent of good land upon the Macleay? No.
41. Is there much trade to the river? Not very much at the present time.
42. Are there steamers trading there? The trade is done mostly by small vessels.
43. What loading do they get? Maize and timber.
44. Judging from the statement of Mr. Hickson, the navigation of the river has been considerably improved by the works already carried out by your Department? Yes; there has been a decided improvement already.
45. Do you think that, under the circumstances, there is a sufficient depth of water for the trade? The entrance to the river is somewhat uncertain, because it changes its position so frequently. There is a very fair bar just now; but it might suddenly become very bad. No doubt the river has improved since we carried

30 Mar., 1898.

C. W. Darley. carried out the southern training-wall. It is permanently better than it was originally. The channel will never shift about again as it previously did.

30 Mar., 1898.

46. I gather that you have had exceptional difficulty in obtaining the stone required for training-walls? We can get stone good enough for training-walls, and inside work, but we have great difficulty in getting stone suitable for outside work. Practically, all that is proposed is inside work.

47. You do not propose to carry out the breakwater shown on the plan? No; I do not submit the breakwaters to the Committee.

48. Do you know the average depth of water on the bar? Late reports give as much as 9 feet at high water; but in January last there was as little as 7 feet.

49. That is about the depth upon the Macleay bar? Yes; but the entrance to this river used to be much more crooked and difficult than the entrance to the Macleay.

50. Then it is evident that the improvements you have made have sufficed to enable the North Coast Steamship Company to send steamers to the river? A steamer has been running in there lately; but I do not know how frequently.

51. I believe that you only propose to make good training-walls upon the two arms of the river? That is all that is put before the Committee.

52. You do not propose to carry out the complete scheme costing £171,000? No. It is only proposed to spend £36,000.

53. Do you know if the trade of these rivers has increased very much of late years? I am not in a position to give any details about the trade of these rivers.

54. It is proposed to spend very large sums of money in improving them; but the population appears to be very small? Many of these districts are unquestionably kept back by the state of the bars, which prevent settlement. If you open up a district, settlement is improved. The bars at the entrances to several of these rivers are so bad, and the insurance charges so heavy, that people are prohibited from shipping goods.

55. That does not apply to the Bellinger, because the entrance to that river has been improved? It has been somewhat improved.

56. Do you think that an expenditure of £36,000 will suffice to make a good navigable channel for vessels drawing 7 feet or 8 feet of water? With the assistance of a dredge. I should like to increase the estimate by running a training-wall up the concave bank of the North Arm, because we have always found great difficulty in keeping that channel open; but I have cut the work down as much as possible. At the present time a craft going up the North Arm, where the chief settlement lies, has to follow a tortuous and uncertain channel, and, in fact, the channel is often so bad that it is found better to go along Back Creek. We have, from time to time, to dredge the northern entrance to Back Creek, and we have also done a great deal of dredging to keep the North Arm open; but if the trade warranted it I should like to construct a training-wall along the concave bank of the North Arm. We should then get deep water right down the North Arm, and the current would make a more direct scour and tend to improve the bar.

57. What would the wall that you speak of cost? £15,000. But I have not put it before the Committee because I do not think that we are justified in spending the money. The Committee will observe that I propose to construct a training-wall upon the eastern side of the North Arm, near its junction with the South Arm, and to join it to the main land by what we term a temporary bank. That bank we are constructing with fascines and sand-bags, to try and divert the water into one channel. At the present time the river flows all over the flats, and the current is not properly directed towards the entrance.

58. Did not the river once find its way out through the channel to the left of the Government wharf? Two or three times when I have been up there the entrance has been much further south. On one occasion the steamer followed a channel which was situated where sand hummocks are now shown on the map. There are a number of ballast heaps scattered about on the sand, showing where small vessels have unloaded ballast before entering the river. The wall that we have made has concentrated the scour to some extent, and has thus improved the bar.

59. Will not the water of the South Arm meeting with the water of the North Arm have a tendency to make a deposit of sand and silt at the end of the point between the two arms? Nothing of serious consequence. The current would cut through any bank there. The current coming down the North Arm will follow the west wall, and will continue straight across to the training-wall on the South Arm, and follow the concave curve out to sea.

60. Do you consider that if the proposed works are carried out it will materially benefit the river? Yes.

61. *Mr. Wright.*] Have you paid many visits to the Bellinger River? I have been there four times.

62. I suppose this scheme has been suggested by the reports and the lengthy observations of your officers stationed on the river? Yes.

63. In every case of this kind you send officers to make some stay on the river? We have had officers there to make surveys, and to collect information.

64. Can you tell the Committee what the population of the Bellinger is? I have not obtained that information.

65. You have confined your inquiries to matters connected with the scheme itself? Yes; I have not had time to do anything else. I have generally gone into the river on one tide and come out on the next. I have not been up the river for any distance.

66. The Committee have had before them a proposal for a rather extensive outlay upon the Macleay. Now we have a similar proposal in regard to the Bellinger, and, subsequently, we shall have a similar proposal in regard to the Nambucca. All these rivers are comparatively near to each other? Yes.

67. I think it is 16 miles from the Bellinger to the Nambucca, and hardly 15 miles from the Nambucca to the Macleay? The Bellinger and the Nambucca are quite close to each other.

68. I suppose no survey has been made to determine the possibility of connecting the three rivers? Each river must stand by itself. A port upon one river would be of no use to the other rivers.

69. It might be possible to connect the rivers by an inexpensive canal;—has that aspect of the case been dealt with? I do not think it would be possible to connect the rivers by a canal. There is high land between the Nambucca and the Macleay.

70. If you could connect the rivers, would it not be better to make only one good entrance? It would be far more costly to connect the rivers than to improve the entrance of each of them.

71. I do not think there is much high land between them? There is a dividing range between the Nambucca and the Macleay.

72. It seems to me extraordinary and without precedent that it should be proposed to make three harbours within 15 or 20 miles of each other? I do not think you can call these harbours. It is only proposed to improve the mouths of the rivers. Nature has made the rivers, and there is good land there for people to live upon. C. W. Darley.
30 Mar., 1898.
73. You say that we are not making harbours? There is good land there, and we are giving access to it. There is a certain amount of inland navigation which can be kept open by dredging, and it is proposed to improve it. It might be possible to make a connection, such as you suggest, between the Nambucca and the Bellinger; but I do not think you could make a connection between the Macleay and the Nambucca.
74. Do you know of any similar case upon the coast of England, Ireland, or France? I do not know of any other place where there are three rivers of this size so close to each other, and where there is such inducement for navigation. The only outlet the people of the district have for their produce is by way of these rivers.
75. What records have you in regard to the Bellinger bar? Records have been taken for a great many years back. I have with me records for the the last two years.
76. What has been the state of the bar during that period? This time two years ago there were only 4 feet of water upon the bar, and in August of the same year there were only 4 feet of water upon the bar; but in the interval there had been as much as 7 feet upon the bar.
77. The produce of the district consists almost entirely of timber or maize? I think so.
78. What is the state of the river during the maize season, that is from the middle of February to, perhaps, the middle of May? In 1896, it was at its worst then; but there is no regularity. We have no regular seasons, and the state of the bar depends upon the rainfall.
79. Does the pilot there keep a record of the state of the bar? Yes; I think you could get it from the Marine Board.
80. Do you expect a very large scour of sand when the training-walls are completed? Not a very large scour of sand.
81. What has been the effect of the work already completed? There is deep water all along the wall.
82. Has the bar been deepened, or has it been made shallower? The water upon the bar has been deepened, because the scour has been concentrated. The bar is situated where the outer ends of the two breakwaters are shown on the plan.
83. You have reason to believe that if the proposed works were constructed the entrance to the river would be permanently deepened? I think the entrance would be permanently improved.
84. Is there no danger of the sand-spit drifting down from the south across the entrance? No; the ebb and flow of the tide would keep the entrance open.
85. Is there any danger of a break-through above the training-wall? I do not think so.
86. Are all the works comprised in the scheme shown upon the plan, or are there other works to be proposed at a subsequent date? All the works, I think, the district requires are shown on the plan.
87. Will you fill up Back Creek, or will you leave it open? I propose to leave it open for the present.
88. Will any dredging be done on the Never Never Creek and on the North Creek? We shall have to dredge there almost constantly.
89. What will be the permanent cost of keeping the channels clear by dredging? One dredge will do the whole river. We move the dredge about to deal with the worst places.
90. What would be the annual cost of a dredge suitable for the work? A dredge costs something like £2,000 a year.
91. Do you think the country is justified in spending a large capital sum in improving the navigation of this river, and an annual sum in maintaining it? That is a question of policy. I simply receive instructions to design a scheme for the improvement of the river.
92. *Mr. Fegan.*] Do you find that Back Creek is getting shallower as you go on with your work? No; the only place that gives trouble there is the entrance to Back Creek from the North Arm. There is a tendency to shoal there. I should like to practically close Back Creek by constructing a training-wall along the eastern side of the North Arm, to concentrate the scour.
93. That would make a better job of it than is at present proposed? It would maintain a good depth of water all the way down the North Arm.
94. And save dredging? It would save a good deal of dredging.
95. Then why have you not proposed the work? Because I thought that £36,000 was enough to spend upon the place.
96. But would it not be cheaper to make the wall than to go on dredging? Well, you do not always have to dredge there. You only have to touch it up now and then.
97. *Vice-Chairman.*] Can you say what has been the expenditure upon this river each year? The votes obtained one year have generally been expended in the following year. As a rule we have just expended one vote when we get the next. Once or twice we have anticipated a vote.
98. Can you say how much of the first vote was expended upon permanent work, and how much was expended upon dredging? A portion of the first vote was spent in the construction of a dredge; but I cannot say how much.
99. In the following years how much was spent upon work of a permanent character, and how much was spent upon maintenance? Part of the first vote was expended in constructing a dredge; but with the exception of that amount, all the money has been spent upon permanent work.
100. What would be the annual cost of keeping the river navigable, if the work proposed by you were carried out? A dredge would cost about £2,000 a year.
101. What has been the annual charge hitherto? It has averaged about that.
102. So that there will be no saving upon the annual expenditure? If the proposed works were carried out, I think that the dredge would be needed only occasionally. Perhaps we should be able to make one dredge do for two rivers.
103. Upon what part of the river have you spent most money? Most of the dredging has been done below Fernmont. By far the larger portion of the expenditure has taken place near the entrance. The total expenditure upon dredging to date has been £29,000; of that amount about £18,000 has been spent in dredging near the entrance, and at Back Creek, and about £11,000 higher up the river.
104. That expenditure was spread over what period? Over a period of ten years.

- C. W. Darley. 105. Commander Howard speaks of a training-wall, which would give a good depth of water up to the wharf? The wall has been made.
- 30 Mar., 1898. 106. Has it ensured a deep channel up to the wharf? Yes.
107. What disabilities do the residents of this district labour under at the present time, so far as the river is concerned? The chief difficulty in the navigation of the river lies in the crossing at the entrance. There are certain shoals in the river, but the worst of them have been cut through. The works now proposed get over the worst part of the river.
108. Could any other work now proposed be dispensed with, and still allow a fair entrance to the river to be given? I do not think so. I have cut the scheme down as low as possible. We must either carry out this scheme, or leave the work alone.
109. If nothing is done will the residents have a better river than they would have, if the expenditure which has already taken place had not been made? Yes.
110. During last year and the previous year the expenditure seems to have reached about £16,000. If, as the result of that expenditure, the condition of the river is now fairly good, do you think that it is absolutely necessary to expend £36,000 more? There is no doubt that the proposed expenditure will save something in dredging. A dredge costs about £2,000 a year, and if the whole scheme were carried out, the probability is that a considerable part of that sum would be saved.
111. What would be the saving? I should think that half of that amount might be saved; you might keep one dredge upon two rivers, instead of putting a dredge upon each river. One dredge might be sufficient then for the Bellinger and the Nambucca.
112. You do not want to make any recommendation; you simply give the Committee your opinion as to the probable effect of the proposed works? I do not feel qualified to give an opinion as to the necessity for these works, because I have not been far enough up the river to form an opinion as to the value of the district.
113. *Mr. Wright.*] Do I understand you to say that, if, out of a proposed expenditure of £171,000, £36,000 is spent, the residents will get a fair river? I think the expenditure of £36,000 will be sufficient.
114. That would make the total expenditure about £62,000? Yes; the works already carried out are not sufficient. Something further should be done.
115. *Vice-Chairman.*] You might explain why you have added £100,000 for the work shown by dotted red lines if the expenditure is unnecessary and not recommended? My practice is always to design a complete scheme, and then to say how much of it can be omitted for the present to give a sufficient improvement. Then, when a district develops, and a better class of steamers is demanded for the trade, the improvement can be increased by the extension of the work. I always find it better to do that than to recommend a scheme which cannot be enlarged hereafter.
116. *Mr. O'Connor.*] All the work you are doing now is solid? It is part of a complete design, and if an extension is needed we should not have thrown away any money.
117. *Mr. Wright.*] You say to the Ministry, "Here is my scheme for making a permanent improvement to this river. If the scheme is only partly carried out, it will give a fair measure of relief; but to get a perfect scheme the whole design should be carried out"? Yes; in the return I prepared for the Minister I showed him what the completed scheme would cost, and in another column the expenditure now recommended. I think it was the latter amount which was put before the Committee.
118. *Vice-Chairman.*] You put the complete design before the Minister—a design, it may be described, to carry out in the future, but which is not necessary now? Yes; I recommended the expenditure of £36,500, and we spent something since then.
119. Is the work still going on? The work is still in progress, under a contract terminable at a month's notice.
120. What part of the scheme is now being carried out? The eastern training-wall on the North Arm, and the extension outwards of the southern training-wall, on the South Arm.
121. What is the object of making a wall on the western side of the North Arm, if Back Creek is now being used instead of the North Arm? Back Creek is only used intermittently.
122. Will not Back Creek be the regular channel until the training-wall costing £15,000, to which you have referred, is carried out? No; Back Creek is only used when the North Arm gets bad.
123. Is the Back Creek channel always navigable? No; occasionally it chokes up.
124. Is the North Arm navigable at the present time? The traffic goes through the North Arm at the present time. Of course the channel may be closed next week. It alters very much.
125. When the North Arm is not open, can you always use Back Creek? When the North Arm gets very bad we are generally called upon to dredge the entrance from it into Back Creek.
126. Is the rest of Back Creek always navigable? It has been dredged several times and is always filling up again; otherwise the best channel is in Back Creek.

THURSDAY, 31 MARCH, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.
The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Harbour Works at Bellinger River.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and examined:—

127. *Mr. Fegan.*] You produce a map showing the area of country which would be benefited if the works proposed to be carried out at the entrance to the Bellinger River were carried out? I cannot say how far the beneficial effect of these improvements will be felt; but, as in previous cases, I have taken in the whole watershed of the river. On the map the alienated land is shown tinted blue; it comprises 34,300 acres. The reserves are shown tinted green; they comprise 17,500 acres. The Crown land is tinted brown, and comprises 241,200 acres. The whole of the Crown land is untenanted, unless it may be for an annual lease here and there. C. E. Rennie.
31 Mar., 1898.
128. Do you know what rental is paid for these leases, if they exist? No. We do not keep a record of annual leases. For all I know there may be none at all. The whole of the land shown by brown tint is unoccupied.
129. Do you think that the Crown will be able to lease this land if the proposed works are carried out? I do not think so. I believe that the country is thickly wooded, and mostly inferior land. The alienated land follows the creek, and is, of course, the best land in the district. So far as we can judge, there is not likely to be much extension of settlement there. The only opening seems to be in connection with the timber traffic. There is an area of 20,700 acres at the head of the river which is now being got ready for settlement.
130. Under what conditions? It will be cut up into homestead selections or settlement leases. The land is now being inspected by a surveyor, and is being got ready for settlement. It is not likely that any land will be occupied further back than that. A few small areas—40-acre blocks, similar to those on the North Arm of the river—may be taken up on the South Arm; but there cannot be any settlement of consequence there. So far as we can judge, no great extension of settlement in the district is likely.
131. Have you any other information to give us? I do not think so.
132. *Mr. Wright.*] What is the total length of the brown patch shown on the map, from east to west? Between 30 and 40 miles.
133. I suppose you consider that the western part of that land would come within the sphere of the river influence? So far as I know it would. The area shown on the plan is bounded by the range forming the watershed of the river.
134. You assume that nearly the whole of this land is inferior? I happen to know that it is unsuitable for close settlement.
135. It is not occupied now? No; it is thickly timbered country.
136. The fact that it is unoccupied is strong presumptive evidence of its unsuitability for settlement? I am told that it is so thickly timbered that there is very little grass there, and that it is not profitable to put it under pastoral occupation.
137. Is it brush country, or open forest land? I could not say.
138. The gullies of the eastern slope along the coast contain brush timber, more or less? I believe so. I am of opinion that there is good timber in this district.
139. But you do not think there is much good land? I believe not.
140. Is there any area of good land in the reserves? I think not. There are two large reserves near the sea-coast, but they both contain forest land. The probability is that that country is inferior.
141. So that the total area of land upon the Bellinger, which is of any value for settlement, is something less than 40,000 acres? Yes, judging from the amount of alienation that has taken place there. The country tinted brown has been open to settlement for a long time, but it has not been taken up.

Thomas Ratcliffe, pilot, Bellinger River, sworn, and examined:—

142. *Mr. Hoskins.*] Are you still stationed at the Bellinger River? Yes. T. Ratcliffe.
31 Mar., 1898.
143. How long have you been stationed there? I shall have been stationed there six years next August. I have had experience of the Bellinger for eighteen years. I have traded there, and before I went into the Government service I had charge of the tugboat there.
144. All the good land in the district has been alienated, has it not? The settlement in the district is increasing every year. Every steamer brings fresh families, who go up the Dorrigo way. All that is wanted is a good entrance to the river, so as to give direct communication with Sydney. I think there would be more cargo sent from the Bellinger if the river were in a better condition.
145. Would not Coff's Harbour be the harbour for the Dorrigo district? I do not think so, while the Bellinger is open.
146. The Bellinger District is one of the earliest settled districts in the Colony? Yes; but up to within two years ago there has been no means of getting the produce from there to market, and a considerable number of settlers have had to leave the river.
147. They have abandoned their farms? Yes, and other farmers have taken up the land.
148. What has been the cause of the demand for land during the last few years? The improved condition of the river. From what I have heard from many residents, that is what has brought them.
149. Before two years ago, were steamers trading to the Bellinger? Steamers have been trading to the Bellinger for the last eight years.
150. How large is the steamer that now trades there? 146 tons.
151. How much does she draw? About 8 feet of water.
152. How often does she go to the Bellinger? Once a week regularly since the entrance has been improved.
- 153.

- T. Ratcliffe. 153. Is she frequently delayed at the bar by stress of weather? No; very seldom.
- 31 Mar., 1898. 154. How often has she been delayed within the last two years? Not more than half a dozen times.
155. What has been the average detention? A day or two days. It has not been more than three days.
156. It has never been a fortnight, or a month? No.
157. Are there many sailing vessels trading to the river? About two a month regularly; but the number will increase, because a new mill has just been erected. A gentleman named Ellis has just shifted a large sawmill on to the Bellinger. He told me that he would not have thought of putting the mill there but for the improved condition of the river.
158. Has the population increased principally because of the number of people who have been attracted to the district by the chance of getting employment at the sawmills, or have the people gone there to farm? They have been attracted by the opportunities for farming.
159. The land there which is adapted for the growth of maize is very limited in area—the flats are narrow? The flats are very narrow; but in the majority of cases the settlers have only tried the land just along the river banks, where they can put the maize into punts easily; they have never gone on to the land further back. A great many settlers have not got one-half or one-fourth of their land under cultivation.
160. Have you ever been up on to the ridges where there is unalienated Government land? I have not been far back from the river. I have been 15 miles back, and I know that a good many of the ridges are not good for anything; but in many of the gullies there is splendid land.
161. But the strips are very narrow? They are very narrow in places.
162. The Bellinger district will never support a large population? I do not think it will.
163. It is not like the Hunter, the Clarence, or the Richmond districts? No.
164. The estimated cost of the whole design, shown on the map before the Committee, is £171,000;—do you think the country would be justified in spending so large an amount in improving the navigation of a river which serves such a small district? I feel very doubtful whether such an expenditure would be warranted.
165. The Engineer-in-Chief proposes to spend only £35,000 at the present time, in addition to £33,000 which has already been spent;—do you not think that that is a very liberal proposal for such a small district? The population is very small in this district, but I think it warrants the expenditure. If these improvements are carried out dairying will go ahead. A lot of land that is not used now could be used for dairying.
166. Do you speak of the land on the ridges? A good deal of the land on the ridges can be used for grazing and dairying.
167. It is very heavily-timbered country? The mills will soon clear a good deal of the timber off. There is splendid timber on the Bellinger—enough for many years to come.
168. What kinds of timber? Tallow-wood, blackbutt, and ironbark.
169. Are there many people employed at the saw-mills there? Upon the average, twenty-five hands at each mill.
170. And teamsters and bullocks are employed in drawing logs? Yes; but I do not include them.
171. I suppose two or three small vessels are constantly employed in taking timber away? Some of the mills send away two vessels a month, and the new mill will send away three.
172. Is the timber good timber? It is reckoned to be some of the best on the Northern Coast.
173. Tallow-wood is a good timber? A very good timber.
174. Do you think the improvements designed will be of advantage to the navigation of the river? I think you can hardly do without the eastern wall. It will be necessary to keep a scour running directly through the entrance.
175. Have the walls already constructed increased the depth of water in the channel? They have been a splendid success.
176. Have you any great difficulty in piloting vessels in and out of the river now? Within the last two years things have been very easy. Before that we could not get a steamer drawing 6 feet 6 inches up to the Government wharf, except at Spring-tide, and then we had a difficult job. We could never manage it without anchors and chains.
177. The Government has had a dredge employed on the river a good deal? There is a sand-pump there now.
178. It is proposed to pump up sand and to deposit it behind the stones of the training-walls, so that it will not flow into the river again? I think it is a very good idea. That arrangement will fill up behind the walls much more quickly than it would happen if it were left to nature.
179. There are no rocks at the entrance, only sand? Only sand.
180. Could the sand-pump dredge be worked at the entrance? It would be too risky.
181. Are any shoals created in the river by diverse currents? There is a shoal down at the south-east end of the island, which extends across the channel. I am of opinion, however, that, as the wall there is brought further down, the shoal will be cut away.
182. Has the construction of the training-wall created deep water along the face of them? On an average there is about 10 feet of water all along the wall from the wharf down.
183. What is the depth of water upon the shoal to which you have referred? It is practically dry there at low water.
184. What depth is there at high water? Three feet.
185. Vessels cannot go up the North Arm now? No; they at present time have to go round by Back Creek.
186. The Engineer-in-Chief tells us that if a training-wall is made on the North Arm it will cause a better scour? Yes, and a much better bar, because the scour will be truer.
187. *Mr. Wright.*] Whereabouts is the pilot-station at the Bellinger? Just opposite the entrance.
188. You had considerable experience upon the coast before you became a pilot? I have had about twenty-four years' experience upon the coast.
189. What current is there off the mouth of the Bellinger? It would average from $1\frac{1}{2}$ to 2 knots an hour. Close in upon the beach there is a northern current; but when you get out about a mile, the current is southerly.
190. Is it always northerly in-shore? Not always. Sometimes after an easterly gale we have a strong set along the beach to the southward; but generally the current in-shore is northerly.
191. Is there any danger of the sand accumulating at the entrance through the action of these two currents? I do not think so.

192. You think that the scour will carry the sand out into deep water? Yes, and I think there will be a set round each wall which will keep the entrance clear. T. Ratcliffe.
193. You do not apprehend any danger of a shallower bar being caused by these works? I do not think we shall be troubled by the bar if the breakwaters are carried out as proposed. 31 Mar., 1898.
194. It is not proposed to carry out the breakwaters, but only the training-walls? Well, I am of opinion that the southern wall should be carried along another 200 feet to do any good.
195. You think that to make this work effective the whole scheme should be carried out? No; I do not think the wall down the east side of Long Island would be altogether necessary. If the creek were blocked, and a short wall were made there, and the southern wall lengthened by 200 feet, I think the scour would be sufficient. The tendency of the current is to keep along the south wall.
196. It is not proposed to block up Back Creek;—do you think that is wise? I do not think it would be a good thing to leave Back Creek open, because it is bound to interfere with the scour; but if no dredging is done the creek will be closed by the sand.
197. It is proposed to confine the scour on the North Arm by training-walls, and to leave Back Creek open to assist the scour of the South Arm? I think the scour would be better if Back Creek were blocked.
198. You think that each arm should have its own flow of water? Yes; if you take away any of the water of the main arm, a great scour will be necessary to keep the channel clear.
199. You do not think that the southern wall has been carried out far enough? No.
200. You think that it would be better than to extend the southern wall to construct the western training-wall? Yes.
201. There would be a saving in expense if your plan were carried out? I think there would be a considerable amount saved if you left out the western training-walls.
202. All the old ballast left in the river has been used, has it not? Yes; so far as possible.
203. Where do they propose to get the stone for this work? When vessels come in with ballast we generally put it on top of the wall.
204. But where is it proposed to get the stone for these new works? I do not know that there is any other quarry than that which they are using now, and which is situated about $7\frac{3}{4}$ miles up the south arm.
205. What kind of stone is it? The stone is of a slaty nature.
206. Does it break up in the water? I have watched it, and I have not seen a fret since it was used. If anything, it gets harder in water.
207. I suppose it is not a true slate? No.
208. So far as your knowledge goes, the stone that is being used is good enough for the purpose? Yes; but I think that the stone used upon the extension of the southern wall should be larger than that used now.
209. Can they get larger stone? They could get larger stone out of the quarry.
210. Is there a tug stationed at the Bellinger? Yes.
211. I suppose you do not take in steamers? Sometimes.
212. Have not the trading captains exemptions? They have; but they generally depend upon the pilot.
213. They are afraid to rely upon their own judgment, because of the shifting character of the bar? They seldom rely upon their own judgment; they generally depend upon the pilot.
214. Can you give the Committee any idea of the tonnage entering and leaving the Bellinger in one year? I keep a record of it, but I have not got that record with me.
215. Can you tell us the outward tonnage approximately? Last year the output of maize was 54,000 bags.
216. In round figures, 5,000 tons? Yes.
217. Can you tell us anything about the timber? I believe there were 172,000 feet of hardwood sent away.
218. Do you think that the Bellinger sends away every month timber and maize to the weight of 1,000 tons? I am doubtful if it does. You could average the timber at 30,000 feet a fortnight. We average two sailing vessels a month apart from the steamer.
219. The steamer does not take timber? No.
220. Do you know what freight is paid to bring timber to Sydney? 2s. 9d. per 100 feet.
221. What freight is paid for maize? 1s. 6d. a bag.
222. Then the freight from the Bellinger is 50 per cent. more than the freight from the Macleay? Yes; 15s. a ton is paid for all freight going into the Bellinger.
223. I suppose the freight is higher owing to the difficulties of navigation there? Yes.
224. Have you any idea what the insurance rates are upon the two rivers? They are about the same.
225. Upon the hull and upon the cargo? It is 12 per cent. upon the hull in the case of each river.
226. So that the insurance people regard the Bellinger as being as safe as the Macleay? Yes, at the present time.
227. You spoke about the people there going in for dairying;—if they did that, would not the production of maize be less? No, I think it would be more. One man there, three months ago, bought an estate for £8,000, intending to go in for dairying.
228. But if people go in for dairying, will not the production of maize be less;—if the people there devote their energies to the production of butter instead of to maize-growing, there will be less freight for the ships? Yes; but that will be made up in value.
229. Do you think it likely that they will go in for dairying upon the outside lands, and continue the maize-growing upon the flats? I think that when they go in for dairying they will also go in for pig-breeding, and so on, and they will want a good deal of maize to keep things going.
230. Do you think the output of maize will decrease? I think it will increase.
231. Although a great deal of it will be consumed locally, and a great deal of land will be used for dairying? Yes.
232. The production can only increase by the increase in population;—is there likely to be an increase in population? I think so.
233. How far up the river are the banks cultivated? For a considerable distance above navigation point—20 miles further up.
234. What is the distance from the Heads to Fernmount? Six miles.
235. Fernmount is the head of navigation? For sea-going vessels; but the droghers go up to Bellingen, 3 miles further.

- T. Ratcliffe. 236. There navigation practically ceases? Yes.
- 31 Mar., 1898. 237. What is the country like between the Heads and Bellinghen? It is splendid country.
238. Is it all good? Yes.
239. Is the piece of land lying between the North Arm and Back Creek good? That land is no good at all. You get into good land almost immediately after you enter the main river.
240. For some miles up the river above navigation point there is good cultivation? Yes.
241. I suppose the produce is brought down to Bellinghen by drays? Yes; and it is then punted to the Heads.
242. As a sailor, and as a pilot having an intimate knowledge of the place, do you think the proposed works will be beneficial to the navigation of the river? Yes.
243. Do you think the country will be justified in spending £40,000 or £50,000 more than has already been spent in carrying out these works? As the country has already spent so much, I think it will be cheaper to finish the work.
244. To the extent of the improvements to which you have already referred? Yes.
245. *Mr. O'Connor.*] At the present time you are able to take a steamer of 150 tons burden into and out of the river comfortably;—to what extent will the harbour be improved when these works are completed? I am of opinion that when they are completed the steamer will be able to come and go whenever she likes.
246. Will you be able to take in a steamer of 250 tons then? Yes, comfortably. I am under the impression that there will be 12 feet of water there.
247. That would float a ship of 300 or 400 tons? Yes. I believe that when the improvements are made we shall be able to bring in any of the coasting steamers.
248. Will the improvement of this river, and the additional facilities that will be offered to shipping, tend to increase the population of the district? I think so.
249. It will give an inducement for people to remain in the district, and to cultivate their land? Yes.
250. These works will tend to keep people upon the soil there? They will enable them to remain upon the soil.
251. And others will be attracted there? Yes; people will have more encouragement to cultivate than they have now. Now they only cultivate just round about their houses.
252. The cultivation is neglected now? Yes; it is neglected.
253. That is because of the want of a market? Yes; the people there have become discontented. In many cases people have had to give their crops to the pigs, because they could not get them taken away.
254. *Mr. Fegan.*] What depth of water is there at low-tide in Back Creek? There is fairly good water all through the creek, until you get up to the top. There is an average of 5 feet along the creek at low water.
255. What is about the width of the creek? About 130 feet in places; but in other places it is narrowed down to about 100 feet.
256. What will be the width of the river between the walls? 600 feet.
257. Do you say that the harbour navigation will be restricted to vessels of 300 or 400 tons, upon the completion of the work? Yes.
258. Will not larger vessels be able to come up? Not up the river.
259. Is not the rock 30 feet below water-level at the entrance? That was what Captain Howard made it.
260. Do you not think you will have 14 or 15 feet of water there? Yes; but I am doubtful if any ship will be able to go further up than the Heads. I think that will be the furthest point reached by shipping of any size.
261. Is the width at the mouth only 600 feet? The width there is 500 feet.
262. Do you not think this is a huge expenditure to undertake to provide harbour accommodation for vessels of 300 or 400 tons? Yes; but I think the improvement of the place will bring larger boats into the trade.
263. You know what the sand-pumps can do? Yes.
264. What sand-pump is up there now? The "Thetis."
265. She is only a small dredge? Yes.
266. Dredges like the "Juno" and the "Jupiter," would soon make the sand disappear? Yes.
267. If the training-walls were constructed, it would be a small matter to dredge a channel for large vessels? I do not think the bed-rock is very far down, when you get up about a quarter of a mile.
268. How far down do you think the bed-rock is there? I do not think it is more than from 15 to 20 feet down in one place.
269. Would not that float a vessel of 700 or 800 tons? Yes.
270. So that, should the district become more thickly populated, and warrant the employment of larger vessels in the trade, the river could be dredged? I have not the least doubt that the river could be dredged and made a splendid river.
271. What water do you get down the South Arm? There is an average of from 7 to 10 feet. The bottom is very uneven until you get about 5 miles up, and then there is a rock right across the channel, with from 4 ft. 3 in. to 5 feet of water upon it at low-tide.
272. How far up is that? The river is navigable to vessels of 7 feet draught for a distance of 8½ miles.
273. The South Arm is not dangerous? No. It has a better channel than the North Arm, but for this rock I speak of.
274. But the North Arm is the more important? Yes.

MINUTES OF EVIDENCE—HARBOUR WORKS AT BELLINGER RIVER.

Henry Spondly, Compiler, Government Statistician's Office, sworn, and examined :—

275. *Mr. Wright.*] Have you a statement to make to the Committee, with regard to the population upon the Bellinger River? Yes; I have prepared the following statement for the information of the Committee :—

H. Spondly.
31 Mar., 1898.

HARBOUR at the mouth of the Bellinger.

		Bellinger.			Bellinger.
		No.			acres.
Estimated population at end of 1897		1,870	Area under permanent artificially-sown grasses ...		3,400
Occupied area :—		acres.	Production :—		
Crown lands		5,300	Wheat	bushels
Alienated lands :—			Maize	bushels	204,600
Freehold		22,100	Hay	tons	60
Private leasehold		8,200	Potatoes	tons	130
		30,300	Sugarcane	tons	125
Total		35,600	Live stock :—		No.
Unoccupied area		213,700	Horses		860
Total area		249,300	Cattle :—		
Area under crop :—			Dairy		730
Wheat			Ordinary		1,560
Maize		4,360	Total		2,290
Other grain crops		60	Sheep
Lucerne and sown grasses		5	Swine		220
Sorghum		40			
Root crops		50	Production of butter		lb.
Tobacco			40,950
Sugarcane		20			
Vineyards and orchards		30			
Market gardens		10			
Minor crops		60			
Total		4,635			

276. You can give us no information as to the amount of timber exported from the district? No.

277. Have you any statistics showing the value of the trade to the Bellinger? No. No record is kept of imports and exports except imports and exports beyond the Colony.

278. The population of this district is under 2,000, the area cultivated is less than 5,000 acres, the production of butter is less than 50,000 lb. a year, and the production of maize is something like 200,000 bushels? Yes. Of course the district is a very small one, Woolgoolga and Coff's Harbour on the north, and Nambucca on the south, being so close to it.

279. What is the population of the Raleigh electorate? About 8,300 at the present time.

280. That electorate embraces part of Woolgoolga, the Bellinger, Nambucca, and Coff's Harbour? Yes, and part of the Macleay—practically everything north of the Macleay.

William Sydney Preddey, sworn, and examined :—

281. *Vice-Chairman.*] Are you engaged in business? I am at present out of business; but for twenty-seven years I was a timber merchant.

282. In Sydney? Yes; and my business also connected me with the Macleay, the Bellinger, the Nambucca, and Coff's Harbour.

283. *Mr. Fegan.*] I suppose you have exported a great deal of timber from the Bellinger? Yes; and I am continuing to get timber from there. I got timber from there a fortnight ago. I was a timber merchant; but I am acting now as an agent.

284. What timber do you get from there? Beech, cedar, mountain ash, blackbutt, ironbark, tallow-wood, and various other kinds of hardwood suitable for mercantile purposes.

285. It is a place where good timber can be got? Yes, very good timber.

286. Has the unnavigable state of the river been an impediment to the timber trade? Yes; in the past.

287. It has hampered you considerably? Yes.

288. And to a certain extent it has hurt your trade? Yes. Vessels have been bar-bound from time to time, and they have been afraid to go there for fear of being shut in.

289. Which means all the difference between profit and loss? Yes.

290. You have been at the river since some of these improvements were made? I was there ten days ago.

291. Have they made the river any better? There has been a vast improvement.

292. There is not the same danger of vessels being bar bound now as there used to be? No; they consider the Bellinger one of the best places to go to now. Previously, it was one of the worst.

293. Do you think that if greater facilities were given to shipping, and the timber trade was encouraged, people would be induced to settle in the district? Yes.

294. Do you think these works are necessary? Yes; if you desire people to stay there, or to trade there.

295. Without these improvements the place must be a complete desert; while, if they are carried out, facilities for settlement and trade will be given, and security and quickness of transit ensured? Yes.

296. You have carried on a very large business? Yes; a large business.

297. Would you compare the timber of the Bellinger district with that of any other district along the coast? The timber forests from Raleigh right through to Coff's Harbour are superior to any other forest from Port Stephens to Grafton. I went through the whole of that country the other day. I was astounded at the quantity of good timber there. It is really better timber than exists in any other district I know of, and it is unknown to most people.

298. The greater part of the land is unalienated? Yes; it is in its native state.

299. So that, while the opening up of this river will give opportunities for agricultural settlement, it will also help an important timber trade? Yes.

300. There is plenty of ironbark up there for railway sleepers? Yes.

301. And tallow-wood? Yes.

W. S.
Preddey.

31 Mar., 1898.

W. S.
Preddey.
31 Mar., 1898.

302. So that, in the near future, an impetus will be given to the timber trade on the Bellinger which it has never had before? Since the entrance to the river was improved a new mill has been erected. It was started last week, and will put out about 50,000 feet of timber per week, and employ about fifty hands. All the people belonging there are country people, storekeepers, timber getters, and so on. Mr. Ellis has left Camden Haven and gone to the Bellinger because the timber there is better.
303. At the present time vessels have to go up Back Creek to get to the north arm? Yes.
304. Will the main channel when it is improved be better than Back Creek? Far better.
305. Is the sand pump there doing good work? Yes. There is one thing I should like to suggest, and that is that behind the training-wall some filling in should be done with rubble to prevent the water washing through and bringing the sand back into the channel. The small stuff out of the quarry would do.
306. How far away is the quarry? About 4 miles.
307. Is the stone good? No; it is shaley, slatery stuff, but it does not waste away in the water. It improves in salt water. It is a kind of volcanic stuff that would dissolve in dry air.
308. It would not be very expensive to bring this rubble down? No.
309. Are they doing any of this filling-in now? No, I do not think so. Of course where stones are thrown down in any way a lot of places are left where the water can wash through and bring the sand back into the channel. The channel is swept so clean now that you can see the rock upon the bottom.
310. Had you a mill up there? I had a mill on the Nambucca, and I have always had dealings with the Bellinger.
311. I suppose you do not know how much timber has been shipped from that district? I can only give you an approximate idea. There has been a mill upon the Bellinger for the past thirty years, and it has turned out timber at the rate of 30,000 feet a week. That would amount to 120,000 feet in a month, or 1,440,000 feet in a year.
312. Have you any idea of the extent of the forests you speak of? I only know that I was astounded at their extent, and at the quantity of good marketable timber procurable there.
313. What is the extent of these forests, approximately? I should say that there are 30 or 40 square miles of timber there.
314. There is a fifty years' supply? Yes. It is virgin timber, and the quality is very good.
315. You believe that these improvements are necessary to bring about an expansion of the timber trade, and the settlement of a large number of people in the district? Yes. Some time ago, when the North Coast Shipping Company would not provide a steamer, the farmers had to cart their maize to Coff's Harbour, and ship it from there to Sydney. Some of the corn was lying on the river for five months before they could get it away.
316. Without these improvements, the timber will be of very little use, because of its inaccessibility? Yes. I might mention that the three mooring buoys placed at Coff's Harbour for the safety of shipping are now stranded upon the beach there, and the moorings lost, while the facilities for using the jetty are very poor. I have also to suggest that the Worrall Creek is doing a good deal of harm by creating a bar upon the Nambucca. In my opinion, it is necessary to put a training-wall upon the south side there. The northern wall is doing good service; but to make the improvements efficient, a wall on the south side is also necessary.
317. *Mr. Wright.*] Can you account for the excellency of this timber as compared with the Macleay timber? The soil seems better.
318. I suppose most of the timber is obtained on the eastern slope of the mountains? Yes. There is a much greater rainfall upon the Bellinger than upon the Macleay, and the timber there is perfectly sound. The Macleay timber is, as a rule, very hollow.
319. It is pipey? Yes.
320. What about the timber at the back of Woolgoolga? That is similar in its nature to the Macleay timber. It is very pipey.
321. Is there any brush land at the head of the Macleay? Yes.
322. Is it accessible? No.
323. I suppose that what has been accessible has been got at? Yes; and what is accessible now would not pay to get.
324. Is there good timber upon the Manning? Yes.
325. And upon the Hastings? Yes.
326. Still you think that the timber upon the Bellinger is about the best? Yes; from the Bellinger to Coff's Harbour.
327. Can you give the Committee any idea as to the annual output of timber from the Bellinger? Well, the place has always been blocked by the bad bar. There was only one sawmill there for some years. A second mill, however, has been started because of these improvements.
328. If it has been stated that the annual output of timber is about 170,000 feet, does that accord with your views upon the subject? I think the mill would put out about 120,000 feet a month.
329. But does it work all the year round? If it worked all the year round, it would put out 40,000 feet a week. I am deducting 10,000 feet a week. 1,000 feet of timber would weigh about 3 tons. There is a vessel going away about every fortnight.
330. What does she carry? From 40,000 to 50,000 feet of timber.
331. That would be from 80,000 to 100,000 feet a month? Yes.
332. That is much more than 170,000 feet a year? Yes. •Then, too, a lot of timber goes out of the river unsawn, in the shape of piles, girders, telegraph and electric light poles.
333. Do you get much pine there? Not much; it is a long way inland. There is good pine, and brush timbers, such as beech and cedar. Those are the principal soft timbers.
334. Is there much mahogany there? There is a great deal of swamp mahogany.
335. I suppose, land upon which ironbark and blackbutt grows is not very good? It is not suitable for cultivation.
336. From your knowledge of the district do you think that the bulk of the cultivable land has been taken up.
337. What are the prospects of an increase of population? The great desideratum is an improved harbour; a place is no good if you cannot get there.
338. Do you think that the population of the district is likely to largely increase if a fairly good harbour is made? I am sure of it.

George Charles Yeo, Draftsman, Stock Branch, Department of Mines, sworn, and examined:—

339. *Mr. O'Connor.*] Do you know the district under consideration? Not personally. I only know it from the maps. G. C. Yeo.
340. Have you a statement prepared for the information of the Committee? Yes; the statement which I have prepared deals with an area commencing at the mouth of the Bellinger River on the sea coast, and bounded thence by that coast north-easterly about 15 miles; thence north-westerly about 25 miles; thence south-westerly about 25 miles; thence south-easterly about 25 miles, to the sea-coast aforesaid, and thence by that sea-coast north-easterly about 10 miles to the point of commencement. The returns for the 31st December, 1897, were—horses, 912; cattle, 2,545; sheep, 76; pigs, 783. 31 Mar., 1898.
341. It is not a pastoral district? No; it is mostly a dairying district. I was not able to get the figures for 1895, and 1896; but I have here a return showing the increase in sheep in the district of Port Macquarie, which includes the Bellinger District besides the Macleay and Hastings Districts. The return is as follows:—
- | | | |
|-----------------------------|------------|------------|
| 1895 increase over 1894 | 900 horses | 920 cattle |
| 1896 " " 1895 | 300 " | 660 " |
| 1897 " " 1896 | 330 " | 5,860 " |
342. Is there anything else you would like to add? No; that is all the information I have.

FRIDAY, 1 APRIL, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Harbour Works at Bellinger River.

George De Fraine (De Fraine and Bibby, timber merchants), sworn, and examined:—

343. *Mr. Wright.*] Are you a resident of Sydney? I am now; but for years I resided on the northern G. De Fraine rivers. G. De Fraine.
344. Have you resided upon the Bellinger? I never resided permanently upon the Bellinger; but for some years I was master of a vessel trading there. I was there last Christmas, and I know the district very well indeed. 1 April, 1898.
345. Have you been long in the timber trade? For five years.
346. Can you tell the Committee how much timber comes out of the Bellinger in a year, and what the trade is likely to be in the future? I have been agent for the mill that is now working there. That mill cut about 30,000 feet a week. Another mill has just been erected by Ellis Bros., and it will cut about 50,000 feet a week. At the present time we can load vessels drawing up to about 8 feet of water.
347. How much timber would such a vessel carry? About 60,000 feet.
348. So that two mills cutting 80,000 feet a week would be able to load three vessels every fortnight? They reckon to be able to keep four vessels running there.
349. I suppose they are good sized ketches that trade there? Yes.
350. Is the timber business likely to continue? Yes; and it is likely to increase.
351. There is a great deal of forest-land on the Bellinger? Yes.
352. A great deal of the land is poor; but it grows good hardwood? Yes; none better in the Colony.
353. Is the Bellinger timber noted for its superior quality? From the Foster, Cape Hawke, down to Woolgoolga the timber is of the best.
354. Ironbark? Ironbark, tallow-wood, blackbutt, bluegum, mahogany, and several other timbers.
355. Is there any turpentine there? Plenty of turpentine.
356. The timber is all good? It is all first-class.
357. Do you know enough about the country to be able to say how long the timber is likely to last? It is hard to say. I was at Camden Haven for five years. There are five saw-mills there now, and we reckoned when we commenced that, the timber would not last more than four or five years; but we do not experience any more difficulty in getting logs now than we experienced then, though we have to go further back.
358. The timber must get cut out in time? Yes; but they keep going further back for it.
359. I suppose there is a large patch of heavily timbered country west of the Bellinger towards the mountains? Yes; there is not much trouble in getting timber from the Bellinger.
360. The timber is practically close at hand there? Yes? some of the drawing to Ellis Brothers' mill will not be more than 2 miles.
361. What is the maximum distance for which they can draw hardwood? I have known it to be drawn 12 miles. Of course, it can be drawn further by using tramways.
362. Will it pay teamsters to draw timber 20 miles? I think that, as the timber gets scarce it will increase in price. People do not know the value of our hardwoods yet.
363. At present there is no scarcity? No.
364. I suppose that a mill that had to get its timber from a place 20 miles away, could not compete with a mill getting its timber within 10 miles? No.
365. Has much timber been drawn out of the Bellinger in the past? Not a great deal. There has been only one mill there, and I do not think it has cut more than 25,000 feet a week on the average.
366. Is there any brush-land there? Yes.
367. Do you get cedar there? Cedar still comes out of the Bellinger.
368. Is there any pine? Not a great deal. I have not seen much pine coming out.
369. Is there any cedar obtained there now? Yes; but it hardly pays to get because the price is very low.
370. You have taken vessels to the Bellinger? Yes.
371. What is the port like? It has been greatly improved, and I believe that they will make a good job of it when the work is finished. The walls want extending further out. Still there is a great improvement

- G. De Fraine. as compared with the condition of things some years ago, and I think the improvement will be permanent.
- 1 April, 1898. 372. Do you think Back Creek should be closed? Well, the more you confine the main channel the better it will be.
373. Do you think that if Back Creek is blocked it will give a better scour? Yes.
374. I understand that the Department do not propose to close Back Creek; what effect will the creek have upon the South Arm? It will bring more water down in times of flood.
375. But is there not a danger of a bank being formed in the river by the three currents? An eddy might be caused which would form a shoal. There will always be a spit where the channels meet.
376. Do you think that the ocean currents will be sufficient to clear the entrance of the sand brought down there by the river? I think so, if the breakwater is brought well outside the bar; otherwise the sand will lodge on the bar.
377. What is your experience of the coastal currents there? The currents are mostly local, and run sometimes one way, and sometimes the other. There is a current running south-east most of the year a mile or two off the coast.
378. If one witness says that the in-shore current is always southerly, and another says that it is the reverse which do you agree with? My experience has always been that the stronger the current off-shore, the stronger the opposite current in-shore.
379. In all these bights there is always a swirl along the shore? Yes.
380. The Department tells us that the current is south along the shore? Well, that has not been my experience in beating up the coast.
381. You think there is no danger of the sand causing an obstruction at the mouth of the breakwater? No.
382. Do you think the prospects of the Bellinger justify the expenditure of between £30,000 and £40,000 in addition to £33,000 which have already been spent, and a possible further expenditure of £70,000 or £60,000? I do. Apart from the large quantity of timber coming from there, the land is very good, and the district will be a great dairying district.
383. The dairying industry does not produce much freight. You think there will always be cultivation on the Bellinger? Yes, because it is very good land, and a great deal of it has never yet been cultivated. I do not believe one tenth of the land there is cultivated. If a man holds 100 acres he will not cultivate more than about 10 acres.
384. Men take up more land than they can use? Yes.
385. Is there much room for an increase of population on the Bellinger? Yes, any amount.
386. Suitable land is available there? Yes.
387. The Government returns show that an immense area of the Crown land is very poor? It is not so poor that it is not good enough for grazing.
388. Ironbark and blackbutt do not grow upon good soil? No; but when the timber is taken off you get good grazing land.
389. You think the Government is justified in spending sufficient money to give fair access to this district? Yes; I think the district deserves a port from which to ship its produce.

TUESDAY, 5 APRIL, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Harbour Works at Bellinger River.

William Alexander Manning, solicitor, sworn, and examined:—

- W. A. Manning. 390. *Vice-Chairman.*] You are a solicitor, residing in Sydney? Yes.
- 5 April, 1898. 391. You were formerly practising in Grafton? Yes.
392. *Mr. Hoskins.*] Are you acquainted with the Bellinger River? I am.
393. You practised in Grafton as a solicitor for some time? For six years.
394. Have you frequently visited the Bellinger? Yes.
395. How far is it from the Clarence? Seventy-four miles.
396. How did you get there? Overland, by buggy.
397. The roads there are sufficiently good to be traversed by buggies? Yes.
398. Is there much trade on the Bellinger River? Not very much.
399. How long is it since you were there? Between two and three years.
400. Are there many persons settled in the district? A good many, considering its size.
401. In what occupations are they engaged? In maize-growing, pig-raising, and, latterly, in dairying.
402. We are given to understand that there is a steamer trading to the Bellinger River? Yes.
403. Is dairying increasing there? Yes.
404. Have many difficulties to be encountered in entering and navigating the Bellinger River? Yes; the difficulties are very great.
405. Have you seen the work carried out on the Bellinger by the Government? I have not seen the works immediately at the Heads, though I have seen the plans.
406. Have you seen the work carried on by the Department in the upper part of the river? Yes.
407. Has that work improved the navigation of the river? I do not think so, materially.
408. Is not the depth greater than it was before the work was commenced? It may be a little; but the river is still as difficult, or nearly as difficult, to navigate as it was before.
409. Did not steamers trade regularly to the river before these works were commenced? Yes.
410. Steamers of 150 or 200 tons burden? The "Rosedale" is the steamer trading there now. She belongs to the North Coast Company.

W. A.
Manning.

5 April, 1898.

411. Is she frequently delayed at the mouth of the river because of the difficulties of navigation there? When I was last at the Bellinger—two or three years ago—the difficulties still existed.
412. We have evidence to the effect that the river has improved since then? It had not improved much up to that time; but it may have improved since.
413. People engaged in shipping timber from the river say that the works which have been carried out there have improved the navigation? The later works may have done so.
414. £33,000 have already been expended upon the river;—do you think the Government would be justified in spending £36,000 more in improving the navigation there? I do not.
415. Will you kindly tell the Committee why? The Bellinger is a very small river, perhaps the smallest river on the northern coast. Only a very small volume of water flows through it, so that there is very little scour. It has no northern watershed at all, because it is entirely overhung on the north by the Orara. The whole of its watershed is on the south, and the greater part of this watershed is a gravelly formation. The gravel rolls down the river, so far as the current will carry it, and then spreads and chokes the river. The great obstacle to any harbour works on the Bellinger is the difficulty of dealing with this siltage in the absence of a powerful scour. No matter what works you carry out there, I do not think you will get much scour, except during occasional heavy floods, and I do not think that will make a permanent improvement.
416. I gather from what you say that the area of country drained by the Bellinger is comparatively small? Yes.
417. The Orara drains a greater area of table-land than the Bellinger? Yes. The Bellinger sweeps round the table-land of the Orara, and there is almost a precipice dividing the two.
418. *Mr. Lee.*] Have you resided in the Bellinger district at any time? No.
419. You have no knowledge of the district, except as a casual visitor? I have the knowledge gained by travelling through the country.
420. Do you know anything about the trade of the district? Only from hearsay.
421. Do you think the Government would be justified in making the proposed expenditure, if it would have the desired effect of improving the river? Yes.
422. You think the trade of the district would warrant the expenditure? Yes; I think the settlement of the district would amply justify it.
423. Is this settlement upon the river banks, or does it go back any distance? It is nearly all upon the river banks. The good land is all upon the river. There is very little land further back.
424. The district has been settled for a long time? Yes.
425. If all its exports and imports are carried by one steamer making a weekly trip, do you think there is any justification for the proposed expenditure? There is considerable room for expansion in the district. People cannot do more than they are doing now, because they have no facilities for getting to market.
426. There is no wheat grown in the district? No.
427. And no sugar? I believe that sugar used to be grown there; but of late years sugar-growing has been abandoned.
428. Can you tell us whether the settlers in the district have been seriously inconvenienced by the bad state of the river? Yes, they have; the progress of the district has been greatly retarded by it.
429. But they have always been able to get their produce to market? I think they have not. I have heard of produce rotting on the wharfs because no steamer could get in to take it away.
430. I suppose dairying is coming to the front in the district, as in other North Coast Districts? Yes.
431. You do not know the population of the district? I cannot remember what it is.
432. Do you not think that the district could be opened better by a railway from the Clarence? It could be opened better by a railway.
433. Do you think a railway would meet all the requirements of the district? It would put an end to all the trouble.
434. Are you of opinion that if a railway were made it would be unnecessary to further improve the port? Undoubtedly. Now that you have opened up this question, perhaps you will allow me to explain the direction that I think a railway should take. The Bellinger River is fairly navigable, as far as the township of Raleigh, which is 6 or 8 miles from the Heads. There the trouble begins. Now, if you took a railway from Raleigh to Coff's Harbour, a distance of about 14 miles, you would solve the difficulty. Such a line would tap very valuable country, and I believe that the difficulties of construction from an engineering point of view would be little. I have very little doubt that the £36,000 you are proposing to expend upon the harbour would pay for the railway, and put an end to all trouble. This railway has the further credit that it is an integral portion of the North Coast railway line.
435. What sort of a place is Coff's Harbour? It is a harbour where you can ship almost at all times, except in heavy easterly or south-easterly weather. Now and again, when the weather is very heavy from the north-east, a ship has to pass the place and come back.
436. You have seen Coff's Harbour? Yes.
437. Is there a jetty there? Yes; one of the finest in Australia.
438. Does it not frequently happen that steamers cannot go to the jetty to land either passengers or cargo? It occasionally happens.
439. Is not the entrance so exposed that it is only under very favourable conditions that vessels can go alongside that jetty? Well, I have never been at Coff's Harbour without seeing a vessel lying alongside the jetty, and I have been there a good many times. Like all other roadstead ports on the coast, the place is exposed to heavy weather, but the steamboats manage to carry on their business to the satisfaction of the settlers there.
440. Is Coff's Harbour capable of improvement? If you like to spend money on Coff's Harbour you can make it one of the best ports in the Colony.
441. What settlement is there to the north of Coff's Harbour within 10 or 14 miles? You have one of the finest tracts of alluvial country in the Colony between 5 and 15 miles back from Coff's Harbour. I refer to the valley of the Orara.
442. That is going back towards Grafton? Yes.
443. What is it like north, along the coast? There is no good country on the coast; it is all on the tableland. There are only a very few settlers along there. The coast is a mere fringe.
444. Are not the Bucca Bucca gold-mines in the vicinity of Coff's Harbour? Yes, on the table-land.
445. How far from there? Eight or 9 miles.

- W. A. Manning.
5 April, 1898.
446. Was not all the machinery for those mines landed at Coff's Harbour? I think so—either there or at Woolgoolga.
447. Do you look upon that as an additional reason for concentrating the trade of the district at Coff's Harbour? Yes; Coff's Harbour is the centre of a vast coming country.
448. If Coff's Harbour were made safe under all conditions of weather it would give more satisfaction than any improvement of the Bellinger? Yes; the Bellinger River is a snare. As an outlet to the sea the district would be better without it.
449. Where would you take the railway from;—at what point would you start? I would leave the river at its most northerly point, in the big bend just below Raleigh.
450. Would it be possible for the settlers on the South Arm to take their stuff to the railway? Yes, by drogher. No doubt the railway I suggest would be of more advantage to the people on the North Arm than to those on the South Arm; but a railway would be certain, and the river must always be uncertain.
451. You would suggest a railway as giving most relief to the people of the Bellinger? Yes; I would advocate a railway right through the place rather than any harbour scheme.

Thomas Stewart, sworn, and examined:—

- T. Stewart.
5 April, 1898.
452. *Vice-Chairman.*] You were formerly pilot at the Bellinger River? Yes; for twenty-four years.
453. How are you occupied at the present time? I have retired from the Service, and I am now living upon a pension.
454. *Mr. Clarke.*] I suppose you have had a great deal of experience in connection with the navigation of the Bellinger River? Yes.
455. I suppose when you were there most of the trade was done by sailing vessels? Yes.
456. Previously to being pilot you commanded vessels trading to the river? Yes. My experience of the Bellinger extends from 1852.
457. What was the state of the river when you were pilot? Before the dredges came there the up-river navigation was far better than it is now.
458. What was the state of the bar? The bar was always shifting? You could not depend upon it for twenty-four hours, or, at the most, forty-eight hours at a time.
459. For many years it has been liable to sudden changes? It is shifting all the time. The beach is nothing but a mass of quick-sand. There is no headland there, and the entrance is merely a hole in the beach.
460. How many vessels have been lost going out or coming in? During my term of service there have been three total wrecks, and fifteen vessels or more went ashore, and were taken across the spit into the river to save them from knocking their bottoms out in being eased round the beach.
461. There are steamers trading to the river at the present time? Yes.
462. What steamers trade there? The "Rosedale" is the only one.
463. Has the trade of the district increased since that steamer began to go there? Only slightly.
464. About £33,000 has been spent in improving the river;—has that money been judiciously expended? I consider that about £20,000 of it might just as well have been thrown into the sea. I refer to the amount spent on dredging. They simply dug holes in one place, and dropped the silt into other holes, so that the first ebb-tide brought it all back again.
465. Could a better plan have been adopted? Yes; the silt should have been landed somewhere.
466. Would not that have entailed considerable expense? Not more expense than was entailed by the system which has been adopted.
467. I suppose sand-pumps were not being used when you were there? No; but I believe that they do good work.
468. Can you give the Committee any opinion as to whether the trade of the district has increased of late years? I do not think that it has. The shipment of maize has increased; but the timber trade has fallen off. When I first knew the Bellinger there were from ten to fourteen vessels engaged in the cedar trade there; but now there are no vessels engaged in that trade.
469. Simply because the timber has been taken away from all the accessible parts of the river? Yes.
470. I suppose only hardwood comes from there now? Mostly hardwood, though a few logs of cedar still come.
471. I suppose even the hardwood trade has not increased? It has not increased, but I believe that they are erecting another mill. That may eventually increase the trade.
472. How long is it since you were on the river? Five years.
473. You have not seen the effect of the training-walls recently constructed by the Government? No; but from what I have heard a big mistake has been made.
474. *Mr. O'Connor.*] In what way? Instead of carrying the southern training-wall in a south-easterly direction they put a curve into it, so as to throw the scour to the north; but the water wants no encouragement to go to the north, because of the strong eddy in-shore which sets that way.
475. *Mr. Clarke.*] Do you think it would be advisable to expend £36,000 more upon the river? Not at the present time. I should suggest that the training-walls should be allowed to stop as they are for the next three or four years, so that we can see how they settle. No one knows what the bottom there is like.
476. Will it be possible for the settlement of the district to increase if nothing is done? It increased after I first went up there, although nothing was done. I would not spend another penny until the action of the tides and currents upon the training-walls has been made evident.
477. Surely the engineers know how they will stand? Not one of them have seen what I have seen.
478. *Mr. O'Connor.*] What do you mean by that? They have not seen the effect of heavy floods there. I do not refer to freshes. A flood like those of 1866, 1868, 1870, and 1872, will prove this work.
479. *Mr. Clarke.*] Is the land in the neighbourhood of the Bellinger valuable? There is some good land, but very little.
480. Is the good land comprised in alluvial flats, or is it high land? It is comprised in alluvial flats, which are most of them subject to floods.
481. Large quantities of maize are grown there? 45,000 bags is the largest quantity I have known to be grown there.
482. That is in one year? Yes; they do not get so much in a dry season.

483. Do not the floods, although they may destroy the crops, benefit the soil, by depositing silt upon it? In some places they do; but in other places the alluvial soil is washed away, and nothing but a bed of timber is left. T. Stewart.
5 April, 1898
484. You heard Mr. Manning say that Coff's Harbour was a safe harbour in ordinary weather? Yes; but that is not my opinion.
485. *Mr. O'Connor.*] What is your opinion? I consider that it is a very risky thing to have a jetty there. The jetty will cost the Government more money than they will ever get out of the district.
486. *Mr. Clarke.*] But vessels load there? Yes; and they have loaded off the beaches, as you have known them to do in the south.
487. There is another jetty at Woolgoolga? Yes, and another at Byron Bay. The last heavy weather nearly shook that jetty to pieces.
488. Would it be advisable to go to the expense of making a railway from Coff's Harbour to the Bellinger? I think not. If any railway is to be made, I should say take it from the Clarence or from the Macleay—from the Clarence in preference.
489. Do you know the country between the Bellinger and the Clarence? Yes, it is pretty rough country; but rougher country is gone through in crossing the mountains.
490. Still, any railway made there would be very expensive? Yes.
491. What is the distance? I should say 84 or 85 miles by land.
492. Is there any other information you would like to give the Committee? I would suggest that the Government should stand by and let the present dyke settle down before going on with any further work. When I first knew the Bellinger the shore for a mile and a half south of the breakwater was overgrown with big honeysuckle trees and mangrove trees. The honeysuckle trees were from 15 to 20 inches through, and did not grow in a day. The southern training-wall, instead of turning a little to the north as it does, should have come straight out to the south-east.
493. *Mr. Black.*] Would not that expose the entrance too much to southerly and easterly gales? No. A south-easterly gale would run straight in, and keep the opening clear. At the present time such a gale would be likely to wash away the ground at the back of the breakwater. I have seen 18 feet at low water after a big flood, the channel going out to the south-east, and in less than three months there was a dry sandspit there. The river generally works its way round until it gets to north-east, and a channel is formed about 70 or 80 yards wide. In 1872 from down south to about a quarter of a mile above the breakwater it was all awash at low tide.
494. Do you think that an entrance permitting gales to break right in from the south and south-east would be better than the proposed entrance? I do not think it is possible to avoid any gale. There is no headland there to work on.
495. *Mr. Trickett.*] In your experience, how much does the bar vary in its position? In 1872 I had a depth of 14 feet of water for fourteen months, and a fortnight after that I had only 7 feet. The entrance has altered from a pretty straight channel to a channel going out to north-north-east.
496. But how much does the opening vary north and south? I have known it to shift from 1½ mile to the southward to ¼ mile to the north of the present entrance. It is always alive.
497. There are no rocky headlands on either side of it? There is a rocky headland about 1¼ mile to the southward.
498. But the ordinary entrance is merely an opening in the beach? Yes.
499. Do you think there would be any great danger of the proposed training-wall on the eastern side of the North Arm being washed away by the sea? I am sure of it.
500. In very heavy weather the sea might break over the sand and narrow piece of land to the east of it and wash it away? Yes; I have seen the sea break through as far north as where the "temporary bank" is shown on the map.
501. If the southern breakwater had been carried out in a straight line, do you think the scour would have been as good? I think so. I think it would have been better than it is now.
502. What kind of a bottom is there for the breakwater? It is all quicksand.
503. It makes a very bad bottom to work on? Yes; I do not think anyone knows the depth of it. I am informed that there is 30 feet of sand there. I have known 18 feet of water to be there.
504. The stones used in the breakwater would have to be very big? They ought to weigh 15 tons each; but, from what I can hear, the stones they are using weigh from 20 to 70 lb. In the course of two or three years a ballast-heap which used to lie on a dry beach to the south of the present entrance sank right out of sight.
505. Were you at the Bellinger in 1890? Yes; I left there in 1892.
506. The bar was in a very bad state in 1890? Yes.
507. Several vessels went ashore there in that year? Yes; the "Harrington" was ashore there for a few days, and so was another vessel.
508. From your experience, do you think the entrance can be improved, or do you think it would be wasteful to spend money upon it? I think it would be a waste of money to try to do anything there. The southern breakwater, if carried out as I suggested in 1869, would have been a great help.
509. Do you think that, no matter what money is spent there, the entrance will always be very uncertain? Yes.
510. Do you think that dredging will always be necessary? Yes; the waters flowing in from Back Creek and the South Arm tend to form spits in the channel. One tide will form a spit that you cannot get over.
511. There is no great scour with the ordinary flow of the river? No; you want an occasional flood to scour the channel. You want a big flood. Little freshes are no good.
512. Do you know the entrances to any of the other northern rivers where harbour works have been carried out? I know the Nambucca, the Clarence, the Richmond, and the Tweed.
513. Do you look upon the Bellinger as worse than any of them? Yes; all the other rivers have a headland which you can work on.
514. *Mr. Wright.*] Do I understand you to say that there is a strong northerly set inshore? Yes, for nine months out of the twelve.
515. And a southerly current wide off? Yes.
516. If it has been stated to the Committee that there is always a southerly current both inshore and wide off, that statement is incorrect? Yes; there is always a strong eddy in these bights.

- T. Stewart.
5 April, 1898.
517. A northerly eddy? Yes.
518. Would the sand carried down by the river be lodged at the mouth, or would it be taken away by the current? If it is not taken far enough out, it will be brought back again.
519. Do you think the training-walls go far enough out to give a clear entrance? I object to the northern wall altogether. I would make the southern wall, and let nature do the rest.
520. Is there not always a sandspit at the junction of the North and South Arms? Yes.
521. The professional witnesses say that upon the construction of the training-walls this sandspit will be cut through by the current coming from the North Arm, which will strike the southern training-wall? Where is the current to come from. I do not hold with that view at all.
522. At the present time a great deal of the river traffic goes through Back Creek? Yes.
523. If these works are constructed do you think that Back Creek should be closed? Yes; if they do not close it, the tide will close it for them.
524. Would it not be better to close the creek in order to confine the water to one channel? Yes.
525. That would give a better scour? Yes.
526. There is not a very large volume of water coming down the river at any time? No.
527. Nothing affects the river except a big flood? Or a heavy sea on the coast.
528. What effect has a big flood upon the bar? A big flood upon both arms will take the channel out about east-south-east.
529. Do you think that the Department will be able to create a scour which will always keep the entrance clear? The Department are bringing the entrance out to the northward.
530. I think if you study the map you will see that the entrance is about 2 points south of east? Yes; you are right there.
531. When you spoke of the channel going out to the northward, you did not quite understand the bearings of the plan? That is so. But why make a curve?
532. You do not think it would be advisable to expose the entrance to the full force of south-east weather? The channel would keep open longer if it went out east-south-east.
533. Suppose you had a big flood and a high gale on the coast, what would happen? We never have a flood without an easterly gale—a gale ranging from south-east to north-east. The sea always comes in straight from the east.
534. Suppose the channel was south-east, what would be the effect of an easterly gale meeting a big flood? If the sea was very heavy the flood-water would have no effect upon it; it would get away to the north and to the south. There are no rocks to hold it.
535. Was no silt deposited from the dredges behind the training-walls? Not while I was there. The sand-pump dredges deal with the silt in that way.
536. I suppose that the sand-pump dredges would do good work there? Yes.
537. Will the construction of these training-walls tend to deepen the river? No.
538. Do you not think that the channel would be deepened if the river were narrowed? That depends upon the height of the walls above high water.
539. They will be 3 feet above high water? That would be sufficient for ordinary times.
540. If a flood rose a foot over the walls it would not do much damage? Not if the stone were heavy; but it would wash away small stones.
541. Do I understand you to say that the river is not likely to be improved by any permanent works? I do not think so. They have had 9 or 10 feet of water along the southern wall for the last six months. I have only known the river like that once in thirty years.
542. Then the presumption is that the wall is doing good work? Yes; but they have not yet had a big flood.
543. I suppose you frequently see the masters of vessels trading to the river? Yes.
544. How do they speak of these works? Some of them are against them, but others say that they have done good.
545. They are of diverse opinions on the subject? Yes.
546. You are not in favour of constructing a railway from the Bellinger to Coff's Harbour? No.
547. Is not Coff's Harbour capable of being made a valuable port? That is a matter of opinion.
548. Did you ever hear that Captain Howard had stated that when the Government had spent £2,000,000 on Coff's Harbour they would find the place filled up with sand? That is about correct.
549. *Mr. O'Connor.*] That is your opinion too? Yes.
550. *Mr. Lee.*] Which is the more important arm—the northern or the southern arm? Most of the settlement is on the North Arm, but the South Arm contains the deepest water.
551. Is the best land on the river banks, or does it lie further back? The best land is on the river banks. There is nothing further back.
552. Does that remark apply to the South Arm as well as to the North Arm? Yes; there are only little bits of flats between the hills.
553. What do they grow their chiefly? Maize, and latterly they have been dairying a good deal.
554. How many dairies are there in the district? One, I believe.
555. Do they make butter? Yes.
556. Upon a small scale, I suppose? Yes. A Mr. Matthews is about to erect a large creamery at Raleigh. That will be No. 2.
557. Were you on the river when the training-walls were commenced? Yes; I think I was the first to propose the south wall.
558. They were commenced on the upper part of the South Arm, and continued down to near the mouth? Yes.
559. You are aware that it is not proposed to carry out the south training-wall further than is shown on the map? Yes.
560. Do you think it goes far enough? Yes; for the present.
561. Did you not notice that there was a perceptible increase in the depth of the water as the walls were made? Whenever there is a stone wall for the tide to act upon you will get deep water alongside it.
562. The entrance is bad now, and always has been bad? Yes.
563. But since the training-walls have been built there has been good water alongside them? Yes; but I had better water before there was any training-wall there at all. I had a depth of 14 feet for fourteen months right out to sea.
- 564.

564. That has led you to the conclusion that the training-walls have not been affected? They have been affected to a certain extent.
565. But they have not kept your channel open? No, and they will not do that.
566. If you have training-walls on each side will not that make a sufficient scour? Provided that the sea does not wash the northern wall away.
567. The eastern training-wall to which you refer would be 600 feet back from the beach;—do you say that the sea would wash it away? Well, I have seen grassy hummocks, with trees growing upon them, disappear in less than six hours.
568. What depth of water went over that land? The land kept on sinking while the gale lasted.
569. On the southern side the sand would pile up? It would be just as likely to wash away. One gale might pile it up, and another gale might wash it away.
570. How does this entrance differ from the other entrances upon the coast? There is no headland there. It is all quicksand, and there is an eddy right round the bight.
571. You are of opinion that the southern training-wall should be allowed to stand for some time, to see how much it will settle? Yes.
572. In 1892 only £5,000 had been spent upon these training-walls, and now £33,000 has been spent upon them, so that you cannot have seen their effect? I know the effect of the sea upon the beaches there.
573. But you cannot speak from personal experience of the effect of these training-walls? No.
574. How many trips a week does the steamer make? One.
575. Do many sailing vessels go there? Two or three timber vessels.
576. I suppose the steamer brings maize, butter, pigs, and perishable stuff? Yes.
577. While the sailing vessels bring timber? Yes.
578. If one steamer can carry all the produce of the district, making a weekly trip, do you think the Government is justified in expending £36,000 in improving this entrance? No.
579. Do you think it would be practicable and economical to make a railway to Coff's Harbour instead? It would be practicable, but I do not know if it would be economical.
580. What is the distance? It would be about 18 miles from Raleigh to Coff's Harbour.
581. Would it be practicable to carry the produce of the Bellinger by rail to Coff's Harbour, and to ship it there? Yes. When the Bellinger bar has been bad they have sometimes sent produce there by team.
582. What would be best in the interests of the district? To spend the money in improving the Bellinger. The jetty at Coff's Harbour costs almost as much to repair after a heavy gale as it costs to build.
583. Is the statement that there are many times when the steamers cannot approach the jetty at Coff's Harbour a correct one? I suppose that in one week out of three they cannot go there.
584. Is it not a common practice to anchor the steamer off the jetty and to disembark passengers by means of the crane? Yes, they do that; but they cannot ship cargo that way.
585. Is not the jetty built with buttressed piles, so as to prevent steamers from coming alongside? A steamer can always get alongside if the weather is moderate. There are buoys to moor her clear of the jetty, and if there is any roll she naturally uses them for her own safety.
586. In your opinion it is not necessary to spend anything upon this port at the present time? That is so.
587. *Mr. O'Connor.*] You have not seen the new works constructed on the Bellinger, and therefore you are not in a position to say whether the money expended upon them has been well or ill spent? No.
588. Were you summoned by the Committee to appear here, or did you volunteer your evidence? I was asked to come here.
589. By whom? By the Secretary.

T. Stewart.
5 April, 1898.

WEDNESDAY, 6 APRIL, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	HENRY CLARKE, Esq.
The Hon. JAMES HOSKINS.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.
	FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Harbour Works at Bellinger River.

John See, Esq., M.P., sworn, and examined:—

590. *Chairman.*] You represent the Clarence Electorate in the Legislative Assembly, and you are one of the managing directors of the North Coast Steam Navigation Company? Yes.
591. *Mr. Trickett.*] What has been the effect of the works already carried out on the Bellinger, and what do you think will be the effect of the whole scheme when completed? What has already been done on the Bellinger has considerably improved navigation there, and I think that when the works are completed they will be of great benefit to the district.
592. I think the experience of other places has been that training-walls are very effective in creating a scour where a river is shallow? Yes, in every instance.
593. There is no reason why they should not have this effect on the Bellinger? None whatever.
594. The entrance to the Bellinger differs from the entrances to other rivers on the North Coast, because there is no headland there to work on—the entrance is merely an opening in the sea beach? I have no doubt whatever that that breakwaters will be effective there. In all places breakwaters, although they may be protected at their bases or shore ends by a headland, are to a great extent exposed to the full force of the ocean. At Newcastle, for instance, although a certain portion of the breakwater is protected by the headland, as the wall projects into the sea, it has to withstand the full force of the water. The same thing may be said of the breakwaters at Trial Bay, the Clarence, and other places. I do not think there

J. See,
Esq., M.P.
6 April, 1898.

J. See,
Esq., M.P.
6 April, 1898.

there will be any difficulty in making breakwaters at the entrance to the Bellinger. From what I know of the place, it is not so much exposed as many other places along the coast.

595. Will it not be almost an endless job to get a bottom there, seeing that the sand is so constantly shifting? I do not think so. It simply means that stone will have to be thrown in until the bottom is reached, or until a good foundation is obtained. A good deal of the success of the breakwater would depend upon the size of the stones used in its construction. I do not know if there is an abundance of good stone available; but the size of the stone used has a great deal to do with the efficiency of a breakwater.

596. A gentleman of great experience told us yesterday that in his opinion the southern training-wall should have been carried out straight, without a curve;—what do you think? I think the straighter you make a channel of this kind, the more effective it is likely to be; but the curve you speak of is very small.

597. He contended that there is a northerly set of the current in-shore, which is likely to bank up the sand against the wall? The sand all about the Bellinger is constantly shifting; but, in regard to all these bar harbours, whenever there is a flood, the water always cuts a straight channel out to the ocean. On the Manning, the Macleay, the Bellinger, and the Nambucca—though the Nambucca has more rock about the entrance than the other rivers I have named—after a heavy flood there is always a straight channel out to sea. Then the channel shifts about, following the changes of the winds. Sometimes a sand-spit, which has appeared after a strong easterly gale will quite disappear, or change to another position, after a change in the wind.

598. I suppose the scour caused by the rise and fall of the tide in the Bellinger is not very great? The Bellinger is not a large river; but it has two arms, and that should aid the engineers in creating a scour. It is a very fine little river.

599. It is in flood-time that these training-banks do so much good in creating a scour? Of course, the scour is increased in flood-time. If you confine the waters of a river between training-walls, that largely increases the scour. There is always a great rush of tidal-water in these small rivers. At nearly all of these harbours there is an outer bar and an inner bar or a spit, and training-walls always remove this spit.

600. Even in ordinary weather? Yes; the scour created also invariably improves the outer bar.

601. That has been the experience of other bar-harbours? Yes; if you once define the channel, and keep it clear, the sand banks up and forms a sort of headland, and prevents the sea from forcing its way in.

602. What is proposed to be done now is to continue to build walls which form part of the complete scheme? The scheme seems to me a good one, because it directs the channel fairly out to sea. Before anything was done on the Bellinger, the channel was often very much south of the present channel, and varied greatly from time to time. We never knew from one week to another where the entrance would be.

603. Knowing the locality and the district, you think that, if the scheme as proposed is carried out, it will be beneficial to the people settled on the Bellinger? Unmistakably.

604. At the present time, the trade to the Bellinger is very small? There is a considerable trade there. The bar there is a shallow one, but not a dangerous one, and, so far as I remember, there has never been any loss of life on it. I do not know what the population of the Bellinger is at the present time; but the district is a large farming district, and I should think ranks second to the Manning in importance.

605. What are its staple productions? They grow maize chiefly, and they are now going in for dairying. It is not very far from Coff's Harbour, and some of the passenger trade goes by way of Coff's Harbour because of the uncertainty of the Bellinger entrance. The produce, of course, goes through the Bellinger.

606. A report submitted to us states that the cultivated land on the Bellinger is almost entirely confined to a narrow strip of alluvial soil upon the river bank, and that the staple and almost only crop is maize? Maize is the principle crop.

607. Does the district suffer by reason of the uncertainty of the entrance to the river? There can be no doubt about that. Only very small steamers can go there now, and sometimes for a fortnight or more it is impossible to have communication with the river, except by means of droghers. The people raise a considerable quantity of poultry, eggs, and pigs; and if they do not get their produce to market quickly and regularly it deteriorates, and they suffer loss. If there was an assured depth of 10 feet at the entrance I should think the production of the district would greatly increase, and that the population would double itself within five or six years. The land on the Bellinger is as rich as any of the land upon the northern rivers.

608. Do they grow sugar there? They could do so; but the further you go south the greater the liability to frost. On the Bellinger they are nearer to the hills than they are on the Clarence, and therefore they are more likely to get frosts there. This district is not far away from the Don Dorrigo district.

609. You look upon it as likely to be a large dairying and a maize-growing district? Yes; it is one of the most fertile and beautiful districts in the Colony. The alluvial land there is as good as that upon any of our rivers.

610. Would a permanent depth of 10 feet enable sufficiently large steamers to trade to the district? Yes; very often there is not more than 6 feet of water there. I have been interested in steamers trading to the Bellinger for the last fifteen years, and I know that the losses which have been sustained there by shipowners and insurance companies have been very serious. I had two steamers on shore on the north spit at one time. On several occasions vessels have been stuck there for considerable periods. We had to lift the "Fernmount" nearly a mile from the outer beach into deep water inside. That means additional expense to the shipowners, and this expense has, of course, to be borne by the settlers of the district.

611. Is your company still trading to the Bellinger? Yes.

612. Is that trade a payable part of your business? The trade is comparatively small; but it works in with other business. The North Coast Company have a number of steamers, and they have to supply additional tonnage wherever it is required, so that it pays them to work in all these trades. Our difficulty hitherto has been the shallowness of the water upon the bars at certain seasons of the year. When there is a succession of north-east gales, and an absence of floods, the bars bank-up tremendously. When the floods come they scour out the channel, and the entrance is pretty good for some time. On the other hand, these floods frequently destroy the crops.

J. See,
Esq., M.P.
April, 1898.

613. Have you often had your vessels bar-bound at the Bellinger? Yes; scores of times. Sometimes they have been bar-bound for a fortnight. This is a serious inconvenience to the producers of the district. I should like to say that only recently one of the most enterprising men on the Bellinger bought a large estate there, and intends to go in for dairying on a large scale. It is only reasonable to expect that other people will follow his example.

614. Where do vessels go for shelter when they cannot enter the river? Trial Bay is the nearest place.

615. How far is that from the entrance to the Bellinger? About 20 or 25 miles.

616. I suppose these delays cause great inconvenience to passengers, ship-owners, and others? Yes. Very often the Bellinger passengers go to the Macleay, while sometimes they go to Port Macquarie. Recently they have gone to Coff's harbour.

617. It has been suggested that, in lieu of improving the entrance to the river, a railway should be made from the Bellinger to Coff's Harbour;—how do you view that idea? A railway would be much more expensive to the farmers, because it would mean so much extra handling. At the present time produce intended for shipment is put upon the droghers and brought down by them to the steamer, to which it is transhipped. If there were a railway journey to be made in addition, there would be so much extra handling. A railway might serve the Bellinger people to some extent; but it would not serve them altogether. It would be preferable to improve the river.

618. I suppose there would be a good many creeks to cross in making a railway to Coff's Harbour? I do not know; but I suppose there would be some.

619. Would it not be pretty expensive to construct 20 miles of railway? It would take more to construct the railway than to improve the harbour. From my recollection of the country between the Bellinger and Coff's Harbour, I should say that a railway there would cost from £7,000 to £8,000 a mile.

620. An experiment was tried in making the railway from Murwillumbah to Lismore, but that has not been a very marked success, so far as the production of revenue is concerned? The object of the railway you speak of was not to divert trade from the Tweed, but to open up an enormous tract of intermediate country. Although that line has not been as profitable as we should like it to be, it has opened up an immense area of country. Each year will increase the importance of the traffic upon it, and probably in time it will pay.

621. Having regard to the general wants of the district, and looking at the question of expense involved, would it be better to abandon the improvement of the Bellinger and to construct a railway from the Bellinger to Coff's Harbour, or would you like to see the proposal before the Committee carried out? I have no doubt that it is absolutely essential for the good of the people of the Bellinger that the harbour works should be carried out. I do not think sufficient importance is attached to the rivers on the north coast. The country there is one of the most fertile in the Colony. It is well watered, its climate is salubrious, and it possesses many advantages not possessed by other places. In other countries rivers are much more appreciated. If people went into these districts, as I have been into them, and saw the industry and enterprise of the settlers there, they would recognise the justification for expenditure of this kind.

622. Is it not the policy of all countries to keep open their waterways as much as possible? Unquestionably. In some places they dig canals and harbours to provide themselves with waterways.

623. Water carriage is always cheaper than land carriage? Undoubtedly. What makes the freights to the smaller rivers higher than the freights to the larger rivers is that shipowners labour under many disadvantages in sending vessels to the smaller rivers. The vessels are frequently bar-bound, and they can only bring out small quantities of cargo. But if the entrance to the Bellinger were improved, and a permanent depth of 10 feet given, the freights there should become as cheap as the freights to the Manning.

624. How would a depth of 7 or 8 feet suit a vessel trading there? If there was an assured depth of 8 feet it would give all the relief required at the present time. If we were always sure of 8 feet of water, we could employ a larger steamer to go to the Bellinger. The boat going there now only draws 6 ft. 6 in. when she is loaded. Of course if there were 10 feet of water there we could not send vessels drawing 10 feet to the river, because something must be allowed as a margin.

625. What vessel trades to the Bellinger? The "Rosedale." She draws about 6 ft. 6 in., and you can load her on an even keel with 150 tons at that depth. She is as flat-bottomed as the floor of this room. Her bottom is flatter than her deck.

626. Specially-constructed vessels must be used for this river trade? Yes; the North Coast Company lately built a steamer to act as a sort of tender, to trade between the different rivers. This vessel will be used when there is difficulty in navigating the rivers. She will be able to carry a fair cargo when drawing only 4 ft. 6 in. or 5 ft. of water.

627. In your opinion, what is the least depth that there should be at the Bellinger entrance? If a vessel drawing 8 feet of water can be reasonably sure of entering the river at any time—except, of course, under exceptional circumstances, such as an easterly gale, which might prevent a vessel from leaving the Clarence or the Hunter—I think that the depth would be ample.

628. You do not think that less would be sufficient? I do not. I do not think there would be any difficulty in obtaining this depth. The experience of the works so far carried out has been better than was expected.

629. *Mr. Lee.*] You have already admitted that you believe the district to be entitled to better communication with the outer markets than it has at the present time? Undoubtedly.

630. The question naturally arises, which is the best way to give this communication—by improving the port, or by building a North Coast railway? My opinion is that sooner or later we shall have the North Coast railway as well as the Harbour Improvements.

631. But, speaking of the present time? I think that if the people there had to make their choice, they would say that the harbour improvements would serve them best. A North Coast railway, however, will open up an enormous tract of country lying above the head of river navigation which cannot be opened up now.

632. At the present time the staple product of the district is maize. Could a railway bring that maize to market as cheaply as it could be brought by the steamers? No; if there were a railway there now, the stuff would be brought to Sydney more cheaply, notwithstanding the bad state of the river. A North Coast railway, however, would open avenues of development which the rivers cannot open up.

633. Do you think that the railway would be in competition with the steamers? No.

J. See,
Esq., M.P.
6 April, 1898.

634. You think that in the future the district will require both the railway and steamer communication? I think so. I think the North Coast railway is sure to be made, though I do not know how long it will be before it is made. There are hundreds and thousands of acres of the finest land in the world which would be opened up by such a railway.

635. It would be a gigantic mistake to spend large sums of money in improving the river if that expenditure were afterwards to be made unnecessary by the construction of a railway. You think, however, that the railway when built will not compete with the river? I do not think the two will come into competition in the least degree. The district lower down the river must, of course, always be served by the steamers.

636. The day must come when the settlement of the district will be larger, and when its production will be larger, and when a class of product will be raised which it will pay to send away by railway? Undoubtedly.

637. Therefore, if the country is committed to the improvement of the river, it does not follow that the money spent will be wasted if the railway is afterwards made? I am sure it will not be wasted.

638. *Mr. Fegan.*] Do you know anything about the timber trade of the district? There is not very much timber there now. In olden times, when the scrubs were standing, there used to be a lot of cedar, but they have to go back into the ranges for it now. Cedar and pine are got now in the gorges. The brush on the alluvial flats has been cut down in order to make way for the cultivation of the land.

639. If you go up Back Creek you get nearer to the good country than by going up the North Arm? The steamer does not go up the Bellinger at all; she only goes as far as the Government wharf, just inside the river, and flat-bottomed boats, carrying, perhaps, 600 bags, with a draught of 2 feet, propelled by a small tender, bring down her cargo. On one occasion I sent a small steamer up to Fernmount; but the steamers do not go there regularly. The cargo is brought down the river to them.

640. Pilot Ratchiffe told us that there had already been a great improvement in the river, and that there was now an average depth of 10 feet? I am sure that the training-walls will have the effect of deepening the channel.

641. Another witness told us that there was some of the best timber in the Colony in the Bellinger district? There is no doubt that it is a wonderful district for hardwood—blackbutt, ironbark, and various kinds of gum. The hardwood there is as good as any you get in the world. I suppose the timber from Port Stephens up to the Clarence is as good as you would see in any part of the world.

642. Ellis Bros. are putting up a second mill on the river? Yes; there is no question as to the quantity of timber available, and it is all pine timber.

643. *Mr. Roberts.*] Have there not been several wrecks upon the Bellinger during the last few years? There have not been many wrecks, but a good many vessels have been stranded there. That is nearly as bad from a steamship owner's point of view.

644. The navigation of the entrance is regarded as dangerous? It is not dangerous, but it is very inconvenient. Steamers very often go ashore there. When I was there some five years ago I had two steamers ashore on the north spit, and a vessel carrying coal made for the entrance, but struck one of the spits and sank. I have never entirely lost a vessel there.

645. You think the time has arrived when something should be done for the people residing upon the north coast rivers? Yes; and this is one of the most important rivers on the coast.

646. Does it resemble the Manning and the Macleay in any way? Yes. They are all pretty much about the same; they have all high banks and run through rich alluvial land.

647. Land capable of producing anything? Yes; anything that good land will produce.

648. Are the people there going in for dairying at all? Yes; but the bad state of the entrances injures them to some extent.

649. If these improvements are carried out, will it lead to a development of the district? Yes. The North Coast Company put cool chambers into their steamers whenever there is any large quantity of dairy produce to be carried. These chambers enable shippers to land their goods in Sydney as fresh as when they left the dairy. When, however, there is a detention at the bar, there is a danger of the ice giving out, unless you have a refrigerating machine on board, and if the detention is very great the stuff may perish.

650. Are delays very frequent? Yes.

651. What is the longest period that a steamer has been bar bound? Steamers have been bar bound to my knowledge for a fortnight at a time, and in the olden days they were often bar bound for longer periods. The going into and out of the rivers by the steamers improves the bars to some extent. Mr. Darley has on more than one occasion moved the crust of sand upon the top of these bars, and that has the effect of causing a slight scour, thus deepening the channel, while the dragging of the steamer keels upon the sand has a similar effect. What they call the cover-piece, upon the stern of the steamers, wears out very quickly by reason of this dragging through the sand.

652. Would your vessels attempt to enter this river at the present time if an easterly or south-easterly gale were blowing? No; they would not attempt to enter in an easterly gale if there were 10 feet of water upon the bar.

653. Would they enter with a south-east gale under such conditions? Yes; a south-easterly gale is not so bad.

654. Even if the proposed improvements were carried out it would be risky to attempt to enter during an easterly gale? I think so; but these gales do not last very long—never more than four or five days, allowing for the sea to go down after the wind has stopped.

655. The vessels could enter during southerly weather? Yes. The easterly seas which we get on the coast are not always local. A disturbance at New Caledonia will sometimes make a big sea over here.

656. You think the suggested improvement would be of great advantage to the Bellinger district, because the people living there would have more certain communication with Sydney? Yes. I have no doubt whatever that the Bellinger district is fully entitled to any reasonable expenditure upon work of this kind, which those whose business it is to study these matters think should be carried out.

657. *Mr. Black.*] You said that the land in the district which is suitable for sugar-growing lies nearer to the hills than similar land on the Clarence;—what is the width of the country between the hills and the Bellinger? I do not know. The coast range is nearer the sea-coast at the Bellinger than at the Clarence. I should think it was from 30 to 35 miles by river from the sea-coast to the hills.

658. Is there a belt of cultivatable land 30 miles in width upon each side of the river between the sea and the ranges? No. The river twists and turns a good deal between the sea and the ranges. I suppose that as the crow flies the distance from the coast to the ranges would not be more than 20 miles. There is a strip of good land all along the river. Sometimes it is a mile or two wide, at other times it is 4 or 5 miles wide. At Raleigh, I dare say, it is 5 miles wide. The forest land is good for dairying, just as is the alluvial land.

659. But not for cultivation? No. As a rule they do not cultivate the forest land on these rivers.

660. Is much of the forest land in use now? Not so much as there would be if they went in more for dairying.

661. I suppose the bulk of the flat country is occupied? It is all taken up more or less.

662. So that there is little room for development there? Most of the alluvial land is taken up, but a great deal of forest land could be used for grazing.

663. I suppose that near the coast the land is chiefly covered with a scrubby growth, and is sandy? Yes. Down near the entrance to the river the soil deteriorates.

664. You have to come a few miles up the river before you get into good country. After 5 or 6 miles you begin to get into good country. You never get very good land close to the sea. The salt air would spoil the crops.

665. Do you think the district would develop greatly if facilities were afforded by the improvement of the channel and the deepening of the entrance? Yes; and I think that the people there are entitled to this improvement.

666. You think that the people there can fairly demand the carrying out of these improvements? Yes. If the river were improved there would be an enormous increase in the production of live stock—pigs, poultry, and so on. If pigs are kept several days on a bar-bound vessel they lose condition. The same thing may be said about other farm produce. A farmer reckons to pay the expense of his house by selling his eggs, fowls, and produce of that kind.

667. *Mr. Humphery.*] What is the difference between the freight to the Bellinger and the freight to Coff's Harbour? I do not know, because our boats do not go to Coff's Harbour. The freight to the Bellinger is, I think, 1s. 6d. a bag. I daresay it would be less to Coff's Harbour, but there is no particular settlement about Coff's Harbour.

668. *Mr. Hoskins.*] We were told yesterday by an old pilot that Coff's Harbour was not always approachable? That is so. It is not approachable in easterly weather. Coff's Harbour might be made a good harbour, but it would require the expenditure of a good deal of money.

669. *Mr. Humphery.*] To get goods to Coff's Harbour they would have to be brought down the river by drogher? Yes; and then there would be dray haulage, or railway haulage from (say) Raleigh to Coff's Harbour. We reckon that distance at about 20 miles.

670. It is not likely that where the river was accessible a producer would send stuff by rail to Coff's Harbour rather than put it on board the Bellinger steamer? No.

671. I suppose the river droghers are able to take produce away from almost every part of the district? Yes; we provide sufficient tonnage to take all the produce away.

672. Nearly all the settlement in the district is close to the river? Yes; but there is a good deal of back country that has not as yet been opened up. The present settlement is nearly all upon the banks of the river and of the creeks.

673. So that the steamers practically serve the whole of the settled part of the district? No doubt. When the bar was closed a few months ago some of the settlers, in the desire to get their goods to market, carted them over to Coff's Harbour, but that was very expensive. It is a big day's work to cart produce 20 miles.

674. Has it frequently happened that the river has been closed for more than a day or two? Yes. This is the worst time of the year, because the tides are lower now, and there are not generally any floods to cause a scour. Of course, if we get a heavy fresh that deepens the bar, and I have known there to be as much as 12 feet of water on the Bellinger bar immediately after a flood.

675. In your opinion, the improvement of the river is to be preferred to both a North Coast railway and a railway from the Bellinger to Coff's Harbour? Yes. All these rivers—the Tweed, the Bellinger, the Nambucca, and others—are deserving of consideration, and their improvement must be of great benefit to the people on the North Coast. My intimate knowledge of these districts leads me to say that if better means of communication were provided, so that goods might be taken to market more cheaply, there would be a large increase of settlement.

John McLaughlin, Esq., M.P., sworn, and examined:—

676. *Mr. Humphery.*] You represent the Electorate of Raleigh in the Legislative Assembly? Yes.

677. The Raleigh electorate embraces the Bellinger district? Yes. Raleigh, on the Bellinger, is about the centre of the Raleigh electorate.

678. *Mr. Lee.*] From what point of view do you wish to give evidence upon this question? I want to give evidence in favour of the extension of the training-walls which have already been commenced, and I want to show what a great benefit the carrying out of this work will be to the district. When I visited the Bellinger in May, 1896, I found the people almost in a state of famine. The bar was impassable, and they were almost without the necessaries of life, except such as they produced themselves. The storekeepers had to get their goods from Sydney *via* the Macleay or *via* Coff's Harbour, while the produce that was raised was left on the hands of the producers, because it was impossible to get it to market. I visited the entrance to the river, and I found that the southern training-wall, which was being made, was only a half-tide wall, so that the water flowing over it prevented any considerable scour. The bar was really shoaling up rather than improving, and there were not more than 4 or 5 feet of water upon it. I pointed this out, and it was decided by Mr. Darley, upon the advice of the local engineer, to raise the wall above high-tide, so as to prevent any loss of scour. Along the wall at the present time there is a depth of nearly 15 feet. Very shortly after the wall was raised and brought a little further down the river the entrance began to improve. At one time it used to be a good deal further south than its present position. I have seen the "Rosedale" coming in through a channel nearly half a mile south of the present entrance. The contractor and the Government engineer explained to me that they hoped that as the southern

McLaughlin,
Esq., M.P.
6 April, 1898.

- southern training-wall reached completion the entrance, instead of being down south, would go out nearly straight, further to the north, and within a very few months that was what happened.
679. Have you been there since this improvement came about? Yes, I have been there since, and I found that it has nearly always been impossible to cross the bar. Until the recent rough weather the steamer was never bar-bound. Every £1,000 spent upon the work has improved this harbour. The wall now can never suffer from the rough seas, because the sand prevents them from coming in. It is not intended to take the wall out into rough water, because the stone obtainable is not heavy enough to resist the seas.
680. In your opinion the further the training-walls extend the better the bar becomes? Yes; the construction of the northern training-wall will make a very great improvement.
681. It is not proposed to extend the southern training-wall very much? No; and I do not think that is necessary.
682. It is proposed to put a wall on the north side, where the firm red lines are shown. In your opinion, what effect would that have? The effect of that must be to concentrate the water which now flows over the flats upon the entrance. The short wall that has been completed upon the north side of the South Arm has had a beneficial effect, but the current to a great extent expends its force upon the sandbank a little further down.
683. Which contributes most water in flood-time, the North Arm or the South Arm? I should think the North Arm always; but there is a great deal of high country which drains into the South Arm.
684. If the works now proposed to be carried out were made, they would give a good entrance to the river? I feel confident of it from my own observations since 1896.
685. Have you any suggestions to lay before us in regard to the proposed work? I have never heard any suggestions for the alteration of the plans in any way.
686. *Mr. Fegan.*] What about Back Creek? I understand that it is proposed to dam Back Creek, but I do not think it matters what happens to that creek.
687. Some work has been done in the neighbourhood of Back Creek on the north side of the south arm? Yes; that has confined the scour to some extent.
688. *Mr. Lee.*] You are satisfied with the proposals of the engineers? Perfectly.
689. You think they will be effective if carried out? Yes.
690. Then, as to the justification for the work? I think the Bellinger is as nice a little river as we have in the Colony. No one could pay a first visit there without being struck with great admiration for its richness, the beauty of its scenery, and the magnificent timber to be found there. If you travel between the Bellinger and the Nambucca, you will see extraordinarily good timber and splendid soil all the way through. You cannot excel the soil along the banks of the Bellinger.
691. What settlement there is is situated on the banks of the river? The settlement of the district will largely increase if facilities are given for sending produce to Sydney. Hitherto they have been unable to get anything away from the place.
692. All the river land has been alienated for some years? There is a large amount of good farming land still reserved; blocks are thrown open to selection nearly every year. A lot of land fit for agricultural purposes has been reserved, and a lot of timber land has been reserved.
693. Let us take the position as we have it to-day. The Bellinger is an old settled district, its chief productions being maize, butter, eggs, poultry, and timber. The trade is conducted by one steamer, making a weekly trip, and by a few small coastal vessels. That being the case——? I do not admit it to be the case.
694. We have evidence to prove it? The witnesses are mistaken. Mr. Ellis has recently brought a saw-mill from the Nambucca, and erected it upon the South Arm. He is starting a store, and will give employment to about 200 men. No matter how many men are at work upon it, the timber there will not be exhausted for many years to come. Mr. Ellis' steamers will bring timber to Sydney, and produce as well probably, and they will carry back goods.
695. *Mr. O'Connor.*] We have it in evidence that the timber of the district is the finest in Australia? I should say that it was almost the finest in the world. Between the Bellinger and the Don Dorrigo country you get every kind of timber.
696. *Mr. Lee.*] Timber can be allowed to find its way to market as circumstances permit, because it does not fluctuate in value, nor is it perishable. The timber trade could be dealt with under present conditions? Sometimes the vessels cannot get into the river to take the timber away.
697. If they cannot get in one week they can get in the next; but if maize is kept under the hatches of a steamer for six or seven days it deteriorates? Undoubtedly.
698. Does not the value of maize in the Sydney market fluctuate? Yes, very much.
699. If the settlers upon the Bellinger are to be put upon the same footing as those of more favoured rivers, they must be given an opportunity to take advantage of the Sydney market? That is so.
700. To put them upon the same footing as the residents of the Clarence it becomes necessary to improve the entrance to the Bellinger, as the entrance to the Clarence has been improved? It is both necessary and just.
701. Can maize-growing be carried on profitably in the district unless these facilities are given? Only under a great disadvantage.
702. Live stock and perishable produce must be got to market as quickly as possible? No doubt.
703. Do you think that if a reliable port were given to this district the quantity of produce sent away would largely increase? Yes, very largely.
704. The settlers there would cultivate more of their land? Yes, a great deal more.
705. And probably more Crown land would be taken up? Yes.
706. You think the development of the district is retarded by the want of proper communication with the Sydney markets? Yes.
707. Do you know of any better way of giving this communication than by improving the bar? The only other way would be to make a tramway or a railway to Coff's Harbour, and Coff's Harbour is not always available to shipping. In 1896 the people of the district were in despair because of the state of the Bellinger bar, and an agitation was got up in favour of the railway to Coff's Harbour; but a steamer cannot lie at the jetty there. Passengers have to be landed by the help of the crane.
708. And that is not always possible? No.
709. Would it be possible for settlers on the South Arm to send their produce by droghers up the North Arm,

Arm, then to put it on to the railway, and afterwards to ship it at Coff's Harbour? The handling would handicap them to such an extent that I am afraid there would be no profit left.

710. The increased expenditure would equal the loss now entailed by detentions at the bar? It would intensify their loss. I believe that when the proposed works are carried out there will be from 10 to 15 feet of water on the bar. At the present time, if you are located in Bellingen, Fernmount, or any of the towns in the district, you never know when you can get away again.

711. There is room for the development of the district? A great deal of room.

712. How far away is Don Dorrigo? The Never Never Creek joins the river about 24 miles from the entrance. The district there is very fertile, and you then gradually commence to ascend to the Don Dorrigo country. You go through magnificent country; but the land is so thickly timbered that no attempt can be made to use it until the timber has been removed. After 12 miles travelling you get into the Don Dorrigo country, and you are then at an elevation of nearly 2,000 feet. There you find splendid agricultural land. A large number of settlers are at present engaged in clearing off the timber, which in most cases they destroy altogether. Their produce they bring down to the Bellinger.

713. Not to Coff's Harbour? No; they have no road there.

714. Would that be a more convenient place if there were a road? If there were a good road they would prefer to go to Coff's Harbour, because they are always sure of getting a steamer there. The steamer leaves there at a fixed hour every week.

715. If the proposed works are carried out, how will that produce find its way to market? I think it would then go by way of the Bellinger. Of course, a great many of the settlers residing at the back of Coff's Harbour will always go there.

716. You think that the effect of improving the river will be to concentrate the traffic from the district lying immediately behind the Bellinger and about 30 miles back? I think that the traffic from a great part of the Don Dorrigo country will come down to the Bellinger.

717. There is a lot of good grazing country lying at the back of the river which at the present time cannot be used? Yes; for want of a market. At the present time farmers bring their potatoes from Guy Fawkes down to the Bellinger by team.

718. What is your opinion of the future of this district? I think that the more it becomes known the more its population will increase, and the richer it will become. It is a wonderfully rich country. There used to be but one storekeeper in the district, but now there are four in the town of Bellingen alone.

719. There is a good deal of similar country behind Coff's Harbour? Yes. There is good mining and agricultural country behind Coff's Harbour. The land is higher, but it is similarly timbered.

720. Do you think the residents on the Bellinger would be willing to contribute something to recoup the Government for this expenditure, seeing that it would mean a reduction of freight to them? I think they would be willing to pay something if they were not asked too much. At the present time they pay 1s. 6d. to send away a bag of maize, whereas on the Clarence they only pay 9d. Still, the Clarence people pay nothing to recoup the Government for the expenditure upon the Clarence, and, therefore, it is likely that the Bellinger people would object to pay anything.

721. You think that if river dues are imposed they should be imposed all round? Yes.

722. Beyond that you do not wish to express an opinion in regard to the matter? I would not recommend the imposition of dues.

723. Have you any reason to suppose that the bulk of the settlement will be in the vicinity of Coff's Harbour rather than in the vicinity of the Bellinger? No; because the land near Coff's Harbour is not so well suited for agriculture as is the land along the Bellinger. The country for 10 or 15 miles round Coff's Harbour is timbered country.

724. I presume you are of opinion that if these works are carried out traffic will be attracted from a much larger district than that from which the river at present draws traffic? Undoubtedly.

725. Possibly a large amount of traffic may be drawn from Coff's Harbour? No doubt.

726. Do you see any objection to that? No.

727. It would be better to have a reliable entrance to the Bellinger than an unreliable port at Coff's Harbour? Yes; but Coff's Harbour will always be used.

728. Still it is an unreliable port? Yes; steamers cannot lie there.

729. Is it likely that passengers would go to Coff's Harbour to be put on board the steamer by means of a crane if they could take the steamer from the Bellinger River? No. People going to Coff's Harbour from the Bellinger have to be driven 20 miles, and someone must be there to meet them on their return. There would be a great increase in the passenger trade from the Bellinger if passengers could always be sure of getting away.

730. Do you think the country is justified in undertaking the improvement of the North Coast rivers at the present time? Yes, in the absence of a North Coast railway. The people in these districts have paid large sums of money to the Crown for their land, and there is a very large amount of settlement. Nearly all our maize comes from these rivers, and we must provide the people there with facilities for getting to market.

731. Irrespective of your political connection with the district, you think that it would be wise to carry out this work? If I were about to retire from the district to-morrow I would say that the work is not only justifiable but absolutely necessary.

732. *Mr. Fegan.*] How will the improvement of this river benefit the Crown in any way? The more people settle there the more the Crown will get for its land. A very large land revenue comes from the district now; but if the people are not given facilities for getting to market they will not be able to pay for their land.

733. If a railway were about to be constructed, the people using it would have to pay something towards its cost? No doubt.

734. But the Government will get no direct profit from this work? No. I think it is a pity that the North Coast railway was not constructed many years ago.

735. Would you prefer a railway to the proposed harbour improvements? Yes, if I had a show of getting it.

736. Have you at any time presented a petition in favour of the construction of this work? No. A petition was presented, but that was in 1892, before I became the member for the district. Since I have been a member I have impressed upon the Department the absolute necessity for pushing on with this work.

J.
McLaughlin,
Esq., M.P.
6 April, 1898.

- J. McLaughlin, Esq., M.P.
6 April, 1898.
737. Is one of the polling-booths for the electorate on the Bellinger? There is a polling-booth at Bellingen, another at Fernmount, another at Raleigh, and another at the Bellinger Heads.
738. What is the population? The population at the Heads is not very large. At the time of the election a number of the men employed in connection with the construction of the training-walls were working at a quarry 7 miles up the river, and they voted at Fernmount. Since Mr. Ellis went there the population has considerably increased.
739. The saw-mill will only employ about twenty-five men? More than that. They employ as many people as they can in getting timber. There is plenty of timber to be got, and the mill will cut it.
740. What market have they for the timber? They are sending it to Sydney. The red mahogany they are sending to London.
741. The greater part of the timber taken from the Bellinger may be expected to go to the London market? Yes.
742. We have been informed that there are 34,300 acres of alienated land in the Bellinger district;—17,500 acres of reserved land; and 241,200 acres of Crown land. If the proposed works are carried out, the Crown land will probably fetch a higher price than it would otherwise fetch? Yes.
743. That will be an indirect benefit obtained from this work? Yes.
744. Do you not think that if Back Creek were blocked, there would be a better scour down the main channel? No doubt. I do not know if the blocking of the creek would do any harm.
745. Part of the traffic now goes up the creek? Yes.
746. There is a shoal at the junction of the two arms? Yes.
747. You are satisfied that if the proposed work were carried out, the Government would be recouped indirectly by the sale of Crown land; homes would be given to more people; and a greater amount of produce would be sent to the Sydney market? Yes.

Louis Paulson, master of the steamer "Rosedale," sworn, and examined:—

- L. Paulson,
6 April, 1898.
748. *Mr. Fegan.*] How long have you been trading to the Bellinger? About six years.
749. What is the navigation of the river like now? The river is not navigable for coasting steamers like the "Rosedale." We can only get up about half a mile—as far as the Government wharf.
750. What does your vessel draw? Seven feet six inches when loaded.
751. What hinders you from getting up the river? The shoals and sandbanks. There is a large shoal lying across the entrance to the North Arm. The water follows down the training-wall that is being constructed on the eastern side of the North Arm; but there is no wall on the western side to confine it and thus make a scour. Where the temporary bank is shown on the map they were pumping sand from the south side to the north for some time, until a deep gutter was formed on the south side, and the pressure of water on the north side drove the sand back again. Now they are pumping the sand from the north side, but the bank will never be permanent until the training-walls are made, because the first fresh will break through again. The danger we have to fear is that the river may break through to the beach above the present channel. When they start to build the wall down along the island it will confine the water and cause a scour.
752. I understand that it is easier to get up Back Creek than to get up the main channel? Yes, at the present time, because of the shoal at the entrance to the North Arm. Still a dredge could cut through that bank in a week, and then the droghers could get up the river. Back Creek is merely a gutter. If the north end were blocked, it would silt up altogether.
753. What is the longest detention you have had at the Bellinger? I was kept there six days last trip because of the heavy sea. Three or four years ago I was there for fifteen days; but that was before they started to make the training-wall. There were then only 4 feet of water on the bar.
754. Since these works have been carried out, has the channel improved at all? Yes, considerably.
755. Do you think that if they are continued as proposed, there will be 10 feet of water at the entrance? There is 9 feet at the present time.
756. What is the tonnage of your vessels? Two hundred tons.
757. What are the chief products that you carry? Maize, cedar, poultry, &c.
758. Farm produce? Yes; we bring down cream and butter now because they are going in for dairying.
759. What do you do with the cream when you are detained inside the bar for three days? It kept very well last time. We have a cool chamber on board.
760. The uncertainty of transit is a great drawback to the district? Yes. Of course you would be delayed at times, even if there were 20 feet of water on the bar, by the heavy seas. Under ordinary circumstances, however, I have only been delayed two or three days in a year since they commenced to make the training-walls. We must credit these walls with the improvement.
761. Do you think that the carrying out of this work will develop the district? The district is bound to develop if facilities are given for the carriage of produce.
762. Do you think the lack of these facilities has kept the district from becoming thickly populated? Yes; but since I have been trading there the district has improved wonderfully, and especially during the last four years.
763. Have you any figures, showing what the improvement of the trade has been? No; I am not keeping a special account, but I know that the quantity of farming produce sent down has increased wonderfully, and our vessel has been fairly successful. At one time the channel used to be always shifting away to the north, but now we always have a fair depth of water.
764. What winds are worst for getting into the river? Easterly winds.
765. Is the South Arm navigable? Yes, for a distance of about 7 miles. I do not know exactly what the depth is; but vessels drawing 6 or 7 feet go up there.

TUESDAY, 12 APRIL, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Bellinger River.

Patrick Hogan, sworn, and examined:—

766. *Chairman.*] You at one time were a Member of the Legislative Assembly? Yes.

767. You are now in business in Sydney? Yes.

768. *Mr. Roberts.*] You are well acquainted with the North Coast district generally? Yes. I do not think there are many men who could come before this Committee who are better acquainted with the North Coast district from Newcastle to the Tweed than I am. I have had an every-day acquaintance with it for the last thirty years.

769. You have had business relations with the district for many years? Yes.

770. And you represented an electorate there for some years? Yes; for three years.

771. Are you well acquainted with the Bellinger district? Yes.

772. Do you think that the improvements which it is proposed by the Government to carry out at the entrance to the Bellinger will have the desired effect? I think so. When I was there less than three years ago, a man could have ridden a bicycle over the Bellinger bar.

773. Would that be at low tide? Yes. There is not more than 3 feet of a rise in the tide there at any time, and at the time of which I speak there was not more than 4 ft. 6 in. on the bar. I was there again less than twenty days ago, when the s.s. "Rosedale," upon which I was a passenger, and which was drawing not less than 7 ft. or 7 ft. 6 in., crossed the bar without the slightest difficulty, at ebb tide, and without touching.

774. Is this improvement owing to the work that has already been carried out? Yes, unmistakably. The additional depth is due to the southern training-wall. When I was last there I made it my particular business to look into the whole matter, so as to be able to afford what information I could to this Committee on my return.

775. How much of the works shown on the plan has already been carried out? The greater part of the southern training-wall. When that wall was started at the old ferry a boat drawing more than 4 or 5 feet of water could not moor there, but now there are 20 feet of water at the Government wharf, and I do not think there are less than 17 feet of water at any part of the wall. On the northern side they are also constructing what is shown on the map as a "temporary bank," to conduct the water of the North Arm against the southern wall, and thus cause a scour in the channel. I do not think money has ever been expended in the Colony with better results than at the Bellinger River.

776. Do you think it desirable that the north and south breakwaters should be carried out in the near future? Yes. I am of opinion that if you carry the training-walls 150 or 160 feet further out you will get sufficiently deep water for all practical purposes. The silt from the quarries which they are now throwing away would be very useful in the construction of the temporary bank, because there is no force of water to wash against that bank.

777. Do you think that the works at present proposed will be sufficient to meet the requirements of the river traffic for some years? I think so. There is nothing but sand above where the northern wall is shown. Whether that sand is likely to become troublesome in the absence of the northern wall I cannot say, but at the present time the southern wall carries deep water all along it, and, of course, if the northern wall were constructed it would be impossible for the sand above it to interfere with the channel.

778. Where do they get the stone which they are now using? In a quarry which they have opened up about 6 miles up the South Arm. To get stone of the size required by the specifications, they have to move a lot of silt and small stuff into the river. When I was there I suggested that this refuse, which now goes to waste, might be used in the construction of a temporary bank. It would be just as effective as larger stone, and only less expensive.

779. Has the work been carried out by contract or by day-labour? By contract. The contract is to quarry the stone, and punt it down to the wall, and for this work so much a ton is paid. They are now putting stone into the temporary bank which would be much better used on the southern training-wall. Only very small stone is necessary for the temporary bank.

780. What are the principal products of the Bellinger district? The products of all these rivers are pretty well the same—maize, timber, pigs, poultry, and so forth. This is purely an agricultural district.

781. Is the land as fertile as the land on the Macleay? Yes, it is very similar. There is a sameness about the whole district north of the Manning. The Bellinger is a beautiful little river, and is well worthy of the expenditure necessary to make a harbour there.

782. Is the production sufficiently large to warrant the expenditure of £36,000 there? Unmistakably, yes. I do not know of any public work that has yielded better results than that part of this scheme which has already been carried out. The district is as good as any north of Sydney, though it is limited in area compared with the Clarence and the Macleay districts. Overhanging it is the Don Dorrigo country, one of the best districts in the Colony.

783. Do you think that the improvements to the Bellinger are likely to lead to settlement in the Don Dorrigo country? It must have that effect. The Government have already gone to the expense of making a road from the valley of the Bellinger up to the Don Dorrigo country.

784. Is the soil there capable of producing anything? Yes. It is as good as the soil in the Big Scrub on the Richmond, though the climate is not quite the same.

785. How far would the Don Dorrigo country be from the nearest point at which produce could be shipped on the Bellinger? From 20 to 25 miles.

P. Hogan,

12 April, 1898.

- P. Hogan. 786. How far up the river do the ocean steamers go? Only as far as the Government wharf—not more than a mile and a half.
- 12 April, 1898. 787. Is the North Arm navigable to an ocean steamer? No. The ocean steamer could get up to Fernmount, a distance of about 12 miles, if the channel were dredged.
788. Is all the produce of the district brought down to the Government wharf by droghers and punts? Yes.
789. For how many miles is the produce carried in this way? I should say 20 or 30 miles. There are between 40 and 50 miles of settlement on the Bellinger River.
790. Does that include the North Arm? The North Arm means the main Bellinger River.
791. How far does it extend? Only 40 or 50 miles. I have been at least 15 miles beyond where the Don Dorrigo Road crosses the Bellinger, and I was told that farming settlements extend that distance beyond again.
792. Have you any knowledge of the area of the rich agricultural land on the banks of the Bellinger? I could not say what it is. When you get up to the head of the river the quality of the land is good; but the inconvenience of getting produce away has kept people from taking it up. Less than 20 miles from Bellingen there is only about a foot of water in the river.
793. Could that part of the river be made navigable by the use of dredges? No; you could not make the river navigable, and it would be hopeless to think of bringing the ocean steamer above Fernmount.
794. Is all the land on the banks of the river occupied? Yes; as far as deep water is concerned, and it has been under cultivation for thirty years past. The people that came to the district followed the river up, and the people higher up appear as happy and contented as those down on what is known as the deep water.
795. Is there any land still available for settlement? I think there would be some at the head and arms of the river.
796. How far would the Don Dorrigo people have to bring their produce before they could put it on to the droghers? The distance would be very little, if anything, short of 20 miles.
797. Is Back Creek navigable by punts? Yes; everything has to be punted from any point west of Fernmount.
798. I suppose Sydney is the market for the produce in this district? Yes.
799. Is one steamer able to carry it all? Yes.
800. How many trips does she make? One a week.
801. Are any sailing vessels employed there? Yes; five or six. They are engaged in carrying timber. There are mills there which cut hardwood, and the sailing vessels bring this timber away.
802. Do the sailing vessels also bring maize? No, not now.
803. So that there are two distinct trades? Yes.
804. There is no difficulty now in getting over the bar? Not the slightest. Vessels can get in and out without inconvenience.
805. You say that the works already carried out have brought about this result? Yes. This result is attributable to the good work done by the training-walls.
806. Do you look upon the Bellinger district as as good for the production of maize as the Macleay district? The land is as good, but its area is limited. It is alluvial land, and grows good maize. Right up for 50 miles, it is good farming land.
807. Is there any difference between the quality of the maize produced on the Manning, the Bellinger, the Macleay, the Clarence, and the Richmond? To get the best maize, we must not go further north than the Clarence. Maize grown more to the south is more approved of than maize grown on the Clarence and on the Richmond; but the difference in price is merely nominal. The maize grown on the other rivers is more marketable. The Clarence maize comes into the market earlier than the maize from the rivers further south; but it is not quite as good.
808. The Macleay is one of the best districts in the Colony for the production of maize? Yes; because of its area; but the maize grown there is not better than that grown on the Bellinger or on the Nambucca.
809. From what other parts of the Colony do you get maize? I get maize from Tumut, and I have also got maize from the Bega district.
810. Do you get any from New England? No. The maize grown there is consumed locally.
811. Is not maize now grown in the Western district? Yes; but it is not sent to the Sydney market.
812. How does the maize, grown in the various parts of the Colony, compare? Maize grown at places like Tumut or at Bega will keep longer than maize grown on the northern rivers, because it is not so subject to weevil.
813. *Mr. Clarke.*] Maize sometimes comes to Sydney from Mudgee? Possibly; but I have never had any maize from there.
814. *Mr. Roberts.*] But that maize does not command a higher price? Occasionally, when river maize is weevilly.
815. You are prepared to recommend the expenditure of £36,000 upon this work? Yes. Double that amount would be profitably expended if you could make a good harbour at the Bellinger.
816. The people on the North Coast rivers have for many years past been isolated, and they now think they should be given better communication with the Sydney market? Yes; for thirty years past I have been trading with these places, and have owned vessels going there. When I first sent a vessel to the Macleay she got 3s. 4d. a bag freight, because of the difficulty of navigation and the absence of other communication. It is all nonsense to talk about the North Coast railway relieving this district. It would never pay to send heavy produce by rail to Sydney. What they want is the improvement of their bar harbours.
817. What freight is paid upon maize sent from the Bellinger? I think the average freight on the Nambucca and Bellinger is from 4½d. to 5d. a bushel.
818. That is from the wharf? Yes.
819. And there is an additional charge for droghering? No; the whole freight from the Bellinger is at the present time about 4½d. a bushel.
820. *Mr. Lee.*] That includes droghering? Yes.
821. *Mr. Roberts.*] Do you regard that as a very liberal charge? I do not think there is room for competition with such a freight.
822. What is the freight for timber? For log timber it is 3s. per 100 feet.

823. Since the navigation of the Bellinger has been improved have the insurance charges been reduced? As a matter of fact, there is no insurance effected now on the North Coast in connection with sailing vessels, because, for some years past, there have been subsidised tug services. Tugs meet the sailing vessels, and tow them into and out of the rivers, reducing risk to a minimum. When I was connected with sailing vessels going to the district the average rate of insurance was 10 per cent. on the declared value. P. Hogan.
12 April, 1898.
824. What is the rate now? I do not know. I should think it would be about $1\frac{1}{2}$ or $1\frac{1}{4}$ per cent.
825. The rate for the Bellinger would be about the same as the rate for the Macleay? Yes.
826. Is the entrance to the Bellinger better than the entrance to the Macleay? I should think so; but no doubt the Government will succeed in making a good entrance to the Macleay.
827. Do you think there is any other way in which the people of the North Coast district could be as well served as by the improvement of their harbour? No. The only facility you can give them for getting their produce to market is by the construction of works like this which you are now considering.
828. Have you seen the plans of the surveyed railways from West Maitland to Taree and on to Grafton? No; but I know the country.
829. Of what use would such a railway be to the people of the district? It would facilitate their communication with Sydney, but I do not think it would carry the produce of the district. In the first place, the railway would have to go at the head of the rivers, and it would be next to impossible to take produce to it. In the next place, the railway charges would be too heavy to make it profitable for the people to send produce by it.
830. So that the line would be used only for passenger traffic? Yes; and for light and valuable produce. Heavy produce would not pay to send by railway.
831. What is the steamer fare from the Bellinger to Sydney? The single fare is 25s. first-class and 15s. second-class.
832. Are the fares the same to the other rivers? The passenger fare to the Clarence is lower, because the traffic is greater. The produce rates are less on the Clarence, because the trade is larger and the steamers can go right up the river and load at the various wharfs. The rate for maize is 9d. a bag from the Clarence, and 1s. 6d. a bag from the Bellinger.
833. Maize could not be sent from this district by rail so cheaply as by water? No.
834. Do you know what quantity of maize is shipped from the Bellinger each year? Last year 200,000 bushels of maize were grown on the Bellinger, and it was all shipped to Sydney.
835. Has there been an increase in the production during the last four years? No, not much; but this year being a very favourable one, 250,000 bushels of maize will be sent to Sydney from the Bellinger, and the production from the Nambucca and from the Macleay will probably exceed the ordinary annual production by about the same proportion.
836. Has the railway been surveyed through the Don Dorrigo country? I believe so. Only a railway would serve that country.
837. A railway from the New England table-land? Yes.
838. From what point should such a railway be brought? From any point on the Northern line. There are not many people in the Don Dorrigo district yet, but the land is very valuable. It is all but impossible, however, to bring produce from there to the Bellinger Valley for shipment to Sydney.
839. If a railway were taken to the Don Dorrigo country would it open up any market for the Bellinger maize? No; because they can grow maize in the Don Dorrigo district. There is no land on the Bellinger or on the Macleay better than the Don Dorrigo land. It is what is known as cedar scrub land, and is exactly on all fours with the Richmond River big scrub land.
840. Could any market be found for the Bellinger maize further to the west if such a railway were made? The Don Dorrigo country stands at an elevation of from 2,000 to 3,000 feet above the Bellinger district, so that you could hardly haul anything there from the Bellinger Valley. The only thing that is brought from the Don Dorrigo country to the Bellinger at the present time is cedar and other valuable timber, which is found there in great abundance. I have been up into the Don Dorrigo country, over the Government cutting, but it is very difficult to get there.
841. Is not the road good? Yes; but it is exceedingly steep.
842. How long is it? It would take you from six to seven hours to drive the distance in a buggy, and I suppose you would travel at about 3 miles an hour.
843. I suppose it would be 90 miles from the Northern line to the head of the Bellinger? I do not know exactly what the distance is, but I should think it would be close upon 100 miles from Armidale to Kempsey.
844. Which is the principal town upon the Bellinger? Bellingen is the Government township; then there is Fernmount, 3 miles further east; and there is also a pretty considerable settlement at the Heads, if you include the pilot station and the men working on the harbour works there.
845. Are the people in the district fairly prosperous? They are as well to do in a general way as in any place I know of. They are industrious, and they live on their own resources.
846. Are they making any experiments in dairying? Dairying is carried on there as on the Macleay and in other places. On all these rivers they go in for mixed farming—they milk, grow maize, rear pigs, and so on. Hence they are in a better position now than they used to be in the past.
847. Is much bacon curing done there? There is no factory on the Bellinger, but there is a large factory at Kempsey to which pigs are driven.
848. But the pigs are, as a rule, sent to Sydney alive? Yes; before the Kempsey factory was established they all came to Sydney.
849. Will the North Coast district ultimately become essentially a dairying district? Only on a limited scale. Of course, if they take land away from maize production it will shorten the supply of maize.
850. Which gives the better return, dairying or maize-growing? It depends upon the price at which maize is selling. I understand that it would take an acre to support a cow, whose produce would be worth £7 a year, while an acre of maize, yielding 40 bushels, would give a return at 3s. a bushel of £6 a year, but the labour of production would be less.
851. Is much cheese-making done on the North Coast? No; the cream is mostly sent to Sydney; but at the factories, of course, they make butter and cheese.
852. Do you see any reason why the North Coast district should not gain as good a reputation for cheese and bacon curing as the South Coast district? There is no reason why it should not.
- 853.

- P. Hogan.
12 April, 1898.
853. Is it not a fact that some of the butter produced in the North Coast district is looked upon in England with greater favour than any other Australian butter? I am told that no better butter can be produced than some of that made in the North Coast district. The grass on the Richmond is better for the production of cream than the ordinary grass, because the land there has been laid down with English grasses.
854. Has there been much loss at the Bellinger in connection with shipping? The losses there have been serious, and must represent a considerable figure. Not only have vessels been wrecked, but there has also been great loss of time through detentions.
855. Which is the most dreaded weather there? The most violent weather comes from the south-east; but the easterly weather is also bad.
856. When is the bar at its best—in winter during the prevalence of westerly gales, or in summer when north-easterly winds are blowing? There is no trouble at all now, but in the past north-easterly weather used to wash the sand on to the bar.
857. Therefore the bar used to be best during the winter? Yes. When these works are finished, however, the scour will be sufficient to make a perpetually deep channel.
858. *Mr. Clarke.*] You have stated that the rate of freight is now 1s. 6d. a bag;—do you think that the freight will be reduced when it becomes possible to take vessels into the river drawing 8 or 10 feet of water? The company say that they will then make a reduction in the freight.
859. To what extent? I should not think it would be less than 25 per cent. if the ocean steamers are enabled to go in safely, and load up fully.

WEDNESDAY, 20 APRIL, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Bellinger River.

Frederick Thomas Matthews, sworn, and examined:—

- F. T. Matthews.
20 April, 1898.
860. *Chairman.*] You are a resident of the Bellinger River? Yes.
861. You have resided there for a number of years? For nearly twenty years.
862. *Mr. Clarke.*] What was the state of the bar during the last few years previous to the commencement of harbour works at the Bellinger? At times it was very bad indeed. During my residence on the Bellinger I have known ten weeks to elapse during which vessels were unable to cross in or out, owing to the shallowness of the bar.
863. That would greatly injure the trade of the district? Yes; I have known the farmers to take the maize out of their barns and burn it in order to give room for the new season's crops.
864. Since the commencement of the river improvement has the depth of the water on the bar increased, and the navigation of the entrance become easier? Up to about eighteen months ago the improvement of the bar was not very noticeable, but the crossings inside were very much better. Since November, 1897, however, there has been a marked improvement in the depth of water on the bar.
865. Has that been caused by the harbour works? Yes, undoubtedly.
866. I suppose you are aware that it is proposed to expend between £130,000 and £140,000 in improving the Bellinger entrance;—do you think that in the interests of the country that expenditure is justifiable? I am not an engineer, but from what I have seen of the results of the expenditure up to date I should not think that so large an additional expenditure was required.
867. You are not an engineer? No; but I have had a great deal of experience in connection with the Bellinger bar. I have seen it weekly, and sometimes almost daily.
868. Is the dredging of the river going on at the present time? Yes. I think I have been the largest shipper both inwards and outwards on the Bellinger for many years.
869. I suppose the river still requires dredging? Yes; all the northern rivers do. The floods periodically silt them up.
870. I suppose the dredges will be required even after the improvement of the entrance has been completed? I have noticed that where the training-walls have been constructed the scour has deepened the channel without any dredging. Near where the Government wharf is I have known it to be impossible to get an empty boat up at low tide, but now there are 12 or 13 feet of water there at low tide. The tide, too, rises much more rapidly, even at a distance of some miles up the river, than it used to do. The entrance is straighter.
871. What is the average value of the import trade of the Bellinger? I should say that it was between £35,000 and £40,000 per annum.
872. How many tons of goods are brought in? I should say from 150 to 180 tons a month.
873. About 20,000 tons a year? Yes.
874. What is the export trade? Last year about fifty-one bags of maize were sent away. In conversation with the pilot, who keeps a record, I learnt that 40,000 bags had been sent away, and the season at that time was not quite over.
875. What other produce comes from the district? Pigs, poultry, and eggs are shipped from the district. Probably 40,000 dozen eggs are sent away annually, and from 4,000 to 5,000 pigs. This exportation has increased largely of late owing to the improved shipping facilities.
876. I suppose that when maize is cheap more is consumed by the pigs than when it is bringing a better price? Well, it is only lately that the farmers there have gone in for exporting pigs.

F. T.
Mathews.
20 April, 1898.

877. Is that because of the better prices obtained for bacon? That may have had something to do with it; but I think that it is chiefly due to the improved shipping facilities. During the last eighteen months, the s.s. "Rosedale" has been trading to the port regularly. There have been some slight delays; but they have been owing to heavy weather outside, not to the want of water on the bar.

878. I suppose the depth of water on the bar will increase if the harbour works are continued? I think so, judging from the effect of the existing works.

879. *Chairman.*] Has the improvement of the bar been incidental to the carrying out of the harbour works, or merely contemporaneous with it? I think it has been incidental to it. The harbour works have created a channel in quite a different position from the old channel. The bar has been deepened, and the channel has moved 300 or 400 yards further north. For a time the bar was very bad; but since the influence of the diversion of water caused by the wall overcame the natural flow of the river there has been a good depth of water on the bar, and a straight entrance. The steamer has been coming in regularly, both by night and by day. I should think that the velocity of the tide has at least doubled since the training-wall was constructed.

880. *Mr. Clarke.*] Can you tell us what is the population of the district? There are about 430 electors in the Bellinger division of the Raleigh Electorate.

881. Would that represent a population of 1,600? Well, the families there are pretty large. In the Bostobrick division, which comprises the Don Dorrigo Scrub, there are fifty or sixty electors.

882. These people would be immediately benefited by the improvement of the river? Yes.

883. Do you think that the whole number to be benefited would exceed 2,000? I think that the population of the Bellinger is much more than 2,000, and I include the population of the Don Dorrigo country, whose outlet is the Bellinger. I think the whole population would be about 2,500.

884. If the improvements were carried out, do you think the population of the district would considerably increase in five or ten years? I think there is room for a considerable increase in population. In the Don Dorrigo Scrub alone there is sufficient country to support a much larger population than that already settled on the river. There is a far greater extent of good country there than there is on the Bellinger River. On the Bellinger there is a considerable area which would be used for dairying, if we had regular steam communication.

885. *Mr. Wright.*] What distance is the Don Dorrigo country from the Bellinger? From the point to which the droghers ply to the first selector on the top of the mountain the distance is 18½ miles. You enter the scrub immediately you reach the top of the mountain.

886. *Mr. Clarke.*] I suppose the Bellinger is the only outlet for the population of the Don Dorrigo? Yes; there is a very fair road now from the valley of the Bellinger to the top of the mountain, a distance of 7½ miles. The Government have expended about £11,000 on that road already.

887. There is a considerable quantity of good land in the district, apart from the land on the flats where the maize is grown? Yes.

888. Would that be taken up for dairying and grazing purposes? I think that the whole of the Don Dorrigo Scrub will be taken up for dairying. During the last twelve months 2,000 or 3,000 acres have been taken up there. Men have come across from the Richmond River scrub to take up land there.

889. I suppose that dairying is only in its infancy there, and is likely to increase? There is a very large area there which is admirably adapted for dairying. The climate is very suitable, and the country is well watered.

890. What is the elevation of the Don Dorrigo country? The average elevation would be from 2,500 feet to 2,800 feet. It is 2,800 feet where the road reaches the top of the mountain.

891. There would be frost there in the winter time? Yes, it is cold there in the winter.

892. Would that interfere with dairying? Of course, the winters there would be more severe than the winters on the Bellinger; but the climate is very suitable for the growth of English grasses, such as rye, which does particularly well, so that the cold has its advantages.

893. Would a North Coast railway suit the people of the Bellinger as well as the improvement of the river entrance? No; I do not think it would be possible for it to compete with water carriage if there were a good entrance. The distance to Sydney by rail would be between 300 and 400 miles, whereas the distance by water is only 230 miles. Judging by the rates charged on the Southern line for the carriage of grain, the railway rates that we should have to pay would be twice what we should have to pay for water carriage. Of course, there are some products which we should prefer to send by rail—live stock and perishable goods. There would also be a large passenger traffic by rail.

894. That would scarcely be sufficient to encourage the construction of the railway? Well, the Bellinger district alone would be a very small factor, so far as the railway receipts were concerned.

895. The same remark would apply to nearly all the other river districts? I suppose it would.

896. The proposed expenditure would give you better communication with Sydney and other parts of the Colony, and would bring about the reduction of freights by 25 per cent.? Undoubtedly it will lower the rates of freight; but the district has suffered not so much from the high freights as from the delays which the bad state of the entrance has caused. If we could get more speedy and regular communication, we should be willing to pay even a slightly-increased rate of freight.

897. What has been the chief cause of the delays you complain of? The bad state of the entrance, and of the crossings inside the bar.

898. *Mr. Lee.*] Are you in business? Yes.

899. Have you been in business for many years? Yes; ever since I have been in the district.

900. Have you noticed an increased demand for land in the district of late years? Yes; very recently a number of people have been looking for land there. Several of them have taken up land on the Don Dorrigo.

901. Of course the land along the river banks has been alienated for some years? For many years.

902. I suppose some of it is held under old grants? No; no land was taken up there before the passing of the Act of 1861.

903. Those who have taken up land there recently have had to go back from the river? Yes.

904. They have gone to the Don Dorrigo country? Yes, some of them.

905. Is the Bellinger the natural outlet for the Don Dorrigo country;—do you not think that some of that traffic will find its way to the Nambucca? No; it would be impossible for any of the Don Dorrigo trade to go to the Nambucca. The natural features of the country would prevent it. There are two or three mountain ranges between the two places.

F. T.
Matthews.
20 April 1898.

906. Of course there is some poor country between the Bellinger and the Don Dorrigo? The face of the mountain is poor; it is rugged, broken country. After you leave the fertile flats on the Bellinger you have to go $6\frac{1}{2}$ miles to get into the good country on the Don Dorrigo.
907. There is no land nearer than the Don Dorrigo country which can be compared with it? No.
908. As soon as that land is made available it will probably all be occupied? Yes.
909. At the present time a large part of it is a forest reserve? Yes; a large area has been kept as a cedar reserve. What people want to know is whether, if they go in for dairying there, they will be able to get regular steam communication with Sydney.
910. Up to what point on the river do the steamers go at the present time? Only about a mile inside the bar. Small droghers go up the river for about 25 miles.
911. Would the present state of things suit the residents if they were certain that it would continue? Yes.
912. Would it suit the settlers on the Don Dorrigo? Yes; there are settlers up the river who have to cart their maize a longer distance than some of the settlers on the Don Dorrigo.
913. Is there any other part of the district which would be settled if a certain port were given? There is a considerable area of land on what is known as the Little North Arm or the Never Never Creek. It is brush land; it is not adapted for maize-growing, but it would be very suitable for dairying. Two or three selectors have taken up some of the land within the last few weeks.
914. You spoke about maize being burnt by the farmers; was that not because the price in Sydney was so low that it would not pay them to send it away? No; maize was fetching 4s. and 5s. a bushel at the time, but they could not get their maize away. This happened some fifteen years ago. Of course, much of the maize was very much eaten by weevils, and it was necessary to clear it out to make room for the incoming crops. We had not regular steam communication then, and there were not many pigs on the river.
915. I suppose, that as a business man, you find it necessary to trade in maize? Yes; I am a large shipper of maize.
916. To deal in maize successfully you must have certain regular means of communication to enable you to take advantage of the market? Yes; maize perishes very quickly.
917. And fluctuates in price very much? Yes. A district which has not regular and speedy communication with Sydney is at a great disadvantage with another district which has good communication.
918. How does your district compare in importance with the Nambucca, the Manning, the Macleay, and the Hastings districts? Of course, the Bellinger district cannot compare in importance with either the Manning, the Macleay, or the Hastings districts. I do not think the quantity of maize grown on the Hastings is larger than that grown on the Bellinger; but the population of the Hastings is larger than the population of the Bellinger. As compared with Nambucca, our population is larger, and there is more room for development.
919. You seem to be firmly impressed with the opinion that your district has a future before it? Yes.
920. Do you think that, with proper facilities for getting to market, the population will in a few years nearly double itself? In the Don Dorrigo country alone, there is room for more than twice the present population of the Bellinger. I have been all through that country, and I have had experience of dairying in the South Coast districts.
921. I suppose there is no fear of the Don Dorrigo traffic going towards New England? No. The present railway is too far away. But if a line were made from Guyra to Coff's Harbour the Don Dorrigo traffic would go to Coff's Harbour, because such a line would go right through the middle of the Don Dorrigo country. That railway is the only prospective factor that would divert the trade from the Bellinger River.
922. Do you think that, if a better entrance were given you would have a better steamer service than you have now? That would naturally follow with the increased production.
923. Some people would rather ride to Sydney than travel by the coasting steamers? Yes; people who are not good sailors.
924. If you did not get a better steamship service the scheme would be a partial failure? Yes.
925. Do you think that the trade of the district is likely to increase in proportion with the increased facilities for shipment? Increased production generally means better shipping facilities. A steamship owner will not send his vessels to a port unless there is sufficient produce to be taken away to form a cargo. If we had regular steam communication there are many things we should produce which we do not produce now.
926. You think that if these works are carried out, you will be benefited by having your steamer freights greatly reduced? Yes, I think so. Our insurance rates have already been reduced from 25s per cent. to 17s. 6d. per cent, and a further reduction is in contemplation by the insurance companies.
927. Will you be in a position in the future to pay harbour dues on these northern rivers? If all the other rivers in the Colony are charged tonnage rates, I think it will be only fair and equitable to make a similar charge on us; but I do not think we should be the only place to pay tonnage dues.
928. If tonnage dues were charged on all the rivers, you would be able to pay them? Yes, if all the other districts were similarly treated.
929. You have been agitating for harbour improvements for a very long time? Ever since I have been living on the river I have been one of the agitators.
930. Have you any opinion to express in regard to the Departmental design? I am not an engineer; but it seems to me that the work so far carried out has been very well done.
931. It has fully answered its purpose? Yes.
932. You have no reason to take exception to the Departmental proposal? No. I should like to point out, however, that I fear there is a possibility of the river breaking out 2 or 3 miles to the north of the present entrance. The width of that long spit of land has decreased by one-half at the point I refer to since I have known it.

FRIDAY, 6 MAY, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).	
The Hon. CHARLES JAMES ROBERTS, C.M.G.	CHARLES ALFRED LEE, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.
HENRY CLARKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.	

The Committee further considered the proposed Harbour Works at Bellinger River.

Alderman Francis Buckle, steam-tug proprietor, sworn, and examined:—

933. *Mr. Lee.*] You have a personal knowledge of the Bellinger River? Yes, for fifteen years.
934. Have you had the contract for the steam-tug service all that time? Nearly. I lost the contract for a few years, but I got it back again.
935. You think that something is required to be done to improve that entrance? Yes.
936. If a safe entrance could be made, suitable for ordinary-going steamers and, perhaps, for steamers of a larger draught, you think it would be a very great convenience to the settlers in the district? Yes, very great.
937. You are thoroughly acquainted with all the North Coast rivers? With a good many of them.
938. Possibly some years ahead a railway may be made along the North Coast, say from Maitland to the Clarence? Yes.
939. When it is made would not the bulk of the stuff go by the railway and thus render the ports partly useless? It might; but my experience is that railway carriage is not equal to water carriage.
940. Do you think that the residents of these rivers, if given fair steamers which are fairly navigable in all weathers, will be able to send their stuff by railway as cheaply as they can by steamer? I do not think so.
941. Do you anticipate that if these works are carried out the immediate benefit to the settlers will be a reduction in freight? I think so.
942. Suppose the construction of the works should not result in a reduced freight to the settler, it would afford very little relief to him? There would be a reduction in freight. Larger steamers would come, and they would be able to carry produce for less money, and their profits would be still larger.
943. Are you clear in your mind about that? Perfectly clear.
944. If the rivers are made navigable, naturally large steamers will trade there, carry larger cargoes and charge less freight? The freights must come down if they can get their steamers into these rivers. The "Rosedale" is about the largest steamer which can get in. I think she takes about 1,500 bags—that is about 150 tons—and that on a very shallow draught too.
945. You are aware that it is proposed to improve the bars on two other rivers than the three you have been examined about this afternoon? Yes.
946. The total cost of these harbour improvements will be very large;—if the settlers are going to have the benefit of reduced freights do you not think it would be a reasonable thing for the State to impose a small rate to cover the interest on the outlay? It would not be hard for the Government to try that plan. The work at the Clarence is finished; they know what it has cost and what they can get from it.
947. It would not be fair to impose a rate on one particular river, but inasmuch as the Government is going to improve the entrances to all these rivers, and thus improve the value of property, would it not be a reasonable thing for the State to impose a small tonnage rate on the exports from the rivers, say, so much per bag of maize? To be very candid, I do not think that any one of the rivers will ever be in a position to pay one farthing, or anything like 3 per cent. interest on the capital cost of the works.
948. Why do you think so? We all know that if a Member for a constituency wants a new road he torments the Government till he gets it. I would like to see the Government trying to put a tax on the products of the country. The first cry would be that the Government was going to ruin the country. We know that the settlers would not stand an export duty on their maize.
949. Suppose the freight on maize to-day from the Bellinger was 1s. a bag, and that, with an improved port, it was reduced to 9d., if a local export duty of 1d. a bag were put on for the purpose I mentioned, would not the producers be better off than they are at the present time? Certainly.
950. Would they object to pay the duty under those circumstances? Certainly.
951. Do you not think it is an objection which should be overcome? That is quite right.
952. Considering that wharfage rates or tonnage rates are charged on ships at the various ports of the Colony, why should these river ports be made an exception to the rule? They should pay tonnage dues in every port they go to. If you put a tax on a ship, which she cannot make up, she must charge more freight.
953. If a tax, not a burdensome one, is put on the cargo, not on the ship, it will only be payment by results? Exactly. It might be done, but I am very dubious about it. There is no doubt that when a harbour is made fit for any ship to come in, we ought to pay a small charge. I am sure they would not object to pay a small charge.
954. You approve of the principle that some charge should be made, even if it were only sufficient to maintain the works? Yes. I think if a ship can get in to a port to-day and out to-morrow she has a right to pay something.
955. They would save money if they could? Certainly. If the rivers were in good order, on many occasions vessels would sail in and sail out, and as they would not require to pay any towage, they could afford to pay harbour dues.
956. Do you think these northern rivers are going to sustain their present population? I think it will be doubled if they can get their produce away.
957. Do you think they will go on producing the same kind of agricultural products, and yet be able to make a sufficient living? I would not like to say that. We have so many changes here. A short time ago we had a great sugar industry on the Clarence and the Richmond, but now the cane-growers are producing milk. The same thing might take place in regard to the maize-growers.

F. Buckle.
6 May, 1898.

- F. Buckle. 958. Maize has been grown there for a great many years under all conditions—with fiscal assistance and without it? Yes.
- 6 May, 1898. 959. It would appear that they are able to compete with others under any conditions? Yes.
960. Do you think these conditions are likely to continue? I think so.
961. Do you think the land is likely to become so exhausted that the crops will fall back. I do not think so. If the farmers will cultivate the land as they should they will always get good crops. The trouble is that so long as they can get enough money to carry on with, they will not cultivate. If the people of England, Ireland, and Scotland were to work their lands in the same way as our people work theirs, they would not see their rents; they would not get a bite to eat.
962. Do you think that the construction of these harbour works will lead to further settlement and development? I believe it will. If something is not done to improve these rivers, the people must leave and be ruined. If the water is shallow up the river, they get punts to bring their stuff down to the wharf. All the trouble is at the mouth of the rivers. If you improve the entrances to the rivers, no doubt many men will go down there and settle on the land; but they must work. When I advocate the construction of these harbour works, I am thinking, not of to-day at all, but of the future.

THURSDAY, 19 MAY, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Harbour Works at Bellinger River.

Henry Richard Carleton, Principal Assistant Engineer, Harbours and Rivers Branch, Department of Public Works, sworn, and examined:—

- H. R. Carleton. 963. *Mr. Wright.*] What work have you already done on the Bellinger River? The work which is shown by black lines on the plan; in fact, somewhat more than is shown on the plan is constructed. The temporary bank on the eastern side is almost filled in; we are doing that with the sand-pump.
- 19 May, 1898. 964. What is the object of the bank? It is to drive the water out into this channel. The training-wall leading to the northern breakwater is also in place.
965. What effect have these works had on the river? To put it as concisely as possible, the ocean-steamer can go direct to the wharf now at almost any time. Before we commenced the work we could not reach the wharf at all.
966. Where is the wharf? At the junction of the two arms.
967. What depth of water have you there now? Along the wall it runs 9 feet, 12 feet, 9 feet, 7 feet, 9 feet 3 inches, 13 feet, 15 feet, 15 feet, 20 feet, 16 feet, 11 feet, 10 feet, 8 feet 3 inches, 6 feet 6 inches, 5 feet 9 inches, 6 feet 6 inches, 7 feet 9 inches, and 10 feet.
968. The effect of the work has been to give the channel along the toe of the bank? Yes.
969. How wide is it? From 150 to 200 feet.
970. Quite wide enough for navigation purposes? Quite wide enough. Formerly the river used to wind about in the southern bay.
971. You have got a bit of wall constructed below the junction of Black Creek? That is extended nearly to the junction of the two arms.
972. How much money have you spent there? £29,985.
973. Out of various loans represented by £33,000? Yes.
974. How much additional money is required according to your plan to complete the work? £36,000.
975. Would £36,000 complete the whole of the work? All that is shown by full red lines.
976. It will not complete either breakwater? No.
977. It will not complete the training-wall on either side of the North Arm? That is not included in the scheme before the Committee.
978. What is the proposed expenditure on the additional work which is shown by dotted red lines? The completed scheme is estimated to cost £171,000.
979. You think that with an expenditure of £36,000 you can make a fairly good harbour? It is very much improved as it is. There is very little delay there now. The bar does silt up, but it does not remain shallow for any length of time. You get a good run along the wall, and it soon cuts out again. The periods of delay are very much less than they were.
980. The ocean current, I suppose, helps very largely to remove it? That helps it, and it is swept out.
981. Before the construction of these works you had a very wide entrance? Yes. We were handicapped. We had no headland on either side, and we were rather afraid of it on that account, but the results so far are very pleasing.
982. The entrance was practically several miles wide? It ranges over that distance. It is pretty well fixed now since the training-wall has been constructed.
983. Is there any necessity to continue that wall to the point of both arms of the river;—what is the special object to be obtained by the construction of that piece? So that the two currents will meet at a sharp angle and will not injure one another. If that point were not there they might meet one another and neutralise the current.
984. What, in your opinion, is the order in which this work should be constructed to produce the best results? There is very little left but the northern training-wall now to carry out. That is the one which should be pushed on, and a slight extension of the southern wall if our stone is sufficiently good. We are getting now into rather rough water, and it is doubtful whether the stone we are using there is sufficiently good for it.
985. How much further do you propose to extend the southern wall? I think it is 300 or 400 feet.

H. R.
Carleton.

19 May, 1898.

986. That will almost complete it to the end of the breakwater? No, it will complete half that breakwater.
987. That is not included in the sum of £36,000? No.
988. What stone are you using now? It is something like the same formation as we are getting at the Nambucca. It is a slate which is obtained from a reserve 7 miles up the South Arm. It is brought down by punt.
989. Is the stone deteriorating or improving in quality? It is remaining about the same. The contractor maintains that it is improving. I doubt if there is much variation in the quality of it. It never was good.
990. What is your impression of its durability in the water? It gets a kind of weed on it, and as long as that weed is on it it cannot be eroding. It is standing fairly well. We might get a few 4-ton blocks out of the quarry, but that is not enough. If you go out into broken water you want heavy stone.
991. If you do get into rough water where do you propose to get the heavy stone? If I had had time when I was up there a few weeks ago I would have hunted round the country for better stone. There is a creek called Pigott Hill Creek which runs into the South Arm just opposite the quarry. It leads up to what is called the Bellinger Peak. I know that mountain is granite. The creek is not navigable for any great distance, but it would not be costly to make it navigable for punts. If we had a good quarry I am sure the contractor would be only too glad to be allowed to go there.
992. Suppose you failed to find suitable stone, what would be the result then? We will only have to do inside work. We cannot do any outside work with it, but it is quite good enough for training-walls. I would not be responsible for a breakwater which was built out of it.
993. If you have to go further to get suitable stone for the breakwater, there is a possibility of the cost of construction being considerably increased? I do not think so. I am inclined to think we shall get good stone in the direction I indicated.
994. But suppose you find stone which will involve the expense of land carriage also? In estimating for the breakwater we allowed an increased rate per ton. Our contract rate for the stone which is being used in the training-walls is 3s. 9d., but in estimating for the breakwaters at the Bellinger we allowed as high as 6s.
995. If you have to go much further afield for the stone, that amount will cover the cost? Yes, we can go a long way for 6s. a ton.
996. It ought to be sufficient to cover anything in the shape of land carriage? A farthing per ton per mile would cover the towage.
997. You might have to construct a tramway? We shall try as much as possible to get stone near the water.
998. Even if you have to build a tramway the margin you have left would be sufficient? Quite sufficient.
999. In the event of no suitable stone being found for the breakwaters, what effect would it have on the works;—your works would have to stop? Yes.
1000. Under these circumstances would you have a decent entrance? Yes; it is very much improved by one wall.
1001. You feel satisfied that even the construction of the northern wall and the training-wall at the junction of the two arms, would give you a fairly good entrance, putting the breakwaters on one side? I think so.
1002. Is there any necessity to build that very long length of training-wall on the eastern and western side? I think not. We contemplated facing the work there at one time.
1003. Do you think the necessity is ever likely to arise for the prolongation of those walls? Not for many years to come.
1004. What is the river above the point shown on the plan? There is good water up the South Arm for 6 or 7 miles up to the quarry, which is about the head of navigation.
1005. Where is the largest population? Up the North Arm, at Fernmount and Bellingen. Fernmount is 9 miles from the Heads, and Bellingen 13½.
1006. Is it navigable water to both places? To Fernmount, but not to Bellingen.
1007. What may we consider the minimum depth of water in the shallow portions, between the Heads and Fernmount? About 6 feet.
1008. I suppose the traffic on the river is done entirely by droghers? Yes, the "Rosedale" does not go beyond the wharf.
1009. Is 6 feet a sufficient depth for the droghers which are used, or which are likely to be used, on the rivers? I think if we had a good entrance there would not be much difficulty in cutting out a few shallow places in the river, so as to enable the steamer to go up to Fernmount. There is not much settlement on the navigable portion of the South Arm.
1010. Is it deep all the way in Back Creek? It carries about 6 feet. We dredged it out once or twice. We cannot make it any deeper. There is one bar of rock with 6 feet of water on it.
1011. Is it proposed to leave that open? I do not think we will do anything with it. If it is not touched the mouth of it will silt up of itself.
1012. That would give you a bigger volume of water down the main Arm? Yes.
1013. If £36,000 is spent, the result you think will be to give a good entrance to the river? I think it will.
1014. *Chairman.*] Is there anything which you desire to add? No; unless to emphasise the fact that the Trial Bay breakwater is costing far more than any other work on the coast.
1015. *Mr. Wright.*] So far as its utility as a national work is concerned, it is simply wasting money? I do not see any necessity for it now. It is a very costly work. It is a remarkable thing that it costs 5s. 6d. a ton for the stone which is used in that breakwater.

WEDNESDAY, 15 JUNE, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Bellinger River.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and further examined:—

C. W. Darley. 1016. *Mr. Farnell.*] With regard to the entrance to the Bellinger River, and the alleged danger of the river breaking out at a certain point, towards the end of the eastern training-wall, some of the residents seem to think that the river is very likely to break out there in flood time, and it was suggested that the training-wall should be started, therefore, at a point further up? I do not think there is very much in that contention. Of course, it is very hard to say what a big flood will do. We know that they do break out in the case of many of these rivers, but the openings repeatedly close up again. I have no doubt that the main entrance will be maintained close to where we are forcing it. I gave the local officer instructions to watch the first opportunity to put up some brush fencing at one or two points, which would have the effect of raising the sand where there is a danger of an outbreak in time of flood. The brush fencing catches the sand, and the fence is raised from time to time, and in that way a barrier is created.

15 June, 1898. 1017. You are constructing a temporary bank at one point shown on the plan;—do you think there is much possibility of the river breaking through that bank? Instead of going on with the long wall that cheaper work was undertaken. The bank has been raised with silt from the dredge. It is intended to face it with stone in order to enable it to withstand the action of the flood, and we shall then go on with the wall.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

HARBOUR WORKS AT BELLINGER RIVER.

REPORT.

THE Sectional Committee, consisting of Messrs. C. A. Lee (Chairman), H. Clarke, F. Farnell, the Hon. C. J. Roberts, and the Hon. W. J. Trickett, appointed on Thursday, 12th May, 1898, to "inspect, take evidence, and report with reference to the proposed Harbour Works at Bellinger River," left Sydney on Tuesday, 19th May. The Committee reached Grafton on the following Thursday, and on Monday, 23rd May, they proceeded by special coach, *via* Woolgoolga, to Coff's Harbour, where they arrived next morning. They opened their inquiry at Coff's Harbour on the 25th, and continuing their journey on Thursday, 26th May, they visited and took evidence at Bellinger, Fernmount, and the Bellinger Heads. Here they concluded the examination of witnesses and made a thorough examination of the works now in progress. They visited the quarry at Picket Hill, on the South Arm of the river, from which the stone for the training-wall is obtained, and carefully examined the sites of the proposed walls and protecting banks. They returned by way of the Nambucca and the Macleay, and reached Sydney on Friday, 10th June.

1. During the inquiry the following witnesses were examined:—At Coff's Harbour, Messrs. James Gill, caretaker of the Government jetty; James Marles, storekeeper; William Crabb, manager of the Beacon Gold-mine, Bucca Creek; Eugene Frederick Rudder, farmer, Coramba; and Henry Boulwood, journalist, Fernmount. At Bellinger, Messrs. J. T. Greer, farmer; David Anderson, farmer and maize-buyer; Edward Raymond, wheelwright and coachbuilder; Fred. Doepel, shipbuilder, drogher-master, and local agent for the North Coast S.S. Co.; J. E. Tyler, farmer and grazier, Guy Fawkes; Robert Taylor Thorburn, Nowra; and Fred. T. Matthews, storekeeper. At Fernmount, W. R. Spillett, farmer; A. Black, hotelkeeper, F. R. A. Baker, auctioneer, R. S. MacDougall, and James Pollock, cordial and aerated water manufacturer. At the Bellinger Heads, D. Houison, District Engineer in charge of the Bellinger Harbour Works, W. D. Higgins, Government Inspector of Works, A. E. Ellis, saw-mill proprietor and storekeeper, and T. K. Ratcliffe, pilot and telephone master. Messrs. R. S. MacDougall and A. Black were further examined.

2. Evidence was sought upon, and a thorough investigation made into, all matters relating to the subject referred to the Committee for consideration. Statements as to the present and future trade of the district, its natural resources and possibilities of development, the advantage which would attend the success of the proposed works and their probable efficiency, were obtained from the most reliable sources available, and the Committee spared no pains in the prosecution of an exhaustive and searching inquiry.

3. The Bellinger valley is exceedingly fertile, and capable of supporting a large population. Large crops of maize are grown upon the rich alluvial flats which form its banks; the higher ground, while slightly inferior in quality, is, when cleared, admirably suited for the pasturage of dairy cattle, and excellent hardwood is everywhere exceedingly plentiful. At the present time the staple products of the district

district are maize and timber; the export of maize during 1897 amounted to 51,518 bags, while, in the same period, 587,314 feet of hardwood and 87,774 feet of cedar were shipped to Sydney. The dairying industry is yet in its infancy, and its improvement is retarded by the delays and inconvenience which attend the shipment of cream and butter to the metropolis, but large tracts of country are being cleared and made ready for dairying by the selectors on the land, and inquiries for suitable ground are constantly made by persons desiring to settle in the district and embark in this enterprise. Poultry, eggs, and pigs are sent from the river as opportunity offers, and a tabulated statement of the yearly exports for the years 1892 to 1897, inclusive, shows an increase in every department of production.

4. It was suggested at an early stage of the inquiry by the main Committee that the proposed expenditure could be saved, and the district well served, by the construction of a light line of railway which would connect some point upon the Bellinger with the deep waters of Coff's Harbour. This suggestion was not favourably entertained by the residents of the district, and it was pointed out by them that a railway would render little or no assistance to its development. The rates of freight are now considered excessive, and farmers would find it impossible to pay railway charges in addition to shipping rates, while produce would deteriorate because of the frequent handling. During the occurrence of continuous bad weather upon the coast, or the shoaling of the bar, perishable commodities might be sent by rail in order to reach the market quickly; but under normal conditions shippers would avail themselves of the steamers trading direct to the river, and the railway would be unsupported. To these objections to railway construction the Committee would add that, in their opinion, the cost of even the cheapest line would greatly exceed the estimated cost of the proposed harbour improvements.

5. While on the Clarence the Committee took advantage of the opportunity to inspect the harbour works at the entrance of that river, and they were greatly impressed by the object lesson thus afforded of the value of training-walls in guiding and confining the waters of the river, and the utilisation of the scour thus created in the deepening and straightening of the channel. At the Bellinger almost the whole of the southern training-wall has been completed, and the improvement of the bar which has already resulted justifies the Committee in believing that complete success will attend the carrying out of the scheme submitted by the Engineer-in-Chief. The increase of scour which it will bring about will, it is believed, remove almost all difficulties in the way of safe and easy navigation, and will give a sufficient depth of water to enable vessels suited to the trade of the district to visit the port. For these reasons the Committee recommend that the proposed works be carried out.

CHARLES A. LEE,
Chairman.

Kempsey, 7th June, 1898.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

HARBOUR WORKS AT BELLINGER RIVER.

[TAKEN BEFORE THE SECTIONAL COMMITTEE.]

WEDNESDAY, 25 MAY, 1898.

[The Sectional Committee met at the "Cricketers' Arms Hotel," Coff's Harbour, at 10 a.m.]

Present:—

CHARLES ALFRED LEE, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G. |

HENRY CLARKE, Esq.

FRANK FARNELL, Esq.

The Sectional Committee proceeded to consider the expediency of constructing proposed Harbour Works at Bellinger River.

James Gill, caretaker, Coff's Harbour Jetty, sworn, and examined:—

1. *Chairman.*] How long have you held your present position? Nearly six years.
2. Are you in a position to give the Committee information as to the exports and imports of Coff's Harbour? Yes; I have the figures in my books.
3. Do your books cover the whole of the period during which you have been here? Yes.
4. Will you give us the figures for the first year that you were here? I may state that the first wharfinger was a brother of mine. He was in charge of the jetty from March to July, 1892.
5. Still, the figures for the year are complete? The first entry is dated March 22nd.
6. Do your books show the amounts collected, or the value of the articles exported and imported? They show the value of the articles exported and imported, and the amount of revenue obtained by the Government.
7. Will you tell us the chief items of export during 1892? Maize, sugar—sugar, unfortunately, has fallen off since—cedar, hides, tallow, spokes, poultry, eggs, and pigs.
8. No hardwood was sent away that year? No.
9. Can you give us the value of those exports? No. The only figures I have here relate to the amount of revenue collected by the Government.
10. What were the inward cargoes during 1892? They consisted of general groceries, flour, sugar, potatoes, and stores of that kind. Machinery, too, was imported. We have both exported and imported potatoes.
11. During 1892, how many visits had you from steamers? Seventy-five.
12. Does that number include both steamers going north and steamers going south? Yes.
13. Can you tell us the total weight of the exports and imports of the year? I take it that the imports averaged 10 tons a week, and the imports about the same.
14. Twenty tons of wheat altogether? Yes.
15. Now we come to the year 1893;—if there was any special item of imports or exports that year, you may mention it? In the early part of 1893, 5 tons of machinery were imported, while a large quantity of sawn timber was exported. On the 9th January, 1893, 2,924 feet of timber were exported.
16. Was there an increase in the trade of the district in that year? There has been an increase each year, without doubt. Pine logs and hardwood—sawn timber—were exported in 1893. From May, 1893, I can give you precise figures. The first entry that appears in the cash-book is 6s. 9d. for wharfage dues. Tonnage dues are levied on the steamship companies for the right to come alongside the jetties, while wharfage dues are levied upon every article landed on the jetty.
17. What are the tonnage dues? At that time 10s. was charged for any part of twenty-four hours; but this year the charge has been reduced to 2s. 6d. for the first six hours, 5s. for the first twelve hours, 7s. 6d. for eighteen hours, and 10s. for twenty-four hours.
18. A fixed sum is charged for each vessel, not so much per ton? That is so.
19. Do these charges meet with public approval? So far as I know, they do. I have never had any complaint.
20. Now, as to the year 1894? The business of the port still went on increasing. There was a large increase in 1894.
21. What about 1895? There has been a gradual increase every year up to the present time.
22. Does the year 1898 seem likely to show a larger return than any previous year? Yes.

J. Gill.
25 May, 1898.

- J. Gill.
25 May, 1898.
23. What was the amount collected in January, 1897, from wharfage and tonnage dues? In the first week of January, 1897, the return was £2 1s. 8d.
24. What was the return in the same week of January, 1898? £5 9s. 11d. In the second week of January, 1897, the return was £1 4s. 7d., as against £2 13s. in the same week of January, 1898. The return for the third week of January, 1897, was 13s. 4d., as against £1 12s. 4d. in 1898; for the fourth week 17s. 7d., as against £1 12s. 1d.; and for the fifth week—which, of course, runs into February—£3 4s. 9d., as against £6 8s. 10d.
25. Do any sailing vessels come here? No.
26. Has there been an increase in the number of steamers coming here? Yes. We have now a regular weekly service, and another steamer makes about three trips a month to take away timber.
27. Where is the maize grown which is exported from Coff's Harbour? On the Orara. In 1896 a large quantity of maize came from the Bellinger, because the Bellinger bar was closed.
28. What do you call a large quantity? 3,970 bags; 296 pigs also came from the Bellinger in that year.
29. Has the passenger traffic gradually increased? Yes.
30. Has that been in consequence of an improvement in the class of steamers running here? Yes.
31. Were the Bucca Creek mines in existence when you came here? No.
32. Did not the opening up of those mines cause a large increase in the business of this place? It has done so during the last year. The gold obtained in those mines is shipped from here to Sydney every month. The mines have led to an increase in the passenger trade.
33. And in other trades too? Yes.
34. Was the machinery used in the mines landed at Coff's Harbour? No; but all the material that is required there now is landed here.
35. When did the local sawmill commence work? In the early part of 1897; but there was not so much timber cut then as is being cut now.
36. Do you know whether any of the timber, sent away from here, goes to foreign parts? Yes.
37. Is it used for wood-blocking? Yes, and timber has been sent from here to Marseilles and London for the building of railway trucks.
38. Have you ever known a steamer to be prevented from crossing the Bellinger bar and then to come on to Coff's Harbour? The Belmore could not cross the Bellinger bar, and came round here for shelter; but eventually the captain had to beach her.
39. When steamers are unable to cross the Bellinger Bar, do they come on to Coff's Harbour to discharge passengers and cargo? No; that is never done. A schooner bound for the Bellinger at one time sheltered under the island here for three or four days.
40. How many times a year have you known the steamers to be unable to come alongside the jetties here? During my time, I do not think the boat has passed the jetty three times—that is, in six years. The boats which trade here trade also to Woolgoolga and Byron Bay, and when they come alongside this jetty it is also impossible for them to go alongside either of the other jetties.
41. I suppose in leaving Sydney they are guided a good deal as to their movements by the conditions of the weather? Yes.
42. If a gale sprang up could a steamer come alongside this jetty? It would have to be a very heavy gale to prevent her from discharging at the jetty.
43. But, during the prevalence of certain winds, steamers cannot lie alongside this jetty? A heavy south-east gale will prevent them from doing so.
44. In your opinion, the trade of the port is conducted with a great deal of regularity? Yes.
45. To what do you attribute that? To the goodness of the port—to the shelter afforded by the island, and the headland to the south.
46. Do you think there is a prospect of an increase in the trade of the port? The trade is increasing every year.
47. Is there sufficient water alongside the jetty at low tide to enable vessels to lie there? There is 21 feet of water at low tide where the boats berth.
48. What do you think would be most advantageous to the country—for the Government to carry out the proposed harbour works at the Bellinger Rivers, or to make a railway from the Bellinger here and improve Coff's Harbour? I should not like to answer that question.
49. The district round Coff's Harbour contains a very large quantity of good hardwood? Yes; there is an abundance of it.
50. Consequently, you look forward to large shipments of hardwood from Coff's Harbour? Yes. Unfortunately for us, we are isolated, and cannot communicate directly with Sydney, and it sometimes happens that, although the sea at the Bellinger Heads may be reported rough, it is quite smooth here.
51. The steamers which trade to the rivers and bays along this coast have to regulate their trips according to the weather? I do not think they need do that so far as Coff's Harbour is concerned.
52. But they have to do so in regard to the rivers? Yes.
53. Has a steamer ever had to let go her moorings and get away from the jetty because of bad weather coming on? Not since they have moored to the jetty.
54. Is there any other way they can moor now;—have not the moorings put down by the Government gone ashore? Yes; but they can let out their anchors.
55. We have been informed that the moorings were sent adrift during some very rough weather? Yes.
56. *Mr. Farnell.*] I suppose moorings only have a certain life? They want to be looked to regularly. These buoys were put down and nothing was done to them afterwards. The captains have asked to have them replaced, and I have reported that it would be of advantage to the harbour to have them replaced.
57. *Mr. Roberts.*] What are the dimensions of the jetty? Its length is 1,650 feet, and its width about 21 feet. I believe that it is about 150 feet shorter than the Woolgoolga jetty.
58. And about the same width? That jetty is wider at the outer end than this jetty.
59. Can you tell us the cost of the Coff's Harbour jetty? No.
60. In which item of export has there been the most marked increase since you have been here? In maize.
61. Has there been a large increase in the shipments of timber? Yes, a very large increase. During the first three months of this year something like 100,000 feet of timber went from here.

62. Can you give us any figures showing the increase of the maize export? I hand in figures showing the amount of the exports, and the value and quantity of the imports, from the years 1892 to 1897. They are as follows:—

J. Gill.
25 May, 1898.

1892.				1895.			
Exports—				Exports—			
Maize	149 bags.	Maize	1,998 bags.
Pigs	324	Pigs	410
Hides	139	Hides	200
Timber	20,724 ft.	Timber	90,000 ft.
Sugar	1,604 bags	Sugar	1,600 bags.
Oysters	18 "	Poultry	90 coops.
Eggs	90 cases.	Eggs	200 cases.
Spokes	5,000	Imports—255 tons.			
Poultry	29 coops.	Revenue—£106 5s. 4d.			
Passengers	10				
Sundries	60 packages.				
Imports—11 months, 110 tons.							
Revenue—£51 13s. 4d.							

1893.				1896.			
Exports—				Exports—			
Maize	700 bags.	Maize	5,560 bags.
Pigs	401	Pigs	550
Hides	112	Hides	250
Timber	21,500 ft.	Timber	50,000 ft.
Sugar	1,700 bags.	Hides	210
Spokes	3,000	Poultry	110 coops.
Poultry	32 coops.	Eggs	310 cases.
Passengers	15	Imports—300 tons.			
Sundries	80 packages.	Revenue—£164 10s.			
Eggs	100 cases.				
Imports—12 months, 200 tons.							
Revenue—£80.							

1894.				1897.			
Exports—				Exports—			
Maize	1,100 bags.	Maize	2,500 bags.
Pigs	410	Pigs	450
Hides	200	Hides	300
Timber	2,200 ft.	Timber	224,691 ft.
Sugar	1,400 bags.	Hides	200
Timber	81,000 ft.	Poultry	110 coops.
Sugar	1,000 bags.	Eggs	290 cases.
Poultry	45 coops.	Imports—350 tons.			
Eggs	110 cases.	Revenue—£169 8s. 8d.			
Passengers	50				
Imports—250 tons.							
Revenue—£90 18s. 5d.							

63. Has any maize come here from the Bellinger since 1896? No.

64. How much water was there on the Bellinger bar when the people were unable to send their produce from that river? I think about 4 feet; but I am not certain.

65. Was the bar in that condition long? Yes; but I do not know how long.

66. How far does the maize come to be shipped at Coff's Harbour? Some of it comes from Nana Glen, about 16 miles from here.

67. I suppose it is perfectly safe to land at this jetty unless the wind is from the east? Yes; an easterly gale is the only weather that affects the jetty. During the six years I have been here we have only had two heavy easterly gales, one last year and one this.

68. An easterly gale would affect every harbour upon the coast? Yes.

69. Are the people of the district well satisfied with the loading appliances at the jetty, and with the charges made? I have not heard any expressions of discontent.

70. The jetty affords them every facility for the export and import of goods? Yes.

James Marles, storekeeper, Coff's Harbour, sworn, and examined:—

71. *Chairman.*] How long have you been residing here? Since 1880.

72. *Mr. Clarke.*] How long have you been engaged in the business of a storekeeper? Between six and seven years.

73. What were you doing before that? I was a selector. By trade I am an engineer.

74. You are able to give us some information as to the capabilities of the district? Yes, and I have here a short statement which I would like to read. It is as follows:—

J. Marles.
25 May, 1898.

To the Sectional Committee of the Public Works Committee, sitting at Coff's Harbour.

Gentlemen,

I beg to submit the following brief history and summary of facts relating to the port of Coff's Harbour and country within a radius of 17 miles:—

It was first occupied by selectors for the purpose of agriculture in 1880, although used for many years previously by timbers getters as a safe and easy place to ship timber.

The

J. Marles.
25 May, 1898.

The advent of farmers and development of mining industry caused the Government to erect a jetty, which was commenced in 1890, and finished February, 1892. There are within a radius of 15 miles not less than 200 farmers who depend on this port for access to the market. We have working for the various mining syndicates, and some on their own account, 150 men who draw their supplies from here. Their appliances consist of six batteries.

There is also one dairy factory worked by steam and five smaller separators in operation within the same distance. One sawmill is at work in close proximity to the jetty, and also one other within 3 miles.

The timber is of first-class quality, and in such quantity that years must elapse before it would be necessary to go back more than a short distance to procure logs.

The observation of this Committee will bear me out in this statement.

The port, to a great extent, is naturally protected, and if the Government decides to finish what nature has done much for, there is rock in practically unlimited quantities of good quality, a sample of which I will submit if this Committee require it.

The Progress Committee of this place have received communications from a section of the residents of the Bellinger River asking us to unite with them in praying the Government to construct a line connecting them with this port. Similar requests have come to the hands of our secretary from the Don Dorrigo, Guy Fawkes, and Guyra. And I trust that this Committee will recognise the fitness of this port to serve the places mentioned, and as the nearest and natural outlet for New England, and use their influence to cause the Government to improve this harbour so it may properly serve these places. Money thus spent will certainly be reproductive and for the advancement of New South Wales.

The data *re* number of farmers and miners is from my own ledgers, and probably under-estimated.

I might also add that seven years ago we only had a receiving office, and to-day we have an up-to-date post, telegraph, money order, and savings bank offices. The total amount of moneys remitted to Sydney, exclusive of moneys paid out in the district, amounted to £4,430 for the year 1897.

75. I presume that the trade of the district has increased from year to year? It has increased within the last six or seven years to seven times its original volume.

76. Both as regards imports and exports? Yes, and particularly so far as eggs and poultry are concerned. These may seem small lines, but they are of great importance to the district.

77. I thought that sawn timber was the principal export? I think the export of farm produce is greater than the export of timber, and I believe that in value the export of gold exceeds the export of timber.

78. But the gold exported would not bring much revenue to the Government in wharfage dues? No; but indirectly the gold-mines bring a good deal of revenue. They give employment to people who have to use the wharf.

79. These people increase the local consumption of goods of every description? Yes.

80. What rate of freight is charged from here to Sydney? £1 a ton deadweight.

81. What is the rate from Sydney here? Eighteen shillings for deadweight, and 1s. 6d. wharfage.

82. Do you get your goods from Sydney? Yes.

83. In what way? They are landed on the jetty here.

84. In no other way? No.

85. Then you should know exactly what the freight is? The freight is what I have told you. Cases are charged for according to measurement.

86. Would £1 a ton both ways cover the average freight? Yes.

87. If the port were improved by the construction of a breakwater, would vessels be able to carry goods to and from the harbour at lower rates? If the harbour were improved the rate would not be more than 9s. 6d. a ton. The rate charged on the Clarence is 1s. a ton, and we are much nearer Sydney.

88. But any breakwater would be very expensive? I think its cost would be small in comparison with the good it would do. Suitable material can be obtained at both the north and south headlands.

89. What is the depth of water between the southern headland and the island opposite? I cannot tell you; but a P. and O. boat could enter the bay.

90. A great depth of water would make a breakwater very expensive? Well, on the north side there is a reef which would be of great assistance in the construction of a breakwater.

91. Is it your opinion that a railway from the Bellinger to Coff's Harbour would answer the purposes of people residing on the Bellinger as well, if not better than, an improvement of the entrance to the Bellinger? I have stated that the opinion of a section of the residents there is that the improvement of Coff's Harbour would serve them better than the improvement of the Bellinger. Part of the country on the north arm of the Bellinger is nearer to Coff's Harbour than it is to the Bellinger Heads.

92. But a railway from the Bellinger to Coff's Harbour would not suit farmers residing on the south arm of the Bellinger? I am not able to say.

93. Would it not be very expensive to them to punt their stuff across the river and put it into railway trucks? Our contention that Coff's Harbour should be improved is not based upon the necessities of the Bellinger district, but upon the necessity of the Don Dorrigo, the Upper Orara, and our own district.

94. Does the produce of the Orara all come this way, or does some of it go to Grafton? It all comes this way.

95. You think that a railway is required to open the country between Don Dorrigo and Coff's Harbour? Yes. There are many miles of country there, 100 acres of which would support a family. That land is still in the hands of the Crown, and if a railway were made, and Coff's Harbour improved, the expense would be met by the immediate sale of the land I speak of.

96. Unless a railway were made from Guyra, or some other point on the Northern line, it would be of very little use? The projected line from Guyra would suit us.

97. In your opinion is the improvement of the Bellinger entrance justifiable, or would a connection from the Bellinger to Coff's Harbour by rail be more beneficial to the country? I would rather not offer an opinion upon the subject. The Bellinger people are neighbours whom we think well of, and I hope they will get what they want.

98. Are there any sugar-mills in the district? There are none working, but there are two idle.

99. Why were they closed? Because of the fall in the price of sugar from £36 a ton to £19 a ton.

100. Is there much land under sugar-cane in this district at the present time? The cultivation of sugar-cane has been discontinued in this district owing to the fall in the price of sugar. It is not profitable now to manufacture sugar unless you have very large mills.

101. Is sugar-cane grown to feed cattle? Sugar-cane has been used to feed cattle in this district; but I cannot say if it is used for that purpose now.

102. How many saw-mills have you here at the present time? Two.

103. Is any of the timber sent away in logs? Yes.

104. For piles, I suppose? Yes; and to be sawn at the Sydney mills.

105. Is timber sent from here to other parts of the world? Not directly, I believe.

106. Is the population of the district large? I cannot tell you what it is.

107. Is it likely to increase? Decidedly. The figures which have been placed before you show the advancement which has taken place. J. Marles.
108. *Chairman.*] Your contention is that to improve this part of the district it is necessary to improve Coff's Harbour, and you are of opinion that, if that were done, the trade of a large area of country lying back from here, and probably the trade from a portion of the Bellinger district, would be shipped here? 25 May, 1898.
- Yes.
109. Would the improvement of the Bellinger be of any advantage to the people here? Not the slightest.
110. Why? Because our present harbour accommodation is better than anything you could do for us on the Bellinger.
111. It is not likely that you would send your produce to the Bellinger, or get back goods from the Bellinger? No.
112. Still you are of opinion that something should be done to improve Coff's Harbour? Well, it would reduce the shipping charges from £1 a ton to about 9s. 6d. a ton, and would materially increase our trade.
113. You said just now that the Bellinger people were in favor of the construction of a line to Coff's Harbour—did you refer to a line from the table-land, or to a line from the Bellinger? To a line from the Bellinger.
114. That would lead one to suppose that the Bellinger people are in favour of the improvement of Coff's Harbour? I believe that they are.
115. Those would be the people on the north arm? I believe that the people on the main arm are in favour of the construction of such a line.
116. Do you not think that if the proposed works at the Bellinger were carried out the trade from both arms of the river would be exported through the Bellinger Heads? I could not say.
117. When maize came here from the Bellinger in 1896 from what part of the Bellinger did it come? From beyond Bellingen and from other parts of the river.
118. When the entrance to the Bellinger is bad does any large quantity of perishable goods, such as eggs, poultry, and so on, come here for shipment? At times we get cream. Some cream came here only a short time ago.
119. How far is the creamery from here? Twenty miles.
120. It is closer to the Bellinger Heads? Yes.
121. I suppose that at the time you speak of it could not be shipped from the Bellinger? There was a shoal bar at the Bellinger then, I believe.
122. Apart from the question of opening up the Bellinger, are you of opinion that in the interests of the Colony at large, and particularly in the interests of the residents of this district, Coff's Harbour should be improved? Undoubtedly. I am of opinion that, even if they make a line to the Macleay and another from New England to the Clarence, this line must be made.
123. But do you not think that the improvement of the harbour would meet all your requirements for many years to come? It would do an immense amount of good; but to get the best results, a line from Guyra, or from some other point on the table-land, must be made.
124. It is not likely that you would send timber or maize to Sydney by way of Guyra? No; but we should get produce from the table-land.
125. If that produce came here the harbour would have to be improved to enable better steamers to engage in the trade? Yes. The main object of such a line would be to serve the settlers of Guyra, and those in the Don Dorrigo Scrub.
126. But is it not likely that much of the trade from Don Dorrigo will go to the Bellinger? The natural features of the country make it next to impossible for that trade to go to the Bellinger; it is nearer to Coff's Harbour.

William Crabb, manager of the Beacon Gold-mine, Bucca Creek, sworn, and examined:—

127. *Mr. Roberts.*] Is the mine you manage the property of people residing in the Colony? No; it is the property of English capitalists. W. Crabb.
128. How long have you occupied your present position? A year and nine months. 25 May, 1898.
129. How far is Bucca Creek from Coff's Harbour? It is 12 miles from this place.
130. When you took charge of the mine had it been opened up? No. When I went there little or no work had been done.
131. Is it quartz or alluvial mining? Quartz mining.
132. What area of land does your company hold? Seventy-three acres.
133. To what depth have you gone so far? We have sunk two shafts, each 200 feet deep, on two distinct reefs.
134. What is the width of the reef? It varies from 2 inches to 3 feet. The average width is about a foot.
135. What is your average yield per ton? Our average yield for the first year was 1 oz. 13 dwt.
136. Are the shares saleable in this Colony? I do not think so. The mine is held in 200,000 shares, and the last quotation was 16s. 6d. a share.
137. How much is paid up? Five shillings.
138. What dividends have been declared since the formation of the company? £25,000 has been paid in dividends.
139. Are the dividends declared half-yearly? No; quarterly.
140. How much per share is usually paid? We usually pay 6d. a share; but I think one dividend came to 9d. a share.
141. Do you send your gold direct to Sydney? Yes; by way of Coff's Harbour.
142. Have you a crushing plant on the ground? Yes; with a capacity of 120 tons a week.
143. Do you use it to its full capacity? Yes; it has never stopped yet.
144. Is the ore difficult of treatment? The top ore is not difficult; but as we get down it becomes more refractory. A plant has been ordered to treat the tailings. It will treat 600 tons a month.
145. Where is it coming from? It is being manufactured by the Otis Company in Melbourne.
146. Was the erection of this machinery suggested by you? Yes.
147. You think that it will treat successfully the ores with which you have to deal? Yes.
148. I suppose you have been mining pretty well all your life? I have had forty years of colonial experience. 149.

- W. Crabb. 149. On what other gold-fields? I have been at Bendigo, at Ballarat, and at almost all the gold-fields in the Colony.
- 25 May, 1898. 150. What is your opinion in regard to the country adjacent to the property which you are now managing? Only recently we took over another property—Mount Browne—situated within 6 miles of Coff's Harbour. This is a very large property, consisting of two large lodes. The ore is of a low grade, but it can be worked at a profit. I am expecting daily to receive instructions to obtain machinery to test the property thoroughly. We have laid out something like £600 in developing this property already. I have inspected other mines in the district, and in my opinion there is no reason why, with the employment of capital and systematic management, the Orara should not become a good mining district.
151. Is Bucca Creek on the Orara? No; it is $3\frac{1}{2}$ miles from there.
152. What is its present population? About 400. There are 100 men employed upon our own property, apart from Mount Browne.
153. Does much other mining take place there? There is another claim within $2\frac{1}{2}$ miles which has given very satisfactory results so far. I crushed 48 tons of stone for them, and obtained 50 oz. of gold, and they are sending another 100 tons, which I believe will give equally good results.
154. How many other claims are there there? There is another claim within $\frac{3}{4}$ -mile of the Beacon mine. I had 25 cwt. of ore from that claim, which was given into my custody by the Warden, pending settlement of a law case. From the specimens I have seen I am inclined to think that they have a magnificent lode.
155. Are those the only claims at Bucca? They are the only claims I know of. We almost monopolise the field.
156. Is any prospecting going on? No. It is a difficult country to prospect because of the dense scrub, and the reefs do not as a rule come up to the surface.
157. I suppose it is of no use for men without capital to go there? No.
158. Have you secured all the auriferous country there? Pretty well.
159. Does it appear to you to be merely a patch? No; the gold appears to be in fissure lodes and veins. Up to the present our returns have been very satisfactory. We have not too much free gold in the very deep lodes; but the refractory ores will make up for that.
160. Do you feel satisfied as to the permanency of the field? Yes; but there is always a lot of uncertainty about mining, just as there is about farming.
161. In your opinion there is no more country to be taken up there? Well, capitalists may take up some of the country; but it is beyond the reach of working-men. My expense of water channels alone is £50 a month at the present time. We have two very large steam-pumps and engines.
162. Have you had much water to contend with? Yes; but of course you can utilise it.
163. Would one-half of the population of the district be employed in mining operations? No; but one-half of them get their living from the mines.
164. Is there any land near the mines which is suitable for agriculture? I cannot say.
165. Is any maize grown between Coff's Harbour and Bucca Creek? Yes; we can grow maize on Mount Browne; it has already been grown there I believe.
166. *Chairman.*] Was not Mount Browne originally taken up as a selection? Yes.
167. *Mr. Roberts.*] Do you know the Bellinger district at all? No; I have only been there once.
168. If the proposed harbour works were carried out there, Coff's Harbour would still be your nearest port? Yes, and all the other mines must use Coff's Harbour. Bucca Creek, Nana Creek, Coramba and all these places must use Coff's Harbour.
169. Have you been put to any inconvenience at Coff's Harbour in connection with the landing of machinery? My machinery was landed at Woolgoolga, because at the time I got it up there was no road from Coff's Harbour to Bucca Creek. I paid £50 to cut a road through the scrub to get up my machinery. The present road from Bucca Creek to Coff's Harbour is a great convenience to me.
170. Have the steamers always been able to come alongside the jetty when you have been expecting goods? Yes; but I could not send my gold away last time because the weather was then unusually rough.
171. That was during the recent gales? Yes.
172. They affected every harbour on the coast? Yes.
173. Do you regard the present facilities for shipping here as ample? They are not quite up to date.
174. What do you think ought to be done here? I think we should have a breakwater. We deserve a better class of steamers, and such steamers would call here if we had a breakwater. My directors in London object that they cannot come here because the accommodation is not quite good enough for them. Men with plenty of means do not put themselves about much; but if we could get them to come here it would be an advantage to the district.
175. You think that would attract more capital here, and lead to the increased development of the district? Yes.
176. Where does the Coramba trade go? To Coff's Harbour.
177. Is that a trade to be considered? Yes, there are some very large reefs there which are being worked with satisfactory results.
178. What is the extent of them? I cannot say; but they have been working ever since I have been in the district. There is a 10-head battery there, managed by Mr. Cadell, and he tells me that the results are very satisfactory. The Lady Elerslie is a claim which I tested, and one which could be worked at a profit if it were properly developed. It adjoins the Coramba King, and there are 50,000 or 60,000 tons of ore in sight which I believe it would pay to put through with large machinery. The reef is a very large one, and would keep 50 or 60 heads going for many years to come.
179. Would the stone obtained compare with the stone that you are getting? I do not think it is quite so good; but our stone is of exceptional value.
180. Are the deposits similar to yours? Yes.

Eugene Frederic Rudder, farmer, Coramba, sworn, and examined:—

- E. F. Rudder. 181. *Mr. Farnell.*] How long have you resided in the district? About sixteen years.
- 25 May, 1898. 182. I understand that you know both this district and the Bellinger district? I have not a very intimate knowledge of the Bellinger district.
183. Do you know whether it is necessary that something should be done to give the people on the Bellinger better facilities for getting their produce to market? Undoubtedly it is necessary.

184. How many steamers visit Bellinger in the course of a year? I cannot say.
185. If it has been shown that the works already carried out at the entrance to the Bellinger have proved beneficial do you think we are justified in believing that the proposed improvements will be a success? I think it is a question whether it would not be better to make a railway from the Bellinger to Coff's Harbour.
186. Would there be any justification for making the railway and at the same time improving the Bellinger entrance? I am doubtful about that.
187. Have you inquired into the probable cost of the railway? No; but in my opinion such a railway would confer a permanent and certain advantage upon the residents of the Bellinger. I should look upon it in that light if I were a resident upon the Bellinger.
188. If that railway were made would there be any necessity for the proposed harbour works at the Bellinger? I think not.
189. Do you think the railway would be reproductive? Yes.
190. Do you know what the jetty here cost? £11,000 or £13,000, I believe.
191. Are you aware that the present trade of the district does not pay interest upon that amount? I am not.
192. Still you are thoroughly satisfied that the traffic which could be induced would be sufficient to pay interest and working expenses for a line of railway? I think so. There are great possibilities of development in this district.
193. Which, in your opinion, would be more beneficial to the district concerned, the improvement of the Bellinger entrance or the improvement of Coff's Harbour? The improvement of Coff's Harbour.
194. What district comes within the influence of Coff's Harbour? All the Orara and Bucca Creek country, extending towards Grafton for a distance of 25 miles, and the whole of the Don Dorrigo country from as far as Guy Fawkes. If the railway were made it would draw trade to Coff's Harbour from the Bellinger as well.
195. What part of the Bellinger district would come within the influence of the proposed harbour works at the Bellinger entrance? The south arm and the main river. The people on the north arm would be as near to Coff's Harbour as to the entrance of the Bellinger.
196. Then more trade would come to Coff's Harbour than to the Bellinger? Yes.
197. In your opinion, how could Coff's Harbour be improved? By joining the island and the south headland.
198. That is the island to the south-east of the jetty? Yes.
199. What would it cost to carry out that work? I have an impression that it has been officially estimated at about £30,000.
200. Do you think that that amount will pay for the work? I imagine so. I believe that the depth of water between the two points I have mentioned is something like 32 feet.
201. All the materials for a breakwater are close at hand? Yes. There is ample material of the very best quality.
202. What weather is most dangerous here? South-east and easterly weather. The harbour would be absolutely safe even during the prevalence of gales from the quarter I have mentioned if the breakwater was constructed.
203. Do you think it would be necessary to construct an eastern breakwater? Well, the harbour would then be well sheltered.
204. A northern breakwater would not be necessary? Not for many years.
205. If it were found necessary, I suppose it would be practicable? Yes.
206. The water on the north side is not too deep? No.
207. What has been the development of the district during the last five years? The district has steadily progressed.
208. In what branches of industry? In agriculture generally, in dairying, in mining, and in the timber industry.
209. Is more timber obtained now than was obtained four or five years ago? Yes. The roads are better now, and there is more capital invested in the industry. There were one or two small mills in the district a few years ago, but the men owning them had not sufficient means to work them properly.
210. Are there many consignments of timber from Coff's Harbour to foreign parts? Timber is consigned from this port to foreign parts.
211. And I suppose most of the timber obtained here finds its way to the metropolis? And to inter-colonial ports.
212. What is your opinion of the timber here? It is the finest in New South Wales, or indeed in Australia, with regard to both quality and to size.
213. Do you think there is any fear of the forests being denuded at an early date? That is very unlikely, because they are very extensive and the growth of timber is very heavy. There are many varieties of timber here.
214. You think that, with proper control, the timber resources of the district may be looked upon as a great source of national wealth? Most decidedly. I might mention that, if there were better facilities for shipping, and better access to the port, many farmers would make thousands of pounds out of timber which they have now to destroy. I myself have large quantities of timber which I am most anxious to export, but I cannot do so because of the cost of shipment and the want of facilities in the way of roads.
215. Would the proposed railway be of service to you? No; excepting as a means of communicating with the Bellinger. The vessels which visit Coff's Harbour now are not large enough to allow of the charging of low freights.
216. You think that if the harbour were made safer larger vessels would be sent here, and larger consignments would be taken away? Yes. Some years ago a gentleman came from Sydney and proposed to establish large saw-mills on the Don Dorrigo. He guaranteed to erect machinery and to employ 100 hands if the Government would open a road for him; but the Works Department declined to do anything, and the whole project fell through.
217. How far would it be from Coff's Harbour to the point from which you would start your railway? Do you mean how far away is the the Don Dorrigo country—about 14 miles.
218. Do you anticipate that a railway would be required, or would a tramway serve? A tramway might answer to a certain extent; but I was thinking of a connection by railway with the New England table-land.

E. F. Rudder.

25 May, 1898.

The

- E. F. Rudder. The timber industry alone would supply such a railway with profitable freights for years to come. There are hundreds of millions of feet of the finest pine in Australia in the country I have mentioned, besides other kinds of timber. I have seen cyprus pine there 5 feet in diameter and 70 feet without a limb, though that pine usually only grows to a diameter of about 18 inches.
- 25 May, 1898.
219. What kinds of timber are there in the Don Dorrigo district? There is the cyprus pine, cedar, rose-wood, and what they call the English beech.
220. I suppose it is virgin forest country? Yes. A great deal of the land is comprised in timber reserves and in railway reserves. There are about 300 square miles of heavy brush lands in one patch.
221. You unhesitatingly say that if the harbour improvements are carried out here there would be a large development of the timber industry? I think that the timber industry might give profitable employment to a railway for years to come, and might engage the services of at least 10,000 people. Some of the finest country in New South Wales, in regard to both climate and soil, is to be found in the Don Dorrigo district.
222. Is the rainfall of the Orara and Don Dorrigo districts regular? Yes; and one of the best in Australia.
223. What progress has been made in farming in this district during the last five years? There has been a great increase in the output of the original farmers, and a large number of new men have come into the district. The whole of the produce of the district does not come to Coff's Harbour, because of the want of roads; part of the produce of the Orara goes to Grafton, because there is a better road leading there. When the roads of this district are improved, however, this produce will come to Coff's Harbour.
224. Do you think that if Coff's Harbour is improved people will take up more land here and put more ground under cultivation? Undoubtedly. People will then have an inducement to extend their cultivation areas, and population will increase. All that we require are means of outlet.
225. What does it cost per acre to clear the land here? It depends entirely upon the character of the land. Some of the coast lands will cost £30 an acre to clear; but in a large part of the Don Dorrigo country there is no hardwood, so the clearing there is less expensive. In five or six years the bulk of the timber will rot away, and there is not that undergrowth that you find nearer the coast.
226. What is the Don Dorrigo soil capable of producing? Wheat, potatoes, and semi-tropical products. It is eminently adapted for dairying, both on account of the climate, the supply of water, and the character of the soil.
227. For dairying you must have artificial grasses? Yes; on the Orara we have to resort to the cultivation of artificial grasses.
228. What is the average yield of maize in your district? I should think from 40 to 50 bushels an acre.
229. What do you consider a payable price? The price should never go below 2s. 6d. per bushel.
230. If the growing of maize alone were unprofitable, I suppose a man could make a livelihood by entering upon mixed farming? Yes; in country like this mixed farming yields the best results.
231. Have you tried growing various kinds of fodder for cattle? Yes.
232. With success? Yes.
233. Have you tried growing fruit? Yes; I have grown oranges, pears, apples, persimmons, peaches, apricots, and grapes.
234. Do cattle thrive well here? Exceedingly well.
235. Sheep do not do well? No; sheep are only brought here to kill.
236. Have you any knowledge of the mineral resources of the district? Yes; I have taken an interest in the mining industry here. I quite endorse what Mr. Crabb has said in regard to its being necessary to obtain capital to develop the field. I have been all over the field, and I know that there are dozens of men in a district lying west of that of which Mr. Crabb was speaking—a district which it would pay to work if capital were invested there.
237. So that you have travelled over country showing indications of auriferous deposits which may not have come under the notice of Mr. Crabb? Yes. There are a number of mines there which have been opened up by men who knew nothing about mining. They have simply pig-rooted the country and spoilt it for capitalists coming after them.
238. Your evidence amounts to this: That you do not wish to say anything detrimental to the proposal to improve the Bellinger entrance, but, at the same time, you wish to put forward claims for the improvement of Coff's Harbour and the opening up of this district? Yes. Something has been said about the trade of the Don Dorrigo going to the Bellinger. The road which connects the Don Dorrigo with the Bellinger taps the Don Dorrigo 4 miles east of Bealestown Creek, but owing to the formation of the country it would be impossible to send any of the produce from the main part of the Don Dorrigo to the Bellinger. The northern portion of the Don Dorrigo country must always send its produce to Coff's Harbour, though, no doubt, part of the Don Dorrigo country would send produce to the Bellinger if there were a good entrance to that river.
239. I understand that the north arm of the Bellinger is not navigable? The little north arm is not navigable.
240. Therefore the people on the little north arm would not be able to avail themselves of any facilities for shipping produce to the Bellinger? They would not have a water-way down the river.
241. *Chairman.*] I understand that you were at Coramba about sixteen years ago? Yes; I was the first resident there.
242. There was no dairying done there then, and the timber trade was very little? Yes.
243. How were you employed then? I grew corn, and I exported a small quantity of timber—cedar.
244. By which route? *Via* Grafton.
245. Some time after that the mines were opened up;—is it not to the mining industry that the settlement of that district is really due? Yes, very largely.
246. Almost simultaneously with the opening up of the mines a great development in the timber trade took place? No. The cedar was practically exhausted when I came there, and very little development in the timber trade has taken place of late years. The mines at Nana Creek have been open for fifteen or sixteen years.
247. But the important mines are at Bucca? The Beacon mine is the important centre.
248. You naturally desire to obtain the lowest rate for freight? Yes.
249. You are aware that low rates of freight can only be obtained by the employment of sailing vessels? Yes.

250. Hence the necessity for improving Coff's Harbour to enable sailing vessels to trade here? Yes. I interviewed the manager of Messrs. Howard Smith & Co., and he told me that they would be glad to send their intercolonial boats to Coff's Harbour if better facilities for shipping were given here. E. F. Rudder.
25 May, 1898.
251. They do not want to run too much risk? No. The danger is that the steamers may be thrown heavily against the wharf.
252. As the output of the mines commences to diminish, I suppose what has taken place in other parts of the Colony will take place here—land will come under cultivation, and the country will be permanently settled? Yes. As mining goes out agriculture will take its place.
253. Is the soil good enough for agriculture? Undoubtedly. In accordance with an application made by me, 10,000 acres were measured out of the forest reserve, and the Government sold that land in special areas at from 30s. to £6 an acre. The land I speak of is within about 7 miles of Coff's Harbour.
254. Have the selectors kept that land? Yes.
255. Was it heavily timbered? Yes. Fortunately a reappraisal cut down the price somewhat.
256. Prior to the commencement of dairying and mining there was no settlement worth speaking of in the district? No; the district was then a wilderness.
257. It is only of late years that it has made rapid strides? Yes.
258. The supply of timber here must come to an end? Yes, ultimately. The difficulty of getting to the Don Dorrigo country by railway is caused by the first 14 miles, and I believe that a grade could be got which would be found suitable. When you get into the Don Dorrigo you are upon a plateau 300 or 350 square miles in extent, the whole of it heavily timbered with pine, beach, and other valuable trees.
259. Do not the forests near the coast contain more valuable hardwood than the Don Dorrigo scrub? Undoubtedly.
260. Is there any part of the northern coast country where there is better hardwood than is to be found within 18 or 20 miles of Coff's Harbour? I do not think there is any better hardwood in Australia than here.
261. With better harbour accommodation large sailing vessels would take cargoes of hardwood direct to foreign places? Yes.
262. If the harbour is improved will the improvement be of permanent advantage to the people here, or will it simply serve their purpose for the time being? I think it will be of permanent advantage to them, and it will cause an increase of population.
263. Apart from the question of improving the Bellinger, you think that Coff's Harbour has sufficient claims to justify expenditure here? Yes.
264. Both in the way of harbour improvements and in the construction of a railway to the table-land? Yes.
265. Do you think a line from Don Dorrigo to Coff's Harbour would be warranted? Yes. Coff's Harbour is the only outlet for the Don Dorrigo country? I am speaking of that part of the Don Dorrigo between here and the Bellinger, which is cut off from the Bellinger by a deep gorge.

Henry Boultonwood, journalist, Fernmount, sworn, and examined:—

266. *Mr. Clarke.*] Has the work already carried out at the entrance to the Bellinger improved the navigation of the river? Undoubtedly. H. Boultonwood.
25 May, 1898.
267. Are you aware that it is proposed to expend about £36,000 in extending the training-walls? I thought that that amount included the expenditure up to date.
268. No, that is a proposed further expenditure;—do you think it advisable to spend that money? Well, that is rather a steep question. We who live on the Bellinger have a great idea of its importance. We have now about 8 feet 6 inches on the bar, and the proposed improvements might possibly give us from 12 feet to 13 feet, which would be sufficient for the trade of the district.
269. The Bellinger bar has been considered one of the worst on the coast? It has been among the worst. I think it has been the most dangerous and difficult bar on the coast. The entrance has shifted as much as $\frac{3}{4}$ mile in a few days.
270. Do you recommend any alternative scheme, such as the construction of a breakwater at Coff's Harbour? I think the construction of a breakwater at Coff's Harbour would be of considerable assistance to us in enabling us to get perishable products away. Our district is small, and, of course, our trade is small, and the consequence is that shipping companies do not give us a very regular service. We get a boat now about every ten days, and sometimes at longer intervals, and that is not often enough for perishable products.
271. Do you think the Bellinger would be in a better position if it were connected with Coff's Harbour by rail? I think so. We send a large quantity of our perishable products this way now. We have sent large numbers of pigs and a quantity of cream this way.
272. When vessels could not enter the Bellinger? Until quite recently. If a vessel does not come for more than eight days we are bound to send our produce this way.
273. The dairying industry is only in its infancy on the Bellinger? Yes. I think we have four steam creameries now, and others are projected.
274. Do you think it likely that other people will go in for dairying? I think so. People are buying cows now at every opportunity.
275. Will the alluvial land on the Bellinger, upon which maize is grown now, be utilised for dairying? I think so. A great deal of that land has now been under cultivation for thirty or forty years, and it is therefore not so rich as it used to be; but it would do well for grass.
276. And I suppose there is a good deal of land at the head of the river which might be used for dairying? Our back country is very rough.
277. It has been suggested that a breakwater should be made at Coff's Harbour, and a railway constructed from Guyra through the Don Dorrigo scrub to Coff's Harbour;—do you favour the suggestion? Most decidedly. Those works would be of enormous assistance in the development of country at the back of Coff's Harbour.
278. But the Bellinger people say that the Bellinger is the proper outlet for that district? I do not think that it is. At the Bellinger Heads we are about 25 miles from Don Dorrigo, whereas you can reach the Don Dorrigo country in about 14 miles from Coff's Harbour, and probably by a better road. The road

H.
Boultonwood.
25 May, 1898.

road from the Bellinger contains 7 miles of cutting on a fairly steep grade. Then, too, the freight on maize from the Bellinger is 1s. 6d. a bag, while from Coff's Harbour it is only 1s. a bag.

279. If Coff's Harbour were improved freights would be reduced? Undoubtedly. I have the assurance of Mr. Nicoll that if the trade increases as it promises to increase he will reduce his rates even under present conditions.

280. It has also been proposed to construct a railway from the Bellinger to Coff's Harbour;—what do you think of that proposal? It would be of enormous assistance to us.

281. Would the people on the Bellinger, particularly those on the south arm, be very much inconvenienced if they had to come to Coff's Harbour? It would depend very much upon what it cost. As I have shown you, they would save 6d. a bag in sending maize from here, and if the cost of railway carriage and handling only came to 6d. a bag, it would be of advantage to them to send to Coff's Harbour. Sometimes it is nearly three weeks before a steamer comes to the Bellinger; but at Coff's Harbour they have a steamer weekly.

282. I understand that a great deal of the maize grown on the Bellinger is brought down to the steamer by the droghers? Yes; and of course it could be brought to the railway in the same manner. A railway from the Bellinger would probably start at Raleigh, which is on navigable water, and droghers could bring maize there.

283. But a railway would mean extra expense and handling;—is Coff's Harbour equal to or superior to Woolgoolga? It is very much superior to Woolgoolga.

284. Why? The southern headland extends further to sea, and affords more shelter than is given at Woolgoolga, apart from the shelter that is given by the islands at Coff's Harbour.

285. Your worst weather comes from the south-east? Yes.

286. A breakwater connecting the southern headland with the adjacent island would greatly improve the harbour? Yes. Captain Howard made a thorough survey of Coff's Harbour. His proposal was to carry a wall from the large island to almost connect with the headland, and to guide the sea on to the headland so as to break its force, and to create a scour.

287. Is the water here very deep? As nearly as my memory serves me there are about 24 feet of water near the island, and the depth increases up to about 32 feet.

288. Then a breakwater would be very expensive? Captain Howard's scheme embodied another wall, to shelter Coff's Harbour Creek. His idea was that ultimately the creek might be used as an inner harbour. His estimate of the cost of the whole work was, I think, £270,000. That would make a harbour second only to Sydney Harbour.

289. Do you think the resources of the district would justify such an expenditure? I think sufficient shelter could be given for less money. I think that one breakwater would be enough at present.

290. Do you think that the improvement of the Bellinger entrance is also justifiable? I think so.

291. Apart from any railway scheme? Well, I think if I were in the position of the Government I would scarcely carry out the two works.

292. Which would you prefer to see carried out? I think that the requirements of the Bellinger might be met with a smaller expense than is proposed, and the two works might then be carried out.

293. The opinion of the engineers is that a smaller expenditure than £36,000 would not be effective in improving the Bellinger entrance? Well, in my opinion, they could use cheaper material for part of the wall. They are now paying 3s. 9d. a ton for stone, and they are throwing away debris which, in my opinion, could be used. There is no wash of the sea against a large part of the wall, and that part could be constructed cheaply.

294. Is the jetty at Coff's Harbour sufficiently good for the trade? I think so. I have heard it stated by people connected with the timber trade that if shelter were afforded for sailing vessels there would be a direct export of timber from here to the old world. At the present time it is dangerous for large sailing vessels to lie alongside the jetty. Sailing vessels have attempted it at Woolgoolga, but one or two of them went ashore there.

295. You think the jetty is sufficiently good for steamers? Yes; it is nearly up to the requirements of trade, but if it were more sheltered there would probably be more competition and a cheapening of rates.

296. Do you think it advisable that sailing vessels should come here? Yes; I have known vessels to be able to load and unload at Coff's Harbour when other vessels were weather-bound at both the Bellinger and the Clarence.

297. You think that the expenditure of a reasonable amount of money at the Bellinger should be undertaken? In my opinion the position is simply this: The resources of the Bellinger district justify the improvement of the entrance; but in taking into consideration the development of the outlying districts, the improvement of Coff's Harbour is also to be regarded as beneficial. We have a road from the north arm of the Bellinger which connects with the main road to Coff's Harbour, and I think that the produce from that part of the country will come here. That road is only just being opened up, and I think the people there spent from £50 to £60 upon it themselves. I should like to endorse what Mr. Rudder has said about the Don Dorrigo country. We have been obtaining potatoes from the Don Dorrigo for the supply of the Bellinger district, and they are equal to any we can get from Sydney or elsewhere. Some were exhibited at a local show, and four of them weighed nearly 17 lb.

298. What is the Don Dorrigo soil like? It is a reddish volcanic soil. They tell us that without cultivation they can produce 12 and 14 tons of potatoes to the acre.

299. *Mr. Roberts.*] What is the area of the Don Dorrigo country? I understand that it is not less than 300 square miles. There are 50,000 acres in one reserve, and a great deal of land has been thrown open there and is settled upon. It is beautiful country, and is excellently watered, but the people there labour under enormous difficulties.

300. *Mr. Farnell.*] What do you think of the terms and conditions offered to settlers in this district;—are they suitable? The price of land is excessively high. We have had non-residential selections in special areas sold for as much as £6 an acre, and residential selections for £3 an acre; and they have fixed the price at £2 an acre in some parts of the Don Dorrigo. Such prices are excessive, and prevent people from making a living off the land.

FRIDAY, 27 MAY, 1898.

[The Sectional Committee met at the Court-house, Bellinger, at 10 a.m.]

Present:—

CHARLES ALFRED LEE, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G. | HENRY CLARKE, Esq.
FRANK FARNELL, Esq.

The Sectional Committee further considered the proposed Harbour Works at Bellinger River.

John Thomas Greer, farmer, Bellinger River, sworn, and examined:—

301. *Chairman.*] How long have you resided here? Thirty-four years.
302. What in your opinion would be the best way to overcome the difficulties to navigation which exist at the entrance to the river? To continue the work already begun by the Department.
303. Have you reason to suppose that the Government scheme if carried out will be effective? Yes because the work already done has proved beneficial.
304. Do you think that if it is extended upon the lines suggested by the Department you will obtain all the relief which is necessary at the present time? Yes.
305. You have no exception to take to the Departmental proposal? No.
306. We shall be very glad to hear from you anything you have to say as to the progress of the district, its present position, and its future outlook? Last year we exported about 50,000 bags of maize. I do not think the maize production is likely to increase very much, but I believe that the dairying output will increase, though a good bar and a regular steamer service are necessary for its success. With a good bar thousands of acres of land, which are useless for maize growing, would be cleared and put under grass.
307. Is the land available? Yes.
308. Is it Crown land? Yes; all the back country lying to the north, between here and Coff's Harbour, is Crown land.
309. Is it good land? It is not first-class agricultural land, but it is good grazing land. It would cost a great deal to clear, because it is heavily timbered.
310. It is not likely that maize will be grown there? No; that land is not good enough for maize.
311. Is maize likely to be the chief product of the river-bank land? It has been so up to the present time, but if the dairying industry increases the production of maize will increase.
312. Has maize-growing paid the farmers? In a sort of way. They have made a haphazard living out of it.
313. Would a better steamer service improve the position of the maize-growers? Yes. If the steamer could come in and go out at any time, we could get our produce to market at any time. The entrance has been a little better since the southern training-wall has been taken out.
314. Inasmuch as the price of maize fluctuates from time to time, I suppose it is of importance to a farmer to be able to send his produce to market, so as to take advantage of any change? Yes.
315. At the present time you have to send your maize away when you can? Yes; you cannot wait to take advantage of the market.
316. So that the producer is entirely at the mercy of the seller? That is so.
317. If the entrance were improved, you would have more regular communication, and probably larger vessels? That is my impression.
318. Would you look forward to a reduction in freights? Yes.
319. What is the present rate for maize? 1s. 6d. a bag all the year round.
320. Why is the price so high? I think it is because our trade is not very large, and we cannot keep an opposition boat going. Then, too, everything has to be taken to the steamer on the droghers.
321. And has not the company to take a great risk when it sends a steamer here? Yes. With the improvement to the bar the risk would be lessened.
322. At the present time there is a risk? There are risks at all bar harbours.
323. But here in particular? At the present time I do not think the risk here is greater than the risk at the Macleay entrance.
324. But the Bellinger entrance cannot be compared with, say, the Richmond entrance? There is not a great deal of water on the Richmond bar, but larger boats go there.
325. Unless the construction of harbour works resulted in a reduction of rates, would the proposed Government expenditure be of any advantage to you? Yes; because it would enable us to ship our maize away at any time we pleased, because the steamer could make frequent trips. Now, if the pilot sends word that there are only 6 feet of water on the bar she does not come.
326. You do not attach much importance to the possibility of a reduction of rates? I should like to see the rates reduced, but I would rather have a regular steamer service.
327. How does the present condition of the entrance affect the export of perishable articles, such as live stock and farm produce? The export of perishable articles cannot be carried on to any large extent under present conditions. The company send a wire saying that the steamer is leaving Sydney on a certain day for the Bellinger, but we never know if she will be able to get in. Fowls and other live stock sent down to meet the steamer may be kept waiting on the droghers for a week.
328. And the result is —? Great loss; live stock die, and other articles perish.
329. I suppose people living at a distance cannot get sufficient notice of the arrival of the steamer? That is so.
330. How many creameries are there on the river? There are four which buy cream, and then several people do their own separating.
331. Which is the chief creamery? That at Fernmount. It was built as a butter factory, but it is now a creamery.
332. How is the milk sent to Sydney? Only cream is sent to Sydney.
333. Is it possible to send cream to Sydney in summer time? We send it to Coff's Harbour then.
334. Why? Because our own steamer service is not regular enough.
335. Still you can send cream away in the summer time? Yes; but some preservative is used.

J. T. Greer.
27 May, 1898.

- J. T. Greer. 336. Is there a refrigerating chamber upon the steamer? Yes; upon the steamers leaving Coff's Harbour.
 27 May, 1898. 337. If you can send cream from Coff's Harbour, would it not be possible to keep it on the river for a few days, and then send it direct? No; because the direct boat might not call for a week. You always know when there will be a steamer from Coff's Harbour. We take advantage of both services.
 338. The dairying industry will have to develop a great deal before the shipments from here can be very large? Yes.
 339. You are not butter exporters? No.
 340. Your output of cream will always be small? Yes.
 341. Is it proposed to make butter just yet? I do not think so.
 342. But you think the district eminently adapted for dairying? Yes.
 343. Is there good feed for cows all the year round? You can grow fodder all the year round. Of course, in the winter time grass is rather scarce.
 344. Do you look upon Coff's Harbour as a more reliable port than the entrance to the Bellinger? Yes.
 345. Would you prefer to see Coff's Harbour improved and a railway made there from the Bellinger? Yes; if there was a probability of our getting the railway at once; but if we have to wait long for it I think the Government should go on with the harbour works. If the entrance to the river ceases to be of use to us our bread and butter ceases. We have had difficulties enough in the past, and we cannot afford to go back.
 346. It is not likely that both works will be carried out;—the question is: which would be best for the district? I consider that a railway to Coff's Harbour would be the better.
 347. Failing that? Failing that, you could carry on the harbour works.
 348. Suppose the harbour works were carried out, and no connection with Coff's Harbour made, would that meet the requirements of the district? I think so.
 349. If it resulted in a regular and reliable steamer service? Yes; that is what the producers want.
 350. That is what the district really requires? Yes; it has not suffered so much during the last twelve months, because the bar has been gradually improving. If it has been bad it has only continued so for a day or two.
 351. Has the district improved as the bar has improved? I am sure that it has.
 352. What instance can you give us of a recent development? The people here to-day are in a better position than they were in five or six years ago.
 353. Why? Because of the better steamer service.
 354. Is it because of the better prices? I do not think so. The prices have been about the same.
 355. What has been the average price of maize during the last four years, as compared with the price during the previous four years? I think that the price during the previous four years was a bit better.
 356. I suppose that a regular service has a good moral effect upon the people, in giving them heart to go on with their work? Yes; people get very down-hearted when they cannot send their produce to market. One year we had to send everything to Coff's Harbour.
 357. Do you look upon the Bellinger district as a good one? Yes; it is a small district, but very fertile.
 358. How is the land mostly held? Chiefly by conditional purchase. Some of the land was taken up as early as 1863, and has become freehold.
 359. From that date downwards the people here have had a hand-to-mouth existence? Yes; I have known a vessel here to be bar-bound for weeks at a stretch. In my opinion the people would be a great deal better off if they went in for dairying. With maize-growing you are apt to suffer loss through the floods.
 360. It is possible that dairying may be overdone in the near future. I suppose if the price of butter came down very low, you would cease to produce it? You would have to go in for mixed farming. I do not believe in going in for dairying only. A man need not cease maize-growing when he goes in for dairying. I believe that if people went in more for dairying and grew less maize they would get a better price for their maize.
 361. I suppose it is possible to grow everything on the Bellinger that can be grown on the other northern rivers, with the exception of, perhaps, sugar-cane? Yes.
 362. And you think that you should be put in the same position as the people on the other rivers in regard to the facility for getting to market? Yes.
 363. Which, in your opinion, would be the better—an improved river entrance, or a coast railway from Morpeth? An improved entrance, I think.
 364. Would you be able to send produce by rail to Sydney as cheaply as you can send it by steamer? I do not think so.
 365. If the proposed work were successfully carried out, and larger vessels traded to the Bellinger at reduced rates of freight, and it became necessary for the Government to make a charge upon all the northern rivers for the services rendered in the construction of harbour works, would there be any objection on the part of the producers to paying that charge? I do not think so, if it were applied equally wherever harbour works have been carried out.
 366. Do you think that would be a good arrangement? I think so.
 367. It would be wise for the State to make a charge to recoup the cost of these works? I believe that it would be wise to do so.
 368. If a railway were made, you would have to pay for the services afforded you? Certainly.
 369. I believe that at the present time Bellinger is the head of navigation for droghers? Yes.
 370. Produce is taken down to the Heads from here by the droghers and there put on board the steamer? Yes.
 371. This system of droghering will continue even after the proposed works have been carried out? That is a matter lying with the people themselves. I think that dredging should be carried on in the lower parts of the river. That would give the ocean steamer a chance to come up here.
 372. If that could be done it would be a great advantage to the settlers on the banks, as it would enable them to save the expense of droghing? Yes.
 373. If the dredging of the river is not possible, will the people remain content with a good entrance? I think so, but I think they will try to get the steamer up the river.
 374. Is there any point you would like to emphasise in connection with our inquiry? A railway to Coff's harbour has been mentioned. If we had such a railway, we should have a regular steamer service—a service that could be relied upon.

375. The question is, whether you could pay for the railway carriage, together with the droghering and constant handling? Of course, if it cost more to send the stuff away by rail the people would not use the railway. J. T. Greer.
27 May, 1898.
376. Which do you think would be the better for the district—a railway, or the improvement of the entrance? I think that a railway to Coff's Harbour would suit the people of the district better than the improvement of the entrance to the Bellinger, especially so far as the butter industry is concerned.
377. Could you pay an extra charge for the carriage of your maize? I do not know that we should have to pay an extra charge. I believe that we could get maize taken from Coff's Harbour for 8d. or 9d. a bag.
378. At the present time you have as good a service from the Bellinger as they have from Coff's Harbour? Very little is sent from Coff's Harbour now, but if the Bellinger trade went there there would be a bi-weekly service.
379. There are times when steamers cannot go to Coff's Harbour? Yes; but I believe that the "Wollumbin" has been able to make regular weekly trips. A steamer would only be kept away from Coff's Harbour for a day or two at a time.
380. But some harbour works would be necessary to make Coff's Harbour a certain port? Yes.
381. If the trade of the Bellinger is to go to Coff's Harbour that harbour must be a certain port? Yes; but the making of Coff's Harbour a certain port would be a national work, because it would create a harbour of refuge.
382. But it would cost more to do that than to improve the entrance to the Bellinger? Yes, I believe so. If we can get a railway at once I am in favour of its being made, but if we are likely to have to wait ten years or a generation for it, I say give us a better entrance.
383. If the entrance is improved it will do away with any possibility of railway connection? I am aware of that. I should like to see a railway made to Coff's Harbour.
384. If the Bellinger entrance is made safe, will it be sufficient for the requirements of the district? I think so.
385. *Mr. Roberts.*] What are the principal towns on the Bellinger? The principal town is Bellingen, and there are also Fernmount, Raleigh, and the Bellinger Heads.
386. How far up the river does the "Rosedale" come? She only comes as far as the Government wharf, which is about half a mile inside the entrance.
387. Has she never come further than that? I do not think so.
388. Has any ocean steamer ever come as far as Fernmount? Yes, the "Euroka" came there last week. She draws 5 feet or 5 ft. 6 in. and carries about 1,400 bags.
389. Does she belong to the North Coast Company? Yes.
390. Have they ever been asked to send her here constantly instead of the "Rosedale"? A deputation waited upon Mr. See at Raleigh the other day asking him to send the "Euroka" to Fernmount, and to take cargo from there at lower rates; but his answer was that he could not do it—that the bar would have to be deepened so as to permit of the entrance of larger boats before the freights could be reduced.
391. What is the rate from Fernmount? One shilling and sixpence a bag.
392. Is the same rate charged from all parts of the river? Yes.
393. Does it include droghering? Yes.
394. If a farmer draws his maize to the Government wharf at the entrance, does he get any reduction of freight? No, none whatever.
395. What distance do the droghers bring maize to the Government wharf? From about 16 or 17 miles up the river.
396. How far is Bellingen from the entrance by the river? Sixteen or 17 miles.
397. All the towns you have mentioned are on the North Arm? Yes.
398. Is there not a branch of the river called the Little North Arm? Yes. It joins the North Arm 4 or 5 miles by road from here.
399. Is there much settlement on the Little North Arm? There are a good many settlers there; I cannot say how many.
400. I suppose that the land near the Heads is not suited for agriculture? They grow maize at a distance of 3 or 4 miles from the Heads.
401. Does the land improve in fertility as you go up the river? Yes.
402. Is not the good land confined to very narrow strips? Yes; it does not run very far back from the river—generally not more than the depth of a farm.
403. What is the average acreage of the holdings upon which maize is grown? I think very few farmers hold more than 300 acres. I suppose that from 100 acres to 150 acres would be an average holding.
404. They only grow maize on the river frontages? That is all.
405. Of the 150 acres you spoke of I suppose some would be timbered country? Some of the farms are mostly timbered land.
406. What would be the average acreage under cultivation? I suppose 40 or 50 acres.
407. Is the rest of the land as nature made it? No; a great many farmers have their back lands cleared and under grass.
408. What is that land adopted for? Chiefly for growing grass. It might be possible to grow some kind of produce there if the stuff could be got to market.
409. Still the land is good for dairying? Yes.
410. Does the country improve as you go west from Bellingen? I think the country up the river from a little below Fernmount is nearly all pretty good. The further you go up the newer the land is, and the better are the crops that you get, because, of course, the first settlers took up land as near to navigable water as possible.
411. How far do the farmers on the Little North Arm have to bring their produce in order to get it to the droghers? I suppose 6 miles would be the shortest distance.
412. What would it cost them to carry produce 6 miles? I could not say, but one man told me that he was drawing 10 miles for 5d. a bag.
413. Do the people on the Little North Arm ever send their produce to Coff's Harbour? I do not know that they do, but for some time they have been agitating for a road there. A gentleman the other day told me that when the road was completed all their produce would go to Coff's Harbour.
414. Why do they want a road to Coff's Harbour? Because there they would get a more reliable steam service.

- J. T. Greer. 415. How long has the agitation for this road been going on? For two or three years, and perhaps more.
- 27 May, 1898. 416. Has there been any delay in getting produce away from the Bellinger since the entrance works were commenced? The worst delay we had was about two years ago. There have been delays since; but I do not think they were altogether the fault of the bar. The fault has been with the company in not sending a boat there.
417. Is it not a fact that since the works were commenced you have 10 feet of water on the bar, as a rule? I think the average depth would be 7 or 8 feet. We have had 10 feet and more than that; but I do not think that the bar remains deep for long. I heard the other day that the depth now was 7 ft. 6 in.
418. Is it not true that when the "Rosedale" has been unable to leave the river it has been because of the prevalence of easterly or south-east gales, and not because of the want of water on the bar? About two years ago the "Rosedale" was bar-bound for three or four weeks, because of the want of water, but since the southern training-wall has been carried out the bar has not been so bad.
419. Has she ever been unable to get out since? Last year one of the steamers—I think it was the "Fernmount"—was unable to get out for a couple of days, but these delays have not lasted long.
420. What is the draught of the "Rosedale"? From 7 to 8 feet when loaded.
421. Under these circumstances why do the Little North Arm people want to go to Coff's Harbour? Well, only one steamer trades regularly to the Bellinger, and she has to serve three or four other ports, so that we are sometimes a fortnight without a boat. At Coff's Harbour there is a steamer every week.
422. Does the steamer not come here regularly because there is not sufficient cargo for her? I believe that if the ordinary boat came regularly she could take away all the cargo in six months. In the busy season, of course, we could keep her going.
423. For how many months in the year would that be? For about half the year—that is, when the maize crop is being sent away.
424. Has it been decided to make a road from Little North Arm to Coff's Harbour? It is partly open now.
425. Is it intended to complete it? I cannot say.
426. For how many miles has that road been made? I could not tell you, but I understand that when another £50 has been spent upon it no more stuff will go to the Bellinger.
427. What saving will they make by having that road? They will have to draw 20 miles instead of 10; but they will be able to send their maize away from Coff's Harbour for 1s. a bag.
428. What would it cost to draw stuff 20 miles? I suppose they would get it drawn for 1s. a bag. They have also to pay 1d. a bag wharfage at Coff's Harbour.
429. That would be a total charge of 2s. 1d. as against 1s. 11d. from the Bellinger? Yes; but then they would get a regular service. I suppose it is that that influences them.
430. How often is there a steamer to Coff's Harbour? Once a week.
431. Is 1s. a bag the lowest rate at which maize is carried from the northern river to Sydney? No; I believe that it is taken for 9d. a bag from the Richmond and the Clarence.
432. Although the distance is greater? Yes.
433. Do you know the rate from the Tweed? No.
434. Since the southern training-wall has been made, has there been a more contented feeling among the farmers? Yes.
435. Then is it not difficult to understand why they want to go to Coff's Harbour? I suppose they will get an advantage by going to Coff's Harbour.
436. Has there been any agitation for a railway to Coff's Harbour in this district? I do not think so. A gentleman on the river once called a meeting on the subject, but it was decided that it would be better to go on with the harbour works.
437. Before the harbour works were commenced was any large quantity of produce sent to Coff's Harbour? No; I believe that 3,000 or 4,000 bags of maize went over there on one occasion after our bar had been bad for a few months; but it was found very expensive to send maize there.
438. That was about two years ago? Yes.
439. Not much maize has been sent to Coff's Harbour since? No; live stock—pigs and so on—and cream have been sent there.
440. Is the "Rosedale" fitted with a refrigerating chamber? I think not.
441. Is it a fact that before the improvements were commenced by the Government the farmers upon the river were so disheartened by their isolated position that some of them abandoned their holdings? I never heard of any. Probably one or two found their holdings were no good and left; but I do not know any valuable holding that has been abandoned. Holdings may have been sold, but not abandoned.
442. How many saw-mills are there on the river? Two; one at the Bellinger Heads and the other at Raleigh.
443. Do they send away much timber? Not a large quantity so far; but I believe that they will send away a great deal. The owners of the new mill seem to be very energetic men, and I believe that they will put through a lot of timber.
444. Is not the Bellinger famous for the quantity and quality of its timber? Yes; there is a great deal of hardwood here—blackbutt, tallowwood, gum, ironbark, and so forth.
445. Is there a large foreign trade in timber? I think all the timber is shipped to Sydney.
446. I suppose all the alluvial land here has been taken up? All of any value for maize-growing.
447. From what distance from the Heads is the land settled? I suppose for pretty well 40 miles from the Heads.
448. Do you know the Don Dorrigo district? I was never there; I only know it by repute.
449. Have you ever been to Guy Fawkes? No.
450. Do you know of people being anxious to settle in the district since the harbour works were commenced? A good many people have come here, and I believe that others are coming, but I think it is chiefly to get land for dairying purposes. A good many people are going on to the Don Dorrigo country.
451. Do you think it likely that the Don Dorrigo country will be settled in the near future by a large number of families? From what I hear that land is capable of carrying a great population.
452. What produce is it most likely to grow? They can grow potatoes there, but I do not think the land is suitable for maize-growing. They could grow wheat, probably, and they could dairy.
453. Are there any potatoes grown on the Bellinger? All the potatoes grown here are for local consumption.

454. Would there be a good market here for Don Dorrigo potatoes? The difficulty would be to bring them from Don Dorrigo, because of the expense of carting. J. T. Greer.
455. Do you know if potatoes are being sent away from the Don Dorrigo country at the present time? I cannot say if any are sent to Sydney, but some are sent here. 27 May, 1898.
456. Are they good potatoes? Those I have seen are splendid potatoes; they compare favourably with the best I have ever seen.
457. At what point do you think it would be most convenient to connect the Bellinger with Coff's Harbour? At Raleigh.
458. Have you ever considered whether produce could be sent to Sydney in that way more cheaply than by steamer direct? I do not know what the railway charges would be, but if the freight were no more than the freight we pay now the people would be very well served by a railway.
459. The freight from Coff's Harbour would be at least 1s.? It would not be 1s.
460. Say 9d.? Well, 9d.
461. Would you be likely to have your produce taken from your farm, put on the trucks, carried by the railway, unloaded at Coff's Harbour, and put into a steamer there for another 9d.? I think so.
462. Would it not be very inconvenient for people residing at some distance from Raleigh to get to the railway? They would have to use the river.
463. What do you think it would cost to carry goods by water from Bellingen to Raleigh? Not more than 3d. per bag.
464. The farmers on the Little North Arm would have to pay 5d. a bag to bring their produce to Bellingen? Yes.
465. Therefore, they would have to pay 8d. a bag to get it to Raleigh; then 9d. for railway carriage and handling would make the cost 1s. 5d.? Would the cost of the railway service be more than 6d.
466. Well, if it were 6d., the cost of getting their produce to Coff's Harbour would be 1s. 11d.? We are paying as much as that now; besides, those who did not wish to use the droghers could draw their produce to the railway station themselves.
467. Have you been over the country between Raleigh and Coff's Harbour? Yes.
468. Along the Great North Coast road? I have been through that country by different tracks before the road was made.
469. Is it not very ridgy country? I do not consider it very ridgy; it is good, hard ground.
470. Does it not strike you that it would cost a good deal to make a railway there? I do not know what it would cost, but I have heard it put down at £6,000 a mile.
471. Was that estimate made by a man well able to form an opinion on the subject? I think so.
472. How many miles is it from Raleigh to Coff's Harbour? Fourteen, and then 2 more down to the jetty.
473. Sixteen miles altogether? Yes.
474. That would make the cost of the line £100,000 in round figures? I believe so.
475. Three per cent. on that amount would be £3,000 per annum;—the estimated cost of the proposed harbour improvements is £36,000, or, at 3 per cent., £1,080 per annum? Yes; but the railway would be a section of the North Coast line. Part of that line—from The Tweed to Lismore—is already made.
476. Do you look forward to the continuation of that line south? Well, there is great talk about it, but I do not know if it will ever be made.
477. If that railway were made, what number of farmers would use it? I could not say. I believe that the bulk of the farmers would use it, if it were to their advantage.
478. Do you think the railway would get 50 per cent. of the trade? I think so, and probably more. I believe that the farmers would study their own interests.
479. Do you know how many bags of maize were exported from this district last year? I think 50,000 or 52,000 bags.
480. That at 1s. 6d. a bag would give £3,750 per annum in freight? Yes.
481. If £3,000 of that amount were set apart to meet the interest charges on the railway, how would you make up the working expenses? Other things besides maize would be sent by rail—perishable goods, for instance. The trade too would increase.
482. Is the timber all sent away by sailing vessels? Yes, so far. I believe that the owner of the new sawmill has chartered some small steamers.
483. What steamers are they? The "Trilby" is one.
484. What is her tonnage? I suppose she would carry 30,000 or 40,000 feet of hardwood.
485. Is all the timber sent to Sydney? It goes chiefly to Sydney.
486. How many sailing vessels are there trading to the river now? I do not think there are more than two or three.
487. Are they able to carry all the timber? Yes, so far.
488. What tonnage are they? Some of them are 100 tons, and some of them are 70 tons.
489. Do you think the Bellinger will be the outlet for the Don Dorrigo country? I think so, under certain circumstances.
490. Does much timber come down from there now? Not a great deal.
491. Where does the timber come from chiefly? The cedar trade is about done on this river. It is only cedar that comes here from Don Dorrigo.
492. How far is the timber which is now being cut at the sawmills brought? Some of it comes from above Bellingen. They take it down the river in pontoons.
493. What distance do they have to draw it before they get it to the river? On the higher parts of the river they do not have to draw it very far; but, lower down, near the mill, they have to draw it 3 or 4 miles.
494. Are the mills constantly employed? Up to the present time they have not been constantly employed, but I cannot say what the new mills will do.
495. Has there been a want of timber? Yes; and the machinery of the old mill is not very good. It has broken down and repairs have had to be made.
496. There has been no difficulty in getting timber away by sailing vessels? There was a difficulty about two years ago; but I do not think there has been any since.
497. So far as you can judge, is the stone used for the training-walls well adapted for the purpose? It seems to me to do well enough. 498.

- J. T. Greer. 498. What kind of stone is it? I should call it a sort of hard slate.
 499. Have you ever seen the stone that is being used on the Clarence River? No; I have seen the stone that is used at Trial Bay.
 27 May, 1898. 500. Is the stone on the Bellinger similar to that? No; it is not nearly as good.
 501. Where is the stone that is being used obtained? About 3 or 4 miles up the South Arm.
 502. Do you know of any better stone in the district? There is better stone, I believe, along the coast, but it would be more expensive to get.
 503. Has a quarry been opened up on the South Arm? Yes.
 504. And the stone is brought down the river? Yes, in punts.
 505. How far is the quarry from the river? It is right on the river bank.
 506. Do the sailing vessels still come to the Bellinger in ballast? Chiefly in ballast. The saw-mill proprietors may bring up some back cargo that way sometimes.
 507. Is the ballast used in connection with the harbour works? I do not think so.
 508. Is a dredge constantly employed on the river? Yes; we have had a dredge here for 12 or 13 years.
 509. It has been absolutely necessary? Yes.
 510. What was the river like before you had that dredge? When people first came here there was no erosion of the banks, and consequently the river was deeper. Vessels at that time could come up past Fernmount.
 511. Sailing vessels? Yes.
 512. How much water would they draw? Six or 7 feet.
 513. At that time all the maize was taken to Sydney by sailing vessels? Well, we had a little steamer which used to come up the river.
 514. In those days did the farmers suffer vexatious delays in getting produce to market? Yes; and in one year the maize had to be burnt because it could not be got to market at all.
 515. But you say you had more water then? In the river, but not on the bar.
 516. Once a vessel is got over the bar, what shoals are there to be crossed in the river? There are two or three flats which could be easily dredged; but it would be difficult to dredge the river above Fernmount.
 517. What water have you on the South Arm? The depth is about the same as on the main arm; the droghers go up about the same distance.
 518. Does the South Arm require constant dredging? It has to be dredged once and again.
 519. I suppose the dredge is constantly employed on the river, from one year's end to another? Yes.
 520. Do the droghers go up Back Creek now? That is the only channel at the present time.
 521. Does it require constant dredging? Now and again it may want touching up. It has all been dredged.
 522. Do you think Back Creek ought to be closed? I believe it would be better to keep the main river open.
 523. Are there farmers on the banks of Back Creek? There are no farmers there at all.
 524. Then why do the droghers go up that way? Simply because that is where the deep water is. They cannot get up the Main Arm. They have always come up Back Creek since it has been dredged.
 525. What is the length of Back Creek? Hardly a couple of miles. It commences on the South Arm at about a mile from the Heads, and finishes at the North Arm about 3 miles from the Heads.
 526. Has the North Arm silted up since the training-wall was commenced? There is not much depth of water in the North Arm, because the channel goes through Back Creek. I do not think droghers have gone along the lower part of the North Arm for some years.
 527. What is the value of the best farming land on the river bank here? From £20 to £25 an acre.
 528. What is the highest price that you have known such land on the Bellinger to fetch? I suppose, £30 an acre.
 529. Have you known sales to be effected at these prices? I have known farms to be sold for prices equivalent to about £30 an acre.
 530. Have you heard of sales taking place during the present year at which £20 or £25 an acre has been obtained? No.
 531. Do the farms here often change hands? Not very often. A few of them have changed hands, but a great many of those who selected in 1863 still own the same farms.
 532. Is the district in what you would term a fairly prosperous condition? It is.
 533. Do you think it has been more prosperous since the training-wall was commenced? I think so.
 534. The people realise the great advantage which they will get from the training-wall? Yes.

David Anderson, farmer and maize-buyer, Bellingen, sworn, and examined:—

- D. Anderson. 535. *Chairman.*] How long have you resided here? For thirty-four years.
 536. Where were you residing before you came here? On the Macleay.
 27 May, 1898. 537. *Mr. Clarke.*] We understand that the condition of the river entrance has been detrimental to the interests of the people here? The bar has been very bad. The river enters the sea through an opening in the beach, and there is no headland near the mouth. After heavy floods the entrance has shifted very considerably at times.
 538. What has the bar been like during the last few years? I believe that it has been better than in former years.
 539. During your long residence here have you known vessels to be detained for several days at a time? I have known vessels to be detained here for months. In those times there was no pilot and no tug service, and they had to wait for a favourable wind and tide.
 540. That state of things must have injured the trade of the district? Certainly.
 541. Do you think that the proposed harbour works will materially benefit the district? They may, and they may not. I think that unless the walls are carried out into deep water, the works must be regarded as an experiment.
 542. You consider that the proposed work should be carried out; but, not being an engineer, you cannot give a decided opinion as to their value? No.
 543. What is your opinion of the resources of the district? I would favour the construction of a railway which would give us more direct communication with Coff's Harbour.

544. If such a railway were made, would it not increase the cost of sending goods to Sydney? It might; but I do not think it would. Intercolonial boats could call at Coff's Harbour, and they would take maize and other produce not only to Sydney, but to Melbourne, to Fremantle, and to other places where we might wish to send it. D. Anderson.
27 May, 1898.

545. I suppose if a railway were made to Coff's Harbour it would encourage competition among the steamship companies, and thus bring about a reduction of freights? Yes.

546. What is your opinion about the construction of a line from Guyra to Coff's Harbour? Such a line would open up good country on the Don Dorrigo and at Guy Fawkes; but I do not know that it would be of much advantage to the Bellinger district.

547. If a railway were made from the Bellinger to Coff's Harbour it is not likely that the entrance to the Bellinger would be improved;—now, is not water carriage always cheaper than railway carriage? Perhaps it is where there are large quantities of produce to send away; but here we have no large quantity of produce to send away, and we are at the mercy of monopolists who charge us what they think fit, and serve us just as they choose. They merely come to the Bellinger when they cannot get cargo elsewhere.

548. What are the productions of the Bellinger? Maize chiefly. One cannot go in for fruit-growing or dairying because of the unreliability of the steamer service.

549. Would not the maize always be sent away by the cheapest route? Yes.

550. That I suppose would be by the direct steamer? Yes; if we could send away when the market suited us; but that is impossible now.

551. If the railway were authorised it would take many years to complete? In that case I should approve of the carrying out of the harbour improvements. Eventually the North Coast Railway will come this way.

552. That would be a very expensive line to make? I dare say it would, but it would bring revenue to the Government, whereas dredging and harbour work bring no revenue.

553. Do you think dairying is likely to be a success here? I believe so.

554. Would it employ a larger number of people than are now employed in the district? It would employ a larger number of families, and it would give work to the children. There are thousands of acres here which might be turned into dairy farms which are utterly useless for maize-growing.

555. Then you think that perhaps mixed farming—maize-growing on the alluvial land, and dairying on the grazing land, could be carried on? Yes; our experience is that with regular communication it would pay us to turn our best maize land into paddocks.

556. Where are your creameries? At Raleigh, at Fernmount, at Bellinger, and on the little North Arm. The creameries buy milk from the farmers.

557. Do not some of the farmers separate their own milk? In some cases they do their own separating, sending the cream to Sydney, and selling their butter locally.

558. Is not the cream often spoilt because of the delays at the bar? The delays are not always caused by the bad state of the bars. It sometimes happens that after a steamer has been advertised to call here, she goes to Port Macquarie instead, and we have to wait for another trip. I have known pigs to be sent up and down the river two or three times to catch the steamer.

559. Would it not be better for all the farmers to send their milk to the creamery so as to avoid sending the cream to Sydney? The cream would have to be sent to Sydney in any case.

560. But it would then go as butter? Some of the creameries make butter and sell it locally, but they do not send it to Sydney; they send the cream to Sydney.

561. What has been the average price of maize on the river during the last few years? I think not over 2s. a bushel. From a little under 2s. to 2s. a bushel is what the farmer would get after paying expenses.

562. But what has been the gross price? About 2s. 6d. a bushel.

563. That would give the farmer a net return of from 1s. 11d. to 2s. a bushel? Yes.

564. The freight at 1s. 6d. a bag would be 4½d. a bushel? Yes; but to that must be added commission and other charges. Altogether you must deduct about 6½d. a bushel for expenses.

565. Does this price pay the farmers? No, not when you take into consideration their losses through floods and in other ways. We could often get better prices if we could get our produce to market at the right time.

566. If the entrance were improved to allow vessels drawing 10 feet of water to come into the river do you think there would be a considerable reduction in rates? I hardly think so, because there is not sufficient freight to create competition, and there would still be the expense of taking the maize down the river to the Heads.

567. But if larger vessels could come would they not take the produce at lower rates? If there were competition the rates would be reduced, but when there is only one line of boats the owners generally squeeze all they can out of the people. The trade of this river is not sufficiently large to bring about competition. The whole of our produce could be taken away in three months, and for about six months of the year there would be nothing to take.

568. Then a railway to Coff's Harbour would soon carry off all your produce? Yes; two or three trains would take it all. But with regular communication thousands of acres which are not used now would be taken up, and the present farmers would do more with their land. I do not think there is a better district in New South Wales for citrus fruit than the Bellinger district.

569. We had it stated in evidence in Sydney that if the entrance to the river were improved the steamer rates would be reduced about 35 per cent., and that instead of paying 1s. 6d. a bag for maize the people would have to pay only about 1s. a bag? I only hope that that will happen.

570. You do not believe that there will be any reduction? There may be a slight reduction.

571. What is the freight from Coff's Harbour? At the present time it is 1s. a bag, but only a limited quantity of produce goes from there.

572. There is a very good road from the Bellinger to Coff's Harbour;—would it not be to your advantage to cart your produce to Coff's Harbour now? Two years ago a large quantity of maize was sent there, but after wet weather the road becomes so boggy that it will not carry a waggon loaded with maize.

573. Have you any idea of the quantity of maize sent from the Bellinger annually? It has varied, according to the seasons and the floods, from 28,000 bags to nearly 50,000 bags.

574. What else is sent away besides maize? Large quantities of timber are sent away, together with poultry, pigs, cream, and a little fruit.

- D. Anderson. 575. If a railway were made, would not heavy goods, such as timber and maize, still be sent direct by steamer? I do not think so. I think the maize would be sent by railway to Coff's Harbour, and from there it might be shipped direct to the various colonies.
- 27 May, 1898. 576. You are entirely in favour of a line from either Guyra or the Bellinger to Coff's Harbour? I am in favour of a railway from the Bellinger to Coff's Harbour. I do not know much about the merits of a line from Guyra to Coff's Harbour.
577. *Chairman.*] How much land do you farm? Over 40 acres of maize.
578. Do you think 50,000 bags per annum is a fair estimate of the maize export of this river? No; I think it is too large.
579. What do you think the export is? Between 28,000 and 50,000 bags. 50,000 bags is the largest quantity of maize that has been shipped to Sydney in one year—if that quantity has ever been sent.
580. In a good season the district is capable of producing 50,000 bags;—do you think that with greater facilities for shipment more than that quantity could be produced? Well, there is very little more land to put under maize.
581. Is the district capable of producing 50,000 bags of maize per annum? In a good season.
582. How are your bad seasons caused? By floods.
583. Do you suffer from droughts? No.
584. I suppose the floods enrich your land and give you larger yields the following year? That happens sometimes, but in places the good soil is often swept clean away.
585. A railway to Coff's Harbour would cost at least £100,000; 3 per cent. interest on that amount would be £3,000 a year. What rate do you think you could afford to pay for the carriage of maize by rail from the Bellinger to Coff's Harbour? I should say 3d. or 4d. a bag.
586. Fifty thousand bags at 3d. a bag would only yield £625 to the railway, and even if the rate per bag were 6d. it would not meet the interest on the cost of the line, while the producers would be in no better position than they are in at the present time? I am certain that if half of the maize grown on the Bellinger went to Coff's Harbour, the rates would be reduced. The intercolonial boats take freight from Melbourne to Sydney for 4s. a ton.
587. But none of them call at Coff's Harbour? I understand that there is sufficient water there for them, and I have been told that one intercolonial company would be prepared to send a steamer there for £50 worth of freight. At the present time there is no more produce shipped at Coff's Harbour than Nicoll's boats can carry, so that they have to go to Byron Bay and the Richmond to fully load.
588. Suppose the rate from Coff's Harbour, by steamer, were 8d. a bag, and the railway charges came to another 8d., that would make the total charge 1s. 4d.; with such a charge how much better off would you be than you are at the present time? Well, we should have command of the market.
589. But if the entrance to the Bellinger is improved, and you get regular communication at reduced rate, will not that serve the district? I dare say it will.
590. If the entrance is improved farmers along the river bank can put their produce direct on to the droghers and send it straight away,—is not that the cheapest way of getting rid of it? I have had no experience of any other way.
591. Would not the improvement of the entrance be the best way of serving the general interests of the district? I believe that it would for some time to come, but it will be very expensive to continue the dredging of the river.

Edward Reymond, wheelwright and coachbuilder, Bellingen, sworn, and examined:—

- E. Reymond. 592. *Chairman.*] How long have you been here? Eight years and nine months.
- 27 May, 1898. 593. Where did you come from? From Bowra, on the Nambucca River.
594. How long were you living there? I am a native of the Macleay; and the Bellinger, the Nambucca, and the Macleay, are only short distances apart.
595. *Mr. Farnell.*] You have a general knowledge of the district? Yes.
596. And can speak from personal experience of its capabilities and resources? Yes.
597. The entrance to the river was very bad I understand before the Government commenced the training-wall? Yes.
598. It offered no facilities for the development of the district? No; quite the reverse.
599. What has been the effect of the work already done? Well, last season our maize was taken away very satisfactorily. The "Rosedale" could get in and out almost whenever she chose. She was detained for one or two days, but the delay was caused by bad weather.
600. Do you consider that the work already done will be permanent? Yes; I think it is splendid work.
601. Since these walls have been carried out has there been any development in the district in the way of the establishment of new industries? Well, the creameries are a development. Very little dairying was done here until twelve or eighteen months ago.
602. Do you think the establishment of a dairying industry is the outcome of the facilities offered for ready communication with the market? Certainly. A mill has been shifted from the Nambucca to the Bellinger, because of the improvement of the Bellinger entrance. That mill is capable of turning out 80,000 feet of timber a week. It is one of the best mills on the northern rivers.
603. The works already carried out having proved themselves so valuable, have you any doubt as to the effect of the extended scheme? No; if you confine the water the scour must deepen the channel.
604. Do you think the district is likely to continue to improve? Yes.
605. On how many occasions has the steamer been delayed at the entrance? You mean within the last two years.
606. Yes? I think not more than two or three days. Of course, she may have been detained by heavy weather. Last year's crop went away as well as any crop that has ever been taken from the river. We had a splendid service last year, and we hope to have a similar service this year.
607. Have you known of any sailing vessels being detained? No; when the steamers can get out the sailing vessels can get out, because they draw less water.
608. Do you think that the trade of the district justifies the expenditure which has already been undertaken? I think so.
609. Do you think the probability of development justifies an additional expenditure of £36,000? Yes. Only the other day I heard of a man going with his family to settle on the Don Dorrigo country. Of course,

course, if the entrance were blocked up, it would be useless for people to go there at all. The Bellinger is the natural outlet of that country. There is splendid land to be taken up there, and no doubt the improvement of the entrance would induce people to take it up. E. Reymond.
27 May, 1898.

610. Do you think that the resources of the district can be more fully developed? I do. On the Little North Arm there are thousands of acres of land to be taken up on which people could make good homes for themselves.

611. What is an average holding in this district? About 150 acres, I should say.

612. What portion of these holdings is under cultivation at the present time? As a rule, the alluvial land is used for maize-growing. Probably there would be from 30 to 40 acres of cultivated land on each holding.

613. Then, on the average, only a small part of the holdings has been cultivated? Nearly all the alluvial land has been cultivated.

614. But only a small part of the total holding has been cultivated? Of course, the balance of the land would go under grass.

615. Is the land which is not alluvial suitable for grazing? Yes; and you might grow fruit on it.

616. Will the improvement of the entrance be an incentive to the farmers to put larger areas under crop, and will it induce more people to take up land, and to settle in the district? I believe so. This the home of the citrus fruit. You can get 7s. or 8s. clear for peel for candying.

617. I suppose they only grow the citron here? No; they grow oranges and mandarins as well.

618. What other fruits can they grow here? They could grow the fruits which grow in warm climates. Chinese fruits would be specially suited to this climate; but I do not think English fruits would do.

619. I suppose no one has engaged in fruit-growing here to any extent? No. The cost of carriage is a little too high; but if the entrance is improved we shall probably get lower freights.

620. No one is specially engaged in fruit-growing here? No; they do not grow fruit for market here.

621. Does agriculture pay at the present time? I think so.

622. Agriculture, pure and simple? Yes. I think a man should live very comfortably upon a holding here.

623. What is the average yield of maize here? Between 45 and 50 bushels an acre, I think. Forty-five bushels an acre would be a fair average yield taking the district throughout.

624. And what would be a payable price for maize? If a farmer could get £9 per 100 bushels he would do very well. Such a man will also rear pigs and fowls.

625. Has a man a better chance of making a profitable living when he engages in mixed farming than when he devotes himself solely to agriculture? Most of the farmers keep pigs and cows, and grow maize as well.

626. You think there is a good future for this as an agricultural district? I think it is one of the best districts along the coast.

627. What area of country do you think would be served by the carrying out of the proposed works? The top farm on this river would be 23 or 24 miles west. Then there is the Don Dorrigo country. The Government has opened a road right through it. A team came in here from Guy Fawkes the other day with seventy bags of splendid potatoes.

628. Would the Orara produce come here? No; that would go to Coff's Harbour. Then there is all the country on the South Arm, extending half-way to Bowra, a distance of about 10 miles. Finally, there is a little North Arm country.

629. Do you think that if better facilities for the removal of produce were afforded all this country would use the Bellinger as a port? I think the trade must come to the Bellinger. There is a lot of land to be taken up along the road from the Little North Arm to Coff's Harbour.

630. You contend that there are some thousands of acres of Crown land in the district available for settlement? Yes; there is splendid land available.

631. Have you taken into consideration the cost of clearing this land? I have a fairly good knowledge of it.

632. What is your opinion of the timber of the district? There is not better timber in Australia. We have tallow-wood, blackbutt, messmate, ironbark, rosewood, and beech. The cedar is almost done now, though, of course, a little is still sent away.

633. Do you think it would be possible to cultivate a foreign trade in connection with the timber industry? There is a certain foreign trade being done now, and if we could get large boats into the river we could send the timber away direct, instead of having to send it to Sydney to be transhipped.

634. Do you think that if proper facilities were afforded vessels of a larger draught would come here for timber? They might do so.

635. Have you a local knowledge of Coff's Harbour? I have never been there.

636. Do you think that if a safe port were made there trade would be induced to go there rather than to the Bellinger? I do not think so. I do not think the Bellinger people would think of sending their produce to Coff's Harbour, even if a railway were constructed.

637. Supposing a railway were constructed, and Coff's Harbour improved, while nothing was done to the Bellinger entrance, do you think the people of the district would use the railway? If the entrance were completely locked up they would have to go to Coff's Harbour; but so long as they could they would use the direct water carriage, because that would be cheaper.

638. You contend that the best way of meeting the convenience of the people of this district is to construct harbour works at the Bellinger River? Yes.

639. You do not think there is any justification for carrying out both projects? No. A railway could carry our whole season's production of maize in a very few trips, though of course there is no guarantee that it would get the freight.

640. If a light line were constructed and Coff's Harbour improved, would not that develop the Don Dorrigo, the Guy Fawkes, and the Orara districts? If the railway started from Raleigh stuff would have to be punted down the river or taken by road to that point, and that would be expensive.

641. The question for us to consider is what is the best way to develop the district? I certainly recommend the improvement of the river entrance.

642. Have you any idea of the cost of clearing land in this district? Do you refer to scrub land, or to forest land? I dare say it would cost £12 an acre.

643. Is that the outside price? That is the minimum price.

- E. Reymond. 644. Do you think the farmers could afford to spend so much money in clearing their land? They do not clear all their land at once; they clear it gradually.
- 27 May, 1898. 645. Has the timber all to be burnt off? Yes.
646. Are the terms upon which land can be selected here satisfactory? I do not think so.
647. Do you think they should be more liberal? Yes. The land should be classified. The best land has already been taken.
648. Do the farmers grow fodder for their cattle? Those who have commenced dairying grow oats, tares, sorghum, and farmer's friend.
649. Any lucerne? Yes.
650. Do you know anything about the mineral resources of the district? It has no mineral resources, I believe.
651. The work already done at the entrance has proved so beneficial that you have no hesitation in recommending its extension? That is so.

Frederick Doepel, drogher-master and ship-builder, and local agent for the North Coast S.S. Co., sworn, and examined:—

- F. Doepel. 652. *Mr. Roberts.*] How long have you been residing on the Bellinger? About twenty years.
- 27 May, 1898. 653. How long have you been the local agent of the North Coast S.S. Co.? For four years. I have been in the shipping trade on the Bellinger for the last twenty years, and I have had boats of my own running here from Sydney.
654. Do you do the droghering on the river by contract? Yes.
655. Is the droghering plant your own private property? Yes; my contract is for twelve months at a time.
656. How many droghers do you employ on the river? I have one tug-boat and three punts. You cannot use any big droghers here. You have to have the machinery in one vessel, and the cargo in others, because of the shallowness of the river.
657. Have you ever been engaged upon any of the other rivers upon the North Coast? No; though I was sailing on the coast before I came to the Bellinger.
658. Do you mean that you were trading to the Bellinger? I traded to the Bellinger, to the Nambucca, and to the Manning before I came to reside here.
659. Is the Bellinger a more important river than the Nambucca;—is there more droghering to be done there? Yes; there is more cargo to droghe on the Bellinger than on the Nambucca.
660. How does the Bellinger compare with the Manning? There is no comparison. The Manning serves a far larger district.
661. For what distance up the North Arm do your droghers go? About 16 miles.
662. Do you go above Bellingen? No; a drogher has never been further than Bellingen.
663. Do your droghers go up the South Arm? Yes, for about 16 miles.
664. Is the South Arm as navigable as the North Arm? At the present time there is not much difference between them. The upper end of the South Arm is very shallow.
665. How many feet of water do your droghers draw? The biggest draws 4 feet unloaded; but we can never load it fully at this end of the river. On the average we cannot load it to draw more than 2 feet 6 inches, or 3 feet at spring tides.
666. What depth of water do you get at Bellingen? At the present time, at low tide, we only get a foot. We have to do most of our work during spring tides. With ordinary tides we can only take small cargoes.
667. Is the South Arm as shallow as that? Yes. At the present time there are only 6 inches of water on some of the flats on the South Arm at low tide. The trade there is very small, and we only send a punt when the tide is high.
668. What is the rise and fall of the tide? Sometimes during big spring tides we get 4 feet, but the ordinary rise is 2 feet. During neap tides we sometimes get only a foot.
669. Are you familiar with the proposed scheme for improving the entrance to the Bellinger? Yes; I have been up and down the Heads very frequently during the last twenty years. I am there every week nearly.
670. I suppose you remember the commencement of this work? Yes.
671. When was the work commenced? Something like four years ago.
672. How long was it before an improvement of the entrance took place? There was no improvement for about two years.
673. A good portion of the southern training-wall has now been completed? Yes.
674. What depth of water had you before that training-wall was commenced, and what depth have you now? Before we could not get more than 5 or 6 feet of water, and very often only 4 feet. I have known vessels to be unable to get out for five or six weeks at a time. During the last two years, however, the entrance has not been so bad. Anyone who knew it before would hardly credit the improvement which the training-wall has made.
675. I believe that where you had 4 or 5 feet of water you now have 9 or 10 feet? Well, 9 feet is a fair average.
676. Does that give plenty of draught for the "Rosedale" in moderate weather? Nine feet is quite enough for the "Rosedale."
677. Have you ever known a steamer to be delayed from want of water on the bar since the works were commenced? The steamer has not been delayed during the last two years for want of water on the bar, but she has been delayed a couple of times by heavy seas.
678. What gales are most hostile to a vessel wanting to get out of the Bellinger? South-easterly gales. The south-westerly wind raises the biggest sea on the bar.
679. During such weather the Bellinger entrance is affected only in common with the other harbours on the coast? Yes. As a rule, when the Bellinger bar is not navigable there is a heavy sea upon all the other bars along the coast. Sometimes there is a heavy sea south of Smoky Cape when here it is quite smooth.
680. Delays through bad weather would take place if you had 30 feet of water on the bar? Yes. If, however, the bar is shallow you cannot get out when there is any sea on at all.

681. What are the terms of your agreement with the North Coast Company;—are you paid for every bag of maize that you bring here? Not under the present contract. I put in my tenders to the North Coast Company by the bag and by the ton. F. Doepel.
27 May, 1898.
682. Do they call for tenders? No; but I have to put in tenders for piece-work and for a lump sum for the year, to be paid monthly.
683. Are public tenders invited by the Company? No; they only ask me to give a price.
684. Is it an annual contract? Yes.
685. You have held this contract for the last four years? Yes.
686. Do you carry only maize on your droghers, or do you carry everything? Any produce which the farmers may feel inclined to ship—maize, timber, poultry, anything.
687. I understand that most of the timber is sent away by sailing vessels? Most of the hardwood goes by sailing vessels, but if a farmer wanted to send any timber by steamer I would have to take it down the river.
688. Do you bring down large quantities of cedar? Not during the last two years, because the price has been so low that it does not pay to fetch it in, though there is still a good deal of cedar here. If they could get a good price a fair quantity of cedar would come in.
689. Does the steamer carry at the same rate as the sailing vessels? Yes.
690. What is the rate? 4s. per 100 feet, droghering included. Two years ago it was difficult to get cedar away, and I tried to ship some of it by a sailing vessel; but they could not take it at a lower rate than the rate the steamer was charging.
691. Does the cedar come from the Don Dorrigo district? Yes, most of it at the present time.
692. I understand you to say that the demand for it was not large? At present prices it does not pay to fetch it in.
693. How many miles have they to draw it? Twenty miles, some of it.
694. Is it sawn timber? Mostly sawn timber goes away now.
695. Is the timber sawn at the Don Dorrigo? Yes.
696. How many mills are there there? The timber I speak of is hand-sawn. This saves the drawing of waste pieces.
697. What timber do you bring by the drogher? Some beech logs sometimes. A few weeks ago I brought down some rosewood logs.
698. How far did that timber come? A distance of 2 or 3 miles.
699. It is obtained close to the river? Yes; they have not far to bring it.
700. Does not the "Eureka" sometimes come up the river instead of the "Rosedale"? She has been up here once.
701. Only once? Yes.
702. She is able to come as far as Fernmount? She got up as far as Fernmount with difficulty; but I do not think she will come up again in the present state of the river. There is only just water enough to enable her to get up, and Back Creek is so narrow as to be unsafe for her. She went up and down, but she would not take cargo.
703. Why did she come up;—had she a large cargo on board? No; she came in, and I had not had sufficient notice to get my droghers down to the Heads in time, so I sent one of my men down to pilot her up to Fernmount to take part of the load there. She came up, but the captain was not satisfied with the river, and he was glad to get back again empty.
704. Could not the difficulty be removed by dredging the river? Yes; if the main channel were dredged. Back Creek is too narrow for ocean-going boats.
705. Did the "Eureka" go up Back Creek? Yes; that is the only channel. We have not used the lower part of the main river for the last twelve years. We always get sufficient water in Back Creek for the droghers.
706. If a farmer brings his maize down to the Government wharf at the Heads, has he to pay the same rate to Sydney as if his produce is taken from the river bank and brought down by drogher? Yes.
707. You are paid a lump sum for doing the droghing work whether you carry one bag or 50,000 bags in the year? Yes.
708. Do you make periodical visits to different parts of the river, or have the farmers to communicate with you when they have a load waiting? They have to communicate with me.
709. To ask you to call for their produce? Yes; when I go up and down they let me know whether they have anything to ship.
710. From what part of the river do you get the largest quantity of produce? I get the bulk of the trade at Bellingen.
711. At Bellingen you get all the produce from the district west of that town? Yes; last year we sent close upon 50,000 bags of maize from the river, and of that number 28,000 bags were sent from the Bellingen wharf.
712. Was last year an exceptional year? It was a fair sample of a good year. I think the output this year will be a little better. I expect to have 2,000 or 3,000 more bags this year.
713. How do you account for the increase? By the better season, and because of the improvement of the bar. The crops, too, seem earlier this year, and the farmers are shipping more freely than they did last year.
714. Are they not always ready to ship their produce if they have it? They are guided by the market. If the market is low they are not in a hurry to ship, unless they are compelled to do so. They keep the stuff back if they expect the price to rise.
715. Is there any period of the year when the maize is more in demand than it is at some other time? As a rule the market is overstocked in June and July. People who live on rented farms have to send their produce to market early, and that brings the price down.
716. As a rule, when is the maize ready for market? In April.
717. The price a man gets for his maize depends upon his ability to hold back his produce? Yes, to some extent.
718. Has the improvement of the entrance given an impetus to the development of maize-growing here? Yes.
719. Have you heard of any more families coming to settle in the district? Yes; there are families coming here nearly every month, and settlement is going on in the Don Dorrigo country. 720.

- F. Doepel. 720. Has all the land on the banks of the river been taken up? Yes; all the good land.
- 27 May, 1898. 721. If a new-comer wants land, he must go to the Don Dorrigo country? He can get it nearer than the Don Dorrigo if he goes back on the North Arm or the South Arm.
722. Is there any unalienated land there suitable for the growing of maize? There are pieces suitable for maize, but not large areas. It would pay people to take it up for dairying and for poultry-farming.
723. Can you tell us what the annual export of maize, poultry, eggs, and cedar amounts to? I could not give you any figures, but I know that during the last two years there has been a large increase in the export of poultry and sundries.
724. There has been an increase in the export of poultry? The increase in the export of maize is not so great as the increase in the export of other things such as cream, poultry, butter, eggs, fruit, pigs, hides, and tallow.
725. Where is the fruit grown? Some of the selectors grow fruit. No one goes in for fruit altogether, but a good many farmers have a few fruit trees of their own.
726. What sort of fruit? Oranges and citrons.
727. Any bananas? No bananas are shipped from here, but tomatoes are sent from here.
728. Is much honey exported from the Bellinger? A good few cases of honey are sent away—perhaps fifty cases altogether.
729. Are there any bee farms here? Yes.
730. Do you take passengers down on the droghers? Yes; if any passengers want to come down, they are welcome.
731. Do passengers ever go that way? Yes; it is very seldom that they go by the coach.
732. Do they pay extra? No; it is not mentioned in my contract. I often take passengers without charge.
733. When people are travelling to Sydney, do they take the "Rosedale," or do they prefer to go by way of Coff's Harbour? Passengers often go to Coff's Harbour, not because they prefer that route, but because there is sometimes a steamer leaving there when there is no steamer leaving the Bellinger.
734. They do not abstain from using the "Rosedale," because of their fear of the danger of crossing the bar? No.
735. It is fair to assume that the people of the district travel by the "Rosedale," except under exceptional circumstances? Yes.
736. Do they ever go to the Nambucca or to the Macleay? Occasionally, perhaps, if they have very important business to transact. They then try to catch the first steamer wherever it goes from.
737. I suppose you have had many conversations with the people of the district about the difficulty of entering the river;—have you heard much about the agitation for a railway connection with Coff's Harbour? Not very much lately. About four years ago, when work was commenced at the Heads, there was an agitation for a railway to Coff's Harbour.
738. That was before the training-wall was constructed? Yes.
739. Since then have the people appeared more content? As a general rule I have found them more content. I have heard nothing about the Coff's Harbour railway during the last two years.
740. What is your idea as to the advisability of connecting Coff's Harbour with the Bellinger by rail;—do you think it a feasible scheme? I do not approve of it at all. I know that produce could not be sent that way to Sydney for the same amount of money as it costs to take it direct. The bulk of the produce would, in the first instance, have to be droghered or drawn a long distance to get it to the railway.
741. Would it not be most inconvenient to farmers to bring produce to the railway? Yes; just as inconvenient as to get it to the Heads. Besides, if a railway were made, it would have very little to do, because it would suit most people better to send direct from the Bellinger. The timber trade, which is half the whole trade of the river, would not go by rail at all. The cheapest way of improving our conditions is to make a better entrance.
742. What would it cost a farmer to send his produce from somewhere on the South Arm to a railway-station at, say, Raleigh? He could not send it there for less than 3d. a bag.
743. At the present time he would pay nothing to get it taken to the steamer? Well, of course, the droghering is included in the steamer rates.
744. Would 3d. a bag be a fair charge from any part of the river to Raleigh? Yes.
745. Do you think it would pay you to carry it on the droghers for less than 3d. a bag? No; I do not think so. I estimate the expense of droghering at the present time at 3d. a bag.
746. Once you get the produce on board the drogher, it does not matter much whether you have to take it half a mile or 5 miles? No.
747. How is poultry sent to Sydney—in coops? In coops; but the charge is so much a pair.
748. What is the rate? Sixpence a pair.
749. Is poultry sent away in small lots? From ten to fifteen pairs are put into a coop.
750. How are the eggs carried? One shilling and sixpence is charged for an ordinary case.
751. How many dozen eggs to a case? Thirty-six dozen.
752. What is the charge per coop? One shilling and sixpence a case for a single case, or 1s. a case where more than three cases are sent.
753. How many cases of fruit are sent to Sydney in the year? I do not know. It is only during the last two years that we have shipped any fruit. More fruit is going this year than ever went before.
754. How much has gone? I suppose about 200 cases up to the present time.
755. Are there any orchards in the district? No; because up to the present there has been no opening for the fruit industry here.
756. I suppose a farmer devotes part of his land to maize-growing, part to fruit-growing, and part to poultry-raising? Yes; most of the farmers have land that suits all sorts of produce. It did not pay to go in for fruit-growing when they had no regular communication with Sydney.
757. Is fruit-growing a paying industry on the Bellinger? I could not say.
758. Have you ever heard whether the returns are regarded as satisfactory to the grower? The people who ship the fruit away buy it from the growers.
759. The growers sell it on the tree? Yes.
760. Have you heard of any farmer enlarging his orchard? No; but the people who send away the fruit reckon that they can make it pay, and that the industry would pay if the people went into it extensively.

F. Doepel.
27 May, 1898.

761. What amount of cultivation has taken place in the Don Dorrigo country? I could not say; I have not been up there. Not much of their produce comes down here, except potatoes for local consumption.
762. Have they not sent any to Sydney? No.
763. Would it not pay them to do so? I could not say. The rates are very heavy from Don Dorrigo. It might pay when potatoes are very dear in the Sydney market.
764. What is the rate of carriage from Don Dorrigo down to the Bellinger? I suppose it is £1 a ton.
765. And what would be the freight to Sydney from the Bellinger? £1 a ton.
766. That would make £2 a ton altogether? Yes.
767. Would that charge prevent the Don Dorrigo people from competing with the people of other districts? I think so.
768. Do they not grow very superior potatoes in the Don Dorrigo country? The quality of the potatoes is first-class.
769. Is there any charge for droghering merchandise brought up from Sydney? That service is paid for in the steamer charge. The company pay me for delivering these goods.
770. Do you deliver goods at the farmers' own wharfs? On the river banks if they like.
771. You study the convenience of the residents in every way? Yes. Wherever they ship their produce, there their return goods are landed.
772. Are there any farmers in Back Creek? No.
773. There are farms all the way up the main arm? Yes, from above Back Creek.
774. Does not Back Creek require a great deal of dredging? It did when they started there, but having been properly dredged it has kept open.
775. If Back Creek were closed would there be a better scour? I do not think it would make much difference to the scour. If the main river were dredged it would keep open, and the water would more easily find its way down to the entrance.
776. But would not the closing of Back Creek improve the scour? It would improve the scour of the North Arm a little.
777. Is there constant work for a dredge on the Bellinger? Yes.
778. Where is it working now? At the heads, making a temporary bank.
779. Is there any tendency for silt to deposit where two arms join? I do not think there will be when the training-walls are made. I think there will then be sufficient scour to keep the channel open. At the present time the dredge is making a sand wall to prevent the water of the main arm from joining the water of the south arm before it gets to the bar.
780. Do you regard the work that has been done at the entrance as highly satisfactory? Yes.
781. Do you think any further work is necessary? I think the southern wall should be taken out further; it has not gone far enough out yet.
782. Do you think that Mr. Darley's proposed extension of the works is all that would be necessary for some time to come to enable the trade of the Bellinger to be carried on satisfactorily? Yes. I have been in favour of the work from the first.
783. There is no headland at the entrance to the Bellinger? No; it is something like the entrance to the Manning. Before these works were commenced you could hardly tell where the entrance was.
784. Used not the bar to be constantly shifting? Yes; it was always shifting. It used to work along the north beach for a time, and then break out to the southward again.
785. Has a pilot been stationed at the Bellinger Heads for the last twenty years? There has been one since I have been here.
786. Would the pilot have to signal to the master of the vessel to tell him what course to take? The pilot always places leading-marks, to show the line of the channel, and the masters of the vessels go by them.
787. At the present time the bar is stationary? It shifts a little, but not very much. It cannot get away from the end of the training-wall. Before, there was nothing to confine it.
788. How often have you known it to shift since the training-walls were made? There might be a slight alteration two or three times in the year.
789. Has the alteration been worth speaking about? No; not for the last two years.
790. And there have been 9 feet of water on the bar? Well, they have had as little as 7 feet, but generally there is plenty of water. After a heavy sea the bar shoals up a little, but a few tides scour it again.
791. What was the result of the serious gale which we had recently? It made no change.
792. Did you feel the gale up here? Yes.
793. But there were no disastrous effects? If there was any effect at all it was to improve the bar a little. We had very big tides then, and that made a scour.
794. Has the "Rosedale" ever been unable to get out during the last two years for want of sufficient water on the bar? No. Sometimes she does not take a full cargo, so that she may go out, but that is not often. She can load to 6 feet 6 inches, but then they have to trim her when they get outside.
795. Does she make regular trips here? Yes; every seven or eight days.
796. Is she able to carry away all the produce of the Bellinger by calling once in eight days? Yes.
797. In your opinion, do the people of the district suffer any great inconvenience by having a steamer coming only once a week? No; but, of course, she loses a trip now and again through stress of weather, and then complaints are made.
798. What other places does the "Rosedale" go to? To Port Macquarie.
799. Does the "Euroka" do the Nambucca trade? Yes.
800. To what other ports does she ply? To the Macleay. Sometimes she discharges at Port Macquarie, and sometimes at Trial Bay, into the larger steamers. She very seldom goes to Sydney direct.
801. Do you insure your droghering plant? Not unless I have to go over the bar. I have taken my big drogher over the bar once or twice to load a steamer outside.
802. When did you last load a vessel outside? About two years ago.
803. Before the improvement of the entrance took place? Yes.
804. Do you know if the insurance upon sailing-vessels, steamers, and merchandise has been lower since the construction of the training-wall? I have not heard.
805. Before the improvements were made was not a visit to the Bellinger attended with more danger than has to be faced at the present time? Yes. The insurance companies hardly cared to take the risk of the Bellinger

F. Doepel. Bellinger bar. If they took it they charged a very high rate. The Bellinger bar was looked upon as the most dangerous on the coast. I do not think that that is so now, however. At any rate, it ought not to be so.

27 May, 1898.

806. Do the Don Dorrigo people get their supplies by way of the Bellinger? Yes; most of them.
807. Is that traffic increasing? Yes; every month new settlers are going there.
808. Do the Guy Fawkes people get all their supplies by way of the Bellinger? They get part of them by way of Grafton, but most of them come this way.
809. Does any fruit come from there? No.
810. All the fruit that is shipped is grown close to the river? Yes.
811. Would that be on the ridges? Mostly round about the homesteads, which are generally situated on the higher ground.
812. Have you seen any signs of the development of the dairying industry here? Yes; but it is only within the last two years that there has been any dairying here at all.
813. Is the "Rosedale" fitted with refrigerating chambers? No; but she has a cool room.
814. Is it sufficiently cool to enable her to carry cream to Sydney in good condition? Yes; she has a cool room fitted up with ice boxes.
815. How do you account for cream being sent all the way to Coff's Harbour for shipment? It is sometimes sent there to catch a steamer when the "Rosedale" does not come here regularly.
816. Is any butter made in the district? Very little. Only cream is sent away.
817. Is there a steam-tug always in attendance at the bar? Yes.
818. Principally for towing sailing vessels in? Yes; and sometimes she gives assistance to a steamer.
819. What does she draw? Six feet of water.
820. Do you think it is necessary to construct the breakwater at the present time, or will the training-walls do? I think the training-walls will do for the present. I do not think the district is large enough to justify an expenditure upon breakwaters.
821. You are impressed with the utility of the work so far as it has gone? Yes; and I should be very sorry to see it stopped.
822. Is the work going on at the present time? Yes; and it is showing good results.
823. How far do they bring the stone for the training-walls? About 8 miles.
824. What is your opinion as to the suitability of that stone? I think that stone suits the purpose as well as any stone that you could get. The water seems to have no effect upon it. Oyster-shells and weeds are growing upon it, and are binding it together.
825. Have you ever been to the Clarence—have you seen the work that has been carried on there? No.
826. You have no knowledge of the stone which is being used there? No.
827. Do you know the stone that is being used at Trial Bay? Yes.
828. That is a much harder stone? Yes, it is stone of a different quality; but the sea breaks very heavily there.
829. You do not think that the stone used for the training-walls would be suitable for breakwaters? No.
830. Is the quarry close to the river? Yes, the stone is brought down on punts.
831. *Chairman.*] Can you give us any idea of the value of the exports from this river? Not conveniently.
832. You say that in a good year the export of maize amounts to 50,000 bags;—we have been told that maize sometimes brings as much as 2s. 6d. a bushel in the Sydney market; that would make the value of the maize crop £25,000;—do you think the other exports—timber, butter, hides, pigs, fowls, and sundries—would be equal to another £25,000 a year? Yes. I reckon that the maize crop is equal in value to about half the product of the district.
833. That would make the exports of the district £50,000 a year in value? Yes.
834. Have you any idea of the value of the imports? No; but I can give you an estimate of their quantity.
835. Can you tell us how many tons of goods are imported yearly? About 120 tons a month.
836. 1,440 tons a year? Yes.
837. That would be about 30 tons for every trip of the steamer? Yes.
838. About what cargo of maize would the "Rosedale" carry each trip? 1,700 bags is a full cargo.
839. How much would she draw with a cargo like that? Eight feet.
840. Would not that be too much for the bar? She can load to within 6 inches of the depth of water on the bar. Of course she would not get out without touching.
841. The "Rosedale" is a flat bottomed boat? Yes. She is always dragging on the sand in and out.
842. She is said to draw 6 ft. 6 in. when carrying 1,500 bags, or about 150 tons;—is that about an average load for her? That is about an average load.
843. That being her average load, it must take thirty-two trips to move the maize crop;—does the maize season extend over so long a period? She is taking away maize for about eight months. At the beginning and at the end of the season there is not very much to take away.
844. Do the farmers obtain two crops a year? No; only one.
845. Does the corn keep for eight months? Well, the last of it is not of much value.
846. Does the maize grown in this district deteriorate if kept under hatches for several days? Not to my knowledge, unless it is shipped green; then it sweats.
847. It has been represented to us that farmers are often at a loss by reason of the deterioration of the corn under hatches when a steamer is bar-bound;—is that so? I have never known it to occur, and I have had plenty of experience.
848. Can the bar be in a very bad state when the trade of the river has been carried on so satisfactorily of late? I should not say that it is in a bad state.
849. You wish to convey the idea that the traffic could be carried on more easily, more safely, and more regularly if the proposed works were completed? Yes; and at less expense, and with more satisfaction to the residents. If the bar is improved the residents will have the advantage of cheaper freights, whereas only a certain class of steamer can come here now. If the bar were better there might be competition, and that would mean lower freights, and a more regular service.
850. You saw these works commenced;—did you notice that as the wall went out the depth of the water on the bar gradually increased? Yes.
851. Have you noticed that the trade of the district has increased as the bar has improved? Yes.

852. Has the one thing been consequent upon the other? I put down the increase of the trade to the improvement of the bar. F. Doepel.
853. Has there been any other cause for it—a scarcity of production elsewhere, and consequently a better demand for produce? No; I no not think so. 27 May, 1898.
854. We have been told by the captain of the "Rosedale" that the improvement of the trade during the last four years has been wonderful;—can you confirm that statement? I should not like to say the last four years, but during the last two years I have seen a greater improvement in the trade and the district than I saw in the previous twenty years.
855. And this year is keeping up to the standard of last year? This year is better than last year. I can see the trade increasing every month. I have to handle everything that goes out or comes into the river, and, therefore, I notice it.
856. You are impressed with the idea that as the entrance to the river improves so the trade of the district increases? Yes.

James Edward Tyler, farmer and grazier, Guy Fawkes, sworn, and examined:—

857. *Chairman.*] How far up is your place from Bellingen? Forty-eight miles. J. E. Tyler.
858. How long have you been residing there? Only eighteen months, though I have had property there for a considerable time. 27 May, 1898.
859. *Mr. Clarke.*] Have you resided long in the district? For nearly ten years.
860. What was the condition of the river some years ago? It was very bad.
861. Do you think that the work which has been done at the entrance has improved it? I certainly think so.
862. Do you think that the continuation of these works will be beneficial? Yes.
863. What produce do you grow at the present time? Potatoes chiefly.
864. You are close to the Don Dorrigo country? I am beyond Don Dorrigo.
865. How do you get to market? We come by road to Bellingen.
866. Have you any other market? We can go to Armidale and to Grafton.
867. But you generally come here, this being the shortest distance? Yes.
868. Is it your best market? Well, it is only a limited market.
869. If you had better communication by a good road or a railway, I suppose you would send away much more produce? Yes; if we had facilities for getting to the coast, or even to Bellingen, we should send produce to Sydney.
870. What would be the best means of communication for you? A railway.
871. Where? To either Grafton or Coff's Harbour.
872. Would that be better than to come to Bellingen? It would not be better than a railway to Bellingen, because Bellingen is the nearest place to us.
873. I suppose you would like to see a railway made from Guyra through to Don Dorrigo to either Bellingen, South Grafton, or Coff's Harbour? Yes.
874. What would be the best place to tap the coast? Either Coff's Harbour or South Grafton. I presume that you would get a better grade going to those places.
875. Are the potatoes you grow of good quality? They are second to none.
876. How much do you get to the acre? A fair average is about 8 tons. A good crop goes from 10 to 12 and even to as much as 18 tons.
877. In ordinary years, when potatoes are low in price, I suppose it would be impossible for you to send your potatoes to Sydney? It would not pay us to send them there.
878. What have you to pay for land carriage? £2 per ton to get to the Bellinger.
879. Is the land on the Don Dorrigo easily cleared? No; but the country that I am living in is quite different.
880. Is the country where you are living equal in quality to the Don Dorrigo country, or is it better? We consider it better, although the Don Dorrigo country is considered good.
881. Is your country as heavily timbered? Our country is lightly timbered.
882. What description of soil have you? Red volcanic soil.
883. Are there many farmers and selectors where you are? A good many, but the holdings are fairly large. A great deal of land has been locked up by the Government. I understand that it is locked up because of the possibility of a railway coming through it.
884. Is the land there held under annual lease? Most of the land that is locked up from settlement is held under occupation license.
885. I suppose it can be resumed at any time the Government think proper? Exactly.
886. Do you grow anything besides potatoes? Not to send away—only for our own consumption.
887. Can you grow corn profitably there? It is not a profitable crop; it pays better to grow wheat crops. Straw crops grow very well.
888. You can grow oats and barley? Last year I had oats 7 feet high.
889. And wheat? The climate is too wet for wheat.
890. Is there too much frost for maize? The frosts are bad, but I have a good crop of maize this year. They can grow maize very well in the Don Dorrigo country.
891. You would not particularly care where the railway went, so long as it connected your land with some place on the coast? No.
892. Do you think you could compete in the Sydney market, or in any other market, with districts like the Clarence? With railway communication we could supply New South Wales with potatoes.
893. At the present time you have a fair road? It is not a good road, but it is our only outlet.
894. Have you ever been at Coff's Harbour? Many times.
895. What do you think of that place as a port? I am scarcely able to give an opinion on that point. I have seen it in fine weather.
896. Have you seen Woolgoolga? Yes. I should say that Coff's Harbour is the better port of the two.
897. Even in its present state? Yes.
898. If it were improved by a breakwater it would be even more valuable than it is now? I should say so.

Robert Taylor Thorburn, Nowra, sworn, and examined:—

R. T. Thorburn.
27 May, 1898.

899. *Chairman.*] I understand that you are at present travelling through the North Coast districts? I went to Armidale on a visit, and having heard so much about the Don Dorrigo and Guy Fawkes country, I thought I would come down through it and see it.

900. *Mr. Farnell.*] You have resided nearly all your life on the South Coast? Yes.

901. So that you are able to make a comparison between this country and that? Yes.

902. The country through which you have recently come is looked upon as very good country? I consider the Don Dorrigo country as good as any I have seen—that is, for brush country.

903. What is your opinion of it in comparison with the South Coast land? I think it is equal to the best land we have on the South Coast, and would compare with the Kiama district. It has a similar volcanic soil.

904. Do you know the area available there? I do not think there is any land available for selectors. When it was known that I was going down there I was asked to make inquiries about the country by people who were inclined to take up selections, but I could not find that there was any land open to selection. There was land open to selection some five years ago, but it has been locked up again.

905. It has simply been reserved from selection by the Crown? Yes.

906. It still belongs to the Government? Yes.

907. You are aware that it costs a good deal to clear that land? Yes.

908. Do you think that under liberal conditions it would pay anyone to clear that land and to use it for agriculture combined with dairying? Most certainly.

909. Are you satisfied that it presents a large field for the carrying on of such industries? The Don Dorrigo scrub commences about 20 miles back from here, and then for 40 miles you have good land—all fit to take up under conditional purchase.

910. If you were offered facilities to-morrow would you take it up under present conditions? I would not take it up under homestead lease conditions, but if it were thrown open for selection I would be prepared to take it up, supposing a number of other people were taking up land there, so as to form a settlement.

911. Would you consider it rather a hardship if people were induced to settle in that part of the country before it was given the convenience which is hoped for from the construction of the proposed harbour works? Those works are necessary.

912. You think the Government would be justified in spending £36,000 in improving the entrance to the Bellinger? I think it is a most desirable and splendid thing to do, especially if they throw the back country open.

913. You do not think it absolutely necessary that railway communication should be given to that district? No; but it is desirable, perhaps, if the construction of a railway would be justifiable.

914. Still as long as they have access to a waterway by good roads that is sufficient? At the present time a good waterway is all that is necessary.

915. It naturally follows that if facilities are afforded a regular steamer service would be established? Yes; we have two companies sending steamers twice a week to the Shoalhaven, and I do not see why this district should not have two steamers a week. A bi-weekly service is necessary to ensure the success of the dairying industry.

916. Could the natural grasses be depended upon for dairying here? You never get natural grasses where there is brush country. It is only in the forest and open country that you get natural grasses.

917. You have no doubt as to the suitability of the soil for the production of all sorts of fodder? No; the Don Dorrigo country is most suitable for dairying and the production of root crops. I do not think there is anywhere more suitable soil for root crops. Turnips grow there to an immense size. The red soil is splendid for grazing, and the climate is remarkably good. The Don Dorrigo country is at an elevation of 3,000 feet above the sea. That gives a mild summer climate and a by no means severe winter climate. You do not get snow there, whereas at Guy Fawkes, some 20 miles further on and 1,000 feet higher up, the winters are severe and you get snow. I am very much surprised to find that this country has been lying idle so long.

918. Did you take any particular notice of the timber resources of the district? The whole of the district is splendidly timbered with all kinds of useful trees. Of course, the cedar is all gone, but there are several kinds of soft wood. In the Don Dorrigo district there are immense forests of pine. The road up the mountain has been well made, but beyond that it is not good. The timber has been cleared away, but no macadamising has been done, so that in wet weather it is in a very bad state.

919. *Mr. Clarke.*] Would a good road be of as much advantage to the people as a railway? A railway would give them more facilities for settlement. If more settlement took place, and the Government improved the roads, the return freight that the teams could obtain would reduce rates. £2 a ton is an extreme price to pay for the distance carried, but now there is very little return freight.

920. Would it be a good district for pigs? I think so.

921. Pig-keeping is very profitable on the South Coast. Yes; I pointed that out to several of the people I met on the way. Pigs will carry themselves to market. If you can only get that country thrown open the improvement of the Bellinger entrance will be most justifiable.

922. *Chairman.*] You are favourably impressed by your visit to that district? Most favourably.

923. Are you of opinion that it is a district in which a large population can be expected to settle? Certainly.

924. Therefore, if permanent works are constructed now to improve the entrance to the Bellinger they would be of great benefit to the public in the future? Yes.

Frederick Thomas Matthews, storekeeper, Bellingen, sworn, and examined:—

F. T. Matthews.
27 May, 1898.

925. *Chairman.*] You have heard the evidence given in regard to the possibility of connecting the Bellinger with Coff's Harbour by railway, and the likelihood of produce being taken that way for shipment; will you give us your views on the subject? I am opposed to the construction of such a railway, for the following reasons:—A jetty has been built at Coff's Harbour, but I understand that the ordinary life of any jetty is not more than about twenty years; and one cannot be sure that an easterly gale will not wash that jetty away some day. To make Coff's Harbour a safe port a large expenditure would be required, and it would take a considerable time to make a breakwater. Then the railway you speak of would

would cost a great deal. I think very much more could be done by the expenditure of a much smaller sum at the entrance of the Bellinger. In my opinion the proposed works will give a port sufficiently good for the district. I am certain that it will always cost less to send produce direct from the Bellinger by sea than to send it from here by rail to Coff's Harbour, and from there to Sydney. Under these circumstances I do not think that the Government would be justified in constructing a railway.

F. T. Matthews.
27 May, 1898.

926. If the railway were constructed could produce be sent by it more cheaply than from the river direct? No.

927. A railway, it is estimated, would cost £100,000, and 3 per cent. interest upon that would be £3,000. At the present time the freight on maize from Coff's Harbour to Sydney is 1s. a bag, and from the Bellinger to Sydney 1s. 6d. a bag. If the railway is constructed it must at least earn interest. For it to earn £3,500 a year it would be necessary to charge 1s. a bag for the carriage of maize from the Bellinger to Coff's Harbour? Yes; and in addition there would be the cost of bringing produce to the station at Raleigh, say, and the wharfage at Coff's Harbour.

928. Therefore, is it likely that people would use the railway? I am sure that they would not. Some three years ago, when the bar was very bad, because the wall was turning the natural course of the river, the rate to Coff's Harbour from Sydney was the same as to Bellinger from Sydney—that is, 20s. a ton, and 2s. a ton wharfage. I had some goods sent to Coff's Harbour, and it cost me 10s. a ton to have them brought here; and if the weather had been bad I could not have had them carted at all.

929. If the entrance to the Bellinger is improved the steamer rates may be reduced? I am satisfied that if the entrance to the river is improved there will be a large increase in the production of the district and in its imports, and this will make it necessary for the steamer company to reduce its rates. I think that ultimately the rates in this district will be reduced by 25 or 30 per cent.

930. Can you give us any idea of the value of the imports of the district? I have no reason to alter the figures I gave in Sydney. I still think that they must be worth between £35,000 and £40,000. I have found out that the figures I gave in Sydney, in regard to the export of maize, were under the mark.

931. Is there any other point you would like to bring before us? It has been stated that the trade of the Little North Arm would go to Coff's Harbour; but I am certain that it would not. We are as near to Coff's Harbour as is the centre of settlement on the Little North Arm, and we should not think of taking goods to Coff's Harbour. Of course, the Coff's Harbour steamer runs regularly once a week, so that possibly at times some people may send dairy produce there.

932. If the entrance to the Bellinger were improved would any dairy produce go to Coff's Harbour? I do not think so. Of course, cream has gone to Coff's Harbour from Raleigh and Fernmount, because if a man can get his cream away twice a week in the summer-time it pays him to take a little trouble to do so. It would not pay anyone, however, to go to Coff's Harbour if there was a steamer leaving the Bellinger.

933. Do you think it likely that butter-making will be carried on here in the future? Yes; I intend to erect a factory myself, with refrigerating plant.

934. The climate of the Tweed is warmer than that of the Bellinger? Yes.

935. If it is possible to export butter from the Tweed, it will be possible to export butter from the Bellinger? I feel sure of it.

936. You do not consider your country inferior to the Tweed country for grazing purposes? No; I have seen a good part of New South Wales, and I do not think there is any of it superior to the Bellinger for grazing purposes. Of course, our farmers have had no experience in dairying. I own a considerable part of Raleigh, and it is my intention in letting that land to tenants this year to make it a condition that they are to use it for dairying, and not for maize-growing. I am turning some 300 or 400 acres into a dairy farm.

937. What has been possible in other North Coast districts is possible here? Yes; and we are more favourably situated here, because we are closer to Sydney. They are only twenty-four or twenty-six hours from Sydney.

SATURDAY, 28 MAY, 1898.

[The Sectional Committee met at "Black's Hotel," Fernmount, at 10 a.m.]

Present:—

CHARLES ALFRED LEE, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G. | HENRY CLARKE, Esq.
FRANK FARNELL, Esq.

The Sectional Committee further considered the proposed Harbour Works at Bellinger River.

William Richard Spillett, farmer, South Arm, Bellinger River, sworn, and examined:—

938. *Chairman.*] How long have you been residing here? About thirty years; I selected in 1868.

939. Will you make a statement to the Committee? My idea is that the southern training-wall should be finished. It has now reached a critical point, and in my opinion we are liable to be stuck at any moment.

W. R. Spillett.
28 May, 1898.

940. How much further do you think it should be taken out? I fear that a heavy sea and a fresh in the river might block us as we were blocked eighteen months ago, and the channel might then go across the end of the training-wall.

941. Has not the effect of the construction of the southern training-wall been to throw the bar some distance to the north? Yes, since we have had a fresh; but the question is will it keep there.

942. Prior to the construction of the training-wall, what was the state of affairs? Sometimes we had a good bar, and sometimes a bad bar; but since the channel has been open we have had a good bar.

943. Do you not think that the southern training-wall has had a good deal to do with that? Yes. Once the channel was opened it kept open.

944. If the training-wall had not been made, would not the bar have shifted? Yes; the probability is that it might have moved a mile from its present position.

945. There has been a good depth of water all along the training-wall? Yes.

946.

- W.R.Spillet. 946. Nearly 15 feet? Yes. I believe there is good water right along the wall.
- 28 May, 1898. 947. You believe that the southern training-wall should be extended? If that wall were taken a little further out I believe that the South Arm water would keep the channel clear until the other wall was finished.
948. If the proposed works were carried out, do you think the southern training-wall would need to be extended? I believe that we should have a good bar if the proposed works were carried out. I was under the impression that the southern training-wall had not been taken out so far as it is shown on the map.
949. Where is your place? On the South Arm, about 12 miles from the Heads.
950. I suppose you grow maize and ordinary products? Yes, and I go in for dairying.
951. Is your land situated on the river bank? Yes.
952. I suppose you have no difficulty in getting your produce to market? Sometimes I have.
953. How are you inconvenienced? Well, on the South Arm, there are not many of us.
954. How many people are there there? I suppose not more than forty.
955. Have you been put to inconvenience and loss by not being able to get produce to market because of the bad state of the bar? Yes, at different times; but for some time our chief difficulty has been that we are too much out of the way. We are not on the main river.
956. Are we to understand that the North Coast Company do not send for your produce as often as they send for the produce on the Main Arm? That is so. There is more traffic on the Main Arm.
957. Then you are inconvenienced, not by the bad state of the bar, but by the bad arrangements of the steamship company? Yes. Of course, when the bar is bad, we are put to double inconvenience.
958. How can we overcome your difficulty? If the entrance is improved we shall be able to overcome the difficulty ourselves, because we shall be able to invite competition.
959. You think that if there were a good entrance other shipping companies would be inclined to compete for the trade of the river? Yes; we are now at the mercy of one company.
960. The steamer that trades here runs pretty regularly? Yes.
961. Once a week, as a rule? Yes, I believe so.
962. Does not that give you a sufficient opportunity to get away your produce? Well, I will give you an idea of how we are situated. The corn-pulling has been on since April, and the North Coast Company's punt has been down the South Arm only once this season.
963. How do you get your stuff away? On the punts.
964. When the droghers choose to come for it? That is just it.
965. You have no punts of your own? No.
966. No roads along which you could cart it? No.
967. Have you noticed much development in the district since you have been here? Yes; it has made steady progress.
968. Has it made much progress of late years? Yes; it has made a great deal more progress of late years than formerly.
969. During the last six years? During the last ten years.
970. Has there been very rapid improvement during the last four years? I do not know that there has been anything extra. The place has made steady progress all the time.
971. To what do you attribute that? To the increased settlement to which the harbour works have given an impetus. They have given us heart to improve our land and to raise more produce.
972. What inducement have you had to increase your cultivation? We have had the hope that we shall be able to get more produce taken away. We have gone in for dairying, and there being more people about, we have been able to sell our produce. If the entrance is improved, and we can get regular steamer communication with Sydney, I intend to send cream to Sydney. At present that is impossible.
973. Why? Because we do not know when the steamer will come in and when she will not.
974. It is possible for the people to send cream from the Main Arm? But where I am it is so far away. I am 12 miles up the South Arm, and it takes the best part of the day to come in to the steamer, and perhaps, when I get in she is not there.
975. Are you prepared to swear that there has been a marked improvement in the district since the works at the entrance were commenced? I believe that there has been an improvement.
976. Is the land in your part of the district as good as the land in this part of the district? No.
977. Which do you consider the best part of the Bellinger River? From Fernmount up. On the South Arm the best land is from where I am up the river. The land on the lower part of the South Arm is only fit for dairying.
978. *Mr. Roberts*] Has the "Rosedale" ever gone to Sydney, leaving your own and your neighbours' produce on the wharf? We do not draw our produce from our barns until the droghers come up.
979. Do those in charge of the droghers, although they know that you have a number of bags of maize for shipment, allow the steamer to go away without giving you an opportunity to ship it? Well, the Main Arm stands first. Very often a steamer cannot take in one trip all the produce that is waiting for her, and we on the South Arm have to wait until the glut on the Main Arm is over.
980. Is it not usual to give the drogher people timely notice that there are so many bags of maize to be taken away? As a rule, many of us do not bother about giving notice, because it is of no use to do so. The drogher-master generally lets us know when the punt is coming up. I generally get news from the store here.
981. Do you think that if the entrance is improved rates will be reduced? I consider that if the entrance is improved our position will be better all round. I think we shall get a reduction in rates and a better service. If one company did not serve us properly, we could induce another company to enter into the trade.
982. You are not properly served at the present time? A long way from it, I consider.
983. What do you think ought to be done? I could not suggest anything at the present time.
984. Is it not usual for people having produce to ship to acquaint the drogher-master of the fact? Yes. When the punt is up, I always let them know; but it is useless for me to go to Doepel, and say to him, "I want to send away fifty bags of maize," unless I can tell him that he can get a punt load. He will not go unless he can get a punt load.
985. What do you send away besides maize? Nothing, except pigs sometimes. Butter I sell locally.
986. How long have you been manufacturing butter? I started in a small way first, seven or eight years ago, and I gradually increased my output.
- 987.

987. Are the results satisfactory? Not so satisfactory as I should like. Sometimes I can sell my butter, and at other times I could sell more than I can make. If we had a good steamer service I could send butter direct to Sydney, and sell it to the best advantage.

988. Have you been long enough at the dairying business to be able to form an opinion as to whether it is more profitable than maize-growing? I should continue to go in for both. I do not believe in having all my eggs in one basket.

989. Do you know anything of the country to the west of the Bellinger;—have you ever been to the Don Dorrigo? No, I have never been there.

990. Have you represented to the North Coast Company that the convenience of yourself and of your neighbours is not studied? I have often made complaints to the Company when things have gone astray, but I have got very little satisfaction.

991. Have you put your complaints into writing? Yes.

992. Is there a sufficient quantity of produce grown on the Bellinger to require a more frequent steamer service than you have now? That I cannot say.

993. Is it not fair to assume that if the export of the district were sufficiently large the Company would send another boat? Of course there are times when all the farmers are wishing to ship, and then the steamer accommodation is not sufficient, and we have to wait. No matter what corn is bringing in Sydney we have to wait.

994. What is the depth of water in the South Arm? As far as the quarry there is more water in the south arm than in the Main Arm.

995. There is nothing to prevent the drogher from going up there? There is nothing to prevent a steamer going up, except just where the punt crosses. From there to the quarry it is deep water all the way.

996. How far do the droghers go up the South Arm? About 3 miles above where I am. Produce from the upper south arm is drawn to Fernmount. A place called Hanley is the head of navigation for punts.

997. That would be about as far up the South Arm as Bellinger is on the Main Arm? About the same.

998. What is the area of your selection? 230 acres.

999. How much of that land is under cultivation? This year I have cultivated about 25 acres.

1000. During your thirty years residence, have you always had that area under cultivation? No. I have added to different selections, and increased my holding. I commenced with 50 acres, and then made additions.

1001. How many acres of your land are alluvial? I have 23 acres on the river banks, and another 20 acres on a creek at the back; the rest of the land consists of forest ridges.

1002. Is the land all cleared? No, parts of it are cleared.

1003. Do you regard it as good land for dairying? Yes, when once I can get it under grass.

1004. Do you think that dairying will show a marked increase in the near future? Yes, I see nothing to prevent it increasing.

1005. During the last two years the ocean steamer has never been prevented from going to sea through want of water on the bar? I do not think so.

1006. If she has been delayed at all it has been by heavy weather affecting all the ports on the coast? Yes.

1007. Have you heard anything said as to the desirability of connecting the Bellinger with Coff's Harbour by railway? Yes.

1008. Would such a connection be of advantage to you? No; our produce would go direct from the Bellinger in any case.

1009. You hold the opinion that it would be better for every one on the river that the entrance should be improved so that produce may continue to go direct to Sydney? Yes.

1010. To send it by rail to Coff's Harbour for shipment would be too expensive? Yes, and there would be too much handling and loss.

1011. The produce would be apt to deteriorate? Yes, and I believe the expense would be great.

Andrew Black, hotel-keeper, and Secretary to the Progress Committee, Fernmount, sworn, and examined:—

1012. *Mr. Clarke.*] I suppose you are pretty well acquainted with the whole of the Bellinger district? I am.

1013. Do you think the work already done at the entrance to the river has been beneficial? Undoubtedly.

1014. What is your opinion in regard to the proposed extensions? My opinion is that even if the breakwaters are not made if the training-walls are extended, we should have a sufficient depth of water at all times. I am satisfied of that, because of what I have seen of the effect of the existing training-wall.

1015. What is the depth of water on the bar at high tide now? Eight feet, last time I heard. My experience on the Bellinger during the last twenty years has been that whenever the bars at the Hastings, the Macleay, and the Nambucca have been shoal we have been completely blocked, but last year it happened that when those bars were shoal we were able to get our produce away over the Bellinger bar. The "Rosedale" went out last year all through the season carrying from 1,500 to 1,700 bags each trip. We had the second best bar on the coast throughout the year.

1016. Do you attribute the improved state of the entrance to the work already done? Certainly.

1017. If the works are extended vessels of a larger draught of water than now trade here will be able to come? We want regular steamer communication and large vessels. I have been here at a time when only one little vessel could get out in two months. We want the steamers to be able to come in and get out at any time.

1018. You do not expect that vessels will load here with maize or timber for intercolonial markets? No, I do not expect that.

1019. You think it will be sufficient if vessels of fair tonnage are allowed to come in and out? Yes. With reference to Mr. Spillett's evidence about the channel running past the end of the south training-wall, I should like to point out that the proposed northern training-wall will stop that. While the southern training-wall was being carried out it was at first not sufficiently strong to turn the flow of the water, and the water coming from the main arm used to run across past the end of it, forming a channel towards the south.

1020. *Chairman.*] But you are of opinion that if the proposed northern training-wall were made there would never be any danger of that occurring again? I am convinced that the northern training-wall would make a perfect job of the work.

1021.

W. R.
Spillett.

28 May, 1898.

A. Black.

28 May, 1898.

- A. Black.
28 May, 1898.
1021. *Mr. Clarke.*] A witness in Sydney spoke of there being a fear of the river breaking out through the terrace 2 or 3 miles to the north of the present entrance? There is a danger of that. The spit of land dividing the main arm from the ocean is very narrow, and the danger is that a flood coming down the main arm might come through it. I should like to see the northern training-wall taken up the river to a point about opposite the mouth of Back Creek.
1022. I understand that most of the produce of the river is taken down to the steamer by droghers? Yes.
1023. If the river were improved as we hope it will be, would it be possible for steamers to come direct to Fernmount? Quite possible; very little dredging would be required. The "Buroka" came up here the other day, although there has been no dredging on the lower river for eighteen months. With a few weeks' dredging I think even the "Rosedale" could come up.
1024. I suppose if the steamer came up that would save droghering expenses? It would be profitable for both shipowners and shippers for the steamer to come here. The company could then reduce the rate for maize to 1s. a bag, and be better paid than they are at the present time, while we should save 6d. a bag.
1025. Does the droghering cost 6d. a bag? The droghering one year cost as much as 11d. a bag, so that the steamer company only received 7d. a bag. The rate of 1s. a bag from Fernmount would suit both parties.
1026. And if the river were improved there would be competition? With a good entrance we should get competition. We want to have the river dredged, and then the Bellinger will be good for all time. If the works at the entrance are not completed there will be a chance of the channel shifting.
1027. Can you give us any idea as to the value of the imports of the Bellinger? No; but it must amount to a good deal. We have several business places, and all do very well.
1028. I suppose the principle article of export is maize? Yes.
1029. Can you tell us how many bags of maize have been sent from the Bellinger yearly during the last three or four years? I suppose from 35,000 to 40,000 bags would be our average export of maize.
1030. In a good season I suppose you would send more? I think 50,000 bags is about what we sent in our best year. In a flood year the yield is only 27,000 bags.
1031. I suppose you seldom suffer from droughts here? No. Dry years are our best years. We suffer severely from floods in wet years.
1032. What do you consider the value of the maize? During the last few years it has averaged from 8s. to 10s. a bag.
1033. That would be pretty well 2s. 6d. a bushel? Under 2s. 6d. a bushel. Some years we have got more. Some years we have cleared 15s. a bag.
1034. But take the Sydney price? I suppose 2s. 6d. a bushel would be about the average price last year. It varied from 2s. 9d. to 2s. 3d. a bushel.
1035. Two shillings and sixpence a bushel would be the average price for an ordinary year? Eight shillings a bag would be about the net value of our maize to us.
1036. *Chairman.*] What would be the gross value of the maize;—would it be worth 10s. a bag? Last year the maize exported must have been worth £25,000.
1037. You think that that is a fair estimate of the value of the maize crop of the Bellinger? I think so. Sometimes we send away less maize and get better prices for it.
1038. *Mr. Clarke.*] What other produce do you export? Pigs, poultry, eggs, and, lately, a large amount of cream. Dairying is a new industry here, but it is increasing very much.
1039. What about the timber? There is a large amount of timber sent away. We have two saw-mills constantly at work.
1040. Is only sawn timber sent to Sydney? No; round log timber also goes.
1041. Any cedar? Very large quantities of cedar have been shipped from here, but it is getting scarce.
1042. Do you think it likely that dairying will be successful on this river? Yes; we have tried it sufficiently to know that it will be successful.
1043. As a rule, is not mixed farming more profitable? Yes. There is a lot of land here which can be utilised for grazing purposes, but which would not do for maize-growing. We should be able to continue to grow almost as much maize as we grow now, and, in addition, to raise a large quantity of butter.
1044. You will graze your cattle on land away from the river? Yes; on the back lands. Some of the poor land could be used to advantage in that way, especially on the lower river.
1045. Do you think the rich alluvial flats will be used for dairying? I do not think so at the present time. I think there will be mixed farming here for years.
1046. On the alluvial lands you would have to sow grasses? Yes.
1047. What kinds of grasses do you sow? Clover, rye, and different grasses. The water-couch, which is a natural grass, is equal to any artificial grass. In twelve or eighteen months it spreads all over the paddocks.
1048. Does it do well in the winter time? It is the best grass you can have. The cattle are fond of it, even when it is dry.
1049. I suppose it is the practice at the creameries to separate the milk, and to send the cream to be made into butter in Sydney? Yes; I believe that that is more profitable than to make the butter here. Some people who are too far from the creameries separate their own milk.
1050. I suppose that in time all the cream will be sent to creameries? I think so, when there are more of them. It pays better to send to a creamery than to separate for yourself.
1051. Is not cream likely to spoil, if it is kept on board a steamer for three or four days? When we have a good entrance, I think we shall be able to offer inducements to the steamer companies to put refrigerating machinery into their boats.
1052. What are your views with regard to the proposed railway from the Bellinger to Coff's Harbour? My idea is that if that railway were made, maize and other produce would still be sent away from the Bellinger direct. No doubt some people would use the railway to send cream to Coff's Harbour to catch the steamer there when there was no steamer leaving the Bellinger.
1053. *Chairman.*] A railway to Coff's Harbour would cost about £100,000. Three per cent. interest on that amount is £3,000. If 50,000 bags of maize were sent by rail, and 1s. charged on each bag, the return obtained would be only £2,500? Yes; but you would not get the maize.
1054. It would not be sent by the line? No.
1055. Does not that pretty well settle the matter at once? The people would not be likely to use the railway much.

A. Black.
25 May, 1898.

1056. *Mr. Clarke.*] I suppose the same remarks would apply to a railway from Guyra through the Don Dorrigo scrub to Coff's Harbour? I cannot speak about that line. No doubt Coff's Harbour would be a good outlet for a great deal of country, but I cannot say if the line that you speak of would pay. It would open up a good deal of country.
1057. Is the road from here to Don Dorrigo a fair road? Yes; but it is too far to draw produce with profit.
1058. You do not approve of the construction of a railway to Coff's Harbour? I should like to see a railway made, but I do not think it would be used for the carriage of maize or anything like that. We might use it to send cream sometimes.
1059. *Mr. Roberts.*] Is Fernmount regarded as the head of navigation on the Bellinger? Yes; we have had the "Euroka," the "Avon," and the "Belmore" here.
1060. Have they brought cargoes up here? Yes; there is a sufficient depth of water to enable vessels of light draught to come here at the present time, and with a little dredging we could bring the "Rose-dale" up. What we require is to have the north training-wall finished, so that we may bring vessels up the Main Arm. Until that wall is finished, it will be impossible for vessels to cross the sand-bar at the junction of the two arms.
1061. It would be a great convenience to you to have the steamer come to Fernmount? It would be the greatest advantage the district could get.
1062. Have you told the Department that you want the river dredged, in order to allow vessels to come up here? Only lately we have had a dredge doing temporary work on the North Arm. I consider that a lot of valuable stone is now being thrown away which would be of more use in the construction of a temporary bank than is the sand pumped by the dredge. In my opinion all the inner walls could be done with smaller stone than they are using, at a saving in cost. We have had sailing vessels up here. One came up and unloaded bricks at the wharf here.
1063. At the present time the authorities are devoting their attention to the improvement of the entrance? Yes.
1064. Does the sand accumulate at the junction of the North and the South Arms? Yes; but I think the water in the Main Arm has deepened since the temporary bank was commenced. That bank directs the current on to the sand-spit, and causes a better scour.
1065. Is any work going on in the South Arm at the present time? I do not know exactly where they are putting the stone at the present time.
1066. When the "Euroka" came up a few days ago did she take any produce away? She could have taken 1,000 bags, if it had been here for her to take; but the punts got stuck up above, and she could not take them.
1067. Would there have been sufficient water to enable her to go down loaded? At high water she could have taken down 1,000 bags.
1068. Do you get all your goods from Sydney by the North Coast Company's boats? Yes.
1069. Are they landed on the Government wharf at the Heads, and brought on here by drogher? The stuff is put on board the drogher direct.
1070. Has the river ever been so bad that you have been forced to get your goods up in some other way? In one year we used Coff's Harbour. Fortunately that happened to be a dry time. If the season had been wet we should not have been able to draw over the road.
1071. Are the rates to the Bellinger the same as the rates to other rivers? No; they are nearly as much more.
1072. Is that because of the dangerous state of the entrance? Mr. See told me that when the bar was bad here they lost a considerable amount of money, and they want to recoup themselves now that the bar is good. Besides, we cannot get opposition now. We intend, however, to have the river opened up, so as to do away with the droghering, and to bring the steamers right up. We cannot offer any inducement to a company to send steamers here until the river is opened up. The entrance has given us very little trouble during the last year or two. All the other river entrances, except the Clarence entrance, have been in a worse condition than ours.
1073. For the last two years you have had no delays? When the wall was going across the channel the bar was very bad; but when once the wall got far enough out to turn the water we had no more trouble. The temporary northern bank is improving things still further.
1074. The bar does not shift now as it did previously? No. It shifts, but nothing worth speaking about. I have seen it break out a quarter of a mile from where it was before,—the old entrance perhaps remaining blocked for two or three months.
1075. If the entrance continues in the future to be as good as it is now, that is about all you will want? Yes. We cannot, however, rely upon the permanency of the work until the northern training-wall has been constructed; but during the last eighteen months we have had no reason to complain.
1076. You feel that if these improvements are carried out they will be highly satisfactory? They will be all that is required. Of course, I should like to see a railway made to Coff's Harbour, but I know that such a line will not pay.
1077. Is not the road to Coff's Harbour a very good one? Yes; but, of course, it would never pay us to draw goods to Coff's Harbour.
1078. When you were compelled to have your merchandise sent to Coff's Harbour, how much more did it cost you? It must have cost a good deal more, though I never got anything brought that way myself. I waited until there was an improvement of the entrance here. It cost us 2s. a bag to send our maize away that way—1s. a bag to draw it to Coff's Harbour, and 1s. a bag to take it from Coff's Harbour to Sydney. We hope ultimately to be able to send it direct for 1s. a bag.
1079. *Chairman.*] Have the Progress Committee compiled any statistics to show the condition of the district? No.
1080. Do you think the export and import trade of the district can fairly be estimated at about £90,000 a year? Yes.
1081. With the probability of a large increase in the future? Yes.
1082. You expect such an increase if the entrance to the river is improved? Yes; there is a lot of land now lying idle which will be used for dairying if we get a regular steamer service. With a bad entrance we could never take advantage of the market.

- A. Black.
28 May, 1898.
1083. You are of opinion that the settlers here are inconvenienced by not being able to get their produce to market so as to take advantage of favourable prices? Yes; we have lost heavily from that cause in past years.
1084. To obtain maximum prices producers must be able to take advantage of the market? Yes. When maize has been selling at 6s. a bushel, our maize has been spoiling because of the bad state of the entrance; but I do not think that that is ever likely to occur again.
1085. You have expressed the opinion that unless the northern training-wall is taken up the main arm to a point opposite the mouth of Back Creek, there is a chance of the flood-waters of the river breaking through the terrace to the north? Yes.
1086. Prior to the commencement of the temporary bank, did you ever know the flood-waters to break through that terrace? Many years ago the bar was a long way north of its present position.
1087. But have you ever known the river to break through above the temporary bank? No; it has never done so.
1088. Then why do you think it is likely to do so? Because the ocean seems to be working into the spit from the outside and narrowing it.
1089. The object of the northern training-wall is to direct the water coming down the main arm upon the spit at the entrance? Yes; that is what is required.
1090. The temporary bank is designed to save the large expense of making a training-wall right up the river? Yes.
1091. Suppose the river were likely to break through the terrace, would it not be easy to extend the northern training-wall? Yes.
1092. Such an extension would not interfere with the general design of the scheme? No, not at all.

F. R. H. Baker, auctioneer, Fernmount, sworn, and examined:—

- F. R. H. Baker.
28 May, 1898.
1093. *Chairman.*] How long have you been here? Thirteen years.
1094. *Mr. Roberts.*] Have you made yourself acquainted with the scheme for improving the river entrance? I have seen the work now in progress, and from casual observation I have a fair idea of what is intended.
1095. Are you able to tell the Committee if, since the work has been commenced, there has been a marked improvement at the entrance to the river? Yes, a very marked improvement.
1096. Do you know the average depth of water on the bar now? I should think about 7 ft. 6 in. is the ordinary depth, but it varies.
1097. Does not the "Rosedale" draw from 7 ft. 6 in. to 8 feet? Yes; but she can get out when she has only 6 inches to spare, and they do not load her to her full capacity.
1098. So far as you know there has been no delays since the harbour works were commenced? Not on account of the state of the bar. I believe that on one occasion a small sand-bank was formed through the temporary wall breaking away.
1099. Was it removed by the dredge? The dredge went down and filled up the gap in the wall, and there has been no difficulty since.
1100. Since the improvements have been made has the district advanced;—are there more people coming to the river? There has been a better tone throughout the entire district, because of the assurance that we shall have communication with Sydney unhampered by continual interruptions through the bad state of the bar. People have more confidence in investing their money here now, and in making improvements upon their property. When I first came here 2s. 6d. a bag was charged to send maize to Sydney, but now the charge is only 1s. 6d., and there is room for a still further reduction. Such a reduction will come, I think, when we get competition.
1101. You have a good knowledge of the value of the land in the district? Yes.
1102. Is there much demand for land here? There has not been much demand for land during the past four or five years, but now there are inquiries for it, and there seems to be a move in land. The Raleigh estate changed hands about twelve months ago. It has been purchased by a local man, but for a long time it was lying idle. That is one of the best estates on the lower river.
1103. Has it a water frontage? Yes.
1104. What was the purchase money? The estate comprises 900 acres, and it was sold for £7,000.
1105. I suppose the whole of the land is not first-class;—is any of it swampy? It was swamp land, but it has been drained. It is more suitable for dairying than for agriculture.
1106. You do not regard the whole of the 900 acres as first-class agricultural land? No; I should say 600 acres might be called agricultural land, and the rest grazing land.
1107. Do you regard £8 an acre as a good market price? No; but it would be for an estate of that area.
1108. Was this what you would call a forced sale? It was a mortgagee's sale, but the land was sold privately, not by auction.
1109. What would that land be worth if it was sold in small lots;—upon how many acres could a man and his family get a fair living? I should not think he would want much less than 40 acres.
1110. Could a man live on that? Yes.
1111. Supposing the land were cut up and sold in 50 or 100-acre blocks, what would be a fair price for the best of it? About £12 or £13 an acre.
1112. It is splendid maize-growing land? Yes; but it is better suited for dairying. It is subject to floods.
1113. Does the purchaser intend to use it for dairying? Yes; he has let a large part of it now to be used in that way.
1114. Is there much dairying in this district? Not a great deal, but the district is going ahead pretty fast. A few years ago there was no dairying here at all, but now there are four creameries on the river.
1115. Do you have many inquiries from people outside the district for land suitable for dairying? Yes. When people inquire for land here they generally ask if it is near a creamery, and is it suitable for dairying.
1116. Do the farms on the river often change hands? Not very often, except where mortgagees force a sale.
1117. Do you regard the Bellinger district as a prosperous one;—are most of the people here well-to-do? They are comfortable.

F. R. H.
Baker.

28 May, 1898.

1118. Is your business pretty well all connected with the selling of land and property? Yes; but I also sell cattle, horses, sheep, pigs, and anything there is to be sold. Mine is a very mixed business. I also buy maize, and I have a number of agencies.
1119. Over what extent of country does your business extend? From Kempsey to Mooney Creek on the north. Mooney Creek is about 14 miles north of Coff's Harbour.
1120. Do you do any business in the country between here and the table-land? Occasionally I sell cattle or a piece of land for the people there.
1121. Are there any sheep in the district? Not a great many. There are a good many cattle in the district you speak of. 10,000 head of fat cattle were sent away from the Guy Fawkes country last year. The paddocks there are used for fattening rather than for grazing. The people buy store cattle and fatten them.
1122. That country is very rich? It is splendid country.
1123. What is it best adapted for? Potato growing, dairying, and the fattening of cattle.
1124. The rearing of pigs? Yes; but I think it can be put to a more profitable use.
1125. Does it pay to grow potatoes there;—can they find a market for them here? Not at the present time.
1126. It would not pay to send them to Sydney? Not unless the market is very good. They have to pay £2 a ton carriage.
1127. Is the timber industry here in a flourishing condition? It is going ahead very fast. A sawmill was lately erected at the Bellinger Heads, and there is another at Raleigh. Both mills are working pretty well full time.
1128. Do you know where the timber is sent? To agents in Sydney. From Sydney it may be sent to foreign places.
1129. Is any sugar grown in the district? Not now. Some was grown here a few years ago, but it did not do well enough. The frost interfered with the cane, and there was a great fall in the price of sugar. Out towards Coff's Harbour there were several mills, but they had to close down. They could not continue at the prices paid.
1130. What is your opinion in regard to the advisability of constructing a railway to Coff's Harbour? I am of opinion that such a line is unnecessary, and would never recoup its cost. I am in favour of improving the entrance to the Bellinger.
1131. *Chairman.*] Can you suggest any other way in which the district can be better served? No; there is no other outlet for us.
1132. Can you be better and more cheaply served in any other way than by the opening of the river? I think not.
1133. What is your idea of the future of the district;—do you think it is capable of doubling or trebling its returns? I think they may be very largely increased if we get better communication with the Sydney market.
1134. Do you think the production of the district can be trebled? I would hardly like to say that, but I think it might be doubled. We do not send fruit from here, but I do not think there is any better place for the growing of fruit.
1135. If a reliable entrance can be given, and cheaper rates of freight are established, do you think the district will advance? I am as confident as one can be that it will.
1136. You are subject to no drawbacks here except the floods? Yes.
1137. And they do not happen every year? They have not happened for the last two years, but before that for seven or eight years we had them very regularly.
1138. The flood difficulty may, to a large extent, be mitigated by the improvement of the entrance? Yes.
1139. Are there any flood canals in the district? No.

Robert Stuart McDougall, Fernmount, sworn, and examined:—

1140. *Chairman.*] How long have you resided in the Bellinger district? Since 1863.
1141. Continuously? Yes.
1142. *Mr. Farnell.*] Had you resided in the Colony before coming here? Yes.
1143. Where? For a short time on the Macleay, but principally in Sydney.
1144. Were you on the south coast at all? I never resided there.
1145. During your residence here you have experienced the inconvenience and disabilities from which the district has suffered from want of a proper port? Yes; we have suffered severely.
1146. You remember the condition of the entrance before the harbour works were commenced? Yes.
1147. What were some of the disabilities from which you suffered? Sometimes we had no outlet at all. We have had to burn our crops here. I, for one, have had to do it.
1148. Why had you to burn your crops? We could not get them to market.
1149. Could you not use them for feeding pigs or poultry? If we had had pigs and poultry we should have had no market for them.
1150. What is the quality of the maize grown in this district? There is none better.
1151. Does it contract weevil quickly? All maize will contract weevil on the north coast.
1152. Is there not a maize which is to some extent proof against weevil? I do not know of it.
1153. What has been the effect of the harbour works upon the river? The effect has been good.
1154. Have they answered anticipations? Yes, so far.
1155. They have allowed a more regular steamer service? Yes, especially during the last two years.
1156. Has that had an effect upon the trade of the district? Yes; there can be no doubt about it.
1157. Has it caused the district to progress? Yes. The farmers get their returns more regularly, and they have more money to spend in the stores and in other ways.
1158. You are satisfied that the work already done has been thoroughly justified by its efficiency? Yes.
1159. Has the improvement which has resulted been an incentive to the farmers to put larger areas under crop? Yes, and especially to go into the dairying industry. As we were situated before, we could not get our cream and butter to market. Now, with a regular steamer service, we send cream to market, and get within a trifle for cream what the butter sells for in Sydney. There are a number of inquiries now from outsiders who wish to start dairying for land suitable for grazing. There is a great deal of waste

R. S.
McDougall.

28 May, 1898.

R. S.
McDougall.
28 May, 1898.

waste land here—land which is not fit for agriculture, but which is good grazing land. Now that we are getting dairy factories here, people see the advantage of bringing the forest land into cultivation. That causes an increase of cultivation and more prosperity to the district. Without regular steam service we could not use this land. A large number of pigs are shipped from here, and we could not afford to send our produce away by sailing vessels.

1160. You have not the slightest doubt that if the proposed scheme were carried out people would be disposed to still further improve their land? Yes.

1161. You say that there are areas at present not used which might profitably be used for dairying? Yes.

1162. I suppose that within a reasonable time you will have butter factories established here? No doubt.

1163. What would be a payable yield of maize in this district? There have been yields of 75 and 80 bushels to the acre, and I have had as much as 100 bushels from an acre, but I think that from 35 to 40 bushels is a fair average yield.

1164. At what price will maize pay the farmer? A great deal depends upon his outlay. At the present time the rates, commission charges, and so on, are very high.

1165. Would 2s. a bushel be a payable price? Yes, if a man could get that clear.

1166. If maize-growing proves a failure it is possible that mixed farming might meet with success? Yes, and I think it is advisable to go in for mixed farming. There is a great consumption of maize, and this consumption is increasing.

1167. Have you ever known of the farmers being inconvenienced through the steamers not being able to come here regularly? Yes; a few weeks ago people had their maize thrashed and ready in the barns waiting for the steamer, when, just by chance, the "Euroka" came in and relieved them. The "Rosedale," the regular steamer, is often sent to Port Macquarie, to the Macleay, and sometimes even to the Richmond and to the Manning. If she traded here regularly we should not be put to so much inconvenience. The barns are blocked up sometimes in the expectation of a steamer.

1168. Do you think that if the proposed works are carried out there will be a reduction in rates? Yes. That will mean competition.

1169. Do you think it will be necessary to do something more to assist the people living on the South Arm? I think they must depend upon the steamer companies.

1170. Do you not think it will be necessary to have the river dredged to a considerable extent? The South Arm has better water than the main arm,

1171. But is the convenience of the farmers on that arm met? Well, they have better navigation than we have on this arm at the present time.

1172. But there is not a sufficient depth of water to allow the larger steamers to go there? No.

1173. I suppose it would be a costly undertaking to make the river navigable for large steamers? I do not know what it would cost.

1174. What proportion of the land held by the farmers in this district is cultivated by them? I do not know.

1175. I suppose they have land still available for cultivation? Yes; that land will be made use of now that dairying has started here.

1176. Do you know the Don Dorrigo district? I was never there.

1177. Do you think that if the proposed works were carried out the trade of that district would come here? I could not say.

1178. Do you think it is more likely to go to Coff's Harbour? I could not say.

1179. Do you know Coff's Harbour? I have been there.

1180. You have heard of the proposal to connect the Bellinger with Coff's Harbour, and to improve Coff's Harbour? Yes.

1181. Do you think there is any justification for that work? I do not.

1182. Do you think the trade of the district warrants an increased expenditure upon the improvement of the entrance to the Bellinger? Yes.

1183. Do you think the district will develop sufficiently to justify a further expenditure of £36,000? Yes; especially if they carry out the original idea. I do not approve of what they are doing now. I know what was proposed by Sir John Coode, and I think the original scheme is the proper one to carry out.

1184. Will you explain to us what you think should be done? One proposal was to block the main arm altogether, and to make Back Creek the main channel.

1185. *Chairman.*] Whose proposal was that? Mr. Darley's. He did not like to recommend the main arm scheme because of the great outlay it would entail, and the small population of the district. Now, however, they have decided to make the channel down the main arm. The second proposal was to start a wall on the eastern bank of the North Arm, opposite Back Creek, and to carry it down, as shown on the plan. With the present scheme, however, there is a danger of the sea breaking through the sand-spit to the north of the temporary bank. If the training-wall were carried further up the main arm that danger would be averted. I would recommend that the training-wall should be carried further up the main arm and that there should be no abrupt bend in the line of wall.

1186. *Mr. Farnell.*] If the proposed works are carried out they will be of great benefit, but they stop short of what you think should be done? Yes.

1187. There will be no difficulty in continuing the wall you speak of in the future if it is thought desirable? No.

1188. The complete scheme will cost £171,000? Including what is already done. I would point out that smaller stone, which would only cost half as much, could be used for some of the walls, and the work would then be done more quickly.

1189. Has the timber industry developed since you have been here? It shows signs of improvement; we have now a second saw-mill here.

1190. Do you think it will be some considerable time before the sources of supply are exhausted? Yes. There is nothing that would benefit the district so much as the improvement of the entrance to the river.

1191. *Chairman.*] Do you wish the Committee to understand that unless Captain Howard's proposal is carried out there had better be nothing done at all? The work that has been done has been of great benefit to us.

1192. But this is not Captain Howard's scheme? Part of it is.

1193. Do you think the works now designed by the Engineer of the Department are likely to prove effective? Yes, except that I should like to see the northern training-wall extended. So far as the work has gone the money has been well and wisely spent.

1194. I presume you take rather a hopeful view of the future of the district? Yes.

1195. Do you think its conditions are such as will induce close settlement and a large increase of production? Yes, if the harbour works are carried out. Unless we have a fair outlet to market it is of no use to try and produce very much. These improvements will, I think, give us a regular steamer service at a reasonable cost.

1196. Do you think the stability of the district warrants the expenditure? Yes.

1197. If the North Coast Railway were at your doors would you use it to send maize and timber to Sydney, or could these products be taken more cheaply by steamer? They would go by steamer.

1198. The best way to open the district is to improve the entrance to the river? Yes. Nature has given us this entrance, and we have only to improve it. For a short time nature and science were working against each other, and science has now carried the day.

R. S.
McDougall.
28 May, 1898.

John Pollock, cordial and aerated-water manufacturer, Fernmount, sworn, and examined:—

1199. *Chairman.*] Have you been in the district for any length of time? About fourteen years.

1200. Where were you residing previously? At Nowra, on the south coast.

1201. What is your impression of this part of the country as compared with the south coast country? I think that in a few years the north coast country will compare rather favourably with the south coast country. They are now going into dairying here, and a great deal of our land is well adapted for the industry. The ridge land is well suited for grazing, and in times of drought provides dry places for the cattle to go to. The hill country is hard to clear, but eventually it will all be brought under grass.

1202. Do you think the land is good enough? It seems to grow grass very well once the timber is taken off it.

1203. I suppose there is not much agricultural land lying back from the river flats? There are several flats away to the north which have not been taken up.

1204. What is the nature of the hill country to the back? The hills are of a slaty formation.

1205. Is there any mining in the district? Not a great deal. There was some gold-mining at Deep Creek; but at the present time that is stopped.

1206. Are you able to confirm what has been said by other witnesses in regard to the development of the district during the past five or six years because of the confidence inspired by the improvement of the entrance? Yes; when I came here, fourteen years ago, we only just got over the breakers with the steamer, and we could not get to the wharf at all. Now the boat can get up to the wharf, and lie there in deep water. We had hard work to get up here when I first came.

1207. Has the improvement to the river entrance led to an increase in the passenger traffic? I think so.

1208. How do people travelling to Sydney go from here? From the river direct.

1209. They do not go to Coff's Harbour or to Grafton? Sometimes they go to Coff's Harbour if our steamer is not calling regularly.

1210. Is the fare less from Coff's Harbour? Yes, and rates generally are less from there. I have a factory at Coramba. From Coff's Harbour I pay 8s., and from the Bellinger 13s.

1211. Do the lower rates attract the trade from the Bellinger to Coff's Harbour? No.

1212. Suppose in the future Coff's Harbour were improved so as to bring better boats there, would that attract the trade? I do not think the trade will be drawn from the Bellinger as long as our bar continues good enough to allow the steamers to go in and out.

1213. The maize trade would not be likely to go to Coff's Harbour? I do not think the farmers could afford to cart maize to Coff's Harbour from here.

1214. Nor would it pay to take sawn or log timber across? No.

1215. Those products must be exported direct? Yes. Log timber coming in from the south could not be taken to Coff's Harbour in any case.

1216. The saw-mills are located on the river solely to cheapen transit? Yes.

1217. You do not fear the competition of Coff's Harbour? No.

1218. Do you honestly think that this district is suffering in any way at the present time because of the want of a better entrance to the river? It is suffering from the want of competition. We have a monopoly here, and freights are high; but I think that when the proposed works are carried out we shall have an opposition boat.

1219. But if the North Coast Co. can deal with the whole of the traffic of the river by sending a boat a week, why should an opposition boat come here? Well, the farmers applied to the company for the reduction of rates, but they were told that there could not be a reduction until the bar was improved.

1220. The bar has been improved, but there has been no reduction? Yes. Of course, it can be further improved.

1221. Do you think that if the entrance is made absolutely good, there is certain to be an opposition service, and that then the rates would have to come down? Yes. In regard to the temporary bank which is being made, I think that stone ought to be used where they are only using sand. There is a lot of stuff at the quarry which could be brought down and used at very little cost.

1222. Are the settlers here in a prosperous condition? Fairly so.

1223. Are their farms mortgaged like so many farms in other districts? A few are mortgaged; but a number of them are very comfortably off.

1224. If the State undertakes these works, will the Government money be spent for the purpose of relieving financial institutions, or will the people holding the land be directly benefited? The people holding the land would be directly benefited if improved means of communication were given.

1225. At the present time all the produce of the district can be sent away by sea? Yes; but it is taken away very slowly, and, this being a hot climate, maize deteriorates and becomes very weevilly before the end of the season.

1226. How long will maize keep in the cob here? It does not keep very well until late in the season. As the weather gets warmer the weevils increase.

J. Pollock.
28 May, 1898.

- J. Pollock. 1227. Will it meet the case if steamers can always enter and leave the river, or must you have them coming up as far as Fernmount? It would be a great advantage to have the steamer coming to Fernmount, and it would not be difficult to provide for that. I think there are only three flats between here and the Heads.
- 28 May, 1893. 1228. Do not a great many of the farms lie above Fernmount? Yes.
1229. What advantage would it be to the people owning those farms for the steamer to come to Fernmount? There would be a saving in drogering. They could cart their produce to Fernmount.
1230. You think the farmers pay for the droghering, although they are not specifically charged for it? Yes.

MONDAY, 30 MAY, 1898.

[The Sectional Committee met at "Barratt's Hotel," Bellinger Heads, at 2:30 p.m.]

Present:—

CHARLES ALFRED LEE, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G. | HENRY CLARKE, Esq.
FRANK FARNELL, Esq.

The Sectional Committee further considered the proposed Harbour Works at the Bellinger River.

David Houison, District Engineer, in charge of the Macleay, Hastings, and Camden Haven Districts, sworn, and examined:—

- D. Houison. 1231. *Chairman.*] The harbour works at the Bellinger are under your supervision, the Bellinger being within your district? Yes; these works have been under my supervision since May, 1895.
- 30 May, 1898. 1232. When were they commenced? Shortly after 1890.
1233. All the work that has been done here has been done under your supervision? No; Mr. Brownrigg had charge of the work at first, and I superseded him.
1234. How much of the work was completed when you came here? About 2,000 feet of the southern training-wall. We were just commencing to go above the wharf.
1235. What was the state of the bar at that time? It was in a terrible condition. To get out, vessels had to take a most circuitous course, going right round the end of the wharf. The southern training-wall was at that time about 1,100 feet short of its present length, and vessels had to go round the end of the wall in a southerly direction as far as a ballast heap, and then to turn round and go almost due north, crossing the bar in a direction between north and north-east.
1236. What was the depth of water on the bar at that time? I think about 4 feet 9 inches at low water.
1237. The starting-point of the channel going out of the river was about the point marked "A" on the map; then it followed round the ballast heap marked "B," making a sharp turn when nearly due north to the point marked "C"? Yes.
1238. What effect had the extension of the southern training-wall upon the bar? It had no effect upon the bar until we pass the line of the ballast heap marked "B."
1239. You think that that ballast heap had a considerable effect upon the channel? Yes; it held the water. When we got past the line of the ballast heap with the wall the channel broke straight out, going north-east.
1240. Has the bar shown an inclination to shift round to the south again? No; it has moved very little to the south since.
1241. Do you attribute the improvement of the bar to the extension of the southern training-wall? Yes, solely to that.
1242. Has the construction of the southern training-wall increased the depth of water? Yes, along its whole length. The only place we have had to dredge is a little bit below the wharf, where the North Arm water left a slight deposit.
1243. In 1896, the northern spit completely overlapped the position of the southern training-wall? Yes, by about 300 feet. It was only 100 feet from the end of the wall as we were bringing it out.
1244. That spit was dry at low-water? Yes.
1245. Since the wall has been constructed it has been completely removed? Yes.
1246. At that time no part of the northern wall had been made? No; that has only been commenced this year.
1247. About how many feet of the northern wall have already been made? Between 2,300 and 2,400 feet.
1248. The wall has been carried as far as the point marked "D"? Yes; three or four pegs round the turn.
1249. Have you noticed any perceptible difference in the channel alongside that wall? Yes; the opening between the sand-spit and the end of the wall prevents the wall from having any effect just at present. The old channel followed along the island.
1250. The northern wall has not been continued sufficiently far to have any influence? No.
1251. Do you think that when the northern wall is brought out abreast of the southern wall its effect will be to keep the channel entirely clear? Yes, and when the inner training-walls at the south-east end of the island are finished.
1252. That will lead to the removal of the sand patch that now exists in the channel? Yes, I think so.
1253. Do you anticipate that then you will have a good channel from the south-eastern end of the island? Yes.
1254. What depth do you think you will get at low-water? About 7 feet.
1255. Will that be inside? On the northern wall. We have 12 feet on the southern wall now.
1256. Is it probable that you will have more than 7 feet along the northern wall when the scour is confined? I do not think so, except towards the end, where I expect to get 12 feet.
1257. In what position will the bar be kept then? It will go out direct from the two walls.
1258. Do you expect to obtain a uniform depth of water on the bar? Yes, though it will always be ridgy.
1259. What will be the depth? We ought to have 9 feet outside at low water. 1260.

1260. So far as the design of the work is concerned have you adhered to the course followed by Nature—^{D. Houston.} simply improving the channel without diverting it? Yes; the channel all along the island, on the main arm, has been dredged. ^{30 May, 1898.}
1261. In place of making a short cut you have kept to Nature's channel and improved it? Yes.
1262. Are there any records to show that there was ever any other channel? At one time the river went out much further to the south, right underneath the hill upon which the pilot-station stands.
1263. There is no headland to form part of the Bellinger entrance? No.
1264. How does the Bellinger bar compare with the other bars on the coast? It is one of the best of the small river bars now.
1265. It is by no means a difficult bar to improve? No.
1266. It is of no very great width? No.
1267. Once a reliable scour is set up there will be no difficulty in maintaining a sufficient depth? I do not think so.
1268. Do you think that there is any danger of the proposed works being destroyed by the river making a breach through the spit to the north at any point? No; I do not think that anything will destroy the works.
1269. Your design is to confine the whole of the water between walls so as to create a scour;—if the river should make another opening for itself it would undoubtedly destroy your works? Yes.
1270. The Committee, this morning, inspected part of the terrace opposite the northern entrance to Back Creek;—is there any fear of the sea or the river breaking through there? I do not think so.
1271. You think it is quite unnecessary to protect that place? Yes.
1272. Coming further south down that sand-spit to a point about one-third of the distance between the end of the temporary embankment and the spit, the entrance is very narrow? Yes, it is narrow there, and it is narrow a little above that place. A great erosion was caused by the sea there during the last gale.
1273. But the beach there is in much the same state as it has always been in? I do not think there is much alteration in it.
1274. Was the river ever known to go through there? I never heard of its doing so.
1275. Narrow as that strip of land is, it has stood for a very long time? Yes.
1276. After the northern training-wall is completed, is it probable that the space between it and the spit will be filled up? It is intended to pump sand from the channel to help to fill up that place.
1277. But in any case is not that place likely to silt up;—is not the sand likely to pile there just as it has piled up on the southern side of the southern training-wall? Yes; though to the south the ocean is piling up the sand; where you speak of there will be no agency of that kind. Still, whatever sand is pumped out of the channel will be deposited behind the northern wall. That wall goes into a depth of 12 feet now. The stone of the southern wall went down as much as 25 feet; it went right down on to the pipeclay.
1278. In constructing the southern wall you always had a scour at the end of it? Yes.
1279. And a deep scour? Twenty-five feet.
1280. On the northern side you are working in very much shallower water? Yes.
1281. Do you get a scour there as you work along? Yes; the scour has followed us all the way down, and it gets deeper as we go on.
1282. The inference is that this scour will eventually eat away the sand-spit in front of you? Yes.
1283. That will give you a straight run out? Yes.
1284. You have no reason to believe that you are mistaken in that opinion? No.
1285. You have had sufficient practical experience to be satisfied with the correctness of your opinion? Yes.
1286. At the upper end of the northern training-wall, you are now constructing a temporary bank by means of a sand-pump dredge? Yes.
1287. How has that bank stood? It broke away upon one occasion when there was a very high tide. The tide rose nearly 7 feet 3 inches, and broke through.
1288. Did the opening remain very long? Not very long.
1289. What was the effect of the break-through upon the bar? The bar deteriorated at once. The day after the breach was closed the bar improved again.
1290. If a wall were made for about 3,200 feet from a point where the country is described on the map as a "green and timbered patch" to the upper end of the northern training-wall, would not that make a much more secure job than the temporary bank? No doubt; but a sand-bank which we made on the Macleay has lasted for two years with the sea beating against it.
1291. When the sea broke through the temporary bank was the bank as large as it is now? No; it was hardly finished at the spot where the breakaway took place. We intend to raise the middle of the bank by manual labour, and to protect it with fascines.
1292. Do you think that that will make it sufficiently strong for all purposes? Well, I do not like it myself. I am carrying out departmental instructions.
1293. In the event of the present work being adhered to, should it be necessary in the future to make a wall such as I have spoken of, I suppose it could be done without in any way interfering with the general design of the scheme? Yes.
1294. Would not a breach in the sand-bank give you a very bad bar? Yes, at the present time; but when we close the training-wall on to its terminal point there will be very little, if any, risk of a breach.
1295. What is about the length of the temporary bank? About 1,500 feet.
1296. If it were necessary to make a wall such as I have referred to, I presume that it could be made of smaller stone than you are now using? Yes.
1297. How have the inner walls stood? Very well; we have had very little settlement.
1298. What has been the result of the wash of the sea on the southern training-wall? It has had scarcely any effect. That wall has to be raised to a height of 12 feet at its outer end.
1299. Are you making half-tide walls here? No; the walls all go above the rise of the tide. The southern training-wall was originally a half-tide wall, but we raised it.
1300. About how much further do you propose to extend the southern wall? Only 60 feet.
1301. Do you think that that will be sufficient? I should like to see it extended another 200 feet, because I think that would give us more control of the bar. The Engineer-in-Chief, however, was afraid that the stone

D. Houison. stone we are using was not good enough, though up to the present we have not had it displaced by the sea. We have had settlements, but they have been caused by the scouring away of the sand, and always occur.

30 May, 1898.

1302. Has the sand been scoured down to the bed-rock? The southern wall goes down to pipeclay.
1303. That wall is now standing on a solid foundation? Yes.
1304. And the sand is well packed against it on the southern side? Yes; though there is a slight channel into the bay at the back.
1305. When the northern wall is made you will have two solid walls? Yes.
1306. You are getting your stone from the quarry about 8 miles up the South Arm, at a place opposite Picket Hill Creek? Yes.
1307. The stone is quarried and placed into position by the contractor? Yes.
1308. Do you think an improvement could be made upon the present system of doing the work? No; there is no other way of doing it.
1309. How would you describe the stone you are using? It is slaty stone.
1310. Does it stand well? Yes; it hardens in the water.
1311. Is it not likely to slip about a good deal because of its flat surface? No; it slips about very little. The stones are generally laid on the flat. We have taken a section of the bank, and it runs out very fairly.
1312. The stones are deposited by hand? Yes; and there is a crane for placing the big stones in position. As they get up to the tidal level they have to use the crane.
1313. Is there a sufficient supply of stone at the quarry? Yes.
1314. Have you reason to believe that if the proposed works are carried out vessels such as those now trading here will have access to the river at all ordinary times? Yes; the bar is improving every year. There has been an immense improvement during the last year or eighteen months.
1315. You propose to give a channel for vessels as far as the Government wharf? Yes.
1316. That is all that these works are intended to do? Yes; to keep the mouth of the river open.
1317. If it becomes necessary to deepen the river to allow vessels to go up as far as Fernmount, that would mean a further expenditure? That work would have to be done with a dredge.
1318. The present proposal in no way affects the upper part of the river? Not in any way.
1319. Do you think that the wall at the eastern end of the island will assist in creating a scour between the northern wall and the island? Yes; it will prevent a great deal of the trouble which is now caused by the water of the Main Arm breaking across and depositing sand in front of the southern training-wall.
1320. Between the South Arm and the Main Arm there is a long tongue of sand? Yes.
1321. The stone wall at the south-east end of the island will remove that sand? Yes. I have not seen the river under its best conditions, because there has not been a flood since I have been in the district.
1322. The North Arm is subject to heavy floods at times? Yes.
1323. What will be the effect of a flood? I do not think it would affect the work.
1324. Do you think the fascines will stand? I think so.
1325. What depth of water have you on the bar to-day? Six feet at low-water.
1326. Does the bar vary much in depth? Five or six weeks ago I got a telegram telling me that there was only 4 ft. 9 in. on the bar. I was here next day and took soundings, and got 9 feet.
1327. The southern training-wall was then pretty well where it is now? Yes. That was after a southerly gale. It formed a sand-spit across it, but the sand was gone next day.
1328. You have had soundings taken recently? Soundings were taken yesterday.
1329. What did they show? Six feet at dead low-water.
1330. What is the greatest depth now? Between 10 and 11 feet at spring tide.
1331. Do you think that the sand-spit on the southern side is growing? No; it is receding.
1332. How has that been brought about? By the current. As the tides "make" this week they will probably take it away altogether.
1333. Will the extension of the two training-walls prevent the creation of these spits? I think so.
1334. It is at that point that the bar commences? Yes.
1335. Will you meet with deep water close enough to the bar to enable you to get a proper "spill" for the sand? Yes; the water there deepens very rapidly. You get 8, 9, and 12 feet in three successive dips.
1336. If the sand is carried out in deep water, will the current take it away north? Yes.
1337. It will then be thrown up on the beach? Yes.
1338. You are not afraid of the creation of an outer bar? No.
1339. How long will it take to complete these works if they are sanctioned? About three years, I should think.
1340. Is any large expenditure upon plant involved? No; the cost of the work is calculated upon contract prices.
1341. You find those prices satisfactory? Yes; we are paying 3s. 9d. a ton for the stone.
1342. In your opinion, if the works are carried out as proposed, there will be sufficient water here for all practical purposes? Yes; I think the depth would be ample for the trade of the district.
1343. *Mr. Roberts.*] Do I understand you to say that in 1895, when you first came to the Bellinger, there were only 4 feet 9 inches on the bar? Well, the depth varied; but when I have been out there that is what I have got.
1344. Did the "Rosedale" trade here then? No.
1345. How was the produce of the district got away? In small steamers, I think.
1346. What would be the depth at high tide? About 8 feet.
1347. What do the sailing vessels that trade to the river draw? I think about 7 feet 6 inches, or 8 feet when loaded.
1348. So that the trade of the district was not seriously interfered with then? No; it was the circuitous route that vessels had to take to go out that caused the trouble.
1349. Was the entrance then regarded as absolutely dangerous? Very dangerous. Mr. Hickson, who was then Engineer-in-Chief, came in with us in 1896, and he thought it most dangerous.
1350. Was there not a period in 1896 when the entrance to the river was absolutely closed? I do not know that the entrance was ever absolutely closed, except for about three weeks.
1351. Is that when the farmers were compelled to send their produce to Coff's Harbour? Yes. The Nambucca was closed at the same time.

1352. To what was that state of things attributable—to the south-east gales? Sometimes north-east weather is very bad for the bar. It depends upon the direction the bar is taking. D. Houison.
1353. Before the training-walls were made, the bar constantly altered? Yes; it was never in one place for two days together. 30 May, 1898.
1354. Is there anything to complain about now in that regard? No. The bar is further north than we have seen it for the last twelve months; but it is now working back again.
1355. Would that be due to the recent stormy weather on the coast? Well, the southerly gales would affect it.
1356. With regard to the stone obtained from the quarry we visited this morning, is it the best that can be procured in the district? Yes, at the price.
1357. Is there not granite to be obtained within some miles of here? Yes; but it is very difficult of access.
1358. Would it be expensive to get? It would probably cost 7s. a ton.
1359. Would a tramway have to be made to the place? Yes.
1360. Is that what would make it expensive to get? That would help to make it expensive. When Mr. Carleton was here the other day he spoke about having a look-round for other stone. There is stone up the Picket Hill Creek, and they talk of dredging the creek to get it.
1361. Is not the stone you have now regarded as satisfactory? We cannot get it big enough. Its specific gravity is nearly as much as that of granite.
1362. If it is found necessary to construct breakwaters will you require larger stone? Yes.
1363. With regard to the erosion on the north spit, by the sea, that you spoke of, is it not likely that next summer, when north-east weather prevails, the beach will be restored to its original state? Yes.
1364. There need be no apprehension of the sea washing through? I do not think so.
1365. Are we to understand that the temporary bank is not yet finished? It is not more than half-finished.
1366. Will it not be much less expensive than a training-wall of stone? Yes; it will only cost one-third of what stone will cost. The northern training-wall is expected to cost £12,000, for a length of 6,000 feet; while our estimate of the cost of the temporary bank, which will be 1,500 feet long, is £1,000.
1367. I understood you to say that you do not altogether like this bank;—having in view, however, the extra cost of a stone-wall, do you not think it might be well be given a trial? Yes.
1368. There is 6 feet of water on the bar now at low tide;—what does that give at high tide? During the highest spring tides we have a rise of 5 feet; but you can allow 4 feet as the average rise for a high tide. We allow 3 feet 6 inches.
1369. Is the rise and fall the same all the year round? No; it varies. With a south-west wind you get a very high tide, and with a south-east wind you get a very slight tide.
1370. What about north-east weather? That scarcely affects the tides at all. The inference is that a south-west-wind backs up the southerly current which runs along the coast.
1371. Are the tides higher in winter than they are in summer, because of the prevalence of westerly weather in winter? No; in the winter the highest tides are at night, while in summer they occur during the day.
1372. Is the "Rosedale" always able to load inside the river now? Yes.
1373. Have you ever known her to load outside? No.
1374. Has she only been running since the improvements to the entrance have taken place? Yes. I do not know what steamer was running when I first came here.
1375. *Mr. Clarke.*] Are not similar works on some of the other rivers carried out by day labour? Yes; the works on the Macleay, and at Camden Haven are carried out by day labour. The works on the Manning are carried out by contract, the price being 1d. a ton less than we are paying here.
1376. Do you consider the day-labour system equal to or superior to the contract system? I prefer the day-labour system.
1377. Upon what grounds? Because the actual cost of the work is less. On the Macleay our stone has cost us up to the present time about 3s. 6d. a ton, the cost of plant being included. Here we pay 3s. 9d. a ton, and the contractor owns the plant.
1378. When the scheme is finished, is it proposed to close Back Creek so as to allow a large volume of water to come down the North Arm? Yes; I should like to close Back Creek now.
1379. Have you had any borings taken on the bar? No.
1380. Have you any reason to suppose that as the bar scours you will meet with a reef? No.
1381. It is purely a sand-bar? Yes; 28 feet deep at least.
1382. As you have nothing but sand to deal with, you need only to provide a scour and Nature will do the rest? Yes. The contract for the stone is terminable by a month's notice by either side.

Walter Darwin Higgins, Inspector of Works, Bellinger Heads, sworn, and examined:—

1383. *Chairman.*] How long have you been here? Since 1893.
1384. *Mr. Roberts.*] Did you come here when these harbour works were commenced? A few months after they were commenced. I came here in June, 1893. W.D.Higgins.
30 May, 1898.
1385. Did not the works commence in 1890 or 1891? Not under contract.
1386. When you came here what work had been done, and what was going on? The southern training-wall was down about 1,200 or 1,300 feet from the wharf on the eastern side as a half-tide wall.
1387. The rest of the work that we see has been done under your supervision? Yes.
1388. Both below and above the wharf? Yes.
1389. How many feet have you to go with the northern training-wall to complete it? About 3,000 feet.
1390. How long do you think it will take to complete it? It is very hard to say. It depends so much upon the scour at the end of the wall. We have as much as 35 feet of water at the end of the southern training-wall at times, and a similar scour at the end of the northern training-wall will produce similar results.
1391. Will the next 2,000 feet be more difficult to construct than the part already made? The length to be made will probably be more expensive than the length already made, because of the greater depth of water.
1392. What depth of water was there on the bar when you came here? I hardly remember, but the steamer used to get in and out. 1893.

- W.D.Higgins. 1393. Was the "Rosedale" trading to the Bellinger in those days? Yes. When I came here, instead of the "Rosedale" being able to get up to the wharf, she had to lie about 1,600 or 2,000 feet down the
 30 May, 1898. wall, and the drogher used to load her there.
1394. Did she come in at high-water? Yes, always at high-water.
1395. And left again at high-water? Yes.
1396. Has she to wait for high-water now? I have known her to go out before it was high tide.
1397. That shows that the bar has improved? Yes. For a time it was very crooked. I have seen the leading marks for the bar placed on the southern spit. The northern spit extended right across the present entrance, and past the end of the southern training-wall. Between the end of the southern training-wall and the northern spit there were only 100 feet, so that when the steamer came down the inner side of the second training-wall she had to pass across the end of it, go south for some distance, and then, making a sharp turn, go out in a northerly direction. Now the leading marks are placed about 150 yards south of the pilot station.
1398. *Chairman.*] What does that show? That the effect of the southern training-wall has been to straighten the channel. As soon as we got the wall past the ballast heap referred to by Mr. Houison, the bar straightened.
1399. *Mr. Roberts.*] You feel satisfied that the effect of the southern training-wall has been to improve the bar in the way you have indicated? Yes; at the present time the bar is more to the north than it has been for a long while.
1400. What is your opinion of the stone that is used for these works? I think it has answered very well. It does very well for the inside work and hardens by exposure. Slime forms on it, and weeds and shells grow on it very quickly.
1401. Have you had much experience in works of this kind? Not exactly in connection with works of this kind, but I have had a great deal to do with harbour and marine surveying.
1402. Are you able to say if 3s. 9d. a ton is a satisfactory price to pay for stone? It seems to me a reasonable price. The quarry is a long distance from the work.
1403. Having been on the river now for four years, can you say whether any part of the proposed scheme might be dispensed with? The facing to the bank on the south arm is decidedly necessary.
1404. What sort of work is that to be? Small stone will do for that work.
1405. You think that that is necessary to prevent the erosion of the bank? Yes.
1406. The training-walls at the south-eastern end of the island are essential? Yes.
1407. Do you regard the southern inner training-wall as absolutely necessary? Yes; I do not see any objection to the design.
1408. You know of nothing that could be dispensed with for the sake of economy? No; not if the scheme is to be a success.
1409. How long have they been at work on the temporary sandbank? I think about three months. They had to fill in a break which occurred twice.
1410. How long ago is that? About two months ago.
1411. The work was then not so far advanced as it is now? No.
1412. Do you think that when completed that bank will prove effective? That bank was decidedly wanted. At the time it was commenced there was a probability of the bar breaking across the north spit, and it has had the effect of throwing the water of the Main Arm over towards the island, and down on to the southern training-wall.
1413. The temporary bank will be much less expensive than a stone wall? Yes.
1414. Do you regard it as a wise experiment? Yes.
1415. Do you think there is any danger of the ocean breaking through the northern sand-spit? I do not, because what is taken away in one gale is made up by another. Of course, that spit is very narrow.
1416. *Chairman.*] The entrance to the Bellinger is merely a channel through a sandbank? Yes.
1417. There is no rocky headland on either side? No.
1418. In the course of years the river may have flowed out anywhere from 500 yards south to 500 yards north of the present opening? That is quite possible.
1419. These works are designed to prevent an alteration of the entrance? Yes.
1420. And to keep the bar in its present position? Yes. I think that the northern sand-terrace will be considerably strengthened by the filling up behind the northern training-wall. The southern sand-spit has widened considerably since the southern wall has been made.
1421. There is a shallow patch in the channel about a third of the distance between the wharf and the outer end of the southern training-wall;—what is the reason for that? It is formed during the low tides we have had recently, and it will probably disappear with the first spring-tide.
1422. You have deep water at the wharf? We are down to the rock there.
1423. Is not the shallow patch to which I refer caused by the erosion of the sand-spit which comes down between the southern and the northern training-walls? There is a sort of gutter through the sand-spit you speak of, and the tide fetches a certain amount of sand down and deposits it upon meeting the water of the South Arm.
1424. Do you think that the sand will continue to be deposited when the northern wall has been completed? I do not.
1425. Have you known any of the ocean steamers to load outside the bar? No.
1426. How long is it since the vessels had to load away from the wharf? I think that was in 1893 or 1894.
1427. What vessel came here then? The "Rosedale."
1428. What depth of water had you at the wharf then? There was a spit below the wharf which has now disappeared.
1429. And since then the steamer has been able to load at the wharf? Yes, always.

Robert Stuart McDougall, sworn, and further examined:—

- R. S. McDougall. 1430. *Chairman.*] Is there anything you would like to add to your previous evidence? With respect to
 30 May, 1898. the improvement of the trade of the river, I can speak from experience. That improvement has been very great since the harbour works were commenced. These works were agitated for for a number of years, and before they were commenced we were in a very bad state. At the time the channel went due south
 to

to the grassy headland which is generally known as Hungry Head, about a mile and a half from the wharf. The "William Hestitt" was wrecked there about 1870. From there it came back until it broke out a little to the north of the present wharf. There was no reliance to be placed on it at all.

R. S.
McDougall.

1431. To-day there are heaps of ballast lying on the sand to the south of the southern training-wall, showing the route previously taken by sailing vessels? Yes; and the steamer "Manly," which used to come there, took the same route.

30 May, 1898.

1432. You have seen the channel gradually work north to its present position? Yes; and I have seen it still further north.

1433. It has remained stationary for some years now? Yes, pretty well. A number of people came here with their little savings, and selected land, but one-fourth of them are gone now, and the Banks and other people have got that land. They spent everything; but they could not maintain their wives and families in the district, because of the high freight which was charged in consequence of the bad state of the bar. Since the harbour works have been commenced, however, people have taken heart again, and have gone into various industries. At one time we had to pay 3s. 6d. a bag to send maize away, and we still complain that the rate is higher than that charged on any other part of the coast. The rate charged on the Richmond, which is nearly twice the distance from Sydney, is only 1s. a bag, while we have to pay 1s. 6d. a bag. Then, too, although the steamer communication is better than it used to be, we still have cause for complaint there. There is nothing to prevent the steamer coming regularly if the company choose to send it; but they send it to other places, and neglect us. I should like to see the river dredged, so that ocean boats might go up to Fernmount. That would bring about a reduction of rates, and people would be able to make a living more easily. At the present time the extra 6d. per bag which we are charged on our maize is a heavy item. To my sons it makes a difference of about £30. If the ocean boats could go to Fernmount, they would save that amount.

1434. If the proposed works were carried out, and you were given a reliable port, would not that greatly relieve the district? Yes, because then the company could have no excuse for neglecting it.

1435. *Mr. Clarke.*] And you would have competition? Yes. At the present time they go out at night as often as in the daytime.

1436. What you want is a reliable means of communication with proper markets? Yes.

1437. If these works give you that, you will be satisfied? Yes; if the works are carried out as designed, we should have one of the best bars on the coast.

Andrew Black, hotel-keeper, Fernmount, sworn, and further examined:—

1438. *Chairman.*] Have you anything to add to your former evidence? I wish to say that before anything was done here we had a good bar; but it was continually altering. It would be good, and then it would become bad, and it would be three months before we could get in or out. It is everything to the steamers to have a straight channel. I have known it to happen that there has been 30 feet of water here for a fortnight. Then the river would break out in two places, and for three months we would have no entrance at all. It is of immense advantage to keep the channel straight.

A. Black.

30 May, 1898.

Alfred Edwin Ellis, saw-mill proprietor and storekeeper, Bellinger Heads, sworn, and examined:—

1439. *Mr. Clarke.*] How long have you been a resident of the Bellinger? For four months.

1440. You have had previous experience of the river, as well as of other parts of the coast? Yes.

A. E. Ellis.

1441. Have you known vessels to find it difficult to get into and out of the Bellinger? Yes.

30 May, 1898.

1442. What has been the effect of the harbour works already carried out? They have been very beneficial.

1443. Do you think the proposed extension will further improve the entrance? I think so. My opinion differs a little from what I have heard as to the effect of a wide entrance. I have had a good deal of mining experience; and in connection with the diversion of channels for sluicing purposes, and so on, I have often found that where you had only a certain amount of water from a natural entrance the best way was to assist it. Here you expect to have an opening 500 feet wide; but the natural entrance seems to me to be about 200 feet wide; and in my opinion in trying to make it 500 feet wide you will get a sandspit right down the middle of the channel, and thus divide the water. Of course the engineers say that a greater scour will be provided.

1444. Your contention is that the channel should only be 200 feet wide? Well, very much less than 500 feet. The more you confine it the better, in my opinion.

1445. What is your opinion in regard to the rest of the scheme? I do not see the necessity for the centre wall. From what I can see, the water will stick to the stone walls. There is always a scour in front of a wall and a deep channel alongside it. In my opinion, the termination of the centre wall is not near enough to the bar.

1446. Do you think the scheme will do good? Yes; I am of Mr. Houson's opinion that the southern training-wall should be extended out 200 feet instead of 60 feet. When I came here, four months ago, there was deep water right up the channel to the end of the wall, but the last gale brought the sand right across the front of the wall.

1447. Do you think there is any danger of the sea breaking through the terrace on the north side of the entrance? I do not think so. I think that the breach will fill up again after north-east winds. During the last gale the sea encroached a little, but the next gale may fill the place up again.

1448. You are chiefly engaged in the timber trade? Yes.

1449. You have a large saw-mill on the South Arm? Yes.

1450. I suppose there is enough timber here to enable you to go on working for several years? Yes.

1451. The better the bar the cheaper the rates will be? Yes; we have had high rates to contend against hitherto. At Nambucca, since the last gale, they have raised the rates 3d. per 100 feet.

1452. I suppose the timber trade is likely to be a permanent industry here? Its present prospects are better than we have had for a long time.

1453. You are also engaged in storekeeping? Yes.

1454. Can you give the Committee any information as to the value of the imports of the Bellinger? No, I cannot. I have not been here long enough to form any idea.

1455. Your trade is increasing? My trade is increasing.

- A. E. Ellis. 1456. And the same remark would probably apply to the business of other people on the river? Yes. I expect to do a good business here. I expect to have at least five sailing vessels trading here. During the last fortnight I sent away about 100,000 feet of timber in two vessels.
- 30 May, 1898. 1457. Do you send timber anywhere besides Sydney? No; it all goes to Sydney. If we could ship direct from here to the Islands, to Townsville, and other places we could do a good business. If vessels drawing 9 or 10 feet could come here we could do a very large and profitable export trade with hardwood, but now, when we wish to send to Townsville, Noumea, and places like that, we have to send first to Sydney and trans-ship. We have been paying 3s. up to recently and now we have to pay 2s. 9d. together with the charge from Sydney.
1458. That is a great drawback to the trade? Yes.
1459. It is supposed that when the entrance is improved, vessels drawing 10 feet of water would be able to come here without much difficulty? I think that would happen if the wall is taken further out. I do not think the bar will improve if the wall is only carried out 60 feet.
1460. There are large jetties at Coff's Harbour and Woolgoolga, and I believe the rates from there are higher than from here? I do not think that that is so. I think that the rates there have been increased by 3d. The insurance companies will not take any responsibility for sailing vessels going there. They could get the same rates as we have if they could get sailing vessels to go there, but the insurance companies will not take the risk and consequently the few steamers which trade there have a monopoly.
1461. What do you think of the proposal to construct a railway from Raleigh to Coff's Harbour? I do not think I shall live to see that railway made.
1462. Would it be of any value to the people here at the Heads or to the people up the river? I do not think so.
1463. You think that such a railway would be an expensive undertaking and would not give much benefit to the people? It would give no benefit to the people. This year and succeeding years will show an increase in the trade of the Bellinger. Our output will be quite as large as that of any other mill on the coast.
1464. You think that dairying is likely to make rapid strides here? I think so.
1465. Will it be profitable? I think that in a few years time this will be a splendid district. We are handicapped now because we are paying 1s. 6d. a bag for maize, whereas on the Clarence they are paying only 9d. a bag, and on the Macleay, only 1s. per bag.
1466. Has the value of land here improved very much? I know that it has improved in the township of Urunga. When I came here you could buy the allotments at the upset price; but with the expectation of a saw-mill going up some of them realised 400 and 500 per cent. more.
1467. The same remark would not apply to farming land? No.
1468. Is labour plentiful here or are the people well employed? I think that they are. I think that the people on this river are as well off as those of any community I have been into.
1469. I heard this morning that it was difficult to get labour here? Well, I called tenders for the building of a house, and I did not get one. It is almost as a compliment that a tradesman does work for you. I am thinking of sending to Sydney for tenders.
1470. *Mr. Roberts.*] How does the timber in the Bellinger district compare with that obtainable on the other North Coast rivers? So far, I cannot speak very well of it, but they tell me that what I am getting is coming from places too near the coast, and I have been promised the use of the dredge for the improvement of the South Arm. There is a lot of timber up there which I think is equal to anything I have seen on the coast. I think that the Department made a mistake in constructing a temporary bank of sand instead of stone. When the South Arm is dredged I believe I shall be able to get timber equal to any on the coast.
1471. Have you carried on business as a sawmill proprietor on any of the other rivers? I have been at Camden Haven for nine years.
1472. How does that timber compare with the Bellinger timber? In my opinion, it is very much superior.
1473. Are there many saw-mills there? Five.
1474. Is the timber rapidly being got rid of? There was more timber coming in, and timber of a better quality, when I left last Christmas, than there was eight years ago.
1475. Have the people to go out much further for it now? No; they do not appear to be going further out, but they are using block and tackle, and are getting timber from rougher places. At one time they used only to get the timber from the main spurs, leaving the trees growing in the slopes. Now, they are getting that timber with block and tackle, and it is better than the other.
1476. How many miles are they drawing the timber? I do not think the logs come more than 6 miles, as a rule. Occasionally logs come 8 or 9 miles, but that is when they have been got alongside the main road.
1477. How far are you drawing timber on the Bellinger? I do not think more than 3 miles.
1478. Is there any quantity of it? I think so.
1479. Do you buy the timber delivered at the mill? Yes; or on the river, as the case may be.
1480. I suppose there is a market price for it delivered at the mill? Yes, or delivered at the wharf.
1481. Do prices vary much? No; two years ago it was not 1s. per 100 feet. Now, we are giving 2s., and at the Nambucca mill we are giving 2s. 6d. The price we pay depends a good deal on the quality of the timber and upon what we get for it.
1482. I suppose that teamsters ought to know if you want any timber and ascertain what price they will get? Yes.
1483. What is the annual export of sawn timber from the Bellinger? I do not suppose it is more than 500,000 feet, but I expect it to increase to 4,000,000 feet.
1484. How much would the mill at Raleigh cut? If he does not cut any faster in the future than he has cut up to the present time 500,000 feet will be a good output for him.
1485. How many hands do you employ? Seventeen at the mill.
1486. Do you anticipate that the mill will be kept going all the year round? I think that it will. Of course, including the log-haulers and their families, the mill gives work to a good many.
1487. Do you send much log-timber away? No; we do not encourage that trade.
1488. Do you send away telegraph poles? Yes, I sent some away recently. We go into any kind of business.
1489. The timber industry is in a prosperous condition at the present time? Yes. We are getting ready another bench to-day, and we shall be using five vessels soon, and now we are running three. To-morrow we put on five more hands, and then we shall cut-up one-third more timber. 1490.

1490. Will all these vessels be able to come up to your wharf? If a little dredging is done on the river. At the present time they cannot load fully. A. E. Ellis.
30 May, 1898.
1491. What do they draw? One draws 8 feet, and there is only 7 feet 6 inches at high water.
1492. Then they have to come in and out at high tide? Yes, and when the sea is smooth.
1493. *Chairman.*] There has been a great demand for hardwood timber during the last few years? Yes.
1494. For many years the timber industry was in a most unsatisfactory state? Two years ago it was in a most unsatisfactory state.
1495. You have only been here about four months? Yes; but I have had a mill on the Nambucca for some years.
1496. If it had not been proposed to improve the entrance to the Bellinger, would you have established a mill here? No. If the entrance had been improved earlier there would have been saw-mills here years ago. Mr. Frank Guy came here years ago to start a mill, but the bar frightened him. I came here eight years ago.
1497. The timber trade must eventually come to an end;—do you think that the land in this district will support a considerable number of settlers? The settlement of this district has not commenced yet.
1498. Is there land available? Yes.
1499. Is there plenty of it? Yes.
1500. In a district like this, does it not usually happen that the timber-getters, having made a little money, settled down in the place? Yes.
1501. The timber industry leads to the settlement of the district, just as the mining industry does? Yes: The Government has sold thousands of acres of land at Camden Haven which are not good enough to support the people who have bought it, and when once the timber industry is finished they must go. Three years ago it was said that there was no more timber at Box Creek. Since then there have been ten or twelve teams continuously engaged in hauling it, and the forest is not done yet.
1502. You think that here there is plenty of good land available for settlement? Yes; in a few years' time the log-haulers will take up selections, and make homes for themselves here. Of course, hitherto, they have had no encouragement to do that. For farming you must stick to the agricultural land upon the river bank.
1503. Are you of opinion that there is plenty of new land to be brought under cultivation? There is not land for maize-growing, but there is land for dairying.
1504. Do you think the Bellinger River is thoroughly settled? No; it is not half settled.
1505. Is it capable of carrying three times as many people as are here now? Quite. The land at present in occupation would carry three times as many people as there are upon it, while there are thousands of acres of good land which has not been improved.
1506. You are satisfied as to the future of the district? Yes.
1507. Do you think that the prospects of the district warrant the Government in going into the expenditure necessary to make a good and reliable entrance? Yes.
1508. Whatever immediate benefit the work would be to people here now, it would be of greater benefit to more people in the future? Yes.
1509. Is there any better way of serving the district? I do not think so.
1510. Would the North Coast railway be of use to you? I do not think the people here would avail themselves of it.
1511. Could the railway compete against the steamers? No. Of course, passengers likely to be sea-sick would be glad to use the railway; but traffic would not be carried by train. Farmers could not afford to send their maize that way. Now, too, they can keep their cream for a fortnight, so that it does not make any difference to them if the steamer is bar-bound for a short time.

Thomas Key Ratcliffe, pilot and telephone master, Bellinger River, sworn, and examined:—

1512. *Chairman.*] How long have you held your present position? Six years from August next.

1513. Can you give us any information in regard to the trade of the port? The following statement shows the exports and imports of the Bellinger, and the number of arrivals and departures for the years 1892 to 1897:— T. K. Ratcliffe.

NOTE.—Import tonnage is only approximately correct.

1514. How have you obtained that information? It has been compiled from the ships' manifests. The imports are only approximate.

1515. In 1897, 51,500 bags of maize were sent away? Last year, including what went to Coff's Harbour, I should say that there were 54,000 bags of maize grown in the district.

1516. There is a general opinion throughout the Bellinger district that since the harbour works were commenced the people have had more confidence, and there has been more progress;—have you noticed that? I have had reasons to notice it. Before the harbour works commenced the farmers were leaving their farms to go to other districts. Since the works were commenced, they have been coming back to the farms they left.

1517. Is the bar getting worse, or is it improved? It is improving. I think, however, that the southern training-wall should be taken out another 200 or 300 feet, so that we may get the full benefit of it.

1518.

1518. Do you attach any importance to the statement that there is a danger of the ocean breaking through the terrace to the north of the entrance? I do not think there is any reason to fear that the ocean will break through anywhere there. I have not seen any signs of it. I was trading here for many years before I became pilot. T. K.
Ratcliffe.
30 May, 1898.
1519. The bar was always shifting before the harbour works were commenced? . Yes.
1520. I suppose it is undoubted that the southern training-wall has had the effect of straightening the bar? There can be no doubt of that. Before the wall was finished the steamers had to lie on the tail of either the southern or the northern spit. Sometimes, when she came in and had taken half her cargo, we were two days getting her out again.
1521. Not only has the wall straightened the bar, but it has also kept it in position? Yes. In bad weather, when I have been unable to take soundings, vessels can come in with safety; whereas, before the wall was made, one could never say how much the bar had shifted.
1522. Prior to the construction of the training-wall the bar used to vary in position from $\frac{1}{2}$ a mile south to $\frac{1}{2}$ a mile north of the present entrance? Yes.
1523. Have there been any wrecks on the bar since the harbour works were started? Yes; two vessels have been wrecked, but at that time the wall was not sufficiently far down to create a scour. The channel then went round the ballast heaps shown on the map, but it has not gone south since the wall was completed.
1524. Is there a desire to send sailing vessels here? Before the wall was commenced it was difficult to get sailing vessels to come here, but now they jump at the chance if they can get a cargo.
1525. Had the "Maitland" gale any effect upon the channel? No; except that the South Spit came up a little.
1526. Did it interfere with navigation at all? The sea interfered with navigation for a day or two, but the bar was not made worse.
1527. Was there any part of the wall destroyed? No; you could not see if the sea had affected it.

Hastings River entrance.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

HARBOUR WORKS AT HASTINGS RIVER.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing Harbour Works at Hastings River," have, after due inquiry, resolved that it is not immediately expedient that all the proposed works, as referred to the Committee, should be carried out; but they recommend that the southern training-wall now in course of construction be completed; and, in accordance with the provision of sub-section (IV) of clause 13 of the Public Works Act, report their resolution to the Legislative Assembly:—

THE HASTINGS RIVER (OFFICIAL STATEMENT).

1. The River Hastings, situated about 172 miles north of Sydney, flows through agricultural and pastoral country, and has a watershed covering an area of 1,390 square miles. At about $6\frac{1}{2}$ miles from the entrance the river bifurcates, the main stream running generally south-westerly and the Maria or Wilson River north-westerly, these arms being navigable, for vessels drawing 6 feet, 19 miles (to Morton's Creek) and 23 miles (to Ballengara) from the entrance, respectively. The total length of the main river from its source to the sea is about 110 miles.

A perusal of the official papers, the Committee are informed, shows that in February, 1895, the attention of the Department of Public Works was drawn to the necessity for improving the river entrance. It was represented that the progress of the district had been for many years retarded through being dependent on a most uncertain and tedious means of transit to the metropolitan markets, and that, until a railway were provided, it was necessary that the obstructions to navigation should be removed, better and more fully-equipped boats employed, and freights reduced as low as possible. It was also pointed out that the entrance to the Hastings possessed a natural advantage over many of the coastal rivers from the fact that it was sheltered by a high headland on the south, and that, consequently, a moderate outlay on the construction of training-walls would not only remove the dangers attending the small steamers trading to the river, but would render navigation practicable for vessels of much larger draught. It was further stated that, owing to the close proximity of stone to the site, the cost of the walls should not be great.

The matter was referred to the Engineer-in-Chief, and he, in dealing with it, considered it expedient that a comprehensive scheme should be designed, but only such portions carried out as the present trade requirements of the port justified. The estimated cost of the complete scheme was £163,000, and at the time the design and estimate

estimate were prepared it was stated that a considerable improvement to the entrance would be effected by the construction of western and southern training-walls. An expenditure of £11,000 was recommended for commencing the work, but the matter was allowed to stand over, and it was not until July, 1896, that Ministerial approval was given to the sum of £11,000 being placed on the Loan Estimates, and a tender was accepted for stone for a portion of the southern wall, the amount of the tender being £7,333.

DESCRIPTION OF THE SCHEME.

2. The complete scheme for the improvement of the river consists of breakwaters 650 feet apart at the sides of the river entrance, and low walls extending up stream for confining and guiding the river waters, so as to create a scour which should deepen the river inside, and, by removing the bar, provide a permanently deep channel at the entrance. The walls consist of southern, eastern, and western training-walls, an opening being left between the southern wall and the end of the western wall to permit of vessels proceeding to and from the town wharf. Up to the present, according to the Departmental statement, 385 feet of the southern wall has been constructed, at a cost of £900, and of the remainder of the scheme the portions now recommended are the completion of the southern wall to the extent of 2,315 feet, and the construction of the western wall (8,200 feet), and of 3,000 feet, or northern portion, of the eastern wall, the estimated cost of which additional work is £39,169, but, with the amount of the contract already let, £46,500.

DETAILS OF COST ESTIMATE.

3. The details of the estimated cost of the works it is proposed at present to carry out are:—Southern training-wall, £13,915; western training-wall, £20,437 10s.; eastern training-wall (northern portion), £9,862 10s.; to which must be added £2,285 for supervision at 5 per cent.—or, in all, £46,500.

The complete scheme includes, in addition to the items just stated, the following:—Southern breakwater, 1,600 feet long, £26,347 10s.; extension of the eastern training-wall, 3,300 feet, £10,856 5s.; northern breakwater, 4,000 feet, £73,025; or, with 5 per cent. added for supervision, a total of £115,600.

OBSTRUCTIONS TO NAVIGATION.

4. The bar at the entrance to the Hastings is stated to be generally navigable by the class of vessels trading to Port Macquarie, but with bad weather its extent alters considerably, and while there has been as much as 13 feet of water upon it, there has been at other times as little as 5 feet. The steamer "Rosedale," which does most of the trade of the port, draws when loaded 7 ft. 6 in. Inside the entrance, and between the north sandspit and the site of the proposed western training-wall, are two patches of sand with a narrow channel between them known locally as "the crossing," where there is generally about 9 feet of water. Except in one case, the Committee are informed, there has not been for some years past an instance of a vessel meeting with any serious obstruction when passing this "crossing." Extending some distance up the river, are sand patches upon which it was proposed to construct the western training-wall; and opposite these, on the eastern side of the river and extending to the entrance, is another sandspit, partly covered with trees, which is the site of the proposed eastern training-wall. Up the river, beyond the sites of the training-walls, there are accumulations and obstructions which prevent the easy navigation of the river by vessels of any considerable draught. Most of the produce brought down stream is carried by droghers to the North Coast Steam Navigation Company's steamer, which goes no further than the Port Macquarie wharf. Other than these droghers, the only vessels that proceed any distance up the river are ketches and small schooners engaged in the timber trade.

TRADE OF THE DISTRICT.

5. The principal products of the district, of which the river is the outlet, are maize, timber, and live stock. Dairying has recently been commenced, and is making satisfactory progress. Maize has been the chief crop of the farmers as a whole for the past twenty-five or thirty years, and the export at the present time amounts to

35,000

35,000 bags a year. Other exports, according to statistics placed before the Committee, are for the year :—3,500 pigs, 1,300 cases of eggs, 500 coops of poultry, 1,600 hides, 1,500 boxes of butter, 1,000 gallons of wine, 200 bundles of marsupial skins, and a large quantity of sheepskins, bones, horns, and other sundries. The imports are stated to be about 2,500 tons. Timber—principally hardwood—is exported in large quantities, some of it dressed and some in the rough. Plenty of timber is available, the Committee are informed, and the timber forests are among the finest in the Colony. With regard to the dairying industry, the manager of the Australian Dairying Company's factories on the river states that there is every probability of the industry extending.

Much of the land on the river flats is suitable for agriculture, but the residue is at best fit for grazing purposes only. Where cultivation is possible it has not been carried on as fully as the capacity of the land justifies, and the district, it is asserted, is capable of sustaining double its present population.

Gold and tin mining has been carried on to some extent in the creeks among the ranges at the head of the river, and it is the opinion of the Chief Inspector of Mines, as given in evidence, that, in addition to these metals, there is a probability of copper, lead, and cobalt being discovered in payable quantities.

RECOMMENDATION BY THE COMMITTEE.

6. The evidence taken at Port Macquarie, and the investigation made by the Committee, show that the real difficulty with regard to the river at present is the bar. The "crossing," situated some distance inside the bar, has apparently been no serious difficulty to vessels for several years past. The vessels engaged in the trade of the port and the river have, with one exception, been able to pass over it without experiencing any serious obstruction. At present there may be said to be 9 feet of water on this "crossing" at high tide, and dredging carried on up the river will probably not, in several places, give a permanent depth greater than this; so that the further deepening of the water on the "crossing" would not of itself enable vessels to trade far up the river. The Committee are of opinion that if the southern training-wall be extended, in accordance with the Government design, to a point as shown on the plan somewhat north of the gaol, it should be sufficient to remove the bar into water deep enough to prevent any serious inconvenience being experienced by vessels entering the port.

Beyond the extension of this wall, the Committee are not prepared at present to recommend any work at the Hastings River. The effect of this wall upon the "crossing" and the bar, and also the force and effects of the sea upon the wall in heavy weather, should be carefully noted. It appears probable that as the wall progresses eastward, and reaches a more exposed position, larger stone will be required, and the wall will have to be raised. These matters, however, are details which may well be left to the Department.

The sand is forming behind the southern training-wall, and it appears probable will follow it right out to the end when the wall is completed.

The district generally may be regarded as one which can increase its present production to a certain extent and which is capable of sustaining a larger population than it possesses now, but at the same time the area of unutilized valuable land is, in comparison with what is to be found in other parts of the Colony, limited, and most of it is fit even after improvement for little more than grazing purposes. Though the improvements to the river entrance may lead to increased trade, unless circumstances alter greatly it seems unlikely that the increase will for some time be such as to justify a large expenditure of public money on harbour works.

RESOLUTION PASSED.

7. The resolution passed by the Committee is shown in the following extract from their Minutes of Proceedings :—

Mr. Black moved,—"That, in the opinion of the Committee, it is not immediately expedient that all the proposed Harbour Works at Hastings River, as referred to the Committee by the Legislative Assembly, be carried out; but they recommend that the southern training-wall, now in course of construction, be completed."

Mr. Fegan seconded the motion.

Mr. O'Connor moved,—“That the motion be amended, so that it shall read,—‘That, in the opinion of the Committee, it is expedient the proposed Harbour Works at Hastings River, to cost £16,500, as referred to the Committee by the Legislative Assembly, be carried out.’”

The amendment was seconded by Mr. C. J. Roberts, and negatived on the following division.—

Ayes, 2.
Mr. C. J. Roberts,
Mr. O'Connor.

Noes, 10.
Mr. Ewing,
Mr. Humphery,
Mr. Hoskins,
Mr. Trickett,
Mr. Clarke,
Mr. Lee,
Mr. Fegan,
Mr. Hassall,
Mr. Black,
Mr. Wright.

The original motion was then passed.

THOS. EWING,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 29 June, 1898.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

HARBOUR WORKS AT HASTINGS RIVER.

WEDNESDAY, 27 APRIL, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee proceeded to consider the expediency of constructing Harbour Works at Hastings River.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and examined:—

1. *Chairman.*] You attend here to-day to express the Departmental opinion in regard to this proposal? C. W. Darley. Yes, in the absence of Mr. Hickson, the Under Secretary.

2. Will you read the statement which has been prepared by the Department? It is as follows:—

27 April, 1898.

HASTINGS RIVER.

THE entrance to the Hastings River is about 172 miles north from Sydney. The river flows through a rich agricultural and pastoral country, the total area of the watershed being about 1,390 square miles. At about 6½ miles from the entrance the river bifurcates, the main river running generally south-westerly and the Maria or Wilson River north-westerly, these arms being navigable for vessels drawing 6 feet 19 miles (to Morton's Creek) and 23 miles (to Ballengara) from the entrance, respectively, the total length of the main river from its source to the sea being about 110 miles.

A perusal of the official papers shows that in February, 1895, the attention of the Department was drawn to the necessity for improving the entrance to the river. It was represented that the progress of the district had been retarded for many years, through being dependent on a most uncertain and tedious means of transit to the metropolitan markets. To dispose of the surplus products of the Colony, greater and more modern facilities should be provided, and to do this without rail transit it was necessary that the obstructions to navigation should be removed, better and more fully equipped boats provided, and freights reduced as low as possible. It was also pointed out that the entrance to the Hastings possessed a natural advantage over many of the coastal rivers, in that it was sheltered by a high headland on the south, and consequently a moderate outlay only on the construction of training walls would not only remove the dangers attending the small steamers trading to the river, but would render navigation practicable for vessels of much larger draught; and owing also to the close proximity of stone to the site, the cost of the walls should not be great. It was therefore urged that works should be undertaken for the improvement of the entrance.

The matter was thereupon referred to the Engineer-in-Chief for report, as to "whether the expenditure of a comparatively small sum of money—say, £5,000—would have a beneficial effect, or whether only a complete and comprehensive scheme would be serviceable."

In dealing with the entrance it was considered expedient that a comprehensive scheme for improvements should be laid down, but only such portions carried out as the present trade requirements justified. A complete scheme was therefore prepared, the estimated cost being £163,000, but it was considered that the resources of the district did not justify the expenditure of so large a sum. It was pointed out, however, that a considerable improvement of the entrance would be effected by the construction of the western and southern training-walls. At present the waters within the entrance spread over a very large area, and the force of the current is consequently reduced. By constructing these two walls, the ebb and flood currents would be confined to one and a narrower channel, the scour increased, a greater depth maintained on the bar, and the first step taken to fix the entrance. In reply to the Minister's question as to whether the expenditure of £5,000 would have a beneficial effect, it was pointed out that this sum would construct a portion only of the southern training-wall, which would be of little use in improving the entrance, but it would be sufficient for present requirements if the whole of this wall were constructed. An expenditure of £11,000 was recommended by Mr. Darley for commencing the work, but the matter was allowed to stand over.

In November, 1895, the matter was again brought before the Department, in a numerously-signed petition, in which it was represented that the shipping, agricultural, and commercial interests had suffered, owing to the irregular communication caused by the uncertain state of the entrance, the progress of the district was retarded, and industries handicapped because of the inability to use larger vessels.

Again in July, 1896, further requests were made for the construction of improvement works. Although, during the long spell of dry-weather through which the district had passed, the entrance had maintained a fair depth of water and a fairly negotiable channel, it was pointed out that the class of boat used was very small and of light draught, and freights were very high. And, in addition to the agricultural and dairy produce of the river and its tributaries, the timber industry had been gradually assuming large dimensions. To successfully compete with more favoured localities it was necessary that facilities should be given in the way of improved navigation.

The Minister thereupon approved of a sum of £11,000 being submitted on the Loan Estimates for the construction of the first portion of the works. Tenders were invited, and that of Mr. G. P. Cook accepted for 40,000 tons of stone for portion of the southern wall, at a rate of 3s. 8d. per ton—£7,333 6s. 8d.

The scheme submitted for the consideration of the Committee consists of breakwaters 650 feet apart at the sides of the entrance and low walls extending upstream, for confining and guiding the river waters. The total length of breakwaters and walls in the complete scheme is about 22,800 feet, the estimated cost being £163,000. The work carried out up to 31st December, 1897, consists in the construction of 385 feet of the southern wall, the cost of which was £900. Of the remainder of the scheme, the portions now recommended are the completion of the southern training-wall (2,315 feet), and the construction of the western wall (3,200 feet long), and 3,000 feet of the eastern wall, the estimated cost being £46,500.

The effect of the walls now recommended in directing and confining the river currents, should be such as to ensure a permanent, navigable channel of sufficient depth for all shipping likely to use the port for very many years to come.

The amount voted for the works was £11,000, and the total expenditure to 31st December, 1897, £900, leaving a balance of £10,100.

3. Does that estimate of £46,500 include the cost of the work which is now in progress? It includes the contract of £7,333, less £900 for the work already done.

4. At the present time the steamer passes the end of the south breakwater, keeps south of the wreck of the "Ballina," which is shown on the plan, and following close to the southern training-wall, goes down to the Government wharf? Yes.

- C. W. Darley. 5. Is the repute of the bar good or bad? Sometimes it is a pretty good bar. Just now it threatens to be rather bad. As a rule it remains pretty steady. It has been rather bad twice in the last two years. The western part of the bar is just in a line with the wreck of the "Ballina." It does break out to beyond the breakwater in heavy weather.
- 27 April, 1898. 6. Is it regarded as a bad bar? It is the best of the small bars on the coast.
7. Are the people suffering any inconvenience? There is only one small steamer at present trading to the port; it is the "Rosedale." They are suffering to such an extent that they have to pay larger freights and have a very small boat for the service. I think the company has withdrawn the larger boats, as the risk of losing them was very great.
8. Speaking generally, do you regard the Hastings bar as a bad one? It is a dangerous bar. At times it is very fair indeed, but it gets bad at other times. In January last there was a depth of only 5 feet of water, and the deepest water was very close to the wreck of the "Ballina," so that it really became very dangerous. We had to do some blasting, and removed a portion of the wreck at the time. It deepened after that to 8 or 9 feet. According to the last report the water was only 6 ft. 9 in. deep. In September and October last there was a depth of 12 feet on the bar, but in June last it was down to 5 feet, and the shipping was practically blocked. One or two vessels inside were bar-bound and could not get out. It only lasted for about a month. On March 14 there was a depth of 8 feet, on June 7, 5 feet, on June 17, 5 ft. 9 in., and on June 29, 5 feet, so that the bad bar did not last very long. For the greater part of 1896 and for the first part of 1897 the bar remained in a very fair condition.
9. *Mr. Wright.*] Is it a worse bar than the Manning bar? It is better, because there is more natural shelter there than at the Manning. The pilot can get out of Port Macquarie in almost any weather. The pilot boat is kept outside the bar, and it is the only case where that is done. A sort of gorge between the mainland and a rock makes a natural little dock there, and in comparatively rough weather the pilot boat can get out. I have landed there in very rough weather when no steamer could take the bar. The pilot can always effect a landing there. It is always possible for a passenger to effect a landing there by the pilot boat.
10. *Chairman.*] Will you explain the theory of the scheme? The work I recommended the Minister to take in hand when the sum of £11,000 was voted was the southern training-wall. I saw it was necessary to direct the current, and lead it away from the foul ground. A great deal of current was lost on what I term the foul ground, that is immediately along the frontage to the town, and it was necessary to lead the current away from that so as to get deeper water. We let a contract for 40,000 tons of stone. We had to shape the contract to fit in with the amount voted as nearly as possible. Once you get above the flats there is very fair navigation for a good many miles, but there is no proper connection between the flood channel and the ebb channel. We have to cut a channel with a dredge to let the vessels pass from the flood channel into the ebb channel. We want to get both currents into the one channel. The western training-wall I propose to construct up to high-water mark from the north point down to the front of the town will effect this. I also propose to erect a small portion of the eastern wall to turn the ebb current.
11. *Mr. Black.*] Have you ever considered whether it would be a saving to cut through that neck of land shown on the plan? I do not think so. It would mean a heavy piece of dredging, and the erection of a training-wall on the other side.
12. *Chairman.*] Once a boat has arrived at Port Macquarie is the difficulty in going further up the river a serious one? The sand flats are generally very shallow.
13. Are they expensive to keep open? We have not spent very much on dredging the sand flats. The steamer does not attempt to go up the river; she simply runs into port and out again. We have not done much to open it. It is only sailing vessels that go up there as a rule.
14. Your work could be divided into two parts—the part which is necessary for the deepening of the bar, and the part which is necessary for the removal of the sand flats? Yes. I look upon the training-wall as a great help to the bar.
15. Will a vessel be able to approach the present wharf at Port Macquarie permanently after the construction of the western training-wall? It is rather doubtful. I do not think that channel will shoal up much, but if it does we can easily remove the wharf to the training-wall.
16. *Mr. Wright.*] Why was that gap left in the western training-wall? To allow the shipping to go to the public wharf, and to the wharfs at the saw-mills.
17. Do not you think that channel is likely to fill up? I do not think it will fill up.
18. *Mr. Roberts.*] Does not the ocean-going steamer stop at the foot of Horton-street? Yes.
19. She does not go any further up the river? No.
20. Is not that owing to the shallow state of the river? Yes.
21. Is there enough water to permit of a steamer like the "Rosedale" going up the river for any distance? At times there is; she could go up for about 9 or 10 miles.
22. Have you ever heard of that steamer going up that far? No. The produce is punted to the steamer at the wharf; but sailing vessels sometimes go up a little distance to the saw-mills.
23. What distance? They can go up the main river for about 19 miles, and they go up the Wilson River to Ballengara wharf, which is 23 miles from the entrance.
24. Do they go up the Maria river? I do not think so. We have no wharf up there.
25. *Mr. Black.*] How do you account for having that very deep water (35 feet, I think) beyond Pelican Island? To the fact of the narrow channel, turning sharp round there. You often find deep water at a sharp elbow.
26. *Chairman.*] Provided that your scheme furnished permanently deep water at the entrance to the Hastings River, is it then material that the vessels trading to the port should be able to go up the river? In the interests of the farmers and producers up the river I think it is, because the better the communication up the river, the cheaper the produce can be brought to market, and the greater the saving in handling the produce.
27. Suppose the Committee should be of the opinion that the proposed expenditure is not justifiable, but that it is possible to bring about some result with a less expenditure; what is your most important work on the whole? The southern training-wall.
28. Would not that work be resultful in itself? It would help to maintain the bar a great deal.
29. *Mr. Roberts.*] Has the wreck of the "Ballina" been removed yet? No. We blasted a portion away with powder, but there is a portion of the wreck there still.
30. How many attempts have been made to remove the vessel? I think we have been at it twice.
31. Has it not been an obstacle to the navigation for many years? Occasionally it is. Sometimes when the

the channel runs very close to the wreck it becomes a danger to navigation; at other times it is no trouble. C. W. Darley. It has been a menace to the safe navigation of the entrance to the river for some years.

32. Did the "Ballina" touch the bar when she was wrecked? It was the bar she struck on.

27 April, 1898.

33. *Chairman.*] You stated that the southern training-wall, in your opinion, is the most urgent work, and that the result of the northern training-wall will be beneficial to the bar? Yes.

34. The cost of the southern training-wall is how much? £13,915.

35. Of which sum £11,000 is voted? Yes. In round numbers £1,000 has been spent, so that £10,000 is available towards it.

36. What is your next most important work? The western training-wall, which is estimated to cost £20,437 10s.

37. What is the cost of the northern portion of the eastern training-wall? £9,862 10s. The cost of supervision, at 5 per cent., is £2,285. These four items make up the estimate of £46,500. The following statement shows both the estimated costs of the works now proposed and that of the whole scheme when completed:—

PROPOSED WORKS.			
Southern training-wall	£13,915	0	0
Western training-wall	20,437	10	0
Eastern training-wall, north end.....	9,862	10	0
	44,215	0	0
Supervision, &c., &c., 5 per cent. (say).....	2,285	0	0
		46,500	0 0
TO COMPLETE THE WHOLE SCHEME.			
South breakwater	26,347	10	0
Eastern wall extension	10,856	5	0
North breakwater	73,025	0	0
	110,228	15	0
Supervision, &c. (say)	5,371	5	0
		115,600	0 0
		162,100	0 0
Already spent		900	0 0
Total		£163,000	0 0

38. If the southern training-wall be carried out as you suggest, would the Hastings bar probably be generally satisfactory? I think the bar would certainly be improved. I think we would always carry good water along the wall.

39. Presuming that your command of money were limited, and that you had, say, another £13,000 to expend, how would you expend it;—would you go on with the work at all beyond the southern training-wall? No; I think I would commence with the western training-wall.

40. You would commence with the northern part of the western training-wall? Yes. You must carry it down. It will not do to commence in the centre and work down, because the water will come in behind you; you must bring the water down with you.

41. *Mr. Roberts.*] Do you know the longest period that a steamer has been bar-bound in Port Macquarie, unable to get to Sydney? I have no record of it. The last occasion on which vessels were bar-bound was in January last; some vessels were bar-bound there for a fortnight in that month.

42. I am speaking more particularly of the regular trading steamer? I have no record of it.

43. You are not aware, I suppose, that during last month a steamer was detained there for a great number of days, being unable to get out? I did not hear that. I know that the bar is getting into a bad state. According to the last report I have there are only 6 ft. 9 in. of water on the bar. In January there were only 5 feet of water on the bar, so that it was in a very dangerous state in that month. It deepened a little after that, but it has shoaled up since then.

44. The "Rosedale" would not be able to cross the bar with only 6 ft. 9 in. of water? Not safely.

45. *Mr. Humphery.*] What has been the cost of dredging the river up to the present time? About £12,500 has been spent in dredging the river. The dredge first went up the river in 1886.

46. On what portion of the river were the operations carried on? Mostly on the different flats up the two arms of the main river.

47. Is there a dredge on the river now? Yes, the dredge "Gamma."

48. Is she supposed to be there permanently, or does she only visit the river occasionally? She has been permanently there for some time now.

49. What does she cost a year? In round numbers about £1,000 a year.

50. Would it be necessary to continue dredging operations after the proposed improvements were carried out? At certain points the river would have to be dredged. I do not think it would be permanent because many of the flats we have cut through have remained good ever since. Any work done at the entrance now would, I think, be permanent work. We would have no more dredging to do after the walls were constructed. The inner crossing would be done away with.

51. Would it be necessary to continue dredging on the river? As you improve the entrance, and let a larger class of vessels come in, you have to keep on dredging to let those vessels go higher up the river. We have cut through a good many of the flats on the river. As a rule the water on the river is very good, but in some places there are shallows.

52. Is it proposed to improve in any way the Maria River? No; there has not been much work done on that river. I do not know that there is any occasion to spend much money there.

53. I suppose the only improvements that would be possible there would be by dredging? There is not much settlement there to warrant any expenditure.

54. *Chairman.*] Where are the materials being obtained from for the present work at Port Macquarie? The materials are obtained from a quarry on the mainland, to the south of the township, and the contractor has a tramway which runs across the bay and along the street to the breakwater.

55. Is there plenty of material to be got? There is very fair stone there.

56. Is it easily got? Yes. There is a good sized quarry there.

57. Is it cheaply obtained? Apparently so, because the contract is for 3s. 8d. a ton. That is not a high price at all.

58. Is that the only quarry available within your knowledge? There are quarries to be had up the river. Very likely the material for the western training-wall would be obtained up the river and brought down in punts.

59. *Mr. Hoskins.*] Does that contract price of 3s. 8d. a ton include the depositing of the stone on the works? Yes. The contractor had to find everything to bring the stone down to the work.

THURSDAY,

THURSDAY, 28 APRIL, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).	
The Hon. FREDERICK THOMAS HUMPHERY.	HENRY CLARKE, Esq.
The Hon. JAMES HOSKINS.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKEIT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.	

The Committee further considered the proposed Harbour Works at Hastings River.

Francis Clarke, Esq., M.P., sworn, and examined:—

- F. Clarke, Esq., M.P.
28 April, 1898.
60. *Chairman.*] You represent the Electoral District of The Hastings and Macleay in the Legislative Assembly? Yes.
61. *Mr. Lee.*] You have a personal knowledge of the country through which the Hastings flows? Yes.
62. You are well aware of the difficulties in connection with the bar at the entrance to the river? Yes.
63. Have you taken an active part in bringing before the Minister the requirements of Port Macquarie, and urging the expenditure of public money on improvement works? Yes; on the improvement of the entrance to the river.
64. Have you had an opportunity to see the design of the proposed works? I have seen the design before, but not on such a large scale map as the one on the easel.
65. Would you like to offer an opinion as to the suitability of the design? I think that if the work is carried out according to that design, or even if it is partly carried out, it will be an immense advantage to the navigation.
66. It is not proposed to put in the south breakwater at present? When I was up there a few weeks ago the termination of the south training-wall was pointed out to me, and I formed the opinion that it would not be sufficient. I think the south breakwater will have to be carried out sooner or later.
67. If it is constructed will it not necessitate the construction of a similar work on the north side? It may do so. I am rather inclined to think that the construction of the north breakwater may be postponed for a time.
68. The idea is to create a depth of water by keeping up a scour, and the point is, do you think it could be obtained by the construction, in the first instance, of the western training-wall and the southern training-wall? The construction of those two training-walls would contribute very largely to bring about a scour.
69. I suppose there can be little doubt, but that training-walls placed in that position would create a depth of water under them, and in the vicinity? Exactly.
70. But do you think that would have the effect of creating a sufficient scour on the bar to keep up the depth of water there? That, of course, is a debatable question. I would not care to express an opinion on that point.
71. Would it not be the reason why you suggest that the south breakwater should be constructed? Yes. The figures on the plan, I suppose, represent the depth of water at that part. I think it would be necessary to continue that breakwater to a greater depth of water than they propose to do.
72. In other words, if you train the water out to a certain distance you would be able to spill the sand at a point where it would cause no inconvenience? Exactly.
73. You are aware that all these works are determined by the effect upon the water as they progress, and if it should be found that the object is attained by the construction of the western and southern training-walls, would you urge that the south breakwater should be constructed? No.
74. If the proposed works do attain the ends they are supposed to attain, you would not urge that the south breakwater be constructed? I would leave the work as it is.
75. There are some difficult places inside the entrance and some distance up the river, are there not? Yes, I think the greatest difficulty is up here, on account of the great spread which the river takes: it is of immense width there. I think that a difficulty would be experienced up there in keeping a navigable channel. The ocean steamers lie at the wharf which is at the foot of Horton-street: they never go up beyond that point.
76. Getting up beyond that point, and keeping within the training-walls, are there any difficulties outside the influence of the work and above the work? No, there is nothing which prevents produce being brought down. Of course it has to be pretty well dredged as all the northern rivers have to be. The dredge has to be constantly employed there, but all the work is done by droghers of light draught. The ocean steamers never attempt to go up the river.
77. All the stuff is lightered down to the wharf at Horton-street? Yes.
78. Is there a desire on the part of the residents to have the channel made navigable, so as to allow the ocean-going steamers to go up the river for a considerable distance? I have never heard such a wish expressed; they seem to be perfectly satisfied if they can get the ocean steamer to go to the wharf at Port Macquarie.
79. If the entrance were made fairly good, so that in nearly all conditions vessels could go to that wharf, do you think that would fully meet the requirements? I think so, for many years at least.
80. The Committee will be very glad if you will give some idea of the prospects of the district generally, so as to show what justification there can be for the Government to construct improvement works of this kind? Up to this time the farmers of the district have been principally maize-growers; maize has been their chief production, but within the last year they have started the dairying industry, which I think in the near future will form a very great adjunct to the farming industry. The district is well suited for dairying purposes, and a lot of the land which has been used only for grazing, and has been producing but very little, will now be made more productive, and more beneficial in its occupation by the product of the dairy farm. To carry out dairy-farming successfully it is necessary that the steamers should be able to trade there frequently and regularly. Butter is a perishable product, and the sooner it is got to market the better. Under the system under which they have been carrying on the dairying industry it has been impossible to compete with other places which have better facilities for getting their butter in a marketable state to the metropolis. If the industry is to assume large proportions in the district it must have an opportunity

opportunity to get ready access to this large market either for consumption or for transshipment. Even if the butter industry were not started at all, the freight to the river has been kept up at a very high rate; although the distance from Sydney is shorter, the freight is higher to the Hastings than it is to the Macleay, and I think even to the Clarence River on account of the dangers of the navigation. On that point you will be able to get reliable information from the officers of the North Coast Company.

F. Clarke,
Esq., M.P.
28 April, 1898.

81. Do you know of any instance where the settlers have been put, not only to serious inconvenience, but to loss, through inability to get their maize to market? I cannot recall any particular instance just now where they have suffered actual loss, but I know that delays have occurred. Of course the dangerous state of the entrance will be realised from the fact that on that map the position of one wreck is shown. To my knowledge there is also the wreck of the "Richmond" near the southern headland, that is nearly opposite the Ballina Rock. The ketch "Candidate" within the last few years, to my knowledge, met with an accident there, and two or three men were drowned. Altogether, the port has a very bad reputation on account of its entrance. It is a very dangerous entrance to negotiate.

82. Does the town of Port Macquarie show any sign of progress? Lately it does, but you must understand that it has had a peculiar history. Port Macquarie at one time formed the outlet for all the New England district, and it was also the shipping place for the Macleay. In the early days the place assumed rather important proportions, and all the buildings put up were of a very permanent character. Then, after a few years, when other means of communication were established both from the Macleay and the New England district, the town seemed to go back very much; it became almost like a deserted place, but now it seems to be getting into a better condition. It seems to have taken a spurt. It is going along quietly. It is not one of those places which go ahead by leaps and bounds. It is not like a mining community, but it is steadily going ahead.

83. What are the resources which support the town? Maize-growing, the timber trade, dairying, and wine-growing. They go in a good deal there for wine culture. The soil is specially adapted for wine and fruit-growing. In the upper parts of the river the country is very suitable indeed for grazing.

84. Which is the chief settlement on the river? Port Macquarie.

85. What is the population of the town? The Municipality of Port Macquarie has a population of, I think, about 900 persons.

86. In what direction does the agricultural land lie from the town? Up the river and up the branches. Agriculture is carried on, I suppose, for 40 miles above Port Macquarie—up to where the Forbes River branches off.

87. That is on the river banks? Yes.

88. That country, I presume, has reached its maximum development? Yes. As far as agriculture is concerned, I think it has pretty well done all it can do. As far as the raising of fruit is concerned, I think it has a good future ahead. The timber industry is a very large and important one. It is all hardwood timber. It will be difficult to get reliable statistics on this subject unless from the local mill-owners.

89. You consider, I presume, that these improvements to the entrance to the river will give relief to existing settlers through the medium of better communication and cheaper freights, and that under these improved conditions it will be possible to carry on industries which it is not possible to do now? Yes; it would not otherwise be possible to carry on the dairying industry with any certainty of success.

90. Do you think the district is of sufficient importance to warrant this expenditure? Undoubtedly, I think so.

91. Do you think it can be as well served by any other means? I am sure it cannot. The best means we can have for an outlet is by improving the bar entrance.

92. It may cost a large sum to carry out the works, but the question we have to consider is, will these works when carried out be of a permanent character, and confer a permanent benefit? As to the permanency of the works, I could not give an opinion; but, taking it for granted that they would be permanent, I certainly think that the outlay on their construction would be warranted. I do not think it would be necessary for many years, at least, to spend the sum of £163,000 which the whole scheme is estimated to cost.

93. You think that the portion of the scheme it is proposed to carry out at a cost of £46,500 will be sufficient, and that it will be effective? The officers would have to be guided by the action of the water as the construction of the works progressed. I am inclined to think that the carrying out of that portion would be ample for many years to come. I am of opinion that experience will show that the south breakwater will have to be built, but it may be sometime before its construction will be necessary.

94. If the construction of the south training-wall showed that the south breakwater is not required, you would abandon that opinion? Exactly.

95. If an expenditure of £46,000 will give a depth of water sufficient for the class of vessels which go there, will the importance of the district justify the making of those improvements? Yes, most undoubtedly.

96. Have you any knowledge as to where the stone may be obtained for constructing the breakwater? I only know that the contractor for the present work is bringing his stone from a quarry about a mile and a quarter on the western side of the town. He has a good quarry there, I believe.

97. Do you know anything about the quality of the stone? It seems to be very hard stone. It is not ironstone, nor is it slate. I think it is serpentine.

98. How does that work stand? It is standing very well so far, but of course there is comparatively no great strain on it yet.

99. I suppose it is of very little use at present? It is of no use whatever at present. All the current is brought in on the southern shore and exhausts itself among the rocks. Its force is completely lost in the shallow water.

100. Mr. Darley, the Engineer-in-Chief, has furnished a statement showing what it will cost to complete the whole scheme. The south breakwater will cost £26,347 10s.; the eastern training-wall extension £10,856 5s.; the northern breakwater, £73,025; total £110,228 15s.; the supervision saved comes to £5,371 5s.; and the money spent on the present contract is £900. You will gather from these figures that if it should become necessary to construct the south breakwater and the north breakwater, it means an enormous addition to the cost? Yes.

101. The difference between £162,000 and £46,000 is so enormous that the importance of the district may not warrant the expenditure of the sum? I quite realise that; but I am strongly of opinion that it will not be necessary to spend £163,000.

- F. Clarke,
Esq., M.P.
28 April, 1898.
102. Do you think it is wise on the part of the designers of this scheme to adopt this manner of dealing with the river? I think so.
103. You think it is wiser to do that than to start up by the breakwaters? If you mean are they wise in doing it in sections, I certainly think it is the wisest way to do it.
104. You think it is wiser to deal with the water inside the entrance than to start dealing with the water at the bar? Undoubtedly; by constructing the western training-wall first they will concentrate the water and cause a greater scour out over the bar. It think it is the wisest plan to adopt.
105. I believe the entrance to the river is a very difficult one? It is a pretty straight entrance, but the water is very shallow, and there are a number of rocks there. In that respect it differs from other bars along the north coast. It has always been known as a rocky bar. There is an amount of sand there, but there are some treacherous rocks there too. When I was there a little over a month ago we were stuck for two hours on the bar on which there was only 5 feet of water. There was no danger to the vessel, but it indicates what a difficult place it is to negotiate when a steamer drawing 6 feet had not sufficient water to go in on top of the highest tide.
106. Where is the bar? It extends for about 300 feet on either side of the wreck of the "Ballina."
107. Where were you stuck? I should say we were aground about 400 feet inside the wreck of the "Ballina." We were practically inside the break at the time we struck.
108. You were just inside the points of the sand-spits? Yes.
109. That is just where an accumulation of sand seems to take place? Exactly.
110. As that will be immediately within the influence of the south training-wall the assumption is that the bar which is now there would disappear with a proper scour? It is quite likely that it would. Possibly without any breakwater or training-wall a flood would clear that out.
111. If it will have the effect of shifting the bar into deeper water then of necessity the difficulty will be minimised? It would be minimised, but still it would be dangerous.
112. You have had an opportunity to acquaint yourself with the result of similar works on the northern rivers? Yes; since I gave my evidence on the Macleay River proposal I have seen the result of the training-wall there as far as it has gone.
113. Do the results obtained there lead you to believe that similar works could be wisely undertaken at the Hastings? Undoubtedly.
114. *Mr Wright.*] Do you know the rate of freight from Port Macquarie to Sydney? I think it is about 15s. a ton.
115. Is that dearer than the freight to the Macleay? It is slightly dearer.
116. Is there any other port on the North Coast where a higher rate is charged than is charged to Port Macquarie? Yes; the Nambucca and perhaps the Bellinger, but more reliable information can be got from the agent of the North Coast Company.
117. You know the country pretty well at the Hastings? I have a pretty good general knowledge of the country.
118. Is there much available land of a superior class? No, the land is pretty well all taken up.
119. The land about Rawdon Island is pretty rich? Yes; it is one of the best localities on the river.
120. Is the land at and about Rawdon Island as good as the land at the Macleay and the Bellinger? I do not think it is. It is more inclined to be swampy. Rawdon Island is really a reclaimed swamp; it has been drained.
121. As a rule, what are the flats like on the Hastings, the Maria, and the Wilson Rivers? The flats on the Wilson and the Maria are not much good for cultivation purposes; they are more fit for grazing. The land in the upper reaches of Rolland's Plains is excellent country for grazing.
122. The bulk of it is open forest country? No; it is rather thickly-timbered forest country. You will find there forests of every known hardwood we have in this country.
123. There is no brush land? No; it has all been taken up, and cleared by the farmers.
124. Is there a large production of maize on the Hastings? It is fairly large; it is not one of the largest productions.
125. Am I right in assuming that the land on this river is rather inferior to the land on the rivers further north? It is inferior to the land on the Macleay or the Clarence, or to the land on the Richmond or the Tweed; but it is not inferior to the land on the Nambucca or the Bellinger. It is rather superior to the land on either of those rivers.
126. Has the population in the neighbourhood of Port Macquarie increased or decreased? I think of late years it has increased.
127. To what do you ascribe the fact that while the population of other towns on the North Coast has increased the population of Port Macquarie has practically remained stationary? I think it is owing to the set-back which the town received a few years ago. In the early days of the Colony, great things were expected of Port Macquarie from its being the port of the Macleay. All the Macleay produce and all the merchandise from Sydney to the Macleay went *via* Port Macquarie at one time. That trade gave the town an importance which it could not maintain, and it fell back after that trade left it. Now I think it has come to the normal state, and the population will increase.
128. Has not a considerable area of land on the Hastings River gone out of cultivation of late years? I think not. They may spell the land occasionally; when they do spell it from agriculture they use it for grazing, and after a while it is used for agriculture again. It is just a matter of economy with them.
129. Is there much horned stock raised in the neighbourhood? No; it is not a great district for stock-raising.
130. It is not a good fattening country? Yes, the upper part of it is good. The extent of grazing country is somewhat limited, although what there is of it is of very good quality. The extent of good country is limited pretty well to the valleys of the rivers. The ridges any distance back from the rivers are not good for grazing purposes.
131. Is it generally poor land? Yes.
132. Is it of sandstone formation? It is a sort of slate country.
133. Any mineral discoveries in the district? Yes; they have tin-mines at a place called Gundle, near the head of the Wilson River, where they have erected machinery; and in the upper part of the Hastings they have Cells Creek diggings, where they get gold in small quantities.
134. Do you think the expenditure of this sum will increase settlement and production? I do; because people will be able to cut up some of their larger holdings, and the land will become occupied by families.
- I think it will have a tendency to increase settlement.

F. Clarke,
Esq., M.P.
28 April, 1898.

135. Dairying does not conduce to thick population? No.
136. It does not supply a great deal of freight to the steamers? No.
137. *Mr. Roberts.*] Has not the progress of the Hastings district been long retarded by the danger in connection with the entrance to Port Macquarie? I am of that opinion. When I became the Member for Port Macquarie I started a movement to get some improvements made to the entrance to the river. The idea was taken up by the people; they saw that the place was being retarded from the want of better shipping facilities, and, of course, they assisted me by sending in petitions, and holding public meetings on the subject.
138. Were not the people of Port Macquarie and the Hastings district agitating to a great extent for the construction of the North Coast railway owing to the difficulty connected with the shipping? Yes; for many years they have been agitating for that railway.
139. Suppose these harbour improvements were carried out, would that obviate in a great measure the necessity for providing railway communication? Undoubtedly it would.
140. Would it give satisfaction to the people of the surrounding districts? I am sure that they would be perfectly satisfied if they got good communication by sea.
141. Are not the steamers trading to Sydney frequently delayed at the port, causing great inconvenience and loss to the producers of the district? Yes; the steamers are delayed. There is no certainty about their getting out, and in many instances perishable articles become quite unfit for sale. Pigs and other animals have been known to die while the vessel was waiting to get out of the port, thus entailing a loss on the shippers.
142. Have you any record as to the time the steamer has been delayed at different periods? I have no reliable record as to any long delays which have occurred, but I have been kept waiting in the port twenty-four hours for a favourable tide and favourable weather to get out to sea.
143. Is not the bar very bad at the present moment? It is in a worse condition now than it has been in for years.
144. During last month was not the steamer unable to enter or leave the port owing to the shallow water on the bar? Yes. The "Rosedale" draws about 6 feet of water, but she cannot get that amount of water unless she waits for spring tides, and the weather must be favourable before she can negotiate the bar.
145. While that state of things exists it is not likely that the district will progress? No; because it keeps people who have money, and who are inclined to be enterprising, from settling in the district.
146. What are the principal products of the district? Maize and timber. Lately the dairying industry has come very much into prominence. M'Arthur and Co. have established a butter factory at Port Macquarie. There is another butter factory at Wauchope. Besides, they are establishing creameries in outlying places. They convey the cream to the different factories.
147. The land in the district is admirably adapted for dairying? It is excellent land for dairying. Up the Maria River, and up part of the Wilson River there is a lot of swamp land which, after it is drained, will be excellent for dairying purposes.
148. How far is Wauchope from Port Macquarie? By road it is 11 miles. It is almost on the bank of the Hastings. According to the estimate on the easel here it is 16½ miles by water.
149. It is a great timber district? Yes; the timber is now cut at the saw-mill at Wauchope, and is punted down to the port.
150. How far is the ocean-going steamer able to go up the river? I never knew the "Rosedale" to go beyond the wharf at Horton-street.
151. Is she prohibited from going up owing to the shallow water? She could not go up the river.
152. Would it not be a great advantage to farmers and others if she could go up the river as they do in the case of the Manning, the Macleay, and other rivers? No doubt it might be an advantage; but I think that the company can work the river more economically by using the droghers, and thereby charging the farmers lighter freights. With the droghers they collect the cargo for the steamer while she is making the journey from Port Macquarie to Sydney and back. With their droghers I think the company can work the trade more economically, and if they can the farmer ought to get—I do not say he does—the advantage of it.
153. Would not a shipper of produce at Wauchope, or further up the river, have to pay more freight to Sydney than a man who shipped his produce at Port Macquarie? I think so. I am not sure whether the company charge anything directly for droghering the produce to the wharf.
154. All the land up the Hastings River is as fertile as the land on the river sides on the North Coast? Perhaps there is not quite so much alluvial as there is on some of the rivers; but still it is rich land, land which would be regarded as fit for growing anything.
155. Do you mean that it is, perhaps, not so extensive in area as it is in the case with other rivers? It is not so extensive in area as compared with the Macleay or the Manning.
156. Is Wauchope the first town of any importance after leaving Port Macquarie? Yes.
157. Where is Ennis? It is below Wauchope. It is near a place called San Crox. It is, I think, about 9 miles from the port.
158. It is the centre of a large farming population? Undoubtedly it is.
159. And the land about there is remarkably good? Yes; it is opposite Rawdon Island.
160. Going further up the river, is there not some settlement at Beechwood? Yes; the nucleus of a township or village has within the last ten years sprung into existence there. That was mainly started by the timber industry.
161. Have not some bacon factories been started down there? A bacon factory was started there, but it did not prove a success. I do not know whether it was from want of good management; but, anyway, it did not prove a success.
162. The district is favourable to the carrying on of industries of that character? It is a splendid district for raising pigs. It is noted for raising pigs, and that, I think, is the reason which induced the promoters to start the bacon factory.
163. Could its failure be attributable to the difficulty of getting access to Sydney? I do not think so. It would not affect that sort of cargo so much. It may be attributed, I think, to want of experience on the part of those who had the management of it.
164. Is not Port Macquarie famous for the salubrity of its climate? Yes; it is a very old town, and it has always had a great reputation as a health resort.

F. Clarke,
Esq., M.P.
28 April, 1898.

165. And its residents, as a rule, live to a very ripe old age? Yes; some of the old hands are alive yet.
166. If the district were made more accessible to the people of Sydney it would become a resort for persons requiring a healthy climate? It would, because it offers to the tourist plenty of fishing, shooting, and boating in a good climate. It is the centre of a great farming district, and if it were made accessible it would become very popular as a health resort. The difficulty now is that a man may go there readily enough with luck, but when he wants to get away from there he cannot. No business man can afford to go there. People will tell you that they would go to Port Macquarie readily enough if they could only get away when they wished to go.
167. You think the southern breakwater may stand over for the present? Yes; until such time as the effect is felt on the southern training-wall.
168. But is not the southern entrance in a large measure protected by the outline of the coast? To a great extent.
169. Are there not some islands to the eastward? Yes. The training-wall is required on the southern side to prevent the water from exhausting its force on the rocks.
170. But even with a southerly wind it is well protected? It is well protected. It has a natural advantage in that respect as compared with the entrances to other rivers. For instance, in the case of the Macleay and the Richmond the headland is on the northern side.
171. The only thing which would give trouble to a vessel entering or leaving would be an easterly gale? Yes.
172. In any gale from the south you would be alright? Yes.
173. Have the Port Macquarie and the Hastings district, more particularly the latter, shown any progress during the last few years? It has shown an increase in population during the last few years, and I think it is going ahead, not rapidly, but on safe lines.
174. Would not these works, if carried out, be of great assistance in causing settlement to take place? I think they would give a great impetus to everything on the river. Under existing conditions people have no heart to go in for anything.
175. Has not gold been discovered up the Hastings? Yes, at Cells Creek.
176. Is there any mining population there? There are fifty people on Cells Diggings, but their permanency has not been properly established yet. It is a difficult place to reach. At Gundle a population has sprung up through some of the proprietors putting up machinery to treat the ore on the tin mines.
177. What is the Ellenborough district? The Ellenborough is a very important branch of the Hastings River. It runs in a south-westerly direction.
178. Is there any farming going on there? No; it is more of a grazing district. It is rather too far away from a market to be a farming district. They grow horse-feed and sufficient corn to feed their pigs and fatten them, but they do not grow as a rule for market.
179. How far is the Ellenborough branch from Port Macquarie by water? I should think it is about 50 miles.
180. Is the whole of the land for 50 miles on either side of the Hastings River, and on either side of the Maria River and the Wilson River, good agricultural land? It is all fairly well settled. It is fairly good agricultural land.
181. It is capable of growing anything? Yes.
182. And it is only retarded on account of its inaccessibility? It is a constant source of complaint with the settlers that the place is inaccessible.
183. Have you formed any opinion as to the adaptability of the improvements which are now being carried out? I think, as far as the work has gone, it is going in the right direction. Certainly, there is a good scour already underneath the part which has been constructed; but it is not sufficiently far out to be of any advantage.
184. Do the people of the district seem to recognise that these works will be of great utility? They are all of opinion that the works will be of benefit to the district generally.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and examined:—

C. E. Rennie.
28 April, 1898.

185. *Chairman.*] You wish to furnish a plan to the Committee? I furnish a plan showing the watershed of the Hastings River. The brown colour on the plan shows unalienated Crown land, comprising 716,000 acres, of which 694,000 are untenanted, and 22,000 are held under occupation license. The green colour shows reserves comprising 75,300 acres, and the blue colour shows alienated land comprising 178,700 acres.

TUESDAY, 3 MAY, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

THE HON. CHARLES JAMES ROBERTS, C.M.G.
THE HON. WILLIAM JOSEPH TRICKETT.
THE HON. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Hastings River.

Harold Kingland, master of the schooner "Empress of India," sworn, and examined:—

H. Kingland.
3 May, 1898.

186. *Vice-Chairman.*] You are the master of the schooner "Empress of India"? I am.
187. *Mr. Wright.*] You are aware of the nature of the proposal before the Committee, and you are acquainted with the entrance to the Hastings River? Yes.
188. What effect will the construction of the western and southern training-walls have on the bar and the river itself? The training-wall from up above that point will improve the river and the entrance, but the south breakwater will not improve the bar.
189. It will have no effect on the bar? No; it will make it just as bad as it is now.

H. Kingland.
3 May, 1898.

190. The officers of the Department think that the construction of that south training-wall, which is already commenced, and the south training-bank will have a very great effect on the entrance; but you think it will not? No; it will shoot all away to the northward, and make a great big sand-flat there.
191. Will it not produce a general scour in the river, and force the water out through the bar? It will not improve the bar.
192. Are you sure on that point? I am pretty certain it will not. So far, the breakwater has made the bar worse than ever it was.
193. That is only a very small bit which has been constructed; but if that south training-wall is continued as far as is indicated on the plan, do you not think it will affect the bar at all? No.
194. The officers of the Department say that the force of the water is lost in the bight which they are going to fill up; but that if they confine it by constructing these two training-walls it will narrow the current down, and give it a greater force to wash out the sand on the bar and in the river. It has a tendency to shoot the water over to the northward.
195. No. The water will follow round the bend; it will take the course of the walls? At the present time it is shot over to the other side.
196. It will strike the training-wall about the bend? It shoots from up the river to the south, and then away to the north.
197. Consequently the water is very much dispersed over a big area? Yes, over a great big flat.
198. You do not think that the confining of the current to a narrow channel will have the effect of removing the bar? Not if you build the training-wall first.
199. Do you think that both breakwaters should be built? There is a breakwater on the southern side now. It is all rock there.
200. The natural rock acts as a breakwater on that side? Yes.
201. If the officers of the Department state that the building of two southern training-walls will effect a good entrance over the bar and get the river scoured, do you think that they are wrong in their conclusions? If they build it on the southern side, I do not think so. If they start on the northern side, and do that first, I do.
202. You are speaking of the breakwater now? Yes.
203. I am speaking of the training-wall? The south training-wall up the river will improve it.
204. You think that if that training-wall is built, and the northern breakwater is built, it will effect a very great improvement? Yes.
205. What object have you in suggesting that the northern training-wall should be built first? The crossing is always on the northern side.
206. How much water is there on the bar now? About 8 feet at high tide.
207. Does the bar shift much? It has been shifting within the last ten months to the north and south a bit. It is not a bar at all now; it is a great big sand flat.
208. How long have you been trading to the river? About eight years.
209. During that time what has been the general condition of the bar? Generally speaking, it has been a very good bar. There has always been 16 feet of water at high water.
210. Now there is very little more than half that depth? If you miss the spring-tide you cannot get out.
211. To what cause do you attribute the shallowness of the water? To the breakwater. The tide strikes the big curve in the breakwater and shoots away to the northward.
212. *Vice-Chairman.*] Do you mean the south training-wall when you refer to the breakwater? Yes; I mean that black curve on the southern side which is shown on the map.
213. *Mr. Wright.*] Has that affected the entrance very much? Yes; the tide strikes that curve and shoots away to the northward.
214. Before that bit of training-wall was built, I suppose the tide hugged the southern shore? Yes; it always followed the southern shore right along the rocks.
215. That is the channel which is used by the steamers? Yes.
216. You think that unless the northern breakwater is built they cannot effectually improve the harbour? Yes; it will confine the water to the southern side, where there is always plenty of water.
217. Is there much of a set outside in the current? Yes; there is a good set outside at the anchorage.
218. In which direction? A strong ebb-tide is always setting away to the northward.
219. And right out I suppose it sets to the south? Yes.
220. You think the north breakwater would have the effect of stopping the set of the current north, inside the breakwater? Yes.
221. And give the river a chance to scour out? Yes.
222. You do not think the southern breakwater is required at all? The curve is too sharp, for one thing. All the water strikes that curve, and shoots away north. If it had been made straighter it might have improved it.
223. I am speaking of the breakwater, not the training-wall? They would improve it if they started with the northern one first.
224. Can you explain why you think the north breakwater should be first built? To keep the ebb-tide on the southern side, to give plenty of water, and to get a straight scour right out. As long as the water is confined to a big space it will only make a flat.
225. You think that without the construction of that breakwater these works will not do much good? I do not think they will.
226. Do you know the river above the Government wharf? Yes.
227. Do you think the construction of the south breakwater from a point at the top of the map to where it terminates would have a good effect on the river, by scouring out these sand-flats? It will improve the crossing a lot.
228. What do you call the crossing? The first flat here painted yellow.
229. While you think it will improve the river, you consider that it will not improve the bar unless the breakwater is built? I think so.
230. Do you think it will be likely to scour out the river, and lodge the sand on the bar? It might.
231. Do you tell the Committee that the bar is getting very much worse by the construction of that little bit of training-wall inside? Yes; it has been worse since that work was started.
232. Do you think that is the cause of it, or is there any other cause? I cannot see any other cause for it.

- H. Kingland. 233. How long is it since that work was begun? I suppose it is a little more than twelve months.
- 3 May, 1898. 234. There is not very much completed, is there? About 30 yards from the Beacon Rock.
235. You think that the £900 which has been spent on that work has not only been badly spent, but has affected the bar very detrimentally? Yes; if it had been spent on the other side it would have improved it long ago; we would have had plenty of water now.
236. I cannot see what advantage the breakwater on the other side would be, when according to the reports submitted to us, the current comes down the river into the flat by the Government wharf and spreads over a great area of land? It strikes the Government wharf, and then shoots right over to the northward.
237. That bit of training-wall which is built will not prevent it from shooting across to the northward? It strikes the wall of the breakwater now. The water is confined in the bay between the Government wharf and the breakwater.
238. Can that little bit of wall possibly have altered the current? It strikes the end of the breakwater and shoots away to the northward. Before the breakwater was built there was all bare rock, and it went along the rocks.
239. You think that instead of that work being an improvement it is positively an injury to the harbour? Yes, so far.
240. Have there been any floods or freshes in the river which would cause the bar to silt up, apart from the construction of that training-wall? There has been no flood to speak of within the last three years.
241. Ordinarily speaking, what effect has a flood on the bar there? It always improves the bar.
242. Is it not very likely that by reason of there having been no floods for three years the bar has got worse? That may be.
243. It may be owing to the absence of floods or to the construction of this bit of training-wall? It may be owing to both.
244. But owing to some cause the bar is worse than it was formerly? Yes.
245. *Mr. Trickett.*] How often do you trade to Port Macquarie? Twice a month.
246. Do you go to other places as well? No.
247. What is the tonnage of your vessel? Sixty-two tons, drawing 7 ft. 8 in.
248. Are there any other sailing vessels trading to Port Macquarie? Eight or nine.
249. Any steam communication? The North Coast Company's steamer.
250. Are these vessels often bar-bound? The steamer is not very often bar-bound; it is at times. It draws a lot less water than we do.
251. What do you carry? Timber.
252. How far do you go up the river? At times about 15 or 16 miles, but as a rule only 4 miles.
253. You have to be tugged up the river, I suppose? Yes.
254. Are there many other timber vessels trading there besides yours? About eight.
255. What class of timber do you bring down? Sawn timber, comprising blackbutt, tallow-wood, mahogany, and other sorts. Three or four vessels bring nothing else but piles, girders, and logs.
256. From your observation, is the timber trade increasing? It is.
257. Is the supply of timber on the river a pretty large one? I think so; but they have to draw it in a bit further than they used to do.
258. What are the other products of the river? Corn; and two or three tin-mines have been started about 15 miles above Morton's Creek.
259. Are farming operations carried on along the river? Yes; there is a good bit of farming done all along the banks of the river.
260. Are these flats subject to floods? Yes; the river goes all over the farms at flood-time.
261. Do you think if these training-walls were constructed, and these sand-patches near the entrance were dredged away, they would be likely to form again? I do not think they would ever form again.
262. Which way does the current set outside? It is always setting to the northward at ebb-tide; more so now since the bar is away to the northward.
263. Does it shift at every tide? Lately the bar has been shifting a lot.
264. But is the current shifting? No; the current is always setting to the northward.
265. I did not quite gather the reason why you think that the northern breakwater should be made first? It would confine the water to the southern side; it would not spread so much. We would get a better scour. It would scour the sand out at ebb-tide.
266. It is not proposed at present to carry the eastern training-wall down any distance at all; from the eastern end of the eastern training-wall right away down to the entrance to the port on the northern side nothing is intended to be constructed at present;—do you think it is desirable that something should be constructed there? Yes.
267. Will you state the reasons why you think so? If the southern and western training-walls are constructed, and part of the northern breakwater and training-wall are constructed, that will improve the bar.
268. But you think that they ought to construct the northern breakwater? Yes; and the southern and western training-walls as well. That will confine the water.
269. If they carry on the eastern breakwater up the river as far as it is shown on the plan, and construct the whole of the western training-wall and what is called the southern training-wall, would not the water shoot from that eastern training-wall right down into the bend of the western training-wall, and then go out with a rapid rush? The western training-wall wants to be there, otherwise the water will shoot away down to this big bight here.
270. *Mr. Wright.*] You mean to say that the whole of the works with the exception of the south training-wall should be carried out? Yes.
271. *Mr. Trickett.*] The Department proposes to go as far as the eastern end of that part of the eastern training-wall, but you say that the whole of the eastern training-wall and the north breakwater should be constructed? The north breakwater and part of the training-wall. I do not see why they require to go so far up the river.
272. What is the nature of all that part of the river? It is all sand. There is a lot of ballast there too, so that a training-wall is pretty well built there now.
273. Where is the bar you have to negotiate—by the wreck of the "Ballina"? The water commences to get shallow there, but the bar is further out than that. It is abreast of the flagstaff.

274. When you get over the bar you get into shallower water than there is at the bar? No.
275. Does the position of the bar shift? It shifts a bit to the northward, and a bit to the south.
276. Do you have to be towed into this place? Except with a fair wind. We used to be able to get in until about three or four years ago.
277. What has caused the difference? The channel used to be right along the rocks, and we used to sail in at dead low water.
278. When vessels are bar-bound and cannot get into port, where do they lie? Off Bird Rock, in 8 fathoms of water.
279. Is it pretty good shelter there? No; we can lie there with a southerly wind for eighteen hours.
280. Suppose the breakwaters and the training-walls were constructed, would vessels, in your opinion, be able to enter the port in all weathers? Yes, night or day.
281. I suppose the service of a tug would always be necessary at that entrance? It would not be more necessary there than it is in the case of Newcastle. It is just according to how far the distance would be between the two breakwaters.
282. Would vessels be able to negotiate an entrance 650 feet wide in pretty well all weathers? Yes.
283. Do you ever meet the captains of the steamers? Yes.
284. Do they complain of the bar? Yes, very much.
285. Is it looked upon as a dangerous bar? It has not been. It has always been looked upon as the best bar on the coast, but lately it has been regarded as dangerous. There used always to be plenty of water on the bar.
286. Besides the wreck of the "Ballina" what other wrecks have occurred there during the last few years? The "Barrangarry," a sailing vessel of 80 tons, was wrecked there about eight years ago; the "Candidate," a ketch of between 80 and 90 tons, was also wrecked there; and the "Richmond," a steamer of about 250 tons, was wrecked there between eight and nine years ago.
287. When did the last wreck occur? The last vessel to be wrecked was the "Candidate," which was lost with all hands.
288. Was that during a southerly gale? Yes.
289. Was she trying to enter? She entered, and got stuck on the bar, and broke up.
290. Was she sailing in? Yes.
291. Have you ever been in any peril in entering or going out? Yes; we have had all our bulwarks and sternworks washed out once or twice, when we have touched forward on the bar.
292. You seem to be of the opinion that the northern breakwater must be built to make a complete job of it? The northern breakwater and the western training-wall.
293. *Chairman.*] How long have you known this river? The first time I was there was fifteen years ago.
294. Do you say that until that small portion of the south training-wall, which is tinted black on the map, was built you always had a good bar? Within the last eight years it has always been good.
295. Is it not very probable that some other cause has made the change in the condition of the bar, which you say has been produced by the construction of that work, at a cost of £900? I do not know what could have caused it, except that wall.
296. Do you make your statement as to the cause of the present condition of the bar from personal observations? Yes.
297. What have you observed now in the river to lead you to make that statement? I always observe the tide. It is always shooting away to the northward since that work was begun.
298. Nothing of that kind occurred before the construction of that portion of the training-wall? No.
299. What was the state of the bar before it was constructed? There used to be between 15 and 16 feet of water at high-water.
300. How long ago was that? About two years ago.
301. When did you begin to observe that the bar was becoming difficult? After they started to build the breakwater.
302. How long after they began? A few months.
303. How much of the work was done when you noticed the change which you say has taken place? About 20 or 30 yards.
304. Is it really your opinion that the construction of 20 yards of the south training-bank has produced the change in the bar which you say has taken place—that is to say, that instead of having 15 feet of water you have only 8 feet on the bar? Yes.
305. Has there been an improvement in the river below that portion of the work which has been done, or has that portion of the river been getting worse? It has. There is plenty of water alongside the breakwater, as far as it is built.
306. Has the river, above the breakwater—that is, at the crossing—been getting better or worse? It has been getting better if anything.
307. Do you think it has been improved by the construction of that work? I cannot see that it could improve it much.
308. Do you think the portion which has been constructed has had any effect on that part of the river? No.
309. Not any? I do not think the breakwater has improved the crossing.

Henry Richard Carleton, Principal Assistant Engineer, Harbour and Rivers Branch, Department of Public Works, sworn, and examined:—

310. *Vice-Chairman.*] Have you prepared a statement? I have not prepared a statement. I have only just returned from a trip to all the northern rivers.
311. *Mr. Roberts.*] Are you perfectly familiar with the plan showing the proposed improvements of the entrance to the Hastings River? Yes.
312. The whole scheme, if carried out, is estimated to cost £163,000? Yes.
313. How much will that part of the scheme which has been referred to the Committee cost? £46,500.
314. Did not the Government get authority to borrow £11,000 to carry out a portion of this scheme? Yes, on the Loan Estimates for 1896, £11,000 was voted for the improvement of the Hastings River.
315. An additional outlay of £35,000 would carry out the works which are deemed necessary at the present time? Yes.

H. Kingland.
3 May, 1898.

H. R.
Carleton.
3 May, 1898.

H. R.
Carleton.
3 May, 1893.

316. You have let a contract for the expenditure of £7,000? Yes; and on the 31st December last £900 had been paid on account of that contract, covering that portion of the training-wall which is tinted black on the map.

317. Do you think it is better to commence with the south training-wall? We think it is the first work which should be carried out.

318. Is there good stone obtainable close at hand? Excellent stone is obtainable in the township about $1\frac{1}{2}$ mile away from the training-wall.

319. You have given a contract for the delivery of stone? Yes, at 3s. 8d. or 3s. 9d. a ton.

320. Does that contract for £7,000 cover the construction of the whole of the south training-wall? No; it covers the construction of a little more than half the length which is shown on the map.

321. Will you tell the Committee how it is proposed to expend this sum of £46,000? The western training-wall, which will have a length of 8,200 feet, is estimated to cost £20,437 10s.; the southern extension of the south training-wall, which will have a length of 2,315 feet, is estimated to cost £13,915; and the inner portion of the eastern training-wall, which is shown by the full red line, and which will have a length of 3,000 feet, is estimated to cost £9,862 10s. These items, with 5 per cent. for supervision added, make a total of £46,500.

322. The balance of £120,000 would be required to complete the construction of the eastern training-wall and to construct the north and south breakwaters;—will you now give the estimated cost of the portions required to complete the whole scheme? The southern breakwater, 1,600 feet long, is estimated to cost £26,347 10s.; the extension of the eastern training-wall from here to the root of the breakwater, 3,360 feet long, is estimated to cost £10,856 5s.; and the northern breakwater (a prolongation of the eastern training-wall), which will require very much more weighty material, and will have a length of 4,000 feet, is estimated to cost £73,025. These items, with 5 per cent. added for supervision, make a total of £115,600, in addition to this other sum of £46,500.

323. You have not given any estimate for dredging; the dredging goes on in any case, I suppose? From time to time, as changes take place. We think that will be reduced as we obtain a scour along the walls. I suppose when the western wall is completed we will not require to put a dredge on any portion of it.

324. If this scheme is carried out at a cost of £46,500, what will be the annual saving on dredging? I doubt whether there will be much saving. We have not done much dredging about the entrance to the river.

325. There is a dredge kept constantly at work? Up the river principally. I would not expect any improvement in the river higher up from this work. We are improving all the flats on the river. There has been very little dredging done at the entrance. I think it is only a tenth part of the whole cost.

326. Could it be claimed that any saving would take place in the way of dredging if this work were carried out? Yes; probably a tenth part of our expenditure. We have to dredge in front of the wharf—that would be done away with.

327. On each North Coast river I suppose you have to employ a dredge? Yes; I think there would still be almost continuous dredging on the Hastings. For instance, when we got better water on the bar we should get a larger class of vessel, and we must improve the river higher up to let those vessels go up the stream.

328. Did you hear the last witness say that the bar is in a worse state since the construction of the south training-wall has been going on? Yes.

329. Is it attributable in any way to that work? There is a possibility that the wall may cause the water to shoot across in a northerly direction, but that will all be overcome when the western wall is built.

330. You have every confidence that it will? Yes.

331. You have had a large experience of these rivers? Yes. I have been on nearly all the bars on the coast during the last month.

332. You have every confidence that this scheme will bring about the desired result? I think it will.

333. Do you not regard it as a bad entrance? No.

334. How much water was there on the bar at the time of your last visit? About 9 feet.

335. Has it not been very bad recently? One or two of the rivers—the Hastings and the Bellinger—have been rather bad. The Bellinger improved 4 feet in one night while I was there.

336. Was it at low tide that there was 9 feet of water on the Hastings bar at the time of your last visit? No.

337. You do not think it would be necessary to construct the more expensive portion of the work at present? I think not.

338. Is the object of taking the south breakwater out in a curved shape to leave a wave-trap? Yes; it is to prevent the sea running along the south training-wall, and affecting the shipping lying at what will probably be the future wharf site.

339. These wave-traps have been found to be most effectual? Mr. Walsh, the district engineer, says that there is a marked improvement already in the range of the sea at the Queen's wharf at Newcastle.

340. That is on the southern side of the Newcastle entrance? Yes.

341. Referring to the entrance to the Hastings River,—is not the southern side naturally protected fairly well at present? Yes; but there is a rocky, jagged, foreshore there, in which the current gets entangled and weakened.

342. But would not the formation of the land there, running out slightly in an easterly direction, cause it to be smooth? It is a fairly well-sheltered bar, in consequence of having that good headland on the southern side.

343. Are there not some islands which afford some additional shelter? They are very small, and do not give much shelter.

344. What is the object in putting the north breakwater there;—is it done with the object of breaking the north-easterly weather, or is it done with the object of forming a scour? For that purpose, and for confining the tidal current at ebb tide, and contracting the channel to a width of 650 feet. Otherwise a flood might come down, and cut the sand off the northern sandspit, and you would have a too wide an entrance.

345. Is not the wreck of the "Ballina" a great obstacle to navigation? We blew it up some time ago. It is not so troublesome now as it was. I think portions of the wreck are there still.

H. R.
Carleton.

3 May, 1898.

346. Would it not be a great improvement if you got rid of it altogether? We endeavour to break it up in small pieces, and it sinks into the sand.
347. It is right in the fairway? It is.
348. Is it intended to endeavour to get rid of it? I fancy when we create a scour it will sink down itself. Something of the same kind occurred on the Tweed, when we blew up the wreck of the "Chindera."
349. Is the wreck of the "Ballina" visible at high or low-water? No; not unless you go over it, and look down into the water. There is nothing projecting above the surface of the water.
350. Is the spot marked for the guidance of navigators? Yes; there are buoys to guide the shipping.
351. The present entrance is to the south of the "Ballina" wreck? Slightly to the south of that wreck.
352. How long would it take to carry out these works estimated to cost £46,500? Six years, I think.
353. *Mr. O'Connor.*] How much work is done up to the present? About 600 feet of the south training-wall—that is out to within a few feet of the Beacon Rock.
354. What is the distance between the southern training-wall and the western training-wall? About 350 feet.
355. When the works are completed, what will be the tonnage of the ships which can safely enter the river? Any ships on a draught of 14 feet.
356. *Mr. Black.*] Is it a fact that through what seems to be an abrupt turn made by that portion of the south training-wall which has been constructed, the tide deflects strongly against the northern shore? I hardly think it is. Between the south training-wall and the shore it is rather a rocky ground. We have to go out to a certain distance to get on to sandy bottom where we would be able to create a scour. This rather sharp turn is merely the approach to the training-wall.
357. If that approach to the training-wall had been more gradually diverted from the contour of the coast, would not the tide have been more gently deviated into the entrance? I had a good look at it myself when I was there the other day, and the water lying in this portion here was all slack; there was no run at all; in fact it was slightly silted up.
358. There is no scour in that corner? No; if anything it was slightly silted up.
359. You think that in no circumstance is there likely to be a set from the south training-wall towards the other bank? There might be a slight turn at present, but that will all be overcome when the western training-wall is constructed. No doubt it might affect the current slightly at the present time.
360. In the event of there being strong easterly or northerly gales, would there not be a tendency for the tide to break over the sand-terraces there and silt the channel up? I hardly think so. It is a good sandspit there. I have never heard of it breaking over there. You get into the scrub very soon up there.
361. It is marked on the plan, I see, as "high-water mark?" All inside that black line on the plan is considerably above high-water mark.
362. It is called a low sandspit on the plan? I should say it is from 6 feet to 8 feet above high-water mark.
363. What is the character of the land which is marked pink on the northern side? It is the ocean at present. In the event of the north breakwater being constructed we think the sand will accumulate over that part and silt up there.
364. Suppose you do not construct the northern training-wall, and you have easterly or northerly gales, will not they have a tendency to ease away the sand from that bank, and deposit it in the channel? No doubt an easterly gale would drive sand across there, but the strong current we hope to have down the western training-wall will wash it out again.
365. You think that will be sufficient to keep it clear? I think we shall be able to keep the channel clear. We have a wall on only the southern side of the Clarence, and it keeps itself well open.
366. Do you expect to have a very great scour along the western training-wall and the south training-wall? I think so. Probably a scour-out to 14 or 15 feet at low-water.
367. Will there be no danger of it falling in? It will fall in from time to time as a scour takes place.
368. It will have to be strengthened? It will have to be made up from time to time until it comes to its bearings.
369. I asked Mr. Darley if he thought it would not be possible to cut across that neck of land which is shown on the plan for the purpose of saving so much wall construction? I think that is a very excellent scheme. Mr. Darley did consider that point, but it would be rather too expensive. It would run into too much money.
370. You think that it would be more expensive to cut through that neck than to construct the other work? Yes; the training-walls would have to be made in any case.
371. What depth of water do you expect to have in the channel? I should think we ought to get from 12 to 14 feet at low-water right through.
372. Will that have the effect of keeping the bar open? Yes; it is a fairly good bar as it is, and it will have the effect of making it a more permanent channel.
373. Is this proposed work designed in the interests of the town of Port Macquarie, or in the interests of the people further up the river? It is designed simply to enable vessels to get inside the bar and to bring out anything from the river.
374. Will it be of any assistance to people further up the river;—will it enable steamers of any size to have communication with farmers and others up the river? A vessel drawing 8 feet can go now to Wauchope, which is 17 miles up the river.
375. Is it at the head of the navigation? No; I think smaller vessels can go beyond that point. I know that a vessel drawing 7 feet 8 inches can go to Wauchope now.
376. Is there any town of importance beyond Wauchope? Morton's Creek. Then two arms of the river—the Wilson and the Maria—are also navigable.
377. I suppose the farmers on these rivers send their stuff down by droghers to the wharf near the entrance? Yes.
378. Have you taken into your consideration the possibility of affording them direct steam communication? I do not know that this scheme before the Committee would give the farmers up the river direct communication with larger vessels, but it will be possible, by dredging, to remove the few shallow flats that exist, and thus enable vessels of larger draught to get up the river.
379. Do you think that if these shallow flats are dredged up the river they will make up again? They will require touching up from time to time. We might keep them open by depositing stone along the side of the cutting.

H. R.
Carleton.
3 May, 1898.

380. By an artificial narrowing of the scour? Exactly. It is generally in the wide parts of the river that it is shallow. If we construct light training-walls it may improve the current.
381. Do you think the advantage from the construction of these training-walls would be permanent without the construction of the breakwaters? Yes; as far as the wall itself goes. You will get deep water along the wall wherever it is constructed, and for some considerable distance ahead of it.
382. But will you do away with the shifting bar? I think the south training-wall will improve the bar.
383. Do you know the depth of the river above where these soundings are marked on the plan? It varies very much. We have a line of soundings up the river, for a considerable distance.
384. What is the draught of the vessels which can go now as far as Wauchope? A vessel drawing 8 feet can go there at high-water.
385. *Mr. Lee.*] The question has arisen whether the importance of this district would justify the expenditure of this sum on harbour works;—are you prepared to make any suggestion by which this proposal can be modified, and yet practically attain the end required? I think Mr. Darley has cut it down as fine as it possibly can be cut to obtain a fair result.
386. Are we to understand that unless the works are carried out as a whole, as designed, and submitted to the Committee, the Department will not guarantee that the depth of water will be got? That is so.
387. If there is any departure from that design, or if there is an abandonment of any portion of the proposed works, then, in your opinion, will the effectiveness of the scheme be destroyed? It depends on the extent of the modification.
388. Where is the absolute pressing necessity to construct that portion of the eastern training-wall which is submitted to this Committee? To deflect the current at the bend of the river, across the channel on to the western training-wall.
389. Which training-wall do you propose to start first? The south training-wall.
390. Which one do you propose to take next? I think the western training-wall and the eastern training-wall should be carried on simultaneously.
391. To which training-wall do you attach more importance—the eastern or the western? The western.
392. Would it be a serious departure from the design of the Departmental scheme if that eastern portion were omitted altogether? I think you would lose a great deal of the benefit of the western training-wall if you cut it out. The western training-wall would not be nearly so effective.
393. Would it not be possible, instead of making that long length of eastern training-wall, to run a projecting spur out there? I do not think that would be advisable. These spurs create eddies, and baffle the current very much.
394. Admitting that nothing can so effectively do the work as a well-designed training-wall, in view of the circumstances surrounding this proposal, is there no possibility by which a wall of that character can be modified? A short wall in that position would cost nearly as much; it runs through deep water.
395. The distance between that point and the land is very much shorter? Yes; I do not like spurs running out from the land, because they create disturbing eddies and whirlpools.
396. I presume that a reduction in the scheme, or in the cost of the work, will depend on the circumstances which will develop while it is being constructed? Yes; we must watch the progress of the work from time to time.
397. After all the sums we are dealing with are approximately what will be required to carry out the work? We can tell fairly well now. From the experience we have had, we can now get very close to the cost of a work like this.
398. It has been stated by a witness, not a professional witness, that experience could prove that the south breakwater will have to be built;—have you any reason to believe that that will eventually have to be carried out, notwithstanding the fact that your present works are carried out in their entirety? I think the south training-wall will be sufficient for a considerable time to come, from what I know of the shipping of the district and of the bar.
399. Will it be sufficient to give the required depth of water at all times? I think so.
400. Is there not likely to be a condition of affairs arising that will probably render the bar outside the south training-wall quite inoperative under certain conditions? Only in heavy gales and bad weather. I fancy there will be water enough, but it may be too rough.
401. What about the piling up of the sand there? I think that south training-wall will be sufficient to drive the bar out into deep water and maintain a depth of from 12 to 14 feet on it.
402. How are you going to set up a scour with a shifting bank of that sort? Because the water will cling to the western and south training-walls, and keep a channel open alongside them.
403. You direct the current to that side? Yes. Once it is brought on to that concave-shaped wall it will cling to it all the way. In fact, you could not drive it away from it.
404. Would not the produce of that district be fairly dealt with if it was continued to be droghered down to the wharf at Port Macquarie—in other words, if you were to improve your entrance only and abandon these works up the river on the eastern and western sides? I do not think you could improve the entrance without constructing these walls, so as to concentrate the current on the bar. At present it loses its effect by wandering all round the bay at the western side of the township.
405. Your reply is that it could not be done, because the leading principle of the scheme is that the water shall be kept in a channel? Yes, and directed on to the bar.
406. That would not be the case if the western training-wall were abandoned? I think not.
407. It is quite evident that you have considered the matter from every point of view? I think it has been weighed very carefully.
408. You have been to the district? Several times.
409. Suppose a flood occurs, will not your training-walls be all covered;—will there not be an unbroken sea from one side to the other? No; the floods at the mouths of these rivers rarely rise above high-water level. It remains at high water even though the tide is falling. You have a continuous high tide, perhaps, for two or three days if there is a big flood in the river, but it does not rise much above high-water level.
410. Are the heights of the training-walls such that they would be above high-water mark? Yes.
411. How much? Two or three feet; but it depends upon their proximity to the sea.
412. These conditions will not apply up the river? No; it rises to any height up there.
413. You do not see your way clear to modify the proposal in any way? I think Mr. Darley has cut it as fine as it could be done to produce a useful effect.

H. R.
Carleton.
3 May, 1898.

414. Have you ever reckoned what it costs to maintain these training-walls and breakwaters? The cost of maintenance is very slight. On the Clarence there is a training-wall from 2 to 3 miles long, and we have not put a stone on it for a year.
415. Do you keep a staff of men there? No; they are carrying out other work of the kind. If any erosion took place, or there was any falling in of the wall we would make it up, but the necessity to do so has not arisen. I think the cost of maintaining the training-wall on the Richmond is very little.
416. *Mr. Clarke.*] You stated that the entrance to Port Macquarie is not a bad one? As compared with other bars on the coast it is rather a good one.
417. You think it is equal, if not superior, to the entrance to the Manning, the Bellinger, the Macleay, and the Nambucca? I think it is at the present time. It is not quite as good as the Macleay new entrance at the present time, but that is all.
418. If the entrance is as good as you say it is, how can you account for so many vessels being lost there? I understand that the "Candidate," the last vessel wrecked there, turned completely over, that she never struck the bottom at all. The pilot told me that he was standing on the hill at the time, and saw her turn completely over in the sea.
419. The "Ballina" was wrecked there too? She got out of the channel. It is a rough rocky bottom in places, and there is no hope for a vessel if she gets on to the rocks.
420. Is it your opinion, that, unless this sum of £46,500 is spent on these improvements, it would be, perhaps, not advisable to spend any more? I think we shall have a fairly good entrance then, and certainly drive the shipping away from that bad and foul ground. They could not get on to it then.
421. As it is it is not a bad entrance? No; it is better than the entrance to the Nambucca by far. I do not know that it is much better than the entrance to the Bellinger, which is so much improved, in consequence of our work.
422. Suppose that the scheme before the Committee is carried out at a cost of £46,500, would it give a greater depth of water on the bar? Yes; it will improve itself more than that. Nine feet is very bad for the Hastings. They have as much as 15 feet there at times. They have not had any good floods to assist them there for several years.
423. Do you know the nature of the country which is drained by the river? Yes.
424. Is it good country or is it inferior country? I should say it is good country up the valley of the river.
425. Is the back country timbered? It is timbered, and there is some grazing country. I never saw better grass in twenty years experience than I saw last month down the whole of the coast—down a strip 20 miles wide—from Queensland to Newcastle.
426. *Vice-Chairman.*] What rivers have you visited? The Macleay, Nambucca, Manning, Tweed, Richmond, Clarence, Bellinger, and Camden Haven.
427. Have you kept a record of the state of the bar at the Hastings for a great many years? Yes.
428. Can you state what the condition of that bar has been during the past eight or ten years? Our information only starts from April, 1896. In April, 1896, there was 13 feet of water on the bar; in May, 11 feet; in June, 11 feet; in July, 11 feet; in August, 11 feet; in September, 10 feet; in November, 12 feet; and in December, 12 feet. In January, 1897, there was 10 feet on the bar.
429. Taking the whole of 1897, what was the least depth of water on the bar during the year? The least depth was on June 7, when there was only 5 feet of water and all the shipping was bar-bound.
430. Was that for a short period? It lasted from June 7 to June 17. On June 7, there was 5 feet; on June 17, 5 ft. 9 in.; on June 29, 9 feet; and on July 28, 9 feet.
431. When was the work, which is in course of construction, started? That contract has been running nearly a year.
432. Had the last witness any ground for the opinion he expressed, that the bad condition of the bar last year in some measure was caused by the works in progress? I think not.
433. Will you say why you think so? I think the bar was actually shallower before that contract was let than it has been since.
434. Therefore there can be little doubt that the previous witness was mistaken as to the cause? Perhaps not before the contract was let, but before the work was commenced.
435. At any time previous to 1897 had the bar been in anything like as bad a condition as it was then? They appear to have had very good water all through 1896; but in February, 1897, which was considerably before the contract was let, there was only 7 ft. 6 in. of water, and in April, 1897, 6 ft. 6 in.
436. With that explanation before you, are you now confirmed in the opinion you have expressed that the condition of the bar was not prejudicially affected in any way by the works in progress? I feel pretty sure that the training wall has had no effect on the bar.
437. Do you think that if merely the south training-wall were completed the bar would be improved? Hardly, on account of the river current wandering round the bay on the western side of the town.
438. Therefore, in commencing that portion of the work first, you did not expect to get any good results until other work in connection with the whole of the scheme was carried out? There will be some slight improvement from it, because at present the water in passing out to sea loses a great deal of its force on this wandering over the rocks and this jagged foreshore of the township.
439. But you did not contemplate any substantial improvement being effected simply by the completion of the works now in progress? I am afraid that it would not be very marked. We would have deep water along the wall itself. Whether its effect will be felt on the bar I am not prepared to say.

WEDNESDAY,

WEDNESDAY, 4 MAY, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY, Esq. (VICE-CHAIRMAN)..

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Hastings River.

William John MacDonnell, J.P., accountant, sworn, and examined:—

W. J.
MacDonnell.
4 May, 1898.440. *Vice-Chairman.*] What is your position? I am now an accountant in the city. I was formerly manager of the Bank of New South Wales at Port Macquarie.441. *Mr. Farnell.*] You have had an opportunity to look into the proposal before the Committee? Yes.

442. Have you a knowledge of the entrance to the Hastings River? Yes.

443. Will you state your opinion as to the justification for carrying out these works, and as to the result which they will have on the navigation? The principal obstruction to the entrance is the shifting bar. It varies in depth from 4 ft. 6 in. and 5 ft. to 10 ft. and 12 ft. at times from the end of the western training-wall to nearly the end of the proposed breakwater. It is never very stable; it varies. A very heavy flood often scours it away, and then there is about 10 feet of water on the bar; but after that it shoals up again. I have known steamers to be delayed several times on account of the shoaling which has taken place.

444. Is the shoaling caused by the sand washing in from the sea? No doubt it is, and then the sandbanks are always shifting. That point is always shifting. Sometimes it is carried clean away, and then it is reformed.

445. What effect do you think the construction of these works will have? I am not qualified to give an opinion; but the general opinion is that the south training-wall would create a scour and carry the sand out. Sir John Coode, I think, had another idea. He proposed a northern training-wall, outside which, when a north-east wind blew—which is the prevailing wind there for eight months out of the year—the sand would accumulate, instead of coming into the harbour.

446. Do you think it is likely that the construction of the northern training-wall would have that effect? I think so. There is no doubt that the major quantity of the sand comes in from the ocean.

447. You know the trade which is done on the river? Very well.

448. Would it justify an expenditure of £163,000 on this scheme? The principal trade there is in maize, timber, and live stock. There is no doubt that on account of the cheap carriage the people of the port would sooner see the entrance to the harbour made perfect, so that steamers could get in without interruption, than have a railway there. You cannot surpass a steamer for carrying that stuff. You could not send maize and timber by train. There is a very large export of timber. Three or four sawmills are kept fully employed sending timber to Sydney, Queensland, &c.

449. For how long in the year have you known the navigation to be stopped? It has only been occasionally stopped (and then at long intervals) for a short time; but many times, perhaps for three or four months in the year—not consecutively, but altogether—steamers have been delayed either by the obstruction to the harbour or by the bad weather preventing them from getting out. If the breakwater gives a clear channel the steamer can go in in all weathers. The steamer can practically go in now at any time, but she cannot always get out. I have known steamers to lie nearly a fortnight in the harbour waiting for a chance to get out.

450. You think the construction of the breakwater will create a channel which will let the steamers come in at all times? Yes.

451. How long have you known this district? From 1882 to 1896.

452. Has the trade of the district increased in that period? Yes, it has held its own very well. During the last few years it has fallen off a little owing to bad seasons. The farmers have been unfortunate with their maize crops through floods and other causes, and, therefore, they have not had so much produce to export, but the population is increasing, and the timber industry is increasing.

453. Have you heard the people who are engaged in the industries complain of want of facilities? They are always growling. Every man has his own idea, but they all insist on an improvement of the harbour being made.

454. You think it would be an incentive to the development of the district if these harbour facilities were afforded? Yes.

455. You think that the trade at present, as well as the trade in prospective, would justify the expenditure which is proposed by the Government? Yes; the development of the trade is crippled by the want of a proper outlet.

456. What resources of the district might be further developed? There is mining. There are indications of copper, tin, and gold up in the mountains. At a place 60 or 70 miles from the head of the river, a good deal of gold has been found, but the means of access is very difficult. The best way for people to get there is *viâ* Walcha.

457. I mean, what industries would create a trade on the river? The people are going in for dairy farming and creameries. The factory established in Port Macquarie during the last twelve months promises to be a great success; but that depends on getting a proper outlet for the ships. Eggs, fowls, and other perishable articles have had to be thrown overboard. There is also a large industry in fishing. Some men came from Sydney, and were very successful at deep-sea fishing for a time, but when they had caught a cargo the steamer was unable to go out and so the fish had to be thrown over. Oysters are prolific there.

458. Do you think the timber industry has at its back a sufficient supply? Yes; a large area of the country has not been tapped yet.

459. What is the nature of the timber? Cedar, mahogany, and ironbark. A number of railway sleepers come from there.

W. J.
MacDonnell.
4 May, 1898.

460. Are there plenty of areas available for agricultural pursuits? Yes. Most of the land along the river is taken up by farmers. At the back, where they have a little more difficulty in getting to navigable waters, the land has not been taken up. But that land would be taken up if they had proper means of access to Sydney.
461. Are these settlers of an industrious turn of mind? Yes. They are slow-going in these country places, but they are all industrious. Nearly every farmer has his own trap, and is fairly prosperous.
462. Are there areas of land available for settlement? Yes, on the Comboyne district, and up the Maria and the Wilson Rivers.
463. It is quite possible that if proper facilities were afforded to the shipping, settlers would take up this land? No doubt they would.
464. Are these lands suitable for agricultural purposes? No.
465. Are they suitable for dairying purposes? They are not high-class lands; they are good lands for grazing. The back lands are not very good for maize-growing. The maize-growing land is all along the banks, but that land has nearly all been taken up. There is a large industry in dairying now. Hitherto, the chief attention has been paid to maize-growing. The price of maize has been low, and as land is subject to floods and droughts alternately, the people think that they have a better outlet in dairy farming.
466. Could you give us an idea of the value of the trade to the district per annum? It would be rather difficult to say what it is. There are from 30,000 to 40,000 bags of maize shipped to Sydney annually. There are no statistics published in Port Macquarie, but it is a trade which keeps the North Coast Company's steamer continually employed, besides a dozen schooners which take away timber and bring back supplies. The steamer goes there twice a week, and makes, perhaps, a hundred trips a year.
467. Suppose these works are carried out, do you know any other portions of the river where it will be necessary to incur any expenditure? No; the river is pretty clear up to Morton's Creek for vessels of the size which go there, not for the schooners. Then up the Wilson River as far as the Ballengarra, 23 miles, small schooners can go.
468. Do you know the nature of the construction at the entrance? It is shifting sand with a rocky bottom.
469. How deep do you think the bottom is? The late pilot said it was from 13 to 14 feet.
470. There is sufficient room with this scour to allow of a boat drawing 10 or 11 feet to go in and out? Yes. Steamers drawing 7 feet can go in now. I have been on a steamer when she has had to wriggle her way through the sand and wait for a wave to carry her over, and so get on inch by inch. But you could not get out in that way. Most of the accidents have happened when the ships have been going out. The "Ballina," the "Richmond," and other vessels have struck on the sand, and could not clear themselves.
471. You think the force of the tide running out will be quite sufficient to form a scour? Yes; it runs very swiftly. It would carry a boat swiftly down the river. It goes out at the rate of 4 or 5 miles an hour.
472. It will go very much faster when the work is completed? Yes. There is a channel which is always cutting itself out in different parts of the sand.
473. Have the floods made any material difference in the channel? They scour them out for the time. The pilot has to go and survey the channel after each flood, and lay down the buoys in new places.
474. You think that directly the training-walls are erected the first flood will probably carry out thousands of tons of sand? That is the impression which the people have formed.
475. Do you think the work will be of a permanent character? I think so. If you are going to spend all that money it ought to be permanent. A makeshift work will not do.
476. You think it is not a right policy to peddle with these things, but to make the works of a permanent character right out? Certainly.
477. *Mr. Black.*] Do you think that with the construction of the western training-wall and the southern training-wall, and the upper portion of the eastern training-wall, a sufficient scour will be created to keep that channel open, and to make the bar easy of access? There is no doubt about it, because higher up the river expands as wide as a mile and a half, and the tidal flow would make a big body of water come down this constricted channel. When the tide is running out there is a large scour, and it must go out.
478. Do you hold the opinion that this work will be sufficient? I think it will.
479. When there are strong easterly gales or northerly gales, does the sea ever break over that sandspit on the northern side? No; but it has done so in flood time when the water has been banked up. The river has broken out over here, but it has always filled up again.
480. At high tide and in time of floods, you say the river water being penned up has broken across the low sandspit at a spot near the scrub? Yes. I have no personal knowledge of it. I was told that it did.
481. You have never known the sea to break over? No.
482. You do not anticipate that the channel might at any time be silted up by the action of the sea breaking across the sandspit? I do not think so. It was not from the action of the sea, but from the action of the river that it occurred. The water could not get out; the outlet was not sufficient and it broke over the bank. That must have happened twenty years ago or more—such a thing has not happened since.
483. Of course these works would not prevent a contingency of that character? I do not know. How high would the wall be?
484. It would be 3 feet above high-water? The water never rises very high. That bank is very low, especially where it joins on to the timber. When the north-east wind blows the sand away it is pretty low.
485. How high should you say the sandbank was? The highest part would not be 10 feet above water, and the lowest would not be more than 5 feet above water.
486. It is a variable quantity? Yes; the sand is always shifting.
487. There have been no attempts to build it up or make it permanent? No, you could not do it. It is just loose sand. There was some talk some time ago of getting some grass seed planted over it, but it ended in nothing.
488. Do you think that the two breakwaters as shown on the plan are indispensable to the success of the scheme? I think they are wanted, but there are various opinions held on the point. I should fancy that the north breakwater is most indispensable. It would stop the banking up of the sand, I think. At present the north-east wind brings the sand into the entrance, but with a breakwater at that point the sand would be banked up outside, and could not come in. The late pilot was always under the idea that the south training-wall would be enough—that the scour it would create would carry out any sand.

W. J.
MacDonnell.
4 May, 1898.

489. In heavy north-easterly gales is there any eating away of the extreme edge of that sandspit? It is always changing. Sometimes it is carried away, and then it reforms.
490. When it is carried away is it washed into the channel? Yes, very often.
491. What other towns are there on the river besides Wauchope? Only townships, not regular towns. There are Ennis, Beechwood, Morton's Creek and other settlements along the river.
492. They are only small centres? They are only convenient places for shipping.
493. You think that if this proposed work were constructed, the people would be provided with a convenience which they now lack? There would be the convenience of regularity in the shipping, and of getting their produce away.
494. You think that this work, if constructed, would get rid of the shifting bar? Yes.
495. I suppose if the entrance were deepened in the channel you would have larger steamers put on? Yes, the company cannot risk their larger steamers now.
496. Larger steamers will be able to face rougher weather, and make quicker passages? Yes.
497. And you would have no delays outside or inside? No. As a rule, the steamer can get in except in very bad weather. They do not like facing the bar when they are going to Sydney.
498. In your position of bank manager, you acquired some knowledge of the resources of the district and its financial strength. Do you see anything in the district to warrant the expenditure of £46,500, which includes the contract of £7,333 now in progress, in constructing the south training-wall, the western training-wall, and the upper portion of the eastern training-wall? I certainly think the prospects of the trade of the district warrant the expenditure of that sum.
499. What are the chief products of the district? Maize, wine, and timber. The people are now going in for dairying.
500. What sort of dairying country is it? It is very good. A large number of persons are coming up from the South Coast to take up properties there.
501. What do they grow on the river flats? Maize.
502. Do they have any floods? They are liable to floods. A flood destroys the maize crop and improves the land.
503. Does it always improve the land? Nearly always. The banks are pretty steep, and the water comes up at the back of these high lands, and deposits silt. The farmers do not mind a flood once in five or six years, but when it comes year after year, as it did in the early nineties, it is rather ruinous.
504. There is a fair depth of water in some of the upper reaches of the river? Yes, it is very deep. It is only at the crossings that there are small bars in the river. The river itself has a fair channel, and a large steamer can go up it for 13 miles.
505. Would there be much dredging required to make the channel open for fairly large-sized steamers? Steamers drawing 7 or 8 feet can get up to Wauchope, 20 miles, and they do not want to go any farther. For the convenience of the ships themselves, and in order to get out to sea quickly, they prefer to stop at the wharf and to get the cargo brought down by droghers.
506. You think that if the bar were improved and the channel deepened they would maintain the droghering system? The steamers could only go as far as Wauchope. I do not think the river could ever be made available for large steamers beyond that point. It would make very little difference, I think; it is a matter for the company to consider.
507. Is the town of Port Macquarie growing at all, or is it stagnant? It has been growing, but I think it is at a standstill just now. The population is 1,000. From 1880 to 1890, or 1893, it was increasing. A great number of persons have left the town, but the town itself has not gone back.
508. Can you give any reason for this exodus of population? Only that young fellows want to go out and see the world. A good number of them went over to South Africa during the boom time.
509. Is it not the older residents who leave? No; very few of the old people are leaving.
510. I suppose all the land in the lower reaches of the river is of poor quality? Yes, between Wauchope and the port. There is very little settlement.
511. It is ordinary coast country? Yes.
512. Further up, what is the character of the soil—black loam? Yes. There is a good deal of red soil on the ridges, and it is very suitable for horticulture and fruit.
513. How wide is the country between the river and the ranges? It averages from 4 to 5 miles on each side between the river and the high land.
514. This land is good throughout? No; the best agricultural land is near the river banks. They have not used much of the back land.
515. How does the milk come down to the river to the creamery at the port? I think they have their own launch.
516. Then they make daily trips to collect the milk? Yes; it was started since I left the port.
517. You do not know anything about the output of butter? No, except that more people are giving their attention to butter. They are utilising lands which they could not utilise for maize-growing.
518. *Mr. Wright.*] Are you still a resident of Port Macquarie? No. I removed to Sydney a little under two years ago.
519. What is the population of the district? I should say from 8,000 to 10,000.
520. During your long residence did the population increase or decrease? It increased certainly.
521. Markedly? No. Port Macquarie was once entitled to six aldermen, but when the population got over 1,000 they were entitled to nine aldermen, the number which they have now.
522. Formerly it was a much more important place than it is now? Certainly. At one time it was the complete centre for the Government business, the banking business, and everything. The opening of the rivers to the north and south has drawn away the trade, but that has found its level.
523. Port Macquarie is now in its normal position? Yes.
524. Do you think that if the harbour is improved and better facilities are afforded there is much prospect of the population increasing? Certainly.
525. Is there much available land open for cultivation now? Not alluvial land, but a good lot of second-class agricultural land fit for dairying is available.
526. You get no good alluvial land till you get up to about Rawdon Island? No.
527. How far up does that extend? Fully 20 or 30 miles above Rawdon Island on both banks of the river, but principally on the southern bank.

W. J.
MacDonnell.
4 May, 1898.

528. There is a great deal of timber in the district? Yes, very good timber.
529. Does it grow in fairly good soil or in bad soil? I do not think it grows in very good soil. They generally have to go out into the hilly districts for the timber.
530. But the land on the river frontage is generally pretty low? Yes, it is alluvial land which the river has cut its way through. The banks are from 15 to 20 feet above the river.
531. Is there not a considerable area of swampy land which may be drained and brought into cultivation? Yes, about Blackman's Point.
532. At the junction of the Maria River and the Hastings River is there not a considerable area of swamp which might be drained? Yes. Where the township of Hastings was supposed to have been, there is a large swamp there. Between the Maria River and the sea there is a large area which is all swamp.
533. These swampy lands when drained are generally of the richest description? Yes.
534. It is possible that at a moderate expenditure a large area which is now useless except for grazing stock may be used as fertile land? Between the Maria River and the ocean it is nearly all swampy land. It would make splendid dairying land. It is dark black soil.
535. If drained you think it would carry a large population? Yes.
536. That land if utilised in the best way would sustain a large increase in the present population? Yes. This land runs out for 20 or 30 miles, nearly to the Macleay River.
537. I suppose the land on the low ridges if cleared is fairly good grazing land? Yes, it is what we call second-class agricultural land.
538. It is good grazing land? Yes.
539. Do you think there is much chance of a large dairying industry springing up on the Hastings and its tributaries? I think there is a good chance indeed. The climate is suitable. There is no fear of a drought there. Whenever it does rain the district always gets the rain.
540. One prime factor which is wanted to develop this district in this or any other respect is certainty of communication with Sydney? Yes.
541. With that certainty assured to the port, you think that there is a good future before the district? Certainly.
542. Do you think the importance of this district would justify the country in expending nearly £50,000 to provide a good harbour there? I think it is only fair that it should be done. It will encourage the people; it will not prove a reproductive work, I suppose, but it will facilitate the outgoing of their produce.
543. You look upon it as a reproductive work in this sense, that it will open the door for further settlement, and develop the resources of the district? Yes.
544. You consider that anything which increases settlement and improves the position of people on the land must be good for the whole community? Certainly.
545. In that sense you look upon this proposal as a beneficial work which the State is justified in undertaking? Yes.
546. I think you stated that it is the opinion of some people that the construction of the western training-wall and the south training-wall alone would have a very marked effect in improving the entrance? That is the general opinion.
547. The master of a schooner who was examined yesterday looked upon these works as being of no value, that the north breakwater is the work which is wanted, and that the small bit of the south training-wall which has been made has had the effect of shoaling the harbour very much? I have not been there since it was started. Sir John Coode recommended a northern wall. He recommended pretty much the scheme as shown on this plan. At any rate, he had two breakwaters running out into deep water.
548. The estimated cost of the complete scheme is £163,000; but the officers of the Department are under the impression that the construction of the three works I mentioned at a cost of £46,500 will have such a marked effect on the entrance that any further work, at all events for a time, will not be necessary? I am inclined to agree with that opinion, but I do not want any weight to be given to my opinion.
549. From the general remarks you have heard, you believe that the Departmental proposal will effect a very marked improvement on the entrance? I think so.
550. What is the nature of the country immediately west of the town? It is red soil principally. It is swampy land. It is all settled; it is occupied by either conditional-purchase holders or freeholders.
551. For what purpose is it used? For maize-growing and as small farms for stock, vineyards, &c. It is not very rich land; it is not as good as the land higher up.
552. It will be very good for grazing purposes? Yes; but the area is small.
553. Further north the tendency on the rivers is to go in for a system of mixed farming, to produce better butter and pigs, and to go in for a certain amount of cultivation;—what is the tendency on the part of the population on the Hastings? That is what the people of the Hastings River are waking up to. They used to give all their attention to maize-growing, which at one time was profitable; but now they are being forced into mixed farming, so as to have more sources of income than one.
554. In fact, they are now becoming farmers? Yes.
555. Is there anything else grown on the river besides maize? Wine and fruit; but the fruit very seldom comes to Sydney. There is a constant export of pigs.
556. Was an attempt made there some years ago to grow sugar? Yes, in the early seventies, but it did not succeed.
557. It was grown immediately opposite Rawdon Island? Yes.
558. Was any attempt made to grow cotton there? Not to my knowledge. Wheat used to be grown in the early days, but it was infected by rust, and it was abandoned.
559. The climatic conditions are very good? Yes; it has a lovely climate.
560. What is the average rainfall? It varies. I think Mr. Russell gives the rainfall of Port Macquarie at from 70 to 80 inches, and further inland it is over 50 inches.
561. With that good rainfall and a moderately good soil the capabilities of the district will be very large? Yes.
562. You do not think its capacity has been utilised to anything like its fullest extent? No, because it has been isolated from the rest of the colony.
563. Is there much available Crown land in the district which will be suitable for cultivation? All the best land has been taken up long ago along the banks right up to the head of the river. Otherwise there is plenty of good land in the back.

W. J.
MacDonnell.
4 May, 1898.

564. It is a mining district also? Yes; there is a little mining at the head of the Hastings. I have seen different parcels of gold which have been brought down to me.
565. Is that far from the port? It is 80 or 90 miles from Port Macquarie. All the trade would go through Port Macquarie if there were good communication.
566. Can you give us an idea of the value of the district for minerals? At Rolland's Plains they found very good tin lodes which have not been developed yet.
567. Are they payable? Yes; but they have not been developed yet. Copper exists all round Port Macquarie. Its mineral resources have not been exploited yet.
568. The development of the district in this as in other respects has been retarded by its isolation? Yes.
569. If a good entrance were provided and the steamers could make regular trips, do you think the place would be likely to attract the attention of farmers? Yes; and it would become a large centre for outside districts. People, instead of going to Kempsey, would often ship their produce at Port Macquarie.
570. Is the river itself with its salubrious climate sufficiently attractive? It is one of the finest climates in the world. In winter there is no frost along the coast, and we never want fires in the daytime.
571. You think that in winter it might become a sanatorium for the people of other districts? Yes.
572. In your opinion, the district deserves encouragement, and the country is fully justified in spending this money, and will be amply repaid for the expenditure by the occupation of all this land? I am perfectly certain that it will be recouped if the expenditure is not undue.
573. *Mr. Roberts.*] In your responsible position as the manager of a bank, did you look upon the Hastings River district as a thoroughly sound one? All round, certainly I did. There were some exceptions when I was there. Most of the freeholders hold their own property. There are no wealthy men there, but it is a well-to-do population.
574. As a resident you took an active interest in the welfare of the district? Yes, in all public matters.
575. Did the question of improving the entrance engage the attention of the people in your time? Yes, it was a perennial question.
576. It was the one question uppermost in their minds? Yes. The question was whether the river should be improved or whether a railway should be made. The railway would not affect Port Macquarie, because it would go higher up. The concensus of opinion up there was that the harbour works were more important than even a railway.
577. But failing to get harbour works an agitation was got up by the people on the Manning and on the Macleay, in which the people on the Hastings joined, to construct a North Coast railway? Yes.
578. Was it owing to the apparent neglect of the authorities to improve the entrance to the river that the people joined in that agitation? Yes.
579. Did you and others have any scheme before you to improve the navigation of the Hastings? We had Sir John Coode's scheme. He landed there one afternoon, looked around and had soundings supplied by the Department, and gave his views.
580. Did it coincide with the scheme which is shown on this map? It was pretty much like this scheme. I do not know whether he included the western training-wall—I do not think he did. The main feature of his scheme was two breakwaters carried out to deep water.
581. Can you recollect whether he laid stress on the necessity of having these breakwaters constructed in the way shown on the plan? As far as I can recollect, yes.
582. Are you able to say whether he recommended the construction of the whole of that eastern training-wall as shown on the plan? I do not know whether it went up as far as that. It was to be carried round the front of the spit, to prevent the spit being broken into, but whether he went so high up I do not know.
583. Looking at the map on the easel, does the scheme placed before the Committee strike you as being very similar to his scheme? Yes.
584. Was that south training-wall provided for? I think so.
585. Has the wreck of the "Ballina" been a serious obstacle to navigators? Yes; it has caused a disturbance on the bar for many years.
586. How long is it since you were at Port Macquarie? About two years ago. The wreck of the "Ballina" was completely under cover of sand then.
587. Do you think that without the northern breakwater and the southern breakwater the remainder of the scheme would be effective? I do not know. I am not qualified to express an opinion as to the breakwaters, but it is the opinion of a good number of men that the northern breakwater is not wanted at all. The late pilot used to say that if the south training-wall were carried along here it would produce sufficient scour to clear the harbour.
588. Do you think that a district of the importance of the Hastings is fairly entitled to this expenditure? Yes.
589. Is there not a large area of land there under the vine? Yes; round about Port Macquarie the Isabella grape is grown.
590. It produces grapes admirably suited for wine-making? Yes.
591. Does not wine form a large export from Port Macquarie? Yes.
592. It always sells well? Port Macquarie wine is well known; it is rather strong. They do not grow light wines there.
593. Do you think the district has been retarded by the uncertainty and the irregularity of the communication? Yes; it has been retarded all along.
594. It is a common thing for people to get on board the passing steamers? Yes; or else to go to the Manning to catch the steamer at Taree, which is 60 miles away.
595. Was any dairying carried out while you were there? It was just commencing. They had a butter factory at Wauchope, but they had not sufficient capital to develop it. It was taken up by some Sydney people, and the headquarters were removed to Port Macquarie.
596. The country is well adapted for that purpose? Yes, and that is the opinion of people from the Kiama district.
597. What do you consider the value of the best lands on the river flats per acre? They used to be worth at the very least £20 an acre. Land has fallen in value a good deal now all over the country. I have known in special instances £40 an acre to be refused for land for which the owner would have been glad afterwards to take half the money.

598. Have you any idea of the present value of these lands? The best of the lands should be worth £20 an acre now, but some of the farmers would not sell for that price.
599. There is not a fully supplied market for land of the best description? No.
600. It is held by families from one generation to another? Yes.
601. You have been right up the branches of the Hastings? Yes, nearly as far as Kempsey.
602. How many miles have you been up from Port Macquarie? In a straight line it would be about 25 miles, but following the windings of the river it might be 30 or 40 miles.
603. All through that country there is a settled population well-to-do? Yes, along the river banks.
604. Have you been up as far as Ellenborough? I have been up as far as Ellenborough, but not beyond that.
605. It is good pastoral country up there? The pastoral country commences there, and runs right away across to the New England district.
606. Is there any agriculture carried on as far up as Ellenborough? Yes.
607. Is the land well adapted for it? Fairly well.
608. But its inaccessibility is a drawback to it? Yes.
609. The great drawback to the people has been their inaccessibility to market? Yes.

W. J.
MacDonnell.
4 May, 1898.

Louis Paulson, master of the steamer "Rosedale," sworn, and examined:—

610. *Mr. Black.*] Have you had an opportunity to consider the plan of the proposed scheme to improve the entrance to the Hastings River? I thoroughly understand the scheme.
611. How long have you been trading to Port Macquarie? Seven or eight years.
612. Constantly? Constantly, off and on; for the last six years I have been going there constantly.
613. Have you formed any opinion as to the effect which will be produced by the proposed works? The plan is very good. I do not think you could possibly improve upon the plan. There is no doubt that it is a pretty extensive work; but still, after we get the inside walls down, it will have a certain amount of effect on the bar. I think that when the southern training-wall is completed to the foot of Lord-street we shall derive a certain amount of benefit from it. The water travels over the rocks, and the object of this breakwater is to confine the water on one side, to shut out all the rocks. It will give you a clear channel to go right up to the wharf when it is finished. There is no doubt that it will have a certain amount of effect on the bar, but not sufficient.
614. You think the southern training-wall will have to be extended as far as the red line, which is shown on the map and marked "Southern breakwater," to have any thoroughly beneficial effect? I think before you start that work you want to start on the other side to get a scour. All this swamp on this side monopolises a certain amount of water which you do not get a benefit from. I said sometime ago that the western training-bank would be very beneficial to the bar to throw the current down on the south training-bank.
615. I want you to tell me what you consider will be the effect of the construction of the works as submitted to the Committee, not the effect of this portion or of that portion? If that work is completed it will have all the desired effect; it will give us sufficient water.
616. Do you think there will be sufficient scour then to remove the bar? Yes; if you confine the water there is bound to be a bigger scour which will remove the sand.
617. And keep the channel open? Under adverse circumstances I think you ought to have a fair depth of water.
618. You think that without the north breakwater there would be a tendency for north-easterly gales to clear away sand from that point, and thus fill up the channel? It may. If you do not complete the work it may have a tendency to send the sand in to the bar.
619. But you think that the confined force of the water will be able to scour it out again? It will certainly. A constant scour is bound to remove the sand.
620. Which breakwater do you think is the more necessary of the two? I should say, start the northern one first. It is more wanted than the other, which should be completed last of all.
621. You do not go up the river now? No, we never did.
622. How many feet do you draw? The "Rosedale" draws 7 feet 6 inches, loaded.
623. We are told that there is 8 feet of water up the river? No doubt. There is 20 feet in some places.
624. You do not find it necessary for the purpose of your business to go up the river? No.
625. All the stuff is sent down in droghers? Yes.
626. Do you think that if the river were deepened, and the bar removed, it is likely that the steamers would trade up the river? It is doubtful. There is no advantage as far as the ship is concerned. They may go as far as Wauchope.
627. The chief advantage which would be derived from the construction of these works would be the removal of the bar? Yes; you could get in and out then without any difficulty. You can always have a droghering plant on the river.
628. If the main result to be expected from this work is the removal of the bar, then the work should be so constructed as to fulfil that object, other matters, such as the deepening of the river channel, being of less importance? Certainly it is a less important work.
629. Do you know that it is proposed to spend £46,500 on this work? I have not heard how much is to be expended.
630. The south training-wall, the western training-wall, and the upper portion of the eastern training-wall, as far as the dotted line on the map, will cost, with the contract in hand, £46,500; but if all the works which are shown by red lines are completed the cost will be £163,000;—do you think there is anything in the prospects of the district which warrants an expenditure of £46,500 over its traffic? The traffic warrants it right enough. If you can assure a safe bar to the shipping it must naturally benefit the district.
631. I suppose you would not recommend an expenditure of £163,000 there? I do not know, it just depends on whether you have a population, and you think there is likely to be any increase.
632. Have you got the population there? You have not got the population at present, but very likely you will have the population in ten or twenty years, perhaps fifty years. We must not look to the present day; we must look to the future.

L. Paulson.
4 May, 1898.

- L. Paulson. 633. Do you not think it would be wiser to defer the expenditure till there is some increase in the settlement? I do not know. You suggested that an expenditure of £46,000 would complete the southern and western walls, but you cannot assure a complete or safe entrance till you get the northern breakwater completed. There is always a scour, and the sand shoots into that bay. Unless it is checked, it will always be a source of trouble.
- 4 May, 1898. 634. You think that the north breakwater, if constructed, would intercept the sand and cause it to pile up outside? Certainly.
635. You fear that without that northern breakwater, and in spite of the increased scouring power of the river, there will be a tendency in north-easterly gales for the sand to be scoured from the sandspits and deposited in the channel? No doubt it will always have the effect of driving it across to the rocks, unless we have a scour, or something to check it.
636. Is it a dangerous bar? Yes; it is all rock formation on the southern side, and on the northern side it is all sand.
637. You are sometimes detained a good deal? Yes, I am often detained.
638. How long are you detained outside? I am not often detained outside. I manage to get over as a rule. On my last trip I tried to cross at midnight. I was drawing 7 feet, and I made two attempts to cross. I was stuck each time, and eventually I had to take the tugboat to assist me across. It was half-past 1 o'clock before we got across the bar, on which there was 7 feet 3 inches of water. In the daytime we only get 6 feet sometimes. The bar, as a rule, is good. I consider that it is the best port on the North Coast after the Clarence. It used to average from 14 to 16 feet of water, as a rule; but within the last twelve months, at the lower part, the north sand flat has been washed away through the channel taking across right inside. If the channel runs down where it is now it will make a lot of difference. Once it comes inside we are "done."
639. The construction of the western training-wall will do away with that? Certainly.
640. If the bar were permanently removed, do you think your company would be likely to put on larger steamers? Certainly. We had a steamer drawing 10 feet, but during the last eighteen months we were unable to communicate with Port Macquarie on that draught.
641. How many tons is the "Rosedale"? About 200 tons.
642. What tonnage would a steamer drawing 10 feet be? It would have 400 tons carrying capacity.
643. A boat of that size would be much more powerful? Certainly. For five years in succession I had nothing less than from 12 to 16 feet of water at high water. The channel used to come down by the northern line, strike across to the southern wall, and go right out to sea.
644. It would appear from your evidence that the western training-wall is urgently required? Yes; once the southern training-wall is completed you have the western wall to throw the water on to the southern wall. It would assist it wonderfully.
645. The master of a schooner, who was examined here yesterday, stated that the south training-wall, so far as it has been made, deflects the current and throws the water over the northern side, instead of driving it out on to the bar? There is not sufficient of the south training-wall constructed yet to have an effect on the current. Besides, they are on a straight line with the wall at present. I do not hold with the view he expressed.
646. He told the Committee that, in his opinion, the south training-wall would absolutely destroy the bar? I do not agree with him.
647. He said he observed that it was having that effect when only 20 feet of the training-wall had been constructed? I do not agree with him.
648. He thought that to finish the south training-wall would be to destroy the harbour altogether? I do not understand his theory at all. It must have a material effect on the bar, because the water which comes across from the other side must follow the training-wall out.
649. *Mr. Lee.*] Where does your steamer generally lie? At the wharf at the foot of Horton-street.
650. Do you lie there with safety at all times? In any wind that is blowing.
651. In any sea, or in any wind, you are completely protected at that wharf? Yes.
652. I suppose there is a certain range there? There is a little, but not a great deal.
653. Not enough to interfere with the safety of the ship? No.
654. If that is the case now, and the western training-wall is carried down to that end, will it not make the anchorage and the mooring at the wharf absolutely secure? Certainly, more so than it is now.
655. Do you think that the current, under the conditions which have been explained to you, would carry that channel out far enough for your purpose? Certainly; I think it would give us sufficient water under most adverse circumstances to take the boat in pretty well at any time.
656. Do you think these training-walls will direct the current sufficiently far out to spill the stuff well outside? Yes; any silt which goes out is bound to be carried away.
657. You think it goes out far enough? Certainly.
658. You think that once you get your silt out to that point the current will do all the rest? Certainly.
659. If the proper depth of water can be obtained in this channel, do you think that these works will be sufficient for the requirements of the trade of the river? I am sure they would.

THURSDAY, 5 MAY, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Hastings River.

William Henry John Slee, Chief Inspector of Mines, Department of Mines, sworn, and examined:—

W. H. J.
Slee.

660. *Mr. O'Connor.*] How long have you been in the service of the Colony? Twenty-two years. I have been in Australia forty-two years.

661. Do you know the country which is represented on the map here? I have never actually been at Port Macquarie, but I have been in the surrounding country—in the locality at the head of the Hastings and right through there.

662. Will you state what you know of the value of the different portions surrounding this district, from a mineral standpoint? We have goldfields at Cells Creek and other parts. My opinion is that sooner or later copper deposits and other minerals will be found there. Cobalt, for instance, has been discovered in that district; but the country is rough, and as the roads are bad the cost of carriage is very heavy.

663. When you visited the district from what point did you start? I started from Walcha and rode right through to Ironbark and Cells Creek. I have gone from Kempsey through these ranges right towards Port Macquarie. Mr. Wilkinson, the late Government Geologist, and I spent a fortnight in going through these mountains.

664. What is the easiest route to the most important portions of the district from a mineral standpoint? I think the Port Macquarie route is the most natural. At the present time they actually go from Walcha Railway station right across to that district.

665. Did you spend much time in the district? I have been there at different times. Once I spent about a fortnight there with the late Government Geologist. We went to see for ourselves whether there was a likelihood of payable auriferous deposits or metalliferous deposits being found there.

666. Then what is your opinion in that respect? My opinion is that in addition to gold there is a probability of copper, lead, and cobalt being discovered there in payable quantities; and no doubt the better the route you can make to these fields the more encouragement will be given to prospectors to test them.

667. Which in your opinion would be the easiest mode of access to these fields—by sea or by land? By sea, I think.

668. When did you first visit these places as a public officer? In 1880 or 1881; but I have been there several times since then.

669. In 1881 did you go there to report on a report by prospectors? No. I did not report on it for the simple reason that I was with the Government Geologist. We only went through these parts for our own satisfaction. I frequently go to districts in that way and do not report on them at all.

670. What was the object of your visit there on that occasion? Instead of going on a straight and easy road by coach I went round on horseback to see for myself whether the country was likely to produce minerals, if not at that time, in the future.

671. Was there an anticipation on that occasion with regard to the probable mineral qualities of this country? Yes. From the very first I have always made it a practice to give as much publicity as I was able to do to the mineral resources of our country.

672. What impression did you form at your first visit? My impression was, and is, that sooner or later we shall have a large number of persons employed there in metalliferous mining—for gold, copper, or other minerals.

673. Did it, at your first visit, impress you as being a mineral producing country? Yes. At that time very few persons were actually engaged in mining in these districts; but I thought then, as I think now that, sooner or later, it will be the means of employing a large number of persons—that it was well worthy of prospecting.

674. How often have you visited that district since 1881? Three or four times.

675. In subsequent investigations, did you find any reason to change your original opinion? No.

676. What portion of the district do you think is likely to be of advantage, as indicating the mineral wealth of this country? The head of the Hastings River. On these high mountains and ranges there are parts which have hardly been visited by any person with a knowledge of minerals; and the head of the Hastings especially, I should think, is well worth prospecting.

677. Would you, with your long experience and your intimate knowledge of this country, say that a portion of the prospecting vote should be devoted to the prospecting of this district? That money has been voted under certain conditions. Cells Creek and some parties there have already had a portion of that vote. Many of them took up some ground and applied for aid, and the Prospecting Board made a certain recommendation.

678. Have you any knowledge as to the result produced by that expenditure? Yes; a quartz-crushing machine is crushing quartz for several parties where there was no machinery before.

679. Is the result satisfactory? I think it is.

680. I suppose the crushing machine is of an elementary kind? Yes; it is just at the head of the Hastings. Within a few miles of Port Macquarie they have got cobalt. On these high mountains and ranges which are drained by this river and its tributaries, sooner or later, gold and other minerals will be found. I do not think that gold will be got in the river itself, but certainly it will be got in close proximity to the river and right away back into the country.

681. Are the Committee to understand that the real wealth you anticipate getting will come from the ranges away from the river? Yes. The river has pierced its way through the ranges and drained them, and to a certain extent, no doubt, has some of the minerals in it.

682. From your personal knowledge and your experience of this district, do you think that with a fair expenditure, whether it be by the Government or by private enterprise, certain portions which you have indicated on the map will give a very satisfactory result from a mineral standpoint? I think so. 683.

5 May, 1898.

W. H. J.
Slee.
5 May, 1898.

683. *Mr. Clarke.*] You seem to think that there are strong probabilities of this district being a good mineral district? Yes. If you give better facilities from Port Macquarie it will encourage prospecting. If prospecting is carried on I believe some of the prospectors will be successful, and a large number of people may find employment, and thus the country will be benefited.

684. I suppose it is a considerable distance from navigable water to where the mines are likely to be developed? Yes. There are some minerals found close to Port Macquarie.

685. There is no other means of getting away from the mines except by way of Port Macquarie? I will not say that. I will say that the cheapest and best means for those who embark in mining and for the country at large would be by Port Macquarie.

686. Is there any mining population there? Not a great many miners at present. It is a very rough country. The great drawback is the want of cheap transit and a good road to the different mining centres.

687. I suppose there is no means of communication from the tableland? You can get there from the Northern railway line, but it is a long distance to carry goods from there.

688. The prospects you think are favourable at some time or other? I think that sooner or later there will be a mining population settled there.

689. A large mining population? Yes.

690. Is it chiefly gold they get? They get gold at Cells Creek, Ironbark, and other places. Copper has been found in different parts, but it has never been developed owing to the fact that the country is so very rough. Every reduction in the cost of carriage would tend to cause people to prospect the country.

691. Taking the mining interest along with other interests in the district, you think it is advisable to give improved means of communication to the port by improving the entrance to the river? I think that if the means of communication were improved the mining industry would go ahead to a certain extent.

692. *Mr. Wright.*] What is the geological formation of the country in the Cells district? The formation is Silurian, slate, and granite. You get a great deal of basaltic country right through; in fact, there is every geological formation you could wish for in a mineral country. We have diorite and porphyry there. The indication is favourable to it being auriferous, more so than copper. I have seen copper stains brought from there. They brought some returns to me, but the veins were very small, and the copper was only a stain. Although they thought the lode was of great breadth the rocks were only stained.

693. Is that all the indication of copper they have discovered? No; at one or two places they have actually worked a copper lode, but they had to abandon it on account of the low price of copper and the heavy carriage.

694. How far is this country, Cells Creek and Ironbark, from the navigable waters of the Hastings River? The nearest would be, I should think, about 30 miles.

695. I suppose the question of making a road to the place is not insurmountable? No; it would not cost a great deal. If you had a good entrance to the port it would, to a certain extent, enable them to make their own tracks and roads, which they have to do in many parts of the Colony.

696. Is it a very difficult and expensive country to make roads through? To a certain extent it would be, but in all this mountainous country the Government only give bridle tracks. Afterwards, when minerals are found, the owners of the land, for their own convenience, enlarge these tracks.

697. As a rule, the Government has to make the roads? As a rule, the Government has to do everything.

698. Is the country lower down more suitable for agricultural and pastoral pursuits? I have not been at Port Macquarie. I have only been round the locality on horseback.

699. How near have you been to Port Macquarie? At one time I was as near as 10 miles.

700. What is your impression of the country bordering the river as a country for agricultural settlement? Wherever there is basaltic country, and diorite country, as a rule, the soil is very good; but the greater part of this land is pastoral land.

701. Most of it is hilly land? Yes; but between the mountains there are valleys which are good for agricultural purposes.

702. Do you think it is likely to carry a larger agricultural population? I think if the entrances to the rivers are improved, we shall have a far larger population on the whole of our northern districts. I do not think Port Macquarie is an exception.

703. You think that if better facilities for getting to market are given on our northern rivers the land will be more readily taken up? Yes.

704. *Mr. Roberts.*] How far is Cells Creek from Port Macquarie? I cannot say exactly. Most of them come from Kempsey, or from Walcha to Cells Diggings. It is between 60 and 70 miles from Walcha to Cells Diggings, which are situated at the head of the Hastings River.

705. Is it very mountainous country about there? It is rough country.

706. What was the population at the time of your visit? There were only a few hundreds around that district. But in going from Walcha there is a line of diggings all the way to Cells Creek.

707. Do you think it is auriferous country all the way from Walcha? Yes.

708. How long is it since your last visit? Five or six years. These districts do not make a great deal of progress for some years.

709. What opinion did you form of these diggings? My candid opinion is that in that district sooner or later a mining population will be settled and profitably employed—settled there not for a time, as it were, but permanently.

710. Are the same people there now as were there at the time of your visit? I think some of the people have been there for twenty years or more.

711. Have you heard whether the men there are earning good wages? About three or four years ago I think a few parties were making very good wages. Gold, so far, runs in shoots there, and unless they keep a good observation, and keep following the shoots they often lose a shoot and go in the wrong direction, losing a good deal of time.

712. What is the population now at Cells Creek? I do not think you will find a hundred people there.

713. Are they engaged in mining? Nearly all. There are a few selectors there who have a few head of cattle. There is only one business place at Cells Creek, and the people have to go a long way for their stores.

714. Do the miners as a rule go by way of Walcha to reach Cells Creek? Most of them go by way of Kempsey.

715. Do you mean people coming from Sydney? Most of the people who come from Sydney go *via* Kempsey, because that route is cheaper than the Walcha route.

716. One would imagine that they would go from Port Macquarie? The Kempsey road is better than the other. On one road you can drive; on the other you must get a horse.

717. But there would not be much difference in the steamer fare? No.

718. Has not gold been found at other places on the Hastings nearer to Port Macquarie? Yes, in different parts.

719. Is it what you call payable gold? Payable shoots or patches have been found there.

720. Is it all quartz-mining? So far, most of it has been quartz-mining. There is alluvial-mining on the creeks.

721. Where are the alluvial mines to be found? At the lower part of Cells Creek.

722. Is there plenty of water obtainable at Cells Creek? Yes, and that is why a good many of the men stick there.

723. Have the quartz-miners got satisfactory results? Nothing extraordinary has been got there so far. I know that on one or two mines they have had as much as 2 oz. to the ton in crushing; but they are just running shoots, which disappear unless they are closely watched. If closely watched they are picked up almost as easily as you would pick up a regular run of gold; but if not closely watched you lose them for months or years.

724. Is the crushing machine kept continually employed? Not of late, I think.

725. Would not 2 oz. to the ton pay a miner handsomely? Yes; some of the reefs are of good size there. If they could get an ounce or even 15 dwt. to the ton regularly it would pay them very well. The gold certainly is got in shoots or patches.

726. They cannot get a sufficient quantity of it to yield 2 oz. the ton? Not in a continuous way of working. They cannot open out several hundred feet; it always runs out in the lenticular block system.

727. Is there any record of the average yield obtained from the quartz at Cells Creek diggings? No; unfortunately we have no law to compel the miners or companies to give us the returns, as we ought to have.

728. What do you regard as a satisfactory yield? If they can average with their reefs 15 dwt. to the ton it would be a satisfactory yield. It would pay the working men good wages and meet all the expenditure. It would encourage them to continue at work.

729. Have any public companies been formed to work any mines there? Yes; I think there were some Sydney people there a few years back.

730. Was any important work done there by any of the companies? No; the whole of that district has only been rooted over. Of really practical mining, nothing has been done. Unless they work on a system, and on a system of economy too, they had better keep away.

731. Have there not been what I may term mining rushes on the Hastings? Yes; we often get these rushes. We get them periodically in every district. A district may be dull for years, and all at once a rush takes place, and it is prosperous again.

732. What was the scene of the nearest rush to Port Macquarie? There has been a rush near Port Macquarie lately, but it turned out no good. The nearest rush to the port, I should think, would be from 20 to 30 miles.

733. Is there any mining population nearer to Port Macquarie than the population at Cells Creek diggings? No, not that I am aware of.

734. The places to which those rushes took place have been abandoned? Yes. Unfortunately the miners, who have been about Cells Creek and those parts, have been too long in one place, and too long in one groove. As we can only gain knowledge by exchanging views, they cannot exchange any views except with themselves. They know no more to-day than they did when they first started there.

735. Would it not be fair to assume that they are doing well there? We must assume that they are making a living, or else they would not have stopped there for so many years.

736. Would not that be the best evidence of the gold-producing powers of the district? Yes; I have no doubt that there are men in that neighbourhood and right on to Walcha who have made a living for themselves and their families for more than twenty or thirty years.

737. The fact that miners are doing well in a district is not always made known to the general public? No; we have no power to compel a miner or a company to give us the yield of gold, but a proviso to that effect is made in the leases. A miner or a hundred miners may each make £10 a week, and tell us the opposite, as I know they often do, that they only sell £1 worth a week, just enough to keep them alive. In 1880, when I was a warden at Mount Browne, I had 700 oz. of gold belonging to miners, and the outside public no doubt thought that these men were only making a bare existence. They only sold sufficient gold to keep them going, and left the rest with me till they were ready to leave or had a better opportunity to sell.

738. You find that the majority of the miners prefer to keep their business to themselves? That is the rule with the majority of miners throughout the Colony. I speak from practical experience. I have been a miner since I was 18 years of age.

739. Do you think there is likely to be a big discovery at Cells Creek some day? Yes; I think there is a good future for that part as well as many parts in New South Wales. I believe that before many years are over, not only those parts which have been so much neglected, but parts which have been very little thought of will come to the front.

740. Has not gold been found up in the Macleay? Yes. I have been all through there from the very head of the Macleay. I have been from Kempsey right on to Armidale, and I believe that all that country right through there will, sooner or later, profitably employ a large number of miners.

741. Will you state the boundaries of what you consider the auriferous ground of which the Hastings or the Macleay is the centre? The whole of the head of the Macleay, and right down to within 10 miles of Kempsey. I think that the whole of the Macleay and the whole of the Upper Hastings, sooner or later, will employ a large number of persons. The country will be dotted here and there with parties of miners and their families who will certainly contribute a great deal to the success of the territory of New South Wales.

742. Is there any settled mining population at the head of the Macleay similar to that which you say is at Cells Creek? Yes, in different parts. Some of the parties have gone through a great deal of work, waiting sometimes for the rain (there are sluicing companies) and others who have gone in for reefing.

W. H. J.
Slee.
5 May, 1898.

There are men at the head of the Macleay who have been there, I think, for thirty years. The majority of them appear to be comfortable in their little homes.

743. The remarks you make in regard to Cells Creek diggings apply to the whole of the diggings at the head of the Macleay? Yes.

744. And to the country extending right out to about Walcha? To the country extending behind Walcha and going right on to Armidale.

745. Are mining parties found now dotted over that country? Yes; you will always find a large number of persons mining in that direction down to the fall of the Macleay. For instance, a large number of persons are working at Warm Corner (at the head of the Macleay), which is 40 miles from Hillgrove.

746. Is Hillgrove a continuation of that country? Baker's Creek is a tributary of the Macleay, and Hillgrove is part of that country.

747. There has been a lot of gold taken out of Hillgrove? Yes; I was at Hillgrove when only six men were employed, and now there are two townships there.

748. Which mine has been the most productive? The Baker's Creek mine down in the hollow. I knew Baker's Creek before there was a single hotel or store there, when there was only a manager's hut.

749. Have you any record of the value of the gold which has been taken out of Baker's Creek? It can be obtained from the annual reports of the Department of Mines.

750. Is it still yielding satisfactory returns? —

751. Is not Baker's Creek much nearer to Armidale than to the nearest navigable point of the Macleay? Yes.

752. How far is Baker's Creek from Armidale? Twenty-two miles.

753. How far is it from Kempsey to Hillgrove? About 60 miles. I have gone from Kempsey to Hillgrove.

754. If you are going from the Macleay you go up the river a good deal further than Kempsey? Yes, by means of the drogher. There is a lot of tin on Long's station on the table-land. That would form the top part of the watershed of the Hastings.

755. To go to Hillgrove Armidale is the nearest point? Yes.

756. Some persons go by way of the Macleay? Yes; two years ago the teams used to bring goods cheaper by £1 or so a ton from Kempsey to Armidale than they could be brought by rail.

757. Owing to the low rate of water carriage? Yes.

758. You referred to some tin-mines just now;—where are they situated? They are on a place called Long's station. They are only 2 miles from the river, but you have to go up 1,500 feet to reach them.

759. Has tin been obtained there in payable quantities? Yes; but when tin fell so low in price they abandoned tin-mining. Some people from Tamworth had an interest in mines there.

760. Has tin been low in price during the last few years? Yes, compared with what it used to be. It is now about £68 a ton. In former years it was never less than £90 a ton, but the price dropped all at once. I have known the price of tin to be as much as £120 in New South Wales.

761. Did the drop in price cause the closing of a large number of tin-mines? Yes, a large number all over New South Wales. The northern districts are really the districts in which the most tin is found. I believe New South Wales has the largest tin area of any country in the world.

762. Has not there been some payable tin-mining on the Hastings? Yes, tin has been found there; but there are very few tin-miners there now, because the price is too low. All the easiest deposits have been worked. The deposits which could be worked at present market value would cost too much money to be payable. If the price of tin would rise like the price of copper, no doubt we would have a large number of miners working on the tin-fields all through the northern districts.

763. On the Hastings the principal deposits are gold and tin? Yes. I have seen copper from there, but the copper went so low in price. There were two lodes to my knowledge which they had to give up working owing to the dear carriage. It was found on the Hastings within 10 miles of Cells Creek—out towards Tya.

764. Would that be west of Cells Creek? Yes.

765. Leaving Cells Creek diggings and going down the river you come across fine pastoral country? Yes, it is nearly all pastoral country. There are a few valleys which no doubt would be fit for agriculture.

766. Going down to the port from Cells Creek, where do you first fall in with good agricultural land? At no great distance from Cells Creek there are valleys of good agricultural land, but they are of no great extent.

767. It widens out as you descend, and it is capable of producing anything? Yes.

768. It is to be found on either side of the Hastings and its tributaries? Yes. I suppose we have as fine agricultural lands in the northern districts as you will find anywhere.

769. You look upon this contemplated work, I suppose, with a favourable eye? I feel confident that every improvement you can make on our northern harbours means so much more prosperity to this country.

770. Have you ever been to Port Macquarie by water? No.

771. Have you never visited any of the North Coast rivers by water? Yes; I have been to Lismore, Kempsey, and Byron Bay by steamer.

772. Have you ever been to the Manning by water? Yes; I have been on the Upper Manning too. I have been from a place called Copeland right on to Nowendoc. That country, I suppose, will sooner or later employ a good few persons. It is all pastoral country.

773. Has it not occurred to you that the progress of these great North Coast districts has been greatly retarded owing to the difficulty of negotiating the bars? Yes; any traveller must come to that conclusion.

774. In many cases the journey there is undoubtedly attended with more than ordinary danger? Yes; Mr. Wilkinson and I could not get out from Ballina, because the bar was bad, and we had to ride across to the Clarence River.

775. If these rivers were made safer from a navigator's point of view, is it not probable that they would be visited by experienced miners, and that those men would help to develop a lot of auriferous country which it is now difficult to reach? Yes. Whichever patriotic gentlemen cause our rivers to be improved will be benefactors to this country.

776. From your personal experience do you not think that Port Macquarie and Hastings River districts are of sufficient importance now to warrant an expenditure of £46,500 to improve the entrance to the river?

river? As far as I know, I say yes. I am sure it will encourage settlement in a country in which it is pretty rough to settle. It is only big-hearted people who go out to those parts.

777. *Vice-Chairman.*] How far is Cells Creek from the nearest navigable point on the Hastings River? They generally come to Kempsey, which is 70 miles from the northern railway. Their business, as a rule, is done with Kempsey, which is 40 miles from Cells Creek.

W. H. J.
Slee.
5 May, 1898.

778. How far is Cells Creek from the nearest navigable point on the Hastings River? I should think it is 30 miles.

779. Why is the traffic done with the Macleay instead of with the Hastings? Because the roads are not made yet. There are roads from Kempsey to Cells Creek, Tya, and those places which would be supplied from Port Macquarie, I suppose, if they could get better carriage from that town.

780. Are the roads to Kempsey good? In many instances they are only bridle-tracks. In many instances the goods are brought by pack-horses to Cells Creek and those places.

781. Is Cells Creek difficult of access? Yes; it is difficult to get there from every side.

782. In what way would the improvement of the navigation of the Hastings River assist the miners at Cells Creek? I think at the present time the people would not go to Port Macquarie, because their business connections are centred in Kempsey, which is the nearest town of any consequence.

783. What other mining locality is there which would be assisted by improving the navigation of the Hastings? The whole of the locality. Cells Creek and Ironbark are the only places at which the miners are really working, but there are large areas or localities there which require prospecting, and which may, sooner or later, support a far larger population than Cells Creek does.

784. Would these localities be rendered accessible by improving the navigation of the Hastings? To a certain extent.

785. Would a similar answer apply to a similar question in regard to the Macleay? The head of the Macleay would be served certainly by the same process as you serve the head of the Hastings. There are a large number of miners scattered here and there at the head of the Macleay, but they go down to either Kempsey or Port Macquarie for their provisions.

786. Do you mean to convey the idea that unless the whole of the river were improved the mere improvement of the entrance would not develop mining in the district? The improvement of the entrance would have this effect: the carriage would be less if vessels knew that it was a safe entrance at all times, and to a certain extent the mining populations would reap a benefit from the work. If you can improve the entrance to the harbour, even if you do not improve the river, it must have a great, beneficial effect on the various industries.

787. *Mr. Lee.*] You know the country from Hillgrove right along the coast to Point Danger? Yes.

788. You have visited nearly all the mines in that country? Yes.

789. How long is it since you first went over that country? In 1878.

790. When were you there last? In 1896.

791. Did it strike you then that there has been a satisfactory settlement in that country during that period? There was a far greater settlement at my last visit than there was at my first visit; settlement not only by a mining population, but also by an agricultural population.

792. Did it occur to you that that portion of the Colony was being steadily but surely filled up by *bonâ fide* settlers? Yes.

793. During that period you have noticed considerable progress take place? Yes.

794. During the last ten years the mines have developed very considerably? Yes.

795. Has not the development of the mines had a considerable influence on the settlement of that country? The development of the mines always has a great influence on agricultural settlement, because the miner is a great consumer.

796. You have seen this development going on hand in hand in that district? Yes.

797. All the North Coast country is well watered by innumerable streams running from the mountains to the coast? Yes.

798. Considering the knowledge you have of that country, and your extensive knowledge of the Colony generally, do you think the conditions which exist there are such as would tend to still further settlement? Yes; I think by encouraging these works you encourage *bonâ fide* settlement in these parts, which cannot be settled simply because the cost of settling and living there is too heavy.

799. Before that can take place the conditions must be fairly favourable? Yes.

800. You admit that the agricultural land is there in abundance, and capable of growing anything which can be produced in the Colony except wheat? Yes.

801. And timber is plentiful too? Yes.

802. And the mines are extensive? Yes.

803. Under these conditions do you foresee in that part of the Colony a fairly dense settlement in the future? Yes. I have always looked on the northern districts as the garden of New South Wales.

804. Can you give us an instance, in some arid portion of the Colony, where mines broke out, and eventually settlement took place? I could give a large number of instances. Take Mount Drysdale, near Cobar. Through a prospecting vote of about £100, we have there a township containing several stores, a telegraph office, and other places, and employing a large number of men; formerly it was a wilderness.

805. But that is not agricultural country? No.

806. Is it not more likely that settlement would be much larger in districts where the conditions are favourable? Certainly. I could name thirty or forty towns in the Colony which did not exist until gold was discovered, and which afterwards became great agricultural districts. Young, Grenfell, Forbes, and Parkes never existed until gold was discovered, and then the farmer came and settled down alongside the miner.

807. The mines acted as pioneers to attract the population, and from that the miner turned his attention to farming? Yes.

808. As soon as he saved money enough he took up land and formed the nucleus of a town? Yes.

809. Do you think the mines in the northern district are of such a character as to last long enough to attract population? Yes; I think the mines in the northern district are likely to be permanent, and generation after generation will be able to work them in a payable manner.

810. You have no doubt as to what you say in regard to the future of the northern district? I honestly believe such to be the case.

- W. H. J. Slee.
5 May, 1898.
811. What is the best way to serve these people—by opening ports, or by making a North Coast railway? The best way, I think, is to provide cheap water-carriage.
812. For the conveyance of machinery to the mines, and for the conveyance of stone and minerals from the mines to the large works near Sydney, you think the proper way to develop that part of the Colony will be by keeping the ports open? Yes.
813. *Vice-Chairman.*] Has there been much development lately at Newbold's station, near Grafton? To a certain extent, near Grafton, there has been. In that district it has been rather patchy; but there is a large population in the district.
814. I think there is one mine being worked now—the Sir William Wallace? Yes; I have not been there for two years.
815. You cannot say that the mining population has increased? I know from the reports of the inspectors that it has lately increased again. It decreased very considerably in the northern districts when the price of tin fell so low. The tin-miners had to seek other work on our gold-mines, and a sort of boom took place, but now they have got into a permanent groove again, and although things are not booming they are prosperous.
816. Are any of the northern mining centres close to the navigable portions of the various rivers, or are they a considerable distance away? All I can say is that a large number of persons are permanently settled there. We have ups and downs in mining (very considerable, too) at different times. Bucca Creek, for instance, is coming up. Nana Creek, which went down for a considerable time, is rising again. In 1893 only three men were being employed at Cobar when the Railway Commissioners went there. The Commissioners were grumbling about so few men being employed, and I mentioned in a report I wrote that Cobar would again come to the front, as it has done. Although a district may be dull this month or that month, you will always find that it will come up again.

FRIDAY, 6 MAY, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.	CHARLES ALFRED LEE, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.
HENRY CLARKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.	

The Committee further considered the proposed Harbour Works at Hastings River.

Alderman Francis Buckle, steam-tug proprietor, sworn, and examined:—

- F. Buckle.
6 May, 1898.
817. *Vice-Chairman.*] Are you a steam-tug proprietor? Yes.
818. Do you live in Sydney? Yes. I have a steam-tug on three rivers.
819. *Mr. Clarke.*] I suppose you have been a long time acquainted with the trade on the North Coast? Yes.
820. Are you aware of the nature to the proposed improvements of the entrance to the Hastings River? I have heard of them, but I have only just had an opportunity to look at the plan.
821. The Department thinks that the north breakwater, the south breakwater, and the lower portion of the eastern training-wall will not be required to be constructed at present; they think that they will get a sufficient depth of water by confining the scour without building the two breakwaters; but if they fail in attaining that object, then the breakwaters will have to be built; it is proposed at the present time to construct the south training-wall, the western training-wall, and the upper portion of the eastern training-wall; it is proposed to leave a gap between the south training-wall and the west training-wall, in order to allow any vessels to go through to the wharf? I fully understand the nature of the Departmental proposal.
822. Do you think that the proposal is a good one, and that it will be beneficial in its effects on the bar? Yes. If it does not suit they can easily build that northern wall afterwards. I think it is quite right to construct the works in this manner. At the present time the current comes down the river and strikes the southern wall. There is a flat in the river, and if a ship gets on that flat she never gets off. My opinion is that the whole work, when it is finished, will give a grand harbour. At the crossing, the water has always been very shallow. The river is so very wide at that point that there is no rush of water in one particular place to keep the channel deep, until we come down to the southern side where it is all rock. The training-walls will create a nice current which must improve the entrance to the river. Wherever the rocks are the water is always deep and the channel good. About eight or nine months ago I had a steamer in the port. After a gale of wind she was blown out. She struck on something and it knocked the stern-post clean out of her, and half the keel. I do not know whether it was the wreck of the "Ballina" she struck on, but it was something hard. She was a new boat. When the water of the river is confined it must make a channel. I think there is as much as 13 or 14 feet of water off the rocks on the southern side.
823. Have you any idea of the tonnage or the value of the traffic from Sydney to Port Macquarie? I suppose there is an average of six or seven vessels a week, running from about 50 tons up to perhaps 200 tons.
824. Are they chiefly sailing vessels? Yes; only the North Coast Company runs a steamer to Port Macquarie.
825. Does the "Rosedale" trade exclusively to Port Macquarie? No; she goes on to some of the other rivers. I think she goes to the Hastings and the Bellinger. In the busy season she goes to the Bellinger, and some of the other boats go to the Hastings. When the season gets slack the "Rosedale" calls at Port Macquarie and the Bellinger, both coming and going.
826. You are not able to state definitely the amount of traffic, either in tons or in value? No.
827. Have you a better idea of the traffic from Port Macquarie to Sydney? It is the same each way. They nearly all come in in ballast, and go out loaded with sawn timber or logs. A great lot of corn is sent

F. Buckle.
6 May, 1898.

sent away. In the season the "Rosedale" goes up loaded with maize. She sometimes makes two trips a week. There are three sawmills on the river, and I suppose one mill cuts over 50,000 feet a week, another about 30,000 feet a week, and another about 20,000 feet a week; it would be equal to about 300 tons.

828. Do you know the country along the banks of the river? I have not been up the river more than 10 miles, but I believe it is very good country.

829. You have no idea of the country where the timber is got? No.

830. You do not know whether it is grazing country? No. I only know that a great quantity of corn is brought down. I may tell you that there will be a couple of steamers on the river directly.

831. How long is it since you have been to Port Macquarie? Eighteen months.

832. What was the state of the bar at that time? It was fair. There were 8 or 9 feet of water on the bar.

833. Previous to your visit, what had been the state of the bar? It was good for some considerable time before that date. It sometimes got a little shallow, but nothing like the Nambucca bar. It was far better than the Nambucca bar. I never heard any complaints from Port Macquarie about the bar until this southern training-wall was started.

834. If the river were improved so as to allow vessels of larger tonnage to enter, do you think it would be beneficial to the people of the district, and in the public interest? I think it would. It is a great river for timber. Port Macquarie timber is reckoned to be the best timber which comes into the market. Certainly larger vessels would go there if they could get in and out.

835. Does not the entrance to the Hastings bear favourable comparison to the entrances to the Bellinger, the Nambucca, or the Manning? It has always been better than either of those entrances. It has always been reckoned the best bar on the coast for vessels of a fair size.

836. *Mr. Roberts.*] Have you a thorough knowledge of all the rivers on the North Coast? I have not been to Cape Hawke or to the Manning, but I have been to the Hastings, the Nambucca, Camden Haven, the Macleay, the Bellinger, the Clarence, and the Tweed.

837. Do you regard the entrance to the Hastings River as one of the best or one of the worst on the coast? It was always reckoned one of the best harbours before these stone dykes were started. I suppose the Bellinger bar is about as good as any bar we have, except the Clarence bar. Port Macquarie was always reckoned a good bar harbour. As a rule, there are always 8 feet or 9 feet of water on the bar; sometimes there is more.

838. Has it not been very unfavourable for ship-masters lately? Yes; since these works were started.

839. Do you know what depth of water there is on the bar now? No; only from what I hear from the captains of the steamers, or read in the newspapers. At times the depth is 7 feet; at other times it is 8 feet.

840. Has it not been as low as 5 feet? I think so.

841. Do not you think the time has arrived when something ought to be done to give the population settled on these rivers better communication with the metropolis? I think so. I know the people will not go there at the present time. I know that some of them are leaving for the want of means of getting their produce away. On nearly all the northern rivers that is the case.

842. You think the difficulty of access is a great drawback to the progress of the North Coast districts? Yes. At one time there was a bar in the river here. The dredge would dredge it out to-day, and leave about 10 feet of water, but in a week's time it was as bad as ever.

843. That part of the river is not traversed by the ocean-going steamers? No; but sailing vessels go up the river for timber. The tug-boat takes sailing vessels 40 miles up the river to load timber.

844. Are you referring to your own tug-boat? Yes; she draws 6 ft. 6 in., and she goes 40 miles up the river.

845. Is there any difficulty in her getting up the river? Sometimes there is.

846. That is owing to the want of more dredging on the river, not at the entrance? A shallow place up the river is cleaned out very often; but, unfortunately, it fills up very quickly. The first flood which comes along fills up this hole which is made by the dredge, and it knocks away the fan and the shaft of the tug sometimes.

847. Is the Hastings River dredged as well as other rivers on the coast;—does the dredge stay there sufficiently long? I could not say. At one time there was great trouble with the dredging. The Progress Committee at Port Macquarie used to send the dredge to where it suited them best to dredge.

848. You mean to say that they got the authorities to move the dredge to where they thought it was most wanted? Yes.

849. Did not that always meet your views? Not always. I only know what the captains have written to me and others have told me.

850. Would it not be to the advantage of the district for your tug-boat to be able to get up the river? Yes. I think a dredge ought to be kept up the river at that point. It costs a lot to bring the dredge down 20 miles and then take her back 20 miles when the hole fills up.

851. Is the freight of the sailing vessels which your boat tows confined to timber? Principally. Sometimes they take a back freight.

852. The general merchandise goes up by sailing boat? No, by steamer.

853. What loading do the sailing boats get from Sydney? Only ballast.

854. Is the freight by the steamer so low that the farmers do not feel justified in using the sailing boat? The back freight from Sydney is very high by the steamer companies. It would not pay a merchant to wait for a sailing vessel to send a few packages to a particular place. He thinks it is better to pay the steamers what they demand, than to send the goods by sailing vessels. The steamer is more regular, and the trip is shorter, and no doubt a shipper gets his returns more quickly when his produce is sent by steamer. The steamers as a rule do not carry much timber. It is very hard times when a steamer carries timber. At times they may carry a few pine logs, but that is very seldom.

855. What is the difference in the freight for timber? I think the freight from Port Macquarie now is 2s. 3d. for sawn timber, and about 4s. for logs. Timber merchants find it more convenient now to bring down the logs from the river. It is only marketable timber which the mills cut, unless certain sizes are ordered. If you order special sizes to be cut it may be a month before the supply is received; but if a merchant has the logs in his yard, he can cut the timber to any size which is desired, in a day. Nearly the whole of the timber comes down by the sailing vessels.

856. Have you been to the Clarence since the improvements were effected? I was there when part of the work was finished.

- F. Buckle. 857. Can you speak as to the efficacy of the works? No.
 6 May, 1898. 858. Have you not heard that the improvements have been most effective? Yes.
 859. It would lead one to suppose that the proposed improvements on the Hastings would be equally satisfactory? I think so, if the works are carried out as the Department proposes. If the northern wall is wanted it can be built at any time.
 860. On which rivers have you a steam-tug? The Nambucca, the Bellinger, and the Hastings.
 861. Are the three steamers constantly employed? They are when they can get in and out. At Nambucca, they cannot get out except once in a fortnight.
 862. Is there any difficulty in getting in or out of the Hastings? Yes; sometimes it is shallow.
 863. Would it not be a rather serious position for your boat to be unable to enter during the present south-easterly weather? We can often come in when we cannot get out.
 864. Are yours the only tug-boats which are employed on these rivers? There is an opposition boat at Port Macquarie just now.
 865. Is there sufficient work for two tug-boats on the Hastings? No.
 866. In a south-easterly gale like the present one, would the bar at Port Macquarie be fairly sheltered compared with the bar on other rivers? It would be; but I would not like to go in or out of Port Macquarie in a gale of wind like the prevailing one. I would sooner chance the sea for it than go in on a day like this.
 867. For what period would your tug-boat be able to carry sufficient coal to enable her to keep at sea? She would carry coals for a week. She is a large boat which I built purposely for the trade.
 868. Does she always have a week's supply on board? No; we have to confine the tug to the draught of water. We have to keep her up by the stern and down by the nose. If there is plenty of water we keep her down by the stern.
 869. Do you always keep provisions on board? I never keep any provisions. I pay them by the month, and they find their own.
 870. It would be rather a serious thing for a boat like yours to be kept outside? She would not be kept outside. If she got out she could always get back. She is never out more than an hour, and a sea does not get up there in that short time.
 871. But suppose that there is 5 feet of water on the bar and she wants 6 ft. 6 in. to get in? The bar could not silt up in that short time. If you can get out you can always get in again.
 872. Do you know anything of the Hastings River district? No.
 873. You do not know whether it is progressing or retrogressing? No; I have never been up the river more than a few miles.
 874. How long have you had your tug-boat running there? I have had the tug-boat service since tenders were first called for Port Macquarie, about fifteen years ago. Mr. James Watson was Treasurer at the time the tenders were called.
 875. How much are you paid by the Government? I am getting £10 a month now from the Government for Port Macquarie.
 876. What services are you expected to render for that subsidy? We are expected to go out to the bar whenever the pilot requires us, to sound the bar, to report to vessels when there is water on the bar, and to take vessels out at 30s. each, which the vessels pay themselves.
 877. You are at the command of the pilot at all times? Yes.

TUESDAY, 10 MAY, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Hastings River.

John Lowry Ruthven, civil engineer, sworn, and examined:—

- J.L. Ruthven. 878. *Vice-Chairman.*] You are engaged in business? I am a civil engineer by profession, but at present I am manager of the "Forbes Hotel."
 10 May, 1898. 879. You use to reside at Port Macquarie? Yes, for many years.
 880. *Mr. Lee.*] The object of the proposed works, as shown on the plan, is to increase the depth of water on the bar, and thus afford a safe entrance under ordinary conditions of weather; but it is not proposed to interfere with the navigation of the river above the wharf. As an old resident, do you think that such works would attain that object? I have lived in sight of the bar for ten or twelve years. I have seen the changes in the sandspits. I have spent the greater part of my time on the water inside and outside the harbour, and seen all the changes. While the "Ballina" was there, and there was no channel on the north side of that vessel, the channel on the south side of her I do not think could be improved. But when a heavy flood came, and washed away the spit which was in existence then, and made a channel to the north of the "Ballina," neither channel was good. Sometimes the steamers came in the channel to the north of the "Ballina," and sometimes by the channel to the south of the "Ballina," that is, by whichever channel had most water. But during the time the channel was closed up, to the north of the "Ballina," there was always plenty of water to enable a vessel to come in at any time of the tide.
 881. That proved that when the tide was confined to the channel there was sufficient scour to keep it open? Yes. I think, if instead of taking the "Ballina" away, three or four old hulks filled with concrete had been sunk to the north of the "Ballina," Port Macquarie would be the best harbour on the coast. I do not say that this south training-wall would not improve it. It would confine the water more than it is. The rock on the south side makes a natural training-wall.
 882. The object of the western training-wall is to throw the current on to the south training-wall, and to allow the water to go out towards the sea? My opinion is that the western training-wall will not do a bit of good.
 883.

883. Suppose that, instead of these works, works were designed to start from the northern side out to the point of the "Ballina" wreck? I believe it would do all that is wanted to be done. Of course, it would be much better if the north breakwater were carried out into 3 fathoms of water. J. L. Ruthven.
10 May, 1898.
884. But, abandoning that idea, and supposing that a training-wall were started from the north side out towards the site of the "Ballina" wreck, would it not answer the same purpose as sunken hulks would do there? It would. The old hulks would be actually a training-wall. It would be much better if, instead of stopping at the proposed point, it were carried out to a depth of $3\frac{1}{2}$ fathoms, because it is an understood thing that in 3 fathoms the action of the sea has no effect on the sand at the bottom.
885. The breakwaters which are shown on the map were a portion of Sir John Coode's design, but the Department thinks that a sufficient bar can be obtained by putting in the works it has designed without building the breakwaters? I do not think so. I do not think you will ever get a permanent bar by only carrying out the south training-wall. I have always maintained that you want the north breakwater. I have always believed that it would answer the whole purpose without constructing the southern one, and I believe so still, from my own observations.
886. Do you mean that if the north breakwater were constructed, and no south training-wall were made, it would have the desired effect? It would have a decidedly better effect—twice the effect—than if you construct the south training-wall and leave the other alone.
887. For the reason that the site of the south training-wall is a rocky one? It is a natural training-wall. I do not mean to say that it cannot be improved. The south training-wall certainly would improve the effect that the north breakwater would have.
888. The Department necessarily has been guided to a certain extent by the consideration of probable cost, and although it admits that the works as designed by Sir John Coode would have the desired effect beyond all doubt, it considers that it would involve a very great expenditure to carry out his design, and that it is possible that the trade of the district would not warrant the expenditure;—therefore it has submitted a design which it thinks will answer the same purpose, and at very much less cost? I think Sir John Coode is perfectly correct, because he wishes to have the north breakwater. I maintain that without the north breakwater the bar will be very little improved.
889. Is that the conclusion you formed while you resided at Port Macquarie? Yes; from watching the bar and seeing how it shifted. I suppose for nine months out of the year I was on the water there.
890. If your theory should prove to be correct, then the necessity for the western training-wall would be done away with? I cannot see why that should be constructed. I cannot see what value it is at all.
891. It is claimed by the Department that the water will first touch the eastern training-wall, then it will be thrown on to the western training-wall, alongside which it will form a channel, and then strike the south training-wall and have a direct shoot out to sea across the bar? I reckon that the western training-wall is so much money thrown into the sea. If you want a scour there, you cannot get it in a shorter way than that.
892. Will you explain how it can be done? If that very small neck of land up the river, which is composed of sand, were opened, the current would have nearly a straight run from the longest reach in the river (from Hamilton's saw-mill), down to the bar. There would be very little curve in it. I have always maintained that if you scoop through this narrow neck of land, and allow the water to run, it will cut its own channel. Of course if you want to face the cut you can pile it to any depth you think proper, and it will bring a straight scour nearly right through the bar.
893. *Mr. Black.*] I asked Mr. Darley about that, and he said, "No, the water would have to be turned by another training-wall"? There is a long reach from Hamilton's saw-mill down the river, and if that narrow neck of land were cut through, and faced with piles, it would give a straight scour.
894. *Mr. Lee.*] Your contention is, that to improve the bar there should be a north breakwater, and that whatever other work may be carried out after that is made will be merely supplementary? Yes.
895. You look upon the north breakwater as the primary work? Yes; from the knowledge I gained from the time the "Ballina" was wrecked at the bar. I lived in view of the bar, and I was boating and fishing nearly all my time. When the "Ballina" was wrecked there the sand silted up to the north of the "Ballina," and the channel was always good; when it broke up it was just the opposite; sometimes one was 1 foot or 6 inches deeper than the other. I said at the time, when the Government thought about improving the entrance, that the cheapest thing it could do was to buy three or four "Ballinas," fill them with concrete and sink them there, and then they would always have a good scour. It has proved to be the case.
896. Were you there when they made that portion of the south training-wall which is tinted black on the map? No; I have not been there since it was started.
897. You do not know what effect that portion had, if any? I do not think it could have any effect. The bar has never been so bad for very many years as it has been during the last two or three months.
898. The effect will be bad enough after this last gale? It is not the southerly gales which hurt the bar, it is the north-easters, which for nine months are the prevailing winds.
899. They are winds, not gales? Yes. The bar is protected from southerly gales by nobbies, and a reef from Bird Rock, which breaks the heavy sea occasionally.
900. You are not prepared to say how far out the north breakwater should go? Into a depth of not less than $3\frac{1}{2}$ fathoms. It is supposed that any sea has no effect on the bottom in 3 fathoms.
901. Suppose it was run out to a level with the point of the south training-wall, which would be a little outside the "Ballina" wreck, do you think that would give a sufficient scour? Previously it has.
902. It was the obstruction offered by the wreck which caused the scour? Certainly.
903. The question is would it keep a good bar there, and would it keep the bar open outside that point? No, it would not be enough. The action of the sea in northerly and north-easterly weather would affect the sand at the bottom. It is laid down that you must have 3 fathoms of water before you can depend upon the sand not being disturbed. If you are going to keep the same width there; you will have to go out to a depth of 18 or 20 feet for safety. I think it is only 17 feet 6 inches to the rock at the bar. Some years ago Captain Howard, when he was making a survey, made some soundings, and got down to the rock at a depth of, I think, 17 feet 6 inches, or 18 feet.
904. Do you know much about the district itself? Yes; I have lived there on and off for twenty-five years.
905. Do you look upon it as a progressive district or as a district which has filled up? Certainly there is a good

J.L. Ruthven. good deal of land that is open for settlement; but all the best of the first and second-class lands has been taken up. During the last five years land has been taken up there, which they must have been hard up to take up.

10 May, 1898.

906. They have to take what they can get now? Yes; all the frontages are gone. There is a large amount of good scrub land on this side of the table-land, beyond deep water frontage, which is still available.

907. Do you think the district is kept back in any way, or that the settlers are seriously inconvenienced from want of communication? I think they have been very seriously inconvenienced from want of proper communication with Sydney, owing to the bad state of the bar. I have known vessels to have to wait for a fortnight behind the bar before they could get out with perishable produce—which meant a dead loss to the settlers.

908. Maize, the chief product, will find its way to a market sooner or later even if it is detained on board the steamer for a week? Yes; but you very often miss a good buyer. A man does not thresh his maize out until he sees a good market. The growers on other rivers can get their produce to market, but this man on the Hastings loses his market.

909. He is not able to take advantage of a rise in the market which is a fluctuating one? No.

910. Do you think a better entrance to the river would lead to further settlement and further production in this district? I do, for this reason: That there is a large area of land available for settlement which is not good for cultivation, but which would make good dairy farms. With the factory at Port Macquarie, and creameries established all over the district, I believe it would lead to the settlement of a large portion of country which otherwise could not be utilised.

911. Do you think the farmers on the river are making the best use of the land to-day? That is questionable.

912. Are the owners of land there cultivating? They are cultivating all the land which is fit for cultivation. There has been a very large increase in cultivation during the last five or seven years there.

913. The immediate benefit from these works to the settlers would be more certain communication, possibly a larger class of steamers, and cheaper freights? Cheaper freights, which is the main thing.

914. You think that once a certainty of trade is given an increase of trade is bound to follow? Undoubtedly.

915. And in support of that view you say that the land is there to admit of further settlement? Yes, for dairying purposes.

916. Do you think the district as it stands to-day is of sufficient importance to warrant the country in improving the river? I do undoubtedly.

917. Could relief be given to the people on the river by any other means, such as a railway? There is no doubt that if the North Coast railway were constructed, with a station at Wauchope, all the perishable produce, the live stock, and the passenger traffic would go by that way.

918. If the railway were constructed and the port were improved, one would rob the other? I cannot see that it would, because nine-tenths of the maize would go by water if the freights were satisfactory.

919. The railway would scarcely be able to carry maize as cheaply as a steamer could do? I cannot see why it could not be done when it is done in other parts of the world.

920. As it does not appear from the evidence that the district would support both a railway and a port, which work do you think is the more desirable one to carry out for the benefit of this district? I should say a railway, if it were constructed at once, but that seems to be very far off.

921. Suppose the port is improved, and that eventually no railway is made, will that port be sufficient to enable the people to carry on all their business? It would if it were made a good port.

922. Suppose it were so improved that it would carry a larger steamer, and would be available oftener than it is at present, do you not think that the whole of the produce of the district—maize and perishable products—would be able to find a market? If the works were carried out so as to enable a larger steamer to come in and out in all weathers, and the usual traders could get in and out, I think it would be sufficient for the requirements of the whole of the Hastings district. At the same time, the North Coast line would be a great advantage to them.

923. You think an improved port would meet all requirements for many years? For years to come.

924. A great deal has been said by various witnesses as to the dairying industry on the northern rivers; do you think it can be established anywhere indiscriminately, or must it not be confined to districts which have the grasses suitable for cattle? I do not agree with you there. I do not believe in the natural grasses at all for dairying. To make dairying pay you must cultivate; you must grow all the stuff for your cattle. I look upon a good milch cow as a boiler—the more you fire up the more steam you get. It is coming to that every day.

925. The Hastings River district, I presume, affords as favourable opportunity to do that as any other river district? It is not as large as many other river districts, but the land is as rich as the land in any other part of the Colony, not even excepting the Hunter.

926. If they have been able to accomplish great things on the Richmond and in other places, you think the Hastings River will be capable of doing so? Yes; they have not had an opportunity to do it before, but now that they have a central factory with creameries in different places they will.

927. You think that steam communication will be sufficient to enable them to carry on their work? Quite.

928. *Mr. Black.*] Have you noticed the effect of north-easterly gales on the outer sandspit which is facing the town? It is constantly changing. There is not a month in the year when it is the same.

929. It is eaten away by north-easters? Yes; right at the end of that woody point I have seen a channel 100 yards wide. I have repeatedly sailed out of the river north into the ocean, and then returned through a cutting in the sandspit. I have sailed round the site of the "Ballina" wreck, and sailed to the north inside the outside break, and through there.

930. Was that channel cut by the ocean or by the river current? By the river. The big flood took nearly the whole of that spit away.

931. When that sand is washed away into the channel is it not afterwards washed down to form the bar? Undoubtedly.

932. You think that without the northern breakwater the bar cannot be permanently removed? Certainly not.

933. Does it not appear to you, from the fact that that sandspit is liable to erosion by flood, that that eastern training-wall would also be necessary before you could obtain a perfect channel? I do not think

so, for all practical purposes, because it has only been known once to go through there. The deepest water in the place is to the north of the eastern training-wall. J. L. Ruthven.

934. You do not think the upper end of the eastern training-wall is necessary? Not a bit. There is a natural training-wall on that side. 10 May, 1898.

935. Do you not think that without the western training-wall, the force of the current will be greatly lost on these sand flats, and in the bay above the town? No; if you want to go up the river in a strong ebb-tide, you get over on the lower side where there is little or no current. It is on the eastern side that the current is met with; it comes round here like a mill-race, I suppose at the rate of 7 or 8 knots. The strength of the current is on the eastern side, and when you want to go up against the tide, you hug the sand-bank on the western side.

936. Would not that training-wall still more increase the force of that current? I do not think the result would be commensurate with the expenditure.

937. You were speaking of the non-disturbance of the bottom at a depth of 3 fathoms. Suppose the breakwater were taken out to a depth of 3 fathoms, would it not be possible to lessen that depth by the settlement of sand? I do not think so; from experiences in other parts of the world, they always reckon that, if they can get 3 fathoms at the end of the breakwater, and they have got the scour, the action of the sea will not send the scour back.

938. The only thing you attach any importance to is the construction of the northern breakwater? Principally; but I do not for a moment say that the south training-wall will not help it.

939. Your reason for making that statement is because there is no protection from the north while there is protection from the south by the rocky headland and Nobbies? Yes, and from my own observation of the place.

940. What is required there is mainly, I understand, a safe entrance? Yes.

941. It is not at all necessary to deepen the channel so that steamers can go up the river for any distance? It would be all the better if they could go up to Wauchope, but what they want is to be able to come in and out at any time of the tide as they used to do.

942. There is no great depôt up the river, and the articles of shipment are gathered at various small places and taken down to the wharf? Yes.

943. It might involve a very large cost to deepen the river and its branches so that the steamer could navigate them all in search of traffic? It would not cost much to enable them to go up the main river as far as Wauchope. If the ocean steamer could go to Wauchope, the company could carry the produce at a reduced freight. It would save the main portion of their droghering plant and staff.

944. You think that that would be advisable? Certainly. On one occasion I had one of the ocean steamers as far as Ennis, which is not very far from Wauchope; but we stuck, and we had some trouble to get off.

945. *Mr. Hoskins.*] Have you made a visit to Port Macquarie since you came to Sydney? No.

946. Is it not a very slow-going, unimportant district? The town itself is rather slow, but the district is a good district.

947. Has not one of the drawbacks to the district been that a great deal of the best land was given out years ago in grants, when Port Macquarie was a penal settlement, and the grantees are holding the land expecting to get a very high price, and by their action are deterring people from settling there? No; all the old grants are the worst lands on the whole of the Hastings River. The best lands, with one exception, on that river, have not been old grants. Instead of taking the rich brush lands on the bank of the river, they went to the forest lands, and took nearly all their grants there. Not one of the original grantees owns the land at present. The grants have all been cut up into small farms and sold years ago. I think I was the last one who had an old grant there, and it is now cut up.

948. Were the purchasers of that land residents in the district, or did they come from other places? From other places.

949. I suppose it is quite a rarity to see people going there now? No; if land were put up for sale there to-morrow, and it was any good at all, it would find a purchaser in a resident of the district or residents in other districts.

950. Although these persons in other districts have heard of the state of the bar at Port Macquarie, still they go there and face the difficulties of navigation? Yes; the bars to the north and south, with the exception of the Clarence, are worse than ours.

951. The amount of produce which comes from the district is very small? There is a very large area under cultivation. Every available acre which is fit for maize crops is under maize. There is a lot of land under maize which is not fit for maize-growing.

952. There is only one steamer engaged in the trade;—is it a small steamer? About 300 tons.

953. Do you think that if there were a North Coast railway extending to the Port Macquarie district, a dozen passengers a week would travel by train? Yes; and a great many more, even from the Hastings district alone; but the North Coast railway would not depend on Port Macquarie alone for its passenger traffic.

954. You said that nine-tenths of the maize would be sent by water; do you not think that one railway truck would take all the dairy produce in a week? I do not think it would.

955. Considering the great extent of the Colony, its sparse population, and the needs of the country, do you think the Government would be justified in expending £60,000 in improving the navigation of the Hastings River? I do. I think the people are entitled to it. They have never had 1s., as it were, spent in the district. They have paid their taxes, and so on, and I think they are entitled to a fair share of public expenditure in order that they may get their produce to market.

956. Has not some work been carried out by the Government to improve the navigation of the river? You can hardly call it improving the navigation when they use these old crab-dredges. A couple of Irishmen, with long-handled shovels, would do as much work in a day as a crab-dredge.

957. Has not a portion of the south training-wall been built? I believe a small portion has been built since I was there.

958. Have you not heard that the entrance has been improved? No; it has never been in a worse state for the last fifteen years than it is at present, or has been during the last three months. They have had to wait until the very top of high tide to get up.

959. *Mr. Trickett.*] During your residence in the district there was not much agitation for the improvement of the harbour? Yes, on several occasions; but it all ended in smoke.

- J. L. Ruthven. 960. From the official *precis* which has been presented, it would appear that February, 1895, was the first time the attention of the Department was drawn to any necessity for improving the harbour? I have known meetings to be held years ago. I know that it was brought under the notice of the Member for the district; but whether he did anything further I do not know. It must be fifteen or sixteen years since I called a public meeting at Ennis. We had a large meeting there to agitate for the improvement of the bar.
- 10 May, 1898.
961. It was always looked upon as one of the best bar-harbours on the North Coast? I think, bar the Clarence, it is the best, because it is not subject to change so quickly as the others, owing to that southern rocky headland. When the "Ballina" was there, and when it was sanded up to the north of the "Ballina," we had a good bar, and steamers could come in at nearly any time of the tide. There was as much as 16 feet of water on the bar then.
962. Now you have a sort of dual channel? No; it shifts too much. It is not confined sufficiently.
963. Are all traces of the "Ballina" gone? They blew her up, instead of filling her with concrete and sinking her.
964. If they had left her where she was wrecked, and filled in to the north, you would have had a good scour? Yes. I believe that if they put down two or three hulks filled with concrete they would provide a bar which the steamers could cross at any time of the tide.
965. You have not been to Port Macquarie since that small portion of the south training-wall was built? No; but that would not have the slightest effect.
966. In his evidence the other day, a captain said that its construction had really shallowed all that pink patch which it used to be easy to navigate;—he said that before it was constructed all that pink patch on the southern side was navigable water where he could go in and out at any time, but that since its construction it is all shallow water which he cannot navigate;—he says that the wall has altered the current of the channel? He could never come inside the beacon on the rock, or from that beacon to Diamantina Rock.
967. He said that all inside of that was good water? That is nonsense. It could not be good water, because it is all rock in here. He might come in a bit at one point.
968. But not to any great extent? No. He could not have understood the plan if he said that, because the portion tinted pink is all broken with rocks. He could beat in just underneath the school, but he could never come inside the Diamantina Rock.
969. The Committee have under their consideration two projects—the construction of a North Coast railway and the improvement of the bar-harbours on the North Coast—but it is not likely that both projects will be carried out;—in the interests of the district, which do you think it would be better to carry out—to abandon the proposal to improve the entrance to the port at a cost of £46,000 and let it be silted up, or to construct the North Coast railway? I hardly think it is fair to put on the shoulders of Port Macquarie or Hastings district the whole of that railway.
970. The North Coast railway, if constructed, will tap nearly all these ports, but it is not likely that in the present state of the public finances, we can afford to spend £3,000,000 or £4,000,000 on the construction of that railway, and enormous sums in improving the bar-harbours? Everybody on the North Coast would like to see the railway go ahead as well as the other works; but under the circumstances, I should certainly say, go for the breakwater.
971. It is an acknowledged fact that where water carriage can be availed of for the transport of timber and produce it is cheaper than any other form of carriage? In most instances it is.
972. If the railway were constructed, and the vessels could go in and out of the port, the people would still send their goods by water if the freight were cheaper than the freight by rail? They would send by water all the goods which were not perishable. The railway, if constructed, would open a tremendous lot of land which will never be available until it is made, owing to the want of carriage.
973. The timber would still go by water? Most of it would.
974. You said there is a lot of land under maize which really is not quite up to maize-growing. That remark would point to the fact that the district has reached its maximum development, as far as maize-growing is concerned? I think, as far as maize-growing is concerned, it has; but the land I speak of would make magnificent dairy-farms, which, I understand, pay better than maize-growing.
975. Dairy farming would not tend to induce very dense population? More so, I think, than maize-growing. It is only a farming population which is there.
976. The dairy product is a compact product? It goes into a smaller space than maize.
977. You would not contend, I suppose, that this work should be looked upon as a reproductive work—that there would be a large return from the outlay? I do not see where you are going to get it.
978. You regard it as a kind of national work? I do. I think the people on the river are fairly entitled to the whole of the proposed expenditure. I think it is one of the most neglected districts in the Colony.
979. *Mr. Clarke.*] You said that there is a large area of land up the river available for dairying purposes. Is it land from which the timber has been cleared? No; it is open forest land. Some portions of it have been cleared, but there is a large extent of what you would call first-class grazing land, which could be utilised for dairy-farms, but which now is not really productive.
980. Is it high land? Yes.
981. You said that you considered that dairying would not be profitable except the land were ploughed and laid down with English grasses? I say it would be more profitable.
982. Is that kind of country suitable for growing imported grasses? Yes; it is a rich chocolate soil.
983. Is it all rich chocolate soil? Nearly all.
984. Is it heavily timbered? Portions are, and portions are open—apple-tree and grey gum.
985. The scrub lands are generally the best lands when cleared? Undoubtedly.
986. Would the alluvial land on which maize is grown be suitable for dairying purposes? It is the best in the world.
987. It would have to be laid down with imported grasses? If they want to allow their alluvial soil to go into grass on the northern rivers, they do not sow English grasses, but they simply let it lie fallow, and in eighteen months or two years it is one mass of clover and couch. Couch is the best grass on the northern rivers in winter time.
988. As a rule, in the south the couch grass is not suitable except in summer time? We have not such hard

- hard winters in the north as you have in the south. I know the south country. Even when it is burnt with frost it is nutritious. J.L. Ruthven.
989. Can you say from personal knowledge that dairying pays or will pay better than maize-growing? No; but I have made inquiries from those who have had actual experience, and they tell me it does. I have not dairy-farmed, but I have done a good deal of maize-growing. 10 May, 1898.
990. I suppose mixed farming would be carried on there? Yes; mixed farming is the best all over the world.
991. Has the population increased very much of late years? I do not think it has increased a great deal; but, certainly there is a lot of outside land which has been settled within the last seven years. I could not tell you the population.
992. A good deal of timber is sent from there? Yes; it is acknowledged to be one of the finest hardwood timber districts in the colonies.
993. All the cedar and beech are gone? You may get a little beech now and again, and a few logs of cedar, but the places are so inaccessible that it is hardly worth the trouble.
994. Does land bring a high price on the Hastings? I do not know exactly what the selling price would be just now; but for land with about 13 to 14 chains frontage, and about 80 chains back, I got £20 an acre cash, and I reckon that barely one-half the land on each farm is what I call first-class land. I do not think you would get that for it now.
995. I have heard that there is a good deal of land on the Hastings which might be bought for £1 an acre—old grants? I had a little bit there which I would be glad to sell to you for less than £1 an acre. It is no criterion as to what the land is worth, because some of the old grants comprise the worst land in the district.
996. *Vice-Chairman.*] You say that until the "Ballina" was removed the harbour was a good one, and the bar gave no trouble;—do you know what led to her removal? I think, as I told them at the time, it was some fools who agitated for her removal.
997. Do you remember the agitation? I do.
998. Who led the agitation? I cannot remember distinctly; but I know that I opposed it strongly for exactly the reasons that I have stated here.
999. Was it not in consequence of the local agitation that the Government decided to blow up the wreck? I believe it was.
1000. Was that agitation due to the fact that the bar was bad, and was supposed to be getting worse by allowing the wreck to remain there? While the "Ballina" was there intact, if a strong flood came and opened the channel to the north, that disturbed the channel to the south, because it made two channels and neither of them was good.
1001. Was that owing to the presence of the "Ballina"? No; at the time the agitation was got up both channels were open, but neither of them was good. The people at the port thought that if they had the "Ballina" taken out of that position the water would run into one channel and deepen.
1002. The removal occurred in consequence of both channels being bad at the time the agitation was got up? That was the reason. While the spit sanded up north of Ballina, and the channel was confined to the south side of the "Ballina," you could go in or out at any time of the tide, and there was no talk of any agitation then. But when a flood swept away the spit to the north of the "Ballina" it opened both channels, and neither of them was good.
1003. As a matter of fact, her removal was due to the condition of the bar at the time of that agitation? Yes; it was owing to the two channels.

George Charles Yeo, draftsman, Stock Branch, Department of Mines, sworn, and examined:—

1004. *Mr. Farnell.*] You were asked to produce a return of the stock in the Hastings River district? Yes. G. C. Yeo. 10 May, 1898.
1005. Have you prepared a statement? Yes. It is as follows:—Description of area to include the undermentioned stock: Commencing at the mouth of the Hastings River, and bounded thence on part of the east by the sea-coast northerly to the northern watershed of the Hastings River aforesaid; thence on the north by that watershed westerly about 45 miles; thence on the west by a line southerly about 16 miles to the southern watershed of the Hastings River; thence on the south by that watershed generally easterly to the sea-coast aforesaid; and thence on the remainder of the east by that coast, to the point of commencement. Return, 31st December, 1897:—Horses, 1,835; cattle, 11,261; sheep, 348; pigs, 3,354. 1895—Port Macquarie Sheep District:—8,842 horses, 45,632 cattle, and 798 sheep. Increase in cattle in Port Macquarie Sheep District, which includes the Hastings, 1896 over 1895, 659 cattle; 1897 over 1896, 5,859 cattle.
1006. Cannot you give the proportion in each district? No, because our returns have gone back to the inspectors.
1007. You have not had an opportunity of comparing the stock returns for this year with the returns for 1897? No, not in the particular area I have described. I have given a comparison with the whole of the sheep district, which includes the Hastings, the Macleay, and as far as the Nambucca River.
1008. Would the stock within the area you have described come within the influence of the proposed harbour works? No; they would have their own harbour works. The first return I gave relates wholly to the Hastings district. It would not affect the other rivers at all.
1009. What is the general character of the stock there? Fats and dairy cattle. There is a drift of about 2,000 fats a year from about the Macleay and the Hastings to the southern markets.
1010. *Mr. Clarke.*] The statement you read does not give the returns for the Hastings district separate from the Macleay district and the Nambucca district? The first return was for the Hastings alone, and I gave the others to show what increase there was in the whole of the district.
1011. *Mr. Lee.*] The Port Macquarie sheep district, although there is hardly a sheep in it, is a very large one? Yes; it includes the Hastings, the Macleay, and the Nambucca Rivers.
1012. It includes within its boundaries over 45,000 head of cattle, and 9,000 head of horses. The district, as a whole, is a large one; but the district of the Hastings only would contain, according to your estimate, a little over 11,000 head of cattle? Yes.
1013. A little more than a fourth of the whole of the sheep district? That is just about it.

- G. G. Yeo.
10 May, 1898.
1014. Do the stock travel by the ordinary stock routes, or do they come by steamer? All the large stock travel by the ordinary stock routes.
1015. Why? They do not care to take the risk of sending them by steamer.
1016. As a matter of fact, it does fatten stock to a certain extent? It does.
1017. In view of the very recent and disastrous approach of the tick pest towards this Colony, what effect is it going to have on the cattle in our coastal district, which appear to be the most favourable for the growth of the tick? It is rather a difficult question to answer. There is no doubt it will cause an increase in the price of cattle. It may mean ruination to everybody when it comes there.
1018. You have had to remove the quarantine boundary from the interior of Queensland to our northern border? Yes.
1019. You have had to shift your line in one direction, 200 miles, without a day's warning, in consequence of the tick coming south? Yes.
1020. Notwithstanding all the precautions which the Government of Queensland has taken to prevent its spread, the tick has made its appearance at Brisbane, and within a short distance from our borders? Yes.
1021. Suppose it gets into the Hastings River district, will you be likely, in five years' time, to have 45,000 head of stock there? I do not think so.
1022. If the dairying industry is carried on in the districts very largely, there is a possibility of there being a very large loss of stock? Yes.
1023. And the dairying industry may be crippled for the time being? Yes; but the dairy cattle being tame can be treated more easily than cattle out on the holdings.
1024. These northern districts are most favourable for the growth of this pest? Yes.
1025. Is it not in these particular districts that you expect to have most trouble? All along the coast.
1026. Do you not view with some alarm the possible spread of the pest into these districts? We do.
1027. Can there be any doubt, in view of their experience in Queensland, that if the pest should get into these districts the loss of cattle must be very large? Yes; very great.
1028. If dairying alone is relied on as an industry, there is an extreme probability of its receiving a very severe check in the North Coast districts during the next few years from this cause alone? Yes.

Reginald McRae Mitchell, clerk, Government Statistician's Office, Chief Secretary's Department, sworn, and examined:—

R. M. Mitchell.
10 May, 1898.

1029. *Mr. Black.*] Have you brought a return which was asked for by the Committee? Yes. The clerk who prepared the return is absent, and, therefore, I am unable to tell the Committee the boundaries of the district to which the figures I am going to give, apply. I will furnish the boundaries of the district afterwards. In this return it is stated that the total area of the district is 327,040 acres. The population was 3,470 at the end of 1897. The Crown lands occupied at the 31st March, 1897, comprised 13,058 acres, and of alienated lands, freehold, 45,728 acres, and leasehold 18,796 acres. The total area of alienated land was 64,524 acres, and that area, added to the Crown lands occupied, gives a total area of 77,582 acres. No material alteration in these figures is shown by the returns for 1897-8.

1030. Can you give a comparative statement of the general production of the district for three years? Yes; it is as follows:—

	1895-6.	1896-7.	1897-8.
Wheat	38 acres.	80 acres.	113 acres.
Maize	4,689 "	4,970 "	4,725 "
Other grain crops ...	217 "	270 "	205 "
Lucerne and sown grass	28 "	30 "	24 "
Sorghum	59 "	44 "	17 "
Root crops	65 "	84 "	24 "
Vineyards and orchards	42 "	52 "	45 "
Market-gardens ...	5 "	14 "	6 "
Minor crops	40 "	54 "	18 "
Total under crops...	5,183 acres.	5,598 acres.	5,177 acres.

In addition to that, in permanent artificially-sown grasses, there is an area varying from 700 to 900 acres. It is explained here in a note that the term "other grain crops," includes barley, oats, rye, and millet. The return also states the productions in the most important crops during that period as follows:—

	1895-6.	1896-7.	1897-8.
Wheat	440 bushels.	1,360 bushels.	1,157 bushels.
Maize	177,445 "	177,902 "	*159,477 "
Hay, all kinds	128 tons.	176 tons.	113 tons.
Potatoes	193 "	324 "	38 "
The production of butter during the three years was...	35,788 lb.	43,062 lb., and 75,887 lb. respectively.	

* Estimated.

It also gives the returns of live-stock at the end of each year, as follows:—

	1895-6.	1896-7.	1897-8.
Horses	1,508	1,564	1,652
Dairy cattle	1,158	1,516	1,869
Ordinary cattle ...	5,173	5,484	6,028
Sheep	208	258	252
Pigs	2,107	2,282	2,482

1031. You have not brought any information in regard to the export of timber? No; this will no doubt be supplied to the Committee by the Department of Forestry, while the boundaries of the district to which the figures refer will be supplied by our Department.

WEDNESDAY, 11 MAY, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Hastings River.

John See, Esq., M.P., sworn, and examined:—

1032. *Vice-Chairman.*] You are a Member of the Legislative Assembly and a director of the North Coast Steamship Company? Yes. J. See, Esq.,
M.P.

1033. *Mr. O'Connor.*] Have you seen the plan of the proposed works at Port Macquarie? Mr. Lee has explained the nature of the proposed works to me. I think it is one of the easiest harbours on the coast to improve, because it has a south headland and a rocky point jutting pretty well out to the sea on the south. There is a tremendous sandbank on the north side, and that is where the danger comes from northerly weather; but, as a rule, for light-draught ships it is a good entrance varying from 7 to 12 feet. We look upon it as a safe port for small ships, and I should think it is capable of being very much improved without incurring any very large expense. I do not know the cost of the proposed works. 11 May, 1898.

1034. The scheme as submitted to the Committee is estimated to cost £46,500? The ocean-going steamers do not go beyond the wharf, that is at the beginning of the river. All the produce has to be brought down in droghers from different parts on the Hastings and its tributaries. I do not think the ocean boats have ever gone up beyond the wharf.

1035. Will you give the Committee the benefit of your opinion in regard to the proposed expenditure, and of your knowledge of the condition of the country surrounding that port? I think the proposal is a good one. I have no doubt that the force of the tide will keep a channel along the training-wall. Of course the whole scheme would be better than a part; but still I think it will be effectual in giving a depth of water sufficient for present requirements. The great trouble they have is on the north side, because the sand comes over and chokes up the whole of the channel. A training-wall will help the tide to keep the track clear as it has done on many other rivers.

1036. Do you think the work which is being constructed should be continued? Undoubtedly. The little bit which has been done will be no good unless it is continued. The pink-tinted portion on the map consists of water and sand, and some rocks, and this sand gets into the channel and makes the bar bad. It is accessible at almost all times from the south, except when there is a southerly swell on.

1037. The natural headland is a protection against the southerly winds? Yes. On all rivers which have a south headland it is easier to make harbour works, and the entrances are better than the entrances to rivers where they have not any south headland.

1038. Do you think the proposed expenditure is a proper one to incur? I do, because it is an important district. It used to be the principal port for the tableland in the early days of the Colony. It is one of the oldest if not the oldest settlement on the coast. I have seen soldiers' grave-stones there bearing the date of 1821. It is a quaint old town. It was a place of very considerable importance, as the remains of very large old brick stores would indicate. In the early days it was a depôt for New England, and also for Tamworth. But after the railway was made, and the Hunter was opened up, and better roads were made, traffic was discontinued to the port, and it became a place of much less importance as a depôt than it used to be; but still there is an important agricultural district for a considerable distance inland from the town. They produce a very considerable quantity of produce. I suppose, unless when there is a flood-year, they produce probably from 30,000 to 40,000 sacks of maize—200,000 bushels of maize—a year. Then they produce a very large quantity of pigs and poultry, and a very considerable quantity of hardwood—for Port Macquarie is famous for its hardwood timber. Altogether, it is an important district. It ranks in some degree, I think, as the Bellinger and Nambucca. Perhaps there is a larger settlement at Port Macquarie than there is at the Nambucca, but not quite so large as there is at the Manning. I think it is capable of a very considerable development. There is good country at the back, and there has been a good deal of gold-mining from time to time up in that district. Altogether, I should regard the Hastings as one of our principal rivers. The site of the town, to my mind, is the very best on the coast. It is the prettiest place I have seen on the coast from Point Danger to Cape Howe, and ought to be and would be, no doubt, if there were better means to get into the harbour, made a sanatorium for fishing, shooting, and residential purposes. I have seen no place on the coast which I like so well—that is, apart from its agricultural importance.

1039. Can you of your own knowledge say that the country is capable of very large development if better facilities are afforded to enter the river? There is no question that it is like many other rivers; it is only in its infancy. It only requires facilities to induce settlement for the place to go ahead very much more rapidly than it has done. It is a shallow bar, but it is not a dangerous bar. The only difficulty we have ever heard of, so far as my connection with the port goes, which extends over twenty years, has been when there was an easterly swell on. I think it is a bar which can be very easily improved. I do not think it would be an expensive thing to do, and I think the work would be permanent.

1040. Previous witnesses have said that the southerly gales which are so treacherous to other portions of our coast have not the same destructive effect at the Hastings River? I do not think a southerly wind would touch it at all. The only danger would be from an easterly gale, and that would spend itself, I think, on the sand on the northern side. It would not affect these harbour works at all. The proposed works would not be affected by any action of the waves that has ever come under my notice.

1041. The Committee is also considering an alternative scheme for a railway to the North Coast, and they would like to know how, in your opinion that railway might affect these different ports, particularly Port Macquarie? I do not think the North Coast railway would affect it in the slightest degree, except beneficially. If the railway is made, and I hope it will be made some day, I think it will go a long distance back from

J. See, Esq.,
M.P.
11 May, 1898.

from the mouth of the river. We know well that if you get anything like reasonable facilities for water carriage railway carriage cannot compete against water carriage. I am satisfied that the railway would not injuriously affect the harbour works. On the contrary, I think the harbour works and the extension of the railway would probably assist in the development of trade.

1042. You have no hesitation in recommending to the Committee that the proposed expenditure would be a good one? I think it is quite justifiable, and I consider that the proposal is a good one.

1043. *Mr. Hoskins.*] How many vessels have the North Coast Company running to Port Macquarie? The "Rosedale," a steamer of about 200 tons.

1044. Does she trade to the Bellinger, the Nambucca, and the Hastings? Yes.

1045. In one trip? Sometimes; but that is in a slack season. Sometimes we have what they call flood years. A flood year means that pretty well all the produce on the rivers is swept away. Then one steamer will be sufficient to take supplies to the Hastings, the Bellinger, and the Nambucca. But when they get a fair crop of maize on each river, which would represent, perhaps, over 10,000 bags of maize, that would mean a trip a week for a steamer carrying about 1,000 bags each trip. It would take two steamers like the "Rosedale" to do the work of the three rivers; but the company have droghers which can cross the bar. These droghers very often go into the Nambucca and the Bellinger, and take out a cargo to larger steamers at Trial Bay, or bring it on to the port. Sometimes we take maize from the Bellinger and Nambucca to the port, so as to give despatch to the steamer. Sometimes the maize from the Bellinger and the Nambucca is taken to Trial Bay and put on a larger steamer; but the port, as a rule, could accommodate seven out of ten of the North Coast Company's steamers as far as the draught of water goes.

1046. Are we to understand that one steamer of 200 or 300 tons burden supplies the requirements of the Hastings, the Nambucca, and the Bellinger for six months in the year? I think it does; but that does not include the timber which is taken by sailing vessels.

1047. Is not the timber trade carried on in small vessels of light draught which can go over the bar at almost any time? They draw about a foot, I suppose. These little vessels which are mostly owned by the mill-owners, are employed by the mill-owners to take the different cargoes which are required, and land them at certain places.

1048. But the owners of these small vessels do not generally complain of any difficulty in getting in or out? I do not know.

1049. Very often they are prevented from getting in or out? Sometimes I have known the Bellinger to be blocked for three weeks before the harbour improvements were carried out, and they had to get their supplies of bread and flour from the Macleay.

1050. You have never heard of any great delays to vessels trying to enter the Hastings River? I have been bur-bound at Port Macquarie for a week.

1051. Until recent years Port Macquarie was a very dull place, one of the early settlements, and all the young fellows went away to Victoria and other places and left old men and females behind? When the trade drifted to Maitland and other parts of the country Port Macquarie became something like Goldsmith's Deserted Village. The very large buildings put up in olden times to accommodate the merchandise were not required by the smaller local trade; but still, there is a considerable amount of trade done at the port. There are two or three large hotels and several stores there.

1052. How long is it since you were there last? About three years.

1053. Did you notice that they have not built a new house within the last ten years? Within my recollection they have built one very large hotel of about 40 rooms, and I am sure you would be delighted with that hotel if you only had an opportunity to stay there.

1054. Was it built in anticipation of Port Macquarie becoming a sanatorium? To some extent. It was not put up altogether to supply future requirements. There are two very large hotels there.

1055. It is a very unprogressive place, and the people have very little energy or push, and they take things very easily? I think they have as much energy as the people in any other town. If a man has not very far to go there is no use for him to break his heart to get there. It is a small town, but the district is an important one.

1056. How long have the steamers of the North Coast Company been trading to the Hastings River? About 7 or 8 years.

1057. Have you noticed that the cargoes brought from that district are increasing, or are they about stationary? The trade of every northern river is gradually increasing year by year, and the population too.

1058. Have you been up the river far above the town? I have been up the river as far as what they call the head of navigation.

1059. Has there been much forest land reclaimed by persons to engage in agriculture? Yes.

1060. We were told yesterday that there is a good deal of very inferior land in the Hastings River district? So there is in every district.

1061. There is not much inferior land in the Richmond River district? Yes, there is. There are a good many swamps. I admit that it is a very favourable district, but still there is a considerable quantity of inferior land on the Richmond. On most of these rivers, at the back of the alluvial land, there are swamps. They are useful in summer for grazing, but they are not the best lands. I do not think there is as large a proportion of bad land on the Hastings as there is on the other rivers.

1062. But the area is very much smaller? Yes. It is not quite so important a district, and does not produce as much as the Manning. It is further away from Sydney, and probably it has not the same opportunities, but I think it is capable of very considerable development.

1063. Do you know whether many strangers have gone into the district to take up land? I do not think there have been very many. I think there is a good deal of good land above the head of the river, but it is not suitable for cultivation, because there is no road to it.

1064. Do the directors of the North Coast Company anticipate that that district will progress so much that they will have to have a steamer specially for the river's trade? The policy of the company is to make the necessary provision for trade as the exigencies of trade may require. We cannot anticipate by building a new boat what they believe will be the requirements of the river in a couple of years, but we have steamers which we can place absolutely in the trade if necessary. One steamer a week could not bring away the whole of the maize in the season which is grown there.

1065. Suppose this large sum were not expended in improving the entrance to the Hastings River, which,

I think, you said is one of the best rivers on the North Coast, do you think the district would go back? I do not think the district will go ahead as it ought to do. What I said was that, the port was favourably situated for the construction of harbour works as any river on the coast, but that it was a shallow entrance, with very seldom less than 8 feet of water.

J. See, Esq.,
M.P.
11 May, 1898.

1066. But with the exception of building hotels, they are a very antiquated class of people;—there is not much go in them, is there? You will find an antiquated class of men everywhere, I think. I do not know that the people on the Hastings are any different to other people. I find the people on the Hastings exactly the same as I find the people in other parts, the descendants of English, Irish, and Scotch, and well-grown natives. I think they are a splendid type of men on all these northern rivers, and so far as industry is concerned, they do not get very much unless they work.

1067. Having filled the office of Colonial Treasurer, and knowing the state of the public finances, and remembering the fact that there has been a road made into this district, and that the settlement is not very large, do you think that the public under such circumstances are justified in spending so large a sum in improving the entrance to a district which does not progress very much? Unmistakably I do, and I have not a shilling's worth of interest in the port. The men we hear clamoring for railway construction in various parts of this country, will tell you in Parliament that it is a waste of money to improve our harbours. But, I have no hesitation in saying that, the coastal districts are very much richer and more important in themselves than any other portions of this Colony, and if a reasonable sum were expended in improving the bar-harbours it would have the effect of giving greater facilities to the residents. The country is perfectly justified in incurring this expenditure. As an ex-Treasurer, as a Member of Parliament, as a man who has had a considerable amount of experience commercially with the rivers, I say the expenditure is absolutely justifiable, and that these districts are not nearly as sufficiently known as they ought to be to nine-tenths of the people of the country.

1068. Is it not a fact that large sums have been expended in the coast districts? Not very much in comparison with what has been spent in other districts. I suppose more money was spent on the railway from here to Cooma than has been spent on the North Coast altogether. More money was spent on the railway from here to Newcastle than was spent on the North Coast altogether.

1069. *Mr. Trickett.*] The Member for the district, and Mr. Ruthven, a very old resident of the district, have stated that the Hastings district has reached its maximum, as regards its agricultural development; do you agree with that view? No.

1070. Mr. Ruthven, who lived there for many years, said that there was a great deal of land under maize which was really inferior maize-growing country;—is that your experience? No. You cannot gauge the capacity of a district by a flood season. You must take the seasons when they do not get floods, if you want to test the maize-producing capacity of a district. My experience is, that the production of maize on that river, and on all the rivers, is on the increase, notwithstanding the fact that there has been a large amount of land taken up for sugar.

1071. How far do you think agriculture extends up the river? I suppose it extends for 50 miles up on the river and its tributaries.

1072. How do you think the district is to go ahead? There is an enormous quantity of land which will be available for farming purposes when proper roads are made.

1073. For what kind of farming? Maize-growing. Potatoes they can grow when they get further up on the hills—at what they call the head of navigation. I think most of the land on the river banks is taken up.

1074. Is dairying an industry which would tend much to produce freight from the district? Yes; a lot of freight comes to Sydney from the various dairies.

1075. Only in the shape of butter? Butter and pigs; but butter requires space. You have to have cool chambers for butter. Nearly all the North Coast Company's steamers have cool chambers. They have a cool chamber in the boats going to the Manning, the Richmond, and the Clarence, and if there were any important development of dairying at Port Macquarie, of course they would have cool chambers there.

1076. It would appear from the Departmental *precis* that it was only in February, 1895, that any agitation was started to improve the entrance to Port Macquarie? I could not say that. I have been trading to the port about twenty years. I lost one vessel (the "Richmond") there about fifteen years ago. I do not think it was the fault of the port; I think it was the fault of careless navigation. Then a vessel called the "Ballina," before my boat went there, was wrecked on the bar. I should think it is more than twenty years since the "Ballina" was wrecked. The difficulty which steamers have to contend with in navigating the river is that the sand shifts as it does on most of the rivers.

1077. Have the captains of the boats ever told you what, in their opinion, has been the effect of the little bit of training-wall which has been constructed on the south side of the Hastings? No; there is not enough of it done to do either good or harm.

1078. The captain of a coasting vessel stated here the other day that until that little bit of training-wall was made he used to be able to navigate his ship up the water which is tinted pink on the map, and beat right up into the river, but that since it has been made it has had the effect of filling up this channel, and he cannot navigate it at all now;—he says that the effect of what the Government has done has been to make the navigation worse? On the Clarence the furious rush of water alongside the training-wall, where there used to be a sand-bank, keeps the channel as deep as they want it. Training-walls, wherever they have been made, have had the effect of deepening the water; but what effect they will have on the bar is another matter. If it only removes it from the crossing to put it on the bar, it will not do much good.

1079. *Mr. Lee.*] An old resident has stated that, in his opinion, no works would be effective unless the north breakwater is constructed;—from your knowledge of the place do you think his contention may be right? I think the north breakwater would largely add to the depth of the river, and give greater facilities.

1080. The object of the Department in abandoning that work at the present time is to endeavour to obtain a good bar, sufficient for all purposes, and at a much less cost;—do you think they will get a good bar without going to the enormous cost of building the northern breakwater? I think they would. I think it would add largely to the depth of water. It would get rid of the difficulty they have now about the shallows above Port Macquarie, and enable steamers probably to get up the river.

1081. These works would confine the water to a limited channel? Yes.

1082. Providing that these works did not attain fully the end required, it would be a matter for consideration whether we should proceed with the north breakwater? I should think the works which are submitted by the Department would be sufficient for a good number of years.

1083.

- J. Sec, Esq.,
M.P.
11 May, 1898.
1083. Would you advocate that they should be tried first? Yes.
1084. *Mr. Roberts.*] Are the proposed works on somewhat similar lines to the works which have been found to act so beneficially on the Clarence River? Yes, very much the same. There is a south training-wall like that at Grafton, then there is a break, and further down there is a breakwater on the south side, and a channel which comes down to a place called Iluka. They are very much the same.
1085. What effect has the training-wall had on the Clarence? It cleared away what was known as the crossing. I suppose it has made a difference of 8 feet in the water at the crossing; where there used to be 10 feet of water there is 18 feet now, while close in to the training-wall there is as much water as you want. There is no difficulty at what was known as the crossing.
1086. Is it on the bar of the Clarence where they get 24 feet of water? No, it is inside at the crossing where the water was the shallowest. They only get from 14 to 16 feet on the bar. I think the works on the Clarence have had the effect of shifting the sand out on what was the old bar. They are going out now round the end of the breakwater.
1087. At the place where there is 24 feet of water, what depth used there to be? It varied from 10 to 12 feet.
1088. It is fair to assume that similar works will be equally successful on the Hastings River? I do not see any reason why they should not. It is all shifting sand; it is a question of scour. There is an enormous area of water space on the Hastings—lakes and tributaries—and they would get the same proportion of scour there as they do on other rivers.
1089. Do you not regard the Hastings River district as of sufficient importance to warrant the expenditure of £46,500 on harbour works? I do. It is a much more important district than lots of these little tin-pot places where they are spending a lot of money in making railways to.
1090. Is it not a fair thing, if the district is of some importance and has fine agricultural land, that the residents should get some expenditure of public money in order to enable them to get their produce to market? I think so. It is a national improvement. It is a work which, when it is done once, will be done probably for all time. I think it is a place where harbour works can be constructed perhaps as advantageously as they can at any other port on the coast—at Newcastle or at the Clarence.
1091. You stated that sometimes there was only 7 feet of water on the bar;—do you know that on the 29th June last year there was only 5 feet on the bar? That would be at low water. There is a rise and fall of about 3 feet, I suppose, and I know you could load our little steamer, the “Rosedale,” with what she could carry, 200 tons, on about 7 feet.
1092. Does it not appear to you that the time has arrived when some step ought to be taken to improve the navigation of the Hastings? I do. I think it is possible, if there was 12 feet of water on the bar and an easterly sea, they would be bar-bound for a time.
1093. At what period of the year is the entrance most difficult to negotiate? It is mostly in the winter months that it is the worst.
1094. One would have thought that the north-easters (the prevailing summer winds) would have accumulated the sand? They do. You get north-easterlies through the summer, and they help to bank up the sand. That is how they keep on gradually getting worse.
1095. Would not the westerly winds in winter help to clear out the entrance? We reckon that the worst time of the year for the bar is March, April, May, and June.
1096. What causes you to arrive at that conclusion? Only that it is so. I do not know why it is so, except it may be the action of the north-easters in the summer. These bars are pretty hard to understand. For instance, a southerly gale like the one we had the other day would capsize the whole thing, and change the channel.
1097. When you say the Hastings is not so important as the Manning, do you mean as regards the area of agricultural land? As regards the population and the output; not so much produce is raised.
1098. You mean that more maize is grown on the Manning than on the Hastings? Yes; on the Manning there is a larger population, and I think a larger area of good land. There is an enormous area of back country on the Manning. We reckon that as much produce comes from Wingham, the head of the navigation as from below Wingham. There is an enormous area of land occupied about Nowendoc and all round the head of the Manning.
1099. *Mr. Hoskins* asked you how long the North Coast Company's steamers have been running to Port Macquarie, and you answered eight years;—for many years prior to their advent did not the firm of John See & Co. send down steamers of equal size to those running now? Yes; I succeeded the Clarence and Richmond River Company. But there have been steamers trading down there, within my recollection, for the last thirty years—I remember the “Ballina” and the “Platypus” going there.
1100. If the proposed improvements had been carried out thirty years ago, do you not think this district would have shown a vast improvement compared with what it does now? I do; I think it is a nice little district. For its size it is as good as any district along the coast.
1101. It is really regarded as a sanatorium by a large number of people living on the table-land of New England? Yes; it is a lovely spot. It is a perfect coastal town, and will be, I think, some day a very important place as a sanatorium. Of course, if larger steamers were trading there a larger number of people would go there. Whilst we have so many other places about Sydney which are nearer and cheaper to reach people do not go to Port Macquarie.
1102. What is the longest period a vessel has been bar-bound at Port Macquarie? I should think before the advent of steam it was a month. I remember the time when a little schooner used to be bar-bound there for a fortnight. The arrival of one of these boats was an event in those days.
1103. Do you know anything of the value of land on the river flats at the Hastings? I suppose a good alluvial farm would be worth £15 an acre. Farms, like everything else, vary in value according to quality, area, and conditions.
1104. *Mr. MacDonnell*, formerly a bank manager at Port Macquarie, told the Committee that he valued the land at the present time at about £20 per acre, and that to his knowledge land has been sold at £40 an acre? It is a matter of opinion; if a man fancies a piece of land he will give £40 an acre for it. But I should think the value of land there, speaking generally, would be about £15 an acre for good alluvial. There are lots of men, I daresay, who would not sell their farms at all.
1105. Do you know anything of the mineral resources of the district? No. There is gold I know in the hills at the head of the river.

1106. Which portion of this scheme do you think ought to be proceeded with first? I should think what the Department proposes to do is the best, because the scour will come on the southern side. J. See, Esq.,
M.P.
1107. Which breakwater do you think is most needed, if it is decided to construct a breakwater? The northern one would be the more important, because the southern side is fairly well sheltered from southerly winds. 11 May, 1898.
1108. Of the proposed harbour works at the Nambucca, the Bellinger, and the Hastings, which work do you think in the public interest it would be best to proceed with first? I think they are all important. I would not attempt to pick one in preference to the other. I think that a reasonable expenditure on all these rivers is justifiable.
1109. You think that on the whole of the North Coast rivers something ought to be done to give the people better communication? I do. I reckon that a twelfth of the population of this Colony lives north of Newcastle. I reckon that over 100,000 people are living below the table-land from Port Stephens down to the Queensland border.
1110. Unless the State is prepared to build a railway right along the coast, you think that something ought to be done, without delay, to improve the entrances to all those rivers? I do. I think that if any other colony had these rivers it would only be too glad to improve them.
1111. *Mr. Black.*] Speaking broadly, do you think that the upper portion of the eastern training-wall, the western training-wall, and the southern training-wall, if constructed, will improve the entrance? I am sure they will.
1112. Do you think that those works would improve the entrance to an extent commensurate with the amount of the expenditure? Yes.
1113. *Vice-Chairman.*] How does the freight to Port Macquarie compare with the freight to other rivers on the North Coast? It is higher than the freight to the Clarence. It is about the same as the freight to the Manning.
1114. Is it less than the freight to the Macleay? Yes; because there is a larger volume of trade from the Macleay. The more trade you have the more cheaply you can carry it. The greater the number of people living in a district the more goods they produce; and the more goods a steamship company has to carry the more cheaply it can carry them.
1115. How does the passenger fare compare? It is the same as the fare to the Manning and the Macleay.
1116. Port Macquarie is not under greater disabilities than the Manning, the Bellinger, or the Macleay? I think there is a difference of 3d. a bag on the maize from the Hastings. The steamer does not go beyond the town, and all the maize grown on the Hastings and its tributaries has to be droghered to the port. That makes it somewhat more expensive than the Manning, where a steamer can go up as far as Taree or Wingham.
1117. What about the Macleay? A steamer can go up the Macleay to Kempsey.
1118. Does it always go to Kempsey? Mostly. The big flood they had on the Macleay a few years ago did a lot of damage to the river, but that has been gradually rectified by dredging.
1119. The freights are fairly uniform? Yes, considering the extra expense for droghering.
1120. And the passenger fares the same? Yes.
1121. Have the droghers been under any disability owing to the state of the river? We have a very much smaller drogher on the Hastings than we have on other rivers. We have to work the drogher with punts, because in some parts the channel is not too good. We have two or three punts carrying 300 bags, which are left here and there as they are wanted. There is a distance of 40 miles on the river to be droghered.

THURSDAY, 12 MAY, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Hastings River.

Walter Shellshear, Divisional Engineer, Department of Railways, sworn, and examined:—

1122. *Vice-Chairman.*] What is your profession? I am a civil engineer, and I am engaged in the Railway Department.

1123. *Mr. Hoskins.*] You have left the Harbours and Rivers Department for some time? I was never connected with that Department.

1124. Did you not report on a proposal to construct some breakwaters on the Clarence River? I read two or three papers some years ago to scientific societies on the subject of improvements, but that was all I had to do with them.

1125. Have you ever been on the Hastings River? No.

1126. Did you put before the Engineering Association some years ago a plan for the improvement of the river? Yes; I have a copy of that plan here.

1127. In what respect does it differ from the Departmental plan? What I proposed in my paper was simply to run a groin or training jetty from the north beach to near the end of the proposed north breakwater. It would start on the north beach at a point about midway between the green-tinted portion and the red-tinted portion, and it would run in a south-easterly direction to near the end of the proposed northern breakwater.

1128. What advantage do you think would be gained by your suggestion as compared with the Departmental proposal? This would be a training jetty constructed at a comparatively low level. I did not propose to construct it above half-tidal mark. It could be constructed partly of timber, and partly of stone, and the object was to prevent the action of the north-east winds driving the sand across the entrance.

W.
Shellshear.

12 May, 1898.

W.
Shellshear.
12 May, 1898.

entrance. I claimed that it would effectually trap the sand from the north, and the rocky ground on the south side is a natural breakwater. If you can stop the growth of sand from the north spit, if you can prevent the action of the north-east wind on this sand, by blocking it up here, the current will be sufficient—with a little dredging, perhaps, to give it a start—to cause the water to flow along the south side, and go out into deep water. A peculiarity about all our coastal rivers is that it is only a very short distance from the shore before you get into deep water. If you can concentrate the action of the current for a comparatively short distance, there is no fear of a bar forming beyond you. The difficulty with most of the bar harbours in other places is that the sea is shallow for a considerable distance, and the bar goes out with the extension of your works. But in this particular case you have a depth of from 23 to 33 feet, and if you go out a short distance you get a depth of 10 or 12 fathoms.

1129. Would not your training-jetty have a tendency to curtail the width of the entrance? Not at all; not more than this proposal.

1130. Would it not have a tendency to prevent the water from deepening the river further up? It would not have any effect on the river further up, because the action of that would simply be to cause the sand to form a beach along the northern side of the works until it extended into deep water, when the action of the current running along the coast would keep it clear.

1131. The object of your proposal is to improve the entrance to the river, and not to improve the navigation of the river, or to deepen the channel in the river? If you succeed in getting over the bar the question of improving inside the river is a comparatively simple matter which may be done either by a little judicious dredging with a sand-pump, or by comparatively inexpensive works inside.

1132. But the officers of the Department, in evidence they gave on two or three matters, stated, and other witnesses confirmed their statements, that the erection of training-walls on the side of a river has a tendency to cause a scour which deepens the channel? No doubt training works of that sort will cause a deepening of the river, but the question, I take it, with all these bar-bound rivers is that you have to tackle the bar first. If you succeed in removing the bar, which the outside works do, it is a very simple matter to improve the inside, either by judicious training-works or by dredging with a sand-pump or appliances of that description.

1133. The masters of steamers going to some of our rivers have expressed the opinion that the difficulty of navigating the river for any distance above the bar is even worse than it is at the entrance? That may be; but the question is, if you can succeed by training-works to fix the entrance in one locality, and can concentrate a scour on that one point, you can ensure having deep water for ships to get in and out, which you have not at present. On all these rivers, as far as I have studied them, the channel varies from day to day or from month to month. They are never certain of where they will have to steer to in entering the river.

1134. Witnesses have stated that the advantage of a training-wall on the banks has been not only to cause a scour, but to create such a rush of water that it has kept the entrance clear? The object of the training-jetty I proposed was to fix an entrance. As regards the subsequent improvement of the upper part of the reach, I did not go into that matter at that particular time. If you succeed in fixing the entrance, the natural flow in and out, apart from any further improvements, must tend to improve the channel, but if you want more improvements than you get from the natural flow, you could add such training-works as you thought necessary afterwards. If you spend all your money inside, and do not tackle the bar, which is the shifting element, you do not improve the place where all the danger exists.

1135. Evidence has been given in respect of other rivers on the North Coast, that by erecting training-walls it creates a scour which deepens the channel in the river and gives a better entrance? That may be. If you concentrate it from the inside you may get a better entrance.

1136. You have not been to the Hastings River? No; but I have seen minute surveys and charts of it.

1137. Your proposal is the result of our deliberations on the subject in consequence of having inspected a map and perused the surveys which have been made? Yes. I have been on the Richmond and the Clarence, and studied these questions very closely on the ground. Of course, an analogy which exists between the Hastings and the Richmond and Clarence—

1138. We have had evidence from the departmental officers to the effect that there was very little analogy comparatively speaking, between the waters of the Clarence, the waters of the Hastings and Nambucca, and the Bellinger? The whole of the rivers on our coast are analogous and very similar, except that on some of them you have a larger volume of tidal water to deal with than you have on others. Of course, the larger the river, and the more the volume of tidal water you are dealing with, the easier it is to concentrate sufficiently to get a channel.

1139. Do you not think that the construction of a training-wall outside, facing the ocean, will be more expensive than the construction of a training-wall inside the river? It depends entirely on how you go about it. Where the proposed jetty was, it is only very shallow water. If you ran it out with light timber work, and protected it with moderate-sized stone, and did not bring your work up above half-tidal level, it would present very little surface to the waves to be destroyed. If you attempted to run the breakwater out there in the same way as they did at Newcastle, the work would be enormously expensive and altogether prohibitory.

1140. You do not propose that the upper portion of the training-wall should be level with the surface of the ground adjacent? It would come up to about the height of half tide, but at flood time the water would be over it.

1141. Have you had any conversation with the Harbours and Rivers Branch about this proposal you made? No; it is years since I went into the matter to any extent. This paper, for instance, was written in 1887.

1142. I suppose you know the Department has made great improvements to the entrances to the northern rivers, and to the channels of those rivers? Yes; the works which are being carried out from Sir John Cooke's plan at the Richmond are identical with what I proposed before ever he came out here.

1143. *Mr. Trickett.*] I presume you still think that your scheme would be an efficient one? I believe it would be efficient, and if it were carried out as I suggested I think it could be done very economically.

1144. As you propose to have only one training-jetty, I suppose you consider that the south headland being a rocky foreshore is a natural breakwater? Yes, it is as good as you could possibly wish for.

1145. How long is your proposed training-jetty? It scales about 3,000 feet.

W.
Shellshear.

12 May, 1898.

1146. Have you made any estimate of the cost? I made estimates at the time, but I could not find the papers I estimated the cost on.

1147. Will you be good enough to describe how you proposed to form the training-jetty? The method proposed would be to run out a timber jetty as rapidly as you could, then to pave the bottom with stones about the size of bricks so as to prevent the scouring action from washing the sand away, then to bring up the work with larger stone to half-tidal level so that the water would be awash at half tide.

1148. At high tide the jetty would be submerged? Yes; the object of keeping the jetty at half-tide level is that if you carry it higher it has to resist the full force of the waves, and very much heavier work than is proposed would require to be built.

1149. The wooden jetty which you would construct in the first instance would be capable of carrying a small tram for conveying the material to be shot in? It would be constructed so as to carry the trucks for bringing the stone.

1150. And as you went out you would pitch the stone into the right and the left? Yes; to prevent the piles from being washed away.

1151. In course of time I suppose the wood-work would disappear, but that would not much matter? The wood-work would disappear in a comparatively few years with the destructive insects we have, but at the same time it would probably last long enough for the whole of the jetty to be consolidated by the action of the coral, oysters, shell-fish, and seaweed.

1152. You think the small stone you propose to use will be sufficiently strong to resist the waves? If the structure is not brought above half-tidal level the shock of the waves will pass over it, and the smaller stone is used simply to prevent the action of the sand from bubbling up between the stones. It seals the sand below the level of the jetty.

1153. The temporary jetty for carrying out the work would come considerably above high water? Probably it would have to be taken 15 or 20 feet above high water-mark to keep it from the action of ordinary waves.

1154. It is really a scaffolding for depositing the stone? Yes.

1155. You propose to start your jetty from that sandspit—from just above the word "wall" in the line "eastern training-wall";—ought it not to start further back? The beach would follow it out until it got into deep water.

1156. Is that sand I refer to under or above water? It starts from the sand that is above water.

1157. The sandspit on the north side of the entrance is above high water-mark, and you propose to start your jetty from high water-mark on that sandspit? Yes.

1158. So that you really make a start from solid ground? Yes; probably for the first few hundred feet I would keep the main works above the level of high water-mark, but as we extended the jetty and got out to where the action of the waves was likely to be troublesome we would lower it until it was cut off at half-tidal mark.

1159. Could you tell us of any work of this kind being carried out elsewhere? Jetties very similar to that one were carried out at the mouth of the Danube. There is an essential difference between our northern rivers and the Danube, in that the Black Sea is not tidal; but the principle of construction is practically the same. In the case of the Danube it was run out with timber in the first place. The stone was deposited, and after, I think, fifteen or twenty years, when the mound had got thoroughly consolidated, they built a concrete top on the works.

1160. Are the circumstances similar as regards the outside part? On account of the tide here the training-jetty at the Hastings would be rather more exposed than the proposed Black Sea works were; still they had to stand very heavy storms at the mouth of the Danube.

1161. Has that work been a success? A great success.

1162. As regards the ebb and flow of the tide, would not that appear to be rather a favourable feature in connection with this work? I was speaking of the wall itself. With the large amount of water which flows in and out at every tide, it is a much easier case to deal with, as regards maintaining the channel, than was the case of the Danube.

1163. Is not the bottom at the entrance to the Danube a kind of mud rather than shifting sand. It is a muddy bottom there, mixed with sand. The material is very easily floated or disturbed; as it is very soft. It is not any more substantial than the sand we have here, if so good.

1164. Will you be good enough at your leisure to make an estimate of the cost of carrying out your training-jetty? I have no doubt that it could be done for about £20 a foot—that is, £60,000 for 3,000 feet.

1165. Have you studied the question of dealing with river entrances in other countries? It was a hobby of mine, and at one time I took the trouble to collect information from all parts of the world as to what had been done in almost every river we have any record of.

1166. Did you find that in all progressive countries, in dealing with rivers similar to our coastal rivers, the tendency was to improve the rivers, or to allow them to remain as they were? America is the country where most has been done of late years. Almost every one of the harbours they are improving or attempting to improve is carried out with a system of mattress, the same as was done on the Mississippi. On the Charleston, the Galveston, and other rivers where they have carried out harbour-works, they have used a layer of mattress and a layer of stone, until they gradually brought the work up to about half-tidal mark, and then perhaps they put a coping of heavy stones on top to secure it. As a rule their works have been attended with a considerable amount of success. At the Mississippi they were remarkably successful. There have been several cases around the English coast where they have formed harbours at the mouths of rivers to allow free navigation. The Tyne is a case where they had a very dangerous bar. That has been practically done away with, but they really have formed an outside harbour, into which the river falls. The Tee estuary is another case which they have dealt with successfully. There are many other cases of the kind. A mouth of the Indus has been successfully dealt with by training-jetties.

1167. It would seem to be the policy of all progressive countries to improve their waterways, and the entrances to their rivers? Certainly.

1168. You are not able to say whether material is available on the Hastings for carrying out your suggestion? I could not say what material is available, but from inquiries I made at the time I wrote my paper, I believe there is good stone in the neighbourhood which can be got from the south side.

1169. *Mr. Lee.*] If a training-jetty were carried out as you propose to a distance of 3,000 feet, would it not

W.
Shellshear.
12 May, 1898.

not leave an immensely wide entrance for the outflow to scour? Not necessarily; it is all rock on the south side, so that you could not get any great depth on that side to increase the outflow. If the river comes down from the north, it always tends to deepen on the outer side of the curve. It would scour it down to the rock on the south side, and sufficiently far to give you ample depth over the bar.

1170. Your suggestion was that by carrying out that one jetty, the water would be sufficiently confined to set up a scour? Yes; on account of the peculiar contour of the ground where the river runs.

1171. But inasmuch as the river for several miles above Port Macquarie spreads over so large a flat, would you not have an enormous amount of waste water which would never get the scour at all? You must understand that this proposal is to deal with the entrance. The more water you have to go in and out, the better chance you have to keep your entrance clear. It is only at the bar where you want your concentration. The probability is that if the training-jetty were carried out as shown there, it would get almost completely surrounded with sand on both sides, and the river would form a natural channel inside it.

1172. Sir John Coode was of opinion that the north and south breakwaters would be required. The officers of the Department think that they can do away with the breakwaters, but state that they must have some means of confining the water so as to direct the current on to the bar. Your plan differs altogether from this plan? My plan is simply based on what has proved successful in all the cases I have been able to look up, and without that outside protection I do not know of a single case where you have had a permanent entrance. For a long time you may get a good channel, and you may get heavy storms which will choke up the channel completely, until the action of the tide cuts it out again. If the outside work goes out into deep water then it cannot get choked up.

1173. If your contention is the correct one, then the Departmental proposal must be absolutely wrong, because they propose to terminate at a point on the southern side—nearly 1,000 feet closer to the shore? What I maintain is that you have a training-wall there in the solid rock of the hill. I do not see why you want a training-wall there.

1174. Their work will terminate in comparatively shallow water, but you propose to go out into deeper water? The object is to force the bar out into deep water.

1175. Will the proposed south training-wall be sufficient to set up a scour to keep that bar open? My opinion is that it is very questionable. I question whether you will ever succeed in scouring the bar unless you have protection on the north side. Without the north breakwater, I do not see how you are going to have a permanent channel. You may be able to maintain a channel at ordinary times. It may be good, perhaps, for months at a time, but if you get a heavy north-easterly gale the sandspit must come across and block it.

1176. You think that no matter what works are designed there, provision must be made for a northern training-wall of some sort? In my opinion it is essential.

1177. *Mr. Wright.*] You have looked at the plan, and understand the nature of the proposal of the Department? Yes. The inside works are intended simply to regulate the channel inside the river.

1178. Do you believe, if the upper portion of the eastern training-wall, the western training-wall, and the southern training-wall are built, the channel along the southern training-wall will be kept fairly open? I consider it very doubtful without a northern breakwater groin or jetty.

1179. You think the primary condition of making a harbour there is to prevent the growth of the spit? Yes. If you do not trap the sand from the northern spit it must inevitably work its way across the entrance and trouble you after every storm from the north-east. Apart from the disturbing influence of the north-easters, there is no doubt that the works proposed would improve the entrance in ordinary weather, but if it came to continuous north-east weather I am afraid that without the northern works you would not get the permanent channel you want.

1180. You think that there would be continuous interruptions to its permanency? I am afraid so.

1181-2. *Mr. Roberts.*] Do you regard the deepening of the Hastings River as only a secondary consideration? Yes.

1183. The difficulty which the Committee are asked to deal with is how to secure a good channel at the entrance to the river? Yes.

1184. The proposed works at the Hastings River were described by a witness yesterday as a miniature Clarence River;—does your recollection of the Clarence River warrant you in corroborating that statement? The two rivers are alike in this respect—that the Clarence has splendid protection on the south from Yamba Head, but the bar of the Clarence has been caused by the action of north-easters on the northern beach. If works had been carried out on the Clarence on lines similar to those which had been suggested for the Hastings, I believe it might have taken the “Royal Arthur” through the entrance by this time.

1185. The entrances are very similar to one another? The contours are very similar. They both have splendid protection from the south by a natural headland and a rocky bottom, and the bar in each case is caused by the action of north-easters on the northern sand beach.

1186. Have you been to the Clarence since the training-walls were made? No; it is about fourteen years since I was there.

1187. Are you aware of the great improvement which has taken place there since the training-walls were made? There has been considerable improvement there, but I believe it has cost a considerable sum to get it.

1188. Where they had 14 feet of water they have 24 feet now? Yes; but the Clarence in its original state, I considered, the easiest river of the lot to deal with, because you had such an enormous volume of water to effect your scour.

1189. Would you have dealt with the Clarence in the same way as you propose to deal with the Hastings? The first thing to be done at the Clarence was to shut out the action of the north-east winds on the north spit.

1190. Will not the proposed works shown on this plan, if they are all carried out, effectually deal with the trouble you speak of? If the northern breakwater as shown there is carried out, it should effectually deal with the trouble, and secure a permanent entrance no doubt, but the works on the south-side, I am afraid, without a northern breakwater, will never secure a really permanent entrance.

1191. Do you regard the south breakwater as being necessary? If I had to carry out the work, I should certainly try the effect of the northern one before I spent a penny on the southern one.

1192.

W.
Shellshear.

12 May, 1893.

1192. If the south breakwater were omitted the scour would not be so great? You have a rocky bottom there. It all depends on how far you can contract the entrance what scour you get.

1193. Would you continue the eastern training-wall down according to your plan? Not to start with. I should do the northern work, and see what effect it had on the bar before spending money on other works.

1194. You would approve of, I presume, of the western training-wall being constructed? That is going into the question of improving the upper reaches of the river.

1195. The object of these works is, to create a scour on the bar? The training-jetty I suggest would concentrate the whole action on the bar itself, and the way the river bends will be quite sufficient to cause it to deepen the channel on the outside of each bend without other assistance.

1196. Are we to understand that the only work you deem necessary would be a north training-jetty, at a cost of £60,000, to keep out the north-east winds? That would be in the first instance. I believe if it were made it would secure a permanent entrance to the port.

1197. There would be no necessity you think for building the western, eastern, and southern training-walls? I presume these training-walls are intended to improve the navigation above the town. The work I propose is, I believe, sufficient to secure an entrance; but the improvement of the river above the town is another matter.

1198. All the produce is brought down the river to the ocean-going steamer at the wharf at the foot of Horton-street, and the object of the training-walls is to create a scour on the bar? I consider that the proposed northern training walls would be sufficient to secure a permanent channel over the bar, and to give the necessary depth of water at the wharf for the steamers.

1199. In your plan you would not consider the south breakwater necessary? I consider the south side is well protected by nature.

1200. According to your plan, would not the sand find its way through the piles, and form a bar very soon? A certain amount of sand would be washed over these half-tidal works during a storm, but then, when the channel concentrated, like it would be with the training walls, it would never accumulate, because the first ebb tide would shoot it right out into deep water. After the tide had gone down to half-tidal level, the whole of the last half of the tide must go out through the contracted entrance.

1201. In the case of the Danube, would the winds which the training-jetty had to resist be the same as in this case? There are very heavy seas in the Danube. I do not know that they would be as heavy as the seas we get on our coast at times. Port Macquarie is well protected from our worst winds. It is only with an easterly wind that the Hastings gets a heavy sea. We very seldom have heavy north-easterly weather.

1202. *Mr. Black.*] Your proposal, you say, will have a tendency to remove the existing bar;—do you not think that it might have a tendency to form a bar inside the channel—at about where the “Ballina” wreck is? No; it would not have a tendency to form a bar there, because of the direction in which the water turns in the last bend of the river. But even if it did, a very small training wall would be sufficient to remove a bar formed inside when you have the protection of the outer works.

1203. It appears to me the tendency would be to scour along the training-jetty, form a deep channel there, and fill up in the middle? The tendency of a bend in the river is always to deepen the channel.

1204. You think the tendency of your scheme would be to form an inside entrance, and large open space, mostly flat, some of it at low water exposed, and one deep channel? The deep-channel would be along the south side.

1205. You think it would not be preferable to have a narrower channel with deep water? The channel would probably be wide enough for all practical purposes. The distance from the wharf to where my training-jetty would start would be 5,000 or 6,000 feet. You would not want a channel of that width.

1206. How wide do you think your channel would be? Probably it would be several hundred feet wide. I could not say definitely how wide it would be.

1207. Would not your breakwater be exposed to the full force of easterly and north-easterly gales? It would be exposed to north-easterly and easterly gales. It is not a breakwater in the strict sense of the term; it is a training-jetty, and as it does not come above half tidal level, the waves would simply break over it.

1208. I do not quite understand your reason for preferring that to what I may call an inside breakwater—that is one in the channel of the river? The object of my training-jetty is to prevent the growth of the north sandspit. With the north-east winds that spit always tends to close the entrance, and by cutting off that action, by the artificial works, you concentrate the scour of the river over one defined channel, coming out on the bar. The probabilities are that the sand would follow your works out almost as fast as you put them down, and it would only be at the extreme end where they would be exposed to the action of the sea.

1209. Do you not think that the northern breakwater, as shown on the large map here, would have a similar effect? It would have very much the same.

1210. But it would cost more than yours? I have not seen the details. If it is a breakwater it would cost more than a training jetty, because it would have to be constructed so as to resist the whole force of the sea.

1211. If the sea made breaches in your proposed jetty it would neutralise the effect? It would be the same if it made breaches anywhere.

1212. Would it not be deeper water than shown on the plan by the Department? It runs there to about the same depth.

1213. *Vice-Chairman.*] Are you aware that it has been found quite unnecessary to construct the proposed north breakwater on the Clarence? There is a very large sweep there, and they have constructed an enormous breakwater on the south side, which is practically overlapping the spit.

1214. You are aware that it is found unnecessary to build the northern breakwater? I believe it is unnecessary to do it now.

1215. And the opinion of Mr. Darley is that it will be unnecessary, that there is sufficient water on the bar, and that the bar is likely to remain sufficiently good for all purposes for very many years to come? I know that there is a considerable increase in the depth of water on the bar of the Clarence. With the works which have been carried out there, and the large amount of tidal water you have to deal with, the probabilities are that you may have a moderate depth of water over that bar at any time.

W. Shellshear.
12 May, 1898.

1216. Do you not think it probable that similar results will be obtained on the Hastings River without constructing the northern breakwater? I do not think so. At the time I wrote this paper all that appeared to me to be necessary was to build a jetty on the north side to prevent the growth of the north sandspit forming a bar.

1217. In the light of the experience gained in carrying out the works on the Clarence, would it be necessary to construct the north breakwater all? I think unless it is constructed to scour the entrance it will cost far more money by working round in a continual process of training-walls, as there are at the Clarence.

1218. Do you hold the opinion that it would be more economical to construct the north breakwater than to carry out the other works? If in the first instance the north breakwater had been constructed on the Clarence I believe you would have had a very deep permanent channel at very much less cost.

1219. Although the works which have been carried out on the Clarence have been successful, yet you think that an equally good result could have been obtained by the construction of the north breakwater at less cost? I believe that a better result would have been obtained by constructing the north breakwater at less cost.

SATURDAY, 11 JUNE, 1898.

[The Committee met at Wauchope, at 2 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Harbour Works at Hastings River.

Duncan Bain, farmer, Wauchope, sworn, and examined:—

D. Bain.
11 June, 1898.

1220. *Chairman.*] Where do you reside? About half a mile up the river from here. I desire to inform the Committee that I have resided in the district for the past thirty years. I have a full knowledge of its resources, and the advantages that would result from better means of communication. My statement may be regarded as a fair one from a local stand-point; other leading men, were they here, would be prepared to corroborate it. The present products of the Wauchope district are timber, maize, pigs, fowls, eggs, and incidental farm products. The butter industry has recently taken forward strides in the district. I look to it to produce great developments, and to bring into use a quantity of land not sufficiently good to be used for the cultivation of crops, but which will do well to run cattle upon. I am not in a position to say exactly what the present output of the district is with regard to any of the aforementioned commodities. That information can be obtained more correctly from the various agents at Port Macquarie. I regard the river as being, perhaps, the cheaper way for our goods to get to market, and, therefore, believe that it is essential to have not only the work at the bar carried out as proposed, but also to have the flats that preclude a ready access to the town of Wauchope removed. With regard to the engineering aspect of the question, that must be left to the engineers themselves. My expression of opinion is merely in regard to the necessity for the works to be done. The reason, as the Committee will see, is that any block or bar to navigation means increased freights and inferior boats, and loss of time. With regard to the proposed railway, although the river probably will remain the cheapest means of approaching this part of the Colony, still, I feel sure that the railway would develop a large area of back country at present lying unproductive, and there would be incidental trade and travelling, the means for which the people now have not at their command. Perishable goods also, and anything requiring rapid or safe transit would probably use the railway, even if it cost more, but the bulk of our produce, such as timber and maize, would probably always find its way to market by the cheapest route, which would be by steamer. The Hastings River may be roughly described as follows:—A considerable portion of the river and its tributaries consists of flats, varying in width from a quarter to 1 mile. There are also very fine islands, which are unexcelled for agricultural purposes. Some of the hardwood ridges, which, in almost every instance, back up the alluvial flats, come right to the banks of the river; but for long distances up the tributaries, good alluvial flats are to be found, and satisfactory agricultural occupation is possible. There is also some swamp land, but I am not in a position to say the exact extent of it. Beyond Wauchope the Committee will see the country becomes divided into various watersheds. On all of the other creeks, for a distance, perhaps, as far as 40 miles, alluvial flats are to be found, and satisfactory occupation is possible, but the further you get up the river the more abrupt the country probably becomes, and the smaller, of course, the flats.

MONDAY, 13 JUNE, 1898.

[The Committee met at the Court-house, Port Macquarie, at 10 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Harbour Works at Hastings River.

John Baird, pilot, Port Macquarie, sworn, and examined:—

J. Baird.
13 June, 1898.

1221. *Chairman.*] How long have you been a resident here? Since 1891.

1222. What depth of water have you up the river to Wauchope? About 4 ft. 6 in. at low-water in the shoalest part.

1223. How extensive are those flats? I should think about 1,000 feet.

1224. What is the first flat coming down from Wauchope? Andrew's Falls.

1225.

J. Baird.
13 June, 1898.

1225. What is the width? The flats extend about 1 mile.
 1226. With about how much water on them? They having been cut out by the dredge, the lowest water now is about 6 feet at low tide.
 1227. But that mile has already been dredged? Yes.
 1228. Is it filling again? Not since it was cut out eighteen months or two years ago.
 1229. Did it fill up before then? Yes.
 1230. Is it probable that that part of the river will have a tendency to silt up? Yes; in time of flood.
 1231. That class of work beyond the mouth of the Maria would probably silt up? Yes.
 1232. What is the next place coming down? Ennis Falls.
 1233. What is the width of those? About 400 feet.
 1234. Is the dredge at present working there? No. They have been cut out.
 1235. What depth of water there? About 6 feet. It shoaled when it was done first, and it has been done a second time, and now we have 6 feet.
 1236. What is the third obstruction? Where the dredge is now working—at Glen Ewan.
 1237. What is the extent of the flat there? That is the one I mentioned first—about 1,000 feet.
 1238. How deep is the dredge cutting the channel? Ten feet at low-water.
 1239. She will be through probably in a short time? About the end of the present year.
 1240. From there, how far does the water extend deep? Right down to the crossing.
 1241. How far above Wauchope can a boat go? About $2\frac{1}{2}$ miles.
 1242. Must that be permanently the head of deep water? Yes.
 1243. You can get no further? No.
 1244. Why? The river is completely blocked up there.
 1245. So completely that we may regard Wauchope as the head of navigation? Yes.
 1246. Taking the river up to Wauchope, will you describe such tributaries as might possibly permit a boat drawing 6 feet of water to enter? There is what we call Salt Water Creek. The entrance to that is below Rawdon Island, and the water goes right round Rawdon Island, but only a drogher can get round it.
 1247. Any other place? Not worth considering.
 1248. Now take the Maria—the northern branch of the river—how far is that navigable? I have been about 28 miles up the Maria from the Heads, and about 6 miles up Piper's Creek, a branch of the Maria, with vessels drawing 8 feet.
 1249. That brings you within 10 or 12 miles of Kempsey on the Macleay? Yes; but I believe the Maria extends farther up. However, I have never been higher up than Piper's Creek.
 1250. The Committee, for practical purposes, can regard the Maria as having 30 miles of good water? Yes; and Piper's Creek 6 miles.
 1251. Any other tributaries of any importance where a vessel could go? No; the Wilson extends above the mouth of the Maria. We call it the Wilson from the entrance, to Ballengarra Wharf, but it is charted Maria River. The Wilson extends about 3 miles from the Maria River up to Bullengarra.
 1252. Now, taking the question of the crossing of the bar;—will you describe the difficulties of the crossing first and leave the bar alone for the present; what depth of water is there on the crossing usually? It comes and goes a great deal.
 1253. Give us a high and a low tide? I have seen it when you could not get over it at high tide if you were drawing 6 feet.
 1254. Was that for any length of time? Yes; for some months.
 1255. How long ago? About four years.
 1256. And during the last four years? With the exception of one vessel we have been able to get them all over at high water, drawing 7 feet and 7 ft. 6 in.
 1257. During the last four years there has been 7 feet and 7 ft. 6 in. over the crossing at high-water? Yes.
 1258. What is the rise and fall of the tide? One foot 9 inches at dead low neap, and 5 feet springs.
 1259. Therefore, for the last four years, a vessel drawing 7 ft. 6 in. could get from the Government wharf over the crossing? Yes.
 1260. What depth at low tide? About 4 feet at the worst time.
 1261. What reason have you heard given for the special obstruction of the crossing about four years ago? I can give no reason; but we have seen thousands of tons of sand shift at one tide on the crossing.
 1262. Taking into consideration the class of boat necessary to do the trade of the district, the people, therefore, are not suffering under any serious disability once a vessel is over the crossing—the disability is not up the river? Yes; and the bar has been the most difficult.
 1263. In your opinion, if a vessel could get comfortably to the Government wharf, is it reasonable to suppose that there would be no special obstruction at the crossing? I do not suppose there would be, for the class of vessel that is trading here at the present time, and has been trading here. You get nothing less than 10 feet of water for 10 miles up the river after you get over the crossing.
 1264. Will you enumerate the boats trading here? The steamer "Rosedale," 164 tons, and 8 feet draught, loaded.
 1265. She does not proceed up the river? No. They drogher all the cargo down to the Company's wharf.
 1266. Still she could go up? Yes.
 1267. As far as the timber mills? Yes.
 1268. Any other steamers? No.
 1269. How many trips does she make a week? About five or six a month.
 1270. Now, the sailing vessels that come here? There are ten trading here.
 1271. Do they take timber only? Yes.
 1272. The "Rosedale" does the whole of the ordinary trade of the district? Yes.
 1273. Give us one or two of the names of the timber vessels, and about their draught? The "Jubilee," the deepest, draws about 8 ft. 3 in., when she is loaded.
 1274. Still she gets over the crossing? She has got over, with the exception of one trip, since she has been running here, for about twelve months. She was stuck about three days on the crossing.
 1275. The other vessels all pass over? Yes.
 1276. Such vessels as the "Candidate," which we saw at Wauchope? Yes.
 1277. Taking the experience of the last four years, when you had no trouble at the crossing, has it been a frequent occurrence that vessels could not get over the bar? Yes, very frequent lately.
 1278. The bar is bad? Yes.

- J. Baird. 1279. What is the depth of water on the bar? About 7 feet.
1280. That is all you can depend on now? Yes, taking the tides one with another.
- 13 June, 1898. 1281. The important thing in your opinion is the bar? Yes.
1282. You have had an opportunity of seeing these plans? Yes.
1283. You see the wall that has been commenced? Yes.
1284. Will an extension of that give the deep water necessary? Yes, if it were extended far enough to the east we would have a bar good enough for anything.
1285. When that wall shall have been taken out to opposite the gaol, and shall have done its work there, you think it may have given you a deep enough bar, and if not it should be extended? Yes.
1286. If that were done, you think the port would do well enough? Yes.
1287. You have had an opportunity of seeing the plans of the proposed inside training-walls? Yes.
1288. Supposing that the western training-wall were erected, and no eastern wall, what would the effect of that be on the northern spit? My opinion is that if that were erected, in flood time the whole of the northern spit would go away.
1289. In your opinion, if the western training-wall be erected, the eastern one must also be erected? Yes.
1290. Are we justified in believing these to be your views;—extend the training-wall at present being erected as far east as would be necessary to remove the bar into deep water? Yes.
1291. Whether that point would be where it is proposed to terminate it or a considerable distance to the east is to be decided, as it is being erected? That is my idea. To do that first, before you do any other work, inside or anywhere else.
1292. In your opinion, will that southern training-wall have the effect of putting the bar into deep water? Yes; I believe it will have that effect.
1293. You may as well explain why? As the wall goes out, I believe that the tide will lean against it, and go straight out. We can see the effect at the head of the wall now.
1294. The water comes in such a direction from up the river, that it is thrown on the wall, and once being thrown on to it, it runs along it? Yes.
1295. You believe that a wall 4 feet high, as it is at present, is sufficient to withstand the seas experienced a little farther eastward? No; I do not.
1296. Are there heavy seas there? If it deepens the channel, there will be heavy seas there.
1297. And your suggestion to the Committee would be to raise it gradually on an easy grade until at last you get a height of how much? Ten feet.
1298. At what point would the 10 feet be—opposite the point where it is proposed to terminate? No.
1299. Far in from that? Outside of that—farther east.
1300. Will 4 feet be high enough to the point where it is proposed to terminate? Yes; but it will want a bigger percentage of large stone there than is now being put in.
1301. Would you raise that wall before you come to the point where it is proposed to terminate? There is never a great deal of sea there, unless in a gale of wind.
1302. What would be the effect of a gale of wind on a 4-foot wall at that point? If the blocks were large enough, it would not have much effect there, because the sea is broken up a great deal before it reaches the point where it is proposed to terminate; but the wall might require to be a little higher than 4 feet there.
1303. If it were to terminate there, and end would be required there? Yes.
1304. Do you think that the two inner walls may be dispensed with and the work concentrated on the southern training-wall for the time being? Yes; in my opinion, since the main difficulty at Port Macquarie is the bar itself, and seeing that the crossing has not been a serious difficulty for the last four years, were I consulted I should suggest that the work be concentrated on the southern training-wall, which should be extended a sufficient distance to give a scour over the bar—strengthened at the end if necessary, and extended if necessary. The inner training-walls I would dispense with for the present until I saw the effect of the work at present under construction.
1305. *Mr. Wright.*] What effect would a north-east gale have on the bar, supposing the southern training-wall be constructed? None whatever.
1306. No danger of sand drifting into the mouth of the river? No; the north-east gales affect the bar very little. There is very little sea on the bar with a north-east gale. The heavy seas that we have are with south-east gales.
1307. You are protected from the south by a headland now? Yes. My experience is that in dry seasons the bar comes in, and that with a flood it goes half a mile further out.
1308. What is the set of the tide along the shore? There is very little set at all in these bays.
1309. And outside? With the exception of a month or two in the year, it is a southerly set.
1310. *Chairman.*] Between the mainland and where the southern training-wall is being erected, the sand seems to deposit and follow the wall out? Yes.
1311. In your opinion, will it follow it right out? Yes.
1312. Where does that sand come from? It comes in with the flood tide. The ebb tide has no effect on it to take it away again.
1313. *Mr. Black.*] What effect has an easterly gale on the bar? If it continues for a few days it usually has the effect of shoaling it up.
1314. What kind of weather are the easterlies accompanied by? We have generally floods with easterly gales.
1315. Then you have a scour after a piling up? Yes.
1316. So one effect counteracts the other? Yes.
1317. *Mr. Wright.*] Is there any danger of that sand-drift now forming behind the training-wall gradually passing over it, and filling up the channel inside? I do not think so. I do not think that there will ever be enough of it to get over to the inside.
1318. *Mr. Black.*] As you seem to think that what is necessary is to concentrate the scour on the bar, do you not think it might be advisable to construct a northern breakwater (say) from the end of the sand-spit out as far as that wave trap—to a line opposite that wave-trap which is shown on the end of the southern training-wall? No, I do not think so, unless you were to start it well up towards the scrub somewhere. Then I suppose it would be all right, and would make a good job of it.
1319. Could not a northern breakwater be built without a training-wall? I suppose it could be built from a starting-point anywhere.

1320. What is your reason for thinking that a northern breakwater would have to be accompanied by an eastern training-wall? So that the river would not break out behind the starting-point. J. Baird.
1321. You think that the river might be diverted by the end of the breakwater, and cut through the sandspit there? Yes; that is my only reason. 13 June, 1898.
1322. But is not the set of the river to the south rather than to the north or east, coming round the bend? Yes; but we might have the breakwater, and yet the sand might work away from behind it, with an ebb tide coming down, and the river would very likely break through there.

Daniel Callaghan, master mariner, Port Macquarie, sworn, and examined:—

1323. *Mr. Egan.*] How long have you been trading here—going in and out of the port? I have been D. Callaghan. residing here about thirteen months.
1324. So far, about twelve months you have been trading in and out here? I have been trading here 13 June, 1898. previously.
1325. What is the whole time you have been trading here? About two years.
1326. So you are pretty well acquainted with the bar and the crossing? Yes.
1327. How far have you been up the river? As far as the boat could get—to Morton's Creek.
1328. How many miles above Wauchope? Between 4 and 5 miles above Wauchope.
1329. At high water, what is the greatest depth of water you have on the bar? Since I have been here, I have got 10 feet.
1330. And the lowest at high water? 5 ft. 3 in. has been the lowest I have got since I have been here.
1331. What is the name of your vessel? The "Undaunted."
1332. And its tonnage and draught? Draught 6 ft. 6 in., and I think she is about 35 tons register.
1333. You very often go over the bar? Yes; I have gone over it more frequently than anybody else in the place.
1334. And do you find at any time that your boat cannot go over? Yes.
1335. You are acquainted with the work being carried out at the present time? Yes.
1336. Have you formed any definite opinion as to the necessity for carrying out that work or otherwise? Yes; my opinion is that it is doing good. It has opened the crossing out since the training-wall has been started. We can get 10 feet of water on the crossing now, and previous to that we could not sometimes get over it at all.
1337. So the farther it extends towards the bar the more good it will do? Yes.
1338. And clear the crossing out at the same time? Yes.
1339. Do you think it is necessary to carry out all the work you see on the plan—that is, the construction of the western and the eastern training-walls? Yes; I think it is necessary to carry them out.
1340. For what reason? To carry the tide down. You will have a good crossing and a good bar if those works be carried out.
1341. You say that by constructing the southern training-wall, and carrying it out to that point, you believe it will make a good bar and a good crossing? Yes.
1342. Then where is the necessity for the western and the eastern training-walls? You want to enclose the water. If you carry out the western and eastern training-walls you will take the water across to the north beach.
1343. But if you do not construct either of them what will happen? Go on as usual, then.
1344. You have good water above the crossing with the exception of one or two places? We have good water from the crossing until we get up to Glen Ewan.
1345. That is your first obstacle? Yes.
1346. The next? Ennis Cutting.
1347. But the principal objection at the present time is the low water on the bar? Yes.
1348. You believe that if the southern training-wall be carried out to the point that is marked on the plan, or a little further, that will give you a very good crossing and bar? Yes.
1349. Not constructing those other walls will not make the river any worse, will it? No; it will not.
1350. The principal obstructions, then, really are the bar and the crossing? Yes.
1351. What reason have we to suppose that by the construction of those two walls at present the district will be benefited very much;—do you not think that it would be better to continue the southern training-wall, and wait to see the results that may accrue from its construction? That is a matter I cannot go into.
1352. Before going into a large expenditure of money would it not be better to wait and see what results you get from the construction of that wall? I do not think so; I think it would be better to go on with the other walls also.
1353. For the reason that, you say, they will be the means of bringing the tide down with greater force and scouring the bar? Yes.
1354. And also scouring the river? Yes. They will not make any difference to the upper part of the river.
1355. Then, where is the necessity for taking the training-wall so far? Just to deepen the bar.
1356. So the construction of the southern training-wall will not have very much effect unless the western and eastern walls also be constructed? No.
1357. Have you any other information you can impart to the Committee? I think that the flats up the river are in a very bad state.
1358. In what respect? Ballengarra, for instance, we cannot get over except on the top of high water. It is full of logs, and we have to go full speed ahead and run over them.
1359. You have a dredge there? It is at Glen Ewan; but the dredge is no good for the logs. I think there should be a snagging party up the river, too, to shift the logs. I lost one propeller at Ballengarra.
1360. And you do not want to lose another? No; I do not. At Morton's Creek the river is in a very bad state from logs. You have to get over the best way you can.
1361. I suppose the chief produce taken down by sailing vessels is timber? Yes.
1362. Does much other produce come down from there? Yes; I believe a lot comes down.
1363. The "Rosedale" does not go any farther than the Port Macquarie wharf? No; she cannot go any farther.

- D. Callaghan. 1364. She draws only 7 ft. 6 in.? Yes.
 1365. You have 10 feet of water? On the crossing.
 13 June, 1898. 1366. And also up the river? Some portions of it, but it is a big tide at Glen Ewan if we get 7 ft. 6 in.
 1367. Do you think that the cuttings made by the dredge in the river will last? I think that when it is a direct cutting it will last, but if it is a roundabout cutting it will not. The present cutting takes the run of the tide, but they could not get the tide where the old cuttings were.
 1368. *Mr. O'Connor.*] To where have you been trading vessels from here? I have been going to sea since I was 9 years of age.
 1369. Where? The Richmond, the Clarence, and the Tweed.
 1370. There are other rivers that have similar difficulties? Yes.
 1371. And you have had experience of them? Yes.
 1372. *Mr. Wright.*] You tow most of the sailing vessels in and out of Port Macquarie? Yes.
 1373. What water does the largest sailing vessel that comes here draw? Eight feet six inches—that is, the "Jubilee." Sometimes she loads up to that, and that is her draught if she takes a full load.
 1374. What does she generally load up to? According to the tides. At spring tide they leave it to me, and I sometimes say 7 ft. 6 in.
 1375. You, being the best judge of the water on the bar, tell them the depth they can load up to? Yes.
 1376. Has there been much detention of that vessel since you have been here? She has been detained on two occasions.
 1377. For any length of time? On one occasion for eight days.
 1378. That would mean a serious loss to the owners of the vessel? Yes.
 1379. Have there been any other cases of long detention to your knowledge? A lot have been detained here owing to a heavy sea and the state of the bar.
 1380. Do you think that the detention of vessels that has taken place here has been detrimental to the interests of the port? Yes, very much so.
 1381. Has the steamer ever been detained? Yes; several times.
 1382. Owing to shallow water on the bar? Yes.
 1383. Therefore, to give the district a proper outlet, and trade a fair chance, it is absolutely necessary that some work should be done to improve the entrance? Yes.
 1384. Do you think that £40,000 or £50,000 spent on the port would be too much to give it a good entrance? No; I do not think it would.
 1385. Do you think the country would be justified in spending £46,000 to give Port Macquarie and the Hastings River a really good entrance? Yes; I do.
 1386. And you say that is advisable, from your knowledge as a seaman? Yes.
 1387. There is a good deal of trade done in the port? Yes.
 1388. A large timber trade? Yes; and also in other things.
 1389. The timber-mills employ a number of hands, and they deal with the stores? Yes.
 1390. Does the steamer "Rosedale" always get as much as she can carry in a good season? Yes; and sometimes more than she can take.

William Andrew Spence, Mayor of Port Macquarie, sworn, and examined:—

- W. A. Spence.
 13 June, 1898. 1391. *Chairman.*] How long have you been a resident here? I have been here all my life. I was born here.
 1392. *Mr. O'Connor.*] You know the proposal before the Committee? Yes.
 1393. Would you kindly tell the Committee whether you think that that work is or is not necessary? So far as I can judge, I think that the work is both necessary and will be of very great benefit to the harbour. In connection with the southern training-wall, I base my opinion upon this: I can remember the time when the beach was formed right out to where the present beacon is, and to where the present training-wall is running. The channel was always narrower then, and the water on the bar never less than 18 feet or 15 feet. If the sand clears off the rocks and leaves them bare it must accumulate somewhere else, and it is accumulating at the back of the present training-wall. There was a large sand-bank on the north side, and the channel, when narrow, kept the water in a small space, and the channel was kept clear.
 1394. You know the extent to which it is proposed to carry out the southern training-wall? Yes.
 1395. You strongly approve of that? Yes, I do. I have approved of it ever since the wall has been commenced, and the farther it is going out the better the bar is getting.
 1396. What is your opinion in regard to the necessity for a northern wall? I think it is necessary for the purpose of confining the water and keeping it in as narrow a space as possible, for the narrower the place the greater the force of tide, and the more the scour.
 1397. That would produce the scour anticipated by the engineers who designed the work? Yes, I think so.
 1398. Have you any idea of the trade done in this port? Yes, I have. The exports average 35,000 bags of maize per annum, 3,500 pigs, 1,300 cases of eggs, 500 coops of poultry, 20,000 feet of cedar (I may mention that this quantity of cedar goes only by steam-boat, and that a considerable quantity also goes by sailing vessel), 1,600 hides, and at the present time an average of 1,500 boxes of butter; 1,000 gallons of wine, 200 bundles of marsupial's skins; and there is a large quantity also of bones, horns, and sheepskins and about 1,000 packages of sundries.
 1399. What are the imports? About 2,500 tons per annum by the steamer.
 1400. And that does not cover the whole lot? No; the other is brought by sailing vessels.
 1401. What is the population? A few over 1,000 in the municipality. Financially the municipality is all right; we have about £70 to our credit in the banks, and have not yet received the 2s. 6d. subsidy.
 1402. You said, 1,000 gallons of wine—is that a growing industry here? Yes.
 1403. Does it promise to expand? This vineyard has been in existence for a number of years. They manufacture a considerable quantity more than that, and a great deal more goes perhaps in other ways than we take by the steamer. This one vineyard alone, I think, makes about 4,000 gallons a year.
 1404. I suppose it is distributed in the district? Yes; and some of it goes by vessels.
 1405. The dairy industry is expanding? Yes; I think that the export of butter will more than double during the next year.
 1406. The possibilities of the dairy industry are very great? Yes.
 1407. What size are the boxes of butter? 56 lb. each.

1408. *Mr. Wright.*] What is the capacity of the district for increased settlement and cultivation? It is very hard to say. The main portion of the good agricultural land has already been taken up, but the higher up you go—that is, about Yarras and Ellenborough—about 50 miles from here it will be a splendid country for fruit growing—in fact, I do not think there is a better place in Australia for fruit growing.

W. A.
Spence.

13 June, 1898.

1409. But all the river flats are alienated? Yes.

1410. Are they capable of carrying a larger population than they do at the present time? Yes—more than double.

1411. The land is not cultivated to anything like its full extent? No.

1412. Then the district, even with its present alienated and cultivated land, would sustain double its present population? Yes, fully.

1413. On the Wilson River and its tributaries, is there much agricultural land? Yes; on the Wilson River and on Rolland's Plains there is plenty of good agricultural land.

1414. Is it utilised to its full extent? No, it is not; it is not half used as it should be.

1415. So you think that, with improved means of communication, you would very likely get increased population, and consequently largely increased output? Very much larger, I think. Since the butter industry was started here, hundreds of acres of land that were going to waste in some parts of the district are now being put under grass and cultivated to produce food for the cattle.

1416. Do you see much prospect of the dairy industry being entered into largely in this district? I think it will be fairly. The district is not like some other districts for the production of butter; but I think that, according to the size of the district and its population, it will be comparatively a large industry.

1417. Do you think the population is likely to increase? Yes.

1418. And there is likely to be more dairying and more farming products? Yes.

1419. Do you think that the disabilities of the port are keeping the district back? I think so. Even taking the fishing industry, there are many times when they have to throw away six or eight cases of fish. If there is not sufficient water on the bar to get across they have to wait for the steamer until spring tides.

1420. With better facilities for water transit to the metropolis, you think that a larger population would settle in the district, and the products would materially increase? Yes; very much.

1421. Have you any further information to give to the Committee? Yes. Mr. Hayward, who is a saw-miller here, desires me to express his regret at not being able to be present here this morning. He gave me his own return of exports of timber, which amount to 2,500,000 feet of timber per annum.

Nathaniel Netterfield, sergeant of police, Port Macquarie, sworn, and examined:—

1422. *Mr. Hassall.*] How long have you been here? Nearly thirteen years.

1423. Consequently you know the district pretty well? Fairly well.

1424. I believe you have some statistics in regard to the area, population, and various products in the police district? Yes; the population of the police district is 4,861; the area of freehold land is 45,582 acres; the land rented from private persons is 23,021; the land rented from the Crown is 2,053 acres; the area under cultivation is 3,334 acres.

N.
Netterfield.

13 June, 1898.

1425. What is the area of the police district, and what are the boundaries? It commences at the sea and runs back, I think about 60 miles, towards New England, and it goes along the coast from Diamond Head to Crescent Head. It is about 30 miles from here to Stewart's River, which flows out at Diamond Head. The district also goes 28 miles north—within 5 miles of Kempsey. South, it goes about 6 miles below Camden Haven.

1426. Does it follow the Hastings? No; it follows a dividing range between the Hastings and the Macleay.

1427. Is population increasing much in the district? It is steadily increasing.

1428. More, I suppose, by the natural course of things than by any large amount of immigration? Just by the natural course of things.

1429. Does there seem to be any tendency to increase the area under cultivation? It varies. Some years it is considerably more than others. It has been larger than it is at the present time.

1430. The area under cultivation is 3,334 acres? Yes.

1431. Can you tell us what is about the average size of the holdings? I can hardly give you the average, they vary so much.

1432. What are the principal products of the district? Maize, pigs, fowls, eggs; and the butter industry is growing.

1433. Practically it is just making a start? Yes; there are about fifty dairies registered at present, and a good many more in course of construction and getting prepared for the industry.

1434. Then, judging from that, the farmers who have been devoting their attention more particularly to the cultivation of maize are now also going in for dairy farming? They are turning their attention principally to dairy farming.

1435. Are they leaving off maize cultivation? Not entirely. They cultivate a little, but they are paying particular attention to the dairy industry.

1436. Therefore you think that the cultivation of maize will be to a certain extent reduced? Yes.

1437. Are any gold-mines or any mining operations of any kind being carried on in this district? Yes.

1438. Where are they? There is a tin-mine at Gundle.

1439. How far is that from here? About 24 miles from here, westerly—about 8 or 10 miles from Morton's Creek.

1440. Is there anything besides that? Yes; a cobalt mine in Port Macquarie.

1441. Does it employ many hands? Three, I think.

1442. Does the tin mine of which you have spoken employ many people? Not a great number at present.

1443. Are many people employed in mining operations in the locality, or is it merely a fitful sort of work—prospecting and dodging about? I think the tin-mines will be permanent. They have got machinery there, and it is being erected.

1444. Outside of that, is there much mining carried on? Not a great deal. There are some gold-miners prospecting higher up the river.

1445:

- N.
Netterfield.
13 June, 1898.
1445. You do not look upon mining as a very important factor in the development of the place? Not gold-mining.
1446. What is the timber industry like? It is a large one.
1447. Does it employ many hands? A good many.
1448. Is that second in importance, or does it, in your opinion, exceed in importance the production of maize? I think it is secondary to maize-cultivation.
1449. This is a first-class maize-growing district, is it not? It is very good.
1450. There is not much trade in fat stock in the district, is there? Not much.
1451. Principally pigs? Yes.
1452. That is the only fat stock exported, is it? They export cattle from Yarras station, about 50 miles from here.
1453. They send their fat stock overland? Yes; to Maitland and other places.
1454. Very few live stock are shipped here except pigs? Not many.
1455. Can you tell us anything in regard to the difficulty of getting in and out of the river? I have repeatedly seen vessels not able to cross over the bar.
1456. Detained for a considerable time both in and outside the river? Yes; detained both in and outside for a considerable time.
1457. Have you any knowledge of the effect that has been produced by the works now in course of construction? I think that the present training-wall has done a great deal of good to the bar.
1458. The difficulties of getting in and out are not so great as they used to be? No.
1459. Consequently, judging from what you have seen, you are under the impression that as that training-wall is extended it will make the channel still easier of navigation? That is my opinion.
1460. I presume that from your knowledge of the district and long residence here you can give us your opinion, based upon sound grounds, that the improvement of the entrance to the river is justifiable in the interests of the district? From my knowledge of it, I believe it is.
1461. Speaking about the alienated land in the district, is there not on the Hastings, Maria, and Wilson Rivers very large areas in old grants? Yes.
1462. Are they still held by the original grantees? Some of them.
1463. Do you think the holding of those large grants has had any effect in preventing an increase of population? I think so.
1464. Are any of the large properties utilised by the owners? Some of them are rented for grazing.
1465. That rented portion is part of the original grants? Yes.
1466. Do you think those grants have had a detrimental effect on the district? I do; they stop the farming industry to a great extent.
1467. Are you aware of the fact that this is the only river in the northern districts at present where these grants exist to any extent? I am not aware of that.
1468. If it is a fact that on the rivers north of this the land has been alienated from the Crown to small settlers and farmers, would that be likely to make those places go ahead more than this place goes ahead? It would, in my opinion.
1469. Do you think that if these large grants were in the hands of the Crown they would be taken up? I do.

Robert Davidson, journalist, Port Macquarie, sworn, and examined:—

- R. Davidson.
13 June, 1898.
1470. *Mr. Wright.*] Have you been residing here long? Fourteen and a half years.
1471. You know the district well? Yes; thoroughly well.
1472. Have you seen any ill effects happening from the existing state of the entrance to the river? Yes; very often throughout my experience, more especially about twelve years ago. What I may call the crossing to the north of us here was shoaled up, and I have seen vessels lying there for three weeks at a time waiting loaded before they attempted to cross the bar at all. At that time the channel, instead of going close to the northern spit as it is doing now, curved round inside the harbour more westerly. In fact, the channel was just about opposite the steamer wharf, and went round the bay before it crossed into the deep water on the north side.
1473. Have you studied that plan at all? I have.
1474. Do you feel justified in expressing an opinion as to the probable beneficial effects of the proposed works? My own idea with regard to the southern training-wall is that that was the best method of starting operations, because, from what I have heard and seen of other harbours on the coast, I think the rocks on the southern side had a tendency to keep this harbour in a better state than other harbours were in owing to southerly weather, and since the wall has been made so far as it has been I have noticed that the water is gradually deepening as the wall goes out, and I believe that as it is continued we will have a deeper channel all the way down alongside the wall so far as it goes.
1475. Did you hear the evidence of the pilot? Yes.
1476. Do you agree with his views on the matter? Yes; but speaking with a little longer experience than he has had, I would speak a little more strongly in regard to the operation of an eastern training-wall going down from the scrub towards the north headland. In time of floods the water is apt to cross over the sand-spit there and take away a lot of sand which is apt to be washed back into the channel again as soon as the floods cease. At one time that northern spit came down, perhaps 10 feet high, quite close to the southern side, and gave us a narrower channel, and therefore a better bar. It was about ten years ago we saw the last of it. We had a succession of flood years and the floods carried it away.
1477. The river being confined by the advancement of the sand from the north gave you a better scour? Yes.
1478. You were saying something about the construction of the eastern training-wall;—do you think that that ought to be constructed? I would wait to see the effect of the southern training-wall before speaking authoritatively on that, for, owing to the shifting nature of the sand inside the harbour, one can hardly tell what the effect would be until the southern training-wall were outside of where it is being put.
1479. Then you agree with Mr. Baird in thinking that before any other works be undertaken the southern training-wall should be completed to the point shown on the plan? Yes, and that the north and eastern wall should follow next.

R. Davidson.

13 June, 1898.

1480. You have heard the whole of the pilot's evidence? I have.

1481. And, with your experience, you concur in what he has said? Yes.

1482. You think that the bad entrance has had a detrimental effect on the district? From my own experience, I can speak confidently on that point. It has had a very detrimental effect in regard to people who have come here to settle down and have decided not to do so owing to the uncertainty of the communication between here and Sydney.

1483. It has prevented settlement and the development of the district? It has, to my own personal knowledge.

1484. What freights to Sydney do you pay? I believe about 12s. 6d. per ton boat freight for maize.

1485. Are you under the impression that if a better harbour were secured the steamship company would reduce the freights? I do not know. It would all depend on the increase of population and the increase of production.

1486. Taking the population as it is now, and also the present production of the district, if this harbour were made a better harbour, less difficult and expensive to enter, and with more certainty of vessels being able to leave the river at any time they might like, would not the tendency be for the company to reduce their freights? Yes, the tendency would be that. One steamer could work two or three rivers, instead of one coming here at full tide and waiting twelve or twenty-four hours before she can get out again. If a steamer could come in at any state of the tide and discharge her cargo, and get away in an hour or two, the tendency would be to lower freights.

1487. If they could come in and out as they would like, the traffic would be regulated accordingly? Yes. Certainty and regularity would be the greatest benefit that would be derived—a certain trade, and definite time of arrival and departure. The want of that has hindered the progress of the district to a great extent, for when people come here from Sydney to look at land, either for themselves or for their friends to settle upon, they never know when they will be able to get back.

1488. Has the effect of a bad harbour been more injurious to Port Macquarie and district than, for instance, to the Manning or the Macleay and district? Yes, I think so, because those are larger rivers, and those districts have been better catered for than the smaller districts have; and of course the Manning district has had good overland communication, whereas we have to go 55 miles further overland to communicate in that way with Sydney. It is just because of want of definiteness and regularity in communication that the dairy industry has not prospered as it might have done. But the whole district is now given an opportunity of opening out in the dairy industry, which in the past it has not had an opportunity of doing; and just because the people have not been able to enter into dairying with a prospect of success, a large proportion of the land in the district has not been cleared, or has not been utilised as it might have been. The farmers, as a whole, have stuck to the rich alluvial lands on the river for the purpose of growing maize, and maize has been the one crop of the farmers, as a whole, for the past twenty-five or thirty years.

1489. I suppose that, as a matter of fact, the whole of the products consist of three kinds—maize, pigs, and timber? Yes.

1490. You think that, with better harbour communication, there will be a large variety of produce, and more of it? Apart altogether from the harbour works the dairy industry has made a start, in spite of difficulties. They are getting refrigerating chambers in the new creamery at Port Macquarie, and there is a great likelihood of the industry increasing to a large extent, and it will be benefited by all the more regular communication with Sydney.

1491. How long has the butter factory been established? About eight months.

1492. Is the trade showing any advancement? Yes; a number of farmers are going into the industry who never attempted to do so before.

1493. Simply because they had no outlet for their product? They had no outlet for their product. Some six years ago a small factory was established at Wauchope amongst the farmers themselves in a co-operative manner; and, as all other factories then were started without refrigerating machinery, they also started in that way, thinking they could go into the industry profitably. But either in the first or second summer after the industry was started, three weeks elapsed before forty-two cases of butter which they had sent down were placed on the Sydney market, and it being summer-time the result was that the confidence of the farmers themselves in the industry was destroyed by the hardship they had to endure.

1494. And the butter was oil when it got to Sydney? Yes. I wish to say a few more words with regard to the land on the river. You have had evidence to-day already with regard to large grants of land. Of course these have hindered the progress of the district, and what also has hindered the progress of the district has been the fact that maize was the only crop found suitable for cultivation in the district, but now that the dairy industry has been started lands not utilised yet will be used. Many years ago the district was far more open in character, there was less small growth of timber, and a number of stock was fattened, but the farmers found it unprofitable, owing to competition with people on larger areas of land who could send out fat stock cheaper than we could, and so the whole of the forest lands of this district have been literally unutilised for some years, except for timber-cutting and letting stock go loose all over the bush. There is a large area of brush land which hitherto has not been utilised in this district—that is, in the "Comboyne" reserve, where the Government have thrown open about 4,600 acres as a homestead selection area, and to some extent it is the same as the Richmond River scrub, but for want of better means of communication both by land and by water that rich land has hitherto been unutilised and not taken up.

1495. How far is the "Comboyne" from here? About 32 miles. The nearest way of communication with that place is *via* Kew or Kendall; but we have never regarded harbour communication with Kendall as being worthy of much notice. No steamers have been running there. Kendall has an advantage, because the distance by road is shorter. The precipitous nature of the mountains between the "Comboyne" and the Manning River will prevent the trade from going that way. With regard to the mining industry, I may add to Sergeant Netterfield's evidence, that the tin-mines at Gundle have so far been prospected, and are only now beginning to be operated upon. Machinery has been placed there, and soon will be in full work, and owing to the extent of the tin deposits there is likely to be a large production of tin there. In the same way the gold-mines at Cell's Creek are just in their infancy—a new battery was placed there about six months ago—therefore, I hardly know the capabilities of that part of the district as regards the production of gold. It is about 70 miles west of Port Macquarie. I have been asked to apologise for the
absence

R. Davidson. absence of Mr. Cain, of Wauchope, who promised to be here this morning, and to read some evidence which he has written with regard to timber and shipping, which I desire to have printed as an appendix to my evidence. It is as follows:—
13 June, 1898.

MEMO. from N. Cain, timber merchant, &c., Wauchope.

TIMBER shipped by me during the last three months, including piles, hewn girders, and sawn timber, from this river—part for England, New Zealand, South Australia, and Sydney market; that for the three former places transhipped at Sydney—in all, twenty-four cargoes, containing 1,080,000 superficial feet.

The mill I have here cuts 25,000 super feet a week.

The timber in the bush in this neighbourhood will last for many years to come, allowing it to be shipped at the same rate it is at present going from this river.

There is no end of good timber a little further back, and a small increase of prices will no doubt fetch it.

I consider this is one of the best rivers on the North Coast for timber.

Some parts of the river between here and Port Macquarie are very shallow; a vessel can only get down loaded at the top of high water. Should those shallow places be dredged out it would be a great benefit to shipping. Where the dredge is at present working was the worst place in the river. Many times when the tug has been towing two vessels one has stuck and the other run into her, causing a lot of damage. There are two very bad places above Wauchope where a bucket-dredge would very soon clear both of them out.

I may also add that whilst loading by the wharf here it is very shallow, and the vessels at low water are hard aground while loading, which the dredge could easily alter in a short time, so that the vessels could load while afloat.

I have had several offers of large orders from New Zealand, but owing to the river being in places so shallow, the New Zealand vessels could not get down loaded, so on that account I had to refuse the orders.

Those shallow places I have referred to are a great drawback to this river, while a short time with the bucket-dredge would remove all those drawbacks.

I believe more timber is sent from this river than from any other on the North Coast.

N. CAIN.

John Hibbard, saw-mill proprietor, Port Macquarie, sworn, and examined:—

J. Hibbard. 1496. *Chairman.*] Where is your business carried on? About 2 miles up the river from Port Macquarie.
13 June, 1898.

1497. *Mr. Black.*] How long have you been in the district? Twenty-one years.

1498. Have you been in the saw-mill business all the time? Yes; connected with saw-milling and shipping ever since I have been here.

1499. How many feet of timber do you cut per week all the year round? I will give you our output last year. Our output last year was over 3,000,000 feet; that is about ninety ship-loads in vessels of the size that run from here. Approximately, when we are working full time, our output is about 70,000 feet a week. Our output represents, approximately, in value £14,000 per annum.

1500. That would be about 9,000 tons? Yes. We reckon 3 tons to the 1,000 feet.

1501. And 9s. per 100 feet? Yes, approximately.

1502. Most of that goes to Sydney? The whole of it goes to Sydney.

1503. What does it mainly consist of? Blackbutt, tallowwood, mahogany. We send a great many street blocks.

1504. You use the blackbutt, I suppose, for the blocks? Blackbutt and mahogany. Tallow-wood is generally cut into boards.

1505. Where do you get your timber from? From all over the river and the creeks.

1506. Far back? Some of it comes from 8 miles up on the Hastings River, and some comes by droghers from 40 miles up the Maria.

1507. I suppose you do not see any necessity for shifting your saw-mill? Not at present.

1508. Plenty of timber back? Yes. Prices will have to increase before we go back and reach it, but it will come to that later on. The imports in connection with the mill would, I suppose, run into £200 a month.

1509. What chiefly? Store goods for the men and material for the mill.

1510. Have you anything more to say in regard to your business? Nothing; but I am connected with an industry which I think will turn out largely here—I mean tin-mining.

1511. Whereabouts is that? About 17 miles from Ballengarra, the head of the Wilson, where the droghers go to.

1512. What do you call the place? Gundle. It has been prospected four or five years. The men prospecting there were very poor and had no money, and we put machinery there, and we shall start crushing, I think, at the end of this month. It will turn out, I think, a large industry, because there is a large field; but it is only in its infancy at the present time.

1513. Have you given any consideration to the proposed harbour works? Yes.

1514. Have you taken any notice of the work so far as it has gone? Yes.

1515. Do you think it has done any good? It has had the desired effect so far as it has gone.

1516. You do not think that the rocky ground on the southern side forms a natural breakwater of itself? I am sure it does not, because the ebb and flow of the tide scatters so much, and the tide is broken up. I was working at the "Richmond" wreck eight or nine years ago, when it had been wrecked about a month; and I took notice of the currents while I was working there, I being inside of the ship, and we having a shallow bar at the same time, and I noticed that as soon as the current struck the rocks there was always an eddy along the rocks, and that it killed the scour, either coming in or going out.

1517. Then it is not correct to say, as has been said, that before the training-wall was commenced the tide was on the southern shore; but now it strikes the curve of the training-wall, and shoots away to the north? I do not know what effect that has had on the point here. When I saw the dimensions of the curve I thought it would do that; but it seems from the reports that it has had the effect of deepening the channel very much alongside the training-wall down past the curve which has been put in; and, if so, the curve will not carry the water over to the north side on the ebb-tide.

1518. Do you think that the work will achieve its object without the northern breakwater? I think that the training-wall to be put across the bay from here to Pelican Island—the western training-wall—would have the desired effect.

1519. You do not think that there is anything required on the northern side to trap the sand, and prevent it from going into the entrance? I think that the incoming current has a tendency to go on the western side, and also in going out.

1520. That is to say, that the incoming current on the north does not deposit its sand in the channel, but brings it over to the flats to the west of the town? Yes; but, still, it causes the current to scatter, and
break

- break up. It spreads over those flats and kills the scour in the channel, because wherever there is an eddy the sand is bound to deposit. J. Hibbard.
1521. Supposing that Parliament were disposed to vote only enough money for the construction of one training-wall, which would you prefer to see constructed? The western one. 13 June, 1898.
1522. And with a continuation of the southern wall? Yes—the one they are working at now.

Arthur Percival Hall, district manager, Australian Dairying Company, Port Macquarie, sworn, and examined:—

1523. *Chairman.*] How long have you been here? We started operations only last October. A. P. Hall.
1524. How many cows are being milked on the river? Well, judging by the quantity of milk we get—and that is the only criterion I have to go by—I should say, at present, about 1,500. 13 June, 1898.
1525. Is there any possibility of extension? Every possibility. With regard to the quality of the milk, I am able to say that during last summer the milk tested better than the milk did in the district from which I came, viz., Goulburn. We have four separating stations at present, and we have several other places in view where we intend to erect separating stations next summer. We have not had sufficient time to do it yet. We anticipate putting out about 60 tons of butter a month next summer. Our largest output last summer was about 30 tons a month. We have expended in the district altogether about £5,000. The milk is brought by cart and by drogher to the central place, and there manufactured into butter, which is sent to Sydney. It is our intention to run a launch and to establish separating stations on the higher river, and collect the cream with our own launch. We intend to do that next summer.
1526. Have you any trouble in getting your butter to Sydney? Occasionally the steamer gets bar-bound.
1527. Do you send ice with it? Yes; but it would not, perhaps, keep for more than twenty-four or thirty hours. It is only 4-inch ice.
1528. Are there frequent delays? There have been about six delays since we started.
1529. For how long? The last time, four days.
1530. *Mr. Wright.*] Of what capacity is your machinery? It is a 4-ton refrigerator—that is, in twenty-four hours.
1531. How much butter do you treat in a week? We are capable of treating, with our present plant, at least 30 tons.
1532. That is more than double the quantity you ever have treated? Yes.
1533. So you have a plant sufficiently powerful to cope with the industry even if it grows? Yes; if we get sufficient to make our plant incapable of coping with it all we will soon put in more plant.
1534. But your present plant is much beyond the present wants of the district? Yes; we put in a plant to cope with what we thought the industry might grow to in the next three or four years.
1535. How do you produce your ice—with cold air? By direct expansion, with ammonia.

MONDAY, 27 JUNE, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Hastings River.

Henry Richard Carleton, Principal Assistant Engineer, Harbours and Rivers Branch, Department of Public Works, sworn, and further examined:—

1536. *Chairman.*] The proposals suggested by the Department to the Committee were the western training-wall, portion of the eastern training-wall, and the southern training-wall as shown on the design? Yes, that is correct. H. R. Carleton.
1537. The Sectional Committee, during their recent visit to the district, came to the conclusion that the main difficulty with regard to Port Macquarie was the entrance into the port, the bar being bad; but for once in many years past there has not been any serious difficulty, boats drawing 8 feet negotiating it; under the circumstances the Sectional Committee came to the conclusion that it was well only to construct the southern training-wall at present;—will you give us your views with regard to it? I think I have already stated them before the Committee. I am rather afraid that the southern wall alone will not deepen the bar. It will lead the current away from the rough foreshore; but you want the western training-wall, or certainly some portion of it, to direct the flood-current on to that wall, otherwise it loses its effect. The wall should be extended about twice as much as shown on the map. 27 June, 1898.
1538. Are you aware that there is about 20 feet of water along the wall now? Yes, between 18 and 20 feet.
1539. Why should there not be 20 feet of water further along the wall? The fact of there being 18 feet of water there at present does not prove to me that you will get that all along the wall. You get it at the end of any tip. A scour is created round the stone where you tip it, but it will come in again as the wall proceeds.
1540. What is the southern wall for? To train the current, because of the very rough shore.
1541. And the western wall is to train the current on to that? Yes.
1542. So that if the current is let on to it it will follow it? Yes.
1543. Are you aware that it is following it now? I was aware that it was for a very short distance. But the fact of there being 18 or 20 feet of water at the end of the wall at present is no proof that it will maintain that depth, because you get that anywhere where you tip stone.

H. R.
Carleton.
27 June, 1898.

1544. You mean that there may be forces come into existence that will have a tendency to fill up as the tip goes on? It has filled up to some extent. You only get that deep water you speak of near the tip head.
1545. How long? Not for a very great length.
1546. Where it gets a straight run it is so? Yes. As an engineer, I am not prepared to say that the southern training-wall will give a permanently good bar, but in my opinion it should materially improve the entrance. If you only construct that southern training-wall it will cost more per ton than if you have the two going on together, because the smaller stuff from the quarry could be used in the western wall. We require heavier stuff for the southern wall, and we should have to pick out the best portion of the quarry, and discard about 50 per cent.
1547. *Mr. Black.*] How are you going to get the stone to the western wall? By punts.
1548. Would not that increase the cost? It would add slightly to it.
1549. Would not the saving by using the small stone be counterbalanced by the fact that you would have to shift it in trucks? We have to make it in the quarry in any case, and it has to be put out. It has to be put into trucks, and it might as well be conveyed to the wharf as to any other tip. All that would be a charge against the southern wall if you do not construct the western wall.
1550. *Chairman.*] There is another point. In the opinion of the Committee, as the eastern wall extended seaward towards the termination it would require to be a great deal heavier than you are making it at present? Yes; it will be the same breakwater on the outer end, but we are using big stone—stones 4 tons in weight.
1551. *Mr. Black.*] Do you think you could ever ensure a permanently safe bar without the western breakwater and training-wall? I think we could for vessels up to 14 or 15 feet draught.
1552. Is there no danger in north-easterly gales of that spit being cut away and silted into the river? North-easterly gales are very rare.
1553. But in the event of such a gale coming, is there not a danger of the northern sandspit being cut through and washed into the river? Some of it no doubt would be driven across into the channel, but it would be scoured out again by tidal action.
1554. And deposited where? Taken out to sea.
1555. Would there be sufficient scour? Yes, I think so.
1556. You think there is no danger in flood time of the river cutting a fresh opening through the northern sandspit and finding an entrance to the sea in that way? Well, there again the western training-wall comes in. If the western training wall were constructed I think the river would cling to it. There would be less liability of its breaking through, or attempting to make any other through channel for itself.
1557. Then you put the western training-wall, in importance, before the eastern training-wall? I do. We have seen what a wonderfully good effect a similar wall on the Clarence has had. The Hastings is a miniature Clarence. We are simply going through the same process—lifting the current out of the southern bay.
1558. In spite of what you have said about the western training-wall, you still think that that might wait until the completion of the southern training-wall? It is a matter of funds. Perhaps if the western training-wall were made, a half-tide one, the cost might be reduced in that way.
1559. You think a half-tide wall would do? It would not be as good as a high one, but still it would be a very useful wall. It could be made very much cheaper.
1560. I suppose there is no quarry at the upper end of that bend, is there? I understand that there is, and I believe there is stone similar to that we are using.
1561. If there were, and it could be run out on to the end of the training-wall, would not that greatly reduce the estimate? It is just possible that we may have to go there for stone yet for both works. The supplies are running out where we are at present, unless the Government resume some adjoining land.
1562. *Mr. Roberts.*] Is not the western wall suggested with the view of dealing with the Hastings River in the same manner as the other North Coast rivers have been dealt with and found to be successful? Yes.
1563. At the Clarence, especially, is there not an object lesson showing the necessity for a wall such as that to concentrate the water coming down the river? Yes, that is correct.
1564. Then on the Bellinger and the Nambucca the walls are similar? Yes, on the Bellinger; but on Nambucca it is reversed; but it is much the same in design.
1565. Is not the object of that western training-wall to prevent the river from spreading over that large area to the south? Yes; that is the main object, and it is to direct it on to the bar.
1566. In the opinion of the Department, is not the work as shown on the plan and recommended for the consideration of the Committee believed to be the minimum amount of work to accomplish the desired object, namely, to give a good entrance to the Hastings and improve the navigation of the river? Yes; that is what Mr. Darley considered the least amount that would give a useful effect.
1567. If the work should at the present time be confined to the southern training-wall, and in the near future it should be found necessary to make the western training-wall, would not the construction of the western training-wall be much more costly than it would if carried out now? It would cost more if carried out independently instead of simultaneously with the other one.
1568. Do you think it would cost 25 per cent. more? I should not like to say.
1569. There would be an increased cost? Yes, considerable difference.
1570. Possibly 50 per cent? No, certainly not that.
1571. I think you said that there is a large amount of small stone? Every quarry makes a lot of small stone.
1572. And this could be utilised in making the western training-wall? Yes; it is good, sound stone.
1573. *Mr. Black.*] What kind of stone is it? I think it is basalt—blue metal.
1574. *Mr. Roberts.*] You regard this work as really necessary for improving the entrance to the river? Yes; the matter was gone into very fully by Mr. Darley.
1575. You regard the amount stated as the minimum expenditure necessary? Yes.
1576. *Mr. Humphery.*] What would be the additional cost, supposing you could make use of the small stone for the training-wall? If the work is left in the hands of the present contractor, I doubt whether there will be much difference. It will simply be the waste of material. I have not got the estimate with me to say whether our rate is higher than that which we are actually paying the contractor at present.

1577. Assuming that later on it becomes necessary to build the training-wall, would that stone be available? No; it would have to run to spoil. It must be put out of the way, or we shall block ourselves in the quarry. It will have to be loaded into trucks and taken some distance and tipped. I might also add that we could not complete the western wall or the southern wall under the present contract, because it would be necessary, I think, to use larger stone than we have provided for in our present contract.
1578. Where do you propose to obtain the larger stone? From the same quarry.
1579. Is there sufficient material for the completion of the southern breakwater? If we resumed more land. There is plenty of material in the hill. It was purchased recently, I think, by Mr. Hungerford.
1580. Would that resumption be necessary whether carrying out the southern wall or not? It would not be necessary for us at present. The contractor has to find the stone.
1581. Who is the contractor? Mr. Cook.
1582. Could you undertake to get the work done at a lower cost if you took it in hand yourselves, instead of letting it to the contractor? We can do it quite as cheaply as the rate we are paying them—3s. 8d. per ton.
1583. What do you think would be added to the cost of the southern breakwater if you took the work in hand yourselves instead of letting it to a contractor? I doubt if anything would be added to the cost of the southern wall. It would simply mean that the western wall would cost more when you came to construct it afterwards.
1584. Then there would be no appreciable difference in the cost of the southern breakwater whether you constructed the western wall or not; but if, eventually, you have to construct the western training-wall it will cost a little more than it would if carried out simultaneously with the other? Yes.
1585. *Mr. O'Connor.*] Is it your opinion that if the southern wall were erected, and also the western wall, it would not require the expense of the northern wall? That is my opinion.
1586. That, in your judgment, will be all that is necessary to make it a safe harbour? Yes.

H. R.
Carleton.
27 June, 1898.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Harbour Works at Hastings River.

APPENDIX.

A.

[*To Evidence of F. Clarke, Esq., M.P.*]

MUNICIPAL DISTRICT OF THE HASTINGS.—STATISTICAL INFORMATION.

Dear Sir,

3 May, 1898.

As supplementary to my evidence given before your Committee on the consideration of improving the entrance to the Hastings River, I desire to say that the population within the municipal district of Port Macquarie is, according to latest published statistics, 990. The area embraced by the municipal district is 3,250 acres, and the total value of all ratable property, £77,700.

With regard to the population of the Hastings River valley itself, it is not easy to get reliable information, as the population statistics are compiled on a county basis.

The number of electors on the Electoral Roll, however, for the Hastings River is 948. Assuming an average of five to each elector, this would give a population of 4,740, say, 5,000 persons. If more reliable or accurate information is required under the latter heading, I would respectfully suggest application to the Statistician's Department.

I am, &c.,

FRANK CLARKE.

The Secretary, Public Works Committee.

[Plan.]

Nambucca River entrance.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

HARBOUR WORKS AT NAMBUCCA RIVER.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing harbour works at Nambucca River," have, after due inquiry, resolved that it is expedient the proposed works should be constructed, with such alterations as are suggested in the Report; and, in accordance with the provisions of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

DESCRIPTION OF THE RIVER.

1. The Nambucca River, situated about 219 nautical miles north of Sydney, has a length from its source to the sea of about 58 miles, and drains an area of about 552 square miles. In a report to the Department of Public Works of a survey of the river in 1891, it is stated that the river is north 9 sea miles from the Macleay River Heads, and the same distance south of the Bellinger Heads. The entrance is on the south side of a cliffy headland; what is known as the south head is a sharp sandy point capped with thick scrub. The navigable channel is nearly always close under the north head, usually following the shape of the headland. It can be followed for about 4,000 feet, where the limit of navigation by ocean-going boats is reached. The depth in this channel shoals from 12 to 18 feet to 2 and 3 feet at low water, and its width varies from 50 to 150 feet. Above the limit mentioned the trade of the river is carried on by droghers. From a point on the river known as Red Bank to the Government wharf at Macksville, 6 miles further up stream, the river is free from obstruction for vessels drawing under 9 feet of water. Half a mile above the wharf the river divides into two arms—the Bowra River and Taylor's Arm. A vessel drawing 7 feet can get 3 miles up the Bowra River above the junction, or $12\frac{1}{2}$ miles from the entrance, but above this point the river gradually decreases in width and depth to the township of Bowra, the head of navigation, $17\frac{1}{2}$ miles from the entrance. A vessel drawing 6 feet can get to the Government wharf at Congarini, up Taylor's Arm, 12 miles from the entrance, but only at high water, as there is only 4 feet at low water in the reach below it. For about 7 miles above Congarini the river narrows, and there are numerous obstructions to navigation, even by a boat, at low water.

Warrell Creek joins the Nambucca River at its entrance, and runs to the southward. It has deep reaches, but navigation is much impeded in the lower 4 miles of its course by sand-bars formed at intervals right across.

THE

THE PROPOSED WORKS.

2. The scheme designed by the Department of Public Works for the improvement of the river entrance consists of the construction of breakwaters 500 feet apart on the northern and southern sides of the entrance, and low stone walls extending about 11,000 feet up stream for confining and training the river waters, together with the diversion of Warrell Creek into the main river, so as to obtain the greatest possible scour. The total length of breakwater and walls, including the stone facing to new cutting, is about 33,800 feet, the estimated cost of the complete scheme being £149,700.

Up to 31st December, 1897, 1,394 feet of the northern wall had been constructed at a cost of £5,503, and it is proposed to extend the northern wall and breakwater a further distance of 1,756 feet, construct two training-walls on the left side of the river extending up stream from near the root of the northern wall, the length being 10,650 feet, and divert Warrell Creek into the main river, the estimated cost of these works being £72,500.

By the construction of these works, it is explained, the scouring power of the main river will be augmented by the addition of the waters of Warrell Creek, and the river currents will be brought into one channel and given a more direct course to the sea, instead of, as at present, winding through the extensive sand-flats within the entrance, and passing along an irregular foreshore where most of the force is lost. A perfect entrance is not expected without the construction of the southern breakwater, but, it is pointed out, the improved scour which will follow on the completion of the works now proposed will be such as will, with a little dredging, ensure the river being permanently navigable for all vessels likely to use the port for many years to come.

DETAILS OF THE PROPOSED EXPENDITURE.

3. The following are the details of the estimated cost of the proposed works:—

ESTIMATED Cost of Improvements at the Entrance.

Description of work.	Dimensions of walls.			Amount.	Total.
	Length.	Width on top.	Height.		
Portion completed to 31st December, 1897.					
Northern training-wall	1,394 ft.	12 ft.	4 ft. above H.W.	£ 5,503 0 0	£ 5,503 0 0
Portion now recommended.					
Stewart's Island training-wall	6,400 ft.	5 ft.	level with H.W.	18,492 10 0	61,765 0 0
North-western training-wall	4,250 "	5 "	" "	13,910 0 0	
Northern wall extension	256 "	12 "	4 ft. above H.W.	1,687 10 0	
Northern breakwater	1,500 "	15 "	16 "	27,675 0 0	
Bank across Warrell Creek	800 "	5 "	4½ "	2,161 5 0	
Cutting Warrell Creek to main river				3,190 0 0	7,242 15 0
Stone facing to sides of cutting	4,800 "	3 ft. thick	4½ ft. above H.W.	858 0 0	
" " eastern side of River	1,500 "	3 "	4½ "	1,033 10 0	
					69,007 15 0
				Supervision, &c., 5 per cent. (say)	3,492 5 0
				Portion now recommended—Total	72,500 0 0
Portion required to complete scheme.					
Eastern training-wall	9,600 ft.	5 ft.	half-tide level	15,908 15 0	68,358 15 0
Southern breakwater	3,300 "	15 "	16 ft. above H.W.	52,450 0 0	
				Supervision, &c. (say)	3,338 5 0
				Total	£71,697 0 0

Estimated cost of complete scheme—£149,700.

THE COMMITTEE'S INQUIRY.

4. In making their inquiry concerning these proposed works, the Committee examined several official witnesses (including the Under Secretary, the Engineer-in-Chief, and the Principal Assistant-Engineer of the Harbours and Rivers Branch, Department

Department of Public Works), the Member for the district, the owner of the subsidised steam-tug at the Nambucca, and the master of the North Coast Co.'s steamer which has traded between Sydney and the river. A Sectional Committee was then appointed to visit the river and district, and their report is published with the evidence taken by them.

THE NAMBUCCA BAR.

5. The bar at the entrance of the river is regarded as being the worst on the coast. The water is so shallow that the North Coast Steamship Company has found it necessary to build a vessel with a draught of 4 feet. Formerly, a steamer drawing 7 feet 6 inches, when loaded, traded to the river, but the water on the bar becoming too shallow for a vessel of that size, it had to be withdrawn. Besides the small steamer, there are at present trading to the river, the Committee are informed, a number of small sailing vessels employed in the timber trade.

The depth of water has not been improved by the short length of training-wall already constructed, but the condition of things generally at the entrance is somewhat better than it was before the wall was commenced. No very material improvement can be expected, it is explained, until the proposed works have been carried out to an extent which will lead the river current on to the bar so as to scour it away. The Sectional Committee were informed that the farmers and business people on the Nambucca suffer great inconvenience, and frequently are heavy losers, because of the uncertain movements of the steamers which trade to the river, and complaints against the excessive freights charged are general.

PRODUCE AND TRADE OF THE DISTRICT.

6. The country to be served by the construction of the proposed works, the Sectional Committee say in their report, "very closely resembles that drained by the Bellinger, both in its physical features and in the nature and value of its productions. The evidence given by the pilot stationed at Nambucca Heads shows that during 1897, 39,630 bags of maize, 2,910,000 feet of hardwood, and 84,000 feet of cedar were exported, while pigs, poultry, eggs, cream, and general farm produce of considerable value were also sent away, the total value of exports for the year being estimated at £38,922. The Committee ascertained that the export of all classes of commodities shows a continual yearly increase. As on the Bellinger, farmers have of late years extensively engaged in dairying, and with quicker and more regular means of shipment this industry is likely to become of considerable importance. This will occasion the clearing and occupation of land which is not considered of sufficiently good quality for agriculture, and will bring a large number of settlers into the district."

THE COMMITTEE'S RECOMMENDATION.

In the consideration of these works the question arises whether such a large sum as that proposed to be spent on the Nambucca should be expended upon a river the trade of which is at present comparatively unimportant. The estimated population of the district at the end of 1897 was 2,130.

The three most important of the works proposed are the northern training-wall and breakwater, the training-wall extending south-westerly from near the northern breakwater, and the cutting to divert the water of Warrell Creek. The northern wall and breakwater are expected to straighten and strengthen the ebb current at the place where its force is now almost lost in flowing over the rough irregular northern foreshore; the north-western training-wall will assist in guiding the current on to the northern wall and thence out over the bar at the entrance; and the cutting, by diverting the water at the creek, will increase the flow in the main river. The construction of these works before any others are undertaken is, it is admitted, the order in which the scheme should be carried out; and the Committee are of opinion that before any other portions of the scheme are commenced the two walls

walls and breakwaters, together with the cutting, should be proceeded with, and the results from their construction definitely ascertained. The estimated cost of these works is as follows :—

	£	s.	d.
North-western training-wall	9,295	0	0
Northern wall extension	1,687	10	0
Northern breakwater	27,675	0	0
Cutting and bank, Warrell Creek	7,242	15	0
	<hr/>		
	45,900	5	0
To this must be added cost of supervision, &c., at 5 per cent....	2,295	0	0
	<hr/>		
Total	£48,195	5	0

The expenditure suggested to the Committee by the Department was £72,500. The Committee definitely reject the Stewart's Island training-bank, estimated to cost £18,492 10s., and they have reduced the cost of the north-western training-bank, in accordance with a departmental statement, to £9,295, representing a saving of £4,615, or, with the amount it is estimated the Stewart's Island training-bank will cost, a total saving of £23,107.

The internal works, which are intended to project the water on to the bar, should be carried out as speedily as possible; and, if in the construction of the northern breakwater it should be found that a fair depth of water has been obtained before the whole of the breakwater has been carried out, that work should, in the opinion of the Committee, be then discontinued.

The Committee believe it to be highly probable that an expenditure of between £30,000 and £40,000 will bring about the desired results at the Nambucca, and, in their opinion, that is a sufficient sum to be expended upon the river. It is not, however, possible to state a definite amount, because experience alone can show at what point the northern breakwater may safely be discontinued.

The Committee have passed the following resolution :—

“That, in the opinion of the Committee, it is expedient that the proposed Harbour Works at the Nambucca River, referred to the Committee by the Legislative Assembly, be carried out with such alterations as are suggested in the Report.”

THOS. EWING,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 7th July, 1898.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

HARBOUR WORKS AT NAMBUCCA RIVER.

THURSDAY, 14 APRIL, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee proceeded to consider the expediency of constructing Harbour Works at Nambucca River.

Robert R. P. Hickson, Under Secretary and Commissioner for Roads, Department of Public Works, sworn, and examined:—

1. *Chairman.*] You have a statement to read to the Committee? Yes; it is as follows:—

NAMBUCCA RIVER.

THE entrance to the Nambucca River is about 219 nautical miles north of Sydney. From its source to the sea, the river has a length of about 58 miles, and drains an area of about 552 square miles.

The following particulars are taken from the report of the late Captain F. Howard, who made a complete survey of the river in 1891:—

“The Nambucca River is north 9 sea miles from the Macleay River Heads, and the same distance south of the Bellingor Heads. The entrance is on the south side of a cliffy headland, with a remarkable peaked rock at its south-east extreme. What is known as the South Head is a sharp sandy point capped with thick scrub, and bearing south-west $\frac{1}{4}$ west 3,000 feet from the peaked rock.

“The navigable channel is nearly always close under the North Head, usually following the shape of the headland, which, inside the peaked rock, forms two small bays, both with small sandy beaches, but fronted with numerous jagged reefs, which extend southward, and interfere with the set of the tidal streams.

“The North Head rises steeply from the beach, and is, at the points of the bays, cliffy. The land above shows in three open grassy hills.

“The South Head is the northern point of a long sandy beach extending southward in a curve a distance of 6 sea miles to Scott's Head. Extending northward from the South Head is a sand spit, generally awash at high water, the size and shape of which is constantly changing.

“Inside the South Spit and Beacon Rock Point, the river opens out into a large basin 3,500 feet wide and 5,500 feet long. The greater portion of this space is filled with large sand-banks, the river finding its way through them in narrow winding channels, with less than 1 foot at low-water springs.

“The only navigable channel is close around the northern shore inside the Head. This can be followed for about 4,000 feet, when the limit of navigation by ocean-going boats is reached. The depth in this channel shoals from 12 and 18 feet to 2 and 3 feet at low water, and its width varies from 50 to 150 feet.

“There is at all times a strong tidal stream in the fairway channel from the Beacon Rock outwards, particularly when the South Spit extends right across, leaving only a narrow passage round the rocks. The ebb stream is then forced into the bay under the signal-staff, and takes from thence a south-west by south direction, scouring out a channel on that bearing. Frequently, when this is the case, there is an eddy or slack in the outer bay, and sand is deposited in the usual channel until it is completely blocked. The passage in, after passing the outer bar, is then very dangerous. Vessels coming in with any sea on are liable to be caught by it on the starboard quarter and sent to the northward out of channel, which is always at these times very narrow.

“Stewart's Island lies about 2 miles from the entrance. The channel on its north-west side is used by droghers, and carries about 9 feet at low water. The river south-east of Stewart's Island, though from 800 to 1,400 feet wide, is mostly shallow. There is good water close along the south-east side of the island, but it is blocked by shoals at each end. Above the island the river opens out to a width of 2,000 feet. On the west bank is a red cliff point known as Red Bank. The river between Red Bank, Stewart's Island, and the opposite bank is shoal right across.

“From Red Bank upward, the river is entirely free from any obstruction, or vessels drawing under 9 feet of water up to the Government wharf at Macksville, which is 6 miles above Red Bank. Half a mile above this wharf the river divides into two arms—the Bowra River and Taylor's Arm. A vessel drawing 7 feet could get 3 miles up the Bowra River above the junction, or 12 $\frac{1}{2}$ miles from the entrance. Above this point the river gradually decreases in width and depth to the township

R. R. P. township of Bowra, the head of navigation, 17½ miles from the entrance. A vessel drawing 6 feet could get to the Government wharf at Congarini, up Taylor's Arm, 12 miles from the entrance, but only at high water, as there is only 4 feet at low water in the reach below it. For about 7 miles above Congarini the river narrows, and there are numerous obstructions to navigation even by a boat at low water.

Hickson.
14 April, 1898.

"Warrell Creek joins the Nambucca River at its entrance, and runs to the southward, nearly to Scott's Head, for a distance of 7½ miles, the average distance across from the creek to the ocean beach being ¼ mile; it then turns abruptly westward. The creek is about 700 feet wide at its entrance, gradually contracting to about 150 feet at the bend westward. It has deep reaches, but navigation is much impeded in the lower 4 miles of its course by six sand-bars formed at intervals right across. From the vicinity of Scott's Head, Warrell Creek runs for 7½ miles in a westerly direction in long straight reaches, mostly through hilly country, thickly wooded; thence in a south by west direction for 5 miles to the head of navigation for boats.

"The rock of which the North Head is formed is mostly very soft clay slate; but the strata below, and many feet above high water appear to be much harder, though brittle, with numerous small veins of quartz running through it. Judging by the way the numerous jagged reefs hereabout appear to have withstood the action of the sea and currents for ages, I believe that the same description of rock, quarried from the cliffy points at either end of the bay, would stand well in the proposed dyke.

"The whole of the country drained by the Nambucca and its tributaries appears to have been one unbroken forest, excepting a few small swamps near the entrance. At one time cedar was plentiful and much exported, but at present nothing but hardwood, mostly blackbutt, tallow-wood, and ironbark sawn at the mills is to be obtained. The crop usually grown by the farmers is maize, but little is to be seen on the main river until above Macksville. The soil in the upper reaches, near the head of navigation, seems more suitable for its growth than that below."

The official papers show that from the year 1878 onwards, numerous representations were made by the residents as to the inconvenience and loss which they sustained in consequence of the shoal condition of the entrance. Vessels were often bar-bound for several weeks at a time—some for as long as eight weeks—and then were compelled to leave only half loaded. The depth on the bar at these times was reduced to from 3 to 5 feet, and in April, 1884, the pilot reported the bar so bad that the sand was awash at low water from the North Head to South Beach. There were also serious obstructions to navigation in the portion of the river from Red Bank downwards. At one time vessels were able to proceed up the river, but owing to the extensive sand-flats which had formed within the entrance they were now able to get inside the Heads only, and consequently the whole of the produce of the district had to be punted down to the Heads, entailing heavy loss upon the producer on the river. Urgent requests were therefore made that some works might be undertaken which would ensure a permanent navigable channel at the entrance and in the lower course of the river.

In 1885 Lieutenant Francis who had made a survey of the entrance reported as follows:—"Both the bar and the flats continually shift, and seldom remain in the same position for three months at a time. The depth of water on the bar varies considerably, sometimes there being 8 feet at high water, and at other times so shallow that vessels are detained inside for weeks, or else cross out light and anchor off the South Beach, having their cargoes of timber rafted off to them. The principal export from the river is timber, which is brought down in flat-bottomed punts and stern-wheeled droghers."

In January, 1895, in response to an urgent appeal of the residents for the construction of some works for the improvement of the entrance, the Minister called for "a report as to whether the expenditure of the available money (a vote of £3,000 taken in 1884) would of itself be advantageous to the entrance, and if not, how much more would be required to give reasonable expectation of some improvement without going into a comprehensive scheme." Mr. Darley thereupon prepared a complete scheme for the improvement of the entrance, the carrying out of which would form a permanent harbour. The estimated cost of this scheme is £149,700. Although the expenditure of this amount was out of proportion to the resources of the district, he pointed out that a measure of relief could be given by the construction of the inner portion of the northern breakwater at a cost of £11,000. This wall would straighten and strengthen the ebb-current at the place where its force is now almost lost in flowing over the rough and irregular northern foreshore. Another very important part of the work which he considered should be taken in hand as soon as funds were available, was the training-wall extending south-westerly from near the root of the northern breakwater. With regard to the £3,000 already voted, no useful work could be carried out for so small a sum, and unless a further amount of (say) £10,000 were made available it would be injudicious to enter upon the work.

In October, 1895, an additional vote of £5,000 having been taken, tenders were invited for the construction of the inner end of the northern breakwater, and that of Wooden, Rogers, and Frost, accepted in February, 1896, at rates of 3s. 8d. per ton for stone 1 ton to 4 tons in weight, and 1s. 6d. for ballast. This contract is still in progress.

The amounts voted for the work are as follows:—

1884 Loan.....	£3,000
1895 ,,	5,000
1897 ,,	5,000
Total.....	£13,000
The amount expended to 31 December, 1897, was.....	5,503
Balance at 31 December, 1897.....	£7,497

The scheme designed by Mr. Darley, and now submitted for the consideration of the Committee, includes the construction of breakwaters 500 feet apart on the northern and southern sides of the entrance, and low stone walls extending about 11,000 feet up stream for confining and training the river waters, also the diversion of Gurravembi or Warrell Creek into the main river, so as to obtain the greatest possible scour. The total length of breakwater and walls, including the stone facing to new cutting, is about 33,800 feet, the estimated cost of the complete scheme being £149,700. The work carried out up to 31st December, 1897, was the construction of 1,394 feet of the northern wall at a cost of £5,503.

In addition to the work already done, Mr. Darley recommends the extension of the northern wall and breakwater a further distance of 1,756 feet, the construction of the two training-walls on the left side of the river extending up stream from near the root of the northern wall, the length being 10,650 feet, and the diversion of Warrell Creek into the main river, the estimated cost of these works being £72,500. By the construction of these works, the scouring power of the main river will be augmented by the addition of the waters of Warrell Creek, the river currents will be brought into one channel and given a more direct course to the sea, instead of, at present, winding through the extensive sand-flats within the entrance, and passing along an irregular foreshore where most of the force is lost. Although a perfect entrance cannot be expected without the construction of the southern breakwater, yet the improved scour which will follow on the completion of the works now recommended, will be such as will, with a little dredging, ensure the river being permanently navigable for all vessels likely to use the port for many years to come.

2. What has been the effect of the works already in progress on the Nambucca? I cannot say. I was only on the river once, and then for a very short time, so that I really know nothing about it.
3. Can you tell us anything about the population or the resources of the district? No, I cannot.
4. *Mr. Black.*] Do you know why it is proposed to leave Warrell Creek open at the top end? That opening does not matter, because it is intended to divert the water of the creek into the main river by a cutting lower down.
5. Do you know of any reason for leaving the entrance to the creek open? Well, it is not worth the expense of closing it.

6. *Mr. Hoskins.*] Do you know how many people are engaged in timber-getting on the river? No; but there are two mills there.
7. *Mr. Lee.*] In the matter of importance, how does the Nambucca rank amongst the North Coast rivers? I am not in a position to say, because I know very little about the river.
8. *Mr. Hoskins.*] Is the country between the Nambucca and the Macleay level? It is not level, but it is not very heavy. I have driven across it.
9. Did you ever consider whether it would not be cheaper to construct a tramway from one river to the other than to make these improvements? I do not think the matter has been considered, but I fancy that a tramway would cost a good deal of money.
10. *Mr. Lee.*] Can you tell us the distance in miles from the Bellinger to the Nambucca, and from the Nambucca to the Macleay? By sea, it is about 9 miles in each case. The distance by land would probably be about 12 miles.
11. *Mr. Black.*] The Nambucca very much resembles the Tweed in its northern headland, its uncertain southern headland, and the wide flats just inside the entrance? Yes.
12. Do you not think that if the eastern training-wall is not constructed the tide will have a tendency to form a bar on the flats? You will not get as good a result with one training-wall as with two; but the question is whether you can afford to build the two, and whether the northern wall alone will not give a sufficient depth of water for the trade of this place.
13. Do you not think that it will be discovered when one training-wall has been made that so much sand will be deposited at the entrance, caused by the action of the tide, as to make navigation dangerous? No; I think the construction of the northern works alone would give a sufficient depth of water for the trade of the place; but, of course, you would not get as good an entrance as if the whole scheme were carried out. There is very much less traffic on the Nambucca than on the Tweed. On the Tweed a greater depth of water is required, and, therefore, both breakwaters are necessary. Here, one is hardly justified in recommending the large expense of two breakwaters.
14. Is the staple industry of the district timber-getting? Yes; and there is also some maize grown.
15. You have not formed any idea as to whether the trade of the district warrants the proposed expenditure? No.
16. And I suppose you would not like to express an opinion upon the point? No.
17. Where do the pilots keep their boats? The pilot-station is shown on the map: There is a small slip in the bay, just inside the North Head, where they keep their boats. The entrance to the Nambucca very much resembles the entrance to the Tweed.

R. R. P.
Hickson.
14 April, 1898.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and examined:—

18. *Mr. Black.*] You only recommend the construction of training-walls on one side of the river? C. W. Darley. Yes.
19. Do you recommend the construction of two breakwaters? No; I only recommend the construction of the northern breakwater. 14 April, 1898.
20. Do you think the construction of the northern breakwater and of the two training-banks on the west side of the river will keep the channel open? Yes, I think so. These works will guide the current on to the bar, and will provide a sufficient depth of water for the trade of the port.
21. In heavy weather will not sea break over the low patch of sand coloured pink on the map? Yes; but in heavy weather the vessels must keep off.
22. Will not that sand be carried into the channel and thus form a bar? No; the ebb and flow of the tide will keep the channel along the breakwater open.
23. But will not deep water be only right alongside the breakwater. Will there be any great width of deep water? There will be a sufficiently wide channel for the trade of the port. I should like to carry out the whole scheme if the place could afford it; but, inasmuch as the place cannot afford the expenditure of £149,700, I have recommended a modification of the scheme.
24. Do you think the place can afford anything? That is not an engineering question. I have reported as to what I think is the least that can be done to improve the navigation of this river.
25. You venture the opinion that the place cannot afford the southern breakwater and eastern training-wall? I do not think the Government can afford to spend £150,000 on the Nambucca River.
26. There is a doubt in your mind as to whether the Government can afford the other expenditure; but you do not care to express an opinion yourself? I do not care to express an opinion upon the point.
27. Do you think the diversion of Warrell Creek will be sufficient to prevent the silting up of which I spoke? It will have that tendency. At the present time Warrell Creek discharges near the South Spit, and its waters cause a very complicated state of the currents, and the formation of sand-banks. Until the waters of the creek can be diverted and trained into the main channel it will be impossible to do anything to improve the entrance. I thought that the best way to get rid of this complication of currents was to make Warrell Creek discharge into the main river, and then train the water down so as to get a scour on the bar. Some time ago I was instructed by the Minister, Parliament having voted money for the work, to design a scheme for the improvement of this entrance. I designed what I considered a complete scheme, and then I set myself to ascertain how much of this scheme, if carried out, would effect a sufficient improvement. I recommended the construction of the northern breakwater, and the Minister having authorized the work, a contract was let, and a portion of the wall has been constructed. The ebb and flow of the tide formerly went into the different bights below the North Head, the ebb tide coming down the river meeting the discharge of Warrell Creek, and preventing any scour. Captain Howard, in his report, also pointed out the necessity of keeping the conflicting currents out of the rocky bay just within the entrance on the north side. The effect of the work already carried out has been to divert the rival currents from the bay I speak of, and we have already fairly deep water along the breakwater. I would urge the continuation of this work. If only one part of the scheme is to be carried out, this part will do more good than any other towards maintaining a fair depth of water at the entrance.

- C. W. Darley. 28. Even if you construct the northern breakwater there will be a small opening into the rocky bay you speak of? Yes; but that will do no harm.
- 14 April, 1898. 29. Do you propose to fill up that bay with sand? No. Of course if we were dredging there, and wanted to get rid of the sand, we might pump it into that bay. The current entering the harbour would have to pass along the breakwater. Seeing that most of the traffic now going to the entrance finds its way to the saw-mills near the town, the northern breakwater may be sufficient. It is doubtful as to how far it is necessary to improve the river to let vessels go up it for any distance. There is good water past Stewart's Island for some miles. If the northern breakwater be constructed, and Warrell Creek be diverted, a good deal will be done towards obtaining a good entrance. The training-walls on the west side of the river would, of course, ensure a clean run of water down to the bar.
30. What will the northern breakwater cost? £29,362 10s. is the estimated cost of completing the northern breakwater. The diversion of Warrell Creek is estimated to cost £7,242 15s.
31. I suppose you regard that as an essential part of the scheme? Yes. These two items make a total of £36,605 5s. Then the Stewart's Island training-wall, which it is only proposed to carry up to high-water level, will cost £18,492; the north-western training-wall, £13,910; and, adding the usual percentage for supervision, £3,492 5s., the total cost of the works will be £72,500.
32. The best channel now is that on the west side of Stewart's Island? I think so; but at times the best channel is up the main river.
33. I suppose it will be necessary to keep open the channel at the back of Stewart's Island? Yes; I provide for the keeping open that channel.
34. Are the sand-banks shown on the plan composed of indurated sand? No; they are merely soft sand, and change their position every tide.
35. Do you anticipate that, if the northern training-wall is constructed, the scour will be sufficient to keep the river open? A little dredging may be required in the first place, but after that the channel should be maintained by the scour. Our experience in other places is that once we give the scour a slight lead we have done all that is necessary.
36. The lower end of the northern training-wall turns in towards the land? Yes; that is to prevent too much of the water of the main river passing behind.
37. I suppose you have various reasons for leaving openings opposite the town? Yes; we want to allow the shipping to go in there.
38. Will those openings form a wave-trap? The waves will run in along the breakwater, and expend themselves. With only one breakwater the waves would probably expend themselves on the sand spit at the entrance.
39. During heavy easterly gales I suppose the waves break over the sand-banks? Yes. We have done some dredging on the sand spits in front of the town to widen the channel. We went down pretty deep there; but we had only clean sand to deal with.
40. Is there any rock in any of the channels? There is a rock between the north-western training-wall and the Stewart's Island training-wall. Of course, on the northern side of the entrance it is all rocky; but the foul ground will be covered by the breakwater.
41. There will be no difficulty in deepening the channel? No.
42. I suppose that near the Heads the country is very poor? Yes; like all coast country. I have not been far inland; but I think that it improves.
43. *Mr. Hoskins.*] You have been in this district? I have not been far up the river. I only know the entrance.
44. The only persons living in the locality are timber-getters? Yes; and the people engaged in maize-growing.
45. Are you familiar with the country between the Nambucca and the Macleay? I have not been across it, but I know its appearance.
46. There would be no great engineering difficulty in the way of tramway construction there? No. There is a ridge between the two rivers; but it would not prevent the construction of a tramway.
47. Would it not be cheaper to construct a tramway than to expend £74,000 in improving this entrance? It is 9 miles from the Nambucca to the old entrance to the Macleay, but to the new entrance, which is 6 miles further south, the distance would be 15 miles.
48. If a tramway could be laid down for £2,000 a mile, it would only cost £30,000, as against your proposed expenditure of £74,000? I am afraid that sawn timber would not stand the expense of a second handling. A tramway might suit the maize traffic.
49. The timber vessels are mostly flat-bottomed, and draw very little water; but vessels carrying maize require a greater draught of water;—do you not think that a tramway would suit the district better than the improvement of the entrance, putting the timber traffic on one side. It does not appear that the expenditure of £74,000 would make a very good entrance? This expenditure will make the stream fairly navigable. The channel will not be very deep; but the depth will be constant.
50. Do any steamers go to the river? They do not go up the river; they only go just inside the entrance. They like to go in on one tide and out on the next. I think the "Rosedale" trades to a number of these rivers. Of course a tramway would only get the traffic of the district occasionally, because whenever the bar was open it would go by sea, because of the saving in handling and in freight.
51. *Mr. Trickett.*] What depth of water would you have on the bar at low tide if your modified scheme were carried out? I think we shall always be able to count on having from 8 to 9 feet at low tide.
52. That will be ample for the class of vessels trading there? Yes.
53. At the Tweed, where the entrance is similar to the entrance at the Nambucca, you have constructed an eastern training-wall;—do you not think that an eastern training-wall will also be necessary here? On the Tweed the concave bank is the eastern bank; here the concave bank is the western bank. The current always clings to the concave bank.
54. Can you give us particulars of your proposed expenditure? Yes.
55. Would you recommend the carrying out of this work by contract? I would recommend the completion of the northern breakwater by contract; but I think that the training-walls might be carried out by day labour.
56. I suppose a pilot and tug-boat service is provided at the Nambucca Heads? Yes.

57. That service will be necessary after these works have been carried out? Yes.
58. Does the sea break over the sandy tongue of land between the river and the ocean? No; that piece of land is covered with timber and mangroves. The sea only breaks over at the northern extremity.
59. There is no danger of your works being damaged by the force of the waves? I think not.
60. If you divert Warrell Creek, I suppose the end near the entrance will gradually silt up? Yes.
61. Is it proposed to leave openings between the northern training-wall and the town? Yes; vessels will pass in to the wharf behind the wall.
62. Where do the steamers go at the present time? To the wharf in front of the town. A certain amount of tidal scour will pass round the foreshore, and I have left openings at both ends of the training-wall to enable vessels to get up to the town.
63. Will the proposed works, if carried out, enable steamers to go up the river? If the training-walls are carried out steamers will be able to go up the river for a few miles.
64. Will both the training-walls be necessary to give that result? No; only the concave wall.
65. If your modified scheme is carried out, they will be able to get up? Yes.
66. How far? To the township of Macksville, a distance of about 9 miles. There is very fair water for 10 or 12 miles after you pass Stewart's Island. The head of navigation is about 19 miles up.
67. You think that the expenditure of £72,500 is a reasonable experiment to make? Yes.
68. If the modified scheme is carried out, the complete scheme may be left for some time? I do not think that it is necessary to expend more than the amount you name.
69. *Chairman.*] Where does the shipping go now? The steamer goes to the Government wharf opposite the township, whilst small vessels take timber from the saw-mill on the western side of the town and from the Belmore saw-mill to the west of Stewart's Island.
70. What is the draught of the "Rosedale"? About 7 feet.
71. If the north-west training-bank be carried out as shown the probability is that there will be dead water at the Government wharf and at the wharf opposite the saw-mills; there will be no tendency for that channel to silt up? No.
72. Supposing Warrell Creek is diverted, as proposed, and that the Stewart's Island training-bank is not constructed, it is probable that enough water will flow past the Belmore Saw-mill to keep the channel there open? I think that that channel can be kept open with a little dredging occasionally.
73. The river would then be good as far as the north end of Stewart's Island, but there would probably be a shallow piece from there until you got to the deep water at the entrance? Probably so.
74. You think it would be well to make the north-western training-bank, but you do not regard it as of so much importance as the two works you have spoken of as essentials? It comes next to them in importance.
75. Does the north-western training-bank rise to the importance of an essential? It is essential to open the river for navigation, but it is not essential simply to open the entrance.

C. W. Darley.
14 April, 1898.

WEDNESDAY, 20 APRIL, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Nambucca River.

John McLaughlin, Esq., M.P., sworn, and examined:—

76. *Chairman.*] You represent the Raleigh Electorate in the Legislative Assembly? Yes.
77. The Nambucca River is in the Raleigh Electorate? Yes.
78. *Mr. Hoskins.*] Are there many settlers on the Nambucca River? A considerable number. There are settlements at Bowraville, on Taylor's Arm, at Macksville, and in other parts of the district.
79. When you were canvassing the district, did you consider it worth your while to go to these places? Yes, I went to all of them.
80. Are there many vessels trading to the district? Yes, there are several sailing vessels, and the steamship "Rosedale" used to trade there; but, lately, "the Euroka," a vessel of a smaller draught, has been engaged in the trade. She brings her cargo to the Macleay, and sometimes direct to Sydney.
81. I suppose the cargoes carried from the Nambucca are not very large? The vessel is always fully loaded.
82. What cargo does she get? Maize principally. Large quantities of maize are grown in the district.
83. I thought the principal production was timber? No, the chief production is maize.
84. Did you ever go to the Nambucca by sea? No, I have always gone overland from the Macleay.
85. You have never gone through the entrance then? I have never been through the entrance, but I have been to the entrance.
86. What sort of an entrance is there? The entrance is not good now. There are about 6 miles of sandy beach to the south, which renders the navigation difficult. I think that when the training-walls are completed there will be a very fair entrance.
87. The Government has already carried out some works on the river? Yes; it had spent about £5,000 when I was there last.
88. The money has been spent principally in making a training-wall? Yes, in making the northern training-wall.

J.
McLaughlin,
Esq., M.P.
20 April, 1898.

- J. McLaughlin, Esq., M.P.
20 April, 1898.
89. Has this wall improved the entrance so far? I think so; but there has not been enough of it made to enable me to speak with confidence.
90. What is the opinion of the people trading there? They think that the work when carried out will give a good entrance.
91. The alluvial flats there are not very large? Yes; they are large.
92. They are nothing like the flats on the Macleay? The district is not as large as the Macleay district, but there is a lot of fine land on the Nambucca.
93. Do you think the people would object to pay moderate tonnage dues if the improvement of the river were effected by this scheme? They would not object to pay tonnage dues if similar dues were charged on the Clarence, the Richmond, and on other rivers where similar works have been carried out. Of course, if dues were not charged on those rivers, the people on the Nambucca would also expect to go free.
94. The Nambucca is only about 9 miles from the Macleay? About 9 miles by sea, and about 12 miles overland. The country between the two rivers is hilly.
95. Would it not be better, in the interests of the residents on the river, instead of spending so much money in improving the entrance to the river, to make a tramway to the Macleay, so that they could send their produce away from the Macleay? I think that such a tramway would cost a very large sum of money, and the extra handling would make the cost of transit too high.
96. I suppose that a depth of 7 or 8 feet of water at the entrance would suffice for the traffic? I think so. I think that if they could get that they would not complain very much.
97. *Mr. Humphery.*] Do you know anything about the trade of the district? There are two saw-mills there, and a large quantity of maize is grown on the river. They are always complaining that they are unable to get to market at the proper time, because of the state of the entrance.
98. What disabilities do the residents labour under at the present time? They cannot always send their produce to Sydney regularly.
99. Is that owing to the bad state of the bar? Yes; sometimes they are bar-bound for months.
100. What is the difference between the depth of water on the bar and the depth of water between the bar and where the settlement is? I am told that sometimes there is only about 4 feet of water on the bar, but that after you get inside the entrance there is plenty of water. The river is navigable close up to Bowra, with ordinary dredging. The difficulty is at the entrance.
101. You are not prepared to express an opinion as to whether the proposed works would be effective? It seems to me that they will be as successful as the works at the Bellinger have been. They very much resemble the Bellinger works.
102. Do you know what the population of the Nambucca district is? I cannot say exactly, but I know that it is scarcely as large as the population on the Bellinger.
103. How many voters are there on the electoral roll? I fancy that there must be about 300 on the Nambucca. There are settlements at Bowraville, Taylor's Arm, Macksville, Warrell Creek, Argent's Hill, and at other places.
104. The people residing at all these places are served by the river? Yes; it would never pay them to cart their produce to the Macleay.
105. *Mr. Lee.*] I believe that Coff's Harbour, the Bellinger, the Nambucca, and the Macleay are all within your Electorate? Yes.
106. Do you know what the Government expenditure at Coff's Harbour has been? I cannot say exactly.
107. Exclusive of that expenditure, it is proposed to spend on the Bellinger, the Nambucca, and the Macleay the sum of £216,500. Considering that the Bellinger is only about 8 miles from the Nambucca, and the Nambucca only 12 or 14 miles from the Macleay, do you not think it would be better to improve only one entrance and to give communication by railway from the other places to that entrance? No; I think that it would be better to keep all the river entrances open.
108. Do you think that the importance of the three rivers named is sufficient to justify the expenditure of so large an amount? I do. I believe that the population of these places would increase very rapidly if they were given regular communication with Sydney.
109. Are you prepared to offer any suggestion whereby this proposed expenditure could be lessened? I think you must improve all these entrances.
110. Do you hold the opinion that the produce of the district would not stand railway freight to a port? I think that the extra handling which would be necessary would deprive the producers of all profit.
111. Has it not been found that the most convenient way of dealing with the maize traffic is to send it down the river on a drogher and tranship it to the steamer? Yes, that is what they do with it. If a railway such as you propose were constructed, there would not be enough traffic for a daily train, and whenever the river entrances were good the produce would go by river.
112. Would the interests of the residents be served if the improvement of these entrances were abandoned and the North Coast railway made? Yes; but in the meanwhile, what would happen to the unfortunate people—they have no chance of getting a North Coast railway for the next seven years.
113. If there were a North Coast railway, could they afford to send their maize to Sydney by it? Yes. People send maize to Sydney by rail from Gundagai, which is a longer distance, and it costs them less than it costs to send maize by steamer from the Nambucca. The North Coast Company charge 1s. 6d. a bag freight from the Nambucca.
114. That is 15s. a ton? Yes. If they had to wait for a North Coast railway they would abandon their holdings.
115. Supposing the entrances were improved, and that afterwards the North Coast railway were made, would not the steamer competition rob the railway of the traffic? I do not think so, any more than the Hunter River steamers rob the Newcastle line of its traffic. I believe that there would be traffic for both the steamer and the railway.
116. Only a limited quantity of maize is grown in the district;—if that traffic were divided between the railway and the steamers, neither of them would pay? Well, the passenger traffic would increase five-fold if there were a railway. A number of people in that district have never been to Sydney. They will not travel by the small steamers, because they are afraid of the risk and the discomforts of the voyage. I have seen people 23 and 24 years of age who have never been to Sydney.
117. I want to make sure that any money spent on the improvement of these rivers will not be wasted? I do not think it will. The keeping open of the rivers must always be of advantage to the district.

118. Do you hold the opinion that whether the North Coast railway is or is not made, it is of importance to the Colony that these river entrances should be kept open? Yes; it may be that the people may want to send their produce elsewhere than to Sydney—to the north, or to New Zealand, for example. They are exporting timber from the district to England at the present time. The sailing vessels, when they load, go straight away to England without coming to Sydney.

J.
McLaughlin,
Esq., M.P.
20 April, 1898.

119. If this scheme were carried out it would only give a sufficient depth of water to enable small vessels to enter the river? I understand that it would give a depth of 8 or 9 feet, and you do not know how much more you might get later on. It is expected that the entrance will improve after the works have been carried out.

120. What capacity for development has the district? It will grow everything that can be grown in any part of New South Wales. It is a very good fruit-growing district. Citrus fruits do remarkably well there.

121. What is the probability of agriculture on a larger scale;—is there land for it? There is a large quantity of really good land.

122. Is it available for settlement? Yes; there is still a large quantity of Crown land.

123. Has not all the good land been alienated? No. Only the other day I received a petition asking that a reserve might be thrown open for selection. A large number of families want to take up land there, but the Crown has not yet thought fit to offer it for sale.

124. You think that the proposed expenditure is both necessary and justifiable? Yes; I do not see any escape from it.

Patrick Hogan, sworn, and examined:—

125. *Chairman.*] You are at present residing in Sydney? Yes.

126. You are in business here? Yes.

127. You at one time represented the Nambucca district in the Legislative Assembly? Yes.

128. *Mr. O'Connor.*] For many years you have carried on the business of a commission agent in Sydney? Yes.

129. *Mr. Humphery.*] I understand that you are familiar with the whole of the district which will be served by the proposed work? Yes.

130. From what part of the Nambucca district does the principal traffic come? Bowraville is the principal township. It is the Government township.

131. What facilities have the settlers of the district for getting their produce to market at the present time? They can only use the ocean steamer.

132. There is no other way of getting to Sydney than by steamer? Unless you come overland by road.

133. What is the distance overland? I daresay it is 280 miles.

134. And the expense of coming overland would be much greater than the expense of coming by sea? Yes.

135. Under what disabilities do the people there now labour in regard to the disposal of their produce? They labour under the disability of a bad harbour. The entrance to the river is always bad, more or less.

136. A good entrance is all that they require to enable them to make the best use of their land and to dispose of their produce to the greatest advantage? I do not know of any other way in which their wants can be better served than by the improvement of the river entrance.

137. Does your knowledge of the river enable you to express an opinion as to whether the proposed harbour works would be effective in providing a good entrance? I am thoroughly satisfied that you can make the entrance sufficiently good for the trade of the district.

138. Can you say from personal experience that the traffic of the district has at times been stopped by the defective character of the entrance? Yes; the "Rosedale" has not been to the river for the last six months, owing to the defective entrance.

139. You have been trading with the district for a considerable time? Yes. I have had a thorough knowledge of the district for more than thirty years.

140. What is the extent of the trade of the district? The trade of the Nambucca is pretty well on all-fours with the trade of the Bellinger. As I said last week, about 40,000 bags of maize are grown annually on the Bellinger, and very little less is grown on the Nambucca. Pigs and poultry are also produced there, and the timber trade is considerable.

141. Approximately, what is the value of the produce coming from the district? It would be worth more than £40,000 or £50,000 a year. I should say that the value of the maize produced in the district would be between £20,000 and £30,000 a year.

142. What is the value of the goods sent to the district? I am satisfied that £10,000 worth of goods is sent to the district annually.

143. Then £50,000 would approximately represent the annual value of the trade of the district? I venture to think that it would be nearer the mark to say £100,000. It must be worth between £50,000 and £100,000 per annum, if you included timber and other products.

144. With an improvement of the entrance, do you think that the steamship rates would be reduced? The company undertook to bring maize from the Bellinger at 10s. a ton, if the entrance were improved so as to enable their steamer to enter and leave the river with safety, and to load up fully each trip. I fancy they would make the same reduction if the Nambucca were similarly improved.

145. Steamers would then go to the river more frequently? Yes. The company has had to build a vessel of light draught for the trade of this river, because there is not enough water to let the "Rosedale," which draws 7 ft. 6 in., go in and out.

146. What is the name of the vessel you refer to? The "Euroka."

147. Is she the only vessel trading to the river? The only steamer.

148. Do many sailing vessels go there? There are five or six, or more, used in connection with the timber trade.

149. Has that trade been regarded as profitable? Yes; the timber trade has been established there for more than twenty years.

150. Has it developed in that time? Yes; there has been a large development. There are at least three mills there now.

P. Hogan.
20 April, 1898.

- P. Hogan. 151. Can you say from personal knowledge that the population of the district has increased during the last six or seven years? It has increased.
- 20 April, 1898. 152. And has the trade of the district substantially increased during this time? Yes.
153. Are there a greater number of storekeepers in the district now than there used to be? Yes.
154. Is there much land still available for settlement? I fancy that on the arms of the river, and up at the head, there is land available for settlement.
155. Is it likely that dairying will be carried on in the district to any extent? Just as on the Macleay and on the Bellinger, so on the Nambucca the people are going in for mixed farming. Creameries have been established there, and on nearly every farm they milk cows as well as grow grain.
156. Is the land suitable for dairying, except on the flats? Yes; there is a very large area of good dairying land there, though I cannot say whether it has been selected. The land there is all good grazing country, even though it may not all be suitable for maize-growing.
157. Seeing that the trade of the district is worth only something over £50,000 a year, do you think that the expenditure of £72,500 upon the improvement of the river entrance is justifiable? I have a thorough knowledge of the work now proceeding. I was there very recently, and I made a thorough examination of it. In my opinion a good harbour could be made for considerably less than the sum you named. The work already carried out is of a thoroughly substantial character.
158. That is the work shown in black on the plan? Yes. The work has been well carried on so far. When the southern training-wall is made, I fancy that there will be a sufficient depth of water for the ocean steamer.
159. Would the works you refer to produce a sufficiently strong scour at the entrance? In my opinion the scour created would give a sufficient depth of water for the trade of the district.
160. Of course you are aware that the Departmental evidence does not agree with your evidence upon this point? I am well aware of that. In my opinion the resources of the Colony do not warrant the carrying out of so large a scheme as the Department has put forward. A good entrance can be made for a much smaller sum of money.
161. What work do you consider necessary? I think that the works proposed on the southern side are too large, and more than the district warrants.
162. What is your opinion upon the suggestion to make a railway to the Macleay? I think that nothing short of an improvement of the river entrance will suit this district.
163. If the river entrances are improved, do you think that the North Coast railway will be unnecessary? The best thing you can do for the people on the North Coast is to improve their river entrances and thus give them access to Sydney by sea.
164. That is the cheapest highway that you can provide for them? Yes.
165. You think that if the river entrances are improved, the construction of a railway will be unnecessary? I do not know what the local opinion is; but in my judgment the railway is a secondary consideration.
166. *Mr. Clarke.*] Is the "Euroka" the only steamer trading to the Nambucca at the present time? Yes.
167. What do the sailing vessels which trade there carry? They bring away sawn hardwood.
168. Is the cedar trade at an end there? Not quite; but very little cedar is sent from there now.
169. I suppose the trees are too far back from the river? The price does not justify the expense of drawing the timber.
170. At one time a large quantity of cedar came from that district? Yes.
171. The value of the maize trade fluctuates with the price of maize in Sydney;—last year maize was low in price? In my opinion the value of last year's output of maize was between £20,000 and £30,000.
172. The price of maize is not now quite so good as it was? I think that it would be about the same as last year. This year has been an exceptionally good one, and the produce of all these northern districts has increased about 25 per cent.
173. In the event of the river entrance being improved, I suppose the freights will be reduced? I think so.
174. *Mr. Lee.*] In round figures the freight paid on maize brought from the Nambucca last year would be about £300? About that.
175. If 3 per cent. were charged upon the proposed works, that would come to £2,170 per annum, or nearly the value of the annual freight? Yes.
176. I suppose it is in view of figures like these that you expressed the opinion that the cheaper works would do? My opinion is that less expenditure would do; but, of course, I am not an engineer.
177. It would appear from the figures before us that the trade of the district is not of very great importance in comparison with the cost of improving the entrance to the river? If there were any cheaper way of improving the condition of the residents on the river I would suggest it; but there is no cheaper way.
178. Do you think that if the river entrance were improved the steamship company would reduce the freight on maize to 10s. a ton? My impression is that that is about what would be charged.
179. The improvement of the entrance would be of little advantage to the local residents if they got no reduction in freight? It would be of great advantage to them to have a safe entrance, even if they got no reduction in freight. I have known the people there to be in a state of starvation, because of the want of access to market. Of course, that has not occurred lately.
180. I believe that as a matter of fact the steamer is now rarely detained for more than ten days? Very rarely.
181. And then only occasionally? Yes.
182. How can we give relief to these people unless we give them cheaper freights and a good entrance? I do not know of any other way than that now under consideration.
183. Supposing the proposed works are carried out, and a considerable reduction of freight takes place, would not that leave the coast clear for the consideration of the advisability of imposing a tonnage rate to recoup the State for its expenditure? I think it would be manifestly unfair to levy tonnage rates upon the people of this district alone, because they have not had the advantage of the public expenditure that has been given to people in other places. They are entitled to these works in equity and fairness.
184. And they are entitled, you think, to have them carried out at once? Yes. I think that they are going on now very successfully, and I think that long before £70,000 has been expended you will be satisfied with the results obtained.
185. Do you think that if a good entrance is made the population of the district will double itself within a reasonable time? I do not think it will double itself.

186. Say within ten or fifteen years? I do not think there is room for the population to double itself. There are 400 electors in that portion of the district, nearly all of whom are settlers. The employees at the timber mills of course are exceptions. P. Hogan.
20 April, 1898.
187. There would at any rate be a marked increase in the population? Yes. There is room for an increase in the population.
188. *Mr. Fegan.*] Has the work already done been of any assistance to navigation? Not much up to the present time.
189. The contract was let in 1894, and they have been working there for more than two years? I did not think it was so long.
190. At any rate you say that so far there has not been much improvement? I do not think that a good result will be obtained until the southern breakwater is constructed, and the scour is confined.
191. Can you suggest any way in which the design of the work can be improved? The southern training-wall is the principal wall to be made. The work on the Nambucca will not be as expensive as the work on the Bellinger, and not one-fourth of £70,000 has been spent on the Bellinger.
192. The main channel on the Bellinger is not so much exposed as are portions of the Nambucca? Both rivers are on all-fours so far as exposure is concerned; but the Nambucca has a northern headland, while the Bellinger has not.
193. You say that the southern training-wall ought to be made for less than the expenditure proposed? Yes.
194. How would you lessen the cost? They only pay by the results. The cost of material would not be large.
195. Where do they get the material used? You can throw a stone from the quarry into the water where they are making the sea wall.
196. What kind of stone is obtained there? The great bulk of it is conglomerate; but there is a vein of hard bluestone, which is the stone they are utilising at the present time.
197. *Mr. Black.*] Can they get any of this stone in large blocks? Yes, all the stone used must be in blocks weighing so many tons each. I have seen stone on the scales weighing 10 tons.
198. *Mr. Fegan.*] Is there a large quantity of this stone? Yes; but there is not an unlimited quantity of it. There is, however, an unlimited quantity of rubble, which, I think could be very profitably and cheaply utilised.
199. What is the extent of the quarry? They are quarrying a hill about as big as Nobbys at Newcastle.
200. *Mr. Black.*] Is it all stone? No; the stone is in lumps.
201. *Mr. Fegan.*] You say that the southern breakwater is the more important.—the northern breakwater must be of some value? It is of great value. The object of that wall is to prevent the water from spreading into the bays on the north side of the entrance. When both breakwaters are made you will get a good scour. To the south of the entrance there is now nothing but sand and sea.
202. How far can the steamer go up the river? As far as Macksville, about 9 miles.
203. What depth of water is there? Once you get inside the river there is plenty of water.
204. There is a great deal of hardwood in the district. The hardwood trade has come into prominence of late years? Yes, there is a lively trade in hardwood now.
205. Can the timber on the Nambucca be compared with that on the Bellinger? Yes. The quality of the timber there is very good.
206. You say that the soft timber there has all been taken away? There is still a little left.
207. But the quantity is insignificant compared with what there has been? Yes.
208. Do you think it would be fair to construct these works at a cost exceeding the value of the produce coming from the district? I think that the expenditure of £70,000 is not required; but I think that the place is of sufficient importance to justify the creation of a good harbour.
209. *Mr. Wright.*] Would you be surprised to hear that the Secretary to the North Coast Steamship Company has told us that the trade of the district is only 20,000 bags a year. This was his evidence in his examination upon the question of extending the railway from Maitland to Taree:—
1273. Going farther—farther north, what is the next place? We came to the Nambucca. The trade there is very small; it is something the same as at Port Macquarie.
1274. Twenty thousand bags of maize? I think there might be more sometimes; but taking the average for five years, I suppose that the two places would not differ very much.
1275. What freight? One shilling and sixpence; this is on account of the bad entrance.
1276. How many passengers go there? If we get five going out and five coming back, we think it a good trip.
1277. What outward freight? Twenty tons about every ten days.
1278. What inward freight? I suppose that if we get 500 bags, that is 50 tons of maize, we would think that we had a good trip.
1279. Do you mean in a good season? No; in a good season in ten days we would get 100 tons.
1280. And in dull times 50 tons? At times we would not get 10 tons.
1281. Do any cattle come from there? No; eggs, poultry, and pigs.
1282. The next river we come to is the Bellinger? Yes; that is rather better than Port Macquarie and the Nambucca.
1283. The same cost? Yes. I may mention, to give you an idea of the trade, that a boat like the "Coraki," which carries about 160 tons, does the whole of the trade of the three rivers.
- ? He was speaking of flood years; I am speaking of this year and last year.
210. He said that the average export of maize was 20,000 bags? Taking bad years with good years, up to the time he was speaking of, the average export of maize from the district might have been 20,000 bags, but for the last year and the present one the average would be nearer 40,000 bags.

FRIDAY, 22 APRIL, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Nambucca River.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and examined:—

G. E. Rennie. 211. *Chairman.*] You have certain figures relating to land tenure in the Nambucca district to lay before the Committee? I produce a map showing within a red line the watershed of the Nambucca. The alienated land within that area is tinted blue, and represents about 59,200 acres; the reserves are tinted green, and embrace about 55,300 acres; while the untenanted Crown land is tinted brown, and represents about 253,500 acres.

22 April, 1898.

212. What kind of country is embraced in the reserves? They are nearly all forest reserves. The presumption is that that country is inferior.

213. Some of them were not proclaimed until 1891;—not very much good land close to a coastal river would remain unselected until 1891? No.

214. *Mr. Lee.*] The map would show that the alienation has followed the rivers and creeks? Yes.

215. There does not appear to be much alienated land back from the water-courses? No; practically none.

216. Are you doing anything with the untenanted Crown land? It is proposed to set apart about 5,000 acres at the head of Taylor's Arm for settlement. There is another area of 4,500 acres in the parish of Denison, running back from the same arm of the river for 3 or 4 miles, which it is also proposed to set apart.

217. Why have you selected these isolated portions of land for settlement? I presume that the District Surveyor has picked out the land which he thought most likely to be applied for. There is another small area of 700 acres, 3 miles north-west of Nambucca, which it is proposed to set apart for settlement, and an area of 6,000 acres at Warrell Creek near Scott's Head, which it is proposed to set apart.

218. Has that land been held under reserve? No; it is open country.

219. Do you know the land revenue of the district? No; I have not got those figures.

George Charles Yeo, draftsman, Stock Branch, Department of Mines, sworn, and examined:—

G. C. Yeo. 220. *Mr. Clarke.*] Have you a statement to make to the Committee in reference to the number of stock in the Nambucca district? Yes; it is as follows:—

22 April, 1898.

Description of Area to include the undermentioned Stock.

COMMENCING at the mouth of the Nambucca River, on the sea-coast, and bounded thence by that sea-coast north-easterly about 5 miles; thence by a line westerly about 25 miles; thence by a line southerly about 16 miles; thence by a line north-easterly about 20 miles to the sea-coast aforesaid; and thence by that sea-coast north-easterly about 8 miles to the point of commencement:—

31st December, 1897.

Horses.	Cattle.	Sheep.	Pigs.
894	2,822	21	1,866

INCREASE in Port Macquarie Sheep District.

Horses.	Cattle.	Sheep.
	1895 over 1894.	
891	917	3
	1896 over 1895.	
385	659	70
	1897 over 1896.	
334	5,859	Decrease, 160.

221. Do you know how many milch cows there are in the district? No; but during the last twelve or eighteen months they have started dairying there, so that probably the greater part of the cattle would be milking cows. The dairying industry accounts for the increase in the number of cattle in the district for the year 1897.

Henry

Henry Spondly, Compiler, Government Statistician's Office, Chief Secretary's Department, sworn,
and examined:—

H. Spondly.
22 April, 1898.

222. *Mr. Lee.*] You have a return to give the Committee showing the population of the Nambucca district? The information which I have prepared for the Committee is comprised in the following return:—

NAMBUCCA.									
Estimated population at end of 1897	2,130
Alienated lands—									
Freehold	27,650
Private leasehold	10,275
									37,925
Crown lands	6,625
Occupied area	44,550
Unoccupied area	267,130
									311,680
Total area									
Area under various crops—									
Maize	5,450
Other grass crops	80
Lucerne and sown grasses	5
Sorghum	45
Root crops	65
Sugar-cane	20
Vineyards and orchards	35
Market gardens	10
Minor crops	75
									5,785
Total area under crop									
Area under permanent artificially-sown grasses									
									4,215
Total under cultivation									
									10,000
Live stock—									
Horses	1,070
Cattle—									
Dairy	910
Ordinary	1,950
									2,860
Sheep
Swine	280
Production of butter...									
									52,000 lb.
Production—									
Maize	255,750 bushels.
Hay	75 tons.
Potatoes	165 tons.
Sugar-cane	155 tons.

223. What boundaries do you give for the district to which your figures relate? The district would be bounded on the north by a line about midway between the Nambucca and the Bellinger; on the south by a line about midway between the Nambucca and the Macleay; and on the west by the Dividing Range. It comprises about one-half of the County of Raleigh.

224. In obtaining figures as to areas under crop do you exclude areas under 1 acre? Our figures take into account areas of 1 acre and upwards.

225. Has there been an increase or decrease in the population during the last two years? I cannot say, but I could get you the information.

226. You do not know the value of the trade of the district? No; there is no trade from the district to any place outside the Colony.

227. Do your figures apply to the Coff's Harbour country? No.

228. You have returned the maize crop of the district at about 6,693 tons, while other witnesses have put it down at about 4,000 tons as an excessive estimate? Well, there is a difficulty in determining what boundaries to fix.

229. Possibly you take into consideration the country, traffic from which goes by way of another river? That is quite possible. I have had to get my information from the shipping companies. I do not know anything of the district myself.

FRIDAY, 6 MAY, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.
 The Hon. DANIEL O'CONNOR.
 HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
 GEORGE BLACK, Esq.
 FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Nambucca River.

Alderman Francis Buckle, steam-tug proprietor, sworn, and examined:—

Alderman
 F. Buckle.
 6 May, 1898.

230. *Mr. Wright.*] For the purpose of improving the entrance to the Nambucca River, the training-wall, called the north training-wall on this map, has been commenced. It is not completed yet; but after it is extended a bit further than was originally intended, it is proposed to construct a western training-wall from above Stewart's Island, right down to the extreme point of that island, where it is proposed to leave a gap, so as to give vessels access to the town. After that break the western training-wall, called the south-western training-wall on the map, is continued to a point some distance from the existing work on the northern side. Then it is proposed to construct a training-wall from Warrell Creek to close on to the south headland. Warrell Creek will be dammed where the training-wall crosses; the waters of Warrell Creek will be diverted into the main river. By the construction of these works the scouring power of the main river will be augmented by the addition of the waters of Warrell Creek, the river currents will be brought into one channel, and given a more direct course to the sea. It is not proposed at the present time to construct the breakwaters. It is considered that the other works will be sufficient to give a perfect scour, and it is said that by the construction of the north training-wall the water has been deepened already. Now, having heard an explanation of the Departmental proposal, will you, from your knowledge of the Nambucca River, give the Committee your idea as to the value of these works? The construction of the north training-wall is not of so much importance as the construction of this bit of training-wall at the south headland. At the present time the water comes down the river, strikes the north training-wall, and shoots over to the south beach. The portion of the south-eastern training-wall shown on this plan should, in my opinion, be constructed before any of the other works are begun.

231. What do you think of the proposal to intercept the waters of Warrell Creek, and divert them into the river? I think it is a good plan.

232. Do you approve of the continuation of the eastern training-wall from the proposed junction of Warrell Creek, to the point which is marked on the plan? I do; because the more you confine the water the better channel you get.

233. You approve of the construction of the western training-wall from one point on Stewart's Island to the other; and of the south-western training-wall, from the lower point on Stewart's Island to a point on the existing work? Yes.

234. You approve of the construction of the proposed works; but you think that the small portion of training-wall shown at the south headland should be constructed before any other works are begun? Yes.

235. That portion being constructed, you think that the construction of the remaining works, as shown on the plan, would be of marked benefit to the navigation of the Nambucca? Yes; you can do nothing with it now.

236. You are the owner of the subsidised tug-boat at that river? Yes.

237. Do you find that bar very bad? Yes. It has never been a very good bar; but it has been worse during the last twelve or eighteen months than ever it was.

238. How do you account for that? That training-wall on the northern side is the sole cause of it; and until you get a training-wall erected on the other side, it will throw the water over on to the south beach.

239. You think the construction of the present work on the northern side would have the effect of making the entrance more difficult than it was before? Much more difficult.

240. You believe that difficulty will remain until the southern training-wall is erected? Yes.

241. But after it is erected, you believe there will be an improvement of the entrance to the river? I am sure there will.

242. Have you a knowledge of the river? I have not been further up than Stewart's Island.

243. You have had no great experience of harbour works? Not much.

244. As the owner of the steam-tug, and as one interested in the success of our harbours, as far as your knowledge extends, you believe that the proposed works will effect a very great improvement to the bar on the Nambucca? A very great improvement.

245. You thoroughly understand the scheme before the Committee? Yes.

246. You understand that it is not proposed to construct the northern breakwater at the present time? I do.

247. You think that the construction of training-walls without the addition of the breakwaters will have a good effect on the bar? No; I think the breakwaters are most wanted. When the breakwaters are constructed it matters not, so far as the bar is concerned, if these training-walls are never put down, because the flow of water which comes down must keep that channel good.

248. Is there no danger of the river breaking over and forming another outlet? I do not think so.

249. If the channel is confined between two breakwaters, is it likely to break through that narrow neck by the south headland? It might if there were not sufficient stone. It would do no harm to protect it with a training-wall to the south.

250. *Mr. Roberts.*] How long have you had a tug-boat service at the Nambucca? Seven or eight years.

251. Do the proposed works meet with your approval? Very much.

252. Are they very much wanted? Yes; the bar is so bad that ships cannot get in or out. A man with a saw-mill has to pay so much more freight to get a vessel to go to the Nambucca.

253. Is the marine insurance much greater on vessels trading to the Nambucca than it is on vessels going to other rivers? It is just the same in regard to all the rivers. It is 12 per cent.

254. Is it a shifting bar at the Nambucca? Yes.

Alderman
F. Buckle.
6 May, 1898.

255. Is it altering every few months? Before the northern training-wall was put down the channel ran right along the rocks, and it did not vary very much; but since the northern wall was put down, the water has shot over to the southern side, and made a new channel for itself.
256. Do you consider that the bar has been improved at all since that portion of the work has been done? Certainly not; it has been detrimental to the bar.
257. Which work do you think should be carried out first? The south breakwater.
258. It is not intended to carry out the breakwaters at the present time;—do you not think the training-walls would have the effect of improving the entrance? It would keep the channel all right, because it would confine the water.
259. Have you been there since the present works were started? Yes, about five months ago.
260. You are speaking of the effect of that work, then, from personal observation? Yes.
261. Did you converse with any men who ought to be able to form an opinion on the subject? Yes.
262. Did they all coincide with you in your opinion? Yes.
263. I suppose they were captains of tug-boats and of sailing vessels? They were all practical men.
264. Do you know anything of the Nambucca district? No. It must be a grand district, because so much corn comes from it.
265. It is a fine timber district? Yes.
266. Can you point out on the map where the timber country is situated? No.
267. Is there more than one tug-boat employed there? No.
268. How many sailing vessels are employed in the timber trade? About thirty a month.
269. Do you mean different vessels or the same vessels? They can always get in, but they cannot get out loaded. To get out, they must not draw over 6 feet 6 inches. My steamer draws only 5 feet 6 inches, and sometimes she cannot get out.
270. Are you subsidised to the same extent on the Nambucca as you are on the Hastings? At a more favourable price.
271. What is the tonnage of the sailing vessels trading to the Nambucca? They run from 20 tons up to 120 tons, perhaps.
272. Do thirty sailing vessels get constant work there? Yes, per month. When the bar is good, they make three trips a month, and when it is bad they make only two. I think the south training-wall is very much wanted.
273. How many miles is the Nambucca entrance from Port Jackson Heads? Over 200 miles.
274. With a fair wind, how long does a sailing vessel take to do the trip? A little over twenty-four hours.
275. Is it owing to the shifting of the bar that these vessels cannot get out? It does not shift much now. When the channel went straight out to sea the vessels could try to get out, and if they could not get out they could always go in again. But with the channel running on to the south beach, if vessels cannot get out they cannot get back. They go broadside on to the beach, and perhaps become a total wreck.
276. Now, taking the proposed harbour works at the Bellinger, the Nambucca, and the Hastings, with your good knowledge of the North Coast rivers, which work do you think is most urgently required? First the Nambucca, next the Hastings, and then the Bellinger. The Bellinger has a very good bar now; it is all right.
277. What are the different characteristics of the entrances to these three rivers;—are they all similar as regards a vessel negotiating the bar? They are all similar with reference to entrance and depth of water. The Bellinger bar has a sandspit on each side. It is like a long sandy beach. The Nambucca has a headland on the north side, and the Hastings has a headland on the south side. Nearly all the rivers on this coast which have a headland on the south side are always the best rivers.
278. Do you think the trade of the Nambucca district is of sufficient importance to warrant the expenditure of the sum required to make a safe harbour there? I believe it will come to that. If you do what is there proposed, I believe it will become a grand port.
279. Have you given any consideration to the proposal to unite Maitland with Grafton by railway along the coast? They could never take anything from these rivers by railway.
280. You think that the people on the rivers would be better served by being given navigable harbours? Yes; water carriage is less by half than land carriage. The freight is the principal thing which kills the settlers.
281. *Vice-Chairman.*] Can you say from personal knowledge of the trade of the district whether there has been an increase during your connection with the river? The trade of the district is very much kept back by the condition of the bar. The people are now put to very great inconvenience. No dependence can be put on the bar.
282. You cannot say whether there has been any improvement in the business of the district? There has been a great improvement for the past ten years. I cannot give you any definite information, but I know that a great deal more corn and timber comes from there than did ten years ago.
283. Can you form an opinion from the earnings of your steam-tug whether there has been an improvement or otherwise in that period? There has been a very great improvement in the maize business. All the maize goes by the steamer. I only tow the steamer out when the bar is bad, so that I cannot give you a very safe estimate of the production of maize. I think the North Coast Company could give you a much better idea of the trade of the district.
284. Can you say, from the record of your tug's work, whether there has been any increase in the number of vessels entering and leaving? There has not been any increase lately. The mill-owners can only get small vessels to go there for their timber. It is a long distance from Sydney, and small vessels hardly pay for carrying timber. A mill-owner can afford to pay no more freight from that river than he can from another river. A large vessel which would carry a good cargo cannot get out.

THURSDAY, 12 MAY, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Nambucca River.

Louis Paulson, master of the steamer "Rosedale," sworn, and examined:—

- L. Paulson. 285. *Mr. Clarke.*] From an examination of the plan you are pretty well aware of the nature of the proposed improvements to the entrance to the Nambucca River? Yes.
- 12 May, 1898. 286. Have you been trading to the river? Yes; for four or five years.
287. Is it a dangerous bar? It is pretty dangerous; it is one of the worst bars we have, I think.
288. You consider it is necessary to make some improvements to the entrance, such as are laid out on that plan? I am sure it is. We have had great difficulty in crossing the bar for some considerable time.
289. It would be the means of increasing the trade to and from the river? Certainly; it would facilitate regular transit.
290. What draught of water is there on the bar at present? The last report I heard was that there was 6 feet at high water, which would mean 3 feet at low water.
291. What draught of water does the "Rosedale" require to get in? I have not been there for the last eighteen months, because there is not sufficient water to enable me to cross. We withdrew from the trade because there was not sufficient water on the bar. The "Euroka," which draws 4 feet of water, was built specially for that trade. But for the "Euroka" we could not communicate with the Nambucca at all.
292. Has the bar improved lately? I think for the last two years it has been very bad.
293. Unless the river is made more navigable than it is you think it will be a great disadvantage to the settlers? I do. They can never be sure of having a direct service or regular communication unless some step is taken to improve the entrance.
294. The freight is, I suppose, much more than it would be if they had a better entrance? Considerably more. We must charge extra for the extra boat we put on.
295. Can you say that the trade is increasing? It increased considerably during my time, but since I left off going there they have been handicapped very much. Last year they were not able to get their produce away till the latter part. It was some months before they could secure a service at all—not until this boat of ours was constructed.
296. How does the freight to the Nambucca compare with the freight to the Bellinger and the Macleay? It is a third more. We charge 1s. 6d. a bag for maize, which is about 15s. a ton, and we charge about £1 a ton for back freight.
297. If the entrance to the river were improved the freight would be much less than it is? We would reduce it considerably.
298. Is not £72,000 a very large sum to expend on a river such as the Nambucca? I do not know. I suppose, unless some improvement is made to enable the settlers to send their produce away, the whole district will become valueless.
299. What description of produce comes from there? General farm produce, besides pigs and poultry. It is maize principally. A great quantity of timber is sent away.
300. About how many bags of maize are sent to Sydney? Between 30,000 and 40,000 bags, I should think.
301. That is equal to about 4,000 tons? Yes.
302. And what quantity of timber? I could not say. The saw-mills have been handicapped through the bar not being approachable. For three months they had to knock off working through the bar being blocked.
303. What other kinds of produce come from the Nambucca? They have gone in for dairying. They were sending their cream to Sydney; but I think they have had to close up their places through not being able to send their cream away.
304. Would it be an inducement to vessels to go there for butter and cream;—would not the freight on butter and cream be very small compared to the freight on maize and timber? There is a lot of land which is well suited for dairying purposes; but unless they can secure regular transit for their produce it is of no use to start dairying.
305. Although it would not be beneficial to the owners of steamers and sailing-vessels it would be an advantage to the farmer? Yes.
306. Is it probable that the maize-growers would go in for dairying? They would go in for both. A lot of the land is not well adapted for maize-growing; but it is splendid land for dairying.
307. Is it low-lying land, away back from the entrance? Yes.
308. It is grazing land, I suppose? Principally.
309. Would not the alluvial flats still be used for growing maize? It would be grown on a part of them.
310. Are the low-lying lands in the district liable to be flooded occasionally? Not unless there is a heavy flood.
311. The farm-produce would increase a great lot with an improved entrance to the river? Yes. During my time the trade improved wonderfully as regards poultry and pigs. I could see the trade increasing every year, but as soon as we left off running there the trade dropped off.
312. Would population increase if greater facilities were given to get the produce away from the river? I am sure it would.
313. Is it advisable to carry out the improvements shown on the plan? I reckon the plan is a very good one; it would meet the requirements of the place. On the northern side of the entrance there is a rocky headland. The channel used to come very close to the rocks, and we lost one of our steamers there, the "Wellington."

314. *Mr. Lee.*] Is the entrance difficult owing to the shallowness of the water? Yes. At times we used to have a fair depth of water on the bar, but the channel was very close to the rocks on the north headland. At other times the trouble was inside the entrance. Owing to the flats in the river there was no scour on the bar. L. Paulson.
12 May, 1898.
315. Has the piece of training-wall which has been constructed on the northern side improved the water on the bar? Not as yet. I think the current strikes that training-wall and then shoots over to the south side.
316. Will not the western training-wall wonderfully improve the entrance? I believe it will improve the bar considerably, and avoid the risk we have to run.
317. What depth do you require at low-water? Eight feet for the vessels trading there. At one time we used to have 10 or 12 feet on the bar; it is constantly changing. The "Rosedale" draws 7 ft. 6 in. loaded.
318. Have you had to bring her out with half cargoes owing to the state of the bar? Yes, often. Once I narrowly escaped a chance of being bar-bound there for six weeks.
319. You think that to make the port of any value there must be a continuous depth of 8 feet on the bar at low-tide? At least 8 feet.
320. I suppose the "Rosedale" is big enough to do all the trade of that river? Yes.
321. They are not likely to require a vessel bigger than the "Rosedale" for years to come? Not for twenty years.
322. To give a floating depth of 8 feet it means that we must provide 10 feet of water? Yes. It would ensure regularity of transit at all times.
323. Do you think that can be got without building the southern breakwater? I think you would secure a fair depth from the construction of the western and northern training-walls.

WEDNESDAY, 18 MAY, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. DANIEL O'CONNOR.

The Hon. WILLIAM JOSEPH TRICKETT.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Harbour Works at Nambucca River.

Henry Richard Carleton, Principal Assistant Engineer, Harbours and Rivers Branch, Department of Public Works, sworn, and examined:—

324. *Mr. Wright.*] Have you recently visited the Nambucca River? Yes.
325. Is the construction of the training-bank tinted black on the map, going on, or is it stopped? No; the contract is still running. We have extended the contract 30,000 tons, at a schedule rate of 3s. 8d. or 3s. 9d. a ton. H. R. Carleton.
18 May, 1898.
326. The Department, I understand, can stop it at any time? Yes, when the 30,000 tons are deposited.
327. Did you make a report of the result of your recent inspection? No; there was nothing special on these works to draw the attention of Mr. Darley to. They are going on as well as could be expected. But the stone is of a decidedly inferior character; it never was good.
328. Where are you obtaining the stone from? From the headland just at the root of the wall.
329. Is there any other stone obtainable in the district? Not within a reasonable distance. It is just possible that we might get good stone up Warrell Creek.
330. What is the nature of the stone? It is a rotten slate; it is very poor.
331. Is it affected by the action of the water? It gets a slimy grass weed on it at once which protects it. I should like to use much better stuff.
332. I should have thought that the slate would open out under the action of the water? No.
333. Can you get blocks of any size? Up to 3 or 4 tons.
334. Are they likely to remain intact, or will they separate? They are standing fairly well in the work, better than you would expect from looking at the stone in the headland. I looked into that matter very carefully.
335. Although it is not of the best quality, still you think that it will answer the purpose? It is serving the purpose fairly well. The contractor is going down deeper, and it seems to be somewhat better in the lower beds.
336. Will you give the Committee some idea of the proposed stoppage of the waters of Warrell Creek, and the channel which leads into the main stream? That is a very useful part of the scheme. It is to divert the waters of Warrell Creek into the main river at the upper end of our work.
337. The proposal is to cut a canal and then to dam the creek? Yes; it will secure the advantage of a double scour.
338. Do you think the proposed training-wall in front of Stewart Island is a necessity? I do. I would rather see that north training-bank to the east of Stewart Island built than this cutting made. I consider that to be the most important training-wall after the present one is extended.
339. It will have the effect of shooting the scour against the training-wall in progress? Exactly; instead of allowing it to wander around this irregular bay as it does at present.
340. Is it advisable to allow that channel to exist on the western side of Stewart Island? There is a saw-mill in there. We would interfere with their rights if it was not kept open.
341. That is the only object in keeping it open? It is the only object I am aware of.
342. It means a diversion of waters to a certain extent and a loss of power? Certainly. Some waters will go round the back of the island. I would expect the upper end of this to silt up, and the only access to the mill itself will be through the lower entrance.
343. There is another access left at the eastern end of the northern training-wall? That is to give access to

H. R.
Carleton.
18 May, 1898.

to the township. There are two saw-mills at least in the township. The Government tugboat and the Government wharf are in there also, so that it is absolutely necessary that an opening should be left.

344. You think that there ought to be an opening left there? Yes, and eventually, I take it that the whole of that part will be reclaimed.

345. What do you think will be the effect of the construction of these works altogether on the entrance and on the river itself? We should probably have a channel carrying 10 feet at low-water between the walls as far as they extend, and out over the bar into the ocean.

346. What depth of water have you along the existing northern wall? I think recent soundings show from 7 up to as much as 18 feet.

347. Is that much different from what it was before the wall was built? Yes; it scours along the wall as it advances.

348. It has the effect of creating a channel? Yes; right along the wall. There is good water along the wall as far as it goes.

349. It is not proposed to construct the two breakwaters, as shown on the plan? The northern one is included in the scheme before the Committee, but the southern one is not. The works shown by dotted red lines on the plan are included in the whole scheme.

350. These two dotted portions, comprising both breakwaters, are not included in the modified scheme? The northern breakwater is included in the modified scheme, but the southern one is not, nor is the training-wall on the eastern side.

351. From your knowledge as an engineer, and from what you have seen of the work, do you think it is going to produce the satisfactory results which the Engineer-in-Chief fancies he will obtain from it;—will it secure a permanently deep channel between Stewart Island and the Heads, and also have the effect of permanently removing the bar at the Heads? I think it will. It will never be as deep a bar as the bars on the other rivers, such as the Bellinger or the Hastings will improve to. That is simply because the watershed of the river is so very much smaller; they have not got anything like the scouring power there that they have in other rivers.

352. You still think the proposed works will give a depth of water sufficient to allow trading vessels of a certain class to visit the river? Yes; I think we will get 10 feet there.

353. That is a sufficient draught of water, I suppose, for any vessel likely to be wanting to trade to the river? Yes, for any vessel they deserve to have there either.

354. It is a comparatively small district? I should say it is the least important of the rivers.

355. Therefore it is not likely to require a larger class of vessels to trade there? No; it is a very fine timber district, no doubt; but so far as farming goes they have not anything like the same extent of land.

356. The timber trade is always conducted in comparatively shallow vessels? Yes.

357. Very few vessels drawing more than 7½ feet are engaged in the timber trade? Some of the schooners, I think, draw up to 8½ and 9 feet.

358. How long is it since you were at the Nambucca? A fortnight or three weeks ago.

359. Were you over the bar? No; I was out at the edge of the bar. It was too shallow to get over it at the time with the steamer. It was dead low-water, and she could not go out.

360. What depth of water is there on the bar at high-water? It is about 7 feet 6 inches.

361. Do you think you will increase that depth by 3 or 4 feet by the construction of these works? I think so. We are carrying deep water right down with that wall as we go.

362. Is that channel of any width? It is quite wide enough; it is from 80 to 100 feet wide.

363. You argue from the fact that the present wall is producing satisfactory results, that the construction of other works will produce similar results? I think so. The wall is further out than is shown on the plan at present; it is some time since the plan was compiled. Standing on the end of the wall at present you seem almost to have reached the bar.

364. Is there much shallow water outside for any distance? No, you drop into deep water very soon.

365. At what distance due east from the headland do you obtain 8 or 10 fathoms? You would be in 30 or 40 feet as soon as you are out as far as the headland. The bar is actually inside the headland.

366. You get 6 or 7 fathoms after you reach the headland? Yes.

367. There is no possible chance of any accumulation of sand there? No, it is carried out to the ocean current.

368. What, in your opinion, causes the bar? First of all, the weak river current, and not being able to scour it. It is first brought up from the southern beach.

369. Is there a northerly current setting in? We have not taken any observations; but as a general rule inside the headland there is a northerly current—a kind of eddy. The current on the coast is from north to south, and shoots directly from headland to headland. Inside of that line there is a kind of eddy.

370. There is a continual tendency to drive the sand from the whole of that southern shore up to the north? Yes; and across the bar.

371. I suppose the action of the northerly set-in meeting the outflow of the water causes the precipitation of the sand on the bar? Exactly.

372. Looking at that aspect of the case, does it not strike you that a very important thing to protect that entrance would be a southern breakwater? No doubt it would be better to have both breakwaters; but we consider that we will so strengthen the current by straightening it out with the north breakwater that it will be sufficiently strong in itself to scour out a channel to a reasonable depth. At present it loses its force and strength winding along that irregular shore. It would act as a barrier; but you could never bring the water to it; it would work to the north.

373. The foreshores are rock along the southern headland? Yes, inferior rock.

374. You think that by continuing that wall straight out to a certain depth the scour will hug it, and always keep a channel open? Yes, it would cling to the wall.

375. *Mr. Hoskins.*] How long were you at the Nambucca during your last visit? About half a day.

376. Did you see any vessels go up and down the river? No; one vessel, the "Pelican," passed out just before I got there.

377. Did you see any white men there? Plenty of white men, but no black men.

378. Did you go up the river any distance from the Heads? I stayed a night at the town of Macksville, which is about 10 miles up the river. Higher up still, on the North Arm, is the town of Bowra.

379. It is proposed by your Department to spend £72,500 on this river;—did you see sufficient realisable improved

H. R.
Carleton.

18 May, 1898.

improved property on the river to represent the value of £72,500? Certainly, and farms more than that value. There are at least six or seven important saw-mills on the river alone.

380. The sawn timber is taken out by flat-bottomed sailing crafts, and if the entrance were very much shallower than it is they could go out? No; they are delayed there at times in consequence of the river being too shallow.

381. *Mr. Trickett.*] The estimated cost of the modified scheme is £72,500, and the completed scheme is estimated to cost £149,700? Yes.

382. How far is the Nambucca River from the Macleay River? From head to head it is about 9 miles.

383. You are aware, I suppose, that there is a proposal before the Committee to expend on the Macleay River a sum of £108,000 on a modified scheme and the completed scheme is estimated to cost £218,000? Yes.

384. How far is the Bellinger River from the Nambucca River? From head to head it is 9 miles.

385. You are aware that there is a proposal before the Committee to spend £26,000 on a modified scheme of harbour works at the Bellinger River, and the completed scheme contemplated for that river is estimated to cost £171,000? Yes.

386. Are not these very large sums to expend on rivers within such a very short distance of each other? Yes; if you take the distance by water; but the distance by road from the Nambucca to the Macleay is between 40 and 50 miles, and you could not connect the two rivers in any way for the sum it is proposed to spend on either of them, or both of them—or for anything like that money.

387. But still, it is a large sum of money to spend there? Yes. Viewing it from the standpoint of the distance along the coast, of course it looks as if they were very close together, but they are quite distinct and independent rivers, with their own watersheds and valleys, and separated by high ridges in every instance, except the Hastings and the Macleay.

388. You are not called upon and do not express an opinion as to the resources of the district? No; only in so far as Mr. Hoskins asked me if I thought the valley of the Nambucca was worth the expenditure, or if it was worth £72,000. I certainly would like to have it for that sum.

389. Do you look upon the entrance to the Nambucca as a place which is favourable to the carrying out of harbour improvements? Yes; but it is the weakest of those before the Committee.

390. It is the most difficult one to do any good with? Yes; we have very little to assist us there in the way of upland water compared with what we have on other rivers; it is a small watersbed. It has a headland on the wrong side and other defective points.

391. I suppose that in great measure accounts for the large sum of money which is required? Yes.

392. The statement handed in by Mr. Hickson contains this paragraph:—

There is at all times a strong tidal stream in the fairway channel from the Beacon Rock outwards, particularly when the South Spit extends right across, leaving only a narrow passage round the rocks. The ebb stream is then forced into the bay under the signal staff, and takes from thence a south-west by south direction, scouring out a channel on that bearing. Frequently when this is the case, there is an eddy or slack in the outer bay, and sand is deposited in the usual channel until it is completely blocked. The passage in, after passing the outer bar, is then very dangerous. Vessels coming in with any sea on are liable to be caught by it on the starboard quarter and sent to the northward out of the channel, which is always at these times very narrow.

How do your works propose to deal with that difficulty? We drive the shipping out of that portion altogether. That paragraph, which is from Captain Howard's report, alludes to the bay under the northern headland which the channel used to wind round formerly. Our proposed northern wall and northern breakwater will cut off the whole of that bay and drive the shipping out of there, and make a straight run in inside.

393. And do away with that eddy? Yes, and twisting round that bay past the rocks.

394. That would seem to be one of the worst parts of the entrance in bad weather? It is, undoubtedly; and that is why Mr. Darley started with this wall in the first instance.

395. The construction of that wall would be a very expensive part of the scheme? The cost per foot run of that wall will cost somewhat more than the inner training-walls.

396. You say that one of the disadvantages of this scheme is that the rocky head-land is on the wrong side of the entrance? Yes; the worst weather on this coast comes from the south-east; therefore, it is better to have the head-land on the southward if possible, as in the case of Newcastle, the Clarence, and the Hastings. All those three rivers are better protected and better sheltered in consequence of the head-land being on the southward side. Crookhaven bar is another instance. I suppose it has the best sheltered bar on the coast. The opening there leads somewhat to the west of north; it is a very well-sheltered entrance.

397. That necessarily makes the construction of the southern breakwater an expensive item, because it is so exposed to the ocean? Yes.

398. I see from Mr. Hickson's statement that Lieutenant Francis, in 1885, reported that "both the bar and the flat continually shift and seldom remain in the same position for three months at a time." Does the same state of things prevail there now, as prevailed in 1885? Except in so far as we have driven the current out of the bay under the north head-land by the construction of the training-wall as far as it has gone.

399. You think that the work which is so far done has been done to some advantage? I am certain it has. There is not the same length of delay now as there was formerly. They still have delays from the silting up of the bar, but it does not remain bad for such a long period.

400. Does the bar shift about in the same way now? It does shift still, but not over so great an area.

401. Has the depth of water been improved by this short length of training-wall? I do not think it has on the bar.

402. Do you not think that the two training-walls and the breakwater at the entrance would be sufficient without going to the great expense of these long training-walls up the river? No, you want to lead the river current down on to the bar, and obtain a scour from it. The construction of the two breakwaters would prevent the carrying in of sand, no doubt, on to the entrance, but it would not strengthen the current in any way and scour out the sand lying between them. The breakwater, of course, is a far more costly work per foot run than the training-walls are. The future extension alone of the southern breakwater is estimated to cost £52,450.

403. I understood you to say that owing to the Nambucca not being a very large river you want the training-walls more particularly to accentuate the current? That is the reason.

404. How far up the river do vessels go? A small steamer goes up to Macksville, 10 miles.

- H. R. Carleton.
18 May, 1898.
405. The steamer which trades to Sydney? No, a local steamer or a steamer which comes round from the Macleay. The smaller class still go up the North Arm to Bowra.
406. Where does the steamer which trades to Sydney pull up in the Nambucca? At the wharf alongside the township near the Heads.
407. You want to leave an opening to allow the vessels to get in behind your training-wall? Yes, to load at the saw-mill. There are always vessels lying in that bay loading timber for Sydney.
408. I suppose that place behind the training-wall will take a long while to fill up if it does fill up at all? I should think the best thing would be to reclaim it by pumping in sand and to let the township go out to the training-wall.
409. That might involve claims for compensation? I think the frontage is all Government property.
410. Mr. Hickson in his statement refers to a complete scheme prepared by Mr. Darley, at the request of the Minister, in January, 1895; and speaking of Mr. Darley's scheme he says:—
The estimated cost of this scheme is £149,700. Although the expenditure of this amount was out of proportion to the resources of the district, he pointed out that a measure of relief would be given by the construction of the inner portion of the northern breakwater at a cost of £11,000.
- How much of that sum of £11,000 have you spent? £5,503. That enables vessels to get in and out to the township. Once over the bar there is no block.
411. Mr. Hickson goes on to say in his statement:—
This wall would straighten and strengthen the ebb current at the place where its force is now almost lost in flowing over the rough and irregular northern foreshore. Another very important part of the work which he considered should be taken in hand as soon as funds were available was the training-wall extending south-westerly from near the root of the northern breakwater.
- Where is that? It is the training-wall extending in a south-westerly direction from the root of the present wall.
412. How much would that cost? £13,910.
413. In 1895, the idea of the Department seems to have been that the expenditure of these two sums in carrying out these two particular works would afford considerable relief to the district? Those are the two most important portions of the scheme.
414. Do you not think it would be well before we spent or contemplated spending so large a sum as £72,500, we should expend those two sums in constructing these two works which the Department in 1895 thought would afford a considerable amount of relief to the river? That certainly is the order in which the works should be put in hand.
415. Your idea is, first to complete the northern one, and then to go on with the training-wall extending south-west from the root of the present wall? That is what I consider the relative importance of the works.
416. Would you like to say it would be worth waiting to see the result of these two works before going on with the more extensive works, seeing that it is such a very large expenditure for the district? It might be prudent to do so. If you are anxious to save, I certainly think that is the order in which the work should be carried out, if anything has to be struck out of the scheme.
417. I see it is stated in this *precis*:
In October, 1895, an additional vote of £5,000 having been taken, tenders were invited for the construction of the inner end of the northern breakwater; and that of Wooden, Rogers, and Frost, accepted in February, 1896, at rates of 3s. 8d. per ton, for stone 1 to 4 tons in weight, and 1s. 6d. for ballast.
- Is that contract still in existence? Yes.
418. I suppose that is a very reasonable price? It is about the average rate for contract work on the coast.
419. Were you, at your recent visit, satisfied with the works as they are progressing? I was very pleased with the work as far as it has gone. I was struck with how close the end of the works is approaching to the bar. Although the wall is going out to sea, the bar does not seem to be going any further. In some cases we just push it further out and form another sand-heap. It does not seem to me to be any further out.
420. Have you had any reports as to the effect of the recent rough weather on the training-wall? The recent storm cut about 2 feet off the top of the wall for a length of 800 or 900 feet.
421. That loss will fall on the Government? We will have to make it up. You will see that it is not a very large item, when I tell you that nearly half of it is already repaired.
422. How wide is it on the top? About 14 feet.
423. And at the base? The slopes are about 1 to 1, and the base depends on the depth of water it is in. For instance, if a wall were 10 feet high the base would be about 3½ feet. We tip the stone from a truck over the end of the wall, keeping it 14 feet wide on top, and it runs out to what is called its natural slope.
424. The material finds its own bottom on its own slope? Yes; it is approximately 1 to 1 with random stone.
425. I see that since the former designs were contemplated you wish to bring the scouring power from Warrell Creek into the river? Because we found that the waters of the creek, meeting the Nambucca at the entrance, created disturbing eddies and conflicting currents.
426. What is that work estimated to cost? The deviation of Warrell Creek, including the cutting and protecting the sides of the cutting, is estimated to cost £7,240 15s.
427. Do you think the extra volume of water you will get from this creek is worthy of such a large expenditure? We must cut it off in some way, otherwise it will affect us lower down. That is the trouble. We may as well make it assist us when we do cut it off.
428. If you did not do that up above you would have to do something down below, to make a side-wash? Yes, it would injure us down below.
429. By making an eddy? By striking the river current in the side and weakening it.
430. Was this scheme reported on by Sir John Coode? No; he was not asked to report on this river.
431. Have agitations gone on for any length of time in regard to its improvement? Yes; for a considerable time there have been papers in connection with this improvement.
432. How long have you been in the Department? Nearly twenty years.
433. How long is it since they wanted money expended there? Since before I came to the head office. I was a good deal in the field on the North Coast in the olden days.
- 434.

434. Did you notice whether any particular industry is engaged in except maize-growing and timber-cutting on the Nambucca? That is all. I know the valley of the river fairly well; in fact I know the valleys of all the rivers fairly well, up to the head of navigation, and in some cases beyond it. I should say that it is the least important of the rivers which are submitted to the Committee.

H. R.
Carleton.
18 May, 1898.

435. Does grazing go on to any extent there? There are some good flats about Macksville.

436. Is any dairying going on? There is now.

437. Not much? I could not say what the extent of it is.

438. Any creameries or factories? I am basing my statement on the fact that they are erecting creameries.

439. More than one? I would not be sure about that.

440. Where is the maize all grown—on the river flats? On the river. The valley of the river is not very wide anywhere; it is a big scrub really. When you get back from the river flats there is fine timber—good scrub and a good deal of semi-tropical vegetation. Then up at the head of navigation I believe they are mining for antimony, or some other minerals.

441. *Mr. Wright.*] The mines are not very valuable about the Yarrahappinni; I do not think they are working any mines there now.

442. *Mr. Trickett.*] The district, as a whole, may be regarded as a forest district? Yes, it is forest land.

443. The cedar in the district is pretty well exhausted? I think so. I do not think there is much cedar brought out now. I believe there is still a great deal of cedar up at the head of the river, but it is rather difficult to get it out just now. It is likely to remain there for some time yet.

444. It would not pay them to bring it out? I suppose that is the reason they are not taking it out. At the head of the Nambucca it cannot be very far from the Don Dorrigo Scrub and all that good land.

445. Have you been to the head of navigation? Yes, on all of the rivers.

446. In the case of the Nambucca, what is the character of the land at the head of navigation? At the head of navigation there is a nice little township called Bowra. It is what you call open forest country.

447. Is there much agricultural land there? I should not say there is much; but there is beyond the head of navigation.

448. That, I suppose, is at such a distance that it would be too far for the settler to get his produce to market? Yes.

449. So far as you have been able to judge, the timber-cutting and maize-growing on the river flats are the two chief industries of this district? Those are the principal products.

WEDNESDAY, 15 JUNE, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Harbour Works at Nambucca River.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and further examined:—

450. *Mr. Trickett.*] In reference to your evidence given on the 14th April, I find that in reply to questions 30 and 31 you say—

What will the northern breakwater cost? £29,362 10s. is the estimated cost of completing the northern breakwater. The diversion of Warrell Creek is estimated to cost £7,242 15s. 15 June, 1898.

I suppose you regard that as an essential part of the scheme? Yes. These two items make a total of £36,605 5s. Then the Stewart's Island training-wall, which it is only proposed to carry up to high-water level, will cost £18,492 10s.; the north-western training-wall, £13,910; and, adding the usual percentage for supervision, £3,492 5s., the total cost of the works will be £72,500.

Upon visiting the site of these works the idea somewhat forced itself upon me that the Nambucca River is one of the smallest of those which are about to be served by these harbour improvements, and that if it were possible to save any portion of the proposed expenditure at the outset it would therefore be advisable to do so. Upon looking at the works with the other members of the Sectional Committee, and with some of the residents, it occurred to me that we might possibly, in the first instance, carry out only that portion which I indicated in the amendment I submitted, and which was not carried. The three portions I suggested—subject of course to your opinion—were, the northern breakwater at a cost of £29,362 10s., the north-western training-bank at a cost of £13,910, and the diversion of Warrell Creek at a cost of £7,242, leaving out the other training-walls for the present. Now I should like to ask you whether you think, seeing the large expenditure which it is proposed to make upon this river, we could with safety, and with a prospect of getting a reasonable entrance, carry out those three portions in the first instance, leaving the construction of the southern breakwater, and the Stewart Island training-wall, together with the southern training-wall for the future? In giving evidence before, I recommended the postponement of the southern breakwater, and the southern training-wall. Taking the works recommended in the order of importance, no doubt the Stewart's Island training-wall comes last; but I am afraid the result will not be satisfactory without it; and for this reason: You will notice that we are making an alteration in the present location of the channel by moving it out into the bay from the deep bight in which it is now situated in front of the township. That will require a good concentration of all the current in order to fight against the existing contending forces. With that object I was anxious to see the Stewart's Island training-wall completed, so as to direct the ebb-tide well on to the wall to maintain the channel through the sandspits which are now in the middle of the harbour.

451. *Mr. Lee.*] Was not the idea of closing Warrell Creek put forward with a view to throwing the current well out so as to touch the wall at Stewart's Island, and then throw it along the northern side on to the breakwater? That will be the action of the current; but the direct object of the cutting is to divert the creek and take it away from the point at which it now meets the river, where it causes a most unsatisfactory state of affairs.

- C. W. Darley. 452. Warrell Creek is now a source of great trouble? Yes. My object was to divert it and take it into the main river, making use of the tidal influence we get from that and the scour. I am rather afraid there would be some trouble if we omitted the Stewart Island training-wall, throwing the current across the main river current. I want to concentrate the current on to the north-western wall.
- 15 June, 1898. 453. *Mr. Trickett.*] I understand you to say that you think that unless the Stewart Island training-wall is constructed the current will lose a great deal of its force? I think it would be difficult to maintain a satisfactory channel either in front of or behind the island.
454. If the diversion of Warrell Creek is to be carried out, you regard the training-wall around Stewart Island as a necessity? Yes.
455. Will you give us more information in reference to the southern breakwater. On looking at some of your other reports in cases where there is a northern head, and where it is proposed to construct a breakwater along from that head, and where the southern spit is composed of sand as it is in the case of the Nambucca River, there seems to be a tendency always for the sand to drift over towards the northern breakwater, and to narrow the channel along the course of that breakwater. Do you not think that that will occur here in the absence of the southern breakwater? No doubt it will to some extent, but I do not think the circumstances warrant the extra expense. I thought we were justified in going on with the lesser work, with a view to see whether it would not meet requirements. The channel will cling to the breakwater, and, although it might be a little narrower, it will be sufficiently wide for some time to come I think for the traffic of the district. I thought we might omit the southern breakwater for the present. A certain channel is always maintained there without any breakwater at all. The effect of the breakwater will be to move the channel out into better water and less foul ground, and maintain a good navigable channel.
456. You think that the effect of the proposed works will be to put an end to the sand trouble and that the tidal action will maintain the channel? Yes.
457. Although the channel will be narrower than if the southern breakwater were constructed, you think it will be sufficient for all purposes for some time to come? I think it will be. Of course the construction of the southern breakwater would make the channel more sheltered.
458. *Mr. Lee.*] It was pointed out to the Sectional Committee by the resident engineer that the effect of the present work had been to give an increased depth of water immediately under the northern wall—more than sufficient for navigable purposes. It was also pointed out that one of the chief features in the proposal would be to get the terminal point of the northern breakwater at such a point in the bay as to secure a distribution of the sand by means of the current and tidal action;—you confirm that view? Yes.
459. As to the training-wall around Stewart Island, the effect of the diversion of Warrell Creek throwing the waters into the main arm would necessitate the consideration of some work at Stewart Island;—if that work were not constructed would there not be a possibility of your losing the benefit of some of the current and scour? Yes.
460. The real object of the proposed training-wall at Stewart Island is to tap the current and compel it to go along the wall at that point? Yes.
461. The shingle which exists opposite Stewart Island would secure a good foundation to the low level wall there? Yes.
462. If the proposed works are carried out it will be an absolute certainty that the water diverted from Warrell Creek will get into a larger sectional area and be taken down until it strikes the upper portion of the training-wall? Yes; there will be one continuous current right round.
463. When you get the current to the southern point of the north-west training-bank, is there any danger of its splitting there? Not to any serious extent. The current will take the most direct channel along the wall.
464. It was also pointed out to the Committee that if the channel were dredged a little below Stewart Island it would act as a shoot or spout compelling the current to strike the training-wall? The main current will go right round the wall. No doubt part of the water will go through the opening you indicate. An opening is left there with the object of allowing a portion of the water to get through keeping open a reasonable navigation in front of the township; but, as I have said, most of the water will pass along the wall. The tidal gradient will be greater, and where you get the greater gradient you get the greater velocity. The weight of water will follow the main channel.
465. At the present moment you have tidal scour enough at that point to keep the channel open? Yes.
466. The trouble is not immediately underneath the completed works, but above that point, running inside the proposed training-wall and under Stewart Island, that is where the water is shallowest? Yes.
467. That is caused by Warrell Creek distributing itself over that large area, and by the occasional influx of tidal-water? It is due to the total absence of concentration.
468. You have designed a work which will scour out the channel at those shallow places, and which will give a good navigable channel right down to the terminal point at the Heads? Yes.
469. You get navigable water to the southern end of the works, and the moment you get that, you have a channel with navigable water up as far as Macksville? Yes.
470. Is there not better navigable water lying behind the entrance to the Nambucca than is usually found behind the entrance of these rivers? Yes; and there is also fair navigation up Warrell Creek.
471. Do you think the scour you set up will be enough to provide for a channel at the opening under any circumstances? Yes. If the channel were going to close there is no reason why it should not do so now, but we find that it does not do so. There will be a better tidal action when the northern breakwater is constructed than you have at the present time.
472. The entrance of the harbour will always be a straight one; you are relying upon that? Yes.
473. Do you think any trouble is likely to be caused by reason of sand-bars being created, and making the channel tortuous? I do not think so.
474. You rely upon the straight and strong run to keep a good navigable channel? There will be one straight channel with varying depths and widths.
475. When that is obtained as a bar-harbour, you have got over the greater portion of the difficulty? Yes.
476. It is the tortuous entrance to these bar-harbours which is the source of danger? Yes.
477. *Mr. Roberts.*] Is it not solely on the ground of economy that you do not recommend the immediate construction of the southern breakwater? Yes.
- 478.

478. It would make a more satisfactory work if it were carried out, but in view of the large expenditure which would be necessary, and feeling satisfied as you do that the northern breakwater will answer the requirements of the port for many years to come, you have thought it wise to omit the southern breakwater? I do not think, looking at the matter entirely on the grounds of economy, I should be justified in recommending the construction of the southern breakwater at the present time. C. W. Darley.
15 June, 1898.

479. As to the north-west training-wall, and the Stewart Island training-wall, they are necessary to afford improved navigation to the river? Yes, for that portion of the river unquestionably. Those works will have the effect of confining the scour to one channel, and the entrance will then maintain itself without any further dredging. We look to the tidal action to maintain a good channel right along the wall.

480. *Vice-Chairman.*] Does your proposal mean that all vessels which have entered the Heads will be able to proceed up the river beyond Stewart Island? They will be able to go right up to Macksville.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

HARBOUR WORKS AT NAMBUCCA RIVER.

REPORT.

THE Sectional Committee, consisting of Messrs. C. A. Lee (Chairman), Henry Clarke, Frank Farnell, the Hon. C. J. Roberts, and the Hon. W. J. Trickett, appointed on Thursday, 12th May, 1898, to "inspect, take evidence, and report with reference to the proposed Harbour Works at Nambucca River," left Sydney on Tuesday, 17th May, and reached Grafton on the following Thursday. The construction of harbour works at the Bellinger having been referred to them, several days were devoted to an inquiry into that matter, the Committee arriving at the Nambucca Heads on Tuesday, 31st May. A careful inspection was there made of the portion of the northern training-wall already constructed, and the Members of the Committee visited the quarry from which the material for the work is being obtained, and were shown the method of removing the stone and placing it in position. In the afternoon they opened their inquiry at the Victoria Hotel, and, continuing their journey, on Wednesday, 1st June, visited Macksville, the chief centre of population, a township situated about 16 miles up the river. A number of witnesses was there examined, and the Committee concluded their inquiry the same night.

The following witnesses were examined. At Nambucca Heads, David Houison, district engineer; John Eichmann, saw-mill proprietor and storekeeper, Nambucca; William John Whaites, pilot, Nambucca Heads; David Mitchell, dredge-master, Nambucca; and William Bragg, bee-farmer, Lower Nambucca. At Macksville, Thomas Bolton, President, Macksville Progress Association; Edward Hitchins, auctioneer, Warrell Creek and Macksville; William Ezold, storekeeper, Macksville; Frederick Notley, storekeeper, Macksville; Robert Quayle, first-class constable, Macksville; and William Woods, secretary, Macksville Progress Association.

In the course of their investigations the Committee drove through a large part of the district, and were thus enabled to form some opinion of its character and value from personal observation. In addition, every effort was made to secure full and reliable evidence regarding the quality of the land, its productiveness, and the prospect of development. Testimony was also obtained as to the advantages which would be secured to the settlers by the success of the scheme, the probable efficiency of the works to be undertaken, and the warranty in the trade of the port for the expenditure necessary to bring about a satisfactory result.

The country to be served by the construction of the proposed harbour works very closely resembles that drained by the Bellinger, both in its physical features and in the nature and value of its productions. The evidence given by the pilot stationed at Nambucca Heads shows that during 1897, 39,630 bags of maize, 2,910,000 feet of hardwood, and 84,000 feet of cedar were exported, while pigs, poultry, eggs, cream, and general farm produce of considerable value were also sent away, the total value of exports for the year being estimated at £38,922. The Committee ascertained that the export of all classes of commodities shows a continual yearly increase. As on the Bellinger, farmers have of late years extensively engaged in dairying, and with quicker and more regular means of shipment

shipment this industry is likely to become of considerable importance. This will occasion the clearing and occupation of land which is not considered of sufficiently good quality for agriculture, and will bring a large number of settlers into the district.

At the present time the farmers and business people on the Nambucca state that they suffer great inconvenience, and frequently are heavy losers, because of the uncertainty of the movements of the steamers which trade to the river; and complaints against the excessive rates of freight are general. The carrying out of the scheme before the Committee will, it is believed, result in an improvement of the bar which will enable vessels to enter and leave the river with certainty in any but the roughest weather. In this way not only will the benefits of a sure and regular steamer service be secured, but it is hoped that the removal of the present obstacles and dangers to navigation will result in a considerable lowering of rates.

What is shown on the plans as the northern training-wall has already been constructed, and the breakwater commenced, and it was pointed out by the Resident Engineer in charge of the works that if the breakwater and training-walls were pushed on simultaneously, the small stone which cannot be used where the full force of the sea has to be resisted, and which it is necessary to remove in order to get out the larger blocks, could be disposed of to great advantage and at a considerable saving in the construction of the training-walls. The work already completed, while beneficial, has not gone sufficiently far to make a very great improvement in the channel, and it was the opinion of Mr. Trickett that the result of the completion of the northern breakwater, the completion of the north-west training-bank, and the diversion of Warrell Creek should be ascertained before the other works suggested by the Department were carried out. An amendment to that effect, however, was rejected by four votes to one, the Committee being of opinion, from what they saw of the effect of similar works on the Clarence, and, to a less degree, on the Bellinger, that the ultimate success of the project was undoubted.

For these reasons the Committee recommend that the proposed scheme as submitted by the Engineer-in-Chief be carried out.

CHARLES A. LEE,
Chairman.

Kempsey, June 7th, 1898.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

HARBOUR WORKS AT NAMBUCCA RIVER.

[TAKEN BEFORE THE SECTIONAL COMMITTEE.

TUESDAY, 31 MAY, 1898.

[The Sectional Committee met at the "Victoria Hotel," Nambucca, at 2 p.m.]

Present:—

CHARLES ALFRED LEE, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.
FRANK FARNELL, Esq.

The Sectional Committee proceeded to consider the proposed Harbour Works at Nambucca River.

David Houison, District Engineer, Macleay, Hastings, and Camden Haven Districts, sworn, and examined:—

1. *Chairman.*] The Nambucca River is in your district? Yes.
2. Had you charge of the district before the present works were commenced? Yes.
3. You initiated them? Yes.
4. And have carried them out to their present point? Yes.
5. Will you explain to the Committee the works it is proposed to carry out? It is proposed to continue the northern training-wall and breakwater to a point just west of the outer rock on the northern side of the entrance. The wall will end about 100 feet from the rock.
6. What is the nature of that work? We are out 1,711 feet from the starting-point.
7. What has the work cost so far? To the beginning of May it had cost about £6,200. We are raising the training-wall on an incline of 1 in 150. It was originally carried 1,650 feet on a level 4 feet above high water, and from that point it was to rise for 900 feet on an incline of 1 in 75 until it reached a height of 12 or 16 feet, when it was to continue at that level for 1,200 or 1,600 feet. Now we commence to rise on an incline of 1 in 150 when we are out 750 feet until we reach the same elevation as before, and then the wall is to be continued out level.
8. Why have you raised the height of the wall? The order to raise it came up since the Committee has been in the district. It is to be raised because of a washaway.
9. How much was washed away? From about 600 feet out to about 1,500 feet out. There were breaks all along that portion, caused by the action of a south-east gale.
10. Is it anticipated that when the wall is raised it will be able to resist such a sea? Yes. Small stone is put into the work at 1s. 6d. a ton, and for large stone we pay 3s. 8d. a ton. The small stone is put on top of the breakwater, as a rule.
11. Does the sea in a south-east gale break over the breakwater at its original level? We have had seas quite as big as that which did the damage, but not during such high tides.
12. The damage took place during a very heavy tide? Yes.
13. When the height of the wall is increased will you be secure from the effects of the weather? I think so.
14. What will be the cost of increasing the height of the wall? It will take about £3,000 to fill it in. That will strengthen and consolidate the work.
15. The whole of the work that has been done has been carried out under contract at the prices you have named? Yes.
16. Do they include the quarrying of the stone and the placing of it into position? Yes.
17. Now, regarding the north-west training-bank? That is part of the present proposal.
18. Is it intended to be made of stone of the same weight as the breakwater? No; of smaller stone.
19. What height is it to be kept? Four feet above high water.
20. Will that training-wall be subject to the range of the sea? Very little. The range has come in as far as the Government wharf, I have heard.
21. What is the object of this training-wall? To train the water down on to the breakwater.
22. What is the next work? The Stewart Island training-bank.
23. What will be the length of that wall? 6,400 feet altogether.
24. It will cost? £18,492 10s. This wall will only be raised to high-water level.
25. What will the northern breakwater cost? £27,675.
26. Now for the bank across Warrell Creek? That will be 800 feet long.
27. Then there is the cutting from Warrell Creek to the main river? Yes; that will cost £3,190.
28. Then there is the stone-facing on the eastern side of the river? Yes.
29. That will cost £1,033 10s.? Yes.

D. Houison.
31 May, 1898.

- D. Houston. 30. Then there is the stone-facing for the sides of the cutting;—those comprise the whole of the works referred to the Committee? Yes.
- 31 May, 1898. 31. What result do you expect from the design before us? We expect to get a continuous stream of water down along the walls on to the bar.
32. Is it intended to direct down the tidal water or the flood-water, or both? Both. We hope to meet every contingency.
33. Will not your intention be defeated to some extent by the openings at the ends of the north-western training-wall? I do not think so.
34. Will not the tide split at these openings, both in and out? I think not. It is more likely to deposit sand inside.
35. Will you not lose a certain amount of scour there? Very little.
36. What is the reason for leaving a break between the north-western training-wall and the Stewart Island training-wall? To give access through to Back Creek. That is the main channel at the present time. There is no traffic down the main river.
37. If the proposed works are effective, what result do you think they will have on the bar? They will greatly improve the depth of water.
38. What depth have you now? 5 ft. 6 in. at low water.
39. What depth do you expect to get? Eight or 9 feet at the least.
40. What is the nature of the bottom? Sand. Inside, along the training-wall, we have rock.
41. At what depth? About 7 feet.
42. Is it intended to do anything with that? Something can be done.
43. Are the rocks in the fairway? No, they are close along the wall.
44. Will there be a sufficient depth of water on the bar, when the works are finished, to enable the trade of the river to be carried on satisfactorily? Yes.
45. In your opinion could any part of this work be left over for a time? I hardly think so. Part of the Stewart Island bank would be the only portion of the work that might be left over, and that would break the continuity of the work.
46. Would you get the same result, so far as the crossing and the bar are concerned, if you omitted any part of the design? I think not.
47. You think that the whole of these works are necessary to obtain the end desired? Yes.
48. Suppose it became necessary to reduce the cost, what part of the work could, in your opinion, be left undone? Part of the Stewart Island training-bank.
49. Do you attach importance to the proposed cutting from Warrell Creek into the main river? Yes; that is one of the chief parts of the work.
50. You would carry that out under any circumstances? Yes.
51. Has deep water followed along the training-wall as it has gone out? Yes. For some time the channel left the wall and went out in a southerly direction, but now it is keeping along the wall, and the bar is gradually working north.
52. What is the direction of the bar crossing now? About south-east.
53. Are you going to give a straight opening simply by making one wall? I think so. Originally the channel used to follow round the rocks on the north side of the entrance, but the South Spit used to come up so far that it made the crossing very difficult.
54. I suppose at the present time the worst seas come from the south-east, so that the sand piles upon the south side of the entrance? Yes.
55. If you only make the northern training-wall and breakwater, will not the entrance always be exposed to the south-east gales? To a certain extent, but we expect that the scour caused by the river water and the tide will keep a channel.
56. You do not wish it to be understood that one wall will make as good a job as two would make? No.
57. But it will give a sufficient depth of water to enable the boats that now come here to enter with safety? Yes.
58. It is only intended to improve the entrance to the river, and that part of the river immediately inside the entrance;—nothing is to be done to the upper river? No.
59. If the proposed work is carried out, will the country have to go to the further expense of removing the rocks you speak of? That will be a very slight expense.
60. But some of those rocks will have to be removed? There are pinnacles, here and there, which will have to be removed.
61. Do you know how this work is to be carried out? No; I have received no instructions on the subject. My present instructions are to continue the existing contract.
62. The contractor has all his gear and appliances on the spot, and can supply the stone at a minimum cost? Yes.
63. The stone required for the north-west training-wall and the Stewart Island training-bank would have to be punted? Yes; but for that work we could use small stone which is now useless to us.
64. Have you sufficient stone for the work at the quarry you are now using? I think so, for the work in hand.
65. Have you sufficient heavy stone to complete the northern breakwater? I think so.
66. What is about the weight of the blocks you are putting in there? Some of the stones weigh about 4 tons.
67. Is that the minimum weight? No.
68. You use smaller stone in between these large blocks? Yes.
69. If the training-walls were carried on simultaneously with the breakwater all the small stone and spoil could be used? Yes.
70. That would reduce the cost of the work? Yes.
71. Suppose the northern breakwater were to be continued by contract while day labour was used for the other work, would there not be a conflict? You could not put both parties into one quarry.
72. Is the quarry Government property? Yes.
73. Has it been leased to the contractor? No; he has simply been given the right to go there.
74. Can the Government take what stone they like? Yes.
75. And the contract is terminable at a month's notice? I do not think so. I think it is to go on until the money voted has been expended. The amount available for the work is about £13,000. 76.

76. If the proposed works are recommended, it will be a matter to be decided afterwards whether they shall be carried out by day labour or by contract? Yes. D. Houison.
77. When Warrell Creek is diverted and the training-walls constructed, will the work have any influence upon the flood waters in the higher parts of the river? No. 31 May, 1898.
78. These works will not be detrimental to the low land on the river banks higher up? No.
79. They are more likely to prove beneficial to them by giving a quicker get-away for the water? Yes.
80. Do you consider the Nambucca a rather bad entrance? It has been.
81. How does it compare with the other river entrances on the coast? As a rule, it is the worst in my district.
82. You are satisfied that the work already done has improved it? Yes.
83. Inasmuch as the Department has been able to give great relief by the expenditure of between £6,000 and £7,000, the Committee would like to know why such an enormous sum as £70,000 should be expended to bring about a comparatively small further improvement? We have always had great trouble in keeping the channel open just in front of the township here. It is not long since it was all dredged.
84. Do you not think that it would be wiser to continue the northern breakwater to its terminable point, and to await the effect of that before carrying out other works? That is the present intention.
85. If the object desired is attained by the construction of that breakwater, there will be no necessity for other works? The other works are necessary to enable steamers to get up to the Clarence.
86. Could not a channel be kept clear by means of the dredge? Yes; but she is to be used up the river to let the droghers come down. The "Euroka" goes up to Macksville nearly every trip. I have seen her there several times lately.
87. Could not the waterway be kept open by putting in an inexpensive training-wall? I do not know. We have always great trouble with it now.
88. The original design for improving this place was prepared by Sir John Coode? We have followed his design very nearly.
89. It would appear that to a certain extent the inside works will be experimental? Yes, the inside works.
90. There can be no doubt about the outside works because of the experience that has been gained in regard to similar works in other places? Yes; the only experiment will be in connection with the openings in the walls.
91. How would it do to make only the north breakwater and the north-west training-wall as a start? We should have to make part of the Stewart Island training-bank to guide the water on to the north-west training-bank. We have trouble now at the foot of Stewart Island. It is silting up there again, although it is not long since the place was dredged.
92. You will have the same trouble even when these walls have been carried out to a certain extent? Wherever a wall is made the channel generally hangs to it.
93. Do you expect the north-west training-wall to cut away the sand deposit? Yes; but we should also probably use the dredge there, and pump the sand over the back of the wall.
94. What depth of water do you get immediately outside the bar? I cannot say.
95. Does it shoal gradually there? No; I think the water there is very deep.
96. What is the set of the current there? It is northerly.
97. Will the sand be spilled sufficiently far out for it to be swept round the point? Yes.
98. There will be no danger of its coming back again? No.
99. *Mr. Trickett.*] What is the object of keeping the back channel open? Well, there is a saw-mill round there, and other vested interests.
100. It would not be sufficient to have only one opening to the creek, at the north end? No.
101. Did the recent heavy weather do much damage to your works? I estimate that we lost from 1,200 to 1,500 tons of stone.
102. That was at the end of the wall? No; in the middle of it. The end was hardly touched at all.
103. Will similar damage be prevented in the future by the raising of the wall? Yes. So long as we can keep the water below the wall, very little damage will be done. The wall, when it was damaged, was being carried out on a dead level, 4 feet above high water.
104. Was this damage anticipated? No; we have had very big seas here before, and they have done no damage to the wall.
105. Mr. Darley gives it as his opinion that the material you are using is of a soft slaty character;—do you think it is likely to last? I think so; it does not fret.
106. Have you any works in your mind which can be looked upon as a guide in the construction of the proposed northern training-wall and breakwater? The only other similar work is at the Hastings; but there the wall is on the south side of the entrance, and it is more protected.
107. Do you not think that without a southern training-wall and breakwater there will always be trouble at this entrance? I think not.
108. When the water coming down the north-western training-wall strikes the northern breakwater, do you not think it will bound off from it? I do not think so.
109. You think that the current will hug the wall right along? That has always been our experience.
110. Were you a party to the designing of this scheme? No; I merely carry out the work in accordance with instructions forwarded to me.
111. Is it a work that can be carried out by day labour? I have three works which are being carried out by day labour, and three which are being carried out by contract. Day-labour works entail an immense amount of bother to the officers in charge of them.
112. You keep open the end of the north-western training-wall to serve existing interests? Yes.
113. Do you think that the inner portion will gradually silt up? I think so.
114. Are the prices stated by Mr. Darley based upon current prices? Yes; for these and other works.
115. His prices are not likely to be exceeded? So far as I can see, they are rather over-estimated.

John Eichmann, saw-mill proprietor and storekeeper, Nambucca Heads, sworn, and examined :—

- J. Eichmann. 116. *Mr. Trickett.*] How long have you resided here? Sixteen years in October.
 117. Prior to that, how long were you trading on the coast? About twenty-eight or thirty years.
 31 May, 1898. 118. During that period you frequently came to the Nambucca Heads in command of sailing vessels? Yes.
 119. Therefore you have a thorough knowledge of the district and of the various changes which have taken place at the entrance? Yes. I have seen the entrance at all times.
 120. What was the condition of the entrance when you used to come here first? The bar was something as it is now, but it was never very bad? There used to be good water, though the crossing was generally narrow. Generally there was 8 or 9 feet of water on the bar.
 121. That was before any work was done at all? The works have straightened the channel. When we came in before, we used to have to follow round by the rocks on the north side. Sometimes the south spit worked so far north that you could not get out at all. I have had vessels in here for five and six weeks at a time, and then they could only get out in ballast.
 122. And sometimes vessels have been unable to get in? That very seldom happened. If the wind was favourable we could generally get in.
 123. How did you get out? Sailed out, or hauled out.
 124. In those days there were no tugs to assist you? No.
 125. You have watched the progress of the Departmental works? Yes.
 126. What do you think their effect has been? I think that they have done a great deal of good, and that they will do more good when the walls get a little further out.
 127. What good have they done so far? So far, the deep water has followed right along the wall; and I think that if the wall goes out a little further the entrance will be still more improved.
 128. There is a bit of a bend in the wall;—that I understand is necessary because of the rocky nature of the bottom? There is a rock which used to have a beacon on it, and round this the vessels had to go. By carrying the wall out in the way to which you refer they are getting 7 or 9 feet of water. If they had gone out straight they would have got only 6 feet.
 129. You think they have gone out in the right way? Yes; it is better to have the channel out in deep water.
 130. What depth of water had you on the bar in the olden times? The depth varied from 7 feet to 9 feet and 10 feet, and sometimes it was more. After a flood it was perhaps 11 or 12 feet.
 131. Has the work that has been done improved the channel? It did not do so until lately. A spit used to form in front of the wall, but now the channel is running out straighter, and I think that when we get the wall out a little further there will be a straight channel.
 132. You think that the scour will be stronger, and that the bar will be moved further out? I think so.
 133. Do you think that the channel will go out in a straight line, or is it likely to make a turn, as it does at the Macleay? It may turn if there is no southern wall to stop it, but I do not think that it will. If there is a wall on the south side it could not help going out straight.
 134. To construct a breakwater on the southern side would mean an enormous expenditure; therefore I should like to know from you whether you think the northern breakwater will make the entrance sufficiently good for the class of vessels that are likely to trade here for some years to come? That is a hard question to answer. I think that the tide will follow the wall. Before the wall got out so far as it is now the channel went right over to the south, but as the wall was extended the deep water followed it out.
 135. Mr. Darley told us that if the modified scheme were carried out there would always be a depth of 8 or 9 feet at low tide;—do you think there will be that depth if only the northern breakwater is constructed? If the water of the river is confined as it is proposed to confine it we must have a better scour and a deeper channel.
 136. There are openings left at each end of the north-western training-wall;—do you think that will affect the scour very much? I do not think so, but I am afraid that it will block us up.
 137. You are not raising any difficulty? No.
 138. You look at the general good? Yes.
 139. When the work is carried out will it still be necessary to keep a dredge here? I do not think so. I do not see what good it could do. I think the scour will always keep the channel open.
 140. The sand banks now existing in the channel will have to be removed by the dredge? Yes.
 141. When they are once removed, and the training-wall constructed, do you think they will be likely to form again? I do not think so. I think that the current is sure to keep the channel open.
 142. Is 8 or 9 feet of water a sufficient depth to provide for the trade of this river? Yes; that would allow a vessel of 500 tons to come here, and such vessels will do us for years to come—for 100 years to come.
 143. What vessel trades here now? The “Euroka,” but the “Rosedale” has come here. The “Rosedale” is about 300 tons gross, and the “Euroka” is nearly as big, but she is differently constructed, and does not draw so much water.
 144. Can the “Rosedale” come here at all times? Yes; she used to come regularly, but the bar got very bad and she went away. She draws about 7 ft. or 7 ft. 6 in.
 145. It is proposed to draw the waters of Warrell into the main river;—do you think that that would be an advantage in increasing the scour? It ought to be. At the present time there are half a dozen different channels, none of them of any depth.
 146. Now you never have a good channel? There are so many openings for the water that none of the channels is of any depth. If all the water came down one channel we should get a better scour and a greater depth.
 147. How far do the steamers go up the river? The “Euroka” goes to Macksville, 8 or 9 miles by water. She could go up 15 or 16 miles, but there is nothing to go for.
 148. Is the trade of the river taken by the steamers direct from Macksville? Yes; though droghers bring cargoes down from Bowraville, Taylor’s Creek, Warrell Creek, and other places.
 149. When once you get into the river you have a sufficient depth of water for all purposes? Yes; I dare say that there is a depth of 12 feet, except on the flats near the mouth of the river.
 150. After you pass the sand patch opposite Stewart Island you can go to Macksville, and still further, without any difficulty? Yes.
 151.

151. Would it be of advantage to have a channel which would allow vessels to go right up the river? *J. Eichmann.* Yes; because the less knocking about the live stock gets the better. At the present time live stock is sometimes kept on board the droghers for two or three days and perhaps a week; and then it is some time on board the steamer, so that it wastes away, and profit is lost. 31 May, 1898.
152. I suppose, too, that the employment of droghers means extra rates? Yes.
153. What is the rate from the Nambucca to Sydney? 1s. 9d. a bag for corn, 6d. a pair for fowls, and so on.
154. 1s. 9d. a bag would be about 17s. 6d. a ton? Yes. The back freight is £1 a ton dead weight.
155. How does that compare with the rate on the adjoining rivers? On the Macleay they pay 10d. a bag; on the Bellinger they pay as much as we pay; and on the Clarence they pay, I think, 1s.
156. Although the Clarence is so much further north than the Nambucca, yet by reason of its good entrance the rates from there are less than from here? Yes, and they can use bigger boats. That makes the rates cheaper.
157. What is the lowest price per bushel that pays the farmer? If they can get 2s. 6d. or 2s. clear, that pays them very well.
158. Would 2s. pay them? They could live on that.
159. But that would be cutting things pretty fine? Yes.
160. You mean net? Yes. They could not grow maize for less than that. Of course, if the rates were lower it would help them a great deal.
161. Is much maize grown on this river? 35,000 or 40,000 bags a year.
162. Where is it grown—how near to the entrance? The farms commence about 3 or 4 miles up. One farm is only about 2½ miles from the entrance.
163. Is the district a very good one for maize? Yes; we have some very good patches. There are farms here which produce 2,000 or 3,000 bushels of maize at a time.
164. Is the land subject to floods? Most of it is. Land which is not subject to flood is no good for maize-growing, though it will grow wheat, or oats, or barley. You want very strong land for corn.
165. What other industry is carried on in the district? Plenty of pigs and fowls are raised.
166. They are sent by steamer to Sydney? Yes.
167. Is there any dairying? Yes; we have two or three factories, but not big ones. Butter and cream are sent from here now.
168. Do you think that if you had a permanently good entrance the district would progress? If we had a better entrance, and rates were lowered, people would clear more land, and would go in more for dairying, which pays well. At the present time produce often spoils on their hands. Now they have sometimes to take their cream and their milk to the Macleay. I know two or three people who have done that, because of the bad state of the entrance and the irregularity of the steamer's visits. If the steamer was regular, the traffic in poultry and eggs would be larger than it is now.
169. What other industry is there on the river? There is the timber trade.
170. That is a large industry? Yes, though it has fallen away to some extent because the bar has been so bad. There were five mills here once, and I have seen twenty-four vessels lying here loaded.
171. Now I suppose there is only one at a time? Sometimes there are two or three.
172. Schooners of about 150 tons, I suppose? Schooners of from 80 to 100 tons.
173. All the timber sent from here is sawn stuff? No; we send away cedar, beechwood, and other logs, but most of the timber that is sent away is sawn.
174. I understand that the supply of timber is pretty well exhausted? There is plenty of cedar, but there is some distance to go for it, and prices are so low that it does not pay to draw it.
175. Where have they to go for the cedar? Right to the head of the river. They have to draw it 15 or 20 miles.
176. By bullock team? Yes.
177. Is not cedar becoming expensive? No, it is very cheap. Last time I only got 13s. for it; that would not pay.
178. What is the best paying timber? Hardwood—blackbutt, gum, tallow-wood, mahogany, and ironbark. The haulers will fetch in box, but we cannot get rid of it, because they will not take it in Sydney.
179. How many people do you employ at your mill? Counting in drawers, fellers, and mill hands, thirty or forty men.
180. And Mr. Ellis would employ about the same number? Yes. There are eighteen men in the mill, twelve or thirteen bullock drivers, and six or seven fellers.
181. What prospect do you see of the country being recouped the proposed expenditure;—I do not suppose that the people would agree to pay port charges? Of course there will be more trade, and people will have a reason for settling on the land and improving it. That is all that you can expect.
182. There will be an indirect return in the way of increased settlement and trade? Yes. The money will not all be spent in one year; the work may take four years. When the entrance is improved the district will be opened up, and dairying will go ahead. Sydney would be nothing without the country districts.
183. Do people stay in this district? Yes; people who were here when I came are here still.
184. It is a very fertile district? Yes; but it might be greatly improved.
185. It has a good climate? A nice climate.
186. You honestly believe that it would be a more progressive place if you could have regular steamer communication and producers could be certain of getting to market safely? Yes; if we had a regular direct boat we should be much more comfortable.
187. With regular and certain communication the rates would probably be reduced? Yes; there would be a great reduction.
188. Do cattle do well here? They do very well. Of course, close to the sea the grass is not good, but further inland we have as good dairying country as any in the Colony.
189. As an old resident of the district, and as an old colonist, you recommend the carrying out of these works because of their local and general advantage? Yes.
190. It has been suggested that the Bellinger, the Nambucca, and the Macleay districts could be served by one harbour, with which they could be connected by means of a tramway;—what do you think of that suggestion? I do not think that such an arrangement would suit.

- J. Eichmann. 191. It would be a difficult matter to construct a light line of tramway to the Macleay, because of the hilly nature of the intervening country? Yes.
- 31 May, 1898. 192. I suppose your experience has shown you that water-carriage is always the cheapest? Yes, by far.
193. If to the steamer rates railway charges had to be added, you would be greatly handicapped? Yes. The steamer rates from any harbour you might make would be about the same as they are from here, and then there would be the tram charge in addition.
194. Has the value of property increased here? Yes; when I came here sixteen years ago this was all bush, and I had to clear my way through. The land then had no value, but now we have to pay £50, £60, and as much as £80 for a small allotment.
195. You have every reason to feel confident of the prosperity of the district? Yes.
196. *Mr. Roberts.*] Is 1s. 9d. the lowest rate that has been paid for maize here? Yes; so far as I know. If the rate has been reduced it is only lately.
197. The secretary to the North Coast Steamship Company, in giving evidence in Sydney, said that the rate from the Nambucca was 1s. 6d. a bag? Well, it has been 1s. 9d. quite lately.
198. Are you aware that the rate charged on the Bellinger is only 1s. 6d.? In that case their rate is lower than ours, unless our rate has been very recently reduced.

William John Whaites, pilot, Nambucca Heads, sworn, and examined:—

- W. J. Whaites. 199. *Chairman.*] How long have you been here? Twenty-four years on the 6th of next month.
- 31 May, 1898. 200. *Mr. Roberts.*] Prior to being appointed pilot were you in command of vessels? Yes; I had been in command of several vessels.
201. Vessels trading on this coast? Yes.
202. Did you trade to the Nambucca? Yes.
203. Then you have a knowledge of the state of the entrance for a considerable time? Yes.
204. Was it subject to much variation when you came here first? Yes, to great variation.
205. I suppose, for the whole period prior to the commencement of the harbour works, it was not as good as it is now? The channel used to come in under the North Head and sweep around by the rocks. The South Spit would sometimes work right up north, and then the river would break out through the spit and make a new entrance to the south.
206. Was that channel sufficiently wide to enable vessels to go through with safety? Yes; we have taken vessels out through the spit day and night. When the channel through the spit was open the channel round the rocks was shoaled up.
207. Was the channel through the sand-spit caused by the rush of flood-waters? No; the South Spit would work up to the north so far that the channel round the rocks became shoaled up, and then the river would cut through the spit to the south.
208. What depth of water did you get then? We got various depths. I have known there to be a depth of 10 feet and 11 feet at low tide, but sometimes there were only 3 or 4 feet.
209. What depth of water did you get when the channel came round under the North Head? From 10 feet to 12 feet at times. The channel was generally shallower when it went outside. Sometimes there was not as much as 4 feet of water in the channel through the sand.
210. Could vessels get in then? Yes.
211. You got them in at high-water? Yes.
212. Has the entrance ever been so bad that sailing vessels could not get in? Yes, often.
213. Have they been loaded outside? No; they have waited until there was an improvement.
214. What is the longest time that you have known vessels to wait for an opportunity to come in? A week or eight days.
215. And how long have you known them to wait for an opportunity to get out? Five weeks.
216. For how many years has a steamer been trading here? For fourteen years.
217. What steamers have traded here during that period? The "Mary Cochrane," draught 8 feet; the "Noblie," draught 8 feet; the "Fernmount," draught 7 ft. 6 in.; the "Wellington," draught 9 feet; the "Rosedale," draught 7 feet; and the "Euroka," draught 5 ft. 6 in.
218. Was not the "Euroka" built specially for the Nambucca trade? She was built specially for shallow bar-entrances.
219. Is the "Euroka" a regular trader to the river now? Yes.
220. Was not the "Wellington" lost near here? Yes.
221. Was that in an attempt to enter? No, in crossing out.
222. Did she get stuck on the bar? There were 10 feet of water on the bar at the time, but she struck, and it affected her steering.
223. Was it blowing hard at the time? No. The channel was then close to the rocks, and she struck with her keel. Before the master could get way off her she slewed round broadside on to the rocks.
224. Did she become a total wreck? Yes.
225. Has the northern breakwater advanced sufficiently for you to be able to say if its effect will be beneficial? Yes.
226. Are you of opinion that when it is completed it will answer the expectations of its promoters? I think it will.
227. Was not a large part of it washed away recently by the south-east gales? The top of it was levelled off by an exceptionally heavy sea during a high tide.
228. How often would you have such a sea—once in twelve months? I have not seen such a heavy sea for seven years.
229. Was that what is now known as the "Maitland" gale? Yes.
230. That part of the wall which is washed down had not been finished when the gale occurred? It was finished, but since then they have come to the determination to raise the wall.
231. Do you think that will be an improvement? Yes.
232. Do you think it will render unnecessary the construction of a southern breakwater? I should certainly recommend the other work. Of course, at times, the tide may shoot out through the South Spit.
233. Do you think that something should be done on the south side to protect the entrance? Yes.

W. J.
Whaites.
31 May, 1898.

234. Do you regard that as a very important matter? I think it would be of great advantage if something were done to prevent the tide from crossing the South Spit. The channel now hangs close to the northern breakwater.
235. Do you fear that the northern breakwater may be washed away, or would what you suggest increase the depth of water in the channel? What I suggest would increase the depth of water in the channel, and would make it permanent.
236. Do you not think the channel will be permanent if only the northern breakwater is made? No, because it is possible that the water may cut through the southern spit at times. I think, however, that the northern breakwater will give excellent results. At the present time the scour shoots away from the breakwater for a short distance and comes back to it.
237. Do you not think it would be desirable to await the effect of the northern breakwater before doing anything on the south side? The northern breakwater is certainly the more important work of the two.
238. It is giving a good depth of water in the channel as it proceeds? Yes.
239. You do not apprehend any danger of the wall being washed away after it has been raised? No, though it may settle a bit.
240. Your principal reason for recommending the southern breakwater is so that there may be a better channel? To make the water hang to the northern breakwater.
241. Not to protect the northern breakwater from the sea? No.
242. Do you think that the north-west training-bank and the Stewart Island training-bank will bring about the desired scour? Yes.
243. Do you think that they will bring about that scour without the construction of the eastern training-bank shown on the plans? They will create a scour, but not so good a scour as if the eastern training-bank were made. All the shoals shown on the map are caused, not by the silt coming down the river, but by the sand coming from the sea.
244. You know that it is intended to turn Warrell Creek into the main river? Yes. I think the scheme as a whole is a good one.
245. Is there good water right up to Macksville? Yes, once you get above the flats. The "Euroka" goes up to Macksville.
246. Does she go as far as Bowraville? No; she goes to within 5 miles of that place.
247. How do the Bowraville people get their produce away? They punt it down the river.
248. Where is Taylor's Arm? That is the name of the south branch of the river. It joins the main arm $1\frac{1}{2}$ miles above Macksville.
249. Is the land above Macksville more fertile than the land lower down the river? Yes; it is richer land.
250. Is there a large area of good land there? Yes.
251. How does that land compare with the land on the Macleay? It is very good. I think the alluvial flats are equal to similar land on any of the other rivers on the coast.
252. Are they narrow? They are small flats.
253. Are they all taken up? No.
254. Is there land still open for settlement? Yes.
255. Has settlement increased since the harbour works were commenced? The settlement on Taylor's Arm has been increasing for years, but I cannot say that there has been a great increase since these works were commenced. I believe that they will have the effect of giving an impetus to settlement.
256. Have you heard complaints about the isolated condition of the district? No; but I have felt it myself. The people complain that they cannot send their produce away regularly, especially perishable articles such as pigs, fowls, eggs, and so on.
257. Have they not been asking for these improvements for many years? Yes.
258. Do you think that if the proposed works were carried out a settlement would increase? I am sure of it.
259. What causes you to form that opinion? With regular steam communication hundreds of acres of land would be used for dairying, which people are unable to use now.
260. Is there much difficulty in getting the steamer out now? No; but she has been running very irregularly. At times she is away for ten or twelve days.
261. It would not do for her to be away as long as that if there were produce waiting on the wharf? Well, sometimes she has to go all the way to Sydney.
262. Does the steamer only come here when there is a full cargo for her? People in Sydney generally communicate with the agent here, and when the maize is ready they come for it.
263. Are the farmers put to great inconvenience because of the long intervals between the visits of the steamer? Yes. Of late years the bar has been very bad. Two years before the harbour works were started the bar was very bad, and became bad every winter until this winter.
264. How long is it since the harbour works were started? About two years last February.
265. Since then has the steamer come more frequently? Yes; she was built for the river trade, and she has been coming more frequently.
266. Does she give a weekly service? About that lately, with an occasional break caused by bad weather, or something like that.
267. Given good weather, would not a weekly service suffice for the trade of the river at the present time? Yes.
268. Does the "Euroka" take away timber, or is that trade done by sailing vessels? By sailing vessels.
269. How many regular traders are there? About seven vessels trade here now.
270. What is their draught of water? From 7 ft. to 7 ft. 6 in.
271. How far up the river do they go? As a rule they load at the mills.
272. Are there only two mills on the river at the present time? Yes.
273. Were there ever more? There used to be four mills.
274. Why have some of the mills closed? One mill was burnt down, and another has been shifted to the Bellinger.
275. Does not the Nambucca timber rank among the best on the northern coast? I believe so.
276. Does much of it go to the London market? I know that consignments have gone to London, but not direct from here.

- W. J. Whaites.
31 May, 1898.
277. Is it all dressed timber that goes to England? It is generally sawn into planks, 9 x 3, for road blocks.
278. Is any timber sent for girders? I do not know if any girder timber has been sent out of the Colony.
279. The principal demand in England is for wood blocks? Yes.
280. Would the timber supply here last for years? I think it will last for many years, though, of course, the men will have to go further back for it.
281. How far do they draw the timber now? Five, 6, and 7 miles in many instances. Some people have a less distance to draw it.
282. Is the timber trade in a flourishing state? I believe the mills have as many orders as they can cut.
283. Is less maize being grown here now than was grown a few years ago? No; more maize is grown now.
284. They are not giving up maize-growing to go into dairying? No; the export of maize is increasing.
285. Can you tell us the value of the exports and imports of the river? The following statement contains an account of the exports from the river for the year 1897, and their approximate value:—

			£	s.	d.
Hardwood, sawn...	... 2,868,000 feet, at 10s. per 100 super. feet ...	14,340	0	0	
Cedar, rough 84,000 ,, 15s. ,, ,, ...	630	0	0	
Girders, ironbark 42,000 ,, 1s. per cub. foot... ..	2,100	0	0	
Shingles 104,000, at 15s. per 1,000	78	0	0	
Palings 408,000 ,, 6s. ,, 100	1,224	0	0	
Maize 39,630 sacks, at 10s. per sack	18,815	0	0	
Pigs 1,680, at 15s. each	1,260	0	0	
Fowls 111 coops, at 20s. each... ..	111	0	0	
Eggs 233 cases, ,, 10s. per case	116	10	0	
Oranges 179 ,, ,, 5s. ,,	44	15	0	
Citrons 203 ,, ,, 10s. ,,	101	10	0	
Hides 304, at 6s. 8d. each	101	6	8	
Total	£38,922	1	8	

286. I understand there are some antimony mines here? Some mines were working for three or four years, but the price of antimony went so low that it did not pay to continue.
287. Have those mines been abandoned? Most of them. One or two of them are keeping on in a small way.
288. What dredging is necessary to enable vessels to go up the river with facility? All along the outside of the north-west training-bank, and half way along the Stewart Island training-bank, requires dredging.
289. And from there you have a good depth of water right up to Macksville. Yes.
290. What depth of water have you at the entrance at the present time? The following statement shows the variation in depth from the beginning of 1893 up to May of this year:—

		Soundings, low water, spring tides.	
	1893.	Feet.	Remarks.
January	...	7	
February	...	5	Bar channel worked out south.
March	...	7	Worked back to N. Head.
April	...	7	" " "
May 1 to 10...	...	5	Two channels—one by N. Head, one along south beach.
„ 11 to 31...	...	3	
June 6	...	3½	
„ 15 to 30...	...	9	Freshet deepened and straightened the channel to the N. Head.
July	...	9	
August	...	9	
September	...	9	
October	...	8	
November	...	8	
December	...	8	
1894.			
January	...	8	
February	...	7	
March	...	7	Crossing inside 5 feet.
April	...	7	" " "
May	...	6	" " 6 "
June	...	6	Crossing improved.
July	...	7	
August	...	7	
September	...	7	
October	...	6	
November	...	7	
December	...	8	

Soundings

W. J.
Whaites.
31 May, 1898.

1895.		Feet.	Soundings, low water, spring tides.	Remarks.

February	...	5		
March	...	4½		
April	...	4½	No crossing.	
May	...	5½	and improving.	

The depths are at low-water springs.

Rise of tide—spring, 3 feet to 3 feet 6 inches.

" " neaps, 1½ " 2 " 3 "

291. Do vessels come in here at night? No; but they can go out at night.
 292. Does the steamer come in at night? Yes.
 293. You regard the entrance as safer now than it ever was previously? It is better now than it has been for some years.
 294. Have you ever known it to be better than it is now? Yes, much better. After a fresh the river used to go straight out occasionally.
 295. Do you think that the north-east weather in summer-time is likely to silt up the entrance? No; I think that the scour will prevent that.
 296. You think that the proposed modified scheme will answer all purposes for many years to come? Yes.
 297. If it were not for the expense, you would like to see the southern breakwater and the eastern training-wall constructed? Yes.
 298. That would make a complete job? Yes.
 299. What is the population of the district? I think about 3,000.
 300. Do you think that the importance of the district justifies the proposed expenditure? Yes.

David Mitchell, engineer, and dredge master, Nambucca River, sworn, and examined:—

- D. Mitchell. 301. *Mr. Clarke.*] How long have you been in charge of the dredge here? Since July, 1893.
302. Were you here before that? I was here in November, 1891, for five weeks.
- 31 May, 1898. 303. Why were you removed? I went to take another man's place elsewhere.
304. What work have you done since you have been here? We have dredged the river from the pilot boatshed up the Bellwood channel, and up the main channel.
305. Has the work done by the dredge proved beneficial? Yes; but the river requires constant dredging to keep it open. It is only a year and nine months since we dredged the place where we are working now.
306. How do you dispose of the sand? We have been throwing it behind the spit.
307. Does any part of it go back into the river again? Very little of it.
308. What kind of a dredge are you working? An improved sand pump.
309. I suppose the dredge is kept continually at work? Well, we were down at the Macleay for eighteen months, on one occasion.
310. Dredging will make very little permanent improvement in the river? Of course the improvement done by the dredge is only temporary. The work has to be done over again, continually.
311. Does the river require dredging higher up? There is good water after you get past the flat at Redbank until you get about 3 miles above Macksville.
312. Do you think the proposed harbour works will improve the entrance? I think so. We could do away with the channel between the north-west training-bank and the shore. From my experience it will be necessary to take the dredge there every now and again to clear it.
313. Do you think that the diversion of Warrell Creek will be an improvement? I think it will be a great improvement.
314. Will the dredge be required after the proposed works are carried out? No doubt there will be less dredging to do; but the river will probably shoal in places after freshes.
315. Will it be possible to pump sand over the back of the dyke, and thus to strengthen the dyke? Yes; that would be a good way of disposing of the sand.
316. The breakwater already constructed has had a good effect upon the entrance? Yes; but of course the scheme is incomplete yet.
317. Do you think that the walls on the northern side of the river would be sufficient? No doubt the improvement would be greater if the walls on the south side of the river were made; but I think it would be well to complete the walls on the north side of the river first.
318. *Chairman.*] You look upon the work of the dredge as purely temporary, to keep open a channel, to enable steamers to get round at the back of Stewart Island? Down near the mouth our work is purely temporary; but further up the river, where we have been dredging through a bank of shingle, it has stood very well.
319. You are working now in a comparatively narrow piece of water; but you have not close indurated sand to deal with? No.
320. Consequently, your work is perpetually filling up? Yes, to a large extent. A lot of the sand comes in from the sea.
321. Does not the sand work all along the southern spit, with an incoming tide? Sometimes it does; but at other times it seems to run away from the spit.
322. Does the tide take a direct course, or does it go from the northern shore over towards the sand-spit, and back again? In some places.
323. Were you working here before the harbour works were commenced? Yes.
324. In your opinion have they greatly improved the entrance? I think so. I have seen vessels bar-bound here for eight weeks at a time. Now it is a rare thing for them to be bar-bound for more than a week or eight days.
325. With such an exposed southern shore the bar must, of necessity, shift very much;—has the tendency of the northern breakwater been to straighten the bar? Until it commenced to bend it did. The water seems to strike off from the bend.
326. Is not one of the greatest difficulties in connection with bar entrances the shifting character of the bar? Yes.
327. If any scheme could be adopted to keep the bar in one position, and to deepen the water on it, that would effect an improvement? Yes.
328. The northern breakwater has been designed to drag the scour right round within a few feet of Rocky Cliff; that will draw the bar considerably to the north of its present position; this being so, do you think that there is any danger of the southern sand-spit working north across the channel? I should not think so.
329. I suppose the scour would prevent that? Yes.
330. And the sand would be spilled out over the bar into the outer current, and carried away north? I think so.
331. Do you think that the breakwater will go out sufficiently far to spill the sand into deep water? It seems to go out far enough.
332. The intention of the north-west training-wall is to assist the scour, and thus by natural means to make a channel wide enough for ordinary vessels;—if that result is obtained, the dredge will not be required lower down towards the mouth? Yes.
333. Do you not think it extremely probable that a scour will be set up from the extreme end of north-west training-wall, right round to the extreme end of the northern breakwater? Yes.
334. If the work of the dredge were confined to that part of the river which passes Stewart Island, there would then be uninterrupted navigation right into the river? Yes.
335. I suppose that the cutting through of the bed of shingle near Stewart Island will not take very long? It will take about twelve months. There are a few feet of sand, and then a bed of shingle,
336. If that piece were dredged, any vessel that could cross the bar could go up the river? Yes; so far as we have gone we have found shingle, but about the far end of Stewart Island there is sand.
337. You are getting close to deep water again there? Yes; we will end in about 10 feet of water, I think.
338. I believe that there is a lot of dissatisfaction here about the state of the bar? Yes.

339. I suppose there are plenty of complaints because of the difficulty of navigating the river? Yes; but the upper part of the river is not so bad at the present time. There used to be great complaints about the flats up above, but we have a small dredge at work up there now. D. Mitchell.
31 May, 1898.
340. Do you know of anything that could be added to or taken from the design to improve it? No; I do not.
341. Have you seen the harbour works carried out at any of the other rivers? Yes; at the Clarence and at the Bellinger. The wall at the Bellinger has had a good effect.
342. And the training-walls at the Clarence have been a pronounced success? Yes.
343. Do you know of any reason why these walls should not be equally successful? No.
344. At the present time the bar is very bad? Yes.
345. And at times the people are subject to great inconvenience in getting produce away and in bringing goods here? Yes.
346. I suppose the only way to help them is to improve the bar? I do not see how else you could help them.
347. There is some talk about making a railway connection between this and other rivers, but I suppose there is nothing in that proposal? I do not see how railway carriage is to compete with water carriage.

William Bragg, bee-farmer, Lower Nambucca, sworn, and examined:—

348. *Mr. Farnell.*] How long have you been a resident of the Nambucca? About twelve years. W. Bragg.
31 May, 1898.
349. What is the size of your holding? Forty acres.
350. How much of that is under cultivation? I have only about 4 acres ploughed, and I suppose I have 12 acres partially cleared. The trees have been felled and a crop has been put in with the hoe.
351. Where do you ship your produce? On the Nambucca.
352. Have you been put to any inconvenience by reason of the bad state of the entrance? Yes. The steamers do not run regularly, so that we have great trouble in sending anything away. It is sometimes a matter of weeks to get your stuff away. You have to keep your ears perpetually open for the whistle of the drogher.
353. Have things been improved by the carrying out of the harbour works? There has certainly been an improvement.
354. Have you noticed any improvement in the bar since the breakwater was carried out? I cannot say that I have; but I think that there will be an improvement when all the walls are carried out. There is always deep water alongside the heaps of ballast that are thrown out by sailing vessels.
355. If better facilities were given for getting produce to market, would you put more land under cultivation? I would put all the land I could under cultivation. The lower Nambucca is more suited for dairying than for corn-growing. We have only about 18 inches of soil, but on the upper part of the river the soil is very deep.
356. You are engaged in mixed farming? Yes.
357. You do not grow maize to any extent? No; I do not suppose that when I get the place well worked I shall have more than 16 acres.
358. Is there plenty of land still available for settlement in the district? Yes. If you look at the map you will find that there is only a fringe of land along the bank taken up at the present time.
359. Is the country suitable for dairying and mixed farming? Yes, and especially the lower part of the river. Up as far as Macksville the country is more suited for dairying than for corn-growing, while higher up, again, it is best suited for corn.
360. Have you heard other people complain of the inconvenience of the present steamer service? Yes, ever since I have been here. I have seen twenty-one vessels lying here, unable to get out. Vessels can generally get in because they are bumped over by the seas.
361. What effect have the floods on the bar? There has always been a good bar after a flood. I have heard that there has been 22 feet of water on the bar after a flood.
362. Do you think that the proposed departmental expenditure is justifiable, considering the importance of the district? I think so.
363. Do you think that if the works are carried out more land will be put under cultivation, and that the trade of the district will increase? I think so.
364. Are the people about here industrious? Yes, as a rule, the farmers here.
365. *Chairman.*] Which would be the best way to give relief to the district,—to open the port or to build a railway to the Macleay? To open the port.
366. What the settlers want is certain and regular communication with the market, which, I suppose, is Sydney? Yes.
367. It does not follow that you require either larger vessels or vessels to trade more frequently; what you require is a regular service? Yes.
368. If the port is improved to enable you to get that, you will have the advantage you want? Yes. I sent corn away in April last, upon which I paid 1s. 6d. a bag freight, whereas I heard that corn was taken from the Macleay for 10d. a bag.
369. You think that if the port were improved that would lead to the development of the district? Yes. All round me there are farms lying idle because of the bad state of the entrance.
370. Will larger areas be brought under cultivation if the entrance is improved? Yes. Since these works were started three creameries have commenced operations here.
371. I suppose the land is good enough, but very heavily timbered? Yes; it is disheartening work to clear it.
372. I suppose people are turning their attention to dairying because they can get a return without expending so much in clearing? Partly.
373. *Mr. Roberts.*] You devote most of your attention to bee-farming? A good deal of it, but I intend to go in more for maize-growing. I intend to cultivate about 16 acres. About 20 out of my 40 acres are swampy.
374. Do you find bee-farming profitable? Yes; it was more profitable at first, but too many have gone into it, and the prices are coming down.
375. Is there a great export of honey from this district? No; except what I have sent, very little has gone away. I have sent forty-five cases away—120 lb. to the case.

- W. Bragg. 376. Do you get a satisfactory price? I have got as much as 3½d. a lb. for my honey.
 31 May, 1898. 377. Is the market frequently glutted? Yes; from about November it is best to hold back.
 378. Are you sending as much away now as you did at first? I am increasing my output every year.
 379. Are you the only bee-farmer on the river? No, another man has started.
 380. Do you supply much honey locally? Yes; but the place is so small that it hardly pays to go round with the honey.
 381. Do you go in for poultry and pigs? Yes; but not very much.
 382. Have you been on your present holding long? No; I have been engaged in the mills for some time.

TUESDAY, 1 JUNE, 1898.

[The Sectional Committee met at the "Star Hotel," Macksville, at 2.30 p.m.]

Present:—

CHARLES ALFRED LEE, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.

HENRY CLARKE, Esq.

The Hon. WILLIAM JOSEPH TRICKETT.

FRANK FARNELL, Esq.

The Sectional Committee further considered the proposed Harbour Works at Nambucca River.

Thomas Bolton, President, Progress Association, Macksville, sworn, and examined:—

- T. Bolton. 383. *Chairman.*] How long have you resided here? Over thirty years.
 1 June, 1898. 384. *Mr. Farnell.*] I understand that you have considerable knowledge of the trade and resources of the Nambucca district, and of the difficulties and inconvenience caused by the bad entrance to the river? Yes.
 385. Will you describe to the Committee the difficulties against which you had to contend before the harbour works were commenced? In former years the entrance was an altogether different place from what it is now. The South Spit used to overlap or be on a level with the North Head. Now the sand has all disappeared. The spit in front of the mills was 5 or 6 feet high, and mangroves used to grow on it. The channel from Warrell Creek came across to the Schoolhouse Point, but that channel is now blocked up. In my opinion the channel is not as good as it was in former years. Then they used to shoot vessels over the bar, bringing them up with the anchor on the spit. Now they cannot do that. They have not been able to do it for years. In former years the channel was narrow, but very deep.
 386. In those days the channel was almost straight? It followed round the rocks. Of course there was a reef of rocks where the training-wall is now, and the channel was between it and the spit. A great deal of the sand that used to be there has gone away.
 387. Has it gone away since the harbour works have been in progress? No.
 388. Its disappearance is not owing to them? No; it is due to the floods, and to the heavy seas.
 389. What depth of water had you before the harbour works were commenced? The depth would vary. Sometimes we had 5 ft. 6 in. at low water.
 390. Would that be a sufficient depth for the boats trading here now? Hardly.
 391. They would come in at high water? Yes. Part of the difficulty of entering is overcome now by the employment of the tug-boat. I have known vessels to lie inside the river for eight or ten weeks at a time. I have seen twenty-eight vessels bar-bound here at a time.
 392. I suppose the steamers have not so much difficulty in getting out as the sailing vessels have? No.
 393. I suppose the sailing vessels find it difficult to get steering way? Yes. Until the training-wall was made the South Spit used to come up so far that you had to make a very sharp turn to get out. The wall has caused a scour which has cut the spit away. That shows that when the scheme is completed it must do good. The channel will never be any good to speak of until we get a flood which will wash the place out.
 394. Were the twenty-eight vessels that you speak of bar-bound since the harbour works were commenced? No.
 395. Is the trade of the district equal to or greater than it was at that time? At that time the trade of the district was very little, and consisted principally of the export of cedar and other timber. Since then Taylor's Arm has been opened up—a place which I believe will greatly advance. Land is being cleared all round the district, and they are going in for maize-growing and dairying. The bulk of the drivers, instead of drawing logs, are going into farming and are clearing land, so that every year our exports are increasing. Our exports this year will amount to nearly as much more as the exports of last year.
 396. What was the population of the district when you first settled here? There were a few people living at Bowra, in the cedar scrubs. There was a selection at Macksville and another one near it, and a selection at Congarini. I marked out the road that is now going to the Clybuca.
 397. The population has increased since then? There is a larger population in this district now than there is in the Bellinger, but it is more scattered. The Bellinger is only one big valley, though a very fertile valley, while here the good land lies up the various creeks. There are settlements 25 miles above Bowra and a long way up Taylor's Arm.
 398. What has induced people to come here? There was land for them to take up. They know that a vessel could be got in and out of the river, and that was about all you could say for the Macleay then.
 399. Do you think settlement would have been greater if there had been a better bar? Most decidedly.
 400. Has the work already carried on had a beneficial effect upon the entrance? Most decidedly. As the wall has been made the deep channel has followed it out.
 401. Have you any reason to believe that the other training-walls will prove less beneficial? Yes, most decidedly.
 402. You are opposed to the construction of the other training-walls? Yes.
 403. Do you think that the diversion of the waters of Warrell Creek into the Main Arm will have the effect of creating a better scour? Certainly.
 404. I understand that you do not approve of the proposal before the Committee? Not altogether. There is a flat at the upper end of Stewart Island, and until that flat is cut through the water cannot get into the north channel to wash the bar out.

405. Do you not think that a natural scour will be created if the training-walls are constructed? If you confine the water you must increase the scour. T. Bolton.
406. It is proposed to divert the water of Warrell Creek into the Main Arm;—do you not think that that will bring about the desired result? Certainly. June, 1898.
407. I understand that you advocate the dredging of the river; but would it not be better to create a scour which would have the same effect? It would be of no use to run the training-wall from Blackwood Point at the upper end of the island until you had removed the flat there. The channel at the upper end of the island was closed because a vessel threw out some heaps of ballast there. That flat wants cutting through, so that the channel may be opened up again. I do not see what use the training-walls can be until you open the channel. According to the surveyor, there are 11 ft. 6 in. of water in the river above the flat.
408. Suppose the engineers say that the proposed works will give a good scour, and make a channel, will you not rely on their judgment? I admit that the training-walls must confine the water; but I say that the flat must be dredged first.
409. Suppose the channel is created by the scour caused by the diversion of Warrell Creek? The flat I speak of will have to be dredged through.
410. It is a sand-flat? Yes. There will not have to be a great deal more done from where the dredge left off. Then if the wall is wanted afterwards it can be made.
411. If they construct the training-wall and dredge the place, depositing the sand behind the wall, will that satisfy you? Certainly; because it will make the channel permanent. I want the channel opened first. There was never a channel on the north side of the island until of late years.
412. What steamers trade here now? The principal steamer is the "Euroka."
413. What draught has she? About 4 ft. 6 in. or 5 feet.
414. Does she supply the wants of the trade of the district? Not always. I doubt if she will be able to take all the maize away this season if she runs constantly, leaving the timber trade and the other freight out of consideration.
415. But she has met the requirements of the district so far? Well, she is only a new boat. We have had the "Rosedale," and other boats, trading here.
416. Your cause of complaint is not that you have not a good service, but that you have to keep your perishable goods a long time before you can get a boat? Yes. When we send our produce down to the Heads there is no one there to look after it.
417. You contend that it is essential to have the entrance improved in order to establish a regular service which will be of benefit to the trade of the district? I am of the opinion that once the training-wall is finished to the outer point the first flood of any note will sweep the bar away, and we shall have a port. After a heavy flood I have seen vessels beating in and out in a gale of wind.
418. From what direction? Easterly, and particularly south-easterly, winds play upon the bar. With regard to the tide at Warrell Creek, it will run out in from three-quarters of an hour to an hour after it runs out of the main river, and I will explain the cause of that. From the mouth of Warrell Creek at the Heads to Scott's Head is a distance of 9 miles, a narrow sandy beach intervening all the way. As the tide rises, it comes in under the sand and swells the water in the creek, consequently the tide will be running up in the river for half an hour or an hour, while the ebb tide is running out of the creek.
419. I suppose there is a strong flow of tidal water in Warrell Creek? There is a good flow of water there during a heavy fresh, but otherwise there is not much flow. The creek is very shallow.
420. However, by the diversion of Warrell Creek as proposed, we shall get rid of one source of difficulty? Certainly.
421. Have you any idea as to what the trade of the district amounts to? I have not had time to go into particulars.
422. Do you think 40,000 bags of maize are sent away annually? I cannot say. This year will be an exceptional year.
423. Have you any idea as to how many acres are cultivated for maize? No.
424. Have you any idea as to the average size of the holdings here? No.
425. Are you satisfied that if a good port is given, the farmers will be prepared to put more land under cultivation? They are doing that every year. The land here is very difficult and expensive to clear. It is not like the alluvial scrub land on the Bellinger and on the Macleay.
426. If we give better facilities for the export of produce, do you think more land will be put under cultivation? Yes.
427. Do you think that the improvement of the bar will lead to the reduction of freights? It should do so. Perishable goods, such as pigs, deteriorate on the journey down. Pigs that leave here fat are only store pigs when they get to Sydney.
428. What is your opinion as to the permanency to the timber trade? There is a great deal of timber here yet, but, of course, the drawers have to go farther afield each year.
429. Still, there is sufficient timber to last for many years? Yes. By the time they have got out all the good timber standing now they will be able to fall back on the young trees growing up. Trees that were saplings when I came here are now 2 or 3 feet through.
430. You think there is room for the development of the timber industry? Certainly.
431. Can you give us an idea as to whether the dairying industry promises to expand? It is only in its infancy yet; but everyone here is going in for dairying. All the talk is about it.
432. Is the land suitable for grass? There are thousands of acres that will be taken up for dairying if a proper outlet is provided.
433. Where is this land? All over the place. There are parts of the country out back where only a bit here and there has been taken up, which would keep a dozen families. It is all good grazing land.
434. Do all the lands you speak of come within the influence of the proposed works? Certainly.
435. The produce from those lands would not go to any other port than the Nambucca? No. There is also plenty of good land further out the produce of which will, I think, eventually come this way instead of going to the Macleay.
436. Do you know of an alternative proposal to construct a tramway from the Nambucca to the Macleay Heads? No.
437. Suppose that tramway or railway communication with the Macleay was given to you, and the Macleay entrance was made navigable, would that suit the people of the Nambucca? Which entrance to the Macleay would you improve?
- 438.

- T. Bolton. 438. The new entrance? Decidedly not. With two or three heavy gales the whole of the sandy beach there will be in the river.
- 1 June, 1898. 439. *Chairman.*] Would such a railway suit you better with a waterway of your own? Decidedly not.
440. *Mr. Farnell.*] You think that the Nambucca is the natural outlet to this district? Yes.
441. And you think that the improvement of the entrance will do all that is required by the people of the district? If the flats are opened up to the top end of the island the floods will wash the whole channel out without the aid of any training-wall, besides that which is there now. I have been in and out of these bar-harbours since 1849. I came to the Macleay in 1849, and where the new entrance is now there was then a sand-flat which we used to get water in.
442. Have you noticed any material difference in the depth of water in the main river since you have been here? No, it has always been about the same.
443. I understand that the river is navigable for many miles? Well, the "Euroka" could go up 5 miles above Macksville.
444. Would it be a convenience to the people if she could go up still further? No. The people there will always have to bring their produce down on the droghers. I believe that Macksville will be the head of navigation for all time.
445. Do you know of any other way whereby the convenience of the people of the district may be met than the improvement of the river entrance? There is no other way that I can see.
446. *Mr. Roberts.*] Where is the best maize-growing land on the Nambucca? The best alluvial land is at Bowra and on Taylor's Arm. There is also good land on Warrell Creek.
447. Are there many farmers on Warrell Creek? There is more land to be taken up there.
448. Is all the best land taken up? Yes, and in some places the back land has been taken up. Nearly all the water-frontages have been taken up.
449. Is the land you speak of within easy distance of the Government wharf? It is 15 or 16 miles from the wharf to the first settlement up the creek. For the last 9 miles of its course the creek passes through sand.
450. Do the droghers go up Warrell Creek to get maize? Occasionally, when there is a load ready.
451. There is no difficulty in getting the droghers up? Not during spring tides. I have not heard of any difficulty being met with since the creek was deepened at the island crossing.
452. What freight do you pay to send a bag of maize to Sydney? I think 1s. 6d. a bag.
453. Does that include droghering? Yes, but it is 1s. 6d. a bag whether you put your maize on board the steamer at the Heads or on board the drogher at Bowra.
454. How far does the drogher go to collect maize? From the Heads to Bowra is a distance of about 20 miles. Bowra is the head of navigation for droghers. Welsh's wharf is the head of navigation on Taylor's Arm.
455. Does the drogher bring down any timber? No; there are proper log punts for that.
456. Where is most of the timber obtained for the saw-mills? From all parts of the river—from Warrell Creek, from Taylor's Arm, and on the Main Arm right up as far as Bowra.
457. Is the timber on Taylor's Arm or beyond Bowra superior to that down near the coast? It depends upon the class of timber you want.
458. What are the principal timbers you send from here? Tallow-wood, black butt, flooded gum, and ironbark. A great number of girders and piles are sent away from here.
459. Does the timber on the Nambucca compare favourably with that on the North Coast rivers? I do not think that the timber of any other river on the coast will beat it.
460. Are there many farms higher up the river than Bowra? The greater number of the farms is above Bowra.
461. What is the longest distance that the farmer has to cart his maize in order to put it on the drogher? I cannot tell you. I have seen teams at Taylor's Arm that have come down 18 or 20 miles or even more.
462. Is the river so shallow that they cannot use it? Well, at times there is only one drogher, and she is not able to attend to all the farms. The maize has been lying in the barns until the people have had to bring it right down to Macksville to get it away.
463. How much time does a farmer lose in bringing his maize 20 miles? They generally employ the services of bullock-drivers. I do not know what they pay per bag to have it brought down.
464. Have you a farm on the river yourself? Yes.
465. Where is it situated? Just where you cross the valley.
466. How many acres have you? 198.
467. How many acres do you cultivate? This year I have put about 12 acres under maize; the rest of the land is under grass, more or less.
468. Have you entered upon the dairying industry? I have done a little at it. I intend to go in for it properly, and I have spent £40 upon a separator.
469. Do you think that dairying will be a success in this district? It has to be proved yet, but I think that it will. We want a better outlet for our produce. I have been sending cream to Kempsey.
470. How far is that? Thirty-nine miles from Macksville.
471. Do you send it to Kempsey to catch the Macleay River boat? I have taken it over to the Macleay Heads, and the steam launch has carried it down from there.
472. What is the freight upon cream to Sydney? I have never sent cream to Sydney.
473. Are you able to dispose of your cream at Kempsey? Yes, to Foley Bros.' factory there.
474. From what distance do the people send their produce to Sydney by way of the Nambucca;—do the people half-way to the Macleay use the Nambucca, or do they use the Macleay? Well, it depends upon the rates to some extent. You can go to Kempsey through Clybucca. If you want to get to the entrance you have to go to Jerseyville. You can go to Stewart's Point in about 9 miles; but the road goes round about 16 miles.
475. Do you send your cream to Kempsey regularly? No; my cattle have all gone dry, and I am not dairying at the present time. The reason why I have not cultivated much land is that the land is too expensive to clear. It costs between £25 and £30 per acre to clear, and it is not tip-top land then.
476. Have you held your present farm all the time you have been on the Nambucca? Yes.
477. How much of the land you hold have you cleared? I suppose I have cleared 120 or 130 acres. As fast as I have earned money by contracting, and in other ways, I have spent it in improving my land.

478. Is there any demand for land in this district? You see people looking for land almost every day. T. Bolton.
479. Has the demand for land increased since the improvement of the river entrance has been in contemplation? The demand for land is increasing more or less every year. 1 June, 1898.
480. Is there any good land open for selection at the present time? Not land that is handy to the river. All the river frontages have been taken up.
481. But if you go far enough up the river you can get plenty of land? You can get land in patches all over the place.
482. Cannot you get water frontages some distance beyond the head of navigation? You get frontages to creeks and gullies.
483. But the land is good? You get the best land up among the creeks.
484. Is the farming land here equal to similar land on the Macleay? You may get a good patch of scrub land equal to the land on any part of the Macleay, but the Macleay land is altogether different from the Nambucca land. On the Macleay the land is alluvial, and after the third year you can plough it. The timber is scrub timber, and after a second fire it all disappears. Here, however, after felling the trees we have to draw the logs together, cut them up, burn them, and dig out the stumps. You cannot get rid of hardwood timber easily. I have known places on the Macleay where they have dug trenches and put the trees in and ploughed over them.
485. How does this river compare with the Bellinger? It is not nearly so good as the Bellinger. The Bellinger is one of the best rivers on the coast. It would be difficult to find better land than there is on the Bellinger.
486. How long have you been on the Nambucca? I selected here in 1866.
487. Why have you remained here instead of going to the Macleay or to the Bellinger? I have seen three floods on the Macleay over the river bank in twelve months, besides minor freshes. I came over here as a shipbuilder.
488. How long did you keep on shipbuilding? Not long. Then I went in for contracting, and put my nose to the grindstone to keep things going.
489. How long is it since you settled down at Macksville? I put in two years here. Then I went to the Bellinger for five years, and when I came back I stayed here. I went to the Bellinger because there was no work here at the time.
490. You have done fairly well, I hope, since you have been here? Yes. If I had sold out when the land boom was on I should have done very well. I could have sold then for £2,000, but I doubt if I could get £500 now, although I have put up a house on the land which is worth nearly the money.
491. When was the last flood on the Nambucca? Well, the flood here is more like a spring tide. I have seen tides almost as high as floods. I have seen a very high flood, but at that time there was only a narrow entrance, and a high sea running, so that the water could not get out; but after that the Spit was swept away, and ever since the bar has been coming further in. I consider that now the bar is an inner bar, not an outer bar.
492. When did you have the last flood of any importance? From seven to ten years ago. At Bowra the water might rise 30 or 35 feet, but down here a flood is only like a rise caused by a big spring tide. We are so near the entrance that the water gets away quickly.
493. What is the effect of a flood upon the land here;—does it fertilise the land? On the Macleay a flood leaves a deposit, but down here the water does not go over the land at all.
494. So that here you simply lose by a flood; you gain no advantage from it? Yes. Up about Bowra a flood will wash one point of land away and make up for its loss on the other side, perhaps. The same thing happens on the Bellinger.
495. You are Vice-President of the local Progress Committee? Yes.
496. Have the members of the committee considered the proposal to improve the entrance to the river;—is there unanimity among them on the question? They are unanimous that it is necessary to open the river.
497. Do you regard the proposal of the Department with satisfaction, or are there any suggestions which your committee would like to offer for our consideration? I do not know of any.
498. What are the principal disabilities under which the residents on the river labour;—if you got an improved entrance, will that be all you will require? We want regular communication, so that we may get our things to market at any time we send them down.
499. What you suffer from now is the uncertainty of steamer communication? Yes. Pigs, fowls, eggs, all deteriorate in transit. When they get to Sydney perhaps they fetch hardly anything.
500. How often does it happen that you lose in this way;—are you put to constant inconvenience and loss? Well, there is always inconvenience, more or less. If a vessel makes a good trip the produce gets into Sydney in good order, but if there is any delay perishable articles suffer. Pigs, in particular, fall away.
501. Do you expect a reduction in rates if the harbour improvements are carried out? I think that if we get a proper entrance there will be an opposition company, and we shall then not have to knuckle down to the North Coast Company for everything. Opposition is the life of tradé. Of course vessels cannot run for nothing, steamers in particular.
502. Do you regard the charges which you have to pay now as excessive? I do not know that the company could do the work for less at the present time, but if the place is opened up, and the charges continue as high as they are now, I shall consider them very unreasonable.
503. How does a rate of 1s. 6d. a bag for maize compare with the rate paid on the Macleay? On the Macleay I believe the maize is taken away for 1s. a bag.
504. Would residents on this river be satisfied if they could get their maize taken away for 1s. a bag? They have to be satisfied to get it away at all. For pigs we pay 5s. each, large and small.
505. Is the rate for pigs higher than the rates on the other rivers? I do not know what the rate for pigs is on the other rivers. I have also had to pay 4s. 6d. a head for feed, and to meet other charges in Sydney.
506. Is all your produce sent to Sydney as a rule? We have no other market. All the steamers coming here trade to Sydney.
507. Are there not any local buyers? There may be a local buyer for maize, but he is under the same inconvenience as the shipper. I do not suppose that he gets his money until the return comes back, unless the maize is taken to pay a debt. 508.

- T. Bolton.** 508. Is any quantity of butter produced in the district? No; butter production is in its infancy here. It is only last year that we started.
- 1 June, 1898.** 509. Is it fair to say that the present year will show an increase in the production of maize, timber, eggs, poultry, pigs, and so on, as compared with previous years? Well, I would not say that there will be an increase in the timber production. One mill has been removed to the Bellinger, and there are only two mills now, whereas previously there were four. One of the mills has been burnt down. A large quantity of farm produce will be sent away.
510. Do you think that the exports of this year will exceed the exports of last year? The export of maize this year will be one-half as much more as the exports of last year. In regard to my own crop, I am positive that it will be doubled.
511. Why is that? The land has got into better working order, and we have had a better season than usual.
512. In round figures, the export of last year, as shown by the ships' manifests, was 40,000 bags;—do you think that the exports this year will be 80,000 bags? No; it will be 60,000 bags.
513. That is an increase of 50 per cent.? Yes.
514. What is about the average yield of maize per acre? It depends upon the season. This year I am taking 80 bushels to the acre off one patch. Last year I did not get more than 20. On the average, I should think that the yield last year was about 20 bushels to the acre. This year I believe it will be twice as much.
515. But take one year with another? I think the yield would be about 25 bushels to the acre all through the district.
516. What is the net return per bushel? That depends upon the price obtained in Sydney.
517. What did you get last year? I got 2s. per bushel for what I sent away, and I had to pay 1s. 6d. a bag freight—4½d. a bushel.
518. So that your net return would be about 1s. 6d. a bushel? Yes.
519. How many acres of maize do you think a man would have to cultivate to keep himself and his family alive? On the Macleay a man can just manage to live on 25 or 30 acres of good land.
520. But here he would want 40 or 50 acres? Yes; and then it would not pay for the labour put into it.
521. That being so, what is to make this district productive? The clearing of the land, and the putting of it under cultivation.
522. Under cultivation for what? For maize, and the using of it for dairying.
523. But you say that it does not pay to clear the land? If a man had 40 acres of ground he would have to employ labour to work it, and by the time he had paid wages he would have very little out of his crop.
524. Then what is to make the district prosperous? Well, the land must be cleared, as in other districts.
525. But it would appear from your statement that if a man clears land he goes to the bad? Well, a man would not have to employ labour all the time; but besides that there is the expense of the crop and the expense of sending it to market.
526. What will make things better in this district? To get more land cleared and more people on the land. I will get 60 and 70 bushels to the acre this year, while last year I only got 20 bushels.
527. When the land is thoroughly cleared and worked up it will give a better return? When the land is thoroughly worked up you will get as much off an acre as is obtained on the Macleay and in any other places.
528. You say that to clear the land costs £25 an acre? From that to £30.
529. What does it fetch per acre? There is no sale for land. You might be able to give it away for £2 or £3 an acre. Of course the land must go up again in price.
530. Am I to understand that with proper cultivation a payable yearly crop will be obtained? Yes; the crop improves every year. You must understand that I am speaking of the land down here, not of the land up above Bowra, where there is alluvial soil.
531. It would appear to be of no use for a man to come here unless he had some capital to start with? I do not think a man should go on to land unless he has capital to start with.
532. What was the population of Macksville when you came here? There were only about three families here then.
533. You do not know the population now? No.
534. Has the town grown to a considerable size? Yes; it has improved in some respects, while in other respects it has gone back, like other places on the coast.
535. Do you consider that the farmers in this district are now in a sound financial position? Until you come to sound them you think that they are, but when you find out all about them you discover that most of them are in the hands of the banks.
536. Do you mean with large amounts to their credit? No; I mean that they have all mortgaged their land to the banks.
537. *Mr. Trickett.*] I suppose that is because of the entrance being bad? No; it is owing to the fact that when the land boom was on they mortgaged what land they had to buy more land. I have known people on the Bellinger and on the Macleay owning first-class land who mortgaged it and then lost everything.
538. Then earth-hunger has been the cause of the present state of affairs? Yes.
539. A desire for more land, and an over-estimating of the capabilities of the land? Yes; they have been carrying on too high a game. The times were good, and people thought that they would never change; but they have changed.
540. Corn fetched a better price then than now? In my time corn came up to 5s. a bushel—from a bushel of corn to a bottle of rum. I have seen corn sold at 7s. 6d. a bushel at the barn-door, but next season I got only 1s. 5d. a bushel in Sydney, and paid 1s. 6d. a bushel in freight. You will see that I have had ups and downs.
541. Do you regard 2s. a bushel as about the lowest price that a grower can afford to get? That is about the minimum price.
542. If a man cannot get more he had better leave maize-growing alone? Yes.
543. *Chairman.*] Land that would cost £30 an acre to clear would be covered with heavy timber? Yes.
544. Would not that heavy timber be valuable? You cannot get rid of it. Most of it is pipey or knotty.
545. But would not a large quantity of it be saleable? No; I have had splendid trees on my land, but the mill will not take them. The timber I speak of is grey gum, which is equal to ironbark.

Edward Hitchins, auctioneer, Warrell Creek and Macksville, sworn, and examined:—

546. *Chairman.*] How long have you been in the district? About fourteen years.
547. Have you a general knowledge of it? Yes.
548. *Mr. Clarke.*] You know what has been done at the entrance of the river, and what it is proposed to do there? Yes.
549. Do you think that if the Departmental scheme is carried out it will be beneficial to the public? Yes.
550. Do you think that the best means of developing the district is to make the entrance to the river navigable? That is all we want.
551. It has been suggested that a railway might be made to the Macleay? That would be too expensive, I think.
552. You are of opinion that water carriage is always cheaper than land carriage? Yes.
553. What do you think of the resources of the district? They are very large. The production of the district can be increased by opening up the river. There is any quantity of land here for selection and for purchase. All that is wanted is people.
554. But if prices are as low as they are described to be by a previous witness, do you think it would be profitable for people to come and take up land here and clear it? I think that Mr. Bolton's evidence, as to the cost of clearing land, is too high. I consider that from £10 to £15 an acre will be the cost of clearing.
555. *Chairman.*] Do you refer to land similar to that referred to by Mr. Bolton? Well, anywhere about the salt water the land is more easily cleared than it is down towards the mouth of the river. You have only to put a match to the softwood country and it will all burn away. Up further the land is all covered with softwood, and you only get about eight or nine hardwood trees to the acre. Down the river, of course, the timber is all hardwood.
556. *Mr. Clarke.*] So that the statement of the previous witness would only apply to the land on which he himself resides? To the swampy land, and to the land on the lower parts of the river, where the timber will not burn well. You might have a fire there for three months and it would not burn the timber off.
557. Of course, in dealing with any timber, you must fell it first? Yes. We pay from £1 to £1 10s. an acre for felling timber, and then, if it is softwood, most of it will burn away.
558. I suppose in many cases corn is planted among the timber with a hoe? Yes, in the first year. Then you cut up the timber, pull it together, and burn it.
559. After that the land is fit for maize-growing or for dairying? Yes; there is a little stumping to be done, but as the years go on the softwood timber rots, and the stumps disappear.
560. You cannot sell the hardwood timber to the mills? Not the timber that grows on the alluvial flats, because it is too far up the river, and the timber is not what the mills require. You have to go to the ridges for timber that suits the mills.
561. Do you think that the trade of the port is improved since the harbour works were commenced? Yes, considerably. The only drawback to the district is the bad state of the river. I could induce people to come here if there were facilities for getting produce away. Our resources are very large; but we require better means of communication with the market.
562. What are the resources of the district? Maize-growing, dairying, timber-getting, poultry, and pig-raising.
563. *Mr. Farnell.*] Fruit-growing? There is not much fruit-growing; but oranges will grow well here. You can get splendid self-sown oranges in the scrubs.
564. *Mr. Clarke.*] Pig-raising is very profitable? Yes.
565. Are the pigs generally sent alive to Sydney? Yes.
566. Is any bacon made here? No. People sometimes drive their pigs over to the Macleay, to get them away quickly.
567. To the factory there? No, to ship them to Sydney.
568. Is there any bacon factory on the Macleay? No.
569. After you get away from the coast is the land on the river generally good? Yes; it is as good as any land in the Colony. The alluvial flats are small, but they are very rich.
570. Do they extend any distance from the water? Not any great distance; not beyond 30 or 40 chains, generally.
571. Is the higher land good for dairying if cleared? It is what we call first-class forest land. It is good for maize-growing for six or seven years.
572. It is not nearly as good as the alluvial flats? Certainly not. You cannot tire out the alluvial flats.
573. Is much grazing done here? Not a great deal; the country is not open enough.
574. I suppose it will be some time before the dairying industry becomes of very much importance? No. I consider that the industry has made great strides during the last two years. I started about a year ago with one small hand-separator, and now there are thirty or forty separators in the district, including three steam separators.
575. Do you make butter here? No. We send away our cream to the Macleay, and to Sydney—to Foley Brothers, and to Denham Brothers, on the Macleay.
576. But is there not a risk of losing your cream if you send it to Sydney, because of the delays in shipment? Yes. The people have to take that risk. Some cart their cream to the Macleay, and send it from there to Sydney.
577. I suppose that in the future the cream will be made into butter locally? I think it will not be long before we make butter, if we get good communication with Sydney.
578. Butter will deteriorate if kept a long time on the steamer, unless it is placed in refrigerating or cooling chambers? Yes.
579. Have the vessels trading here refrigerating chambers? I do not think so.
580. If the entrance to the river were improved vessels of a larger size might come here, and you might get competition, which would lower the rates of freight? Yes. Once the steamers can get inside the river they can steam up to the wharf.
581. Do you consider that 1s. 6d. a bag is too high a rate for maize in the present state of the bar? Yes. Of course there is not sufficient trade on the river, at the present time, to employ two steamers.
582. It requires a considerable amount of capital to go in for dairying? Yes. If people own land of their own the vendors of cows will give them accommodation.

E. Hitchins.
1 June, 1898.

- E. Hitchins.
1 June, 1898.
583. Do you think that dairying will be successful? Very successful.
584. But I suppose that on the whole mixed farming would be better? Yes. The flats here are too rich to put under grass, so that there will always be maize-growing and pig-raising.
585. In the dairying industry the returns are made monthly;—you do not have to wait a long time for your money, as in the case of the maize-growing industry? Yes.
586. That is a great consideration? Yes. There are many risks connected with maize-growing which are not connected with dairying. In many instances it is a hundred to one that you never get a crop.
587. How many acres would it take to keep a cow here? I think that in some places we could put three or four cows on to one acre. In a back paddock here there are 5 acres which will keep twenty cows for twelve months.
588. It must be very rich alluvial land? It is rich grass land. It is surprising how much stock it will carry.
589. Taking everything into consideration, you think that the carrying out of the proposed works would be of considerable benefit to the whole district? Certainly.
590. I suppose it will be the salvation of the district? Yes. Once we can get the steamer to come up here we shall get competition.
591. Most of the farmers in the hands of the banks now will require to get clear before they can do much? The banks have given them splendid terms, and some of them will get their land back. The banks have given them as much as ten years in some cases.
592. So that things are coming to a normal condition again? Yes.
593. Is there anything you would like to add? I should like to say that when I came here there were only two families at Taylor's Arm, and now there about 100. Out at Warrell Creek the population had increased 200 per cent. The Unkya Creek and the Allomera Creek people take all their maize now to the Macleay Heads, which is several miles further than to the head of Warrell Creek.
594. Do you think that the population of the district will continue to increase? Yes. I sold a farm a couple of days ago to some Macleay people who wanted land. That farm contained 660 acres.
595. What is the price of fair average alluvial land here? We can get £10 an acre for the alluvial land fronting the river.
596. The back land would not be so valuable? No, not in proportion. I am speaking of improved land.
597. *Chairman.*] Is unimproved land saleable? There is very little unimproved land, unless it is land available for selection.
598. *Mr. Clarke.*] What is the value of land which is not improved;—could you put any value upon it? Not unless I saw the land myself.
599. I suppose unimproved land here would not average much more than £1 an acre? No, it would not be worth more than that. In some parts the trees have been felled and have grown up again.
600. Do you think that the population and the production of the district are likely to increase by 50 per cent. within the next few years? Yes; they are both increasing very fast.
601. *Mr. Trickett.*] With regard to land transactions, do you find that the people here stick to their holdings well? Yes, as long as they can. Of course the banks have weeded out a few of them.
602. Can the struggling hardworking farmer get along here? Yes. Some years ago we had a repetition of floods, and that crippled all the farmers, but they are getting on to their legs again now.
603. I thought that the floods did no good here? Of course, down on this part of the river the floods do not go over the land, but higher up, where there are alluvial flats, the land is flooded. Maize is grown 40 miles up Taylor's Arm.
604. Has that maize to be brought down to the steamer by teamsters? It has to be brought to the head of navigation. Of course, it takes a very small rise in the river to flood the flats there. Down here, however, the water does not come over the banks.
605. We have been told by a Government officer that, it is intended to throw open about 5,000 acres of land at the head of Taylor's Arm for selection;—do you think that land will be taken up for farming purposes? Yes.
606. In what areas? From 40 acres upwards. It is very rich land, like the Orara land. That land must all be taken up. All that is wanted is facilities for getting maize away.
607. We have been told that there are 253,500 acres of unalienated land in this district;—do you think that if increased facilities for getting produce away are given that land will be taken up? Yes.
608. Do you think that there is no doubt about that? Yes; I know how the production of the district has increased of late. Last year we sent away over 40,000 bags of maize. This year the export will be 50 per cent. more.
609. I suppose a large quantity of the maize is consumed locally by pigs and other live stock? Yes; and a large quantity of the maize that is grown on the Unkya and Allomera Creeks now goes to the Macleay Heads.
610. Have any of the banking companies an office on the river now? No.
611. I suppose at the present time the payment for produce is very often in return stores? I dare say in many cases it is.
612. Where are your bank centres? The Banking Company have a branch at Bellingen, and the A.J.S. Bank have a branch at Kempsey.
613. *Mr. Roberts.*] You differ from Mr. Bolton as to the cost of clearing land;—do you differ from him upon any other point? Yes; I think that he said that the "Euroka" took all the produce from here; but I should like to point out that there are several sailing vessels which come here for timber. The timber is not sent away by steamer at all.
614. Do other steamers come here besides the "Euroka"? Yes; the "Billy Barlow" and the "Tilbury" also comes here.
615. Do the sailing vessels all come up to Macksville? Not now.
616. Does the "Euroka" come to Macksville? Occasionally.
617. Is she the only steamer that can come here? The "Pelican" comes here, and tranships to the "Burrawong" at the Macleay.
618. The small steamers meet the "Burrawong" at the Macleay? Yes, or meet a steamer at Port Macquarie.

619. Do you think the future of the district is sufficiently good to warrant the proposed expenditure at the mouth of the river? Considering that so much money has been thrown away in other parts of the Colony, I believe that we are entitled to even a larger expenditure than is proposed. These works will have to be carried out, and the sooner they are carried out the sooner the district will improve. E. Hitchins.
1 June, 1898.
620. Would you regard the construction of these works as the throwing away of money? No; I consider that it would be a good expenditure, because it would help to settle people on the soil.
621. *Mr. Clarke.*] And it would keep them here? Yes.
622. Do you think that 25 bushels an acre is a fair average yield of maize? No; I think that the average yield of maize in the district is from 50 to 60 bushels.
623. *Chairman.*] Is that taking one year with another? That is providing that there are no floods.
624. But take a period of ten years? For the last ten years the average yield has not, perhaps, been more than 25 bushels, but for the last five years the average yield has been from 30 to 40 bushels. On some land you get over 100 bushels.
625. How is the land held, under ordinary conditional purchase, or is any quantity of it special area land? I think the Unkya land is all special area land.
626. Has any quantity of land been taken up here under the special area system? Yes.
627. At what price? At, I think, 30s. an acre.
628. What is about the average yield of a free selector in the district? I should think about 100 bushels.
629. Are there any holdings of 640 acres? Very few.
630. That is because the land is so expensive to clear? Yes; and to get 640 acres, you have to go right back to the mountains in some places. All the frontages are taken up.
631. It is estimated that within the area contained by a line midway between the Nambucca and the Bellinger, by a line midway between the Nambucca and the Macleay, and by the dividing range, there were at the end of last year 27,600 acres of freehold land, and over 10,000 acres of privately-leased land; this year there were 5,450 acres of land under maize;—do you think that the area I have described is capable of trebling its present output? I hardly think it would treble it; but I believe that you could double it.
632. Would all the country I have described be within the influence of the Nambucca River if the entrance were made good? Yes.
633. Would the whole of this area contribute to the trade of the river? Certainly.

Angus McKay, storekeeper, Macksville, sworn, and examined:—

634. *Chairman.*] How long have you resided here? For about fifteen years.
635. *Mr. Trickett.*] I suppose you have watched the progress of the district very closely;—do you regard this as a progressive district? Of late years it has been very progressive. A. McKay.
1 June, 1898.
636. Will you tell us what its development has been since you came here? When I came here only one small sailing vessel used to trade to the river and she did not take away more than fifty bags of maize a month, or about 3,000 bags a year. Now, however, there are about 40,000 bags of maize sent away each year. I think that about 3,000 pigs go from the district now. Last year about 10,000 bags of maize went to the Macleay from the Unkya and from Warrell Creek.
637. In your opinion, the district has improved year by year? Yes.
638. Like other districts, it has had its ups and downs? Yes.
639. Why did the place fall behind so much a little while ago? The bad state of the bar two years ago made it fall behind. Last year we were eight months without any communication across the bar, and maize was lying rotting all along the banks.
640. Was that after the commencement of the harbour works? A swell altered the channel and sent the sand everywhere, leaving no permanent entrance. Since it has gone further out, however, the channel has improved wonderfully.
641. How does the district stand in regard to floods? It does not suffer so much as the Macleay and other districts in floods. Floods go over the maize, but the houses and cattle are secure.
642. Do you look upon this as a fairly sound district? It is going to be a very sound district.
643. You have done fairly well in business here? Yes; there is not so much credit asked for now as was asked for two years ago.
644. Steam communication is getting better? Yes.
645. We hear that the output of the district is likely to be more extensive next year than it has been in the past? Yes.
646. Why do you think that that will be so? Five years ago I do not think we exported 20,000 bags of maize. This year I am certain that we shall export 60,000 bags of maize. The increase in our export is due to the larger area of land that has been cleared and cultivated.
647. How do you get your goods up from Sydney? By the North Coast Company's boat and the drogher.
648. What is the quantity of goods brought to the Nambucca by the steamers in a year? About 20 tons a week.
649. That would be general goods—groceries, ironmongery, and articles for household use and consumption? Yes; of course that is not counting the stores which are brought up by sailing vessels for the saw-mills.
650. What would be the value of those goods? I could scarcely say. I suppose £100 worth of goods would be brought here every week.
651. So that the imports of the district would be worth £52,000 a year? Yes.
652. How many storekeepers are there here? We have four stores.
653. Are they all doing pretty well? I think so.
654. Is there any other way in which goods can be brought to Macksville than by steamer? When the bar is bad we get our stores from the Macleay.
655. Is much brought from the Macleay;—would the goods brought that way be worth £2,000 or £3,000 a year? I think so. Cream, eggs, and fowls go to the Macleay very often when the bar here is bad.
656. Does the town of Macksville serve as a centre for a large district? Yes; there is a small town up the river about the size of Macksville where there are four stores.
657. Do the goods for these stores go up the river? Yes.
658. Do you hear many inquiries for land in the district? Yes; there is always someone wanting land. There have been two or three looking for land this week.
659. For dairying purposes? Yes.

- A. McKay.
1 June, 1898.
660. It looks as if dairying would be a large business in the future here? Yes; I have two steam creameries working, one here and one at Bowraville.
661. Have you any cattle? No; I only buy the milk.
662. Where do you send the cream? We used to send it to the Macleay; but this month I am churning it myself.
663. Do you find that butter-making pays? Yes.
664. Are the creameries which you have started profitable? Yes, they are doing very well.
665. How many are there in the neighbourhood? One more besides my own; that is, without counting the hand separators.
666. Is dairying a large industry here? They are getting what companies they can here, and going into it as much as possible. They only started dairying here about two years ago.
667. What is the rate of freight inwards? About 30s. a ton.
668. How does that rate compare with the rates on the other rivers? The rate to the Macleay is £1 a ton for general goods, and 12s. 6d. for heavy goods—salt, flour, sugar.
669. Therefore, you are handicapped to some extent? Yes.
670. Is that because of the entrance? Yes. No parcel is carried for less than 1s. 6d.
671. With an improved entrance, do you think you would have lower rates? Yes. I have seen the ship people myself, and I have asked if they would not charge lower rates. They told me that as soon as we get a better bar they would reduce the rates as they had been reduced on other rivers.
672. The reduction of the rates would be of great advantage to the people here in giving them larger profits? Yes. The ship people say "Make the bar good and we will take your stuff away at lower rates." At the present time the vessels have to go out only half loaded.
673. Do you agree with the evidence of previous witnesses? I do not agree with what Mr. Bolton said, as to the price of clearing land here, and as to the value of land. I do not think he understands anything about farming. People who are used to clearing land can clear it much more easily than he supposes.
674. What do you think land for farming purposes is worth, and what does it cost to clear for maize-growing? The maize-growing land is felled for 30s. an acre, and the timber is cleared away very quickly.
675. That land is higher up than the navigable part of the river? Yes. The timber on that country is easily burnt off.
676. Do the people who deal with you keep their engagements pretty well? Yes. The people on the land here are in a very good position. Only very short credits are asked for. A few years ago, however, we used to stand to the people for twelve months; now there is none of that.
677. Are there many abandoned holdings in the district? There are a good many old abandoned holdings, but no one has left the district during the last few years. People are continually coming into the district, because it is looked upon as a good one.
678. You think that this is a progressive district, and that lately it has been progressive at a more rapid rate than formerly? Yes.
679. You think that what has given it an extra start is the improvement in the means of communication? Yes. We ask for nothing more than a good bar. If the proposed works are carried out this district will be second to none on the coast.

William Ezold, storekeeper, Macksville, sworn, and examined:—

- W. Ezold.
1 June, 1898.
680. *Chairman.*] How long have you been here? Five years.
681. *Mr. Roberts.*] How many stores are there at Macksville at the present time? Four.
682. Were there three other stores here when you arrived? No; there were only two here then.
683. Do you regard the increase in the number of stores as a proof of the improvement of the district? It should be considered a proof of its improvement.
684. Has your business increased since you came into the district;—is the trade of the district expanding? As there are four stores here, and each is doing about the same amount of trade as I have done, there must be an improvement in the district.
685. Are you doing as well now as when there were fewer stores? Yes.
686. Do you get all your goods from Sydney? Yes.
687. Do they all come up the river? Yes.
688. Are they brought by steamer or by sailing vessel? By steamer.
689. Do you know what quantity of general merchandise has been imported during the last few years? No.
690. The last witness told us that about 20 tons of general merchandise is imported weekly? I consider that 30 or 40 tons of general merchandise must be imported each week.
691. What would be about the value of the goods coming here weekly? I could hardly say.
692. What would be about the value of the goods you purchase in twelve months? About £2,000.
693. Do the other stores in Macksville do about the same business as you do? I could not say.
694. How many stores are there in the district altogether? In addition to those at Macksville, there are, I think, four at Bowra.
695. And how many down at the Heads? I think three.
696. And how many at other places? There are a few people who import goods and sell them, but they do not keep stores.
697. Well, suppose there are twelve stores or their equivalent in the district altogether, and each does the same business as you, the value of the imports of the river must be about £24,000 per annum? Yes.
698. Is your business confined to Macksville? No.
699. How far do you send goods? Right up Taylor's Arm for 30 miles, to Unkya, and to Allgomera.
700. Do you send any goods to Bowra? No.
701. Do you send any goods to places between here and the Heads? No; I cannot compete with people lower down the river.
702. People on the river have their goods delivered by the drogher free? Yes.
703. I suppose your goods are landed at the Government wharf here? Yes.
704. When you send goods up the river I suppose you have to pay the cost of droghering? No; my goods are taken round the district in a waggonette.

705. Is that the cheapest way of reaching your customers? There is no other way in which to reach them.
706. What freight do you pay to bring goods from Sydney? For heavy goods (sugar, flour, &c.), £1 per ton; the small goods come to £4 or £5 a ton.
707. But you have never paid as much as £5 a ton on goods? I pay at that rate for small cases. I am charged for every package brought to the wharf. I can get a parcel of drapery sent up by post for 8d. or 9d., but if it comes by steamer I have to pay 1s. 6d.
708. Is not the rate for some merchandise 30s. a ton? Of course, for big boxes you may have to pay only about 30s. a ton, but for small boxes of groceries and other goods you pay much more. On the average I pay £3 a ton.
709. How do the rates charged on this river compare with the rates charged on other rivers on the North Coast? I think on the Macleay they only pay half as much as I pay. I cannot say whether they pay as much for small goods as I have to pay.
710. Is the district in a fairly prosperous state? It promises to be much better than it has been for several years past.
711. You have good opportunities for judging, because of your transactions with the settlers here? Yes.
712. Do you buy much produce from the farmers? I buy produce conditionally.
713. Do you ship it away for them? Yes. Last year I bought some corn, but I could not get it away because the company did not come for it. In the meanwhile the market dropped, and my customers were greatly annoyed, because they lost by the arrangement. The North Coast Company monopolise the trade of the river, and they do what they like.
714. Is there not a regular weekly steamer? No.
715. Is the steam communication altogether irregular? Yes. Just lately the steamer has been a little more regular. I told the company that I was very glad about it, but they informed me that when the maize trade commenced again on the Macleay they might not be so regular.
716. Do you lose much through being unable to get perishable goods to market? Yes.
717. You receive consignments of eggs, fowls, and so on, from the farmers? Yes; I take them in exchange for goods.
718. Is this business satisfactory to both parties? Yes; but the difficulty is to get things to Sydney. There is always something short. I have sent citrons and oranges away. In some cases, instead of getting a return for what I have sent, I have got a bill for excess freight.
719. Do you regard the rates charged by the company as too high? Yes; much too high. They lowered them 50 per cent. when the Farmers' League was established. That was for small cases of eggs, fowls, and so on, nominally; but actually the rates have not been lowered at all. It is very desirable that we should have competition. Without it it is almost impossible to carry on business in this district.
720. Are we to regard the district as fairly prosperous? Yes; but the storekeepers have to suffer. I think they are the only ones who suffer.
721. Is that because of the irregular steam communication? We have to compete with the Macleay prices, and we have to pay high freights and make losses of all kinds because of the irregular steamer communication.
722. Notwithstanding all these drawbacks, do you think there is a good future for the district? I should like to see steamer competition here. The company has promised to run more regularly if the bar is made good.

W. Ezold.
1 June, 1898.

Frederick Notley, general storekeeper, Macksville, sworn, and examined:—

723. *Chairman.*] How long have you been here? Nine months.
724. Where were you living before you came here? On the Macleay.
725. For how long? All my life, except two years.
726. Have you a general knowledge of this and of the Macleay district? I do not know this district as well as I know the Macleay district, because I was not acquainted with it before I came to Macksville.
727. *Mr. Farnell.*] Have you seen the works in progress at the entrance to the river? I have seen them from the boat when coming up the river.
728. You had no knowledge of the state of the entrance before these works were commenced? Only from hearsay.
729. What do you think of the future of the district? The conclusion I have come to with regard to this district is that in a few years, with improved navigation and better communication with the Sydney market, it will make leaps and strides, and become one of the principal dairying districts in the Colony. I consider that this will be a good dairying district, because so much of the land here is not subject to floods, and cattle can always find pasture upon it, while there is sufficient alluvial land to enable a certain amount of agriculture to be carried on. With agriculture there always goes pig-raising. This is also a splendid district for poultry.
730. Do you think that mixed farming can be profitably carried on here, providing that the bad state of the entrance is improved? Yes; this would then be a very prosperous district.
731. Do the natural grasses grow well here after the timber has been removed? Yes; on a good deal of the land the natural grasses grow well after the timber has been removed.
732. Do you think there is any doubt as to the capacity of the land to grow sufficient fodder for cattle? None at all. I believe that there is land in abundance to grow fodder for cattle.
733. Do you know any farmers who have been growing lucerne or making ensilage? I know that lucerne has been grown. One man told me that he cut his lucerne ten times in one season. I have seen lucerne here that would compare favourably with the lucerne grown on the Hunter. I have seen wheat and good grass growing on ridges 50 feet high, and growing to the very top of them.
734. Are you much in communication with the farmers here? A great deal. I travel throughout the district in my van.
735. Do you purchase things from them? Yes; I take almost anything in exchange for goods.
736. Do you consign this produce to Sydney? Yes.
737. Since you have been here, have you suffered inconvenience because of the irregular steamer service? Yes; I have suffered considerable inconvenience and loss through it, though I understand that the trouble was greater before I came here. Perishable articles do not get to the markets soon enough. Fowls have left here healthy and in good condition, but on reaching Sydney many of them have been dead or unsaleable. Eggs have been a month in getting to the Sydney market.

F. Notley.
1 June, 1898.

- F. Notley.
1 June, 1898.
738. You have no doubt as to the reasonableness of the supposition that more land would be put under cultivation if greater facilities are afforded for getting produce away? I have not the least doubt that a very much larger area of land will be put under cultivation or cleared for grass if we are given better means of communication with the market.
739. Can you tell us what is a fair price to pay for the clearing of land here, and the making of it fit for cultivation? Of course there are two kinds of agricultural land on the Nambucca. I do not know much about the land just here, but I should think that very little over £10 an acre would be sufficient to clear the land higher up the river—that is, the alluvial flats. I have seen the scrubs felled and burnt off, and a splendid crop obtained in the one season. Of course that land is covered with soft timber.
740. The £10 an acre would, of course, include grubbing, stumping, and burning;—would 30s. an acre be too much to pay for felling alone? I could not say. I have not seen any of these flats in their original state. I have only seen them after the timber has been felled.
741. In the Richmond district the timber, after being felled, is allowed to decay;—I understand that that would not happen here? No.
742. The ground is cleared here by burning off the timber? A certain amount of grubbing is done. That is not done in the first year, and when it is done the stumps have pretty well decayed.
743. What is a fair average yield in the Macleay district? Between 40 and 50 bushels to the acre. If we get 50 bushels as an average yield, we reckon that we have a good crop.
744. What would be the average yield here? I can only judge from one year.
745. What would be the average yield this year? About 50 bushels to the acre.
746. What do you think is a payable price for maize? One shilling and nine-pence to 2s. a bushel clear.
747. What is the freight from Macksville to Sydney for maize? I have paid 1s. 6d. a bag.
748. That would be 4½d. a bushel? Yes, about that.
749. Do you consider that a high rate? Yes.
750. Do you think there is a reasonable prospect of the rates being reduced if the entrance to the river is improved? Yes; because there is not so much droghering here as there is on the Macleay.
751. What rates are charged on the Macleay? I do not know for certain. They were charging 1s. a bag; but they have reduced the rate since the opposition boat started.
752. It is quite likely that you will have an opposition boat here if the bar is improved? I see no reason why an opposition boat should not ply here during the busy season.
753. Do you think that a tramway to the Macleay Heads will serve this district? No.

Robert Quayle, first-class constable, Macksville, sworn, and examined:—

- R. Quayle.
1 June, 1898.
754. *Chairman.*] How long have you been in this district? Four and a half years.
755. I believe you compile the local statistics every year? Yes; I do not take the whole of the Nambucca district.
756. How far would your district extend from Macksville? It extends out to the range between here and the Macleay, about 18 miles in one direction, and up Taylor's Arm about 40 or 50 miles in another direction.
757. You do not go down to the Heads? No.
758. What statistics have you for your district? In my district there are 161 homesteads of 1 acre or more, in the Bowra district 151 homesteads, and in the Nambucca Head district about twenty-five homesteads. The population of Macksville is 1,100, of Bowra 1,078, and of Nambucca Heads about 400.
759. Do these three places comprise the whole district? Yes.
760. How many public schools are there here? In the Macksville district there are four public schools.
761. Is there a Court of Petty Sessions held here? Yes.
762. Where is the nearest District Court held? The District Court is held in Bellingen and at Kempsey. Those places are about equally distant from here.
763. What do you think of the future of the district? The population of the district has increased a good deal since I came here.
764. Has that been simply the natural increase, or has it been brought about by the influx of people? A good many fresh people have come here.
765. What are the circumstances of the people generally? As a rule they are getting into fair circumstances now.
766. Has it come under your notice that many of the farmers have had to abandon their holdings? No. I believe that a great many of the farms are mortgaged, but the farmers have not had to abandon their homes.
767. Do you consider that the district as a whole is in a worse state than the other districts on the North Coast? No.
768. Have you seen any striking evidence of poverty here? Yes; but not lately. During flood time blankets have had to be given out.
769. But a flood causes an unusual state of things? Yes. There is no such poverty in the district now.
770. How long is it since the last flood? I think about three years.
771. Do floods affect this portion of the river? Not much. They affect the upper part of the river more.
772. And the residents on the river flats? Yes.
773. Have you any reason to believe that the district is not a prosperous one? No; it is a prosperous one.
774. Do you think there is still a large area of Crown land which might be profitably occupied? Yes. At the head of Taylor's Creek there is a great deal of good land, and I understand that a large part of it has been surveyed.
775. Most of the available good land is up there? Yes.
776. A large part of this district is locked up in forest reserves? Yes.
777. Is the timber business a large one? Yes.
778. Do you issue timber licenses? Yes.
779. Has their number increased or decreased? It remains about the same. People take out licenses at the Nambucca Heads as well as here.
780. Here you are not immediately in the timber district, as they are at Nambucca Heads and at Bowra-ville? The timber goes from this place to the Nambucca Heads to be sawn up.

781. I suppose it is brought here from some distance up the river? Yes.
782. The timber industry is rather a progressive one? No; it is going back.
783. To what do you attribute the falling off? I cannot say; but good timber is getting scarce. One mill was removed to the Bellinger. I suppose they thought that they would be in a better timbered country there.
784. Do the timber reserves show any signs of giving out? They have to go further back for timber now; but still there is plenty of it.
785. They have used the timber most easily got, and now they have to go back into rougher country? Yes; but there is plenty of timber if they like to go for it. I think there has been some misrepresentation in regard to the yields of maize per acre in this district. I heard one witness say that it was 25 bushels, but this year they are pulling fully 75 bushels to the acre, and in some cases 100 bushels.
786. Has this been an unusually good season? Yes.
787. You have had a good rainfall and no floods? Yes.
788. Would it be only in years of flood that the yield of maize would be 25 bushels to the acre? Yes.
789. I suppose there are never droughts here? There has been a drought since I have been here.
790. Do the crops ever suffer from want of rain here? Yes.
791. That would make the yields more? Yes.
792. But in a good season like the present the yield would be from 50 to 60 bushels to the acre? That would be a low average yield. I think that from 65 to 70 bushels to the acre would be about the actual yield. Every one has his barn full now. About one-fourth of the maize grown here is consumed locally in the feeding of pigs and other live stock.

R. Quayle.
1 June, 1898.

William Woods, Secretary, Progress Committee, Macksville, sworn, and examined:—

793. *Chairman.*] How long have you been here? Three years and three months.
794. There are two Progress Committees here? Yes; one is called the Progress Association.
795. Has your committee met at any time to prepare evidence to place before us in regard to the proposal to improve the entrance to the river? No.
796. Have you any statistics of any kind that you would like to put before us? No.
797. Do you wish to comment upon any of the evidence that you have heard, or do you agree with what has been said? I will content myself with endorsing what has been said by the other witnesses.
798. The Progress Committee are satisfied that they have had the fullest opportunity to lay their case before us? Yes.

W. Woods.
1 June, 1898.

1898.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

BOROUGH COUNCIL OF ROOKWOOD.

(PETITION FROM JOHN GROVES, EX-AUDITOR, BOROUGH OF ROOKWOOD, RESPECTING HIS POSITION WHEN AUDITOR OF.)

Received by the Legislative Assembly, 6 July, 1898.

PETITION to the Honorable Members of the Legislative Assembly of New South Wales for some inquiry and remedy in regard to the following injustice:—

The Petitioner states he was duly elected as auditor to Borough of Rookwood, on 17th July, 1897, and subscribed the declaration of office under the Municipalities Act to fulfil the duties in accordance with the provisions and directions of the Act, which has the sanctity of an oath.

Obstacles were placed in the way of my auditing, as reported to the Colonial Secretary, supported by sworn affidavits, on the 26th August, 1897, and the books, &c., were not exhibited for audit—as provided by section 183 of the Act (1867), and opinion of Crown Solicitor, of 14th July, 1898—until the 24th September, 1897, being nine days after time defined in the Act, and then only in part.

I then proceeded with the audit, and finding gross irregularity in the expenditure, contrary to the Act, of ratepayers' money by the Council, I reported thereon to the Council on the 16th October, 1897, showing sums amounting to £271 5s. 8d., wrongly appropriated to purposes not sanctioned by the Act, the by-laws, and legal decisions, and asking for corrections to enable the audit to be completed.

From thence onward the Council entirely ignored me as elected auditor, and instead, communicated with Government Departments, eventually obtaining the services of a Government inspector—a Mr. Percy Williams, a similar name to my co-auditor—who stated auditors had nothing to do with matter even if fraud was detected; who apparently made some sort of an examination of the Council's books, and reported, according to newspapers, "That all collections had been duly accounted for, and disbursements had been made with approval of Finance Committee, and complimented the Council Clerk upon the neat and correct way the books were kept," &c.

Upon this certificate the Council took action in the Police Court, at Parramatta, against me for not signing the abstract as correct, to enable the Council to obtain the endowment from Government.

The case was heard on 20th and 22nd December, 1897, and decided by majority of two against and one for me; the latter, a Mr. Pearson, an experienced Bank manager.

Mr. Inspector Williams stated, upon oath, that the abstract was then incorrect, and he would not have signed it had he been in my place as auditor. His certificate was, therefore, incorrect and false.

In various letters to the Treasury, I pointed out that there was a deficiency of £4 1s. in the cash-book; numbers of knife erasures in cash-book; thirty-four pages of totals incorrect in rate-book; only £3 15s. 6d. cash in hand as confessed by the clerk, instead of £18 6s. 6d. as shown; that £10 had been paid for work unperformed, there being no ledger account nor asset of the amount, as being due to the Council until covered by work; that the amount, with others, is entered in abstract for 31st January, 1898, as an asset, presumably by alteration and entries in accounts since 2nd August, 1897, such being a dishonest concealment of irregularity.

That the sum of £271 5s. 8d., including £61 15s. by promissory note for a piano, £5 for flags and fairy lamps for Jubilee expenses, &c., &c., without the sanction of the Governor, and £120 taken from rates in June, 1897, to reduce debt upon the Town Hall building, but shown in accounts "as to pay for land for site of Council," which was actually paid for in November, 1896, has been wilfully and wrongfully applied. And that in my report of 16th October, 1897, I was justified in objecting to whole of foregoing, and I stated in Court, upon oath, that the accounts were wrong to that extent, and that the abstract also was then, 22nd December, 1897, incorrect, although showing alterations made since 16th October, 1897.

A ledger was not produced in Court which had been asked for by my solicitor, and that and other books were not produced for audit, causing grave suspicion.

No contract book had been kept, and payments to one contractor of £162 were made as progress payments without showing what, if any, work had been partly or wholly completed, or even if commenced.

Papers ordered by by-laws to be kept as records were not kept, causing incomplete accounts, and conducing to encourage commencement of fraud.

The fact of my being fined for practically not signing an incorrect account is a miscarriage of justice, which I submitted to the Minister of Justice, together with a statement of suspended prejudgment of my case by Mr. Withers, one of the majority sitting Magistrates, on 20th December, 1897, according to an assertion by the Mayor of Rookwood, but without effect, and without reply as regards suspicion of Mr. Withers prejudging the case.

That I submitted the whole case as grossly reflecting upon Mr. Inspector P. Williams, to the Auditor-General, as well as to Treasury, also without effect.

That I then submitted the whole matter to the Public Service Board, for inquiry as to conduct of Mr. Williams, under the Public Service Act of 1895, as advised, but was informed the Board had no jurisdiction.

Mr. Williams appears to have done the audit in about fifteen hours, as reported to Treasury, which accountants inform me is an utter impossibility.

That the third auditor legally appointed by the Rookwood Council and contrary to the Act, is the clerk of an adjoining Council (I having stated my willingness to complete the audit), signed the abstract sworn to as being incorrect, after a possible six hours' work, and upon this signature, with that of my co-auditor, the abstract was accepted by the Treasury in its incorrect state as being correct.

This (third) auditor had been previously paid £2 18s. 9d., the exact sum due by him for arrears of rates, by the Council for some peculiar reason, and was paid £3 3s. for his convenient signature to a sworn incorrect abstract.

One of the aldermen here (Garthwaite) stated in presence of three witnesses on 30th November, 1897, "That as soon as Groves was elected, they (meaning some of the Council) put money from one account to another to put things right, knowing how particular he (Groves) was," and during my audit I detected sums amounting to £9 6s. 5d. had been irregularly transferred on 13th July, 1897, without any sanction by Council.

The whole of documents referred to are in Government Departments named.

Your Petitioner, therefore, humbly prays for inquiry and simple justice.

And your Petitioner, as in duty bound, will ever pray.

JOHN GROVES.

Rookwood, 31st March, 1898.

1898.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

BOROUGH COUNCIL OF ROOKWOOD.

(PETITION FROM RATEPAYERS OF THE BOROUGH OF ROOKWOOD, CALLING ATTENTION TO ALLEGED EVASIONS OF THE MUNICIPALITIES ACT, 1897.)

Received by the Legislative Assembly, 6 July, 1898.

PETITION to the Honorable Members of the Legislative Assembly of New South Wales for some remedy of the Municipalities Act of 1897, in regard to the actions of the Borough Council of Rookwood in evasion thereof, to enable ratepayers to enforce the proper laying out of their money by aldermen entirely in accordance with the Act, the by-laws, and legal decisions thereupon, in some inexpensive way, without the ratepayers having to go to the enormous expenses of appealing to the Supreme Court.

The Petitioners state that in their opinion their money paid in rates, with endowment thereupon received from Government, has been wastefully expended in and for purposes not provided for by section 141 of the Act, and in disobedience of the by-laws, &c., especially in following instances, for six months to the 2nd August, 1897, and also since that date, in opposition to interests of ratepayers generally:—

£ s. d.		
120 0 0	To reduce debt upon town building, &c. (Hall) ..	See opinion, Dr. Sly, 29th April, 1897, and wording of authority for loan for Town Hall.
6 12 10	For Park, without sanction of Governor	Opinion of Mr. Pigott, 3rd August, 1891, and section 132 of Act.
7 16 10	Jubilee expenses	Section 141 of Act.
4 11 8	Men working at Town Hall	" "
1 8 1	Men attending Council meetings	" "
5 0 0	Flags and fairy lamps	" "
*10 0 0	Advanced to solicitors for work unperformed, and not shown as an asset.	By-law 64 and 15.
6 15 0 } 6 15 3 }	Interest on overdrafts without authority	Section 151 of Act, and Municipal Association.
61 15 0	Promissory note for piano	Sections 158 and 141.
4 1 0	Deficient, as per butts of receipts	Deficiency in cash-book.
15 5 0	Election expenses and valuation	To servants already paid by salary, and sections 126 and 127.*
21 5 0	Law expenses, part not stated for what purpose...	By-law 15.
Total ... £271 5 8		

* Accounts since altered, and this amount, with others, shown as an asset in abstract for 31st January, 1898.

£140 18s. 8d., shown as debt of Town Hall, by—section 163 of Act, Overdraft—proper amount is £321 8s. 8d., as per entries in books, difference being appropriated from rates.

And other amounts expended without due notice of motion, in compliance with By-laws 15; and that one of the elected auditors reported above to Council of Rookwood without effect, and the Government has been unable to afford any relief. That the said auditor was fined at Police Court at Parramatta, at instance of Council, for practically not signing an incorrect account, as proved by Council's own witnesses and Government Inspector Percy E. Williams, on 22nd December, 1897.

Wherefore your Petitioners pray your Honorable Assembly to perform what acts the Municipalities Act of 1897, the by-laws, and legal decisions thereunder infer shall be done, to enable ratepayers to have some appeal for justice without the expense of the Supreme Court, which they are unable to incur, and there appearing at present no remedy within their reach to enforce the proper laying out of their money, and to enforce this that the full duties of auditors may be defined, so that they (the auditors) be compelled to examine in detail all books of accounts, vouchers, &c., and shall certify that in their opinion the books are kept in a manner to show expenditure by roads and streets so as to be understood generally, and that the aldermen have, in all the expenditure incurred, complied with the provisions of the Municipalities Act, the by-laws, and legal decisions (the latter as shown by Browning and Municipal Association books and circulars to be laid before auditors by Council) thereupon, with the following exceptions (here stating particulars of exceptions), which are consequently disallowed.

And also that the auditors, both or one, as convenient, may have access to books, &c., at all reasonable office hours during the period of their office.

In conclusion, and in support hereof, we respectfully draw attention to the fact of a sum of £264 1s. 10d. only, out of a total revenue of £1,063 2s. 5d., having been laid out upon the roads and streets, &c., of the borough for the six months to 2nd August, 1897, and that the business papers of the Council, showing authorisation of all expenditure according to By-laws (13), and ordered to be kept as records of the Council by By-law 66, are not so kept, thereby preventing a proper audit of the accounts.

Your Petitioners, therefore, humbly pray for such remedy as your Honorable Assembly may consider just and proper to meet the merits of their case.

And your Petitioners, as in duty bound, will ever pray.

[Here follow 65 signatures.]

1898.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

LEPROSY IN NEW SOUTH WALES.

(REPORT ON, FOR THE YEAR 1896.)

Printed under No. 1 Report from Printing Committee, 30 June, 1898.

The Secretary to the Board of Health to The Under Secretary for Finance and Trade.

Sir, Board of Health Office, 93, Macquarie-street, Sydney, 4 November, 1897.

I have the honor, by direction of the Board of Health, to forward you herewith a report on Leprosy in New South Wales for the year 1896, and to suggest that it should be laid before the Houses of Parliament.

I have, &c.;

CLARENCE A. SIMMS,

Secretary.

ON the 1st January, 1896, thirty-seven persons remained under detention at the lazaret. [See *Appendix A.*]

During the year nine persons were reported under the Leprosy Act, 1890, as being suspected lepers. Three of them were eventually admitted to the lazaret under warrants issued by the Board after careful investigation, the disease presented by the other six turning out to be of some other kind than leprosy.

Five patients died during the year. Four were natives of Australia of European decent (including one female); one was a native of Ireland.

During the year preparations were made for returning the Chinese patients, of whom there were twenty, to their own country. On 14th August nineteen of them were embarked in the cargo steamer "Whamboa." They travelled in charge of a male attendant, who was furnished with a supply of dressings and comforts, including opium, and they were given money at the end of the voyage to enable them to purchase Chinese clothes and to make their way to their villages, to the amount of £5 in some cases and of £8 in others, according to their alleged destination. The attendant who accompanied them and the agents at Hong Kong both reported that they arrived in their usual health, and evinced gratitude for the care taken of them during the voyage. They were transferred to a tug at Hong Kong, and were dismissed at Canton under supervision of the Consul there.

Thus the number remaining in the lazaret on 31st December, 1896, was 16 persons; 11 were whites, 7 of whom (including 3 females) were natives of New South Wales, 2 were English, 1 was a native of Fiji, and 1 of Germany, 2 were Chinese, 1 was a Javanese, 1 an aboriginal of Tanna, and 1 a native of India.

In Appendix B appears a complete statement of the sex, nationality, occupation, age at and date of admission, former residence, and date of decease of all persons admitted to the lazaret from the beginning. The Roman numerals have reference to further details given in Appendix C hereto (and in Appendices to the Reports of former years).

In Appendix C are given, as usual, notes of the new cases received during the year. To these are added radiographs of the bones of the hands of two patients suffering from the smooth form of leprosy. This Appendix being of a strictly technical character is not attached hereto, and, as usual, will be issued only to medical men specially interested in the subject and to the libraries of learned societies.

From Appendix B it will be seen that the total number of persons admitted since 1883, when patients first began to be received (though the notification of leprosy was first made compulsory and the detention of lepers provided for by law only towards the end of 1890), is sixty-one. Distributed under nationalities, the account stands as follows:—Natives of New South Wales, 15, of whom 7 have died and 1 was released; of Queensland, 1, deceased; of England, 2; of Ireland, 2, deceased; of New Zealand, 1, deceased; of Fiji, 1; of Germany, 1; and all of these were whites, of European decent. There were also

32 natives of China, of whom 11 have died, and 19 have been returned to China; of India, 2, of whom 1 has died; of the West Indies, 1, discharged in 1885; of Java, 1; of the New Hebrides (Tanna), 1; of New Caledonia, 1, deceased; and all of these were coloured people.

The three patients received during the year were all Chinese. This is the first year since the Leprosy Act, 1890, was passed, in which no case in a white has come to notice.

Every opportunity has been given to members of the medical profession to visit the lazaret for the purpose of seeing such patients as were formerly under their care, and for study of the disease.

The following statements show the total expenditure for the year 1896 and the source from which the moneys have been paid:—

STATEMENT of the total Expenditure of the Leper Lazaret (male and female) at Little Bay during the year 1896, showing from what sources the amounts have been paid:—

EXPENDITURE.			HOW PAID.		
	£	s. d.		£	s. d.
To working expenses, as per attached statement	2,353	12 7	From vote for the maintenance of Lepers by the Board of Health	1,868	10 8
„ removal and erection of lavatory, recreation room, &c.	74	0 0	From vote for stores by the Controller-General of Stores	312	10 2
„ forming paths, &c.	26	9 0	From votes under control of Government Architect	147	19 0
„ fees for examination of lepers, proved or suspected	15	15 0	From vote of the Coast Hospital by services and stores transferred	146	1 9
„ transferring nineteen Chinese lepers to China	1,946	0 0	From vote under control of the Chief Secretary	1,946	0 0
„ X-ray photo of leper—H. J. T.	5	5 0			
Total	£4,421	1 7	Total	£4,421	1 7

STATEMENT showing the Working Expenses of the Leper Lazaret (male and female) at Little Bay for the year 1896:—

	£	s.	d.
Salaries	560	4	5
Provisions	829	18	3
Fuel	137	4	10
Drugs, disinfectants, &c.	200	14	7
Tobacco, cigars, and opium	69	5	7
Drapery, bedding, uniforms, &c.	205	16	7
Furniture, ironmongery, brushware, glassware, &c.	121	13	10
Books, papers, &c.	47	12	7
Material for repairs	46	13	10
Wines, beer, and spirits	58	5	8
Sundries	76	2	5
Total	£2,353	12	7

Being equal to an average of £81 3s. 2d. per inmate per annum.

It has been the earnest endeavour of the Board of Health to mitigate the sufferings of these unfortunate patients. Their wants have been carefully attended to by an experienced wardsman in charge, and by attendants and nurses, under direct supervision of the Medical Superintendent and Matron of the Coast Hospital.

Sydney, 4th November, 1897.

J. ASHBURTON THOMPSON,
President.

APPENDIX.

* These are all natives of New South Wales, of European descent † Date of report These patients were afterwards removed to Little Bay. ‡ Of European descent. § This patient was transferred to a Hospital for the Insane on 2nd April, 1885, where also his death occurred. ¶ This patient was discharged on the 29th December, 1885 (see note * to Appendix A) || Discharged, 1st May, 1896

NOTES.—(a) The only additional cases of leprosy in New South Wales which have been reported to the Board of Health are P S, et 38, died in the Richmond River District in March, 1887, and G R, et 28, whose death, certified by his medical attendants, was reported by the City Coroner on the 13th July, 1889 Both of these persons were of European parentage (b) On comparison with the reports for previous years, differences in ages or dates of admission of some coloured patients will be observed, those now given are the correct ages and dates. (c) Returned to China, 14th August, 1896.

1898.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

ABORIGINES.
(REPORT OF BOARD FOR 1897.)

Printed under No. 1 Report from Printing Committee, 30 June, 1898.

The Aborigines Protection Board to The Principal Under Secretary.

Sir,

Office of Board for Protection of Aborigines,
105, Phillip-street, Sydney, 31 March, 1898.

In accordance with the usual practice, we have the honor to submit, for the information of the Chief Secretary, a Report of our proceedings during the year 1897, together with information as to the number, location, and present condition of the Aborigines throughout the Colony, and a detailed statement of the expenditure of the funds voted by Parliament for their assistance.

Weekly meetings of the Board continue to be regularly held and attended by the majority of the members. Messrs. John See, M.L.A., Unni William Carpenter, and George Edward Ardill were appointed by the Government to seats on the Board, Mr. See's appointment dating from the 25th June, and that of the other two gentlemen from the 19th October last.

The constant attention given by the Board to the interests of the aboriginal population of the Colony has resulted in a decided improvement in their moral and social condition, and in their general welfare. The children are more generally taught and trained; many of the adults are employed in industrial pursuits; they are decently housed and clad; and the aged, sick, and infirm are fairly cared for, clothed, and fed. There is still, however, room for improvement. Huts are required on many of the reserves; farming appliances, boats, fencing, &c., are also needed; but the action of the Board is greatly restricted by the want of the necessary funds. The expenditure is not large, and the Vote is administered with rigid economy. The Board therefore express an earnest hope that this appeal for a more liberal provision will receive favourable consideration by the Government.

The statistics of the aboriginal population of the Colony (*see Appendix A*), compiled from information collected by the police on the 15th October last, show a total of 3,422 full-bloods and 3,663 half-castes—7,085 in all.

These figures exhibit, as compared with the numbers for the previous year, a decrease of 81 full-bloods, but an increase of 182 half-castes—a net increase of 101.

The deaths amongst the full-bloods exceeded the births by 60, the numbers being 137 and 77 respectively. On the other hand, there were 86 more births than deaths amongst the half-castes, the former reaching a total of 151 and the latter 65. These figures would, however, show a total increase of 20 only. The difference can only be accounted for by the fact that great difficulty is experienced in taking a correct census, more especially in the remote districts, owing to the wandering habits of the race.

The number of half-castes now exceeds that of the full-bloods, there being a difference of 241 in favour of the former. Twelve years back the number of full-bloods was slightly more than double that of the half-castes. Since that time the full-bloods have decreased at the average annual rate of 160, against an average annual increase of 86 half-castes.

A total sum of £16,732 12s. 3d. was expended by the Government on behalf of the Aborigines during the year (*see Appendix C*). This includes an expenditure of £12,170 1s. 2d. by the Board, £864 1s. 2d. by the Chief Medical Officer, £987 5s. 2d. by the Minister of Public Instruction, £2,658 18s. 9d. by the Controller-General of Stores, and £52 6s. by the Chief Secretary.

The expenditure by the Board is given in detail (*see Appendix D*). A sum of £9,206 3s. 7d. was expended in the purchase of food, clothing, medical comforts, boats and gear, fishing-tackle, fencing-wire, farming-implements, seed, material for the erection and improvement of dwellings, &c.; £315 19s. 10d. for the fares of Aborigines travelling on the railway lines; and £2,647 17s. 9d. in liquidating claims incurred specially in connection with the Cumeroogunga (Murray), Warangesda (Murrumbidgee), and Brewarrina (Barwon) Aboriginal Stations.

We may again point out that the rule by which we have been guided in the distribution of the funds placed at our disposal has been to restrict the issue of rations and clothing to Aborigines who are aged, sick, or infirm, and therefore unable to work for their own support, and to children who are attending school or whose parents are unable to provide for them. The young and able-bodied are made to support themselves and their families if work is at all procurable.

Four additional reserves, as under, aggregating an area of 1,632 acres, have been set apart during the year for the use of Aborigines:—

Megalong	22 acres
Goodooga	240 „
Bundarra	170 „
Quambone... ..	1,200 „

The reserve of 40 acres at Byron Bay being no longer required has been revoked.

In 1883, the year in which the Board took office, the number of such reserves throughout the Colony was 25 only, with a total area of 3,500 acres. On the 31st December last the number had been increased to 113, and the total area to 26,930 acres.

Fair progress continues to be made in the cultivation of a number of these reserves, in which direction the Board continue to give every assistance and encouragement. Some of the reserves, particularly those in the pastoral districts, are simply used by the Aborigines as camping-grounds, the men being generally employed in various kinds of labour on sheep-stations.

Suitable provision for housing the Aborigines has been made in several districts. During the year comfortable dwellings have been erected at Barrington, La Perouse, Terry-hie-hie, Ingalba, Lake Macquarie, Uralla, Walcha, and Wellington.

Schools established specially for the instruction of aboriginal children are still in operation at Brewarrina, Brungle, Cumeroogunga, Forster, Grafton, Mulyan (Cowra), Rolland's Plains, Warangesda, and Wauchope. Satisfactory reports regarding the same continue to be received from inspectors under the Public Instruction Department. The pupils are generally bright and happy in appearance, very attentive and orderly, and are making good progress in their studies.

The half-time school on the reserve at Barrington has been temporarily closed, as, owing to the removal of a number of settlers from the district, another half-time school with which it was being worked had to be discontinued.

The total number of aboriginal children now receiving instruction is 617—606 at public schools, and 11 privately. The Board continue to offer every inducement for the attendance of these children at school, chiefly by the supply of decent clothing and rations to all who regularly attend.

The police have been successful during the year in obtaining convictions against a number of persons in the Metropolitan District for supplying Aborigines with intoxicating liquor, also in the following country districts:—Yass, Burrowa, Pilliga, Bourke, Milparinka, Cuttabri, Menindie, Gilgunnia, Lismore, Hillgrove, Narrandera, and Urana.

Very satisfactory progress continues to be made at the Home for Aborigines near Grafton. Fifty-two Aborigines are now settled there, and a number of others throughout the Clarence River district make it their home when out of work, sick, or in need of rest. The health generally has been good, and the local Board report that the residents are very contented and comfortable. The Board have reason to be gratified with the success of this institution—established by them to afford homes for the old, infirm, and sick, to give work to the young and able-bodied, and to educate and train the children. Several visitors have made commendatory remarks regarding the management and progress of the station.

A number of improvements have been effected at Warangesda during the year by the erection of additional dwellings, repairs of fences, scrub-cutting, &c. About 83 acres were put under wheat, but owing to the drought a poor yield only resulted. The health of the residents has been good, and their conduct, with few exceptions, satisfactory.

At the Brewarrina Station the whole of the ringbarked area, consisting of about 3,000 acres, has been suckered. Six boys and 5 girls are apprenticed out from this settlement to district residents, and, generally speaking, give satisfaction. 474 sheep were shorn, yielding 3,986 lb. of wool, giving a net return of £81 11s. 1d. The local Board report that the place is kept thoroughly clean, that the Aborigines are well satisfied, and that the children are improving considerably owing to the care bestowed upon them by the matron. When it is considered that upon the Board taking action at Brewarrina the whole of the local aboriginal population were affected with loathsome disease, and were living in and near the town in a state of the utmost distress and degradation, the present satisfactory state of affairs is a subject for the deepest congratulation.

The assumption by the Board of the control of the Cumeroogunga, Warangesda, and Brewarrina Aboriginal Stations has been approved by the Chief Secretary, and the Board have made all necessary arrangements for the proper carrying on of the work at those institutions, with the assistance of the local Boards already in existence. So far the result appears entirely satisfactory.

The Council of the Aborigines Protection Association were given representation on the Board by the appointment thereto of two of their members (Messrs. Carpenter and Ardill), and so that their work in connection with the religious instruction of the Aborigines might be continued, the Chief Secretary directed the retention by the Council of a sum of £100 as a fund specially for that purpose. A sum of £14 16s. 6d., collected by the La Perouse Mission Committee, and lodged with the Council, was returned to that body, and the balance in hand, together with all books, was transferred to the Board on the 8th January last.

The necessary authority having been obtained from the Treasury, a special account was opened with the Commercial Banking Company of Sydney (Limited) for moneys received from the various aboriginal stations, as proceeds of sale of produce, &c., and of goods disposed of to the Aborigines from the station sale-stores.

The receipts from produce during the year totalled £315 19s. 2d., and the expenditure £168 0s. 1d. A detailed statement will be found in Appendix H.

The Board decided to continue the stores established by the Aborigines Protection Association at Cumeroogunga and Warangesda for the sale of goods to Aborigines, chiefly articles of food and clothing not included in the ordinary ration. The Aborigines at times earn good wages in the surrounding districts in shearing and other work, and in contract work at the stations, grubbing, clearing, ploughing, &c. The goods being retailed at cost price, or slightly over, to allow for any depreciation, not only is a pecuniary advantage gained by the Aborigines in purchasing their requirements at the station store, but their earnings are not squandered in drink by visits to the towns, as was often the case before such stores were in existence. The receipts during the year totalled £352 4s. 1d., and the expenditure £350 15s. 3d. (*see Appendix I*).

A sum of £107 8s. 3d. was on the 31st December last lying to the credit of a trust account opened by the Board with the Government Savings Bank, being wages received in trust from employers of a number of aboriginal children apprenticed from the stations. On the same date the Association had similar moneys in hand totalling £174 1s. 6d. This was transferred to the Board on the 12th January last.

In conclusion, we desire to acknowledge much valuable assistance cheerfully rendered us by the various local Boards and the police generally in our efforts to ameliorate the condition of the race.

We have, &c.,

EDMUND FOSBERY, Chairman.	}	Members.

APPENDIX K.

REPORTS OF LOCAL BOARDS.

Dear Sir,

Home for Aborigines, Grafton, Clarence River, 28 January, 1898.

We have the pleasure to report that during the year ending 31st December, 1897, very satisfactory progress has been made at the Home in every way.

The popularity of the Home has been well sustained, as will be seen by the average of the inmates as given by the manager, their general health is good, and we are extremely pleased to note that they are very contented. At present, the young men have a cricket team, which is of much interest to them. During the winter football was indulged in, and your Local Board have encouraged these sports as it keeps down gambling.

At present there is a very fine crop of maize, consisting of over 20 acres, which should bring in a good return if no flood takes place.

Last year the different crops returned, according to our manager's report, over £40 after allowing for consumption at the Home, which is very large—particularly in respect to potatoes.

A fine school-house has been erected at the Home, which is now constituted as a Public School. This was duly opened by the Chairman of the Grafton Public School Board (Mr. Thomas Page, J.P.) in company with the Local Board.

A large tank has been excavated at the Home, and when cemented and completed will give ample supply to the inhabitants.

Some new buildings have been erected, others improved, and a good deal of clearing and burning off done, which gives the Home a more civilised appearance.

Taken generally, and considering the difficulty experienced in keeping aborigines at work, the manager deserves much credit for works accomplished.

The Home is recognised by visitors as an interesting sight, and many have paid visits during the year and expressed their satisfaction and pleasure at the appearance of the inhabitants and place.

The matron (Mrs. Curry) has done much to assist the Board and to make the people comfortable.

Yours faithfully,

THOMAS PARKER, Chairman.
 GEORGE CRISPIN, }
 JAS. C. WILCOX, } Members.

The Chairman, Aborigines' Protection Board, Sydney.

REPORT on the Home for Aborigines, Clarence River, for Year ended 31st December, 1897.

Number of people (Aborigines) settled in houses at the Home—men, 9; women, 16; children, 27; total, 52. There are also a number of people (Aborigines) who make the Home their headquarters, and live here whenever they are out of work, sick, or want a rest, making up the number who really belong to the Home to over 70. The aborigines from the Upper Clarence also come here for food and shelter whenever near Grafton.

Average daily population for the year, 50.1.

Number of aboriginal children ordinarily attending school—boys, 10; girls, 15.

A very fair crop of maize, potatoes, onions, vegetables, &c., was gathered from the farm, the return from produce sold—over the requirements of the Home—amounting to nearly £44.

Permanent improvement.—A school-house, 16 ft. x 27 ft. x 10 ft., with skillion, 27 ft. x 8 ft. x 7 ft., was completed. Value, about £75. A tank, 16 ft. x 16 ft. x 16 ft., was excavated in the stone; when completed, it will be an asset worth about £60.

The farm land worked last year was cleared of many stumps, cultivated, and re-planted. About 2 acres of new ground were broken up and planted, and clearing continued of the remaining land. A substantial two-rail fence was erected on the farm side line, about $\frac{1}{4}$ -mile. Two new dwellings were built, and a number of minor improvements effected.

F. C. CURREY, Manager.

The Chairman, Local Board.

Sir, Aborigines' Protectorate, Local Board, Darlington Point, 2 March, 1898.

In compliance with your request, we beg to report as follows:—Improvements made during the past year consist of the erection of three new cottages, and a hut for single men, repairs to fences, alterations to stores and other buildings, scrub clearing, rabbit destruction.

About 83 acres were ploughed and put under wheat, the return from which being 30 tons of hay and 30 bags of wheat.

The station suffered greatly from terrible drought which wrought such great havoc throughout Riverina. The rainfall for the year was under 9 inches. From the end of January to the end of June no rain fell at all, and as a consequence there was no grass and many of the cattle died. The spring rains, although light, came at the right time and sufficiently for grass, of which there is still a good supply, but not sufficiently for the crop as the poor yield mentioned above will show.

The stock are in splendid condition. There are 750 sheep, 20 cattle, 12 horses. In addition to the station stock many of the residents have cattle and horses of their own, not more than two head being allowed to a family except under special circumstances.

The village has always presented a clean and orderly appearance; and the extreme care taken of all the station property by the manager has been most praiseworthy.

The store has been kept and conducted in a thoroughly satisfactory manner, cleanliness, perfect order, and arrangement pervading it throughout.

The health of the residents has been good, and their conduct, with but few exceptions, has been satisfactory.

In cases of grave misconduct the Local Board instructed the manager to take severe measures in meting out punishment to the offenders, and we are pleased to be able to say that in every instance the result has been thoroughly satisfactory.

In view of the small amount of useful work done in proportion to the number of strong, able-bodied men (the majority of whom are half-castes) who are always to be seen about the station, and who often do no work at all, the Local Board towards the end of the year gave instructions to the manager not to supply rations to any of these men until they have earned it by doing a fair amount of work.

The school continues to make satisfactory progress. At the last examination the inspector expressed himself as being well pleased with the results.

During the year there were 8 births, 1 marriage, 5 deaths.

HERMAN KOOK,
Chairman.
G. R. F. NOBBS,
Hon. Secretary.

The Secretary, Aborigines Protection Board, Sydney.

Sir, Aborigines' Protectorate, Local Board, Brewarrina, 7 March, 1898.

I have the honour to herewith submit the report of the Local Board for the year 1897.

Apart from the ordinary duties of the station the principal work has been suckering ringbarked timber, and although the workmen have only been on the station at intervals of short period, the whole of the ringbarked country, consisting of about 3,000 acres, has been suckered during the year.

There were 43 people (23 full blood and 20 half-castes) sleeping on the station the last night of the year, the weekly average for the whole year being 49.

There were 3 births, 2 deaths, and 1 marriage during the year. The health of the people was generally very good.

The average attendance of children at school was 10 girls and 8 boys, and when examined in June last the classification of the first-class was moderate, second-class tolerable, and third-class fair.

At the end of the year there were 6 boys and 5 girls apprenticed out, and, generally speaking, they were giving satisfaction.

The stock at the end of the year consisted of 683 sheep, 33 cattle, 23 horses, and 15 pigs, all in splendid condition.

There were 474 sheep shorn, yielding 3,986 lb. wool, giving a net return of £81 11s. 1d., and in addition to this, sheepskins and oddments of wool realised £13 3s. 1d.

Four hundred and one sheep were killed for rations during the year.

Two small paddocks were let for grazing during the year, each for three months, at £26 and £20 respectively. The sum of £4 10s. was also received for agistment of sundry stock.

The

The present season is a particularly good one, and all the stock should remain fat for a considerable time. The Board feel they cannot speak too highly of the manager and his wife (Mr. and Mrs. Hopkins), who still continue to give every attention to their duties, the place is kept thoroughly clean, and the aborigines are well satisfied. The children improve considerably under Mrs. Hopkins' care.

The improvements on the station are also well looked after.

I have, &c.,

H. LORAINÉ CATHIE,
Chairman, Local Board.

The Secretary, Aborigines' Protection Board, Sydney.

Sir,

Aborigines' Station, Brungle, January, 1898.

Subjoined I beg leave to submit my report for the year 1897.

1. *School*.—This has been in operation every school-day throughout the year. The average attendance for the year has been slightly over 20, the total enrolment for that period being 27, and the average quarterly enrolment 24. The Inspector's last report showed that it was in an efficient condition under the management of Miss Ussher, who was appointed to the sole charge by the Minister for Education in June last.

2. *Cultivation*.—Little was done last year, in consequence of the dry weather, in the ploughing season. About 5 acres were sown for hay, but as the crop looked unusually good, it was decided to keep about half for seed. Afterwards, owing to labour troubles and the difficulty of getting a machine, as previously explained by Mr. M'Gruer, only 1 acre was cut for hay, the remainder being harvested for seed. It is stacked waiting for the threshing machine, and has been thatched with reeds, no straw being obtainable.

Corn.—About 3 acres at present in good order.

Medical.—Births: Males, 2; female, 1—all half-castes. Deaths: Female, 1—adult full-blood. Marriage, 1.

For the first three quarters the general health was fair; during the last quarter several serious cases have caused a very heavy increase in the doctor's account.

General Conduct.—Has not been so good as last year. Drinking has been on the increase, and lately the practice of bringing in liquor has caused much trouble. It is very difficult to catch them with it in their possession; but on one occasion, having information of what was going on, I notified Sub-Inspector Jones, who sent out a trooper who succeeded in capturing a man on his way back from Gundagai with a quantity of liquor in his possession that he was bringing to the camp; and in another case evidence was obtained against the publican, who was convicted and fined.

Ex School Children.—I desire again to draw the attention of the Board to the necessity for finding employment for the boys and girls as they leave school. Could not the State Children's Act be made to apply to enable them to be apprenticed? It is useless to find places for them unless they are bound to their employers, as they will either desert or the others will entice them away.

If left in the camp their education will only assist to make them rather worse than the present generation, whose laziness, vice, and immorality cannot be comprehended by anyone who is not brought constantly into contact with them.

Rules.—Following your instructions I have prepared a draft code of rules which I annex. I would suggest that the Central Board be asked to affix their seal to the code finally agreed upon.

I have, &c.,

J. G. USSHER,
Superintendent.

Noted and forwarded for Central Board's serious consideration.—(Signed) A. M'GRUER, Acting Chairman, 21/1/98. The Secretary A. P. Board, Sydney.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

COAST HOSPITAL, LITTLE BAY.
(REPORT FOR 1896.)

Presented to Parliament by Command,

Printed under No. 1 Report from Printing Committee, 30 June, 1898.

The Chief Medical Officer of the Government to The Principal Under Secretary.

Sir,

Sydney, 25 November, 1897.

I have the honour to submit, for the information of the Chief Secretary, the Annual Report on the working of the Coast Hospital at Little Bay for the year 1896, with appendices containing the usual returns.

The following general statement shows the number of patients under treatment during the year, with results :—

Remaining in hospital on 31st December, 1895	175
Admitted during the year	2,213
					2,388
	Total	2,388
Discharged well or convalescent...	1,641
" relieved	388
" unrelieved	40
Died	120
					2,189
	Total	2,189
Remaining in hospital on 31st December, 1896	199
Average number resident daily throughout the year	204.06
Mean residence of each patient in days...	31.3
Rate of mortality over all cases...	5.4

The number of patients admitted during 1896 shows a decrease of 238 over the previous year. The average daily number resident throughout the year was 204.06, as against 176.3 for the year 1895, the residence in hospital of each patient being lengthened from 24.6 days in 1895 to 31.3 in 1896. The average rate of mortality was 5.4, as against 3.7 for 1895.

RETURN No. 1.—Showing the channels through which the Patients admitted during the year reached the Hospital.

	Hospital Admission Depôt.	Medical Adviser's Office.	Medical Superintendent.	Total.
Number of patients.....	1,571	447	195	2,213

From the following returns relating to typhoid fever, it will be seen that 236 cases were admitted, being 140 more than in 1895, and that the mortality from this disease was 8.05 per cent. as against 6.25 per cent. in the preceding year.

RETURN No. 2.—Showing the number of cases of Typhoid Fever, distributed under sex and age, and the deaths at each age, which were admitted during 1896.

(Average stay in Hospital, 39 days; mortality, per cent., 8'05.)

Return No. 4, which deals with the infectious cases admitted, shows the various forms of such disease which were under treatment. The total number of such cases was 141, and they included scarlet fever, diphtheria, whooping-cough, chicken-pox, measles, and erysipelas; three of them proved fatal. The hospital is doing most valuable work in receiving and isolating cases of infectious character. It is being availed of by the public for the purpose more and more as time goes on, and there is no doubt segregation of these patients effectively retarded the spread of infection in many instances.

The

The treatment of infectious cases of several different diseases taxes the resources of the nursing staff far more than an equivalent number of patients suffering from non-infectious maladies; and partly for this reason, but also partly because the average daily number of total patients rose from 176 to 205, it became necessary to increase the nursing staff from 26, which was its strength at the end of 1895, to 30. In this necessity an increase of enteric fever admissions from 96 to 236 had its share; for although the subjects of this disease do not require such strict isolation as those of the other communicable diseases mentioned above, yet they do require much more continuous attention, and during a greater number of days.

Dr. George Henry Taylor performed the duties of Medical Superintendent to June, 1896, when he was transferred to the position of Pathologist and Second Government Medical Officer for Sydney, his place being taken by Dr. Robert Usher Russell. Miss McMaster continued to act as Matron, and the House Surgeons and Dispensers, Drs. Shaw and Fordyce, having completed their term of engagement on the 31st March, were replaced by Drs. Conlon and Dunlop.

The treatment of surgical cases has been continued, and particulars of the operations performed during the year will be found in Appendix B. The delivery of lectures to the nurses by the Medical Superintendent and the Matron has also had close attention, and during the year examinations were held at which those nurses who showed themselves proficient were granted certificates of having undergone a full course of training.

A convenient room has been fitted up for the carrying on of bacteriological work, and it is considered that this will prove a valuable assistance in the treatment of the cases admitted.

Indigent and deserving patients have, upon their discharge, continued to receive relief from the Samaritan Fund to give them an opportunity of seeking work or of returning to their friends in the country.

In Appendices A and C will be found the usual classification of the diseases treated, and particulars relative to the patients who died in hospital.

I have, &c.,

J. ASHBURTON THOMPSON,
Chief Medical Officer of the Government.

The following deceased leper patients were buried in the Little Bay cemetery during 1896 :—A. M., grave No. 729 ; R. W., grave No. 730 ; N. G., grave No. 731 ; W. F., grave No. 771 ; and W. H. A., in grave No. 775.

1898.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

COAST HOSPITAL, LITTLE BAY.

(REPORT FOR 1897.)

Presented to Parliament by Command.

Printed under No. 2 Report from Printing Committee, 6 July, 1898.

The Chief Medical Officer of the Government to The Principal Under Secretary.

Sir,

Sydney, 16 June, 1898.

I have the honor to submit to the Minister the Annual Report on the working of the Coast Hospital at Little Bay for the year 1897, with tables containing the usual particulars (see Appendix A).

I believe the time has now come to consider this institution anew, and, accordingly, I have the honor to offer the following remarks upon it.

The Coast Hospital was hurriedly designed and hurriedly built on a site which was hastily selected in 1881. It was intended to serve as a quarantine station for cases of small-pox occurring ashore, and was arranged (as to disposition of its buildings) with that object in view. The site is 9 miles distant from the General Post Office, 5 miles of the road running through uninhabited country; and it is 3 miles or more from the terminus of the Botany tram-line, and of regular communication with Sydney by public conveyance. Its buildings are very widely scattered; they were constructed in the simplest manner of wood and iron; the water-supply was from a dam, filled by natural drainage of the reserve; there were no sewers. It may have been suited well enough to the purpose for which it was built, but to call such an establishment a hospital would be a misuse of words.

After some incomplete occupation and some changes of purpose, which were fully described in the Annual Report for the year 1884, the institution was opened at the end of 1883 as a place to which convalescents might be removed from the metropolitan hospitals to complete their cure. For this purpose it would be expected to answer tolerably well; such persons, when chosen with due care, requiring only shelter, warmth, good food, and rest in order to re-establish them. This use of the place, though connected with hospitals, could not be called hospital use; and, consequently, construction, situation, and arrangement were not matters of the first consequence.

But, almost immediately, an epidemic of typhoid fever threw the metropolitan hospitals into embarrassment again. They had been relieved by getting rid of their convalescents, and so making room for acute cases of general illness; but now they were called upon to admit so large a proportion of typhoid cases that their general work was seriously embarrassed or even crippled. They had to seek further relief. In this difficulty, it was suggested that cases of fever should be provided for at the Coast; this was agreed to, and from that time the institution began to be used (*a*) as a convalescent hospital; (*b*) as a hospital for the destitute chronic sick; and (*c*) as a hospital for treatment not merely of typhoid fever but of cases of all the infectious diseases.

For several years the main body of patients was constituted by the destitute chronic sick for whom active medical treatment might still do something to relieve them; but with them were inevitably mingled from the first a proportion of cases of acute illness occurring to poor persons who could not be placed in the class alluded to as destitute, because, although *de facto* destitute as soon as overtaken with illness, they would again support themselves successfully on recovery. The proportion of such cases steadily increased as time went on, so that while it had been found necessary to appoint an assistant to the resident medical officer as early as 1886, in the middle of 1893 it became necessary to appoint a second assistant. This change in the character of cases admitted continued and became more marked. Whereas in the earlier years no surgery was attempted, this gradually became requisite; the proportion of acute medical cases continued to increase; the number of fever cases varied only with the epidemic conditions of the season, and was almost always much above 200, in one year rising to near 400; while the number of infectious cases of other sorts rose to more than 500 in one year (1893), and, as to kinds, seldom included less than five, all of which, of course, required isolating, not merely from the general cases, but also from each other.

A moderate number of out-patients, being poor people living in the neighbourhood of the hospital, have always been advised and supplied with medicines on application. During latter years this number increased, until this attendance became an appreciable addition to the sum of the day's work. No record was kept, however, until August 22nd of the year now reported on. It was found that the number of out-patients so attended during the remaining four months of the year amounted to 430; all were of the working classes; all resided at the village of Botany, 3 miles away, where no medical man is established. They paid for medicines when able to do so, but in small proportion to the total relieved.

The aboriginals' camp at La Perouse was frequently visited by the Medical Superintendent during the year, and necessary prescriptions were dispensed at the hospital.

Members of the garrison at Bare Island occasionally requisitioned the services of the medical staff, no medical man residing within sufficiently easy reach of this fort.

Another duty must be mentioned which falls on the medical staff, which is performed in connection with the Lazaret—an institution which stands within the extensive reserve attached to the hospital, but which is under control of the Minister at the Treasury. This department of the establishment has its own nursing and general staff, entirely separate from the Coast staff, and paid from a different Vote; supervision of it, however, is a duty of the matron of the Coast Hospital, just as medical attendance is a duty thrown on its medical staff, for which neither receive additional pay. It might be supposed that care of a number of chronic sick, who have but the slenderest chances of recovery, would be a matter involving very little trouble; but, apart from other considerations, it is the case that such patients require a good deal of attention, and that a considerable amount of time is devoted to them. Besides that, they suffer from chronic sores, which are often of a serious character, and which require frequent dressings, while some of them are so affected that almost constant watchfulness is necessary, in order that medical relief may be promptly available when certain complications arise. On the whole, the Lazaret is a special hospital, which involves much serious responsibility, much actual labour, and a constant exercise of tact to compose differences among the inmates (who are isolated under the law for the public good, and who are not all of them in destitute circumstances), and which forms a very important item in the tale of daily duty done by the medical staff and by the matron.

In short, the Coast Hospital has now become a general hospital, to the daily work of which the major operations of surgery are alone wanting.

The development indicated in the foregoing paragraphs can be illustrated by the following figures (see Appendix B). The total number of patients admitted in successive years increased from 1,132 in 1884 to 2,307 in 1897, the year now reported on, but the increase of work thus entailed on the staff is better shown by the average daily number of persons under treatment; this increased from 104 in 1884 to 224 in 1897. Nevertheless, the increase of work is far from being fully shown by these figures, for in that relation very much indeed depends on the kind and variety of cases admitted. The fever, and other infectious cases of different kinds, are of most importance, and for further information on this and some other points, reference may be made to the tables appended hereto.

Here is the proper place to point out, also, that while the results obtained during this series of years, as regards recovery or relief, have not being inferior to those of other large hospitals of New South Wales, the cost of maintenance and treatment compares very favourably with the cost elsewhere. The total cost per bed and per annum has varied between the following extremes:—£59 1s. 11d. in 1895, and £41 13s. 2d. in 1888. But this hospital has, from its situation and functions, to support the expense of a large ambulance service, from which other hospitals are free. This item, therefore, may be deducted from the total cost for purposes of comparison, and when that is done the two extremes become £53 10s. 11d. and £35 16s. 2d. respectively. These charges, in which repairs but not structural additions are reckoned, are extraordinarily low, and by way of indicating the methods by which such economy may be attained, I mention one item which often does not receive the attention it deserves. The cost of beer, wine, and spirits per bed per annum has varied between £2 3s. 2d. and 5s. 11d. under different Medical Superintendents. It is, in my opinion, quite impossible to trace any effect on the mortality from the different allowances thus represented; and in the year preceding that quoted in which this cost just exceeded 5s. 11d. (6s. 4d.) 342 cases of typhoid fever were treated (being the largest number for any year but one) with the highly satisfactory percentage of recoveries of 93. The table in Appendix B furnishes all the data available for further study of this point; for my own part I have formed an opinion that the cost of alcoholic stimulants varies with the individual views or custom or feeling of medical attendants rather than with any rational rule or sound experimental teaching, and that it should not exceed more than 5 or 6 shillings a year on an average of occupied beds.

From all the circumstances which have now been referred to, increases in the medical, nursing, and general staffs have, of course, from time to time become necessary. Thus, in the years 1884 and 1885 a single resident medical superintendent sufficed; from 1886 to 1893 a junior resident medical officer was added; in 1893 two junior medical officers were necessary, making a medical staff of three, but they were also charged with the dispensing; in 1896 I was obliged to recommend appointment of a qualified dispenser, in order that their whole time might be devoted to their professional duties. So also the nursing staff increased gradually from 17 in 1884 to 21 in 1888, to 25 in 1895, to 31 in 1896, while in 1897 the variety and number of cases of infectious disease, and an increase of 20 in the average daily number of patients, rendered a further increase to 37 indispensable. For another reason, to be mentioned below, a further addition of 2 was made to this staff about the middle of the year, and was continued throughout its remainder, making a total nursing staff of 39. Lastly, the general staff—ambulance service, wardsmen, yardsmen, and servants—increased during this series of years from 23 to 35.

From the circumstance of the original construction having been unsuited to hospital purposes, it follows that material improvements of an expensive character have also been required from time to time. It is scarcely necessary to do more than mention this, because the details have been given in earlier reports. The institution, however, has been sewered, and supplied with water from the public service.

This review, and the appended tables on which, together with my personal knowledge of the place almost since the date of its opening, it is founded, show, I submit, that the Coast Hospital has been successfully managed under very serious difficulties, and at a remarkably small cost. It shows, also, that from a camp for convalescents it has developed, on the same economical and successful lines, into a general hospital of not less importance either in size or in the class of cases treated than any other in the country. But it shows more than this; it is clear that the time has come when the medical staff must be still further increased, and perhaps when the future of the institution should be carefully considered.
